PIX AGRI BELTS

PIX Agribelts are available in different types e.g. Regular section, Hexagonal section, Variable speed belts and Banded. They are specially made to provide maximum service life in the practical application.

Hexagonal section provides the stability and support to transmit power on Agricultural serpentine drives.

Agriculture Variable Speed Belts are specially designed to withstand the high ambient temperature and oily conditions generally encountered in adjustable speed applications. For heavy duty application these belts are provided with special type of fabric at bottom for the extra flexibility required on small diameter pulleys and also with fibre filled compound on top side to impart extra rigidity in transverse direction. This enables the belt to withstand the forces and loads subjected during movement inside split type of pulleys.

The notable feature of Agricultural Variable Speed belts is that they transmit much higher loads over a narrower speed range. Therefore, Agricultural Variable Speed belts require higher tensile strength and are thicker with more reinforcement in the tensile support than Industrial belts.

PIX Banded belts are more suitable in conditions where high vibrations and shock loads are expected.

Salient features of PIX Agribelts

- PIX Agribelts are designed for efficient power transmission with minimised heat generation.
- A special rubber compound with textile fibre oriented across the transverse direction of length of the Cut Edge Belts provides high stability and minimizes deflection in the cross section.
- The minimum stretch stiff polyester cords have been designed for heavy power transmission, while at the same time ensuring a very high degree of length stability.
- The sides of the belts have excellent abrasion resistant properties contributing significantly to long and useful belt life.
- Moulded cogs reduces bending stresses and improves heat dissipation in Cut Edge construction.

PREVENTIVE MAINTENANCE TIPS

Problems	Causes	Remedies
Belt turnover in pulleys	• Poor drive alignment	• Realign
	• Incorrect pulley groove or excessive wear in grooves	• Renew or replace pulleys
	• Excessive belt flap	• Use an idler on slack side
	• Low belt tension	• Retension
	• Worn out belts	• Replace with new belts
	• Ingress of foreign material	• Use more effective drive guard
Excessive wear	• Incorrect pulley section	• Renew or replace pulleys
	• Excessive wear in pulley groove	• Renew or re-machine pulleys
	• Poor drive alignment	• Realign
	• Small pulley diameter than recommended	• Redesign using correct pulley diameter.
	• Belt catching on protruding parts	• Remove protrusion or move drive away
Excessive noise	• Poor drive alignment	• Realign
	• Incorrect belt tension	• Retension
	• Overloaded	• Check drive details and redesign
	• Unbalanced pulleys	• Redesign, if necessary balance the pulleys
Belt swelling or softening	• Contamination by oil or other chemicals	• Protect the drive from contamination, clean pulley grooves. If contamination cannot be prevented use PIX AOH V- Belts.
Unusual belt stretch	• Worn out badly damaged grooves	• Re-machine or renew pulleys
	• Used belts & new belts are mixed up on drive	• Replace with completely new set of V-Belts
	• Belts from different manufacturers	• For using a matched set, belts must be from one manufacturer
Belt breaking after fitment	• Forcing belt over pulleys when fitting, damaging the cord and cover	• Reduce drive centre distance to fit belt
	• Ingress of foreign material	• Fit an effective guard
	• Insufficient belt or wrong section or drive	• Check drive design and fit correct number or section of belts
	• Drive stalled	• Ascertain cause and rectify
Cannot be re-tensioned	• Insufficient allowance for stretch in drive design	• Give sufficient allowance for take-up
	• Excessive stretch caused by insufficient belts or wrong belt section for drive	• Recalculate drive design and modify
	• Incorrect belt length	• Use belt of proper length
	• Belts from different manufacturers used on the same drive	• Use belts from one manufacturer

PREVENTIVE MAINTENANCE TIPS

Problems	Causes	Remedies
Excessive slippage	• Too low belt tension	• Increase belt tension
	• Too small area of contact	• Increase shaft centre distance
	• Overload	• Redesign belt drive
	• Worn belt or pulley	• Change to new belt or pulley
Transversal cracking	• Too small pulleys	• Use standard size pulley.
	• Outside idler pulleys	• Use inside idler pulley in slack side
	• Ambient temperature too high	• Ensure good ventilation and protect from direct heat.
	• Ambient temperature too low	• Warm area surrounding the drive
Bottom & side of belt burnt	• Abnormal belt slip	• Check drive tension and drive design to ensure correct number of belts
Belt pulled apart (snapped)	• Belt slipping under starting or stalling load	• Replace belt and tighten drive until slipping stops
	• Worn sheaves	• Replace sheaves
Belt pulled apart (snapped)	• Extreme shock load	• Remove cause of load
	• Misaligned drive	• Check drive alignment
	• Foreign particle in the drive	• Use drive guard

TYPES OF FAILURES

Bottom crack

Belt snapped

Shining surface due to high slippage

Stuck up and burnt

Belt snapped due to cord break while fitment

Envelope wear
(side, bottom & top wear-out)

Belt twisted due to belt turnover in pulley

DO'S & DON'TS OF PIX V-BELTS
