SERVICE MANUAL

1996 Model

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of 1998 model Mitsubishi Fuso Truck FE.FG series.
Read this manual carefully as an aid to providing correct, efficient and fast maintenance.
Please note, however, that due to continuous improvements on the specifications, numbers and description for maintenance might be changed without prior notice.
If you have any question, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso dealer or distributor.

5	ⒺFuel injection timing							×		Check fuel injection timing	Gr 13A
6	Ⓔ[illegible]		Every 40000 km/24000 miles or							Clean gauze filter inside connector [illegible] gas oil	Gr 13A
			[illegible]000 miles or							Replace fuel [illegible]	

(1) This column contains the maintenance and inspection items.
(2) The periods between inspection and service and based on the assumption that the vehicle will be driven approximately 60000 kilometers (36000 miles) per year.
Inspection which must be made are indicated by an "×" or by the appropriate period between servicing.
(3) This column provides a simplified explanation of the operational procedures involved for each inspection or maintenance item.
(4) The Gr. No. refers to the "group number" in this vehicle Service Manual. For visual checks and simple inspections, see the sections labelled "Working Procedures".

MAINTENANCE OPERATIONS

Oil Filter Replacement

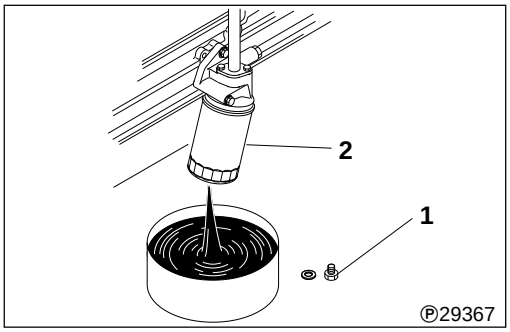
Lubricant

Location	Points of application	Specified lubricant	Quantity
2	Oil filter	Engine oil (API CD or higher)	Approx.1 L {1.1 qts}

Special tools

Unit: mm {in.}

Location	Tool name and shape	Part No.	Application
—	Oil Filter Element Socket  08550	MH061566	Oil filter removal
	Oil Filter Wrench **ϕ107 to 120 {ϕ4.21 to 4.72}** 01503	MH063200	

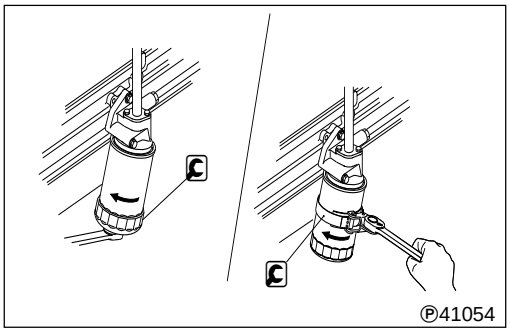


WARNING ⚠

- **Wipe up any spilled engine oil since it may cause a fire.**
- **Do not touch oil when the engine is hot since it can inflict severe burns.**

CAUTION ⚠

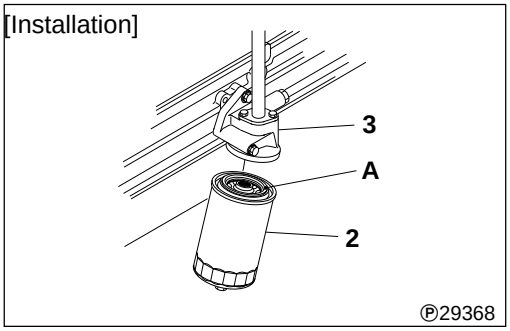
When pouring oil into the engine, take care not to spill any on the V-ribbed belt. Contact with oil could make the V-ribbed belt slip, rendering the cooling system less effective.



Loosen oil filter drain plug **1** to drain the engine oil from inside the filter **2**.
[Removal]

: Oil Filter Element Socket or Filter Wrench

[Installation]



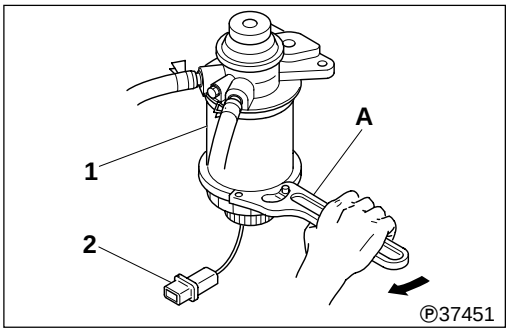
- Clean the surface of oil filter head **3** to which oil filter **2** is fitted.
- Apply a thin coat of engine oil to the gasket A of oil filter **2**.
- Screw oil filter **2** into oil filter head **3** by hand until gasket **A** contacts the oil filter head. Then, tighten oil filter **2** further by giving it a 3/4 turn.
- After installing the oil filter, start the engine and check gasket **A** for oil leakage.
- Check to see if the engine oil level is in the specified range.

https://truckmanualshub.com/

Replacing Fuel Filter

Lubricant

Location	Parts to be tightened	Specified lubricant	Quantity
3	Gasket for fuel filter cartridge	Engine oil	As required



[Removal]

A: Filter Wrench
(Commercially available one: For filter diameter of approx. 90 mm {3.54 in.})

WARNING ⚠

- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **To minimize the risk of fire, wipe up any spilled fuel.**

CAUTION ⚠

- **The water level sensor 2 may be reused if it properly functions.**

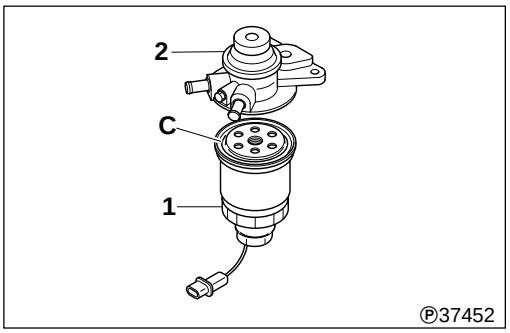
[Installation]

WARNING ⚠

Use of an unsuitable fuel filter cartridge 1 can lead to fuel leaks and fires. Be sure to use a genuine filter.

CAUTION ⚠

To prevent injection failures, keep dust and dirt out of the fuel filter cartridge 1 and the fuel pipe.



- To fit the fuel filter cartridge **1**, turn it until the gasket **C** touches seal surface of the fuel filter head **2**. Be sure to turn the filter by hand clockwise.
  Then, tighten the filter by 3/4 turn.
- After fitting the filter, start the engine and check that no fuel leakage occurs.
- Bleed all air out of the fuel system. P.01-6

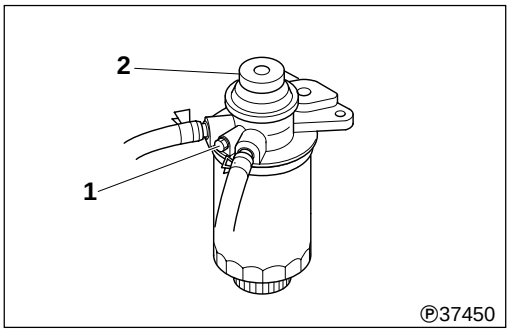
https://truckmanualshub.com/

Bleeding Air from Fuel System

❶ Tightening torque

Unit: N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Air vent plug	6±1 {4.3±0.7, 0.6±1}	—

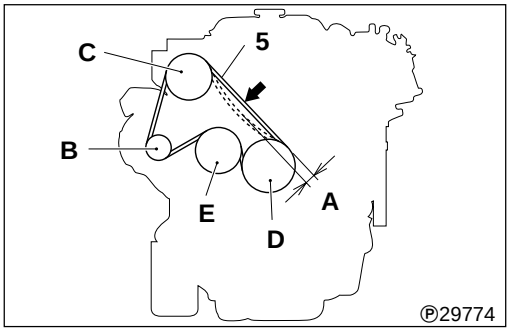


- Loosen the fuel filter air vent plug **1**.
- Operate the priming pump **2** to pump up fuel.
- Continue to pump fuel until no air bubbles are found in the fuel flowing out from the air vent plug **1**.
- After ascertaining that air bubbles have completely disappeared, tighten the air vent plug **1** securely.
- Operate the priming pump **2** further until it feels heavy.
- Wipe up all spilled fuel, then start the engine.
- Check that no fuel leakage occurs.

WARNING ⚠

- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **Be sure to wipe up all spilled fuel. Unless it is wiped up, it could catch fire.**

V-ribbed belt tension



[Inspection]

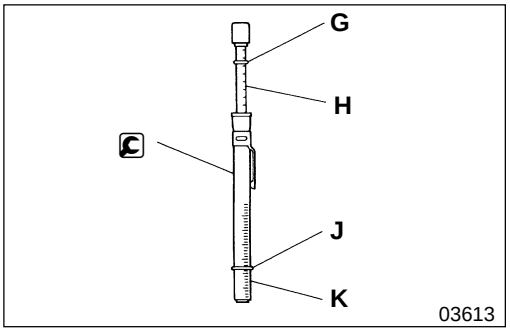
NOTE

Before checking for tension, crank the engine one turn or more clockwise.

Apply force of approximately 98 N {22.1 lbf, 10 kgt} to the span center of the V-ribbed belt **5**, and measure the extent of belt deflection **A**.

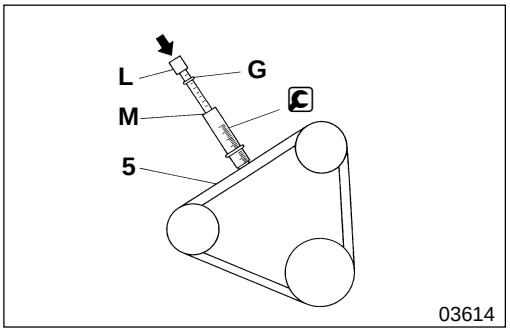
B: Alternator pulley
C: Air conditioner compressor pulley or tension pully
D: Fan pulley
E: Water pump pulley

https://truckmanualshub.com/

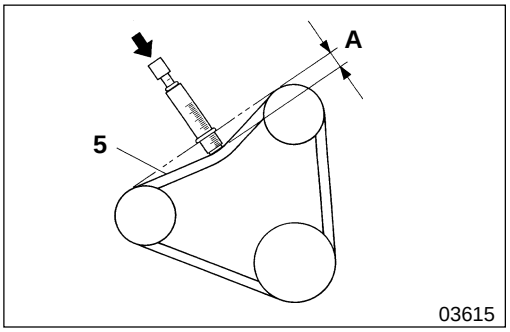


● **Use of belt tension gauge**

- Set the upper O-ring **G** of the Belt Tension Gauge to a push load of 98 N {22 lbf, 10 kgt} on scale **H**.
- Set the lower O-RING **J** of the Belt Tension Gauge to the belt's specified maximum deflection value on scale **K**.



- Apply the Belt Tension Gauge to the center of the V-ribbed belt **5** and push **L** until the upper O-ring **G** reaches the flange **M**.



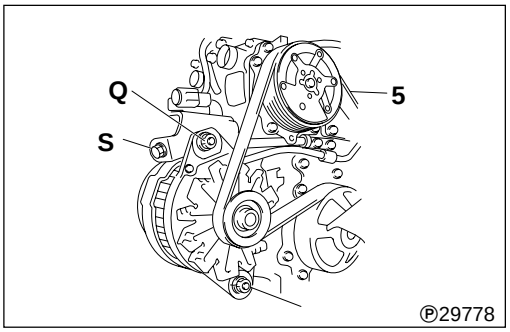
- Measure the deflection **A** of the V-ribbed belt **5**. If the measurement does not comply with the standard value, adjust the tension in accordance with the following procedure.

[Adjustment]

(1) Tension adjustment of V-ribbed belt for water pump

CAUTION ⚠

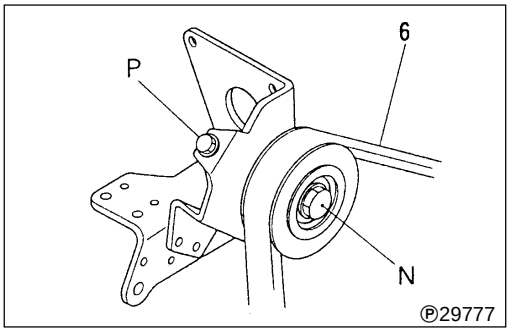
- **Excessive tension in the V-ribbed belt 5 may damage the belt and related bearings.**
- **Keep the V-ribbed belt 5 free of oil. If the belt becomes oily, it may slip, resulting in overheating of the engine and insufficient charging of the battery.**



<With air conditioner>

- Loosen the alternator mounting nuts **Q** and **R**, then adjust the tension of the V-ribbed belt **5** using the adjustment bolt **S**.
- When the adjustment is completed, securely tighten the nuts **Q** and **R**.

https://truckmanualshub.com/



<Without air conditioner>

- Loosen the tension pully mounting sleeve **N** and adjust the tension of the V-ribbed belt **6** using the adjusting belt **P**.
- After the adjustment, tighten the sleeve **N** securely.

Battery

DANGER ⚠

- **Since flammable hydrogen gas is generated by the battery, be sure to obey the following warnings:**
- **Do not short-circuit the ⊕ and ⊖ terminals on the battery.**
- **Keep sparks and lit cigarettes away from the battery.**
- **Do not wear metal objects on your arms and lean over the battery.**
- **Because the battery electrolyte is diluted sulfuric acid and is corrosive, when handling the battery wear safety glasses and rubber gloves to protect the eyes and hands.**
- **Battery posts, terminals and related accessories contain lead and lead compounds. Wash hands after handling.**

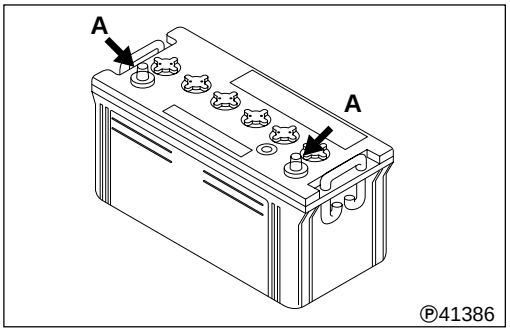
WARNING ⚠

To prevent a short-circuit be sure that disconnected the battery cables do not accidentally touch the battery terminals.

CAUTION ⚠

- **Make sure that you disconnect the battery cable ⊖ first when you disconnect the battery cables.**
- **Make sure that all electrical switches of the vehicle are OFF before connecting the battery cables.**
- **Make sure that you connect the battery cables ⊕ before you connect the battery cable ⊖.**

https://truckmanualshub.com/

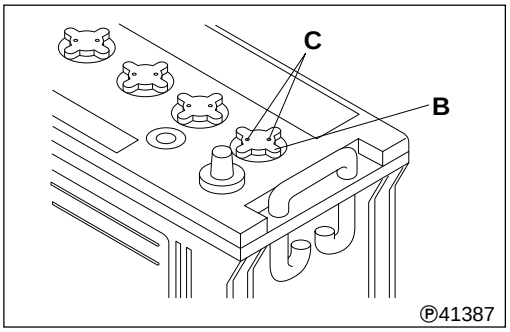


Visual inspection

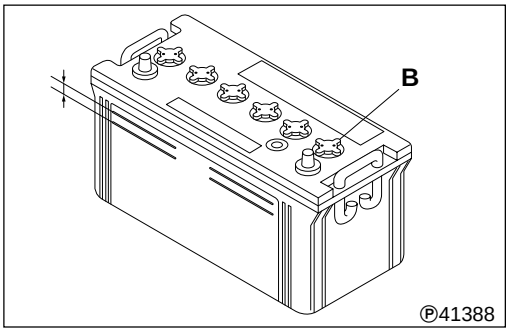
- If terminal **A** is corroded, scrub off the corrosion from it using a wire brush.
- If cracks or defects are found on battery **7**, replace it because the cracks or defects can cause liquid spills.

CAUTION ⚠

Be sure to apply grease to the ⊕ side of terminal A because it is easily corroded.

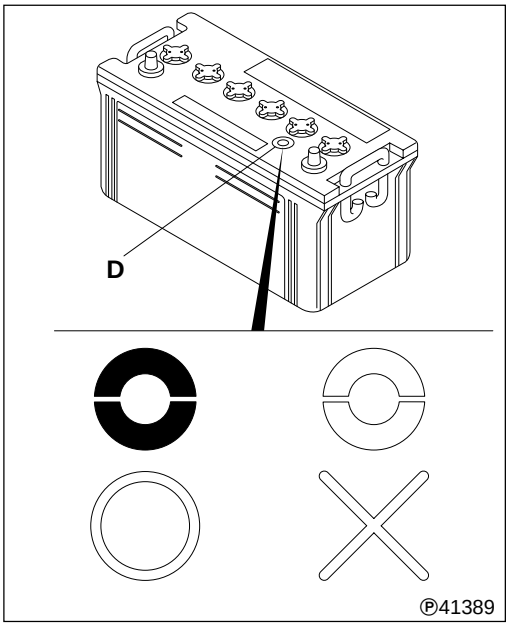


- If the air bleed hole **C** of vent plug **B** is clogged, clean the hole.



Inspection of fluid level

- Confirm that the level of battery electrolyte is between UPPER and LOWER LEVEL lines.
- If the level is below LOWER LEVEL line, remove vent plug **B** and replenish the distilled water or battery fluid to the UPPER LEVEL.

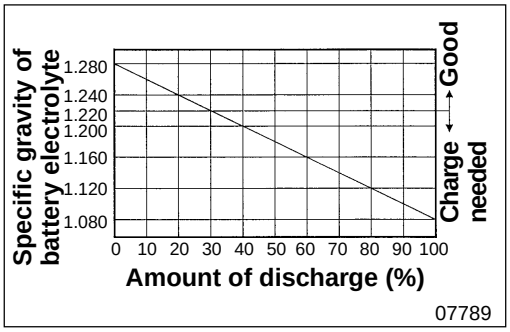


Specific gravity measurement

You can tell the specific gravity of the battery electrolyte by the color shown in indicator **D**.

Blue : Good
White : Charge or replace

https://truckmanualshub.com/



Charging

- Although, as a rule, charging of the battery should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect the battery cable ⊖.
- Remove vent plug **B** before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C{°F})
Normal charge	$\frac{\text{value of 5-hour rating capacity}}{10}$	$\frac{\text{*Amount of discharge (Ah)}}{\text{Charge current (A)}} \times 1.2$ (to 1.5)	45 {113}
Quick charge	$\frac{\text{Value of 5-hour rating capacity}}{1.5}$	0.5	55 {131}

* Amount of discharge (Ah) = 5 hour rating capacity (Ah) $\times \frac{\text{Amount of discharge (\%)}}{100}$

- Use the graph shown on the left to calculate the amount of discharge (%).
- If electrolyte level is low add distilled water to raise level.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER ⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep unprotected lights away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because its dangerous.**
- **After charging the battery, tighten vent plug B, wash away sulfuric acid from the battery using water, and dry the surface.**
- **Be sure to check the electrolyte level before charging the battery. Charging with the electrolyte level below the lower limit (LOWER LEVEL) can cause premature deterioration, heat generation and explosion of the battery.**

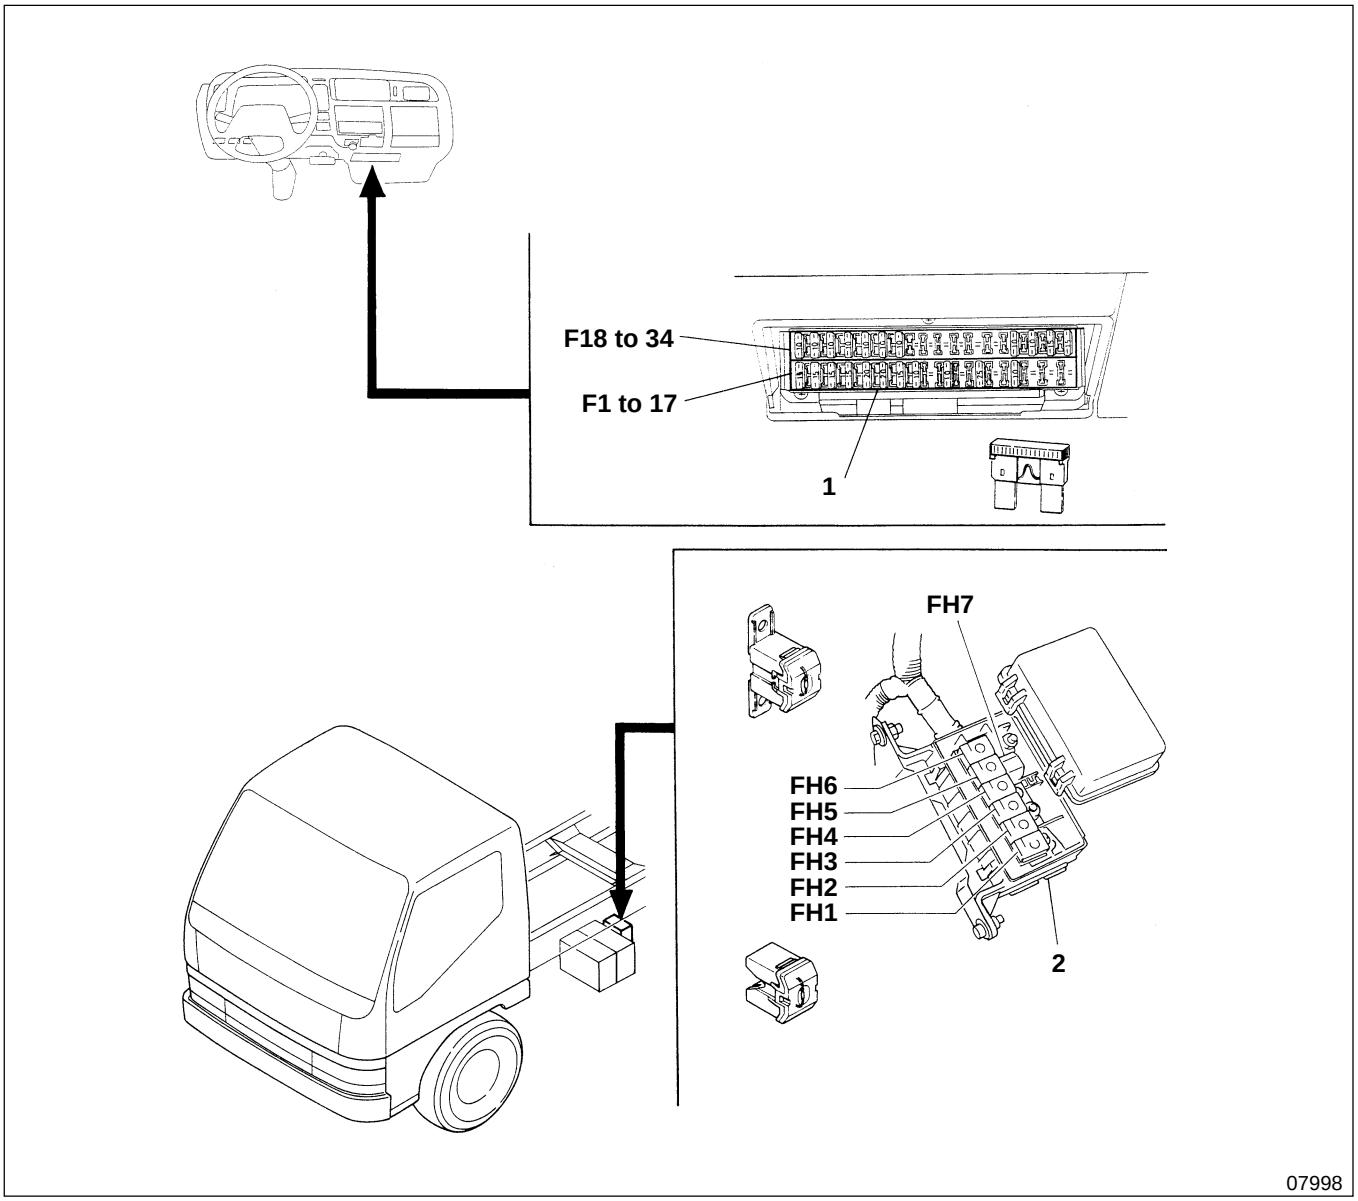
MEMO

https://truckmanualshub.com/

MAINTENANCE OPERATIONS

Fuse



1 Fuse box
2 High-current fuse box

CAUTION ⚠

- **If a fuse blow, make sure you identify and remedy the cause, then replace the fuse.**
- **Make sure that you replace the fuse with one having the same rating.**
- **Make sure that you remove the ⊖ terminal of the battery cable before removing high-current fuses FH1 to 7.**

https://truckmanualshub.com/

High-current fuse box

Engine Oil Replacement

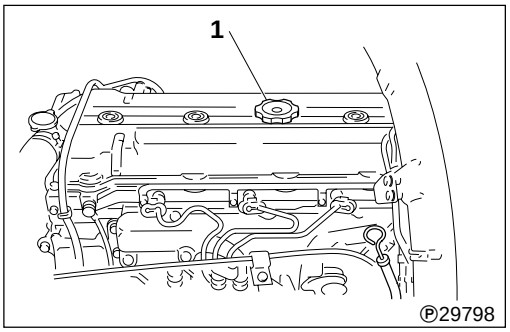
❶ Tightening torques

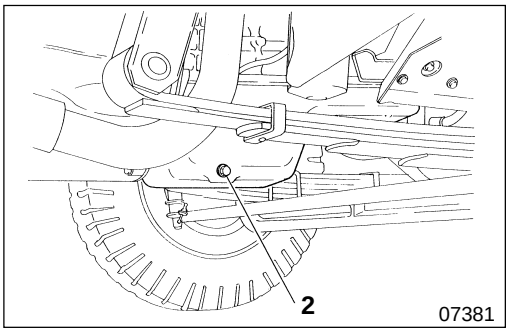
Unit: N·m {lbf·ft, kgf·m}

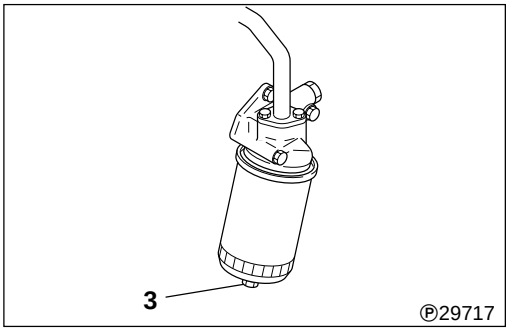
Location	Parts to be tightened	Tightening torque	Remarks
2	Oil pan drain plug	34.3 to 43.1 {25 to 32, 3.5 to 4.4}	—
3	Oil filter drain plug	9.8±1.96 {7.2±1.4, 1.0±0.2}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
—	Oil pan	Engine oil (API CD or higher)	Approx.9 L {9.5 qts}
—	Oil filter	Engine oil (API CD or higher)	Approx.1 L {1.1 qts}







WARNING ⚠

Wipe up any spilled engine oil since it can cause a fire.
Do not touch oil when the engine is not since it can inflict severe burns.

CAUTION ⚠

When pouring oil into the engine, take care not to spill any on the V-ribbed belt. Contact with oil could make the V-ribbed belt slip, rendering the cooling system less effective.

[Draining]

- Warm up the engine, then remove oil filler cap **1**.
- Remove oil pan drain plug **2** and oil filter drain plug **3**. Then, drain the engine oil.

[Filling]

Tighten oil pan drain plug **2** and oil filter drain plug **3** to their specified torques. Then, add new engine oil to the specified level.

https://truckmanualshub.com/

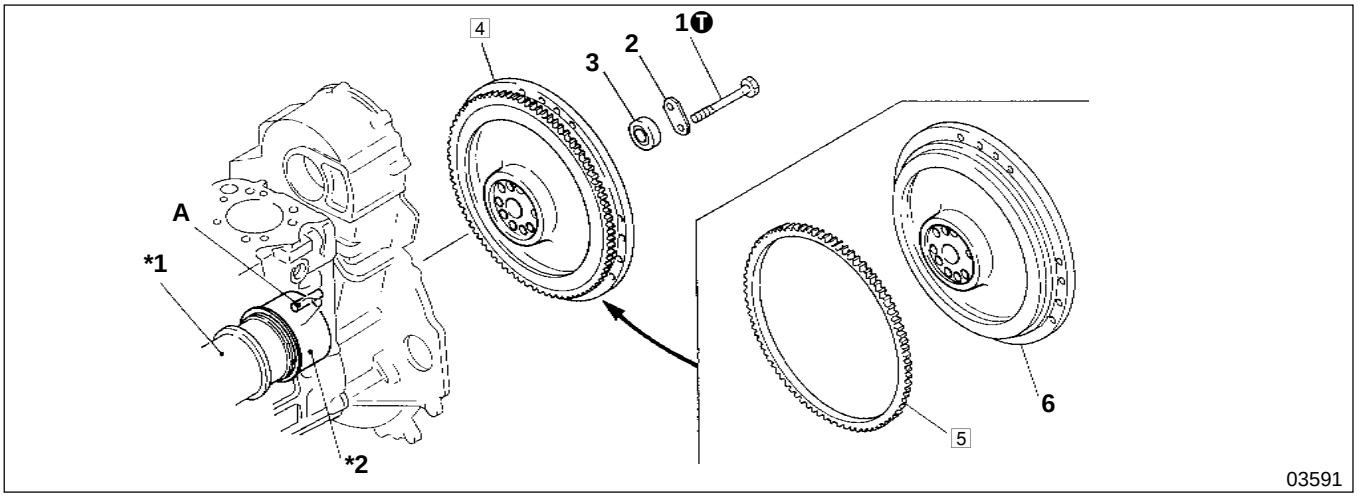
GROUP 11 ENGINE <4D34T3>

FLYWHEEL 11-2

FLYWHEEL POWER TAKE-OFF 11-6

https://truckmanualshub.com/

FLYWHEEL



● **Disassembly sequence**

1 Bolt
2 Plate
3 Bearing
4 Flywheel assembly
5 Ring gear
6 Flywheel

1: Crankshaft Gr.11
2: Crankshaft power take-off pulley P.11-6

A: Location Pin

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

After the flywheel assembly 4 is installed, be sure to check the flywheel 6 for runout.

https://truckmanualshub.com/

Service standards

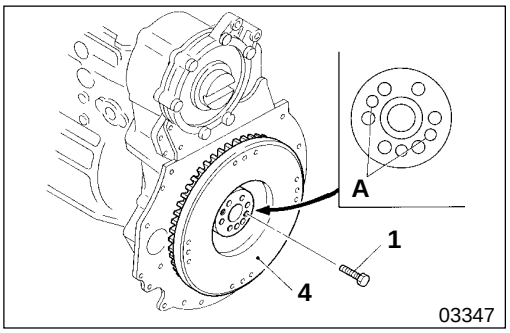
Unit: mm (in.)

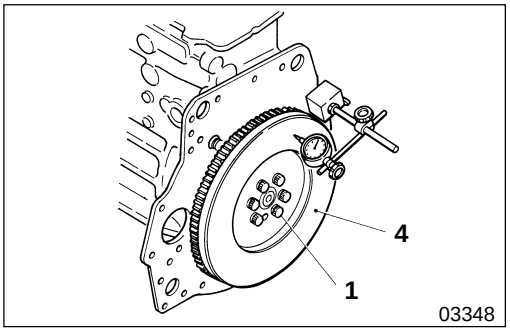
Location	Maintenance item		Standard value	Limit	Remedy
4	Flywheel assembly	Height of friction surface	25	24	Correct or replace
		Friction surface distortion	0.05 or less	0.2	Correct or replace
		Friction surface runout (when fitted)	—	0.2	Correct or replace

Ⓣ Tightening torques

Unit: N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks	
1	Bolt (flywheel assembly installation)	120 {90, 12.5}	M12 bolt	
		175 {130, 18.0}	M14 bolt	





◆ Service procedure

4 Flywheel assembly

[Removal]

- To remove the flywheel assembly **4**, screw the mounting bolts **1** into the removal holes **A**.
- Loosen the bolt of the tensioner pulley assembly to remove the tension from the belt. P.11-8

[Installation]

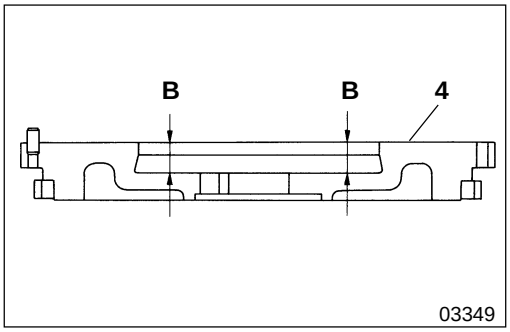
Adjust the belt tension after installing the flywheel assembly **4**.
P.11-6

[Inspection]

(1) Runout

If runout exceeds the specified limit, check that the bolts **1** are tightened correctly and inspect the surface in contact with the crankshaft ***1**. Then, rectify or replace the flywheel assembly **4** as required.

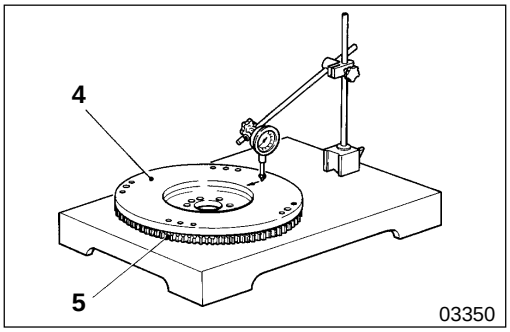
https://truckmanualshub.com/



(2) Height of friction surface

If the measurement is below the specified value, rectify or replace the flywheel assembly **4**.

B: Height of friction surface

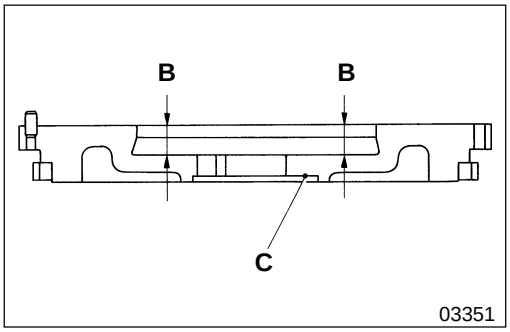


(3) Distortion of friction surface

If distortion exceeds the specified limit, rectify or replace the flywheel assembly **4**.

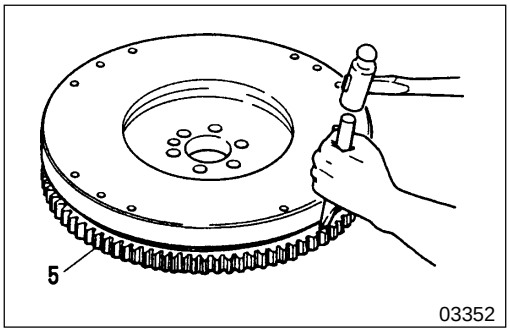
CAUTION ⚠

If any abnormality is evident on the ring gear 5, replace the ring gear before making inspections.



[Rectification]

Grind the friction surface such that its height **B** remains greater than the specified minimum. The friction surface must remain parallel with surface **C** with a tolerance of 0.1 mm {0.0039 in.}.



5 Ring gear

[Inspection]

Check the ring gear **5** for damage and abnormal wear, and replace the ring gear if it is faulty.

[Removal]

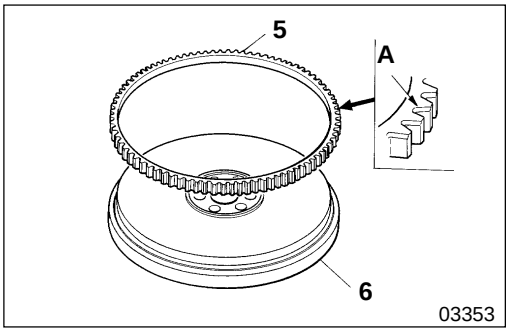
- Heat the ring gear **5** evenly with an acetylene torch or the like.

WARNING ⚠

Be careful not to get burned.

- Remove the ring gear **5** from the flywheel by tapping around its entire periphery.

https://truckmanualshub.com/



[Installation]

- Using a piston heater or the like, heat the ring gear **5** to approximately 100°C {212°F} for 3 minutes.

WARNING ⚠

Be careful not to get burned.

- Fit the ring gear **5** with the non-chamfered side of its teeth toward the flywheel **6**.

  A: Chamfered side of ring gear

Note 1 : The automatic transmission electronic control unit activates fail-safe functions when there is an abnormality in the input/output signals.
Note 2 : The self-diagnosis function actiates.
Note 3 : Backup for vehicle speed sensor 2 (mounted on transmission)
*1 : FE640
*2 : FG639
*3 : Except FE640

https://truckmanualshub.com/

● **Self-diagnosis function <FE640>**

The warning lamp lights when an abnormality occurs during vehicle operation.

- The warning lamp does not light if the abnormality causes minimum effect to vehicle operation.
- The warning lamp lights when the following parts are malfunctioning to indicate the abnormal condition since these malfunctions significantly reduce vehicle performance.
  - Vehicle speed sensor 1
  - Vehicle speed sensors 1 and 2
  - Shift solenoid 1
  - Shift solenoid 2
  - Accelerator sensor
  - Timing solenoid
  - Inhibitor switch
  - Throttle pressure solenoid

CAUTION ⚠

The warning lamp lights only when the malfunction prevents proper vehicle operation.

The indicator lamp provides self-diagnosis information.

- To facilitate the discovery of malfunctions that may not reproduce themselves frequently, the automatic transmission electronic control unit stores in the memory information of malfunctions that occur during vehicle operation.
- An input of a self-diagnosis start signal produces the output of the data from the memory, and causes the automatic transmission warning lamp to flash according to the data.

CAUTION ⚠

The automatic transmission electronic control unit stores information of all malfunctions that occur after the previous self-diagnosis operation.

● **Vehicle speed sensor <FE640>**

The vehicle speed monitoring system is composed of two sensor circuits; vehicle speed sensor 2 (output shaft rotation sensor) and vehicle speed sensor 1. Accordingly, the normal driving mode is not disabled even when one of the vehicle speed sensor circuits is faulty.

https://truckmanualshub.com/

● Diagnosis Code Chart

Diagnosis code	Problem location	Judgement criterion	Fail-safe measure
1	Normal		
11	Power supply voltage	Power supply voltage remains below 7.5 V for 1 second or longer with range selector in a position other than P or N range.	
12	Vehicle speed sensor 1	• Vehicle speed sensor 1 indicates sudden speed decrease.	• Maintains the gear selected immediately before malfunction detection. • Turns off shift solenoids 1, 2 when engine speed sensor detects a value or less than 1000 rpm.
13	Oil temperature sensor	When oil temperature of more than 135°C {275°F} or lower than –50°C {–58°F} is detected. Note that MUT display is fixed at “40°C {104°F}” after fail-safe judgement result.	Maximum oil temperature
15	Engine speed sensor	Engine speed sensor detects a value of less than 300 rpm when range selector is in a position other than P or N range and when output shaft rotating speed is 1000 rpm or higher.	Prohibits 2-3 shift timing control.
24	Accelerator sensor	When accelerator sensor signal input to engine ECU is faulty.	• Shift-point in set at 0% throttle opening. • Prohibits 2-3 shift timing control. • Executes controls assuming that throttle pressure is at maximum. • Prohibits lock-up control (lock-up solenoid OFF) except during diving at high speeds.
25	Vehicle speed sensor 2	• Vehicle speed sensor 2 indicates sudden speed decrease.	• Maintain the gear selected immediately before malfunction detection. • Turns off shift solenoids 1, 2 when engine speed sensor detects a value or less than 1000 rpm.
31	Shift solenoid 1	• When solenoid output short-circuit occurs while solenoid is receiving current. • When solenoid output disconnection occurs while solenoid is not receiving current.	• Turns off malfunctioning shift solenoid. • Turns off lock-up solenoid and timing solenoid. • Refer to the chart on P23-54 for gear selection.
32	Shift solenoid 2	• When solenoid output short-circuit occurs while solenoid is receiving current. • When solenoid output disconnection occurs while solenoid is not receiving current.	• Turns off malfunctioning shift solenoid. • Turns off lock-up solenoid and timing solenoid. • Refer to the chart on P23-54 for gear selection.
34	Line pressure solenoid	When wire breakage or short-circuit occurs.	Turns off line pressure solenoid.
35	Lock-up solenoid	• When solenoid output short-circuit occurs while solenoid is receiving current. • When solenoid output disconnection occurs while solenoid is not receiving current.	Turns off lock-up solenoid.
43	Inhibitor switch	• No signal	Operates as D range and prohibits shifting to 4th gear.
		• Two or more signals	• Control function activates based on priority order of L > R > 2 > D > N (P). • Refer to pages 23 through 54 for actual vehicle operation conditions.

● Diagnosis Code Chart

Diagnosis code	Problem location	Judgement criterion	Fail-safe measure
50	PTO solenoid	• When solenoid output short-circuit occurs while solenoid is receiving current.	Turns off PTO solenoid.
		• When solenoid output disconnection occurs while solenoid is not receiving current.	
51	Timing solenoid	• When solenoid output short-circuit occurs while solenoid is receiving current.	Truns off timing solenoid.
		• When solenoid output disconnection occurs while solenoid is not receiving current.	
54	Exhaust brake cut-off signal	Exhaust brake activates when exhaust brake cut-off signal is generated.	• Prohibits exhaust brake cut-off control • Allows lock-up only at high cruising speed.

https://truckmanualshub.com/

● **Inspection using MUT-II <FE640>**

① The MUT-II indicates diagnosis codes that provide information of malfunctioning items (devices that require inspection).

② The MUT-II indicates sensor signal conditions with numerical values (service data). Comparison of the service data with judgement criteria allows evaluation of the transmission operation. Diagnosis codes and service data codes can be effectively used for troubleshooting.

①		②				
Indicated by MUT-II		Indicated by MUT-II			Inspection procedure	
Diagnosis code	Mulfunctioning item (devices that require inspection)	Service data code	Signal name	Service data	Inspection condition	Judgement criterion
11	POWER VOLTAGE					
12	VEH SPD SNSR 1	12	VEH SPEED 1	□□□.□ MPH	With vehicle standstill	0 MPH
					During driving	To be synchronized with speedometer

GROUP 24 TRANSFER <FG>

STRUCTURE AND OPERATION 24-2

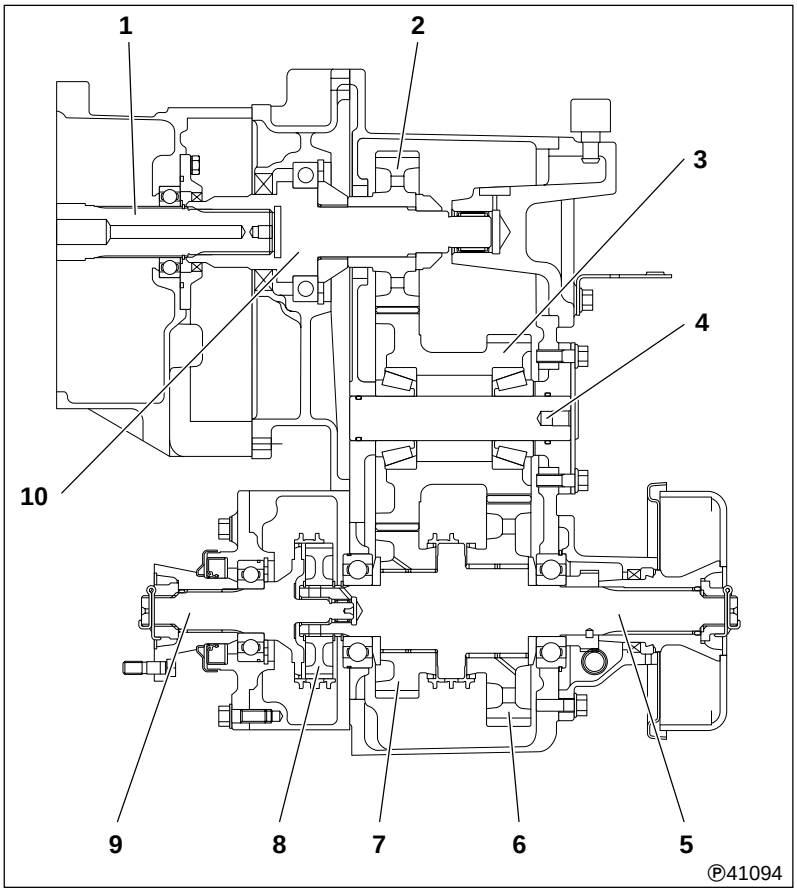
REMOVAL AND INSTALLATION OF TRANSFER ASSEMBLY 24-4

FRONT DRIVE 24-8

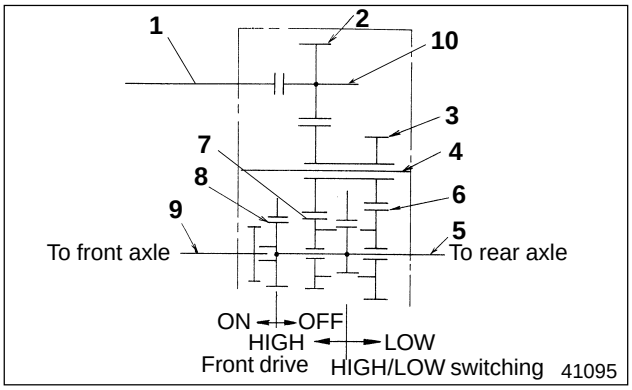
IDLER GEAR AND REAR DRIVE 24-14

https://truckmanualshub.com/

Transfer Body



1 Transmission main shaft
2 Drive shaft gear
3 Transfer idler gear
4 Transfer idler shaft
5 Output shaft
6 Output shaft LOW gear
7 Output shaft HIGH gear
8 Front drive hub and sleeve
9 Front drive shaft
10 Transfer drive shaft



The transfer functions as both the distributer for four-wheel drive and as the sub-transmission with a reduction device.
This transfer is a three-shaft constant-mesh type.
HIGH/LOW changeover and front drive ON/OFF are controlled by a transfer control lever in the cab.

https://truckmanualshub.com/

◆ Service procedure

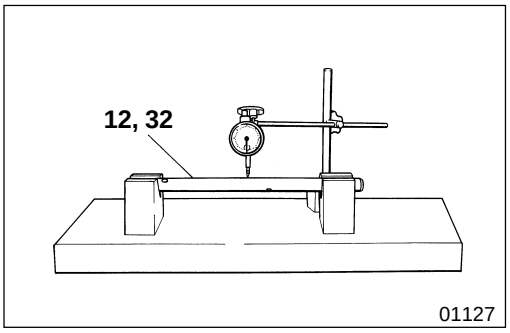
11 25 Removal and installation of set bolt

Tighten shift fork mounting set bolt **11**, **25** at specified torque, and stake the thread area at three points using at punch.

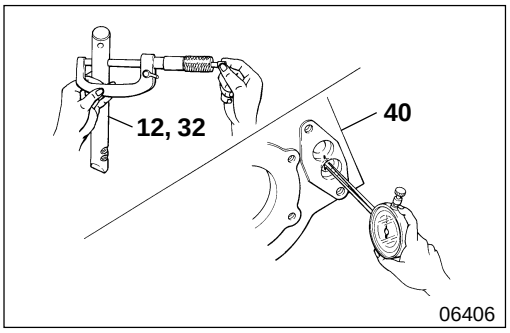


12 32 Inspection of shift rail

If the measured value is higher than the limit, correct or replace shift rails **12**, **32**.

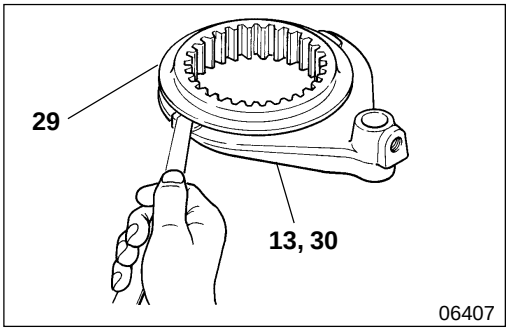
NOTE

To measure the deflection of shift rails 12, 32, turn them one full revolution and read the dial gauge indicator. The deflection is one half of the indicated value.



12 32 40 Clearance between shift rail and transfer assembly rail hole

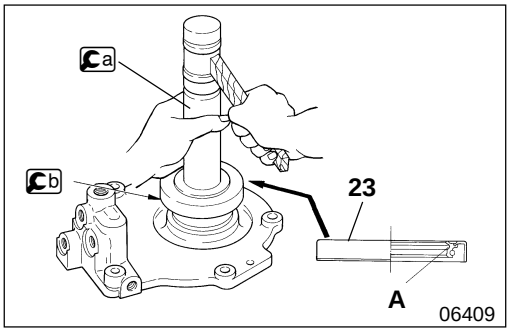
Measure the outer diameter of shift rail **12**, **32** and the inner diameter of transfer assembly hole **40**. If the clearance is higher than the limit, replace faulty parts.



13 29 30 Clearance between shift fork and synchronizer sleeve

If the measured value is higher than the limit, replace faulty parts.

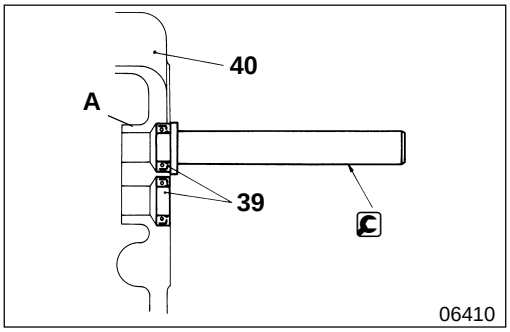
https://truckmanualshub.com/



23 Installation of oil seal

Apply grease to lip area **A** of oil seal **23**, and press-fit it.

a : Bearing installer
b : Differential bearing inner race installer adapter



39 Installation of oil seal

Apply grease to lip area **A** of oil seal **39** and press-fit it into transfer assembly **40**.

: Oil seal installer

https://truckmanualshub.com/

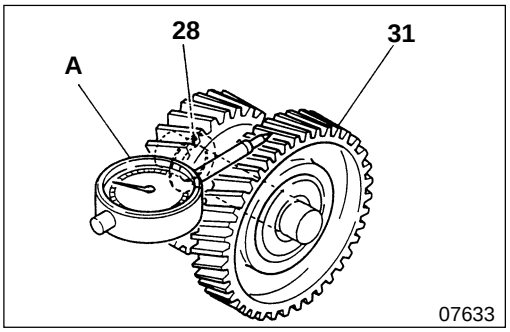
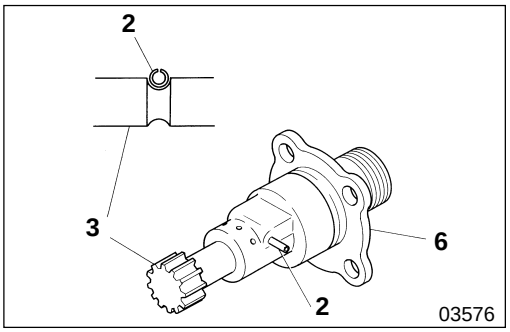
◆ Service procedure

Inspection before service



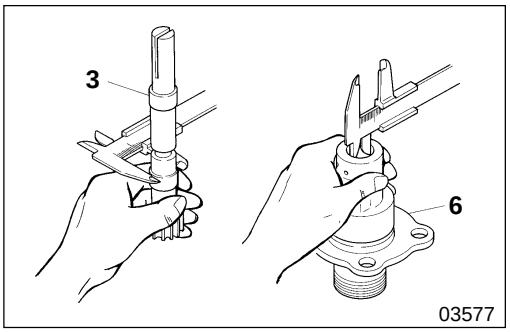
● **Starting torque of transfer idler gear**

- Disassemble parts, and measure the torque with push gauge **A** leaving only transfer idler gear **31** in transfer case.
  If the value deviates from the standard value, adjust it using shim **28**.
- On assembly, also check that starting torque is within the standard value range using the same method.
- Shim **28** is available in four thickness: 0.01 mm {0.00039 in.}, 0.02 mm {0.00079 in.}, 0.03 mm {0.0012 in.}, 0.06 mm {0.0024 in.}.



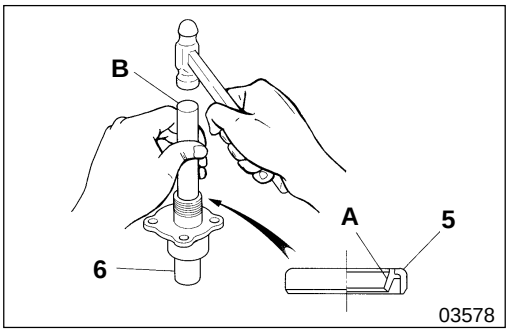
2 **Driving-in spring pin**

Drive spring pin **2** into speedometer gear bushing **6** with the opening in the opposite direction to speedometer gear **3**.



3 6 **Clearance between speedometer gear and speedometer gear bushing**

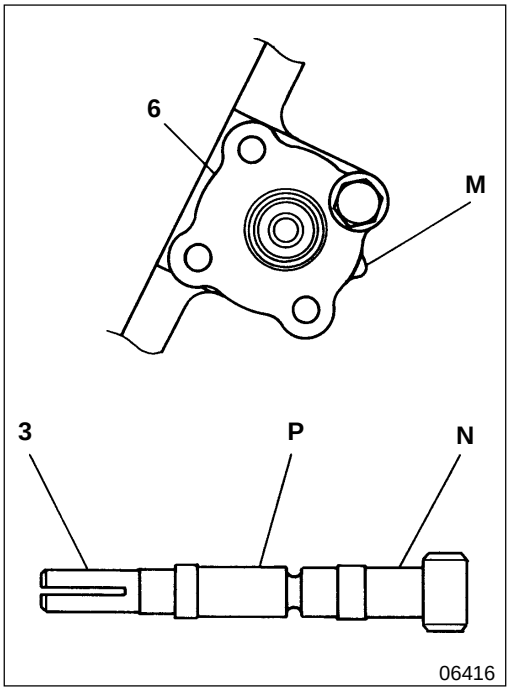
If the clearance is higher than the limit, replace the faulty parts.



5 **Installation of oil seal**

Apply grease to lip area **A** of the inner rim of the oil seal, and press-fit oil seal evenly into speedometer gear bushing **6** in the direction as illustrated using bar **B** (approximately ϕ15 mm {0.59 in.}).

https://truckmanualshub.com/

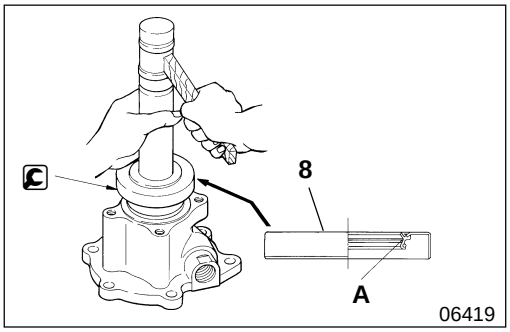


6 Installation of speedometer gear bushing

Due to its eccentric center arrangement, speedometer gear bushing **6** allows replacement of speedometer gear **3** with gears having a different number of teeth by changing only the installation direction, the worm gear does not have to be changed.
When installing the bushing, align the stamped number, identical to the number of speedometer gear teeth, with alignment mark **M** of output rear cover **9**.
The number of speedometer gear teeth can be identified by the identification marks stamped on **N** or **P**.

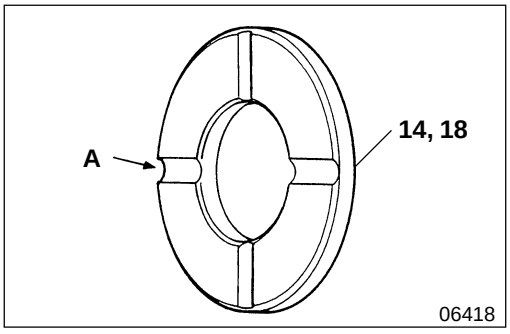
Identification mark and number of speedometer gear teeth

Identification mark	A	B	C	D	L	E	F	G	H	I	J	K
Number of teeth	15	16	17	18	19	20	21	22	23	24	25	26
Gear ratio	3.0	3.2	3.4	3.6	3.8	4.0	4.2	4.4	4.6	4.8	5.0	5.2



8 Installation of oil seal

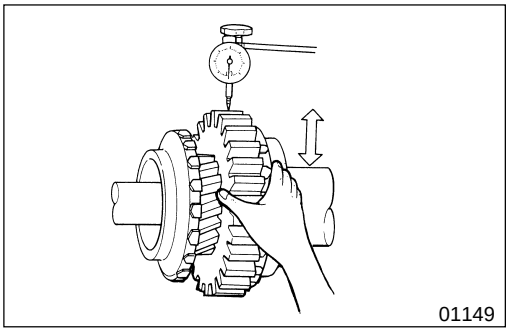
Apply grease to lip area **A** of oil seal **8** and press-fit into output rear cover **9**.



14 18 Installation of thrust washer

Install thrust washer **14**, **18** with oil groove **A** facing gear side.

https://truckmanualshub.com/

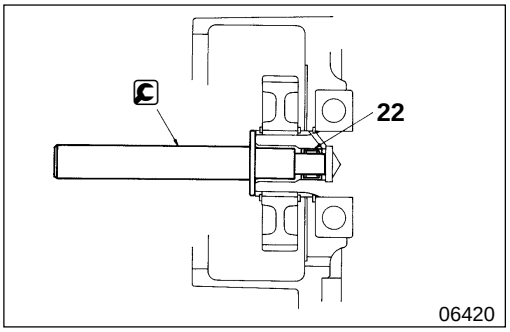


15 18 20 23 24 **Play of rear drive shaft gear in diameter direction after assembly**

If the measured value is higher than the limit, replace faulty parts.

NOTE

When replacing needle bearing 20, 24, use bearings from the same color package.



22 **Installation of needle bearing**

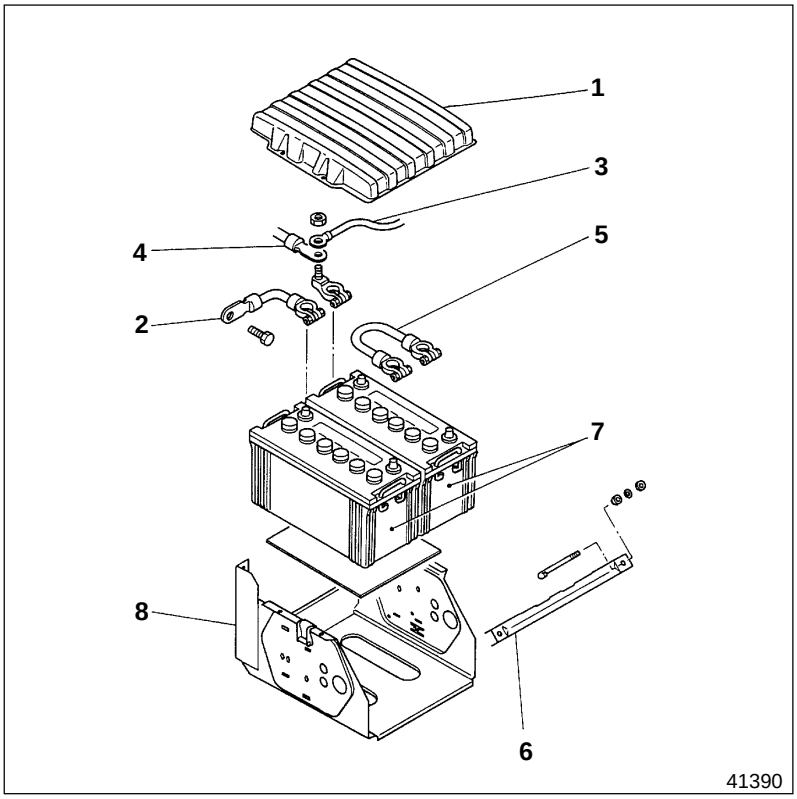
101 BATTERY



● **Removal sequence**

1 Battery cover
2 Battery cable ⊖
3 Harness
4 Battery cable ⊕
5 Battery cable
6 Angle frame
7 Battery
8 Battery box

● **Installation sequence**

Follow the removal sequence in reverse.

DANGER ⚠

- **Because flammable hydrogen gas is generated from battery 7, be sure to obey the following.**
  - **Never attempt to short-circuit the positive and negative terminals of battery 7, and generate sparks, or smoke a cigarette near it.**
  - **Do not wear metal objects on your arms or do not lean over battery 7.**
- **Sulfuric acid of the electrolyte is very corrosive. Whenever handling battery 7, wear safety goggles and rubber gloves to protect your eyes and hands.**
- **Battery posts, terminals and related accessories contain lead and lead compounds. Wash hands after handling.**

WARNING ⚠

When you disconnect battery cables 2 to 4, disconnect battery cable ⊖ 2 first.

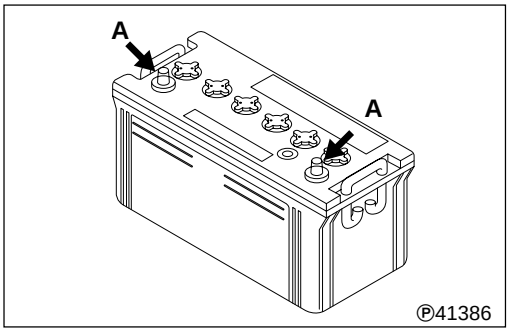
CAUTION ⚠

- **Make sure that all electrical switches of the vehicle are off before connecting battery cables 2 and 4.**
- **Be sure to connect battery cable ⊕ 4 first before you connect battery cable ⊖ 2.**
- **To prevent a short-circuit, take care that disconnected battery cables 2 and 4 may not accidentally touch the battery terminals.**

Service standards

Location	Inspection item	Standard value	Limit	Remedy
7	Specific gravity of battery electrolyte (20°C {68°F})	1.220 to 1.290	—	Charge or replace

https://truckmanualshub.com/



◆ Service procedure

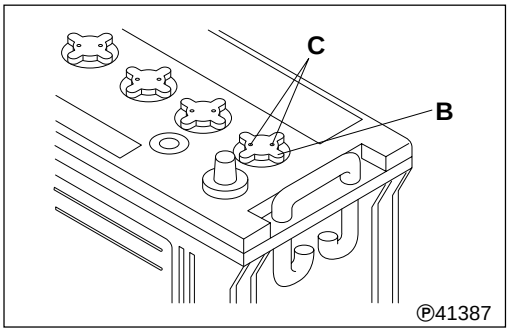
7 Inspection of battery

(1) Visual inspection

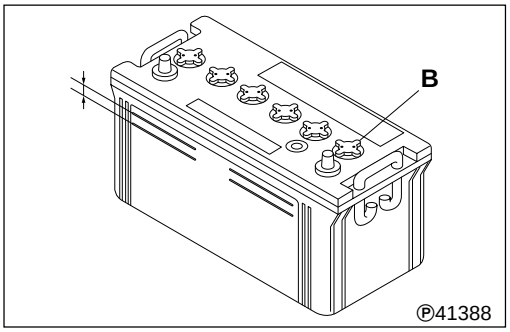
- If terminal **A** is corroded, scrub off the corrosion from it using a wire brush.
- If cracks or defects are found on battery **7**, replace it because the cracks or defects can cause liquid spills.

CAUTION ⚠

Be sure to apply grease to the ⊕ side of terminal A because it is easily corroded.

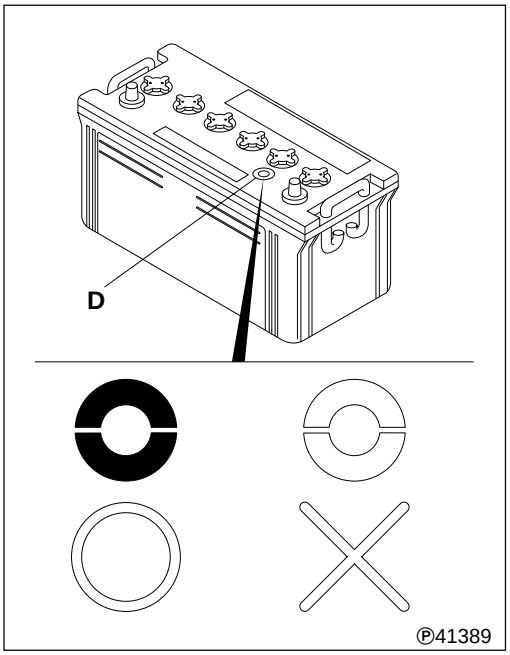


- If the air bleed hole **C** of vent plug **B** is clogged, clean the hole.



(2) Inspection of fluid level

- Confirm that the level of battery electrolyte is between UPPER and LOWER LEVEL lines.
- If the level is below LOWER LEVEL line, remove vent plug **B** and replenish the distilled water or battery fluid to the UPPER LEVEL.

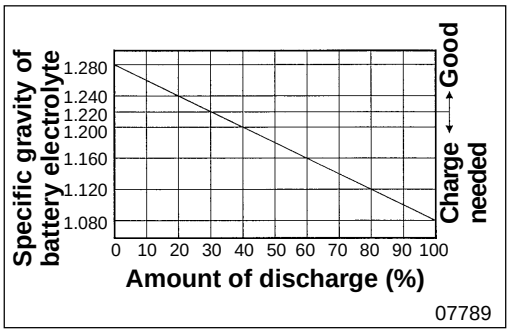


(3) Specific gravity measurement

You can tell the specific gravity of the battery electrolyte by the color shown in indicator **D**.

Blue :Good
White :Charge or replace

https://truckmanualshub.com/



(4) Charging

- Battery **7** must be, as a rule, charged in the off-vehicle condition. If it is charged on vehicle, however, be sure to remove the grounding cable before starting the procedure.
- The battery must be charged with its all of vent plugs removed.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity/10	{*Amount of discharge (Ah)/Charge current (A)} × 1.2 (to 1.5)	45 {113}
Quick charge	Value of 5-hour rating capacity/1.5	0.5	55 {131}

* Amount of discharge (Ah) = 5-hour rating capacity (Ah) × [Amount of discharge (%)] / 100

- Use the graph shown left to calculate the amount of discharge (%).
- For the battery electrolyte, use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water.
- The specific gravity of fully-charged battery electrolyte is 1.280 at the liquid temperature of 20°C {68°F}.

DANGER ⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep open flame away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because it is dangerous.**
- **After charging the battery, tighten the vent plugs, wash away sulfuric acid from the battery using water, and dry the surface.**
- **Be sure to check the electrolyte level before charging the battery. Charging with the electrolyte level below the lower limit (LOWER LEVEL) can cause premature deterioration, heat generation and explosion of the battery.**

8 Inspection of battery box

- If battery box **8** is corroded, scrub off the corrosion from it using a wire brush and apply acid resistant coating.
- If the battery box **8** is corroded excessively, deformed or cracked, replace it with new one.

CAUTION ⚠

- **When removing yoke and brush holder assembly 8, make sure you first pull out brushes 11, 14 from brush holder assembly 12 to avoid damaging the commutator of armature 19.**
- **Do not remove bearings 17, 37 unless they are faulty.**
- **Make sure you do not drop armature assembly 16 when you remove yoke and brush holder assembly 8 from front bracket assembly 21.**
- **Be careful not to lose ball 20, since it might come out together with armature assembly 16 when you remove it.**

NOTE

- **You do not have to remove pinion 3 when you disassemble or inspect only the motor assembly, for example: when inspection of the brush assembly is required.**
- **Except for the above, make sure you remove pinion 3 before disassembling any parts.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

Whenever magnetic switch 5 has been replaced, be sure to adjust the pinion gap.

● **Inspection after assembly**

P54-18

Service standards

Unit : mm {in}

Location	Maintenance item		Standard value	Limit	Remedy
—	Pinion gap		0.5 to 2.0 {0.02 to 0.079}	—	Adjust
—	No-load characteristic (11 V when current flowing)	Current	180 A or less	—	Inspect
		Revolutions per minute	3800 rpm or more	—	
10	Pressure of brush spring		29 to 39 N {6.6 to 8.8 lbf, 2 to 4 kgf}	13.7 N {3.1 lbf, 1.4 kgf}	Replace
11, 14	Length of brush		18 {0.71}	11 {0.43}	Replace
16	Armature assembly	Outer diameter of commutator	32 {1.26}	31.4 {0.24}	Replace
		Deflection of commutator periphery	—	0.05 {0.002} or more	Replace
		Insulator depth between segments	—	0.2 {0.0079} or less	Correct or replace

Lubricant

Location	Points of application	Kinds	Quantity
5	Contact surface between lever and magnetic switch	Multipurpose grease [NLGI No.2 Li soap]	As required
16	Teeth of armature assembly gear	MOLYKOTE ® AG650	As required
20	Ball	MOLYKOTE ® AG 650	As required
24, 32	Teeth of planetary gear and internal gear	MOLYKOTE ® AG650	As required
30, 33	Friction surfaces of gear shaft and overrunning clutch	Multipurpose grease [NLGI No.2 Li soap]	As required
31	Washer	MOLYKOTE ® AG650	As required
33	Splin of overrunning clutch	Multipurpose grease [NLGI No.2 Li soap]	As required

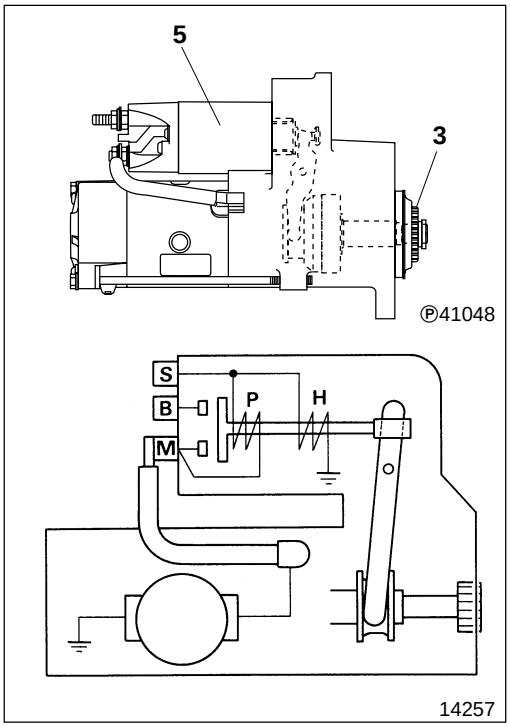
38	Oil seal	Multipurpose grease [NLGI No.2 Li soap]	As required

https://truckmanualshub.com/



◆ Service procedure

● **Inspection after assembly**

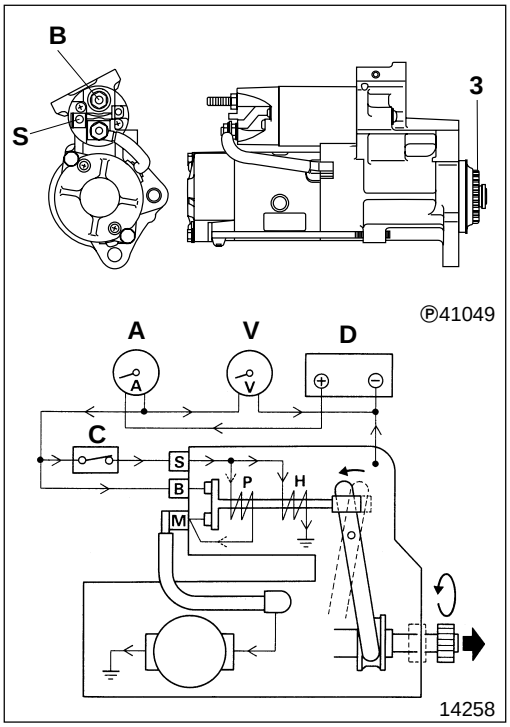
Inspection after assembly the starter should be carried out with current fed to the starter.

WARNING ⚠

- **Do not touch pinion 3 because it jumps out and turns when current is fed to the starter.**
- **Take care not to burn your hand, magnetic switch 5 might be hot after inspection.**

CAUTION ⚠

- **The current feeding time to the starter should be within 10 seconds at pull-in coil P side and within 30 seconds at holding coil H side. If the current feeding time exceeds these limits the coil might burn due to overheating.**
- **When current is flowing into the starter, a current of over 100 amperes is fed. When inspecting, use thick cable, such as a booster cable, and make secure connections.**



(1) Performance test

- Connect the starter as illustrated.
  - **A:** Ammeter
  - **B:** Terminal B of starter
  - **C:** Switch
  - **D:** DC power supply (12 volts)
  - **S:** Terminal S of starter
  - **V:** Voltmeter
- Set the voltage to 11 volts DC.

CAUTION ⚠

Up to12 volts can be loaded.

- The following work should be done with current fed to the starter. You must complete the full procedure of measuring the intensity of the current and the number of revolutions within 30 seconds.
  - Turn switch **C** ON and feed current into the starter. In this state, pinion **3** jumps out and rotates.

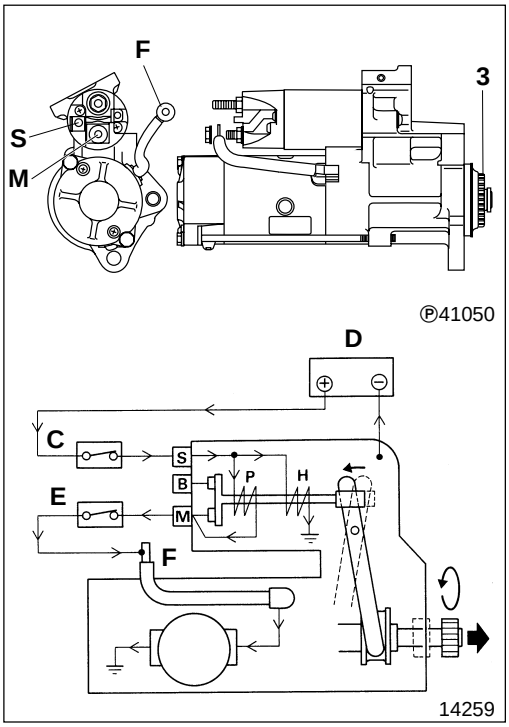
CAUTION ⚠

When switch C is turned ON, current is fed both to pull-in coil P and holding coil H. When a large amount of current is fed into terminal M from DC power supply D, via terminal B of the starter, the current stops flowing into the pull-in coil but continues to flow into the holding coil.

To avoid burning the holding coil, be sure to carry out the performance test within 30 seconds.

  - Measure the intensity of the current and the number of revolutions of the starter. Train a strobe light on pinion **3** to measure the revolutions.
  - Turn switch **C** OFF to stop current to the starter.
- If the measured value deviates from the standard value, disassemble the starter again and inspect it.

https://truckmanualshub.com/



(2) Pinion gap

[Inspection]

- Connect the starter as illustrated.

C: Switch	**F:** Cable
D: 12 volts DC	**M:** Terminal M of starter
E: Switch	**S:** Terminal S of starter

- The following work should be done with current fed to the starter. You must complete the full procedure for measuring the pinion gap within 30 seconds.
  - Turn switches **C** and **E** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.

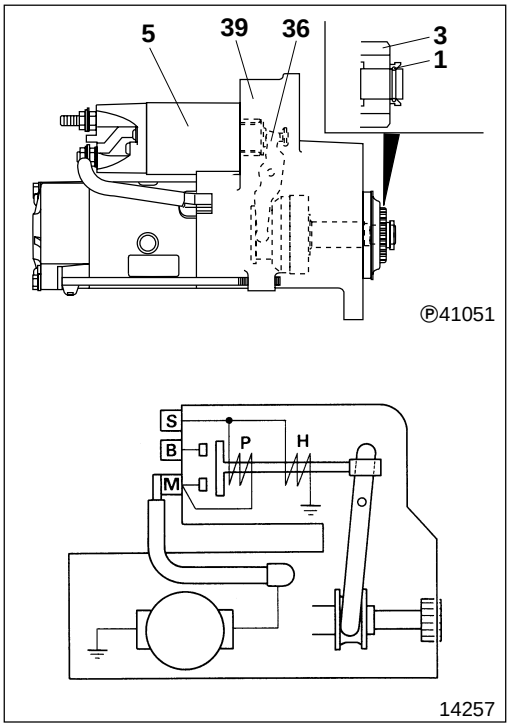
  - Within five seconds of pinion **3** rotating, turn switch **E** OFF to stop rotation of the pinion.

CAUTION ⚠

When switches C and E are turned ON, current is fed both to pull-in coil P and holding coil H. The circuit is wired in such a way that the voltage is not applied to terminal B of the starter, so the current continues to flow into the pull-in coil while pinion 3 rotates. To avoid burning the pull-in coil, be sure to turn switch E OFF within five seconds of the pinion rotating.

  - Push the tip of overrunning clutch **33** lightly and measure pinion gap **G** in the axial direction.
  - Turn switch **C** OFF to stop current to the starter.
- If the measured value deviates from the standard value, replace the lever **36**.

https://truckmanualshub.com/



3 **Pinion**

[Removal]

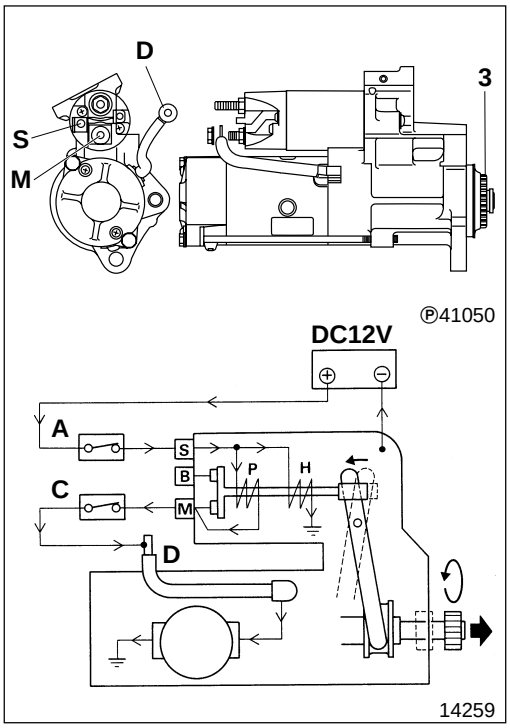
Feed current to the starter and protrude pinion **3** to remove the pinion.

WARNING ⚠

- **Do not touch pinion 3 because it jumps out and turns when current is fed to the starter.**
- **The care not to burn your hand, magnetic switch 5 might be hot after inspection.**

CAUTION ⚠

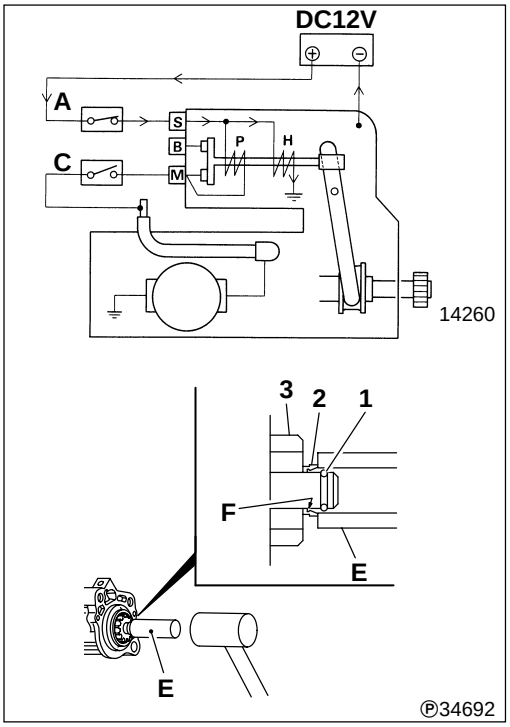
- **The current feeding time to the starter should be within 10 seconds at pull-in coil P side and within 30 seconds at holding coil H side. If the current feeding time exceeds these limits, the coil might burn due to overheating.**
- **Before making pinion 3 jump out, be sure to feed current to the starter to obtain the correct state. If current is not fed to the starter and lever 36 is pulled to protrude the pinion, front bracket 39 or the lever might be damaged due to the shock produced on removal of stopper ring 1.**
- **The current, when fed to the starter, is over 100 amperes. When inspecting, use thick cable, such as a booster cable, and make secure connections.**



- Connect the starter as illustrated.
  - **A:** Switch
  - **C:** Switch
  - **D:** Cable
  - **M:** Terminal M of starter
  - **S:** Terminal S of starter

- The following work should be done while current is flowing into the starter. You must complete the full procedure for removing pinion **3** within 30 seconds.
  - Turn switches **A** and **C** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.

https://truckmanualshub.com/



- Within 5 seconds of pinion **3** rotating, turn switch **C** OFF to stop rotation of the pinion.

CAUTION ⚠

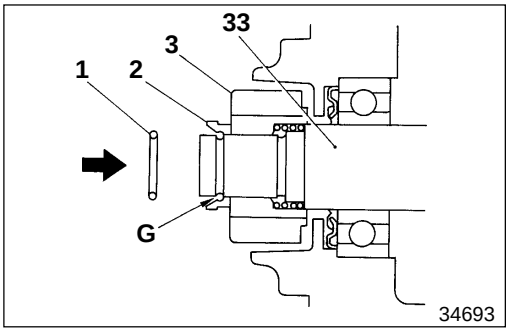
When switches A and C are turned ON, current is fed both to pull-in coil P and holding coil H. The circuit is wired in such a way that the voltage is not applied to terminal B of the starter, so the current continues to flow into pull-in the coil while pinion 3 rotates. To avoid burning the pull-in coil, be sure to turn switch C OFF within five seconds after the pinion rotates.

- Apply pipe-shaped tool **E** onto pinion stopper **2**.
- Hit tool **E** lightly using a mallet to remove stopper ring **1** from ring groove **F** of pinion stopper **2**.
- Remove stopper ring **1** and pinion **3**.
- Turn switch **A** OFF to stop current to the starter.

NOTE

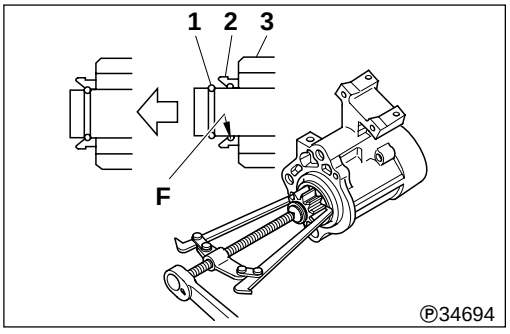
When the current to the starter is stopped, stopper ring 1 might fall back into ring groove F of pinion stopper 2 because pinion 3 is pushed inside.
If this occurs, feed current to the starter again and carry out the work.

[Installation]



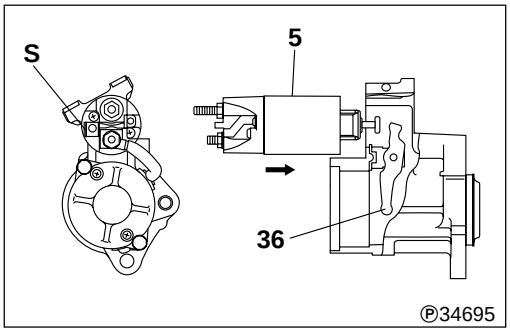
When installing pinion **3**, it is not necessary to feed current to the starter.

- Install pinion stopper **2** and pinion **3** onto overrunning clutch **33** in the direction as illustrated.
- Fit stopper ring **1** into ring groove **G** of overrunning clutch **33**.



- Pull pinion **3** firmly and set stopper ring **1** on groove **F** of pinion stopper **2**.

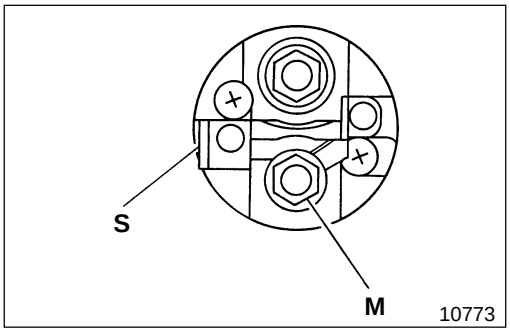
https://truckmanualshub.com/



5 **Magnetic switch**

[Installation]

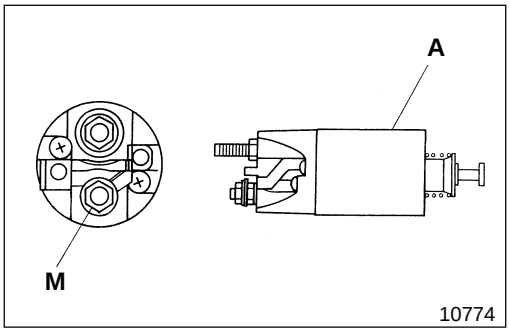
Install magnetic switch **5** to lever **36**, with terminal **S** facing the direction as illustrated.



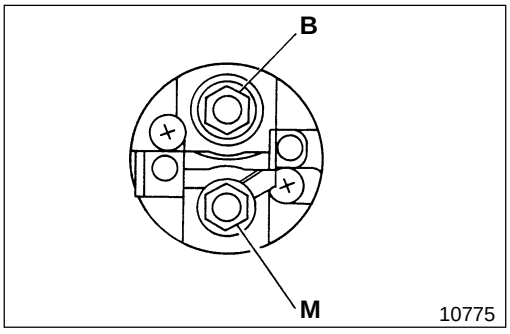
[Inspection]

(1) Testing for coil discontinuity

- Make sure that there is continuity between terminal **S** and **M**.
- If there is no continuity, replace magnetic switch **5**.

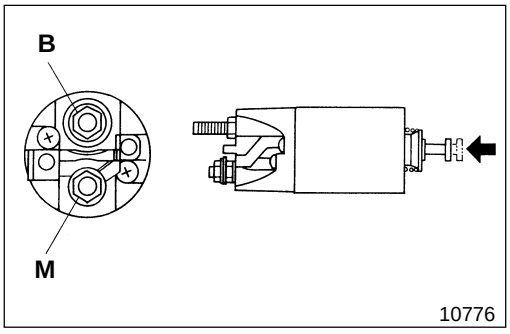


- Make sure that there is continuity between terminal **M** and body **A** of magnetic switch **5**.
- If there is no continuity, replace magnetic switch **5**.



(2) Inspection of welded connections

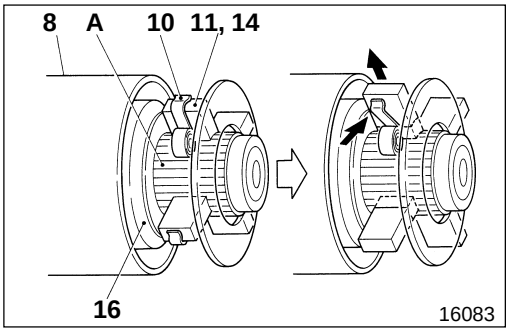
- Make sure that there is no continuity between terminals **B** and **M**.
- If there is continuity, replace magnetic switch **5**.



(3) Inspection of connections

- Push the tip of magnetic switch **5** to close the internal connection.
- Make sure that there is continuity between terminals **B** and **M**.
- If there is no continuity, replace magnetic switch **5**.

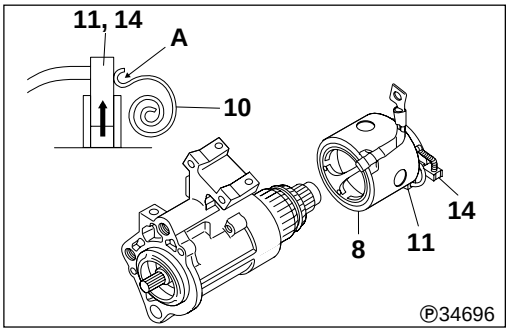
https://truckmanualshub.com/



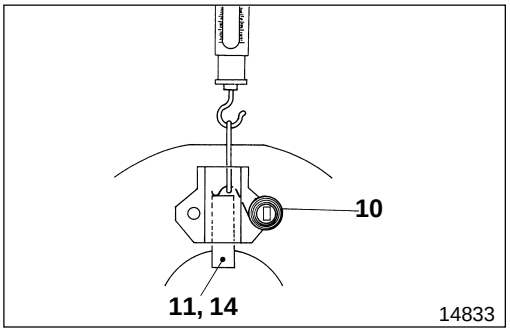
8 Removal and installation of yoke and brush holder assembly

Use the following method to remove the yoke and brush holder assembly **8** in order to prevent the commutator **A** of the armature assembly **16** from being damaged by the brushes **11** and **14**.

- Lift the brushes **11** and **14** away from the commutator **A** and hold them lifted by applying the brush springs **10** against the sides of the brush springs.

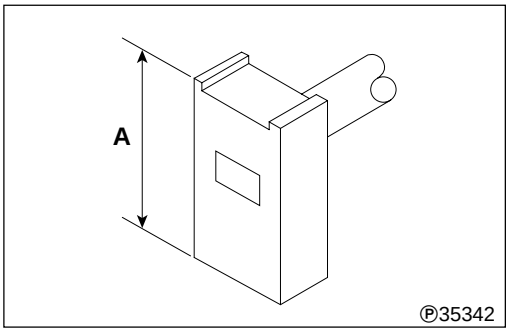


- Pull part **A** of each brush spring **10** and pull up the brushes **11** and **14**.
- Hold the brushes **11** and **14** in position with the brush springs **10** as illustrated.
- Remove the yoke and brush holder assembly **8**.



10 Inspection of brush springs

- Using new brushes **11** and **14**, measure the load required to separate each brush spring **10** from its brush.
- If either measurement is lower than the specified limit, replace the brush springs **10**.



11 14 Inspection of brush

(1) Length of brush

If the measured value is lower than the limit, replace brushes **11** and **14**.

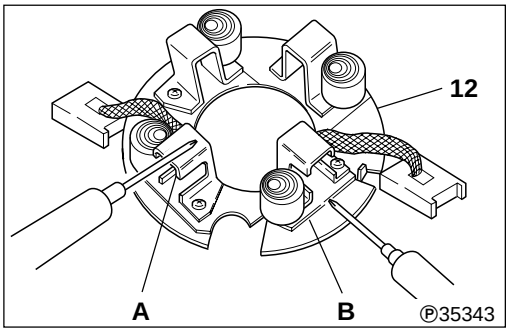
A: Length of brush

NOTE

To replace brush ⊖ 11, replace entire brush holder assembly 12.

(2) Contact surface with commutator

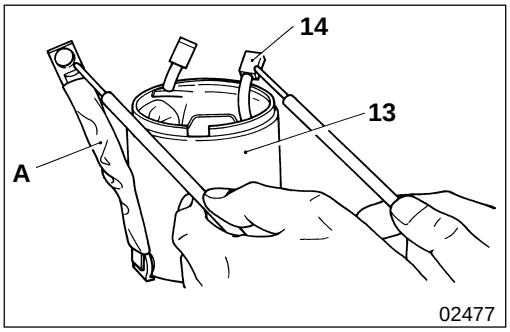
If the surface where the brushes contact the commutator is rough or is worn unevenly, polish the surface with emery paper (300 to 500 grit).



12 Inspection of brush holder assembly

- Make sure that there is no continuity between the ⊕ side of the brush holder and the ⊖ side of the holder plate.
- If there is continuity, they are grounded. Replace brush holder assembly **12**.

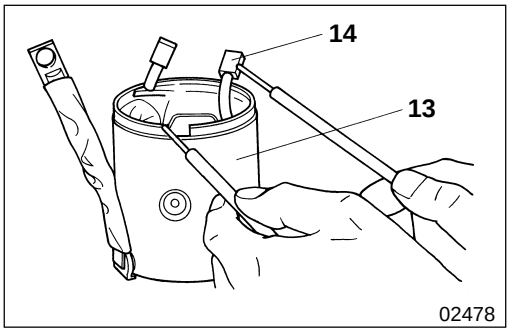
https://truckmanualshub.com/



13 Inspection of yoke assembly

(1) Testing for coil disconnection

- Make sure that there is continuity between cable **A** and brush ⊕ **14**.
- If there is no continuity, they are disconnected. Replace brush ⊕ **14** or yoke assembly **13**.

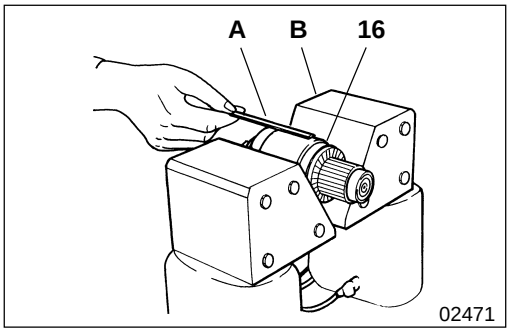


(2) Testing for coil grounding

- Make sure that there is no continuity between yoke assembly **13** and brush ⊕ **14**.
- If there is continuity, they are short-circuited. Inspect the insulated point. If it is hard to repair, replace brush ⊕ **14** or yoke assembly **13**.

CAUTION ⚠

The coil may be grounded to the yoke assembly 13 due to the accumulation of worn-off metal particles from the brushes and/or armature.

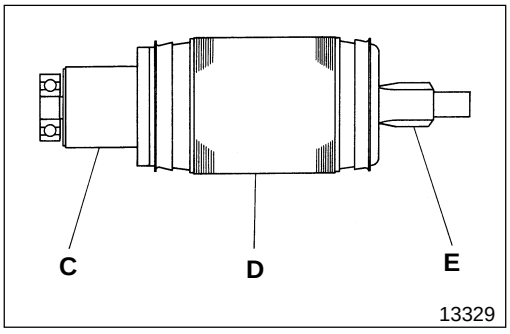


16 Inspection of armature assembly

(1) Testing for coil short-circuit

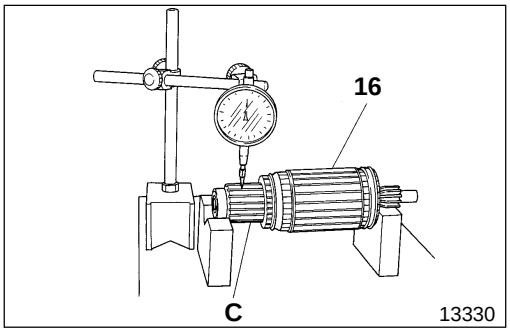
- Place iron rob **B** parallel to armature assembly **16**.

  A: Armature tester
- Rotate armature assembly **16** slowly.
- If iron rob **B** is pulled or shakes, it indicates that armature assembly **16** is short-circuited, so replace it.



(2) Testing for coil grounding

- Make sure that there is no continuity between commutator **C** and core **D** (or shaft **E**).
- If there is continuity between them, they are short-circuited. Replace armature assembly **16**.



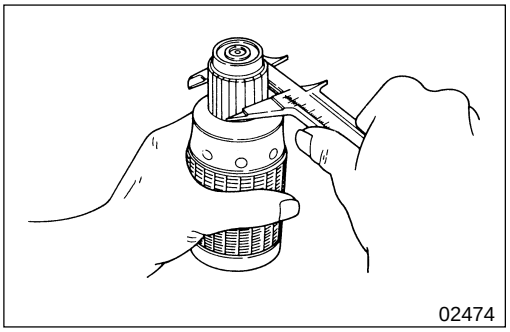
(3) Deflection of commutator

If the measured value is higher than the limit, adjust the outer diameter of commutator **C** within the limit.

(4) Rough commutator surface

- If the surface is rough or has stepped wear, polish the surface with emery paper (300 to 500 grit).
- After polishing, check deflection of comutator **C**.

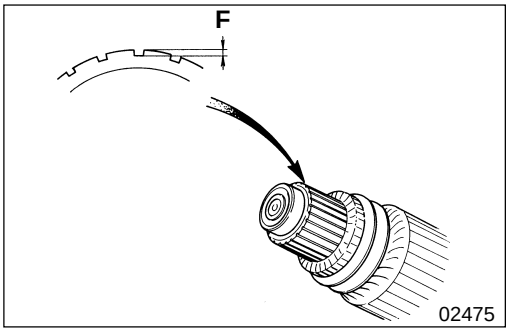
https://truckmanualshub.com/



02474

(5) Outer diameter of commutator

If the measured value is higher than the limit, replace armature assembly **16**.

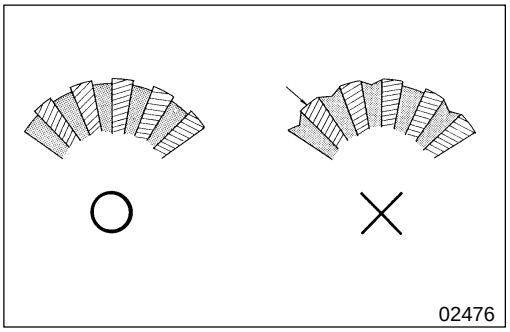


02475

(6) Insulator depth between segments

- If the measured value is lower than the limit, correct of replace armature assembly **16**.

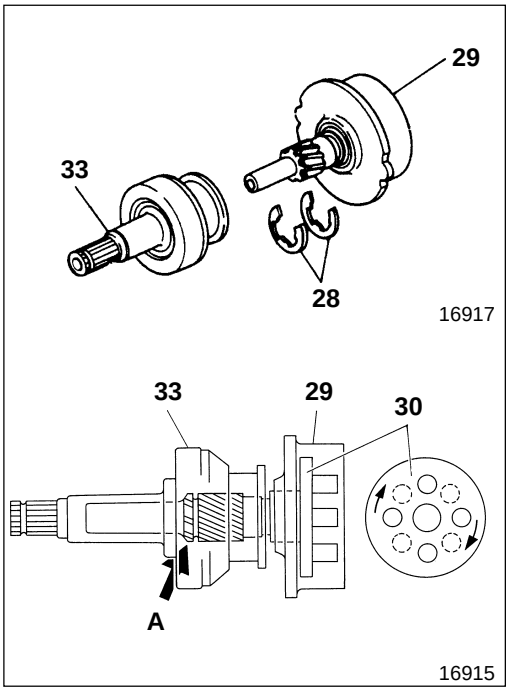
  F: Insulator depth



02476

- If the insulator is worn as illustrated, replace armature assembly **16**.

  ○ : Good
  × : Faulty

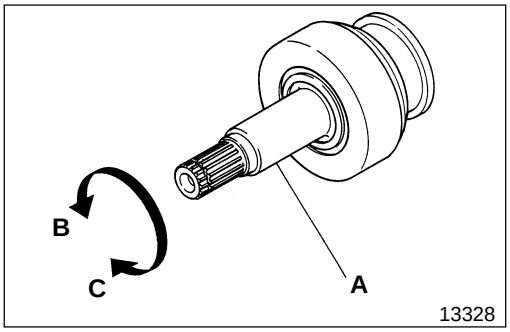


29 Removal of gear shaft and internal gear assembly

Remove the E-rings **28** and then the gear shaft and internal gear assembly **29** from the overrunning clutch **33**.
Proceed as follows if the assembly **29** cannot be removed due to interference of the splined section **A** of gear shaft **30** with internal parts of the overrunning clutch **33**.

- Press the gear shaft **30** against the overrunning clutch **33**.
- Turn the gear shaft **30** approx. 1/8 of a turn to change the position of splined section **A**.

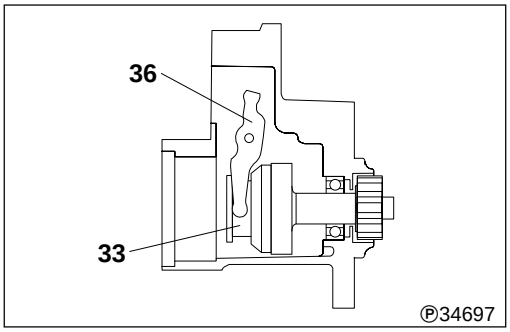
https://truckmanualshub.com/



33 **Installation of overrunning clutch**

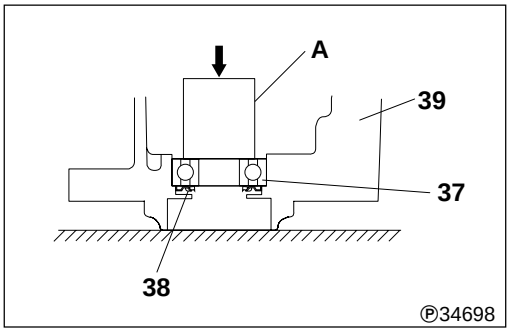
Carry out the following inspection. If any fault is found, replace overrunning clutch **33**.

- Make sure that shaft **A** turns smoothly when turned in direction **B**.
- Make sure that shaft **A** locks when turned in direction **C**.



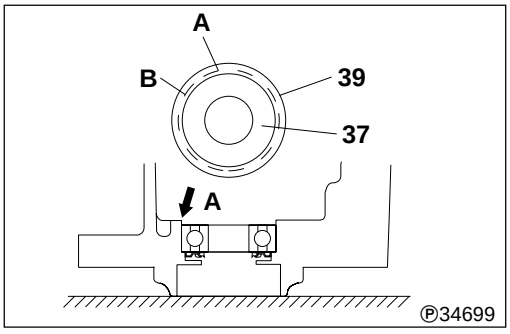
36 **Installation of lever**

Install lever **36** onto overrunning clutch **33** in the direction as illustrated.



37 **Installation of front bearing**

- Install oil seal **38** before press-fitting front bearing **37**.
- Press-fit front bearing **37** into front bracket **39** using pipe-shaped tool **A**.



- Re-caulk front bracket **39**.

NOTE

Do not re-caulk previously caulked points B.

A : Caulking points (4 points)

https://truckmanualshub.com/

◆ Service procedure

7 **Inspection of starter relay**

- Follow the table below to inspect continuity:

	③	④	①	②
No current			○——○	
Current	○——○		⊕——⊖	

○——○ : There is continuity between terminals ○ and ○.
⊕——⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace relay **7**.

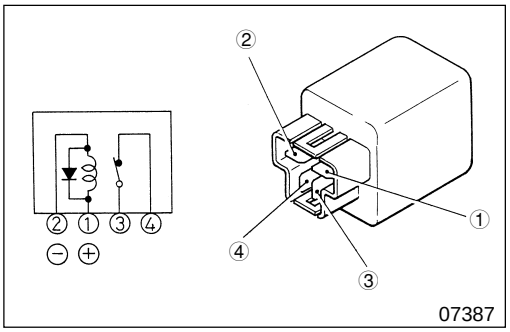
◆ Service procedure



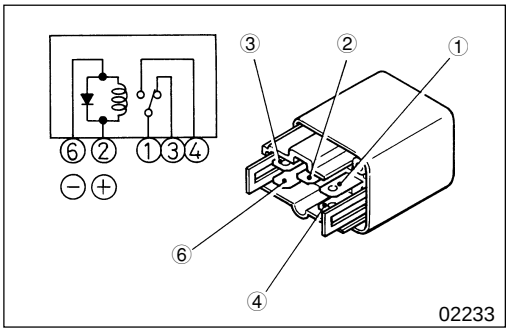
16 Inspection of relay (Close type 4-pin)

- Follow the table below to inspect continuity:

	①	②	③	④
No current	○——○			○——○
Current	⊕——⊖		◌- - - -◌	

○——○ : There is continuity between terminals ○ and ○.
⊕——⊖ : Indicates that 12 volts DC is applied to the line between the terminals.
◌- - - -◌ : Indicates that the continuity between the terminals is lost.

- If any fault is found, replace the relay.



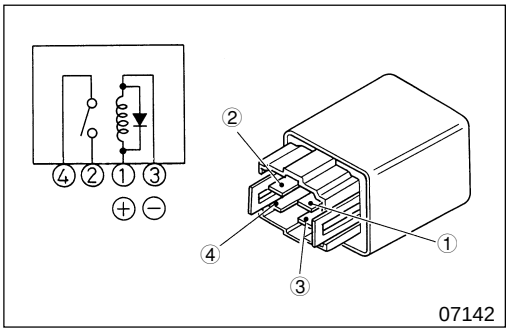
18 Inspection of relay (Open type 5-pin)

- Follow the table below to inspect continuity

	①	②	③	④	⑥
No current	○——○		○——○		○——○
Current	○——○	⊕——⊖		○——○	

○——○ : There is continuity between terminals ○ and ○.
⊕——⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.



19 20 21 Inspection of relay (Open type 4-pin)

- Follow the table below to inspect continuity:

	①	②	③	④
No current	○——○		○——○	
Current	⊕——⊖	○——○		○——○

○——○ : There is continuity between terminals ○ and ○.
⊕——⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.

◆ Service procedure

4 Inspection of glow relay

(1) Inspection of fuse

If any fault is found, replace fuse **A** (127 amperes).

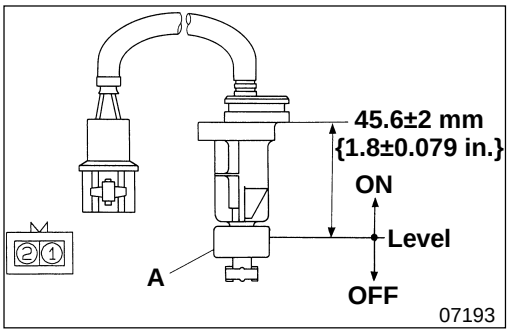
(2) Inspection of body

- Follow the table below to inspect continuity:

	④	②	③	①	⑤
No current	○——○				
Current	○——○——○			⊕——⊖	

○——○ : There is continuity between terminals ○ and ○.
⊕——⊖ : Indicates that 12 volts DC is applied to the line between the terminals.
A: Fuse (127 amperes)

- If any fault is found, replace glow relay **4**.



11 Inspection of engine oil level sensor

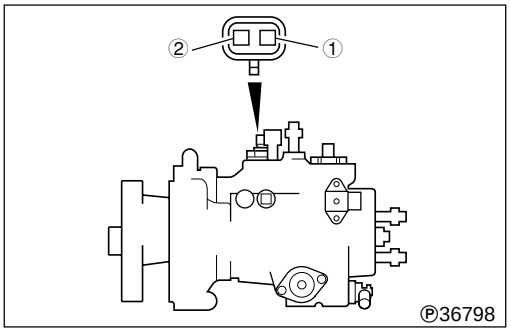
- Follow the table below to inspect continuity:

	①	②
ON	○——○	
OFF		

○——○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace engine oil level sensor **11**. Gr12
A: Float

https://truckmanualshub.com/



13 **Inspection of engine speed sensor**

- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace engine speed sensor **13**. Gr13.

SERVICE MANUAL

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of 2000 model Mitsubishi Fuso Truck FE.FG series.
Read this manual carefully as an aid to providing correct, efficient and fast maintenance.
Please note, however, that due to continuous improvements on the specifications, numbers and description for maintenance might be changed without prior notice.
If you have any question, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso dealer or distributor.

2000 MODEL CHANGES

Item	'00 Model ⇦ '99 Model	
Gr 35 Brake System • Load sensing valve and bypass valve are no longer installed due to addition of anti-lock brake system (ABS).	Without load sensing valve and bypass valve	With load sensing valve and bypass valve
• Procedures for bleeding brake system are added because of anti-lock brake system (ABS).	[Procedure for bleeding hydraulic unit] • Ordinary bleeding procedure is used for the primary side (non ABS-hydraulic system). However, when the solenoid valve of the hydraulic unit operates (ABS operation) with air mixed in the primary side, air enters the secondary side (hydraulic system). Therefore, be sure to bleed air from the secondary side using the MUT-II by following the procedures described below. • Regarding the use of the MUT-II, refer to 🗀 Gr 35A. < Bleeding front brakes > • Bleed the primary side of the front brake system. (Ordinary bleeding procedure) • Depress the brake pedal, and select the actuator drive mode, "FL ABS MV ON," on the MUT-II to force-drive the brake. • Open bleeder, bleed air from the wheel cylinder of the front left wheel brake system. • Repeat the above two steps until air is completely removed. • Depress the brake pedal, and select the actuator drive mode, "FR ABS MV ON," on the MUT-II to force-drive the brake. • Bleed air from the secondary side of the front right wheel brake system. • Repeat the above two steps until air is completely removed. < Bleeding rear brakes > • Bleed the primary side of the rear brake system. (Ordinary bleeding procedure) • Depress the brake pedal, and select the actuator drive mode, "RL ABS MV ON," on the MUT-II to force-drive the brake. • Bleed air from the secondary side of the rear left wheel brake system. • Repeat the above two steps until air is completely removed. • Depress the brake pedal, and select the actuator drive mode, "RR ABS MV ON," on the MUT-II to force-drive the brake. • Bleed air from the secondary side of the rear right wheel brake system. • Repeat the above two steps until air is completely removed.	
Gr 35A Anti-lock Brake System • Anti-lock brake system (ABS) is added.	🗀 Gr 35A Anti-lock brake system (ABS) '00 Minor Change (Pub. No. TWSE9501-435A)	—

Starter Continuous Power Supply Prevention Function

- This function is for preventing the starter from overrunning.
- After starting the engine, when the starter rotates for a determined period of time or longer, the MUTIC interprets that the starter is in a continuous power supply condition. This will shut off the current to the starter and to the starter relay in order to prevent the starter from being seized. After starting the engine, alternator (L terminal) signal B causes the safety relay to operate (contacts to be opened) after lapse of a determined period of time.

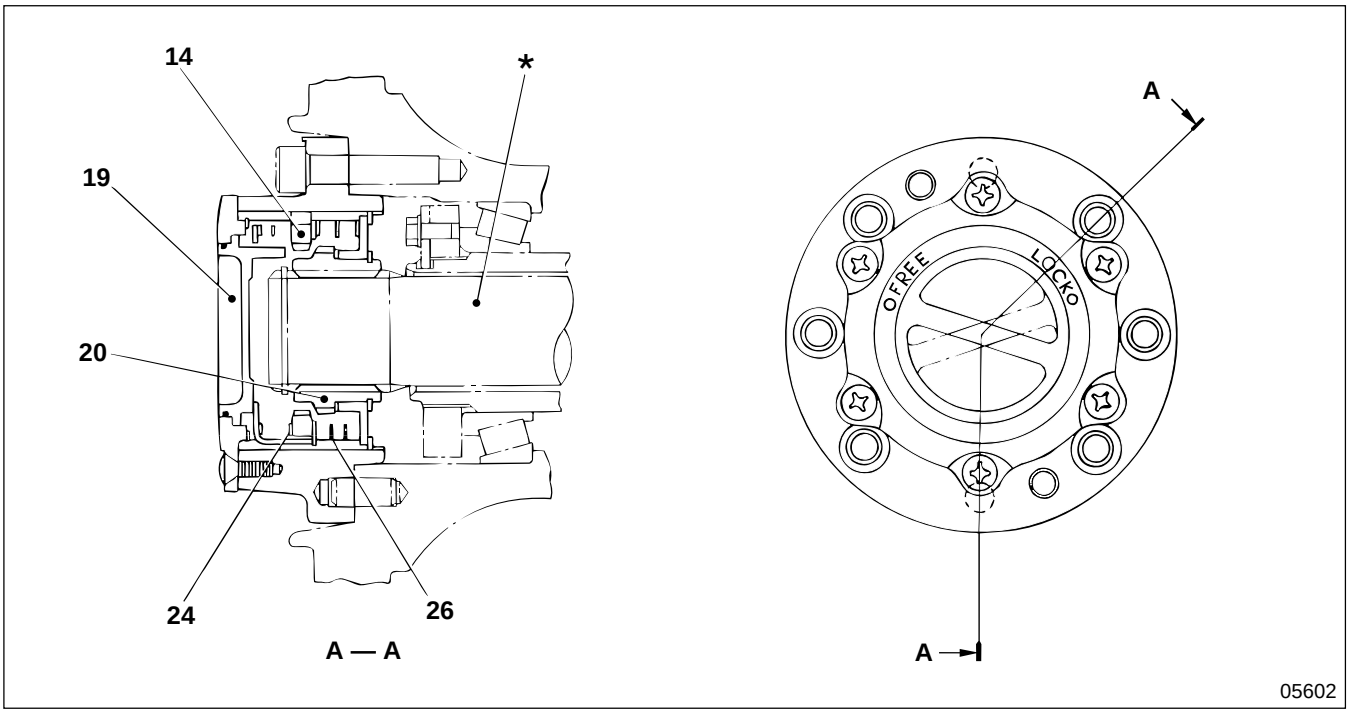
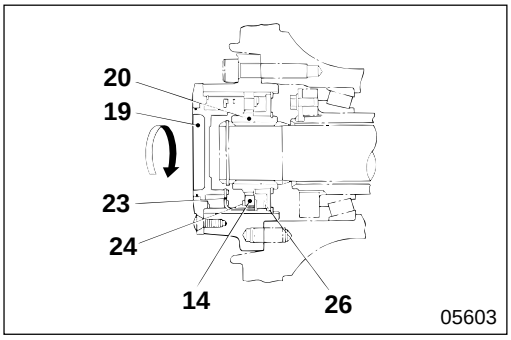
Free-wheel Hub



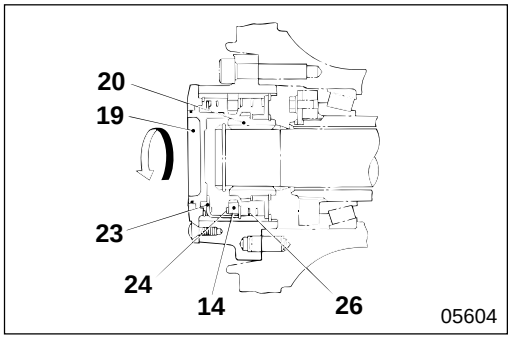
- In the case of a four-wheel drive vehicle, even when it is running in rear-wheel drive only, the drive shaft *, differential, propeller shaft, and driving parts of the transfer front drive shaft continue to run due to transmission of rotation from the wheels. This subjects the vehicle drive to a load, and it causes loss of driving power.
  Now, with a free-wheel hub, transmission of rotation from the front wheels to the drive shaft * is cut, reducing driving loss when running in rear-wheel drive only. This improves fuel efficiency and reduces vibration and noise.
- With a free-wheel hub, FREE (cutting of driving power) ↔ LOCK (transmission of driving power) is made easily by manual operation.



Operating mechanism

● **From FREE to LOCK**

When knob **19** is turned to LOCK, retainer **23** shifts to the inside along with the shape of the knob, pressing return spring **26**. At this instance, driven gear **14**, being pressed by shift spring **24**, engages with drive gear **20** at the spline, and transmits the driving power.



● **From LOCK to FREE**

When knob **19** is turned to FREE, the action is the reverse of FREE to LOCK, and the driving power is disengaged.

ON-VEHICLE INSPECTION AND ADJUSTMENT

Adjustment of Wheel Alignment

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
—	Wheel alignment	Toe-in (with tires on the ground)	0 to 6 {0 to 0.24}	—	—
		Camber	1°00'±30'	—	—
		Caster	0°30'±1°00'	—	—
		Kingpin inclination angle	9°30'	9°30'±30'	—

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Clamp bolt (Tie rod end clamp fastening)	25±5 {18±3.6, 2.5±0.5}	—

Special tools

Unit : mm {in.}

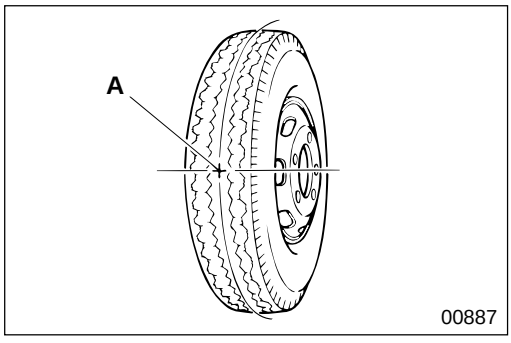
Location	Tool name and shape	Part No.	Application
—	Alignment gauge adapter 	MH061994	Measurement of camber and caster angles, and kingpin inclination angle: with free-wheel hub only

NOTE

- **Measure the wheel alignment when the vehicle is empty and level.**
- **Be sure that each part of the front axle has been serviced perfectly before adjusting the wheel alignment.**

Before adjusting the wheel alignment, check for the following faults :

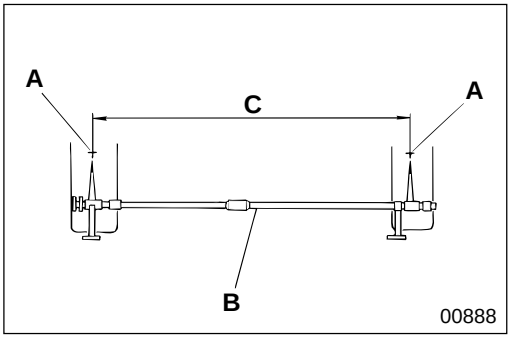
- Play in front wheel hub
- Play or looseness in kingpin
- Play or looseness in the joint between the tie rod and the knuckle arm
- Looseness of any fasteners
- Fatigued or damaged leaf springs
- Incorrect tire pressure
- Incorrect steering gear backlash



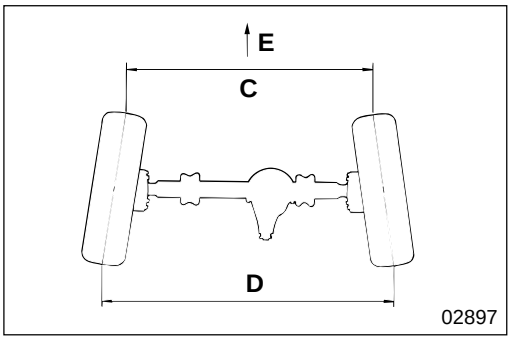
(1) Measurement and adjustment of toe-in

- Point the front wheels exactly forward.
- Put mark **A** on the left and right front tires at the height of front wheel axis and in the middle of the tire width.

https://truckmanualshub.com/

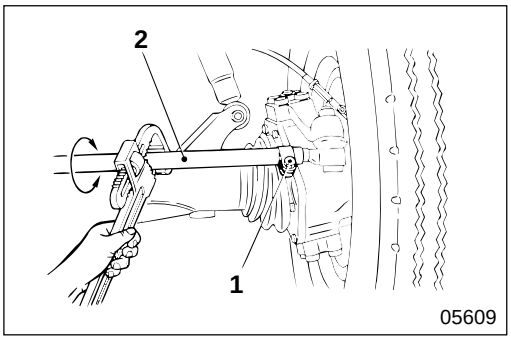


- Align the two points of toe-in gauge **B** to the respective marks **A** on the front tires. Measure the distance **C** between the marks at the front of the vehicle.

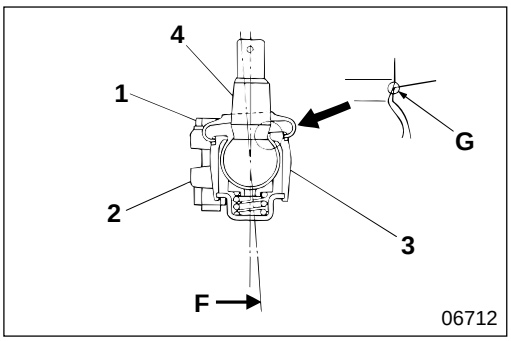


- Rotate the tires 180° and measure the distance **D** between the marks at the rear of the vehicle with the tires on the ground.
- Check if the difference between distances **C** and **D** is within the standard value.

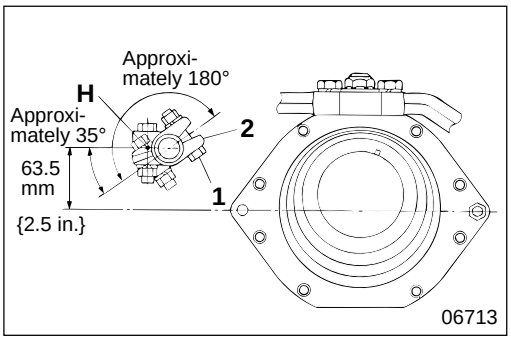
E : Front of the vehicle



- If the measured value deviates from the standard value, with the tires pointed forward, loosen left and right clamp bolts **1** and adjust the toe-in to the standard value by turning tie rod **2** with a pipe wrench.

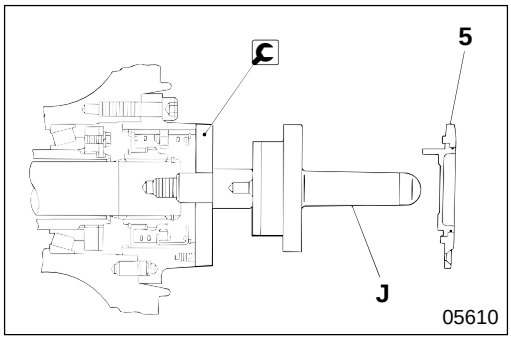


- Move the vehicle forward and turn tie rod **2** towards the front, with the tires pointed forward (**F** as illustated). Make sure when adjusting toe-in to the standard value, that both left and right tie rod ends **3** are in contact with ball stud **4** (**G** as illustrated) at the same time.
  After adjustment, tighten clamp bolt **1** to secure the tie rod.
- In order to keep the end of clamp bolts **1** away from the vehicle, mount tie rod **2** so that clamp center **H** is placed in the range as illustrated.



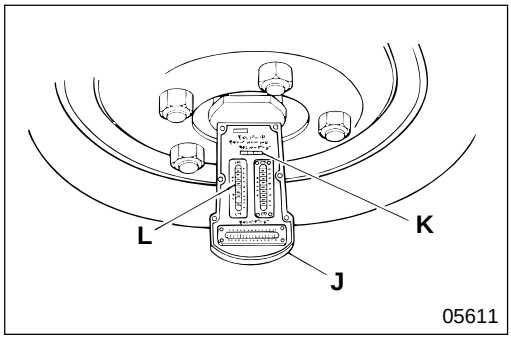
https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

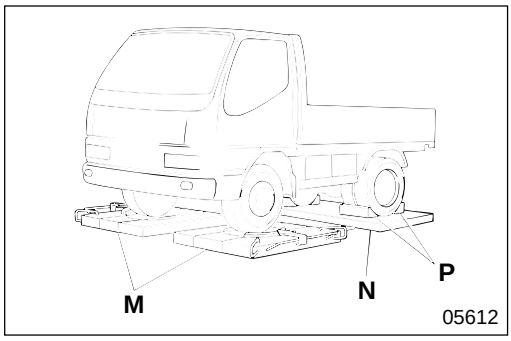


(2) Measurement of camber

- Point the front wheels exactly forward.
- Remove cover assembly **5** and attach 🔧 alignment gauge adapter. Then, attach camber/caster kingpin gauge **J**.



- While keeping the bubble in level **K** centered, measure the camber angle by reading the scale mark at the center of the bubble on camber scale **L**. Follow this procedure to measure the camber angles on the left and right sides.



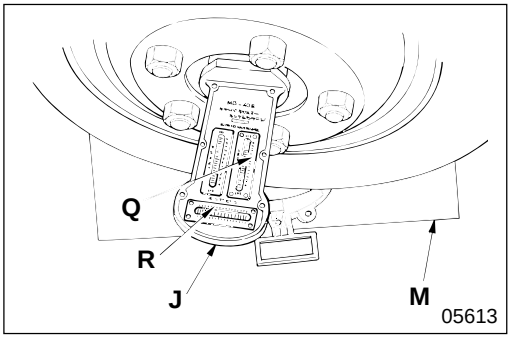
(3) Measurement of caster and kingpin inclination angle

- Align turning radius gauges **M**. Prepare a platform **N** having the same height as the turning radius gauges and place the platform under the rear wheels so that the vehicle is kept level.
- Keep turning radius gauges **M** locked.
- Jack up the vehicle and set the left and right front wheels so that the ground contact area of both front tires and the turntables of turning radius gauges **M** meet at their respective centers.

WARNING⚠

- **After jacking up the vehicle, chock the rear wheels securely with chocks P.**
- **Do not remove chocks P until the entire operation is completed.**

https://truckmanualshub.com/



- Unlock turning radius gauges **M**, and set the scale at 0°.
- As in measuring camber explained previously, attach camber/caster kingpin gauge **J** tightly to the front wheel hub and keep the bubble centered.
- Apply the brake to the front wheels and turn the steering wheel slowly from the 0° point on the scale of turning radius gauges **M**, until direction changes 20° to the left for the left front wheel and 20° to the right for the right front wheel.

NOTE

It is not possible to obtain an exact reading of camber unless the brake is applied to the front wheels because the tires might rotate slightly.

- At the 20° point, align the bubbles in caster scale **Q** and kingpin scale **R** to 0° by turning the adjuster.

NOTE

Kingpin scale R has scales for left and right; use the left scale when adjusting the left wheel, and the right scale when adjusting the right wheel.

- Turn the steering wheel slowly until the left front wheel changes its direction 20° to the right, or until the right front wheel changes its direction 20° to the left, past the 0° point of turning radius gauge **M** scale. At this point read the scale marks at the center of the bubbles on caster scale **Q** and kingpin scale **R**. The scale marks indicate the caster and kingpin inclination angles.

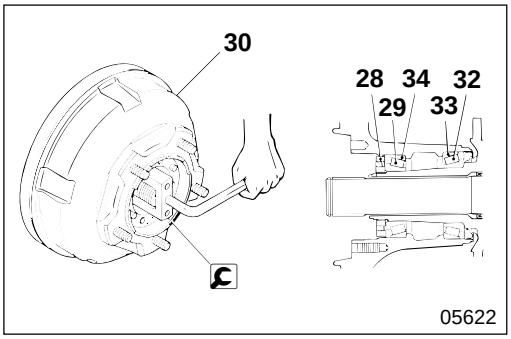
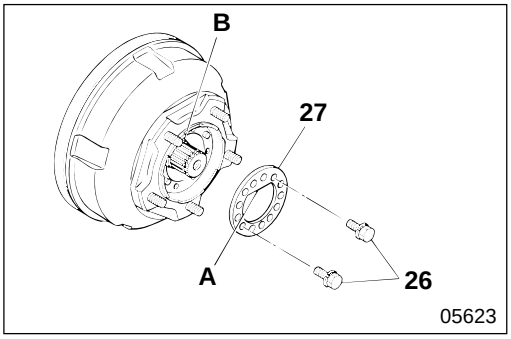
◆ Service procedure



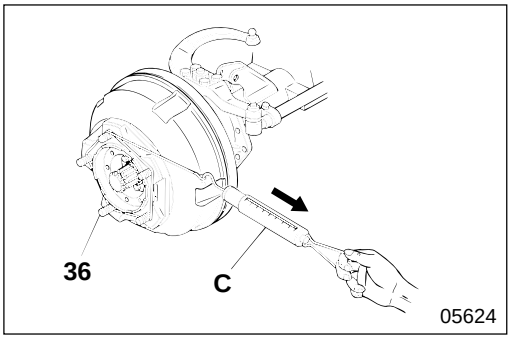
● Starting torque of wheel hub bearing

[Adjustment]

- Tighten lock nut **28** at specified torque (primary tightening) while turning wheel hub and brake drum assembly **30**, then slacken off.
- Turn wheel hub and brake drum assembly **30** several times to smooth operation of outer bearings **29**, **34**, and inner bearings **32**, **33** and retighten lock nut **28** at specified torque (secondary tightening).
- After adjustment, make sure that there is no play in the axial direction.
  : Lock nut adjustment tool



- Insert lock washer **27** so that flat area **A** fits onto notch **B** of the knuckle spindle. Mount two bolts **26** (diagonally opposite each other) to lock nut **28**, and tighten them at specified torque.
- If lock nut **28** and the hole of lock washer **27** do not align, slacken off the lock nut slightly.



[Measurement]

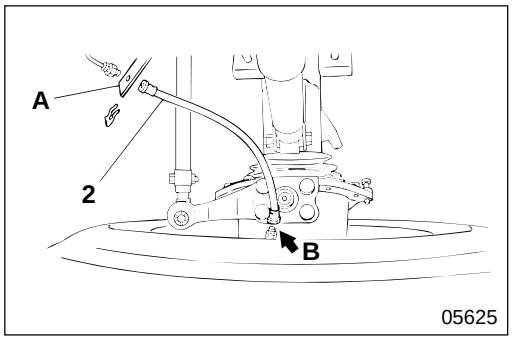
- Fasten spring balance **C** to hub bolt **36** and measure the tangential force.
- If the measured tangential force is the standard value, the starting torque conforms to the standard value.
- If the measured value deviates from the standard value, adjust the starting torque of the wheel hub bearing according to the procedure described above.
  If any fault is found after adjustment, replace outer bearings **29**, **34**, or inner bearings **32**, **33**.

NOTE

- **Make sure that there is no drag in the brake lining and brake drum 38 before you measure the tangential force.**
- **Make sure that you install oil seal 31.**
- **Do not install free-wheel hub assembly 25.**

https://truckmanualshub.com/

WHEEL HUB AND BRAKE DRUM

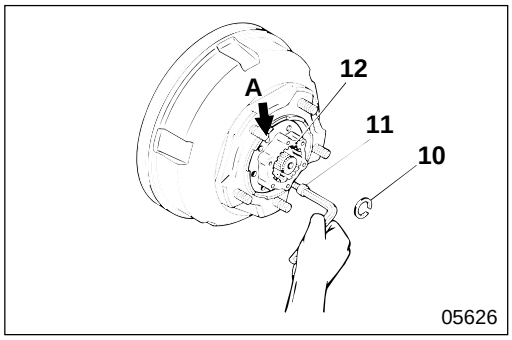


2 **Removal and installation of brake hose**

First remove brake hose **2** from bracket **A** (on the frame), then remove the brake hose from wheel brake **B**. For installation, follow this procedure in reverse.

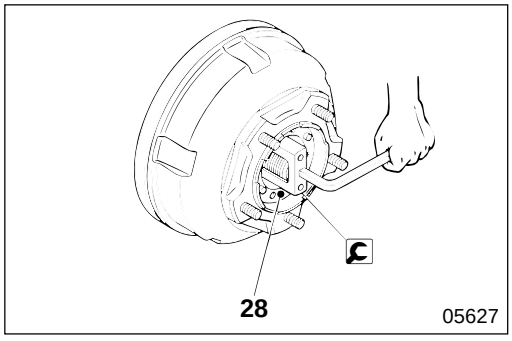
CAUTION

Make sure that brake hose 2 is not twisted when you install it.



16 **Removal of housing assembly**

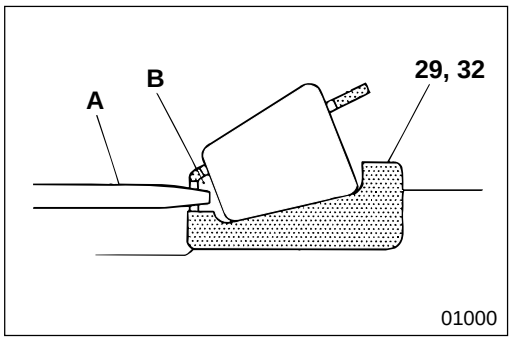
Remove snap ring **10**, and insert bolts **11** (to the same depth) into two tapped holes **A** provided for disassembly. Then, remove housing assembly **12**.



32 **Removal and installation of lock nut**

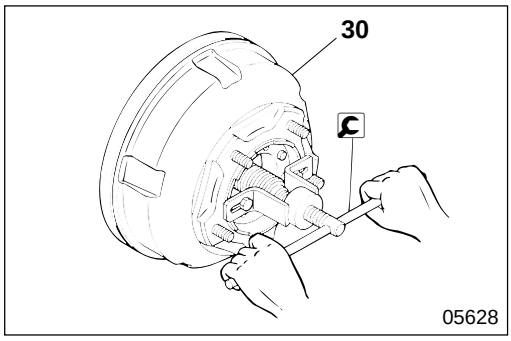
When mounting lock nut **28** see P26B-11 : adjustment procedure for starting torque of the wheel hub bearing.

: Lock nut adjustment tool



29 **32** **Packing grease in outer bearing race and inner bearing race**

A : Grease pump nozzle
B : Between roller

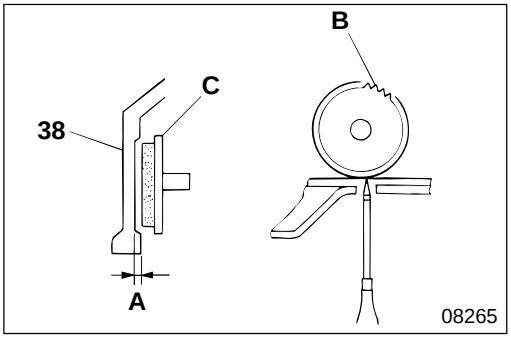


30 **Wheel hub and brake drum assembly**

[Removal]

: Hub puller

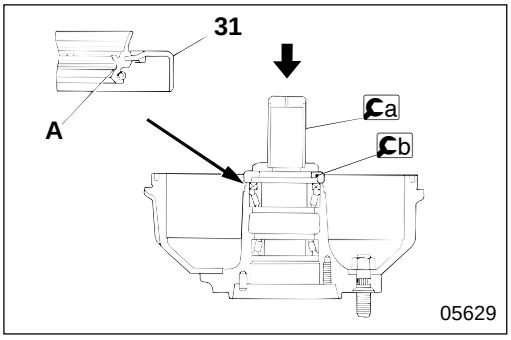
https://truckmanualshub.com/



- If wheel hub and brake drum assembly **30** cannot be removed because of stepped wear **A** in brake drum **38**, remove the backing plate cover. Turn adjuster **B** in the opposite direction to the arrow on the backing plate to increase the clearance between the brake drum and brake shoe assembly **C**. Then, remove the wheel hub and brake drum assembly.
- Correct brake drum **38** if any fault is found. Gr 35

[Installation]

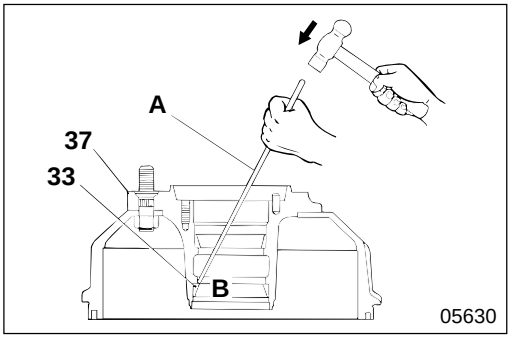
After installing wheel hub and brake drum assembly **30**, adjust the clearance between brake drum **38** and brake shoe assembly **C**. Gr 35



31 Installation of oil seal

Apply grease to lip area **A** of oil seal **31** and press-fit it.

Ca : Bearing installer
Cb : Oil seal installer

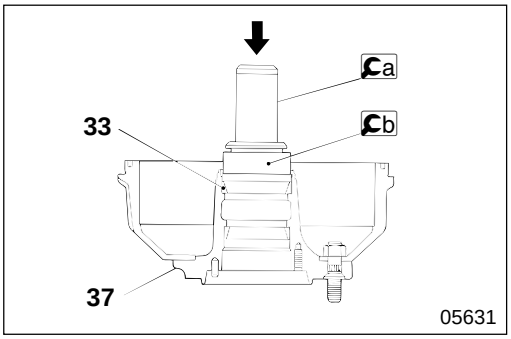


33 Inner bearing outer race

[Removal]

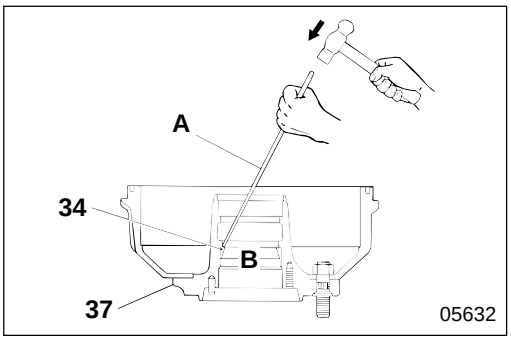
Drive out inner bearing race **33** evenly from three indented parts **B** in wheel hub **37**.

A : Pin-punch



[Press-fitting]

Ca : Bearing installer
Cb : Bearing installer



34 Outer bearing race

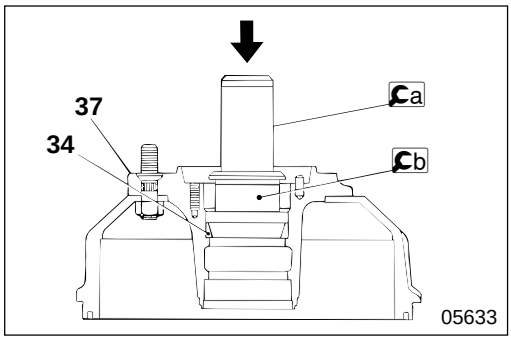
[Removal]

Drive out outer bearing race **34** evenly from three indented parts **B** in wheel hub **37**.

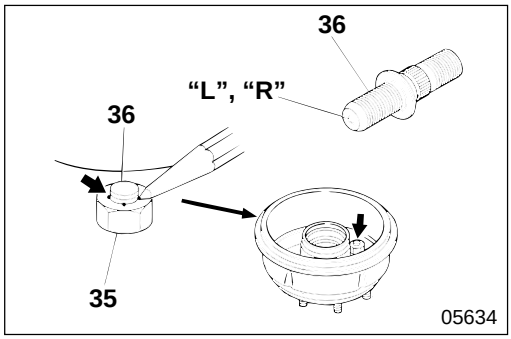
A : Pin-punch

https://truckmanualshub.com/

WHEEL HUB AND BRAKE DRUM



[Press-fitting]
Ca : Bearing installer
Cb : Bearing installer



35 **36** **Installation of nut and hub bolt**

- Hub bolt **36** is marked with **"L"** (left) or **"R"** (right) to indicate the side it is to be mounted on. Check this symbol before mounting the bolt.
- Screw nut **35** onto hub bolt **36** and tighten at specified torque. Then, stake the hub nut to keep it from turning.

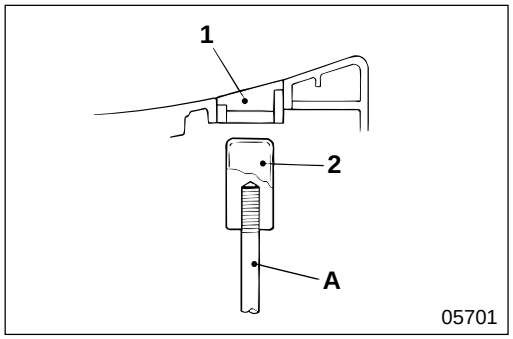
24	Threads of nut	Loctite (Japan) Drylock No. 203	As required
25	Threads of glass holder bolt	Loctite (Japan) Drylock No. 203	As required
29	Sliding surfaces of regulator & rail assembly	Dynamic GB	As required
31	Waterproof cover installation surface of door panel	Butyl tape	As required

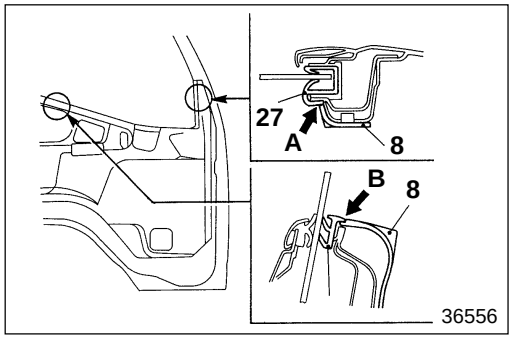
https://truckmanualshub.com/

◆ Service procedure



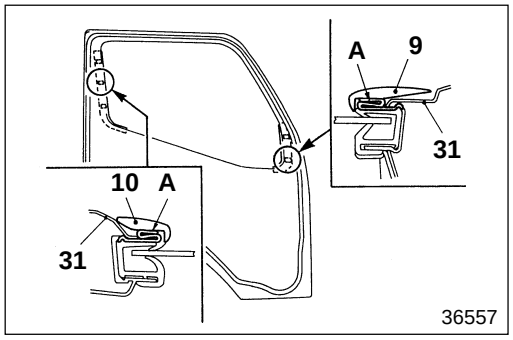
2 **Installation of door lock knob**

- Install door lock knob **2** to door lock rod A of door lock actuator **21**, and turn the knob fully in clockwise direction.
- Back off door lock knob **2** by turning it 1 or 2 turns in counterclockwise direction.
- Position cover **1** to prevent door lock knob **2** from turning.



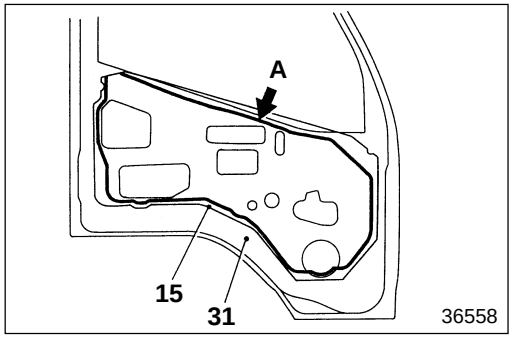
8 **Installation of door trim**

- On the front pillar section, install door trim **8** by pressing it to lip section **A** of run channel **27**.
- On the belt line section, install door trim **8** by pressing it to lip section **B** of inner weatherstrip **14**.



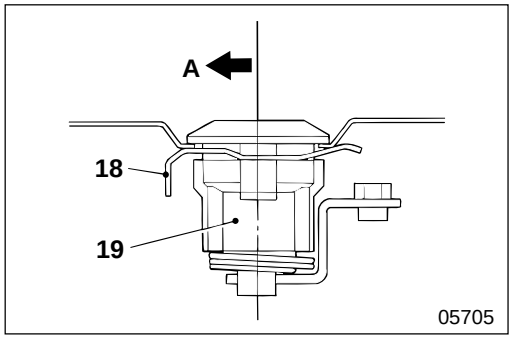
9 **10** **Installation of front and rear garnishes**

- Install clips **A** to door panel **31** prior to the installation of the garnishes.
- Install front garnish **9** and rear garnish **10** to clips **A**.



15 **Installation of waterproof cover**

- Apply butyl tape **A** to door panel **31**, as indicated in the illustration.
- Install waterproof cover **15** by pasting onto butyl tape **A**.

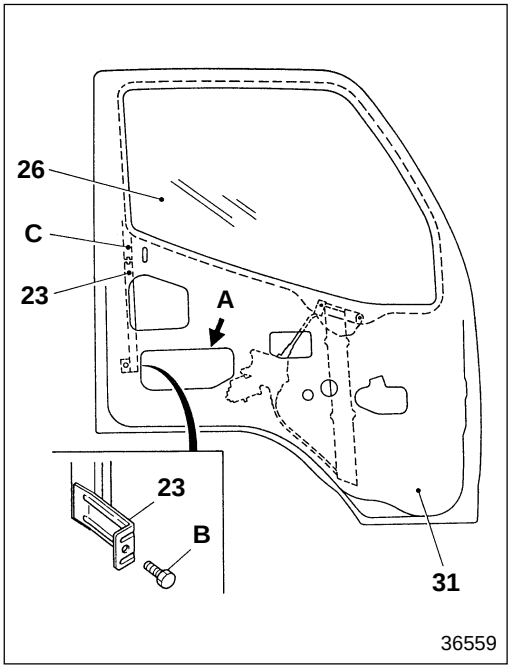


19 **Installation of door lock cylinder**

Install door lock cylinder **19** to clip **18** in the direction indicated in the illustration.

A : Vehicle front side

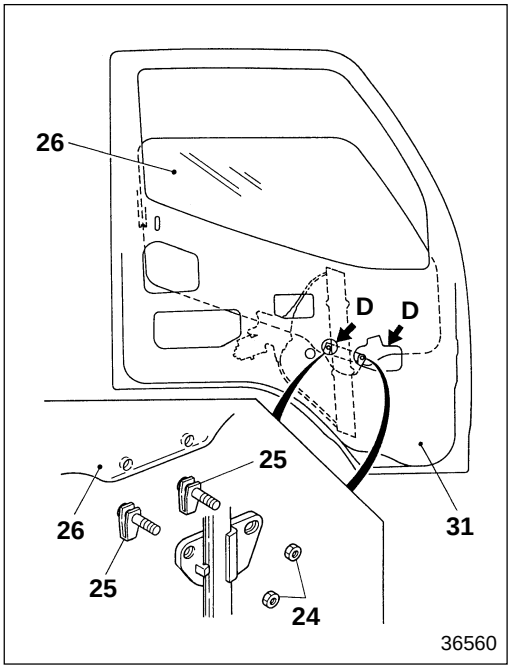
https://truckmanualshub.com/



26 Removal and installation of door glass

Remove all parts supporting door glass **26**, then remove the door glass through the open space in the door.

- Pull door glass **26** all the way to the top.
- Remove bolt **B** through hole **A** in door panel **31**, and remove lower sash **23**.
  Note that the lower sash is inserted in upper sash **C**.



- Lower door glass **26** until nut **24** becomes visible through hole **D** in door panel **31**.
- Support door glass **26** by hand, then remove glass holder **25**.
- Remove door glass **26** through the open space in the door.
- To install door glass **26**, follow the removal procedure in reverse.

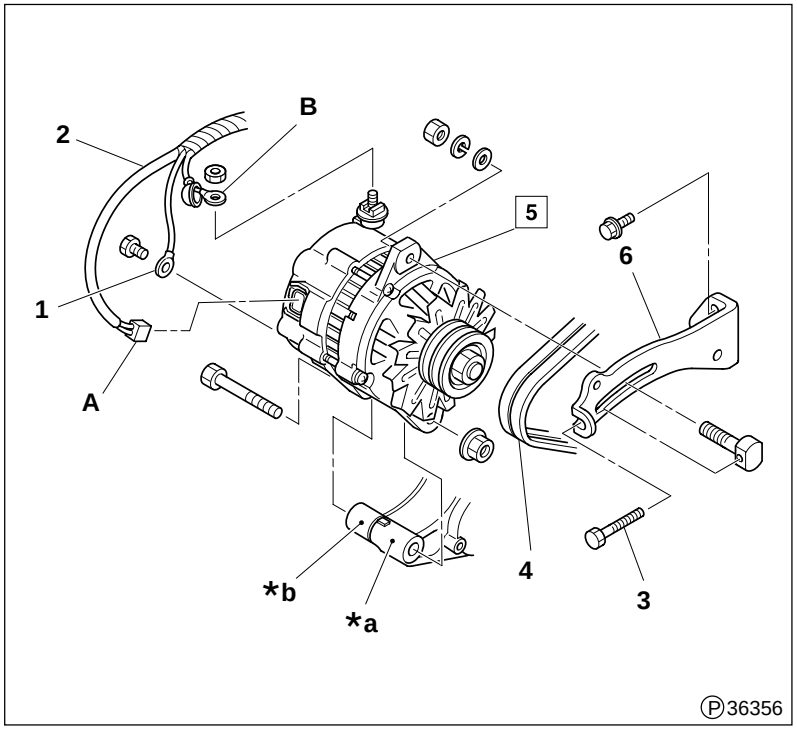
106 ALTERNATOR



● **Removal sequence**

1 Ground cable
2 Chassis harness
3 Adjusting bolt
4 V-belts
5 Alternator 🕮 P54-8
6 Adjusting plate

***a**: Timing gear case and front plate
Gr 11
***b**: Power steering oil pump
A : To terminals L and R
B : To terminal B
C : Connected to crankcase
E : To terminal E

WARNING ⚠

- **Terminal B is always loaded with voltage from the battery, supplied via chassis harness 5. Therefore when you remove the harness from terminal B, make sure that tools do not touch any adjacent parts because this would cause a short-circuit.**
- **Make sure that you disconnect terminal ⊖ of the battery before removing the harness and insulate the terminal with tape.**

● **Installation sequence**

Follow the removal sequence in reverse.

● **Adjustment after installation**

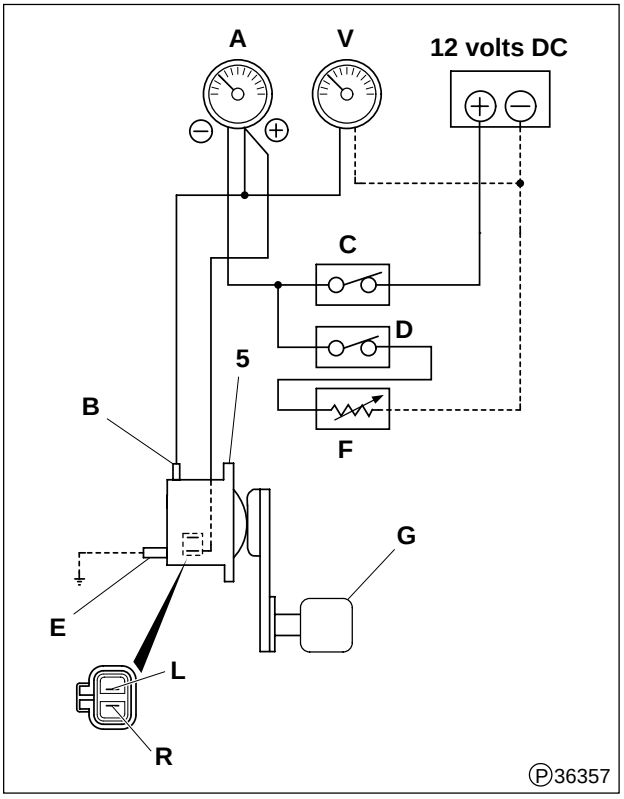
Adjustment of V-belt **4** tension Gr 14

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
5	Output current (* When engine is hot and 13.5 V is loaded)	At 1500 rpm	53 A or more	—	Inspect
		At 2500 rpm	84 A or more	—	
		At 5000 rpm	102 A or more	—	
	Adjustment voltage of regulator (At 5000 rpm, 5 A is loaded)		14.7±0.3 V	—	Replace

* : The value of the ambient temperature is measured after running the alternator drive motor at maximum power (5000 rpm) for 30 minutes.

https://truckmanualshub.com/



5 Inspection of alternator

(1) Inspection of alternator performance (bench test)

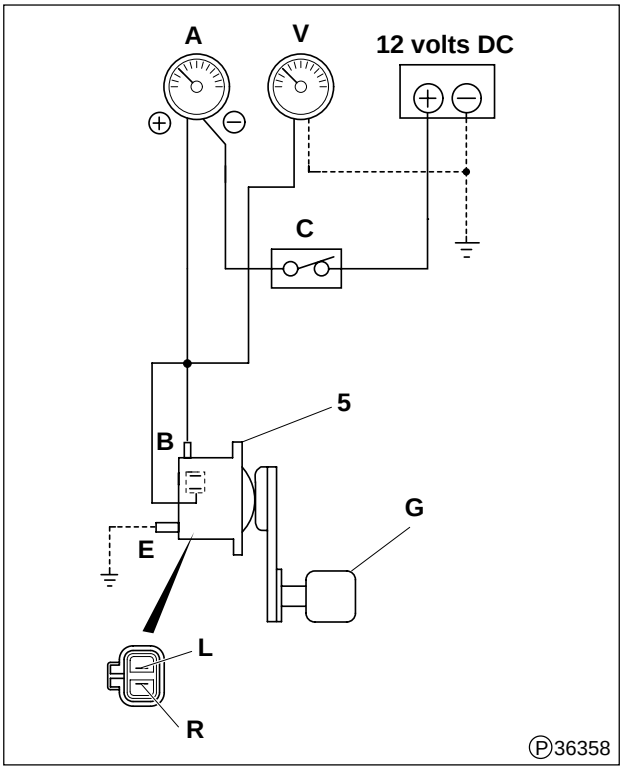
- Connect each unit to alternators **5** as illustrated.

CAUTION⚠

Use sufficiently thick wires for the wiring and make sure all connecting parts are securely connected.

A : Ammeter
B : Terminal B on alternator
C : Switch
D : Switch
E : Terminal E on alternator
F : Load resistance (variable resistance)
G : Alternator drive motor
L : Terminal L on alternator
R : Terminal R on alternator
V : Voltmeter

- Maximize load resistance **F** (load current hardly flows).
- Turn switches **C**, **D** ON.
  With the alternator **5** rotating at 5000 rpm, adjust load resistance **F** to the current specified in the Service Standards table. Then, operate the alternator for 30 minutes.
  Specified output of the alternator : Approx. 100 A
- Increase the rotation of alternator **5** gradually and measure current at specified rpm.
- If the measured value deviates from the standard value, disassemble and inspect alternator **5**. 🕮 P54-8



(2) Inspection of regulator (bench test)

- Connect each unit to the alternators as illustrated.
  A : Ammeter
  B : Terminal B on alternator
  C : Switch
  E : Terminal E on alternator
  G : Alternator drive motor
  L : Terminal L on alternator
  R : Terminal R on alternator
  V : Voltmeter
- Turn switch **C** ON.
- Run alternator **5** at low speed.
- Measure the voltage (adjustment voltage) when alternator **5** has reached a speed of 5000 rpm. Make sure at such time that the value of the current is five amperes or less.
- If the measured value deviates from the standard value, perform either of the following.
  - If the measured value is higher than the standard value : Replace the regulator
  - If the measured value is lower than the standard value : Before replacing the regulator check the alternator area.

1 Rotor and front bracket assembly
2 Nut
3 Pulley
4 Fan
5 Spacer
6 Rear bearing
7 Rotor assembly
8 Cover
9 Front bearing
10 Front bracket
11 Stator and rear bracket assembly
12 Screw
13 Screw
14 Field coil
15 Stator assembly
16 Regulator
17 Rectifier
18 Rear bracket

⊗ : Non-reusable parts

CAUTION⚠

When removing field coil 15, support the field coil by hand or with a stand to prevent it from falling due to its own weight.

NOTE

Do not remove parts 6, 9, 14 unless they are faulty.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

https://truckmanualshub.com/

Service standards

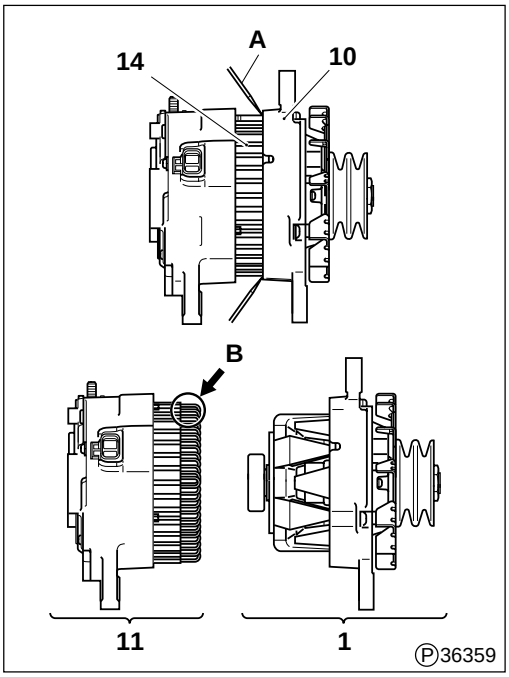
Location	Maintenance item	Standard value	Limit	Remedy
15	Field coil resistance (20°C {68°F})	2.0 to 2.4 Ω	—	Replace

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Nut (Pulley mounting)	132 to 162 {98 to 120, 13.5 to 16.5}	—

◆ Service procedure



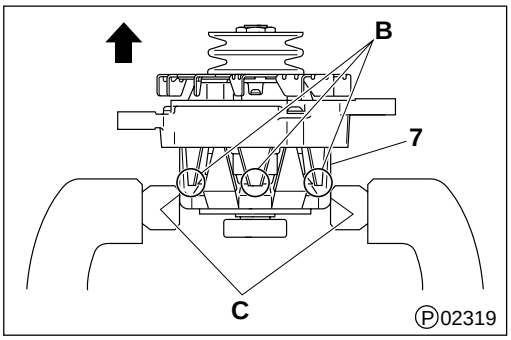
1 Rotor and front bracket assembly

[Removal]

- Insert screwdriver **A** between front bracket **10** and stator assembly **14**.
- Use screwdriver **A** to pry rotor and front bracket assembly **3** away from stator and rear bracket assembly **11**.

CAUTION

Be careful not to insert the screwdriver too deep or it will damage coil B of stator assembly 14 and might cause a short-circuit.

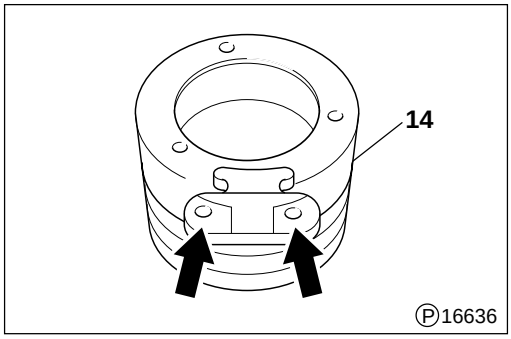


[Disassembly]

CAUTION

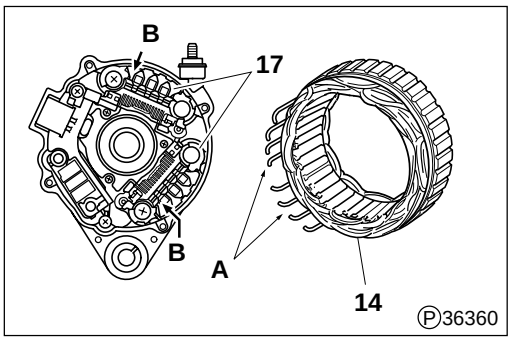
Make sure, when you hold rotor assembly 7 in a vise, to grip root C of the core claws. Gripping claws D can damage them.

https://truckmanualshub.com/



15 Inspection of stator

- Measure the resistance between the terminals of stator **15**.
- If the measured value deviates from the standard value, replace stator **15**.



14 Field coil assembly

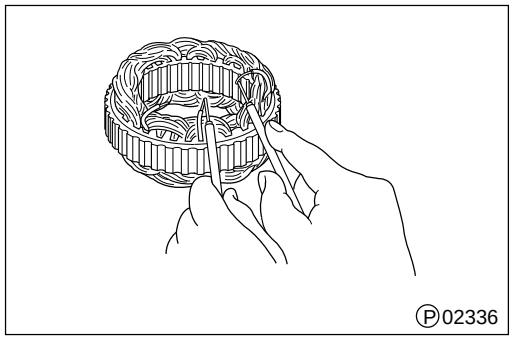
[Removal and installation]

- Disconnect lead **A** of field coil assembly **14** from rectifier **17**. The lead is soldered to diode **B** of rectifier **17** at eight points. (Each of the two rectifiers has 4 soldered sections.)

CAUTION ⚠

Make sure that you desolder within five seconds because the diode is heat sensitive.

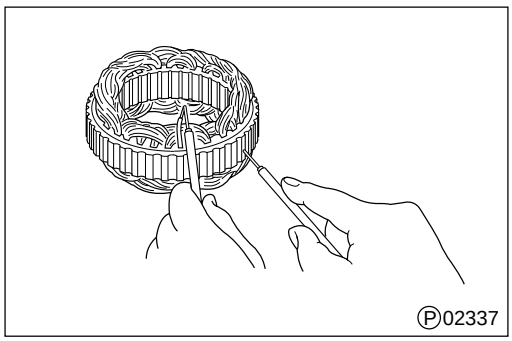
- To install, follow the removal sequence in reverse.



[Inspection]

(1) Continuity of each lead wire

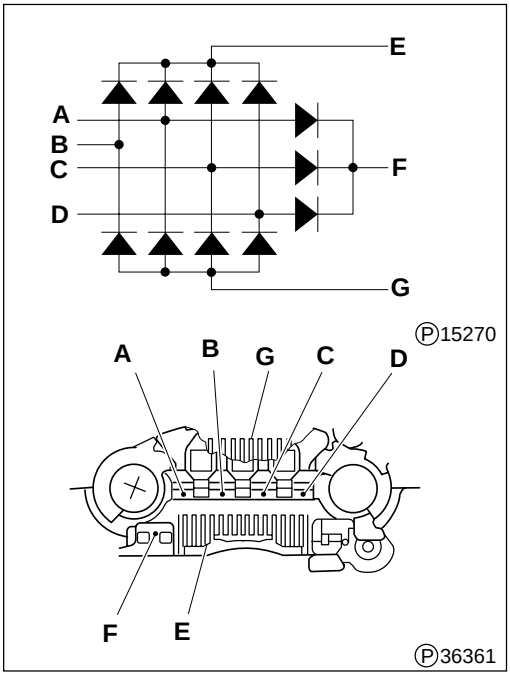
- Check electrical conductivity between individual lead wires of the four wires soldered to each rectifier.
- If there is no continuity, the lead wire is broken. Replace field coil assembly **14**.



(2) Continuity between lead wires and the core

- Make sure that there is no continuity between all lead wires and the core.
- If there is continuity, replace field coil assembly **14**, since it might be short-circuited.

https://truckmanualshub.com/



17 **Inspection of rectifier**

- Inspect whether the diode inside rectifier **17** functions properly, and if any fault is found, replace the rectifier.
  Infinite resistance in both.....Open circuit
  Near-zero Ω resistance in both.....Short circuit
  A, B, C, D : Lead connecting area of stator coil
  E, G : Heat sink area
  F : Regulator connecting area
- Inspect the rectifier twice, before and after the ⊕ side and ⊖ side of the tester have been changed over.

CAUTION⚠

When inspecting using a tester, the current becomes weaker than the usual current flowing through rectifier 17. Therefore, an incomplete resistance value might be indicated.
Also, this tendency increases as the range of the tester gets smaller. Therefore, use as large range as possible.

3 : '99 Model Gr 54 (Pub No. TWSE9501-3)

[Outline]
The daytime running light system (DRL) turns on head lamps **13**, **14** in low beam as soon as the engine starts even if the light switch is in the OFF position.
Headlamps **13**, **14** repeat On/Off operations at 120 Hz according to the above timing chart. Because of the cyclic On/Off operations, the headlamps are dimmer than when the headlamp switch is ON.
Explanation of timing chart
- After the engine starts, when alternator **18** begins generating electricity with starter switch **3** in the ON position, headlamps **13**, **14** light.
- When parking brake switch **12** is ON, the DRL turns off to switch off the headlamps.

SERVICE MANUAL

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of 1999 model Mitsubishi Fuso Truck FE.FG series.
Read this manual carefully as an aid to providing correct, efficient and fast maintenance.
Please note, however, that due to continuous improvements on the specifications, numbers and description for maintenance might be changed without prior notice.
If you have any question, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso dealer or distributor.

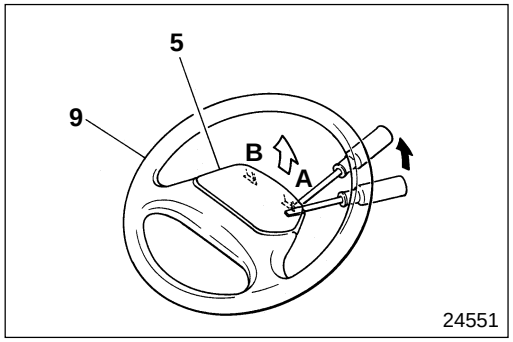
Location	Parts to be tightened	Tightening torque	Remarks
6	Nut (Telescopic lever mounting)	8.8 to 9.8 {6.5 to 7.2, 0.9 to 1.0}	—
8	Nut (Steering wheel assembly mounting)	39 to 49 {29 to 36, 4 to 5}	—
14	Screw (Combination switch mounting)	2.5±0.5 {1.8±0.4, 0.25±0.05}	—
17	Head cutting bolt (Starter switch mounting)	14.2±1.5 {10±1.1, 1.45±0.15}	—
21	Nut (Steering column subassembly and power steering booster mounting)	53 to 65 {39 to 48, 5.4 to 6.6}	—
25	Bolt (Steering column at floor side mounting)	17 to 26 {12 to 19, 1.7 to 2.6}	—
26	Bolt (Steering column subassembly to instrument panel side mounting)	17 to 26 {12 to 19, 1.7 to 2.6}	—
28	Pressure tube	29 to 39 {22 to 29, 3 to 4}	—
29	Return tube	39 to 49 {29 to 36, 4 to 5}	—
31	Nut (Power steering booster mounting)	83.5 to 108 {61 to 80, 8.5 to 11.0}	—
33	Nut (Tie rod assembly mounting)	93±25 {69±18, 9.5±2.5}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
12	Contact area between combination switch of cover assembly and horn contact	Wheel bearing grease [NLGI No.2 (Li soap)]	As required

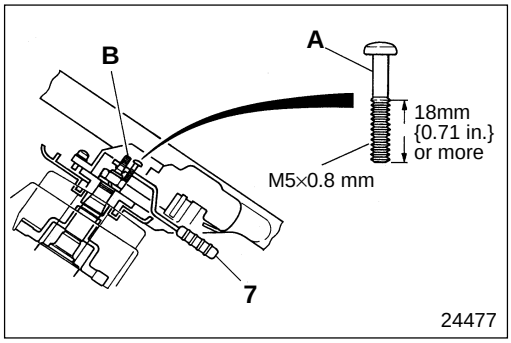
https://truckmanualshub.com/

◆ Service procedure



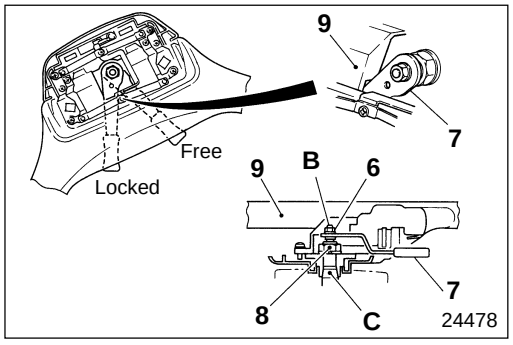
5 Removal of horn pad

- Insert a flat-tip screwdriver into the space between steering wheel assembly **9** and shoulder sections **A**, **B** of horn pad **5**, and disengage the latch by prying open the horn pad with the screwdriver until a clicking sound is produced.
- Insert fingers into the space behind lifted horn pad **5** and remove the horn pad.



7 Telescopic lever

[Removal]
Secure screw **A** (M5×0.8 mm) in tapped hole in telescopic lever **7** and remove telescopic lever from telescopic shaft **B**.



[Installation]
Make adjustment so that telescopic lever **7** positioned at the designated location applies the specified torque on telescopic shaft **B**.

CAUTION
Be careful not to damage the threads on the tip of telescopic shaft B.

C : Telescopic shaft assembly

https://truckmanualshub.com/

Start procedure

Install steering wheel assembly **9**. Using a long socket wrench, tighten nut **8** at specified torque 39 to 49 N·m {29 to 36 lbf.ft, 4 to 5 kgf·m}

Rotate telescopic shaft **B** counterclockwise with your fingers and check for looseness

Looseness found

No looseness

Using a flat-blade screwdriver turn telescopic shaft **B** clockwise and drive it in until it hits lightly with a "clunk", but do not turn it any further

CAUTION

Be careful not to over tighten or you will crush the end of the telescopic shaft, requiring replacement of telescopic shaft assembly C

Install telescopic lever **7** at a location that allows easy tightening, then tighten nut **6** until the telescopic lever will not slip

Tighten telescopic shaft **B** at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 lbf.ft, 0.7 to 0.8 kgf·m}. (Tighten telescopic bar **7** at torque 69 to 78 N {15 to 18 lbf, 7 to 8 kgf} at 100 mm {3.94 in.} from the center of steering wheel assembly **9**)

To maintain lock, hold telescopic lever **7** clockwise, then loosen and remove lock nut **6**

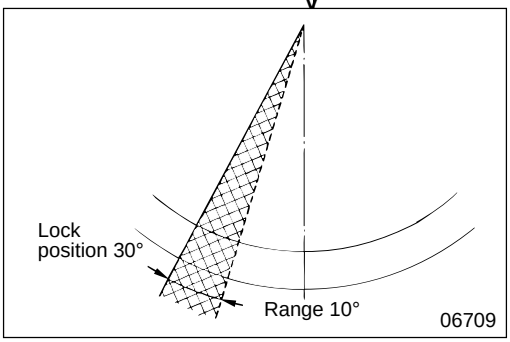
Remove telescopic lever **7**

NOTE

Remove telescopic lever 7 following the description under [Removal], taking care not to loosen telescopic shaft B.

Set telescopic lever **7** to specified lock position (within 10° before the position at which telescopic lever contacts steering wheel assembly **9**).

Tighten nut **6** at specified torque 8.8 to 9.8 N·m {6.5 to 7.2 lbf.ft, 0.9 to 1.0 kgf·m}



When telescopic lever **7** is released, and telescopic shaft **B** is retightened at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 lbf.ft, 0.7 to 0.8 kgf·m}, the telescopic lever should lock in the 10° range this side of specified lock position 30°

Out of the range

Within the range

Jiggle steering wheel assembly **9** up and down and check for looseness

Looseness found

No looseness

Remove nut **6**

Procedure is completed

Remove telescopic lever **7**

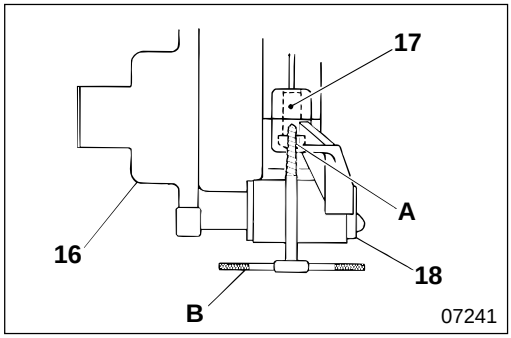
CAUTION

Be sure not to operate telescopic shaft B while steering wheel assembly 9 is removed.

NOTE

Be sure to assemble telescopic lever 7 only after steering wheel assembly 9 has been installed.

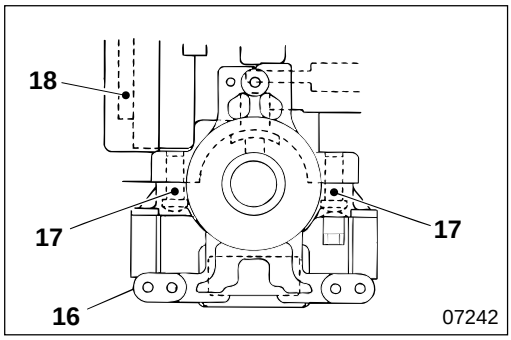
https://truckmanualshub.com/



17 **18** **Head cutting bolt, starter switch**

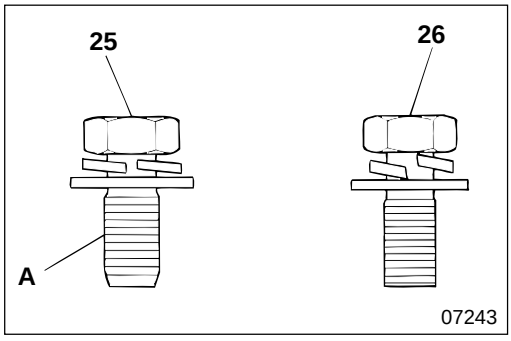
[Removal]

- After removing bracket **16**, drill a ø5.5 to 6.0 mm {0.22 to 0.24 in.} hole 10 to 15 mm {0.39 to 0.59 in.} deep on cutting face **A** of head cutting bolt **17** for mounting starter switch **18**.
- Screw in screw extractor **B** counterclockwise, then pull out head cutting bolt **17**.



[Installation]

- With new head cutting bolt **17**, tighten starter switch **18** at specified torque to cut the head off the bolt.
- After installing bracket **16**, verify operation of the steering lock function of starter switch **18**.

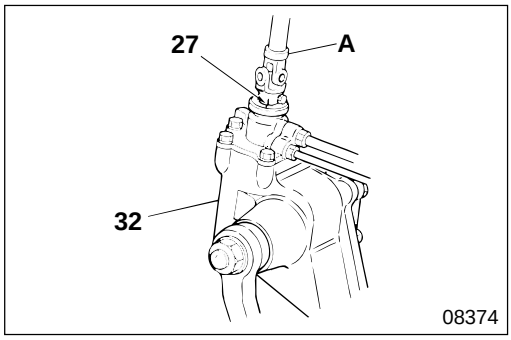


25 **26** **Installation of bolt**

Bolts **25** and **26**, differ in shape. Do not mix them up when installing.

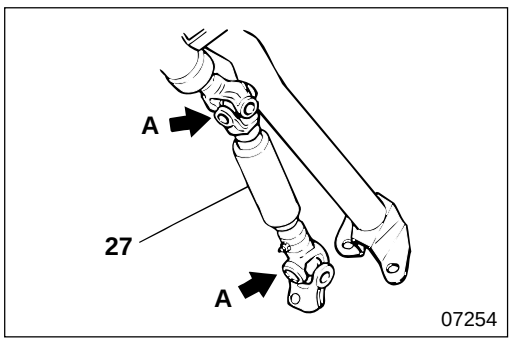
NOTE

Thread area A of bolt 25 is elliptical to facilitate grounding of the horn circuit.



27 **32** **Removal and installation of steering column subassembly and power steering booster**

Before removing steering column subassembly **27**, power streering booster **32**, be sure to make alignment mark **A**.



27 **Steering column subassembly**

When the spline of steering column subassembly **27** is disconnected, align the yokes to the same direction **A**.

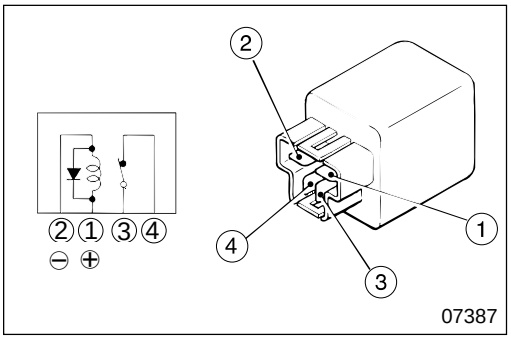
◆ Service procedure



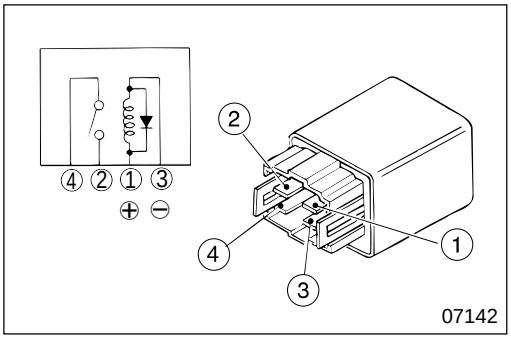
2 **Inspection of relay (Close type 4-pin)**

- Follow the table below to check for continuity and operation.

	①	②	③	④
No current	○—○		○—○	
Current	⊕—⊖		◌----◌	

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.
◌----◌ : Indicates that the continuity between the terminals is lost.

- If any fault is found, replace the relay.



10 **11** **20** **Inspection of relay (Open type 4-pin)**

- Follow the table below to check for continuity and operation.

	①	②	③	④
No current	○—○			
Current	⊕		○—⊖	○

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.

SERVICE MANUAL

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of 1998 model Mitsubishi Fuso Truck FE.FG series.
Read this manual carefully as an aid to providing correct, efficient and fast maintenance.
Please note, however, that due to continuous improvements on the specifications, numbers and description for maintenance might be changed without prior notice.
If you have any question, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso dealer or distributor.

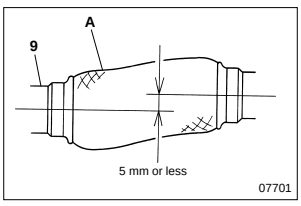
14	Nut (Muffer mounting)	26 to 33 {20 to 34, 2.7 to 3.4}	—



◆ **Service procedure**

9 Installation of front pipe assembly

Install front pipe assembly **9** so that the offset tolerance in the vertical and horizontal sections between the front and back of bellows **A** conforms to the standard value.

CAUTION

Be sure when installing bellows A of front pipe assembly 9 that the bellows are not forcibly bent and that the bellows do not pull on themselves. This is because they are designed to reduce the external noise of the vehicle and are not designed to absorb dimensional tolerances in the installation of pipes.

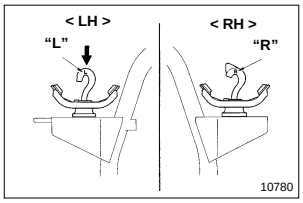
Lubricant

Location	Points of application	Specified lubricant	Quantity
4	Upper side of anchor hook (contact area between lock handle and stopper)	Chassis grease [NLGI No. 1 (Ca Soap)]	—



10780

◆ **Service procedure**

4 **Installation of anchor hook**

Install anchor hook **4** so that open side of the hook comes to left side of the vehicle while aligning the identification marks "**L**" and "**R**".
Also always make sure to apply grease on upper part of the left anchor hook (▼ part).

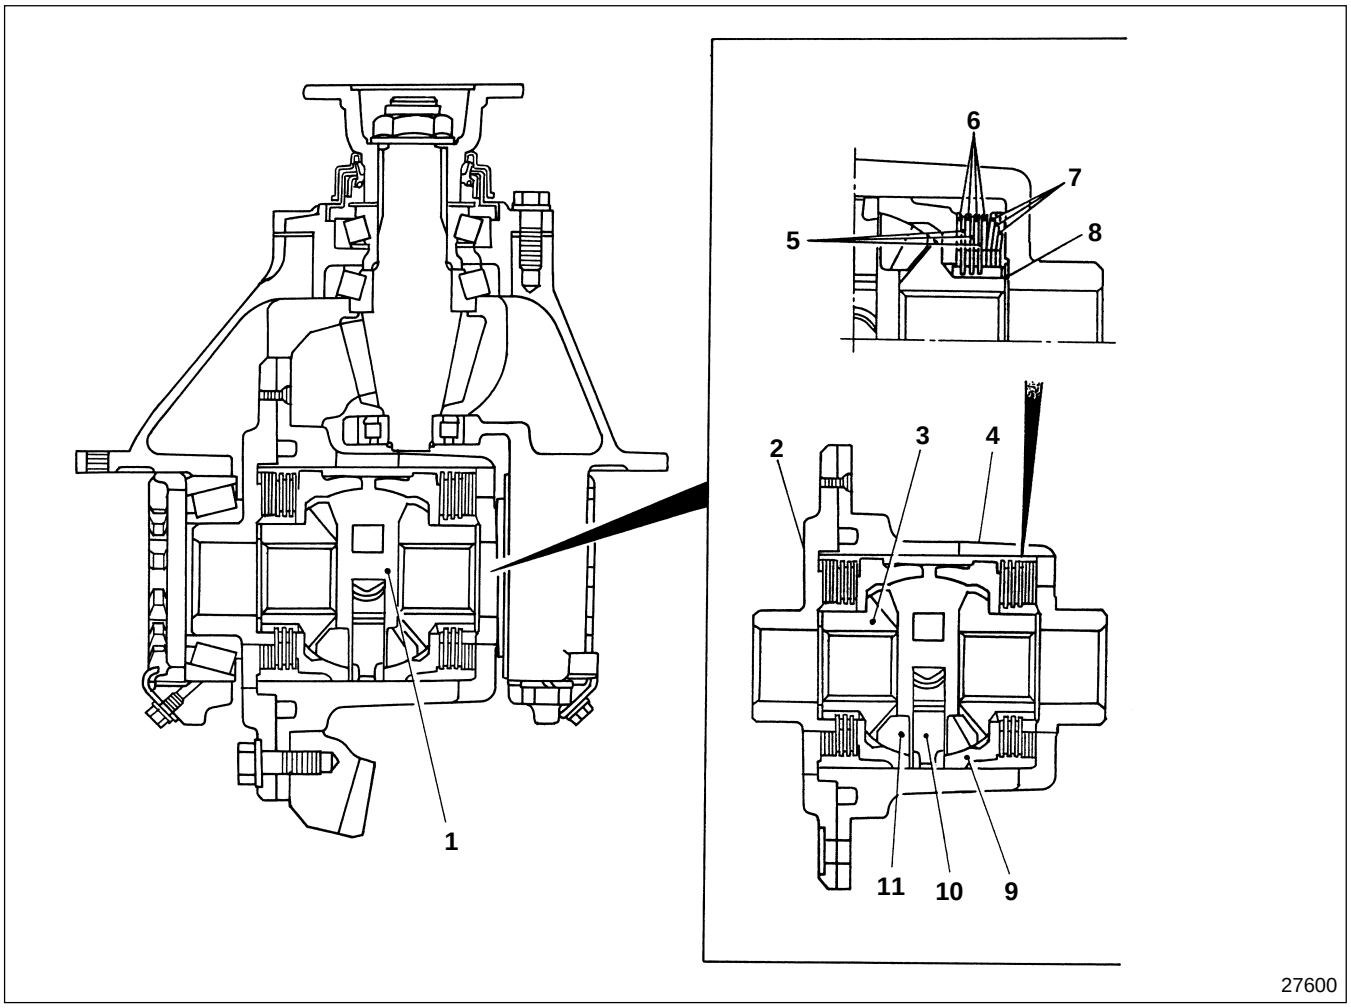
STRUCTURE AND OPERATION

MULTIPLE LIMITED SLIP DIFFERENTIAL ASSEMBLY < D033H >



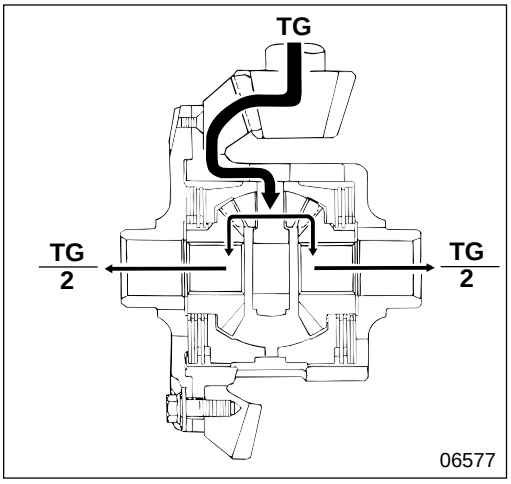
1 Limited slip differential assembly
2 Differential case, LH
3 Side gear
4 Differential case, RH
5 Friction disc
6 Friction plate
7 Spring plate
8 Thrust washer
9 Pressure ring
10 Pinion shaft
11 Differential pinion

Friction disc **5** and friction plate **6** engage side gear **3** and differential case RH **4**, respectively. These parts are pressed against pressure ring **9** by spring plate **7**. The pressure ring mates with the groove in the differential case RH and always turns at the same speed.

https://truckmanualshub.com/

Operation mechanism

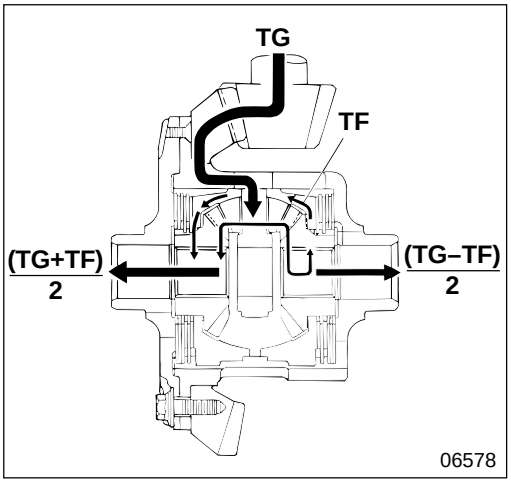
When the wheel of one side starts spinning, a rotational difference between side gear **3** and differential cases, LH **2** and RH **4** occurs. Then, friction disc **5** and friction plate **6** start rotating with a relative difference in revolution speed. This causes friction torque between the disc and plate.



● **Operation in straight movement**

In the case of straight movement, as the revolution speed of the left axle shaft and that of the right axle shaft are equal, no friction torque occurs.

TG : Torque input



● **Operation when there is a difference in revolution speed between left and right wheel**

When a difference in the resistance the wheels receive from the road surface occurs, such as when the wheel of one side encounters mud, the differential function comes into play, transmitting friction torque **TF**. This exertion of friction torque reduces the revolution speed causing the high-revolution speed axle to reduce its speed and the low-revolution speed axle to increase its speed.

Therefore, when the wheel of one side starts spinning, when caught in mud for example, a big difference in revolution speed occurs, causing a large amount of friction torque to come into action. The differential functions in such a manner that a smaller ratio of the torque is transmitted to the axle of the wheel which is spinning while the axle of the wheel on the other side receives a greater ratio of the torque. This makes it easier for the vehicle to get out of the mud.

$\frac{(TG-TF)}{2}$ High rotation side (spin side)

$\frac{(TG+TF)}{2}$ Low rotation side

https://truckmanualshub.com/

MULTIPLATE LIMITED SLIP DIFFERENTIAL ASSEMBLY < D033H >

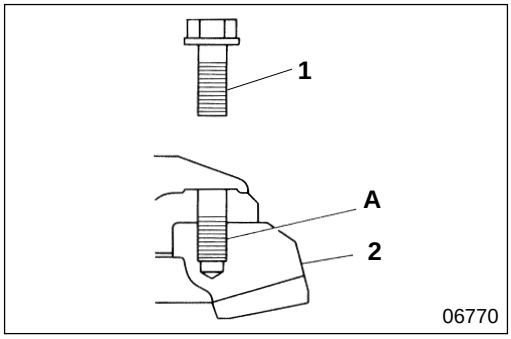
◆ Service procedure

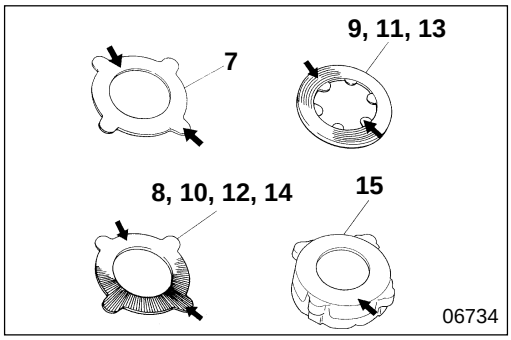


2 Final drive gear

Apply LOCKTITE to thread area **A** of all the bolt holes of final drive gear **2**.

CAUTION⚠

- **Be sure to let bolts 1 harden for at least an hour, after installation, before driving.**
- **Furthermore, be sure to let bolts 1 harden for at least four hours before running at full torque.**



3 Multiplate limited slip differential assembly

[Inspection of contact and sliding surfaces]

- Inspect spring plates **7**, friction plates **8**, **10**, **12**, **14** and friction discs **9**, **11**, **13** and replace if the friction surface or sliding surface shows extreme wear or heat discoloration.

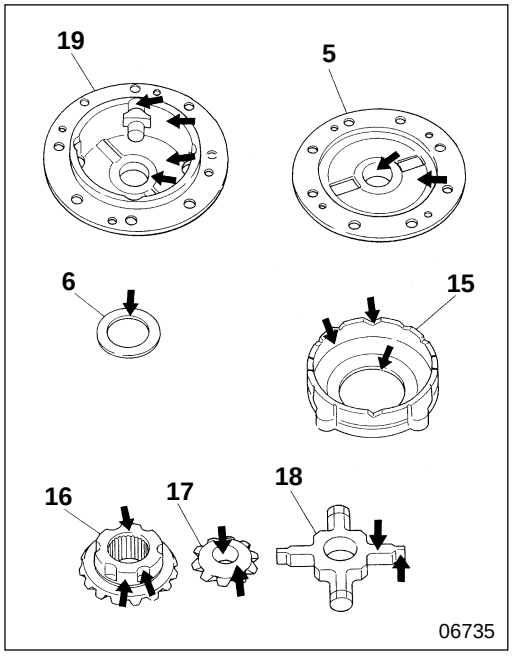
NOTE

The hardened area on the inner periphery of the friction surfaces of plates and discs 7 to 14 is due to the force exerted by the springs and should not be mistaken for abnormal wear.

- Replace spring plates, friction discs and friction plates **7** to **14** if their protruding areas have cracks or are damaged.
- If there are nicks or marred areas on the friction and sliding surfaces of pressure rings **15** and friction plates **14** remove using an oil stone, then fit and correct on the base using compound.

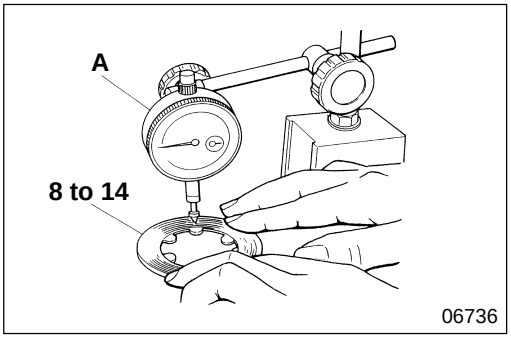
NOTE

The hardened area on the inner periphery of the friction surfaces of plates and discs 7 to 14 is due to the force exerted by springs and should not be mistaken for abnormal wear.

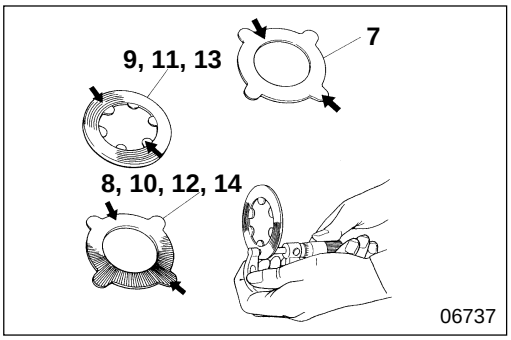


- Inspect the contact and sliding parts (⬅) of differential case LH **5**, thrust washer **6**, pressure ring **15**, side gear **16**, differential pinion **17**, pinion shaft **18**, and differential case RH **19**. If there are nicks or marred areas remove using an oil stone.

https://truckmanualshub.com/



[Inspection for deformation]
Check friction plates **8**, **10**, **12**, **14** and friction discs **9**, **11**, **13** for deformation by mounting dial gauge **A** on a base and rotating the plate or disc and measuring its flatness.

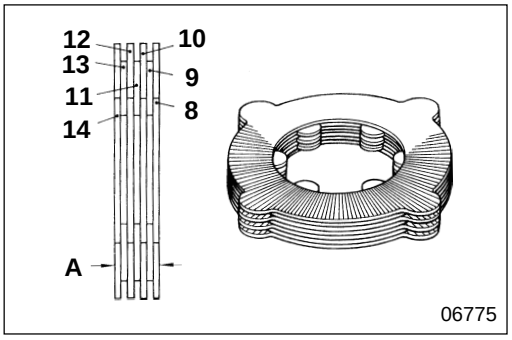


[Measurement of thickness]
Measure the thickness of the friction surfaces and the protruding parts (⬅) of spring plates **7**, friction plates **8**, **10**, **12**, **14** and friction discs **9**, **11**, **13**. If the measured values deviate from the limit, replace the faulty parts.

NOTE

Measure several locations on each part.

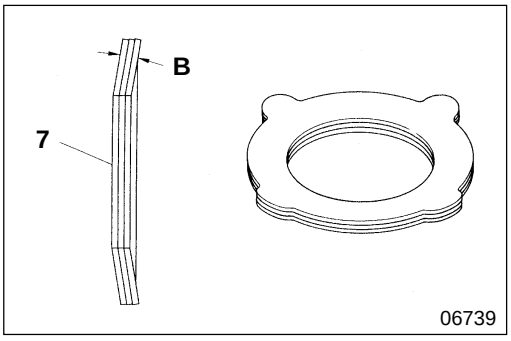
[Work before assembly]
In order to adjust the tolerance in the axial direction when the internal parts of differential cases LH **5** and RH **19** are inserted (clutch plates **7** to **14** friction force) and the tolerance in the axial direction of side gear **16** follow the procedure below.



- Put friction plates **8**, **10**, **12**, **14** and friction discs **9**, **11**, **13** one on top of the other as illustrated. Using a micrometer measure thickness **A**, and by selecting the right combination of plates and discs for each set, make sure the difference in thickness between the left and right sets conforms to the standard value.

NOTE

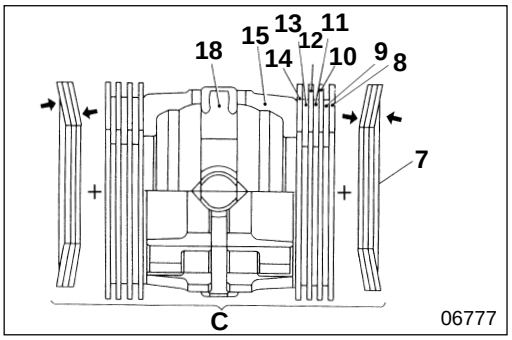
When using new parts, keep in mind that friction plates 8, 10, 12, 14 come in one size, 2.0 mm {0.0079 in.} and friction discs 9, 11, 13 in three sizes, 1.9 mm {0.075 in.}, 2.0 mm {0.079 in.} and 2.1 mm {0.083 in.}.



- Put spring plates **7** one on top of the other as illustrated. Using a micrometer measure thickness **B** and by selecting the right combination of plates for each set, make sure the difference in thickness between the left and right sets is minimal.

NOTE

When replacing spring plates 7 with new ones, the plate thickness is 2.0 mm {0.079 in.}.

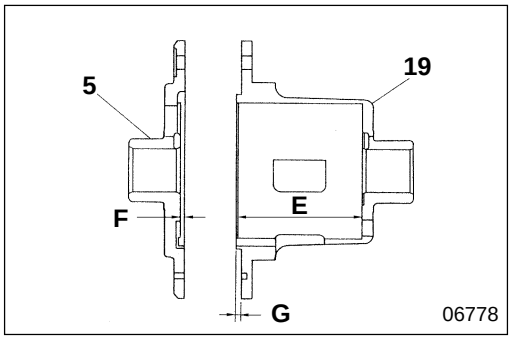


- Assemble pressure rings **15**, pinion shaft **18**, the friction discs, the friction plates and spring plates **7** to **14** and measure total width **C** using a micrometer.

NOTE

When measuring, press down both ends of pressure ring 15 to make sure its V-shaped groove is properly mated with pinion shaft 18.

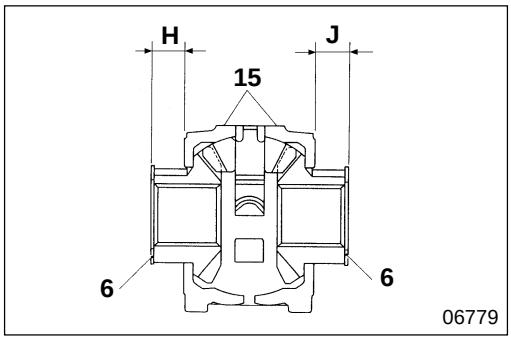
https://truckmanualshub.com/



- Calculate dimension **D** between the surfaces of differential cases LH **5** and RH **19** which come in contact with spring plate **7** when the two cases are assembled.
  D = E + F – G
- If the above mentioned total width **C** and clearance **(D – C)** between differential cases LH **5** and RH **19** deviate from the standard value, adjust by changing friction discs **9**, **11**, **13**.

NOTE

When using new friction discs 9, 11, 13, keep in mind that there are three different sizes, 1.9 mm {0.075 in.}, 2.0 mm {0.079 in.} and 2.1 mm {0.083 in.}.



- Install thrust washers **6** as illustrated. Make sure the difference between dimensions **H** and **J** from the back face of pressure ring **15** to the end face of thrust washer on either side conforms to the standard value.

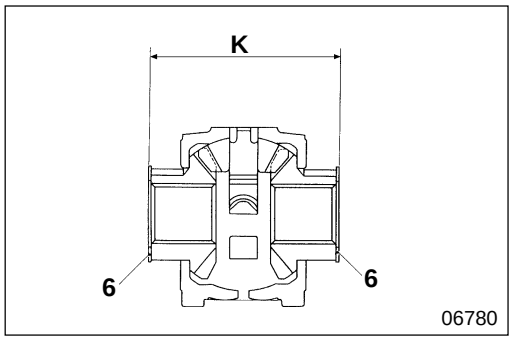
NOTE

When measuring press down both ends of pressure ring 15 to make sure its V-shaped groove is in full contact with pinion shaft 18.

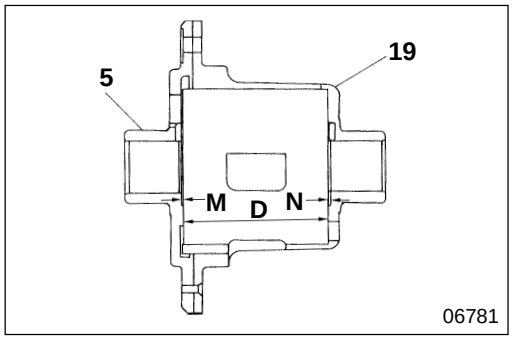
- If the variation of tolerance deviates from the standard value, adjust by changing thrust washers **6**.

NOTE

When using new thrust washers 6 keep in mind that there are three different sizes, 1.50 mm {0.059 in.}, 1.60 mm {0.063 in.} and 1.70 mm {0.067 in.}.



- Measure total width **K**.



- Calculate dimension **L** between the surfaces of differential cases LH **5** and RH **19** that come in contact with thrust washers **6** when the two cases are assembled.
  L = D + M + N

NOTE

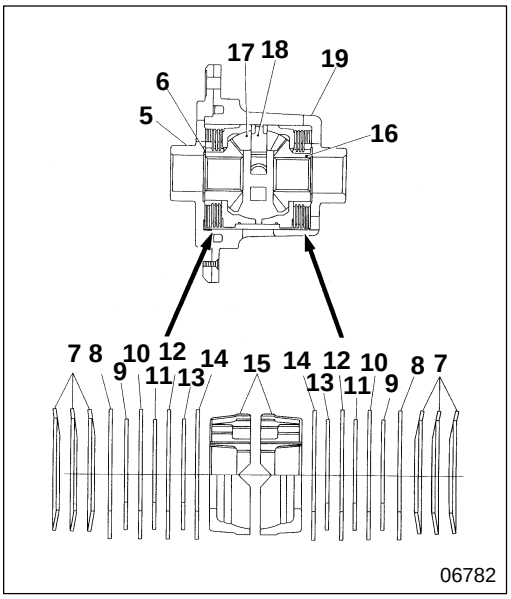
Dimension D is the dimension between the surfaces of differential cases LH 5 and RH 19 that come in contact with spring plate 7 when the two cases are assembled and was calculated above.

- Make sure that side gear **16** clearance in the axial direction **(L – K)** conforms to the standard value. If the measured value deviates from the standard value, adjust by replacing thrust washers **6**.

NOTE

- **Select thrust washers 6 so that the difference in dimension between the left and right sides from the back face of pressure ring 15 to the end face of thrust washers conforms to the standard value.**
- **When using new thrust washers keep in mind that there are three sizes, 1.50 mm {0.059 in.}, 1.60 mm {0.063 in.} and 1.70 mm {0.067 in.}.**

https://truckmanualshub.com/

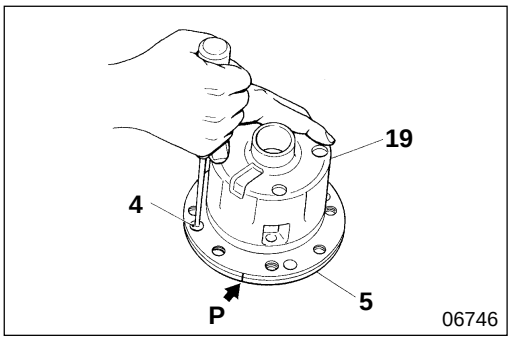


[Assembly]

Assemble the different parts in differential case RH **19** in the direction as illustrated.

CAUTION

- **Make sure that friction plates 8, 10, 12, 14 and friction discs 9, 11, 13 are installed in the correct order and that spring plate 7 is assembled in the correct direction.**
- **Apply the specified gear oil to each of the parts before assembly. Special attention should be given to applying oil to the contact and sliding surfaces.**

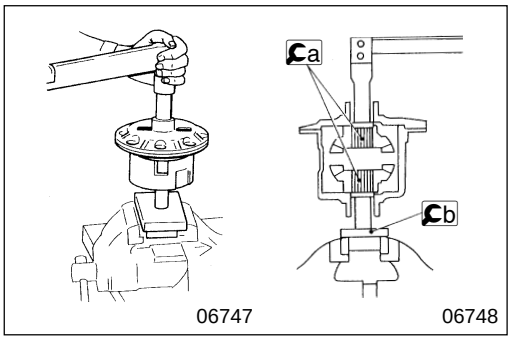


[Tightening of screws]

Align alignment marks **P** (identical Arabian numerals) on differential cases LH **5** and RH **19** and gradually tighten screws **4** evenly in diagonal order.

CAUTION

If differential cases LH 5 and RH 19 are not joined firmly even when screws 4 have been tightened, it may be because thrust washers 6 or spring plates 7 are not properly assembled and they should be reassembled.



[Measurement of rotational torque]

In order to verify the friction force of clutch plates **7** to **14** after assembly, use a side gear holding tool and b side gear holding base to measure the rotation torque and make sure it conforms to the standard value.

NOTE

When measuring the rotation torque, rotate the gear and measure after the rotation has reached a sufficiently steady pace.

SERVICE MANUAL

FOREWORD

1997 Model Changes

212 Sub-Starter Circuit
<Manual Transmission>
<Automatic Transmission>

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of 1997 model Mitsubishi Fuso Truck FE series.
Read this manual carefully as an aid to providing correct, efficient and fast maintenance.
Please note, however, that due to continuous improvements on the specifications, numbers and description for maintenance might be changed without prior notice.
If you have any question, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso dealer or distributor.

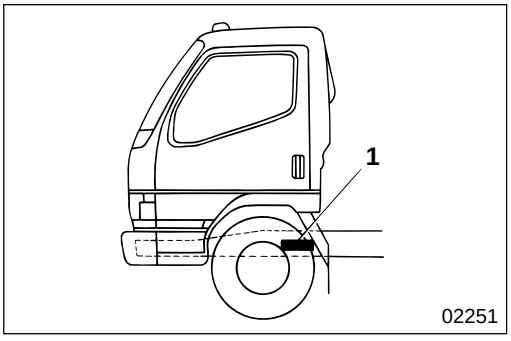
CHASSIS NUMBER AND ENGINE NUMBER

The serial numbers for chassis and engines are assigned to the respective vehicles and engines in manufacturing sequence: every vehicle and engine has its own numbers. These numbers are required for registration and incidental inspection of the vehicle. Please do not fail to mention these numbers to the dealers when ordering spare parts.



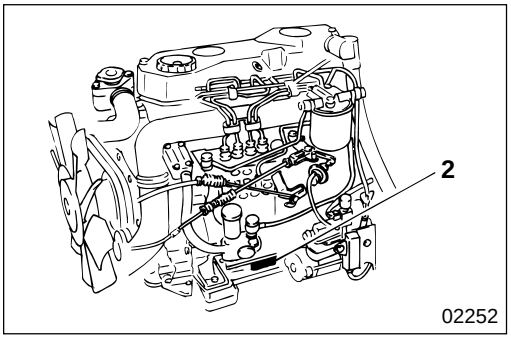
Chassis number

Chassis number 1 is punch-marked on the frame by the left-side front wheel.

Example : FE639C–□□□□□□

Vehicle model

Chassis number



Engine number

Engine number 2 is punch-marked on the left of the crankcase.

Example : 4D34–□□□□□□

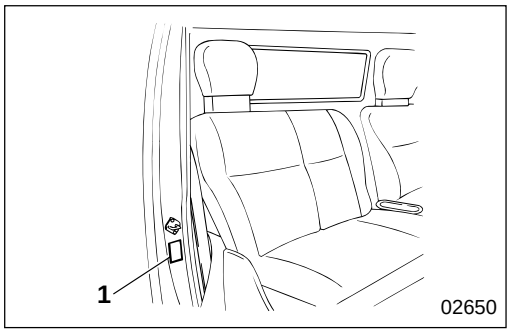
Engine number

Engine model

https://truckmanualshub.com/

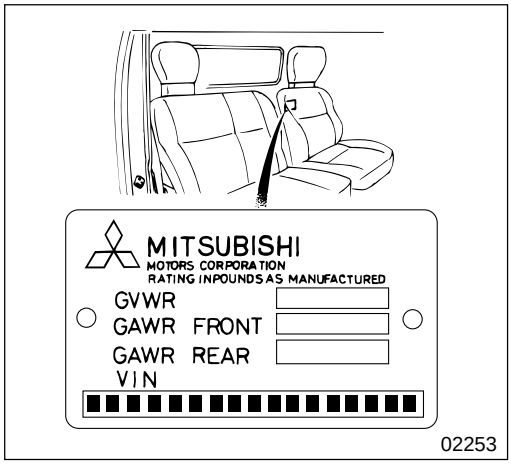
POWER TRAIN LABEL/VEHICLE IDENTIFICATION NUMBER

POWER TRAIN LABEL



Power train label **1** located in the position illustrated indicates the vehicle model, chassis number and information relevant to the vehicle's power transmission components.

VEHICLE IDENTIFICATION NUMBER



The vehicle identification number is punch-marked on the plate, which is attached in the position as illustrated.
The vehicle identification number consists of a 17-digit set of alphanumeric characters. Each digit represents the following specifications.

J W 6 A A C 1 H □ T L □ □ □ □ □ □

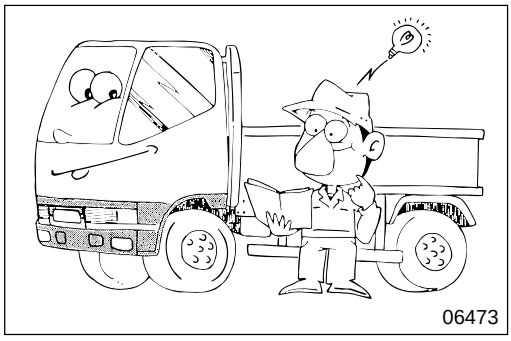
MEMO

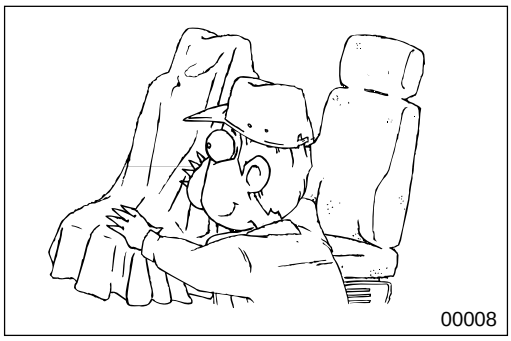
https://truckmanualshub.com/

PRECAUTIONS FOR MAINTENANCE OPERATION

In order to determine the condition of the vehicle adequately, attend the vehicle beforehand to find and keep record of the accumulated mileage, operating condition, what the customer's demand is, and other information that may be necessary. Prepare the steps to be taken and perform efficient and wasteless maintenance procedure.

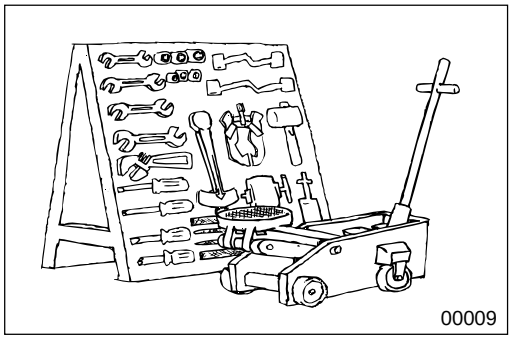


Determine where the fault exists and check for the cause to see whether removal or disassembly of the part is necessary. Then follow the procedure specified by this manual.



Perform maintenance work at a level area.
Prepare the following.

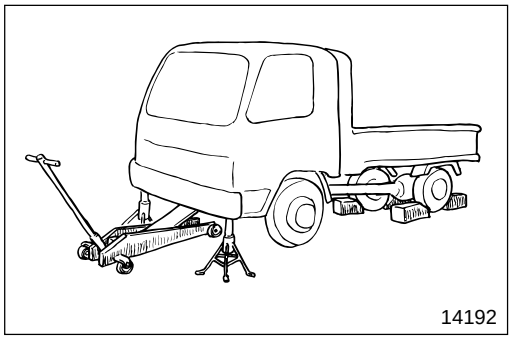
- To prevent the seats, upholstery, floor and bodywork from being spoiled or scratched, cover with workshop sheet cover(s).



- Prepare general and special tools necessary for the maintenance work.

WARNING ⚠

Do not attempt to use tools other than special tools where use of special tools is specified in this manual. This will avoid injury or damage.



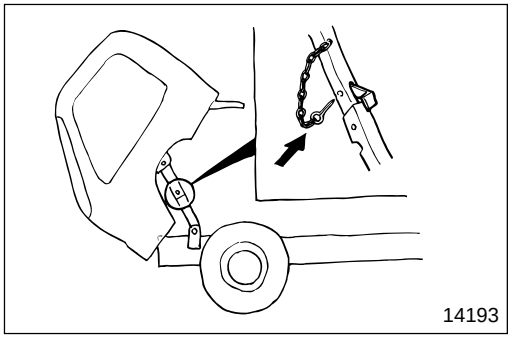
When jacking up the vehicle to work under the vehicle, carry out the following preparatory work:

- Chock the wheels on both sides.
- Jack up the vehicle using a garage jack.
- Support the frame on rigid racks.

WARNING ⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

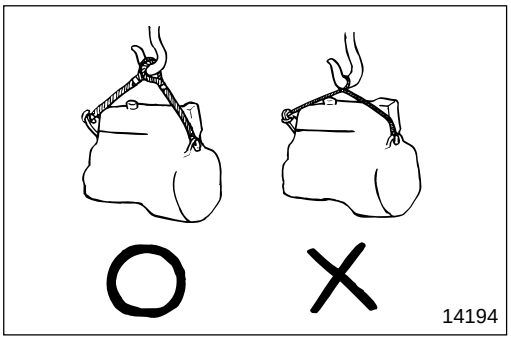
https://truckmanualshub.com/



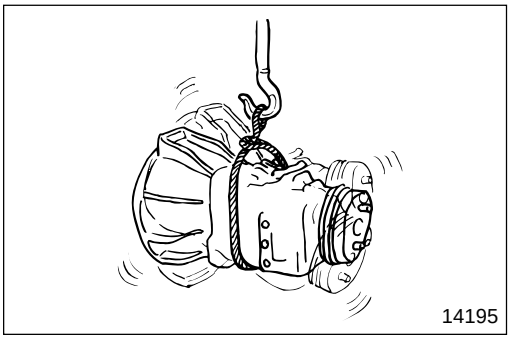
When tilting the cab, be sure to insert the safety pin into the cab stay so that the cab stay remains locked and is not released when the cab is tilted.

Pay special attention to safety when removing or installing heavy items such as engines, transmissions and axles.

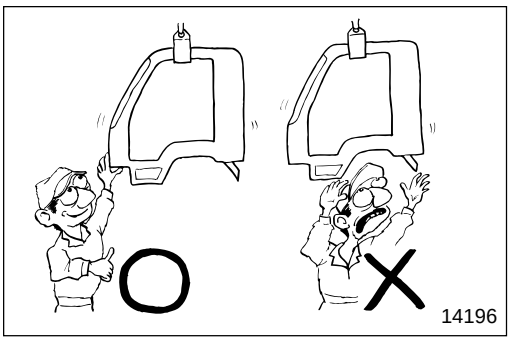
When lifting up heavy items using cables, pay special attention to the following points:



- Check the mass of the item to be lifted and use a cable capable of lifting that mass.



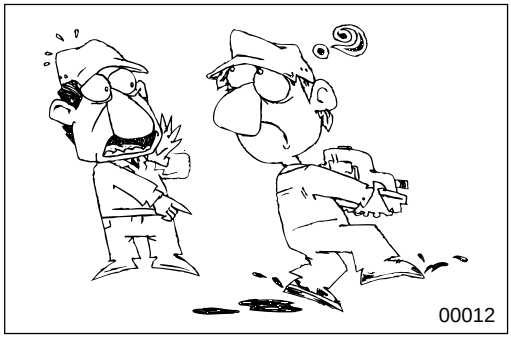
- If you do not have the specified lifting hanger, secure the item using cable taking the point-of-balance of the item into consideration.



- You must work in a position where you will not be injured even if the cable comes undone and the lifted item falls.

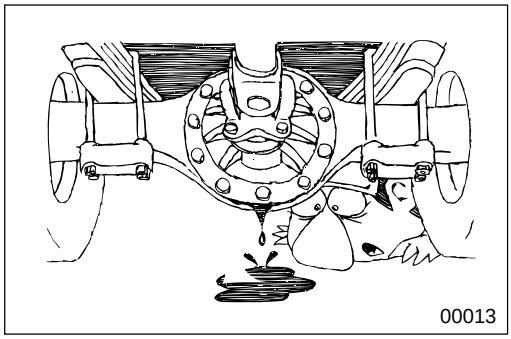
https://truckmanualshub.com/

PRECAUTIONS FOR MAINTENANCE OPERATION



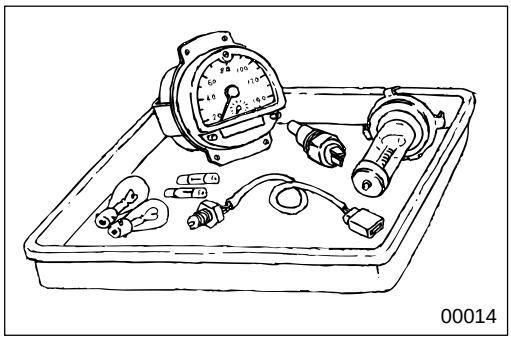
00012

Be particularly careful not to work in shoes that have oily soles and are slippery. When working as a team of two or more, arrange signals in advance and keep confirming safety. Be careful not to accidentally bump switches or levers.



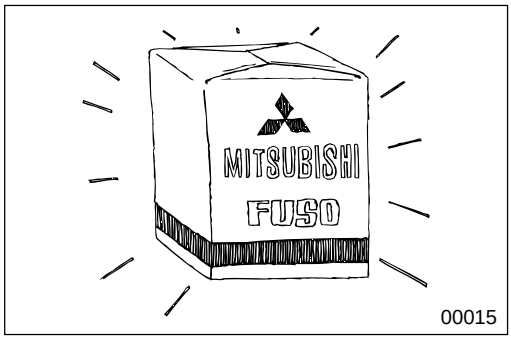
00013

Check for oil leakage before cleaning the area having the fault otherwise you might miss detecting the leakage.



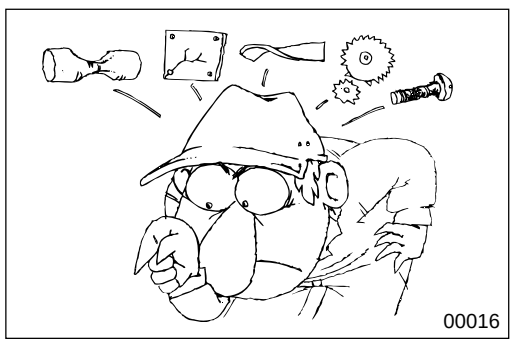
00014

Prepare replacement part(s) beforehand.



00015

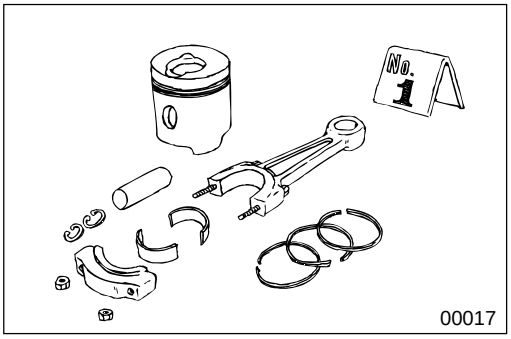
Replace oil seals, packing, O-rings and other rubber parts; gaskets and split pins with new parts whenever any of them has been removed. Use only genuine MITSUBISHI replacement parts.



00016

On disassembly, visually inspect all parts for wear and tear, cracks, damage, deformation, degradation, rust, corrosion, smoothness in rotation, fatigue, clogging and any other possible defect.

https://truckmanualshub.com/

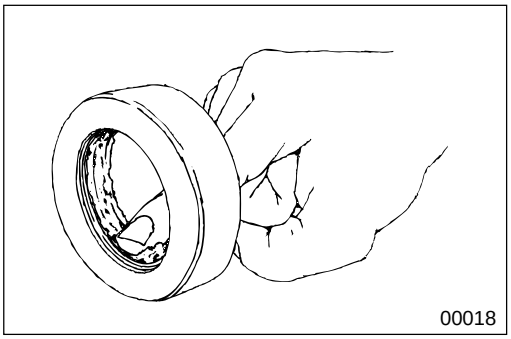


00017

Put alignment marks on part combinations before disassembly and arrange the disassembled parts neatly. This will help avoid mismating of the parts later.
Put the alignment marks, punch marks, etc. where performance and appearance will not be affected.
Cover the area left open after removal of parts to keep it free from dust.

CAUTION⚠

- **Take care to avoid mixing up numerous parts, similar parts, left and right, etc.**
- **Keep new parts for replacement and original (removed) parts separate.**

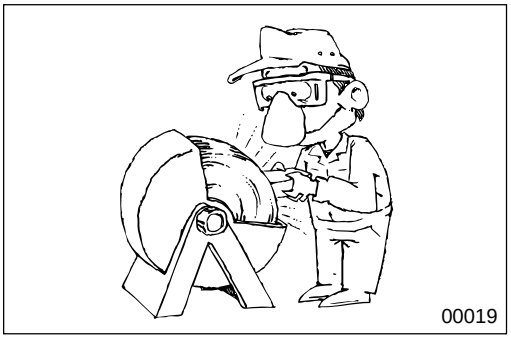


00018

Apply the specified oil or grease to U-packings, oil seals, dust seals and bearings during assembly.
Use only the specified oil, grease, etc. for lubricant, remove the excess immediately after application with a piece of waste, etc.

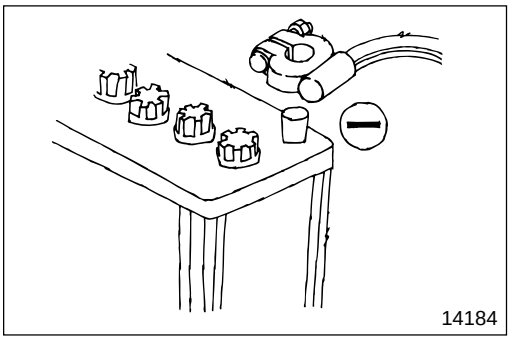
CAUTION⚠

When the specified lubricant, fluid and sealant is not available, you may use an equivalent.



00019

Wear goggles when using a grinder or welder. Pay full attention to safety by wearing gloves when necessary. Watch out for sharp edges, etc. that might injure your hands or fingers.



14184

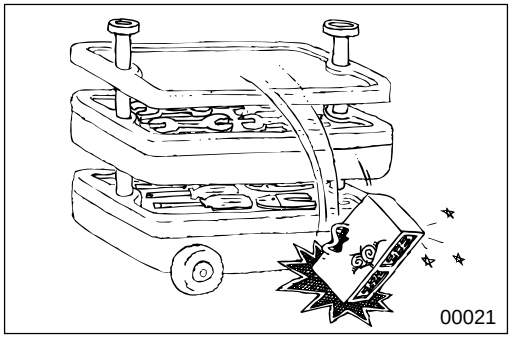
Before carrying out maintenance work on the electric system, disconnect the negative terminals of the batteries to prevent them from short-circuiting and burning-out.

CAUTION⚠

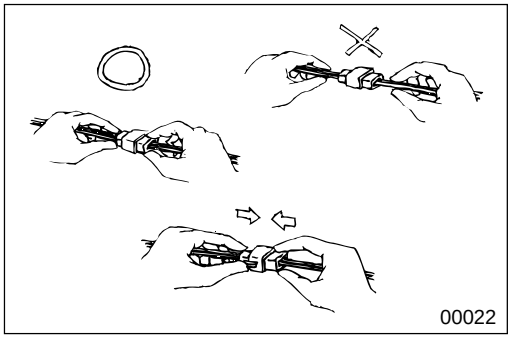
Be sure to turn starter and lighting switches, etc. off before disconnecting or connecting battery terminals, because the semiconductors can be damaged.

https://truckmanualshub.com/

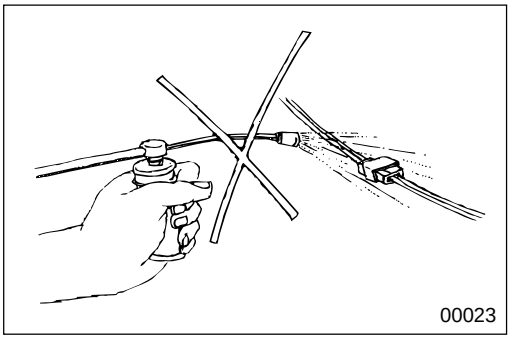
PRECAUTIONS FOR MAINTENANCE OPERATION



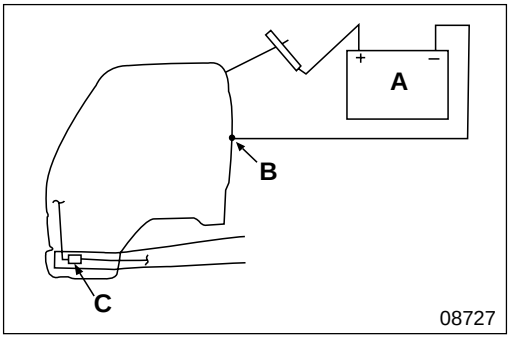
Take care when handling sensors, relays, etc. which are vulnerable to shock and heat. Do not attempt to remove the cover from, or apply paint to, the electronic control unit.



Pull the connector, and not the harness lead, to separate connectors. To separate a lock-type connector, first push toward arrow mark. To reconnect a lock-type connector, press the separated parts until they click together.



When washing the vehicle, cover the electric system parts and instruments with waterproof material beforehand (Cover with vinyl sheet or the like). Keep water away from harness wire connectors and sensors. If any of them should get wet, wipe them off immediately.



When using an electric welder, such electronic parts that are directly connected to the batteries might be damaged due to the flow of current from the welder that flows through the negative circuit. Parts that have switches might be subject to the same danger if the switches are left on. Therefore, do not fail to observe the following.

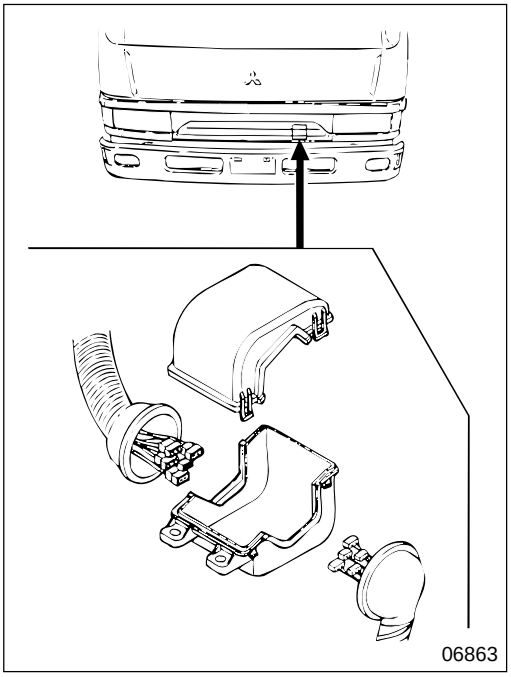
A : Welder

B : Connect the negative terminal of the welder as near as possible to the area that is to be welded.

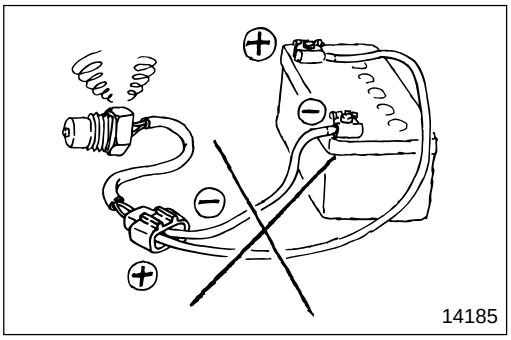
C : Disconnect the negative cable at the cab.

Gr 54 130

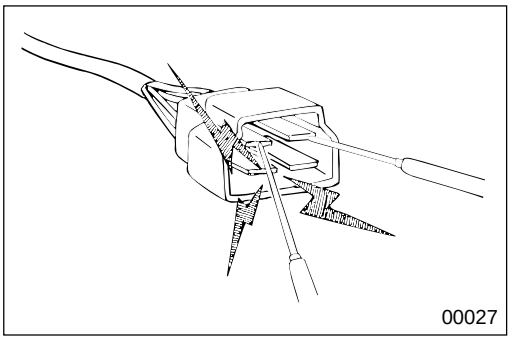
https://truckmanualshub.com/



- Disconnect the negative terminals of batteries.
- Disconnect connections between the cab harness wires and the chassis harness wires.

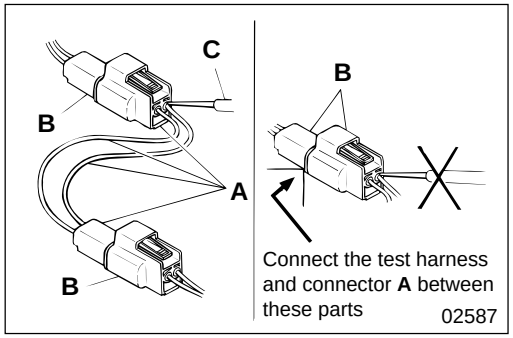


To apply voltage for testing, check that the positive and negative cables are connected properly, then increase voltage gradually from 0 volt. Do not apply voltage higher than the specified value.
In particular, pay close attention to the electronic control unit and sensors, since they are not always fed the battery voltage.



When using testers or the like for continuity tests, be careful not to allow test probes to touch the wrong terminals.

https://truckmanualshub.com/



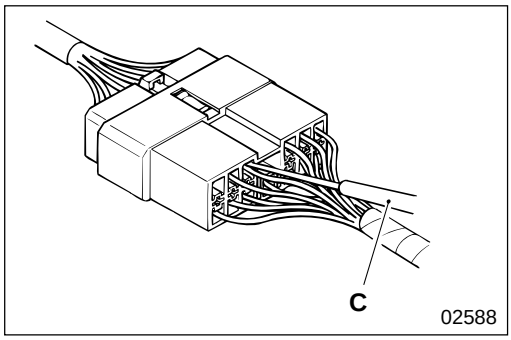
Measurement procedures using connectors

- **Test with connectors engaged (continuity through circuit obtained)**

  < Waterproof connector >

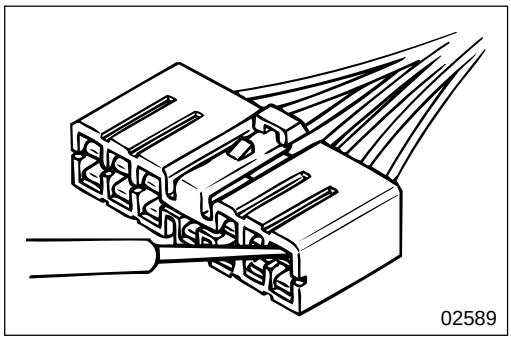
  Prepare a test harness and connectors **A**, then connect if between the two parts of harness **B** that is to be tested. Check the circuit by touching test probe **C** to the test connector.

  Never insert the test probe from the harness side of the waterproof connection, or waterproof performance might be diminished causing corrosion of the connector.



< Non-waterproof connector >

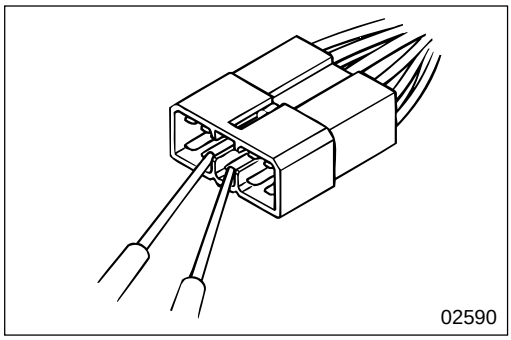
Insert test probe **C** from the harness side of the connector. Where control units, etc. have connectors that are too small to accept the test probe, do not force the test probe into them.



- **Test with connectors disengaged**

  Using female pins

  Insert a test probe into a terminal. However, do not force the probe into the terminal, or it will cause a poor contact.



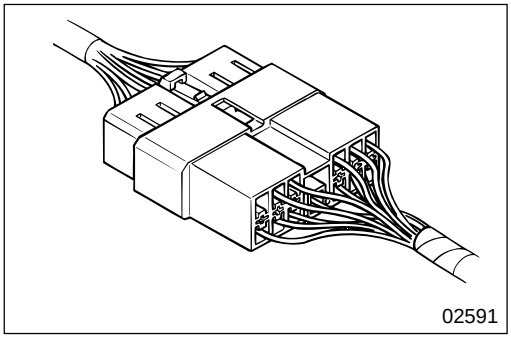
Using male pins

Touch the pins directly using test probes.

CAUTION⚠

Be sure that you do not short circuit the connector pins when you use the test probe because this could damage the internal circuit of the electronic control unit.

https://truckmanualshub.com/

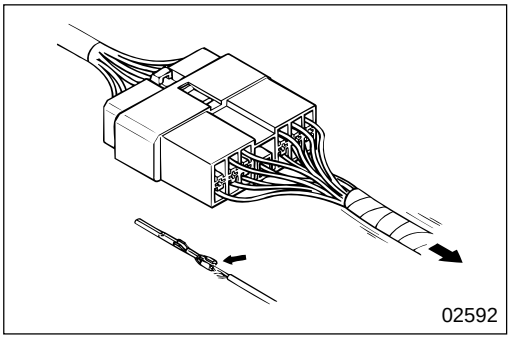


02591

Connector inspection procedures

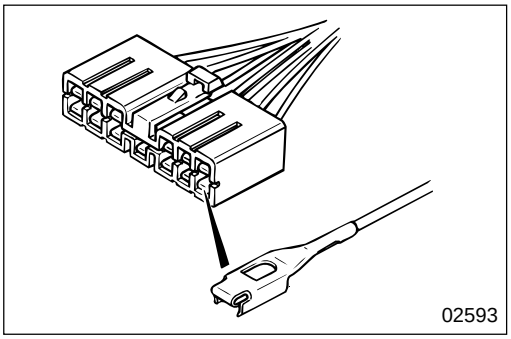
- **Visual inspection**

  Check for loose connection and poor engagement.



02592

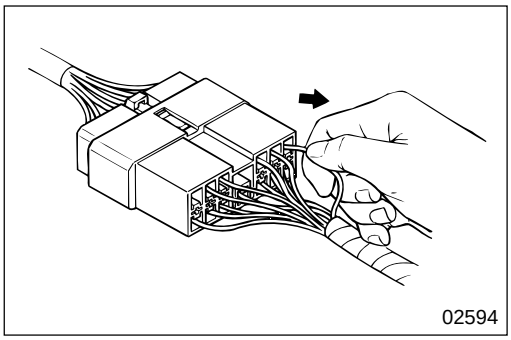
Check if harnesses are broken by pulling gently around the terminals.



02593

Check for a decrease in contact pressure between the male and female terminals.

Check for poor contact caused by connector pins having fallen out, rusted terminals or foreign particles.



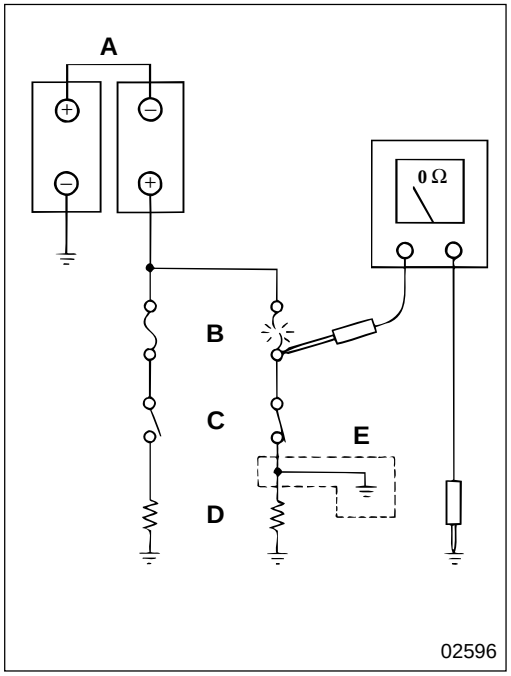
02594

- **Connector pin fall out inspection**

  Damaged connector pin stoppers can cause poor engagement of the terminals (male and female pins) even if the connector body is secured, and might cause some pins to fall out. Check if the pins have fallen out from the connector by pulling each harness gently.

https://truckmanualshub.com/

PRECAUTIONS FOR MAINTENANCE OPERATION



Inspection procedures for blown fuses

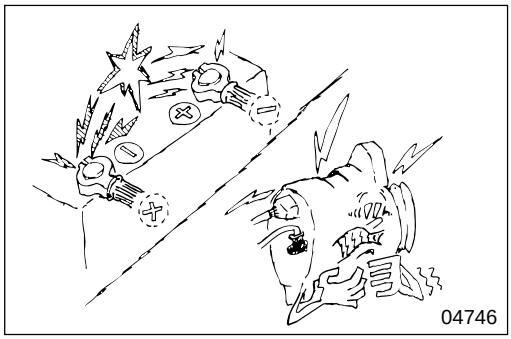
Remove fuse **B** and measure resistance between the loaded side of the fuse and ground.

Turn on all circuit switches (connected to the fuse). If the resistance value reading is approximately 0 Ω, a short has occurred between the switch and the loaded point. A value of other than zero may indicate that the fuse was blown by a temporary short but the short is no longer present.

The major causes of a short circuit are as follows:

- Harness stuck onto the vehicle body.
- Harness sheath damaged by friction or heat.
- Water in connectors or circuits.
- Mistakes (accidental short circuits)

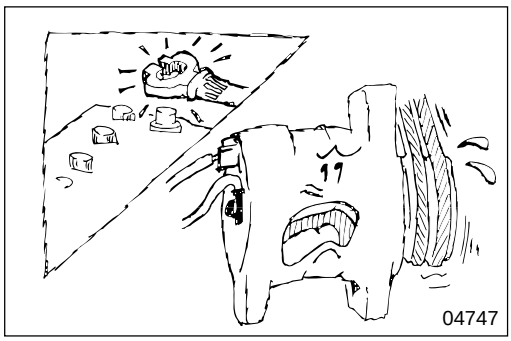
A : Battery
B : Fuse
C : Loaded switch
D : Load
E : Short circuit



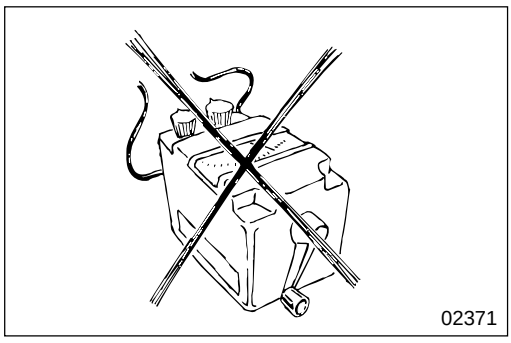
Precautions for handling alternator

When servicing the alternator, pay attention to the following :

- Do not connect the alternator with battery polarities reversed.
  If the alternator is connected with reversed polarities, a large current flow from the battery to the alternator occurs, and the diode or regulator might be damaged.

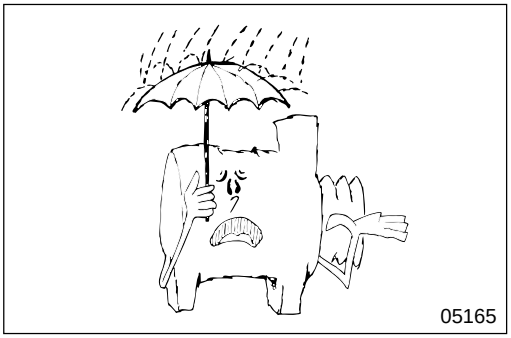


- While the engine is running, do not remove the battery terminals. If the battery terminals are removed at that time, a surge voltage is generated and the diode or regulator might be weakened.

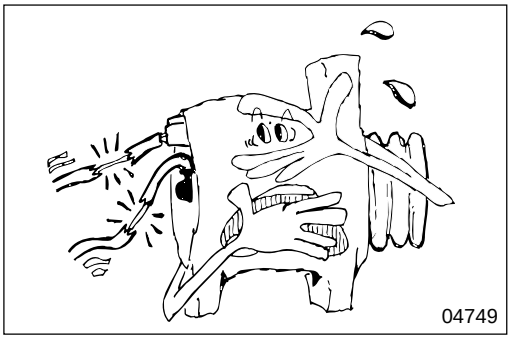


- Do not use a high-voltage tester such as a megger for inspection.
  If a high-voltage tester is used, the diode or regulator might be destroyed.

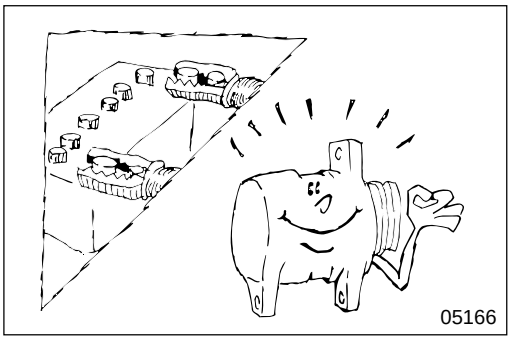
https://truckmanualshub.com/



- Do not splash water over the alternator.
  If water is directly splashed over the alternator, individual components will be short-circuited and might be destroyed.

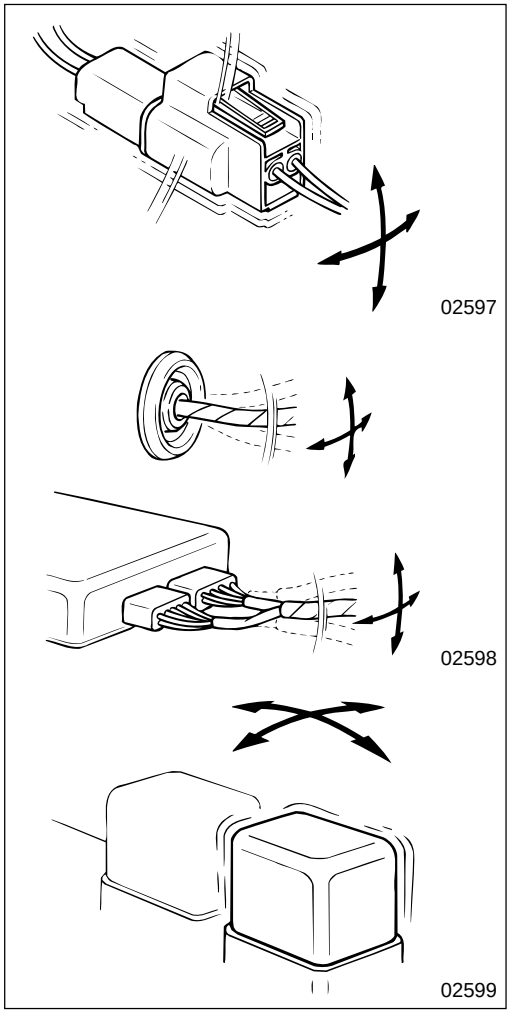


- Do not short-circuit terminal B and terminal L while running the alternator.
  If the terminals are short-circuited while the alternator is running, the diode trio might be destroyed.



- Disconnect the battery terminals before quick-charging the battery. Quick-charging without disconnecting the battery terminals might damage the diode or regulator.

https://truckmanualshub.com/



Measures for temporary faults

Temporary faults often occur under certain conditions. So identifying those conditions helps to find possible causes. To find the conditions under which temporary faults occurred, you need to reproduce the faults after interviewing customers in detail about actual driving conditions, weather, frequency of occurence and fault phenomena.
Then determine if the faults were caused by vibration, temperature or other possible elements depending on the actual conditions identified. If vibration is suspected as a possible cause, inspect individual connectors as follows to check if the fault will occur:

- Shake the connector gently in all four directions of the arrows as illustrated.
- Shake the wiring harness gently in all four directions of the arrows as illustrated.
- Wiggle each sensor or piece of equipment by hand.
- Gently shake the wiring harnesses near movable parts such as suspensions.

The inspection subjects include possible causes related to the diagnosis code outputs and faults, as well as the connectors and other parts in the inspection procedure.

MEMO

https://truckmanualshub.com/

TABLE OF STANDARD TIGHTENING TORQUES

- Use specified bolts and nuts and tighten them at specified torques according to the following table, unless otherwise specified.
- Threads and contact seats shall be dry.
- Where there is a difference in strength classification between the nut and bolt (or stud bolt), the torque specified for the bolt shall apply.

Hex-head Bolt and Stud Bolt

Unit : N·m {lbf.ft, kgf·m}

Strength classification	4 T		7 T		8 T

HOW TO READ THE MAINTENANCE SCHEDULE TABLES

Example Table :

Ⓔ : Exhaust emission items
Ⓝ : Noise control items

Inspection and maintenance (1)		Time of inspection and maintenance (2)								Working procedures (3)	Remarks (4)
		New vehicle at 4000 km/ 2500 miles	Inspection interval: Every 10000 km/ 6000 miles	Every 20000 km/ 12000 miles	Every 30000 km/ 18000 miles	Every 40000 km/ 24000 miles	Every 50000 km/ 30000 miles	Every 90000 km/ 54000 miles	Every 250000 km/ 150000 miles		
ENGINE											
1	Manifold bolts torque	×					×			Check inlet and exhaust manifold nuts for looseness	Gr 15
2	Ⓔ Check and adjust valve clearance	×					×			Check valve clearance with feeler gauge	Gr 11
3	Ⓔ Oil filter replacement	×	Every 10000 km/6000 miles or 12 months							Replace oil filter	Gr 12
4	Ⓔ Injection nozzle Ⓝ							×	×	Check and clean injection nozzle	Gr 13
5	Ⓔ Fuel Injection timing Ⓝ							×		Check fuel injection timing	Gr 13
6	Ⓔ		Every 40000 km/24000 miles or 24 months							Clean gauze filter inside co	
						km/12000 miles or 12 months				Rep	

(1) This column contains the maintenance and inspection items.
(2) The periods between inspection and service are based on the assumption that the vehicle will be driven approximately 60000 kilometers (36000 miles) per year.
Inspections which must be made are indicated by an "×" or by the appropriate period between servicing.
(3) This column provides a simplified explanation of the operational procedures involved for each inspection or maintenance item.
(4) The Gr. No. refers to the "group number" in this vehicle Service Manual. For visual checks and simple inspections, see the sections labelled "Working Procedures".

MAINTENANCE SCHEDULE TABLES

Ⓔ : Exhaust emission items
Ⓝ : Noise control items

Inspection and maintenance		Time of inspection and maintenance								Working procedures	Remarks
			Inspection interval								
		New vehicle at 4000 km/ 2500 miles	Every 10000 km/ 6000 miles	Every 20000 km/ 12000 miles	Every 30000 km/ 18000 miles	Every 40000 km/ 24000 miles	Every 50000 km/ 30000 miles	Every 90000 km/ 54000 miles	Every 250000 km/ 150000 miles		
FRONT AND REAR AXLE											
19	Wheel hub bearing				×					Check wheel hub bearing for play	Gr 26, 26B, 27
20	Wheel hub bearing hub seals replacement				×					Replace wheel hub bearing hub seals	Gr 26, 26B, 27
21	Wheel and tire		×							Check disc wheel for corrosion, deformation and cracks. Measure inflation pressure with tire gauge. Check tire tread and side wall for cracks and damage. Measure tire tread groove depth to make sure it is deep enough. Check tire tread for uneven wear, stepped wear and other abnormal wear. Rotate tires if there is a difference in the amount of wear of each tire	Gr 31
22	Retightening wheel nuts	×	×							Check wheel nuts for looseness. Check at the first 50 to 100 km/30 to 60 miles after changing a wheel	Gr 31
SUSPENSION SYSTEM											
23	Retightening U-bolts	×		×						Check U-bolt nuts for looseness. Check at the first 1000 km/600 miles after removing and retightening U-bolt nuts	Gr 33, 34
BRAKING SYSTEM											
24	Disc brake pad and disc		×							Check disc brake pad and disc for damage and wear	Gr 35
25	Brake lining		×							Check lining for wear through inspection hole	Gr 35
26	Brake drum				×					Disassemble and check drum for wear, cracks and damage	Gr 35
27	Looseness, play and damage of brake system parts		×							Inspect brake lines and hoses for looseness, play and damage. Inspect wheel cylinder and brake master cylinder for looseness, play and damage	Gr 35
STEERING SYSTEM											
28	Steering system		×							Check steering system for looseness, steering wheel play and operating condition. Inspect for fluid leakage, booster and oil pump function	Gr 37

https://truckmanualshub.com/

This section explains simple maintenance procedures. See the relevant Group in this manual for further details.

Replacement of Oil Filter

Lubricant

Location	Points of application	Specified lubricant	Quantity
2	Inside oil filter	Engine oil	Approximately 1 L {1.1 qts}
	Gasket area of oil filter with thin application	Engine oil	As required

Special tools

Unit : mm {in.}

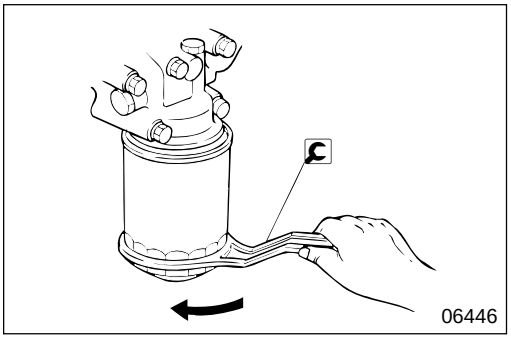
Location	Tool name and shape	Part No.	Application
2	Oil filter wrench  06478	MH061587	Removal of oil filter

WARNING

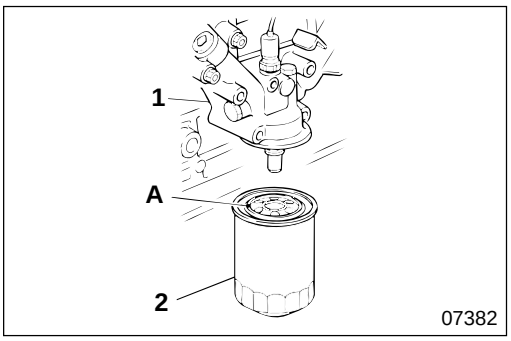
- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**

CAUTION

- **Take care not to spill engine oil on the V-belts, because this would cause them to slip, reducing service life.**



[Removal]



[Installation]

- Clean the surface of oil cooler body **1** that makes contact with oil filter **2**.
- Apply engine oil thinly and evenly to gasket area **A** of oil filter **2**.
- Screw oil filter **2** into oil cooler body **1** until gasket area **A** sits on the body. From this position, tighten further by rotating by three quarters of a turn.
- After installation, run the engine and check that there is no oil leakage from gasket area **A**.
- Check the oil level and if it is low, top it up.

https://truckmanualshub.com/

Replacement of Fuel Filter

Lubricant

Location	Points of application	Specified lubricant	Quantity
2	Gasket contact surfaces of fuel filter and fuel filter head	Engine oil	As required

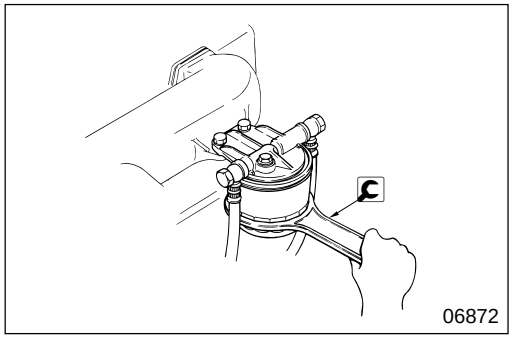
Special tools

Unit : mm {in.}

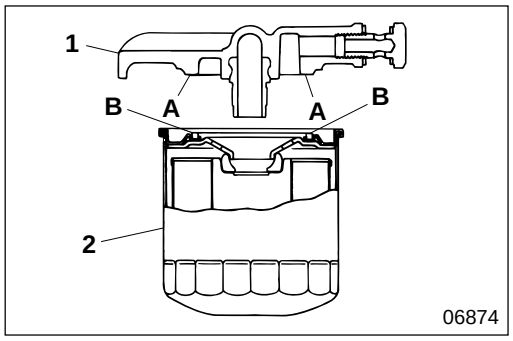
Location	Tool name and shape	Part No.	Application
2	Filter wrench  01882	MH061509	Removal of fuel filter

WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any diesel fuel that has been spilled because it can cause a fire.**
- **Do not use an unsuitable filter because it can cause a fire.**



[Removal]



[Installation]

- Install by tightening three quarters to one full turn after contact surface **A** of fuel filter head **1** makes contact with gasket **B** of fuel filter **2**. Be sure to tighten by hand.
- After installation, run the engine and check for fuel leakage.

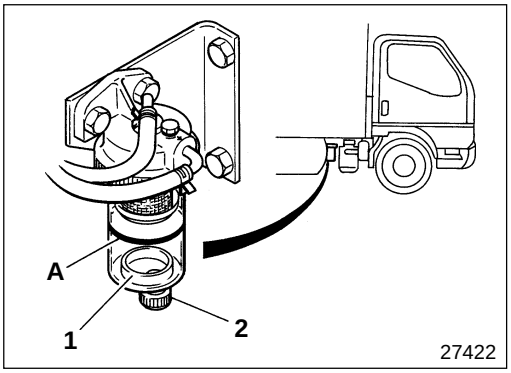
https://truckmanualshub.com/

Draining of Water Separator Condensation

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Drain plug	3 to 4 {2.2 to 2.9, 0.3 to 0.4}	—



Visually inspect the water separator before driving.
When level ring **1** reaches red line **A**, drain the condensation as follows:

- Loosen drain plug **2** and drain out the condensation.
- When level ring **1** has dropped to the bottom, tighten drain plug **2**.
- Carefully wipe the water separator and the surrounding area.
- Check for fuel leakage.

Cleaning of Fuel Feed Pump Gauze Filter

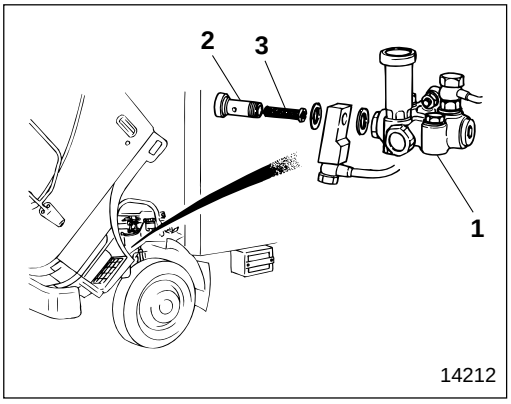
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Eye bolt	25 to 29 {18 to 22, 2.5 to 3}	—

WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any diesel fuel that has been spilled because it can cause a fire.**



- Remove eye bolt **2** on the inlet side of fuel feed pump **1**.
- Remove gauze filter **3** from eye bolt **2**.
- Clean gauze filter **3** with diesel fuel .
- Follow the removal sequence in reverse and reinstall gauze filter **3**. Install eye bolt **2** in the fuel feed pump.
- Bleed the air from the fuel line.
- Start the engine and check for fuel leakage.

https://truckmanualshub.com/

Bleeding of Air from Fuel Line

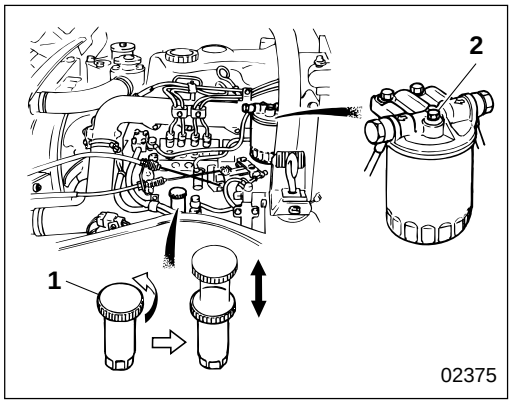
Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Air vent plug	7.8 to 12 {5.8 to 8.7, 0.8 to 1.2}	—

WARNING ⚠

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any diesel fuel that has been spilled because it can cause a fire.**



- Turn the top of priming pump **1** of the injection pump counterclockwise and pull it up so the top protrudes.
- Loosen air vent plug **2** of the fuel filter and move the top part of priming pump **1** up and down.
- Move priming pump **1** up and down repeatedly until air bubbles are no longer present in the fuel drained from air vent plug **2**.
- When the fuel being drained is free of air bubbles, tighten air vent plug **2**.
- After moving priming pump **1** up and down another five or six times, push the top down and turn clockwise to drive it in fully.
- After bleeding the air, carefully wipe up spilled fuel and start the engine.
- Check for fuel leakage.

https://truckmanualshub.com/

Adjustment of V-Belt Tension

Newly installed V-belts can stretch during their initial running-in period. To prevent this from becoming a problem, run the engine for several minutes after installing the V-belt, then readjust. Perform this cycle several times.

WARNING⚠

You must take special precautions to prevent the engine from rotating while a V-belt is being inspected or adjusted.

CAUTION⚠

- **Make sure that you turn off the engine before attempting to inspect or adjust the V-belts.**
- **Make sure that you fasten all bolts and nuts securely after adjusting the V-belts. Remember that too much tension can damage the V-belts and bearings.**
- **Do not grease V-belts. This causes them to slip, which reduce service life.**

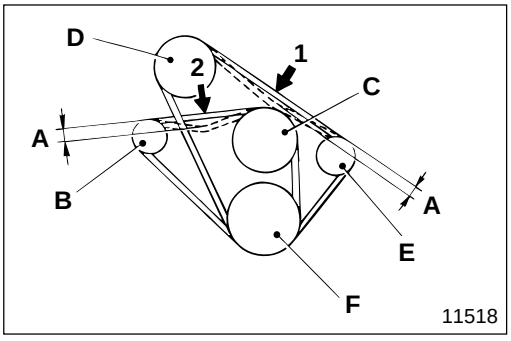
Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1, 2	V-belt tension (Each one)	Fan	12 to 16 {0.47 to 0.63}	—	Adjust
		Air-conditioner	16 to 20 {0.63 to 0.79}		

Special tools

Location	Tool name and shape	Part No.	Application
1, 2	Belt tension gauge 03612	MH062345	Measurement of tension of V-belt

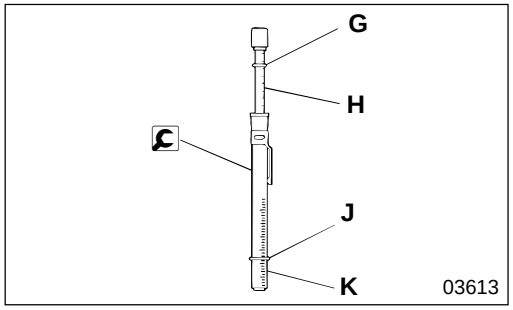


[Inspection]

Measure the extent of flex **A** when the center of V-belts **1**, **2** as illustrated is depressed with a force of 98 N {22 lbf, 10 kgf}.

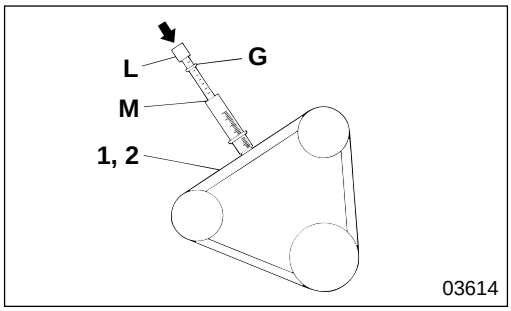
- **B** : Alternator pulley
- **C** : Water pump pulley
- **D** : Cooler compressor pulley (Air-conditioner)
- **E** : Tension pulley
- **F** : Crankshaft pulley

https://truckmanualshub.com/

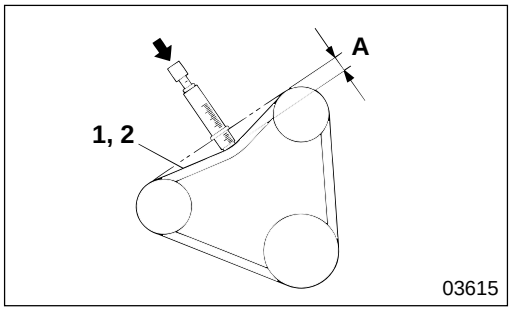


Use of special tool belt tension gauge

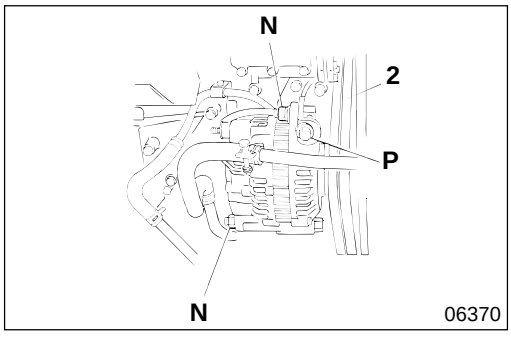
- Set upper O-ring **G** of 🔧 belt tension gauge to 98 N {22 lbf, 10 kgf} (push load) on graduation **H**.
- Set lower O-ring **J** of 🔧 belt tension gauge to graduation **K** (maximum flex of belt).



- Place 🔧 belt tension gauge at the center of V-belts **1**, **2** perpendicularly as illustrated and push top **L** all the way down until upper O-ring **G** hits upper edge **M**.



- Measure the extent of flex **A** of V-belts **1**, **2** at this point, and if the measured value deviates from the standard value, adjust as follows:



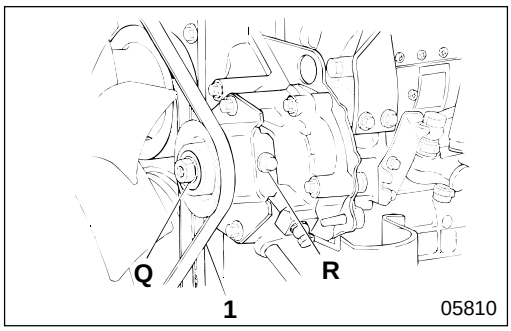
[Adjustment]

(1) Adjustment of tension of V-belt for fan

- Loosen alternator mounting bolts **N** (two points), and adjust the tension of V-belts **2** by moving adjusting bolt **P**.
- After adjustment, tighten bolts **N**, **P** securely.

CAUTION⚠

- **Bear in mind that excessive tension of V-belts 2 might damage the belts and bearings that engage with the V-belts.**
- **Be sure to replace V-belts 2 as a set to maintain even tension between them.**
- **Be careful not to let oil stick to V-belts 2. If oil gets onto the belts, it causes slipping, resulting in overheating and insufficient battery charging.**



(2) Adjustment of tension of V-belt for air-conditioner

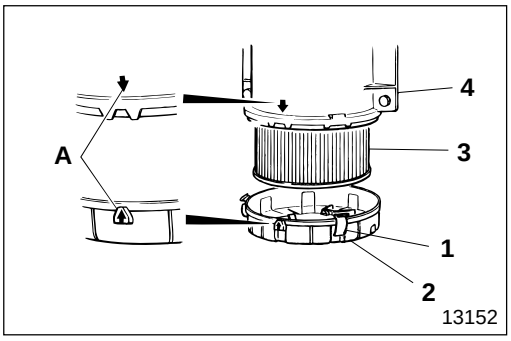
- Loosen tension pulley mounting nut **Q**, and adjust the tension of V-belt **1** moving adjusting bolt **R**.
- After adjustment, tighten mounting nut **Q** securely.

CAUTION⚠

- **Bear in mind that excessive tension of V-belt 1 might damage the belt and bearings that engage with the V-belt.**
- **Be careful not to let oil stick to V-belt 1. If oil gets onto the belt, it causes slipping, resulting in poor performance of the air conditioner.**

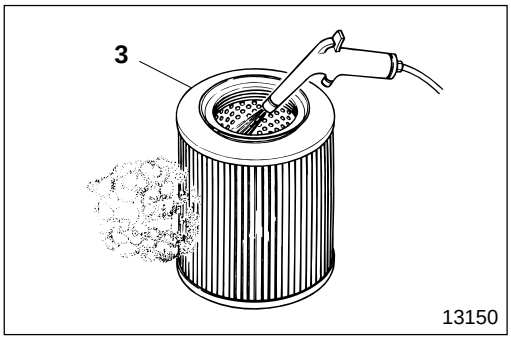
https://truckmanualshub.com/

Cleaning and Replacement of Air Cleaner Element



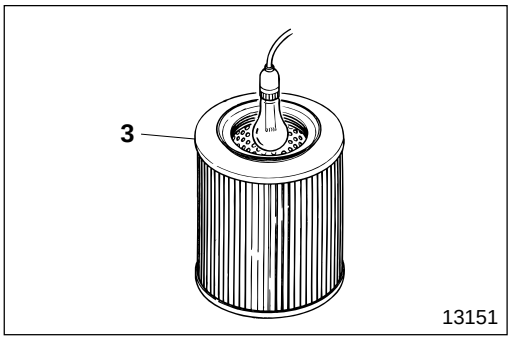
[Removal]
- Unfasten clamp **1** and remove air cleaner cap **2**.
- Remove air cleaner element **3**.

[Installation]
- Install by aligning alignment marks **A** of air cleaner cap case **4** and air cleaner cap **2**.



[Cleaning]
- Blow compressed air of 685 kPa {100 lbf/in^2, 7 kgf/cm^2} or less through air cleaner element **3** from the inside.
- When using compressed air, move the blower's nozzle up and down along the pleats of air cleaner element **3** evenly.

CAUTION⚠
- **Do not tap or hit air cleaner element 3 to remove dust.**
- **Do not blow compressed air through air cleaner element 3 from the outside.**



[Inspection]
- Illuminate the inside of air cleaner element **3**.
- If parts of the filter paper are torn or thin, or if the packing of the upper surface of air cleaner element **3** is damaged, replace the air cleaner element.

NOTE

If the dust on air cleaner element 3 is wet due to oil smoke or soot, replace the air cleaner regardless of the scheduled replacement interval.

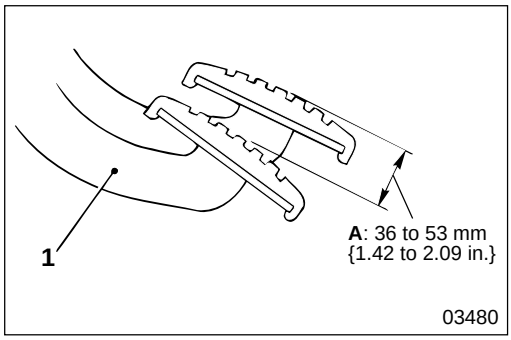
https://truckmanualshub.com/

Inspection of Clutch Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	Clutch pedal free play	36 to 53 {1.42 to 2.09}	—	Adjust or replace



[Confirmation]
Push clutch pedal **1** with your hand and measure the amount of movement **A** (free play) until you meet resistance. If the measured value does not conform to the standard value, adjust stroke of clutch power cylinder push rod or replace the clutch disc.

[Clutch operation]
- Check for unusual noises when clutch pedal **1** is pressed while the engine is idling, and also for abnormally heavy clutch operation. Also check to be certain that it is not difficult to shift the vehicle into first and reverse gears.
- Gradually release clutch pedal **1** to set the vehicle in motion.
  Check to be sure there is no slippage, and that the clutch engages smoothly.

https://truckmanualshub.com/

Tire

Service standards

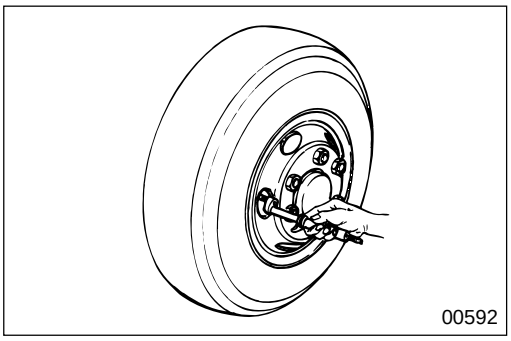
Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	Depth of tire tread grooves	—	1.6 {0.063}	Replace

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Wheel nut	490±49 {360±36, 50±5}	—



00592

Air pressure

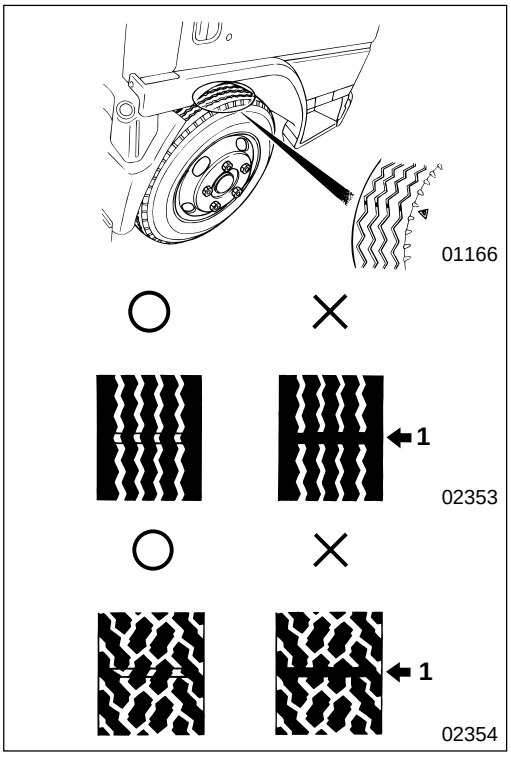
Tire air pressure should be checked before the vehicle is driven, while the tires are still cool.

Item / Vehicle model	Tire size	Air pressure kPa {Psi, kgf/cm²}	
		Front	Rear
FE639 (GVWR : 11600 lb, 5260 kg)	215/85R16(D)	450 {65, 4.50}	450 {65, 4.50}
FE639 (GVWR : 13500 lb, 6120 kg)	215/85R16(E)	550 {80, 5.50}	550 {80, 5.50}
FE649 (GVWR : 14500 lb, 6580 kg)	215/85R16(E)	550 {80, 5.50}	550 {80, 5.50}
FG639 (GVWR : 11000 lb, 5000 kg)	7.50R16(E)	550 {80, 5.50}	550 {80, 5.50}

GVWR : Gross vehicle weight rating

CAUTION

- **Make certain that there is no difference in the air pressure between the inner and outer rear tires.**
- **Make certain you use valve caps on the air valves.**
- **It is not necessary to increase the air pressure for high-speed driving.**



01166
02353
02354

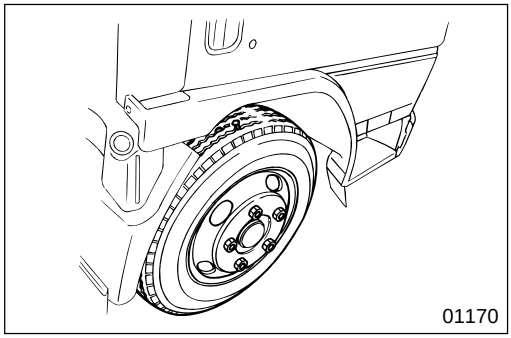
Checking tread depth

- Check all around the tire treads to make sure that the depth of the tread grooves is above the wear limit.
- If the tread grooves are not deep enough, slip sign **A** appears at the position of the △ mark, where the tread groove has worn away.

WARNING

If the depth of the tread grooves is not adequate, the tires will slip on wet roads and present a hazard. Such tires are also extremely dangerous because they are more susceptible to hydroplaning when the vehicle is running at high speeds in the rain. Such tires must be replaced with new ones as soon as possible.

https://truckmanualshub.com/



Checking for cracks, damage, and objects embedded in the treads

- Check the tire treads and walls for cracks and damage.
- Check tire treads for uneven wear or other abnormal wear.
- Check if metal objects or nails have penetrated the tires.
- Check for stones embedded between double tires.

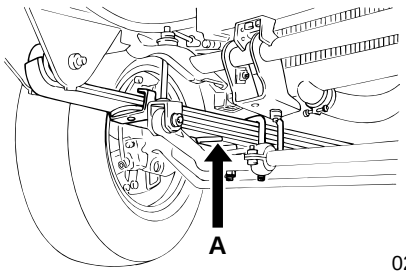
WARNING

Badly damaged or worn tires are extremely dangerous, because they can be punctured more easily when the vehicle is running, they must be replaced with new ones as soon as possible.

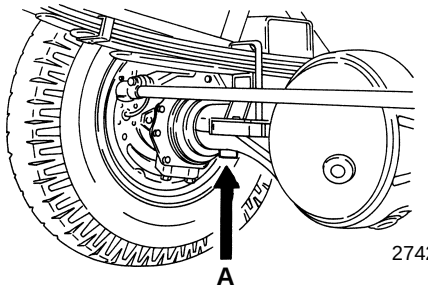
Removing tires

- Jacking up point
  - For FE front wheels : Point **A** under the leaf spring in front of the front axle
  - For FG front wheels : Point **A** under the front axle housing
  - For rear wheels : Point **B** under the rear axle housing

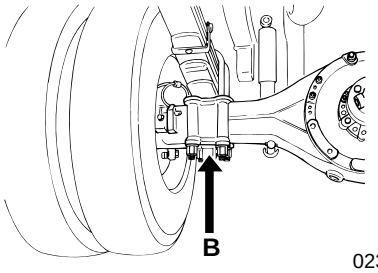
< FE Front wheel >



< FG Front wheel >



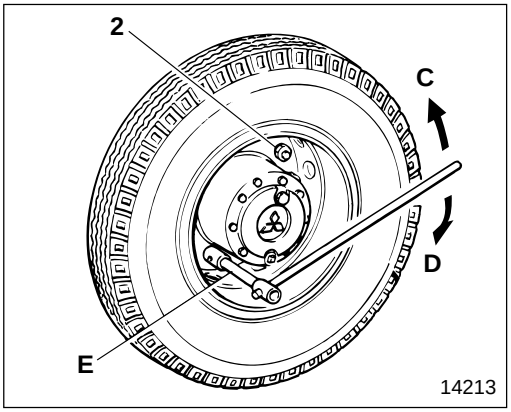
< Rear wheel >



WARNING

- **The jack should be placed on flat, solid ground, and should not be used to raise the vehicle higher than necessary.**
- **Do not use the jack at vehicle locations other than those illustrated.**
- **Keep in mind the danger of a slipping jack. Never crawl under the vehicle while the jack is in use or rock the vehicle. Also, do not start the engine while the vehicle is jacked up.**
- **To increase safety, use rigid racks for the vehicle when it is necessary to leave it jacked up for long periods.**
- **Chock both the tire to be removed and the tire diagonally opposite to it so that they will not rotate when you are removing the tire.**

https://truckmanualshub.com/



- Loosen wheel nuts **2** slightly. The wheel nuts for right tires **C** have right-hand threads "**R**", and the wheel nuts for left tires **D** have left-hand threads "**L**".

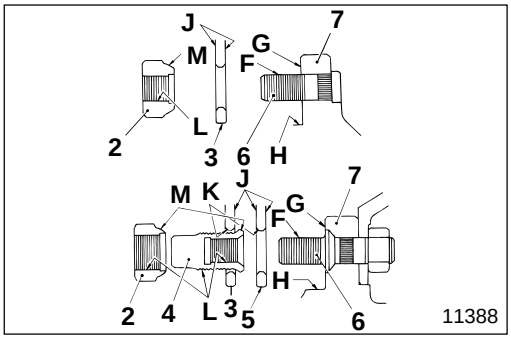
WARNING

Make certain that wheel nut wrench E is fully engaged, all the way to the back of nuts 2. If it is not, it could slip.

CAUTION

Only loosen wheel nuts 2 slightly. Do not remove them.

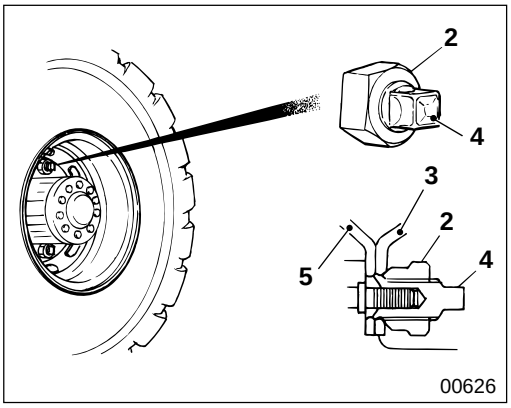
- Jack up the vehicle carefully, until the tire is slightly off the ground. Remove wheel nuts **2**, then remove the tire.
- When working on the double tires at the rear of the vehicle, first remove the outside tire, then lower the vehicle and loosen the nuts on the inside tire. After doing this, jack the vehicle back up and remove the tire.



Mounting tires

To prevent wheel nuts **2**, **4** and hub bolt **6** from becoming loose and to prevent mounted parts (tire assemblies **3**, **5** and hub **7**) from being damaged, remove rust, dust, additional coatings of paint, and foreign particles from the following areas:

F : Hub bolt thread area
G : Wheel mounting surface of hub
H : Wheel alignment area of hub
J : Disc wheel mating surface
K : Disc wheel nut mounting surface
L : Wheel nut thread area
M : Wheel nut spherical area



- Put on the double rear tires as follows:
  - After mounting inner tire **5** and fully tightening inner wheel nuts **4**, jack the vehicle up and mount on outer tire **3**, then tighten outer wheel nuts **2**.
  - Even if only outside tire **3** is to be changed, do not mount it until inner wheel nuts **4** have been fastened at the specified torque.
  - Slide the air valves on the inside and outside tires down when mounting the tires.

WARNING

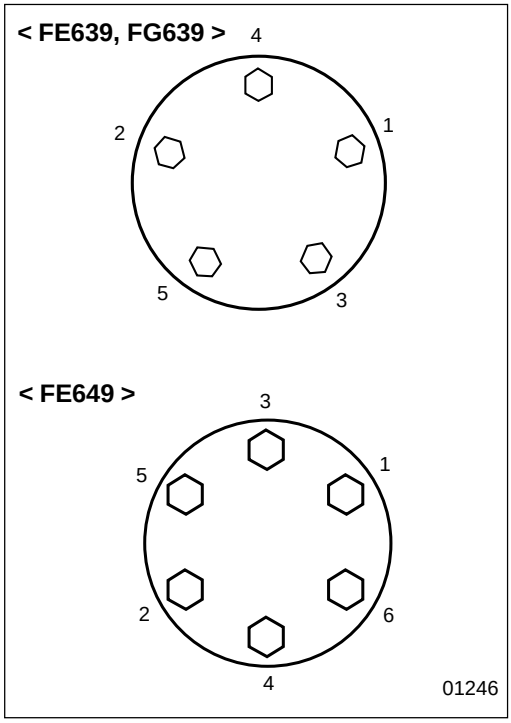
If the threads are scored, or the disc wheel is deformed or cracked, change bolts 6, nuts 2, 4 and disc. Driving the truck before correcting such problems can cause the tire in question to come loose, which could be the source of major accidents.

CAUTION

Check hub bolt 6 threads carefully for scratches before putting the tire on.

- Place the tapered end of wheel nuts **2**, **4** towards the disc wheel and fasten temporarily. Center so that there is no eccentricity between bolts **6** and the disc wheel bolt holes.
- Lower the vehicle.

https://truckmanualshub.com/



- Tighten the nuts in the order as illustrated, tightening each nut two or three times. To finish, tighten each nut at the specified torque.

WARNING

- **Always use the specified torque when tightening the wheel nuts. If the wheel nuts are not tightened properly, the wheels could come loose while the vehicle is being driven, which could result in life threatening accidents or the truck being disabled.**
- **Do not coat the threads with grease when tightening the nuts. This could result in over-tightening force, which could be dangerous.**

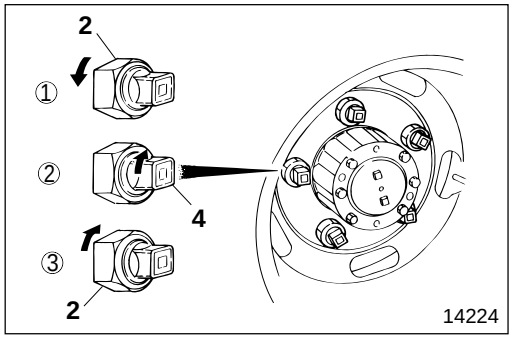
CAUTION

Over-tightening the wheel nuts can damage them.

Checking the wheel nuts for looseness

The wheel nuts should be checked for looseness every 10000 km (6000 miles). All nuts should be tightened at the specified torque.

- Check the double rear tires for looseness as follows:



① Loosen outer wheel nuts **2**.
② Tighten inner wheel nuts **4** at specified torque.
③ Tighten outer wheel nuts **2** at specified torque.

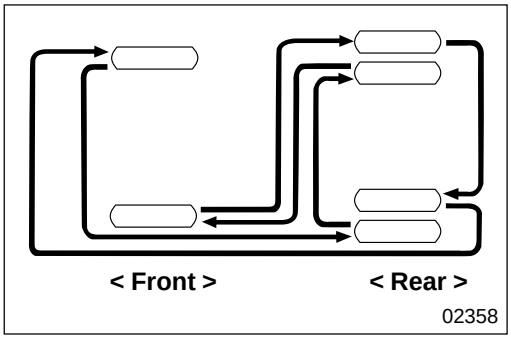
CAUTION

If outer wheel nuts 2 are tightened without first being loosened, it might not be possible to tighten them at the specified torque.

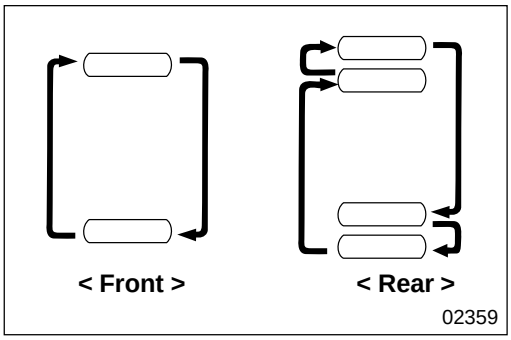
https://truckmanualshub.com/

Tire rotation

Tires wear differently, according to the location where they are mounted. To make this wear uniform and prolong the life of your tires, they should be rotated every 10000 km (6000 miles) in the rotation order shown below:



- When the tread patterns for all tires are identical:



- When the tread patterns are different for the front and rear tires:

CAUTION⚠

- **Always adjust air pressure after running-in new tires.**
- **When using tires of different tread patterns, use rib-type patterns for the front tires and traction type patterns for the rear tires.**
- **Avoid using both radial and biased tires on the same vehicle.**

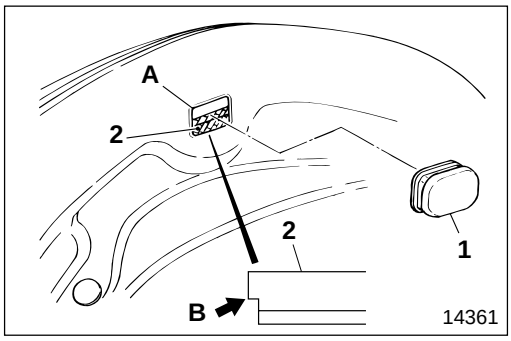
https://truckmanualshub.com/

Inspection of Brake Lining Thickness < Drum Brake Only >

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2	Thickness of brake lining	—	4 {0.16} (Side shoulder means wear limit)	Replace



NOTE

Be sure to inspect at two points for each wheel per side.

- Remove cover **1** from the packing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall cover **1**.

Battery

DANGER⚠

- **Since flammable hydrogen gas is generated by the battery, be sure to obey the following warnings :**
  - **Do not short-circuit the ⊕ and ⊖ terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over the battery.**
- **Because the battery electrolyte is diluted sulfuric acid and is corrosive, when handling the battery wear safety glasses and rubber gloves to protect the eyes and hands.**

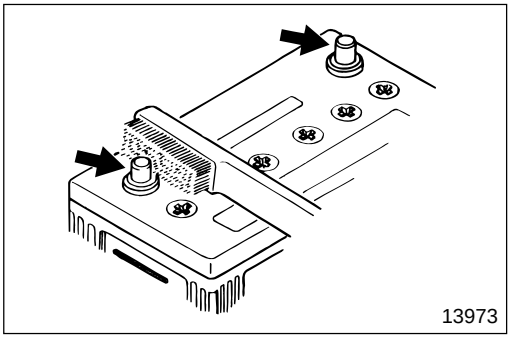
WARNING⚠

To prevent a short-circuit be sure that disconnected the battery cables do not accidentally touch the battery terminals.

CAUTION⚠

- **Make sure that you disconnect the battery cable ⊖ first when you disconnect the battery cables.**
- **Make sure that all electrical switches of the vehicle are OFF before connecting the battery cables.**
- **Make sure that you connect the battery cable ⊕ before you connect the battery cable ⊖.**

https://truckmanualshub.com/



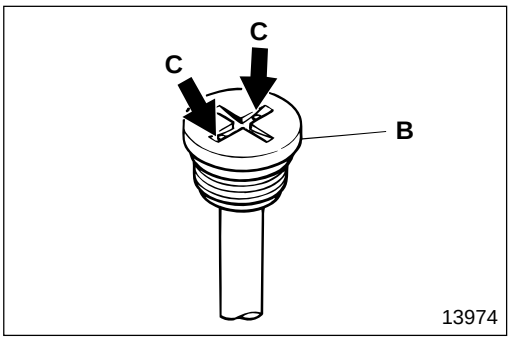
13973

Visual inspection

- If terminal **A** is corroded, scrub off the corrosion from it using a wire brush.
- If cracks or defects are found on the battery, replace it since the cracks or defects can cause liquid spills.

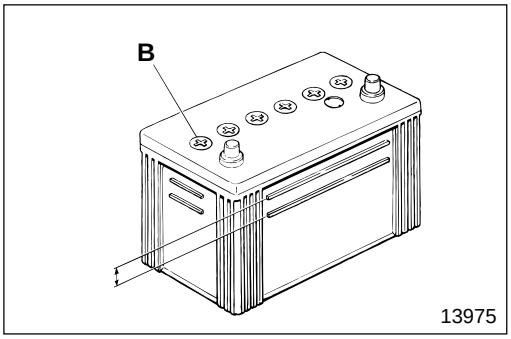
CAUTION⚠

Make sure you grease the ⊕ side of terminal A because it is easily corroded.



13974

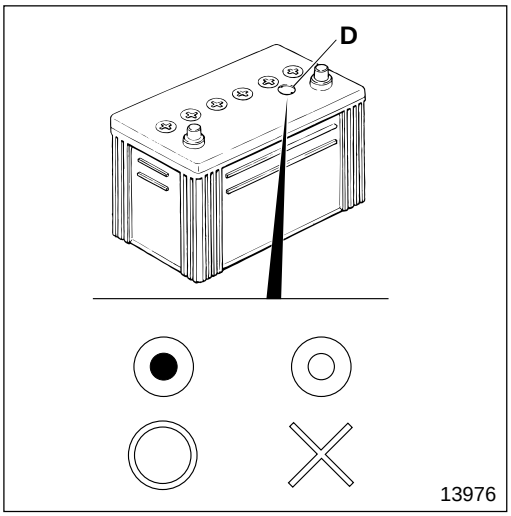
- If bleed hole **C** of vent plug **B** is clogged, clean the hole.



13975

Inspection of fluid level

- Make sure that the battery electrolyte level is between UPPER and LOWER.
- If the level is below LOWER, remove vent plug **B** and fill the battery with distilled water or battery replenisher to UPPER.



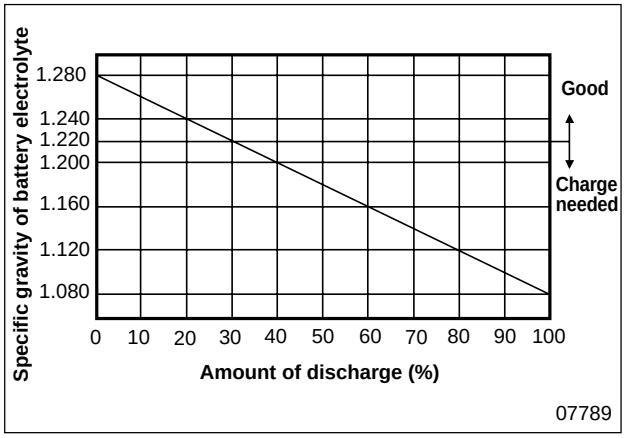
13976

Measurement of specific gravity

You can tell the specific gravity of the battery electrolyte by the color shown in indicator **D**.

Blue : Good
White : Charge or replace

https://truckmanualshub.com/



Charging

- Although, as a rule, charging of the battery should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect the battery cable ⊖.
- Remove vent plug **B** before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity / 10	*Amount of discharge (Ah) / Charge current (A) ×1.2(to 1.5)	45 {113}
Quick charge	Value of 5-hour rating capacity / 1.5	0.5	55 {131}

* Amount of discharge (Ah)=5-hour rating capacity (Ah)× Amount of discharge (%) / 100

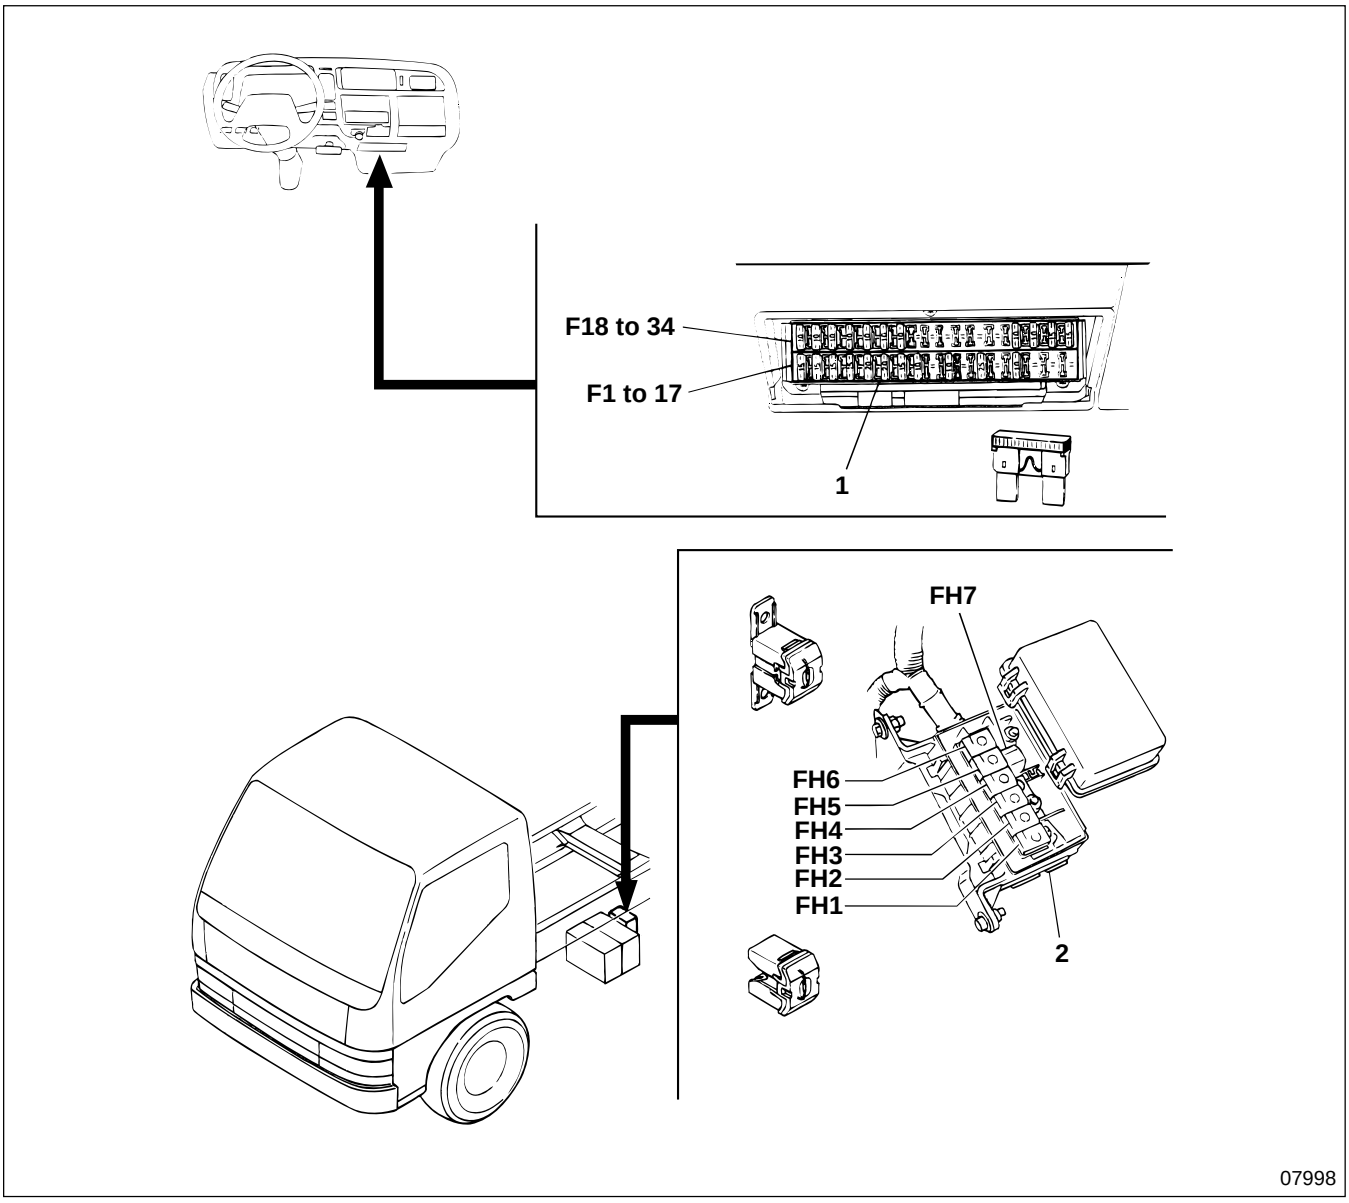
- Use the graph shown on the left to calculate the amount of discharge (%).
- If electrolyte level is low add distilled water to raise level.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep unprotected lights away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because its dangerous.**
- **After charging the battery, tighten vent plug B, wash away sulfuric acid from the battery using water, and dry the surface.**

https://truckmanualshub.com/

Fuse



1 Fuse box
2 High-current fuse box

CAUTION⚠

- **If a fuse blows, make sure you identify and remedy the cause, then replace the fuse.**
- **Make sure that you replace the fuse with one having the same rating.**
- **Make sure that you remove the ⊖ terminal of the battery cable before removing high-current fuses FH1 to 7.**

https://truckmanualshub.com/

High-current fuse box

Fuse No.	Main load	Capacity
FH1	Fuse box (F1 to F4)	50 A
FH2	Fuse box (F5 to F8)	50 A
FH3	—	—
FH4	—	—
FH5	Starter switch (Terminal B)	50 A
FH6	Fuse box (F31 to F34)	50 A

LUBRICATION

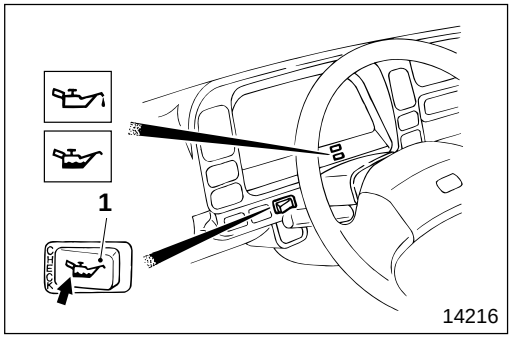
Engine Oil

Tightening torque

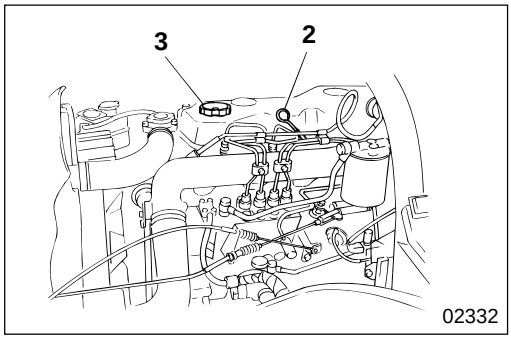
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Oil pan drain plug	34 to 39 {25 to 29, 3.5 to 4.0}	—

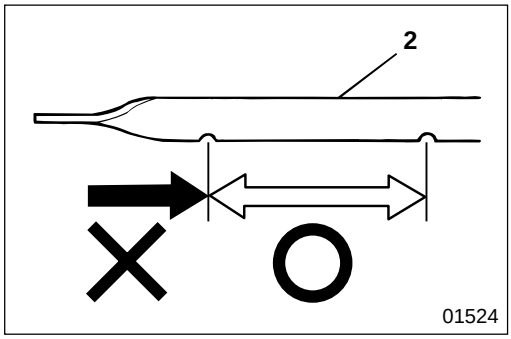


[Inspection]
There are two methods for inspecting the engine oil level; using oil level check switch **1**, and using dipstick **2**. Inspection using the oil level check switch is a simple inspection method. For a more accurate inspection use the dipstick.

- Inspection using oil level check switch **1** (simple inspection)
  - Press oil level check switch **1** before starting the engine. Check the oil level using the illuminated lamp.
    lamp (green) : Correct oil level
    lamp (red) : Low oil level
  - If the level is low, fill to correct level.



- Inspection using dipstick **2**
  - Tilt the cab.
  - Pull out dipstick **2**, wipe off the oil with a cloth.
  - Reinsert dipstick **2**, then pull it out carefully.
  - Oil level is correct if there is oil sticking to the dipstick between the two notches.
  - If the level is low, fill to correct level.



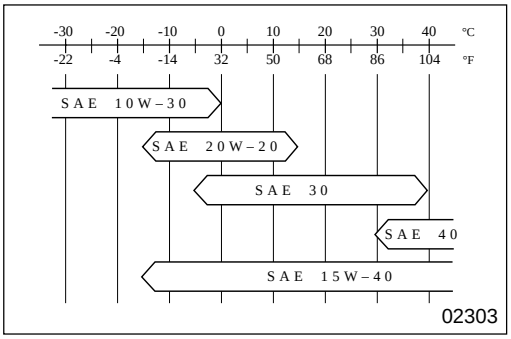
https://truckmanualshub.com/

[Replenishment]
- Clean the area surrounding oil filler cap **3** and prevent dust from entering through the filler.
- Remove oil filler cap **3** and top up with engine oil.
- Wait five minutes before checking the oil level.
- Replace filler cap **3**.

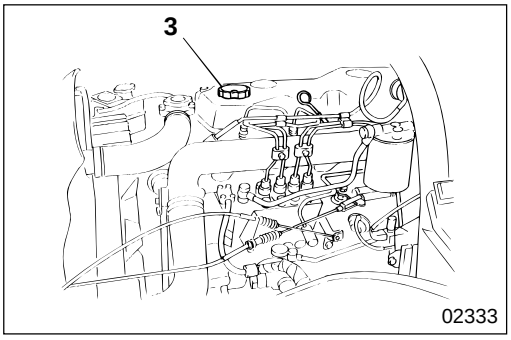
WARNING
- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot as it will burn you.**

CAUTION

Take care not to spill engine oil on the V-belts, because this would cause them to slip, reducing service life.



[Replacement]
Since engine oil greatly influences the performance, the life expectancy, and the ability to start the engine, use only oil of the specified grade and viscosity.
The chart illustrates the relationship between oil viscosity and the ambient air temperature.



- Clean the area surrounding oil filler cap **3** and prevent dust from entering through the filler.
- Remove oil filler cap **3**.
- Remove oil pan drain plug **4**, and drain the oil. At the same time replace the oil filter.
- After reinstalling drain plug **4**, slowly add engine oil through the oil filler.
- Using the dipstick, check the oil level after more than five minutes have passed.
- Start the engine and let it idle. When the oil has reached all parts, stop the engine. Let 30 minutes pass before checking the oil level again.

LUBRICATION

Manual Transmission Gear Oil

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

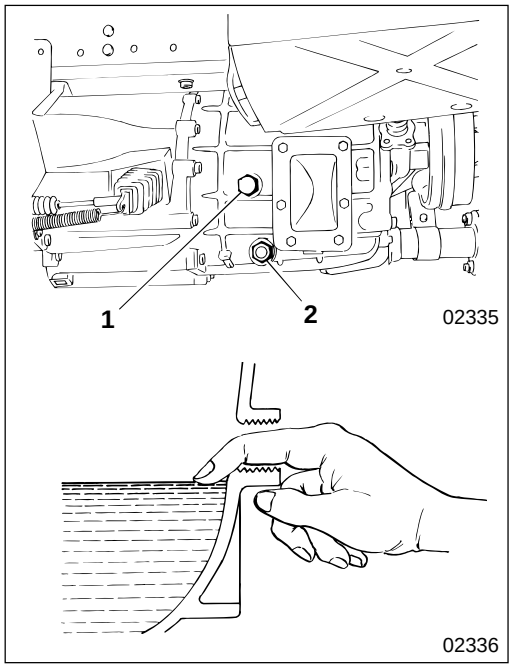
Location	Parts to be tightened	Tightening torque	Remarks
1	Inspection plug	69±15 {51±11, 7±1.5}	—
2	Drain plug	69±15 {51±11, 7±1.5}	—

Sealant

Location	Points of application	Specified sealant	Quantity
1	Thread area of inspection plug	THREEBOND 1105D	As required
2	Thread area of drain plug	THREEBOND 1105D	As required

WARNING

The engine is hot immediately after the vehicle has stopped, so take care not to burn yourself.



[Inspection and replenishment]

- Remove inspection plug **1** and check whether the oil level is up to the edge of the entrance.
- If the level is low, add oil through the inspection plug hole until the level comes up to the edge of the entrance.

[Replacement]

- Drain the oil after removing inspection plug **1** and drain plug **2**.
- Remove any metal particles sticking to the magnetic part of drain plug **2** before reinstalling the plug.
- Add oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Insert inspection plug **1**.

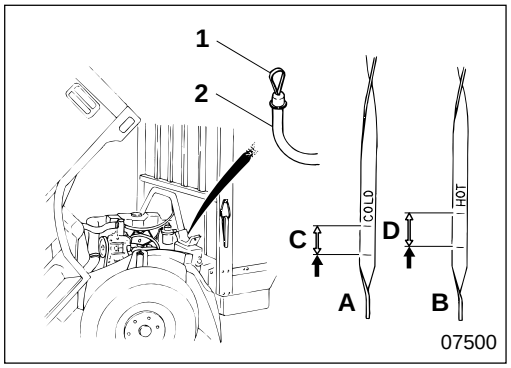
LUBRICATION

Automatic Transmission Fluid

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Drain plug	29 to 39 {22 to 29, 3 to 4}	—



[Inspection and replenishment]

- Park the vehicle on level ground, make sure that the parking brake is fully activated and chock the wheels to keep them from rolling.
- Start the engine and let it idle. To fill the hydraulic circuit with automatic transmission fluid, slowly shift the range selector lever once through the P to L ranges and finally shift into the N range.
- While the engine is still idling, pull out dipstick **1** and wipe off the fluid sticking to it. Reinsert the dipstick, then pull it out again and check the fluid level.
- If the fluid level is inspected right after the engine is started and the fluid temperature is still low (40±15°C {104±27°F}) the level should be within area **C** marked COLD on dipstick **1** as illustrated in **A**.
- If the fluid level is inspected after the vehicle has been driven and the fluid temperature is high (65±15°C {149±27°F}) the level should be within area **D** marked HOT on dipstick **1** as illustrated in **B**.

WARNING ⚠

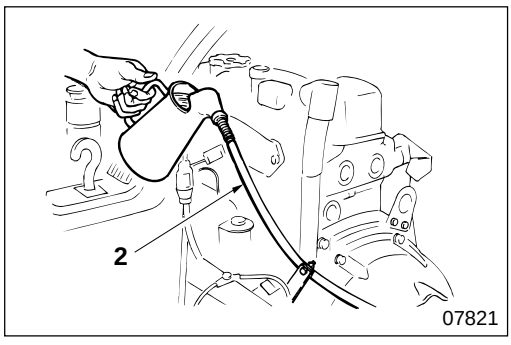
Take care during the inspection because the engine will be running. Take sufficient care to avoid burns or injuries resulting from contact with moving parts.

CAUTION ⚠

Be sure to wipe off the dust from the safety cap and the upper part of filler tube 2 before you pull out dipstick 1.

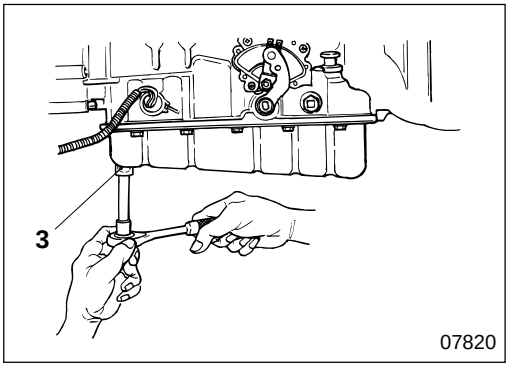
NOTE

- **Make sure the vehicle is parked on level ground when you are checking the fluid level.**
- **Make sure the range selector lever is in the N range and the engine is idling when you are checking the fluid level. When the engine is at standstill, the fluid level appears higher than it actually is.**
- **To ensure the fluid is correct, reinspect the fluid level after an actual drive.**



- If the fluid level is low, top it up to the specified level by supplying automatic transmission fluid (DEXRON II type) through filler tube **2**.

https://truckmanualshub.com/



[Replacement]

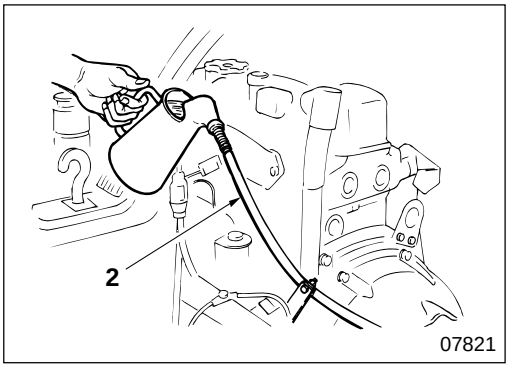
- Place a container under the oil pan, remove drain plug **3** in the front of the oil pan and drain the fluid.

WARNING

Take care because the automatic transmission fluid temperature immediately after the engine has stopped is very high. To avoid scalds, wait until a safe temperature has been reached before draining the fluid.

NOTE

- **The fluid will drain faster if the engine is first run to raise the fluid temperature.**
- **The fluid cannot be drained from the hydraulic circuit, the torque converter or the oil cooler.**



- Reinstall the gasket, and oil pan drain plug **3**.
- Add automatic transmission fluid (DEXRON II type) through filler tube **2**.

CAUTION

Make sure that dirt and foreign particles do not become mixed in with the fluid when it is added.

- Shift the range selector lever into the N range, start the engine and let it idle for at least two minutes.
- After shifting the lever through all ranges once, shift it back into N.

CAUTION

To prevent burning out the interior of the automatic transmission assembly, make sure that the engine is not allowed to race when you do the above.

- Supply the fluid until the fluid level is at the lower limit of the specified area on dipstick **1**. Next, check the fluid level to make sure it is within the specified limit.

NOTE

- **Determining the fluid level immediately after supplying the fluid might be difficult due to the fluid stuck in the inside of the filler tube. Therefore, check the fluid level a few times between intervals.**
- **If the fluid is overfilled, it will overflow and can be mistaken for leakage.**
- **Let the engine idle and, while paying attention to the fluid level, pour in the fluid slowly.**

Power Steering Fluid

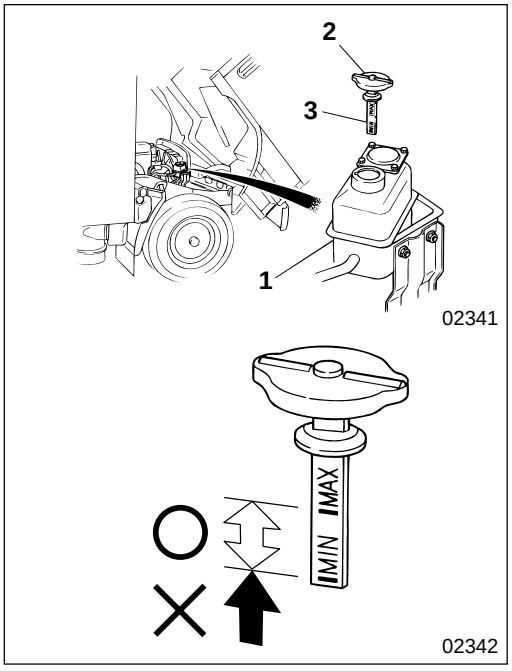
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Pressure tube	29 to 39 {22 to 29, 3 to 4}	—
5	Return tube	39 to 49 {29 to 36, 4 to 5}	—

Fluid

Location	Points of application	Specified fluid	Quantity
1	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Between MIN and MAX on filler cap dipstick



[Inspection and replenishment]

- Straighten the front wheels and stop the engine.
- Tilt the cab.
- Remove filler cap **2** of power steering oil tank **1** by turning the filler cap counterclockwise.
- Wipe off the fluid sticking to dipstick **3** on filler cap **2**. Replace the filler cap.

NOTE

Check the fluid level without screwing on filler cap 2.

- Carefully lift up filler cap **2** and check the fluid sticking to dipstick **3** to make sure that the fluid is at a point between the “MAX” and “MIN” levels. If the fluid position does not reach the “MIN” level, add fluid.
- After inspection install filler cap **2** by turning it clockwise.

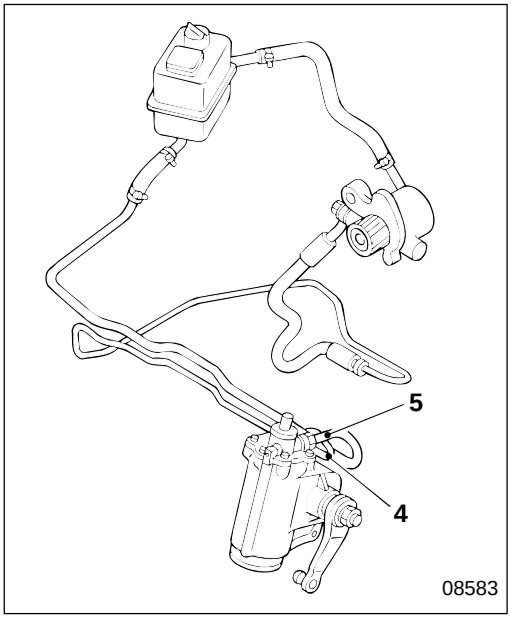
WARNING⚠

Close filler cap 2 firmly; otherwise the fluid may leak and could catch fire. Also wipe up spilled fluid.

CAUTION⚠

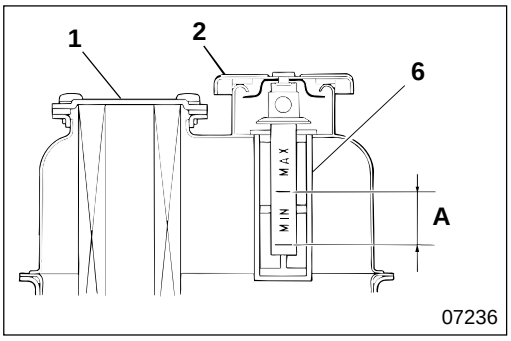
If the fluid level is far below the recommended range, the fluid may be leaking.

https://truckmanualshub.com/



[Replacement]

- Drainage
  - Jack up the front wheels.
  - Release pressure tube **4** and return tube **5** connected to the power steering booster.
  - Turn the steering wheel fully left and right repeatedly, and drain the fluid from the power steering booster.
  - After draining the fluid, tighten pressure tube **4** and return tube **5** at specified torque.



[Fluid supply]

- Pour fluid into power steering oil tank **1** up to the inner port of strainer **6**.
- With the engine stopped, jack up the front wheels and turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.

NOTE

Check the fluid level without screwing on filler cap 2.

- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times to raise the fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise, bleeding is completed.
- When bleeding is finished, check fluid level of power steering oil tank **1**, and pipe and hose connections for fluid leakage.

LUBRICATION

Brake Fluid

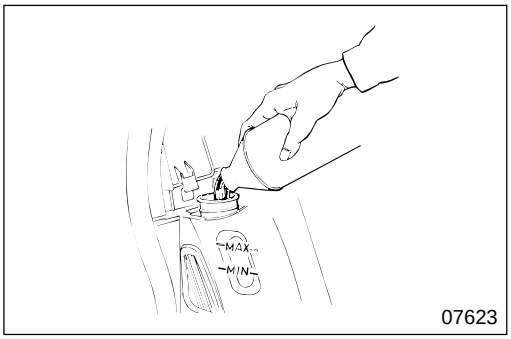
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened		Tightening torque	Remarks
1	Air bleeder	Front disc brake < FE >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Front wheel cylinder < FG >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Rear wheel cylinder < FE639, FG639 >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Rear disc brake < FE649 >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Bypass valve	8.8 to 13 {6.5 to 9.4, 0.9 to 1.3}	—

Fluid

Location	Points of application	Specified fluid	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required



07623

WARNING

- **The clutch fluid system and the brake fluid system use the fluid tank in common. Therefore, replacement and air bleeding of the clutch fluid must be carried out simultaneously with that of the brake fluid. Gr 21**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a container for adding brake fluid, keep it solely for that purpose.**

CAUTION

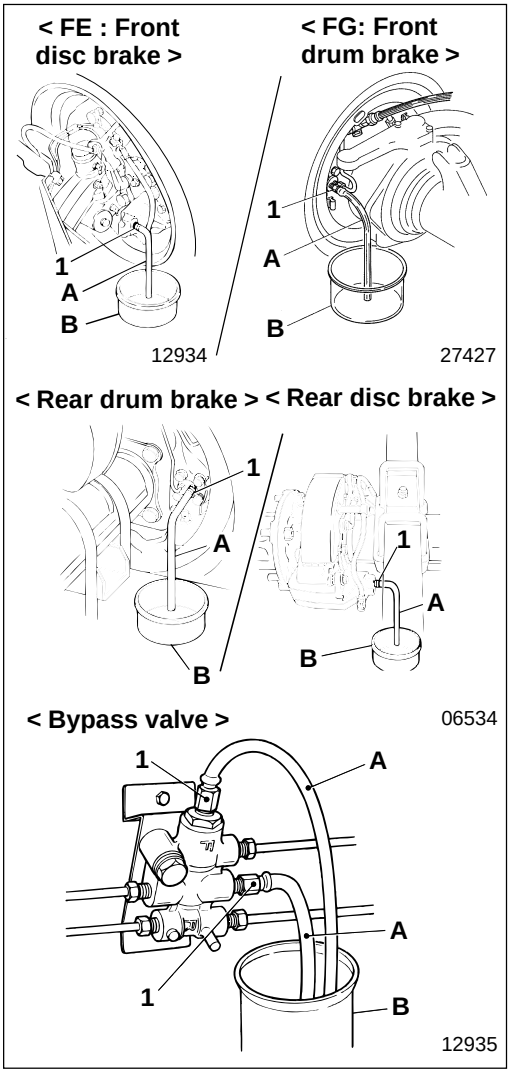
- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

NOTE

Supply brake fluid to maintain the “MAX” level of the fluid tank always.

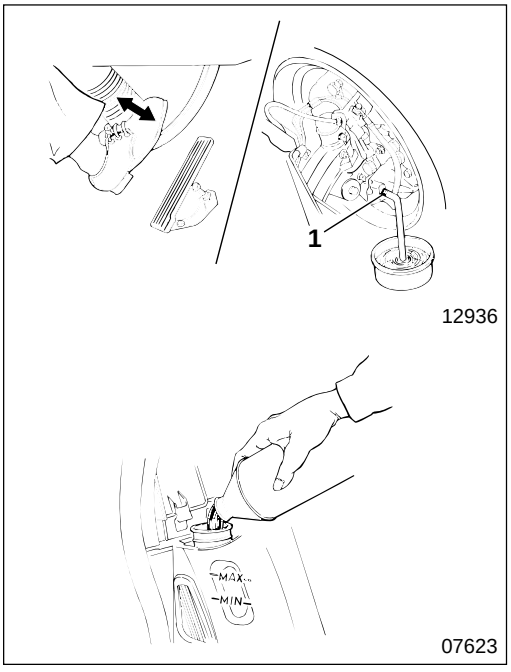
[Inspection and replenishment]
Inspect the level of the brake fluid in the fluid tank. It should be between the “MAX” and “MIN” levels. If it is below the “MIN” level, lift up the lid and remove the cap from the fluid tank, then add specified brake fluid until the level reaches the “MAX” level. Do not fill above the “MAX” level.

https://truckmanualshub.com/



[Replacement]

- Start the engine and let it idle until you complete brake fluid replacement.
- Attach vinyl pipe **A** to the front disc brake < FE >, the front drum brake < FG >, the rear drum brake < FE639, FG639 >, the rear disc brake < FE649 > and the bypass valve.
- Place the free end of vinyl pipe **A** into container **B**.



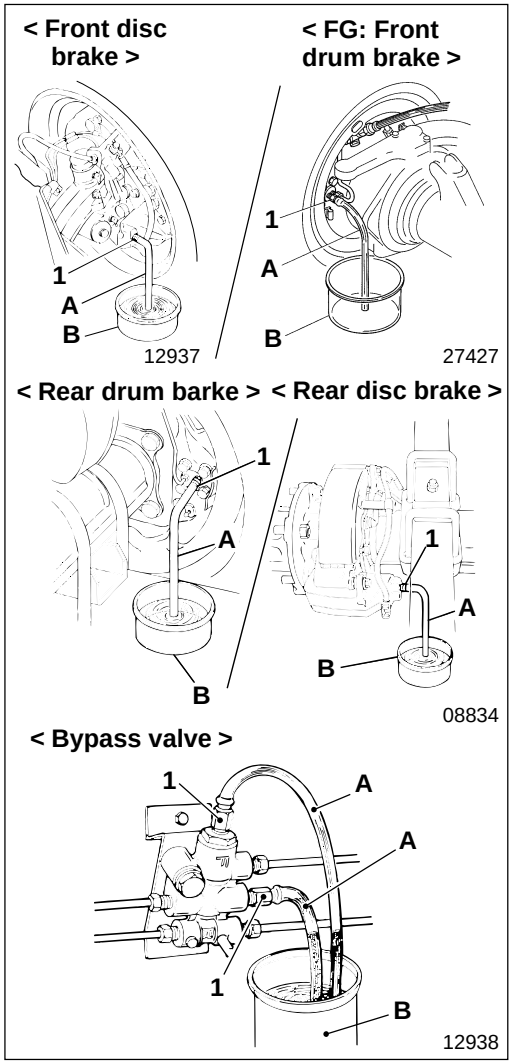
- Loosen air bleeders **1** and depress the brake pedal several times to drain brake fluid completely.
- Maintaining a supply of new brake fluid up to the “MAX” level of the fluid tank, depress the brake pedal repeatedly until the old brake fluid of the brake system is replaced with new fluid. After you complete the work, tighten each air bleeder **1** at specified torque.

NOTE

You can tell when the brake fluid has been completely replaced because the fluid coming out will be a different color.

- Carry out air bleeding of the brake system.

https://truckmanualshub.com/



[Air bleeding]

- Start the engine and let it idle until you complete air bleeding of the brake system.
- Attach vinyl pipe **A** to the front disc brake < FE >, the front drum brake < FG >, the rear drum brake < FE639, FG639 >, the rear disc brake < FE649 > and the bypass valve.
- Place the free end of vinyl pipe **A** into container **B**, then bleed air from the brake system as follows:

< Front brake system >

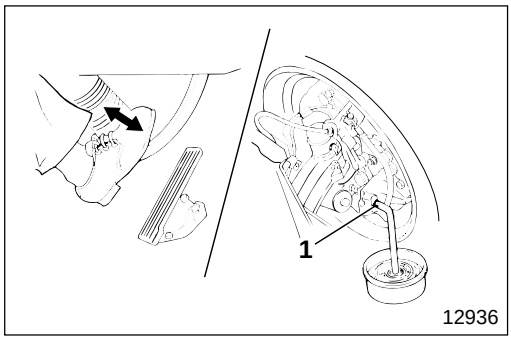
FG639	FE639, FE649
Drum brake, RH	Disc brake, RH
↓	↓
Drum brake, LH	Disc brake, LH

< Rear brake system >

FE639, FG639	FE649
Drum brake, RH	Disc brake, RH
↓	↓
Drum brake, LH	Disc brake, LH

< Bypass valve system >

Bypass valve



- Depress the brake pedal slowly several times, and with the brake pedal depressed, loosen air bleeder **1** to discharge air together with the brake fluid. After closing the air bleeder, release the brake pedal.
- Repeat the above operation until air bubbles are no longer present in the brake fluid discharged from air bleeder **1**.
- When the discharged fluid is free of air bubbles, tighten air bleeder **1** at specified torque.
- Make sure that the brake fluid level is at the “MAX” level of the brake fluid tank, and depress the brake pedal several times to ensure that the brake fluid does not leak from anywhere. Then, conduct a brake test.

Inspection and maintenance		Time of inspection and maintenance								Working procedures	Remarks
			Inspection interval								
		New vehicle at 4000 km/ 2500 miles	Every 10000 km/ 6000 miles	Every 20000 km/ 12000 miles	Every 30000 km/ 18000 miles	Every 40000 km/ 24000 miles	Every 50000 km/ 30000 miles	Every 90000 km/ 54000 miles	Every 250000 km/ 150000 miles		
FRONT AND REAR AXLE											
19	Wheel hub bearing				×					Check wheel hub bearing for play	Gr 26, 27
20	Wheel hub bearing hub seals replacement				×					Replace wheel hub bearing hub seals	Gr 26, 27
21	Wheel and tire		×							Check disc wheel for corrosion, deformation and cracks. Measure inflation pressure with tire gauge. Check tire tread and side wall for cracks and damage. Measure tire tread groove depth to make sure it is deep enough. Check tire tread for uneven wear, stepped wear and other abnormal wear. Rotate tires if there is a difference in the amount of wear of each tire	Gr 31
22	Retightening wheel nuts	×	×							Check wheel nuts for looseness. Check at the first 1000 km/600 miles after changing a wheel	Gr 31
SUSPENSION SYSTEM											
23	Retightening U-bolts	×		×						Check U-bolt nuts for looseness. Check at the first 1000 km/600 miles after removing and retightening U-bolt nuts	Gr 33, 34
BRAKING SYSTEM											
24	Disc brake pad and disc		×							Check disc brake pad and disc for damage and wear	Gr 35
25	Brake lining		×							Check lining for wear through inspection hole	Gr 35
26	Brake drum				×					Disassemble and check drum for wear, cracks and damage	Gr 35
27	Looseness, play and damage of brake system parts		×							Inspect brake lines and hoses for looseness, play and damage. Inspect wheel cylinder and brake master cylinder for looseness, play and damage	Gr 35
STEERING SYSTEM											
28	Steering system		×							Check steering system for looseness, steering wheel play and operating condition. Inspect for fluid leakage, booster and oil pump function	Gr 37

https://truckmanualshub.com/

This section explains simple maintenance procedures. See the relevant Group in this manual for further details.

Replacement of Oil Filter

Lubricant

Location	Points of application	Kinds	Quantity
2	Inside oil filter	Engine oil	Approximately 1 L {1.1 qts}
	Gasket area of oil filter with thin application	Engine oil	As required

Special tools

Unit : mm {in.}

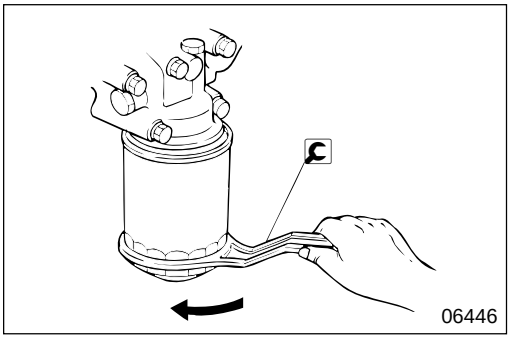
Location	Tool name and shape	Part No.	Application
2	Oil filter wrench  06478	MH061587	Removal of oil filter

WARNING

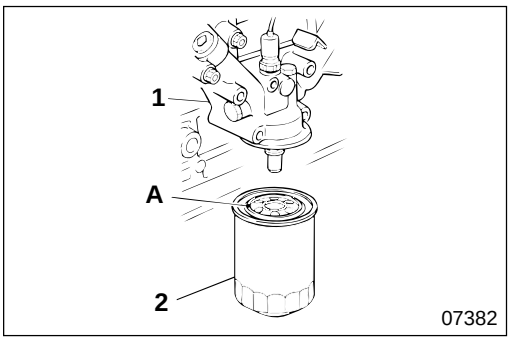
- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**

CAUTION

- **Take care not to spill engine oil on the V-belts, because this would cause them to slip, reducing service life.**



[Removal]



[Installation]

- Clean the surface of oil cooler body **1** that makes contact with oil filter **2**.
- Apply engine oil thinly and evenly to gasket area **A** of oil filter **2**.
- Screw oil filter **2** into oil cooler body **1** until gasket area **A** sits on the body. From this position, tighten further by rotating by three quarters of a turn.
- After installation, run the engine and check that there is no oil leakage from gasket area **A**.
- Check the oil level and if it is low, top it up.

https://truckmanualshub.com/

Replacement of Fuel Filter

Lubricant

Location	Points of application	Kinds	Quantity
2	Gasket contact surfaces of fuel filter and fuel filter head	Engine oil	As required

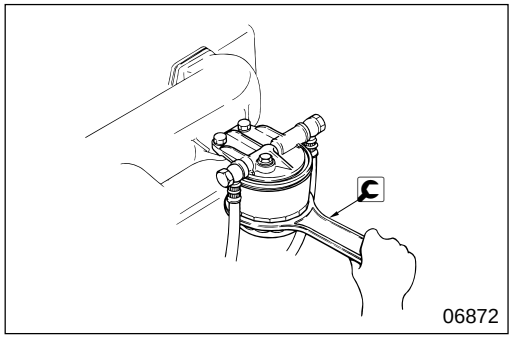
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
2	Filter wrench  01882	MH061509	Removal of fuel filter

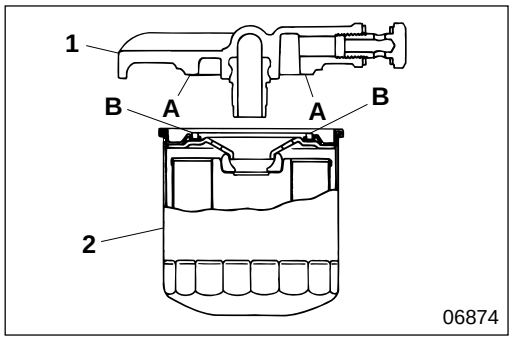
WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any gas oil that has been spilled because it can cause a fire.**
- **Do not use an unsuitable filter because it can cause a fire.**



06872

[Removal]



06874

[Installation]

- Install by tightening three quarters to one full turn after contact surface **A** of fuel filter head **1** makes contact with gasket **B** of fuel filter **2**. Be sure to tighten by hand.
- After installation, run the engine and check for fuel leakage.

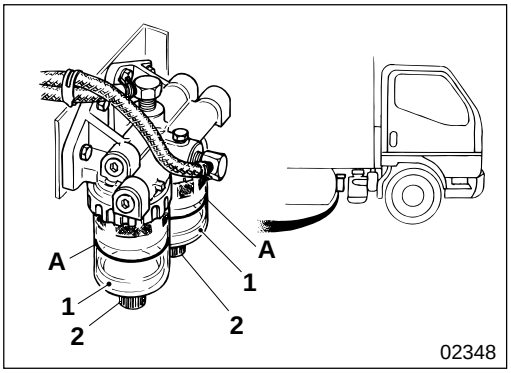
https://truckmanualshub.com/

Draining of Water Separator Condensation

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Drain plug	2.9 to 3.9 {2.2 to 2.9, 0.3 to 0.4}	—



Visually inspect the water separator before driving.
When float **1** reaches red line **A**, drain the condensation as follows:

- Loosen drain plug **2** and drain out the condensation.
- When float **1** has dropped to the bottom, tighten drain plug **2**.
- Carefully wipe the water separator and the surrounding area.
- Check for fuel leakage.

Cleaning of Fuel Feed Pump Gauze Filter

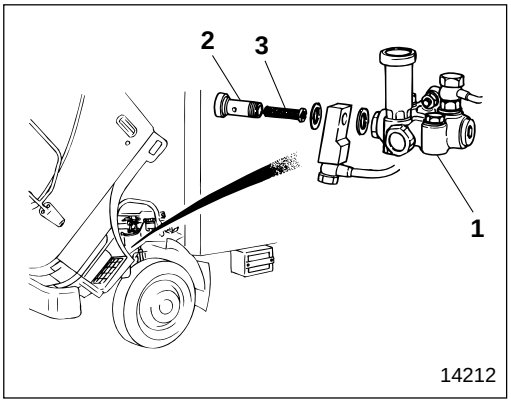
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Eye bolt	25 to 29 {18 to 22, 2.5 to 3}	—

WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any gas oil that has been spilled because it can cause a fire.**



- Remove eye bolt **2** on the inlet side of fuel feed pump **1**.
- Remove gauze filter **3** from eye bolt **2**.
- Clean gauze filter **3** with gas oil.
- Follow the removal sequence in reverse and reinstall gauze filter **3**. Install eye bolt **2** in the fuel feed pump.
- Bleed the air from the fuel line.
- Start the engine and check for fuel leakage.

https://truckmanualshub.com/

Bleeding of Air from Fuel Line

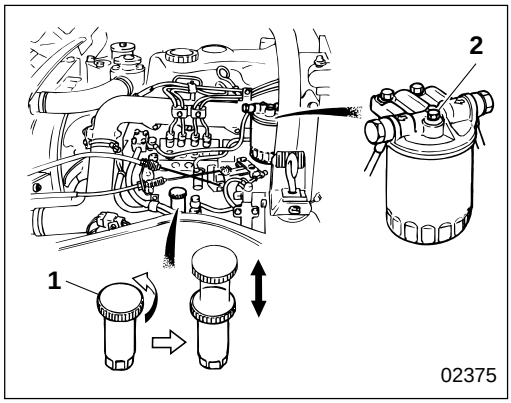
Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Air vent plug	7.8 to 12 {5.8 to 8.7, 0.8 to 1.2}	—

WARNING ⚠

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any gas oil that has been spilled because it can cause a fire.**



- Turn the top of priming pump **1** of the injection pump counterclockwise and pull it up so the top protrudes.
- Loosen air vent plug **2** of the fuel filter and move the top part of priming pump **1** up and down.
- Move priming pump **1** up and down repeatedly until air bubbles are no longer present in the fuel drained from air vent plug **2**.
- When the fuel being drained is free of air bubbles, tighten air vent plug **2**.
- After moving priming pump **1** up and down another five or six times, push the top down and turn clockwise to drive it in fully.
- After bleeding the air, carefully wipe up spilled fuel and start the engine.
- Check for fuel leakage.

https://truckmanualshub.com/

Adjustment of V-Belt Tension

Newly installed V-belts can stretch during their initial running-in period. To prevent this from becoming a problem, run the engine for several minutes after installing the V-belt, then readjust. Perform this cycle several times.

WARNING⚠

You must take special precautions to prevent the engine from rotating while a V-belt is being inspected or adjusted.

CAUTION⚠

- **Make sure that you turn off the engine before attempting to inspect or adjust the V-belts.**
- **Make sure that you fasten all bolts and nuts securely after adjusting the V-belts. Remember that too much tension can damage the V-belts and bearings.**
- **Do not grease V-belts. This causes them to slip, which reduce service life.**

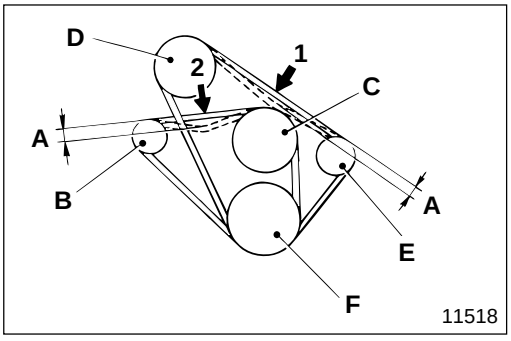
Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1, 2	V-belt tension (Each one)	Fan	12 to 16 {0.47 to 0.63}	—	Adjust
		Air-conditioner	16 to 20 {0.63 to 0.79}		

Special tools

Location	Tool name and shape	Part No.	Application
1, 2	Belt tension gauge 03612	MH062345	Measurement of tension of V-belt

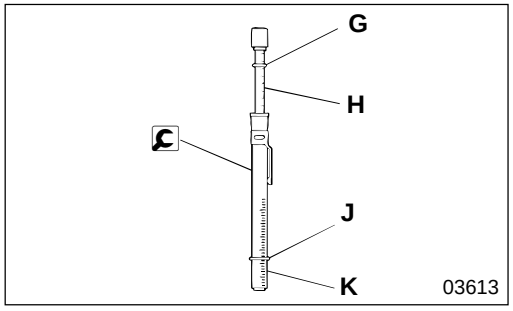


[Inspection]

Measure the extent of flex **A** when the center of V-belts **1**, **2** as illustrated is depressed with a force of 98 N·m {72 lbf.ft, 10 kgf·m}.

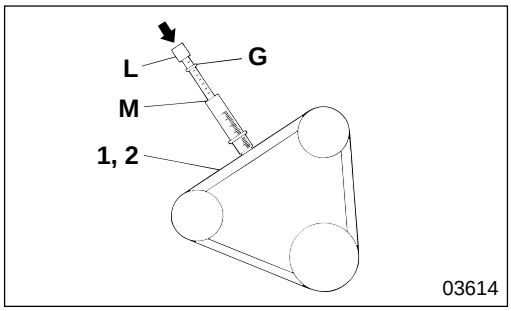
- **B** : Alternator pulley
- **C** : Water pump pulley
- **D** : Cooler compressor pulley (Air-conditioner)
- **E** : Tension pulley
- **F** : Crankshaft pulley

https://truckmanualshub.com/

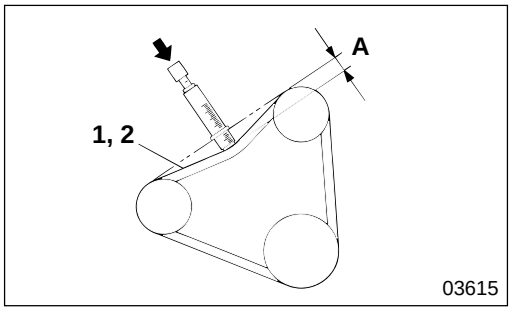


Use of special tool belt tension gauge

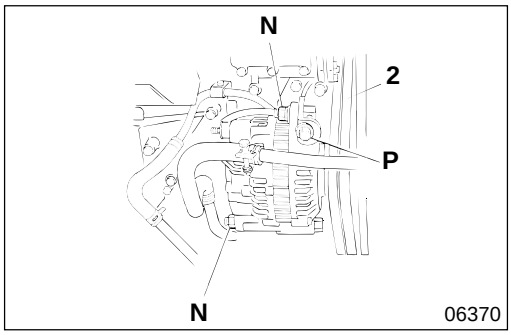
- Set upper O-ring **G** of belt tension gauge to 98 N·m {72 lbf.ft, 10 kgf·m} (push load) on graduation **H**.
- Set lower O-ring **J** of belt tension gauge to graduation **K** (maximum flex of belt).



- Place belt tension gauge at the center of V-belts **1**, **2** perpendicularly as illustrated and push top **L** all the way down until upper O-ring **G** hits upper edge **M**.



- Measure the extent of flex **A** of V-belts **1**, **2** at this point, and if the measured value deviates from the standard value, adjust as follows:



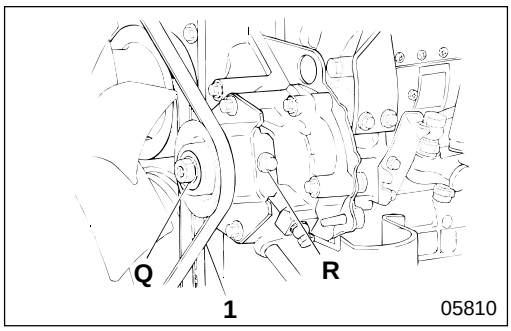
[Adjustment]

(1) Adjustment of tension of V-belt for fan

- Loosen alternator mounting bolts **N** (two points), and adjust the tension of V-belts **2** by moving adjusting bolt **P**.
- After adjustment, tighten bolts **N**, **P** securely.

CAUTION

- **Bear in mind that excessive tension of V-belts 2 might damage the belts and bearings that engage with the V-belts.**
- **Be sure to replace V-belts 2 as a set to maintain even tension between them.**
- **Be careful not to let oil stick to V-belts 2. If oil gets onto the belts, it causes slipping, resulting in overheating and insufficient battery charging.**



(2) Adjustment of tension of V-belt for air-conditioner

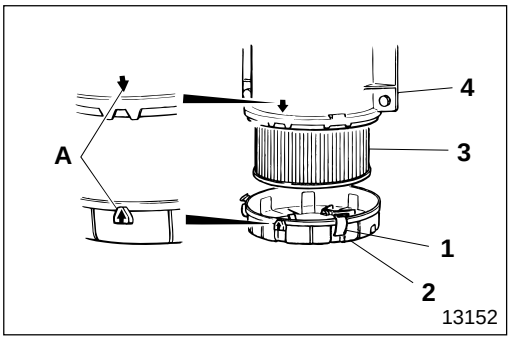
- Loosen tension pulley mounting nut **Q**, and adjust the tension of V-belt **1** moving adjusting bolt **R**.
- After adjustment, tighten mounting nut **Q** securely.

CAUTION

- **Bear in mind that excessive tension of V-belt 1 might damage the belt and bearings that engage with the V-belt.**
- **Be careful not to let oil stick to V-belt 1. If oil gets onto the belt, it causes slipping, resulting in poor performance of the air conditioner.**

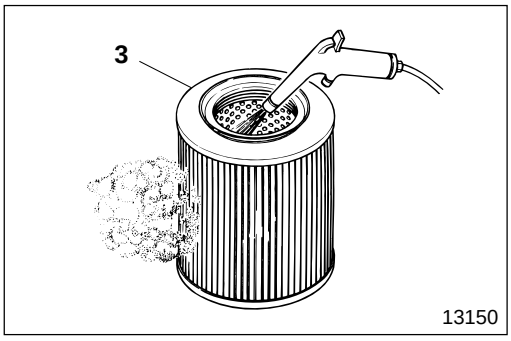
https://truckmanualshub.com/

Cleaning and Replacement of Air Cleaner Element



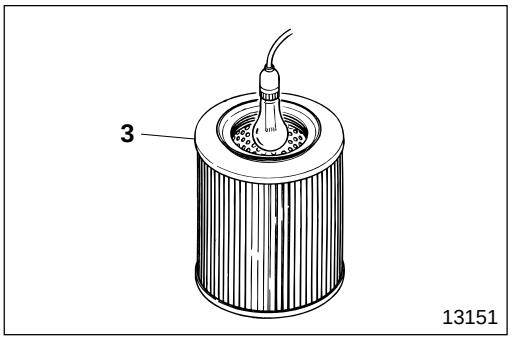
[Removal]
- Unfasten clamp **1** and remove air cleaner cap **2**.
- Remove air cleaner element **3**.

[Installation]
- Install by aligning alignment marks **A** of air cleaner cap case **4** and air cleaner cap **2**.



[Cleaning]
- Blow compressed air of 685 kPa {100 lbf/in^2, 7 kgf/cm^2} or less through air cleaner element **3** from the inside.
- When using compressed air, move the blower's nozzle up and down along the pleats of air cleaner element **3** evenly.

CAUTION⚠
- **Do not tap or hit air cleaner element 3 to remove dust.**
- **Do not blow compressed air through air cleaner element 3 from the outside.**



[Inspection]
- Illuminate the inside of air cleaner element **3**.
- If parts of the filter paper are torn or thin, or if the packing of the upper surface of air cleaner element **3** is damaged, replace the air cleaner element.

NOTE

If the dust on air cleaner element 3 is wet due to oil smoke or soot, replace the air cleaner regardless of the scheduled replacement interval.

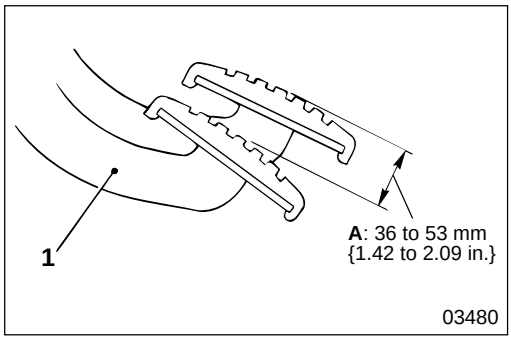
https://truckmanualshub.com/

Inspection of Clutch Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	Clutch pedal free play	36 to 53 {1.42 to 2.09}	—	Adjust or replace



[Confirmation]
Push clutch pedal **1** with your hand and measure the amount of movement **A** (free play) until you meet resistance. If the measured value does not conform to the standard value, adjust by stroke of clutch power cylinder push rod or replace the clutch disc.

[Clutch operation]

- Check for unusual noises when clutch pedal **1** is pressed while the engine is idling, and also for abnormally heavy clutch operation. Also check to be certain that it is not difficult to shift the vehicle into first and reverse gears.
- Gradually release clutch pedal **1** to set the vehicle in motion.
  Check to be sure there is no slippage, and that the clutch engages smoothly.

https://truckmanualshub.com/

Tire

Service standards

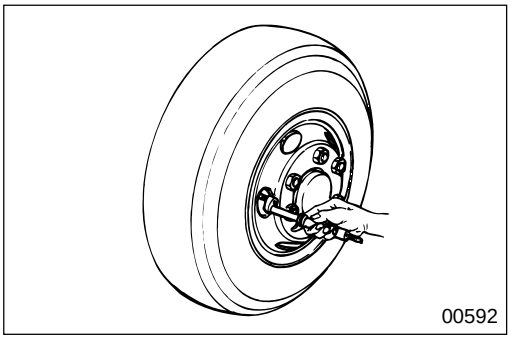
Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	Depth of tire tread grooves	—	1.6 {0.063}	Replace

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Wheel nut	490±49 {360±36, 50±5}	—



00592

Air pressure

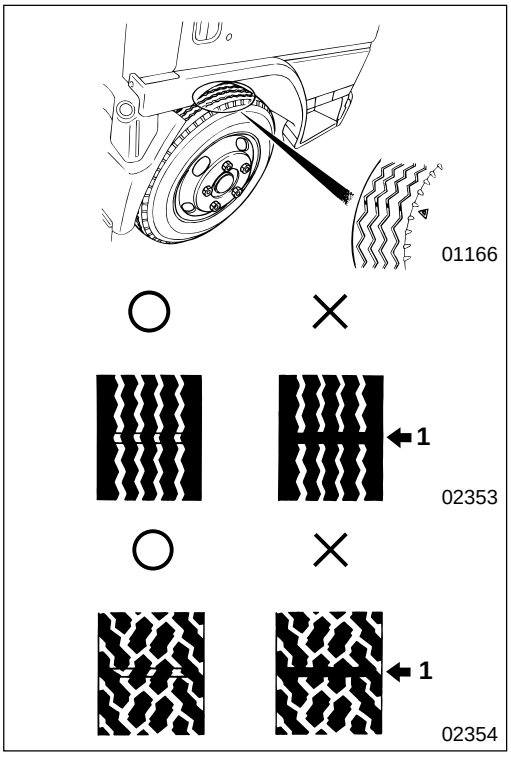
Tire air pressure should be checked before the vehicle is driven, while the tires are still cool.

Item / Vehicle model	Tire size	Air pressure kPa {Psi, kgf/cm²}	
		Front	Rear
FE639 (GVWR : 11600 lb, 5260 kg)	215/85R16(D)	450 {65, 4.50}	450 {65, 4.50}
FE639 (GVWR : 13500 lb, 6120 kg)	215/85R16(E)	550 {80, 5.50}	550 {80, 5.50}
FE649 (GVWR : 14500 lb, 6580 kg)	215/85R16(E)	550 {80, 5.50}	550 {80, 5.50}

GVWR : Gross vehicle weight rating

CAUTION⚠

- **Make certain that there is no difference in the air pressure between the inner and outer rear tires.**
- **Make certain you use valve caps on the air valves.**
- **It is not necessary to increase the air pressure for high-speed driving.**



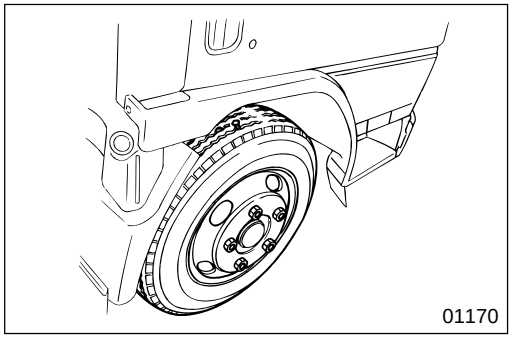
Checking tread depth

- Check all around the tire treads to make sure that the depth of the tread grooves is above the wear limit.
- If the tread grooves are not deep enough, slip sign **A** appears at the position of the ⚠ mark, where the tread groove has worn away.

WARNING⚠

If the depth of the tread grooves is not adequate, the tires will slip on wet roads and present a hazard. Such tires are also extremely dangerous because they are more susceptible to hydroplaning when the vehicle is running at high speeds in the rain. Such tires must be replaced with new ones as soon as possible.

https://truckmanualshub.com/



Checking for cracks, damage, and objects embedded in the treads

- Check the tire treads and walls for cracks and damage.
- Check tire treads for uneven wear or other abnormal wear.
- Check if metal objects or nails have penetrated the tires.
- Check for stones embedded between double tires.

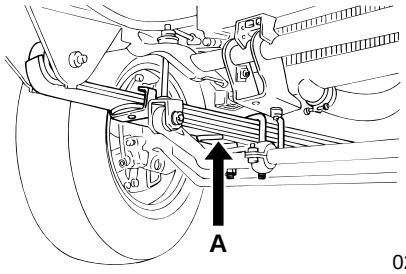
WARNING

Badly damaged or worn tires are extremely dangerous, because they can be punctured more easily when the vehicle is running, they must be replaced with new ones as soon as possible.

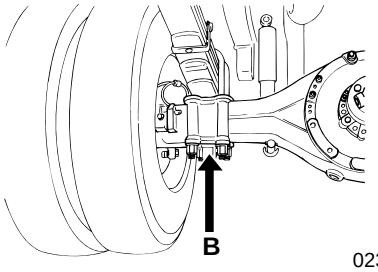
Removing tires

- Jacking up point
  - For front wheels : Point **A** under the leaf spring in front of the front axle
  - For rear wheels : Point **B** under the rear axle housing

< Front wheel >



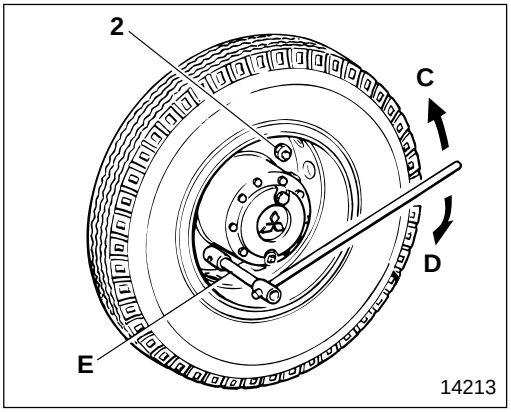
< Rear wheel >



WARNING

- **The jack should be placed on flat, solid ground, and should not be used to raise the vehicle higher than necessary.**
- **Do not use the jack at vehicle locations other than those illustrated.**
- **Keep in mind the danger of a slipping jack. Never crawl under the vehicle while the jack is in use or rock the vehicle. Also, do not start the engine while the vehicle is jacked up.**
- **To increase safety, use supports for the vehicle when it is necessary to leave it jacked up for long periods.**
- **Chock both the tire to be removed and the tire diagonally opposite to it so that they will not rotate when you are removing the tire.**

https://truckmanualshub.com/



- Loosen wheel nuts **2** slightly. The wheel nuts for right tires **C** have right-hand threads "**R**", and the wheel nuts for left tires **D** have left-hand threads "**L**".

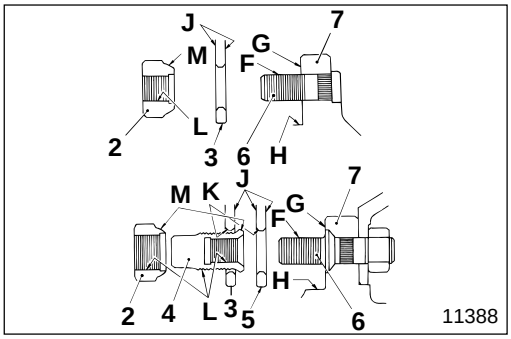
WARNING

Make certain that wheel nut wrench E is fully engaged, all the way to the back of nuts 2. If it is not, it could slip.

CAUTION

Only loosen wheel nuts 2 slightly. Do not remove them.

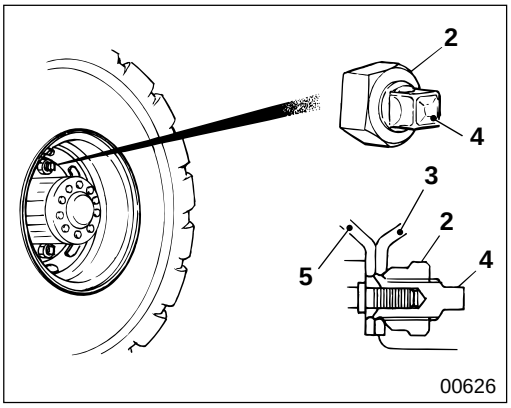
- Jack up the vehicle carefully, until the tire is slightly off the ground. Remove wheel nuts **2**, then remove the tire.
- When working on the double tires at the rear of the vehicle, first remove the outside tire, then lower the vehicle and loosen the nuts on the inside tire. After doing this, jack the vehicle back up and remove the tire.



Mounting tires

To prevent wheel nuts **2**, **4** and hub bolt **6** from becoming loose and to prevent mounted parts (tire assemblies **3**, **5** and hub **7**) from being damaged, remove rust, dust, additional coatings of paint, and foreign particles from the following areas:

F : Hub bolt thread area
G : Wheel mounting surface of hub
H : Wheel alignment area of hub
J : Disc wheel mating surface
K : Disc wheel nut mounting surface
L : Wheel nut thread area
M : Wheel nut spherical area



- Put on the double rear tires as follows:
  - After mounting inner tire **5** and fully tightening inner wheel nuts **4**, jack the vehicle up and mount on outer tire **3**, then tighten outer wheel nuts **2**.
  - Even if only outside tire **3** is to be changed, do not mount it until inner wheel nuts **4** have been fastened at the specified torque.
  - Slide the air valves on the inside and outside tires down when mounting the tires.

WARNING

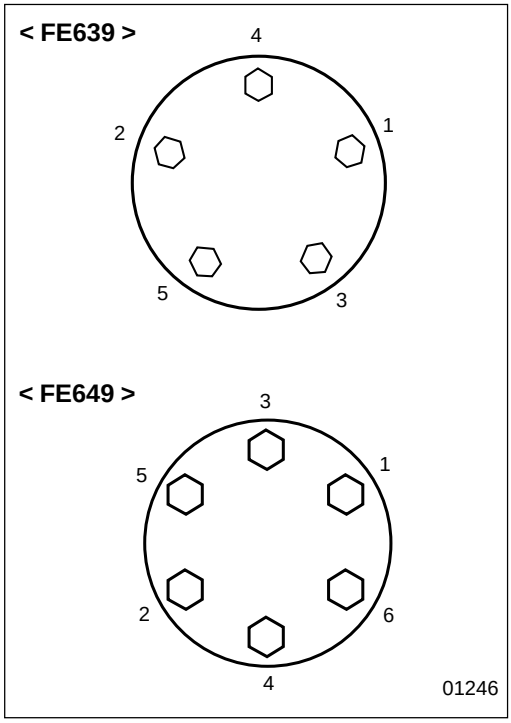
If the threads are scored, or the disc wheel is deformed or cracked, change bolts 6, nuts 2, 4 and disc. Driving the truck before correcting such problems can cause the tire in question to come loose, which could be the source of major accidents.

CAUTION

Check hub bolt 6 threads carefully for scratches before putting the tire on.

- Place the tapered end of wheel nuts **2**, **4** towards the disc wheel and fasten temporarily. Center so that there is no eccentricity between bolts **6** and the disc wheel bolt holes.
- Lower the vehicle.

https://truckmanualshub.com/



- Tighten the nuts in the order as illustrated, tightening each nut two or three times. To finish, tighten each nut at the specified torque.

WARNING

- **Always use the specified torque when tightening the wheel nuts. If the wheel nuts are not tightened properly, the wheels could come loose while the vehicle is being driven, which could result in life threatening accidents or the truck being disabled.**
- **Do not coat the threads with grease when tightening the nuts. This could result in over-tightening force, which could be dangerous.**

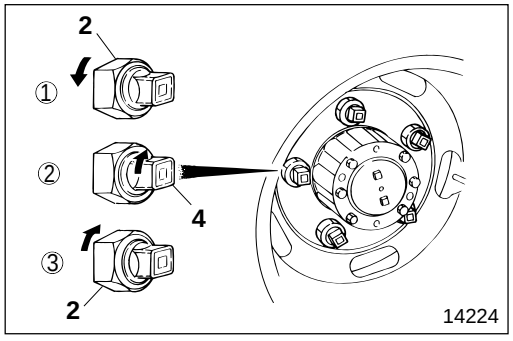
CAUTION

Over-tightening the wheel nuts can damage them.

Checking the wheel nuts for looseness

The wheel nuts should be checked for looseness every 10000 km (6000 miles). All nuts should be tightened at the specified torque.

- Check the double rear tires for looseness as follows:



① Loosen outer wheel nuts **2**.
② Tighten inner wheel nuts **4** at specified torque.
③ Tighten outer wheel nuts **2** at specified torque.

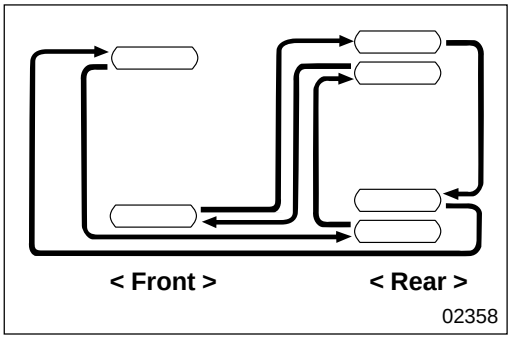
CAUTION

If outer wheel nuts 2 are tightened without first being loosened, it might not be possible to tighten them at the specified torque.

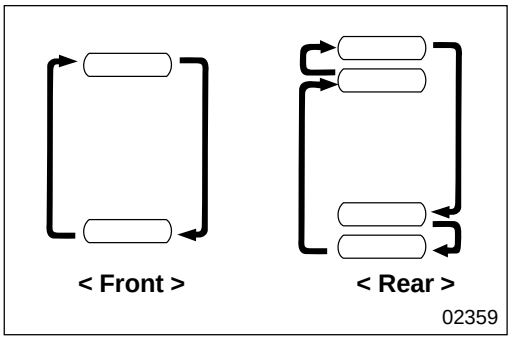
https://truckmanualshub.com/

Tire rotation

Tires wear differently, according to the location where they are mounted. To make this wear uniform and prolong the life of your tires, they should be rotated every 10000 km (6000 miles) in the rotation order shown below:



- When the tread patterns for all tires are identical:



- When the tread patterns are different for the front and rear tires:

CAUTION⚠

- **Always adjust air pressure after running-in new tires.**
- **When using tires of different tread patterns, use rib-type patterns for the front tires and traction type patterns for the rear tires.**
- **Avoid using both radial and biased tires on the same vehicle.**

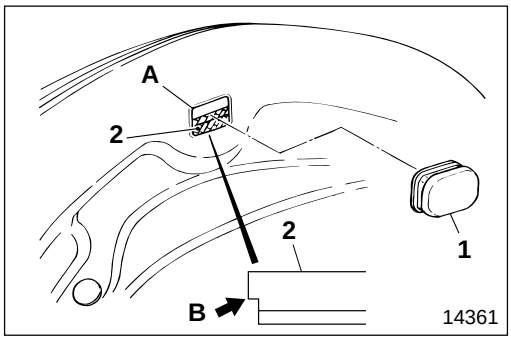
https://truckmanualshub.com/

Inspection of Brake Lining Thickness < Rear Drum Brake >

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2	Thickness of brake lining	—	4 {0.16} (Side shoulder means wear limit)	Replace



NOTE

Be sure to inspect at two points for each wheel per side.

- Remove cover **1** from the packing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall cover **1**.

Battery

DANGER⚠

- **Since flammable hydrogen gas is generated by the battery, be sure to obey the following warnings :**
  - **Do not short-circuit the ⊕ and ⊖ terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over the battery.**
- **Because the battery electrolyte is diluted sulfuric acid and is corrosive, when handling the battery wear safety glasses and rubber gloves to protect the eyes and hands.**

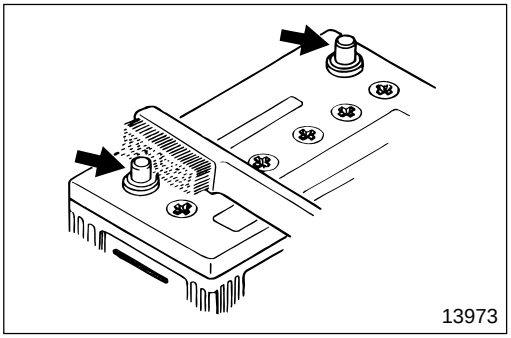
WARNING⚠

To prevent a short-circuit be sure that disconnected the battery cables do not accidentally touch the battery terminals.

CAUTION⚠

- **Make sure that you disconnect the battery cable ⊖ first when you disconnect the battery cables.**
- **Make sure that all electrical switches of the vehicle are OFF before connecting the battery cables.**
- **Make sure that you connect the battery cable ⊕ before you connect the battery cable ⊖.**

https://truckmanualshub.com/



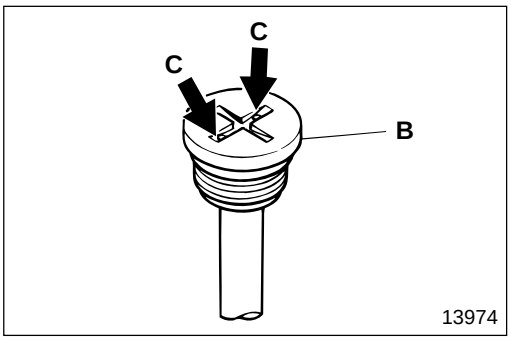
13973

Visual inspection

- If terminal **A** is corroded, scrub off the corrosion from it using a wire brush.
- If cracks or defects are found on the battery , replace it since the cracks or defects can cause liquid spills.

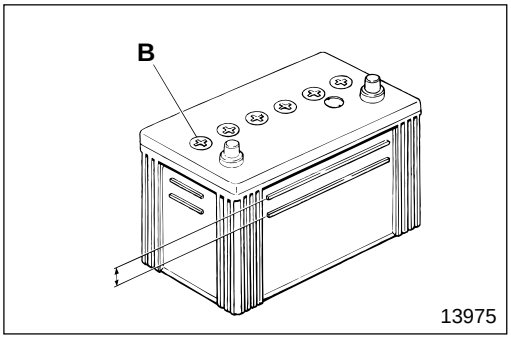
CAUTION⚠

Make sure you grease the ⊕ side of terminal A because it is easily corroded.



13974

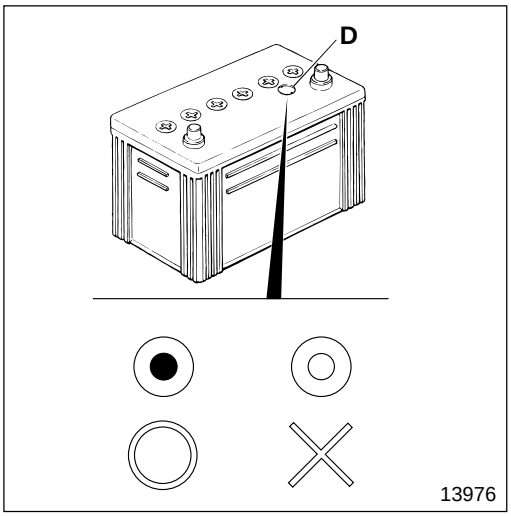
- If bleed hole **C** of vent plug **B** is clogged, clean the hole.



13975

Inspection of fluid level

- Make sure that the battery electrolyte level is between UPPER and LOWER.
- If the level is below LOWER, remove vent plug **B** and fill the battery with distilled water or battery replenisher to UPPER.



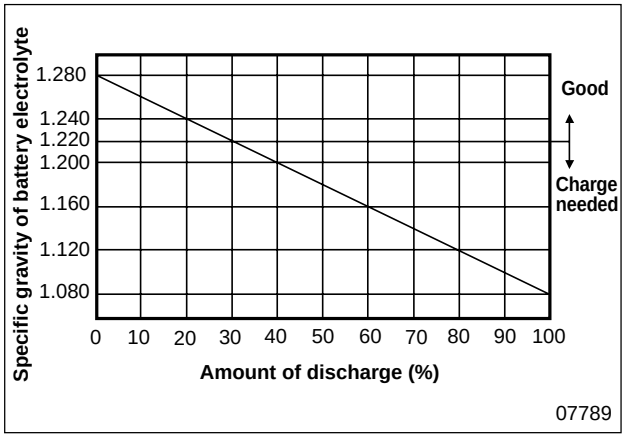
13976

Measurement of specific gravity

You can tell the specific gravity of the battery electrolyte by the color shown in indicator **D**.

Blue : Good
White : Charge or replace

https://truckmanualshub.com/



Charging

- Although, as a rule, charging of the battery should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect the battery cable ⊖.
- Remove vent plug **B** before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity / 10 {113}	*Amount of discharge (Ah) / Charge current (A) ×1.2(to 1.5)	45
Quick charge	Value of 5-hour rating capacity / 1.5 {131}	0.5	55

* Amount of discharge (Ah)=5-hour rating capacity (Ah)× Amount of discharge (%) / 100

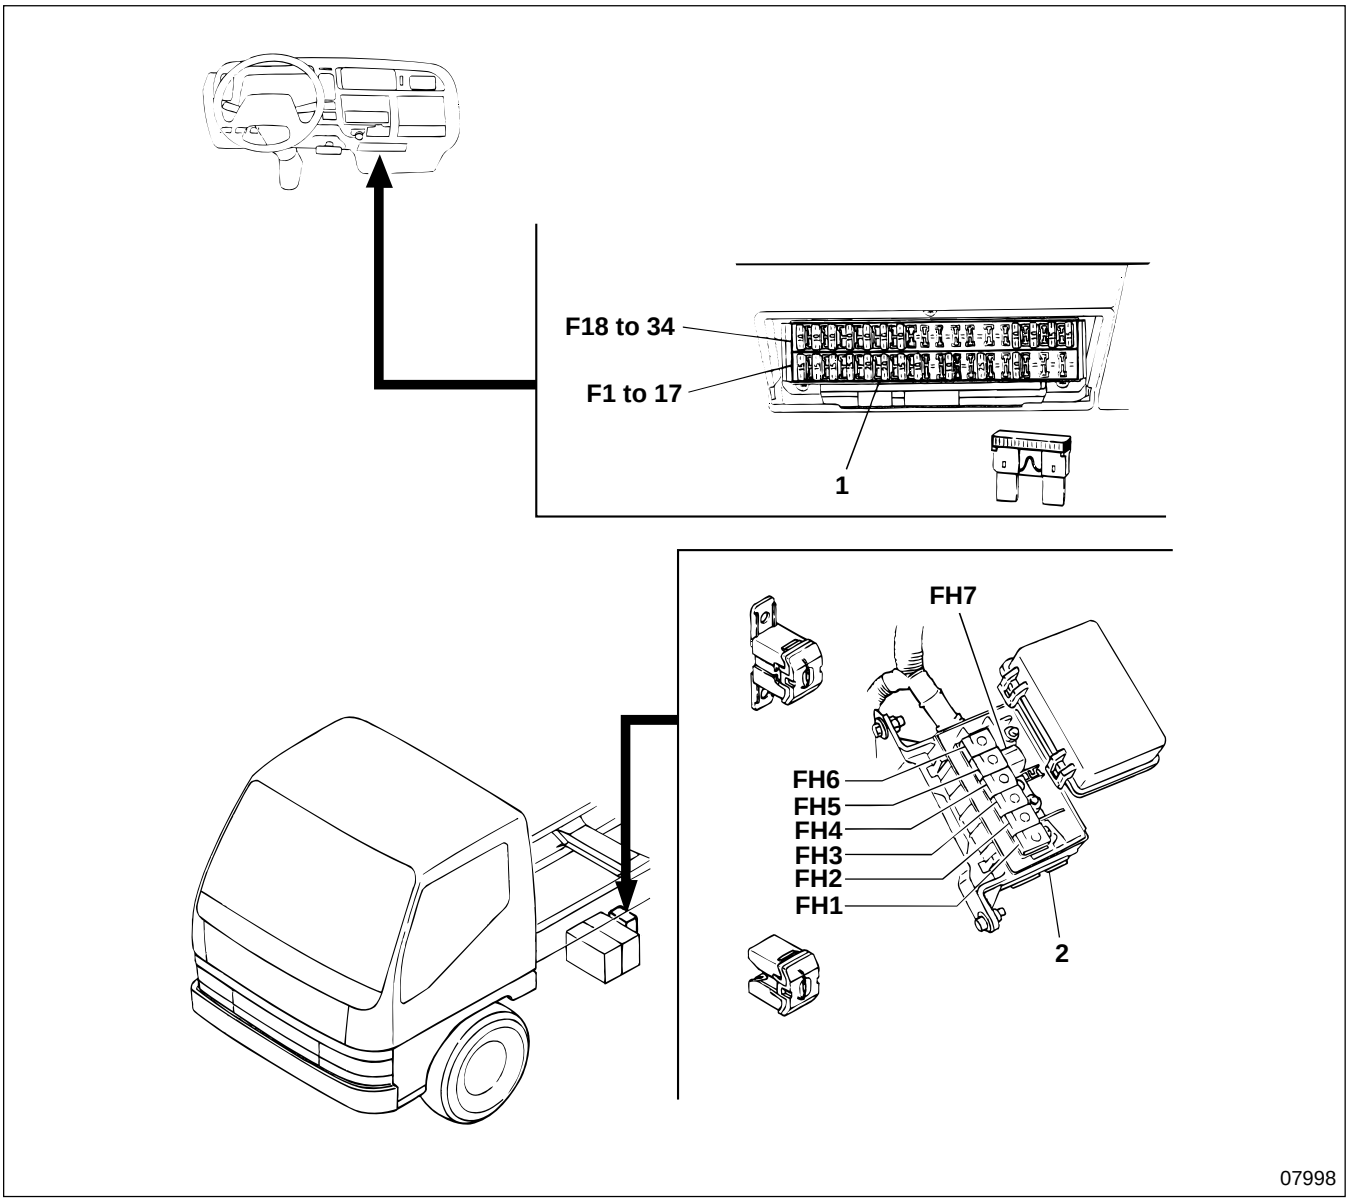
- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep naked lights away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because its dangerous.**
- **After charging the battery, tighten vent plug B, wash away sulfuric acid from the battery using water, and dry the surface.**

https://truckmanualshub.com/

Fuse



1 Fuse box
2 High-current fuse box

CAUTION⚠

- **If a fuse blows, make sure you identify and remedy the cause, then replace the fuse.**
- **Make sure that you replace the fuse with one having the same rating.**
- **Make sure that you remove the ⊖ terminal of the battery cable before removing high-current fuses FH1 to 7.**

https://truckmanualshub.com/

High-current fuse box

Fuse No.	Main load	Capacity
FH1	Fuse box (F1 to F4)	50 A
FH2	Fuse box (F5 to F8)	50 A

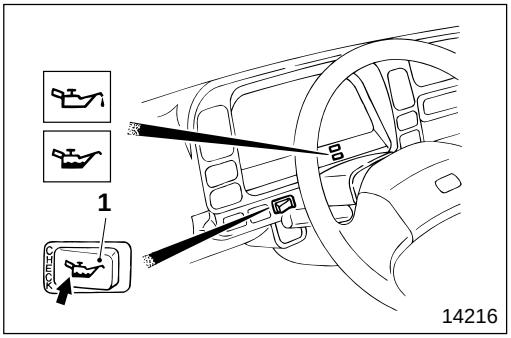
Engine Oil

Tightening torque

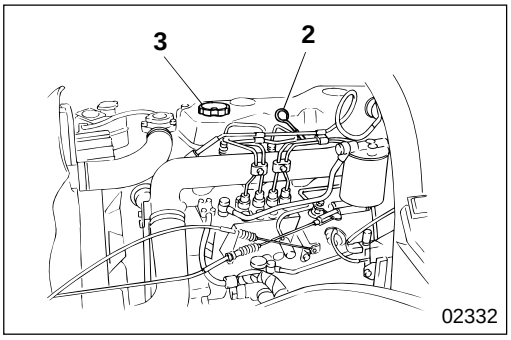
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Oil pan drain plug	34 to 39 {25 to 29, 3.5 to 4.0}	—

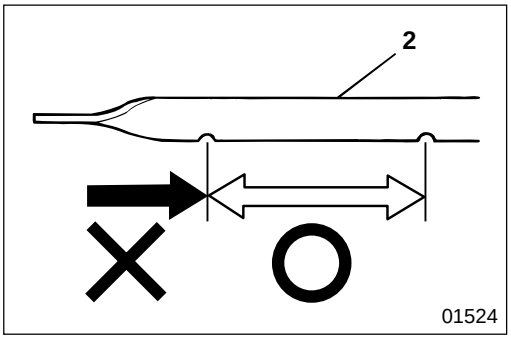


[Inspection]
There are two methods for inspecting the engine oil level; using oil level check switch **1**, and using dipstick **2**. Inspection using the oil level check switch is a simple inspection method. For a more accurate inspection use the dipstick.

- Inspection using oil level check switch **1** (simple inspection)
  - Press oil level check switch **1** before starting the engine. Check the oil level using the illuminated lamp.
    lamp (green) : Correct oil level
    lamp (red) : Low oil level
  - If the level is low, top it up.



- Inspection using dipstick **2**
  - Tilt the cab.
  - Pull out dipstick **2**, wipe off the oil with a cloth.
  - Reinsert dipstick **2**, then pull it out carefully.
  - Oil level is correct if there is oil sticking to the dipstick between the two notches.
  - If the level is low, top it up.



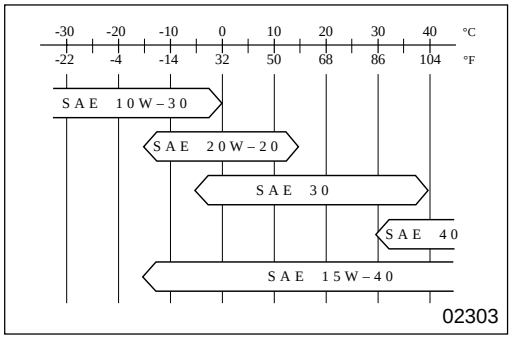
https://truckmanualshub.com/

[Replenishment]
- Clean the area surrounding oil filler cap **3** and prevent dust from entering through the filler.
- Remove oil filler cap **3** and top up with engine oil.
- Wait five minutes before checking the oil level.
- Replace filler cap **3**.

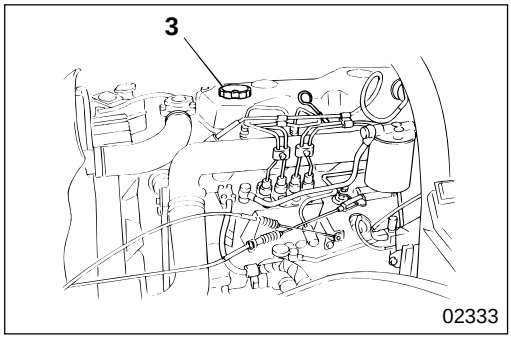
WARNING
- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot as it will burn you.**

CAUTION

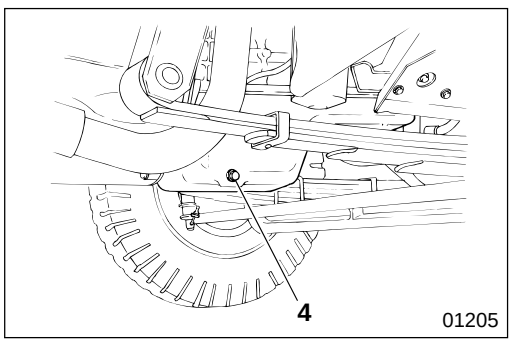
Take care not to spill engine oil on the V-belts, because this would cause them to slip, reducing service life.



[Replacement]
Since engine oil greatly influences the performance, the life expectancy, and the ability to start the engine, use only oil of the specified grade and viscosity.
The chart illustrates the relationship between oil viscosity and the ambient air temperature.



- Clean the area surrounding oil filler cap **2** and prevent dust from entering through the filler.
- Remove oil filler cap **2**.
- Remove oil pan drain plug **4**, and drain the oil. At the same time replace the oil filter.
- After reinstalling drain plug **4**, slowly add engine oil through the oil filler.
- Using the dipstick, check the oil level after more than five minutes have passed.
- Start the engine and let it idle. When the oil has reached all parts, stop the engine. Let 30 minutes pass before checking the oil level again.



https://truckmanualshub.com/

Manual Transmission Gear Oil

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

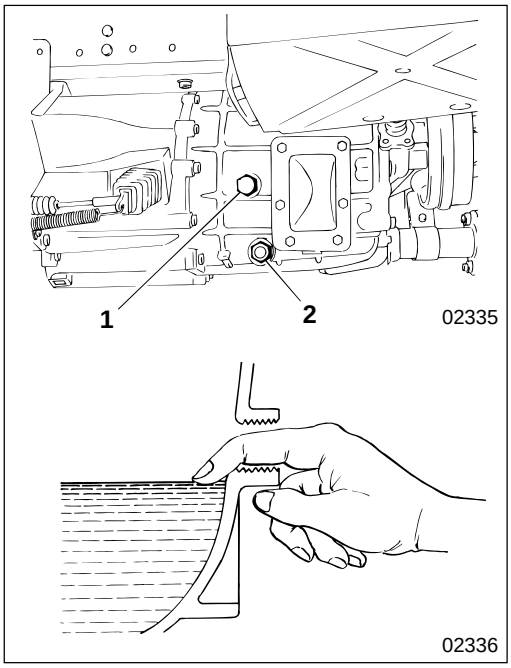
Location	Parts to be tightened	Tightening torque	Remarks
1	Inspection plug	69±15 {51±11, 7±1.5}	—
2	Drain plug	69±15 {51±11, 7±1.5}	—

Sealant

Location	Points of application	Kinds	Quantity
1	Thread area of inspection plug	THREEBOND 1105D	As required
2	Thread area of drain plug	THREEBOND 1105D	As required

WARNING

The engine is hot immediately after the vehicle has stopped, so take care not to burn yourself.



[Inspection and replenishment]

- Remove inspection plug **1** and check whether the oil level is up to the edge of the entrance.
- If the level is low, add oil through the inspection plug hole until the level comes up to the edge of the entrance.

[Replacement]

- Drain the oil after removing inspection plug **1** and drain plug **2**.
- Remove any metal particles sticking to the magnetic part of drain plug **2** before reinstalling the plug.
- Add oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Insert inspection plug **1**

https://truckmanualshub.com/

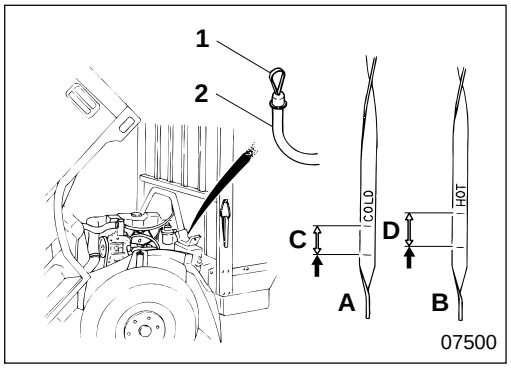
LUBRICATION

Automatic Transmission Fluid

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Drain plug	29 to 39 {22 to 29, 3 to 4}	—



[Inspection and replenishment]

- Park the vehicle on level ground, make sure that the parking brake is fully activated and chock the wheels to keep them from rolling.
- Start the engine and let it idle. To fill the hydraulic circuit with automatic transmission fluid, slowly shift the range selector lever once through the P to L ranges and finally shift into the N range.
- While the engine is still idling, pull out dipstick **1** and wipe off the fluid sticking to it. Reinsert the dipstick, then pull it out again and check the fluid level.
- If the fluid level is inspected right after the engine is started and the fluid temperature is still low (40±15°C {104±27°F}) the level should be within area **C** marked COLD on dipstick **1** as illustrated in **A**.
- If the fluid level is inspected after the vehicle has been driven and the fluid temperature is high (65±15°C {149±27°F}) the level should be within area **D** marked HOT on dipstick **1** as illustrated in **B**.

WARNING ⚠

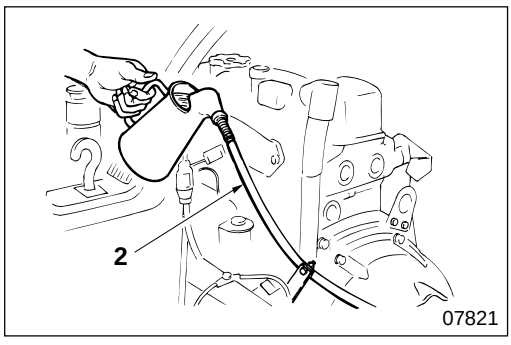
Take care during the inspection because the engine will be running. Take sufficient care to avoid burns or injuries resulting from contact with moving parts.

CAUTION ⚠

Be sure to wipe off the dust from the safety cap and the upper part of filler tube 2 before you pull out dipstick 1.

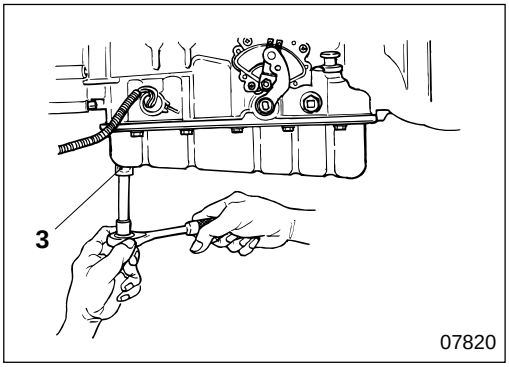
NOTE

- **Make sure the vehicle is parked on level ground when you are checking the fluid level.**
- **Make sure the range selector lever is in the N range and the engine is idling when you are checking the fluid level. When the engine is at standstill, the fluid level appears higher than it actually is.**
- **To ensure the fluid is correct, reinspect the fluid level after an actual drive.**



- If the fluid level is low, top it up to the specified level by supplying automatic transmission fluid (DEXRON II type) through filler tube **2**.

https://truckmanualshub.com/



[Replacement]

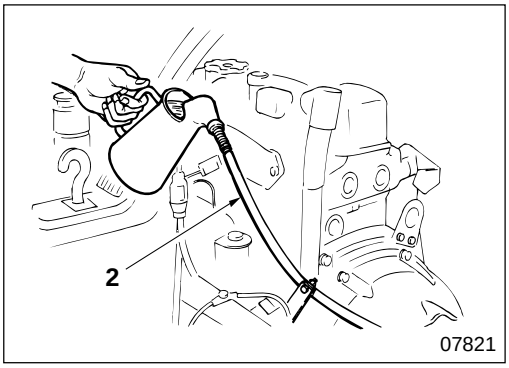
- Place a container under the oil pan, remove drain plug **3** in the front of the oil pan and drain the fluid.

WARNING

Take care because the automatic transmission fluid temperature immediately after the engine has stopped is very high. To avoid scalds, wait until a safe temperature has been reached before draining the fluid.

NOTE

- **The fluid will drain faster if the engine is first run to raise the fluid temperature.**
- **The fluid cannot be drained from the hydraulic circuit, the torque converter or the oil cooler.**



- Reinstall the gasket, and oil pan drain plug **3**.
- Add automatic transmission fluid (DEXRON II type) through filler tube **2**.

CAUTION

Make sure that dirt and foreign particles do not become mixed in with the fluid when it is added.

- Shift the range selector lever into the N range, start the engine and let it idle for at least two minutes.
- After shifting the lever through all ranges once, shift it back into N.

CAUTION

To prevent burning out the interior of the automatic transmission assembly, make sure that the engine is not allowed to race when you do the above.

- Supply the fluid until the fluid level is at the lower limit of the specified area on dipstick **1**. Next, check the fluid level to make sure it is within the specified limit.

NOTE

- **Determining the fluid level immediately after supplying the fluid might be difficult due to the fluid stuck in the inside of the filler tube. Therefore, check the fluid level a few times between intervals.**
- **If the fluid is oversupplied, it will overflow and can be mistaken for leakage.**
- **Let the engine idle and, while paying attention to the fluid level, pour in the fluid slowly.**

https://truckmanualshub.com/

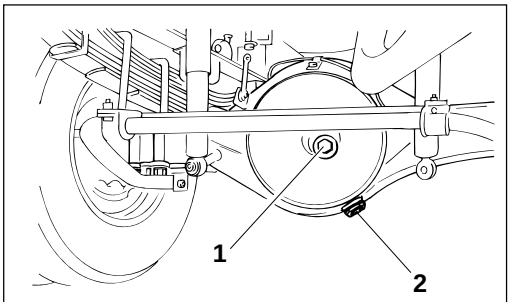
LUBRICATION

Rear Axle Gear Oil

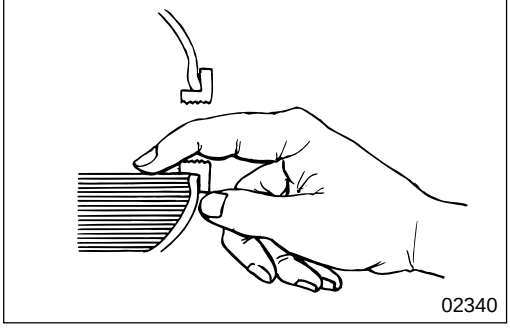
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Inspection plug	98 to 115 {72 to 87, 10 to 12}	—
2	Drain plug	98 to 115 {72 to 87, 10 to 12}	—



02339



02340

[Inspection and replenishment]

WARNING

The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.

- Remove inspection plug **1**, check the oil level and make sure it is up to the edge of the entrance.
- If the oil level is low, add oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Insert inspection plug **1**.

[Replacement]

- Drain the oil after removing inspection plug **1** and drain plug **2**.
- Remove any metal particles sticking to the magnetic part of drain plug **2** before reinstalling the plug.
- Supply oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Reinstall inspection plug **1**.

https://truckmanualshub.com/

Power Steering Fluid

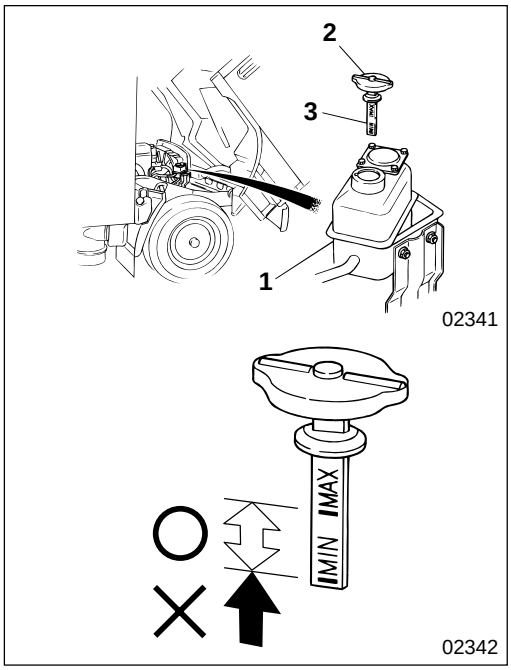
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Pressure tube	29 to 39 {22 to 29, 3 to 4}	—
5	Return tube	39 to 49 {29 to 36, 4 to 5}	—

Fluid

Location	Points of application	Kinds	Quantity
1	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Between MIN and MAX on filler cap dipstick



[Inspection and replenishment]

- Straighten the front wheels and stop the engine.
- Tilt the cab.
- Remove filler cap **2** of power steering oil tank **1** by turning the filler cap counterclockwise.
- Wipe off the fluid sticking to dipstick **3** on filler cap **2**. Replace the filler cap.

NOTE

Check the fluid level without screwing on filler cap 2.

- Carefully lift up filler cap **2** and check the fluid sticking to dipstick **3** to make sure that the fluid is at a point between the “MAX” and “MIN” levels. If the fluid position does not reach the “MIN” level, add fluid.
- After inspection install filler cap **2** by turning it clockwise.

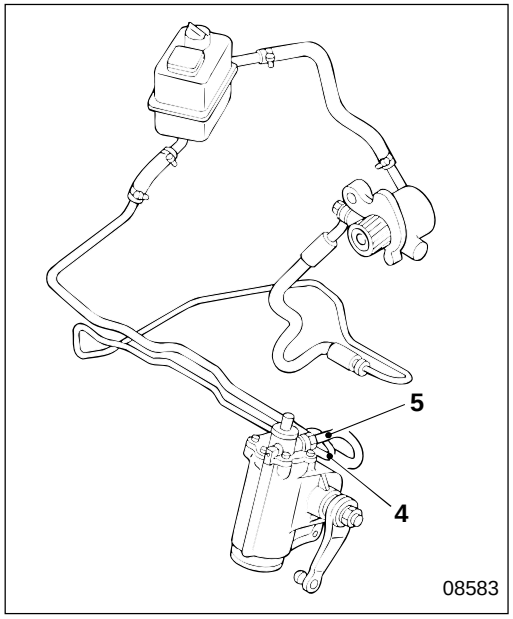
WARNING⚠

Close filler cap 2 firmly; otherwise the fluid will leak and could catch fire. Also wipe up spilled fluid.

CAUTION⚠

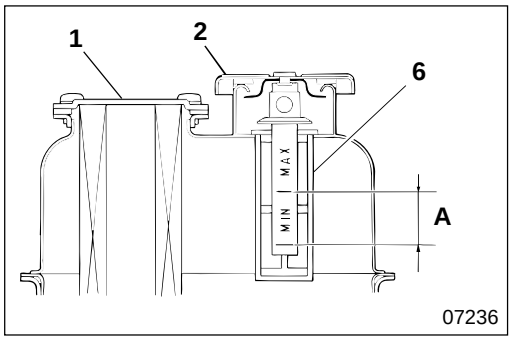
If the fluid level is far below the recommended range, the fluid may be leaking.

https://truckmanualshub.com/



[Replacement]

- Drainage
  - Jack up the front wheels.
  - Release pressure tube **4** and return tube **5** connected to the power steering booster.
  - Turn the steering wheel fully left and right repeatedly, and drain the fluid from the power steering booster.
  - After draining the fluid, tighten pressure tube **4** and return tube **5** at specified torque.



[Fluid supply]

- Pour fluid into power steering oil tank **1** up to the inner port of strainer **6**.
- With the engine stopped, jack up the front wheels and turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.

NOTE

Check the fluid level without screwing on filler cap 2.

- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times to raise the fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise, bleeding is completed.
- When bleeding is finished, check fluid level of power steering oil tank **1**, and pipe and hose connections for fluid leakage.

https://truckmanualshub.com/

Brake Fluid

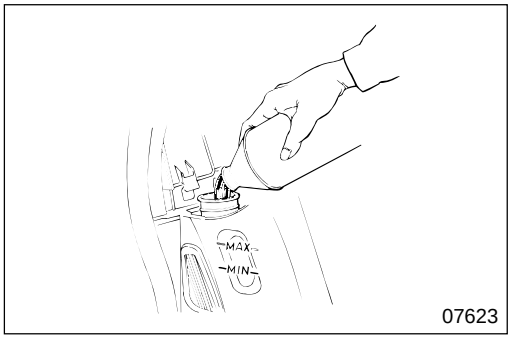
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened		Tightening torque	Remarks
1	Air bleeder	Front disc brake	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Rear wheel cylinder < FE639 >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Rear disc brake < FE649 >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Bypass valve	8.8 to 13 {6.5 to 9.4, 0.9 to 1.3}	—

Fluid

Location	Points of application	Kinds	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required



WARNING

- **The clutch fluid system and the brake fluid system use the fluid tank in common. Therefore, replacement and air bleeding of the clutch fluid must be carried out simultaneously with that of the brake fluid. Gr 21**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose.**

CAUTION

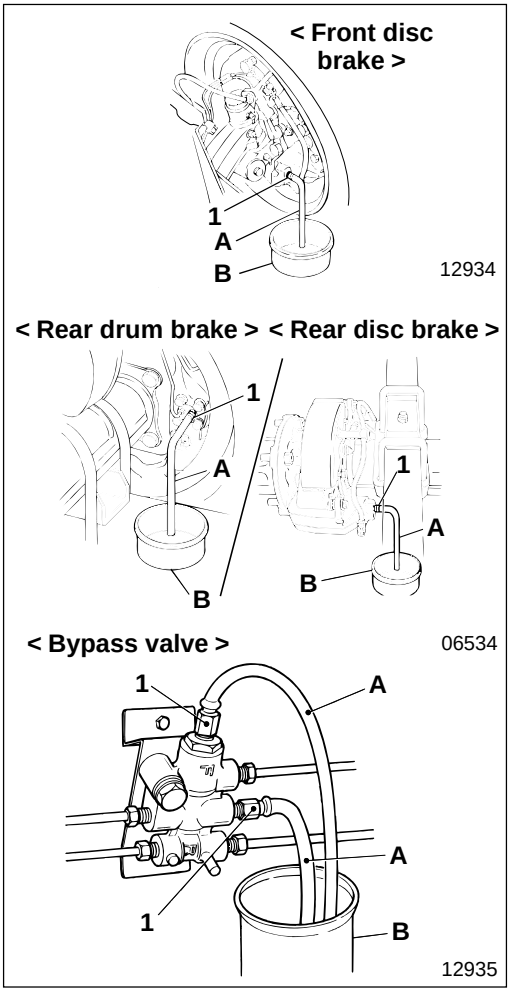
- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

NOTE

Supply brake fluid to maintain the “MAX” level of the fluid tank always.

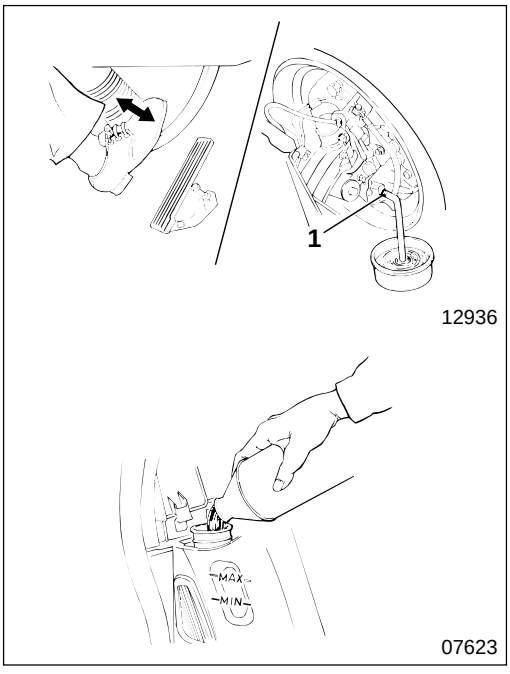
[Inspection and replenishment]
Inspect the level of the brake fluid in the fluid tank. It should be between the “MAX” and “MIN” levels. If it is below the “MIN” level, lift up the lid and remove the cap from the fluid tank, then add specified brake fluid until the level reaches the “MAX” level. Do not fill above the “MAX” level.

https://truckmanualshub.com/



[Replacement]

- Start the engine and let it idle until you complete brake fluid replacement.
- Attach vinyl pipe **A** to the front disc brake, the rear drum brake < FE639 >, the rear disc brake < FE649 > and the bypass valve.
- Place the free end of vinyl pipe **A** into container **B**.



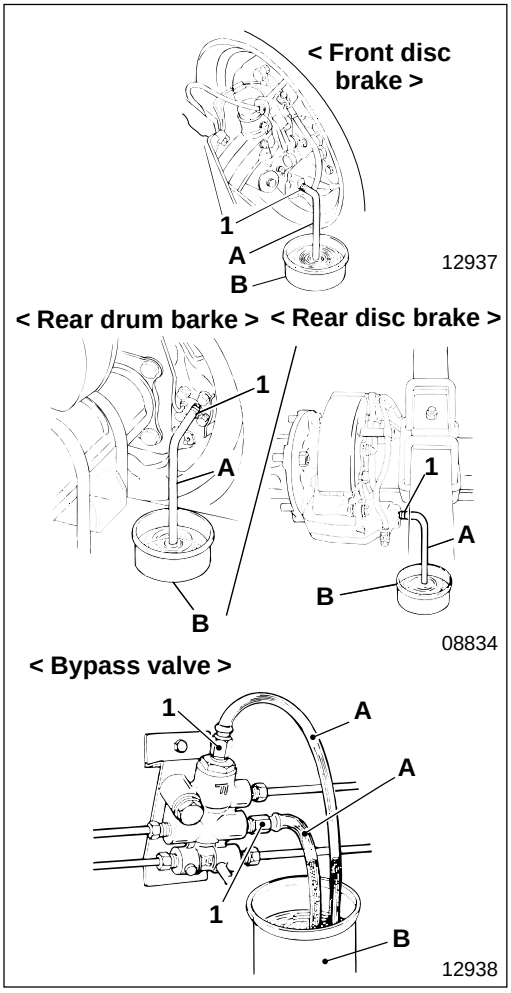
- Loosen air bleeders **1** and depress the brake pedal several times to drain brake fluid completely.
- Maintaining a supply of new brake fluid up to the “MAX” level of the fluid tank, depress the brake pedal repeatedly until the old brake fluid of the brake system is replaced with new fluid. After you complete the work, tighten each air bleeder **1** at specified torque.

NOTE

You can tell when the brake fluid has been completely replaced because the fluid coming out will be a different color.

- Carry out air bleeding of the brake system.

https://truckmanualshub.com/



[Air bleeding]

- Start the engine and let it idle until you complete air bleeding of the brake system.
- Attach vinyl pipe **A** to the front disc brake, the rear drum brake < FE639 >, the rear disc brake < FE649 > and the bypass valve.
- Place the free end of vinyl pipe **A** into container **B**, then bleed air from the brake system as follows:

< Front brake system >

Disc brake, RH

↓

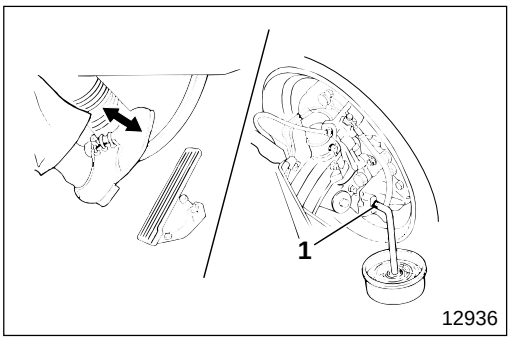
Disc brake, LH

< Rear brake system >

FE639	FE649
Drum brake, RH	Disc brake, RH
↓	↓
Drum brake, LH	Disc brake, RH

< Bypass valve system >

Bypass valve



- Depress the brake pedal slowly several times, and with the brake pedal depressed, loosen air bleeder **1** to discharge air together with the brake fluid. After closing the air bleeder, release the brake pedal.
- Repeat the above operation until air bubbles are no longer present in the brake fluid discharged from air bleeder **1**.
- When the discharged fluid is free of air bubbles, tighten air bleeder **1** at specified torque.
- Make sure that the brake fluid level is at the “MAX” level of the brake fluid tank, and depress the brake pedal several times to ensure that the brake fluid does not leak from anywhere. Then, conduct a brake test.

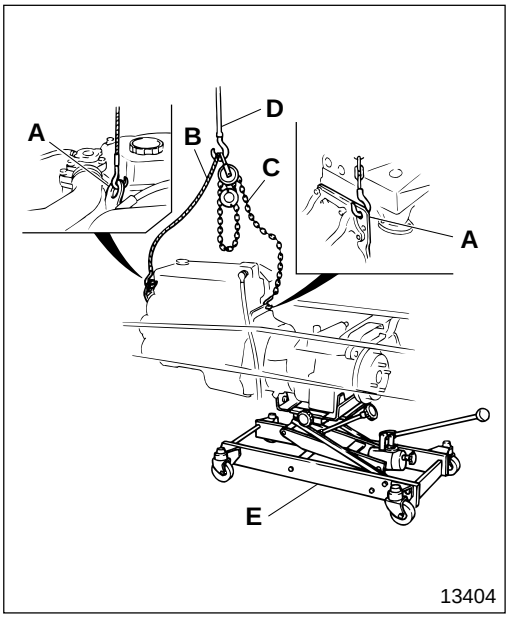
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

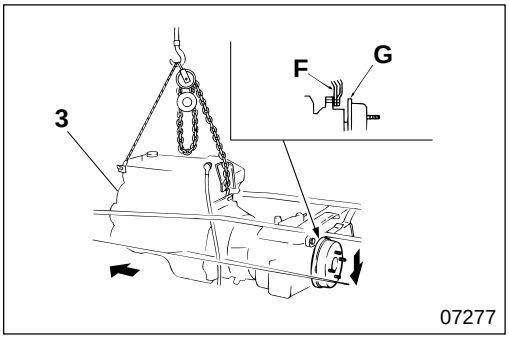
Location	Parts to be tightened		Tightening torque	Remarks
1	Nut (Front mounting installation)		68 to 88 {50 to 65, 6.9 to 9.0}	—
2	Bolt (Rear mounting installation)	Manual transmission	125 to 175 {94 to 130, 13 to 18}	—
		Automatic transmission	83 to 105 {61 to 80, 8.5 to 11.0}	—

◆ Service procedure

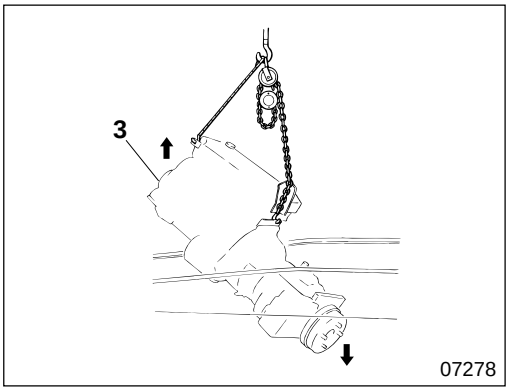


3 Removal of engine and transmission assembly

- Hook cable **B** and chain block **C** to two hangers **A** on the engine and transmission assembly and lift the engine using crane **D** until the lifting gear becomes taut.
- Support the transmission using transmission jack **E**.
- Make sure that wiring and hoses are disconnected.



- Lower the transmission carefully so that transmission back plate **G** does not hit engine rear support **F** then move engine and transmission assembly **3** forward.



- Lift engine and transmission assembly **3** carefully adjusting the lifting angle. As the transmission appears from the front of the rear body turn the transmission 90° clockwise and place it down on the right side carefully so that it does not hit the frame or cab.

13 Harness (Chassis harness)
14 Cooler compressor Gr 55A
15 Harness (Chassis harness)
16 Vacuum hose
17 Front pipe Gr 15
18 Air intake hose Gr 15

NOTE

- **For vehicles fitted with an air-conditioner do not disconnect the hose that goes to the air-conditioner from cooler compressor 14 when you remove it otherwise you will have to recharge the air-conditioner with refrigerant.**
- **After removing cooler compressor 14 tie it to the frame temporarily.**

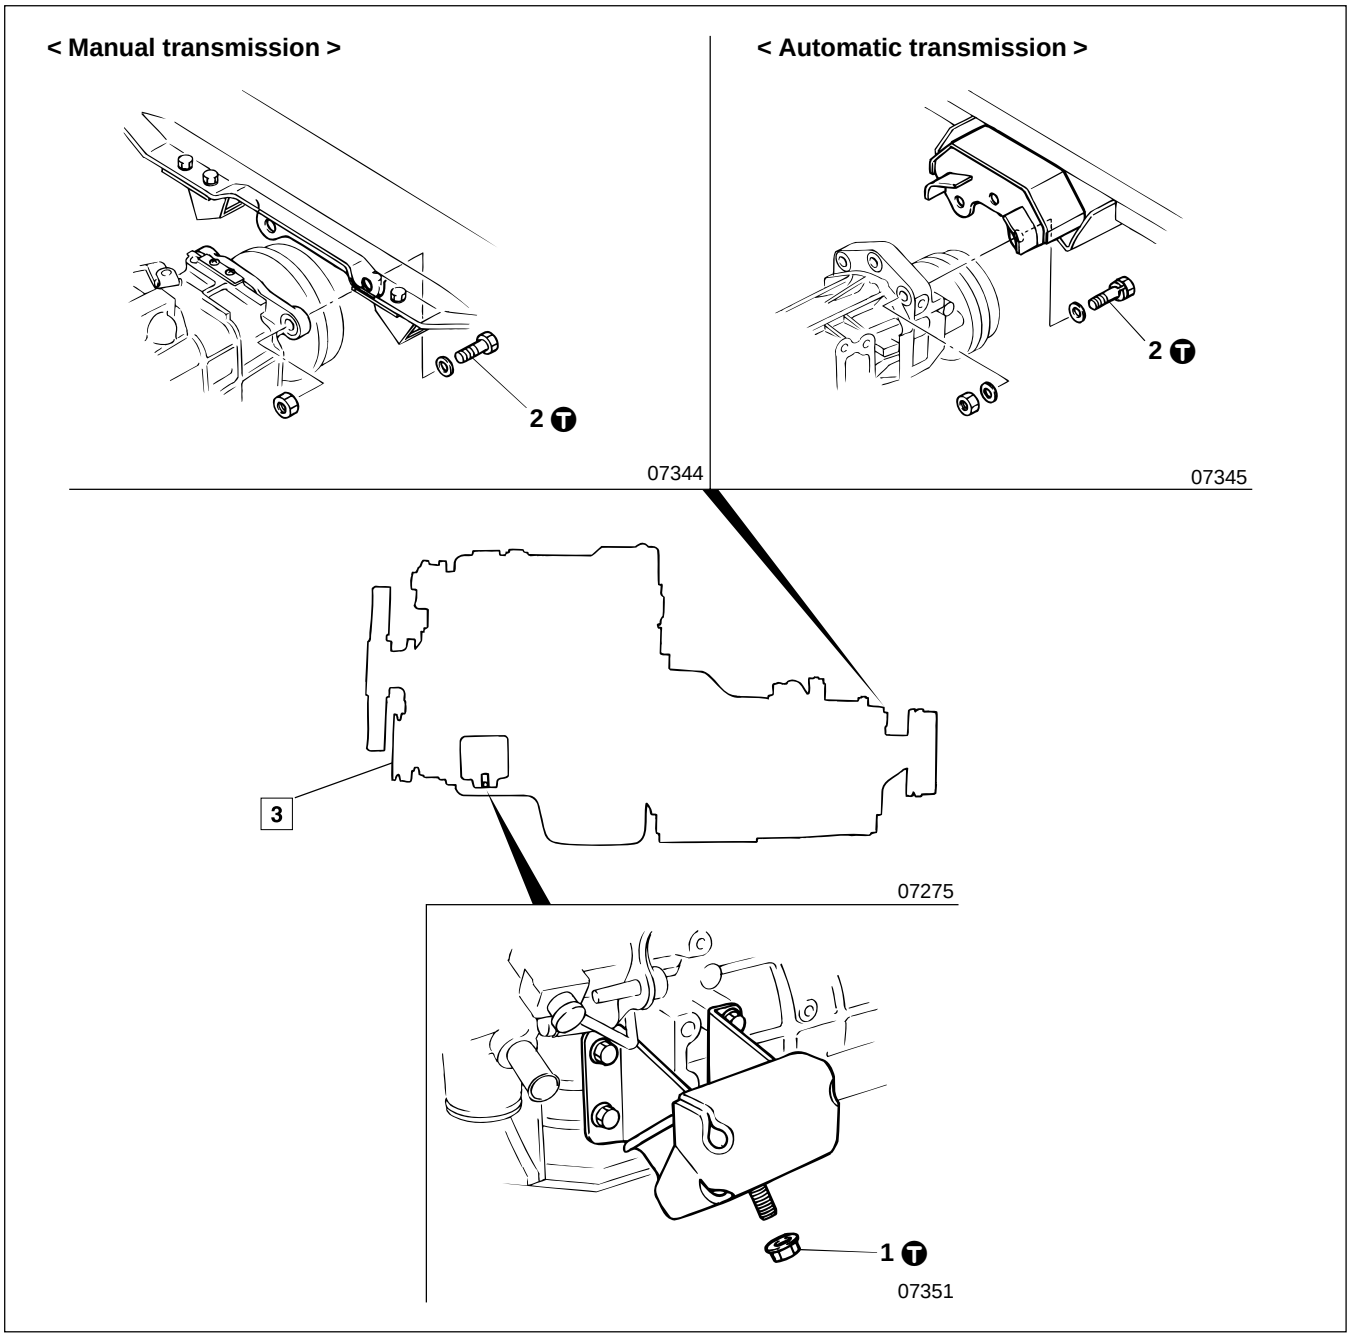
● **Installation sequence**

Follow the removal sequence in reverse.

https://truckmanualshub.com/

REMOVAL AND INSTALLATION OF ENGINE

Removal and Installation of Engine



● **Removal sequence**

1 Nut
2 Bolt
3 Engine and transmission assembly

WARNING⚠

When you lift engine and transmission assembly 3 you must use lifting gear that is strong enough to lift the mass of the engine and transmission assembly (400 to 480 kg {880 to 1060 lb}).

● **Installation sequence**

Follow the removal sequence in reverse.

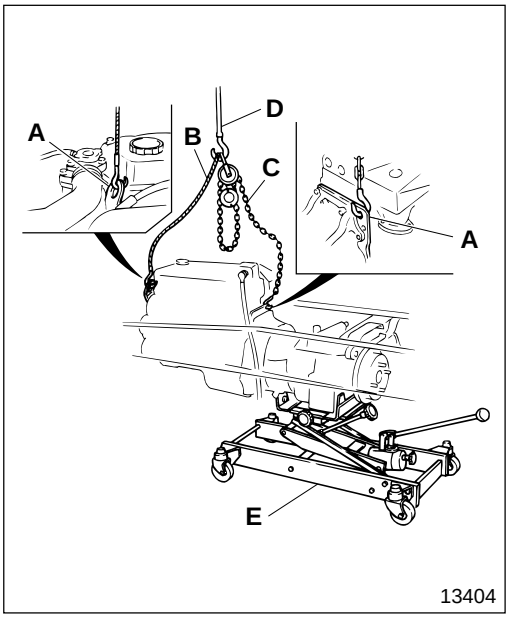
https://truckmanualshub.com/

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

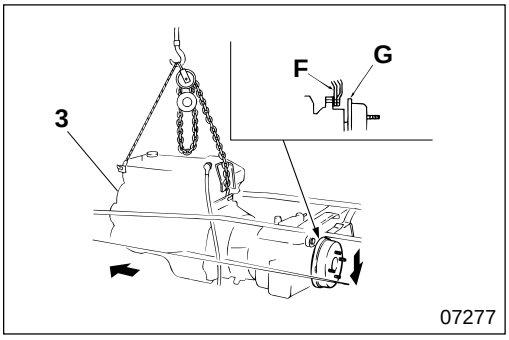
Location	Parts to be tightened		Tightening torque	Remarks
1	Nut (Front mounting installation)		69 to 78 {51 to 59, 7 to 8}	—
2	Bolt (Rear mounting installation)	Manual transmission	125 to 175 {94 to 130, 13 to 18}	—
		Automatic transmission	83 to 105 {61 to 80, 8.5 to 11.0}	—

◆ Service procedure

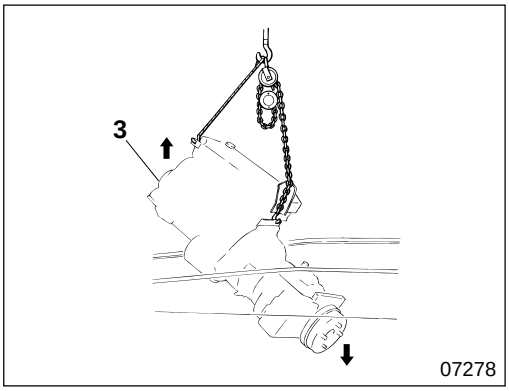


3 Removal of engine and transmission assembly

- Hook cable **B** and chain block **C** to two hangers **A** on the engine and transmission assembly and lift the engine using crane **D** until the lifting gear becomes taut.
- Support the transmission using transmission jack **E**.
- Make sure that wiring and hoses are disconnected.



- Lower the transmission carefully so that transmission back plate **G** does not hit engine rear support **F** then move engine and transmission assembly **3** forward.



- Lift engine and transmission assembly **3** carefully adjusting the lifting angle. As the transmission appears from the front of the rear body turn the transmission 90° clockwise and place it down on the right side carefully so that it does not hit the frame or cab.

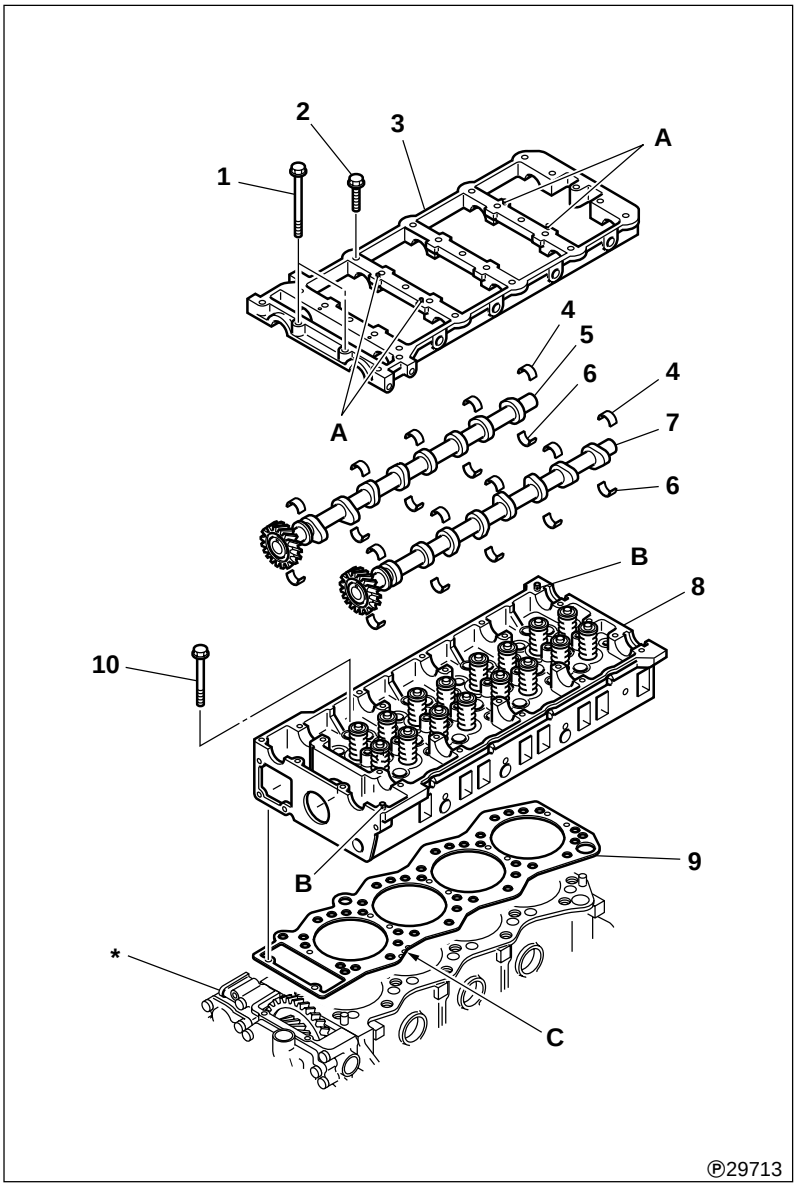
Cylinder Head, Cylinder Head Gasket, Camshaft and Camshaft Frame



1 Bolt (x 2)
2 Bolt (x 13)
3 Camshaft frame
4 Camshaft bearing (Upper)
5 Exhaust camshaft
6 Camshaft bearing (Lower)
7 Inlet camshaft
8 Cylinder head
9 Cylinder head gasket
10 Cylinder head bolt

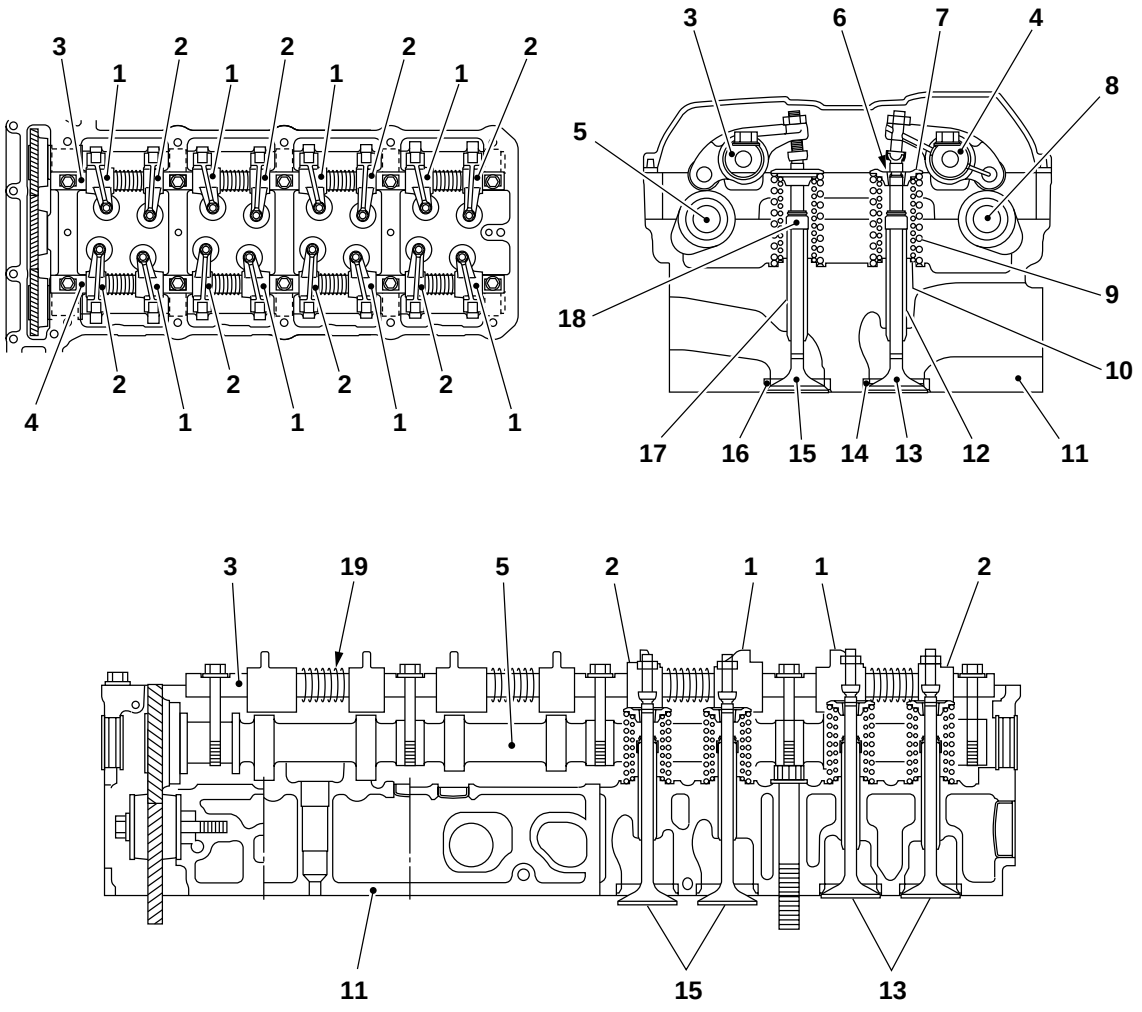
A: Locating pin
B: Locating pin
C: Notched portion
***:** Front

- The camshafts **5** and **7** have their journals supported by the cylinder head **8**, and are held down from above by the camshaft frame **3**.
- The camshaft bearings **4** and **6**, both upper and lower, are identical parts. When they are reassembled, however, be sure to reinstall them in their original positions, as they were before disassembly.
- The exhaust camshaft **5** and the inlet camshaft **7** have the same gears but use different cams. Use care not to confuse them at reassembly.
- As for the cylinder head gasket **9**, select and use one of proper thickness suitable for the projection of piston. The thickness of gaskets is identifiable by a difference in the shape of the notched portion **C**.
- The bolts **2** (x 13) are threaded into the cylinder head **8**, whereas the bolts **1** (x 2) are threaded into the front case*.

https://truckmanualshub.com/

STRUCTURE AND OPERATION

Valve Mechanism



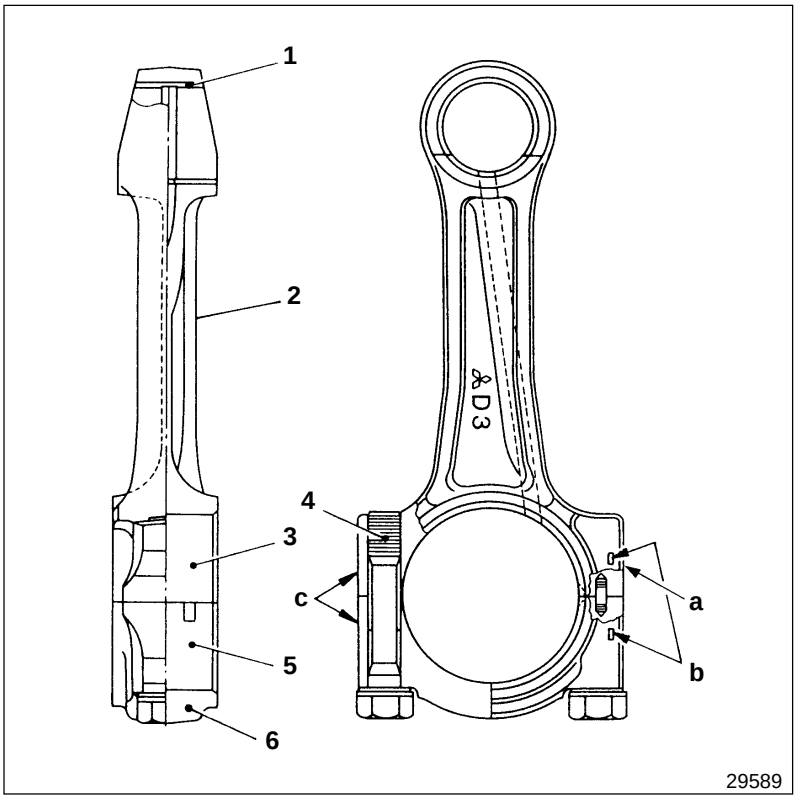
Ⓟ29714

1 Short rocker
2 Long rocker
3 Exhaust rocker shaft
4 Inlet rocker shaft
5 Exhaust camshaft
6 Valve collet
7 Upper retainer
8 Inlet camshaft
9 Outer valve spring
10 Inner valve spring
11 Cylinder head
12 Inlet valve guide
13 Inlet valve
14 Inlet valve seat
15 Exhaust valve
16 Exhaust valve seat
17 Exhaust valve guide
18 Valve stem seal
19 Rocker shaft spring

- The rockers come in two types; short rockers **1** and long rockers **2**, and are mounted in different directions as illustrated.
- The valve springs include the outer springs **9** and inner springs **10**. A pair of outer and inner springs are used for a valve.

https://truckmanualshub.com/

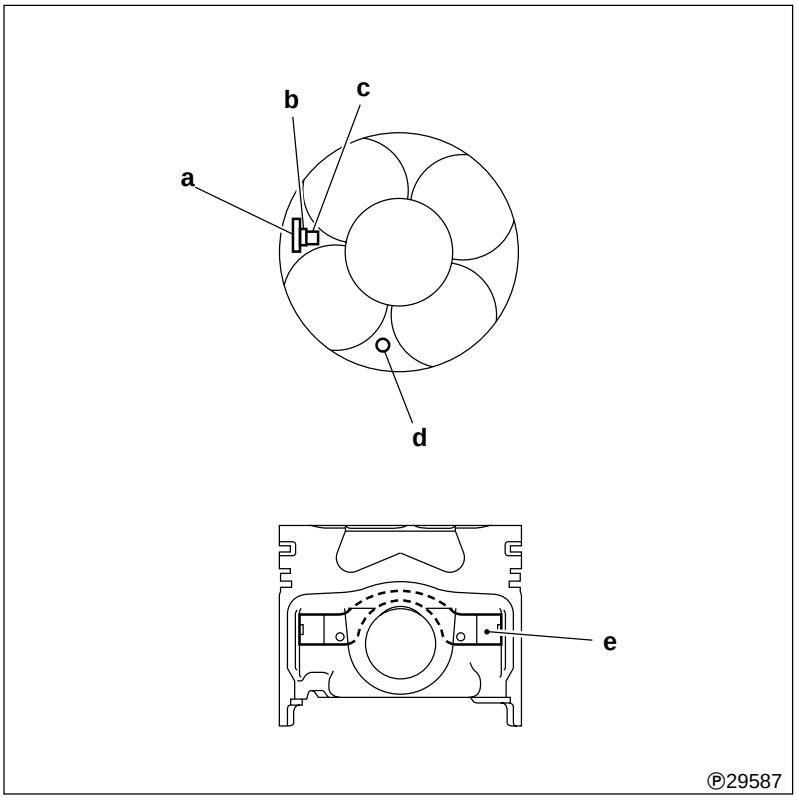
Connecting Rods



1 Connecting rod bushing
2 Connecting rod
3 Upper connecting rod bearing
4 Connecting rod bolt
5 Lower connecting rod bearing
6 Connecting rod cap

***a:** Weight mark stamp
"A" to "G"
(where "A" indicates the maximum connecting rod weight.)
***b:** Alignment mark
***c:** Alignment mark

Pistons

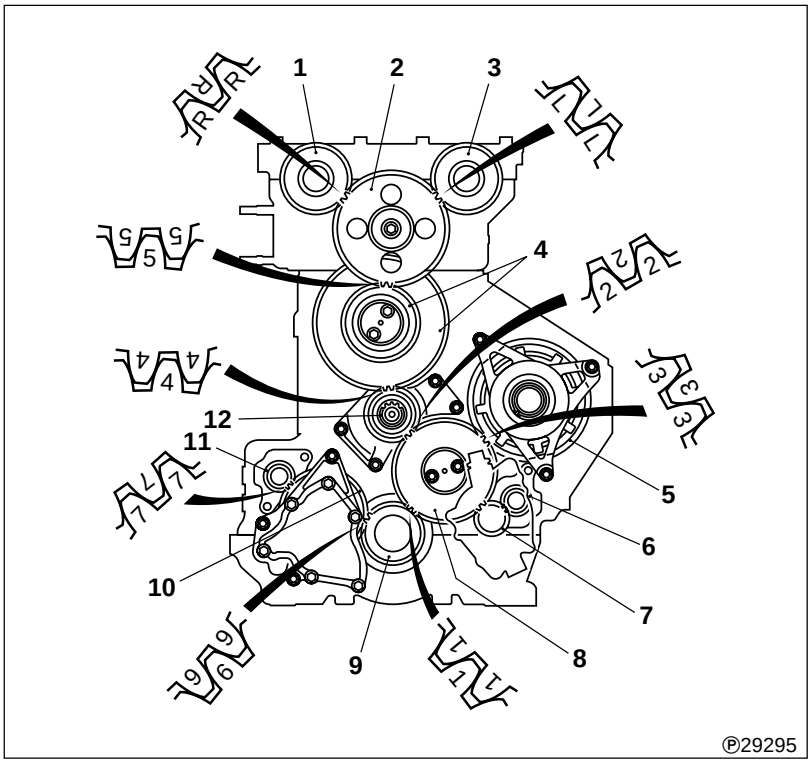


a: Part number
b: Weight mark
c: Size mark
"**A**", "**B**"
Pistons marked "**B**" are larger than those marked "**A**" in the outside diameter.
d: Front mark
Indicated by "○".
e: Strut

- Pistons to be used can be selected by matching the size mark of the piston with that of the cylinder liner. P. 11A-11
- The piston is made of special aluminum alloy. Its total height is relatively low and both end faces of the piston in the direction of the piston pin are concaved for weight reduction.
- The piston is an autothermic piston reinforced with strut **e**.

https://truckmanualshub.com/

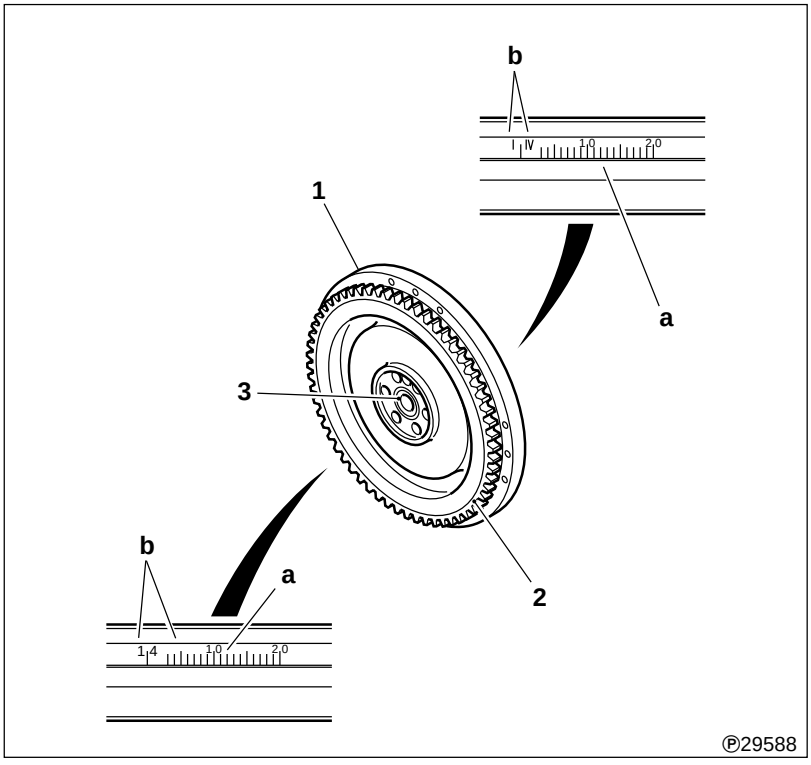
Timing Gears



1 Camshaft gear RH (32)
2 Head idler gear (54)
3 Camshaft gear LH (32)
4 Idler gear (63, 36)
5 Injection pump gear (56)
6 Balance shaft gear LH (14)
7 Vacuum pump gear (15)
8 No. 1 idler gear (49)
9 Crankshaft gear (28)
10 Oil pump gear (41)
11 Balance shaft gear RH (14)
12 Fan shaft (25)
Number of teeth shown in parentheses

Each of the timing gears (except the vacuum pump gear) has alignment marks to ensure correct assembly.

Flywheel

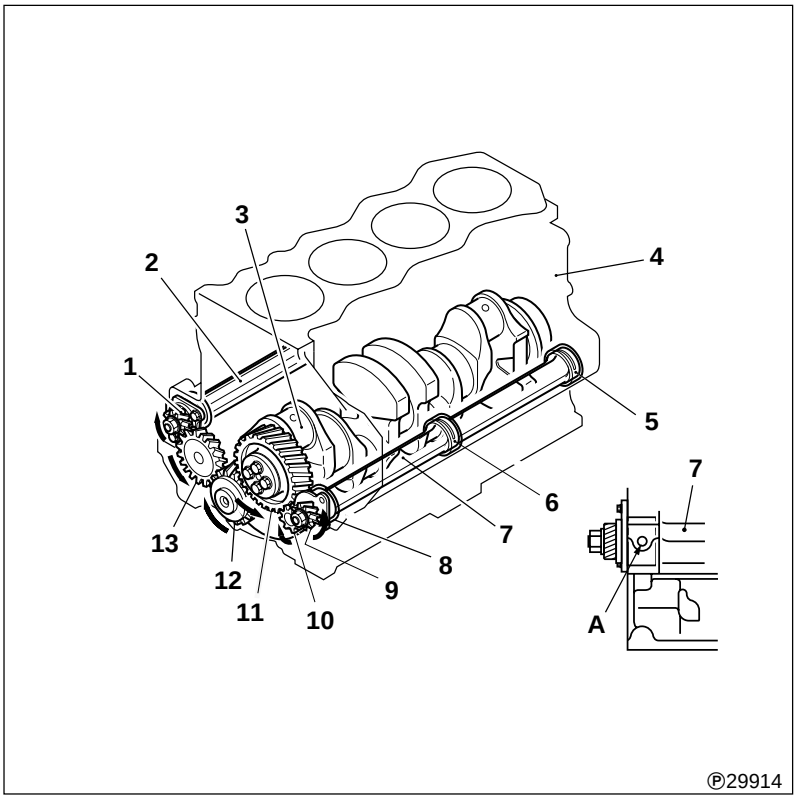


1 Flywheel
2 Ring gear
3 Pilot bearing

a: Angle scale
b: Cylinder No. (“1 4”, “I IV”)

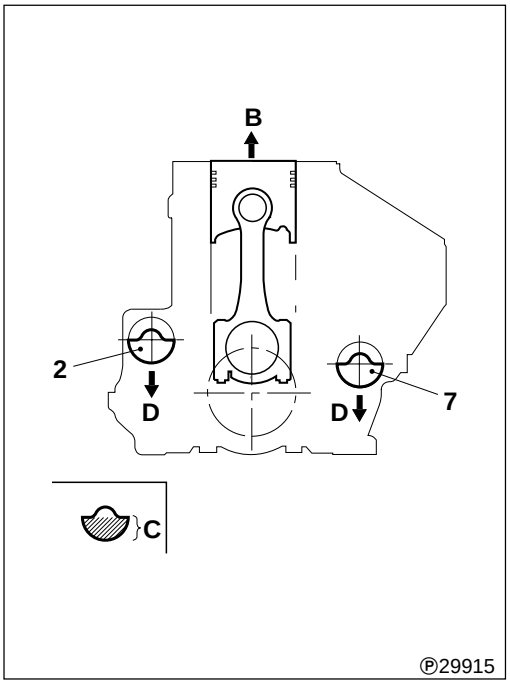
https://truckmanualshub.com/

Balance Shaft



1 Balance shaft gear RH
2 Balance shaft RH
3 Crankshaft
4 Upper crankcase
5 No. 3 balance shaft bushing
6 No. 2 balance shaft bushing
7 Balance shaft LH
8 No. 1 balance shaft bushing
9 Balance shaft gear LH
10 Vacuum pump gear
11 No. 1 idler gear
12 Crankshaft gear
13 Oil pump gear

- The balance shafts RH **2** and LH **7** are mounted in the upper crankcase **4** with the crankshaft **3** sandwiched in between, and serve to reduce the engine vibration caused by rotation of the crankshaft.
- Both balance shafts RH **2** and LH **7** are supported by the three balance shaft bushings **5**, **6** and **8** mounted in upper crankcase **4** and driven by the timing gears (🕮 P. 11A-8).
- The balance shaft LH **7** is provided with a positioning hole **A** to ensure correct assembly. 🕮 P. 11A-59

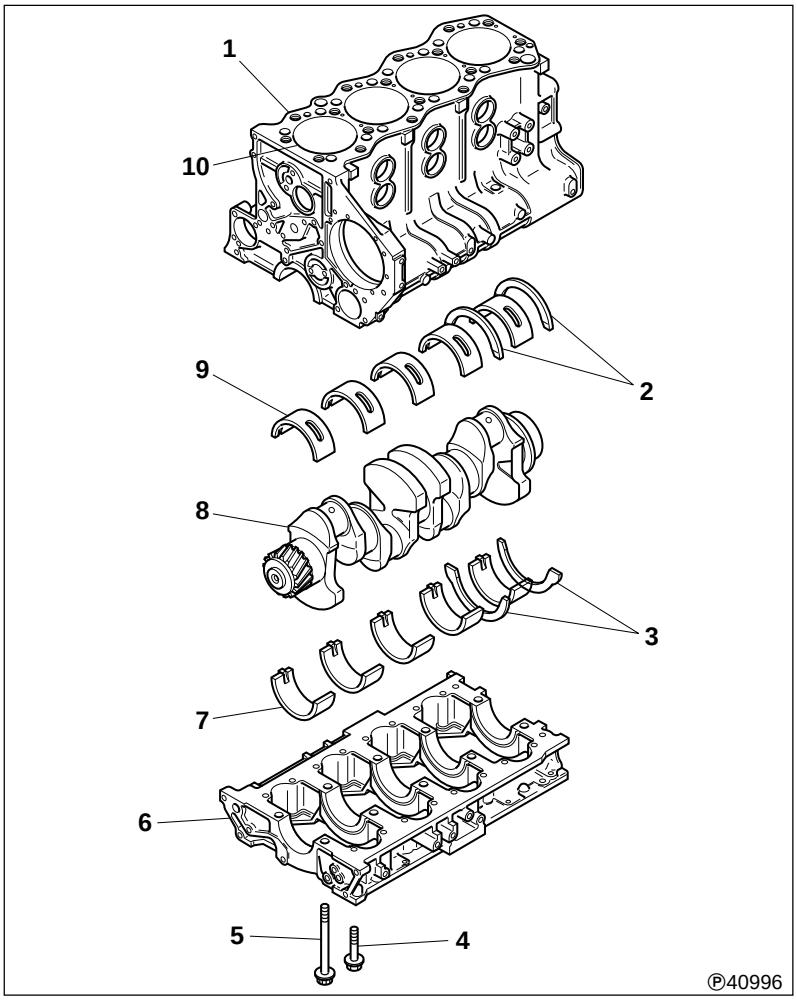


● **Reduction of vertical vibration (Secondary components)**

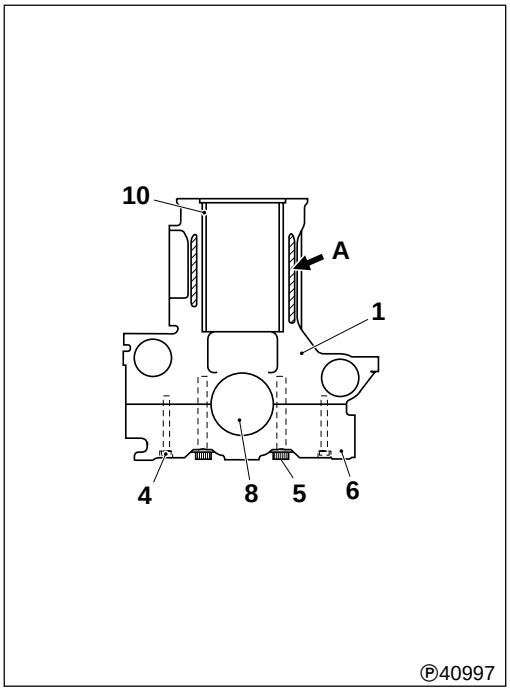
- The reciprocating motion of the piston produces inertial force **B**, the source of vertical vibration, at the top and bottom dead centers of the piston.
- The balance shafts RH **2** and LH **7** rotate in such a way that at the top and bottom dead centers of the piston, the semi-circular weight portion **C** will always be placed opposite to the piston head in terms of top or bottom position.
- As a result, at the top and bottom dead centers of the piston, both balance shafts RH **2** and LH **7** produce equal centrifugal force **D** to offset inertial force **B** of the piston, thereby reducing vertical vibration.
- In addition, in the medium and high engine speed ranges, the crankshaft rotation moments (secondary components) are also reduced by the balance shafts.

https://truckmanualshub.com/

Crankcase and Main Bearings



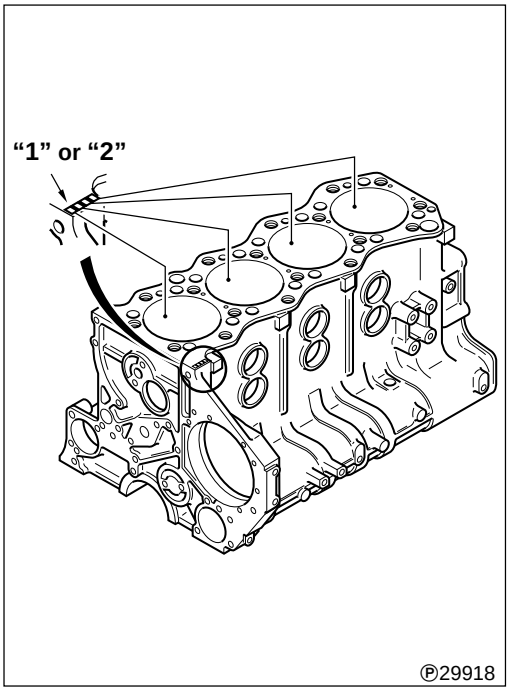
1 Upper crankcase
2 Upper thrust plate
3 Lower thrust plate
4 Bolt
5 Main cap bolt
6 Lower crankcase
7 Lower main bearing
8 Crankshaft
9 Upper main bearing
10 Cylinder liner



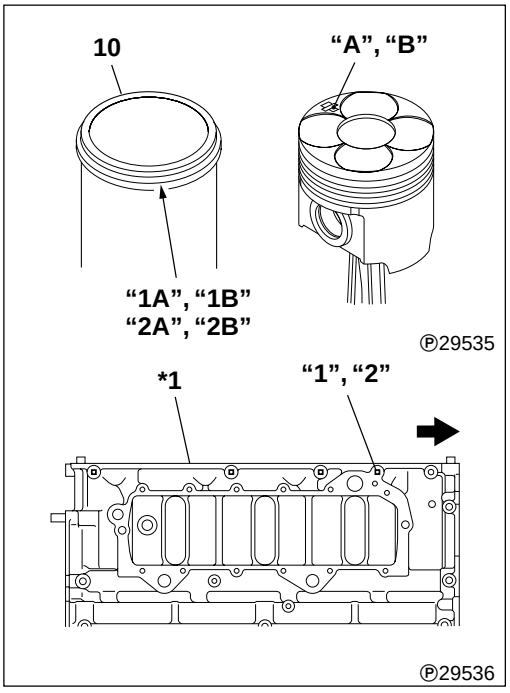
● **Crankcase**

- The crankcase is composed of two parts; upper crankcase **1** and lower crankcase **6**, which are coupled together with crankshaft **8** in between.
- The upper crankcase **1** has four cylinder bores provided into which cylinder liners **10** are fitted.
- Water jacket **A** is provided around the cylinders to cool down the cylinder liners **10**.
- The bolts **4** used to couple the upper crankcase **1** and the lower crankcase **6** and the main cap bolts **5** require the specified procedure to be followed when tightened. 📖 P. 11A-79

https://truckmanualshub.com/



- Size mark "**1**" or "**2**" is stamped on the upper crankcase **1** for selective fitting of pistons in the crankcase.
- The size marks for the four cylinders are collectively stamped at a single location, and indicate the sizes of the respective cylinder liners as illustrated. P. 11A-7

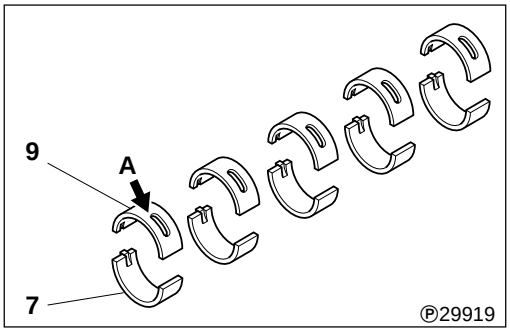


● **Cylinder liner**

- Select a cylinder liner **10** which has the same size mark as those stamped on the upper crankcase ***1*** the piston.
- The size marks on the upper crankcase ***1*** are arranged in the order of No. **1**, **2**, **3** and **4** cylinders starting from the engine front **C**.

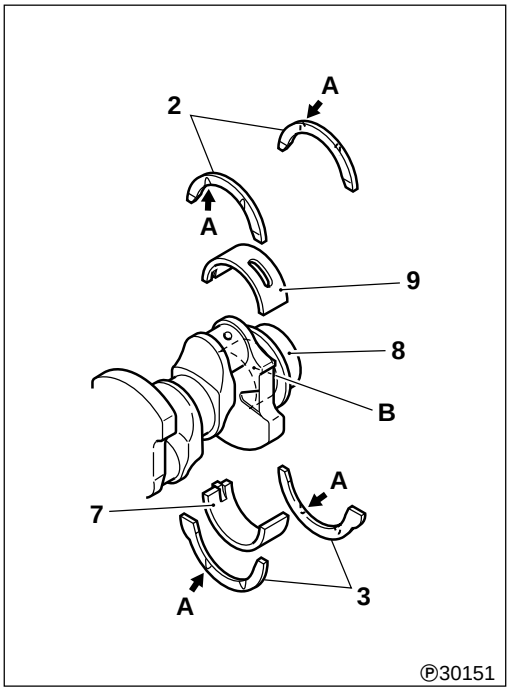
Size marks on upper crankcase	Size marks on cylinder liners	Size mark on pistons
"1"	"1A"	"A"
	"1B"	
"2"	"2A"	"B"
	"2B"	

https://truckmanualshub.com/



● **Main bearings**

The upper main bearing **9** has an oil hole **A** through which engine oil is supplied to the journal of the crankshaft **8**.

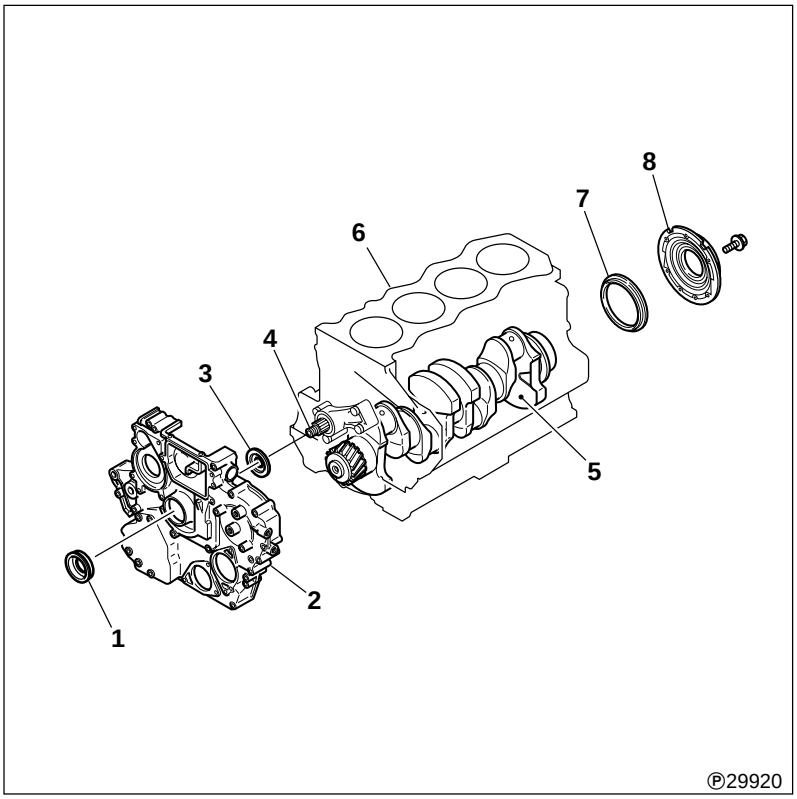


● **Thrust plates**

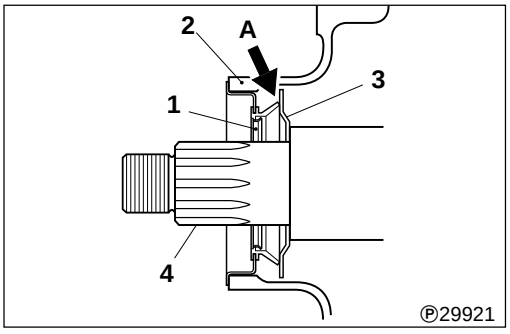
- The thrust plates include upper thrust plates **2** and lower thrust plates **3**. They are mounted at both ends of the upper main bearing **9** and the lower main bearing **7** at the rearmost portion of the crankshaft **8**.
- The thrust plates to be used should have a proper thickness suitable for the end play of the crankshaft **8**.
  Each thrust plate has an oil groove in two places to assure its smooth sliding on the journal **B** of the crankshaft **8**.

https://truckmanualshub.com/

Oil Seals

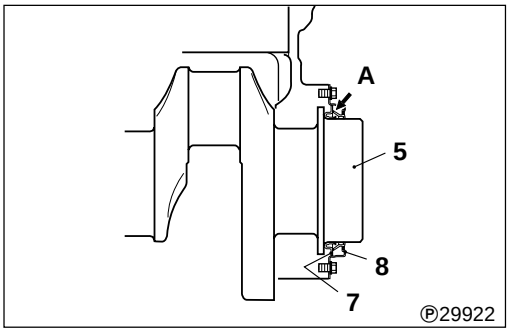


1 Front oil seal
2 Front case
3 Front oil seal slinger
4 Fan shaft
5 Crankshaft
6 Crankcase
7 Rear oil seal slinger
8 Rear oil seal



● **Front Oil Seal**

- The front oil seal **1** is mounted on the front case **2**. Its lip **A** is in contact with the front oil seal slinger **3** for sealing.
- The front oil seal slinger **3** is fitted on the fan shaft **4**.



● **Rear Oil Seal**

- The rear oil seal **8** is mounted on the crankcase **6**. Its lip **A** is in contact with the rear oil seal slinger **7** for sealing.
- The rear oil seal slinger **7** is press-fitted on the rear end of the crankshaft **5**.

ON-VEHICLE INSPECTION AND ADJUSTMENT

Measuring Compression Pressure
Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Compression pressure	Each cylinder (at 200 rpm)	2550kPa {370 psi², 26 kgf/cm²}	1960 kPa {285 psi², 20 kgf/cm²}	Inspect
		Cylinder-to-cylinder pressure difference	–	0.4 kPa {57 psi², 4 kgf/cm²}	Inspect

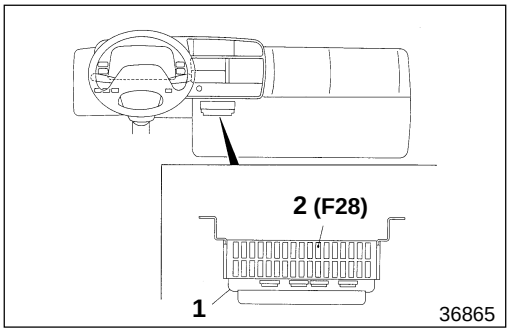
Special tools

Unit: mm {in.}

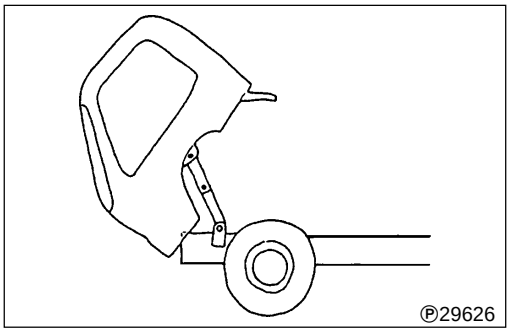
Location	Tool name and shape	Part No.	Application
–	Compression Gauge Adapter 	MH063434	Measuring compression pressure

A drop in compression pressure should be used as a guide in determining a time to overhaul the engine.
Measure the compression pressure at regular intervals, and keep track of its transition which will provide a useful tool for troubleshooting. On a new vehicle, or for a while after replacement of parts with new ones, the compression pressure will be somewhat higher, depending on the break-in condition of piston rings, valve seats, etc., but will return to normal as the parts wear down.

- Prior to an inspection, check to ensure that the engine oil, starter and battery are in normal condition.
- Place the vehicle in the following condition.
  - Warm up the engine until the coolant temperature reaches approx. 75 to 85 °C {167 to 185 °F}.
  - Turn off the lights and auxiliaries.
  - Place the transmission in neutral.
  - Place the steering wheel in the straight-ahead position.

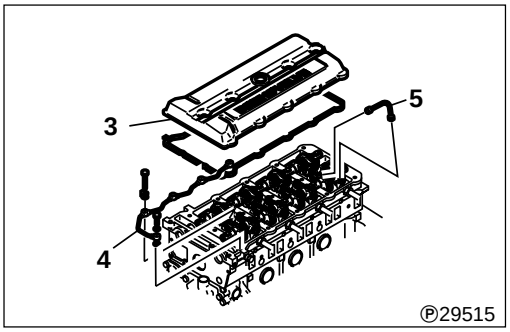


- Remove the fuel cut motor fuse **2** from the fuse box **1** in the cab to make sure that the fuel is not injected when the engine is cranked by the starter.

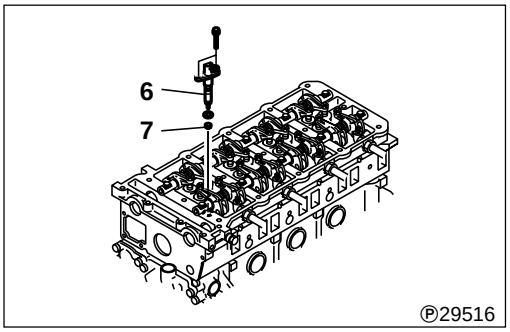


- Tilt the cab.

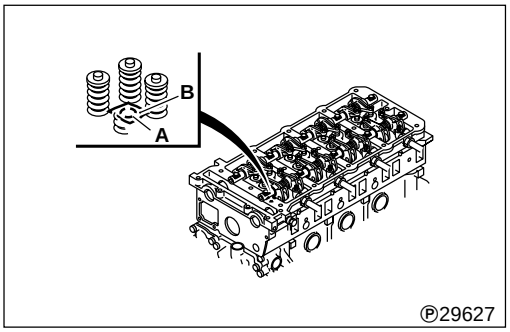
https://truckmanualshub.com/



- Remove the rocker cover **3**, fuel leak-off pipe **4** and injection pipe **5**.
  P. 11A-20



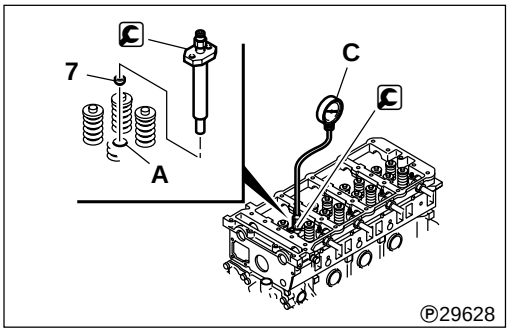
- Remove all injection nozzle assemblies **6** and nozzle gaskets **7**.
  P. 11A-34



- Cover the injection nozzle mounting holes with pieces of waste cloth **B**. After cranking the engine by the starter, check to ensure that no foreign substances are deposited on the waste cloth.

WARNING ⚠

If there is a crack in any of the cylinders, some of the coolant, engine oil, fuel, etc. will enter the cylinder through the crack.
If the engine is cranked in such a condition, these substances heated to high temperatures will blow out from nozzle mounting holes A and can be very dangerous. When the engine is cranked, therefore, stay away from the nozzle mounting holes.



- Fit the nozzle gasket **7** and the C Compression Gauge Adapter onto the injection nozzle mounting hole **A** and mount the compression gauge **C**.
- Crank the engine and measure the compression pressure.
- On all of the cylinders, measure the compression pressure and determine the pressure difference between cylinders.
- If any compression pressure or cylinder-to-cylinder pressure difference is out of the limits, pour in a small amount of engine oil from injection nozzle mounting hole **A** and check by measuring the compression pressure again.
  - If the compression pressure increases:
    Worn/damaged piston rings and cylinder inner surfaces are suspected.
  - If the compression pressure remains unchanged:
    A seized valve, incorrectly seated valve or defective cylinder head gasket is suspected.

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

Inspecting and Adjusting Valve Clearances

Service standards

Unit: mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
–	Valve clearance (when cold)	Inlet	0.4 {0.016}	–	Adjust
		Exhaust	0.5 {0.020}	–	Adjust

❶ Tightening torques

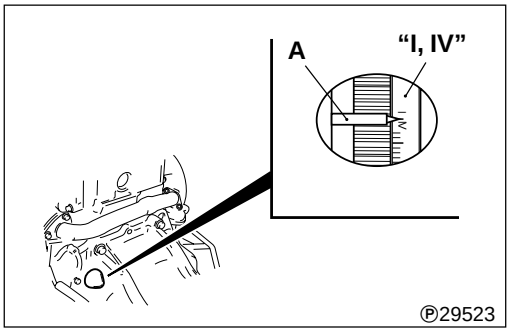
Unit: N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Lock nut (adjusting screw tightening)	11.2 {8.25, 1.14}	–

Valve clearances should be checked and adjusted as follows while the engine is cold.

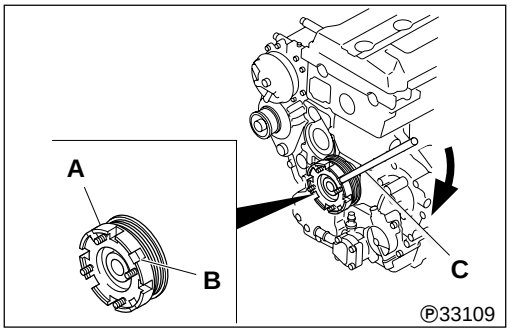
[Inspection]

- Tilt the cab.
- Remove the rocker cover. 📖 P. 11A-20
- To place the piston No. 1 or No. 4 at the top dead center on the compression stroke, crank the engine until the pointer **A** in the clutch housing inspection window is aligned with the mark between "**I** and **IV**" inscribed in the flywheel.

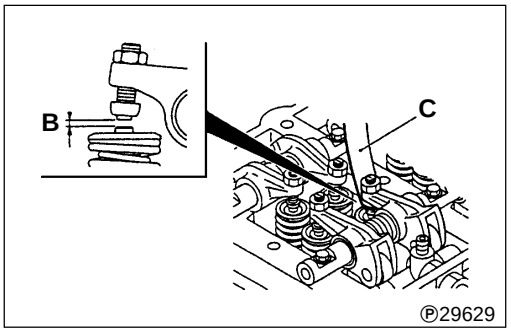


NOTE:

Find the cylinder where the rocker arms for both the inlet and exhaust valves can be pushed down. The piston of the cylinder is at the top dead center (TDC) on the compression stroke.



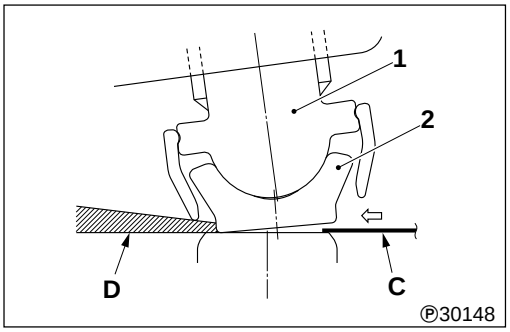
- Use a1/2" drive extension bar **C** (for socket wrench) to crank the engine; insert its end in the groove **B** located on the outer circumference of the fan pulley **A** to turn the crankshaft.



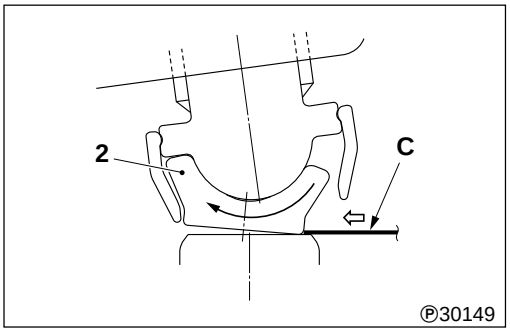
- With the piston No. 1 or No. 4 at the top dead center (TDC) on the compression stroke, measure the valve clearance **B** at the valves marked × in the following table.

Cylinder No.	1		2		3		4	
Valve arrangement	IN	EXH	IN	EXH	IN	EXH	IN	EXH
Piston No. 1 at TDC on compression stroke	×	×	×	–	–	×	–	–
Piston No. 4 at TDC on compression stroke	–	–	–	×	×	–	×	×

https://truckmanualshub.com/



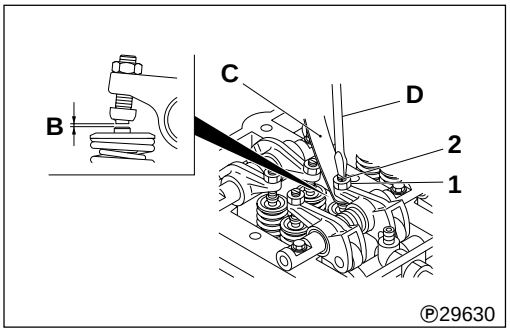
- When measuring the clearances, push the pad **2** of the adjusting screw **1** with the tip of a plain screwdriver **D** or something else from opposite the side where the feeler gauge **C** is to be inserted to open a gap as illustrated, then insert the feeler gauge in the gap.



- If an attempt is made to insert a feeler gauge **C** without opening a gap, the pad will be tilted as illustrated, making it impossible to insert the feeler gauge.

NOTE:

- **The feeler gauge C must have a slight drag when taking a measurement.**
- **If the feeler gauge moves without any resistance, the measurement is incorrect (too loose).**



- If the reading is out of specification, adjust by the following procedures.

[Adjustment]

- To adjust the valve clearance **B**, loosen the lock nut **1** and rotate the adjusting screw **2** to adjust the clearance to the extent that the feeler gauge **C** is somewhat hard to move.
- After the adjustment, hold the adjusting screw **2** in position with a screwdriver **D** and tighten the lock nut **1** to the specified torque.
  Thereafter, re-check the valve clearance **B** with the feeler gauge **C**.

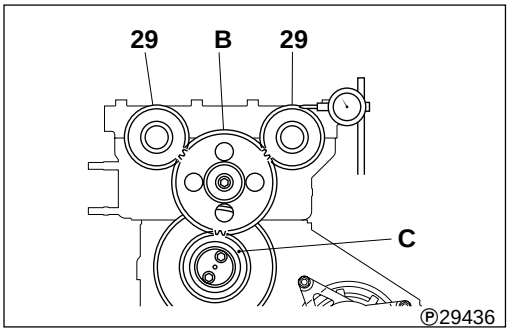
25	Circumference of packing	THREEBOND 1207C or D	As required
31, 32	Journal and cam portions of camshaft	Engine oil	As required

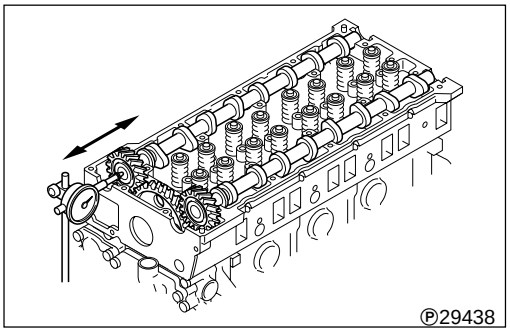
https://truckmanualshub.com/



● **Pre-disassembly inspection**

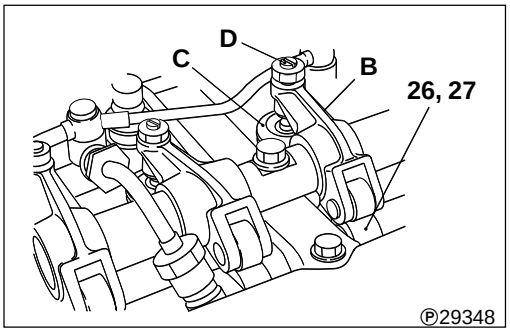
(1) Backlash between head idler gear B and camshaft gear 29 and idler gear assembly C

On a pair of gears, measure backlash at more than three positions. If the reading is more than the limit, replace defective parts.



(2) End play of camshaft

If the reading is more than the limit, replace defective parts.

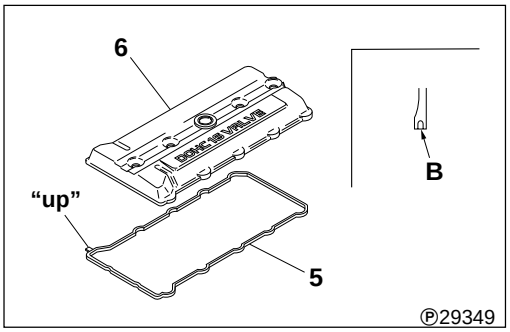


● **Pre-disassembly work**

If the rocker **B** forced up by the camshaft **26** or **27** is pressing the valve spring **C** down, loosen the adjusting screw **D** of the rocker to set the valve spring free.

◆ Service procedure

5 6 **Installation of rocker cover and rocker cover gasket**



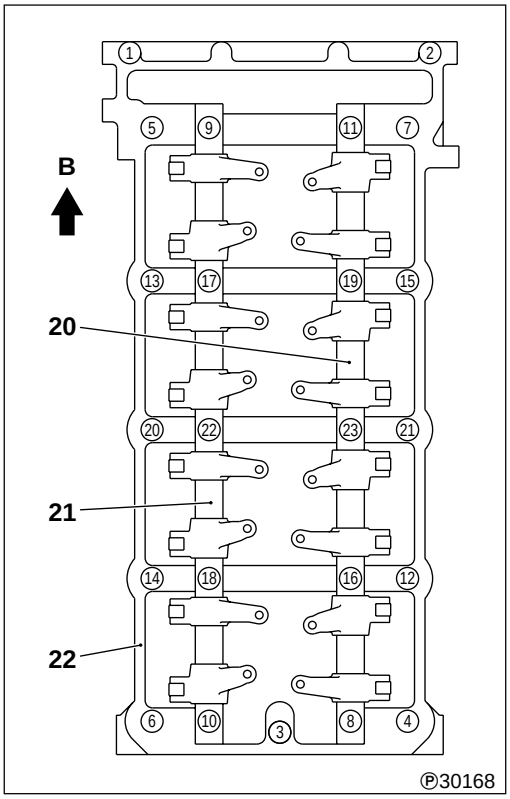
- Before installing the rocker cover **6**, remove oil and other deposits thoroughly from the gasket groove **B**.
- Face the rocker cover gasket **5** as illustrated when it is installed on the rocker cover **6**.

CAUTION ⚠

Make sure that the rocker cover gasket 5 is not twisted when installed.

https://truckmanualshub.com/

ROCKER COVER, ROCKER ASSEMBLIES AND CAMSHAFTS

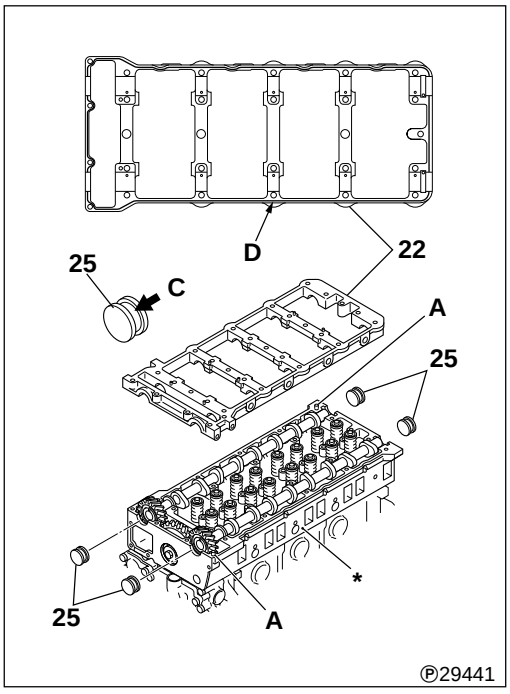


20 to 22, 25 Rocker shaft assemblies, camshaft frame and packing

[Removal]

Loosen the bolts **18** and **19** (① through ㉓) one after another, a small amount at a time, in the numbered sequence shown in the illustration. Then remove the rocker shaft assemblies **20** and **21** and the camshaft frame **22**.

B: Front of engine



[Installation]

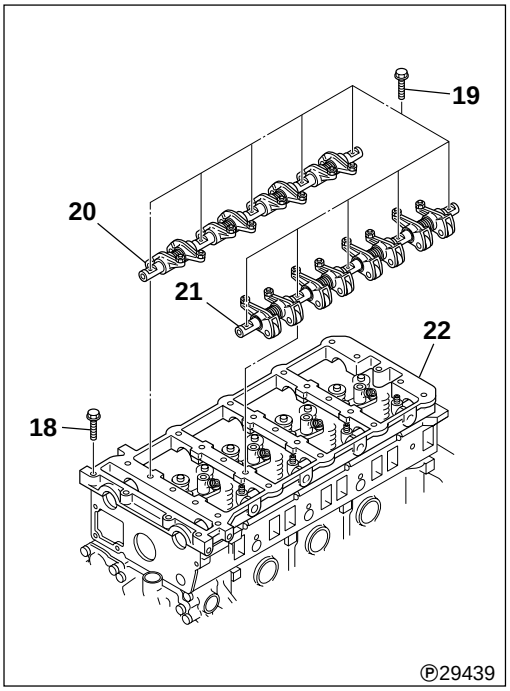
- Apply an even bead of sealant (ϕ 2 ± 1 mm {ϕ 0.079 ± 0.039}) without any break to all around the illustrated portion **C** of the four packings **25**.
- Apply an even bead of sealant (ϕ 1 mm {0.039}) without any break on the circumference **D** of the camshaft frame **22**.
- After the sealant application, install the camshaft frame **22** and the packings **25** on the cylinder head assembly* in less than three minutes.

CAUTION ⚠

- **Check to ensure that the sealant application surfaces C and D are clean and free from any oil or other deposits.**
- **When installing the parts, make sure that the sealant is not forced out of position.**
- **Do not start the engine in less than an hour after installation.**

A: Locating pin

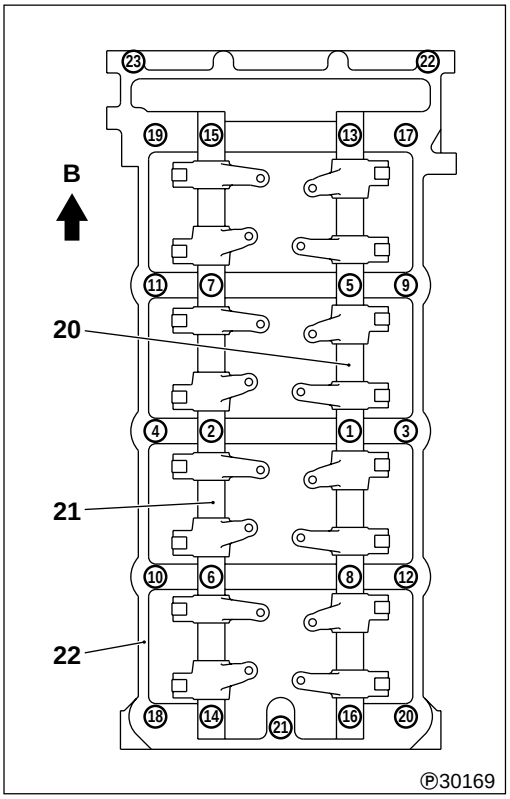
https://truckmanualshub.com/



- The bolts **18** (x 13) and **19** (x 10) must be tightened in the following sequence. Therefore, secure the rocker shaft assemblies **20** and **21** together with the camshaft frame **22**.

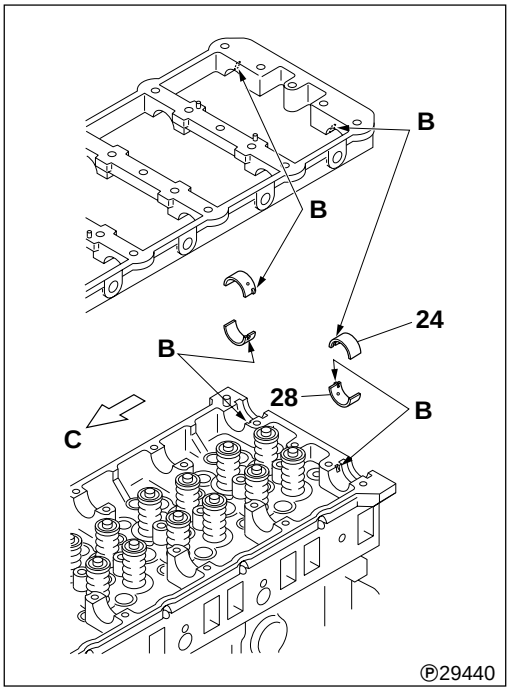
CAUTION ⚠

When the bolts 18 and 19 were loosened or removed after installation, be sure to re-apply sealant.



- Tighten the bolts **18** and **19** (① through ㉓) to the specified torque in the numbered sequence shown in the illustration.

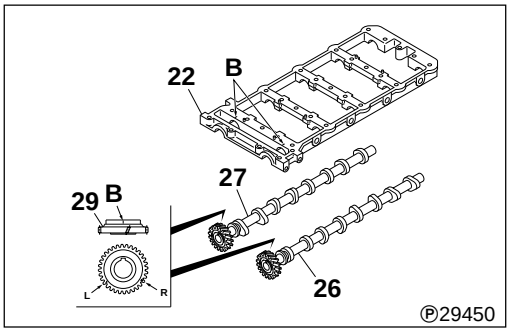
https://truckmanualshub.com/



24 28 Installation of camshaft bearings

Be sure to fit the lugs **B** of the camshaft bearings **24** and **28** in the mating notches.

C: Front of engine

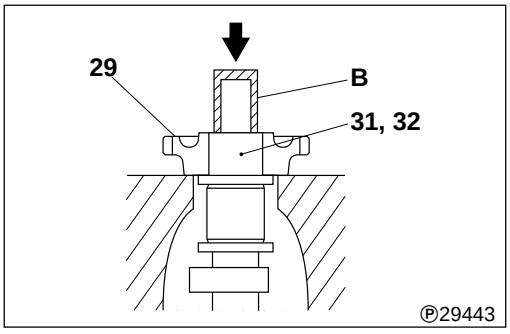


26 27 Installation of camshaft assemblies

- Place the piston of No. 1 cylinder at the top dead center on the compression stroke.
- Install the camshaft assemblies **26** and **27** with the alignment marks **B** on the camshaft gear **29** and on the camshaft frame **22** in alignment.

NOTE:

The alignment marks "L" and "R" on the camshaft gear 29 and those on the head idler gears need not always be in alignment, because the alignment mark of the head idler gears, depending on their mounted condition, does not always match that of the camshaft gear.



29 Camshaft gear

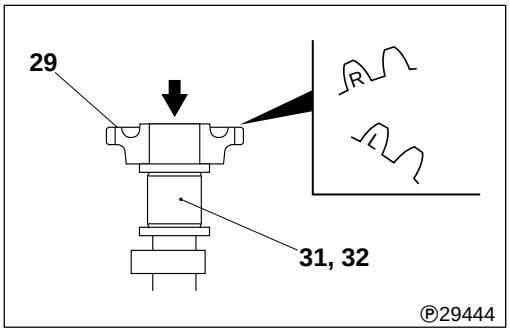
[Removal]

Remove the camshaft gear **29** by pressing the camshaft end with a press.

B: Removal block

CAUTION ⚠

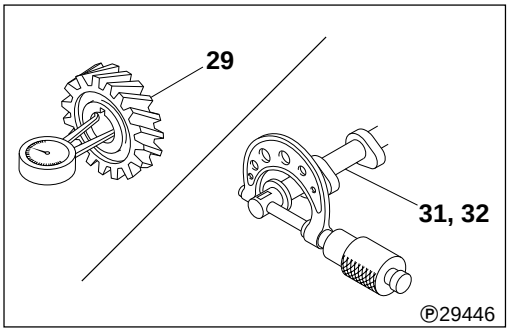
Never strike the camshaft gear 29 with a hammer to remove it. Be sure to use a press or a similar tool.



[Installation]

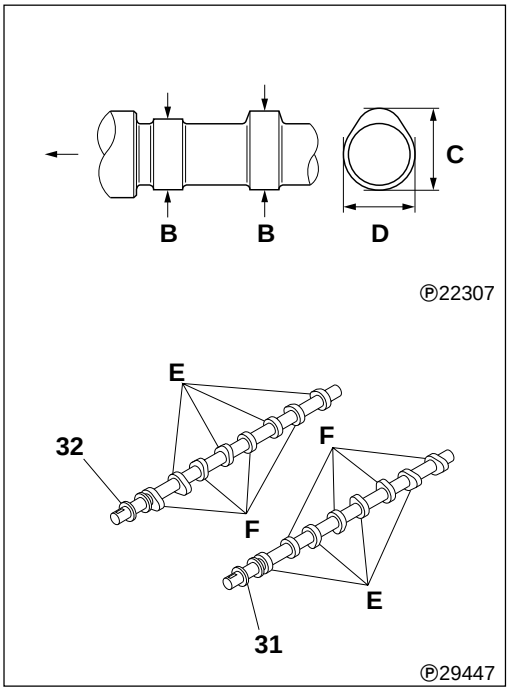
- Heat the camshaft gear **29** to 150 °C {302°F} by a piston heater or a similar tool and install it with the alignment mark "R" or "L" directed as shown.
- Install the camshaft gear **29** such that it is held tightly against the camshaft **31** or **32**.

https://truckmanualshub.com/



29 31 32 **Camshaft gear and camshaft interference**

If the reading is out of the standard values, replace defective parts.



31 32 **Inspection of camshafts**

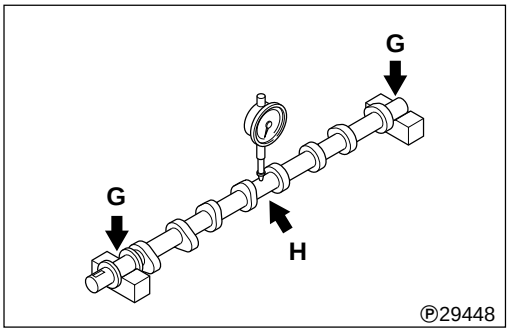
(1) Cam lift (Difference between lobe height and base circle diameter)

If the reading is less than the limit, replace the camshafts **31** and **32**.

- **B:** Measuring position
- **C:** Cam lobe height
- **D:** Base circle diameter
- **E:** Long rocker side cam
- **F:** Short rocker side cam

NOTE:

The cam dimensions are different between the long rocker side cams E and the short rocker side cams F.



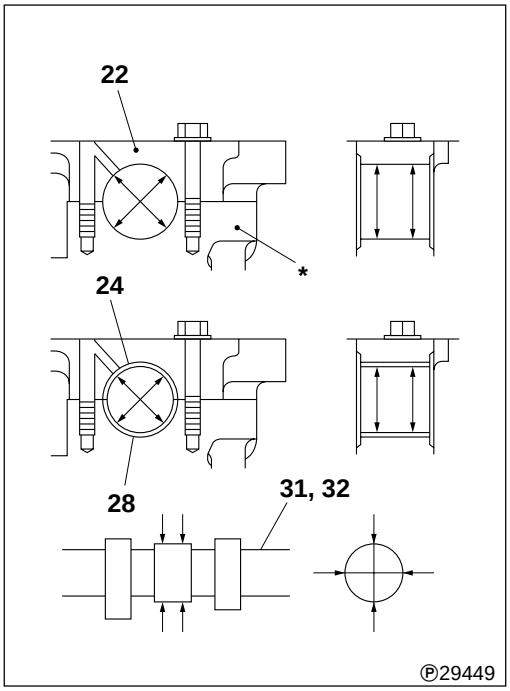
(2) Bend

Measure the bend of the camshafts **31** and **32** at the journal **H** with the journals **G** supported. If the reading is in excess of the limit, replace the camshaft.

NOTE:

The bend of the camshafts 31 and 32 is one half of the reading of the dial indicator taken after turning the camshaft through a rotation.

https://truckmanualshub.com/



(3) Oil clearance between journals and bearings

Measure the oil clearance. If the reading is in excess of the limit, replace defective parts.

CAUTION ⚠

If a camshaft bearing 24 or 28 is to be replaced, make sure that both upper and lower halves are simultaneously replaced as a pair.

Location	Tool name and shape	Part No.	Application
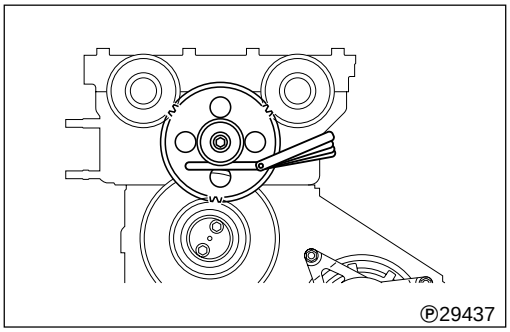
11	Idler Gear Bushing Puller  **ϕ 31** **{ϕ 1.22}** Ⓟ22322	MH061779	Removal and installation of idler gear bushing



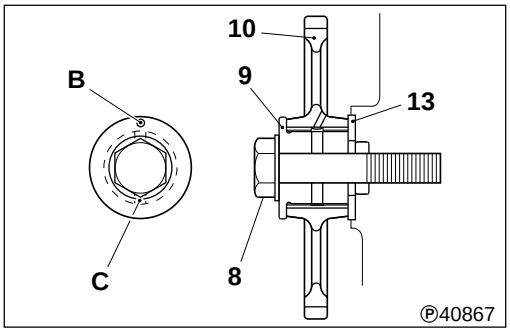
Ⓟ29437

◆ Service procedure

● **Pre-disassembly inspection**

End play of head idler gear assembly

If any measurement exceeds the specified limit, replace the defective part(s).



Ⓟ40867

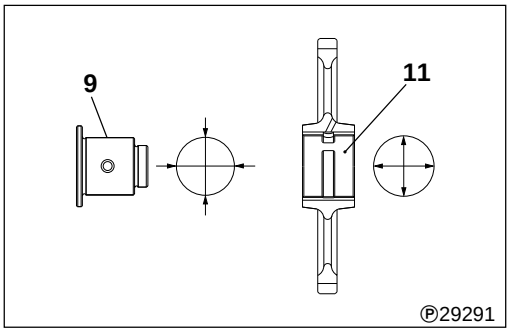
9 **Installing head idler shaft**

Install the head idler shaft **9** as illustrated.

B: Depression
C: Oil hole

CAUTION ⚠

Don't forget to install the thrust plate 13.

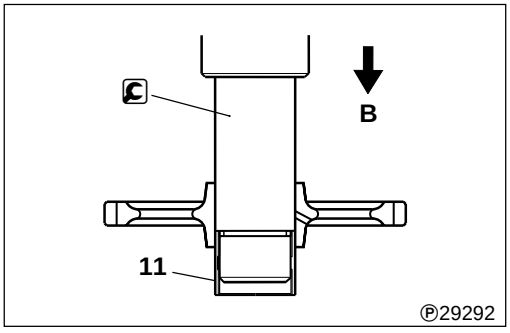


Ⓟ29291

9 11 **Head idler shaft and head idler gear bushing**

[Inspection]

If the clearance exceeds the specified limit, replace the defective part(s).



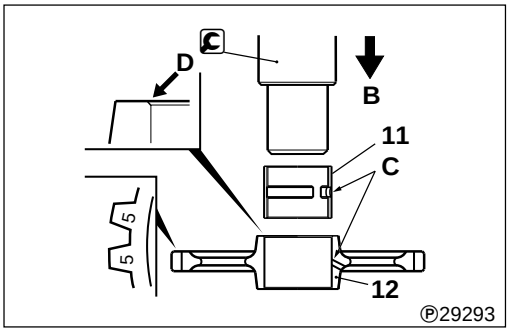
Ⓟ29292

Head idler gear bushing.

[Removal]

B: Press
: Idler Gear Bush Puller

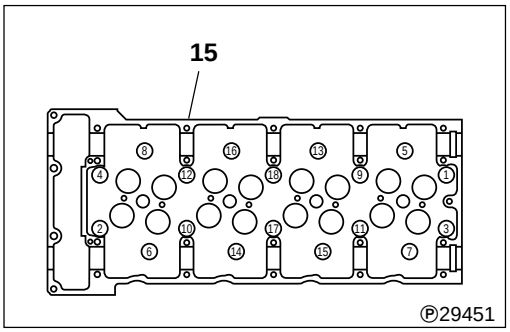
https://truckmanualshub.com/



[Installation]

- Fit the idler gear bushing **11** in the head idler gear **12** in the illustrated direction so that the oil holes **C** may be aligned with each other when press-fitted.
- Using the C Idler Gear Bush Puller, press the bushing into the head idler gear **12** until its end face becomes flush with the chamfered end **D** of the gear.

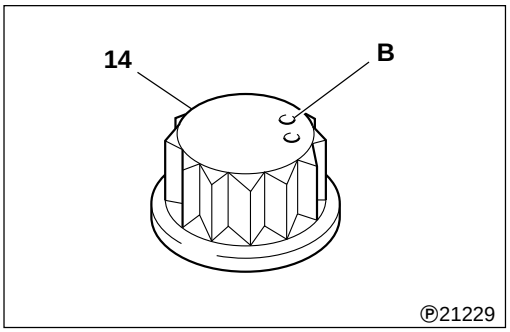
  B: Press
- After press-fitting, measure the clearance again. If the measurement is below the specified limit, ream the head idler gear bushing **11** to the standard value.



15 **Cylinder head assembly**

[Removal]

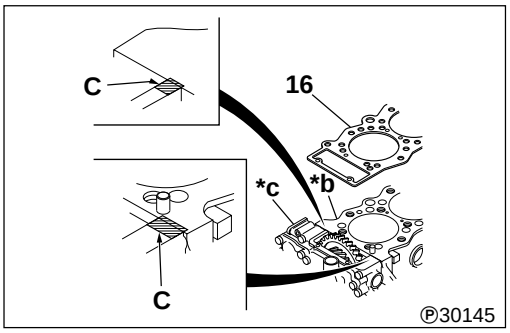
Loosen and remove the cylinder head bolts **14** in the sequence shown (① to ㉓). Each cylinder head bolt should be loosened a little at a time.



[Fitting]

CAUTION ⚠

- **Before fitting any cylinder head bolt 14, check the punch marks B on its head. Do not use bolt if there are more than two punch marks.**
- **The punch marks indicate the number of times each bolt has been tightened using the torque-turn tightening method. Any bolt that already has three punch marks must be replaced.**

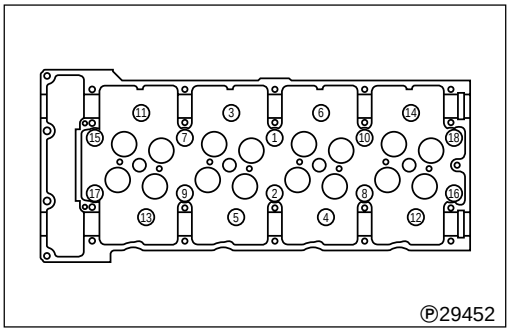


- Select an appropriate cylinder head gasket **16**. P. 11A-38
- Apply a coat of specified sealant to the upper surface **C** of the joint section between the frontcase assembly ***c** and the crankcase assembly ***b**.
- Within 3 minutes after the sealant application, install the cylinder head assembly to the crankcase assembly ***b** together with the cylinder head gasket **16**.

CAUTION ⚠

- **Check to ensure that the sealant application surface C is clean and free of oil and other foreign matter.**
- **During installation of the cylinder head assembly, use care to ensure that the sealant is kept in place.**
- **Do not start the engine for at least 1 hour after the cylinder head assembly is installed.**
- **Whenever the cylinder head bolt 14 is loosened or removed after the cylinder head assembly has been installed, always apply a fresh coat of specified sealant.**

https://truckmanualshub.com/

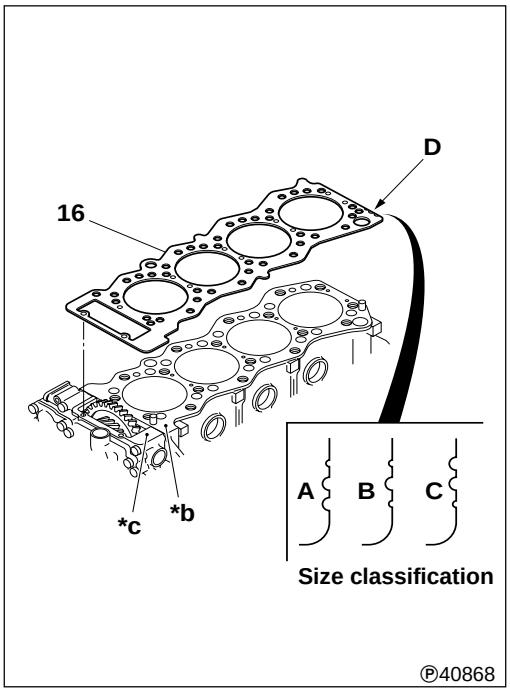


Ⓟ29452

- Tighten the cylinder head bolts **14** (① through ⑱) to a torque of 145 N·m {110 lbf.ft, 15 kgf·m}(wet) in the sequence shown.
  After tightening,give the bolts an additional 90 degree turn in the sequence of the numbers shown.
- After tightening the cylinder head bolts **14** using the torque-turn tightening method, make a punch mark on the head of each one to indicate the times of use.

CAUTION ⚠

Since the cylinder head bolts utilize the torque-turn tightening method, they must not be tightened further after the angular tightening procedure has been performed.



Ⓟ40868

16 **Cylinder head gasket**

[Removal]

CAUTION ⚠

Be careful not to scratch cylinder head assembly 15, the crankcase assembly *b and the front case assembly *c when removing cylinder head gasket 16.

[Installation]

Cylinder head gasket **16** installed must be the one which can accommodate the piston projection. Select such a gasket as follows:

- Measure the piston projection at each cylinder. 🕮 P. 11A-62
- Select a cylinder head gasket **16** appropriate for the piston projection average value from the following table.
- If any of the piston projection measurements is more than 0.05 mm {0.002 in.} larger than the average value, then use the gasket one rank higher than that rank (**A** → **B**, **B** → **C**).

Unit: mm {in.}

Average value of piston projection	Cylinder head gasket	
	Size classification	Thickness when tightening
–0.088 to –0.027 {–0.0034 to 0.0106}	A	0.75 ± 0.03 {0.029 ± 0.0012}
–0.027 to –0.033 {–0.0106 to 0.0129}	B	0.80 ± 0.03 {0.031 ± 0.0012}
–0.035 to –0.094 {–0.0129 to 0.0370}	C	0.85 ± 0.03 {0.033 ± 0.0012}

- The classification (size) of the cylinder head gasket **16** can be known from the shape of the notches **D** cut in the gasket edge.
- Install the cylinder head gasket **16** on the crankcase ***b** in the direction as illustrated.

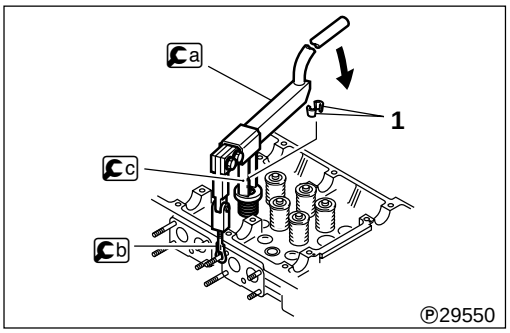
	Valve Guide Installer  01960	MH063604	Installing valve guides
10, 11	A: Caulking Tool Body B: Caulking Ring  01961	Use Equivalent	Installing inlet and exhaust valve seats

https://truckmanualshub.com/

◆ Service procedures



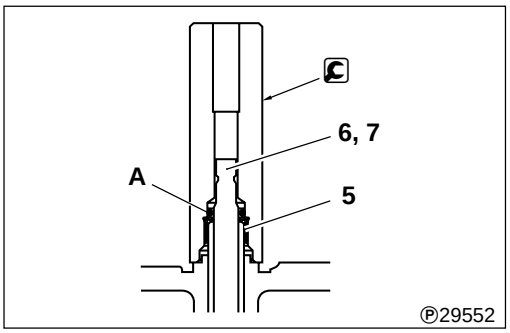
1 Valve cotter

[Removal]

To remove the valve collets **1**, use the a Valve Lifter, b Valve Lifter Hook and c Valve Lifter Seat to evenly compress the valve springs **3**, **4**.

[Installation]

To install valve collets, follow the removal instructions in reverse.

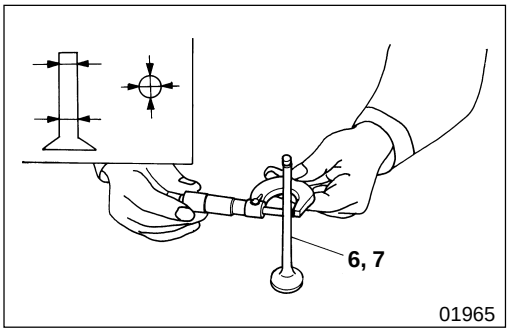


5 Installing valve stem seals

- Apply engine oil to the lip **A** of the valve stem seal **5**.
- Install the valve stem seal **5** using the Valve Stem Seal Installer.
- Strike the Valve Stem Installer until it sits snugly on the cylinder head **18**.

CAUTION ⚠

After installing the valve stem seal 5, check that its spring area is neither deformed nor damaged.



6 7 Inlet and exhaust valves

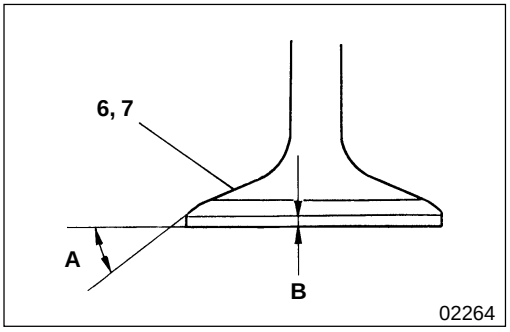
[Inspection]

(1) Valve stem outside diameter

Replace the valve **6**, **7** if its stem's outside diameter is below specification or severely worn.

CAUTION ⚠

Whenever a valve 6, 7 is replaced, be sure to lap the valve and valve seat 10, 11. P. 11A-45.

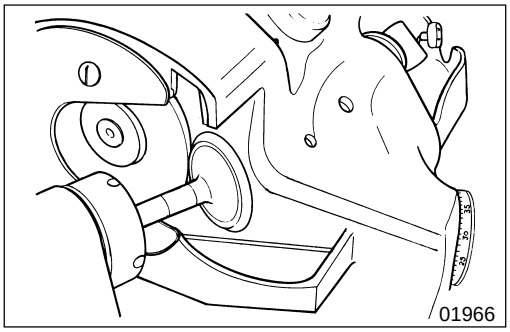


(2) Valve seat angle and valve margin

Reface or replace the valve **6**, **7** if the valve seat angle or valve margin exceeds the specified limits.

A: Valve seat angle
B: Valve margin

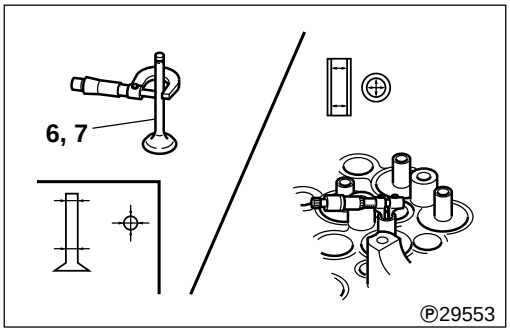
https://truckmanualshub.com/



[Rectification]

NOTE:

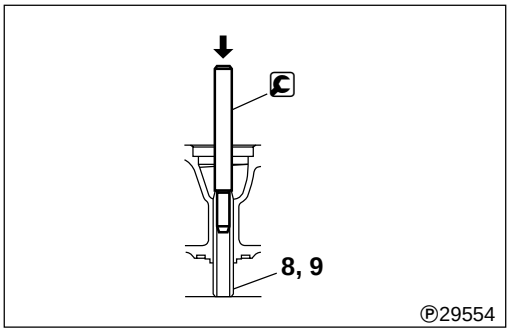
- **Keep grinding to a minimum.**
- **If the valve margin is below specification after grinding, replace the valve 6, 7.**
- **After grinding, be sure to lap the valve 6, 7 and valve seat 10, 11.** **P. 11A-45**



6 to 9 Valve and valve guides

[Inspection]

If any clearance exceeds the specified limit, replace the defective part(s).



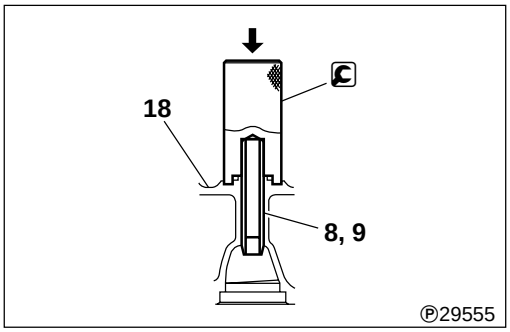
Valve guides

[Removal]

: Valve Guide Puller

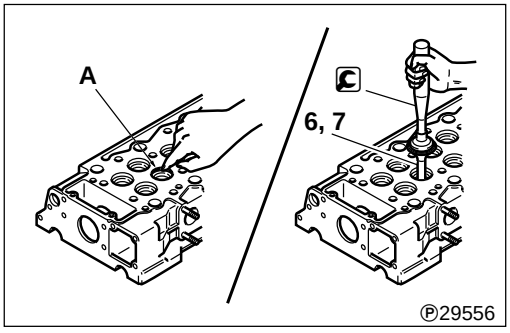
[Installation]

Using the Valve Guide Installer, install the valve guide **8**, **9** until the tool sits snugly on the cylinder head **18**.



CAUTION

- **The valve guides 8, 9 must be pressed in to the specified depth.Be sure to use the Valve Guide Installer for this operation.**
- **Exhaust valve guides 8 are longer than inlet valve guides 9.Be sure to install the correct type of guide in each location.**



6 7 10 11 Valves and valve seats

[Inspection]

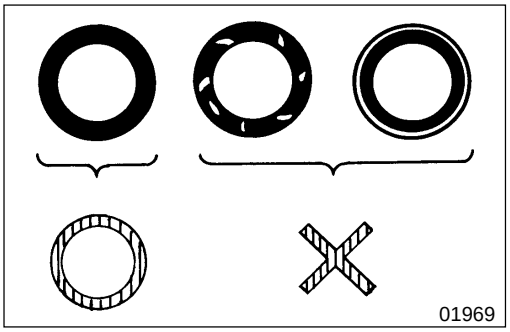
- Apply an even coat of prussian blue to the valve seat **10**, **11** surface **A** that makes contact with the valve **6**, **7**.
- Strike the valve **6**, **7** against the valve seat **10**, **11** once. Do not rotate the valve during this operation.

  : Valve Lapper

NOTE:

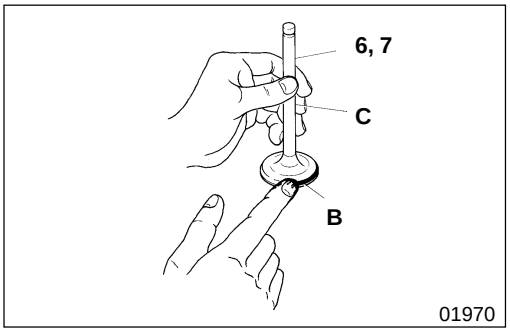
Carry out these inspections after inspecting the valves 6, 7 and valve guides 10, 11.

https://truckmanualshub.com/



- If the prussian blue deposited on the valve **6**, **7** indicates a poor contact pattern, rectify the contact pattern as follows:

Contact	Corrective action
Minor defect	Lapping
Serious defect	Reface or replace valve and valve seat



[Refacing]

Lap the valve in accordance with the following procedure:

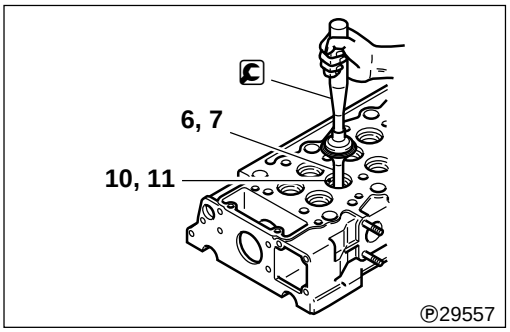
- Apply a thin, even coat of lapping compound to the surface **B** of the valve **6**, **7** that makes contact with valve seat **10**, **11**.

CAUTION ⚠

- **Ensure that no compound adheres to the stem C of the valve 6, 7.**

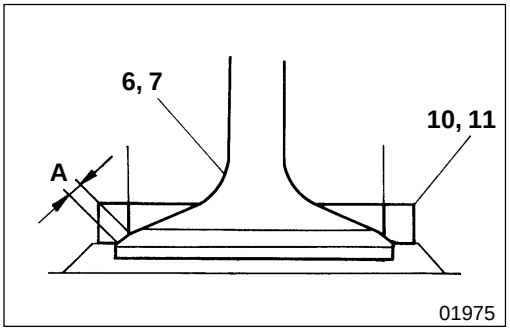
NOTE:

- **Start with intermediate-mesh compound (120 to 150 mesh) and finish with fine-mesh compound (200 mesh or more).**
- **The addition of a small amount of engine oil makes lapping compound easier to apply.**



- Strike the valve **6**, **7** against the valve seat **10**, **11** while turning it little by little.

  C: Valve Lapper
- Wash away the compound with cleaning fluid.
- Apply engine oil to the contact surfaces of the valve seat **10**, **11** and rub it in so that the contact surfaces are lubricated and mate together snugly.
- Inspect the contact pattern of the valve **6**, **7** and valve seat **10**, **11** once more.
- If the contact pattern is still defective, replace the valve seat **10**, **11**.



10 11 Valve seats

[Inspection]

(1) Valve seat width

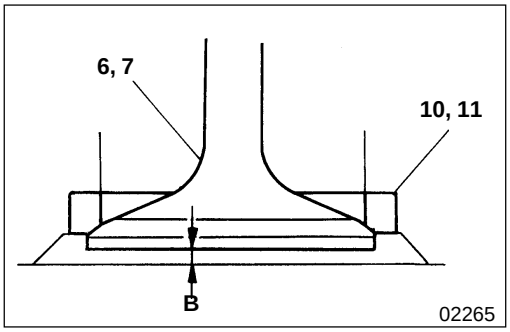
If the measurement exceeds the specified limit, rectify or replace the valve seat **10**, **11**.

A: Valve seat width

NOTE:

Whenever a valve seat 10, 11 is rectified or replaced, be sure to lap the valve seat and valve 6, 7. 📖 **P. 11A-45**

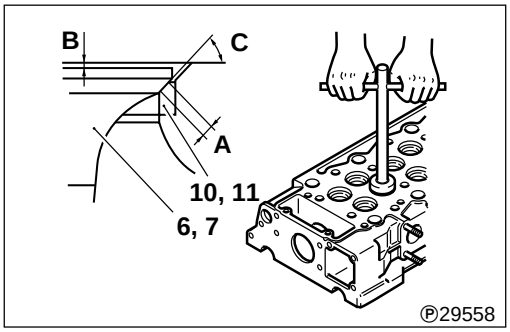
https://truckmanualshub.com/



(2) Valve sinkage from cylinder head bottom surface

If any measurement exceeds the specified limit, rectify or replace the defective part(s).

B: Valve sinkage



[Rectification]

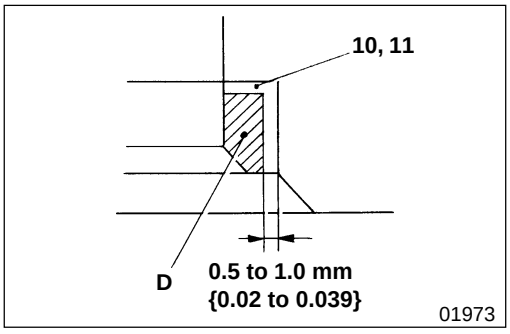
- Grind the valve seat **10**, **11** using a valve seat cutter or valve seat grinder.
- Use a 15° or 75° cutter to achieve the specified valve seat width **A** of the valve **6**, **7**.
- After grinding, put some sandpaper of around #400 grade between the cutter and valve seat and grind the valve seat lightly.

C: Valve seat angle

CAUTION ⚠

Ensure that grinding does not cause the sinkage B of the valve 6, 7 to exceed the specified limit.

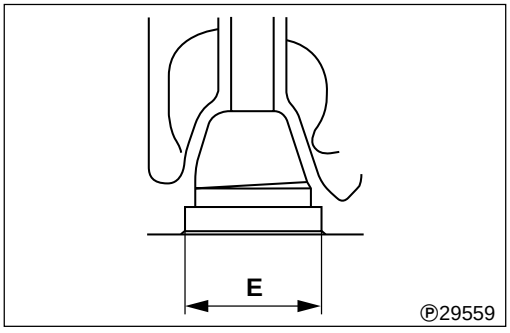
- After rectification, lap the valve **6**, **7** and valve seat **10**, **11**.
🕮 P. 11A-45



[Removal]

Valve seats **10**, **11** are installed by expansion fitting. To remove a valve seat, grind the inside surface to reduce its thickness, then remove the valve seat at room temperature.

D: Material to be ground



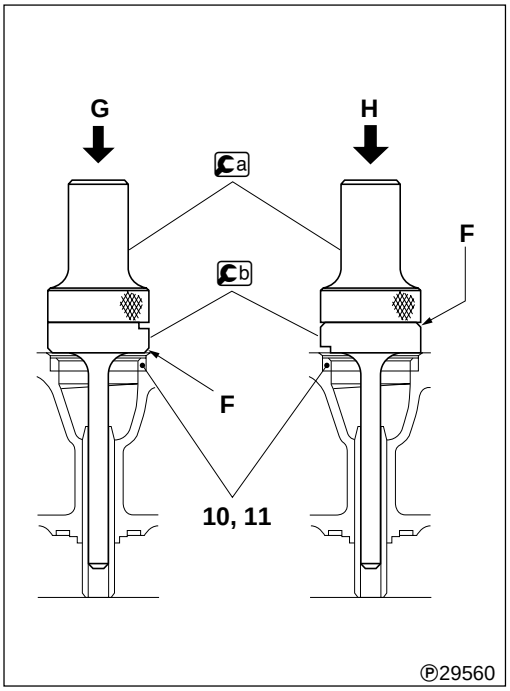
[Installation]

- Check that the valve seat hole diameter **E** in the cylinder head **18** conforms with the value shown below.

Unit: mm {in.}

Size marks on upper crankcase	Size marks on cylinder liners	Size mark on pistons	
"1"	"1A" "1B"	"A"	
	38	{1.49	}
"2"	"2A" "2B"	"B"	

https://truckmanualshub.com/



- Cool the valve seat **10**, **11** by immersing it in liquid nitrogen.
- Install the valve seat **10**, **11** in the cylinder head **18** using the a Caulking Tool Body and the b Caulking Ring.

CAUTION ⚠

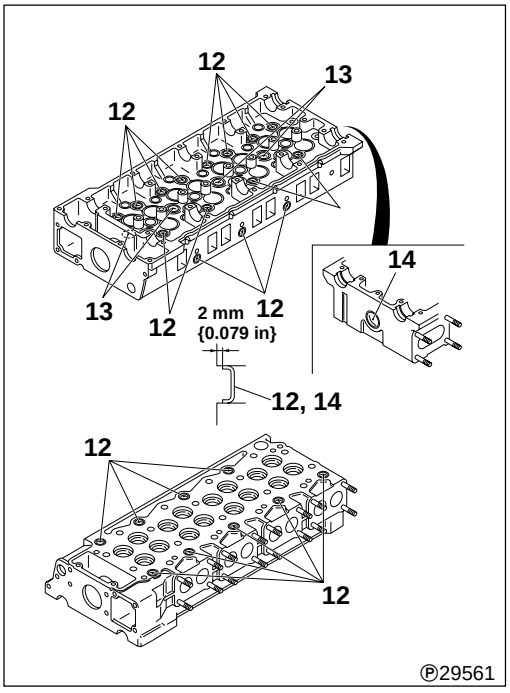
- **For installation, the chamfered side F of the b Caulking Ring must be against the valve seat 10, 11.**

G: Configuration for installation

- Invert the b Caulking Ring such that its chamfered side **F** is against the a Caulking Tool Body, then caulk the valve seat **10**, **11**.

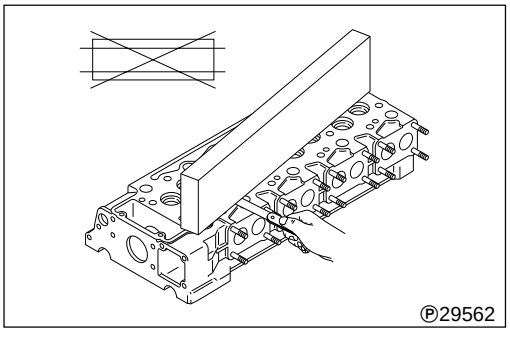
H: Configuration for caulking

- After installing the valve seat **10**, **11**, lap the valve seat and valve **6**, **7**. P. 11A-45



12 to 14 Installing sealing cup plugs

Drive the sealing cups **12** to **14** in the cylinder head **18** until the specified depth is reached.



18 Inspecting cylinder head

Measure the extent of distortion in the cylinder head **18** bottom surface. If the degree of distortion exceeds the specified limit, rectify the distortion with a surface grinder.

CAUTION ⚠

Ensure that grinding does not cause the cylinder head 18 top surface-to-bottom surface distance to fall below the specified limit.

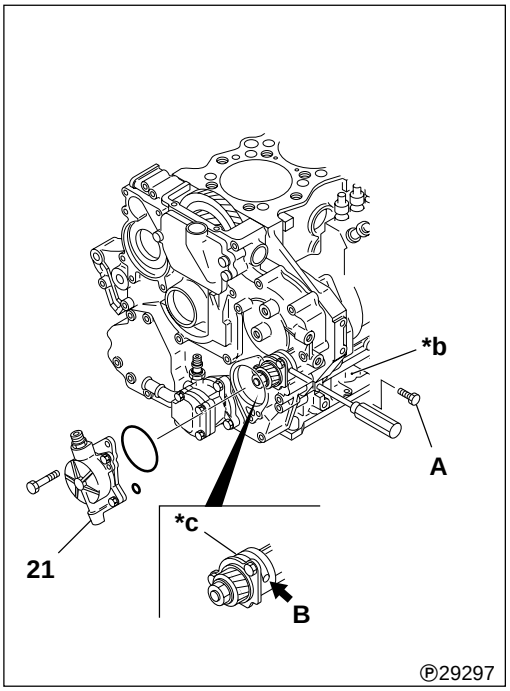
Lubricant and sealant

Location	Points of application	Specified lubricant and/or sealant	Quantity
16	Threaded portion of engine speed sensor	THREEBOND 1104J	As required
19, 22	All around O-ring	Engine oil	As required
23	Lip of front oil seal	Engine oil	As required
25	Front case mounting surface	THREEBOND 1207C or D	As required



◆ Service procedure

21 Installation of vacuum pump assembly

The vacuum pump assembly **21** serves also to position the balance shaft assembly LH ***c**. For this reason, before the assembly is installed, the balance shaft assembly must be kept in the right position by the following procedure.

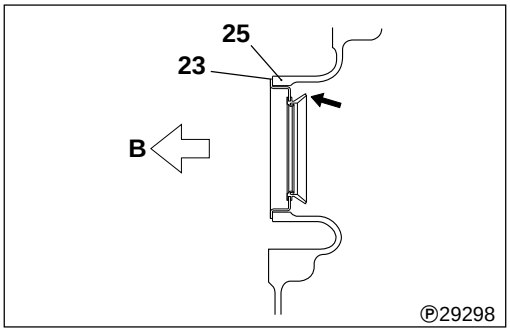
- Place the piston of cylinder No. 1 at the top dead center on the compression stroke.
- Remove plug **A** from the upper crankcase ***b**.
- Insert a screwdriver into the hole from which the plug **A** was removed until it slightly touches the balance shaft assembly LH ***c**.

CAUTION ⚠

Be sure not to force the screwdriver in, as there is danger of damage to the No. 1 journal of the balance shaft assembly LH *c.

- Slowly rotate the balance shaft assembly LH ***c** to align the tip of the screwdriver with the shaft support hole **B** in the No. 1 journal of the balance shaft.
- Supporting the balance shaft by inserting the screwdriver in the hole, install the vacuum pump assembly **21**.
- After the installation, remove the screwdriver.

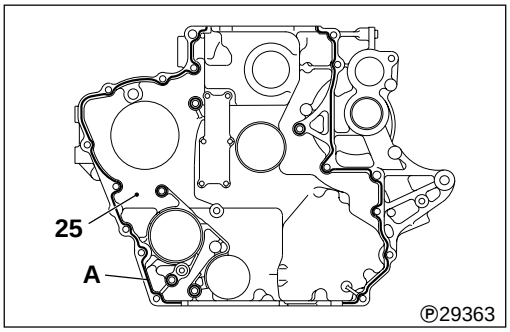
https://truckmanualshub.com/



23 Installation of front oil seal

Install the front oil seal **23** on the front case **25** in the illustrated direction after applying engine oil to the lip **A**.

B: Front of vehicle

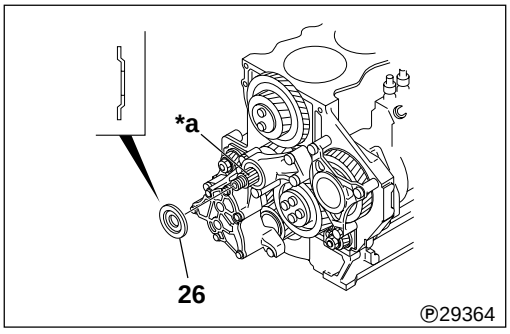


25 Installation of front case

- Apply sealant **A** evenly without any break to the mounting surface of the front case **25** as shown. (Approx. ϕ 1 mm {ϕ 0.0393})
- After application of sealant **A**, install the front case **25** in less than three minutes.

CAUTION ⚠

- **Check to ensure that the sealant application surface is clean and free from any oil and other deposits.**
- **When installing the parts, make sure that the sealant is not forced out of position.**
- **Do not start the engine less than an hour after installation.**
- **If the mounting bolts were loosened or removed after installation of the front case 25, be sure to re-apply sealant A.**



26 Installation of front oil seal slinger

Install the front oil seal slinger **26** on the fan shaft assembly ***a** in the illustrated direction.

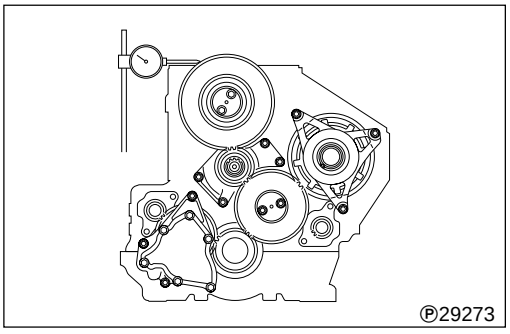
18	Idler Gear Bushing Puller 	MH062541	Installation and removal of No. 1 idler gear bushing



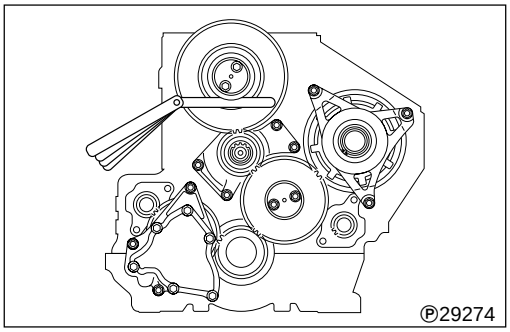
◆ Service procedure

● **Pre-disassembly inspection**

(1) Backlash between gears

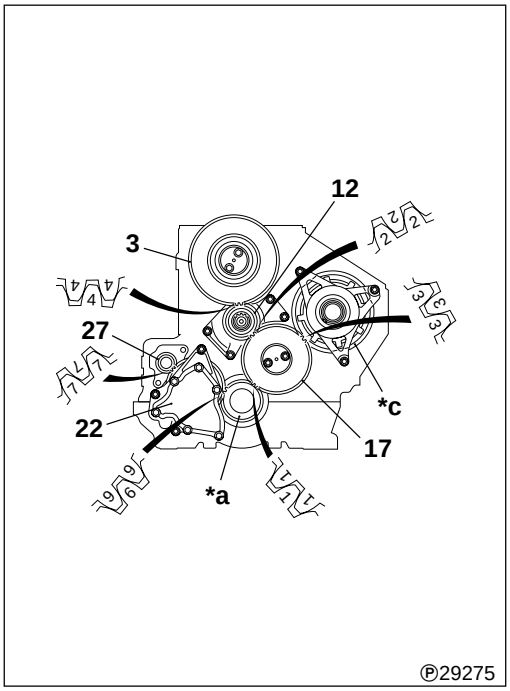
On a pair of gears, measure backlash at more than three positions. If the reading is more than the limit, replace defective parts.

https://truckmanualshub.com/



(2) End play of each gear and shaft

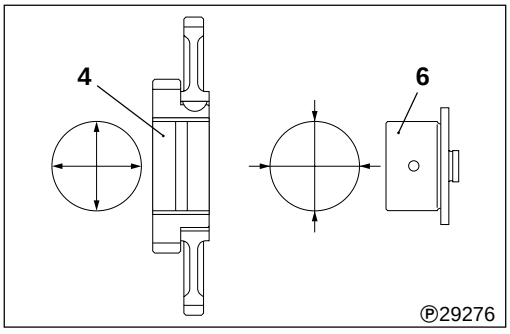
If the reading is more than the limit, replace defective parts.



3 12 17 22 **Installation of timing gears**

Install the timing gears in the following sequence.

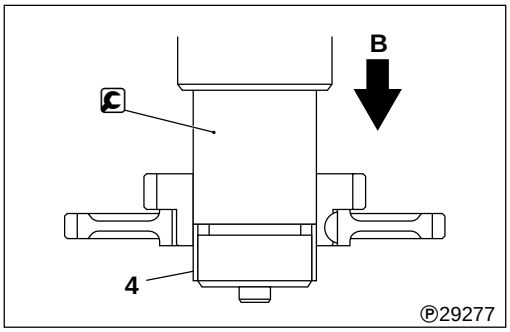
- Place the piston of No. 1 cylinder at the top dead center to position the crankshaft gear ***a**.
- Install the gear of the oil pump assembly **22** while aligning the alignment marks "**6**" and "**7**" with those on the crankshaft gear ***a** and balance shaft gear RH **27**, respectively.
- Install No. 1 idler gear assembly **17** while aligning the alignment marks "**1**" and "**3**" with those on the crankshaft gear ***a** and injection pump gear ***c**, respectively.
- Install the fan shaft assembly **12** while aligning the alignment mark "**2**" with that of No. 1 idler gear assembly **17**.
- Install the idler gear assembly **3** while aligning the alignment mark "**4**" with that of the fan shaft assembly **12**.



4 6 **Idler gear bushing and idler shaft**

[Inspection]

If the reading is more than the limit, replace defective parts.

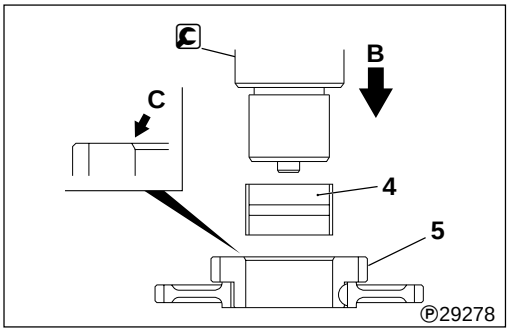


Idler gear bushing

[Removal]

B: Press
C: Idler Gear Bushing Puller

https://truckmanualshub.com/

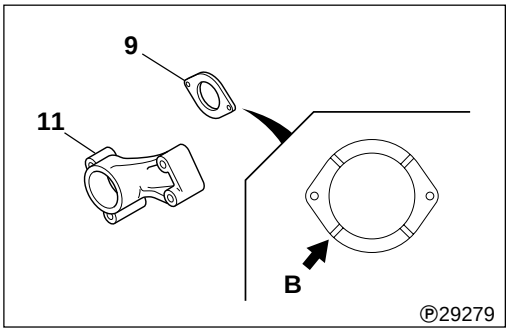


[Installation]

- Face the idler gear **5** in the illustrated direction. Using 🔧 Idler Gear Bushing Puller, press-fit the idler gear bushing **4** into the idler gear up to the chamfered portion **C**.

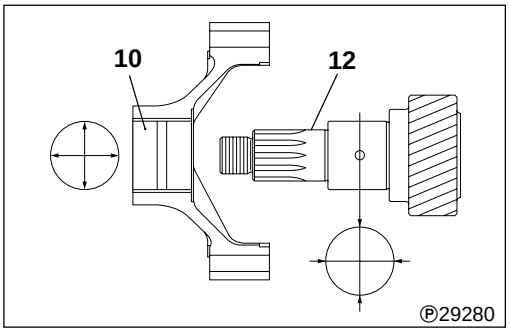
  B: Press

- After press-fitting the bushing, re-measure the clearance. If the reading is less than the standard limits, ream the idler gear bushing **4** until the clearance falls within the standard limits.



9 Installation of thrust plate

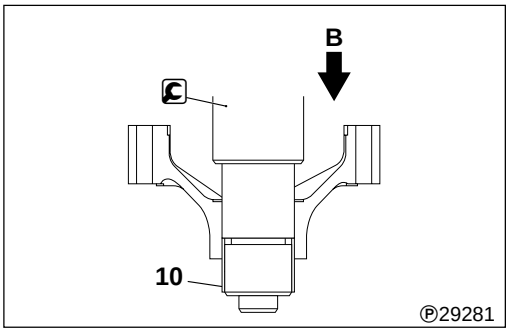
Install the thrust plate **9** with that side which does not have oil grooves **B** toward the fan shaft case **11**.



10 12 Fan shaft case bushing and fan shaft assembly

[Inspection]

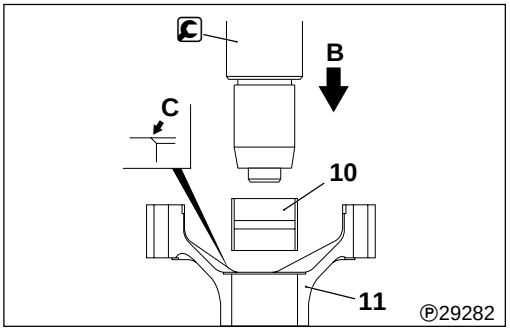
If the clearance is more than the limit, replace defective parts.



Fan shaft case bushing

[Removal]

B: Press
🔧**:** Idler Gear Bushing Puller



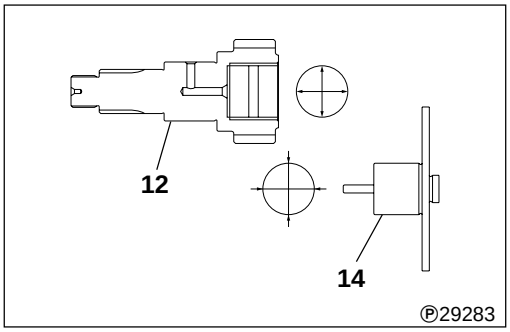
[Installation]

- Face the fan shaft case in the illustrated direction. Using 🔧 Idler Gear Bushing Puller, press-fit the fan shaft case bushing up to the chamfered portion **C** of the fan shaft case.

  B: Press

- After press-fitting the bushing, re-measure the clearance. If the reading is less than the standard limits, ream the fan shaft case bushing **10** until the clearance falls within the standard limits.

https://truckmanualshub.com/



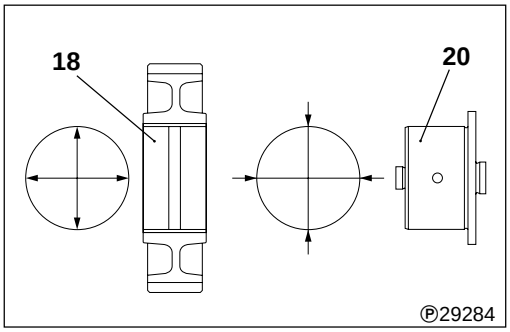
12 14 Fan shaft assembly and fan gear shaft

[Inspection]

If the clearance is more than the limit, replace defective parts.

14 Installation of fan gear shaft

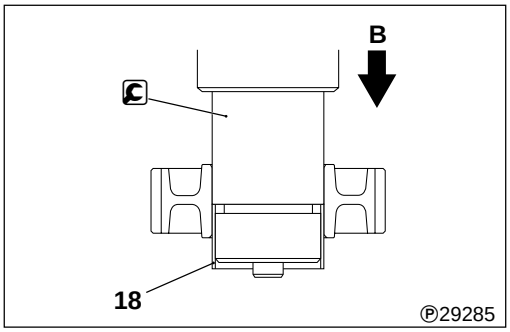
Install the fan gear shaft **14** with its oil hole upward.



18 20 No. 1 idler gear bushing and No. 1 idler shaft

[Inspection]

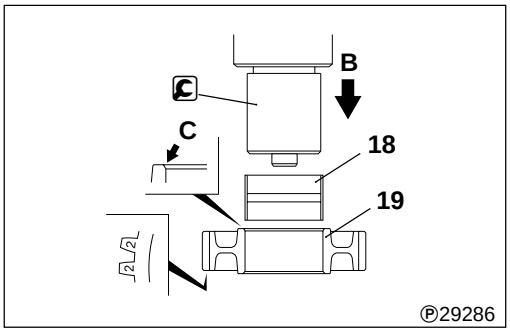
If the clearance is more than the limit, replace defective parts.



Idler gear bushing

[Removal]

B: Press
C: Idler Gear Bushing Puller



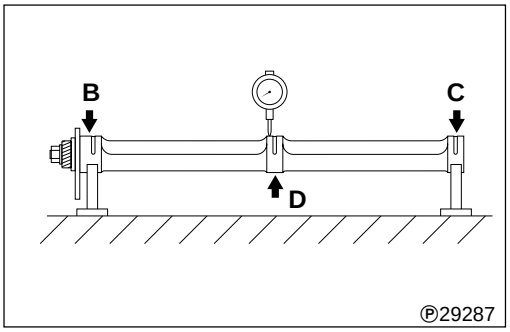
[Installation]

- Face the No. 1 idler gear **19** in the illustrated direction. Using C Idler Gear Bushing Puller, press-fit the idler gear bushing up to the chamfered portion **C** of the No. 1 idler gear.

  B: Press

- After press-fitting the bushing, re-measure the clearance. If the reading is less than the standard limits, ream the No. 1 idler gear bushing **18** until the clearance falls within the standard limits.

https://truckmanualshub.com/



25 33 Balance shaft assembly

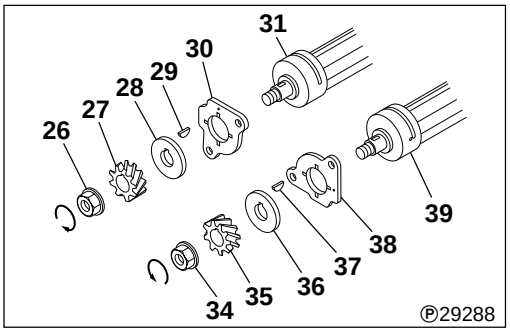
[Inspection]

- Check the balance shaft assemblies RH **25** and LH **33** for bend.
- Measure the balance shaft bend at No. 2 journal **D** while supporting the shaft at No. 1 journal **B** and No. 3 journal **C**.

NOTE

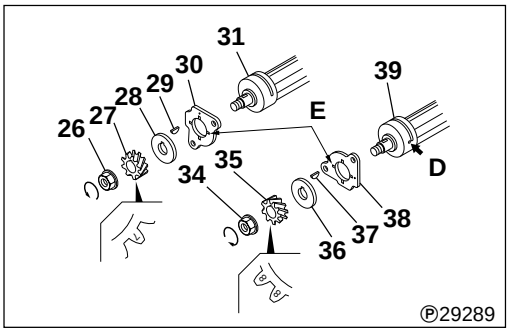
The bend of the balance shaft assemblies RH 25 and LH 33 is one half of the reading of the dial indicator taken after turning the balance shaft assembly through a rotation.

- If the reading exceeds the limit, disassemble the balance shaft assembly RH **25**, LH **33**, and replace the balance shaft RH **31**, LH **39**.



[Disassembly]

- The nut **26** of the balance shaft RH **31** and the nut **34** of the balance shaft LH **39** are different in the thread cutting direction.
- Remove the nut **26** by turning counter-clockwise. Remove the nut **34** by turning clockwise.



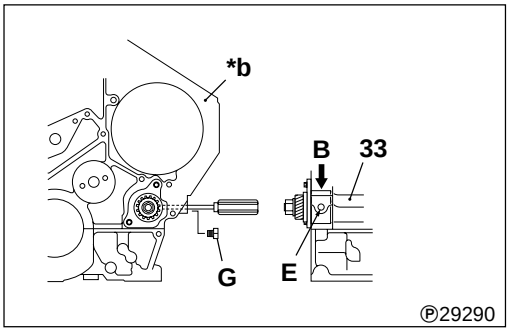
[Assembly]

- Of the balance shaft RH **31** and LH **39**, one with a shaft support hole **D** (ϕ 5 mm {ϕ 0.2 in.}) in No. 1 journal is the balance shaft LH **39**.
- Install the thrust plates **30** and **38** in the illustrated direction.

  E: Oil groove
- Install the balance shaft gears RH **27** and LH **35** in the illustrated direction.
- Install the nut **26** by turning clockwise. Install the nut **34** by turning counter-clockwise.

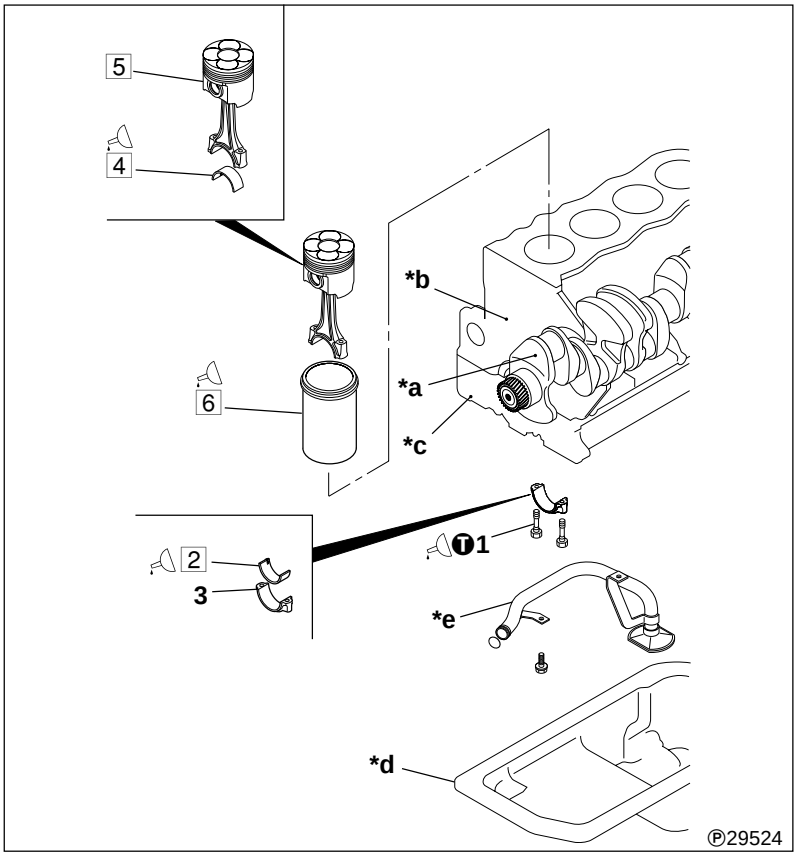
[Installation]

- The installation position of the balance shaft assembly RH **25** is determined by the gears to put in mesh when oil pump assembly **22** is installed. P. 11A-49
- The balance shaft assembly LH **33** is not brought in mesh with any gear until when the vacuum pump assembly is installed with the front case attached. Therefore, the following steps must be performed before installation.
  - Remove the plug **G** from the upper crankcase ***b**.
  - Insert a screwdriver from the hole from which the plug **G** was removed into the shaft support hole **E** (ϕ 5 mm {ϕ 0.2 in.}) provided in the No. 1 journal **B** of the balance shaft assembly LH **33** to support the balance shaft assembly.
  - Align the alignment marks of all the timing gears. P. 11A-56
  - By so doing, the balance shaft assembly LH **33** can be positioned. Keep it in position until the vacuum pump assembly is installed (P. 11A-49).



https://truckmanualshub.com/

PISTONS, CONNECTING RODS AND CYLINDER LINERS



● **Pre-disassembly inspection**

P. 11A-61

● **Removal sequence**

1 Bolt
2 Lower connecting rod bearing
3 Connecting rod cap
4 Upper connecting rod bearing
5 Piston and connecting rod assembly P. 11A-65
6 Cylinder liner

***a:** Crankshaft assembly P. 11A-76
***b:** Upper crankcase P. 11A-76
***c:** Lower crankcase P. 11A-76
***d:** Oil pan Group 12
***e:** Oil strainer Group 12

NOTE:

Since the bolts 1 (for installing connecting rod cap 3) utilize the torque-turn tightening method, they must not be removed unless it is absolutely necessary.

● **Installation sequence**

Follow the disassembly sequence in reverse.

Service standards

Unit: mm {in.}

Ⓟ29525

◆ Service procedure

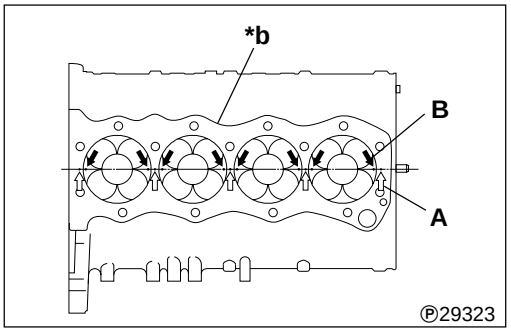
● **Pre-disassembly inspection**

CAUTION ⚠

The cylinder liners 6 may be forced out if the upper crankcase *b is turned over or if the crankshaft assembly *a is rotated with the pistons inserted. Before beginning with inspection procedures, be sure to hold each cylinder liner at its flange section using a washer A or a similar tool.

https://truckmanualshub.com/

PISTONS, CONNECTING RODS AND CYLINDER LINERS



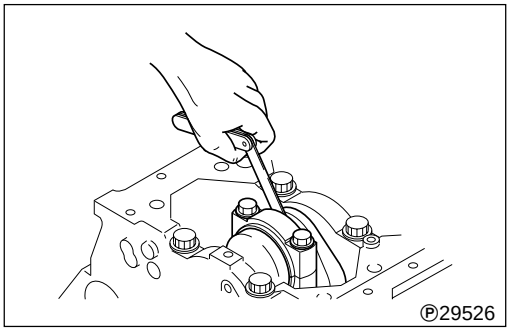
(1) Piston protrusion from crankcase top surface

NOTE:

The piston protrusion affects engine performance and must therefore be checked.

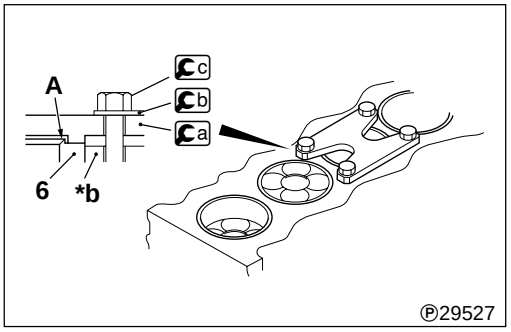
- Set the piston at top dead center.
- Make standard points **A** (five points) on upper crankcase assembly ***b** the 0 (zero) point and measure any protrusion relative to this point.
- Measure at four points on each piston at the nearest standard point from the zero point and produce the average value.

  B: Measurement point (16 points)
- If the average value is out of specification, check the clearances between all relevant parts.



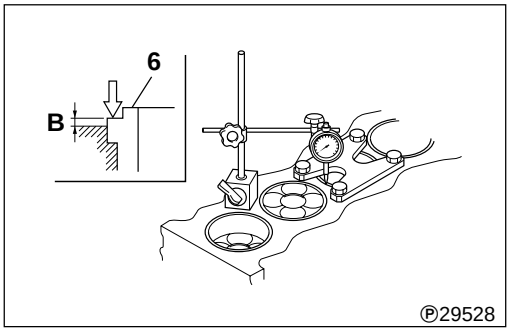
(2) Connecting rod end play

- Measure the end play every connecting rod.
- If any measurement exceeds the specified limit, replace the defective part (s).



(3) Cylinder liner flange protrusion amount and its difference between adjacent cylinders.

- Install the [a] Adapter on the upper crankcase in such a way that it may not ride on the flange **A** of the cylinder liner **6** and secure it by tightening the [b] Washer and [c] Bolt to a torque of 49 N·m {36 lbf.ft, 5 kgf·m}.

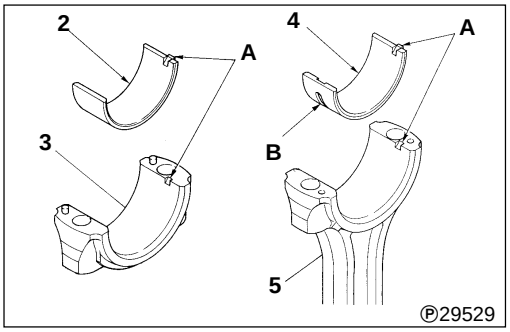


- Measure the protrusion amount **B** of flange of the cylinder liners **6**.
- If the measurement is out of specification, replace the defective part(s).
- Calculate the differences of the protrusion amounts between adjacent cylinders. If any difference is out of specification, check the mounting condition of the liners and replace the defective part(s).

CAUTION ⚠

If the cylinder liner 6 flange protrusion is insufficient, bearing pressure on the cylinder head gasket will be too low in the region of the bore, possibly causing gas to leak.

https://truckmanualshub.com/



2 4 Connecting rod bearings

[Installation]

Fit the lower connecting rod bearing **2** into the connecting rod cap **3**, and fit the upper connecting rod bearing **4** into the piston and connecting rod assembly **5.** Make sure the lugs **A** on the bearings are fitted into their respective grooves.

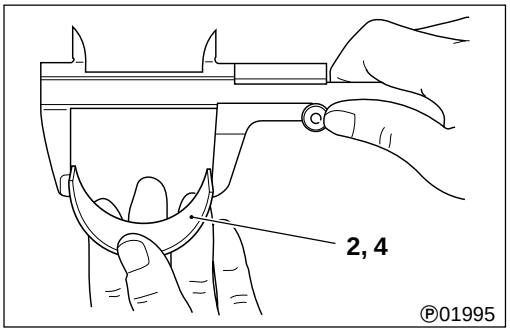
CAUTION ⚠

The upper connecting rod bearing 4 has an oil hole B. The lower connecting rod bearing 2 has no oil hole. Take care not to confuse the upper and lower parts.

[Inspection]

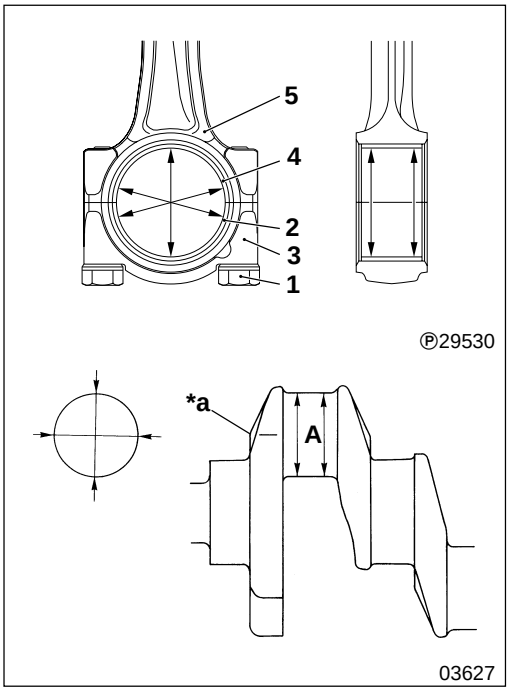
CAUTION ⚠

- **Do not attempt to manually expand a connecting rod bearing 2, 4 if its span is insufficient.**
- **Upper and lower connecting rod bearing 2,4 must be replaced as a set.**



(1) Span when free

If the span is less than the specified requirement, replace the upper and lower connecting rod bearings **2**, **4** as a set.

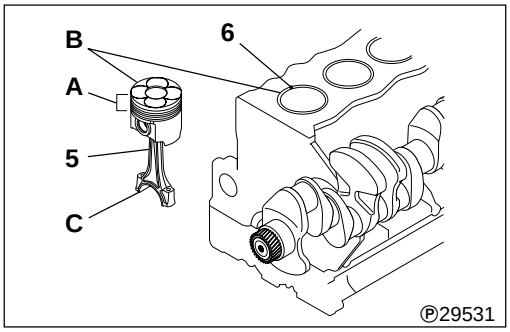


(2) Connecting rod bearing-to-crankshaft pin clearance (oil clearance)

- Fit the lower connecting rod bearing **2** into the connecting rod cap **3**, and fit the upper connecting rod bearing **4** into the piston and connecting rod assembly **5**. Then, tighten the bolts **1** to the specified torque.
- Measure the inside diameter of the connecting rod bearings **2**, **4** and the outside diameter of the crankshaft ***a** pin **A**. If the clearance exceeds the specified limit, replace the defective part(s).
- If the connecting rod bearing **2**, **4** have to be changed to undersized ones, adjust crankshaft ***a** pin outer diameter **A** in accordance with the specified procedure to fit the undersized dimensions. 📖 P. 11A-82

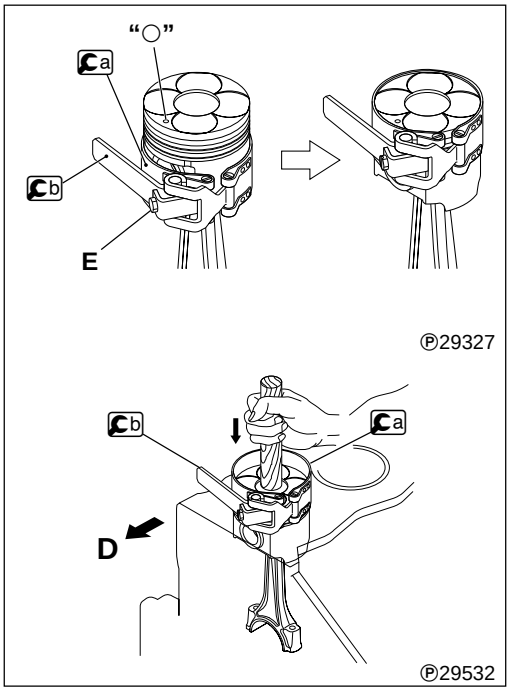
https://truckmanualshub.com/

PISTONS, CONNECTING RODS AND CYLINDER LINERS

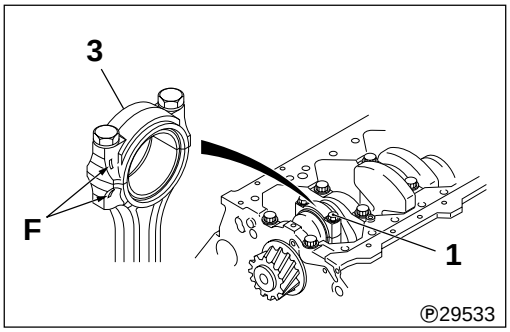


5 Installing piston and connecting rod assembly

- Ensure the gaps of the piston rings **A** remain in their correct positions. P. 11A-70
- Check that the size marks **B** on the piston and cylinder liner are the same. P. 11A-65
- Use care to prevent the connecting rod **C** from damaging the cylinder liner **6** and crankshaft pin.



- With the piston's front mark "○" facing the front of the engine **D**, carefully insert the piston and connecting rod assembly into the cylinder liner.
- Using the bolt **E** of the Cb Piston Guide Lever, adjust the inside diameter of the Ca Piston Guide Clamp such that it matches the piston's outside diameter.
- After adjustment, remove it from the piston and smear engine oil over the following items**:**
  - Outside of piston
  - Inside of the Ca Piston Guide Clamp
  - Inside of the cylinder liner



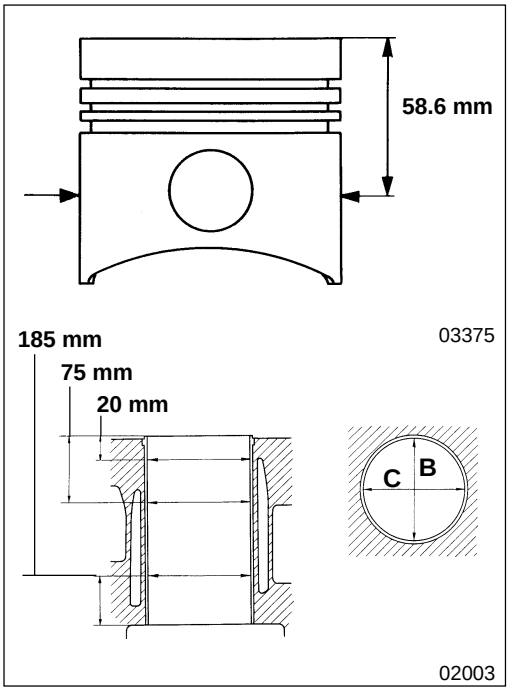
- With the piston installed, align the mating marks **F** on the connecting rod and connecting rod cap **3** and tighten the bolts **1** to the specification.
- Tighten bolts **1** alternately in the following manner.
  - First tighten to a torque of 29 N·m {22 ft.lbs, 3 kgf·m}.
  - Then tighten further 90° ± 5°.

NOTE:

After installation of connecting rod cap 3, inspect the following points:

- **End play of the connecting rod: P. 11A-62**
- **Piston Protrusion: P. 11A-62**

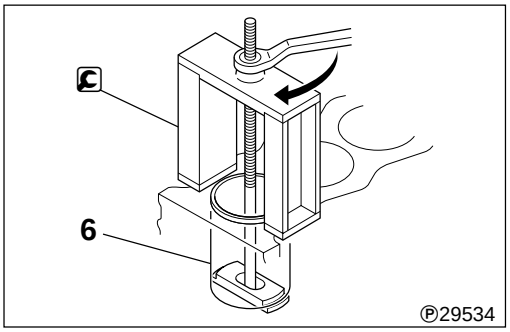
https://truckmanualshub.com/



5 6 **Piston-and-connecting rod assembly and cylinder liners**

[Inspection]

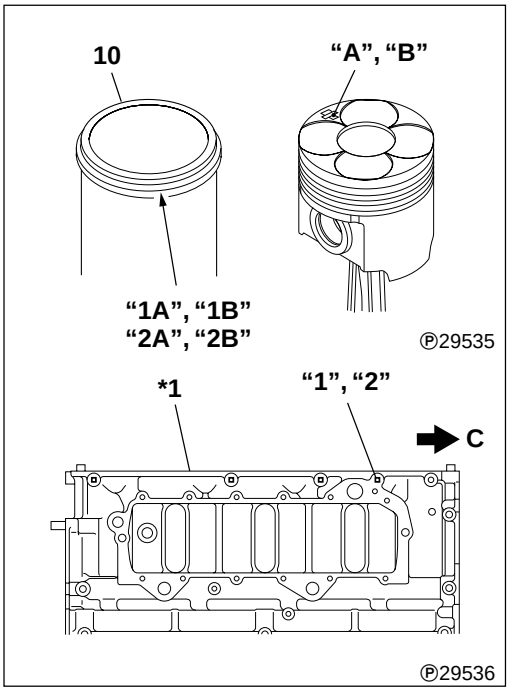
- Take measurements to determine the clearance between the piston and cylinder liner **6**.
  - **A:** Outside diameter measurement position
  - **B:** Direction of crankshaft axis
  - **C:** Perpendicular to crankshaft axis
- If the clearance is out of specification, replace the defective part(s).



Cylinder liners

[Removal]

- **C:** Cylinder Liner Extractor

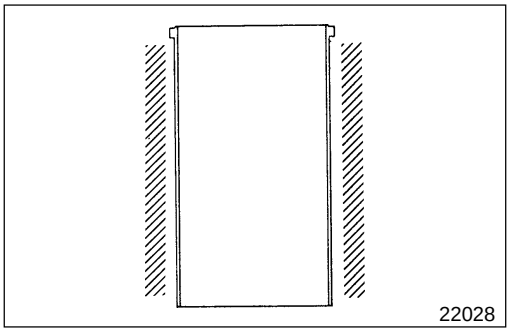


[Installation]

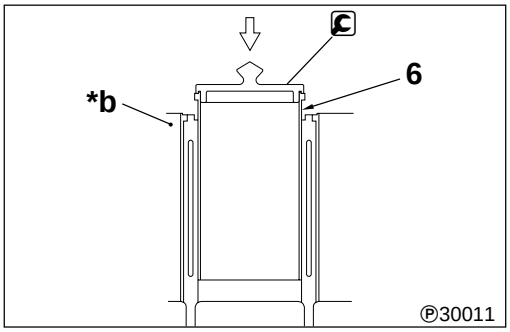
- Select a cylinder liner **6** which has the same size mark as those stamped on the upper crankcase ***b** and the piston.
- The size marks on the upper crankcase ***b** are arranged in the order of No. **1**, **2**, **3** and **4** cylinders starting from the engine front **C**.

Size marks on upper crankcase	Size marks on cylinder liners	Size mark on pistons
"1"	"1A"	"A"
	"1B"	
"2"	"2A"	
	"2B"	"B"

https://truckmanualshub.com/



- Apply engine oil to the indicated ▨ parts of the cylinder liner **6**.



- Using the C Cylinder Liner Installer, gently tap down the cylinder liner **6** until it is snugly seated on the upper crankcase ***b**.

CAUTION ⚠

The cylinder liner 6 is thin in wall thickness.
Use utmost care when handling it.

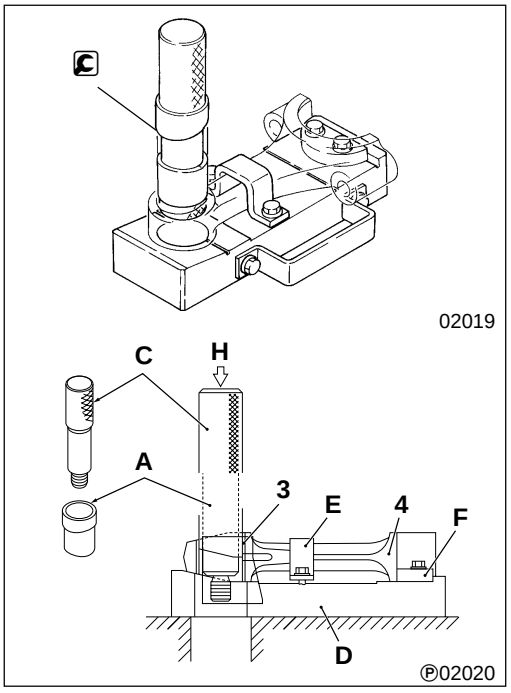
◆ Service procedure

2 3 **Piston pin and connecting rod**

[Inspection]

If the clearance exceeds the specified limit, replace the defective part(s).



02019
Ⓟ02020

Connecting rod bushing

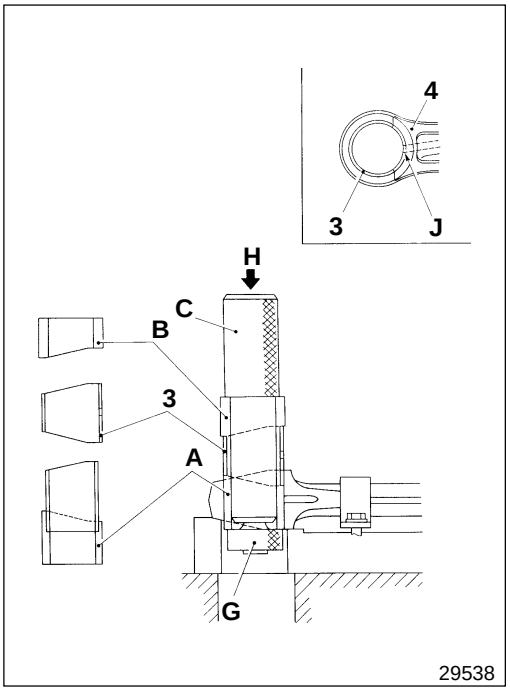
Replace the connecting rod bushing **3** using the Connecting Rod Bushing Puller Kit.
(Components of the Connecting Rod Bushing Puller Kit)

- **A:** Collar
- **B:** Collar
- **C:** Puller
- **D:** Base
- **E:** Bracket
- **F:** Plate
- **G:** Nut

[Removal]

- Remove the upper bearing (if fitted) from the big end of the connecting rod **4**.
- Mount the connecting rod **4** on the base **D** and lock it in position with the bracket **E** and place **F**.
- Fit the Collar **A** over the Puller **C** in the direction shown. Then, slowly apply pressure of approximately 49 kN (11020 lbf, 5,000 kgf) **H** until the connecting rod bushing **3** is pressed out.

https://truckmanualshub.com/

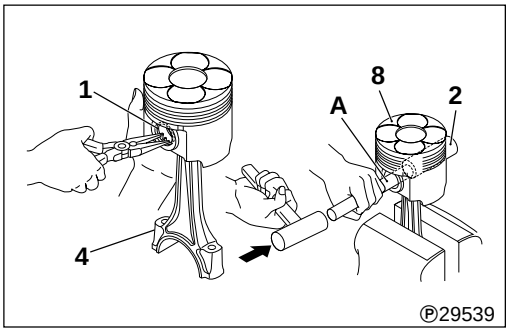


[Installation]

- Apply engine oil to the small end of the connecting rod **4** and to the outer surface of the connecting rod bushing **3**.
- Fit the Collar **B** over the Puller **C**, position the connecting rod bushing **3** and the Collar **A**, and lock this arrangement together with the Nut **G**.
- Align the oil holes **J** in the connecting rod bushing **3** and in the small end of the connecting rod **4**. Then, use a press to slowly apply pressure of approximately 49 kN (11020 lbf, 5,000 kgf) **H** until the bushing is pressed into place.
- After press-fitting the connecting rod bushing **3**, ream it to achieve the specified normal clearance between the bushing and piston pin **2**.

NOTE:

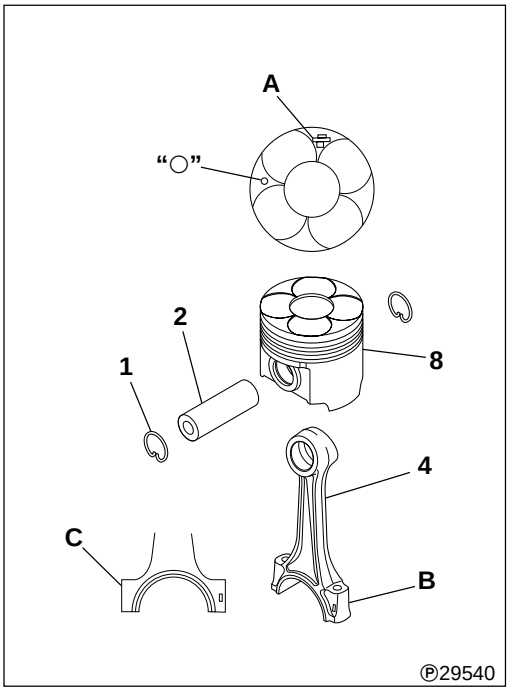
After reaming the connecting rod bushing 3, insert the piston pin 2 and check that it turns smoothly and without play.



2 4 8 **Piston Pin, connecting rod, and piston.**

[Removal]

- Removal the snap ring **1** and tap out the piston pin **2** using a rod **A** and hammer.
- If the piston pin **2** is difficult to remove, heat the piston **8** in hot water or using a piston heater.



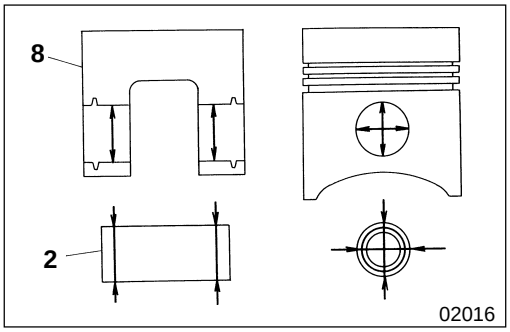
[Installation]

- Apply engine oil to the piston pin **2**. With the connecting rod **4** and piston **8** and aligned as illustrated, insert the piston pin to hold these components together.
  - **A:** Weight mark
  - **B:** Weight mark (**A** through **G**: "**A**" stands for the largest weight)
  - **C:** Alignment mark for connecting rod cap
  - "○"**:** Front mark
- If the piston pin **2** is difficult to insert, heat the piston pin **8** in hot water or using a piston heater.

CAUTION ⚠

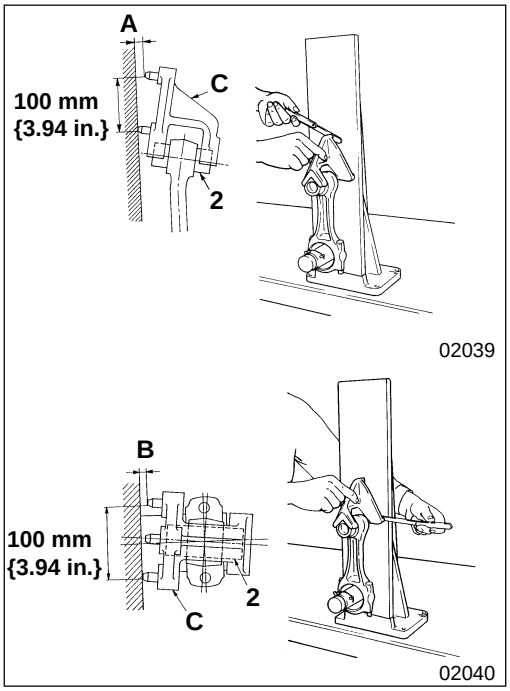
- **Make sure that all pistons have the same weight mark.**
- **The connecting rods must all have the same weight mark.**
- **After inserting the pin 2, check that it turns smoothly and without play.**

https://truckmanualshub.com/



2 8 Piston pin-to-piston clearance

If the clearance exceeds the specified limit, replace the defective part(s).



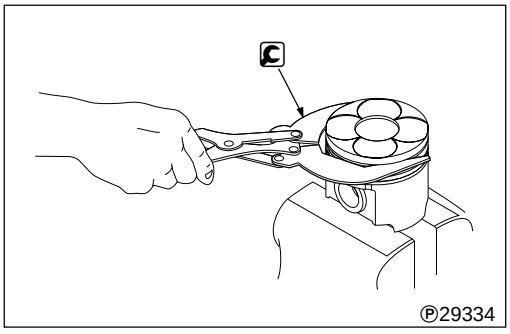
4 Connecting rod bend and twist

- Fit the connecting rod bushing **3** and piston pin **2** in their respective positions of the connecting rod **4**.
- Measure the extent of bending **A** and twisting **B** in the connecting rod **4**. If either measurement exceeds the specified limit, replace the connecting rod.

  C: Connecting rod aligner (Measurement device)

NOTE:

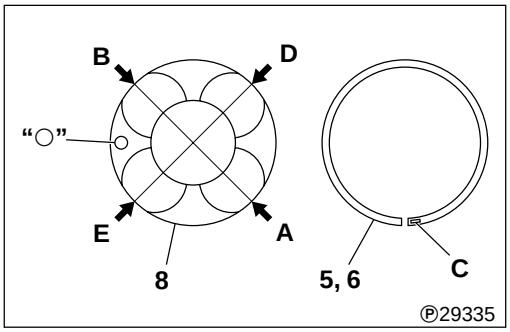
- **Before mounting the connecting rod 4 on the connecting rod aligner C, install the upper and lower connecting rod bearings in their respective positions.** **P. 11A-64**
- **Measurements must be made with the connecting rod cap mounting bolts tightened to the specification.** **P. 11A-64**



5 to 8 Piston rings and piston
Piston rings

[Removal]

C: Piston Ring Tool

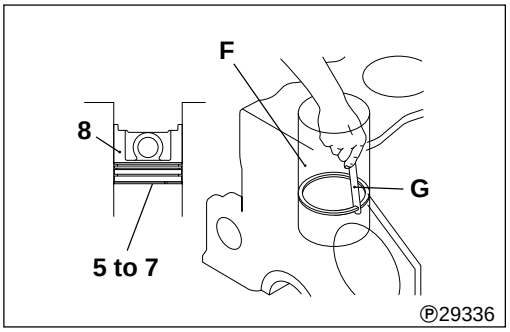


[Installation]

- Fit the oil ring **7** onto the piston **8** with its gap **A** and the expander spring end joint **B** in the position illustrated.
- Fit the piston ring **5**, **6** onto the piston **8** such that the manufacturer's marks **C** near the gaps face upward.
- Align the gaps **D**, **E** of the piston ring **5**, **6** as illustrated.

  D: 1st compression ring gap
  E: 2nd compression ring gap
  "○"**:** Front mark

https://truckmanualshub.com/



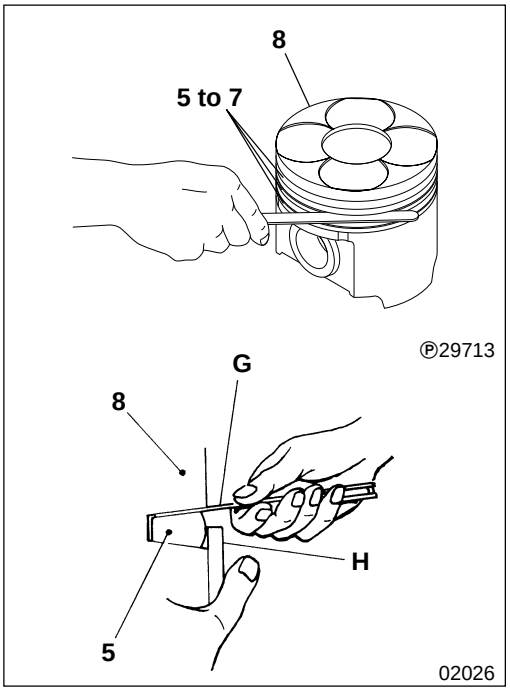
[Inspection]

(1) Piston ring end gap

- Using the crown of a piston **8**, push the piston ring **5**, **6** or **7** horizontally into a cylinder liner **F** in the upper crankcase for measurement.
- Taking care not to remove the piston ring **5**, **6** or **7**, measure the end gap using a thickness gauge **G**. Replace all the rings of piston if any gap exceeds the specified limit.

NOTE:

- **To keep the piston ring 5, 6 or 7 horizontal, be sure to insert them into the cylinder liner F using a piston 8.**
- **Push the piston ring 5, 6 or 7 down to the bottom of cylinder liner F; the bottom should be less worn than the top.**
- **Piston rings 5, 6 or 7 must be replaced as a set. Never replace piston rings individually.**



(2) Piston ring-to-piston ring groove clearance

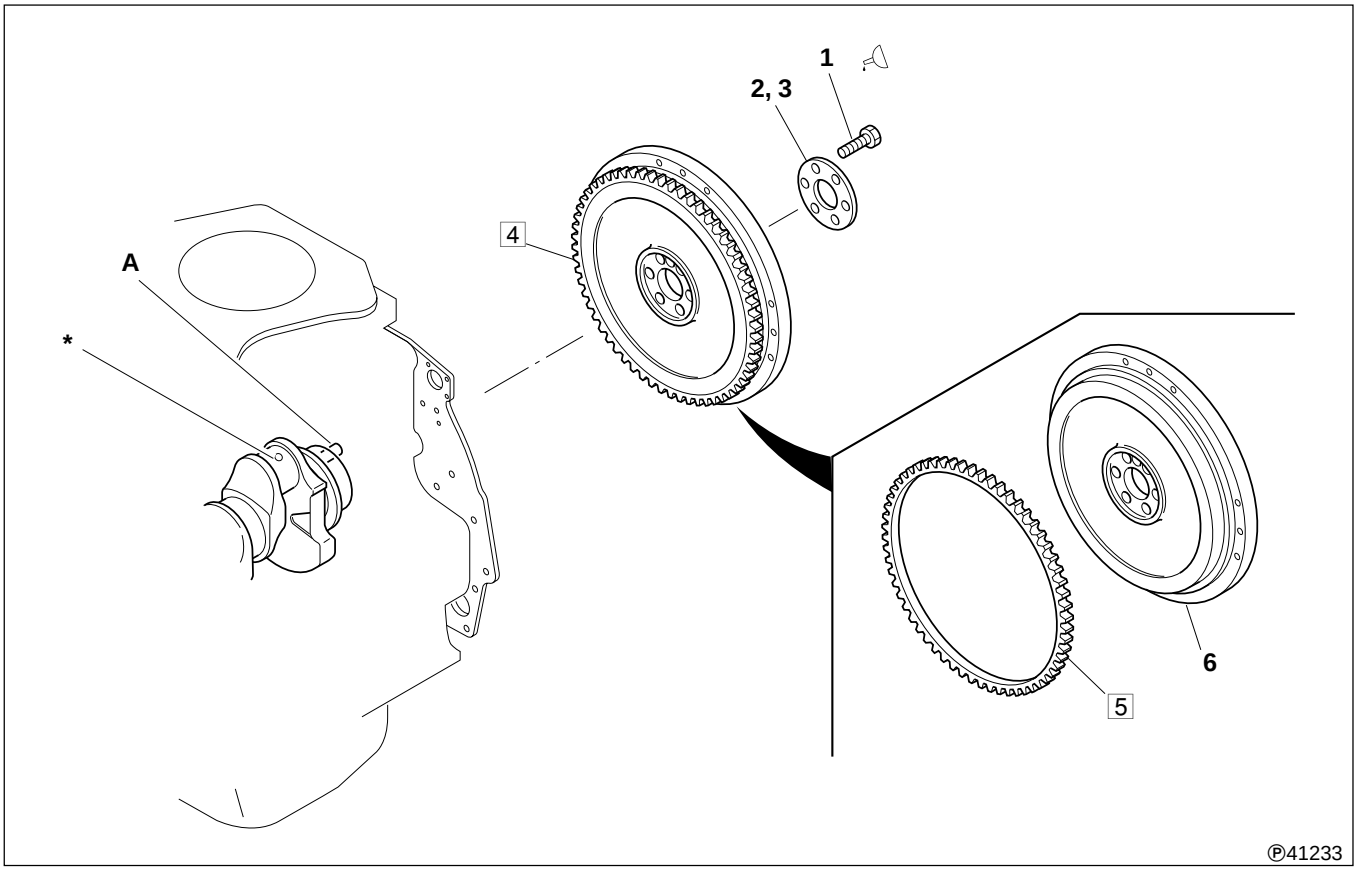
- If any measurement exceeds the specified limit, replace the defective part(s).
- Measure the 1st compression ring **5** clearance with a thickness gauge **G** while pressing the ring against the piston **8** with a straight edge **H**.

NOTE:

- **Remove any carbon deposits from the ring groove of the piston 8 and measure the clearance around the piston's entire periphery.**
- **Piston ring 5, 6, 7 must be replaced as a set. Never replace piston rings individually.**

https://truckmanualshub.com/

FLYWHEEL



● **Disassembly sequence**

1 Bolt
2 Plate
3 Pilot bearing
4 Flywheel assembly
5 Ring gear
6 Flywheel
***:** Crankshaft assembly
📖 P. 11A-76
A: Locating pin

● **Assembly sequence**
Follow the disassembly sequence in reverse.

CAUTION ⚠
- **Make sure that the mounting surface of the flywheel assembly 4 is free from any foreign substances, oil and detrimental flaws.**
- **After installing flywheel assembly 4, check for runout.**

NOTE
- **Do not remove the pilot bearing 3 or ring gear 5 unless an abnormality is evident.**

❶ Tightening torques

Unit: N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Blot (flywheel assembly installation)	39.0 {29.0, 4.0} +40°	Wet

https://truckmanualshub.com/

Lubricant

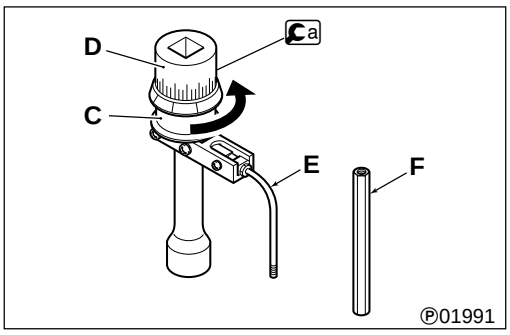
Location	Points of application	Specified lubricant	Quantity
1	Blot threads	Engine oil	As required

Special tools

Unit: mm {in.}

Location	Tool name and shape	Part No.	Application
4	Socket Wrench **Width across flats: 22 {0.87}** Ⓟ01984	Obtain Locally	Installation of flywheel
	Magnet Base  00471	Obtain Locally	

https://truckmanualshub.com/

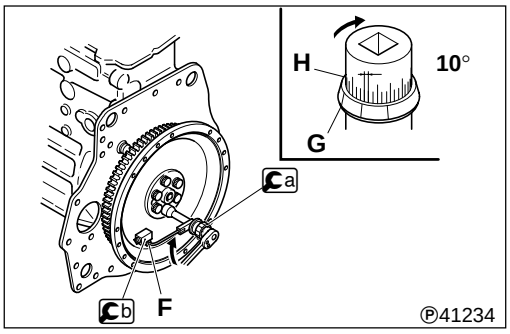


◆ Service procedure

[Installation]

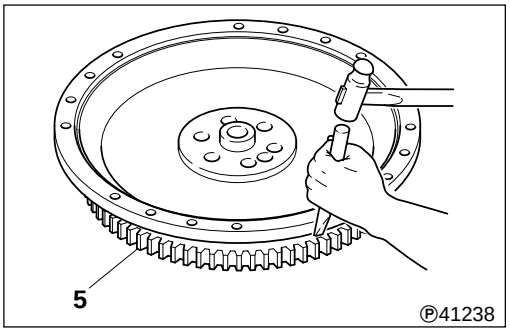
- Tighten the bolts **1** to the specified torque (39.0 N·m {29 ft.lbs**,** 4.0 kgf·m}. After that, turn the bolts further in accordance with the following procedure.
- Turn the holder **C** of the a Socket Wrench counterclockwise to the tension the built-in spring.

  D: Socket
  E: Rod
  F: Rod (extension)



- Fit the b Magnet Base on the flywheel at a position where it can come in contact with the Rod **F** (for extension) as shown in the illustration.
- Set the rod **F** (for extension) such that it may be pressed against the b Magnet Base by the spring force.
- Align any inscribed line **G** on the holder **C** with any inscribed line **H** on the socket **D**. (Use this point as reference 0° position.)
- From the above reference position, turn the socket **D** clockwise by 40° to tighten the bolt further.

https://truckmanualshub.com/



5 **Ring gear**

[Inspection]

Inspect ring gear **5** for damage and abnormal wear. If any defect is evident, the ring gear must be replaced.

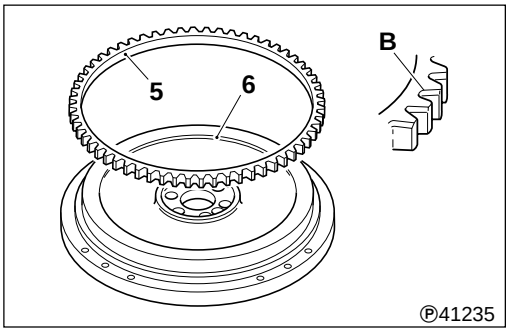
[Removal]

Heat the ring gear **5** evenly with an acetylene torch or the like.

WARNING ⚠

Be careful not to get burned.

- Remove the ring gear **5** from the flywheel by tapping around its entire periphery.



[Installation]

Using an acetylene torch or the like, heat the ring gear **5** to approximately 100 °C {212 °F} for **3** minutes.

WARNING ⚠

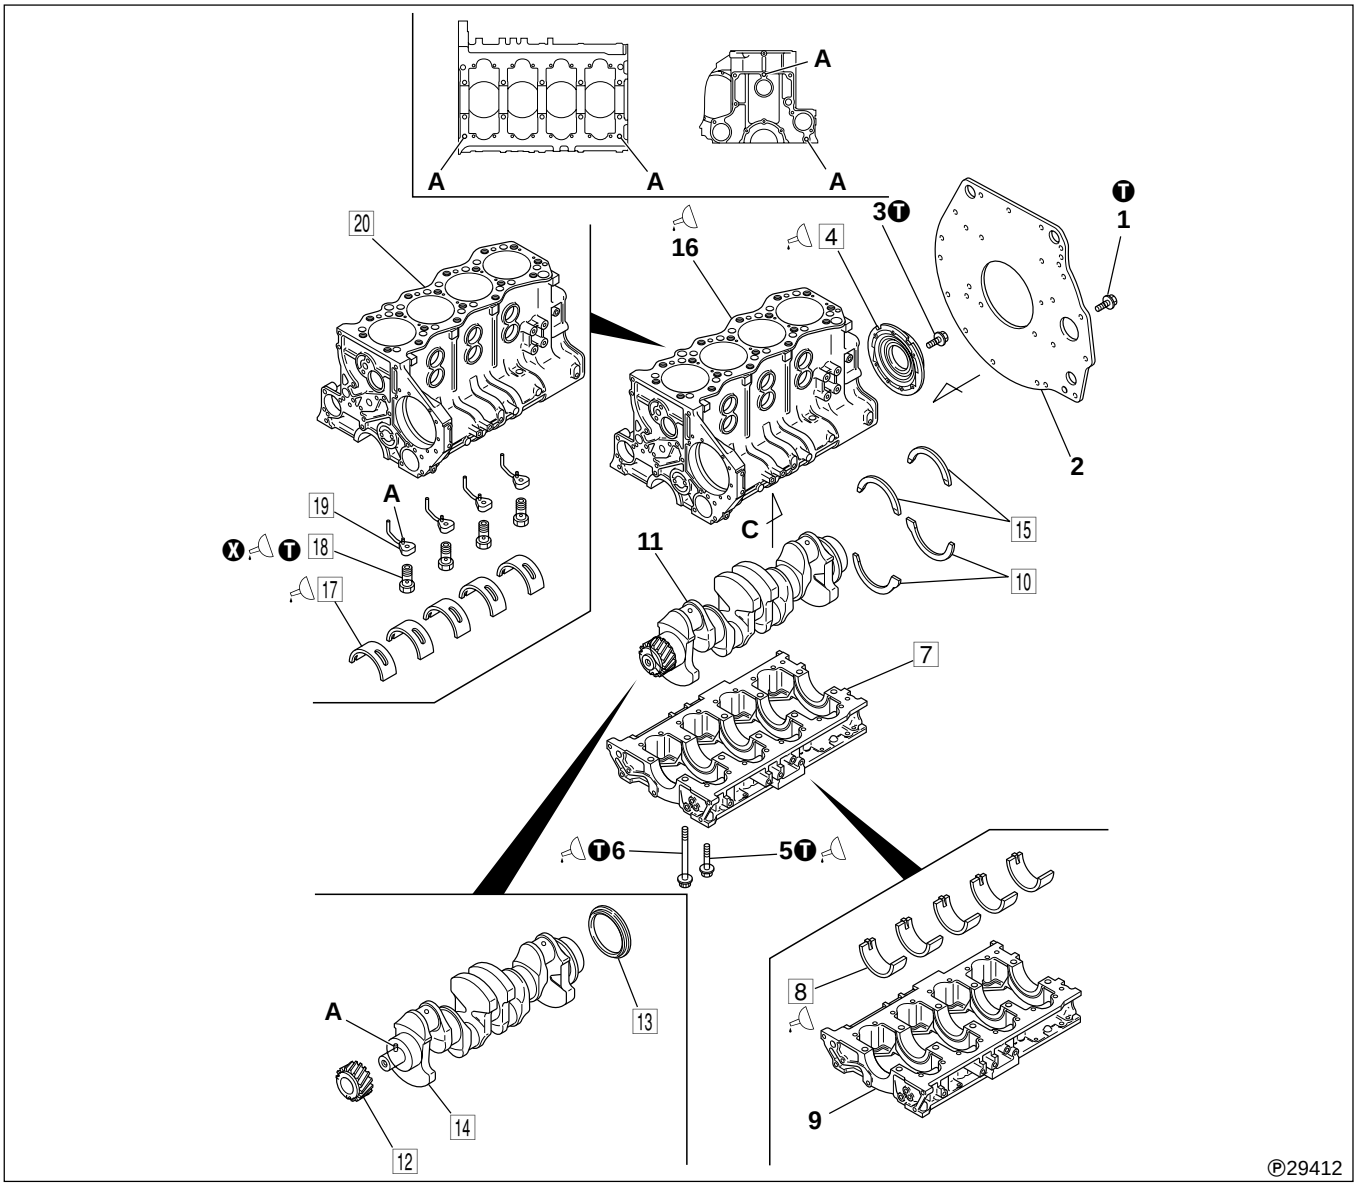
Be careful not to get burned.

- Fit the ring gear **5** with the non-chamfered side of its teeth toward the flywheel **6**.

  B: Chamfered side of ring gear **5**.

https://truckmanualshub.com/

CRANKSHAFT AND CRANKCASE



● **Pre-disassembly inspection**

P. 11A-78

● **Disassembly sequence**

1 Bolt
2 Rear plate
3 Bolt
4 Rear oil seal
5 Bolt
6 Main cap bolt
7 Lower crankcase assembly
8 Lower main bearing
9 Lower crankcase
10 Lower thrust plate
11 Crankshaft assembly
*** 12** Crankshaft gear
*** 13** Rear oil seal slinger
14 Crankshaft
15 Upper thrust plate
16 Upper crankcase assembly
17 Upper main bearing
*** 18** Check valve
19 Oil jet
20 Upper crankcase

A: Locating pin
X: Non-reusable part

NOTE:

- **Do not remove parts marked * unless defects are evident.**
- **The lower crankcase 9 and upper crankcase 20 have been machined in a pair. Therefore, replacing either one of the pair is not allowed.**

https://truckmanualshub.com/

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **If the main cap bolt shows evidence of having been tightened three times, replace it. P. 11A-79**
- **Do not overtighten the check valve 18. If the tightening torque exceeds the specified one, the check valve may malfunction, resulting in seizure of the engine.**

Service standards

Unit: mm {in.}

Location	Maintenance item			Standard value (Basic diameter in [ ])	Limit	Remedy
–	Crankshaft end play			0.10 to 0.28 {0.0039 to 0.0110}	0.4 {0.016}	Replace thrust plate
8, 17	Main bearing	Oil clearance	No. 1, 2, 4, 5	[86 {3.385}] 0.04 to 0.11 {0.0016 to 0.0043}	0.15 {0.0059}	Replace
			No. 3	[86 {3.385}] 0.06 to 0.13 {0.0024 to 0.0051}		
		Span when free (See pg.11A-80)		–	Less than 91.5 {3.60}	Replace

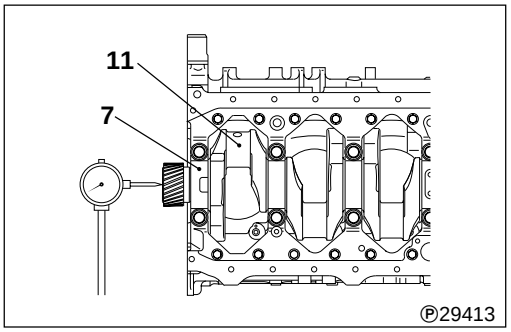
CRANKSHAFT AND CRANKCASE

Special tools

Unit: mm {in.}

Location	Tool name and shape	Part No.	Application
12	Gear Puller  Ⓟ02065	Obtain Locally	Removing crankshaft gear
13	Rear Oil Seal Slinger Installer  Ⓟ02051	MH061470A	Installing rear oil seal slinger

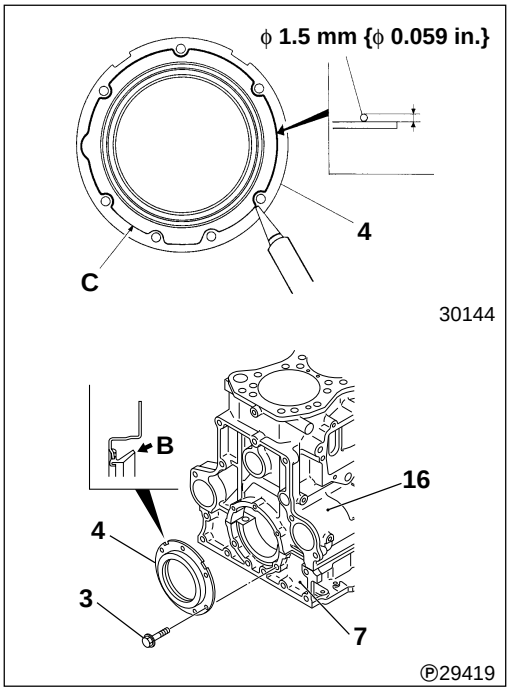


Ⓟ29413

◆ Service procedure

● **Pre-disassembly inspection**
Crankshaft end play

- Before removing the lower crankcase assembly **7**, measure the extent of crankshaft end play.
- If the measurement exceeds the specified limit, replace the thrust plates with oversize ones. 🕮 P. 11A-87



Ⓟ29419

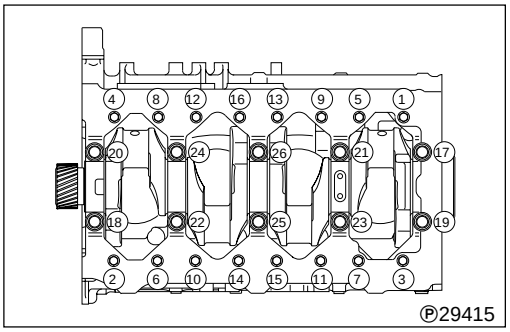
4 **Mounting of rear oil seal**

- Apply engine oil to lips **B** of rear oil seal **4**.
- Apply sealant **D** along black line **C** stamped on the rear oil seal **4** evenly without break. (ϕ 1.5 mm {ϕ 0.059 in.})
- After applying sealant **D**, install the rear oil seal **4** between the lower crankcase assembly **7** and upper crankcase assembly **16** within three minutes.

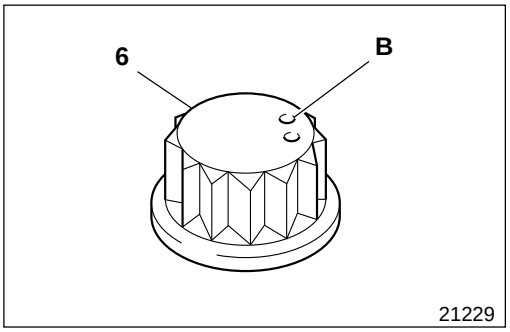
CAUTION ⚠

- **Make sure that the sealant application surfaces are clean and free from grease and oil.**
- **Use care not to let the applied sealant slip out of place during installation.**
- **After fitting rear oil seal, wait at least an hour before starting the engine.**
- **Apply a new bead of sealant D whenever mounting bolts 3 of rear oil seal have been loosened.**

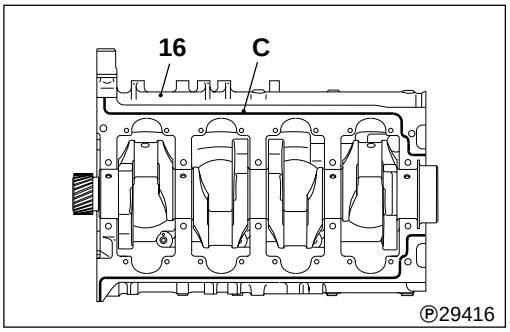
https://truckmanualshub.com/



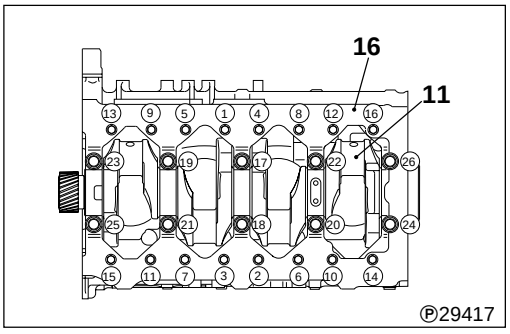
Ⓟ29415



21229



Ⓟ29416



Ⓟ29417

7 **Lower crankcase assembly**

- ① – ⑯ : Bolt **5**
- ⑰ – ㉖ : Main cap bolt **6**

[Removal]

- Gradually loosen the bolts **5** in the sequence of numbers ① – ⑯ shown in the illustration.
- Then, gradually loosen the main cap bolts **6** in the sequence of numbers ⑰ – ㉖ shown, and remove.

[Installation]

CAUTION ⚠

- **Before installing the lower crankcase assembly check the head of the main cap bolt 6 for punch marks B.**
- **The number of punch marks corresponds to the number of times the bolt has been tightened using torque-turn method (bolts with two or less punch marks are reusable). If there are three, replace the main cap bolt.**

- Apply ϕ 2 mm {ϕ 0.079 in.} thick bead of specified sealant **C** to the fitting surface of the upper crankcase assembly **16** as shown.
- After applying sealant **C**, install the lower crankcase assembly **7** to the upper crankcase assembly **16** within three minutes and secure with the main cap bolts **6** and the bolts **5** as follows:

CAUTION ⚠

- **Make sure that the sealant application surfaces are clean and free from grease and oil.**
- **Use care not to let the applied sealant C slip out of place during installation.**

- Apply a thin coat of engine oil to the threaded part and seating surface of each main cap bolt **6**, then tighten the bolts to a torque of 49 N·m {36 lbf.ft, 5.0 kgf·m} in the sequence of the numbers shown (⑰ – ㉖)
- After tightening, give the bolts an additional 90° turn.
- Following the main cap bolts **6**, tighten the bolts **5** to the specified torque in the sequence of the numbers shown (① – ⑯).

CAUTION ⚠

- **After installation, wait at least an hour before starting the engine.**
- **Apply a new bead of sealant C whenever the bolts 5 or the main cap bolts 6 have been loosened.**

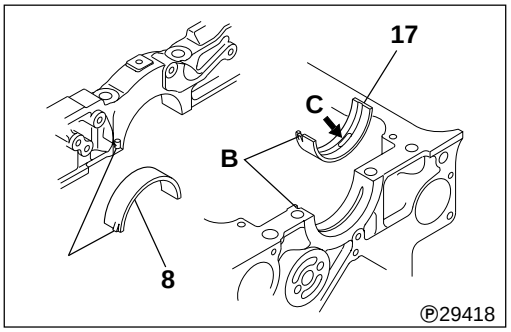
- After tightening the main cap bolts **6** using the torque-turn tightening method, make a punch mark on the head of each one to indicate the time of use.

NOTE:

Since bolts 1 utilize the torque-turn tightening method, they must not be tightened further after this procedure.

https://truckmanualshub.com/

- After installing the lower crankcase assembly, check the following:
  - Smooth rotation of crankshaft assembly **11**
  - End play of the crankshaft assembly **11** P. 11A-78



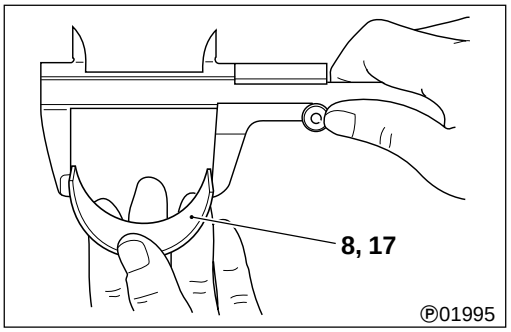
8 17 Main bearings

[Installation]

Install the main bearings **8**, **17** such that their lugs **B** fit into the corresponding grooves.

CAUTION ⚠

The upper main bearing 17 has an oil hole C. The lower main bearing 8 has no oil hole. Take care not to confuse the upper and lower parts.



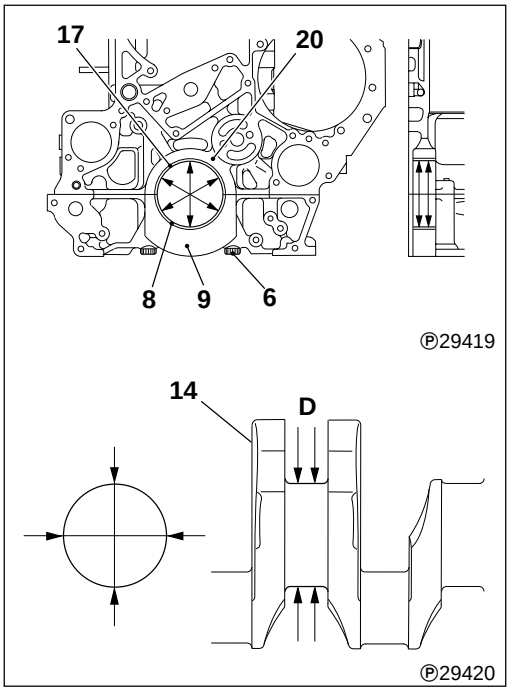
[Inspection]

CAUTION ⚠

- **Do not attempt to manually expand either bearing 8, 17 if its span is insufficient.**
- **Upper and lower bearings 8, 17 must be replaced as a set.**

(1) Span when free

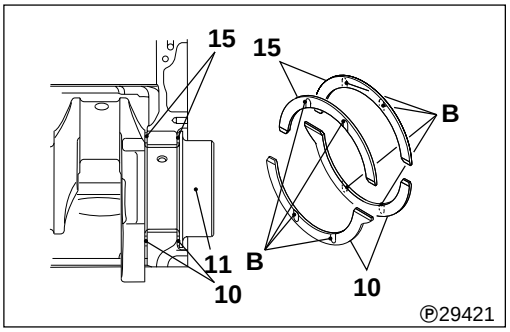
If either bearing's span when free exceeds the specified limit, the bearings **8**, **17** must be replaced.



(2) Main bearing-to-crankshaft clearance

- Fit the upper main bearing **17** into the upper crankcase **20** and the lower main bearing **8** into the lower crankcase **9**. Then, tighten the main cap bolts **6** to their specified torque (49 N·m {36 lbf.ft, 5.0 kgf·m}).
- Measure the internal diameters of the main bearings **8**, **17** and the journal outside diameter **D** of the crankshaft **14**. If the clearance exceeds the specified limit, replace the defective part(s).

https://truckmanualshub.com/

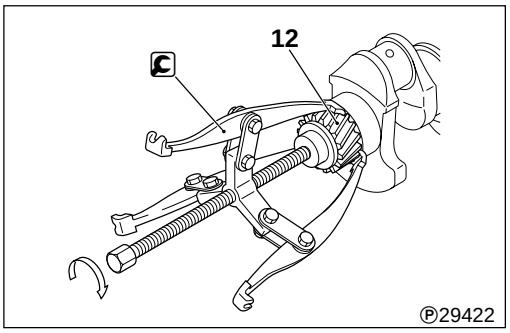


10 15 **Thrust plate**

Install the thrust plates **10**, **15** to the crankshaft assembly **11** at No. 5 journal only. Install all halves of the thrust plates with the oil groove **B** oriented outward.

NOTE:

If any oversize thrust plates are to be used, be sure to use an upper thrust plate 15 and lower thrust plate 10 of the same size at one side. However, using the same size upper (or lower) thrust bearings on both sides is not necessary.
Available oversize: 0.15, 0.30, 0.45 mm {0.0059, 0.012, 0.018 in.}



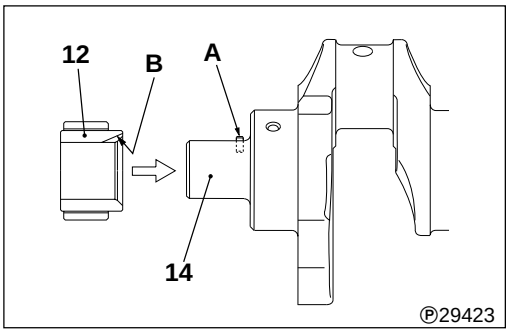
12 **Crankshaft gear**

[Removal]

: Gear Puller

CAUTION ⚠

Do not tap off the crankshaft gear 12 since this could damage it.



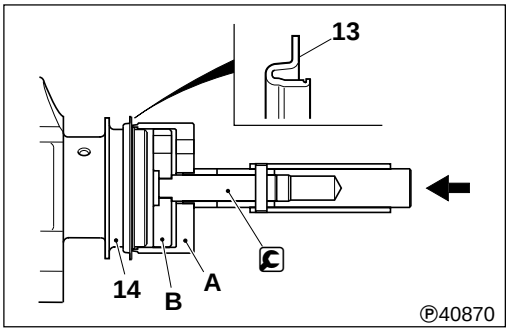
[Installation]

- Using a piston heater or the like, heat the crankshaft gear **12** to a temperature of approximately 150 °C {302 °F}.

WARNING ⚠

Be careful not to get burned.

- Align the location pin **A** on the crankshaft **14** with the notch **B** in the crankshaft gear **12**. Then, drive the gear into position by striking its end face with a plastic mallet.



13 **Rear oil seal slinger**

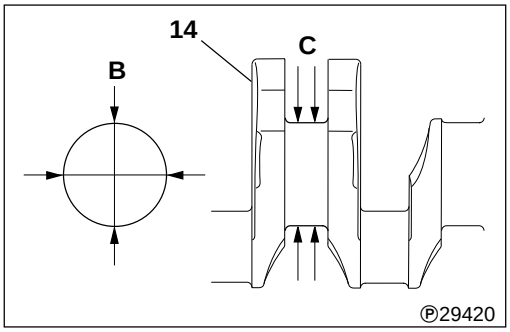
[Removal]

Taking care not to damage the crankshaft **14**, split the oil seal slinger using a chisel or the like.

[Installation]

With the rear oil seal slinger **13** directed as illustrated, drive it onto the crankshaft using the Rear Oil Slinger Installer until the tools end face **A** is pressed firmly against the guide **B**.

https://truckmanualshub.com/



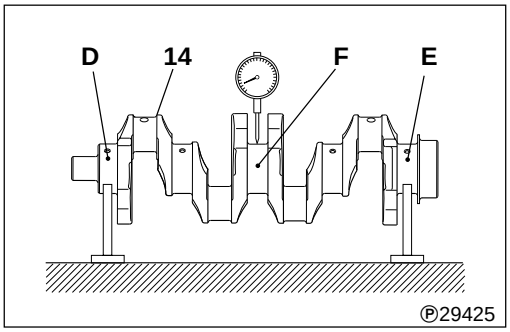
14 **Crankshaft**

[Inspection]

(1) Roundness and cylindricity of crankshaft journal and pin

If either measurement exceeds the specified limit, grind it to undersize or replace the crankshaft **14**.

B: Roundness
C: Cylindricity

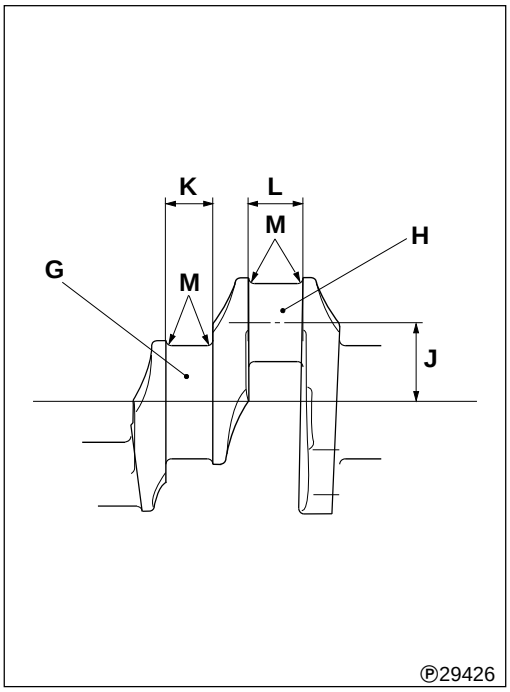


(2) Bend

- Support the crankshaft **14** at its No. 1 journal **D** and No. 7 journal **E**. Measure the extent of bending in the crankshaft at the center of the No. 4 journal **F**.
- If the measurement exceeds the specified limit, replace the crankshaft **14**.

NOTE:

Turn the crankshaft 14 through one revolution. One-half of the dial indicator reading represents the extent of bending.



[Rectification]

NOTE:

If the crankshaft 14 is rectified by grinding, the main bearings 8, 17 must be replaced with undersized ones.
Available undersizes: 0.25 mm, 0.50 mm 0.75 mm, 1.00 mm {0.0098, 0.02, 0.03, 0.039 in.}

- Grind such that the center-to-center distance **J** between the journal **G** and pin **H** never be changed.

  J: 60 ± 0.05 mm {2.36 ± 0.002 in.}
- Grind such that the journal width **K** and pin width **L** do not change.

  K: 33.5 mm {1.32 in.} (No. 1 journal)
  35 mm {1.38 in.} (No. 2 to No. 4 journals)
  $35^{+0.039}_{0}$ mm {$1.38^{+0.0015}_{0}$ in.} (No. 5 journal)
  L: $41^{+0.2}_{0}$ mm {$1.61^{+0.0079}_{0}$ in.}
- Finish the corner fillet smoothly and to the specified radius M.

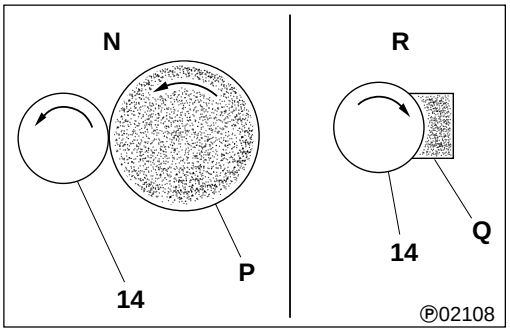
  M: 5 mm {0.2 in.}
- Carry out a magnetic inspection to check for cracks caused by grinding. Also, check that the Shore hardness of the surface has not dropped below Hs 75.

https://truckmanualshub.com/

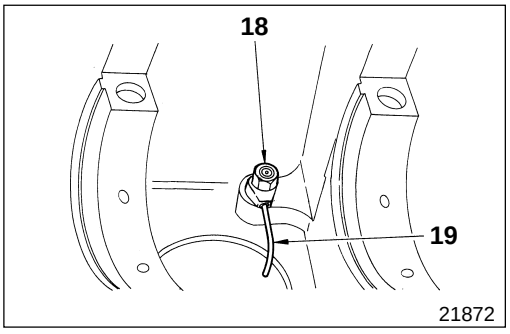
Crankshaft undersize dimensions

Unit: mm {in.}

		Degree of undersize			
		0.25 {0.0098}	0.50 {0.020}	0.75 {0.030}	1.00 {0.039}
Finished journal diameter	No. 1, 2, 4, 5	85.68 to 85.70 {3.373 to 3.374}	85.43 to 85.45 {3.363 to 3.364}	85.18 to 85.20 {3.353 to 3.354}	84.93 to 84.95 {3.343 to 3.344}
	No. 3	85.66 to 85.68 {3.372 to 3.373}	85.41 to 85.43 {3.362 to 3.363}	85.16 to 85.18 {3.352 to 3.353}	84.91 to 84.93 {3.342 to 3.343}
Finished pin diameter		64.69 to 64.71 {2.546 to 2.547}	64.44 to 64.46 {2.537 to 2.5378}	64.19 to 64.21 {2.527 to 2.528}	63.94 to 63.96 {2.517 to 2.518}
Roundness		0.01 {0.00039} or less			
Cylindricity		0.006 {0.00024} or less			



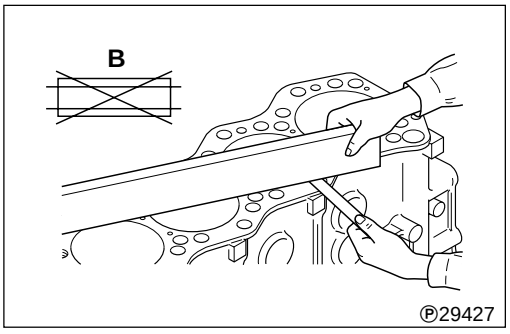
- When grinding **N**, turn the crankshaft **14** counter-clockwise as viewed from its front end. The grinder **P** should rotate in the same direction.
- When finishing **R** the crankshaft **14** with whetstone or sandpaper **Q**, rotate the crankshaft clockwise.



18 19 Installation of check valve and oil jet

CAUTION ⚠

Do not overtighten the check valve 18. If the tightening torque exceeds the specified one, the check valve may malfunction, resulting in seizure of the engine.



20 Inspecting upper crankshaft

- Measure the upper surface distortion of the upper crankcase **20**.
- If distortion exceeds the specified limit, correct it with a surface grinder.

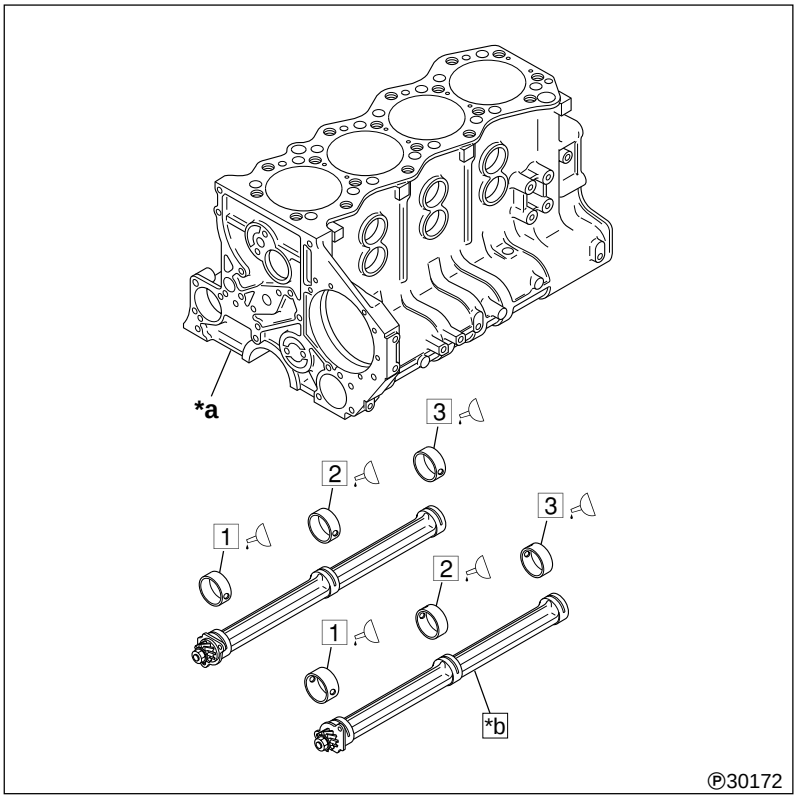
B: Measurement positions

CAUTION ⚠

When grinding the crankcase 20, take care that the piston protrusions stay within specification.

https://truckmanualshub.com/

BALANCE SHAFT BUSHINGS



● **Disassembly sequence**

1 No. 1 balance shaft bushing
2 No. 2 balance shaft bushing
3 No. 3 balance shaft bushing

***a:** Upper crankcase 📖 P. 11A-76
***b:** Balance shaft 📖 P. 11A-52

CAUTION ⚠

Do not remove the balance shaft bushings 1 through 3 unless something wrong is evident.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Unit: mm {in.}

Location	Maintenance item		Standard value (Basic diameter in [ ])	Limit	Remedy
***b, 1 to 3**	Clearance between balance shaft and balance shaft bushing	No. 1 journal	[51.5 {2.027}] 0.055 to 0.099 {0.0021 to 0.0039}	0.15 {0.0059}	Replace

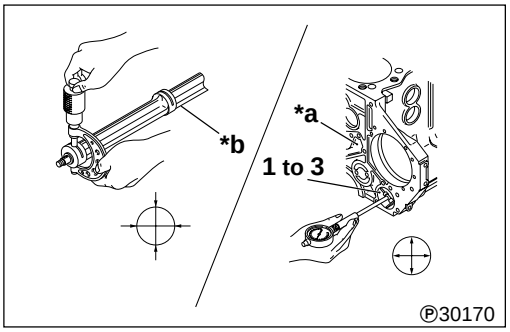
https://truckmanualshub.com/



◆ Service procedure

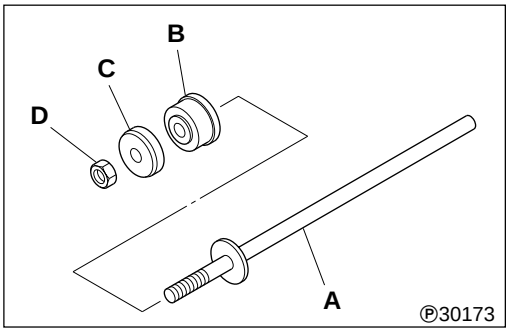
***b 1 to 3 Balance shaft and balance shaft bushing**

[Inspection]

If the clearance is more than the limit, replace defective parts.

NOTE:

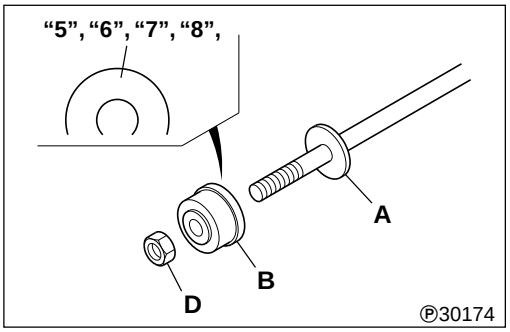
Measure the inner diameter of the balance shaft bushings 1 through 3 with the bushings installed on the upper crankcase *a.



Balance shaft bushing

Use the Balance Shaft Bushing Installer & Extractor to replace the balance shaft bushings **1** through **3**.
(Components of Balance Shaft Bushing Installer & Extractor)

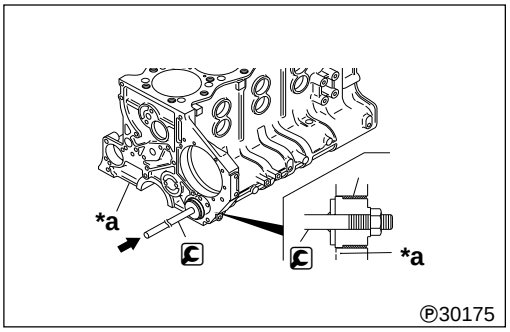
- **A:** Rod
- **B**: Adapter
- **C**: Guide piece
- **D**: Nut



[Removal]

- Drive out the balance shaft bushings **1** to **3** using the Balance Shaft Bushing Installer & Extractor consisting of the adapter **B** appropriate to each bushing secured on rod **A** with nut **D**.

Balance shaft bushing		Identification mark of adapter **B**
No. 1	Left	5
	Right	6
No. 2		7
No. 3		8

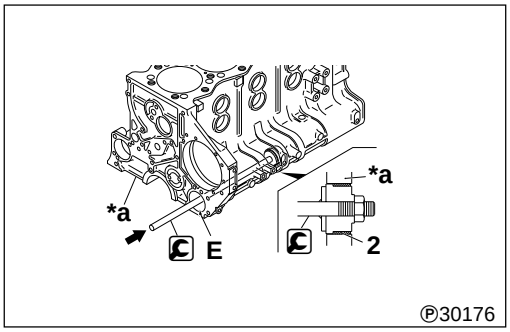


- Remove the No. 1 balance shaft bushing **1** from the front side of the upper crankcase ***a**.

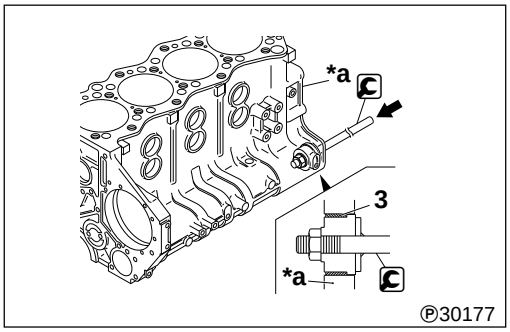
  : Balance Shaft Bushing Installer & Extractor

https://truckmanualshub.com/

BALANCE SHAFT BUSHINGS

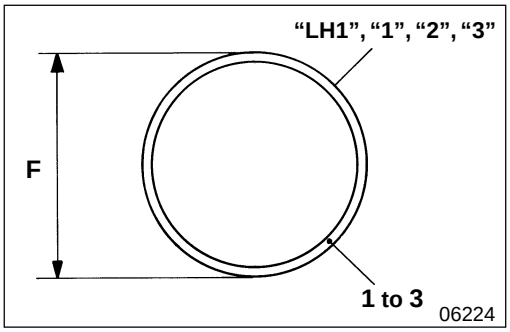


- Remove the No. 2 balance shaft bushing **2** from the upper crankcase ***a** by inserting the Balance Shaft Bushing Installer & Extractor through the hole **E** from which the No. 1 balance shaft bushing was removed.



- Remove the No. 3 balance shaft bushing **3** from the rear side of the upper crankcase ***a**.

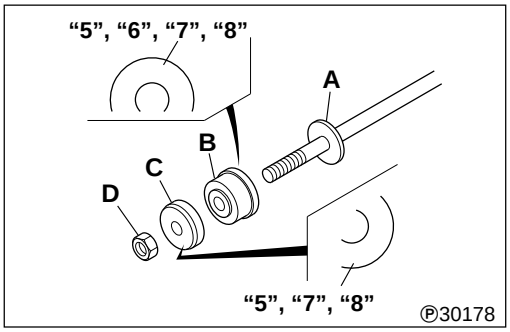
  : Balance Shaft Bushing Installer & Extractor



[Installation]

- Identify balance shaft bushings **1** through **3** by the marks "1", "2", "3" or "LH1" stamped on each bushing.
  If the mark on a bushing is unclear, identify the bushing by measuring the outside diameter **F** of the bushing.

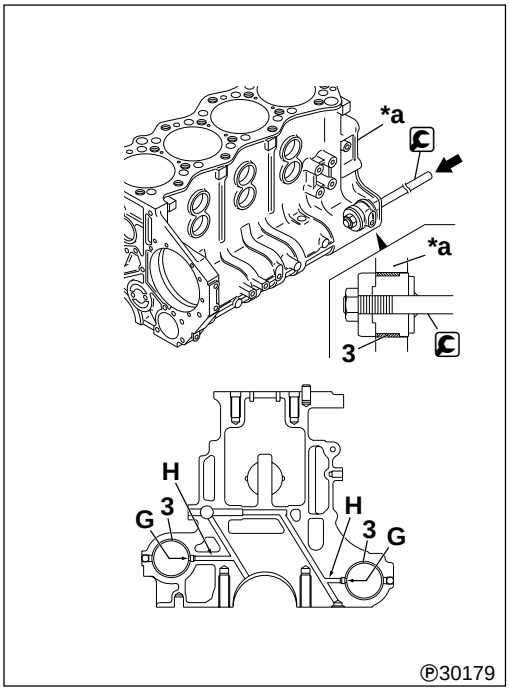
Balance shaft bushing (from front of engine)		Mark	Outside diameter (mm {in.})
No. 1	Left (two oil holes)	LH1	ϕ 55.25 {ϕ 2.175}
	Right (one oil hole)	1	
No. 2		2	ϕ 55 {ϕ 2.165}
No. 3		3	ϕ 54.75 {ϕ 2.155}



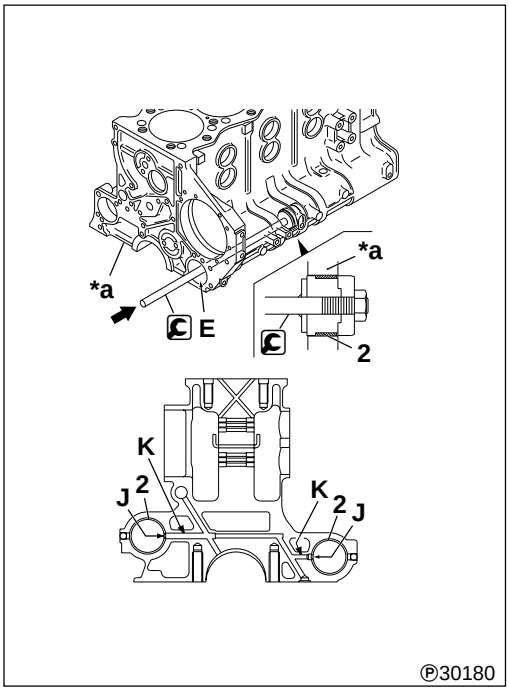
- Drive the balance shaft bushings **1** through **3** in position by hammering on the Balance Shaft Bushing Installer & Extractor consisting of the adapter **B** and guide piece **C** appropriate to each bushing secured on the rod **A** with nut **D**.

Balance shaft bushing		Identification mark of adapter **B**	Identification mark of guide piece **C**
No. 1	Left	5	5
	Right	6	
No. 2		7	7
No. 3		8	8

https://truckmanualshub.com/



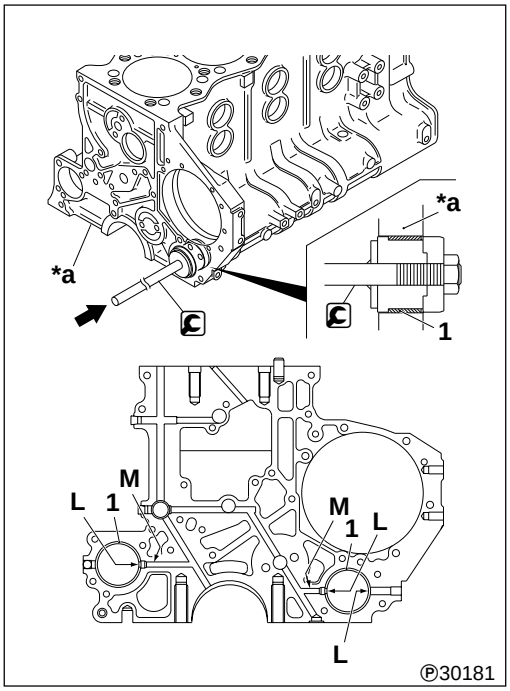
- Install the No. 3 balance shaft bushing **3** from the rear side of the upper crankcase ***a**.
  In this case, make sure that the oil hole **G** in the bushing matches the oil passage **H** in the crankcase.
  : Balance Shaft Bushing Installer & Extractor



- Install the No. 2 balance shaft **2** by inserting the Balance Shaft Bushing Installer & Extractor through the No. 1 balance shaft bushing mounting hole **E** of the upper crankcase ***a**.
  In this case, make sure that the oil hole **J** in the bushing matches the oil passage **K** in the crankcase.
  : Balance Shaft Bushing Installer & Extractor

https://truckmanualshub.com/

BALANCE SHAFT BUSHINGS



- Install the No. 1 balance shaft bushing **1** from the front side of the upper crankcase ***a**.
  In this case, make sure that the oil hole **L** in the bushing matches the oil passage **M** in the crankcase.

  : Balance Shaft Bushing Installer & Extractor

CAUTION ⚠

- **The No. 1 balance bushings 1 include the right and left ones which are different from each other. Use care to prevent confusion when installing them.**
  The left one has two oil holes, whereas the right one has one oil hole.
- **Before installing No. 1 balance bushing 1, check to ensure that No. 2 balance shaft bushing 2 has been installed.**

Inspection of Engine Compression

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Engine Compression	Each cylinder (200 rpm)	2550 kPa {370 lbf/in^2, 26 kgf/cm^2}	1960 kPa {285 lbf/in^2, 20 kg/cm^2}	Inspect
		Pressure difference between each cylinder	—	within 390 kPa {57 lbf/in^2, 4 kgf/cm^2}	Inspect

Special tools

Unit : mm {in.}

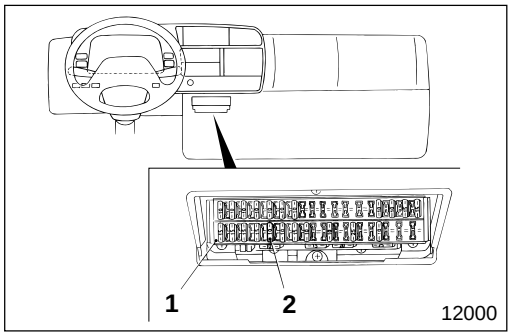
Location	Tool name and shape	Part No.	Application
—	Compression gauge adapter  06197	MH061460	Measurement of engine compression

The decrease of engine compression is a signal that it is time to overhaul the engine. It is strongly recommended that this item is inspected periodically and that you record the history of deterioration in engine performance as this will help you to diagnose causes of future irregularities.
When the vehicle is still new or immediately after installation of new parts, there may be a slight increase in engine compression, but normal performance will be restored soon.

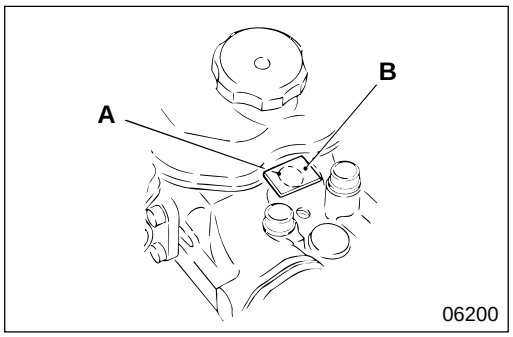
- Before inspection make sure that engine oil, starter and battery are in normal condition.
- Before inspecting the vehicle do the following:
  - Run the engine to bring the temperature of the coolant up to approximately 75 to 85°C {167 to 185°F}.
  - Turn all the lights and accessory equipment OFF.
  - Put transmission in neutral. (P range for automatic transmission)
  - Set the steering wheel at center and straight position.

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE



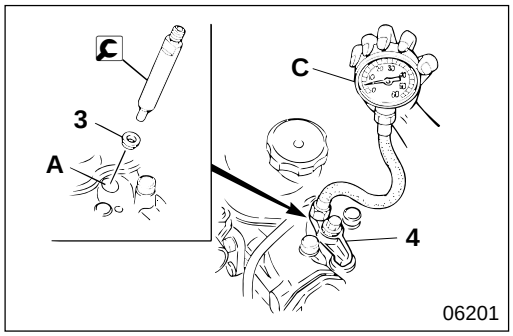
- Remove fuse **2** for the fuel-cut motor from fuse box **1** inside the cab to prevent the fuel from being injected when the engine is cranked by the starter.



- Remove all the injection nozzles. Gr 13
- Check that no foreign particles are sticking to waste cloth **B** covering injection nozzle mounting hole **A** after cranking the engine.

WARNING

You must stay clear of injection nozzle mounting hole A when you crank the engine during this inspection. Assume that all cylinders have cracked, and that coolant, engine oil, fuel, etc. have seeped into the cylinder chambers. If this is the state when the engine is cranked, there is an extreme danger of these substances being injected out of the injection nozzle mounting hole at high temperature.



- Mount gasket **3** and compression gauge adaptor in injection nozzle mounting hole **A** and fasten them with nozzle bridge **4**, then mount compression gauge **C**.
- Measure engine compression while cranking the engine.
- Measure engine compression of cylinders and calculate the difference among the cylinders.
- If the engine compression and pressure difference between each cylinder deviate from the limit, reinspect by pouring a small amount of engine oil into injection nozzle mounting hole **A**.
  - When pressure is high : It is likely that either wear or damage of the slide-contact area of both the piston ring and the cylinder inner surface has taken place.
  - When pressure is low : It is likely that burning of the valve, faulty contact of valve surfaces and/or faults in the cylinder head gasket have developed.

https://truckmanualshub.com/

Inspection and Adjustment of Valve Clearance

Service standards

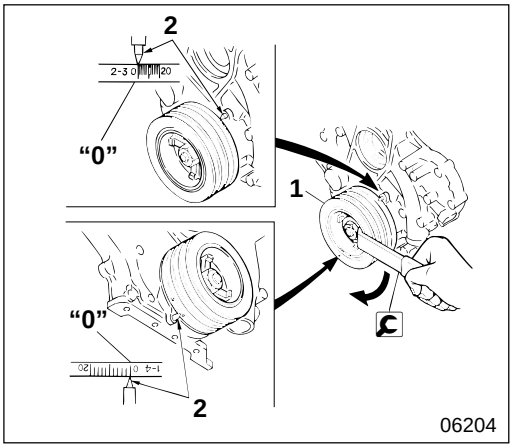
Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Valve clearance (When engine is cold)	0.4 {0.016}	—	Adjust

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
—	Cranking handle  05999	MH061289	Cranking of engine
—	Flat-blade screwdriver  06000	MH060008	Valve clearance adjustment (Used for an installed engine)



06204

Inspect and adjust the valve clearance while the engine is cold in the following way.

[Inspection]

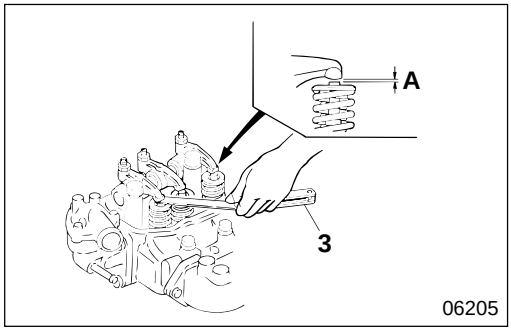
- Crank the engine to move No.1 or No.4 piston to top dead center. Do this by turning crankshaft pulley **1** clockwise using cranking handle to align stamped mark "**0**" on the crankshaft pulley with pointer **2**.

NOTE

- **The cylinder whose push rod is not pushing up the inlet/outlet rocker is the one whose piston is at top dead center.**
- **There are two pointers 2. Use any one of the two pointers to align the stamped mark of crankshaft pulley 1 in the position as illustrated.**

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE



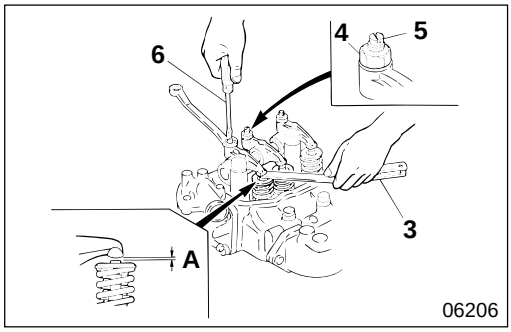
- Measure valve clearance **A** when either No.1 or No.4 piston is at top dead center in accordance with the following tabulated sequence of each valve.

Cylinder No.	1		2		3		4	
Valve arrangement	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust
No.1 piston at top dead center	○	○	○	—	—	○	—	—
No.4 piston at top dead center	—	—	—	○	○	—	○	○

NOTE

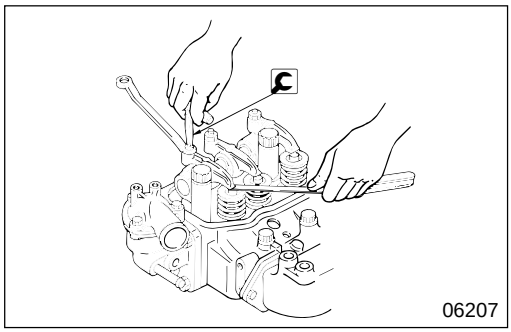
Be sure when taking measurements using feeler gauge 3 that some resistance is felt when inserting the gauge. If the gauge can be inserted freely without any resistance, an accurate measurement cannot be obtained.

- If the measured value deviates from the limit, adjust as follows:



[Adjustment]

- Adjust valve clearance **A** so that feeler gauge **3** encounters some resistance when it is inserted. Do this by loosening lock nut **4** and turning adjusting screw **5**.
- After adjusting, tighten adjusting screw **5** using screwdriver **6** and tighten lock nut **4**. Reinspect valve clearance **A** using feeler gauge **3**.



- When turning adjusting screw **5** on an engine that is installed, using flat-blade screwdriver will make the work easier.

Lubricant

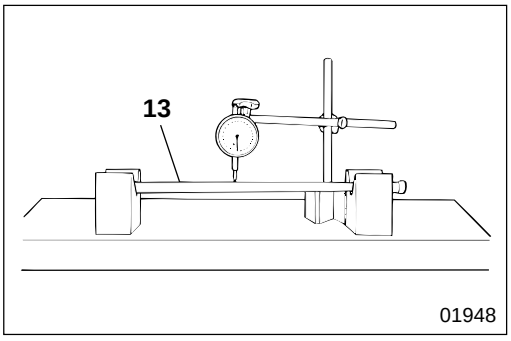
Location	Points of application	Kinds	Quantity
11	Thread area of cylinder head bolt	Engine oil	As required
13	Both ends of push rod	Engine oil	As required
16	Outer periphery of tappet	Engine oil	As required

https://truckmanualshub.com/

Special tools

Location	Tool name and shape	Part No.	Application
14	Socket wrench  01984	MH061560	Installation of cylinder head and valve assembly
16	Tappet extractor  03320	MH063329	Removal of tappet

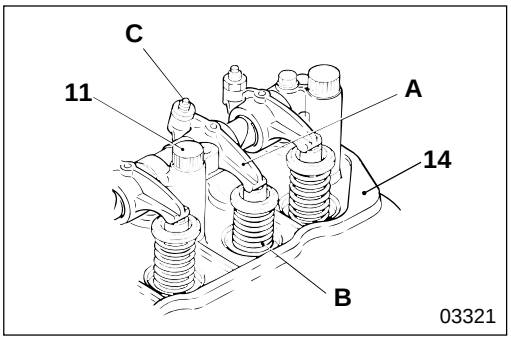
◆ Service procedure



01948

13 **Push rod deflection**

If the measured value is higher than the limit, replace push rod **13**.

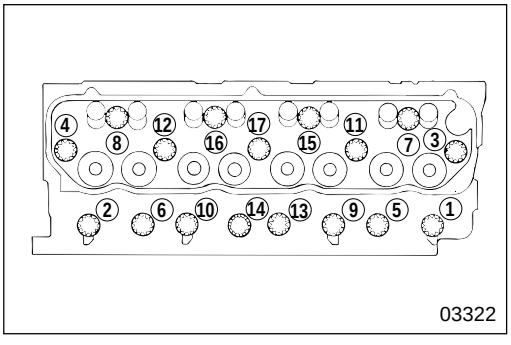


03321

14 **Cylinder head and valve assembly**

[Removal]

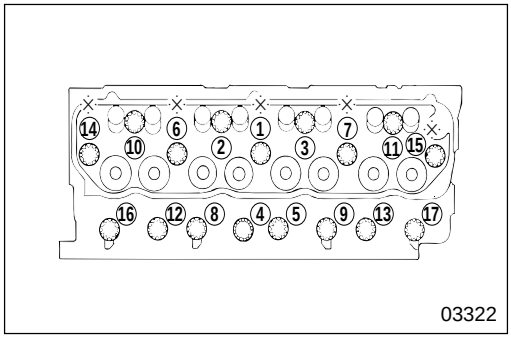
- Before undoing cylinder head bolts **11**, first loosen adjusting screw **C** of rocker **A** that pushes down valve spring **B**.



03322

- First loosen cylinder head bolts **11** in the numbered order as illustrated, then remove them.

https://truckmanualshub.com/



03322

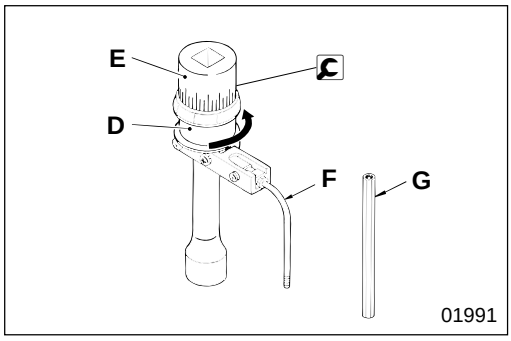
[Installation]

- Center punch the heads of cylinder head bolts **11** before installation.

CAUTION

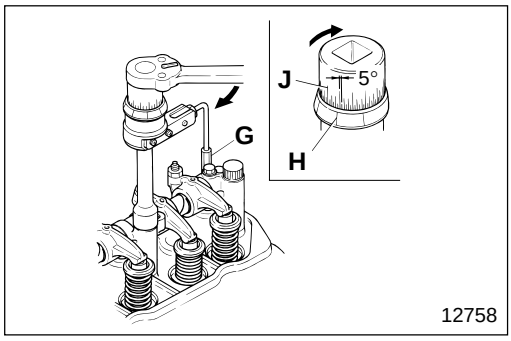
If there are already three center-punch marks, replace the cylinder head bolt with a new one.

- After tightening cylinder head bolts **11** at specified torque in the numbered order as illustrated, tighten further as follows:
  ⁘ : Tightened simultaneously with rocker and bracket assembly



01991

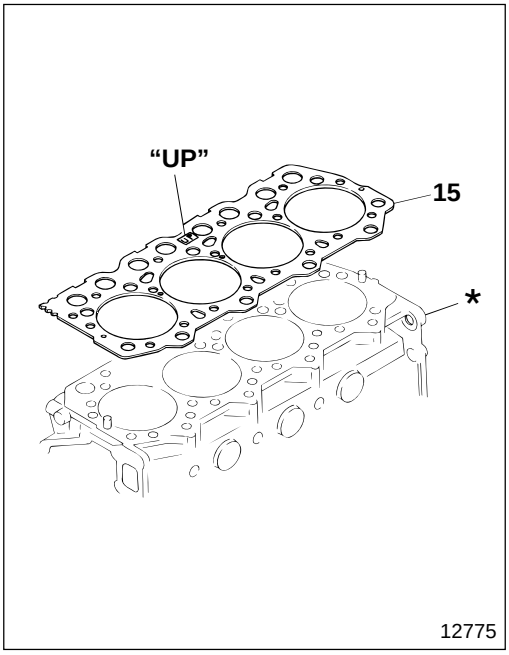
- Turn socket wrench holder **D** counterclockwise and keep the spring in the wrench compressed.
  E : Socket
  F : Rod
  G : Rod (for connection)



12758

- Set socket wrench holder **D** so that the repercussive force of the spring presses rod **G** (for connection) against adjacent parts such as, rocker shaft bracket or the injection pipe.
- Select a scale that is convenient for reading graduation **H** on holder **D**.
- Tighten further by turning socket **E** clockwise by 90° (setting is in 5° increments), referring to graduation **J** on the selected scale.

https://truckmanualshub.com/



15 **Cylinder head gasket**

[Removal]

CAUTION

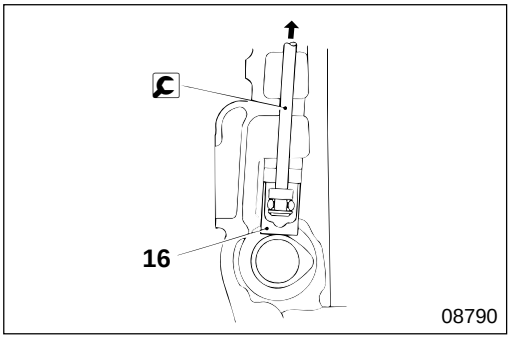
Be careful not to scratch the cylinder head or crankcase * when you remove cylinder head gasket 15.

[Installation]

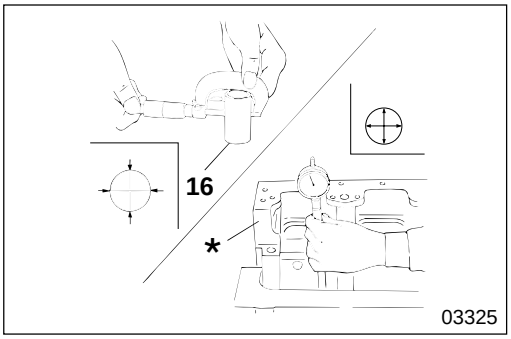
Install cylinder head gasket **15** onto crankcase * in the direction as illustrated.

CAUTION

Be sure to measure the amount of protrusion whenever a piston or connecting rod is replaced, since replacement changes the amount of protrusion.



16 **Removal of tappet**



16 ***** **Clearance between tappet and crankcase tappet hole**

If the measured value is higher than the limit, replace the faulty parts.

https://truckmanualshub.com/

◆ Service procedure

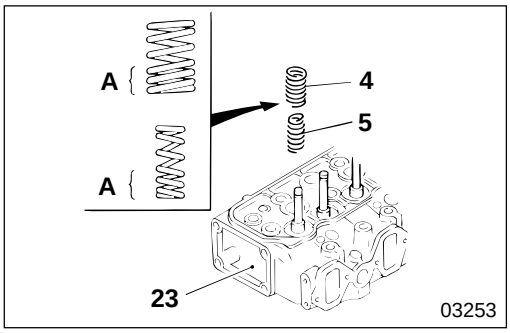
2 **Valve cotter**

[Removal]
Remove valve cotter **2** making sure that valve springs **4**, **5** are squarely and evenly pressed down by 🔧 valve lifter.

[Installation]
Follow the removal procedure in reverse.

CAUTION⚠

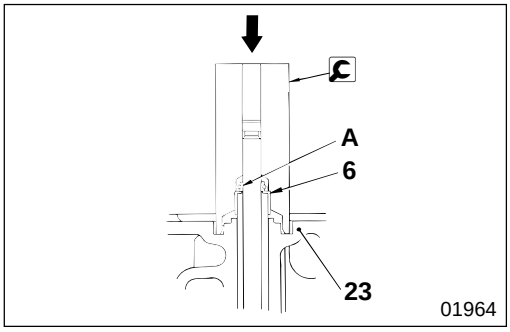
Be sure not to press down on valve springs 4, 5 too hard because this would cause upper retainer 3 to contact valve stem seal 6 and damage it.



4 **5** **Installation of outer and inner valve springs**

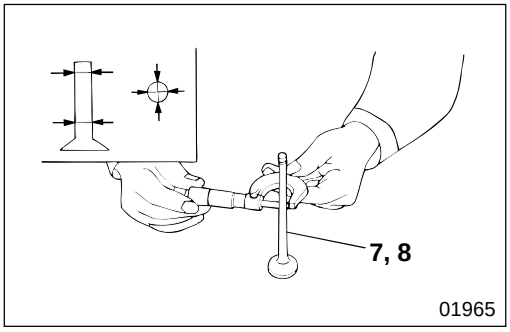
Install outer springs **4** and inner springs **5** in cylinder head **23** in the direction as illustrated.

A : Closely wound area



6 **Installation of valve stem seal**

- Apply engine oil to lip **A** of valve stem seal **6**.
- Tap down 🔧 valve stem seal installer until it hits cylinder head **23**.



7 **8** **Inlet valve and exhaust valve**

[Inspection]

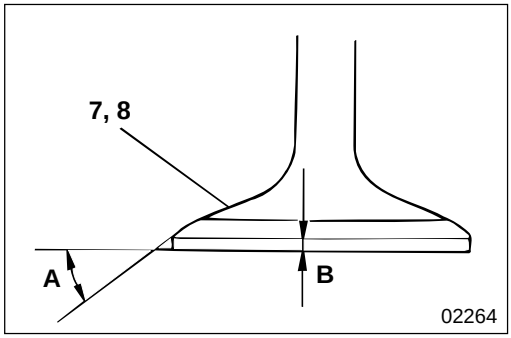
(1) Inspection of stems

If the measured value is lower than the limit or in the case of excessive wear, replace valves **7**, **8**.

CAUTION⚠

Be sure to lap valve seats 19, 20 when valves 7, 8 are replaced with new ones. 📖 **P11-23**

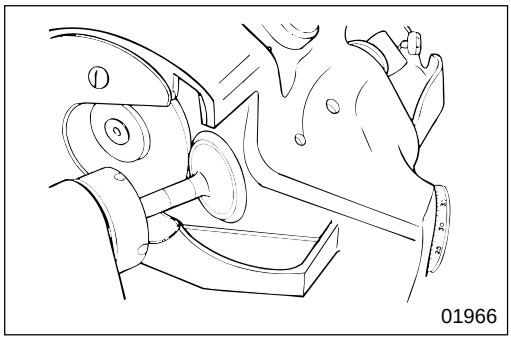
https://truckmanualshub.com/



(2) Valve seat angle and valve margin

If the measured value is higher than the limit, correct or replace valves **7**, **8**.

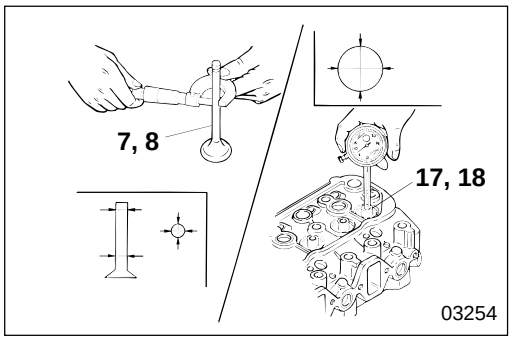
A : Valve seat angle
B : Valve margin



[Correction]

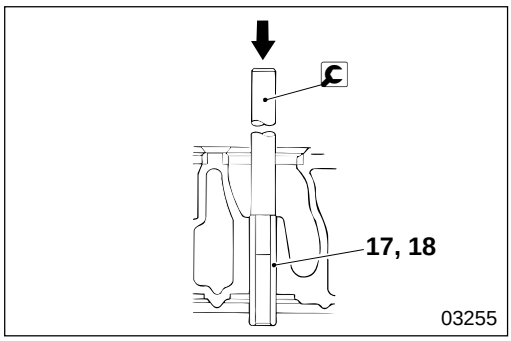
NOTE

- **Be sure to keep the grinding work as light as possible.**
- **Be sure to replace valves 7, 8 after grinding if valve margin deviates from the limit.**
- **Be sure to lap valve 7, 8 and valve seats 19, 20 after grinding.** **P11-23**



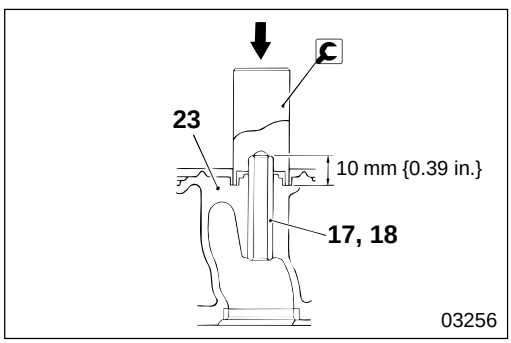
7 **8** **17** **18** **Valve and valve guide**

[Inspection]
When the clearance is higher than the limit, replace the faulty parts.



Valve guide

[Removal]



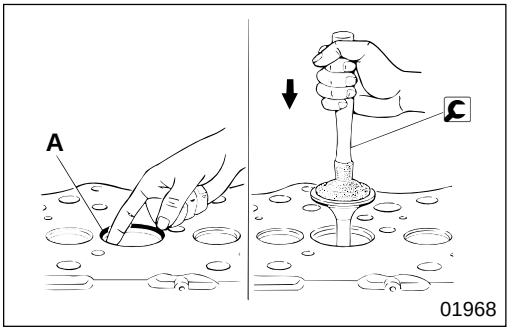
[Installation]

- Tap down valve guides **17**, **18** with valve guide installer until it hits cylinder head **23**.

CAUTION

- **The length of fit of valve guides 17, 18 is standardized. Be sure to use valve guide installer.**
- **Be sure to distinguish between valve guides 17, 18. Exhaust valve guide 18 is longer.**

https://truckmanualshub.com/



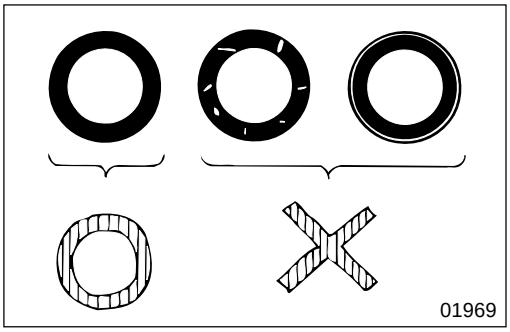
7 **8** **19** **20** **Valve and valve seat**

[Inspection]

- Apply red lead evenly to entire surface **A** of valve seats **19**, **20** that contact valves **7**, **8**.
- Fit valves **7**, **8** to valve seats **19**, **20** and tap once without rotating.

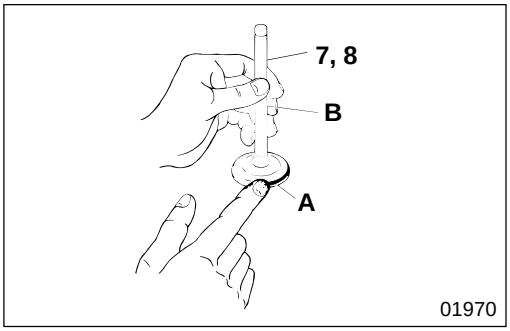
NOTE

Be sure to carry out inspection under the condition that valves 7, 8 and all parts of valve guides 17, 18 are normal.



- Check how much red lead has transferred to valves **7**, **8** to determine the contact of the valve and the seat. According to the degree of abnormality, take proper measures to correct it.

Contact conditions	Correction measures
Minor fault	Valve lapping
Major fault	Repair of valve and seat or replacement of both



[Correction]

Valve polishing is done in the following manner:

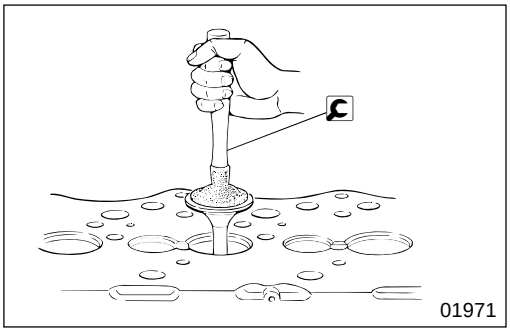
- Apply valve lapping compound thinly to contact surface **A** of valves **7**,**8** with valve seats **19**, **20**.

CAUTION ⚠

Take care not to smear stems B of valves 7, 8 with the compound.

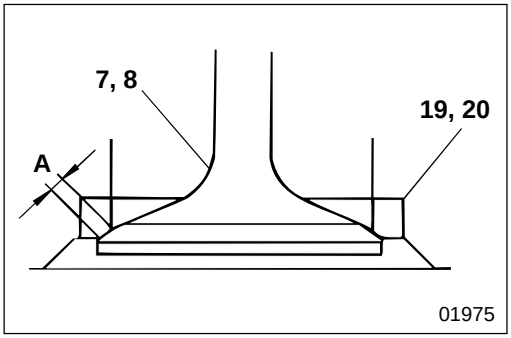
NOTE

- **Start with medium grit compound (120 to 150 grit) and for finishing up, use finer grit (200 grit or finer).**
- **Mixing with a small amount of engine oil will make the compound consistent and make even application easier.**



- Tap valves **7**, **8** against valve seats **19**, **20** several times while rotating the valves slightly at each strike.
- Clean off the compound with gas oil.
- Apply engine oil to contact surface **A** of valve seats **19**, **20** and smooth the surface.
- Check the contact of valves **7**, **8** and valve seats **19**, **20**.
- If contact does not take place completely around the seat, replace valve seats **19**, **20**.

https://truckmanualshub.com/



19 **20** **Valve seat**

[Inspection]

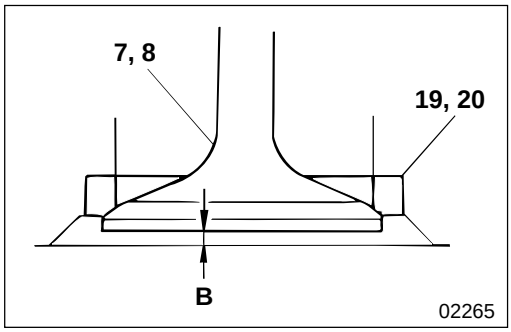
(1) Valve seat width

If the measured value is higher than the limit, replace valve seats **19**, **20**.

A : Valve seat width

NOTE

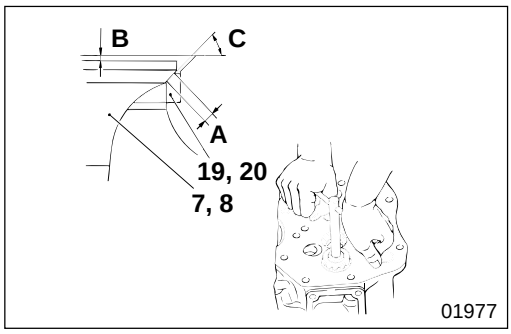
Be sure to lap and fit valves 7, 8 and valve seats 19, 20 after correction or replacement.



(2) Extent of valve recess from the bottom surface of cylinder head

If the measured value is higher than the limit, correct or replace the faulty parts.

B : Extent of valve recess



[Correction]

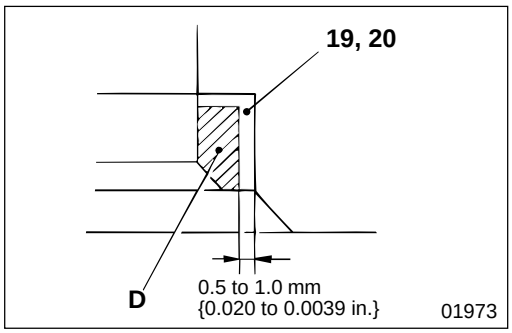
- Grind valve seats **19**, **20** using valve seat cutter or valve seat grinder.
- After grinding, do another light abrasion using 400 grit emery paper placed between the cutter and the seat.
- Adjust the seat width **A** of valves **7**, **8** using 15° or 75° cutter to make seat width conform to the standard value.

C : Valve seat angle

CAUTION ⚠

Be sure that as a result of grinding, recess B of valves 7, 8 does not become higher than the limit.

- After correction is done, be sure to carry out lapping and fitting on valves **7**, **8** and valve seats **19**, **20**.

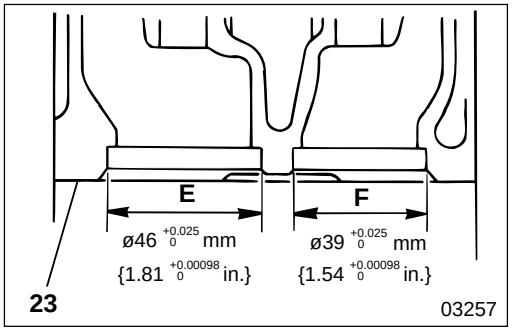


[Removal]

- Valve seats **19**, **20** have been set in by the cooling-off-process, and have to be thinned by grinding off the inner side for removal under normal temperature.

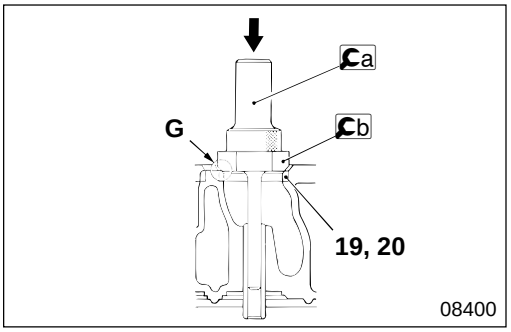
D : Part to be ground

https://truckmanualshub.com/



[Installation]

- Make sure that the diameter of valve seat hole of cylinder head **23** conforms to the standard value.
  E : Inlet valve seat hole diameter
  F : Exhaust valve seat hole diameter

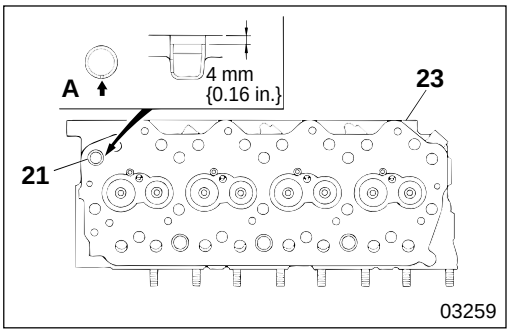


- Immerse valve seats **19**, **20** in liquid nitrogen and cool them substantially. Press-fit into the cylinder head using Ca caulking tool body and Cb caulking rings inlet and exhaust.

CAUTION

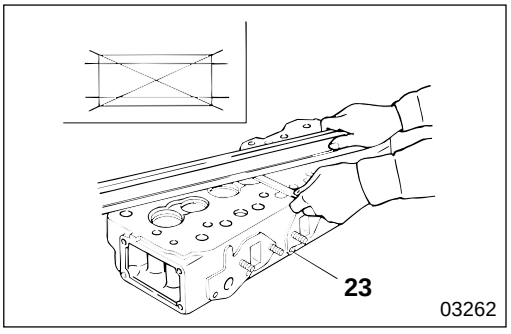
Be sure, when press-fitting, to place the chamfered side G of Cb caulking rings inlet and exhaust against valve seats 19, 20.

- After installation of valve seats **19**, **20**, work until they contact valves **7**, **8** smoothly.



21 Installation of water director

- With indent **A** set in the direction as illustrated, press-fit water director **21** into cylinder head **23** to the specified depth.



23 Inspection of cylinder head

Measure the extent of distortion of the bottom of cylinder head **23**, and if the measured value is higher than the standard value, grind using a surface grinder.

CAUTION

Be sure to keep the amount of grinding within the limit of the height of cylinder head 23.

Lubricant and sealant

Location	Points of application	Kinds	Quantity
4, 5, 20	Entire body of O-ring	Engine oil	As required
7	Front oil seal lip	Engine oil	As required
9	Mounting surface of timing gear case	THREEBOND 1207C	As required
10	Thread area of bolt	Engine oil	As required

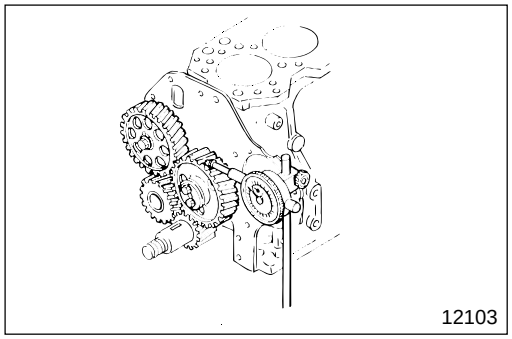
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
13	Idler gear bushing puller 	MH062224	Removal and installation of idler gear bushing

https://truckmanualshub.com/

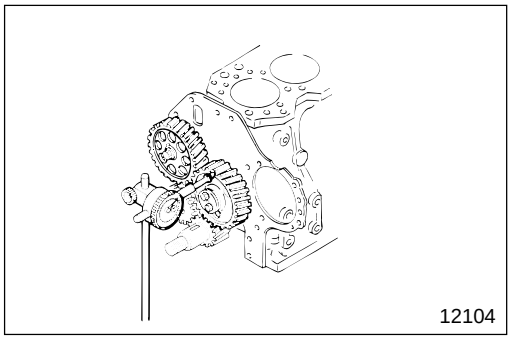
◆ Service procedure



● **Inspection before disassembly**

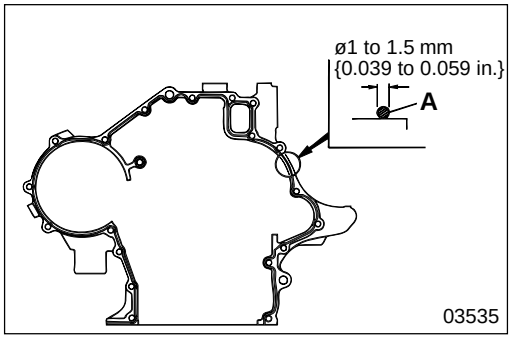
(1) Backlash of each gear

Measure three or more locations on the pairing gears and if the measurements are higher than the limit, replace the faulty parts.



(2) End play of idler gear

If the measured value is higher than the limit, replace the faulty parts.

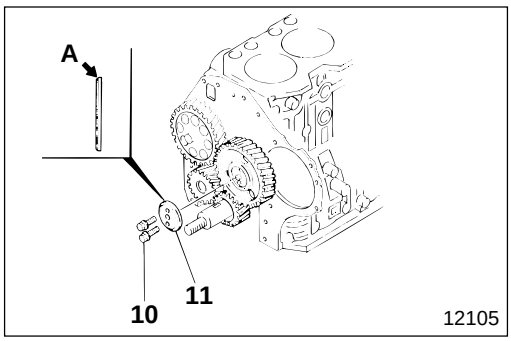


9 Installation of timing gear case

Apply sealant **A** to the mounting surface of timing gear case **9** evenly without break. After applying sealant, within three minutes, mount to the front plate.

CAUTION ⚠

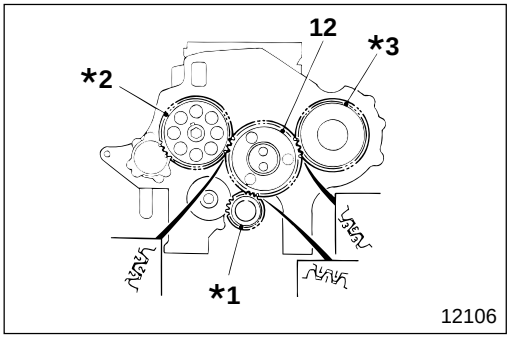
- **Be sure to clean and wipe off oily substances from the surface where sealant A is to be applied.**
- **Make sure that sealant A is not transferred to other areas while the mounting work is being done.**
- **Be sure to reapply sealant A if the bolts are loosened or removed by any cause whatsoever after mounting.**
- **Do not start the engine within an hour of mounting.**



11 Installation of thrust plate

A : Chamfered side

https://truckmanualshub.com/



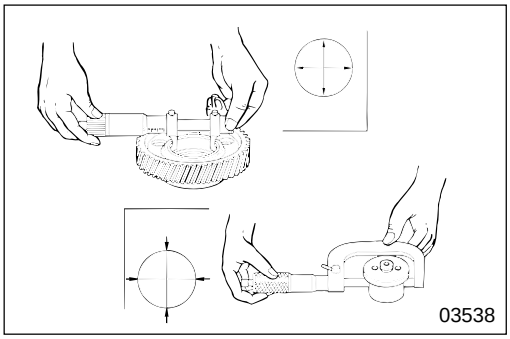
12 **Installation of idler gear assembly**

Install idler gear assembly **12** by matching alignment marks **"1"**, **"2"**, **"3"** on the gears that engage with those on the assembly.

***1** : Crankshaft gear
***2** : Camshaft gear
***3** : Injection pump gear

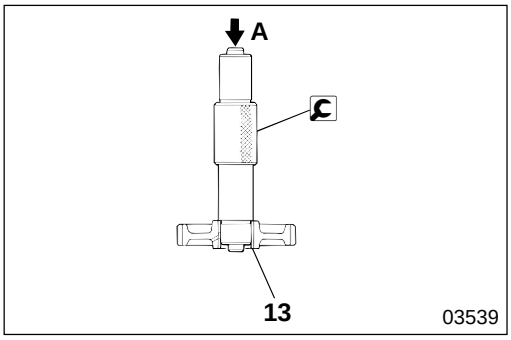
NOTE

When aligning each gear with its alignment mark, make sure that pistons No.1, 4 are higher than top dead center.



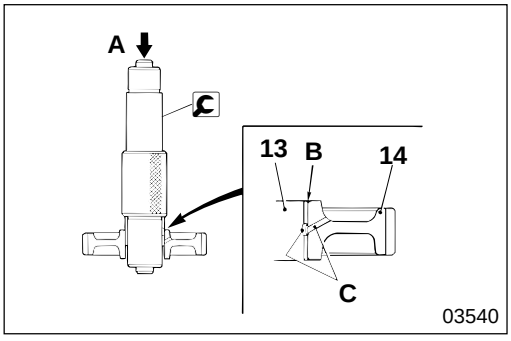
13 **15** **Idler gear bushing and idler shaft**

[Inspection]
If the clearance is higher than the limit, replace the faulty parts.



Idler gear bushing

[Removal]
A : Press



[Press-fitting]

- Press-fit idler gear bushing **13** from chamfered side **B** of idler gear **14** and align oil holes **C** of the idler gear and the bushing.
- After press-fitting, finish the fitting by bringing the clearance between idler gear bushing **13** and the idler shaft to the standard value.

https://truckmanualshub.com/

CAMSHAFT

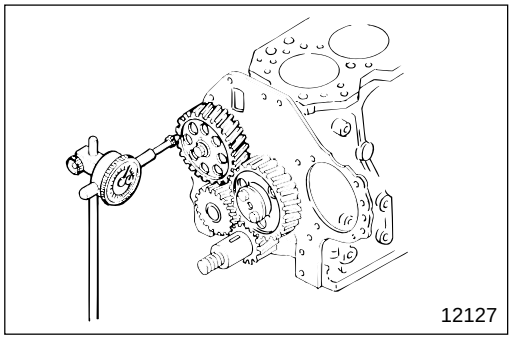
◆ Service procedure

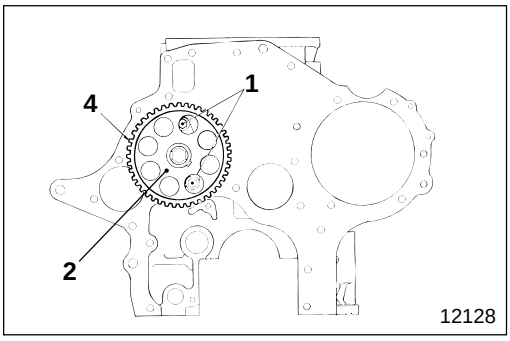


12127

● Inspection before disassembly

Camshaft end play

If the measured value is higher than the limit, replace the faulty parts.



12128

2 **Camshaft assembly**

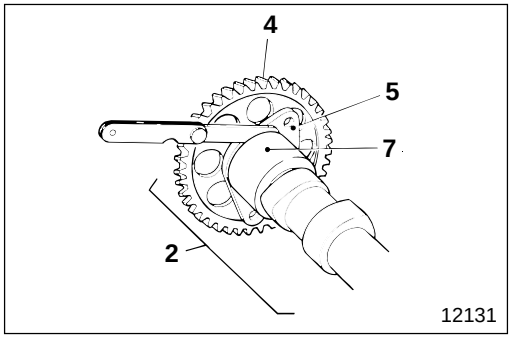
[Removal]

Remove camshaft assembly **2** by undoing bolts **1** through the holes in camshaft gear **4**.

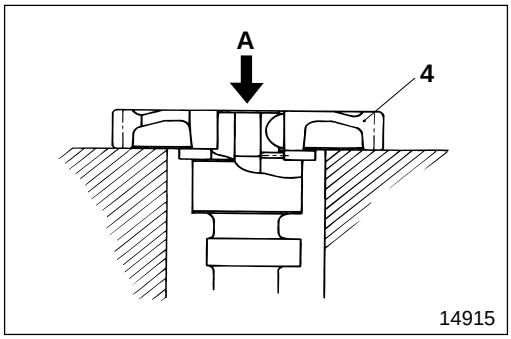
CAUTION⚠

Be careful not to damage the camshaft bushings when you remove camshaft assembly 2.

https://truckmanualshub.com/



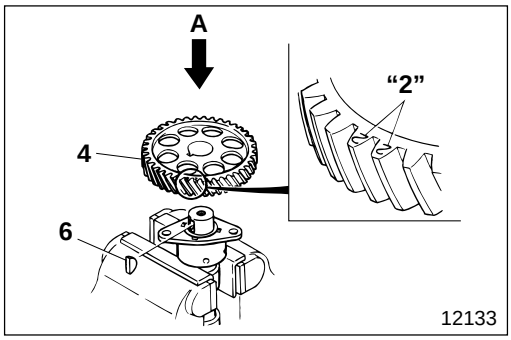
[Installation]
- Before installing camshaft assembly **2**, measure the end play between thrust plate **5** and camshaft **7**.
- If the measured value is higher than the limit, replace thrust plate **5**.
- Install the camshaft assembly by matching the alignment mark on camshaft gear **4** with the alignment mark on the idler gear. P11-29



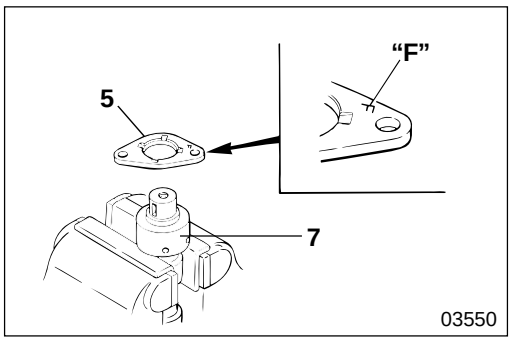
4 **Camshaft gear**

[Removal]

A : Press



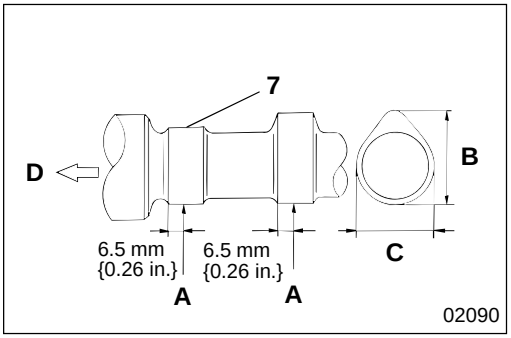
[Installation]
- Install camshaft gear **4** onto camshaft **7** in the direction as illustrated.
  A : Press
- Be sure when finishing the installation to install key **6**.



5 **Installation of thrust plate**

- Install thrust plate **5** onto camshaft **7** in the direction as illustrated.

https://truckmanualshub.com/



7 Inspection of camshaft

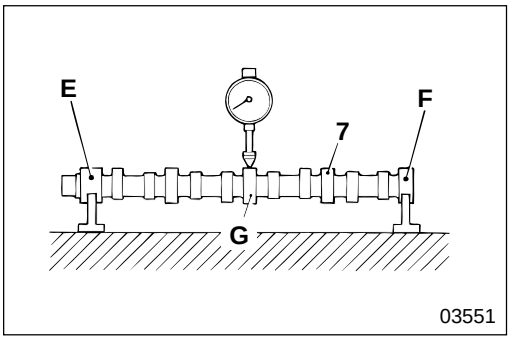
(1) Difference between long diameter and short diameter

If the measured value is lower than the limit, replace camshaft **7**.

NOTE

Measure at point A, as illustrated, because the cam is tapered.

B : Long diameter
C : Short diameter
D : Front of the engine

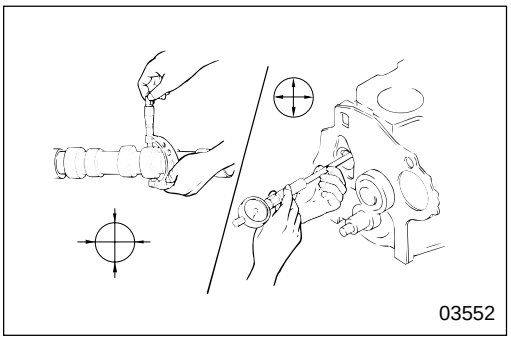


(2) Degree of bend

To measure bend, support camshaft **7** at area **E** of No.1 journal, and area **F** of No.5 journal. Then, measure the amount of bend at area **G** of No.3 journal. If the measured values are higher than the limit, replace the camshaft.

NOTE

Degree of bend of camshaft 9 is a half of the indicated value of the gauge after rotating the shaft 360°.

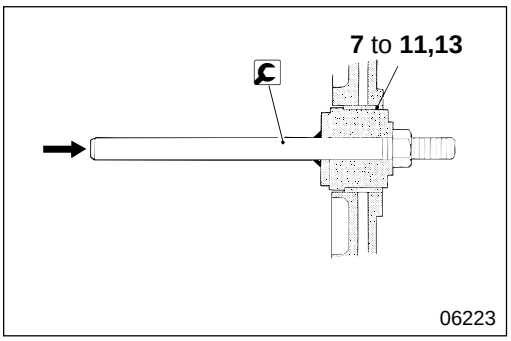


7 to 11 13 Camshaft and camshaft bushing

[Inspection]
If the clearance is greater than the limit, replace the faulty parts.

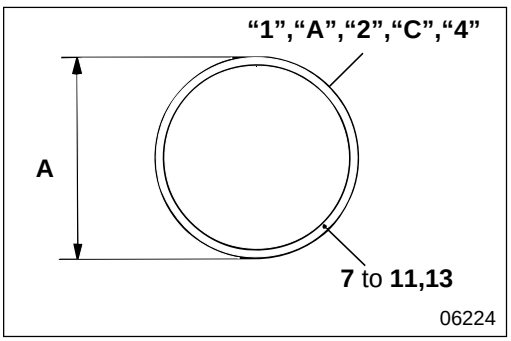
NOTE

Measure bushings 8 to 11, 13 mounted in the crankcase.



Camshaft bushing

[Removal]
Remove No. 5 camshaft bushing **13** from the rear of the engine by striking camshaft bushing installer and extractor.

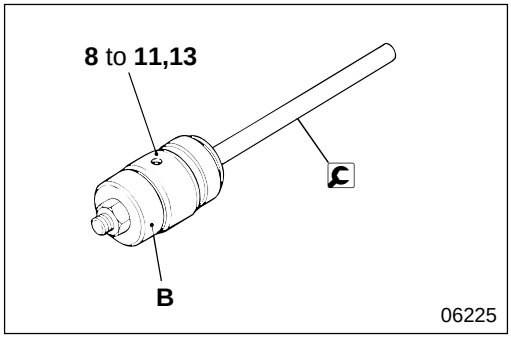


[Press-fitting]

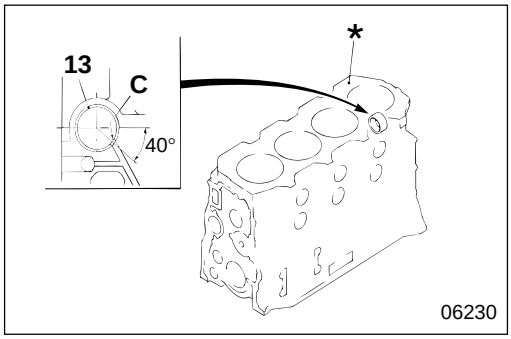
- Identify, by referring to the table below, No.1 to No.5 camshaft bushings by noting marks **"1"**, **"A"**, **"2"**, **"C"**, **"4"** on camshaft bushings **7** to **11**, **13**. If you cannot identify the mark, measure outer diameter **A** of the bushing and refer to the table below.

Bushing No. (from the front of the engine)	Mark	Outer diameter A (mm {in.})
No.1	1	ø58.50 {2.30}
No.2	A	ø58.25 {2.29}
No.3	2	ø58.06 {2.28}
No.4	C	ø57.75 {2.27}
No.5	4	ø57.06 {2.25}

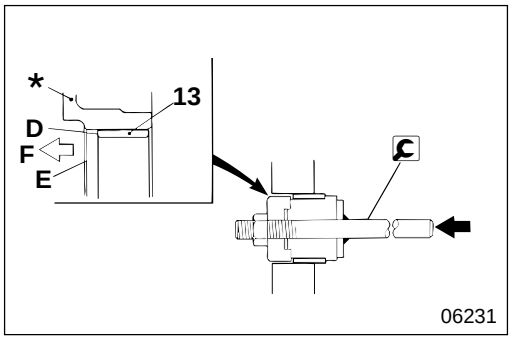
https://truckmanualshub.com/



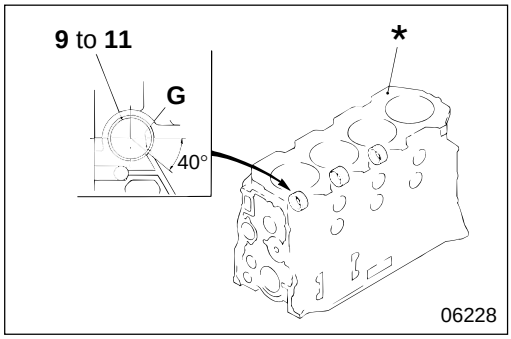
- For press-fitting, mount guide **B** to camshaft bushing installer and extractor.
- Install camshaft bushings **8** to **11** and **13** in descending order, from No.5 to No.1.
- Install No.5 camshaft bushing **13** from the rear end of the engine, and No.4 to No.1 camshaft bushings **8** to **11** from the front end of the engine.



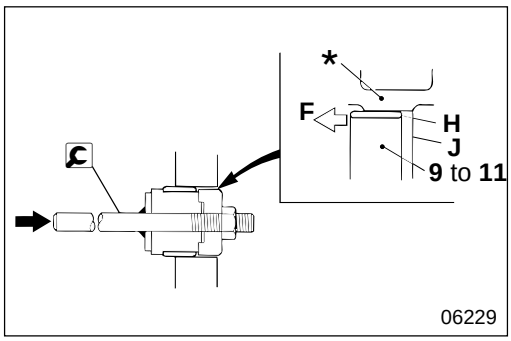
- Align oil hole **C** of No.5 camshaft bushing **13** in the direction as illustrated.



- Press in until surface **D** of No. 5 camshaft bushing **13** is flush with chamfered part **E** of crankcase *.
  F : Front of the engine

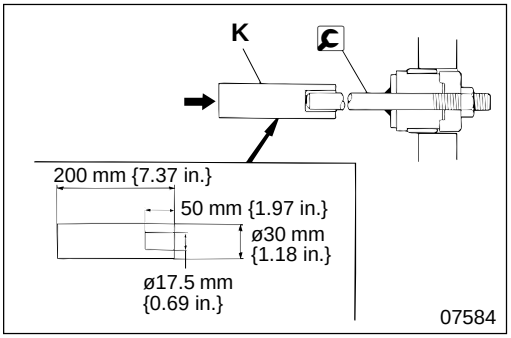


- Align oil hole **G**, of No.2 to No.4 camshaft bushings **9** to **11**, in the direction as illustrated, and press-fit in the order of No. 4, 3, 2.

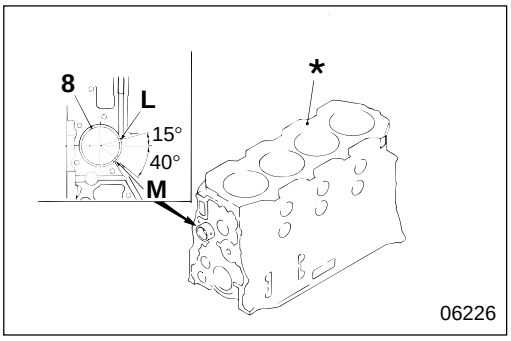


- Press in until surface **H** of No.2 to No.4 camshaft bushings **9** to **11** is flush with surface **J** of crankcase *.
  F : Front of the engine

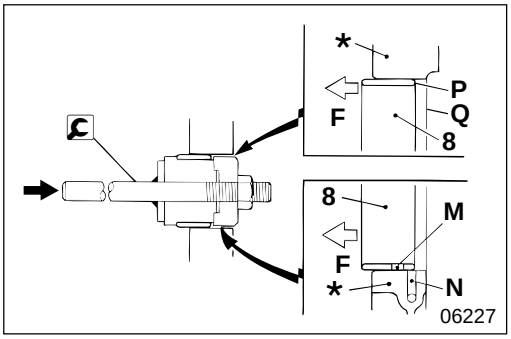
https://truckmanualshub.com/



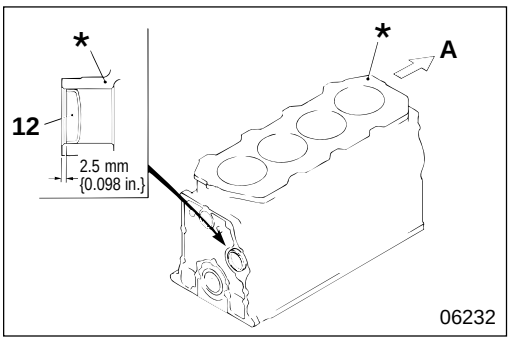
- For press-fitting of No.4 camshaft bushing **11**, use tool **K** as illustrated.



- Align oil holes **L**, **M** of No.1 camshaft bushing **8** in the direction as illustrated.
  L : ø3 mm {0.11 in.}
  M : ø8 mm {0.31 in.}
  ***** : Crankcase



- Align oil hole **M** of No.1 camshaft bushing **8** with oil hole **N** of crankcase ***** and press in until camshaft bushing surface **P** is flush with crankcase surface **Q**.
  F : Front of the engine



12 **Installation of sealing cap**

Press-fit sealing cap **12** into crankcase ***** to the specified depth.
A : Front of the engine

https://truckmanualshub.com/

PISTON, CONNECTING ROD AND CYLINDER SLEEVE

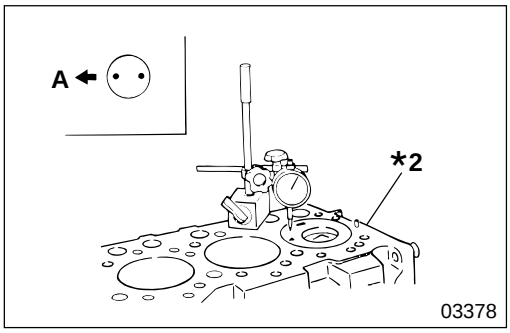
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
5	Socket wrench  01984	MH061560	Installation of piston and connecting rod assembly
	A : Piston guide clamp **B** : Piston guide lever  01981	**A** : MH061890 **B** : MF061658	
6	Cylinder sleeve installer  ø103 {4.06} 03377	MH062228	Installation of cylinder sleeve

◆ Service procedure



03378

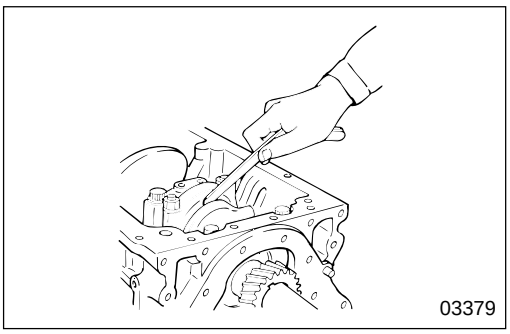
● **Inspection before disassembly**

(1) Extent of piston protrusion from the upper surface of crankcase *2

NOTE

Always inspect the extent of piston protrusion because it affects the engine performance greatly.

- Measure piston protrusion at two points on the top of the piston, and produce the average value.
  A : Front of the engine
- If the average valve deviates from the limit, inspect clearance of the related parts.

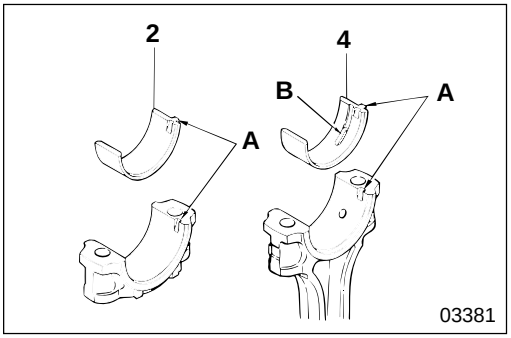


03379

(2) End play of connecting rod

- Measure the end play of each connecting rod.
- If the measured value is higher than the limit, replace the faulty parts.

https://truckmanualshub.com/



2 **4** **Connecting rod bearing**

[Installation]
Install connecting rod bearings **2**, **4** by matching lugs **A** to the connecting rods.

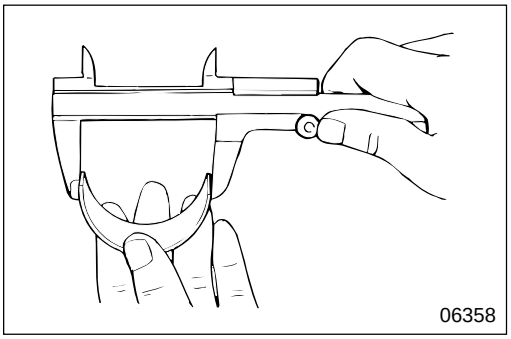
CAUTION

Be sure to distinguish between upper and lower connecting rod bearings 2, 4. The upper bearing has oil opening B while the lower bearing has no oil opening.

[Inspection]

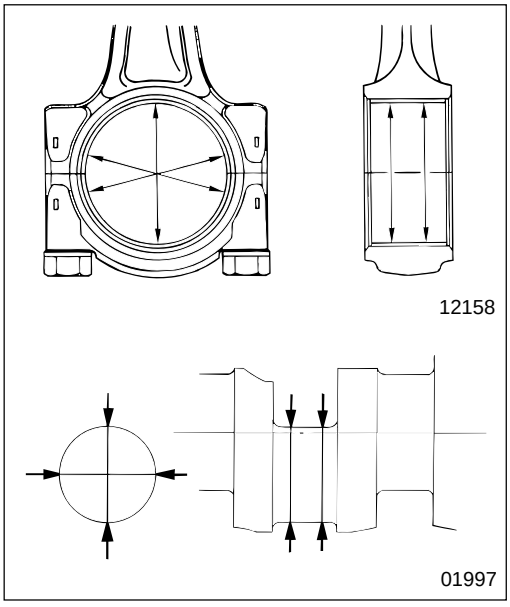
CAUTION

- **Do not forcibly open or expand connecting rod bearings 2, 4.**
- **When either upper or lower connecting rod bearings 2, 4 needs replacing, replace as a set.**



(1) Expansion at free state

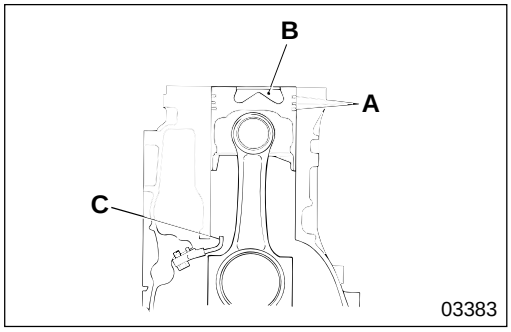
If the measured value is lower than the limit, replace connecting rod bearings **2**, **4**.



(2) Clearance between connecting rod bearing and crankshaft

If the clearance between connecting rod bearing **2**, **4** and crankshaft ***1** is lower than the limit, replace the faulty parts.

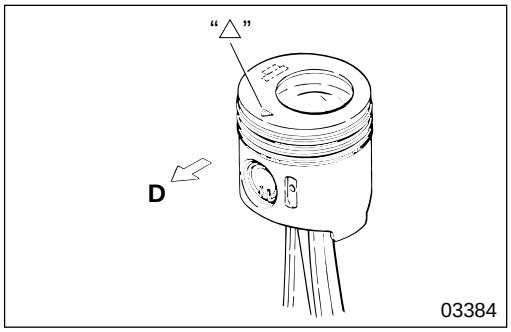
https://truckmanualshub.com/



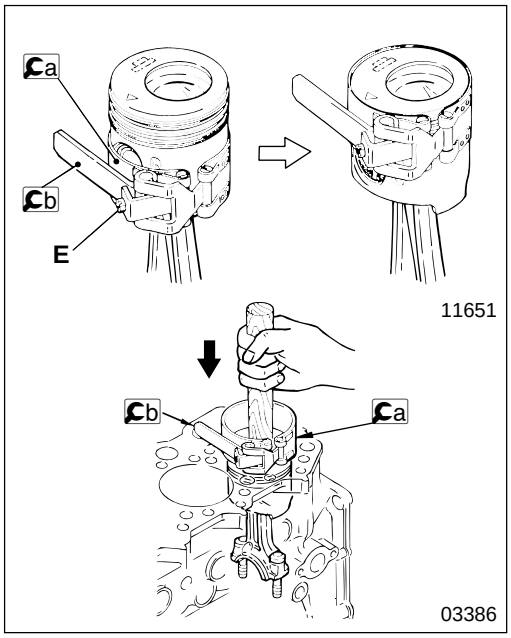
5 **Installation of piston and connecting rod assembly**

CAUTION

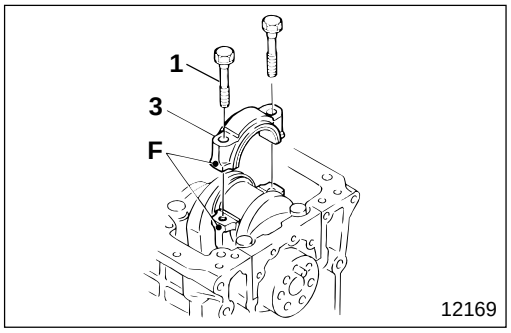
- **Be sure to fit piston ring A in the correct position.**
  P11-48
- **Be careful not to scratch or damage head B of the piston (a part of the combustion chamber).**
- **Make sure that the connecting rod does not hit oil jet C.**



- Install piston front mark "△" directed towards the front of the engine using the following procedure.
  D : Front of the engine

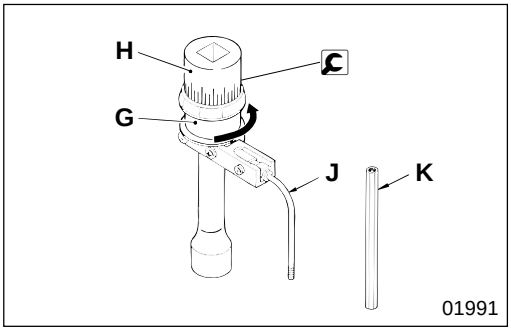


- Match the inner diameter of a piston guide clamp to the outer diameter of the piston skirt by turning adjusting bolt **E** of b piston guide lever.
- After adjusting, set a piston guide clamp and b piston guide lever at the top of the piston so that the clamp is flush with the top of the piston.

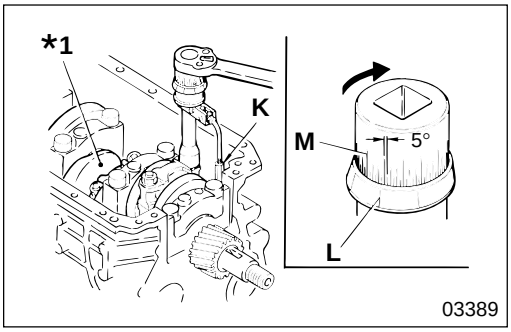


- After the piston is inserted, align alignment marks **F** on the connecting rod with the alignment marks on connecting rod cap **3** and tighten bolt **1** at specified torque. Then tighten the bolt further as follows:

https://truckmanualshub.com/



- Turn socket wrench holder **G** counterclockwise and keep the spring in the wrench compressed.
  H : Socket
  J : Rod
  K : Rod (for connection)



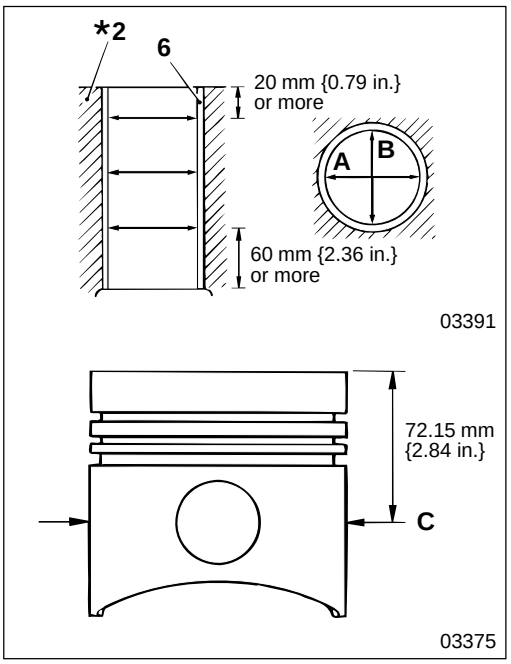
- Set socket wrench holder **G** so that the repercussive force of the spring presses rod **K** (for connection) against crankshaft ***1**.
- Select a scale that is convenient for reading graduation **L** on holder **G** side.
- Tighten further by turning socket **H** clockwise by 90° (setting is in 5° increments), referring to graduation **M** on the selected scale.

NOTE

After installation of connecting rod cap 3, inspect the following points :

- **End play of the connecting rod : 🕮 P11-38**
- **Piston protrusion : 🕮 P11-38**

5 **6** **Piston and connecting rod assembly, and cylinder sleeve**



[Inspection]

- If the inner diameter of cylinder sleeve **6** is higher than the limit, bore the cylinder sleeve oversize and use an oversized piston.
  A : In the direction of the crankshaft axis
  B : At right angles to the crankshaft axis

- If the clearance between piston **5** and cylinder sleeve **6** deviates from the standard value, even when the inner diameter of the cylinder sleeve is within the limit, replace the piston.

[Selection of oversized piston]
Extent of oversize : 0.50, 1.00 mm {0.020, 0.039 in.}

- Determine the extent of oversize by measuring the inner diameters of all the cylinders and calculating the maximum wear amount of all the cylinders.
- Measure the outer diameter of the oversized piston to be used.
  C : Position to measure the outer diameter of the piston

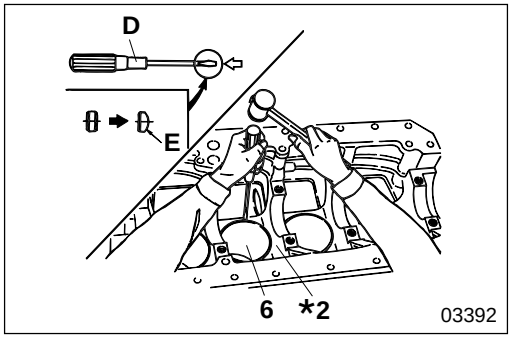
- Bore cylinder sleeve **6** and hone it to make the clearance between piston **5** and the cylinder sleeve conform to the standard value.

NOTE

- **Even if only one cylinder sleeve 6 requires boring, all the other cylinder sleeves must be bored to the identical oversize.**
- **Piston rings must be replaced with the corresponding oversized ones.**

https://truckmanualshub.com/

PISTON, CONNECTING ROD AND CYLINDER SLEEVE



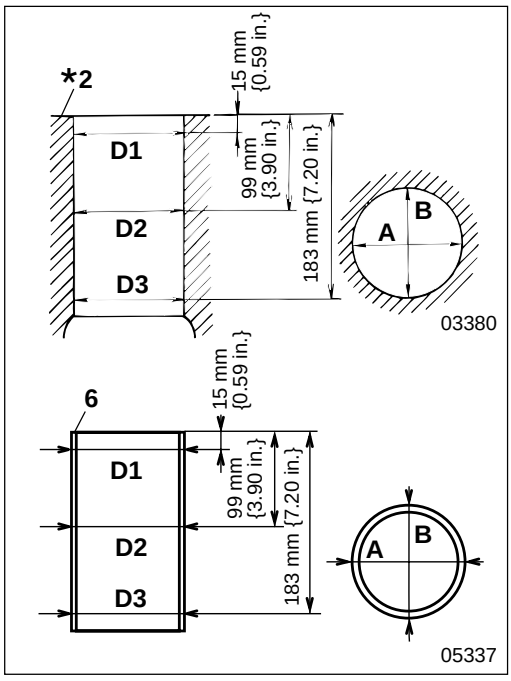
Cylinder sleeve

[Removal]

- Mount a boring machine on crankcase ***2** and center. Centering must be done at the lower part of cylinder sleeve **6** which is less unevenly worn.
- Bore until the thickness of cylinder sleeve **6** is approximately 0.5 mm {0.020 in.}.
- Insert tool **D** (a modified screwdriver) between crankcase ***2** and cylinder sleeve **6**, break the sleeve by tapping it gently, then remove.

CAUTION

Make sure when inserting tool D that round part E is facing crankcase *2.



[Installation]

- Inspect sleeve hole of crankcase ***2** before installing cylinder sleeve **6**. If there are irregularities, such as defects or insufficient interference, correct them by boring.

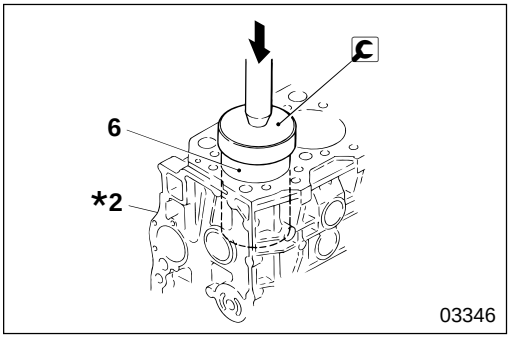
NOTE

- **Pull out cylinder sleeve 6 of all cylinders and bore the sleeve holes perfectly round when you bore the sleeve holes of crankcase *2.**
- **Apply spindle oil (ISO VG 32) when you push cylinder sleeve 6 into the sleeve hole of crankcase *2.**

Inspection of interference must be carried out as follows.

- Measure the inner diameter of the sleeve hole of crankcase ***2** and the outer diameter of cylinder sleeve **6** at the specified positions illustrated.
- Take the average value at the top, middle and bottom (**D1**, **D2**, **D3**) and across the diameter (**A**, **B**). If the interference is lower than the limit, bore the sleeve hole of crankcase ***2** oversize.

https://truckmanualshub.com/



< If interference is sufficient >

- Press-fit cylinder sleeve **6** into crankcase ***2** from the chamfered end using cylinder sleeve installer.

NOTE

Align the top of cylinder sleeve 6 with the top of crankcase *2 when press-fitting.

- After press-fitting, make the inner diameter of cylinder sleeve **6** conform to the standard value by honing the surface.

< If interference is insufficient >

- Prepare cylinder sleeve **6** which is 0.5 mm {0.020 in.} oversize in diameter.
- Hone crankcase ***2**, making the clearance between the outer diameter of cylinder sleeve **6** and the sleeve hole of crankcase ***2** conform to the standard value.
- Press-fit cylinder sleeve **6** into crankcase ***2** from the chamfered end using cylinder sleeve installer.

NOTE

Align the upper face of cylinder sleeve 6 with the upper face of crankcase *2 when press-fitting.

- After press-fitting, make the inner diameter of cylinder sleeve **6** conform to the standard value by honing the surface.

https://truckmanualshub.com/

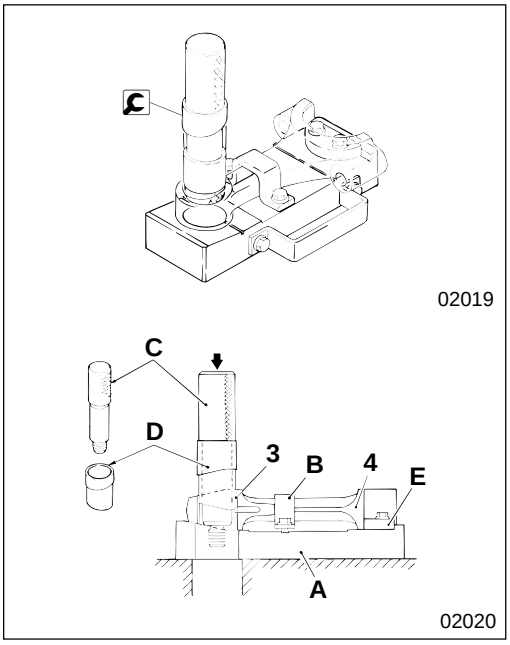
12171

◆ Service procedure

2 **3** **Piston pin and connecting rod bushing**

[Inspection]
If the clearances are higher than the limit, replace the faulty parts.



02019
02020

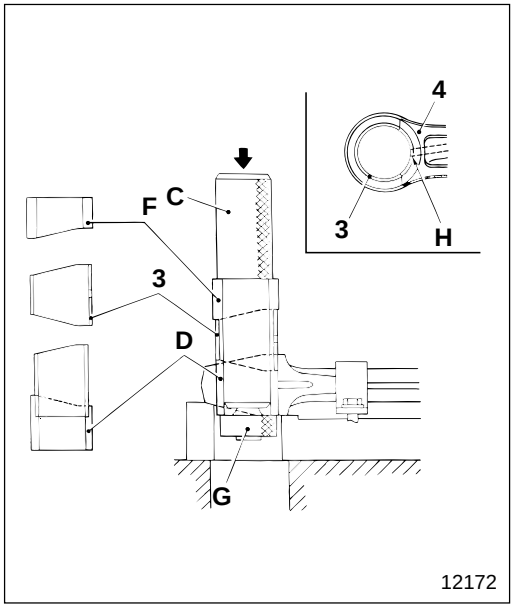
Connecting rod bushing

Use connecting rod bushing puller kit to replace connecting rod bushing **3**.
(Components of connecting rod bushing puller kit)
A : Base **B** : Bracket **C** : Puller **D** : Collar **E** : Plate **F** : Collar **G** : Nut

[Pulling-out]

- Remove upper connecting rod bearing from the big end of connecting rod **4**.
- Place connecting rod **4** on base **A** and fix it to the base at two points, bracket **B** and plate **E**.
- Fit collar **D** in puller **C** in the direction as illustrated, and pull out connecting rod bushing **3** with a gradual load of approximately 49 kN {11020 lbf, 5000 kgf}.

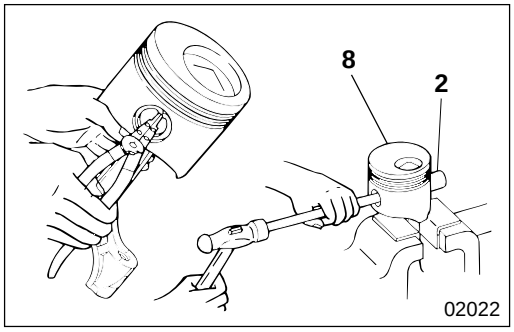
https://truckmanualshub.com/



[Press-fitting]
- Apply engine oil to the exterior peripheral area of connecting rod bushing **3** and the inner area of the bushing fitting ring of connecting rod **4**.
- Fit collar **F**, connecting rod bushing **3** and collar **D** in puller **C** in the arrangement and direction as illustrated and mount them with nut **G**.
- Align oiling holes **H** of connecting rod bushing **3** and connecting rod **4**, and gradually press in the bushing with approximately 49 kN {11023 lbf, 5000 kgf} load.
- After press-fitting, ream connecting rod bushing **3** to make its clearance with piston pin **2** conform to the standard value.

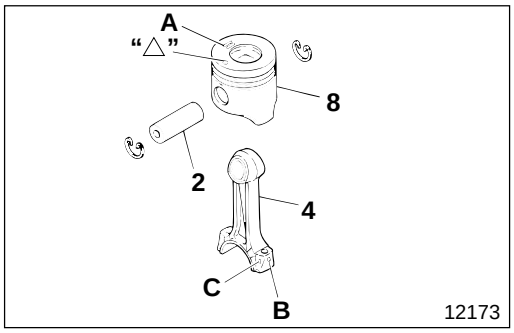
NOTE

After press-fitting bushing 3, insert piston pin 2 and make sure that the rod moves smoothly without any excessive play.



2 **4** **8** **Piston pin and connecting rod and piston**

[Disassembly]
- Drift out piston pin **2** using a rod.
- When removal of piston pin **2** is difficult, warm piston **8** using a piston heater or hot water.



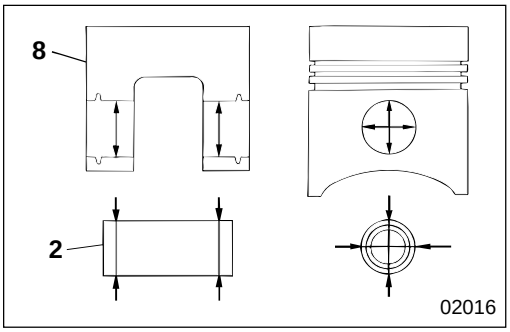
[Installation]
- Apply engine oil to piston pin **2** and assemble connecting rod **5** and piston **8** in the direction as illustrated.
  A : Piston mass (Mass of piston is marked)
  B : Connecting rod mass mark (Alphabetical: A, B, C, D, E, F, G)

  C : Mounting base of connecting rod cap
  △ : Front mark

- When piston pin **2** insertion is difficult, warm piston **8** using a piston heater or hot water.

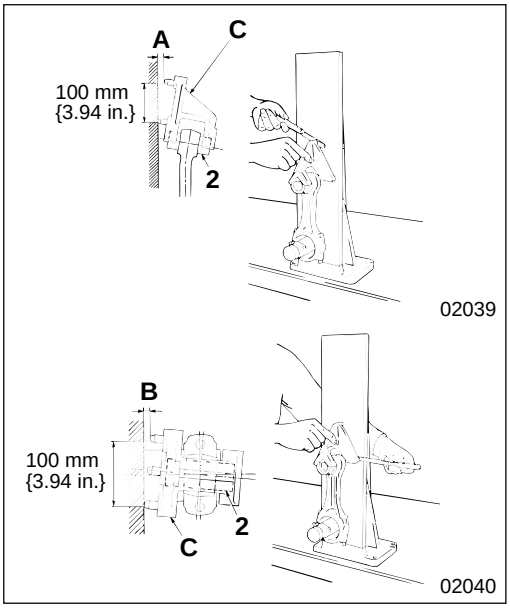
CAUTION⚠
- **Make sure that the total mass error of all pistons 8 in one engine is 10 g {0.35 oz.} or less.**
- **Be sure to install connecting rods 4, to be used in one engine, that have identical mass mark B.**
- **Be sure that after inserting piston pin 2 the connecting rod operates smoothly without excessive play.**

https://truckmanualshub.com/



2 **8** **Clearance between piston pin and piston**

If the clearance is higher than the limit, replace the faulty parts.



4 **Degree of bend or distortion of connecting rod**

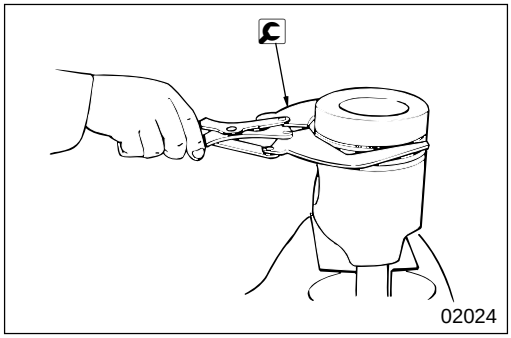
- Mount connecting rod bushing **3** and piston pin **2** to connecting rod **4**.
- Measure degree of bend **A** and distortion **B** of connecting rod **4**. If the measured value is higher than the limit, repair or replace the connecting rod.
  C : Connecting rod aligner (Measuring instrument)

NOTE

- **When making measurements by mounting connecting rod 5 to connecting rod aligner C, make sure that the upper connecting rod bearing and the lower connecting rod bearing are mounted on the rod.**
- **Mount the connecting rod cap by tightening the bolt at specified torque.** 🕮 **P11-36**

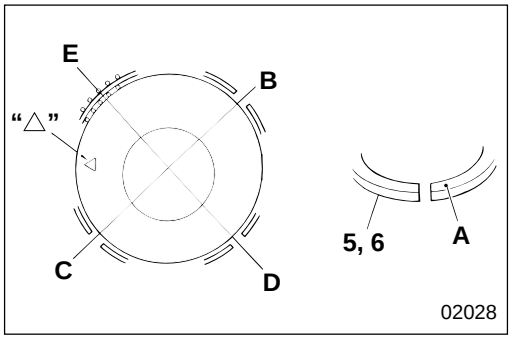
https://truckmanualshub.com/

PISTON, CONNECTING ROD AND CYLINDER SLEEVE



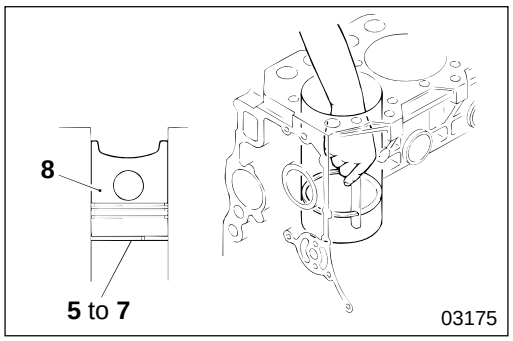
5 to **8** **Piston ring and piston**

Piston ring
[Removal]



[Installation]

- Install oil ring **7** so that split **D** and the butting joint of expander spring **E** come to the points as illustrated.
- Compression rings **5** and **6** have a manufacturer's mark **A** at the split, and installation should be made with the mark outward.
  B : The split of the 1st compression ring
  C : The split of the 2nd compression ring
  D : Oil ring slit
  E : Oil ring expander spring butt joint
  △ : Front mark of piston



[Inspection]

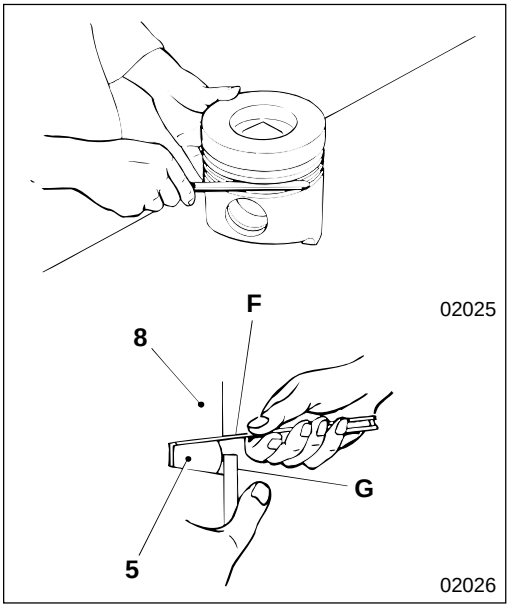
(1) Clearance of piston ring slit

- Install piston rings **5** to **7** into the crankcase cylinder sleeve using the head of piston **8** to level the piston ring.
- Measure the clearance of the piston ring split while keeping them level and stationary. If the measured value is higher than the limit, replace the piston ring.

NOTE

- **Use piston 8 to ensure that piston rings 5 to 7 are kept level when inserting them into the crankcase cylinder sleeve.**
- **Insert piston rings 5 to 7 into the lower part of the crankcase cylinder sleeve, where the area is less worn, when measuring clearance of piston ring split 5 to 7.**
- **Exchange the whole set of piston rings 5 to 7 as a set if any of the rings is faulty.**

https://truckmanualshub.com/



(2) Clearance between piston ring and ring groove

- If the measured value is higher than the limit, replace the faulty parts.
- Measure using feeler gauge **F**, by pressing 1st compression ring **5** against piston **8** with straight edge **G**.

NOTE

- **Measurement has to be conducted around the whole periphery of piston 8 after removing carbon deposits.**
- **Be sure to exchange the whole set of piston rings 5 to 7 as a set if any of the rings is faulty.**

https://truckmanualshub.com/

FLYWHEEL

		Distortion of friction surface	0.05 {0.0020} or less	0.2 {0.0079}	
		Wobble of friction surface	—	0.2 {0.0079}	

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Flywheel mounting)	39 {29, 4}+40°	Wet

https://truckmanualshub.com/

Lubricant

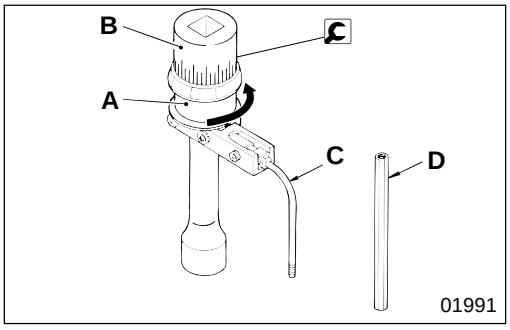
Location	Points of application	Kinds	Quantity
1	Thread area of bolt	Engine oil	As required

Special tools

Location	Tool name and shape	Part No.	Application
4	Socket wrench  01984	MH061560	Installation of flywheel assembly
	Magnetic base < Manual transmission > 00471	MH062356	

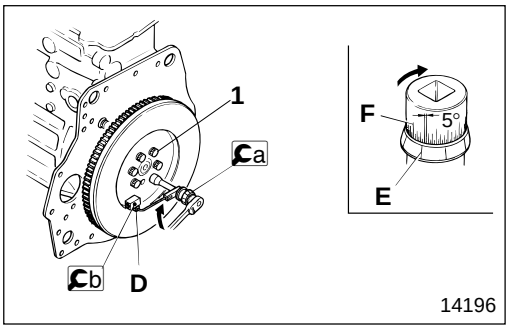
◆ Service procedure

4 Flywheel assembly

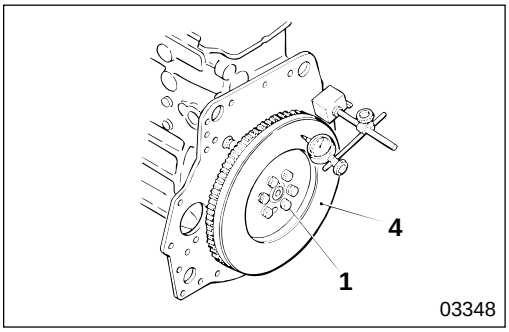


[Installation]

- After tightening bolt **1** at specified torque, tighten further as follows:
- Turn [C] socket wrench holder **A** counterclockwise and keep the spring in the wrench compressed.
  - **B** : Socket
  - **C** : Rod
  - **D** : Rod (for connection)



- Set [Ca] socket wrench holder **A** so that the repercussive force of its spring presses rod **D** (for connection) against [Cb] magnetic base
- Select a scale that is convenient for reading graduation **E** on holder **A** side.
- Tighten further by turning the socket clockwise by 40° (setting is in 5° increments) referring to graduation **F** on the selected scale.



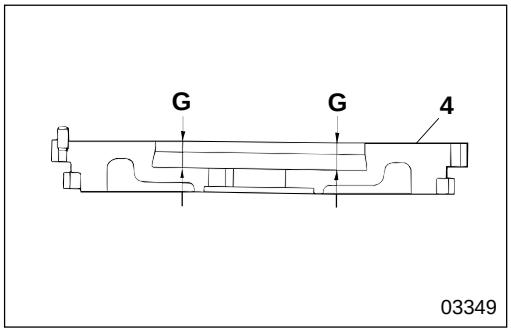
[Inspection]

< Manual transmission >

(1) Wobble

If the measured value is higher than the limit, check the fastening of bolt **1**, the attachment surface of crankshaft assembly, and depending on the condition found, either repair or replace flywheel assembly **4**.

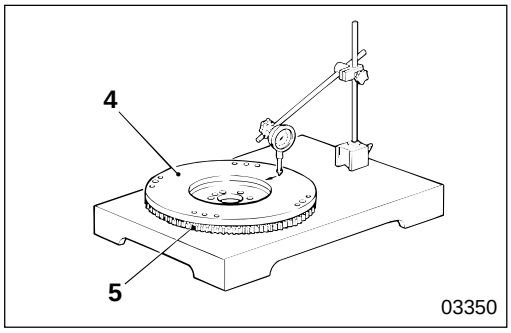
https://truckmanualshub.com/



(2) Height of friction surfaces

If the measured value is lower than the limit, repair or replace flywheel assembly **4**.

G : Height from bolt mounting surface to friction surface

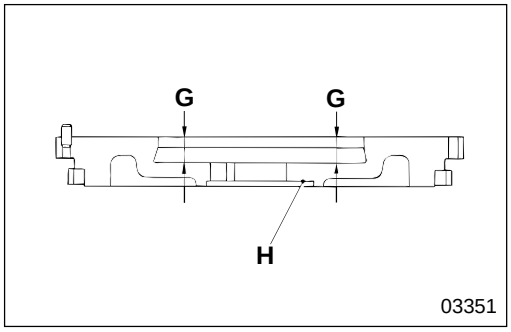


(3) Distortion of friction surface

If the measured value is lower than the limit, repair or replace flywheel assembly **4**.

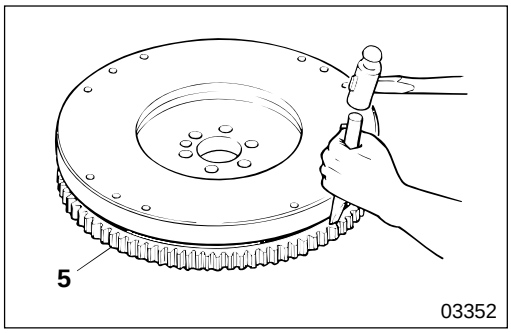
NOTE

If any fault is found in ring gear 5, replace it first, then begin the inspection.



[Correction]

Make sure when grinding the friction surfaces for correction, that height **G** is not lower than the limit while maintaining the degree of parallel with surface **H** within 0.1 mm {0.0039 in.}.



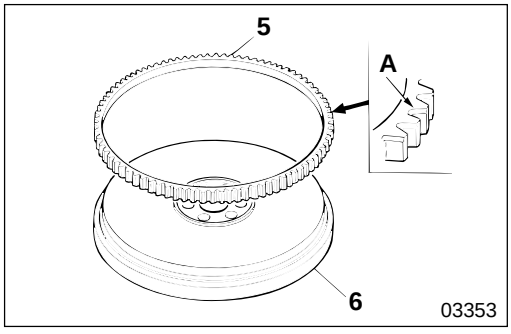
5 Ring gear

[Inspection]

Check and see if there is any damage, wear or other fault, and if any fault is found, replace ring gear **5**.

[Removal]

- Heat up ring gear **5** evenly using an acetylene torch.
- Hammer the outer edge of ring gear **5** evenly until it drops off.



[Installation]

- Heat up ring gear **5** using a piston heater to approximately 100°C {212°F} for three minutes.
- With the side of the chamfered teeth of ring gear **5** facing you, mount it on flywheel **6**.

  A : Chamfered ring gear side

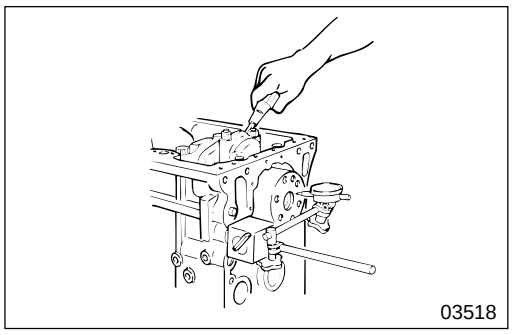
7 to 11	Socket wrench 01984	MH061560	Installation of main bearing cap
11	Bearing cap extractor  03516	MH061083	Removal of rear main bearing cap
15	Rear oil seal slinger installer  02051	MH062677	Installation of rear oil seal slinger
16	Gear puller  02065	MH061326	Removal of crankshaft gear

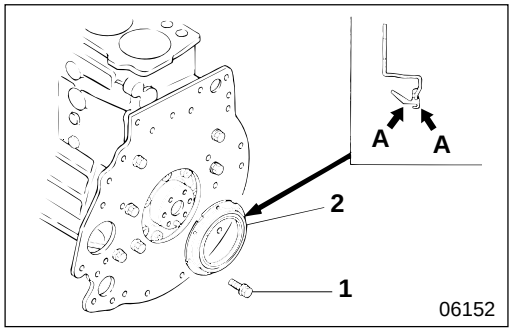
https://truckmanualshub.com/

◆ Service procedure



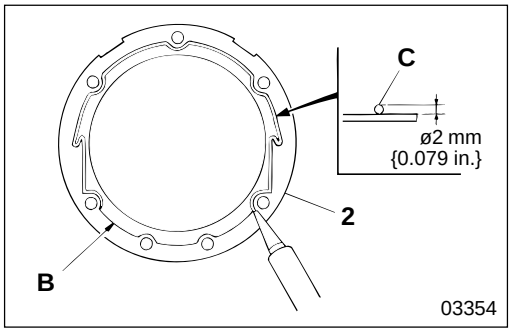
● **Inspection before disassembly**

Crankshaft assembly end play
If the measured value is higher than the limit, replace thrust plates **12** with oversized ones. P11-58
< Available oversize ones >
+0.15, +0.30, +0.45 mm
{+0.0059, +0.012, +0.018 in.}



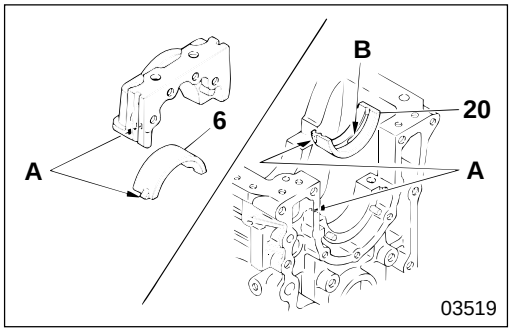
2 **Mounting of rear oil seal**

- Apply engine oil to lip area **A** of rear oil seal **2**.



- Apply sealant **C** along line **B** on rear oil seal **2** evenly without break.
- After applying sealant **C**, within three minutes, mount rear oil seal **2**.

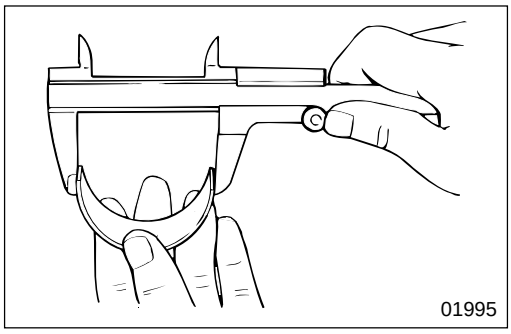
CAUTION
- **Do not start the engine within an hour of mounting rear oil seal 2.**
- **Be sure to reapply sealant C if bolts 1 (for mounting rear oil seal 2) are loosened or removed by any cause whatsoever after mounting.**



6 **20** **Main bearing**

[Installation]
When installing main bearings **6**, **20**, align lugs **A**.

CAUTION
Be sure to distinguish between main bearings 6, 20. The upper bearing has oil opening B while the lower bearing has no oil opening.



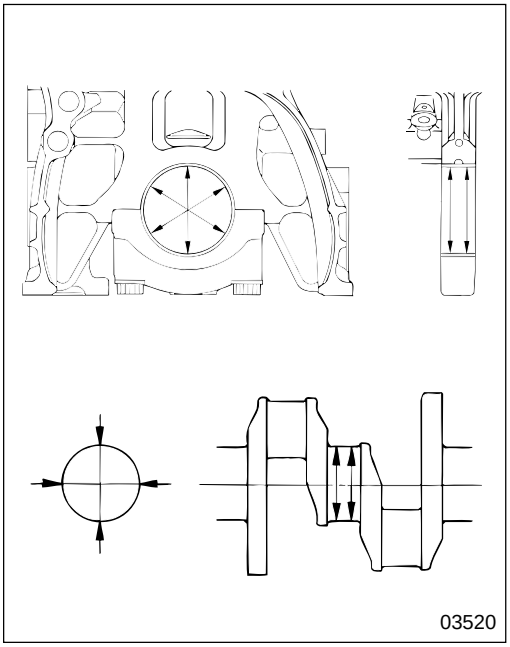
[Inspection]

CAUTION
- **Do not forcibly expand main bearings 6, 20.**
- **Be sure to replace both upper and lower main bearings 6, 20 as a pair when replacement is necessary.**

(1) Expansion at free state

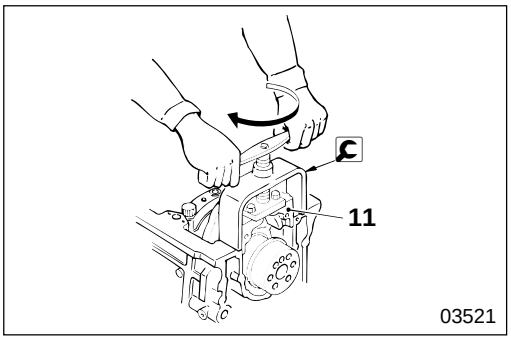
If the measured value is lower than the limit, replace main bearings **6**, **20**.

https://truckmanualshub.com/



(2) Clearance between main bearing and crankshaft

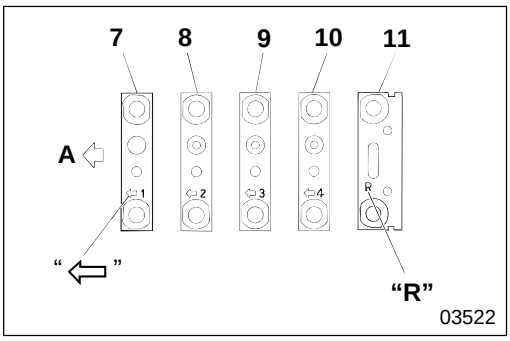
If the measured value is lower than the limit, replace faulty parts.



7 to 11 Main bearing cap

[Removal]

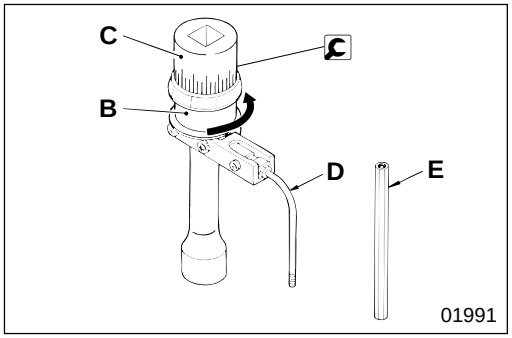
Use bearing cap extractor to remove rear main bearing cap **11** because side seal **13** is installed between crankcase **23** and the rear main bearing.



[Installation]

- Install main bearing caps **7** to **11** in the direction as illustrated.
  A : Front of engine

https://truckmanualshub.com/

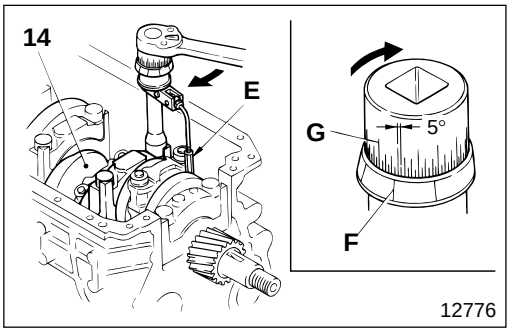


- Center punch the head of bolt **5** before installation.

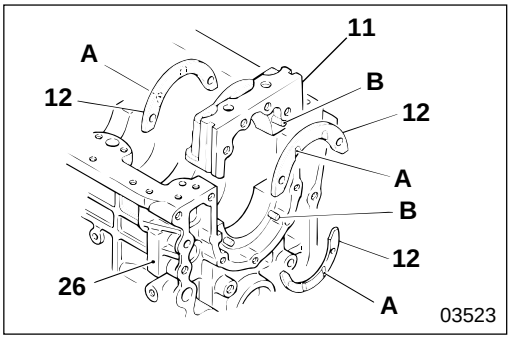
CAUTION

If there are already three center-punch marks, replace the cylinder head bolt with a new one.

- After tightening bolt **5** at specified torque, tighten further as follows:
- Turn socket wrench holder **B** counterclockwise and keep the spring in the wrench compressed.
  C : Socket
  D : Rod
  E : Rod (for connection)



- Set socket wrench holder **B** so that the repercussive force of the spring presses rod **E** (for connection) against crankshaft assembly **14**.
- Select a scale that is convenient for reading graduation **F** on holder **B**.
- Tighten further by turning socket **C** clockwise by 90° (setting is in 5° increments), referring to graduation **G** on the selected scale.
- After installation, check the following points :
  - Crankshaft assembly **14** can be rotated easily by hand.
  - The end play of crankshaft assembly **14**. P11-56

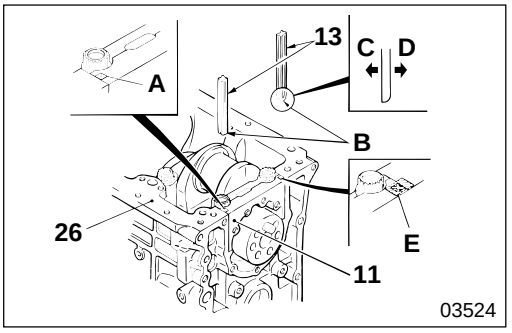


12 Installation of thrust plate

Install thrust plates **12** on both ends of rear main bearing **11** and the rear end of crankcase **26** in the direction as illustrated.
A : Oil groove
B : Positioning pin

CAUTION

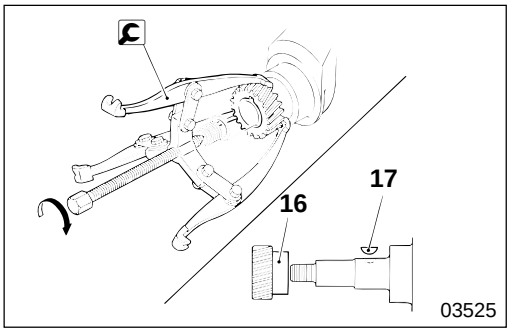
When installing oversized thrust plates 12, mount them on the front and rear of rear main bearing cap 11. It is not necessary that the thrust plates used are all of the same size, but use the same-size-combination of thrust plates for mounting on the rear of crankcase 26 and on the rear of the rear bearing cap.



13 Installation of side seal

- Supply sealant in side seal mounting groove **A** of rear main bearing cap **11**.
- Apply sealant at end **B** of side seal **13**.
- Press in side seal **13** between rear main bearing cap **11** and crankcase **26** in the direction as illustrated.
  C : Rear main bearing cap side
  D : Crankcase side
- After pressing in, apply sealant to side seal mounting **E** of rear main bearing cap **11**.

https://truckmanualshub.com/



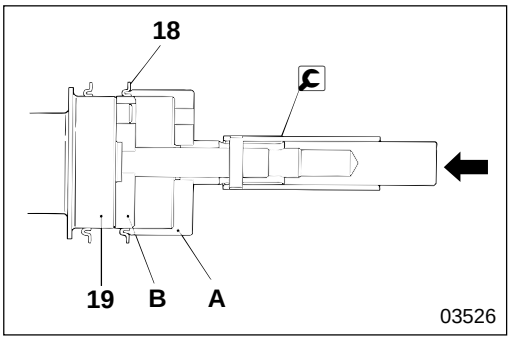
16 Crankshaft gear

[Removal]
Never remove crankshaft gear **16** by striking, hitting or hammering it.

[Installation]
Before installing heat up crankshaft gear **16** using a piston heater or similar device to approximately 100°C {212°F}.

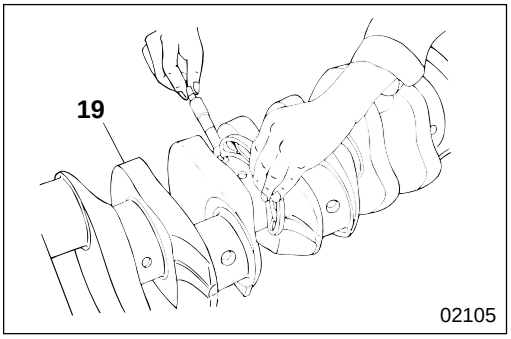
NOTE

Install key 17 to prevent rotation.



18 Installation of rear oil seal slinger

Install rear oil seal slinger **18** using oil seal slinger installer. Strike installer **A** until it hits guide **B** positively.

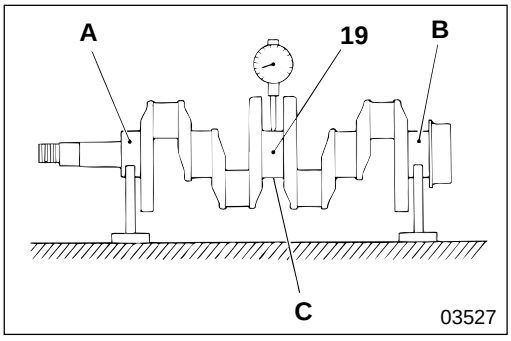


19 Crankshaft

[Inspection]

(1) Cylindrical and circular accuracy of the journal and the pin

If the measured value is higher than the limit, grind and correct crankshaft **19** to convert it to the undersize specifications or replace it.



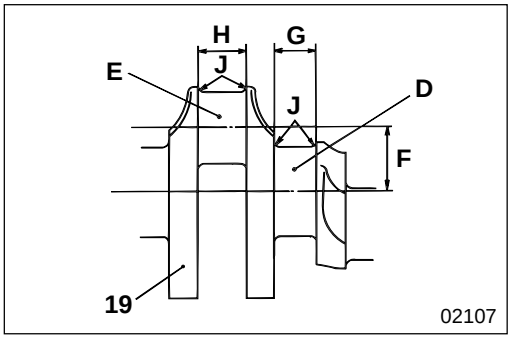
(2) Degree of bend

The degree of bend of crankshaft **19** is measured at No.3 journal **C** by supporting No.1 journal **A** and No.2 journal **B.** If the measured value is higher than the limit, replace the crankshaft.

NOTE

The degree of bend of crankshaft 19 is half of the indicated value of the gauge after rotating the shaft 360°.

https://truckmanualshub.com/



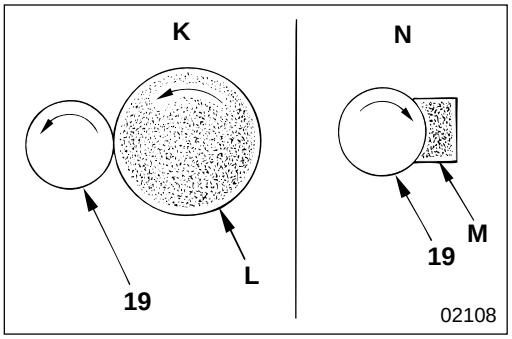
[Correction]

NOTE

Be sure to replace main bearings 6, 20 with those that meet the undersize specifications after crankshaft 19 is corrected by grinding.

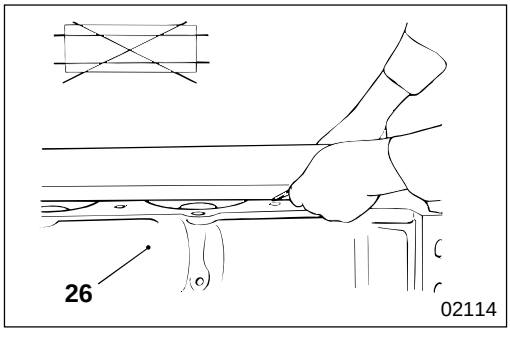
- Set **F**, distance between the center line of the journal **D** and that of the pin **E**, constant.
  F : 57.5±0.05 mm {2.26±0.0020 in.}
- Set the width of journal **G** and pin **H** so they are constant.
  G : 35 mm {1.38 in.} (32 mm {1.26 in.} for No.1 journal)
  H : $41\ ^{+0.2}_{0}$ mm
  {$1.61\ ^{+0.0079}_{0}$ in.}

- Finish the fillet **J** smoothly.
  J : R4±0.2 mm {0.0079 in.}
- Check and confirm that there has been no cracking caused by grinding using the magnetic particle inspection method (Magnafluxing). Also make sure the surface hardness has not deteriorated (Shore hardness to be maintained at not less than Hs 75).
- When grinding **K**, set crankshaft **19** and grinder **L** so that they both rotate counterclockwise as viewed from the front of the crankshaft.
- To finish grinding **M** using a grindstone or emery paper **N,** rotate crankshaft **19** clockwise.



Undersize specifications of crankshaft Unit : mm {in.}

		Undersize scales			
		0.25 {0.0098}	0.50 {0.020}	0.75 {0.030}	1.00 {0.039}
Finish outer diameter of journal	No.1, 2, 4, 5 journals	77.68 to 77.70 {3.058 to 3.059}	77.43 to 77.45 {3.048 to 3.049}	77.18 to 77.20 {3.038 to 3.039}	76.93 to 76.95 {3.028 to 3.029}
	No.3 journal	77.66 to 77.68 {3.057 to 3.058}	77.41 to 77.43 {3.047 to 3.048}	77.16 to 77.18 {3.037 to 3.038}	76.91 to 76.93 {3.027 to 3.028}
Finish outer diameter of pin		59.695 to 59.715 {2.3501 to 2.3509}	59.445 to 59.465 {2.340 to 2.341}	59.195 to 59.215 {2.33 to 2.331}	58.945 to 58.965 {2.320 to 2.321}
Circular accuracy		0.01 {0.00039} or less			



Cylindrical accuracy

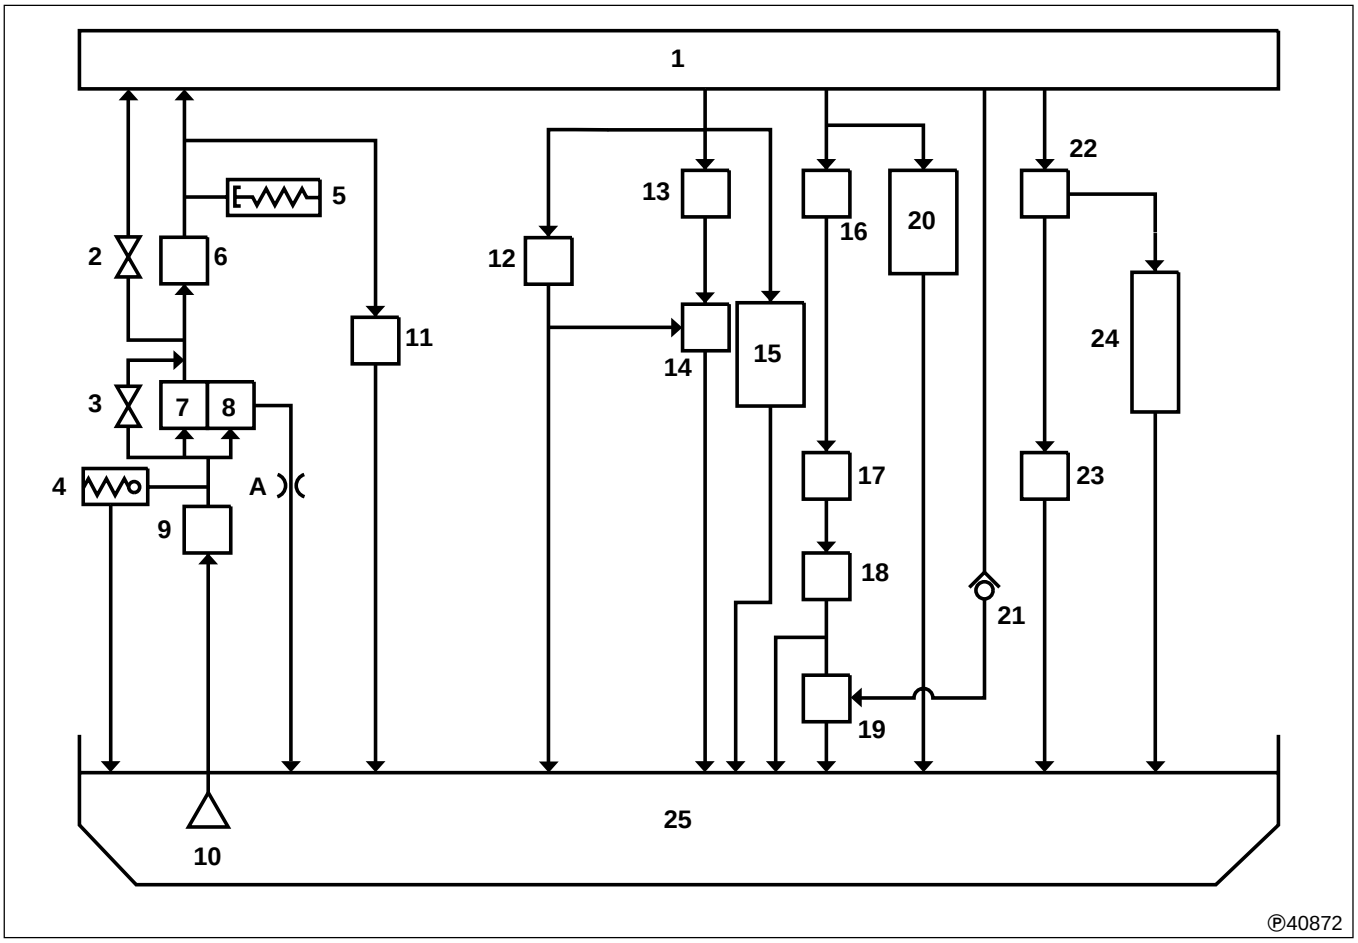
STRUCTURE AND OPERATION

Lubrication System (Oil Flow)

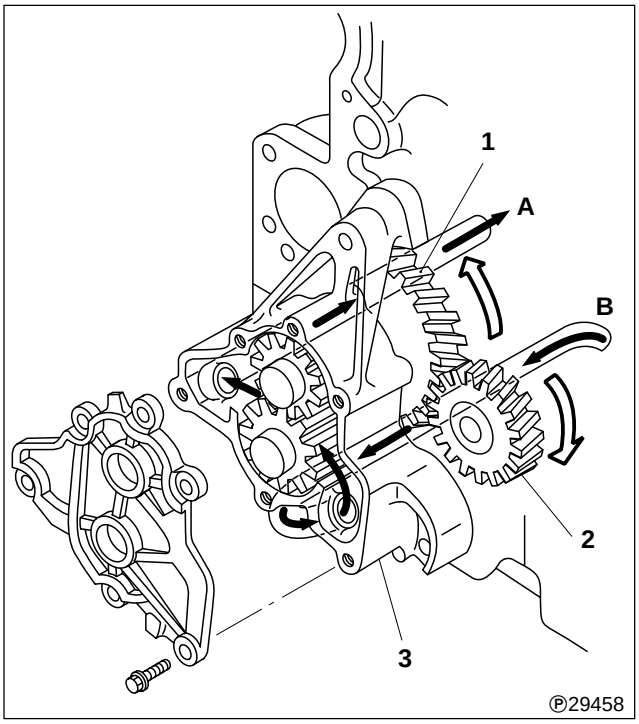


1 Main oil gallery
2 Bypass valve
3 Bypass valve
4 Relief valve
5 Engine oil pressure switch
6 Oil cooler
7 Full-flow oil filter
8 Bypass oil filter
9 Oil pump
10 Oil strainer
11 Turbocharger
12 Vacuum pump
13 Idler bushing
14 Timing gear
15 Balancer bushing LH
16 Crankshaft main bearing
17 Connecting rod bearing
18 Connecting rod bushing
19 Piston
20 Balancer bushing RH
21 Oil jet check valve
22 Rocker bushing
23 Camshaft bushing
24 Rocker roller
25 Oil pan

A: Orifice

https://truckmanualshub.com/

Oil Pump



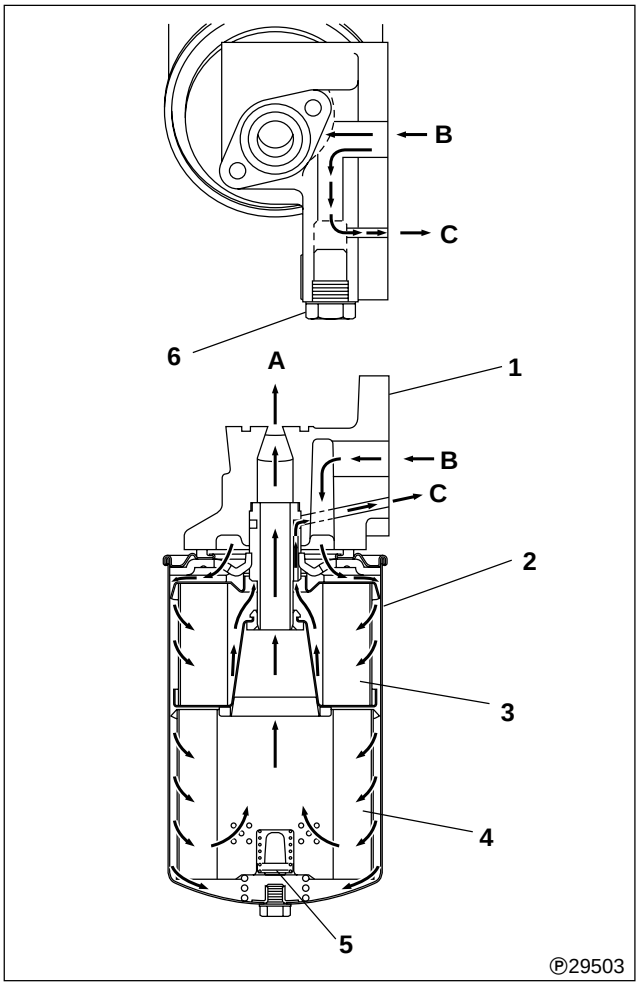
1 Oil pump gear
2 Crankshaft gear
3 Oil pump

A: To oil filter
B: From oil strainer

Oil pump **3** is a gear type. It is driven by rotation of the crankshaft via crankshaft gear **2** and oil pump gear **1**.

https://truckmanualshub.com/

Oil Filter



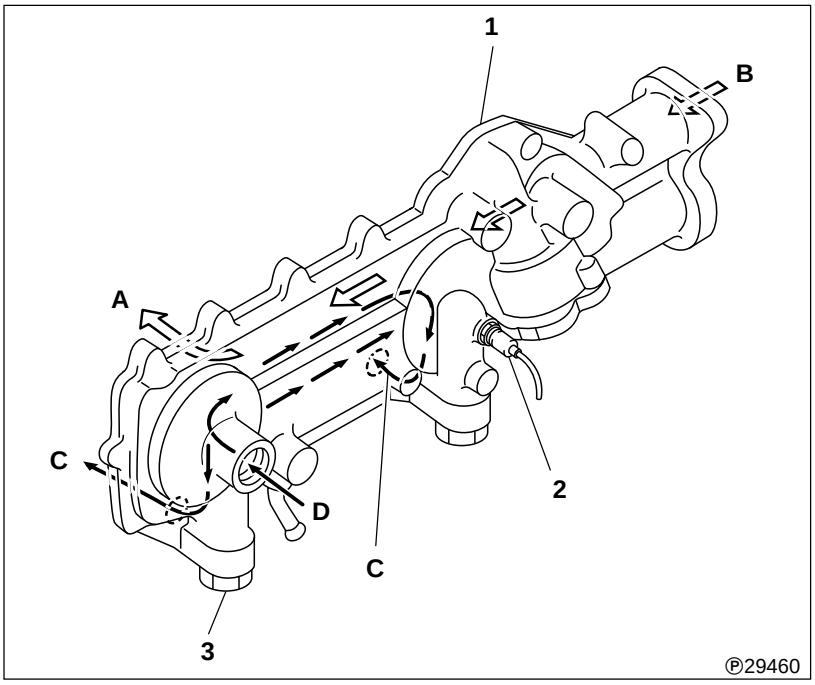
1 Oil filter head
2 Oil filter
3 Bypass filter
4 Full-flow filter
5 Bypass valve
6 Regulator valve

A: To oil cooler
B: From oil pump
C: To oil pan

- The oil filter is a spin-on filter-paper type incorporating a bypass filter **3** and a full-flow filter **4**.
  A bypass valve **5** is fitted at the bottom of the filter assembly. If the elements become clogged, the bypass valve opens and allows oil to flow to oil cooler without passing through the elements. This operation prevents seizure of the engine.
- When the pressure of oil going to the main oil gallery exceeds a specified level, regulator valve **6** opens, allowing some of the engine oil to return to the oil pan. The oil pressure is thus constantly regulated.

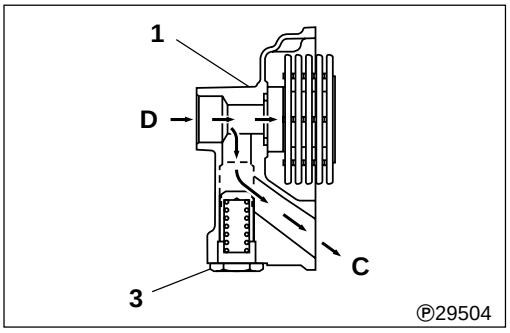
https://truckmanualshub.com/

Oil Cooler



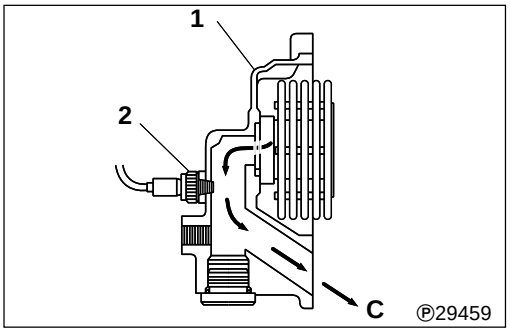
1 Oil cooler
2 Engine oil pressure switch
3 Bypass valve

A: Coolant outlet
B: Coolant inlet
C: To main oil gallery
D: From oil filter



● **Bypass valve**

When the oil's viscosity is high at low temperatures or when oil cooler **1** element is clogged and resists the oil's flow, bypass valve **3** opens, thus allowing engine oil to flow to main oil gallery without passing through the cooler.

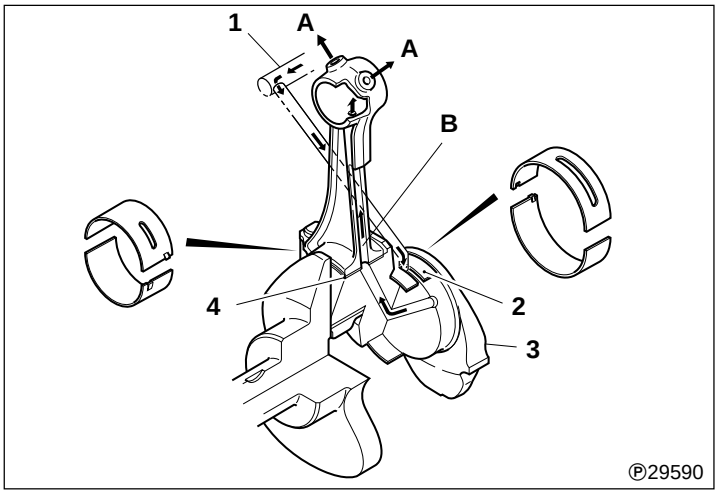


● **Oil pressure switch**

If the pressure of oil fed to main oil gallery drops below the specified level, electric contacts close inside engine oil pressure switch **2**. As a result, a warning lamp illuminates in the meter cluster to alert the driver.

https://truckmanualshub.com/

Lubrication of Related Parts

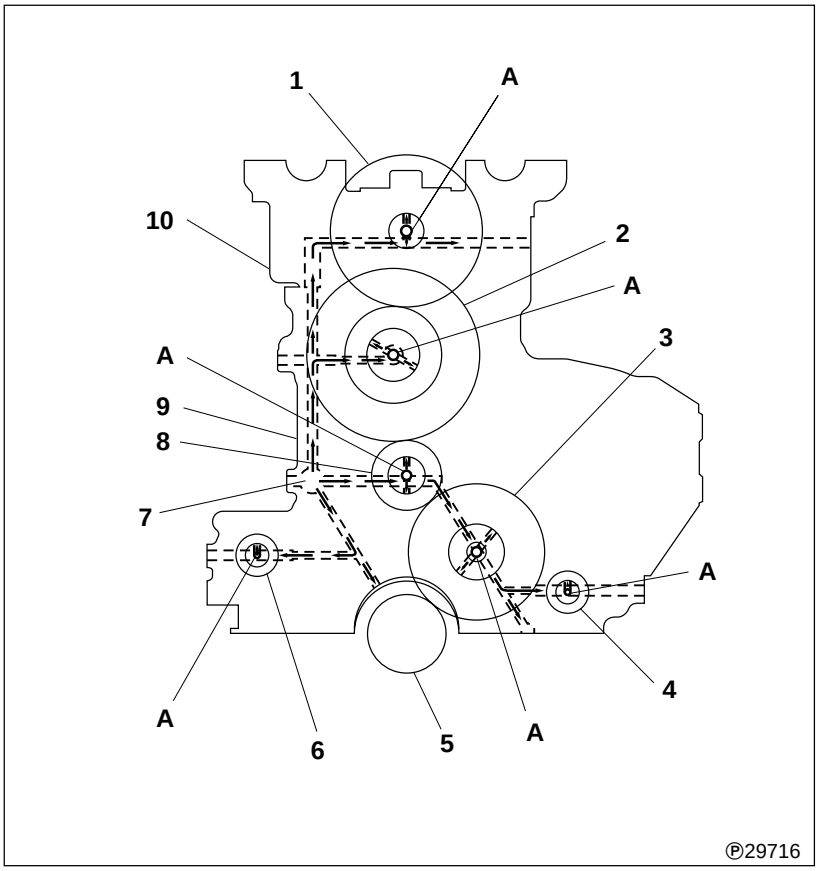


● **Main bearing and connecting rod bearing**

1 Main oil gallery
2 Main bearing
3 Crankshaft
4 Connecting rod bearing

A: Oil jet
B: Connecting rod oil passage

Oil supplied via the oil passage in the crankshaft flows through oil passage **B** in the connecting rod to lubricate the connecting rod's small end. The oil then sprays out from oil jet **A** at the top of the connecting rod to cool the piston.



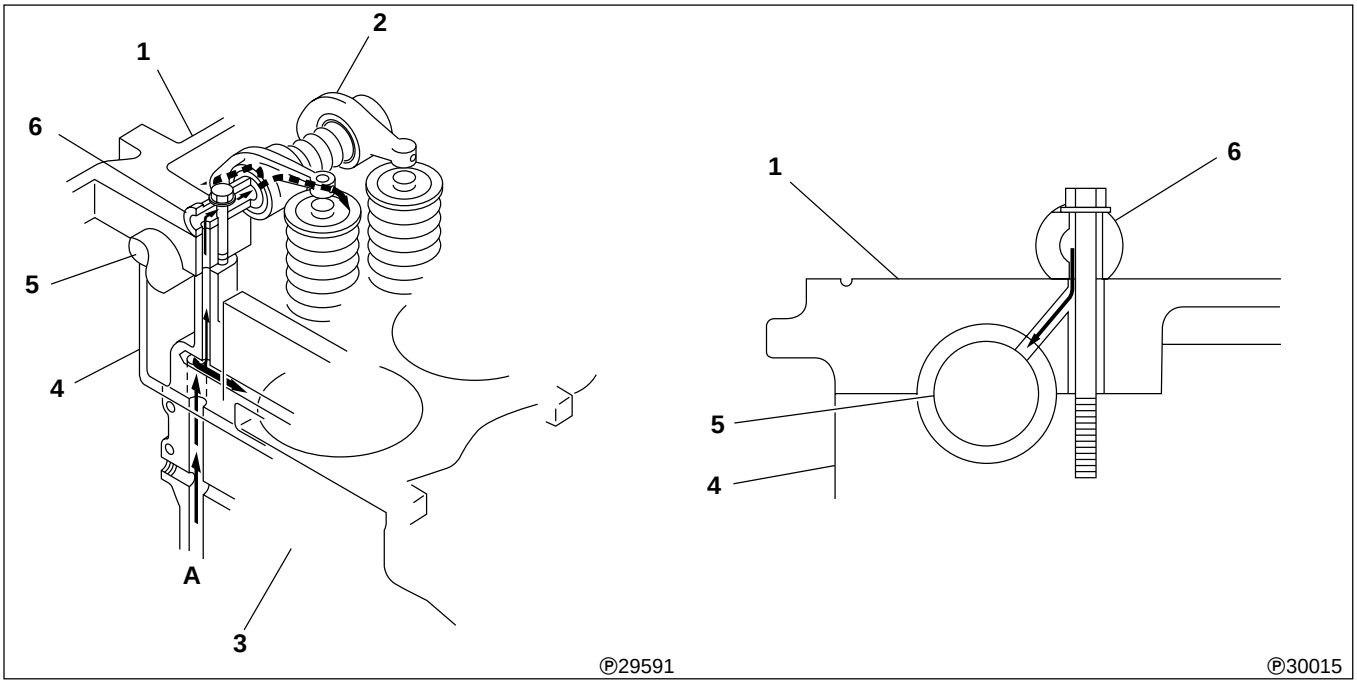
● **Timing gear**

1 Head idler gear
2 Idler gear A, B
3 Idler gear No.1
4 Balanceshaft gear LH
5 Crankshaft gear
6 Balanceshaft gear RH
7 Main oil gallery
8 Fan shaft assembly
9 Upper crankcase
10 Cylinder head

A: Oil hole

Engine oil from main oil gallery **7** passes through upper crankcase **9** and cylinder head **10** to lubricate the journals of the gears. The oil that has lubricated head idler gear **1** sprays out of oil hole in the gear boss and returns to the oil pan through inside the front case while lubricating the gears.

https://truckmanualshub.com/

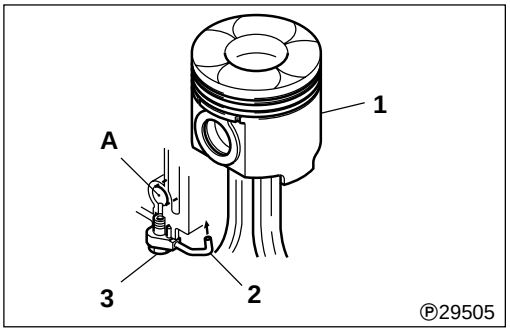


● **Valve mechanism**

1 Camshaft frame
2 Rocker arm
3 Upper crankcase
4 Cylinder head
5 Camshaft
6 Rocker shaft

A: From main oil gallery

Engine oil from main oil gallery **A** passes through upper crankcase **3**, cylinder head **4** and camshaft frame **1** to rocker shaft **6**. Then, the oil flows through the oil passage of rocker shaft and returns to the oil pan while lubricating rocker arm **2** and camshaft **5**.



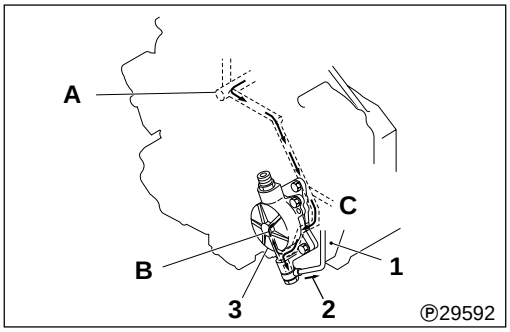
● **Oil jet**

1 Piston
2 Oil jet
3 Check valve

A: Main oil gallery

An oil jet **2** is fitted in the lower part of the main oil gallery **A** for each cylinder. These oil jets cool the pistons **1** by injecting oil into them. Each oil jet is fitted with check valve **3** that opens and closes at specified oil pressure levels. At low engine speeds, these check valves close to maintain the required volume of oil in the lubrication system and prevent reductions in oil pressure.

https://truckmanualshub.com/



● **Vacuum pump**

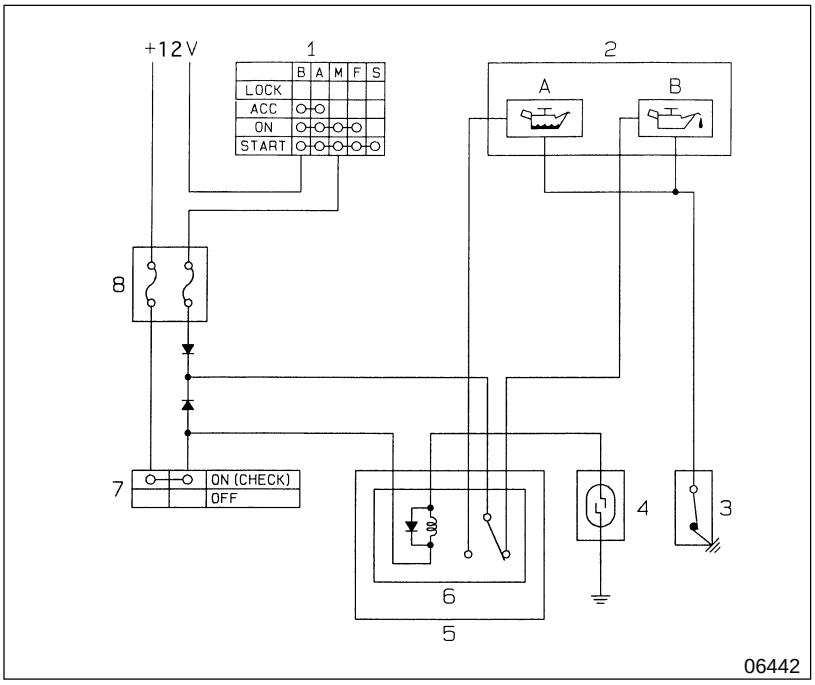
1 Front case
2 Oil pipe
3 Vacuum pump

A: Main oil gallery
B: To front case
C: To automatic timer

Engine oil delivered from main oil gallery **A** flows to vacuum pump **3** where it branches into two flows; one is, after lubricating the vanes, discharged into front case **1** from the air vent hole and returns to the oil pan. The other passes through oil pipe **2** to lubricate various parts of the automatic timer and then returns to the oil pan.

https://truckmanualshub.com/

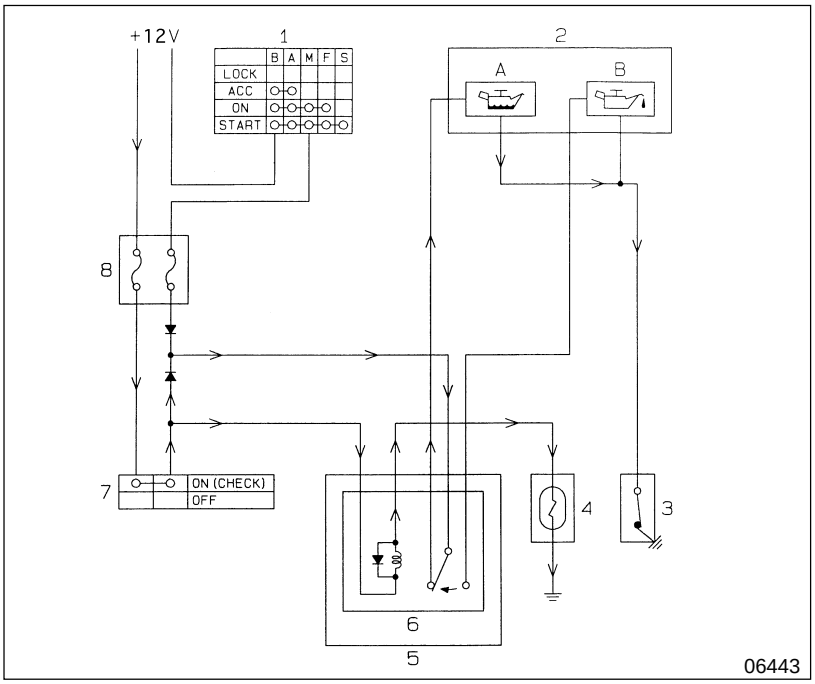
Lubrication System Monitoring Circuit



1 Starter switch
2 Meter cluster
3 Oil pressure switch
4 Oil level sensor
5 Relay box
6 Oil level relay
7 Oil level check switch
8 Fuse box

A: Oil level indicator lamp
B: Oil pressure warning lamp

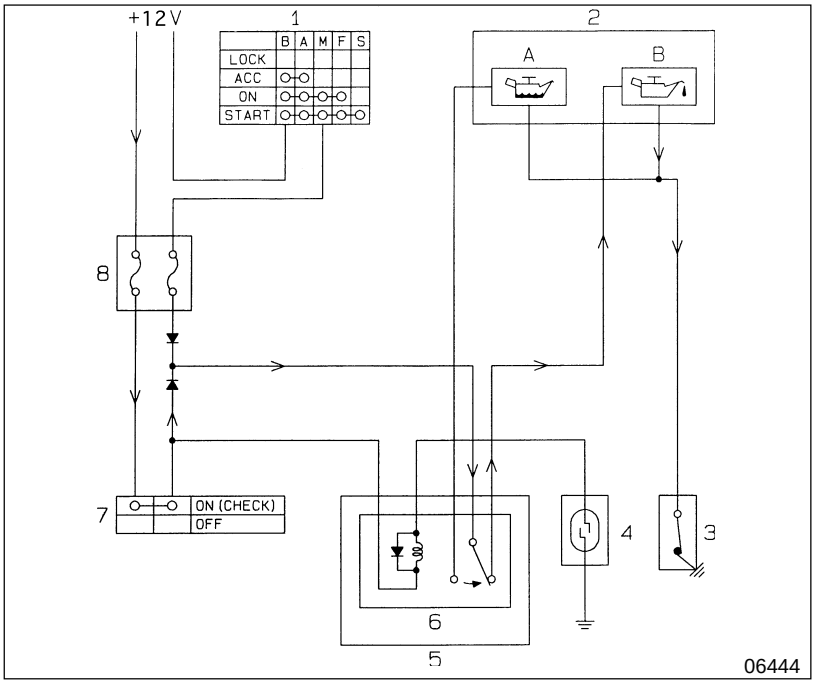
This circuit monitors the lubrication system by detecting the pressure and level of engine oil.



- Oil level normal (oil level sensor ON)
  When oil level check switch **7** is turned ON while the engine is not running (oil pressure switch **3** ON), oil level sensor **4** is grounded and therefore oil level relay **6** is energized. This allows current to flow through the route given below and turn on oil level indicator lamp **A**.

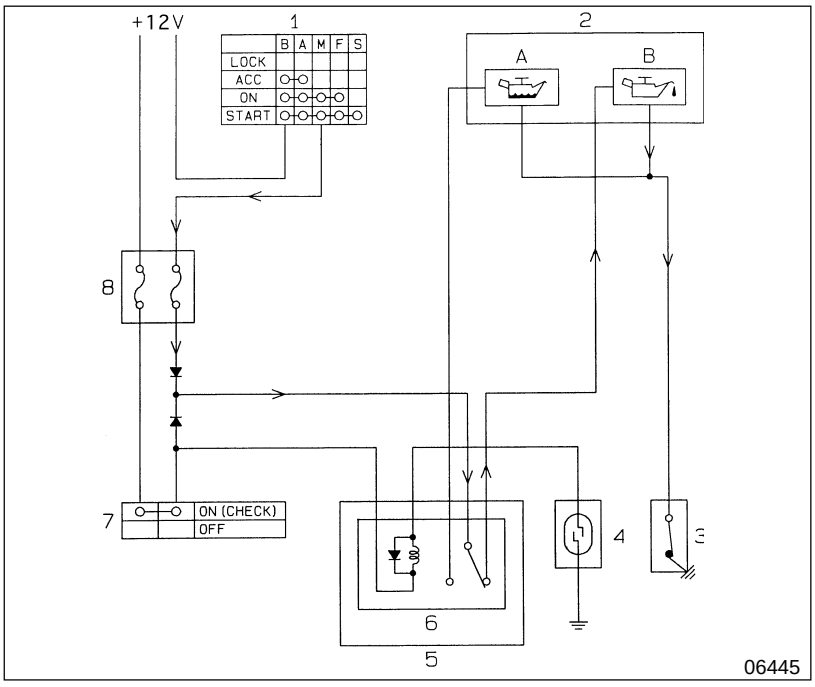
Fuse box **8** → oil level check switch **7** → relay box **5**
→ oil level relay **6** → oil level sensor **4** → ground
→ meter cluster **2** → oil level indicator lamp **A**
→ oil pressure switch **3** → ground

https://truckmanualshub.com/



● Oil level low (oil level sensor OFF)
Even when oil level check switch **7** is turned ON while the engine is not running (oil pressure switch **3**: ON), oil level relay **6** is not energized because oil level sensor **4** is off. This causes the current to flow through the route given below and turn on oil pressure warning lamp **B**.

Fuse box **8** → oil level switch **7** → Relay box **5** → oil level relay **6** → meter cluster **2** → oil pressure warning lamp **B** → oil pressure switch **3** → ground



● Oil pressure abnormal (oil pressure switch ON)
The oil pressure drops while the engine is running oil pressure switch **3** turns ON. As a result, current flows through the route given below to turn on oil pressure warning lamp **B**. When oil pressure is normal, oil pressure switch **3** remains off and no current flow.

Starter switch **1** → fuse box **8** → relay box **5** → oil level relay **6** → meter cluster **2** → oil pressure warning lamp **B** → oil pressure switch **3** → ground

ON-VEHICLE INSPECTION AND ADJUSTMENT

Oil Filter Replacement

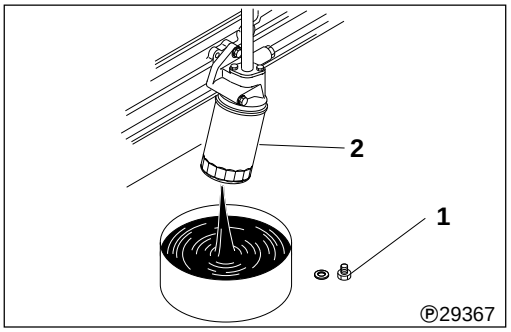
Lubricant

Location	Points of application	Specified lubricant	Quantity
2	Oil filter	Engine oil (API CD or higher)	Approx.1 L {1.1 qts}

Special tools

Unit: mm {in.}

Location	Tool name and shape	Part No.	Application
—	Oil Filter Element Socket  08550	MH061566	Oil filter removal
	Oil Filter Wrench  **ϕ107 to 120 {ϕ4.21 to 4.72}** 01503	MH063200	

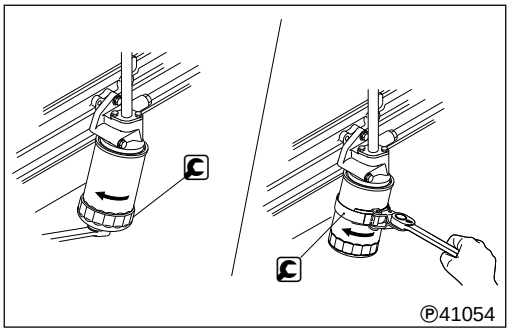


WARNING ⚠

- **Wipe up any spilled engine oil since it may cause a fire.**
- **Do not touch oil when the engine is hot since it can inflict severe burns.**

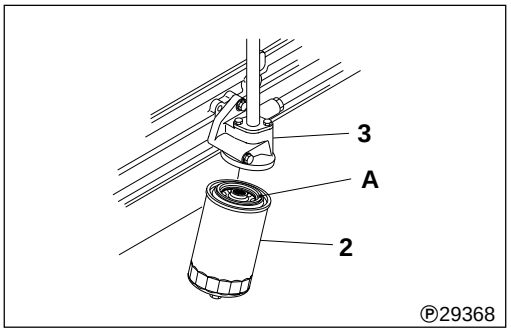
CAUTION ⚠

When pouring oil into the engine, take care not to spill any on the V-ribbed belt. Contact with oil could make the V-ribbed belt slip, rendering the cooling system less effective.



Loosen oil filter drain plug **1** to drain the engine oil from inside the filter **2**.
[Removal]

: Oil Filter Element Socket or Filter Wrench



[Installation]

- Clean the surface of oil filter head **3** to which oil filter **2** is fitted.
- Apply a thin coat of engine oil to the gasket A of oil filter **2**.
- Screw oil filter **2** into oil filter head **3** by hand until gasket **A** contacts the oil filter head. Then, tighten oil filter **2** further by giving it a 3/4 turn.
- After installing the oil filter, start the engine and check gasket **A** for oil leakage.
- Check to see if the engine oil level is in the specified range.

https://truckmanualshub.com/

Engine Oil Replacement

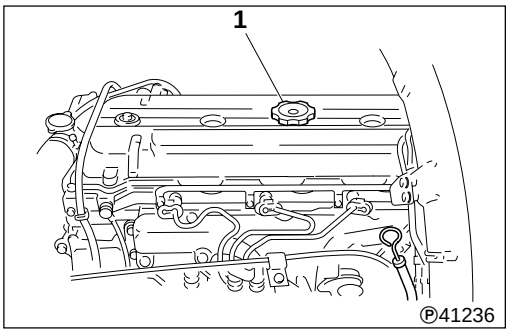
❶ Tightening torques

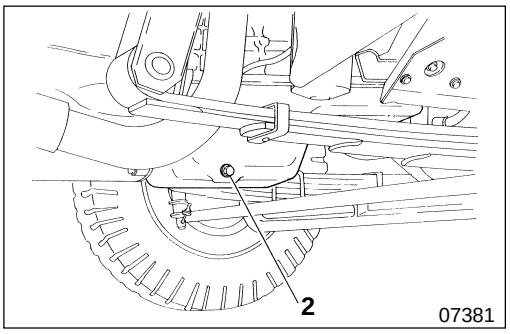
Unit: N·m {ft.lbs, kgf·m}

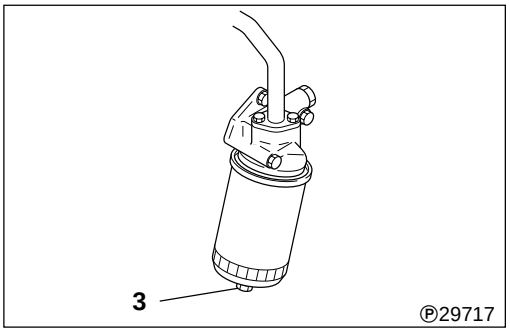
Location	Parts to be tightened	Tightening torque	Remarks
2	Oil pan drain plug	34.3 to 43.1 {25 to 32, 3.5 to 4.4}	—
3	Oil filter drain plug	9.8±1.96 {7.2±1.4, 1.0±0.2}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
—	Oil pan	Engine oil (API CD or higher)	Approx.9 L {9.5 qts}
—	Oil filter	Engine oil (API CD or higher)	Approx.1 L {1.1 qts}







WARNING ⚠

- **Wipe up any spilled engine oil since it can cause a fire.**
- **Do not touch oil when the engine is hot since it can inflict severe burns.**

CAUTION ⚠

When pouring oil into the engine, take care not to spill any on the V-ribbed belt. Contact with oil could make the V-ribbed belt slip, rendering the cooling system less effective.

[Draining]

- Warm up the engine, then remove oil filler cap **1**.
- Remove oil pan drain plug **2** and oil filter drain plug **3**. Then, drain the engine oil.

[Filling]

Tighten oil pan drain plug **2** and oil filter drain plug **3** to their specified torques. Then, add new engine oil to the specified level.

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

Oil Pressure Measurement
Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Oil pressure (at oil temperature of 158 to 194°F, 70 to 90°C)	At no-load minimum speed	145 kPa {21 psi^2, 1.5kgf/cm^2}	49 kPa {7.1 psi^2, 0.5 kgf/cm^2}	Check
		At no-load maximum speed	295 to 490 kPa {43 to 71 psi^2, 3 to 5 kgf/cm^2}	195 kPa {28 psi^2, 2 kgf/cm^2}	

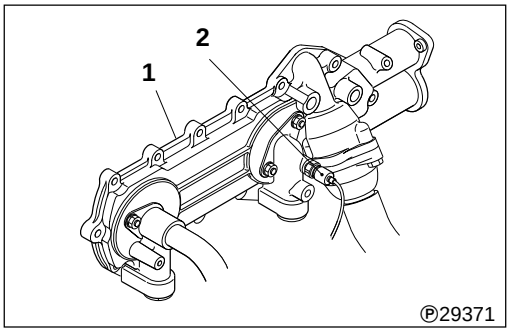
❶ Tightening torque

Unit: N·m {ft.lbs, kgf·m}

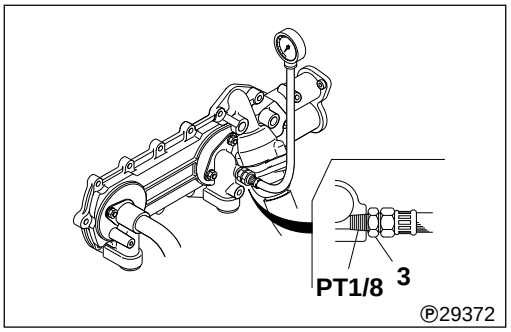
Location	Parts to be tightened	Tightening torque	Remarks
2	Engine oil pressure switch	7.8 to 14.7 {5.8 to 11.0, 0.8 to 1.5}	Check with engine cold

Sealant

Location	Point of application	Specified sealant	Quantity
2	Threaded part of engine oil pressure switch	Teflon tape	3 and half turns



- Remove engine oil pressure switch **2** from oil cooler **1**.



- Fit adapter **3** onto the engine oil pressure switch **2** mounting, then fit the oil pressure gauge onto the adapter.
- Warm up the engine until the oil temperature reaches 158 to 194°F (70 to 90°C).
- Measure the oil pressure at no-load minimum speed and at no-load maximum speed. If the measured values are below the specified standard values, overhaul the lubrication system.
- After taking measurements, fit oil pressure switch **2** and tighten it to the specified torque.

CAUTION ⚠

Oil pressure switch 2 must be fitted when the engine is cold.

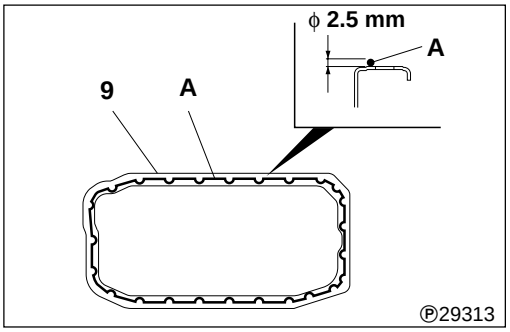
Lubricant and/or sealant

Location	Points of application	Specified lubricant and/or sealant	Quantity
9	Crankcase mounting surface of oil pan	Threebond 1207C	As required
12, 15	Entire circumference of O-ring	Engine oil	As required
17	Threads of check valve	Engine oil	As required



◆ Service procedure

9 Fitting oil pan

- Apply sealant **A** to the mounting surface of oil pan **9** as illustrated. Apply the sealant evenly and without breaks.
- Within three minutes of applying sealant **A**, fit oil pan **9** onto the crankcase*.

CAUTION ⚠

- **Clean the oil pan mounting surface and ensure it is free of oily substances before applying sealant.**
- **Carefully mount oil pan exactly in the correct position. Ensure that sealant A does not spread to other areas.**
- **After fitting oil pan 9, wait at least one hour before starting the engine.**
- **Reapply sealant A to the oil pan mounting surface whenever the mounting bolts 8 of oil pan 9 have been loosened.**

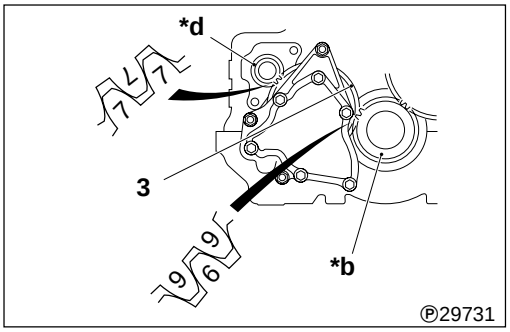
Special tools

Unit: mm {in.}

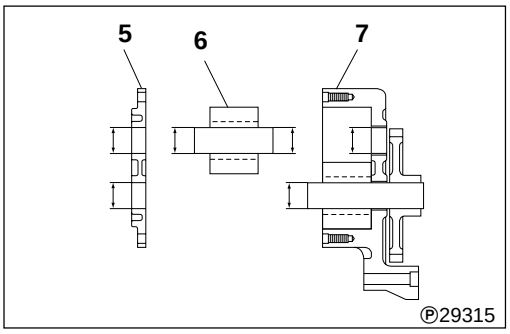
Location	Tool name and shape	Part No.	Application
5	Pump Cover Pin 	MH063431	Oil pump cover installation



Service procedure

3 Installation of oil pump assembly

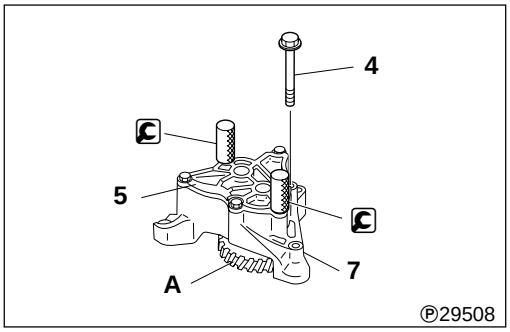
- With No. 1 cylinder set at its top dead center, position crankshaft gear ***b**.
- Install oil pump assembly **3** while meshing its gear with crankshaft gear ***b** and balance shaft gear RH ***d** at the match marks "**6**" and "**7**" as shown.



5 to 7 Inspection of oil pump cover, driven gear assembly and oil pump case assembly

Measure the clearance between each gear shaft and oil pump case assembly **7** or cover **5**. Replace the oil pump assembly if any measurement is out of specification.

https://truckmanualshub.com/

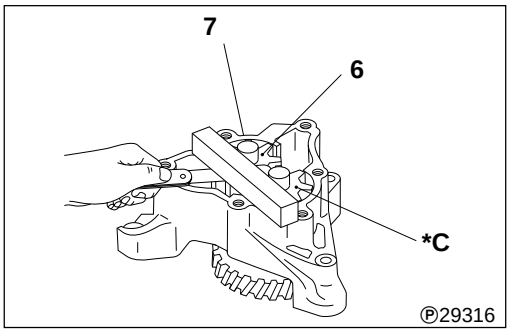


5 7 Installation of oil pump cover and oil pump case assembly

- Position oil pump cover **5** on oil pump case assembly **7** using two 🔧 Pump Cover Pins.
- Fit bolt **4** and tighten it to the specified torque.
- Remove 🔧 Pump Cover Pins, then fit other bolts **4** and tighten them to the specified torque.

CAUTION ⚠

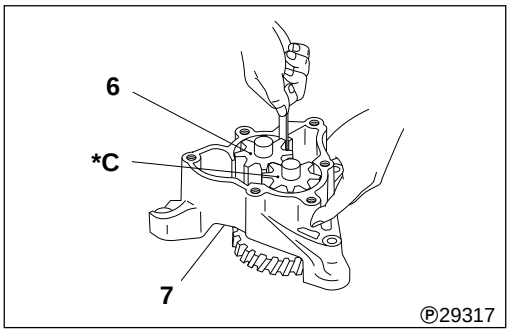
- **Before assembly, apply engine oil to various parts. Pour approximately 5 cm³ {0.3 Cu.in.} of engine oil into the assembly from the oil outlet before installing to the engine.**
- **After assembly, turn the oil pump gear A by hand and check that it rotates smoothly. If the gear does not rotate smoothly, disassemble and reassemble the components.**



6 7 Inspection of driven gear assembly and oil pump case assembly

(1) Differences between gear heights and oil pump case depth

Replace the oil pump assembly if the measurement is out of specification.



(2) Clearance between gear teeth tip and oil pump case

Replace the oil pump assembly if the measurement is out of specification.

Lubricant

Location	Points of application	Specified lubricant	Quantity
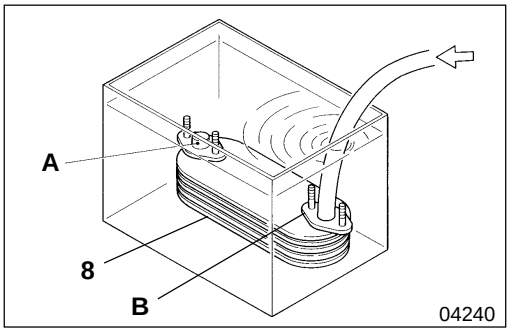
12, 15	Entire circumference of O-ring	Engine oil	As required

https://truckmanualshub.com/

◆ Service procedure

● **Cleaning**

- Check whether carbon deposits or sludge have accumulated in the oil passage of oil cooler element **8** or in the oil cooler's bypass arrangement. Remove any deposits with cleaning solvent.
- Clean out any water scale or fur that has accumulated in the oil cooler element **8** or oil cooler body **19**.



8 **Inspection of oil cooler element**

- Plug outlet **A** of oil cooler element **8** and connect a hose to the oil inlet **B**. Then, immerse the oil cooler element in a tank of water.
- Apply an air pressure of 980 kPa {140 psi^2, 10 kgf/cm^2} via the hose and check that no air leaks from the oil cooler element **8**.
- If any air leaks, replace the oil cooler element **8**.

OIL PUMP 18

OIL COOLER AND OIL FILTER 22

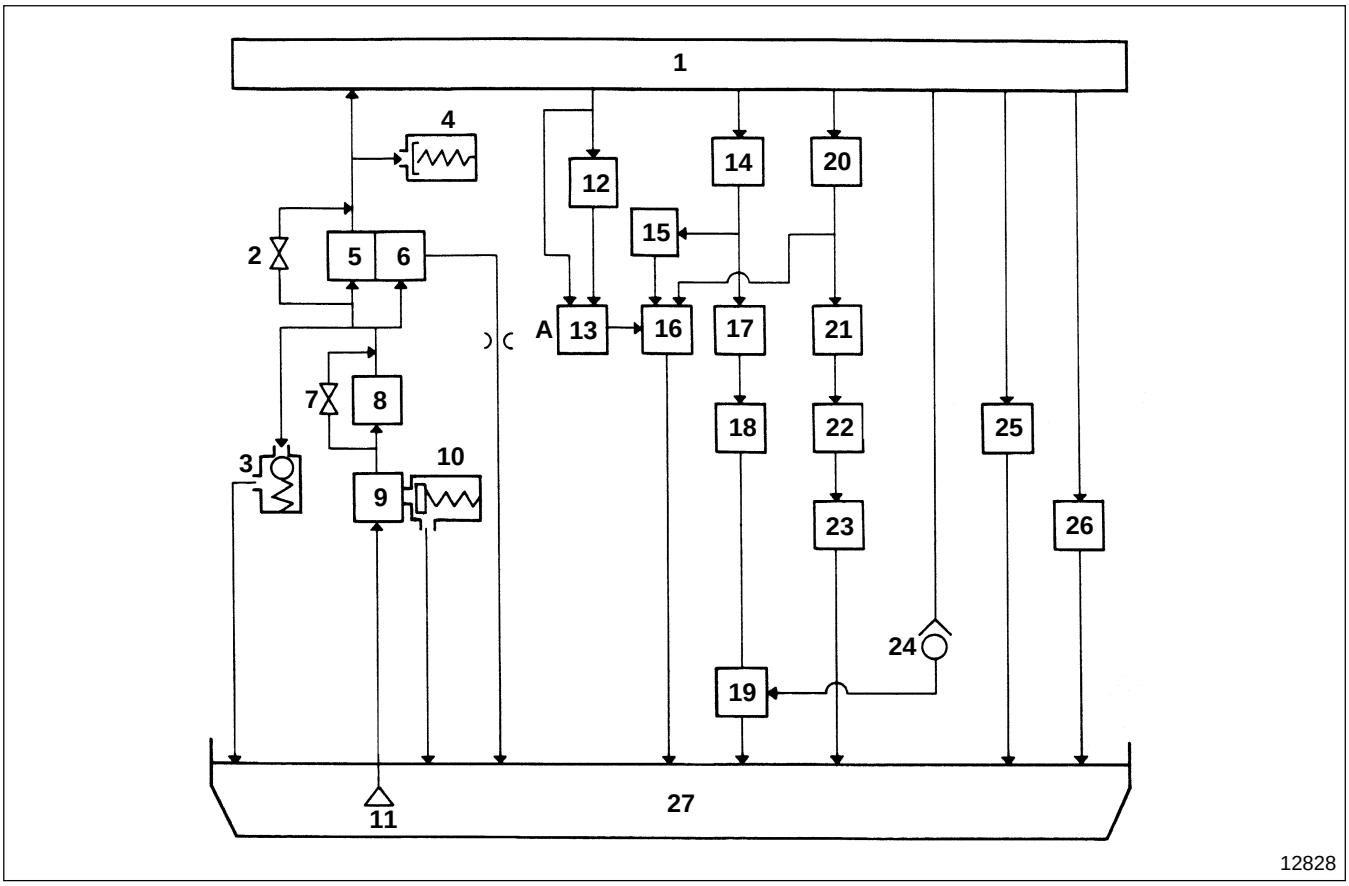
https://truckmanualshub.com/

SPECIFICATIONS

Item			Specifications
Mode of lubrication			Oil pump type
Oil filter type			Spin-on filter paper type
Oil cooler type			Shell and plate type (Multiple-plate type)
Engine oil	Grade		Grade CD or above as per API classification
	Quantity of oil L {qts}	Oil pan	Approximately 8 {8.5}
		Oil filter	Approximately 1 {1.1}

https://truckmanualshub.com/

Lubrication System (Flow of Oil)

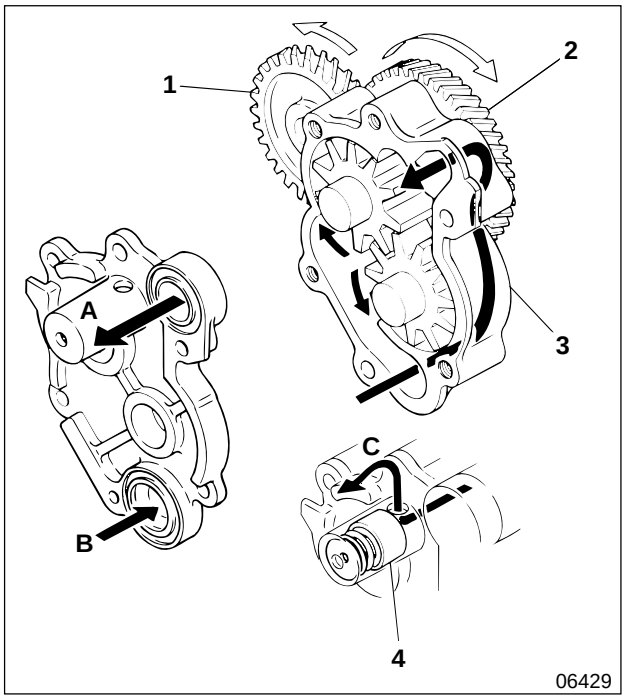


1 Main oil gallery
2 Bypass valve (Built-in within oil filter)
3 Regulator valve
4 Engine oil pressure switch
5 Full-flow filter element
6 Bypass filter element
7 Bypass valve
8 Oil cooler
9 Oil pump
10 Relief valve (Built-in within oil pump)
11 Oil strainer
12 Injection pump
13 Automatic timer
14 Crankshaft main bearing
15 Idler bushing
16 Timing gear
17 Connecting rod bearing
18 Connecting rod bushing
19 Piston
20 Camshaft bushing
21 Rocker bushing
22 Push rod
23 Tappet
24 Check valve for oil jet
25 Turbocharger
26 Vacuum pump
27 Oil pan

A : Orifice

https://truckmanualshub.com/

Oil Pump



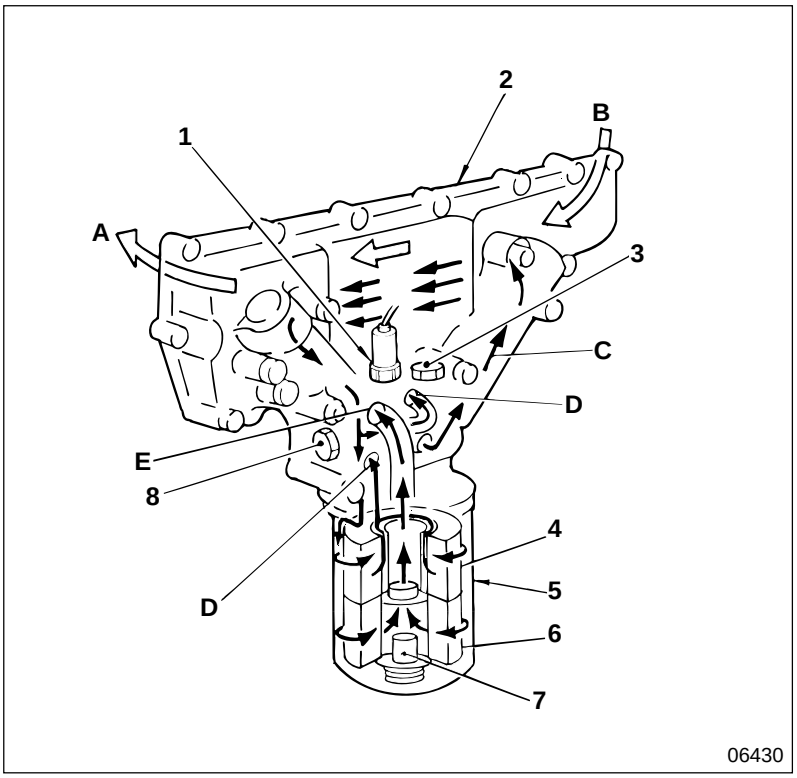
1 Crankshaft gear
2 Oil pump gear
3 Oil pump
4 Relief valve

A : To oil cooler
B : From oil strainer
C : To oil pan

Oil pump **3** is a gear type, driven by rotation of the crankshaft transmitted by crankshaft gear **1** that engages oil pump gear **2**. Relief valve **4** is installed on the oil pump and when the oil pump discharge pressure becomes higher than the standard pressure level, part of the engine oil is returned to the oil pan by relief action of the valve, protecting the lubricating system from breakdown caused by excessive oil pressure.

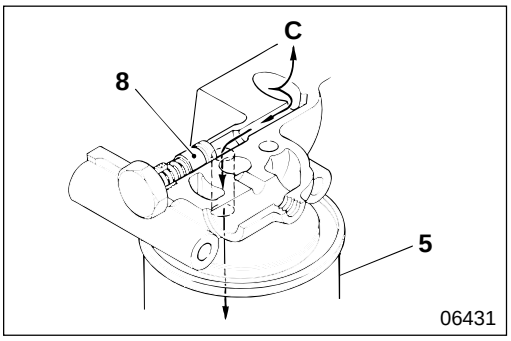
https://truckmanualshub.com/

Oil Cooler and Oil Filter



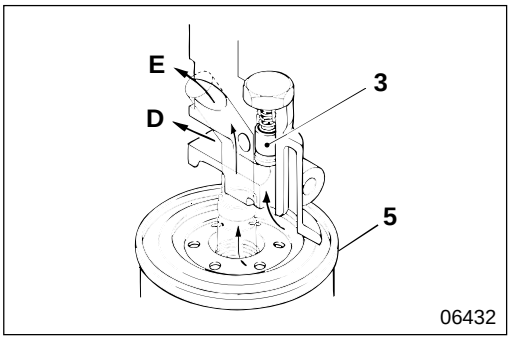
1 Engine oil pressure switch
2 Oil cooler
3 Regulator valve
4 Bypass filter element
5 Oil filter
6 Full-flow filter element
7 Bypass valve
8 Bypass valve

A : Coolant exit port
B : Coolant entry port
C : To oil cooler
D : To oil pan
E : To main oil gallery



● **Operation of bypass valve**

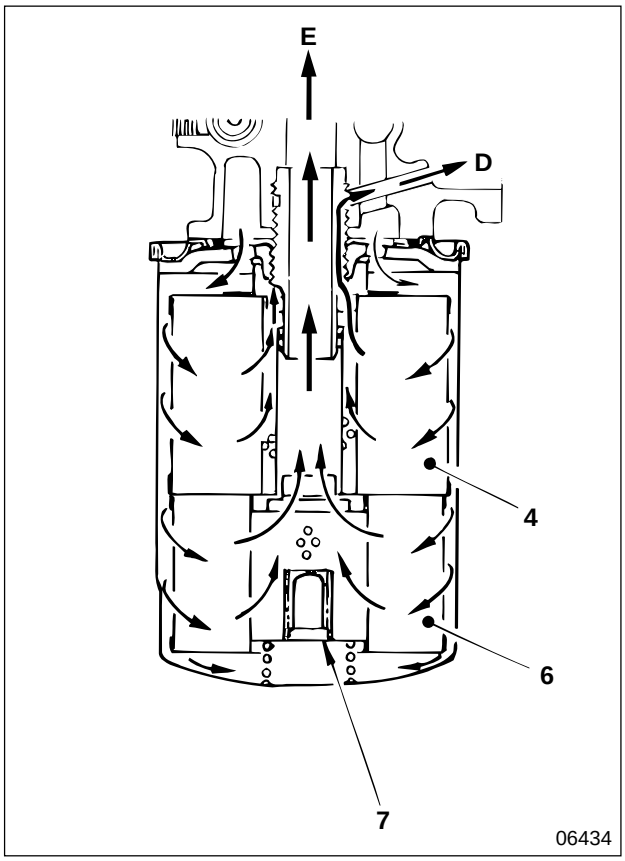
When the viscosity of the engine oil is high at low temperatures, or when oil cooler **2** element is clogged, flow resistance is high, and if this happens, bypass valve **8** opens to let the engine oil return directly to oil filter **5** without going through the oil cooler.



● **Operation of regulator valve**

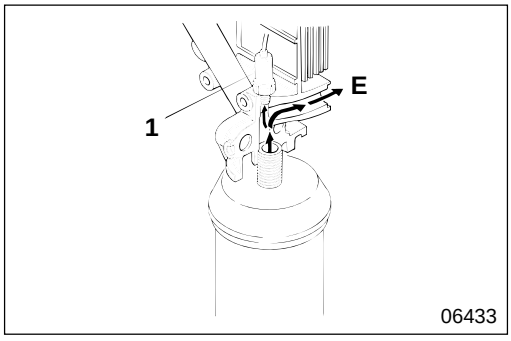
When the oil pressure in the main oil gallery becomes higher than standard, regulator valve **3** opens to let part of the oil return to oil pan **D**, thereby regulating the oil pressure.

https://truckmanualshub.com/



● **Oil filter element**

This oil filter uses a spin-on, filter paper type element, that integrates full-flow filter element **6** and bypass filter element **4**. When the filter element is clogged, bypass valve **7**, installed at the base of the filter, opens to let the oil bypass the element and flow directly to main oil gallery **E**, preventing engine seizure.

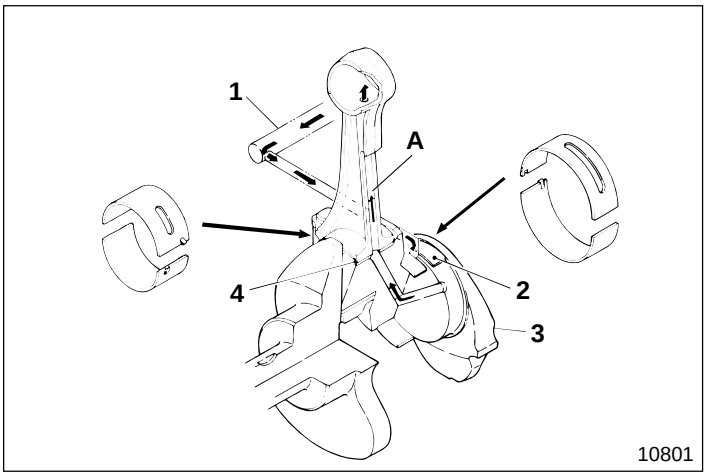


● **Operation of engine oil pressure switch**

When pressure for delivering the oil to main oil gallery **E** becomes lower than standard, the built-in electric contact point of engine oil pressure switch **1** closes to light the warning lamp in the meter cluster, warning the driver that the oil pressure is abnormal.

https://truckmanualshub.com/

Lubrication of Related Parts



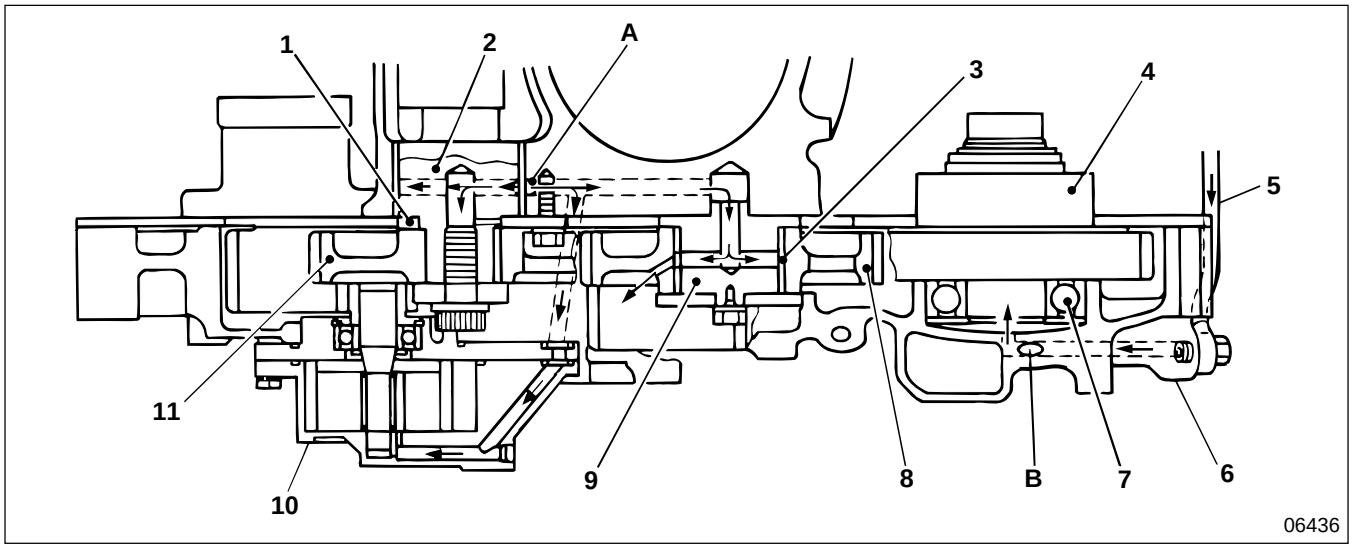
● **Main bearing and connecting rod bearing**

1 Main oil gallery
2 Main bearing
3 Crankshaft
4 Connecting rod bearing

A : Connecting rod oil passage

Engine oil supplied through the oil passage drilled in the crankshaft flows through connecting rod oil passage **A** to lubricate the small end of the connecting rod.

● **Timing gear**

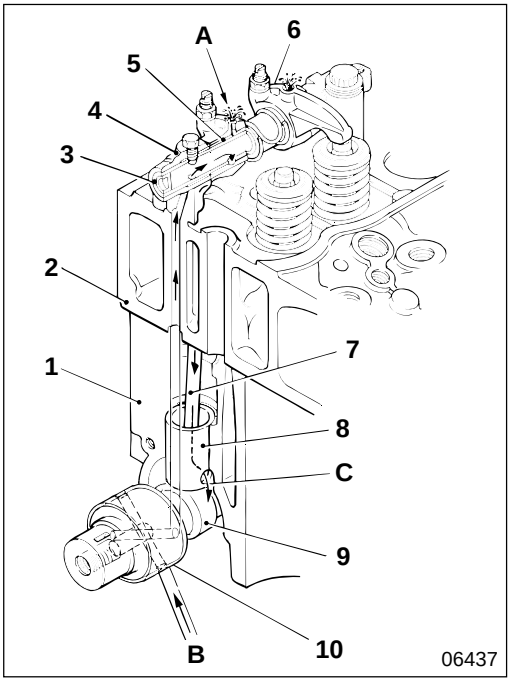


1 Thrust plate
2 Camshaft
3 Idler gear bushing
4 Automatic timer
5 Oil pipe
6 Timing gear case
7 Bearing
8 Idler gear
9 Idler shaft
10 Vacuum pump
11 Camshaft gear

A : From main oil gallery
B : Oil jet (for forced lubrication of automatic timer)

Eengine oil from main oil gallery **A** flows through the inside of camshaft **2** and idler shaft **9** and lubricates each gear along the way including vacuum pump **10**. Inside timing gear case **6** is oil jet **B** that constantly provides automatic timer **4** with forced lubrication.

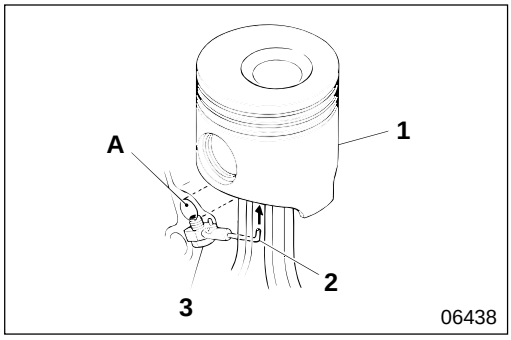
https://truckmanualshub.com/



● **Valve mechanism**

1 Crankcase
2 Cylinder head
3 Rocker shaft
4 Rocker shaft bracket
5 Rocker bushing
6 Rocker
7 Push rod
8 Tappet
9 Camshaft
10 No. 1 camshaft bushing

A : Rocker oil hole
B : From main oil gallery
C : To oil pan

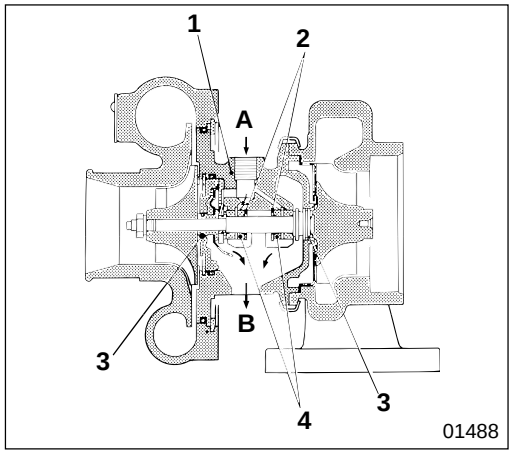


● **Oil jet**

1 Piston
2 Oil jet
3 Check valve

A : Main oil gallery

An oil jet **2** is installed, in the lower part of main oil gallery **A**, for each cylinder and cools piston **1** by injecting engine oil toward the inside of the piston. The oil jet is fitted with check valve **3** which opens and closes at standard oil pressure levels. This prevents a decrease of oil volume at low oil pressure as well as a decrease of oil pressure itself.



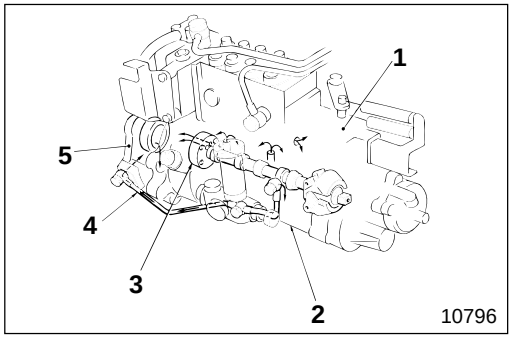
● **Turbocharger**

1 Bearing housing
2 Snap ring
3 Piston ring
4 Bearing

A : From main oil gallery
B : To oil pan

Engine oil is delivered from the main oil gallery to bearing housing **1** through the oil pipe to lubricate bearing **4**. Piston ring **3** installed at both ends of the turbine wheel shaft works as an oil seal.

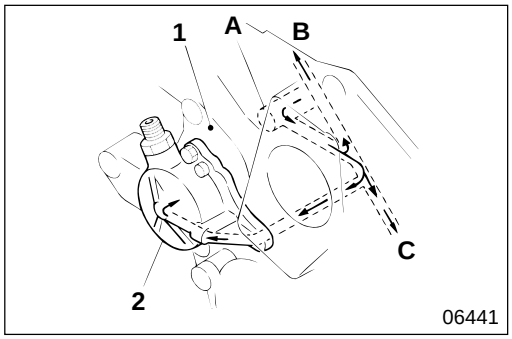
https://truckmanualshub.com/



● **Injection pump**

1 Governor
2 Injection pump
3 Bearing cover
4 Oil pipe
5 Timing gear case

Engine oil that has lubricated injection pump **2** and governor **1** returns to the oil pan through the oil passage of bearing cover **3**.



● **Vacuum pump**

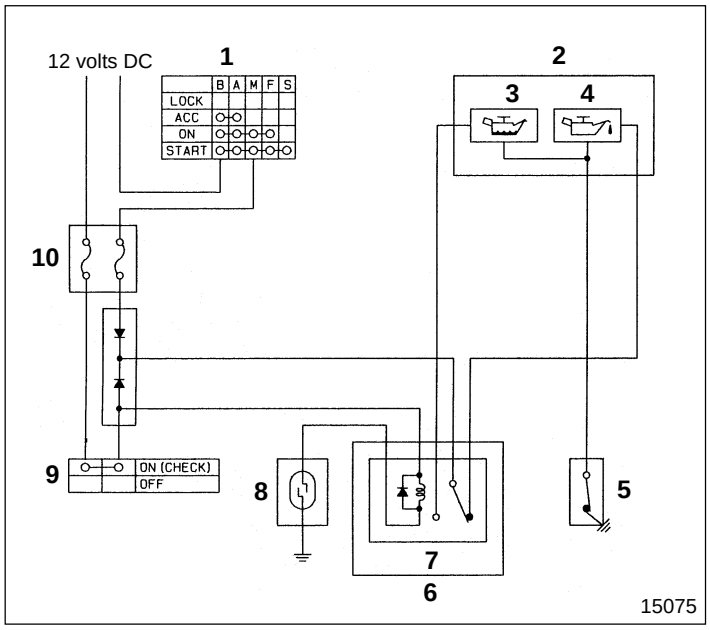
1 Timing gear case
2 Vacuum pump

A : Main oil gallery
B : To camshaft
C : To crankshaft

Engine oil is delivered from main oil gallery **A** to vacuum pump **2** through the oil passage of timing gear case **1** to lubricate the vanes. Then, the oil is discharged to the timing gear case through the air outlet port together with air to be returned to the oil pan.

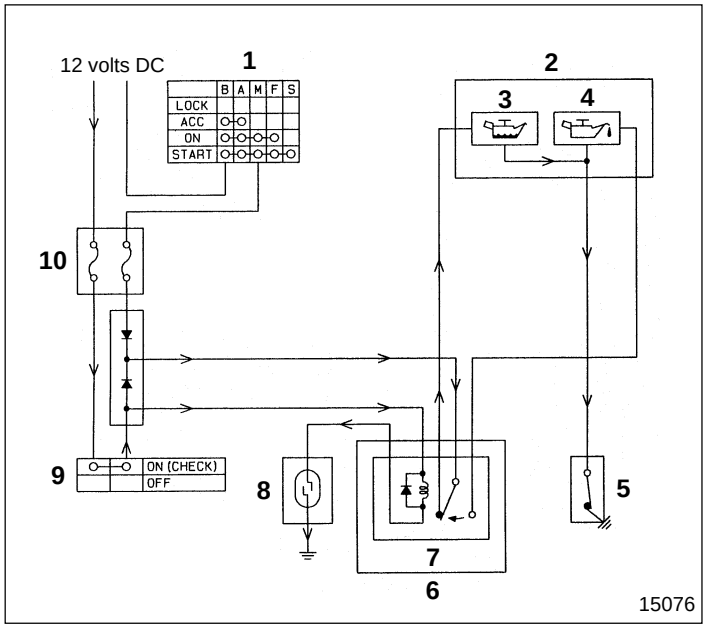
https://truckmanualshub.com/

Lubrication System Electric Circuit



1 Starter switch
2 Meter cluster
3 Engine oil level indicator lamp (Green)
4 Engine oil pressure warning lamp (Red)
5 Engine oil pressure switch
6 Relay box
7 Engine oil level relay
8 Engine oil level sensor
9 Engine oil level check switch
10 Fuse box

This system detects irregularities of engine oil pressure and engine oil level using a sensor-based system.

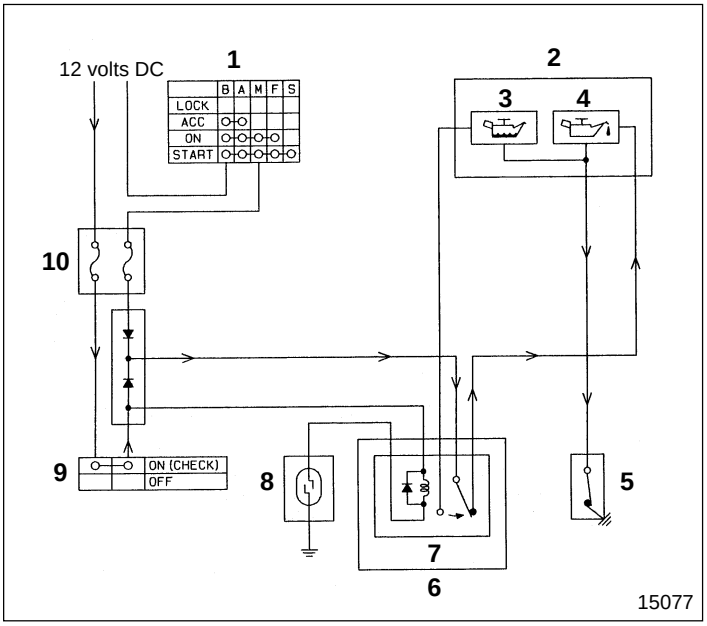


When oil level is normal
(Engine oil level sensor : ON)

When the engine is at a standstill (engine oil pressure switch **5** : ON), by turning engine oil level check switch **9** ON, engine oil level relay **7** is magnetized through engine oil level sensor **8** making electric current flow to light engine oil level indicator lamp **3**.

10 → **9** → **7** (coil) → **8** → Ground
10 → **7** (contact point) → **3** → **5** → Ground

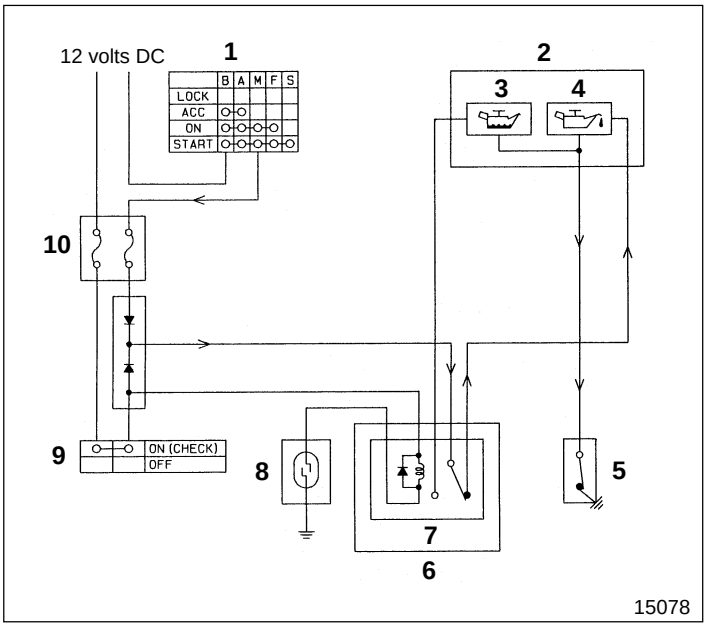
https://truckmanualshub.com/



When oil level is low
(Engine oil level sensor : OFF)

When the engine is at a standstill (engine oil pressure switch **5** : ON), no magnetization of engine oil level relay **7** takes place when engine oil level switch **9** is turned ON because engine oil level sensor **8** is OFF, but electric current flows to light engine oil pressure warning lamp (Red) **4**.

10 → **9** → **7** → **4** → **5** → Ground



When oil level is abnormal
(Engine oil pressure switch : ON)

When the oil pressure drops while the engine is running, engine oil pressure switch **5** is ON, making electric current flow to light engine oil pressure warning lamp (Red) **4**. Under normal conditions, engine oil pressure switch **5** remains OFF and therefore no electric current flows.

1 → **10** → **7** → **4** → **5** → Ground

https://truckmanualshub.com/

TROUBLESHOOTING

Replacement of Oil Filter

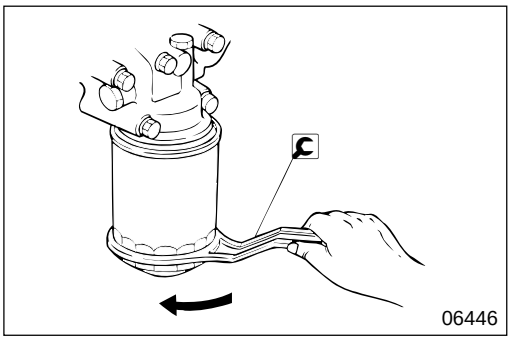
Special tools

Unit : mm {in.}

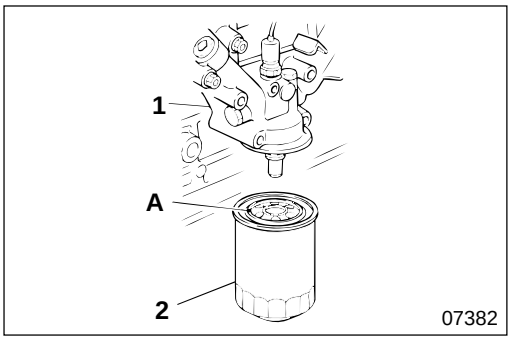
Location	Tool name and shape	Part No.	Application
2	Oil filter wrench  06478	MH061587	Removal of oil filter

WARNING

- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**
- **When replacing oil filter 2, take care not to spill oil on the V-belt.**



[Removal]



[Installation]

- Clean the surface of oil cooler body **1** that makes contact with oil filter **2**.
- Apply engine oil thinly and evenly to gasket area **A** of oil filter **2**.
- Screw in oil filter **2** to oil cooler body **1** until gasket area **A** sits on the body. From this position, tighten further by rotating by three quarters of a turn.
- After installation, run the engine and check that there is no oil leakage from gasket area **A**.
- Check the oil level and if it is low, fill to correct level.

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Replacement of Engine Oil

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

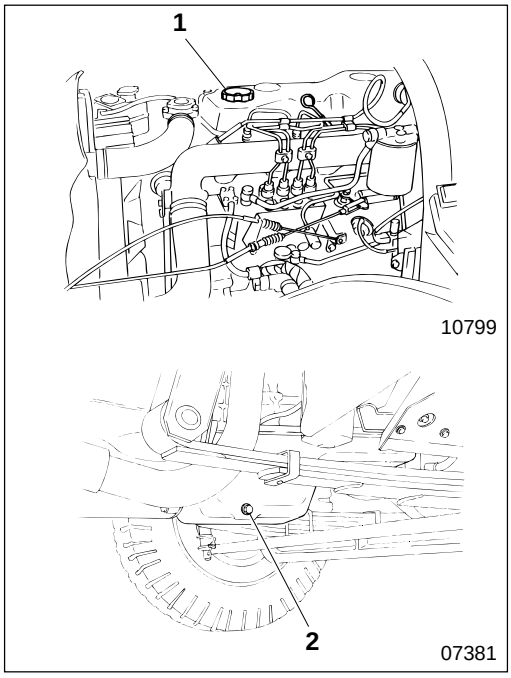
Location	Parts to be tightened	Tightening torque	Remarks
2	Oil pan drain plug	34 to 39 {25 to 29, 3.5 to 4.0}	—

Lubricant

Location	Points of application	Kinds	Quantity
—	Oil pan	Engine oil (Grade CD or above as per API Classification)	Approximately 8 L {8.5 qts}
—	Oil filter	Engine oil (Grade CD or above as per API Classification)	Approximately 1 L {1.1 qts}

WARNING

- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**
- **When replacing oil, take care not to spill oil on the V-belt.**



[Draining]
After warming-up the engine, remove oil filler cap **1** and remove drain plug **2** of the oil pan and drain the engine oil.

[Refilling]
Tighten drain plug **2** of the oil pan at specified torque and fill with the specified quantity of engine oil.

https://truckmanualshub.com/

Measurement of Oil Pressure

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Oil pressure (Oil temperature 70 to 90°C {158 to 194°F})	At no-load minimum revolution	145 kPa {21 lbf/in², 1.5 kgf/cm²}	49 kPa {7.1 lbf/in², 0.5 kgf/cm²}	Inspect
		At no-load maximum revolution	295 to 490 kPa {43 to 71 lbf/in², 3 to 5 kgf/cm²}	195 kPa {28 lbf/in², 2 kgf/cm²}	

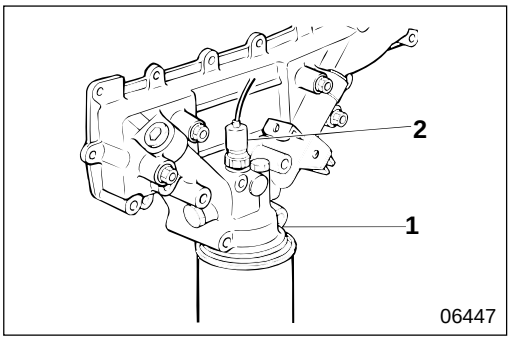
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

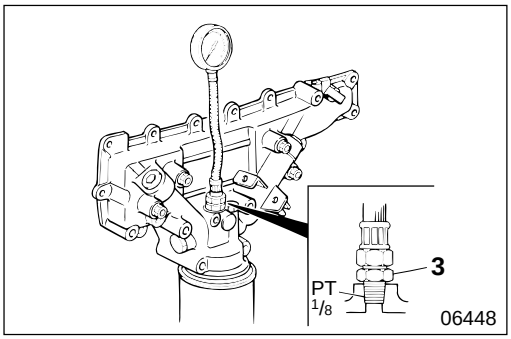
Location	Parts to be tightened	Tightening torque	Remarks
2	Engine oil pressure switch	7.8 to 15 {5.8 to 11, 0.8 to 1.5}	When engine is cold

Sealant

Location	Points of application	Kinds	Quantity
2	Thread area of engine oil pressure switch	Teflon tape	3 1/2 turns



- Remove oil pressure switch **2** from oil cooler **1**.
- Mount the oil pressure gauge after installing adaptor **3** onto oil cooler **1**.
- Warm up the engine until the oil temperature reaches 70 to 90°C {158 to 194°F}.
- Measure oil pressure at no-load minimum revolution and at no-load maximum revolution. If the measured values are lower than the limit, overhaul the lubricating system.



- After measurement, install engine oil pressure switch **2** and tighten at specified torque.

CAUTION

Make sure you install oil pressure switch 2 when the engine is cold.

https://truckmanualshub.com/

◆ Service procedure

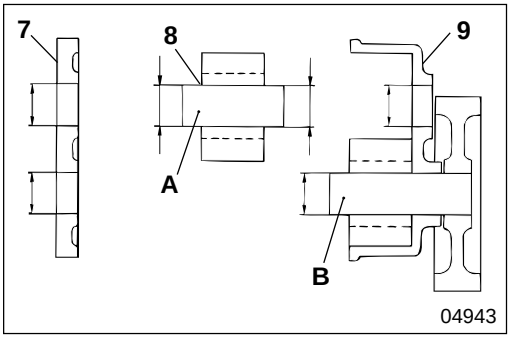
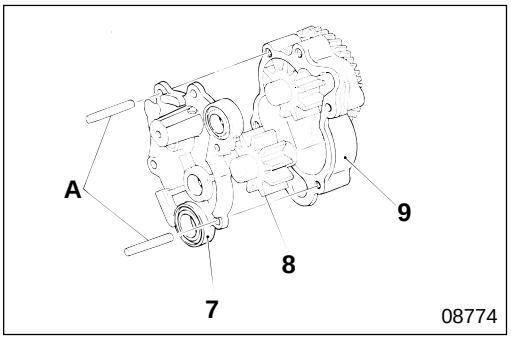
6 **Installation of seat**

A : Oil pump cover side



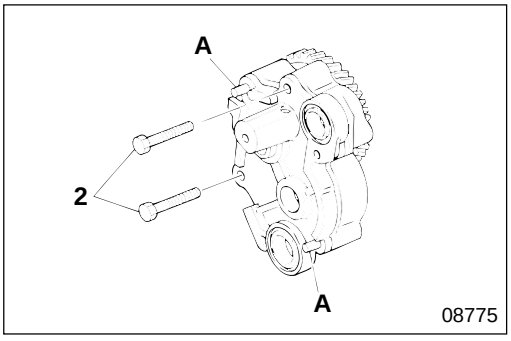
7 **to** **9** **Inspection of oil pump cover, driven gear assembly, and gear and case assembly**

- Measure the clearance between oil pump cover **7** and driven gear shaft **A**, and the clearance between oil pump gear case assembly **9** and the driven gear shaft.
  Measure the clearance between the oil pump cover and drive gear shaft **B**.
- If the measured values are higher than the limit, replace the faulty parts.



7 **9** **Installation of oil pump cover and oil pump case assembly**

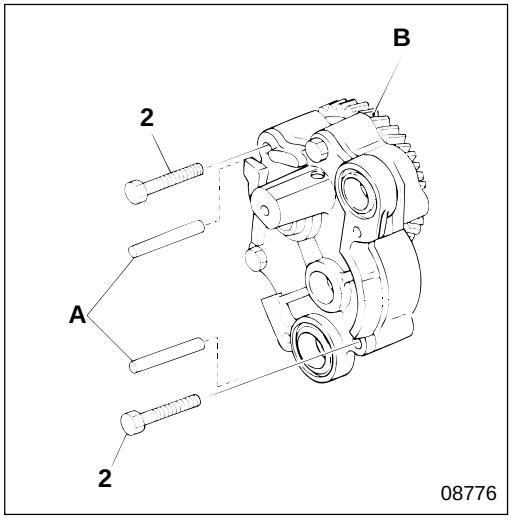
- Prepare two pins **A** of 9 mm {0.35 in.} in outer diameter and position oil pump cover **7** and oil pump case assembly **9** as illustrated.



- Tighten the illustrated bolts **2** at specified torque.

https://truckmanualshub.com/

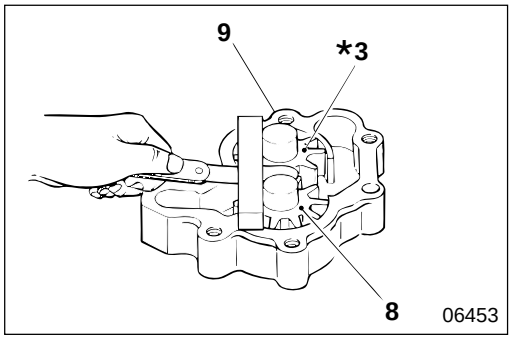
OIL PUMP



- Remove pins **A**, replacing them with bolts **2** and tighten at specified torque.

NOTE

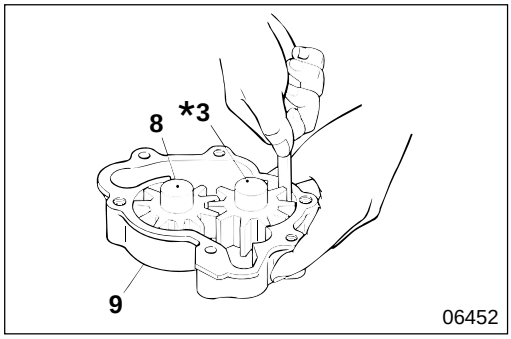
Confirm smooth movement by rotating oil pump gear B by hand. If it catches, disassemble and reassemble it.



8 9 *3 Inspection of driven gear assembly, and oil pump case assembly

(1) Difference between height of each gear and depth of oil pump case

If the measured value is higher than the limit, replace the faulty parts.



(2) Clearance between tooth tip and oil pump case

If the measured value is higher than the limit, replace the faulty parts.

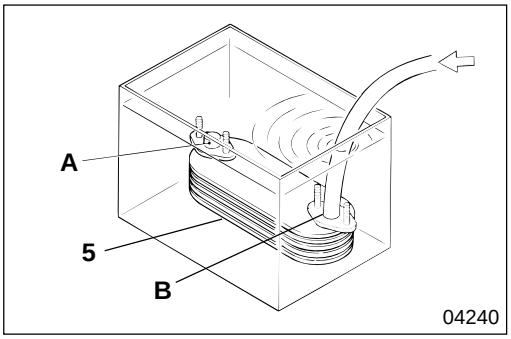
Lubricant and sealant

Location	Points of application	Kinds	Quantity
1	Gasket area of oil filter with thin application P12-13	Engine oil	As required
4	Body of O-ring	Engine oil	As required
6	Thread area of engine oil pressure switch	Teflon tape	3 1/2 turns

◆ Service procedure

● Cleaning

- Check and see if any carbon deposits or sludge have developed in the oil passage of oil cooler element **5** or its bypass. Clean any deposits off thoroughly with cleaning solvent.
- Also clean any water scale or fur found in oil cooler element **5** or oil cooler body **17**.



5 **Inspection of oil cooler element**

- Immerse oil cooler element **5** in a water tank after plugging exit port **A** and connecting the hose to engine oil entry port **B**.
- Apply air pressure of 980 kPa {140 lbf/in^2, 10 kgf/cm^2} via the hose and see if there is any air leakage from any part of oil cooler element **5**.
- If you see any leakage, replace oil cooler element **5**.

SPECIFICATIONS

Injection Pump Assembly

Item		Specification
Manufacturer		DENSO
Model		V4
Type		Distributor type electronically controlled pump
Spill valve solenoid		Electronically controlled
Timer	Control	High-pressure chamber control
	Drive	Timer controlled valve (TCV)
Feed pump type		Vane

Injection Nozzle Assembly

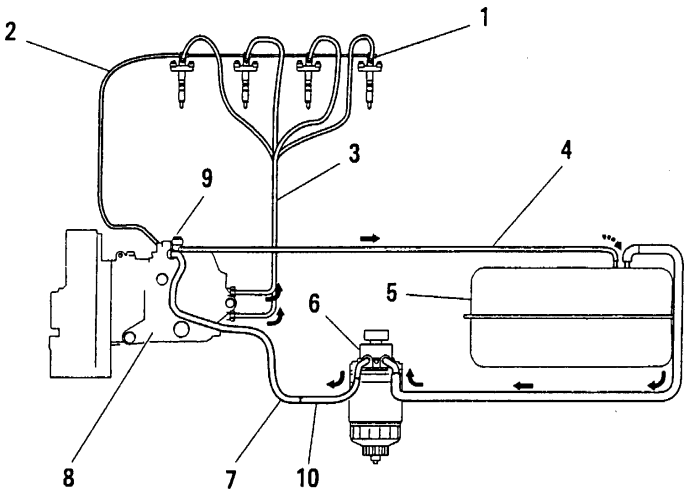
Item	Specification
Manufacturer	DENSO
Type	Hole-type (2-spring)
No. of holes	6
Hole diameter mm {in.}	ϕ 0.20 {0.0079}

Fuel Filter

Item	Specification
Fuel filter type	Spin-on type (paper filter)
Water level alarm	Provided
Priming pump	Provided

https://truckmanualshub.com/

1. Fuel System (Fuel flow)



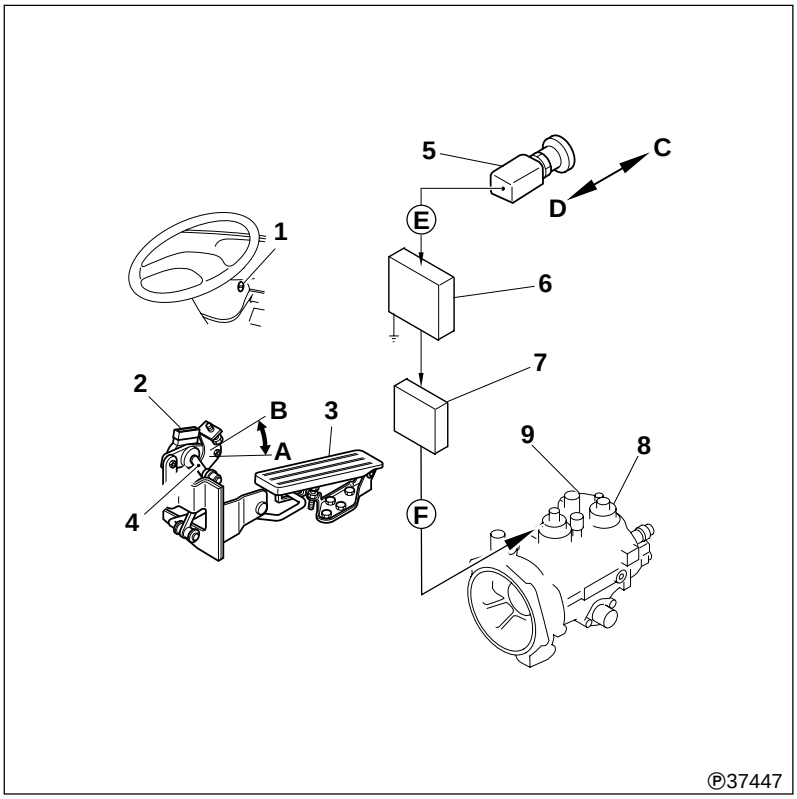
Ⓟ37446

1 Injection nozzle
2 Fuel leak-off pipe
3 Injection pipe
4 Fuel return pipe
5 Fuel tank
6 Fuel filter
7 Fuel suction pipe
8 V4 injection pump
9 Overflow valve
10 Fuel hose

- Fuel from the fuel tank **5** is drawn up by the feed pump, which is driven by the V4 injection pump **8**. Then, the fuel is delivered into the V4 injection pump through the fuel filter **6**.
- After filtration, the fuel is fed to the V4 injection pump **8**. From there, it is fed under high pressure to the injection nozzles **1**. The injection nozzles spray the fuel into the combustion chambers.
- Excess fuel from the injection nozzles **1** returns to the fuel tank **5** by way of the fuel leak-off pipe **2**.
- If the fuel pressure in the V4 injection pump **8** exceeds a preset level, the overflow valve **9** opens to allow excess fuel to return from the fuel return pipe **4** to the fuel tank **5**.

https://truckmanualshub.com/

2. Engine Control



1 Starter switch
2 Accelerator position sensor & accelerator switch assembly
3 Accelerator pedal
4 Lever
5 Emergency engine stop switch
6 V4 ECU
7 EDU
8 Spill valve
9 V4 injection pump assembly

A: Idling position
B: Full-load position
C: Engine stopping position
D: Engine starting position
E: Fuel cut signal
F: Power supply

● **Accelerator position sensor & accelerator switch unit**

The accelerator position sensor & accelerator switch unit **2** consists of an accelerator position sensor and a built-in accelerator switch.

- The accelerator switch responds to the foot pressure acting upon the accelerator pedal **3**.
- The accelerator position sensor detects the movement of the accelerator pedal **3** and outputs an electric signal to the V4 ECU **6**. The lever **4** is constantly pulled by the return spring toward the idling position **A**.

● **Emergency engine stop switch**

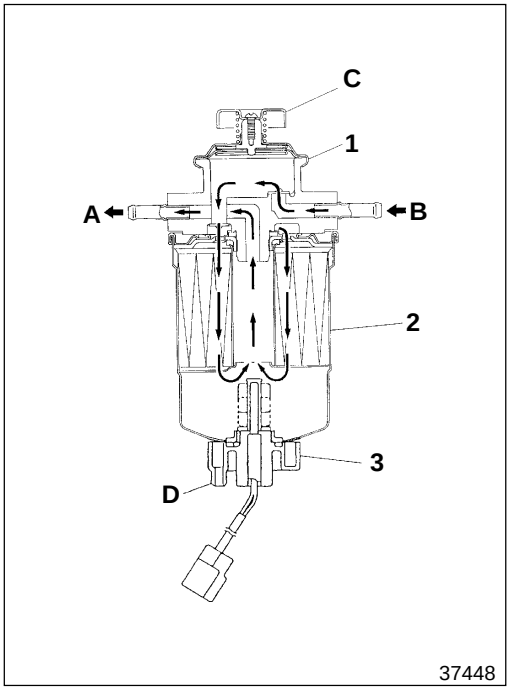
The emergency engine stop switch **5** is used to stop the engine when the starter switch **1** placed in the ACC position fails to do it due to a system failure or for other reason. If the switch is pulled into the engine stopping position **C**, a fuel cut signal **F** is sent to the V4 ECU **6**, which in turn supplies power **F** to the spill valve **8** of the V4 injection pump assembly **9** to stop the engine.

CAUTION ⚠

When restarting the engine stopped by means of the emergency engine stop switch 5, set the starter switch 1 to the ACC or LOCK position beforehand to initialize the computer in the V4 ECU 6.

https://truckmanualshub.com/

3. Fuel Filter



1 Fuel filter head
2 Fuel filter cartridge
3 Water level sensor

A: To injection pump
B: From fuel tank
C: Priming pump
D: Drain port

The fuel filter cartridge **2** serves also as a water separator, it separates water from fuel as well as removes impurities. Separated water is collected in the lower part of the filter. The filter is provided with a water level sensor **3**. When water is collected to a certain level, this sensor turns on the warning lamp in the meter cluster.
Collected water can be drained away through the drain port **D** by loosening the water level sensor **3**. The fuel filter head **1** is equipped with a priming pump **C** for bleeding the fuel system.

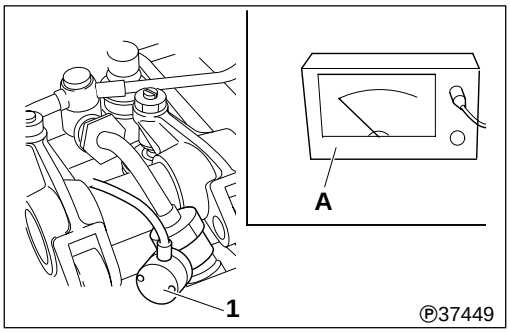
https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Checking Minimum and Maximum No-Load Speeds

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	No-load minimum speed (Idling speed)	650 ± 25 rpm	–	Check
–	No-load maximum speed	3400 ± 50 rpm	–	Check



● **No-load minimum speed**

Prepare the vehicle for inspection as follows.

- Engine coolant temperature: 176 to 203°F {80 to 95°C}
- Lamps and electrical equipment: Off
- A/T: “P” range
- Steering wheel: Neutral position
- Connect a tachometer **A** to the injection nozzle **1** or the injection pipe.

NOTE:

Before connecting the tachometer A to the injection pipe, undo all clamps from the pipe.

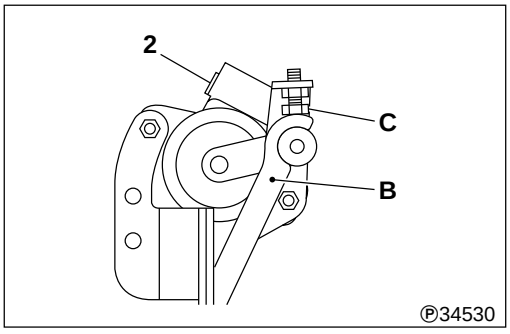
- Check that the minimum speed meets the standard value when the accelerator pedal is free of foot pressure.
- If the reading deviates from the standard value, check the accelerator position sensor & accelerator switch unit **2** for malfunction. Gr 13E
- If the accelerator position sensor & accelerator switch unit **2** is found normal, check the fuel system diagnosis code, injection pump and ECU. Gr 13E

● **No-load maximum speed**

- Connect a tachometer **A** to the injection nozzle **1** or the injection pipe.

NOTE:

Before connecting the tachometer A to the injection pipe, undo all clamps from the pipe.



- Check that the maximum speed meets the standard value when the lever **B** of the accelerator position sensor & accelerator switch unit **2** is in contact with the full load stopper bolt **C**.
- If the reading deviates from the standard value, check the accelerator position sensor & accelerator switch unit **2** for malfunction. Gr 13E
- If the accelerator position sensor & accelerator switch unit **2** is found normal, check the fuel system diagnosis code, injection pump and ECU. Gr 13E

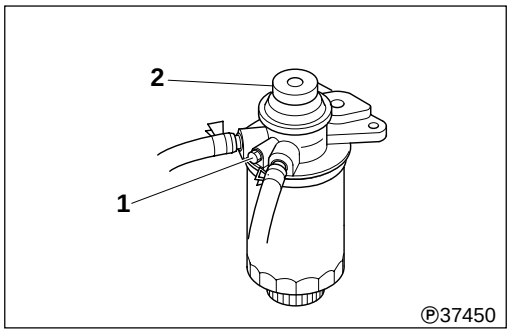
https://truckmanualshub.com/

2. Bleeding Air from Fuel System

Tightening torque

Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Air vent plug	6 ± 1 {4.3 ± 0.7, 0.6 ± 0.1}	–



- Loosen the fuel filter air vent plug **1**.
- Operate the priming pump **2** to pump up fuel.
- Continue to pump fuel until no air bubbles are found in the fuel flowing out from the air vent plug **1**.
- After ascertaining that air bubbles have completely disappeared, tighten the air vent plug **1** securely.
- Operate the priming pump **2** further until it feels heavy.
- Wipe up all spilled fuel, then start the engine.
- Check that no fuel leakage occurs.

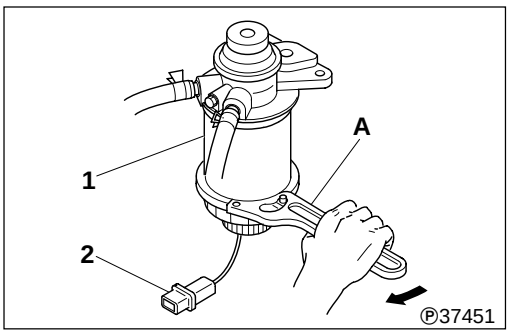
WARNING ⚠

- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **Be sure to wipe up all spilled fuel. Unless it is wiped up, it could catch fire.**

3. Replacing Fuel Filter

Lubricant

Location	Point of application	Specified lubricant	Quantity
1	Gasket for fuel filter cartridge	Engine oil	As required



[Removal]

A: Filter Wrench
(Commercially available one: For filter diameter of approx. 90 mm {3.54 in.})

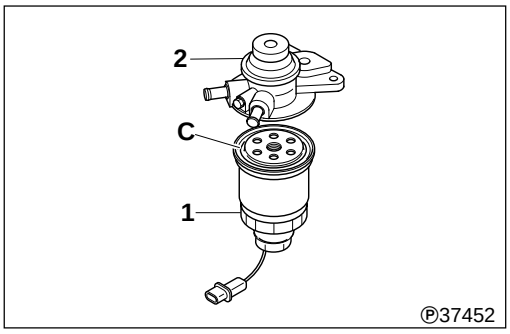
WARNING ⚠

- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **To minimize the risk of fire, wipe up any spilled fuel.**

CAUTION ⚠

- **The water level sensor 2 may be reused if it properly functions.**

https://truckmanualshub.com/



[Installation]

WARNING ⚠

Use of an unsuitable fuel filter cartridge 1 can lead to fuel leaks and fires. Be sure to use a genuine filter.

CAUTION ⚠

To prevent injection failures, keep dust and dirt out of the fuel filter cartridge 1 and the fuel pipe.

- To fit the fuel filter cartridge **1**, turn it until the gasket **C** touches seal surface of the fuel filter head **2**. Be sure to turn the filter by hand clockwise.
  Then, tighten the filter by 3/4 turn.
- Bleed all air out of the fuel system. 🕮 P. 13A-7
- After fitting the filter, start the engine and check that no fuel leakage occurs.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

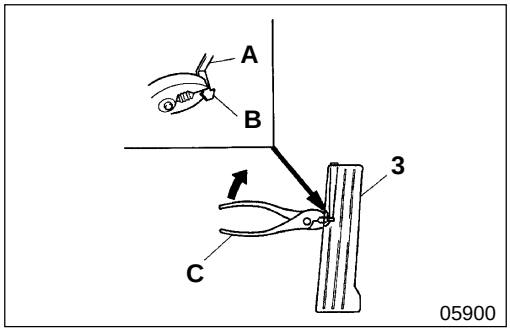
https://truckmanualshub.com/

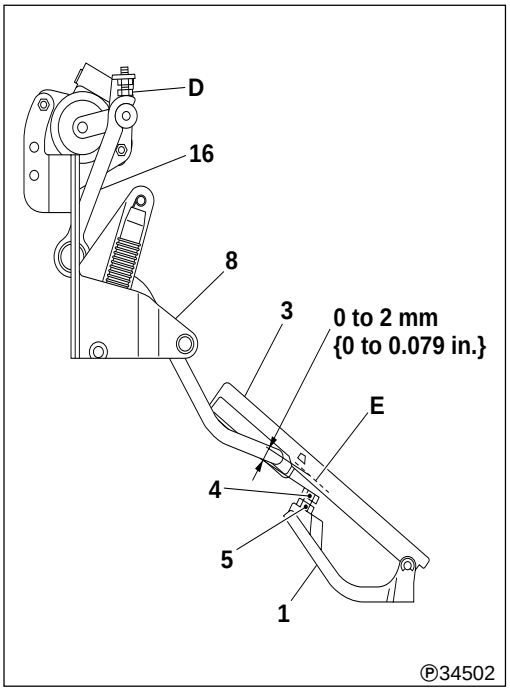
Service standards

Location	Maintenance item			Standard value	Limit	Remedy
17	Accelerator position sensor & accelerator switch output voltage 5 4 3 2 1 Ⓟ37519 (Backside of harness connector)	Sensor I ② - ⑤ Sensor II ② - ①	Idling position	0.85 ± 0.1 V	–	Replace
			Full-load position	4.15 ± 0.1 V	–	Replace
			Accelerator switch actuated position (no continuity between terminals ③ - ②)	1.0 ± 0.24 V	–	Replace

Lubricant

Location	Point of application	Specified lubricant	Quantity
3	Sliding contact surface between accelerator pedal and bracket	Mitsubishi chassis grease	As required





◆ Service procedure

1 Accelerator pedal assembly

[Removal]

Extract the stopper **A** from the accelerator pedal **3**.

To do so, pinch the hook **B** of the stopper with a pair of pliers **C** and pull it lightly toward the front of the vehicle while twisting the hook approximately 45 degrees.

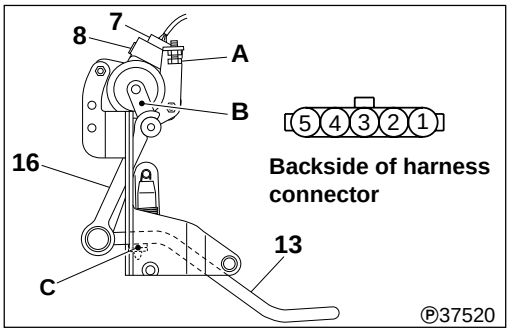
CAUTION ⚠

Do not pull the stopper A by force. It could be damaged.

[Installation]

- Fit the accelerator pedal assembly **1** to the accelerator position sensor & accelerator switch assembly **8**.
- Depress the accelerator pedal **3** until the accelerator control extension **16** touches the stopper bolt **D** of the accelerator position sensor & accelerator switch assembly **8**.
- Check that the clearance between the stopper bolt **4** and the stopper bolt contacting surface **E** of the accelerator pedal **3** is within the tolerance shown in the illustration.
- If not, adjust the stopper bolt **4** to achieve the specified clearance. Secure the bolt with the nut **5**.

https://truckmanualshub.com/



8 **Accelerator position sensor & accelerator switch assembly**

[Inspection]

- Fit the harness connector **7** to the accelerator position sensor & accelerator switch assembly **8**.
- Turn on the starter switch.
- Check the output voltage level of the accelerator position sensor & accelerator switch assembly **8** at the backside of the harness connector **7** in accordance with the table below.

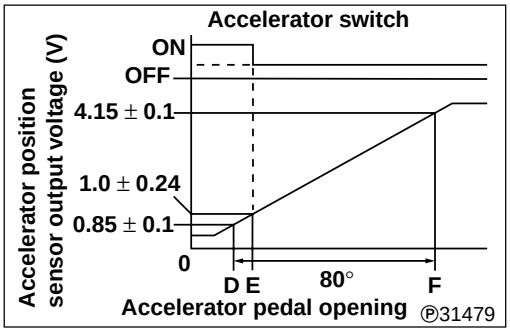
Connector terminal / Control lever **B** position	Harness connector **7**					
	Accelerator position sensor I		Accelerator position sensor II		Accelerator switch	
	②	⑤	②	①	③	②
Idling position **D**	⊖ — ⊕		⊖ — ⊕		○ — ○	
Accelerator switch actuated position **E**	⊖ — ⊕		⊖ — ⊕		○	○
Full-load position **F**	⊖ — ⊕		⊖ — ⊕		○	○

○——○ Continuity established between terminals

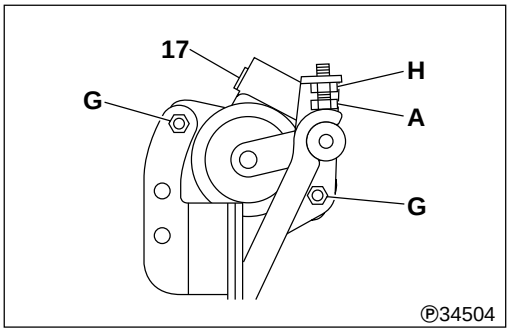
D: Accelerator control arm **13** in contact with stopper **C**

E: Continuity lost between terminals ③ and ② as accelerator pedal is depressed

F: Accelerator control extension **16** in contact with stopper bolt **A**

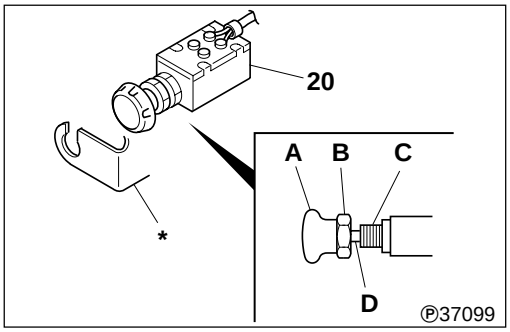


- If the sensor output voltage deviates from the specified value, rectify the deviation as follows.



[Adjustment]

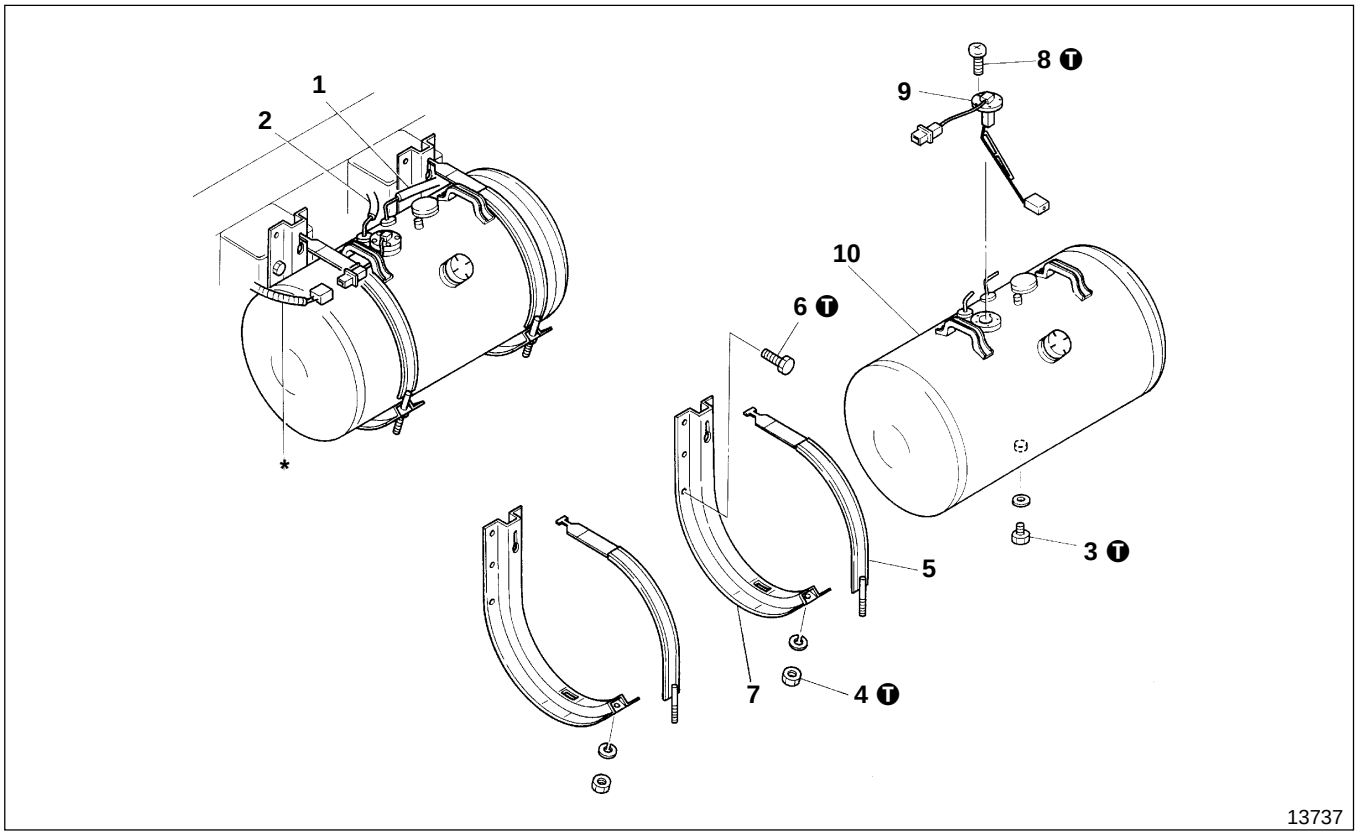
- Output voltage in idling position **D**:
  Loosen the screw **G** move the accelerator position sensor & accelerator switch unit **17** as required and retighten the screw.
- Output voltage with lever **B** in full-load position **F**:
  Loosen the nut **H**, turn the stopper bolt **A** as required and retighten the nut.



20 **Installation of emergency engine stop switch**

- Pull the knob **A** of the emergency engine stop switch **20** into the OFF position. Loosen the nut **B** to remove from the threaded end **C** of the switch.
- Set the shaft **D** in the bracket *****.
- Position the shaft **D** properly in the hole of the bracket ***** and tighten the nut **B**.

https://truckmanualshub.com/



● **Work before removal**

WARNING ⚠

- **Keep unprotected lights away because of the risk of explosion.**
- **Wipe up any spilled fuel because it can cause a fire.**

NOTE:

Drain fuel before working on the job.

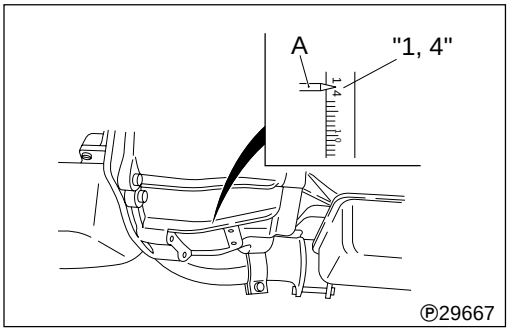
22	Bolt (sensor plate mounting)	4.9 {3.6, 0.5}	–

Lubricant

Location	Points of application	Specified lubricant	Quantity
21	O-ring	Engine oil	As required



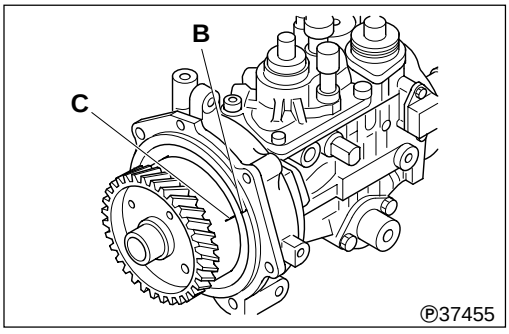
◆ Service procedure

24 **Installation of injection pump assembly**

- Crank the engine clockwise to bring the cylinder No. 1 piston to the top dead center of compression stroke; align the pointer **A** in the torque converter housing inspection opening with the inscribed mark between "**1**" and "**4**" on the flywheel.
- Check that the rocker arms of both inlet and exhaust valves of the cylinder No. 1 move.
- If the rocker arms still hold the valves down, give the engine another turn.

NOTE:

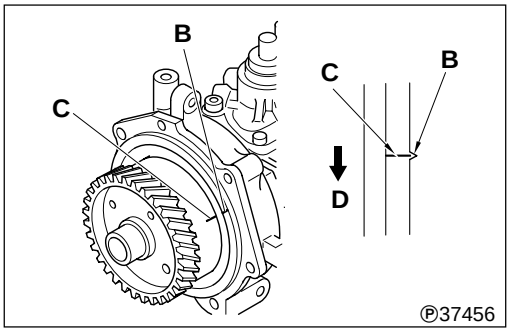
There are two kinds of marks inscribed in the flywheel, "I" and "IV" and "1" and "4". Do not confuse.



- Align the notch **B** in the flange plate with the inscribed mark **C** on the injection pump gear.

https://truckmanualshub.com/

INJECTION PUMP



- Ascertaining the alignment between notch **B** and inscribed mark **C**, push in the injection pump assembly to install in position. At this time, the inscribed mark moves in the direction **D**.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

https://truckmanualshub.com/

CAUTION ⚠

- **Take care not to touch the sliding part of the needle valve 14. It could be scratched or corroded in the worst case, resulting in the loss of airtightness between the valve and the nozzle 15.**
- **Under no circumstances change the needle valve 14 and nozzle 15 combination between cylinders.**
- **Dirt particles can seriously detract from engine performance. To prevent ingress of dirt, cover parts to which the injection nozzle assemblies 8 were fitted after removal.**

NOTE:

Clean off any carbon deposits before disassembling, reassembling or adjusting the injection nozzle assembly 8. Before disassembly, check the pressure and shape of the spray and inspect the assembly for fuel leads. If no abnormality is apparent, do not commence disassembly.

INJECTION NOZZLE

◆ Service procedure

● Inspection before disassembly

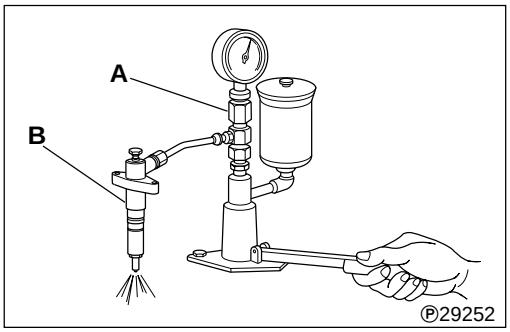
Fit the injection nozzle assembly **8** onto the nozzle tester **A** ready for inspection.

WARNING ⚠

Do not touch the spray that comes out of the nozzle.

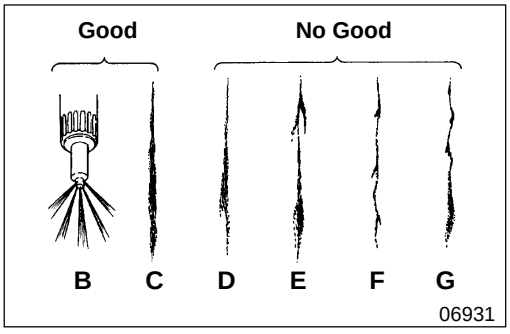
NOTE:

Before commencing inspection, operate the lever on the nozzle tester A two or three times to bleed all air out of the arrangement.



(1) Checking valve opening pressure

- Push down the lever on the nozzle tester **A** at a rate of 1 to 2 seconds per stroke. The pressure gauge reading will gradually rise, then the needle will suddenly deflect. Note the pressure when the needle starts to deflect.
- If the measurement is out of specification, disassemble the nozzle, clean it and make adjustments by changing the shims **17**, **21**.
- If the measurement is still out of specification after adjustment, replace the injection nozzle assembly **8**.

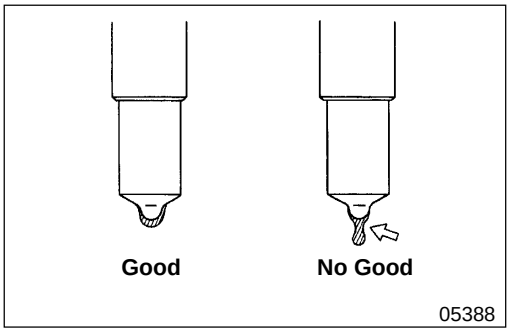


(2) Inspecting spray condition

- Pump the lever on the nozzle tester **A** at a rate of about 1 to 2 strokes per second and maintain a continuous spray.

  B: Even spray from all five injection orifices (Good)
  C: Even and symmetrical spray (Good)
  D: Asymmetrical spray (No Good)
  E: Branched spray (No Good)
  F: Thin spray (No Good)
  G: Irregular spray (No Good)

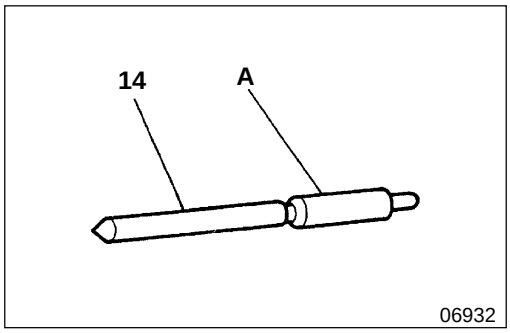
- If the spray is unsatisfactory, disassemble and clean the injection nozzle assembly **8**, then inspect the spray again. If the spray is still unsatisfactory, replace the injection nozzle assembly.
- Check that no fuel drips from the nozzle after the spray is complete.



(3) Inspecting for oil-tightness and leaks

- Slowly increase the nozzle pressure to the pressure below the specified 1st valve opening pressure by 1.96 MPa {285 lbf/in^2, 20 kgf/cm^2}. Maintain this pressure for 10 seconds and check that no fuel drips from the end of the nozzle.
- If the injection nozzle assembly **8** appears defective, disassemble and clean it, then inspect it again. If the injection nozzle assembly still appears defective, it must be replaced.

https://truckmanualshub.com/

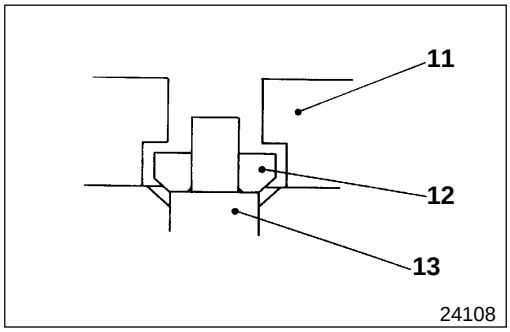


8 **Injection nozzle assembly**

[Disassembly]

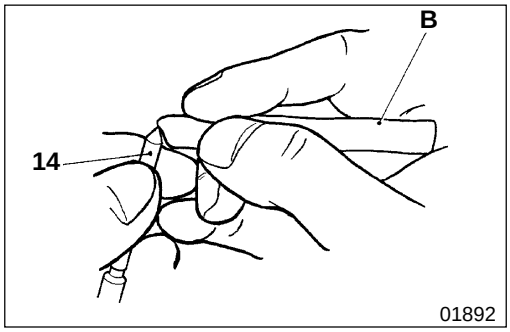
CAUTION ⚠

- **Never touch the sliding part A of the needle valve 14.**
- **Never change the needle valve 14 and nozzle 15 combination on each cylinder.**



[Assembly]

Assemble the tip packing **11** and the washer **12** (for adjustment of needle valve lift) in the illustrated directions.



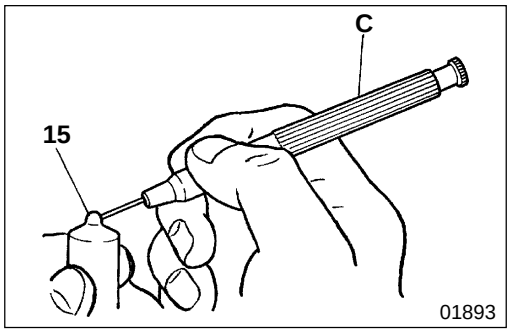
[Cleaning]

Wash the needle valve **14** and nozzle **15** in diesel fuel, then use the 🔧 Cleaning Tool to remove any carbon deposits in accordance with the following procedure.

- Remove carbon from the end of the needle valve **14** using the Cleaning Bar **B** of the 🔧 Cleaning Tool.

CAUTION ⚠

Do not use a wire brush or any hard metallic object for cleaning.

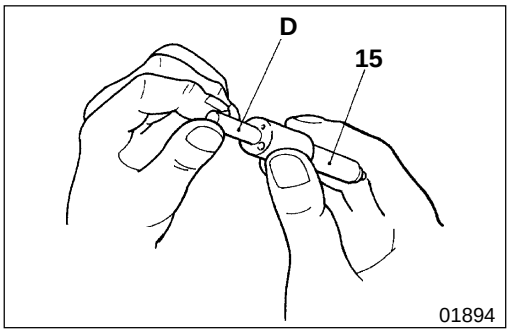


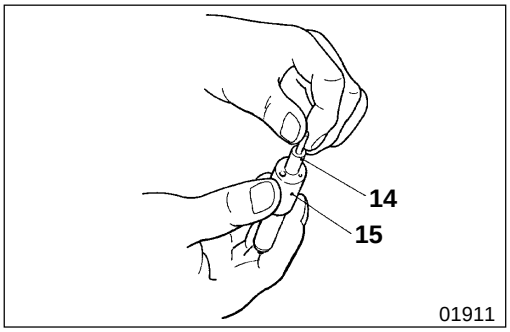
- Remove carbon from the injection orifice of the nozzle **15** using the Cleaning Needle **C** of the 🔧 Cleaning Tool. Insert the Cleaning Needle and rotate it to remove carbon.

  Cleaning needle diameter: 0.20 mm {0.0079 in.} or smaller

https://truckmanualshub.com/

INJECTION NOZZLE





- Clean the seat of the nozzle **15** using the Cleaning Scraper **D** of the Cleaning Tool.
- To remove burned and hardened carbon, use FUSO Carbon Remover.

[Inspection]

- Wash the needle valve **14** and nozzle **15** in diesel fuel, then fit them together.
- Pull up the needle valve **14** by approximately 1/3 of its entire stroke, then check that it drops under its own weight. Repeat this test several times, turning the needle valve each time.
- If the needle valve **14** does not drop as required, wash it in diesel fuel and carry out this test again. If the needle valve is still defective, replace the needle valve and nozzle **15** as a set.

[Adjustment]

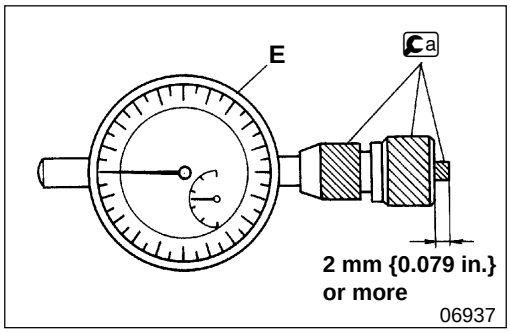
During reassembly, make adjustments in the sequence shown below.

CAUTION ⚠

- **Before making adjustments, wash all parts in diesel fuel and ensure that they are free of dirt and other foreign material.**
- **Do not touch the sliding surfaces of the needle valve 14.**

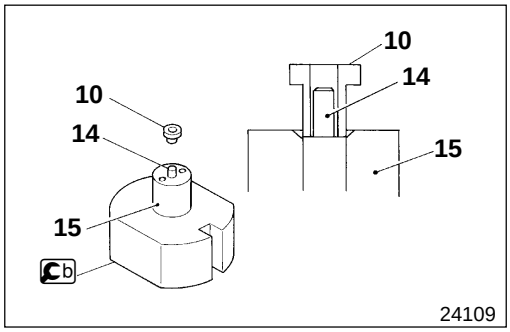
- Check needle valve full lift
- Check prelift
- Adjust 2nd valve opening pressure
- Adjust 1st valve opening pressure

https://truckmanualshub.com/

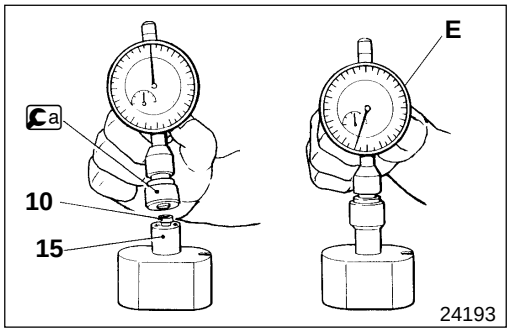


● **Checking needle valve full lift**

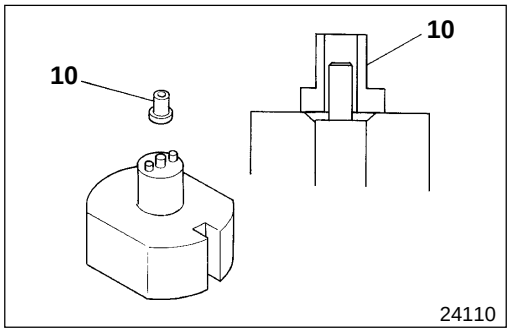
- Set the a Attachment Measure to a dial gauge **E**.



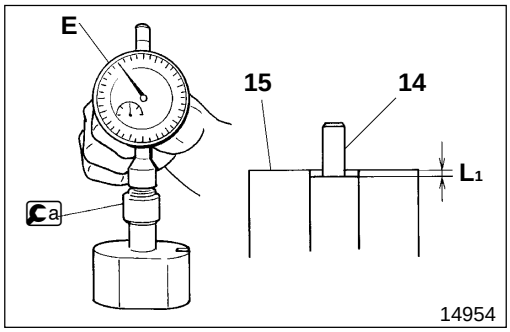
- Mount the nozzle **15** on the b base, with the needle valve **14** and spring seat **10** (for adjustment of pre-lift) fitted to the nozzle in that order.



- Fit the a Attachment Measure onto the nozzle **15**.
- Zero the dial gauge **E**.



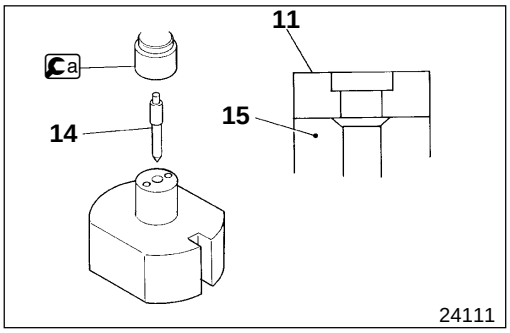
- Remove the a Attachment Measure. Remove the spring seat **10** (for adjustment of pre-lift) and refit it to the nozzle upside down.



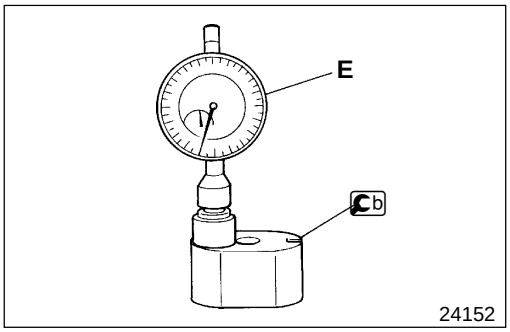
- Fit the a Attachment onto the nozzle **15** again, and read the dial gauge **E**. The reading should be the illustrated dimension **L_1.**

https://truckmanualshub.com/

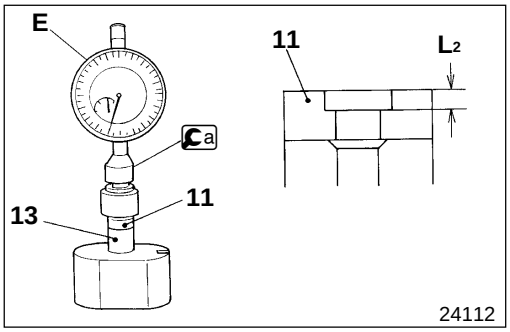
INJECTION NOZZLE



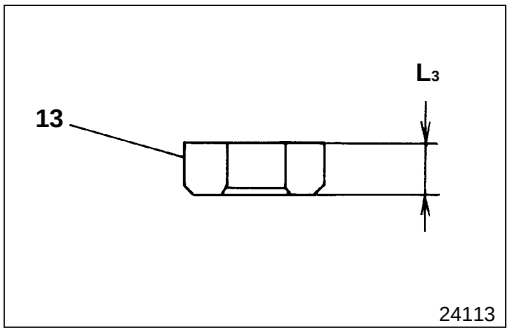
- Remove the a Attachment Measure and the needle valve **14**. Fit the tip packing **11** to the nozzle **15** as shown.



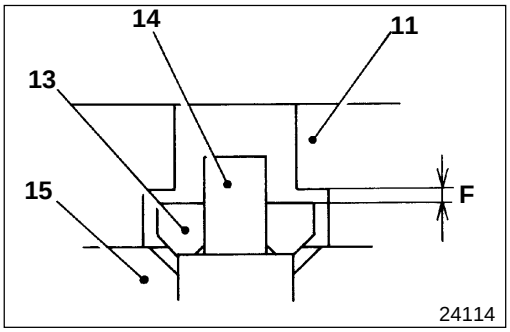
- Zero the dial gauge **E** on the b base.



- Fit the a Attachment Measure to the tip packing **11**, and read the dial gauge **E**.
  The reading should be the illustrated dimension **L2**.

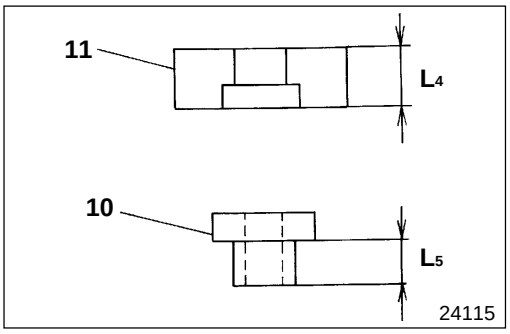


- Measure the thickness **L3** of the washer **13** (for adjustment of needle valve lift).



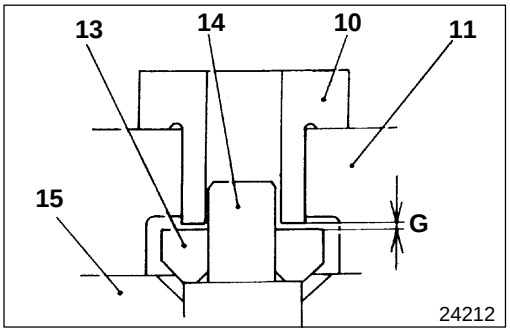
- Calculate the maximum lift **F** of the needle valve **14** from the measurements **L1**, **L2** and **L3** as follows.
  Maximum lift **F** = **L1** + **L2** - **L3**
- If the calculated value is out of specification, make the necessary adjustment by changing the washer **13** (for adjustment of needle valve lift).
  Washers **13** are available in the following thicknesses (**L3**):
  2.40, 2.425, 2.45, 2.475, 2.50 mm {0.094, 0.095, 0.096, 0.097, 0.098 in.} (5 sizes)

https://truckmanualshub.com/

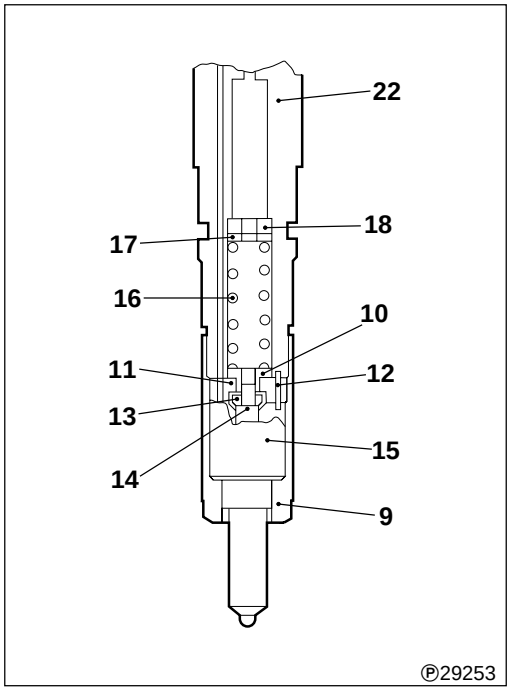


● **Adjusting pre-lift**

- Measure the thickness **L4** of the tip packing **11**.
- Measure the thickness **L5** of the spring seat **10 (**for adjustment of pre-lift).



- Calculate the pre-lift **G** from the measurements **L1**, **L3**, **L4** and **L5** as follows.
  Pre-lift **G** = **L4** - **L5** - **L3** + **L1**
- If the calculated value is out of specification, make the necessary adjustment by changing the spring seat **10** (for adjustment of pre-lift).
  Spring seats 10 are available in the following thicknesses (L_5):
  2.59 to 2.80 mm {0.101 to 0.110 in.} (22 sizes at steps of 0.01 mm {0.00039 in.})



● **Adjusting 2nd valve opening pressure**

- Assemble parts to the nozzle holder **22** as shown. Fit the Ⓒ Master Spring Seat in the place of the spring seat **10** (for adjustment of pre-lift).
- Tighten the retaining nut **9** to the specified torque.
- Fit the nozzle assembly onto the nozzle tester and measure the 2nd valve opening pressure.

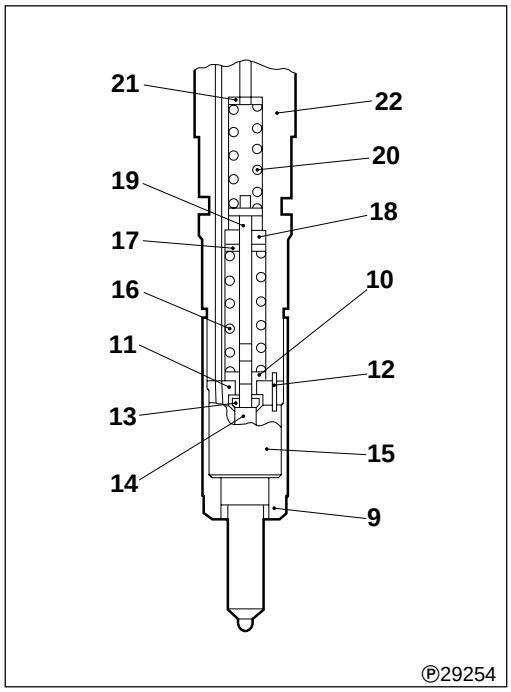
CAUTION ⚠

Never touch the spray that comes out of the nozzle.

- If the reading is out of specification, make the necessary adjustment by changing the adjusting shim **17** (for adjustment of 2nd valve opening pressure). Adjusting shims **17** are available in the following thicknesses.
  0.70 to 2.15 mm {0.028 to 0.085 in.} (30 sizes at steps of 0.05 mm {0.002 in.})
  0.975 to 1.775 mm {0.038 to 0.070 in.} (17 sizes at steps of 0.05 mm {0.002 in.})
- A difference of 0.025 mm {0.00098 in.} in the thickness of the adjustment shim **17** changes the 2nd valve opening pressure by 345 kPa {50 psi^2, 3.5 kgf/cm^2}.

https://truckmanualshub.com/

INJECTION NOZZLE



● **Adjusting 1st valve opening pressure**

- Assemble parts to the nozzle holder **22** as shown.
- Tighten the retaining nut **9** to the specified torque.
- Fit the nozzle assembly onto the nozzle tester and measure the 1st valve opening pressure.

CAUTION ⚠

Never touch the spray that comes out of the nozzle.

- If the reading is out of specification, make the necessary adjustment by changing the adjusting shim **21** (for adjustment of 1st valve opening pressure).

  Adjusting shims **21** are available in the following thicknesses:
  0.8 to 2.0, 2.05, 2.075 to 2.2 mm {0.031 to 0.079, 0.080, 0.081 to 0.087 in.} (56 sizes at steps of 0.025 mm {0.00098 in.})
  A difference of 0.025 mm {0.00098 in. } in the thickness of the adjusting shim **21** changes the 1st valve opening pressure by 345 kPa {20 psi^2, 3.5 kgf/cm^2}.

SPECIFICATIONS

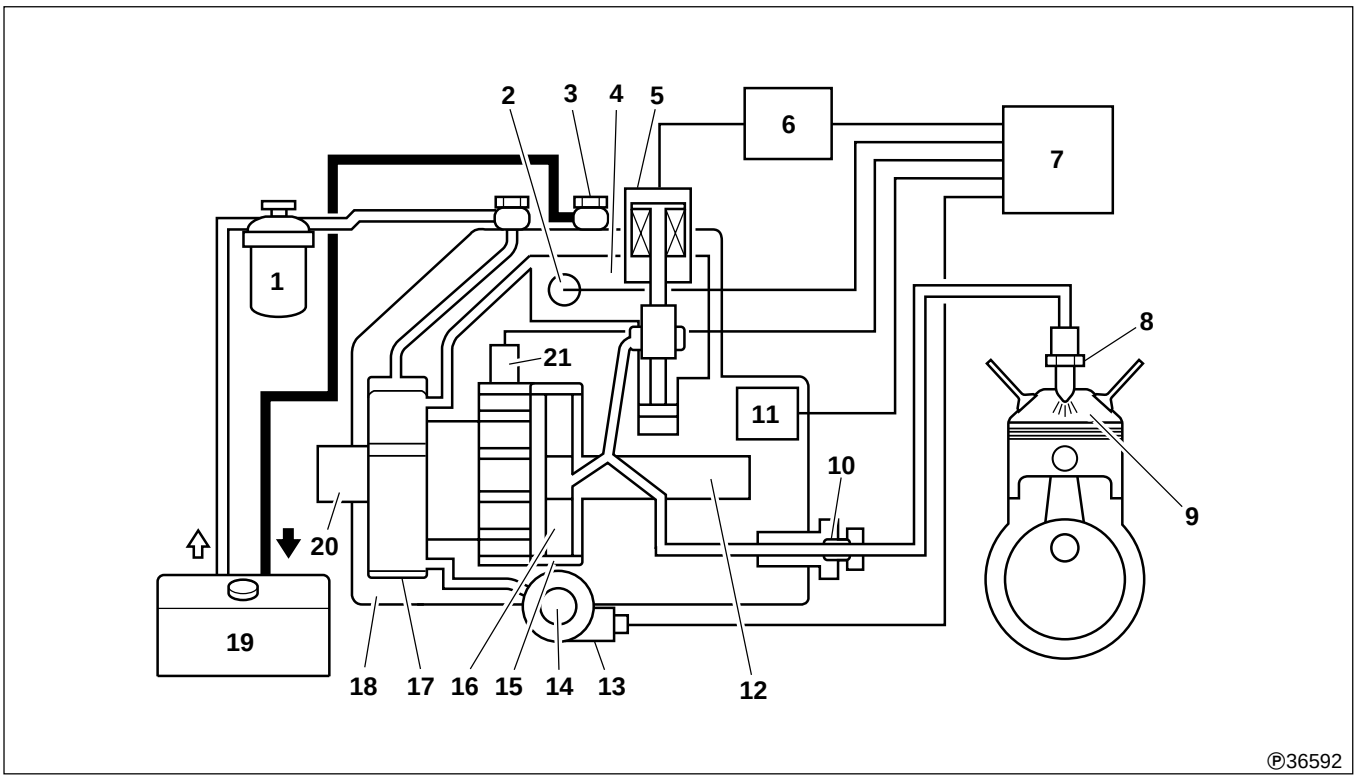
Item			Specification
Injection pump assembly	Manufacturer		DENSO
	Model		V4
	Type		Distribution type electronically controlled pump
	Spill valve (Solenoid valve)		Electronically controlled type
	Timer	Control scheme	High pressure chamber control
		Drive method	Timer control valve (TCV)
	Overflow valve	Valve opening pressure kPa (psi^2, kgf/cm^2)	343 {49.8, 3.5}
	Feed pump	Type	Vane type
		Theoretical delivery rate cc {cu.in.}	6.4 {0.39} (per rotation)
	Fuel temperature sensor		Provided
	Engine speed sensor		Provided
Engine control unit	Manufacturer		DENSO
	Rated voltage V		12
Drive unit	Manufacturer		DENSO
	Rated voltage V		12

https://truckmanualshub.com/

1. GENERAL

The V4 system adopts a distribution type injection pump, which features small size and light weight and yet high speed, as well as an electronic control unit which controls the fuel injection rate, fuel injection timing, etc., thereby operating the engine in an optimum condition.

Theory of Operation



1 Fuel filter
2 Fuel temperature sensor
3 Overflow valve
4 Pump chamber
5 Spill valve
6 Drive unit
7 Engine control unit
8 Injection nozzle
9 Fuel chamber
10 Delivery valve
11 Injection rate adjusting read-only memory
12 Rotor
13 Timer control valve
14 Timer piston
15 Inner cam
16 Plunger
17 Feed pump
18 Injection pump proper
19 Fuel tank
20 Drive shaft
21 Engine speed sensor

https://truckmanualshub.com/

- The feed pump **17** in the injection pump proper **18** pumps up the fuel from the fuel tank **19**, keeping the inside of the injection pump full of the fuel at all times.
- The rotor **12** rotates in the inner cam **15**.
- The drive unit **6** converts the spill valve **5** drive signal delivered from the engine control unit **7** into a high voltage signal to enhance the responsiveness of the spill valve **5**.
- The fuel injection rate is increased or reduced by adjusting the opening time of the spill valve **5**.
- When the spill valve **5** is opened, the inside of the rotor **12** is filled with the fuel.
- After it has been filled, the spill valve **5** closes to confine the fuel in the rotor **12**. In this condition, as the drive shaft **20** rotates, the fuel is pressurized by the inner cam **15** and plunger **16** and fed through the delivery valve **16** to the injection nozzle **8** from which it is injected.
- Then the spill valve **5** opens, and a resultant decline in the fuel pressure in the rotor **12** causes the delivery valve **10** to close, thereby bringing the fuel injection to an end.
- The overflow valve **3** returns the fuel to the fuel tank **19** when the fuel pressure in the injection pump exceeds a predetermined value.
- The fuel injection timing is controlled by the timer control valve **13** which controls the fuel pressure acting on the timer piston **14**.
- The timer control valve **13** is activated by commands from the engine control unit **7**.

https://truckmanualshub.com/

2. ELECTRONIC CONTROL SYSTEM

2.1 System Block Diagram

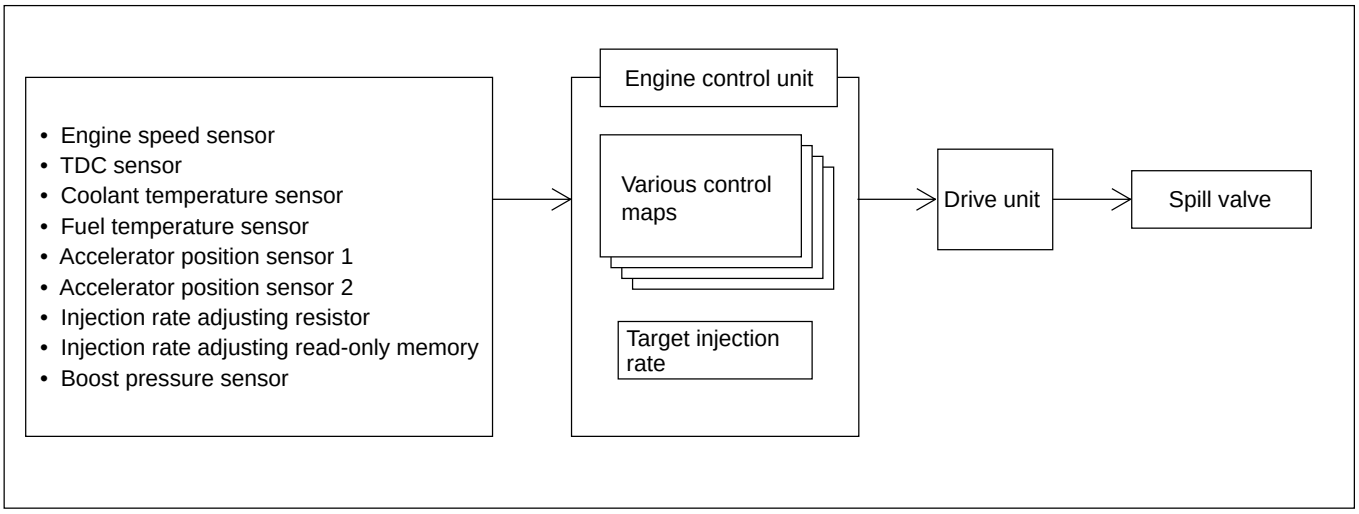
	Information Signal	Part Names	Major Function or Operation
1	Engine speed signal	Engine speed sensor	Detection of engine speed
2	Fuel temperature signal	Fuel temperature sensor	Detection of fuel temperature
3	Coolant temperature signal	Coolant temperature sensor	Detection of coolant temperature
4	Crank angle signal	TDC sensor	Detection of crank angle signal
5	Boost pressure signal	Boost pressure sensor	Detection of boost pressure
6	Boost air temperature signal	Boost air temperature sensor	Detection of boost air temperature
7	Engine start signal	Starter switch	Recognition of engine start when starter switch is placed at START position
8	Accelerator depressed signal	Accelerator position sensor	Detection of amount that accelerator pedal has been depressed
		Accelerator switch	Detection of released/depressed accelerator pedal
9	Warmup accelerating signal	Idle control variable resistor	Acceleration of warmup
		Cold start switch	
10	Fuel injection amount adjustment signal	Injection amount adjusting ROM	Adjustment of fuel injection amount
11	Auxiliary brake signal	Exhaust brake switch	Control of auxiliary brake
		Exhaust brake cut relay	
12	Vehicle speed signal	Vehicle speed sensor	Detection of vehicle speed

https://truckmanualshub.com/

	Information Signal	Part Names	Major Function or Operation
13	Diagnostic signal	Diagnosis switch	Transmission of diagnosis signal
		Memory clear switch	Erasure of diagnostec trouble code Transmission of past diagnostic trouble code
14	Engine emergency stop signal	Emergency engine stop switch	Emergency shutdown of engine
15	–	Drive unit	Assurance of high voltage for high speed drive of spill valve
16	–	Spill valve	Control of fuel injection amount and injection rate
17	Timer control valve operation signal	Timer control valve	Operation of timer piston
18	–	Intake shutter 3-way magnet valve	Operation of intake shutter 3-way magnet valve

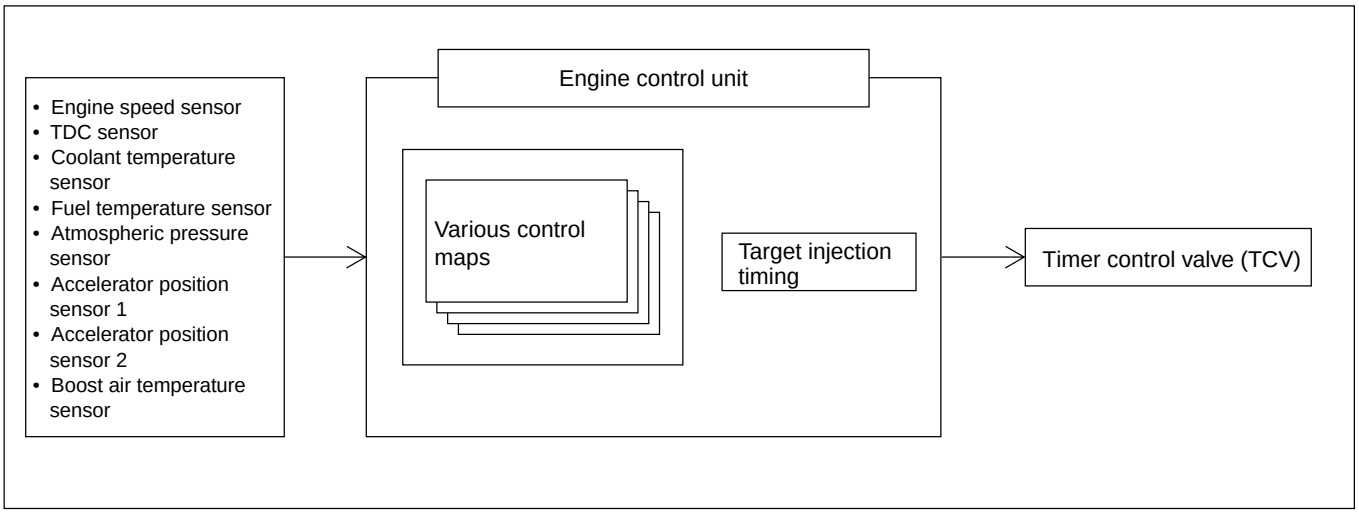
https://truckmanualshub.com/

2.2 Fuel Injection Rate Control



- During operation of the engine, the engine control unit (ECU) processes the individual information signals according to the control maps to select an appropriate injection mode from among the “basic”, “maximum” and “minimum”.
- After selection of the injection mode, the ECU calculates the minimum value to ensure that the maximum injection rate is not exceeded and determines the target injection rate.
- Once the target injection rate has been determined, the engine control unit outputs a signal to drive the spill valve.
- The signal to drive the spill valve is passed through the drive unit so that its responsiveness for high speed driving will be enhanced.
- The drive unit immediately converts the signal voltage delivered from the engine control unit to a high voltage.

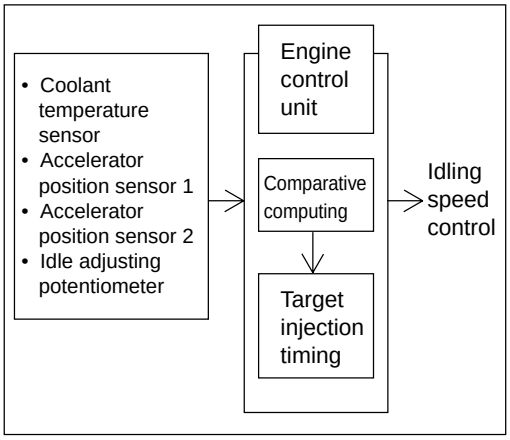
2.3 Fuel Injection Timing Control



- During operation of the engine, the engine control unit (ECU) processes the individual information signals according to the control maps to calculate the target injection timing, and drives the timer control valve (TCV) in such a way that the real timing computed on the basis of the engine speed sensor and TDC sensor will match the target timing.
- Controls at the time of an engine start are achieved by the start compensation map contained in each control map.

https://truckmanualshub.com/

2.4 Warmup Accelerating Function



The warmup accelerating function varies the idling speed according to the engine coolant temperature to accelerate warmup. The function includes the automatic and manual modes. Either of the modes can be selected by pushing/pulling the idle adjusting potentiometer.

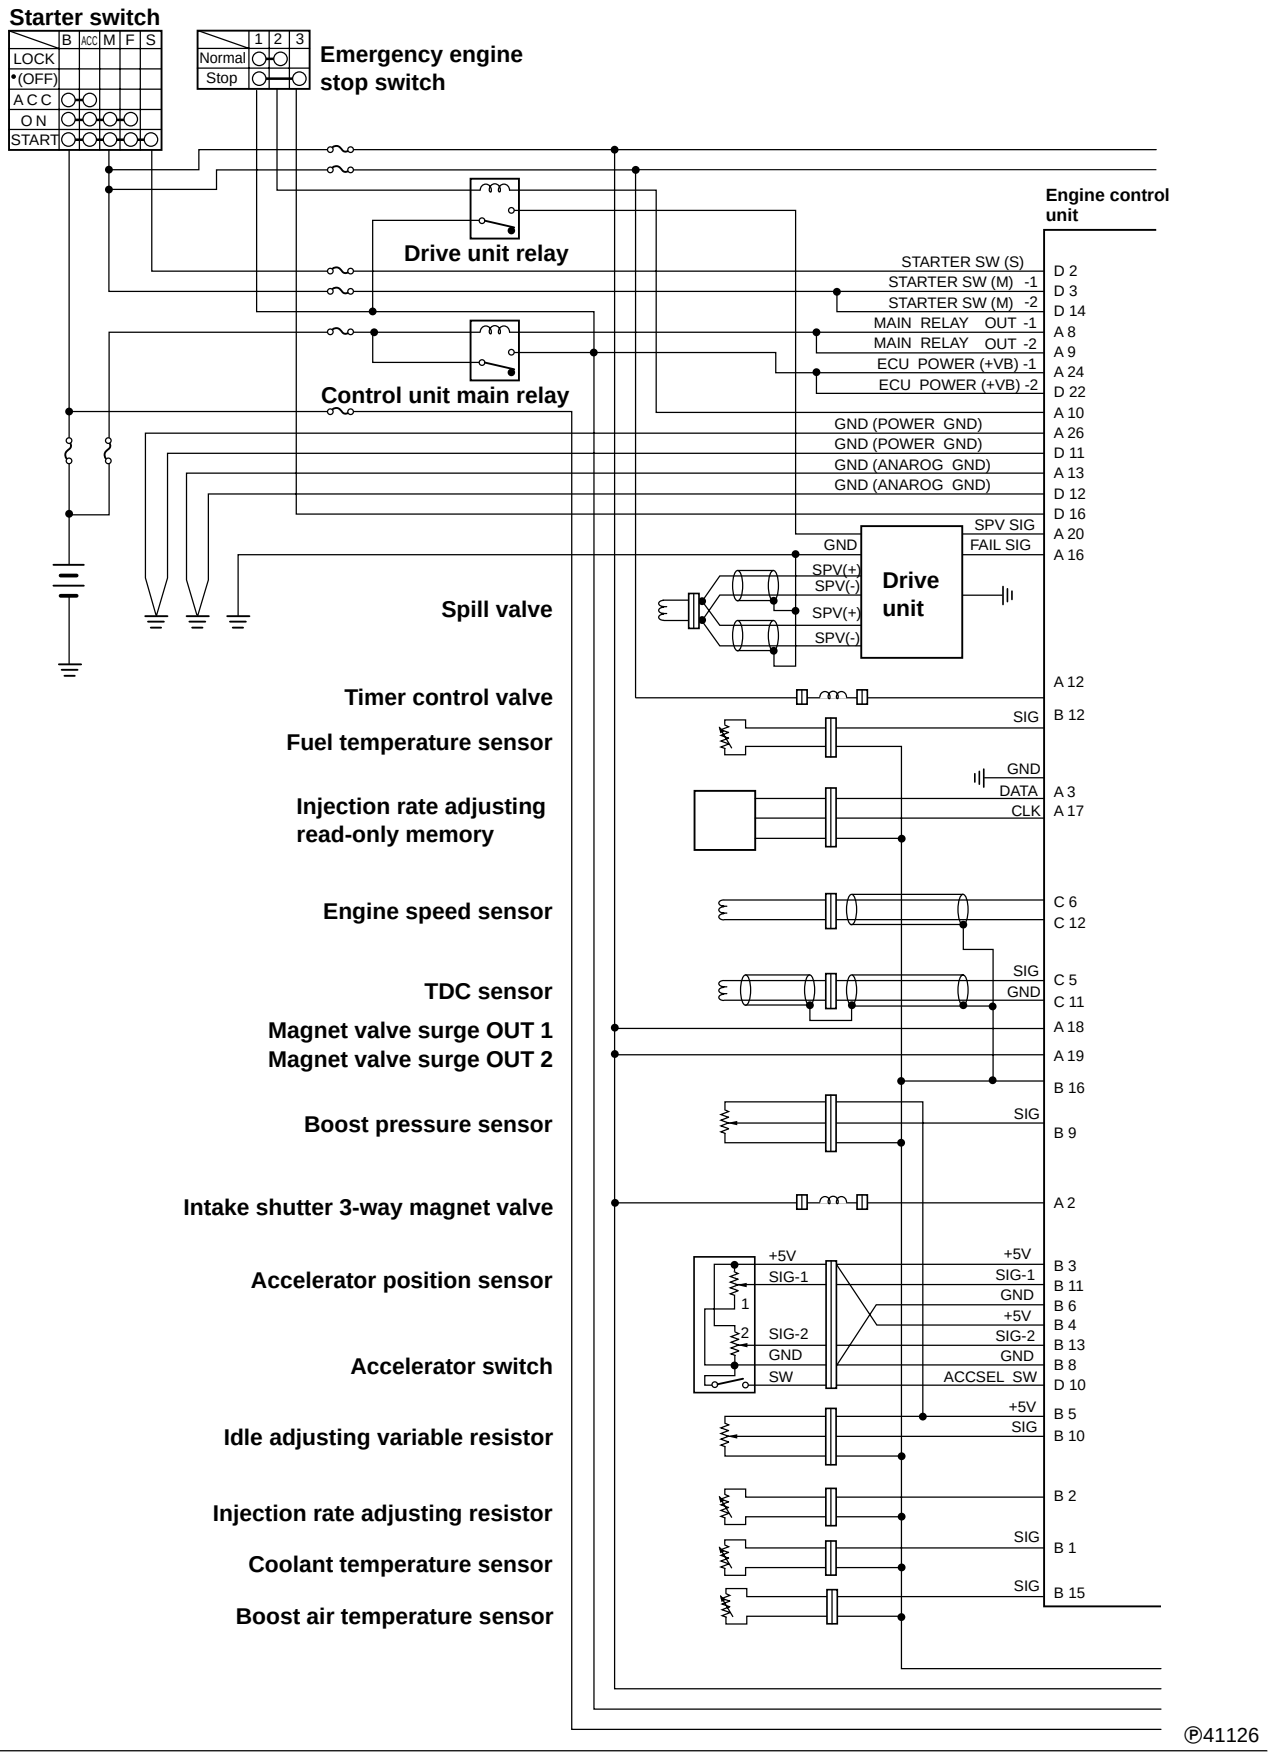
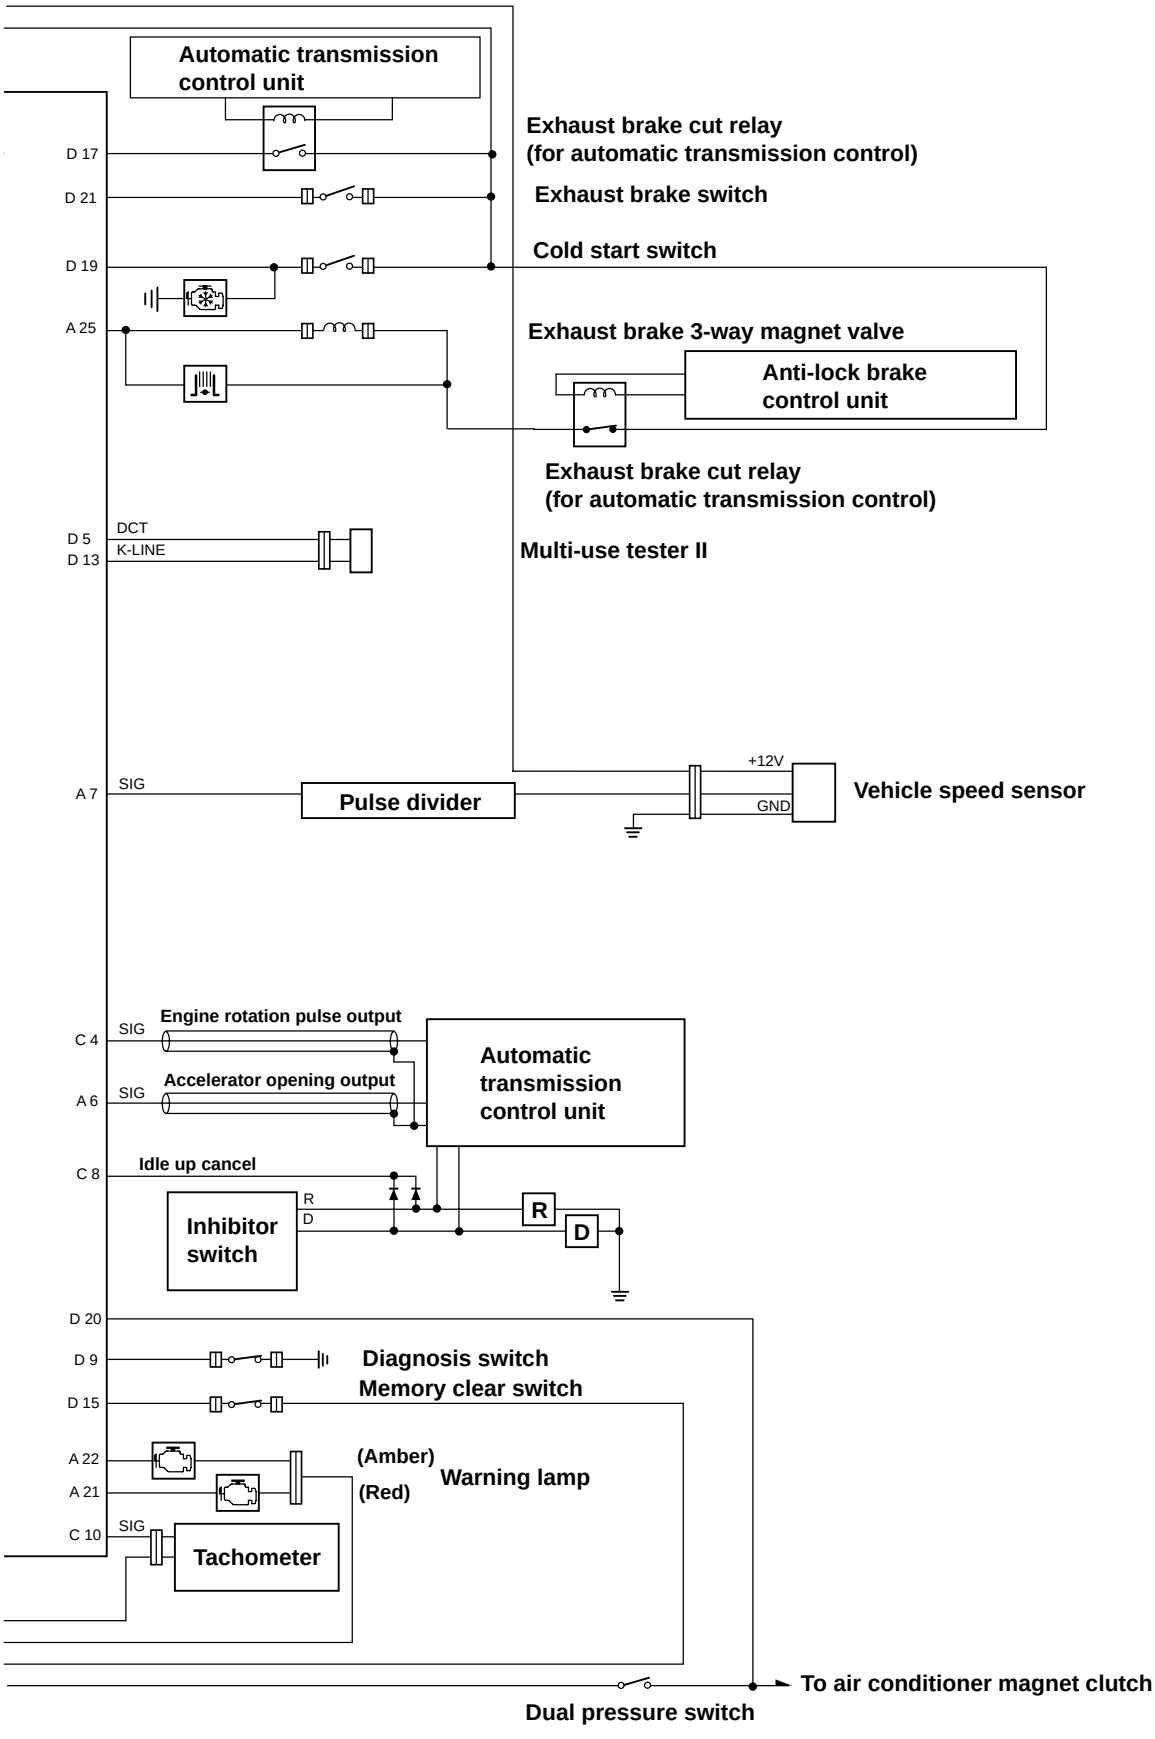
MEMO

https://truckmanualshub.com/



https://truckmanualshub.com/



Ⓟ41127

https://truckmanualshub.com/

TROUBLESHOOTING

1. INSPECTION PROCEDURES

Diagnostic Function

- Whenever the starter switch is placed at ON, the diagnostic function is activated to check all the sensors, etc. If any of them is found faulty, the warning lamp in the meter cluster is lit to alert the driver. At the same time, the fault location is stored in memory, and the system enters the backup mode.

  Warning Lamp Indications

	(Red)	(Amber)
Safety-critical error (Vehicle must not be driven)	ON	OFF
Non-safety-critical error (Vehicle can be driven despite poor control feeling)	OFF	ON

- The stored fault location can be read as a diagnostic trouble code by the Multi-Use Tester II or the diagnosis switch.

CAUTION ⚠

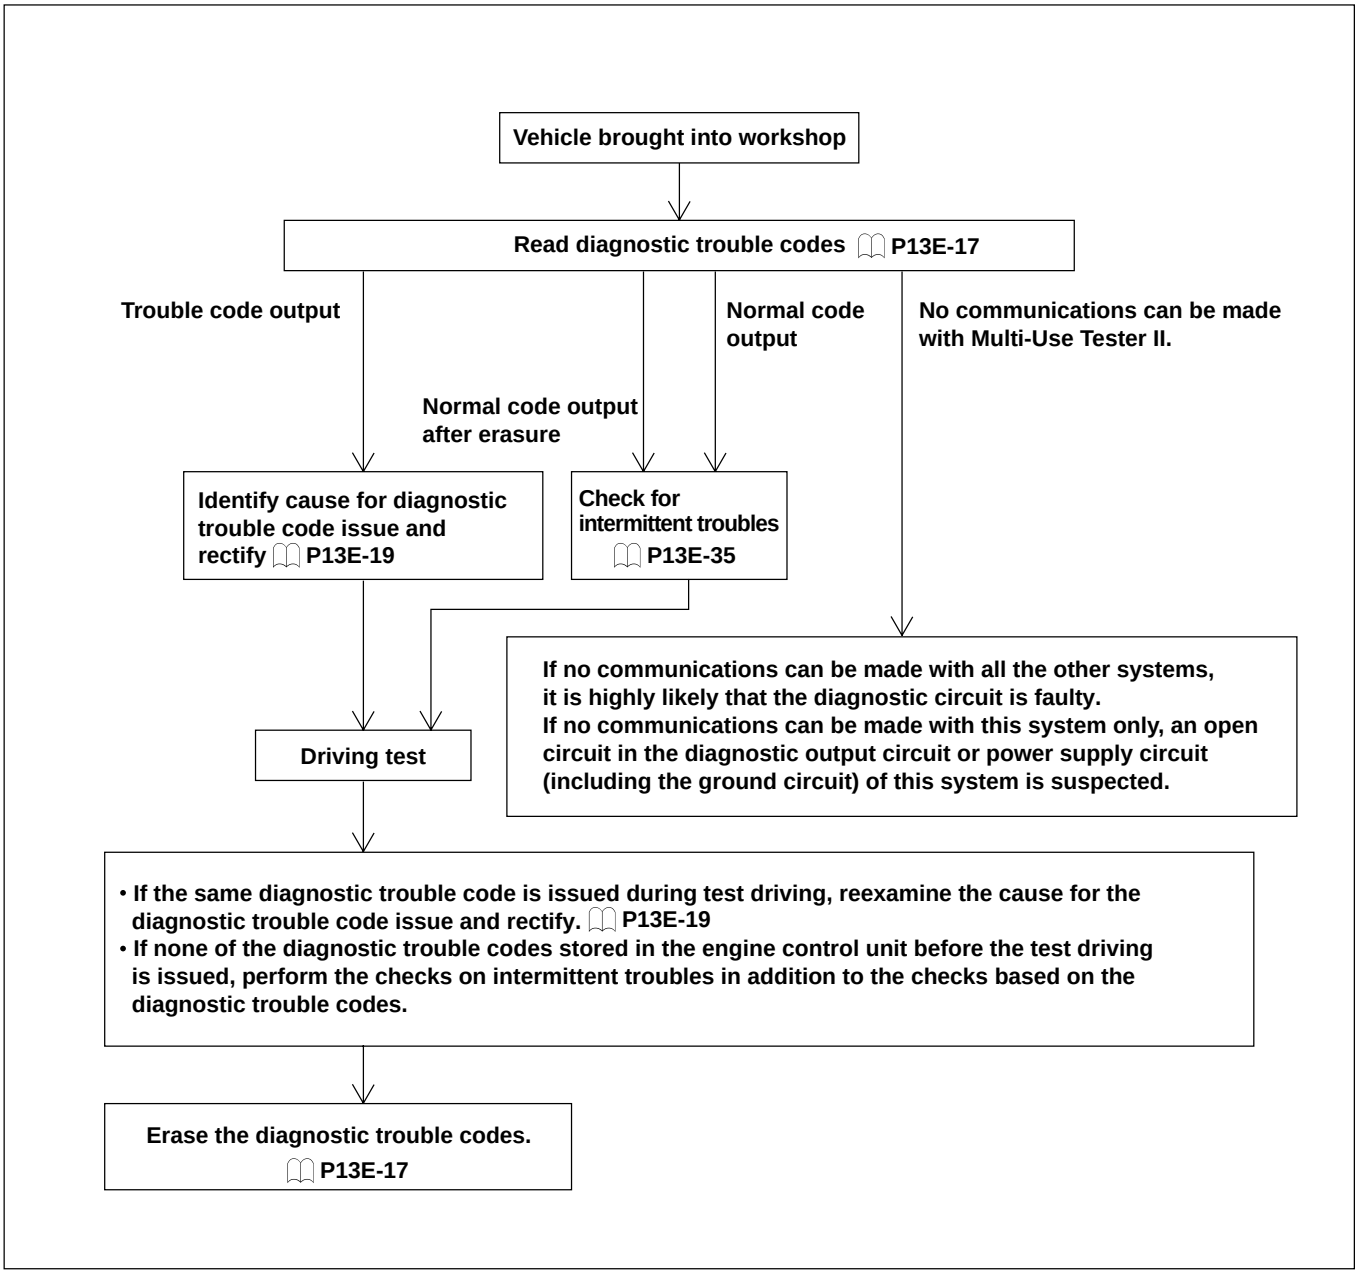
- **Check to ensure that the battery voltage is within the specified range.**
- **Check all the harness and device connectors for looseness. Always remove a connector at least 20 seconds after placing the starter switch at the LOCK position.**
- **Do not forget to clear the diagnostic trouble code by the Multi-Use Tester II or memory clear switch after a fault has been rectified.**
- **As a rule, inspection operations should be performed with the starter switch at the LOCK position. Some checks, however, may have to be made with the starter switch at the ON position. In such a case, use care to make sure that no short circuit develops between pins of the connectors or with the body.**
- **The resistance value of each component is affected by the temperature and the accuracy of the tester. The reading, therefore, does not always fall within the standard limits. Note that the check values shown in the text are the values obtained at normal temperature (10 to 35°C)**
- **Whether or not the system automatically returns to normal from the backup mode after a fault has been removed depends on the diagnostic trouble code (fault location). When the system returns to normal, the warning lamp will be OFF.**
- **Even when the fault has been removed and the system has been automatically returned to the normal mode, the diagnostic trouble code of the fault remains stored in the engine control unit.**
- **When a fault occurs at a point where the system is not automatically reset, perform the memory clear procedure to let the system exit from the backup mode. 🕮 P13E-17**

https://truckmanualshub.com/

Inspection Flowchart

The system inspection can be performed effectively by use of the Multi-Use Tester II. The types of system inspections may be broadly divided as shown below in accordance with the trouble symptoms and diagnostic trouble code outputs.

- Inspections based on diagnostic trouble codes stored in the engine control unit
- Inspections of intermittent troubles

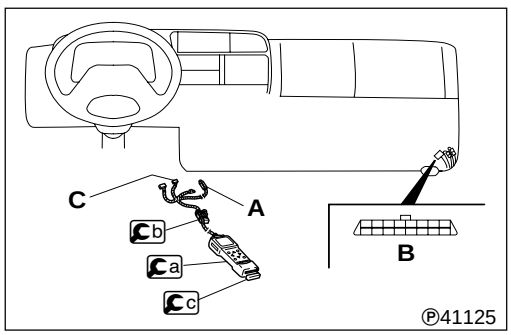


https://truckmanualshub.com/

2. CONNECTION OF MULTI-USE TESTER II

Special Tools

Location	Name and Shape of Special Tool	Part No.	Application
–	Multi-Use Tester II  19492	MB991496	Inspection of system
–	Multi-Use Tester II harness (for communications)  19141	MK327601	To supply power to Multi-Use Tester II proper and communicate with vehicle side electrical devices
–	Read-only memory pack (MRT-E7)  19493	MK386562	Data for inspection and control of engine control unit
–	Memory card (set in Multi-Use Tester II proper)  20538	MB991500	To write data
–	Multi-Use Tester II harness  20536	MB991499	To use Multi-Use Tester II as a circuit tester



- Place the starter switch at the LOCK position.
- Connect the a Multi-Use Tester II harness to b Multi-Use Tester II and insert the c read-only memory in the tester.
- Connect the connector **A** to the cigar lighter socket.
- Connect the Multi-Use Tester II connector **C** (16 pins) to the data link connector **B** (16 pins).

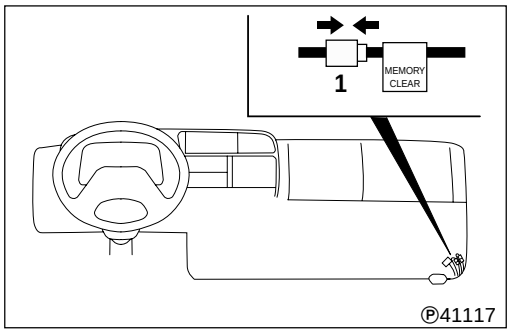
NOTE:

For the operating procedures for the Multi-Use Tester II, refer to the instruction manual for the Multi-Use Tester II.

https://truckmanualshub.com/

3. READING AND ERASING DIAGNOSTIC TROUBLE CODES

Two types of methods are available for reading or erasing a diagnostic trouble code; one using the Multi-Use Tester II and one using the vehicle side diagnostic functions.

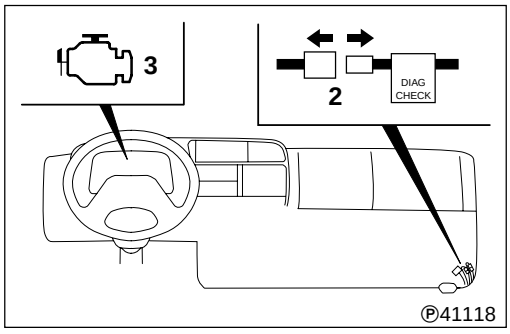


(1) Method using Multi-Use Tester II

● **Current Diagnostic Trouble Code**
- Check to see that the memory clear switch **1** is connected.
- Set the starter switch to ON.
- Operate the Multi-Use Tester II to read the current diagnostic trouble code and determine the fault location.

● **Past Diagnostic Trouble Code**
- Set the starter switch to ON.
- Disconnect the memory clear switch **1**.
- Operate the Multi-Use Tester II to read the past registered diagnostic trouble codes and determine the fault location.

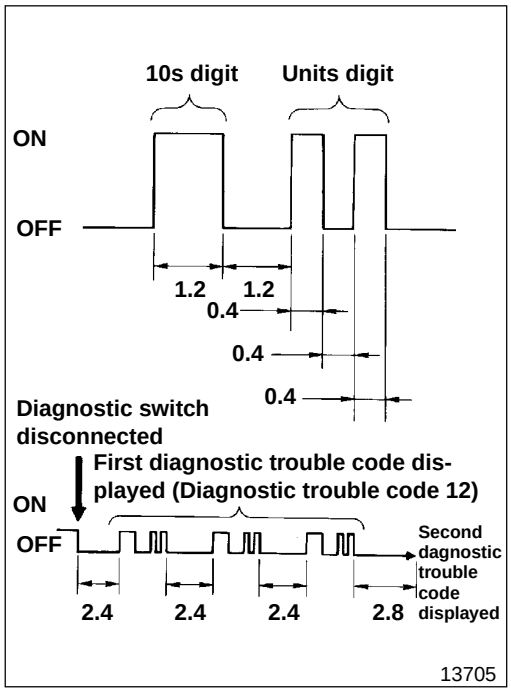
● **Erasing Diagnostic Trouble Codes**
- Set the starter switch to ON.
- Operate the Multi-Use Tester II to erase all of the diagnostic trouble codes stored in the engine control unit.



(2) Method Not Using Multi-Use Tester II (Method Using Diagnostic Switch and Memory Clear Switch)

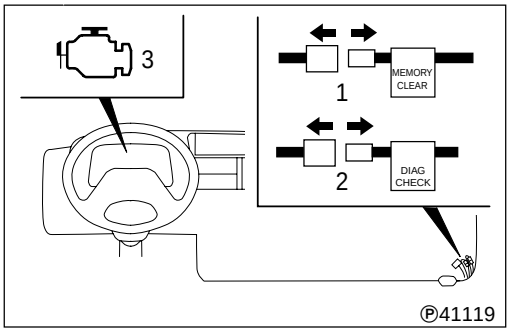
● **Current Diagnostic Trouble Code**
- Set the starter switch to ON.
- Disconnect the diagnostic switch **2**.
- The diagnostic trouble code is displayed by flashes of the warning lamp **3**.

https://truckmanualshub.com/



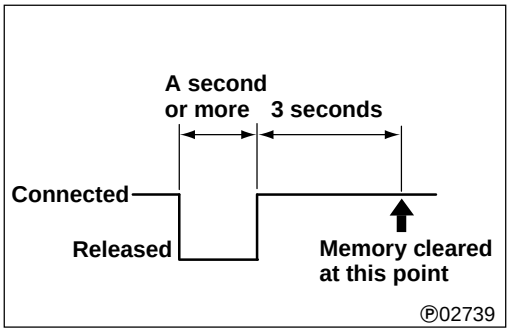
● **Reading Diagnostic Trouble Code**

- Diagnostic trouble codes are indicated by the number of times the warning lamp **3** flashes and their duration.
  - The flashing intervals also differ between the 10s digit and units digit.
  - 10s digit: 1.2 second interval
  - Units digit: 0.4 second interval
  - Each diagnostic trouble code is displayed from the 10s digit followed by the units digit. As for a code which has no 10s digit, units digit only is displayed.
- Each diagnostic trouble code is displayed three times in succession.
- If there is no more code stored, the sequence is then repeated from the beginning with each code indicated three times.
- When the diagnostic switch **2** is connected, the engine control unit will immediately stop displaying codes.



● **Past Diagnostic Trouble Codes**

- After reading the current diagnostic trouble codes (with the diagnostic switch **2** disconnected), disconnect the memory clear switch **1**. Then the warning lamp **3** will restart flashing.
- This time, the warning lamp displays the past diagnostic trouble codes. Determine the fault locations based on the indicated codes.



● **Erasing Diagnostic Trouble Codes**

Disconnect the memory clear switch **1** and the diagnostic switch **2** then reconnect them. Then all the diagnostic trouble codes stored in the engine control unit will be cleared.

CAUTION ⚠

- **If the contents of memory are not to be cleared after display of the stored codes, set the starter switch to OFF with the memory clear switch 1 disconnected. Thereafter, connect the memory clear switch.**
- **When you change the combination of the injection pump and engine control unit, you must rewrite the pump data stored in the engine control unit. For this purpose, be sure to perform the diagnostic trouble code erasing procedure.**
- **Whenever the engine control unit has been replaced with a new one, be sure to erase the diagnostic trouble codes by disconnecting the memory clear switch 1 and diagnostic switch 2 after connecting all the connectors. Upon completing the procedure, confirm that no diagnostic trouble codes is stored.**

https://truckmanualshub.com/

4.2 Diagnostic Trouble Code Issued Conditions and Check Items

Perform service procedures taking the diagnostic trouble code issued conditions and the probable causes into consideration.

06 EDU/SPV		
Code issued condition [Reset condition]	Diagnostic trouble code **06** is intended for checking the drive unit and spill valve for anything abnormal. The code is issued when the FAIL signal is not input the specified number of consecutive times from the drive unit to the control unit despite the fact that the battery voltage is normal, the engine is running at a speed higher than the idling speed, and the drive unit is outputting the spill valve drive signal. [Starter switch OFF]	
Action taken by control unit	Engine stopped	
Warning lamp illuminated	(Red)	
Probable cause and check item	• Open or short circuit between control unit and drive unit, or between drive unit and spill valve • Faulty drive unit • Faulty spill valve	• Check on the basis of the service data of the Multi-Use Tester II. 🕮 P13E-28 No. 83: Spill valve operation check • Test the actuator by the Multi-Use Tester II. 🕮 P13E-30 No. 9B: Spill valve operation check • Check the drive unit. (Ask your DENSO service station to do the job.) • Check the spill valve. 🕮 P13E-36: Inspection of Electrical Devices **536** • Check the circuit between the control unit and drive unit or the circuit between the drive unit and spill valve. 🕮 P13E-48: Electrical wiring Diagram

https://truckmanualshub.com/

07 OVER REV		
Code issued condition [Reset condition]	Diagnostic trouble code **07** is intended for checking whether the engine speed has reached an overspeed. When the engine speed reaches an overspeed, the code is issued. (When the engine speed decreases to fall within the normal range, a reset is made.)	
Action taken by control unit	Spill valve operation stopped	
Warning lamp illuminated	None	
Probable cause and check item	• Faulty spill valve of injection pump assembly • Overrevved engine during driving downhill • Faulty control unit	Check the injection pump assembly (Ask your DENSO service station to do the job.)

14 TDC SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **14** is intended for checking the TDC sensor operation. It is issued when the TDC sensor signal is not input to the control unit the specified number of consecutive times while the engine is running. [When normal TDC sensor signal input is restored, the system is reset.]	
Action taken by control unit	Injection timing feedback control stopped and open-loop control executed	
Warning lamp illuminated	(Amber)	
Probable cause and check item	• Open or short circuit between control unit and TDC sensor • Faulty TDC sensor • Faulty control unit	• Perform checks at control unit connector. P13E-32 **01**: Measure resistance of TDC sensor. • Check TDC sensor. P13E-36: Inspection of Electrical Devices **316** • Check circuit between control unit and TDC sensor. P13E-48: Electrical Writing Diagram

15 NE SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **15** is issued when the signal from the engine speed sensor is not input the specified number of times to the control unit while the engine is in operation. [When the signal from the engine speed sensor returns to normal, a reset is made.]	
Action taken by control unit	Synchronous control of spill valve with timer control valve interrupted	
Warning lamp illuminated	(Red)	
Probable cause and check item	• Open or short circuit in harness between control unit and engine speed sensor • Faulty engine speed sensor • Gap of engine speed sensor maladjusted • Faulty control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. P13E-28 No. 01: Measure engine speed. • Perform checks at control unit connector. P13E-36 **02**: Measure resistance of engine speed sensor. • Check engine speed sensor. P13E-36: Inspection of Electrical Devices **263** • Check circuit between control unit and engine speed sensor. P13E-48: Electrical Wiring Diagram

https://truckmanualshub.com/

16 ACCEL SNSR-2		
Code issued condition [Reset condition]	Diagnostic trouble code **16** is intended for checking the accelerator position sensor 2 for an abnormal voltage. The code is issued when the voltage of the accelerator position sensor 2 is out of the specified limits. When diagnostic trouble code **24** is also registered, the portion between the accelerator position sensors is faulty. [When the voltage of the accelerator position sensor 2 falls within the specified limits, a reset is made.]	
Action taken by control unit	① : Ordinary controls are made by using only accelerator position sensor 1 ② : When accelerator position sensor 1 is also faulty, controls are made on the assumption that the pedal is depressed 30% when accelerator switch is OFF and 0% when accelerator switch is ON.	
Warning lamp illuminated	① : None ② : (Amber)	
Probable cause and check item	• Open or short circuit in harness between control unit and accelerator position sensor 2 Faulty accelerator position sensor 2 • Faulty control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13E-28 No. 0B: Accelerator pedal opening measurement. No. 0C: Measurement of accelerator position sensor output voltage. • Perform checks at control unit connector. 🕮 P13E-32 **03**: Measurement of accelerator position sensor 2 output voltage • Check accelerator position sensor 2. 🕮 P13E-36: Inspection of Electrical Devices **324** • Check circuit between control unit and accelerator position sensor 2. 🕮 P13E-48: Electrical Wiring Diagram

19 AIR PRES SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **19** is intended for checking the atmospheric pressure sensor (built into the control unit) for anything abnormal. The code is issued when a voltage signal from the atmospheric pressure sensor is out of the specified limits. [When the output voltage of the atmospheric pressure sensor falls within the specified range, a reset is made.]	
Action taken by control unit	Controls achieved on the assumption that atmospheric pressure is 100 kPa {29.9 in. Hg, 760 mmHg}.	
Warning lamp illuminated	None	–
Probable cause and check item	• Faulty atmospheric pressure sensor (built into control unit) Faulty control unit	Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13E-28 No. 14: Atmospheric pressure measurement.

21 WTR TEMP SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **21** is intended for checking for open or short circuit in the harness of the coolant temperature sensor or anything abnormal in coolant temperature sensor. The code is issued when the output voltage from the coolant temperature sensor is out of the specified limits. [When the output voltage of the coolant temperature sensor falls within the specified range, a reset is made.]	
Action taken by control unit	Controls achieved on the assumption that the coolant temperature is 80°C {178°F}	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harness between control unit and coolant temperature sensor • Faulty coolant temperature sensor • Faulty control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13E-28 No. 10: Engine coolant temperature measurement • Check coolant temperature sensor. 🕮 P13E-36: Inspection of Electrical Devices **262** • Check circuit between control unit and coolant temperature sensor. 🕮 P13E-48: Electrical Wiring Diagram

https://truckmanualshub.com/

23 TCV		
Code issued condition [Reset condition]	Diagnostic trouble code **23** is intended for checking the harness of the timer control valve for open or short circuit and checking the timer control valve for anomalies. The code is issued when the real advance angle position of the timer continues to be out of the specified limits under the condition that fuel injection timing feedback control is in progress after completion of engine warmup. [When the advance angle re-enters the specified range with the engine at a speed of less than 1200 rpm, a reset is made.]	
Action taken by control unit	Controls are made on the assumption that the coolant temperature is 20°C {-4°F} when the engine is started, and 120°C {248°F} during operation.	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harness between control unit and timer control valve • Faulty timer control valve • Faulty control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13E-28 No. 09: Timer advance angle measurement • Check timer control valve. 🕮 P13E-36: Inspection of Electrical Devices **584** • Check circuit between control unit and timer control valve. 🕮 P13E-48: Electrical Wiring Diagram

24 ACCEL SNSR-1		
Code issued condition [Reset condition]	Diagnostic trouble code **24** is intended for checking the accelerator position sensor 1 for abnormal voltage. The code is issued when the output voltage of the accelerator position sensor 1 is out of the specified limits. When diagnostic trouble code 16 is also registered, the portion between the accelerator position sensors is faulty. [When the output voltage of the accelerator position sensor 1 re-enters the specified range, a reset is made.]	
Action taken by control unit	① : Ordinary controls are continued by using only the accelerator position sensor 2. ② : When accelerator position sensor 2 is also faulty, controls are made on the assumption that the pedal is depressed 30% when accelerator switch is OFF and 0% when accelerator switch is ON.	
Warning lamp illuminated	① : None ② : (Amber)	
Probable cause and check item	• Open or short circuit in harness between control unit and accelerator position sensor 1 • Faulty accelerator position sensor 1 • Faulty control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13E-28 No. 0B: Accelerator pedal opening measurement No. 0C: Measurement of accelerator position sensor output voltage. • Perform checks at control unit connector. 🕮 P13E-32 **04** : Measurement of accelerator position sensor 1 output voltage • Check accelerator position sensor 1. 🕮 P13E-36: Inspection of Electrical Devices **324** • Check circuit between control unit and accelerator position sensor 1. 🕮 P13E-48: Electrical Wiring Diagram

https://truckmanualshub.com/

25 SPEED SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **25** is intended for checking the harness of the vehicle speed sensor for open/short circuit and checking the vehicle speed sensor for abnormalities. The code is issued when there are no pulse inputs from the vehicle speed sensor to the control unit in the specified time duration. [When a pulse is input, a reset is made.]	
Action taken by control unit	ISC (Idle Speed Control) disabled	
Warning lamp illuminated	None	
Probable cause and check item	• Open or short circuit in harness between control unit and vehicle speed sensor • Faulty vehicle speed sensor • Faulty control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13E-28 No. 0D: Vehicle speed measurement. • Perform checks at control unit connector. 🕮 P13E-32 **05**: Measurement of vehicle speed signal voltage. • Check vehicle speed sensor. 🕮 P13E-36: Inspection of Electrical Devices **265** • Check circuit between control unit and vehicle speed sensor. 🕮 P13E-48: Electrical Wiring Diagram

26 PUMP ROM		
Code issued condition [Reset condition]	Diagnostic trouble code **26** is intended for checking for an error in the loaded pump read-only memory data necessary for control of the injection rate. The code is issued when any of the following situations occurs. Loaded read-only memory has unmatched data. • Read-only memory data cannot be read. • Loaded data exceeds the upper limit of correction. • There is a mismatch between control unit backup data and loaded data. [No automatic reset takes place.]	
Action taken by control unit	Initial values used	
Warning lamp illuminated	None –	
Probable cause and check item	• Open or short circuit in harness between control unit and injection rate adjusting read-only memory • Faulty injection rate adjusting read-only memory • Faulty control unit	• Check injection rate adjusting read-only memory. (Ask your DENSO service station to do the job.) • Check circuit between control unit and injection rate adjusting read-only memory. 🕮 P13E-48: Electrical Wiring Diagram

27 SILENCER M/V		
Code issued condition [Reset condition]	Diagnostic trouble code **27** is intended for checking the harness of the intake silencer 3-way magnet valve for open/short circuit. [No automatic reset takes place.]	
Action taken by control unit	Intake silencer control disabled	
Warning lamp illuminated	(Amber)	
Probable cause and check item	• Open or short circuit in harness between control unit and intake silencer 3-way magnet valve • Faulty intake silencer 3-way magnet valve • Faulty control unit	• Check intake silencer 3-way magnet valve. P13E-36: Inspection of Electrical Devices **565** • Check circuit between control unit and intake silencer 3-way magnet valve. P13E-48: Electrical Wiring Diagram

https://truckmanualshub.com/

31 IDL VOLUME		
Code issued condition [Reset condition]	Diagnostic trouble code **31** is intended for checking the harness of the idle adjusting potentiometer for open or short circuit and checking the idle adjusting potentiometer for abnormalities. The code is issued when the voltage of the idle adjusting potentiometer continues to be out of the specified limits for the predetermined period of time. [When the voltage of the idle adjusting variable resistor re-enters the specified range, a reset is made.]	
Action taken by control unit	Operation mode fixed to auto idle	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harness between control unit and idle adjusting potentiometer • Faulty idle adjusting potentiometer • Faulty control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13E-28 No. 0E: Measurement of idle adjusting variable resistor voltage. • Perform checks at control unit connector. 🕮 P13E-32 **06**: Measurement of idle adjusting variable resistor output voltage. • Check idle adjusting potentiometer. 🕮 P13E-36: Inspection of Electrical Devices **157** • Check circuit between control unit and idle adjusting potentiometer. 🕮 P13E-48: Electrical Wiring Diagram

32 BOOST PRES		
Code issued condition [Reset condition]	Diagnostic trouble code **32** is intended for checking the harness of the boost pressure sensor for open or short circuit and checking the boost pressure sensor for abnormalities. The code is issued when the output voltage of the boost pressure sensor continues to be out of the specified limits for the predetermined period of time. [When the voltage of the boost pressure sensor re-enters the specified range, a reset is made.]	
Action taken by control unit	Controls are made on the assumption that the boost pressure is 100 kPa {29.9 in. Hg, 760 mmHg}	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harness between control unit and boost pressure sensor • Faulty boost pressure sensor • Faulty control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13E-28 No. 15: Boost pressure measurement • Check boost pressure sensor. 🕮 P13E-36: Inspection of Electrical Devices **318** • Check circuit between control unit and boost pressure sensor. 🕮 P13E-48: Electrical Wiring Diagram

33 ECU SYSTEM		
Code issued condition [Reset condition]	Diagnostic trouble code **33** is issued in the following cases. ① : A/D converter out of order [When A/D converter returns to normal, a reset is made.] ② : Mutual monitoring error, interruption processing error [When starter switch is turned OFF, a reset is made.]	
Action taken by control unit	① : All Fail Safe functions against a faulty A/D input are activated. ② : Engine stopped	
Warning lamp illuminated	① : None ② : (Amber)	
Probable cause and check item	Faulty control unit	–

https://truckmanualshub.com/

34 Q RESISTOR		
Code issued condition [Reset condition]	Diagnostic trouble code **34** is intended for checking the harness of the injection rate adjusting resistor for open or short circuit and checking the injection rate adjusting resistor for abnormalities. The code is issued when the output voltage of the injection rate adjusting resistor continues to be out of the specified limits for the predetermined period of time. [When the voltage of the injection rate adjusting resistor re-enters the specified range, a reset is made.]	
Action taken by control unit	The injection rate correction value is fixed to No. 1 value.	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harness between control unit and injection rate adjusting resistor • Faulty injection rate adjusting resistor • Faulty control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13E-28 No. 13: Resistor No. check of injection rate adjusting resistor. • Check circuit between control unit and injection rate adjusting resistor. 🕮 P13E-48: Electrical Wiring Diagram

41 FUEL TEMP		
Code issued condition [Reset condition]	Diagnostic trouble code **41** is intended for checking the harness of the fuel temperature sensor for open or short circuit and checking fuel temperature sensor for abnormalities. The code is issued when the output voltage of the fuel temperature sensor continues to be out of the specified limits for the predetermined period of time. [When the voltage of the fuel temperature sensor re-enters the specified range, a reset is made.]	
Action taken by control unit	Control is made on the assumption that fuel temperature is 40°C {104°F}	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harness between control unit and fuel temperature sensor • Faulty fuel temperature sensor • Faulty control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13E-28 No. 11: Fuel temperature measure. • Perform checks at control unit connector. 🕮 P13E-32 **12**: Measurement of fuel temperature sensor resistance. • Check fuel temperature sensor. 🕮 P13E-41: Inspection of Electrical Devices **323** • Check circuit between control unit and fuel temperature sensor. 🕮 P13E-48: Electrical Wiring Diagram

44 BOOST TEMP		
Code issued condition [Reset condition]	Diagnostic trouble code **44** is intended for checking the harness of the boost air temperature sensor for open or short circuit and checking the boost air temperature sensor for abnormalities. [When the voltage of the boost air temperature sensor re-enters the specified range, a reset is made.]	
Action taken by control unit	Control is made on the assumption that boost air temperature is 80°C {176°F}	
Warning lamp illunimated	None	–
Probable cause and check item	• Open or short circuit in harness between control unit and boost air temperature sensor • Faulty boost air temperature sensor • Faulty control unit	• Check boost air temperature sensor. 🕮 P13E-36 **303**: Inspection of Electrical Devices • Check circuit between control unit and boost air temperature sensor. 🕮 P13E-48: Electrical Wiring Diagram

https://truckmanualshub.com/

45 FUEL CUT SW		
Code issued condition [Reset condition]	Diagnostic trouble code **45** is intended for checking the harness of the emergency engine stop switch for open or short circuit and checking the emergency engine stop switch for abnormalities. The code is issued when a fault is detected in the circuit with both emergency engine stop switch and starter switch at the ON position (without starting the engine). [When the emergency engine stop switch is set to OFF, a reset is made.]	
Action taken by control unit	Engine start inhibited	
Warning lamp illuminated	(Red)	–
Probable cause and check item	• Open or short circuit in harness between control unit and emergency engine stop switch • Faulty emergency engine stop switch • Faulty control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13E-28 No. 42: Operation check of emergency engine stop switch. • Perform checks at control unit connector. 🕮 P13E-32 **11**: Measurement of emergency engine stop switch operating voltage. • Check emergency engine stop switch. 🕮 P13E-36: Inspection of Electrical Devices **156** • Check circuit between control unit and emergency engine stop switch. 🕮 P13E-48: Electrical Wiring Diagram

46 EDU RELAY		
Code issued condition [Reset condition]	Diagnostic trouble code **46** is issued in the following cases. ①: Drive unit relay is not ON with drive unit relay ON command issued. [When the drive unit relay is turned ON by the drive unit relay ON command, and the voltage exceeds 16V, a reset is made.] ②: Drive unit relay is not OFF with drive unit relay OFF command issued. [When the drive unit relay is turned OFF by the drive unit relay OFF command, and the voltage exceeds 16V, a reset is made.]	
Action taken by control unit	①: Drive unit relay OFF ②: Ordinary controls continued	
Warning lamp illuminated	①: (Amber) ②: None	
Probable cause and check item	• Open or short circuit in harness between control unit and drive unit relay • Faulty drive unit relay	• Check drive unit relay. 🕮 P13E-36: Inspection of Electrical Devices **228** • Check circuit between control unit and drive unit relay. 🕮 P13E-48: Electrical Wiring Diagram

https://truckmanualshub.com/

65 ACCEL SW		
Code issued condition [Reset condition]	Diagnostic trouble code **65** is intended for checking the harness of the accelerator switch for open or short circuit and checking the accelerator switch for abnormalities. The code is issued when the accelerator position sensor 1 or 2 shows an opening of more than 20% with the accelerator switch ON. [If the accelerator switch turns OFF when the accelerator position sensor shows an opening of more than 20%, a reset is made.]	
Action taken by control unit	Ordinary controls continued	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harness between control unit and accelerator switch • Faulty accelerator switch • Faulty control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13E-28 No. 43: Check of accelerator switch operating signal. Perform checks at control unit connector. 🕮 P13E-32 **09** : Measurement of accelerator switch operating voltage. Check accelerator switch. 🕮 P13E-36: Inspection of Electrical Devices **324** Check circuit between control unit and accelerator switch. 🕮 P13E-48: Electrical Wiring Diagram

66 STARTER SW (S)		
Code issued condition [Reset condition]	Diagnostic trouble code **66** is intended for checking the harness of the starter switch for open or short circuit and checking the starter switch for abnormalities. The code is issued when a start signal is input with the engine running at a speed higher than the specified speed. [When the start signal is no longer input, a reset is made.]	
Action taken by control unit	Ordinary controls continued	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harness between control unit and starter switch • Faulty starter switch • Faulty control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13E-28 No. 41: Start signal ON/OFF check. • Perform checks at control unit connector. 🕮 P13E-32 **13** : Measurement of starter switch signal voltage. • Check starter switch. 🕮 P13E-36: Inspection of Electrical Devices **002** • Check circuit between control unit and starter switch. 🕮 P13E-48: Electrical Wiring Diagram

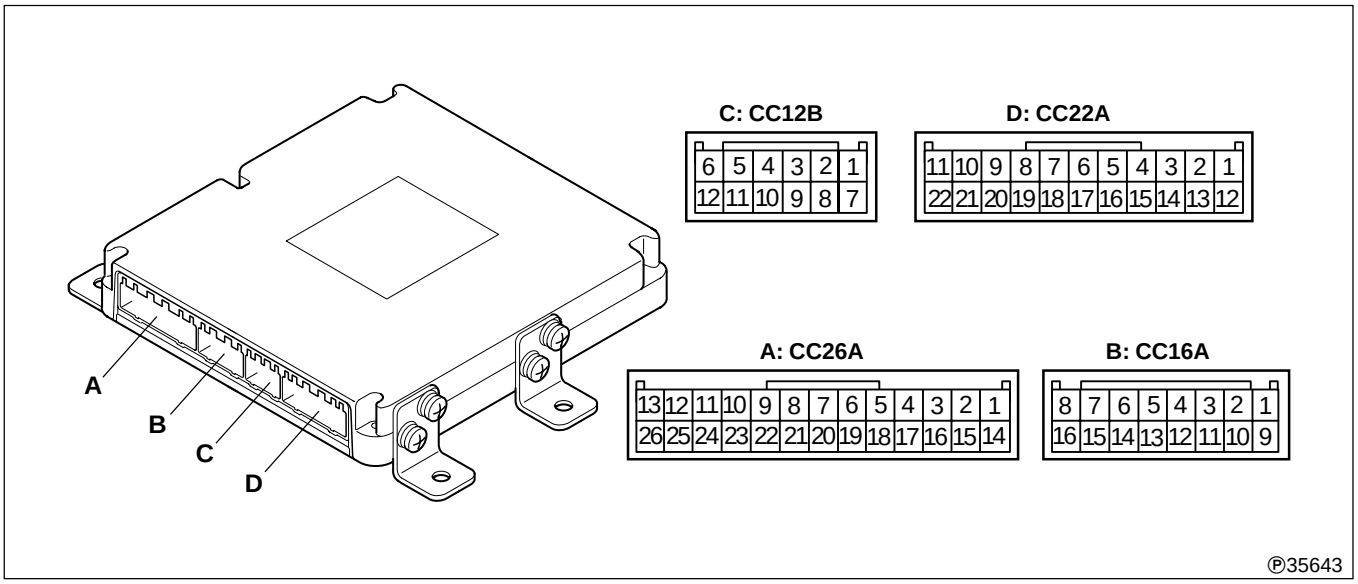
MEMO

https://truckmanualshub.com/

7. CHECKS AT CONNECTOR OF CONTROL UNIT

This method of checks is useful for checking whether all the signals of the control unit are transmitted without any error through the vehicle side harness and connector.
The numbers in the table correspond to the call numbers used in “4. DIAGNOSTIC TROUBLE CODES AND CHECK ITEMS” for referencing this section.

Pin Configuration of Control Unit



No.	Item	Reference Page
01	Resistance of TDC sensor	🕮 P13E-33
02	Resistance of engine speed sensor	
03	Output voltage of accelerator position sensor 1	
04	Output voltage of accelerator position sensor 2	
05	Signal voltage of vehicle speed sensor	
06	Output voltage of idle adjusting potentiometer	🕮 P13E-34
09	Voltage of accelerator switch	
11	Voltage of emergency engine stop switch	
12	Resistance of fuel temperature sensor	
13	Voltage of starter switch (start signal)	

https://truckmanualshub.com/

Checking Procedures

CAUTION ⚠

Each item is checked by one of two methods; one by disconnecting the connectors and one by leaving the connectors connected.
Pay heed to the following points.

- **Be sure not to touch any other pin than the one to be checked.**
  Especially, use utmost care that a short circuit is never produced between pins by the tester.
- **All the illustrations of the connectors in the table show the connectors on the control unit side. Be careful not to confuse the pins with those to be checked.**

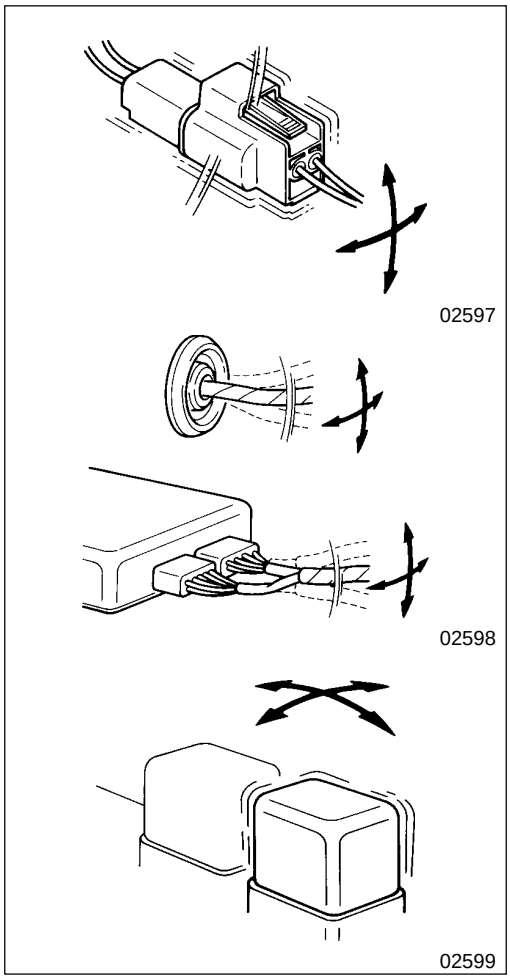
Check Item	Checking Procedure
01 Resistance of TDC sensor	[Conditions] • Starter switch OFF • Disconnect connector and make checks at vehicle side harness connector (25°C {77°F}). [Judging Criteria] Between pins: C ⑤ – C ⑪ 1.5 ± 0.2 kΩ
02 Resistance of engine speed sensor	[Conditions] • Starter switch OFF • Disconnect connector and make checks at vehicle side harness connector. [Judging Criteria] Between pins: C ⑥ – C ⑫ 230 ± 25 Ω
03 Output voltage of accelerator position sensor 2	[Conditions] • Starter switch OFF • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): B ⑬ – B ⑧ • When accelerator pedal is released: 0.85V • When accelerator pedal is depressed: 4.15V
04 Output voltage of accelerator position sensor 1	[Conditions] • Starter switch OFF • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): B ⑪ – B ⑥ • When accelerator pedal is released: 0.85V • When accelerator pedal is depressed: 4.15V
05 Signal voltage of vehicle speed sensor	[Conditions] • Starter switch ON • Leave vehicle side harness connected (make checks from back side of vehicle side connector). • Using chassis dynamometer or something else, slowly rotate wheels. [Judging Criteria] Between pins (⊕ — ⊖): A ⑰ – A ⑬ • Hi: Approx. 8V • Lo: 0.5V or less

https://truckmanualshub.com/

Check Item	Checking Procedure
06 Output voltage of idle adjusting potentiometer	[Conditions] • Starter switch ON • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): C ⑤ – C ⑩ • When knob is pulled: Approx. 1 to 3V • When knob is pushed all the way: Approx. 3.6 to 4.3V
09 Voltage of accelerator switch	[Conditions] • Starter switch ON • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): D ⑩ – B ⑧ • When accelerator pedal is depressed: 0V • When accelerator pedal is released: 5V
11 Voltage of emergency engine stop switch	[Conditions] • Starter switch ON • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): D ㉒ – D ⑯ • Switch at stop position: 0V • Switch at normal position: 24V
12 Resistance of fuel temperature sensor	[Conditions] • Starter switch OFF • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins: B ⑫ – B ⑯ 2.5 ± 1.0 kΩ
13 Voltage of starter switch (starter signal)	[Conditions] • Leave vehicle side harness connected (make checks from back side of connector). • Starter switch (S position) [Judging Criteria] Between pins (⊕ — ⊖): D ② – D ⑪ 24V

https://truckmanualshub.com/

8. CHECKS ON INTERMITTENT TROUBLES



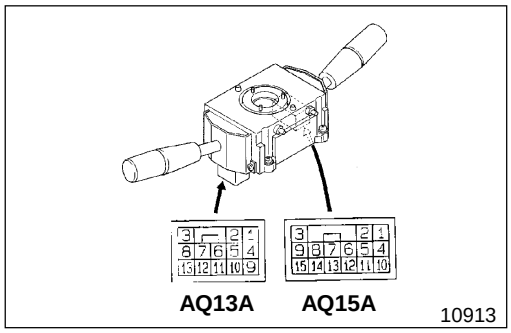
A intermittent trouble often occurs in a specific condition. Therefore, pinpointing the condition will make it easy to estimate the cause. To pinpoint the condition for a intermittent trouble, ask the customer in detail about the driving condition when the trouble occurs, weather, occurrence frequency and symptoms, and reproduce the symptoms of the trouble.
Depending on the condition where the trouble occurs, determine whether the cause of the trouble is vibration, temperature or any other factor.
If the probable cause is vibration, perform the following checks on the relevant connectors harnesses, etc. and check whether the symptoms of the trouble are reproduced.

- Lightly move the connector up and down and to the right and left.
- Lightly move the harness up and down and to the right and left.
- Lightly shake the sensors and other devices by hand.
- Lightly shake the wiring harness located in the moving components such as the suspension.

The connectors and other parts to be checked are identifiable from the descriptions in the Probable Causes or the Checking Procedures for the displayed diagnostic trouble code.

https://truckmanualshub.com/

INSPECTION OF ELECTRICAL EQUIPMENT



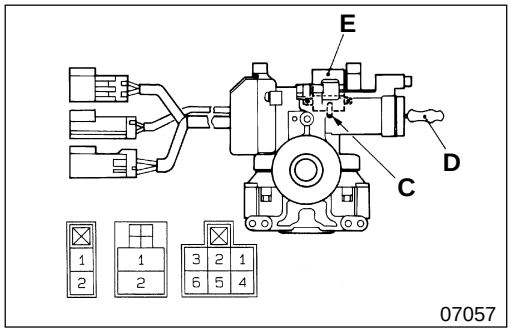
001 Checking Combination Switch

- Perform continuity checks according to the following table.
  AQ15A Connector Connection Table

		⑤	⑥
Exhaust brake switch	OFF		
	ON	○——○	

○——○ : There must be continuity between the pins.

- If there is anything wrong, replace the switch.



002 Checking Starter Switch

- Perform continuity checks according to the following table.
- If there is anything wrong, replace the starter switch. Gr37

(1) Continuity Check

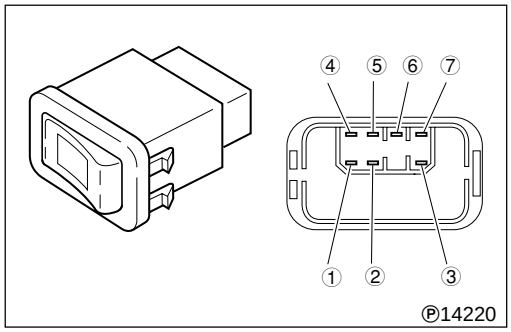
		AP2A		AN6A				
		②	①	③	④	②	⑥	⑤
LOCK	Key not in position							
	Key in position						○——○	
• (OFF)							○——○	
ACC		○———		○			○——○	
ON		○——○		○——○			○——○	
START		○——○		○——○——○			○——○	
		B	M	A	F/M	S	K1	K2

○——○ : There must be continuity between the pins.

(2) Checking Key Interlock Solenoid

	AN2A		LOCK	ACC	ON	START	Remarks
	①	②					
Rotating range of key **D**	⊕——⊖			←——→			Plunger **C** is locked and key **D** cannot be removed.
			←——→				Plunger **C** is free and key **D** can be removed.

⊕——⊖ : Apply voltage across these pins.
DC 12V
E: Key interlock solenoid



014 Checking Cold Start Switch

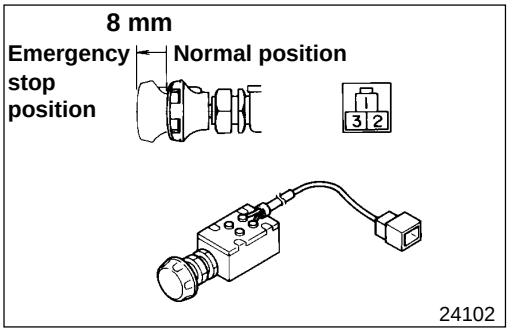
- Perform continuity checks according to the following table.

	①	⑤
ON	○——○	
OFF		

○——○ : There must be continuity between the pins.

- If there is anything wrong, replace the switch.

https://truckmanualshub.com/



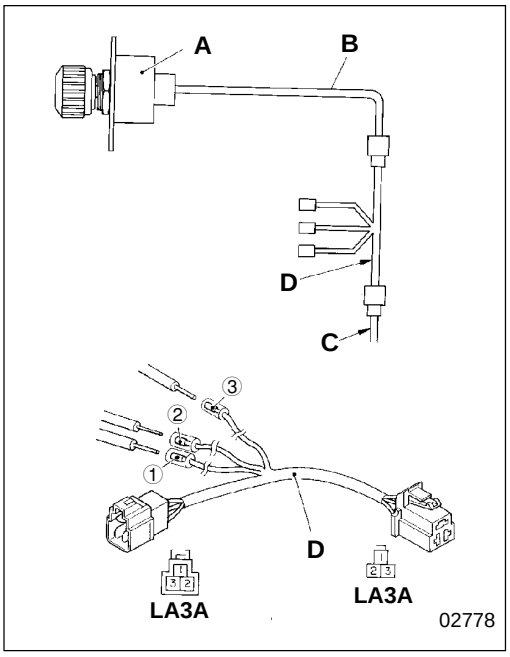
156 Checking Emergency Engine Stop Switch

- Perform continuity checks according to the following table.

	①	②	③
Normal position	○——	——○	
Emergency stop position	○——		——○

○——○ : There must be continuity between the pins.

- If there is anything wrong, replace the switch.
  Gr13A

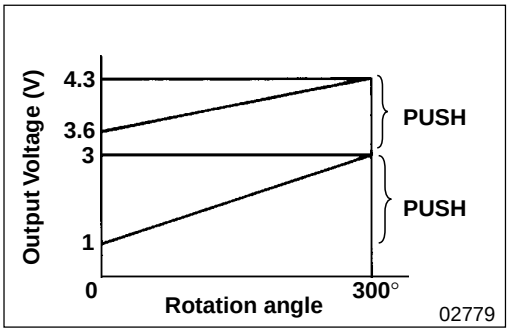


157 Checking Idle Adjusting Potentiometer

- Disconnect the harness **B** of the idle adjusting variable resistor **A** from the vehicle side harness **C**, and connect the inspection harness **D** between them.
- Set starter switch to ON.
- Measure the output voltage of the idle adjusting variable resistor **A** according to the following table.

	②	③		
Standard value	⊖	⊕	Output voltage PULL (Knob in pulled position)	1 to 3 V
			Output voltage PUSH (Knob in pushed position)	3.6 to 4.3 V

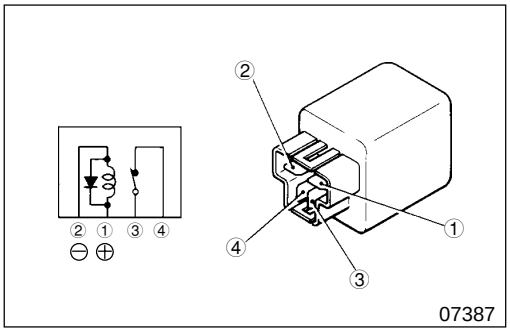
- If the reading is out of the standard value range, replace the idle adjusting potentiometer **A**.



Output Characteristics

https://truckmanualshub.com/

INSPECTION OF ELECTRICAL EQUIPMENT



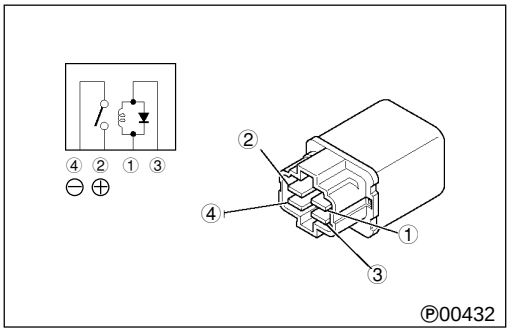
180 Checking Relay (Normally closed type 4-pin)

- Perform continuity and operation checks according to the following table.

	①	②	③	④
When not energized	○——○		○——○	
When energized	⊕——⊖		◌·····◌	

○——○ : There must be continuity between the pins.
⊕——⊖ : Apply a voltage of 12 V DC across these pins.
◌·····◌ : Continuity between these pins must be lost.

- If there is anything wrong, replace the relay.



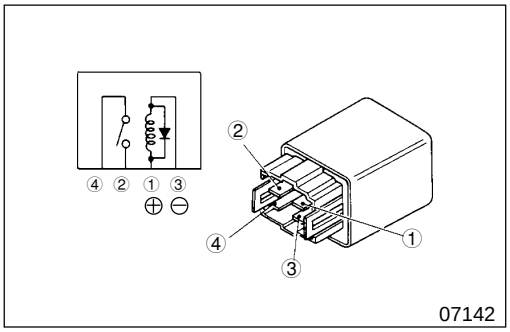
181 Checking Relay (Normally open type 4-pin)

- Perform continuity and operation checks according to the following table.

	①	②	③	④
When not energized	○——○			
When energized	⊕——⊖	○——○		○——○

○——○ : There must be continuity between the pins.
⊕——⊖ : Apply a voltage of 12V DC across these pins.

- If there is anything wrong, replace the relay.



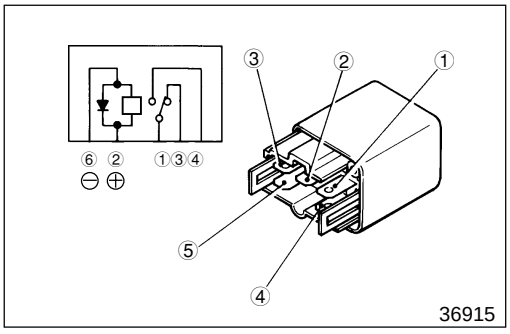
185 Checking Relay (Normally open type 4-pin)

- Perform continuity and operation checks according to the following table.

	①	②	③	④
When not energized	○——○			
When energized	⊕——⊖	○——○		○——○

○——○ : There must be continuity between the pins.
⊕——⊖ : Apply a voltage of 12V DC across these pins.

- If there is anything wrong, replace the relay.



228 Checking Relay (Normally open type 6-pin)

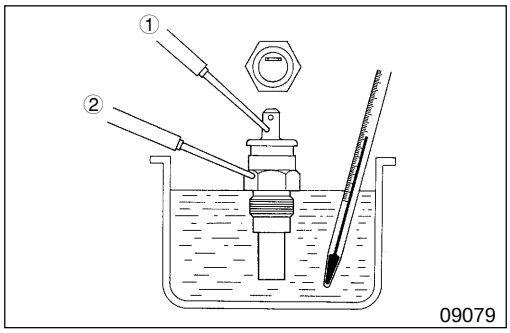
- Perform continuity and operation checks according to the following table.

	①	②	③	④	⑥
When not energized	○——○	○——○			
When energized	○——⊕			○——○	⊖

○——○ : There must be continuity between the pins.
⊕——⊖ : Apply a voltage of 12 V DC across these pins.

- If there is anything wrong, replace the relay.

https://truckmanualshub.com/



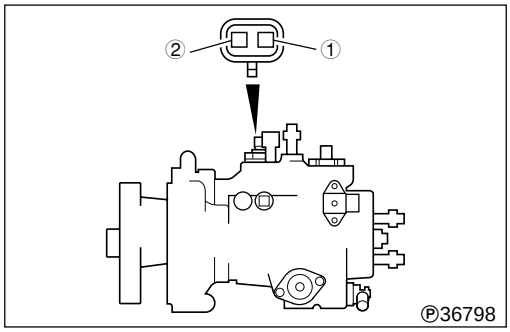
262 Checking Coolant Temperature Sensor

- Put the coolant temperature sensor in a container filled with engine oil.
- Heat the engine oil to various specified temperatures while stirring the engine oil.
- Measure the resistance value between pins ① and ② (body).

Standard value	0°C {32°F}	(8.62 kΩ)
	20°C {68°F}	(3.25 kΩ)
	40°C {104°F}	(1.5 kΩ)
	60°C {140°F}	620 ± 62 Ω

Reference value in parentheses

- If the reading is out of the standard value, replace the coolant temperature sensor. Gr14

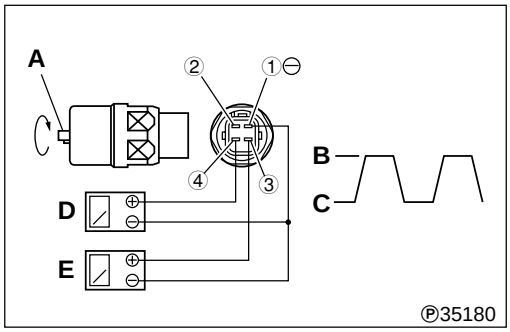


263 Checking Engine Speed Sensor

- Measure the resistance value between pins ① and ②.

Standard value (at 20°C {68°F})	230 ± 25 Ω

- If the reading is out of the standard value range, replace the engine speed sensor. Ask your DENSO service station to replace it.



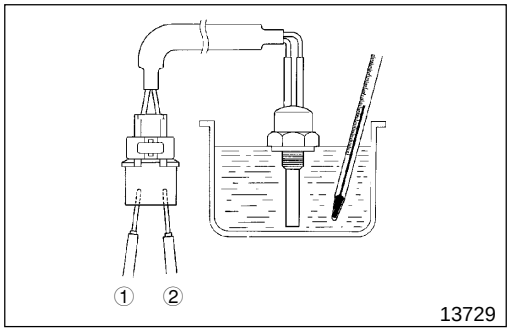
265 Checking Vehicle Speed Sensor

- Slowly rotate portion **A** of the vehicle speed sensor with a voltage of 12V DC applied across pins ① and ③.
- Measure the maximum value (high pulse voltage **B**) and minimum value (low pulse voltage **C**) of the voltage generated across the pins ① and ②.

D: Tester (to check 25 pulses)

Standard value	Low pulse	0.5 V or less
	High pulse	8 ± 1 V

- If the reading is out of the standard value, replace the vehicle speed sensor.



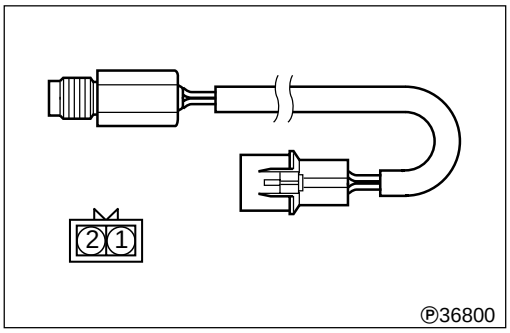
304 Checking Boost Air Temperature Sensor

- Place the boost air temperature sensor in glycerin in a container.
- Raise the glycerin temperature to the specified values and stir the glycerin.
- Measure the resistance between pins ① and ②.
- If the measured value deviates from the standard value, replace the boost air temperature sensor. Gr15

Standard value	0°C {32°F}	5880 ± 588 Ω
	20°C {68°F}	2450 ± 245 Ω
	80°C {176°F}	322 ± 48 Ω

https://truckmanualshub.com/

INSPECTION OF ELECTRICAL EQUIPMENT



316 Checking TDC Sensor

- Measure the resistance between pins ① and ②.

Standard value (at 25°C {77°F})	1.5 ± 0.2 kΩ

- If the reading is out of the standard value, replace the TDC sensor.

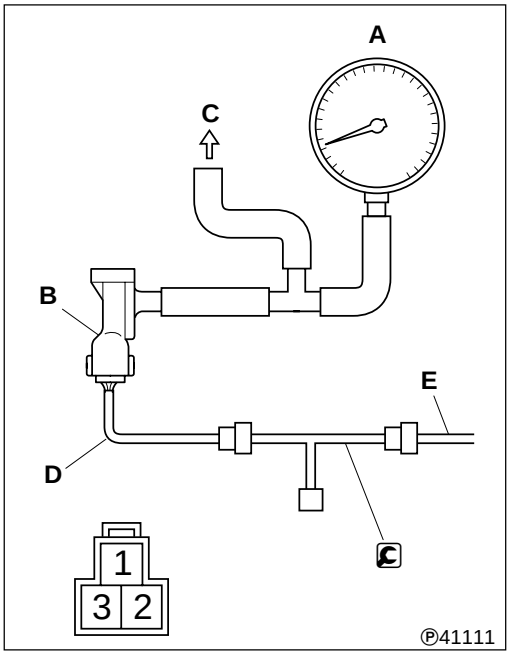
318 Checking Boost Pressure Sensor

<Checking by use of Multi-Use Tester II>

P13E-28

NOTE:

The boost pressure checking conditions differ between when the boost pressure is checked by use of the Multi-Use Tester II and when it is checked without use of the Multi- Use Tester II. So the standard values also differ.



<Checking without use of Multi-Use Tester II>

- Disconnect the harness **D** of the boost pressure sensor from the chassis side harness **E** and connect the C inspection harness between them.

Too Name and Shape	Part No.
Inspection Harness  02806	MC854336

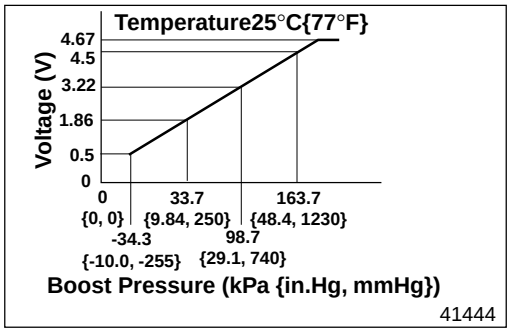
- Mount pressure gauge **A** for measurement of the boost pressure.
  C: To inlet manifold
- Set the starter switch to ON.
- Measure the output voltage of the boost pressure sensor **B** according to the following table.

Item	Connector Pin		
	① Power (+)	② GND (-)	③ Output (+)
Power voltage	○	○	
* Output voltage (Refer to the output characteristics shown at left.)		○	○

*: Start the engine before measurement.

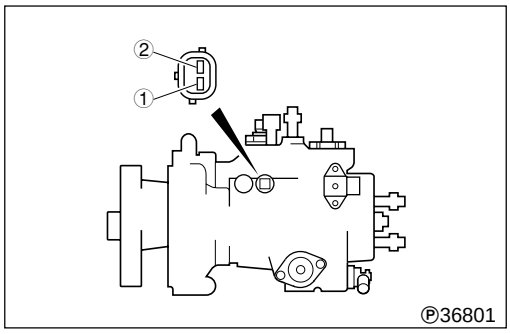
https://truckmanualshub.com/

Output Characteristics



Standard Value	② - ③	5 V
	① - ②	0.5 V/–34.3 kPa {–10.0 in. Hg, –255 mmHg}
		1.86 V/33.7 kPa {9.84 in. Hg, 250 mmHg}
		3.22 V/98.7 kPa {29.1 in. Hg, 740 mmHg}
		4.5 V/163.7 kPa {48.4 in. Hg, 1230 mmHg}

- If the results of the above mentioned checks show any deviation from the standard values, replace the boost pressure sensor **B**.

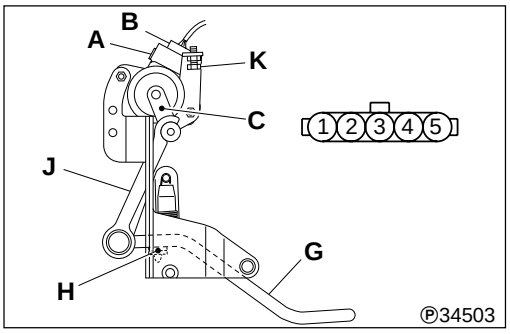


323 Checking Fuel Temperature Sensor

- Measure the resistance between pins ① and ②

Standard value (at 20°C {68°F})	2.5 ± 1.0 kΩ

- If the reading is out of the standard value range, replace the fuel temperature sensor. Ask your DENSO service station to replace it.



324 Checking Accelerator Position Sensor

[Inspection]

- Set the starter switch to ON.
- Measure the output voltage of the accelerator position sensor **A** from the back side of harness connector **B** according to the following table.

Lever **C** position		Accelerator Position Sensor 1		Accelerator Position Sensor 2		Accelerator Switch	
		②	①	②	⑤	②	③
		⊕	⊖	⊕	⊖	⊕	⊖
Standard value	Idling position **D**	0.85 ± 0.1 V		0.85 ± 0.1 V		4V or more	
	Accelerator switch operating position **E**	1.0 ± 0.24 V		1.0 ± 0.24 V		1V or less	
	Full load position **F**	4.0 ± 0.1 V		4.0 ± 0.1 V			

○——○ : There must be continuity between the pins.

⊕ , ⊖ : Polarity when voltage is measured

D: Where accelerator control arm **G** is in contact with stopper **H**

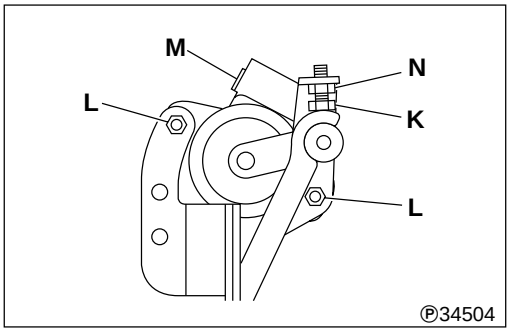
E: Where voltage across pins ② and ③ is reduced to 1V or less by slowly depressing the accelerator pedal

F: Where accelerator control extension **J** is in contact with stopper bolt **K**

- If the output voltage is out of the standard value range, adjust by the following procedures.

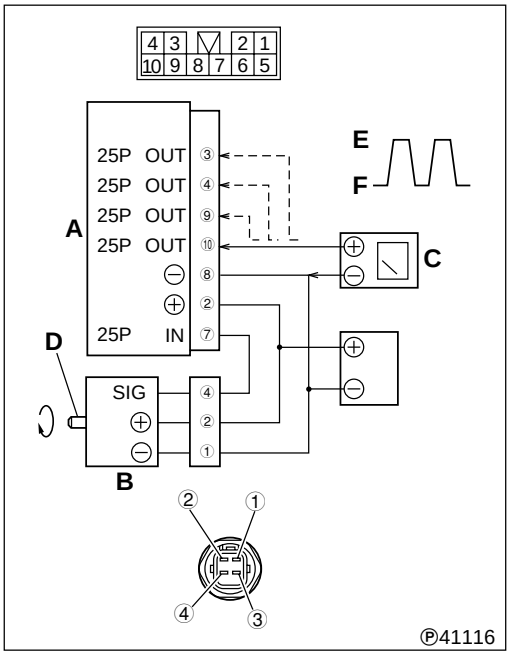
https://truckmanualshub.com/

INSPECTION OF ELECTRICAL EQUIPMENT



[Adjustment]

- Adjust the output voltage at the idling position **D** by loosening the screw **L** and moving the accelerator position sensor **A**.
  After the adjustment, retighten the screw.
- Adjust the output voltage at the full load position **F** by loosening the nut **M** and adjusting the stopper bolt **K**.
  After the adjustment, lock the bolt with the nut.

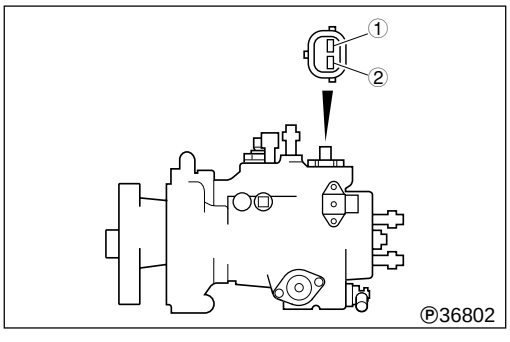


351 **Checking Pulse Divider**

- Wire the pulse divider **A** as shown.
  B: Vehicle speed sensor (Use 25-pulse pins.)
  C: Tester
- Slowly rotate the shaft **D** of the vehicle speed sensor **B** by hand and measure the maximum value (high pulse voltage **E**) and the minimum value (low pulse voltage **F**) of the voltage generated across each of the output pins (③, ④, ⑨, ⑩) and pin ⑧ of the pulse divider **A**.

Standard value	Low pulse voltage **F**	0.5V or less
	High pulse voltage **E**	8 ± 1 V

- If the reading is out of the standard value, replace the pulse divider **A**.



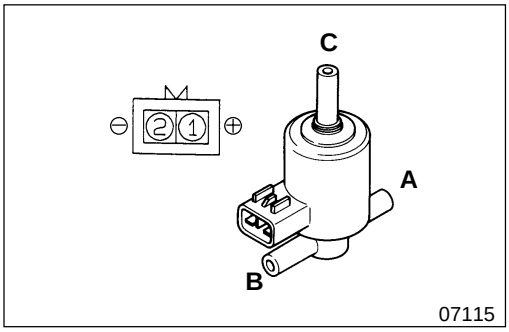
536 **Checking Spill Valve**

- Measure the resistance between pins ① and ②.

Standard value (at 20°C {68°F})	1.5 ± 0.5 Ω

- If the reading is out of the standard value range, replace the spill valve. Ask your DENSO service station to replace it.

https://truckmanualshub.com/



565 Checking 3-Way Magnet Valve

Perform the following checks. If there is anything wrong, replace the 3-way magnet valve.

(1) Operation Check

- Apply DC voltage across pins ① and ② and slowly increase, beginning at 0V.
- Measure the voltage at the time when the 3-way magnet valve is operated.
  (Determine whether the magnet valve is ON or OFF on the basis of its operating sound.)

Standard value (Lowest operating voltage)	11 V or less

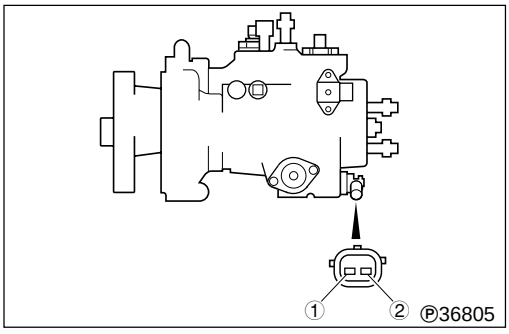
(2) Continuity and Air Tightness Checks

Perform continuity checks according to the following table.

	Input Port **A**	Output Port **B**	Exhaust Port **C**
ON	○——○		
OFF		○——○	

○——○ : There must be continuity between the pins.

Negative pressure at the time of check: 100 kPa {30 in.Hg, 750 mmHg}



584 Checking Timer Control Valve

- Measure the resistance between pins ① and ②.

Standard value (at 20°C {68°F})	11.3 ± 3 Ω

- If the reading is out of the standard value range, replace the timer control valve. Ask your DENSO service station to replace it.

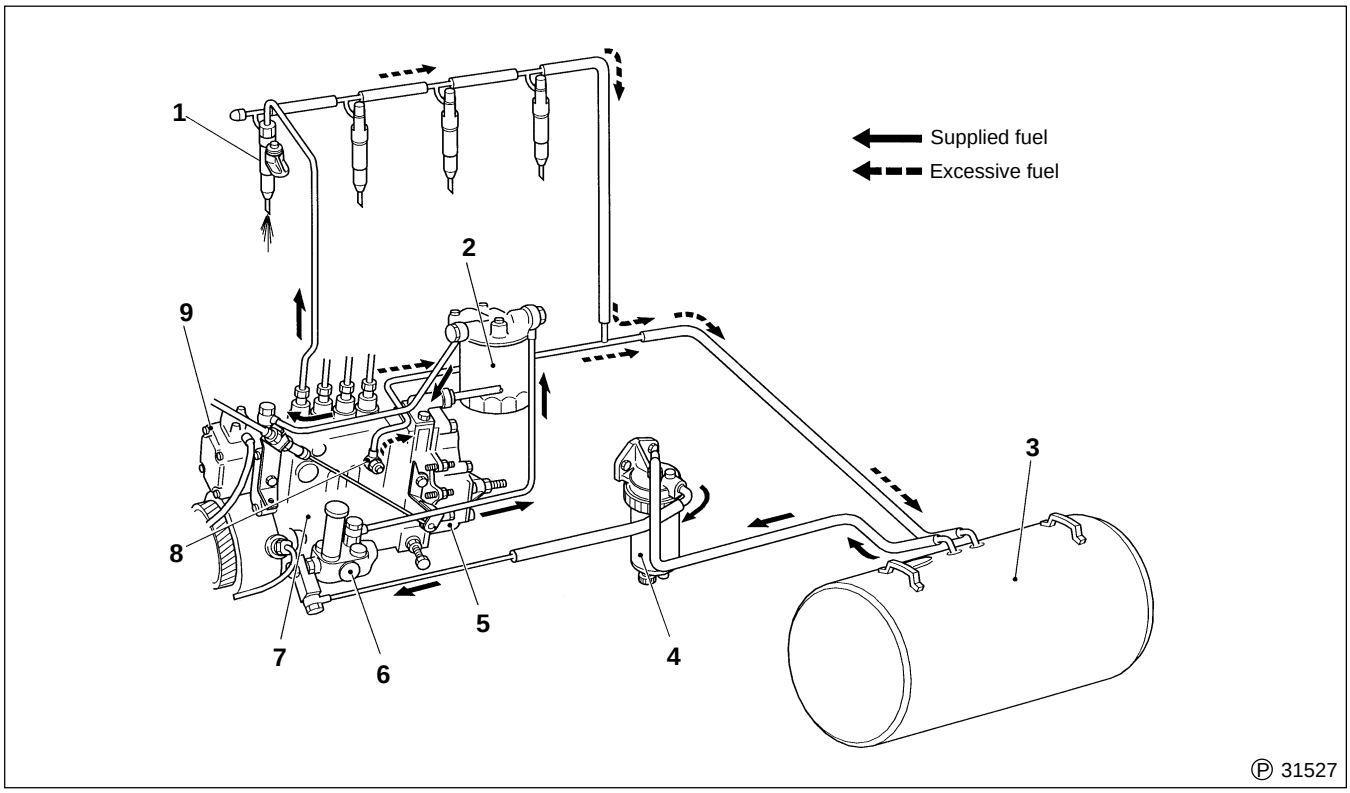
STRUCTURE AND OPERATION

Fuel System (Flow of Fuel)

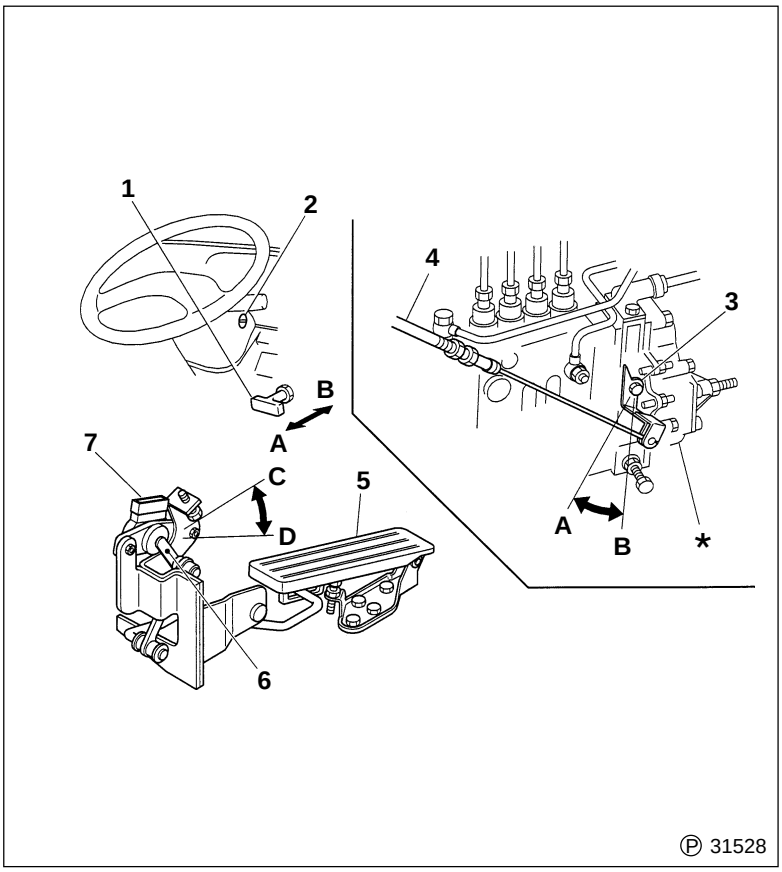


1 Injection nozzle
2 Fuel filter
3 Fuel tank
4 Water separator
5 Electronic governor
6 Feed pump
7 Injection pump
8 Overflow valve
9 Pre-stroke actuator

Fuel in fuel tank **3** is sucked up by feed pump **6** which is driven by the cam action of injection pump **7** and is filtered through fuel filter **2** which removes dirt and other foreign particles.
Filtered fuel is sent to the injection pump where the fuel pressure is boosted and injected through injection nozzle **1** into the combustion chamber.
When fuel pressure is higher than the specified value, overflow valve **8** opens to let the fuel return to the fuel tank.

https://truckmanualshub.com/

Engine Control



1 Emergency engine stop handle
2 Starter switch
3 Engine stop lever
4 Engine stop cable
5 Accelerator pedal assembly
6 Lever
7 Accelerator pedal position sensor

***** : Electronic governor

A : Engine-stop position
B : Engine start-up position
C : Full-load position
D : Idling position

● **Accelerator switch**

The accelerator switch is integrated in the accelerator pedal position sensor **7**. It detects the pressing of accelerator pedal assembly **5**.

● **Accelerator pedal position sensor**

Accelerator pedal position sensor **7** detects the movement of accelerator pedal assembly **5**, and sends an electric signal to the electronic governor control unit. Lever **6** of the accelerator pedal position sensor is constantly pulled by the return spring towards idle position **D**.

● **Emergency engine stop button**

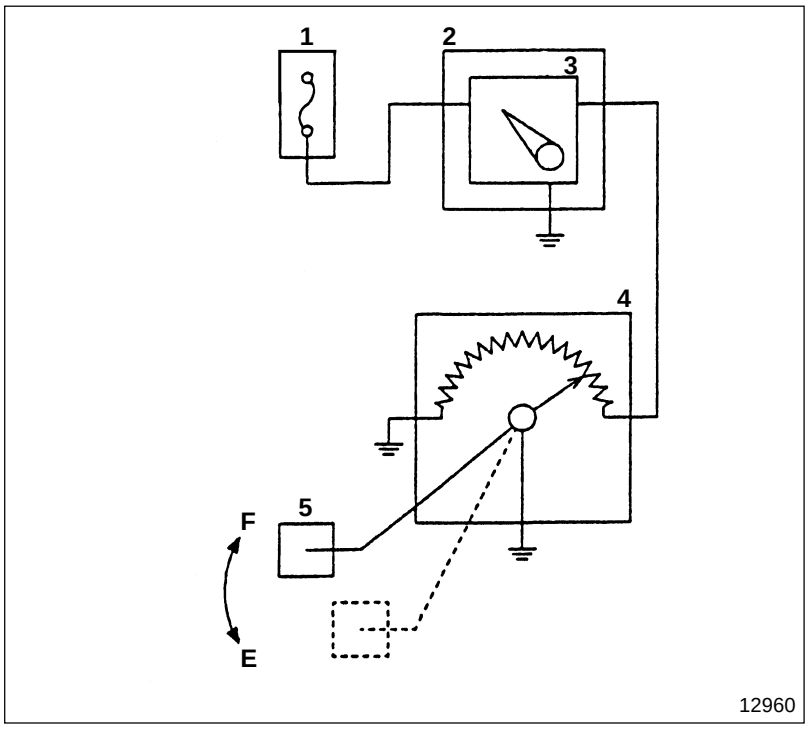
In normal condition, turn starter switch **2** to the ACC position to electrically shut down the engine operation.
In the case the engine does not stop when the starter switch is turned to the ACC position due to malfunction of the electronic governor system or other cause, stop the engine by pulling emergency engine stop handle **1** to move stop lever **3** of electronic governor ***** to engine-stop position **A**.

CAUTION ⚠

When the engine is stopped by pulling engine stop handle 1, set starter switch 2 to the ACC or LOCK position to reset the control unit computer.
Restarting the engine without resetting the computer results in unstable engine speed control.

https://truckmanualshub.com/

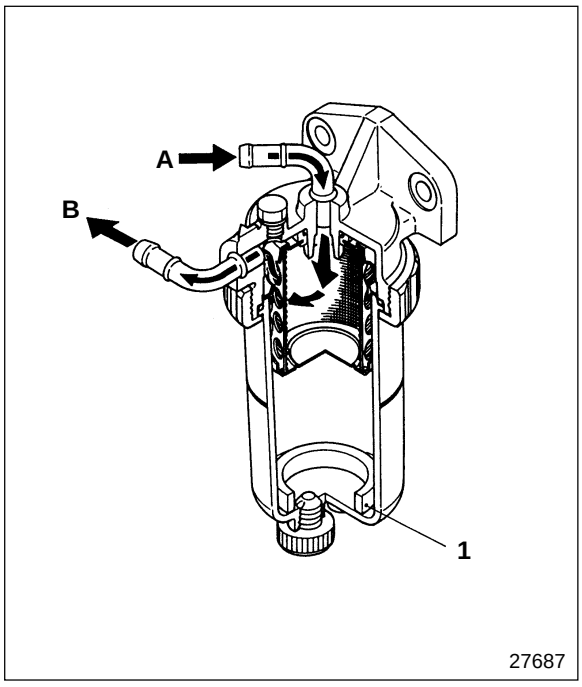
Fuel Gauge Electric Circuit



1 Fuse box
2 Meter cluster
3 Fuel gauge
4 Fuel gauge sending unit
5 Float

The fuel gauge circuit indicates the amount of fuel remaining in the fuel tank by means of a gauge.

Water Separator



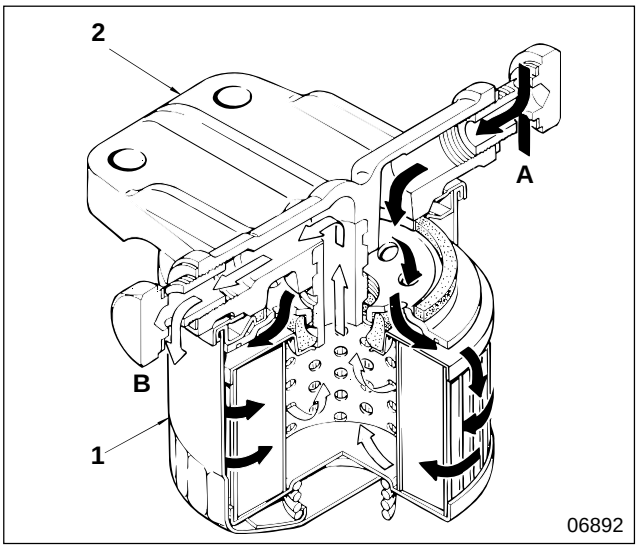
1 Water level ring

A : From fuel tank
B : To feed pump

The water separator is installed between the fuel tank and the feed pump. Any water present in the fuel is separated by the baffle plate and the screen assembly.

https://truckmanualshub.com/

Fuel Filter



1 Fuel filter
2 Fuel filter head

A : From feed pump
B : To injection pump

Pressurized fuel is delivered from the feed pump of the injection pump to the fuel filter which separates water from the fuel. Dirt and other foreign particles are removed from the fuel by fuel filter **1**.

https://truckmanualshub.com/

- The electronic governor and pre-stroke control injection pump system combines an electronic governor **10** with an injection pump **6** that has an electronically controlled pre-stroke adjustment feature.
- The injection pump's plunger lift speed varies in accordance with the engine speed, causing concomitant variations in the injection pipe pressure.
- Variations in the injection pipe pressure make it difficult to achieve an optimum spray from the injection nozzles and the optimum air/fuel mixture.
- To compensate for changes in the injection pipe pressure, the injection pump plunger pre-stroke is increased at low and mid- range speeds, thus ensuring that fuel injection takes place late in the cam lift, when plunger movement is relatively fast.
- At high speeds, the plunger pre-stroke is decreased, thus ensuring that fuel injection takes place in early in the cam lift, when plunger movement is relatively slow. Excessive increases in injection pipe pressure are thus prevented.
- By adjusting the plunger pre-stroke in this manner, the pre-stroke control injection pump **6** ensures that the spray and air/ fuel mixture are always optimally suited to combustion.
- The overall benefits are higher engine torque and cleaner exhaust emissions than are possible with a conventional injection pump.
- Control operations are performed by the electronic governor control unit **35**, which receives data from sensors on the engine and other vehicle components, processes them, and issues appropriate drive signals to the pre-stroke actuator **5** (located at the rear of the injection pump) and to the linear DC motor **9** (located inside the electronic governor).

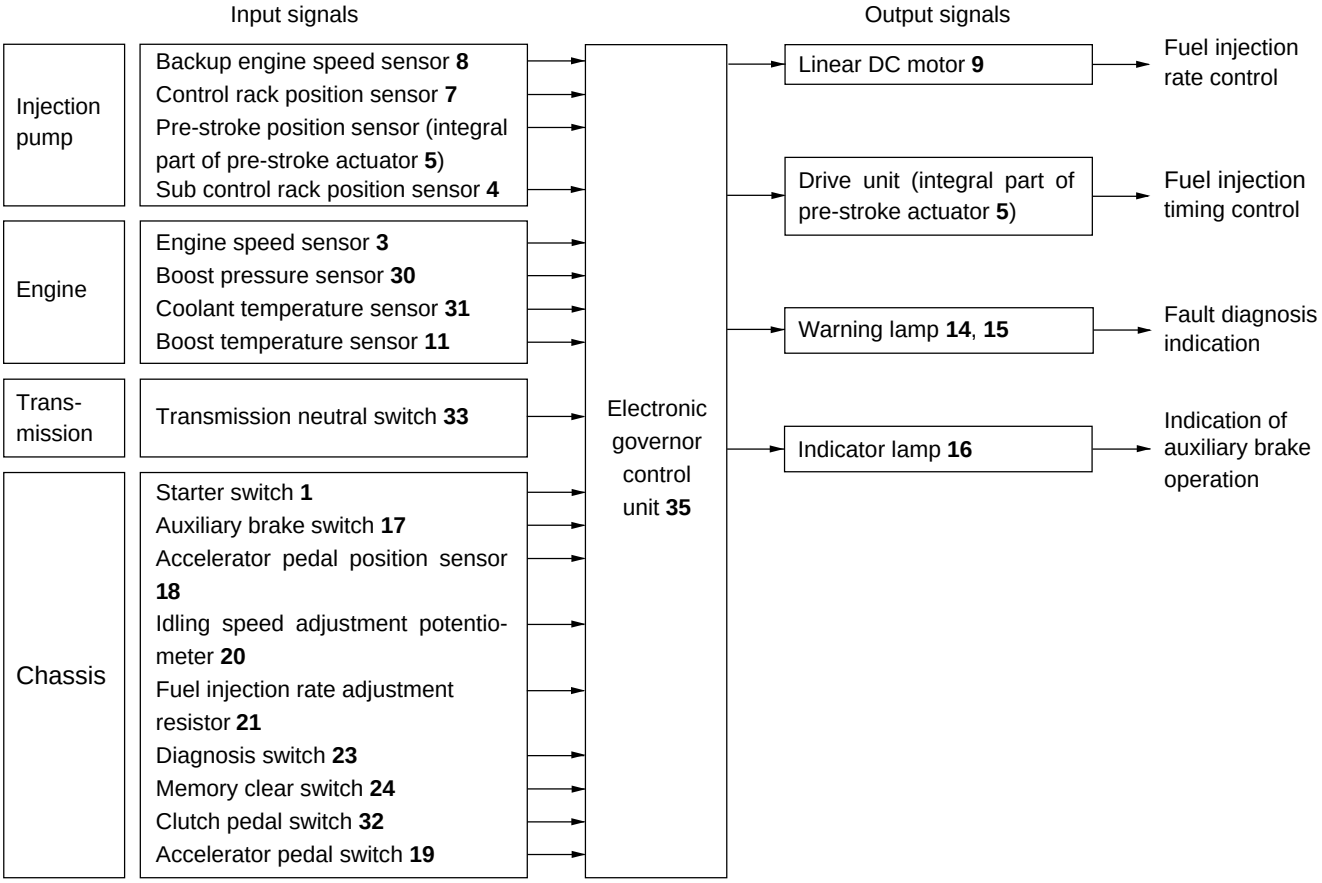
The system's control functions (including auxiliary functions) are shown in the following table.

Item	Operation	Data source	
		Sensor(s)	Data signal(s)
Fuel injection rate control	The fuel injection rate is optimized to match engine operating conditions. P13-12	3, 7, 18, 19, 21, 28	Ⓓ, Ⓖ, Ⓟ, Ⓠ, Ⓢ, ⓑ
Pre-stroke control	The timing sleeve position is altered, thereby changing the pre-stroke and advancing the fuel injection timing. P13-13	3, 5, 18, 31	Ⓓ, Ⓐ, Ⓑ, Ⓟ, ⓔ
* Control rack preliminary operation	In cold weather and other conditions that are unfavorable for engine startup, the control rod is caused to move slightly in the fuel increase direction, thus enhancing startabilily. This operation takes place when the starter switch is turned ON.	1, 18, 19, 31	ⓗ, Ⓟ, Ⓠ, ⓔ
* Warmup time shortening function	In cold weather, the engine's idling speed is increased to shorten the time required for warmup. P13-14	18, 19, 20	Ⓟ, Ⓠ, Ⓡ
* Overrun prevention function	In the event of an abnormal increase in engine speed, the control rack is pulled in the fuel decrease direction to prevent the engine from overrunning.	3	Ⓓ
* Emergency vehicle operation function (used in event of control rack position sensor fault)	In the event of a fault in the control rack position sensor **7**, the control rack position is sensed by the sub control rack position sensor **4**. If both rack position sensors develop faults, thus preventing detection of the rack position and optimization of the fuel injection rate, the fuel injection rate is controlled in accordance with engine speed signals only. P13-16	3, 4, 7	Ⓓ, Ⓒ, Ⓖ
* Auxiliary brake control function	The auxiliary braking devices (exhaust brake) are controlled by the electronic governor control unit **35**. (In a conventional system, the auxiliary braking devices are controlled by switches, relays, and dedicated controllers.) P13-17	3, 16, 18, 19, 29, 32, 33	Ⓓ, Ⓜ, Ⓟ, Ⓠ, ⓑ, ⓕ
* Fault diagnosis function	The status of each system sensor is monitored continuously during engine operation. In the event of a fault, a warning lamp is illuminated to alert the driver and data related to the fault are stored in memory. P13-34	ALL	ALL
* Fail-safe function	In the event of a fault, a backup mode is selected and remedial action is taken in accordance with the type of fault. P13-38	ALL	ALL
* Reverse engine operation prevention function	In the event of reverse engine operation, the control rack is pulled in the fuel decrease direction to stop the engine.	3	Ⓓ

* : Auxiliary function

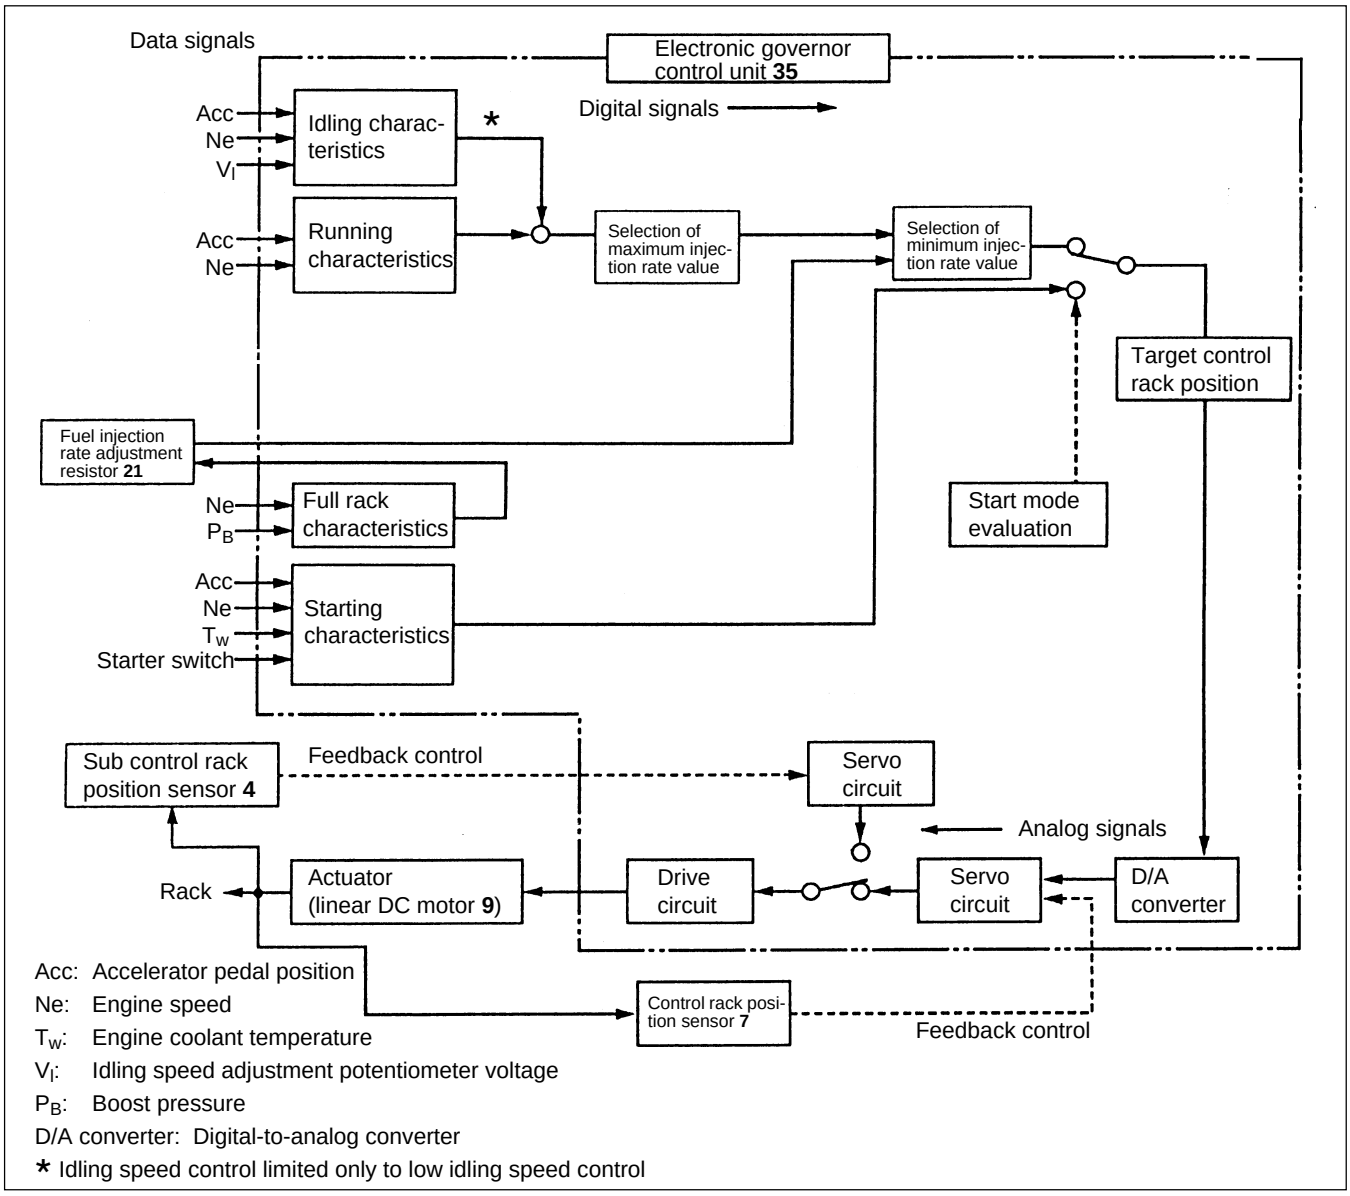
https://truckmanualshub.com/

System Block Diagram



https://truckmanualshub.com/

● Fuel Injection Rate Control



Operation of electronic governor control unit 35

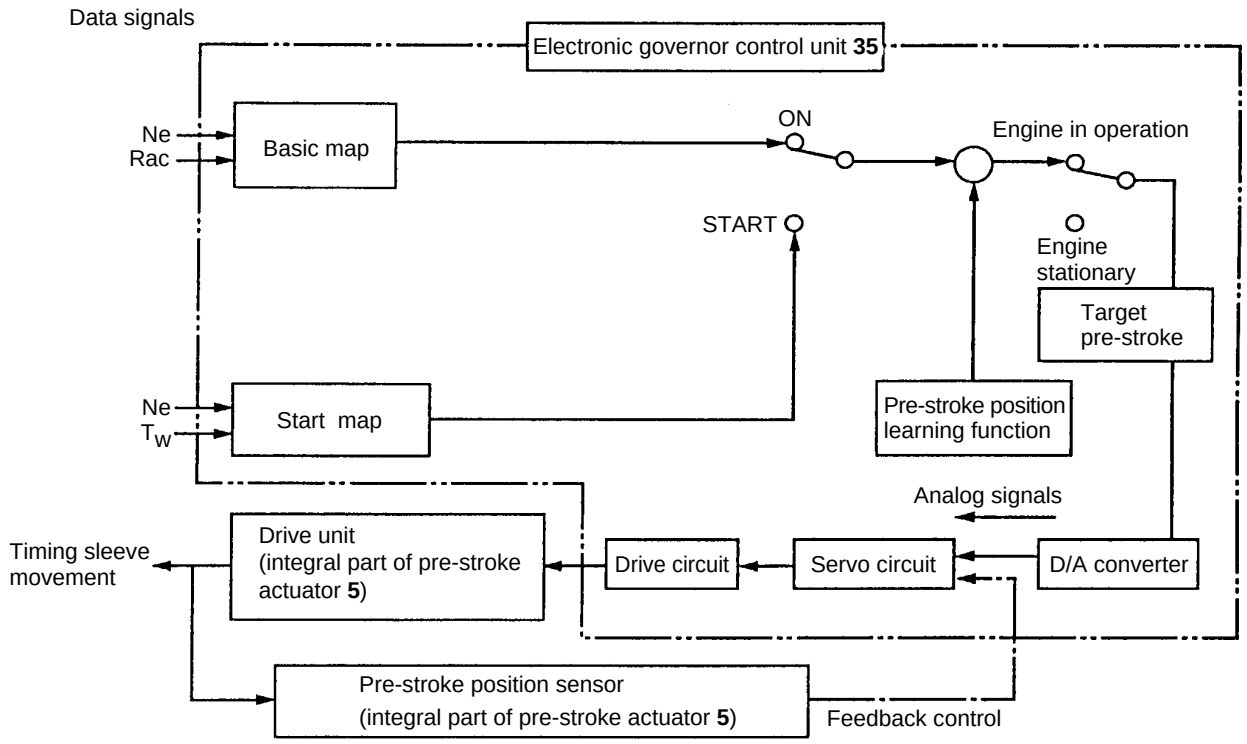
- During engine operation, control is effected in accordance with the idling characteristics and running characteristics. The maximum fuel injection rate value is selected in accordance with the output signals.
- After this selection, the control unit calculates and determines the minimum injection rate to prevent the injection rate selected in accordance with the full rack characteristics from exceeding the maximum injection rate. The target control rack position is thus determined. (During engine startup, control is effected in accordance with the starting characteristics, with the target rack position determined directly in accordance with the data signals.)
- The determined control rack position signal is converted into a continuous analog signal. By way of the servo circuit and drive circuit, the signal is applied to the linear DC motor **9**, which moves the rack.

Operation of control rack position sensor 7

- The control rack position sensor **7** monitors the operation of the linear DC motor **9**. In accordance with the position of the control rack, the sensor determines whether the linear DC motor is operating in accordance with the target, and it transmits feedback signals to the electronic governor control unit **35**.
- In accordance with the feedback signals, the electronic governor control unit **35** calculates the actual control rack position. If the actual position differs from the target, the control unit issues a correction command.
- Through repetition of this process, the system ensures that the control rack position complies with the target at all times.

https://truckmanualshub.com/

● Pre-stroke control



Rac: Control rack position
Ne: Engine speed
T_W: Engine coolant temperature
D/A converter: Digital-to-analog converter

Operation of electronic governor control unit 35

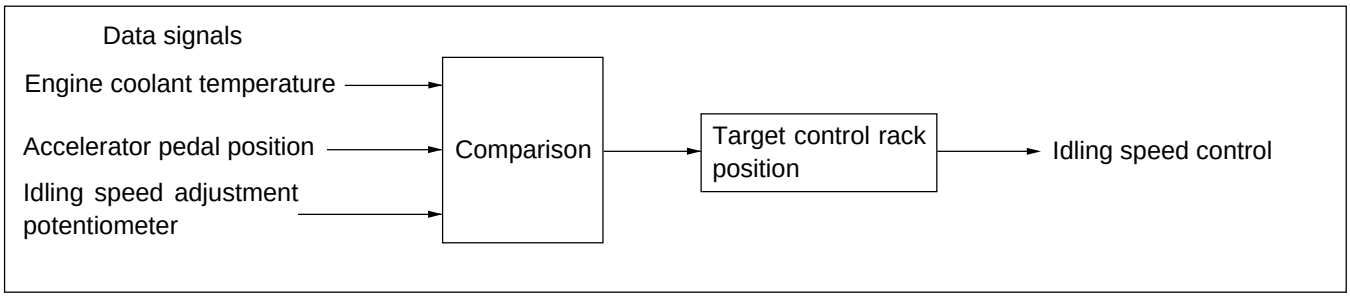
- During engine operation, control is effected in accordance with the basic map.
- The pre-stroke position learning function compensates for pre-stroke position sensor adjustment errors and other injection pump errors using the pre-stroke position sensor output voltage, thereby enabling determination of the target pre-stroke.
- The determined target pre-stroke value is converted into a continuous analog signal. By way of the servo circuit and drive circuit, the signal is applied to the drive unit. The drive unit moves the timing sleeve to alter the pre-stroke.
- During engine startup, control is effected in accordance with the start map.

Operation of pre-stroke position sensor (integral part of pre-stroke actuator 5)

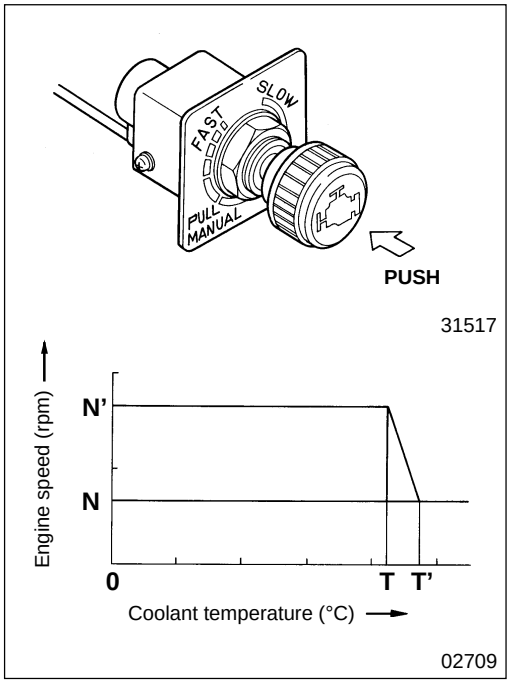
- The pre-stroke position sensor monitors the operation of the drive unit. In accordance with the position of the timing sleeve, the sensor determines whether pre-stroke control is being performed in accordance with the target, and it transmits feedback signals to the electronic governor control unit **35**.
- In accordance with the feedback signals, the electronic governor control unit **35** calculates the actual timing sleeve position. If the actual position differs from the target, the control unit issues a correction command.
- Through repetition of this process, the system ensures that the timing sleeve position complies with the target at all times. The appropriate pre-stroke is achieved as a result.

https://truckmanualshub.com/

● Warmup time shortening function



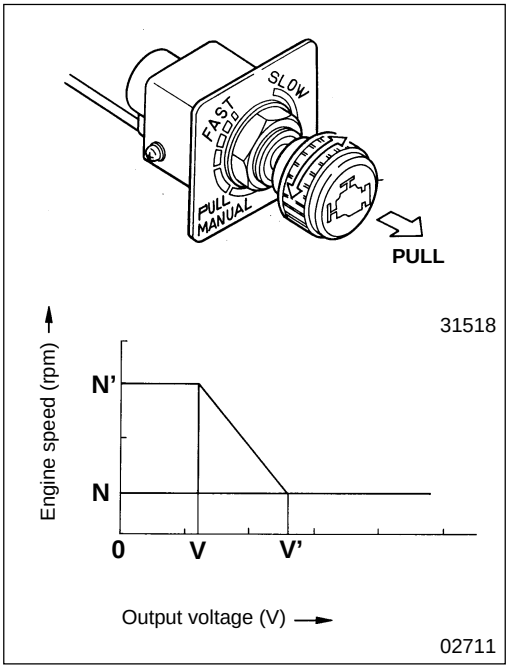
The warmup time shortening function increases the engine's idling speed in accordance with the coolant temperature, thereby shortening the time required for the engine to warm up. Control is effected automatically or manually in accordance with the position of the idling speed adjustment potentiometer **20**. Automatic control is selected by pushing the potentiometer, and manual control is selected by pulling it.



Automatic control (Potentiometer pushed)

- Automatic control is selected when the idling speed adjustment potentiometer **20** is pushed.
- When the coolant temperature is low, the engine's idling speed is automatically increased to shorten the time required for warmup.
- If the coolant temperature increases from **T** to **T'** (see the graph), the engine speed is decreased from **N'** to **N**, thus returning to its standard idling level.

https://truckmanualshub.com/



Manual control (Potentiometer pulled)

- When the idling speed adjustment potentiometer **20** is pulled, the automatic mechanism is deselected. The driver can then adjust the idling speed as desired by rotating the potentiometer. (Rotation of the potentiometer causes the potentiometer's output voltage to change accordingly.)
- With the output voltage between **0** and **V**, the engine speed stays at the **N** to **N'** level.
- If the output voltage is increased from **V** to **V'** (see the graph), the engine speed decreases from **N'** until it reaches its standard idling level **N**.

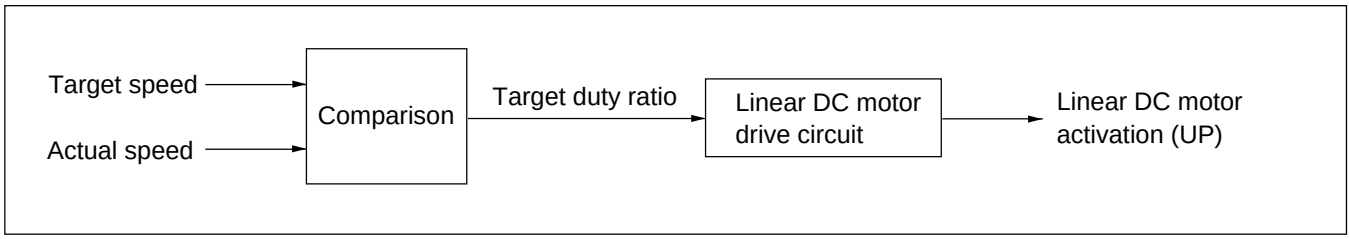
https://truckmanualshub.com/

● Emergency vehicle operation function (Used in event of control rack position sensor fault)

Fault in Control rack position sensor 7

In the event of a fault in the control rack position sensor **7**, detection of the control rack position is performed using the sub control rack position sensor **4**. This enables more-or-less normal vehicle operation.

Fault in control rack position sensor 7 and sub control rack position sensor 4



In the event of faults in both the control rack position sensor **7** and sub control rack position sensor **4**, the position of the rack, which is controlled by the linear DC motor **9**, cannot be sensed directly. The fuel injection rate cannot be controlled normally with the engine in this condition. As an emergency measure, therefore, control operations are performed in accordance with engine speed data signals only. For this function, target engine speeds for given degrees of accelerator pedal depression are pre-programmed into the electronic governor control unit **35**. Control is effected as follows:

- The target engine speed is compared with the actual engine speed (this is indicated by the engine speed sensor **3**).
- The target duty ratio is determined in accordance with the result of the comparison. In accordance with the target duty ratio, a drive signal is transmitted to the UP-side (speed increasing side) circuit to effect control over the engine speed. If the target engine speed exceeds the actual engine speed or vice versa, the UP-side circuit's ON time period is altered such that the target engine speed is maintained.

The target duty ratio is the ratio of the time periods during which the linear DC motor's UP-side and DOWN-side (speed decreasing side) circuits are energized. It is calculated as follows:

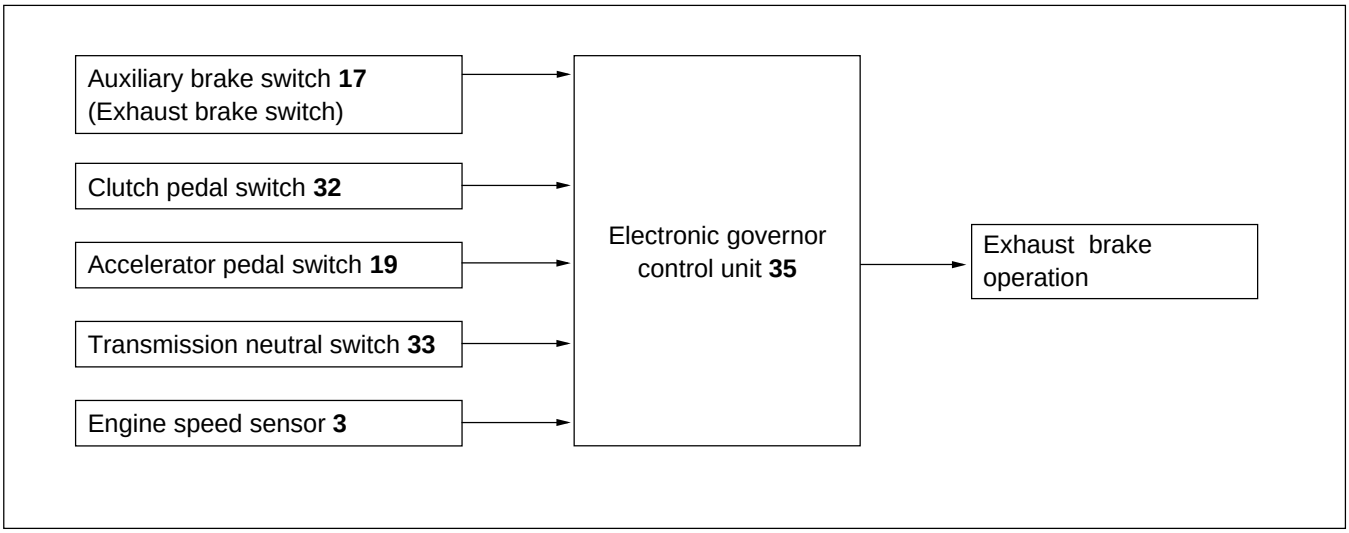
$$\text{Duty ratio} = \frac{\text{UP-side circuit ON time period}}{\text{UP-side circuit ON time period + DOWN-side circuit ON time period}} \times 100\%$$

CAUTION ⚠

When this function is activated, the warning lamp 14, 15 flashes to indicate that the engine must be inspected immediately. 🕮 **P13-34**

https://truckmanualshub.com/

● Auxiliary brake control function



The auxiliary brake control function acts upon the auxiliary braking devices, i.e., the exhaust brake, when the following conditions are satisfied:

- Clutch pedal switch **32**: OFF (clutch pedal released)
- Accelerator pedal switch **19**: ON (accelerator pedal released)
- Transmission neutral switch **33**: ON (transmission not in neutral)

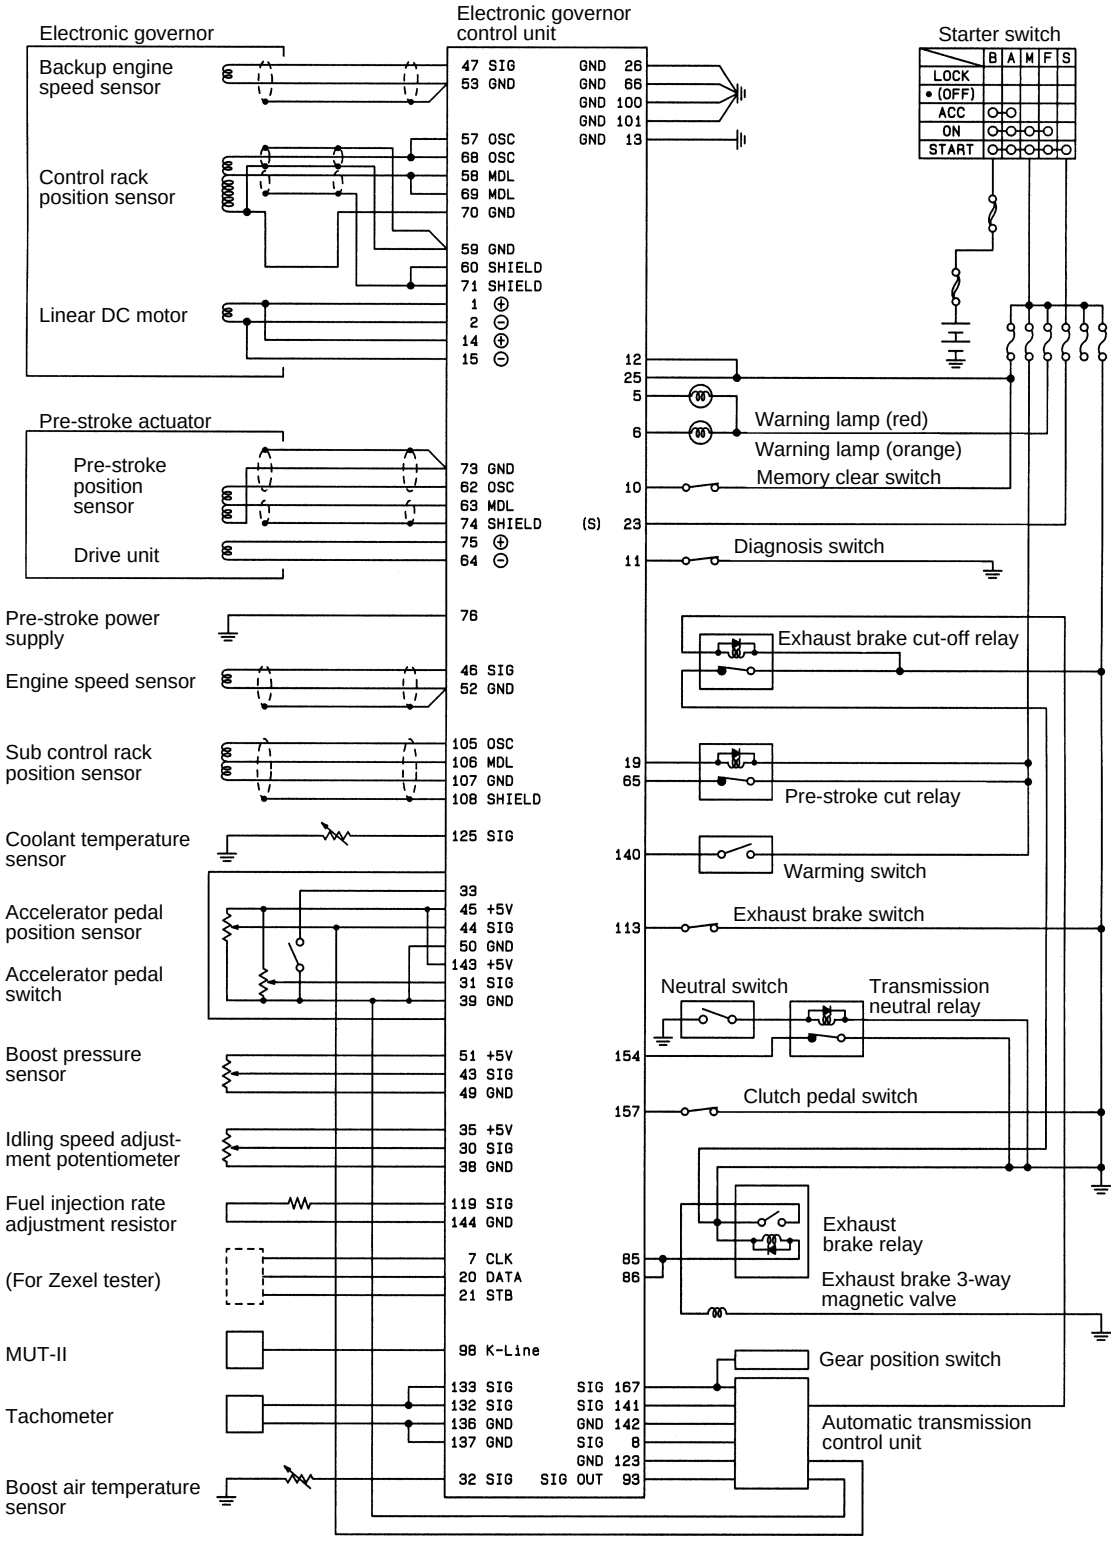
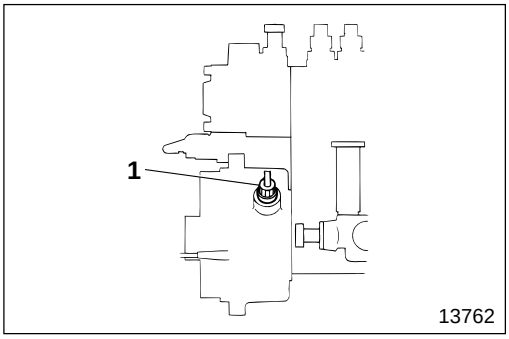
Electronic governor control unit



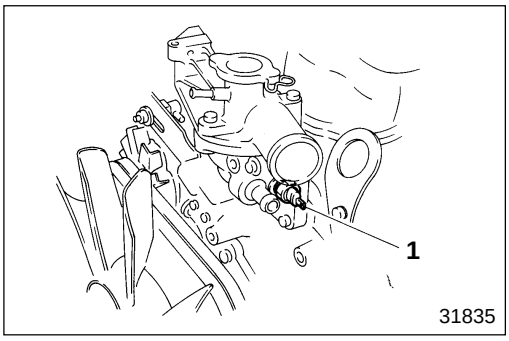
https://truckmanualshub.com/

Engine speed sensor



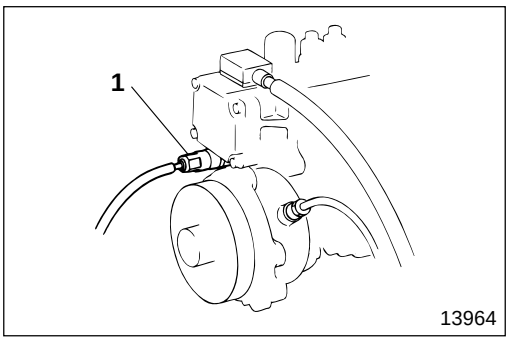
- The engine speed sensor **1** is a pickup type. It converts the rotation speed of a injection pump into electric signals.
- Signals generated by the engine speed sensor are fed to the electronic governor control unit which uses them as correction values in its calculation of the target pre-stroke position.

Coolant temperature sensor



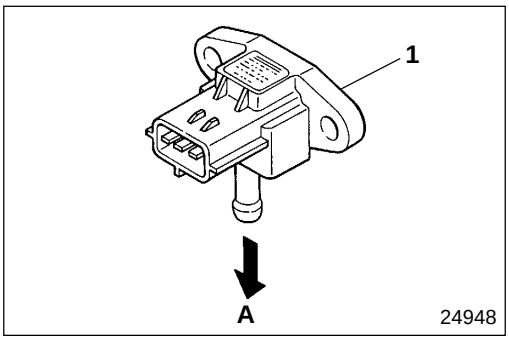
- The coolant temperature sensor **1** is a thermistor type. It converts the engine coolant temperature into electric signals.
- Signals generated by the coolant temperature sensor are fed to the electronic governor control unit which uses them as correction values in its calculation of the target rack position.

Sub control rack position sensor



- The sub control rack position sensor **1** provides backup detection of the control rack position in the event of a fault in the control rack position sensor.
- The sub control rack position sensor **1** converts the degree of control rack movement into electric signals.
- Signals generated by the sub control rack position sensor are fed to the electronic governor control unit which uses them as correction values in its calculation of the target rack position.

Boost pressure sensor

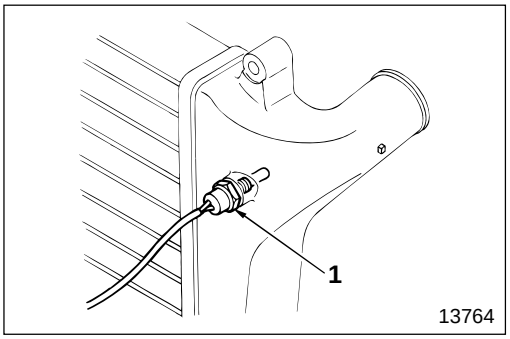


The boost pressure sensor **1** feeds boost pressure information to the electronic governor control unit. During turbocharged engine operation, it enables the full rack signal (maximum fuel injection rate value) characteristics to be selected by the control unit in accordance with the engine speed.

A : To intake manifold

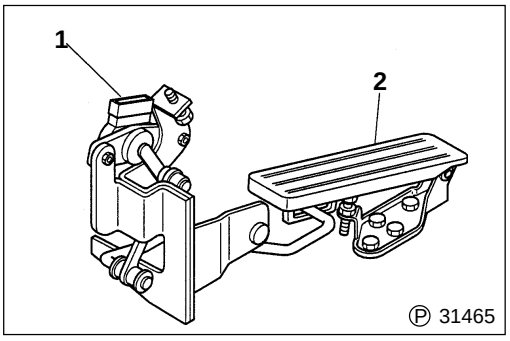
https://truckmanualshub.com/

Boost air temperature sensor



- Boost air temperature sensor **1** is a thermistor type that converts the intake air temperature, immediately after its passage through the intercooler, into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the boost air temperature signal, which is used as the correction value by the electronic governor control unit to determine the desired pre-stroke position value.

Accelerator pedal position sensor and accelerator pedal switch



- The accelerator pedal position sensor **1** provides the electronic governor control unit with information on the degree to which the accelerator pedal **2** is depressed.
- The accelerator pedal switch detects whether the accelerator pedal is currently depressed or released.
  Accelerator switch is integrated in accelerator pedal position sensor **1**.

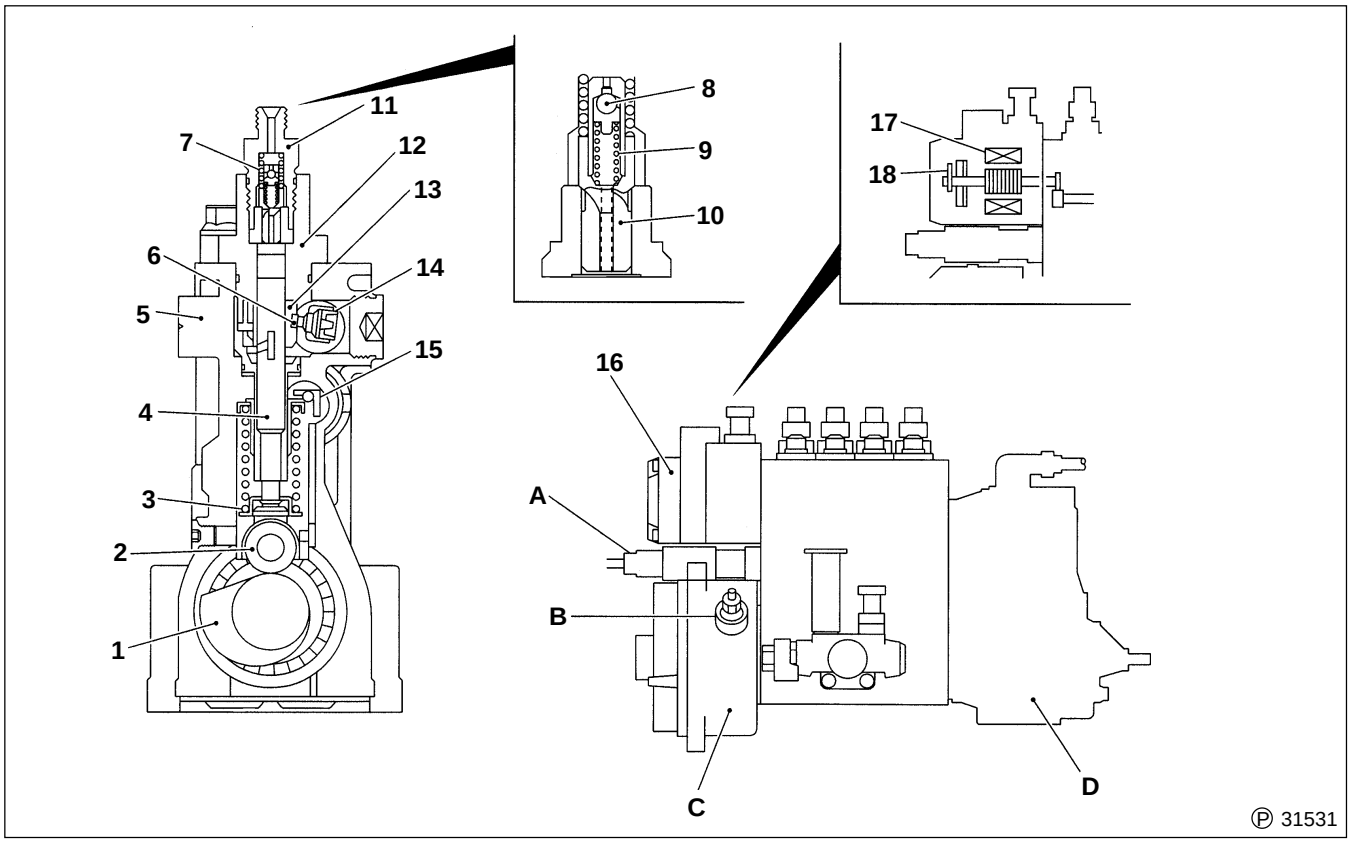
Pre-stroke Control Injection Pump Unit

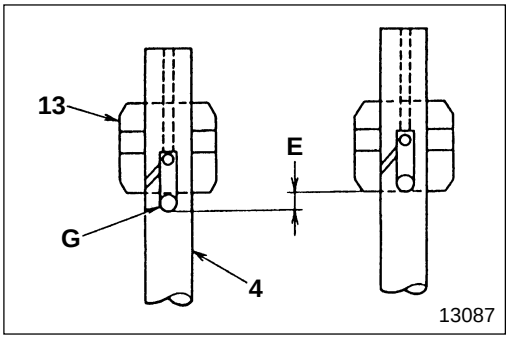


1 Camshaft
2 Tappet
3 Plunger spring
4 Plunger
5 Pump housing
6 Pin
7 Delivery valve spring
8 Ball
9 Spring
10 Delivery valve
11 Delivery valve holder
12 Plunger barrel
13 Timing sleeve
14 Timing rod
15 Control rod
16 Pre-stroke actuator
17 Drive unit
18 Pre-stroke position sensor

A : Sub-control rod position sensor
B : Engine speed sensor
C : Mechanical timer
D : Electronic governor

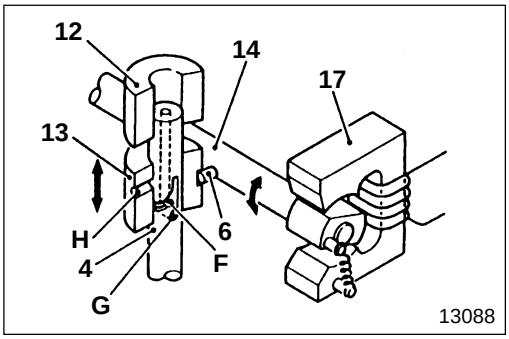
- The injection pump is provided with a mechanism that enables variation of the plunger pre-stroke.
- Variation of the plunger pre-stroke enables the creation of air/fuel mixture and spray conditions that are optimally suited to combustion. The overall benefits are higher engine torque and cleaner exhaust emissions than are possible with a conventional injection pump.

https://truckmanualshub.com/



Pre-stroke

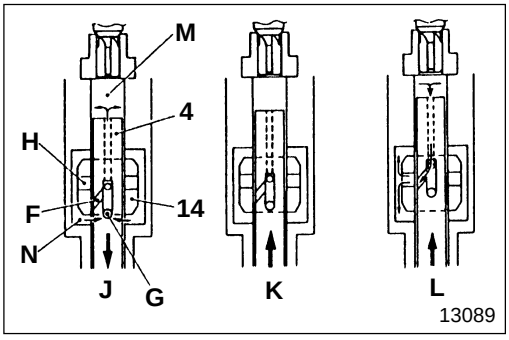
The term “pre-stroke” refers to the stroke dimension **E** of a plunger **4** from the plunger’s bottom dead center position to the point at which its fuel inlet hole **G** is closed by the timing sleeve **13** and fuel feed begins. This stroke dimension is constant in a conventional injection pump.



Variable pre-stroke mechanism

F : Lead
G : Inlet hole
H : Outlet hole

- In contrast to the fixed plunger barrel arrangement of a conventional injection pump, each plunger barrel **12** in the pre-stroke control type injection pump incorporates a vertically moveable timing sleeve **13**.
- Movement of the timing sleeve is effected by the timing rod **14**, pin **6**, and drive unit **17**.
- When the drive unit **17** rotates the timing rod **14**, the pin **6** moves the timing sleeve **13** up or down accordingly.
- Since the timing sleeve **13** incorporates a fuel outlet hole **H**, the pre-stroke changes in accordance with the movement of the timing sleeve.

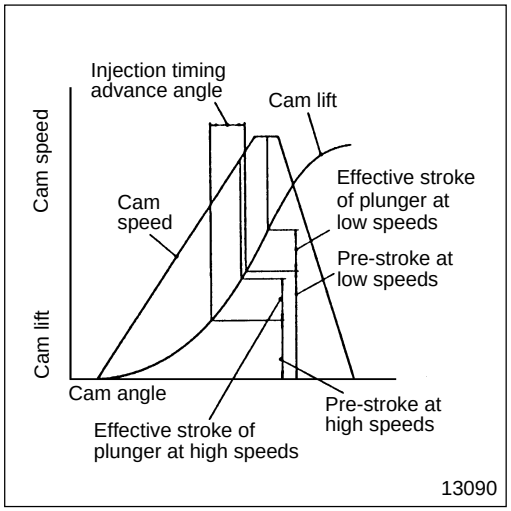


Fuel feed action

J : Fuel intake
K : Start of pressurization
L : End of pressure feed

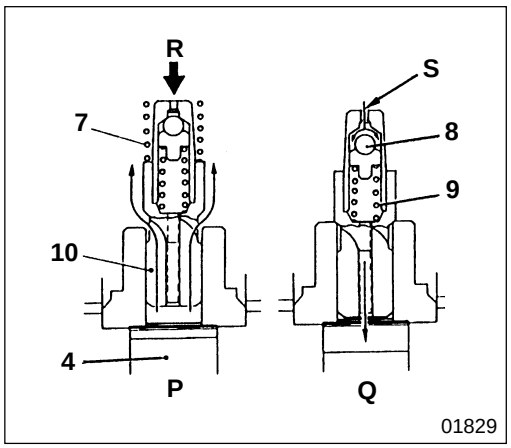
- As the plunger **4** moves downward from its top dead center position and its inlet hole **G** opens, fuel flows into the pressure chamber **M** owing to the vacuum pressure created by the plunger’s downward movement and the fuel pressure produced by the feed pump.
- When the plunger **4** moves upward but its lift dimension is still small, the fuel in the pressure chamber **M** escapes into the sump **N** through the inlet hole **G** in the plunger. Thus, the pressure in the pressure chamber does not increase.
- As the plunger **4** moves further upward and the inlet hole **G** is closed by the timing sleeve **13**, the fuel starts to be pressurized. The pressure increases as the plunger moves upward, and the injection pump starts to feed the pressurized fuel to each injector.
- When the lead **F** in the plunger **4** becomes aligned with the outlet hole **H** in the timing sleeve **13**, the fuel in the pressure chamber **M** returns to the sump **N**, thus completing the pressure feed cycle.
- Adjustment of the injected fuel volume is achieved by rotation of the plunger **4**, which alters the position of the outlet hole **H** in the timing sleeve **13** relative to the lead **F** in the plunger.

https://truckmanualshub.com/



Fuel injection timing and fuel injection characteristics

- Changes in the position of the timing sleeve **13** cause concomitant changes in the pre-stroke, which in turn alter the fuel injection timing.
- A decrease in the pre-stroke causes the fuel inlet hole **G** in the plunger **4** to close earlier such that the fuel injection timing is advanced.
- This arrangement provides highly responsive control over the injection timing and thus enhances the engine's cold startability.



Delivery valve

P : Start of pressure feed
Q : End of pressure feed

- The delivery valve **10** keeps constant the residual pressure **R** in the injection pipe at all engine speeds. This operation prevents the generation of bubbles in the fuel (this is known as "cavitation") and thus enables fuel injection at a high pressure.
- When the plunger **4** moves upward and the pressure of the fuel pushed by the plunger overcomes the residual pressure **R** in the injection pipe and the preset force of the delivery valve spring **7**, the delivery valve is pushed upward and delivery of the pressurized fuel begins.
- As soon as fuel delivery is complete, the fuel in the injection pipe rapidly returns to the plunger side and the delivery valve closes.
- Surplus fuel slowly returns through the orifice **S**, thus reducing the pressure in the injection pipe.
- When the preset force of the spring **9** in the delivery valve **10** is exactly offset by the pressure in the injection pipe, the ball **8** closes the orifice **S**, thus ensuring that the residual pressure **R** in the injection pipe remains constant.

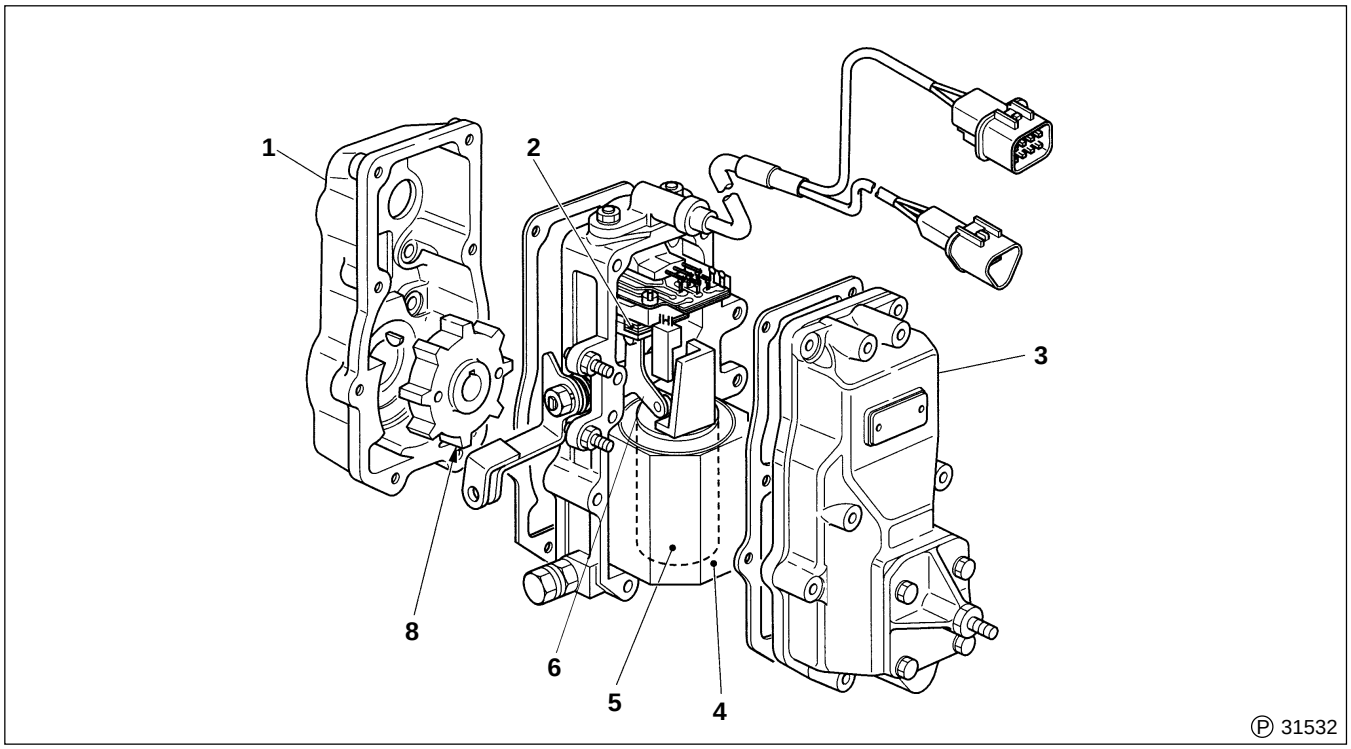
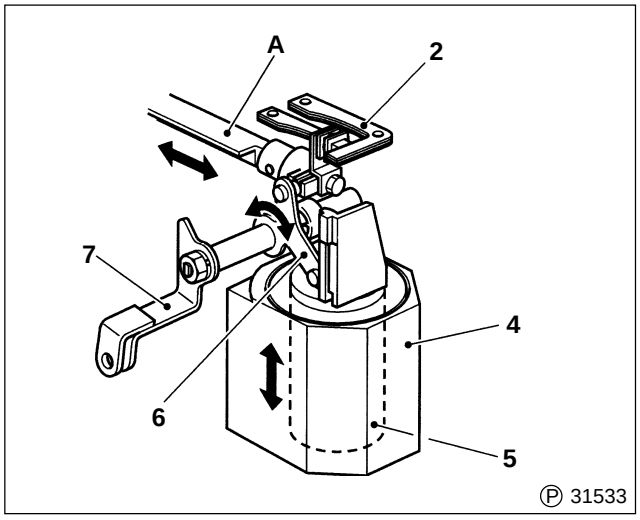
M E M O

https://truckmanualshub.com/

Electronic Governor



1 Housing
2 Control rack position sensor
3 Cover
4 Coil assembly
5 Linear DC motor
6 Link
7 Emergency engine stop lever
8 Sensing gear



● Linear DC motor

The linear DC motor **5** moves the coil assembly **4** vertically in accordance with signals from the electronic governor control unit. Via the link **6**, this movement is transmitted to the control rack **A**, which moves longitudinally to increase and decrease the fuel quantity.

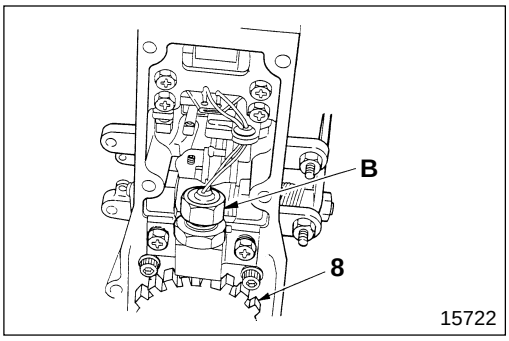
● Control rack position sensor

The control rack position sensor **2** senses whether the control rack **A** is moved to the correct position by the linear DC motor **5**. In the event of a discrepancy between the actual control rack position and the target control rack position (this is determined by the electronic governor control unit), the control unit instructs the linear DC motor to perform a corrective movement.

https://truckmanualshub.com/

● **Emergency engine stop lever**

The emergency engine stop lever **7** is connected to the link **6**. Via a cable, it enables the link to be moved from the driver's seat. In the event of a system fault that prevents the engine from being stopped normally, operation of the emergency engine stop lever forces the control rack **A** to move to the position at which fuel injection is terminated. This operation takes place irrespective of the position of the linear DC motor **5**.

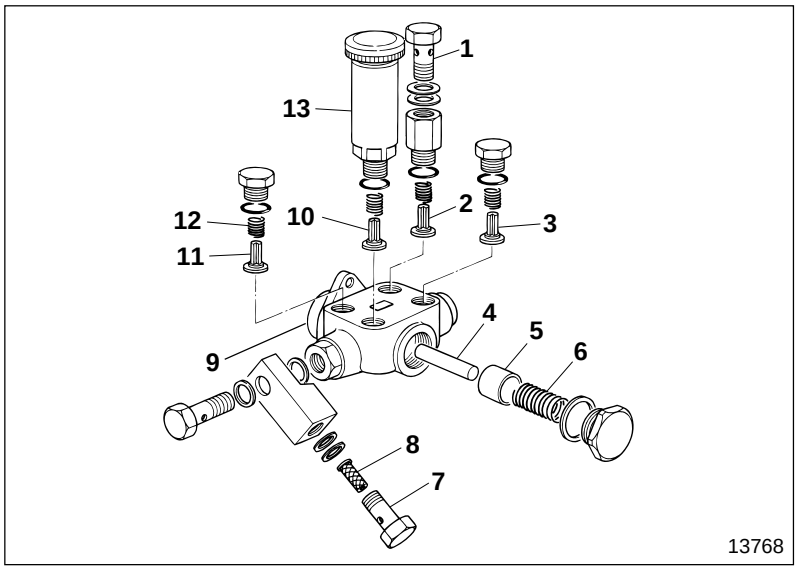


● **Backup engine speed sensor**

The backup engine speed sensor **B** is fitted inside the governor. It converts the rotation speed of the sensing gear **8** into electric signals and feeds the signals to the electronic governor control unit to provide an indication of the engine speed.

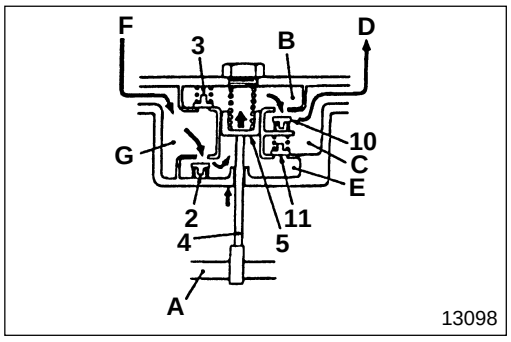
https://truckmanualshub.com/

Feed Pump



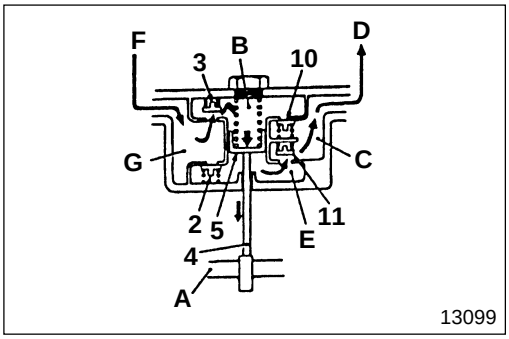
1 Eye bolt on fuel outlet side
2 Check valve
3 Check valve
4 Push rod
5 Piston
6 Piston spring
7 Eye bolt on fuel inlet side
8 Gauze filter
9 Feed pump housing
10 Check valve
11 Check valve
12 Check valve spring
13 Priming pump

- The feed pump is a double-action type pump which, with four check valves operating, sucks and discharges fuel during both strokes of pistons **5**.
- Push rod **4** makes contact with the injection pump camshaft directly, moving piston **5**.
- Priming pump **13** can be manually operated, when the injection pump is not operating, to suck up fuel and thus can be used for air bleeding.
- Gauze filter **8** eliminates large foreign particles from the fuel sucked up from the fuel tank to prevent clogging of the feed pump. This gauze filter must be cleaned with diesel fuel periodically.



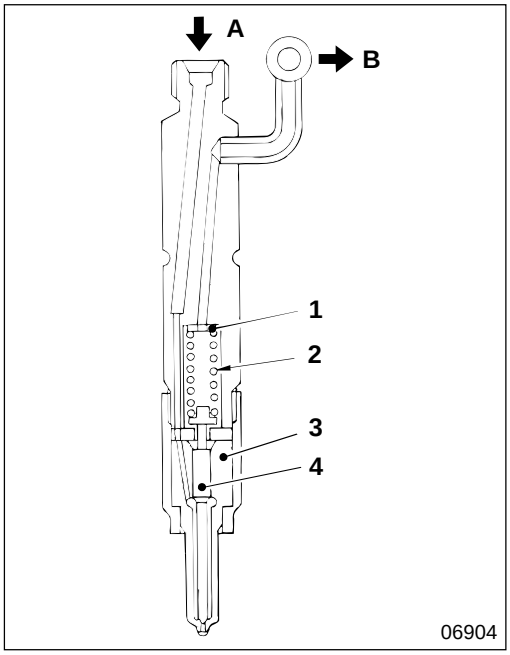
The rotation of injection pump camshaft **A**, pushes up push rod **4** and piston **5**, and the pressure in inner chamber **B** increases. This closes check valve **3**, and check valve **10** opens to let the fuel in inner chamber **B** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **E** decreases, check valve **11** closes, and check valve **2** opens to let fuel flow from fuel tank **F** through outer chamber **G** to inner chamber **E**.

https://truckmanualshub.com/



When injection pump camshaft **A** rotates further, it pushes down push rod **4** and piston **5**, and the pressure in inner chamber **E** increases. This closes check valve **2**, and check valve **11** opens to let the fuel in inner chamber **E** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **B** decreases, check valve **10** closes, and check valve **3** opens to let fuel from fuel tank **F** flow through outer chamber **G** to inner chamber **B**.

Injection Nozzle



1 Washer
2 Spring
3 Nozzle tip
4 Needle valve

A : From injection pump
B : To fuel tank

- As the pressure of the fuel delivered from the injection pump overcomes the repercussive force of spring **2**, needle valve **4** is pushed up to allow the fuel to spray out the opening at the tip of the nozzle .

- Injection pressure can be adjusted by increasing or decreasing the number of washers **1**.

TROUBLESHOOTING

Fault Diagnosis Function

- While the starter switch is in the ON position, the fault diagnosis function continuously monitors relevant sensors for faults.
  In the event that a fault is detected, the function illuminates a warning lamp (red or orange) in the meter cluster to alert the driver, memorizes the location of the fault, and switches to a backup mode.
- The memorized fault location can be read as a diagnosis code using an MUT-II or the diagnosis switch.

Warning lamp illumination

	(Orange)	(Red)
1. Safety-critical error (vehicle must not be driven)	OFF	ON
2. Non-safety-critical error (vehicle can be driven despite poor control feeling)	ON	OFF

CAUTIONS

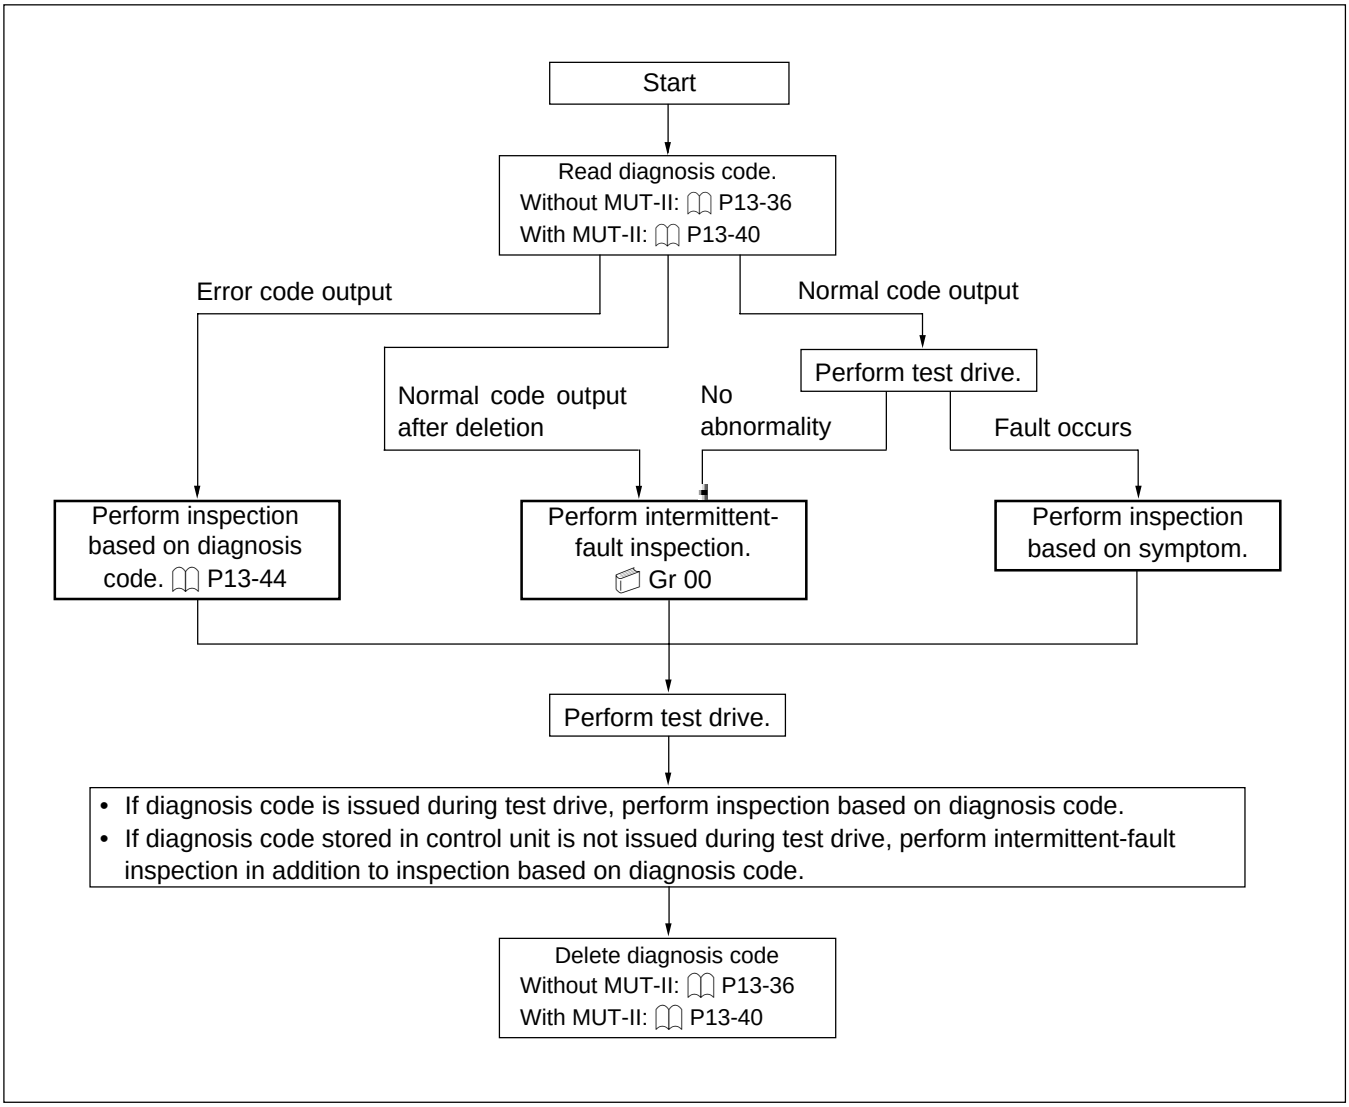
- **The fault diagnosis function requires a battery voltage of 12 V or higher.**
- **In the event of fault detection, check the harnesses and connectors for looseness. Before undoing any connector, turn the starter switch to the LOCK position and wait for 20 seconds.**
- **After rectifying a fault, delete the fault code using the MUT-II or memory clear switch.**
- **As a general rule, inspections should be performed with the starter switch in the LOCK position. If any inspection requires that the starter switch be in the ON position, be careful to avoid short circuits between connector terminals and with the vehicle body.**
- **All component resistances shown in this manual assume a temperature range of 10 to 35°C {50 to 95°F}. In practice, component values may not comply with standard values owing to temperature effects and/or to inaccuracy in the test instrument.**
- **After the rectification of a fault, the system's ability to return to normal operation automatically depends upon the diagnosis code, i.e., the fault location. When the system returns to normal operation, the warning lamp goes out.**
- **When the system returns to normal operation after the rectification of a fault, the diagnosis code remains stored in electronic governor control unit.**

https://truckmanualshub.com/

Inspection Procedure

Inspection of the electronic governor and pre-stroke control injection pump system can be performed most effectively using an MUT-II. Types of system inspection can, in accordance with fault systems and diagnosis codes, be broadly classified as follows:

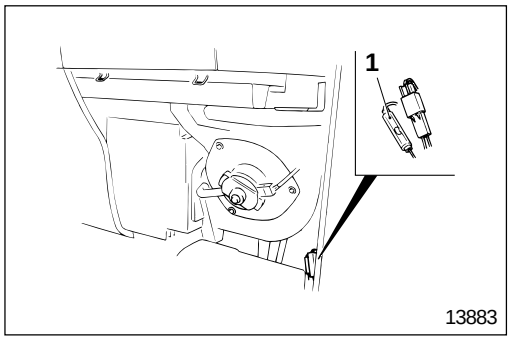
- Inspections based on diagnosis codes stored in the control unit
- Inspections based on symptoms
- Inspections of intermittent faults



https://truckmanualshub.com/

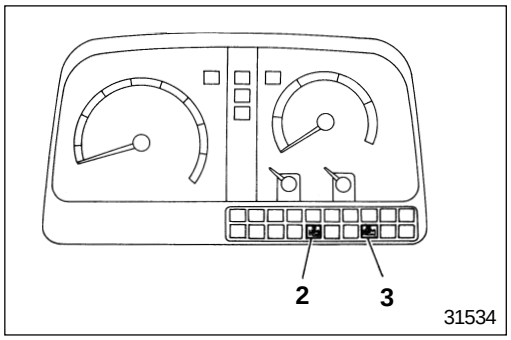
READING AND ERASING DIAGNOSIS CODES

Without MUT-II

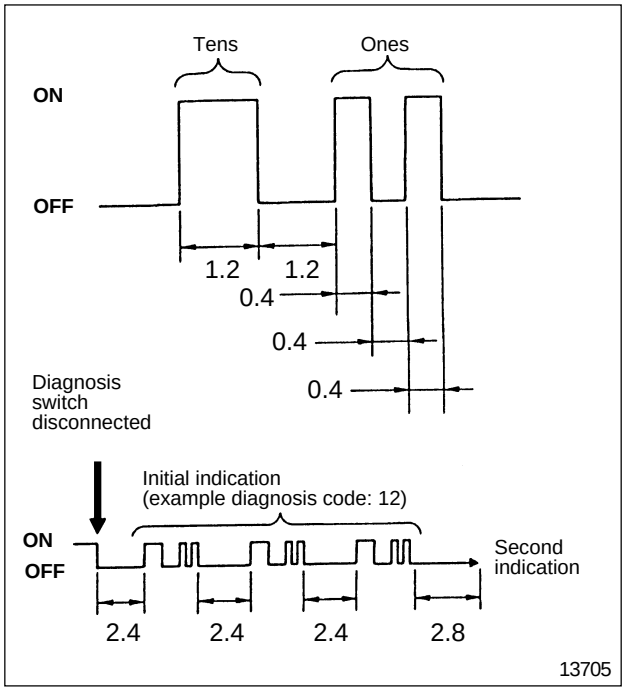


Current diagnosis code

- Turn ON the starter switch.
- Disconnect the diagnosis switch **1**.



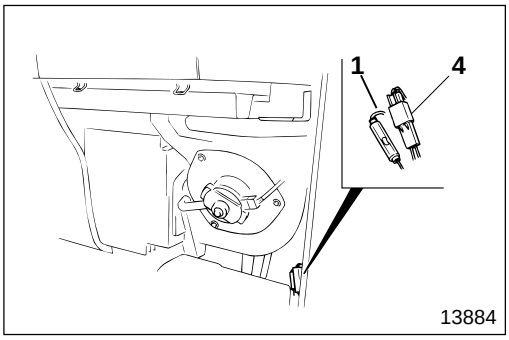
- The diagnosis code is indicated by flashing of warning lamp **2** (red) or warning lamp **3** (orange).



Diagnosis code indication

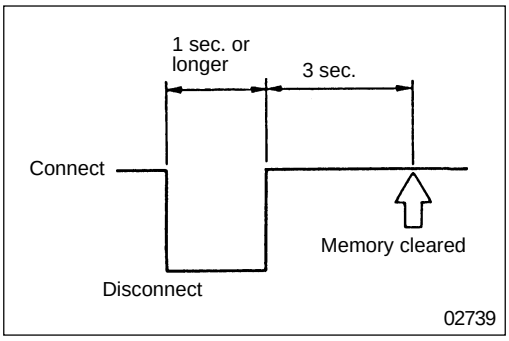
- Diagnosis codes are indicated by the numbers and durations of the warning lamp flashes.
  - Flashes for units of ten and units of one have different lengths, as follows:
    Units of ten: 1.2 seconds
    Units of one: 0.4 second
  - For each diagnosis code, units of ten are given first, followed by units of one. For a code that has no units of ten, only units of one are given.
- Each diagnosis code is indicated three times. If there are no new codes, the sequence is then repeated from the beginning with each code indicated three times.
- When the diagnosis switch **1** is connected, the control unit immediately stops the indication of codes.

https://truckmanualshub.com/



Past diagnosis codes

With the diagnosis switch **1** disconnected, disconnect the memory clear switch **4** after reading the current diagnosis code(s). The warning lamp will begin to flash again, this time to indicate any past diagnosis code(s). Verify the fault location in accordance with the code(s).



Diagnosis code eraser

To eraser all stored diagnosis codes from the control unit, disconnect and reconnect the memory clear switch **4**.

CAUTION

- **Stored codes are cleared only by disconnection and reconnection of the memory clear switch 4.**
- **To prevent the memory contents from being cleared after the indication of stored codes, turn OFF the starter switch with the memory clear switch 3 disconnected then connect the memory clear switch.**

https://truckmanualshub.com/

READING AND ERASING DIAGNOSIS CODES

Diagnosis Codes Table

Diagnosis code	Fault location	Warning lamp	Electronic control unit countermeasure(s) in the case of failure (back-up mode)	Drive ability
01	Normal	—	—	○
03	Pre-stroke actuator learning function	Orange	Provides control with “0” as correction value.	○
06	Sub-control rack position sensor	Orange	Normal control using the main control rack position sensor	○
11	Governor servo	Red	*1 Engine stopped by the pull-down function.	×
12	Pre-stroke servo	Orange	Pre-stroke control stop engine revolution speed limit (approximately 1800 rpm)	△
13	Pre-stroke sensor	Orange	Pre-stroke control stop engine revolution speed limit (approximately 1800 rpm)	△
14	Back-up engine speed sensor	Orange	Control using the main engine speed sensor	○
15	Engine speed sensor	Orange	Calculate the engine revolution speed from the pulse count of the back-up engine speed sensor.	○
14+15	Both the back-up engine sensor and the main engine speed sensors are faulty upon start-up.	Red	Do not start the engine.	○
16	Accelerator pedal position sensor II	Orange	Control using the accelerator pedal sensor I	○
21	Water temperature sensor	Orange	Set the water temperature to 80 °C {176°F}.	○
22	Control rack position sensor	Orange	Switch to the sub-control rack position sensor control.	△
24	Accelerator pedal position sensor I	Orange	Control using the accelerator pedal position sensor II.	○
24+16	Both accelerator pedal position sensor I and accelerator pedal position sensor II are faulty	Red	Set the maximum accelerator depression angle to 30 degrees even if the accelerator pedal is depressed.	△
31	Idling adjustment volume	Orange	Set to auto idling.	○
32	Boost pressure sensor	Orange	Set the boost pressure to 0 kpa {0 mmHg, 0 in. Hg}.	△*2
33	RAM (ECU internal memory circuit)	Red	Do not start the engine.	×
41	Boost temperature sensor	Orange	Normal control assuming the boost temperature is 80 °C {176 °F}.	○
45	Reverse engine operation	Orange	*1 Engine stopped by the pull-down function.	×*2
65	Accelerator switch	Orange	Limited accelerator depressing angle (Approximately 30%)	○

*1 : The pull-down function indicates the rack pull-back action. In the event of an engine over-run or severe accident, the rack is pulled back immediately to the no-injection direction in order to protect the engine.

*2 : Driveable if the starter switch is turned OFF once and then restarted again.

○ : Driveable
△ : Back-up mode driving possible
× : Undriveable

MEMO

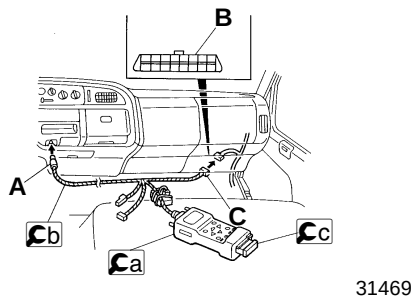
https://truckmanualshub.com/

READING AND ERASING DIAGNOSIS CODES

With MUT-II

Special tools

Location	Tool name and shape	Part No.	Application
—	MUT-II PLUS  19492	MB991496-A	Inspection of electronic governor and pre-stroke control injection pump system
—	MUT Communication  19141	MK327601	
—	ROM Pack (MRT-E4)  19493	MK327927	



31469

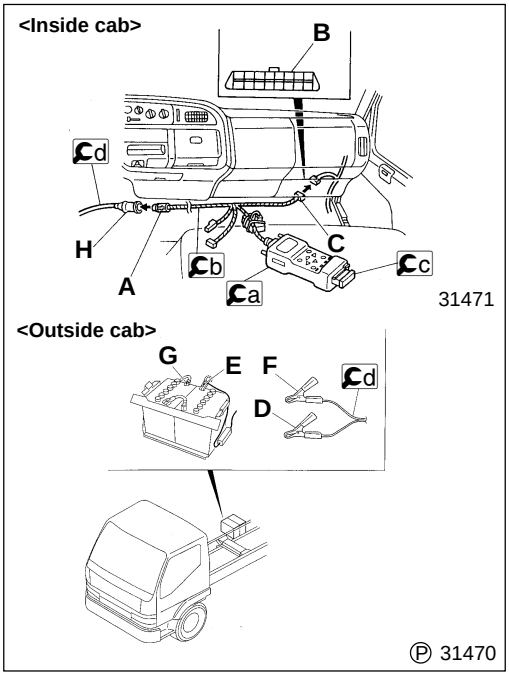
Connecting the MUT-II

- Turn the starter switch to the LOCK position.
- Connect the b MUT Communication Harness to the a MUT-II, and insert the c ROM Pack.
- Plug connector **A** into the cigarette lighter socket.
- Fit connector **C** onto MUT connector **B** (16 pin) in the relay box.

NOTE

Instructions for operation of the MUT-II are given in the separate MUT-II Reference Manual.

https://truckmanualshub.com/



- To verify the service data “START SIG”, connect the MUT-II as follows:
- Turn the starter switch to the LOCK position.
- Connect the b MUT Communication Harness to the a MUT-II, and insert the c ROM Pack.
- Attach the (+) clamp **D** (red) of the d Battery Clamp Harness to the battery’s (+) terminal **E**. Attach the (–) clamp **F** (black) of the d Battery Clamp Harness to the battery’s (–) terminal **G**.
- Fit the connector **A** into the socket **H** of the d Battery Clamp Harness.
- Fit connector **C** onto MUT connector **B** (16 pin) in the relay box.

CAUTION ⚠

Connect the (+) clamp D (red) of the b Battery Clamp Harness before connecting the (–) clamp F (black).

Current diagnosis codes

- Turn the starter switch to the ON position.
- Determine the fault location(s) in accordance with the past MUT-II diagnosis code(s).

Past diagnosis codes

- Turn the starter switch to the ON position.
- Determine the fault location(s) in accordance with the past MUT-II diagnosis code(s).

Diagnosis code erasure

- Turn the starter switch to the ON position.
- Using the MUT-II, erase all diagnosis codes stored in the control unit.

Diagnosis codes

Diagnosis codes are indicated as shown in the following table. For details of these codes, refer to the “Without MUT-II” section. 📖 P13-36

Display item			
Diagnosis code	Fault	Diagnosis code	Fault
03	PS OFFSET	**22**	RACK SNSR
06	SUB RACK SNSR	**24**	ACCEL. SNSR-1
11	GOV. SERVO	**31**	IDLE VOLUME
12	PS SERVO	**32**	BST PRES SNSR
13	PS SNSR	**33**	RAM
14	SUB NE SNSR	**41**	BST TEMP SNSR
15	NE SNSR	**45**	ENG. REVERSE
16	ACCEL. SNSR-2	**65**	ACCEL SW
21	WTR TEMP SNSR		

https://truckmanualshub.com/

SERVICE PROCEDURES USING MUT-II

Service operations can be performed most effectively using the following MUT-II functions:

● Reading of diagnosis codes

Using the diagnosis code function, it is possible to read diagnosis codes stored in the control unit.

● Erasure of diagnosis codes

By selecting the diagnosis code erasure function from the special function menu, it is possible to erase diagnosis codes stored in the control unit.

● Indication of service data

When required for service operations, data in the control unit's random-access memory can be displayed as numeric values or graphs.

Service data

MUT-II display			Inspection procedure	
No.	Data signal	Type of data	Inspection condition	Evaluation criterion

INSPECTION BASED ON DIAGNOSIS CODE

Diagnosis code	Diagnosis code display condition (s)	Cause	Remedy
03	Indicates that pre-stroke learning function has not been excuted.	Faulty timing rod, timing sleeve or other parts in the injection pump assembly.	Repair or replace the injection pump assembly. *
		Faulty adjusment or pre-stroke position sensor	Repair or replace the injection pump assembly. *
		Faulty electronic governor control unit	Replace the electronic governor control unit
06	Displayed if the output voltage of the control rack position sensor is less than 0.06 V or more than 3.5 V.	Open or short in harness wire or poor connector contact between the sub-control rack position sensor and the electronic governor control unit	Inspect the harness and the connector 🕮 P13-82
		Open, short, or poor connector contact in the sub-control rack position sensor	Inspect the sub-control rack position sensor 🕮 P13-74
		Faulty electronic governor control unit	Replace the electronic governor control unit
11	Displayed if the difference between the target control rackposition and the actual control rack position is ± 1mm {0.039 in.}.	Open or short in harness wire or poor connector contact between the linear DC motor and the electronic governor control unit	Inspect the harness and the connector 🕮 P13-82
		Open or shorted wire in the linear DC motor connector	Inspect the linear DC motor 🕮 P13-77
		Poor adjustment of the emergency engine stop cable (The lever is pulled in the stop direction)	Inspect the emergency engine stop button 🕮 P13-79
		Faulty injection pump assembly rack movement or poor governor actuator link	Repair or replace the injection pump assembly. *
		Faulty electronic governor control unit	Replace the electronic governor control unit
12	Displayed if the difference between the target timing rod angle and the actual timing rod angle is ± 2°.	Open or short in harness wire or poor connector contact between the pre-stroke actuator, pre-stroke cut relay, and electronic governor control unit	Inspect the harness and the connector 🕮 P13-82
		Open or shorted wire in the pre-stroke cut relay	Inspect the pre-stroke cut relay 🕮 P13-73
		Faulty pre-stroke actuator	Repair or replace the injection pump assembly. *
		Faulty timing rod, timing sleeve, etc. in the injection pump assembly	Repair or replace the injection pump assembly. *
		Faulty electronic governor control unit	Replace the electronic governor control unit

*: Contact your MFTA representative for current injection pump repair and replacement procedures.

https://truckmanualshub.com/

Diagnosis code	Diagnosis code display condition (s)	Cause	Remedy
13	Displayed if the output voltage of the pre-stroke position sensor is less than 0.9 V or more than 3.4 V.	Open or short in harness wire or poor connector contact between the pre-stroke position sensor and the electronic governor control unit	Inspect the harness and the connector 🕮 P13-82
		Open or shorted pre-stroke position sensor coil	Inspect the pre-stroke actuator 🕮 P13-75
		Faulty electronic governor control unit	Replace the electronic governor control unit
14	Displayed if the pulse count of the back-up engine speed sensor is less than that of the main engine speed sensor.	Open or short in harness wire or poor connector contact between the back-up engine speed sensor and the electronic governor control unit	Inspect the harness and the connector 🕮 P13-82
		Faulty back-up engine speed sensor	Repair or replace the injection pump assembly. *
		Faulty electronic governor control unit	Replace the electronic governor control unit
15	Displayed if the pulse count of the main engine speed sensor is less than that of the back-up engine speed sensor.	Open or short in harness wire or poor connector contact between the speed sensor and the electronic governor control unit	Inspect the harness and the connector 🕮 P13-82
		Open or shorted wire or improperly assembled coil in the engine speed sensor main unit	Inspect the engine speed sensor main unit 🕮 P13-78
		Faulty electronic governor control unit	Replace the electronic governor control unit
16	Displayed if the output voltage of the accelerator pedal position sensor is less than 0.5 V or more than 4.5 V.	Open or short in harness wire or poor connector contact between the accelerator pedal position sensor II and the electronic governor control unit	• Inspect the accelerator position sensor using MUT-II 🕮 P13-42 • Inspect the harness and the connector 🕮 P13-82
		Internal malfunction or faulty adjustment of the lever portion of the accelerator pedal position sensor II	• Inspect the accelerator pedal position sensor 🕮 P13-54 • Inspect the accelerator pedal position sensor using MUT-II 🕮 P13-42
		Faulty electronic governor control unit	Replace the electronic governor control unit
21	—	Open or short in harness wire or poor connector contact between the coolant temperature sensor and the electronic governor control unit	Inspect the harness and the connector 🕮 P13-82
		Faulty coolant temperature sensor	• Inspect the coolant temperature sensor 🕮 P13-74 • Inspect the coolant temperature sensor using MUT-II 🕮 P13-42
		Faulty electronic governor control unit	Replace the electronic governor control unit

*: Contact your MFTA representative for current injection pump repair and replacement procedures.

INSPECTION BASED ON DIAGNOSIS CODES

Diagnosis code	Diagnosis code display condition (s)	Cause	Remedy
22	Displayed if the output voltage of the control rack position sensor I is less than 0.5 V or more than 4.5 V.	Open or short in harness wire or poor connector contact between the control rack position sensor and the electronic governor control unit	Inspect the harness and the connector 🕮 P13-82
		Open or shorted wire in the coil or poor control rack position sensor contact	• Inspect the control rack position sensor 🕮 P13-76 • Inspect the control rack position sensor using MUT-II 🕮 P13-42
		Faulty movement of the injection pump assembly control hook or poor governor actuator link.	Repair or replace the injection pump assembly. *
		Faulty electronic governor control unit	Replace the electronic governor control unit
24	Displayed if the output voltage of the accelerator pedal position sensor I is less than 0.5 V or more than 4.5 V.	Open or short in harness wire or poor connector contact between the accelerator pedal position sensor and the electronic governor control unit	• Inspect the accelerator position sensor using MUT-II 🕮 P13-42 • Inspect the harness and the connector 🕮 P13-82
		Internal malfunction or poor adjustment of the accelerator pedal position sensor I lever	• Inspect the accelerator position sensor I 🕮 P13-54
		Faulty electronic governor control unit	Replace the electronic governor control unit
31	Displayed if the output voltage of the idling adjustment volume is less than 0.6 V or mor than 4.6 V.	Stuck idling speed adjustment potentiometer knob (between PUSH and PULL)	Reset the knob to PUSH or PULL
		Open or short in harness wire or poor connector contact between the idling speed adjustment potentiometer and the electronic governor control unit	Inspect the harness and the connector 🕮 P13-82
		Open wire in the switch portion of the idling speed adjustment potentiometer or faulty internal movement	Inspect the idling speed adjustment potentiometer 🕮 P13-73
		Faulty electronic governor control unit	Replace the electronic governor control unit
32	Displayed if the output voltage of the boost pressure sensor is less than 0.5 V or more than 4.8 V.	Open or short in harness wire or poor connector contact between the boost pressure sensor and the electronic governor control unit	Inspect the harness and the connector 🕮 P13-82
		Internal malfunction of boost pressure sensor	• Inspect the boost pressure sensor using MUT-II 🕮 P13-42 • Inspect the boost pressure sensor 🕮 P13-75
		Clogged boost hose or faulty assembly	Inspect the boost hose
		Faulty electronic governor control unit	Replace the electronic governor control unit

*: Contact your MFTA representative for current injection pump repair and replacement procedures.

https://truckmanualshub.com/

Diagnosis code	Diagnosis code display condition (s)	Cause	Remedy
33	Displayed if the electronic governor control unit is faulty.	Faulty electronic governor control main unit	In order to reset the electronic governor control unit, temporarily turn the starter switch OFF and erase the diagnostic codes by pressing the memory clear switch P13-37 Replace the electronic governor control unit if the diagnostic codes persist after performing the above procedure
41	Displayed if the output voltage of the boost temperature sensor is more than 4.9 V.	Open or short in harness wire and poor connector contact between the boost temperature sensor and the electronic governor control unit	Inspect the harness and the connector P13-82
		Open or shorted wire or poor assembly of the boost temperature sensor coil	• Inspect the boost temperature sensor P13-79 • Inspect the boost temperature sensor using MUT-II P13-49
		Faulty electronic governor control unit	Replace the electronic governor control unit
45	—	Faulty phase of engine speed sensor and backup engine speed sensor	• Inspect the engine speed sensor P13-78 • Repair or replace the injection pump assembly. *
65	Faulty accelerator switch	Open or short in harness wire or poor connector contact between the accelera-tor switch and theelectronic governor control unit	Inspect the harness and the connector P13-82
		Open or shorted wire in the accelerator switch	Inspect the accelerator switch (Accelerator switch is built in the accelerator pedal position switch.) P13-54
		Faulty electronic governor control unit	Replace the electronic governor control unit

ON-VEHICLE INSPECTION AND ADJUSTMENT

Checking and Adjusting Injection Timing

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Fuel injection timing (BTDC)	3° ± 0.5°	—	Adjust

Tightening torque

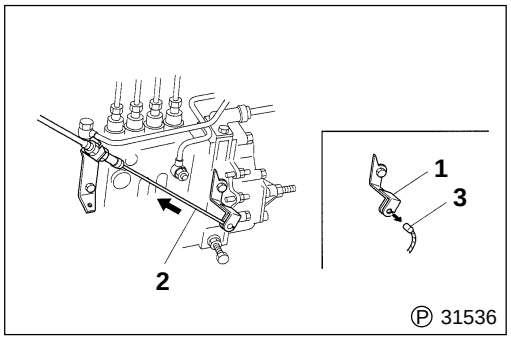
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
6	Union nut	29 to 49 {22 to 36, 3 to 5}	—
7	Delivery valve holder	100 to 110 {76 to 83, 10.5 to 11.5}	—

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
—	Cranking handle 	MH061289	Cranking of engine
15, 16	Universal extension 	MH061099	Inspection and adjustment of fuel injection timing

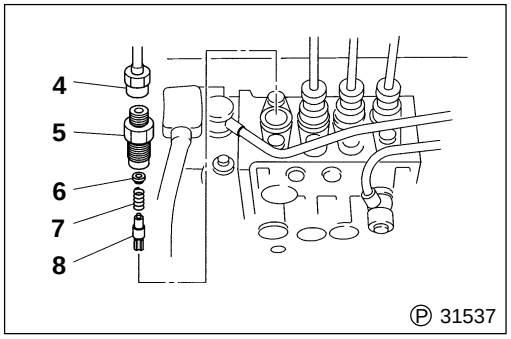


[Inspection]

NOTE

Set the starter switch to “LOCK” or “ACC” before starting operation.

- Pull governor stop level **1** toward STOP direction.
- Remove cable end **3** of engine stop cable **2.**

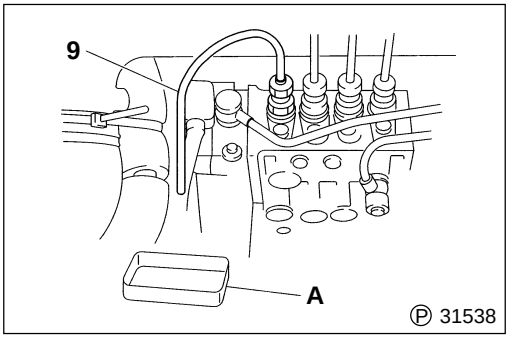


- Remove union nut **4** of the injection pipe, delivery valve holder **5**, stopper **6**, delivery valve spring **7** and delivery valve **8** from the injection pump of No.1 cylinder.
- After removing these parts, install delivery valve holder **5**.

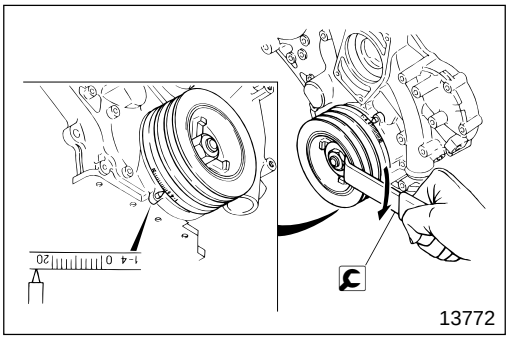
CAUTION ⚠

Be sure to keep all the removed parts in diesel fuel to keep them free from dirt.

https://truckmanualshub.com/



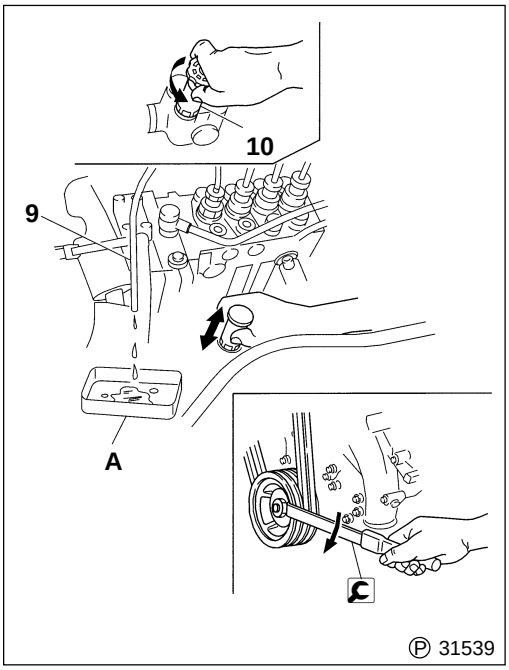
- Mount extra injection pipe **9** on No.1 cylinder. Direct the free end the pipe downwards so that the fuel discharge can be clealy of served.
  A : Oil tray



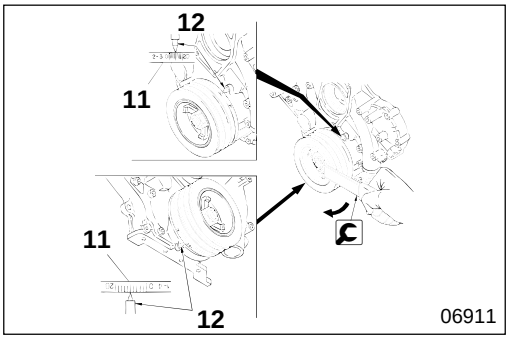
- Turn the crankshaft more than 180° in the direction of engine rotation and bring No.1 cylinder to approximately 30° before top dead center the compression cycle.

NOTE

Refer to the location where there are 30° gradations, since angle gradations on the crankshaft pulley side only extend to 20°.



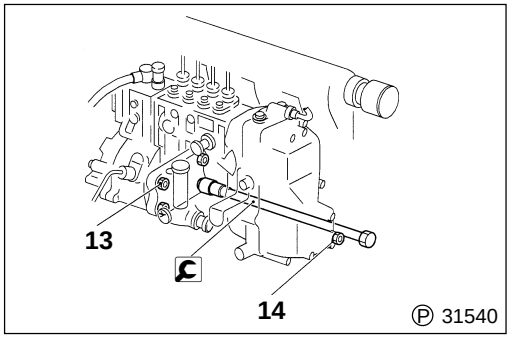
- Turn the engine in the direction of engine rotation slowly while discharging fuel from injection pipe **9**, deliver fuel using priming pump **10**
  A : Oil tray
- When the discharge of fuel from injection pipe **9** becomes intermittent, turn the crankshaft slower, stop turning the crankshaft when the discharge stops completely.



- Make sure that indent **11** on the crankshaft pulley and pointer **12** on the timing gear case show the standard fuel injection timing.

https://truckmanualshub.com/

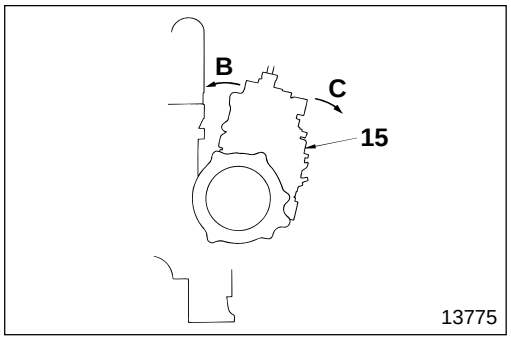
ON-VEHICLE INSPECTION AND ADJUSTMENT



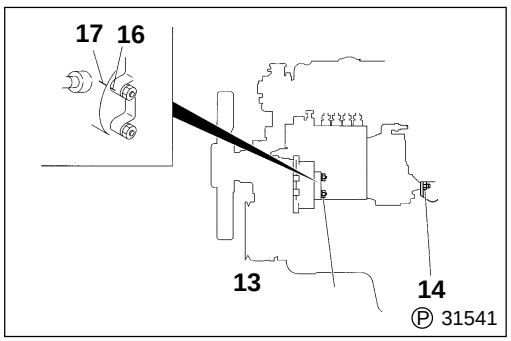
- Adjust fuel injection timing as follows if it does not conform to the standard value.

[Adjustment]

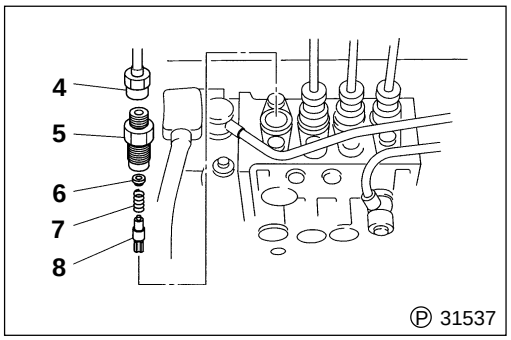
- Loosen injection pump mounting nuts **13**, **14**.
  13 : 4 points (on flange)
  14 : 1 point



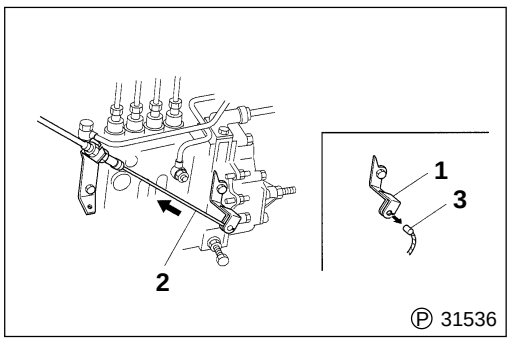
- When fuel injection timing is retarded, tilt injection pump **15** torward crankcase side **B**.
- When fuel injection timing is advanced, tilt injection pump **15** towards **C**.



- Adjustment of one graduation on indented scale **16** of the timer case flange adjusts fuel injection timing by 6°.
  17 : Pointer
- Tighten nuts **13**, **14** at specified torque, and remeasure fuel injection timing



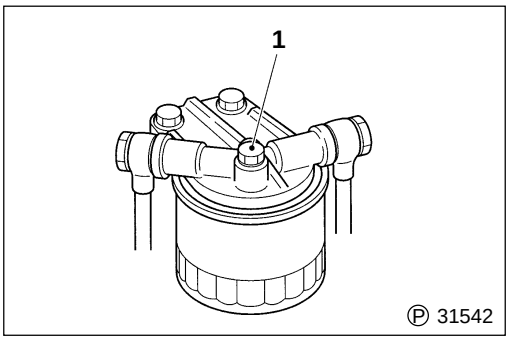
- After making sure that the fuel injection timing conforms to the standard value, install delivery value **8**, delivery value spring **7** and stopper **6**, then tighten delivery value holder **5**, and union nut **4**.
- Tighten each part at specified torque.



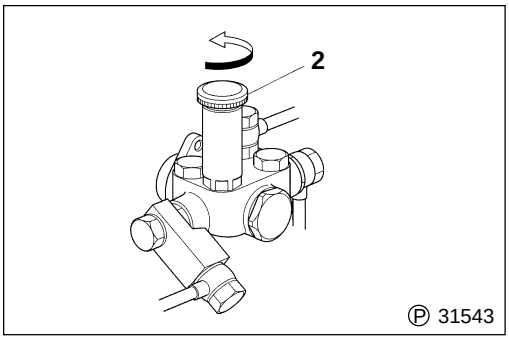
- With stop level **1** pulled toward the STOP direction, insert cable end **3** through the stop lever slot.
- Adjust engine stop cable **2** after installing it. 🕮 P13-55

https://truckmanualshub.com/

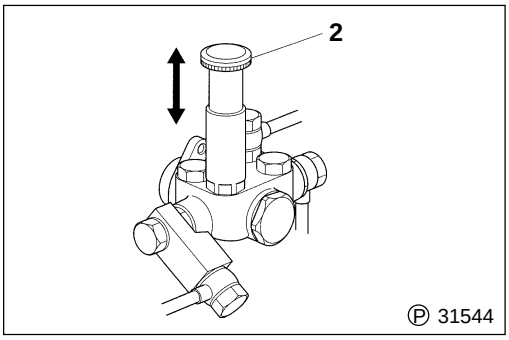
Bleeding Air from Fuel System



- Loosen the fuel filter air plug **1**.



- Turn the priming pump knob **2** counterclockwise until it pops up.
- Move the priming pump knob **2** up and down to feed fuel through the fuel filter.
- When fuel emerging from the fuel filter air plug **1** no longer contains air bubbles, tighten the air plug securely.

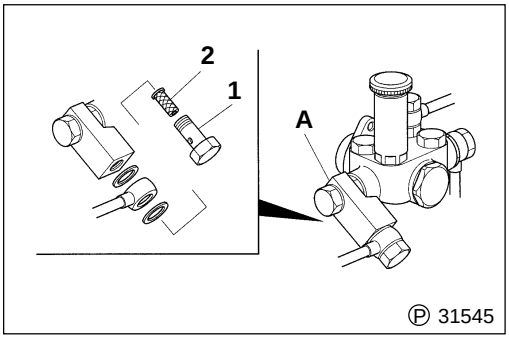


- Move the priming pump knob **2** up and down five or six more times. Then, press the knob down and screw it clockwise to lock it in position.
- Wipe up all spilled fuel, then start the engine.
- Check that no fuel leakage occurs.

WARNING ⚠

- **Be sure to wipe up all spilled fuel. Unless it is wiped up, it could catch fire.**
- **Fuel is highly flammable. Keep it away from flames and sources of heat.**

Cleaning Gauze Filter



- Remove the eyebolt **1** from the suction port side **A** of the fuel feed pump.
- Remove the gauze filter **2** from the eyebolt **1**.
- Clean the gauze filter **2** in diesel fuel.
- Refit the gauze filter **2** and eyebolt **1** in the opposite order to that in which they were removed.
- Bleed all air out of the fuel system. 🕮 P13-51
- Start the engine and check that no fuel leakage occurs.

WARNING ⚠

- **To minimize the risk of fire, wipe up any spilled fuel.**
- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **After refitting the gauze filter, check that no fuel leakage occurs.**

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

Replacing Fuel Filter

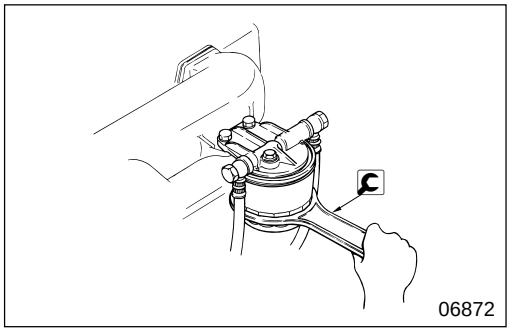
Lubricant

Location	Points of application	Specified lubricant	Quantity
1	Gasket between fuel filter and fuel filter head	Engine oil	As required

Special tool

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Filter wrench  01882	MH061572	Fuel filter removal



[Removal]

: Filter Wrench

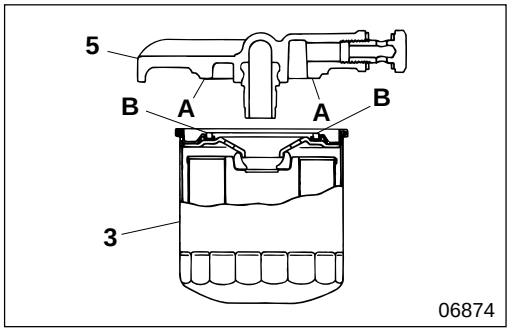
WARNING

- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **To minimize the risk of fire, wipe up any spilled fuel.**

[Installation]

WARNING

Use of an unsuitable fuel filter 1 can lead to fuel leaks and fires. Be sure to use a genuine filter.

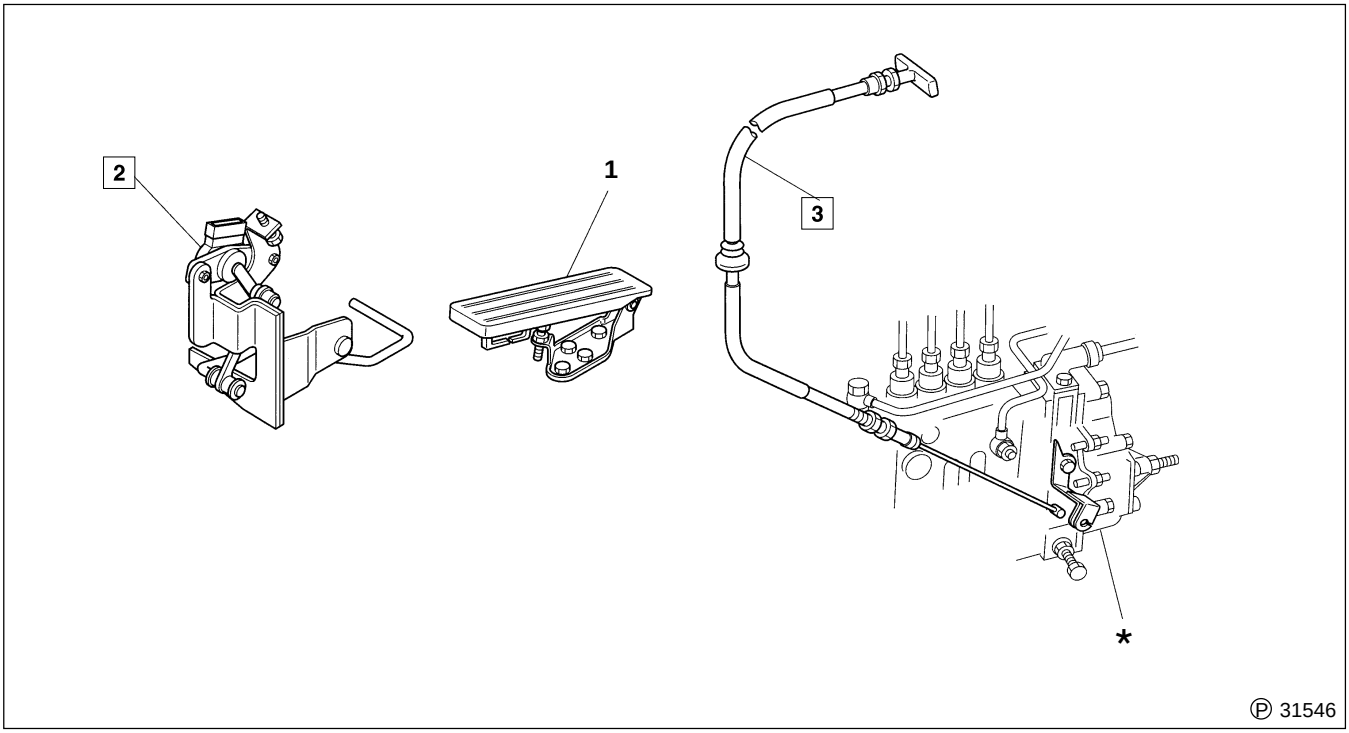


- To fit the fuel filter **1**, turn it until the gasket **B** touches surface **A** of the fuel filter head **2**. Then, tighten the filter by 1 to $1\frac{1}{8}$ turn. Be sure to turn the filter by hand.
- Bleed all air out of the fuel system. P13-51

WARNING

After fitting the fuel filter 1, start the engine and check that no fuel leakage occurs. Any leaking fuel could cause a fire.

https://truckmanualshub.com/



● **Removal sequence**

1 Accelerator pedal assembly 🕮 P13-56
2 Accelerator pedal position sensor assembly
3 Emergency engine stop cable
***** : Injection pump assembly

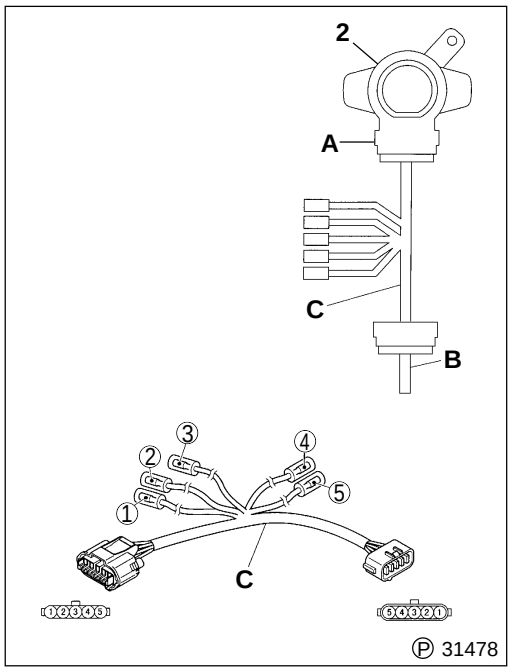
● **Installation sequence**

Follow the removal sequence in reverse.

Service standards

Location	Maintenance item			Standard value	Limit	Remedy
4	Output voltage of accelerator pedal position sensor  Ⓟ31477	Sensor II: ① – ④	Idle position	0.85 ± 0.1 V	—	Adjust or replace
		Sensor I: ④ – ⑤	Full-load position	4.15 ± 0.1 V	—	Adjust or replace
	Output voltage of accelerator switch  Ⓟ31477		Electrical conduction between terminals ② and ③ of accelerator switch	1.00 ± 0.24 V	—	Adjust or replace

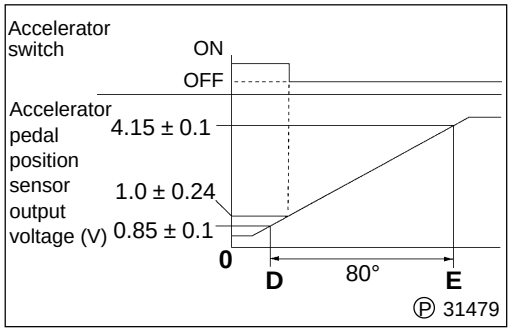
https://truckmanualshub.com/



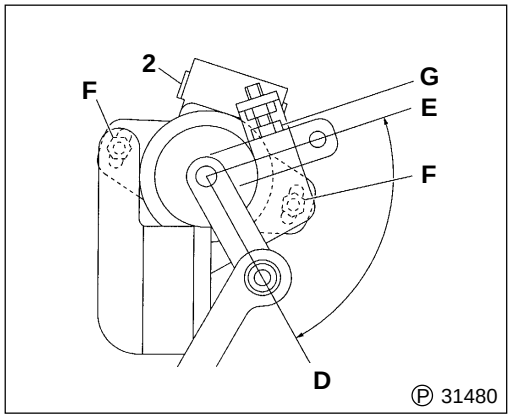
2 **Inspection of accelerator pedal position sensor assembly**

- Disconnect connector **A** of accelerator pedal position sensor **2** from harness **B** on the cab side. Prepare inspection harness **C,** and connect it between the above two connectors. Note: This harness is not necessary with MUT-II PLUS tester.
- Set the starter switch to the ON position.
- Measure the output voltages of accelerator pedal position sensor **4** and the accelerator switch according to the table below. Adjust, if necessary.

Item	Connector terminal					
	Accelerator position sensor inspection harness					
	Sensor II		Sensor I		Accelerator switch	
	①	④	④	⑤	②	③
Output voltage ***a** (Idle position)	⊖	⊕	⊖	⊕		
Output voltage ***b** (Full-load position)	⊖	⊕	⊖	⊕		
Output voltage ***c** (Accelerator switch activating point)					⊖	⊕



***a** : Measure voltage with accelerator pedal at idle position.
***b** : Measure voltage with the accelerator pedal at full-load position.
***c** : Press accelerator pedal gradually from idle position. Measure voltage when electrical conduction stops between connector terminals ② and ③ of accelerator pedal position sensor 2.
D : Idle position
E : Full-load position

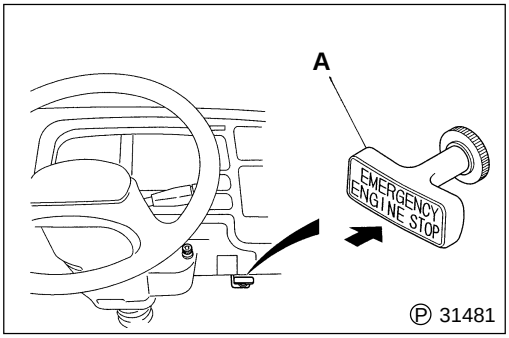


- If measured value ***a** and ***b** deviate from the standard values, adjust the following adjusting bolts.

Adjustment item	Adjusting bolt
***a** Idle position output voltage	Screw **F**
***b** Full-load position output voltage	Full-load stopper bolt **G**

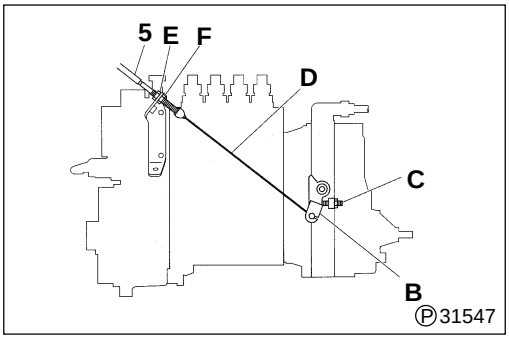
- If the measured output voltage at accelerator switch activating point ***c** deviates from the standard value, replace accelerator pedal position sensor **2**.

https://truckmanualshub.com/



5 **Installation of emergency engine stop cable**

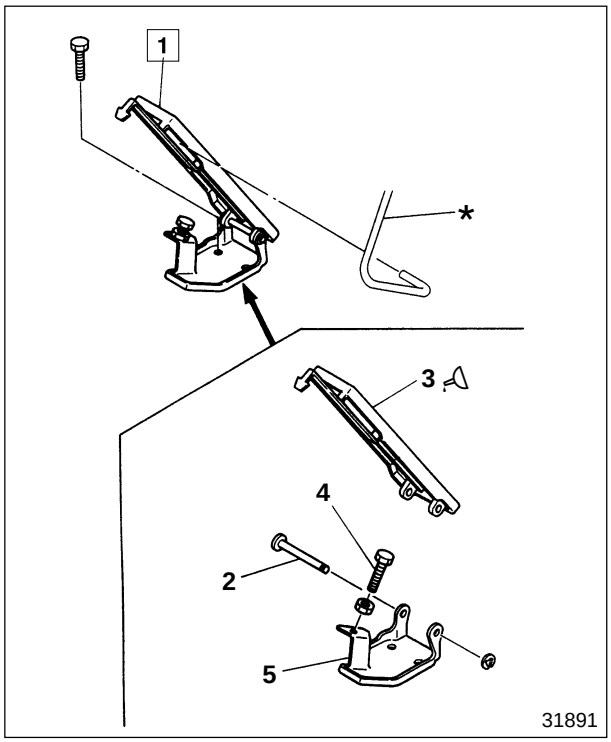
- Mount stop button **A** on emergency engine stop cable **5** and press the button firmly in position.



- With stop lever **B** of the governor contacting stopper bolt **C**, adjust nut **E** so that inner cable **D** of emergency stop cable **5** is taut. Then, tighten nut **F** to secure it in place.
- After installation, start the engine. Pull the stop button to make sure that the engine stops operating.

https://truckmanualshub.com/

Accelerator Pedal Assembly



● **Disassembly sequence**

1 Accelerator pedal assembly
2 Clevis pin
3 Accelerator pedal

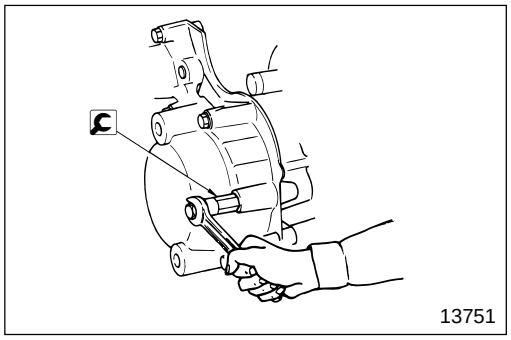
—	Cranking handle  05999	MH061289	Cranking of engine

https://truckmanualshub.com/

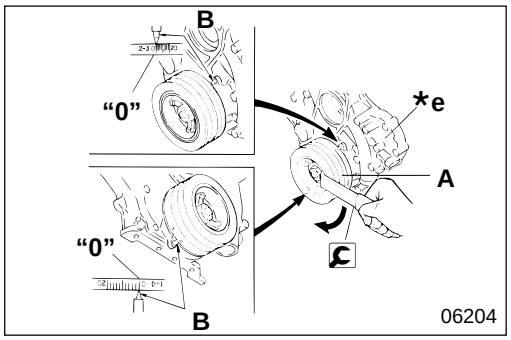
◆ Service procedure



23 **Injection pump assembly**

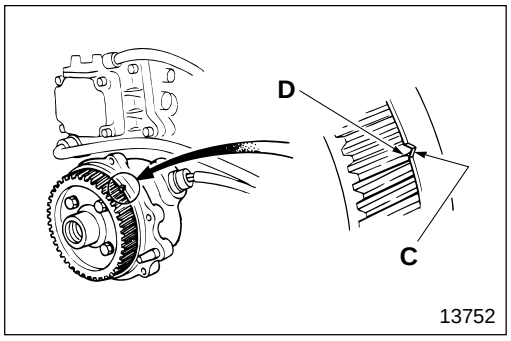
[Removal]

- Refer to Removal sequence on page 13-62.

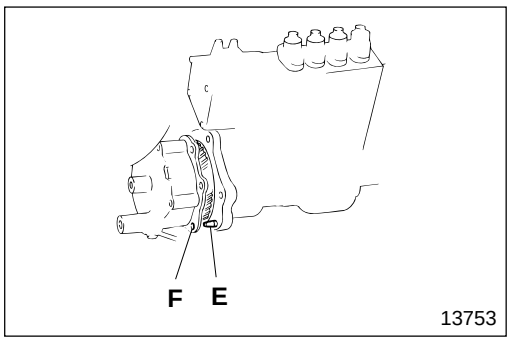


[Installation]

- To bring No. 1 cylinder piston to top dead center in the compression cycle, align pointer **B** of timing gear case ***e** with indent mark "**0**" on crankshaft pulley **A** by turning the crankshaft pulley clockwise using cranking handle. At this point, make sure that the intake and exhaust valves of No. 1 cylinder are not depressed by the push rod. If they are depressed, make another full rotation of the crankshaft pulley.

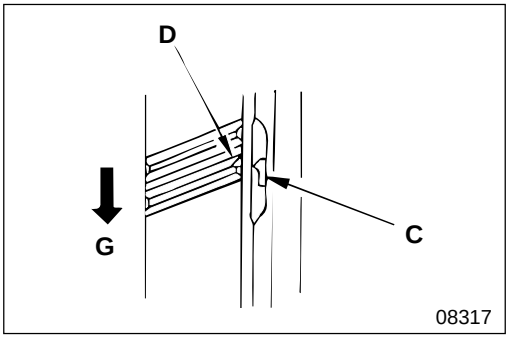


- Align indent **C** on the timer case with indent **D** on the injection pump gear.



- By aligning guide bar **E** of the timer case with guide hole **F** of the front plate, push in the idler gear up to a fraction of an inch short of engaging the injection pump gear.

https://truckmanualshub.com/



- Making sure that alignment mark **C** on the timer case aligns with indent **D** on the injection pump gear, push in the injection pump assembly.
  As this fitting is taking place, the indent will turn in direction **G**.

https://truckmanualshub.com/

P13-67

● **Disassembly sequence**

1 Injection pipe
2 Leak-off pipe
3 Bolt
4 Bridge
5 O-ring
6 Injection nozzle assembly
7 Retaining nut
8 Tip packing
9 Straight pin
10 Needle valve
11 Nozzle
12 Pressure pin
13 Spring
14 Adjusting shim
15 Nozzle holder
16 Nozzle gasket

* : Cylinder head Gr 11
⊗ : Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

WARNING ⚠

Wipe up any spilled fuel because it can cause a fire.

CAUTION ⚠

- **Be sure not to touch the slide-contact area of needle valve 10 because any scratches or corrosion might spoil the airtightness of nozzle 11. It must be handled with utmost care.**
- **Never change the combination of needle valve 10 and nozzle 11 for each cylinder.**
- **Be sure to protect all openings by covering them after removal of hoses and pipes because the engine performance is adversely affected if dirt and foreign particles enter injection nozzle assembly 6.**

NOTE

Remove carbon deposits and clean injection nozzle assembly 6 before working on it, then test the injection pressure and jet spray condition, and check for fuel leakage before disassembly. If no fault is found, do not disassemble.

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
6	Valve opening pressure	21.6 MPa {3130 lbf/ in^2, 220 kgf/cm^2}	—	Adjust

—	Nozzle cleaning tool	★105789-0010	Cleaning of injection nozzle assembly

★ ZEXEL code number

◆ Service procedure

● Inspection before disassembly

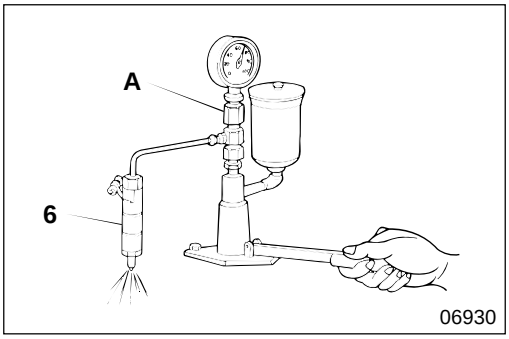
Attach injection nozzle assembly **6** to nozzle tester **A**, and conduct the following inspection.

WARNING ⚠

Never touch the spray from nozzle 11 or let your hands get too close to the spray point during the test.

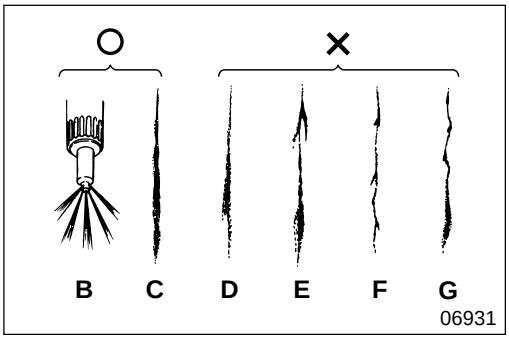
NOTE

Before inspection, bleed the air out in a couple of bursts by pressing nozzle tester A lever.



(1) Valve opening pressure

- Raise the pressure of nozzle tester **A** by operating the lever, and measure the pressure that the gauge registers when the pressure is released which will be observed by the sudden movement of the gauge indicator.
- If the measured value deviates from the standard value, disassemble the nozzle and clean, and adjust it using adjusting shims **14**.
- Variation of 0.05 mm {0.0020 in.} thickness in adjusting shims **14** causes a difference of 735 kPa {105 lbf/in^2, 7.5 kgf/cm^2} of pressure, for example, to alter the pressure for 98 kPa {14 lbf/in^2, 1 kgf/cm^2}, a thickness of 0.0067 mm {0.00026 in.} is required.
- If the performance cannot reach the standard value even after adjustment, replace injection nozzle assembly **6**.

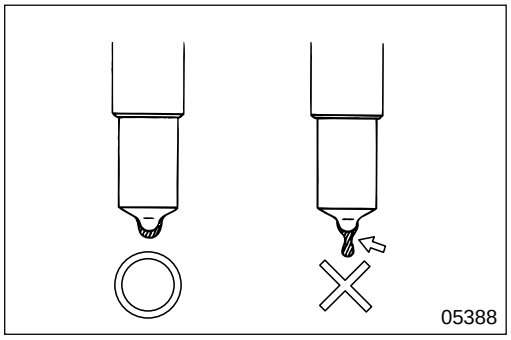


(2) Spray condition

- Test injection spray condition by quick lever actions of nozzle tester **A**, 4 to 6 actions per second.
  - **B** : Even spray from all five orifices (Good)
  - **C** : Even and symmetrical spray (Good)
  - **D** : Asymmetrical spray (Faulty)
  - **E**: Spray direction deviates from the nozzle axis line (Faulty)
  - **F**: Thin and insufficient spray (Faulty)
  - **G**: Irregular spray (Faulty)
- If faulty spray cannot be corrected, disassemble injection nozzle assembly **6** and clean every part and repeat the test.
  If faulty spray still occurs after repeating test, replace the injection nozzle assembly.
- Make sure that there is no post-spray dripping after injection.

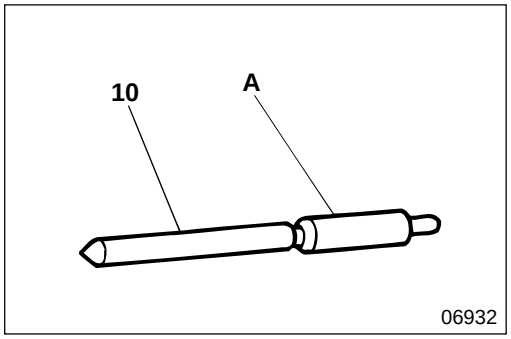
https://truckmanualshub.com/

INJECTION NOZZLE



(3) Fuel air tightness and leakage at related contact points

- Maintain interior pressure of nozzle at 1960 kPa {285 lbf/in^2, 20 kgf/cm^2} lower than the valve opening pressure, and check and see if any fuel seeps out of the nozzle tip within 10 seconds.
- If any fault is found, disassemble injection nozzle assembly **6** and clean every part and repeat the test. If any fault is still found, replace the injection nozzle assembly.

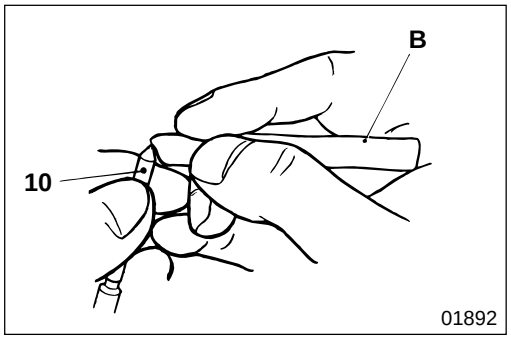


6 Injection nozzle assembly

[Disassembly]

CAUTION

- **Be sure not to touch sliding part A of needle valve 10 with your hands.**
- **Never change the combination of removed needle valve 10 and nozzle 11 for each cylinder.**



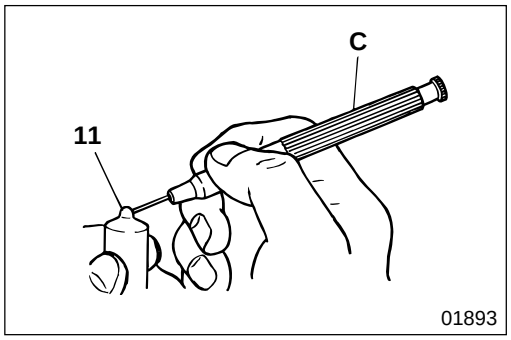
[Cleaning]

Clean needle valve **10** and nozzle **11** with diesel fuel (cleaning solvent). Remove carbon deposits with cleaning tool in the following manner:

- Clean needle valve **10** by removing carbon deposits from its tip using cleaning bar **B** of cleaning tool.

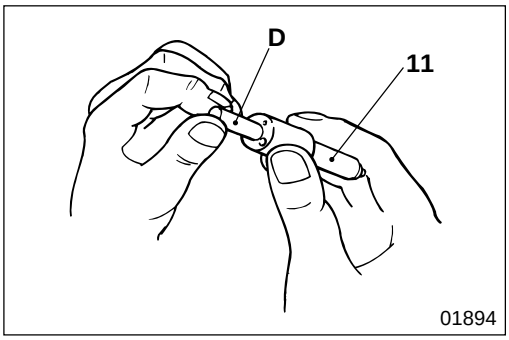
CAUTION

Never use a wire brush or hard steel for cleaning.

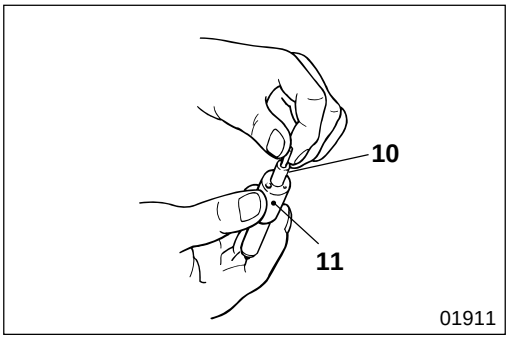


- To clean nozzle **11**, remove carbon deposits from the orifices of the nozzle using needle cleaner **C** of cleaning tool, by inserting it into the orifices and turning it.
  Needle cleaner diameter : ø0.25 mm {0.0098 in.} or less

https://truckmanualshub.com/



- Clean the seat of nozzle **11** using cleaning needle **D** of [C] cleaning tool.
- Use FUSO carbon remover to remove hard-to-remove, burnt-on carbon deposits.



[Inspection]

- Immerse needle valve **10** and nozzle **11** in diesel fuel (cleaning solvent) and clean them thoroughly.
- Check and see if needle value **10** drops by its own weight into the nozzle from the position where a third of its length is pulled out. (Repeat this several times rotating the needle valve.)
- If needle valve **10** does not drop smoothly, repeat cleaning and repeat the test. If any fault is still found, replace both the needle valve and nozzle **11** together as a set.

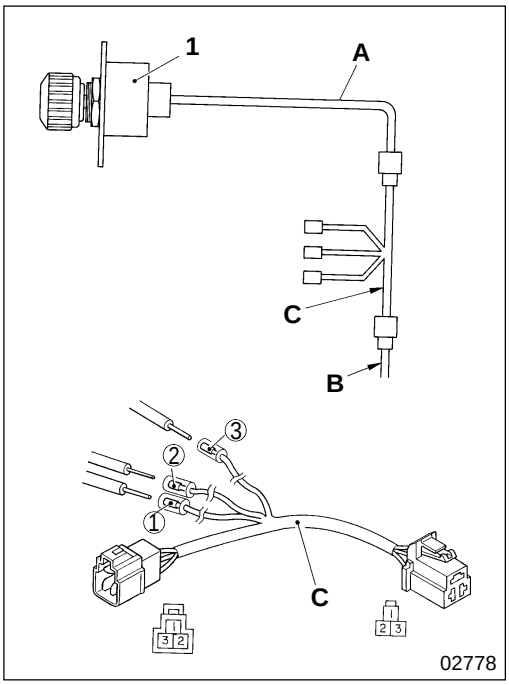
Tightening torque

Unit : N·m {lbt.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
7	Coolant temperature sensor	34 ± 6.9 {25 ± 5, 3.5 ± 0.7}	—
13	Lock nut of engine speed sensor	24 to 35 {17 to 26, 2.4 to 3.6}	—

https://truckmanualshub.com/

◆ Service procedure

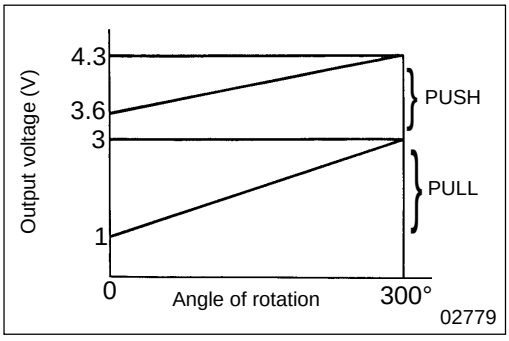


1 **Inspection of idling speed adjustment potentiometer**

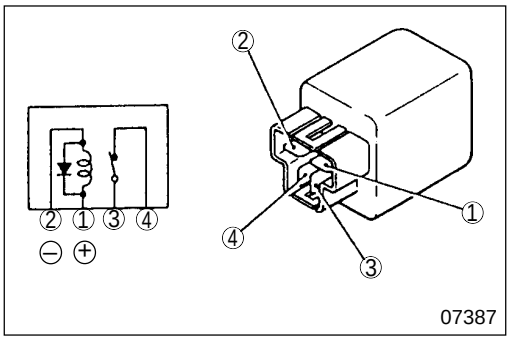
- Disconnect the harness **A** of the idling speed adjustment potentiometer **1** from the cab-side harness **B**. Then, connect an inspection harness **C** between harnesses **A** and **B**. (The inspection harness must be made specially for this procedure, but is not necessary with MUT II PLUS tester.)
- Turn the starter switch to the ON position.
- Check the output voltages of the idling speed adjustment potentiometer **1** in accordance with the following table.

Item	Connector terminal		
	Accelerator pedal position sensor inspection harness		
	①: Power supply (+)	②: GND (–)	③: Output(+)
Output voltage with knob pulled		⊖	⊕
Output voltage with knob pushed			

Output characteristics



- If the output voltages are out of specification, replace the idling speed adjustment potentiometer **1.**



3 **4** **Inspection of pre-stroke cut relay and exhaust brake cut relay (normally-closed type with 4-pin connector)**

- Perform continuity checks in accordance with the following table.

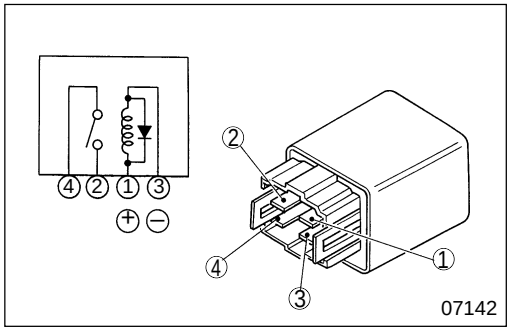
	①	②	③	④
Not energized	○——○		○——○	
Energized	⊕——⊖		〔⊢ - - - - ⊣〕	

○——○ : Continuity exists between terminals.
⊕——⊖ : Terminals across which 12 V DC is applied
〔⊢ - - - - ⊣〕 : Continuity no longer exists between terminals

- Replace the relay if any abnormality is evident.

https://truckmanualshub.com/

INSPECTION OF OTHER DEVICES



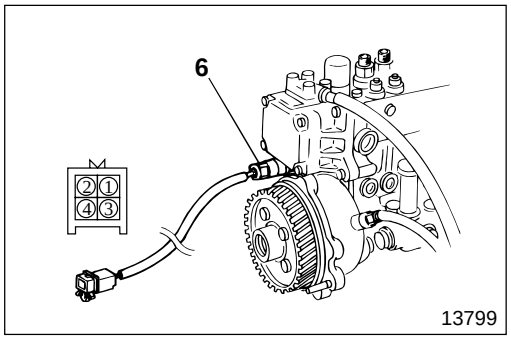
5 Inspection of exhaust brake relay (Open type 4 pin)

- Follow the table below to inspect continuity :

	①	②	③	④
No current	○		○	
Current	⊕		⊖	○

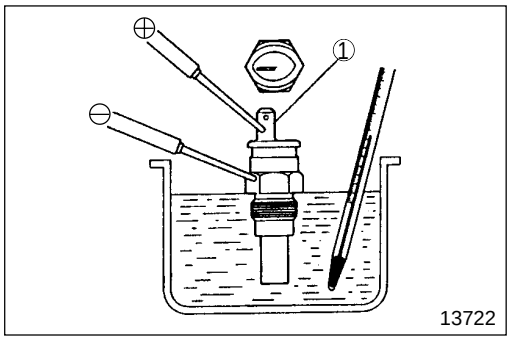
○—○ : There is continuity between terminal ○ and ○.
⊕—⊖ : Indicates that **12** volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.



6 Inspection of sub control rack position sensor

- Measure the resistances between the following terminals : ① and ④ ; ① and ③ ; ③ and ④.
- If any resistance is out of specification, replace the sub control rack position sensor **6**.
- Have replacement performed by the nearest MFTA Dealer.



7 Inspection of engine water temperature sensor

- Put the engine water temperature sensor **7** in a container of engine oil.
- Heat the oil to each of the specified temperatures. Stir the oil to ensure that it heats up evenly.
- At each of the specified temperatures, measure the resistance between the terminal ① and body of the engine water temperature sensor **7**.
- If the measurements are out of specification, replace the engine water temperature sensor.

Item			Standard value (reference values)	Limit	Remedy
Engine coolant temperature sensor	Between terminal and body	20°C {68°F}	(3.25 k)ohms	—	Replace
		40°C {104°F}	(1.5 k)ohms	—	
		60°C {140°F}	(620 ± 62 k)ohms	—	

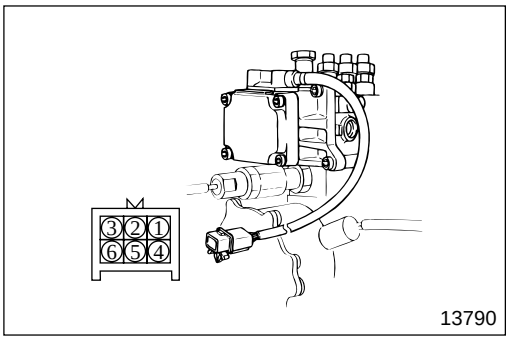
https://truckmanualshub.com/

8 Inspection of pre-stroke actuator

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA Dealer.

CAUTION ⚠

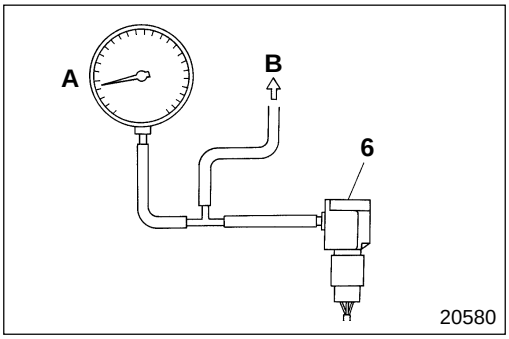
The pre-stroke actuator 8 must be inspected when the engine is cold.



13790

(1) Measurements on connectors

Measure the resistance between terminals ② and ③; ① and ③; ① and ②; ④ and ⑤.



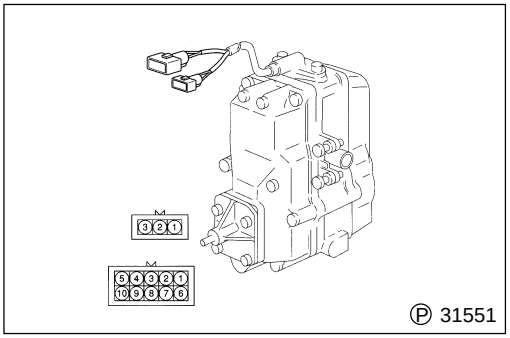
20580

9 Inspection of boost pressure sensor

- Mount pressure gauge **A** for boost pressure measurement as shown in the diagram.
- Connect the MUT-II . 🕮 P13-42.
- Set the MUT-II for boost pressure measurement
- Start the engine. Compare the value displayed on the MUT-II and the value indicated by pressure gauge **A**. If the values are different, replace boost pressure sensor **9**.

  B : To inlet manifold.

https://truckmanualshub.com/



10 Inspection of control rack position sensor

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA Dealer.

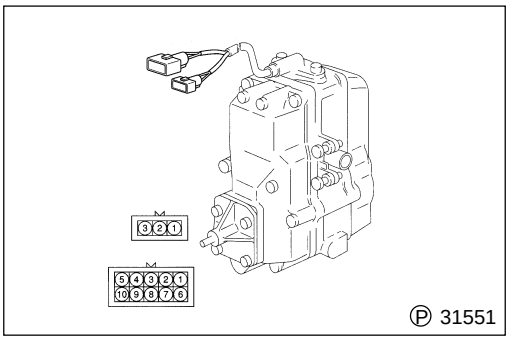
● **Measurements on connectors**

Measure the resistances between the following terminals: 3-pin connector's ③ and ④; 10-pin connector's ③ and ⑨; ④ and ⑨.

https://truckmanualshub.com/

12 Inspection of linear DC motor

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA Dealer.

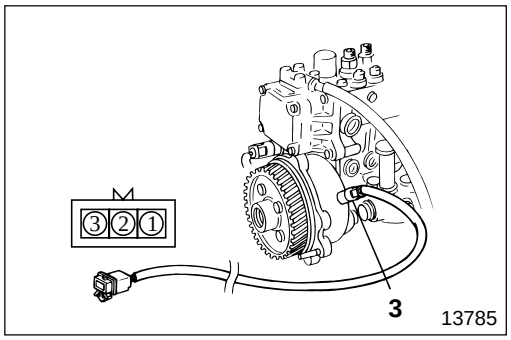


(1) Measurements on connectors

Measure the resistance between terminals ① and ② on each connector.

https://truckmanualshub.com/

INSPECTION OF OTHER DEVICES



13 Engine speed sensor

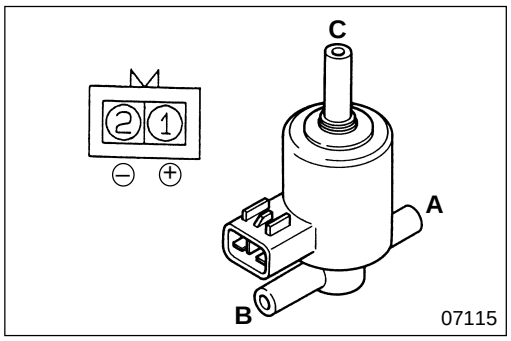
[Inspection]

(1) Main unit

- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace engine speed sensor **13**.

CAUTION ⚠

Be sure to check the tightening torque of engine speed sensor 13. If the tightening torque is insufficient, the sensor may not output a signal.



14 Inspection of 3-way magnetic valve

Carry out the following inspection. If any fault is found, replace 3-way magnetic valves **14** :

Air circuit table (There is air continuity between terminals ○ and ○.)

	Input port A	Output port B	Exhaust port C
ON	○	○	
OFF		○	○

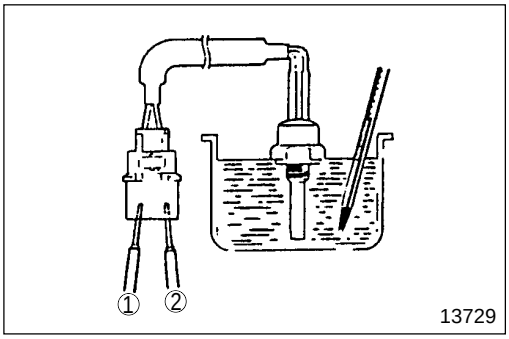
(1) Operation inspection

- Apply voltage between terminals ① and ②, increasing gradually from 0 volt.
- Measure voltage (minimum operating voltage) when magnetic valves **14** starts operating. (You can tell if the magnetic valves are ON or OFF by listening for an operating sound.)

(2) Airtightness inspection

- When magnetic valve is ON :
  - Close output port **B.**
  - Apply 12 volts DC between terminals ① and ②.
  - Make sure that there is no air suction from exhaust port **C** when negative pressure (–100 kPa {–30 in.Hg, –750 mmHg}) is applied to input port **A**.
- When magnetic valve is OFF :
  - Close exhaust port **C**.
  - Make sure that there is no air suction from output port **B** when negative pressure (–100 kPa {–30 in.Hg, –750 mmHg}) is applied to input port **A**.

https://truckmanualshub.com/

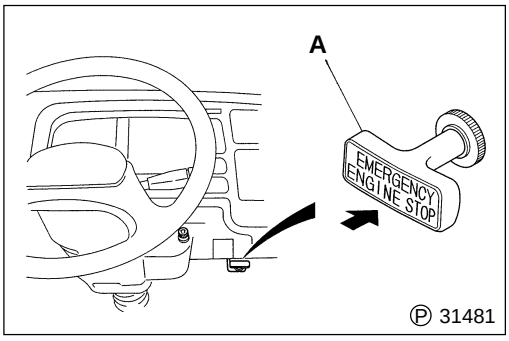


16 **Inspection of boost temperature sensor**

- Place boost temperature sensor **16** in glycerin in a container.
- Raise the glycerin temperature to the specified values and stir the glycerin.
- Measure the resistance between terminals ① and ②.

Item	Standard value	Limit	Remedy
0°C {32°F}	5880 ± 588 ohms	—	Replace
20°C {68°F}	2455 ± 245 ohms	—	
80°C {176°F}	322 ± 32 ohms	—	

- If the measured value deviates from the standard value, replace boost temperature sensor. Gr 15

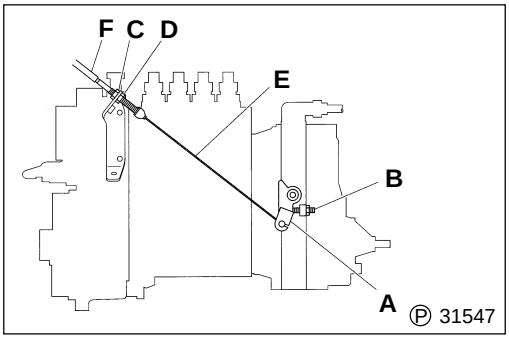


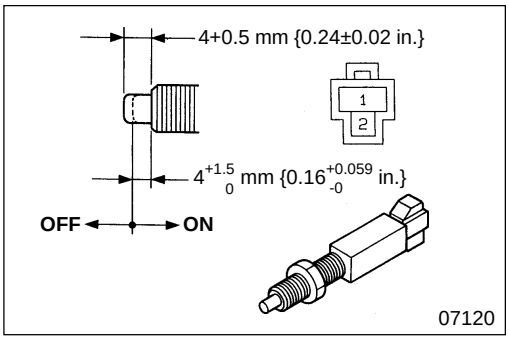
17 **Inspection of emergency engine stop handle**

- Push emergency engine stop handle **17** all the way.
- In this step, make sure that stop lever **A** of the governor is in contact with stopper bolt **B**.
- If the stop lever does not contact the stopper bolt, turn nut **C** until they contact, and tighten nut **D** to secure it in place.
- Inner wire **E** of stop cable **F** should be taut. If not, make adjustment.

CAUTION

Be careful not to make the tension of inner wire E too high, since excess tension prevents stop lever A from fully contacting stopper bolt B.





18 **Inspection of clutch switch**

- Follow the table below to inspect continuity:

	①	②
OFF		
ON	○—○	

○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace clutch switch **18**. Gr 21

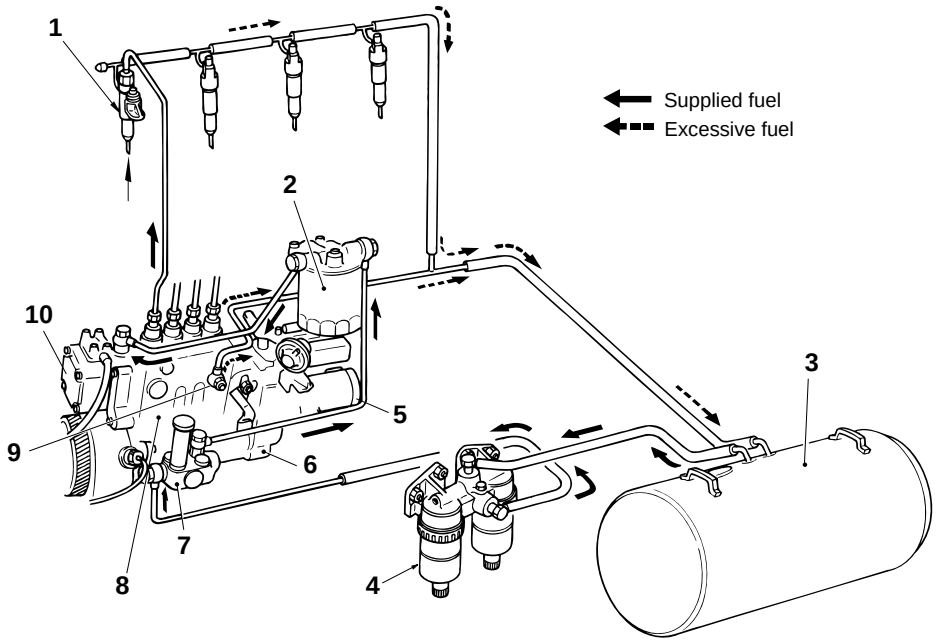
MEMO

https://truckmanualshub.com/

Fuel System (Flow of Fuel)



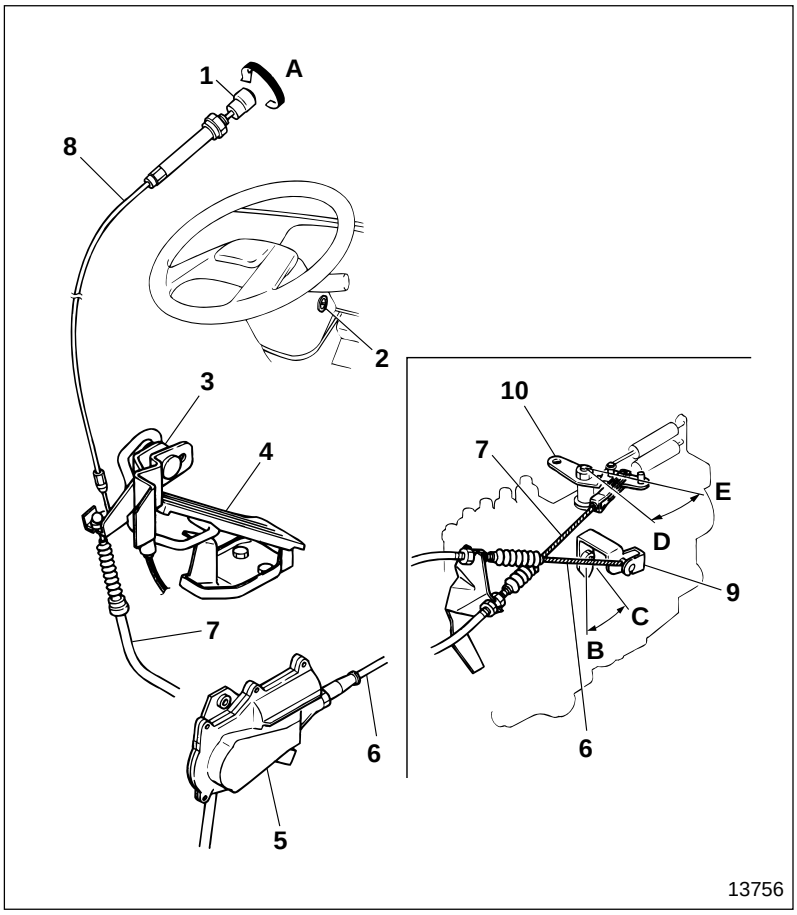
13755

1 Injection nozzle
2 Fuel filter
3 Fuel tank
4 Water separator
5 Boost compensator
6 Governor
7 Feed pump
8 Injection pump
9 Overflow valve
10 Pre-stroke actuator

Fuel in fuel tank **3** is sucked up by feed pump **7** which is driven by the cam action of injection pump **8** and is filtered through fuel filter **2** which removes dirt and other foreign particles.
Filtered fuel is sent to the injection pump where the fuel pressure is boosted and injected through injection nozzle **1** into the combustion chamber.
When fuel pressure is higher than the specified value, overflow valve **9** opens to let the fuel return to the fuel tank.

https://truckmanualshub.com/

Engine Control



1 Idling control knob
2 Starter switch
3 Accelerator arm assembly
4 Accelerator pedal assembly
5 Fuel-cut motor
6 Engine-stop cable
7 Accelerator control cable
8 Idling control cable
9 Engine-stop lever
10 Idling control lever

A : Idling revolution rising
B : Engine-stop position
C : Engine start-up position
D : Full-load position
E : Idling position

(1) Idling control knob

Idling control knob **1** is for making fine adjustment to the idling revolution of the engine. Turning the knob clockwise raises the revolution. It works in the same way as accelerator pedal assembly **4** does when it is depressed.

(2) Fuel-cut motor

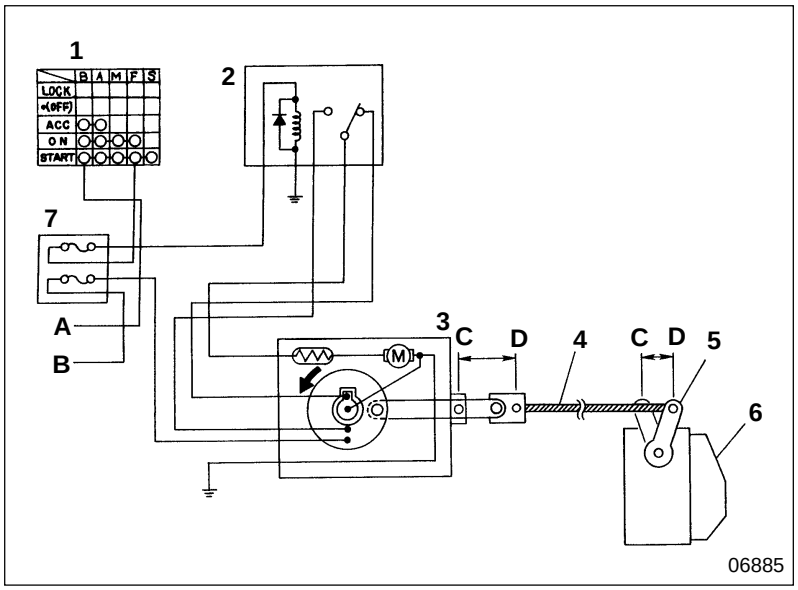
Fuel-cut motor **5** is connected to starter switch **2**, and it is activated by the starter switch being turned ON (or to S). This brings engine-stop lever **9** of the governor to engine-stop position **B** (or engine start-up position **C**), and stops (or starts) the engine. P13-6

(3) Accelerator pedal

When accelerator pedal assembly **4** is freed from foot pressure, the governor return spring forces idling control lever **10** to idling position **E**, restoring the pedal to its original position.

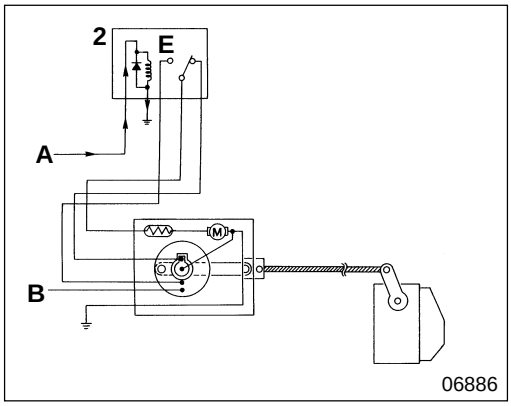
https://truckmanualshub.com/

Engine Stopping Circuit



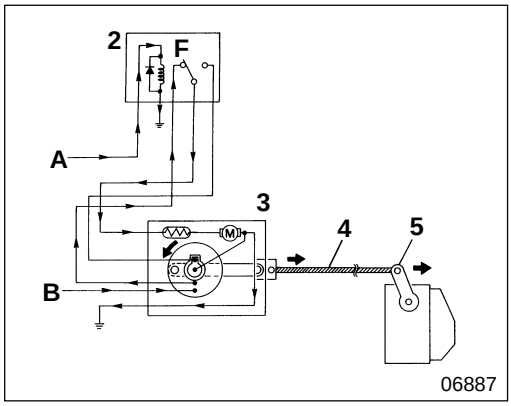
1 Starter switch
2 Fuel-cut relay
3 Fuel-cut motor
4 Engine-stop cable
5 Engine-stop lever
6 Governor
7 Fuse box

A : Power source
B : Power source
C : Engine-stop position
D : Engine start-up position



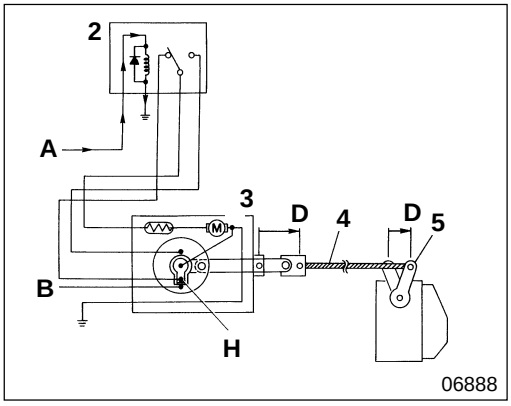
● **At engine start-up (starter switch ON)**

- Electric current flows as illustrated, and coil **E** of fuel-cut relay **2** is magnetized.

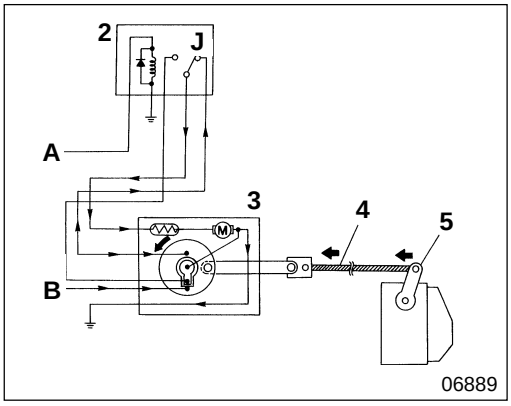


- Contact point **F** of fuel-cut relay **2** closes, and fuel-cut motor **3** is activated.
- Engine-stop cable **4** is pushed out, and engine-stop lever **5** moves to engine start-up position.

https://truckmanualshub.com/

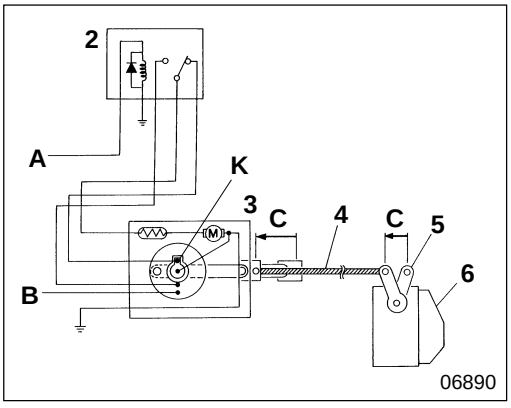


- Engine-stop lever **5** moves to engine start-up position **D**, and fuel is ready to flow. Contact point **H** of fuel-cut motor **3** opens, and the fuel-cut motor stops.



● **When engine is at standstill (starter switch OFF)**

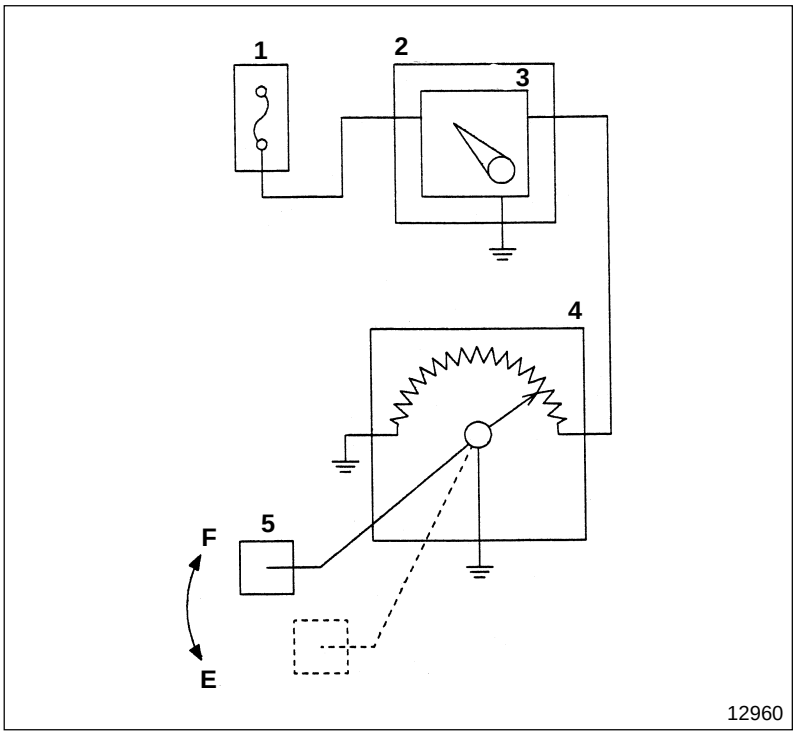
- Electric current from the starter switch is broken, and contact point **J** of fuel-cut relay **2** closes, and fuel-cut motor **3** is activated.
- Engine-stop cable **4** is pulled to bring engine-stop lever **5** to engine-stop position.



- When engine-stop lever **5** reaches engine-stop position **C**, fuel flow stops and the engine stops. Simultaneously, contact point **K** of fuel-cut motor **3** opens, and the fuel-cut motor stops.

https://truckmanualshub.com/

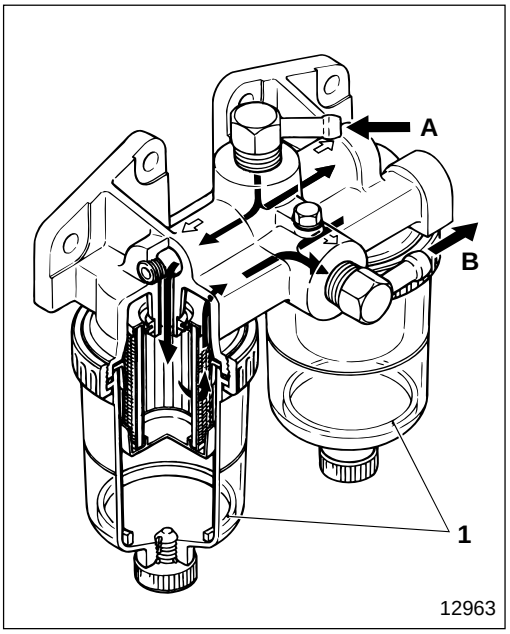
Fuel Gauge Electric Circuit



1 Relay and fuse box
2 Meter cluster
3 Fuel gauge
4 Fuel gauge unit
5 Float

The fuel gauge circuit indicates the amount of fuel remaining by means of a gauge.

Water Separator



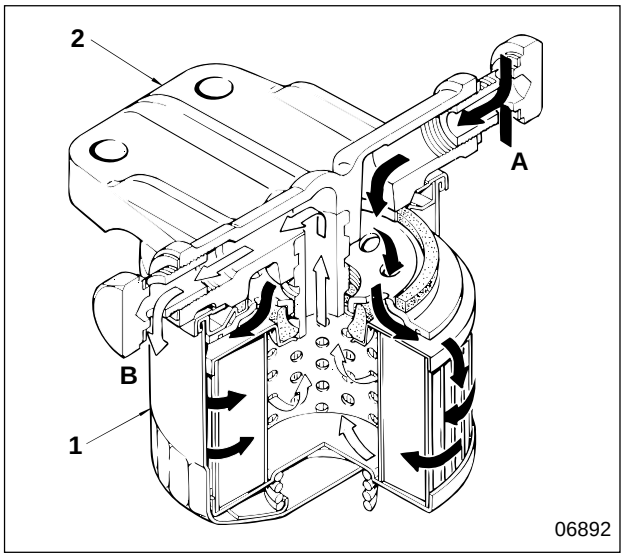
1 Water level ring

A : From fuel tank
B : To feed pump

The water separator is installed between the fuel tank and the feed pump. Any water present in the fuel is separated by the baffle plate and the screen assembly.

https://truckmanualshub.com/

Fuel Filter



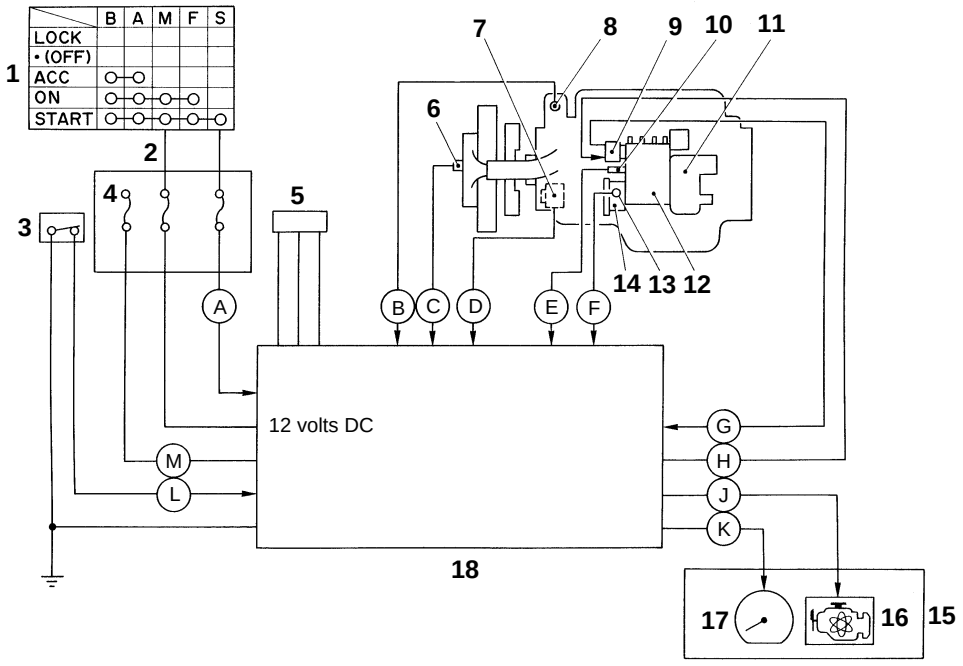
1 Fuel filter
2 Fuel filter head

A : From feed pump
B : To injection pump

Pressurized fuel is delivered from the feed pump of the injection pump to the fuel filter which separates water from the fuel. Dirt and other foreign particles are removed from the fuel by fuel filter **1**.

https://truckmanualshub.com/

Structure of Pre-stroke Control Injection Pump System



13758

Part name	Main function	Main signal
1 Starter switch	Detection of start signal	Ⓐ : Start signal

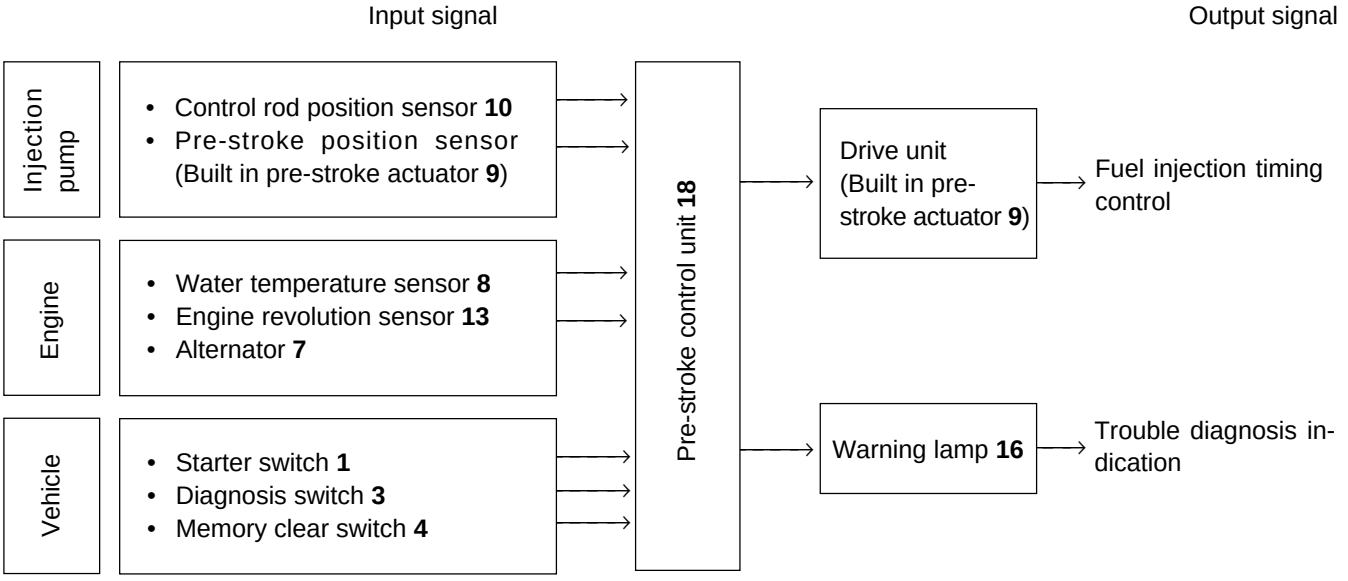
10 Control rod position sensor	Detection of control rod position	Ⓔ : Control rod position signal
11 Mechanical governor	Control of fuel injection quantity (Mechanical control)	
12 Pre-stroke control injection pump	Change of pre-stroke (Adjustment of fuel injection timing)	
13 Engine revolution sensor	Detection of engine revolution	Ⓕ : Engine revolution signal
14 Mechanical timer (Dummy timer)	Absorption of torsional vibration, smoothing of revolution	
15 Meter cluster		
16 Warning lamp	Indication of system abnormality, indication of diagnosis code	Ⓙ : Lamp lighting signal
17 Tachometer		Ⓚ : Tachometer drive signal
18 Pre-stroke control unit	Control of entire system	

https://truckmanualshub.com/

- The pre-stroke control injection pump system uses, in the injection pump body, electronically controlled pre-stroke control injection pump **12**, mechanical governor **11**, and mechanical timer **14**.
- The lifting speed of the plunger in the injection pump varies with the engine revolution. Because of this, the pressure in the injection pipe also changes.
- This change of pressure in the injection pipe means the appropriate state of fuel injection and air/fuel mixture from the injection nozzle is no longer obtainable.
- In low- and medium-range engine revolution, the amount of pre-stroke is made larger so that the fuel is injected at the point the plunger lifting speed increases during the second half of cam lift. 🕮 P13-18
- On the other hand, in high-range engine revolution, the amount of pre-stroke is made smaller so that the fuel is injected while the plunger lifting speed remains low during the first half of cam lift. This prevents the pressure in the injection pipe from becoming excessively high.
- Because of this variation in the amount of pre-stroke, pre-stroke control injection pump **12** can obtain the appropriate injection state and air/fuel mixture for combustion.
- Thus, engine torque is larger than engines that use a normal injection pump. Also, the exhaust gas emission is cleaner.
- Control is achieved by making the pre-stroke adjustable in conjunction with the drive of pre-stroke actuator **9**, which is mounted on the rear of the injection pump body. This pre-stroke actuator is activated by commands received from pre-stroke control unit **18**, which processes data signals received from the various sensors installed on the engine and vehicle body.
  This system also has a trouble diagnosis function and a fail-safe function. The following table shows control items.

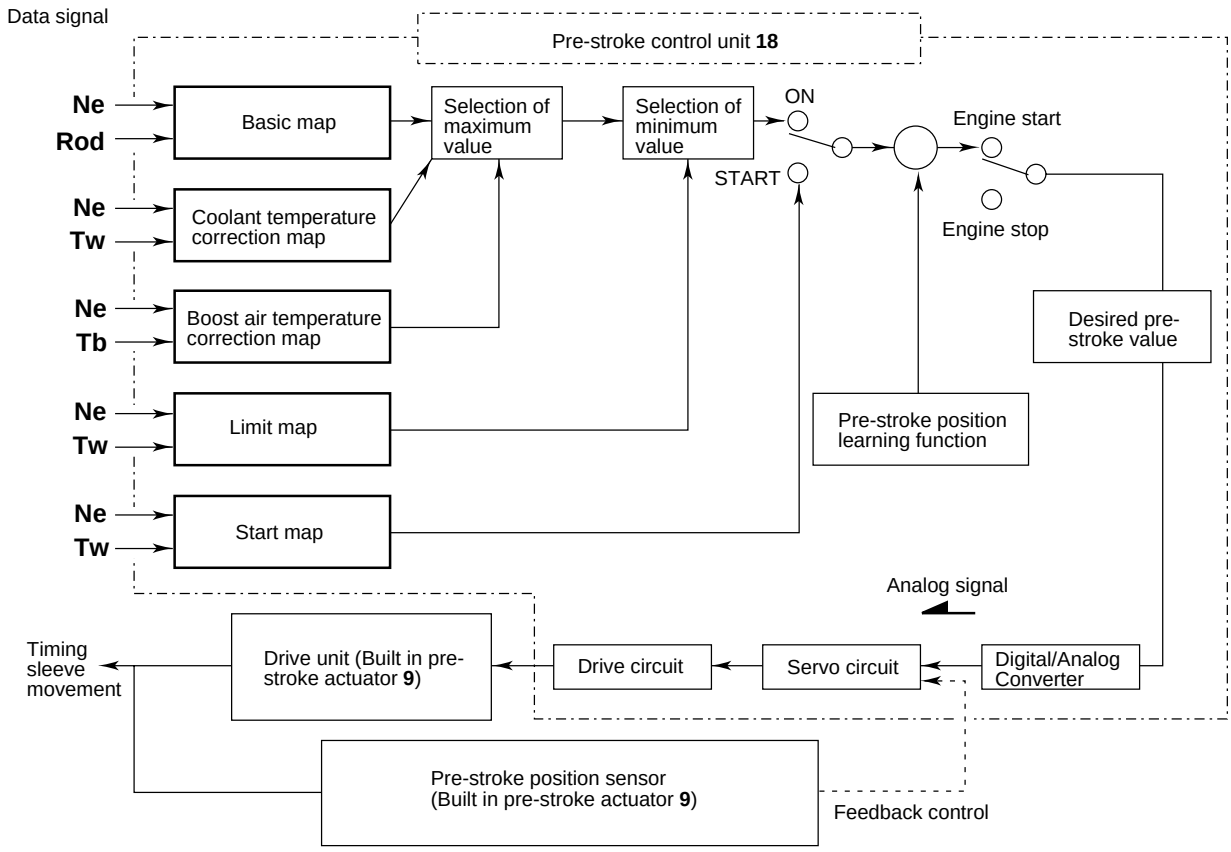
Control item	Control description	Information source	
		Sensor	Data signal
Pre-stroke control	Adjusts the fuel injection timing by changing the timing sleeve position to change the pre-stroke	6 to 10, 13, 12	Ⓐ to Ⓗ
Trouble diagnosis function	Checks and diagnoses the status of the sensors of the pre-stroke control injection pump system while the engine is running. Warns the driver, via warning lamp **16**, if any trouble occurs, and memorizes the data on the trouble 🕮 P13-13	ALL	ALL
Fail-safe function	When trouble occurs, backup mode is activated and countermeasures for the trouble are taken 🕮 P13-13	ALL	ALL
* Fuel injection quantity control	Controlled by mechanical governor **11** 🕮 P13-20	—	—

* : This is not controlled by the pre-stroke control injection pump system but by ordinary mechanical control.



https://truckmanualshub.com/

● Pre-stroke control



Ne : Engine revolution **Rod** : Control rod position
Tw : Engine coolant temperature **Tb** : Engine intake air temperature
Digital/Analog converter : Converts digital signals into analog signals

Control by Pre-stroke Control Unit 18

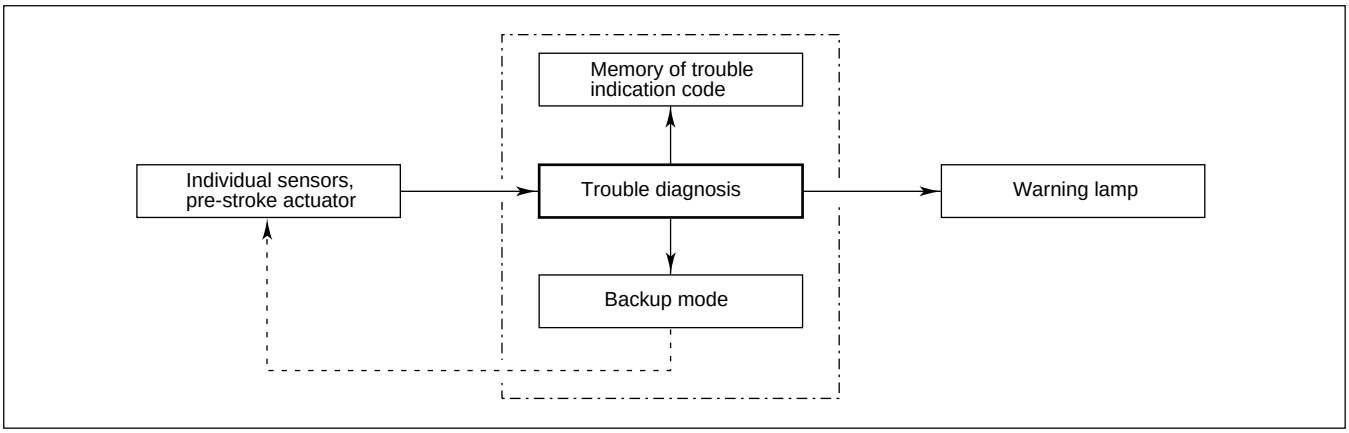
- The control unit commands the system while the engine is running, and selects the maximum value of the desired pre-stroke value based on data signals received from the basic map, coolant temperature correction map, and boost air temperature correction map.
- After the maximum value has been selected, the limit map selects and processes the minimum value so that the desired pre-stroke value does not exceed the maximum value.
- The desired pre-stroke value is further determined by the pre-stroke position learning function. This corrects any deviation in positional adjustment by the pre-stroke position sensor and any deviation by the injection pump, correcting the output voltage of the pre-stroke position sensor.
- The pre-stroke thus determined is converted into continuous analog signals by the Digital/Analog converter and transmitted through the servo circuit and drive circuit to actuate the drive unit. The drive unit moves the timing sleeve position to change the pre-stroke.
- Control at the time of engine start up is handled by the start map.

Control by Pre-stroke Position Sensor (built in pre-stroke actuator 9)

- The pre-stroke position sensor monitors the operating condition of the drive unit by feeding back signals to pre-stroke control unit **18** and judging whether the pre-stroke is controlled in accordance with the desired value by noting the timing sleeve position.
- When pre-stroke control unit **18** receives the feedback signals, it computes the actual measured value of the timing sleeve position, and if there is any difference between the desired and actual values, it issues a correction command.
- This operation is repeated to constantly maintain the timing sleeve position at the desired position, thus determining the final pre-stroke.

https://truckmanualshub.com/

● Trouble diagnosis function, fail-safe function



- The trouble diagnosis function detects and diagnoses troubles reported by the various sensors and the pre-stroke actuator, while the engine is running. If any trouble occurs, this function warns the driver by lighting warning lamp and at the same time stores the trouble point in memory as a diagnosis code.
- The fail-safe function is put into operation simultaneously and the trouble is treated accordingly in the backup mode.
- In the backup mode, the pre-stroke control starts when trouble occurs. If the trouble does not affect the operation of the engine, fixed data from the backup mode is used to treat the trouble. If the trouble dangerously affects the operation of the engine, the pre-stroke control stops.
- If the function goes into backup mode, the function stays in that mode until the starter switch is set to LOCK. When a normal signal is returned, control of the system returns and warning lamp goes off.
- There are two kinds of diagnosis code, current and previous.
  - Current diagnosis code : Indicates data when the engine has been running with the starter switch set to ON since the abnormality occurred.
  - Previous diagnosis code : Indicates previous data when the engine was stopped with the starter switch set to ACC or LOCK after the abnormality occurred.

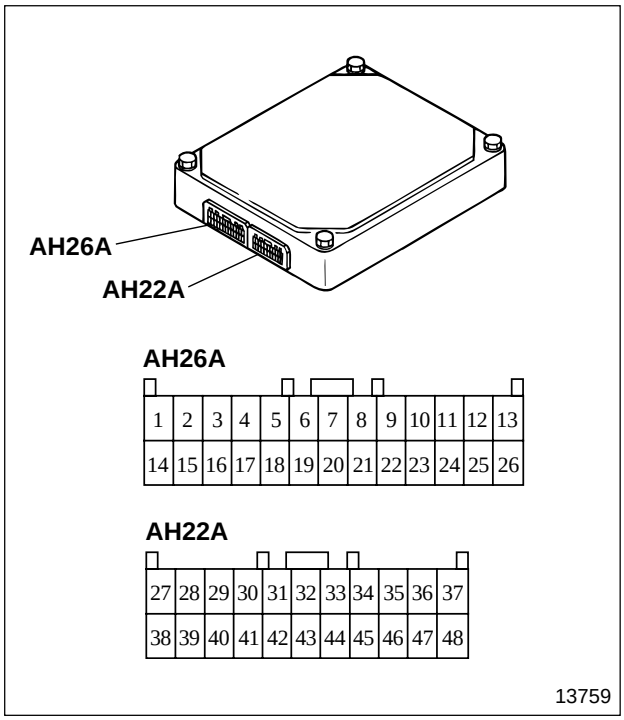
Table of diagnosis codes

Diagnosis code	Abnormal item	Countermeasures taken by pre-stroke control unit (Backup mode)
01	Normal	—
03	Pre-stroke learning function	Controls with correction value assumed to be 0
04	Pre-stroke actuator power source	Stoppage of pre-stroke control
05	Engine revolution sensor (No pulse)	Controls with engine revolution assumed to be 0
12	Pre-stroke servo system	Stoppage of pre-stroke control
13	Pre-stroke position sensor	Stoppage of pre-stroke control
15	Engine revolution sensor (Wiring breakage)	Controls with engine revolution assumed to be 0
21	Water temperature sensor	Controls with water temperature assumed to be 80˚C {176˚F}
22	Control rod position sensor	Controls with control rod position assumed to be full load
41	Boost air temperature sensor	Controls with boost air temperature assumed to be 80˚C {176˚F}

It is possible to run the vehicle even if the pre-stroke control develops an abnormality. However, do not run the vehicle for a long period of time, run it only for the time necessary to obtain repairs.

https://truckmanualshub.com/

Pre-stroke Control Unit



- The pre-stroke control unit monitors and computes data signals received from the various sensors and, using its internal computer, converts the computed results into control signals (pre-stroke actuator drive signals).
- These signals operate the various instruments to control the system.

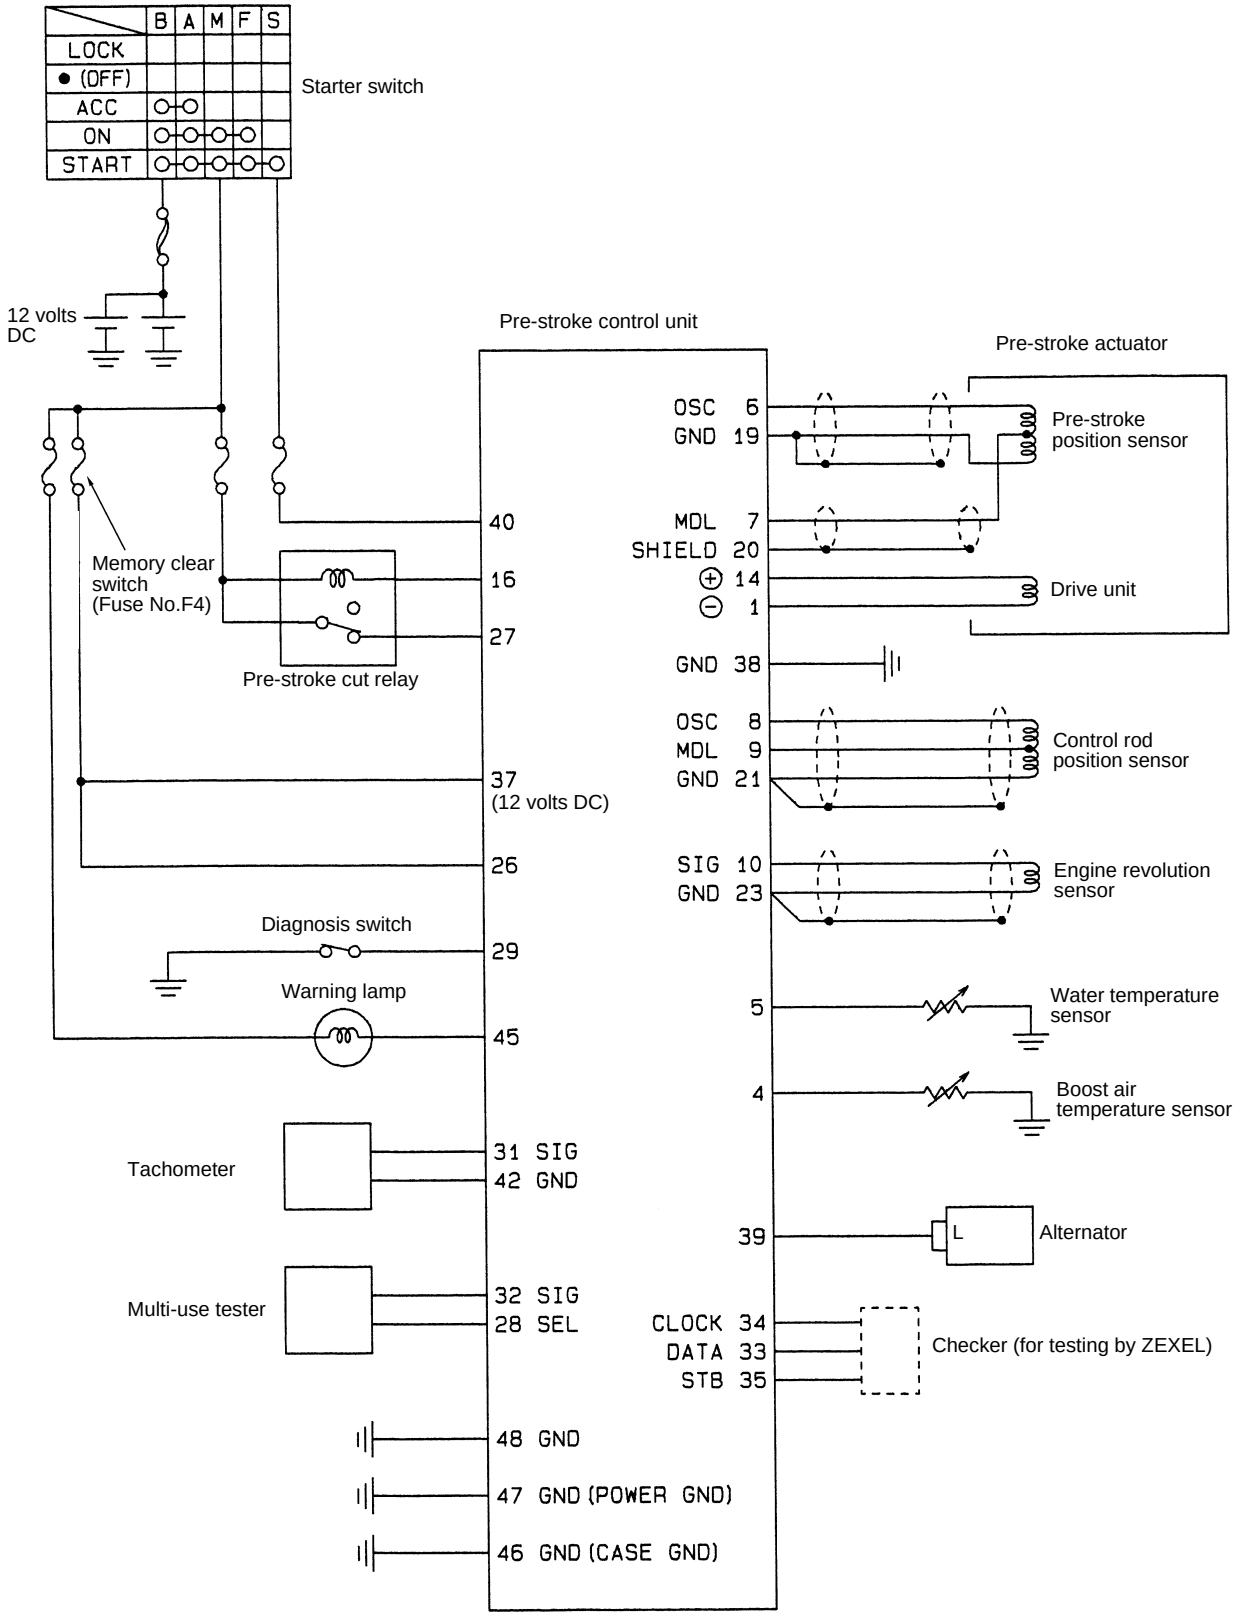
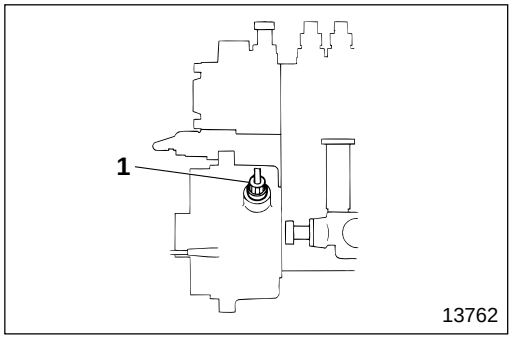
https://truckmanualshub.com/



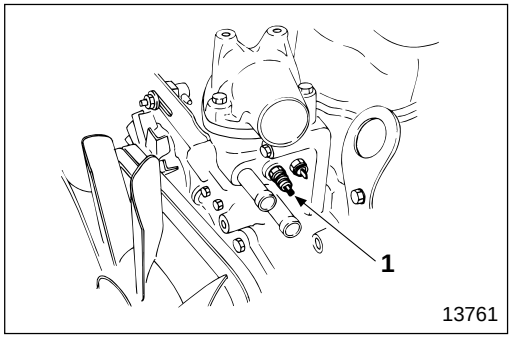
https://truckmanualshub.com/

Engine Revolution Sensor



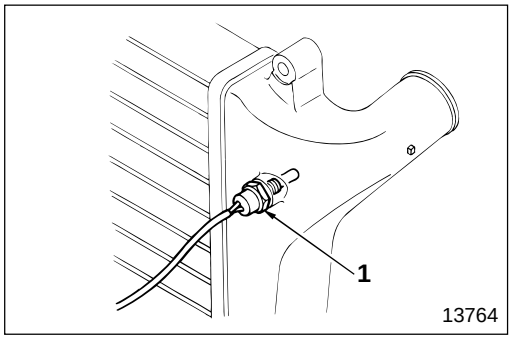
- Engine revolution sensor **1** is a pick-up type that detects the revolution of the injection pump and converts the revolution value into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the engine revolution signal, which is used as the correction value by the control unit to determine the desired pre-stroke position value.

Water Temperature Sensor



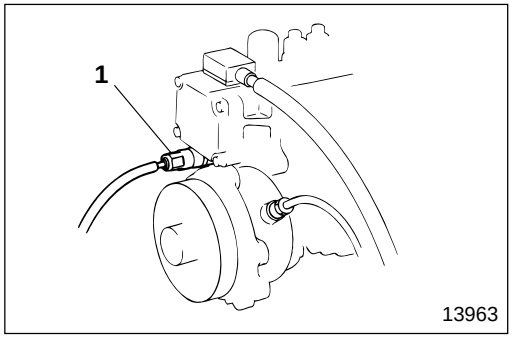
- Water temperature sensor **1** is a thermistor type that converts the coolant temperature into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the engine coolant temperature signal, which is used as the correction value by the control unit to determine the desired pre-stroke position value.

Boost Air Temperature Sensor



- Boost air temperature sensor **1** is a thermistor type that converts the intake air temperature, immediately after its passage through the intercooler, into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the boost air temperature signal, which is used as the correction value by the control unit to determine the desired pre-stroke position value.

Control Rod Position Sensor

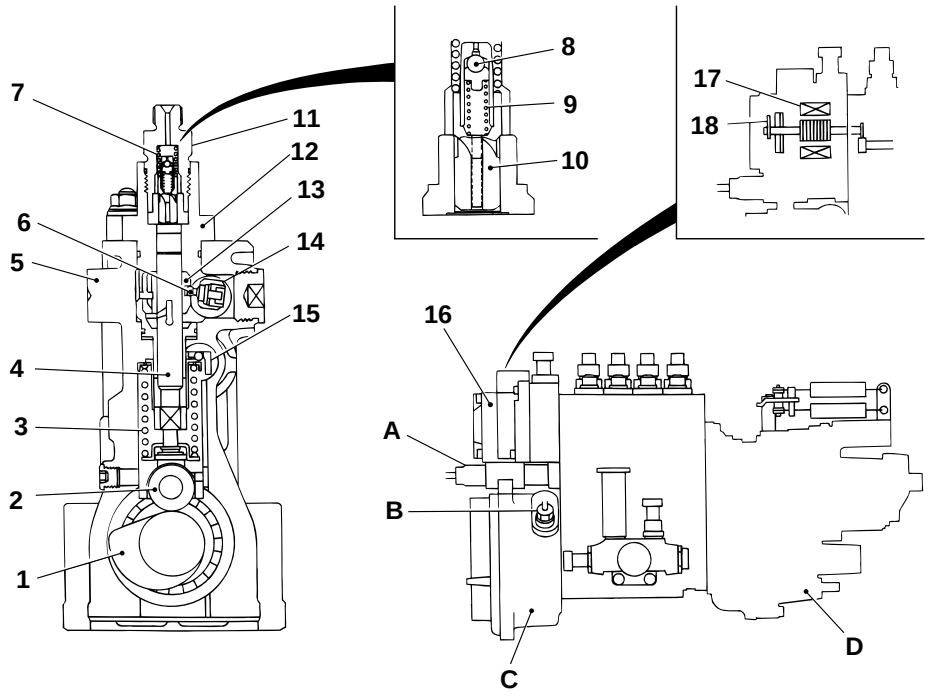


- Control rod position sensor **1** is a resistor type that converts the amount of movement of the control rod into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the control rod position signal, which is used as the correction value by the control unit to determine the desired pre-stroke position value.

Pre-stroke Position Sensor P13-10, 12

https://truckmanualshub.com/

Injection Pump Body



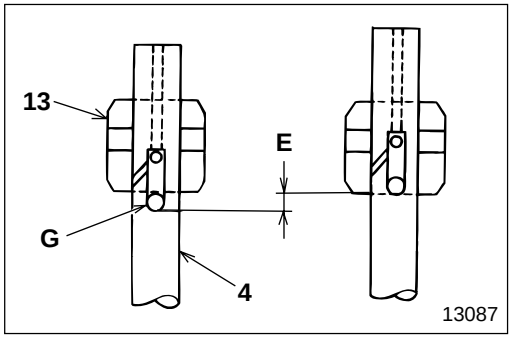
13765

1 Camshaft
2 Tappet
3 Plunger spring
4 Plunger
5 Pump housing
6 Pin
7 Delivery valve spring
8 Ball
9 Spring
10 Delivery valve
11 Delivery valve holder
12 Plunger barrel
13 Timing sleeve
14 Timing rod
15 Control rod
16 Pre-stroke actuator
17 Drive unit
18 Pre-stroke position sensor

A : Control rod position sensor P13-16
B : Engine revolution sensor P13-16
C : Mechanical timer (Dummy timer)
D : Mechanical governor P13-20

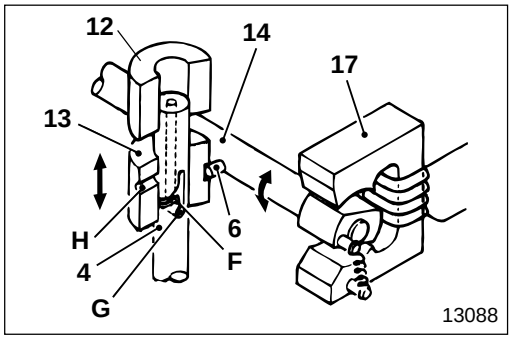
- The injection pump has a variable pre-stroke mechanism.
- Because of the variation in the amount of pre-stroke, the appropriate injection state and air/fuel mixture for combustion can be obtained, thus the engine torque is larger than when a normal injection pump is used and the exhaust gas emission is cleaner.

https://truckmanualshub.com/



Pre-stroke

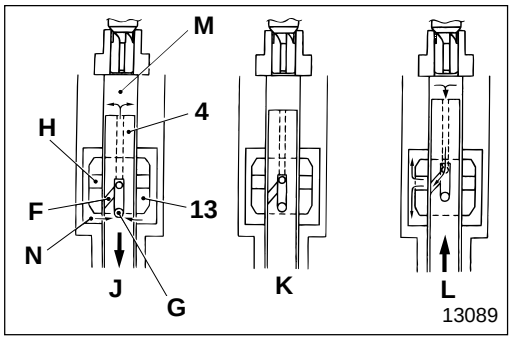
Pre-stroke is stroke **E** whose range is from the bottom dead point of plunger **4** to the starting point of pressurized delivery of fuel, at which point suction port **G** is closed by timing sleeve **13**. An ordinary injection pump has a fixed stroke length.



Pre-stroke variable mechanism

F : Indent
G : Suction port
H : Exhaust port

- In a conventional injection pump, plunger barrel **12** is fixed. In the pre-stroke control injection pump system, vertically movable timing sleeve **13** is fitted in the fixed plunger barrel.
- Timing rod **14**, pin **6** and drive unit **17** are installed to operate timing sleeve **13**.
- The operation of drive unit **17** rotates timing rod **14**, causing pin **6** to move timing sleeve **13** vertically.
- As timing sleeve **13** is fitted with fuel exhaust port **H**, the pre-stroke changes in accordance with the movement of the timing sleeve.

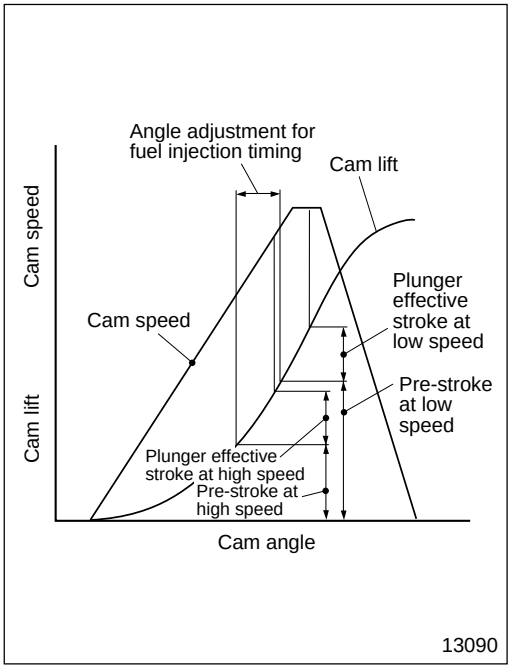


Pressurized fuel delivery

J : Ongoing suction
K : Start of pressurization
L : Delivery ends

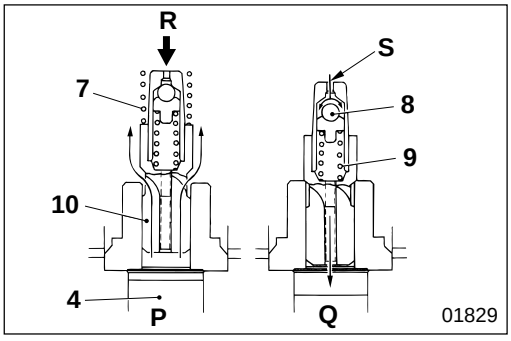
- When suction port **G** opens as plunger **4** moves down from the top dead point, fuel is delivered into pressure chamber **M** by both the negative pressure caused by the downward movement of the plunger and the pressure of the fuel itself delivered by the feed pump.
- When the lift of plunger **4** is low enough, the pressure in pressure chamber **M** does not increase as the fuel in the pressure chamber flows via suction port **G** into fuel reservoir **N**, even if the plunger lifts.
- As plunger **4** lifts further and suction port **G** is closed by timing sleeve **13**, pressurization of the fuel starts. The pressure increases as the plunger lifts further, making the injection pump start pressurized fuel delivery.
- When indent **F** on plunger **4** meets exhaust port **H** of timing sleeve **13**, the fuel in pressure chamber **M** is pushed back to fuel reservoir **N**, stopping pressurized fuel delivery.
- Adjustment of the fuel quantity to be injected is made by changing the relative meeting position of exhaust port **H** of timing sleeve **13** and indent **F**, by the rotation of plunger **4**.

https://truckmanualshub.com/



Fuel injection timing and fuel injection characteristics

- The pre-stroke changes according to changes in the position of timing sleeve **13**, whereby the fuel injection timing can be advanced or retarded.
- By making the pre-stroke smaller, suction port **G** of plunger **4** closes early, making the fuel injection timing quicker accordingly.
- By making the pre-stroke larger, suction port **G** of plunger **4** closes late, making the fuel injection timing slower accordingly.
  The quick response of the fuel injection timing improves engine start - up performance at low temperatures.



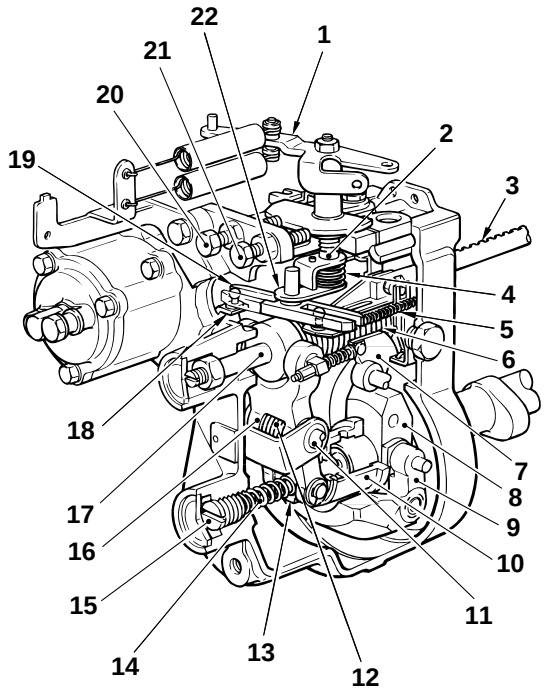
Delivery valve

P : Start of pressurized delivery
Q : End of pressurized delivery

- Delivery valve **10** keeps residual pressure **R** in the injection pipe at a certain level throughout the entire engine revolution range preventing cavitation and allowing high-pressure injection.
- When the fuel pressure on plunger **4** side, as the plunger is lifted, overcomes the combined force of residual pressure **R** in the injection pipe and the repercussive force of delivery valve spring **7** of the plunger, delivery valve **10** is pushed up and pressurized fuel delivery starts.
- Fuel in the injection pipe returns quickly to plunger **4** side the moment pressurized delivery from the plunger ends, and the delivery valve is closed.
- The excess fuel is returned slowly through orifice **S**, reducing the pressure in the injection pipe.
- When the repercussive force of spring **9** in delivery valve **10** equalizes with the pressure in the injection pipe, ball **8** closes orifice **S** and residual pressure **R** in the injection pipe is kept at a specified level.

https://truckmanualshub.com/

Governor

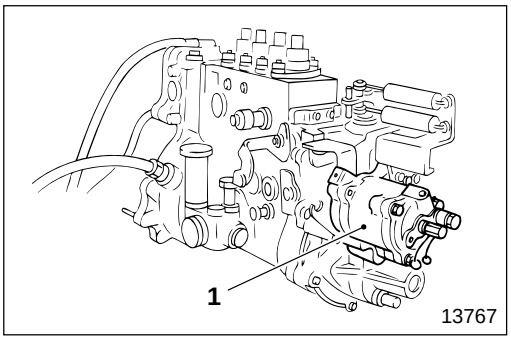


1 Control lever
2 Adjusting lever shaft
3 Control rod
4 Cancel spring B
5 Start spring
6 Governor spring
7 Torque cam
8 Flyweight holder
9 Flyweight
10 Sleeve
11 Tension lever shaft
12 Cancel spring A
13 Shifter
14 Idling spring
15 Idling screw
16 Tension lever
17 Governor shaft
18 Guide lever
19 Floating lever
20 Idling set bolt
21 Full-speed set bolt
22 Supporting lever

The governor is a mechanical type that uses centrifugal force generated by flyweights **9**, its characteristics are between those of a minimum/maximum speed governor and those of an all-speed governor. Because there is no repercussive force from governor spring **6** or control lever **1**, when the accelerator pedal is depressed, the repercussive force transmitted to the accelerator pedal, via the control lever, is quite light, making accelerator pedal operation easy.

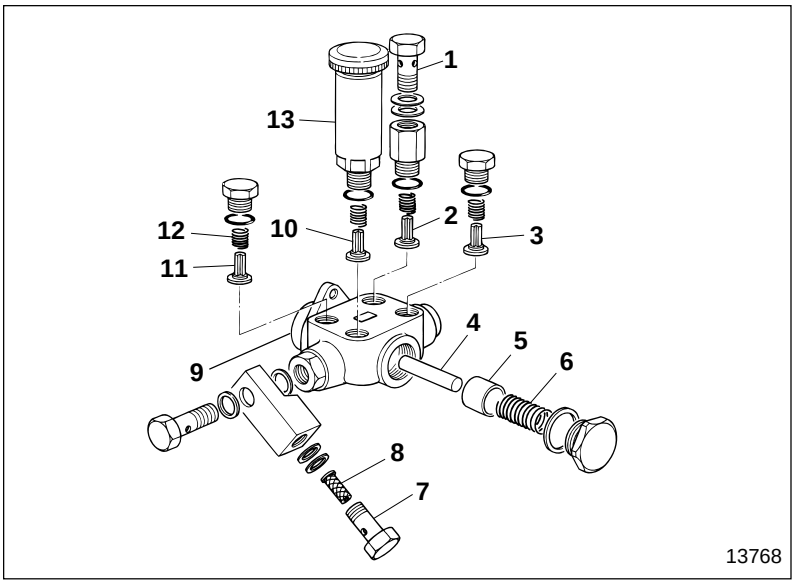
https://truckmanualshub.com/

Boost Compensator



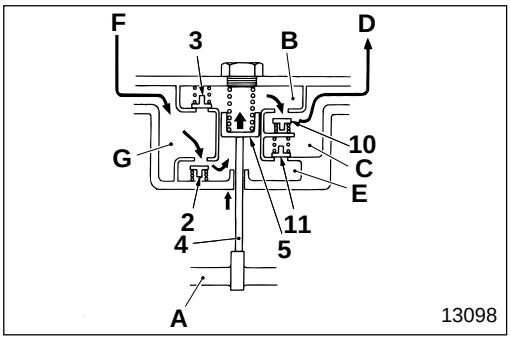
Boost compensator **1** is a device that automatically adjusts the quantity of fuel to be injected to suit the increase in the intake air mass delivered into the engine cylinders by the turbocharger.

Feed Pump



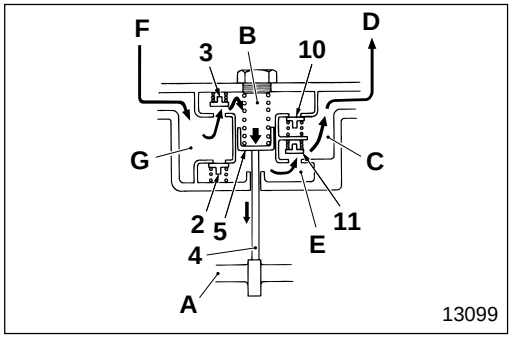
1 Eye bolt on fuel outlet side
2 Check valve
3 Check valve
4 Push rod
5 Piston
6 Piston spring
7 Eye bolt on fuel inlet side
8 Gauze filter
9 Feed pump housing
10 Check valve
11 Check valve
12 Check valve spring
13 Priming pump

- The feed pump is a double-action type pump which, with four check valves operating, sucks and discharges fuel during both strokes of pistons **5**.
- Push rod **4** makes contact with the injection pump camshaft directly, moving piston **5**.
- Priming pump **13** can be manually operated, when the injection pump is not operating, to suck up fuel and thus can be used for air bleeding.
- Gauze filter **8** eliminates large foreign particles from the fuel sucked up from the fuel tank to prevent clogging of the feed pump. This gauze filter must be cleaned with gas oil periodically.



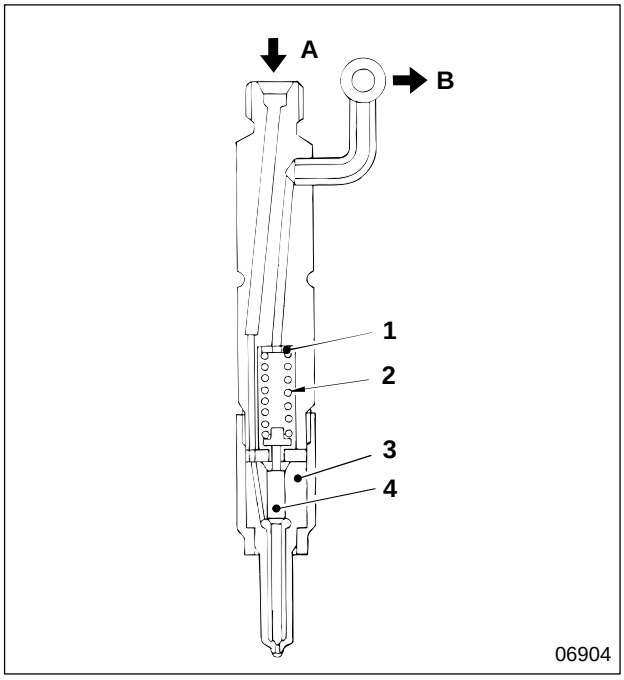
The rotation of injection pump camshaft **A**, pushes up push rod **4** and piston **5**, and the pressure in inner chamber **B** increases. This closes check valve **3**, and check valve **10** opens to let the fuel in inner chamber **B** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **E** decreases, check valve **11** closes, and check valve **2** opens to let fuel flow from fuel tank **F** through outer chamber **G** to inner chamber **E**.

https://truckmanualshub.com/



When injection pump camshaft **A** rotates further, it pushes down push rod **4** and piston **5**, and the pressure in inner chamber **E** increases. This closes check valve **2**, and check valve **11** opens to let the fuel in inner chamber **E** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **B** decreases, check valve **10** closes, and check valve **3** opens to let fuel from fuel tank **F** flow through outer chamber **G** to inner chamber **B**.

Injection Nozzle



1 Washer
2 Spring
3 Nozzle tip
4 Needle valve

A : From injection pump
B : To fuel tank

- As the pressure of the fuel delivered from the injection pump overcomes the repercussive force of spring **2**, needle valve **4** is pushed up to allow the fuel to spray out the opening at the tip of the nozzle.

- Injection pressure can be adjusted by increasing or decreasing the number of washers **1**.

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection and Adjustment of Fuel Injection Timing

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Fuel injection timing	7°	—	Adjust

Tightening torque

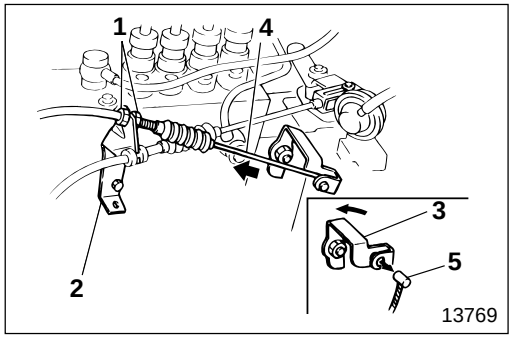
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
6	Union nut	100 to 110 {76 to 83, 10.5 to 11.5}	—
7	Delivery valve holder	29 to 49 {22 to 36, 3 to 5}	—

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
—	Cranking handle  05999	MH061289	Cranking of engine
15, 16	Universal extension  05163	MH061099	Inspection and adjustment of fuel injection timing



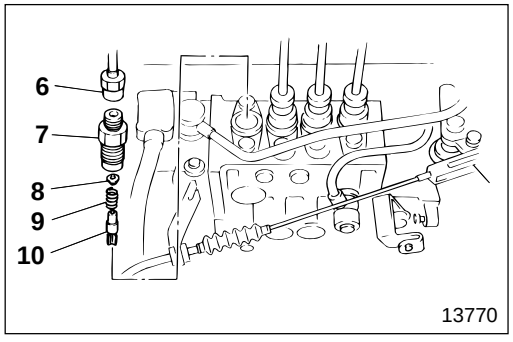
13769

[Inspection]

NOTE

Set the starter switch to “LOCK” or “ACC” before starting operation.

- Loosen lock nut **1** of control cable bracket **2** and remove from the bracket slit.
- Pull governor stop lever **3** toward STOP direction.
- Remove cable end **5** of engine stop cable **4**.



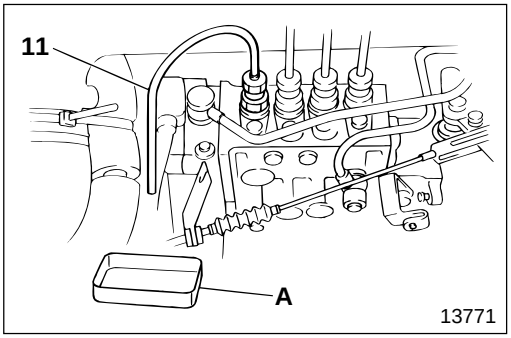
13770

- Remove union nut **6** of the injection pipe, delivery valve holder **7**, stopper **8**, delivery valve spring **9** and delivery valve **10** from the injection pump of No.1 cylinder.
- After removing these parts, install delivery valve holder **7**.

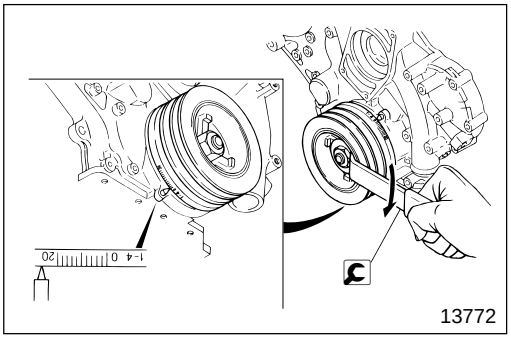
CAUTION

Be sure to keep all the removed parts in gas oil to keep them free from dirt.

https://truckmanualshub.com/



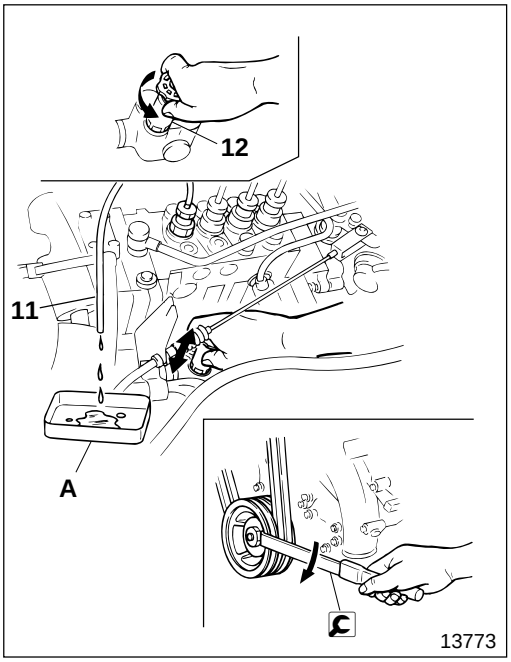
- Mount extra injection pipe **11** on No.1 cylinder. Direct the free end of the pipe downwards so that the fuel discharge can be clearly observed.
  A : Oil tray



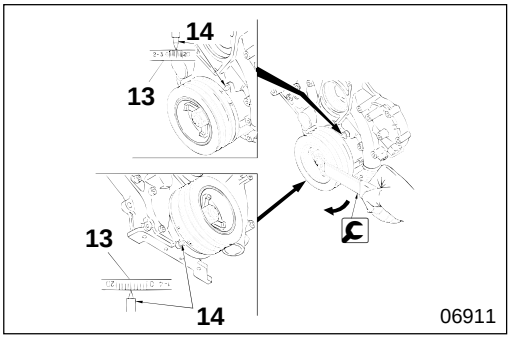
- Turn the crankshaft more than 180° in the forward running direction and bring No.1 cylinder to approximately 30° before top dead center in the compression cycle.

NOTE

Refer to the location where there are 30° gradations, since angle gradations on the crankshaft pulley side only extend to 20°.



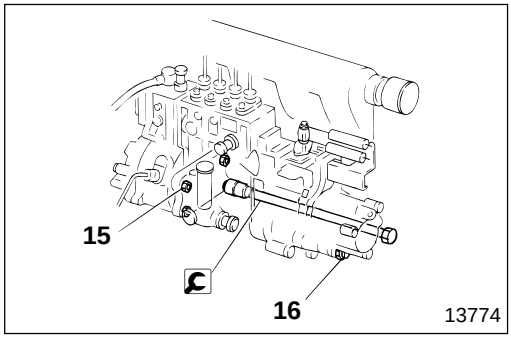
- Turn the engine in the forward running direction slowly while discharging fuel from injection pipe **11**, deliver fuel using priming pump **12**.
  A : Oil tray
- When the discharge of fuel from injection pipe **11** becomes intermittent, turn the crankshaft slower, stop turning the crankshaft when the discharge stops completely.



- Make sure that indent **13** on the crankshaft pulley and pointer **14** on the timing gear case show the standard fuel injection timing.

https://truckmanualshub.com/

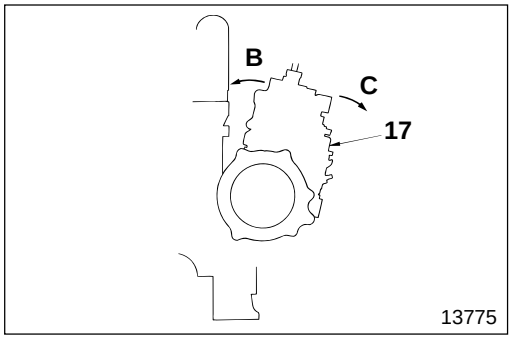
INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE



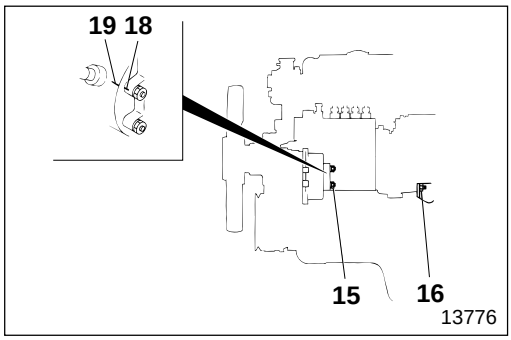
- Adjust fuel injection timing as follows if it does not conform to the standard value.

[Adjustment]

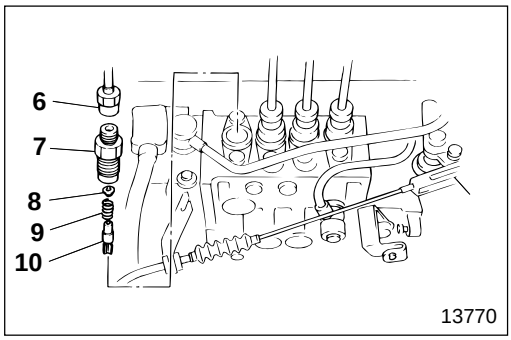
- Loosen injection pump mounting nuts **15**, **16**.
  15 : 4 points (on flange)
  16 : 1 point



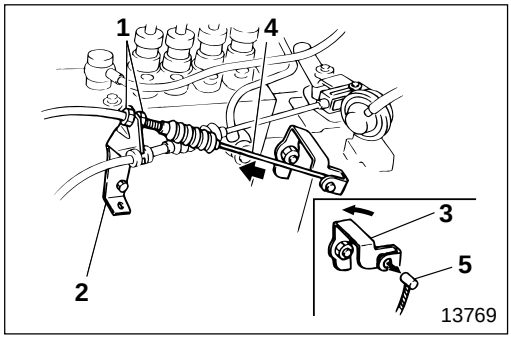
- When fuel injection timing is retarded, tilt injection pump **17** toward crankcase side **B**.
- When fuel injection timing is advanced, tilt injection pump **17** away from crankcase **C**.



- Adjustment of one graduation on indented scale **18** of the timer case flange adjusts fuel injection timing by 6°.
  19 : Pointer
- Tighten nuts **15**, **16** at specified torque, and remeasure fuel injection timing.



- After making sure that the fuel injection timing conforms to the standard value, install delivery valve **10**, delivery valve spring **9** and stopper **8**, then tighten delivery valve holder **7**, and union nut **6**.
- Tighten each part at specified torque.



- With stop lever **3** pulled toward the STOP direction, insert cable end **5** through the stop lever slit.
- Fix to control wire bracket **2** with lock nut **1**.
- Adjust engine stop cable **4** after installing it. P13-64

https://truckmanualshub.com/

Inspection and Adjustment of No-load Minimum and Maximum Revolution

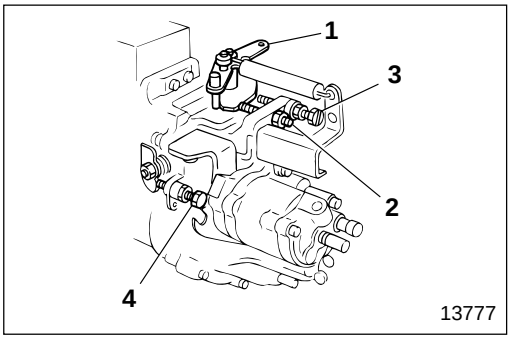
Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	No-load minimum revolution (Idling revolution)	Manual transmission	700 to 750 rpm	—	Adjust
		Automatic transmission	* 750 to 800 rpm	—	Adjust
—	No-load maximum revolution		3650 to 3750 rpm	—	Adjust

* : Revolutions per minute in P range

● **Before inspecting the vehicle do the following :**

- Run the engine to bring the coolant temperature up to approximately 80 to 90°C {176 to 194°F}.
- Turn all the lights and accessory equipment OFF.
- Put transmission in neutral. (For automatic transmission, put transmission into the P range.)
- Set the steering wheel at center and straight position.



(1) No-load minimum revolution (Idling revolution)

- Make sure that control lever **1** strikes idling set bolt **2**, and in this state, check and see if the minimum revolution is within the standard value.
- If the minimum revolution deviates from the standard value, adjust using idling set bolt **2**.
- After adjustment increase the revolution from between 2800 rpm to 3400 rpm once, and check the minimum revolution.

(2) No-load maximum revolution

- Make sure that adjusting lever **1** strikes full-speed set bolt **3**, and in this condition, check and see if the maximum revolution is within the standard value.
- If the maximum revolution deviates from the standard value, adjust using full-speed set bolt **3**.

CAUTION

Never change the fixed position of full-load stopper bolt 4.

NOTE

Ensure that the engine does not stall or hunt when adjusting lever 1 is moved from the full-speed position to the idling position quickly. If performance is faulty, adjust it to within standard values.

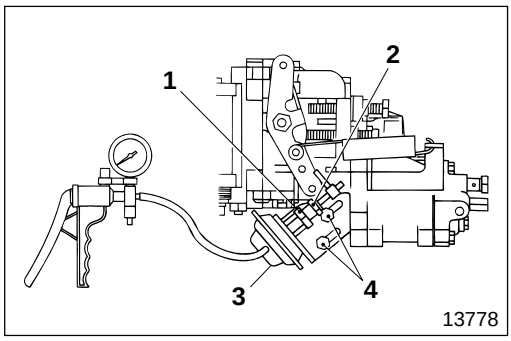
https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection and Adjustment of Idling Actuator < with Cab Cooler >

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Idling revolution		625±25 rpm	—	Adjust
—	Idling revolution under idling operation	Manual transmission	950 to 1000 rpm	—	Adjust
		Automatic transmission	850 to 900 rpm	—	Adjust



● **Before inspecting the vehicle do the following:**

- Run the engine to bring the coolant temperature up to approximately 80 to 90°C {176 to 194°F}.
- Turn all the lights and accessory equipment OFF.
- Put transmission in neutral. (For automatic transmission, put transmission into the P range.)

[Inspection]

- Make sure that idling speed is within the standard value.

- If idling speed deviates from the standard value, adjust idling speed. P13-31
- Apply vacuum of more than 47 kPa {14 in.Hg, 350 mmHg} to activate actuator **3**, and in that state, make sure that the idling speed is within the standard value.

- If the idling speed deviates from the standard value, adjust in the following manner.

[Adjustment]

- Activate actuator **3** by applying vacuum of more than 47 kPa {14 in.Hg, 350 mmHg}.
- Loosen lock nut **1**, and adjust idling speed by turning adjusting screw **2** until idling speed conforms to the standard value.

- After depressing the accelerator pedal several times, make sure that the idling speed is within the standard value.

NOTE

If adjustment using adjusting screw 2 fails to meet the standard value, loosen actuator mounting bolts 5 and adjust by shifting the position of actuator 3. Then, tighten mounting bolts 4 at specified torque.

MEMO

https://truckmanualshub.com/

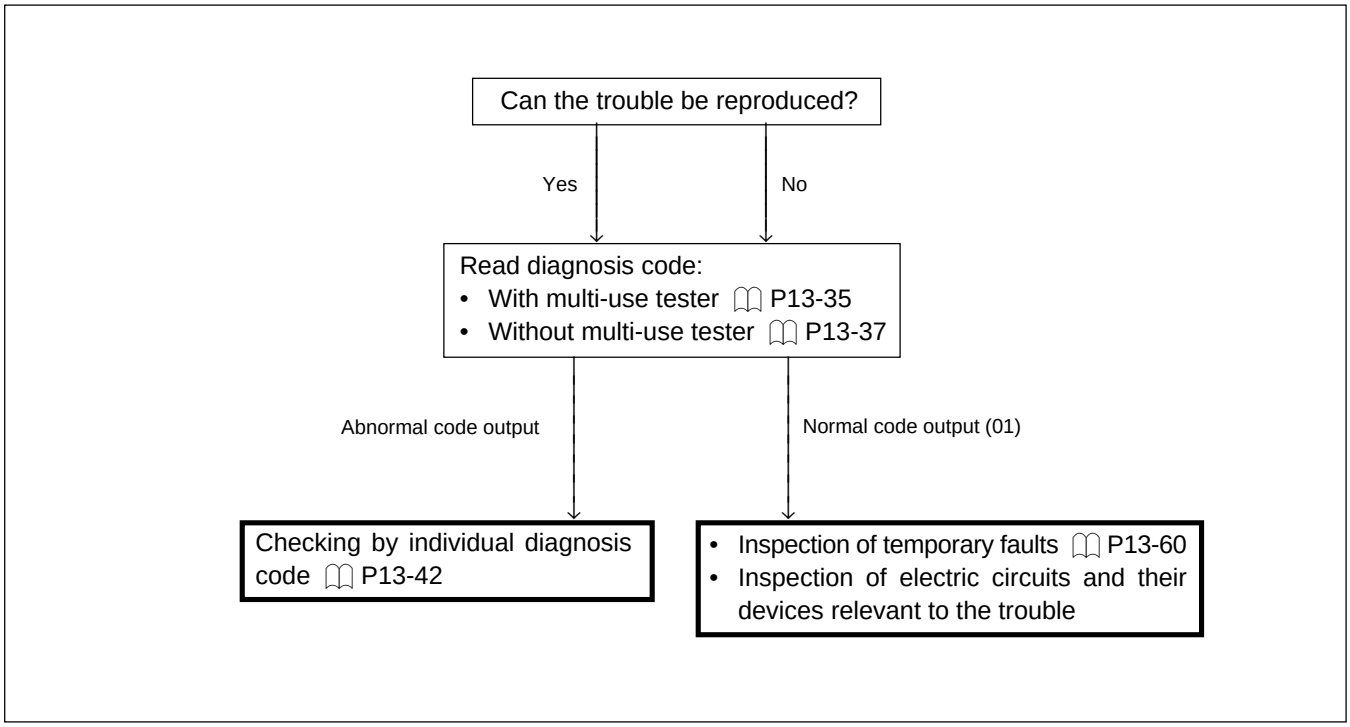
PRE-STROKE CONTROL INJECTION PUMP SYSTEM

Troubleshooting Procedure

The pre-stroke control type injection pump system has a trouble diagnosis function, this function is used for troubleshooting.

This means you have to read the diagnosis code memorized in the pre-stroke control unit, and carry out an inspection based on this code. There are two ways of reading the code; with a multi-use tester, and without a multi-use tester.

In the case of trouble that does not have a diagnosis code, the normal 01 code is indicated, and it is necessary to carry out a check depending on the situation. In this case, inspect the electric circuits and their relative devices.



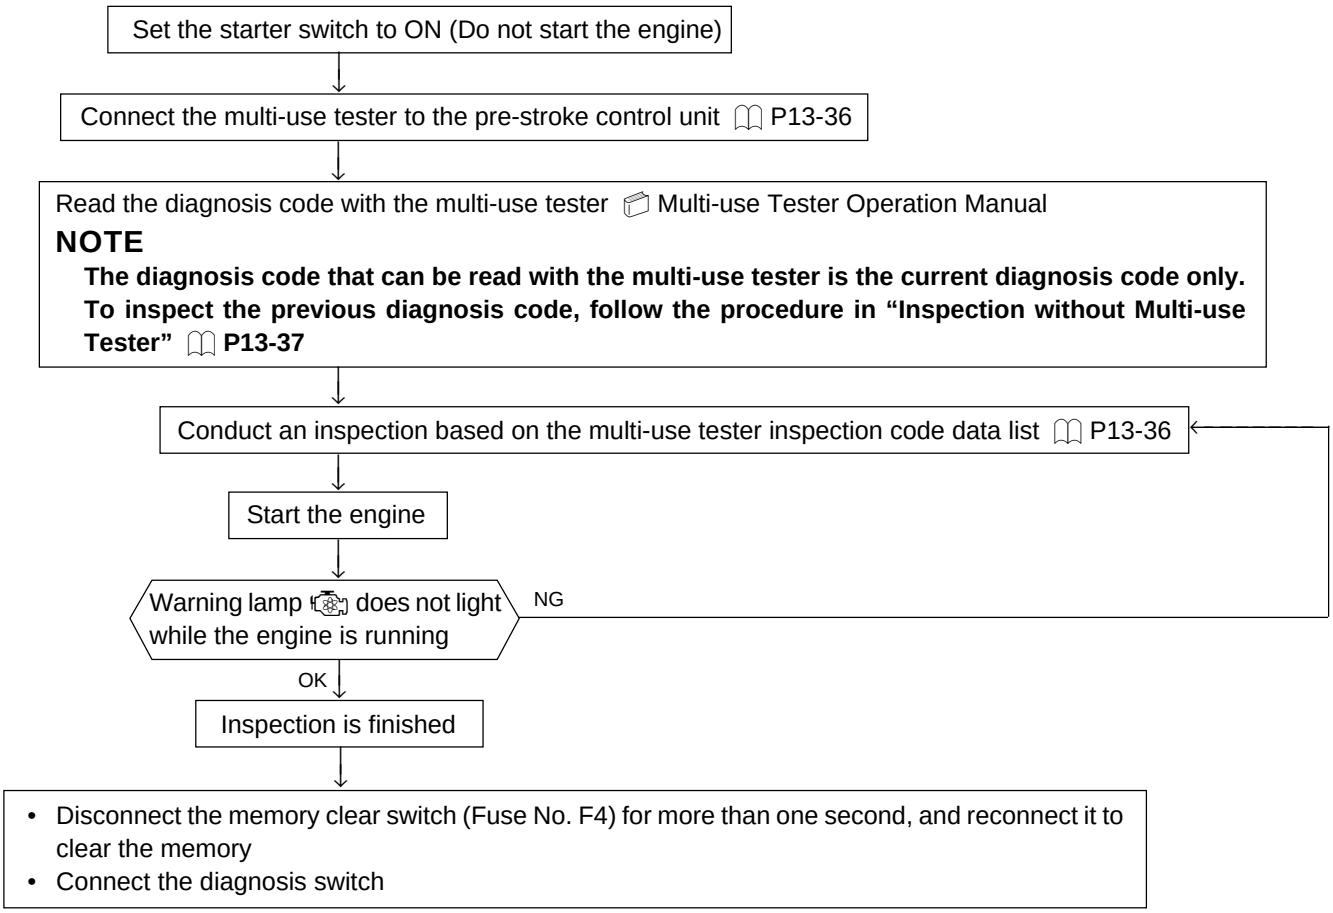
https://truckmanualshub.com/

● Inspection with multi-use tester

Special tools

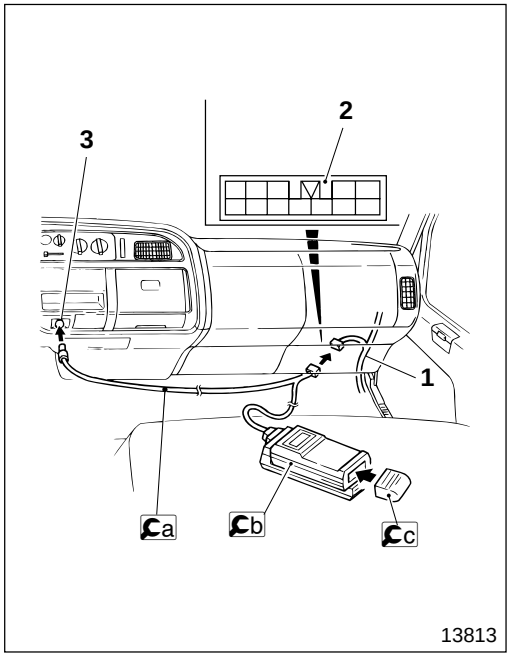
Tool name and shape	Part No.	Application
Multi-use tester sub-assembly  02803	MC858999	Inspection of system
Multi-use tester harness  02804	MB991231	
ROM pack  02805	MC858989	

● Inspection flow chart



https://truckmanualshub.com/

PRE-STROKE CONTROL INJECTION PUMP SYSTEM



● **Connection of Multi-use Tester to Pre-Stroke Control Unit**

- Set the starter switch to LOCK.
- Connect a multi-use tester harness to multi-use tester connector **2** of cab harness **1** and to cigarette lighter socket **3**.
- Connect a multi-use tester harness to b multi-use tester sub-assembly.
- Connect c ROM pack to b multi-use tester sub-assembly.

NOTE

Refer to the Multi-use Tester Operation Manual for details regarding the operation of the multi-use tester.

● **Inspection with Multi-use Tester**

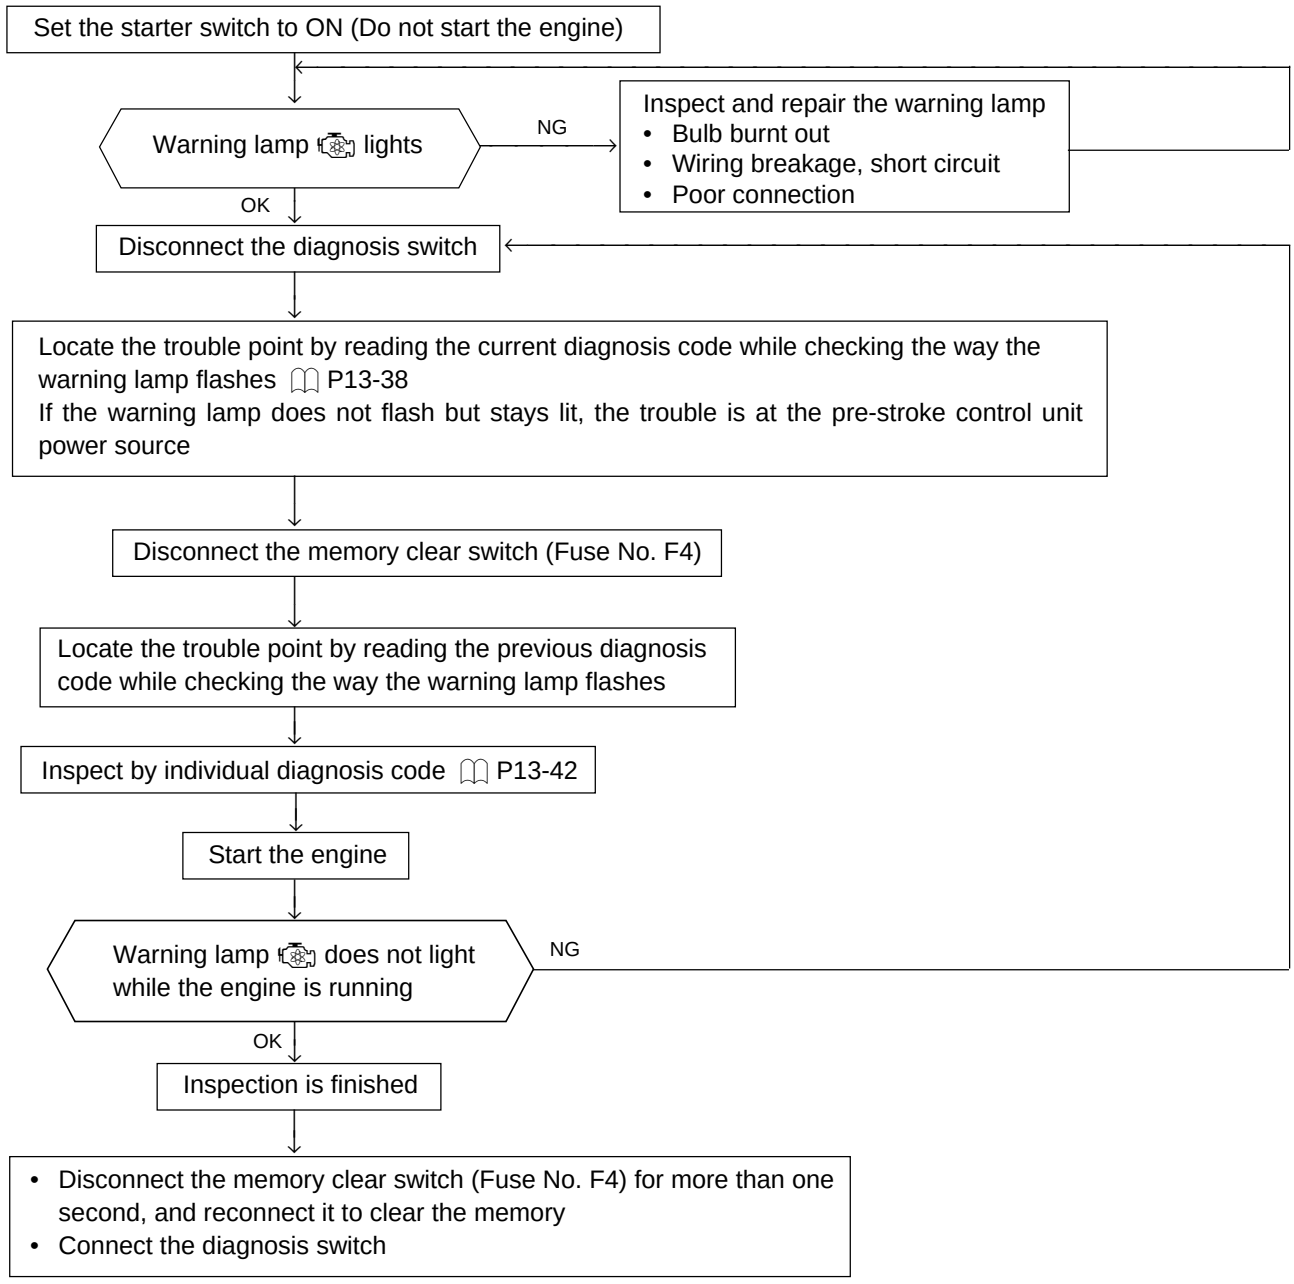
Inspection using service data is possible as well as by diagnosis code indication (self-diagnosis) using the multi-use tester. This enables you to compare the indicated figures (service data) that represent the data signals from the various sensors on the vehicle with the judgement standards, and judge whether they are good or bad. The service data code is indicated as well as the diagnosis code.

Self-diagnosis			Inspection using Service Data				
Indicated on multi-use tester			Indicated on multi-use tester			Inspection procedure	
Diagnosis code	Trouble item (Inspected instrument)	Inspection procedure	Service data code	Data signal name	Service data	Condition at inspection	Judgement standard
03	PS OFFSET	🕮 P13-42	—				
04	PS VOLTAGE		—				
05	NE NO PULS		—				
12	PS SERVO		12	PS ANG DIFF	■■.■■ deg	Engine running	Within ±5.5 deg
13	PS SNSR		—			400<Ne≦2000 Ne : Engine revolution	Within ±2°CA
15	NE SNSR		15	ENGINE SPEED	■■ rpm	Racing	Synchronization with tachometer
—			16	CTRL ROD ADJ	■■ V	Starter switch set to ON	Within ±0.04 V
21	WTR TEMP SNSR		21	WATER TEMP	■■ °F	While engine is cool While engine is warmed up Engine is stopped after warming up	Equivalent to ambient temperature Gradually rising temperature Gradual falling temperature
22	CTRL ROD SNSR		22	CTRL ROD VOLT	■■ V	Engine running	3 V or less
41	BST TEMP SNSR		41	BOOST TEMP	■■ °F	At high idling	4.9 V or less

https://truckmanualshub.com/

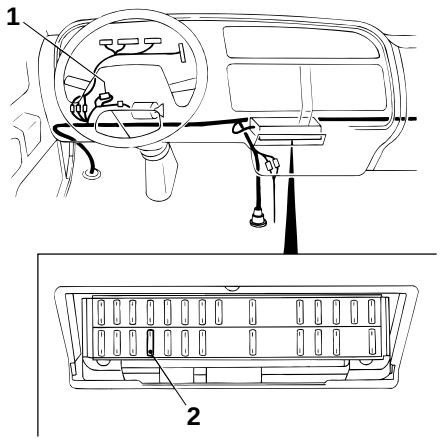
● Inspection without multi-use tester

● Inspection flow chart



https://truckmanualshub.com/

PRE-STROKE CONTROL INJECTION PUMP SYSTEM



13779

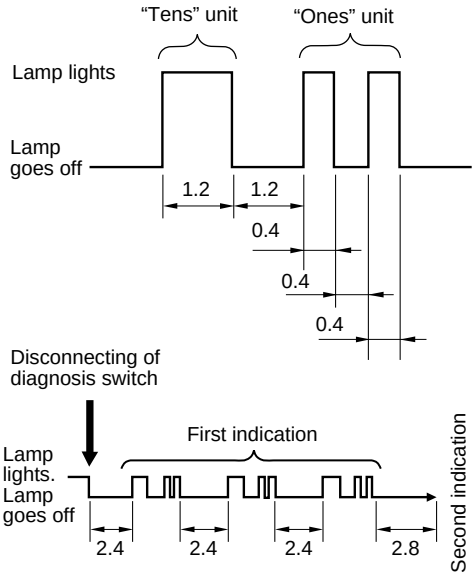
● **Reading of Diagnosis Code with Warning Lamp**

CAUTION

- **Make sure you read the current diagnosis codes first, then read the previous diagnosis codes.**
- **You must take care not to disconnect memory clear switch 2 (Fuse No. F4) before removing diagnosis switch 1 (1-pin connector without locking device) because this would make it impossible for the system to indicate the current diagnosis code.**
- **Note that if memory clear switch 2 is reconnected after being disconnected, it will clear all the diagnosis codes.**

Current diagnosis code

- When diagnosis switch **1** is disconnected, the pre-stroke control unit starts diagnosis of the trouble and indicates the current diagnosis codes by flashing warning lamp within the meter cluster.



13705

- The diagnosis codes are read by the number of flashes and the duration of flashes of warning lamp.
  - The flash duration differs for the "tens" unit and the "ones" unit.
    "Tens" unit : Every 1.2 seconds
    "Ones" unit : Every 0.4 seconds
  - The number of flashes indicates the numeral for each unit.
  - The diagnosis code indication shows the "tens" unit first, then the "ones" unit. However, when the "tens" unit begins with a zero, only the "ones" unit is shown.
- A diagnosis code is shown by the repetition of three consecutive indications. After the code indication, if another code does not exist, the indication returns to the first code and is again shown three times.
- When diagnosis switch **1** is connected, the pre-stroke control unit immediately terminates code indication.

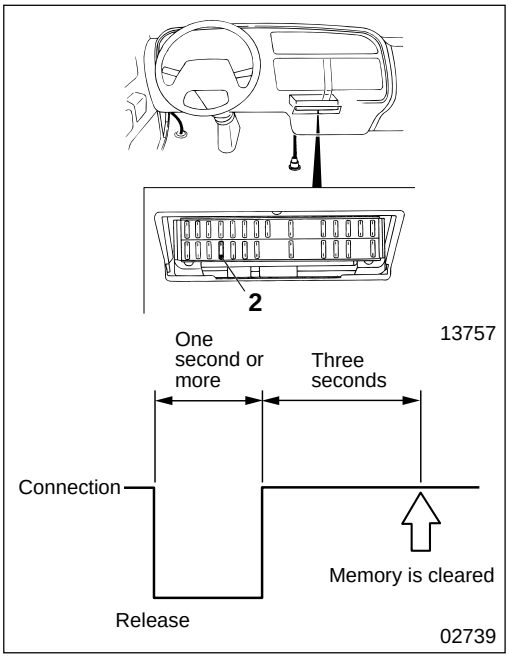
Previous diagnosis code

After reading the current diagnosis codes (with diagnosis switch **1** disconnected), disconnect memory clear switch **2** (Fuse No. F4). Warning lamp starts flashing again. This flashing indicates the previous diagnosis codes, and by interpreting these codes, the location of the trouble is determined.

https://truckmanualshub.com/

Diagnosis code	Warning lamp flashing pattern
01 (Normal)	
03 (Pre-stroke learning faulty)	
04 (Pre-stroke actuator power source faulty)	
05 (Engine revolution sensor no pulse faulty)	
12 (Pre-stroke servo system faulty)	
13 (Pre-stroke position sensor faulty)	
15 (Engine revolution sensor wiring breakage faulty)	
21 (Water temperature sensor faulty)	
22 (Control rod position sensor faulty)	
41 (Boost air temperature sensor faulty)	

13970



Clearing diagnosis codes

By disconnecting memory clear switch **2** (Fuse No. F4) once and reconnecting it, all the diagnosis codes memorized in the pre-stroke control unit are cleared.

CAUTION

Clearing of diagnosis codes must be done using memory clear switch 2.

PRE-STROKE CONTROL INJECTION PUMP SYSTEM

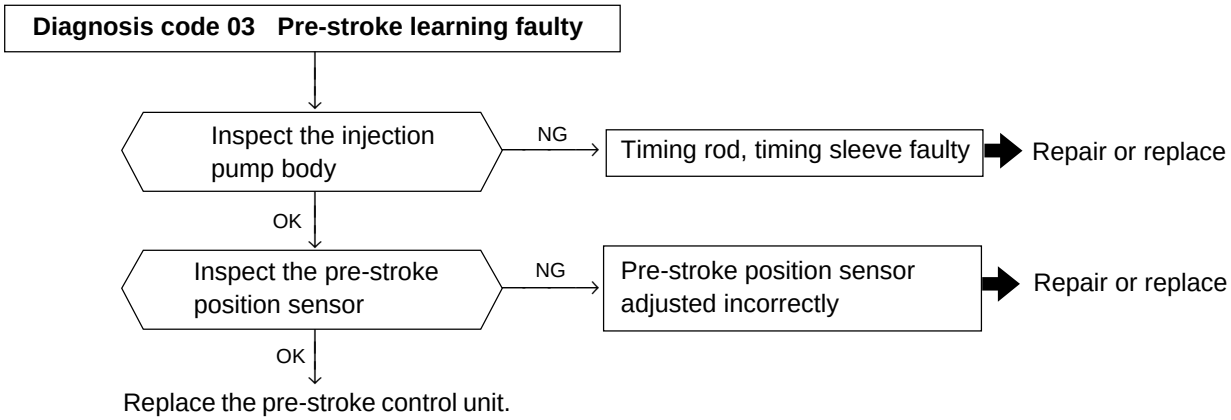
Inspection by Individual Diagnosis Code



When diagnosis code 03 is indicated, inspect the injection pump body and the pre-stroke position sensor. However, special tools and equipment are necessary for this work, so it is recommended that the work be carried out by a ZEXEL service station. If the inspection result shows normal, replace the pre-stroke control unit.

PRE-STROKE CONTROL INJECTION PUMP SYSTEM

Diagnosis code 04 Pre-stroke actuator power source faulty

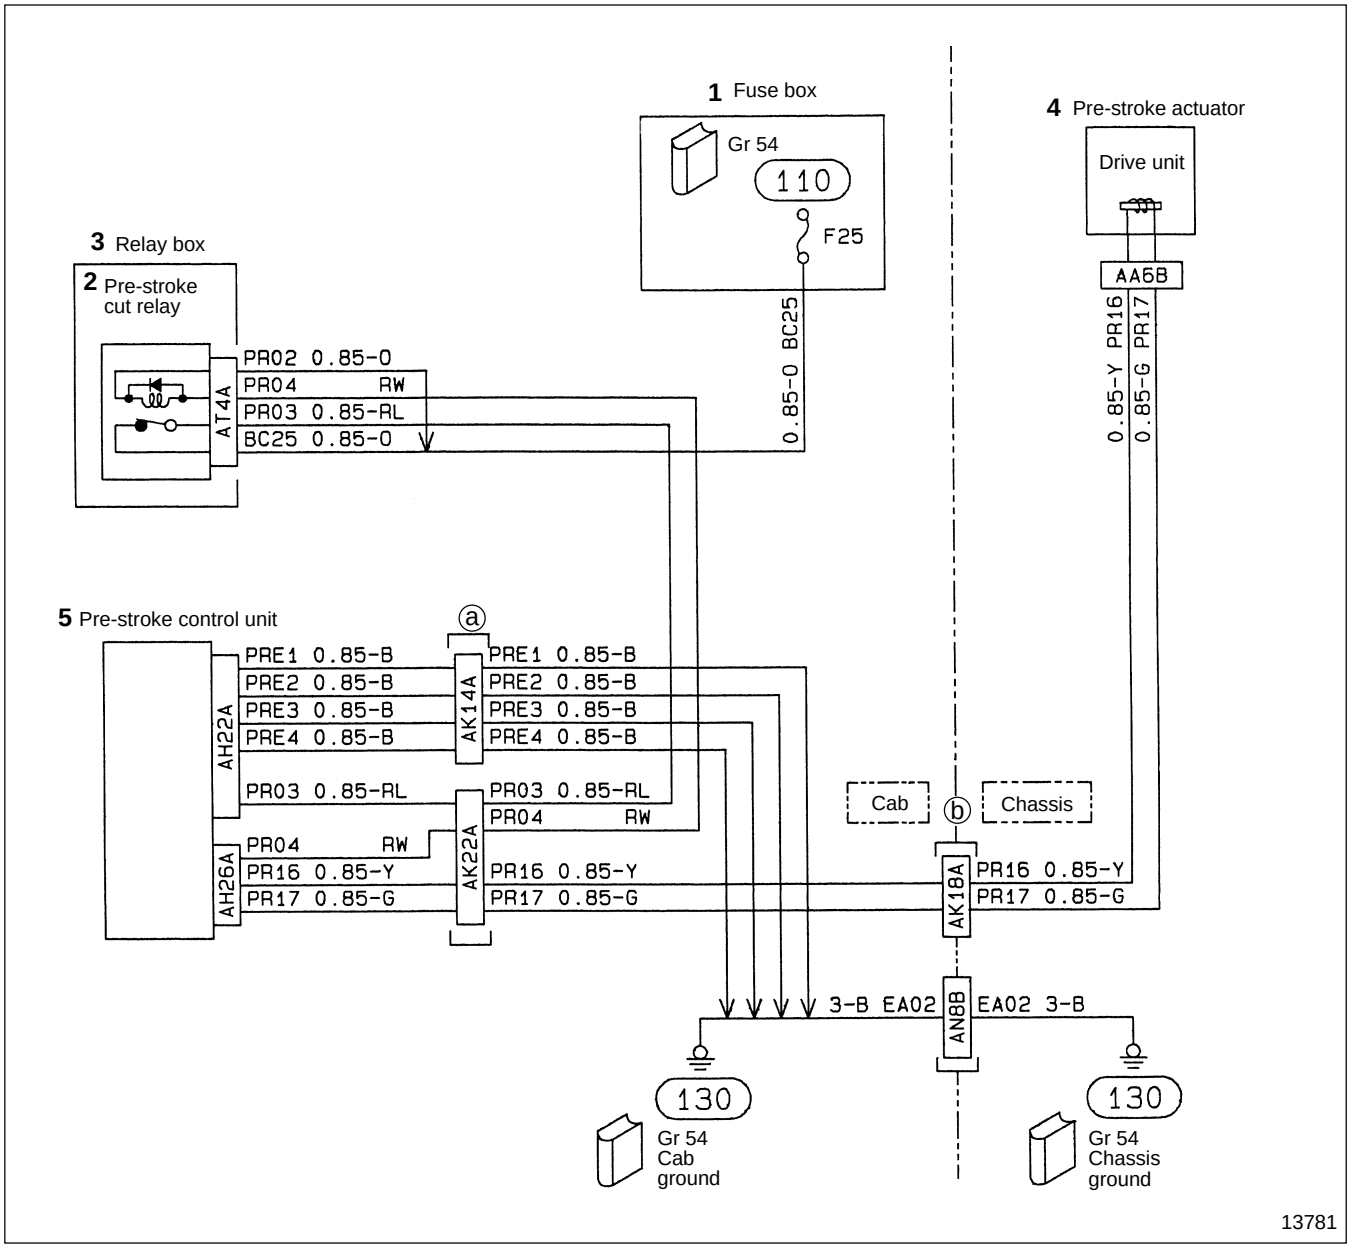
Inspect the harness and connector — NG → • Wiring breakage, harness short circuit • Connector not connected properly → Repair or replace

OK

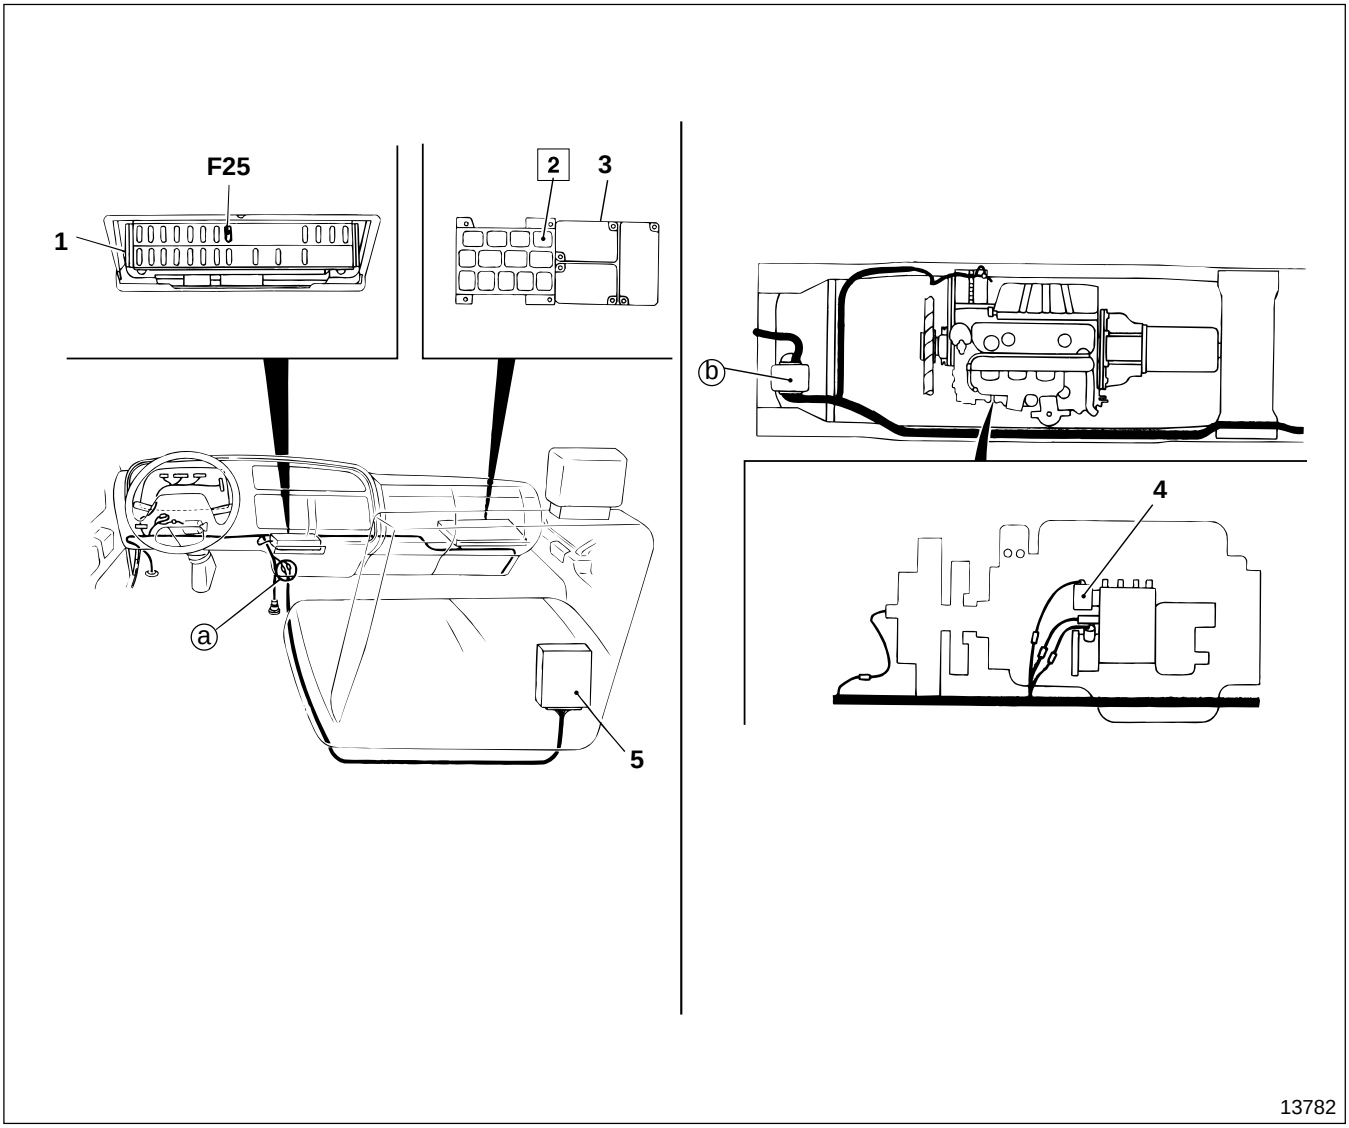
Inspect the pre-stroke cut relay P13-45 — NG → • Wiring breakage, coil short circuit • Installation faulty → Repair, adjust or replace

OK

Replace the pre-stroke control unit.

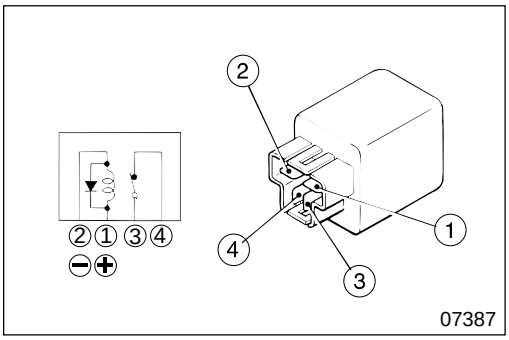


https://truckmanualshub.com/



1 Fuse box
2 Pre-stroke cut relay
3 Relay box
4 Pre-stroke actuator
5 Pre-stroke control unit

◆ Service procedure



2 **Inspection of pre-stroke cut relay**

- Follow the table below to inspect continuity.

	①	②	③	④
No current	○—○			○—○
Current	⊕—⊖		◌—◌	

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.
◌—◌ : Indicates that continuity is lost between the terminals.

- If any fault is found, replace pre-stroke cut relay **2**.

https://truckmanualshub.com/

PRE-STROKE CONTROL INJECTION PUMP SYSTEM

Diagnosis code 05 Engine revolution sensor faulty
(No pulse error : Output signal from the sensor is weak or unstable)

Inspect the harness and connector
NG
- Wiring breakage, harness short circuit
- Connector not connected properly

→ Repair or replace

OK

Inspect the engine revolution sensor. P13-48
Inspect the output voltage of alternator terminal L Gr 54
NG
- Wiring breakage, coil short circuit
- Installation faulty

→ Repair, adjust or replace

OK

Replace the pre-stroke control unit.

		ⒶⒷ	5.5 to 6.1 Ω	—	
		ⒹⒺ	1.0 to 1.3 Ω	—	

https://truckmanualshub.com/

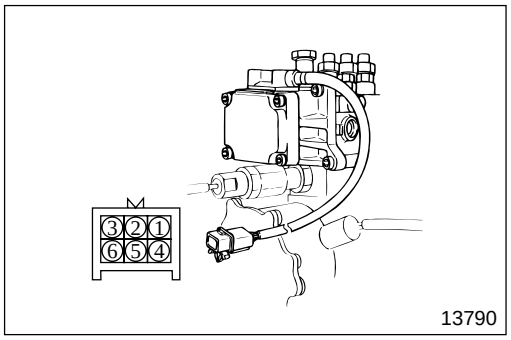
◆ Service procedure

2 Inspection of pre-stroke actuator

Inspect the following points and if any fault is found, have the unit inspected and repaired by a ZEXEL service station.

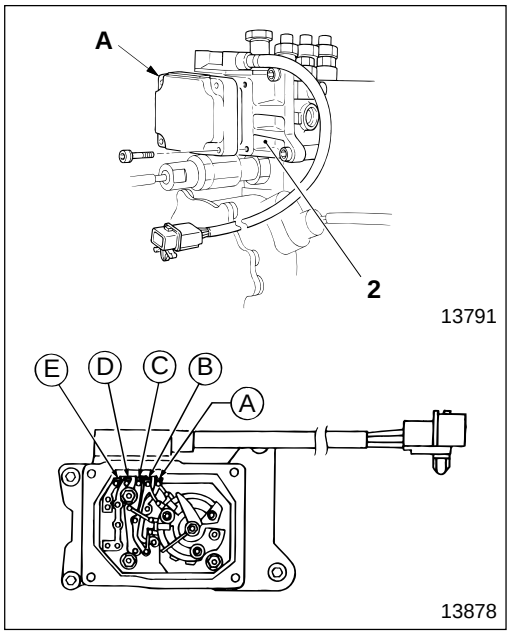
NOTE

Inspection of pre-stroke actuator 2 must be carried out when the engine is cold.



(1) Inspection at connector point

- Measure resistance between terminals ②-③, ①-③, ①-② and ④-⑤.



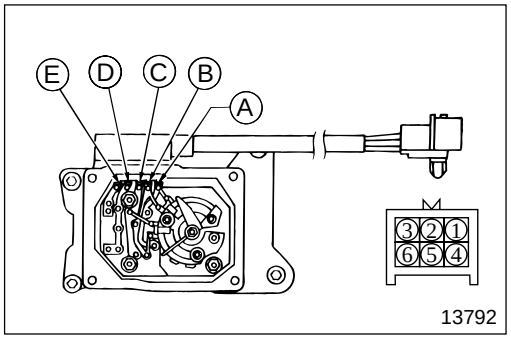
(2) Inspection of pre-stroke actuator body

- Remove cover **A** from pre-stroke actuator **2**.

CAUTION ⚠

- **Remove only cover A from pre-stroke actuator 2, never remove the actuator body itself. If the actuator is removed, it requires special tools to replace and adjust it.**
- **When removing cover A, do not exert excessive force on pre-stroke actuator 2 with your hands or by treading on it, etc.**

- Measure resistance between terminals Ⓐ-Ⓒ, Ⓑ-Ⓒ, Ⓐ-Ⓑ and Ⓓ-Ⓔ.

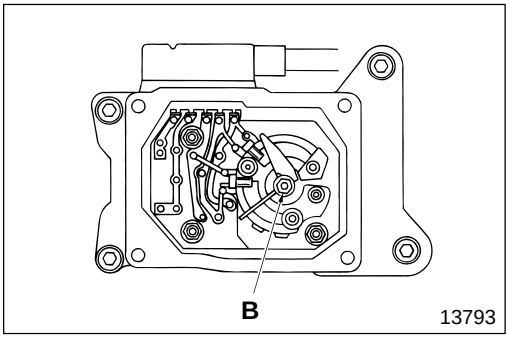


(3) Inspection of continuity between pre-stroke actuator and connector

Make sure that continuity exists between terminals as listed in the table below.

Connector terminal	Pre-stroke actuator body	Application
④	Ⓓ	Pre-stroke actuator driving power source ⊖
⑤	Ⓔ	Pre-stroke actuator driving power source ⊕
⑥	GND	Shield
①	Ⓒ	Pre-stroke position sensor (GND)
②	Ⓑ	Pre-stroke position sensor (MDL)
③	Ⓐ	Pre-stroke position sensor (OSC)

https://truckmanualshub.com/



(4) Inspection of copper plate mounting nut

Check that copper plate mounting nut **B** was not loosened when the cover of pre-stroke actuator **2** was removed.
If nut **B** is loose, tighten it.

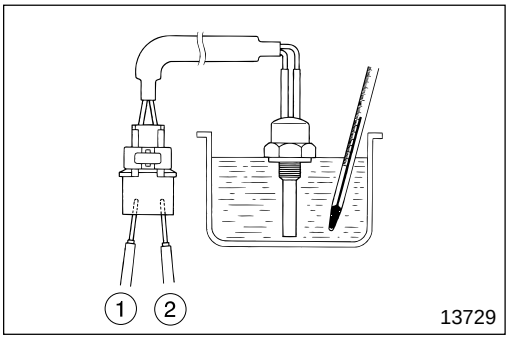
2 Boost air temperature sensor

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
2	Resistance value of boost air temperature sensor	0˚C {32˚F}	5880±588 Ω	—	Replace
		20˚C {68˚F}	2455±245 Ω	—	Replace
		80˚C {176˚F}	322±32 Ω	—	Replace



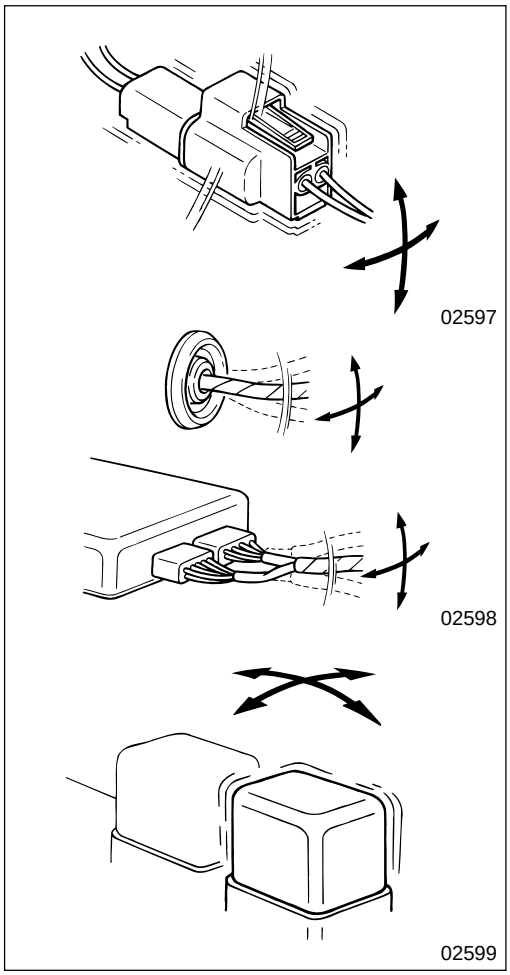
◆ Service procedure

2 **Inspection of boost air temperature sensor**

- Place boost air temperature sensor **2** in rape seed oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace boost air temperature sensor **2**. Gr 15

https://truckmanualshub.com/

Inspection of Temporary Faults



Temporary faults often occur under certain conditions. So identifying those conditions helps to find possible causes. To find the conditions under which temporary faults occurred, you need to reproduce the faults after interviewing customers in detail about actual driving conditions, weather, frequency of occurence and fault phenomena.
Then determine if the faults were caused by vibration, temperature or other possible elements depending on the actual conditions identified.
If vibration is suspected as a possible cause, inspect individual connectors as follows to check if the fault will occur:

- Shake the connector gently in all four directions of the arrows as illustrated.
- Shake the wiring harness gently in all four directions of the arrows as illustrated.
- Wiggle each sensor or piece of equipment by hand.
- Gently shake the wiring harnesses near movable parts such as suspensions.

The inspection subjects include possible causes related to the diagnosis code outputs and faults, as well as the connectors and other parts in the inspection procedure.

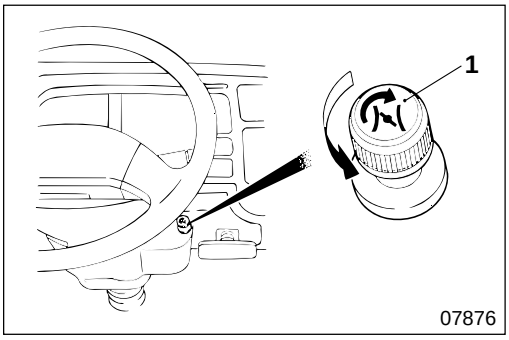
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

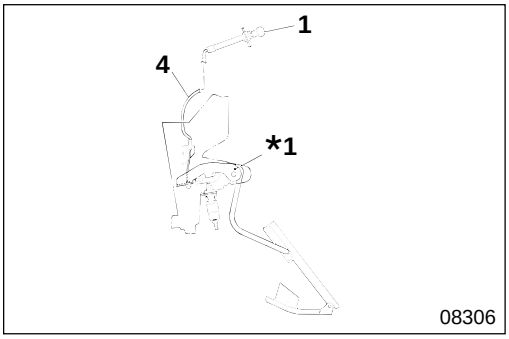
Location	Parts to be tightened	Tightening torque	Remarks
8	Bolt (Fuel-cut motor mounting)	4.9 to 5.9 {3.6 to 4.3, 0.5 to 0.6}	—

◆ Service procedure

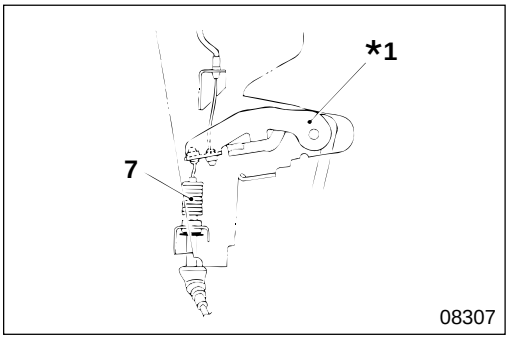


4 **Installation of idling control cable**

- Rotate idling control knob **1** counterclockwise until the inner cable protrudes at its maximum.



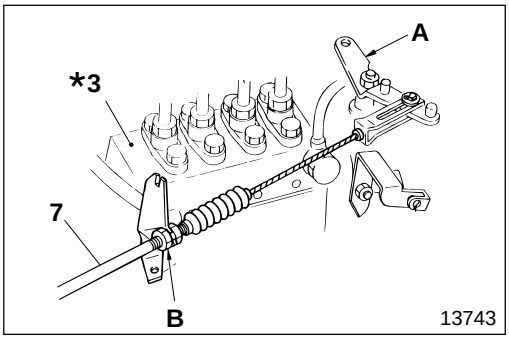
- While maintaining this state, install accelerator arm assembly ***1**.



7 **Accelerator control cable**

[Installation]

- Mount accelerator control cable **7** to accelerator arm assembly ***1**.

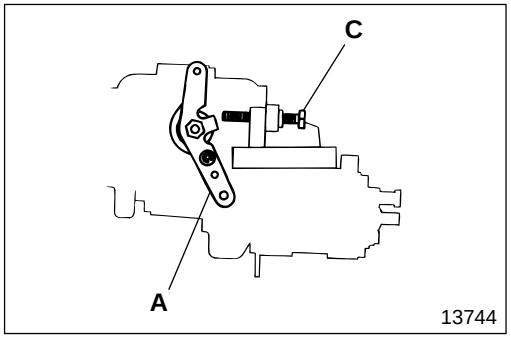


- Make sure that the accelerator pedal does not move by turning idling control knob **1** clockwise as far as it will go.
- Mount the engine end of accelerator control cable **7** to control lever **A** of injection pump assembly ***3**.
- Tighten the accelerator control cable **7** using adjustor nut **B** so that the accelerator pedal does not move.

NOTE

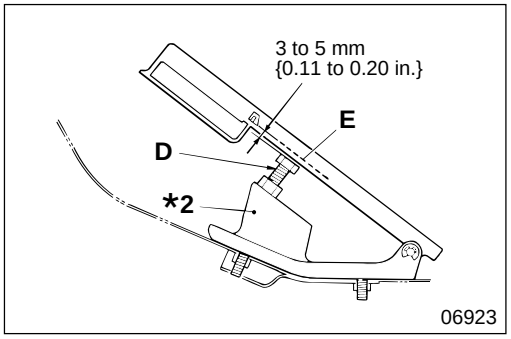
When mounting accelerator control cable 7, do not move control lever A.

https://truckmanualshub.com/

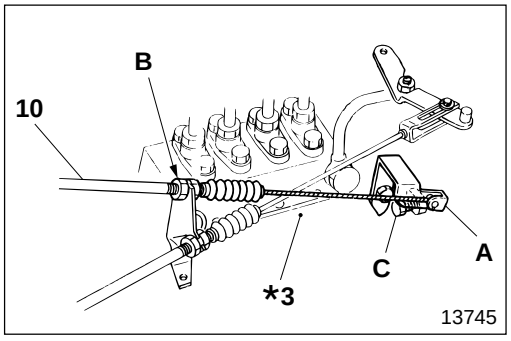


[Adjustment]

- Turn the starter switch ON, and press down on the accelerator pedal until control lever **A** hits stopper bolt **C**.



- Adjust the height of stopper bolt **D** of accelerator pedal assembly ***2** in such a manner that the clearance between stopper bolt contact surface **E** and the stopper bolt conforms to the specified value.



10 **Installation of engine stop cable**

- Mount engine stop cable **10** to stop lever **A** of injection pump assembly ***3**.
- Turn the starter switch to ACC or LOCK. Fasten using mounting nut **B** while keeping stop lever **A** pressed against stopper bolt **C**.
- After installation, start the engine using the starter switch, and make sure that the engine stops when the switch is turned to ACC.

https://truckmanualshub.com/

◆ Service procedure

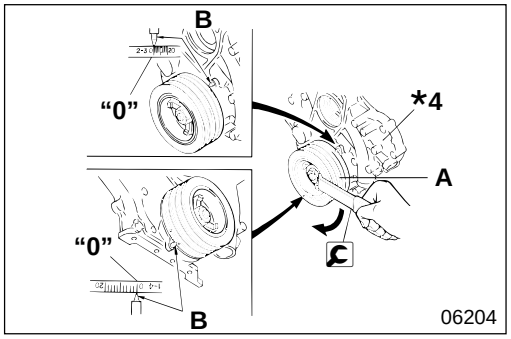
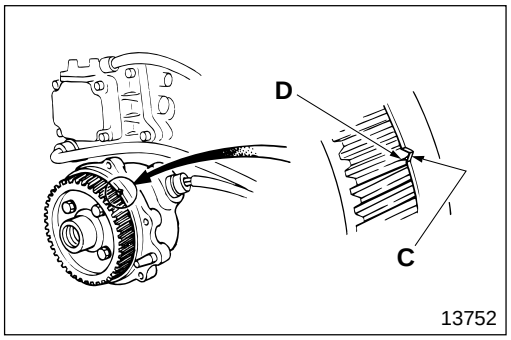
21 **Injection pump assembly**

[Removal]

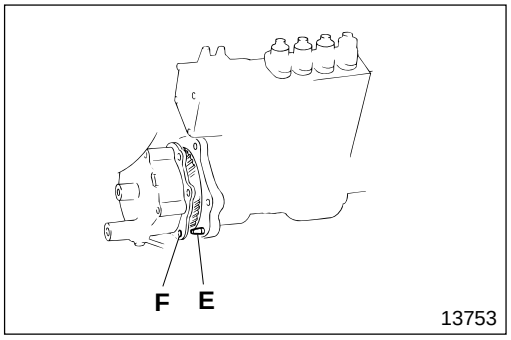


[Installation]

- To bring No. 1 cylinder piston to top dead center in the compression cycle, align pointer **B** of timing gear case ***4** with indent mark "**0**" on crankshaft pulley **A** by turning the crankshaft pulley clockwise using 🔧 cranking handle. At this point, make sure that the intake and exhaust valves of No.1 cylinder are not depressed by the push rod. If they are depressed, make another full rotation of the crankshaft pulley.

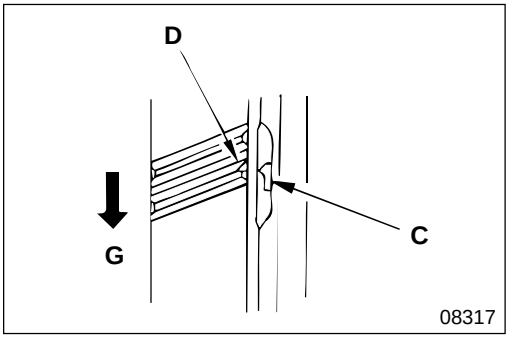


- Align indent **C** on the timer case with indent **D** on the injection pump gear.



- By aligning guide bar **E** of the timer case with guide hole **F** of the front plate, push in the idler gear up to a fraction of an inch short of engaging the injection pump gear.

https://truckmanualshub.com/



- Making sure that alignment mark **C** on the timer case aligns with indent **D** on the injection pump gear, push in the injection pump assembly.
  As this fitting is taking place, the indent will turn in direction **G**.

https://truckmanualshub.com/

Special tools

Location	Tool name and shape	Part No.	Application
—	Nozzle cleaning tool	★105789-0010	Cleaning of injection nozzle assembly

★ ZEXEL code number

◆ Service procedure

● Inspection before disassembly

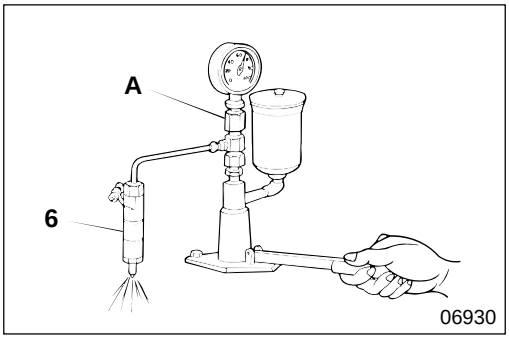
Attach injection nozzle assembly **6** to nozzle tester **A**, and conduct the following inspection.

WARNING

Never touch the spray from nozzle 11 or let your hands get too close to the spray point during the test.

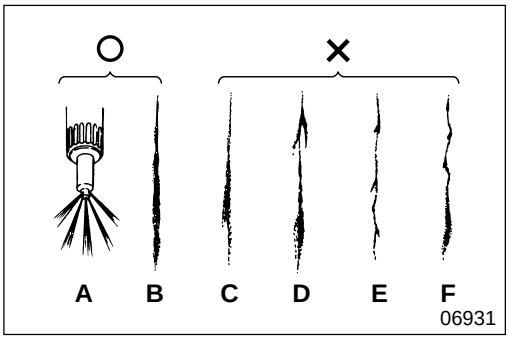
NOTE

Before inspection, bleed the air out in a couple of bursts by pressing nozzle tester A lever.



(1) Valve opening pressure

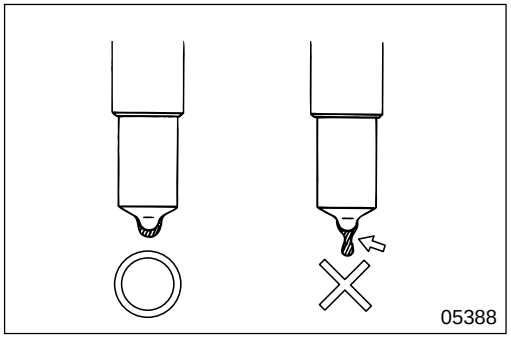
- Raise the pressure of nozzle tester **A** by operating the lever, and measure the pressure that the gauge registers when the pressure is released which will be observed by the sudden movement of the gauge indicator.
- If the measured value deviates from the standard value, disassemble the nozzle and clean, and adjust it using adjusting shims **14**.
- Variation of 0.05 mm {0.0020 in.} thickness in adjusting shims **14** causes a difference of 735 kPa {105 lbf/in^2, 7.5 kgf/cm^2} of pressure, for example, to alter the pressure for 98 kPa {14 lbf/in^2, 1 kgf/cm^2}, a thickness of 0.0067 mm {0.00026 in.} is required.
- If the performance cannot reach the standard value even after adjustment, replace injection nozzle assembly **6**.



(2) Spray condition

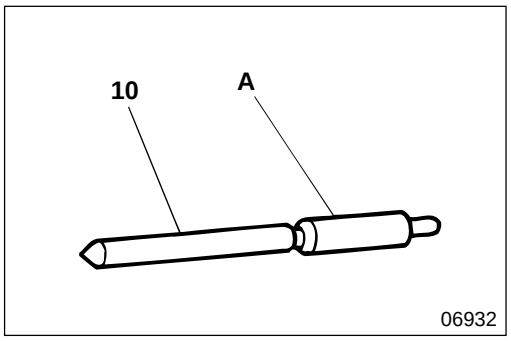
- Test injection spray condition by quick lever actions of nozzle tester **A**, 4 to 6 actions per second.
  - **A** : Even spray from all five orifices (Good)
  - **B** : Even and symmetrical spray (Good)
  - **C** : Asymmetrical spray (Faulty)
  - **D** : Spray direction deviates from the nozzle axis line (Faulty)
  - **E** : Thin and insufficient spray (Faulty)
  - **F** : Irregular spray (Faulty)
- If faulty spray cannot be corrected, disassemble injection nozzle assembly **6** and clean every part and repeat the test.
  If faulty spray still occurs after repeating test, replace the injection nozzle assembly.
- Make sure that there is no post-spray dripping after injection.

https://truckmanualshub.com/



(3) Fuel air tightness and leakage at related contact points

- Maintain interior pressure of nozzle at 1960 kPa {285 lbf/in^2, 20 kgf/cm^2} lower than the valve opening pressure, and check and see if any fuel seeps out of the nozzle tip within 10 seconds.
- If any fault is found, disassemble injection nozzle assembly **6** and clean every part and repeat the test. If any fault is still found, replace the injection nozzle assembly.

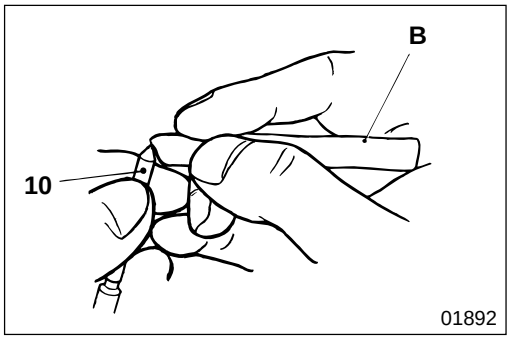


6 Injection nozzle assembly

[Disassembly]

CAUTION

- **Be sure not to touch sliding part A of needle valve 10 with your hands.**
- **Never change the combination of removed needle valve 10 and nozzle 11 for each cylinder.**



[Cleaning]

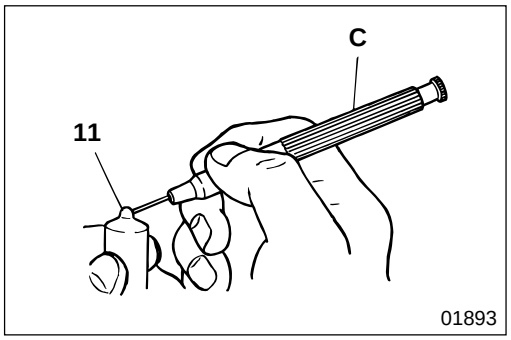
Clean needle valve **10** and nozzle **11** with gas oil (cleaning solvent).

Remove carbon deposits with 🔧 cleaning tool in the following manner:

- Clean needle valve **10** by removing carbon deposits from its tip using cleaning bar **B** of 🔧 cleaning tool.

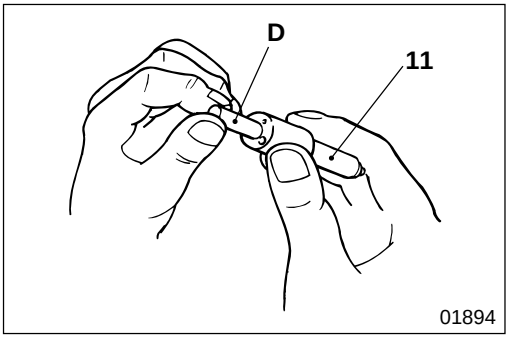
CAUTION

Never use a wire brush or hard steel for cleaning.

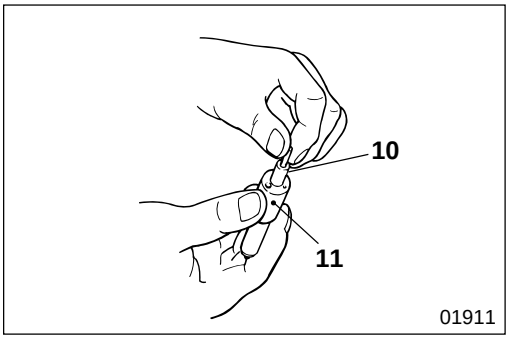


- To clean nozzle **11**, remove carbon deposits from the orifices of the nozzle using needle cleaner **C** of 🔧 cleaning tool, by inserting it into the orifices and turning it.
  Needle cleaner diameter : ø0.25 mm {0.0098 in.} or less

https://truckmanualshub.com/



- Clean the seat of nozzle **11** using cleaning needle **D** of cleaning tool.
- Use FUSO carbon remover to remove hard-to-remove, burnt-on carbon deposits.



[Inspection]

- Immerse needle valve **10** and nozzle **11** in gas oil (cleaning solvent) and clean them thoroughly.
- Check and see if needle value **10** drops by its own weight into the nozzle from the position where a third of its length is pulled out. (Repeat this several times rotating the needle valve.)
- If needle valve **10** does not drop smoothly, repeat cleaning and repeat the test. If any fault is still found, replace both the needle valve and nozzle **11** together as a set.

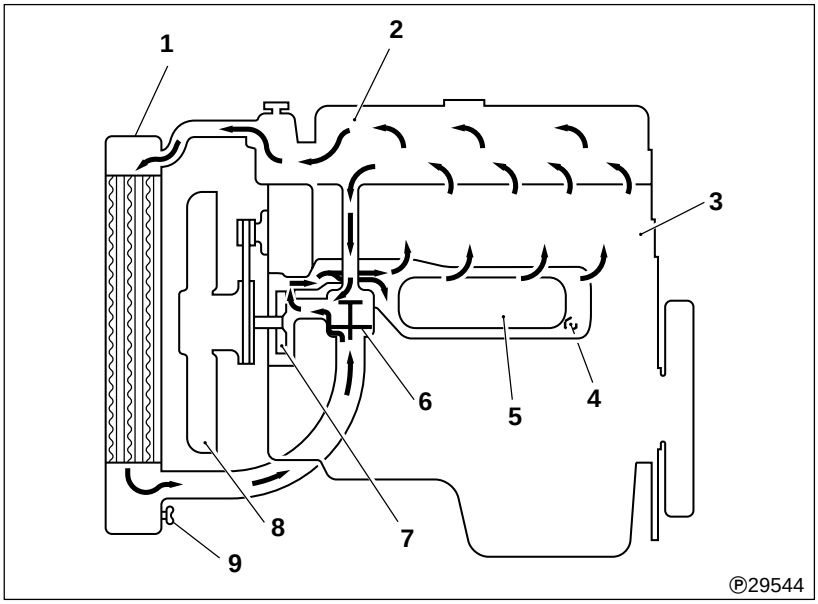
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Item	Specifications
Kind of cooling system	Forced water circulation system
Water pump type	Belt-driven involute type
Thermostat type	Wax-pellet, bottom bypass type (with jiggling valve)
Automatic cooling fan coupling type	Continuous control type
Radiator type	Tube and corrugated fin type
Coolant capacity L {qts}	13 {14}

STRUCTURE AND OPERATION

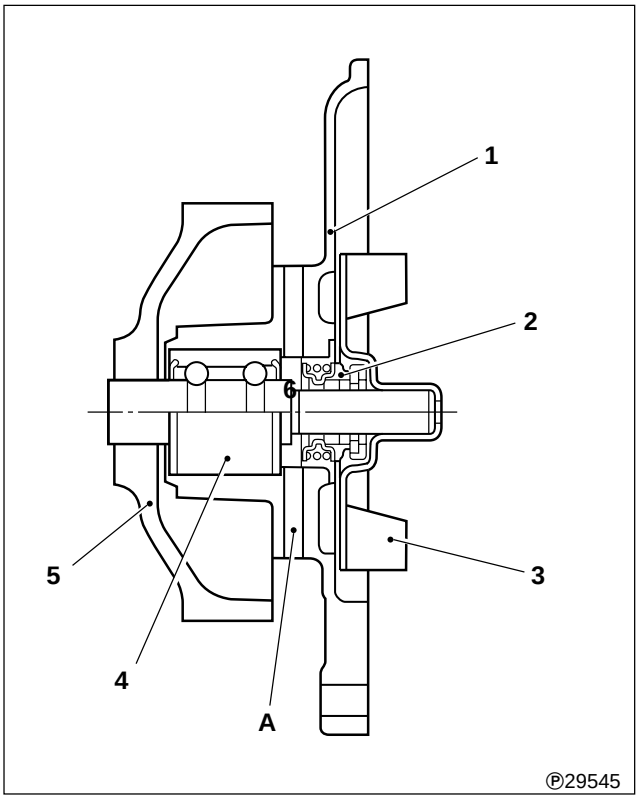
Cooling System (Flow to Coolant)



1 Radiator
2 Cylinder head
3 Crankcase
4 Crankcase drain cock
5 Oil cooler
6 Thermostat
7 Water pump
8 Cooling fan
9 Radiator drain cock

https://truckmanualshub.com/

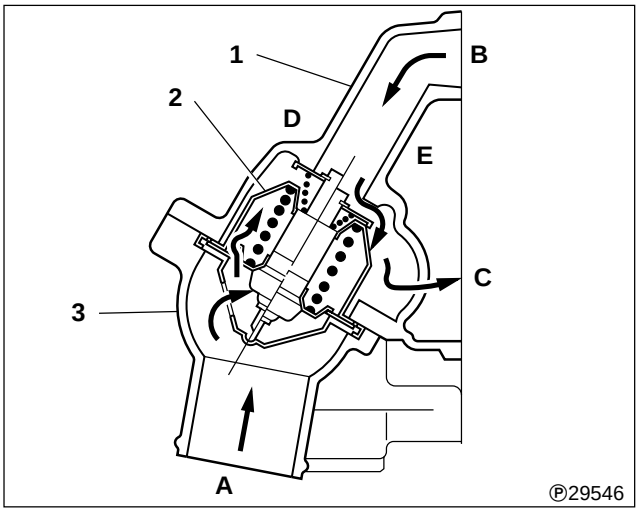
Water Pump



1 Case
2 Unit seal
3 Impeller
4 Unit bearing
5 Pulley

A: Drain hole

Thermostat



1 Oil cooler
2 Thermostat
3 Thermostat cover

A: From radiator
B: From cylinder head
C: To water pump
D: With high coolant temperature
E: With low coolant temperature

Thermostat **2** is a bottom bypass type that uses wax-charged pellets as its regulating element. As the wax changes from solid to liquid in with temperature increases, the total wax volume changes. As a result, the position of the valve, changed by the coolant temperature, regulates the flow of coolant from the radiator and cylinder head (by-pass side) before entering the engine to control the coolant temperature (inlet control type).

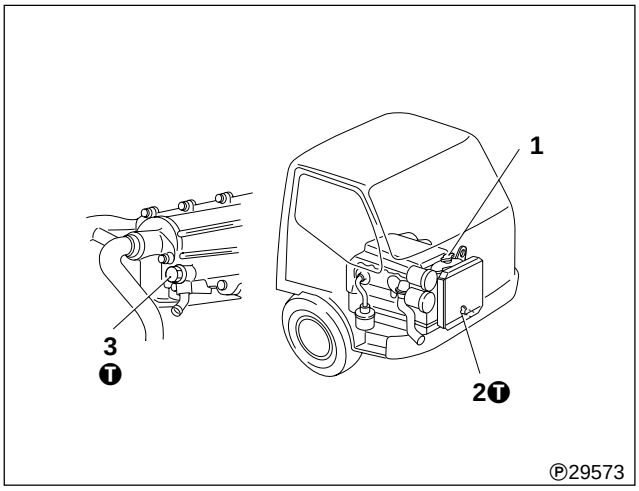
MEMO

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

Replacing Coolant and Cleaning Cooling System



1 Pressure cap
2 Drain cock
3 Water drain plug

T Tightening torque

Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Drain cock	2 {14.5, 0.2}	—
3	Water drain plug	24.5±4.9 {18.1±3.6, 2.5±0.5}	—

Using the radiator for extended periods without cleaning the cooling system will cause overheating since rust and scale will accumulate. The cooling system must be cleaned periodically.

● **Draining the coolant**

Before draining the coolant, loosen the pressure cap **1** to reduce the pressure in the cooling system.

WARNING ⚠

- **To avoid being scalded, make sure the coolant has cooled sufficiently before loosening the pressure cap 1.**
- **Unless care is taken, opening the pressure cap 1 when the coolant is hot can cause the coolant to spray out. Cover the pressure cap with a cloth, and loosen the cap slowly to bleed off the pressure before opening it fully.**

● **Cleaning procedure**

- Run the engine and keep the coolant at a temperature of approximately 90°C {194°F} such that the thermostat valves remain open and the coolant circulates continuously in the radiator.
- To increase the coolant temperature quickly, cover the front of the radiator with cardboard or a similar material.
- If cleaning is carried out after a large amount of rust has accumulated, the radiator may start to leak. Carefully examine the radiator for leaks after cleaning the cooling system.
- Soft water to be used should have the following properties.

CAUTION ⚠

Do not use hard water as it causes scale and rust.

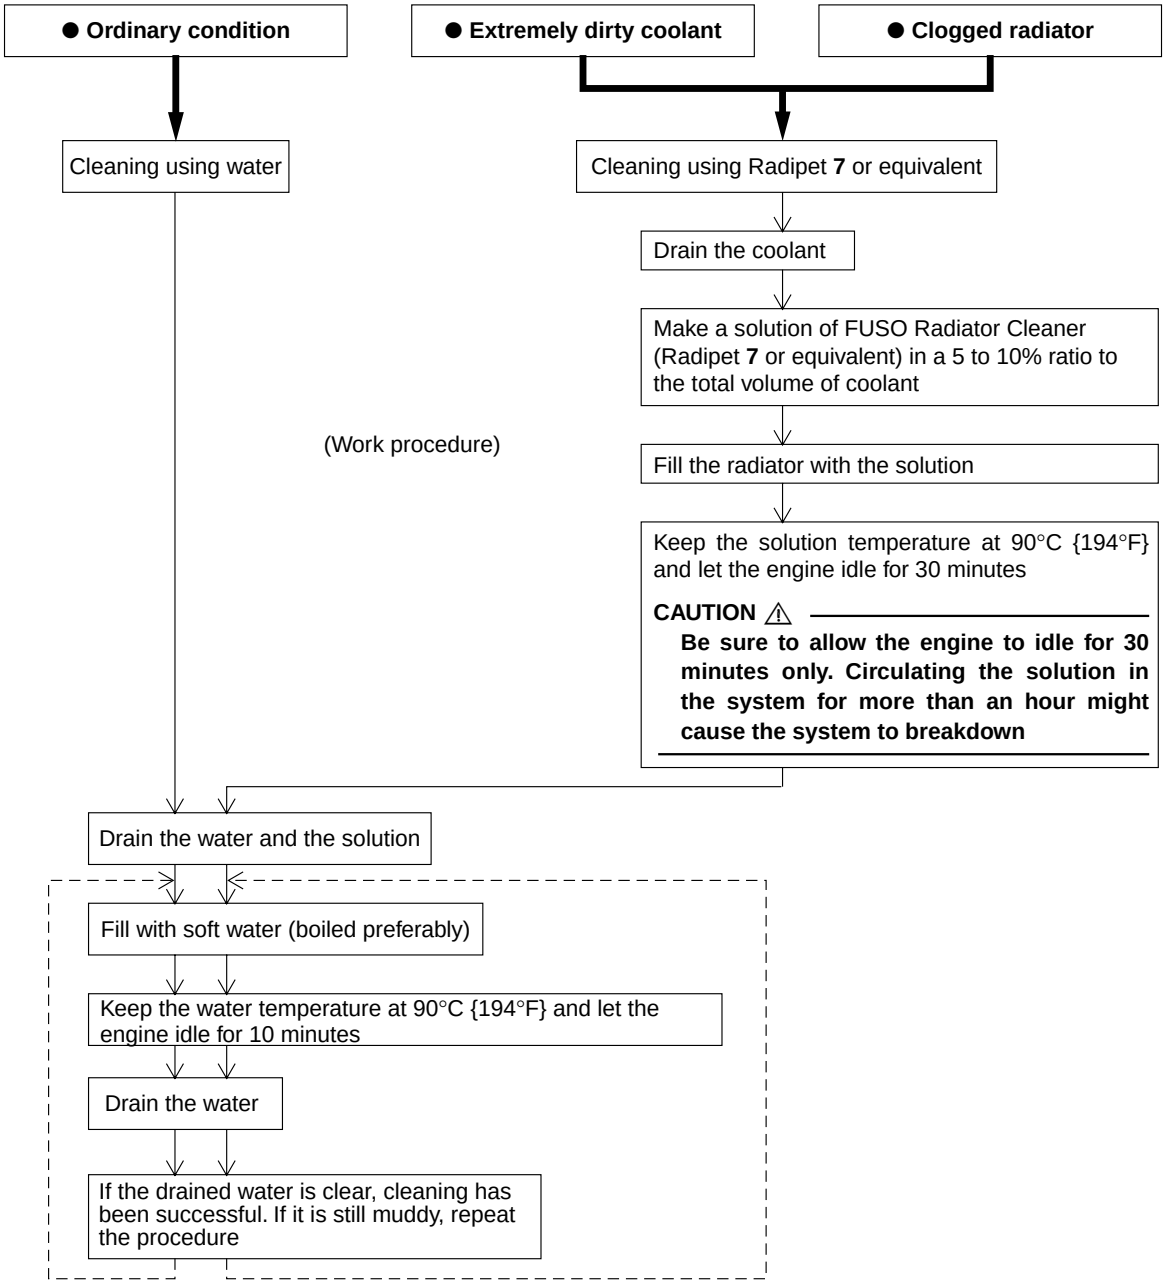
Required properties of soft water

Total hardness	300 ppm or less
Sulfate SO_4^-	100 ppm or less
Chloride Cl^-	100 ppm or less

Total dissolved solids	500 ppm or less
pH	6 to 8

https://truckmanualshub.com/

Method of cleaning the cooling system depends on its condition.



DANGER ⚠

If FUSO DIESEL LONG LIFE COOLANT solution gets in your eyes accidentally, you must immediately rinse your eyes with copious amounts of water, and be sure to consult a doctor.

WARNING ⚠

FUSO DIESEL LONG LIFE COOLANT is inflammable. Do not put it near unprotected lights.

NOTE:

- **After cleaning with solution, fill with coolant as quickly as possible.**
- **To prevent freezing of the coolant and corrosion of the cooling system, use specified coolant solution of FUSO DIESEL LONG LIFE COOLANT. (See the Owner's Handbook for use of these materials.)**

https://truckmanualshub.com/

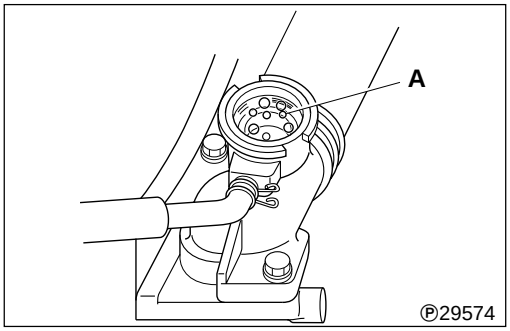
ON-VEHICLE INSPECTION AND ADJUSTMENT

Air Bleeding of Cooling System

- Remove the pressure cap. Then, introduce cooling water little by little up to the water outlet pipe neck. Do not pour water up to the outlet port brim, otherwise water would overflow out of the outlet port after the engine is started as water will expand due to temperature rise.
- With the pressure cap removed, run the engine at idle. While keeping temperature at 90°C {194°F}, bleed the cooling system completely.
- After bleeding the cooling system of air, add coolant to the water outlet pipe and reservoir tank as required.

Gas Leak Testing

The presence of air or exhaust gas in the coolant increases corrosion and rust in the cooling system. Check for air or exhaust gas in the coolant using the following procedure.



- Open the pressure cap.

WARNING ⚠

Make sure the coolant is cool before loosening the pressure cap. If the coolant is hot, it may spray out.

- Run the engine and let the coolant temperature reach approximately 90°C {194°F}.
- If bubbles **A** appear continuously, there is air or exhaust gas in the coolant.
- If the coolant contains air, the cylinder head bolts, water pump mounting bolt, or hose connections may be loose. Alternatively, the hoses may be damaged.
- If the coolant contains exhaust gas, it is possible that the cylinder head gasket is damaged or that the cylinder head is cracked.

7 Baffle plate
8 Support cushion
9 Radiator assembly P. 14A-12

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Tightening torques

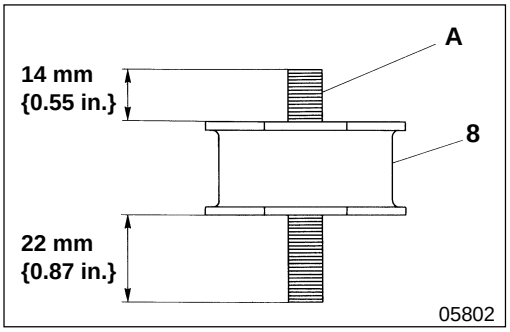
Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1, 4	Clamp	3 to 4.5 {2.2 to 3.3, 0.3 to 0.45}	—
3	Clamp	1.5 to 2 {1.1 to 1.4, 0.15 to 0.2}	Wet

Lubricant

Location	Points of application	Specified lubricant	Quantity
3	Threads of clamp	Engine oil	As required

https://truckmanualshub.com/



◆ Service procedur-

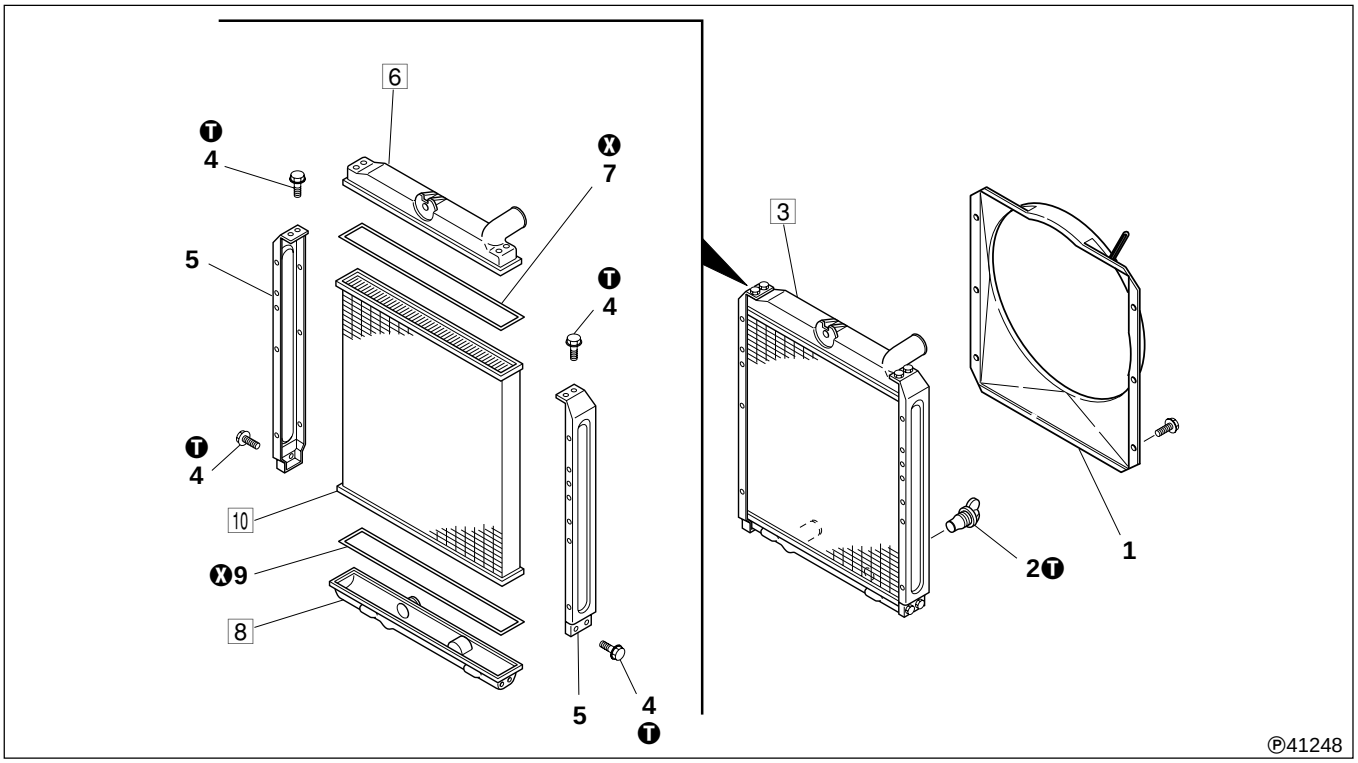
8 Support cushio

Install the support cushion **8** with its shorter threaded part **A** on the radiator side

https://truckmanualshub.com/

RADIATOR

Radiator Assembly



● **Disassembly sequence**

1 Radiator shroud
2 Drain cock
3 Radiator assembly
4 Bolt
5 Side member
6 Upper tank
7 O-ring
8 Lower tank
9 O-ring
10 Core
X: Non-reusable part

CAUTION ⚠

- **Do not disassemble the radiator assembly 3 unless defects are evident.**
- **The upper tank 6 and lower tank 8 are made of plastic and could crack if subjected to undue shock. Handle them with care.**
- **Replace the core 10 if the clinching tabs that hold the upper tank 6 or lower tank 8 have two paint marks, showing that the tabs have been bent back twice.** 📖 **P. 14A-13**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
3	Radiator air leakage (with air pressure of 150 kPa {21 psi, 1.5 kgf/cm^2})	0 cm^3 {0 cu.in.}	—	Rectify or replace

https://truckmanualshub.com/

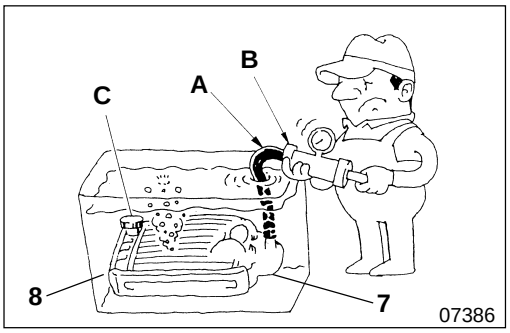
Tightening torque

Unit: N·m {ft.lbs, kg·fm}

Location	Parts to be tightened	Tightening torque	Remarks
2	Drain cock	2 {1.4, 0.2}	—
4	Bolt (side member mounting)	13 {9.4, 1.3}	—

Special tool

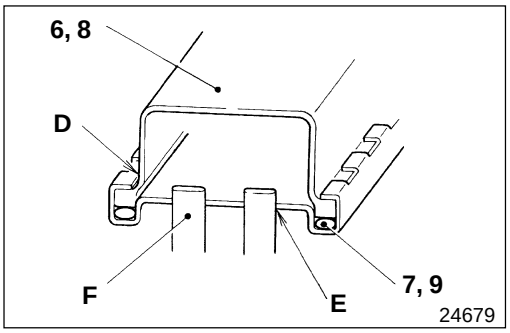
Location	Tool name and shape	Part No.	Application
6, 8	Lock & Break Tool	Obtain locally or use sublet repair	Upper tank, lower tank removal



Service procedure

3 **Radiator inspection**

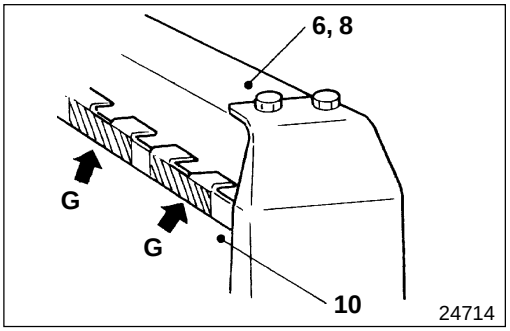
- Fit a hose **A**, and radiator cap tester **B** onto the radiator upper tank **6**.
- Fit a plug **C** onto the radiator lower tank **8**, then immerse the radiator in a tank of water.
- Using the radiator cap tester **B**, apply the specified air pressure of 150 kPa {21 psi, 1.5 kgf/cm^2}, and check for air leakage.
- If air leakage is apparent, repair or replace the radiator assembly **3**.



- Replace the following parts according to the leaking locations.

Leaking location	Part to replace
Tank root **D**	O-ring **7** or **9**
Tank **6**	Tank **6**, O-ring **7**
Tank **8**	Tank **8**, O-ring **9**
Tube fitted area **E**	Core **10**, O-ring **7**, **9**
	* Tube **F** (TIG welded), O-ring **7**, **9**
Tube **F**	Core **10**, O-ring **7**, **9**

*: When repaired



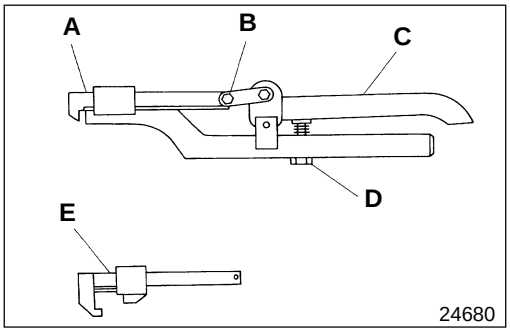
CAUTION ⚠

Replace the core 10 if its clinching tabs that hold the upper tank 6 or lower tank 8 have two paint marks G, evidence of the tabs having been bent back twice.

The tabs are provided with one paint mark each time they are bent back. Count the paint marks on each of upper and lower tabs separately.

https://truckmanualshub.com/

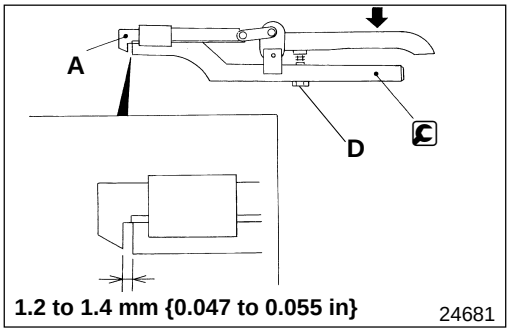
RADIATOR



6 8 **Upper tank and lower tank**

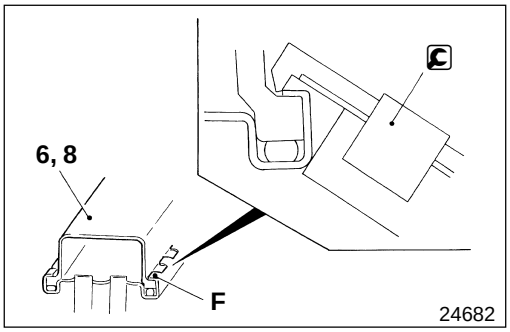
Remove and reinstall the tanks using the Lock and Break Tool.

- **A** Attachment (for tank removal
- **B** Attachment locking bol
- **C** Slide handl
- **D** Stopper/adjuster bol
- **E** Attachment (for tank installation

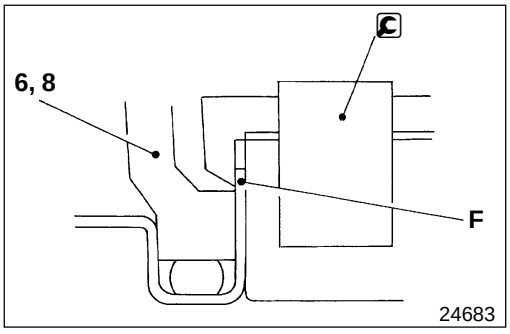


[Rexmoval]

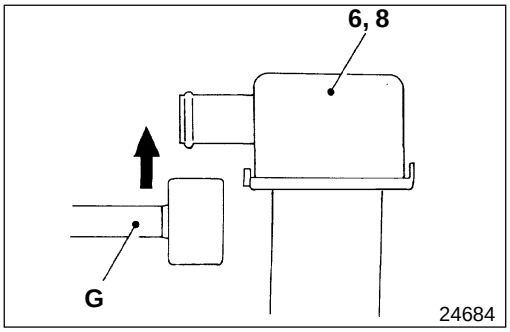
- Fit attachment **A** onto the end of the Lock and Break Tool, set it to the illustrated dimension and lock it in position with the stopper/adjuster bolt **D**.



- Using the Lock and Break Tool, bend up the tabs **F** of the core **10** that hold the tank **6**, **8**.
- Straighten the tabs **F** completely as shown by gripping the Lock and Break Tool.



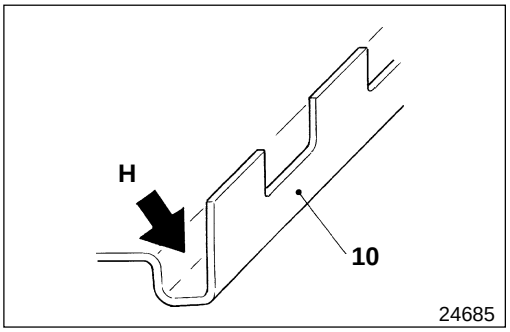
- After straightening all the tabs **F**, grasp the inlet or outlet pipe and remove the tank **6**, **8**.
- If the tank **6**, **8** is difficult to remove, tap it with a rubber or plastic hammer **G**.



CAUTION ⚠

The tanks 6 and 8 are made of plastic and may crack if subjected to undue shock. Handle them with care.

https://truckmanualshub.com/

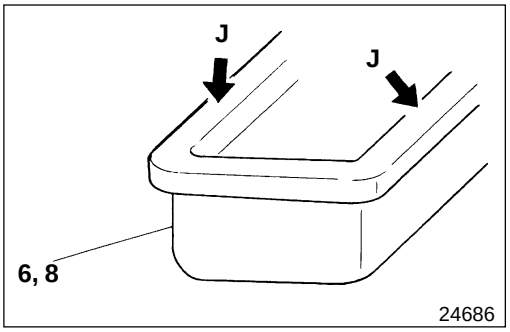


[Inspection]

- Check the tank mounting channels **H** of the core **10** for foreign matters.
- If foreign matter is stuck inside the mounting channels, rub them away with sandpaper (approx. #1000) or blow them out with compressed air.

CAUTION ⚠

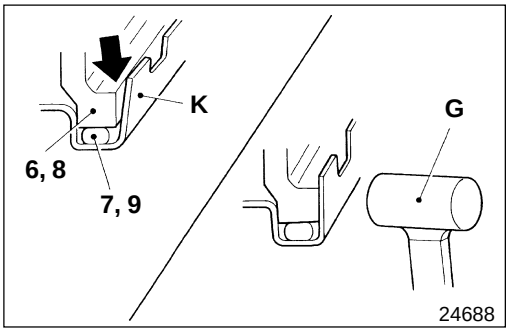
If any foreign matter (even a single hair) remains when the O-ring 7, 9 and tank 6, 8 are fitted, leakage can occur. Carefully inspect and clean each tank mounting channel H entirely.



- Clean the core contacting surface **J** of the tank **6**, **8** and inspect it for damage. Replace the tank if any defect is evident.

CAUTION ⚠

Perform procedure with bare hands to prevent foreign matter from sticking to the surface J.

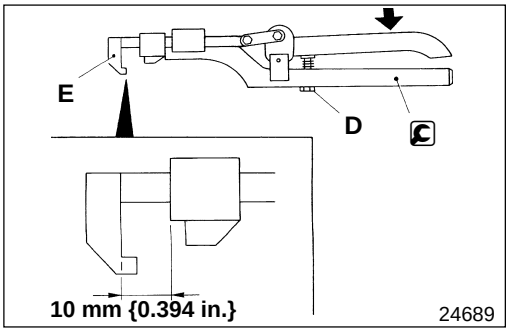


[Installation]

- Install the tank **6**, **8** in position. Check that the sub-plate **K** of the core is in close contact with the tank. If there is any space, tap the sub-plate lightly with a rubber or plastic hammer to eliminate space.

CAUTION ⚠

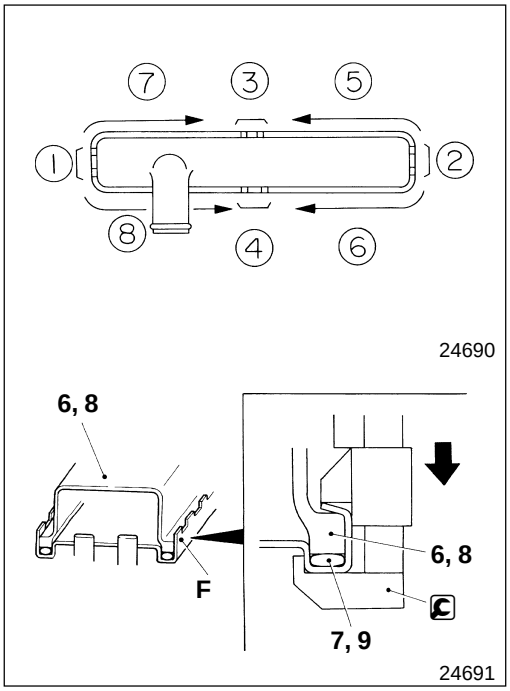
Handle the parts with bare hands to prevent foreign matter from sticking to the O-ring 7, 9 and tank 6, 8.



- Fit attachment **E** onto the end of the Lock and Break Tool, set it to the illustrated dimension and lock it in position with the stopper/adjuster bolt **D**.

https://truckmanualshub.com/

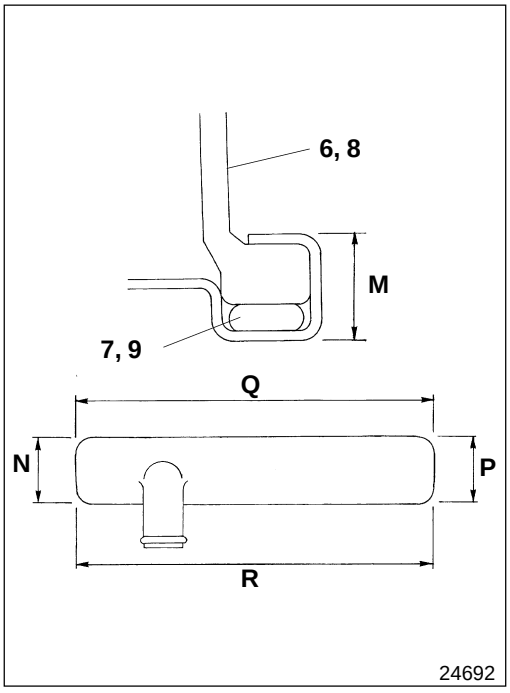
RADIATOR



- Clinch the tabs **F** of the core **10** to hold the tank **6**, **8** in the illustrated order.
  ① to ④: Two center tabs on each side
  ⑤ to ⑧: Remaining tabs in illustrated sequence
  : Lock and Break Tool (with attachment **E**)

NOTE :

The sides ① and ② do not allow the Lock and Break Tool to be used for clinching. Clinch these sides using a pair of pliers with tape wrapped around its jaws.

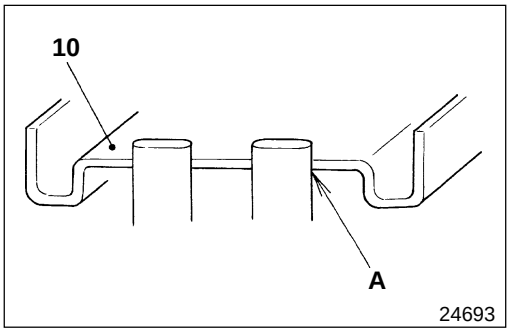


- Check that the tabs has been clinched to the following dimensions.
  M:14.65 to 15.05 mm {0.576 to 0.592 in.} (Sides **N** and **P**)
  10.05 to 10.45 mm {0.395 to 0.411 in.} (Sides **Q** and **R**)

- Check for leaks. P. 14A-13
- Provide a paint mark to the sub-plate **K** of the core **10** to indicate that the tabs have been bent up and then down.

NOTE:

Provide one paint mark after each removal of the tank.



11 Core

If water leaks from the tube fitted area **A**, replace the core **10** or repair it by the following method.

https://truckmanualshub.com/

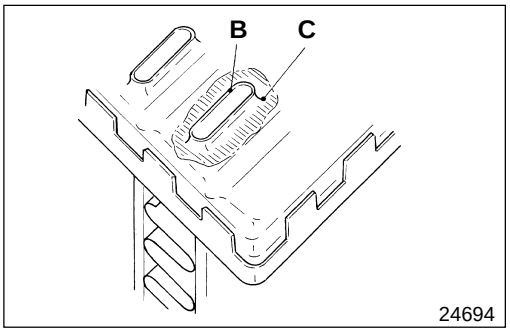
[Repair]

NOTE:

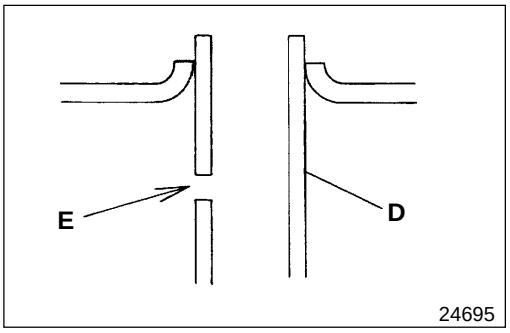
Repair is carried out by tungsten inert gas arc (TIG) welding, which requires the skill of a trained welder.

WARNING ⚠

To avoid danger, dry the core 10 completely before welding.



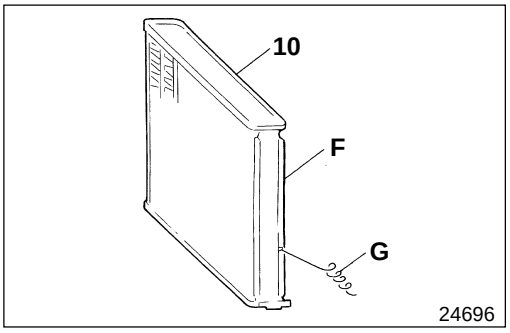
- Clean both edges **B** of the leaky tube and their surroundings **C** using a stainless steel wire brush. Scrub the surface until it glistens with exposed aluminum.



- Since both ends of the tube are covered with weld metal, make a small hole **E** in the tube **D** to allow air venting.

NOTE:

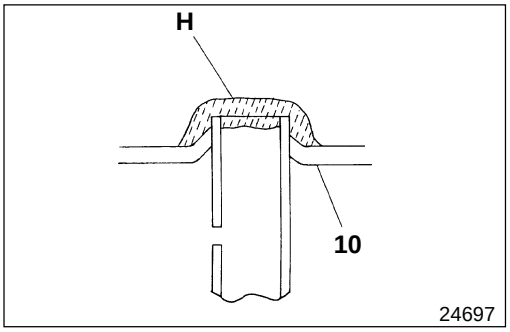
Absence of the small hole E causes escaping air to produce small pin holes in the weld.



- Connect a grounding wire **G** from the support **F** of the core **10** to an appropriate object.

CAUTION ⚠

Improper connection of the grounding wire G causes a short circuit during welding work and the core could be fused at the welded portion.



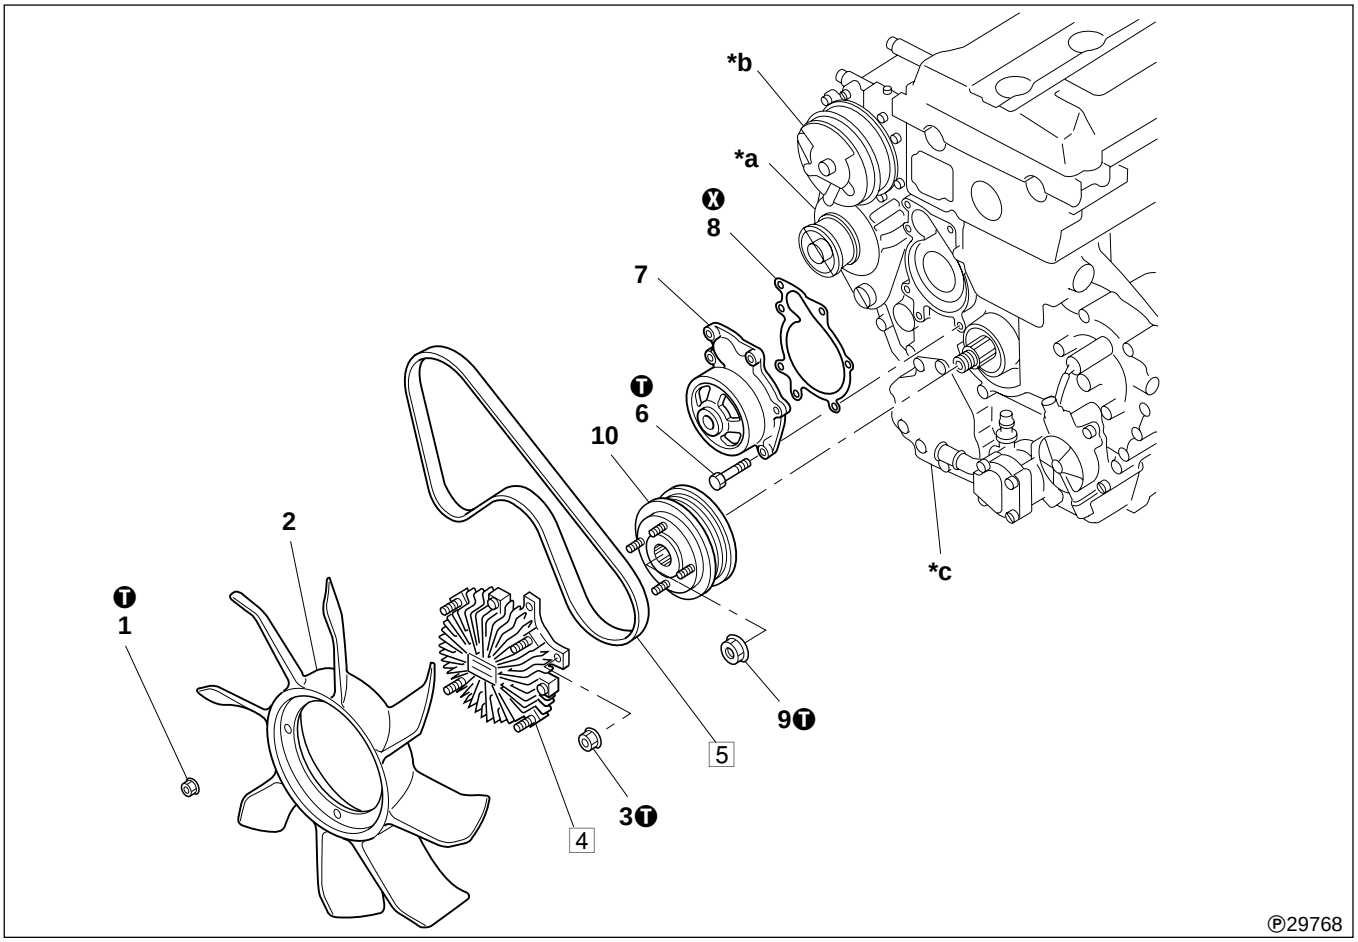
- Cover both ends of the tube with welding metal.
  H: Tungsten inert gas arc weld (TIG)
  Welding conditions:
  Welding rod: A4043 (approx. ϕ 2 mm {ϕ 0.0079 in.} in diameter)
  Welding current: 80A AC
- After welding, check for the following defects. Rectify the weld or replace the core **10** if any of the defects is evident.
  - Undercut
  - Bead crack
  - Crack in base metal

CAUTION ⚠

Weld with sufficient care. Poor welding may cause leakage to recur.

https://truckmanualshub.com/

COOLING FAN, V-RIBBED BELT AND WATER PUMP



● **Disassembly sequence**

1 Nut
2 Cooling fan
3 Nut
4 Automatic cooling fan coupling
5 V-ribbed belt (for water pump)
6 Bolt
7 Water pump assembly
8 Gasket
9 Nut
10 Fan pulley

***a:** Altenator ELECTRICAL
***b:** Compressor
***c:** Front case Group 11A
X: Non-reusable part

● **Assembly sequence**

Follow the disassembly sequence in reverse

https://truckmanualshub.com/

Service standard

Unit: mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
5	V-ribbed belt tension (for water pump)	When belt is new	9 to 11 (0.35 to 0.43)	—	Adjust
		When belt in use is re-tensioned	11 to 13 (0.43 to 0.51)	—	

Tightening torque

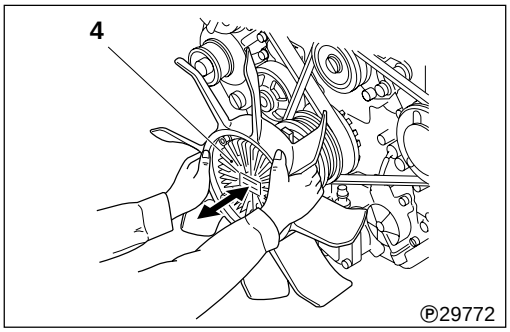
Unit: N·m {ft.lbs, kgf·m}

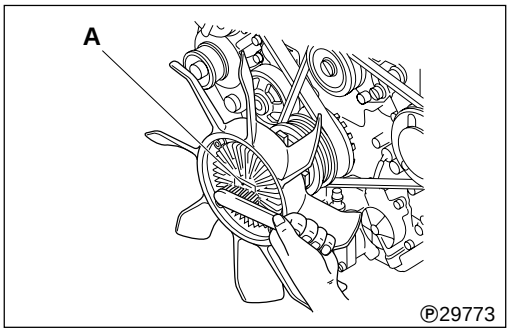
Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (cooling fan mounting)	4.9 {3.6, 0.5}	—
3	Nut (for automatic cool fan coupling mounting)	12.7 {9.4, 1.3}	—
6	Bolt (for water pump assembly mounting)	23.5 {17.4, 2.4}	—
9	Nut (for fan pulley mounting)	196.1 {145, 20}	—

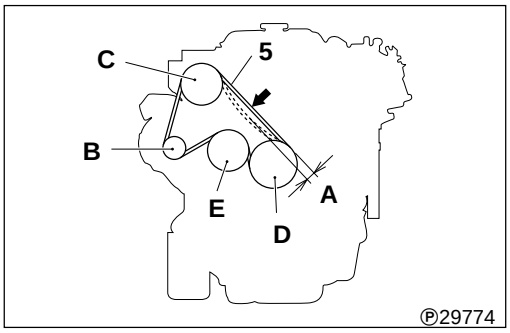
Special tools

Location	Tool name and shape	Part No.	Application
5	Belt Tension Gauge 03612	Obtain Locally	V-ribbed belt tension measurement

https://truckmanualshub.com/







◆ Service Procedure

4 Automatic cooling fan coupling

[Inspection

Inspect the automatic cooling fan coupling **4** in accordance with the following procedure. If any defect is apparent, replace the unit

Check for leakage of oil from the coupling body

Rotate the automatic cooling fan coupling **4** by hand and check fo irregular movement or abnormal noise caused by a defect in the bearing

Check for excessive axial play in the automatic cooling fan coupling when the engine is cool

[Cleaning

If any foreign particles have adhered to the bimetal **A**, brush them of gently

5 V-ribbed belt tension

[Inspection]

NOTE

Before checking for tension, crank the engine one turn or mor clockwise

Apply force of approximately 98 N {22 lbf, 10 kgf} to the span center of th V-ribbed belt **5**, and measure the extent of belt deflection **A**

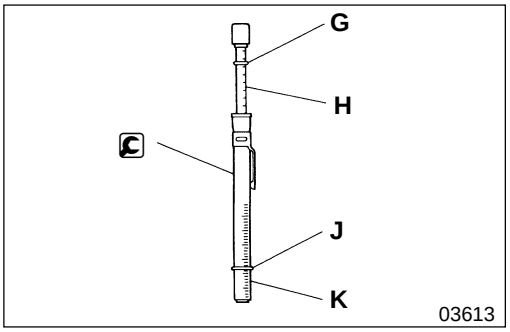
B Alternator pulle

C Air conditioner compressor pulley or tention pulle

D: Fan pulley

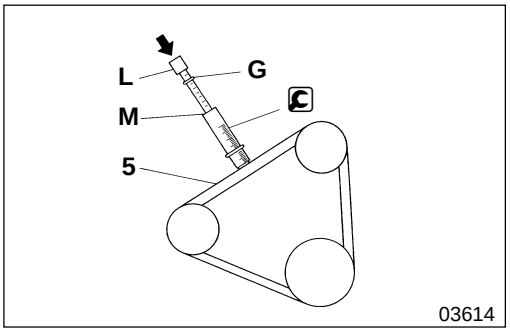
E: Water pump pulley

https://truckmanualshub.com/

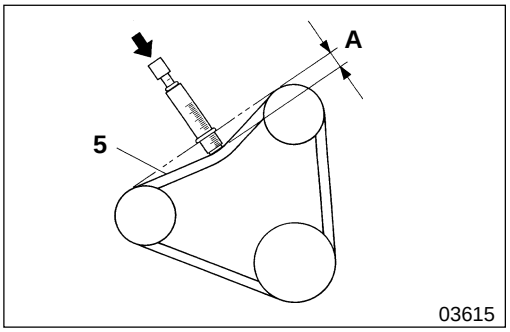


● **Use of belt tension gauge**

- Set the upper O-ring **G** of the Belt Tension Gauge to a push load of 98 N {22 lbf, 10 kgf} on scale **H**.
- Set the lower O-RING **J** of the Belt Tension Gauge to the belt's specified maximum deflection value on scale **K**.



- Apply the Belt Tension Gauge to the center of the V-ribbed belt **5** and push **L** until the upper O-ring **G** reaches the flange **M**.



- Measure the deflection **A** of the V-ribbed belt **5**. If the measurement does not comply with the standard value, adjust the tension in accordance with the following procedure.

[Adjustment]

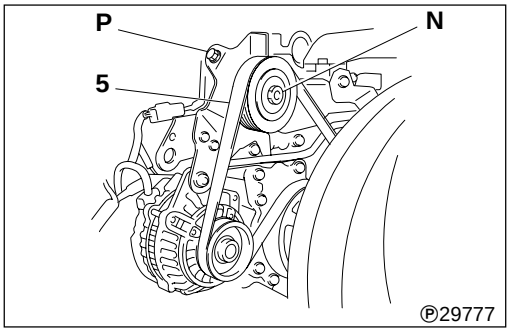
(1) Tension adjustment of V-ribbed belt for water pump

CAUTION ⚠

- **Excessive tension in the V-ribbed belt 5 may damage the belt and related bearings.**
- **Keep the V-ribbed belt 5 free of oil. If the belt becomes oily, it may slip, resulting in overheating of the engine and insufficient charging of the battery.**

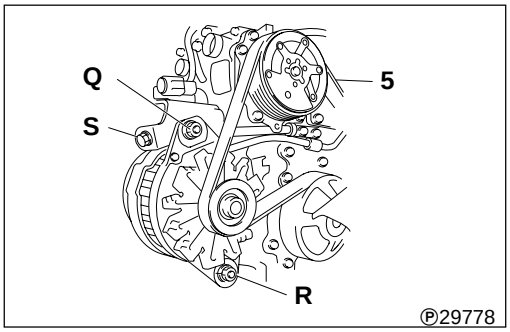
https://truckmanualshub.com/

COOLING FAN, V-RIBBED BELT AND WATER PUMP



[Without air-conditioner]

- Loosen the tensioner pulley mounting sleeve **N**, then adjust the tension of the V-ribbed belt **5** using the adjustment bolt **P**.
- When the adjustment is completed, securely tighten the sleeve **N**.



[With air-conditioner]

- Loosen the alternator mounting nuts **Q** and **R**, then adjust the tension of the V-ribbed belt **5** using the adjustment bolt **S**.
- When the adjustment is completed, securely tighten the nuts **Q** and **R**.

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
1	Valve opening pressure of pressure cap	90±15 kPa {12.8±2.2 psi, 0.9 ±0.15 kgf/cm^2}	—	Replace

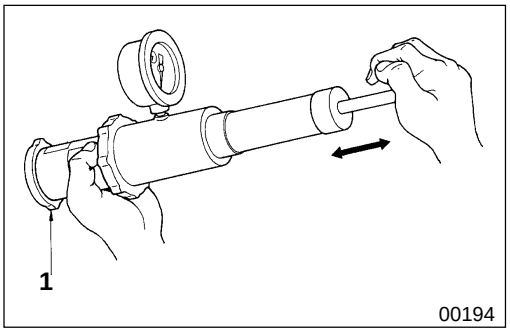
Tightening torque

Unit: N·m {lbf.ft, kgf·m

Location	Parts to be tightened	Tightening torque	Remarks
2	Bolt (for water outlet pipe mounting)	23.5 {17.4, 2.4}	—
6	Bolt (for water outlet case mounting)	23.5 {17.4, 2.4}	—
9	Bolt (for heater elbow mounting)	23.5 {17.4, 2.4}	—

https://truckmanualshub.com/

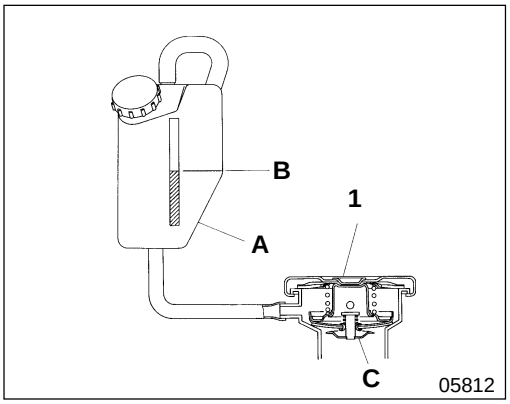
◆ Service procedure



1 Pressure cap inspection

(1 Pressure valve opening pressur

If the gauge reading deviates from the standard value, replace the pressure cap **1**



(2) Vent valve inspection

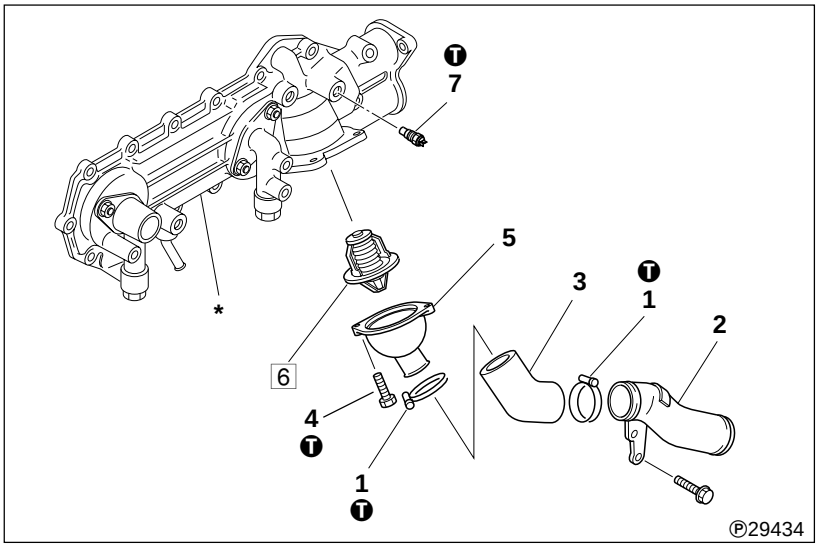
- Observe the water level **B** in the reservoir tank **A**.
- Run the engine at a high speed. Stop the engine when a small amount of coolant has overflowed into the reservoir tank **A**.
- Wait for a while in this condition. When the coolant returns to the ambient temperature, check to see if the water level in the reservoir tank **A** has returned to the level at which it was observed before the engine was started.
- If the water level has not dropped, the vent valve **C** is faulty. Replace the pressure cap **1**.

NOTE:

If the pressure cap 1 is removed before the coolant temperature drops to the ambient temperature, the vacuum in the radiator is lost, preventing the coolant from returning to the radiator.

https://truckmanualshub.com/

THERMOSTAT



● **Disassembly sequence**

1 Clamp
2 Water pipe
3 Rubber hose
4 Bolt

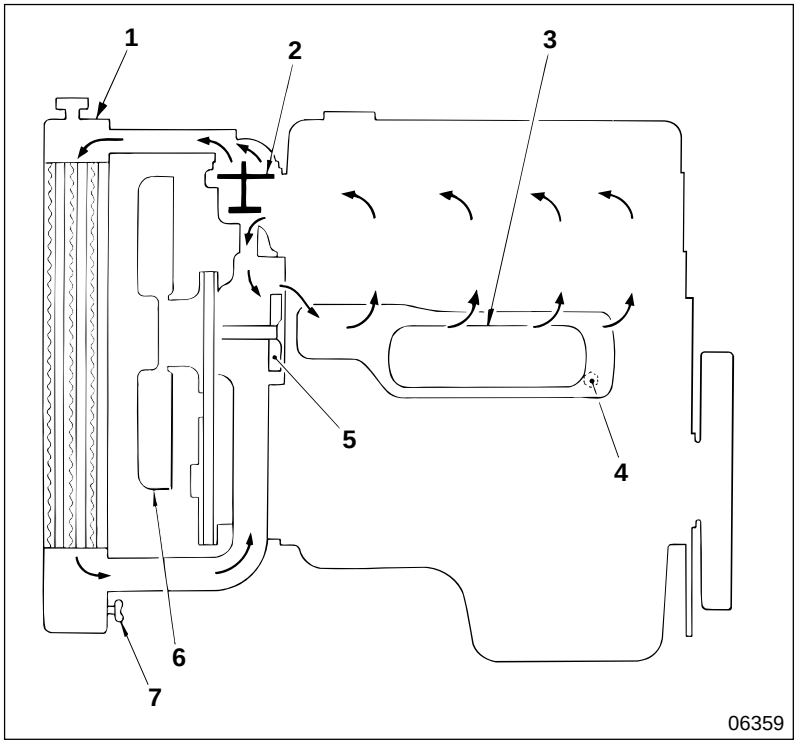
Thermostat type	Wax-pellet, bottom bypass type (with jiggling valve)
Automatic cooling fan coupling type	Continuous control type
Radiator type	Tube and corrugated fin type
Coolant capacity L {qts}	13 {14}

STRUCTURE AND OPERATION

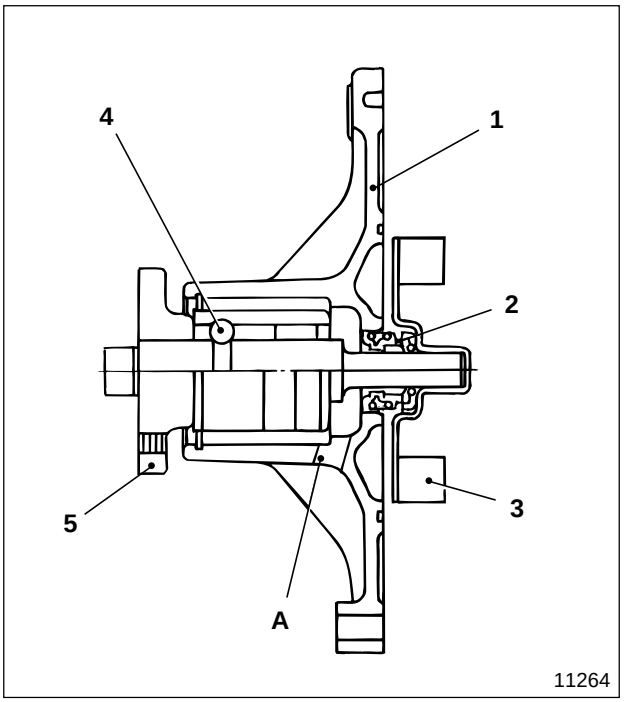
Cooling System (Flow of Coolant)



1 Radiator
2 Thermostat
3 Oil cooler
4 Crankcase drain plug
5 Water pump
6 Cooling fan
7 Radiator drain cock

https://truckmanualshub.com/

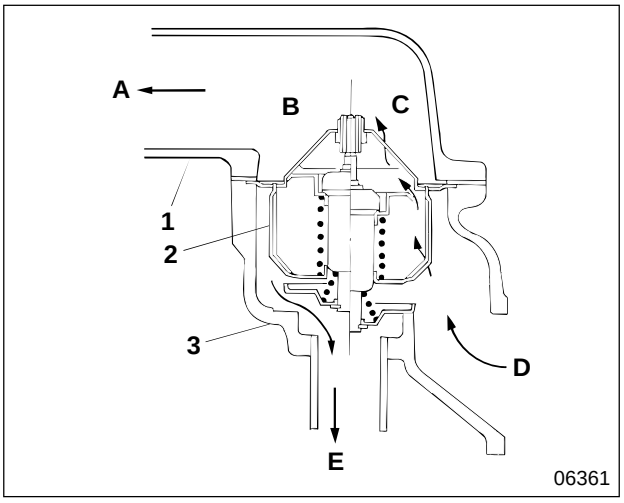
Water Pump



1 Case
2 Unit seal
3 Impeller
4 Ball bearing
5 Flange

A : Drain hole

Thermostat



1 Thermostat cover
2 Thermostat
3 Thermostat case

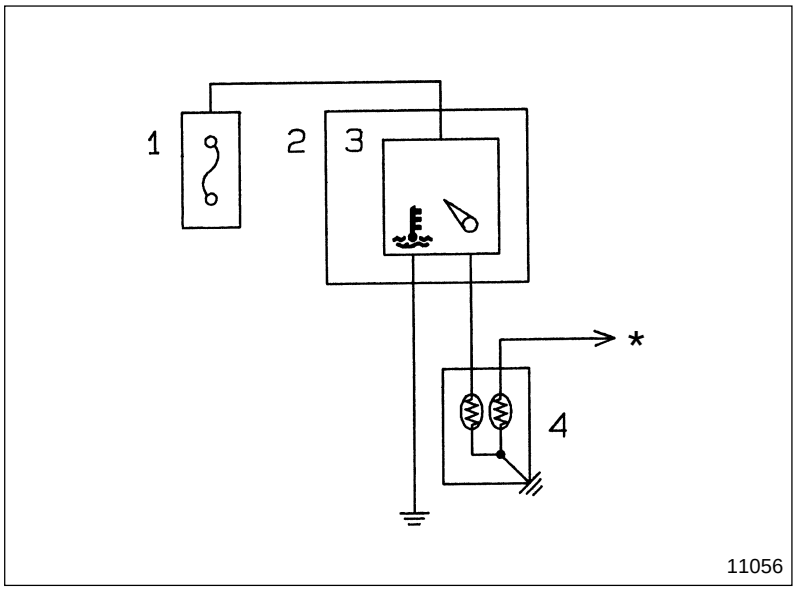
A : To radiator
B : When low coolant temperature
C : When high coolant temperature
D : From cylinder head
E : To water pump

Thermostat **2** is a bottom bypass type that uses wax pellets as its regulating element. As the wax changes its form from solid to liquid according to changes in temperature, the volume of the wax changes. Therefore, the position of the valve, changed by the coolant temperature, regulates the flow of the coolant to the radiator and water pump (bypass side) and controls the coolant temperature.

https://truckmanualshub.com/

Cooling System Electric Circuit

● Water temperature gauge circuit

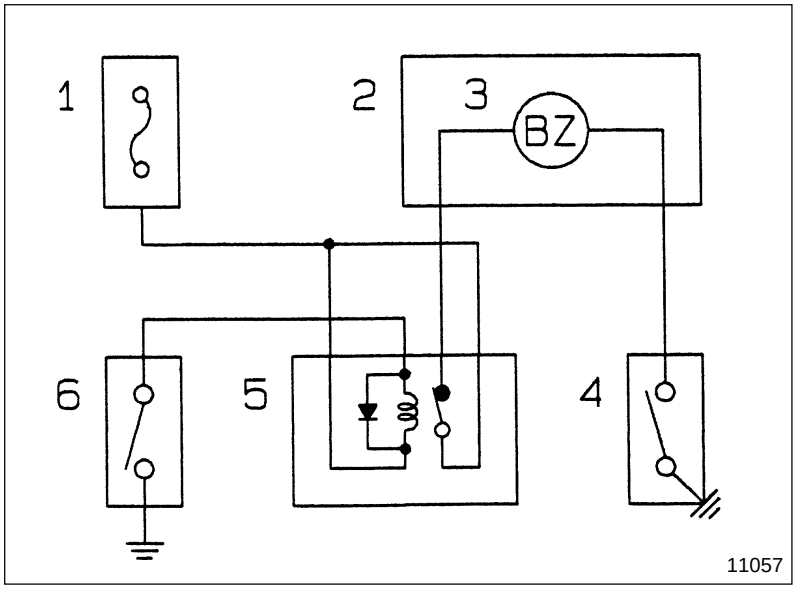


1 Fuse box
2 Meter cluster
3 Water temperature gauge
4 Water temperature sensor

***** : To multipurpose control unit Gr 54

This circuit detects the coolant temperature by changes of resistance in water temperature sensor **4** and relays the signal to water temperature gauge **3** in meter cluster **2** to indicate the temperature.

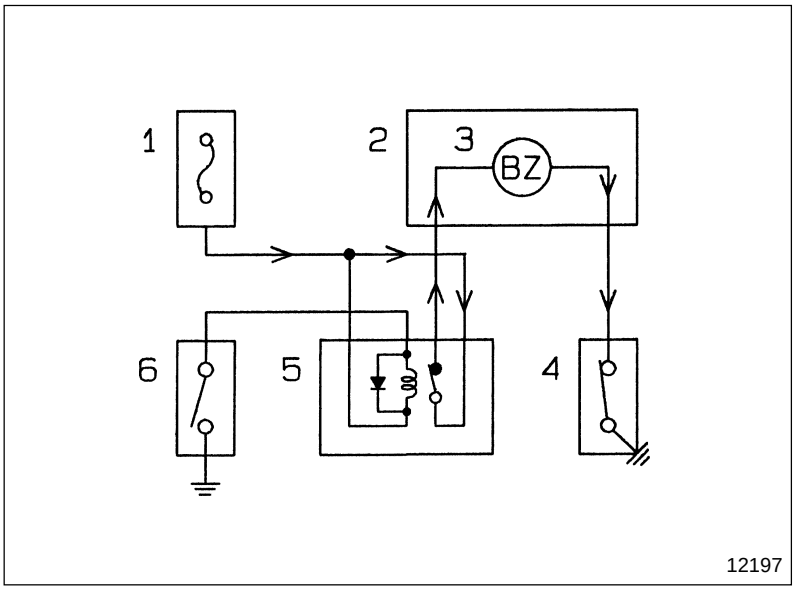
● Overheating Circuit



1 Fuse box
2 Meter cluster
3 Overheating buzzer
4 Overheating switch
5 Overheating relay
6 Parking brake switch

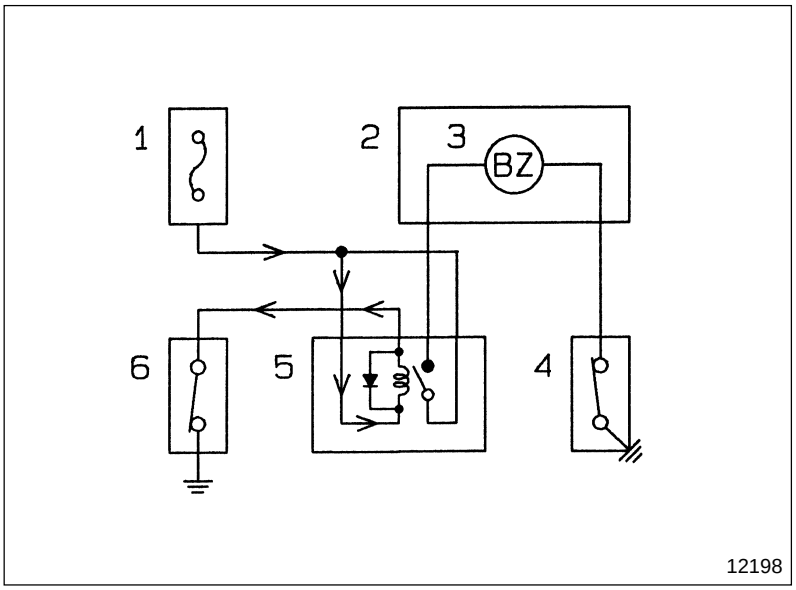
When this circuit detects extremely high coolant temperature, it sounds overheating buzzer **3** to warn the driver of the abnormal condition. To stop the buzzer, first stop the vehicle, then pull up the parking lever.

https://truckmanualshub.com/



When overheating switch is activated

- 1→5 (Contact point)→3→4→Ground
- Buzzer **3** sounds.



When parking brake switch is activated

- 1→5 (Coil)→6→Ground
- Buzzer **3** stops sounding as the contact points of overheating relay **5** opens.

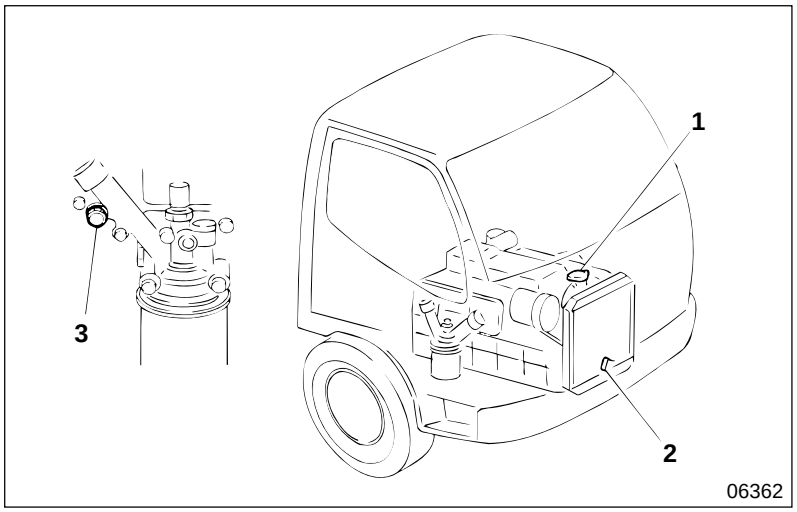
INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Replacing Coolant and Cleaning Cooling System



1 Pressure cap
2 Radiator drain plug
3 Crankcase drain plug

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Crankcase drain plug	34 to 39 {25 to 29, 3.5 to 4.0}	—

Using the radiator for a long period of time without cleaning it will cause overheating because rust and scale deposits will accumulate inside the cooling system. Periodical cleaning is recommended.

● **Draining coolant**

First loosen pressure cap **1,** to lower the pressure in the cooling system, before draining coolant.

WARNING

- **You must make sure that the engine coolant is cold before draining it so as not to scald yourself.**
- **It is dangerous to open pressure cap 1, when the coolant temperature is high, without taking due care because the hot water would spray out. Be sure to cover the pressure cap with a cloth and loosen slowly to bleed the pressure before opening fully.**

● **Cleaning procedure**

- Keep the coolant temperature at approximately 90°C {194°F} so that the thermostat valve remains open and the coolant continues to circulate in the radiator.
- For the sake of convenience you can raise the coolant temperature quickly by covering the front of the radiator with corrugated cardboard or something similar.
- Set the temperature adjusting lever of the heater controller at maximum so that the coolant can circulate freely in the heater piping area.
- In cases where a great amount of rust has accumulated it often happens that as a result of cleaning the radiator starts leaking. Conduct a thorough check for leakage after cleaning.
- Soft water to be used should have the following properties.

CAUTION

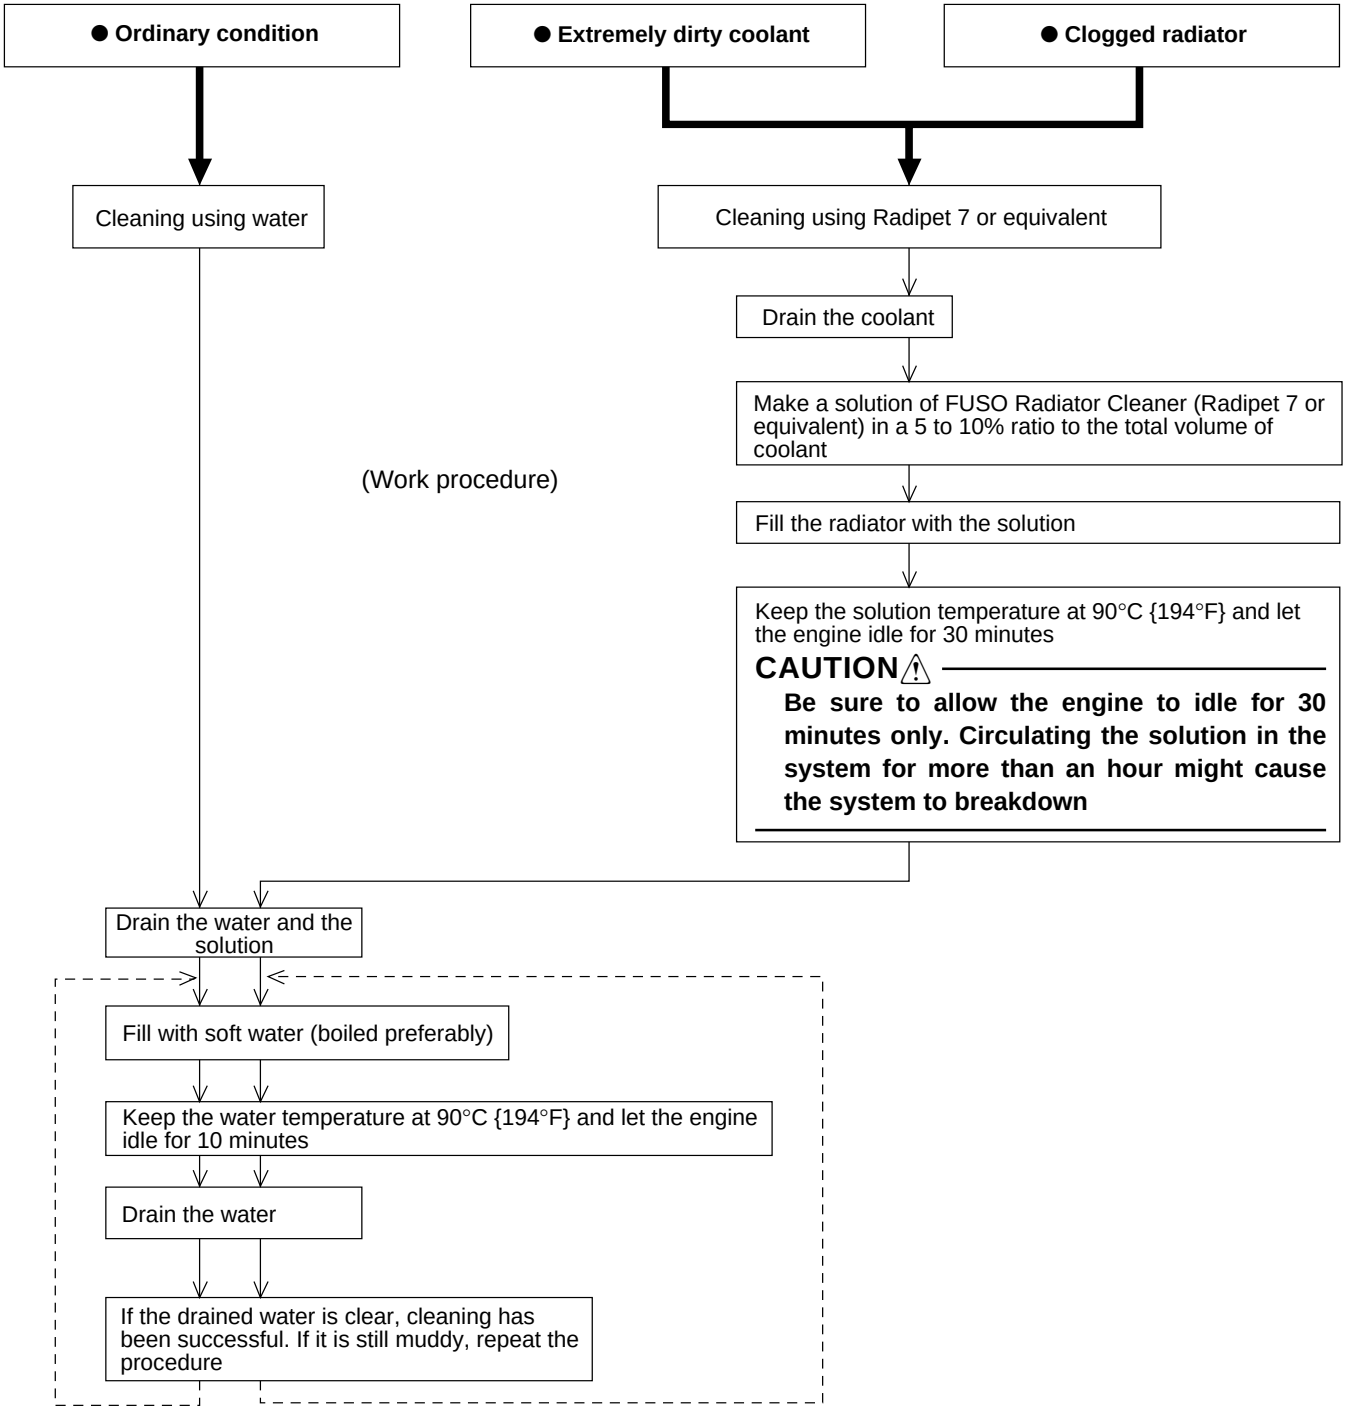
Do not use hard water as it causes scale and rust.

Required properties of soft water

Total hardness	300 ppm or less	Total dissolved solids	500 ppm or less
Sulfate SO_4^-	100 ppm or less	pH	6 to 8
Chloride Cl^-	100 ppm or less		

https://truckmanualshub.com/

Method of cleaning the cooling system depends on its condition.



DANGER

If FUSO DIESEL LONG LIFE COOLANT solution gets in your eyes accidentally, you must immediately rinse your eyes with copious amounts of water, and be sure to consult a doctor.

WARNING

FUSO DIESEL LONG LIFE COOLANT is inflammable. Do not put it near naked lights.

NOTE

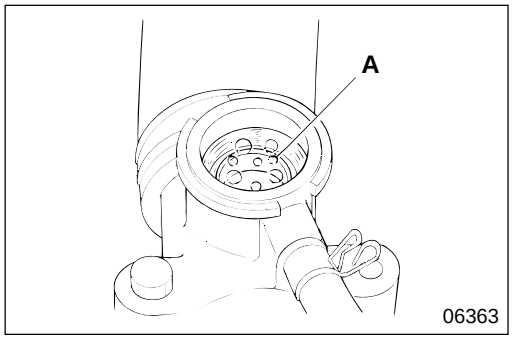
- **After cleaning with solution, fill with coolant as quickly as possible.**
- **To prevent freezing of the coolant and corrosion of the cooling system, use specified coolant solution of FUSO DIESEL LONG LIFE COOLANT. (See the Owner's Handbook for use of these materials.)**

https://truckmanualshub.com/

Air Bleeding of Cooling System

- Remove the pressure cap and keep the coolant temperature at 90°C {194°F} while letting the engine idle and bleed the air out completely. Keep the temperature adjusting lever of the heater controller at maximum so that the coolant can circulate freely in the heater piping area.
- After completing adequate air bleeding of the cooling system, refill coolant sufficiently enough for the radiator and the reservoir tank.

Gas Leakage Test



Air or exhaust gas in the coolant increases corrosion and rusting in the system. Therefore, carry out the following test:

- Remove the pressure cap.

WARNING ⚠

Be sure that the coolant temperature is low enough so that hot coolant does not spout out when you loosen the pressure cap.

- Run the engine to bring the coolant temperature to approximately 90°C {194°F}.
- If air bubbles **A** continuously rise from the coolant, it is an indication that air or exhaust gas has gotten into the coolant.
- If it is air, it is possible that the cylinder head bolts, the water pump mounting bolts or the hose connections are loose, or that the hose is damaged.
- If it is exhaust gas, it is possible that the cylinder head gaskets are damaged, or that the cylinder head is cracked.

Service standards

Location	Maintenance item	Standard value	Limit	Remedy and remarks
13	Radiator air leakage (Air pressure of 150 kPa {21 lbf/in^2, 1.5 kgf/cm^2})	0 cm^3 {0 cu. in.}	—	Correct or replace

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

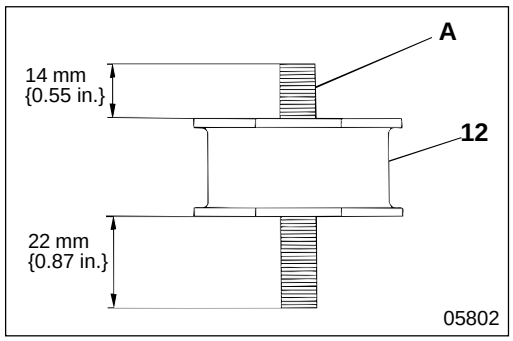
Location	Parts to be tightened	Tightening torque	Remarks
1, 4	Hose clamp	3.9 {2.9, 0.4}	—
3	Hose clamp	1.5 to 2 {1.1 to 1.4, 0.15 to 0.2}	Wet

Lubricant

Location	Points of application	Kinds	Quantity
3	Thread area of bolt	Engine oil	As required

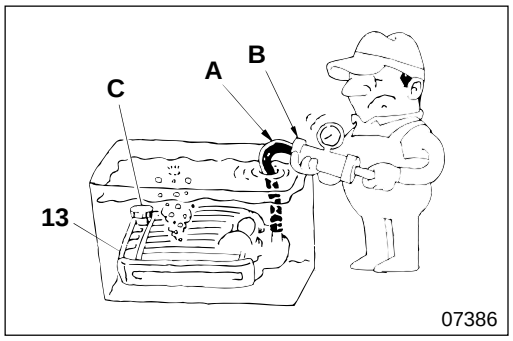
https://truckmanualshub.com/

◆ Service procedure



12 **Support cushion**

Place support cushion **12** so that thread part **A** (shorter than the other side) comes to the radiator side for mounting.



13 **Inspection of radiator**

- Install radiator cap tester **B** by connecting hose **A** to the radiator inlet hole.
- Plug any other openings **C** with plugs, and immerse the radiator in a water tank.
- Apply specified air pressure of 150 kPa {21 lbf/in^2, 1.5 kgf/cm^2} using cap tester **B**, and check if there is any air leakage.
- If you find air leakage, correct or replace radiator **13**.

https://truckmanualshub.com/

COOLING FAN AND V-BELT

1 V-belt (Compressor)
2 V-belt (Fan)
3 Nut
4 Cooling fan
5 Nut
6 Automatic cooling fan coupling
7 Bolt
8 Coupling plate
9 Water pump pulley

***1** : Tension pulley Gr 54
***2** : Cooler compressor Gr 54

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION

- **Be sure to replace automatic cooling fan coupling 6 as an assembly if it is faulty because it is a unit construction.**
- **Be sure to replace V-belts 2 as a set to maintain even tension between them.**

https://truckmanualshub.com/

Service standards

Unit : mm {in.}

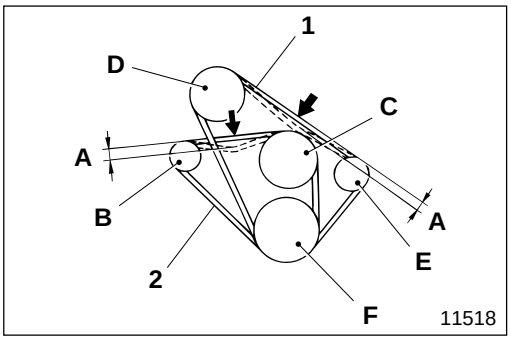
Location	Maintenance item	Standard value	Limit	Remedy
1	V-belt tension (Air-conditioner)	16 to 20 {0.63 to 0.79}	—	Adjust
2	V-belt tension (Fan)	12 to 16 {0.47 to 0.63}	—	Adjust

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1, 2	Belt tension gauge 03612	MH062345	Measurement of tension of V-belt

◆ Service procedure



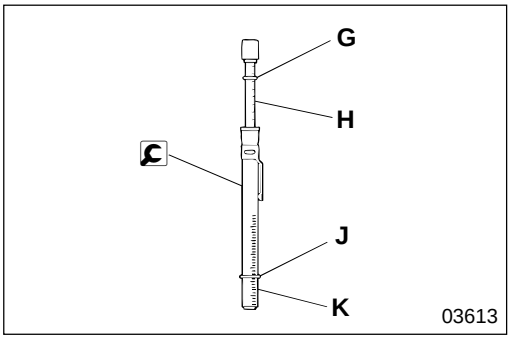
11518

1 **2** **V-belt**

[Inspection]

Measure the extent of flex **A** when the center of V-belts **1**, **2** as illustrated is depressed with a force of 98 N {72 lbf, 10 kgf}.

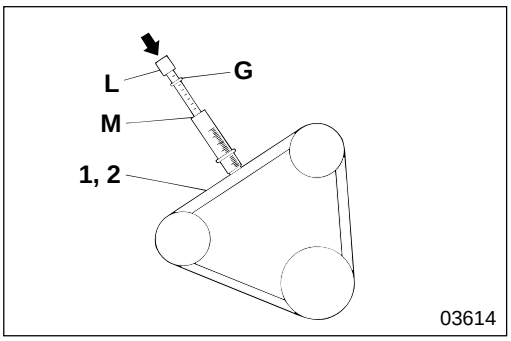
B : Alternator pulley
C : Water pump pulley
D : Cooler compressor pulley (Air-conditioner)
E : Tension pulley
F : Crankshaft pulley



03613

● **Use of special tool belt tension gauge**

- Set upper O-ring G of belt tension gauge to 98 N {72 lbf, 10 kgf} (push load) on graduation **H**.
- Set lower O-ring **J** of belt tension gauge to graduation **K** (maximum flex of belt).

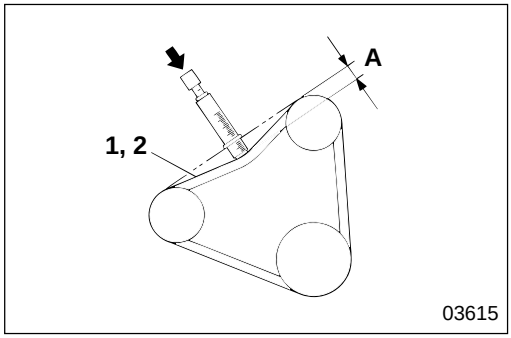


03614

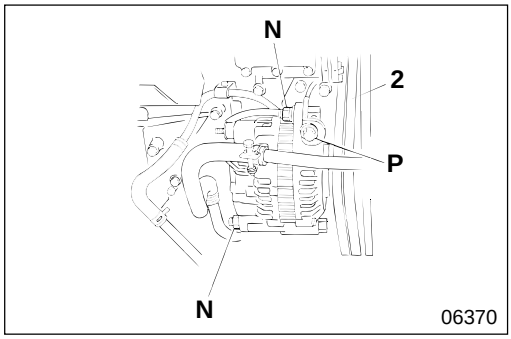
- Place belt tension gauge at the center of V-belts **1**, **2** perpendicularly as illustrated and push top **L** all the way down until upper O-ring **G** hits upper edge **M**.

https://truckmanualshub.com/

COOLING FAN AND V-BELT



- Measure the extent of flex **A** of V-belts **1**, **2** at this point, and if the measured value deviates from the standard value, adjust as follows.



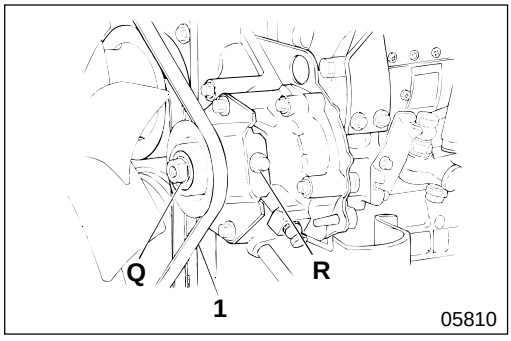
[Adjustment]

(1) Adjustment of V-belt tension for fan

- Loosen alternator mounting bolts **N** (two places), and adjust the tension of V-belts **2** by moving adjusting bolt **P**.
- After adjustment, tighten the bolts and nuts securely.

CAUTION⚠

- **Bear in mind that excessive tension of V-belts 2 might damage the belts and bearings that engage with the V-belts.**
- **Be sure to replace V-belts 2 as a set to maintain even tension between them.**
- **Be careful not to let oil stick to V-belts 2, if oil gets onto the belts, it causes slipping, resulting in overheating and insufficient battery charging.**



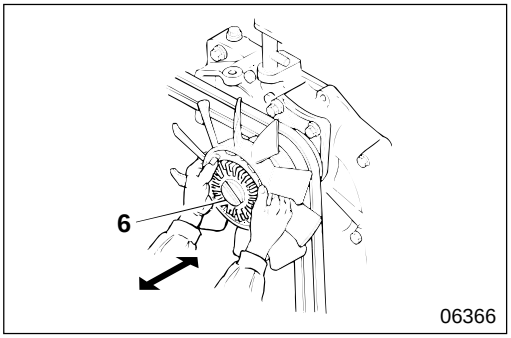
(2) Adjustment of V-belt tension for air-conditioner

- Loosen tension pulley mounting nut **Q**, and adjust the tension of V-belt **1** by adjusting bolt **R**.
- After adjustment, tighten the bolts and nuts securely.

CAUTION⚠

- **Bear in mind that excessive tension of V-belt 1 might damage the belt and bearings that engage with the V-belt.**
- **Be careful not to let oil stick to V-belt 1, if oil gets onto the belt, it causes slipping, resulting in poor performance of the air-conditioner.**

https://truckmanualshub.com/

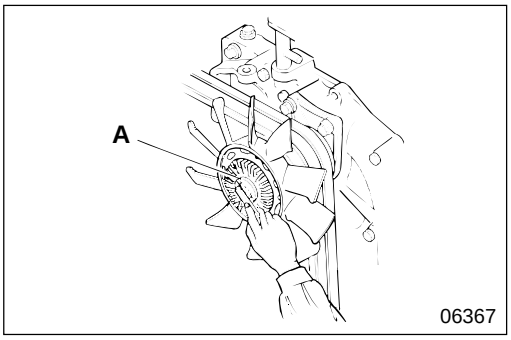


6 Automatic cooling fan coupling

[Inspection]

Carry out the following inspection of automatic cooling fan coupling **6** and if any fault is found, replace the unit.

- Check for any leakage of lubricating oil sealed in the coupling body.
- Rotate automatic cooling fan coupling **6** by hand, and check for any irregularity in rotation related to the coupling bearing or any abnormal noise.
- Check for any excessive play of automatic cooling fan coupling **6** in the axial direction when the engine is cool.

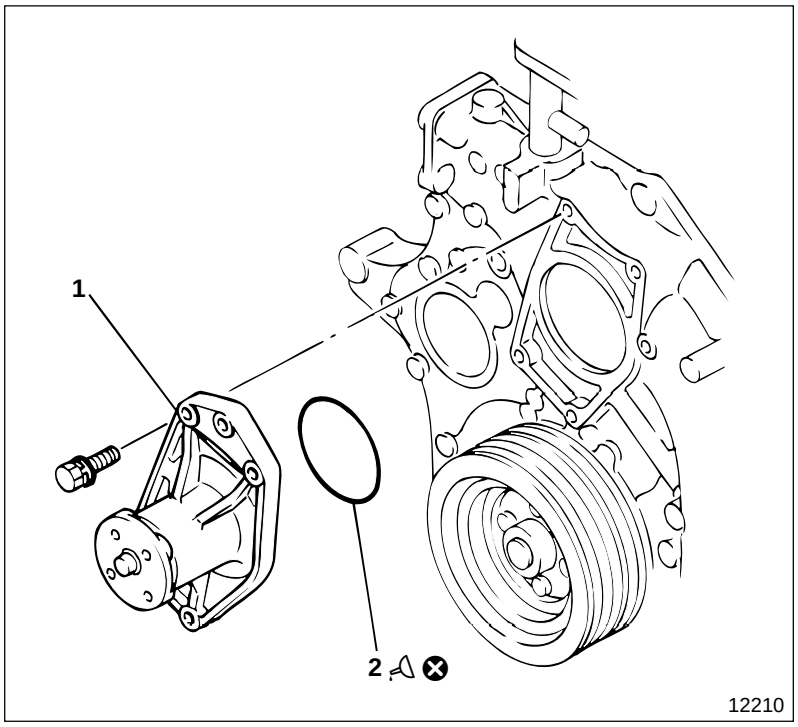


[Cleaning]

- If there are any foreign particles sticking to bimetal **A**, remove them by brushing lightly.

https://truckmanualshub.com/

WATER PUMP



● **Removal sequence**

1 Water pump assembly
2 O-ring

⊗ : Non-reusable parts

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION

- **Be sure to replace water pump assembly 1 as an assembly if it is faulty because it is a unit construction.**
- **Never apply engine oil to the O-ring because it will cause the O-ring to swell.**

11 Water temperature sensor (Water temperature gauge and multi-purpose timing control unit) Gr 54
12 Overheating switch Gr 54
13 Water temperature sensor (Pre-stroke control type injection pump) Gr 54

*: Cylinder head
⊗: Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION

Be sure to apply soapy water to O-ring 3, 10 for easier fitting. Never use engine oil because it will cause the O-ring to swell.

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy and remarks
1	Pressure cap valve opening pressure		88±15 kPa {13±2.1 lbf/in², 0.9±0.15 kgf/cm²}	—	Replace
6	Thermostat	Valve opening temperature	82±2°C {180±36°F}	—	Replace
		Extent of valve lift (95°C {203°F})	10 {0.39} or more	—	Replace

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

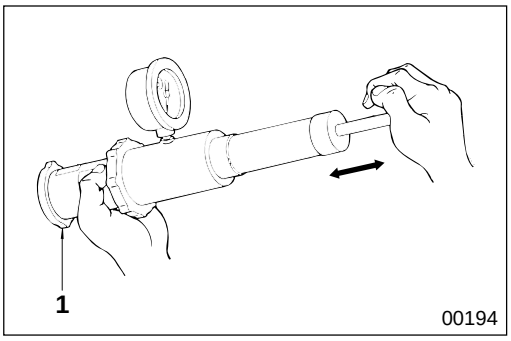
Location	Parts to be tightened	Tightening torque	Remarks
11	Water temperature sensor	34±6.9 {25±5.1, 3.5±0.7}	—
12	Overheating switch	27 to 41 {20 to 30, 2.8 to 4.2}	—
13	Water temperature sensor	34±6.9 {25±5.1, 3.5±0.7}	—

Lubricant

Location	Points of application	Kinds	Quantity
3, 10	O-ring	Soapy water	As required

https://truckmanualshub.com/

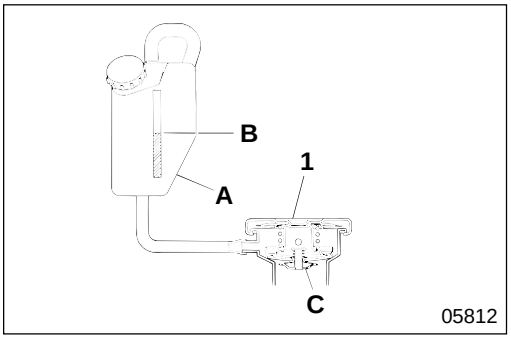
◆ Service procedure



1 Inspection of pressure cap

(1) Pressure valve opening pressure

If the measured value deviates from the standard value, replace pressure cap **1**.

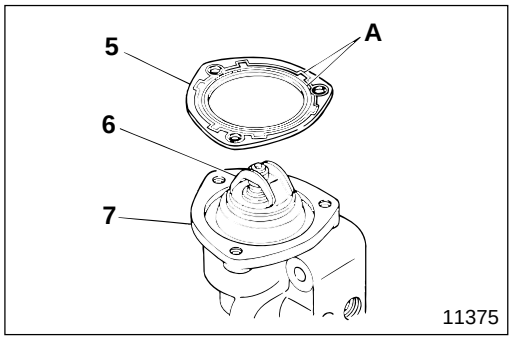


(2) Inspection of vent valve

- Take note of the liquid level **B** of reservoir tank **A** beforehand.
- Run the engine at a high revolution and before the overflow reaches the capacity of tank **A** stop the engine.
- Leave things for a while. Check the time it takes for the coolant temperature to return to the ambient temperature, and check whether the coolant level in tank **A** is the same as before running the engine.
- If the coolant level has not returned to that before running the engine, it means vent valve **C** is faulty, therefore replace pressure cap **1**.

NOTE

Do not remove pressure cap 1 before the coolant temperature decreases to the ambient temperature. If you do the coolant will not return to reservoir tank A because negative pressure in the radiator is lost.



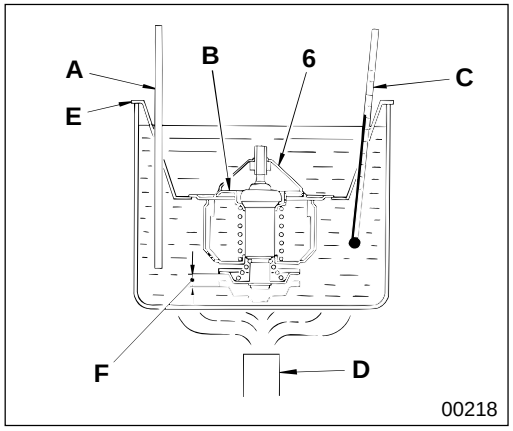
5 Mounting of thermostat cover gasket

Mount thermostat cover gasket **5** on thermostat case **7** in the direction as illustrated.

A : Sealant application surface

https://truckmanualshub.com/

THERMOSTAT



6 Thermostat

[Inspection]
Stir the water using stick **A** to maintain an even water temperature in the container, then carry out the following tests. If the measured value deviates from the standard value, replace thermostat **6**.

(1) Valve opening temperature

- Hold thermostat **6** with wire **E** so as not to get the thermostat too close to heat **D**.
- Heat the water gradually to raise the temperature to the valve opening temperature.
- Maintain this temperature for five minutes and make sure that valve **B** has opened.
- Make sure that valve **B** has closed when the water temperature has dropped to 65°C {149°F}.

C : Water temperature gauge

(2) Extent of valve lift

Measure valve lift **F**, while maintaining the water temperature a little higher than the valve opening temperature, with valve **B** fully open for five minutes.

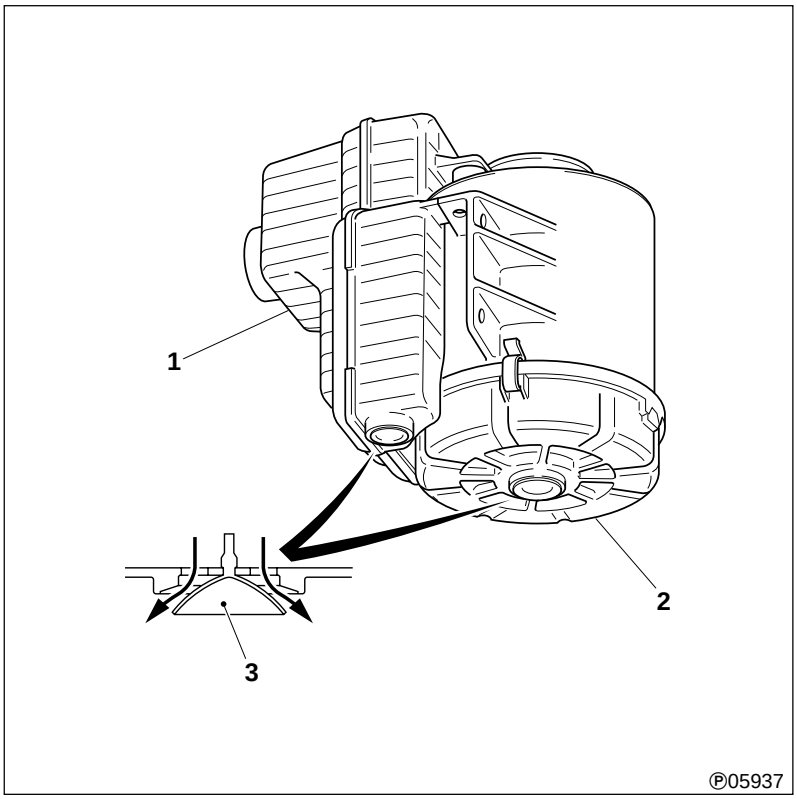
SPECIFICATIONS / STRUCTURE AND OPERATION

SPECIFICATIONS

Item		Specifications
Air cleaner element		Cyclone paper filter type
Turbocharger	Model	TD05
	Manufacturer	Mitsubishi Heavy Industries
Intercooler type		Tube and corrugated fin (air cooled)

STRUCTURE AND OPERATION

1. Air Cleaner

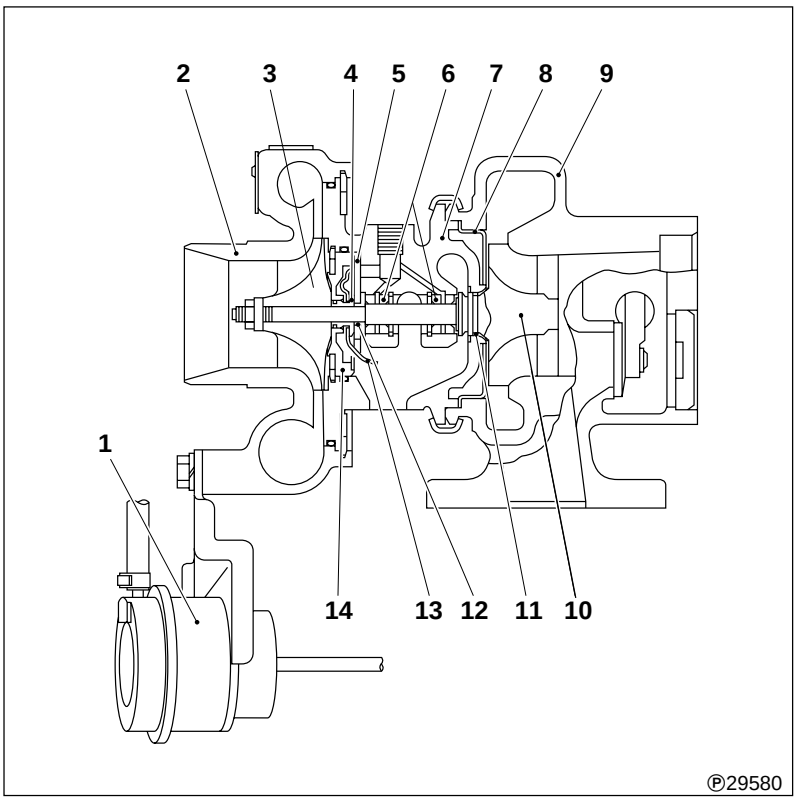


1 Air box
2 Air cleaner assembly
3 Unloader valve

- The air cleaner assembly **2** utilizes a single element.
- The air box **1** and the air cleaner assembly **2** incorporate an unloader valve **3**.
- The unloader valve vibrates due to a vacuum fluctuation when the engine speed drops below a predetermined level, automatically discharging accumulated water and dust.

https://truckmanualshub.com/

2. Turbocharger Assembly

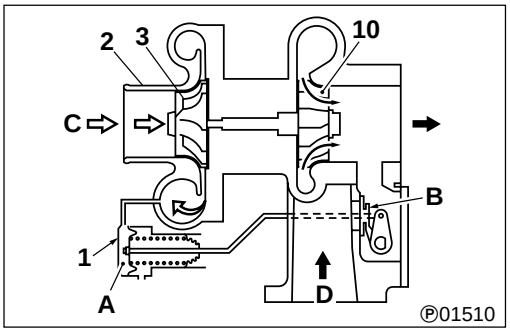


1 Actuator
2 Compressor cover
3 Compressor wheel
4 Thrust sleeve
5 Thrust bearing
6 Bearing
7 Bearing housing
8 Turbine back plate
9 Turbine housing
10 Shaft and turbine wheel
11 Piston ring
12 Thrust ring
13 Oil deflector
14 Insert

3 to 14: Cartridge assembly

● **Waste gate mechanism**

- The waste gate mechanism has actuator assembly **1** to let extra exhaust gas escape. By so doing, the boost pressure is properly controlled to prevent the turbine wheel from overrunning and prevent an excessive pressure in the intake manifold.
- The boost pressure is led from compressor cover **2** through a rubber hose to chamber **A** of actuator assembly **1**. When the boost pressure **C** that acts on chamber **A** is below the setting, the actuator assembly does not operate, and the waste gate valve remains closed, and exhaust gas **D** is blown against turbine wheel **10**.



- When the boost pressure that acts on chamber **A** exceeds the setting, the waste gate valve is opened. As a result, the amount of exhaust gas blown against turbine wheel **10** decreases, the rotating speed of compressor wheel **3** also decreases, and the boost pressure falls.

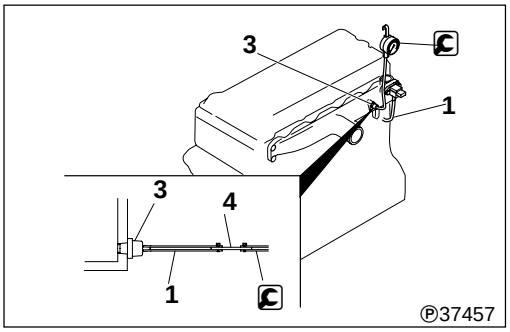
1. Measurement of Turbocharger Boost Pressure

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Boost pressure (at ambient temperature of 20°C {68°F} and atmospheric pressure of 100 kPa {29.9 in.Hg, 760 mmHg})	–	34.7 kPa {10.2 in.Hg, 260 mmHg}/ 3750 rpm 136 kPa {10.2+29.9 in.Hg/260+760 mmHg} when measured by MUT	Inspect/ adjust

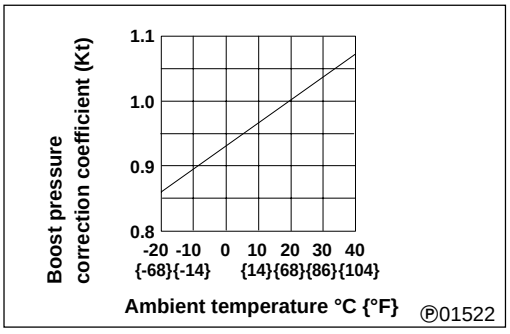
Special tool

Location	Tool name and shape	Part No.	Application
–	Boost pressure gauge  Ⓟ01524	Obtain Locally	Measurement of boost pressure



Ⓟ37457

- Before measuring the boost pressure, clean or replace the air cleaner element.
- Disconnect the vacuum hose **1** at the boost pressure sensor **2** side.
- Connect the pipe **4** (MH062049 [component part of MH062047]) between the vacuum hose **1** fitted to the gas filter assembly **3** and the Boost Pressure Gauge.
- Warm up the engine, then measure the boost pressure at the engine's maximum idling speed. At the same time, measure the engine speed and ambient temperature.



Ⓟ01522

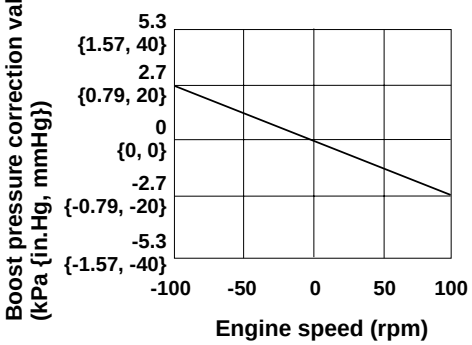
- Correct the measurement to determine the boost pressure under standard conditions. (The boost pressure varies in accordance with the ambient temperature and engine speed.)

  [Correction for ambient temperature]

  From the graph, determine the boost pressure correction coefficient Kt for the ambient temperature.

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT



(Differece between the median of the no-load maximum engine speed and the actual engine speed used for boost pressure measurement)

Ⓟ06165

[Correction for engine speed]

From the engine speed during boost pressure measurement, subtract the median of the maximum idling speed. From the result, determine the boost pressure correction value (**Pa**) in accordance with the graph.

Median**:** 3,750 rpm

[Calculation of corrected boost pressure]

If the measured boost pressure is **P**, the corrected boost pressure **Pb** is determined as follows**:**

Pb = KtP + Pa

Pb: Corrected boost pressure
P: Measured boost pressure
Kt: Boost pressure correction coefficient for ambient temperature
Pa: Boost pressure correction value

If **Pb** is out of specification, the turbocharger must be inspected and adjusted.

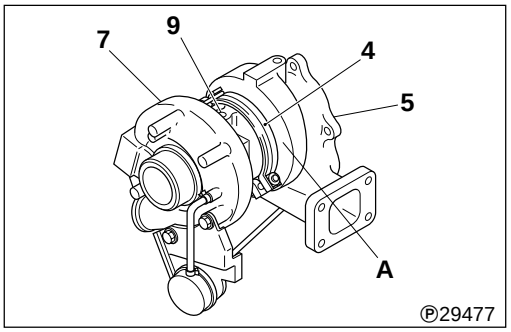
8	Entire periphery of O-ring	Engine oil	As required

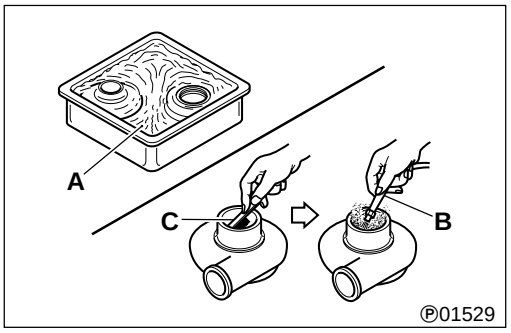
https://truckmanualshub.com/

◆ Service procedure



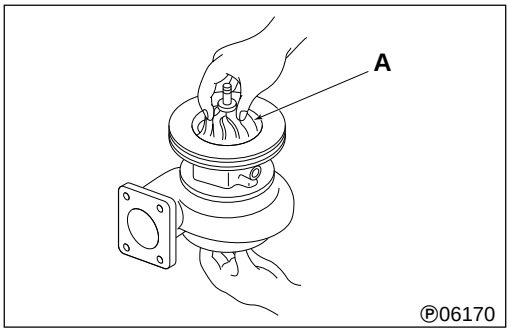
● **Operations before disassembly**

Make alignment marks **A** on the coupling **4**, turbine housing **5**, compressor cover **7**, and cartridge assembly **9**.



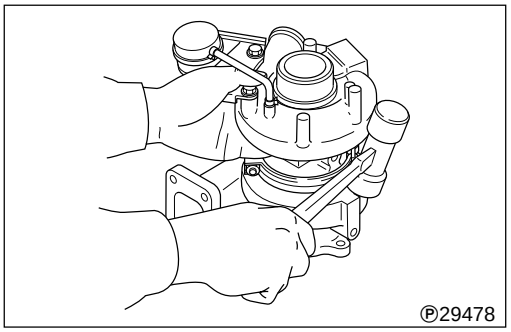
● **Cleaning after disassembly**

- Visually check the disassembled parts for scorches, abrasion, and other marks that may be difficult to see after cleaning. Replace any part that appears defective.
- Immerse the disassembled parts in a non-flammable solvent **A** and remove the parts from the solvent and blow them dry with compressed air **B**. Before this procedure, remove adhering matter if any using a plastic scraper on a wire brush **C**.
- Immerse the parts in the solvent **A** again.
- Blow the parts dry with compressed air **B**.



● **Inspection after assembly**

Manually rotate the wheel **A** of the cartridge assembly **9** to check that it turns smoothly.

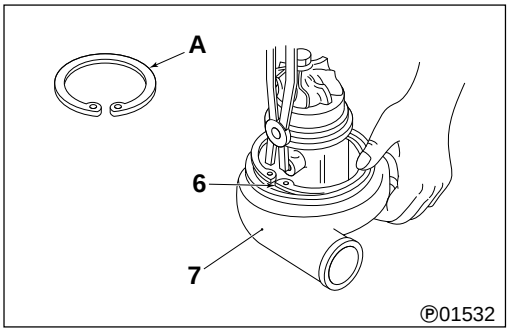


5 **Removal of turbine housing**

CAUTION ⚠

- **While using care to prevent damage to the turbine housing, lightly strike its entire circumference with a rubber hammer or similar tool.**
- **Since the blades of the turbine wheel are easily bent, use care to make sure that they do not hit turbine housing 5.**

https://truckmanualshub.com/

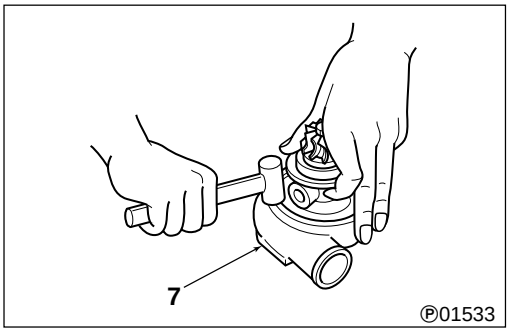


6 **Installing snap ring**

- Fit snap ring **6** onto compressor cover **7** with its tapered surface **A** facing upward.

WARNING ⚠

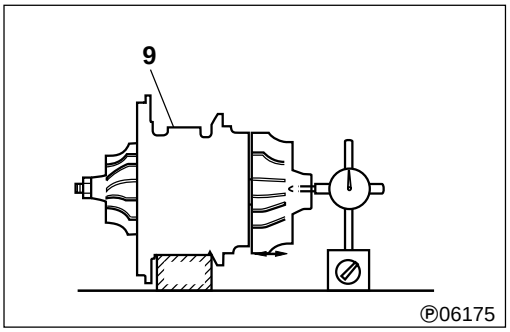
When fitting snap ring 6, hold it down to prevent it from flying off.



7 **Removal of compressor cover**

CAUTION ⚠

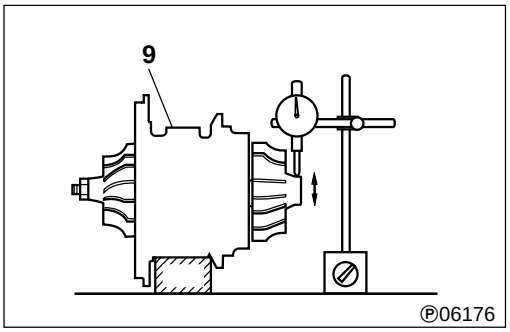
- **While using care to prevent damage to compressor cover 7, lightly strike its entire circumference with a rubber hammer or similar tool.**
- **Since the blades of the compressor wheel are easily bent, use care to make sure that they do not hit the compressor cover.**



9 **Inspection of cartridge assembly**

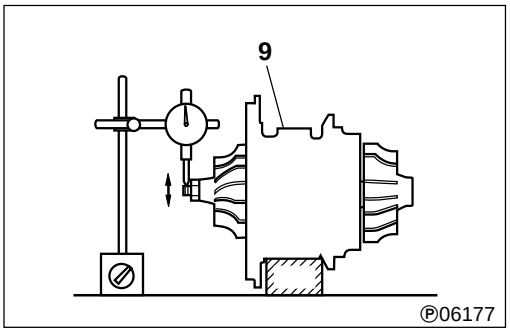
(1) Axial play in shaft and turbine wheel assembly

If the measurement exceeds the specified limit, replace cartridge assembly **9**.



(2) Play at right angle to shaft direction in shaft and turbine wheel assembly

- Play on turbine wheel side
  If the measurement exceeds the specified limit, replace cartridge assembly **9**.



- Play on compressor wheel side
  If the measurement exceeds the specified limit, replace cartridge assembly **9**.

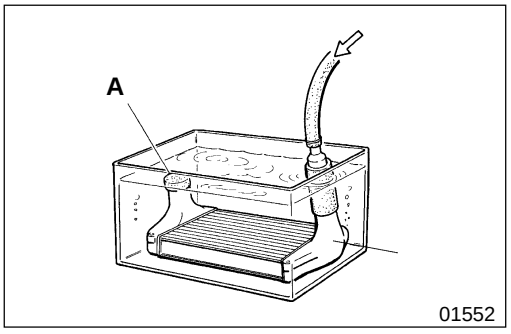
Service standard

Location	Maintenance item	Standard value	Limit	Remedy
13	Intercooler air leakage (at air pressure of 150 kPa {21 psi, 1.5 kgf/cm^2})	0 cm^3 {0 cu.in.}	–	Replace

❶ Tightening torque

Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1, 3, 5, 9, 11	Clamp	2.9 to 3.4 {2.2 to 2.5, 0.3 to 0.35}	–
7	Clamp	3.9 to 4.9 {2.9 to 3.6, 0.4 to 0.5}	–



◆ Service procedure

13 **Inspection of intercooler**

Fit a cap over one of the air ports **A** on the intercooler **13**, connect a hose to the other port, and immerse the intercooler in a tank of water. Then, apply the specified air pressure (150 kPa {21 lbf/in^2, 1.5 kgf/cm^2}) via the hose and check for air leakage.
If leakage is apparent, replace the intercooler **13**.

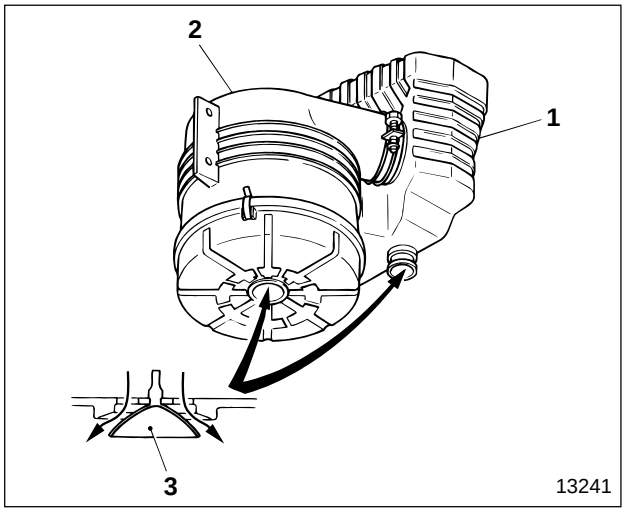
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Items		Specifications
Air cleaner element		Cyclone paper filter type
Turbocharger	Model	TD05
	Manufacturer	MITSUBISHI HEAVY INDUSTRIES
Intercooler type		Air-cooled, tube and corrugated fin type

STRUCTURE AND OPERATION

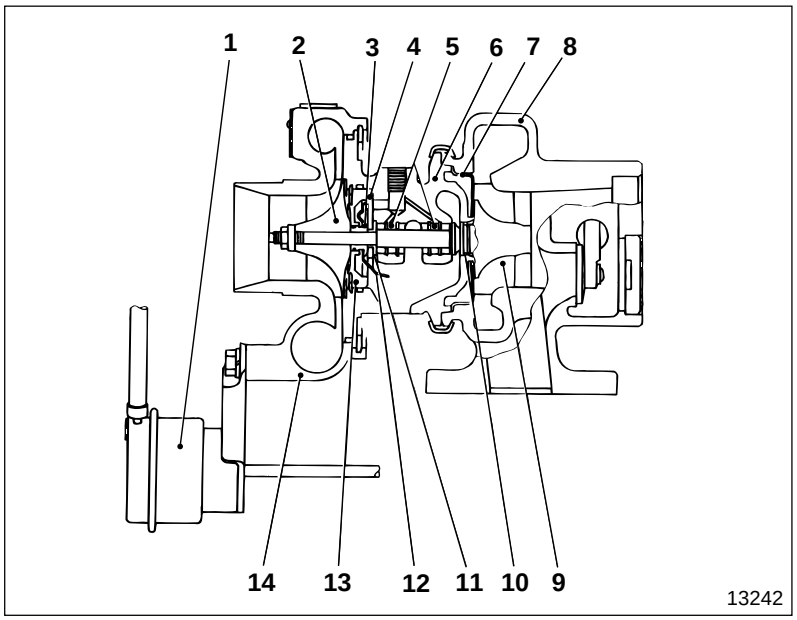
Air Cleaner



1 Air box
2 Air cleaner assembly
3 Unloader valve

- Air cleaner assembly **2** uses a single element.
- Air box **1** and air cleaner assembly **2** are fitted with unloader valve **3**. Water, dust and dirt that collect in the unit are automatically vented by vibration caused by the change of negative pressure when the engine revolution falls below the specified revolution.

Turbocharger



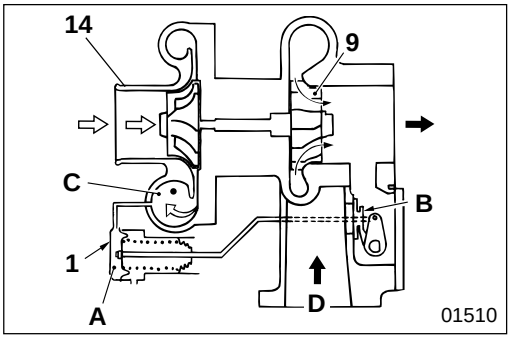
1 Actuator
2 Compressor wheel
3 Thrust sleeve
4 Thrust bearing
5 Bearing
6 Bearing housing
7 Turbine backplate
8 Turbine housing
9 Shaft and turbine wheel
10 Piston ring
11 Thrust ring
12 Oil deflector
13 Inserter
14 Compressor cover

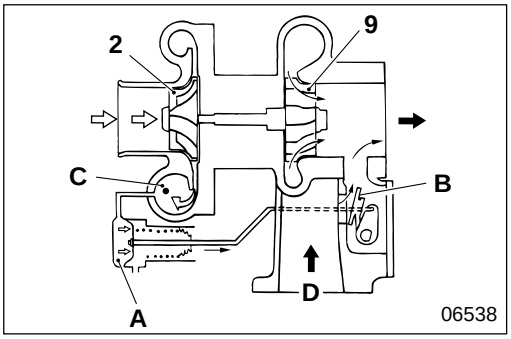
2 to **13** : Cartridge assembly

https://truckmanualshub.com/

Waste gate mechanism

- The waste gate mechanism relieves the boost pressure of excess exhaust gas using actuator **1**. This controls the boost pressure appropriately and prevents the turbocharger from overrunning, and prevents excessive pressure in the intake manifold.
- The boost pressure is fed into chamber **A** of actuator **1** from compressor cover **14** via a rubber hose. When boost pressure **C**, acting on the chamber, is lower than the preset value, the actuator does not operate and waste gate valve **B** remains closed, therefore exhaust gas **D** is blown against shaft and turbine wheel **9**.

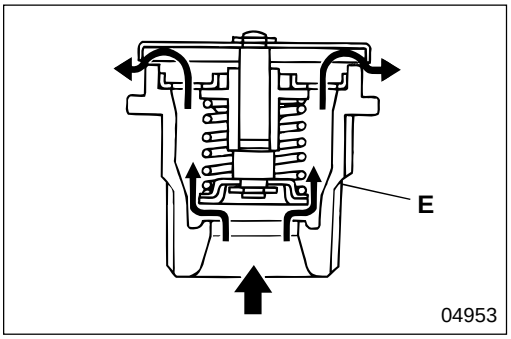




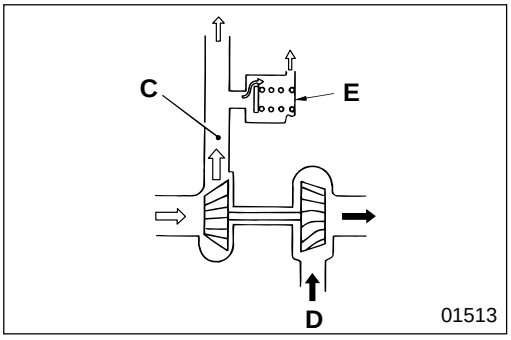
- As the boost pressure acting on chamber **A** increases to become higher than the preset value, waste gate valve **B** is opened and the exhaust gas blown against shaft and turbine wheel **9** decreases. Therefore the rotation of compressor wheel **2** decreases, causing the boost pressure to decrease.

Operation of over-boost valve

- Over-boost valve **E** operates when the boost pressure increases abnormally because of faulty operation of the waste gate mechanism.

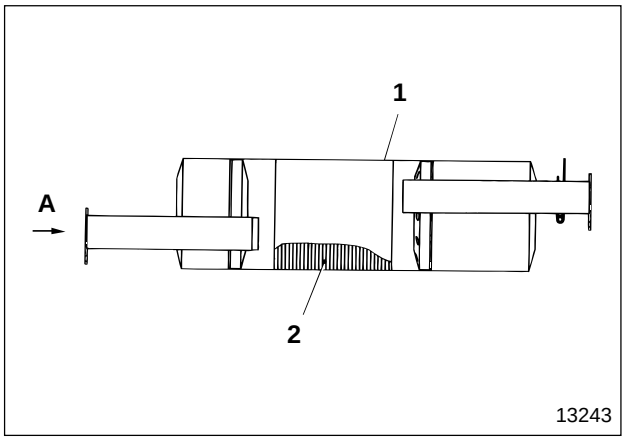


- If boost pressure **C** of over-boost valve **E** increases to become higher than the preset value, the excessive boost pressure is discharged into the atmosphere, protecting the engine from excessive boost pressure. When the valve is operating, a pipe-blowing sound is generated.



https://truckmanualshub.com/

Muffler



1 Muffler
2 Catalytic converter

A : Exhaust gas intake

Converter **2** is built into muffler **1** to decrease the amount of particulate matter (PM) in the exhaust gas.

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

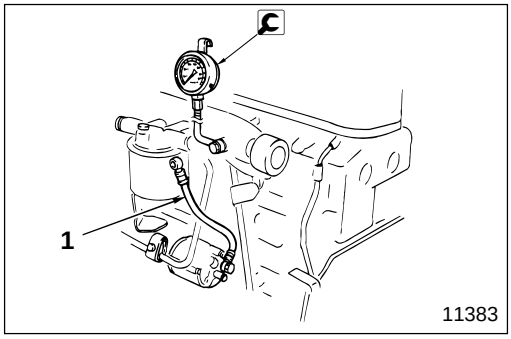
Measurement of Turbo Boost Pressure

Service standards

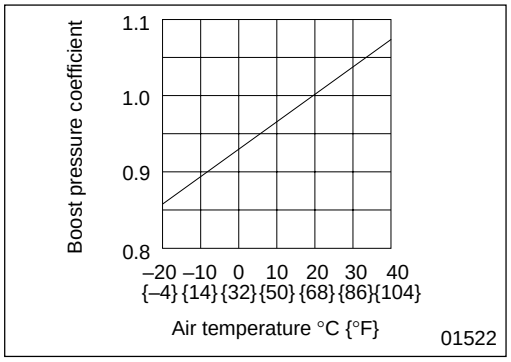
Location	Maintenance item	Standard value	Limit	Remedy
—	Boost pressure (Air temperature 20°C {68°F}, Atmospheric pressure 100 kPa {29.9 in. Hg, 760 mmHg})	—	36 kPa {10.6 in. Hg, 270 mmHg}/ 3700 rpm	Inspect and adjust

Special tools

Location	Tool name and shape	Part No.	Application
—	Boost pressure gauge  01524	MH061366	Measurement of turbo boost pressure

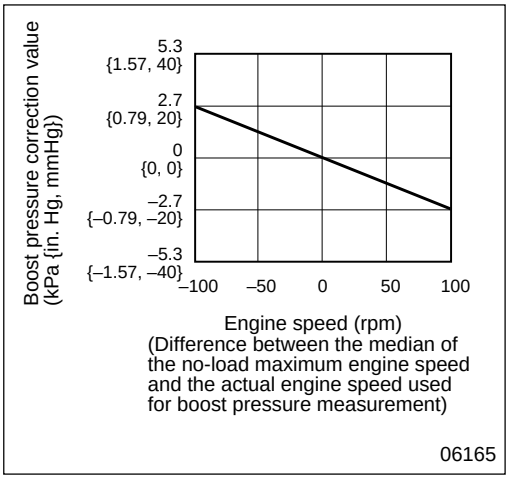


- Before measuring the turbo boost pressure, clean or replace the air cleaner element.
- Remove boost compensator hose **1** and attach boost pressure gauge.
- After warming up the engine, measure the boost pressure at the no-load maximum engine speed. Also measure the engine speed and the air temperature.



- Correct the boost pressure at standard conditions. (Since the boost pressure varies depending on the air temperature and engine speed.)
  [Correction for air temperature]
  Identify boost pressure coefficient depending on the air temperature from the graph.

https://truckmanualshub.com/



[Correction for engine speed]
Subtract the engine speed actually used for measuring the boost pressure from the median of the no-load maximum engine speed. Identify the boost pressure correction value (**Pa**) according to the graph.

Median value : 3700 rpm

[Calculation of corrected boost pressure]
Given the measured boost pressure to be **P**, corrected boost pressure **Pb** can be calculated from the following equation:

Pb = ktP + Pa

- **Pb** : Corrected boost pressure
- **P** : Measured boost pressure
- **kt** : Boost pressure correcting coefficient depending on air temperature
- **Pa** : Boost pressure correction value

If **Pb** is lower than the limit, the turbocharger must be inspected and adjusted.

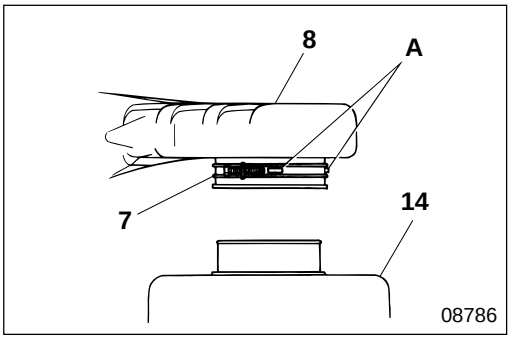
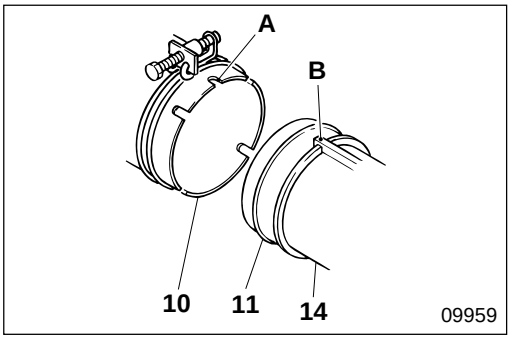
◆ Service procedure



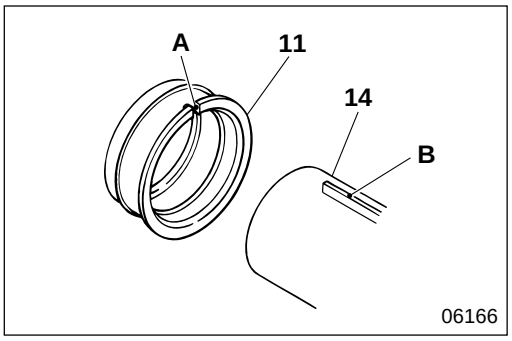
8 **Installation of air duct**

- Fit clamp **7** over protrusions **A** of air duct **8**.
- Push air duct **8** in until it hits air cleaner case **14**.



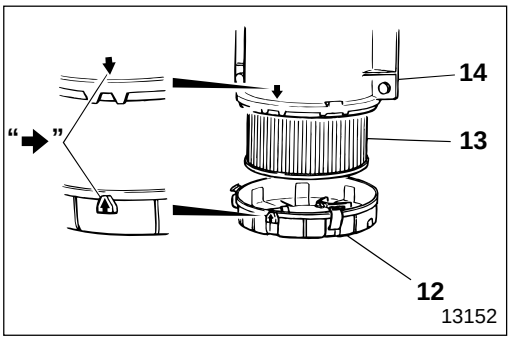
10 **Installation of air box**

Align slit **A** of air box **10** with key **B** of air cleaner case **14**.



11 **Installation of rubber seal**

Align slit **A** of rubber seal **11** with key **B** of air cleaner case **14**.

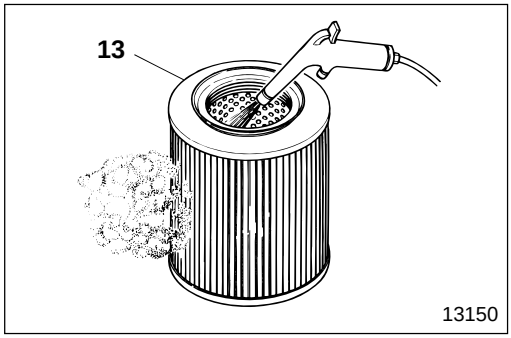


12 **Installation of air cleaner cap**

➡ : Alignment mark

https://truckmanualshub.com/

AIR DUCT AND AIR CLEANER



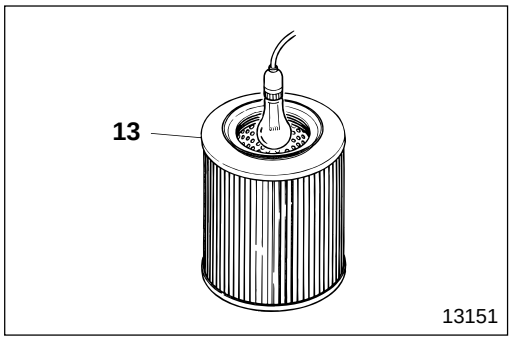
13 **Air cleaner element**

[Cleaning]

- Blow compressed air of 685 kPa {100 lbf/in^2, 7 kgf/cm^2} or less through air cleaner element **13** from the inside.
- When using compressed air, move the blower's nozzle up and down along the pleats of air cleaner element **13** evenly.

CAUTION

- **Do not tap or hit air cleaner element 13 to remove dust.**
- **Do not blow compressed air through air cleaner element 13 from the outside.**



[Inspection]

- Illuminate the inside of air cleaner element **13**.
- If parts of the filter paper are torn or thin, or if the packing of the upper surface of air cleaner element **13** is damaged, replace the air cleaner element.

NOTE

If the dust on air cleaner element 13 is wet due to oil smoke or soot, replace the air cleaner regardless of the scheduled replacement interval.

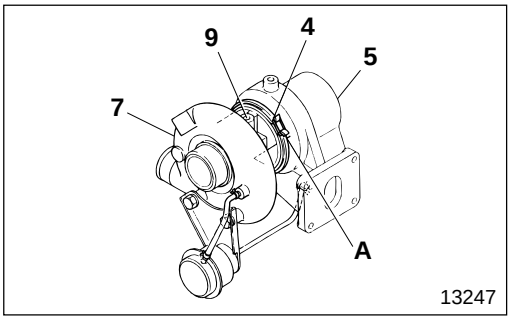
3	Thread area of bolt	Molybdenum disulfide grease	As required
8	Periphery of O-ring	Engine oil	As required

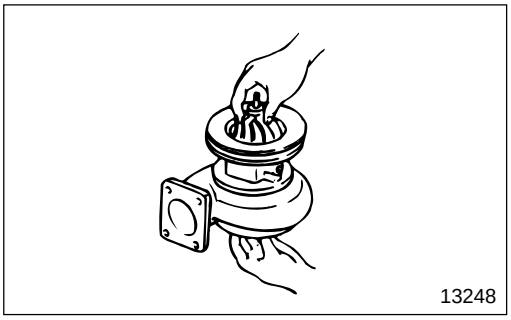
https://truckmanualshub.com/

◆ Service procedure



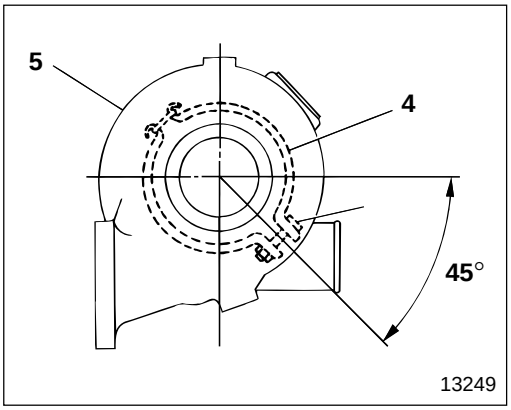
● Work before disassembly

Put alignment marks **A** on coupling **4**, turbine housing **5**, compressor cover **7** and cartridge assembly **9**.



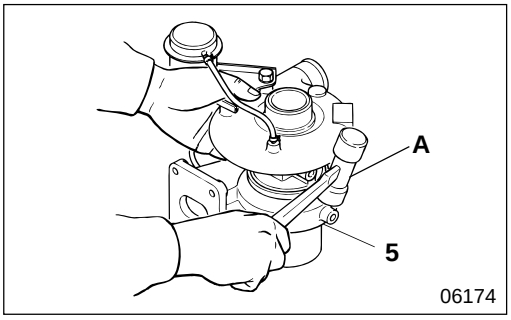
● Inspection after assembly

Turn the turbine wheel and the compressor wheel of cartridge assembly **9** to make sure that they turn smoothly.



4 Installation of coupling

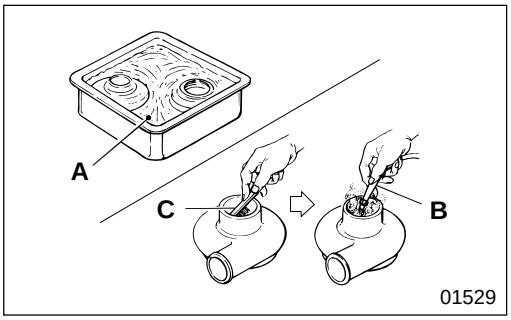
Install coupling **4** onto turbine housing **5** in the direction as illustrated.



5 Removal of turbine housing

CAUTION ⚠

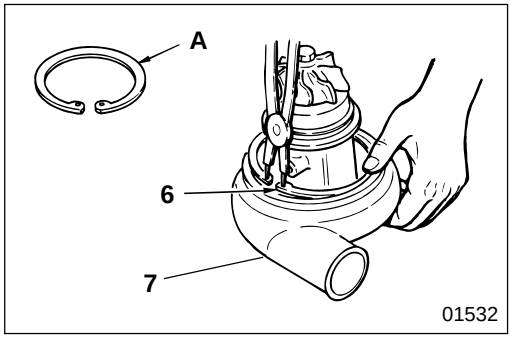
- **When removing turbine housing 5, tap all around the circumference lightly using rubber-headed hammer A so as not to damage the turbine housing.**
- **Do not hit the turbine wheel near turbine housing 5, since the blade of the turbine wheel can be easily bent.**



5 7 Cleaning of turbine housing and compressor cover

- Visually inspect related parts before cleaning to check if there are any burns or scratches as these would not be seen after cleaning. If any fault is found, replace the faulty parts.
- Remove any foreign particles before cleaning by scraping them off using plastic scraper or bristle-headed brush **C**. Immerse the disassembled parts in nonflammable solvent **A** (DAIDO KAGAKU KOGYO DAICLEANER T-30), then take them out and blow compressed air **B** on them.

https://truckmanualshub.com/

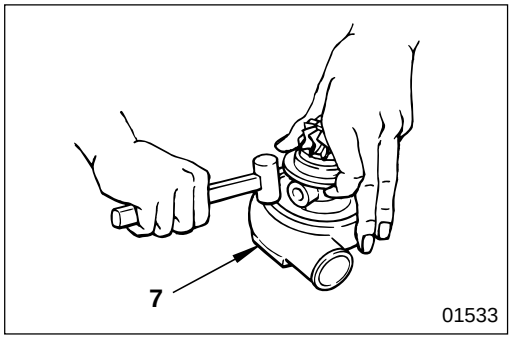


6 Installation of snap ring

Install snap ring **6** into compressor cover **7** with taper surface **A** upward.

WARNING

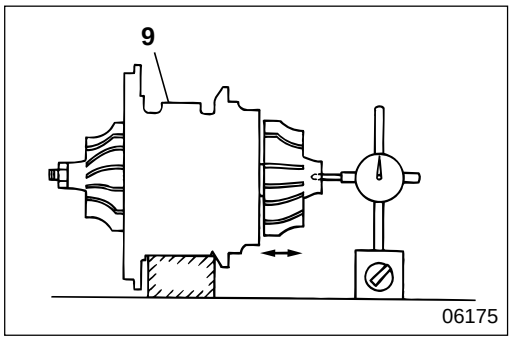
Use your hand to hold snap ring 6 in place to prevent it from springing out.



7 Removal of compressor cover

CAUTION

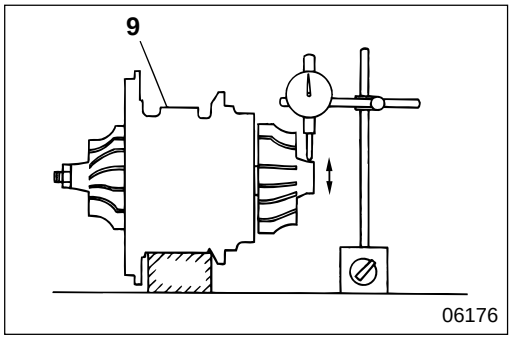
- **When removing compressor cover 7, tap all around the circumference lightly so as not to damage the compressor cover.**
- **Avoid hitting the compressor wheel near compressor cover 7, since the blade of the compressor wheel can be easily bent.**



9 Inspection of cartridge assembly

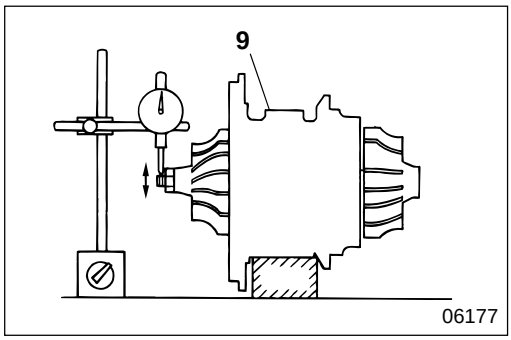
(1) Play in the shaft direction of the shaft and turbine wheel assembly

If the measured value deviates from the standard value, replace cartridge assembly **9**.



(2) Play at right angles to the shaft of the shaft and turbine wheel assembly

- Play on turbine wheel side
  If the measured value is higher than the limit, replace cartridge assembly **9**.



- Play on compressor wheel side
  If measured value is higher than the limit, replace cartridge assembly **9**.

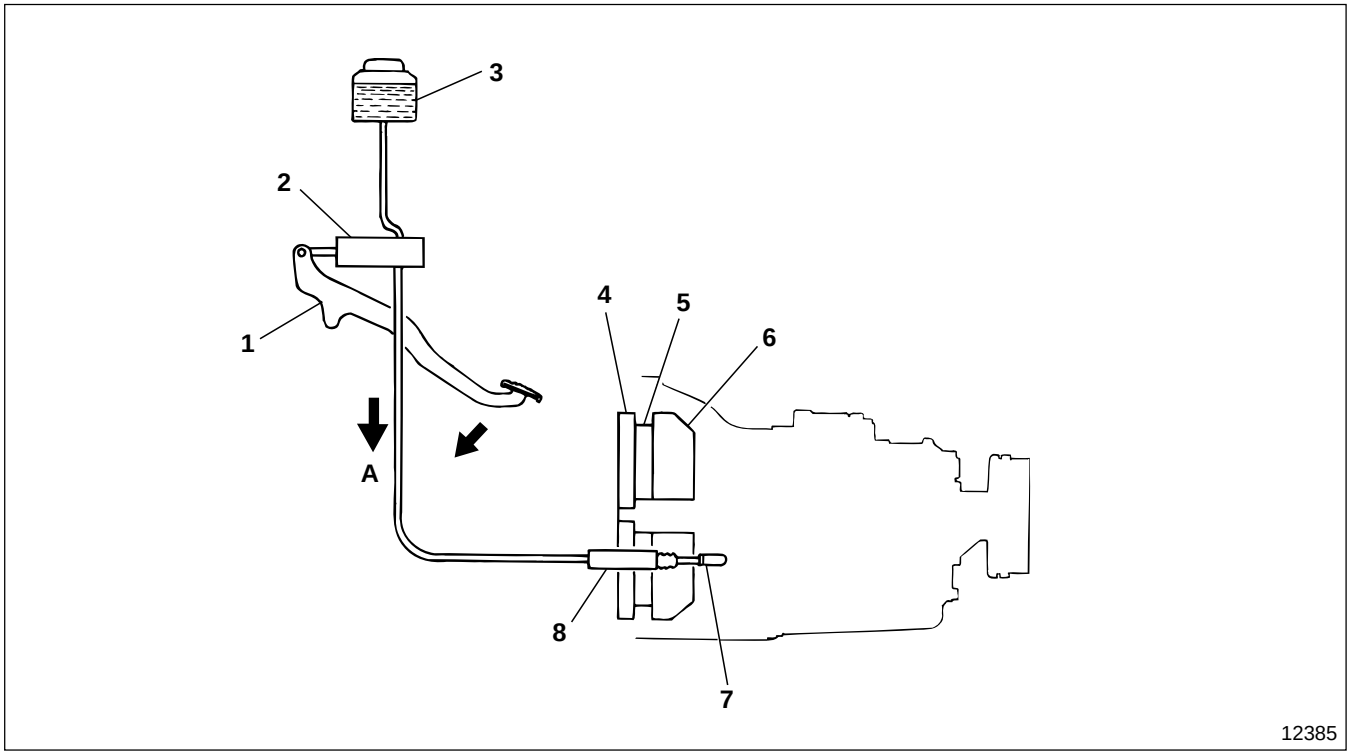
Clutch master cylinder	Manufacturer	NISSIN KOGYO
Clutch power cylinder	Manufacturer	NISSIN KOGYO

STRUCTURE AND OPERATION

Clutch Control

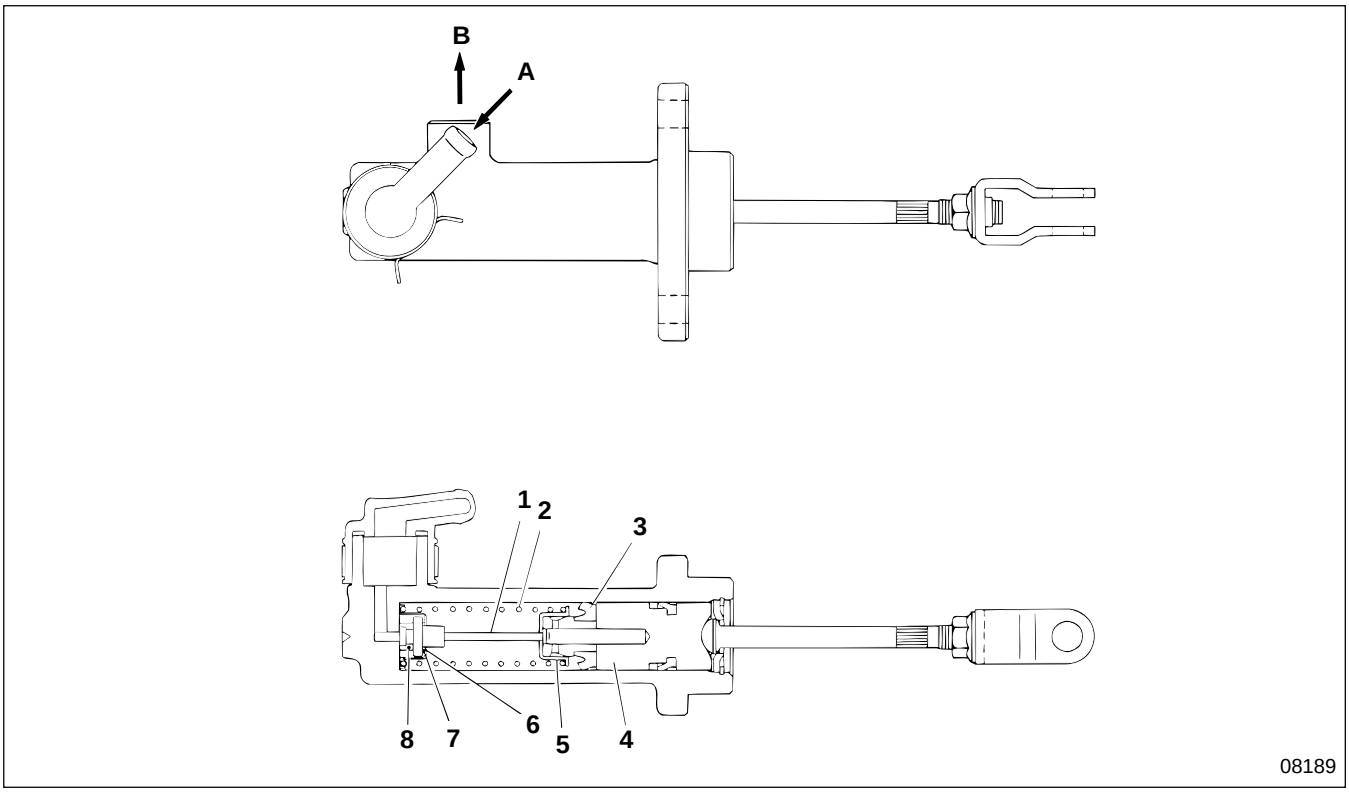


1 Clutch pedal
2 Clutch master cylinder
3 Fluid tank
4 Flywheel
5 Clutch disc
6 Clutch cover assembly
7 Push rod
8 Clutch power cylinder

A : Hydraulic pressure

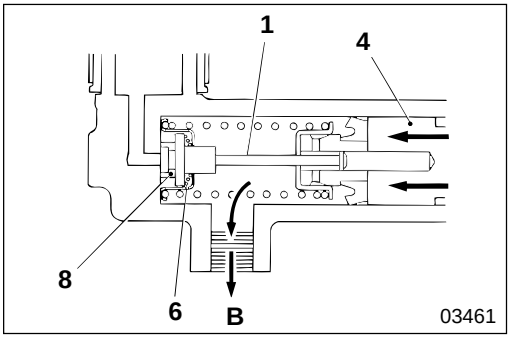
https://truckmanualshub.com/

Clutch Master Cylinder



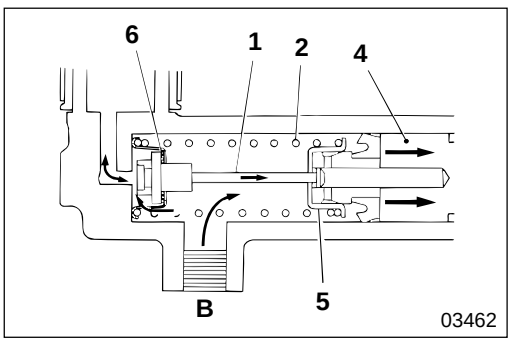
1 Valve stem
2 Return spring
3 Pressure cup
4 Piston
5 Spring seat
6 Valve spring
7 Valve case
8 Valve seal

A : From fluid tank
B : To clutch power cylinder (hydraulic pressure)



When clutch pedal is depressed

- As piston **4** is pressed in the direction as illustrated, valve spring **6** of valve stem **1** forces down valve seal **8** to close the fluid tank port.
- Then, the hydraulic pressure in the master cylinder increases to transmit hydraulic pressure **B** to the power cylinder.

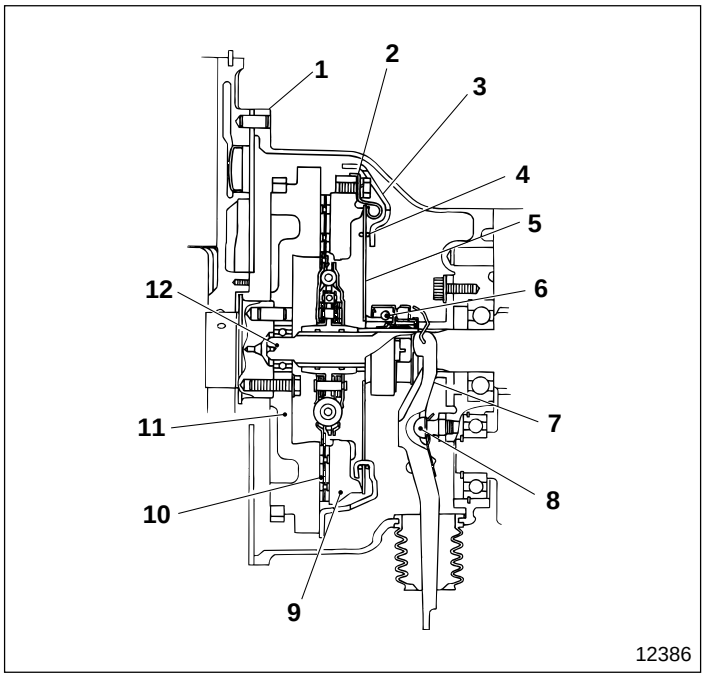


When clutch pedal is released

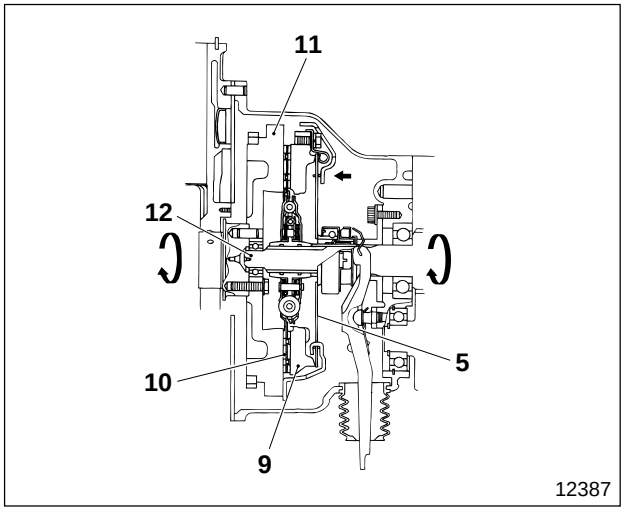
- As the clutch pedal is released, hydraulic pressure **B** from the power cylinder and return spring **2** push back piston **4**.
- At the same time, valve stem **1** is retracted by spring seat **5** and compresses valve spring **6** to open the fluid tank port.
- Thus released, hydraulic pressure **B** in the master cylinder returns piston **4** to its original position.

https://truckmanualshub.com/

Clutch Body

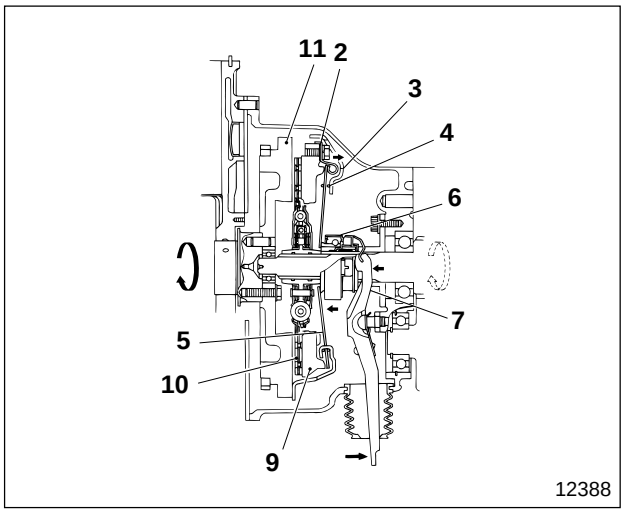


1 Clutch housing
2 Strap plate
3 Clutch cover
4 Pivot ring
5 Diaphragm spring
6 Clutch release bearing
7 Clutch release rocker arm
8 Rocker arm pivot
9 Pressure plate
10 Clutch disc
11 Flywheel
12 Drive pinion



When clutch pedal is released

- Pressure plate **9**, activated by diaphragm spring **5**, forces clutch disc **10** against flywheel **11**.
- Clutch disc **10** forced against flywheel **11** runs together with the flywheel and transmits power from the engine to transmission drive pinion **12**.



When clutch pedal is depressed

- Hydraulic pressure generated within the clutch master cylinder activates the power cylinder. This pushes out clutch release bearing **6** via clutch release rocker arm **7** to compress diaphragm spring **5**. The diaphragm spring supported by pivot ring **4** retracts pressure plate **9**, which is connected to clutch cover **3** via the strap plate **2**. The resulting clearance between clutch disc **10** and flywheel **11** cuts off the transmission of engine power.

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Clutch Fluid (Brake Fluid) Replacement and Air Bleeding

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bleeder screw	10.8 to 14.7 {8 to 11, 1.1 to 1.5}	—

Fluid

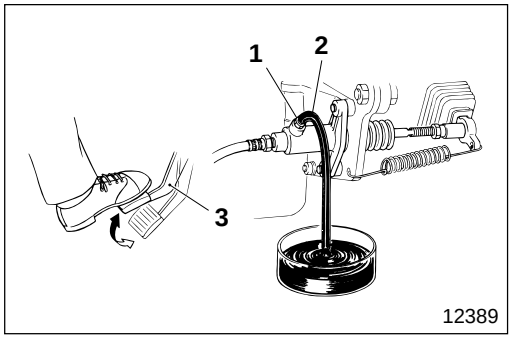
Location	Points of application	Kinds	Quantity
4	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

WARNING

- **The clutch fluid system and the brake fluid system use the fluid tank in common. Therefore, replacement the clutch fluid must be carried out simultaneously with that of the brake fluid. Gr 35**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in faulty clutch and brake operations.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oils.**

CAUTION

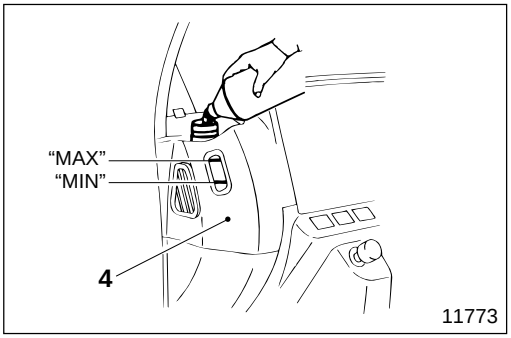
- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**



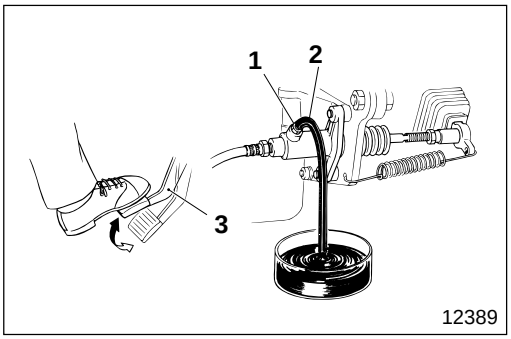
(1) Replacement of brake fluid

- Attach vinyl pipe **2** to bleeder screw **1** of the clutch power cylinder.
- Loosen bleeder screw **1** and depress clutch pedal **3** several times to drain brake fluid completely.

https://truckmanualshub.com/



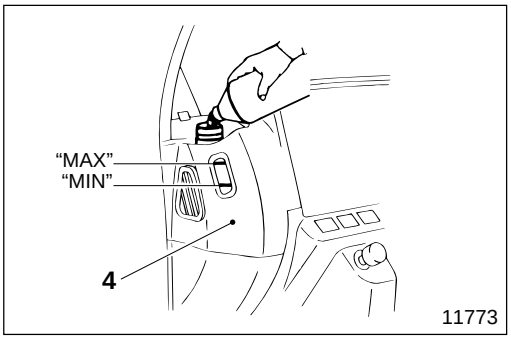
- Supply new brake fluid to the "MAX" level of fluid tank **4**. Depress clutch pedal **3** repeatedly until the old brake fluid discharged from vinyl pipe **2** is replaced by the new brake fluid.



(2) Air bleeding of clutch system

NOTE

Carry out this operation maintaining the brake fluid level in fluid tank 4 between "MAX" and "MIN".



- Attach vinyl pipe **2** to bleeder screw **1** of the clutch power cylinder as in the replacement procedure.
- Fill fluid tank **4** with brake fluid, and loosen bleeder screw **1** of the clutch power cylinder, then depress clutch pedal **3** continuously.
- Keep depressing clutch pedal **3**, and tighten bleeder screw **1** when air is bled completely.
- Depress clutch pedal **3** several times again, then keep it depressed at its fullest extent.
- With the clutch pedal depressed, loosen bleeder screw **1** to drain brake fluid containing air. Release the pedal after tightening the bleeder screw.
- Repeat this operation until air is no longer present in the fluid being drained.
- When this operation is completed, tighten bleeder screw **1** at specified torque.
- Check that brake fluid is at the "MAX" level of fluid tank **4**, and supply new brake fluid if necessary.
- Check for brake fluid leakage from each of the parts with clutch pedal **3** depressed.

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

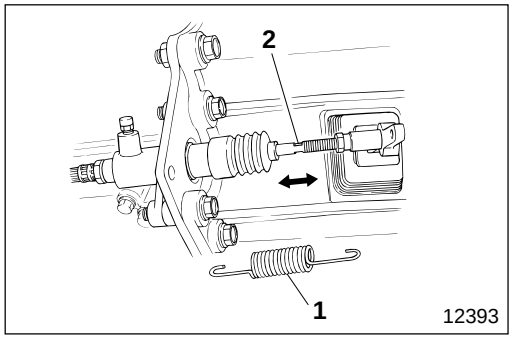
Clutch Pedal Free Play

Service standards

Unit : mm {in.}

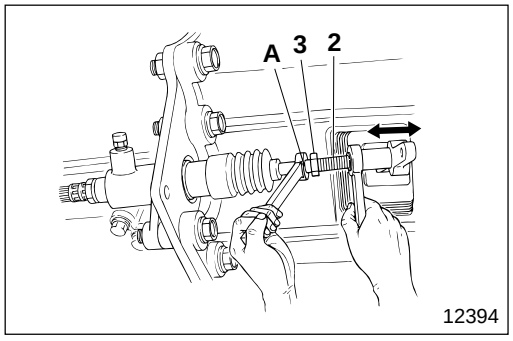
Location	Maintenance item	Standard value	Limit	Remedy
2	Push rod stroke	4 {0.16}	—	Adjust or replace
6	Clutch pedal free play	36 to 53 {1.42 to 2.09}	—	Adjust or replace

Inspect and adjust the free play of the clutch pedal, by noting the stroke of the clutch power cylinder push rod, after the clutch pedal has been correctly adjusted.



[Inspection]

- Bleed air from the clutch system P21-7
- Adjust the clutch pedal P21-11
- Disconnect return spring **1** and check the free play of push rod **2** by hand. If the measured value deviates from the standard value, adjust as follows:

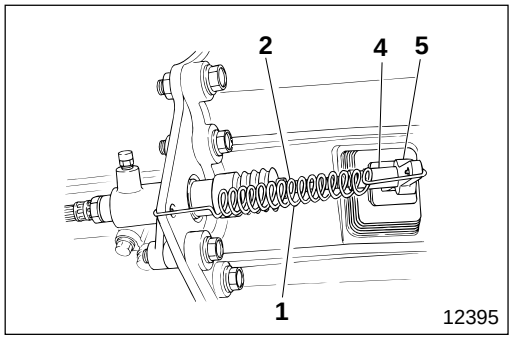


[Adjustment]

- Loosen nut **3** and turn flat parts **A** of push rod **2** to extend push rod until it stops.
- Then, return flat parts **A** of push rod **2** by the following value and retighten nut **3**.

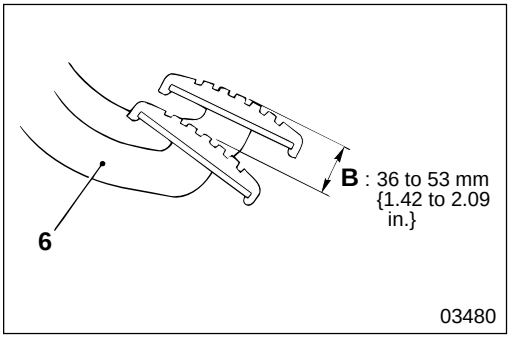
  Amount of return : Approximately three and one fifth of a turn

- If push rod **2** cannot be returned by the above amount, the clutch disc is worn beyond the limit and needs replacing.



- Install return spring **1**, and check that there is no space between push rod cap **4** and clutch release rocker arm **5** by moving push rod **2**.

https://truckmanualshub.com/



[Confirmation]
Push clutch pedal **6** with your hand until you feel a resistance and measure free play **B**.
If the measured value deviates from the standard value, readjust or replace the clutch disc.

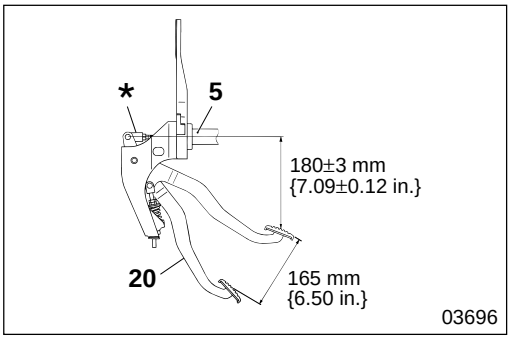
15	External surface of collar	Chassis grease [NLGI No.1 (Ca soap)]	As required

https://truckmanualshub.com/

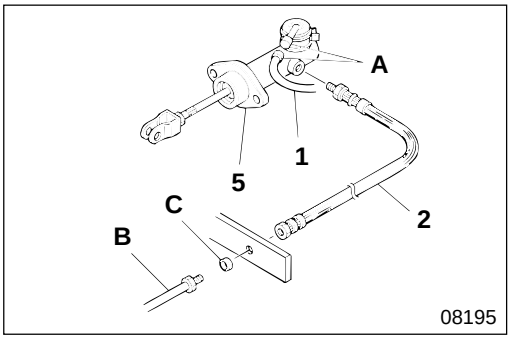
◆ Service procedure



● Adjustment after assembly

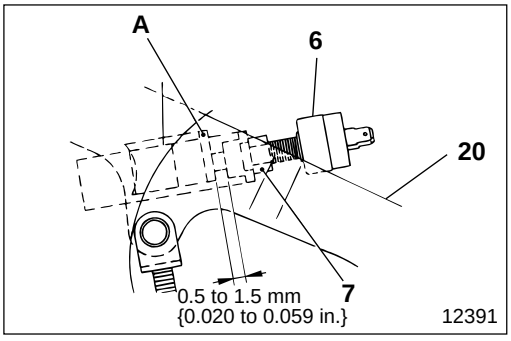
Adjustment of clutch pedal

Adjust clevis * of clutch master cylinder **5** so that clutch pedal **20** is installed as illustrated. 🕮 P21-13



1 **2** **Removal and installation of fluid hose**

- Remove fluid hose **1** from the fluid tank and clutch master cylinder **5**, and fit stopper **A** after draining is completed.
- Remove fluid hose **2** from clutch master cylinder **5** after removing pipe **B** from the cab, then fit stopper **C** to pipe **B**.
- After installation, bleed the system. 🕮 P21-7

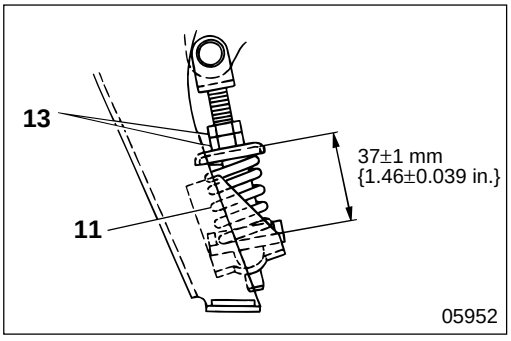


6 **Installation of clutch switch**

After adjusting clutch pedal **20**, adjust the clearance between the thread end of clutch switch **6** and pedal stopper **A** so that it is within the standard value, and tighten lock nut **7**.

CAUTION⚠

Do not allow the thread end of clutch switch 6 to come into contact with pedal stopper A of clutch pedal 20 because this will cause the clutch to slip.



11 **Adjustment of return spring installation length**

Adjust return spring **11** to the installed length as illustrated using lock nut **13**.

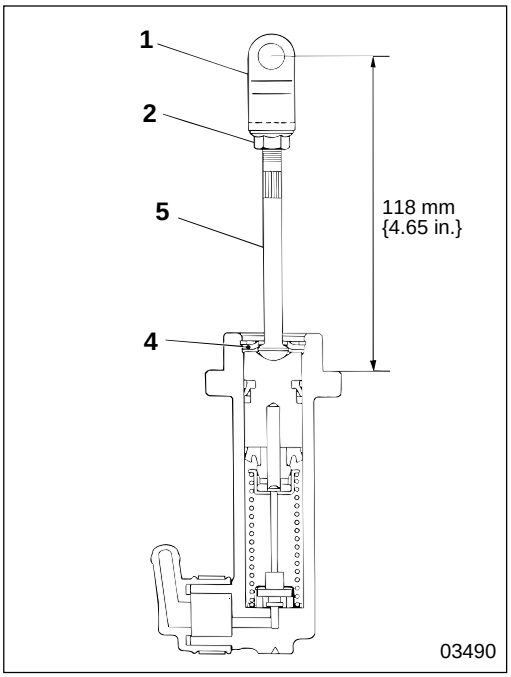
9, 10	Friction surfaces of piston assembly and cylinder body	Rubber grease	0.2 to 0.3 g {0.0071 to 0.011 oz}

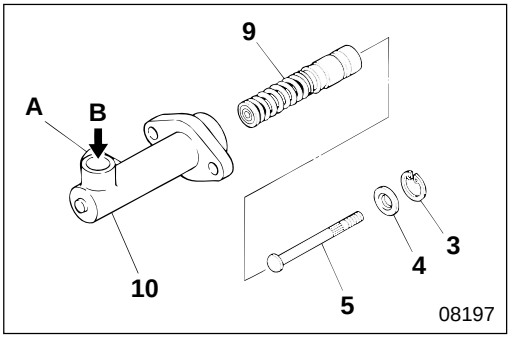
https://truckmanualshub.com/

◆ Service procedure



1 **2** **5** **Adjustment of push rod length**

- If the length, as illustrated, deviates from the specified value, loosen nut **2**, and adjust the length of push rod **5** by turning clevis **1**.
- Measure the length while push rod **5** is touching stop plate **4**.
- After adjustment, tighten nut **2** at specified torque.



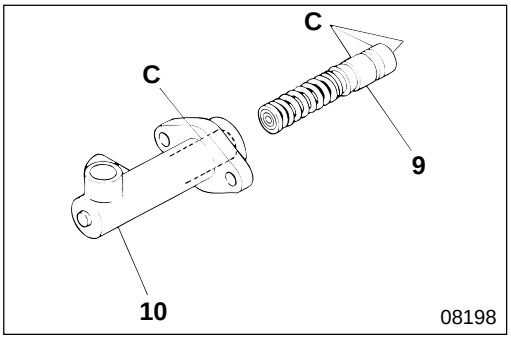
9 **Piston assembly**

[Removal]

- Remove retaining ring **3**, stop plate **4** and push rod **5**.
- Block port **A** of cylinder body **10**, and apply compressed air from **B** as illustrated to remove piston assembly **9**.

WARNING⚠

You must apply compressed air gradually when you remove piston assembly 9. If you applied compressed air strongly at one time, the piston assembly would be violently ejected.



[Installation]

Before installing the assembly, apply rubber grease to friction surface **C** of piston assembly **9** and cylinder body **10**.

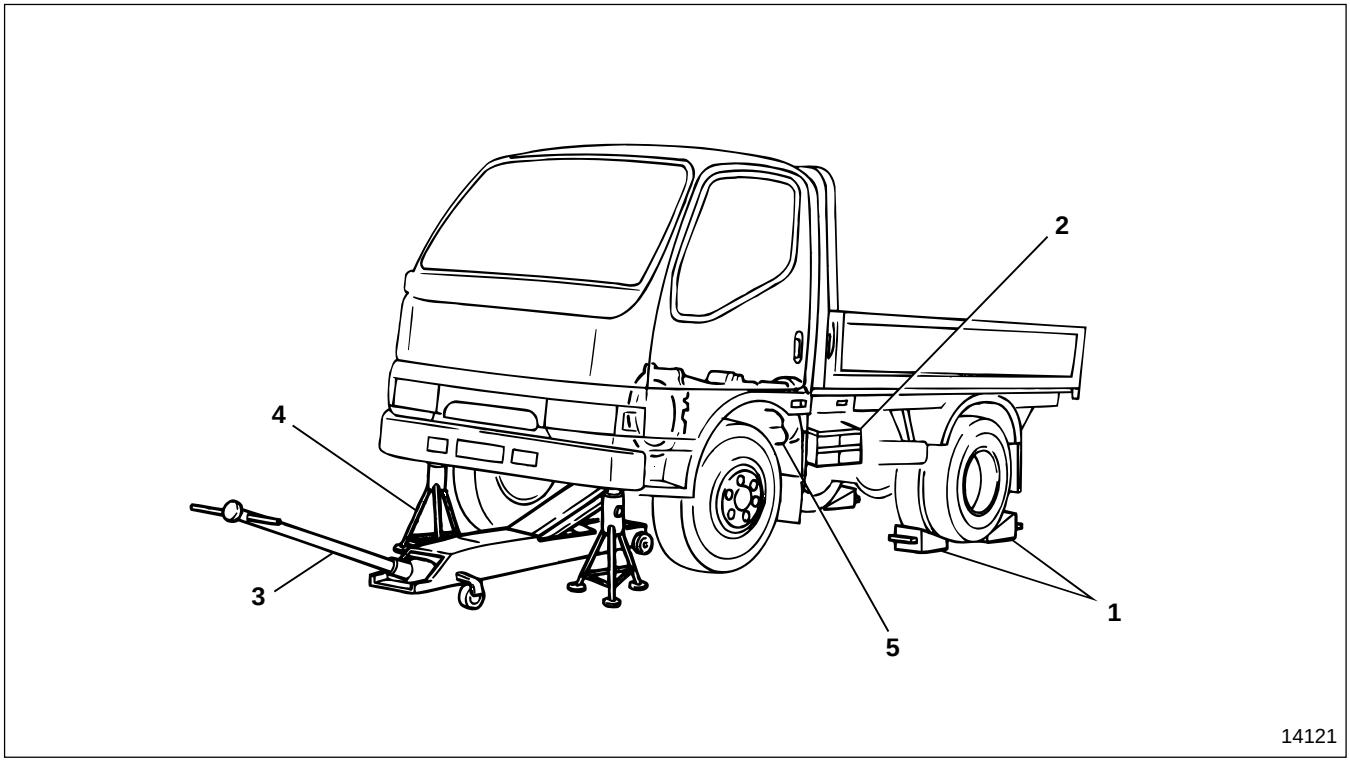
WORK BEFORE REMOVAL AND INSTALLATION OF CLUTCH BODY



● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect the negative battery cable. Gr 54
3 Jack up the front axle using a garage jack.
4 Support the front frame on rigid racks.
5 Remove the transmission. Gr 22

WARNING⚠

- **Since the parking brake will be removed, naturally it cannot be used. Therefore, you must chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION⚠

Keep the transmission in neutral throughout the operation.

● **Work sequence after installation**

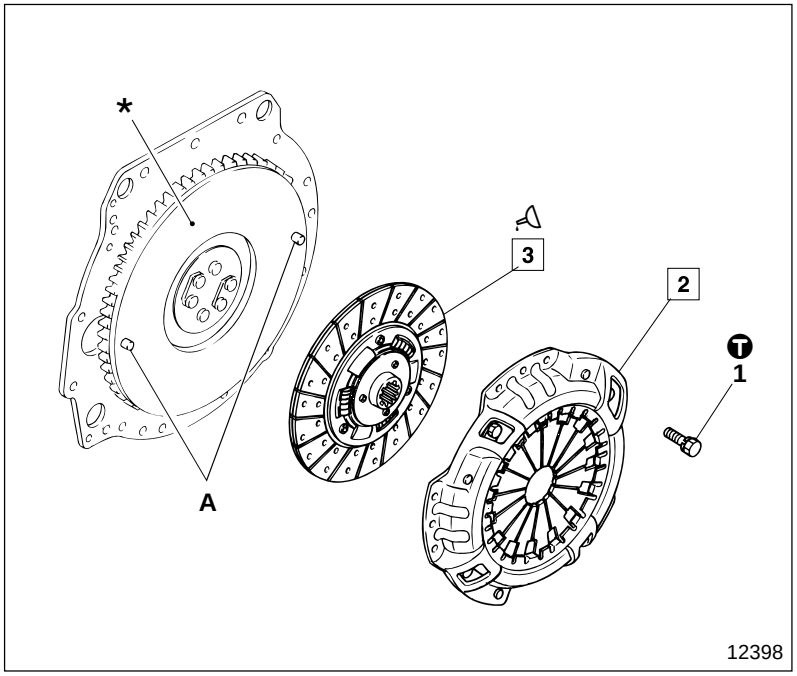
Follow the work sequence before removal in reverse.

https://truckmanualshub.com/

MEMO

https://truckmanualshub.com/

CLUTCH BODY



● **Removal sequence**

1 Bolt
2 Clutch cover assembly
3 Clutch disc

***** : Flywheel Gr 11
A : Positioning pins (two points)

WARNING

Be careful when you handle pressure plate and lever assembly 2 because it is rather heavy.

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION

Be careful not to get oily substances on clutch disc 3 surfaces because this will cause the clutch to slip.

Service standards

Lubricant

Location	Points of application	Kinds	Quantity
3	Spline of clutch disc	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	3.2 to 4.2 g {0.11 to 0.15 oz}

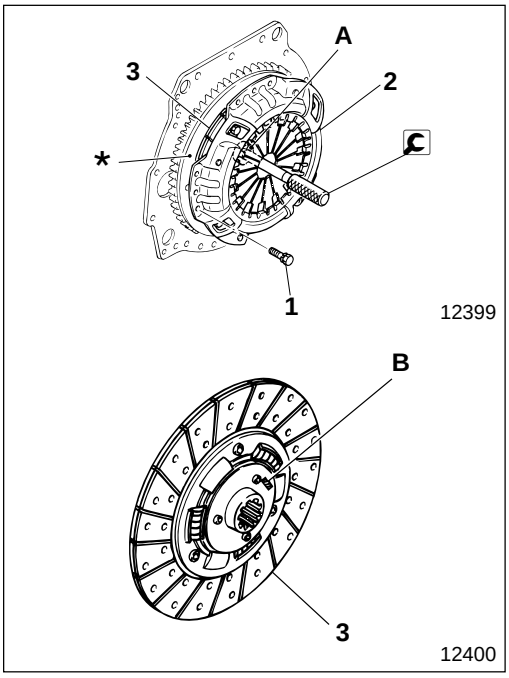
https://truckmanualshub.com/

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
2, 3	Clutch alignment arbor 	MH061387	Holding of clutch disc
	Sleeve 	MH061425	Inspection of installed height of diaphragm spring
	Plate 	MH061424	Adjustment of diaphragm spring
	Adjust wrench 	MH061426	Adjustment of diaphragm spring

◆ Service procedure



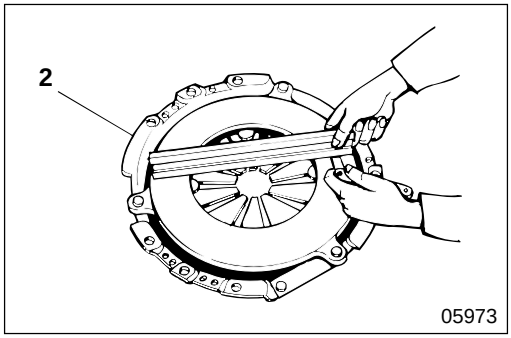
2 Clutch cover assembly

[Removal]

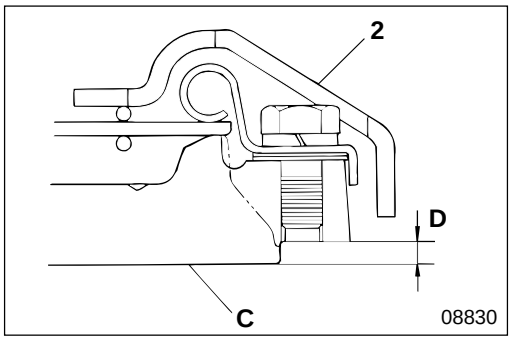
- Insert clutch alignment arbor into pilot bearing **A** on flywheel * to hold clutch disc **3**, and remove clutch cover assembly **2**.
- For installation, follow the removal sequence in reverse.
- Install clutch disc **3** so that part No. B is visible.
- Tighten bolts **1** gradually, in diagonal order, to specified torque.

https://truckmanualshub.com/

CLUTCH BODY

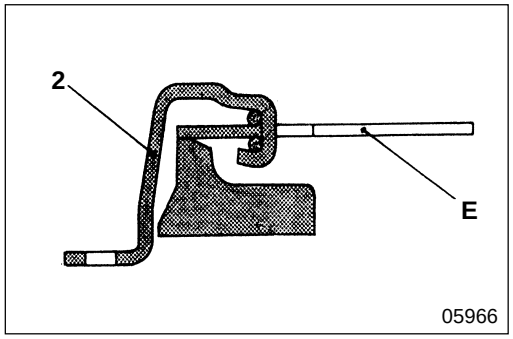


[Flatness of pressure plate]
If the measured value is higher than the limit, replace clutch cover assembly **2**.

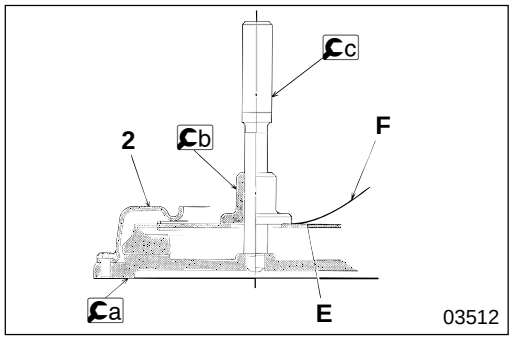


[Friction surface of pressure plate]
Measure pressure plate friction surface **C** at specified position **D** (measuring position of friction surface must be within the maximum and minimum diameters), and if the measured value is lower than the limit, replace clutch cover assembly **2**.

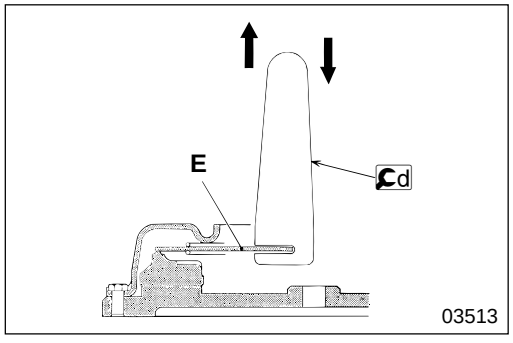
Maximum diameter	298 mm {11.7 in.}
Minimum diameter	192 mm {7.56 in.}



[Inspection]
- Check for play in diaphragm spring **E**.
- If there is play, replace clutch cover assembly **2**.

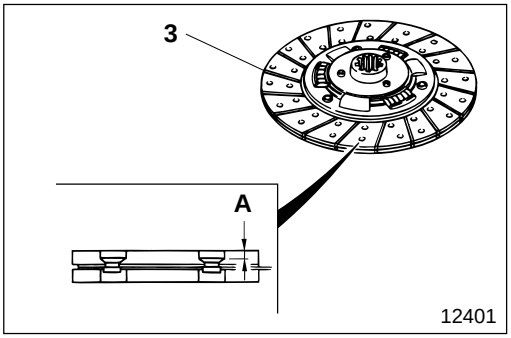


[Inspection of installation height]
- Place a plate on a surface plate and install clutch cover assembly **2**.
- Install b sleeve and c clutch alignment arbor, measure finger heights of diaphragm spring **E** to see if they are uneven, using feeler gauge **F**. If the measured value is higher than the limit, correct the heights.



[Correction]
- Correct uneven finger heights of diaphragm spring **E** using d adjust wrench.

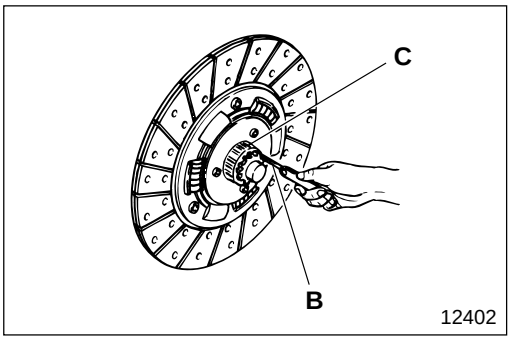
https://truckmanualshub.com/



3 Clutch disc

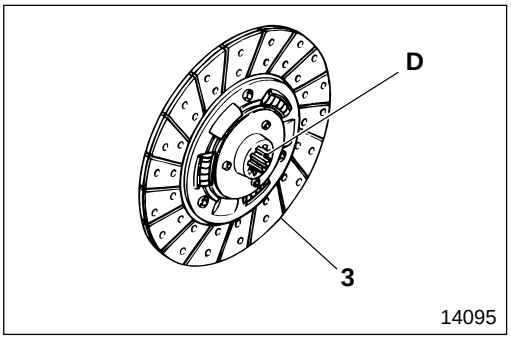
(1) Height of facing

Measure dimension **A** of clutch disc **3**. If the measured value is lower than the limit, replace the clutch disc.



(2) Play in direction of revolution

- Reshape feeler gauge **B** for insertion into drive pinion spline **C**, and measure play. If the measured value is higher than the limit, replace clutch disc **3** or the drive pinion.
- Carry out the same measurement on new clutch disc **3**. If the measured value is higher than the limit, replace the drive pinion.



(3) Applying grease

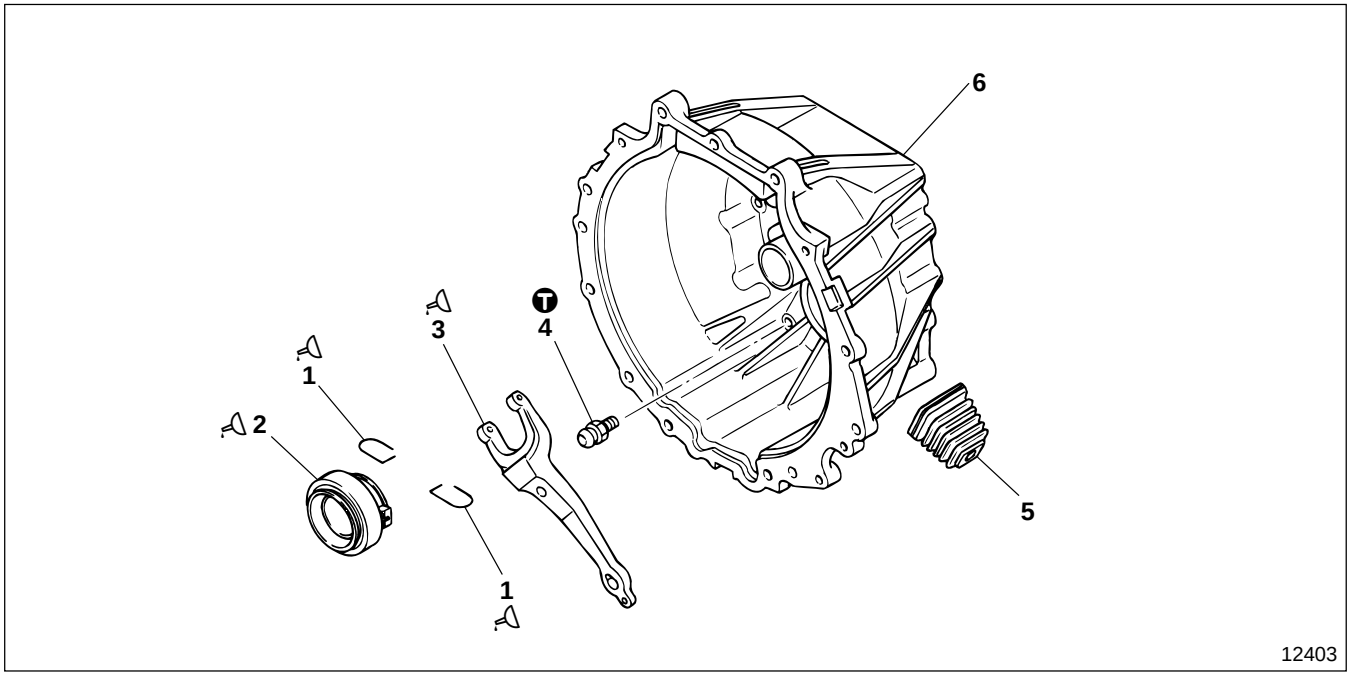
Apply grease evenly to spline **D** entire tooth surface of clutch disc **3**. Apply grease to the grease groove of the spline up to its large diameter.

CAUTION⚠

Be careful not to apply too much grease because excessive grease causes grease leakage from spline D and makes the clutch slippery.

https://truckmanualshub.com/

CLUTCH CONTROL



● **Disassembly sequence**

1 Return spring
2 Clutch release bearing
3 Clutch release rocker arm
4 Rocker arm pivot
5 Clutch rocker arm cover
6 Clutch housing

NOTE

Do not remove rocker arm pivot 4 unless it is faulty.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Ⓣ Tightening torque

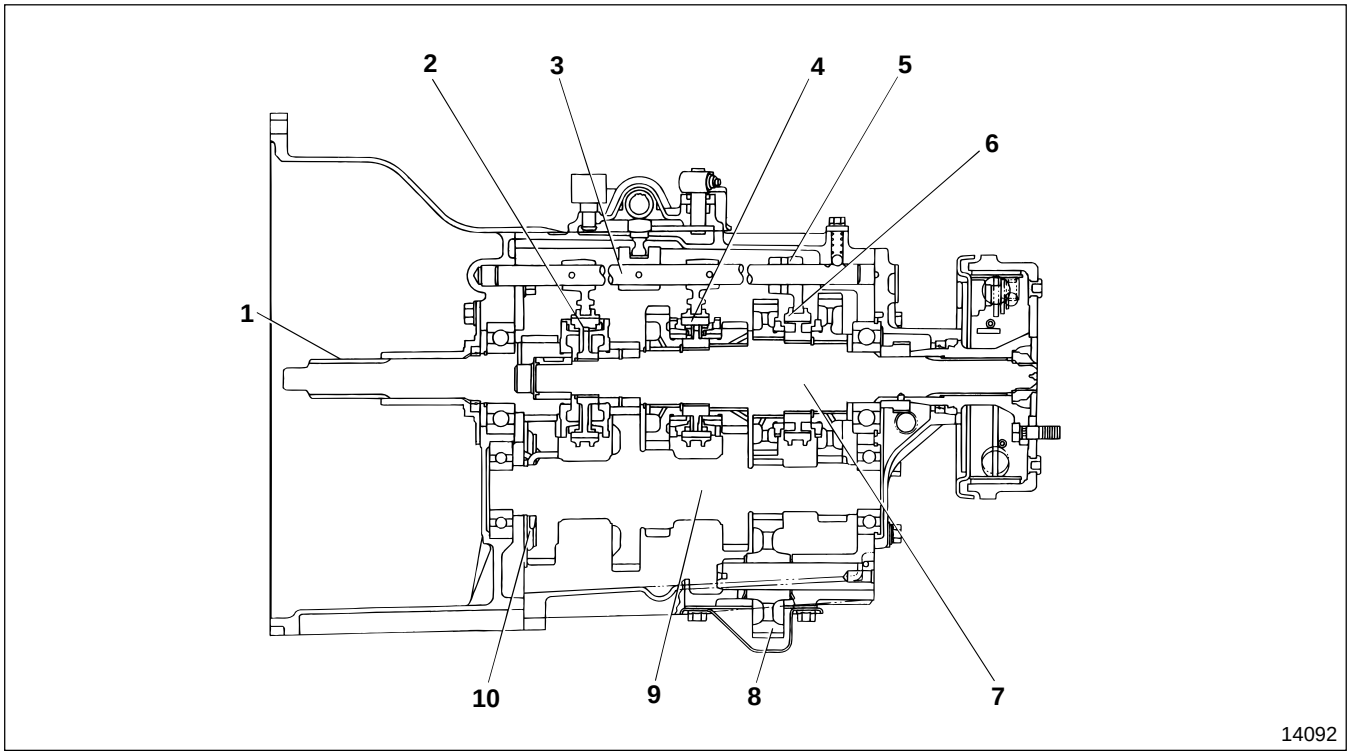
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Item		Specifications
Mode of control		Floor shift remote control
Transmission model		M035S5
Gear ratio	1st	5.380
	2nd	3.028
	3rd	1.700
	4th	1.000
	5th	0.722
	Reverse	5.380
Oil capacity L {qts}		Approximately 3.1 {3.3}
Mass kg {lb}		Approximately 100 {220}

STRUCTURE AND OPERATION

Transmission Assembly

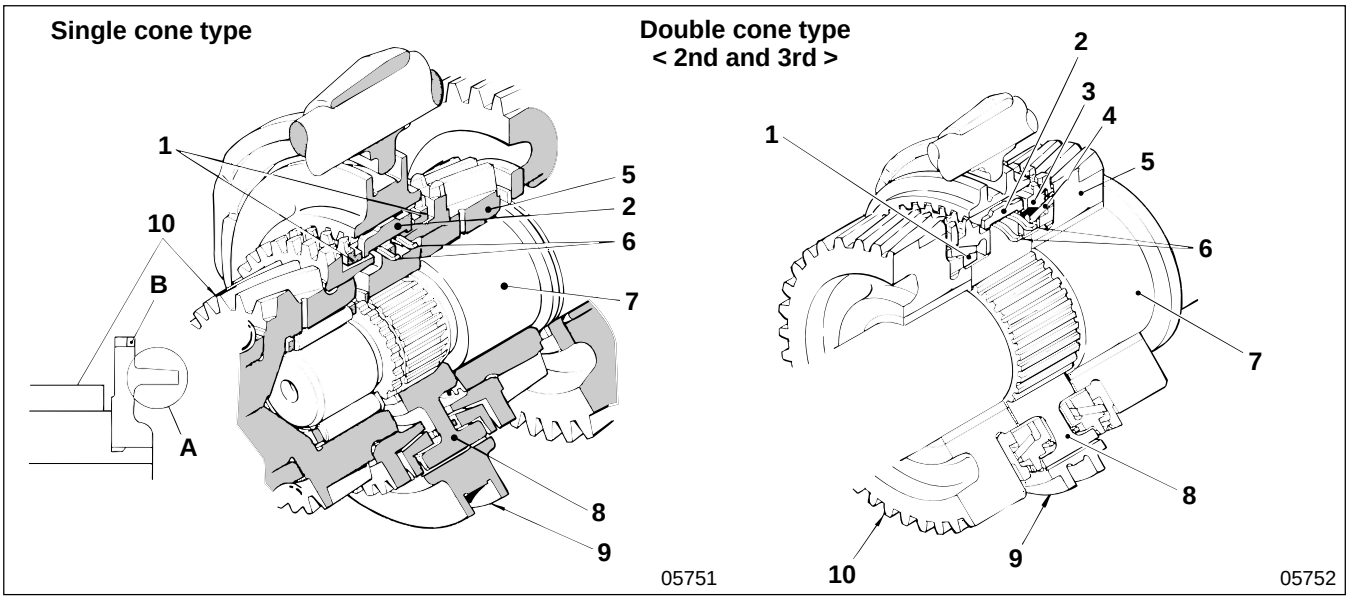


1 Drive pinion
2 4th and 5th synchronizer assembly
3 Shift rail
4 2nd and 3rd synchronizer assembly
5 Shift fork
6 1st and reverse constant-mesh assembly
7 Main shaft
8 Reverse idler gear
9 Countershaft
10 Non-backlash mechanism

The transmission changes revolution and torque generated by the engine into those that match the vehicle's power requirement (driving force). Revolution and torque are increased or decreased by making a selection from several sets of engaged gears. The transmission uses an interlock mechanism to avoid double engagement and the non-backlash mechanism reduces the idling noise of the transmission when the engine is idling.

https://truckmanualshub.com/

Synchromesh Mechanism



1 Synchronizer ring (Single cone type)
Inner synchronizer ring (Double cone type)
2 Shifting key
3 Outer synchronizer ring (Double cone type)
4 Center cone (Double cone type)
5 Overdrive gear (Single cone type)
3rd gear (Double cone type)
6 Shifting key spring
7 Mainshaft
8 Synchronizer hub
9 Synchronizer sleeve
10 Drive pinion (Single cone type)
2nd gear (Double cone type)

A : Taper cone
B : Dog clutch

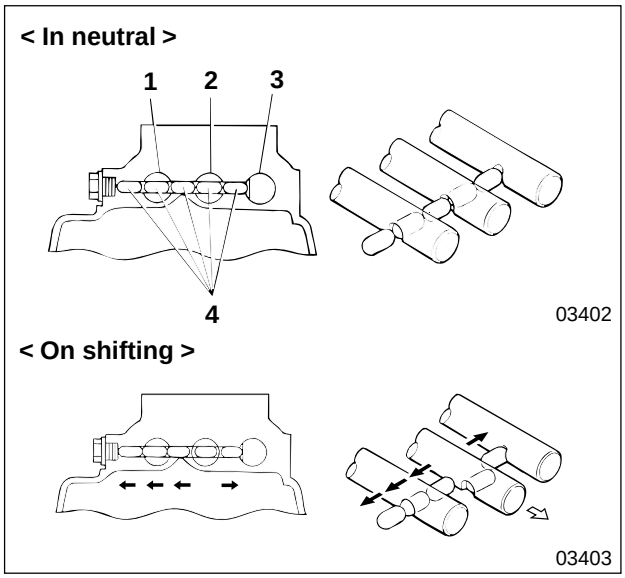
The synchromesh mechanism synchronizes the rotating speed of mainshaft **7** and associated synchronizer hub **8** with the rotating speed of the gears to be selected when shifting gear.

Single cone type
In this cone type, gear taper cone **A** acts as a cone clutch for synchronization with synchronizer ring **1**. So the rotating speed of the gear to be synchronized with synchronizer hub **8** gradually changes to the matching speed. When synchronizer sleeve **9** moves into the appropriate position efficiently through this process and engages with the synchronizer hub and dog clutch **B** of the gear to be selected, gear shift is completed.

Double cone type < only for 2nd and 3rd gear >
In this cone type, unlike the single cone type, inner synchronizer ring **1**, center cone **4** and outer synchronizer ring **3** are used instead of just the synchronizer ring. The center cone is between the inner synchronizer ring and the outer synchronizer ring and reduces synchronizing time through more efficient operation of the cone clutch.

https://truckmanualshub.com/

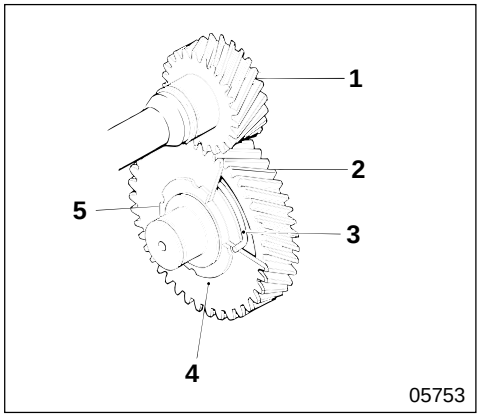
Interlock Mechanism



1 4th and 5th shift rail
2 2nd and 3rd shift rail
3 1st and reverse shift rail
4 Interlock pin

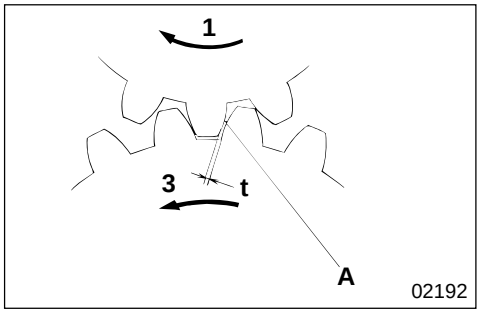
The interlock mechanism is designed to avoid double engagement of gears. When 2nd and 3rd shift rail **2** is shifted, interlock pins other than interlock pin **4** in the 2nd and 3rd shift rail are pushed by the 2nd and 3rd shift rail to lock other shift rails.

Non-Backlash Mechanism

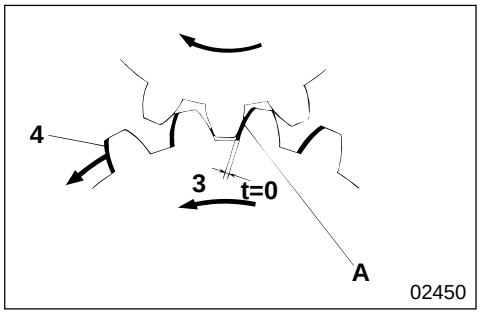


1 Drive pinion
2 Countershaft constant mesh gear
3 Sub-gear spring
4 Sub-gear
5 Sub-gear plate

Sub-gear spring **3** is between sub-gear **4** and countershaft constant mesh gear **2**. The sub-gear is engaged with drive pinion **1** together with countershaft constant mesh gear, being turned in the contracting direction of the sub-gear spring.



The revolution of drive pinion **1** varies in accordance to the engine revolution when idling.
Without a non-backlash mechanism, backlash **t** at point **A** would vary between zero to the maximum, causing a gear grinding noise.



With a non-backlash mechanism, sub-gear **4** maintains backlash **t** at zero at point **A** regardless of change in revolution caused by the engine, eliminating gear grinding noise, resulting in a reduction of idling noise.

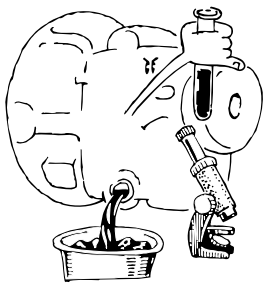
◆ Service procedure



01116

● **Replacement of oil**

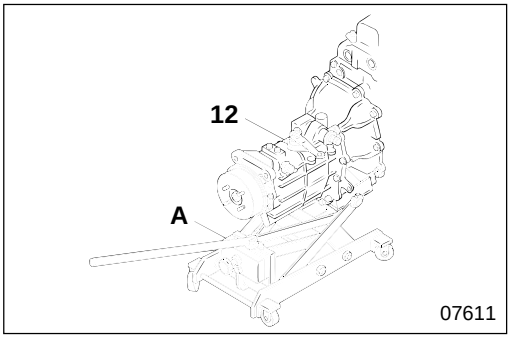
[Draining]

- When draining oil, check the quantity and quality of oil, especially for small pieces of metal and metal dust.
- Clean drain plug **10** before reinstalling it because it is magnetic.

[Filling]

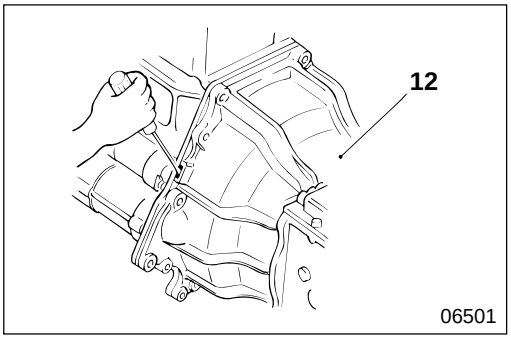
- Check that drain plug **10** is tightened in the transmission case at specified torque.
- Pour in gear oil until the oil overflows from the inspection hole. (For oil quantity, see specifications.)

https://truckmanualshub.com/



12 Transmission assembly

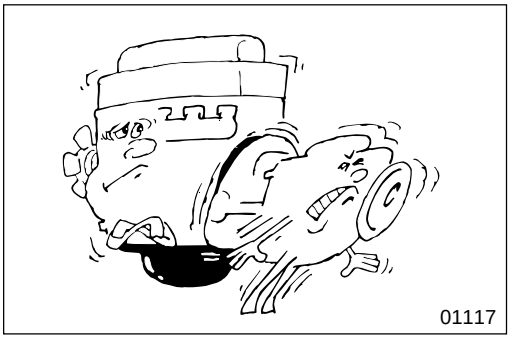
[Supporting transmission]
Support transmission assembly **12** on transmission jack **A**.



[Removal]
- Insert a screwdriver into the three removal grooves to remove transmission assembly **12** from the engine.

CAUTION

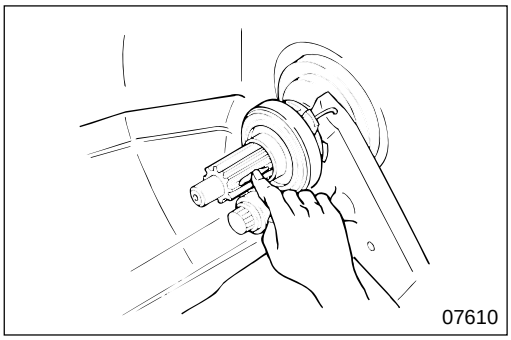
Make sure that you remove hoses and cables correctly during service operations.



- Move transmission assembly **12** backward until the spline of the drive pinion is detached from the clutch.

CAUTION

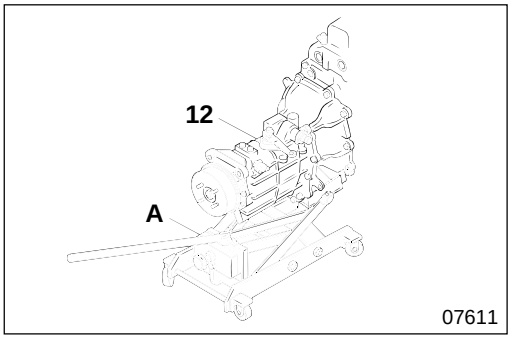
Make sure that you pull transmission assembly 12 out in a straight line. If you seesaw the transmission assembly violently, you will damage the spline that connects the drive pinion and the clutch.



[Installation]
- Check the spline of the drive pinion for rust. If rust is found, remove it using a wire brush.
- Rub grease onto the friction surfaces of the drive pinion using your hand.

CAUTION

Make sure that you apply only the necessary amount of grease because too much grease would drip and cause clutch slip.



- Support transmission assembly **12** on transmission jack **A**, and insert the transmission assembly into the pilot bearing of the flywheel paying attention to the drive pinion spline.
- Tighten bolt **11** at specified torque to mount transmission assembly **12** to the engine.

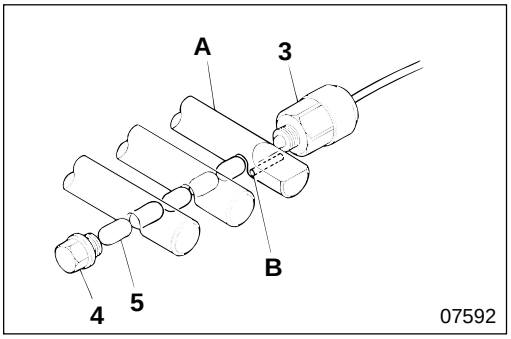
7	Contact surface of transmission case	THREEBOND 1215	As required

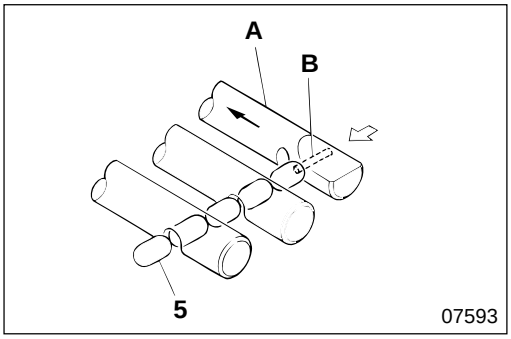
https://truckmanualshub.com/

◆ Service procedure



5 **Removal of interlock pin**

- 1st and reverse shift rail **A** is provided with hole **B** (ø3 mm {0.12 in.}) for the removal of interlock pin **5**.



- When 1st and reverse shift rail **A** is shifted into reverse, hole **B** for removal of the interlock pin aligns with the interlock pin holes of the other shift rails, backup lamp switch **3** installation hole and screw plug **4** hole.
- Remove interlock pin **5** from back-up lamp switch **3** installation hole side using a wire.

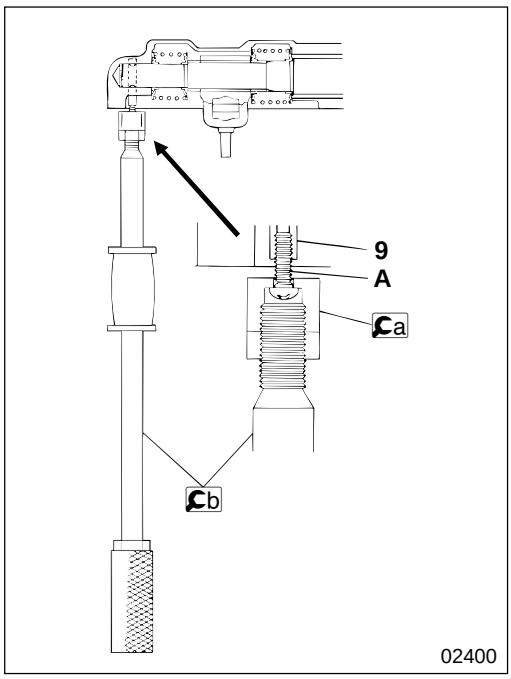
	Reverse shaft puller  02118	03726-82000	

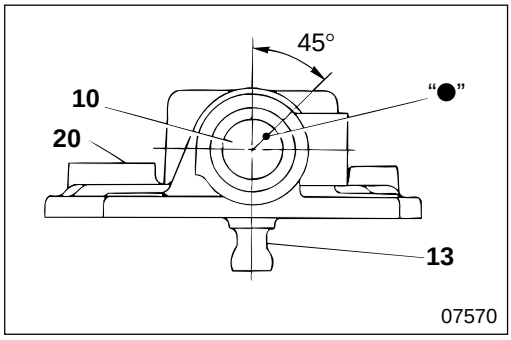
https://truckmanualshub.com/

◆ Service procedure



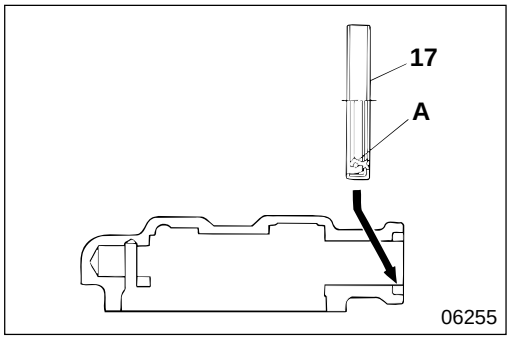
9 **Removal of spring pin**

- Tap spring pin **9** using an M4 tap.
- Attach a spring pin puller with an M4 screw **A** of appropriate length, and pull out spring pin **9** using b reverse shaft puller.



10 **13** **Installation of torsion shaft and gear shift slide lever**

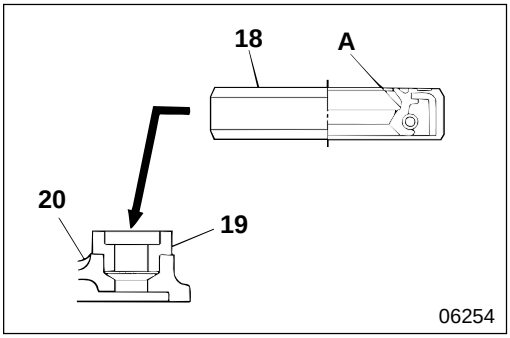
When you install torsion shaft **10**, position punch mark "●" on the tip of the torsion shaft end and gear shift slide lever **13** as illustrated.



17 **Installation of oil seal**

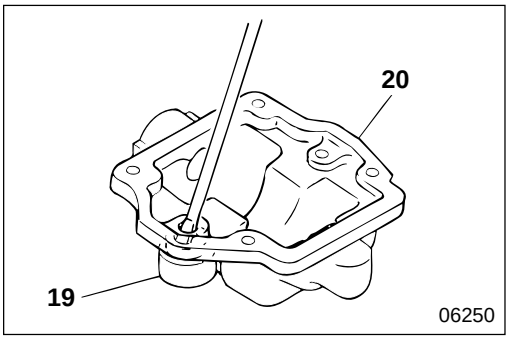
Apply grease to lip area **A** of oil seal **17**, and press-fit evenly in the direction as illustrated.

https://truckmanualshub.com/



18 Installation of oil seal

Apply grease to lip area **A** of oil seal **18** with bushing **19** press-fitted onto selector lever case **20**, and press-fit evenly in the direction as illustrated.

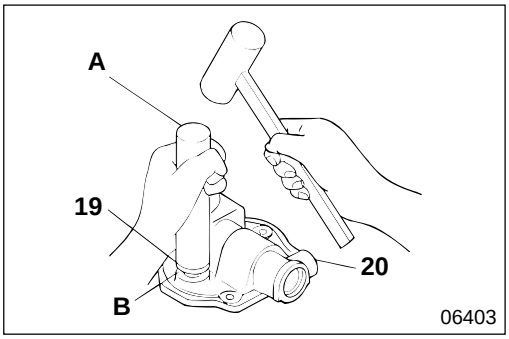


19 Bushing

[Removal]
Bushing **19** is press-fitted onto selector lever case **20**. For replacement, remove using a screwdriver.

CAUTION⚠

Be careful not to damage selector lever case 20.



[Press-fitting]
Clean the inner surface of selector lever case **20**, and drive bushing **19** evenly into the case using bar **A** (approximately ø30 mm {1.18 in.}) taking care not to damage the case.
After press-fitting, apply sealant to bushing outer side **B**.

CAUTION⚠

Make sure that you prevent sealant from sticking to the inner surface of bushing 19.

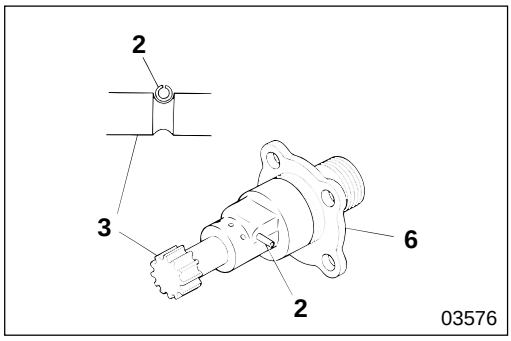
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
8	Oil seal installer 	MH062691	Installation of rear cover oil seal
15	Reverse shaft puller 	03726-82000	Removal of reverse idler gear shaft

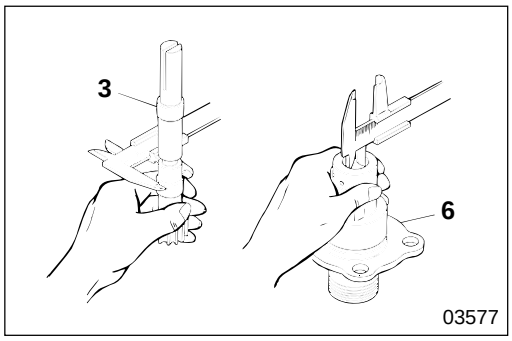
https://truckmanualshub.com/

◆ Service procedure



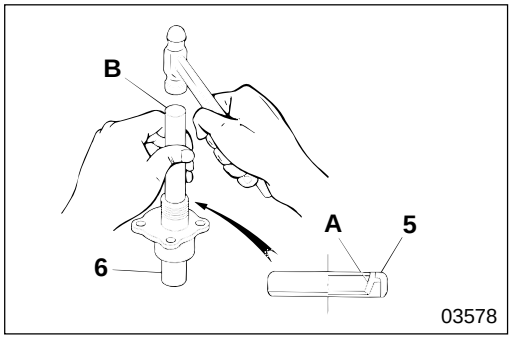
2 **Driving-in spring pin**

Drive spring pin **2** into speedometer gear bushing **6** with the opening in the opposite direction to speedometer gear **3**, as illustrated.



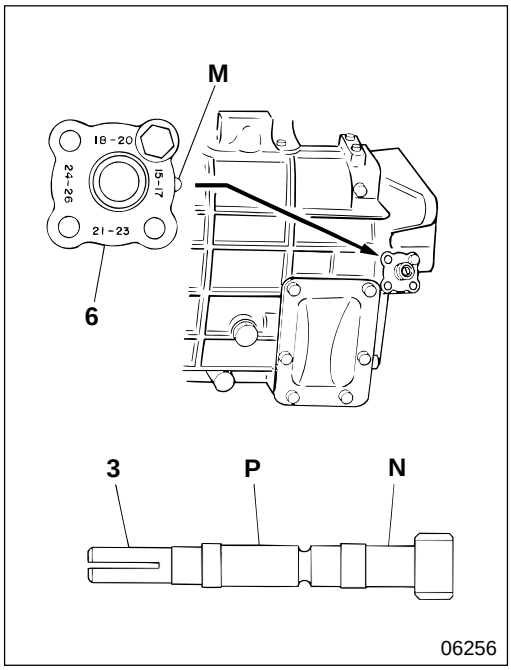
3 **6** **Clearance between speedometer gear and speedometer gear bushing**

If the clearance is higher than the limit, replace faulty parts.



5 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **5**, and drive oil seal evenly into speedometer gear bushing **6** in the direction as illustrated using bar **B** (approximately ø14 mm {0.55 in.}).

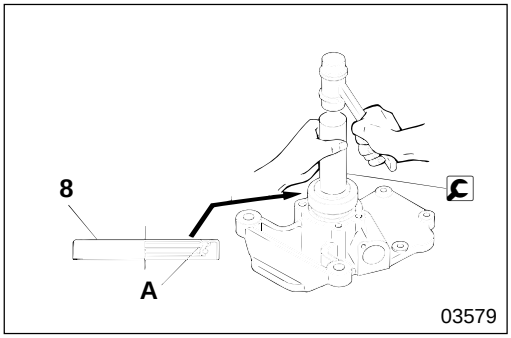


6 **Installation of speedometer gear bushing**

Due to its eccentric center arrangement, speedometer gear bushing **6** allows replacement of speedometer gear **3** with gears having a different number of teeth by changing only the installation direction, the worm gear does not have to be changed.
When installing the bushing, align stamped number, identical to the number of speedometer gear teeth, with alignment mark **M**.
The identification mark is stamped on points **N** or **P**. The following table shows the relationship between the identification marks and the number of speedometer gear teeth:

Identification mark	A	B	C	D	L	E	F	G	H	I	J	K
Number of teeth	15	16	17	18	19	20	21	22	23	24	25	26
Gear ratio	3.0	3.2	3.4	3.6	3.8	4.0	4.2	4.4	4.6	4.8	5.0	5.2

https://truckmanualshub.com/



8 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **8**, and press-fit it.

https://truckmanualshub.com/

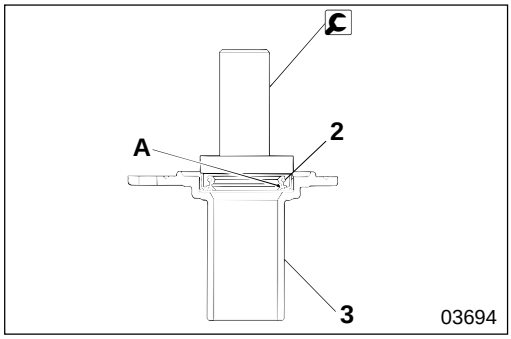
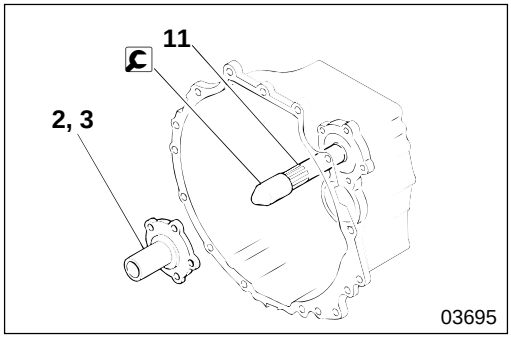
10, 11, 12	Steel lifting band 	MH063311	Removal and installation of countershaft assembly, drive pinion assembly and mainshaft assembly
	Eye nut 	MH063308	
11, 12	Synchro guard 	MH063318	Prevention of synchronizer sticking when driving-in mainshaft

◆ Service procedure



2 **Installation of oil seal**

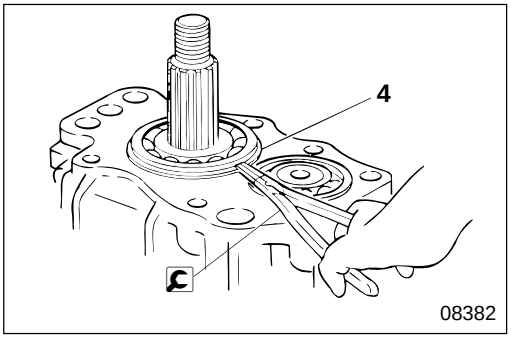
Apply grease to lip area **A** of oil seal **2**, and press-fit into front bearing retainer **3**.



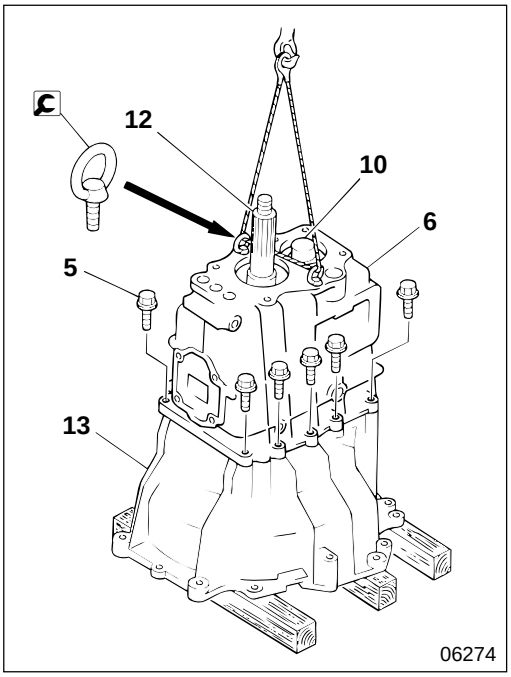
3 **Installation of front bearing retainer**

Install oil seal guide onto drive pinion **11** to protect oil seal **2** installed on front bearing retainer **3**. Then install the front bearing retainer.

https://truckmanualshub.com/

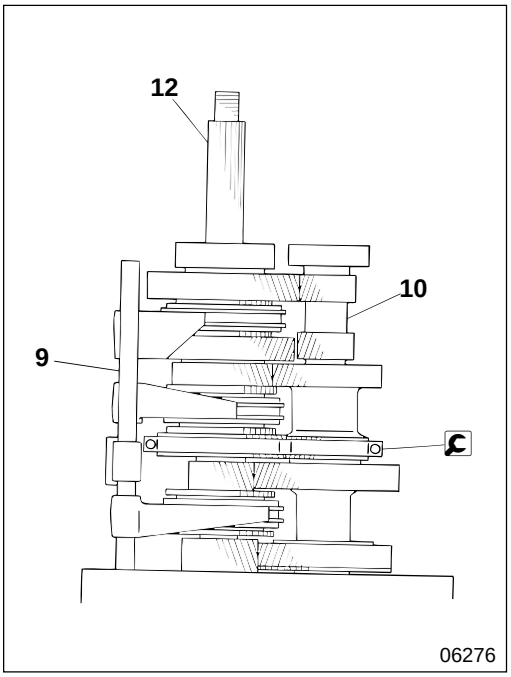


4 Removal and installation of snap ring



6 Removal of transmission case

- When lifting up with a crane, install 🔧 eye bolts on transmission case **6** and pass a steel sling through them.
- After removing bolt **5**, lift transmission case **6** up with a crane and keep hitting the rear ends of clutch housing **14**, mainshaft assembly **12** and countershaft assembly **10** to remove the transmission case.



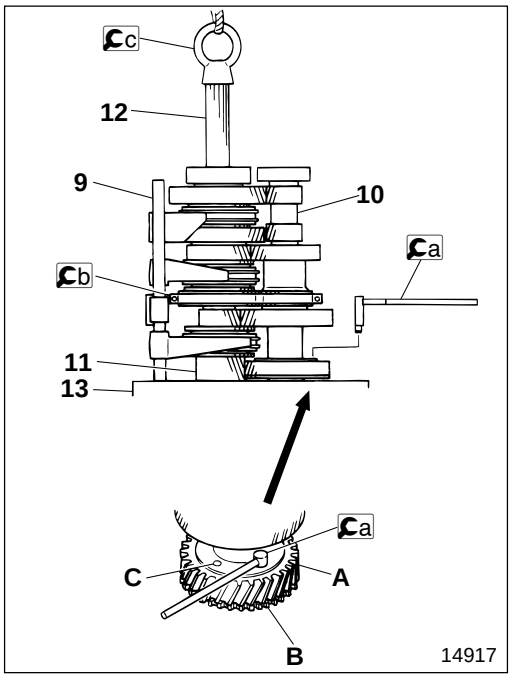
- After removing transmission case **6**, fit the 2nd gear using 🔧 steel lifting band to ensure safety.

CAUTION ⚠

Be sure to tighten 🔧 steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.

https://truckmanualshub.com/

TRANSMISSION BODY



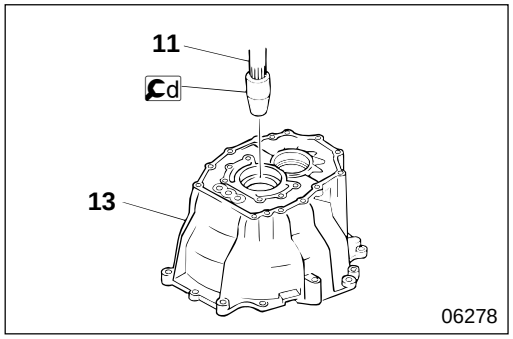
9 to 12 Removal and installation of shift rail and shift fork, countershaft assembly, drive pinion assembly and mainshaft assembly

[Removal]

- When removing or installing shift rail and shift fork **9**, countershaft assembly **10**, drive pinion assembly **11** and mainshaft assembly **12**, handle them as a group.
- Insert a set pin into alignment hole **C** of countershaft constant mesh gear **A** to hold sub-gear **B**.
- After removing the case, install c eye bolt on mainshaft assembly **12** with b steel lifting band fitted so that the whole assembly can be lifted up.
- Fix shift rail and shift fork **9** to mainshaft assembly **12** using rubber bands.
- Attach wooden blocks to clutch housing **13**. Then lift the whole assembly (with drive pinion assembly **11**) up with a crane to remove them. During hoisting, hit the assembly using a mallet.

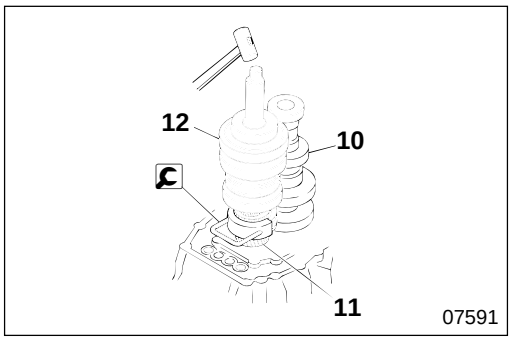
CAUTION

- **Be sure to tighten b steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.**
- **Be sure that you support mainshaft assembly 12, etc. with your hand when lifting them because if the mainshaft assembly and countershaft assembly 10 become detached, drive pinion assembly 11 would fall.**



[Installation]

- Follow the removal sequence in reverse.
- Before installing parts, install d oil seal guide onto drive pinion **11** to prevent damage to oil seal **2** of front bearing retainer **3**.



- To drive-in drive pinion **11**, mainshaft assembly **12** and countershaft assembly **10**, attach synchro guard which prevents the drive pinion and the mainshaft synchronizer sticking during installation.

NOTE

Remember to remove all special tools after use.

https://truckmanualshub.com/

2 4th and 5th shift fork
3 Spring pin
4 4th and 5th shift rail jaw
5 4th and 5th shift rail
6 Spring pin
7 2nd and 3rd shift fork
8 Spring pin
9 2nd and 3rd shift rail jaw
10 2nd and 3rd shift rail
11 Spring pin
12 1st and reverse shift fork
13 Spring pin
14 1st and reverse shift rail jaw
15 1st and reverse shift rail

***1** : Mainshaft assembly
***2** : Countershaft assembly
⊗ : Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

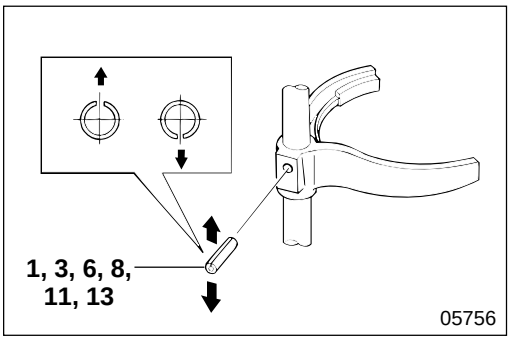
Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2, 7, 12	Shift fork claw tilt	0.1 {0.0039} or less	0.2 {0.0079}	Replace
2, 7, 12, *1	Clearance between shift fork and synchronizer sleeve	0.3 to 0.6 {0.012 to 0.024}	1.0 {0.039}	Replace
5, 10, 15	Deflection of shift rail	0.04 {0.0016} or less	0.05 {0.0020}	Correct or replace

https://truckmanualshub.com/

◆ Service procedure

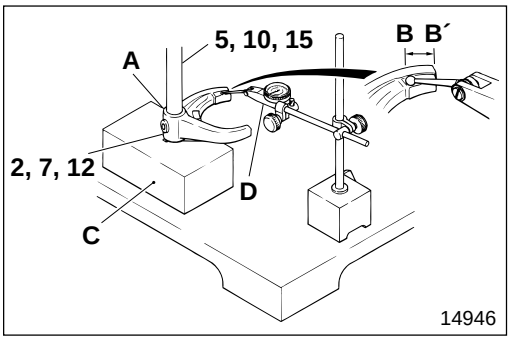


1 **3** **6** **8** **11** **13** **Driving-in spring pin**

For installation of spring pins **1**, **3**, **6**, **8**, **11**, **13**, position the openings in the direction of the shift rail axes.

CAUTION

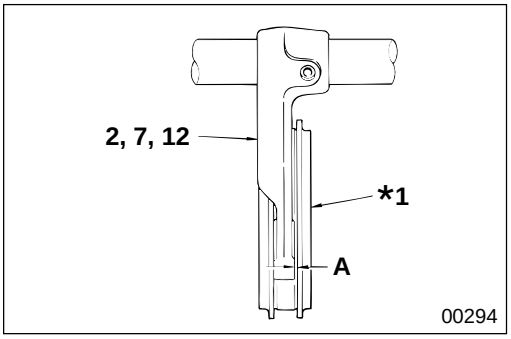
- **Be careful when driving in spring pins 1, 3, 6, 8, 11, 13, that you do not subject shift rails 5, 10, 15 to excessive strain, because this would cause faults such as bent shift rails.**
- **Make sure you do not drive in spring pins 1, 3, 6, 8, 11, 13 fully, leave 0 to 0.5 mm {0 to 0.020 in.} outside to prevent them from slipping out.**



2 **7** **12** **Tilt of shift fork claw**

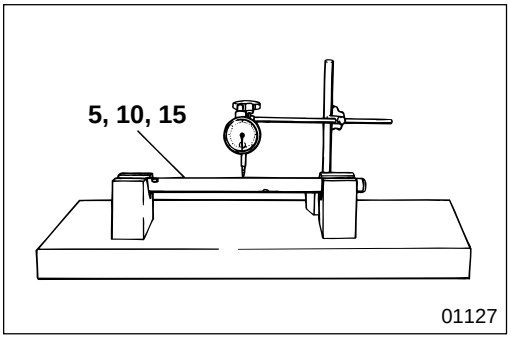
- Measure the tilt (difference between **B** and **B´**) of claw **B-B´** against hole **A** of shift rails **5**, **10**, **15** of shift forks **2**, **7**, **12** with the shift rails upright.
- If the tilt is higher than the limit, replace shift forks **2**, **7**, or **12**.

C : V-block
D : Dial gauge



2 **7** **12** ***1** **Clearance between gear shift fork and mainshaft synchronizer sleeve**

If the measured value for clearance **A** is higher than the limit, replace faulty parts.



5 **10** **15** **Deflection of shift rail**

If the measured value is higher than the limit, correct or replace shift rails **5**, **10**, **15**.

NOTE

To measure the deflection of shift rails 5, 10, 15, turn them one full revolution and read the dial gauge indicator. The deflection is one half of the indicated value.

https://truckmanualshub.com/

MAINSHAFT ASSEMBLY

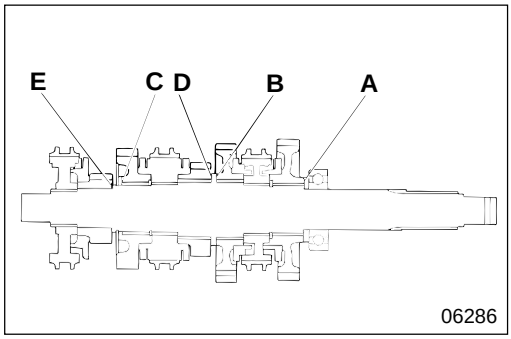
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Bearing puller and installer  08978	MH062697	Removal and installation of mainshaft rear bearing
5, 10, 17, 21	Snap ring expander  01137	MH061268	Removal and installation of snap ring

◆ Service procedure



06286

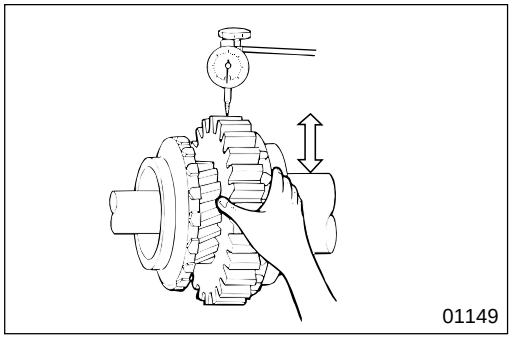
● Work before disassembly

[Inspection]

(1) End play of gears

A : 1st gear
B : Reverse gear
C : 2nd gear
D : 3rd gear
E : 5th gear

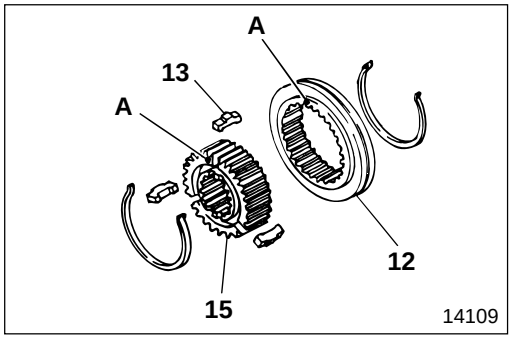
If the measured value is higher than the limit, replace faulty parts.



01149

(2) Play of gears in the diameter direction

If the measured value is higher than the limit, replace faulty parts.



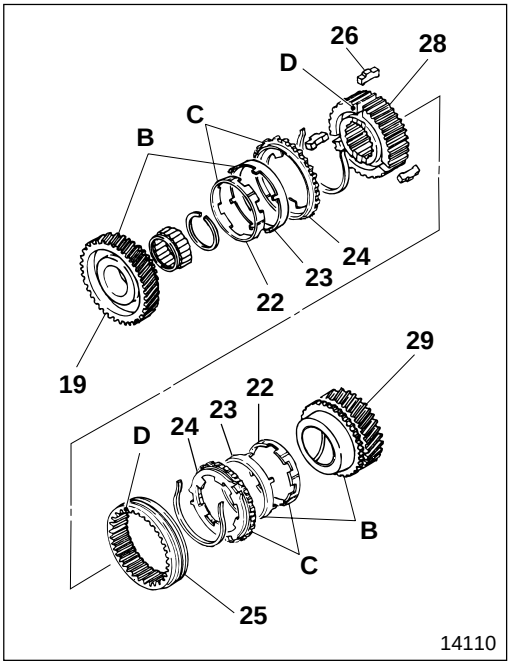
14109

[Alignment marks]

(1) Single cone synchromesh

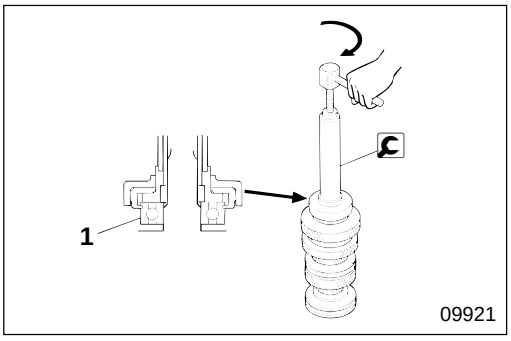
Before disassembling synchronizer sleeve **12** and synchronizer hub **15**, put alignment marks **A** on the places where shifting keys **13** are installed. When reusing parts, align the alignment marks to assemble.

https://truckmanualshub.com/



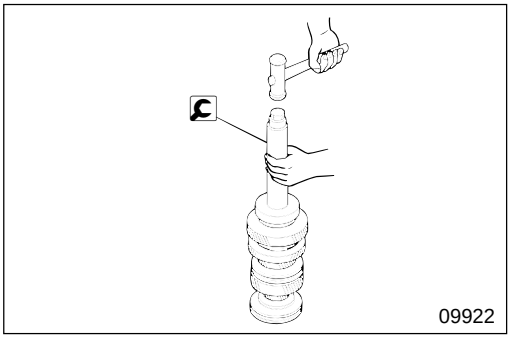
(2) Double cone synchromesh

- Before disassembling synchronizer center cone **23**, 2nd gear assembly **19**, and 3rd gear assembly **29**, put alignment marks **B** on them. Similarly, put alignment marks **C** on synchronizer inner ring **22**, and synchronizer outer ring **24**. When reusing parts, align the alignment marks to assemble.
- Before disassembling synchronizer sleeve **25** and synchronizer hub **28**, put alignment marks **D** on the places where shifting keys **26** are installed. When reusing parts, align the alignment marks to assemble.

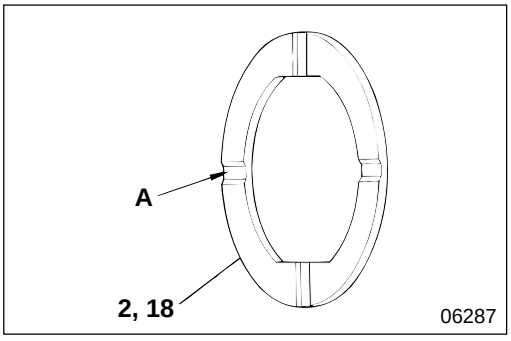


1 Bearing

[Removal]



[Installation]
Press-fit bearing **1** with its snap ring groove facing the rear.

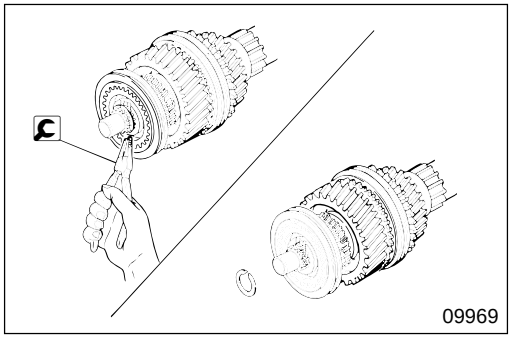


2 18 Installation of thrust washer

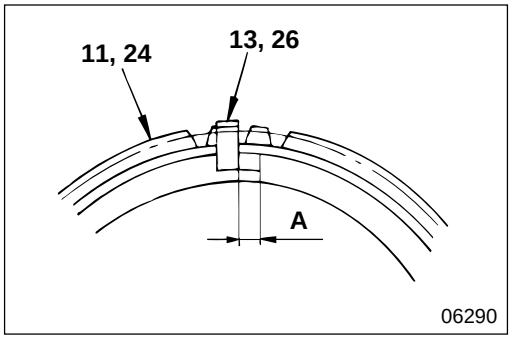
Install thrust washer with oil groove **A** facing gear side.

https://truckmanualshub.com/

MAINSHAFT ASSEMBLY

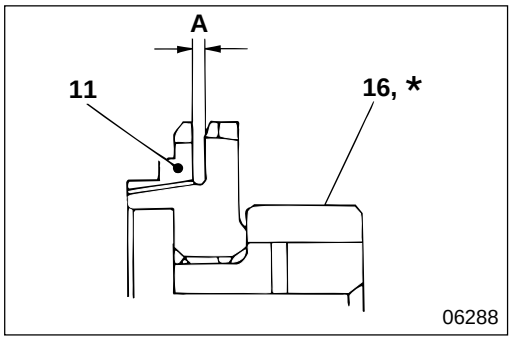


5 **10** **17** **21** **Removal and installation of snap ring**



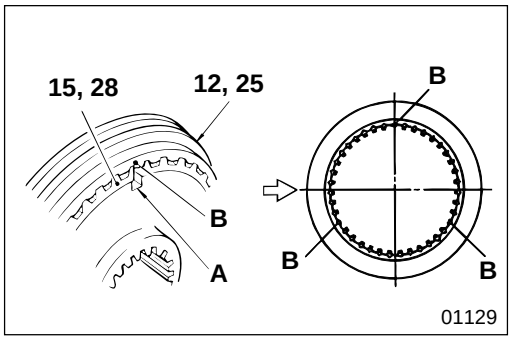
11 **13** **24** **26** **Clearance between synchronizer ring or synchronizer outer ring and shifting key**

If the measured value for clearance **A** is higher than the limit, replace faulty parts.



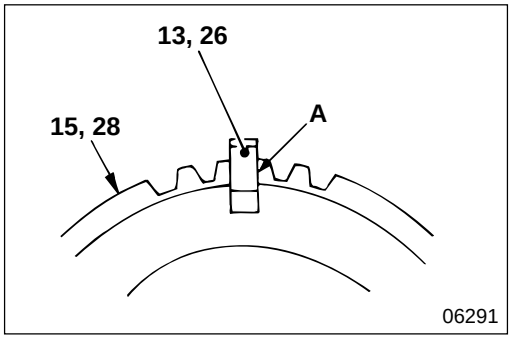
11 **16** ***** **Clearance between synchronizer ring and gear assemblies**

- Press in synchronizer ring **11** evenly, and measure all circumferences.
- If the measured value for clearance **A** is lower than the limit, replace faulty parts.



12 **25** **Installation of synchronizer sleeve**

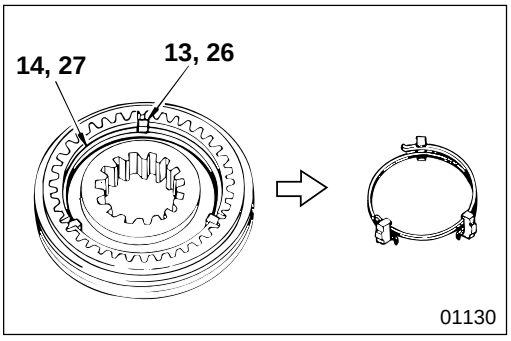
- To install synchronizer sleeves **12**, **25**, align three keyways **A** of synchronizer hubs **15**, **28** with the three stub teeth **B** of synchronizer sleeves.
- Before assembling synchronizer hubs **15**, **28** and synchronizer sleeves **12**, **25**, align the alignment marks (made before disassembly).



13 **15** **26** **28** **Clearance between shifting key and synchronizer hub**

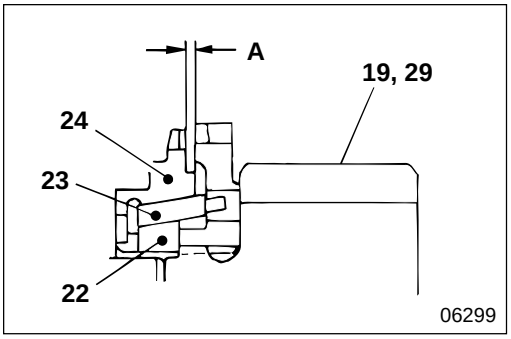
If the measured value for clearance **A** is higher than the limit, replace faulty parts.

https://truckmanualshub.com/



14 **27** **Installation of shifting key spring**

- Place shifting keys **13**, **26** into keyways of synchronizer hubs **15**, **28**, and install shifting key springs **14**, **27** taking care to locate the openings away from the shifting key positions.
- Two openings of shifting key springs **14**, **27** should not align with each other.



19 **24** **29** **Clearance between 2nd, 3rd gear assembly and synchronizer outer ring**

- Press in synchronizer inner ring **22**, synchronizer center cone **23** and synchronizer outer ring **24** evenly, and measure all circumferences.
- If the measured value for clearance **A** is lower than the limit, replace faulty parts.

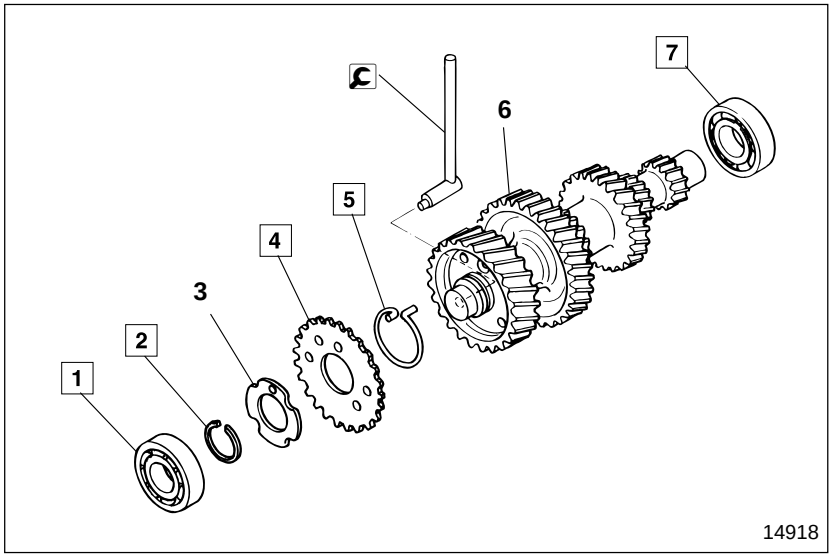
COUNTERSHAFT ASSEMBLY <NON-BACKLASH MECHANISM>



● **Disassembly sequence**

1 Countershaft front bearing
2 Snap ring
3 Sub-gear plate
4 Sub-gear
5 Sub-gear spring
6 Countershaft assembly
7 Countershaft rear bearing

WARNING ⚠

You must remove set pin that was installed before disassembling countershaft assembly 6. When removing the set pin, you must be very careful not to let sub-gear spring 5 rotate sub-gear 4, or you might hurt your hand.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

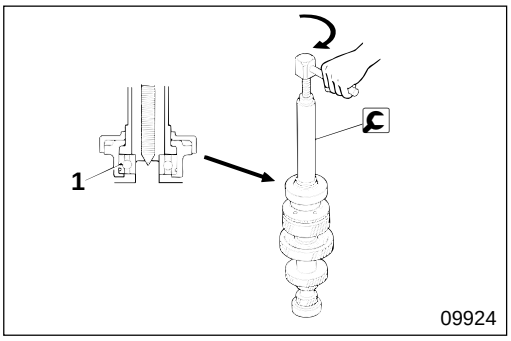
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Bearing puller and installer  08978	MH062697	Removal and installation of countershaft front bearing
2	Snap ring expander  01137	MH061268	Removal and installation of countershaft front bearing snap ring and sub-gear snap ring
4	Set pin  14916	MH063385	Securing of sub-gear
	Jig assembly  07576	MH063313	Installation of sub-gear
7	Bearing puller and installer  08978	MH062697	Removal and installation of countershaft rear bearing

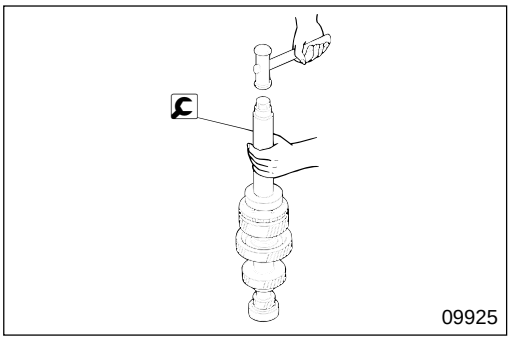
https://truckmanualshub.com/

◆ Service procedure

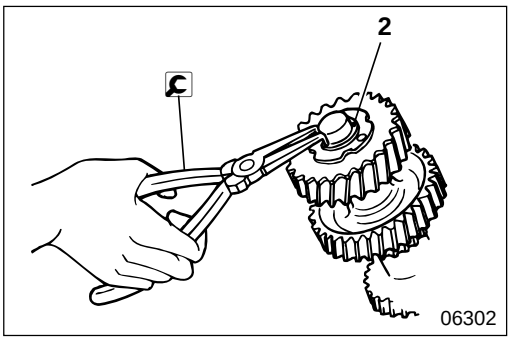


1 **Countershaft front bearing**

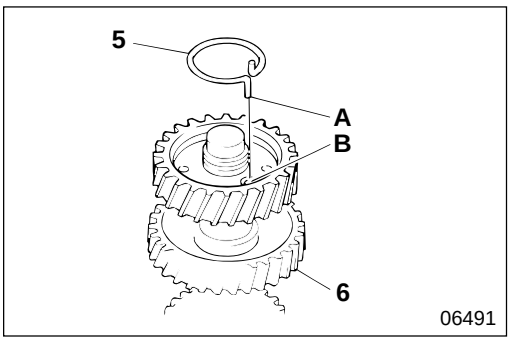
[Removal]



[Installation]
Press-fit countershaft front bearing **1** with its snap ring groove facing the gear side.



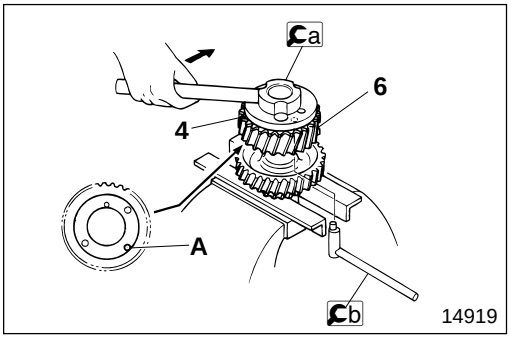
2 **Removal and installation of snap ring**



4 **5** **Sub-gear, sub-gear spring**

● **Installation of sub-gear spring**

Install sub-gear spring **5**, inserting longer bent end **A** of the sub-gear spring into constant mesh gear spring installation hole **B** of countershaft assembly **6**. Press the spring in until its rim is wholly fitted into the gear.

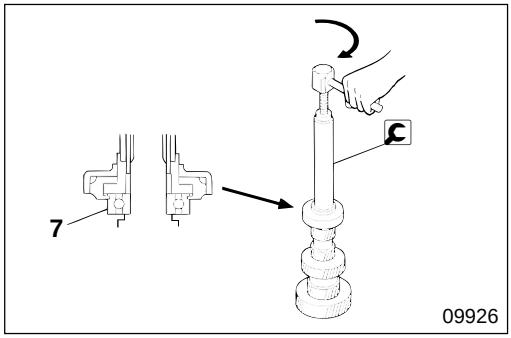


● **Positioning of sub-gear**

Turn sub-gear **4** to the right using a jig assembly, and insert b set pin into alignment hole **A**, in the direction as illustrated to secure the sub-gear, with all parts assembled except for snap ring **2** and countershaft front bearing **1**.
Turn the set pin so that the sub-gear and the constant mesh gear teeth are positioned identically.

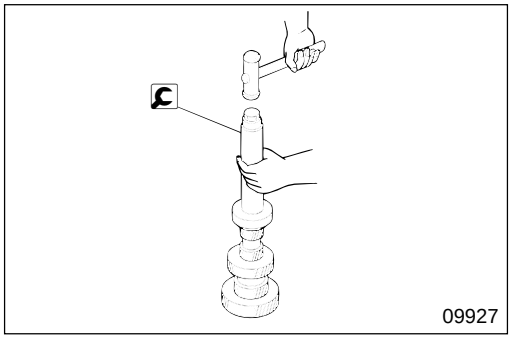
https://truckmanualshub.com/

COUNTERSHAFT ASSEMBLY <NON-BACKLASH MECHANISM>



7 **Countershaft rear bearing**

[Removal]



[Installation]
Press-fit countershaft rear bearing **7** with its snap ring groove facing the rear.

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

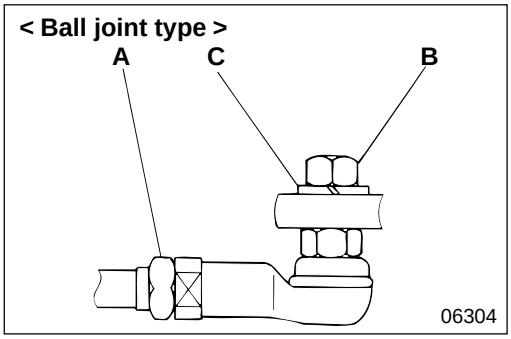
Location	Parts to be tightened	Tightening torque	Remarks
—	Nut (Ball joint mounting)	17 to 22 {12 to 16, 1.7 to 2.2}	—
—	Nut (Ball joint securing)	16 to 24 {12 to 17, 1.6 to 2.4}	—
7, 8	Knuckle (Turn buckle securing)	19 to 27 {14 to 20, 1.9 to 2.8}	—

Lubricant

Location	Points of application	Kinds	Quantity
1 to 8	Rod installation points	Chassis grease [NLGI No.1 (Ca soap)]	As required

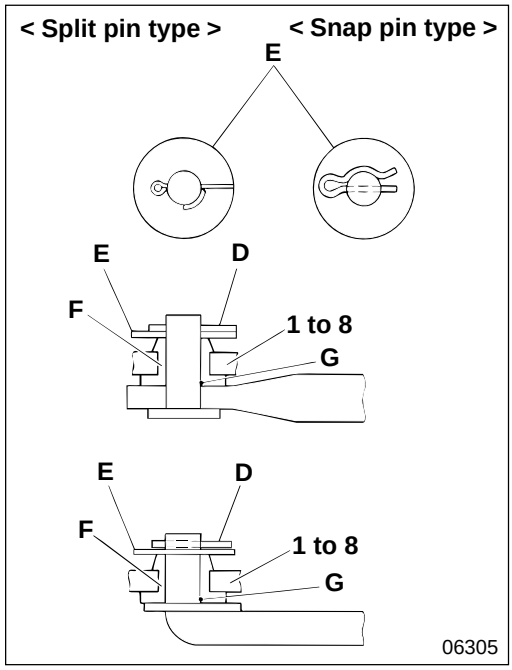
https://truckmanualshub.com/

◆ Service procedure

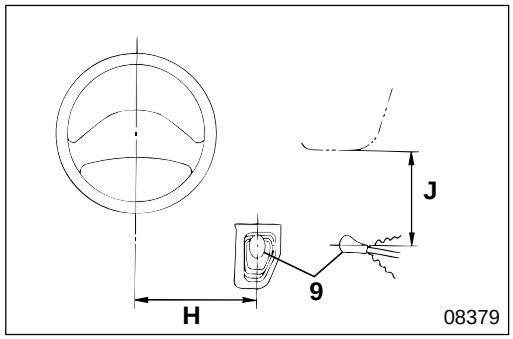


1 to **8** **Installation of rod**

- Tighten nuts **A**, **B** at specified torque.
  A : T 16 to 24 N·m {12 to 17 lbf. ft, 1.6 to 2.4 kgf·m}
  B : T 17 to 22 N·m {12 to 16 lbf. ft, 1.7 to 2.2 kgf·m}
  C : Spring washer

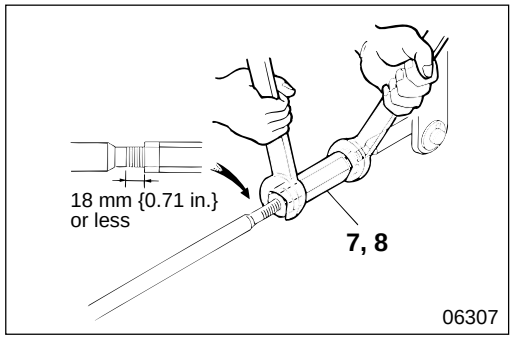


- Apply grease to area **G**.
- Install split pin or snap pin **D**.
  E : Washer
  F : Bushing



- Turn the turn buckles of shift rod No.4 **7** and selector rod No.4 **8** to adjust change lever assembly **9** position.

Left and right direction H (mm {in.}) (Distance from steering wheel center)	Fore-and-aft direction J (mm {in.}) (Distance from instrument panel)
362 to 372 {14.3 to 14.6}	301 to 311 {11.9 to 12.2}



- Adjust the thread area dimension of rods **7**, **8** that extends from both ends of the turn buckles. Exposed threads should be almost identical at left and right ends.

- After adjustment, tighten lock nuts for turn buckles at specified torque.
- Make sure that shift or select into positions can be performed smoothly.

22 Intermediate shaft
23 Extension housing
24 Speedometer drive gear

The automatic transmission is comprised of a torque converter with a lock-up mechanism and a fully automatic 4-speed gear system.

● **Torque converter**

The torque converter is driven by the engine crankshaft, and functions as the input device for the transmission. The torque converter is a fluid coupling device that magnifies torque produced by the engine and absorbs shock that generates when the vehicle accelerates from a standstill or when the transmission shifts. At a cruising speed, the lock-up mechanism prevents slippage for improved power transmitting efficiency.

● **Transmission gear section**

The gear system provides four forward speeds and one reverse speed. The gear section contains two one-way clutches, three sets of planetary gears, each comprised of a sun gear, pinion gears and a ring gear, three sets of hydraulic wet-type multi-plate clutches; and three sets of wet-type multi-plate brakes.

● **Hydraulic control section**

The electronic control system uses a microcomputer to regulate the mechanism operations for precise shifting.

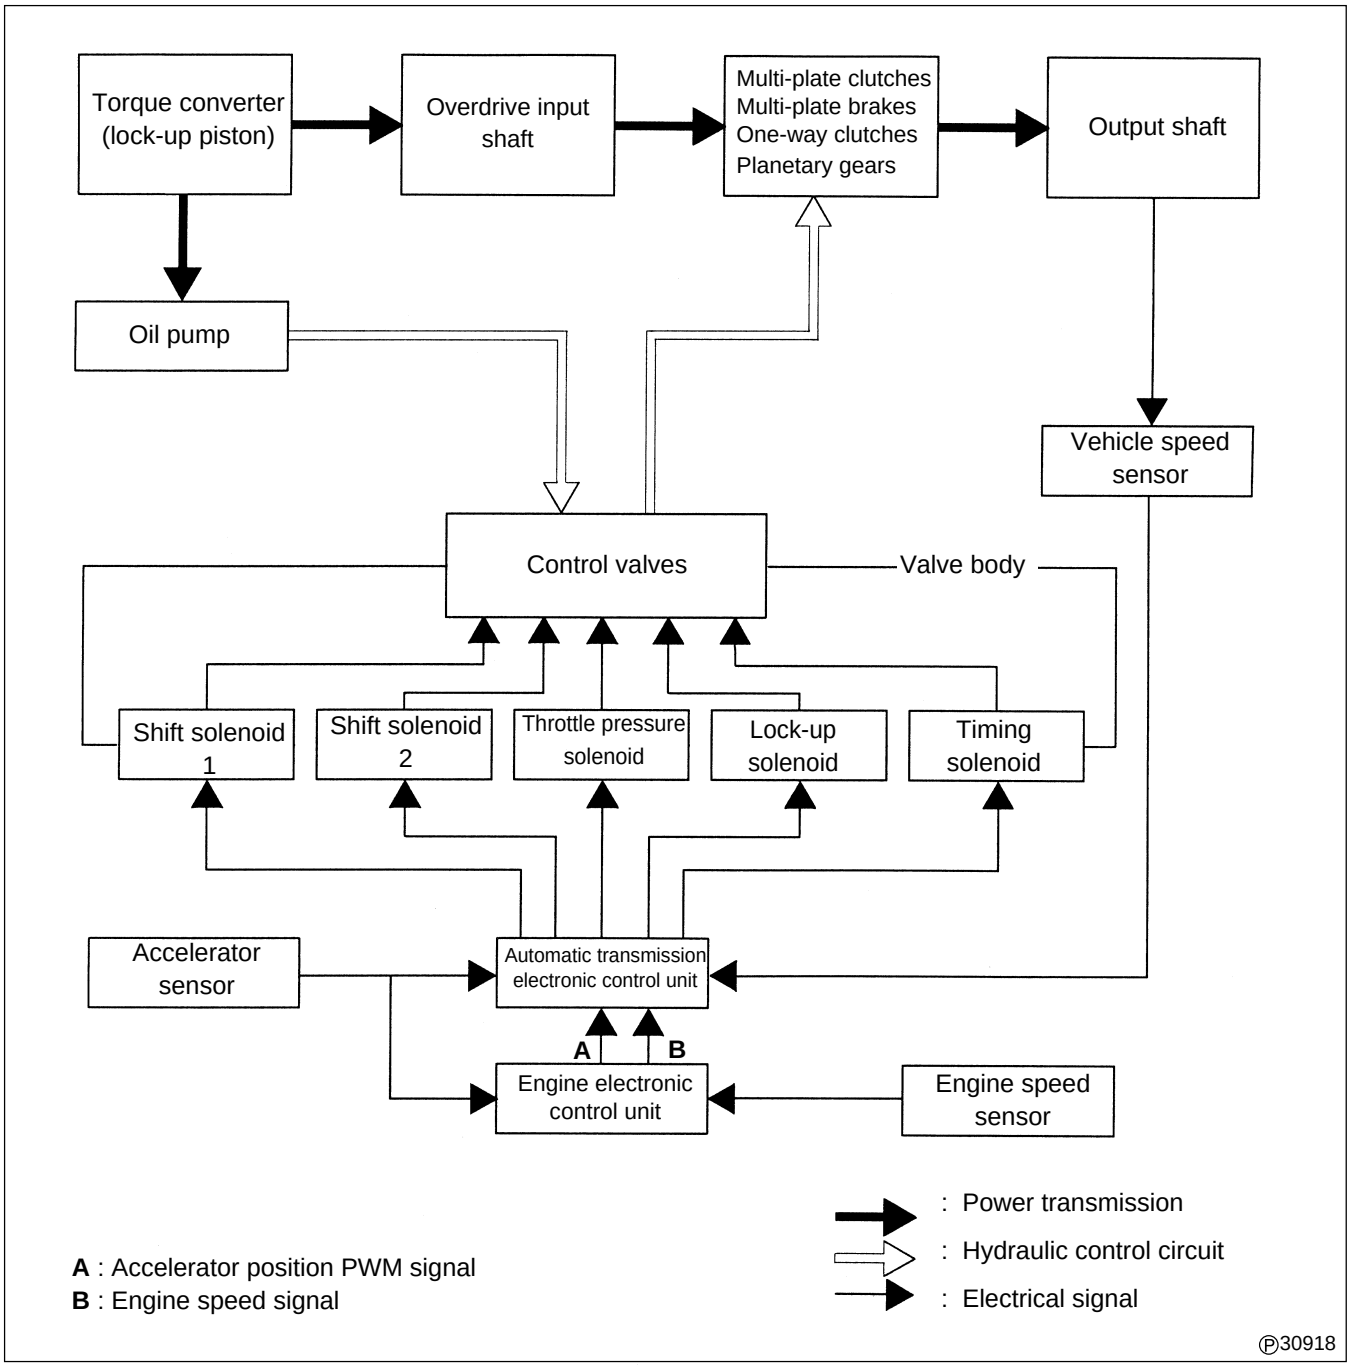
STRUCTURE AND OPERATION

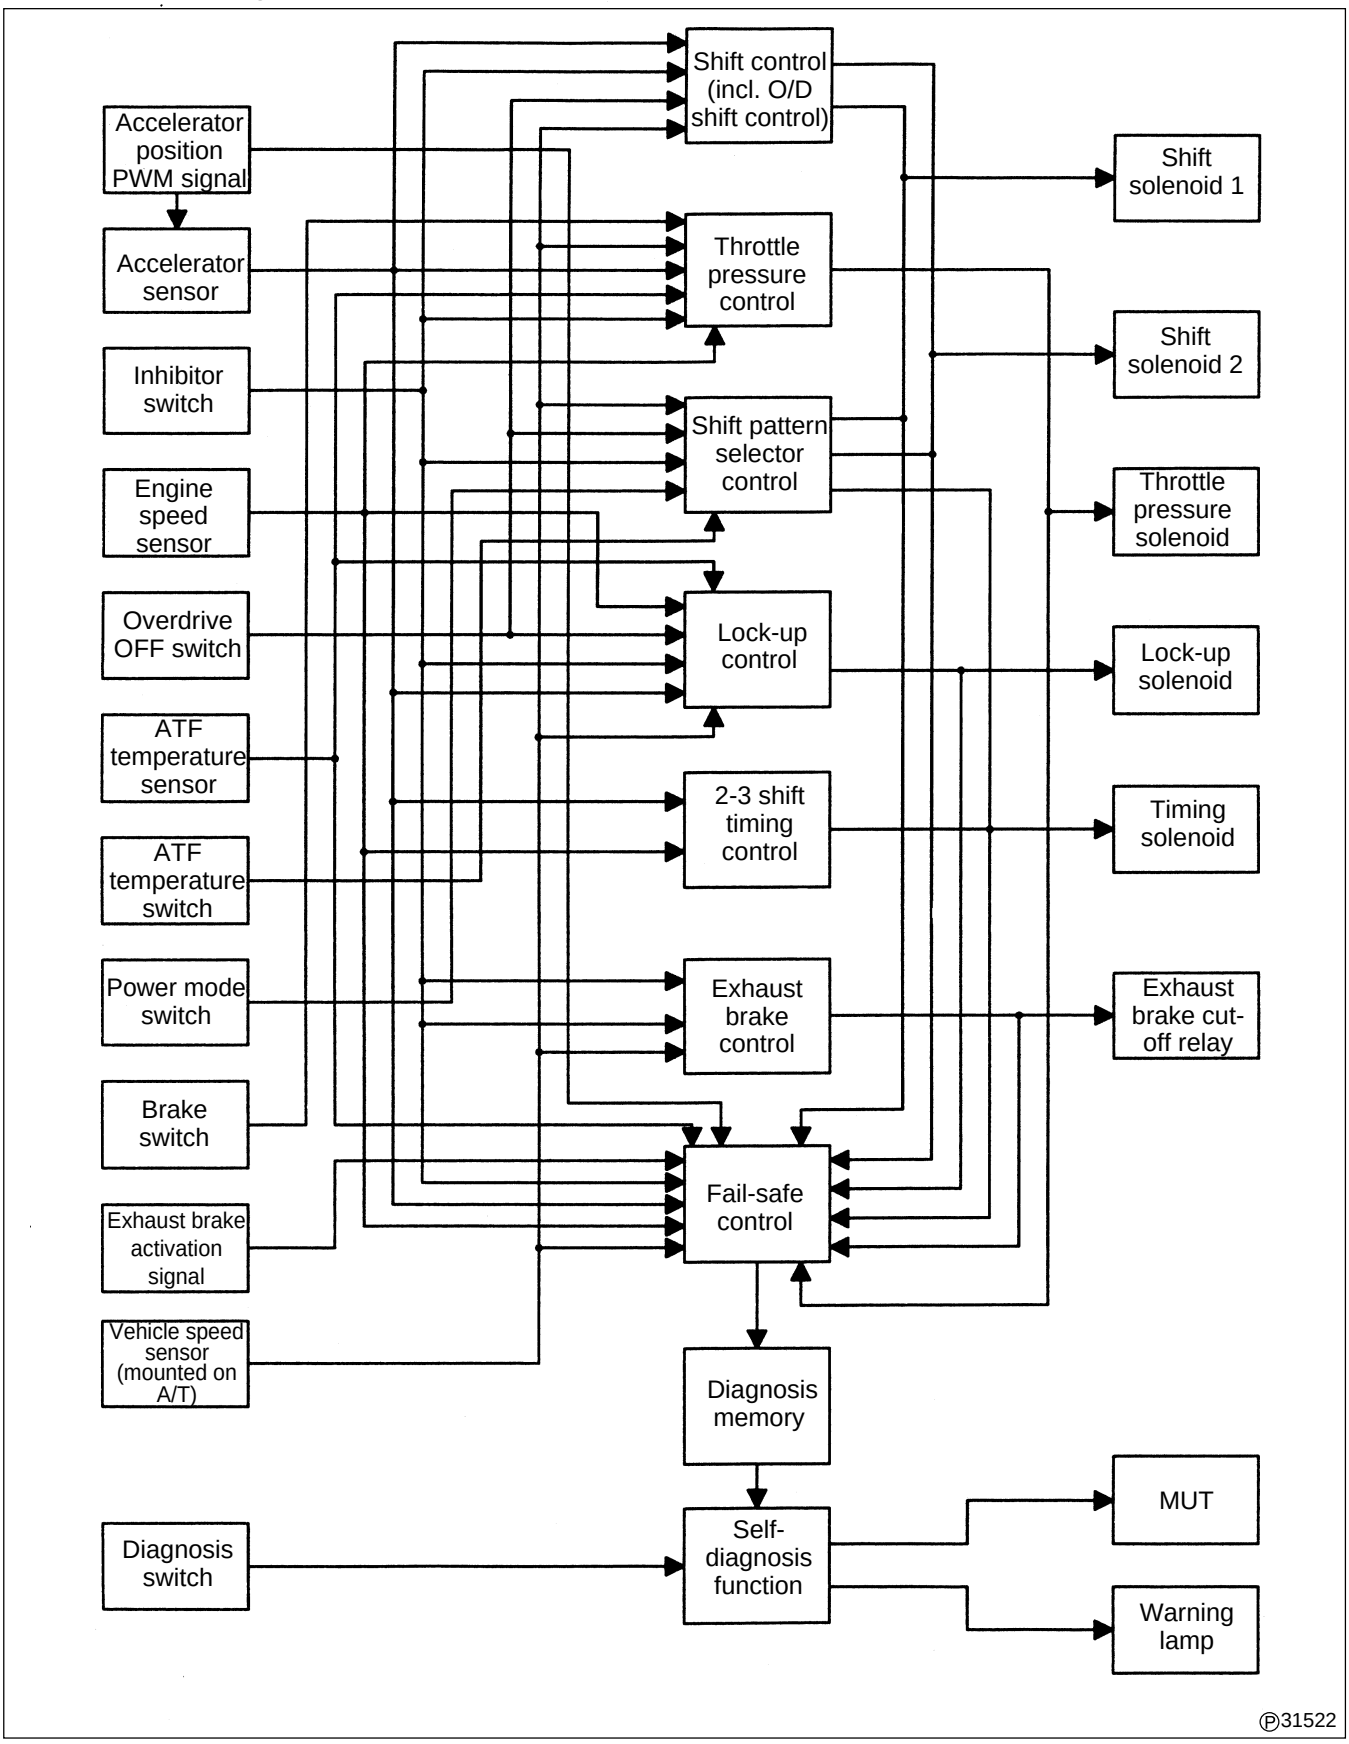
Control Mechanisms

Control system



https://truckmanualshub.com/

Control block diagram



https://truckmanualshub.com/

STRUCTURE AND OPERATION

The control functions can be roughly divided into shift control, lock-up control and 2-3 shift control. The electronic control unit electronically controls these functions precisely in accordance with driving conditions.

Chart of control items, inputs and outputs

Item \ Control item			Shift control (incl. overdrive control)	Shift pattern selector control	Throttle pressure control	Lock-up control	2-3 shift control	Exhaust brake control	Fail-safe control	Self-diagnosis control

	Throttle pressure solenoid				○				○ Note 1	○
	Exhaust brake cut-off relay							○	○ Note 1	○
	Warning lamp									○

Note 1 : The automatic transmission electronic control unit activates fail-safe functions when there is an abnormality in the input/output signals.

Note 2 : The self-diagnosis function activates.

● **Shift control**

Based on the accelerator operation signal transmitted from the accelerator sensor and the signal from the vehicle speed sensor, the automatic transmission electronic control unit outputs signals according to the predetermined shift curve. These signals are sent to shift solenoid 1, shift solenoid 2 and the timing solenoid mounted on the valve body, and automatically shift to the optimum gear.

● **Throttle pressure control**

The accelerator sensor detects the degree of throttle operation. This data is used to control the throttle pressure solenoid, and the hydraulic pressure supplied from the reducing valve is maintained at the optimum level (throttle pressure) according to the vehicle's operating condition.

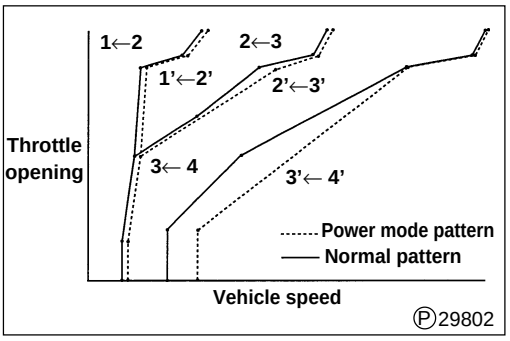
● **2-3 shift control**

Based on the signal from the throttle sensor and the signal from the engine speed sensor, the automatic transmission electronic control unit outputs a signal to the timing solenoid mounted on the valve body, and controls the discharge timing of automatic transmission fluid to reduce shift shock.

https://truckmanualshub.com/

● **Lock-up control**

The lock-up mechanism eliminates slippage of the torque converter for improved power transmitting efficiency. Based on the accelerator operation signal transmitted from the accelerator sensor and the signal from the vehicle speed sensor, the automatic transmission electronic control unit outputs a signal according to the predetermined shift curve. This signal is sent to the lock-up solenoid mounted on the valve body, and engages or disengages the lock-up mechanism.



● **Shift pattern selector control**

This control function allows the selection between the economy mode for fuel-saving operation and the power mode for improved acceleration performance.

In the power mode, the shift points of the transmission are set to a higher vehicle speed than in the economy mode. The graph on the left shows the shift points during down-shifting operations.

● **Fail-safe control**

The fail-safe functions minimize adverse effects to the vehicle operation caused by malfunctioning of the vehicle speed sensor, engine speed sensor, accelerator sensor, inhibitor switch or solenoids.

• Accelerator sensor

This sensor prohibits lock-up control change and 2-3 shift timing control by determining the shift-point vehicle speed at closed throttle position and the line pressure at maximum pressure, thus allowing vehicle operation.

• Inhibitor switch

If the inhibitor switch malfunctions in a stationary or moving vehicle and there is no signal input to the automatic transmission electronic control unit, the automatic transmission electronic control unit determines the transmission position setting as the D range and prohibits shifting from 3rd to 4th gear. If the automatic transmission electronic control unit receives two or more signals, the automatic transmission electronic control unit operates according to the following priority order for the range selector position and enables vehicle operation: L > R > 2 > D > N >P. Since the manual valve changes the hydraulic circuit in the valve body according to the range selector position, the vehicle operates as follows.

Range selector lever position	Inhibitor switch input signal	Vehicle operating condition
P	P and other selector signals	P
R	R and other selector signals	R
N	N and other selector signals	N
D	D and other selector signals (excludes R, L and 2 range signals)	$D_1 \leftrightarrow D_2 \leftrightarrow D_3 \leftrightarrow D_4$
↑	D and L range signals	$D_1 \leftrightarrow D_2 \leftarrow D_3$
↑	D and R range signals	D_4
↑	D and 2 range signals	$D_1 \leftrightarrow D_2 \leftrightarrow D_3$
2	2 and other selector signals (excludes R and L signals)	$2_1 \leftrightarrow 2_2 \leftarrow 2_3$
↑	2 and L range signals	$2_1 \leftrightarrow 2_2 \leftarrow 2_3$
↑	2 and R range signals	2_3
L	L and other selector signals	$L_1 \leftrightarrow L_2 \leftarrow L_3$

https://truckmanualshub.com/

• Engine speed sensor

The 2-3 shift timing control becomes inactive to ensure proper vehicle operation.

• Shift solenoid 1 and shift solenoid 2

If a solenoid malfunction occurs when the transmission is in the D, 2 or L range, the operating conditions of the solenoids change as shown in the following table. The automatic transmission electronic control unit also deactivates the lock-up solenoid and timing solenoid to allow vehicle operation.

Range selector position	Normal				Malfunctioning of S1			Malfunctioning of S2			Malfunctioning of S1 and S2		
	S1	S2	ST	Gear	S1	S2	Gear	S1	S2	Gear	S1	S2	Gear
D range	○	×	×	1st	–	×→○	3rd	○	–	1st	–	–	4th
	○	○	×	2nd	–	○	3rd	○→×	–	4th	–	–	4th
	×	○	×	3rd	–	○	3rd	×	–	4th	–	–	4th
	×	×	×	4th	–	×	4th	×	–	4th	–	–	4th
2 range	○	×	×	1st	–	×→○	3rd	○	–	1st	–	–	3rd
	○	○	×	2nd	–	○	3rd	○→×	–	3rd	–	–	3rd
	×	○	×	3rd	–	○	3rd	×	–	3rd	–	–	3rd
L range	○	×	×	1st	–	×	1st	○	–	1st	–	–	1st
	○	○	×	2nd	–	○	2nd	○	–	1st	–	–	1st
	×	○	○	3rd	–	○	2nd	×	–	1st	–	–	1st

○ : Electric current supplied × : Electric current not supplied – : Malfunctioning → : Fail-safe function
S1 : Shift solenoid 1 S2 : Shift solenoid 2 ST : Timing solenoid

• Throttle pressure solenoid

The malfunctioning solenoid is deactivated to bring the line pressure to a maximum level, thus allowing vehicle operation.

• Timing solenoid and lock-up solenoid

The malfunctioning solenoid is deactivated to allow vehicle operation.

● Self-diagnosis function

The warning lamp lights when an abnormality occurs during vehicle operation.

- The warning lamp does not light if the abnormality causes minimum effect to vehicle operation.
- The warning lamp lights in the case of the following malfunctions to indicate the abnormal condition since these malfunctions significantly reduce vehicle performance.
  Malfunction of vehicle speed sensor, malfunction of throttle position PWM signal, malfunction of shift solenoid 1, malfunction of shift solenoid 2, malfunction of accelerator sensor, malfunction of timing solenoid, malfunction of inhibitor switch, malfunction of throttle pressure solenoid.

CAUTION ⚠

The warning lamp lights only when the malfunction prevents proper vehicle operation.

The indicator lamp provides self-diagnosis information.

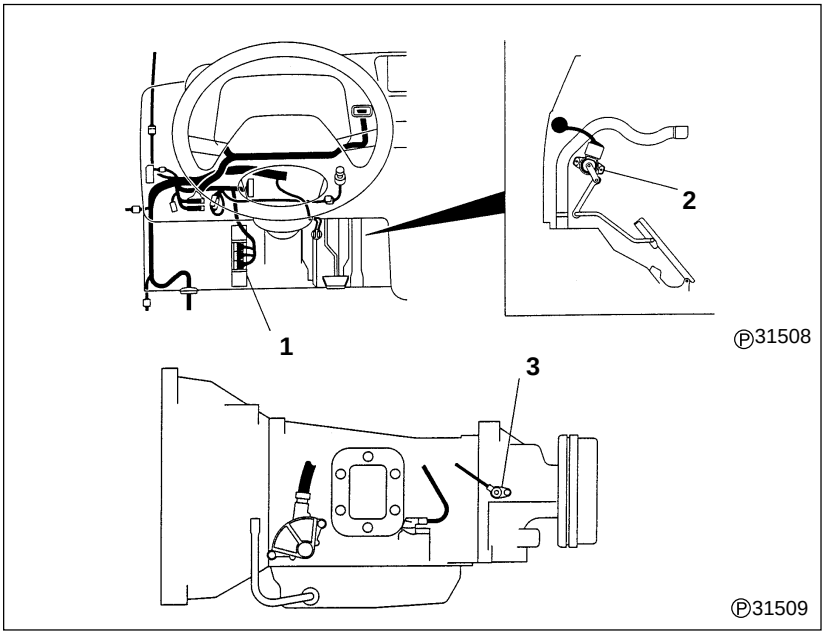
- To facilitate the discovery of malfunctions that may not reproduce themselves frequently, the automatic transmission electronic control unit stores in the memory information of malfunctions that occur during vehicle operation.
- An input of a self-diagnosis start signal produces the output of the data from the memory, and causes the automatic transmission warning lamp to flash according to the data.

CAUTION ⚠

The automatic transmission electronic control unit stores information of all malfunctions that occur after the previous self-diagnosis operation.

https://truckmanualshub.com/

Electronic Control Devices

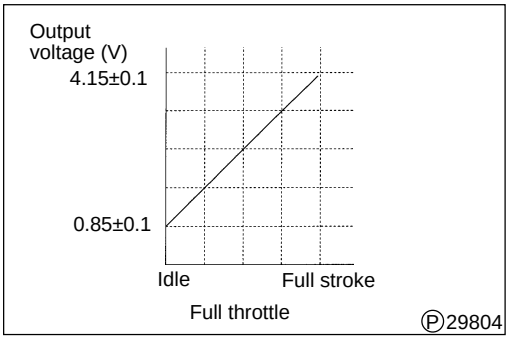


1 Automatic transmission electronic control unit
2 Accelerator sensor
3 Vehicle speed sensor

● Automatic transmission electronic control unit

The automatic transmission electronic control unit is mounted near the brake booster on the driver's seat side. It determines the vehicle operating conditions based on signals sent from sensors, and outputs signals to solenoids to regulate shift control, lock-up control and other automatic transmission functions.

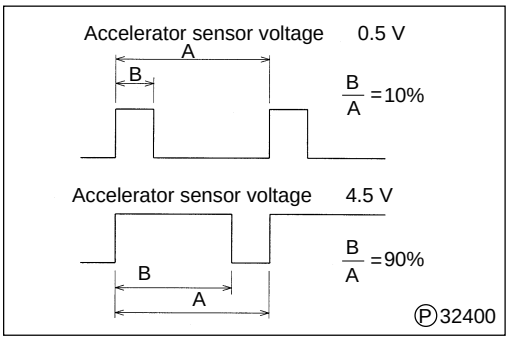
The automatic transmission electronic control unit is also equipped with a self-diagnosis function for the detection of malfunctions of main sensors and solenoids.



● Accelerator sensor

The accelerator sensor is mounted on the accelerator lever. It converts the accelerator pedal operation to voltage and sends it to the automatic transmission electronic control unit.

The output characteristic of the electric signal produced by the sensor is shown in the graph on the left. This output signal is used to determine the accelerator pedal angle and pressing speed.



● Throttle position PWM signal

The accelerator sensor voltage detected by the electronic governor control unit is converted to a PWM signal and output to the automatic transmission electronic control unit. The PWM signal is a chopping wave with a duty ratio shown in the diagram at the left.

https://truckmanualshub.com/

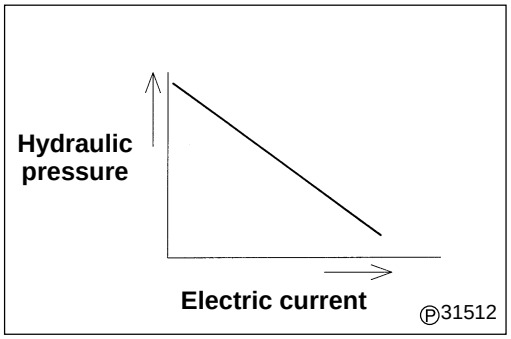
● **Vehicle speed sensor**

This sensor is mounted on the extension housing of the transmission, and converts the vehicle speed to a pulse signal by means of the parking lock gear and sends it to the automatic transmission electronic control unit.

● **Shift solenoids 1 and 2**

These solenoids are mounted on the valve body, and control shifting by turning ON and OFF in accordance with the signals sent from the automatic transmission electronic control unit.
The ON and OFF conditions of the two solenoids result in the following gear positions.

Shift solenoid 1	ON	ON	OFF	OFF
Shift solenoid 2	OFF	ON	ON	OFF
Gear position	1st gear	2nd gear	3rd gear	4th gear



● **Throttle pressure solenoid**

The throttle pressure solenoid is mounted on the valve body. It adjusts the throttle pressure based on the throttle opening signal sent from the automatic transmission electronic control unit. The throttle pressure adjustment characteristics are shown in the diagram.

● **Timing solenoid**

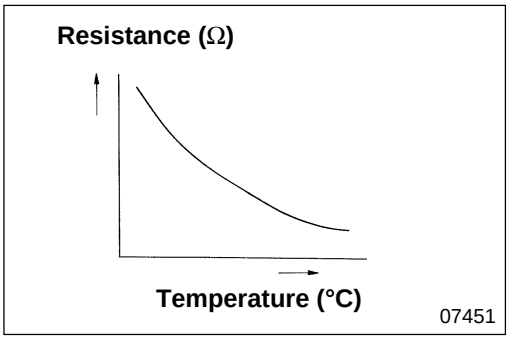
This solenoid is mounted on the valve body, and regulates the 2-3 shift timing control by turning ON and OFF in accordance with the signal sent from the automatic transmission electronic control unit.

● **Lock-up solenoid**

The lock-up solenoid is mounted on the valve body. According to the signal sent from the automatic transmission electronic control unit, the solenoid repeats ON and OFF operations, thereby opening and closing the drain circuit to control the hydraulic pressure at a predetermined level. The lock-up solenoid is a duty-cycle type that can control the ON and OFF time ratio in each cycle between 0 and 100%.

● **Automatic transmission fluid temperature switch**

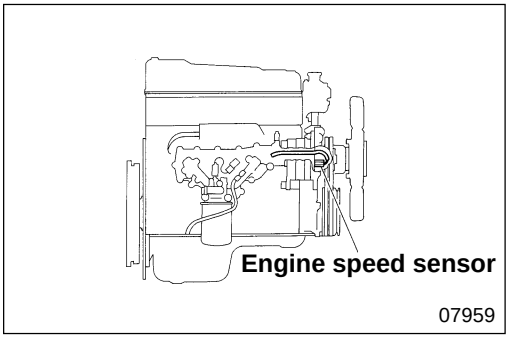
This switch is mounted on the oil cooler outlet section of the transmission case. It detects abnormal temperatures of the automatic transmission fluid and turns on the warning lamp located on the meter cluster to indicate the abnormal condition.



● **Automatic transmission fluid temperature sensor**

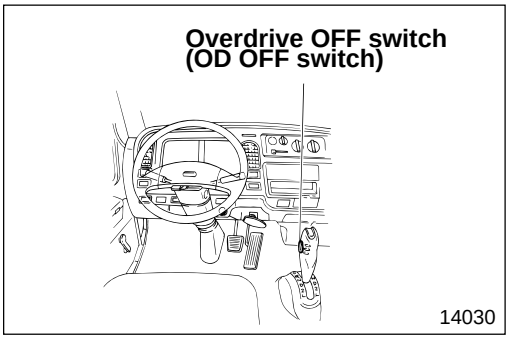
This sensor is mounted on the control valve in the transmission. It coverts temperature changes into continuous electric signals and sends to the automatic transmission electronic control unit. The characteristics of the sensor's electric output signal are shown at the left. Based on this output signal, the automatic transmission electronic control unit prohibits overdrive shifting and lock-up operation and also performs partial correction of line pressure control.

https://truckmanualshub.com/



● **Engine speed sensor**

The sensor converts the engine revolution speed to a pulse signal, and outputs to the electronic governor control unit. This signal is then transmitted from the electronic governor control unit to the automatic transmission control unit.

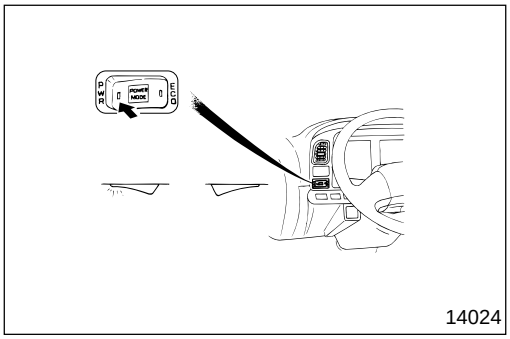


● **Overdrive OFF switch**

This switch is mounted on the range selector lever. It is operated by the driver, and it allows switching between the 3-speed and 4-speed modes.

OFF : Transmission shifts to 4th gear for improved fuel efficiency.

ON : Transmission does not shift to 4th gear, thus increasing the engine brake effect and improving driveability on an up grade incline.



● **Power mode switch**

This switch is provided on the instrument panel. It is used by the driver to select the shift-point vehicle speed setting.

PWR (power mode) : Sets the shift points to a higher vehicle speed to use engine power effectively.

ECO (economy mode) : Sets the shift points to a lower vehicle speed for improved fuel economy.

● Valve Functions

- **Upper valve body**

No.	Valve name	Description of function
1	2-3 Shift valve	Switches between 2nd and 3rd gears
2	Reverse inhibitor valve	When range selector is shifted to R range while vehicle is moving forward at moderate or high speed, this valve, operated by solenoid output, prevents shifting to reverse.
3	Modulator valve	Adjusts line pressure and supplies hydraulic pressure to lock-up signal valve and orifice control valve
4	Throttle valve	Adjusts signal pressure (throttle pressure) that is used to provide optimum line pressure in accordance with operating conditions
5	Secondary regulator valve	Controls pressure of automatic transmission fluid supplied from primary regulator valve to torque converter as well as lubricating oil pressure
6	Reducing valve	Reduces line pressure and feeds to throttle valve
7	Lock-up signal valve	Engages and disengages lock-up mechanism
8	Accumulator control valve	Lowers accumulator back pressure when throttle opening becomes smaller, and obtains accumulator control pressure from line pressure that is used to reduce shift shock
9	Low coast modulator valve	Lowers line pressure to reduce shift shock when range selector is shifted to L range
10	Orifice control valve	Switches orifices to reduce shock
11	Low inhibitor valve	When range selector is shifted to L range at high vehicle speed, this valve, operated by timing solenoid output, shifts to 3rd gear
12	Check valve	Switches fluid passage to rear clutch (C2) in D range and R ranges

- **Lower valve body**

No.	Valve name	Description of function
1	Manual valve	Switches fluid passage according to the position (P, R, N, D, 2, L) of range selector lever
2	1-2 Shift valve	Switches between 1st and 2nd gears
3	3-4 Shift valve	Switches between 3rd and overdrive gears
4	Pressure relief valve	Maintains pressure supplied to cooler at low level
5	Primary regulator valve	Regulates hydraulic pressure (line pressure) to devices
6	Lock-up control valve	Adjust flow rate of automatic transmission fluid to torque converter
7	C0 exhaust valve	Reduces shock in 3rd-to-2nd shifting
8	2-3 Timing valve	Adjusts hydraulic pressure switching timing in 3rd-to-2nd shifting to reduce shock
9	Cutback valve	Applies cutback pressure to throttle valve to reduce line pressure

A : Operating pressure

< Active condition >

The control valve supplies operating pressure **A** to overdrive direct clutch piston **3**, coupling clutch discs **8** and clutch plates **7**. This interlocks overdrive planetary sun gear **11** with overdrive planetary carrier **12**.
As a result, the entire overdrive planetary gear acts as a single unit to transmit the engine's driving power from overdrive input shaft **13** to input shaft **14**.

< Inactivate condition >

Since operating pressure **A** is not supplied, the force of overdrive clutch return springs **5** presses against overdrive direct clutch piston **3**.
As a result, clutch plates **7** are separated from clutch discs **8**, and the engine power is not transmitted.

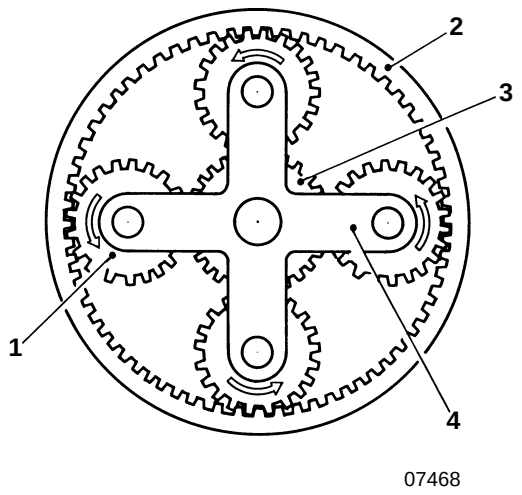
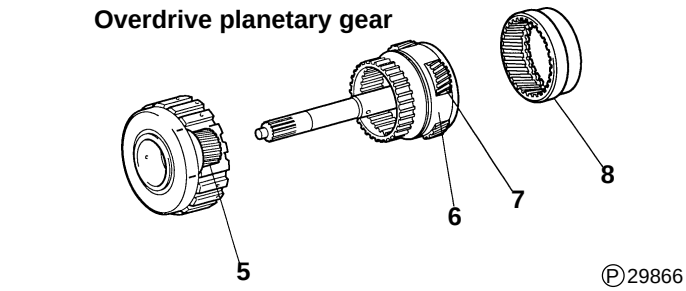
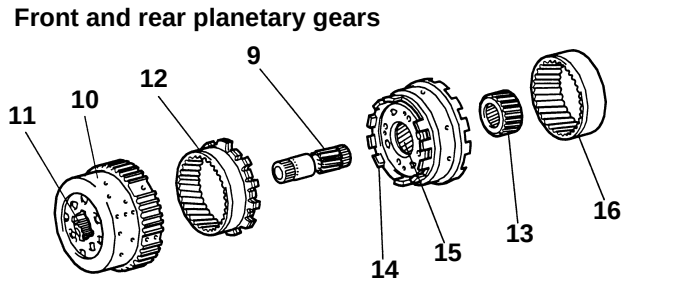
● Planetary Gears



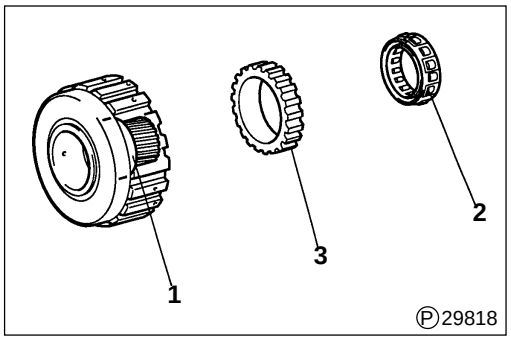




1 Pinion gear
2 Ring gear
3 Sun gear
4 Planetary carrier
5 Overdrive sun gear
6 Overdrive planetary carrier
7 Overdrive pinion gears
8 Overdrive ring gear
9 Front sun gear
10 Front planetary carrier
11 Front pinion gears
12 Front ring gear
13 Rear sun gear
14 Rear planetary carrier
15 Rear pinion gears
16 Rear ring gear

- Three sets of Simpson-type planetary gears provide a total of five gear ratios: four forward speeds and one reverse speed.
- Each planetary gear set consists of a sun gear **3** at the center and pinion gears **1** that revolve around the sun gear and on their axes. This set of gears are contained in a ring gear **2**. The pinion gears are attached to a planetary carrier **4**, so that all pinion gears rotate in the same direction and at the same rate. Gear shifting occurs when these four elements — sun gear, pinion gears, ring gear and planetary carrier — are provided with certain conditions. Clutches and brakes provide operating conditions to the planetary gears in accordance with shifting.

● Overdrive One-Way Clutch

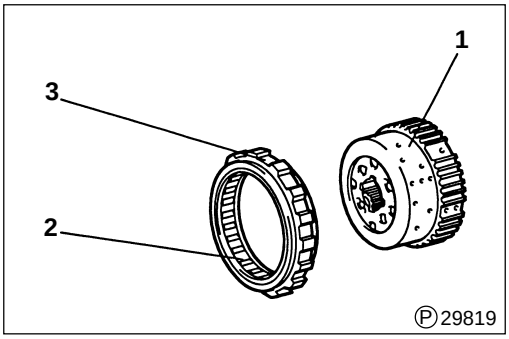


1 Overdrive direct clutch drum and overdrive one-way clutch inner race
2 Overdrive one-way clutch
3 Overdrive one-way clutch outer race

- During acceleration in the 1st, 2nd and 3rd gears, the overdrive one-way clutch **2** engages and becomes interlocked with the overdrive sun gear and overdrive planetary carrier.
- In the 4th gear, the overdrive one-way clutch **2** rotates freely.

https://truckmanualshub.com/

● No. 2 One-Way Clutch



1 Front planetary carrier and No. 2 one-way clutch inner race
2 No. 2 one-way clutch
3 No. 2 one-way clutch outer race

- During acceleration in the 1st gear, the No. 2 one-way clutch **2** engages and becomes interlocked with the front planetary carrier.
- In the 1st, 2nd and 3rd gears, the No. 2 one-way clutch **2** rotates freely.

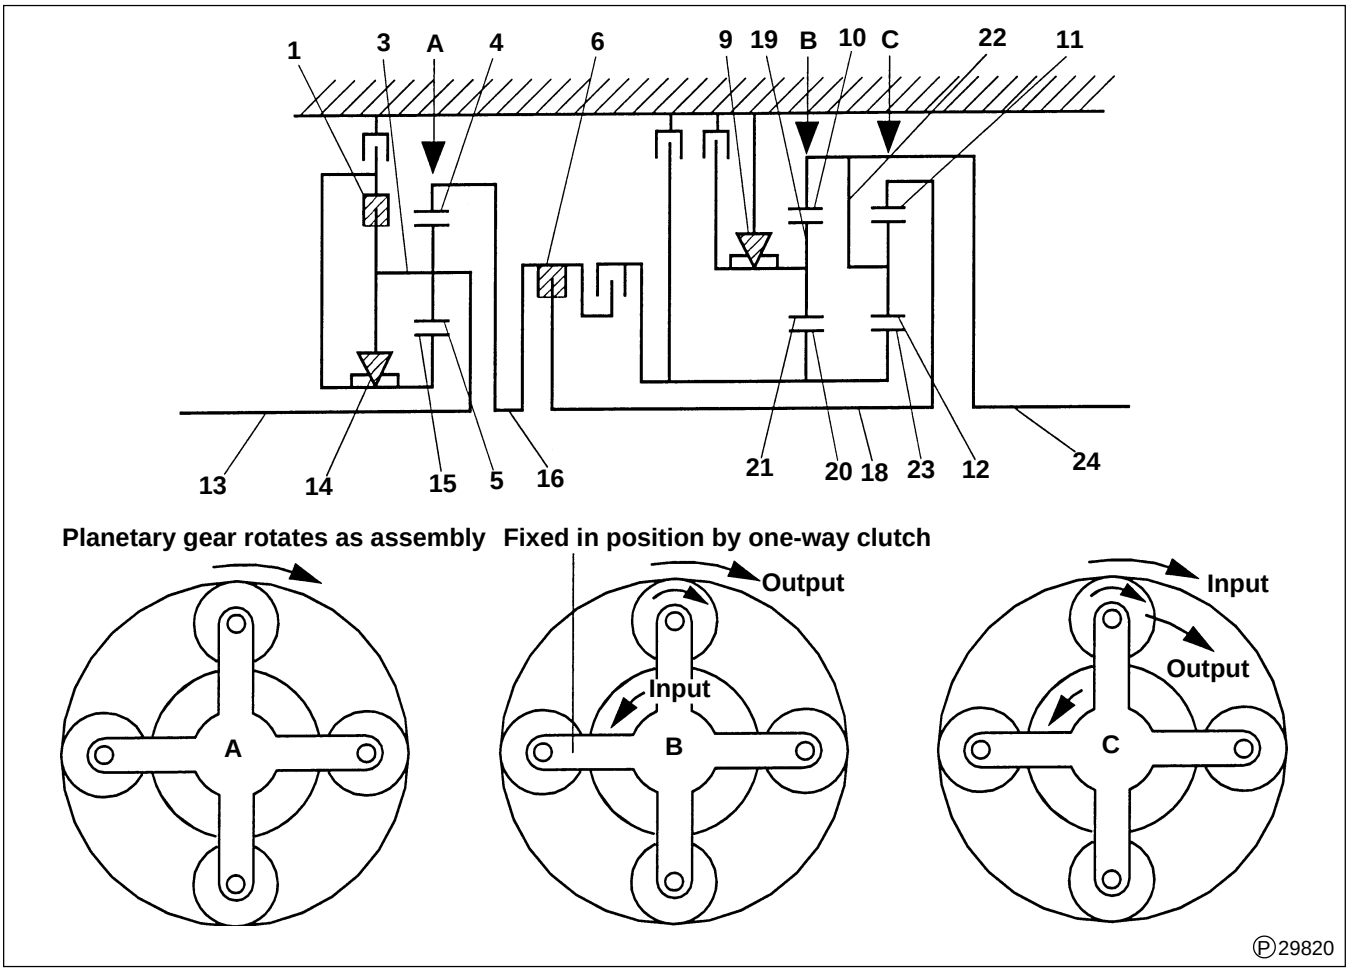
● D, and 2 Ranges (1st Gear)

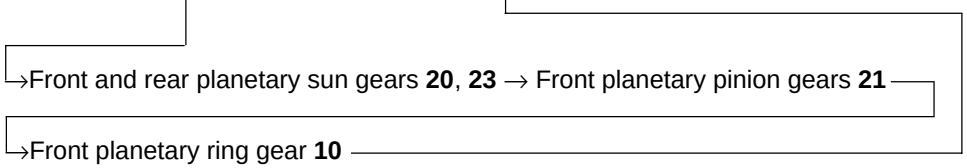


Overdrive direct clutch **1**, front clutch **6**, overdrive one-way clutch **14** and No. 2 one-way clutch **9** activate to provide the 1st gear. At overdrive planetary gear **A**, overdrive direct clutch **1** operates to interlock overdrive planetary carrier **3** (overdrive input shaft **13**) with overdrive planetary sun gear **15**. This disables overdrive planetary pinion gears **5** from rotating on their axes, and overdrive planetary carrier **3** becomes locked (direct coupling) in position with overdrive planetary ring gear **4**, thus transmitting driving force to input shaft **16**. Clockwise rotation of overdrive planetary carrier **3** results in a force that attempts to turn overdrive pinion gears **5** in a counterclockwise direction, producing clockwise rotating force for overdrive planetary sun gear **15**. However, since overdrive planetary sun gear **15** rotates faster than overdrive planetary carrier **3**, overdrive one-way clutch **14** activates, interlocking overdrive planetary carrier **3** with overdrive planetary sun gear **15**. This disallows overdrive planetary pinion gears **5** from rotating on their axes, in the same way as when overdrive direct clutch **1** activates. Therefore, overdrive planetary carrier **3** becomes locked (direct coupling) in position with overdrive planetary ring gear **4**, thus transmitting the driving force to input shaft **16**.
These two power transmitting systems reduce the load on overdrive direct clutch **1**.
The clockwise rotating force of input shaft **16** is transmitted to intermediate shaft **18** by the action of front clutch **6**, then turns rear planetary pinion gears **12** clockwise by means of rear planetary ring gear **11**. In this process, rear planetary carrier **22** is stationary due to vehicle weight. Therefore, rear planetary sun gear **23** receives counterclockwise rotating force and transmits this force to front planetary pinion gears **21**, exerting force to rotate front planetary carrier **19** in a counterclockwise direction. However, since No. 2 one-way clutch **9** prevents front planetary carrier **19** from rotating in a counterclockwise direction, pinion gears **12**, **21** cause front planetary ring gear **10** and rear planetary carrier **22** to rotate in a clockwise direction, thereby transmitting the rotating force to output shaft **24**. (Rotational directions are described as viewed from the torque converter side.)

https://truckmanualshub.com/

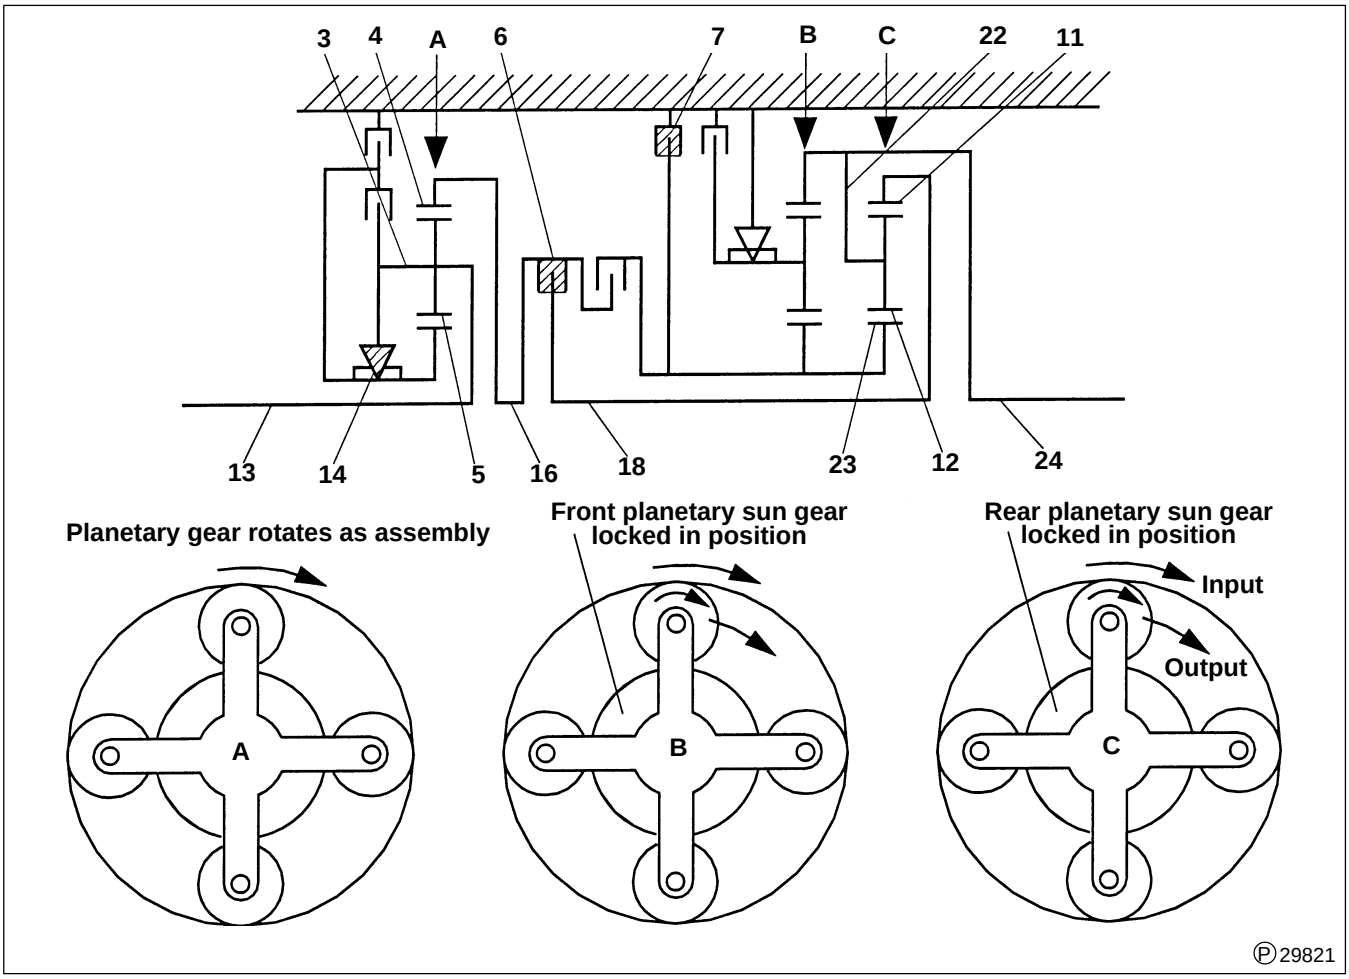
Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** → Front clutch **6** → Intermediate shaft **18** → Rear planetary ring gear **11** → Rear planetary pinion gears **12** → Rear planetary carrier **22** → Output shaft **24**



https://truckmanualshub.com/

● D Range (2nd Gear)



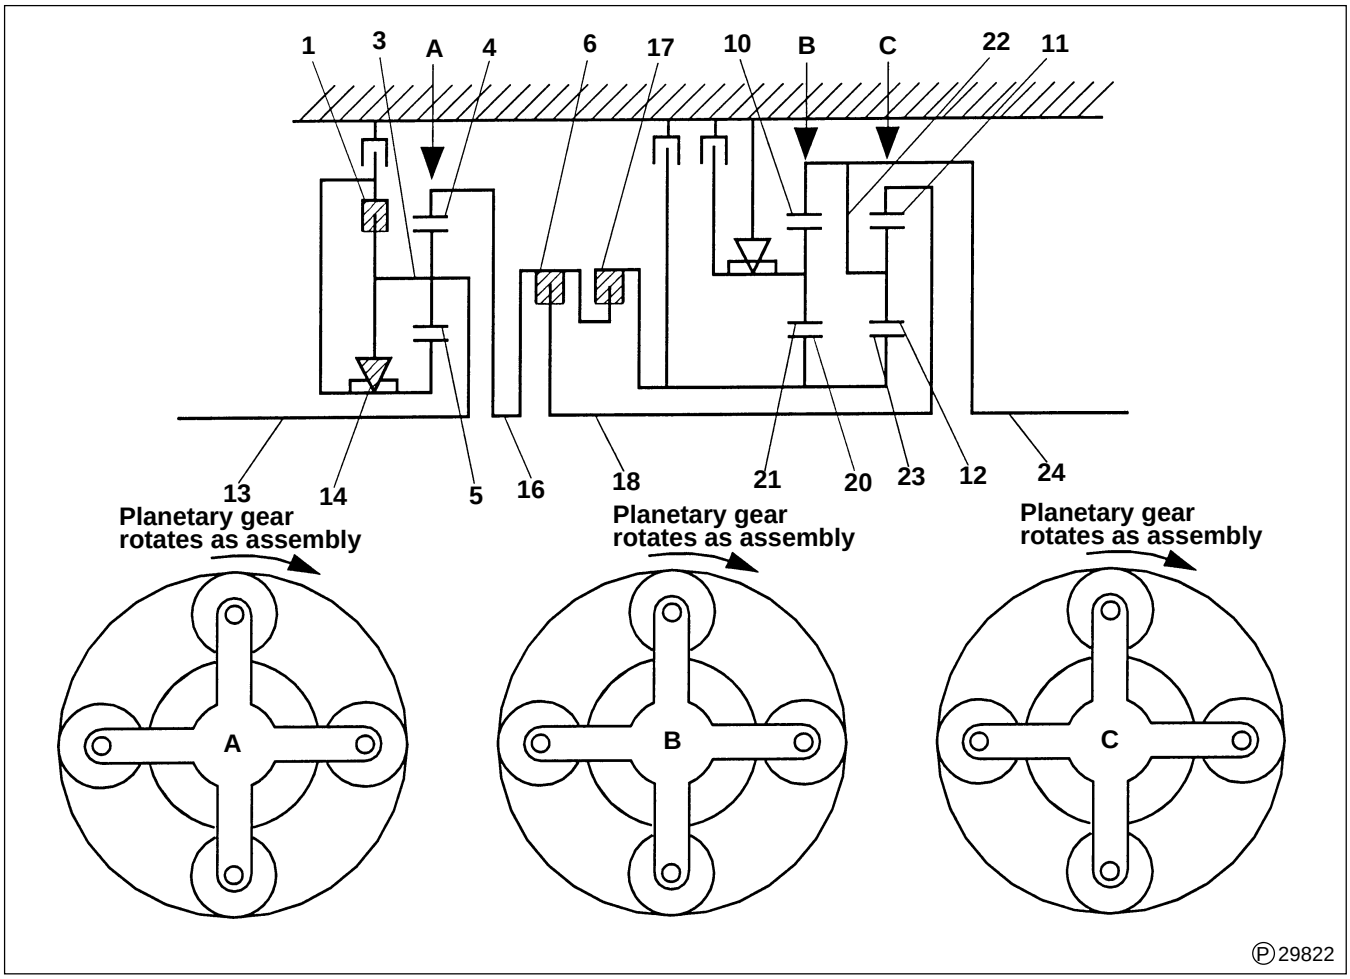
Front clutch **6**, 2nd brake **7** and overdrive one-way clutch **14** activate to provide the 2nd gear. In this gear, overdrive one-way clutch **14** transmits the rotating force of input shaft **16** to rear planetary pinion gears **12** by means of intermediate shaft **18** and rear planetary ring gear **11**. Although rear planetary sun gear **23**, which is meshed with pinion gears **12**, receives a counterclockwise rotating force, 2nd brake **7** prevents its rotation, disabling the transfer of the rotating force to front planetary gear **B**. As a result, the rotating force transmits to rear planetary carrier **22** via rear planetary pinion gears **12**, then to output shaft **24**.

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** → Front clutch **6** → Intermediate shaft **18** → Rear planetary ring gear **11** → Rear planetary pinion gears **12** → Rear planetary carrier **22** → Output shaft **24**

https://truckmanualshub.com/

● D, 2 and L Ranges (3rd Gear)



Overdrive direct clutch **1**, front clutch **6**, rear clutch **17** and Overdrive one-way clutch **14** activate to provide the 3rd gear. In this gear, front clutch **6** and rear clutch **17** cause intermediate shaft **18** and front and rear sun gears **20**, **23** to rotate in the same direction. Therefore, front and rear planetary pinion gears **12**, **21** become locked in position, thus the entire assemblies of planetary gears **A**, **B**, **C** rotate together to transmit the rotating force of input shaft **16** to output shaft **24** without reducing the rate of rotating speed.

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** →Front clutch **6** → Intermediate shaft **18**

→Rear planetary ring gear **11** → Rear planetary pinion gears **12**

→Rear clutch **17**

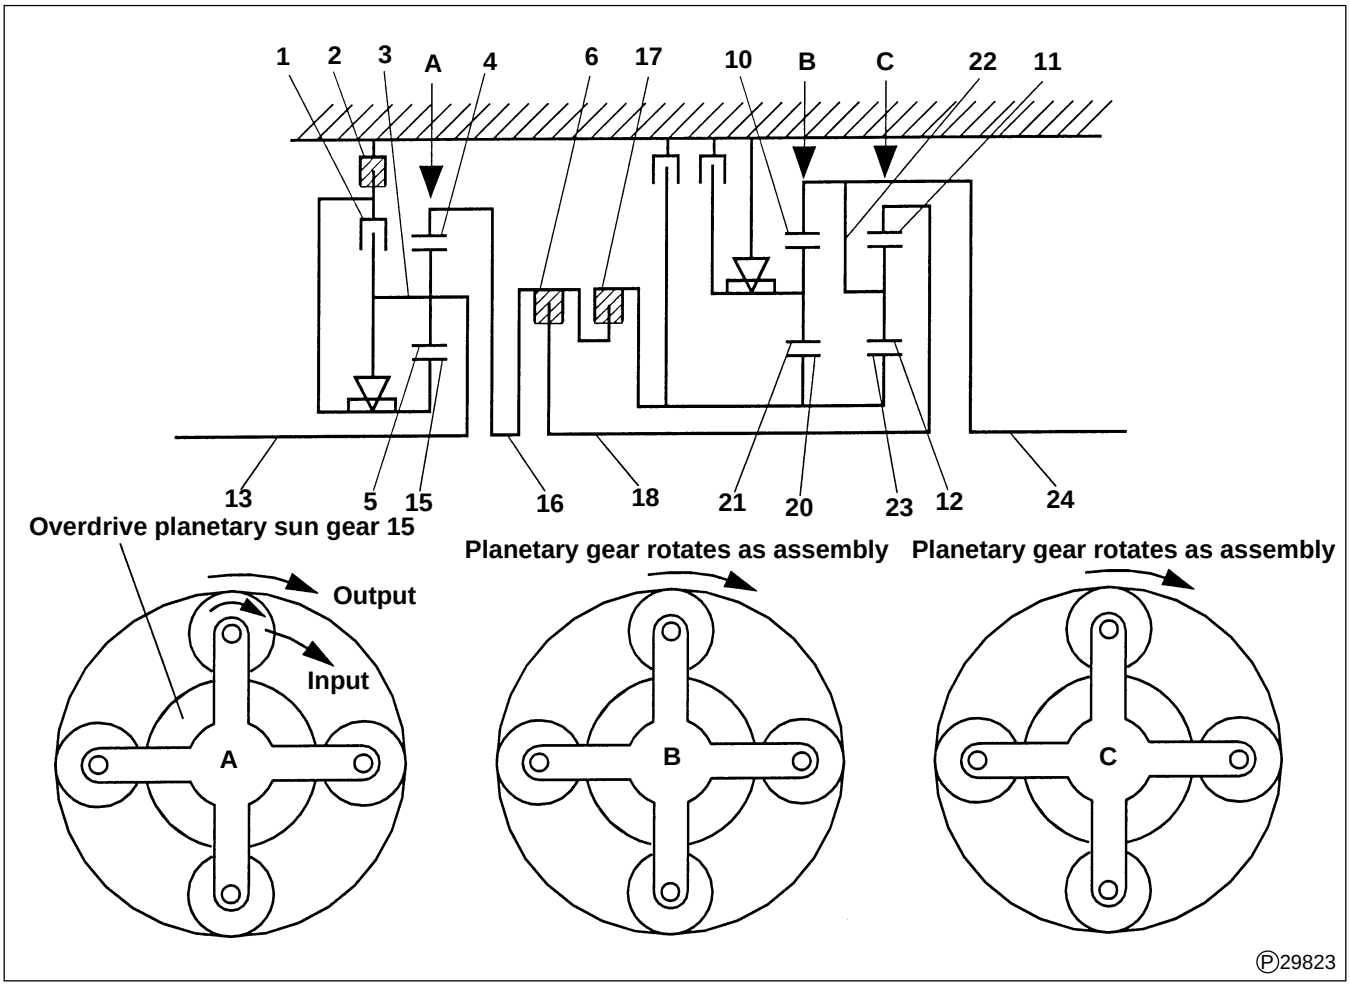
→Rear planetary carrier **22** →Output shaft **24**

→Rear planetary sun gear **23** → Rear planetary pinion gears **12**

→Front planetary sun gear **20** → Front planetary pinion gears **21** → Front planetary ring gear **10**

https://truckmanualshub.com/

● D Range (4th Gear)



If the overdrive conditions (see the table below) are fulfilled when the transmission is in 3rd gear, overdrive direct clutch **1** disengages, and overdrive brake **2** activates at the same time to provide the overdrive gear ratio. In the overdrive gear, overdrive brake **2** is in operation, thus locking overdrive planetary sun gear **15** in position. Therefore, the rotating force transmitted from overdrive input shaft **13** to overdrive planetary carrier **3** causes overdrive planetary pinion gears **5** to revolve around the sun gear and on their own axes, which results in an increased rotating speed of overdrive planetary ring gear **4** (input shaft **16**). The rotating force of input shaft **16** is transmitted to output shaft **24**, in the same way as in the 3rd gear.

Overdrive conditions

Shift position	D
Overdrive OFF SW	OFF
Temperature of oil in oil pan	Approximately 0°C {32°F} or higher

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** → Front clutch **6** → Intermediate shaft **18**

→ Rear planetary ring gear **11** → Rear planetary pinion gears **12**

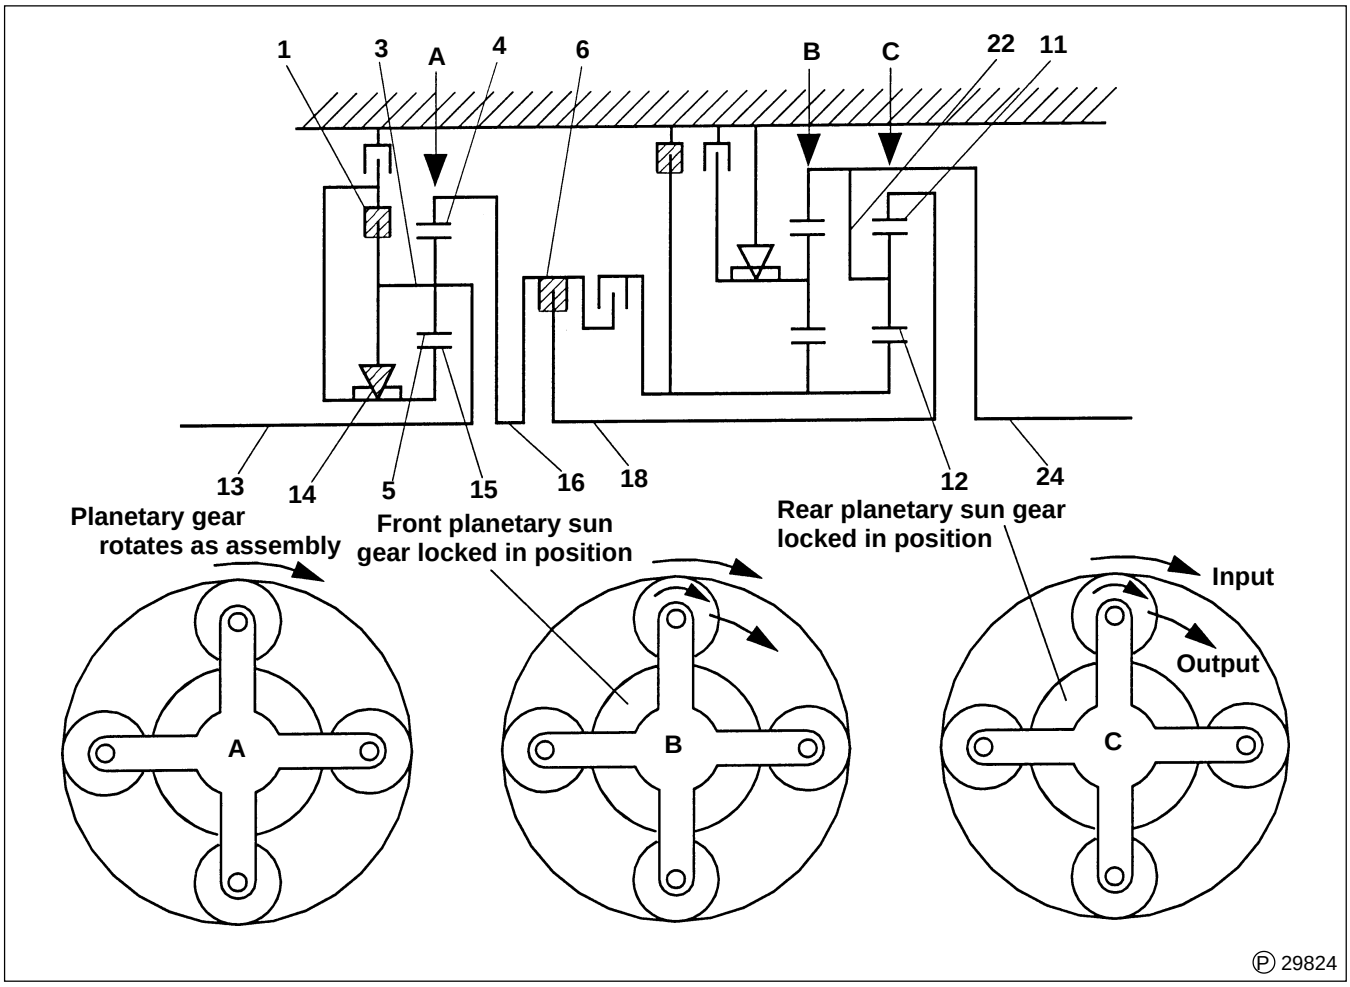
→ Rear clutch **17** → Rear planetary carrier **22** → Output shaft **24**

→ Rear planetary sun gear **23** → Rear planetary pinion gears **12**

→ Front planetary sun gear **20** → Front planetary pinion gears **21** → Front planetary ring gear **10**

https://truckmanualshub.com/

● 2 Range (2nd Gear)



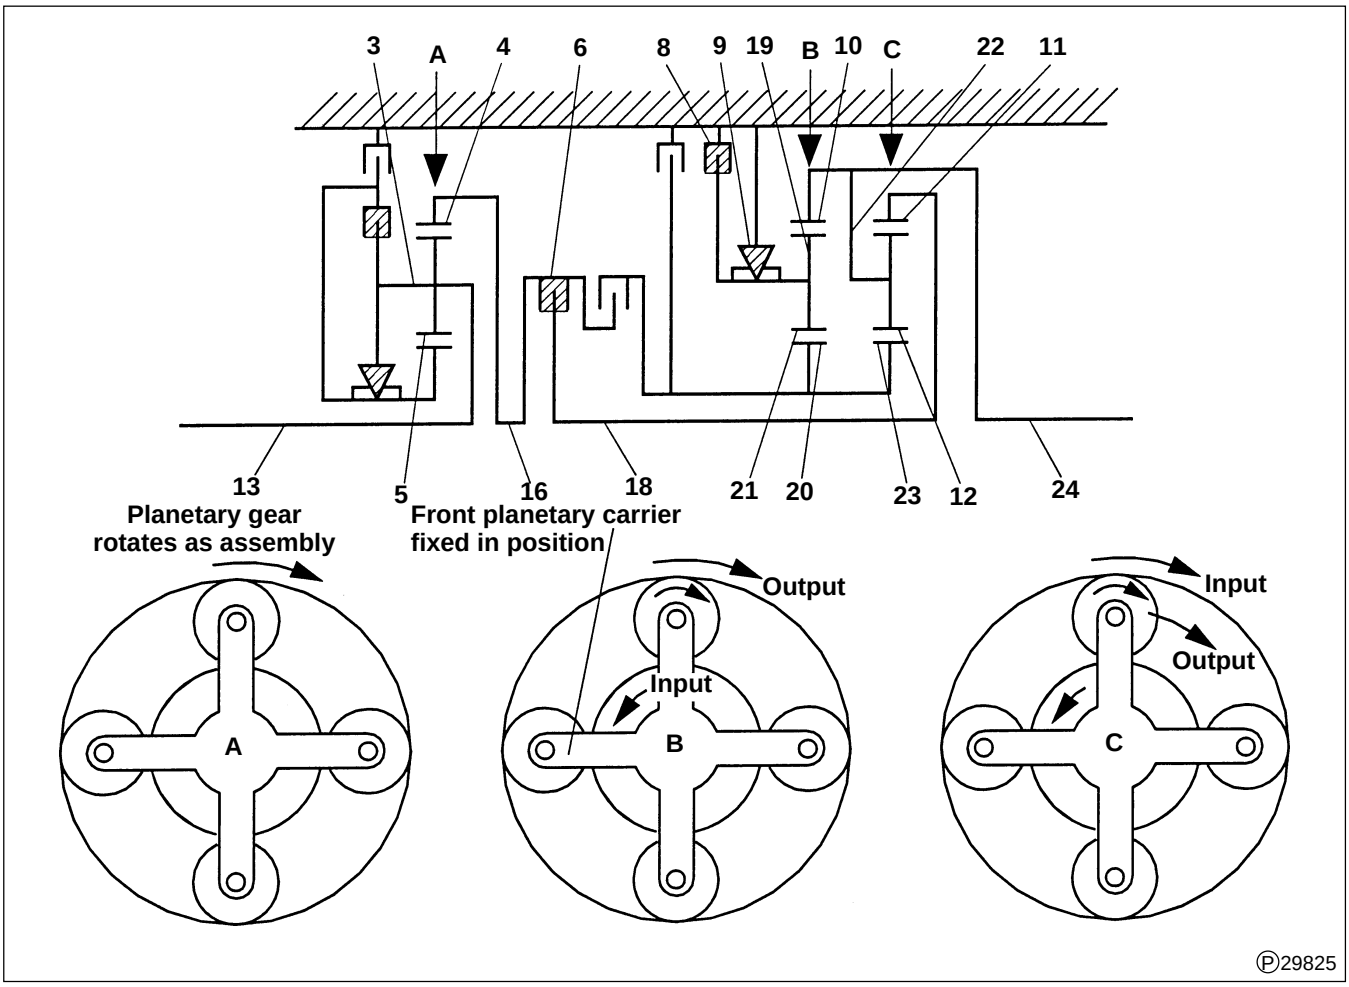
The rotating power is transmitted in the same way as in the previously described 2nd gear in the D range. However, when engine brake is applied, overdrive direct clutch **1** activates and prevents overdrive planetary sun gear **15** from rotating clockwise. In other words, when the transmission is in 2nd gear with the range selector in the D range, overdrive one-way clutch **14** transmits the rotating power to input shaft **16**. When the engine brake is applied, however, the counterclockwise rotating force of overdrive planetary sun gear **15** inactivates overdrive one-way clutch **14** and causes overdrive planetary sun gear **15** to spin freely. This disallows the transmission of the engine brake force. To properly transmit the engine brake force in the 2 range, overdrive direct clutch **1** is activated to interlock overdrive planetary sun gear **15** with overdrive planetary carrier **3**.

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft**16** → Front clutch **6** → Intermediate shaft **18** → Rear planetary ring gear **11** → Rear planetary pinion gears **12** → Rear planetary carrier **22** → Output shaft **24**

https://truckmanualshub.com/

● L Range (1st Gear)



The rotating power is transmitted in the same way as in the previously described 1st gear in the D and L ranges. However, when the engine brake is applied, 1st and reverse brake **8** activates and prevents front planetary carrier **19** from rotating clockwise. In other words, when the transmission is in 1st gear with the range selector in the D or 2 range, No. 2 one-way clutch **9** prevents a counterclockwise rotation of front planetary carrier **19** and transmits the rotating power to output shaft **24**. When the engine brake is applied, however, a rotating force in the reverse direction is generated, inactivating No. 2 one-way clutch **9** and allowing front planetary carrier **19** to spin freely. This disallows the transmission of the engine brake force. To properly transmit the engine brake force in the L range, 1st and reverse brake **8** is activated to lock front planetary carrier **19** in position.

Power transmitting process

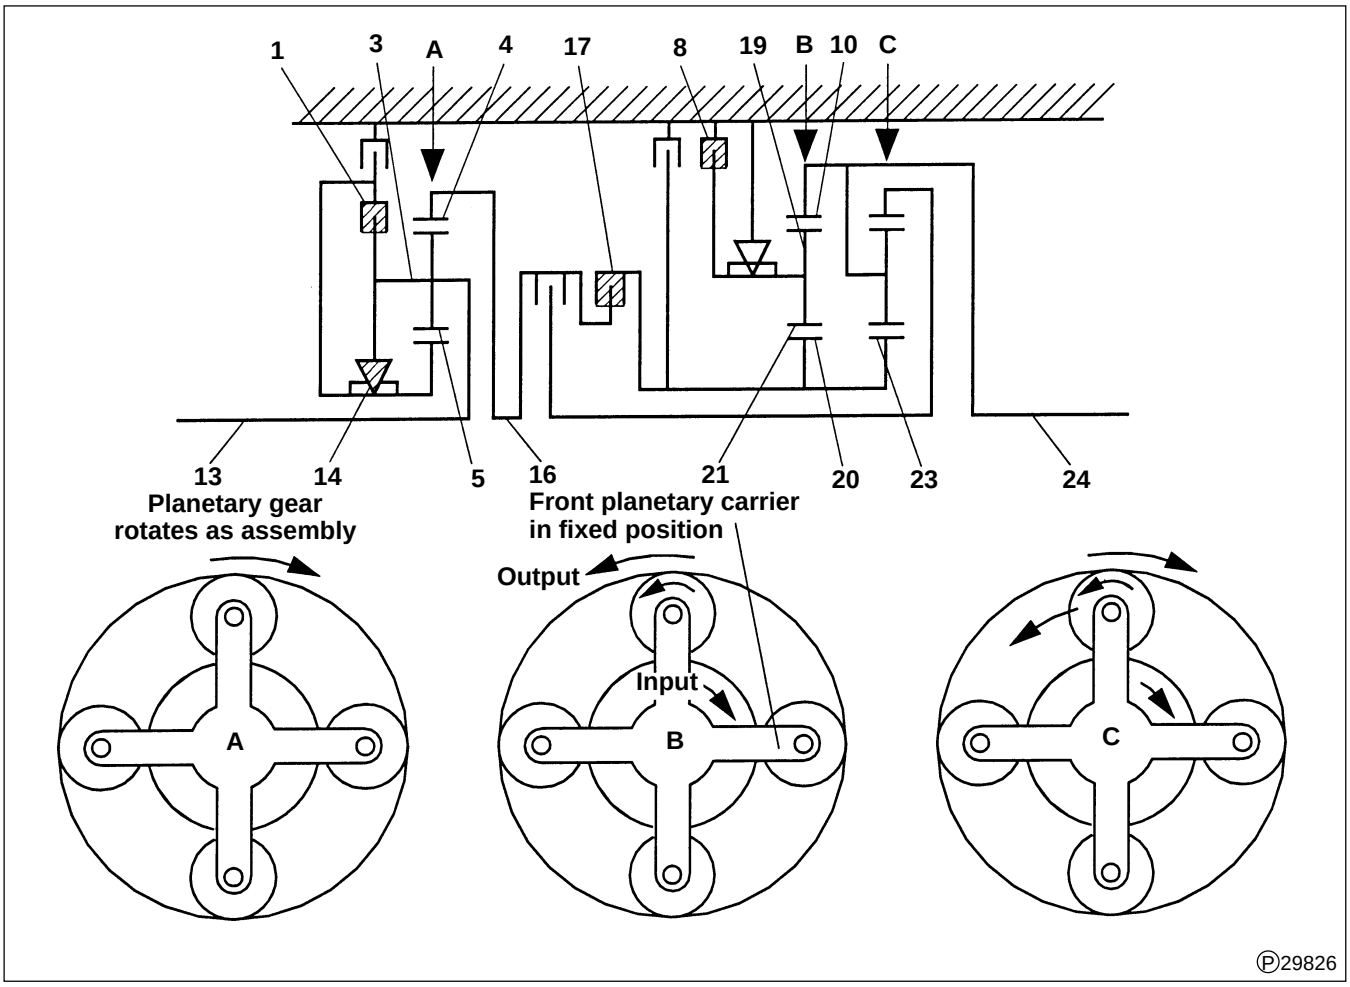
Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** → Front clutch **6** → Intermediate shaft **18** → Rear planetary ring gear **11** → Rear planetary pinion gears **12** → Rear planetary carrier **22** → Output shaft **24**

→Front and rear planetary sun gears **20**, **23** → Front planetary pinion gears **21**

→Front planetary ring gear **10**

https://truckmanualshub.com/

● R Range



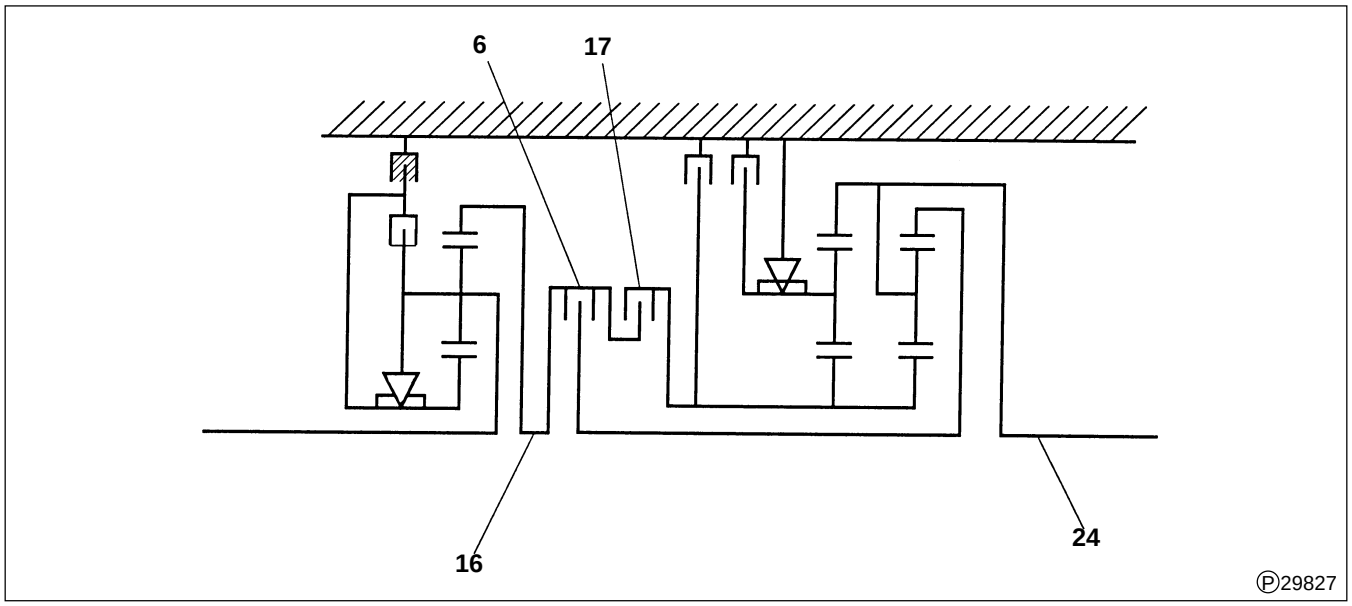
In the R range, overdrive direct clutch **1**, overdrive one-way clutch **14**, rear clutch **17** and 1st and reverse brake **8** activate to provide reverse gear. The rotating force of overdrive input shaft **13** is transmitted to input shaft **16** via direct coupling, in the same way as in the 1st gear in the D and 2 ranges. Since rear clutch **17** in operation, the rotating force of input shaft **16** is transmitted to pinion gears **21** of front planetary gear **B** by means of the sun gear. However, because front planetary carrier **19** is locked in position by 1st and reverse brake **8**, the rotating force of front planetary sun gear **20** is transmitted to the ring gear by means of front planetary pinion gears **21**, thus providing a counterclockwise rotating force to output shaft **24**.

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** → Rear clutch **17** → Front planetary sun gear **20** → Front planetary pinion gears **12** → Front planetary ring gear **10** → Output shaft **24**

https://truckmanualshub.com/

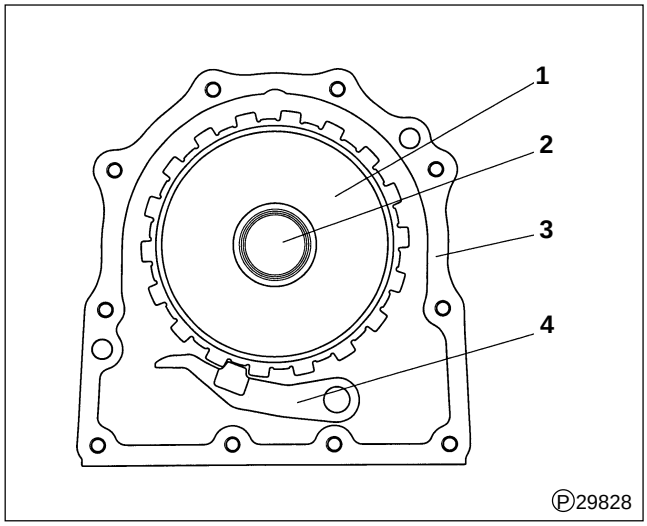
● N Range



- **N range**

  Since front clutch **6** and rear clutch **17** are disengaged, the driving force of input shaft **16** is not transmitted to output shaft **24**.

● P Range



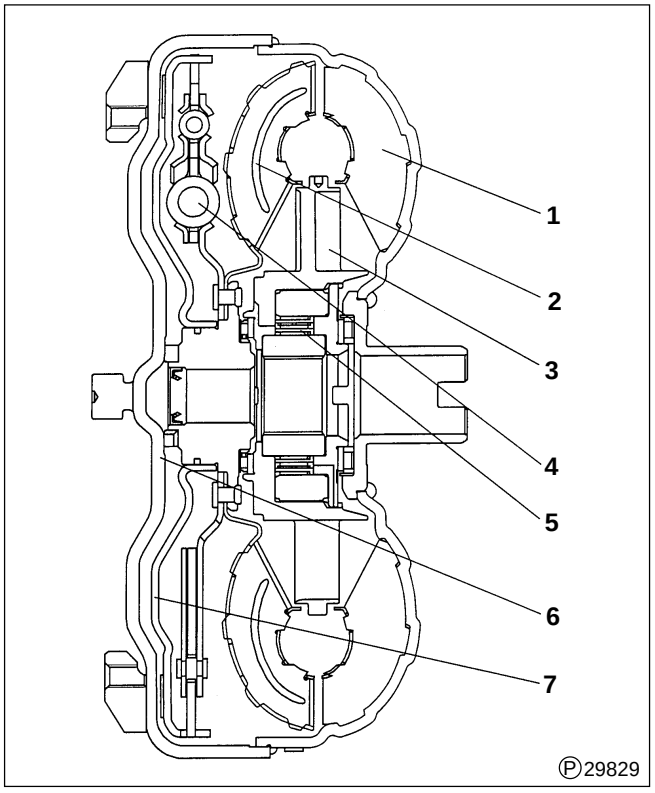
1 Parking lock gear
2 Output shaft
3 Transmission case
4 Parking lock pawl

- **P range**

  In the same way as in the N range, the driving force of the input shaft is not transmitted to output shaft **2**. Parking lock pawl **4**, which is linked with the range selector lever, meshes with parking lock gear **1** which is directly connected to the output shaft, thus disallowing vehicle movement.

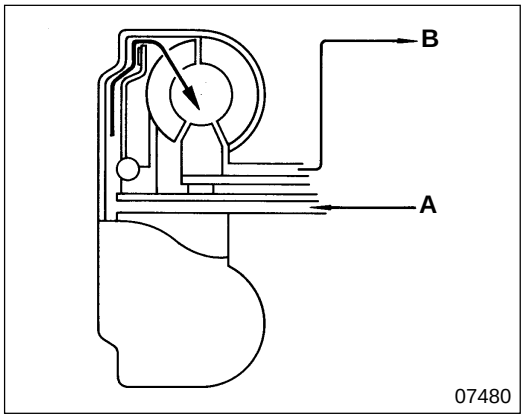
https://truckmanualshub.com/

● Torque Converter



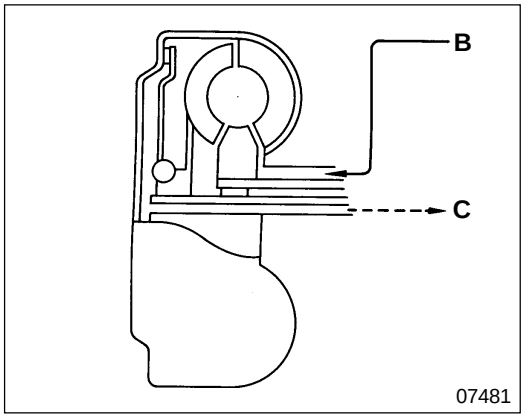
1 Pump impeller
2 Turbine liner
3 Stator
4 Lock-up damper
5 One-way clutch
6 Front converter cover
7 Lock-up piston

- The torque converter transfers engine torque to the transmission. It transmits engine torque by means of oil when it is not in a lock-up condition, and it transfers power via the lock-up piston when it is in a lock-up condition.
- The torque converter is a 3-element, 1-stage, 2-phase type.
- “1-stage” indicates that the torque converter has one turbine liner, which is an output element. “2-phase” means that it provides a torque converter function when the turbine liner speed is relatively slow as compared to the pump impeller speed, and acts as a fluid coupler when the turbine liner speed is high.



< Lock-up mechanism in inactive condition >

The lock-up control valve supplies the torque converter operating pressure through oil passage **A** to the space between the front converter cover and lock-up piston. This oil pressure separates the clutch facing of the lock-up piston from the front converter cover. As a result, the torque converter operating pressure supplied through oil passage **A** is released from oil passage **B**, and enters the oil cooler.

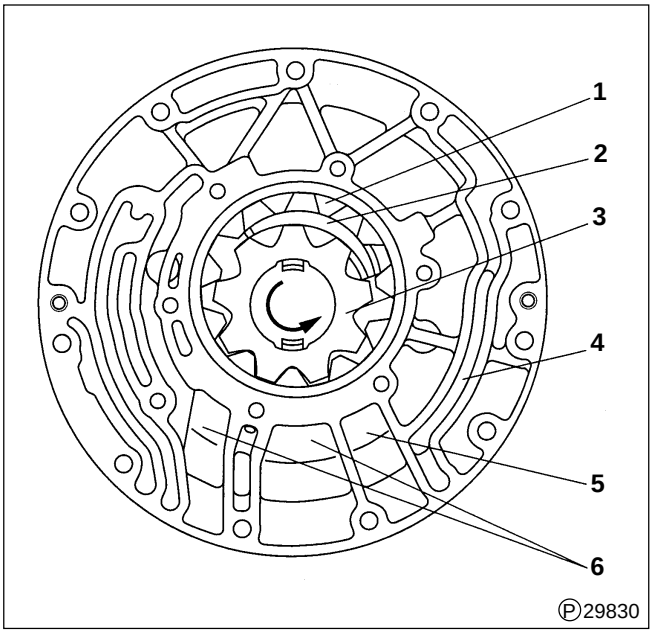


< Lock-up mechanism in active condition >

The lock-up control valve switches the operating oil passage. The torque converter operating pressure is supplied through oil passage **B** to the pump impeller, turbine liner and stator.
As a result, the oil pressure applied to the lock-up piston causes the clutch facing of the lock-up piston to engage with the front converter cover for improved power transmitting efficiency.
C : Drain

https://truckmanualshub.com/

● Oil Pump



1 Driven gear
2 Crescent
3 Drive gear
4 Oil pump body
5 Outlet port
6 Inlet port

- Feature ..... The oil pump gears have a small number of gear teeth and features a special high-performance tooth profile.
- Operation ··· The drive gear is fitted to the extension sleeve of the torque converter, and rotates in the same direction (in the direction of the arrow) as the engine to compress and discharge the intake oil.

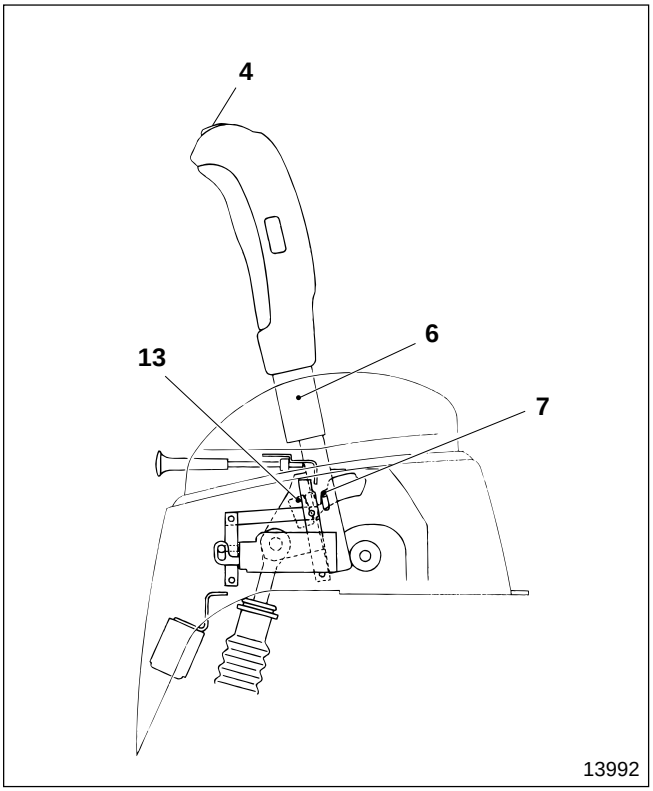
19 Automatic transmission electronic control unit
20 Backup lamp relay

A : From inhibitor switch
B : To backup buzzer

● **Parking Shift Lock Device with Key Interlock**

The key interlock device prevents the removal of the key unless selector lever **6** is in the P (Parking) range. The shift lock device disallows the selector lever from moving from the P range position unless brake pedal **15** is pressed, thereby preventing accidental vehicle movement caused by an unintended selector lever operation.



Key interlock device

< Lock condition >

Condition: When selector lever **6** is in a position other than the P range or when shift button **4** is pressed with the selector lever in the P range, pin **7** is not in contact with P range switch **13** (switch is set free). Therefore, the switch is ON.

↓

An electric current flows from key interlock electronic control unit **18** to key interlock solenoid **1** to activate the key interlock solenoid.

↓

Key interlock solenoid **1** turns ON to prevent starter switch **2** from being turned to the LOCK position, thus disabling the removal of the key.

< Unlock condition >

Condition: When selector lever **6** is in the P range and shift button **4** is not pressed, pin **7** presses again P range switch **13** (switch is activated). Therefore, the switch is OFF.

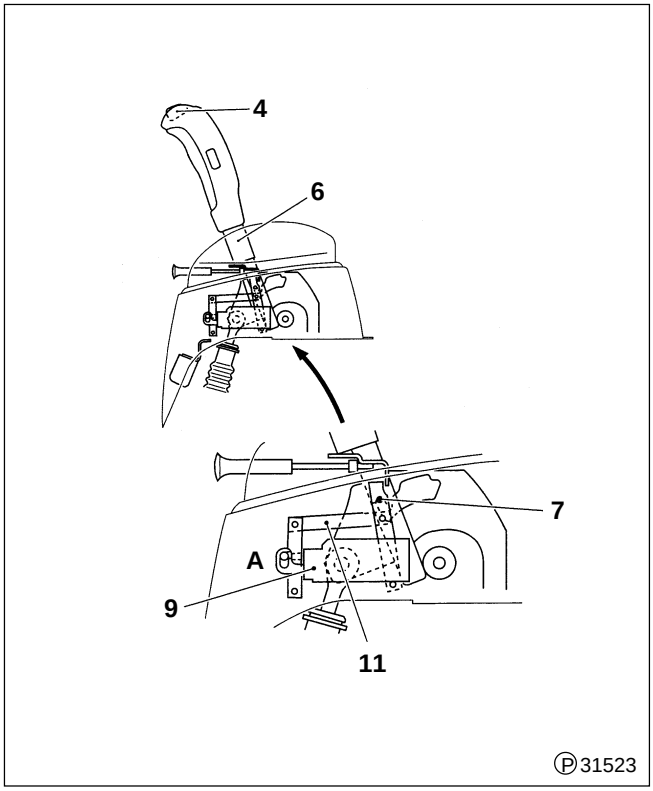
↓

No electric current flows from key interlock electronic control unit **18** to key interlock solenoid **1**. Therefore, the key interlock solenoid is OFF.

↓

Key interlock solenoid **1** does not turn ON, thereby disengaging starter switch **2** and allowing the switch to turn to the LOCK position for the removal of the key.

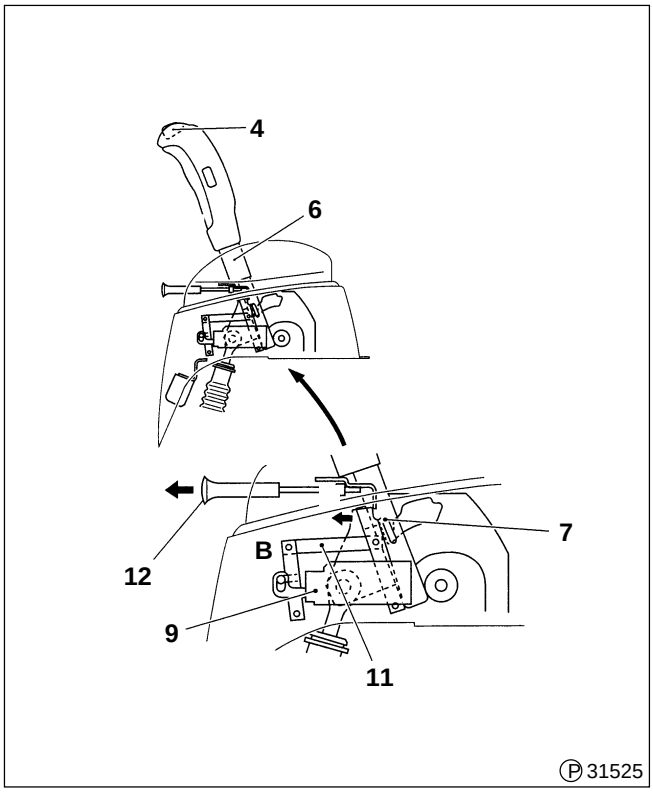
https://truckmanualshub.com/



P shift lock device

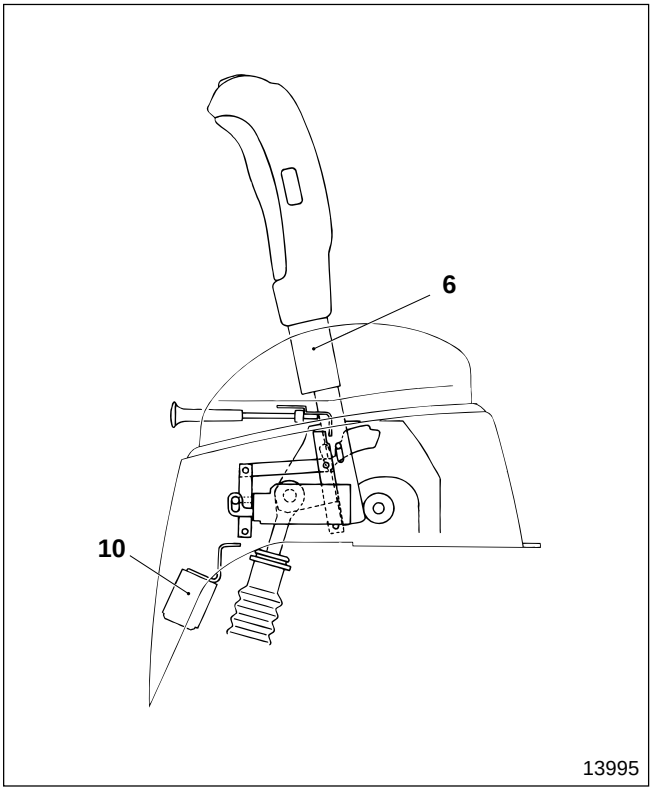
- With selector lever **6** in the P range, when the electric current (see the table below) supplied to shift lock actuator **9** sets the shift lock actuator in lock position **A**, pin **7** is restrained by shift lock link **11** and disallows pressing of shift button **4**. Therefore, the selector lever cannot be moved from the P range.

Power supply		Switch		Operation mode	
IG	+B	Brake	P range	Unlock	Lock
○	○	○	○	○←	
○	○		○		→○
○	○	○		○	
○	○			○	
	○	○	○		→○
	○		○		→○
	○	○		○	
	○			○	



- With selector lever **6** in the P range, when the electric current (see the above table) supplied to shift lock actuator **9** sets the shift lock actuator in unlock position **B**, shift lock link **11** is in the forward position to set pin **7** free, thus allowing pressing of shift button **4**. Therefore, the selector lever can be moved from the P range to another range position.
- Should an electrical problem occur and hinder proper operation, pulling of shift lock release knob **12** deactivates the P shift lock.

https://truckmanualshub.com/



● **Selector lever reverse position warning device**

When starter switch **2** is ON, moving selector lever **6** to the R (reverse) range activates the reverse position detecting switch (inhibitor switch: built into automatic transmission) and turns on automatic transmission reverse buzzer **10** to warn the driver that the selector lever is in the reverse position.

TROUBLESHOOTING PROCEDURES

Automatic transmission problems can be caused by the following malfunctions.

- Engine malfunction
- Improperly adjusted parts
- Faulty hydraulic system
- Faulty mechanical functions
- Faulty electrical system

When diagnosing the above abnormalities, be sure to inspect the following basic items.

- Engine condition: Engine Shop Manual 4D3
- Accelerator control cable adjustment: Engine Shop Manual 4D3 Gr 13
- Automatic transmission fluid level and condition: P 23-56
- Range selector cable adjustment

In addition to the inspection of the above items, use the self-diagnosis function to locate the cause of the problem and take necessary measures.

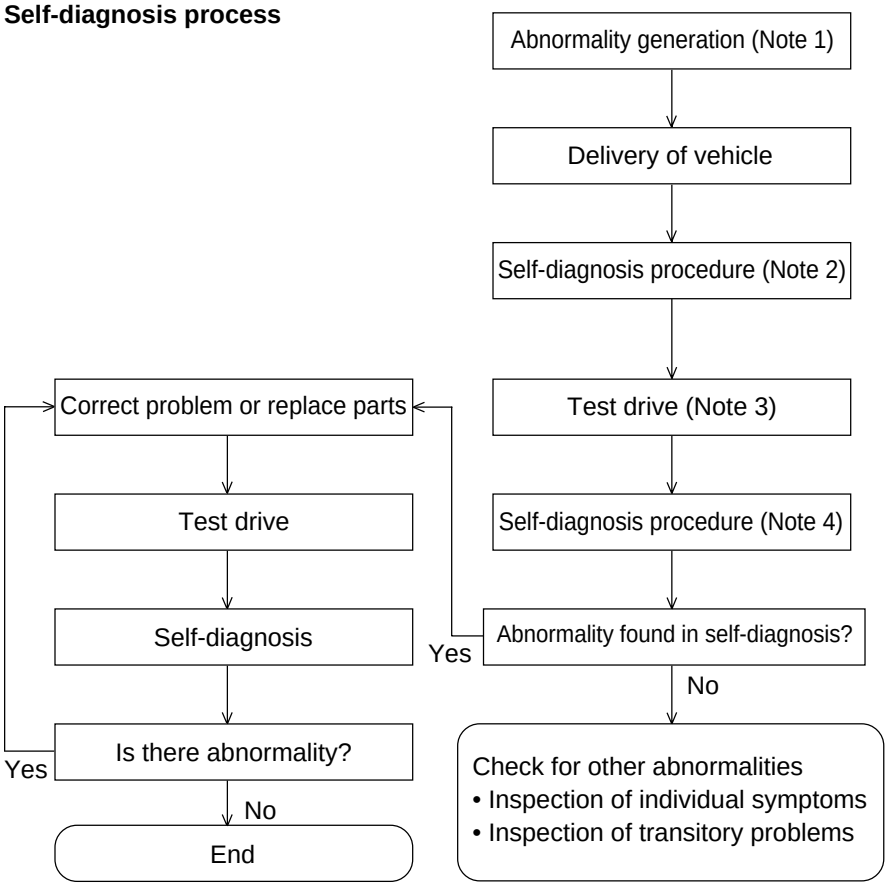
After repair is complete, test-drive the vehicle to determine whether the problem is corrected or further inspection is necessary.

If the cause of the problem cannot be located, or if repair work does not correct the problem, conduct a line pressure test and a stall test. P 23-50, 52

It should be noted that special knowledge and tools are required to repair the automatic transmission unit or replace parts. Therefore, conduct an inspection for the purpose of evaluating the operating condition of the transmission. For maintenance or repair of the automatic transmission, contact your nearest authorized Mitsubishi dealer or distributor.

Use of the MUT-II allows efficient inspection of the automatic transmission system.

Self-diagnosis process



Note 1 : The following abnormalities significantly lower driving performance. In the case that these abnormalities generate during operation, the automatic transmission warning lamp lights.
- Faulty operation of vehicle speed sensors
- Faulty operation of solenoid other than lock-up solenoid
- Faulty operation of accelerator sensor
- Faulty operation of inhibitor switch
- Faulty throttle position PWM signal

Note 2 : Inspect for malfunctions that occurred during user operation. Record inspection results.

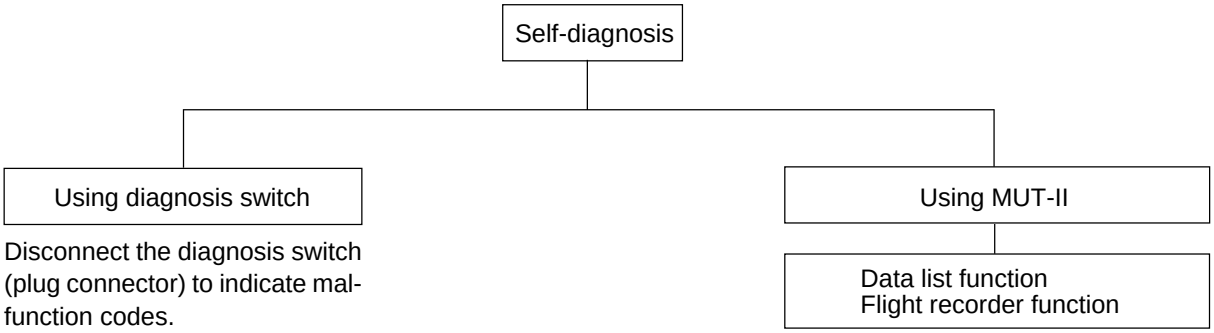
Note 3 :
- Check abnormal conditions.
- In a test drive, operate the accelerator pedal in full range (from the released position to full throttle) with a vehicle speed of up to approximately 50 km/h {31.1 mph}.

Note 4 : Inspect problems that generate during a test drive. Record inspection results.

https://truckmanualshub.com/

Types of Self-Diagnosis

The following two types of self-diagnosis function can be selected.



Disconnect the diagnosis switch (plug connector) to indicate malfunction codes.
Data of malfunctions stored in the memory can be deleted with the memory clear switch.

Connect the MUT-II to the automatic transmission electronic control unit with a test harness to download and display malfunction codes.
In addition to the self-diagnosis function, the MUT-II is equipped with a data list function that indicates sensor and switch values and a flight recorder function that records those data for a certain length of time before and after the triggering. These functions are useful in analyzing malfunctions.
(Refer to the MUT-II operation manual.)

Features of the two self-diagnosis methods

Item \ Self-diagnosis method	Use of diagnosis switch	Use of MUT-II
Convenience	○	◎
Number of self-diagnosis items	◎	◎
Data reading ease	○	◎
Data application range	×	◎

◎ : Good
○ : Fair
× : Bad

TROUBLESHOOTING

Using diagnosis switch to recall diagnosis codes and using memory clear switch to delete diagnosis codes

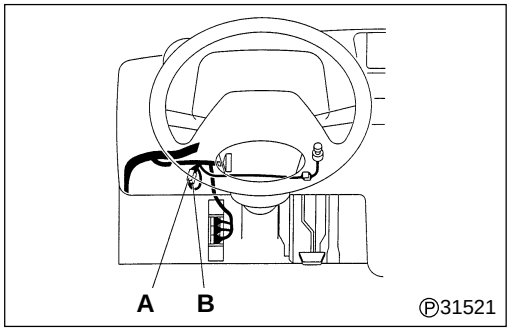
The diagnosis switch is used for the analysis of malfunction, and the memory clear switch allows deletion of stored diagnosis codes.

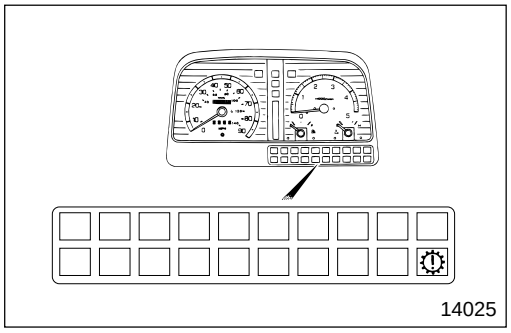
● **Recalling diagnosis code** P23-42

- Pull out the diagnosis switch to recall the diagnosis code of the current problem from the electronic control unit's memory.
- Pull out the diagnosis switch and memory clear switch to recall the diagnosis codes of the current and past problems from the electronic control unit's memory.

● **Deleting diagnosis codes** P23-43

Pull out and reinsert the memory clear switch to delete the diagnosis codes stored in the electronic control unit's memory.





● **Procedure for recalling diagnosis codes**

[Current diagnosis code]

- Turn on the starter switch.
- Remove diagnosis switch **A** (plug connector). The warning lamp begins flashing. The flashing pattern indicates a diagnosis code. Check the code list to locate the problem location. P23-44

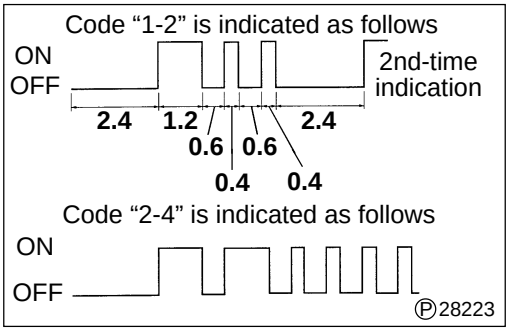
[Current and past diagnosis codes]

- Turn on the starter switch.
- Remove diagnosis switch **A** (plug connector) and memory clear switch **B** (1-pin connector). The warning lamp begins flashing to indicate diagnosis codes.
- The warning lamp indicates the diagnosis codes of past malfunctions and the diagnosis code of the current problem, if any.

CAUTION

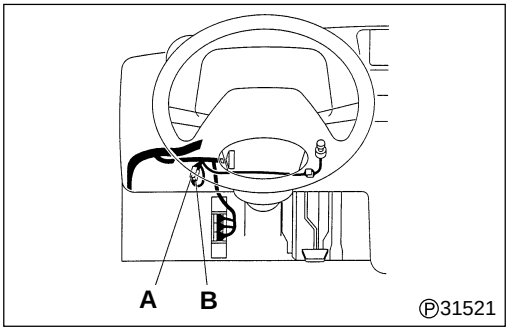
If diagnosis switch A is connected first, diagnosis codes in the electronic control unit's memory are deleted, and a "01" (normal) code is indicated.

https://truckmanualshub.com/



● **Procedure for reading diagnosis codes**

- The automatic transmission electronic control unit’s memory is stored with the data of all malfunctions that occurred after the previous self-diagnosis operation.
- The warning lamp turns off for 2.4 seconds after the self-diagnosis operation starts, then indicates a code.
  - The tens digit is indicated by 1.2-second ON operation and 0.6-second OFF operation.
  - The ones digit is indicated by 0.4-second ON operation and 0.6-second OFF operation.
  - The lamp remains OFF for 2.4 seconds between codes.
- If there are two or more malfunction codes in the memory, they are output in an order from the smallest code number. Each malfunction code is indicated three times before the following code is output.
- After all malfunction codes in the memory are output, the indication process repeats from the beginning.



● **Procedure for deleting diagnosis codes**

- Keep diagnosis switch **A** (plug connector) connected.
- Turn on the starter switch.
- Disconnect memory clear switch **B** (1-pin connector). After more than one second, connect the memory clear switch. When the memory clear switch remains connected for more than three seconds, diagnosis codes in the electronic control unit are deleted.

https://truckmanualshub.com/

● **Diagnosis Code Chart**

Diagnosis code	Problem location	Judgement criterion	Fail-safe measure
1	Normal		
11	Power supply voltage	Power supply voltage remains below 7.5 V for 1 second or longer with range selector in a position other than P or N range.	
13	Oil temperature sensor	When oil temperature of more than 135°C {275°F} or lower than -50°C{-58°F} is detected. Note that MUT display is fixed at “40°C {104°F}” after fail-safe judgement result.	Maximum oil temperature
15	Engine speed sensor	Engine speed sensor detects a value of less than 300 rpm when range selector is in a position other than P or N range and when output shaft rotating speed is 1000 rpm or higher.	Prohibits 2-3 shift timing control.
24	Accelerator sensor	• When accelerator sensor voltage is less than 0.4 V, or 4.6 V or higher	• Shift-point is set at 0% throttle opening. • Prohibits throttle learning function. • Prohibits 2-3 shift timing control. • Line pressure at maximum • Lock-up control change
25	Vehicle speed sensor 2	• Vehicle speed sensor 2 indicates sudden speed decrease.	• Maintains the gear selected immediately before malfunction detection. • Turns off shift solenoids 1, 2 when engine speed sensor detects a value of less than 1000 rpm.
31	Shift solenoid 1	• When solenoid output short-circuit occurs while solenoid is receiving current. • When solenoid output disconnection occurs while solenoid is not receiving current.	• Turns off malfunctioning shift solenoid. • Turns off lock-up solenoid and timing solenoid. • Refer to the chart on P23-54 for gear selection.
32	Shift solenoid 2	• When solenoid output short-circuit occurs while solenoid is receiving current. • When solenoid output disconnection occurs while solenoid is not receiving current.	• Turns off malfunctioning shift solenoid. • Turns off lock-up solenoid and timing solenoid. • Refer to the chart on P23-54 for gear selection.
34	Line pressure solenoid	When wire breakage or short-circuit occurs.	Turns off line pressure solenoid.
35	Lock-up solenoid	• When solenoid output short-circuit occurs while solenoid is receiving current. • When solenoid output disconnection occurs while solenoid is not receiving current.	Turns off lock-up solenoid.
43	Inhibitor switch	• No signal	Operates as D range and prohibits shifting to 4th gear.
		• Two or more signals	• Control function activates based on priority order of L > R > 2 > D > N (P). • Refer to pages 23 through 54 for actual vehicle operation conditions.
50	PTO solenoid	When solenoid output short-circuit occurs while solenoid is receiving current. When solenoid output is cut off while solenoid is not receiving current.	Turns off PTO solenoid.
51	Timing solenoid	• When solenoid output short-circuit occurs while solenoid is receiving current. • When solenoid output disconnection occurs while solenoid is not receiving current.	Turns off timing solenoid.

https://truckmanualshub.com/

● **Diagnosis Code Chart**

Diagnosis code	Problem location	Judgement criterion	Fail-safe measure
54	Exhaust brake cut-off signal	Exhaust brake activates when exhaust brake cut-off signal is generated.	• Prohibits exhaust brake cut-off control • Allows lock-up only at high cruising speed.
58	PWM signal	Malfunction of engine electronic control unit (PWM signal fixed at 1 V or lower)	Shift-point is set at 0% throttle opening. Prohibits 2-3 shift timing control. Line pressure at maximum Prohibits throttle position learning function.
		Wire breakage or short-circuit	Prohibits throttle position learning function.

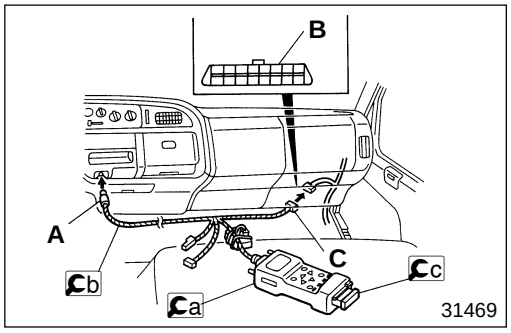
TROUBLESHOOTING

Procedure for servicing with MUT-II

Special tools

Location	Tool name and shape	Part No.	Application
—	MUT-II PLUS  19492	MB991496-A	System inspection
—	MUT-II harness  19141	MK327601	
—	ROM pack (MRT-E4)  19493	MK327927	



● **Connecting the MUT-II**

- Turn the starter switch to the LOCK position.
- Connect the b MUT Communication Harness to the a MUT-II, and insert the c ROM Pack.
- Plug connector **A** into the cigarette lighter socket.
- Fit connector **C** onto Mut connector **B** (16-pin) in the relay box.

NOTE

Instructions for operation of the MUT-II are given in the separate MUT-II Reference Manual.

https://truckmanualshub.com/

● **Inspection using MUT-II**

①The MUT-II indicates diagnosis codes that provide information of malfunctioning items (devices that require inspection).

②The MUT-II indicates sensor signal conditions with numerical values (service data). Comparison of the service data with judgement criteria allows evaluation of the transmission operation. Diagnosis codes and service data codes can be effectively used for troubleshooting.

①		②

https://truckmanualshub.com/

Stall Test

● **Purpose**

To check wearing of gears, slippage of one-way clutches, operation of torque converter and overall performance of the engine.

● **Measuring procedure**

Before the test, inspect the engine coolant, engine oil and automatic transmission fluid. Run the engine until the engine coolant temperature reaches an appropriate level. Also conduct a warm-up operation for the automatic transmission and bring the automatic transmission fluid temperature to an appropriate level.

- Place wheel chocks in front and back of all wheels, and apply the parking brake. When operating the accelerator pedal, be sure to press down firmly on the foot brake pedal.
- Shift the range selector lever to the D range.
- Press down on the accelerator pedal gradually to full throttle. When the engine speed stabilizes, quickly read the engine rpm (stall speed) and remove foot from the accelerator pedal.

CAUTION ⚠

- **Limit each measuring operation to five seconds. Extended testing causes automatic transmission fluid degradation and adverse effects to the internal parts.**
- **If the engine speed does not stabilize but continues to increase or suddenly jumps, stop the test immediately.**

- Shift the range selector lever to the N range, and let the engine run at approximately 1200 rpm for one minute or longer for cooling.
- Conduct tests in the same way with the range selector lever in each of the 2, L and R ranges.
- Stall speed

FE 639	1810±150 rpm
FE 649	1890±150 rpm

● **Diagnosis of test result**

Measuring result	Suspected abnormality
Lower than standard value in all ranges	Insufficient engine output power
	Faulty operation of one-way clutch in torque converter
Higher than standard value in D range	Slippage of front clutch
	Faulty operation of No. 2 one-way clutch
	Low line pressure
Higher than standard value in R range	Slippage of rear clutch
	Slippage of 1st and reverse brake
	Low line pressure
Higher than standard value in all range	Low line pressure
	Inappropriate automatic transmission fluid level
	Slippage of overdrive direct clutch
	Faulty operation of overdrive one-way clutch

https://truckmanualshub.com/

Time Lag Test

● **Purpose**

To check the conditions of overdrive direct clutch, front clutch, rear clutch and 1st and reverse brake.

● **Measuring procedure**

- Bring the oil temperature to normal operating level of between 50 and 80°C {122 and 176°F}.
- Start the engine and check the idle speed.
- Shift the range selector lever from the N range to the D range and use a stopwatch to measure the time it takes for shock to be felt.
- In the same way, measure the time lag by shifting the range selector lever from the N range to the R range.

	Standard value
N→D shifting	0.7 sec or less
N→R shifting	1.2 sec or less

● **Diagnosis of test result**

Measuring result	Suspected abnormality
Large time lag in N→D shift	Low line pressure
	Slippage of front clutch
	Faulty operation of overdrive one-way clutch
Large time lag in N→R shift	Low line pressure
	Slippage of rear clutch
	Slippage of 1st and reverse brake
	Faulty operation of overdrive one-way clutch

https://truckmanualshub.com/

Line Pressure Test

● **Purpose**

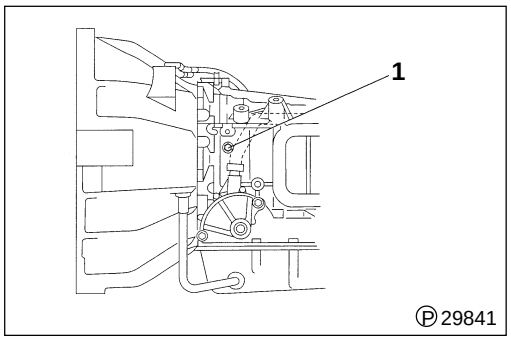
To check the oil pump capacity, control valve functions and leaks in hydraulic circuit.

● **Measuring procedure**

CAUTION ⚠

The line pressure test requires two persons. One person must observe tire movement and wheel chocks from outside the vehicle, while the other person conducts the test.

- Apply the parking brake firmly.
- Place wheel chocks.



- Remove pressure detecting plug **1**, and mount the oil pressure gauge.
- Start the engine, and operate it until the automatic transmission fluid temperature reaches between 50 and 80°C {122 and 176°F}. Then, check the idle speed.
- While pressing the brake pedal firmly with the left foot, shift the range selector lever to the D range and measure the oil pressure while the engine is idling.
- Press the accelerator pedal all the way, and quickly measure the oil pressure at stall speed.

CAUTION ⚠

If the engine RPM's do not reach stall speed and the rear wheels start rotating, release the accelerator pedal and stop the test.

- Measure the oil pressure with the range selector lever in the R range by following the above procedure.
- After the measurement, re-install pressure detecting plug **1** and tighten to the specified torque.

Pressure detecting plug	Bolt size	1/2-20UNF
	Tightening torque	7.5 N·m {5.5 lbf.ft, 0.76 kgf·m}

● **Line pressure** kPa {lbf/in^2, kgf/cm^2}

Idle oil pressure	FE639	D range	529 to 784 {77 to 115, 5.4 to 8.0}
	FE649	R range	755 to 1127 {110 to 165, 7.7 to 11.5}
Stall oil pressure	FE639	D range	990 to 1480 {145 to 215, 10.1 to 15.1}
	FE649	R range	1401 to 2107 {205 to 305, 14.3 to 21.5}

https://truckmanualshub.com/

● **Diagnosis of test result**

Measuring result	Suspected abnormality
Higher than standard value in all ranges	Faulty adjustment of throttle cable
	Sticking of regulator valve
	Sticking of throttle valve
Lower than standard value in all ranges	Faulty adjustment of throttle cable
	Sticking of regulator valve
	Sticking of throttle valve
	Excessive wear of oil pump
	Faulty overdrive direct clutch
Lower than standard value only in D range	Oil leak in D range system
	Faulty front clutch
Lower than standard value only in R range	Oil leak in R range system
	Faulty rear clutch
	Faulty 1st and reverse brake

https://truckmanualshub.com/

Road Test

● **Measuring procedure**

Before the road test, check the level and condition of the automatic transmission fluid. Also make sure that the range selector cable and the accelerator control cable are properly adjusted.
Operate the automatic transmission in every range position during the road test and check slippage and other operating conditions during shifting of gears.
Check to see if the shift feels too tight or too loose.
Check the shift points of up-shifting and downshifting.
Check shift-point vehicle speeds under various driving conditions.

● **Shift-point vehicle speeds**

Unit : km/h {mph}

Throttle opening	Shifting	Economy mode	Power mode
Half throttle	D1→D2	8.63 to 11.1 {5.36 to 6.9}	9.37 to 11.84 {5.82 to 7.36}
	D2→D3	19.73 to 22.2 {12.3 to13.8}	20.96 to 23.43 {13.0 to 14.6}
	D3→D4	48.83 to 51.3 {30.3 to 31.9}	38.72 to 41.19 {24.1 to 25.6}
Full throttle	D1→D2	17.26 to 19.73 {10.7 to 12.3}	19.48 to 21.95 {12.1 to13.6}
	D2→D3	34.53 to 36.99 {21.5 to 23.0}	41.93 to 44.39 {26.1 to 27.6}
	D3→D4	63.14 to 65.6 {39.2 to 40.8}	73.99 to 78.92 {46.0 to 49.0}
Closed throttle	L2→L1	22.94 to 25.4 {14.3 to 15.8}	22.94 to 25.4 {14.3 to 15.8}
	23→22	51.79 to 54.26 {32.2 to 33.7}	51.79 to 54.26 {32.2 to 33.7}

https://truckmanualshub.com/

● **Lock-up vehicle speeds** Unit : km/h {mph}

Throttle opening	Shifting	Economy mode	Power mode
Half throttle	3rd gear ON (Overdrive ON)	48.09 to 50.56 {29.9 to 31.4}	
	3rd gear ON (Overdrive OFF)	53.03 to 55.49 {33.0 to 34.5}	
	4th gear ON	56.38 to 58.85 {35.0 to 36.6}	
Full throttle	3rd gear ON	53.03 to 55.49 {33.0 to 34.5}	
	4th gear ON	73.99 to 78.92 {46.0 to 49.0}	
Closed throttle	3rd gear OFF	43.16 to 45.63 {26.8 to 28.4}	
	4th gear OFF		

The above standard values are based on the following conditions.
5.714 differential gear ratio, 0.374 m tire radius (215/85R16)
If the differential gear ratio and/or the tire radius are different from the above, proper standard values must be calculated based on the ratios of the differences and the above figures.

https://truckmanualshub.com/

Inspection of Automatic Transmission Fluid (ATF)

If the automatic transmission has insufficient ATF, the pump draws air together with ATF. Air bubbles mixed in the ATF cause a “sponge” effect and lower the pressure. This can cause slipping of internal clutches.
On the other hand, if the ATF level is too high, excess air bubbles also result when rotating parts agitate the ATF, thus causing the same effect as when the ATF level is low.
In both cases, excess air bubbles lead to overheat, oxidation of oil and varnish generation, thereby hindering proper operation of the valves and clutches.
Excess air bubbles in the ATF also cause ATF to overflow from the vent hole and filler tube, which may be mistakenly diagnosed as an ATF leak.
To prevent these problems, read the ATF level accurately by following the procedure described below.

(1) Inspection of ATF condition

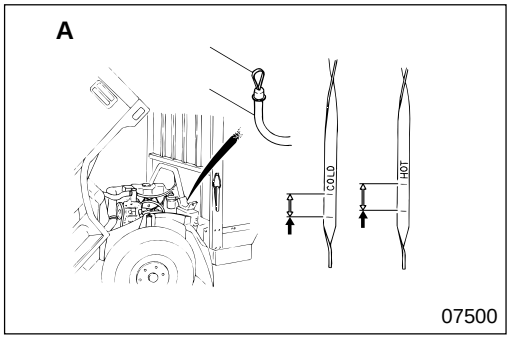
If ATF has a burned odor and contains metal shavings or particles, the automatic transmission needs an overhaul. Closely inspect the ATF adhered on level gauge **A**.
If ATF is suspected to be in poor condition, take out a sample and inspect closely.

(2) Inspection of ATF level

CAUTION ⚠

- **Inspection is conducted while the engine is running. Be careful of moving parts and hot areas to prevent personal injuries and burns.**
- **Before inspection, check the idle speed.**
- **Place the vehicle on level ground.**
- **Bring the transmission to normal operating temperature (70 to 80°C {158 to 176°F}) before inspection.**
- **Before pulling out level gauge A, clean the protective cap and the upper part of the filler tube.**

- Apply the parking brake firmly, and place wheel chocks.
- With the engine idling, press down on the brake pedal and shift the range selector lever slowly from the P range to the L range, stopping at each position in between. Then return the range selector lever to the P range.
- With the engine idling, pull out level gauge **A**. Wipe the ATF from the level gauge and blow compressed air to remove lint and other particles. Insert the level gauge, and pull it out. Check to make sure that the ATF level is in the range marked “HOT.”



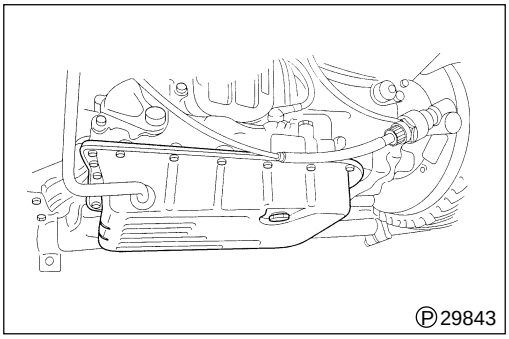
CAUTION ⚠

- **If the ATF temperature is low (20 to 30°C {68 to 86°F}), such as after an ATF change, bring the ATF level to the area on the level gauge marked “COLD.” Then, after the transmission temperature rises to normal operating level (70 to 80°C {158 to 176°F}), check to make sure that the ATF level is in the area on the level gauge marked “HOT.”**
- **If the markings on the front and back sides of the level gauge show different level indications, use the line that indicates the lower ATF level.**

- If the ATF level is low, add ATF from the filler tube to the specified level on level gauge **A**.

https://truckmanualshub.com/

Changing Automatic Transmission Fluid (ATF)



(1) Drain

- Place an ATF receiving tray under the automatic transmission oil pan. Remove the drain plug located at the back side of the pan to drain ATF.
  Tightening torque: 27 N·m {20 lbt.ft, 2.8 kgf·m}

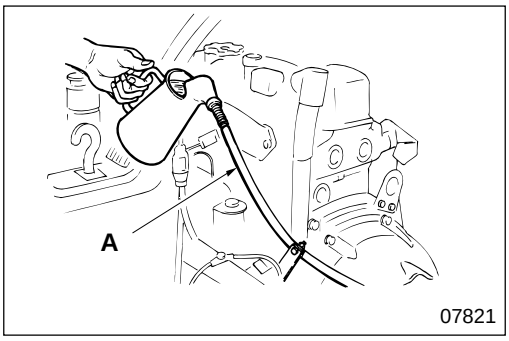
CAUTION ⚠

- **ATF is very hot immediately after the engine is turned off. Wait until the ATF temperature lowers sufficiently.**
- **For faster ATF drainage, warm up the engine.**
- **ATF in the hydraulic circuit, torque converter and oil cooler cannot be drained in the above process.**
- **Inspect the drained ATF for dirtiness and contamination such as metal shavings and particles.**

- After the above process, approximately 1 L {1.1 qts} of ATF remains in the oil pan. If you wish to drain this remaining ATF, remove the oil pan. 🕮 P23-76

Amount of drained ATF

ATF drained by removing oil pan : Approximately 4.5 L {4.8 qts}
ATF drained by removing drain plug : Approximately 3.5 L {3.7 qts}



(2) Adding ATF

- Prepare new ATF.
- Re-install the oil pan drain plug and gasket.
- From filler tube **A**, add the same amount of ATF as drained.

CAUTION ⚠

Be careful not to let dust and other particles mix with ATF.

- Start the engine and let it idle for at least two minutes.
- Shift the range selector lever into every position, then back to the P range.

CAUTION ⚠

Do not rev up the engine in the above process.

- Check the ATF level. 🕮 P23-56

(3) ATF leaks

- Torque converter housing of the automatic transmission unit
- Check for leaking locations
  Since the torque converter and the surrounding area can be soiled with oil that leaks from the engine, inspect those areas carefully. ATF is red, so that it can be easily distinguished from engine oil.
- Before dismounting the automatic transmission, carefully examine if ATF leaks from the torque converter or the automatic transmission unit (oil seal of oil pump housing or connection of oil pump housing and case).

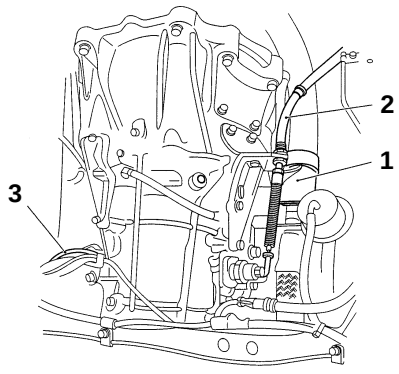
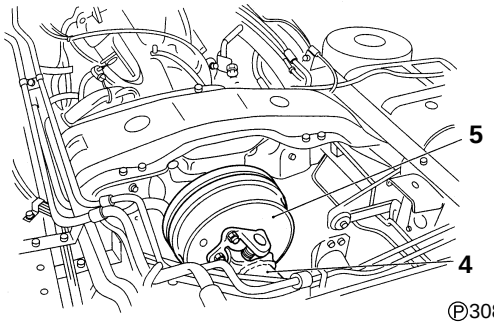
REMOVAL AND INSTALLATION OF AUTOMATIC TRANSMISSION ASSEMBLY

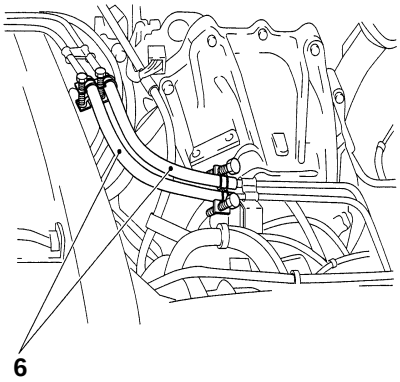
Preparation



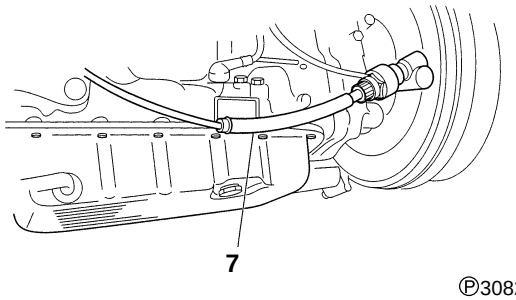
Ⓟ31515



Ⓟ30821



Ⓟ30920



Ⓟ30822

● **Removal sequence**

1	Exhaust pipe	Gr 15
2	Selector cable	P23-72
3	Electrical harness	
4	Propeller shaft	Gr 25
5	Parking brake	Gr 36
6	Oil cooler hose	P23-63
7	Speedometer cable	

CAUTION

After removing propeller shaft 5, suspend the shaft at the same height as the installation position by securing it to the frame with a rope.

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION

If the automatic transmission unit is replaced due to a malfunction and if the automatic transmission fluid contains a large amount of impurities, conduct flushing of the oil cooler system. P23-63

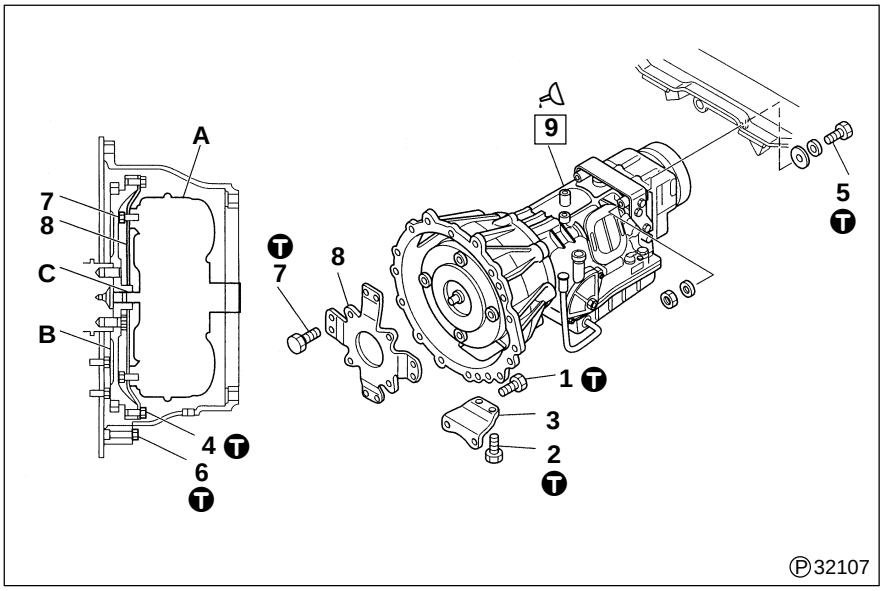
Removal



● **Removal sequence**

1 Bolt
2 Bolt
3 Dust cover
4 Bolt (8)
5 Bolt
6 Bolt
7 Bolt (4)
8 Drive plate
9 Automatic transmission assembly

A: Torque converter
B: Flywheel
C: Pilot section

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION ⚠

Remove the automatic transmission assembly with drive plate 8 attached to torque converter A.

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Automatic transmission assembly mounting and dust cover mounting)	47 {35, 4.8}	—
2	Bolt (Dust cover mounting)	13 {9.4, 1.3}	—
4	Bolt (Flywheel and drive plate coupling)	32 {24, 3.3}	—
5	Bolt (Rear mounting)	83 to 105 {61 to 80, 8.5 to 11}	—
6	Bolt (Automatic transmission assembly mounting)	82 {61, 8.4}	M12
		47 {35, 4.8}	M10
	Bolt (Bracket mounting)	40 {30, 4.1}	—
7	Bolt (Drive plate mounting)	79±12 {59±8.7, 8.1±1.2}	—

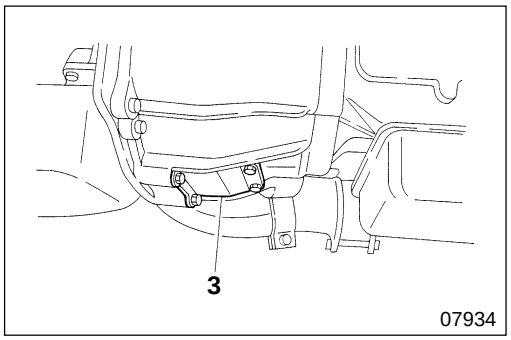
Lubricant

Location	Points of application	Specified lubricant	Quantity
9	Pilot section C on torque converter A in automatic transmission assembly	Molybdenum disultide grease [NLGI No.2 (Li soap)]	As required

https://truckmanualshub.com/

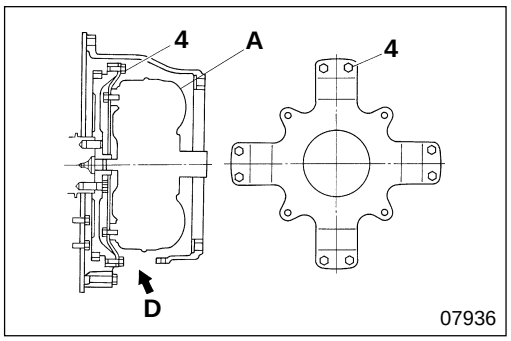
◆ Service procedure

9 Automatic transmission assembly

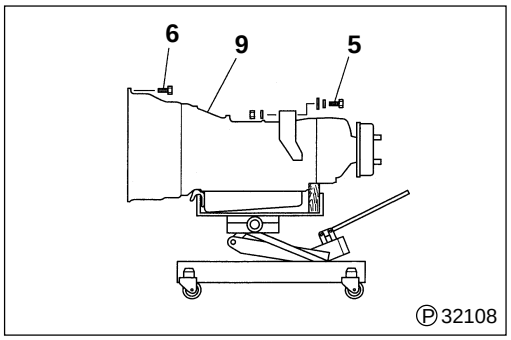


[Removal]

- Remove dust cover **3**.



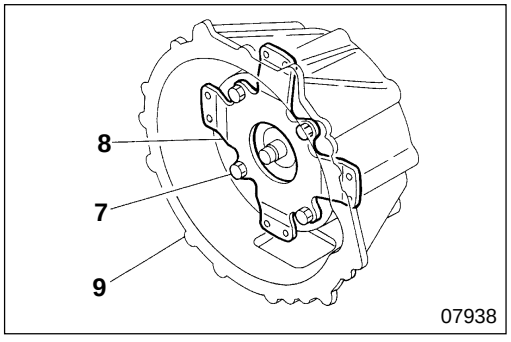
- Turn the engine so that bolt **4** is positioned at service window **D**.
- Remove eight bolts **4**. Remove two bolts at each of the four locations by turning the engine and stopping at the proper position.



- Support automatic transmission assembly **9** with a jack, then remove automatic transmission assembly mounting bolts **5**, **6**.
- Remove automatic transmission assembly **9** by pulling towards the back of the vehicle.

CAUTION ⚠

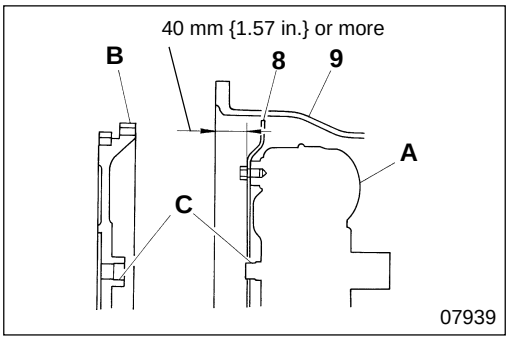
- **Do not support the automatic transmission by the oil pan, since it causes shape deformation of the oil pan and oil pan gasket.**
- **Since torque converter A can easily separate from the automatic transmission assembly, be careful not to drop the torque converter.**
- **Mounting bolts 6 are different in length. Record the length of each bolt when removing, so that bolts can be re-installed in the original locations.**



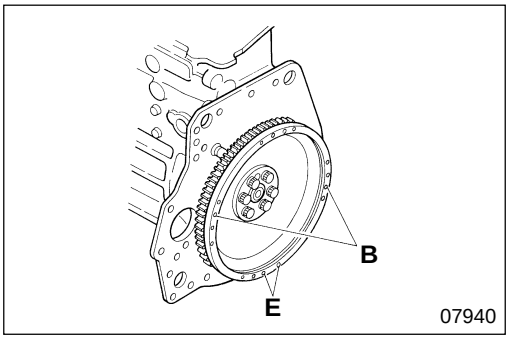
[Installation]

- Install drive plate **8** to torque converter **A** before installing the torque converter into automatic transmission assembly **9**.
  Tighten bolts **7** to the specified torque.

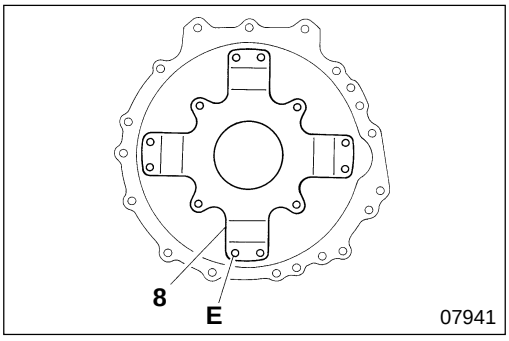
https://truckmanualshub.com/



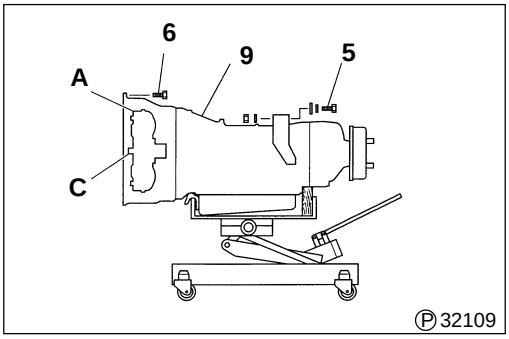
- Check to make sure that torque converter **A** is properly mounted in automatic transmission assembly **9**.
  When the torque converter is properly installed, the distance between the surface of drive plate **8** and the case mounting surface is as indicated in the diagram.
- Apply grease on pilot sections **C** of flywheel **B** and torque converter **A**.



- Turn flywheel **B** so that one of bolt holes **E** on the flywheel is located at the lowest position. Bolt holes are used to connect drive plate **8** to the flywheel.



- Turn drive plate **8** so that one of bolt holes **E** is located at the lowest position.



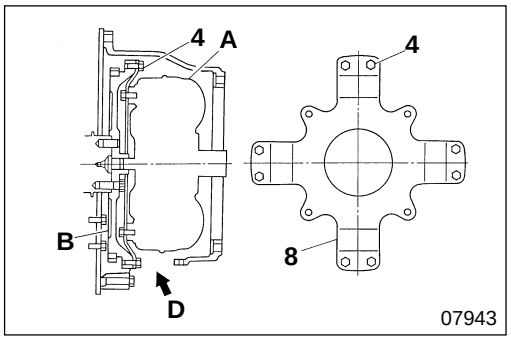
- Install automatic transmission assembly **9** into position slowly and carefully while aligning pilot section **C** and the dowel pin of the rear plate.
- Tighten several mounting bolts **6** on automatic transmission assembly **9** for temporary holding. Tighten bolts **5** to the specified torque to mount the automatic transmission assembly to the rear support.

CAUTION ⚠

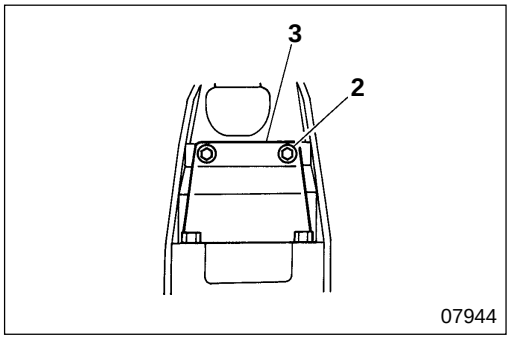
- **Torque converter A can easily separate from the automatic transmission assembly 9. To keep the torque converter in place, set the back side of automatic transmission assembly slightly lower than the front part.**
- **Before mounting the automatic transmission assembly 9, wipe oil adhered on the internal wall of the torque converter housing.**

https://truckmanualshub.com/

REMOVAL AND INSTALLATION OF AUTOMATIC TRANSMISSION ASSEMBLY



- Align the bolt holes of drive plate **8** and flywheel **B** by looking through service hole **D**, and mount bolts **4**.
- Temporarily tighten all eight bolts, two bolts at each of the four locations, by turning the engine and stopping at the proper position. Then, repeat the same process, and tighten the bolts to the specified torque.



- Tighten all automatic transmission assembly mounting bolts **6** to the specified torque.
- Tighten bolts **2** to the specified torque to secure dust cover **3** in place.

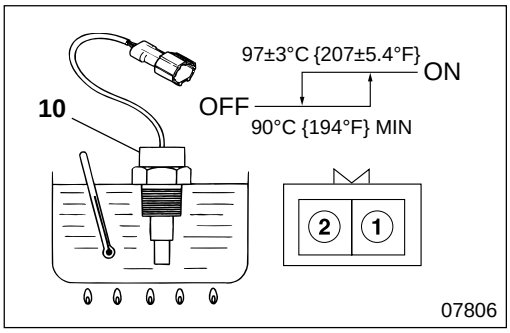
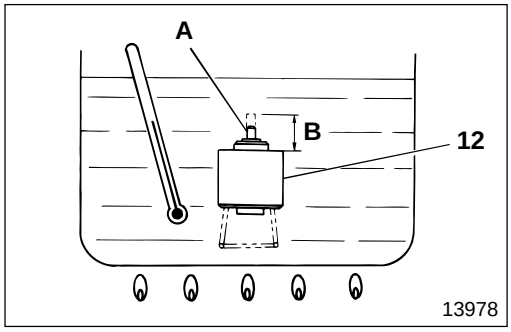
◆ Service procedure



10 Inspection of automatic transmission fluid thermostat switch

Carry out the following inspection and replace automatic transmission fluid thermostat switch **10** if there are any faults.

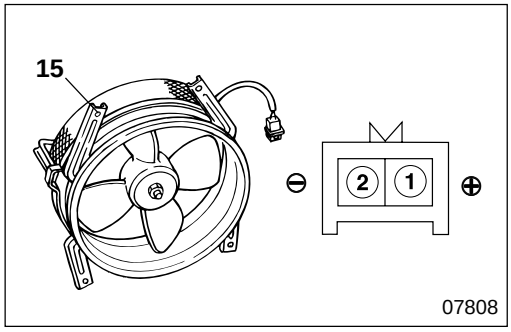
- Check that there is no continuity between terminals ① and ② at ambient temperature of 20±5°C {68±9°F}.
- Place automatic transmission fluid thermostat switch **10** in a container filled with automatic transmission fluid, and raise the temperature while stirring well.
  Measure the temperature when continuity has been achieved between terminals ① and ②, and check that the measured value conforms to the standard value.
- Lower and measure the temperature when continuity is lost between terminals ① and ②, and check that the measured value conforms to the standard value.



12 Inspection of thermostat valve

Carry out the following inspection. If any fault is found, replace thermostat valve **12**.

- Place thermostat valve **12** in a container filled with automatic transmission fluid and raise the fluid temperature while stirring the fluid.
  Make sure that end **A** starts stroking at a temperature of 76.5±3°C {170±5.4°F}.
- Raise the fluid temperature further and make sure that end **A** expands by 4.5 mm {1.18 in.} and dimension **B** in the illustration is 13.4 mm {0.53 in.} at a temperature of 83±2°C {181±3.6°F}.



15 Inspection of blower assembly

Check blower assembly **15** and make sure it operates when battery voltage is loaded between terminals ① and ②. If any fault is found, replace the blower assembly.

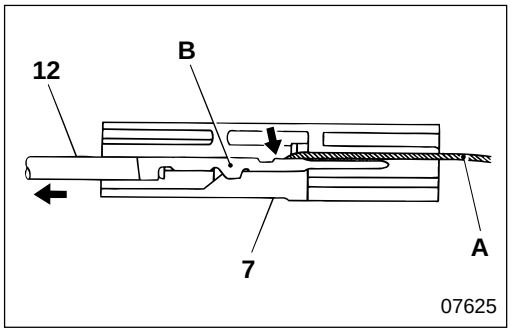
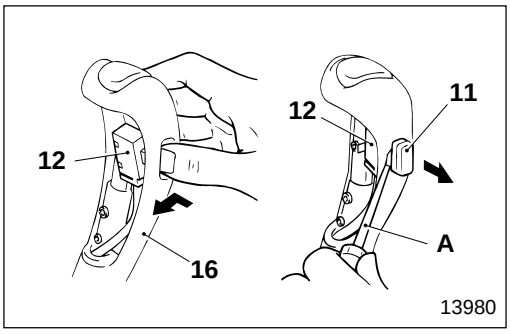
◆ Service procedure



7 **Removal of connector**

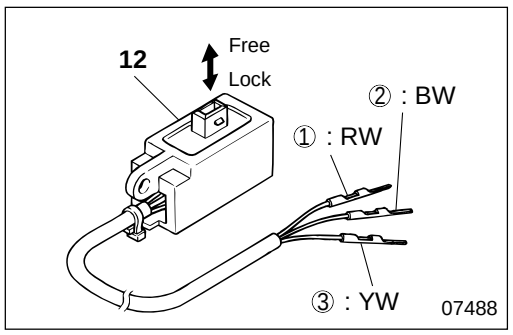
Using screwdriver **A**, pull out terminal **B** of overdrive OFF switch **12** from the inside of connector **7** and remove the connector.



11 **12** **Switch button, overdrive OFF switch**

[Removal]

- Using screwdriver **A**, remove switch button **11** from overdrive OFF switch **12**.
- Remove overdrive OFF switch **12** from automatic transmission knob **16** by pushing the switch out.

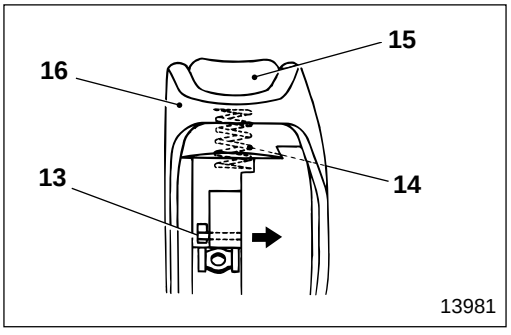


[Inspection of overdrive OFF switch **12**]

	① : RW	② : BW	③ : YW
Free	○		○
Lock	○	○	

○——○ : There is continuity between terminals ○ and ○.

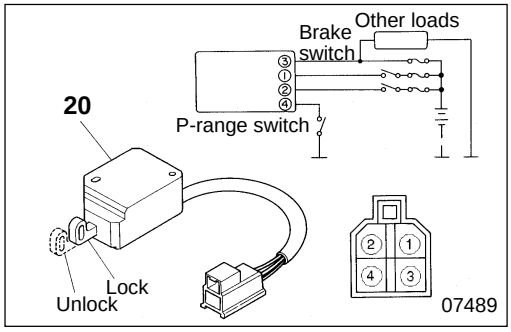
Replace overdrive OFF switch **12** if it is faulty.



13 **Removal of pin**

While keeping shift button **15** and spring **14** pressed down, remove pin **13** towards the inside (arrow direction) of automatic transmission knob **16**.

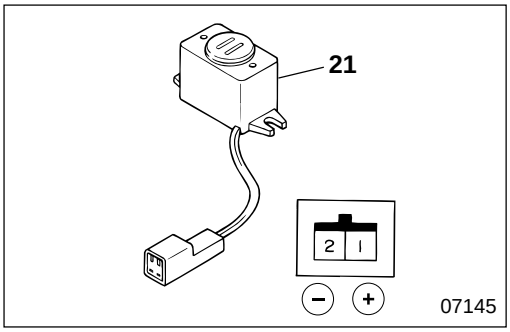
https://truckmanualshub.com/



20 **Inspection of shift lock actuator**

Power supply		Switch		Operating mode	
IG	+B	Brake	P range	Unlock	Lock
○	○	○	○	○←	
○	○		○		→○
○	○	○		○	
○	○			○	
	○	○	○		→○
	○		○		→○
	○	○		○	
	○			○	

Check to make sure that shift lock actuator **20** is in operating mode under the above power supply and switch position.
Replace the shift lock actuator if it is faulty.

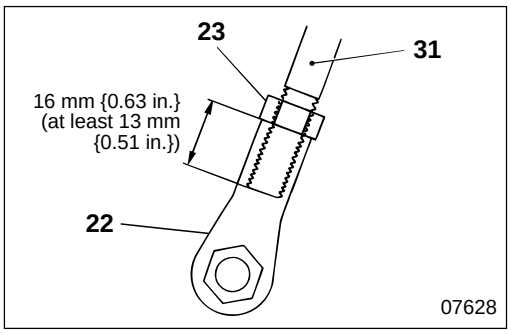


21 **Inspection of automatic transmission reverse buzzer**

- Check to make sure that the automatic transmission reverse buzzer sounds when 12 volts DC is loaded between terminals ① and ②.
- Replace automatic transmission reverse buzzer **21** if it is faulty.

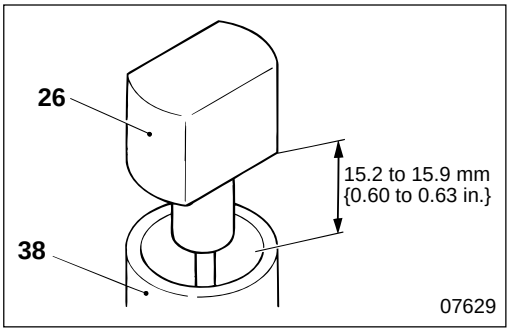
NOTE

- **Automatic transmission reverse buzzer 21 sounds continuously when you apply voltage.**
- **If you want to make automatic transmission reverse buzzer 21 sound intermittently, use the automatic transmission reverse buzzer and the back buzzer in combination.**



22 **Installation of ball joint**

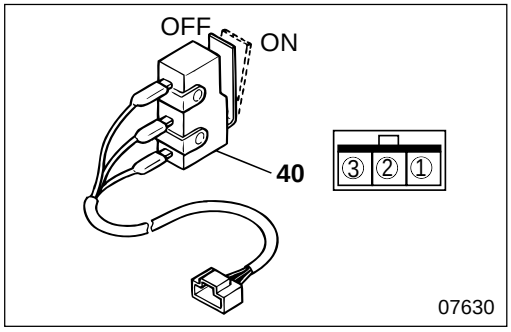
Using ball joint **22** adjust rod **31** so that its thread ridge conforms to the dimensions as illustrated, then tighten with lock nut **23**.



26 **Installation of sleeve**

Shift range selector lever **38** to the P range. Install sleeve **26** by rotating it so that the dimension between the sleeve and the upper part of the lever conforms to the value as illustrated.

https://truckmanualshub.com/



40 **P-range switch**

[Inspection]

	①	②	③
ON	○		○
OFF		○	○

○——○ : There is continuity between terminals ○ and ○.
Replace P-range switch **40** if it is faulty.

[Installation]
Install P-range switch **40** so that it is OFF when the range selector lever is in the P range.

https://truckmanualshub.com/

Lubricant

Location	Points of application	Specified lubricant	Quantity
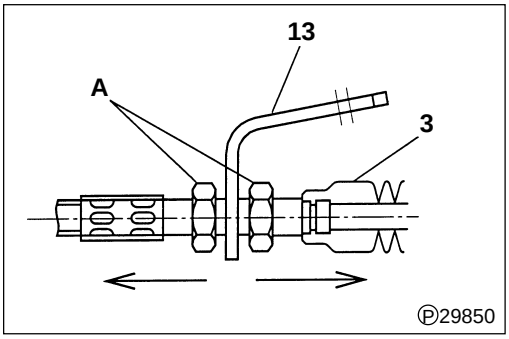
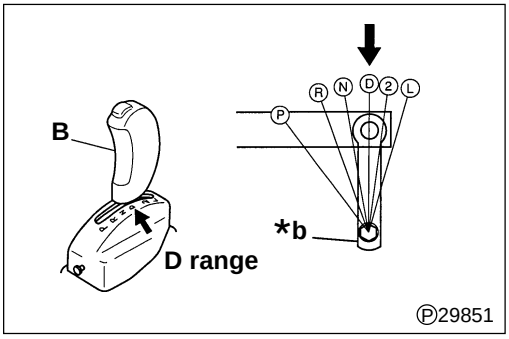
9	Inside bushings	Chassis grease [NLGI No.1 (Ca soap)]	As required





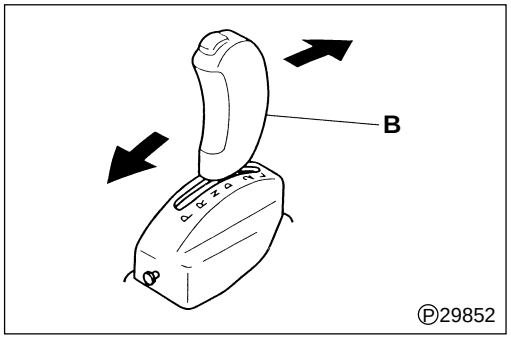
◆ Service procedure

3 **Selector cable**

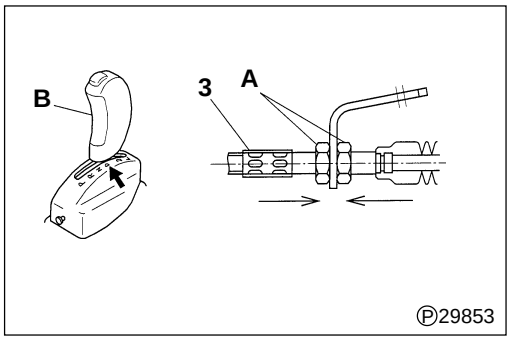
- Loosen nuts **A** on the selector cable **3** all the way to the ridges.

- Set automatic transmission lever knob **B** (located inside the cabin) and transmission control lever ***b** to the D range position.

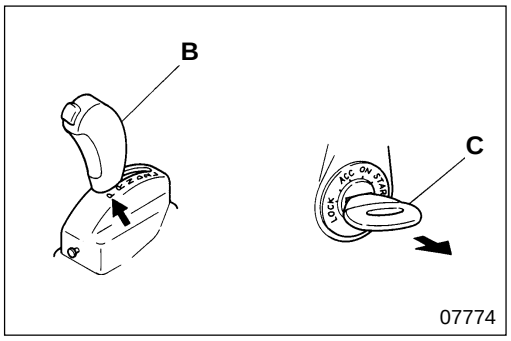
https://truckmanualshub.com/



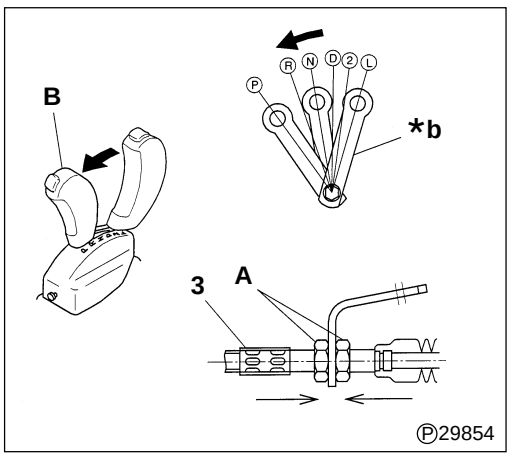
- Shake automatic transmission lever knob **B** back and forth.



- Check to make sure that automatic transmission lever knob **B** is in the D range, and tighten nuts **A** on selector cable **3** to the specified torque.



- Make sure that starter key **C** can be removed with automatic transmission lever knob **B** in the P range.



[Adjustment]

Adjust nuts **A** on selector cable **3** so that transmission control lever ***b** moves smoothly in the entire range when automatic transmission lever knob **B** is moved from the L range to P range.

CAUTION ⚠

If the adjustment of nuts A is improper, automatic transmission lever knob B produces resistance when it is moved to the L or P range. In some cases, the starter key cannot be removed with the automatic transmission lever knob in the P range.

REPLACEMENT OF AUTOMATIC TRANSMISSION PARTS

Special tools

Location	Tool name and shape	Part No.	Application
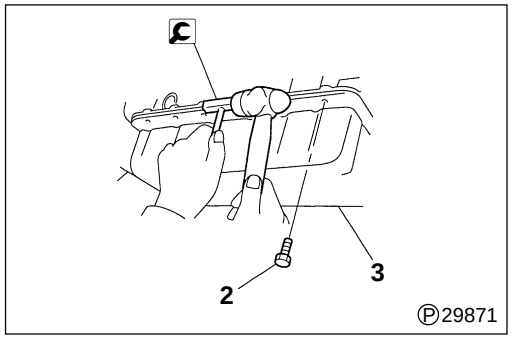
25	Oil seal installer  Ⓟ29857	MH063608	Installation of oil seal

◆ Service procedure



3 Oil pan

[Removal]

- Remove bolts **2**.

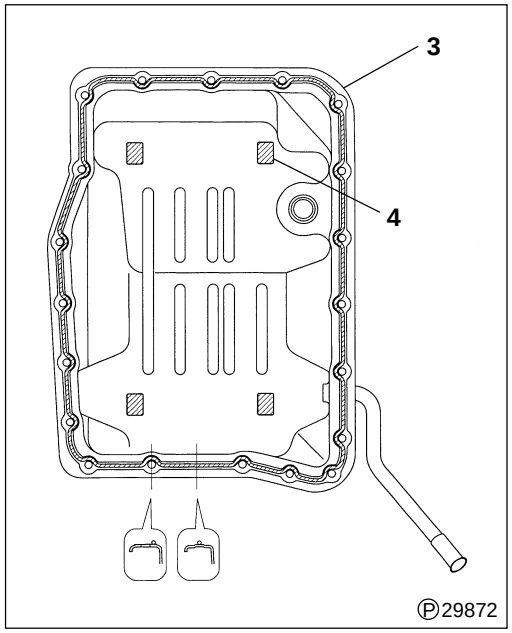
CAUTION

To prevent oil pan 3 from dropping when separating the sealant from the oil pan, keep several bolts (not tightened) mounted at intervals of three bolt holes.

- Insert oil pan remover at a corner of oil pan **3**, and separate the oil pan from the automatic transmission unit.

CAUTION

- **Be careful not to deform the shape of oil pan 3 when inserting oil pan remover.**
- **Do not tilt the oil pan during removal since the oil pan 3 contains oil.**



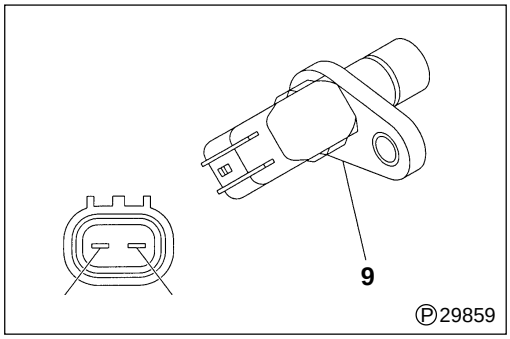
[Installation]

- Remove the sealant from the mounting surfaces of the automatic transmission unit and oil pan **3**.
- Clean oil cleaner magnets **4**, and mount them in the oil pan.
- Apply sealant on oil pan **3**, and mount the oil pan on the automatic transmission unit.
- Tighten bolts **2** to the specified torque.

CAUTION

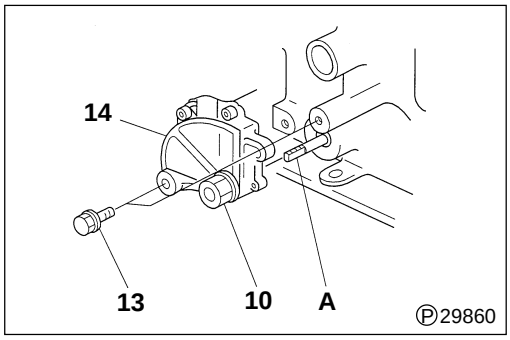
- **Do not allow automatic transmission fluid on the contact surfaces of oil pan 3 and the automatic transmission unit.**
- **Apply sealant continuously with a diameter of 2 or 3 mm {0.079 to 0.12 in.}, as shown in the diagram.**
- **Install the oil pan within 10 minutes after the application of the sealant.**
- **Tighten bolts 2 evenly by conducting the tightening operation for each bolt several times.**

https://truckmanualshub.com/



9 Inspection of speed sensor

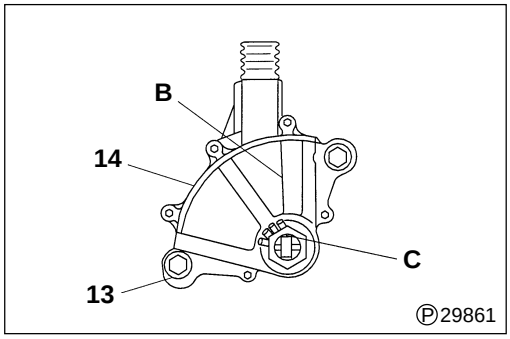
- Measure the resistance between the connector terminals shown in the diagram. If the measured value deviates from the standard value, the connector is defective.
- Standard resistance between terminals: 560 to 680 Ω (at normal temperature)



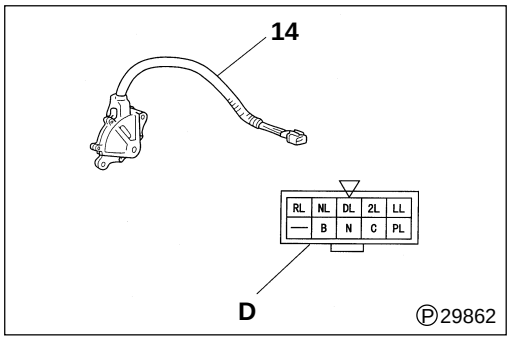
14 Inhibitor switch

[Installation]

- Set control shaft **A** to the N position.
- Mount inhibitor switch **14** on control shaft **A**.
- Tighten two bolts **13**.
- Tighten nut **10**.



- Loosen two bolts **13**, and position inhibitor switch **14** so that reference line **B** on the inhibitor switch aligns with groove **C**.
- While holding inhibitor switch **14** with one hand, tighten two bolts **13** to the specified torque with the other hand.
- Bend the two lock tabs on the nut of inhibitor switch **14**.



[Inspection]

Check the electric conduction at wire connector **D** of inhibitor switch **14** using a tester.

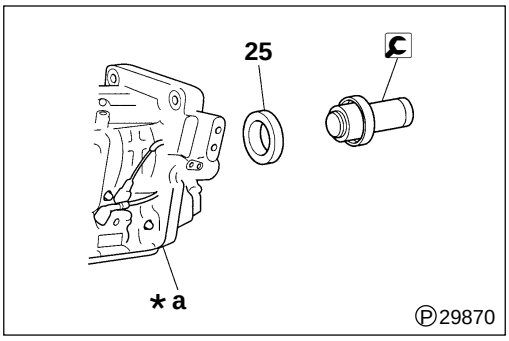
19 **Oil temperature switch**

Place oil temperature switch assembly **19** in a container filled with glycerin. Vary the temperature of the oil, and check to make sure that the switch operates (ON and OFF) at the specified temperatures.

https://truckmanualshub.com/



25 Installation of oil seal

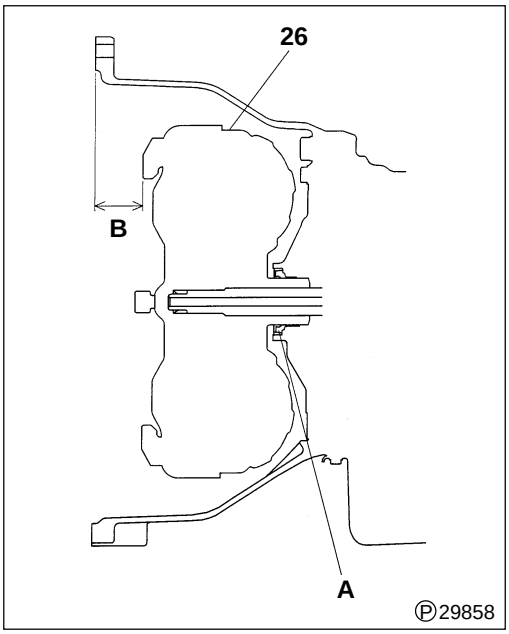
CAUTION

After the oil seal 25 is removed, clean the surface of the extension housing of automatic transmission unit *a to which oil seal is mounted.

- Apply grease on the lip section of oil seal **25**.
- Use oil seal installer to insert oil seal **25** all the way into the extension housing of automatic transmission unit ***a**.

CAUTION

- **Insert oil seal 25 evenly.**
- **Do not damage or deform the shape of oil seal 25.**



26 Installation of torque converter

- Pour new automatic transmission fluid into torque converter **26** when the torque converter to be installed is new.
  Automatic transmission fluid quantity : Approximately 2 L {2.1 qts}
- Apply automatic transmission fluid on front oil seal **A**, and mount torque converter **26** on the oil pump.

CAUTION

Be careful not to damage oil seal A when mounting torque converter 26.

- Measure dimension **B** between the torque converter housing and the set block of torque converter **26** to make sure that the torque converter is inserted into the proper position.
  Dimension **B** : 44 mm {1.73 in.} or more

https://truckmanualshub.com/

3 Accelerator sensor

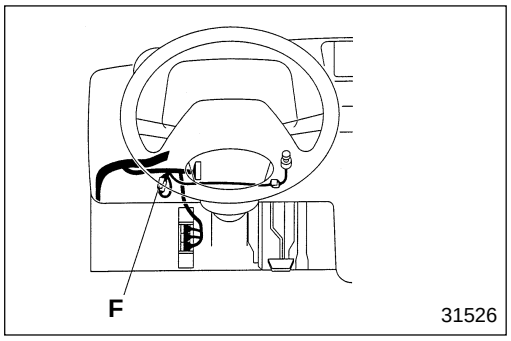
(1) Initial voltage data storage

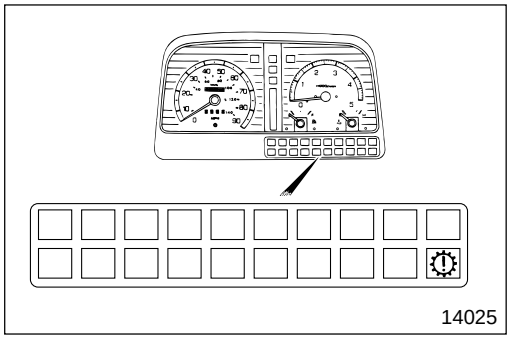
When accelerator sensor **3** is dismounted or replaced, it is necessary to save the initial voltage value (full throttle) in the automatic transmission electronic control unit memory.

Check items

- Idle adjustment knob is appropriate.
- Accelerator sensor **3** are properly mounted. 4D3 Gr 13
- Idle adjustment knob **A** is fully pushed in.

https://truckmanualshub.com/

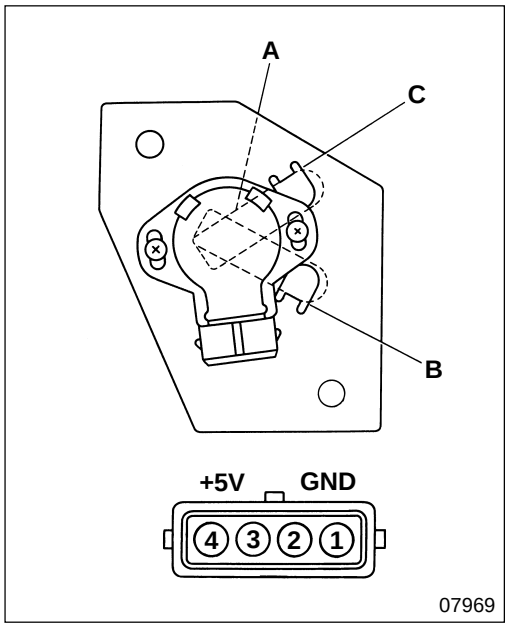




Initial full-throttle voltage data storage

- Turn the starter switch to the ON position.
- Delete the data in the automatic transmission electronic control unit memory by keeping the following conditions for five seconds.
  Turn the starter switch to the ON position.
  Stop the vehicle (engine OFF).
  Shift the range selector lever to the L range.
  Turn off the overdrive OFF switch. (Overdrive OFF)
  Disconnect diagnosis switch (plug connector) **F**.
  Press on the brake pedal.
  Press on the accelerator pedal to full throttle.
  When data deletion is complete, the warning lamp [⚙] flashes.
- Remove feet from the accelerator and brake pedals, and shift the range selector lever to the P range and connect diagnosis switch **F**.
- Hold the accelerator pedal at full throttle, and press down on the brake pedal for more than three seconds.
  During this process, the warning lamp [⚙] lights for three seconds. After the full throttle position data is stored in the electronic control unit, the warning lamp turns off.
- After confirming that the warning lamp [⚙] has turned off, remove feet from the brake and accelerator pedals. Then turn off the starter switch.
- If the warning lamp does not light, repeat the procedure from the beginning.

https://truckmanualshub.com/

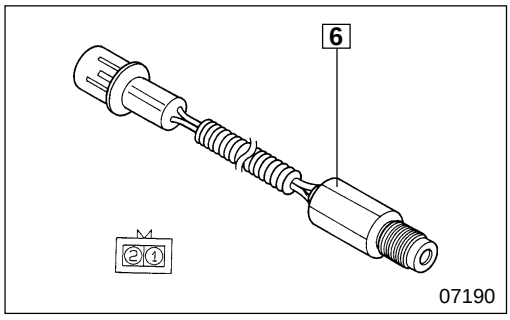


(2) Inspection of accelerator sensor

Apply a voltage of 5 V to terminal ④, and ground terminal ①.
Measure the output voltage that generates at terminal ③ when lever **A** is moved to each position.
If the measured values deviate from the standard value, replace the accelerator sensor.
Regarding the removal and installation of the sensor, refer to 4D3 Gr 13
B : Idle position
C : Maximum lever stroke position

Accelerator sensor output voltage at idle (V)	Connector terminals	
	③	①
0.85±0.1	⊕	⊖

Accelerator sensor output voltage at full throttle (V)	Connector terminal	
	③	①
4.15±0.1	⊕	⊖



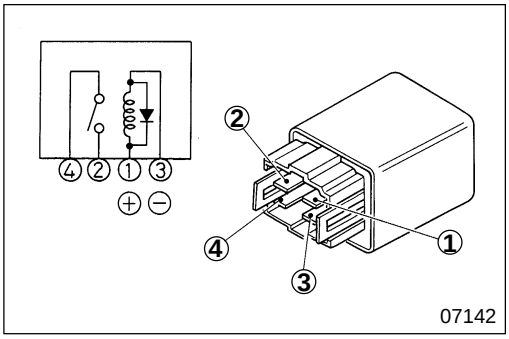
6 Inspection of engine speed sensor

(1) Inspection of engine speed sensor mounting condition Gr 11

(2) Inspection of engine speed sensor unit

Standard value (kΩ)	Connector terminals	
	①	②
1.4±0.2	○	○

If the measured value deviates from the standard value, replace the engine speed sensor.



7 8 9 Inspection of relay (constant-open type, 4-pin)

	①	②	③	④	Remarks
Electric current supplied	○		○		—
Electric current not supplied	⊕	○	⊖	○	Measure the voltage of electric current.

○——○ : Electric conduction between terminals
⊕ – – – ⊖ : Terminals applied with battery voltage
If an abnormality is found, replace the relay.

6	Forward clutch	**13**	Parking gear	**20**	Converter housing
7	Overrunning clutch	**14**	Low and reverse brake	**21**	Input shaft

The automatic transmission consists of a torque converter with a lock-up system and a fully automatic 4-speed gear system.

● **Torque converter**

The transmission input system of the torque converter increases the torque transmitted from the engine to a maximum of twice the input torque. The torque converter also acts as a fluid coupling which absorbs shock during engine start up and gear shifting. Above a specified speed level, the lock-up system is activated to prevent slippage and to improve transmission efficiency.

● **Transmission**

The transmission has four forward speeds and one reverse speed. Transmission is accomplished by two sets of planetary gears, and four sets of hydraulically operated, wet-type multiplate brakes and brake bands.

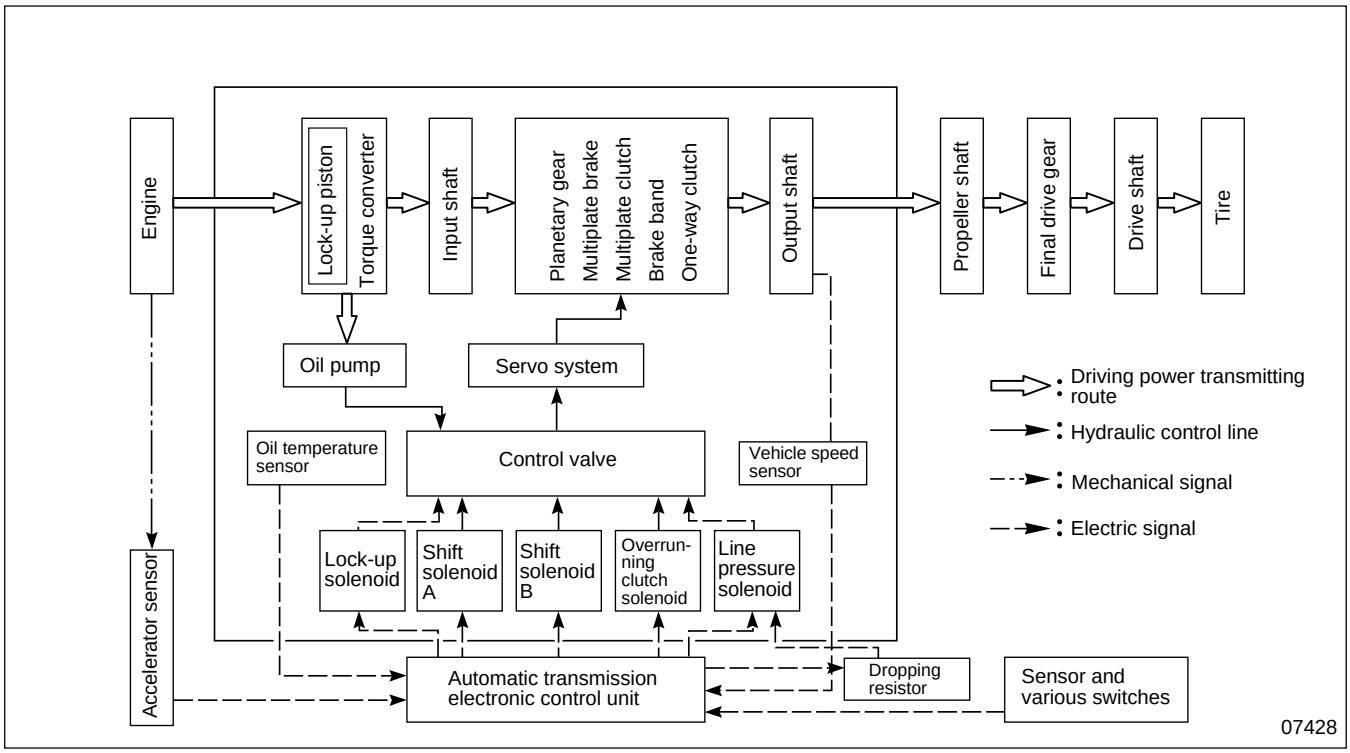
● **Hydraulic control**

Precise gearshift control is achieved by the incorporation of various electronic controls that are handled by a microcomputer which has entire control of the system.

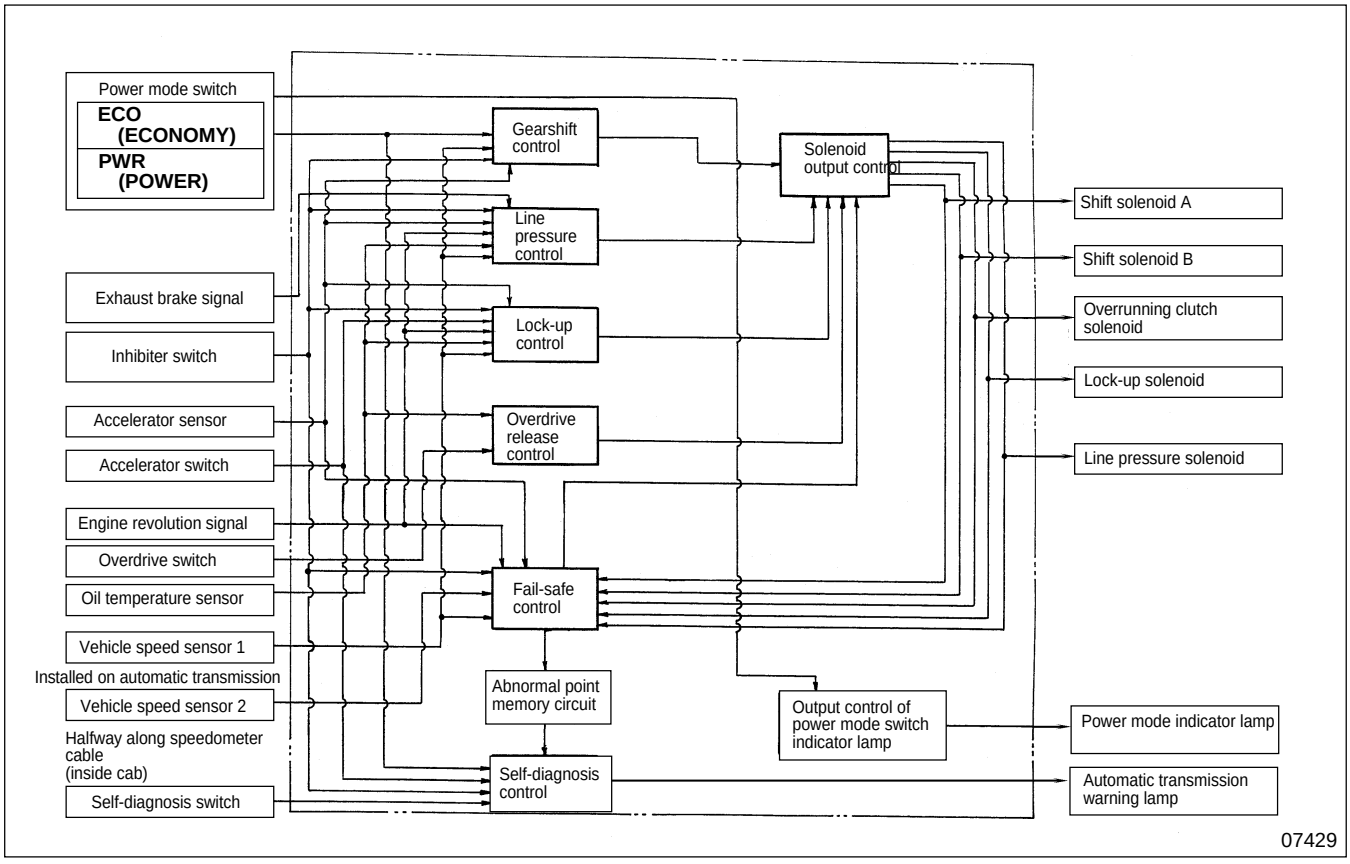
https://truckmanualshub.com/

Control Mechanism

Control system



Control block diagram



https://truckmanualshub.com/

The control method basically consists of: gearshift control, line pressure control, lock-up control and overrunning clutch control; and issues electronic commands for control, all of which are controlled by the electronic control unit depending on the driving conditions of the vehicle.

Table of control item and input/output

Item \ Control item			Line pressure control	Gearshift control (includes overdrive gearshift control)	Shift pattern selection control	Lock-up control	Engine brake control	Fail-safe control	Self-diagnosis function

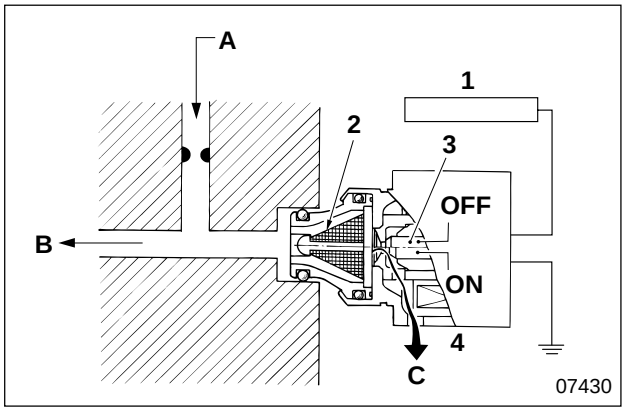
Note 1 : Backup vehicle speed sensor 1 (installed on the transmission)
Note 2 : Backup accelerator sensor
Note 3 : When these input/output signals become abnormal, the automatic transmission electronic control unit activates the fail-safe function.
Note 4 : This is used as a the basis for the start of self-diagnosis, and if self-diagnosis is not initiated, it judges that either one is faulty.
Note 5 : Activates self-diagnosis function.

https://truckmanualshub.com/



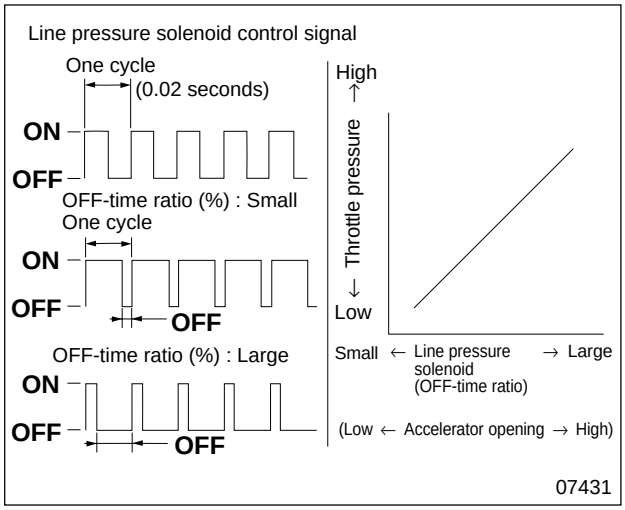
● **Line pressure control**

• **Line pressure solenoid**

1 Automatic transmission electronic control unit
2 Filter
3 Needle valve
4 Line pressure solenoid

A : Pilot pressure
B : Throttle pressure (to pressure modifier valve)
C : Drain

The accelerator sensor monitors the amount of the accelerator opening, and by controlling line pressure solenoid **4**, pilot pressure **A** from the oil pump is regulated, via the pressure regulator valve, into the optimum hydraulic pressure (throttle pressure **B**) for driving.

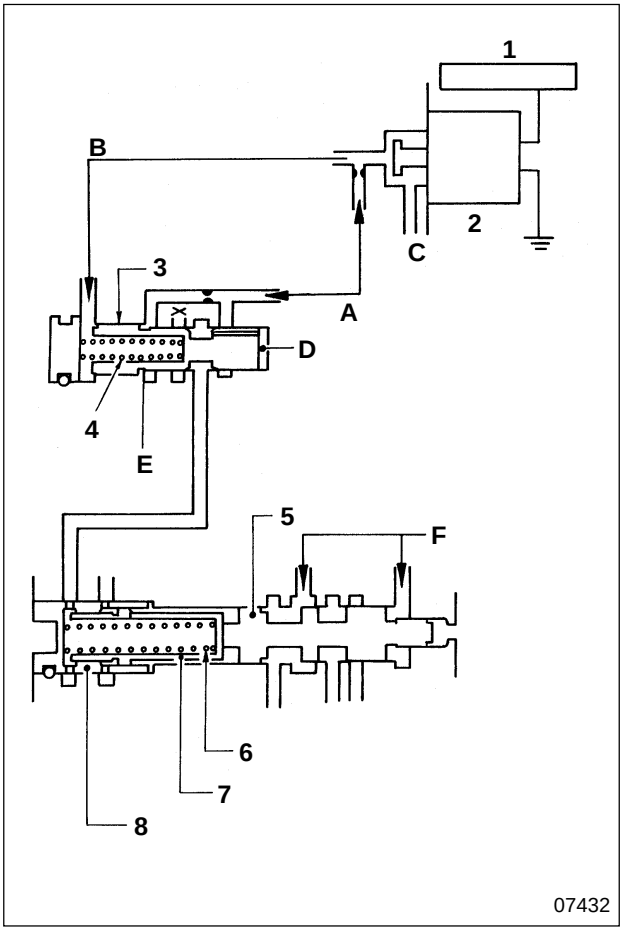


The line pressure solenoid is controlled by the ON-OFF operation activated by signals transmitted from automatic transmission electronic control unit **1**.
The ON-OFF signals are transmitted to line pressure solenoid **4** at 50 Hz (0.02 cycles per second). However, the ratio of ON and OFF signal time coming from the accelerator sensor, in conjunction with accelerator opening, is determined by automatic transmission electronic control unit **1**.
When line pressure solenoid **4** is switched OFF, needle valve **3** closes the pilot pressure (*1) drain line. When the line pressure solenoid is switched ON, the drain line opens. Accordingly, the larger the OFF-time ratio in the ON-OFF signals at 50 Hz, the longer the closing time of the drain line, and the higher the throttle pressure **B** (*2).
On the contrary, the smaller the OFF-time ratio, the shorter the closing time of the drain line, and throttle pressure **B** does not increase.

*1 : The pilot pressure is the pressure for use in the control mechanism, obtained after the line pressure has been adjusted by the pilot valve. In line pressure control, pilot pressure is supplied as a signal pressure to the pressure modifier valve and as a hydraulic pressure source.

*2 : The throttle pressure is the pressure obtained after pilot pressure has been adjusted by the activation of the line pressure solenoid.

https://truckmanualshub.com/



- **Pressure modifier valve**

1 Automatic transmission electronic control unit
2 Line pressure solenoid
3 Pressure modifier valve
4 Spring
5 Pressure regulator valve
6 Spring
7 Pressure regulator plug
8 Pressure regulator sleeve

A : Pilot pressure
B : Throttle pressure
C : Drain
E : Pressure reception area difference
F : Oil pump delivery pressure

The activation of line pressure solenoid **2** regulates throttle pressure **B**. This regulated pressure in turn acts as an input signal to convert pilot pressure **A** into a signal pressure that activates pressure regulator valve **5**.
As illustrated, the pilot pressure line and the throttle pressure line are connected to pressure modifier valve **3**.
By this design, the pilot pressure acts on chamber **D** and pressure reception area difference **E**, and is regulated to equalize with the repercussive force of spring **6** and the throttle pressure.
When the pressure that has been adjusted by the pressure modifier valve is delivered to pressure modifier plug **7**, it is added to the repercussive force of the spring and adjusts the line pressure. In this fashion, the line pressure is controlled by signals from electronic control unit **1**.

https://truckmanualshub.com/

● **Gearshift control**

Based on the signals it receives from the accelerator sensor (corresponding to the accelerator opening), and from the vehicle speed sensor (corresponding to the vehicle speed), the automatic transmission electronic control unit sends signals to solenoids A, B, installed on the control valve, to shift gears automatically into the optimum gear position.

Gearshift control under normal conditions

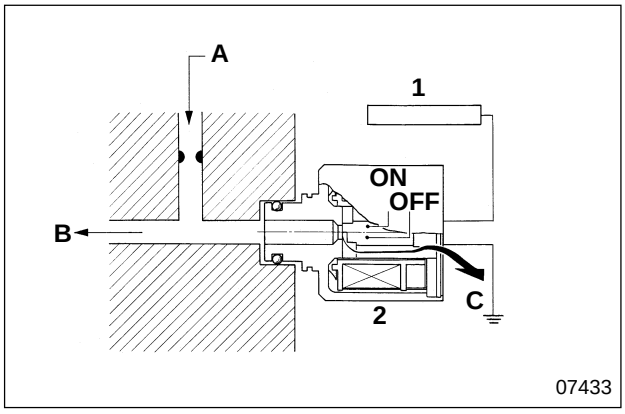
The accelerator sensor evaluates the engine load, and the vehicle speed sensor evaluates the vehicle speed. After evaluating this data, the optimum converter gear position is determined according to the gearshift diagram. At standstill in the drive range, the gears are shifted into 2nd to reduce creep. (When starting by depressing the accelerator pedal, down shifting takes place immediately to shift the gears into 1st.)

Gearshift control under cold conditions

The design of the system is such that 4th gear cannot be selected if the temperature of the automatic transmission fluid is below the specified level, or the vehicle speed is below the specified rate.

Operating conditions for overdrive (D_4 position)

Overdrive switch	ON
Range selector lever	D range
Vehicle speed	The specified minimum or more
Oil temperature sensor	Approximately 10˚C {50˚F} or more



- **Solenoids A, B**

1 Automatic transmission electronic control unit
2 Shift solenoids A, B

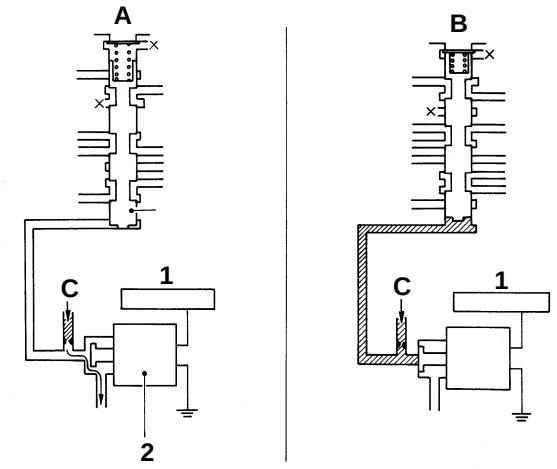
A : Pilot pressure
B : Shift valve operation pressure
C : Drain

Solenoids A **2**, B **2** are ON-OFF solenoids controlled by signals received from automatic transmission electronic control unit **1**.
The ON signal of solenoids A, B generates oil pressure by closing the drain line, and this oil pressure acts on the gear shifting valve, switching the valve operations.

- Solenoid A controls the operation of shift valve A (shifting valve)
- Solenoid B controls the operation of shift valve B (shifting valve)

When solenoids A, B are switched OFF, the drain line is opened and no oil pressure acts on the valve, so it is inactive.

https://truckmanualshub.com/



This illustration shows the example of shift valve A

07434

- **Shift valves A, B**
  - **1** Automatic transmission electronic control unit
  - **2** Shift solenoid

A : Inactive condition
B : Operating state
C : Pilot pressure

Shift valves A, B are gear shifting valves that change the operating pressure applied to the friction parts (clutch, brakes, etc.) by making the oil pressure generated by solenoids A, B act on the end surfaces of the valves.
Combining the ON and OFF states of shift valves A, B causes the operating pressure to shift gears into 1st, 2nd, 3rd and 4th.
A solenoid ON signal, causes the oil pressure to act on the end surfaces of the valves to overcome the repercussive force (spring force) coming from the reverse direction, opening the valves.
When the solenoid is OFF, no operation occurs as no oil pressure is applied to the end surfaces of the valves. If the valves are operating, they are pushed back by the repercussive force of the spring.

● Lock-up control

The lock-up control improves the efficiency of the transmission by eliminating slippage of the torque converter. Control of the operation of the lock-up control valve is done by signals transmitted from the automatic transmission electronic control unit via the lock-up solenoid.

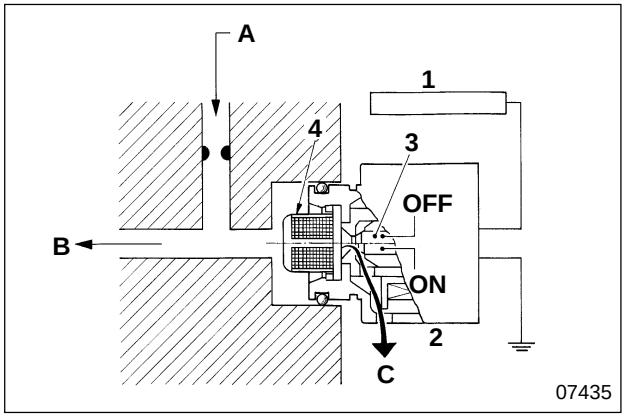
Lock-up control under normal conditions

The accelerator sensor monitors the engine load, and the vehicle speed sensor monitors the vehicle speed. On the basis of these monitored data, the lock-up ON-OFF operation is controlled according to the specified gearshift diagram.

Lock-up control under cold conditions

The lock-up control improves the efficiency of heat-up by not operating until the temperature of the automatic transmission fluid reaches 40˚C {104˚F}. After the temperature reaches 40˚C {104˚F} or more, lock-up operation is possible until the temperature drops below 20˚C {68˚F}, this prevents hunting.

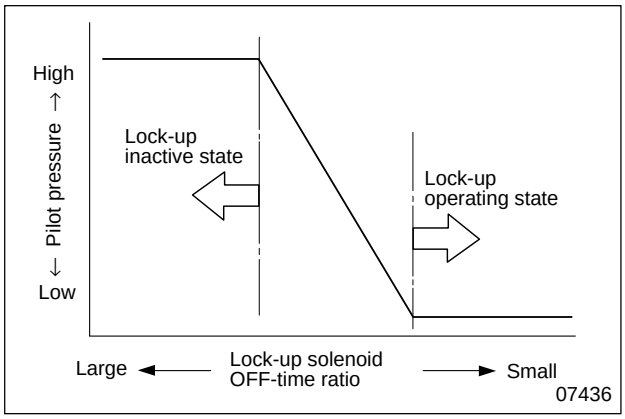
https://truckmanualshub.com/



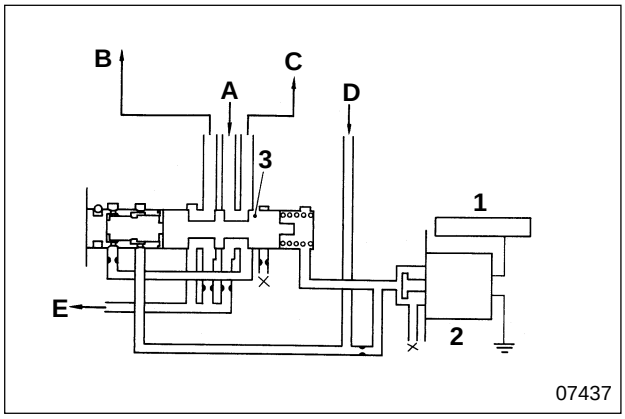
- **Lock-up solenoid**
  - **1** Automatic transmission electronic control unit
  - **2** Lock-up solenoid
  - **3** Needle valve
  - **4** Filter

  A : Pilot pressure
  B : To lock-up control valve
  C : Drain

Lock-up solenoid **2** is controlled by the ON-OFF operation according to the lock-up range established by automatic transmission electronic control unit **1**.
The ON-OFF signals are transmitted to lock-up solenoid **2** at 50 Hz (0.02 cycles per second) and the time ratio of the ON signal is determined by automatic transmission electronic control unit **1**.
When lock-up solenoid **2** is switched OFF, needle valve **3** closes pilot pressure **A** (*1) drain line. When the lock-up solenoid is switched ON, the drain line opens.
Accordingly, the larger the OFF-time ratio in the ON-OFF signals at 50 Hz, the longer the closing time of the drain line, which maintains the pilot pressure.
On the contrary, the smaller the OFF-time ratio, the longer the opening time of the drain line, which reduces the pilot pressure.



(*1) : The pilot pressure is the pressure for use in the control mechanism, obtained after the line pressure has been adjusted by the pilot valve.

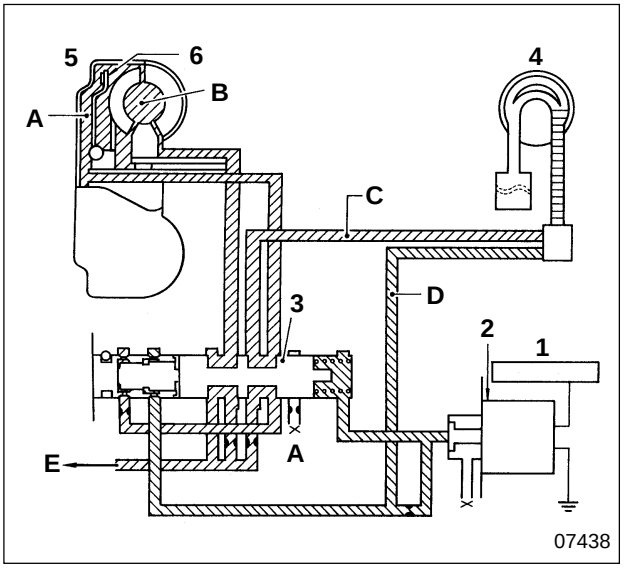


- **Lock-up control valve**
  - **1** Automatic transmission electronic control unit
  - **2** Lock-up solenoid
  - **3** Lock-up control valve

  A : Converter pressure
  B : Converter pressure (Lock-up piston operating side)
  C : Converter pressure (Lock-up piston release side)
  D : Pilot pressure
  E : To oil cooler

As illustrated, the converter pressure line is connected to lock-up control valve **3**. Changeover of the lock-up control valve is made by lock-up solenoid **2**, based on signals received from automatic transmission electronic control unit **1**. This operation changes over the line of hydraulic oil to be supplied to the torque converter to either the lock-up piston release side or the lock-up piston operating side.

https://truckmanualshub.com/

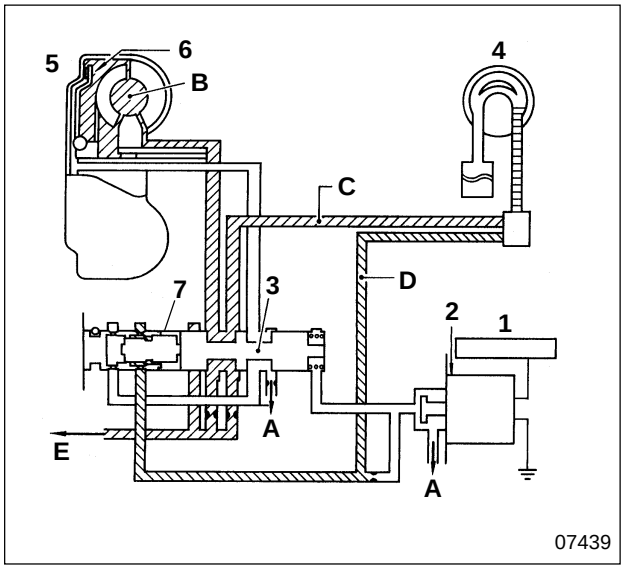


< Lock-up inactive state >

1 Automatic transmission electronic control unit
2 Lock-up solenoid
3 Lock-up control valve
4 Oil pump
5 Torque converter
6 Lock-up clutch

C : Torque converter pressure
D : Pilot pressure
E : To oil cooler

When the lock-up is inactive, the OFF-time ratio of lock-up solenoid **2** is long and the closing time of the drain line is long, which maintains pilot pressure **D**. Accordingly, the lock-up solenoid outlet pressure, combined with the repercussive force of the spring, acts on lock-up control valve **3** end surface, pushing it to the left. This operation causes torque converter pressure **C** to act on chamber **A**, and lock-up clutch **6** is not connected as the oil flows from chamber **A** into chamber **B**.



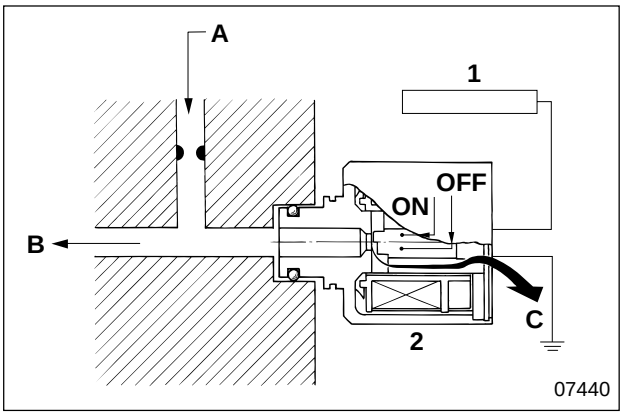
< Lock-up operating state >

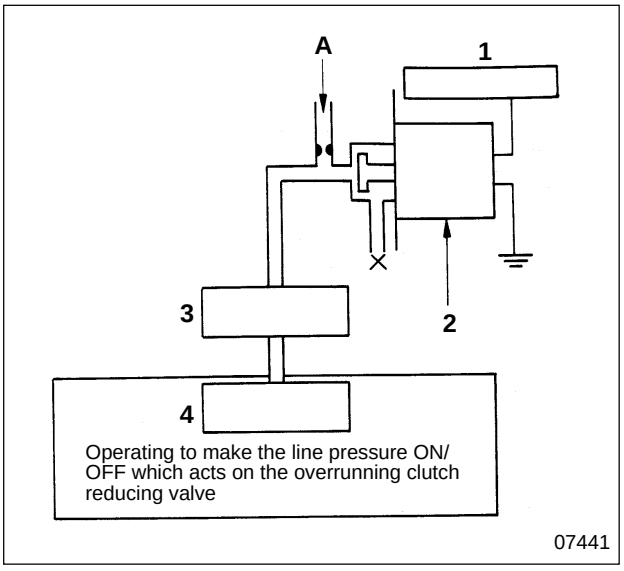
1 Automatic transmission electronic control unit
2 Lock-up solenoid
3 Lock-up control valve
4 Oil pump
5 Torque converter
6 Lock-up clutch
7 Lock-up control plug

A : Drain
C : Torque converter pressure
D : Pilot pressure
E : To oil cooler

When the lock-up is operating, the OFF-time ratio of lock-up solenoid **2** is short and the opening time of the drain line is long, which reduces pilot pressure **D**. Accordingly, torque converter pressure **C** and the pilot pressure act on lock-up control plug **7**, pushing lock-up control valve **3** to the right. This operation causes the torque converter pressure to act on chamber **B**, connecting lock-up clutch **6** directly.

https://truckmanualshub.com/





● **Overrunning clutch control**

The automatic transmission power train uses a forward one-way clutch to buffer shocks from gear shifting which are likely to occur when shifting down.

When the vehicle is coasting, and when the engine brake is applied from D to 2nd, and D to L during range selection, the forward one-way clutch freewheels so that no opposite driving force is transmitted to the engine. To deal with this situation, the operation of the overrunning clutch prevents freewheeling of the forward one-way clutch, so that the engine brake takes effect.

• **Overrunning clutch solenoid**

1 Automatic transmission electronic control unit
2 Overrunning clutch solenoid
3 Shuttle shift valve S
4 Overrunning clutch control valve

A : Pilot pressure
B : Overrunning clutch control valve operating pressure
C : Drain

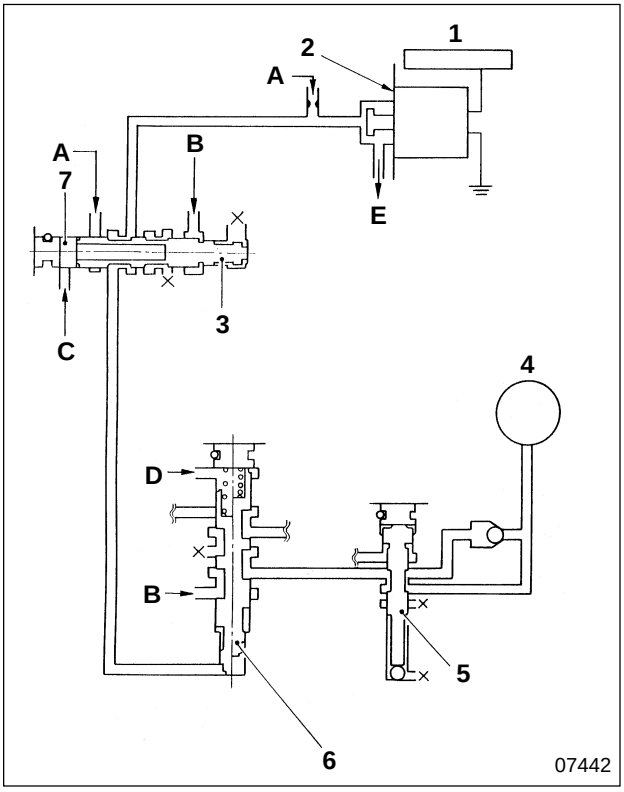
Overrunning clutch solenoid **2** is controlled by the ON-OFF operation activated by signals transmitted from automatic transmission electronic control unit **1**. The ON signal is determined by the automatic transmission electronic control unit, based on data received from various sensors.

When the overrunning clutch solenoid is switched ON, the needle valve closes the drain line. When the overrunning clutch solenoid is switched OFF, the drain line opens. Accordingly, when the overrunning clutch solenoid is switched ON, the hydraulic pressure generated by the operation of the overrunning clutch solenoid acts on overrunning clutch control valve **4** end surface, via shuttle shift valve S **3**.

• **Shuttle shift valve S**

Shuttle shift valve S **3** is a fixed valve that is part of the hydraulic line and makes the pilot pressure, generated when overrunning clutch solenoid **2** is switched ON, act on overrunning clutch control valve **4**.

https://truckmanualshub.com/



- **Overrunning clutch control**

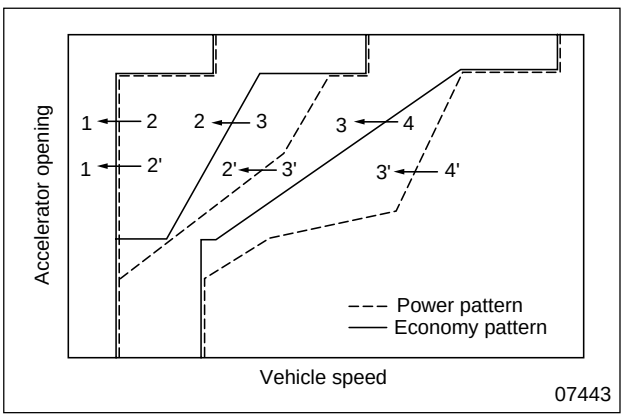
1 Automatic transmission electronic control unit
2 Overrunning clutch solenoid
3 Shuttle shift valve S
4 Overrunning clutch
5 Overrunning clutch reducing valve
6 Overrunning clutch control valve
7 Plug

A : Pilot pressure
B : Line pressure (D, 2, L range)
C : Line pressure (2, L range)
D : L range 1st reducing valve pressure
E : Drain

The line pressure is controlled by the ON-OFF operation of the overrunning clutch control. The line pressure acts on overrunning clutch reducing valve **5** using the operation of overrunning clutch solenoid **2**.

< Overrunning clutch solenoid ON >
Overrunning clutch control valve **6** comes into operation when the hydraulic pressure generated by the operation of overrunning clutch solenoid **2** acts on the overrunning clutch control valve end surface via shuttle shift valve S **3**. By this operation, the line pressure does not act on overrunning clutch reducing valve **5**.

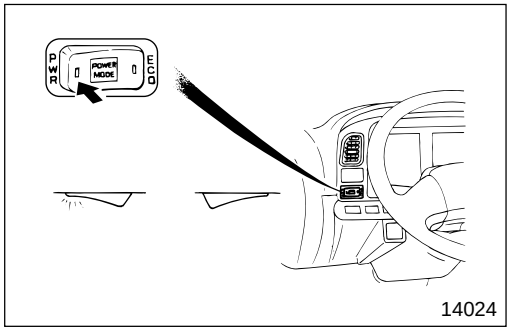
< Overrunning clutch solenoid OFF >
Overrunning clutch control valve **6** becomes inactive due to the repercussive force of the spring. By this operation, the line pressure reduced by overrunning clutch reducing valve **5** acts on overrunning clutch **4**. In the L range, the overrunning clutch control valve is fixed in its inactive state by 1st reducing valve pressure **D**.

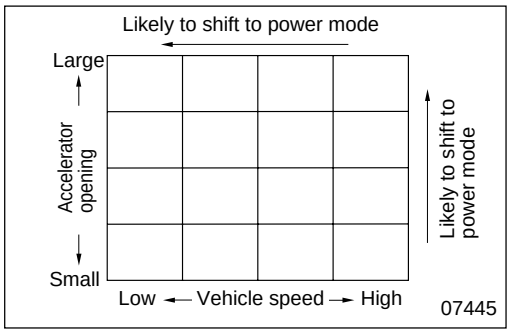


- **Shift pattern selection control**

Two kinds of driving mode can be selected: the economy mode suitable for driving with a light load; or the power mode suitable for driving with the maximum load, for climbing, and for accelerating.
When the power mode is PWR, the power mode is fixed. When the power mode is ECO, either the economy mode or the power mode is automatically selected depending on the driving conditions of the vehicle.
In the power mode, the vehicle speed at the time of gear shifting is set to a higher side than in the economy mode.
The diagram on the left shows a model of gear shifting characteristics.

https://truckmanualshub.com/





Shift pattern shifting conditions

< Economy mode to power mode >

Range selector lever	D range
Accelerator depression angle	Higher than the standard value (Note)
Power mode switch	ECO

Note : Sixteen ranges are established, as shown in the diagram on the left, depending on the accelerator opening and the vehicle speed. Each range determines the power mode shift and the accelerator opening rate.

Shift from the economy mode to the power mode occurs when the accelerator opening exceeds a specified value.

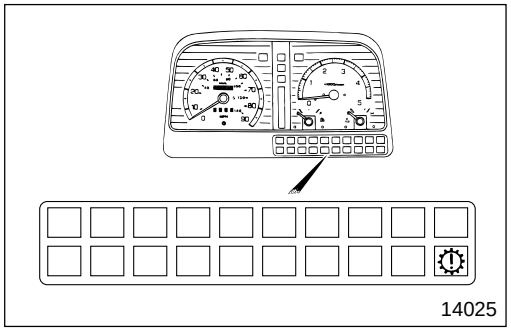
The lower the vehicle speed and the larger the accelerator opening, the more likely the shift to the power mode.

< Power mode to economy mode >

Power mode switch	ECO
Accelerator opening	Low
Operating time lag	Maximum of three seconds depending on the vehicle speed

< Power mode fixed >

Power mode switch	PWR



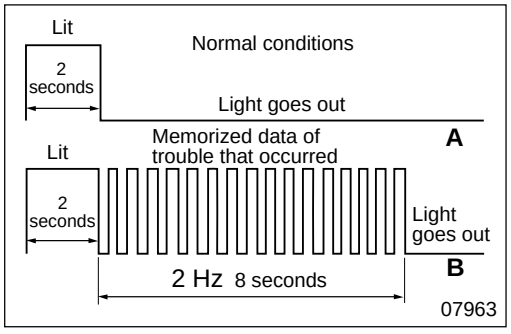
● **Self-diagnosis function**

Warning lamp indication with key turned to ON

- If an abnormality occurs sometime during the day-to-day operation of the vehicle, the warning lamp within the meter cluster alerts the driver by flashing for eight seconds at 2 Hz, as shown by **B** in the diagram, when the key is turned to ON.
- If no abnormality is found, the lamp lights for two seconds, and self-checking is carried out to see if the bulb has burnt-out, as shown by **A** in the diagram.

NOTE

Abnormalities are notified only when they were detected during the immediate preceding operation (duration of key ON to OFF time).



Warning lamp lighting when an abnormality occurs while the vehicle is being driven

- The warning lamp does not light when a minor abnormality occurs that would have a slight affect on the driving performance.
- When any of the troubles listed below occur that would greatly impair the driving performance, the warning lamp lights to alert the driver to the trouble.

  Both speed sensors **1**, **2** faulty
  Shift solenoid A faulty
  Shift solenoid B faulty
  Line pressure solenoid faulty
  Lock-up solenoid faulty
  Overrunning clutch solenoid faulty
  Accelerator sensor faulty
  Inhibiter switch faulty

https://truckmanualshub.com/

NOTE

Warning of an abnormality occurring is limited to such troubles that would greatly impair the driving performance.

Indicator lamp lighting at self-diagnosis

- To facilitate an easy search for causes of troubles that have a low possibility of recurrence, the automatic transmission electronic control unit memorizes the data on trouble while the vehicle is being driven.
- By entering the signal for the start of self-diagnosis, the memorized data are recalled and the automatic transmission warning lamp flashes.

NOTE

The automatic transmission electronic control unit stores all the data on the troubles that have occurred since the immediate previous self-diagnosis.

● **Fail-safe function**

The fail-safe function controls the operation of the vehicle in as safe a way as possible so that the operating performance is not hindered when an abnormality occurs in the vehicle speed sensor, the accelerator sensor, the inhibiter switch or in the control mechanism solenoids.

- Vehicle speed sensor
  The vehicle speed sensor has two ways of sending signals: using the sensor installed on the transmission (output shaft revolution sensor); and using the sensor installed halfway along the speedometer cable. Therefore, it is possible to continue operating the vehicle even if one of them fails.
- Accelerator sensor
  If the accelerator sensor fails, the idling switch detects the accelerator opening and controls the line pressure in accordance with the table below so that it is possible to continue operating the vehicle.

Idling switch	Line pressure	Vehicle speed at time of shift
OFF	Pressure at maximum	Throttle opening at 8/8 equivalent
ON	Pressure at minimum	Throttle opening at 0/8 equivalent

- Inhibiter switch
  If the inhibiter switch fails and multiple signals are input by the automatic transmission electronic control unit while the vehicle is either travelling or at standstill, the selection position is set in the order: D > N > R > 2 > L, so it is possible to continue operating the vehicle. However, depending on the range selection position, the hydraulic circuit line inside the control valve is changed over by the manual valve, and the actual vehicle travelling state is as shown in the table below.

Range selector lever position / Item	P	R	N	D	2		L	
Input signal from inhibiter switch	P and other selection range signals	R and other selection range signals	N and other selection range signals	D and other selection range signals	2 and other selection range signals (except L range signal)	2 and L range signals	L and other selection range signals (except 2 range signal)	L and 2 range signals
Vehicle travelling state	P	R	N	$D_1 \leftrightarrow D_2 \leftrightarrow D_3$	$2_1 \leftrightarrow 2_2 \leftrightarrow 2_3$	$2_1 \leftrightarrow 2_2$	$L_1 \leftrightarrow L_2 \leftrightarrow L_3$	$L_1 \leftrightarrow L_2$

https://truckmanualshub.com/

- **Shift solenoids A, B**

If one of the solenoids fails while the range is in D, 2 or L, the other solenoid is switched to OFF (in the gear position as shown in the table) and it is possible to continue operating the vehicle. If both solenoids fail, the mechanically controlled hydraulic circuit takes over.

Shift position	Normal			Solenoid A faulty			Solenoid B faulty			Solenoids A, B faulty		
	A	B	Gear	A	B	Gear	A	B	Gear	A	B	Gear
D range	○	○	1st	—	○→×	3rd	○→×	—	3rd	—	—	3rd
	×	○	2nd	—	○→×	3rd	×	—	3rd	—	—	3rd
	×	×	3rd	—	×	3rd	×	—	3rd	—	—	3rd
	○	×	4th	—	×	3rd	○→×	—	3rd	—	—	3rd
2 range	○	○	1st	—	○→×	3rd	○→×	—	3rd	—	—	3rd
	×	○	2nd	—	○→×	3rd	×	—	3rd	—	—	3rd
	×	×	3rd	—	×	3rd	×	—	3rd	—	—	3rd
	○	×	4th	—	×	3rd	○→×	—	3rd	—	—	3rd
L range	○	○	1st	—	○→×	3rd	○→×	—	3rd	—	—	3rd
	×	○	2nd	—	○→×	3rd	×	—	3rd	—	—	3rd
	×	×	3rd	—	×	3rd	×	—	3rd	—	—	3rd
	○	×	4th	—	×	3rd	○→×	—	3rd	—	—	3rd

○ : Continuity × : No continuity — : Faulty

- Line pressure solenoid
  If the line pressure solenoid fails, it is switched to OFF and the line pressure is maximized so it is possible to continue operating the vehicle.
- Lock-up solenoid
  If the lock-up solenoid fails, it is switched to OFF and the lock-up is released.
- Overrunning clutch solenoid
  If the overrunning clutch solenoid fails, it is switched to OFF and the overrunning clutch is engaged so that the engine brake takes effect all the time the vehicle speed is reduced.

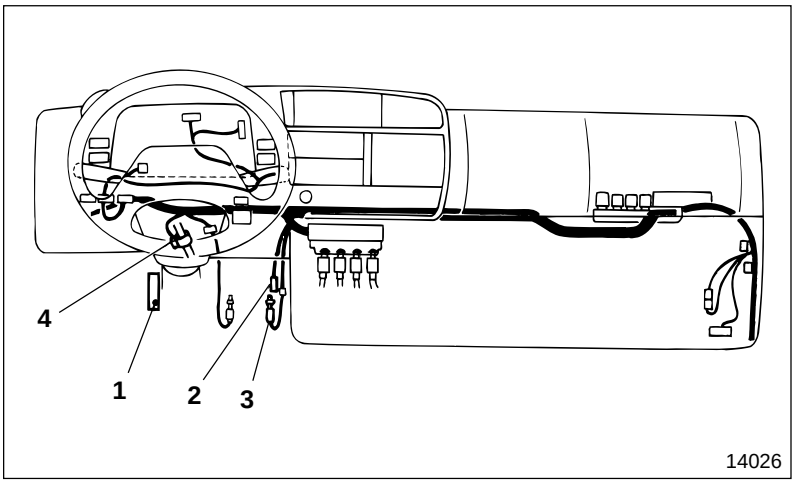
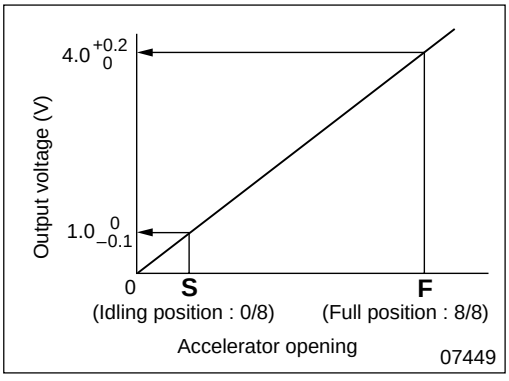
Electronic Control Mechanism



1 Automatic transmission electronic control unit
2 Accelerator sensor
3 Accelerator switch
4 Vehicle speed sensor 2

● **Automatic transmission electronic control unit**

The automatic transmission electronic control unit is installed at the master vac area by the driver's seat and processes data to judge the vehicle travelling state based on the signals received from the sensors, and transmits its own signals to the solenoids to perform gear shifting control, lock-up control, and the automatic transmission control needed to keep the vehicle operating.
The automatic transmission electronic control unit also carries out self-diagnosis of the major sensor solenoids.



● **Accelerator sensor**

The accelerator sensor is installed on the accelerator lever and converts the accelerator opening data into voltage signals, then transmits them to the automatic transmission electronic control unit.
The electric signals of the accelerator sensor have the output characteristics as shown in the diagram on the left and, using these output features the accelerator sensor monitors the accelerator pedal angle and the accelerator opening rate.

● **Accelerator switch**

The accelerator switch is installed on the accelerator lever and detects when the accelerator is fully closed, then transmits this signal to the automatic transmission electronic control unit.

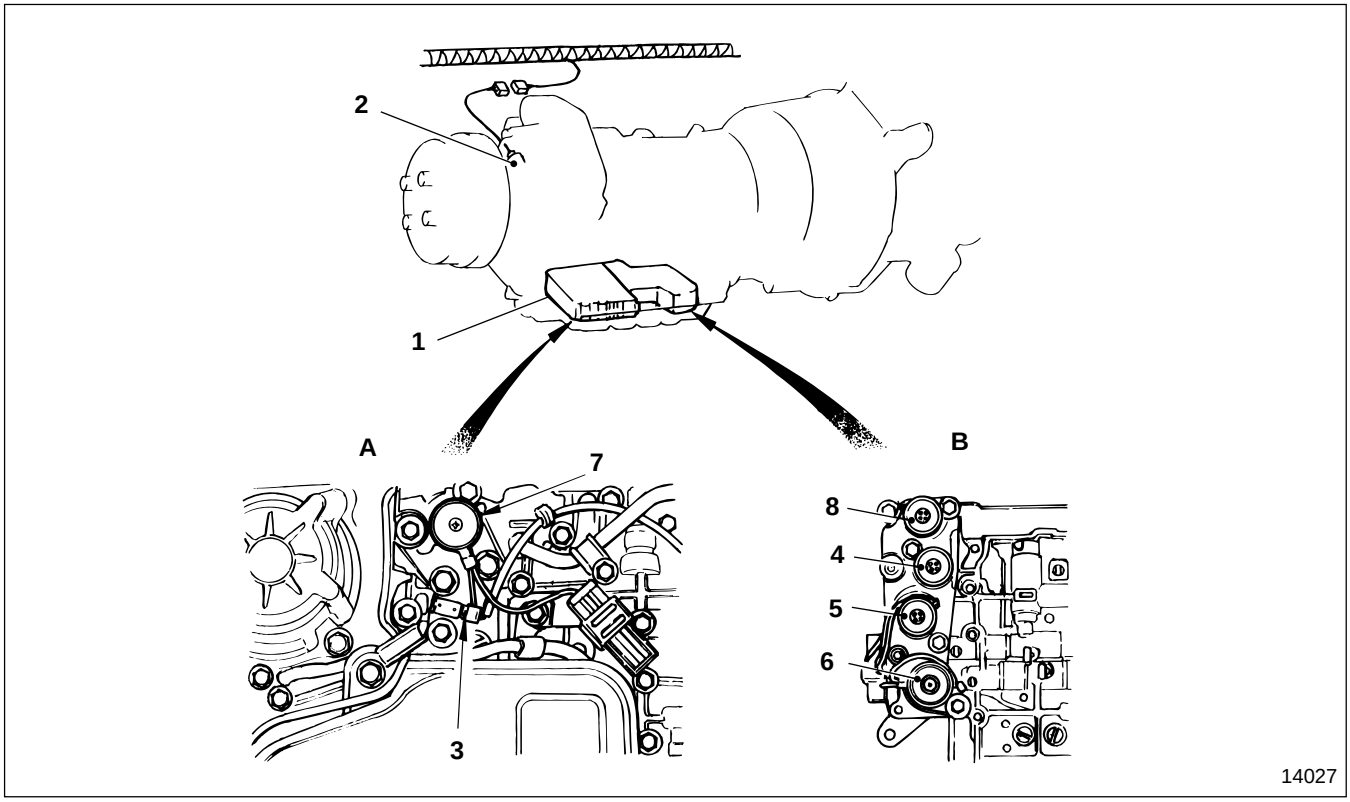
NOTE

The accelerator switch is also used for exhaust brake control.

● **Vehicle speed sensor 2**

Vehicle speed sensor **2** is installed halfway along the speedometer cable (inside the cab) and converts the vehicle speed into pulse signals, then transmits them to the automatic transmission electronic control unit.

https://truckmanualshub.com/

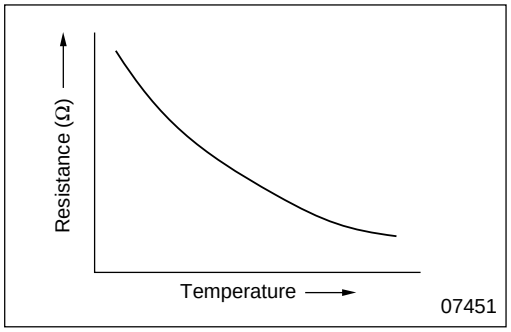


1 Control valve
2 Vehicle speed sensor 1
3 Oil temperature sensor
4 Shift solenoid A
5 Shift solenoid B
6 Line pressure solenoid
7 Lock-up solenoid
8 Overrunning clutch solenoid

A : Lower body side
B : Upper body side

● **Vehicle speed sensor 1**

Vehicle speed sensor **1** is installed on the parking gear located at the output shaft side, inside the transmission case, and converts the vehicle speed into pulse signals, then transmits them to the automatic transmission electronic control unit.



● **Oil temperature sensor**

The oil temperature sensor is installed in the control valve inside the transmission case and converts data on the change in oil temperature into continuous electric signals, then transmits them to the automatic transmission electronic control unit.

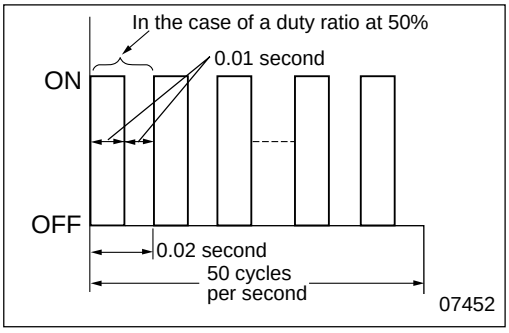
The electric signals of the oil temperature sensor have the output characteristics as shown in the diagram on the left, and after receiving these output signals, the automatic transmission electronic control unit exerts control to prevent shifting up to D_4 (overdrive), to prevent lock-up, and to make partial modification to the line pressure control, etc.

https://truckmanualshub.com/

● **Shift solenoids A, B**

Shift solenoids A, B are installed in the control valve. They control shifting using the ON-OFF operation after receiving signals from the automatic transmission electronic control unit.
Combining the ON and OFF states of the two solenoids, controls gear shift positioning as shown in the table below.

Shift solenoid A	ON	OFF	OFF	ON
Shift solenoid B	ON	ON	OFF	OFF
Gear position	1st	2nd	3rd	4th

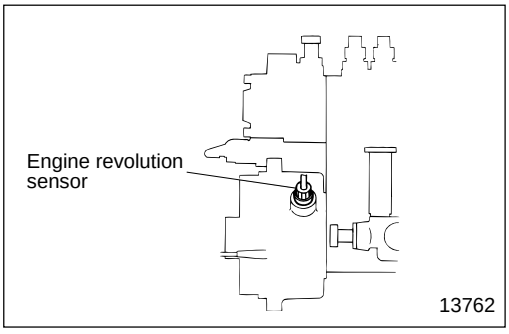


● **Line pressure solenoid and lock-up solenoid**

The line pressure and lock-up solenoids are installed in the control valve. They maintain the specified pressure by opening or closing the drain line by repeating the ON and OFF operation at 50 Hz (0.02 cycles per second) corresponding to the signals received from the automatic transmission electronic control unit.
A duty cycle type solenoid is used which makes it possible to alter and control the ON-time and OFF-time ratios within one cycle from 0% to 100%.
At a duty ratio of 50%, the ON-time is 0.01 seconds and the OFF-time is 0.01 second within the cycle of 0.02 seconds.

● **Overrunning clutch solenoid**

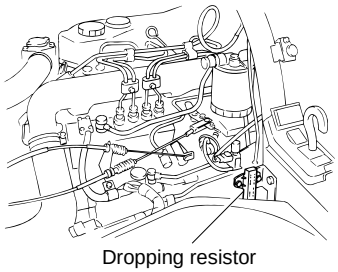
The overrunning clutch solenoid is installed in the control valve and receives signals from the automatic transmission electronic control unit to carry out the ON and OFF operations by which the overrunning clutch is either engaged or disengaged.



● **Engine revolution signal**

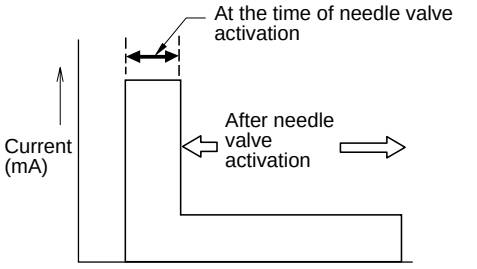
Signals from the engine revolution sensor for control of the engine operation are first sent to the pre-stroke control unit, then they are transmitted to the automatic transmission electronic control unit.

https://truckmanualshub.com/

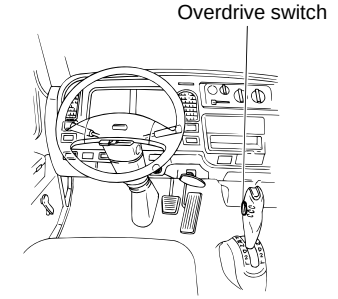


● **Dropping resistor**

The dropping resistor is installed at the rear cab mount. Electric current to the line pressure solenoid is re-routed through the dropping resistor after activating the needle valve.



The line pressure solenoid draws a great amount of electric current when the needle valve is activated and, for that reason, the current from the automatic transmission electronic control unit is routed to the line pressure solenoid, bypassing the dropping resistor.
However, once the needle valve of the line pressure solenoid has started operating, the ON-OFF operation can be maintained with a relatively small amount of current and the current is routed through the dropping resistor to the line pressure solenoid.

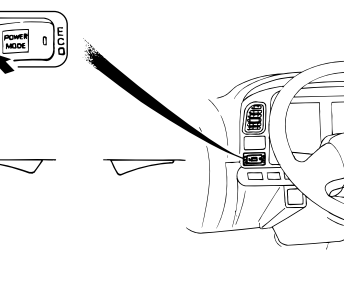


● **Overdrive switch**

The overdrive switch, installed on the range selector lever, is operated by the driver to shift from 3rd to 4th gear.

ON : Shifts up into 4th gear, increasing fuel consumption

OFF : Does not shift up into 4th, making the engine brake effective, and improving climbing performance.



● **Power mode switch**

The power mode switch, installed on the instrument panel, is operated by the driver to change the vehicle speed setting when shifting gears.

PWR (Power mode) : Fixes the power mode which increases the vehicle speed when shifting gears.

ECO (Economy mode) : Automatically selects either the power mode which increases the vehicle speed when shifting gears, or the economy mode which decreases vehicle speed when shifting gears depending on the travelling conditions of the vehicle.

<tr><td>14</td><td>4 – 2 relay valve</td><td>At shift-down from 4th gear to 2nd gear, while the 4th gear operation is being memorized, the operation of 4 – 2 sequence valve 15, shift valve A 10 and shift valve B 11 prevent shift-down from 4th gear to 2nd gear through 3rd gear</td></tr>
<tr><td>15</td><td>4 – 2 sequence valve</td><td>This prevents draining of the band servo pressure that acts when shifting into 4th gear.
It continues operating until the clutch high-operating pressure and servo release pressure (in the same hydraulic line) drain out at the time of shifting down from 4th gear to 2nd gear</td></tr>
<tr><td>16</td><td>Servo charger valve</td><td>An accumulator and a one-way orifice are fitted to the hydraulic line of 2nd gear band servo operating pressure to buffer the shifting shock caused at shift-up from 1st gear to 2nd gear. Accordingly, to ensure a sufficient flow of oil at the time of shift-down from 4th gear to 2nd gear, and 3rd gear to 2nd gear, servo charger valve 16 operates at 3rd gear and higher, so that the 2nd gear band servo operating pressure is supplied without going through the one-way orifice</td></tr>
</table>

https://truckmanualshub.com/

Name		Function
17	3 – 2 Timing valve	This is a fixed valve that is part of the hydraulic line between shift valve B 11 and the band servo release side
18	1st reducing valve	To buffer the shock of engine brake caused at the time of shift-down from 2nd gear to 1st gear in the L range, it reduces the operating pressure for the low and reverse brake
19	Overrunning clutch reducing valve	To buffer the shock of the engine brake, this valve reduces the operating pressure to the overrunning clutch. The hydraulic pressure that has been adjusted by the accumulator control valve is applied to the valve, and regulated to equalize the overrunning clutch operating pressure corresponding to the engine brake capacity
20	Torque converter relief valve	This prevents the torque converter pressure from becoming excessive
21	Lock-up control valve	Makes the lock-up operate or not operate. By making the lock-up release operation transitional, the lock-up can be made smoothly
22	Lock-up control plug	
23	Lock-up control sleeve	
24	Shuttle shift valve D	This changes over the hydraulic lines so that the output pressure of the lock-up solenoid acts on the lock-up valve in 2nd, 3rd or 4th gear in the D range. (The lock-up operation is prevented in 1st gear and in the P, R and N ranges) * When no output pressure is generated from lock-up solenoid G by the signals received from the automatic transmission electronic control unit, the lock-up control does not operate even in 2nd, 3rd, or 4th gear in the D range

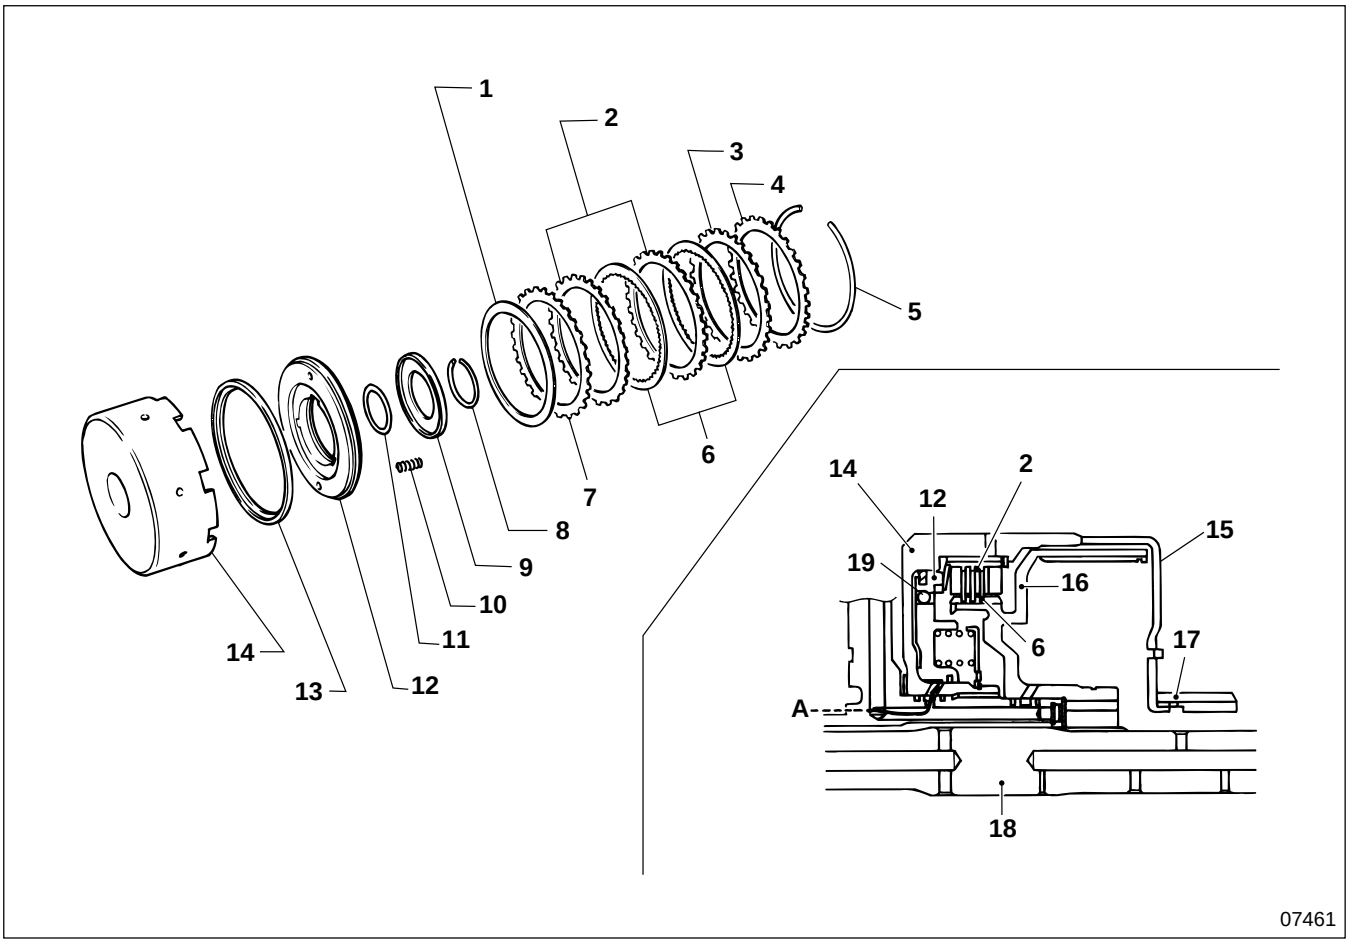
*1 : Hydraulic pressure acts on both sides of the band servo piston of the 2nd gear engaged position and the 3rd gear released position. But as the pressure reception area at the release side is largest, the brake band does not bind up.
*2 : In the above *1 state, hydraulic pressure acts on the 4th gear engaged position and the brake band is engaged.
○ : Always engaged
◎ : Engaged at vehicle speeds of 10 km/h {6.21 mph} or more
● : Operates during acceleration
⊗ : Engaged but does not transmit power

https://truckmanualshub.com/

● Reverse Clutch (Multiplate type)



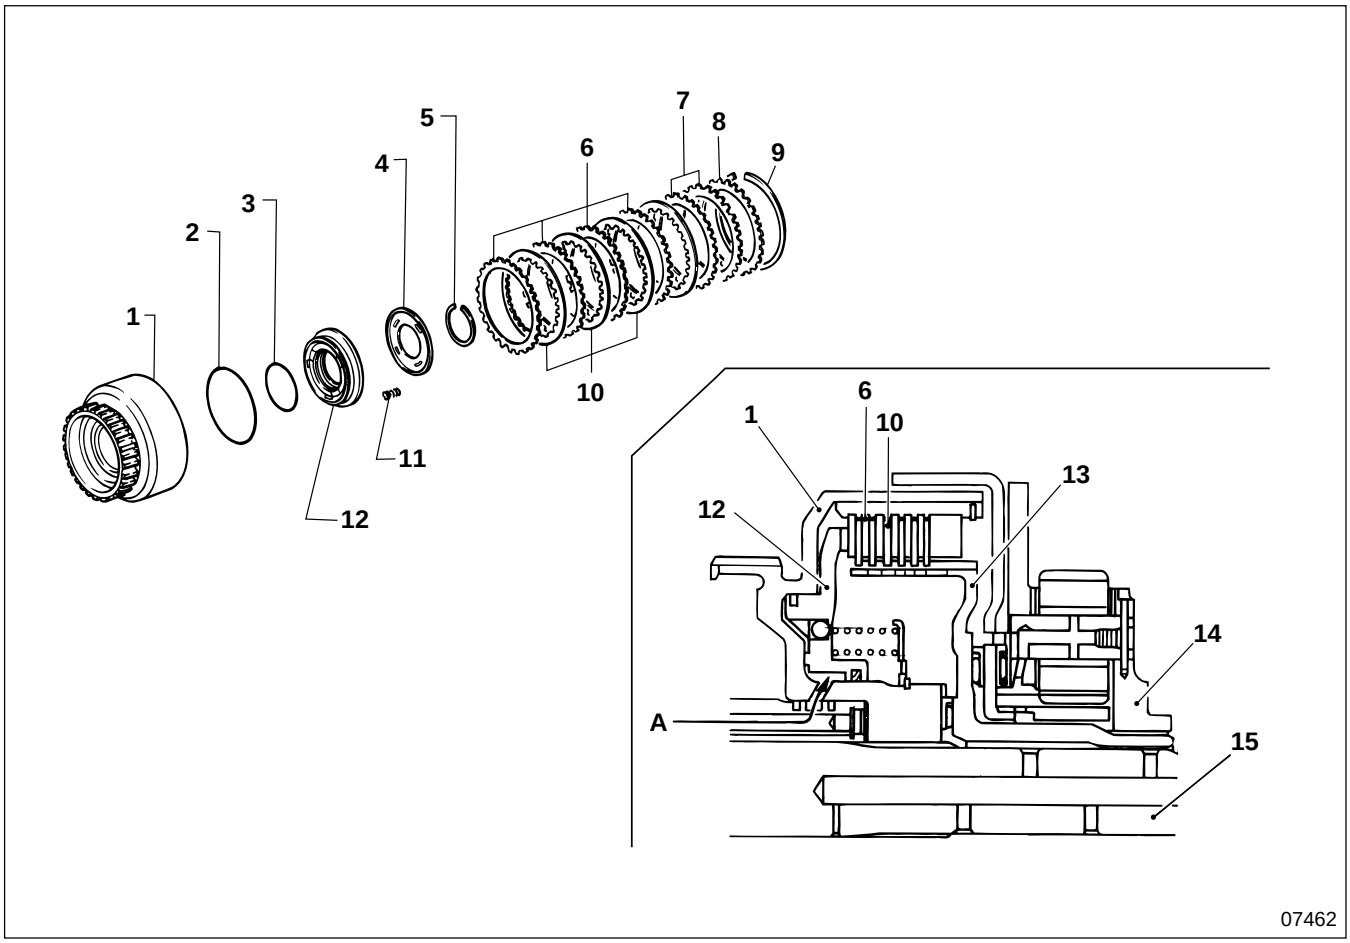
1	Dish plate	**8**	Snap ring	**15**	Connecting shell
2	Driven plate	**9**	Spring retainer	**16**	High clutch drum
3	Spacer	**10**	Return spring	**17**	Front sun gear
4	Retaining plate	**11**	D-ring	**18**	Input shaft
5	Snap ring	**12**	Reverse clutch piston	**19**	Check ball
6	Driving plate	**13**	Oil seal		
7	Spacer	**14**	Reverse clutch drum	**A** :	Clutch operating pressure

< When operating >
The hydraulic pressure from the control valve, that has been changed over by the manual valve, is delivered only during reversing and pushes reverse clutch piston **12**. This operation brings driving plate **6** and driven plate **2** into contact with each other, so that the power transmitted from high clutch drum **16** is transmitted to front sun gear **17** via connecting shell **15**.

< When not operating >
As no pressure is delivered except during reversing, reverse clutch piston **12** is pushed back by the repercussive force of return spring **10**. This operation separates driving plate **6** and driven plate **2** and no power transmission takes place.
Check ball **19**, which is built into the reverse clutch piston, releases oil when reverse clutch drum **14** is freewheeling so that the residual oil within the drum does not build up pressure and cause partial clutch operation. (The check ball is also fitted to other multiplate type clutches.)

https://truckmanualshub.com/

● High Clutch (Multiplate type)



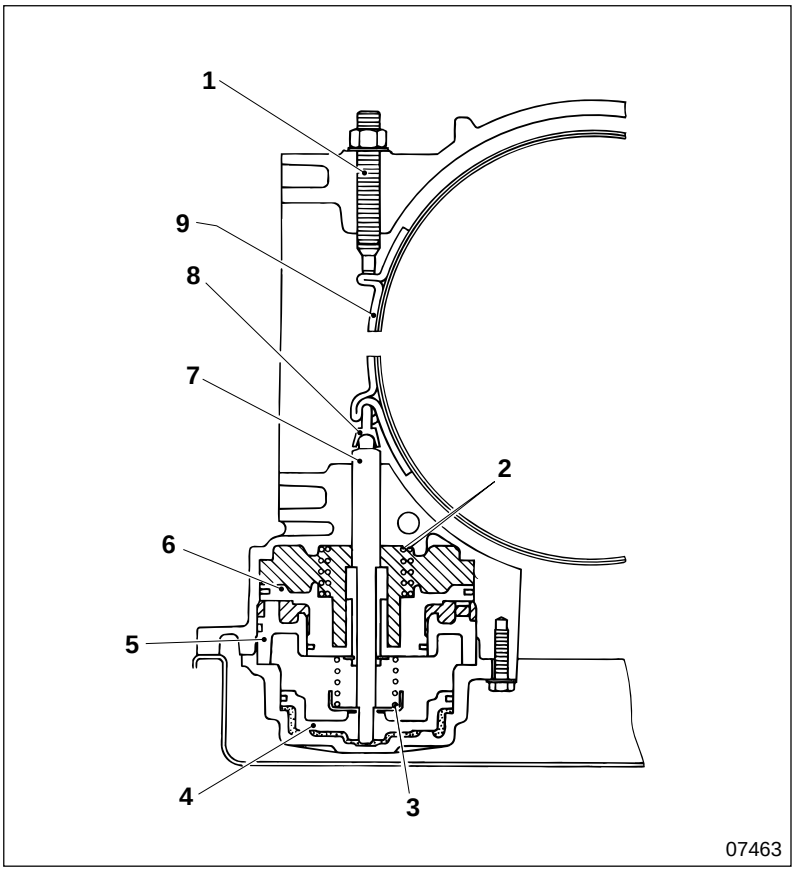
1 High clutch drum
2 D-ring
3 D-ring
4 Spring retainer
5 Snap ring
6 Driven plate
7 Spacer
8 Retaining plate
9 Snap ring
10 Driving plate
11 Return spring
12 High clutch piston
13 High clutch hub
14 Front planetary gear carrier
15 Input shaft

A : Clutch operating pressure

In the 3rd or 4th (overdrive) gear positions, the control valve (hydraulic control mechanism) makes hydraulic pressure act on high clutch piston **12**, so that the clutch plates (driving plate **10** and driven plate **6**) come into contact with each other and the power transmitted from input shaft **15** is transmitted to front planetary gear carrier **14** via high clutch hub **13**.

https://truckmanualshub.com/

● Brake Band



1 Anchor end bolt
2 Return spring
3 Return spring
4 Overdrive servo piston
5 Servo piston retainer
6 Servo piston
7 Piston stem
8 Band strut
9 Brake band

2nd gear shift operating chamber
3rd gear shift operating chamber
4th gear shift operating chamber

One end of brake band **9** is fixed to the transmission case by anchor end bolt **1**.
The servo piston assembly has three chambers each of which corresponds to a certain gear position, to which hydraulic pressure is supplied. Operating pressure is transmitted from the control valve to act on the piston for each gear shift position, and piston stem **7** is pushed up to make the brake band fix the reverse clutch drum. This operation fixes the front sun gear.

1st gear : As there is no delivery of hydraulic pressure to the servo piston assembly, the brake band does not act due to the repercussive force of the return spring.
2nd gear : Hydraulic pressure is delivered to the 2nd gear shift operating chamber, pushing up the piston stem to make the brake band fix the reverse clutch drum.
3rd gear : Hydraulic pressure is delivered to the 2nd gear shift operating chamber and the 3rd gear shift operating chamber. The force acting on the pressure reception area difference of the piston with the repercussive force of return spring **2**, pushes the piston stem down to release the brake band.
4th gear : The pressure acting on the 2nd and 3rd gear shift operating chambers releases the piston. But pressure delivered to the 4th gear shift operating chamber acts on drive servo piston **4** to push up the piston stem, and this operation causes the brake band to fix the reverse clutch drum.

	2nd gear shift operating chamber	3rd gear shift operating chamber	4th gear shift operating chamber
1st gear			
2nd gear	○		
3rd gear	○	○	
4th gear	○	○	○

23 Forward clutch hub and forward one-way clutch outer race
24 Overrunning clutch hub

A : Forward clutch related parts
B : Overrunning clutch related parts
C : Forward clutch operating pressure
D : Overrunning clutch operating pressure

- Forward clutch
  In the 1st, 2nd, 3rd, or 4th (overdrive) gear positions of any of the forward ranges (D, 2, L), the control valve (hydraulic control mechanism) makes hydraulic pressure act on forward clutch piston **12**, so that the clutch plates (driving plate **3** and driven plate **4**) come into contact with each other and connect forward clutch drum **11**, front planetary gear carrier **20**, and the forward one-way clutch outer race.
- Overrunning clutch
  In the case of the D range, overdrive switch OFF and 2, and the L ranges, the control valve (hydraulic control mechanism) makes hydraulic pressure act on overrunning clutch piston **15** to operate the engine brake, so that the clutch plates (driving plate **8** and driven plate **9**) come into contact with each other and connect forward clutch drum **11**, front planetary gear carrier **20**, and the rear internal gear without connecting with forward one-way clutch **22**.

https://truckmanualshub.com/

● Low and Reverse Brake (Multiplate type)

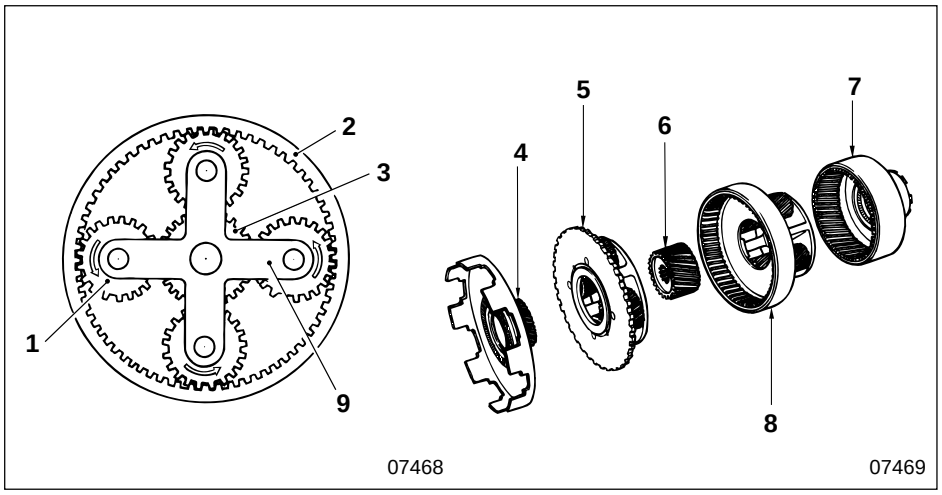
14 Bolt
15 Dish plate
16 Driving plate
17 Forward clutch drum
18 Transmission case
19 Front planetary gear carrier

In the 1st gear position in the L range and in the R range, the control valve (hydraulic control mechanism) makes hydraulic pressure act on low and reverse brake piston **10**, so that the clutch plates (driving plate **16** and driven plate **4**) come into contact with each other and fix transmission case **18** and forward clutch drum **17**, fixing front planetary gear carrier **19**.

https://truckmanualshub.com/

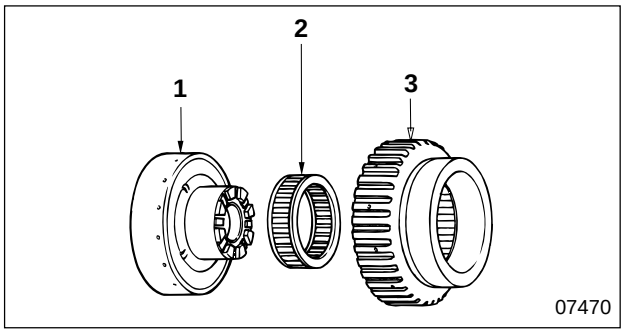
● Planetary Gear



1 Pinion gear
2 Internal gear
3 Sun gear
4 Front sun gear
5 Front planetary carrier
6 Rear sun gear
7 Rear internal gear
8 Front internal gear and rear planetary carrier
9 Planetary carrier

- Two sets of Simpson type planetary gears are used so that five gear ratios, four forward speeds and one reverse speed are possible.
- The planetary gear is constructed so that sun gear **3** is in the center and pinion gears **1** revolve within internal gear **2**, enclosing them. The pinion gears are supported by planetary gear carrier **9** so that all the pinion gears make identical rotations, in the same direction, simultaneously. Thus, the planetary gear consists of four elements: the sun gear, the pinion gear, the internal gear, and the planetary gear carrier. If the necessary conditions are met by any two of the following: the sun gear, the internal gear or the planetary gear carrier; gear ratio is changed. The clutch and the brake give conditions to the planetary gear in conjunction with gear shifting.

● Forward one-way clutch



1 Rear internal gear and forward one-way clutch inner race
2 Forward one-way clutch
3 Forward clutch hub and forward one-way clutch outer race

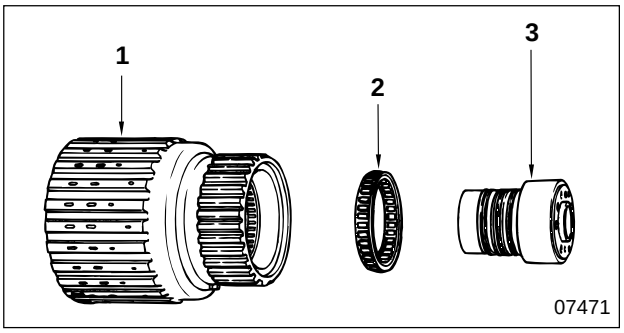
The forward one-way clutch, being fixed on the accelerating side of the 1st, 2nd, and 3rd gears, contributes to the power transmission. In the 4th gear, however, although the forward one-way clutch is making the forward clutch operate, it does not transmit power to forward one-way clutch **2** because the forward clutch remains free. (Inner race revolution > outer race revolution)
Accordingly, at shift-down from 4th gear to 3rd gear, and 4th gear to 2nd gear positions, gear shifting is possible by controlling only one set of friction elements so that the shift timing is maintained correctly with the shifting shock buffered.

Friction elements	Forward clutch	High clutch	Brake band
N			
D1	○		
D2	○		○
D3	○	○	
D4 (Overdrive)	⊗	○	○

○ : Friction element set is connected
⊗ : Friction element set is connected but not transmitting power

https://truckmanualshub.com/

● Low one-way clutch

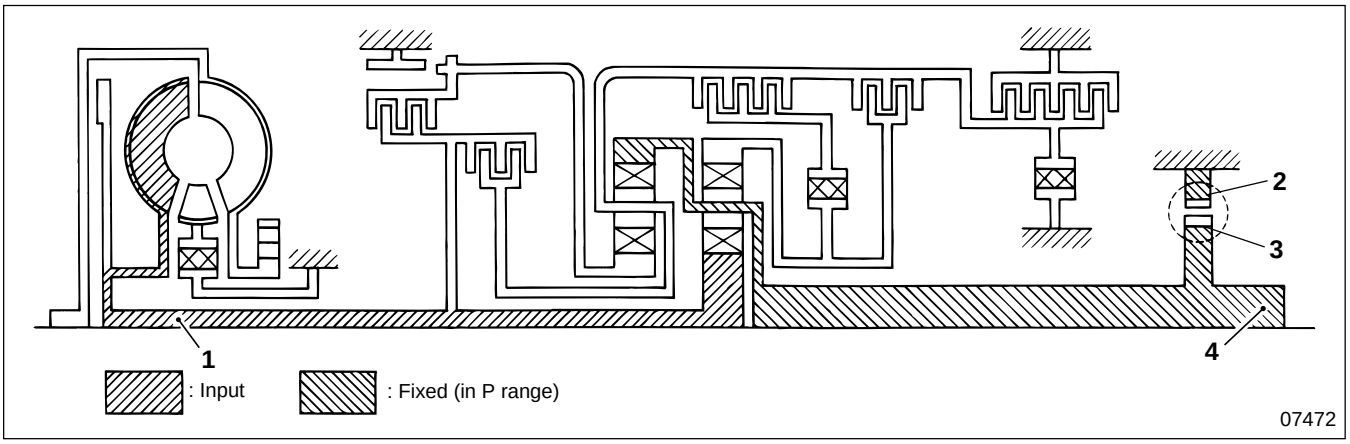


1 Forward clutch drum and low one-way clutch outer race
2 Low one-way clutch
3 Low one-way clutch inner race

The low one-way clutch fixes the rear internal gear via the forward clutch and the forward one-way clutch on the accelerating side in the 1st gear position of the D, 2 ranges. In the 2nd, 3rd or 4th gears it freewheels.

● Torque transmitting route

N range, P range



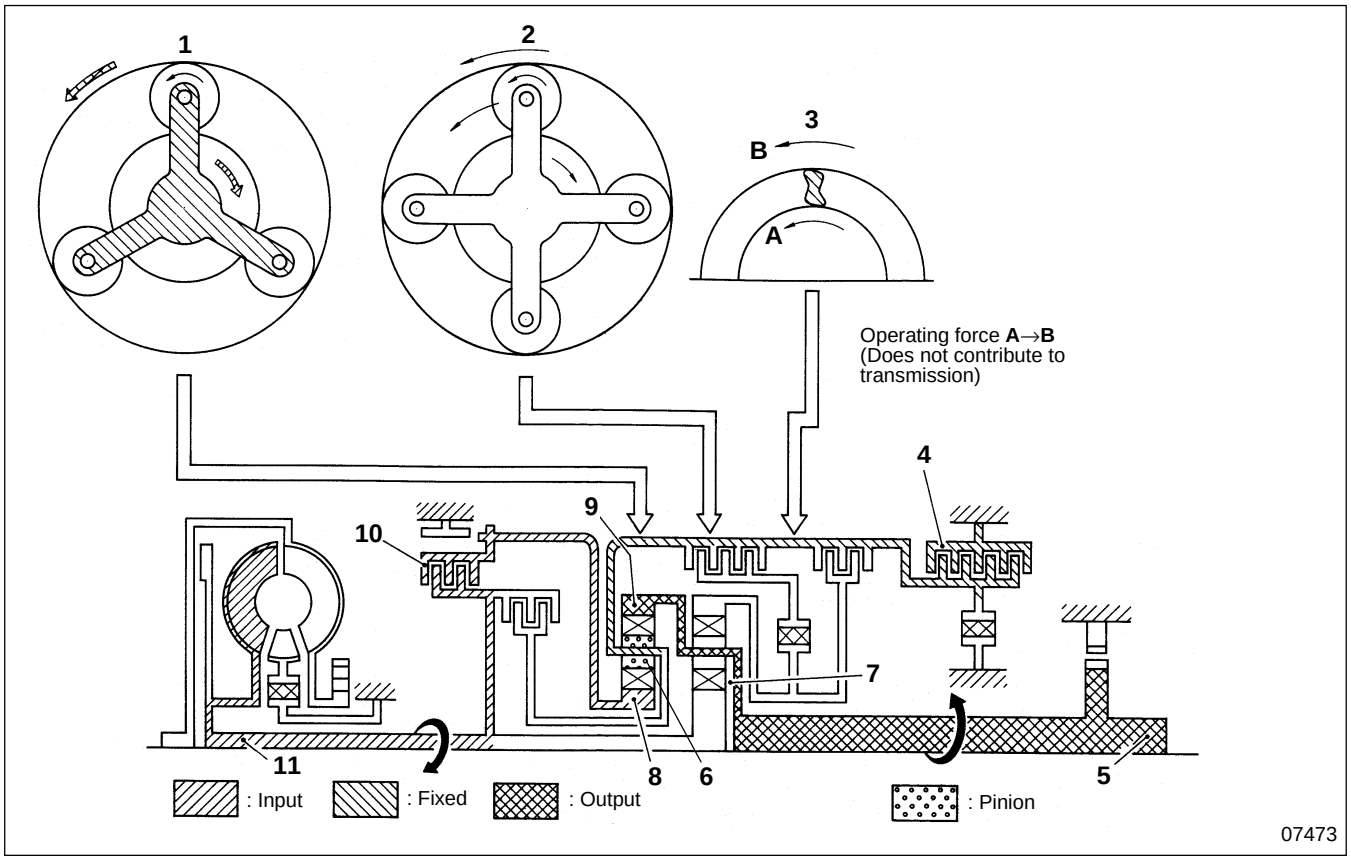
1 Input shaft
2 Parking pawl
3 Parking gear
4 Output shaft

< N range >
None of the control systems work. The power of input shaft **1** is not transmitted to output shaft **4** because the clutch is not engaged.

< P range >
The control systems are in the same state as in the N range. Parking pawl **2**, which is linked to the range selector lever, is engaged with parking gear **3** and output shaft **4** is fixed mechanically. (The area encircled in a dotted line, as illustrated.)

https://truckmanualshub.com/

R range



1 Front planetary gear
2 Rear planetary gear
3 Forward one-way clutch
4 Low and reverse brake
5 Output shaft
6 Front pinion gear
7 Rear planetary carrier
8 Front sun gear
9 Front internal gear
10 Reverse clutch
11 Input shaft

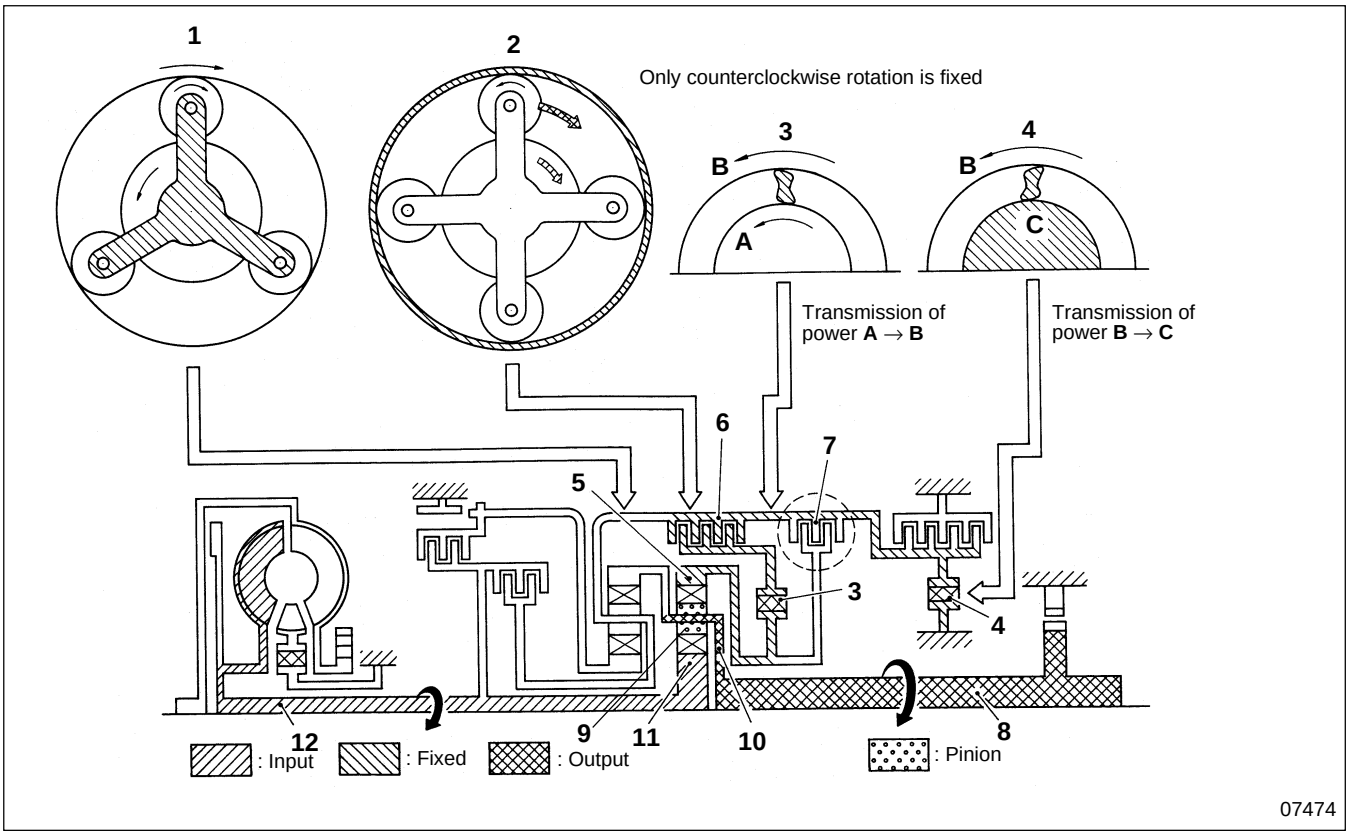
Reverse clutch **10** is engaged and power is transmitted from input shaft **11** to front sun gear **8** via the reverse clutch drum. Also low and reverse brake **4** engages to fix the front planetary carrier. By this operation, the clockwise rotation of front sun gear **8** makes front internal gear **9** (connected to output shaft **5**) rotate counterclockwise at a reduced rate.
(Direction of rotation is as seen from the torque converter side.)

Conditions
- Reverse clutch **10** engaged
- Low and reverse brake **4** engaged

Power transmitting route
Input shaft **11** → Reverse clutch **10** → Front sun gear **8** → Front pinion gear **6** →
→ Front internal gear **9** → Output shaft **5**

https://truckmanualshub.com/

D and 2 Ranges (1st gear)



1 Front planetary gear
2 Rear planetary gear
3 Forward one-way clutch
4 Low one-way clutch
5 Rear internal gear
6 Forward clutch
7 Overrunning clutch
8 Output shaft
9 Rear pinion gear
10 Rear planetary carrier
11 Rear sun gear
12 Input shaft

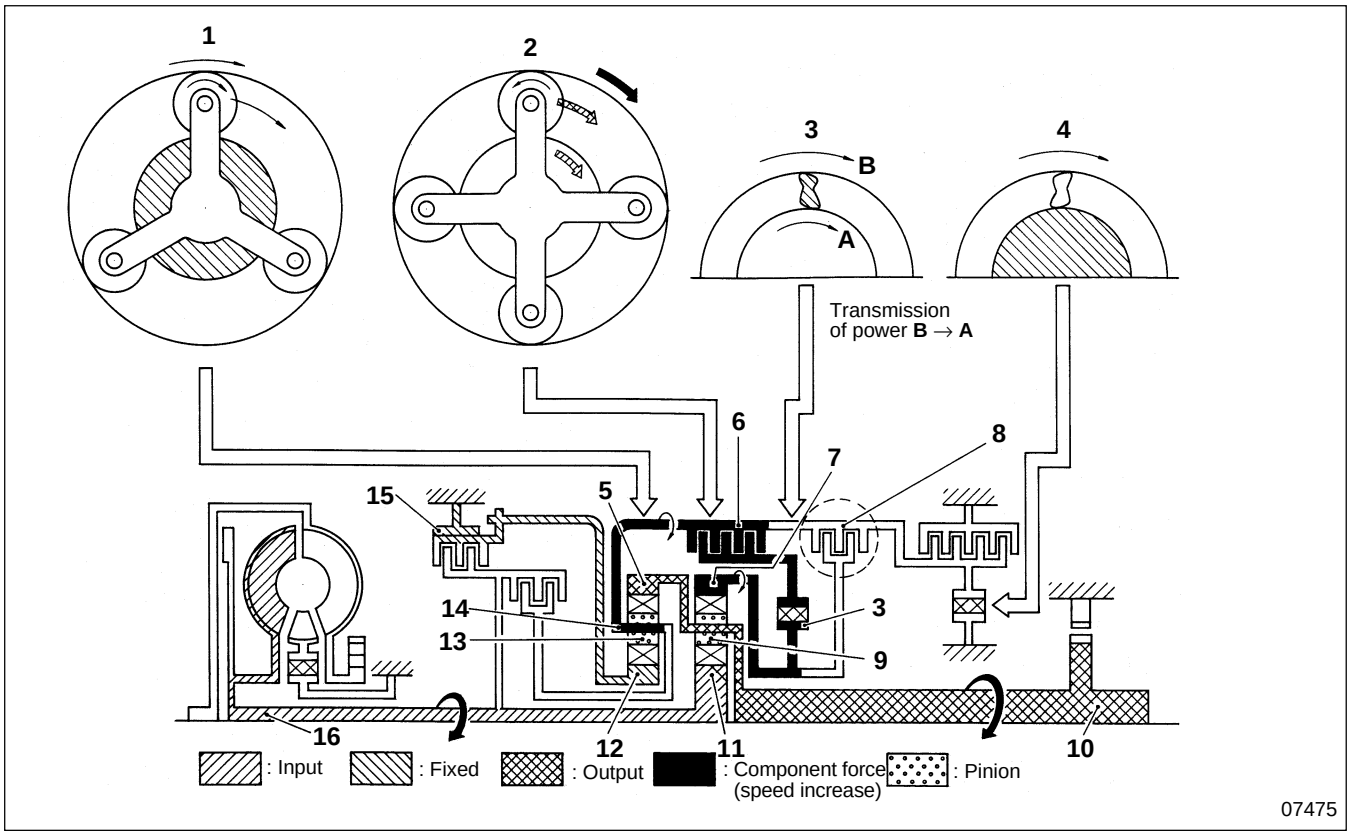
Forward clutch **6** engages, and forward one-way clutch **3** and low one-way clutch **4** operate to prevent rear internal gear **5** from rotating counterclockwise.
Power is transmitted from input shaft **12** to rear sun gear **11** causing it to rotate clockwise. When this happens, rear pinion gear **9** rotates counterclockwise, and tries to force rear internal gear **5** to rotate in the same direction. However, counterclockwise rotation of the rear internal gear is prevented, therefore rear planetary carrier **10** (engaged with output shaft **8**) rotates at a reduced speed clockwise. When the vehicle is coasting, the rear internal gear rotates clockwise so the forward one-way clutch freewheels. When this happens, the engine brake is not effective because low one-way clutch **4** is freewheeling, and opposite driving power is not transmitted to the engine even if overrunning clutch **7** is engaged.
(Direction of rotation is as seen from the torque converter side.)

Conditions
- Forward clutch **6** engaged
- Forward one-way clutch **3** operating
- Low one-way clutch **4** operating
- Overrunning clutch **7** engaged
  D : Vehicle speeds of 10 km/h {6.21 mph} or more
  2 : Accelerator opening for the entire range

Power transmitting route
Input shaft **12** → Rear sun gear **11** → Rear pinion gear **9** → Rear planetary carrier **10** → Output shaft **8**

https://truckmanualshub.com/

D, 2 and L Ranges (2nd gear)



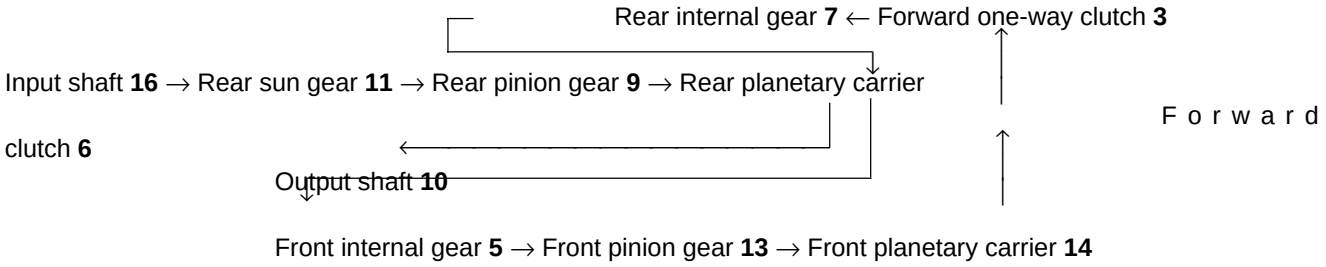
1 Front planetary gear
2 Rear planetary gear
3 Forward one-way clutch
4 Low one-way clutch
5 Front internal gear
6 Forward clutch
7 Rear internal gear
8 Overrunning clutch
9 Rear pinion gear
10 Output shaft
11 Rear sun gear
12 Front sun gear
13 Front pinion gear
14 Front planetary carrier
15 Brake band
16 Input shaft

https://truckmanualshub.com/

Forward clutch **6** engages, and front planetary carrier **14** and rear internal gear **7** are connected by forward one-way clutch **3**, causing brake band **15** to fix front sun gear **12**. Power is transmitted from input shaft **16** to rear sun gear **11**, making the rear planetary carrier rotate clockwise together with front internal gear **5**, which rotates in the same direction and at the same speed because it is connected to the rear planetary carrier. When this happens, with the front sun gear fixed by the operation of the brake band, the front planetary carrier, the forward clutch, and the forward one-way clutch causes the rear internal gear to rotate clockwise. Therefore, the speed becomes faster, in proportion to the rate of rotation of the rear internal gear, than in 1st gear position. When the vehicle is coasting, the rear internal gear rotates clockwise and the forward one-way clutch freewheels so opposite power is not transmitted to the engine. (No engine braking takes place.) For this reason, overrunning clutch **8** (the area enclosed in a dotted line, as illustrated) is engaged to prevent the forward one-way clutch from freewheeling so that the opposite driving power is transmitted to the engine, making engine braking effective.
(Direction of rotation is as seen from the torque converter side.)

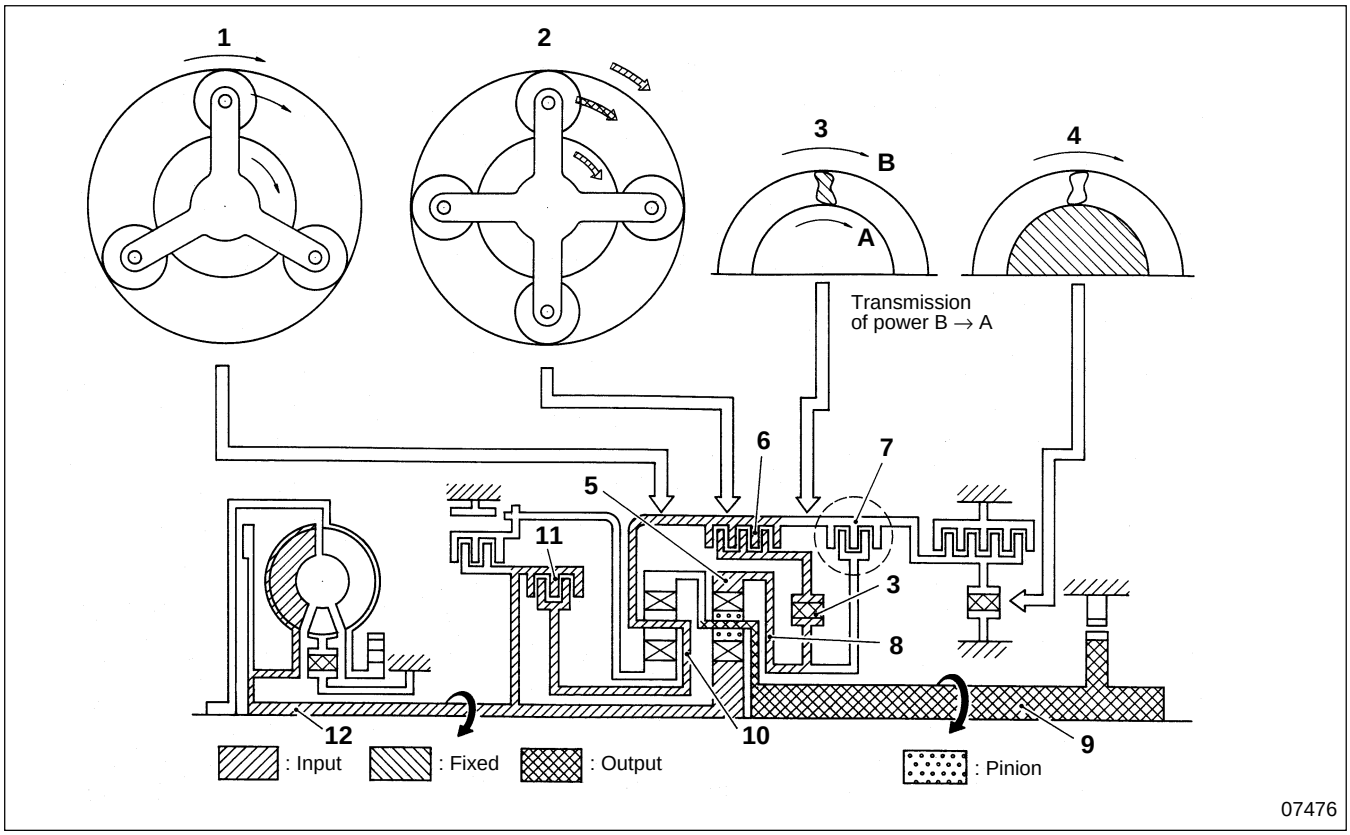
Conditions
- Forward clutch **6** engaged
- Forward one-way clutch **3** operating
- Brake band **16** engaged
- Overrunning clutch **8** engaged
  D : Vehicle speeds of 10 km/h {6.21 mph} or more
  2 : Accelerator opening for the entire range
  L : Accelerator opening for the entire range

Power transmitting route



https://truckmanualshub.com/

D, 2 and L Ranges (3rd gear)



1 Front planetary gear
2 Rear planetary gear
3 Forward one-way clutch
4 Low one-way clutch
5 Rear internal gear
6 Forward clutch
7 Overrunning clutch
8 Rear planetary carrier
9 Output shaft
10 Front planetary carrier
11 High clutch
12 Input shaft

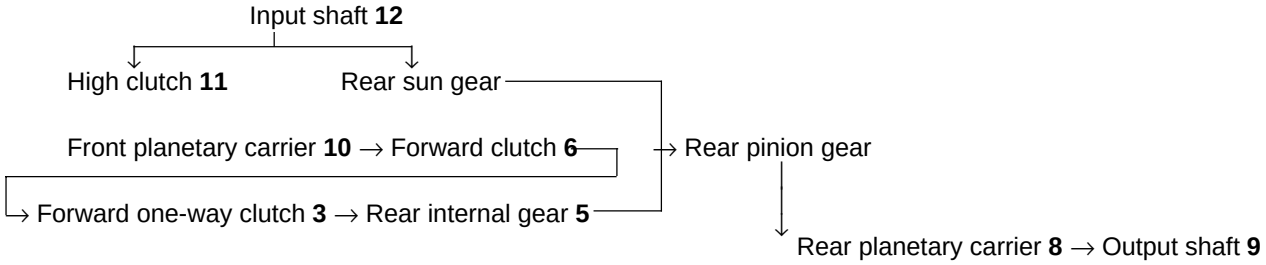
https://truckmanualshub.com/

High clutch **11** engages to connect input shaft **12** and front planetary carrier **10**. Also, forward clutch **6** engages and forward one-way clutch **3** operates to connect the front planetary carrier and rear internal gear **5**. Power is transmitted from the input shaft to the rear sun gear, as well as to the rear internal gear by the operation of the high clutch. This transmission of power causes the rear sun gear and the rear internal gear to rotate clockwise simultaneously. This makes rear planetary carrier **8** (connected to output shaft **9**) rotate together with the rear sun gear and the rear internal gear as one set. When the vehicle is coasting, the rear internal gear is rotating clockwise so that the forward one-way clutch is allowed to freewheel, therefore, opposite driving power is not transmitted to the engine (no engine brake taking effect). For this reason, overrunning clutch **7** (the area enclosed in a dotted line, as illustrated) is engaged, preventing forward one-way clutch **3** from freewheeling, so the opposite driving power is transmitted to the engine to make engine braking effective.
(Direction of rotation is as seen from the torque converter side.)

Conditions
- High clutch **11** engaged
- Forward clutch **6** engaged
- Forward one-way clutch **3** operating
- Overrunning clutch **7** engaged

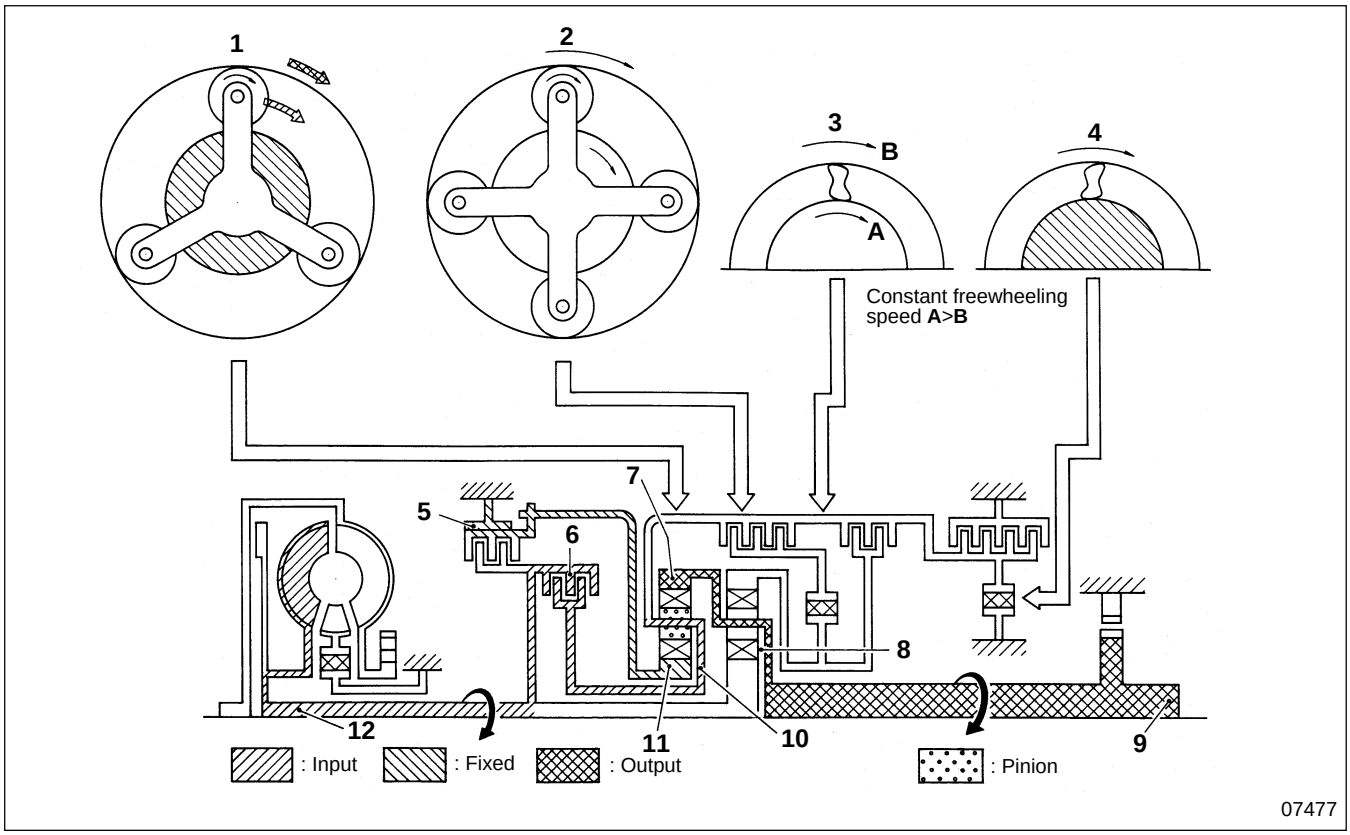
  D : Vehicle speeds of 10 km/h {6.21 mph} or more
  2 : Accelerator opening for the entire range
  L : Accelerator opening for the entire range

Power transmitting route



https://truckmanualshub.com/

D, 2 and L Ranges (4th gear)



1 Front planetary gear
2 Rear planetary gear
3 Forward one-way clutch
4 Low one-way clutch
5 Brake band
6 High clutch
7 Front internal gear
8 Rear planetary carrier
9 Output shaft
10 Front planetary carrier
11 Front sun gear
12 Input shaft

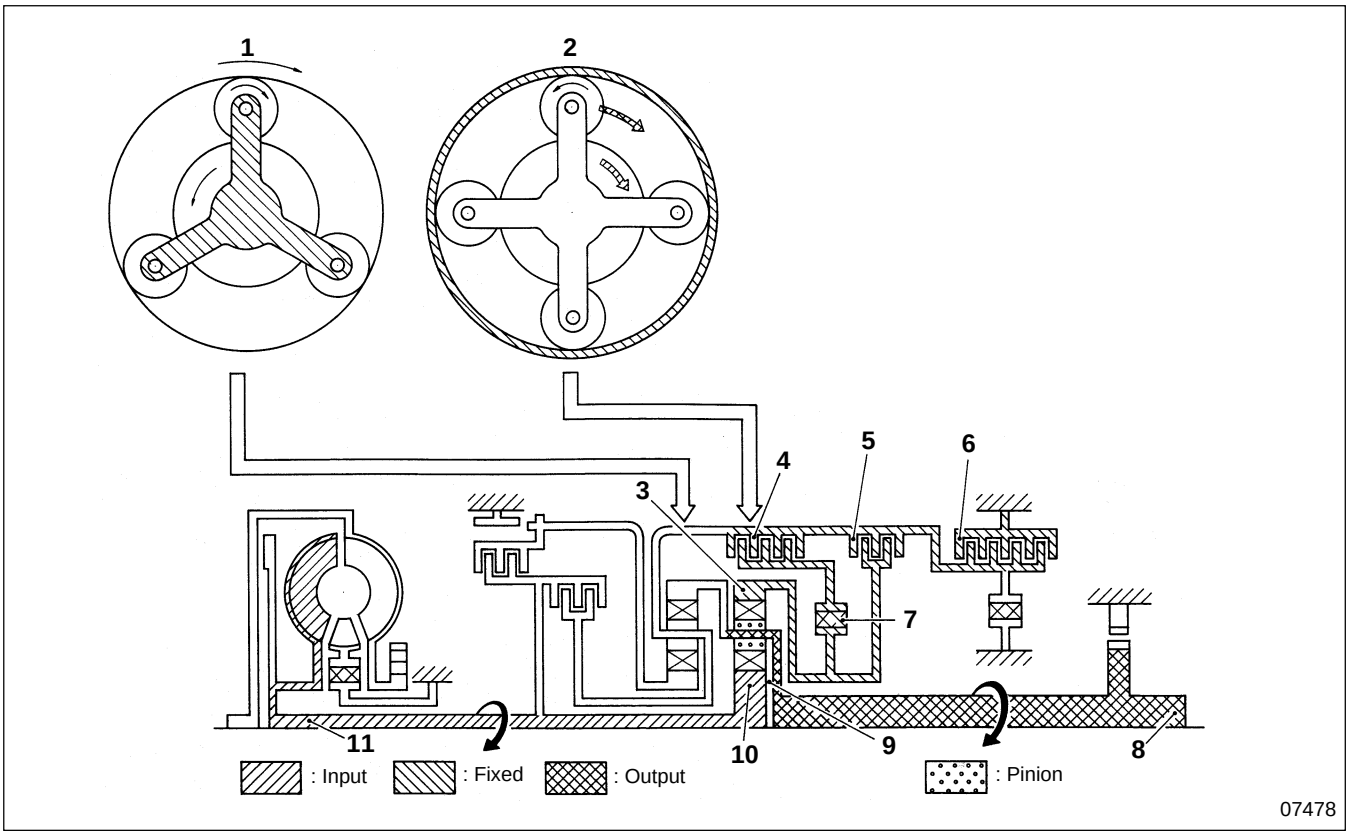
High clutch **6** engages to connect input shaft **12** and front planetary carrier **10**.
Also, brake band **5** operates to fix front sun gear **11**. The operation of high clutch **6** transmits power from the input shaft to the front planetary carrier, making the front planetary carrier rotate clockwise. This makes front internal gear **7** (connected to output shaft **9**) rotate clockwise at an increased speed as the front sun gear is fixed by the brake band. When the vehicle is coasting, opposite driving power is transmitted to the engine making engine braking effective. In operation in the 4th gear position in the D range, because forward one-way clutch **4** freewheels, driving power is not transmitted although the forward clutch is engaged.
(Direction of rotation is as seen from the torque converter side.)

Conditions
- High clutch **6** engaged
- Brake band **5** engaged
- Forward clutch engaged (not transmitting power)

Power transmitting route
Input shaft **12** → High clutch **6** → Front planetary carrier **10** → Front pinion gear
→ Front internal gear **7** → Rear planetary carrier **8** → Output shaft **9**

https://truckmanualshub.com/

L Range (1st gear)



1 Front planetary gear
2 Rear planetary gear
3 Rear internal gear
4 Forward clutch
5 Overrunning clutch
6 Low and reverse brake
7 Forward one-way clutch
8 Output shaft
9 Rear planetary carrier
10 Rear sun gear
11 Input shaft

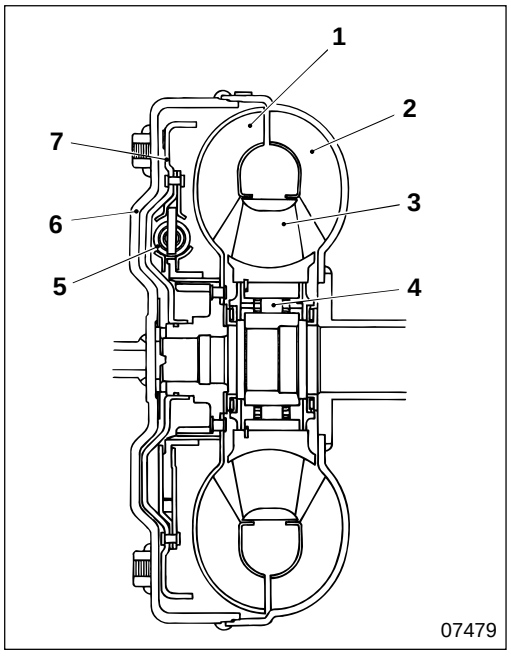
Forward clutch **4** and overrunning clutch **5** engage to connect the front planetary carrier and rear internal gear **3**. Also, low and reverse brake **6** engages to fix the front planetary carrier and the rear internal gear. In contrast to the operation in 1st gear position in the D, 2 ranges, in 1st gear position in the L range, forward one-way clutch **7** is fixed by overrunning clutch **5**, and the rear internal gear is fixed by the low and reverse brake instead of by the low one-way clutch. This operation prevents freewheeling of the forward one-way clutch and the low one-way clutch when the vehicle is coasting or when shifting down from 2nd to 1st gear in the L range, so that opposite driving power is transmitted to the engine to make engine braking effective.
(Direction of rotation is as seen from the torque converter side.)

Conditions
- Forward clutch **4** engaged
- Forward one-way clutch **7** operating (when accelerating)
- Overrunning clutch **5** engaged
- Low and reverse brake engaged

Power transmitting route
Input shaft **11** → Rear sun gear **10** → Rear pinion gear → Rear planetary carrier **9** → Output shaft **8**

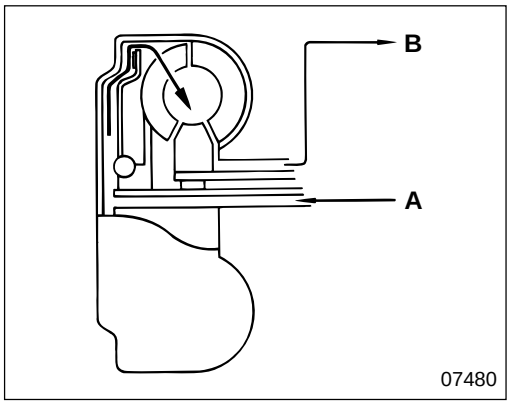
https://truckmanualshub.com/

● Torque Converter (with lock-up clutch)

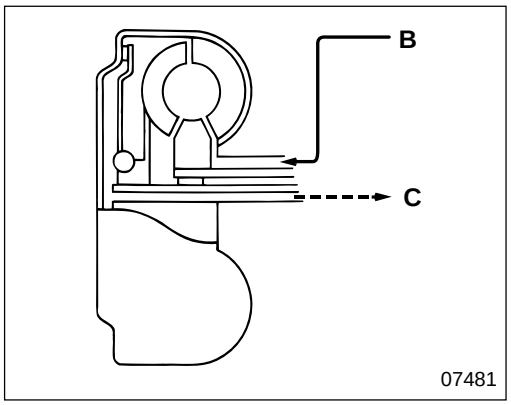


1 Turbine runner
2 Pump impeller
3 Stator
4 One-way clutch
5 Torsional damper
6 Converter cover
7 Lock-up piston

The torque converter transmits the engine torque to the transmission. When the lock-up clutch is not operating, power is transmitted by oil, and when the lock-up clutch is operating, power is transmitted by lock-up piston **7**. The torque converter is a symmetrical 3-element, 1-stage, 2-phase type. Symmetrical 3-element means that the three elements: pump impeller **2**, turbine runner **1** and stator **3**; are arranged symmetrically. 1-stage means that there is only one turbine runner (output element). 2-phase means that when the speed of the turbine is relatively low compared to that of the pump impeller, the torque converter operates as a torque converter, and while at high speed, it acts as a fluid coupling.



< When lock-up is not operating >
The torque converter operating pressure is delivered from the lock-up valve and supplied to the space between converter cover **6** and lock-up piston **7** through oil passage **A**, and separates the clutch facing of the lock-up piston from the converter cover. By this operation, the torque converter operating pressure fed through oil passage **A** is released through oil passage **B** to the oil cooler.



< When lock-up is operating >
The pressure line is changed over by the lock-up valve to feed the torque converter operating pressure to pump impeller **2**, turbine runner **1**, and stator **3** side through oil passage **B**.
By this operation, the lock-up piston receives hydraulic pressure to make the facing of lock-up piston **7** make contact with converter cover **6** so that the efficiency of the power transmission is improved.
C : Drain

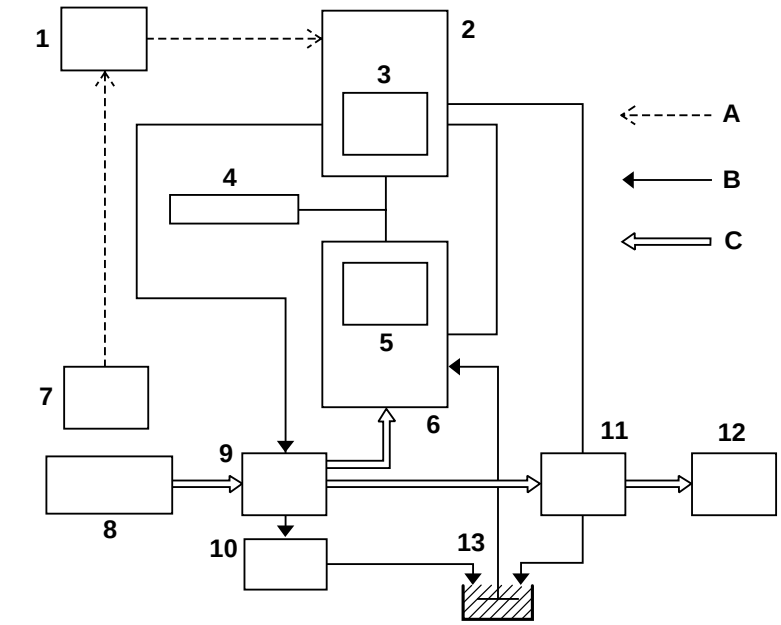
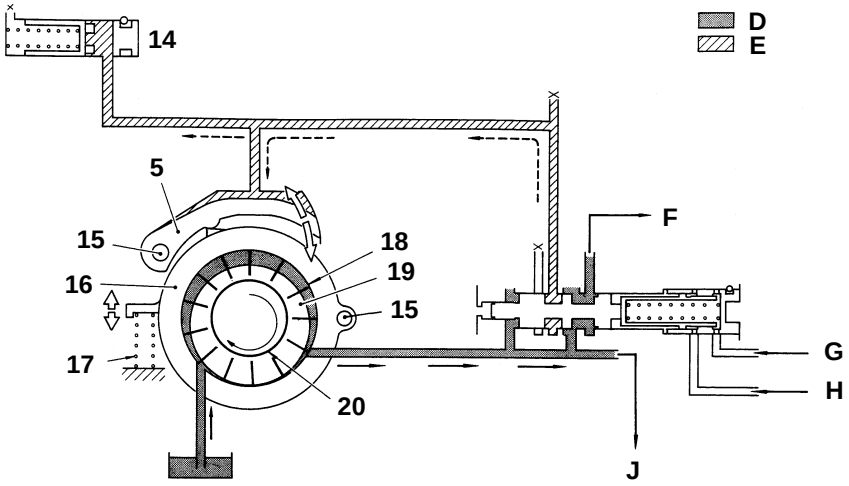
● Oil Pump (Variable displacement vane pump)



07482

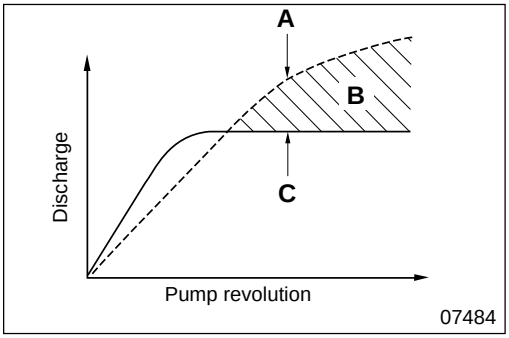


07483

1 Automatic transmission electronic control unit
2 Control valve
3 Pressure regulator valve
4 Accumulator piston
5 Control piston
6 Oil pump
7 Accelerator sensor
8 Engine
9 Torque converter
10 Oil cooler
11 Transmission system
12 Tire
13 Oil pan
14 Feedback accumulator piston
15 Pivot pin
16 Cam ring
17 Return spring
18 Vane
19 Rotor
20 Vane ring

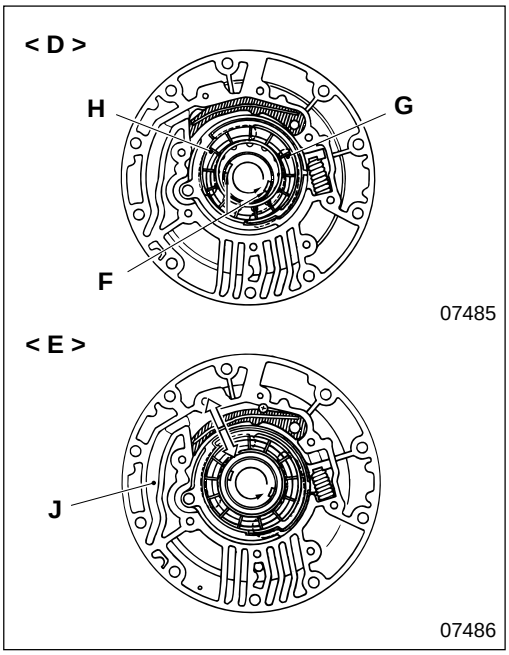
A : Electric signal
B : Flow of oil
C : Power transmission
D : Line pressure
E : Feedback pressure
F : Torque converter operating pressure
G : Pressure modifier pressure (D, 2, L and R ranges)
H : Line pressure (R range)
J : Line pressure (operating oil and lubricant for other devices)

https://truckmanualshub.com/



A : Gear pump
B : Unnecessary flow
C : Variable displacement vane pump

This pump makes it possible to control the oil pump discharge to the minimum necessary throughout the operation from low revolution to high revolution. It suppresses the increase in the driving torque in comparison to the gear pump that discharges an excessive amount of oil at high revolutions. Also, in comparison to the gear pump: it has less variation in discharge pressure, less pressure loss due to friction, less noise, etc.



D : When control piston is not operating
E : When control piston is operating
F : Engagement part of the torque converter drive sleeve

(1) The rotor is fitted to the drive sleeve of the torque converter, and rotates in the same direction as the engine (in the arrow direction), and the oil sucked into chamber **G** is discharged at **H**. (Direction of rotation when seen from the rear side of the oil pump is counterclockwise.)

(2) The discharged oil functions as the operating pressure and lubricant for the torque converter, the control valve, the clutch, and the brake.

(3) The discharge increases in accordance with the increase in the rate of revolution of the oil pump.

(4) Feedback pressure from the control valve works in area **J** and adjusts the cam ring position (amount of eccentricity) relative to the center axis of revolution of the rotor by the movement of the control piston (in the arrow direction). This operation increases or decreases the intake volume of area **G** to control the pump discharge.

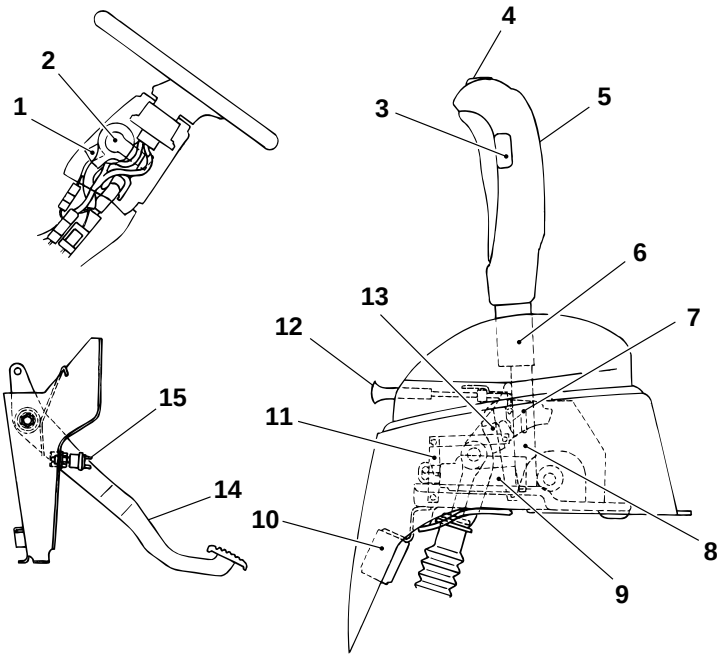
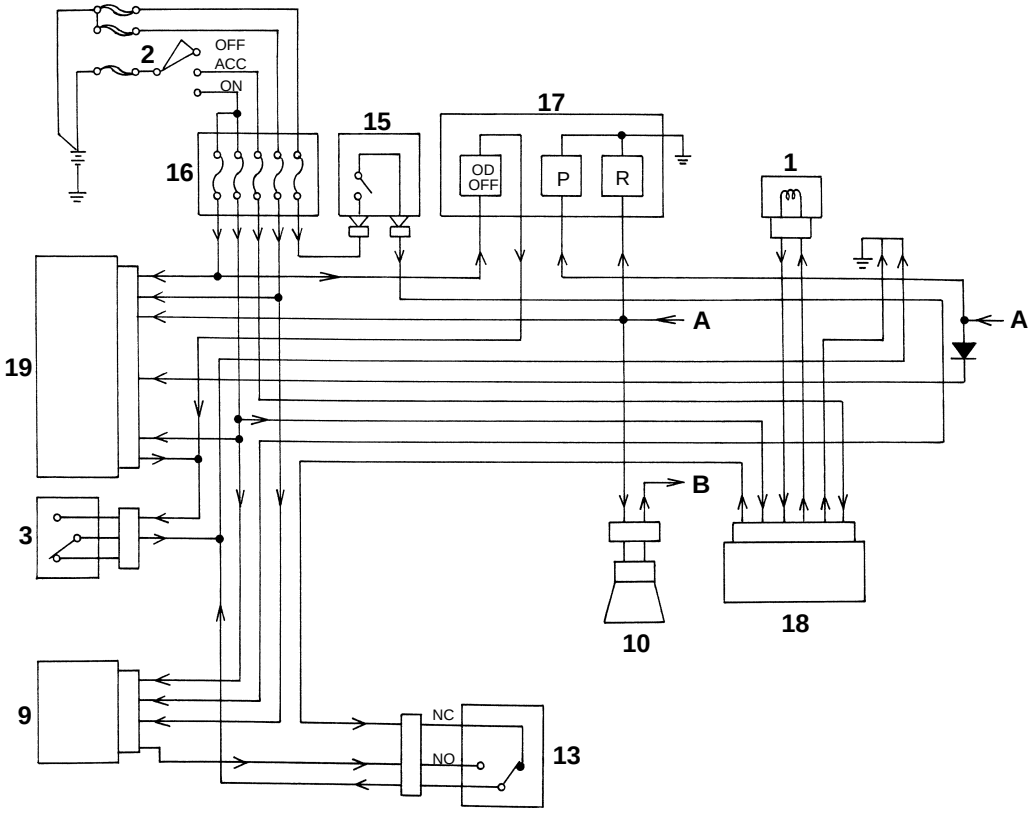
Fail-safe system



13990



13991

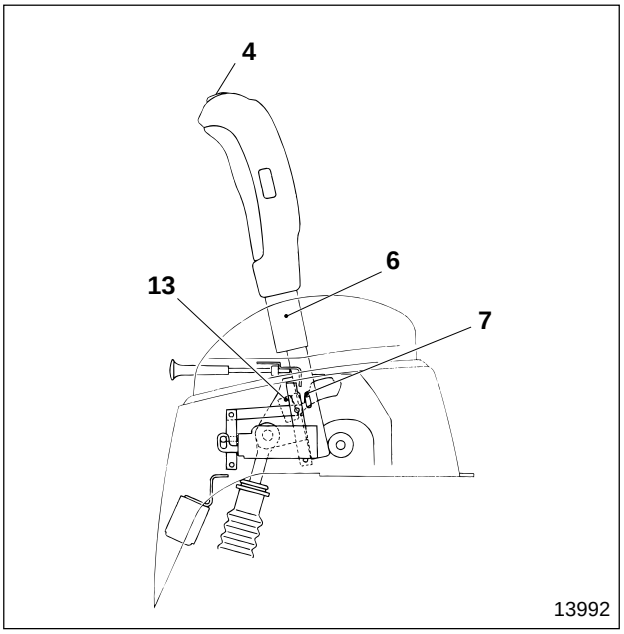
https://truckmanualshub.com/

1 Key interlock solenoid
2 Starter switch
3 Overdrive OFF switch
4 Shift button
5 Automatic transmission knob
6 Selector lever
7 Pin
8 Lever bracket
9 Shift lock actuator
10 Automatic transmission reverse buzzer
11 Shift lock link
12 Shift lock release knob
13 Parking range switch
14 Brake pedal
15 Stop lamp switch
16 Fuse box
17 Meter cluster
18 Key interlock electronic control unit
19 Automatic transmission electronic control unit

A : To inhibiter switch
B : To back buzzer

● **Parking shift locking with key interlocking system**

The key interlocking device is a system that makes it impossible for the key to be pulled out when selector lever **6** is in any position other than the P (parking) range. The shift locking safety device is a system that makes it impossible for the vehicle to move when the selector lever is locked in the P range unless brake pedal **14** is depressed.



Key interlocking system

< When locked >
Conditions : When selector lever **6** is in any position other than in the P range, or in the P range but shift button **4** is depressed, pin **7** moves away from P range switch **13** (so the switch is free from any contact), therefore the switch is ON.

↓

Current flows from key interlock electronic control unit **18** to key interlock solenoid **1**, switching the key interlock solenoid ON.

↓

Activation of key interlock solenoid **1** means starter switch **2** cannot be turned to the LOCK position, therefore the key cannot be pulled out.

< When not locked >
Conditions : When selector lever **6** is in the P range and shift button **4** is not depressed, pin **7** presses down P range switch **13** (the switch is operating), therefore the switch is OFF.

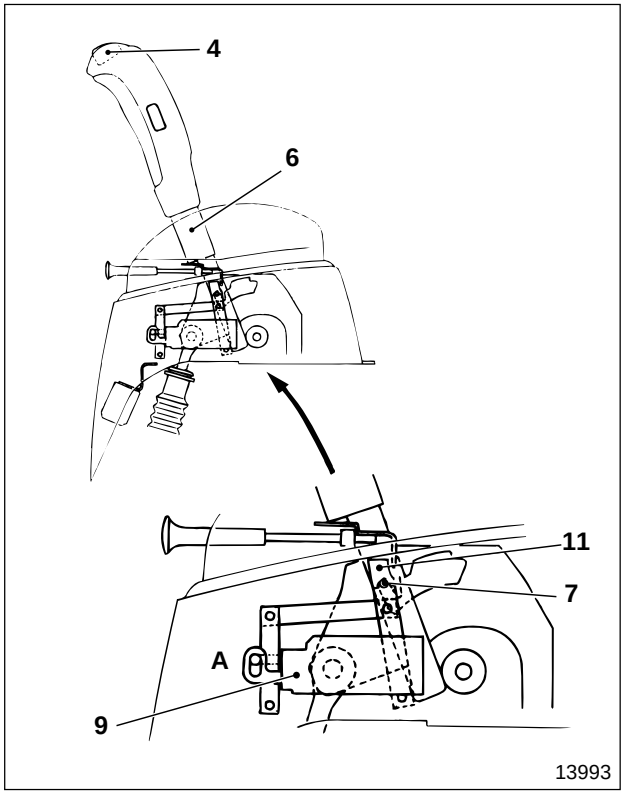
↓

No current flows from key interlock electronic control unit **18** to key interlock solenoid **1**, switching the key interlock solenoid OFF.

↓

Key interlock solenoid **1** is not operating and starter switch **2** is released so that the starter switch is turned to the LOCK position, and the key can be pulled out.

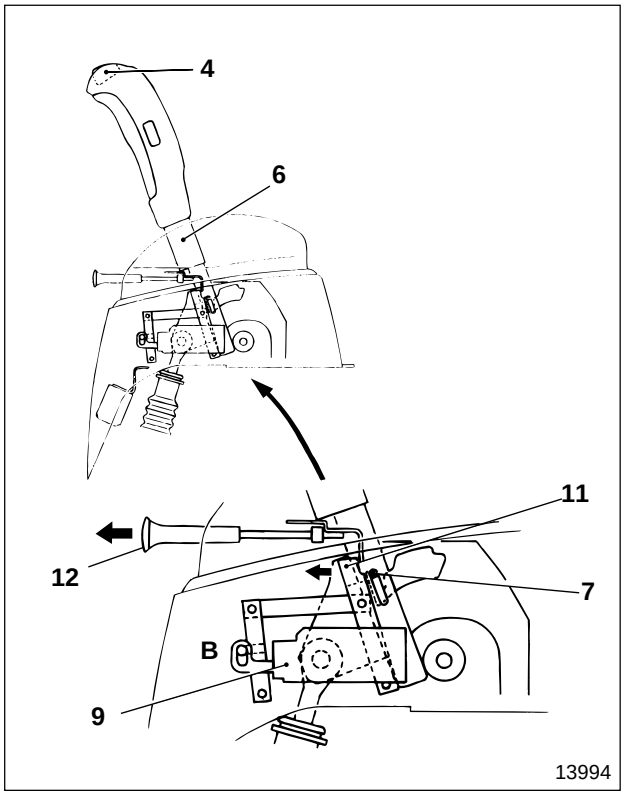
https://truckmanualshub.com/



Parking shift locking system

- When selector lever **6** is in the P range and shift lock actuator **9** is locked (state **A**) depending on the state of the power supply (refer to the table below) to the shift lock actuator, pin **7** is restrained by shift lock link **11** and cannot push shift button **4**, and the selector lever cannot be shifted to any position other than the P range.

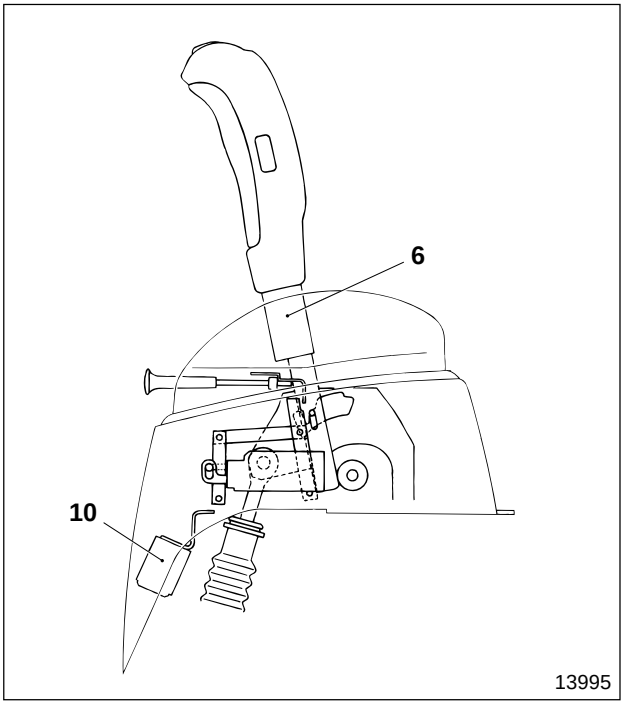
Power supply		Switch		Operating mode	
IG	+B	Brake	P range	Unlock	Lock
○	○	○	○	○←	
○	○		○		→○
○	○	○		○	
○	○			○	
	○	○	○		→○
	○		○		→○
	○	○		○	
	○			○	



- When selector lever **6** is in the P range and shift lock actuator **9** is unlocked (state **B**) depending on the state of the power supply (refer to the table above) to the shift lock actuator, shift lock link **11** falls forward freeing pin **7** so that shift button **4** is pressed down, allowing the selector lever to move to positions other than the P range.

- In the event of any electrical troubles, P shift locking can be released by pulling shift lock release knob **12**.

https://truckmanualshub.com/



● **Warning system for selector lever reverse position**

When starter switch **2** is ON, if selector lever **6** is put into the R (reverse) range, the reverse position detector switch (inhibiter switch built into the automatic transmission) operates to turn automatic transmission reverse buzzer **10** ON, and alerts the driver that the lever is in the reverse position.

https://truckmanualshub.com/

TROUBLESHOOTING PROCEDURE

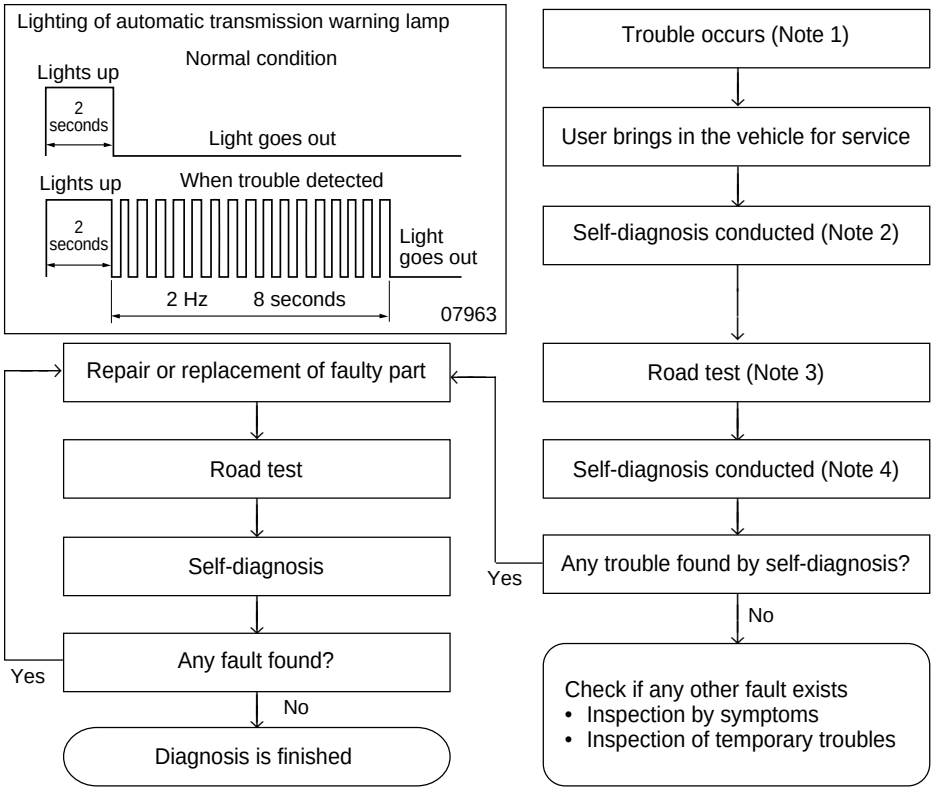
Possible causes for automatic transmission troubles are as follows:
- Engine performance faulty
- Incorrect adjustment of components
- Hydraulic system faulty
- Mechanical function faulty
- Electrical system faulty

In carrying out a diagnosis of the above items, elementary inspections must be made on the following matters.
- Condition of the engine Gr 13
- Adjustment of accelerator control cable Gr 13
- Automatic transmission fluid quantity and deterioration P23-117
- Adjustment of selector cable P23-136

At the same time, use the self-diagnosis function to search for and study the causes of the troubles and take proper measures to deal with the cause.
After this is done, carry out a road test to see if the trouble has been solved and to judge if any further diagnosis is required.
When causes cannot be located or the trouble cannot be solved even after repair, carry out a stall test and a line pressure test. P23-112, 113
Repair and replacement of parts inside the automatic transmission body cannot be carried out yourself. Therefore, after evaluating the condition in the service works, if there is trouble inside the automatic transmission body, or any of the interior parts need to be inspected, replace the automatic transmission body as a unit.

For inspection of the automatic transmission system, it is recommended that you use the multi-use tester for more efficient testing.
System inspections are classified into the following categories according to symptoms and recognition of the diagnosis codes.
- Inspection by individual diagnosis code memorized by the electronic control unit
- Inspection by symptoms
- Inspection of temporary troubles

Self-diagnosis Procedure



Note 1 : If a trouble was detected during the last trip (i. e. sometime between the key being turned ON and OFF), the automatic transmission warning lamp will flash when the starter switch is turned ON, as illustrated in the diagram on the left.
Also if any of the troubles listed below occur while driving that would reduce the driving performance considerably, the automatic transmission warning lamp will light up.
- Both vehicle speed sensors 1, 2 faulty
- Any solenoid faulty
- Accelerator sensor faulty
- Inhibiter switch faulty

Note 2 : Troubles that occurred during vehicle use are inspected and recorded.

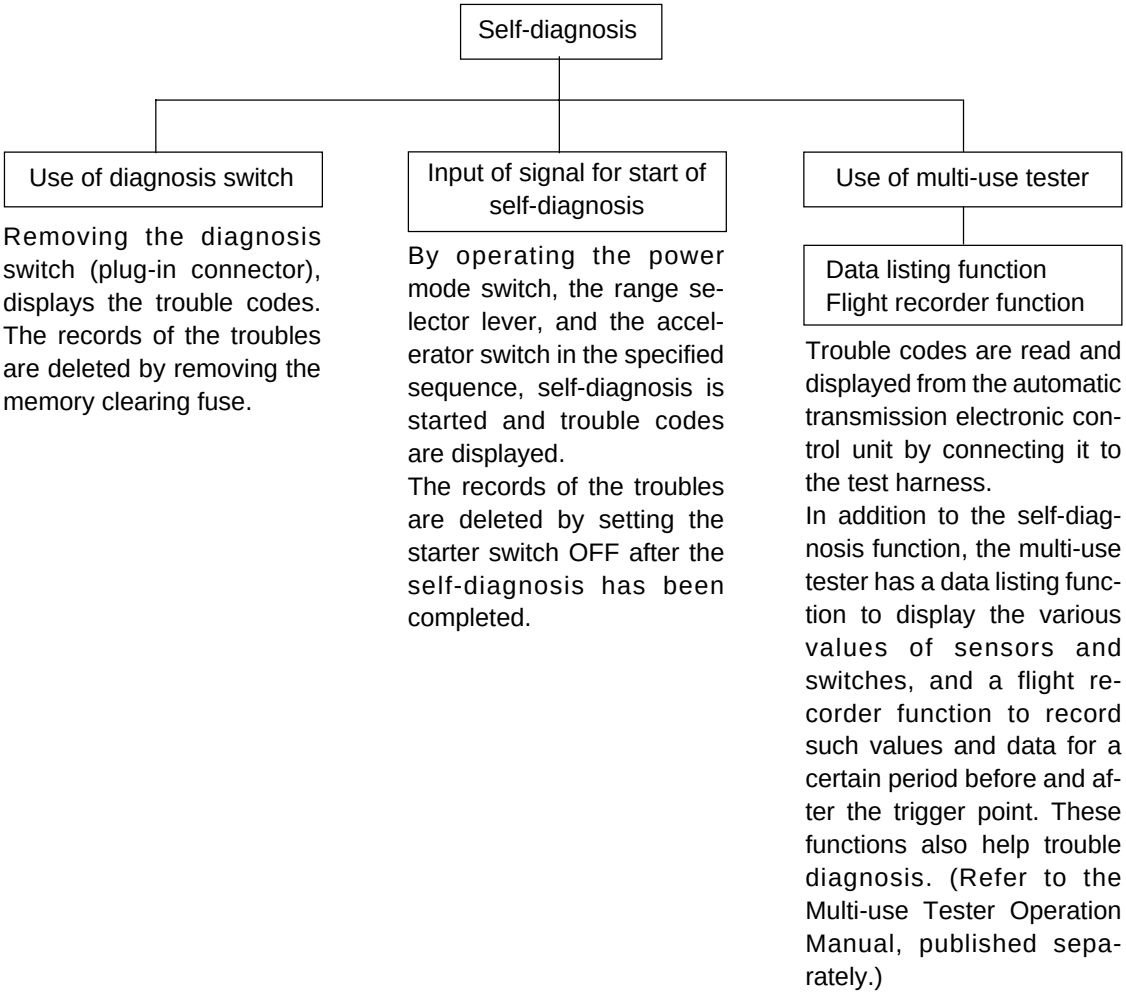
Note 3 :
- Detecting the fault.
- You must carry out a road test at a speed lower than 50 km/h {31.1 mph} and operate the accelerator from fully closed to fully opened.

Note 4 : Troubles that occurred during the road test are inspected and recorded.

https://truckmanualshub.com/

Self-diagnosis methods

You can select a self-diagnosis method from the three alternatives below.



Characteristic features of each method

Item \ Self-diagnosis method	Use of diagnosis switch	Input of signal for start of self-diagnosis	Use of multi-use tester
Convenient	○	△	◎
Items to be self-diagnosed	◎	○	◎
Ease of reading	○	△	◎
Scope of application	×	×	◎

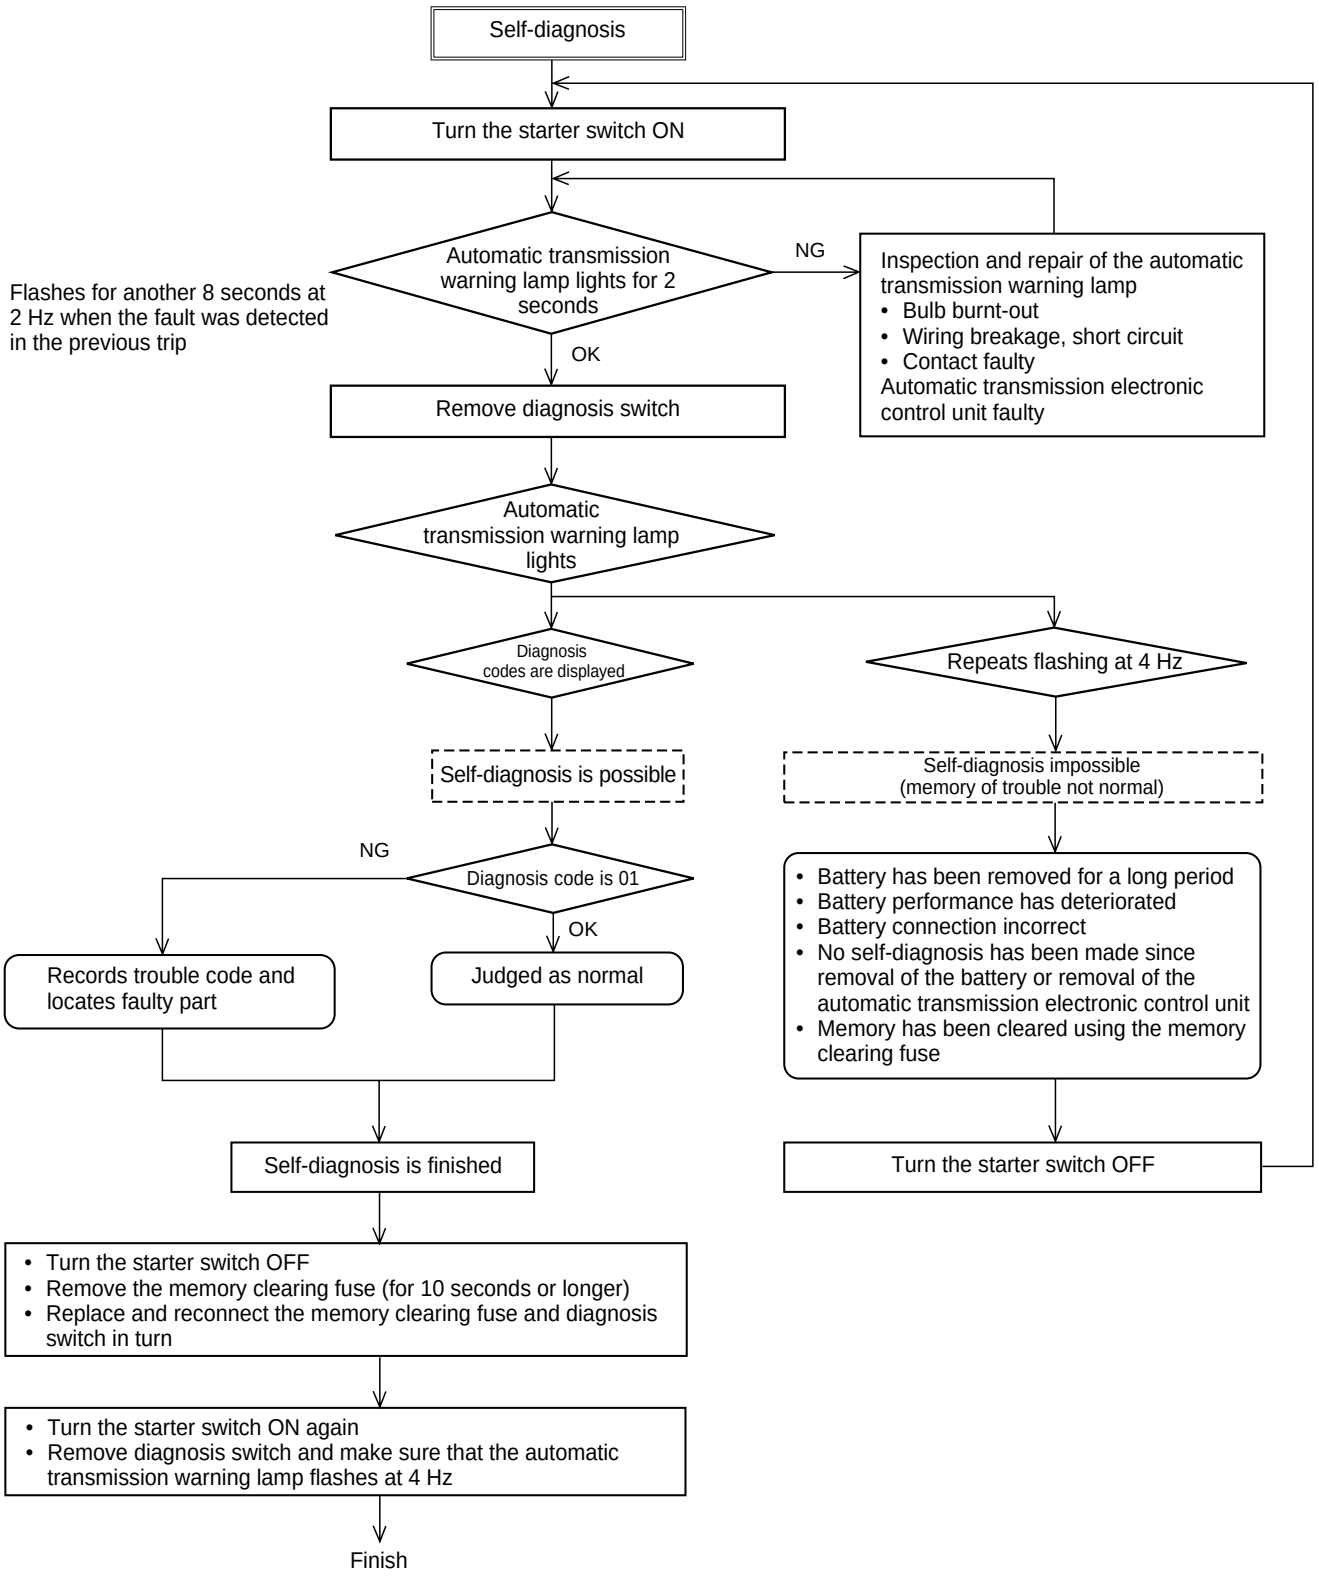
◎ : Excellent
○ : Good
△ : Fair
× : Bad

https://truckmanualshub.com/

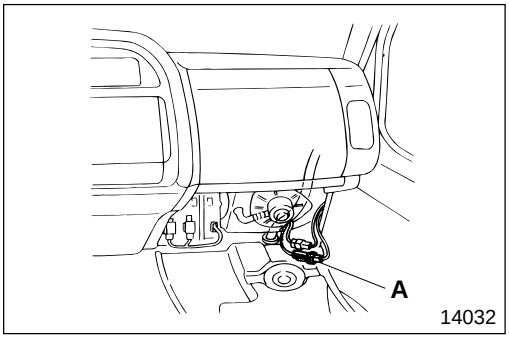
TROUBLESHOOTING PROCEDURE

Reading of diagnosis codes
< When Using Diagnosis Switch >

Reading of the diagnosis codes using the diagnosis switch is to be carried out in accordance with the following flow chart:

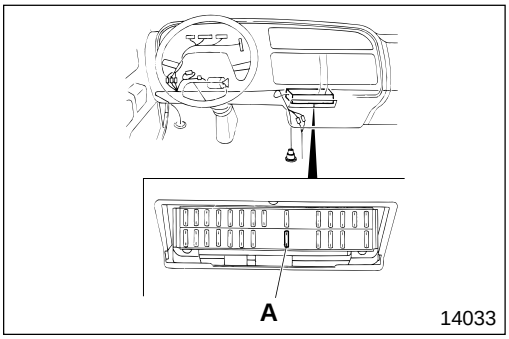


https://truckmanualshub.com/



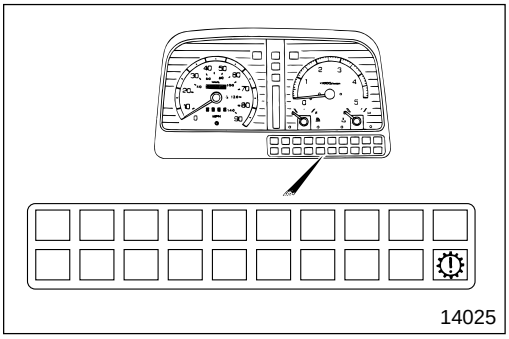
Diagnosis switch

When carrying out a self-diagnosis, turn the starter switch ON and let the power mode indicator flash by removing diagnosis switch **A** (plug-in connector).
This flashing pattern denotes the trouble codes.



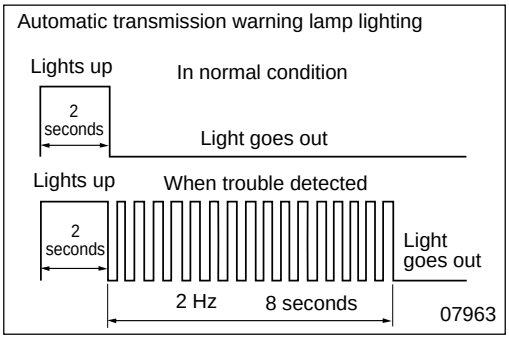
Memory clearing fuse

In normal cases, the trouble codes recorded in the automatic transmission electronic control unit are not deleted automatically. You must delete them yourself after reading the codes or after repairs have been completed.
To delete the memories, turn the starter switch OFF and remove memory clearing fuse **A** for longer than 10 seconds.



Indication of automatic transmission warning lamp

● Indication at the time the trouble occurs while driving
It lights up when a trouble occurs that would reduce driving performance considerably.
- Both vehicle speed sensors 1, 2 faulty
- Shift solenoid **A** develops a fault
- Shift solenoid **B** develops a fault
- Line pressure solenoid develops a fault
- Lock-up solenoid develops a fault
- Overrunning clutch solenoid develops a fault
- Accelerator sensor develops a fault
- Inhibiter switch develops a fault



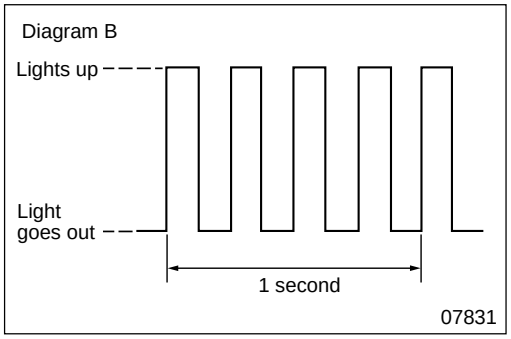
● Indication at the time starter switch was turned ON
- If any trouble has occurred during operation by the user, the indicator lamp within the meter cluster flashes for 8 seconds at 2 Hz to alert the user of the fault, when the key is turned ON as shown in **B**.
- When there is no trouble the lamp lights for 2 seconds, as shown in **A**, to tell the user that things are normal. This also indicates that the bulb has not burnt-out.

NOTE

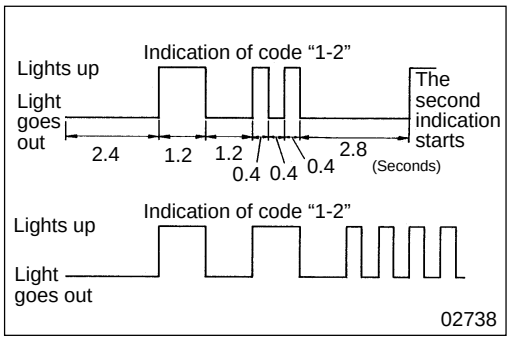
The indicator lamp flashes only when a trouble occurred in the previous trip. Any trouble that happened prior to that will not cause the indicator lamp to flash.

https://truckmanualshub.com/

TROUBLESHOOTING PROCEDURE



● Indication when self-diagnosis is impossible
- The indicator lamp flashes constantly at 4 Hz when self-diagnosis cannot function, even when the starter switch is turned ON and the diagnosis switch is removed.



● Trouble codes indication
- The automatic transmission electronic control unit records the data of all the troubles that have occurred since the last self-diagnosis.
- When trouble diagnosis is started, the light goes out for 2.4 seconds then the code indication starts.
  - The "tens" digit is indicated by the number of flashes of 1.2 seconds duration, followed by 1.2 seconds unlit
  - The "ones" digit is indicated by the number of flashes of 0.4 seconds duration, followed by 0.4 seconds unlit
  - Interval between codes is indicated by 2.8 seconds unlit
- When several codes are to be output, the output order is by time of occurrence, and each trouble code is output three times, then the automatic transmission electronic control unit moves on to the next data output.
- After all the trouble codes have been output, the output is repeated from the first code.
- Any fault newly detected while a current trouble code is being output will not be reflected in the on-going indication.

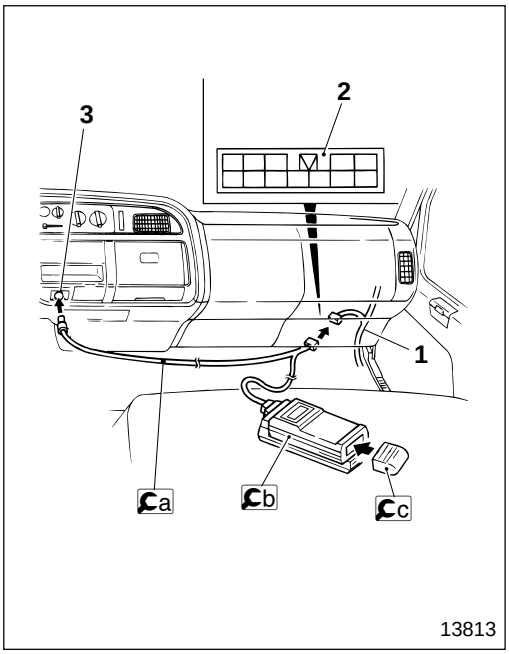
● Items to be self-diagnosed

Diagnosis code	Trouble point	Pattern of flashing of automatic transmission warning lamp
01	(Normal)	Light goes out
11	Voltage at power supply	Lights up Light goes out
12	Vehicle speed sensor 1	
13	Oil temperature sensor	
15	Engine revolution signal	
24	Accelerator sensor	
25	Vehicle speed sensor 2	
31	Shift solenoid A	
32	Shift solenoid B	
34	Line pressure solenoid	
35	Lock-up solenoid	
41	Overrunning clutch solenoid	
43	Inhibiter switch	

12071

https://truckmanualshub.com/

< When Using Multi-use Tester >



● **Connection of multi-use tester and electronic control unit**

- Turn the starter switch to LOCK.
- Connect the ends of a multi-use tester harness to multi-use tester connector **2** of cab harness **1** and cigarette lighter socket **3** respectively.

NOTE

Multi-use tester connector 2 is fastened to cab harness 1 with adhesive tape.

- Connect c ROM pack to b multi-use tester sub-assembly.
- Carry out trouble diagnosis using diagnosis codes and service data using the multi-use tester.

NOTE

Refer to the Multi-use Tester Operation Manual, published separately, for details regarding the operation of the multi-use tester.

Special tools

Tool name and shape	Part No.	Application
Multi-use tester harness  02804	MB991231	Inspection of system
Multi-use tester sub-assembly  02803	MC858999	
ROM pack  02805	MC885250	

https://truckmanualshub.com/

TROUBLESHOOTING PROCEDURE

Inspection with Multi-use Tester

① The multi-use tester indicates diagnosis codes and faulty items, identifying the devices to be inspected.

② Information signals from various sensors are indicated in certain values (service data). The multi-use tester compares the values with the judgement standards to make sure of the conditions of the sensors. Service data codes are also indicated as well as diagnosis codes.

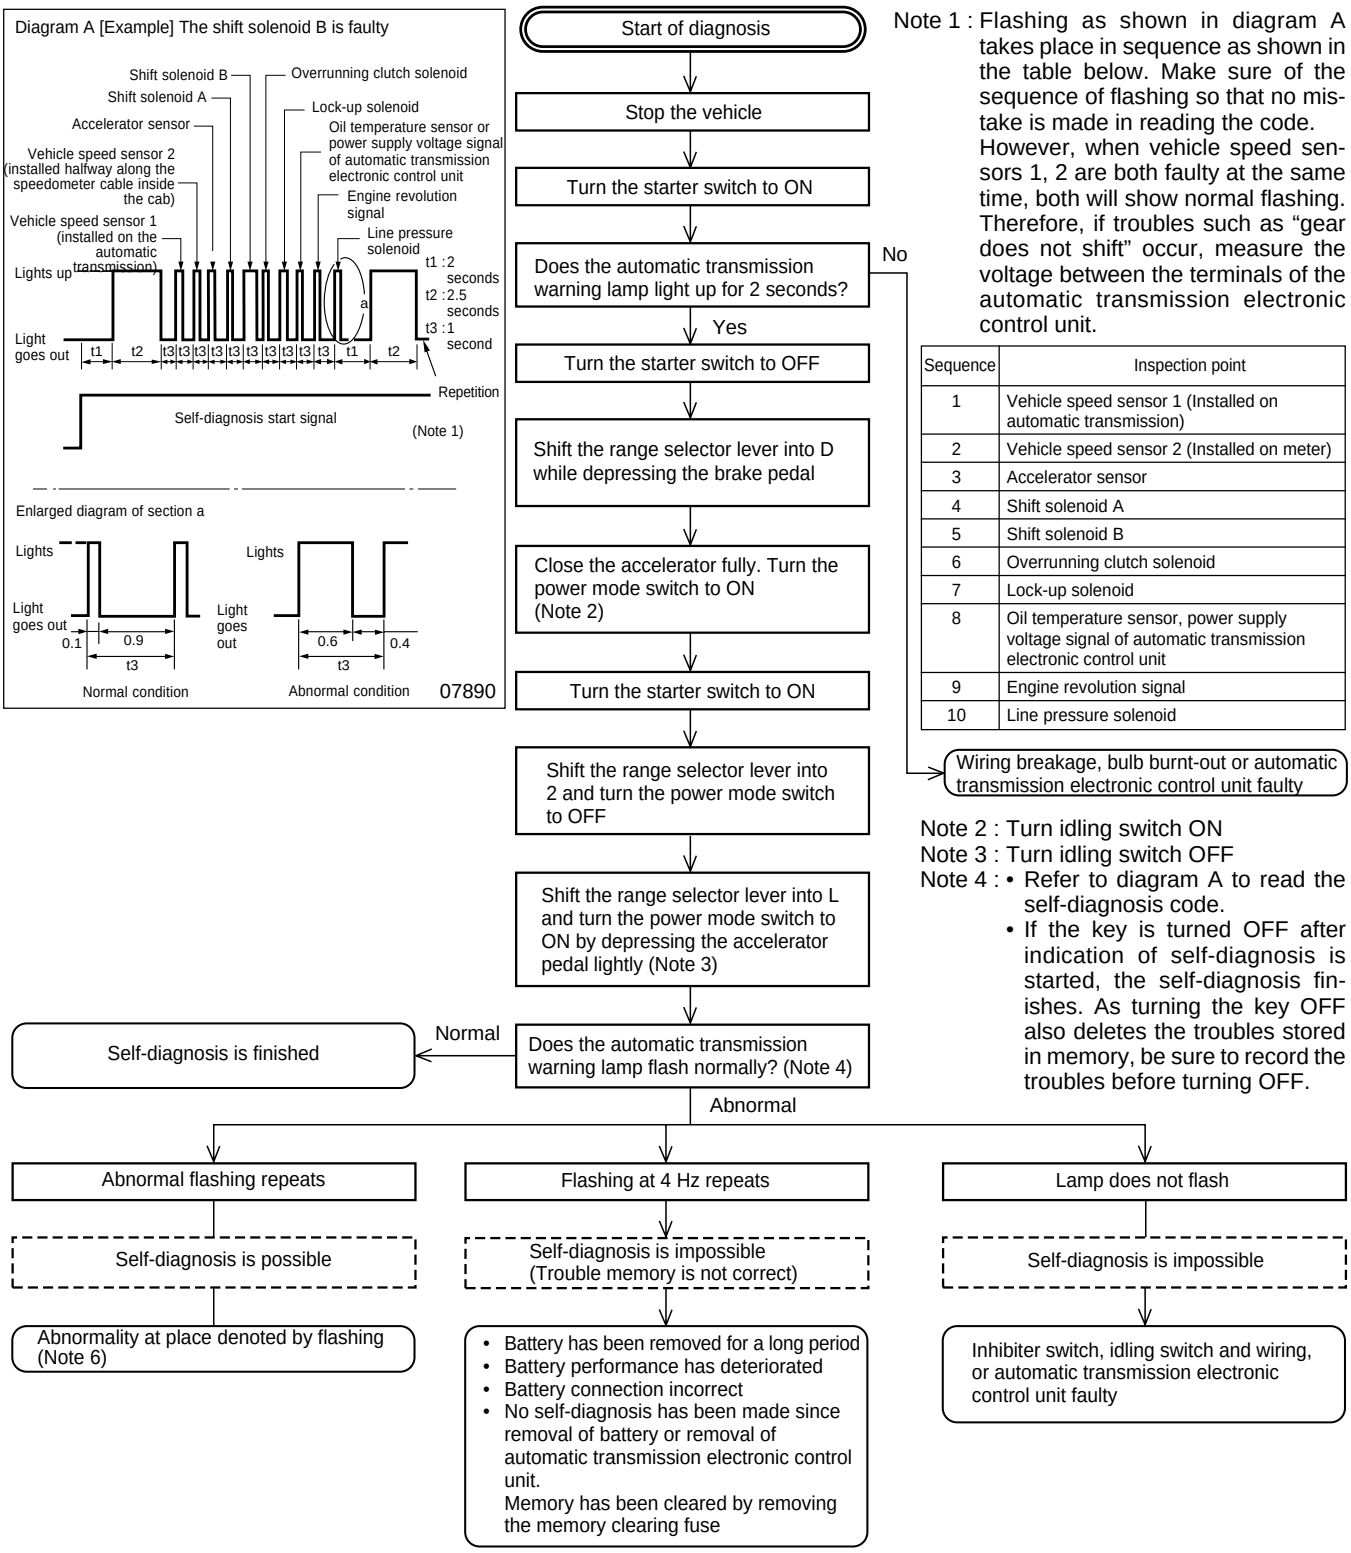
TROUBLESHOOTING PROCEDURE

< When Using the Signal Input for Start of Self-diagnosis >

The trouble diagnosis is started under the conditions determined using the accelerator switch. Therefore, all the switches that function with the idling up system, such as the air-conditioner switch, must be turned OFF. After fully warming up the engine, input start signal of self-diagnosis in accordance with the following flow chart.



Note 1 : Flashing as shown in diagram A takes place in sequence as shown in the table below. Make sure of the sequence of flashing so that no mistake is made in reading the code.
However, when vehicle speed sensors 1, 2 are both faulty at the same time, both will show normal flashing. Therefore, if troubles such as “gear does not shift” occur, measure the voltage between the terminals of the automatic transmission electronic control unit.

Sequence	Inspection point
1	Vehicle speed sensor 1 (Installed on automatic transmission)
2	Vehicle speed sensor 2 (Installed on meter)
3	Accelerator sensor
4	Shift solenoid A
5	Shift solenoid B
6	Overrunning clutch solenoid
7	Lock-up solenoid
8	Oil temperature sensor, power supply voltage signal of automatic transmission electronic control unit
9	Engine revolution signal
10	Line pressure solenoid

Note 2 : Turn idling switch ON
Note 3 : Turn idling switch OFF
Note 4 : • Refer to diagram A to read the self-diagnosis code.
• If the key is turned OFF after indication of self-diagnosis is started, the self-diagnosis finishes. As turning the key OFF also deletes the troubles stored in memory, be sure to record the troubles before turning OFF.

Note 6 : When abnormal flashing occurs for signal 8 (in Note 1), inspect the output voltage of the automatic transmission electronic control unit at terminals 12 (+) and 15 (-) (oil temperature sensor circuit). Measure the output voltage when the oil temperature is 40°C {104°F}. If the voltage is approximately 1.1 volts, it is normal; if approximately 2.4 volts, it is faulty.
Also, inspect the output voltage of the automatic transmission electronic control unit at terminals 29 (+) and 31 (-) (power supply voltage signal). Measure during travelling at a speed of 15 km/h {9.32 mph}. If the voltage is within 12 to 13 volts, it is normal; if less than 12 volts, it is faulty.

https://truckmanualshub.com/

● **Trouble Diagnosis Item**

Sequence	Pattern of flashing of automatic transmission warning lamp	Trouble point	Trouble code
1		Vehicle speed sensor 1	12
2		Vehicle speed sensor 2	25

https://truckmanualshub.com/

TROUBLESHOOTING PROCEDURE

● **Measures to be taken when self-diagnosis does not work**

Carry out an inspection in the following sequence when self-diagnosis does not function after the input of a self-diagnosis start signal.

Stop the vehicle

↓

Turn the starter switch to ON (Engine is not operating)

↓

Is D range input signal to the automatic transmission electronic control unit terminal 20 normal?

Abnormal → Inhibiter switch or wiring is faulty

Normal (12 to 13 volts in D range)

↓

Is 2 range input signal to the automatic transmission electronic control unit terminal 1 normal?

Abnormal → Inhibiter switch or wiring is faulty

Normal (12 to 13 volts at 2 range)

↓

Is L range input signal to the automatic transmission electronic control unit terminal 2 normal?

Abnormal → Inhibiter switch or wiring is faulty

Normal (12 to 13 volts in L range)

↓

Is power mode switch input signal both in PWR and ECO conditions to the automatic transmission electronic control unit terminal 9 normal?

Abnormal → Power mode switch or wiring is faulty

Normal (With power mode switch ECO, 4.5 to 5.5 volts, with ON, 1 volt or less)

↓

Is idling switch input signal in ON condition to the automatic transmission electronic control unit terminal 4 normal?

Abnormal → Accelerator switch or wiring is faulty

Normal (At idling, 12 to 13 volts)

↓

Automatic transmission electronic control unit is faulty

Note : When automatic transmission warning lamp is normal.

Automatic transmission electronic control unit

List of diagnosis codes

Diagnosis code	Trouble point	Judgement standard	Countermeasures for troubles using A/T ECU (Backup mode)
11	Power supply voltage	10 volts or less (At vehicle speed of 10 km/h {6.21 mph} or more)	None
12	Vehicle speed sensor 1	(Note)	Control in accordance with vehicle speed sensor 2
13	Oil temperature sensor	Indication of –20°C {–4°F} or less (At vehicle speed of 10 km/h {6.21 mph} or more)	None (Oil temperature : Judged as extremely low temperature)
15	Engine revolution sensor	Indication of 500 rpm or less (At vehicle speed of 10 km/h {6.21 mph} or more)	None
24	Accelerator sensor	Accelerator sensor voltage 0.1 volt or less, or 4.7 volts or more	Set accelerator opening using accelerator switch and control shifting and line pressure
25	Vehicle speed sensor 2	(Note)	Control in accordance with vehicle speed sensor 1
31	Shift solenoid A	Wiring breakage or short circuit for 30 ms or more	Shift solenoids A, B OFF (3rd gear fixed)
32	Shift solenoid B	Wiring breakage or short circuit for 30 ms or more	↑
34	Line pressure solenoid	Wiring breakage or short circuit for 140 ms or more	Line pressure solenoid OFF
35	Lock-up solenoid	Wiring breakage or short circuit for 140 ms or more	Lock-up solenoid OFF
41	Overrunning clutch solenoid	Wiring breakage or short circuit for 30 ms or more	Overrunning clutch solenoid OFF and line pressure maximum at 4th gear
43	Inhibiter switch	No signal or duplicate signals	• Put in the D range and do not shift to 4th gear • Select the range following the priority order and do not shift to 4th gear. Priority order D>N>R>2>1

A/T ECU : Automatic transmission electronic control unit

(Note) Detection of faulty vehicle speed sensors 1, 2

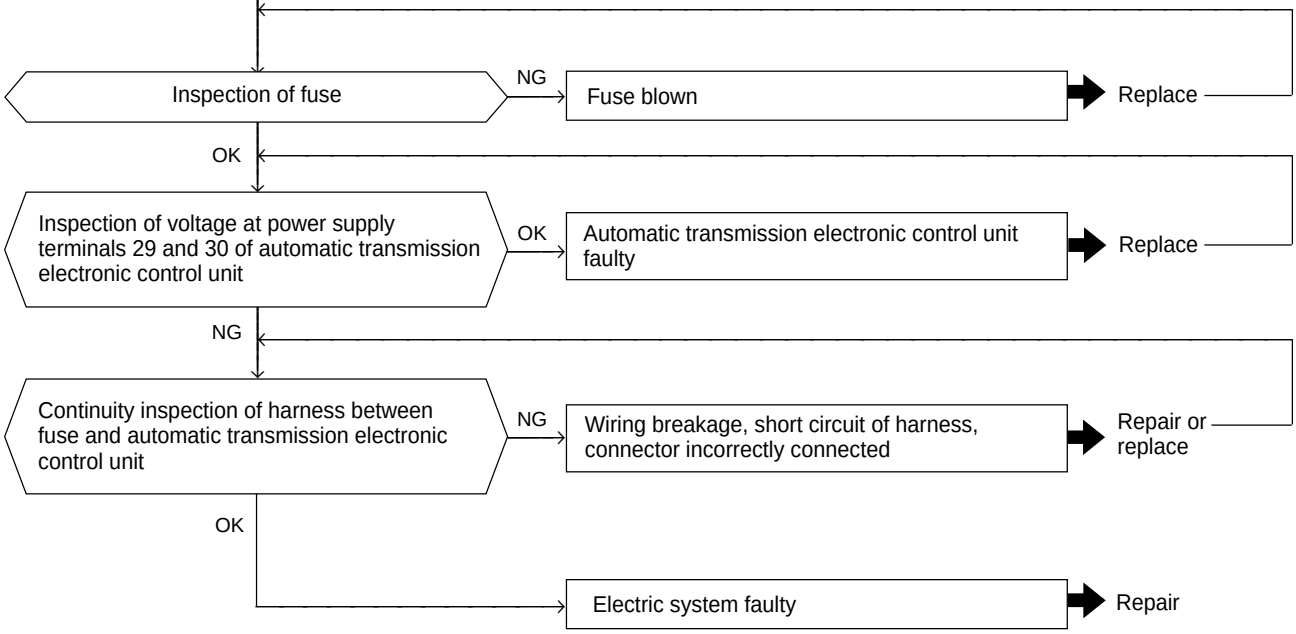
Compare the indications of vehicle speed sensors 1, 2. When either one of them shows 20 km/h {12.4 mph} or more while the other remains at 0, the one that shows “0” is faulty.

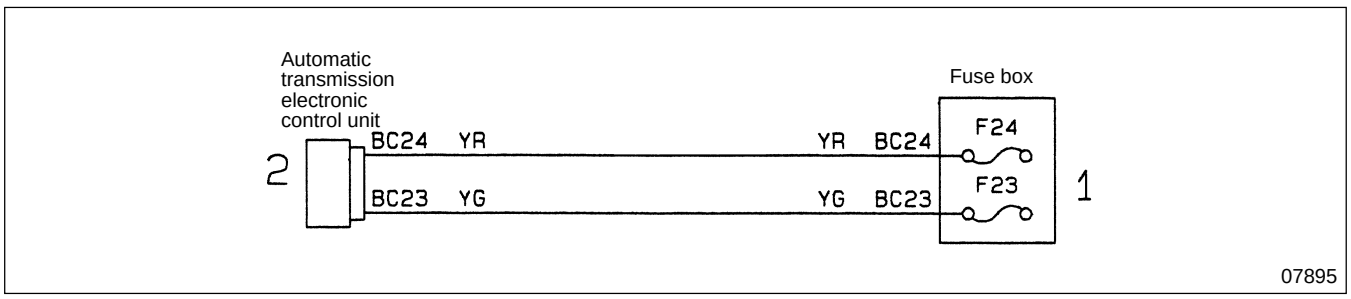
When travelling at vehicle speeds of 20 km/h {12.4 mph} or more and either sensor indicates an unusually drastic fall (10 km/h {6.21 mph} per 0.1 second), the sensor is faulty.

https://truckmanualshub.com/

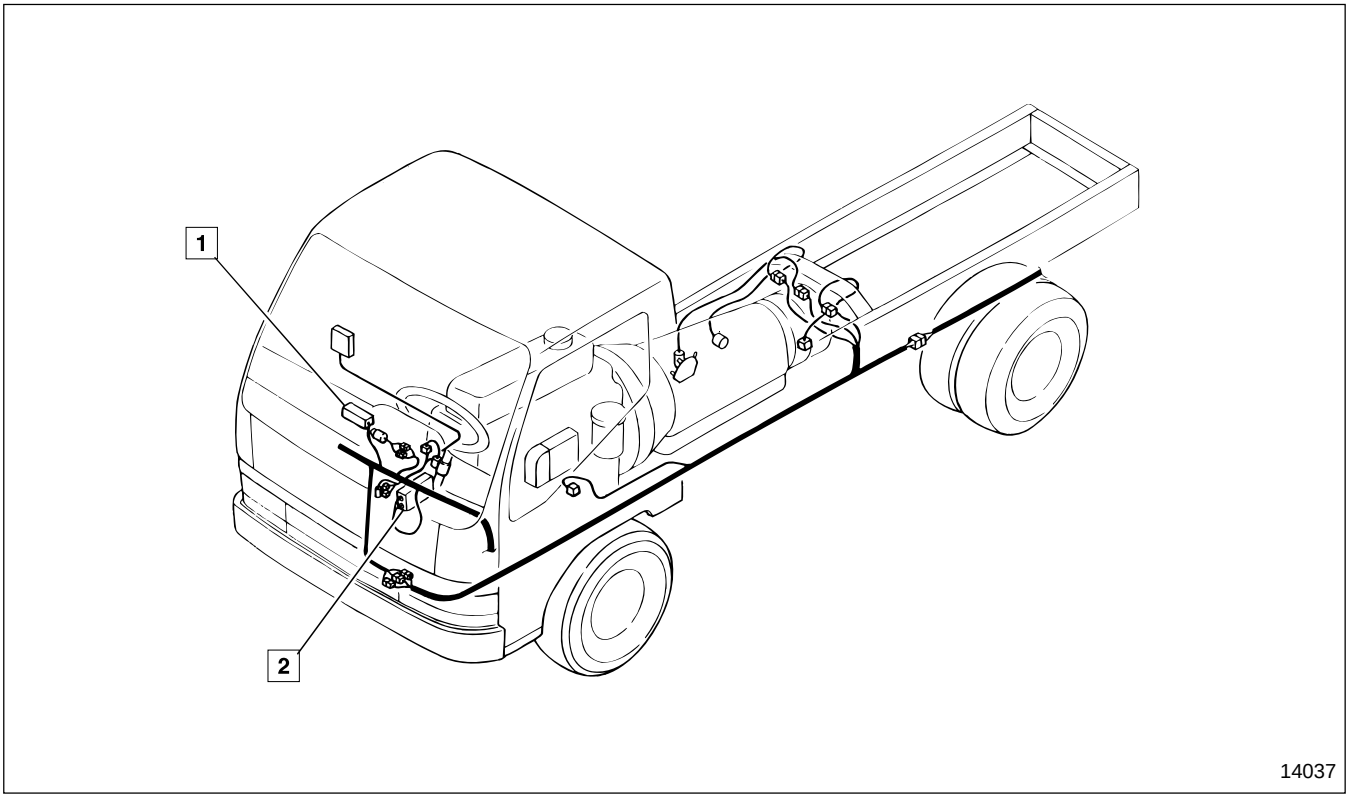
INSPECTION BY INDIVIDUAL DIAGNOSIS CODE

11. Abnormal voltage at power supply



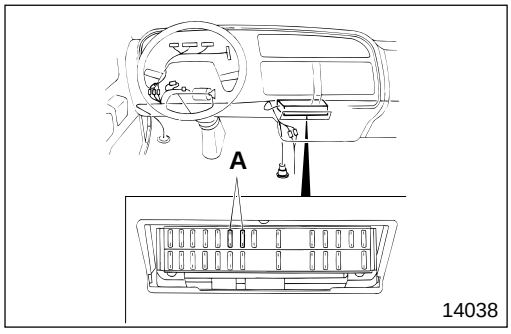


https://truckmanualshub.com/



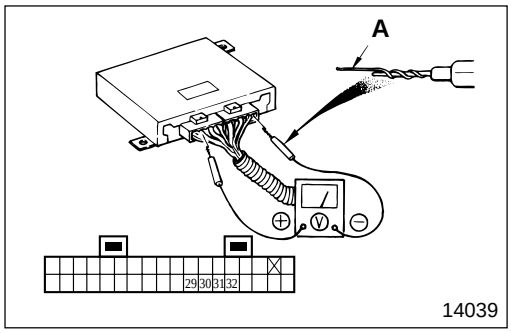
1 Fuse box
2 Automatic transmission electronic control unit

◆ Service procedure



1 **Inspection of fuse**

A : Automatic transmission fuse



2 **Inspection of voltage at power supply terminals of automatic transmission electronic control unit**

With the starter switch ON, inspect to see that battery voltage is applied to terminals **29** and **30** respectively.
Terminals **31** and **32** are ground terminals.

A : Twist wire

https://truckmanualshub.com/

INSPECTION BY INDIVIDUAL DIAGNOSIS CODE

12. Vehicle speed sensor 1 signal faulty

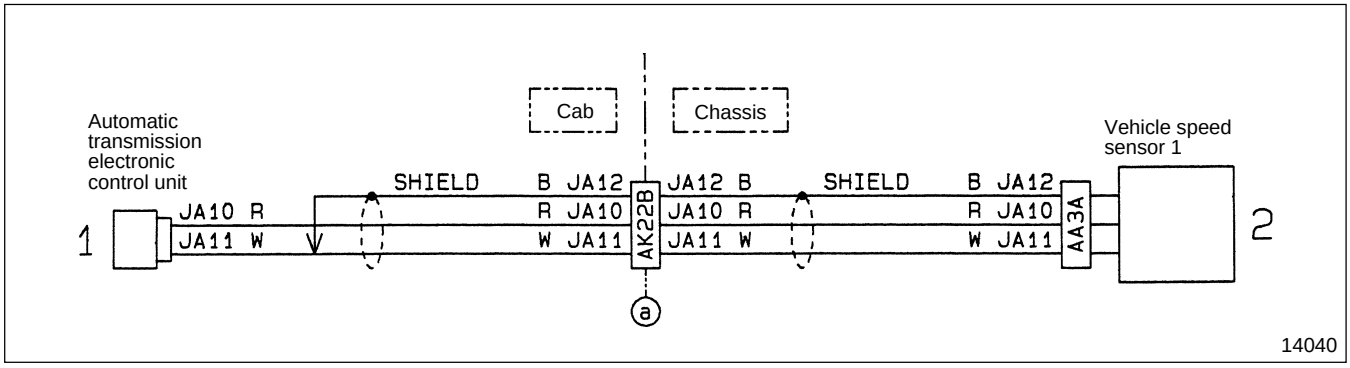
Inspection of installation condition of vehicle speed sensor 1
NG → Vehicle speed sensor 1 installation faulty → Repair
OK

Inspection of vehicle speed sensor 1 body
NG → Vehicle speed sensor 1 body faulty → Replace
OK

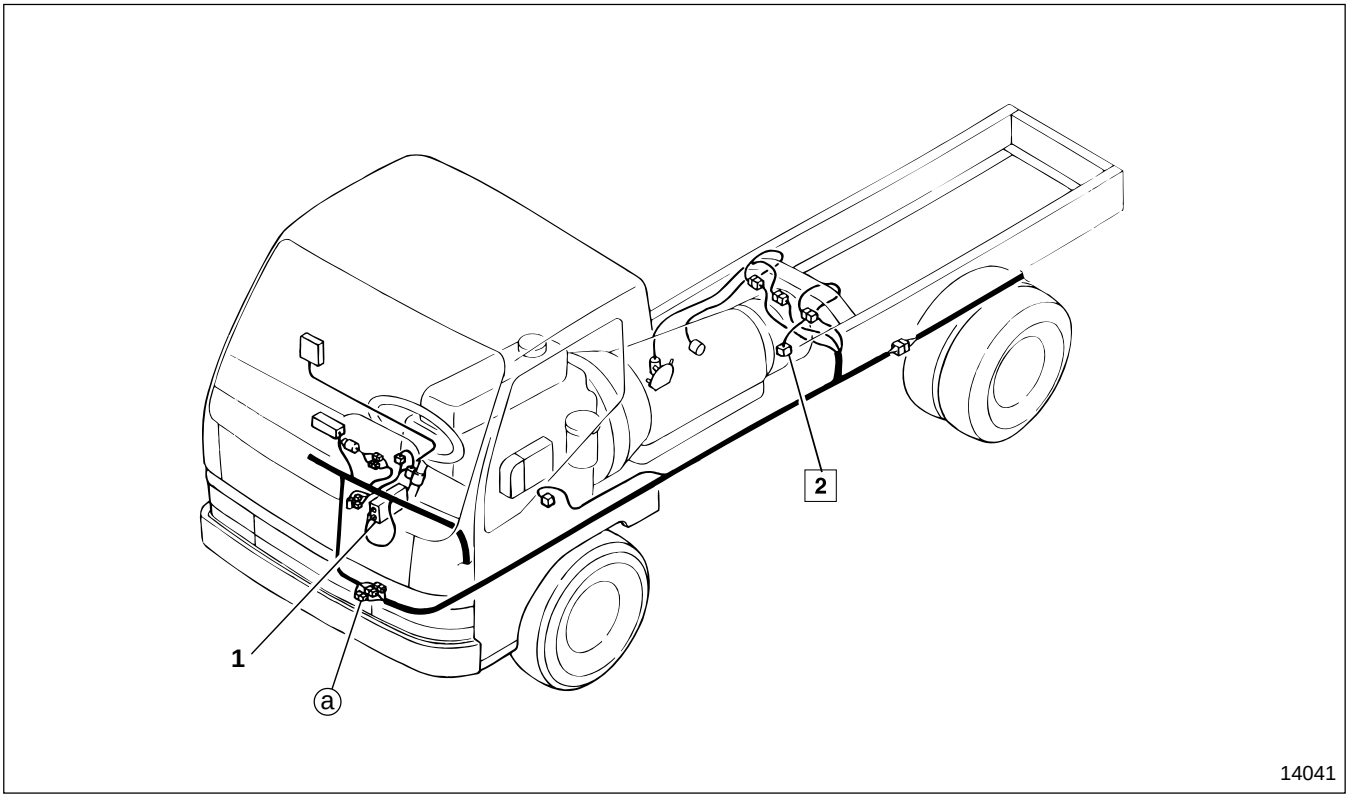
Continuity inspection of harness between vehicle speed sensor 1 and automatic transmission electronic control unit
NG → Wiring breakage, short circuit of harness, connector incorrectly connected → Repair or replace
OK

Inspection of parking gear (sensor plate)
NG → Parking gear (sensor plate) faulty → Replace automatic transmission body
OK

Automatic transmission electronic control unit faulty → Replace



https://truckmanualshub.com/

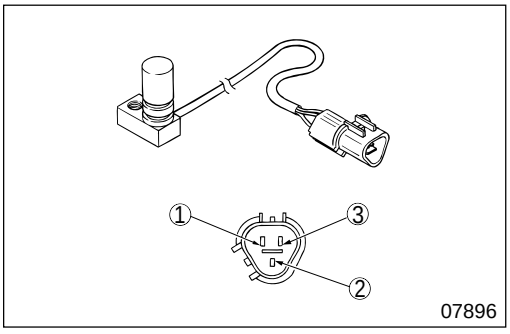


1 Automatic transmission electronic control unit
2 Vehicle speed sensor 1

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
2	Resistance of vehicle speed sensor 1 (At connector)  14042	① - ②	500 to 650 Ω	—	Replace
		② - ③	∞	—	
		① - ③	∞	—	

◆ Service procedure



2 **Inspection of vehicle speed sensor 1**

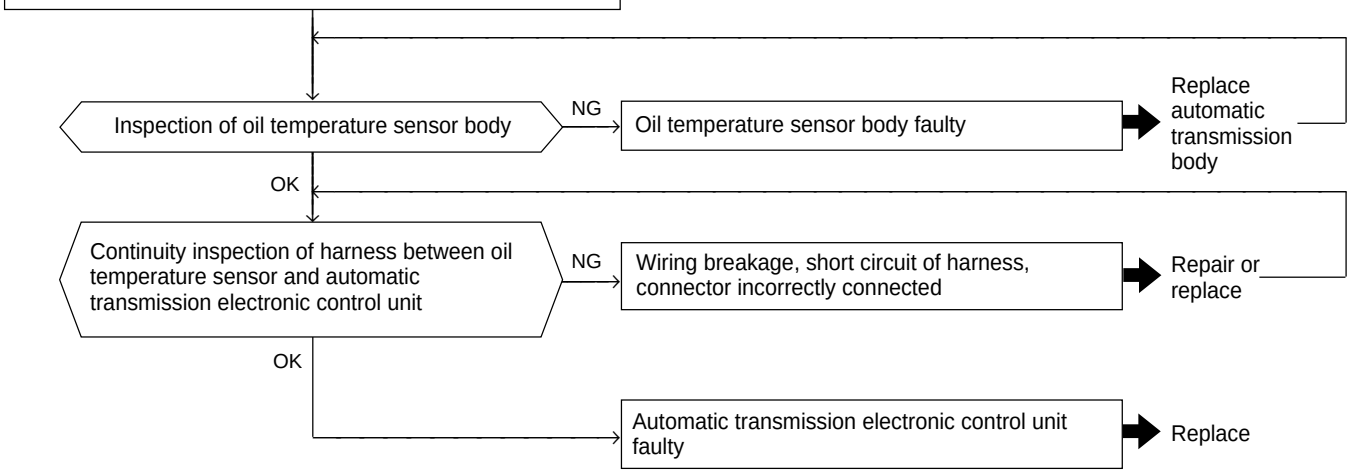
Standard value	Connector terminals		
	① : Output	② : GND	③ : Shield
500 to 650 Ω	○	○	
∞		○	○
∞	○		○

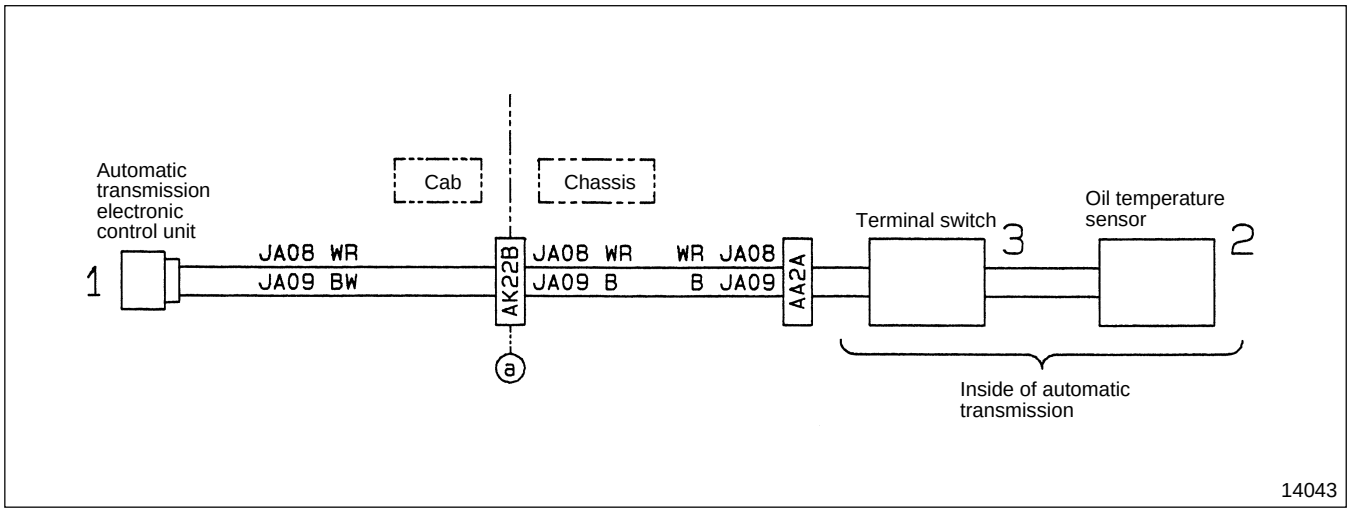
If the measured value deviates from the standard value, replace vehicle speed sensor 1 **2**.

https://truckmanualshub.com/

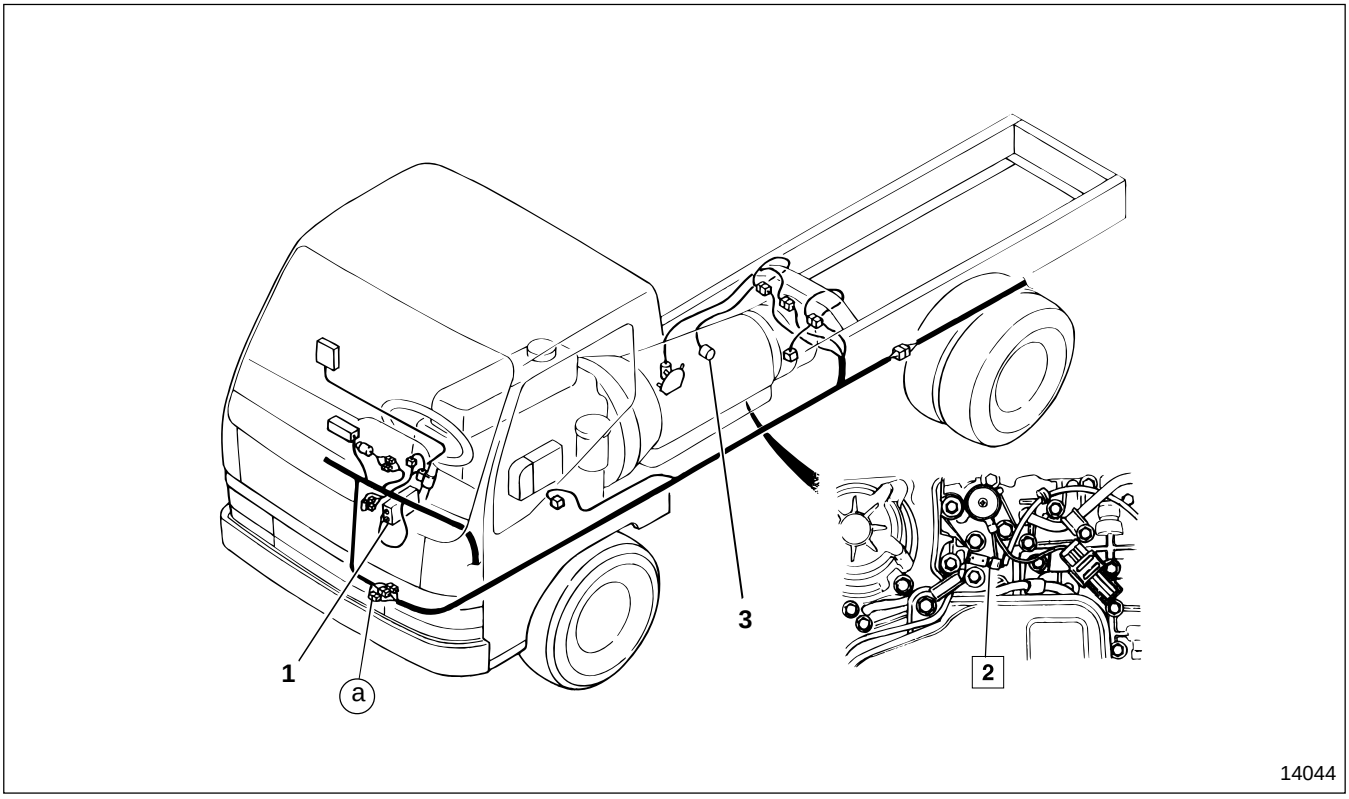
INSPECTION BY INDIVIDUAL DIAGNOSIS CODE

13. Oil temperature sensor signal faulty





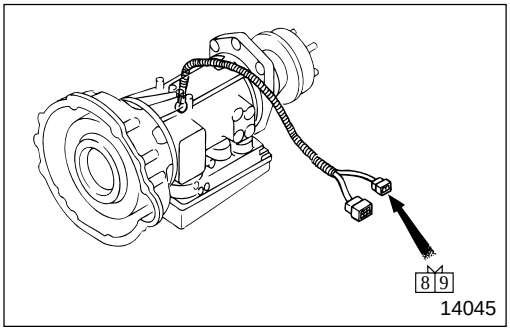
https://truckmanualshub.com/



1 Automatic transmission electronic control unit
2 Oil temperature sensor
3 Terminal switch

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
2	Resistance of oil temperature sensor (At terminal switch connector)	20°C {68°F}	Approximately 2.5 kΩ	—	Replace
		40°C {104°F}	Approximately 1.2 kΩ	—	
		60°C {140°F}	Approximately 0.6 kΩ	—	
		80°C {176°F}	Approximately 0.3 kΩ	—	



◆ Service procedure

2 **Inspection of oil temperature sensor body**

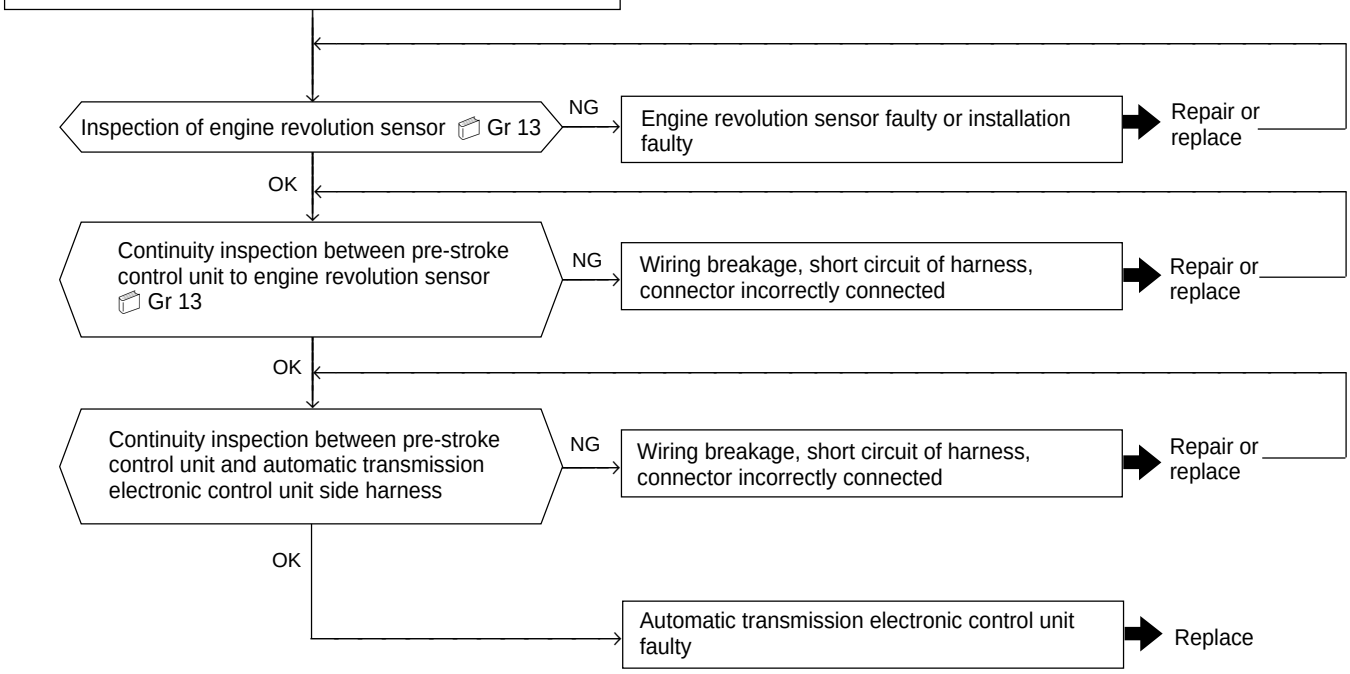
Standard value	Connector terminal		Oil temperature
	8	9	
Approximately 2.5 kΩ	○	○	20°C {68°F}
Approximately 1.2 kΩ			40°C {104°F}
Approximately 0.6 kΩ			60°C {140°F}
Approximately 0.3 kΩ			80°C {176°F}

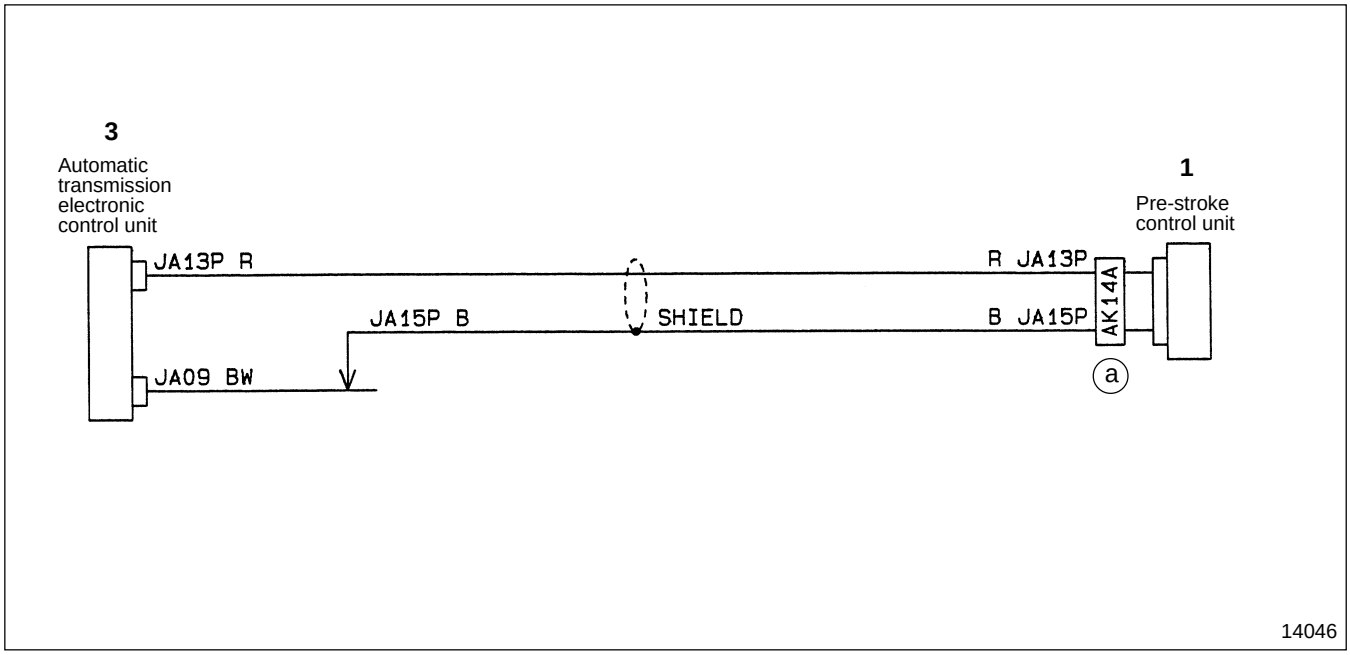
When the measured value deviates extremely from the standard value or when the resistance value does not change in spite of the change in the fluid temperature, replace the oil temperature sensor body.

https://truckmanualshub.com/

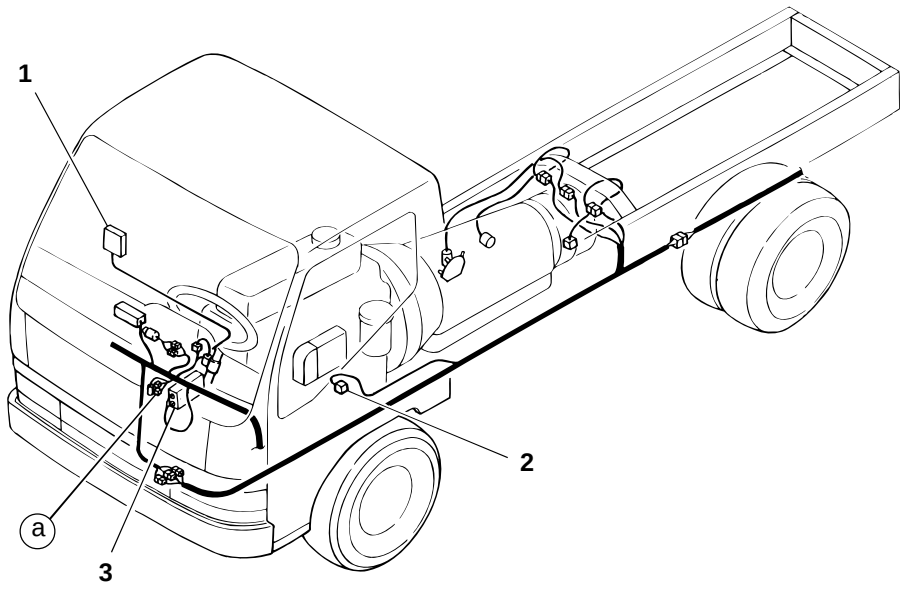
INSPECTION BY INDIVIDUAL DIAGNOSIS CODE

15. Engine revolution sensor signal faulty





https://truckmanualshub.com/



14047

1 Pre-stroke control unit Gr 13
2 Engine revolution sensor Gr 13
3 Automatic transmission electronic control unit

https://truckmanualshub.com/

INSPECTION BY INDIVIDUAL DIAGNOSIS CODE

24. Accelerator sensor signal faulty

Inspection of power supply voltage of accelerator sensor at automatic transmission electronic control unit terminal
→ Power supply system faulty → Repair or replace

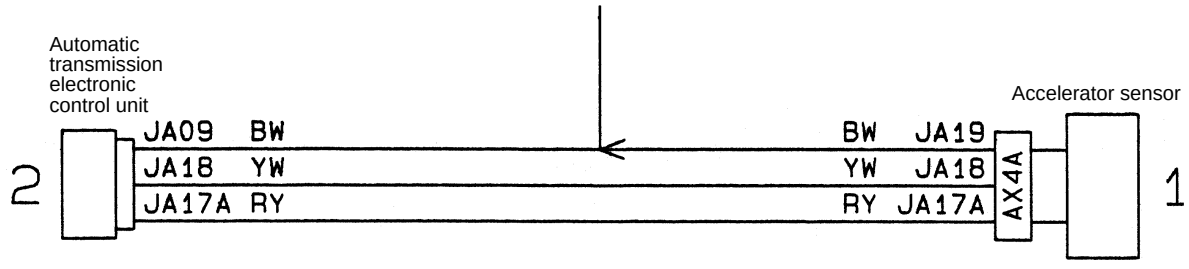
Inspection of input voltage at automatic transmission electronic control unit terminal
OK → Automatic transmission electronic control unit faulty → Replace

NG

Inspection of voltage at connector of accelerator sensor
NG → Inspection of accelerator sensor
NG → Accelerator sensor faulty → Replace
OK → Automatic transmission electronic control unit faulty → Replace

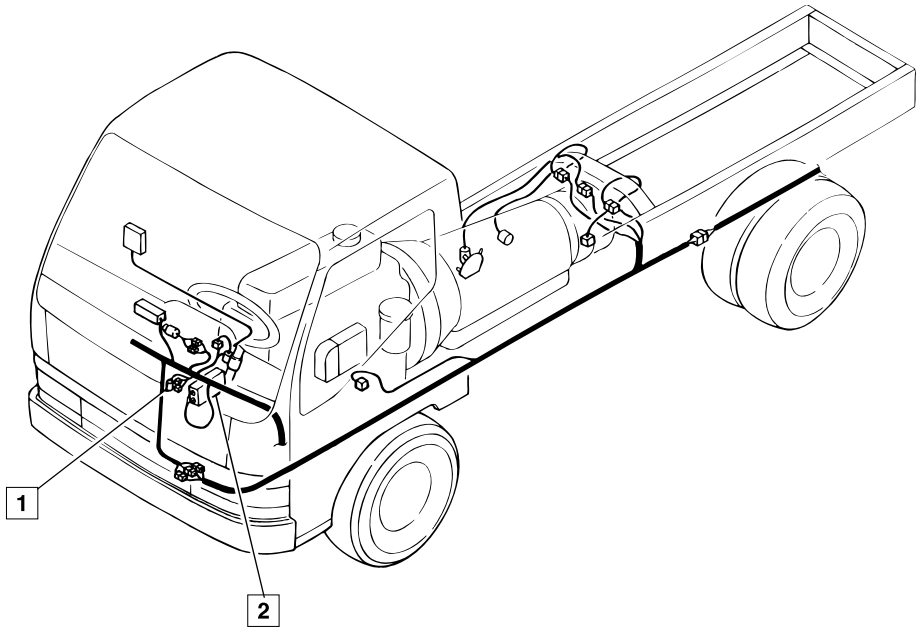
OK

Continuity inspection of harness between accelerator sensor and automatic transmission electronic control unit
NG → Wiring breakage, short circuit of harness, connector incorrectly connected → Repair or replace



14048

https://truckmanualshub.com/



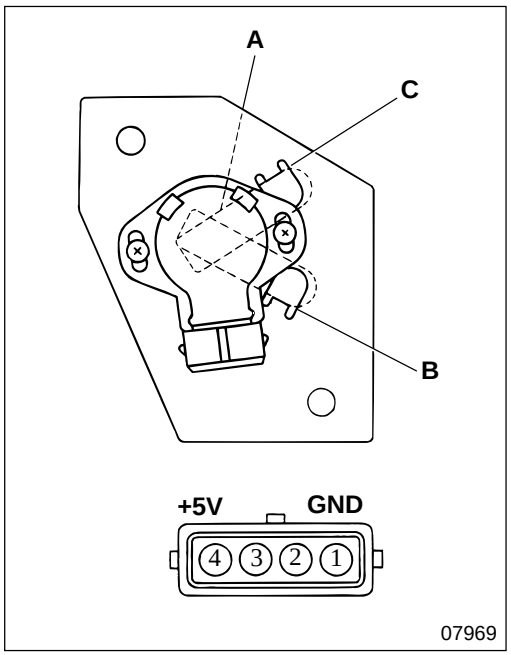
14049

1 Accelerator sensor
2 Automatic transmission electronic control unit

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
1	Output voltage of accelerator sensor  14050 ① : Ground ③ : Output ④ : Input (5 volts)	Idling position	$1.0\,^{0}_{-0.1}$ V	—	Replace
		Accelerator at full throttle	$4\,^{+0.2}_{0}$ V	—	
2	Input/output voltage of connector of automatic transmission electronic control unit (With starter switch ON)  14051	Power supply voltage of accelerator sensor 10 – 15	4.5 to 5.5 V	—	Repair or replace
		Output voltage of accelerator sensor (At idling) 11 – 15	$1.0\,^{0}_{-0.1}$ V	—	
		Output voltage of accelerator sensor (With accelerator at full throttle) 11 – 15	$4\,^{+0.2}_{0}$ V	—	

https://truckmanualshub.com/



◆ Service procedure

1 **Inspection of accelerator sensor**

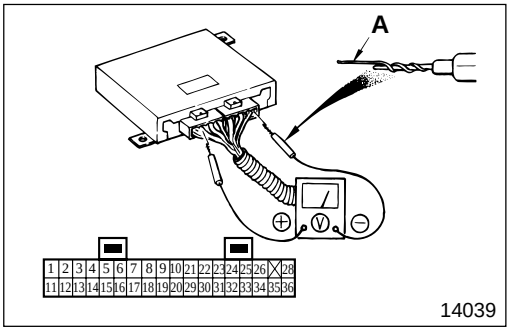
Load 5 volts to terminal ④, and ground terminal ①.
Measure output voltage from terminal ③ at each position of lever **A**.
If the measured value deviates from the standard value, replace accelerator sensor **1**.
Removal and installation of sensor : Gr 13

B : Idling position
C : Maximum stroke position of lever

Output voltage of accelerator sensor at idling	Connector terminal	
	③	①
$1.0^{0}_{-0.1}$ V	⊕	⊖

Output voltage of accelerator sensor with accelerator at full throttle	Connector terminal	
	③	①
$4^{+0.2}_{0}$ V	⊕	⊖

https://truckmanualshub.com/



2 **Inspection of voltage of automatic transmission electronic control unit terminals**

[Inspection of power supply voltage of accelerator sensor]

- Loosen the accelerator control button as much as possible.
- With the key turned ON, measure power supply voltage between terminals 10 (+) and 15 (–) of the automatic transmission electronic control unit and check if the measured value conforms to the standard value.

A : Twist wire.

Power supply voltage of accelerator sensor	Connector terminal	
	10	15
4.5 to 5.5 V	⊕	⊖

[Inspection of output voltage of accelerator sensor]

- With the key turned ON and at idling (accelerator pedal released), measure output voltage of the accelerator sensor between terminals 11 (+) and 15 (–) of the automatic transmission electronic control unit, and check if the measured value conforms to the standard value.

Output voltage of accelerator sensor at idling	Connector terminal	
	11	15
1.0±0.1 V	⊕	⊖

- With the key turned ON and the accelerator at full throttle (accelerator pedal depressed fully), measure output voltage of the accelerator sensor between terminals 11 (+) and 15 (–) of the automatic transmission electronic control unit, and check if the measured value conforms to the standard value.

Output voltage of accelerator sensor with accelerator at full throttle	Connector terminal	
	11	15
$4^{+0.2}_{0}$ V	⊕	⊖

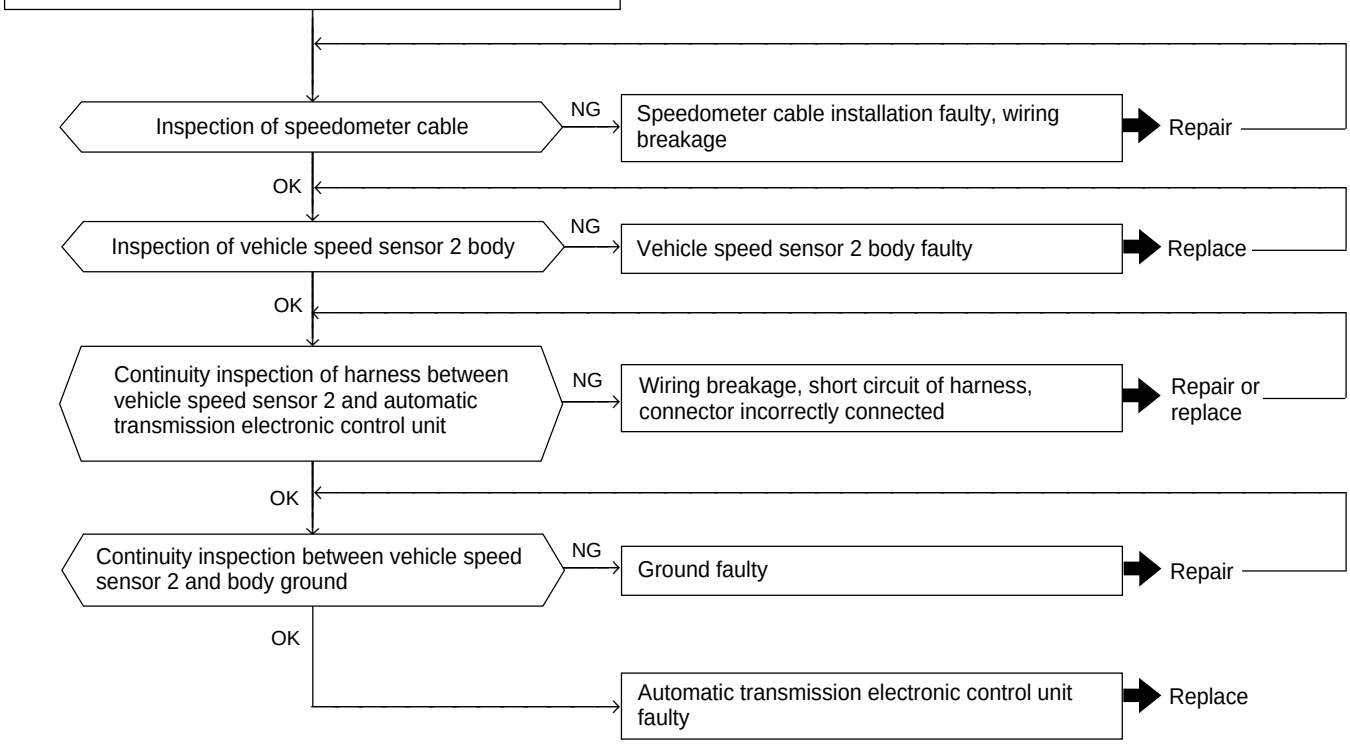
- With the key turned ON and while depressing the accelerator pedal slowly and smoothly from idling to full throttle, measure output voltage of the accelerator sensor between terminals 11 (+) and 15 (–) of the automatic transmission electronic control unit, and check to see if the measured value conforms to the standard value.

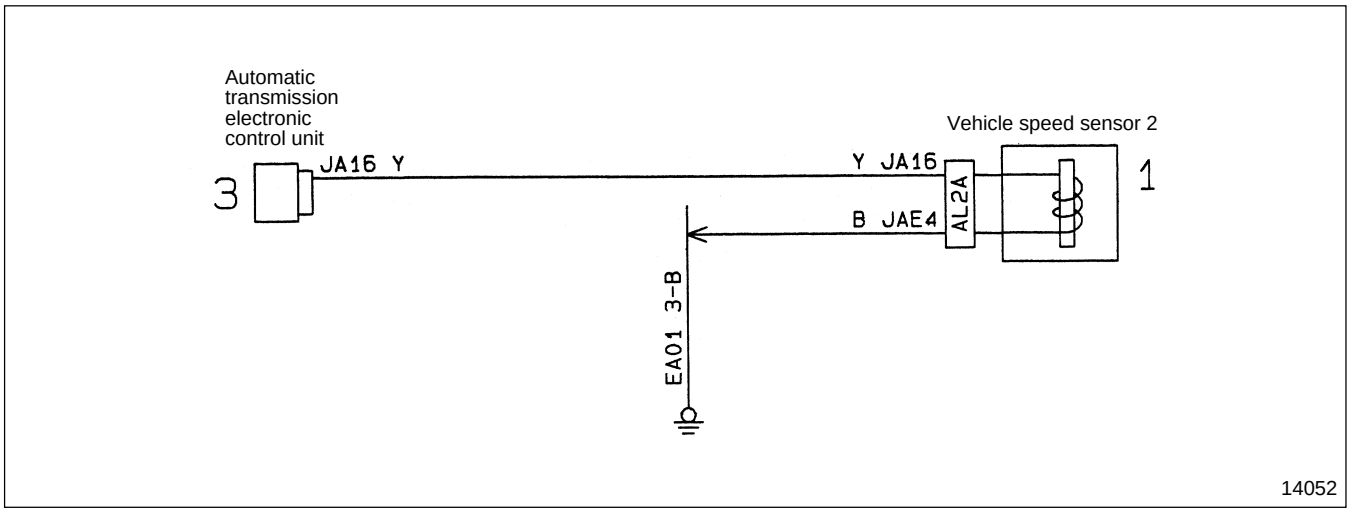
Output voltage of accelerator sensor at pedal depression	Connector terminal	
	11	15
To change continuously in accordance with the movement of the accelerator pedal	⊕	⊖

https://truckmanualshub.com/

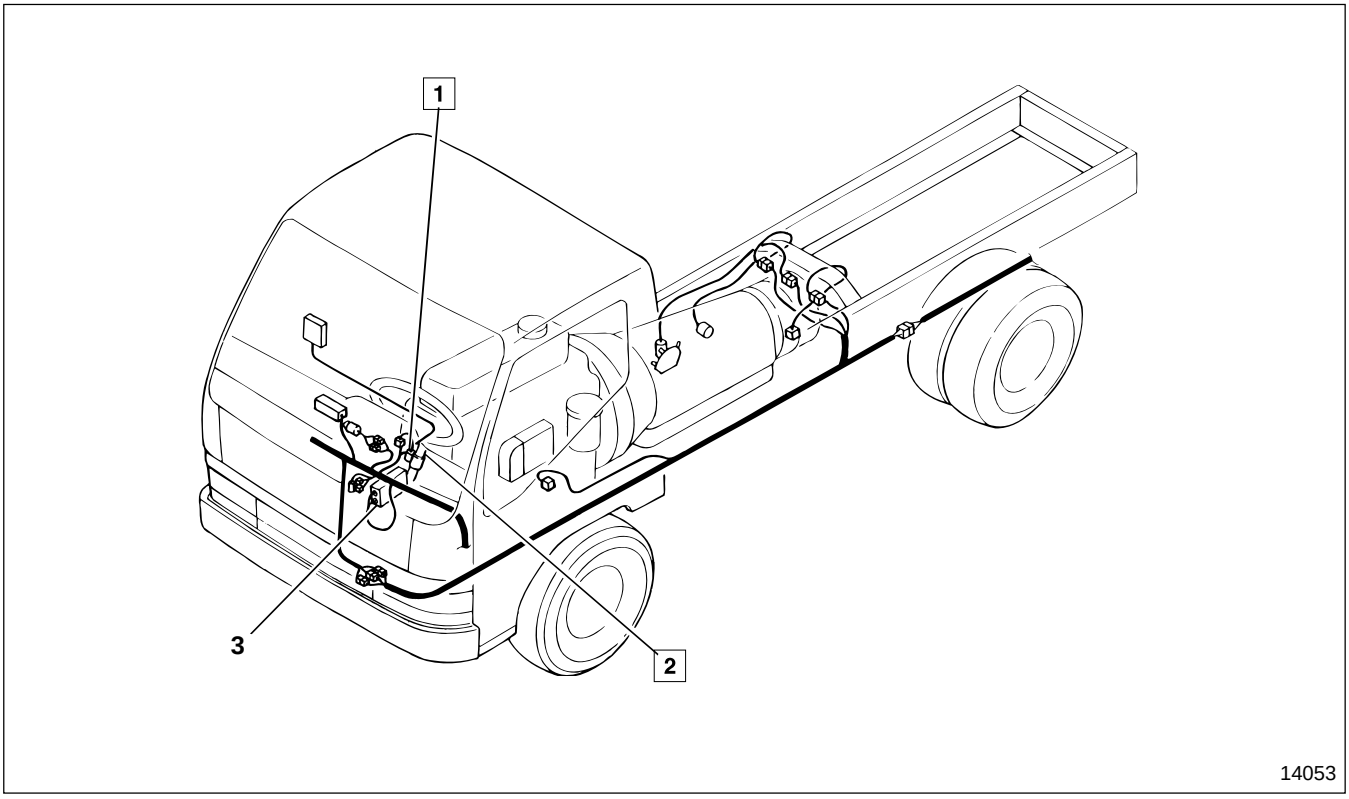
INSPECTION BY INDIVIDUAL DIAGNOSIS CODE

25. Vehicle speed sensor 2 faulty



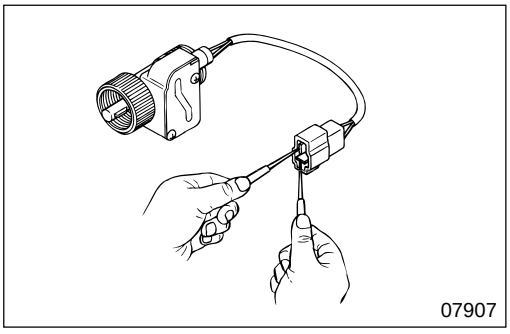


https://truckmanualshub.com/



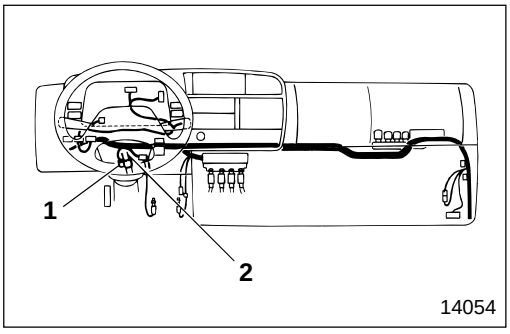
1 Vehicle speed sensor 2
2 Speedometer cable
3 Automatic transmission electronic control unit

◆ Service procedure



1 Inspection of vehicle speed sensor 2 body

Inspect continuity between terminals while manually rotating the revolving shaft of vehicle speed sensor 2 **1**. When continuity is found and lost alternately four times in one rotation of the revolving shaft, the vehicle speed sensor 2 is normal. If any fault is found, replace the vehicle speed sensor 2.



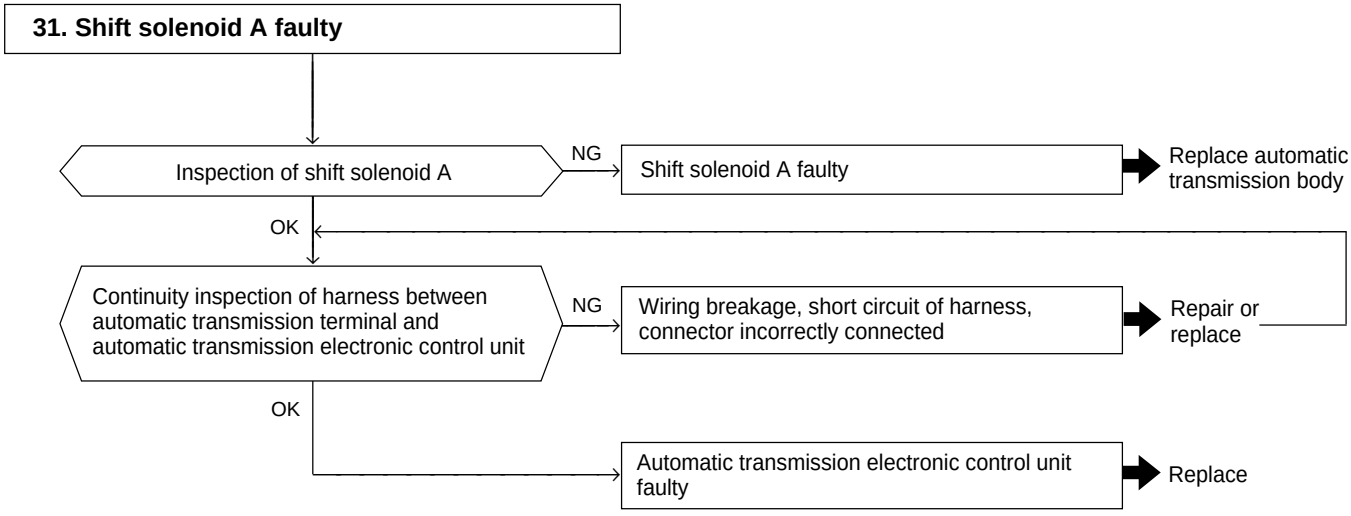
2 Inspection of speedometer cable

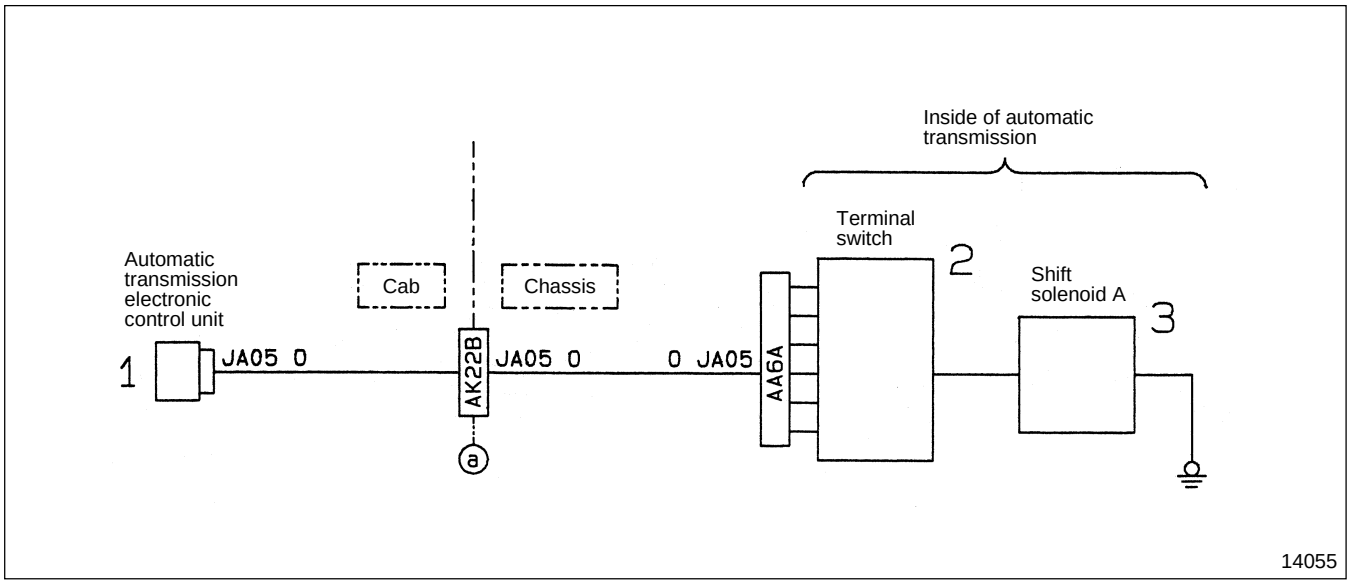
Inspect speedometer cable **2** for any fracture of the cable and check the way it rotates, also inspect the mounting area of vehicle speed sensor 2 **3**. If any fault is found, repair or replace the speedometer cable.

https://truckmanualshub.com/

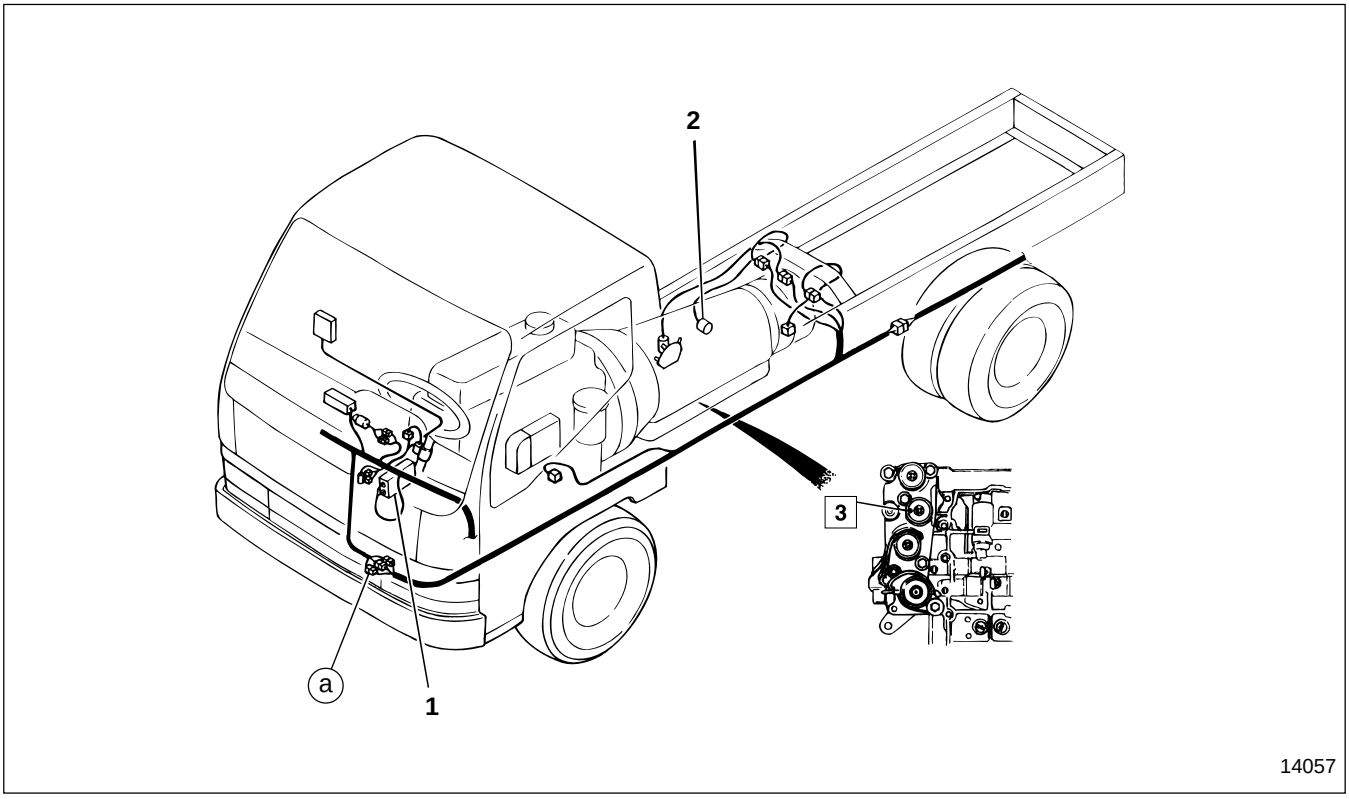
INSPECTION BY INDIVIDUAL DIAGNOSIS CODE

31. Shift solenoid A faulty





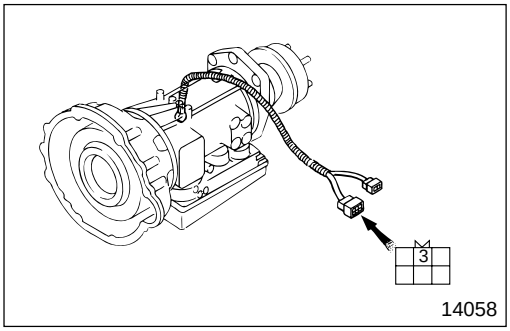
https://truckmanualshub.com/



1 Automatic transmission electronic control unit
2 Terminal switch
3 Shift solenoid A

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
3	Resistance of shift solenoid A (At fluid temperature 20°C {68°F}) Measure the resistance between terminal 3 of the connector of the terminal switch side and the automatic transmission case  14056	25.0 Ω	—	—



◆ Service procedure

3 **Inspection of shift solenoid A**

Measure the resistance between terminal 3 of the connector of automatic transmission terminal switch **2** side and the automatic transmission case (near the automatic transmission terminal).

Standard value	Connector terminal		Fluid temperature
	3	Automatic transmission case	
25.0 Ω	○	○	20°C {68°F}

If the measured value deviates from the standard value, replace shift solenoid A **3**.

https://truckmanualshub.com/

INSPECTION BY INDIVIDUAL DIAGNOSIS CODE

32. Shift solenoid B faulty

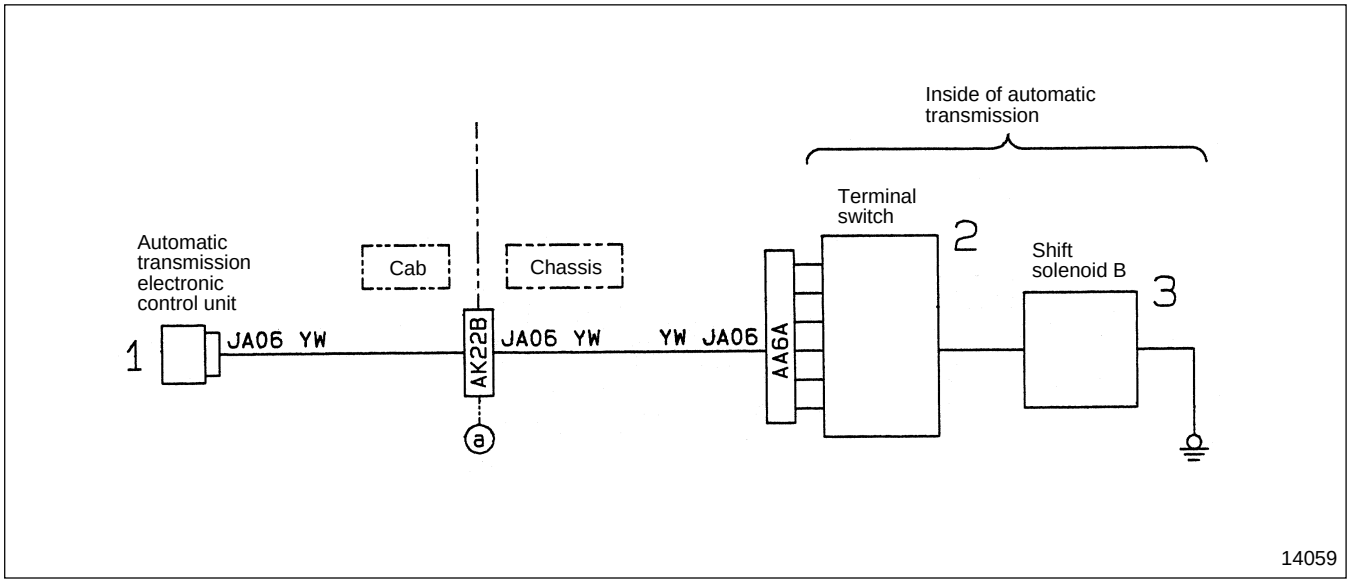
Inspection of shift solenoid B
NG → Shift solenoid B faulty → Replace automatic transmission body

OK

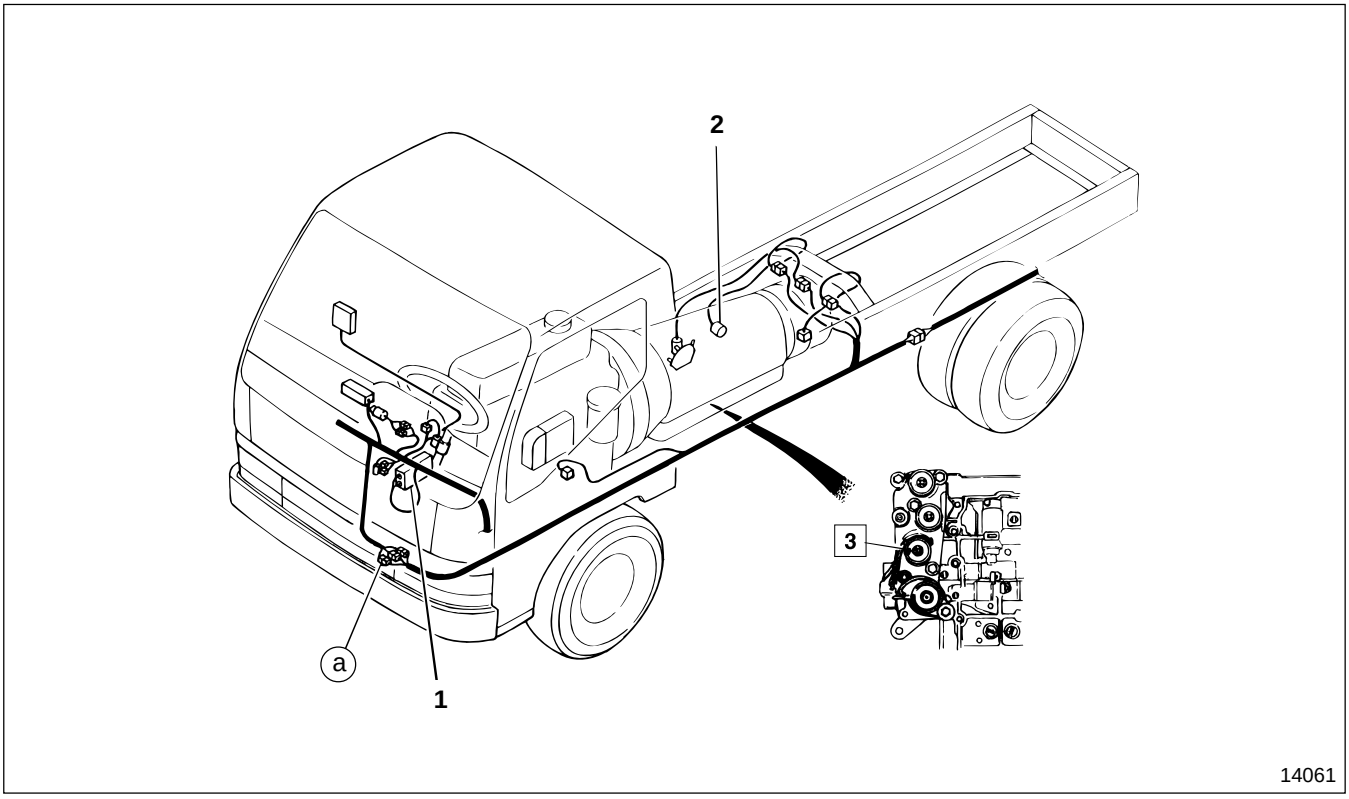
Continuity inspection of harness between automatic transmission terminal and automatic transmission electronic control unit
NG → Wiring breakage, short circuit of harness, connector incorrectly connected → Repair or replace

OK

Automatic transmission electronic control unit faulty → Replace



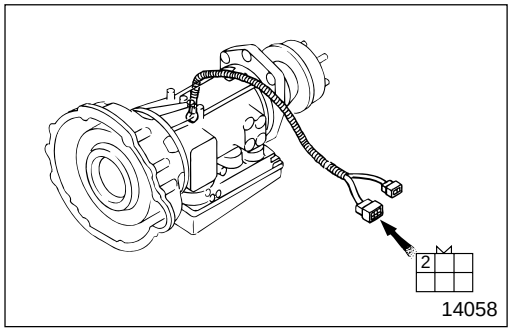
https://truckmanualshub.com/



1 Automatic transmission electronic control unit
2 Terminal switch
3 Shift solenoid B

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
3	Resistance of shift solenoid B (At fluid temperature 20°C {68°F}) Measure resistance between terminal 2 of the connector of the terminal switch side and the automatic transmission case  14056	25.0 Ω	—	—



◆ Service procedure

3 **Inspection of shift solenoid B**

Measure the resistance between terminal 2 of the connector of automatic transmission terminal switch **2** side and the automatic transmission case (near the automatic transmission terminal).

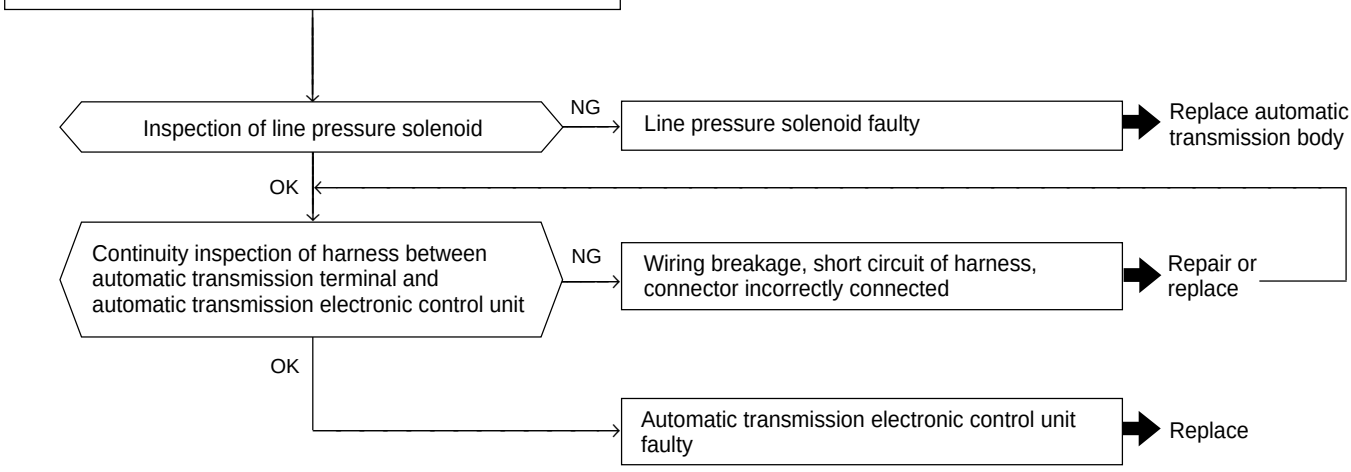
Standard value	Connector terminal		Fluid temperature
	2	Automatic transmission case	
25.0 Ω	○	○	20°C {68°F}

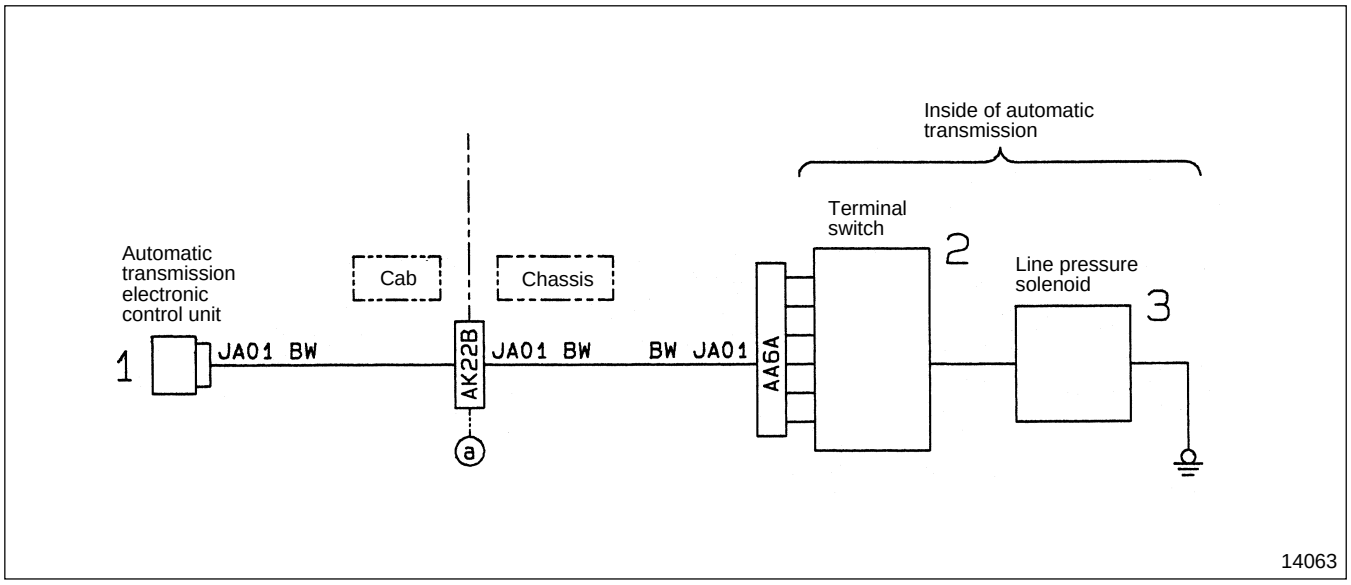
If the measured value deviates from the standard value, replace shift solenoid B **3**.

https://truckmanualshub.com/

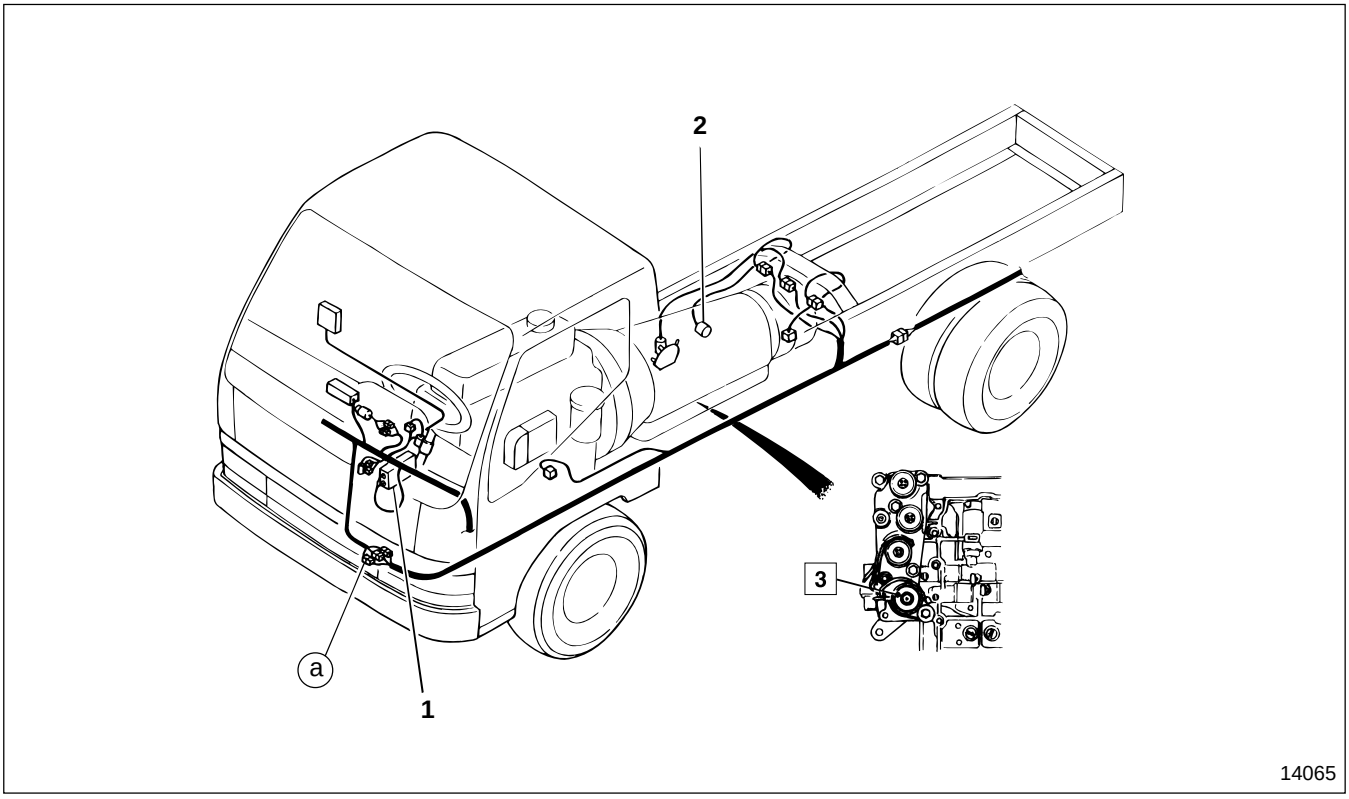
INSPECTION BY INDIVIDUAL DIAGNOSIS CODE

34. Line pressure solenoid faulty





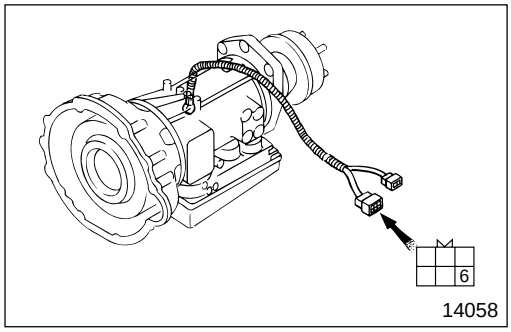
https://truckmanualshub.com/



1 Automatic transmission electronic control unit
2 Terminal switch
3 Line pressure solenoid

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
3	Resistance of line pressure solenoid (At fluid temperature 20°C {68°F}) Measure resistance between terminal 6 of the connector of the terminal switch side and the automatic transmission case  14056	3.2 Ω	—	—



◆ Service procedure

3 **Inspection of line pressure solenoid**

Measure the resistance between terminal 6 of the connector of automatic transmission terminal switch **2** side and the automatic transmission case (near automatic transmission terminal).

Standard value	Connector terminal		Fluid temperature
	6	Automatic transmission case	
3.2 Ω	○	○	20°C {68°F}

If the measured value deviates from the standard value, replace line pressure solenoid **3**.

https://truckmanualshub.com/

INSPECTION BY INDIVIDUAL DIAGNOSIS CODE

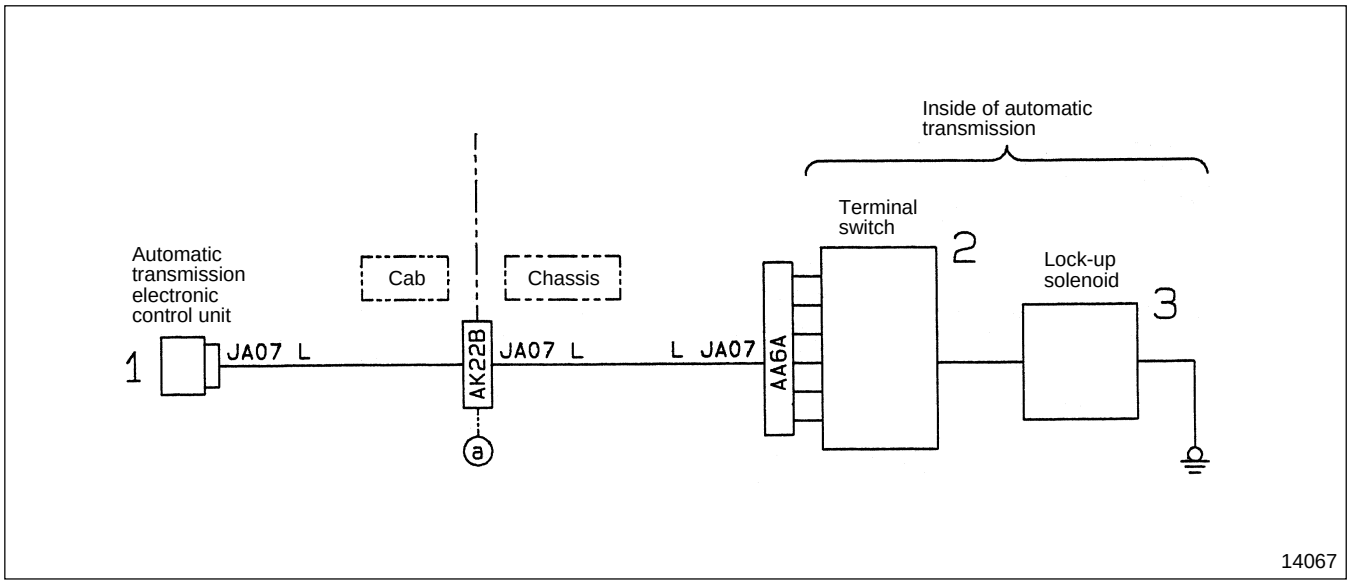
35. Lock-up solenoid faulty

Inspection of lock-up solenoid
NG → Lock-up solenoid faulty → Replace automatic transmission body

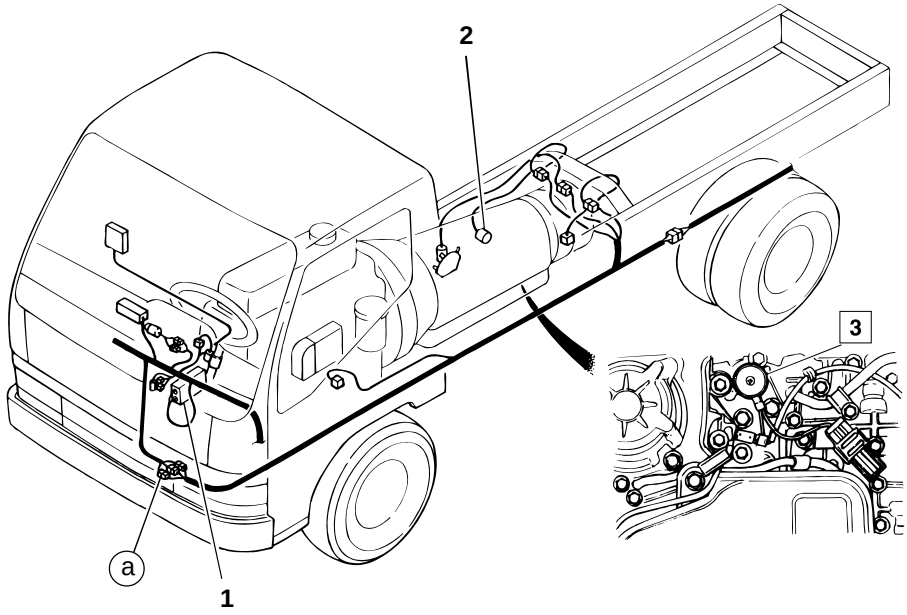
OK

Continuity inspection of harness between automatic transmission terminal and automatic transmission electronic control unit
NG → Wiring breakage, short circuit of harness, connector incorrectly connected → Repair or replace

OK → Automatic transmission electronic control unit faulty → Replace



https://truckmanualshub.com/

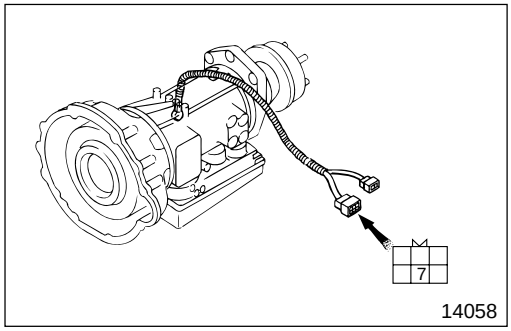


14069

1 Automatic transmission electronic control unit
2 Terminal switch
3 Lock-up solenoid

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
3	Resistance of lock-up solenoid (At fluid temperature 20°C {68°F}) Measure resistance between terminal 7 of the connector of the terminal switch side and the automatic transmission case  14056	13.4 Ω	—	—



14058

◆ Service procedure

3 **Inspection of lock-up solenoid**

Measure the resistance between terminal 7 of the connector of automatic transmission terminal switch **2** side and the automatic transmission case (near automatic transmission terminal).

Standard value	Connector terminal		Fluid temperature
	7	Automatic transmission case	
13.4 Ω	○	○	20°C {68°F}

If the measured value deviates from the standard value, replace lock-up solenoid **3**.

https://truckmanualshub.com/

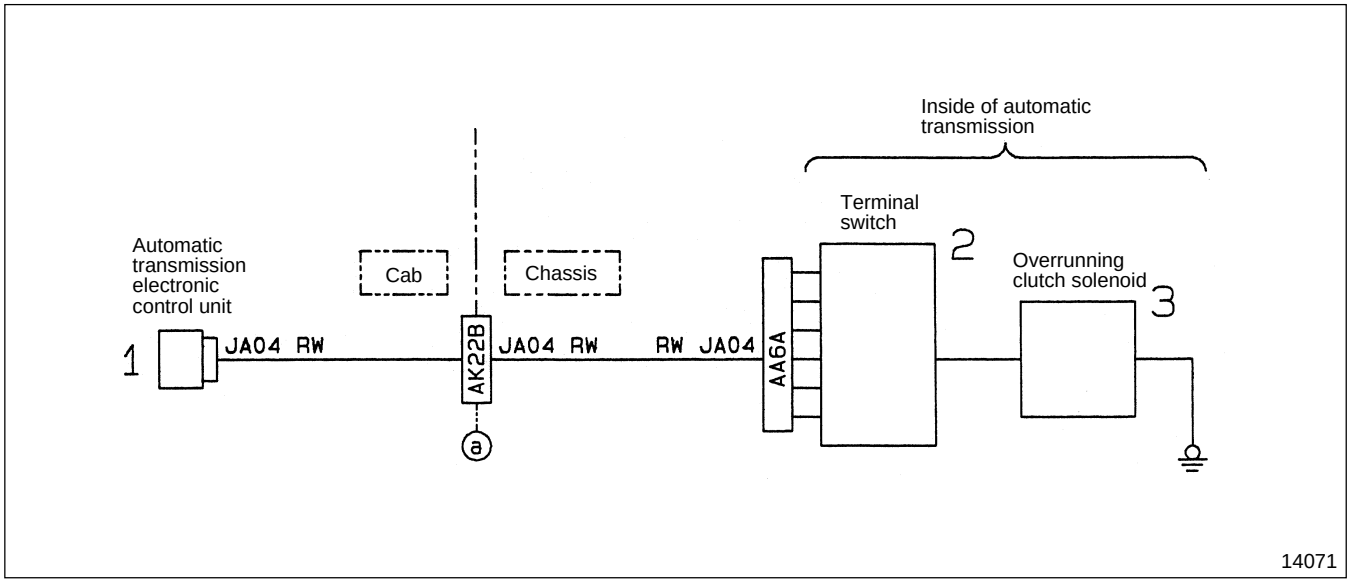
INSPECTION BY INDIVIDUAL DIAGNOSIS CODE

41. Overrunning clutch solenoid faulty

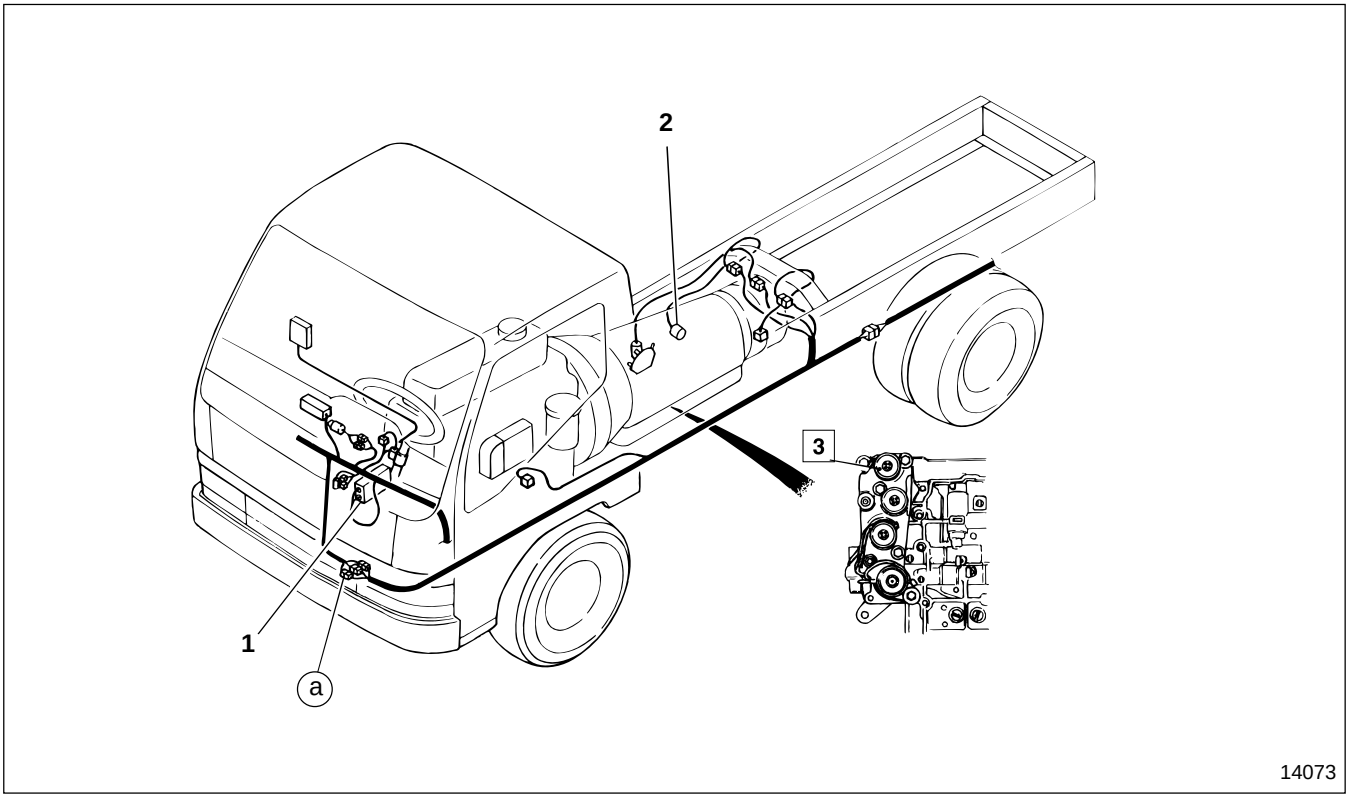
Inspection of overrunning clutch solenoid
NG → Overrunning clutch solenoid faulty → Replace automatic transmission body
OK

Continuity inspection of harness between automatic transmission terminal and automatic transmission electronic control unit
NG → Wiring breakage, short circuit of harness, connector incorrectly connected → Repair or replace
OK

Automatic transmission electronic control unit faulty → Replace



https://truckmanualshub.com/

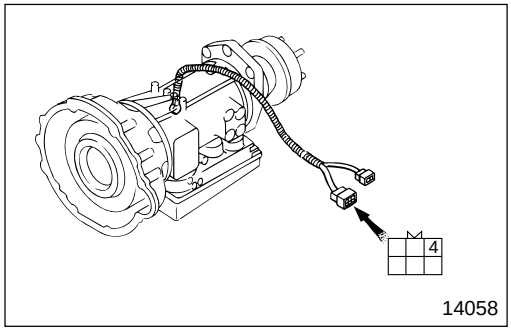


1 Automatic transmission electronic control unit
2 Terminal switch
3 Overrunning clutch solenoid

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
3	Resistance of overrunning clutch solenoid (At fluid temperature 20°C {68°F}) Measure resistance between terminal 4 of the connector of the terminal switch side and the automatic transmission case  14056	25.0 Ω	—	—

◆ Service procedure



3 **Inspection of overrunning clutch solenoid**

Measure the resistance between terminal 4 of the connector of automatic transmission terminal switch **2** side and the automatic transmission case (near automatic transmission terminal).

Standard value	Connector terminal		Fluid temperature
	4	Automatic transmission case	
25.0 Ω	○	○	20°C {68°F}

If the measured value deviates from the standard value, replace overrunning clutch solenoid **3**.

https://truckmanualshub.com/

INSPECTION BY INDIVIDUAL DIAGNOSIS CODE

43. Inhibiter signal faulty

Inspection and adjustment of inhibiter switch
NG → Inhibiter switch faulty → Replace
OK

Power supply inspection of inhibiter switch power supply terminal (terminal 3)
NG → Inspection of fuse
NG → Fuse blown → Replace
OK

OK

NG → Continuity inspection of harness between inhibiter switch and automatic transmission electronic control unit
OK

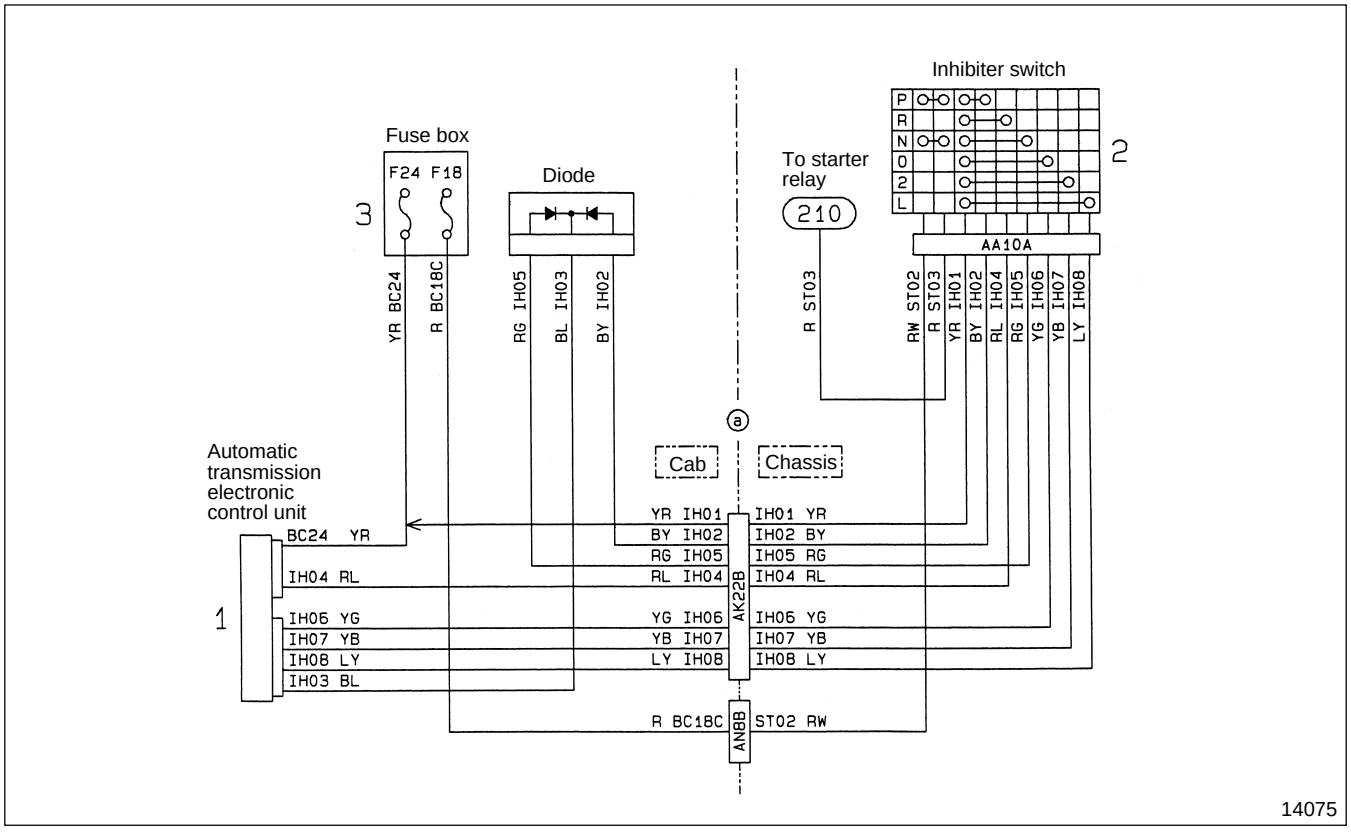
Automatic transmission electronic control unit faulty
Replace

Wiring breakage, short circuit of harness, connector incorrectly connected
Repair or replace

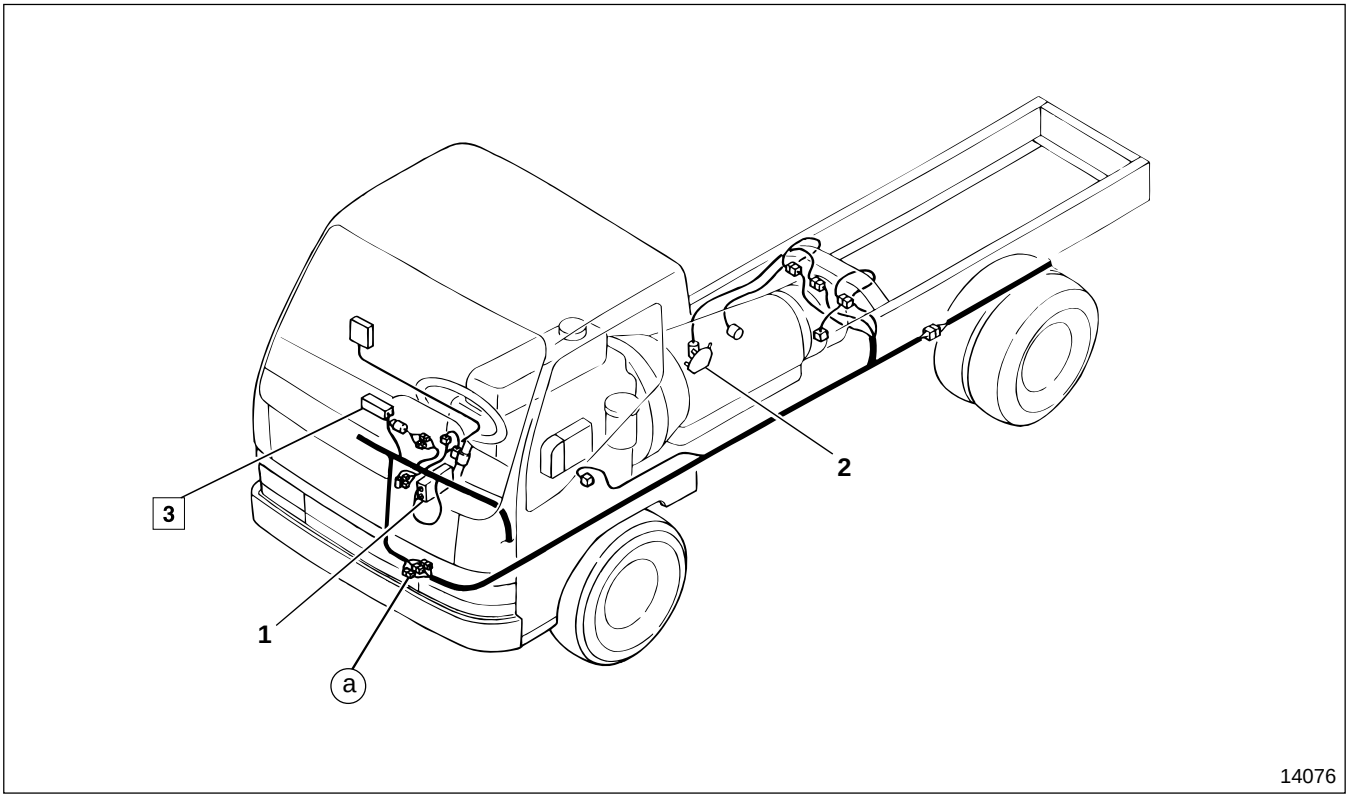
OK

Continuity inspection of harness between inhibiter switch and fuse
NG → Wiring breakage, short circuit of harness, connector incorrectly connected → Repair or replace
OK

Power supply system faulty → Repair

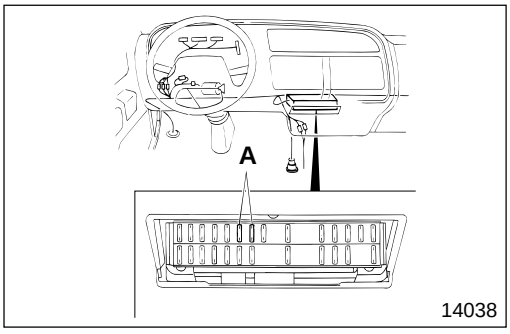


https://truckmanualshub.com/



1 Automatic transmission electronic control unit
2 Inhibiter switch P23-136
3 Fuse box

◆ Service procedure



3 **Inspection of fuse**

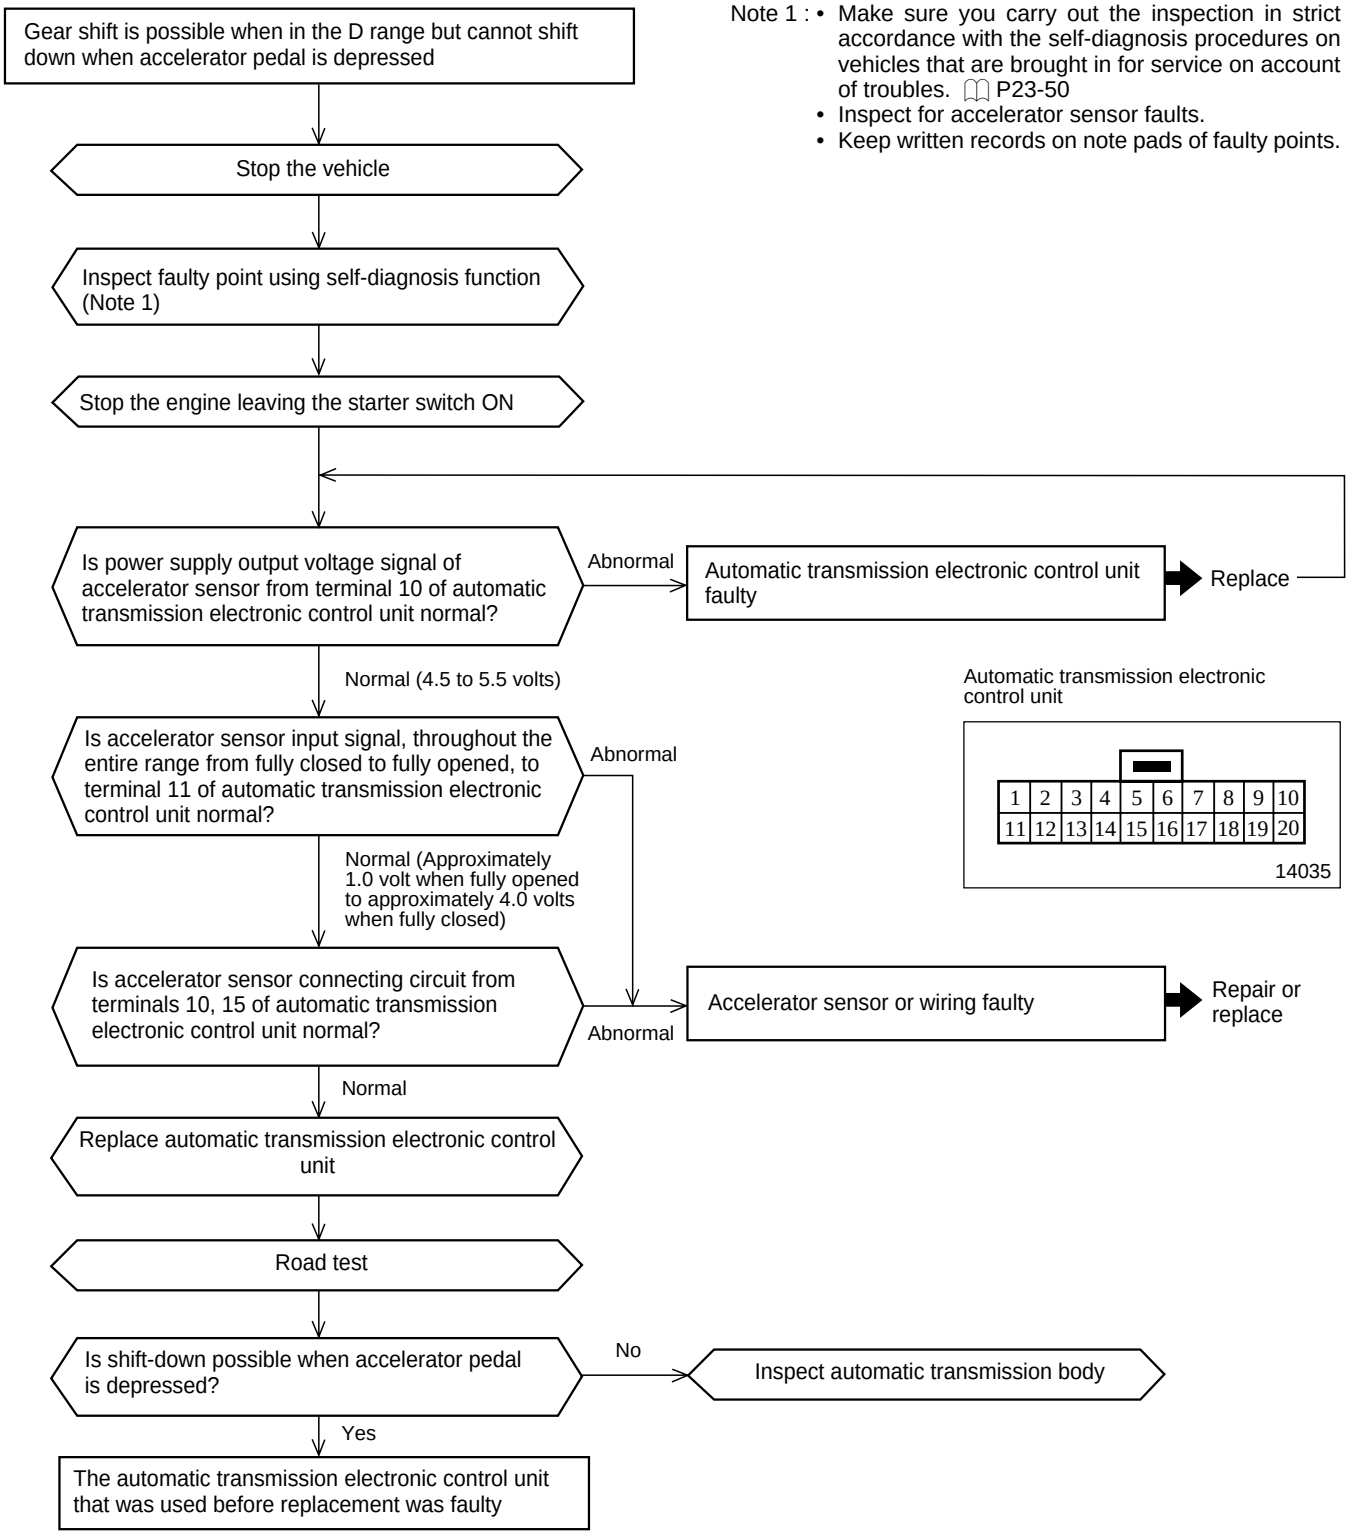
A : Fuse for automatic transmission

https://truckmanualshub.com/

INSPECTION BY SYMPTOM

● Shift Control Faulty

Note 1 : • Make sure you carry out the inspection in strict accordance with the self-diagnosis procedures on vehicles that are brought in for service on account of troubles. P23-50
• Inspect for accelerator sensor faults.
• Keep written records on note pads of faulty points.



https://truckmanualshub.com/

Does not shift up when accelerator pedal is depressed slowly while travelling in the D range. (Does not shift up from D_1 to D_2, from D_2 to D_3, or from D_3 to D_4)

Stop the vehicle

Inspect faulty point using self-diagnosis function (Note 1)

Warm up the engine and raise the fluid temperature to 40°C {104°F} or more (Note 2)

Stop the engine leaving the key ON.
Put the range selector lever into the D range.
Set the overdrive switch to ON

Is input signal to terminal 6 of automatic transmission electronic control unit with overdrive switch ON normal?
- Abnormal → Overdrive switch or wiring faulty → Repair or replace
- Normal (4.5 to 5.5 volts with overdrive switch ON)

Is input signal to terminals 20, 19, 1, 2 of automatic transmission electronic control unit when inhibiter switch in the respective range normal?
- Abnormal → Inhibiter switch or wiring faulty → Repair or replace
- Normal (In the respective range: 12 to 13 volts)

Is oil temperature sensor input signal to terminal 12 of automatic transmission electronic control unit normal?
- Abnormal → Oil temperature sensor or wiring faulty → Repair or replace
- Normal (1.1 volts or less)

Is vehicle speed sensor 2 (built into meter) input signal to terminal 24 of automatic transmission electronic control unit normal? (Note 3)
- Abnormal → Vehicle speed sensor 2 (built into meter) or wiring faulty → Repair or replace
- Normal (Intermittent at 1 volt or less and at 4 volts or more)

Turn starter switch OFF and raise the vehicle

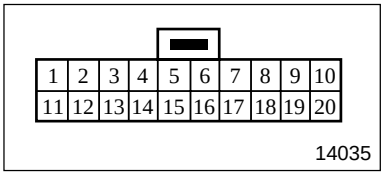
(A)

Note 1 : • Make sure you carry out the inspection in strict accordance with the self-diagnosis procedures on vehicles that are brought in for service on account of troubles. P23-50
• Inspect for faults in vehicle speed sensor and the various solenoids (except lock-up solenoid).
• Keep written records on note pads of faulty points.

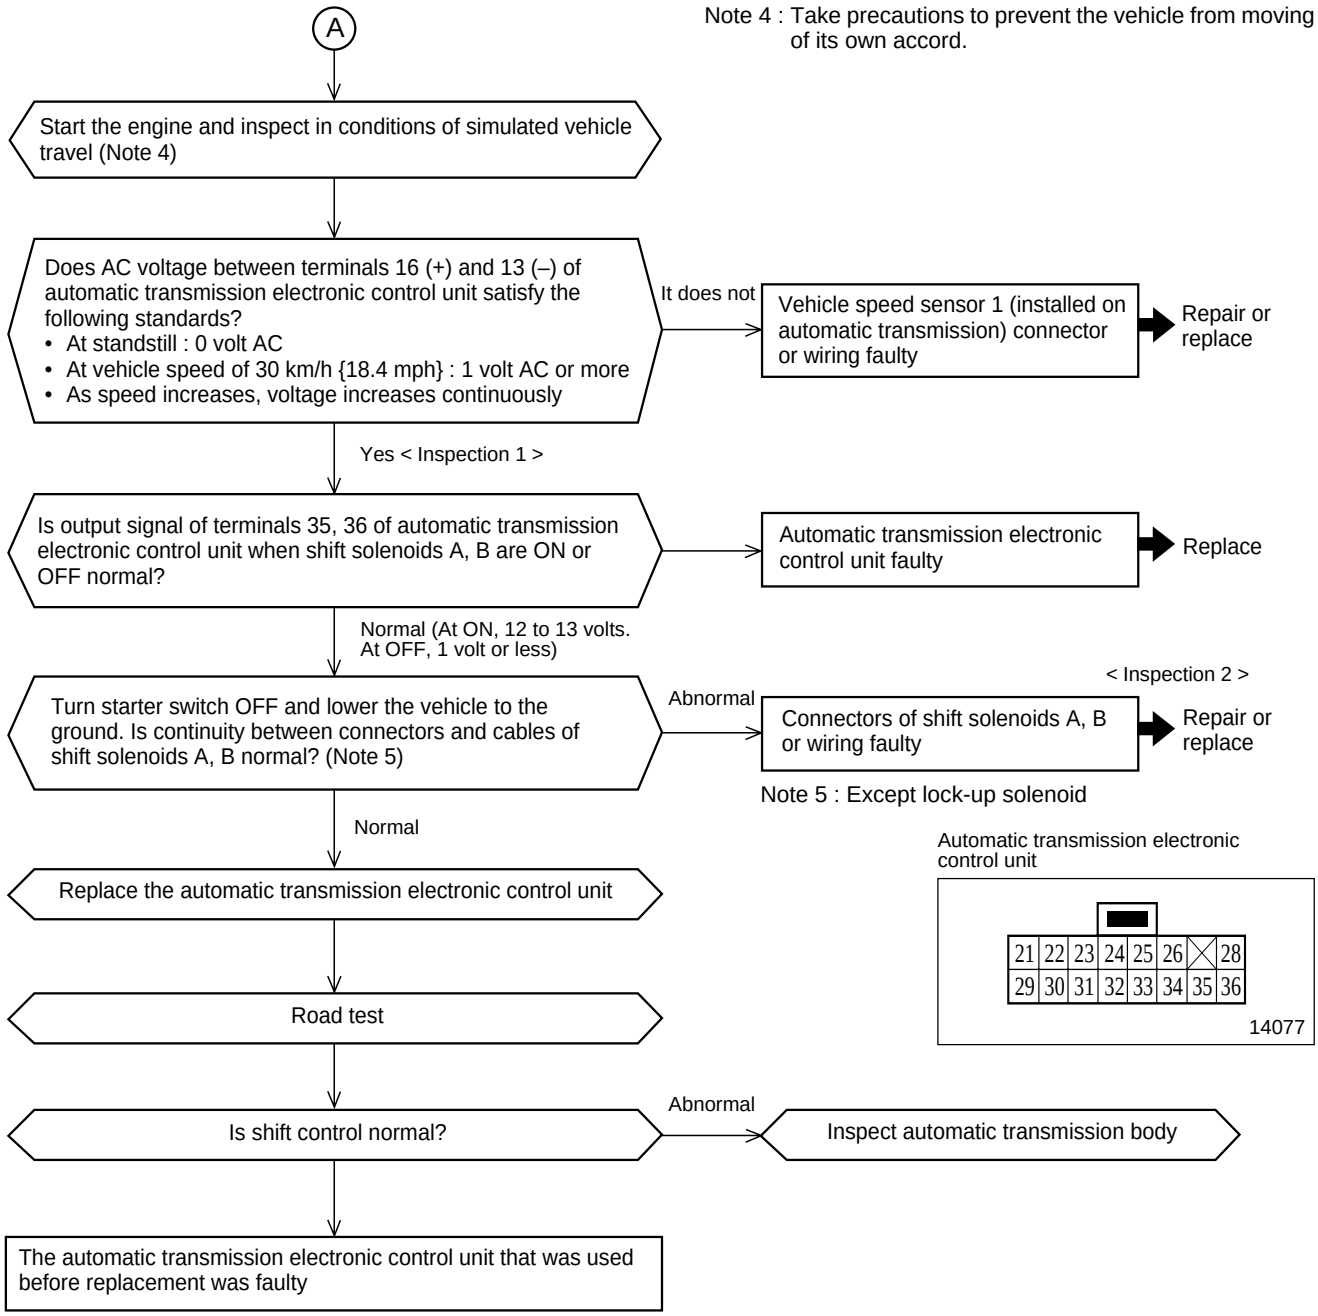
Note 2 : When the fluid temperature is 40°C {104°F} or more, output voltage of terminal 12 of automatic transmission electronic control unit becomes 1.1 volts or less.

Note 3 : If the connector of the vehicle speed sensor is almost disconnected, self-diagnosis might misjudge the situation as normal because the connector will be disconnected while the vehicle is travelling and connected while it is standing still. Therefore, make sure that the connector is securely connected.

Automatic transmission electronic control unit



https://truckmanualshub.com/



https://truckmanualshub.com/

< Inspection 1 >

Inspection of output voltage to various solenoids

- Inspect and see if the ON and OFF operation of the various solenoids are normal while increasing vehicle speed.

Automatic transmission electronic control unit terminal / Solenoid / Gear position		D_1	D_2	D_3	D_4
35	Shift solenoid A	ON	OFF	OFF	ON
36	Shift solenoid B	ON	ON	OFF	OFF

< Inspection 2 >

Inspection of various solenoids, connectors and wiring

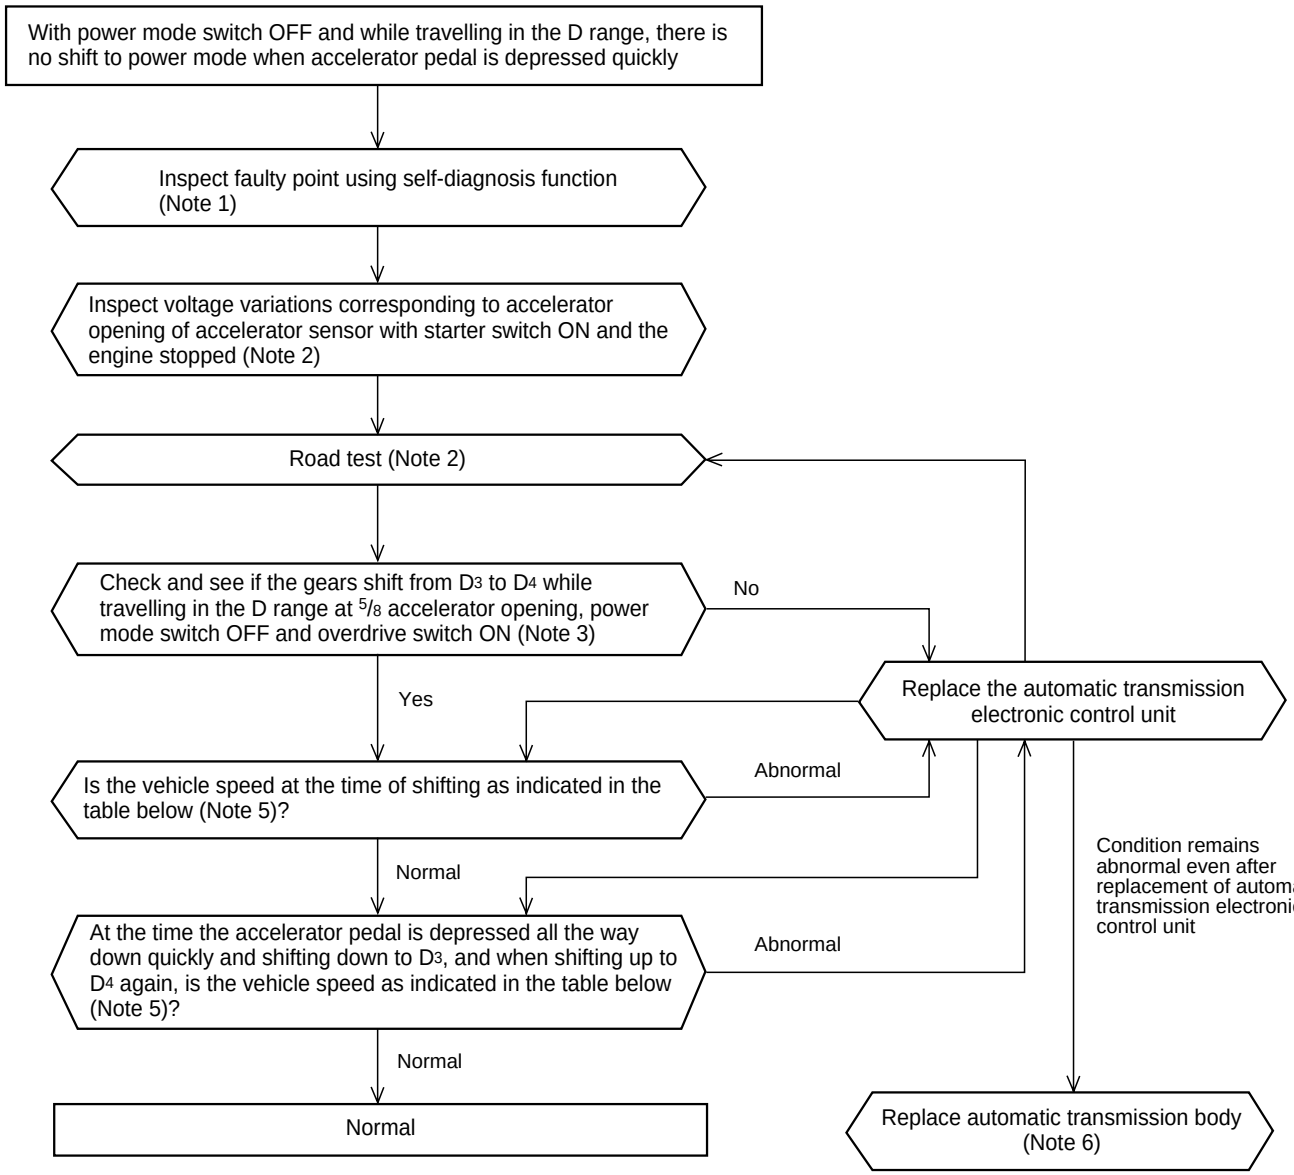
- Remove the connector of the automatic transmission electronic control unit. Then inspect and see if the resistance between the terminals of the solenoids (terminals to be connected to 35 and 36) and the vehicle ground conforms to the standard value.

Resistance between terminals	Connector terminals		
	35	36	Vehicle ground
20 to 40 Ω	○——		——○
		○——	——○

https://truckmanualshub.com/

INSPECTION BY SYMPTOM

● Shift pattern selection control faulty



Note 1 : • Make sure you carry out the inspection in strict accordance with the self-diagnosis procedures on vehicles that are brought in for service on account of troubles. 🕮 P23-50
- Inspect abnormality of accelerator sensor, vehicle speed sensors and overdrive switch.
- Keep written records on note pads of faulty points.

Note 2 : Mount check box, and check voltage at time of 5/8 accelerator opening. When road testing, depress the accelerator pedal and use a tester to see if the voltage conforms to the voltage at time of 5/8 accelerator opening. 🕮 P23-108

Voltage at 5/8 accelerator opening
Approximately 2.8 to 2.9 V

https://truckmanualshub.com/

Note 3 : Shift point can be detected using the light-emitting diode, installed in the check box, which reflects the operation of shift solenoids A, B.

D_3 position	Neither shift solenoids A, B are lit
D_4 position	Shift solenoid A is lit. B is not lit

Note 4 :

FE639	Approximately 32 Km/h {19.88 mph}
FE649	Approximately 34 Km/h {21.13 mph}

The vehicle speed at the time of shifting must be within the specified range ± approximately 5 km/h {3.1 mph}.

Note 5 :

FE639	Approximately 80 Km/h {49.71 mph}
FE649	Approximately 79 Km/h {49.09 mph}

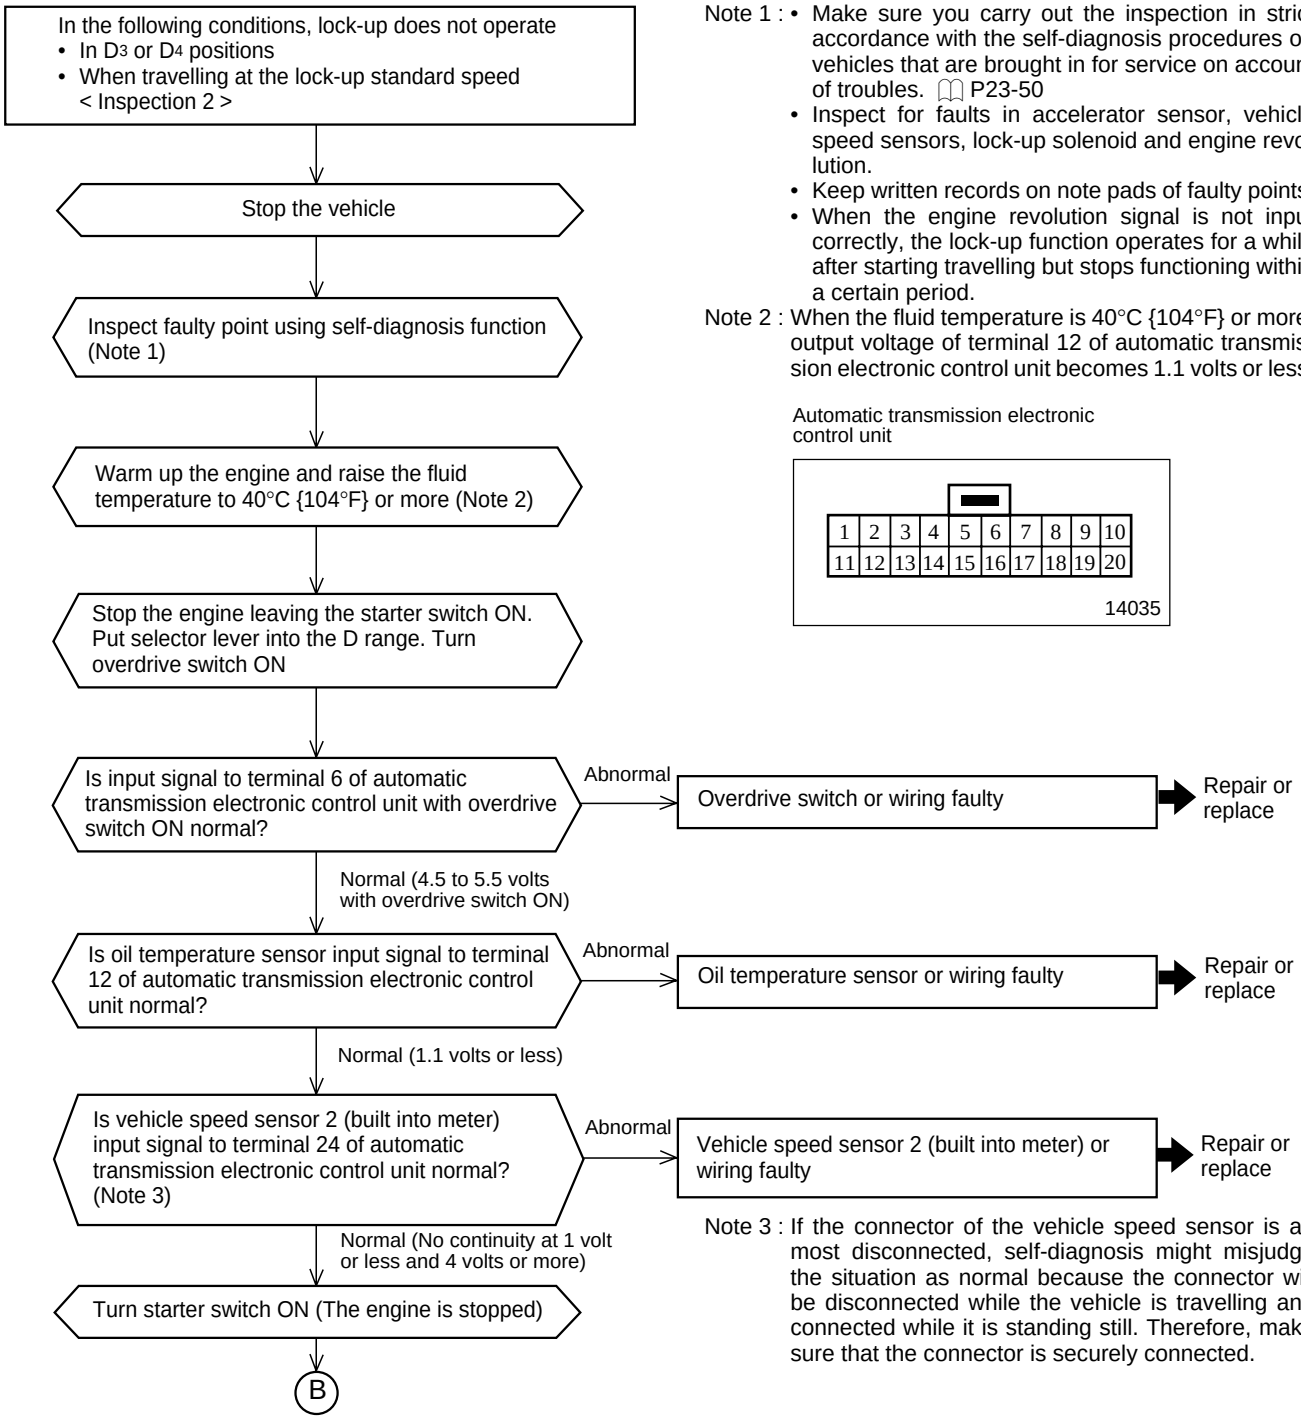
The vehicle speed at the time of shifting must be within the specified range ± approximately 5 km/h {3.1 mph}.

Note 6 : When any fault is found by reinspection after replacement of automatic transmission electronic control unit.

https://truckmanualshub.com/

INSPECTION BY SYMPTOM

● Lock-up control faulty



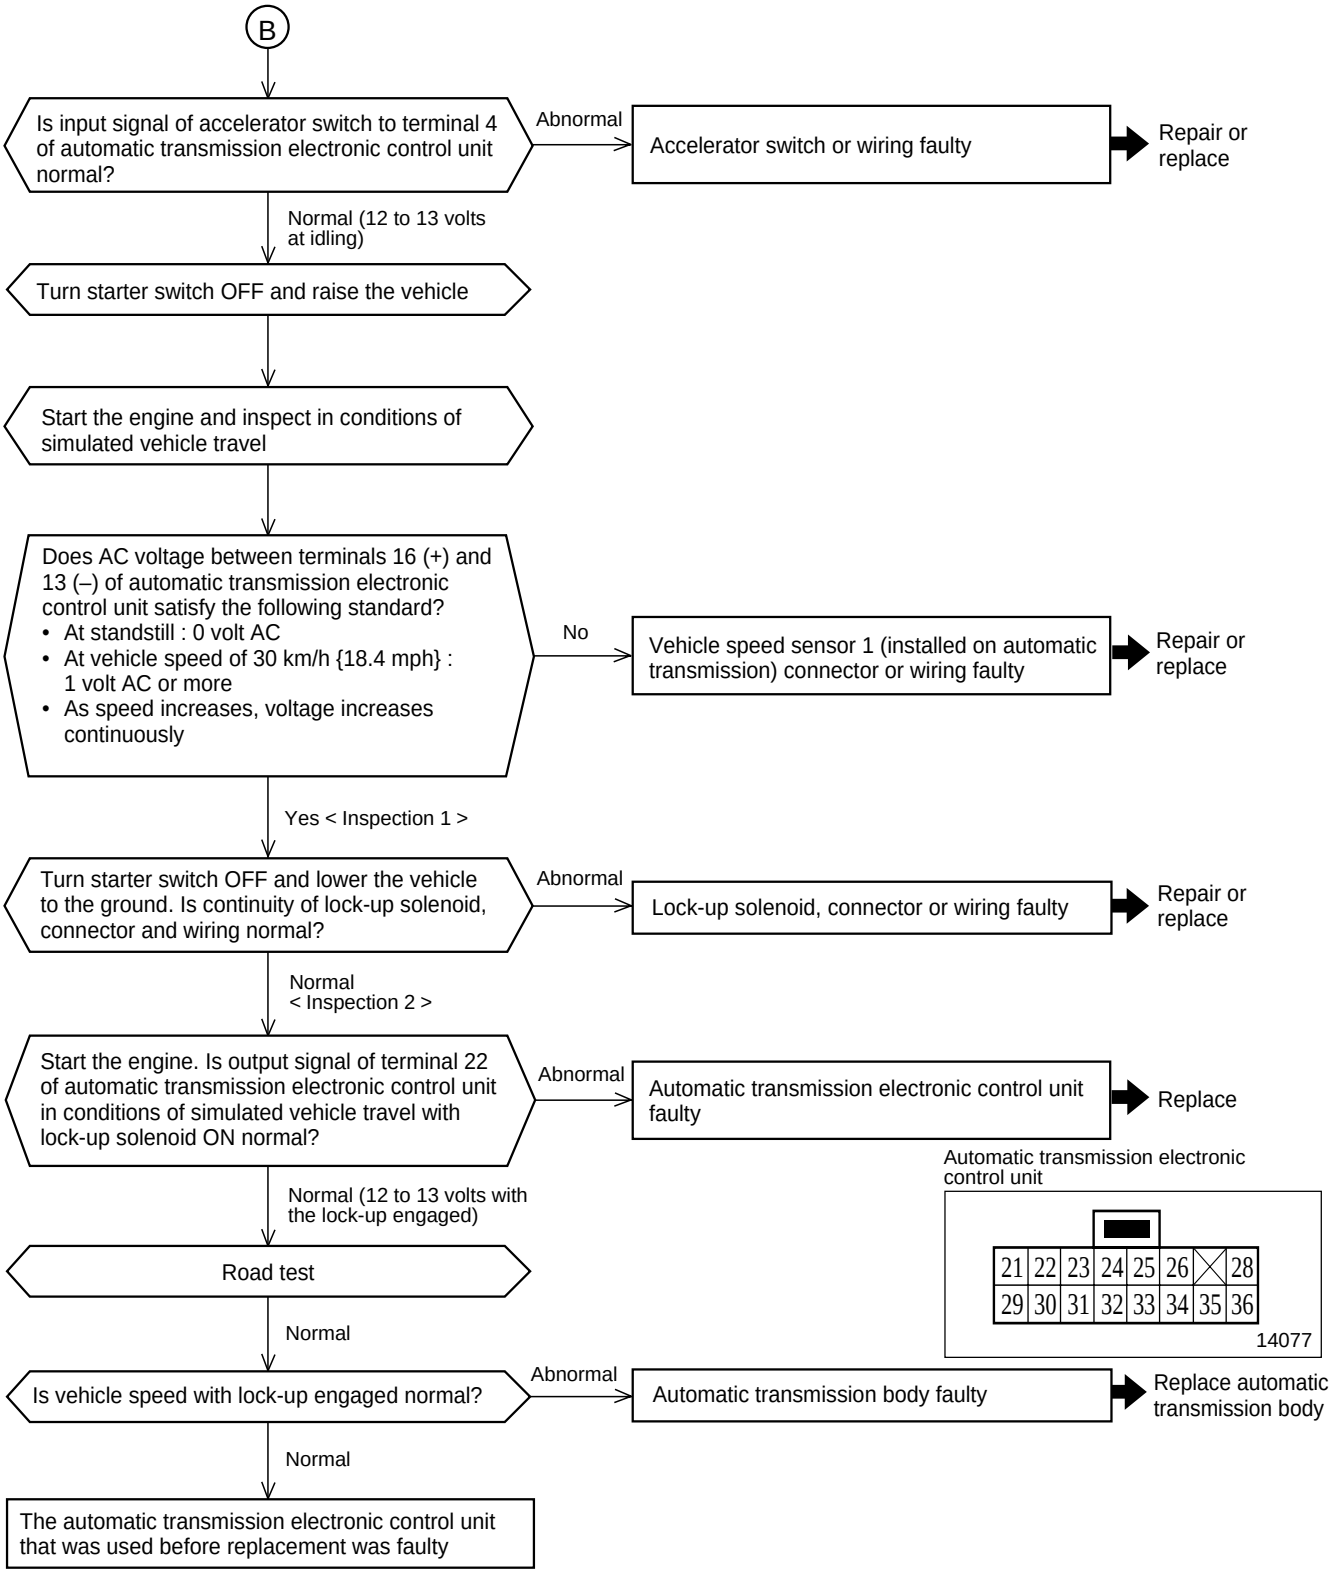
Note 1 : • Make sure you carry out the inspection in strict accordance with the self-diagnosis procedures on vehicles that are brought in for service on account of troubles. 📖 P23-50
• Inspect for faults in accelerator sensor, vehicle speed sensors, lock-up solenoid and engine revolution.
• Keep written records on note pads of faulty points.
• When the engine revolution signal is not input correctly, the lock-up function operates for a while after starting travelling but stops functioning within a certain period.

Note 2 : When the fluid temperature is 40°C {104°F} or more, output voltage of terminal 12 of automatic transmission electronic control unit becomes 1.1 volts or less.

Automatic transmission electronic control unit

Note 3 : If the connector of the vehicle speed sensor is almost disconnected, self-diagnosis might misjudge the situation as normal because the connector will be disconnected while the vehicle is travelling and connected while it is standing still. Therefore, make sure that the connector is securely connected.

https://truckmanualshub.com/



https://truckmanualshub.com/

< Inspection 1 >
Inspection of lock-up solenoid, connector and wiring
- Remove the connector of the automatic transmission electronic control unit. Then inspect and see if voltage between terminal 22 and the vehicle ground conforms to the standard value.

Standard value

Resistance between terminals	Connector terminal	
	22	Ground
10 to 20 Ω	○	○

<Inspection 2>
Inspection of vehicle speed with lock-up engaged
- Inspect and see if the vehicle speed at the time when the output signal to the lock-up solenoid is changed over from OFF to ON with 4/8 accelerator opening conforms to the standard value.

Standard value

Shift gear position	Vehicle model	Vehicle speed with lock-up engaged
D3	FE639	51 to 57 Km/h {31.69 to 35.42 mph}
	FE649	53 to 59 Km/h {32.93 to 36.66 mph}
D4	FE639	70 to 76 Km/h {43.50 to 47.23 mph}
	FE649	74 to 80 Km/h {45.98 to 49.71 mph}

https://truckmanualshub.com/

https://truckmanualshub.com/

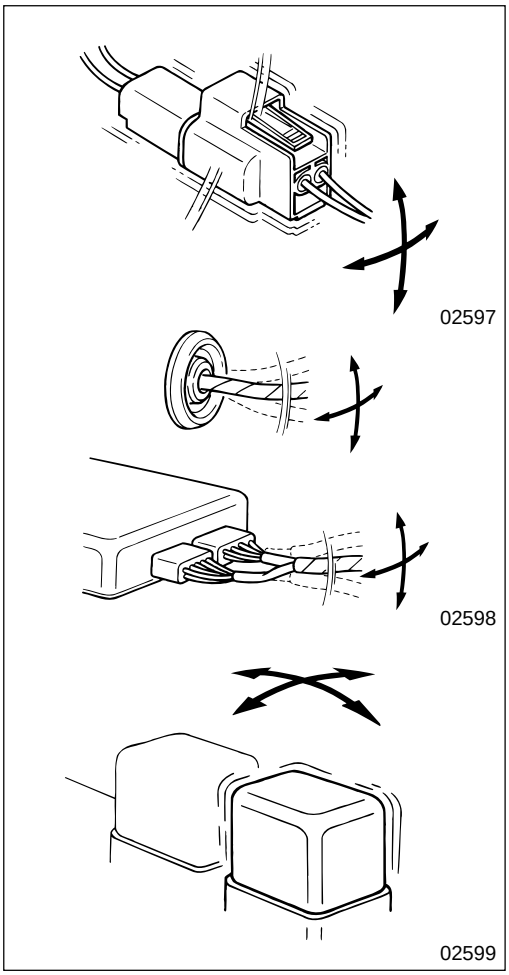
Temporary Faults



Temporary faults often occur under certain conditions. So identifying those conditions helps to find possible causes. To find the conditions under which temporary faults occurred, you need to reproduce the faults after interviewing customers in detail about actual driving conditions, weather, frequency of occurence and fault phenomena.
Then determine if the faults were caused by vibration, temperature or other possible elements depending on the actual conditions identified. If vibration is suspected as a possible cause, inspect individual connectors as follows to check if the fault will occur:

- Shake the connector gently in all four directions of the arrows as illustrated.
- Shake the wiring harness gently in all four directions of the arrows as illustrated.
- Wiggle each sensor or piece of equipment by hand.
- Gently shake the wiring harnesses near movable parts such as suspensions.

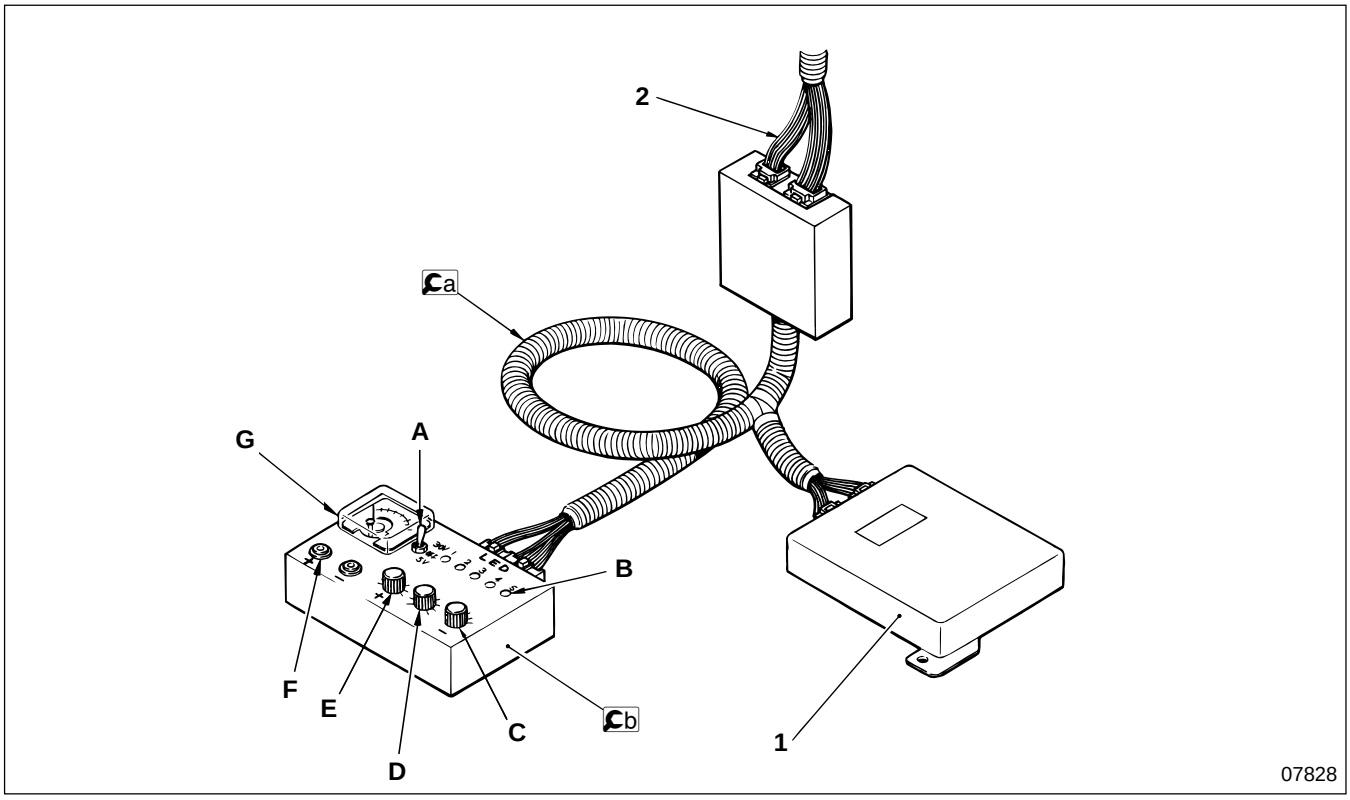
https://truckmanualshub.com/

INSPECTION USING THE CHECK BOX (HARNESS CHECKER)

A simple method for checking the electrical system is to use the harness checker and the check box.

NOTE

In this method, to connect the check harness, the connection between the cab harness and the automatic transmission electronic control unit is cut off. This erases the trouble related signals recorded in the automatic transmission electronic control unit. Therefore, if you carry out both this method and self-diagnosis for a trouble, you must carry out self-diagnosis and keep written records of the diagnosis preceding this method.



● **Preparatory work before inspection**

- Turn the starter switch to ACC and cut off the power.
- Disconnect automatic transmission electronic control unit **1** and cab harness **2**.
- Connect a check harness (MC134298) and b check box (MC134299) between cab harness **2** and automatic electronic control unit **1**.

A : Voltmeter changeover switch between 5 and 30 volts
B : Light-emitting diode
C : Right channel ⊖
D : Center channel ⊕ 8 to 17
E : Left channel ⊕ 1 to 7, or 8 to 17 (changeover)
F : Output terminal for external voltmeter (tester) or oscilloscope
G : Voltmeter

● **Inspection of sensor, harness and switch**

- Inspection is performed by operating channels **C**, **D** and **E** of b check box. For the changeover of ⊕ channels from 1 to 7 use left channel **E**. To change over from 8 onward turn the left channel from 8 to 17, then use center channel **D** in the proper order.

CAUTION ⚠

Turn the voltmeter changeover switch to OFF, before changing over channels.

https://truckmanualshub.com/

No.	Name	Key switch	⊕ channel	⊖ channel	Normal condition
1	Accelerator switch	ON (Engine stopped)	1	4	12 to 13 volts when the accelerator pedal is released, 1 volt or less when the accelerator pedal is lightly depressed
2	Overdrive switch	↑	2	↑	12 to 13 volts when the switch is ON, 1 volt or less when the switch is OFF
3	Power mode switch	↑	3	↑	10.5 to 11.5 volts when the switch is ECO, 1 volt or less when the switch is PWR
4	Automatic transmission fluid temperature sensor	↑	4	2	1.8 volts when the automatic transmission fluid temperature is 10°C {50°F}, 1.1 volts when the automatic transmission fluid temperature is 40°C {104°F}
5	Ground	ACC	5	—	Resistance between check box ⊖ terminal and metal parts of the vehicle is 100 Ω or less
6	↑	↑	6	—	↑
7	VBATT (Power supply from battery)	ACC or ON (Engine stopped)	7	4	12 to 13 volts
8	VIG (Power supply from starter switch)	ON (Engine stopped)	8	↑	↑
9	↑	↑	9	↑	↑
10	VOUT (Accelerator sensor power)	↑	10	2	4.5 to 5.5 volts
11	Accelerator sensor	↑	11	↑	0.9 to 1.0 volt when the accelerator is fully closed, 4.0 to 4.2 volts when the accelerator is fully opened
12	Exhaust brake	↑	12	4	11.5 to 12.5 volts when the exhaust brake is operating, 1 volt or less when the exhaust brake is not operating
For the inspection of items 13, 14 and 15 below, use an external voltmeter (tester) or oscilloscope					
13	Vehicle speed sensor 1	ON (While travelling)	13	1	0 volt when the vehicle is stopped, 1 volt or more when the vehicle is cruising at 30 km/h {18.6 mph}
14	Vehicle speed sensor 2	↑	14	4	637×4 pulses/km square wave VL : 1 volt or less, VH : 4.5 to 5.5 volts
15	Engine revolution signal	ON (Engine revolving)	15	3	4 pulses/Rev 0 V↔5 V square wave

https://truckmanualshub.com/

INSPECTION USING THE CHECK BOX (HARNESS CHECKER)

● **Inspection of Automatic Transmission Electronic Control Unit**

- Connect the vehicle to a chassis dynamo, etc.
- Inspect the various parts by monitoring whether Cb check box light-emitting diode **B** lights up.

No.	Name	Light-emitting diode	Normal Condition
1	Overrunning clutch solenoid	1	Lights up in 1st and 4th gear shift ranges (Overrunning clutch OFF)
2	Lock-up solenoid	2	Lights up when the lock-up mechanism is operating
3	Line pressure solenoid	3	Brightest when the accelerator is fully closed, the more the accelerator is opened the dimmer it gets
4	Shift solenoid A	4	Lights up in the 1st and 4th gear shift ranges
5	Shift solenoid B	5	Lights up in the 1st and 2nd gear shift ranges

NOTE

Gear shift range refers to the range into which each gear is shifted.

● **Work after inspection**

- Turn the starter switch to LOCK and cut off the power.
- Disconnect Ca check harness from between the automatic transmission electronic control unit and the cab harness.
- Connect the automatic transmission electronic control unit and the cab harness.

https://truckmanualshub.com/

MEMO

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Stall Test

● **Aim**

The stall test is carried out to check the friction-prone elements inside the automatic transmission, the sliding of the one-way clutch, the operation of the torque converter and the overall performance of the engine.

● **Measurement procedure**

Be sure to inspect the engine coolant, engine oil and the automatic transmission fluid, before the test. Warm up the engine and the automatic transmission to raise the temperatures of the coolant and the automatic transmission fluid to an appropriate level.
Also make sure, in advance, that the accelerator sensor voltage is within the specified limit. Replace the accelerator sensor if it is faulty.

CAUTION⚠

Performing the stall test when the accelerator sensor voltage is low might damage the transmission.

- Chock the front and rear wheels, and apply the parking brake. Be sure to keep the foot brake fully depressed while operating the accelerator pedal.
- Shift the range selector lever into the D range.
- Slowly depress the accelerator pedal until it is fully depressed. When the engine has reached a point at which it revolves at a steady rate (stall revolution), write down the number of revolutions quickly and release the accelerator pedal.

CAUTION⚠

- **Each measurement should be completed within 10 seconds. If continued for a longer time it might cause the deterioration of the automatic transmission fluid or have an adverse effect on internal parts.**
- **Stop the test immediately if the engine revolution does not stabilize and keeps increasing gradually or if it suddenly increases as if the engine were racing.**

- Shift the range selector lever into the N range, and cool the engine by stabilizing its revolution at approximately 1200 rpm for one minute or more.
- Repeat the test for selector lever ranges 2, L and R.
- Stall revolution

FE639	1720±150 rpm
FE649	1820±150 rpm

● **Diagnosis of results**

Measurement results	Possible faults
High at any selector lever range	• Line pressure is low
High when in the D range	• Forward clutch or forward one-way clutch is weakened .....*
High when in the D and 2 ranges	• Low one-way clutch slips .....*
High when in the R range	• Reverse clutch or low and reverse brake slips .....*
Within the limits	• One-way clutch stuck inside torque converter, or a fault in the high clutch or the brake band. Other parts are normal .....*
Lower than the standard value	• Engine fault or one-way clutch inside torque converter slips .....*

* : To determine the cause precisely, carry out a road test.

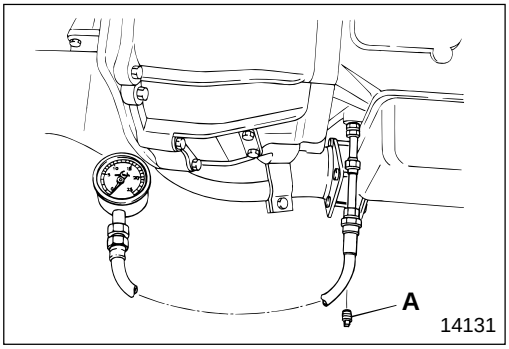
https://truckmanualshub.com/

Line Pressure Test

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Pressure detector plug	4.9 to 9.8 {3.6 to 7.2, 0.5 to 1.0}	—



● **Aim**

The line pressure test is carried out to check the oil pump performance, the control valve functions and to check the hydraulic circuit for leakage.

● **Measurement procedure**

- Remove pressure detector plug **1** and install the pressure gauge in the bottom front part of the automatic transmission case.
- Measurement procedure is the same as for the stall test. Measure as you gradually open the accelerator from engine idling.
- Read the line pressure.
- After measurement is completed, tighten pressure detector plug **1** at specified torque.

NOTE

- **Since pressure detector plug 1 has sealant on its threads it cannot be reused.**
- **Measure line pressure when the engine idling revolution is the standard value.**

Thread size for pressure detector plug **1**

Automatic transmission case female screw (parallel pipe thread)	Plug, pressure gauge fitting male screw (taper pipe thread)
PS $^1/_8$	PT $^1/_8$

● **Line pressure**

Unit : kPa {lbf/in^2, kgf/cm^2}

Oil pressure when engine is idling	FE639 FE649	R	470 to 745 {68 to 108, 4.8 to 7.6}
		D, 2, L	295 to 470 {43 to 68, 3.0 to 4.8}
Oil pressure when engine is stalled	FE639 FE649	R	1225 to 1520 {178 to 220, 12.5 to 15.5}
		D, 2, L	920 to 1100 {134 to 159, 9.4 to 11.2}

https://truckmanualshub.com/

● **Diagnosis of results**

Measurement results		Possible faults
When engine is idling	Measured value is low in all shift ranges (P, R, N, D, 2, and L)	Abnormality might exist in the pressure supply system or output from the oil pump is low. For example: • Oil pump worn • Control piston abnormal • Pressure regulator valve or plug stuck, spring fatigued • Hydraulic pressure leaks along the hydraulic line via the oil strainer → oil pump → pressure regulator valve • Engine idling revolution low
	Measured value is low at particular selector lever range	Hydraulic pressure delivered from manual valve might be leaking from the related devices or lines. For example: • When there are hydraulic pressure leaks in the low and reverse brake systems, line pressure will decrease in shift ranges R and L but will stay normal in ranges P, N, D and 2
	Measured value is high	Abnormality might exist in sensors or in pressure adjustment functions. For example: • Accelerator sensor adjusted incorrectly • Oil temperature sensor broken • Line pressure solenoid malfunction (stuck in OFF, filter clogged, disconnection) • Pressure modifier valve stuck • Pressure regulator valve or plug stuck
Hydraulic pressure does not rise from engine idling level		Abnormality might exist in sensors or in pressure adjustment functions. For example: • Accelerator sensor adjusted incorrectly • Automatic transmission electronic control unit broken • Line pressure solenoid malfunction (stuck in ON) • Pressure regulator valve or plug stuck • Pressure modifier valve stuck • Pilot valve stuck or pilot filter clogged
Pressure rises but does not reach standard value		Abnormality might exist in sensors or in pressure adjustment functions. For example: • Accelerator sensor adjusted incorrectly • Control piston abnormal • Line pressure solenoid malfunction (stuck, filter clogged) • Pressure regulator valve or plug stuck • Pressure modifier valve stuck • Pilot valve stuck or pilot filter clogged

https://truckmanualshub.com/

Road Test

● **Measurement procedure**

Check, before the test, the level and state of the automatic transmission fluid, and make sure that the range selector and accelerator control cables are adjusted correctly.
During the road test, shift gears into every range to check for slippage and other abnormalities.
Check if the lever is easy or hard to shift.
Check the shift points for both shift-up and shift-down.
Under various driving conditions, check the vehicle speeds at shifting.

● **Vehicle speeds at shifting**

Unit : km/h {mph}

Item \ Power mode switch			OFF (Economy mode)	ON (Power mode)
Half throttle Accelerator opening : 4/8	FE639	$D_1 \rightarrow D_2$	6 to 10 {3.73 to 6.21}	7 to 11 {4.35 to 6.84}
		$D_2 \rightarrow D_3$	14 to 20 {8.70 to 12.43}	16 to 22 {9.94 to 13.67}
		$D_3 \rightarrow D_4$	22 to 28 {13.67 to 17.40}	29 to 35 {18.02 to 21.75}

			3rd gear OFF	35 to 42 {21.75 to 26.10}
			4th gear OFF	35 to 42 {21.75 to 26.10}

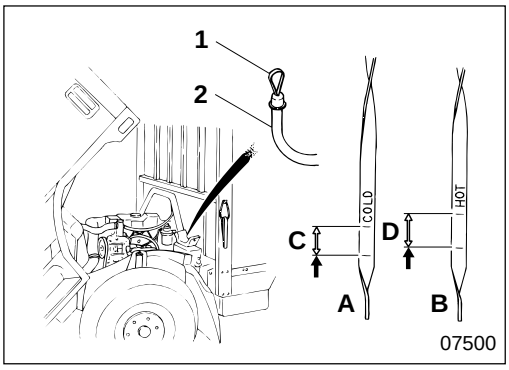
When the automatic transmission fluid level is too low, air is sucked in along with the fluid from the pump. The air bubbles turn the fluid spongy and can lead to a decline in pressure and slippage of the internal clutch.
If, on the other hand, the fluid level is too high due to an incorrect top up, the fluid is whipped up by the revolving parts and the air bubbles thus created can lead to the same adverse conditions as when the level is too low.
In both cases the presence of air bubbles will lead to overheating, oxidation of the fluid or creation of varnish and will prevent the valves and clutches from operating correctly.
Furthermore, the presence of air bubbles will cause the fluid to be discharged through the automatic transmission vents or filler tubes, and can be mistaken for fluid leakage.
To prevent these from happening use the following procedure to correctly inspect the fluid level.

https://truckmanualshub.com/

Inspection of Automatic Transmission Fluid

(1) Inspection of characteristics

If the automatic transmission fluid smells burnt or if it contains metal particles or sludge as a result of internal friction and wear of metal or other material, the transmission assembly must be completely overhauled. Make sure you carefully examine the fluid on dipstick **1**. If you find the quality questionable, take a sample and examine it more closely.



(2) Inspection of automatic transmission fluid level

- Park the vehicle on level ground, make sure that the parking brake is fully activated and chock the wheels to keep them from rolling.
- Start the engine and let it idle. To fill the hydraulic circuit with automatic transmission fluid, slowly shift the range selector lever once through the P to L ranges and finally shift into the N range.
- While the engine is still idling, pull out dipstick **1** and wipe off the fluid sticking to it. Reinsert the dipstick, then pull it out again and check the fluid level.
- If the fluid level is inspected right after the engine is started and the fluid temperature is still low (40±15°C {104±27°F}) the level should be within area **C** marked COLD on dipstick **1** as illustrated in **A**.
- If the fluid level is inspected after the vehicle has been driven and the fluid temperature is high (65±15°C {149±27°F}) the level should be within area **D** marked HOT on dipstick **1** as illustrated in **B**.

WARNING⚠

Take care during the inspection because the engine will be running. Take sufficient care to avoid burns or injuries resulting from contact with moving parts.

CAUTION⚠

Be sure to wipe off the dust from the safety cap and the upper part of filler tube 2 before you pull out dipstick 1.

NOTE

- **Make sure the vehicle is parked on level ground when you are checking the fluid level.**
- **Make sure the range selector lever is in the N range and the engine is idling when you are checking the fluid level. When the engine is at standstill, the fluid level appears higher than it actually is.**
- **To ensure the fluid is correct, reinspect the fluid level after an actual drive.**

- If the fluid level is low, top it up to the specified level by supplying automatic transmission fluid (DEXRON II type) through filler tube **2**.

https://truckmanualshub.com/

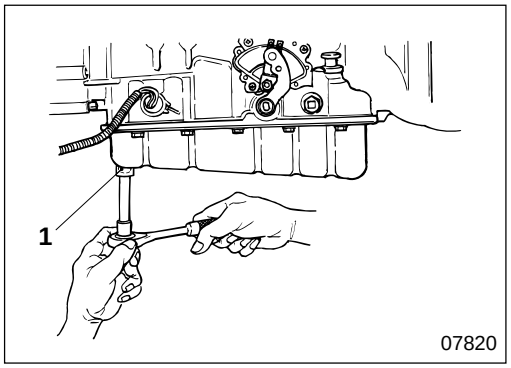
INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Replacement of Automatic Transmission Fluid

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Drain plug	29 to 39 {22 to 29, 3.0 to 4.0}	—



(1) Draining

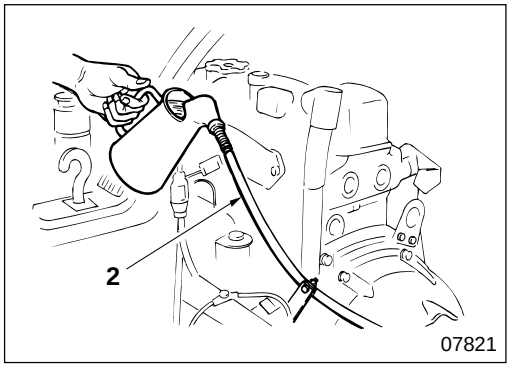
- Place a container under the oil pan, remove drain plug **1** in the front of the oil pan and drain the fluid.

WARNING

Take care because the automatic transmission fluid temperature immediately after the engine has stopped is very high. To avoid scalds, wait until a safe temperature has been reached before draining the fluid.

NOTE

- **The fluid will drain faster if the engine is first run to raise the fluid temperature.**
- **The fluid cannot be drained from the hydraulic circuit, the torque converter or the oil cooler.**
- **Check the drained fluid for dirt, metal particles and metal fragments.**



(2) Supply

- Reinstall the gasket, and oil pan drain plug **1**.
- Add approximately 6.7 L {7.1 qts} of automatic transmission fluid (DEXRON II type) through filler tube **2**.

CAUTION

Make sure that dirt and foreign particles do not become mixed in with the fluid when it is added.

- Shift the range selector lever into the N range, start the engine and let it idle for at least two minutes.
- After shifting the lever through all ranges once, shift it back into N.

CAUTION

To prevent burning out the interior of the automatic transmission assembly, make sure that the engine is not allowed to race when you do the above.

- Supply fluid until the fluid level is at the lower limit of the specified area on dipstick **1**. Next, check the fluid level to make sure it is within the specified limit.

NOTE

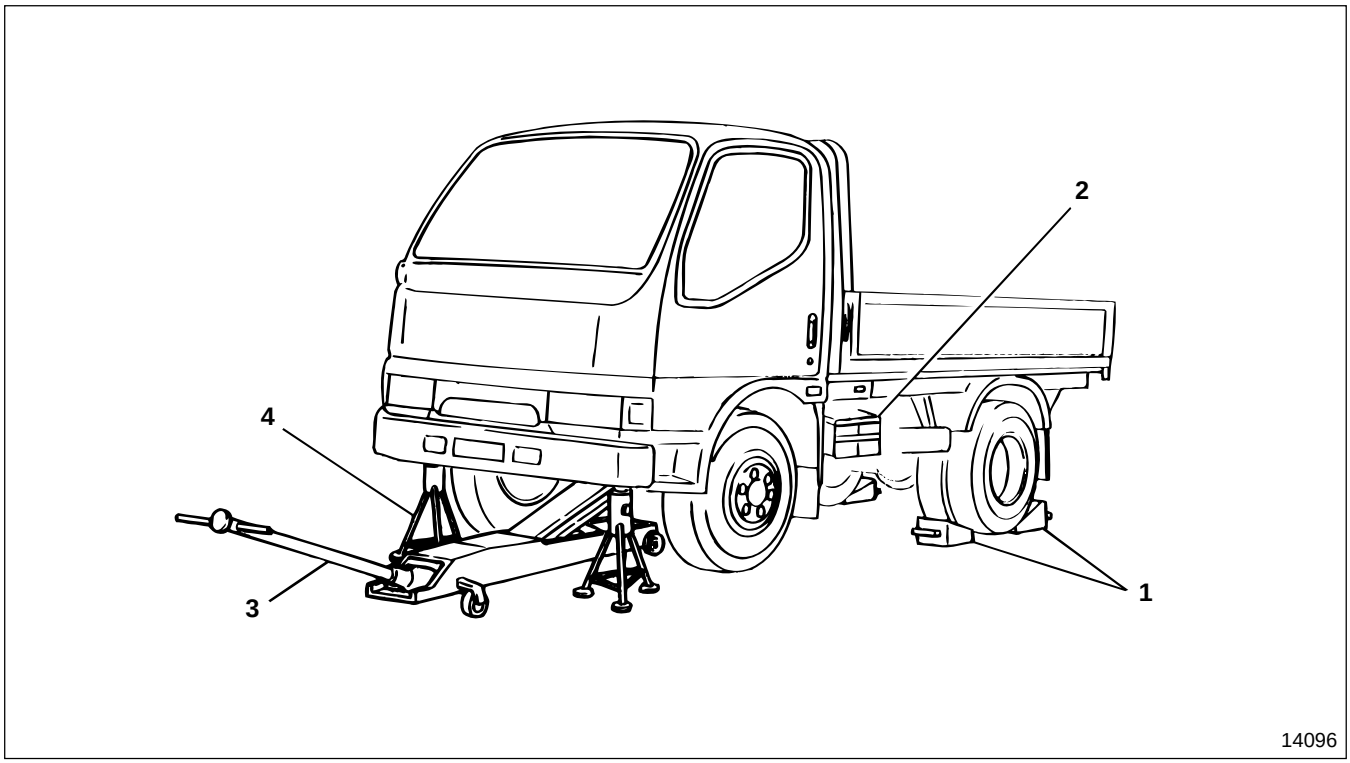
- **Determining the fluid level immediately after supplying the fluid might be difficult due to the fluid stuck in the inside of the filler tube. Therefore, check the fluid level a few times between intervals.**
- **If the fluid is oversupplied, it will overflow and can be mistaken for leakage.**
- **Let the engine idle and, while paying attention to the fluid level, pour in the fluid slowly.**

https://truckmanualshub.com/

(3) Fluid leakage

- Automatic transmission converter housing area
- Checking for the source of leakage
  When checking for leaks keep in mind that leaks in the converter and the surrounding areas can be the result of oil leaking from the engine.
  The color of the fluid is red and can be distinguished from engine oil.
- Carry out the following inspection before removing the automatic transmission.
  Check carefully to find out whether the leaking is from the torque converter or from the automatic transmission side (the oil seal area of the oil pump housing or the area where the oil pump housing is engaging with the case).

https://truckmanualshub.com/



● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect negative battery cable. Gr 54
3 Jack up the front axle on a garage jack.
4 Support the front frame on rigid racks.

WARNING

- **Since the parking brake will be removed, naturally it cannot be used. Therefore, you must chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION

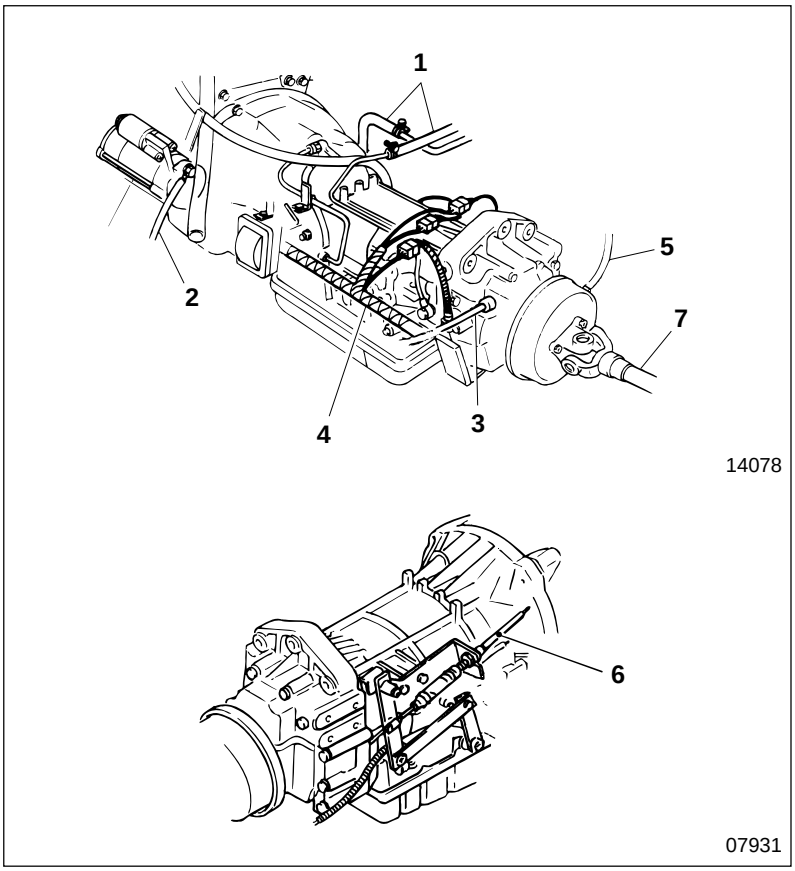
Keep the automatic transmission in neutral throughout the operation.

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

https://truckmanualshub.com/

Preparatory Work



● **Removal sequence**

1 Oil cooler hose 🕮 P23-126
2 Harness (ground)
3 Speedometer cable
4 Chassis harness
5 Parking brake cable 🗀 Gr 36
6 Selector cable 🕮 P23-136
7 Propeller shaft 🗀 Gr 25

NOTE

After removing propeller shaft 7, tie it to the frame at the height of installation assembly using a piece of rope, etc.

● **Installation sequence**

Follow the removal sequence in reverse.

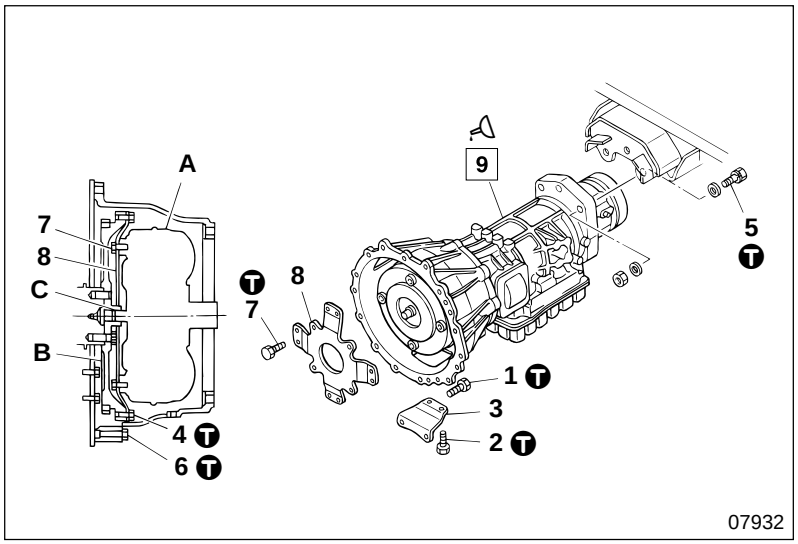
REMOVAL AND INSTALLATION OF AUTOMATIC TRANSMISSION ASSEMBLY

Removal and Installation



● **Removal sequence**

1 Bolt
2 Bolt
3 Dust cover
4 Bolt (×8)
5 Bolt
6 Bolt
7 Bolt (×4)
8 Driving plate
9 Automatic transmission assembly

A : Torque converter
B : Flywheel
C : Pilot area

● **Installation sequence**

Follow the removal sequence in reverse.

NOTE

Remove the automatic transmission assembly with driving plate 8 attached to torque converter A.

T Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Automatic transmission assembly and dust cover, common mounting)	47 {35, 4.8}	—
2	Bolt (Dust cover mounting)	13 {9.4, 1.3}	—
4	Bolt (Flywheel and driving plate connecting)	32 {24, 3.3}	—
5	Bolt (Rear mounting)	83 to 105 {61 to 80, 8.5 to 11}	—
6	Bolt (Automatic transmission assembly mounting)	82 {61, 8.4}	M12
		47 {35, 4.8}	M10
	Bolt (Bracket mounting)	40 {30, 4.1}	—
7	Bolt (Driving plate mounting)	79±12 {59±8.7, 8.1±1.2}	—

Lubricant

Location	Points of application	Kinds	Quantity
9	Pilot area C of torque converter A inside the automatic transmission assembly	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

https://truckmanualshub.com/

Special tools

Unit : mm {in.}

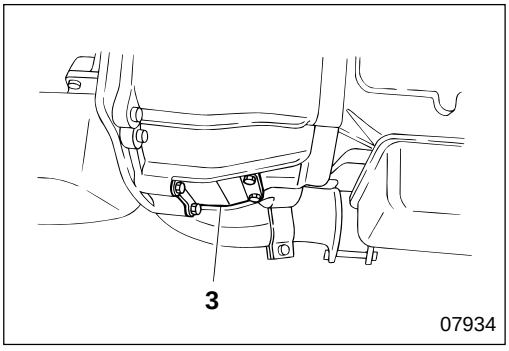
Location	Tool name and shape	Part No.	Application
9	Cranking handle 	MH061289	Cranking of engine

◆ Service procedure

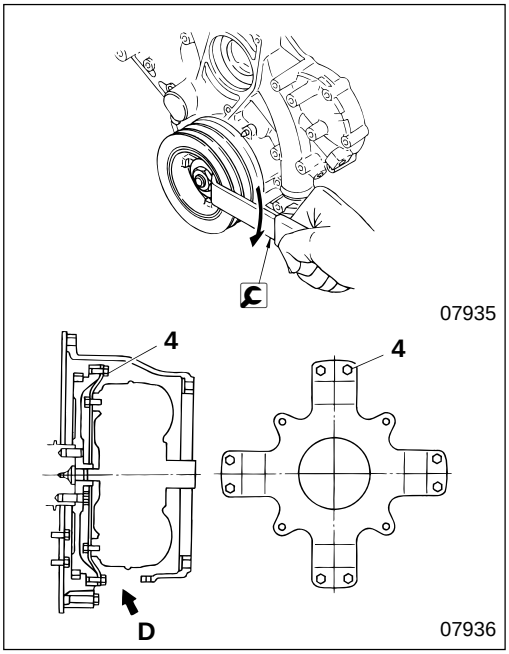
9 **Automatic transmission assembly**

[Removal]

- Remove dust cover **3**.

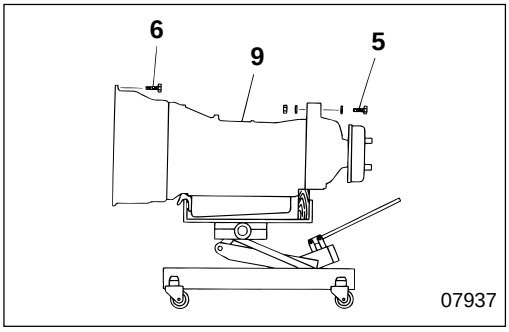


- Put cranking handle on the engine crankshaft pulley mounting nut, and crank until bolt **4** can be reached through working hole **D**.
- Continue cranking and remove eight bolts **4**, two each at four points, one by one.



https://truckmanualshub.com/

REMOVAL AND INSTALLATION OF AUTOMATIC TRANSMISSION ASSEMBLY



- Use a jack to support automatic transmission assembly **9** and remove automatic transmission installation bolts **5**, **6**.
- Remove automatic transmission assembly **9** by pulling it backward.

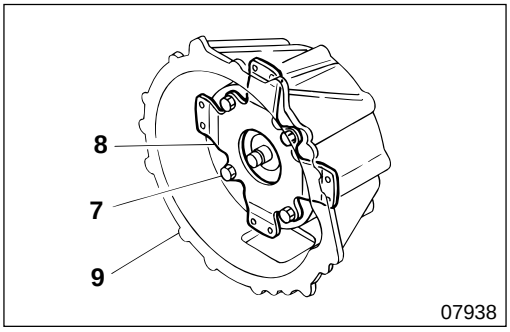
CAUTION

- **Be careful not to apply force to any part of the oil pan.**
- **Since as a single unit torque converter A can come loose easily, be careful not to drop it.**

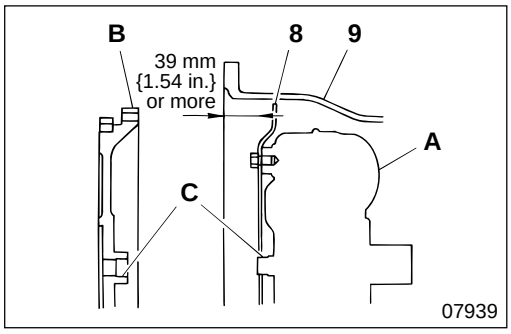
NOTE

Installation bolts 6 differ in length, write down the location of each before removing.

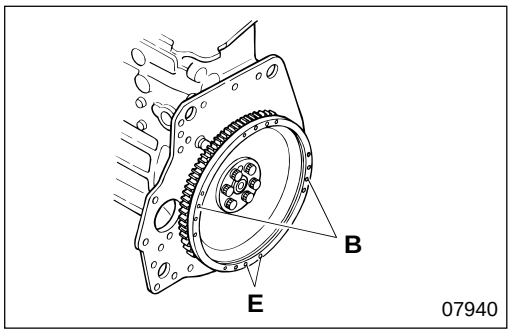
[Installation]



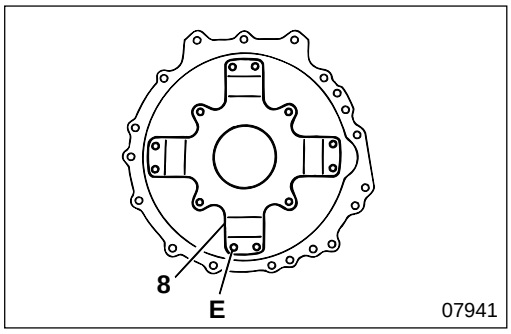
- Install in advance driving plate **8** to torque converter **A** of automatic transmission assembly **9**.
  Tighten bolts **7** at specified torque.



- Make sure that torque converter **A** is installed onto automatic transmission assembly **9** correctly.
  When the torque converter is correctly installed, the distance between the surface of driving plate **8** and the mounting surface of the case conforms to the dimension as illustrated.
- Apply grease to pilot area **C**.

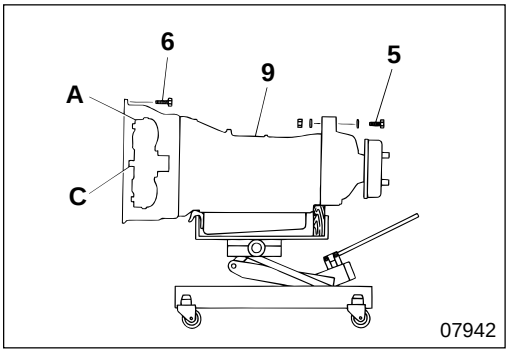


- One of bolt holes **E** of flywheel **B**, for connection with driving plate **8**, should be at the bottom.



- One of bolt holes **E**, of driving plate **8**, should be at the bottom.

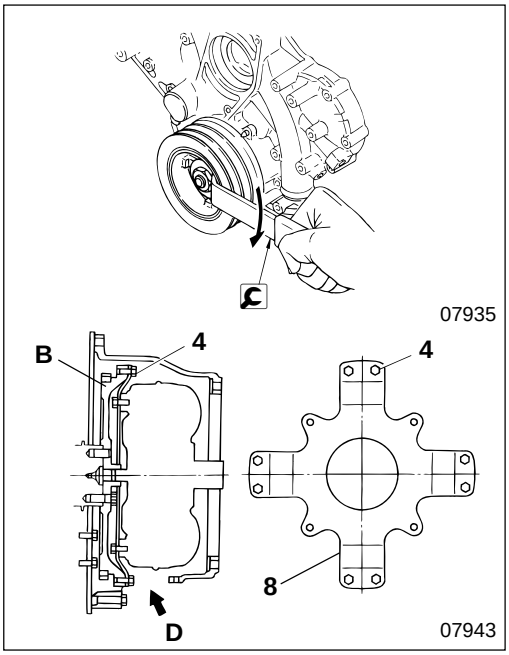
https://truckmanualshub.com/



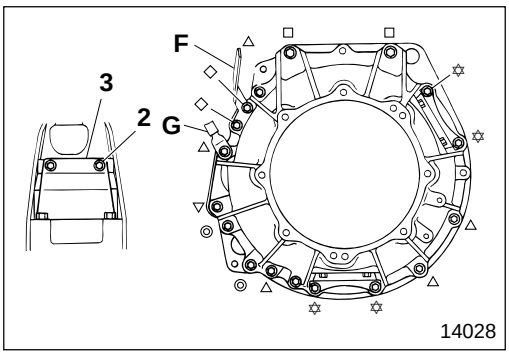
- While aligning pilot area **C** with the dwell pin of the rear plate, slowly insert automatic transmission assembly **9**.
- After temporarily tightening several installation bolts **6** of automatic transmission assembly **9**, tighten installation bolt **5** into the rear support at specified torque.

NOTE

- **Since as a single unit torque converter A can come loose easily, make sure that it is correctly positioned by slightly lowering the rear part of automatic transmission assembly 9.**
- **Before connecting the parts together remove the oil sticking to the interior walls of the torque converter housing.**



- Through working hole **D** align the connecting holes on driving plate **8** and flywheel **B** and temporarily tighten bolts **4**.
- Use 🔧 cranking handle to crank the engine and temporarily tighten the eight bolts, two each at four points. Then, tighten all the bolts in the same order, at specified torque.



While simultaneously tightening ground strap **G** and dust cover **3**, tighten all of the automatic transmission installation bolts **6** at specified torque.

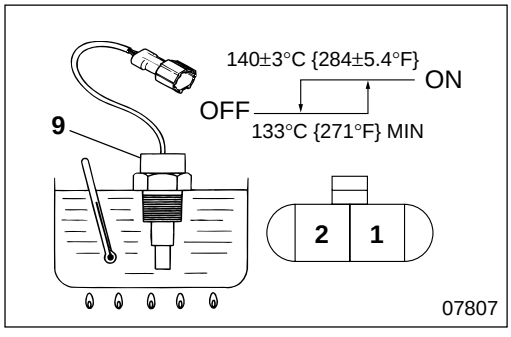
10	Thread area of automatic transmission fluid thermostat switch	THREEBOND 1110B	As required



◆ Service procedure

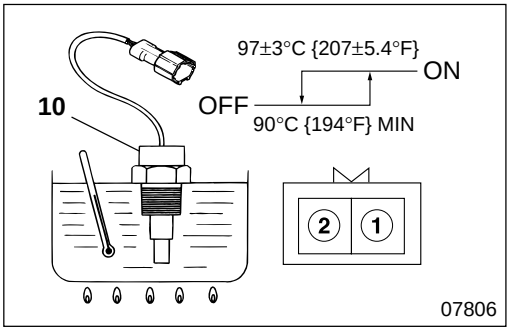
9 **Inspection of automatic transmission fluid temperature switch**

Carry out the following inspection and replace automatic transmission fluid temperature switch **9** if there are any faults.

- Check that there is no continuity between terminals ① and ② at ambient temperature of 20±5°C {68±9°F}.
- Place automatic transmission fluid temperature switch **9** in a container filled with automatic transmission fluid, and raise the temperature while stirring well.
  Measure the temperature when continuity has been achieved between terminals ① and ②, and check that the measured value conforms to the standard value.
- Lower and measure the temperature when continuity is lost between terminals ① and ②, and check that the measured value conforms to the standard value.

https://truckmanualshub.com/

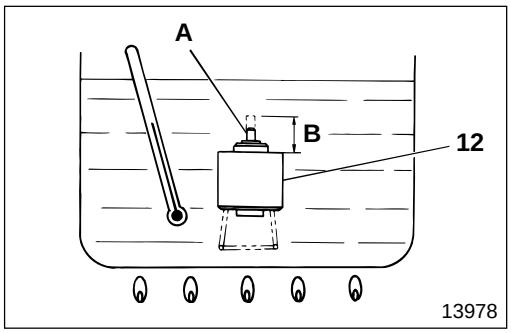
OIL COOLER



10 **Inspection of automatic transmission fluid thermostat switch**

Carry out the following inspection and replace automatic transmission fluid thermostat switch **10** if there are any faults.

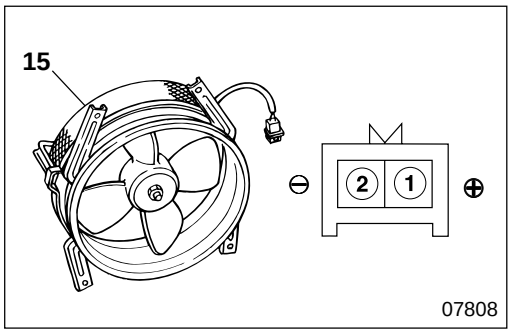
- Check that there is no continuity between terminals ① and ② at ambient temperature of 20±5°C {68±9°F}.
- Place automatic transmission fluid thermostat switch **10** in a container filled with automatic transmission fluid, and raise the temperature while stirring well.
  Measure the temperature when continuity has been achieved between terminals ① and ②, and check that the measured value conforms to the standard value.
- Lower and measure the temperature when continuity is lost between terminals ① and ②, and check that the measured value conforms to the standard value.



12 **Inspection of thermostat valve**

Carry out the following inspection. If any fault is found, replace thermostat valve **12**.

- Place thermostat valve **12** in a container filled with automatic transmission fluid and raise the fluid temperature while stirring the fluid.
  Make sure that end **A** starts stroking at a temperature of 76.5±3°C {170±5.4°F}.
- Raise the fluid temperature further and make sure that end **A** expands by 4.5 mm {1.18 in.} and dimension **B** in the illustration is 13.4 mm {0.53 in.} at a temperature of 83±2°C {181±3.6°F}.



15 **Inspection of blower assembly**

Check blower assembly **15** and make sure it operates when battery voltage is loaded between terminals ① and ②. If any fault is found, replace the blower assembly.

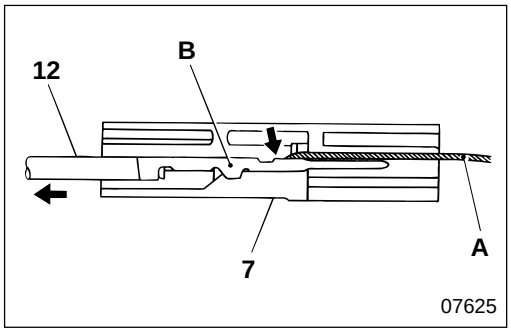
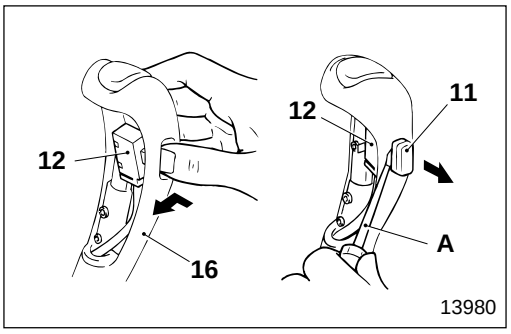
◆ Service procedure



7 **Removal of connector**

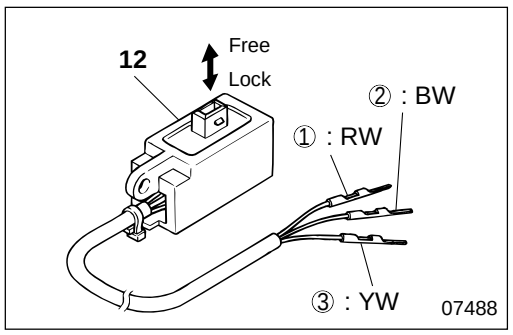
Using screwdriver **A**, pull out terminal **B** of overdrive OFF switch **12** from the inside of connector **7** and remove the connector.



11 **12** **Switch button, overdrive OFF switch**

[Removal]

- Using screwdriver **A**, remove switch button **11** from overdrive OFF switch **12**.
- Remove overdrive OFF switch **12** from automatic transmission knob **16** by pushing the switch out.

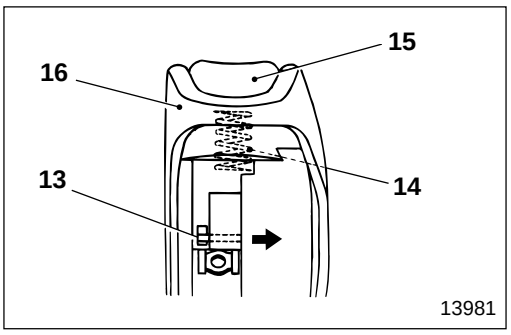


[Inspection of overdrive OFF switch **12**]

	① : RW	② : BW	③ : YW
Free	○——○		○——○
Lock	○——○	○——○	

○——○ : There is continuity between terminals ○ and ○.

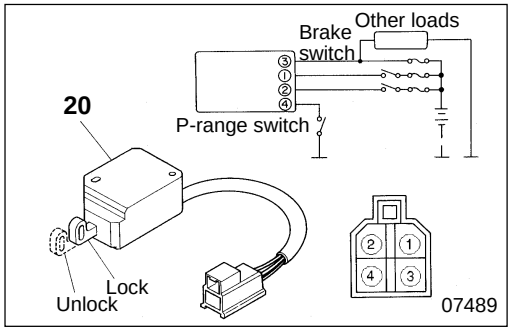
Replace overdrive OFF switch **12** if it is faulty.



13 **Removal of pin**

While keeping shift button **15** and spring **14** pressed down, remove pin **13** towards the inside (arrow direction) of automatic transmission knob **16**.

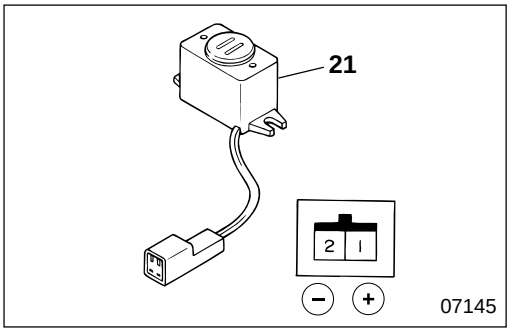
https://truckmanualshub.com/



20 **Inspection of shift lock actuator**

Power supply		Switch		Operating mode	
IG	+B	Brake	P range	Unlock	Lock
○	○	○	○	○←	
○	○		○		→○
○	○	○		○	
○	○			○	
	○	○	○		→○
	○		○		→○
	○	○		○	
	○			○	

Check to make sure that shift lock actuator **20** is in operating mode under the above power supply and switch position.
Replace the shift lock actuator if it is faulty.

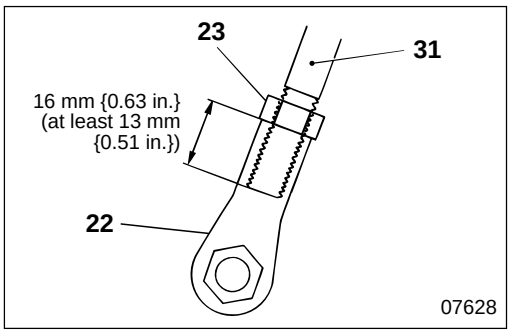


21 **Inspection of automatic transmission reverse buzzer**

- Check to make sure that the automatic transmission reverse buzzer sounds when 12 volts DC is loaded between terminals ① and ②.
- Replace automatic transmission reverse buzzer **21** if it is faulty.

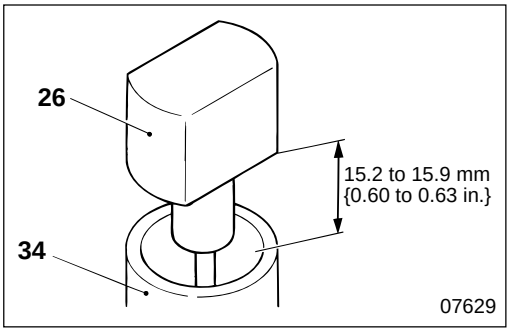
NOTE

- **Automatic transmission reverse buzzer 21 sounds continuously when you apply voltage.**
- **If you want to make automatic transmission reverse buzzer 21 sound intermittently, use the automatic transmission reverse buzzer and the back buzzer in combination.**



22 **Installation of ball joint**

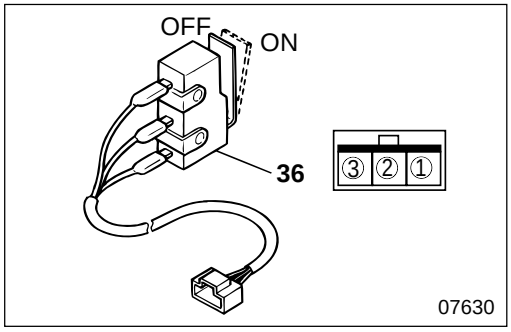
Using ball joint **22** adjust rod **31** so that its thread ridge conforms to the dimensions as illustrated, then tighten with lock nut **23**.



26 **Installation of sleeve**

Shift range selector lever **34** to the P range. Install sleeve **26** by rotating it so that the dimension between the sleeve and the upper part of the lever conforms to the value as illustrated.

https://truckmanualshub.com/



36 **P-range switch**

[Inspection]

	①	②	③
ON	○———		———○
OFF		○———	———○

○——○ : There is continuity between terminals ○ and ○.
Replace P-range switch **36** if it is faulty.

[Installation]
Install P-range switch **36** so that it is OFF when the range selector lever is in the P range.

https://truckmanualshub.com/

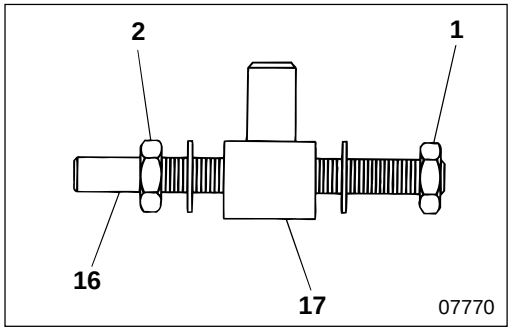
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
29	Inhibiter switch set pin  03727	MH062063	Adjustment of inhibiter switch

◆ Service procedure

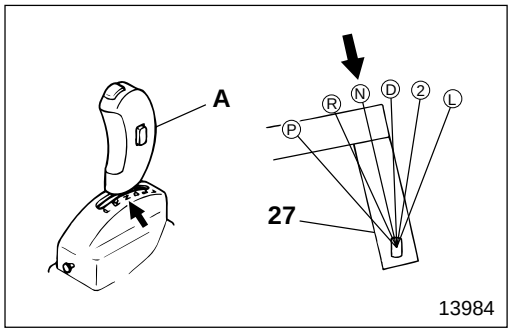


07770

1 **2** **6** **15** **to** **17** **Nut, bracket, selector cable and adjuster**

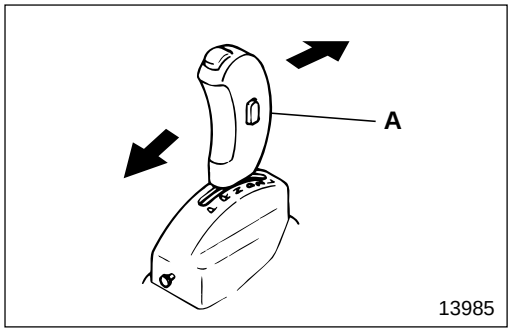
[Installation]

- Loosen nuts **1**, **2** all the way to the two ends of the screw as illustrated.



13984

- Put in-cab automatic transmission lever knob **A** and automatic transmission lever **27** into the N range.

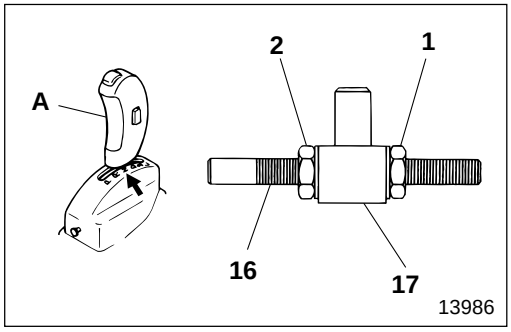


13985

- Jiggle in-cab automatic transmission lever knob **A** back and forth.

https://truckmanualshub.com/

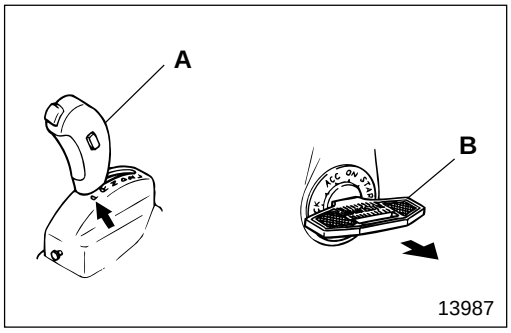
AUTOMATIC TRANSMISSION CONTROL



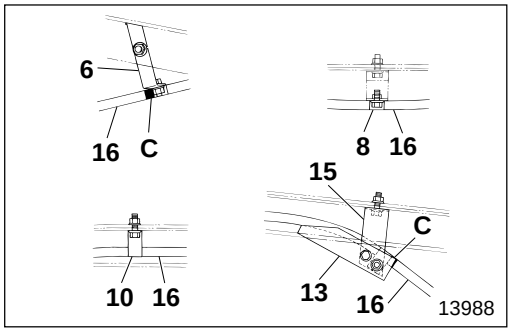
- After making sure that in-cab automatic transmission lever knob **A** is in the N range, tighten nuts **1**, **2** at specified torque.

CAUTION

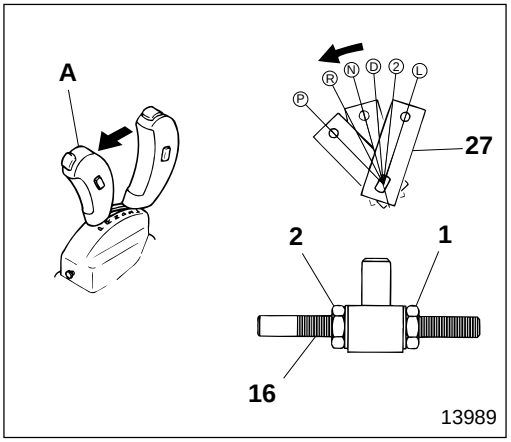
When tightening nuts 1, 2 make sure that adjuster 17 does not move from its position.



- Make sure that starter key **B** can be pulled out when in-cab automatic transmission lever knob **A** is in the N range.



- Install brackets **6**, **15** to marking area **C** of selector cable **16** as illustrated. Install clips **8**, **10** and insulator **13** in that order.



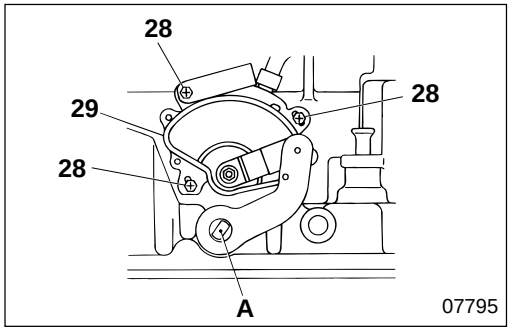
[Adjustment]

While shifting the in-cab automatic transmission lever knob **A** through all the ranges from L to P, use nuts **1**, **2** to adjust selector cable **16** so that automatic transmission lever **27** can move smoothly through ranges L to P.

CAUTION

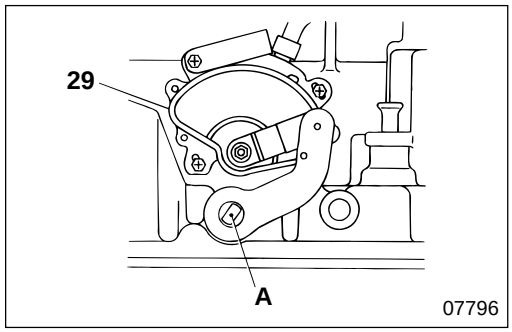
If nuts 1, 2 are adjusted incorrectly, in-cab automatic transmission lever knob A will not move smoothly around ranges L or P. Incorrect adjustment can also prevent the starter key from being pulled out when the range selector lever is in the P range.

https://truckmanualshub.com/

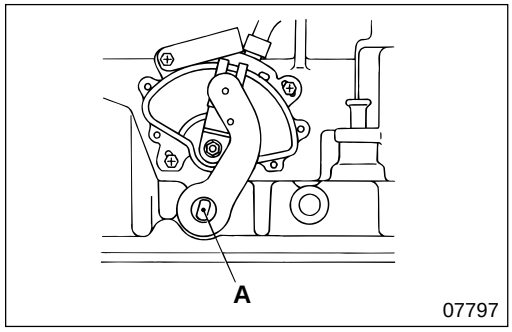


29 Inhibiter switch

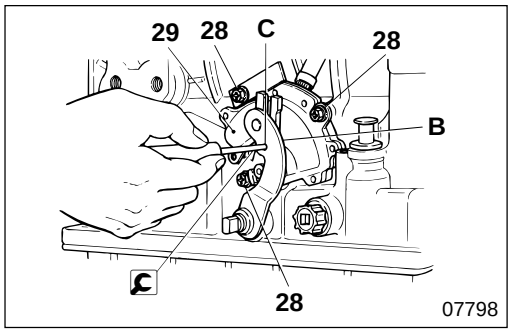
[Removal]
After moving manual shaft **A** to the L range as illustrated, loosen bolt **28** and remove inhibiter switch **29**.



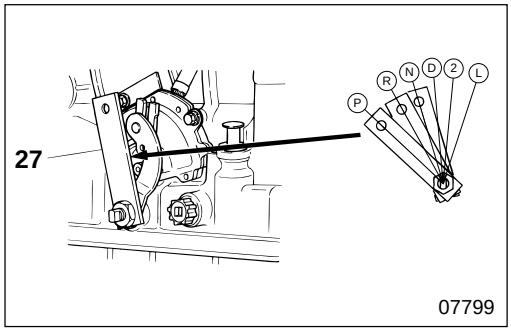
[Installation]
Move manual shaft **A** to the L range as illustrated and install inhibiter switch **29** temporarily.



- Move manual shaft **A** to the N range as illustrated.



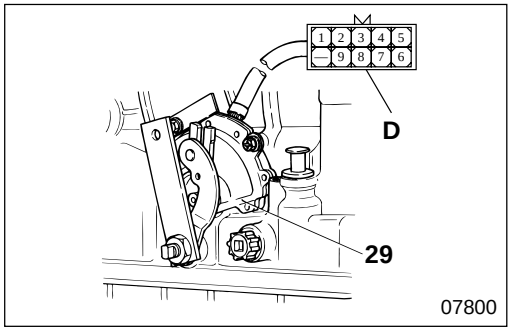
- Insert 🔧 inhibiter switch set pin or a ø4 mm pin through positioning holes **C** of inhibiter switch **29** and range selector lever **B** at right angles, tighten bolt **28** at specified torque and pull out the pin.



[Inspection]
- Check to make sure that when lever **27** is moved to the R range, the back lamp lights and the back buzzers (inside and outside the cab) sound. Also check to see that the starter operates when the lever is in the N and P ranges.

https://truckmanualshub.com/

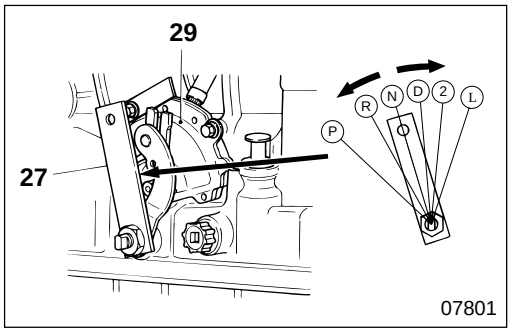
AUTOMATIC TRANSMISSION CONTROL



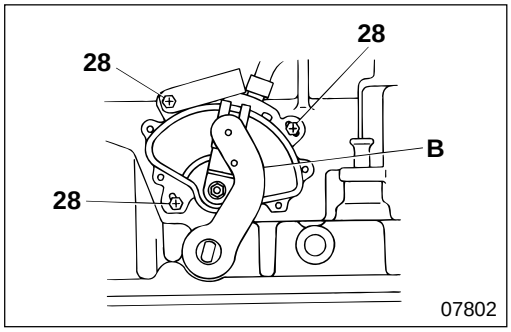
- Use a tester and check wiring connector **D** leading out from inhibiter switch **29** for continuity.
  < Connection chart >

	1	2	3	4	5	6	7	8	9
P	○	○	○				○		
R			○					○	
N	○	○	○						○
D			○			○			
2			○		○				
L			○	○					

○——○ : There is continuity between terminals ○ and ○.

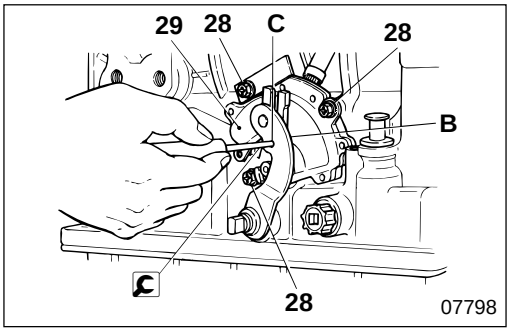


- Check to make sure that when lever **27** is in the N range and is rotated in both directions from a fixed position, continuity exists within (almost) the same range in both other directions. (Continuity within approximately 1.5° from the fixed position in each of the other two directions is considered normal.)
  Adjust inhibiter switch **29** as required, depending on whether there is continuity and whether continuity is in the correct range.



[Adjustment]

- Loosen bolts **28** and move range selector lever **B** into the N range as illustrated.



- Insert 🔧 inhibiter switch set pin or a ø4 mm pin through positioning holes **C** of inhibiter switch **29** and range selector lever **B** at right angles, tighten bolt **28** at specified torque and pull out the pin.

- Repeat the inspection procedure mentioned above and replace inhibiter switch **29** if it is faulty.

REPLACEMENT OF RELATIVE PARTS OF AUTOMATIC TRANSMISSION BODY

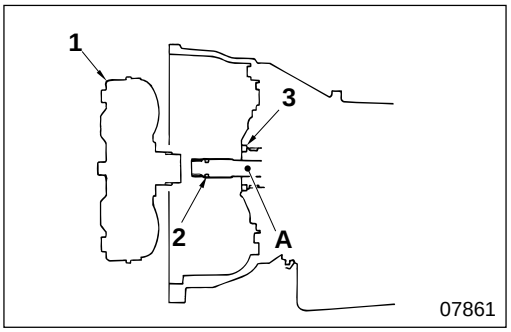
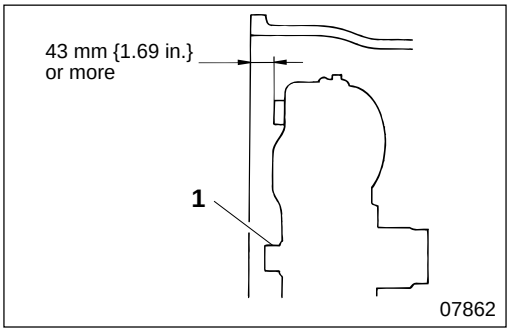
◆ Service procedure



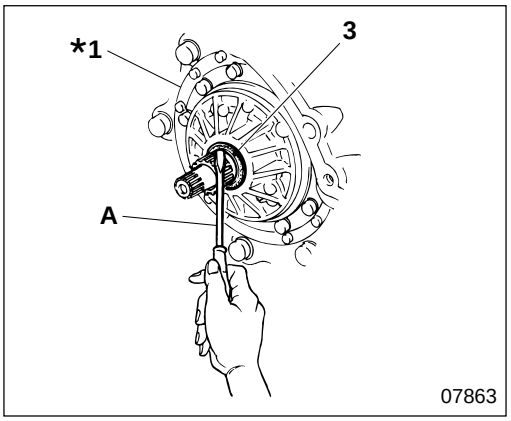
1 **Installation of torque converter**

- After applying automatic transmission fluid (DEXRON II type) to O-ring **2** and front oil seal **3**, assemble torque converter 1 by rotating and pushing it in.
  A : Input shaft

CAUTION
Be careful not to damage front oil seal 3



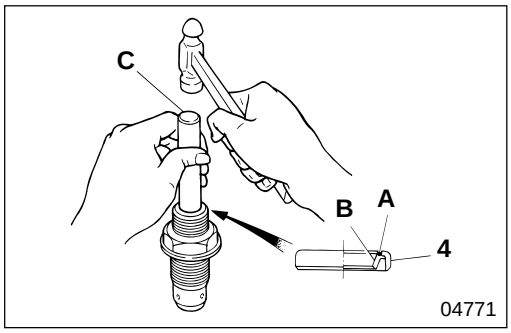
- When torque converter **1** is correctly assembled, the distance between the lug and case surfaces conforms to the dimension as illustrated.



3 **Front oil seal**

[Removal]

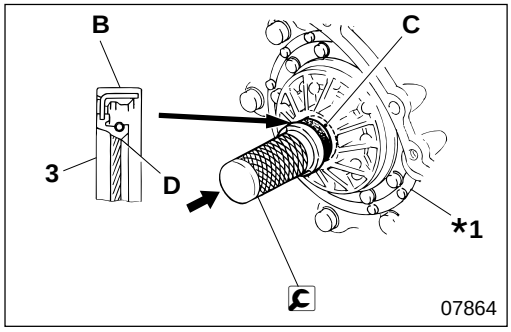
- Using screwdriver **A** or a similar instrument as a lever, remove front oil seal **3** from automatic transmission body ***1**.
- After removing front oil seal **3**, be sure to clean the area on automatic transmission body ***1** where it was installed.



4 **Installation of oil seal**

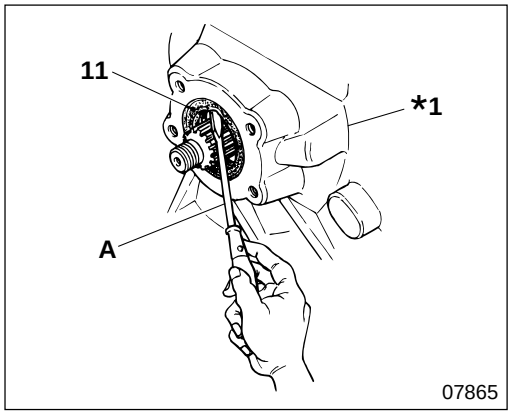
- Apply grease to packing area **A** and lip area **B** of oil seal **4**.
- Using a round bar **C** of approximately ø15 mm {0.59 in.}, drive in oil seal **4** evenly in the direction as illustrated.

https://truckmanualshub.com/



[Installation]

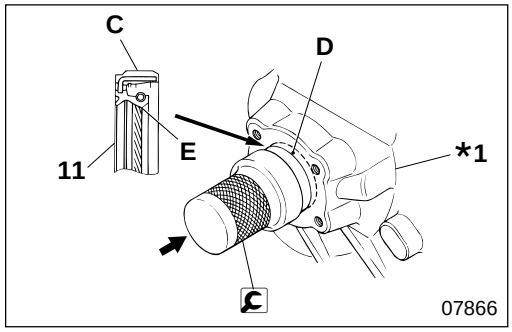
- Apply automatic transmission fluid (DEXRON II type) to periphery **B** of front oil seal **3** and to oil seal installation surface **C** on automatic transmission body ***1**.
- Apply grease to lip area **D** of front oil seal **3**, and use 🔧 oil seal installer to press-fit the oil seal into automatic transmission body ***1**.



11 **Rear oil seal**

[Removal]

- Using screwdriver **A** or a similar instrument as a lever, remove rear oil seal **11** from automatic transmission body ***1**.
- After removing rear oil seal **11**, be sure to clean the area on automatic transmission body ***1** where it was installed.

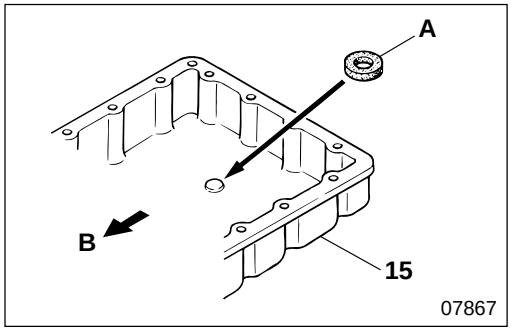


[Installation]

- Apply automatic transmission fluid (DEXRON II type) to periphery **C** of rear oil seal **11** and to oil seal installation surface **D** on automatic transmission body ***1**.
- Apply grease to lip area **E** of rear oil seal **11**, and use 🔧 oil seal installer to press-fit the oil seal into automatic transmission body ***1**.

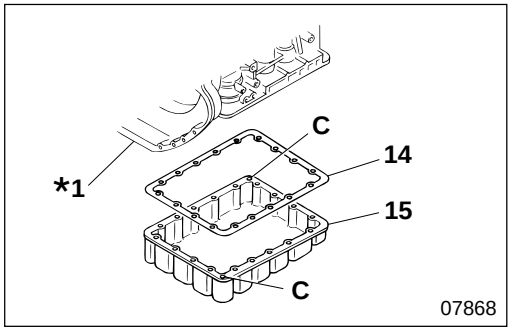
15 **Installation of oil pan**

- Be sure to wipe off sealant sticking to the thread area on automatic transmission body ***1**.
- Be sure to clean the area on automatic transmission body ***1** where gasket **14** is to be installed.
- Install magnet **A** as illustrated, when using new oil pan **15** or when the magnet has been removed.
  B : Front of the vehicle

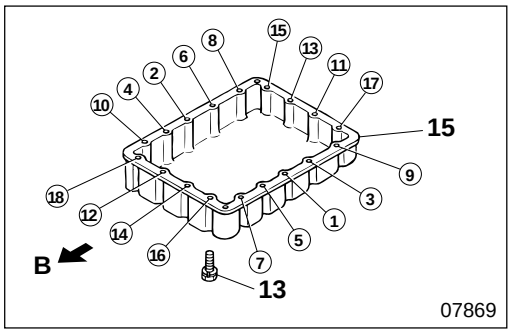


https://truckmanualshub.com/

REPLACEMENT OF RELATIVE PARTS OF AUTOMATIC TRANSMISSION BODY



- After installing a new gasket **14** in oil pan **15**, align illustrated holes **C** with automatic transmission body ***1** and install the oil pan.
- When installing gasket **14**, be sure to clean the surface on oil pan **15** where the gasket is to be installed.



- Install bolts **13** to oil pan **15** and tighten at specified torque in the numbered order as illustrated.
  B : Front of the vehicle

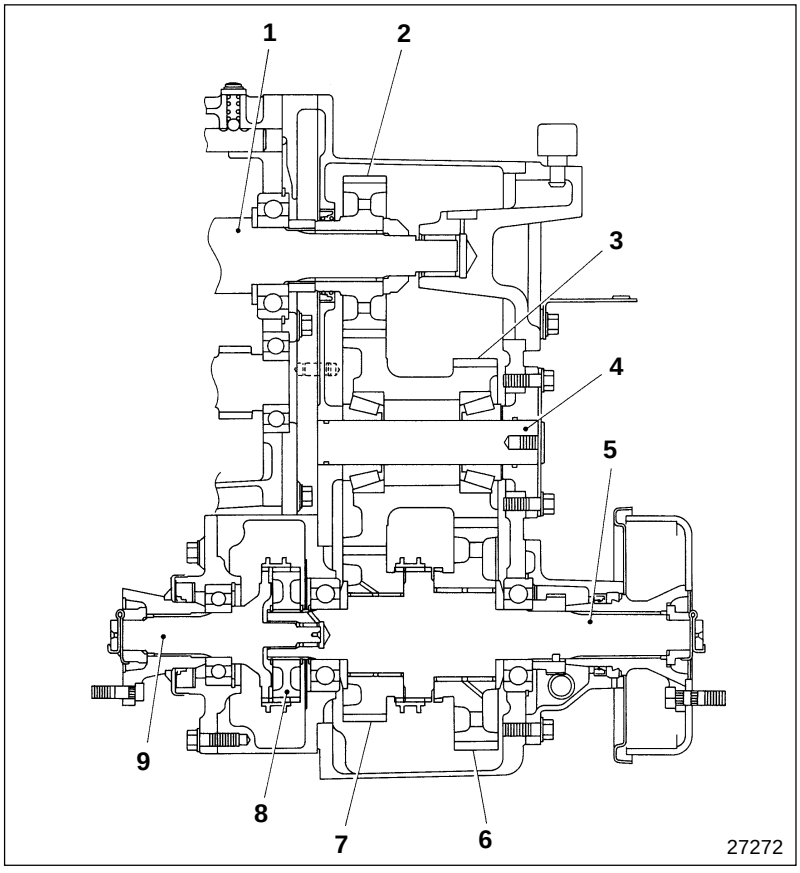
SPECIFICATIONS

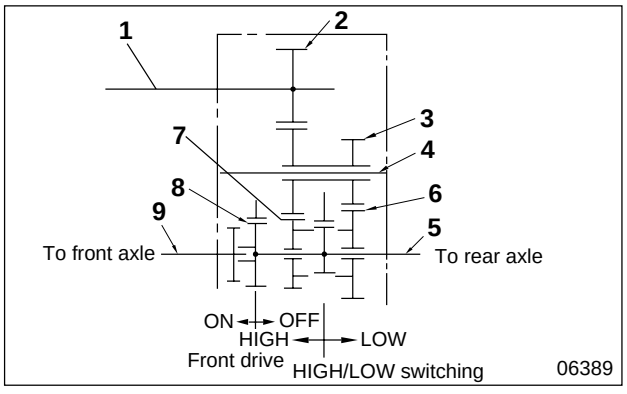
Item		Specifications
Model		TF3
Gear ratio	HIGH	1.090
	LOW	1.987
Gear oil	Oil quantity L {qts.}	3.0 {3.2}
Dry mass (including transmission body) kg {lb}		Approximately 190 {420}
Control		Front drive and HIGH-LOW switching floor change remote control

STRUCTURE AND OPERATION

Transfer Body



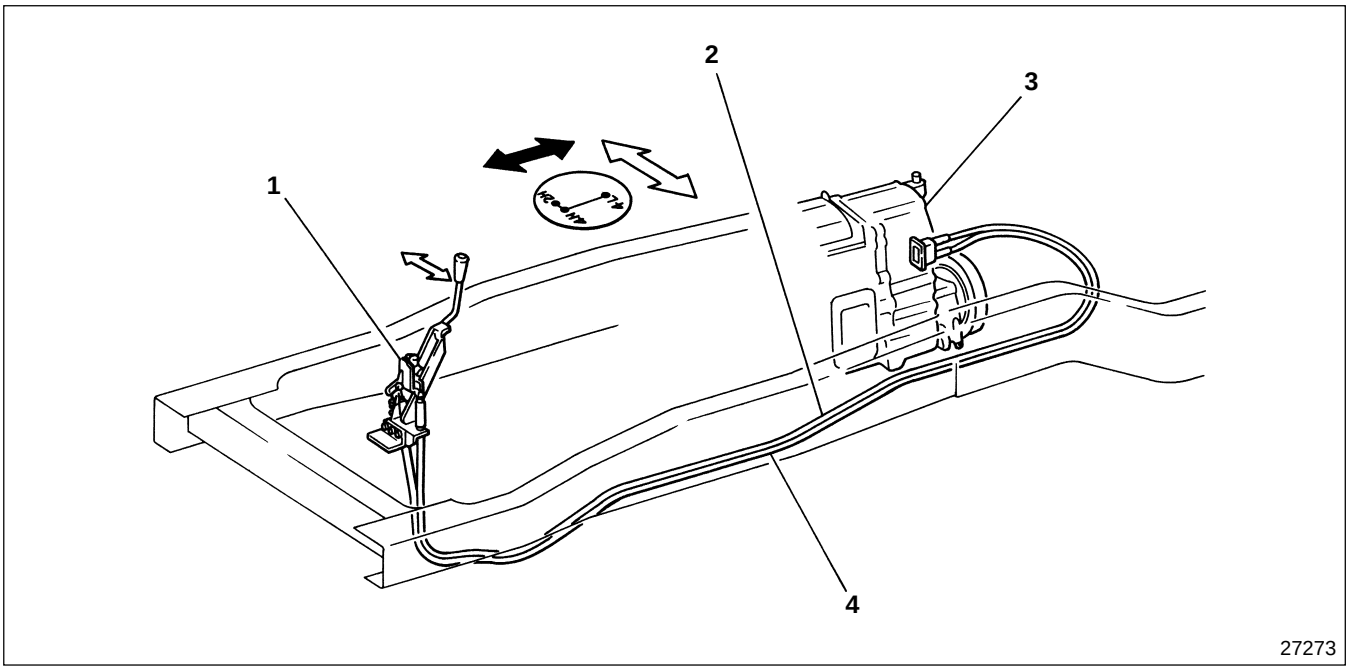
1 Transmission main shaft
2 Drive shaft gear
3 Transfer idler gear
4 Transfer idler shaft
5 Output shaft
6 Output shaft LOW gear
7 Output shaft HIGH gear
8 Front drive hub and sleeve
9 Front drive shaft



The transfer functions as both the distributer for four-wheel drive and as the sub-transmission with a reduction device. This transfer is a three-shaft constant-mesh type.
HIGH/LOW changeover and front drive ON/OFF are controlled by a transfer control lever in the cab.

https://truckmanualshub.com/

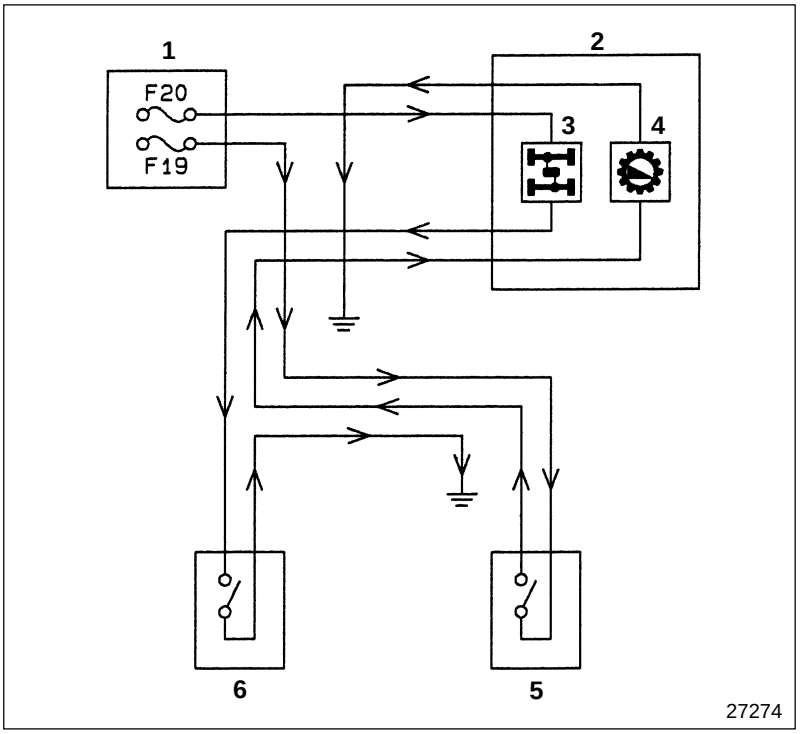
Transfer Control



1 Transfer control lever
2 2H/4H control cable
3 Transfer
4 HIGH/LOW control cable

Move the transfer control lever **1** from left to right to change-over between two-wheel drive and four-wheel drive. Forward and backward movement changes between HIGH and LOW.

Transfer Control Electric Circuit



1 Fuse box
2 Meter cluster
3 Transfer four-wheel drive indicator lamp
4 Transfer LOW indicator lamp
5 Transfer LOW switch
6 Transfer four-wheel drive switch

Shift transfer control lever to 4L and transfer LOW switch **5** comes ON and transfer LOW indicator lamp **4** in the meter cluster **2** lights up. Shift transfer control lever to 4H and transfer four-wheel drive switch **6** comes ON and transfer four-wheel drive indicator lamp **3** lights up.

https://truckmanualshub.com/

TROUBLESHOOTING

Possible causes	Symptoms	Noise while cruising	Gears fail to engage at front drive changeover	Gears fail to engage at HIGH/LOW changeover	Gears slip out while cruising in front drive	Gears slip out while cruising	Gears fail to disengage on front drive changeover	Gears fail to disengage on HIGH/LOW changeover	Front drive is engaged, but indicator is not lit	LOW is selected, but indicator is not lit	Front drive is not engaged, but indicator is lit	LOW is not selected, but indicator is lit
Transfer body faulty	Front drive shaft and constant sleeve splines worn				○							
	Hub and HIGH/LOW constant sleeve splines worn					○						
	Idler shaft bearing worn or damaged	○										
	Output shaft bearing worn or damaged	○										
	Drive shaft needle bearing worn or damaged	○										
	Gears damaged	○										
	Output shaft LOW gear and HIGH gear backlash excessive	○										
	Gear oil insufficient	○										
	Gear oil viscosity unsuitable	○										
	Constant sleeve and dog clutch cracked		○		○							
	HIGH/LOW constant sleeve and hub cracked			○		○						
Control mechanism faulty	Shift rail bent		○	○								
	Shift rail friction movement poor				○	○						
	Shift fork bent		○	○								
	Shift fork claw worn		○	○								
	Steel ball and shift rail poppet groove worn					○						
	Poppet spring fatigued or cracked							○				
Transfer control system faulty	Control cable faulty		○	○			○	○				
	LOW switch faulty									○		○
	Transfer four-wheel drive switch faulty								○		○	
	Wiring broken or connection poor								○	○

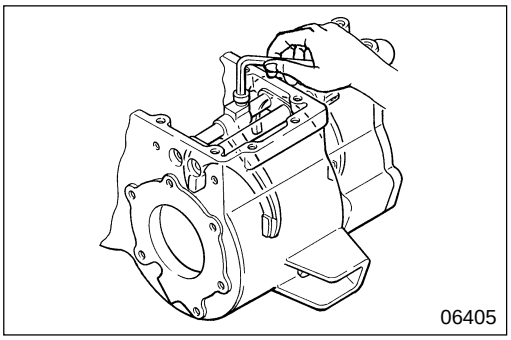
39	Oil seal installer  06404	MH061923	Installation of shift rail oil seal

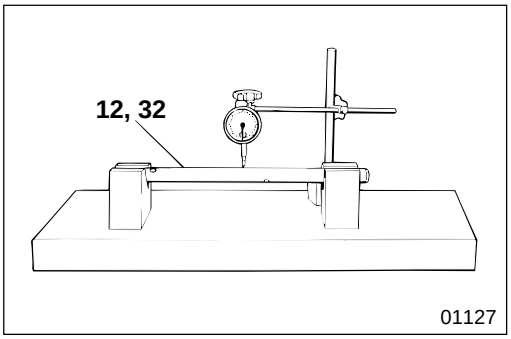
https://truckmanualshub.com/

◆ Service procedure



11 **25** **Removal and installation of set bolt**

Tighten shift fork mounting set bolt **11, 25** at specified torque, and stake the thread area at three points using a punch.

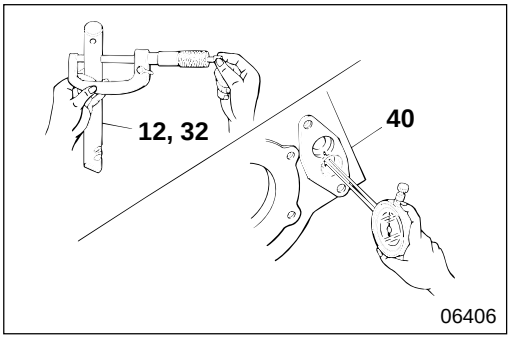


12 **32** **Inspection of shift rail**

If the measured value is higher than the limit, correct or replace shift rails **12**, **32**.

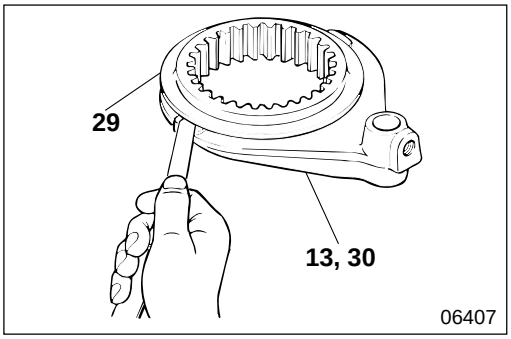
NOTE

To measure the deflection of shift rails 12, 32, turn them one full revolution and read the dial gauge indicator. The deflection is one half of the indicated value.



12 **32** **40** **Clearance between shift rail and transfer assembly rail hole**

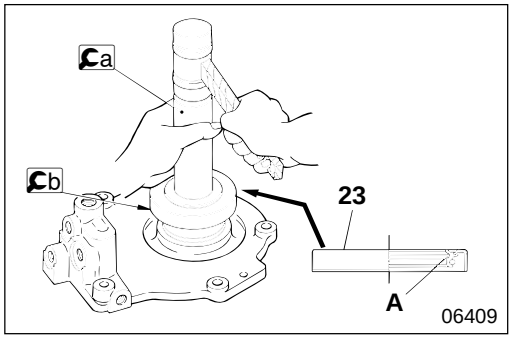
Measure the outer diameter of shift rail **12**, **32** and the inner diameter of transfer assembly hole **40**. If the clearance is higher than the limit, replace faulty parts.



13 **29** **30** **Clearance between shift fork and synchronizer sleeve**

If the measured value is higher than the limit, replace faulty parts.

https://truckmanualshub.com/

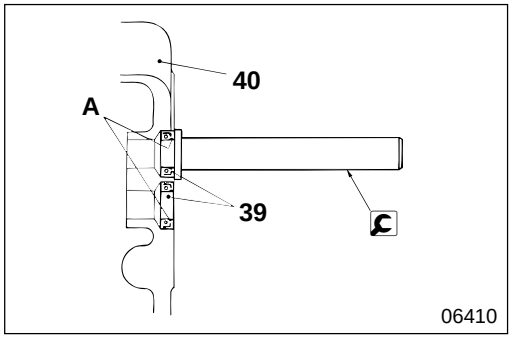


23 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **23**, and press-fit it.

a : Bearing installer

b : Differential bearing inner race installer adapter



39 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **39** and press-fit it into transfer assembly **40**.

https://truckmanualshub.com/

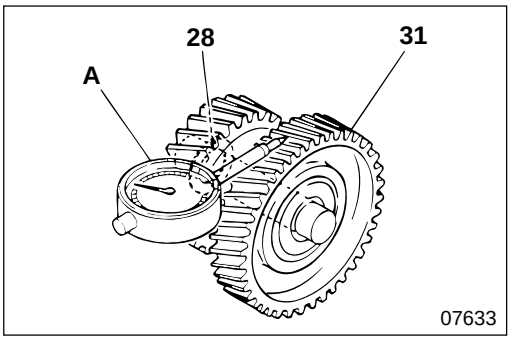
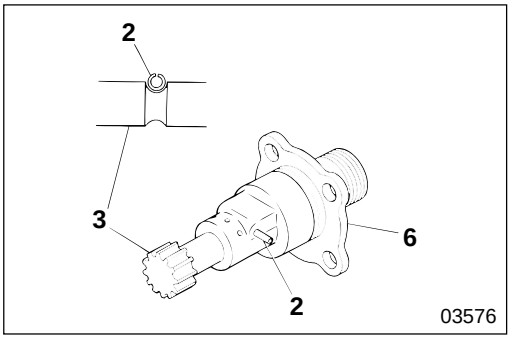
◆ Service procedure

Inspection before service



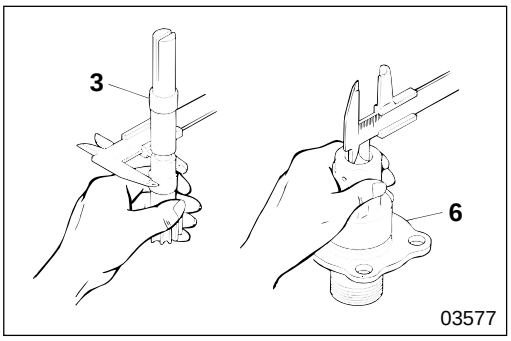
● Starting torque of transfer idler gear

- Disassemble parts, and measure the torque with push gauge **A** leaving only transfer idler gear **31** in transfer case.
  If the value deviates from the standard value, adjust it using shim **28**.
- On assembly, also check that starting torque is within the standard value range using the same method.
- Shim **28** is available in four thicknesses : 0.01 mm {0.00039 in.}, 0.02 mm {0.00079 in.}, 0.03 mm {0.0012 in.}, 0.06 mm {0.0024 in.}.



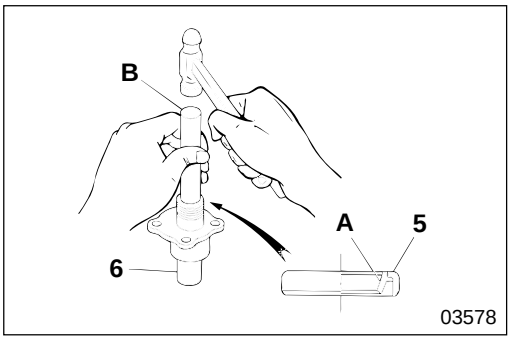
2 **Driving-in spring pin**

Drive spring pin **2** into speedometer gear bushing **6** with the opening in the opposite direction to speedometer gear **3**.



3 **6** **Clearance between speedometer gear and speedometer gear bushing**

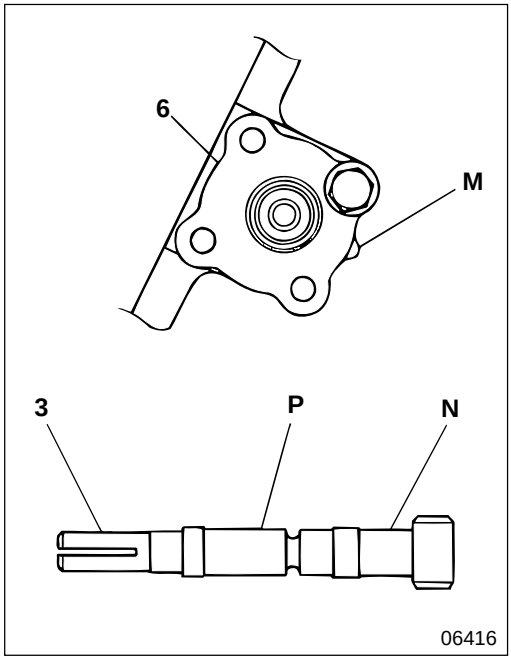
If the clearance is higher than the limit, replace the faulty parts.



5 **Installation of oil seal**

Apply grease to lip area **A** of the inner rim of the oil seal, and press-fit oil seal evenly into speedometer gear bushing **6** in the direction as illustrated using bar **B** (approximately ø15 mm {0.59 in.}).

https://truckmanualshub.com/

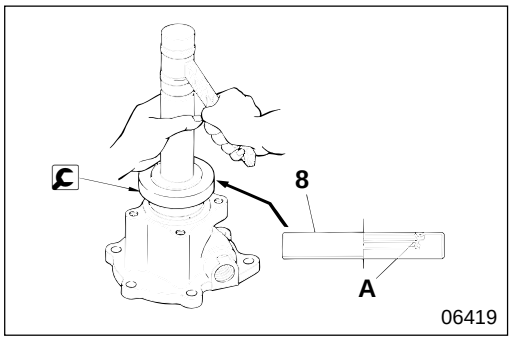


6 Installation of speedometer gear bushing

Due to its eccentric center arrangement, speedometer gear bushing **6** allows replacement of speedometer gear **3** with gears having a different number of teeth by changing only the installation direction, the worm gear does not have to be changed.
When installing the bushing, align the stamped number, identical to the number of speedometer gear teeth, with alignment mark **M** of output rear cover **9**.
The number of speedometer gear teeth can be identified by the identification marks stamped on **N** or **P**.

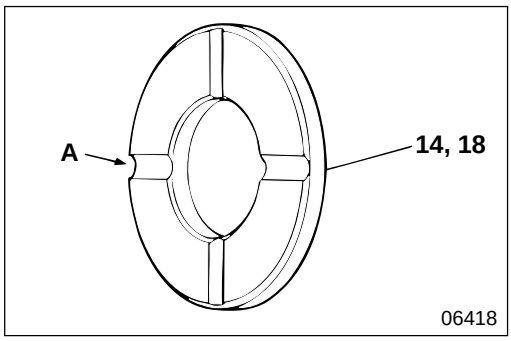
Identification mark and number of speedometer gear teeth

Identification mark	A	B	C	D	L	E	F	G	H	I	J	K
Number of teeth	15	16	17	18	19	20	21	22	23	24	25	26
Gear ratio	3.0	3.2	3.4	3.6	3.8	4.0	4.2	4.4	4.6	4.8	5.0	5.2



8 Installation of oil seal

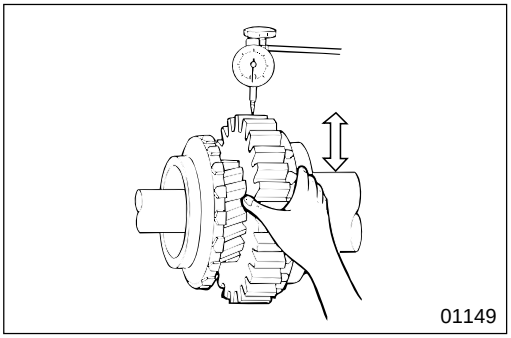
Apply grease to lip area **A** of oil seal **8** and press-fit it into output rear cover **9**.



14 18 Installation of thrust washer

Install thrust washer **14**, **18** with oil groove **A** facing gear side.

https://truckmanualshub.com/

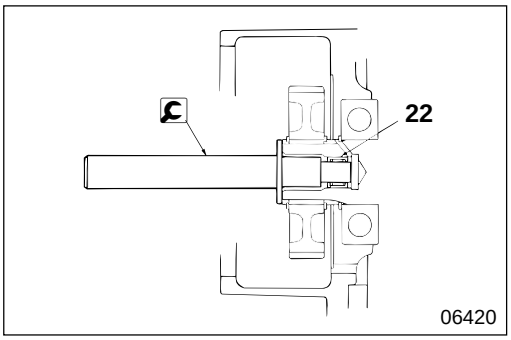


15 **18** **20** **23** **24** **Play of rear drive shaft gear in diameter direction after assembly**

If the measured value is higher than the limit, replace faulty parts.

NOTE

When replacing needle bearing 20, 24, use bearings from the same color package.



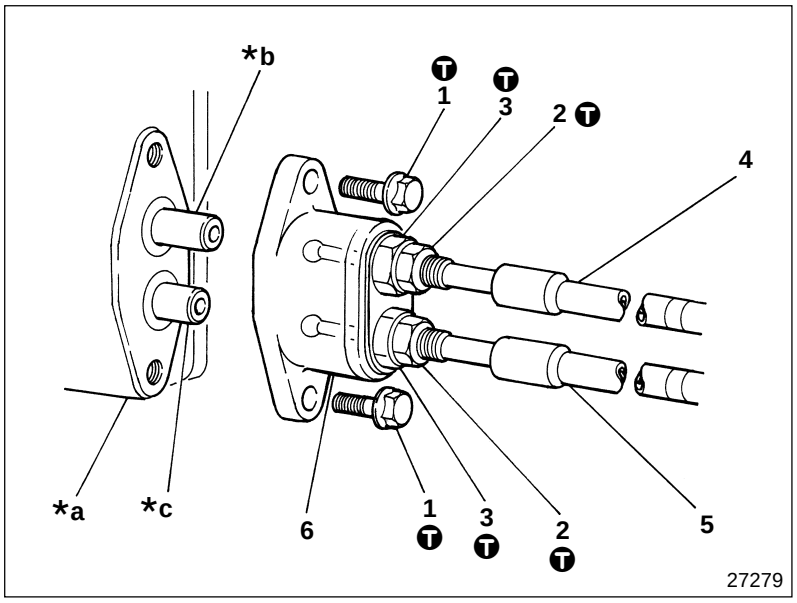
22 **Installation of needle bearing**

: Needle roller bearing installer

https://truckmanualshub.com/

TRANSFER CONTROL

Control Cable < Removal from the transfer side >



● **Work before removal**

P24-22

● **Removal sequence**

1 Bolt
2 Nut
3 Nut
4 HIGH/LOW control cable
5 2H/4H control cable
6 Shift rail cover

***a** : Transfer body
***b** : HIGH/LOW shift rail
***c** : Front drive shift rail

● **Installation sequence**

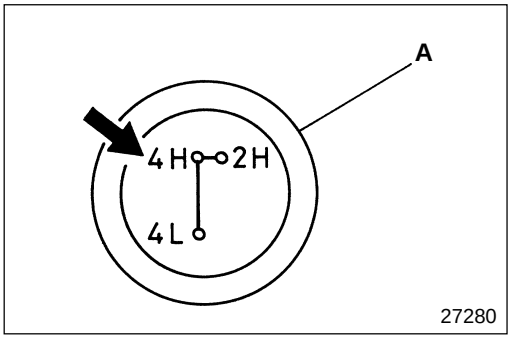
Follow the removal sequence in reverse.

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Shift rail cover mounting)	44 {33, 4.5}	—
2, 3	Nut (HIGH/LOW and 2H/4H control cable mounting)	44 to 59 {33 to 43, 4.5 to 6.0}	—

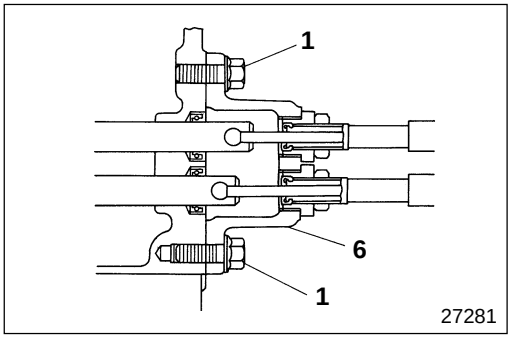
◆ Service procedure



● **Work before removal**

When removing, move shift lever knob **A** of the transfer control bar to the position 4H.

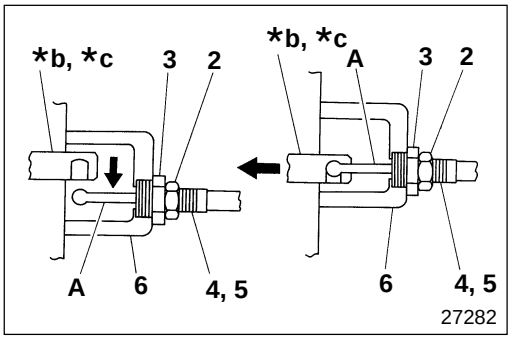
https://truckmanualshub.com/



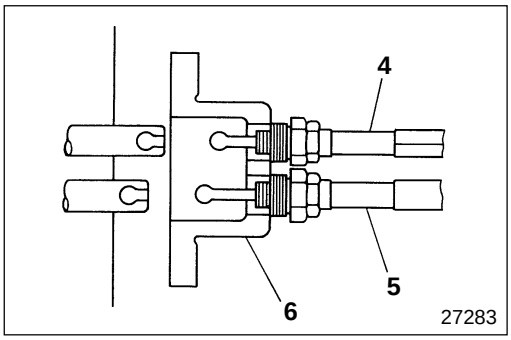
4 **5** **HIGH/LOW, 2H/4H Control Cable**

[Removal]

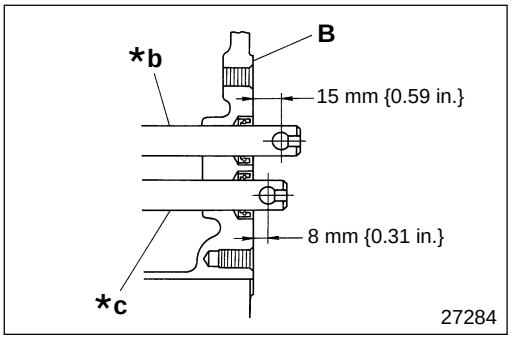
- Remove bolt **1** securing shift rail cover **6**.



- Remove shift rail cover **6**, and then remove inner cable **A** of HIGH/LOW and 2H/4H control cables **4** and **5**, from HIGH/LOW shift rail ***b**, and front drive shift rail ***c**. Loosen nuts **2** and **3** to their end of their threads.

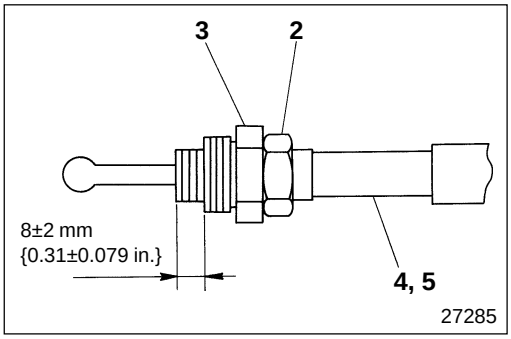


- Remove HIGH/LOW and 2H/4H control cables **4** and **5** from shift rail cover **6**.



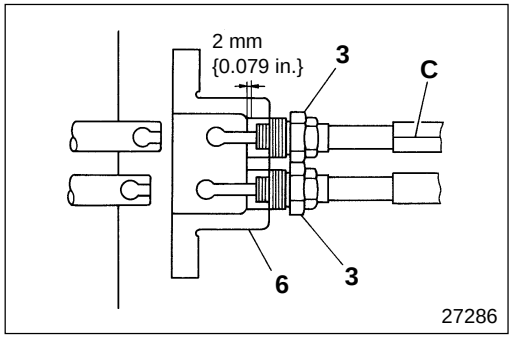
[Installation]

- Position HIGH/LOW shift rail ***b** and front drive shift rail ***c** as shown.
  B : Transfer end face



- Adjust nuts **2** and **3** to the end of the thread to align the end of HIGH/LOW and 2H/4H control cables **4** and **5** as shown.

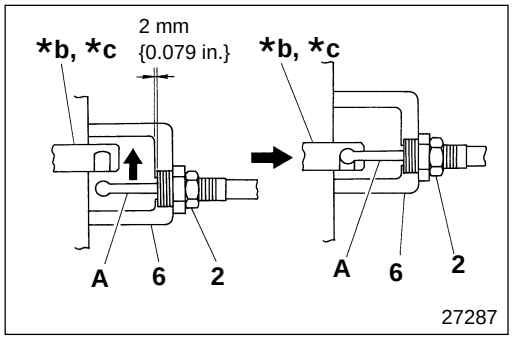
https://truckmanualshub.com/



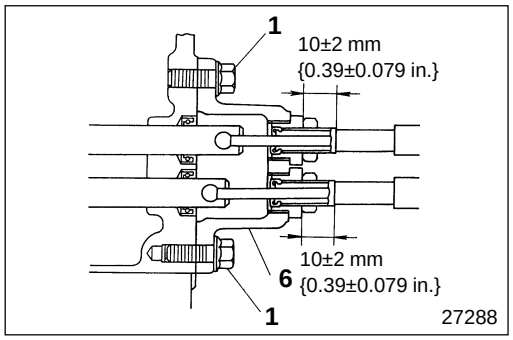
•Screw nut **3** into shift rail cover **6** and tighten it to the specified torque.

CAUTION

- **Ensure that the HIGH/LOW and four-wheel / two-wheel drive control cables are not positioned incorrectly.**
  The cable with the white line C is for HIGH/LOW.
- **After installation, the end of nut 3 should be located 2 mm{0.079 in.} from the front face of shift rail cover 6.**



- Tighten the nut with its specified torque and lock it with nut **3**. Then slide the shift rail cover **6** and install the inner cable **A** to HIGH/LOW shift rail ***b** and front drive shift rail ***c**.



- Tighten shift rail cover **6** installation bolt **1** at the specified torque.

https://truckmanualshub.com/

◆ Service procedure

● Inspection before disassembly

Clearance in axial direction for spider

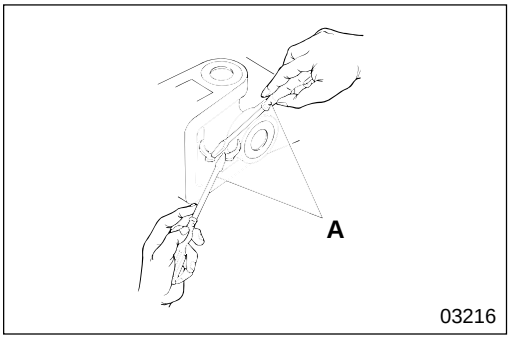
Press needle bearing **2** downward firmly, and measure clearance **A** between snap ring **1** and flange yoke **3**, slip yoke joint **6**, and rear propeller shaft **9**. If the measured value is higher than the limit, adjust it by changing the thickness of the snap ring.

< Available snap ring thicknesses and their combination : Combination indicated by solid line is preferred >

Part name	Thickness	Color identification mark	Combination	Thickness	Color identification mark
Snap ring	1.5 mm {0.059 in.}	None		1.5 mm {0.059 in.}	None
Snap ring	1.55 mm {0.061 in.}	Yellow		1.55 mm {0.061 in.}	Yellow
Snap ring	1.6 mm {0.063 in.}	Blue		1.6 mm {0.063 in.}	Blue
Snap ring	1.65 mm {0.065 in.}	Purple		1.65 mm {0.065 in.}	Purple

NOTE

For snap ring 1, it is recommend that you use rings with the same thickness on both ends.

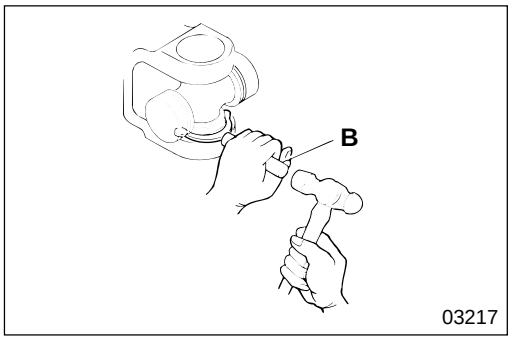


1 **Snap ring**

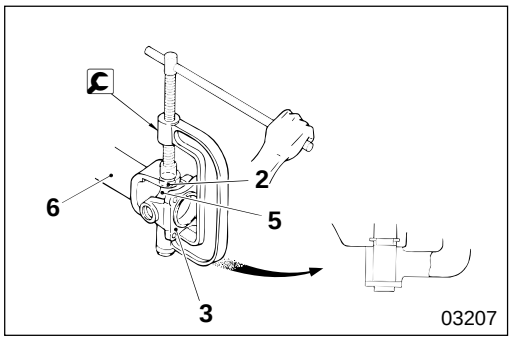
[Removal]

A : Flat-blade screwdriver

https://truckmanualshub.com/

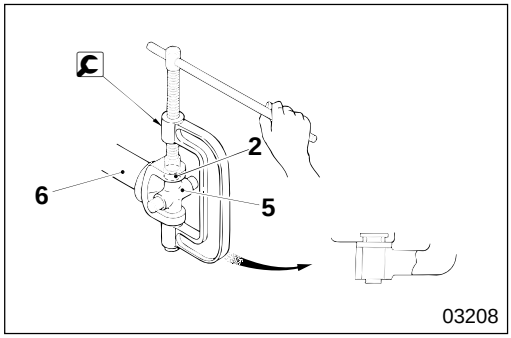


[Installation]
B : Drift

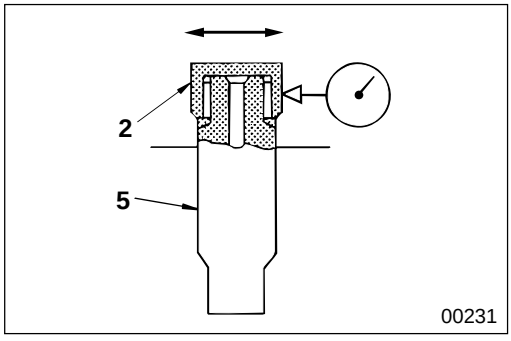


2 **Needle bearing**

[Removal]
- Put alignment marks on needle bearing **2** and spider **5**.
- Put alignment marks on flange yoke **3** and slip yoke joint **6**.
  : Universal joint tool set

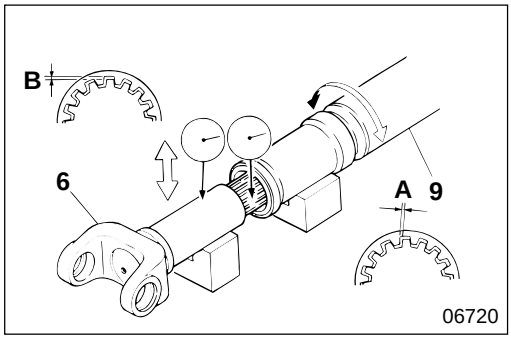


[Press-fitting]
: Universal joint tool set



2 **5** **Clearance between needle bearing and spider**

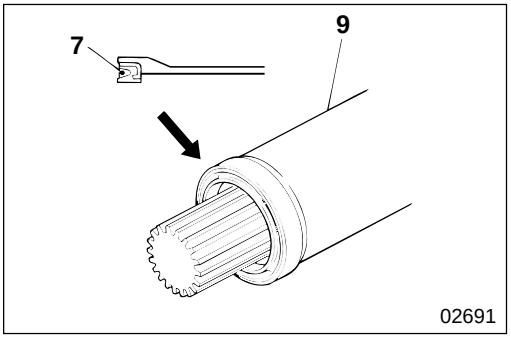
Measure the play towards the diameter direction between needle bearing **2** and spider **5**. If the measured value is higher than the limit, replace with universal joint spider kit.



6 **9** **Play between slip yoke joint and rear propeller shaft spline**

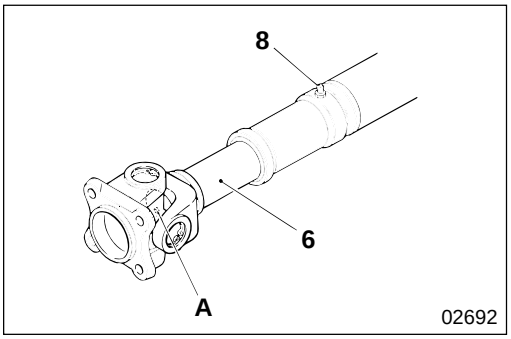
- Measure play **A** in the rotation direction between slip yoke joint **6** and rear propeller shaft **9** at the spline area. If the measured value is higher than the limit, replace the faulty parts.
- Measure play **B** in the diameter direction between slip yoke joint **6** and rear propeller shaft **9** at the spline area. If the measured value is higher than the limit, replace the faulty parts.

https://truckmanualshub.com/



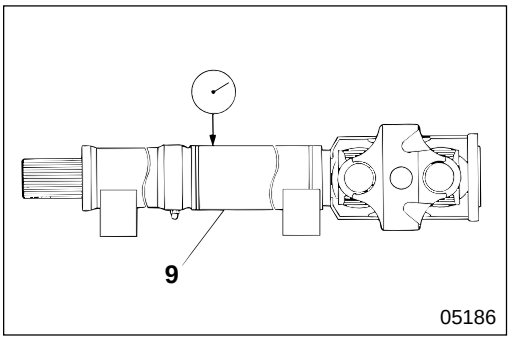
7 **Installation of sealed packing**

Install sealed packing **7** onto propeller shaft **9** in the direction illustrated until it is flush with the propeller shaft.



8 **Supply of grease via grease nipple**

Pack grease via grease nipple **8** until grease starts overflowing from dust plug **A** of slip yoke joint **6**.



9 **Deflection of rear propeller shaft**

Measure the deflection of rear propeller shaft **9** at the center. If the measured value is higher than the limit, correct or replace it.

CAUTION

Be sure to check for cracks at the welded area after straightening has been done by means of a press.

NOTE

To measure the deflection of rear propeller shaft 9, turn it one full revolution and read the dial gauge indicator. The deflection is one half of the indicated value.

https://truckmanualshub.com/

BALANCING PROPELLER SHAFT

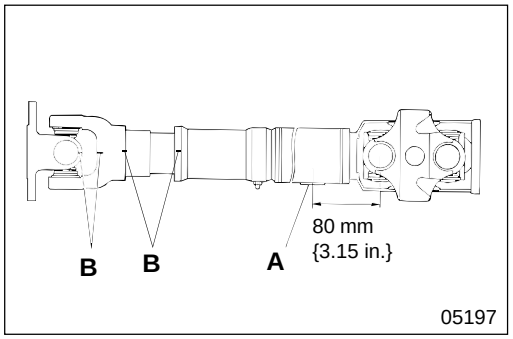
(1) After correcting propeller shaft deflection or replacing the flange yoke, universal joint, or related parts, measure the balance of the completed propeller shaft assembly on a balancing machine and attach balance weights as required to correct amount of imbalance to within the permissible range.

(2) Use the polar coordination method to correct dynamic balance.

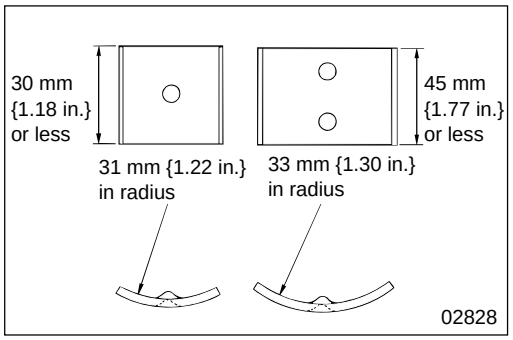
(3) Permissible amount of imbalance for propeller shaft circumference
10 g {0.35 oz} or less/3,000 rpm

(4) Correction procedure
- Balance weight attachment point

< Rear propeller shaft >



A : Balance weight attachment point
B : Alignment marks



- Available balance weights

Mass (g {oz})	Radius (mm {in.})
2 {0.071}	31 {1.22}
4 {0.14}	31 {1.22}
6 {0.21}	31 {1.22}
8 {0.28}	31 {1.22}
10 {0.35}	31 {1.22}
30 {1.06}	33 {1.30}
35 {1.23}	33 {1.30}
40 {1.41}	33 {1.30}
45 {1.59}	33 {1.30}
50 {1.76}	33 {1.30}

NOTE
- **Maximum balance weight allowed for one point is 100 g {3.53 oz}.**
- **Use a combination that keeps number of balance weights to the minimum.**

◆ Service procedure

● Inspection before disassembly

Clearance in axial direction for spider

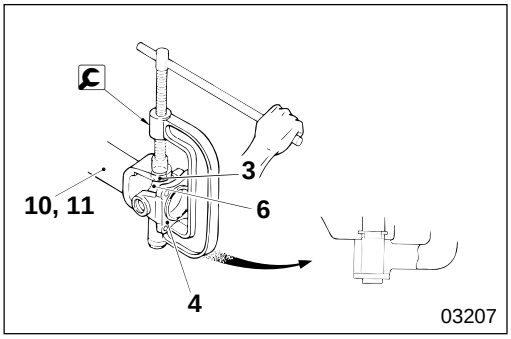
Press needle bearing **3** downward firmly, and measure clearance **A** between snap ring **1** and shim **2**. If the measured value is higher than the standard value, adjust it by changing the thickness of the shim.

Available shim thicknesses :

0.1 to 0.7 mm {0.0039 to 0.028 in.} (7 thicknesses available in 0.1 mm {0.0039 in.} increments)

NOTE

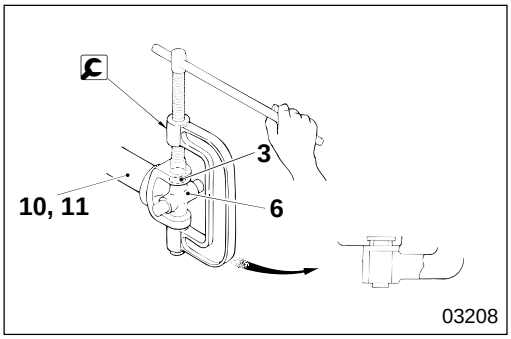
For shim 2, it is recommended that you use shims with the same thickness on both ends to ensure balanced revolution.



3 **Needle bearing**

[Removal]

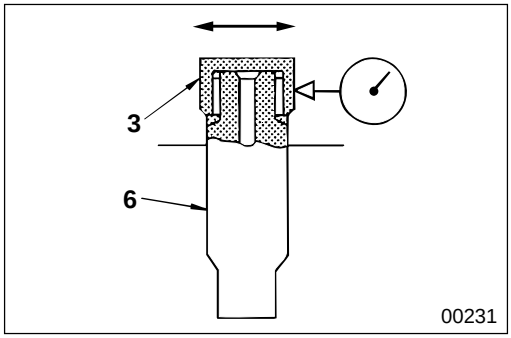
- Put alignment marks on needle bearing **3** and spider **6**.
- Put alignment marks on flange yoke **4**, slip yoke joint **10** and rear propeller shaft **11**.



[Press-fitting]

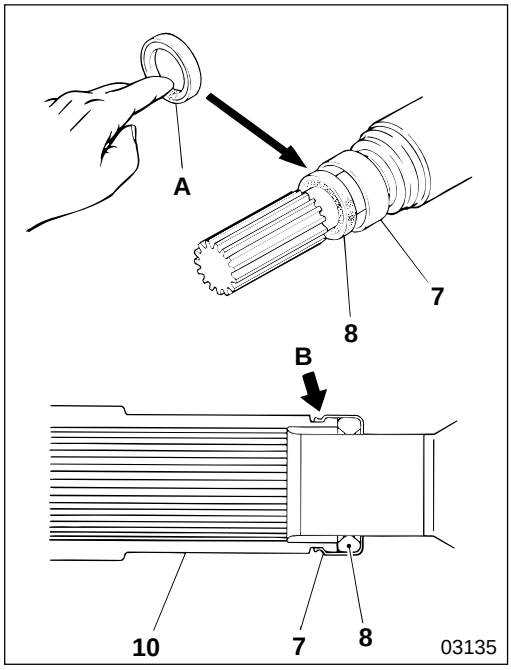
https://truckmanualshub.com/

REAR PROPELLER SHAFT



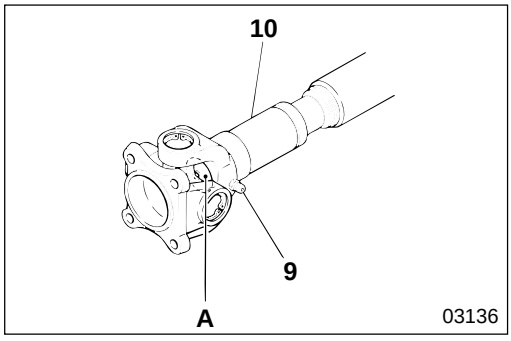
3 **6** **Clearance between needle bearing and spider**

Measure the play towards the diameter direction between needle bearing **3** and spider **6**. If the measured value is higher than the limit, replace with universal joint spider kit.



7 **8** **Installation of retainer packing and sealed packing**

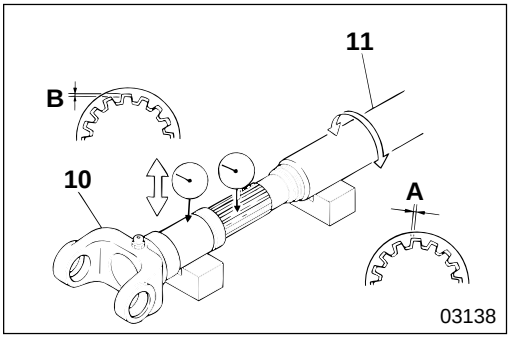
- Apply grease to inner periphery **A** of sealed packing **8** and install it as illustrated.
- Press retainer packing **7** onto slip yoke joint **10**, and caulk claw **B** at eight points.



9 **Supply of grease via grease nipple**

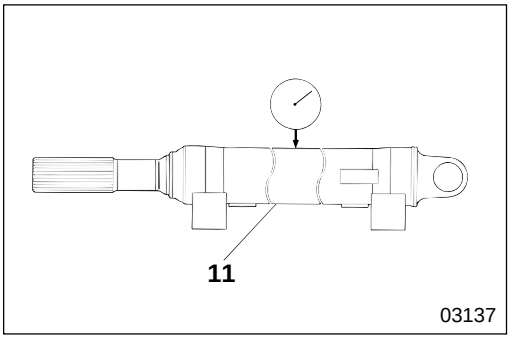
Pack grease via grease nipple **9** until grease starts overflowing from dust plug **A** of slip yoke joint **10**.

https://truckmanualshub.com/



10 **11** **Play between slip yoke joint and rear propeller shaft spline**

- Measure play **A** in the rotation direction between slip yoke joint **10** and rear propeller shaft **11** at the spline area. If the measured value is higher than the limit, replace the faulty parts.
- Measure play **B** in the diameter direction between slip yoke joint **10** and rear propeller shaft **11** at the spline area. If the measured value is higher than the limit, replace the faulty parts.



11 **Deflection of rear propeller shaft**

Measure the deflection of rear propeller shaft **11** at the center. If the measured value is higher than the limit, correct or replace it.

CAUTION⚠

Be sure to check for cracks at the welded area after straightening has been done by means of a press.

NOTE

To measure the deflection of rear propeller shaft 11, turn it one full revolution and read the dial gauge indicator. The deflection is one half of the indicated value.

◆ Service procedure

● Inspection before disassembly

Clearance in the axial direction for spider

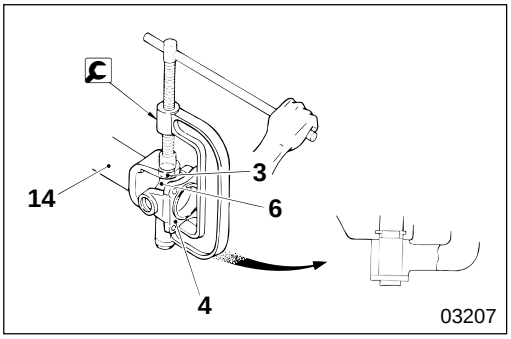
Press needle bearing **3** downward firmly, and measure clearance **A** between snap ring **1** and shim **2**. If the measured value is higher than the standard value, adjust it by changing the thickness of the shim.

Available shim thicknesses :

0.1 to 0.7 mm {0.0039 to 0.028 in.} (7 thicknesses available in 0.1 mm {0.0039 in.} increments)

NOTE

For shim 2, it is recommended that you use shims with the same thickness on both ends to ensure balanced revolution.

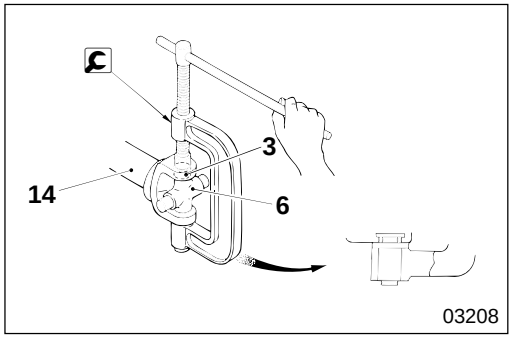


3 **Needle bearing**

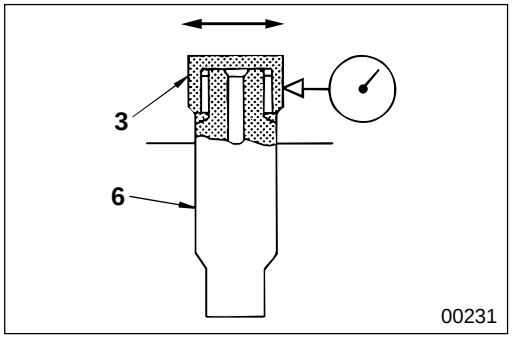
[Removal]

- Put alignment marks on needle bearing **3** and spider **6**.
- Put alignment marks on flange yoke **4** and front propeller shaft **14**.

https://truckmanualshub.com/

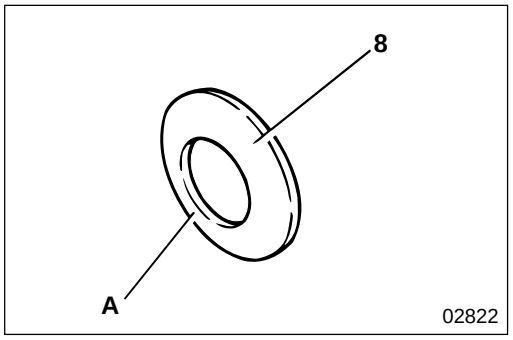


[Press-fitting]



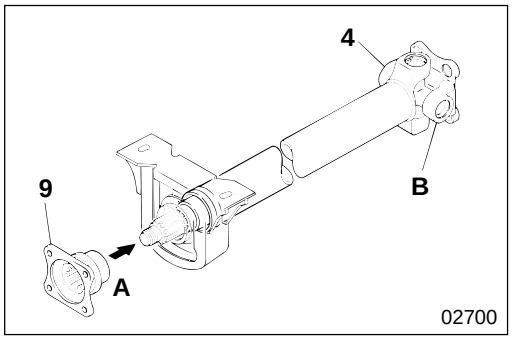
3 **6** **Clearance between needle bearing and spider**

Measure the play towards the diameter direction between needle bearing **3** and spider **6**. If the measured value is higher than the limit, replace with universal joint spider kit.



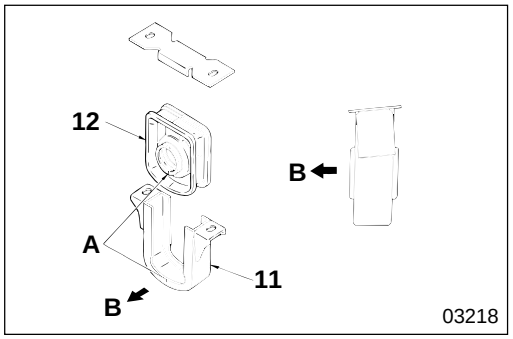
8 **Installation of disc spring**

Install disc spring **8** with its convex side facing nut **A**.



9 **Installation of companion flange**

When installing, position concave side **A** of companion flange **9** and convex side **B** of flange yoke **4** as illustrated.

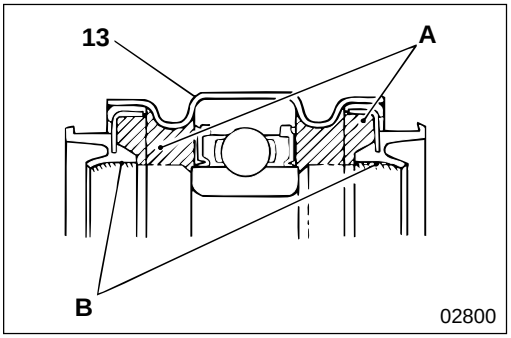


11 **12** **Hanger and cushion rubber**

[Removal]
Make alignment marks **A** before removal.

[Installation]
Install hanger **11** and cushion rubber **12** aligning alignment marks **A**.
The relative position to the front of vehicle **B** is as illustrated.

https://truckmanualshub.com/

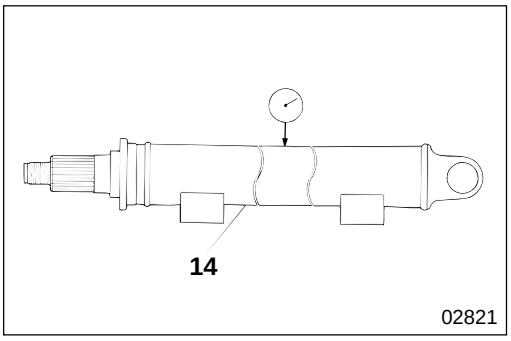


13 **Greasing center bearing assembly**

- Inspect the center bearing assembly for leaking grease every 50000 km {31000 miles} or at regular safety inspection. If a substantial grease leak is found, pack grease into housing **A**.
- Apply grease to seal lip area **B**.

NOTE

Bearing does not require greasing because it is sealed.



14 **Deflection of front propeller shaft**

Measure the deflection of front propeller shaft **14** at the center. If the measured value is higher than the limit, correct or replace it.

CAUTION

Be sure to check for cracks at the welded area after straightening has been done by means of a press.

NOTE

To measure the deflection of front propeller shaft 14, turn it one full revolution and read the dial gauge indicator. The deflection is one half of the indicated value.

https://truckmanualshub.com/

BALANCING PROPELLER SHAFT

(1) After correcting propeller shaft deflection or replacing the flange yoke, universal joint, or related parts, measure the balance of the completed propeller shaft assembly on a balancing machine and attach balance weights as required to correct amount of imbalance to within the permissible range.

(2) Use the polar coordination method to correct dynamic balance.

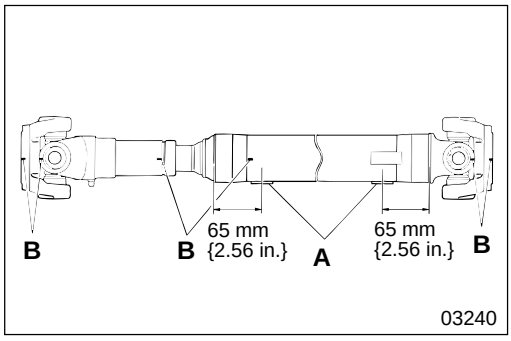
(3) Permissible amount of imbalance for propeller shaft circumference

10 g {0.35 oz} or less/3000 rpm < Rear propeller shaft >
5 g {0.18 oz} or less/3000 rpm < Front propeller shaft >

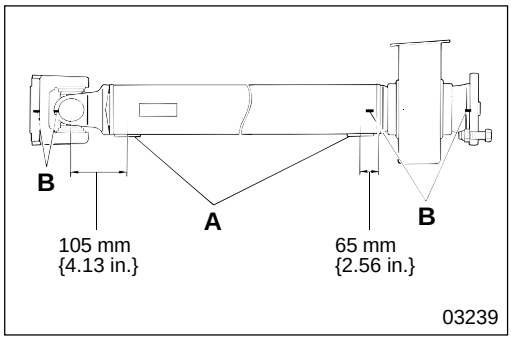
(4) Correction procedure

- Balance weight attachment point

< Rear propeller shaft >



< Front propeller shaft >



A : Balance weight attachment point

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Adjustment of Wheel Alignment

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
—	Wheel alignment	Toe-in (with tires on the ground)	0 to 6 {0 to 0.24}	—	—
		Camber	1°00'±30'	—	—
		Caster	2°30'±1°00'	—	—
		Kingpin inclination angle	8°	8°±10'	—

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

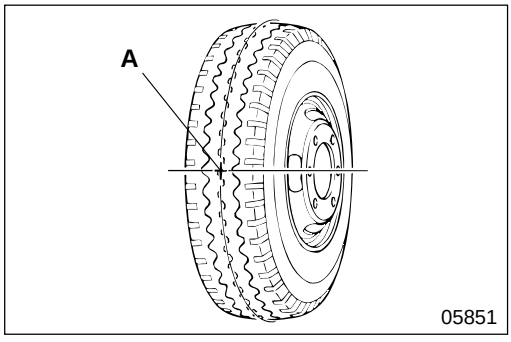
Location	Parts to be tightened	Tightening torque	Remarks
1	Clamp bolt (Tie rod end clamp fastening)	25±5 {18±3.6, 2.5±0.5}	—

NOTE

- **Measure the wheel alignment when the vehicle is empty and level.**
- **Be sure that each part of the front axle has been serviced perfectly before adjusting the wheel alignment.**

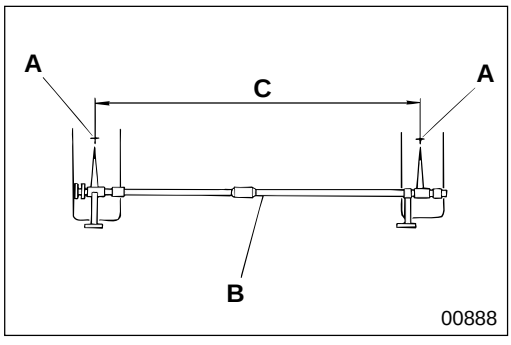
Before adjusting the wheel alignment, check for the following faults:

- Play in front wheel hub
- Play or looseness in kingpin
- Play or looseness in the joint between the tie rod and the knuckle arm
- Looseness of any fasteners
- Fatigued or damaged leaf springs
- Incorrect tire pressure
- Incorrect power steering booster backlash



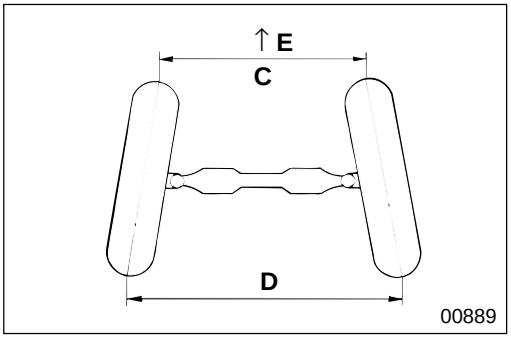
(1) Measurement and adjustment of toe-in

- Point the front wheels exactly forward.
- Put mark **A** on the left and right front tires at the height of front wheel axis and in the middle of the tire width.



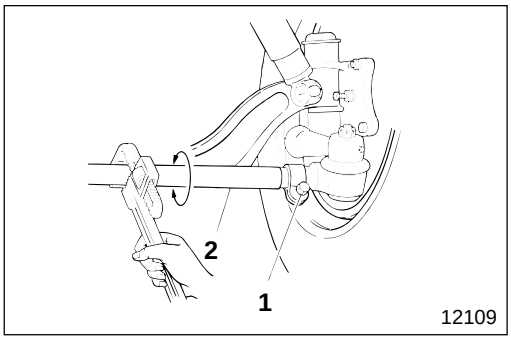
- Align the two points of toe-in gauge **B** to the respective marks **A** on the front tires. Measure the distance **C** between the marks at the front of the vehicle.

https://truckmanualshub.com/

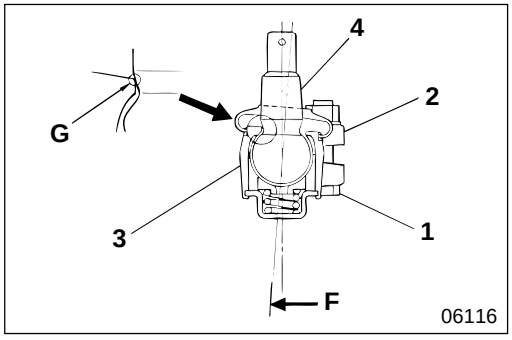


- Rotate the tires 180° and measure the distance **D** between the marks at the rear of the vehicle with the tires on the ground.
- Check if the difference between distances **C** and **D** is within the standard value.

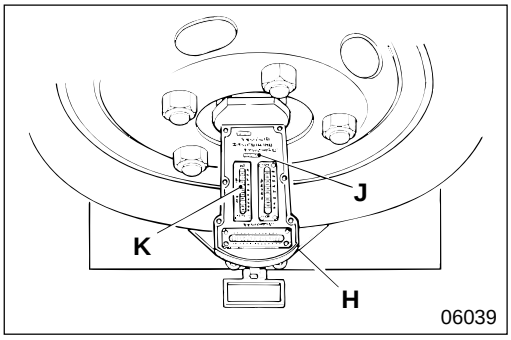
E : Front of the vehicle



- If the measured value deviates from the standard value, with the tires pointed forward, loosen left and right clamp bolts **1** and adjust the toe-in to the standard value by turning tie rod **2** with a pipe wrench.

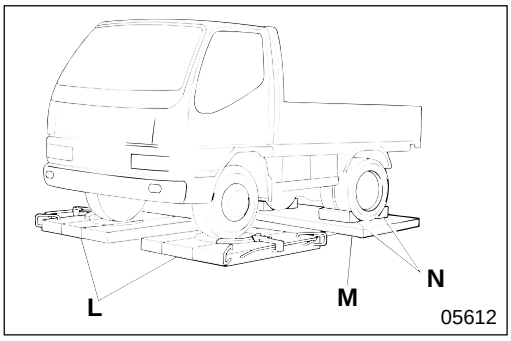


- Move the vehicle forward and turn tie rod **2** towards the front, with the tires pointed forward (**F** as illustrated). Make sure when adjusting toe-in to the standard value, that both left and right tie rod ends **3** are in contact with ball stud **4** (**G** as illustrated) at the same time. After adjustment, tighten clamp bolt **1** to secure the tie rod.



(2) Measurement of camber

- Point the front wheels exactly forward.
- Remove the hub caps.
- Wipe off grease from the knuckle end, and attach camber/caster/kingpin gauge **H** to the knuckle.
- While keeping the bubble in level **J** centered, measure the camber angle by reading the scale mark at the center of the bubble on camber scale **K**. Follow this procedure to measure the camber angles on the left and right sides.



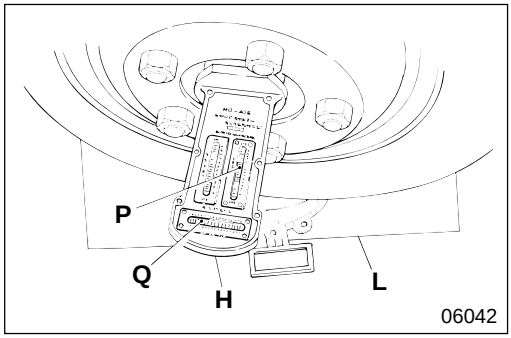
(3) Measurement of caster and kingpin inclination angle

- Align turning radius gauges **L**. Prepare a platform **M** having the same height as the turning radius gauges and place the platform under the rear wheels so that the vehicle is kept level.
- Keep turning radius gauges **L** locked.
- Jack up the vehicle and set the left and right front wheels so that the ground contact area of both front tires and the turntables of turning radius gauge **L** meet at their respective centers.

WARNING⚠

- **After jacking up the vehicle, chock the rear wheels securely with chocks N.**
- **Do not remove chocks N until the entire operation is completed.**

https://truckmanualshub.com/



- Unlock turning radius gauge **L**, and set the scale to 0°.
- As in measuring camber explained previously, attach camber/caster kingpin gauge **H** tightly to the front wheel hub and keep the bubble centered.
- Apply the brake to the front wheels and turn the steering wheel slowly from the 0° point on the scale of turning radius gauge **L**, until direction changes 20° to the left for the left front wheel and 20° to the right for the right front wheel.

NOTE

It is not possible to obtain an exact reading of camber unless the brake is applied to the front wheels because the tires might rotate slightly.

- At the 20° point, align the bubbles in caster scale **P** and kingpin scale **Q** to 0° by turning the adjuster.

NOTE

Kingpin scale Q has scales for left and right; use the left scale when adjusting the left wheel, and the right scale when adjusting the right wheel.

- Turn the steering wheel slowly until the left front wheel changes its direction 20° to the right, or until the right front wheel changes its direction 20° to the left, past the 0° point of turning radius gauge **L** scale. At this point read the scale marks at the center of the bubbles on caster scale **P** and kingpin scale **Q**. The scale marks indicate the caster and kingpin inclination angles.

https://truckmanualshub.com/

Adjustment of Steering Angle

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Steering angle	Inside (Outside : reference)	42° (33°)	—	Adjust

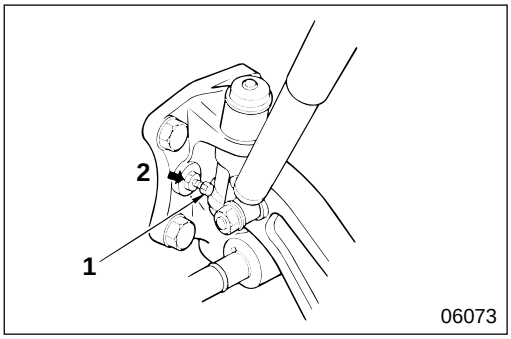
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Lock nut (Knuckle stopper bolt fastening)	46.5±7 {34±5.4, 4.75±0.75}	—

NOTE

Be sure that wheel alignment is adjusted perfectly before adjusting the steering angle.



- To adjust the steering angle, set the turning radius gauges and platform in the same way as for caster and kingpin inclination angle measurement.
- Turn the steering wheel to the left or right completely, and from the position where the turning radius gauge is aligned to 0°, adjust knuckle stopper bolt **1**. Adjust so that the steering angle is within the standard inside steering angle value, to the left for the left front wheel, and to the right for the right front wheel. Then, tighten lock nut **2** at specified torque.

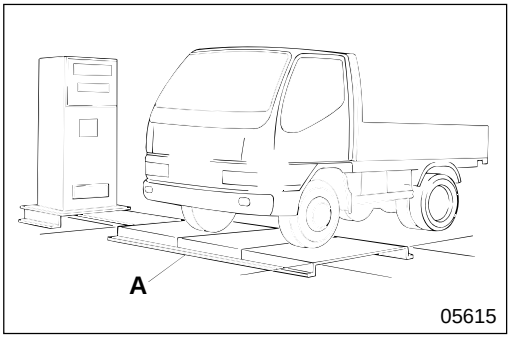
NOTE

Be sure when working on the vehicle, to adjust both stopper bolts 1 at the front and back of the knuckle arm side.

Measurement of Side Slip

NOTE

Be sure that wheel alignment is adjusted fully before measuring side slip.



- Point the front wheels exactly forward.
- Maintain this position and slowly move vehicle forward, over side slip tester **A**, as slowly as possible.

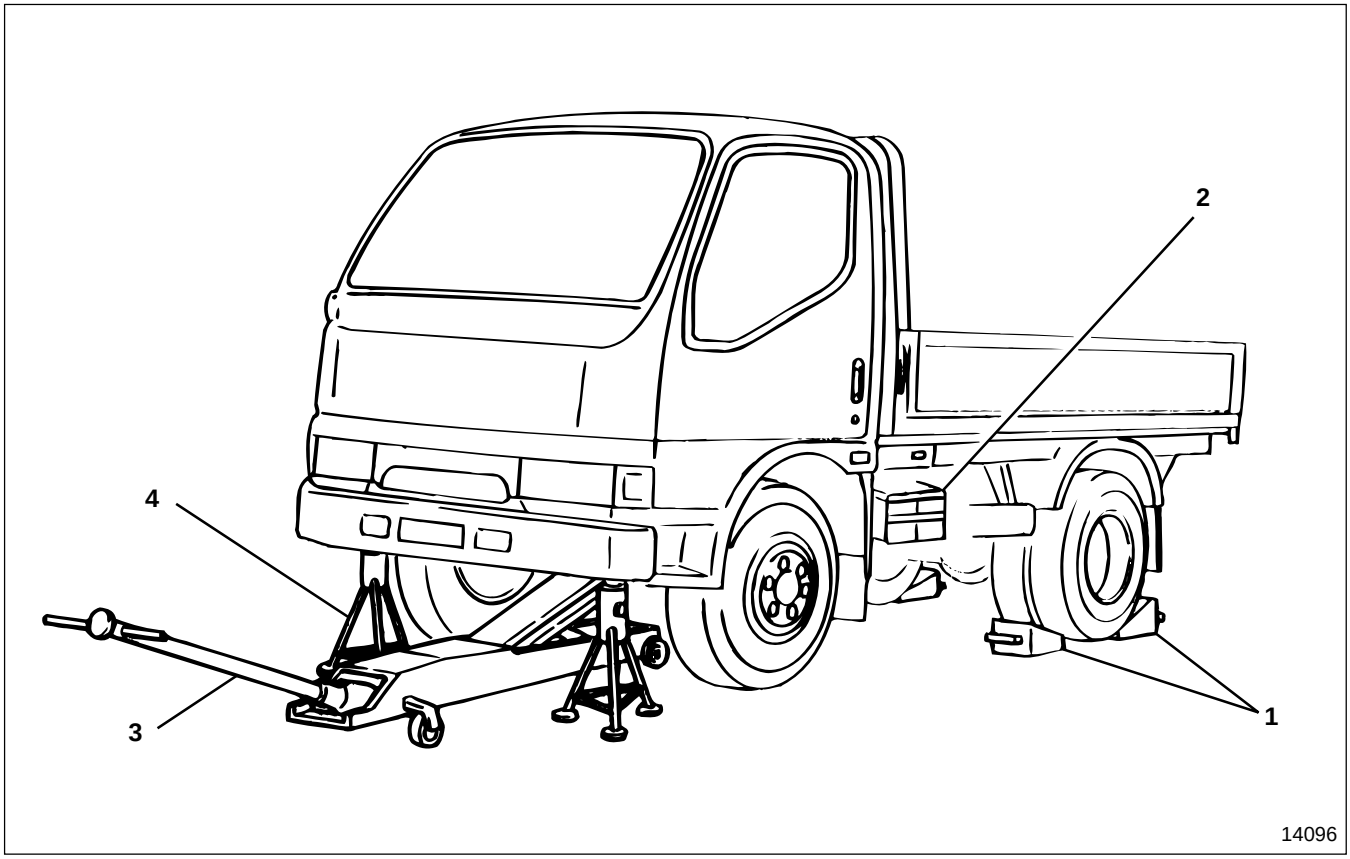
NOTE

Make sure, when measuring side slip, that the wheels point exactly forward when the vehicle passes over side slip tester A. Do not allow the wheels to veer from side-to-side.

- The side slip is indicated by side slip tester **A** after the vehicle has passed through the tester. Readjust wheel alignment if slippage is 3 mm {0.12 in.} or more per meter {3.28 ft.}.

https://truckmanualshub.com/

WORK BEFORE REMOVAL AND INSTALLATION OF FRONT AXLE



● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect the negative battery cable. Gr 54
3 Jack up the front axle with a garage jack.
4 Support the front frame on rigid racks.

WARNING

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

https://truckmanualshub.com/

MEMO

31 Spacer

*: Knuckle P26-16
⊗: Non-reusable parts

WARNING

When you work, take care not to burn yourself because disc brake assembly 9 and disc rotor 21 are hot immediately after the vehicle has been driven.

CAUTION

Be sure to protect brake hoses 3, 7 from dust by fitting blanking plugs after removal.

NOTE

Do not disassemble disc rotor 21 and wheel hub 23 except for replacement.

https://truckmanualshub.com/

● **Assembly sequence**

Follow the disassembly sequence inreverse.

WARNING⚠

You must bleed air from the brake system after installing the brake hose, failure to do so would cause the brake to malfunction. Gr 35

CAUTION⚠

Be careful not to damage oil seal 15 when installing wheel hub and rotor assembly 14 onto knuckle *.

Service standards

Location	Maintenance item		Standard value	Limit	Remedy

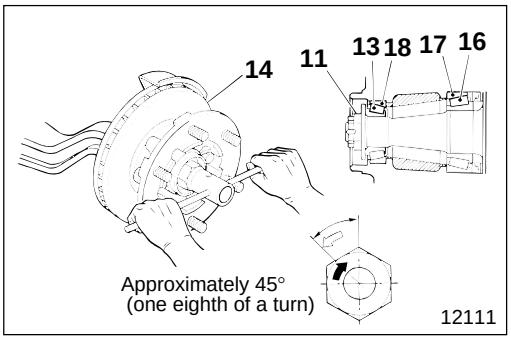
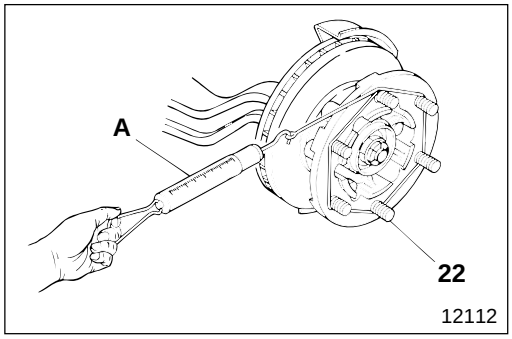
◆ Service procedure



● Starting torque of wheel hub bearing

[Adjustment]

- Tighten lock nut **11** at specified torque (primary tightening) while turning wheel hub and rotor assembly **14**. Then, slacken off.
- Turn wheel hub and rotor assembly **14** several times to smooth operation of outer bearings **13** and **18**, and inner bearings **16** and **17**, and retighten lock nut **11** at specified torque (secondary tightening).
- Slacken off lock nut **11** by approximately 45° (one eighth of a turn), and lock it with a split pin. If the split pin and the pin hole do not align, slacken off the lock nut slightly, making sure that there is no play in the axial direction.

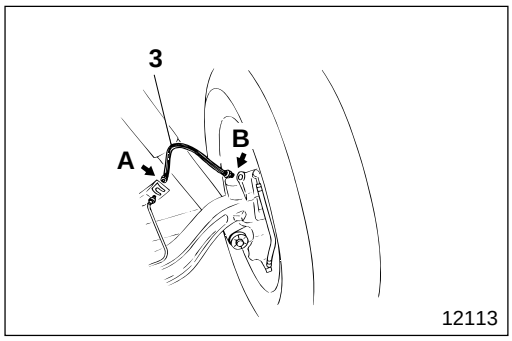


[Measurement]

- Fasten spring balance **A** to hub bolt **22** and measure the tangential force.
- If the measured tangential force is the standard value, the starting torque conforms to the standard value.
- Make sure that the starting torque is smaller than the tangential force.
- If the tangential force deviates from the specified value, adjust the starting torque again.
- If the measured value deviates from the standard value, adjust the starting torque of the wheel hub bearing according to the procedure described above.
- If any fault is found after adjustment, replace outer and inner bearings **13**, **16** to **18**.

NOTE

- **Measure the starting torque when oil seal 15 has been installed.**

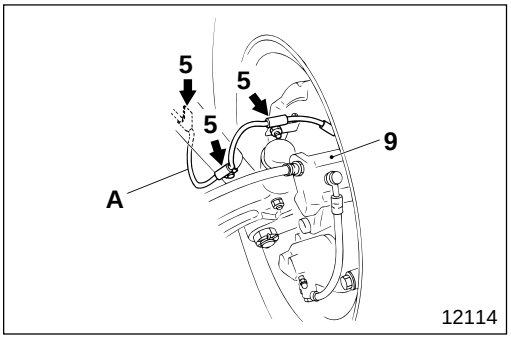


3 Removal and installation of brake hose

First remove brake hose **3** from bracket **A** (on the frame), then remove the brake hose from wheel brake **B**. For installation, follow this procedure in reverse.

CAUTION ⚠

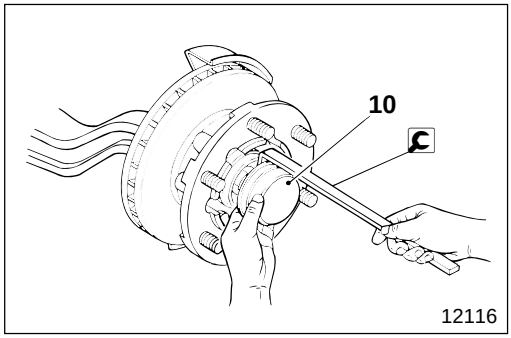
Make sure that brake hose 3 is not twisted when you install it.



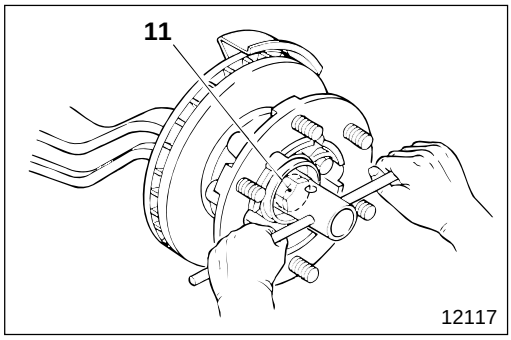
9 Installation of brake pad wear indicator harness of disc brake assembly

Fix the taping position for brake pad wear indicator harness **A** on disc brake assembly **9** using clip **5**.

https://truckmanualshub.com/

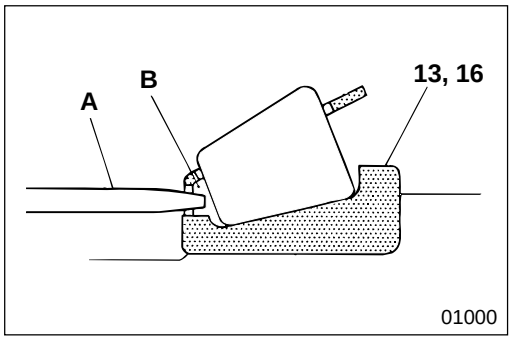


10 **Removal of hub cap**



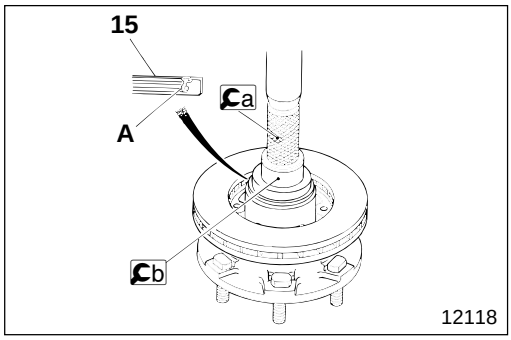
11 **Removal and installation of lock nut**

Refer to adjustment of the starting torque of the wheel hub bearing.
P26-13



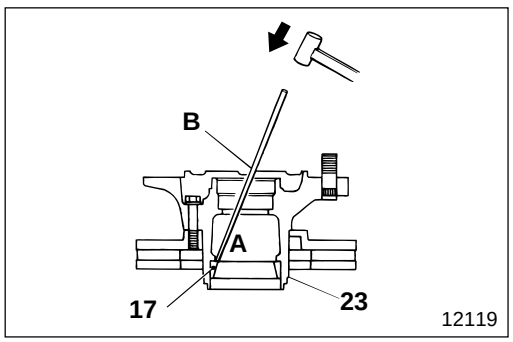
13 **16** **Packing grease in outer bearing inner race and inner bearing inner race**

A : Grease pump nozzle
B : Between rollers



15 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **15** and press-fit it.

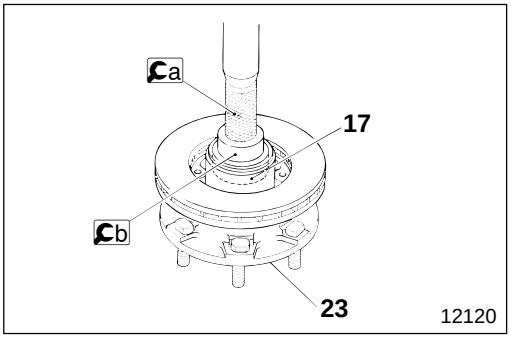


17 **Inner bearing outer race**

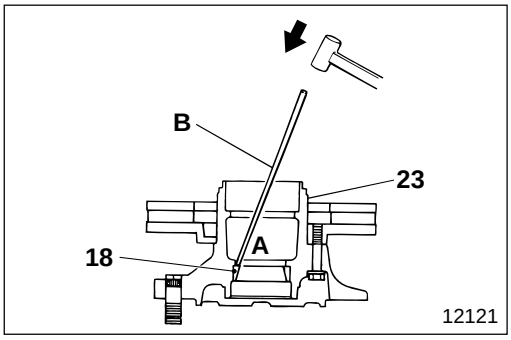
[Removal]
Drive out inner bearing outer race **17** from the two indented parts **A** in wheel hub **23**.

B : Pin-punch

https://truckmanualshub.com/

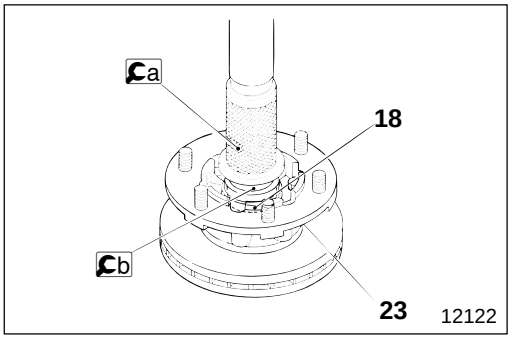


[Installation]

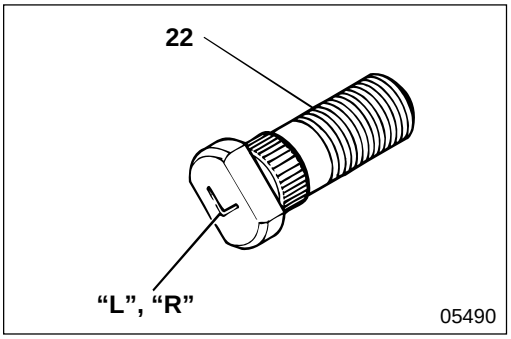


18 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **18** from the two indented parts **A** in wheel hub **23**.
B : Pin-punch



[Installation]



22 **Installation of hub bolt**

Hub bolt **22** is marked with “**L**” (left) or “**R**” (right) to indicate the side it is to be installed on. Check this symbol before installing the bolt.

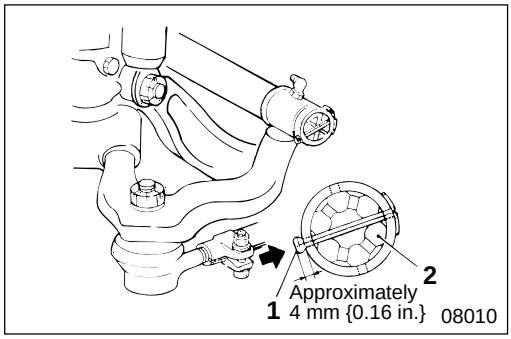
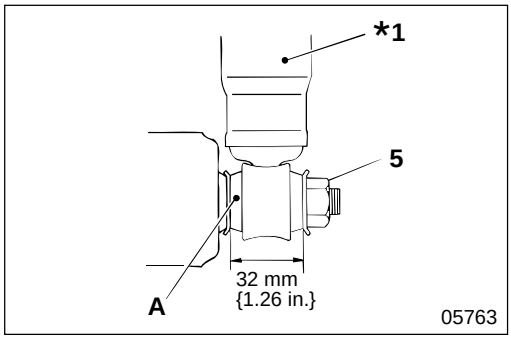
29	Bushing installer **A** : Bushing installer A **B** : Bushing installer B 	MB999066 **A**: MB999067 **B**: MB999068	Removal and installation of kingpin bushing

◆ Service procedure



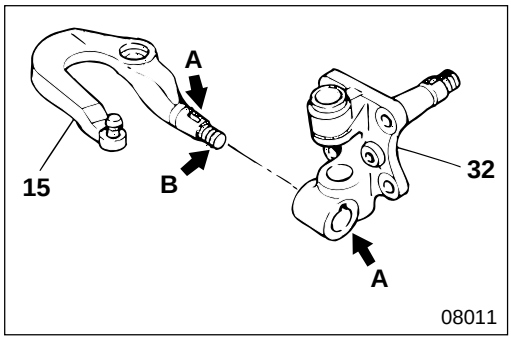
1 **2** **Mounting of split pin and end plug**

- Tighten end plug **2** fully and slacken off by one half of a turn, then turn the plug so that the head of split pin **1** faces the outside of the body.
- Caulk the head of split pin **1** until it is approximately 4 mm {0.16 in.} thick.



5 **Mounting of nut**

Mount and tighten nut **5** so that the dimensions of rubber bushing **A** of shock absorber ***1** are as illustrated.

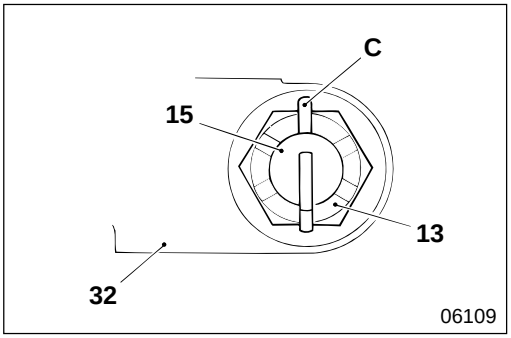


15 **32** **Installation of knuckle arm and knuckle**

(1) Reassembly of existing knuckle arm 15 and/or knuckle 32

- Polish taper surfaces **A** of knuckle arm **15** and knuckle **32** with emery paper (120 grit or finer) uniformly, until abrasion traces left by the emery paper are only just visible. For new parts, polishing is not required.
- Clean taper surfaces **A** of knuckle arm **15** and knuckle **32**, and thread area **B** of the knuckle arm. (Use a cleaning solvent for acetone color checking or other solvent.)

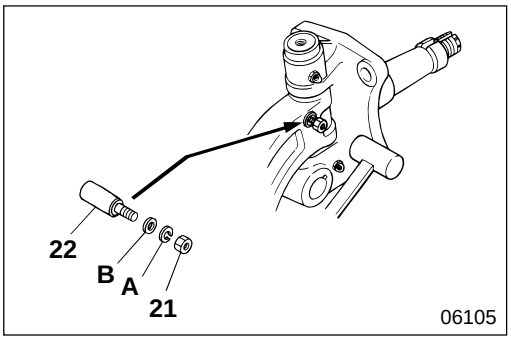
https://truckmanualshub.com/



- Install knuckle arm **15** after applying grease to thread area **B**. (Do not grease the taper surface of knuckle arm and knuckle **32**.)
- Tighten new nut **13** at specified torque. Without loosening the nut, insert split pin **C** into the pin hole to lock the nut.

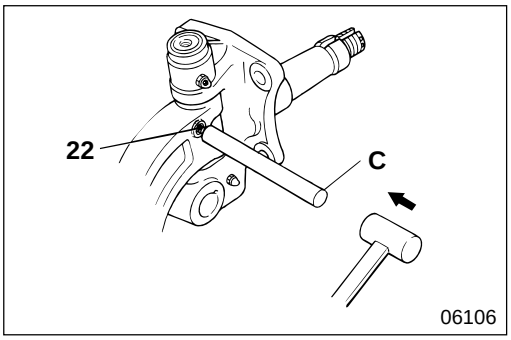
(2) Installation of new knuckle arm 15 and new knuckle 32

- Clean taper surfaces **A**, or thread area **B**, of knuckle arm **15** and knuckle **32**, and install them without greasing.
- Tighten new nut **13** at specified torque. Without loosening the nut, insert split pin **C** into the pin hole to lock the nut.

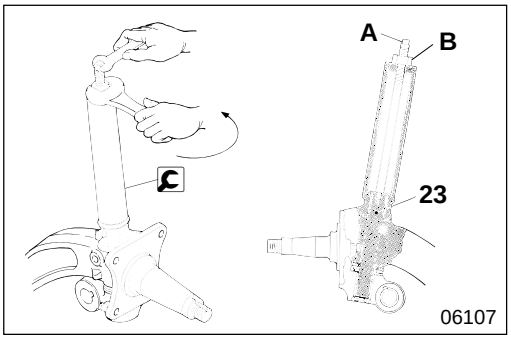


22 Removal of lock pin

- Remove nut **21**, spring washer **A**, and washer **B**. Screw the nut into lock pin **22** again until they are almost level with each other. Then, tap the nut lightly to loosen the lock pin.



- Remove nut **21**. While holding drift **C** against lock pin **22**, tap the lock pin lightly to extract it.

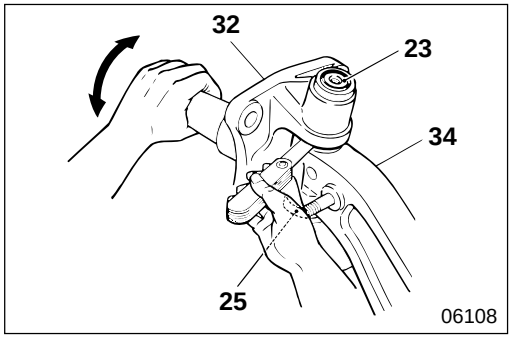


23 Removal of kingpin

- Screw bolt **A** of the kingpin puller into the thread area of kingpin **23**.
- Fasten bolt **A** with nut **B**, and remove kingpin **23**.

https://truckmanualshub.com/

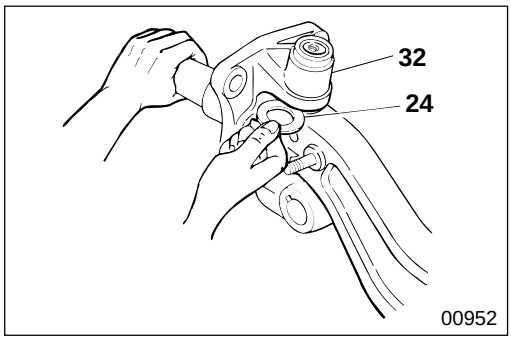
FRONT AXLE, KNUCKLE AND KINGPIN



24 **32** **34** **Kingpin shim, knuckle, and front axle**

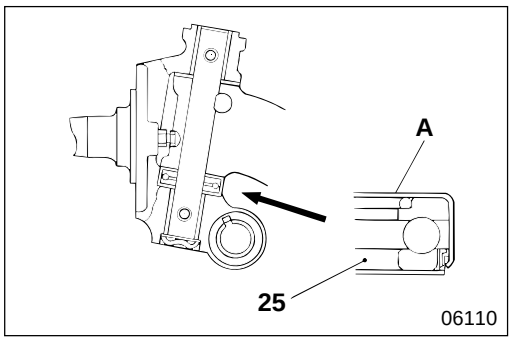
[Inspection]

- Assemble kingpin **23** and thrust bearing **25** temporarily, and turn knuckle **32** a couple of times to smooth its operation.
- Measure the clearance between the upper surface of front axle **34** and the lower part of knuckle **32**.
- If the measured value is higher than the limit, adjust the clearance.



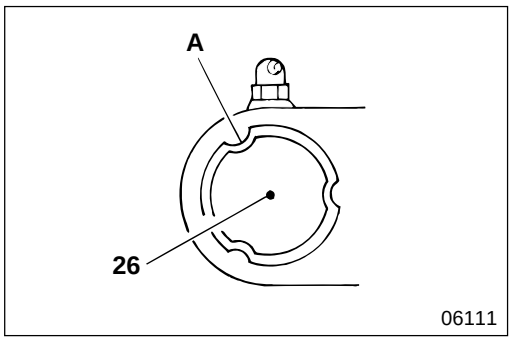
[Adjustment]

- Adjusting kingpin shim **24** is available in four thickness: 0.10 mm {0.0039 in.}, 0.15mm {0.0059 in.} 0.20 mm {0.0079 in.} and 0.30 mm {0.012 in.}
- Be sure to minimize the clearance by selecting appropriate kingpin shim **24**.
- Make sure that knuckle **32** turns smoothly after assembly.



25 **Installation of thrust bearing**

Install thrust bearing **25** with case **A** facing upwards.

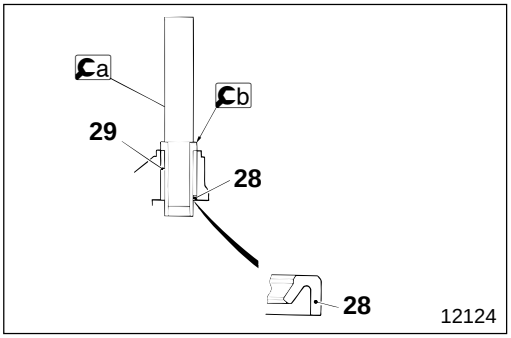


26 **Mounting of plug**

Drift in plug **26**, and caulk it securely at three equidistant points around the circumference.

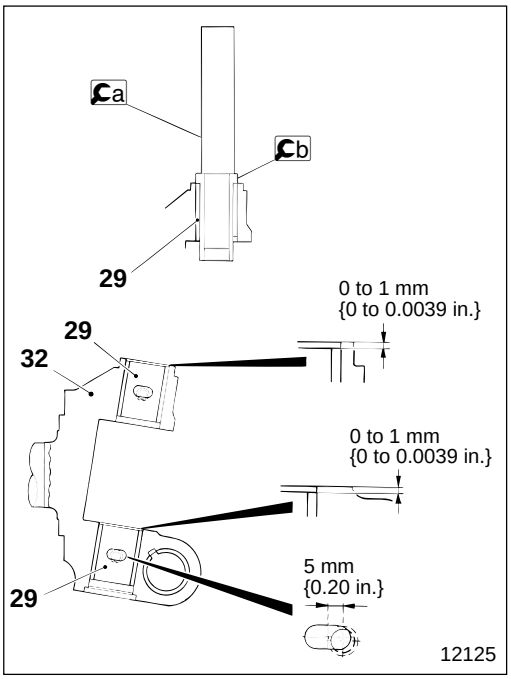
A : When caulked

https://truckmanualshub.com/



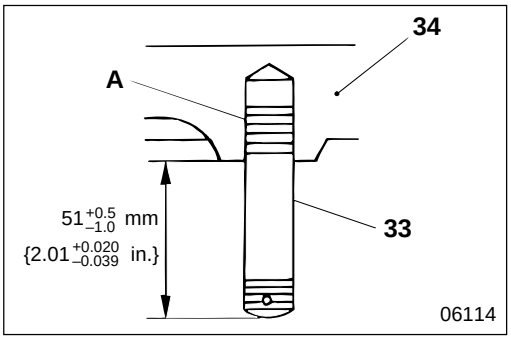
28 **29** **Dust seal and kingpin bushing**

[Removal]
When removing the upper part of kingpin bushing **29**, remove dust seal **28** at the same time.



[Installation]

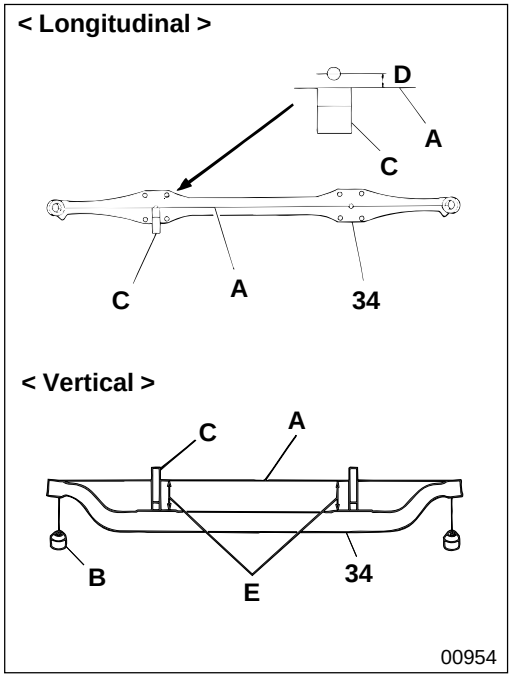
- Press-fit kingpin bushing **29** so that gap **A** between kingpin bushing **29** and knuckle **32** is within 0 to 1 mm {0 to 0.039 in.}.
- Oil hole of kingpin bushing **29** and tapped hole of knuckle **32** should not deviate from each other by more than 5 mm {0.20 in.}.
- Apply grease to lip area **C** of dust seal **28** and press-fit in the direction as illustrated in the upper figure.



33 **34** **Stud bolt and front axle**

- Coat thread area **A** of stud bolt **33** in front axle **34** with lock paint.
- Mount stud bolt **33** maintaining a mounting dimension within $51^{+0.5}_{-1.0}$ mm {$2.01^{+0.020}_{-0.039}$ in.}.

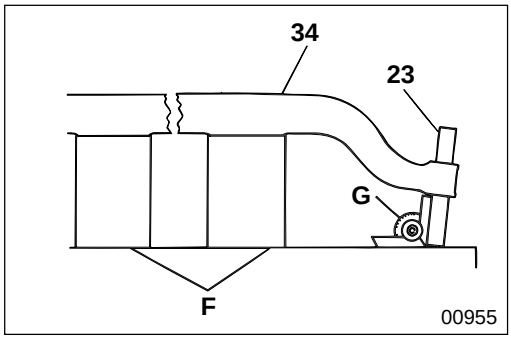
https://truckmanualshub.com/



34 Inspection of front axle

(1) Measurement of bend in front axle in longitudinal and vertical directions

- Pass a piece of thread **A** through the kingpin hole of front axle **34** and hang weights **B** on both ends.
- Use square **C** to find the degree of bend in both the longitudinal direction **D** and the vertical direction **E**.
- If the measured value is higher than the limit, replace front axle **34**.



(2) Measurement of kingpin inclination angle

Mount kingpin **23** in front axle **34** as illustrated, and measure the kingpin inclination angle. If the measured value is higher the limit, replace the front axle.

F : Block gauge

G : Bevel square

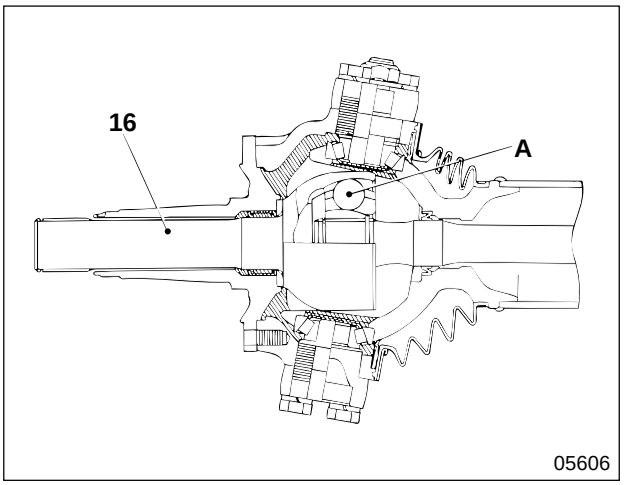
14 Spacer
15 Needle bearing
16 Drive shaft assembly
17 Knuckle spindle
18 Trunnion bearing



Drive shaft assembly **16** should transmit power in response to the variations in rotation speed that occur due to variations in steering angle, etc. when steering the vehicle.
To support this function, Birfield joint assembly area **A** in drive shaft assembly **16** uses a constant speed joint that transmits power evenly, eliminating variations in rotation speed between the driving shaft and the driven shaft.

Adjustment of Wheel Alignment

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
—	Wheel alignment	Toe-in (with tires on the ground)	0 to 6 {0 to 0.24}	—	—
		Camber	1°00'±30'	—	—
		Caster	0°30'±1°00'	—	—
		Kingpin inclination angle	9°30'	9°30'±30'	—

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

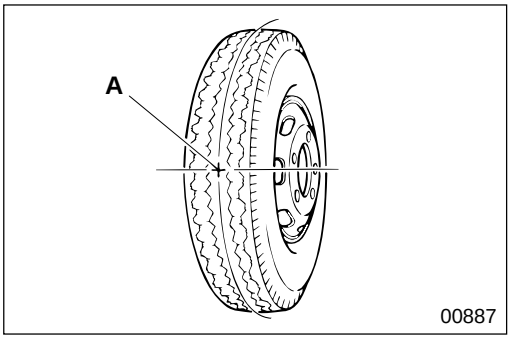
Location	Parts to be tightened	Tightening torque	Remarks
1	Clamp bolt (Tie rod end clamp fastening)	25±5 {18±3.6, 2.5±0.5}	—

NOTE

- **Measure the wheel alignment when the vehicle is empty and level.**
- **Be sure that each part of the front axle has been serviced perfectly before adjusting the wheel alignment.**

Before adjusting the wheel alignment, check for the following faults :

- Play in front wheel hub
- Play or looseness in kingpin
- Play or looseness in the joint between the tie rod and the knuckle arm
- Looseness of any fasteners
- Fatigued or damaged leaf springs
- Incorrect tire pressure
- Incorrect steering gear backlash

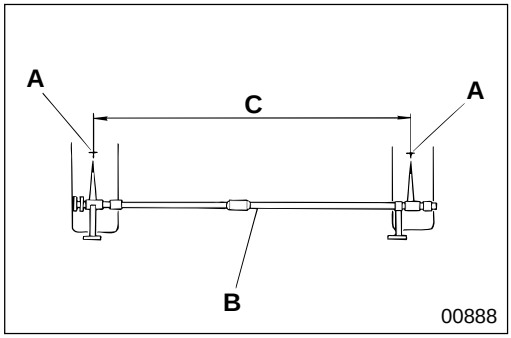


(1) Measurement and adjustment of toe-in

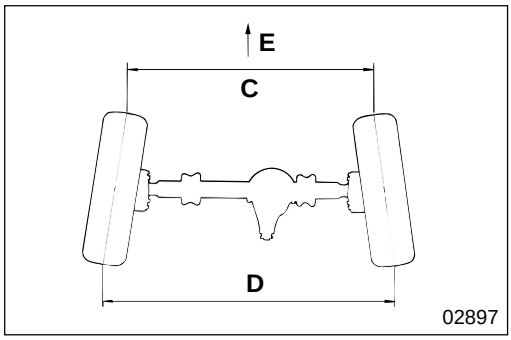
- Point the front wheels exactly forward.
- Put mark **A** on the left and right front tires at the height of front wheel axis and in the middle of the tire width.

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

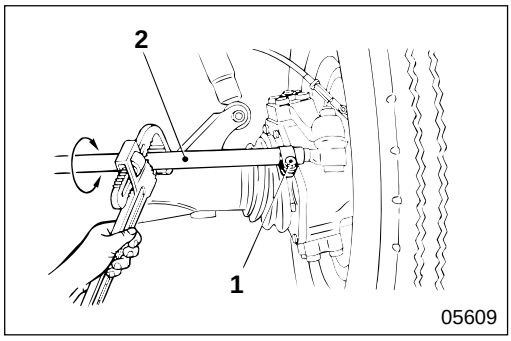


- Align the two points of toe-in gauge **B** to the respective marks **A** on the front tires. Measure the distance **C** between the marks at the front of the vehicle.

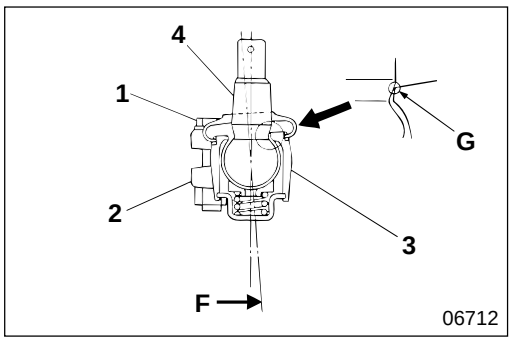


- Rotate the tires 180° and measure the distance **D** between the marks at the rear of the vehicle with the tires on the ground.
- Check if the difference between distances **C** and **D** is within the standard value.

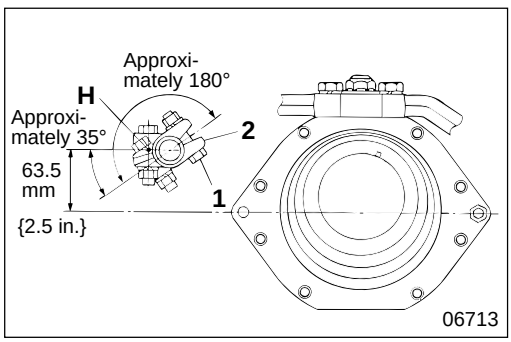
E : Front of the vehicle



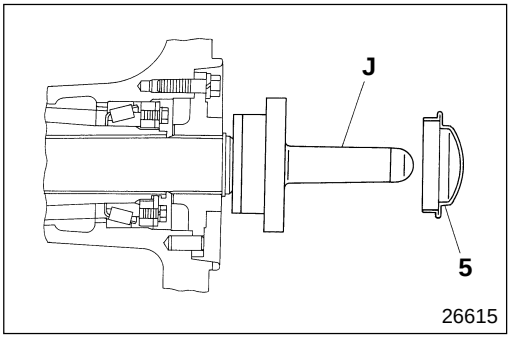
- If the measured value deviates from the standard value, with the tires pointed forward, loosen left and right clamp bolts **1** and adjust the toe-in to the standard value by turning tie rod **2** with a pipe wrench.



- Move the vehicle forward and turn tie rod **2** towards the front, with the tires pointed forward (**F** as illustated). Make sure when adjusting toe-in to the standard value, that both left and right tie rod ends **3** are in contact with ball stud **4** (**G** as illustrated) at the same time.
  After adjustment, tighten clamp bolt **1** to secure the tie rod.
- In order to keep the end of clamp bolts **1** away from the vehicle, mount tie rod **2** so that clamp center **H** is placed in the range as illustrated.

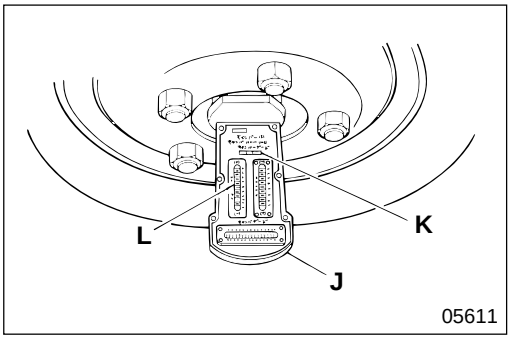


https://truckmanualshub.com/

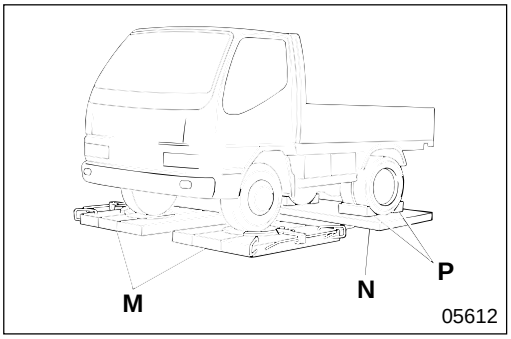


(2) Measurement of camber

- Point the front wheels exactly forward.
- Remove hub cap **5**, and attach camber caster kingpin gauge **J**.



- While keeping the bubble in level **K** centered, measure the camber angle by reading the scale mark at the center of the bubble on camber scale **L**. Follow this procedure to measure the camber angles on the left and right sides.

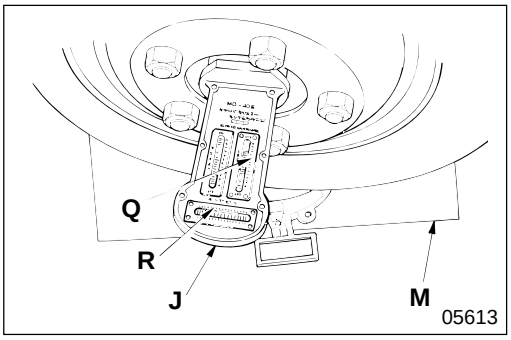


(3) Measurement of caster and kingpin inclination angle

- Align turning radius gauges **M**. Prepare a platform **N** having the same height as the turning radius gauges and place the platform under the rear wheels so that the vehicle is kept level.
- Keep turning radius gauges **M** locked.
- Jack up the vehicle and set the left and right front wheels so that the ground contact area of both front tires and the turntables of turning radius gauges **M** meet at their respective centers.

WARNING⚠

- **After jacking up the vehicle, chock the rear wheels securely with chocks P.**
- **Do not remove chocks P until the entire operation is completed.**



- Unlock turning radius gauges **M**, and set the scale at 0°.
- As in measuring camber explained previously, attach camber/caster kingpin gauge **J** tightly to the front wheel hub and keep the bubble centered.
- Apply the brake to the front wheels and turn the steering wheel slowly from the 0° point on the scale of turning radius gauges **M**, until direction changes 20° to the left for the left front wheel and 20° to the right for the right front wheel.

NOTE

It is not possible to obtain an exact reading of camber unless the brake is applied to the front wheels because the tires might rotate slightly.

https://truckmanualshub.com/

- At the 20° point, align the bubbles in caster scale **Q** and kingpin scale **R** to 0° by turning the adjuster.

NOTE

Kingpin scale R has scales for left and right; use the left scale when adjusting the left wheel, and the right scale when adjusting the right wheel.

- Turn the steering wheel slowly until the left front wheel changes its direction 20° to the right, or until the right front wheel changes its direction 20° to the left, past the 0° point of turning radius gauge **M** scale. At this point read the scale marks at the center of the bubbles on caster scale **Q** and kingpin scale **R**. The scale marks indicate the caster and kingpin inclination angles.

Adjustment of Steering Angle

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Steering angle	Inside (Outside : reference)	30° (29°)	—	Adjust

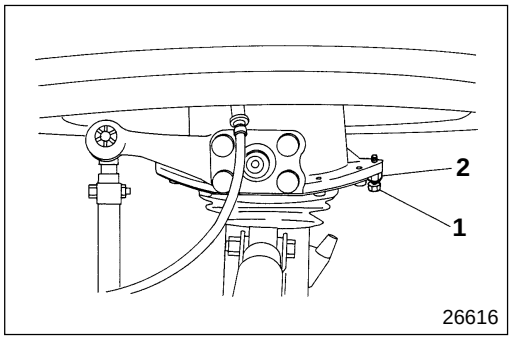
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Lock nut (Knuckle stopper bolt tightening)	96±12 {71±9, 9.75±1.25}	—

NOTE

Be sure that wheel alignment is adjusted perfectly before adjusting the steering angle.



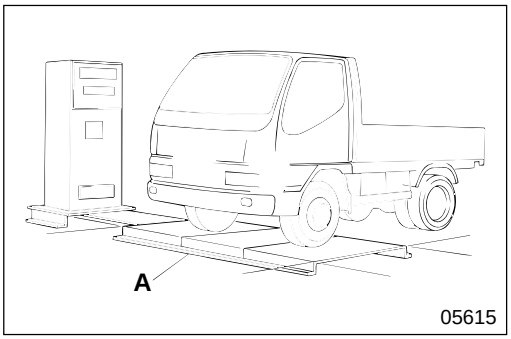
- To adjust the steering angle, set the turning radius gauges and platform in the same way as for caster and kingpin inclination angle measurement.
- Turn the steering wheel to the left or right completely, and from the position where the turning radius gauge is aligned to 0°, adjust knuckle stopper bolt **1**. Adjust so that the steering angle is within the standard inside steering angle value, to the left for the left front wheel, and to the right for the right front wheel. Then, tighten lock nut **2** at specified torque.

NOTE

Be sure when working on the vehicle, to adjust both stoper bolts 1 at the front and back of the knouckle arm side.

https://truckmanualshub.com/

Measurement of Side Slip



NOTE

Be sure that wheel alignment is adjusted perfectly before measuring side slip.

- Point the front wheels exactly forward.
- Maintain this position and slowly move vehicle forward, over side slip tester **A**, as slowly as possible.

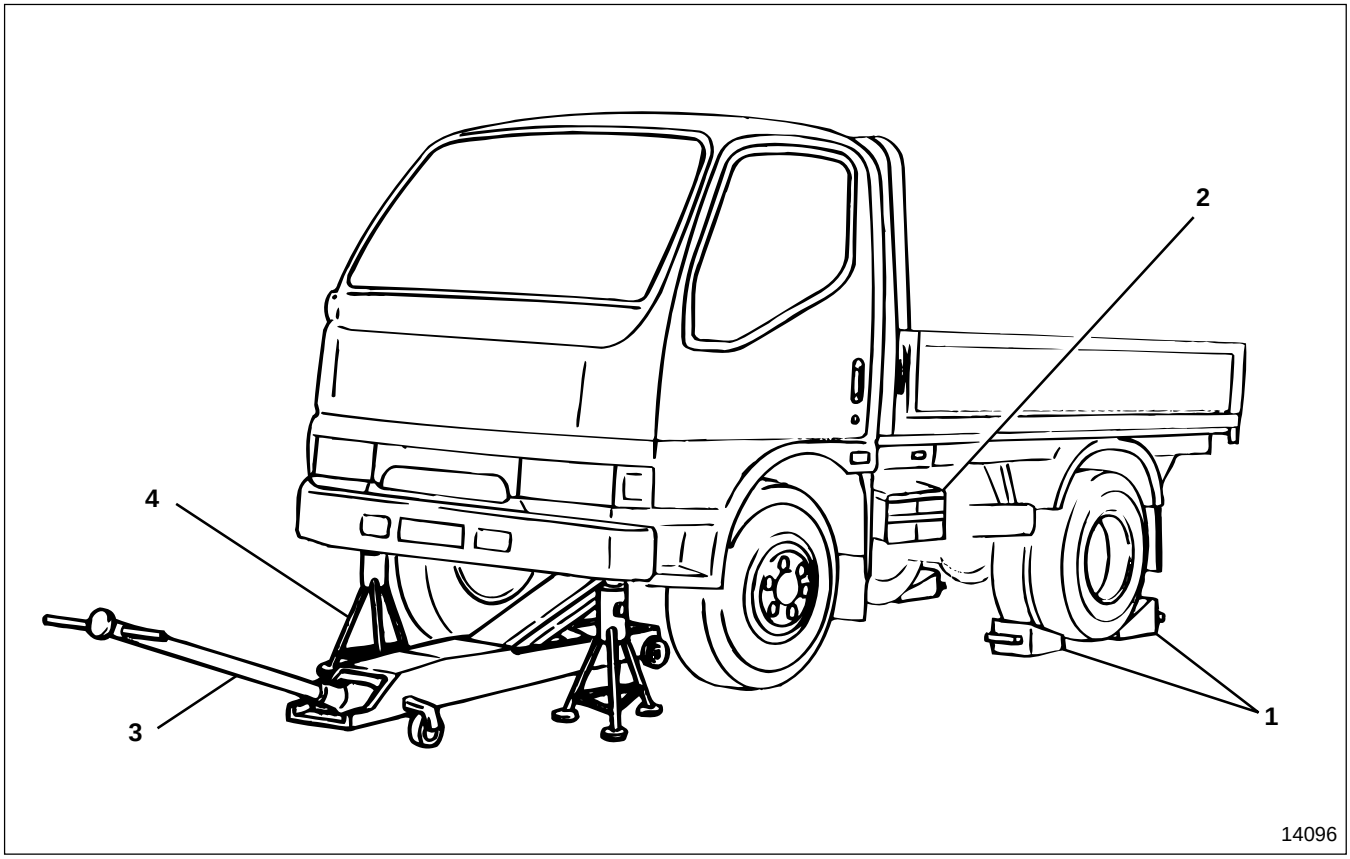
NOTE

Make sure, when measuring side slip, that the wheels point exactly forward when the vehicle passes over side slip tester A. Do not allow the wheels to veer from side-to-side.

- The side slip is indicated by side slip tester **A** after the vehicle has passed through the tester. Readjust wheel alignment if slippage is 3 mm {0.12 in.} or more per meter {3.28 ft.}.

https://truckmanualshub.com/

WORK BEFORE REMOVAL AND INSTALLATION OF FRONT AXLE



● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect the negative battery cable. Gr 54
3 Jack up the front axle with a garage jack.
4 Support the front frame on rigid racks.

WARNING

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

*: Knuckle and drive shaft P26B-22
⊗: Non-reusable parts

CAUTION ⚠

Be sure to protect brake hose 2 from dust by fitting plugs after removal.

NOTE

Do not disassemble wheel hub 18 and brake drum 19 except for replacement.

https://truckmanualshub.com/

● **Assembly sequence**

*→21→20→11→10→9→8→7 →6→5→4→3→2→1

11 : 19→18→17→16→15→14→13→12

WARNING⚠

You must bleed air from the brake system after installing the brake hose, failure to do so would cause the brake to malfunction. Gr 35

CAUTION⚠

Be careful not to damage oil seal 12, press-fitted into the top of wheel hub 18, when installing wheel hub and brake drum assembly 11 into the knuckle and drive shaft.

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
10, 12, 13, 15	Starting torque of wheel hub bearing	3±1 N·m {2.2±0.7 lbf.ft, 0.3±0.1 kgf·m}	—	Tangential force at hub bolt 18 to 34 N {4.0 to 7.7 lbf., 1.8 to 3.5 kgf}

https://truckmanualshub.com/

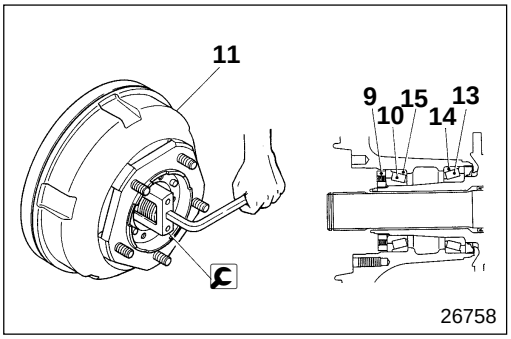
◆ Service procedure



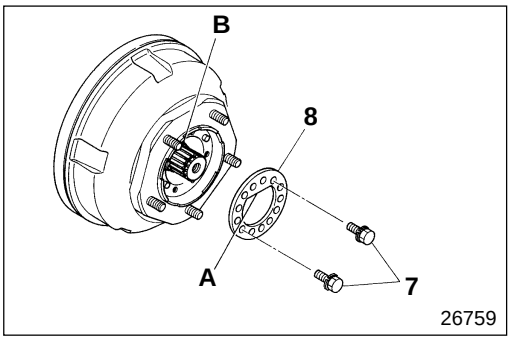
26758

● Starting torque of wheel hub bearing

[Adjustment]

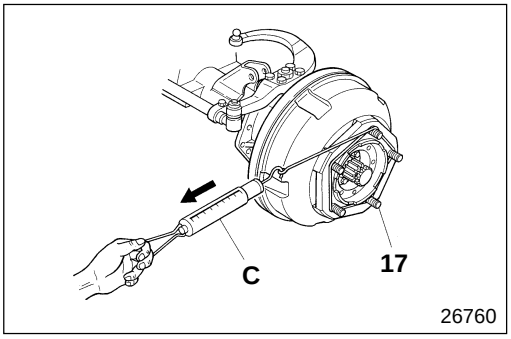
- Tighten lock nut **9** at specified torque (primary tightening) while turning wheel hub and brake drum assembly **11**, then slacken off.
- Turn wheel hub and brake drum assembly **11** several times to smooth operation of outer bearings **10**, **15**, and inner bearings **13**, **14** and retighten lock nut **9** at specified torque (secondary tightening).
- After adjustment, make sure that there is no play in the axial direction.

: Lock nut adjustment tool



26759

- Insert lock washer **8** so that flat area **A** fits onto notch **B** of the knuckle spindle. Mount two bolts **7** (diagonally opposite each other) to lock nut **9**, and tighten them at specified torque.
- If lock nut **9** and the hole of lock washer **8** do not align, slacken off the lock nut slightly.



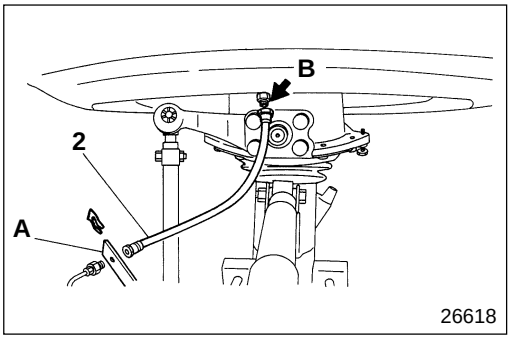
26760

[Measurement]

- Fasten spring balance **C** to hub bolt **17** and measure the tangential force.
- If the measured tangential force is the standard value, the starting torque conforms to the standard value.
- If the measured value deviates from the standard value, adjust the starting torque of the wheel hub bearing according to the procedure described above.
  If any fault is found after adjustment, replace outer bearings **10**, **15**, or inner bearings **13**, **14**.

NOTE

- **Make sure that there is no drag in the brake lining and brake drum 19 before you measure the tangential force.**
- **Make sure that you install oil seal 12.**
- **Do not install drive flange 6.**



26618

2 Removal and installation of brake hose

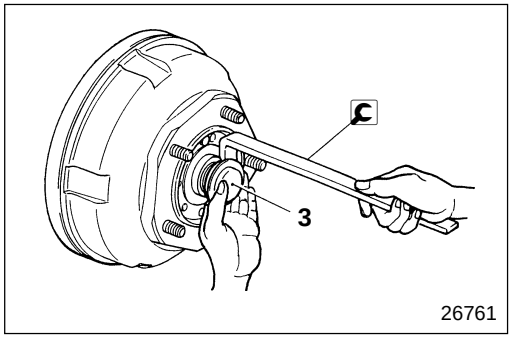
First remove brake hose **2** from bracket **A** (on the frame), then remove the brake hose from wheel brake **B**. For installation, follow this procedure in reverse.

CAUTION⚠

Make sure that brake hose 2 is not twisted when you install it.

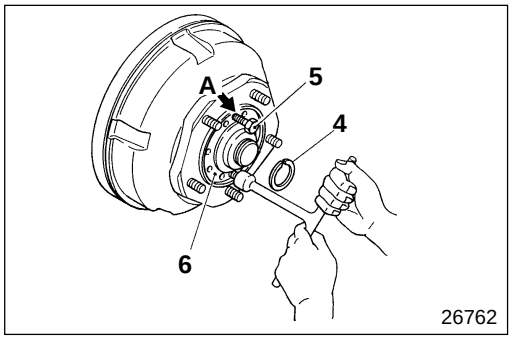
https://truckmanualshub.com/

WHEEL HUB AND BRAKE DRUM



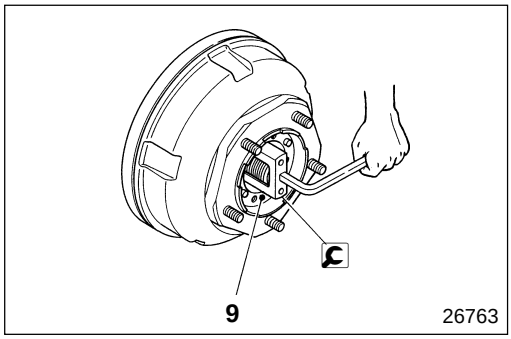
3 **Removal of hub cap**

: Hub cap wrench



6 **Removal of drive flange**

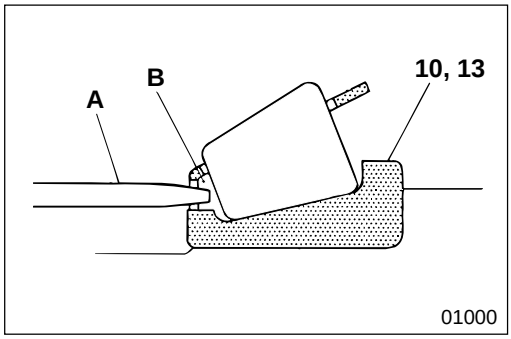
Remove snap ring **4**, and insert bolts **5** (to the same depth) into two tapped holes **A** provided for disassembly. Then, remove drive flange **6**.



9 **Removal and installation of lock nut**

When mounting lock nut **9** see P26B-17 : adjustment procedure for starting torque of the wheel hub bearing.

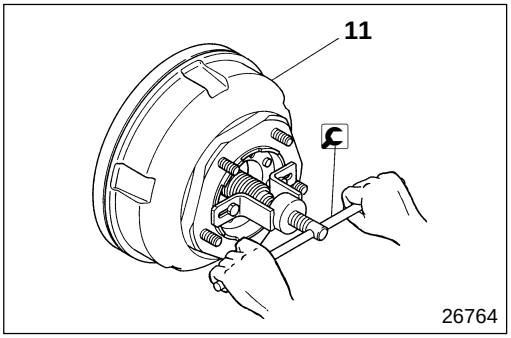
: Lock nut adjustment tool



10 **13** **Packing grease in outer bearing inner race and inner bearing inner race**

A : Grease pump nozzle
B : Between roller

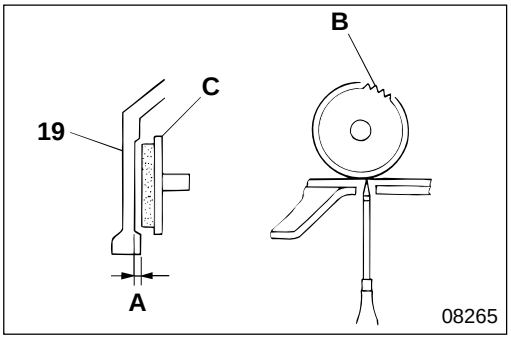
https://truckmanualshub.com/



11 Wheel hub and brake drum assembly

[Removal]

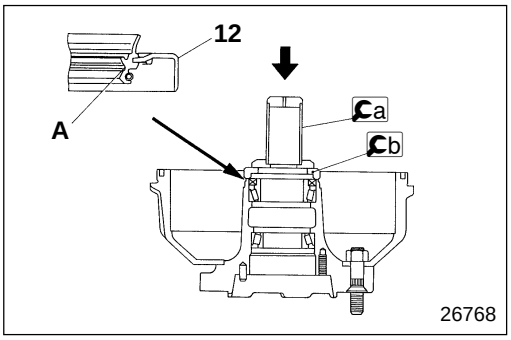
: hub puller



- If wheel hub and brake drum assembly **11** cannot be removed because of stepped wear **A** in brake drum **19**, remove the backing plate cover. Turn adjuster **B** in the opposite direction to the arrow on the backing plate to increase the clearance between the brake drum and brake shoe assembly **C**. Then, remove the wheel hub and brake drum assembly.
- Correct brake drum **19** if any fault is found. Gr 35

[Installation]

After installing wheel hub and brake drum assembly **11**, adjust the clearance between brake drum **19** and brake shoe assembly **C**. Gr 35

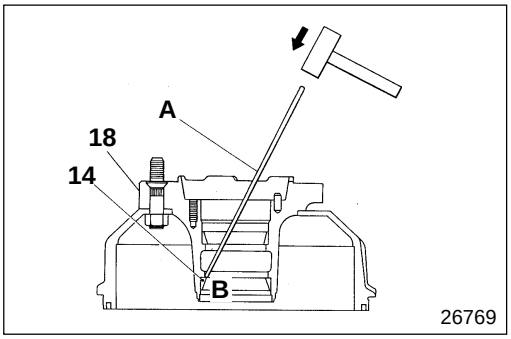


12 Installation of oil seal

Apply grease to lip area **A** of oil seal **12** and press-fit it.

a : Bearing installer

b : Oil seal installer

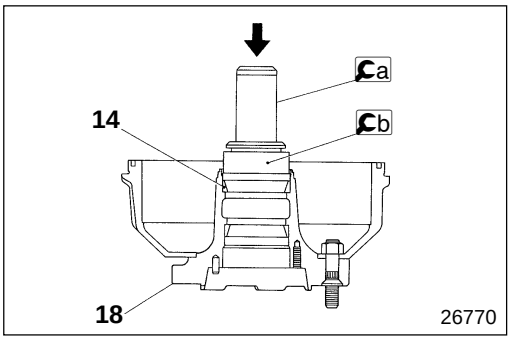


14 Inner bearing outer race

[Removal]

Drive out inner bearing outer race **14** evenly from three indented parts **B** in wheel hub **18**.

A : Pin-punch



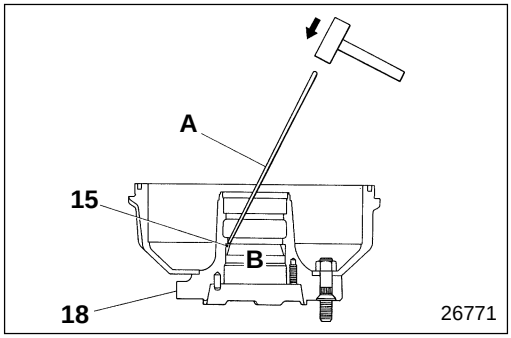
[Press-fitting]

a : Bearing installer

b : Bearing installer

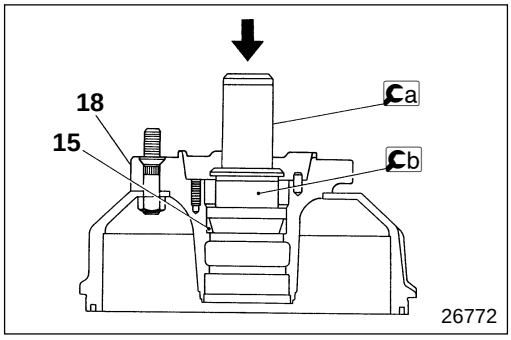
https://truckmanualshub.com/

WHEEL HUB AND BRAKE DRUM

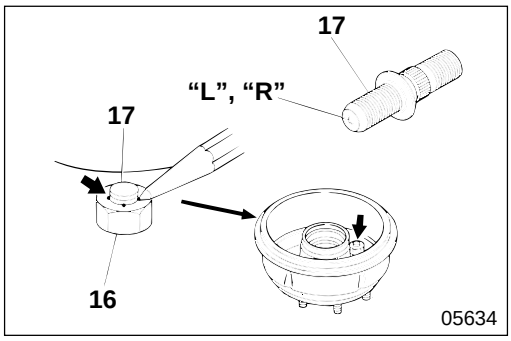


15 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **15** evenly from three indented parts **B** in wheel hub **18**.
A : Pin-punch



[Press-fitting]
Ca : Bearing installer
Cb : Bearing installer



16 **17** **Installation of nut and hub bolt**

- Hub bolt **17** is marked with **"L"** (left) or **"R"** (right) to indicate the side it is to be mounted on. Check this symbol before mounting the bolt.
- Screw nut **16** onto hub bolt **17** and tighten at specified torque. Then, stake the hub bolt to keep it from turning.

KNUCKLE AND DRIVE SHAFT

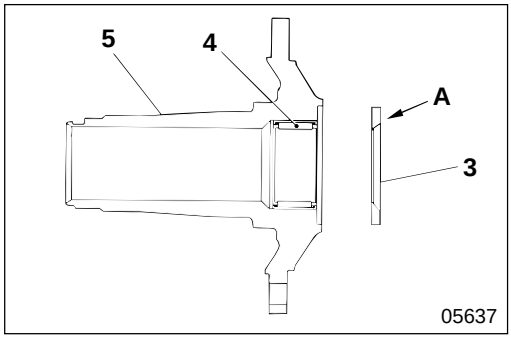
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
25	Bearing installer 	MB999097 (T90ST30)	Press-fitting of trunnion bearing outer race (Use in combination)
	Bearing installer 	MB999101 (T90ST25)	
26	Oil seal installer 	MB999152	Press-fitting of oil seal

◆ Service procedure

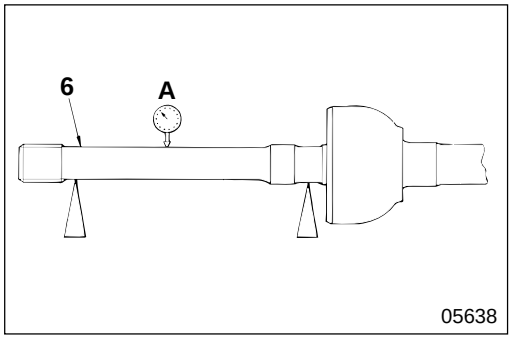


3 **4** **Installation of spacer and needle bearing**

- Pack the space between rollers of needle bearing **4** with grease and press-fit the needle bearing until it is level with the end of knuckle spindle **5**.
- Install spacer **3** on knuckle spindle **5** as illustrated.
- After installing spacer **3**, coat the chamfered side **A** of the inner diameter of the spacer with grease.

CAUTION

Take care not to use too much force when installing needle bearing 4.



6 **Drive shaft assembly**

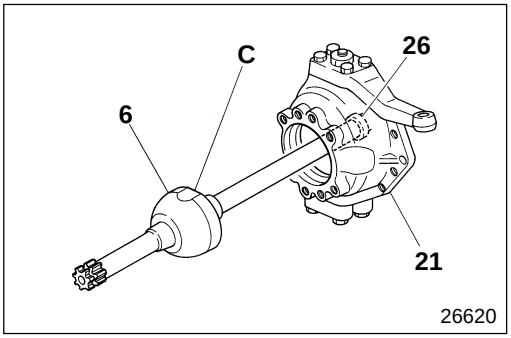
[Inspection]

Measure deflection **A** of drive shaft assembly **6** at the center of the inner shaft. If the measured value is higher than the limit, replace the drive shaft assembly.

NOTE

To measure the deflection of drive shaft assembly 6, turn it one full revolution and read the dial gauge indicator. The deflection is one half of the indicated value.

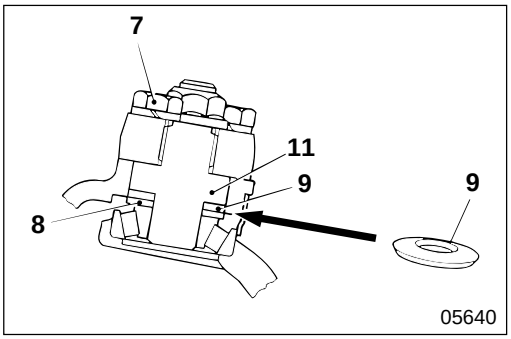
https://truckmanualshub.com/



[Installation]
Insert drive shaft assembly **6** into steering knuckle **21** with flat part **C** of the Birfield joint facing upwards.

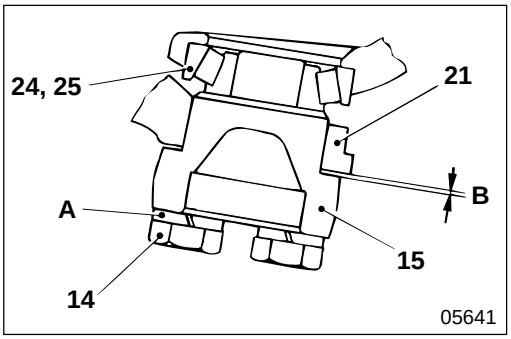
CAUTION

Be careful not to damage oil seal 26, when installing drive shaft assembly 6.



8 **9** **Spacer and conical spring**

[Adjustment of pre-pressure in trunnion bearing]
Assemble conical spring **9** and spacer **8** (thickness=3.2 mm {0.13 in.}) and temporarily tighten kingpin, upper **11** with assembly bolt **7** as illustrated.



- Install kingpin, lower **15** into steering knuckle **21**. Screw bolt **14** into spring washer **A**, and tighten sufficiently but without applying tension to the spring washer.
- Offer up kingpin, lower **15** until it fits snugly into trunnion bearings **24**, **25** in the lower part.
