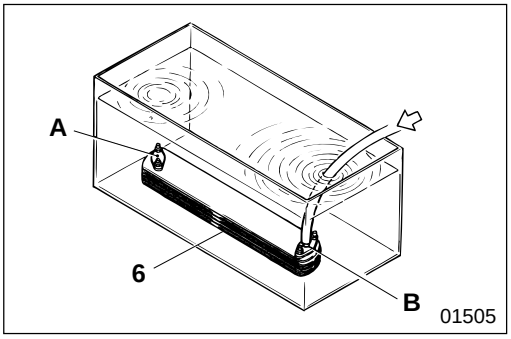
◆ Service procedure

● Cleaning

- Check and see if any carbon deposits or sludge have developed in the oil passage of oil cooler element **6** or its bypass. Clean any deposits off thoroughly with cleaning solvent.
- Also clean any water scale or fur found in oil cooler element **10** or oil cooler cover **10**. Gr 14.



6 Inspection of oil cooler element

- Immerse oil cooler element **6** in a water tank after plugging exit port **A** and connecting the hose to engine oil entry port **B**.
- Apply air pressure of 980 kPa {140 lbf/in^2, 10 kgf/cm^2} via the hose and see if there is any air leakage from any part of oil cooler element **6**.
- If you see any leakage, replace oil cooler element **6**.

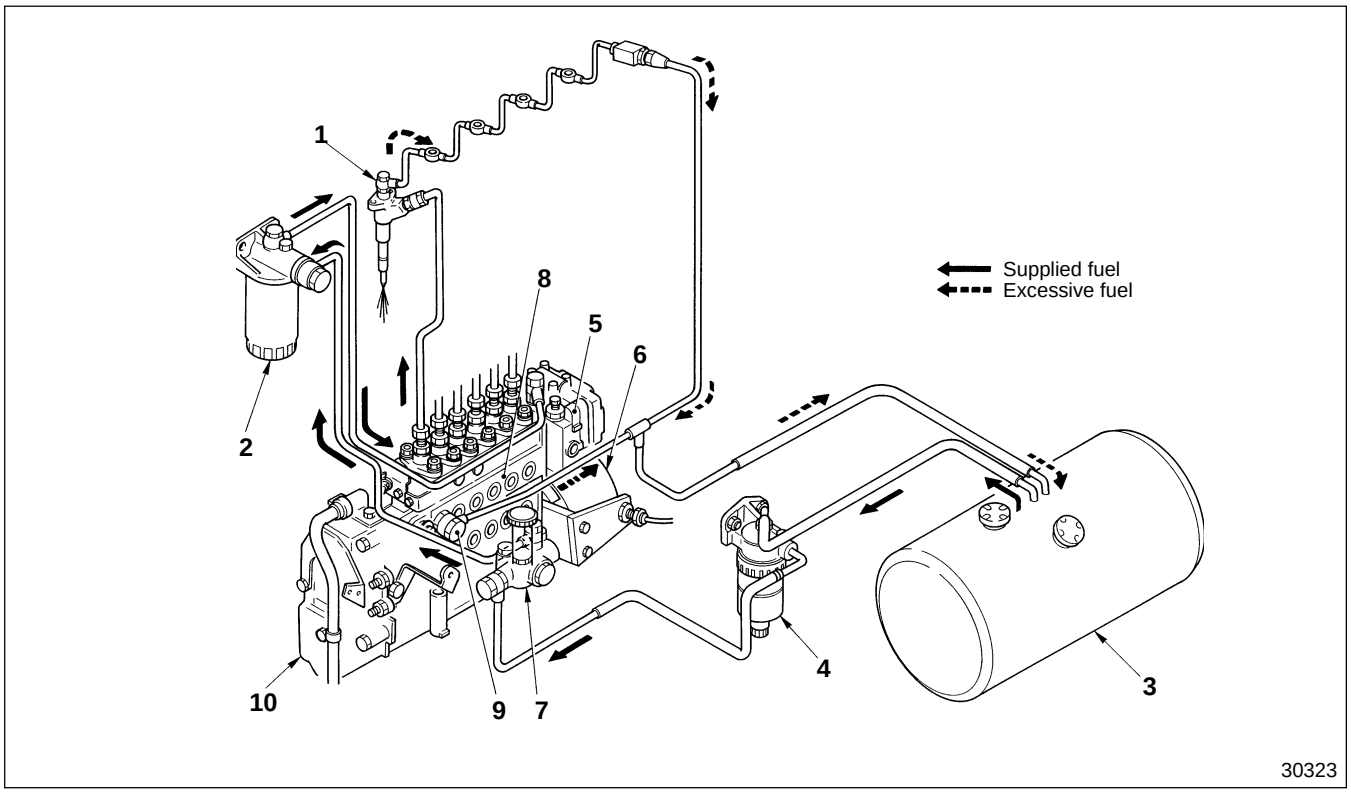
1 Injection nozzle
2 Fuel filter



3 Fuel tank
4 Water separator
5 Pre-stroke actuator
6 Automatic timer
7 Feed pump
8 Injection pump
9 Overflow valve
10 Electronic governor

Fuel in fuel tank **3** is sucked up by feed pump **7** which is driven by the cam action of injection pump **8** and is filtered through fuel filter **2** which removes dirt and other foreign particles.
Filtered fuel is sent to the injection pump where the fuel pressure is boosted and injected through injection nozzle **1** into the combustion chamber.
When fuel pressure is higher than the specified value, overflow valve **9** opens to let the fuel return to the fuel tank **3**.

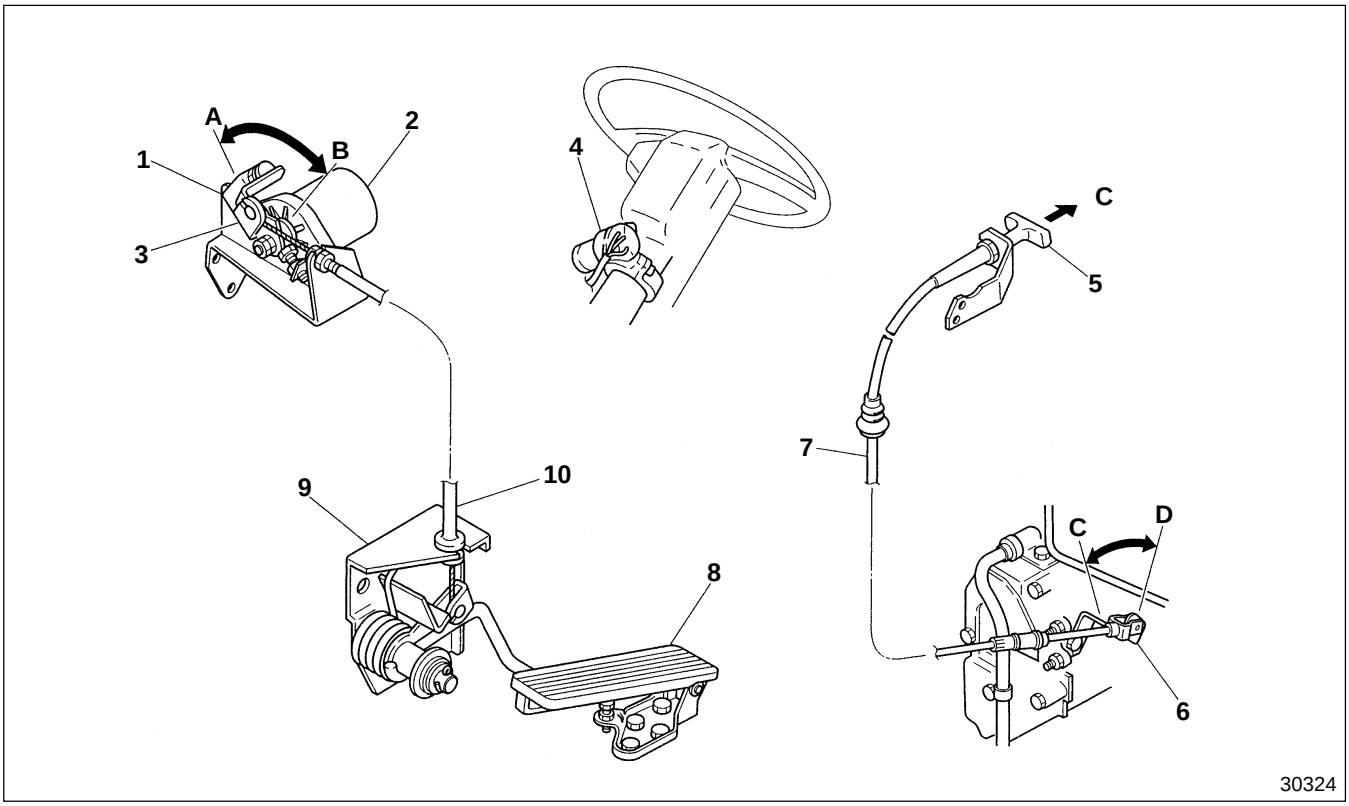
Engine Control



1 Accelerator pedal switch
2 Accelerator pedal position sensor
3 Lever
4 Starter switch
5 Emergency engine stop button
6 Stop lever
7 Engine stop cable
8 Accelerator pedal assembly
9 Accelerator link assembly
10 Accelerator control cable

A : Idling position
B : Full-load position
C : Engine-stop position
D : Engine start-up position

● **Accelerator pedal switch**

Accelerator pedal switch **1** detects whether the accelerator pedal assembly **8** is depressed.

● **Accelerator pedal position sensor**

Accelerator pedal position sensor **2** detects the movement of the accelerator pedal assembly **8** and sends the information to the electronic governor control unit in the form of electrical signals. Moreover, the accelerator position sensor lever **3** is continuously pulled in the idling position direction **A** by the return spring.

● **Emergency engine stop button**

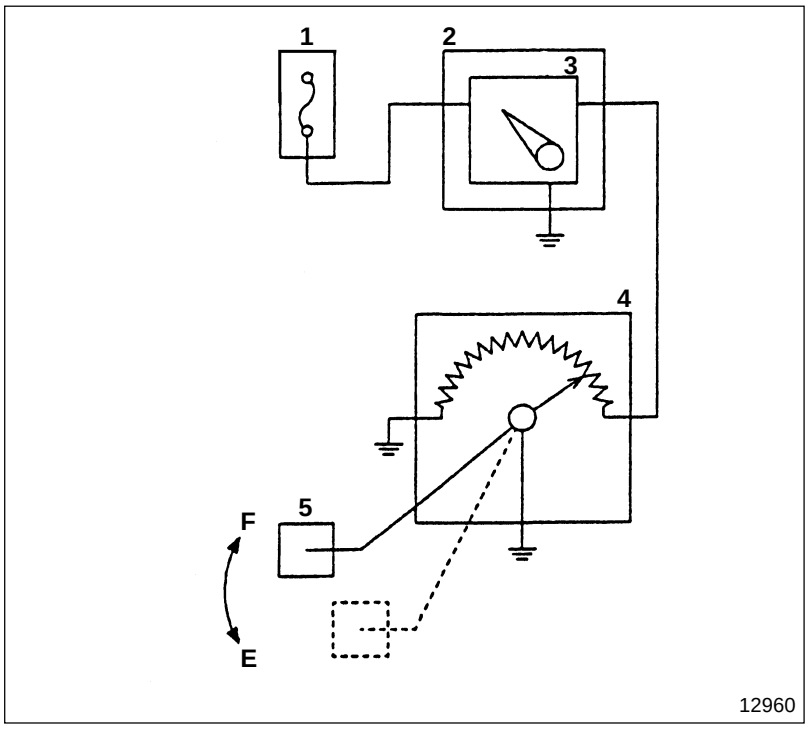
The engine is generally stopped electrically by setting the starter switch **4** to the ACC position.
However, if the engine does not stop by setting the starter switch to the ACC position because of malfunctions in the electronic governor system, etc., pulling the emergency engine stop button **5** moves the electronic governor stop lever **6** to the stop position **C** and stops the engine.

CAUTION⚠

If the engine was stopped by pulling the engine stop button 5, the control unit computer must be reset by setting the starter switch 4 to the ACC or LOCK position.
If the engine is restarted without resetting the computer, the engine revolution control will be unstable.

https://truckmanualshub.com/

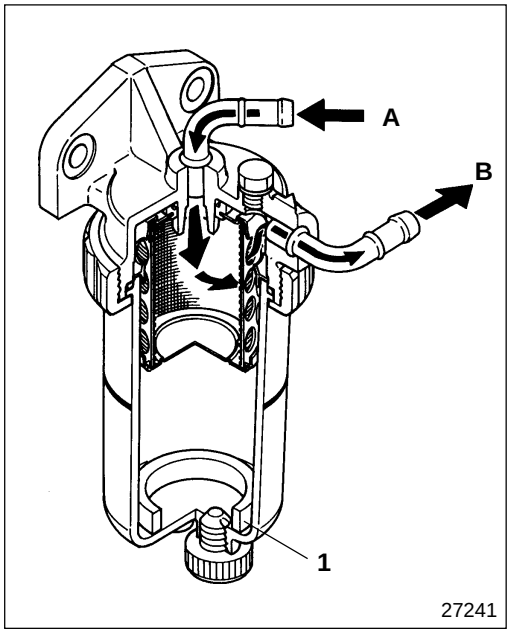
Fuel Gauge Electric Circuit



1 Relay and fuse box
2 Meter cluster
3 Fuel gauge
4 Fuel gauge sending unit
5 Float

The fuel gauge circuit indicates the amount of fuel remaining in the fuel tank by means of a gauge.

Water Separator



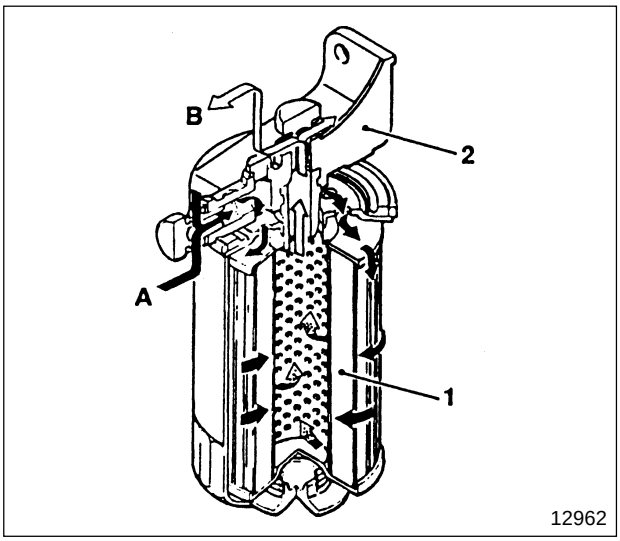
1 Water level ring

A : From fuel tank
B : To feed pump

The water separator is installed between the fuel tank and the feed pump. Any water present in the fuel is separated by the baffle plate and the screen assembly.

https://truckmanualshub.com/

Fuel Filter



1 Fuel filter
2 Fuel filter head

A : From feed pump
B : To injection pump

Pressurized fuel is delivered from the feed pump of the injection pump to the fuel filter which separates water from the fuel and removes foreign particles from the fuel by fuel filter **1**.

*2 : Automatic transmission

- The electronic governor and pre-stroke control injection pump system combines an electronic governor **6** with an injection pump **7** that has an electronically controlled pre-stroke adjustment feature.
- The injection pump's plunger lift speed varies in accordance with the engine speed, causing concomitant variations in the injection pipe pressure.
- Variations in the injection pipe pressure make it difficult to achieve an optimum spray from the injection nozzles and the optimum air/fuel mixture.
- To compensate for changes in the injection pipe pressure, the injection pump plunger pre-stroke is increased at low and mid- range speeds, thus ensuring that fuel injection takes place late in the cam lift, when plunger movement is relatively fast.
- At high speeds, the plunger pre-stroke is decreased, thus ensuring that fuel injection takes place in early in the cam lift, when plunger movement is relatively slow. Excessive increases in injection pipe pressure are thus prevented.
- By adjusting the plunger pre-stroke in this manner, the pre-stroke control injection pump **7** ensures that the spray and air/ fuel mixture are always optimally suited to combustion.
- The overall benefits are higher engine torque and cleaner exhaust emissions than are possible with a conventional injection pump.
- Control operations are performed by the electronic governor control unit **41**, which receives data from sensors on the engine and other vehicle components, processes them, and issues appropriate drive signals to the pre-stroke actuator **8** (located at the rear of the injection pump) and to the linear DC motor **3** (located inside the electronic governor).

The system's control functions (including auxiliary functions) are shown in the following table.

Item	Operation	Data source	
		Sensor(s)	Data signal(s)
Fuel injection rate control	The fuel injection rate is optimized to match engine operating conditions. 🕮 P13 - 12	5, 10, 22, 24, 34, 39	Ⓐ, Ⓖ, Ⓣ, Ⓥ, ⓓ, ⓗ
Pre-stroke control	The timing sleeve position is altered, thereby changing the prestroke and advancing the fuel injection timing. 🕮 P13 - 13	8, 10, 22, 35	Ⓔ, Ⓕ, Ⓖ, Ⓣ, ⓔ
* Control rack preliminary operation	In cold weather and other conditions that are unfavorable for engine startup, the control rod is caused to move slightly in the fuel increase direction, thus enhancing startability. This operation takes place when the starter switch is turned ON.	1, 22, 25, 35	ⓘ, Ⓣ, ⓦ, ⓔ
* Warmup time shortening function	In cold weather, the engine's idling speed is increased to shorten the time required for warmup. 🕮 P13 -14	22, 23, 35	Ⓣ, Ⓤ, ⓔ
* Overrun prevention function	In the event of an abnormal increase in engine speed, the control rack is pulled in the fuel decrease direction to prevent the engine from overrunning.	10	Ⓖ
* Emergency vehicle operation function (used in event of control rack position sensor fault)	In the event of a fault in the control rack position sensor **5**, the control rack position is sensed by the sub control rack position sensor **9**. If both rack position sensors develop faults, thus preventing detection of the rack position and optimization of the fuel injection rate, the fuel injection rate is controlled in accordance with engine speed signals only. 🕮 P13 -16	5, 9, 10	Ⓐ, Ⓓ, Ⓖ

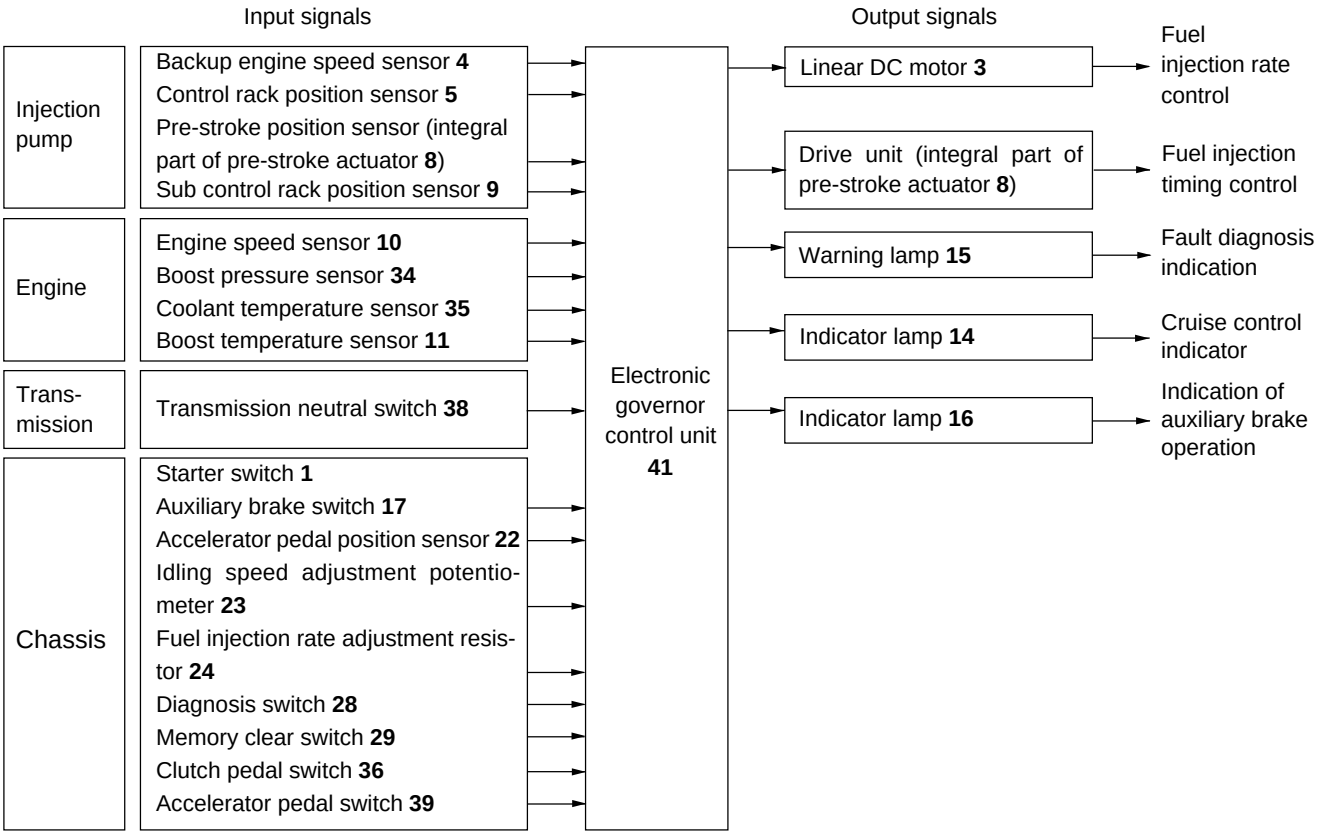
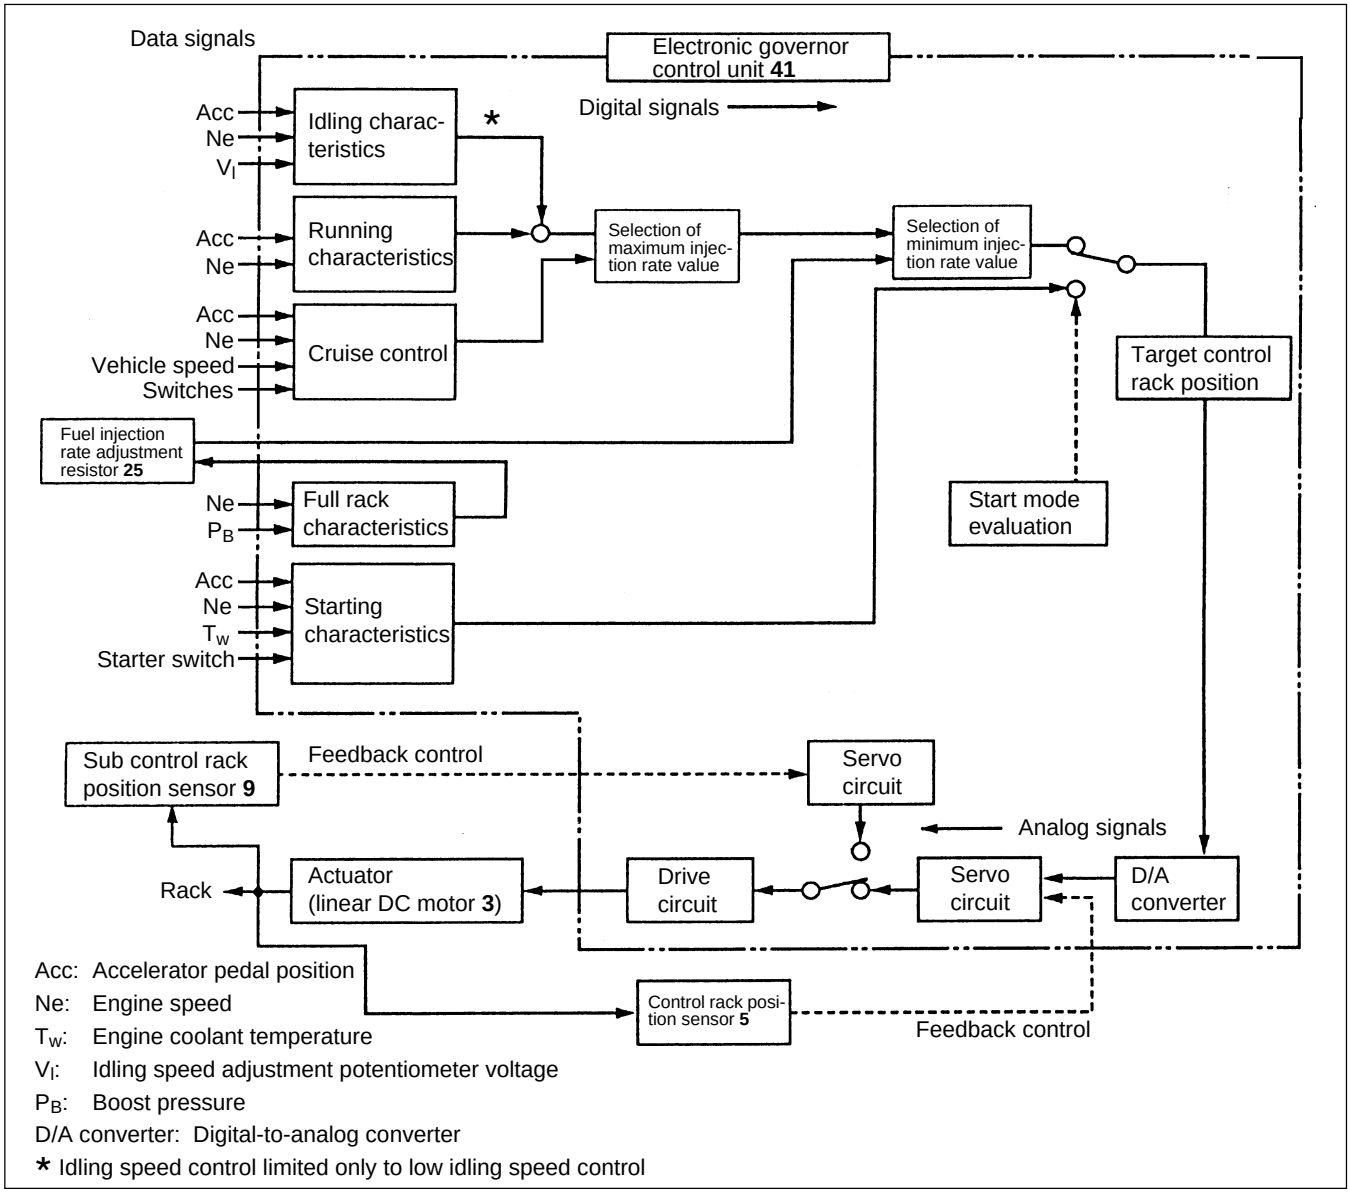
System Block Diagram



https://truckmanualshub.com/

● Fuel injection rate control



Acc: Accelerator pedal position
Ne: Engine speed
T_W: Engine coolant temperature
V_I: Idling speed adjustment potentiometer voltage
P_B: Boost pressure
D/A converter: Digital-to-analog converter
* Idling speed control limited only to low idling speed control

Operation of electronic governor control unit 41

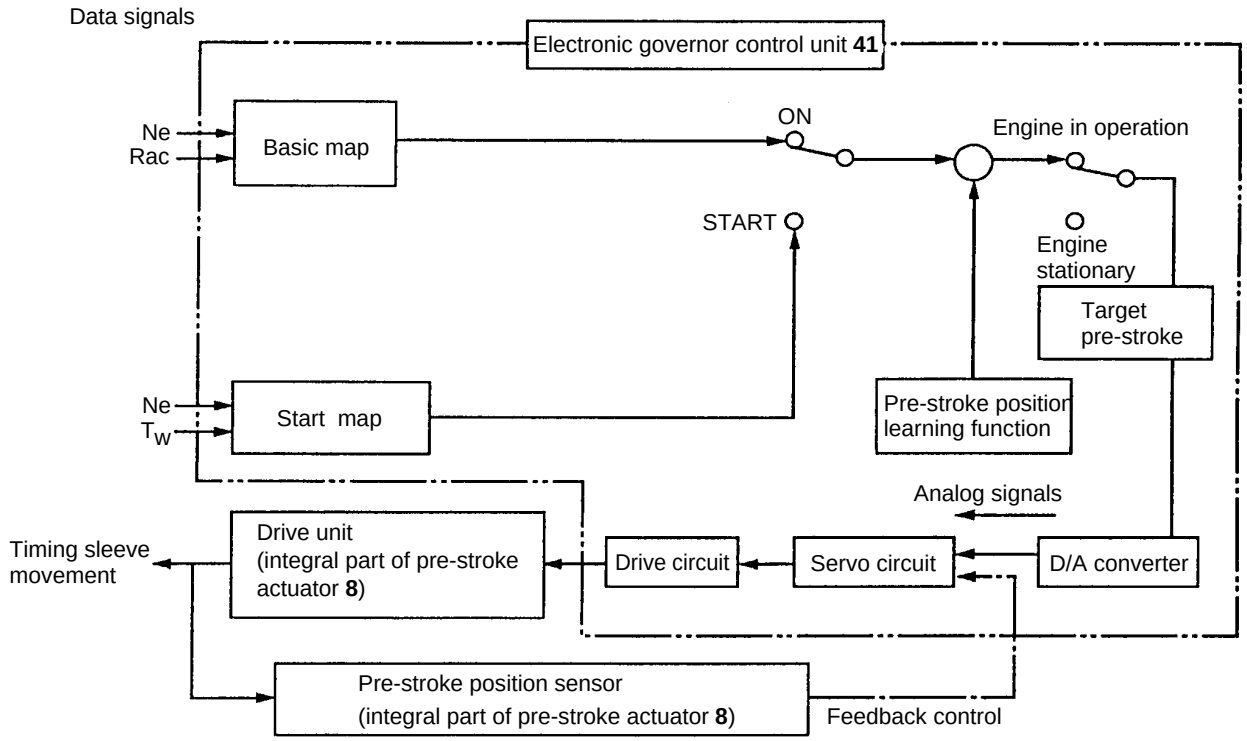
- During engine operation control is effected in accordance with the cruise control, idling characteristics and running characteristics. The maximum fuel injection rate value is selected in accordance with the output signals.
- After this selection, the control unit calculates and determines the minimum injection rate to prevent the injection rate selected in accordance with the full rack characteristics from exceeding the maximum injection rate. The target control rack position is thus determined. (During engine startup, control is effected in accordance with the starting characteristics, with the target rack position determined directly in accordance with the data signals.)
- The determined control rack position signal is converted into a continuous analog signal. By way of the servo circuit and drive circuit, the signal is applied to the linear DC motor **3**, which moves the rack.

Operation of control rack position sensor 5

- The control rack position sensor **5** monitors the operation of the linear DC motor **3**. In accordance with the position of the control rack, the sensor determines whether the linear DC motor is operating in accordance with the target, and it transmits feedback signals to the electronic governor control unit **41**.
- In accordance with the feedback signals, the electronic governor control unit **41** calculates the actual control rack position. If the actual position differs from the target, the control unit issues a correction command.
- Through repetition of this process, the system ensures that the control rack position complies with the target at all times.

https://truckmanualshub.com/

● Pre-stroke control



Rac: Control rack position
Ne: Engine speed
T_w: Engine coolant temperature
D/A converter: Digital-to-analog converter

Operation of electronic governor control unit 41

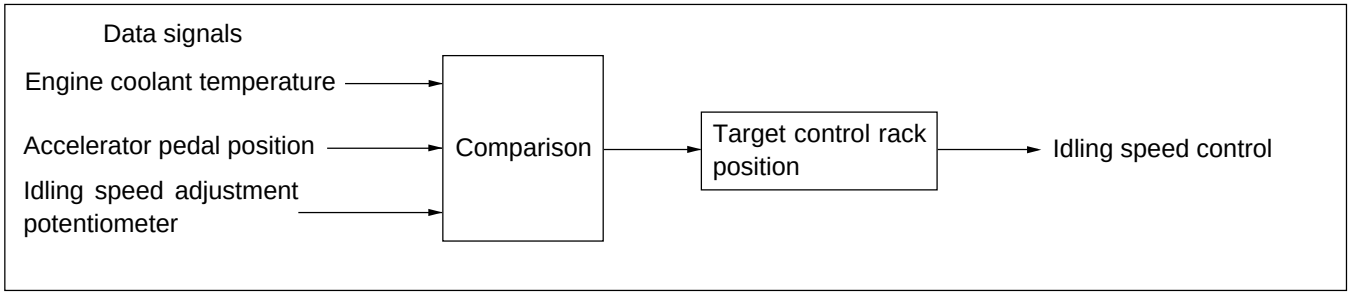
- During engine operation, control is effected in accordance with the basic map.
- The pre-stroke position learning function compensates for pre-stroke position sensor adjustment errors and other injection pump errors using the pre-stroke position sensor output voltage, thereby enabling determination of the target pre-stroke.
- The determined target pre-stroke value is converted into a continuous analog signal. By way of the servo circuit and drive circuit, the signal is applied to the drive unit. The drive unit moves the timing sleeve to alter the pre-stroke.
- During engine startup, control is effected in accordance with the start map.

Operation of pre-stroke position sensor (integral part of pre-stroke actuator 8)

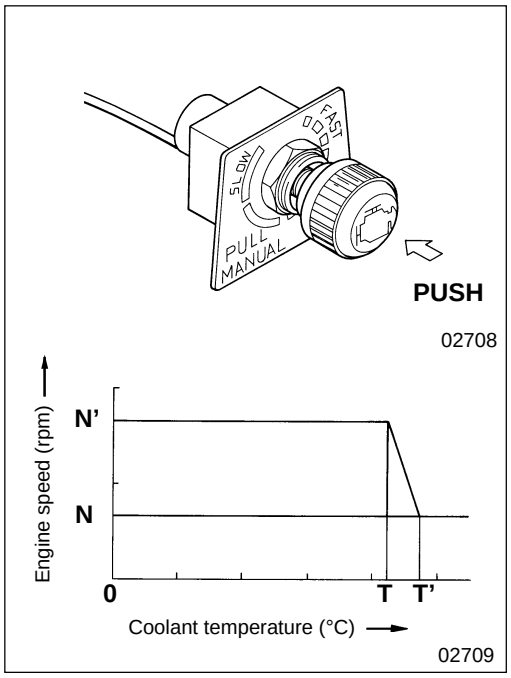
- The pre-stroke position sensor monitors the operation of the drive unit. In accordance with the position of the timing sleeve, the sensor determines whether pre-stroke control is being performed in accordance with the target, and it transmits feedback signals to the electronic governor control unit **41**.
- In accordance with the feedback signals, the electronic governor control unit **41** calculates the actual timing sleeve position. If the actual position differs from the target, the control unit issues a correction command.
- Through repetition of this process, the system ensures that the timing sleeve position complies with the target at all times. The appropriate pre-stroke is achieved as a result.

https://truckmanualshub.com/

● Warmup time shortening function



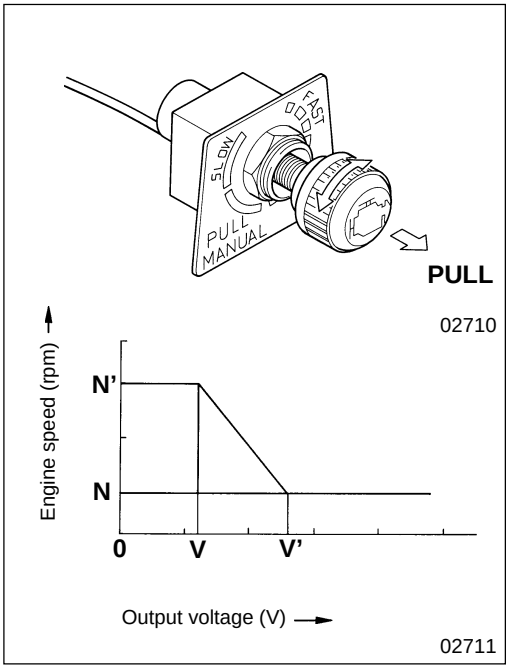
The warmup time shortening function increases the engine's idling speed in accordance with the coolant temperature, thereby shortening the time required for the engine to warm up. Control is effected automatically or manually in accordance with the position of the idling speed adjustment potentiometer **23**. Automatic control is selected by pushing the potentiometer, and manual control is selected by pulling it.



Automatic control (Potentiometer pushed)

- Automatic control is selected when the idling speed adjustment potentiometer **23** is pushed.
- When the coolant temperature is low, the engine's idling speed is automatically increased to shorten the time required for warmup.
- If the coolant temperature increases from **T** to **T'** (see the graph), the engine speed is decreased from **N'** to **N**. thus returning to its standard idling level.

https://truckmanualshub.com/



Manual control (Potentiometer pulled)

- When the idling speed adjustment potentiometer **23** is pulled, the automatic mechanism is deselected. The driver can then adjust the idling speed as desired by rotating the potentiometer. (Rotation of the potentiometer causes the potentiometer's output voltage to change accordingly.)
- With the output voltage between **0** and **V**, the engine speed stays at the **N** to **N'** level.
- If the output voltage is increased from **V** to **V'** (see the graph), the engine speed decreases from **N'** until it reaches its standard idling level **N**.

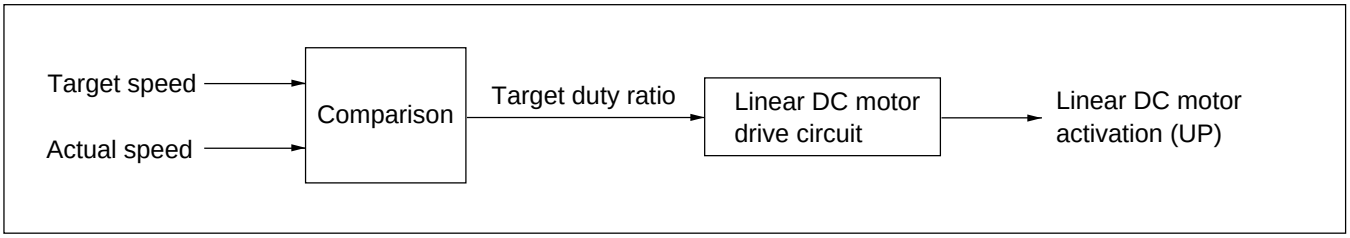
https://truckmanualshub.com/

● Emergency vehicle operation function (Used in event of control rack position sensor fault)

Fault in Control rack position sensor 5

In the event of a fault in the control rack position sensor **5**, detection of the control rack position is performed using the sub control rack position sensor **9**. This enables more-or-less normal vehicle operation.

Fault in control rack position sensor 5 and sub control rack position sensor 9



In the event of faults in both the control rack position sensor **5** and sub control rack position sensor **9**, the position of the rack, which is controlled by the linear DC motor **3**, cannot be sensed directly. The fuel injection rate cannot be controlled normally with the engine in this condition. As an emergency measure, therefore, control operations are performed in accordance with engine speed data signals only. For this function, target engine speeds for given degrees of accelerator pedal depression are pre-programmed into the electronic governor control unit **41**. Control is effected as follows:

- The target engine speed is compared with the actual engine speed (this is indicated by the engine speed sensor **10**).
- The target duty ratio is determined in accordance with the result of the comparison. In accordance with the target duty ratio, a drive signal is transmitted to the UP-side (speed increasing side) circuit to effect control over the engine speed. If the target engine speed exceeds the actual engine speed or vice versa, the UP-side circuit's ON time period is altered such that the target engine speed is maintained.

The target duty ratio is the ratio of the time periods during which the linear DC motor's UP-side and DOWN-side (speed decreasing side) circuits are energized. It is calculated as follows:

$$\text{Duty ratio} = \frac{\text{UP-side circuit ON time period}}{\text{UP-side circuit ON time period + DOWN-side circuit ON time period}} \times 100\%$$

CAUTION ⚠

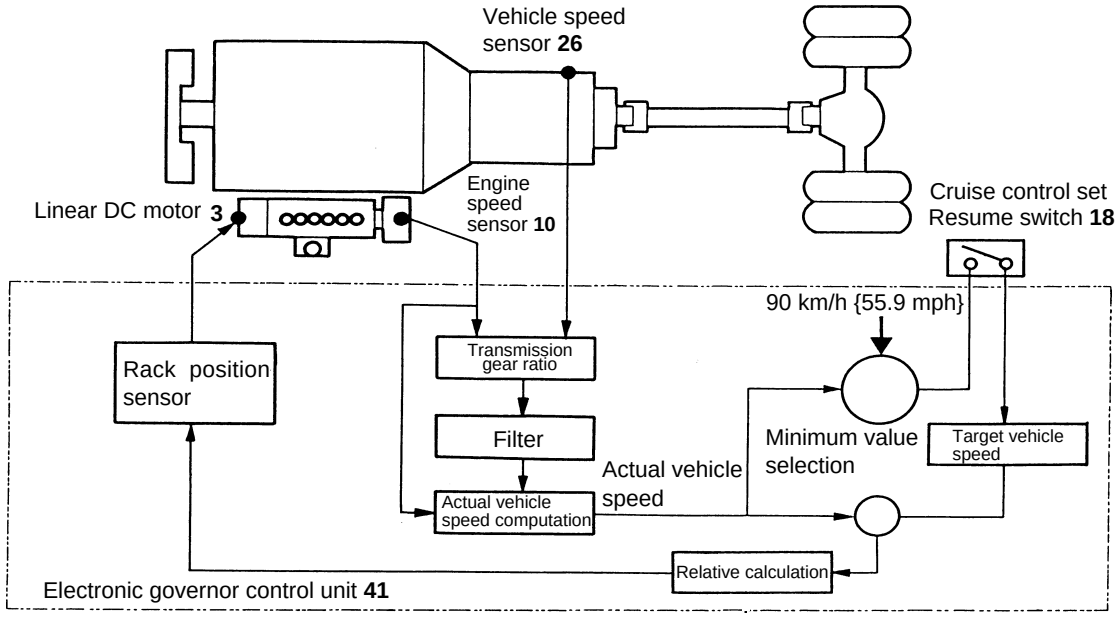
When this function is activated, the warning lamp 15 flashes to indicate that the engine must be inspected immediately. 🕮 **P13-38**

https://truckmanualshub.com/

M E M O

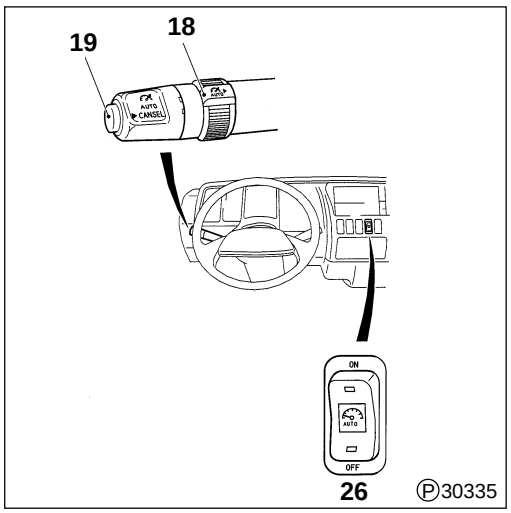
https://truckmanualshub.com/

● Cruise control function <Manual transmission>



25930

- The transmission gear ratio is calculated based on the information from the vehicle sensor **26** and the engine speed sensor **10**.
- The actual vehicle speed is calculated from the gear ratio and the engine revolution speed.
- The cruise control vehicle speed is set to the minimum of the maximum possible vehicle speed (100 km/h {62 mph}) and the calculated actual vehicle speed.
- By setting the desired vehicle target speed, the difference between the set speed and the actual vehicle speed is calculated and the target rack position is determined.
- This command is sent to the linear DC motor **3** as an operational signal and thus an even vehicle speed can be maintained by controlling the rack position.



Ⓟ30335

The cruise control should be operated using the cruise control set switch **19** and the resume switch **18** as follows.

CAUTION⚠

The following conditions must be satisfied for cruise control to operate.

- **The vehicle speed must be between 40 to 90 km/h {25 to 55.9 MPH} and the gear shift lever must be in the 4th position or higher.**
- **The cruise control main switch 28 must be ON.**
- **The exhaust brake must be OFF.**
- **The clutch and the brake pedal must be in released.**

https://truckmanualshub.com/

Cruise control set resume switch 18

SET side

This switch is used to set and change the cruise vehicle speed.

- Setting the cruise speed
  Set the vehicle speed at your discretion by operating the accelerator pedal.
  Turn cruise control set/resume switch **18** to SET, and the cruise speed will be set to the current vehicle speed when it is released. The indicator lamp will light up at the same time.
- Reducing the cruise speed
  With cruise control in activation, vehicle speed decreases while cruise control set/resume switch **18** is turned to SET. Release the switch when the vehicle reaches a desired speed to set cruise control at that speed.
- Increasing the cruise speed
  Press the accelerator pedal. When the vehicle reaches a desired speed, turn cruise control set/resume switch **18** to SET and release it immediately. The vehicle continues traveling at the set speed.

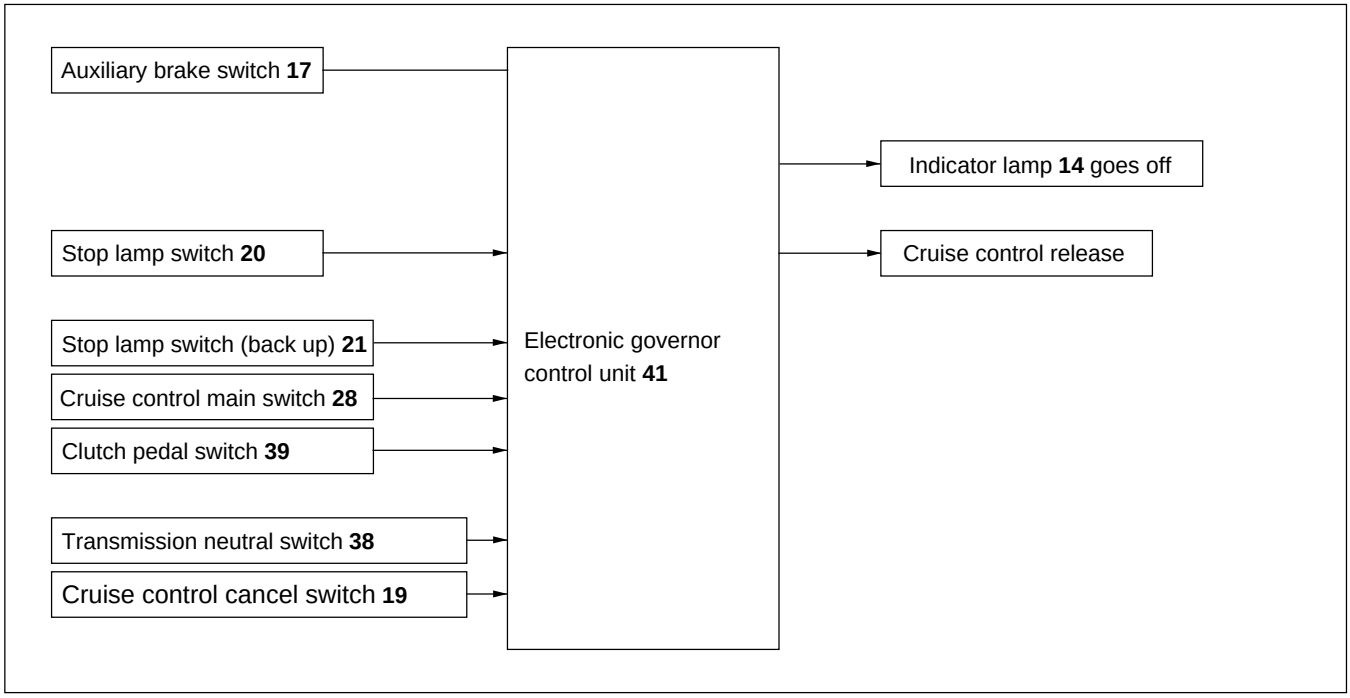
RESUME side

To restore or change vehicle speed setting.

- Restoring previous vehicle speed setting when cruise control is deactivated by deceleration, turning and releasing cruise control set/resume switch **18** will restore the previous vehicle speed setting.
- Increasing the set vehicle speed setting with cruise control in activation, turning cruise control set/resume switch **18** to RESUME will increase vehicle speed. When the switch is released, vehicle speed at that time is set as cruise control speed.

https://truckmanualshub.com/

Cruise control release <Manual transmission>

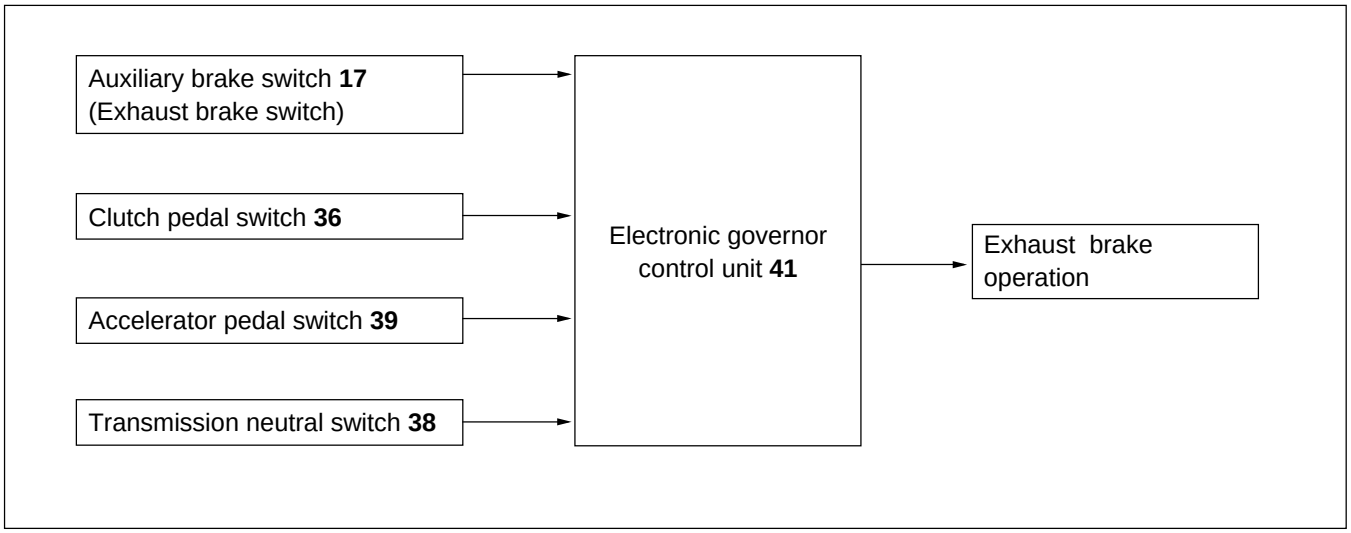


The cruise control is disengaged or temporarily disabled when the switches are in the following conditions.
<Disengaged>
Cruise control main switch **28** OFF
<Temporarily disabled>

- Auxiliary brake switch **17** ON
- Clutch pedal switch **39** ON (Depressing the clutch pedal)
- Transmission neutral switch **38** OFF (Transmission in neutral position)
- Stop lamp switch **21** ON (Depressing the brake pedal)
- Cruise control cancel switch **19** ON
- Vehicle speed goes below 18 mph

https://truckmanualshub.com/

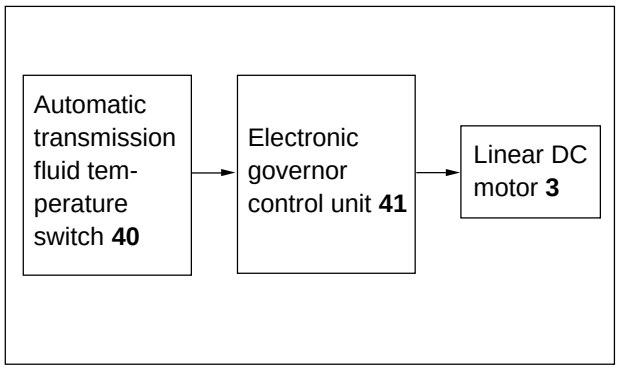
● Auxiliary brake control function



The auxiliary brake control function acts upon the auxiliary braking devices, i.e., the exhaust brake, when the following conditions are satisfied:

- Clutch pedal switch **36**: OFF (clutch pedal released)
- Accelerator pedal switch **39**: ON (accelerator pedal released)
- Transmission neutral switch **38**: ON (transmission not in neutral)

● Injection control function in high ATF temperature condition <Automatic transmission>



When the temperature of automatic transmission fluid exceeds the normal range, automatic transmission fluid temperature switch **40** turns ON. When electronic governor control unit **41** detects this rack limit switch operation, it controls linear DC motor **3** to reduce the engine output power.

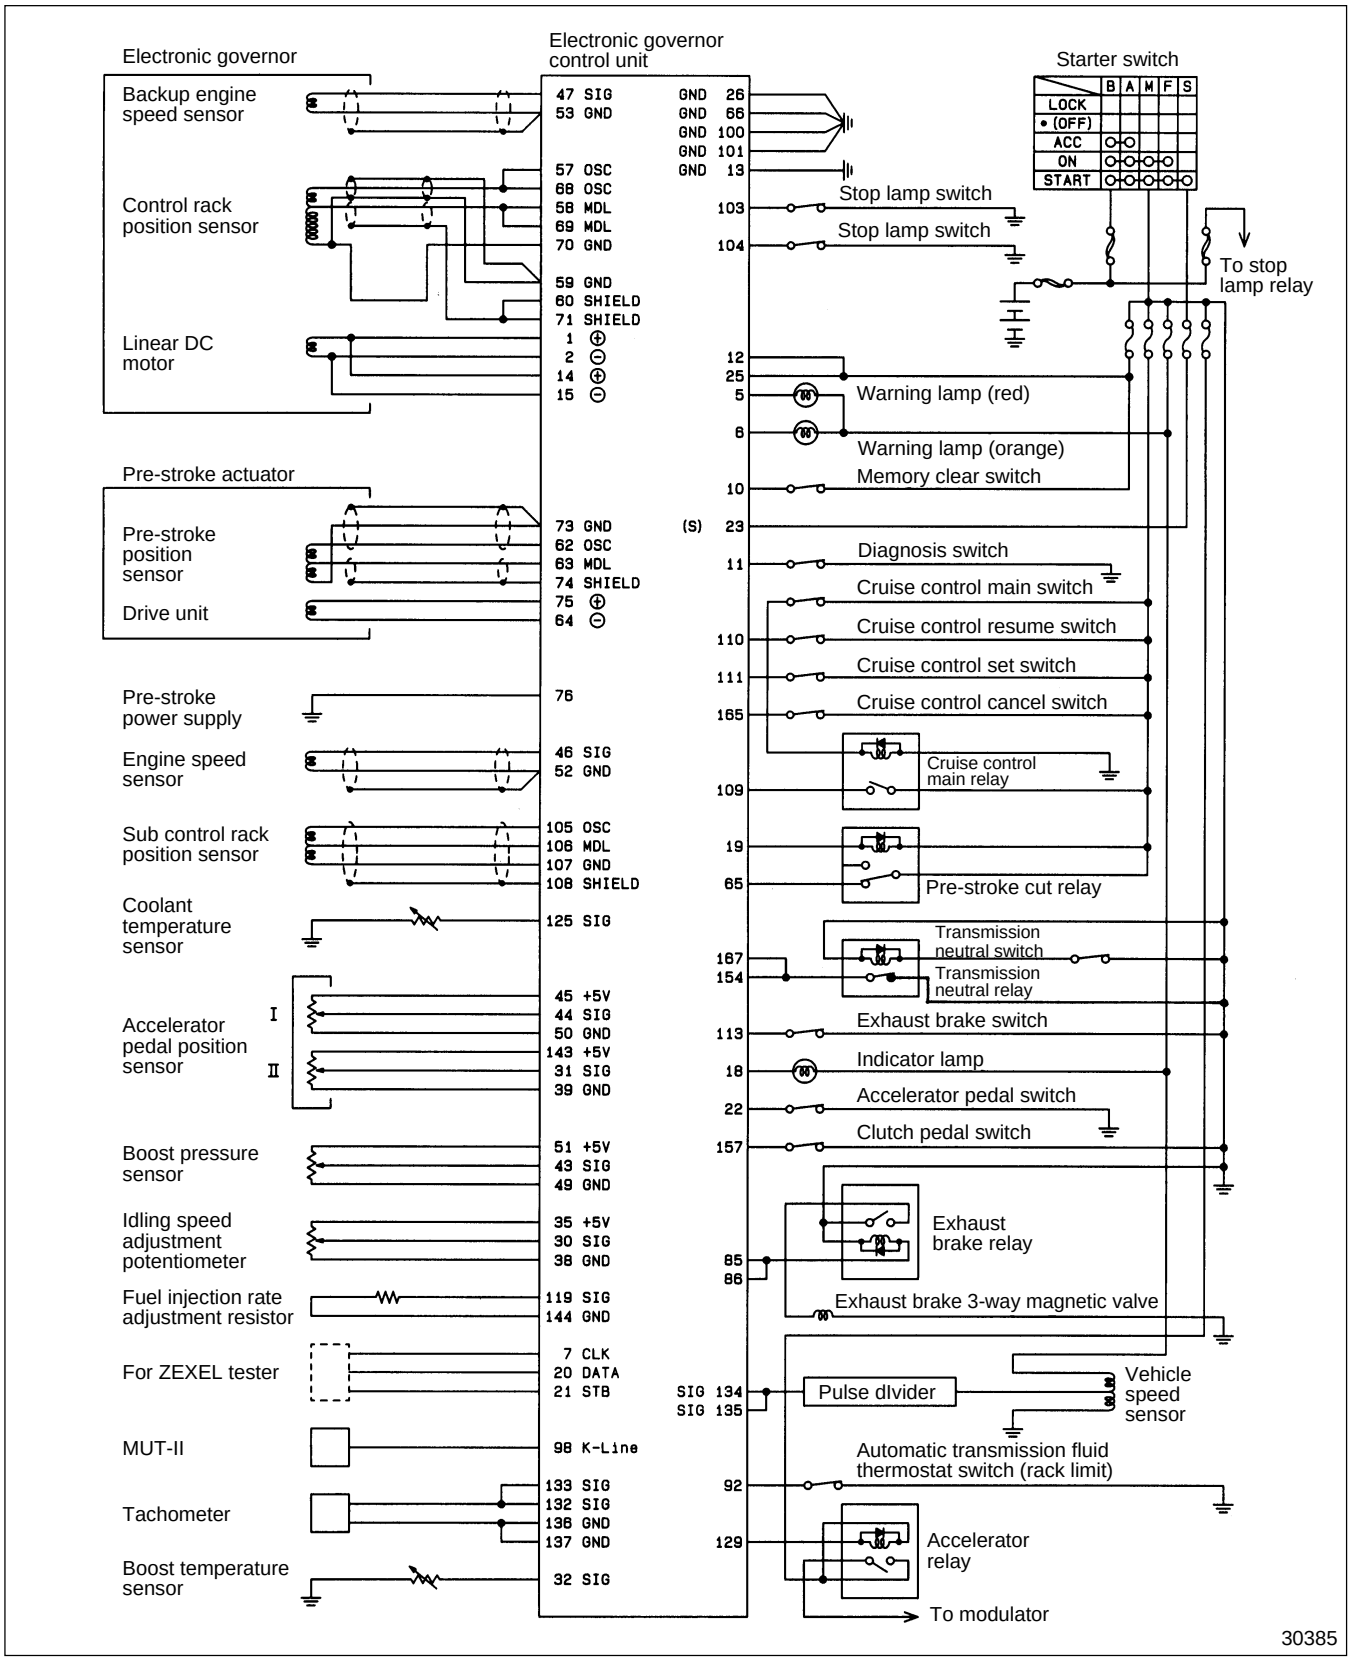
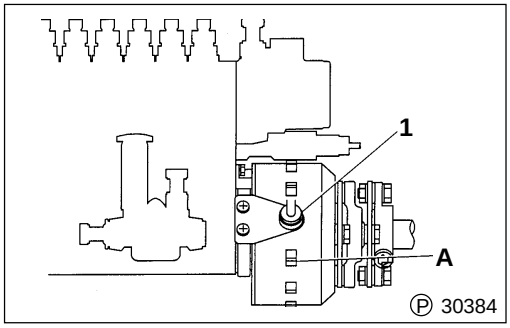
Electronic governor control unit



https://truckmanualshub.com/

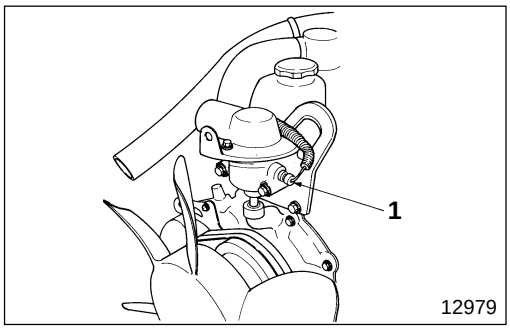
Engine speed sensor



- The engine speed sensor **1** is a pickup type. It converts the rotation speed of a injection pump into electric signals.
- Signals generated by the engine speed sensor are fed to the electronic governor control unit which uses them as correction values in its calculation of the target pre-stroke position.

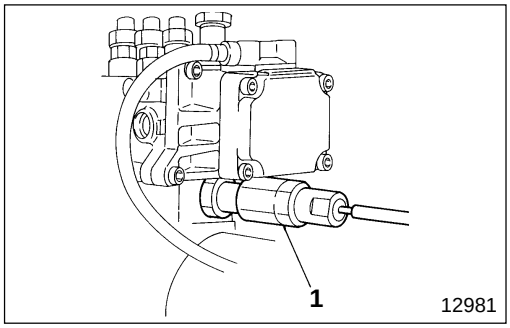
A : Timer housing protrusion

Coolant temperature sensor



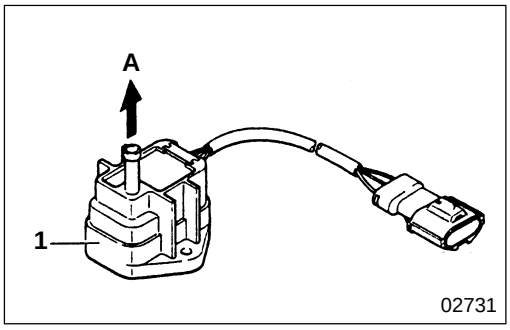
- The coolant temperature sensor **1** is a thermistor type. It converts the engine coolant temperature into electric signals.
- Signals generated by the coolant temperature sensor are fed to the electronic governor control unit which uses them as correction values in its calculation of the target rack position.

Sub control rack position sensor



- The sub control rack position sensor **1** provides backup detection of the control rack position in the event of a fault in the control rack position sensor.
- The sub control rack position sensor **1** converts the degree of control rack movement into electric signals.
- Signals generated by the sub control rack position sensor are fed to the electronic governor control unit which uses them as correction values in its calculation of the target rack position.

Boost pressure sensor

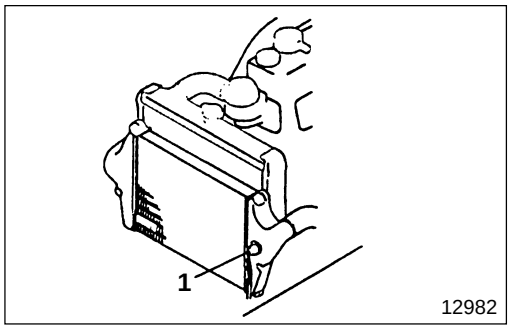


The boost pressure sensor **1** feeds boost pressure information to the electronic governor control unit. During turbocharged engine operation, it enables the full rack signal (maximum fuel injection rate value) characteristics to be selected by the control unit in accordance with the engine speed.

A : To intake manifold

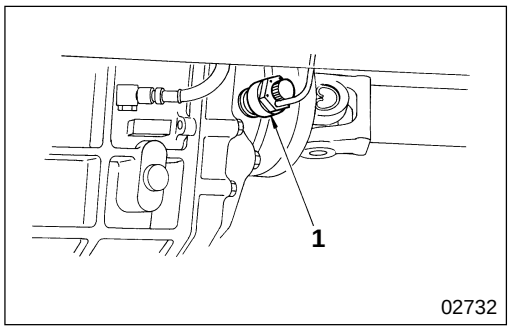
https://truckmanualshub.com/

Boost temperature sensor



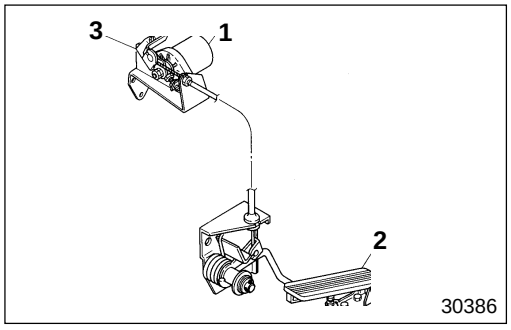
- Boost temperature sensor **1** is a thermistor type that converts the intake air temperature, immediately after its passage through the intercooler, into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the boost temperature signal, which is used as the correction value by the electronic governor control unit to determine the desired pre-stroke position value.

Vehicle speed sensor



The vehicle speed sensor **1** not only detects the vehicle speed but it also sends the vehicle speed information to the electronic governor control unit for cruise control use.

Accelerator pedal position sensor and accelerator pedal switch



- The accelerator pedal position sensor **1** provides the electronic governor control unit with information on the degree to which the accelerator pedal **2** is depressed.
- The accelerator pedal switch **3** detects whether the accelerator pedal is currently depressed or released

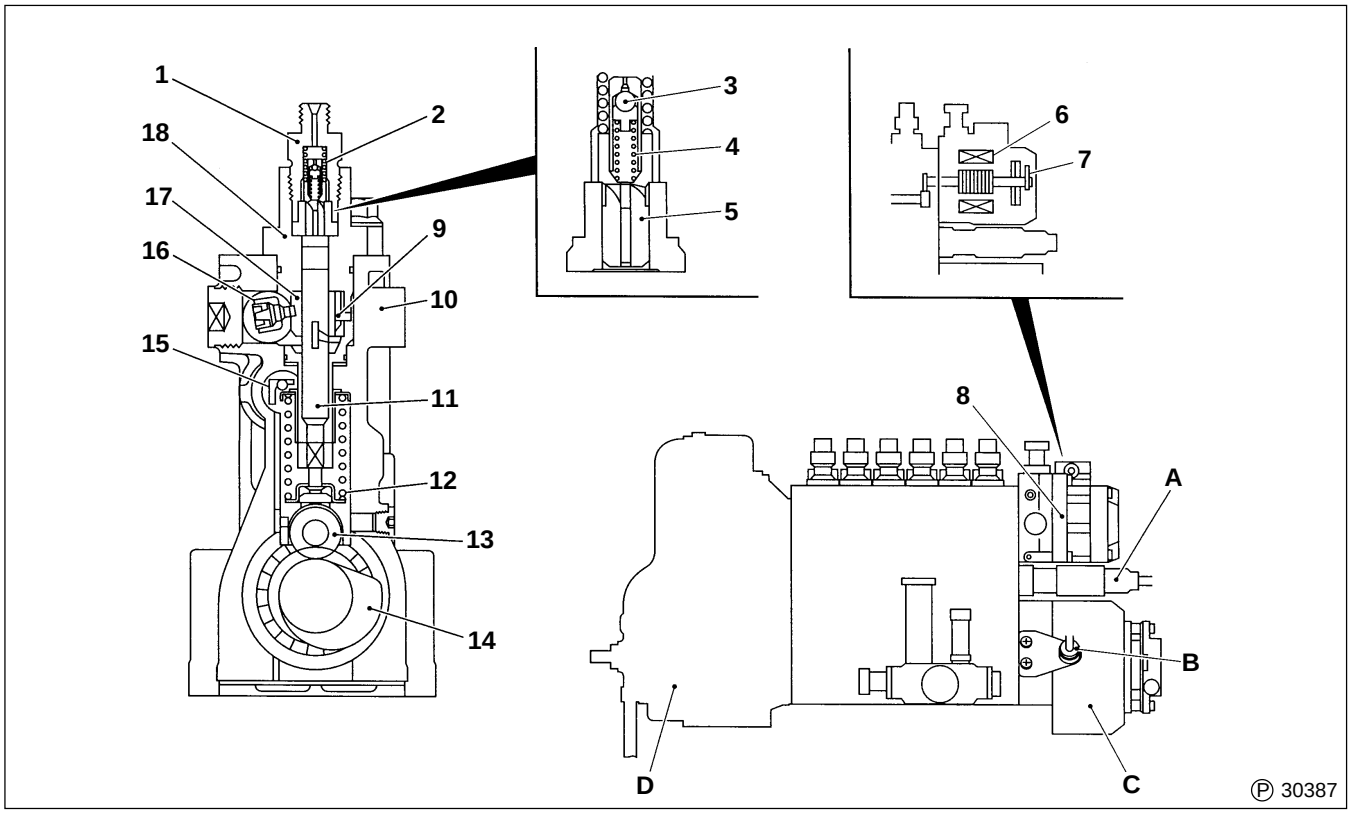
Pre-stroke control injection pump main unit

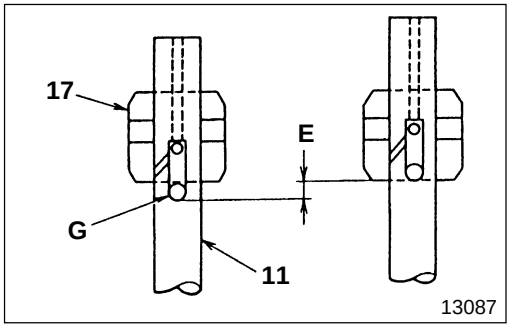


1 Delivery valve holder
2 Delivery valve spring
3 Ball
4 Spring
5 Delivery valve
6 Drive unit
7 Pre-stroke position sensor
8 Pre-stroke actuator
9 Pin
10 Pump housing
11 Plunger
12 Plunger spring
13 Tappet
14 Camshaft
15 Control rod
16 Timing rod
17 Timing sleeve
18 Plunger barrel

A : Sub-control rod position sensor
B : Engine speed sensor
C : Mechanical timer
D : Electronic governor

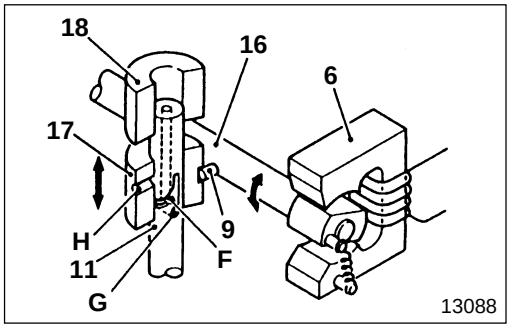
- The injection pump is provided with a mechanism that enables variation of the plunger pre-stroke.
- Variation of the plunger pre-stroke enables the creation of air/fuel mixture and spray conditions that are optimally suited to combustion. The overall benefits are higher engine torque and cleaner exhaust emissions than are possible with a conventional injection pump.

https://truckmanualshub.com/



Pre-stroke

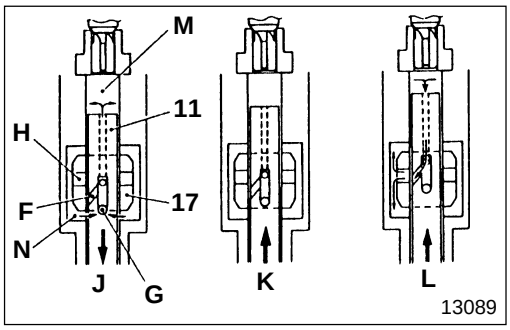
The term “pre-stroke” refers to the stroke dimension **E** of a plunger **11** from the plunger’s bottom dead center position to the point at which its fuel inlet hole **G** is closed by the timing sleeve **17** and fuel feed begins. This stroke dimension is constant in a conventional injection pump.



Variable pre-stroke mechanism

F : Lead
G : Inlet hole
H : Outlet hole

- In contrast to the fixed plunger barrel arrangement of a conventional injection pump, each plunger barrel **18** in the pre-stroke control type injection pump incorporates a vertically moveable timing sleeve **17**.
- Movement of the timing sleeve is effected by the timing rod **16**, pin **9**, and drive unit **6**.
- When the drive unit **6** rotates the timing rod **16**, the pin **9** moves the timing sleeve **17** up or down accordingly.
- Since the timing sleeve **17** incorporates a fuel outlet hole **H**, the pre-stroke changes in accordance with the movement of the timing sleeve.

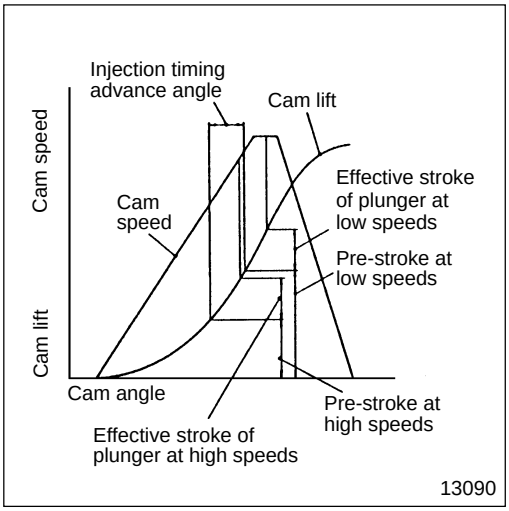


Fuel feed action

J : Fuel intake
K : Start of pressurization
L : End of pressure feed

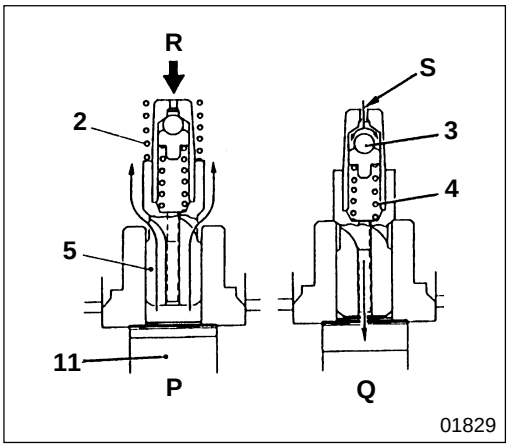
- As the plunger **11**, moves downward from its top dead center position and its inlet hole **G** opens, fuel flows into the pressure chamber **M** owing to the vacuum pressure created by the plunger’s downward movement and the fuel pressure produced by the feed pump.
- When the plunger **11** moves upward but its lift dimension is still small, the fuel in the pressure chamber **M** escapes into the sump **N** through the inlet hole **G** in the plunger. Thus, the pressure in the pressure chamber does not increase.
- As the plunger **11** moves further upward and the inlet hole **G** is closed by the timing sleeve **17**, the fuel starts to be pressurized. The pressure increases as the plunger moves upward, and the injection pump starts to feed the pressurized fuel to each injector.
- When the lead **F** in the plunger **11** becomes aligned with the outlet hole **H** in the timing sleeve **17**, the fuel in the pressure chamber **M** returns to the sump **N**, thus completing the pressure feed cycle.
- Adjustment of the injected fuel volume is achieved by rotation of the plunger **11**, which alters the position of the outlet hole **H** in the timing sleeve **17** relative to the lead **F** in the plunger.

https://truckmanualshub.com/



Fuel injection timing and fuel injection characteristics

- Changes in the position of the timing sleeve **17** cause concomitant changes in the pre-stroke, which in turn alter the fuel injection timing.
- A decrease in the pre-stroke causes the fuel inlet hole **G** in the plunger **11** to close earlier such that the fuel injection timing is advanced.
- This arrangement provides highly responsive control over the injection timing and thus enhances the engine's cold startability.



Delivery valve

P : Start of pressure feed
Q : End of pressure feed

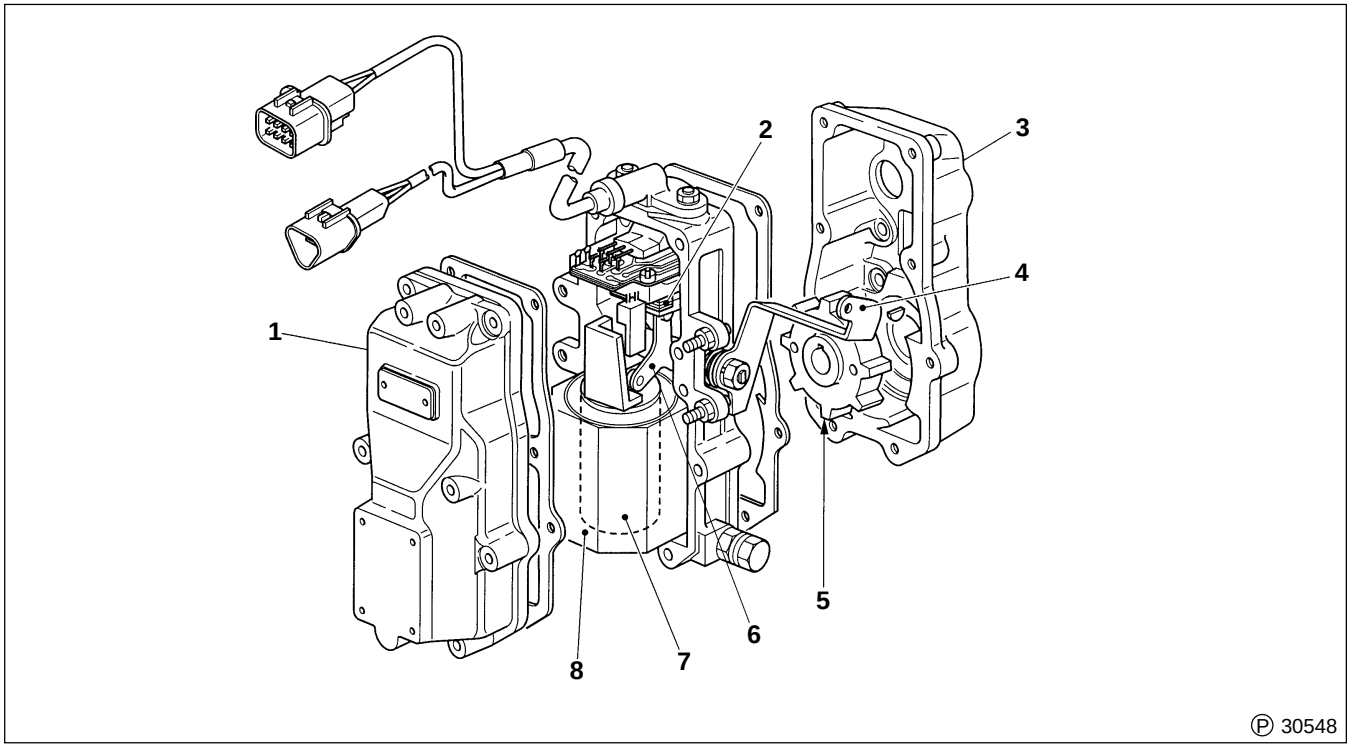
- The delivery valve **5** keeps constant the residual pressure **R** in the injection pipe at all engine speeds. This operation prevents the generation of bubbles in the fuel (this is known as "cavitation") and thus enables fuel injection at a high pressure.
- When the plunger **11** moves upward and the pressure of the fuel pushed by the plunger overcomes the residual pressure **R** in the injection pipe and the preset force of the delivery valve spring **2**, the delivery valve is pushed upward and delivery of the pressurized fuel begins.
- As soon as fuel delivery is complete, the fuel in the injection pipe rapidly returns to the plunger side and the delivery valve closes.
- Surplus fuel slowly returns through the orifice **S**, thus reducing the pressure in the injection pipe.
- When the preset force of the spring **4** in the delivery valve **5** is exactly offset by the pressure in the injection pipe, the ball **3** closes the orifice **S**, thus ensuring that the residual pressure **R** in the injection pipe remains constant.

https://truckmanualshub.com/

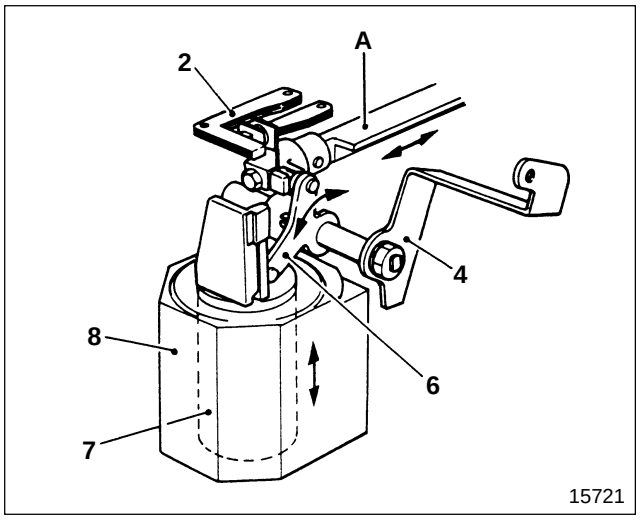
MEMO

https://truckmanualshub.com/

Electronic Governor



1 Cover
2 Control rack position sensor
3 Housing
4 Emergency engine stop lever
5 Sensing gear
6 Link
7 Linear DC motor
8 Coil assembly



● Linear DC motor

The linear DC motor **7** moves the coil assembly **8** vertically in accordance with signals from the electronic governor control unit. Via the link **6**, this movement is transmitted to the control rack **A**, which moves longitudinally to increase and decrease the fuel quantity.

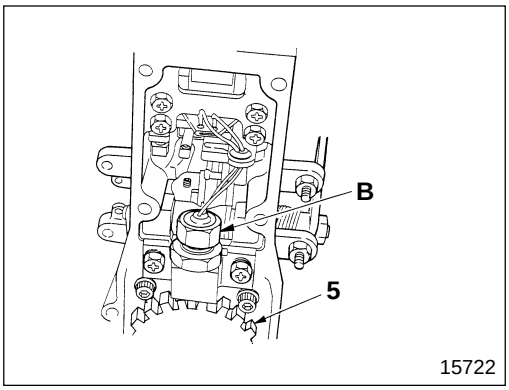
● Control rack position sensor

The control rack position sensor **2** senses whether the control rack **A** is moved to the correct position by the linear DC motor **7**. In the event of a discrepancy between the actual control rack position and the target control rack position (this is determined by the electronic governor control unit), the control unit instructs the linear DC motor to perform a corrective movement.

https://truckmanualshub.com/

● **Emergency engine stop lever**

The emergency engine stop lever **4** is connected to the link **6**. Via a cable, it enables the link to be moved from the driver's seat. In the event of a system fault that prevents the engine from being stopped normally, operation of the emergency engine stop lever forces the control rack **A** to move to the position at which fuel injection is terminated. This operation takes place irrespective of the position of the linear DC motor **7**.

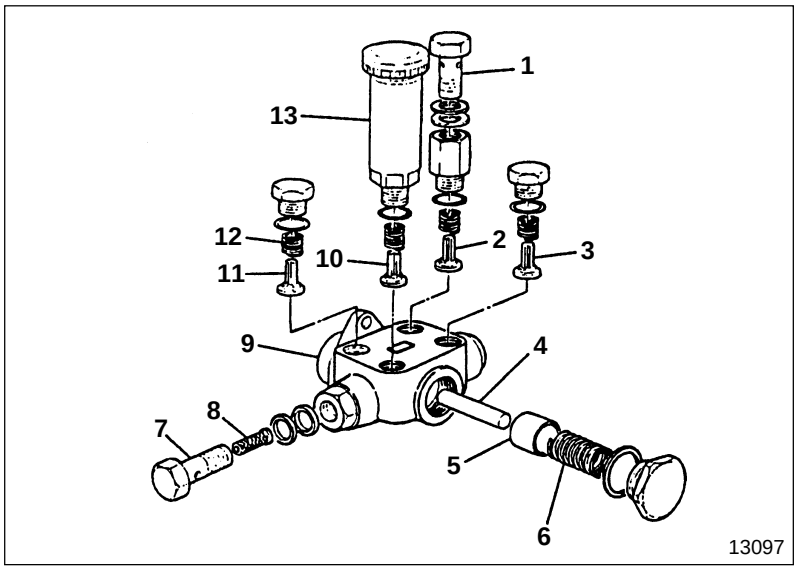


● **Backup engine speed sensor**

The backup engine speed sensor **B** is fitted inside the governor. It converts the rotation speed of the sensing gear **5** into electric signals and feeds the signals to the electronic governor control unit to provide an indication of the engine speed.

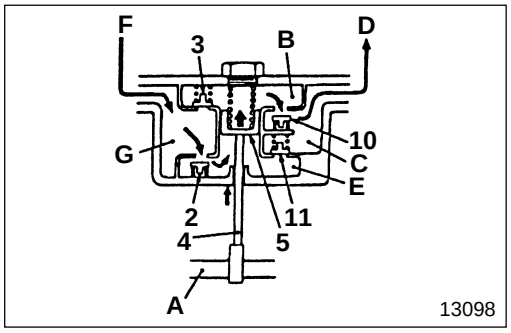
https://truckmanualshub.com/

Feed Pump

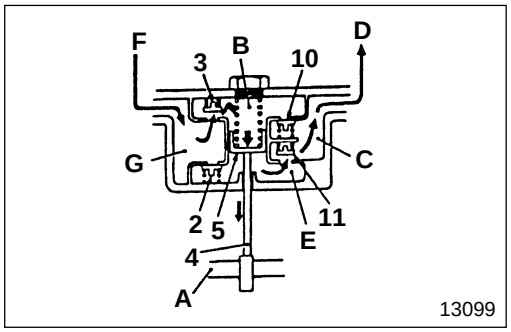


1 Eye bolt at fuel outlet
2 Check valve
3 Check valve
4 Push rod
5 Piston
6 Piston spring
7 Eye bolt at fuel inlet
8 Gauze filter
9 Feed pump housing
10 Check valve
11 Check valve
12 Check valve spring
13 Priming pump

- The feed pump is a double-action type pump which, with four check valves operating, sucks and discharges fuel during both strokes of pistons **5**.
- Push rod **4** makes contact with the injection pump camshaft directly, moving piston **5**.
- Priming pump **13** can be manually operated, when the injection pump is not operating, to suck up fuel and thus can be used for air bleeding.
- Gauze filter **8** eliminates large foreign particles from the fuel sucked up from the fuel tank to prevent clogging of the feed pump. This gauze filter must be cleaned with diesel fuel periodically.



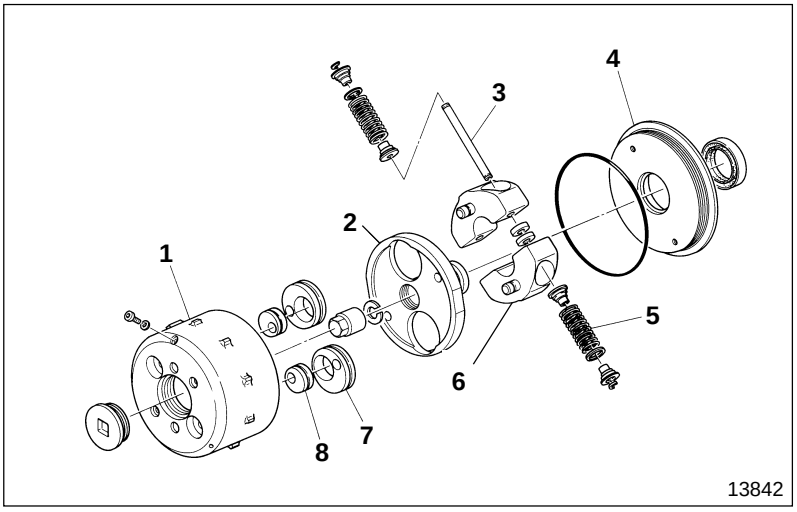
The rotation of injection pump camshaft **A**, pushes up push rod **4** and piston **5**, and the pressure in inner chamber **B** increases. This closes check valve **3**, and check valve **10** opens to let the fuel in inner chamber **B** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **E** decreases, check valve **11** closes, and check valve **2** opens to let fuel flow from fuel tank **F** through outer chamber **G** to inner chamber **E**.



When injection pump camshaft **A** rotates further, it pushes down push rod **4** and piston **5**, and the pressure in inner chamber **E** increases. This closes check valve **2**, and check valve **11** opens to let the fuel in inner chamber **E** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **B** decreases, check valve **10** closes, and check valve **3** opens to let fuel from fuel tank **F** flow through outer chamber **G** to inner chamber **B**.

https://truckmanualshub.com/

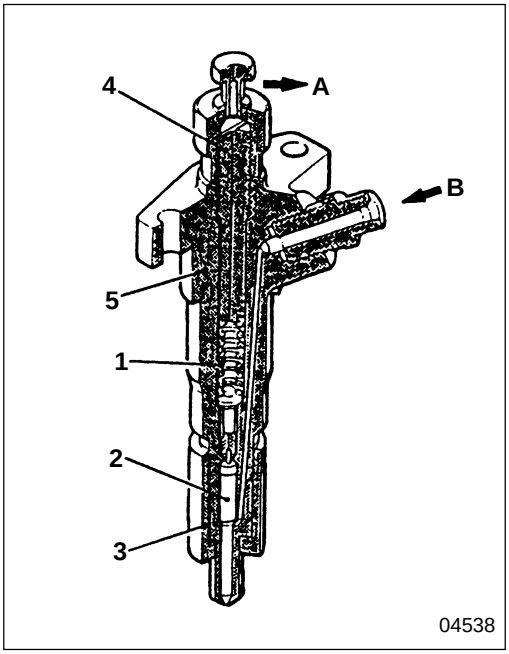
Automatic Timer



1 Timer housing
2 Timer holder
3 Pilot pin
4 Cover
5 Timer spring
6 Flyweight
7 Eccentric cam (Large)
8 Eccentric cam (Small)

- The mechanical type automatic timer changes fuel injection timing automatically when the engine revolution reaches the specified rate.
- The automatic timer controls the retard of fuel injection timing. The pre-stroke control unit controls the advance of fuel injection timing.

Injection Nozzle



1 Nozzle spring
2 Needle valve
3 Nozzle
4 Adjusting screw
5 Nozzle holder

A : Excess fuel
B : Supply of fuel

Fuel delivered from the injection pump enters the nozzle holder and, when the specified pressure is reached, the fuel pressure overcomes the repercussive force of the nozzle spring to push out the needle valve, allowing fuel to spray out the opening at the tip of the nozzle into the cylinder.
Part of the high-pressure fuel lubricates the needle valve and returns through the fuel return pipe to the fuel tank.

TROUBLESHOOTING

Fault Diagnosis Function

- While the starter switch is in the ON position, the fault diagnosis function continuously monitors relevant sensors for faults.
  In the event that a fault is detected, the function illuminates a warning lamp (red or orange) in the meter cluster to alert the driver, memorizes the location of the fault, and switches to a backup mode.
- The memorized fault location can be read as a diagnosis code using an MUT-II or the diagnosis switch.

Warning lamp illumination

	(Orange)	(Red)
1. Safety-critical error (vehicle must not be driven)	OFF	ON
2. Non-safety-critical error (vehicle can be driven despite poor control feeling)	ON	OFF

CAUTIONS

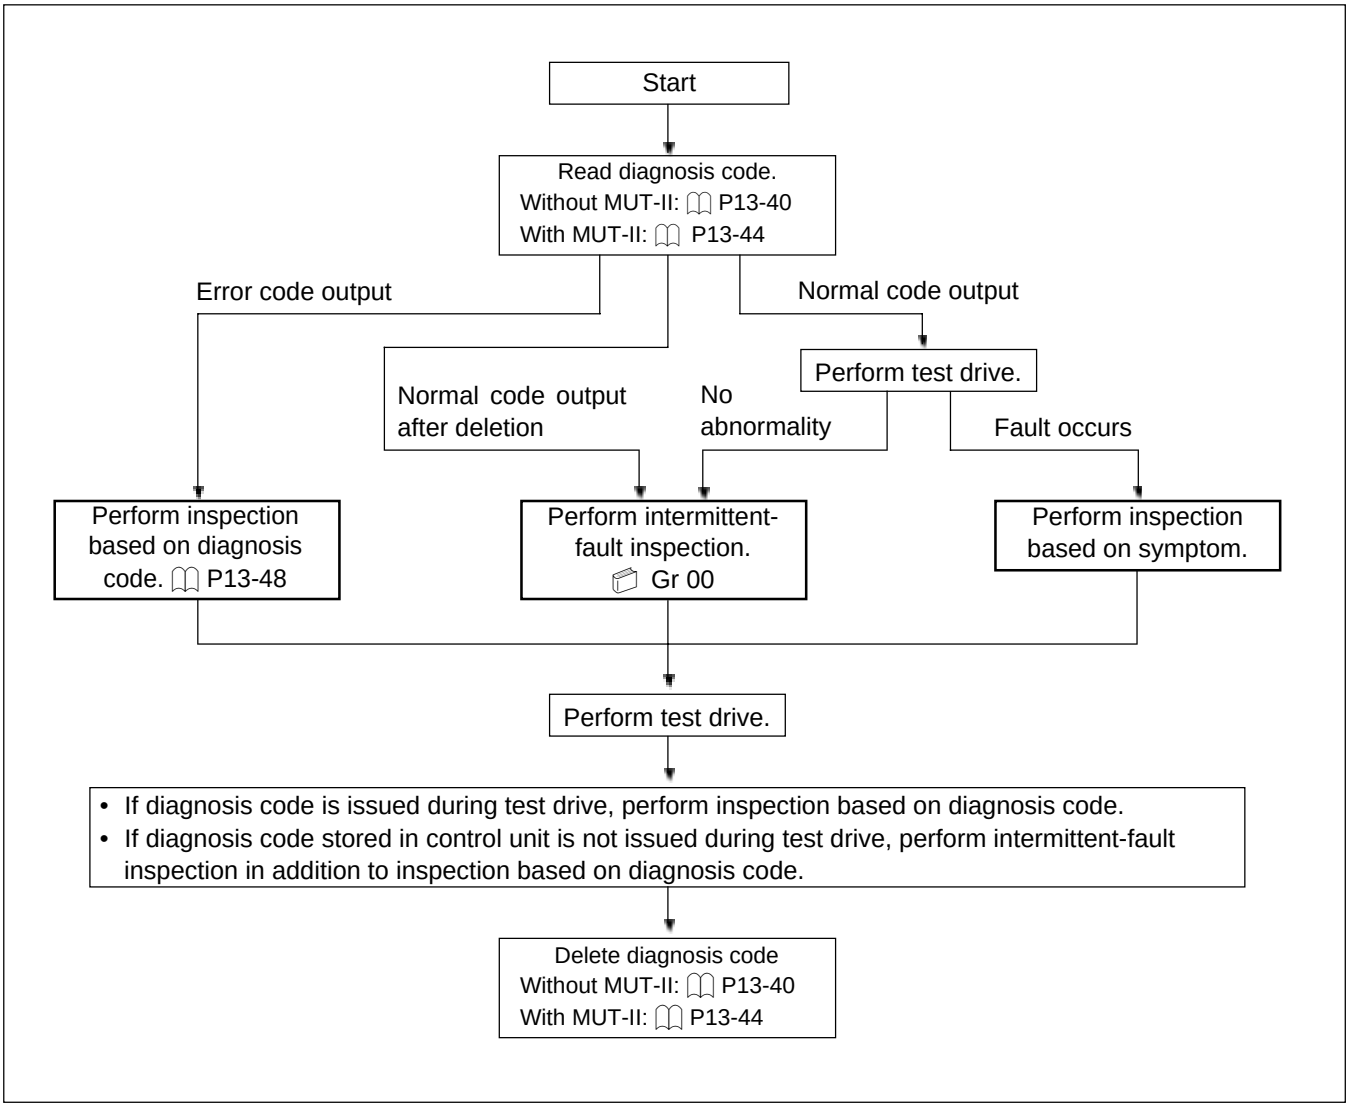
- **The fault diagnosis function requires a battery voltage of 12 V or higher.**
- **In the event of fault detection, check the harnesses and connectors for looseness. Before undoing any connector, turn the starter switch to the LOCK position and wait for 20 seconds.**
- **After rectifying a fault, delete the fault code using the MUT-II or memory clear switch.**
- **As a general rule, inspections should be performed with the starter switch in the LOCK position. If any inspection requires that the starter switch be in the ON position, be careful to avoid short circuits between connector terminals and with the vehicle body.**
- **All component resistances shown in this manual assume a temperature range of 10 to 35°C {50 to 95°F}. In practice, component values may not comply with standard values owing to temperature effects and/or to inaccuracy in the test instrument.**
- **After the rectification of a fault, the system's ability to return to normal operation automatically depends upon the diagnosis code, i.e., the fault location. When the system returns to normal operation, the warning lamp goes out.**
- **When the system returns to normal operation after the rectification of a fault, the diagnosis code remains stored in electronic governor control unit.**

https://truckmanualshub.com/

Inspection Procedure

Inspection of the electronic governor and prestroke control injection pump system can be performed most effectively using an MUT-II. Types of system inspection can, in accordance with fault systems and diagnosis codes, be broadly classified as follows:

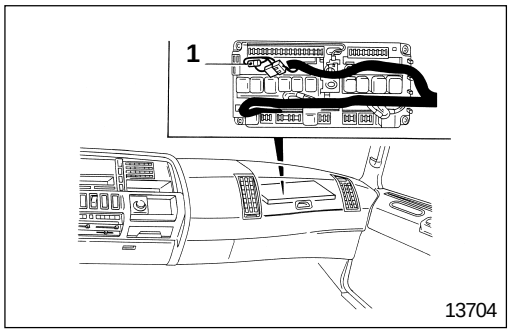
- Inspections based on diagnosis codes stored in the control unit
- Inspections based on symptoms
- Inspections of intermittent faults



https://truckmanualshub.com/

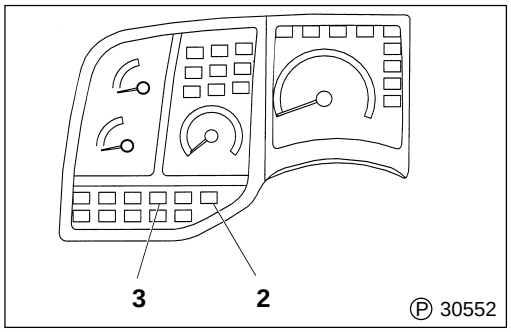
READING AND ERASING DIAGNOSIS CODES

Without MUT-II

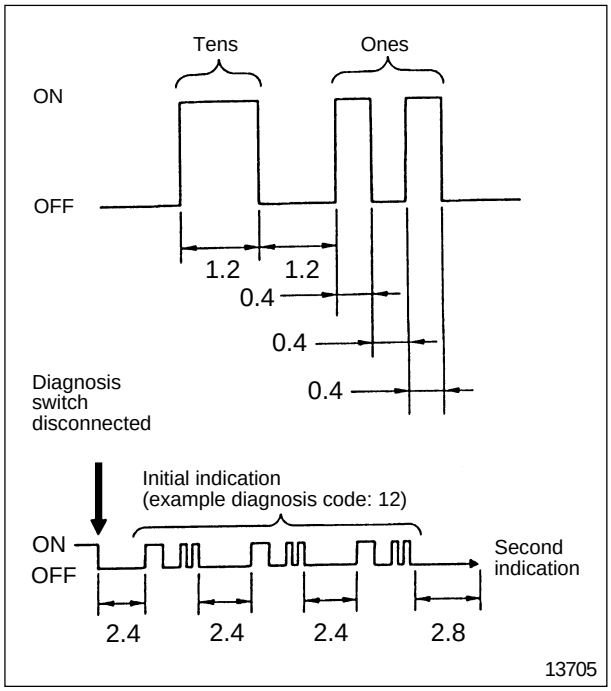


Current diagnosis code

- Turn ON the starter switch.
- Disconnect the diagnosis switch **1**.



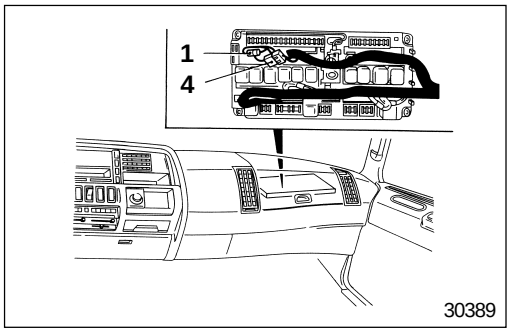
- The diagnosis code will be indicated by flashes of the warning lamp (orange) **2** or warning lamp (red) **3**.



Diagnosis code indication

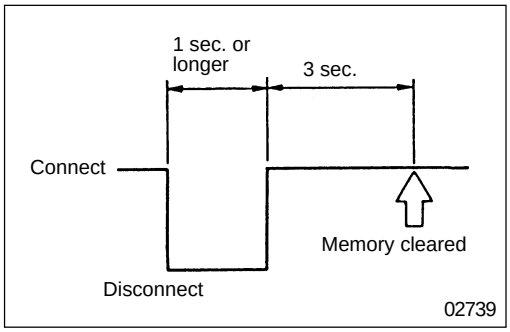
- Diagnosis codes are indicated by the numbers and durations of the warning lamp flashes.
  - Flashes for units of ten and units of one have different lengths, as follows:
    Units of ten: 1.2 seconds
    Units of one: 0.4 second
  - For each diagnosis code, units of ten are given first, followed by units of one. For a code that has no units of ten, only units of one are given.
- Each diagnosis code is indicated three times. If there are no new codes, the sequence is then repeated from the beginning with each code indicated three times.
- When the diagnosis switch **1** is connected, the control unit immediately stops the indication of codes.

https://truckmanualshub.com/



Past diagnosis codes

With the diagnosis switch **1** disconnected, disconnect the memory clear switch **4** after reading the current diagnosis code(s). The warning lamp will begin to flash again, this time to indicate any past diagnosis code(s). Verify the fault location in accordance with the code(s).



Diagnosis code eraser

To erase all stored diagnosis codes from the control unit, disconnect and reconnect the memory clear switch **4**.

CAUTION ⚠

- **Stored codes are cleared only by disconnection and reconnection of the memory clear switch 4.**
- **To prevent the memory contents from being cleared after the indication of stored codes, turn OFF the starter switch with the memory clear switch 4 disconnected then connect the memory clear switch.**

https://truckmanualshub.com/

READING AND ERASING DIAGNOSIS CODES

Diagnosis codes table

Diagnosis code	Fault location	Warning lamp	Electronic control unit countermeasure(s) in the case of failure (back-up mode)	Drive ability
01	Normal	—	—	○
03	Pre-stroke actuator learning function	Orange	Provides control with “0” as correction value.	○
06	Sub-control rack position sensor	Orange	Normal control using the main control rack position sensor	○
11	Governor servo	Red	*1 Engine stopped by the pull-down function.	×
12	Pre-stroke servo	Orange	Pre-stroke control stop engine revolution speed limit (approximately 1800 rpm)	△
13	Pre-stroke sensor	Orange	Pre-stroke control stop engine revolution speed limit (approximately 1800 rpm)	△
14	Back-up engine speed sensor	Orange	Control using the main engine speed sensor	○
15	Engine speed sensor	Orange	Calculate the engine revolution speed from the pulse count of the back-up engine speed sensor.	○
14+15	Both the back-up engine sensor and the main engine speed sensors are faulty upon start-up.	Red	Do not start the engine.	×
16	Accelerator pedal position sensor II	Orange	Control using the accelerator pedal sensor I	○
21	Water temperature sensor	Orange	Set the water temperature to 80 °C {176°F}.	○
22	Control rack position sensor	Orange	Switch to the sub-control rack position sensor control.	△
24	Accelerator pedal position sensor I	Orange	Control using the accelerator pedal position sensor II.	○
24+16	Both accelerator pedal position sensor I and accelerator pedal position sensor II are faulty	Red	Set the maximum accelerator depression angle to 30 degrees even if the accelerator pedal is depressed.	△
25	Vehicle speed sensor	Orange	Cruise control disabled.	○
31	Idling adjustment volume	Orange	Set to auto idling.	○
32	Boost pressure sensor	Orange	Set the boost pressure to 0 kpa {0 mmHg, 0 in. Hg}.	△*2
33	RAM (ECU internal memory circuit)	Red	Do not start the engine.	×
41	Boost air temperature sensor	Orange	Normal control assuming the boost temperature is 80°C {176 °F}	○
42	Cruise cotrol release switch	Orange	Cruise control disabled.	○
45	Reverse engine operation	Orange	*1 Engine stopped by the pull-down function.	×*2
65	Accelerator switch	Orange	Limited accelerator depressing angle (Approximately 30%)	○

*1 : The pull-down function indicates the rack pull-back action. In the event of an engine over-run or severe accident, the rack is pulled back immediately to the no-injection direction in order to protect the engine.

*2 : Driveable if the starter switch is turned OFF once and then restarted again.

○ : Driveable
△ : Back-up mode driving possible
× : Undriveable

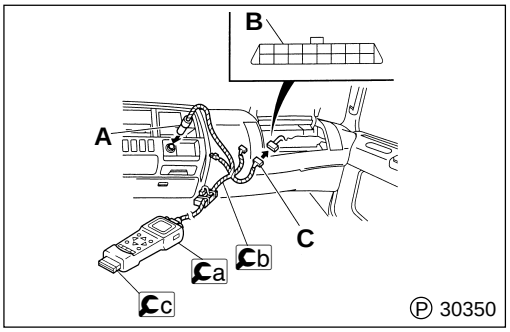
READING AND ERASING DIAGNOSIS CODES

With MUT-II

Special tools

Location	Tool name and shape	Part No.	Application
—	MUT-II PLUS  19492	MB991496-A	Inspection of electronic governor and pre-stroke control injection pump system
—	MUT Communication Harness  19141	MK327601	
—	ROM Pack (MRT-E4)  19493	MK327927	



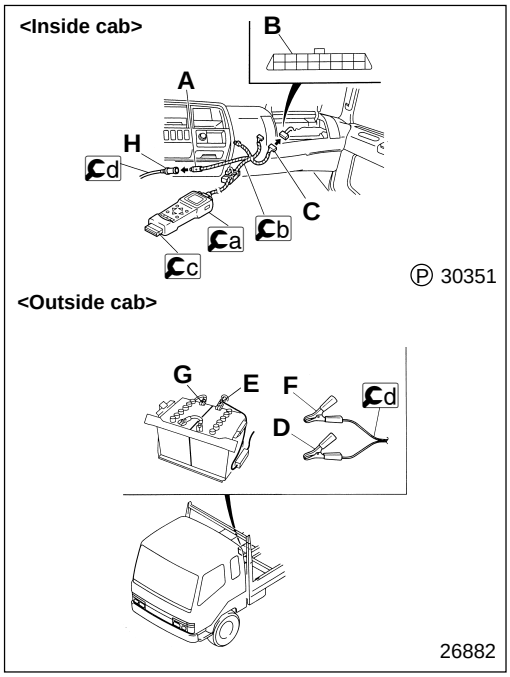
Connecting the MUT-II

- Turn the starter switch to the LOCK position.
- Connect the b MUT Communication Harness to the a MUT-II, and insert the c ROM Pack.
- Plug connector **A** into the cigarette lighter socket.
- Fit connector **C** onto MUT connector **B** (16-pin) in the relay box.

NOTE

Instructions for operation of the MUT-II are given in the separate MUT-II Reference Manual.

https://truckmanualshub.com/



- To verify the service data “START SIG”, connect the MUT-II as follows:
- Turn the starter switch to the LOCK position.
- Connect the b MUT Communication Harness to the a MUT-II, and insert the c ROM Pack.
- Attach the (+) clamp **D** (red) of the d Battery Clamp Harness to the battery’s (+) terminal **E**. Attach the (–) clamp **F** (black) of the d Battery Clamp Harness to the battery’s (–) terminal **G**.
- Fit the connector **A** into the socket **H** of the d Battery Clamp Harness.
- Fit connector **C** onto MUT connector **B** (16-pin) in the relay box.

CAUTION ⚠

Connect the (+) clamp D (red) of the b Battery Clamp Harness before connecting the (–) clamp F (black).

Current diagnosis codes
- Turn the starter switch to the ON position.
- Determine the fault location(s) in accordance with the MUT-II diagnosis code(s).

Past diagnosis codes
- Turn the starter switch to the ON position.
- Determine the fault location(s) in accordance with the past MUT-II diagnosis code(s).

Diagnosis code eraser
- Turn the starter switch to the ON position.
- Using the MUT-II, erase all diagnosis codes stored in the control unit.

Diagnosis codes

Diagnosis codes are indicated as shown in the following table. For details of these codes, refer to the “Without MUT-II” section. 🕮 P13-42

Display item			
Diagnosis code	Fault	Diagnosis code	Fault
03	PS OFFSET	**24**	ACCEL. SNSR-1
06	SUB RACK SNSR	**25**	SPEED SNSR
11	GOV. SERVO	**31**	IDLE VOLUME
12	PS SERVO	**32**	BST PRES SNSR
13	PS SNSR	**33**	RAM
14	SUB NE SNSR	**41**	BST TEMP SNSR
15	NE SNSR	**42**	ASC REL SW
16	ACCEL. SNSR-2	**45**	ENG. REVERSE
21	WTR TEMP SNSR	**65**	ACCEL SW
22	RACK SNSR		

https://truckmanualshub.com/

SERVICE PROCEDURES USING MUT-II

Service operations can be performed most effectively using the following MUT-II functions:

● **Reading of diagnosis codes**

Using the diagnosis code function, it is possible to read diagnosis codes stored in the control unit.

● **Eraser of diagnosis codes**

By selecting the diagnosis code eraser function from the special function menu, it is possible to erase diagnosis codes stored in the control unit.

● **Indication of service data**

When required for service operations, data in the control unit's random-access memory can be displayed as numeric values or graphs.

Service data

MUT-II display			Inspection procedure	
No.	Data signal	Type of data	Inspection condition	Evaluation criterion
11	ENGINE SPEED	IIII. rpm	Gradual acceleration (during engine operation)	Synchronization with tachometer

ON-VEHICLE INSPECTION AND ADJUSTMENT

Checking and Adjusting Injection Timing

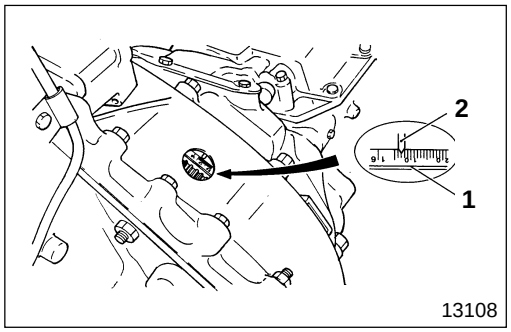
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Fuel injection timing (BTDC)	2˚± 0.5˚	–	Adjust

Tightening torque

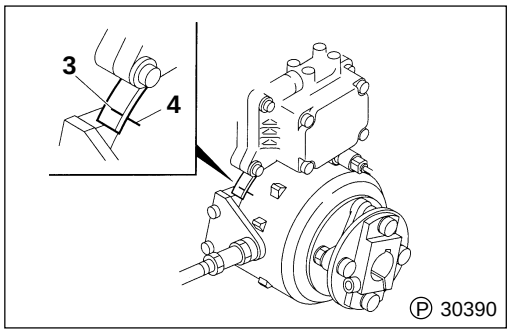
Unit: N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
5	Adjusting bolt	59 to 64 {43 to 47, 6 to 6.5}	–

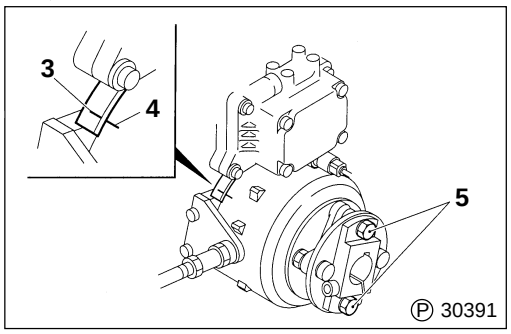


[Inspection]

- Turn the crankshaft more than 180° in the direction of engine rotation. Check if notch **1** on the flywheel and pointer **2** on the flywheel housing show the standard fuel injection timing.



- When pointer **3** on the injection pump and notch **4** on the automatic timer align, the fuel injection timing is standard.
- If the fuel injection timing is not standard, adjust as follows.



[Adjustment]

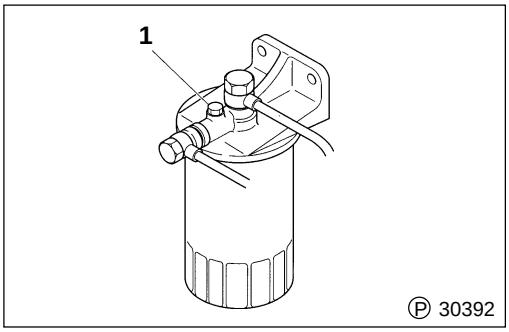
- Loosen adjusting bolts **5** and turn the automatic timer to align pointer **3** and notch **4**.
- Tighten adjusting bolts **5** at specified torque.
- Reinspect the fuel injection timing.

CAUTION ⚠

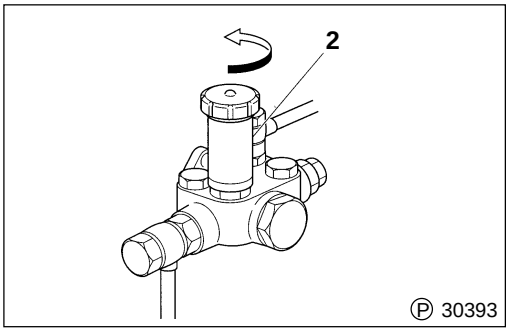
Do not loosen any bolts other than adjusting bolts 5.

https://truckmanualshub.com/

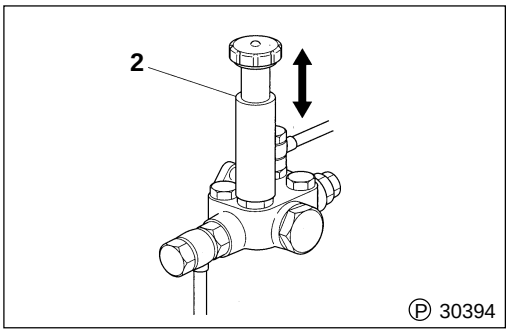
Bleeding Air from Fuel System



- Loosen the fuel filter air plug **1**.



- Turn the priming pump knob **2** counterclockwise until it pops up.
- Move the priming pump knob **2** up and down to feed fuel through the fuel filter.
- When fuel emerging from the fuel filter air plug **1** no longer contains air bubbles, tighten the air plug securely.

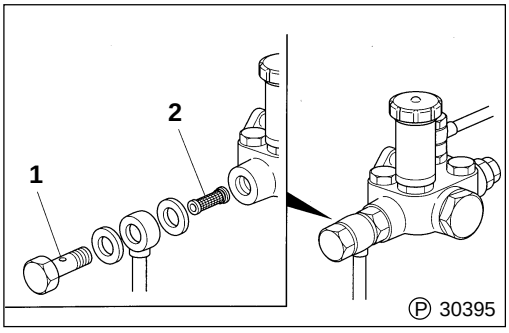


- Move the priming pump knob **2** up and down five or six more times. Then, press the knob down and screw it clockwise to lock it in position.
- Wipe up all spilled fuel, then start the engine.
- Check that no fuel leakage occurs.

WARNING

- **Be sure to wipe up all spilled fuel. Unless it is wiped up, it could catch fire.**
- **Fuel is highly flammable. Keep it away from flames and sources of heat.**

Cleaning Gauze Filter



- Remove the eyebolt **1** from the suction port side **A** of the fuel feed pump.
- Remove the gauze filter **2** from the eyebolt **1**.
- Clean the gauze filter **2** in diesel fuel.
- Refit the gauze filter **2** and eyebolt **1** in the opposite order to that in which they were removed.
- Bleed all air out of the fuel system. P13-53
- Start the engine and check that no fuel leakage occurs.

WARNING

- **To minimize the risk of fire, wipe up any spilled fuel.**
- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **After refitting the gauze filter, check that no fuel leakage occurs.**

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

Replacing Fuel Filter

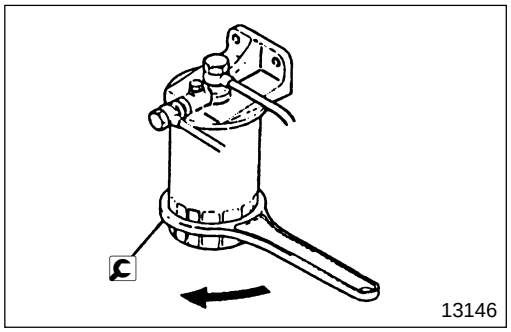
Lubricant

Location	Points of application	Specified lubricant	Quantity
1	Gasket between fuel filter and fuel filter head	Engine oil	As required

Special tool

Unit : mm {in}

Location	Tool name and shape	Part No.	Application
1	Filter wrench  01882	MH061572	Fuel filter removal



13146

[Removal]

: Filter Wrench

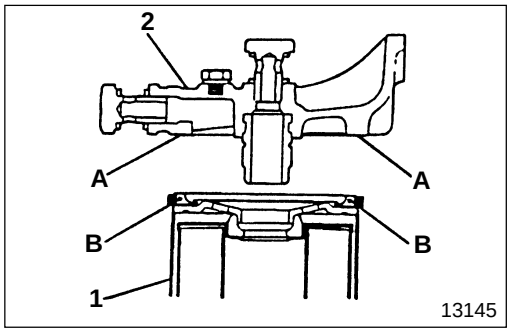
WARNING

- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **To minimize the risk of fire, wipe up any spilled fuel.**

[Installation]

WARNING

Use of an unsuitable fuel filter 1 can lead to fuel leaks and fires. Be sure to use a genuine filter.



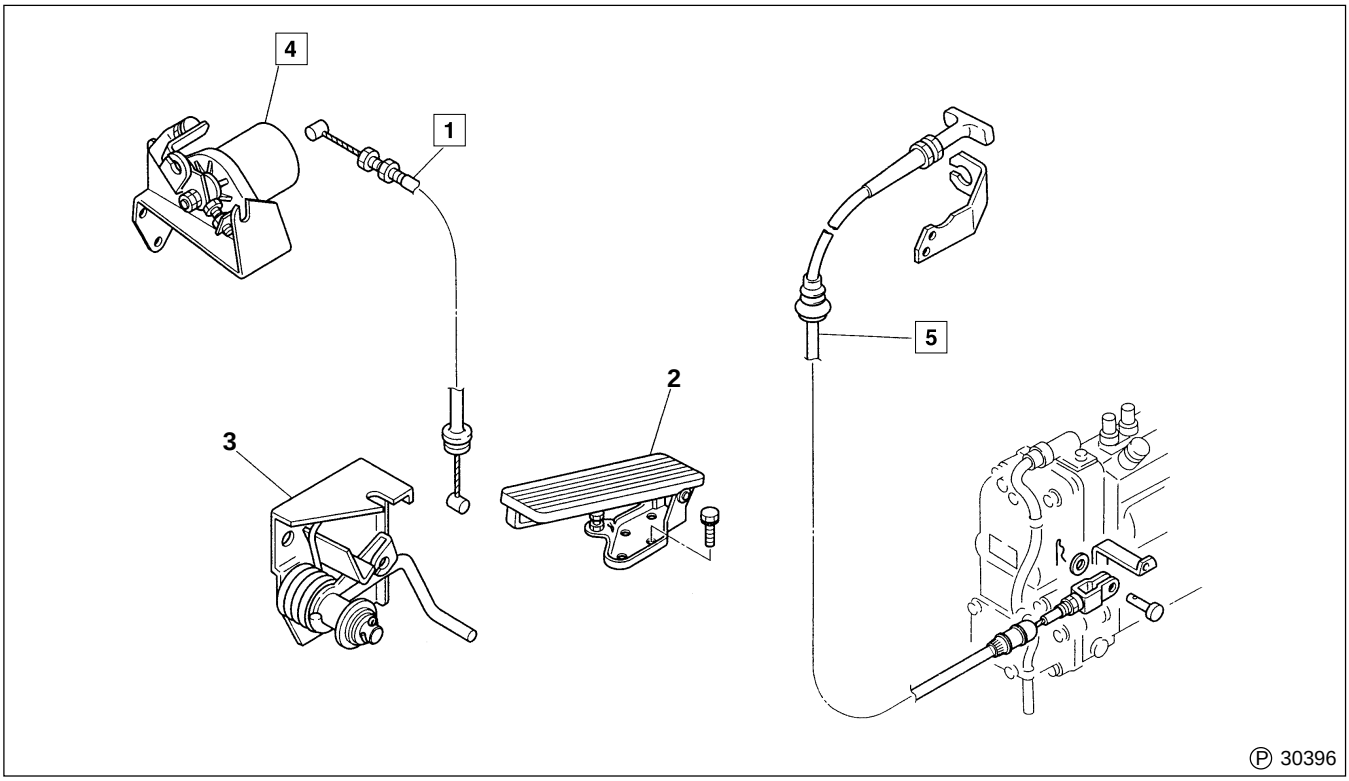
13145

- To fit the fuel filter **1**, turn it until the gasket **B** touches surface **A** of the fuel filter head **2**. Then, tighten the filter by 1 to $1\frac{1}{8}$ turn. Be sure to turn the filter by hand.
- Bleed all air out of the fuel system. P13-53

WARNING

After fitting the fuel filter 1, start the engine and check that no fuel leakage occurs. Any leaking fuel could cause a fire.

https://truckmanualshub.com/



● **Disassembly sequence**

1 Accelerator control cable
2 Accelerator pedal assembly
3 Accelerator link assembly
4 Accelerator pedal position sensor
5 Emergency engine stop cable

***** : Injection pump assembly

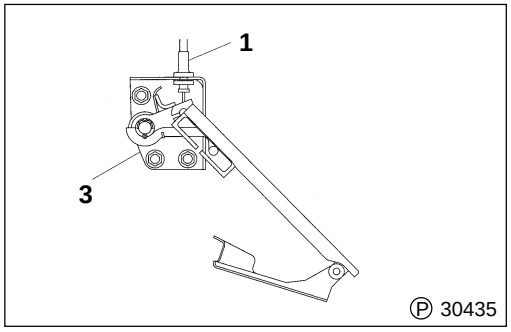
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Location	Maintenance item			Standard value	Limit	Remedy
4	Accelerator pedal position sensor output voltage  13714	Sensor II: ① – ②	Idling position	0.85 ± 0.1 V	—	Adjust or replace
			Full-load position	4.15 ± 0.1 V	—	Adjust or replace
		Sensor I: ④ – ⑤	When there is conduction between the accelerator switch terminals ① and ②  31018	1.00 ± 0.2 V	—	Adjust or replace

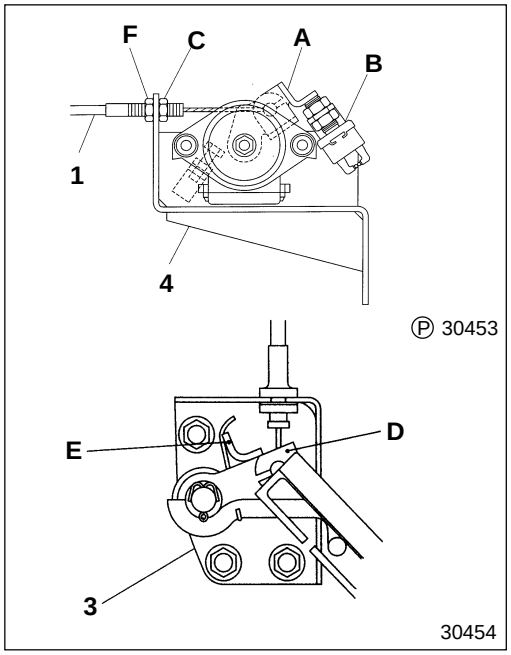
https://truckmanualshub.com/



◆ Service procedure

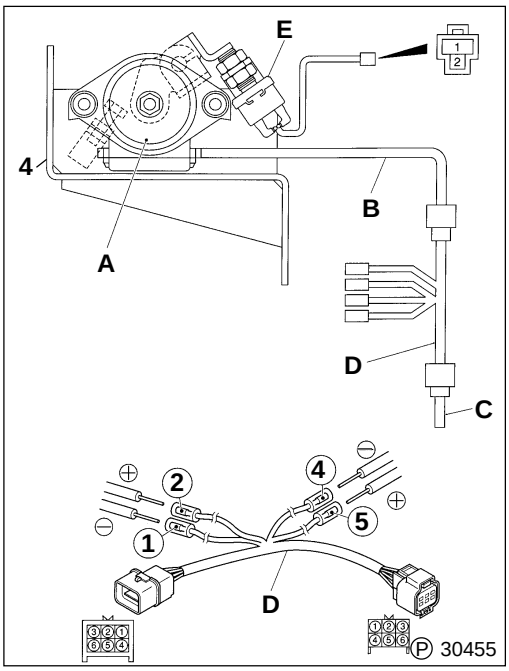
1 Installation of the accelerator control cable

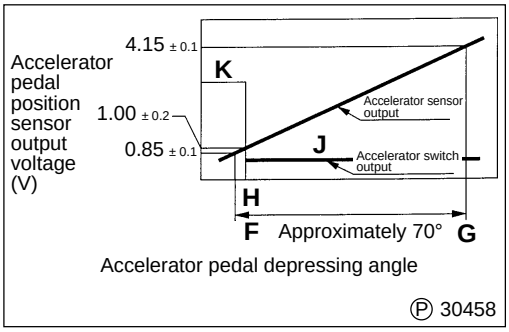
- Install accelerator control cable **1** to accelerator link assembly **3**.

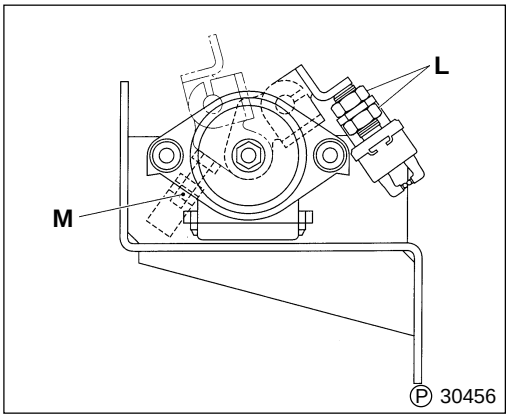


- Install the other end of accelerator control cable **1** to lever **A** of the accelerator pedal position sensor **4**.
- Check that lever **A** of the accelerator pedal position sensor **4** is completely pushed down by accelerator switch **B**.
- Stretch the cable until lever **D** of the accelerator link assembly **3** meets stopper **E** using nut **C** of the accelerator control cable **1** and secure with nut **F**.

https://truckmanualshub.com/







4 Inspect the accelerator pedal position sensor

- Disconnect connector **B** of accelerator pedal position sensor **A** from harness **C** on the cab side. Prepare inspection harness **D,** and connect it between the above two connectors.
- Disconnect the harness of accelerator switch **E**.
- Turn the starter switch ON.
- Inspect the output voltage of the accelerator pedal position sensor **A** and accelerator switch **E** as shown in the following chart and adjust as needed.

Item	Connector terminal					
	Inspection harness for accelerator pedal position sensor				Accelerator switch	
	Sensor II		Sensor I		①	②
	① :GND (–)	② :Output (+)	④ :GND (–)	⑤ :Output (+)		
Output voltage ***a** (Idling position)	⊖	⊕	⊖	⊕		
Output voltage ***b** (Full-load position)	⊖	⊕	⊖	⊕		
Output voltage ***c** (Accelerator switch active position)	⊖	⊕	⊖	⊕	○	○

○—○ Conduction between the terminals

***a** : Measure the voltage with the accelerator pedal in the idling position.

***b** : Measure the voltage with the accelerator pedal in the full-load position.

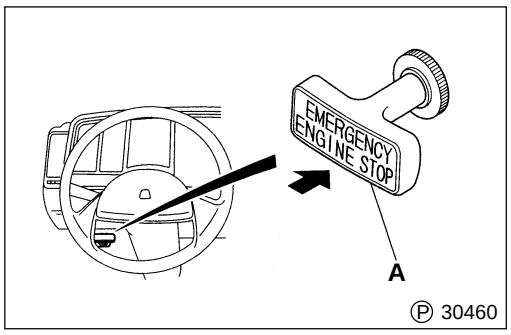
***c** : Gradually depress from the idling position and measure the voltage when the accelerator switch connector terminals ① and ② are no longer conducting.

F : Idling position
G : Full-load position
H : Accelerator switch change position
J : Accelerator switch - conduction
K : Accelerator switch - no conduction

- If the measured value of the idling position output voltage is outside of the standard range, replace the accelerator pedal position sensor.
- If the measured values of ***b** and ***c** are outside of the standard range, adjust using the following adjustment bolts.

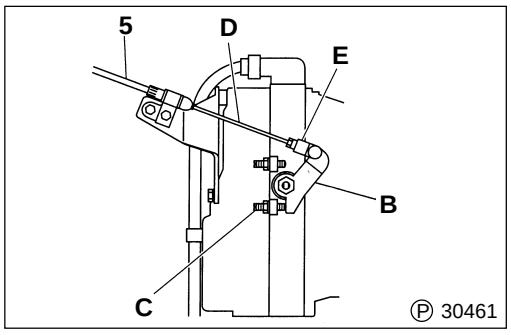
Adjustment item	Adjustment bolt
***b** Full-load position output voltage	Full-load stopper bolt **M**
***c** Accelerator switch active position output voltage	Adjustment bolt **L**

https://truckmanualshub.com/



5 **Installation of the emergency engine stop cable**

- Install the push button **A** side of the emergency engine stop cable **5** and push the stop button in.



- With the stop lever **B** of the governor making contact with the stopper bolt **C**, install the cable and adjust clevis **E** such that the inner cable of the emergency engine stop cable is not loose.
- After the installation, start the engine. Check that pulling the stop button stops the engine.

https://truckmanualshub.com/

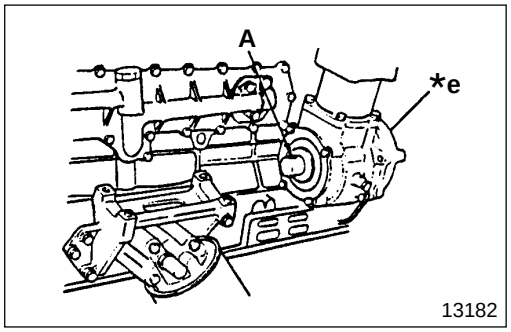
13181

◆ Service procedure

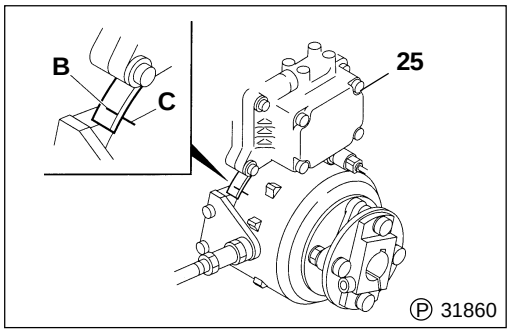
25 Installation of Injection pump assembly

- Turn the engine and adjust No.1 cylinder piston to the specified fuel injection timing.



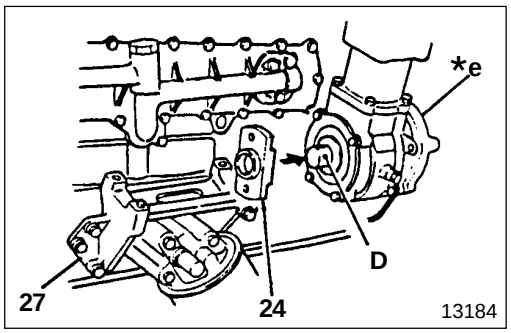
13182

- In this state, make sure that keyway **A** in the crankshaft of air compressor ***e** faces upward.
- If keyway **A** is not facing upward, turn the engine crankshaft by one turn.



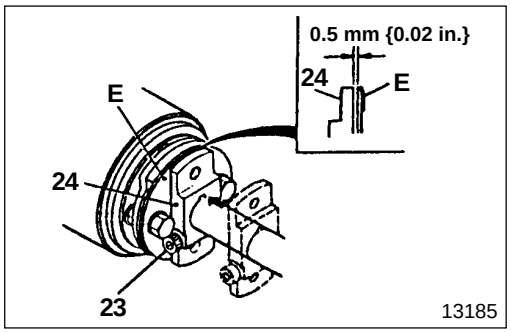
Ⓟ 31860

- Align pointer **B** on injection pump assembly **25** with notch **C** on the automatic timer.



13184

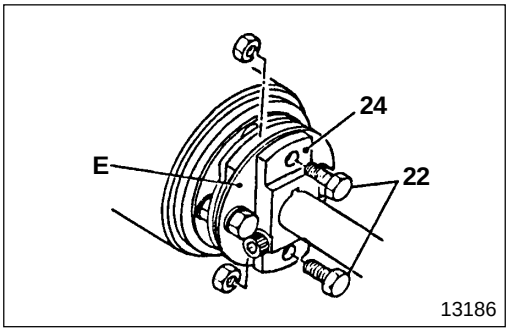
- Install driving coupling **24** to crankshaft **D** of air compressor ***e** and place the driving coupling on the air compressor side.
- Install injection pump assembly **25** on injection pump bracket **27**.



13185

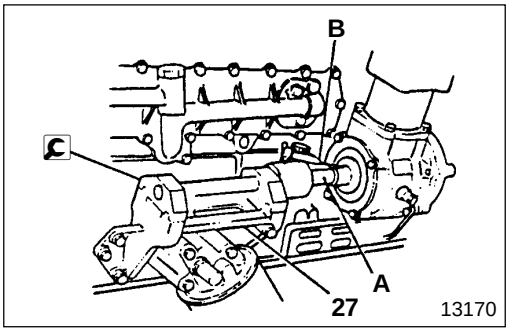
- Move driving coupling **24** to adjust the clearance between the driving coupling and coupling plate **E** as illustrated, then tighten cotter bolt **23** at specified torque.

https://truckmanualshub.com/



- Attach driving coupling **24** and coupling plate **E** using bolts **22** and tighten the bolts temporarily.

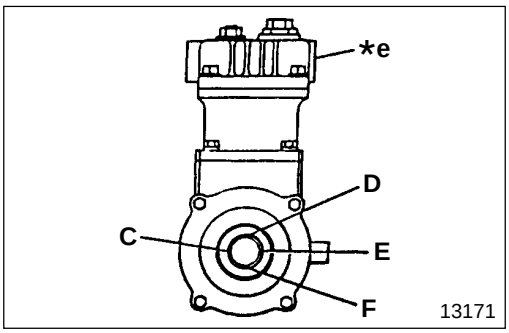
- In this state, adjust the fuel injection timing.
  Adjustment of fuel injection timing : P13-52
  After adjusting the fuel injection timing, tighten bolts **24** at specified torque.



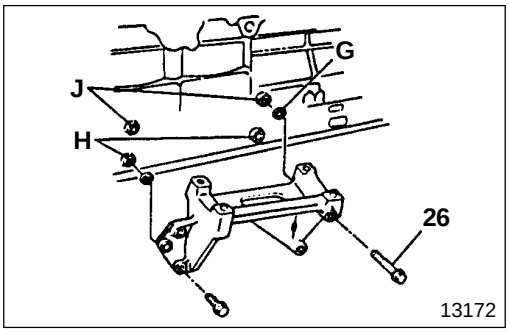
27 Injection pump bracket

[Inspection]

- Attach dial gauge **B** to arbor **A** of injection pump centering tool and adjust to gauge to zero setting.



- Slide dial gauge **B** toward air compressor ***e** and measure the eccentricity of crankshaft **C** against arbor **A** at points **D**, **E** and **F**.
- If the measured value is higher than the standard value, adjust as follows.



[Adjustment]

- When the measured value at point **E** is higher than the standard value: Insert shims **G** into four points equally.
- When the measured value at point **D** is higher than the standard value: Insert shims **G** into lower side **H**.
- When the measured value at point **F** is higher than the standard value: Insert shims **G** into upper side **J**.

CAUTION

Insert shims G observing the following conditions:

- **Number of shims per point is three or less.**
- **The same number of shims should be used for the front and the rear.**
- **The difference in number of shims used for bottom and top is none or one.**

- Tighten bolt **26** at specified torque, then reinspect.

* : Cylinder head Gr11
⊗ : Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

WARNING ⚠

Wipe up any spilled fuel because It can cause a fire

CAUTION ⚠

- **Be sure not to touch the slide-contact area of needle valve 12 because any scratches or corrosion might spoil the airtightness of nozzle 13. It must be handled with utmost care.**
- **Never change the combination of needle valve 12 and nozzle 13 for each cylinder.**
- **Be sure to protect all openings by covering them after removal of hoses and pipes because the engine performance is adversely affected if dirt and foreign particles enter injection nozzle assembly 5.**

NOTE

- **Remove carbon deposits and clean injectlon nozzle assembly 5 before working on it, then test the injection pressure and jet spray condition, and check for fuel leakage before disassembly. If no fault is found, do not disassemble.**
- **After installing injectlon nozzle assembly 5, tighten the two bolts 4 alternately.**

◆ Service procedure

● Inspection before disassembly

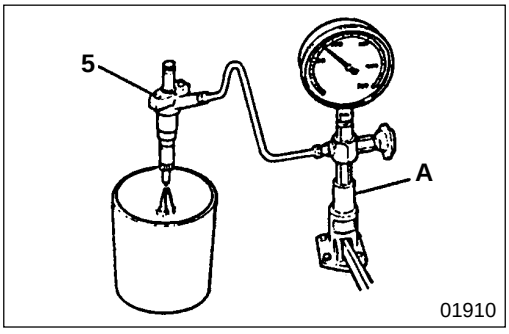
Attach injection nozzle assembly **5** to nozzle tester **A**, and conduct the following inspection.

WARNING ⚠

Never touch the spray from the nozzle or let your hands get too close to the spray point during the test.

NOTE

Before inspection, bleed the air out in a couple of bursts by pressing nozzle tester A lever.

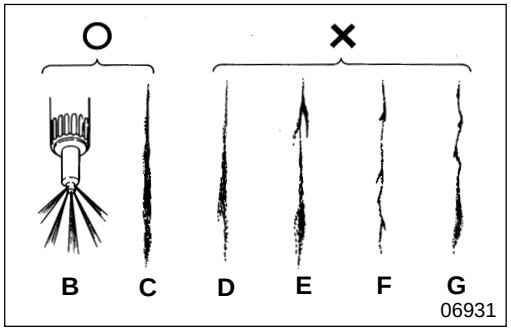


(1) Valve opening pressure

- Spray continuously with quick lever actions of nozzle tester **A**, one to two seconds per stroke, and measure the pressure that the gauge registers when the pressure is released which will be observed by the sudden movement of the gauge indicator.
- If the measured value deviates from the standard value, disassemble injection nozzle assembly **5** and clean it, then adjust using adjusting screw **8**.
- If the performance cannot reach the standard value even after adjustment, replace injection nozzle assembly **5**.

https://truckmanualshub.com/

INJECTION NOZZLE

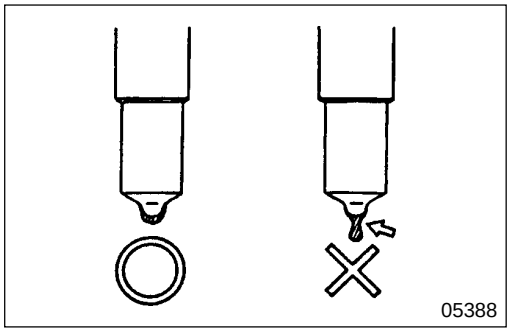


(2) Spray condition

- Spray continuously with quick lever actions of nozzle tester **A**, one to two seconds per stroke.
  - **B** : Even spray from all five orifices (Good)
  - **C** : Even and symmetrical spray (Good)
  - **D** : Asymmetrical spray (Faulty)
  - **E** : Spray direction deviates from the nozzle axis line (Faulty)
  - **F** : Thin and insufficient spray (Faulty)
  - **G** : Irregular spray (Faulty)
- If faulty spray cannot be corrected, disassemble injection nozzle assembly **5** and clean every part and repeat the test.
  If faulty spray still occurs after repeating test, replace the injection nozzle assembly.
- Make sure that there is no post-spray dripping after injection.

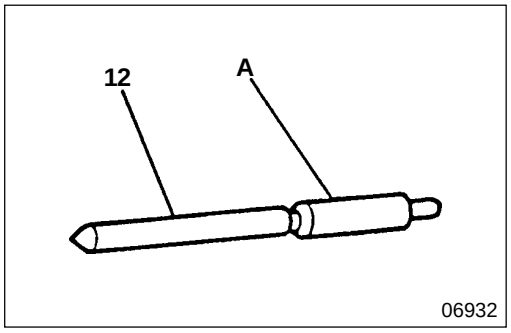
WARNING

Never touch the spray from the nozzle or let your hands get too close to the spray point during the test.



(3) Fuel air tightness and leakage at related contact points

- Raise the interior pressure of the nozzle gradually to the test pressure of 14.7 MPa {150 kgf/cm^2}. Maintaining the pressure, check and see if any fuel seeps out of the nozzle tip within 10 seconds.
- If any fault is found, disassemble injection nozzle assembly **5** and clean every part and repeat the test. If any fault is still found, replace the injection nozzle assembly.

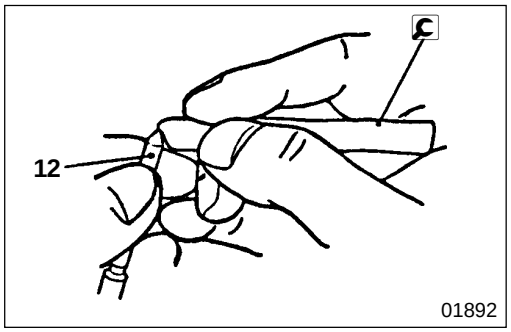


5 Injection nozzle assembly

[Disassembly]

CAUTION

- **Be sure not to touch sliding part A of needle valve 12 with your hands.**
- **Never change the combination of removed needle valve 12 and nozzle 13 for each cylinder.**



[Cleaning]

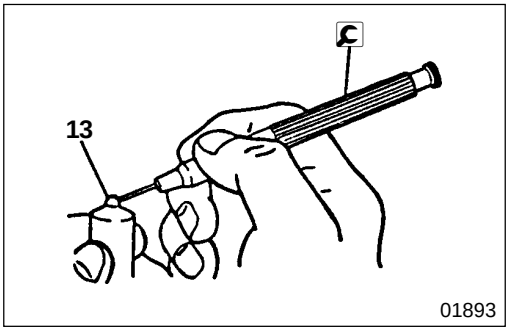
Clean needle valve **12** and nozzle **13** with diesel fuel (cleaning solvent).
Remove carbon deposits with cleaning tool in the following manner:

- Clean needle valve **12** by removing carbon deposits from its tip using the cleaning bar of cleaning tool.

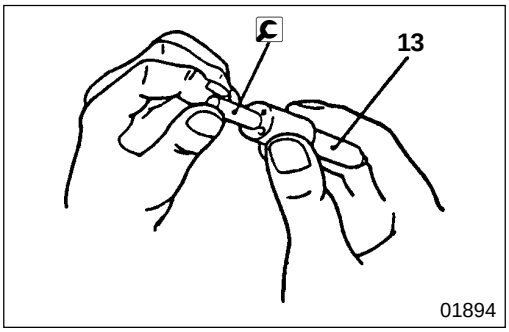
CAUTION

Never use a wire brush or hard steel for cleaning.

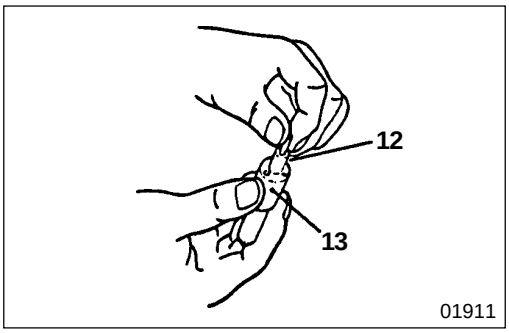
https://truckmanualshub.com/



- To clean nozzle **13**, remove carbon deposits from the orifices of the nozzle using the needle cleaner of cleaning tool, by inserting it into the orifices and turning it.
  Needle cleaner diameter: ø 0.25 mm {0.0098 in.} or less



- Clean the seat of nozzle **13** using the cleaning needle of cleaning tool.
- Use FUSO carbon remover to remove hard-to-remove, burnt-on carbon deposits.



[Inspection]

- Immerse needle valve **12** and nozzle **13** in diesel fuel (cleaning solvent) and clean them thoroughly.
- Check and see if needle valve **12** drops by its own weight into the nozzle from the position where a third of its length is pulled out.
  (Repeat this several times rotating the needle valve.)
- If needle valve **12** does not drop smoothly, repeat cleaning and repeat the test. If any fault is still found, replace both the needle valve and nozzle **13** together as a set.

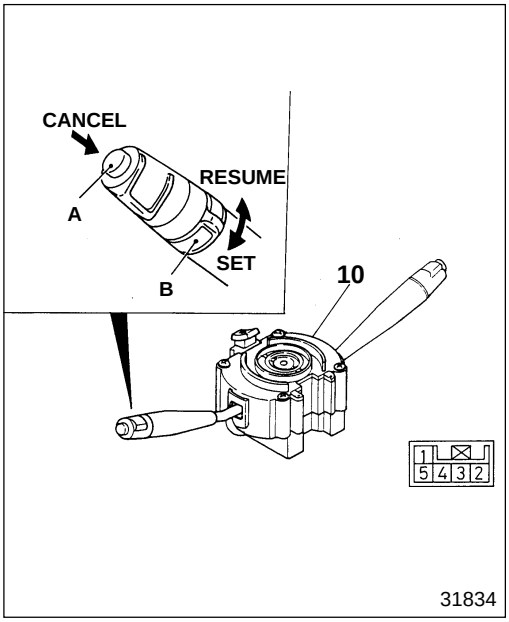
◆ Service procedure



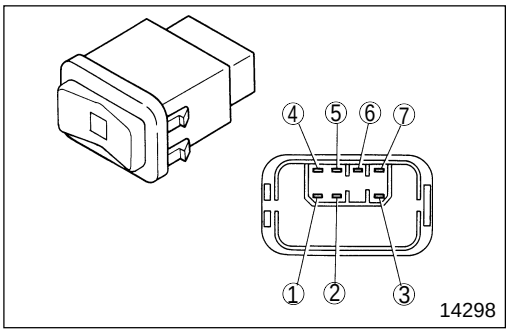
1 **Inspection of the combination switch <M/T>**

- Check for conduction as indicated in the following chart.

		①	②	③	④	⑤
Set/resume switch and cancel switch	Set		○	○		
	Cancel			○		○
	Off					
	Resume			○	○	

A : Cruise control cancel switch
B : Cruise control set/resume switch
There should be conduction between the ○——○ terminals in the chart.

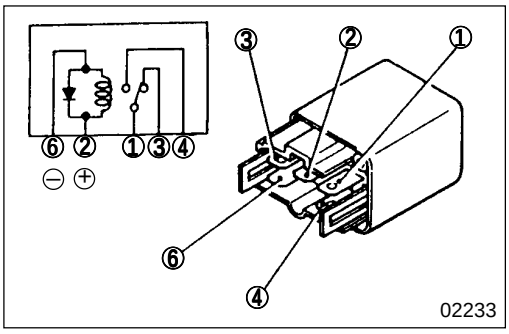
- If there is a malfunction, replace the combination switch **1**.



2 **Cruise control main switch <M/T>**

- Check for conduction as indicated in the following chart. There should be conduction between the ○——○ terminals in the chart.
- If there is a malfunction, replace the main cruise control switch **2**.

	①	⑥	⑤	④	⑦	LED (Operation indicator)	③
ON	○	○	○	○	○	○	○
N (Neutral)		○		○			
OFF							



3 **15** **Inspection of the cruise control main relay <M/T>, exhaust relay, and accelerator relay**

- Check for conduction as indicated in the following chart.

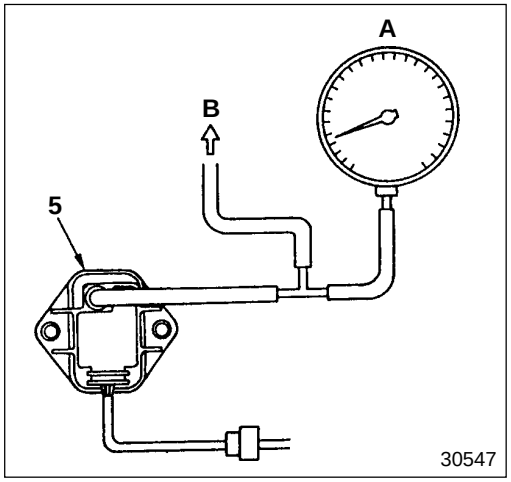
	①	②	③	④	⑥
Not Energized	○		○		
		○			○
Energized	○			○	
		○			○

There should be conduction between the ○——○ terminals in the chart.
Apply 12 V DC between ⊕——⊖ terminals.

- If there is a malfunction, replace the relay.

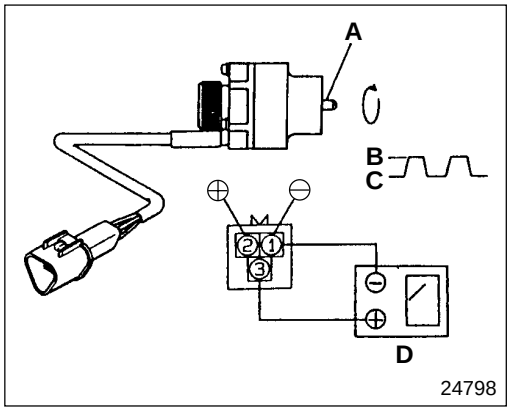
https://truckmanualshub.com/

INSPECTION OF OTHER DEVICES



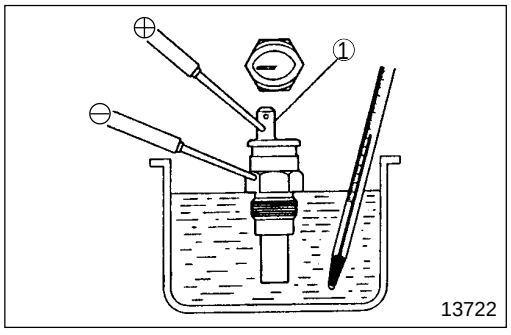
5 Inspection of the boost pressure sensor main unit

- Install pressure gauge **A** for boost pressure measurement as shown in the diagram.
- Connect MUT-II. P13-44
- Set the MUT-II service data display to BOOST PRESS.
- Start the engine. If the MUT display value and the value indicated by the boost pressure measurement gauge **A** differ, replace the boost pressure sensor **5**.
  B : To the inlet manifold



6 Inspection of the vehicle speed sensor

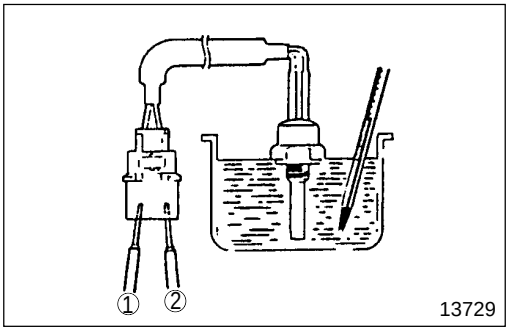
- Apply 12 V DC between terminals ① and ②, and slowly turn portion **A** of the vehicle speed sensor **6**.
- Measure the maximum value (high pulse voltage **B**) and the minimum value (low pulse voltage **C**) generated between terminals ① and ③under the above conditions.
  D : Tester
- If the measured value is outside of the standard range, replace vehicle speed sensor **6**.



7 Inspection of engine coolant temperature sensor

- Put the engine coolant temperature sensor **7** in a container of engine oil.
- Heat the oil to each of the specified temperatures. Stir the oil to ensure that it heats up evenly.
- At each of the specified temperatures, measure the resistance between the terminal ① and body of the engine coolant temperature sensor **7**.
- If the measurements are out of specification, replace the engine coolant temperature sensor **7**.

https://truckmanualshub.com/

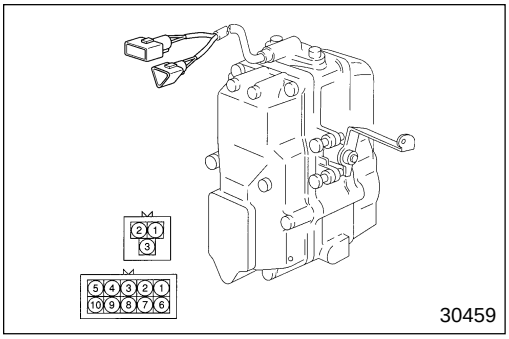


8 Inspection of boost temperature sensor

- Place boost temperature sensor **8** in glycerin in a container.
- Raise the glycerin temperature to the specified values and stir the glycerin.
- Measure the resistance between temminals ① and ②.
- If the measured value deviates from the standard value, replace boost temperature sensor **8**. Gr 15

9 Inspection of control rack position sensor

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA Dealer.



● Measurements on conectors

Measure the resistances between the following terminals: 3-pin connector's ③ and 10-pin connector's ④; 10-pin connector's ③ and ⑨; ④ and ⑨.

https://truckmanualshub.com/

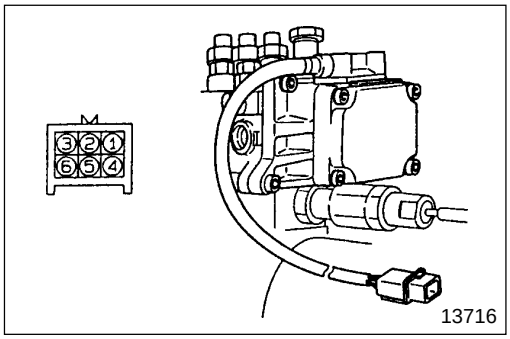
INSPECTION OF OTHER DEVICES

10 Inspection of pre-stroke actuator

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA Dealer.

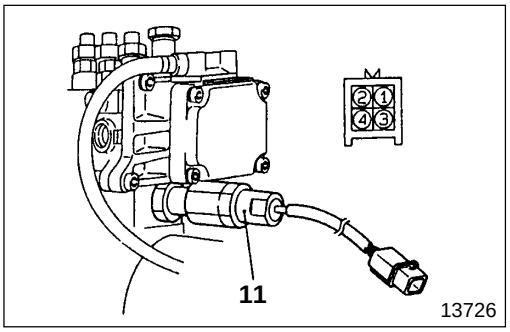
CAUTION ⚠

The pre-stroke actuator 10 must be inspected when the engine is cold.



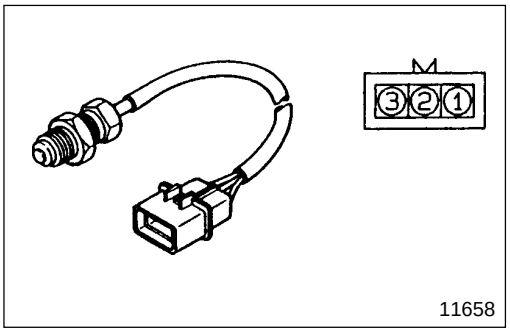
(1) Measurements on connectors

Measure the resistance between terminals ② and ③; ① and ③; ① and ②; ④ and ⑤.



11 Inspection of sub control rack position sensor

- Measure the resistances between the following terminals: ① and ④; ① and ③; ③ and ④.
- If any resistance is out of specification, replace the sub control rack position sensor **11**.
- Have replacement performed by the nearest MFTA Dealer.



12 Engine speed sensor

[Inspection]

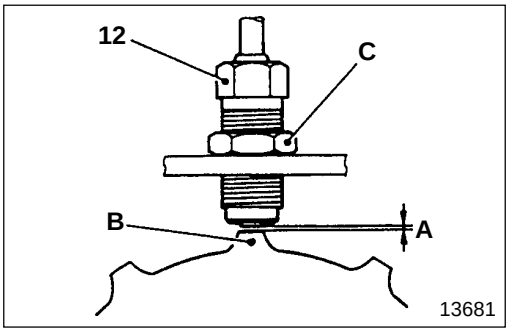
(1) Main Unit

- Measure the resistance value between terminals ① and ②.
- If the measured value is outside of the standard range, replace the engine speed sensor **12**.

CAUTION ⚠

If the tightening torque of engine speed sensor 12 is insufficient, the signals may not be output correctly. Therefore, check the tightening torque.

https://truckmanualshub.com/



(2) Gap of protrusion

If the gap **A** between the engine speed sensor **12** and the protrusion **B** of the timer housing is outside of the standard range, adjust with the following procedure.

[Adjustment]

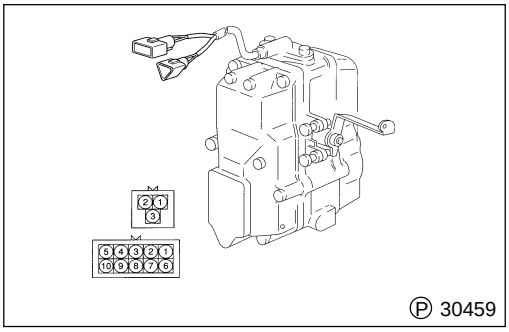
- Adjust by loosening lock nut **C** and turning engine speed sensor **12**.
- After adjustment is complete, tighten lock nut **C** with the specified torque.

CAUTION

If the gap C between the engine speed sensor 12 and the protrusion B of the timer housing is too large, no signals will be output, and if it is too small, the sensor might make contact with the protrusion.

13 Inspection of linear DC motor

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA Dealer.

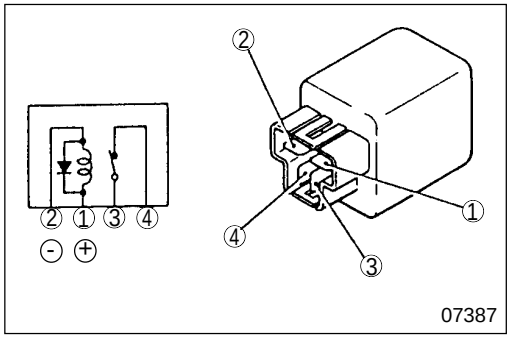


(1) Measurements on connectors

Measure the resistance between terminals ① and ② on each connector.

https://truckmanualshub.com/

INSPECTION OF OTHER DEVICES



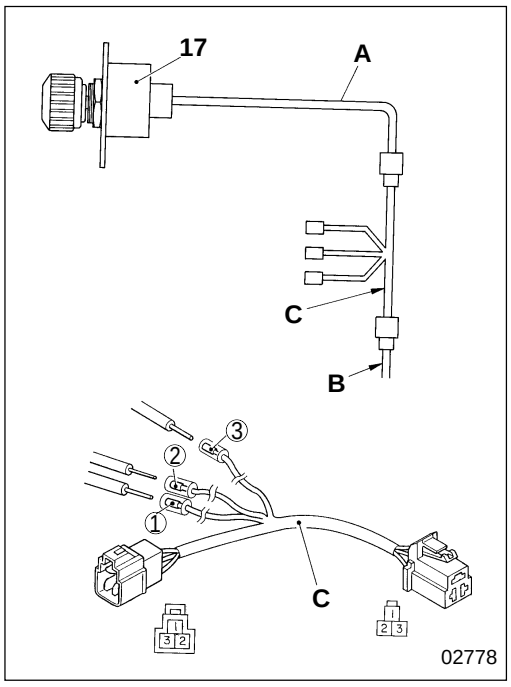
16 Inspection of pre-stroke cut relay (normally-closed type with 4-pin connector)

- Perform continuity checks in accordance with the following table.

	①	②	③	④
Not energized	○——○		○——○	
Energized	⊕——⊖		◌- - -⊣◌	

○——○ : Continuity exists between terminals.
⊕——⊖ : Terminals across which 12 V DC is applied
◌- - -⊣◌ : Continuity no longer exists between terminals

- Replace the relay if any abnormality is evident.



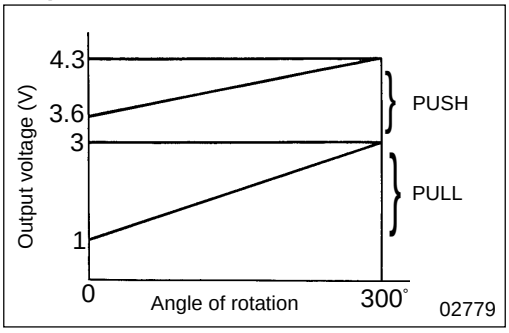
17 Inspection of idling speed adjustment potentiometer

- Disconnect the harness **A** of the idling speed adjustment potentiometer **17** from the cab-side harness **B**. Then, connect an inspection harness **C** between harnesses **A** and **B.** (The inspection harness must be made specially for this procedure.)
- Turn the starter switch to the ON position.
- Check the output voltages of the iding speed adjustment potentiometer **17** in accordance with the following table.

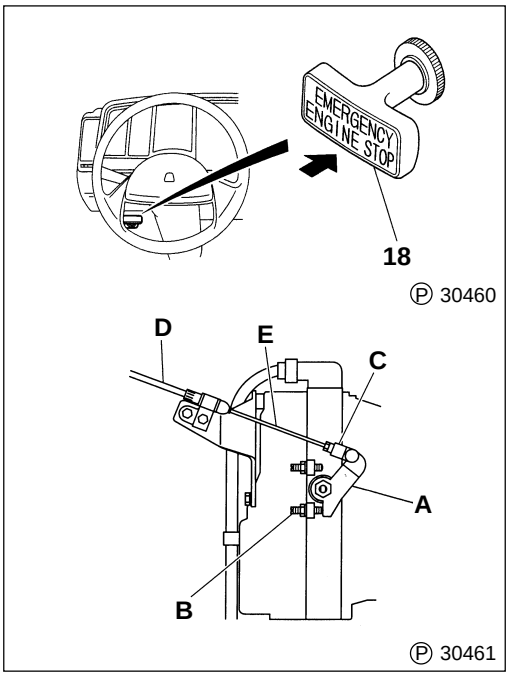
Item	Connector terminal		
	Accelerator pedal position sensor inspection harness		
	①: Power supply (+)	②: GND (–)	③: Output (+)
Output voltage with knob pulled		⊖——⊕	
Output voltage with knob pushed			

https://truckmanualshub.com/

Output characteristics



- If the output voltages are out of specification, replace the idling speed adjustment potentiometer **17**.



18 **Inspection of the emergency engine stop button**

- Fully press down the emergency engine stop button **18**.
- Check that the stop lever **A** of the governor is in contact with the stopper bolt **B** at this time.
- If it is not in contact, adjust it such that it makes contact by turning crevice **C**.
- Moreover, tighten inner wire **E** of stop cable **D** just enough to prevent it from being slack.

CAUTION ⚠

Be careful not to stretch the inner wire E too much. Doing so can cause the stop lever A not to make contact with the stopper bolt B.

SPECIFICATIONS

Injection Pump

Item	Specifications
Manufacturer	ZEXEL
Body model	MD–TICS (Pre-stroke control type)
Governor type	RLD – J all-speed mechanical governor with boost compensator
Feed pump model	KD
Automatic timer model	SPG mechanical type

Injection Nozzle

Item		Specifications	
Engine model		6D16T2	6D16T3, T4
Manufacturer		ZEXEL	
Model and type		DLLA hole type 1-spring nozzle	
Nozzle orifice quantity		5	
Orifice diameter	mm {in.}	ø0.25 {0.0098}	ø0.23 {0.0091}

Fuel Filter Type

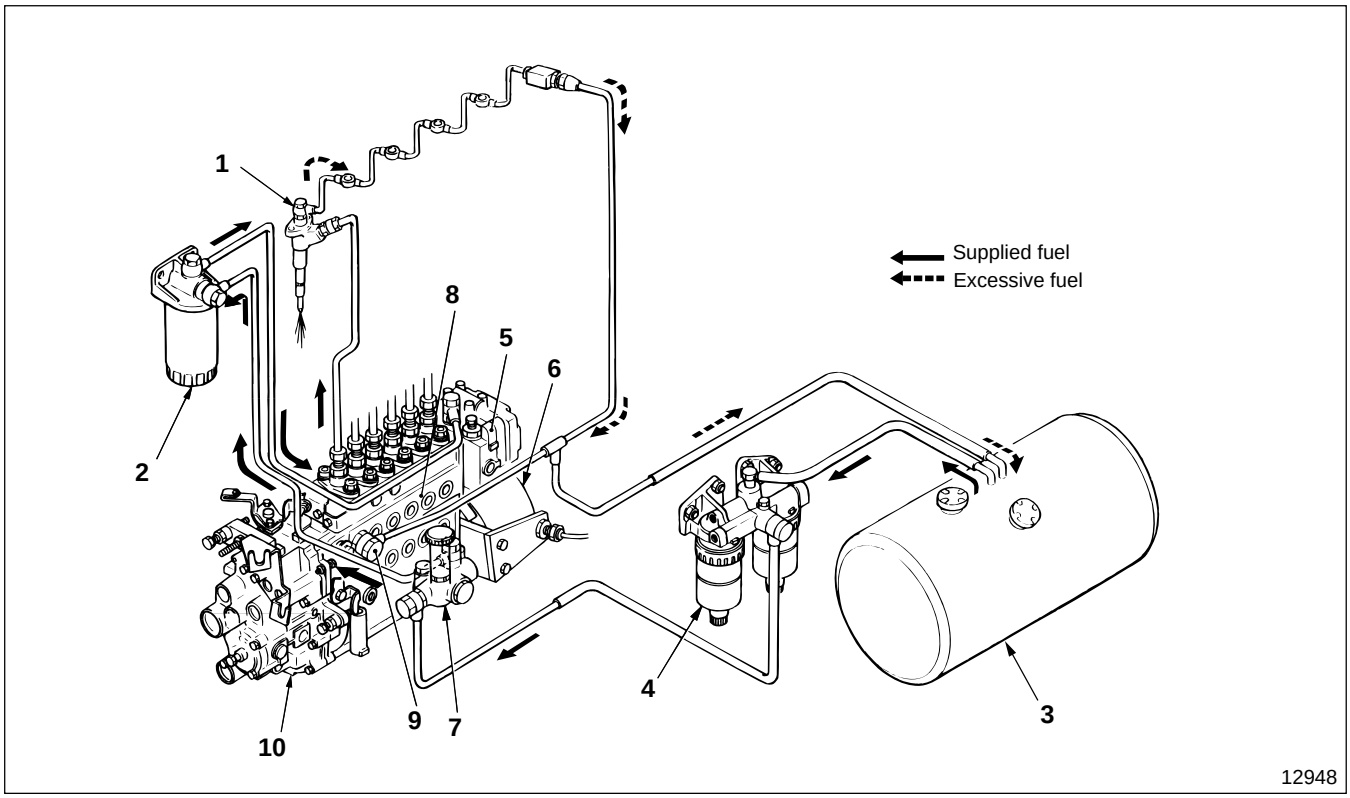
Item	Specifications
Filter type	Spin-on type

https://truckmanualshub.com/

MEMO

https://truckmanualshub.com/

Fuel System (Flow of Fuel)

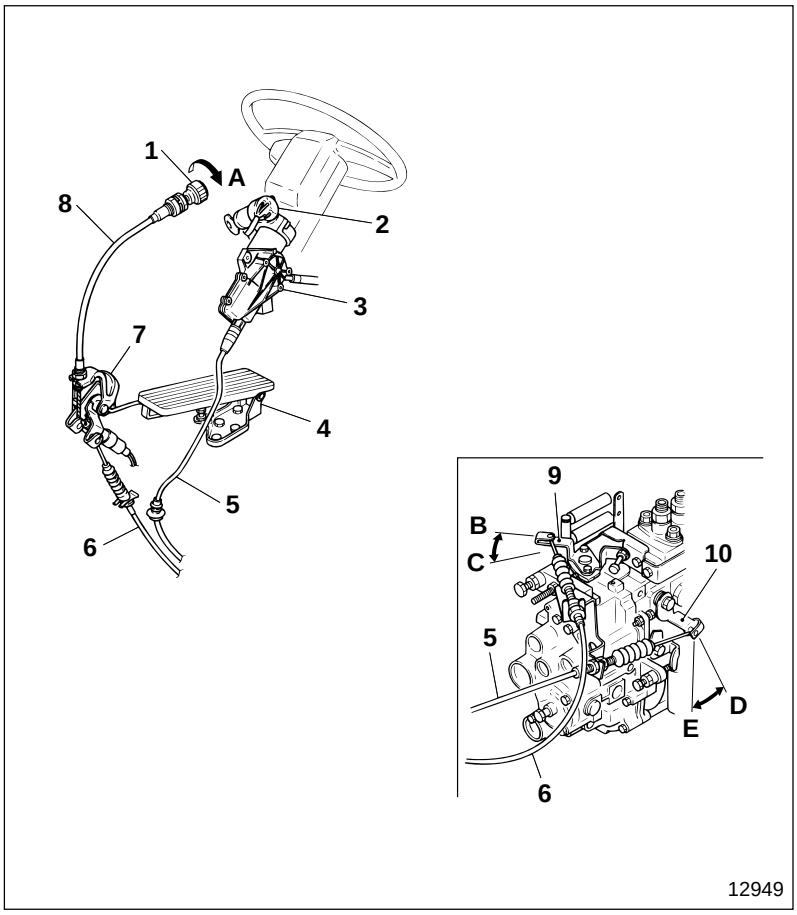


1 Injection nozzle
2 Fuel filter
3 Fuel tank
4 Water separator
5 Pre-stroke actuator
6 Automatic timer
7 Feed pump
8 Injection pump
9 Overflow valve
10 Governor

Fuel in fuel tank **3** is sucked up by feed pump **7** which is driven by the cam action of injection pump **8** and is filtered through fuel filter **2** which removes dirt and other foreign particles.
Filtered fuel is sent to the injection pump where the fuel pressure is boosted and injected through injection nozzle **1** into the combustion chamber.
When fuel pressure is higher than the specified value, overflow valve **9** opens to let the fuel return to the fuel tank.

https://truckmanualshub.com/

Engine Control



1 Idling control knob
2 Starter switch
3 Fuel-cut motor
4 Accelerator pedal assembly
5 Engine stop cable
6 Accelerator control cable
7 Accelerator and bracket assembly
8 Idling control cable
9 Idling control lever
10 Engine stop lever

A : Idling revolution rising
B : Idling position
C : Full-load position
D : Engine start-up position
E : Engine-stop position

(1) Idling control knob

Idling control knob **1** is for making fine adjustment to the idling revolution of the engine. Turning the knob clockwise raises the revolution. It works in the same way as accelerator pedal assembly **4** does when it is depressed.

(2) Fuel-cut motor

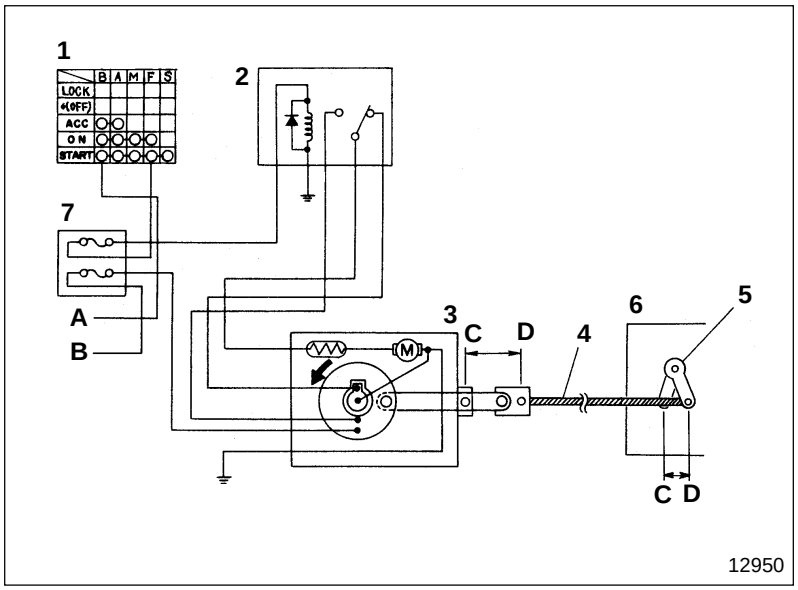
Fuel-cut motor **3** is connected to starter switch **2**, and it is activated by the starter switch being turned ON (or to S). This brings engine-stop lever **10** of the governor to engine-stop position **E** (or engine start-up position **D**), and stops (or starts) the engine. P13-6

(3) Accelerator pedal

When accelerator pedal assembly **4** is freed from foot pressure, the governor return spring forces idling control lever **9** to idling position **B**, restoring the pedal to its original position.

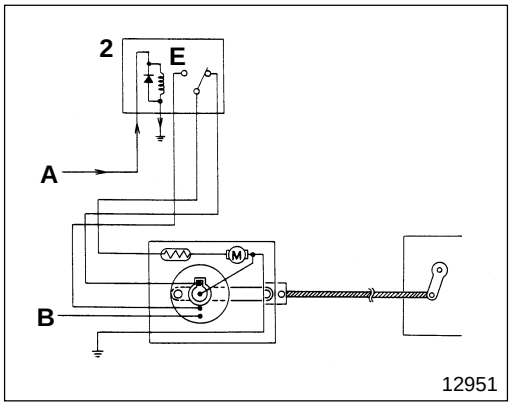
https://truckmanualshub.com/

Engine Stopping Circuit



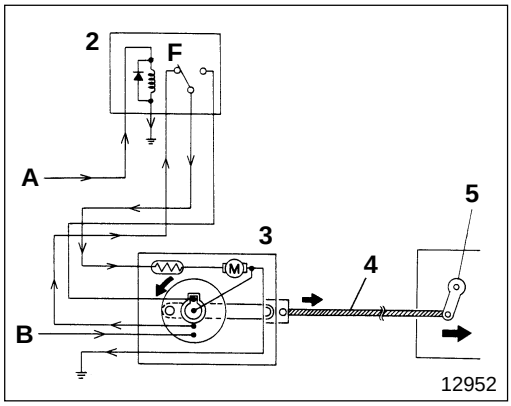
1 Starter switch
2 Fuel-cut relay
3 Fuel-cut motor
4 Engine-stop cable
5 Engine-stop lever
6 Governor
7 Relay and fuse box

A : Power source
B : Power source
C : Engine-stop position
D : Engine start-up position



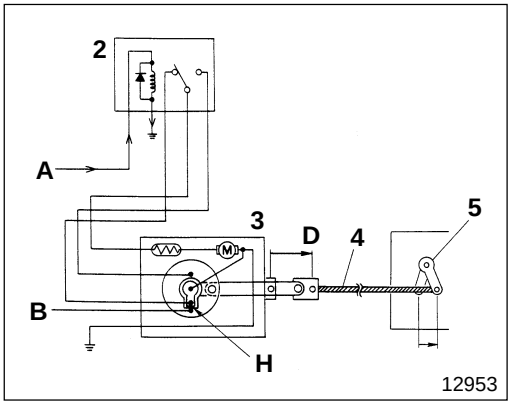
● **At engine start-up (starter switch ON)**

- Electric current flows as illustrated, and coil **E** of fuel-cut relay **2** is magnetized.

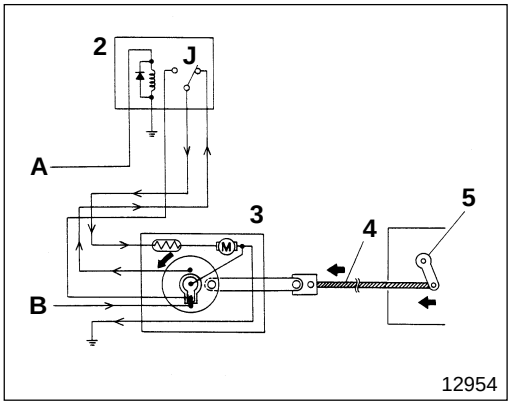


- Contact point **F** of fuel-cut relay **2** closes, and fuel-cut motor **3** is activated.
- Engine-stop cable **4** is pushed out, and engine-stop lever **5** moves to engine start-up position.

https://truckmanualshub.com/

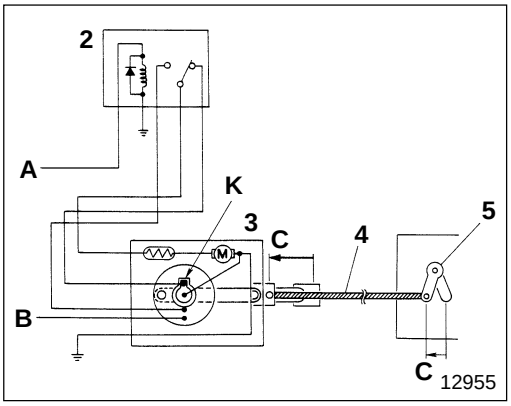


- Engine-stop lever **5** moves to engine start-up position **D**, and fuel is ready to flow. Contact point **H** of fuel-cut motor **3** opens, and the fuel-cut motor stops.



● **When engine is at standstill (starter switch OFF)**

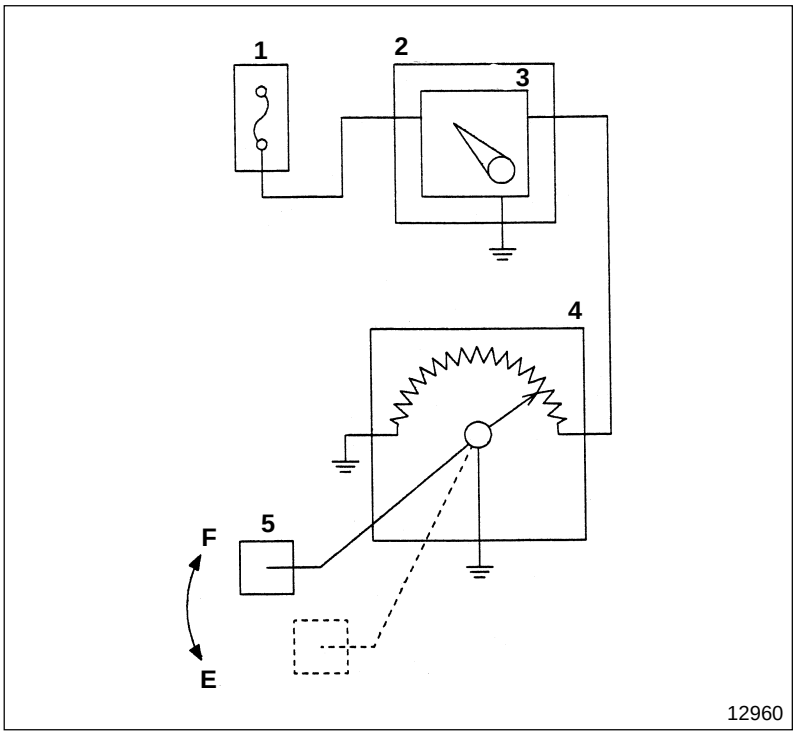
- Electric current from the starter switch is broken, and contact point **J** of fuel-cut relay **2** closes, and fuel-cut motor **3** is activated.
- Engine-stop cable **4** is pulled to bring engine-stop lever **5** to engine-stop position.



- When engine-stop lever **5** reaches engine-stop position **C**, fuel flow stops and the engine stops. Simultaneously, contact point **K** of fuel-cut motor **3** opens, and the fuel-cut motor stops.

https://truckmanualshub.com/

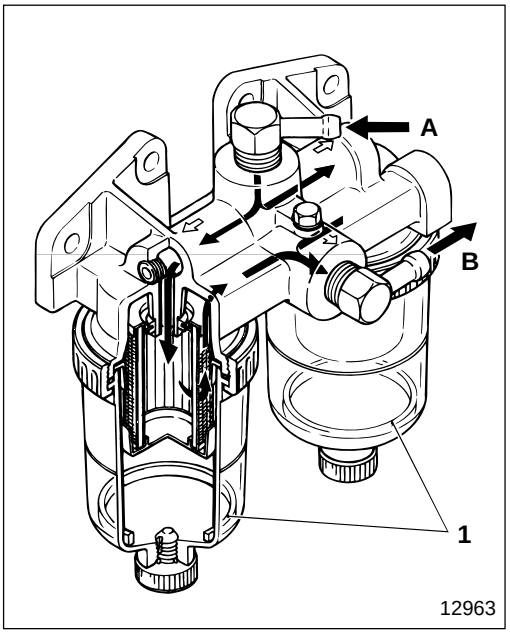
Fuel Gauge Electric Circuit



1 Relay and fuse box
2 Meter cluster
3 Fuel gauge
4 Fuel gauge unit
5 Float

The fuel gauge circuit indicates the amount of fuel remaining by means of a gauge.

Water Separator



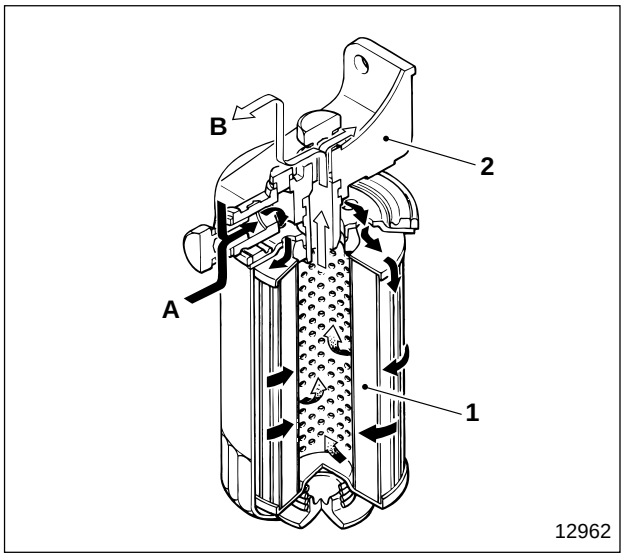
1 Water level ring

A : From fuel tank
B : To feed pump

The water separator is installed between the fuel tank and the feed pump. Any water present in the fuel is separated by the baffle plate and the screen assembly.

https://truckmanualshub.com/

Fuel Filter



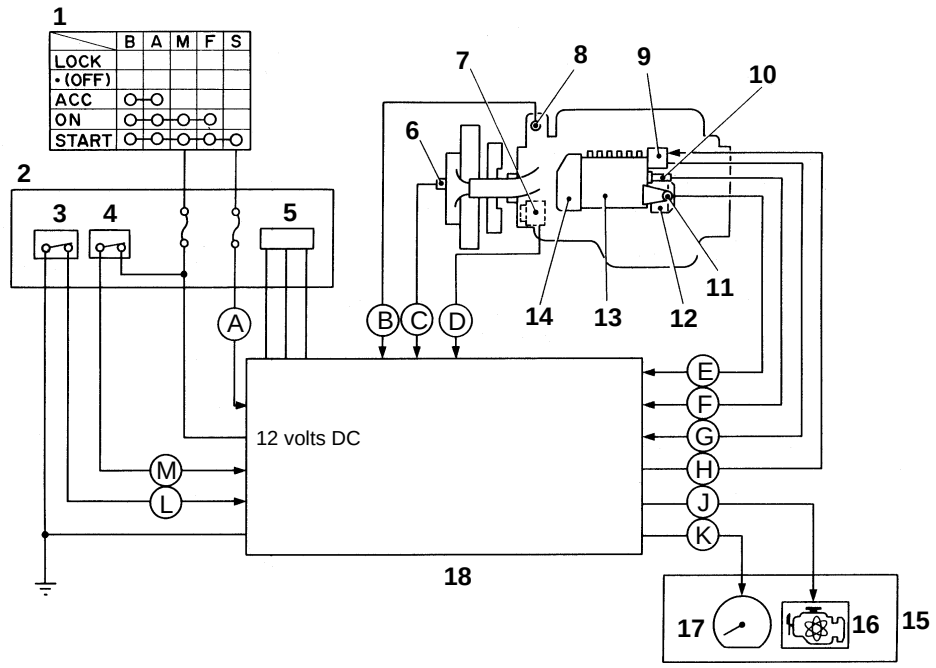
1 Fuel filter
2 Fuel filter head

A : From feed pump
B : To injection pump

Pressurized fuel is delivered from the feed pump of the injection pump to the fuel filter which separates water from the fuel and removes foreign particles are removed from the fuel by fuel filter **1**.

https://truckmanualshub.com/

Structure of Pre-stroke Control Injection Pump System



13086

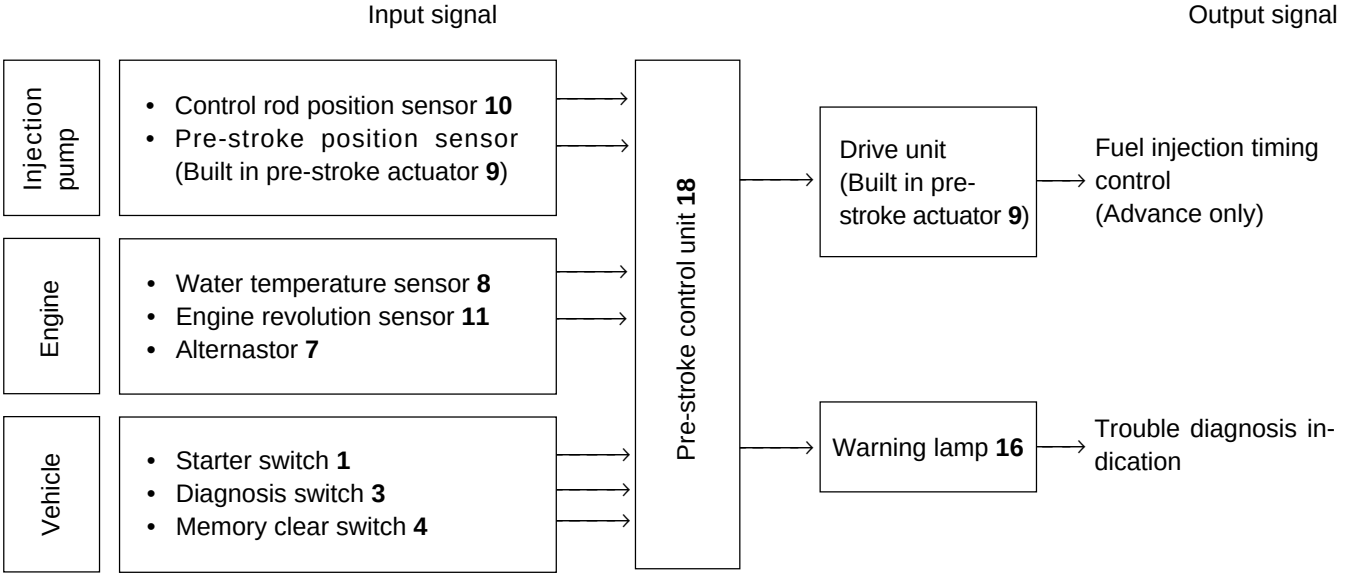
Part name	Main function	Main signal
1 Starter switch	Detection of start signal	Ⓐ : Start signal
2 Relay and fuse box		
3 Diagnosis switch	Transmission of diagnosis code signal	Ⓛ : Diagnosis code signal
4 Memory clear switch	Clearing of diagnosis code	Ⓜ : Diagnosis code clearing signal
5 Multi-use tester connector	Connection of multi-use tester	
6 Boost air temperature sensor	Detection of engine intake air temperature	Ⓒ : Boost air temperature signal
7 Alternator	Detection of engine revolution	Ⓓ : Alternator L terminal signal
8 Water temperature sensor	Detection of engine coolant temperature	Ⓑ : Engine coolant temperature signal
9 Pre-stroke actuator		
• Pre-stroke position sensor		Ⓖ : Pre-stroke position signal
• Drive unit		Ⓗ : Actuator drive signal
10 Control rod position sensor	Detection of control rod position	Ⓕ : Control rod position signal
11 Engine revolution sensor	Detection of engine revolution	Ⓔ : Engine revolution signal
12 Mechanical timer	Retards fuel injection timing (Mechanical control)	
13 Pre-stroke control injection pump	Change of pre-stroke (Advance fuel injection timing)	
14 Mechanical governor	Control of fuel injection quantity (Mechanical control)	
15 Meter cluster		
16 Warning lamp	Indication of system abnormality, indication of diagnosis code	Ⓙ : Lamp lighting signal
17 Tachometer		Ⓚ : Tachometer drive signal
18 Pre-stroke control unit	Control of entire system	

https://truckmanualshub.com/

- The pre-stroke control injection pump system uses, in the injection pump body, electronically controlled pre-stroke control injection pump **13**, mechanical governor **14**, and mechanical timer **12**.
- The lifting speed of the plunger in the injection pump varies with the engine revolution. Because of this, the pressure in the injection pipe also changes.
- This change of pressure in the injection pipe means the appropriate state of fuel injection and air/fuel mixture from the injection nozzle is no longer obtainable.
- In low- and medium-range engine revolution, the amount of pre-stroke is made larger so that the fuel is injected at the point the plunger lifting speed increases during the second half of cam lift. P13-18
- On the other hand, in high-range engine revolution, the amount of pre-stroke is made smaller so that the fuel is injected while the plunger lifting speed remains low during the first half of cam lift. This prevents the pressure in the injection pipe from becoming excessively high.
- Because of this variation in the amount of pre-stroke, pre-stroke control injection pump **12** can obtain the appropriate injection state and air/fuel mixture for combustion.
- Thus, engine torque is larger than engines that use a normal injection pump. Also, the exhaust gas emission is cleaner.
- Control is achieved by making the pre-stroke adjustable in conjunction with the drive of pre-stroke actuator **9**, which is mounted on the rear of the injection pump body. This pre-stroke actuator is activated by commands received from pre-stroke control unit **18**, which processes data signals received from the various sensors installed on the engine and vehicle body.
  This system also has a trouble diagnosis function and a fail-safe function. The following table shows control items.

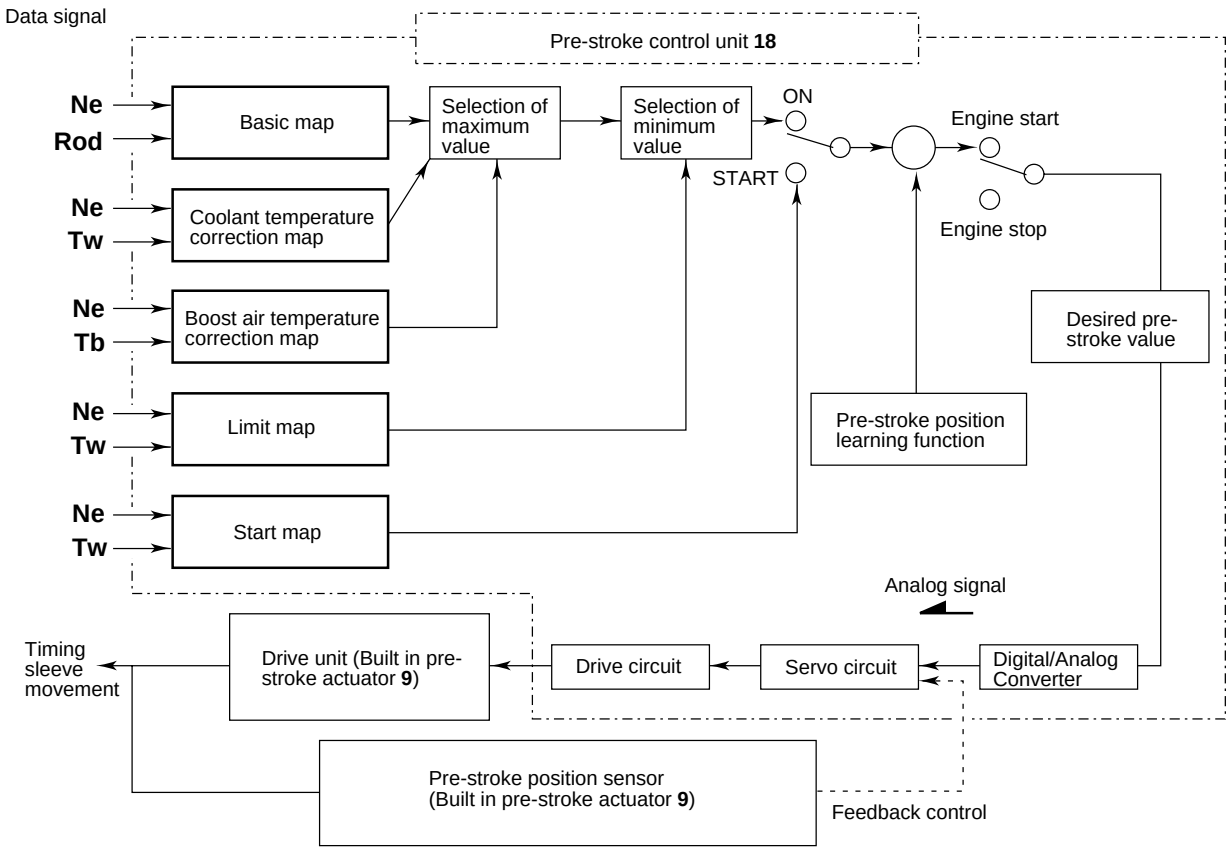
Control item	Control description	Information source	
		Sensor	Data signal
Pre-stroke control	Adjusts the fuel injection timing by changing the timing sleeve position to change the pre-stroke	6 to 11	Ⓐ to Ⓗ
Trouble diagnosis function	Checks and diagnoses the status of the sensors of the pre-stroke control injection pump system while the engine is running. Warns the driver, via warning lamp **16**, if any trouble occurs, and memorizes the data on the trouble P13-13	ALL	ALL
Fail-safe function	When trouble occurs, backup mode is activated and countermeasures for the trouble are taken P13-13	ALL	ALL
* Fuel injection quantity control	Controlled by mechanical governor **14** P13-20	—	—
* Fuel injection timing control (retard)	Controlled by mechanical timer **12** P13-22	—	—

* : This is not controlled by the pre-stroke control injection pump system but by ordinary mechanical control.



https://truckmanualshub.com/

● Pre-stroke control



Ne : Engine revolution **Rod** : Control rod position
Tw : Engine coolant temperature **Tb** : Engine intake air temperature
Digital/Analog converter : Converts digital signals into analog signals

Control by Pre-stroke Control Unit 18

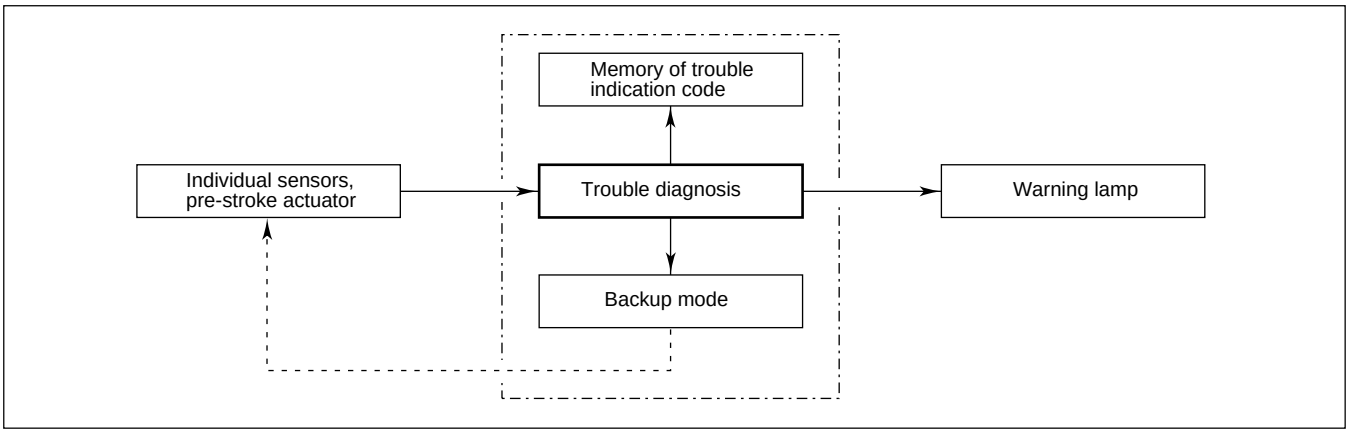
- The control unit commands the system while the engine is running, and selects the maximum value of the desired pre-stroke value based on data signals received from the basic map, coolant temperature correction map, and boost air temperature correction map.
- After the maximum value has been selected, the limit map selects and processes the minimum value so that the desired pre-stroke value does not exceed the maximum value.
- The desired pre-stroke value is further determined by the pre-stroke position learning function. This corrects any deviation in positional adjustment by the pre-stroke position sensor and any deviation by the injection pump, correcting the output voltage of the pre-stroke position sensor.
- The pre-stroke thus determined is converted into continuous analog signals by the Digital/Analog converter and transmitted through the servo circuit and drive circuit to actuate the drive unit. The drive unit moves the timing sleeve position to change the pre-stroke.
- Control at the time of engine start up is handled by the start map.

Control by Pre-stroke Position Sensor (built in pre-stroke actuator 9)

- The pre-stroke position sensor monitors the operating condition of the drive unit by feeding back signals to pre-stroke control unit **18** and judging whether the pre-stroke is controlled in accordance with the desired value by noting the timing sleeve position.
- When pre-stroke control unit **18** receives the feedback signals, it computes the actual measured value of the timing sleeve position, and if there is any difference between the desired and actual values, it issues a correction command.
- This operation is repeated to constantly maintain the timing sleeve position at the desired position, thus determining the final pre-stroke.

https://truckmanualshub.com/

● Trouble diagnosis function, fail-safe function



- The trouble diagnosis function detects and diagnoses troubles reported by the various sensors and the pre-stroke actuator, while the engine is running. If any trouble occurs, this function warns the driver by lighting warning lamp and at the same time stores the trouble point in memory as a diagnosis code.
- The fail-safe function is put into operation simultaneously and the trouble is treated accordingly in the backup mode.
- In the backup mode, the pre-stroke control starts when trouble occurs. If the trouble does not affect the operation of the engine, fixed data from the backup mode is used to treat the trouble. If the trouble dangerously affects the operation of the engine, the pre-stroke control stops.
- If the function goes into backup mode, the function stays in that mode until the starter switch is set to LOCK. When a normal signal is returned, control of the system returns and warning lamp goes off.
- There are two kinds of diagnosis code, current and previous.
  - Current diagnosis code : Indicates data when the engine has been running with the starter switch set to ON since the abnormality occurred.
  - Previous diagnosis code : Indicates previous data when the engine was stopped with the starter switch set to ACC or LOCK after the abnormality occurred.

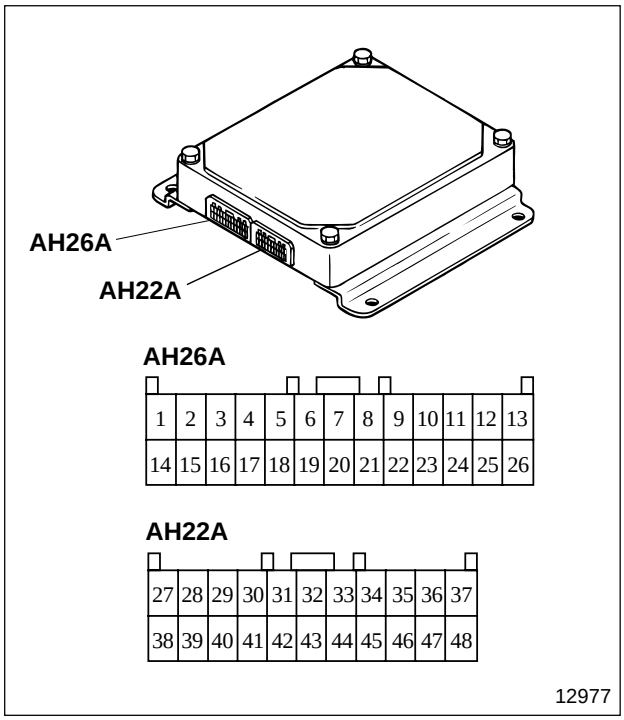
Table of diagnosis codes

Diagnosis code	Abnormal item	Countermeasures taken by pre-stroke control unit (Backup mode)
01	Normal	—
03	Pre-stroke learning function	Controls with correction value assumed to be 0
04	Pre-stroke actuator power source	Stoppage of pre-stroke control
05	Engine revolution sensor (No pulse)	Controls with engine revolution assumed to be 0
12	Pre-stroke servo system	Stoppage of pre-stroke control
13	Pre-stroke position sensor	Stoppage of pre-stroke control
15	Engine revolution sensor (Wiring breakage)	Controls with engine revolution assumed to be 0
21	Water temperature sensor	Controls with water temperature assumed to be 80˚C {176˚F}
22	Control rod position sensor	Controls with control rod position assumed to be full load
41	Boost air temperature sensor	Controls with boost air temperature assumed to be 80˚C {176˚F}

It is possible to run the vehicle even if the pre-stroke control develops an abnormality. However, do not run the vehicle for a long period of time, run it only for the time necessary to obtain repairs.

https://truckmanualshub.com/

Pre-stroke Control Unit



- The pre-stroke control unit monitors and computes data signals received from the various sensors and, using its internal computer, converts the computed results into control signals (pre-stroke actuator drive signals).
- These signals operate the various instruments to control the system.

Connector AH26A		Connector AH22A

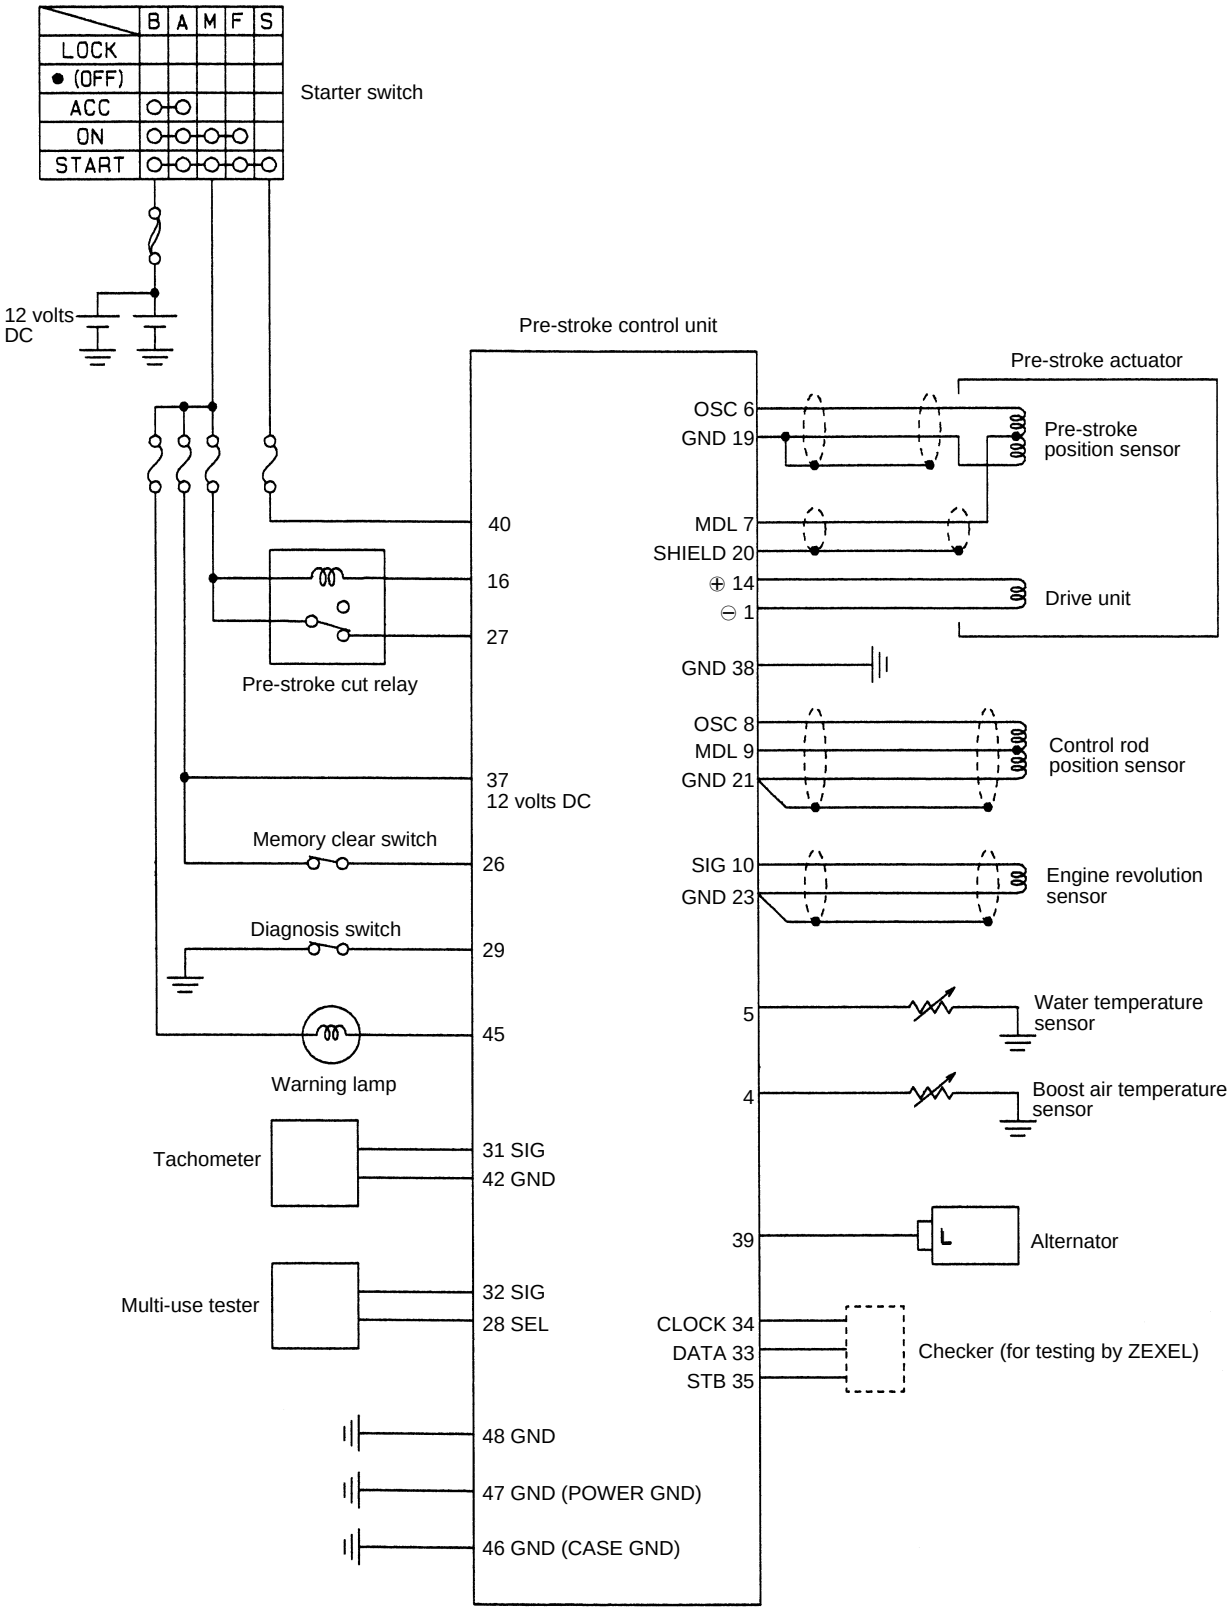
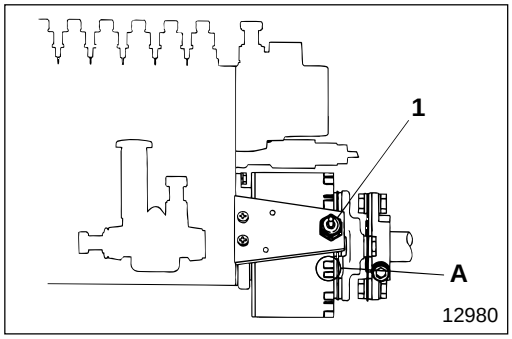
https://truckmanualshub.com/



https://truckmanualshub.com/

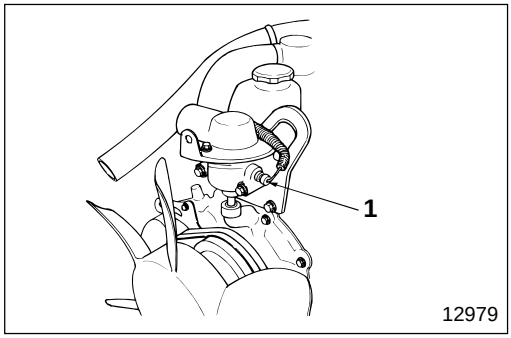
Engine Revolution Sensor



- Engine revolution sensor **1** is a pick-up type that detects the revolution of the injection pump and converts the revolution value into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the engine revolution signal, which is used as the correction value by the control unit to determine the desired pre-stroke position value.

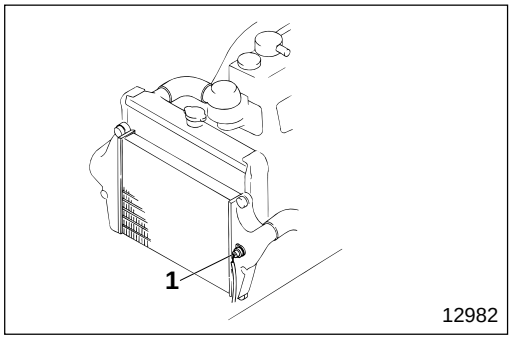
  A : Timer housing protrusion

Water Temperature Sensor



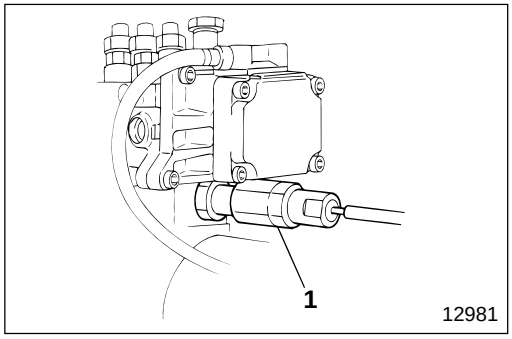
- Water temperature sensor **1** is a thermistor type that converts the coolant temperature into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the engine coolant temperature signal, which is used as the correction value by the control unit to determine the desired pre-stroke position value.

Boost Air Temperature Sensor



- Boost air temperature sensor **1** is a thermistor type that converts the intake air temperature, immediately after its passage through the intercooler, into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the boost air temperature signal, which is used as the correction value by the control unit to determine the desired pre-stroke position value.

Control Rod Position Sensor



- Control rod position sensor **1** is a resistor type that converts the amount of movement of the control rod into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the control rod position signal, which is used as the correction value by the control unit to determine the desired pre-stroke position value.

Pre-stroke Position Sensor P13-10, 12

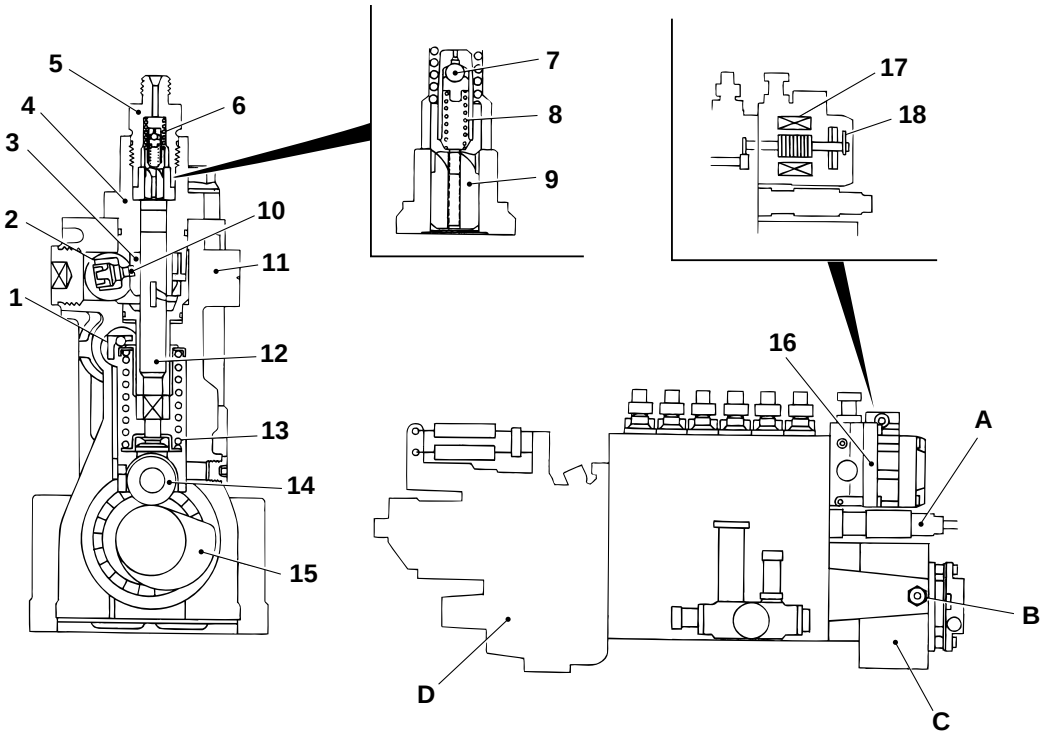
Injection Pump Body

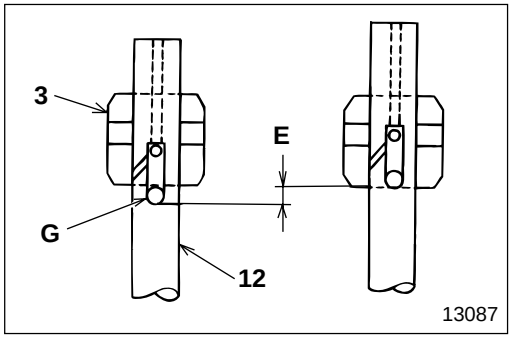


1 Control rod
2 Timing rod
3 Timing sleeve
4 Plunger barrel
5 Delivery valve holder
6 Delivery valve spring
7 Ball
8 Spring
9 Delivery valve
10 Pin
11 Pump housing
12 Plunger
13 Plunger spring
14 Tappet
15 Camshaft
16 Pre-stroke actuator
17 Drive unit
18 Pre-stroke position sensor

A : Control rod position sensor P13-16
B : Engine revolution sensor P13-16
C : Mechanical timer P13-22
D : Mechanical governor P13-20

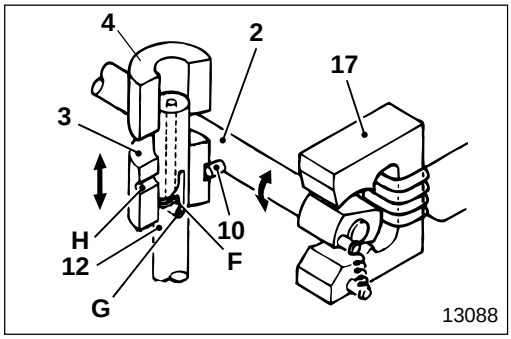
- The injection pump has a variable pre-stroke mechanism.
- Because of the variation in the amount of pre-stroke, the appropriate injection state and air/fuel mixture for combustion can be obtained, thus the engine torque is larger than when a normal injection pump is used and the exhaust gas emission is cleaner.

https://truckmanualshub.com/



Pre-stroke

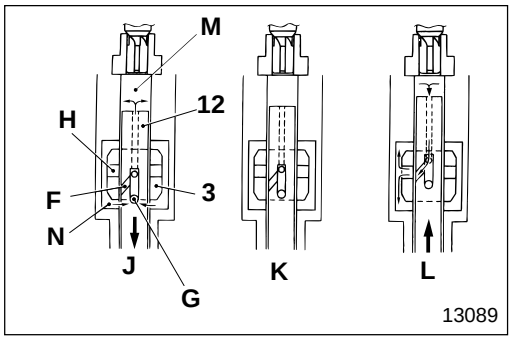
Pre-stroke is stroke **E** whose range is from the bottom dead point of plunger **12** to the starting point of pressurized delivery of fuel, at which point suction port **G** is closed by timing sleeve **3**. An ordinary injection pump has a fixed stroke length.



Pre-stroke variable mechanism

F : Indent
G : Suction port
H : Exhaust port

- In a conventional injection pump, plunger barrel **4** is fixed. In the pre-stroke control injection pump system, vertically movable timing sleeve **3** is fitted in the fixed plunger barrel.
- Timing rod **2**, pin **10** and drive unit **17** are installed to operate timing sleeve **3**.
- The operation of drive unit **17** rotates timing rod **2**, causing pin **10** to move timing sleeve **3** vertically.
- As timing sleeve **3** is fitted with fuel exhaust port **H**, the pre-stroke changes in accordance with the movement of the timing sleeve.

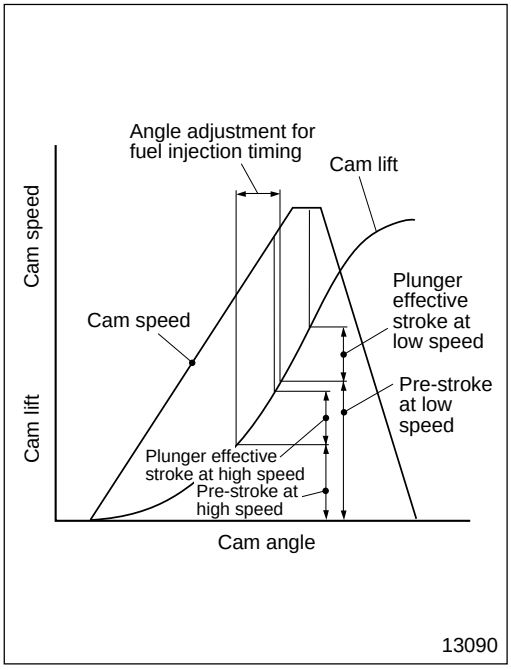


Pressurized fuel delivery

J : Ongoing suction
K : Start of pressurization
L : Delivery ends

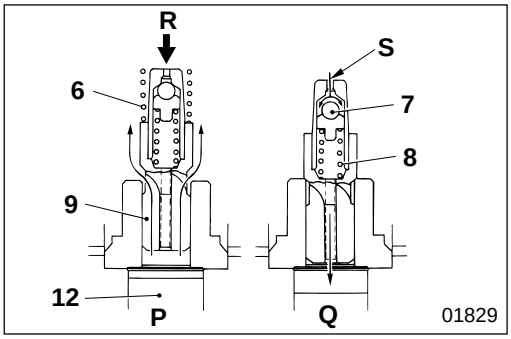
- When suction port **G** opens as plunger **12** moves down from the top dead point, fuel is delivered into pressure chamber **M** by both the negative pressure caused by the downward movement of the plunger and the pressure of the fuel itself delivered by the feed pump.
- When the lift of plunger **12** is low enough, the pressure in pressure chamber **M** does not increase as the fuel in the pressure chamber flows via suction port **G** into fuel reservoir **N**, even if the plunger lifts.
- As plunger **12** lifts further and suction port **G** is closed by timing sleeve **3**, pressurization of the fuel starts. The pressure increases as the plunger lifts further, making the injection pump start pressurized fuel delivery.
- When indent **F** on plunger **12** meets exhaust port **H** of timing sleeve **3**, the fuel in pressure chamber **M** is pushed back to fuel reservoir **N**, stopping pressurized fuel delivery.
- Adjustment of the fuel quantity to be injected is made by changing the relative meeting position of exhaust port **H** of timing sleeve **3** and indent **F**, by the rotation of plunger **12**.

https://truckmanualshub.com/



Fuel injection timing and fuel injection characteristics

- The pre-stroke changes according to changes in the position of timing sleeve **3**, whereby the fuel injection timing can be advanced or retarded.
- By making the pre-stroke smaller, suction port **G** of plunger **12** closes early, making the fuel injection timing quicker accordingly.
  Retard of fuel injection timing is not controlled by the variable pre-stroke mechanism, but by mechanical timer **D**.
- By making the pre-stroke larger, suction port **G** of plunger **12** closes late, making the fuel injection timing slower accordingly.
  The quick response of the fuel injection timing improves engine start-up performance at low temperatures.



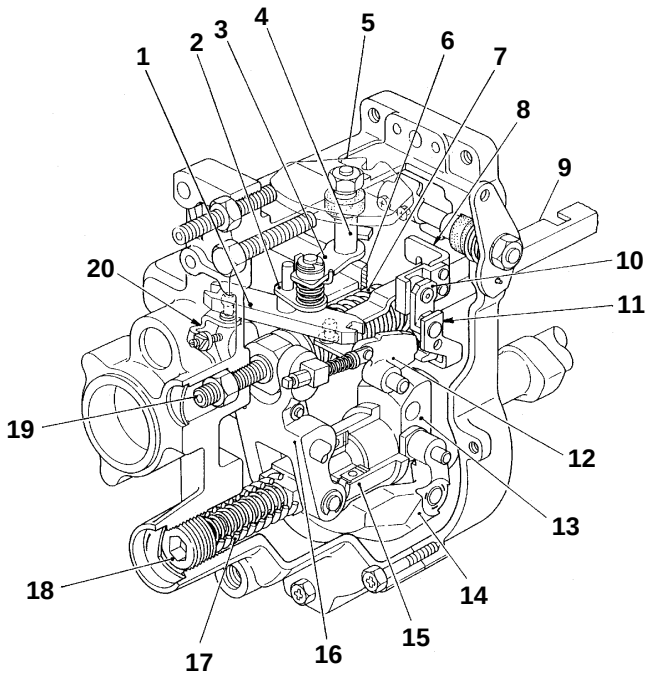
Delivery valve

P : Start of pressurized delivery
Q : End of pressurized delivery

- Delivery valve **9** keeps residual pressure **R** in the injection pipe at a certain level throughout the entire engine revolution range preventing cavitation and allowing high-pressure injection.
- When the fuel pressure on plunger **12** side, as the plunger is lifted, overcomes the combined force of residual pressure **R** in the injection pipe and the repercussive force of delivery valve spring **6** of the plunger, delivery valve **9** is pushed up and pressurized fuel delivery starts.
- Fuel in the injection pipe returns quickly to plunger **12** side the moment pressurized delivery from the plunger ends, and the delivery valve is closed.
- The excess fuel is returned slowly through orifice **S**, reducing the pressure in the injection pipe.
- When the repercussive force of spring **8** in delivery valve **9** equalizes with the pressure in the injection pipe, ball **7** closes orifice **S** and residual pressure **R** in the injection pipe is kept at a specified level.

https://truckmanualshub.com/

Governor



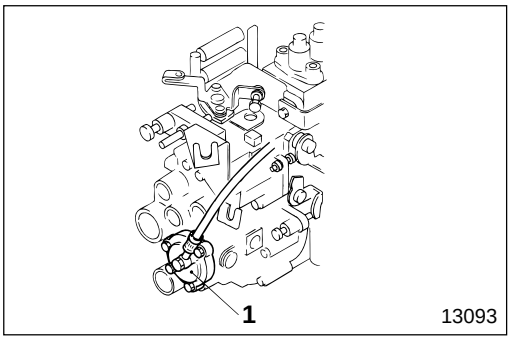
09407

1 Floating lever
2 No.2 supporting lever
3 No.1 supporting lever
4 Adjusting lever shaft
5 Control lever
6 Guide plate
7 Governor spring
8 Rack connecting
9 Control rod
10 Sensor lever
11 U-lever
12 Torque cam
13 Flyweight holder
14 Flyweight
15 Sleeve
16 Tension lever
17 Idling spring
18 Idling screw
19 Governor shaft
20 Guide lever

The governor is a mechanical type that uses centrifugal force generated by flyweights **14**, its characteristics are between those of a minimum/maximum speed governor and those of an all-speed governor. Because there is no repercussive force from governor spring **7** or control lever **5**, when the accelerator pedal is depressed, the repercussive force transmitted to the accelerator pedal, via the control lever, is quite light, making accelerator pedal operation easy.

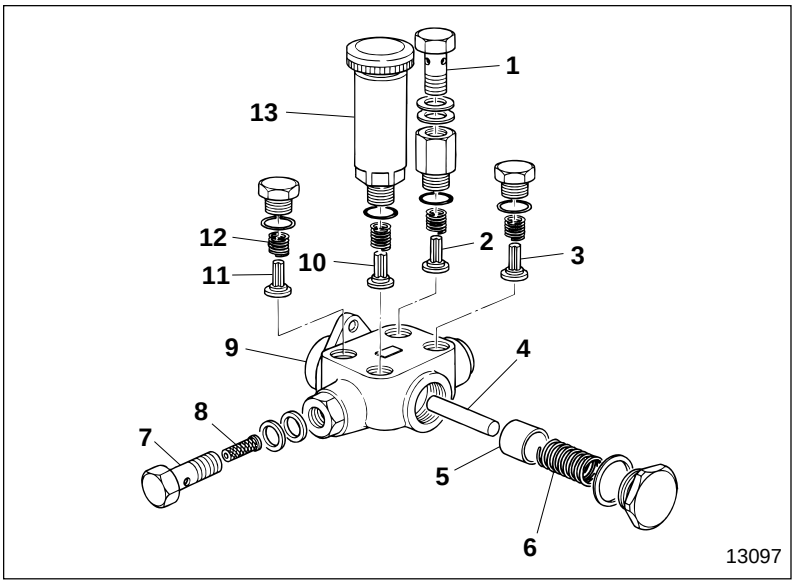
https://truckmanualshub.com/

Boost Compensator



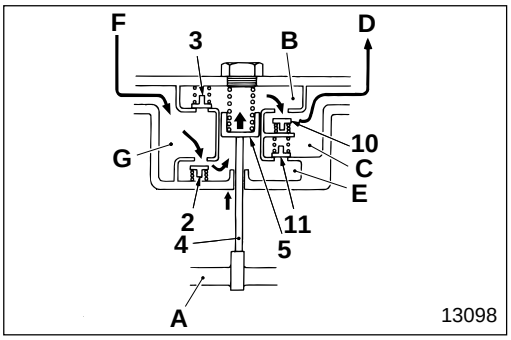
Boost compensator **1** is a device that automatically adjusts the quantity of fuel to be injected to suit the increase in the intake air mass delivered into the engine cylinders by the turbocharger.

Feed Pump



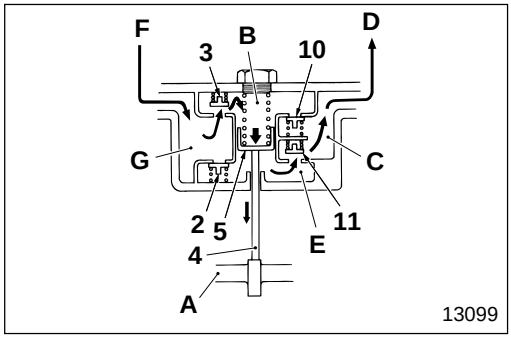
1 Eye bolt at fuel outlet
2 Check valve
3 Check valve
4 Push rod
5 Piston
6 Piston spring
7 Eye bolt at fuel inlet
8 Gauze filter
9 Feed pump housing
10 Check valve
11 Check valve
12 Check valve spring
13 Priming pump

- The feed pump is a double-action type pump which, with four check valves operating, sucks and discharges fuel during both strokes of pistons **5**.
- Push rod **4** makes contact with the injection pump camshaft directly, moving piston **5**.
- Priming pump **13** can be manually operated, when the injection pump is not operating, to suck up fuel and thus can be used for air bleeding.
- Gauze filter **8** eliminates large foreign particles from the fuel sucked up from the fuel tank to prevent clogging of the feed pump. This gauze filter must be cleaned with gas oil periodically.



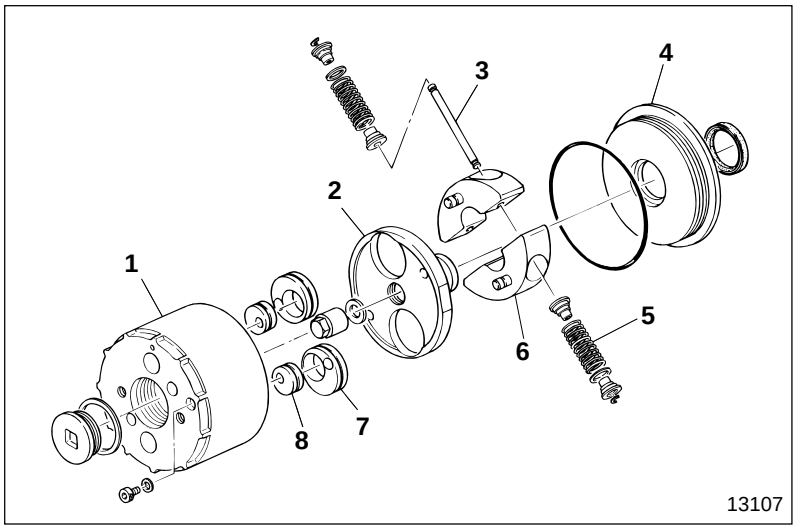
The rotation of injection pump camshaft **A**, pushes up push rod **4** and piston **5**, and the pressure in inner chamber **B** increases. This closes check valve **3**, and check valve **10** opens to let the fuel in inner chamber **B** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **E** decreases, check valve **11** closes, and check valve **2** opens to let fuel flow from fuel tank **F** through outer chamber **G** to inner chamber **E**.

https://truckmanualshub.com/



When injection pump camshaft **A** rotates further, it pushes down push rod **4** and piston **5**, and the pressure in inner chamber **E** increases. This closes check valve **2**, and check valve **11** opens to let the fuel in inner chamber **E** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **B** decreases, check valve **10** closes, and check valve **3** opens to let fuel from fuel tank **F** flow through outer chamber **G** to inner chamber **B**.

Automatic Timer

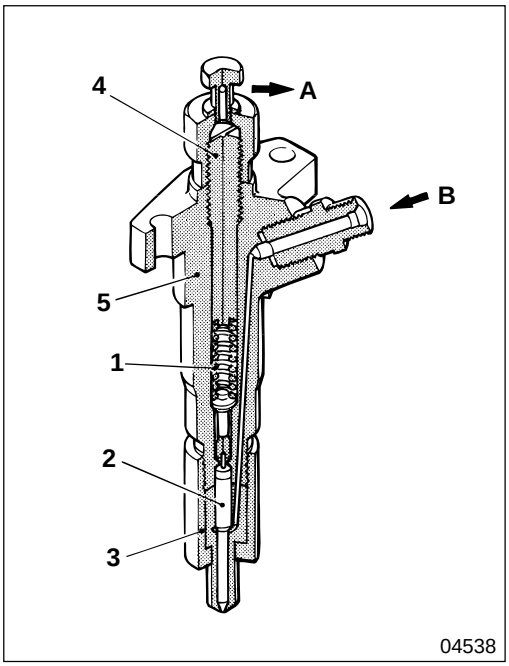


1 Timer housing
2 Timer holder
3 Pilot pin
4 Cover
5 Timer spring
6 Flyweight
7 Eccentric cam (Large)
8 Eccentric cam (Small)

- The mechanical type automatic timer changes fuel injection timing automatically when the engine revolution reaches the specified rate.
- The automatic timer controls the retard of fuel injection timing. The pre-stroke control unit controls the advance of fuel injection timing.

https://truckmanualshub.com/

Injection Nozzle



1 Nozzle spring
2 Needle valve
3 Nozzle
4 Adjusting screw
5 Nozzle holder

A : Excess fuel
B : Supply of fuel

Fuel delivered from the injection pump enters the nozzle holder and, when the specified pressure is reached, the fuel pressure overcomes the repercussive force of the nozzle spring to push out the needle valve, allowing fuel to spray out the opening at the tip of the nozzle into the cylinder.
Part of the high-pressure fuel lubricates the needle valve and returns through the fuel leak-off pipe to the fuel tank.

https://truckmanualshub.com/

TROUBLESHOOTING

Possible causes \ Symptoms		Engine does not start	Engine hard to start	Engine knocks	Engine output inconsistent	Engine output does not develop full power	Engine maximum revolution too high	Engine idling unstable	Engine starts but stalls	Engine revolution does not reach specified maximum speed	Engine does not stop	Accelerator pedal hard to depress	Fuel supply insufficient

MEMO

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection and Adjustment of Fuel Injection Timing

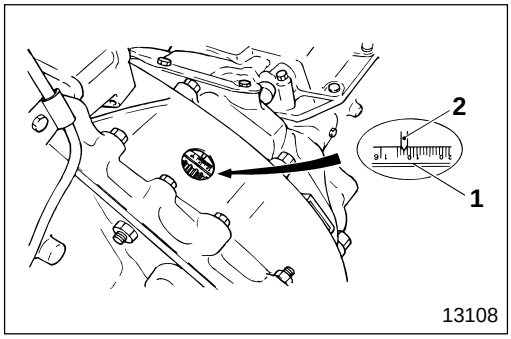
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Fuel injection timing (BTDC)	7°±0.5°	—	Adjust

Tightening torque

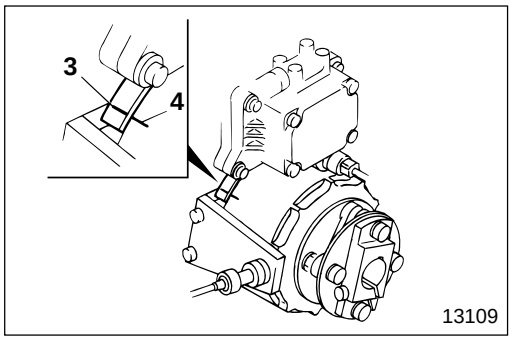
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
5	Adjusting bolt	59 to 64 {43 to 47, 6 to 6.5}	—

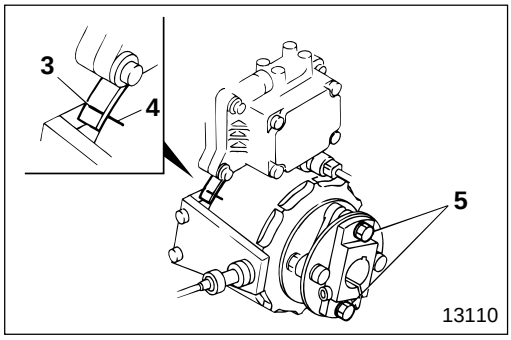


[Inspection]

- Crank the crankshaft more than 180° in the forward running direction. Check if notch **1** on the flywheel and pointer **2** on the flywheel housing show the standard fuel injection timing.



- When pointer **3** on the injection pump and notch **4** on the automatic timer align, the fuel injection timing is standard.
- If the fuel injection timing is not standard, adjust as follows.



[Adjustment]

- Loosen adjusting bolts **5** and turn the automatic timer to align pointer **3** and notch **4**.
- Tighten adjusting bolts **5** at specified torque.
- Reinspect the fuel injection timing.

CAUTION

Do not loosen any bolts other than adjusting bolts 5.

https://truckmanualshub.com/

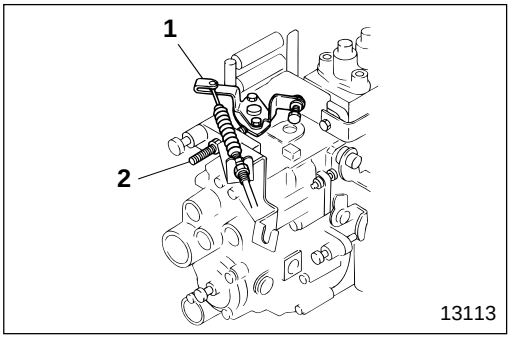
Inspection and Adjustment of No-load Minimum and Maximum Revolution

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	No-load minimum revolution (Idling revolution)	Manual transmission	650 to 700 rpm	—	Adjust
		Automatic transmission	700 to 750 rpm	—	
—	No-load maximum revolution	6D16T2	3180 to 3220 rpm	—	Adjust
		6D16T3, T4	3255 to 3295 rpm	—	

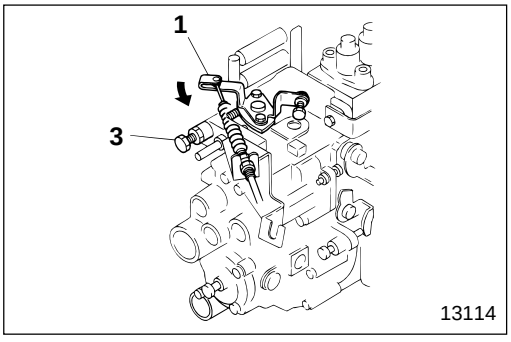
● **Before inspecting the vehicle do the following :**

- Run the engine to bring the coolant temperature up to approximately 80 to 90°C {176 to 194°F}.
- Turn all the lights and accessory equipment OFF.
- Put transmission in neutral. (For automatic transmission, put transmission in N range.)
- Set the steering wheel at center and straight position.



(1) No-load minimum revolution (Idling revolution)

- Make sure that control lever **1** strikes idling set bolt **2**, and in this state, check and see if the minimum revolution is within the standard value.
- If the minimum revolution deviates from the standard value, adjust using idling set bolt **2**.
- After adjustment increase the revolution from between 2800 rpm to 3400 rpm once, and check the minimum revolution.



(2) No-load maximum revolution

- Make sure that control lever **1** strikes full-speed set bolt **3**, and in this condition, check and see if the maximum revolution is within the standard value.
- If the maximum revolution deviates from the standard value, adjust using full-speed set bolt **3**.

NOTE

Ensure that the engine does not stall or hunt when control lever 1 is moved from the full-speed position to the idling position quickly. If performance is faulty, adjust it to within standard values.

https://truckmanualshub.com/

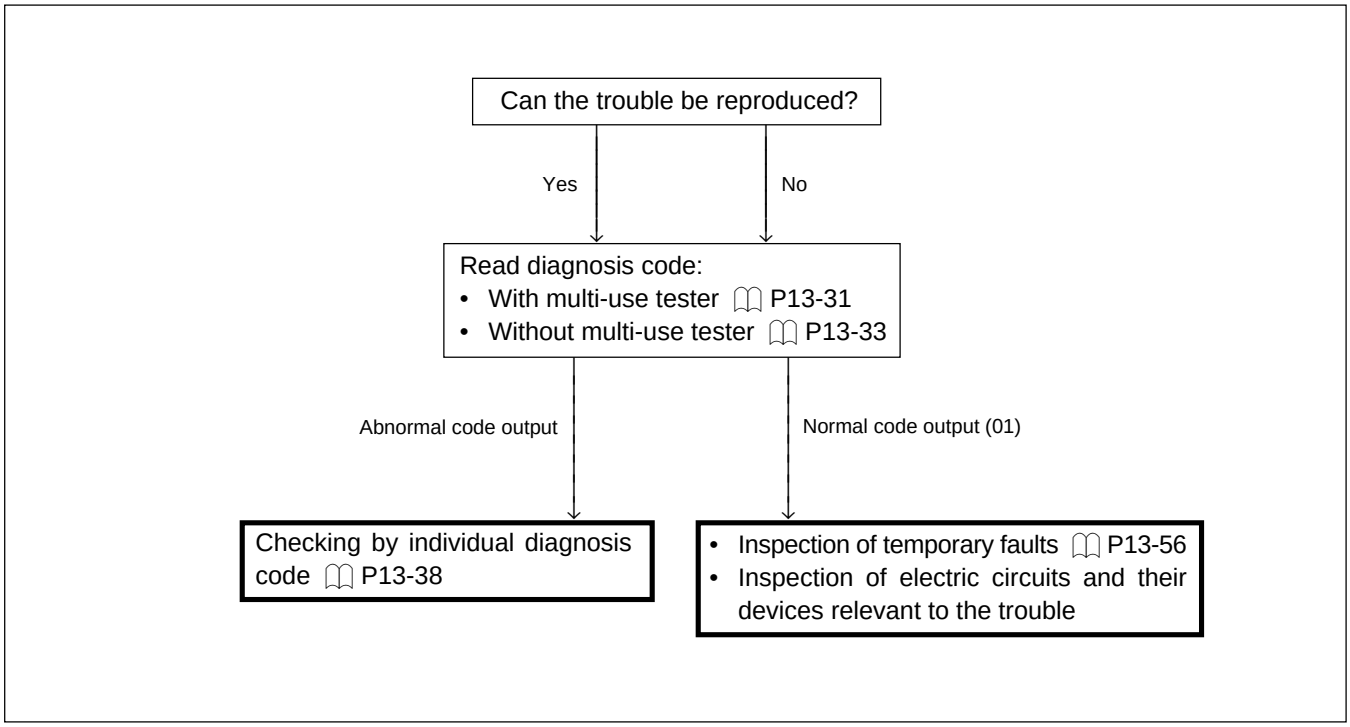
PRE-STROKE CONTROL INJECTION PUMP SYSTEM

Troubleshooting Procedure

The pre-stroke control type injection pump system has a trouble diagnosis function, this function is used for troubleshooting.

This means you have to read the diagnosis code memorized in the pre-stroke control unit, and carry out an inspection based on this code. There are two ways of reading the code; with a multi-use tester, and without a multi-use tester.

In the case of trouble that does not have a diagnosis code, the normal 01 code is indicated, and it is necessary to carry out a check depending on the situation. In this case, inspect the electric circuits and their relative devices.



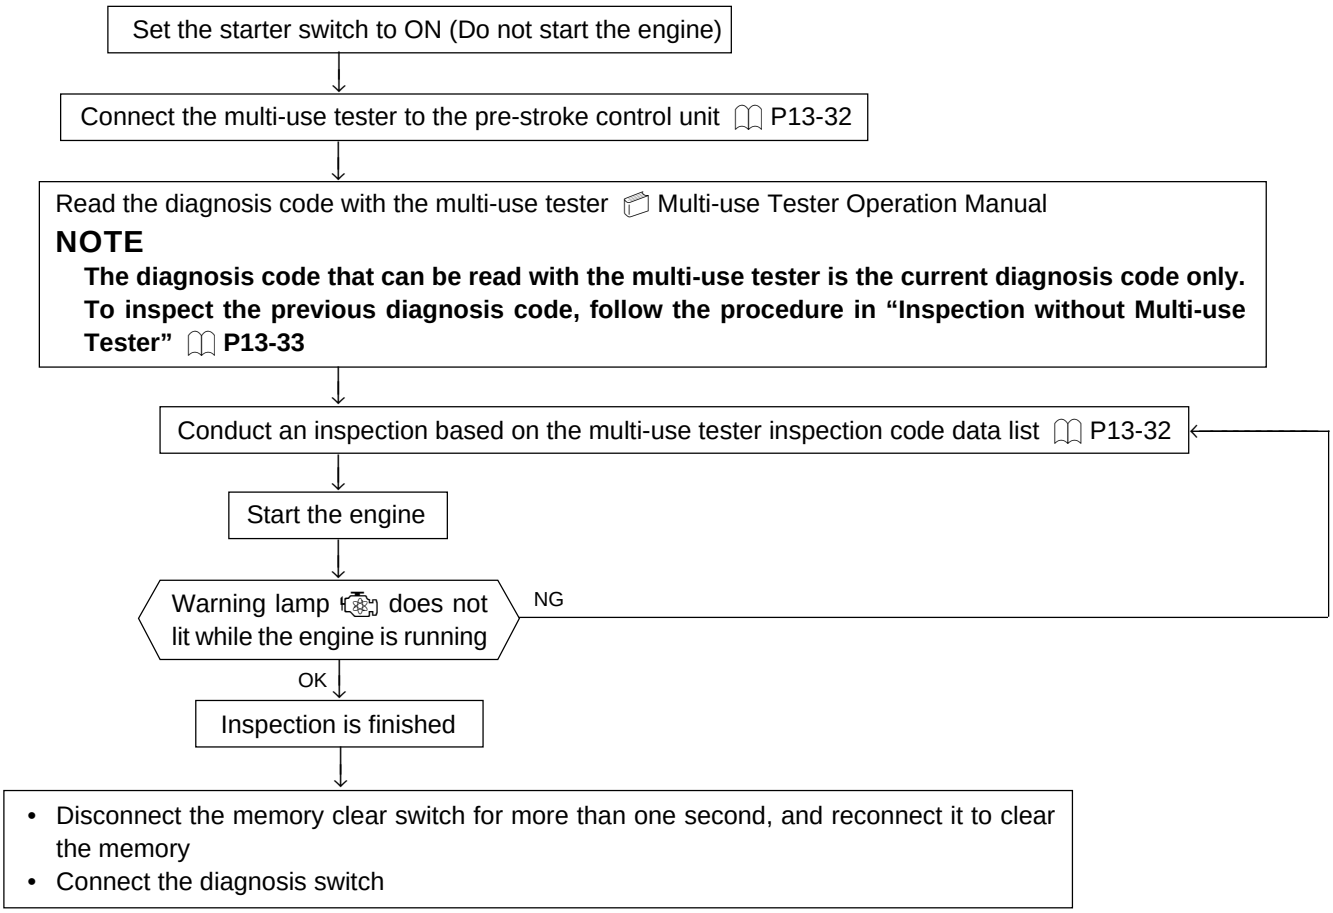
https://truckmanualshub.com/

● Inspection with multi-use tester

Special tools

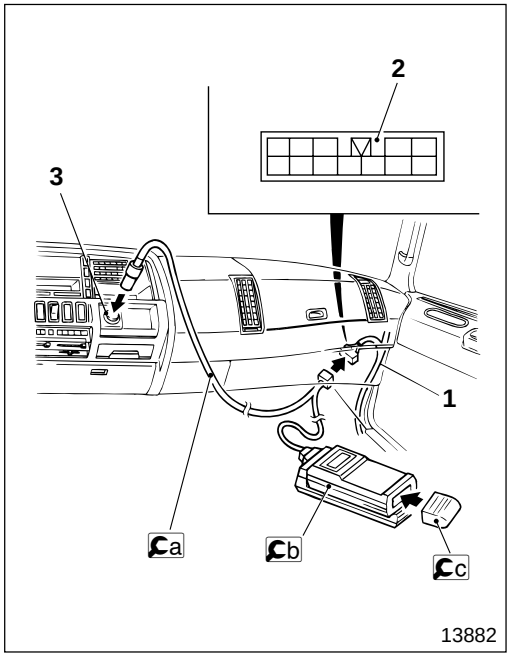
Tool name and shape	Part No.	Application
Multi-use tester sub-assembly  02803	MC858999	Inspection of system
Multi-use tester harness  02804	MB991231	
ROM pack  02805	MC858989	

● Inspection flow chart



https://truckmanualshub.com/

PRE-STROKE CONTROL INJECTION PUMP SYSTEM



● **Connection of Multi-use Tester to Pre-Stroke Control Unit**

- Set the starter switch to LOCK.
- Connect a multi-use tester harness to multi-use tester connector **2** of cab harness **1** and to cigarette lighter socket **3**.
- Connect a multi-use tester harness to b multi-use tester sub-assembly.
- Connect c ROM pack to b multi-use tester sub-assembly.

NOTE

Refer to the Multi-use Tester Operation Manual for details regarding the operation of the multi-use tester.

● **Inspection with Multi-use Tester**

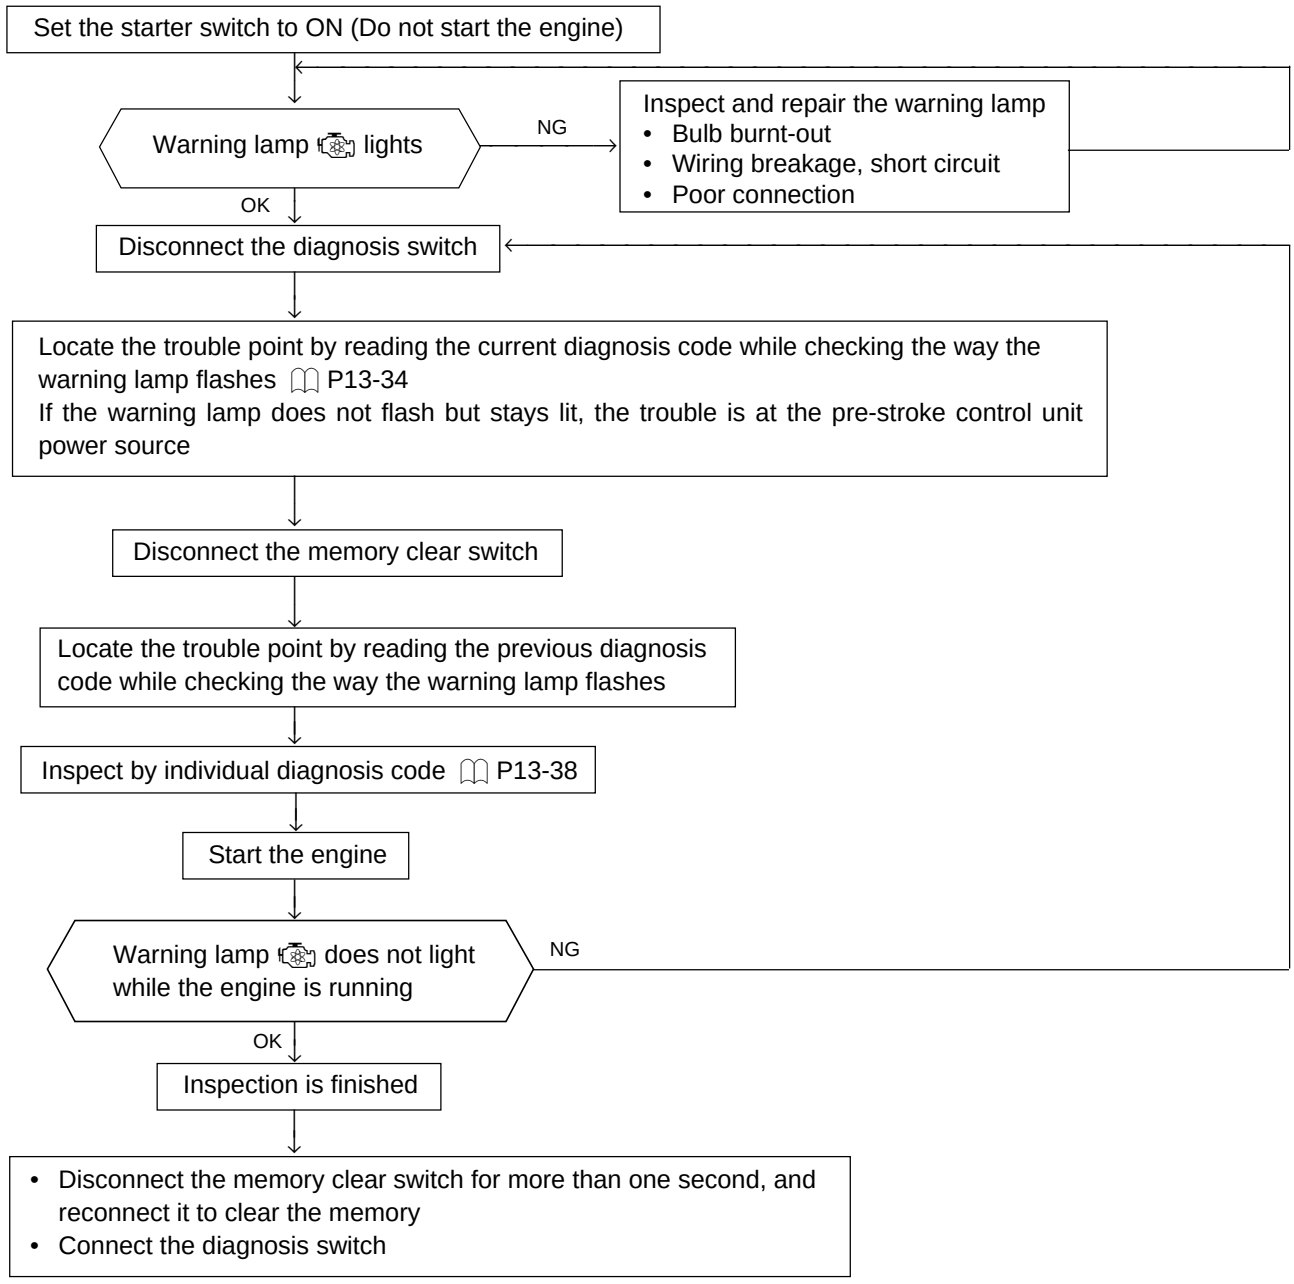
Inspection using service data is possible as well as by diagnosis code indication (self-diagnosis) using the multi-use tester. This enables you to compare the indicated figures (service data) that represent the data signals from the various sensors on the vehicle with the judgement standards, and judge whether they are good or bad. The service data code is indicated as well as the diagnosis code.

Self-diagnosis			Inspection using Service Data				
Indicated on multi-use tester			Indicated on multi-use tester			Inspection procedure	
Diagnosis code	Trouble item (Inspected instrument)	Inspection procedure	Service data code	Data signal name	Service data	Condition at inspection	Judgement standard
03	PS OFFSET	🕮 P13-38	—				
04	PS VOLTAGE		—				
05	NE NO PULS		—				
12	PS SERVO		12	PS ANG DIFF	■■.■■ deg	Engine running	Within ±5.5 deg
13	PS SNSR		—			400<Ne≦2000 Ne : Engine revolution	Within ±2°CA
15	NE SNSR		15	ENGINE SPEED	■■ rpm	Racing	Synchronization with tachometer
—			16	CTRL ROD ADJ	■■ V	Starter switch set to ON	Within ±0.04 V
21	WTR TEMP SNSR		21	WATER TEMP	■■ °F	While engine is cool While engine is warmed up Engine is stopped after warming up	Equivalent to ambient temperature Gradually rising temperature Gradual falling temperature
22	CTRL ROD SNSR		22	CTRL ROD VOLT	■■ V	Engine running	3 V or less
41	BST TEMP SNSR		41	BOOST TEMP	■■ °F	At high idling	4.9 V or less

https://truckmanualshub.com/

● Inspection without multi-use tester

● Inspection flow chart



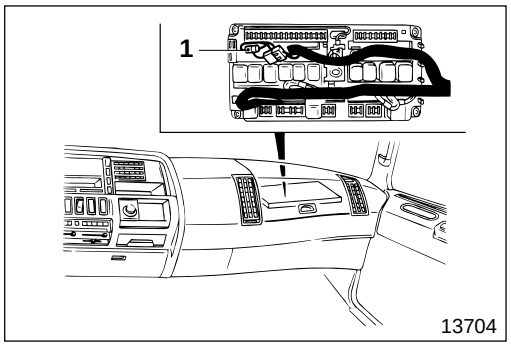
https://truckmanualshub.com/

PRE-STROKE CONTROL INJECTION PUMP SYSTEM

● **Reading of Diagnosis Code with Warning Lamp**

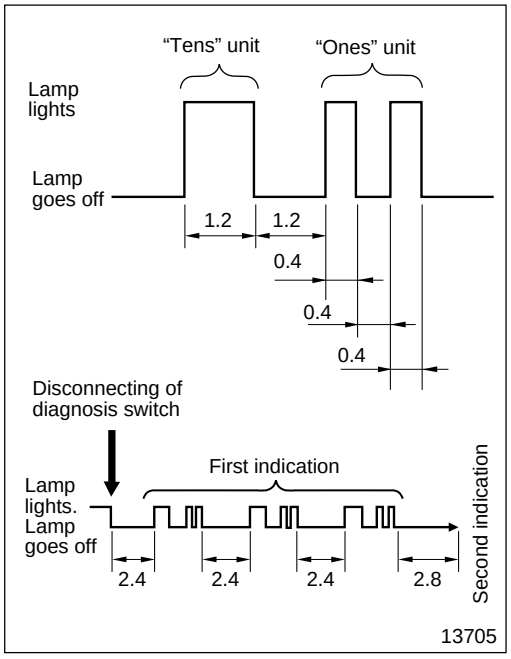
CAUTION

- **Make sure you read the current diagnosis codes first, then read the previous diagnosis codes.**
- **You must take care not to disconnect memory clear switch 2 (1-pin connector) before removing diagnosis switch 1 (1-pin connector without locking device) because this would make it impossible for the system to indicate the current diagnosis code.**
- **Note that if memory clear switch 2 is reconnected after being disconnected, it will clear all the diagnosis codes.**



Current diagnosis code

- When diagnosis switch **1** is disconnected, the pre-stroke control unit starts diagnosis of the trouble and indicates the current diagnosis codes by flashing warning lamp within the meter cluster.



- The diagnosis codes are read by the number of flashes and the duration of flashes of warning lamp.
  - The flash duration differs for the "tens" unit and the "ones" unit.
    "Tens" unit : Every 1.2 seconds
    "Ones" unit : Every 0.4 seconds
  - The number of flashes indicates the numeral for each unit.
  - The diagnosis code indication shows the "tens" unit first, then the "ones" unit. However, when the "tens" unit begins with a zero, only the "ones" unit is shown.
- A diagnosis code is shown by the repetition of three consecutive indications. After the code indication, if another code does not exist, the indication returns to the first code and is again shown three times.
- When diagnosis switch **1** is connected, the pre-stroke control unit immediately terminates code indication.

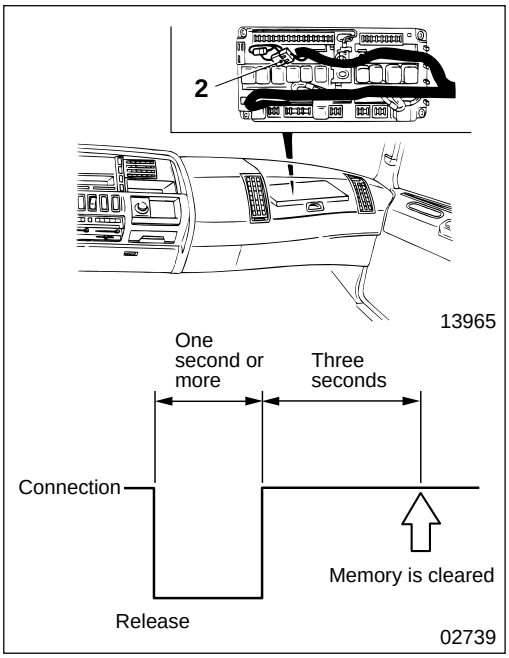
Previous diagnosis code

After reading the current diagnosis codes (with diagnosis switch **1** disconnected), disconnect memory clear switch **2**. Warning lamp starts flashing again. This flashing indicates the previous diagnosis codes, and by interpreting these codes, the location of the trouble is determined.

https://truckmanualshub.com/

Diagnosis code	Warning lamp flashing pattern
01 (Normal)	
03 (Pre-stroke learning faulty)	
04 (Pre-stroke actuator power source faulty)	
05 (Engine revolution sensor no pulse faulty)	
12 (Pre-stroke servo system faulty)	
13 (Pre-stroke position sensor faulty)	
15 (Engine revolution sensor wiring breakage faulty)	
21 (Water temperature sensor faulty)	
22 (Control rod position sensor faulty)	
41 (Boost air temperature sensor faulty)	

13970



Clearing diagnosis codes

By disconnecting memory clear switch **2** once and reconnecting it, all the diagnosis codes memorized in the pre-stroke control unit are cleared.

CAUTION

Clearing of diagnosis codes must be done using memory clear switch 2.

https://truckmanualshub.com/

◆ Service procedure

2 Engine revolution sensor

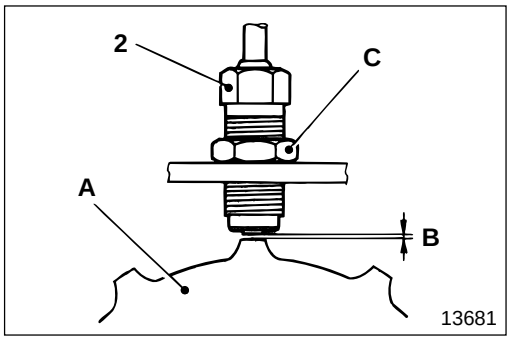
[Inspection]

(1) Sensor body

- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace engine revolution sensor **2**.

CAUTION

Be sure to adjust the clearance between engine revolution sensor 2 and the protrusion on the timer housing after replacing the engine revolution sensor.



(2) Clearance to protrusion

If clearance **B** between engine revolution sensor **2** and protrusion **A** on the timer housing deviates from the standard value, adjust the clearance as follows.

[Adjustment]

- Loosen lock nut **C** and rotate engine revolution sensor **2** to adjust.
- After adjustment, fix by tightening lock nut **C** at specified torque.

NOTE

If the clearance between engine revolution sensor 2 and protrusion A on the timer housing is too large, the signal might not be output. If the clearance is too small, the engine revolution sensor might hit the protrusion.

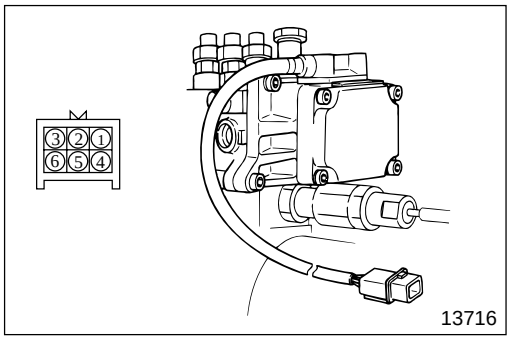
◆ Service procedure

2 Inspection of pre-stroke actuator

Inspect the following points and if any fault is found, have the unit inspected and repaired by a ZEXEL service station.

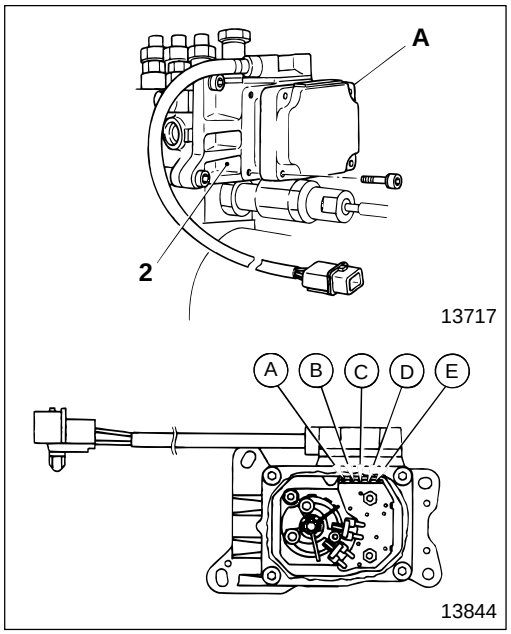
NOTE

Inspection of pre-stroke actuator 2 must be carried out when the engine is cold.



(1) Inspection at connector point

- Measure resistance between terminals ②-③, ①-③, ①-② and ④-⑤.



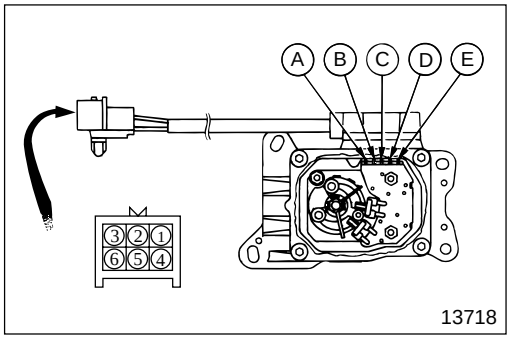
(2) Inspection of pre-stroke actuator body

- Remove cover **A** from pre-stroke actuator **2**.

CAUTION ⚠

- **Remove only cover A from pre-stroke actuator 2, never remove the actuator body itself. If the actuator is removed, it requires special tools to replace and adjust it.**
- **When removing cover A, do not exert excessive force on pre-stroke actuator 2 with your hands or by treading on it, etc.**

- Measure resistance between terminals Ⓐ-Ⓒ, Ⓑ-Ⓒ, Ⓐ-Ⓑ and Ⓓ-Ⓔ.

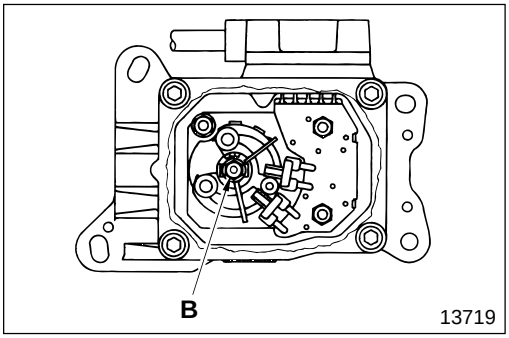


(3) Inspection of continuity between pre-stroke actuator and connector

Make sure that continuity exists between terminals as listed in the table below.

Connector terminal	Pre-stroke actuator body	Application
④	Ⓓ	Pre-stroke actuator driving power source ⊖
⑤	Ⓔ	Pre-stroke actuator driving power source ⊕
⑥	GND	Shield
①	Ⓒ	Pre-stroke position sensor (GND)
②	Ⓑ	Pre-stroke position sensor (MDL)
③	Ⓐ	Pre-stroke position sensor (OSC)

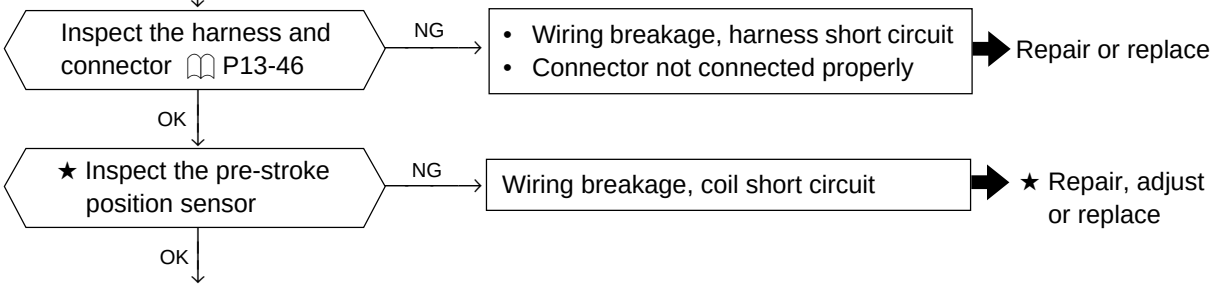
https://truckmanualshub.com/



(4) Inspection of copper plate mounting nut

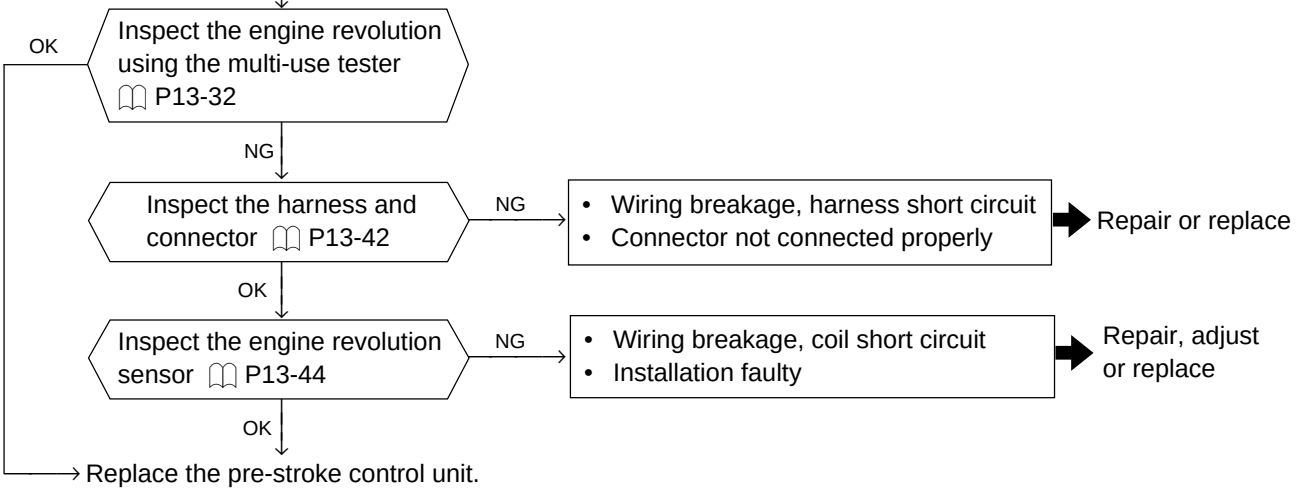
Check that copper plate mounting nut **B** was not loosened when the cover of pre-stroke actuator **2** was removed.
If nut **B** is loose, tighten it.

Diagnosis code 13 Pre-stroke position sensor faulty



★ : To be carried out by a ZEXEL service station

Diagnosis code 15 Engine revolution sensor faulty
(Wiring breakage error : No output signal transmitted by the sensor)

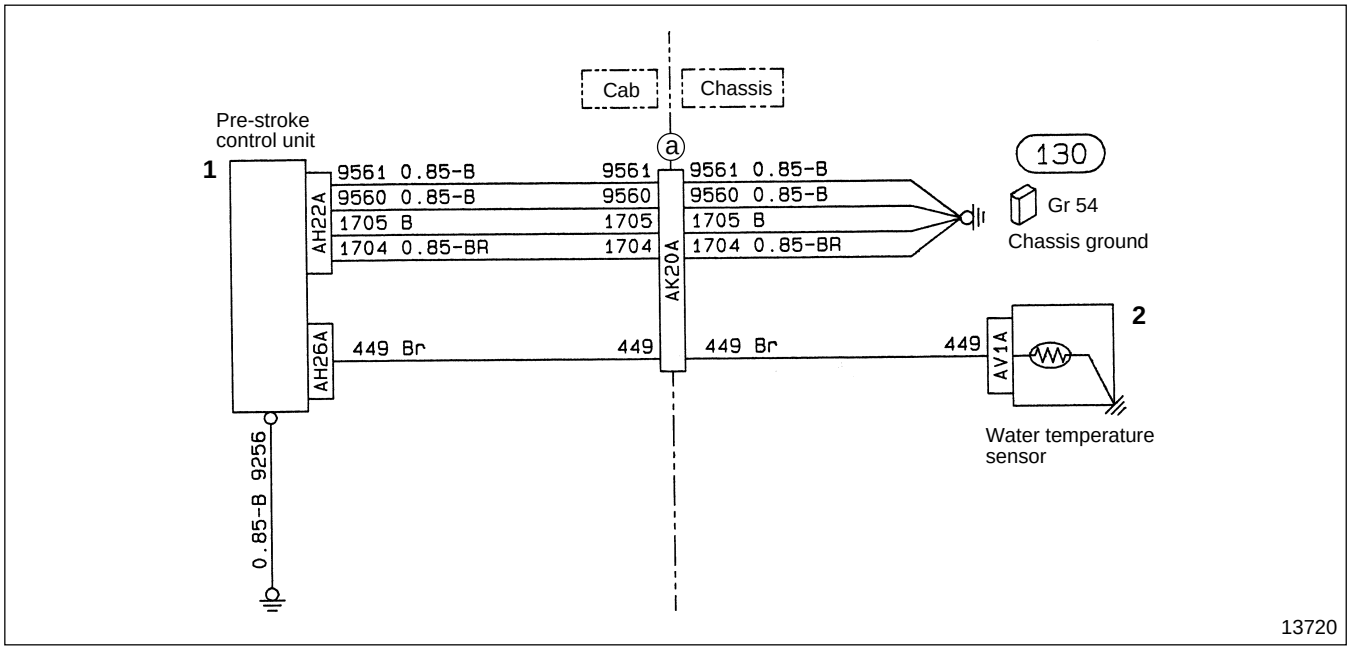


https://truckmanualshub.com/

PRE-STROKE CONTROL INJECTION PUMP SYSTEM

Diagnosis code 21 Water temperature sensor faulty

- Inspect the engine coolant temperature using the multi-use tester 🕮 P13-32
  - OK → Replace the pre-stroke control unit.
  - NG → Inspect the harness and connector
    - NG → • Wiring breakage, harness short circuit • Connector not connected properly → Repair or replace
    - OK → Inspect the water temperature sensor 🕮 P13-51
      - NG → • Wiring breakage, coil short circuit • Installation faulty → Repair, adjust or replace
      - OK → Replace the pre-stroke control unit.



https://truckmanualshub.com/

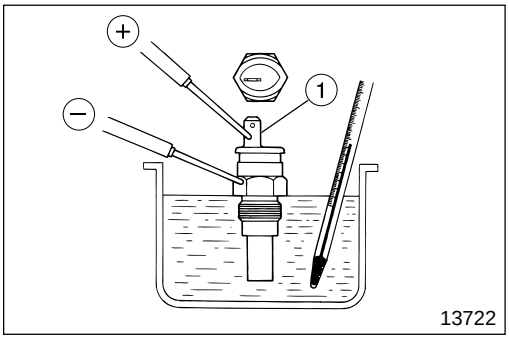
2 Water temperature sensor

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
2	Resistance value of water temperature sensor	20˚C {68˚F}	3250	—	Replace
		40˚C {104˚F}	1500	—	Replace
		60˚C {140˚F}	620±62	—	Replace



◆ Service procedure

2 **Inspection of water temperature sensor**

- Place water temperature sensor **2** in engine oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the resistance between terminal ① and the body.
- If the measured value deviates from the standard value, replace water temperature sensor **2**. Gr 14

https://truckmanualshub.com/

PRE-STROKE CONTROL INJECTION PUMP SYSTEM

Diagnosis code 22 Control rod position sensor faulty

- Inspect the control rod position sensor power output voltage using the multi-use tester 🕮 P13-32
  - OK → Replace the pre-stroke control unit.
  - NG → Inspect the harness and connector
    - NG → • Wiring breakage, harness short circuit • Connector not connected properly → Repair or replace
    - OK → Inspect the control rod position sensor 🕮 P13-53
      - NG → • Wiring breakage, coil short circuit • Installation faulty → ★ Repair, adjust or replace
      - OK → Replace the pre-stroke control unit.

Location	Maintenance item		Standard value	Limit	Remedy
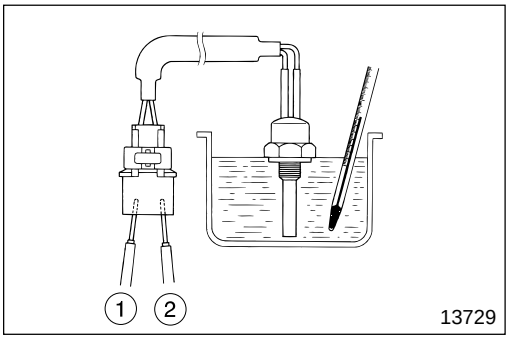
2	Resistance value of boost air temperature sensor	0˚C {32˚F}	5880±588	—	Replace
		20˚C {68˚F}	2455±245	—	Replace
		80˚C {176˚F}	322±32	—	Replace



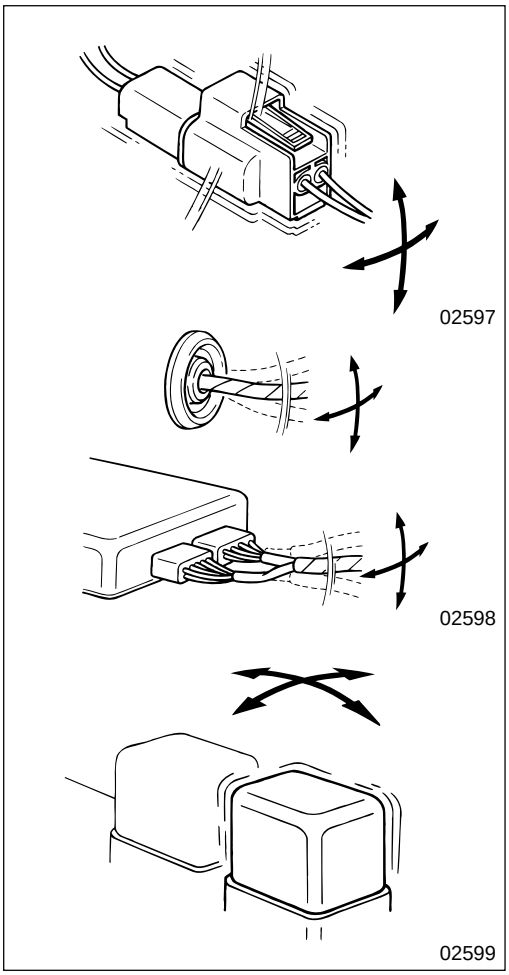
◆ Service procedure

2 **Inspection of boost air temperature sensor**

- Place boost air temperature sensor **2** in rape seed oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace boost air temperature sensor **2**. Gr 15

https://truckmanualshub.com/

Inspection of Temporary Faults



Temporary faults often occur under certain conditions. So identifying those conditions helps to find possible causes. To find the conditions under which temporary faults occurred, you need to reproduce the faults after interviewing customers in detail about actual driving conditions, weather, frequency of occurence and fault phenomena.
Then determine if the faults were caused by vibration, temperature or other possible elements depending on the actual conditions identified. If vibration is suspected as a possible cause, inspect individual connectors as follows to check if the fault will occur:

- Shake the connector gently in all four directions of the arrows as illustrated.
- Shake the wiring harness gently in all four directions of the arrows as illustrated.
- Wiggle each sensor or piece of equipment by hand.
- Gently shake the wiring harnesses near movable parts such as suspensions.

The inspection subjects include possible causes related to the diagnosis code outputs and faults, as well as the connectors and other parts in the inspection procedure.

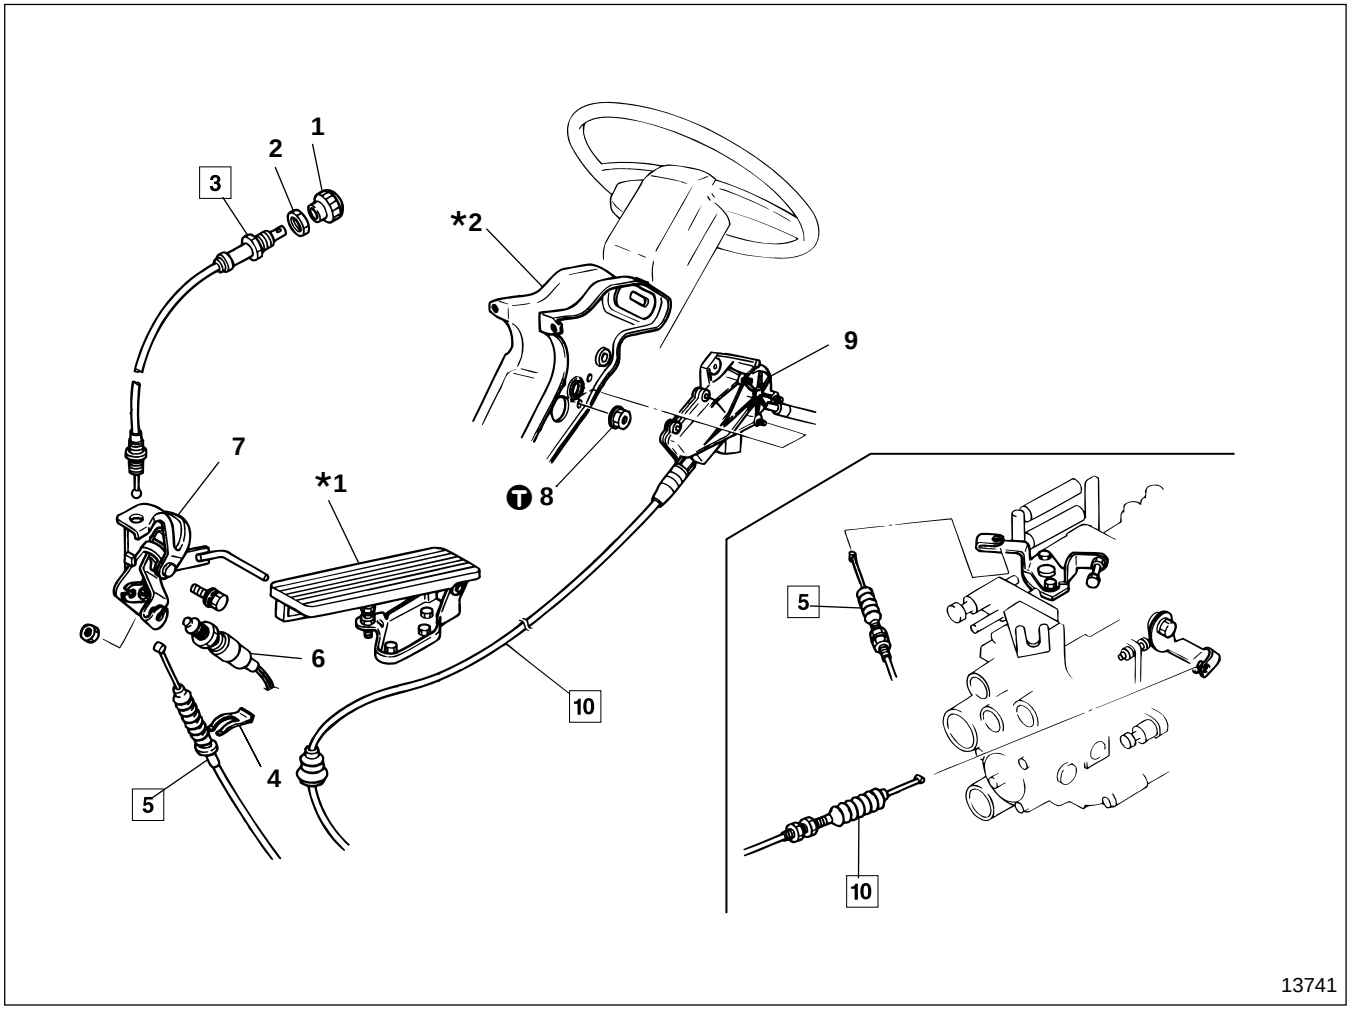
ENGINE CONTROL



● **Disassembly sequence**

1 Idling control knob
2 Nut
3 Idling control cable
4 Cable clip
5 Accelerator control cable
6 Accelerator switch
7 Accelerator lever and bracket assembly
8 Nut
9 Fuel-cut motor Gr 54
10 Engine stop cable

***1** : Accelerator pedal assembly P13-61
***2** : Steering column bracket Gr 37

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION

Be sure when laying and routing cables, not to let them contact metal edges.

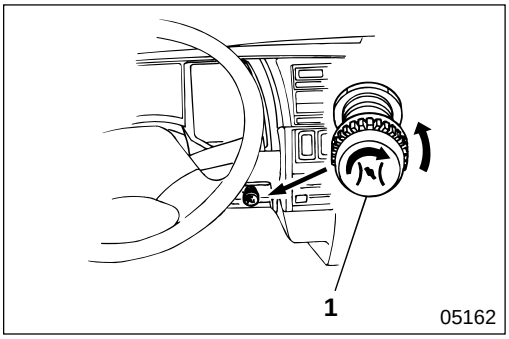
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
8	Nut (Fuel-cut motor mounting)	3.9 to 4.9 {2.9 to 3.6, 0.4 to 0.5}	—

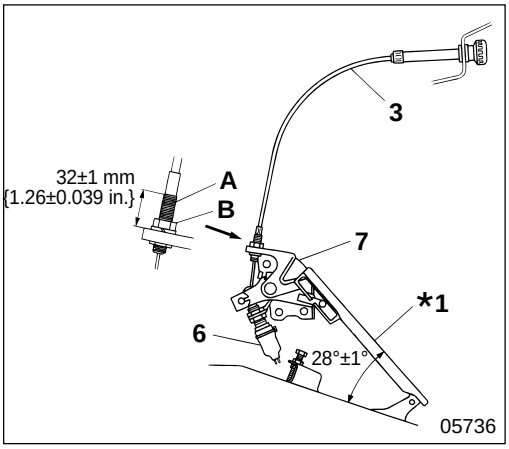
https://truckmanualshub.com/

◆ Service procedure



3 **Installation of idling control cable**

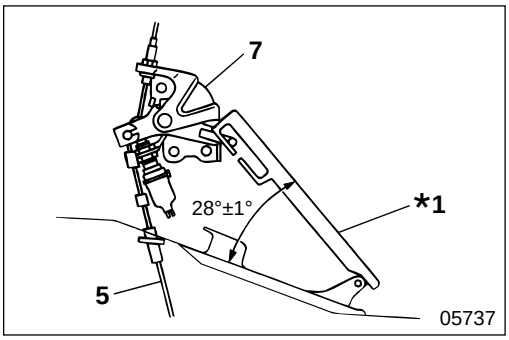
- Rotate idling control knob **1** counterclockwise until the inner cable protrudes at its maximum.



- In this state, install idling control cable **3** onto accelerator lever and bracket assembly **7**.
- Fasten idling control cable **3** using nut **B** so that the dimension of thread area **A** of the idling control cable is as illustrated.
- After installation, make sure that the pedal angle of accelerator pedal assembly ***1** conforms to the illustrated value.

NOTE

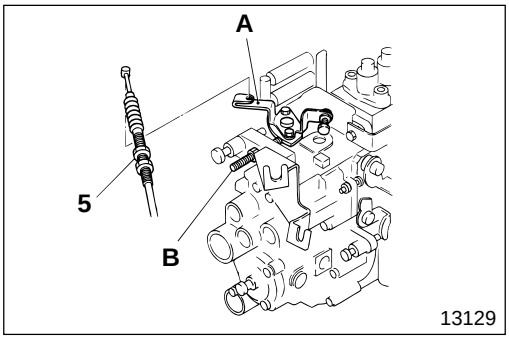
In this state, make sure that accelerator switch 6 remains pushed in.



5 **Accelerator control cable**

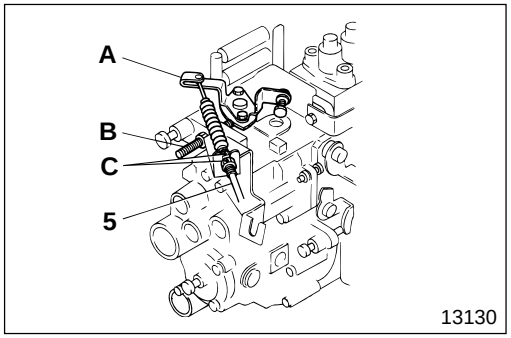
[Installation]

- Adjust the pedal angle of accelerator pedal assembly ***1** to the dimension as illustrated.
- Install accelerator control cable **5** onto accelerator lever and bracket assembly **7**.

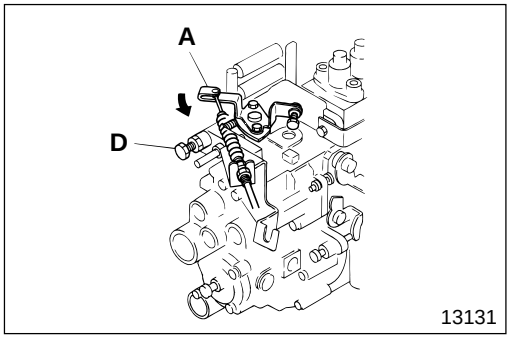


- Install accelerator control cable **5** onto control lever **A** of the governor making sure that the control lever makes contact with idling set bolt **B**.

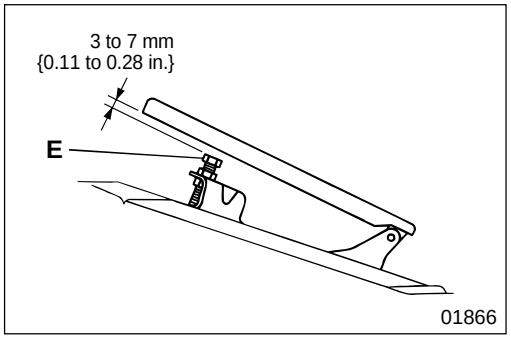
https://truckmanualshub.com/



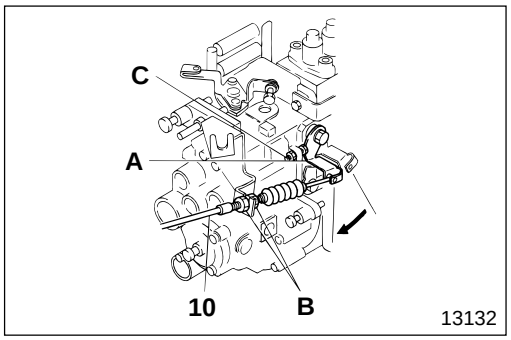
- Adjust mounting nut **C** of accelerator control cable **5** so that the accelerator control cable is stretched but control lever **A** remains in contact with idling set bolt **B**.



- Depress the accelerator pedal until control lever **A** makes contact with full-speed set bolt **D**.



- Adjust stopper bolt **E** so that the clearance between the pedal and the stopper bolt conforms to the illustrated dimension.



10 **Installation of engine stop cable**

- Install engine stop cable **10** onto stop lever **A**.
- Turn the starter switch to ACC or LOCK. Fasten using mounting nut **B** while keeping stop lever **A** pressed against stopper bolt **C**.
- After installation, start the engine using the starter switch, and make sure that the engine stops when the switch is turned to ACC.

⊗ : Non-reusable parts

https://truckmanualshub.com/

WARNING⚠

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any spilled fuel because it can cause a fire.**

CAUTION⚠

- **Be sure to protect all openings by covering them after removal of hoses and pipes because the engine performance is adversely affected if dirt and foreign particles enter injection pump assembly 25.**
- **Do not hold the control lever when lifting injection pump assembly 25. Also, do not remove the control lever because removal of the lever might cause poor performance of the pump.**
- **Do not remove injection pump bracket 27 unless it is faulty.**
- **Make sure you connect fuel hose *6 at a high position because fuel in the fuel tank would leak out if the end of the fuel hose were at a position lower than the tank.**

● **Installation sequence**

Follow the removal sequence in reverse.

Service standards

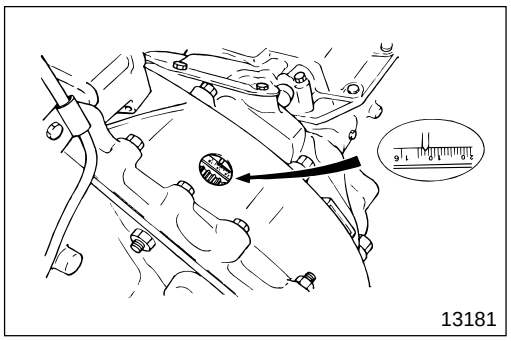
23	Cotter bolt	83 to 93 {61 to 69, 8.5 to 9.5}	—
26	Bolt (Injection pump bracket mounting)	33 to 55 {25 to 41, 3.4 to 5.6}	—

Special tools

Location	Tool name and shape	Part No.	Application
27	Injection pump centering tool  14311	MH063336	Positioning of injection pump bracket

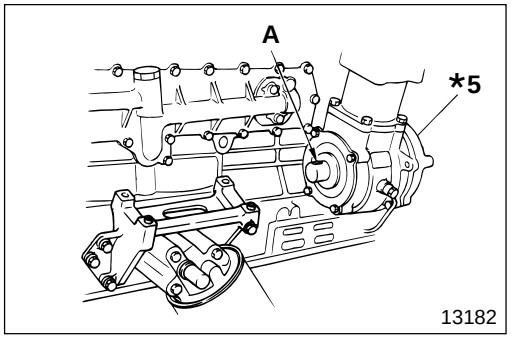
https://truckmanualshub.com/

◆ Service procedure

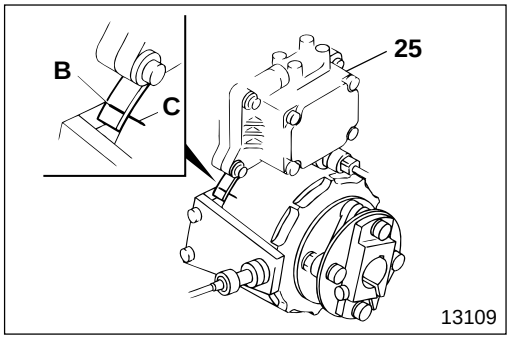


25 **Installation of injection pump assembly**

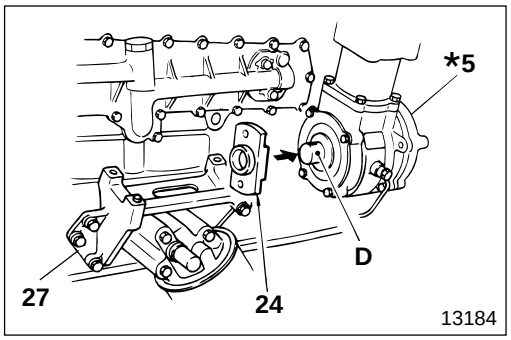
- Crank the engine and adjust No.1 cylinder piston to the specified fuel injection timing.



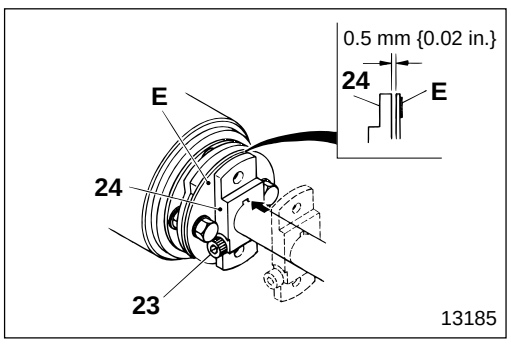
- In this state, make sure that keyway **A** in the crankshaft of air compressor ***5** faces upward.
- If keyway **A** is not facing upward, turn the engine crankshaft by one turn.



- Align pointer **B** on injection pump assembly **25** with notch **C** on the automatic timer.

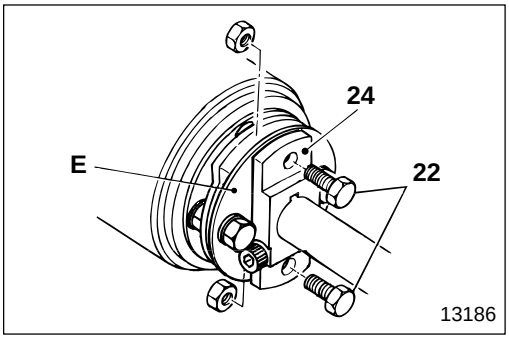


- Install driving coupling **24** to crankshaft **D** of air compressor ***5** and place the driving coupling on the air compressor side.
- Install injection pump assembly **25** on injection pump bracket **27**.



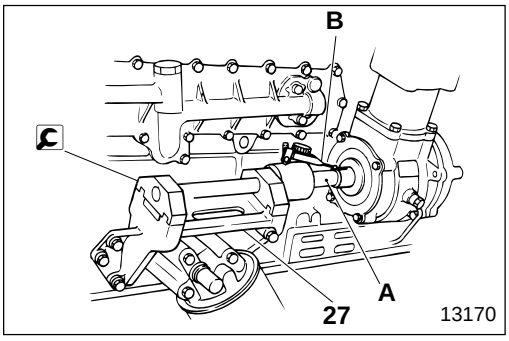
- Move driving coupling **24** to adjust the clearance between the driving coupling and coupling plate **E** as illustrated, then tighten cotter bolt **23** at specified torque.

https://truckmanualshub.com/



- Attach driving coupling **24** and coupling plate **E** using bolts **22** and tighten the bolts temporarily.

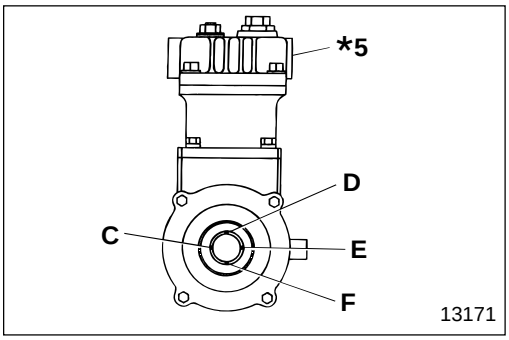
- In this state, adjust the fuel injection timing.
  Adjustment of fuel injection timing : P13-26
  After adjusting the fuel injection timing, tighten bolts **24** at specified torque.



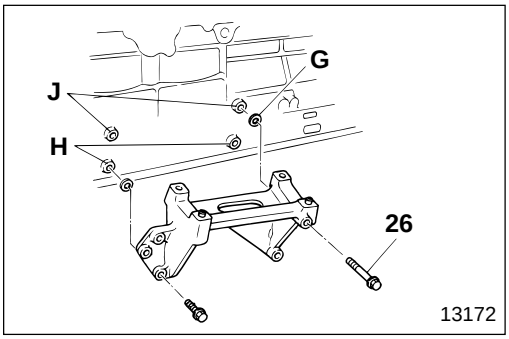
27 **Injection pump bracket**

[Inspection]

- Attach dial gauge **B** to arbor **A** of injection pump centering tool and adjust to carry out zero point adjustment.



- Slide dial gauge **B** toward air compressor ***5** and measure the eccentricity of crankshaft **C** against arbor **A** at points **D**, **E** and **F**.
- If the measured value is higher than the standard value, adjust as follows.



[Adjustment]

- When the measured value at point **E** is higher than the standard value:
  Insert shims **G** into four points equally.
- When the measured value at point **D** is higher than the standard value:
  Insert shims **G** into lower side **H**.
- When the measured value at point **F** is higher than the standard value:
  Insert shims **G** into upper side **J**.

CAUTION

Insert shims G observing the following conditions:

- **Number of shims per point is three or less.**
- **The same number of shims should be used for the front and the rear.**
- **The difference in number of shims used for bottom and top is none or one.**

- Tighten bolt **26** at specified torque, then reinspect.

17 Gasket

*: Cylinder head Gr 11
⊗: Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

WARNING

Wipe up any spilled fuel because it can cause a fire.

CAUTION

- **Be sure not to touch the slide-contact area of needle valve 12 because any scratches or corrosion might spoil the airtightness of nozzle 13. It must be handled with utmost care.**
- **Never change the combination of needle valve 12 and nozzle 13 for each cylinder.**
- **Be sure to protect all openings by covering them after removal of hoses and pipes because the engine performance is adversely affected if dirt and foreign particles enter injection nozzle assembly 5.**

NOTE

- **Remove carbon deposits and clean injection nozzle assembly 5 before working on it, then test the injection pressure and jet spray condition, and check for fuel leakage before disassembly. If no fault is found, do not disassemble.**
- **After installing injection nozzle assembly 5, tighten the two bolts 4 alternately.**

https://truckmanualshub.com/

◆ Service procedure

● Inspection before disassembly

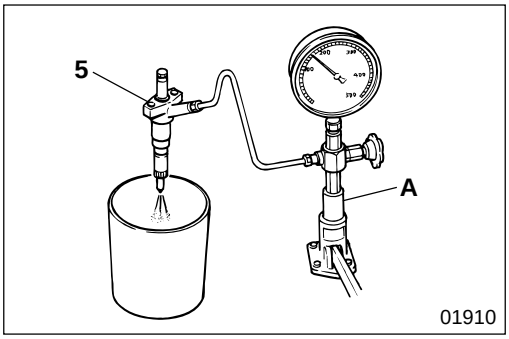
Attach injection nozzle assembly **5** to nozzle tester **A**, and conduct the following inspection.

WARNING

Never touch the spray from the nozzle or let your hands get too close to the spray point during the test.

NOTE

Before inspection, bleed the air out in a couple of bursts by pressing nozzle tester A lever.

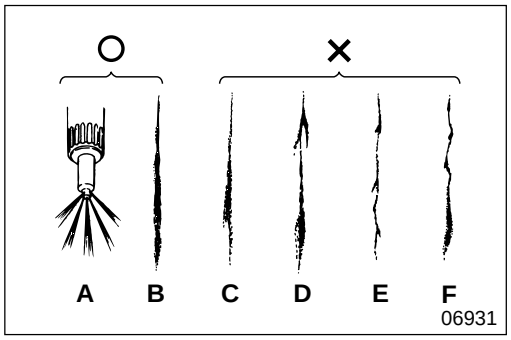


(1) Valve opening pressure

- Spray continuously with quick lever actions of nozzle tester **A**, one to two seconds per stroke, and measure the pressure that the gauge registers when the pressure is released which will be observed by the sudden movement of the gauge indicator.
- If the measured value deviates from the standard value, disassemble injection nozzle assembly **5** and clean it, then adjust using adjusting screw **8**.
- If the performance cannot reach the standard value even after adjustment, replace injection nozzle assembly **5**.

https://truckmanualshub.com/

INJECTION NOZZLE



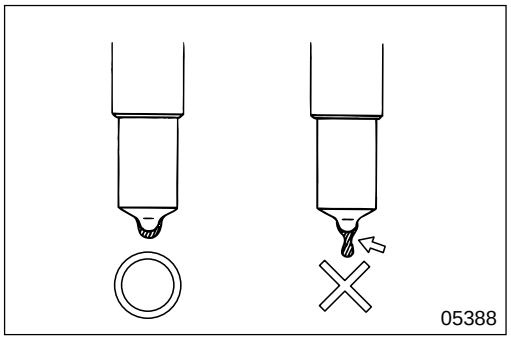
(2) Spray condition

- Spray continuously with quick lever actions of nozzle tester **A**, one to two seconds per stroke.
  - **A** : Even spray from all five orifices (Good)
  - **B** : Even and symmetrical spray (Good)
  - **C** : Asymmetrical spray (Faulty)
  - **D** : Spray direction deviates from the nozzle axis line (Faulty)
  - **E** : Thin and insufficient spray (Faulty)
  - **F** : Irregular spray (Faulty)

- If faulty spray cannot be corrected, disassemble injection nozzle assembly **5** and clean every part and repeat the test.
  If faulty spray still occurs after repeating test, replace the injection nozzle assembly.
- Make sure that there is no post-spray dripping after injection.

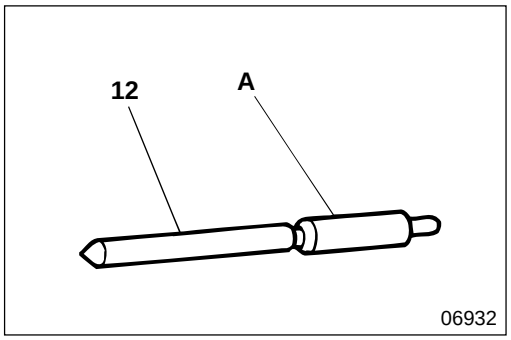
WARNING

Never touch the spray from the nozzle or let your hands get too close to the spray point during the test.



(3) Fuel air tightness and leakage at related contact points

- Raise the interior pressure of the nozzle gradually to the test pressure of 14.7 MPa {150 kgf/cm^2}. Maintaining the pressure, check and see if any fuel seeps out of the nozzle tip within 10 seconds.
- If any fault is found, disassemble injection nozzle assembly **5** and clean every part and repeat the test. If any fault is still found, replace the injection nozzle assembly.

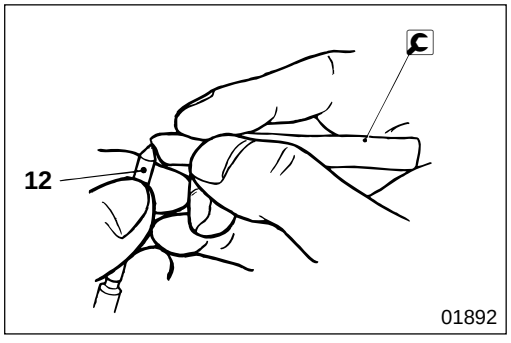


5 Injection nozzle assembly

[Disassembly]

CAUTION

- **Be sure not to touch sliding part A of needle valve 12 with your hands.**
- **Never change the combination of removed needle valve 12 and nozzle 13 for each cylinder.**



[Cleaning]

Clean needle valve **12** and nozzle **13** with gas oil (cleaning solvent).

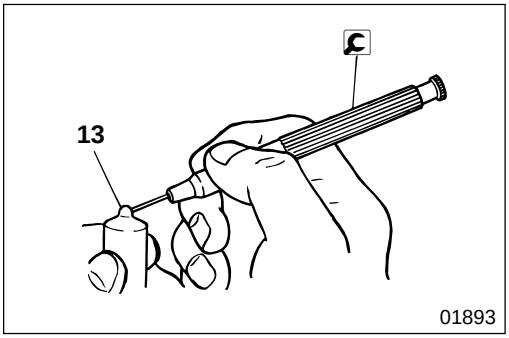
Remove carbon deposits with cleaning tool in the following manner:

- Clean needle valve **12** by removing carbon deposits from its tip using the cleaning bar of cleaning tool.

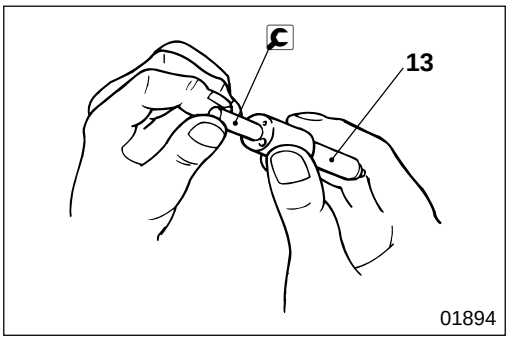
CAUTION

Never use a wire brush or hard steel for cleaning.

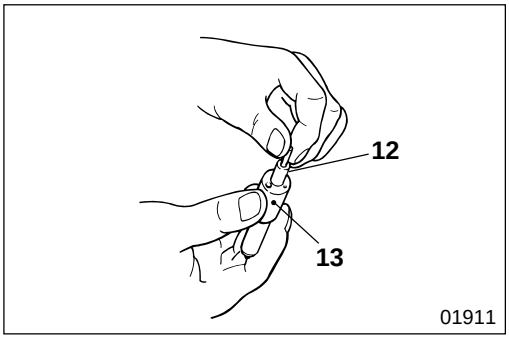
https://truckmanualshub.com/



- To clean nozzle **13**, remove carbon deposits from the orifices of the nozzle using the needle cleaner of [tool] cleaning tool, by inserting it into the orifices and turning it.
  Needle cleaner diameter : ø0.25 mm {0.0098 in.} or less



- Clean the seat of nozzle **13** using the cleaning needle of [tool] cleaning tool.
- Use FUSO carbon remover to remove hard-to-remove, burnt-on carbon deposits.



[Inspection]

- Immerse needle valve **12** and nozzle **13** in gas oil (cleaning solvent) and clean them thoroughly.
- Check and see if needle valve **12** drops by its own weight into the nozzle from the position where a third of its length is pulled out. (Repeat this several times rotating the needle valve.)
- If needle valve **12** does not drop smoothly, repeat cleaning and repeat the test. If any fault is still found, replace both the needle valve and nozzle **13** together as a set.

B : When low coolant temperature
C : When high coolant temperature
D : From cylinder head
E : To water pump

Thermostat **2** is a bottom bypass type that uses wax pellets as its regulating element. As the wax changes its form from solid to liquid according to changes in temperature, the volume of the wax changes. Therefore, the position of the valve, changed by the coolant temperature, regulates the flow of the coolant to the radiator and water pump (bypass side) and controls the coolant temperature.

Cooling System Electric Circuit

● Water temperature gauge circuit

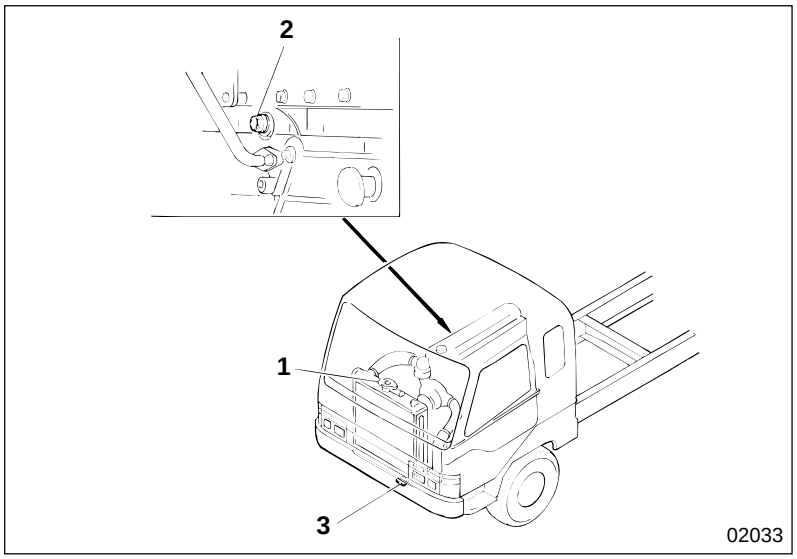
INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Replacing Coolant and Cleaning Cooling System



1 Pressure cap
2 Crankcase drain plug
3 Radiator drain plug

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Crankcase drain plug	115 {87, 12}	—

Using the radiator for a long period of time without cleaning it will cause overheating because rust and scale deposits will accumulate inside the cooling system. Periodical cleaning is recommended.

● **Draining coolant**

First loosen pressure cap **1,** to lower the pressure in the cooling system, before draining coolant.

WARNING

- **You must make sure that the engine coolant is cold before draining it so as not to scald yourself.**
- **It is dangerous to open pressure cap 1, when the coolant temperature is high, without taking due care because the hot water would spray out. Be sure to cover the pressure cap with a cloth and loosen slowly to bleed the pressure before opening fully.**

● **Cleaning procedure**

- Keep the coolant temperature at approximately 90°C {194°F} so that the thermostat valve remains open and the coolant continues to circulate in the radiator.
- For the sake of convenience you can raise the coolant temperature quickly by covering the front of the radiator with corrugated cardboard or something similar.
- Set the temperature adjusting lever of the heater controller at maximum so that the coolant can circulate freely in the heater piping area.
- In cases where a great amount of rust has accumulated it often happens that as a result of cleaning the radiator starts leaking. Conduct a thorough check for leakage after cleaning.
- Soft water to be used should have the following properties.

CAUTION

Do not use hard water as it causes scale and rust.

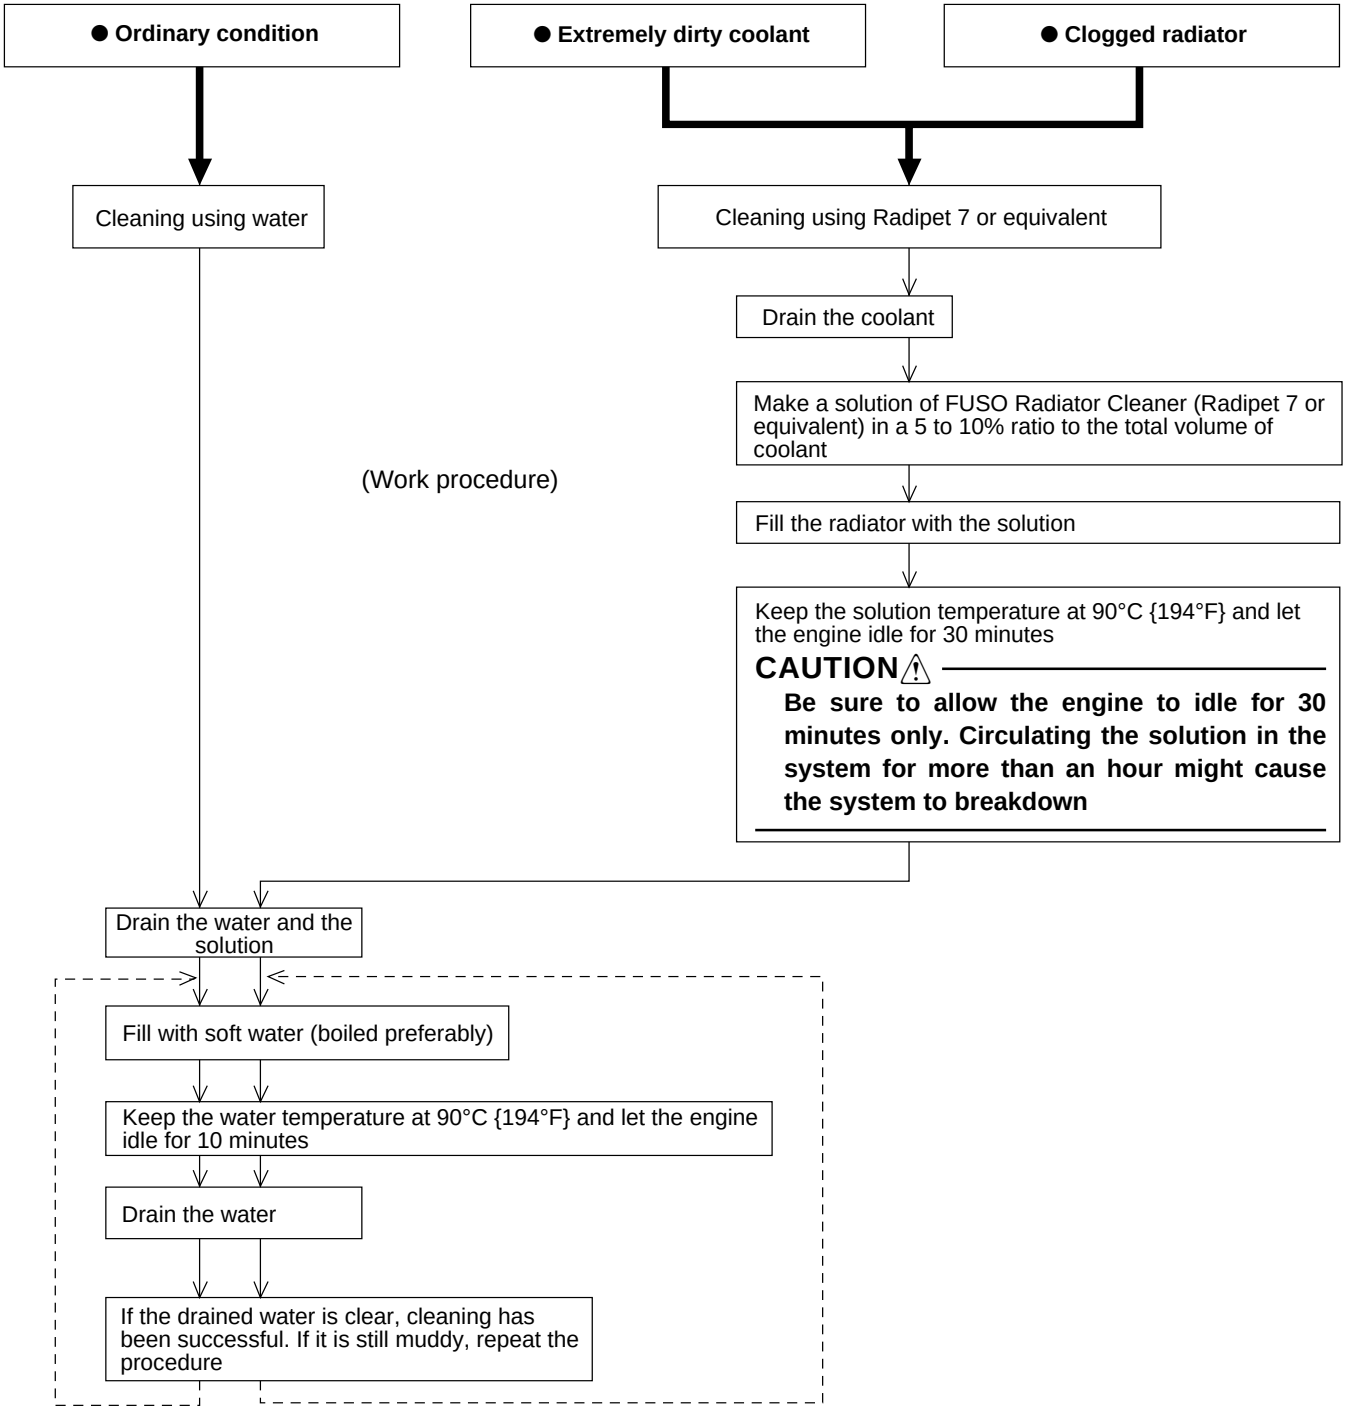
Required properties of soft water

Total hardness	300 ppm or less
Sulfate SO_4^-	100 ppm or less
Chloride Cl^-	100 ppm or less

Total dissolved solids	500 ppm or less
pH	6 to 8

https://truckmanualshub.com/

Method of cleaning the cooling system depends on its condition.



DANGER

If FUSO DIESEL LONG LIFE COOLANT solution gets in your eyes accidentally, you must immediately rinse your eyes with copious amounts of water, and be sure to consult a doctor.

WARNING

FUSO DIESEL LONG LIFE COOLANT is inflammable. Do not put it near naked lights.

NOTE

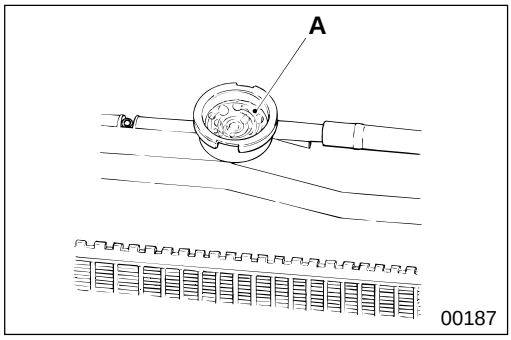
- **After cleaning with solution, fill with coolant as quickly as possible.**
- **To prevent freezing of the coolant and corrosion of the cooling system, use specified coolant solution of FUSO DIESEL LONG LIFE COOLANT. (See the Owner's Handbook for use of these materials.)**

https://truckmanualshub.com/

Air Bleeding of Cooling System

- Remove the pressure cap and keep the coolant temperature at 90°C {194°F} while letting the engine idle and bleed the air out completely. Keep the temperature adjusting lever of the heater controller at maximum so that the coolant can circulate freely in the heater piping area.
- After completing adequate air bleeding of the cooling system, refill coolant sufficiently enough for the surge tank.

Gas Leakage Test



Air or exhaust gas in the coolant increases corrosion and rusting in the system. Therefore, carry out the following test:

- Remove the surge tank pressure cap and check if the coolant level comes up to the lip of the tank.
- Put the end of the overflow pipe into the water tank.

WARNING

Be sure that the coolant temperature is low enough so that hot coolant does not spout out when you loosen the pressure cap.

- Run the engine to bring the coolant temperature to approximately 90°C {194°F}.
- If air bubbles **A** continuously rise in the water tank, it is an indication that air or exhaust gas has gotten into the coolant.
- If it is air, it is possible that the cylinder head bolts, the water pump mounting bolts or the hose connections are loose, or that the hose is damaged.
- If it is exhaust gas, it is possible that the cylinder head gaskets are damaged, or that the cylinder head is cracked.

https://truckmanualshub.com/

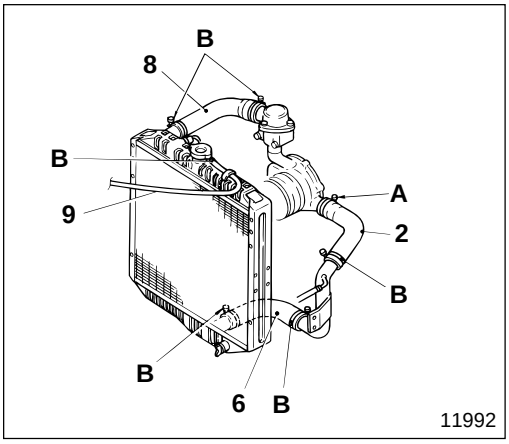
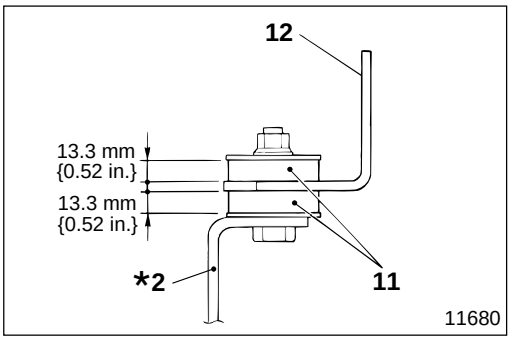
◆ Service procedure



2 **6** **8** **9** **Installation of hose**

The depth of hose installation is as follows.

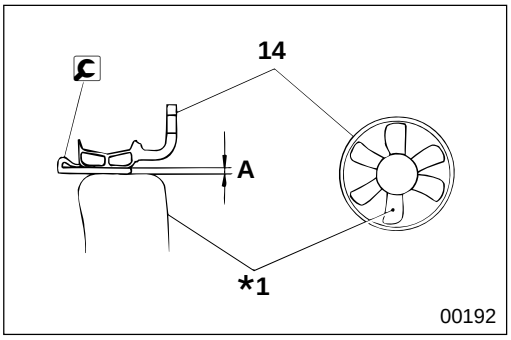
A : 30 mm {1.18 in.}
B : 35 mm {1.38 in.}



12 **Installation of radiator assembly**

Tighten nuts until thickness of rubber seat **11** conforms to the dimension as illustrated.

***2** : Frame



14 **Installation of fan shroud**

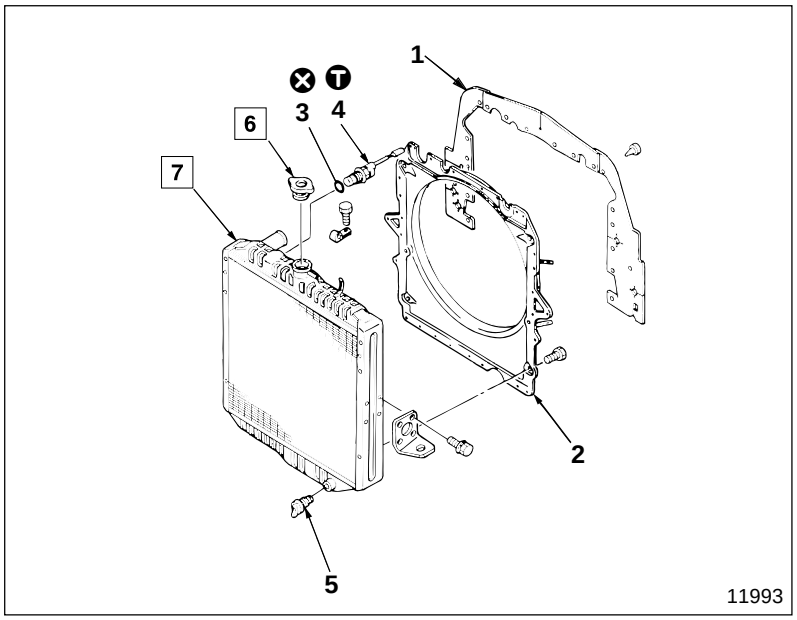
Adjust using tip clearance spacer so that clearance **A** conforms to the standard value all around the periphery.

***1** : Cooling fan

https://truckmanualshub.com/

RADIATOR AND FAN SHROUD

Radiator Assembly



● **Disassembly sequence**

1 Baffle plate
2 Radiator shroud
3 O-ring
4 Water level sensor Gr 54
5 Drain cock
6 Pressure cap
7 Radiator

⊗ : Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

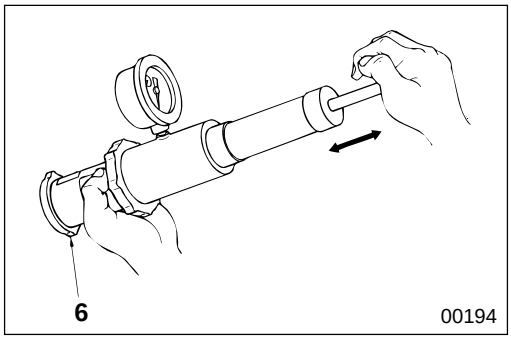
Location	Maintenance item	Standard value	Limit	Remedy
6	Pressure cap valve opening pressure	69±15 kPa {10±2.1 lbf/in^2, 0.7±0.15 kgf/cm^2}	—	Replace
7	Radiator air leakage (Air pressure of 150 kPa {21 lbf/in^2, 1.5 kgf/cm^2})	0 cm^3 {0 cu. in.}	—	Correct or replace

ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Water level sensor	2.9 to 3.9 {2.2 to 2.9, 0.3 to 0.4}	—

◆ Service procedure

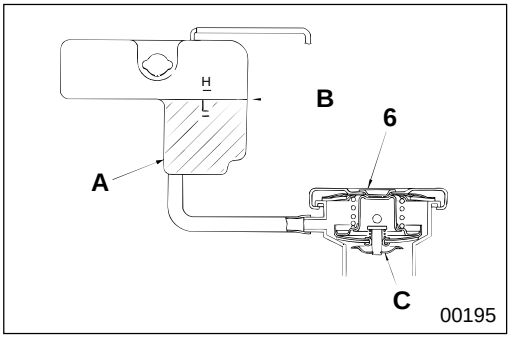


6 **Inspection of pressure cap**

(1) Pressure valve opening pressure

If the measured value deviates from the standard value, replace pressure cap **6**.

https://truckmanualshub.com/

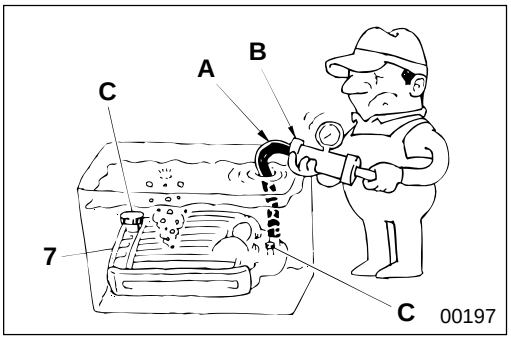


(2) Inspection of vent valve

- Take note of liquid level **B** of reservoir tank **A** beforehand.
- Run the engine at a high revolution and before the overflow reaches the capacity of tank **A** stop the engine.
- Leave things for a while. Check the time it takes for the coolant temperature to return to the ambient temperature, and check whether the coolant level in tank **A** is the same as before running the engine.
- If the coolant level has not returned to that before running engine, it means vent valve **C** is faulty, therefore replace pressure cap **6**.

NOTE

Do not remove pressure cap 6 before the coolant temperature decreases to the ambient temperature. If you do the coolant will not return to reservoir tank A because negative pressure in the radiator is lost.

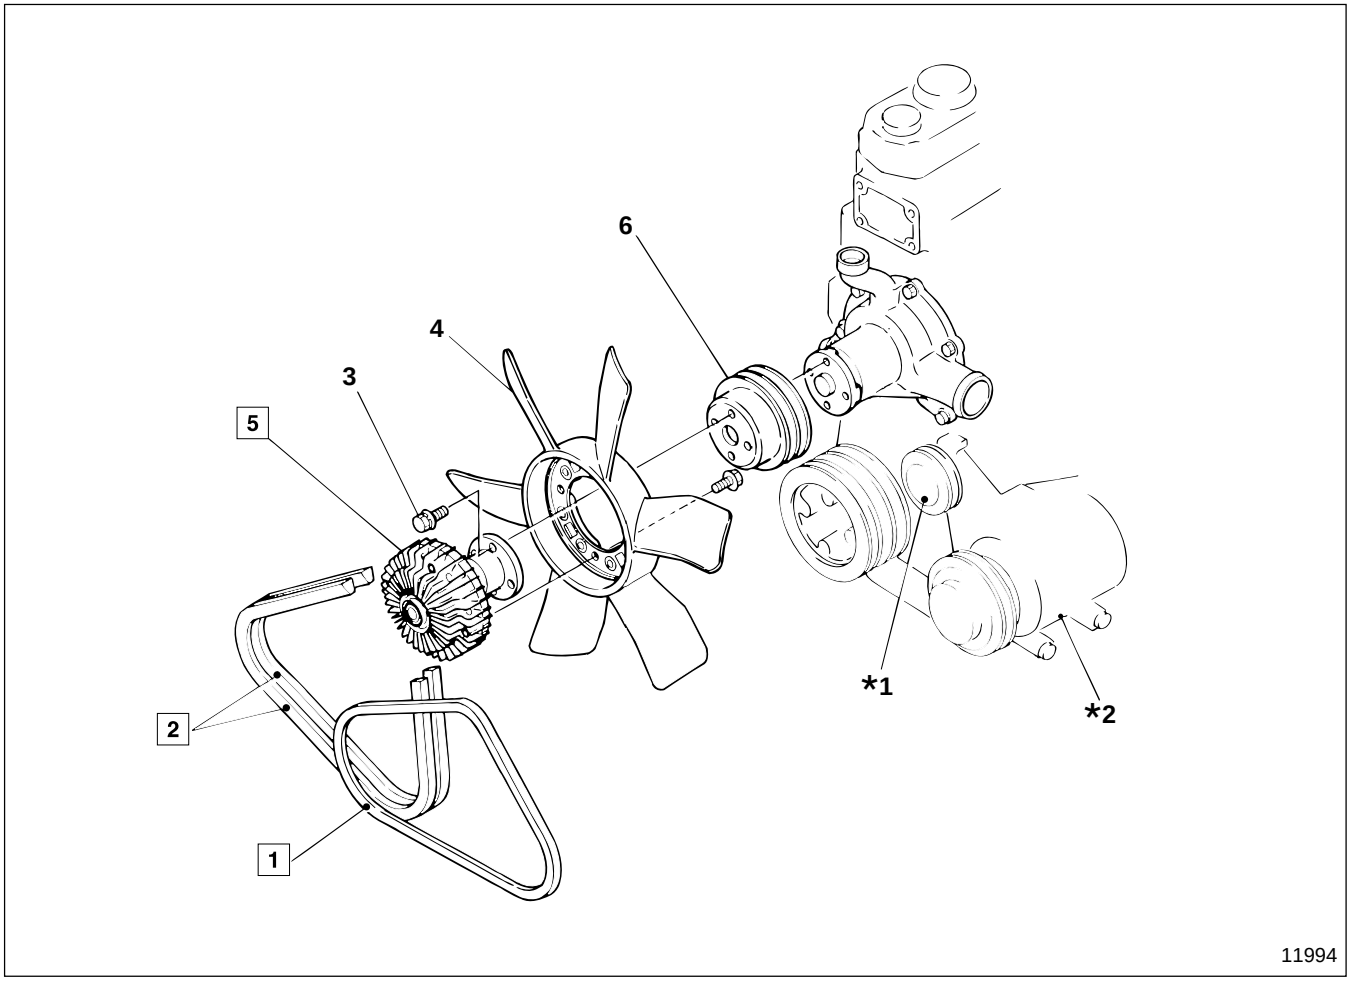


7 Inspection of radiator

- Install radiator cap tester **B** by connecting hose **A** to the radiator inlet hole.
- Plug any other openings **C** with plugs, and immerse the radiator in a water tank.
- Apply specified air pressure of 150 kPa {21 lbf/in^2, 1.5 kgf/cm^2} using cap tester **B**, and check if there is any air leakage.
- If you find air leakage, correct or replace radiator **7**.

https://truckmanualshub.com/

COOLING FAN AND V-BELT



● **Disassembly sequence**

1 V-belt (Air-conditioner)
2 V-belt (Fan)
3 Bolt
4 Cooling fan
5 Automatic cooling fan coupling
6 Water pump pulley

***1** : Tension pulley
***2** : Cooler compressor

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION⚠

- **Be sure to replace automatic cooling fan coupling 5 as an assembly if it is faulty because it is a unit construction.**
- **Be sure to replace V-belts 2 as a set to maintain even tension between them.**

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	V-belt tension (Air-conditioner)	7 to 10 {0.28 to 0.39}	—	Adjust
2	V-belt tension (Fan)	10 to 15 {0.39 to 0.59}	—	Adjust

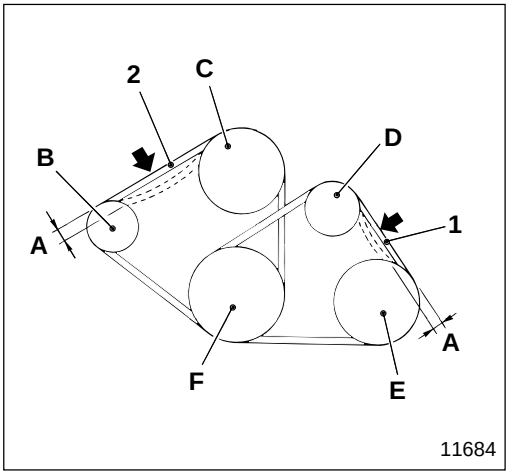
https://truckmanualshub.com/

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1, 2	Belt tension gauge 03612	MH062345	Measurement of tension of V-belt

◆ Service procedure

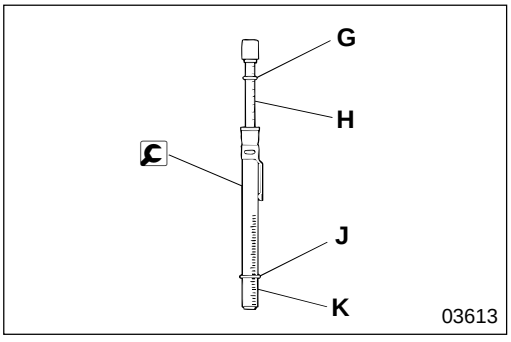


11684

1 **2** **V-belt**

[Inspection]
Measure the extent of flex **A** when the center of V-belts **1**, **2** as illustrated is depressed with a force of approximately 98 N {72 lbf, 10 kgf}.

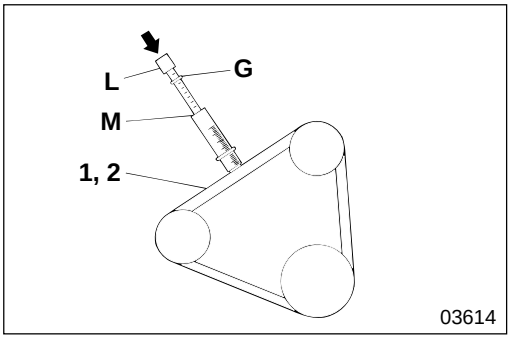
- **B** : Alternator pulley
- **C** : Water pump pulley
- **D** : Tension pulley
- **E** : Cooler compressor pulley
- **F** : Crankshaft pulley



03613

● **Use of special tool belt tension gauge**

- Set upper O-ring **G** of belt tension gauge to 98 N {72 lbf, 10 kgf} (push load) on graduation **H**.
- Set lower O-ring **J** of belt tension gauge to graduation **K** (maximum flex of belt).

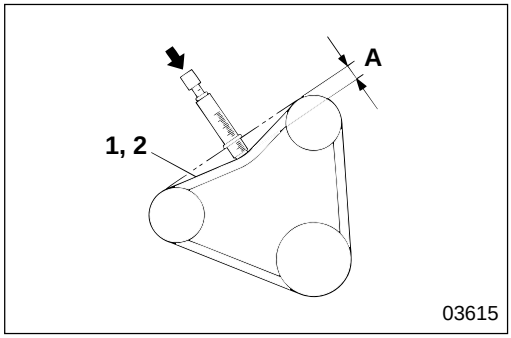


03614

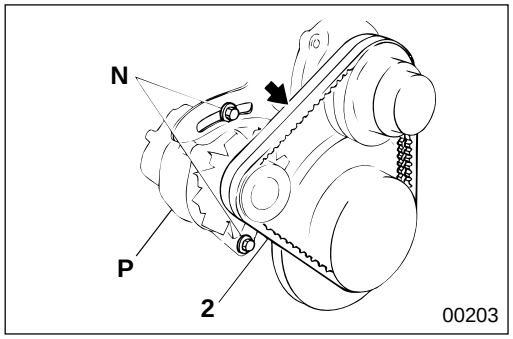
- Place belt tension gauge at the center of V-belts **1**, **2** perpendicularly as illustrated and push top **L** all the way down until upper O-ring G hits upper edge **M**.

https://truckmanualshub.com/

COOLING FAN AND V-BELT



- Measure the extent of flex **A** of V-belts **1**, **2** at this point, and if the measured value deviates from the standard value, adjust as follows.



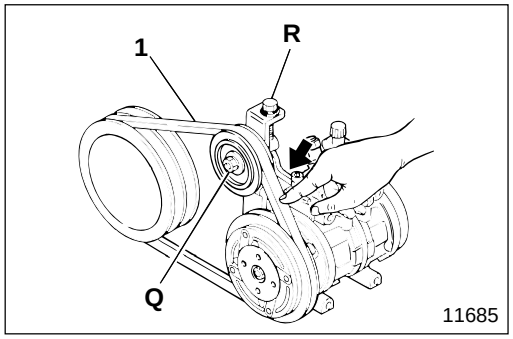
[Adjustment]

(1) Adjustment of V-belt tension for fan

- Loosen alternator mounting bolts **N** (two places), and adjust the tension of V-belts **2** by moving alternator **P** left or right.
- After adjustment, tighten the bolts and nuts securely.

CAUTION ⚠

- **Bear in mind that excessive tension of V-belts 2 might damage the belts and bearings that engage with the V-belts.**
- **Be sure to replace V-belts 2 as a set to maintain even tension between them.**
- **Be careful not to let oil stick to V-belts 2, if oil gets onto the belts, it causes slipping, resulting in overheating and insufficient battery charging.**



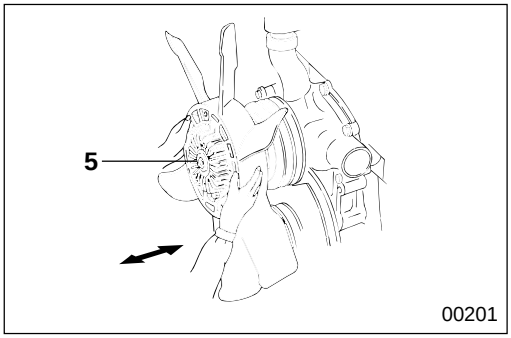
(2) Adjustment of V-belt tension for air-conditioner

- Loosen tension pulley mounting nut **Q**, and adjust the tension of V-belt **1** by adjusting bolt **R**.
- After adjustment, tighten the bolts and nuts securely.

CAUTION ⚠

- **Bear in mind that excessive tension of V-belt 1 might damage the belt and bearings that engage with the V-belt.**
- **Be careful not to let oil stick to V-belt 1, if oil gets onto the belt, it causes slipping, resulting in poor performance of the air-conditioner.**

https://truckmanualshub.com/

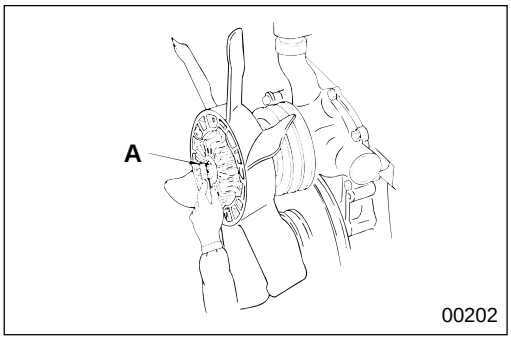


5 Automatic cooling fan coupling

[Inspection]

Carry out the following inspection of automatic cooling fan coupling **5** and if any fault is found, replace the unit.

- Check for any leakage of lubricating oil sealed in the coupling body.
- Rotate automatic cooling fan coupling **5** by hand, and check for any irregularity in rotation related to the coupling bearing or any abnormal noise.
- Check for any excessive play of automatic cooling fan coupling **5** in the axial direction when the engine is cool.



[Cleaning]

- If there are any foreign particles sticking to bimetal **A**, remove them by brushing lightly.

Lubricant

Location	Points of application	Kinds	Quantity
5	Lip area of front oil seal	Engine oil	As required
7, 10	Interior and exterior peripheries on installation of bearing	Engine oil	As required
12	Lip area of rear oil seal	Engine oil	As required

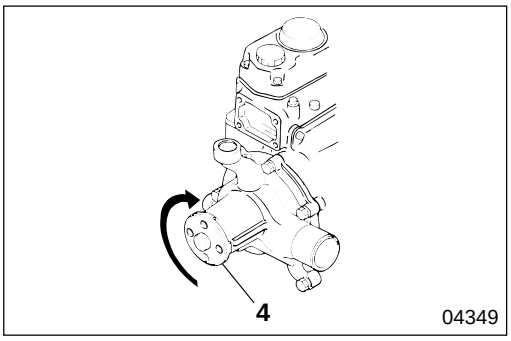
https://truckmanualshub.com/

Special tools

Unit : mm {in.}

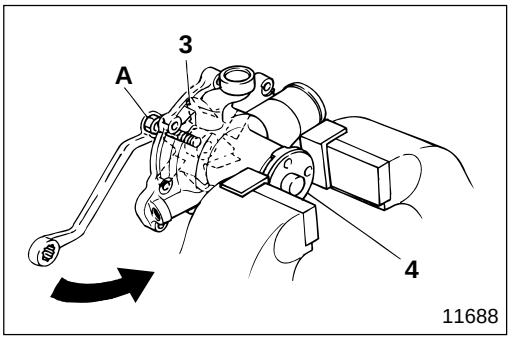
Location	Tool name and shape	Part No.	Application
13	Unit seal installer 	MH062195	Installation of unit seal

◆ Service procedure



● Inspection after assembly

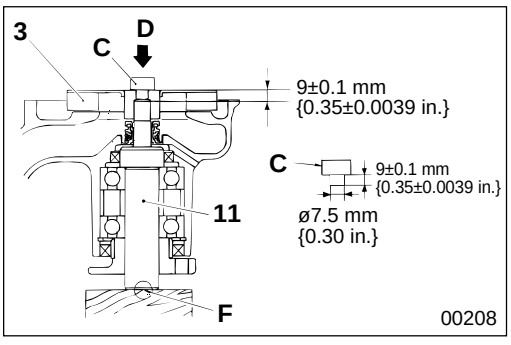
- Rotate flange **4** by hand after assembly, and check that it rotates freely without obstruction.
- If it does not rotate freely, disassemble and reinspect.



3 Impeller

[Removal]

To remove, screw bolts **A** (Screw size : M×1.5 mm, over 25 mm {0.98 in.} in length) into threads of impeller **3**.



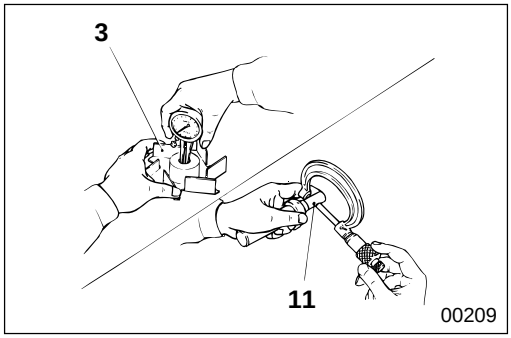
[Press-fitting]

- Press-fit impeller **3** until jig **C** makes contact with water pump shaft **11**.
  D : Press
  : 4410 N {990 lbf, 450 kgf} or more
  34320 N {7720 lbf, 3500 kgf} or less
- After press-fitting, confirm that the depth is the specified value, if it is not the specified value, check the mounting of the shaft.

NOTE

Press-fit with shaft end F, on the flange side, as the load receiving surface.

https://truckmanualshub.com/

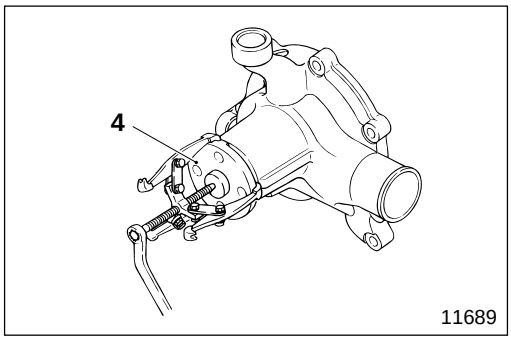


3 **11** **Interference between impeller and water pump shaft**

If the measured value deviates from the specified value, replace the faulty parts.

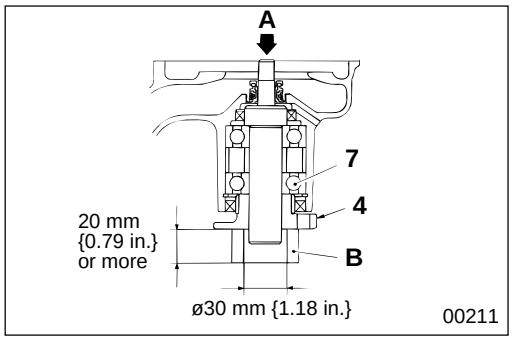
CAUTION

Reassembly is restricted to twice only, even if the specified value is met.



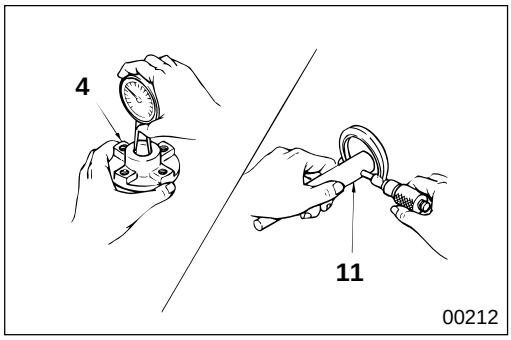
4 **Flange**

[Removal]



[Press-fitting]
Press-fit flange **4** until it makes contact with bearing **7** at specified press-fitting load **C**.

A : Press
B : Cylindrical jig
C : 6370 N {1430 lbf, 650 kgf} or more
19610 N {4410 lbf, 2000 kgf} or less

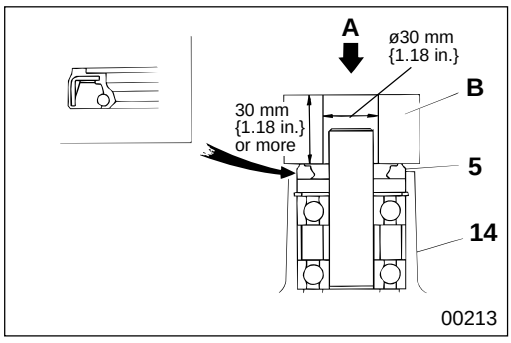


4 **11** **Interference between flange and water pump shaft**

If the measured value deviates from the specified value, replace the faulty parts.

CAUTION

Reassembly is restricted to only twice, even if the specified value is met.

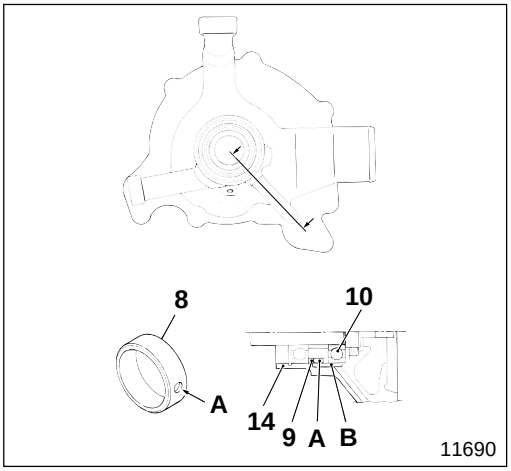


5 **Installation of front oil seal**

Position front oil seal **5** as illustrated, then press-fit until jig **B** makes contact with water pump case **14**.

A : Press

https://truckmanualshub.com/

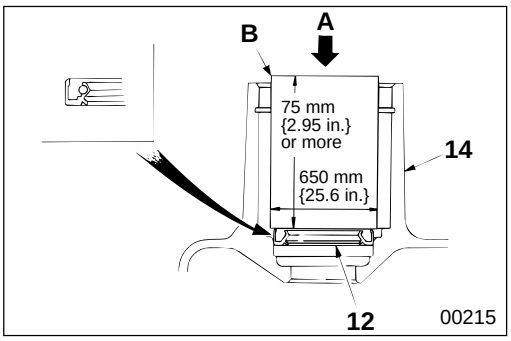


8 **Installation of outer spacer**

Align hole **A** of the outer spacer with oil groove **B** of water pump case **14** and press-fit outer spacer **8** slowly until it makes contact with bearing **10**.

CAUTION

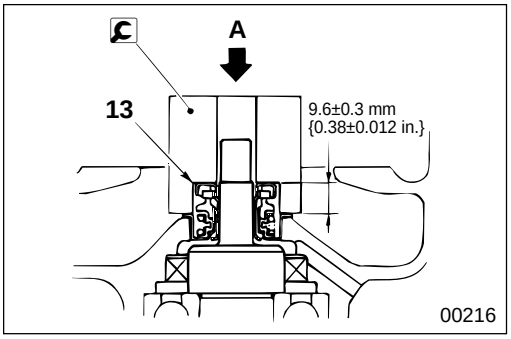
Be sure to align hole A with oil groove B, misalignment would prevent lubricating oil from reaching the water pump, causing seizure.



12 **Installation of rear oil seal**

Position oil seal **12** as illustrated, then press-fit until jig **B** makes contact with water pump case **14**.

A : Press



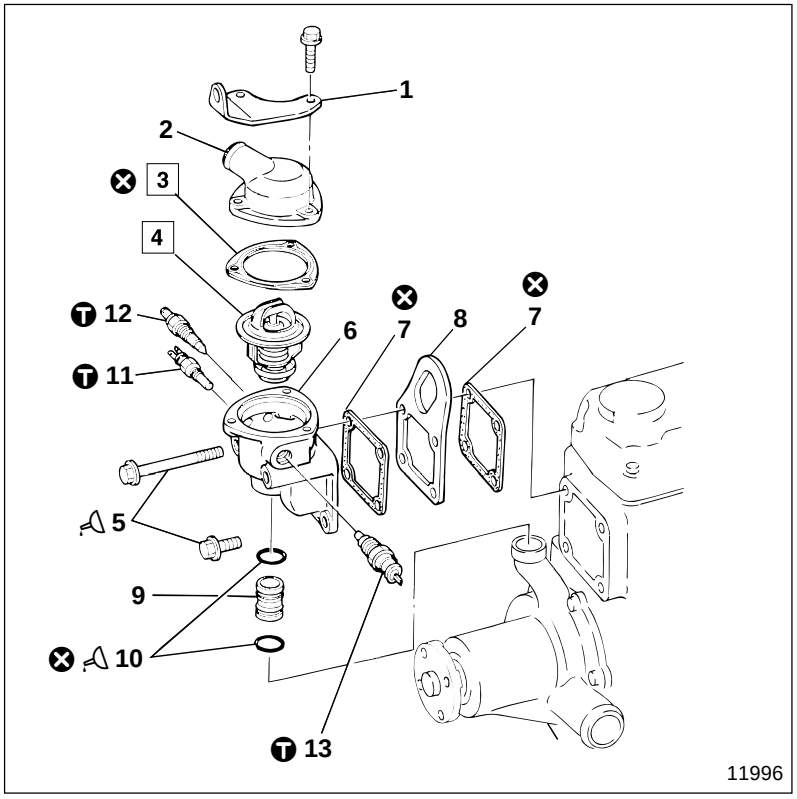
13 **Installation of unit seal**

Press-fit unit seal **13** with specified press-fitting load **B** and specified speed **C**, until the installation length conforms to the specified value.

A : Press
B : 44 N {7.05 to 9.92 lbf, 3.2 to 4.5 kgf}
C : 14 to 28 mm/sec {0.55 to 1.1 in./sec}

https://truckmanualshub.com/

THERMOSTAT



● **Disassembly sequence**

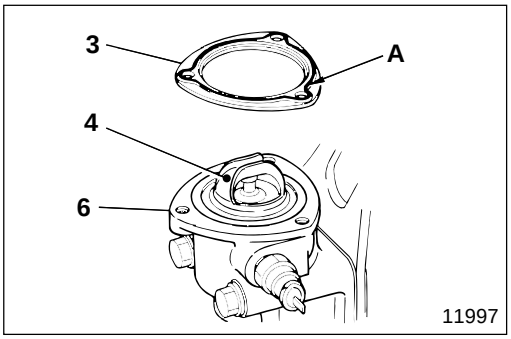
10	Periphery of O-ring	Soapy water	As required

https://truckmanualshub.com/

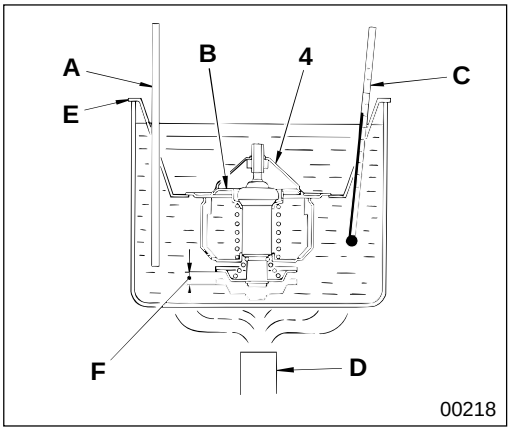
◆ Service procedure



3 **Mounting of thermostat cover gasket**

Mount thermostat cover gasket **3** on thermostat case **6** in the direction as illustrated.

A : Sealant application surface



4 **Thermostat**

[Inspection]

Stir the water using stick **A** to maintain an even water temperature in the container, then carry out the following tests. If the measured value deviates from the standard value, replace thermostat **4**.

(1) Valve opening temperature

- Hold thermostat **4** with wire **E** so as not to get the thermostat too close to heat **D**.
- Heat the water gradually to raise the temperature to the valve opening temperature.
- Maintain this temperature for five minutes and make sure that valve **B** has opened.
- Make sure that valve **B** has closed when the water temperature has dropped to 65°C {149°F}.

  C : Water temperature gauge

(2) Extent of valve lift

Measure valve lift **F**, while maintaining the water temperature a little higher than the valve opening temperature, with valve **B** fully open for five minutes.

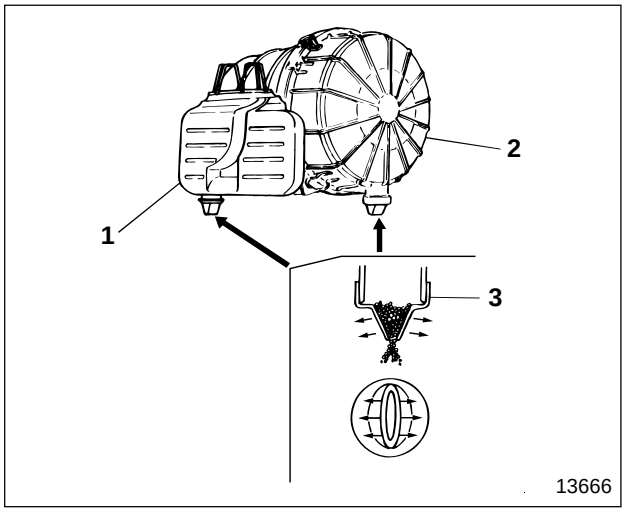
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Items		Specifications
Air cleaner element		Cyclone paper filter type
Turbocharger	Model	TD07
	Manufacturer	MITSUBISHI HEAVY INDUSTRIES
Intercooler type		Air-cooled, tube and corrugated fin type

STRUCTURE AND OPERATION

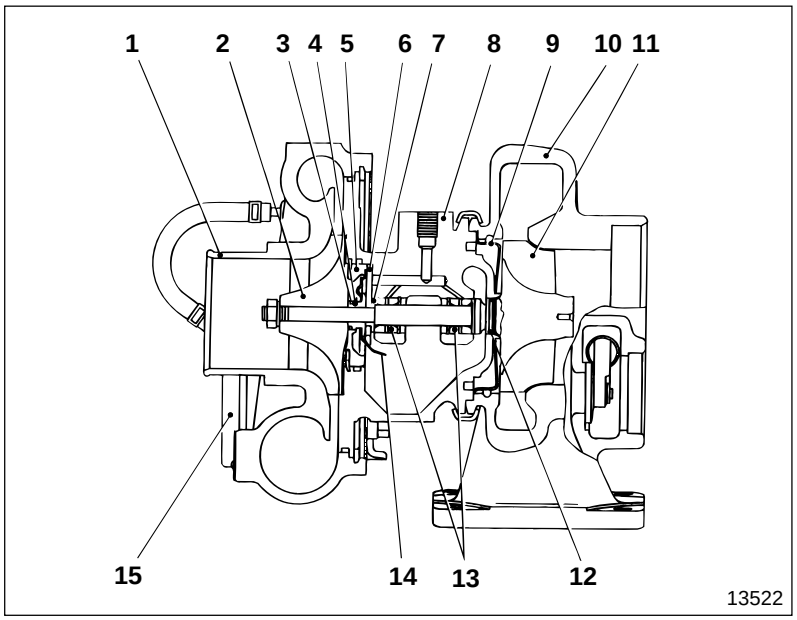
Air Cleaner



1 Air lower duct
2 Air cleaner assembly
3 Evacuator valve

- Air cleaner assembly **2** uses a single element.
- Evacuator valves **3** are fitted with air lower duct **1** and air cleaner assembly **2**.
- Evacuator valves **3** automatically vent dust and dirt by the repercussive force of the rubber of the valve that overcomes the inner negative pressure when the engine revolution falls below the specified revolution.

Turbocharger

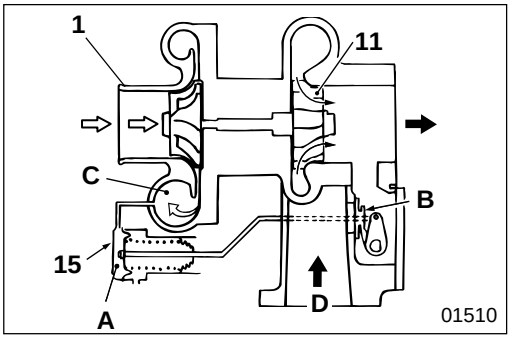


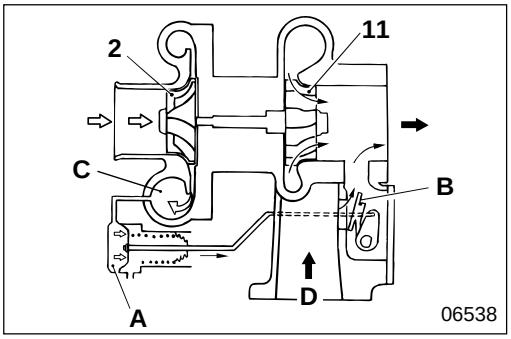
1 Compressor cover
2 Compressor wheel
3 Piston ring
4 Thrust sleeve
5 Insert
6 Thrust bearing
7 Thrust ring
8 Bearing housing
9 Turbine backplate
10 Turbine housing
11 Shaft and turbine wheel
12 Piston ring
13 Bearing
14 Oil deflector
15 Actuator

https://truckmanualshub.com/

Waste gate mechanism

- The waste gate mechanism relieves the boost pressure of excess exhaust gas using actuator **15**. This controls the boost pressure appropriately and prevents the turbocharger from overrunning, and prevents excessive pressure in the intake manifold.
- The boost pressure is fed into chamber **A** of actuator **15** from compressor cover **1** via a rubber hose. When boost pressure **C**, acting on chamber **A**, is lower than the preset value, the actuator does not operate and waste gate valve **B** remains closed, therefore exhaust gas **D** is blown against shaft and turbine wheel **11**.

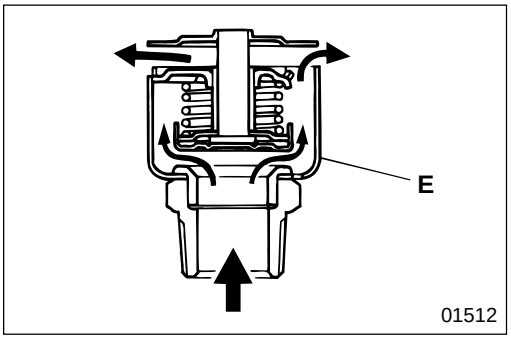




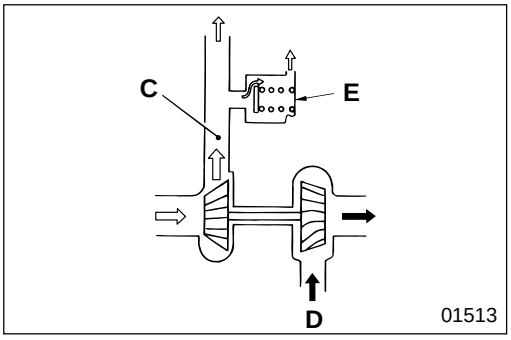
- As the boost pressure acting on chamber **A** increases to become higher than the preset value, waste gate valve **B** is opened and the exhaust gas blown against shaft and turbine wheel **11** decreases. Therefore the rotation of compressor wheel **2** decreases, causing the boost pressure to decrease.

Operation of over-boost valve

- Over-boost valve **E** operates when the boost pressure increases abnormally because of faulty operation of the waste gate mechanism.



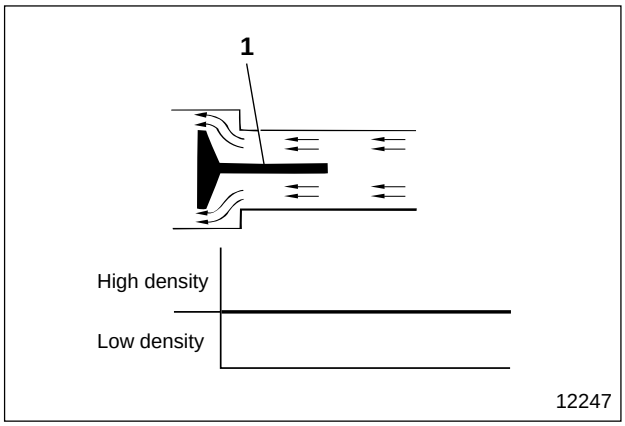
- If boost pressure **C** of over-boost valve **E** increases to become higher than the preset value, the excessive boost pressure is discharged into the atmosphere, protecting the engine from excessive boost pressure. When the valve is operating, a pipe-blowing sound is generated.



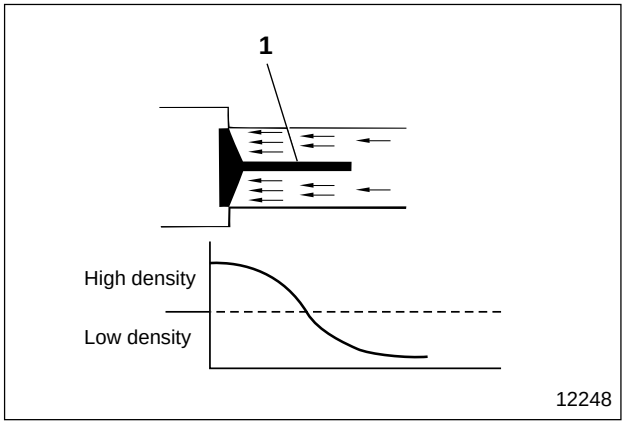
https://truckmanualshub.com/

Inertia Supercharger

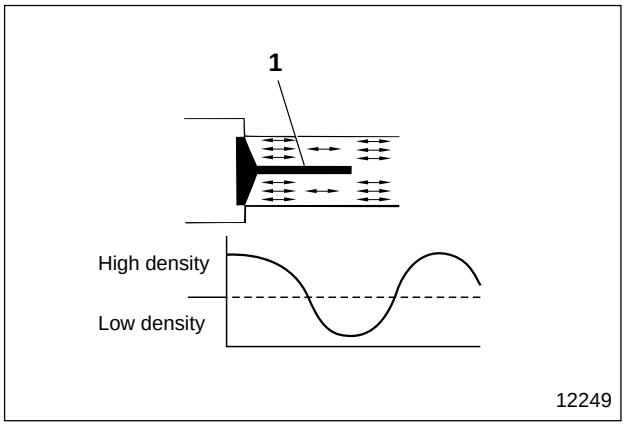
The inertia supercharger increases air intake by using the compressional wave of air generated by the air density in the intake manifold that is created by the inertia force of the air.
This supercharger improves engine performance in the low speed range where the air supply might be lower than necessary.



When inlet valve **1** is open, there is stable air flow in the intake manifold.



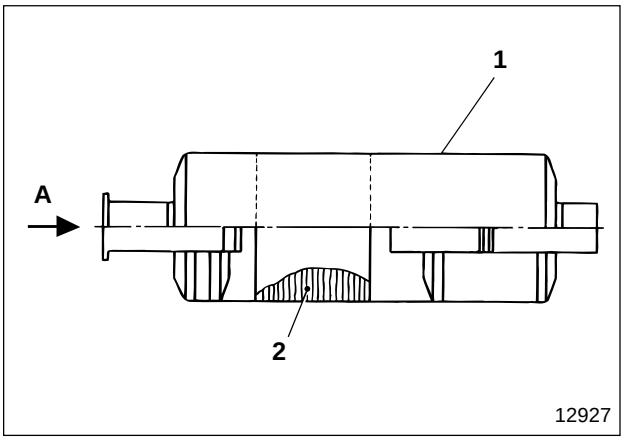
When inlet valve **1** closes and the air flow stops suddenly, the air around the inlet valve is compressed by the inertia force of the air, generating a compressional wave of air in the inlet manifold.



An intake coupler, which is split into two parts, resonates to amplify the compressional wave of air that is generated in each air conduit. When inlet valve **1** opens again, the air flows through an area where the air density is high, thus supplying a large mass of air to the combustion chamber.

https://truckmanualshub.com/

Muffler



1 Muffler
2 Catalytic converter

A : Exhaust gas intake

Converter **2** is built into muffler **1** to decrease the amount of particulate matter (PM) in the exhaust gas.

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

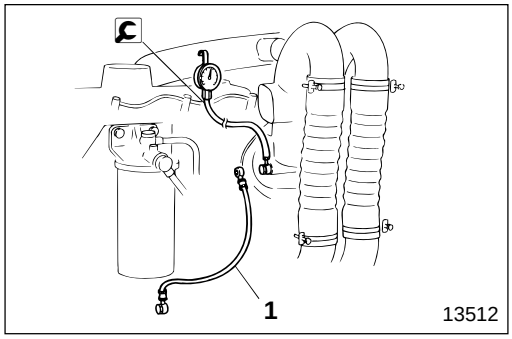
Measurement of Turbo Boost Pressure

Service standards

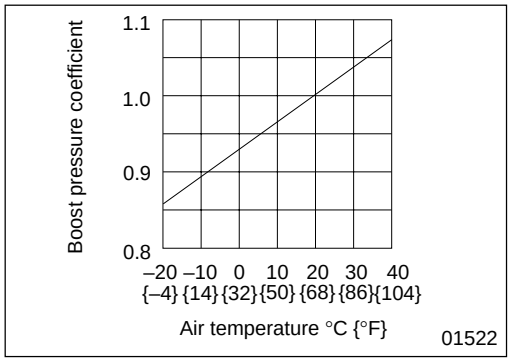
Location	Maintenance item		Standard value	Limit	Remedy
—	Boost pressure (Air temperature 20°C {68°F}, Atmospheric pressure 100 kPa {29.9 in. Hg, 760 mmHg})	6D16T2	—	38 kPa {11 in. Hg, 280 mmHg}/ 3200 rpm	Inspect and adjust
		6D16T3, 16T4	—	40 kPa {11.8 in. Hg, 300 mm Hg} / 3275rpm	Inspect and adjust

Special tools

Location	Tool name and shape	Part No.	Application
—	Boost pressure gauge  01524	MH061366	Measurement of turbo boost pressure

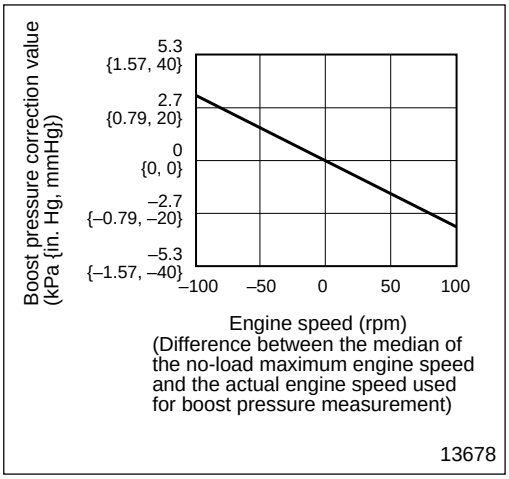


- Before measuring the turbo boost pressure, clean or replace the air cleaner element.
- Remove boost compensator hose **1** and attach boost pressure gauge.
- After warming up the engine, measure the boost pressure at the no-load maximum engine speed. Also measure the engine speed and the air temperature.



- Correct the boost pressure at standard conditions. (Since the boost pressure varies depending on the air temperature and engine speed.)
  [Correction for air temperature]
  Identify boost pressure coefficient depending on the air temperature from the graph.

https://truckmanualshub.com/



[Correction for engine speed]
Subtract the engine speed actually used for measuring the boost pressure from the median of the no-load maximum engine speed. Identify the boost pressure correction value (**Pa**) according to the graph.

Median value : 3200 rpm < 6D16T2 >
3275 rpm < 6D16T3, 16T4 >

[Calculation of corrected boost pressure]
Given the measured boost pressure to be **P**, corrected boost pressure **Pb** can be calculated from the following equation:

Pb = ktP + Pa

- **Pb** : Corrected boost pressure
- **P** : Measured boost pressure
- **kt** : Boost pressure correcting coefficient depending on air temperature
- **Pa** : Boost pressure correction value

If **Pb** is lower than the limit, the turbocharger must be inspected and adjusted.

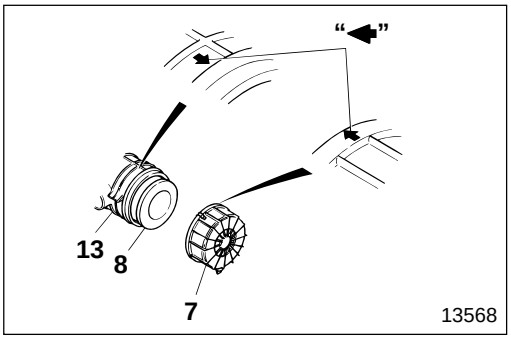
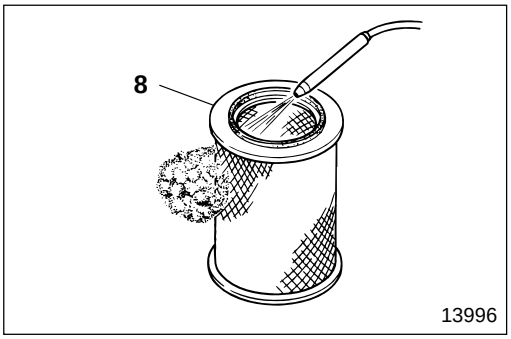
◆ Service procedure



7 **Installation of cover**

➡ : Alignment mark



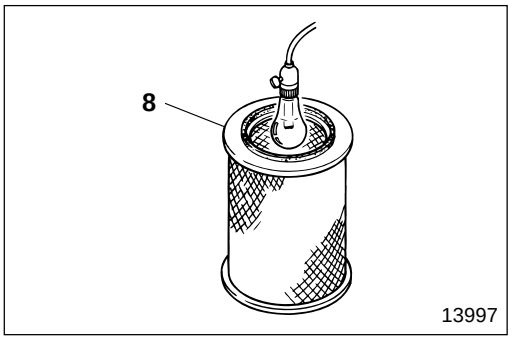
8 **Element**

[Cleaning]

- Blow compressed air of 685 kPa {100 lbf/in^2, 7 kgf/cm^2} or less through element **8** from the inside.
- When using compressed air, move the blower's nozzle up and down along the pleats of element **8** evenly.

CAUTION ⚠

- **Do not tap or hit element 8 to remove dust.**
- **Do not blow compressed air through element 8 from the outside.**



[Inspection]

- Illuminate the inside of element **8**.
- If parts of the filter paper are torn or thin, or if the packing of the upper surface of element **8** is damaged, replace the element.

NOTE

If the dust on element 8 is wet due to oil smoke or soot, replace the air cleaner regardless of the scheduled replacement interval.

https://truckmanualshub.com/

◆ Service procedure

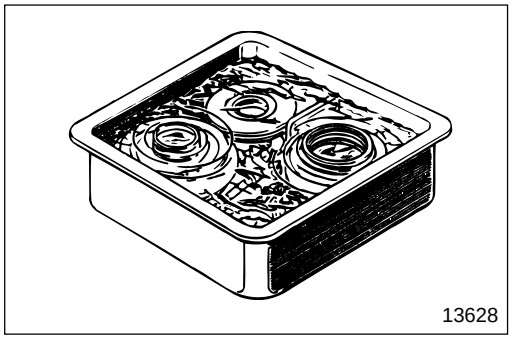
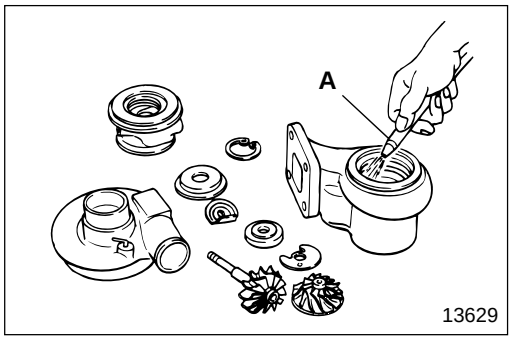
● Work before disassembly

Put alignment marks **A** on coupling assembly **3**, turbine housing **4**, compressor cover **6** and bearing housing **24**.

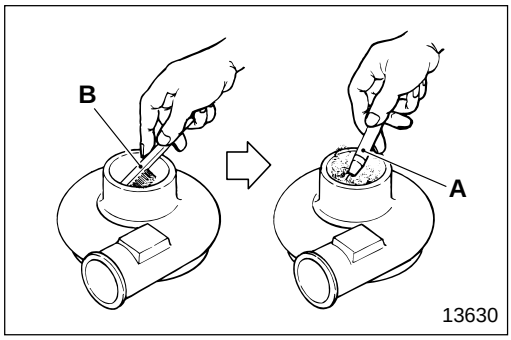


● Cleaning after disassembly

- Visually inspect related parts before cleaning to check if there are any burns or scratches as these would not be seen after cleaning. If any fault is found, replace the faulty parts.
- Immerse the disassembled parts in a nonflammable solvent (DAIDO KAGAKU KOGYO DAICLEANER T-30).

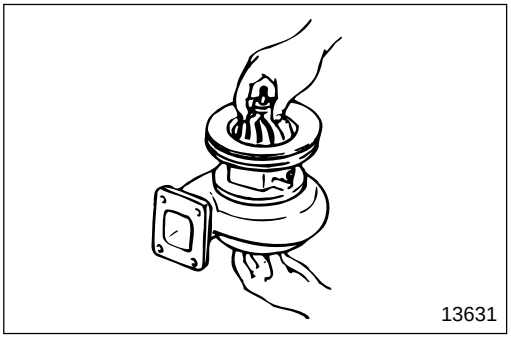


- Take the parts out and blow compressed air **A** on them.



- Scrape foreign particles off.
  B : Plastic scraper or bristle-headed brush
- Immerse the parts again in the solvent.
- Blow compressed air **A** on them.

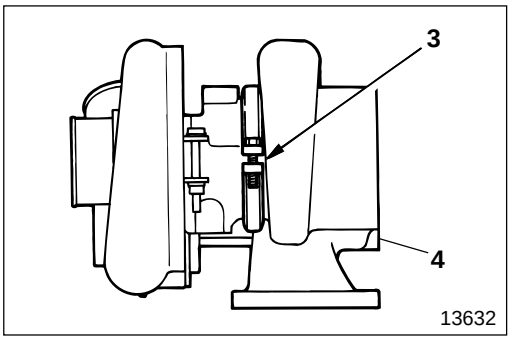
https://truckmanualshub.com/



13631

● **Inspection after assembly**

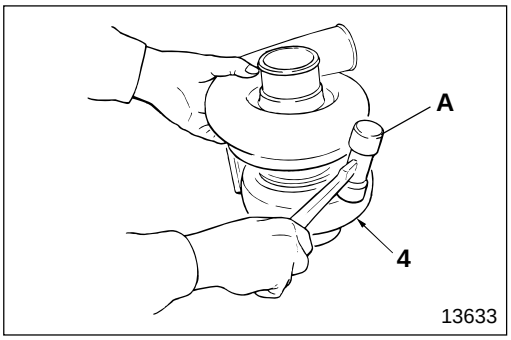
Turn turbine wheel **21** and compressor wheel **10** to make sure that they turn smoothly.



13632

3 **Installation of coupling assembly**

Install coupling assembly **3** to turbine housing **4** in the direction as illustrated.



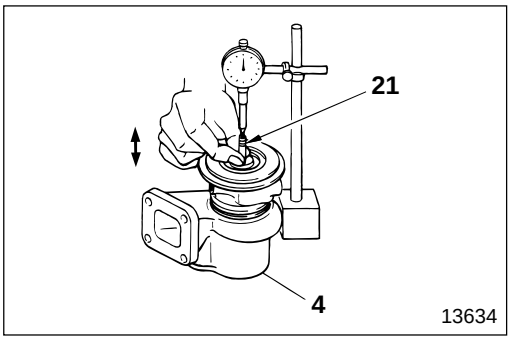
13633

4 **Removal of turbine housing**

A : Rubber-headed hammer

CAUTION⚠

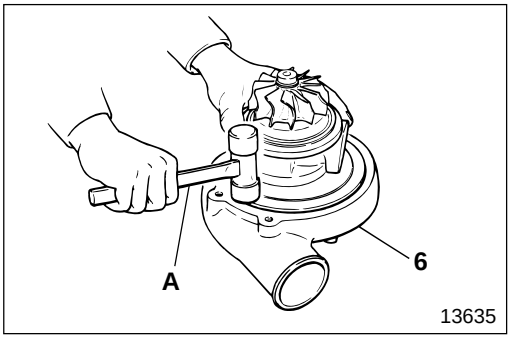
- **When removing turbine housing 4, tap all around the circumference lightly using rubber-headed hammer A so as not to damage the turbine housing.**
- **Do not hit the turbine wheel near turbine housing 4, since the blade of shaft and turbine wheel 21 can be easily bent.**



13634

4 **21** **Inspection of clearance between turbine housing and shaft and turbine wheel**

If the measured value deviates from the standard value, disassemble and determine the cause.



13635

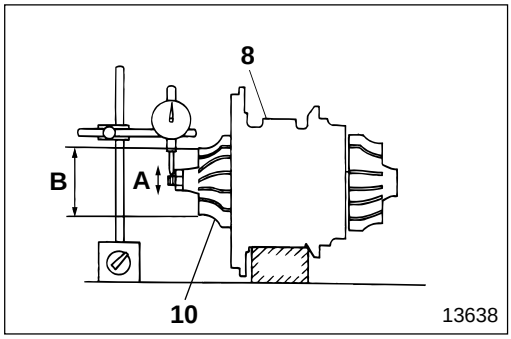
6 **Removal of compressor cover**

A : Rubber-headed hammer

CAUTION⚠

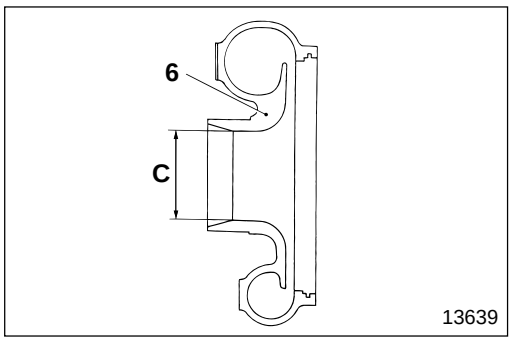
- **When removing compressor cover 6, tap all around the circumference lightly so as not to damage the compressor cover.**
- **Avoid hitting compressor wheel 10 near compressor cover 6, since the blade of the compressor wheel can be easily bent.**

https://truckmanualshub.com/



6 **8** **Inspection of clearance between wheel and bearing housing assembly and compressor cover**

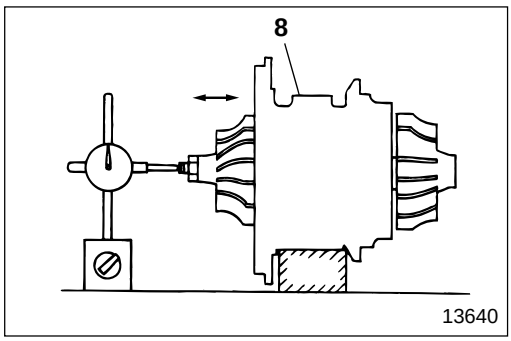
- Measure deflection **A**.
- Measure outer diameter **B** of compressor wheel **10**.



- Measure inner diameter **C** of compressor cover **6**.
- Calculate the clearance between wheel and bearing housing assembly **8** and compressor cover **6** using the following equation.

$$\text{Clearance} = \frac{\mathbf{C} - \mathbf{B} - \mathbf{A}}{2}$$

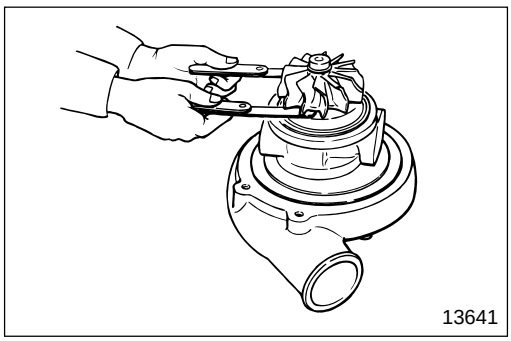
- If the calculated clearance deviates from the standard value, disassemble and determine the cause.



8 **Inspection of wheel and bearing housing assembly**

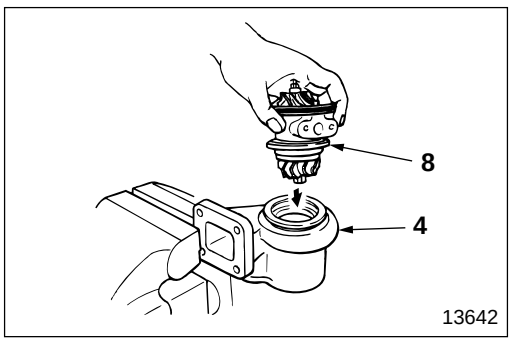
(1) Play in the shaft direction

If the measured value deviates from the standard value, disassemble and determine the cause.



(2) Clearance between turbine backplate and shaft and turbine wheel rear side.

- Measure using the tip of two feeler gauge blades.
- If the measured value deviates from the standard value, disassemble and determine the cause.



10 **Compressor wheel**

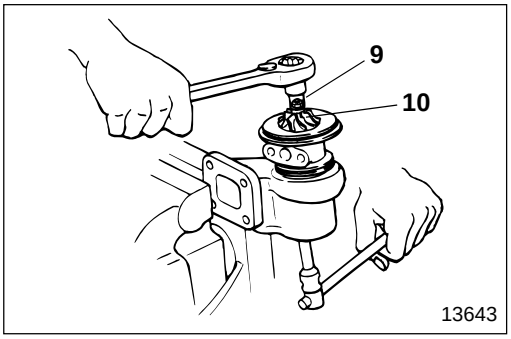
[Removal]

- Install wheel and bearing housing assembly **8** in turbine housing **4**.

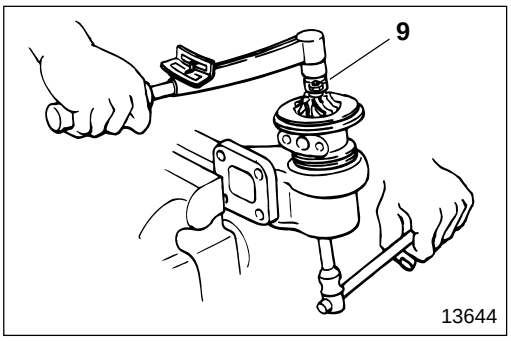
CAUTION

Avoid hitting shaft and turbine wheel 21 near turbine housing 4, since the blade of the shaft and turbine wheel can be easily bent.

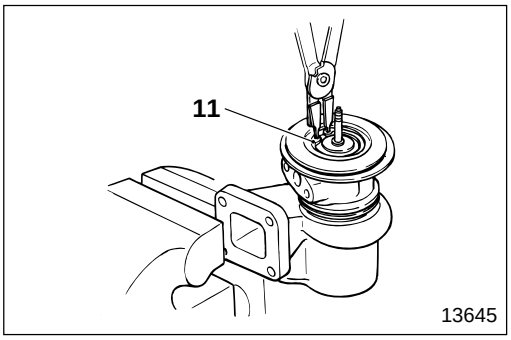
https://truckmanualshub.com/



- Remove lock nut **9** while holding the boss of shaft and turbine wheel **21**.



[Installation]
Tighten lock nut **9** at specified torque while holding the boss of shaft and turbine wheel **21**.

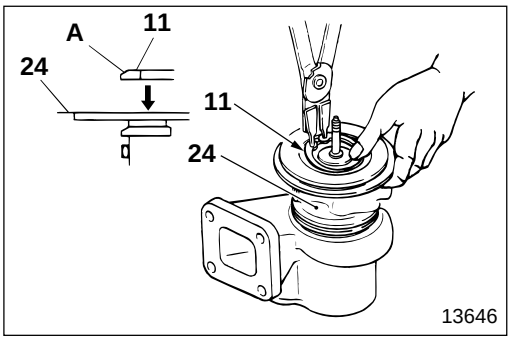


11 **Snap ring**

[Removal]

WARNING

When removing snap ring 11, hold it with your hand to prevent it from springing out.

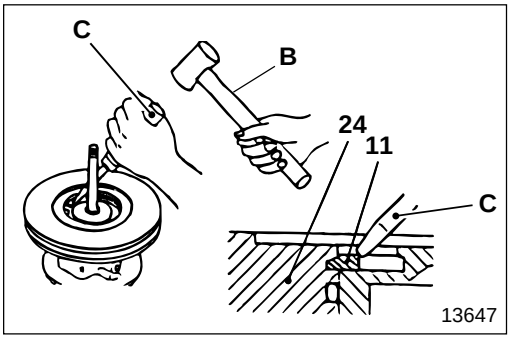


[Installation]

- Install snap ring **11** onto bearing housing **24** in the direction as illustrated.
  A : Tapered surface

WARNING

When installing snap ring 11, hold it with your hand to prevent it from springing out.

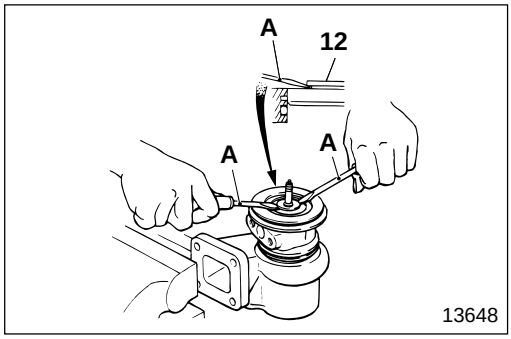


- Install so that snap ring **11** fits into the groove of bearing housing **24** fully.
  B : Mallet
  C : Screwdriver

CAUTION

Make sure you do not hit bearing housing 24 with screwdriver C.

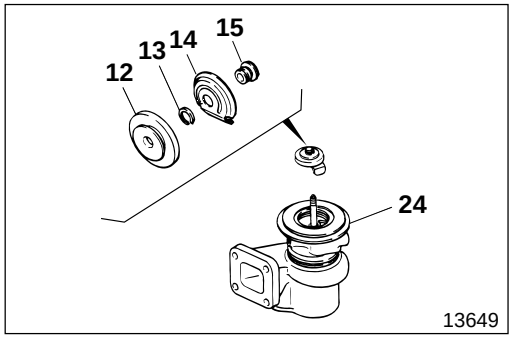
https://truckmanualshub.com/



12 **Insert**

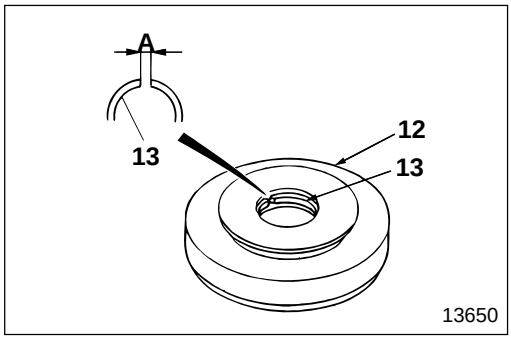
[Removal]

A : Screwdriver



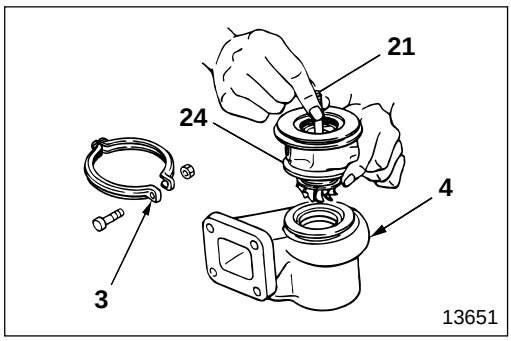
[Installation]

Install oil deflector **14** onto bearing housing **24** in the direction as illustrated.



13 **Inspection of clearance of piston ring split**

- Install new piston ring **13** in insert **12**.
- Measure clearance **A** of the split of piston ring **13**.
- If the measured value deviates from the standard value, replace inserter **12**.

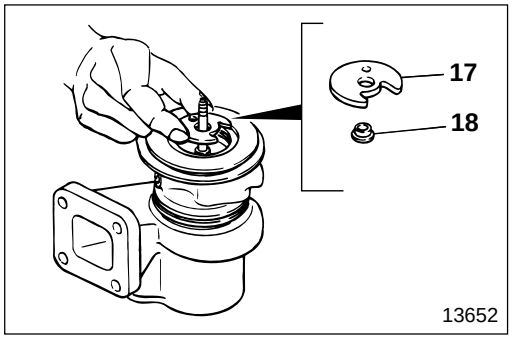


17 **18** **Installation of thrust bearing and thrust ring**

- Install parts **19** to **23** into bearing housing **24**.
- Hold shaft and turbine wheel **21** and bearing housing **24** with your hand and install them in turbine housing **4**.
- Fix temporarily using coupling assembly **3**.

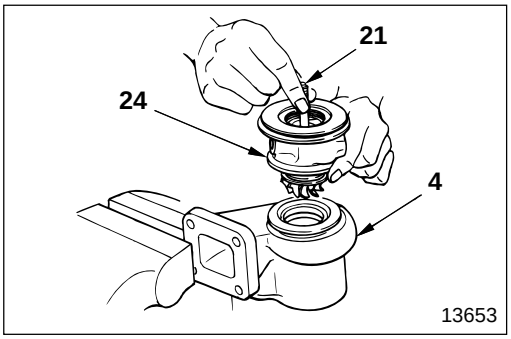
CAUTION

- **Avoid hitting shaft and turbine wheel 21 near turbine housing 4, since the blade of the shaft and turbine wheel can be easily bent.**
- **Do not drop shaft and turbine housing 21.**



- Install thrust bearing **17** and thrust ring **18** so that the thrust bearing faces the direction as illustrated.

https://truckmanualshub.com/

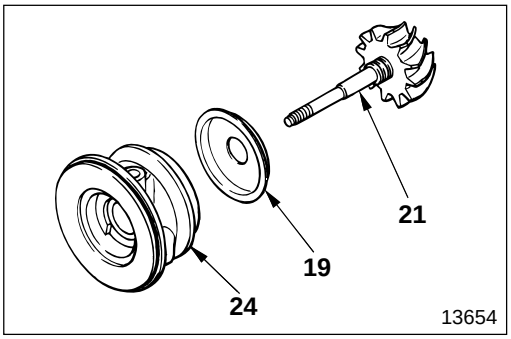


19 Removal of turbine backplate

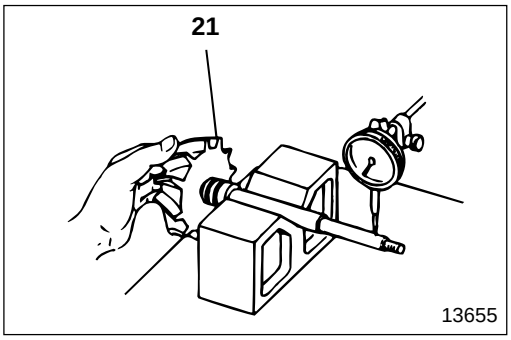
- Hold shaft and turbine wheel **21** and bearing housing **24** with your hand and remove them from turbine housing **4**.

CAUTION

- **Avoid hitting shaft and turbine wheel 21 near turbine housing 4, since the blade of the shaft and turbine wheel can be easily bent.**
- **Do not drop shaft and turbine housing 21.**



- Remove turbine backplate **19**.

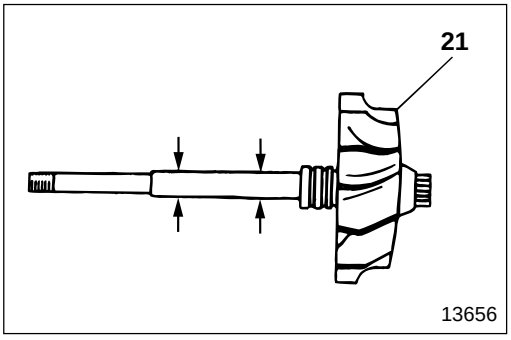


21 Shaft and turbine wheel

[Inspection]

(1) Bend of shaft

- Measure the bend at the position as illustrated.
- If the measured value is higher than the limit, replace shaft and turbine wheel **21**.



(2) Outer diameter of journal

If the measured value is lower than the limit, replace shaft and turbine wheel **21**.

(3) Smoothness of journal

If the journal is rough, correct it.

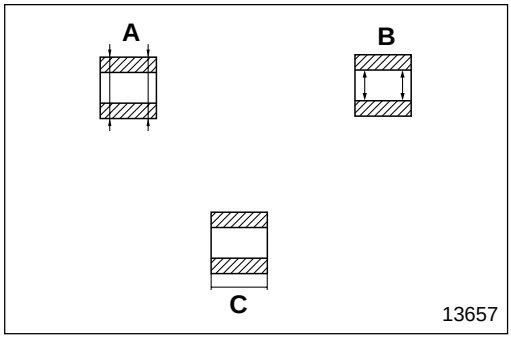
[Correction]

- Mount shaft and turbine wheel **21** between two centers on a lathe.
- Polish the journal softly with emery paper (400 grit) and engine oil.

CAUTION

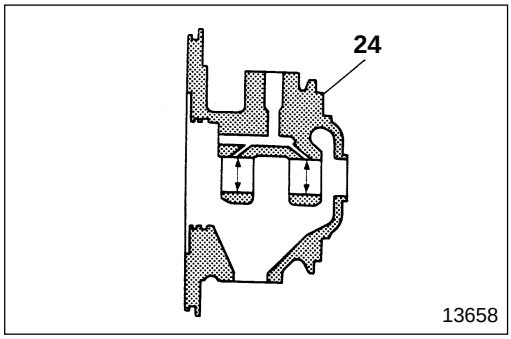
Be sure to measure the outer diameter of the journal after polishing it.

https://truckmanualshub.com/



22 **Inspection of bearing**

- Measure at three points as illustrated.
  A : Outer diameter
  B : Inner diameter
  C : Length
- If the measured value of the inner diameter is higher than the limit, or if the outer diameter or the length is lower than the limit, replace bearing **22**.



24 **Inspection of bearing housing**

- Measure the inner diameter of bearing **22** installation area.
- If the measured value is higher than the limit, replace bearing housing **24**.

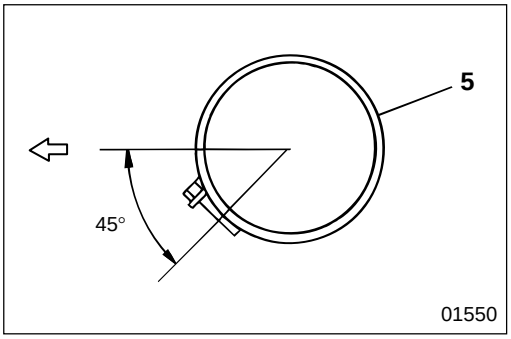
Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1, 3, 5	Clamp (Air inlet hose and inlet duct mounting)	4.9 to 9.8 {3.6 to 7.2, 0.5 to 1.0}	—
7	Boost air temperature sensor	14.7±2 {11±1.4, 1.5±0.2}	—

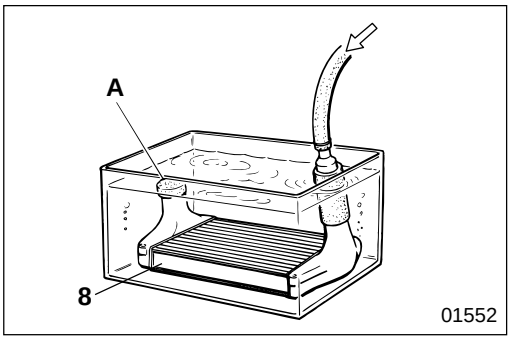
https://truckmanualshub.com/

◆ Service procedure



5 **Installation of clamp**

Install clamp **5** so that it faces the direction as illustrated when viewed from the front of the engine.



8 **Inspection of intercooler**

- Fit plug **A** on one of the air inlets of intercooler **8** and connect a hose to the other, then lower the intercooler into the water tank. Apply air at the specified pressure (195 kPa {28 lbf/in^2, 2.0 kgf/cm^2}) from the hose side and check for air leaks.
- If air leaks, replace intercooler **8**.

SPECIFICATIONS/STRUCTURE AND OPERATION

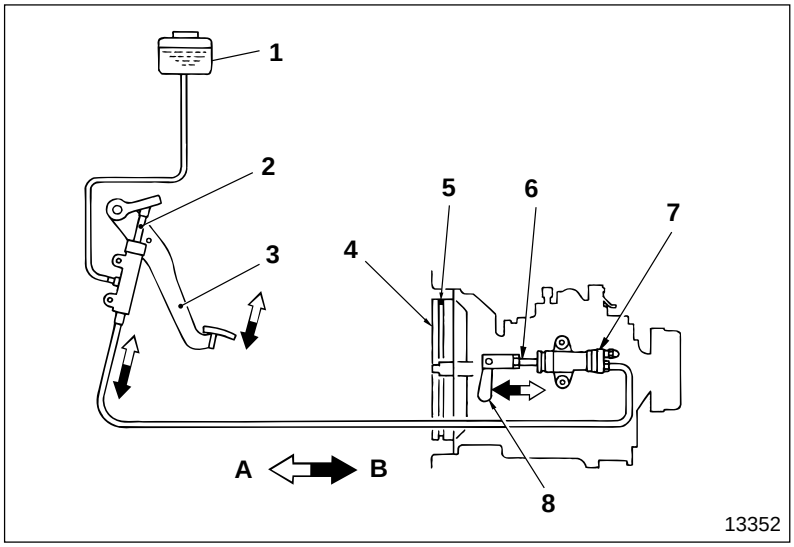
SPECIFICATIONS

Item		Specifications	
Clutch	Model	C6M35, C7M38 < M070S6 >	C7M38 < M8S2×5 >
Drive type		Strap drive	
Clutch disc	Type	Dry, single plate type	
Pressure plate	Type	Coil spring type	
Control system		Hydraulic pressure type	
Clutch master cylinder	Manufacturer	NABCO	
Clutch power cylinder	Manufacturer	NABCO	—
Clutch booster	Manufacturer	—	JIDOSHA KIKI

STRUCTURE AND OPERATION

Clutch Control

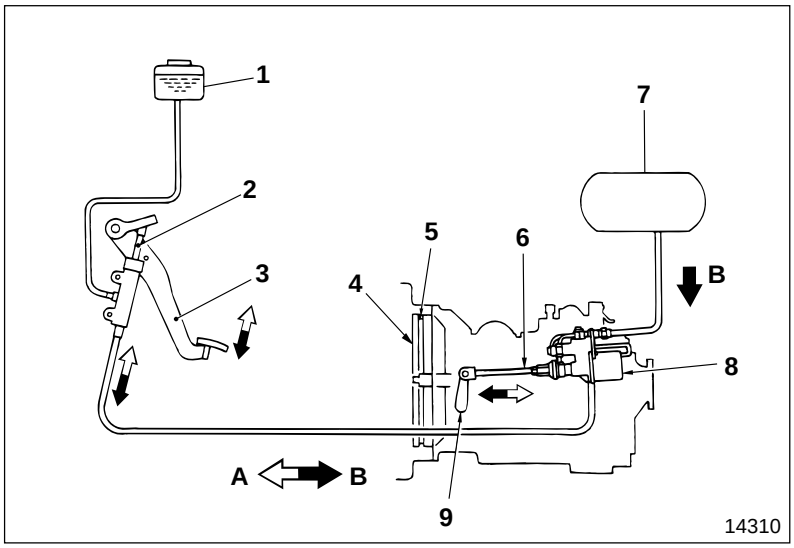
< C6M35, C7M38 (M070S6) >



1 Fluid tank
2 Clutch master cylinder
3 Clutch pedal
4 Flywheel
5 Clutch disc
6 Push rod
7 Clutch power cylinder
8 Release fork shaft

A : Power transmission
B : Cutting off power transmission

< C7M38 (M8S2×5) >

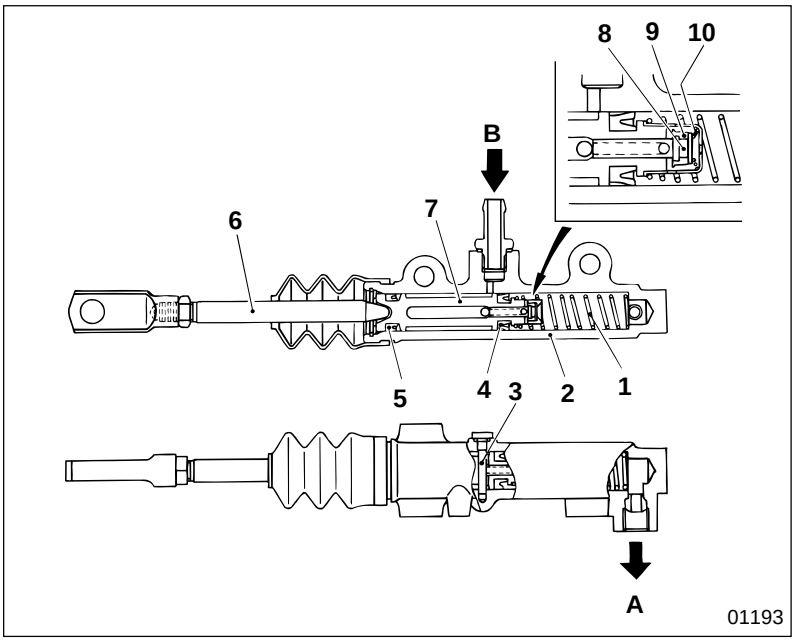


1 Fluid tank
2 Clutch master cylinder
3 Clutch pedal
4 Flywheel
5 Clutch disc
6 Push rod
7 Air tank
8 Clutch booster
9 Release fork shaft

A : Power transmission
B : Cutting off power transmission

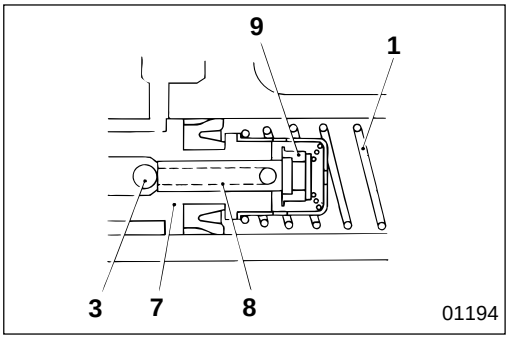
https://truckmanualshub.com/

Clutch Master Cylinder



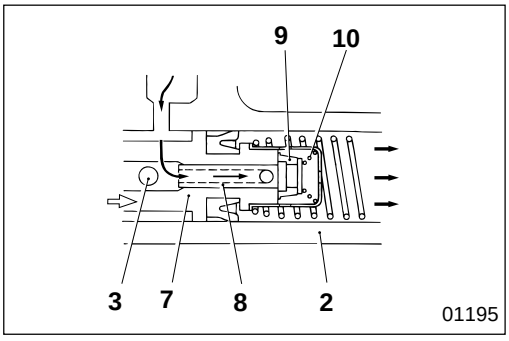
1 Return spring
2 Cylinder
3 Supply valve stopper
4 Primary cup
5 Secondary cup
6 Push rod
7 Piston
8 Supply valve rod
9 Supply valve
10 Supply valve spring

A : To clutch power cylinder
B : From fluid tank



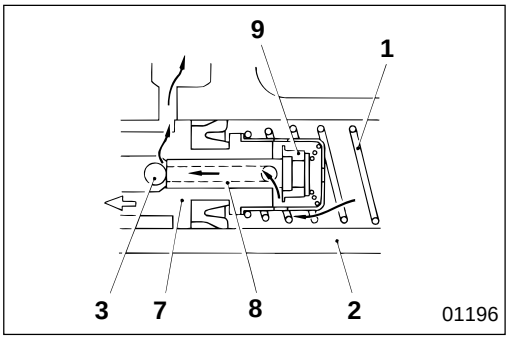
Before clutch pedal is depressed

- As piston **7** is pressed in the direction of push rod **6** by return spring **1**, supply valve rod **8** rests at supply valve stopper **3**, and supply valve **9** remains open.
- This opens the passage between the fluid tank and the clutch.



When clutch pedal is depressed

- As push rod **6** pushes piston **7**, supply valve rod **8** separates from supply valve stopper **3**. At the same time, supply valve spring **10** closes supply valve **9**.
- As piston **7** is pressed further, hydraulic pressure is generated inside cylinder **2** to actuate the clutch power cylinder.
- Fluid is supplied in proportion to the amount of movement of piston **7**.

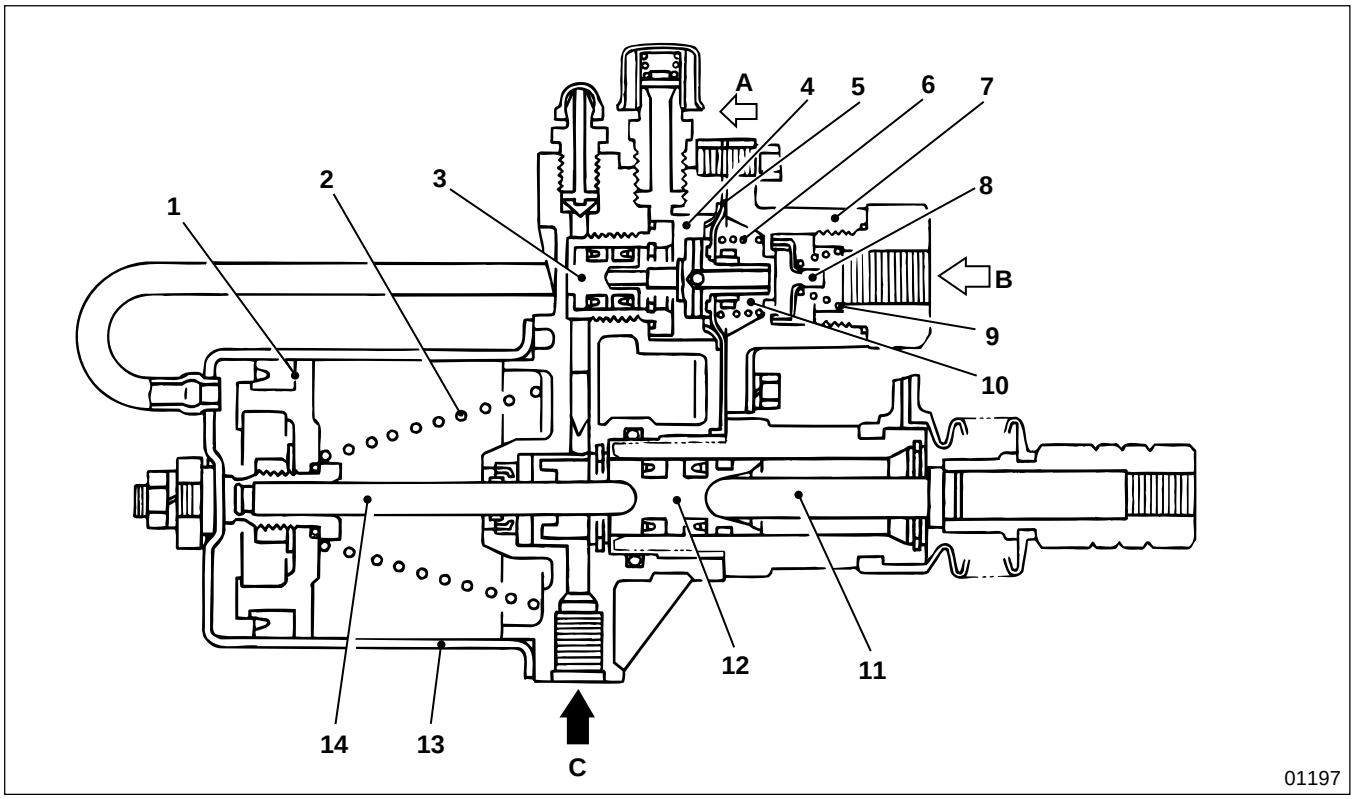


When clutch pedal is released

- The combined repercussive forces of the hydraulic pressure inside cylinder **2** and return spring **1** push piston **7** back, causing supply valve rod **8** to hit supply valve stopper **3**, opening supply valve **9**.
- Fluid from the clutch power cylinder returns to the fluid tank, and hydraulic pressure ceases to exist.

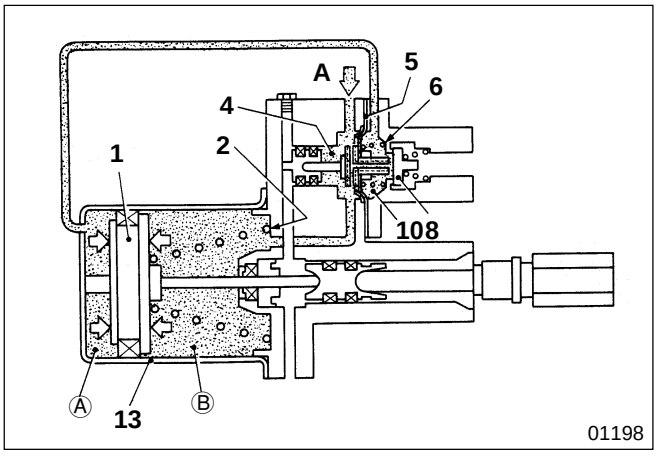
https://truckmanualshub.com/

Clutch Booster < C7M38 (M8S2×5) >



1 Power piston
2 Spring
3 Relay valve piston
4 Air chamber
5 Diaphragm
6 Spring
7 Valve body
8 Poppet valve
9 Spring
10 Control chamber
11 Rod
12 Hydraulic piston
13 Cylinder shell
14 Push rod

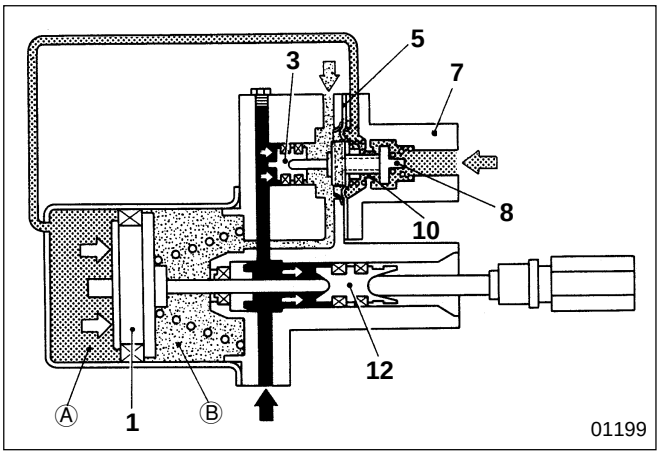
A : Atmospheric pressure
B : Air pressure from air tank
C : Hydraulic pressure from clutch master cylinder



When clutch booster is not operated

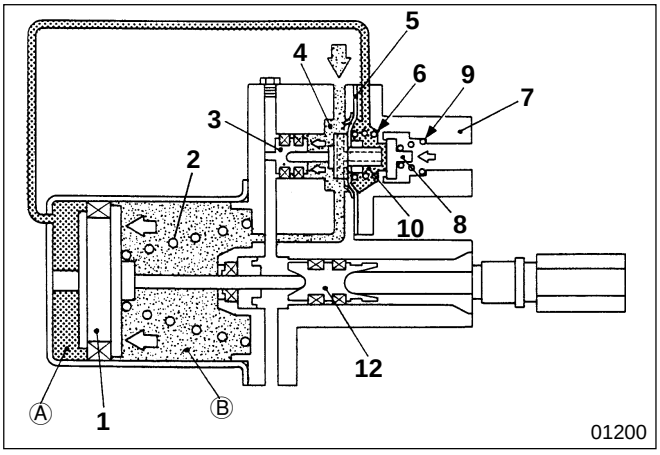
- Both air chamber **4** and control chamber **10** are under atmospheric pressure **A**.
- Spring **6** pushes diaphragm **5** to the left, opening a clearance between the diaphragm and poppet valve **8**.
- This clearance connects control chamber **10** to chamber Ⓐ of cylinder shell **13**, so chamber Ⓐ is under atmospheric pressure.
- Since chamber Ⓑ of cylinder shell **13** is connected to air chamber **4**, chamber Ⓑ is under atmospheric pressure. Thus, there is no pressure difference between chambers Ⓐ and Ⓑ.
- Therefore, power piston **1** remains pushed to the left by spring **2**.

https://truckmanualshub.com/



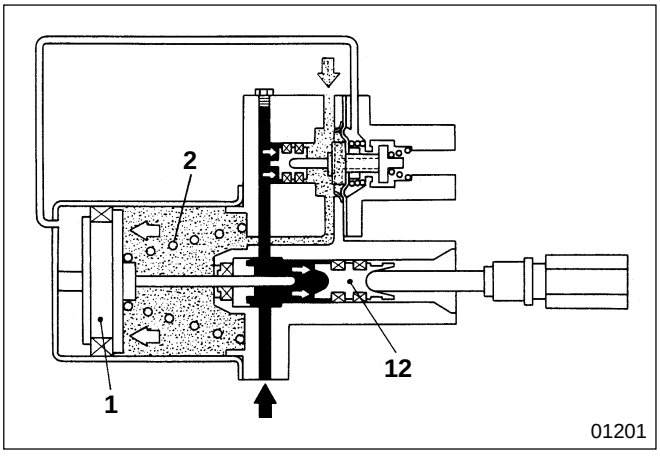
When clutch pedal is depressed

- Hydraulic pressure **C** acts on hydraulic piston **12** and relay valve piston **3**.
- Relay valve piston **3** pushes diaphragm **5** to the right and the diaphragm sticks to poppet valve **8**, closing the clearance.
- This blocks the atmospheric pressure passage between control chamber **10** and chamber Ⓐ.
- Diaphragm **5** pushes poppet valve **8** further, opening a clearance between the poppet valve and valve body **7**.
- Air pressure **B** flows into chamber Ⓐ through this clearance, creating a pressure difference between chambers Ⓐ and Ⓑ.
- This pressure difference acts on power piston **1** to push it to the right where it combines with the hydraulic pressure acting on hydraulic piston **12**, cutting off the clutch at low depression force.



When clutch pedal is released

- The hydraulic pressure acting on hydraulic piston **12** and relay valve piston **3** ceases, freeing the pistons.
- Therefore, diaphragm **5** and poppet valve **8**, being pushed by relay valve piston **3**, are returned to the left by the repercussive force of springs **6**, **9**.
- Poppet valve **8** sticks to valve body **7** to block the air pressure passage to chamber Ⓐ, opening a clearance with diaphragm **5** instead.
- This clearance connects air chamber **4** to control chambers **10** and Ⓐ, and they are all under atmospheric pressure. Since the pressure difference between chambers Ⓐ and Ⓑ is lost, power piston **1** is returned to the left by the repercussive force of spring **2**.

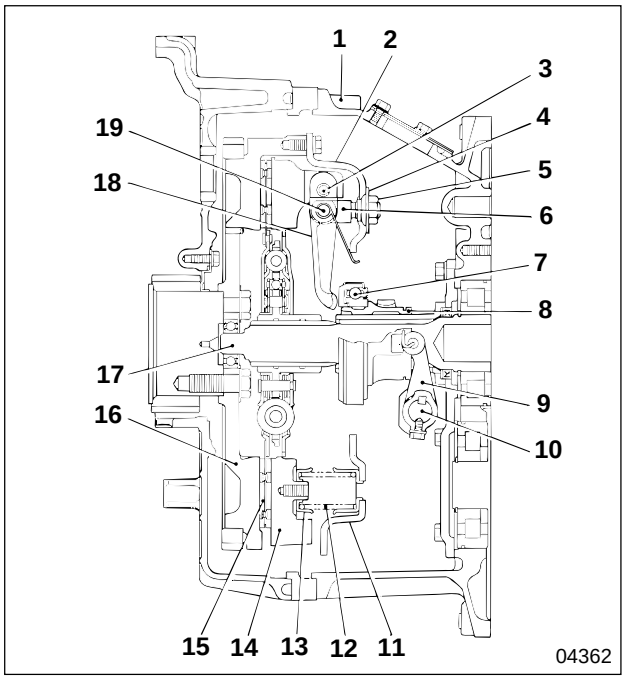


When air system is faulty

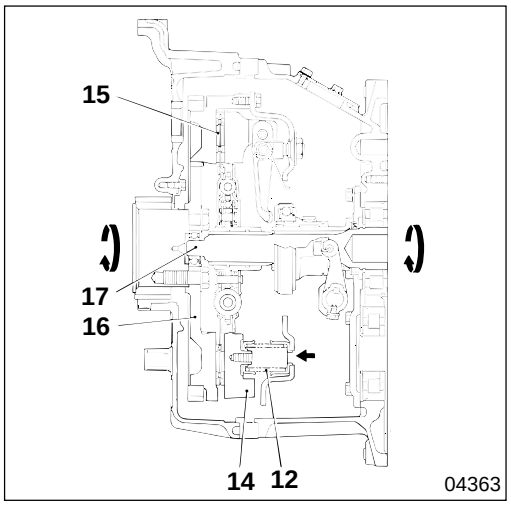
- If the air pressure fed by the air tank is lost, the air pressure in chamber Ⓐ is lost, too.
- As a result, power piston **1** is returned to the left by spring **2**.
- Therefore, the clutch is cut off solely by the hydraulic pressure applied to hydraulic piston **12**.

https://truckmanualshub.com/

Clutch

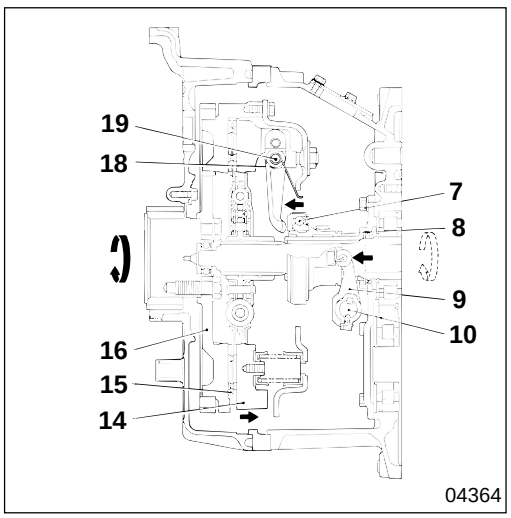


1 Clutch housing
2 Clutch cover
3 Release lever pin
4 Lock plate
5 Support nut
6 Support lever
7 Release bearing
8 Clutch shifter
9 Release fork
10 Release fork shaft
11 Pressure spring cap
12 Pressure spring
13 Pressure spring cap
14 Pressure plate
15 Clutch disc
16 Flywheel
17 Drive pinion
18 Release lever
19 Support lever pin



When clutch pedal is released

- Pressure plate **14**, activated by pressure spring **12**, forces clutch disc **15** against flywheel **16**.
- Clutch disc **15** forced against flywheel **16** runs together with the flywheel and transmits power from the engine to transmission drive pinion **17**.



When clutch pedal is depressed

- Hydraulic pressure generated within the clutch master cylinder activates the clutch power cylinder < C6, C7 (M070S6) >, or clutch booster < C7 (M8S2×5) >. Release fork shaft **10** actuates release fork **9** and pushes release bearing **7** forward together with clutch shifter **8**, pushing release lever **18**.
- Release lever **18**, with support lever pin **19** acting as the fulcrum, retracts pressure plate **14**, which opens a clearance between clutch disc **15** and flywheel **16**, cutting off power transmission from the engine.

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Clutch Fluid (Brake Fluid) Replacement and Air Bleeding < Clutch Power Cylinder >

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

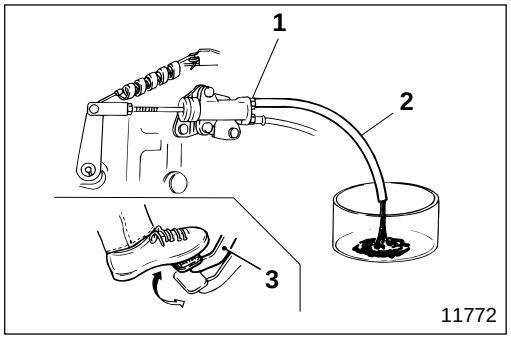
Location	Parts to be tightened	Tightening torque	Remarks
1	Air bleeder	25 to 34 {18 to 25, 2.5 to 3.5}	—

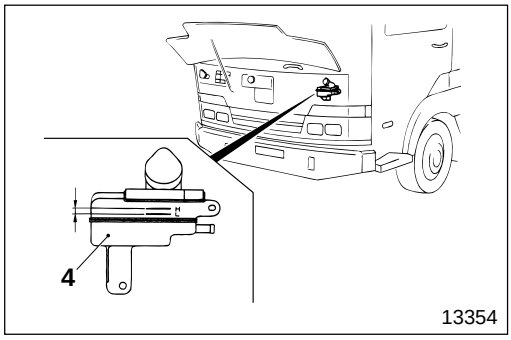
Fluid

Location	Points of application	Kinds	Quantity
4	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system to swell, resulting in faulty clutch operation.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will cause faulty clutch operation.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oils.**

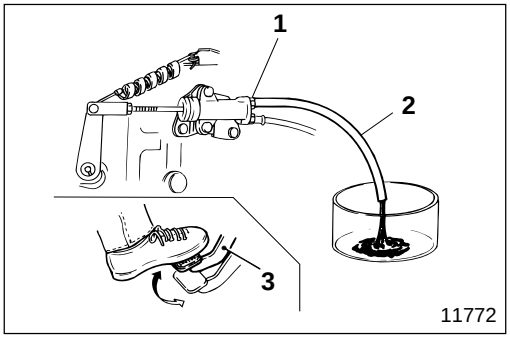


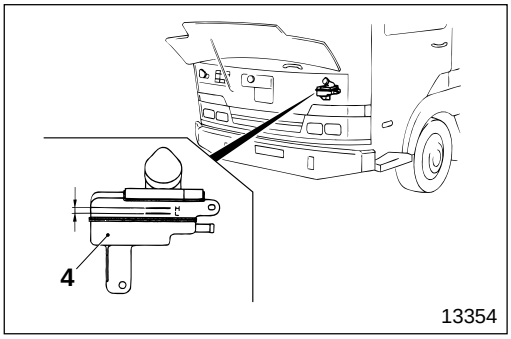


(1) Replacement of brake fluid

- Attach vinyl pipe **2** to air bleeder **1** of the clutch power cylinder.
- Loosen air bleeder **1** and depress clutch pedal **3** several times to drain brake fluid completely.
- Supply new brake fluid to the "**H**" level of fluid tank **4**. Depress clutch pedal **3** repeatedly until the old brake fluid discharged from vinyl pipe **2** is replaced by the new brake fluid.

https://truckmanualshub.com/





(2) Air bleeding of clutch system

NOTE

Carry out this operation maintaining the brake fluid level in fluid tank 4 between “H” and “L”.

- Attach vinyl pipe **2** to air bleeder **1** of the clutch power cylinder as in the replacement procedure.
- Fill fluid tank **4** with brake fluid, and loosen air bleeder **1** of the clutch power cylinder, then depress clutch pedal **3** continuously.
- Keep depressing clutch pedal **3**, and tighten air bleeder **1** when air is bled completely.
- Depress clutch pedal **3** several times again, then keep it depressed at its fullest extent.
- With clutch pedal **3** depressed, loosen air bleeder **1** to drain brake fluid containing air. Release the pedal after tightening the air bleeder.
- Repeat this operation until air is no longer present in the fluid being drained.
- When this operation is completed, tighten air bleeder **1** at specified torque.
- Check that brake fluid is at the “**H**” level of fluid tank **4**, and supply new brake fluid if necessary.
- Check for brake fluid leakage from each of the parts with clutch pedal **3** depressed.

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Clutch Fluid (Brake Fluid) Replacement and Air Bleeding < Clutch Booster >

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

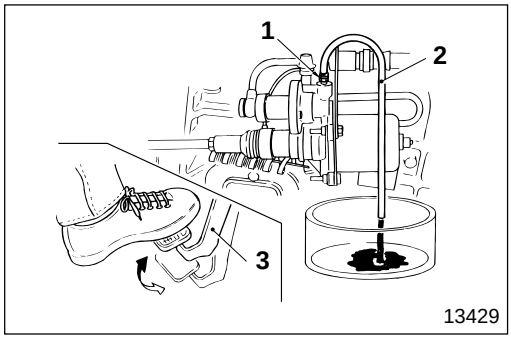
Location	Parts to be tightened	Tightening torque	Remarks
1	Air bleeder	6.9 to 13 {5.1 to 9.4, 0.7 to 1.3}	—

Fluid

Location	Points of application	Kinds	Quantity
4	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

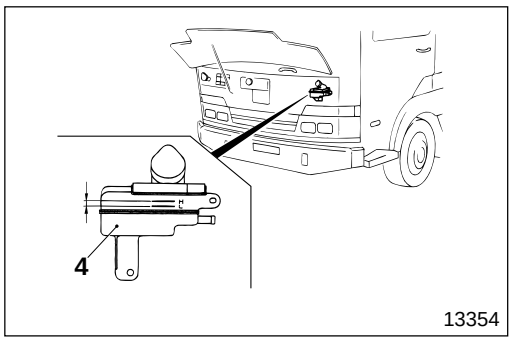
CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system to swell, resulting in faulty clutch operation.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will cause faulty clutch operation.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oils.**

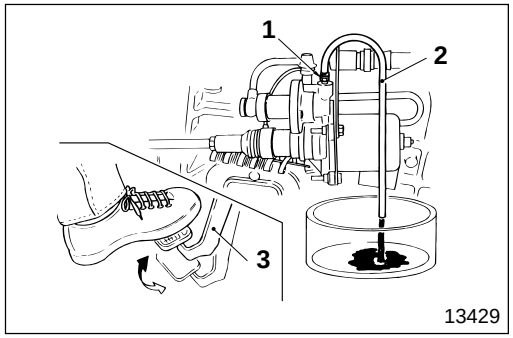


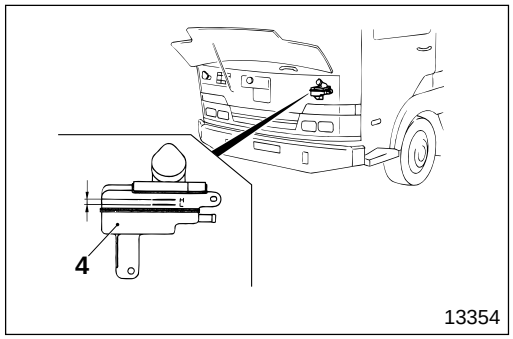
(1) Replacement of brake fluid

- Attach vinyl pipe **2** to air bleeder **1** of the clutch booster.
- Loosen air bleeder **1** and depress clutch pedal **3** several times to drain brake fluid completely.
- Supply new brake fluid to the "**H**" level of fluid tank **4**. Depress clutch pedal **3** repeatedly until the old brake fluid discharged from vinyl pipe **2** is replaced by the new brake fluid.



https://truckmanualshub.com/





(2) Air bleeding of clutch system

NOTE

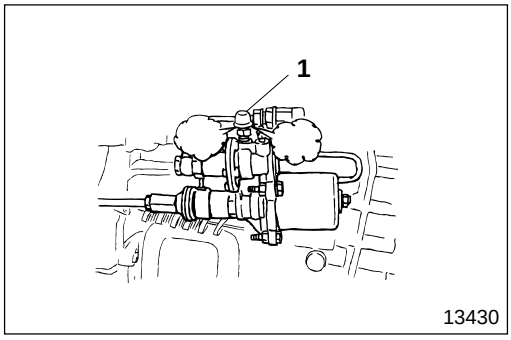
Carry out this operation maintaining the brake fluid level in fluid tank 4 between "H" and "L".

- Attach vinyl pipe **2** to air bleeder **1** of the clutch booster as in the replacement procedure.
- Fill fluid tank **4** with brake fluid, and loosen air bleeder **1** of the clutch booster, then depress clutch pedal **3** continuously.
- Keep depressing clutch pedal **3**, and tighten air bleeder **1** when air is bled completely.
- Depress clutch pedal **3** several times again, then keep it depressed at its fullest extent.
- With clutch pedal **3** depressed, loosen air bleeder **1** to drain brake fluid containing air. Release the pedal after tightening the air bleeder.
- Repeat this operation until air is no longer present in the fluid being drained.
- When this operation is completed, tighten air bleeder **1** at specified torque.
- Check that brake fluid is at the "**H**" level of fluid tank **4**, and supply new brake fluid if necessary.
- Check for brake fluid leakage from each of the parts with clutch pedal **3** depressed.

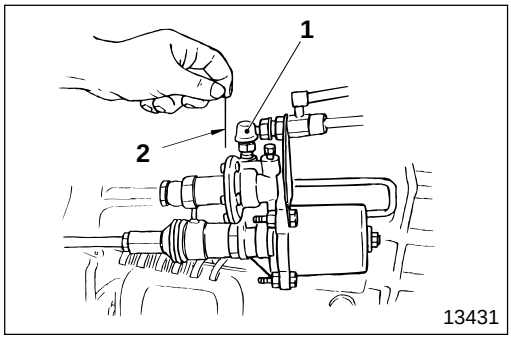
https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection of Function < Clutch Booster >



- Make sure that the depression force required to depress the clutch pedal when the air pressure is 0 kPa {0 lbf/in^2, 0 kgf/cm^2} is notably different from that when the air pressure is 590 to 785 kPa {85 to 115 lbf/in^2, 6 to 8 kgf/cm^2}.
- Make sure that air is instantly bled from exhaust cover **1** when you release the clutch pedal.



- Apply air pressure of 590 to 785 kPa {85 to 115 lbf/in^2, 6 to 8 kgf/cm^2} and hang thread **2** in front of exhaust cover **1**. Make sure that the thread is not blown upward when depressing and releasing the clutch pedal.
  If the thread is blown upward, it indicates that air is leaking from the poppet valve.

https://truckmanualshub.com/

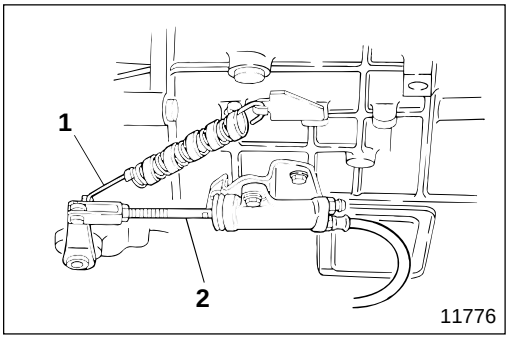
Clutch Pedal Free Play < Clutch Power Cylinder >

Service standards

Unit : mm {in.}

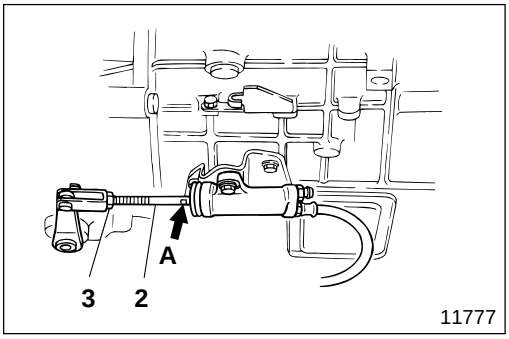
Location	Maintenance item	Standard value	Limit	Remedy
2	Push rod stroke	3.8 {0.15}	—	Adjust or replace
4	Clutch pedal free play	32 to 44 {1.25 to 1.73}	—	Adjust or replace

Inspect and adjust the free play of the clutch pedal, by noting the stroke of the clutch power cylinder push rod, after the clutch pedal has been correctly adjusted.



[Inspection]

- Bleed air from the clutch system. P21-9
- Adjust the clutch pedal. P21-18
- Remove return spring **1** and measure the free travel of push rod **2** by moving it with your hand. If the measured value deviates from the standard value, adjust as follows:

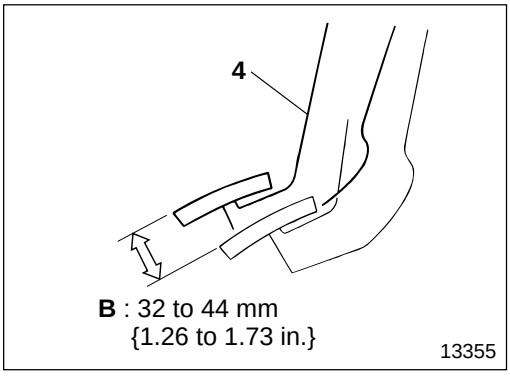


[Adjustment]

- Loosen nut **3** and turn head **A** of push rod **2** to extend the push rod until it stops.
- Then, slacken off head **A** of push rod **2** by the following value and retighten nut **3**.

  Amount of slackening off: Approximately three turns

- If push rod **2** does not return by the above amount, replace the clutch disc because it is worn beyond the limit.



[Confirmation]

Push clutch pedal **4** with your hand until you feel a resistance and measure free play **B**.

If the measured value deviates from the standard value, readjust or replace the clutch disc.

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

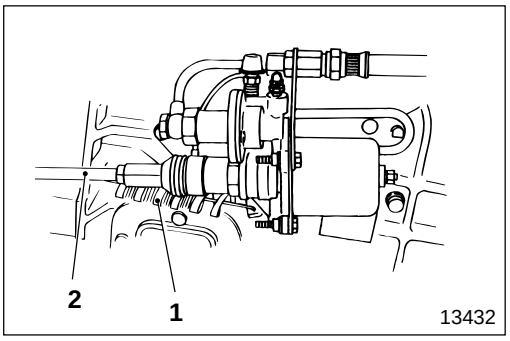
Clutch Pedal Free Play < Clutch Booster >

Service standards

Unit : mm {in.}

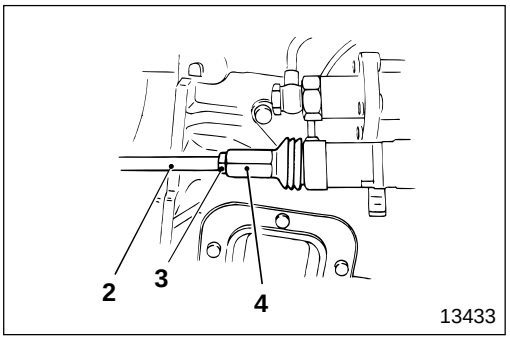
Location	Maintenance item	Standard value	Limit	Remedy
2	Push rod stroke	3.2 {0.13}	—	Adjust or replace
5	Clutch pedal free play	25 to 37 {0.98 to 1.46}	—	Adjust or replace

Inspect and adjust the free play of the clutch pedal, by noting the stroke of the clutch booster push rod, after the clutch pedal has been correctly adjusted.



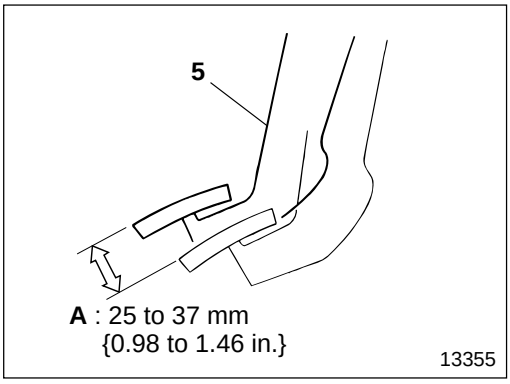
[Inspection]

- Bleed air from the clutch system. P21-11
- Adjust the clutch pedal. P21-22
- Remove return spring **1** and measure the free travel of push rod **2** by moving it with your hand. If the measured value deviates from the standard value, adjust as follows:



[Adjustment]

- Loosen nut **3** and turn head **4** of push rod **2** to extend the push rod until it stops.
- Then, slacken off head **4** of push rod **2** by the following value and retighten nut **3**.
  Amount of slackening off: Approximately two and three-fifth turns
- If push rod **2** does not return by the above amount, replace the clutch disc because it is worn beyond the limit.



[Confirmation]

Push clutch pedal **5** with your hand until you feel a resistance and measure free play **A**.
If the measured value deviates from the standard value, readjust or replace the clutch disc.

Lubricant

Location	Points of application	Kinds	Quantity
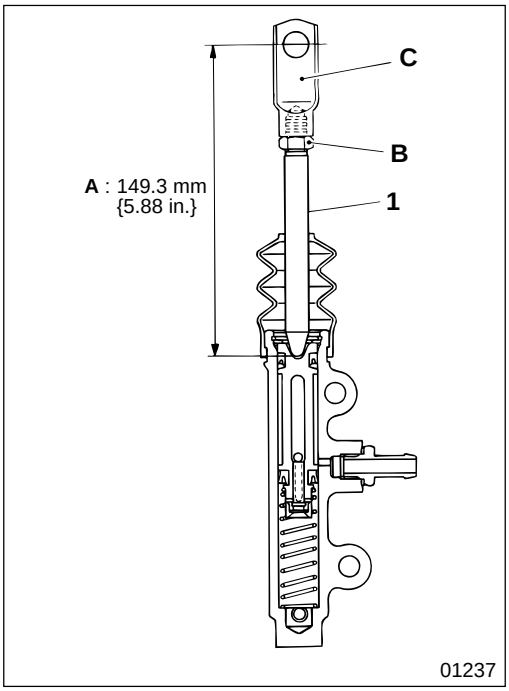
6, 9	Friction surfaces between piston assembly and cylinder	Rubber grease	As required

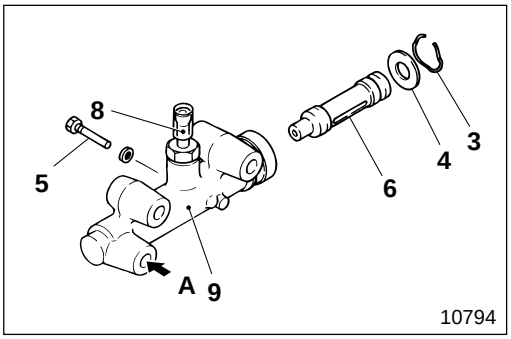
https://truckmanualshub.com/

◆ Service procedure



1 Adjustment of push rod length

If illustrated dimension **A** does not conform to the standard value, loosen lock nut **B** of push rod **1** and turn head **C** to adjust.
After adjustment, tighten lock nut at specified torque.



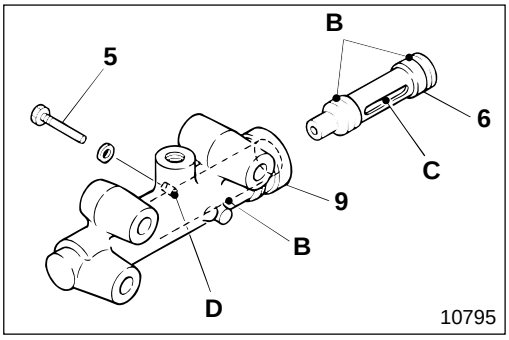
6 Piston assembly

[Removal]

- Remove piston stop ring **3**, piston stop plate **4** and supply valve stopper **5**.
- Block nipple **8** of cylinder **9**, and apply compressed air from **A** as illustrated to remove piston assembly **6**.

WARNING⚠

You must apply compressed air gradually when you remove piston assembly 6. If you applied compressed air strongly at one time, the piston assembly would be violently ejected.



[Installation]

- Apply grease to friction surfaces **B** of piston assembly **6** and cylinder **9**.
- Fit piston by aligning piston assembly **6** groove **C** to cylinder **9** hole **D**, then insert valve stopper **5** to hold the piston in place.

◆ Service procedure

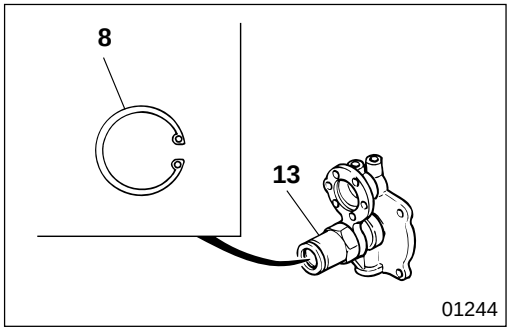
● Work before disassembly

- Put alignment marks on the connecting areas of all parts before disassembly.
- Mount the flange of end plate assembly **5** of the clutch booster on stand plate and place the clutch booster in a vise.

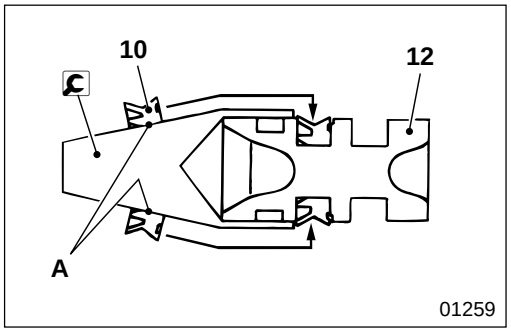
https://truckmanualshub.com/

CLUTCH BOOSTER < C7 (M8S2×5) >



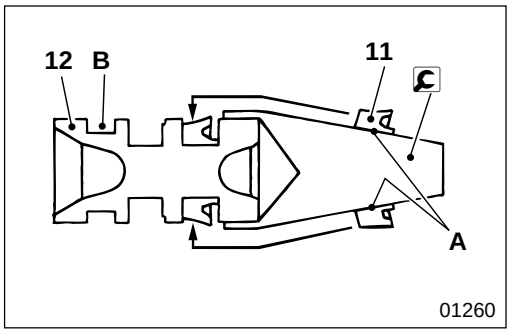
8 **Installation of retaining ring**

Install retaining ring **8** on hydraulic cylinder **13** in the direction as illustrated, so that opening area **A** of the retaining ring is horizontal.



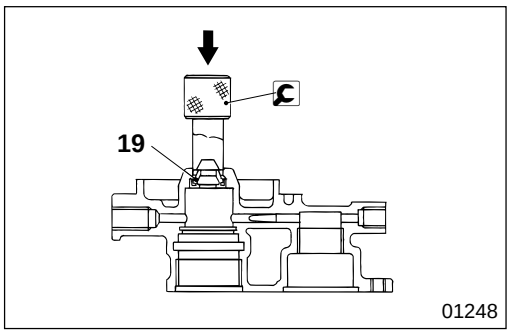
10 **Installation of cup packing**

Apply grease to inner periphery **A** of cup packing **10** and install the cup packing on hydraulic piston **12** in the direction as illustrated.



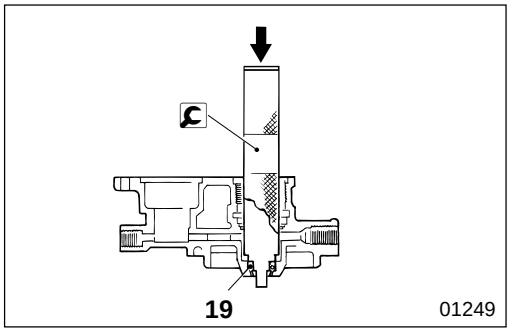
11 **12** **Installation of cup packing and grease packing of hydraulic piston**

- Apply grease to inner periphery **A** of cup packing **11** and install the cup packing on hydraulic piston **12** in the direction as illustrated.
- Pack grease into grease groove **B** of hydraulic piston **12**.



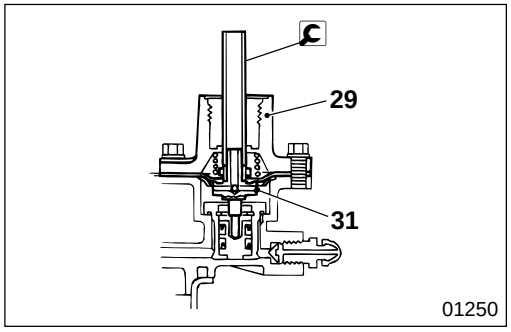
19 **Oil seal**

[Removal]



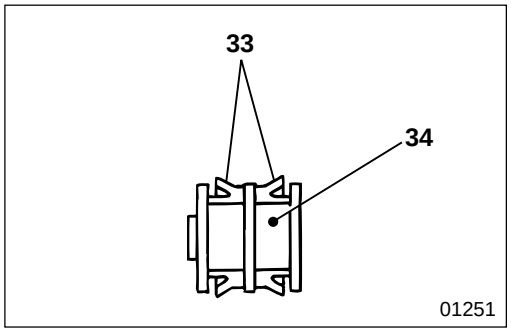
[Installation]

https://truckmanualshub.com/



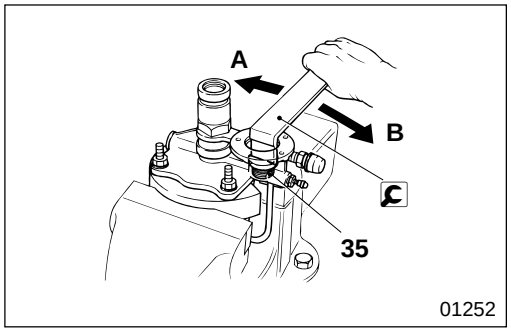
29 **Installation of upper valve body**

After centering diaphragm assembly **31** using push guide, install upper valve body **29**.



33 **Installation of cup packing**

Install cup packing **33** on relay valve piston **34** in the direction as illustrated.

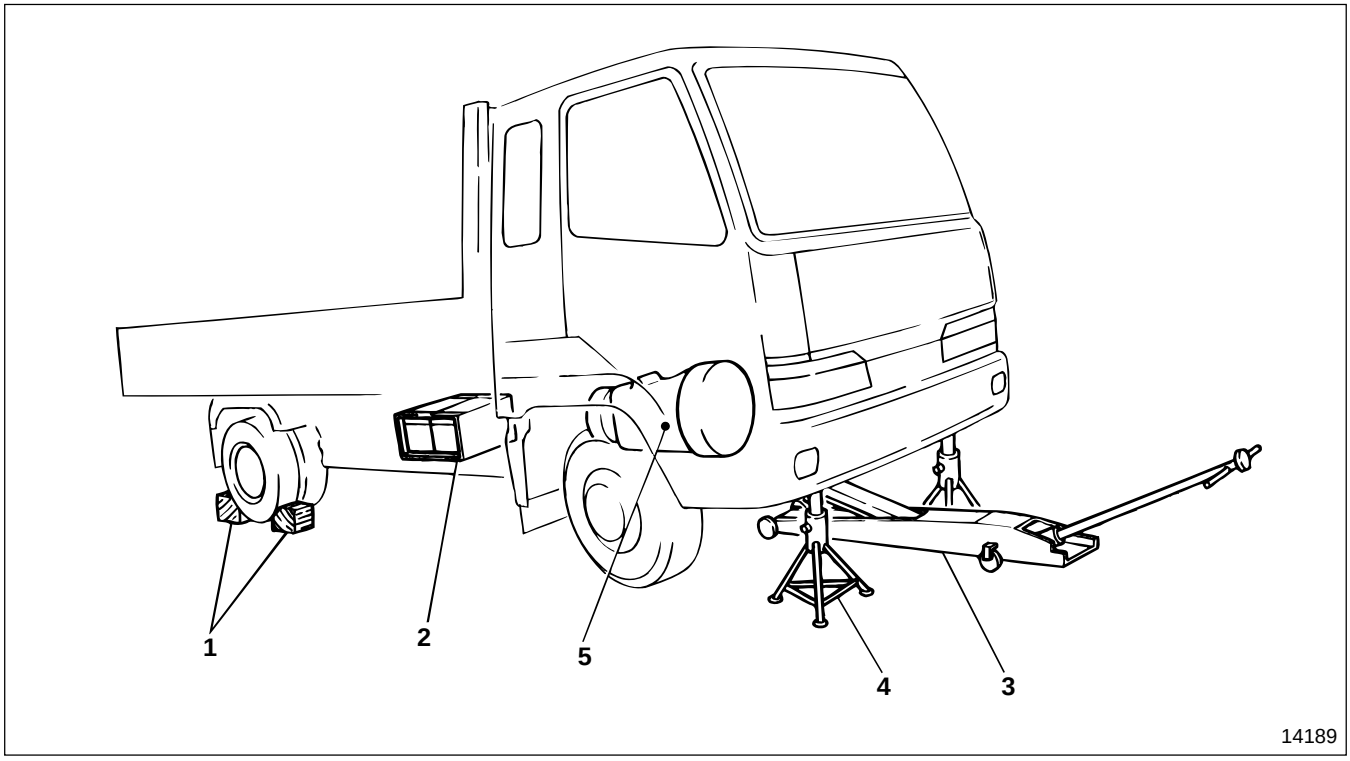


35 **Removal and installation of fitting**

A : Removal
B : Installation

https://truckmanualshub.com/

WORK BEFORE REMOVAL AND INSTALLATION OF CLUTCH BODY



● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect the negative battery cable. Gr 54
3 Jack up the front axle using a garage jack.
4 Support the front frame on rigid racks.
5 Remove the transmission. Gr 22A, B

WARNING⚠

- **Since the parking brake (center parking) will be removed, naturally it cannot be used. Therefore, you must chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION⚠

Keep the transmission in neutral throughout the operation.

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

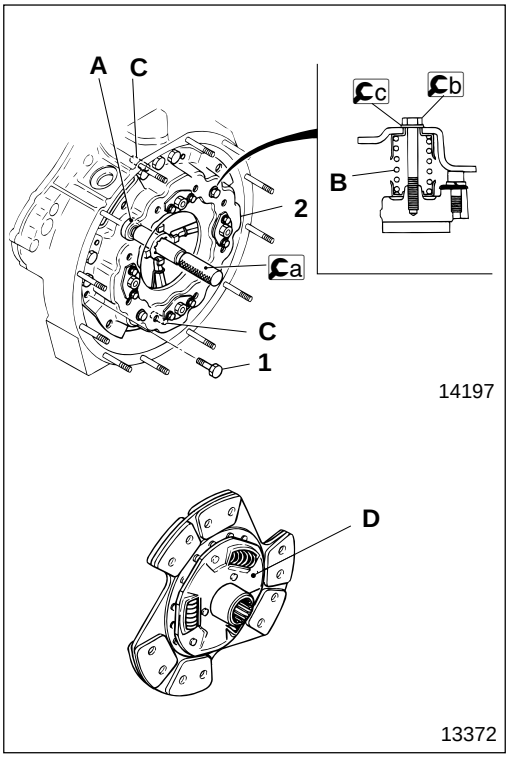
Location	Tool name and shape	Part No.	Application
2	Stopper bolt Washer 	43402-09200 < Stopper bolt > MH005024 < Washer >	Removal and installation of pressure plate and lever assembly
2, 3	Clutch alignment arbor 	MH061987	Holds clutch disc

◆ Service procedure

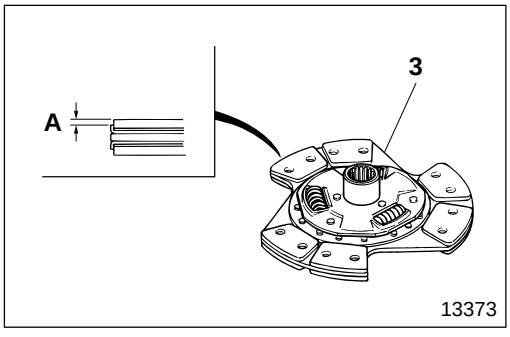


2 Removal and installation of pressure plate and lever assembly

- Insert [a] clutch alignment arbor in flywheel pilot bearing **A** to hold clutch disc **3**.
- Compress springs **B** using [b] stopper bolt and [c] washer, then remove bolt **1**.
- For installation, follow the removal sequence in reverse.
- Install clutch disc **3** so that part No. **D** is visible.
- Tighten bolts **1** gradually, in diagonal order, to specified torque.

CAUTION

- **Beware, if you do not use [b] stopper bolts and [c] washers (four points) to remove bolt 1, the force of springs B might push out pressure plate and lever assembly 2, damaging the strap plate. It might even come apart from knock pin C and drop off.**
- **Remember to remove stopper bolts and washers after installation (four points). If the stopper bolts and washers are left on, the clutch will not engage.**

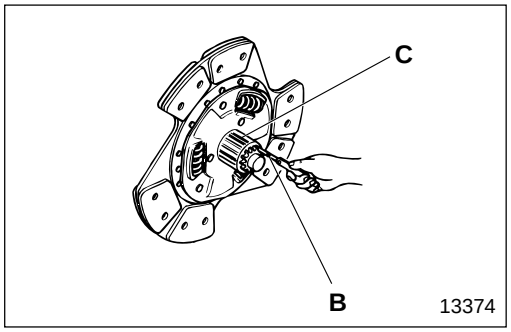


3 Clutch disc

(1) Height of facing

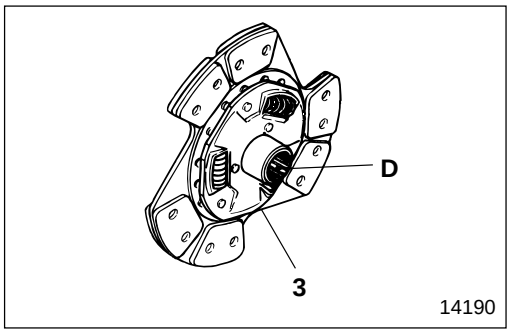
Measure dimension **A** as illustrated.
If the measured value does not conform to the standard value, replace clutch disc **3**.

https://truckmanualshub.com/



(2) Play in direction of revolution

- Reshape feeler gauge **B** for insertion into drive pinion spline **C**, and measure play.
- If the measured value is higher than the limit, replace clutch disc **3** or the drive pinion.
- Carry out the same measurement on new clutch disc **3**. If the measured value is higher than the limit, replace the drive pinion.



(3) Applying grease

Apply grease evenly to spline **D** and the entire tooth surface of clutch disc **3**. Apply grease to the grease groove of the spline up to its large diameter.

CAUTION

Be careful not to apply too much grease because excessive grease causes grease leakage from spline D and makes the clutch slippery.

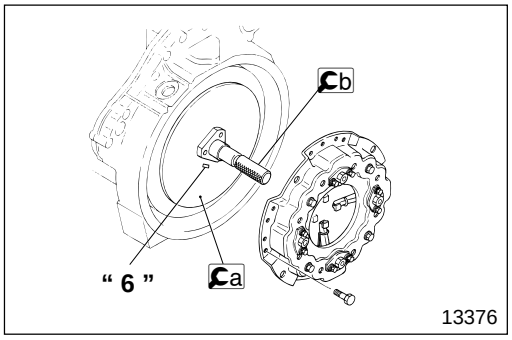
16	Clutch master plate 	MH062292	Adjustment of release lever heights
	Clutch alignment arbor 	MH061987	

◆ Service procedure



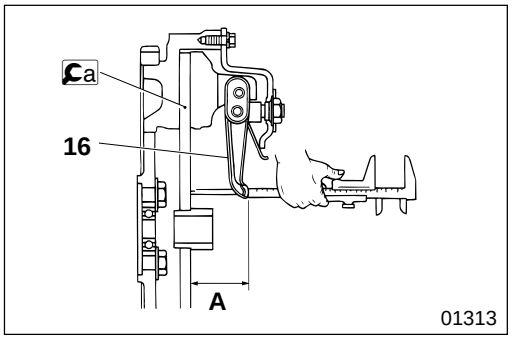
● Work before disassembly

Put alignment marks on all parts before disassembly.

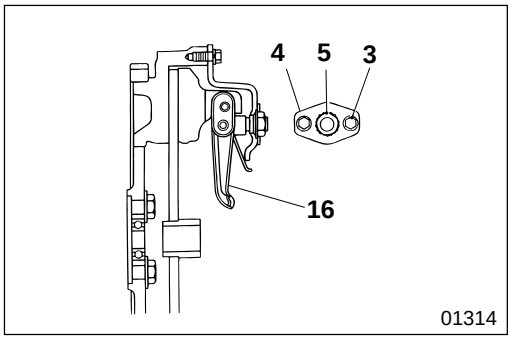
● Inspection and adjustment after assembling

(1) Measurement of release lever height

- Install the pressure plate and lever assembly using Ca clutch master plate and Cb clutch alignment arbor instead of clutch disc.
- Install Ca clutch master plate so that identification mark "**6**" can be seen.



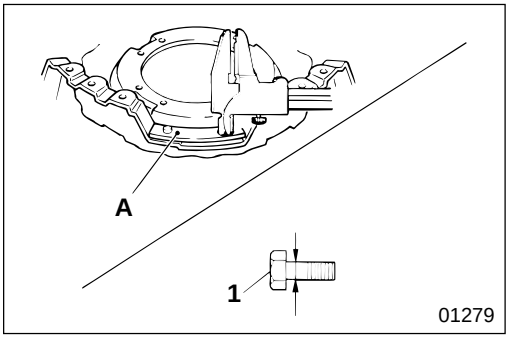
- Measure dimension **A** between Ca clutch master plate and each upper surface of release levers **16** (four points).
- If the measured values deviate from the standard value, adjust as follows. Even if the measured values are within the standard value, if the relative difference among each measured value is 0.5 mm {0.020 in.} or more, adjust the heights, too.



(2) Adjustment of release lever height

- Remove bolt **3** and lock plate **4**, and adjust the height by turning support nut **5**.
- After adjustment, install lock plate **4**, fasten support nut **5** and check the height of release lever **16**.

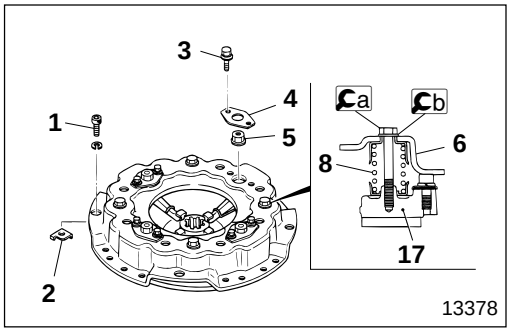
https://truckmanualshub.com/



1 **A** **Clearance between strap bolt and strap plate**

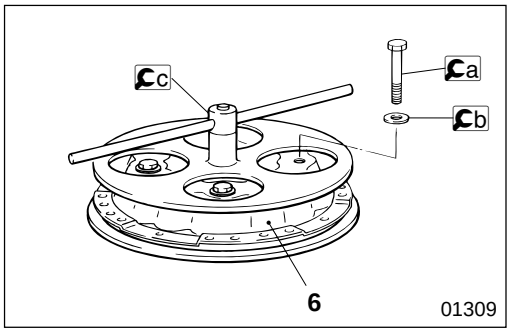
If the measured value is higher than the limit, replace the faulty parts.

A : Strap plate

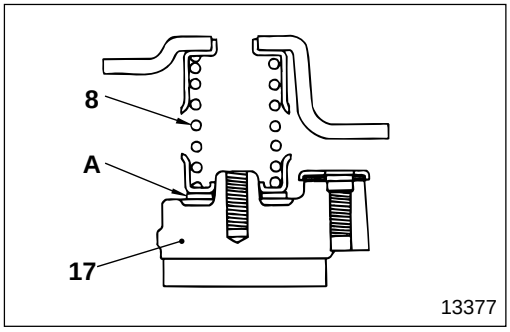


6 **Removal and installation of clutch cover**

- After fixing clutch cover **6** and pressure plate **17** using Ca stopper bolt and Cb washer, remove strap bolt **1**, washer **2**, lock bolt **3**, lock plate **4** and support nut **5**.



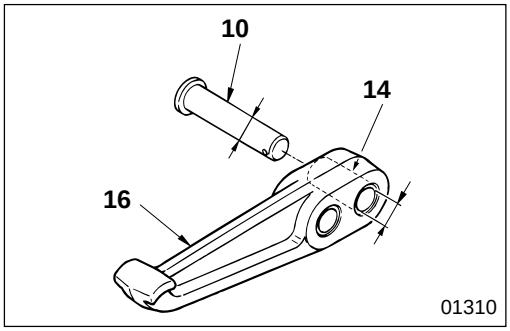
- Compress pressure spring **8** using Cc clutch installer, and remove Ca stopper bolt and Cb washer.
- Gradually loosen Cc clutch installer until pressure spring **8** is released, and remove clutch cover **6**.
- For installation, follow the removal sequence in reverse.



8 **Installation of pressure spring**

When grinding pressure plate **17** to correct it, insert adjusting washer **A**, equivalent to the amount of correction made by grinding, between the pressure plate and pressure spring **8**.

Amount of correction made by grinding	Thickness of adjusting washer
Less than 1mm {0.039 in.}	Not required
1 to 2mm {0.039 to 0.079 in.}	1.2 mm {0.047 in.}×1
2 to 3mm {0.079 to 0.12 in.}	1.2 mm {0.047 in.}×2 or, 2.3 mm {0.091 in.}×1



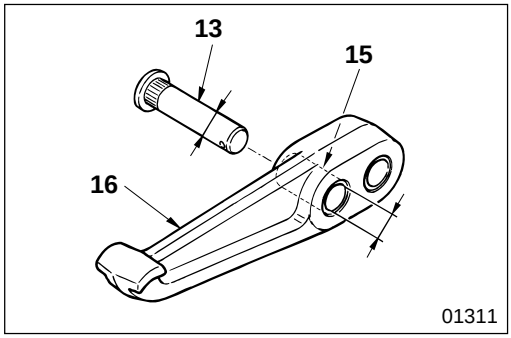
10 **14** **Clearance between support lever pin and bushing**

If the measured value is higher than the limit, replace the faulty parts.

NOTE

This inspection must be made with bushing 14 press-fitted in release lever 16.

https://truckmanualshub.com/

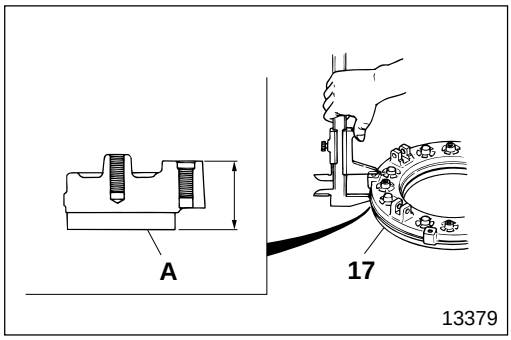


13 **15** **Clearance between release lever pin and bushing**

If the measured value is higher than the limit, replace the faulty parts.

NOTE

This inspection must be made with bushing 15 press-fitted in release lever 16.

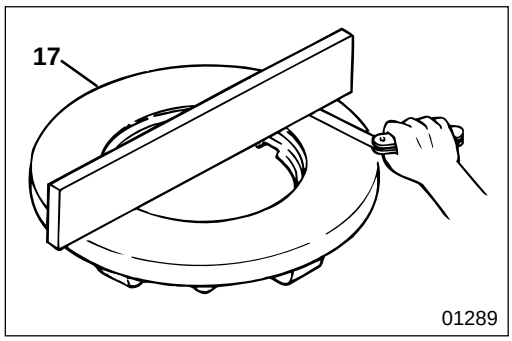


17 **Inspection of pressure plate**

(1) Thickness

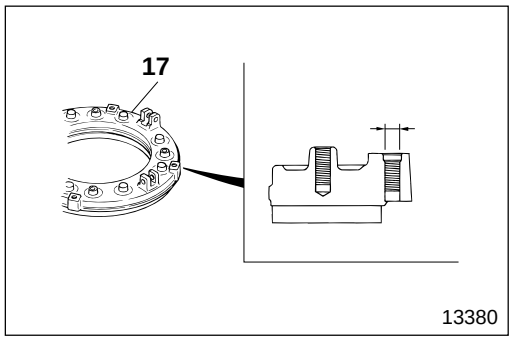
- Measure friction surface **A** of pressure plate **17** (measuring position must be within the maximum and minimum diameters), and if the measured value is lower than the limit, replace the pressure plate.

Maximum diameter	340 mm {13.4 in.}
Minimum diameter	250 mm {9.84 in.}



(2) Levelness

If the measured value is lower than the limit, replace pressure plate **17**.



(3) Inner diameter of fitting hole of strap bolt

If the measured value is higher than the limit, replace pressure plate **17**.

◆ Service procedure

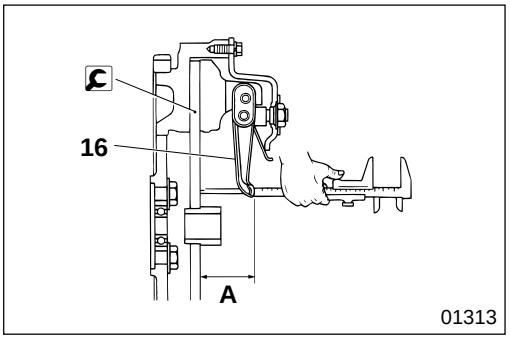
● Work before disassembly

Put alignment marks on all parts before disassembly.

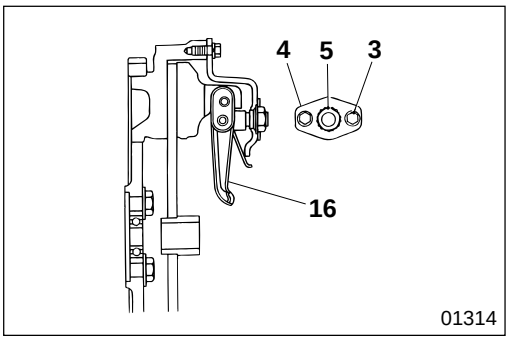
● Inspection and adjustment after assembling

(1) Measurement of release lever height

- Install the pressure plate and lever assembly using a clutch master plate and b clutch alignment arbor instead of clutch disc.
- Install a clutch master plate so that identification mark "**7**" can be seen.



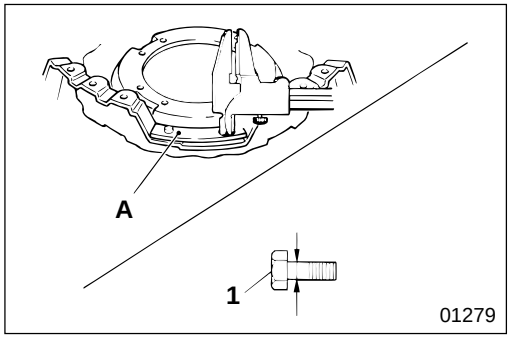
- Measure dimension **A** between clutch master plate and each upper surface of release levers **16** (four points).
- If the measured values deviate from the standard value, adjust as follows. Even if the measured values are within the standard value, if the relative difference among each measured value is 0.5 mm {0.020 in.} or more, adjust the heights, too.



(2) Adjustment of release lever height

- Remove bolt **3** and lock plate **4**, and adjust the height by turning support nut **5**.
- After adjustment, install lock plate **4**, fasten support nut **5** and check the height of release lever **16**.

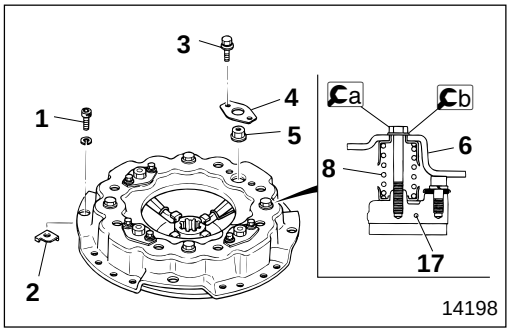
https://truckmanualshub.com/



1 **A** **Clearance between strap bolt and strap plate**

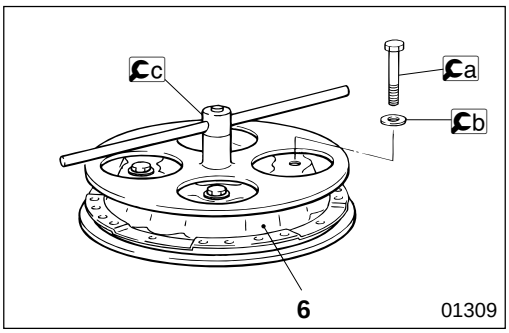
If the measured value is higher than the limit, replace the faulty parts.

A : Strap plate

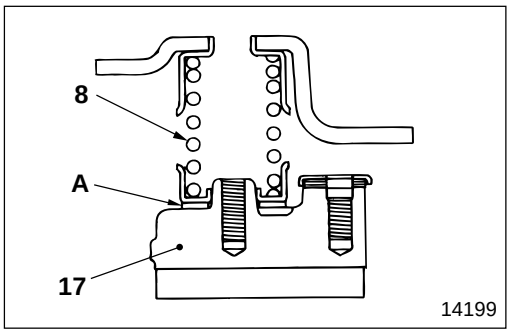


6 **Removal and installation of clutch cover**

- After fixing clutch cover **6** and pressure plate **17** using [a] stopper bolt and [b] washer, remove strap bolt **1**, washer **2**, lock bolt **3**, lock plate **4** and support nut **5**.



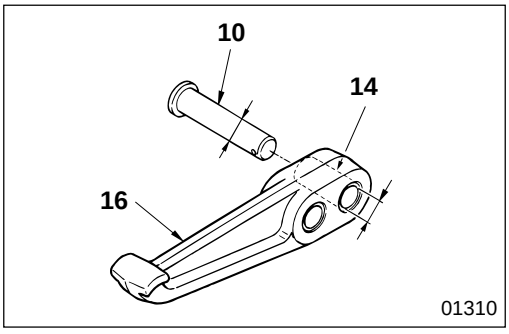
- Compress pressure spring **8** using [c] clutch installer, and remove [a] stopper bolt and [b] washer.
- Gradually loosen [c] clutch installer until pressure spring **8** is released, and remove clutch cover **6**.
- For installation, follow the removal sequence in reverse.



8 **Installation of pressure spring**

When grinding pressure plate **17** to correct it, insert adjusting washer **A**, equivalent to the amount of correction made by grinding, between the pressure plate and pressure spring **8**.

Amount of correction made by grinding	Thickness of adjusting washer
Less than 1mm {0.039 in.}	Not required
1 to 2mm {0.039 to 0.079 in.}	1.2 mm {0.047 in.}×1
2 to 3mm {0.079 to 0.12 in.}	1.2 mm {0.047 in.}×2 or, 2.3 mm {0.091 in.}×1



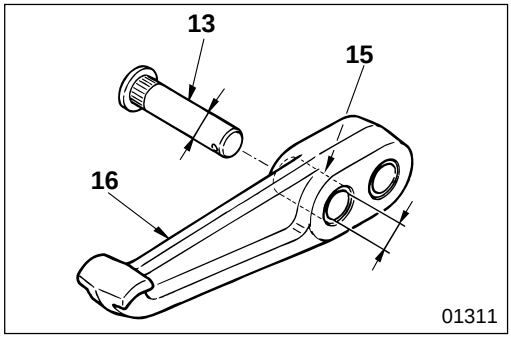
10 **14** **Clearance between support lever pin and bushing**

If the measured value is higher than the limit, replace the faulty parts.

NOTE

This inspection must be made with bushing 14 press-fitted in release lever 16.

https://truckmanualshub.com/

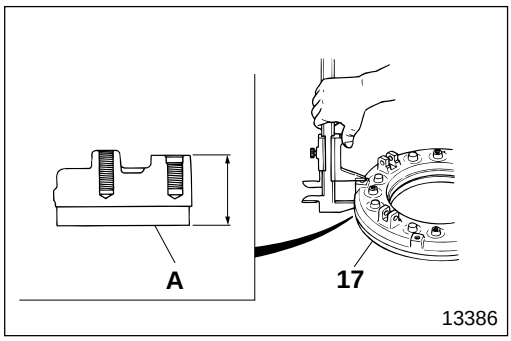


13 **15** **Clearance between release lever pin and bushing**

If the measured value is higher than the limit, replace the faulty parts.

NOTE

This inspection must be made with bushing 15 press-fitted in release lever 16.

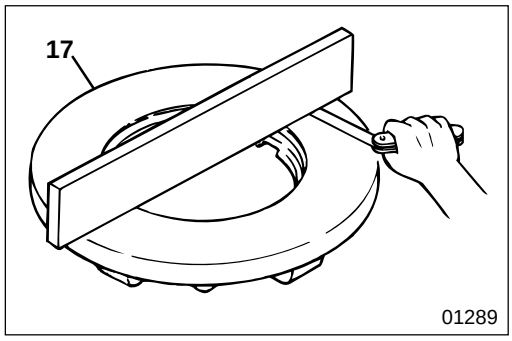


17 **Inspection of pressure plate**

(1) Thickness

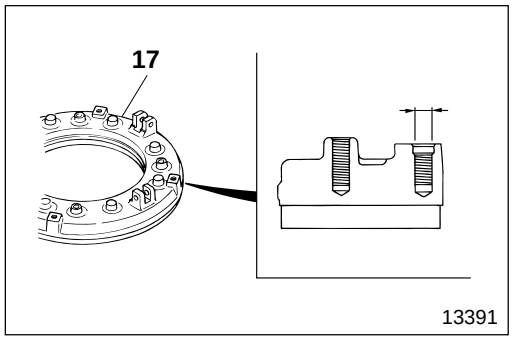
- Measure friction surface **A** of pressure plate **17** (measuring position must be within the maximum and minimum diameters), and if the measured value is lower than the limit, replace the pressure plate.

Maximum diameter	370 mm {14.6 in.}
Minimum diameter	240 mm {9.45 in.}



(2) Levelness

If the measured value is lower than the limit, replace pressure plate **17**.



(3) Inner diameter of fitting hole of strap bolt

If the measured value is higher then the limit, replace pressure plate **17**.

The transmission changes revolution and torque generated by the engine into those that match the vehicle's power requirement (driving force). Revolution and torque are increased or decreased by making a selection from several sets of engaged gears. The transmission uses an interlock mechanism to avoid double engagement.

https://truckmanualshub.com/

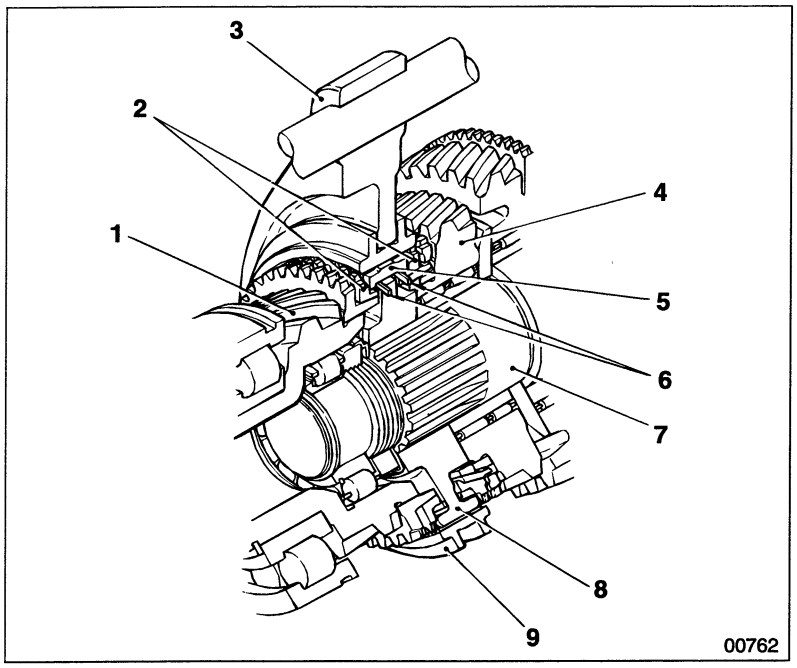
STRUCTURE AND OPERATION

Synchromesh Mechanism

This vehicle has two synchromesh mechanisms, a single cone type, and a double cone type, and uses the key system. The single or double cone type is used depending on the gear positions as shown below:

Transmission model / Synchromesh type	S5 S6 O/D	S6 D/D
Single cone type	5th, 6th	5th, 6th
Double cone type	2nd and 3rd, 4th	2nd, 3rd and 4th

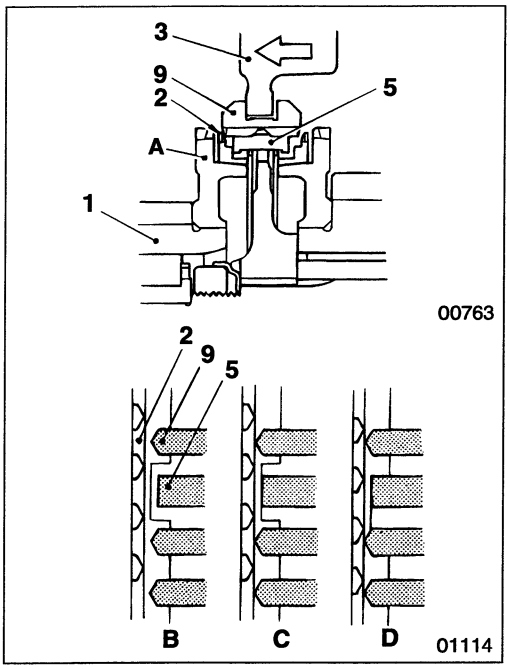
Single Cone Type



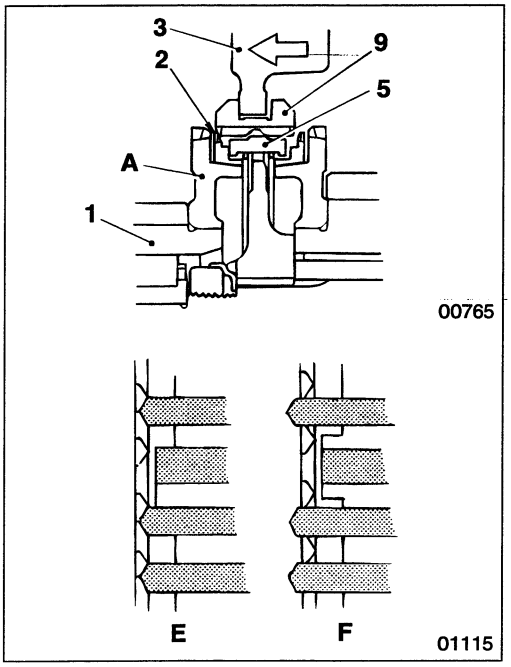
1 Drive pinion (Single cone type)
2 Synchronizer ring
3 4th and 5th shift fork
4 4th gear (Double cone type)
5 Shifting key
6 Shifting key spring
7 Mainshaft
8 Synchronizer hub
9 Synchronizer sleeve

- The following descriptions are for 4th and 5th gear < S5, S6 O/D >
  The inside of synchronizer hub **8** engages the spline of mainshaft **7** and rotates with it. The outside of the synchronizer hub has a spline that engages synchronizer sleeve **9** and three keyways.
- Shifting keys **5** are inserted into these keyways. When the gear shift is in neutral, a protrusion in the center of each shifting key engages a groove inside the synchronizer sleeve and the shifting keys are pressed against the inside of the synchronizer sleeve by shifting key springs **6**.
- Synchronizer rings **2** are inserted into drive pinions **1** in the front and rear of synchronizer hub **8**, and the taper cone of 4th gear **4**.
- The internal tapers of synchronizer rings **2** have fine threads, and the outer splines engage synchronizer sleeve **9**. On the hub side of the synchronizer rings are three keyways in which the ends of shifting keys **5** are inserted. These keyways are wider than the width of the shifting keys.
- Synchronizer rings **2** rotate relative to synchronizer sleeve **9** by the amount of play of the keyways.

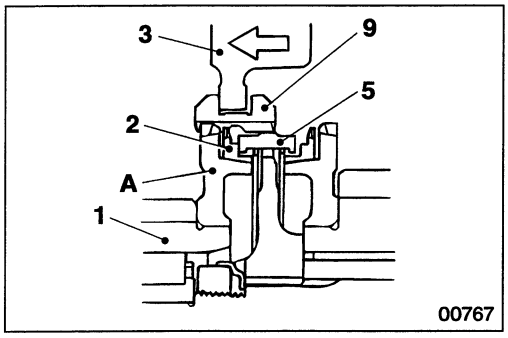
https://truckmanualshub.com/



- When the gear shift is in neutral (Figure **B**), moving shift fork **3** in the direction of the arrow as illustrated, moves synchronizer sleeve **9** slightly to the left. At the same time, shifting key **5**, the central protrusion of which engages the synchronizer sleeve, moves to the left and presses synchronizer rings **2** against taper cone **A** of drive pinion **1**. (Figure **C**)
- When the taper surfaces of synchronizer rings **2** make contact with the taper cone of the drive pinion, the taper surfaces of the synchronizer rings act as cone clutches. This frictional torque rotates the synchronizer rings in the rotating direction of the drive pinion by the amount of play between shifting key **5** and the synchronizer rings. The spline chamfers of the synchronizer rings and the spline chamfer of synchronizer sleeve **9** are offset from each other. (Figure **D**)
- The disengagement direction of synchronizer rings **2** is defined by the speed of rotation of the synchronizer—sleeve **9**, and the synchronized—drive pinion **1**. When increasing the vehicle speed by shifting up, disengagement is made in the opposite direction to rotation, and when decreasing the vehicle speed by shifting down, disengagement is made in the rotating direction.



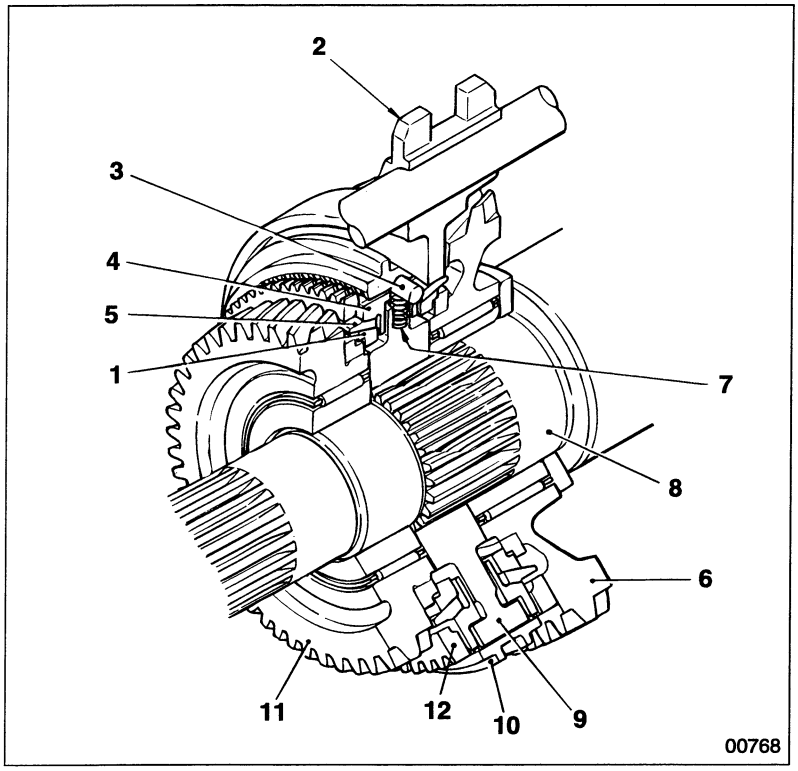
- When synchronizer sleeve **9** moves further to the left, synchronizer rings **2** prevent shifting key **5** from moving, and the synchronizer sleeve disengages from the protrusion of the shifting key.
- Since synchronizer rings **2** remain disengaged, the spline chamfer of synchronizer sleeve **9** presses the spline chamfers of the synchronizer rings, which in turn press the synchronizer rings against taper cone **A** of drive pinion **1**.
- As the frictional torque increases on the taper surfaces, the relative speed of the synchronizer and the synchronized gradually decreases.
  E : In synchronization
  F : After synchronization



- When synchronizer sleeve **9** and drive pinion **1** rotate at the same speed, synchronizer rings **2** no longer prevent the synchronizer sleeve from moving, and the synchronizer sleeve moves further to the left and smoothly engages the spline of taper cone **A** of drive pinion **1**, transmitting the driving force.

https://truckmanualshub.com/

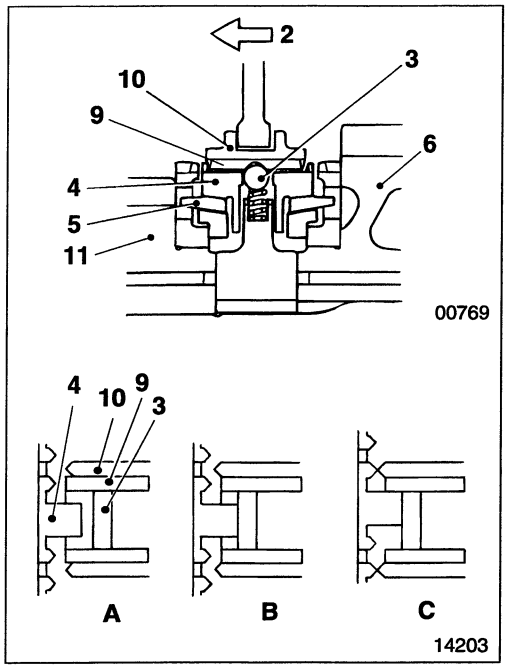
Double Cone Type



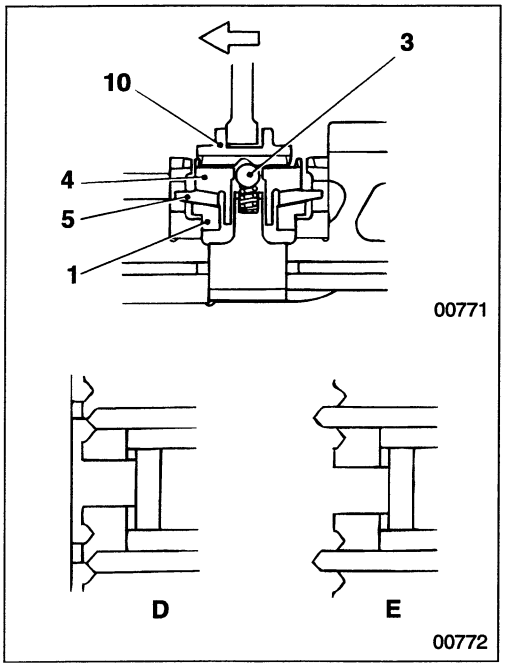
1 Synchronizer inner ring
2 2nd and 3rd shift fork
3 Shifting key
4 Synchronizer outer ring
5 Synchronizer center cone
6 2nd gear
7 Shifting key spring
8 Mainshaft
9 Synchronizer hub
10 Synchronizer sleeve
11 3rd gear
12 Dog clutch

- The following descriptions are for 2nd and 3rd gear < S5, S6 O/D >
  The synchromesh structure and operation of the double cone type are basically the same as for the single cone type.
- Synchronizer center cone **5** is a taper cone independent of 2nd gear **6** and 3rd gear **11**, (both the inside and outside surfaces are tapered). The synchronizer center cone is between synchronizer inner ring **1** and synchronizer outer ring **4** to increase the synchronization capacity.
- Six protrusions on the outside of center cone **5** fit into corresponding gear holes, in the same manner as the taper cone of the single cone type. The center cone and the gear are installed as if integrated.
  Shifting key **3** is a cylinder installed so that the lengthwise direction of the cylinder is at right angles to the diameter direction of synchronizer hub **9**. Shifting key spring **7** is a coil spring inserted in a hole in the synchronizer hub, this spring presses the shifting key against the inside of synchronizer sleeve **10**.
- The 4th gear of the < S5, S6 O/D > model uses the double cone type; however, the structure of shifting key **3** and shifting key spring **7** is the same as for the single cone type.

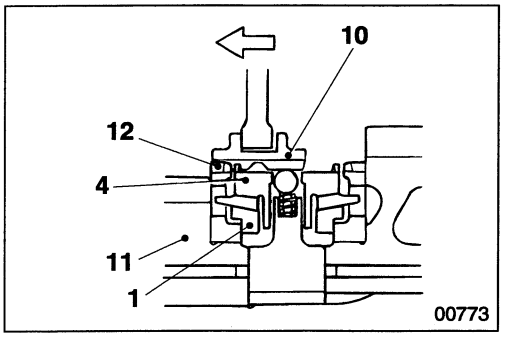
https://truckmanualshub.com/



- When the gear shift is in neutral (Figure **A**), moving shift fork **2** in the direction of the arrow as illustrated, moves synchronizer sleeve **10** slightly to the left. At the same time, shifting key **3**, the central protrusion of which engages the synchronizer sleeve, moves to the left and presses synchronizer outer ring **4** against synchronizer center cone **5**. (Figure **B**)
- When the taper surface of synchronizer outer ring **4** makes contact with the taper cone of synchronizer center cone **5**, the taper surface of the synchronizer outer ring acts as a cone clutch. This frictional torque rotates the synchronizer outer ring in the rotating direction of 3rd gear **11** by the amount of play between the synchronizer outer ring and synchronizer hub **9**. The spline chamfer of the synchronizer outer ring and the spline chamfer of synchronizer sleeve **10** are offset from each other. (Figure **C**)
- The disengagement direction of synchronizer outer ring **4** is defined by the speed of rotation of the synchronizer—the sleeve, and the synchronized—3rd gear **11**. When increasing the vehicle speed by shifting up, disengagement is made in the opposite direction to rotation, and when decreasing the vehicle speed by shifting down, disengagement is made in the rotating direction.



- When synchronizer sleeve **10** moves further to the left, synchronizer outer ring **4** prevents shifting key **3** from moving, and the synchronizer sleeve disengages from the protrusion of the shifting key.
- Since synchronizer outer ring **4** remains disengaged, the spline chamfer of synchronizer sleeve **10** presses the spline chamfer of the synchronizer outer ring, which in turn presses the synchronizer outer ring against the taper cone of synchronizer center cone **5**, and the frictional torque acts on the taper surface.
- As the frictional torque increases on the taper surface of synchronizer inner ring **1**, the relative speed of the synchronizer and the synchronized gradually decreases. The frictional torque acts on both sides of the synchronizer center cone. The double cone type has greater capacity for synchronization than the single cone type.
  D : In synchronization
  E : After synchronization

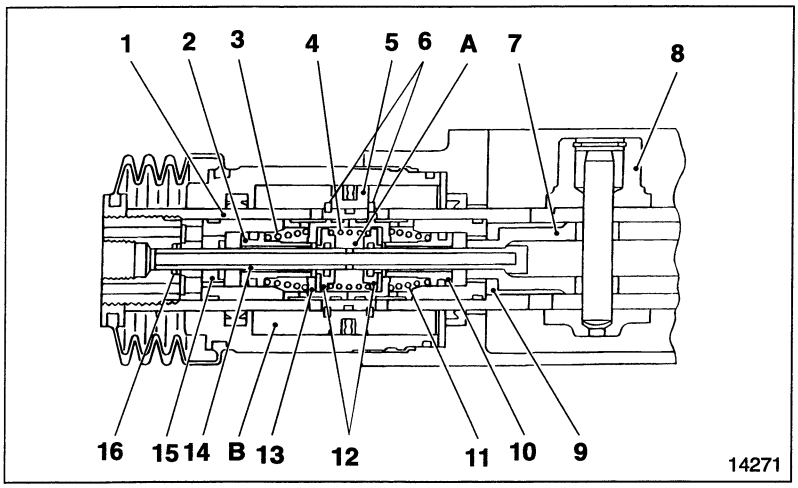


- When synchronizer sleeve **10** and 3rd gear **11** rotate at the same speed, synchronizer outer ring **4** no longer prevents the synchronizer sleeve from moving and the synchronizer sleeve moves further to the left and smoothly engages the spline of dog clutch **12** of the 3rd gear, transmitting the driving force.

https://truckmanualshub.com/

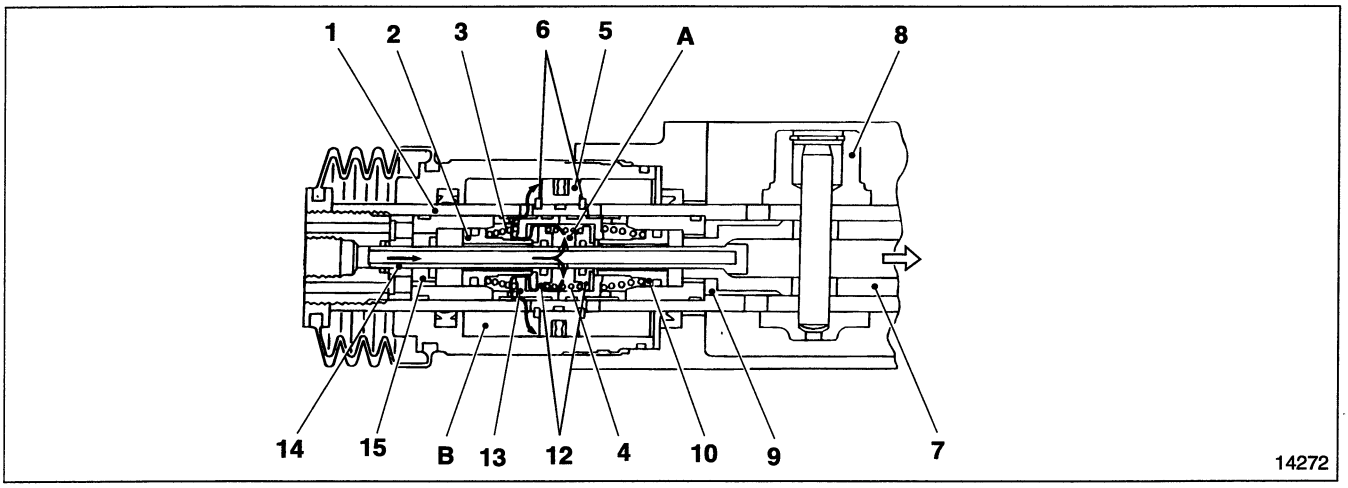
STRUCTURE AND OPERATION

Power Shift



1 Shifter rod
2 Valve lifter
3 No.3 spring
4 No.2 spring
5 Piston
6 Retaining ring
7 Actuating rod
8 Striker
9 Cap
10 Valve lifter
11 No.1 spring
12 Valve seal
13 Valve seat
14 Pipe
15 Retainer
16 Retaining ring

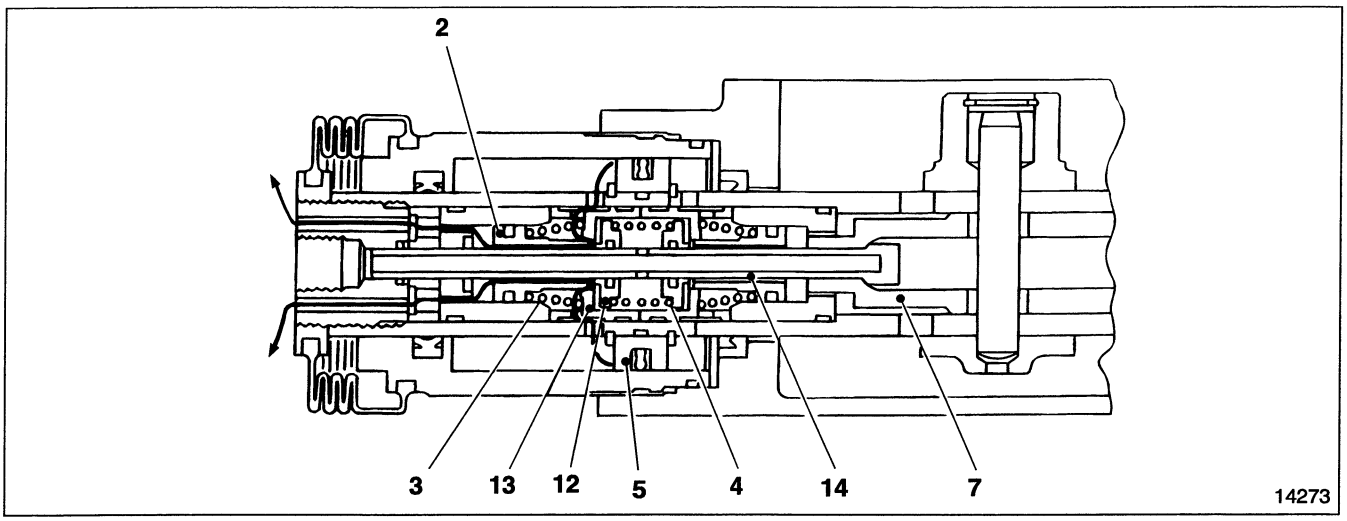
A : Primary side chamber
B : Secondary side chamber



When activated

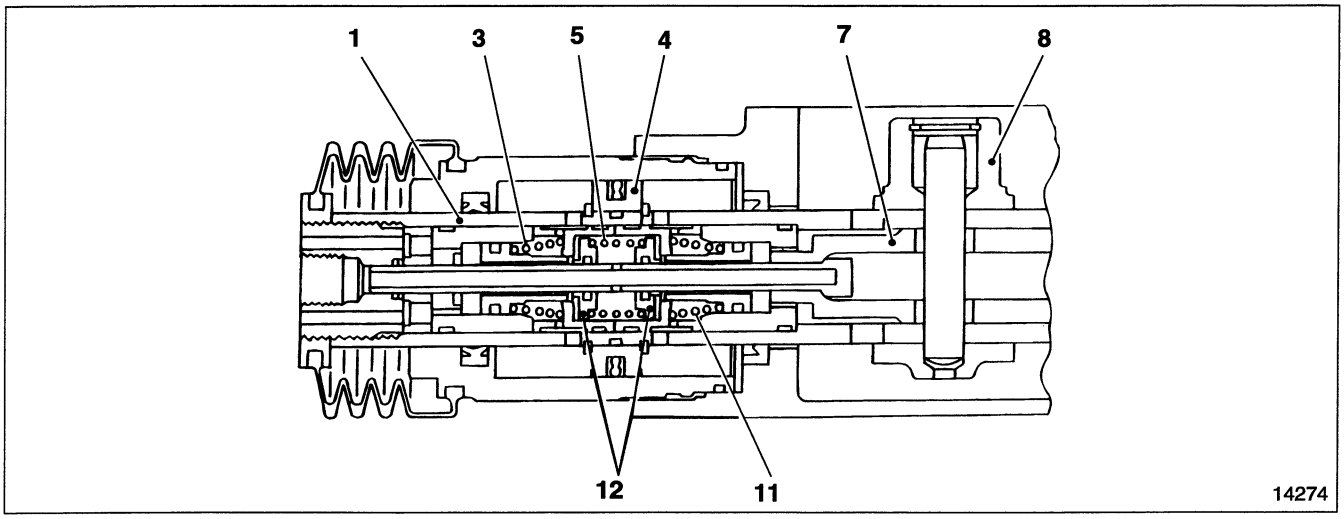
- When actuating rod **7** is moved in the direction of the arrow as illustrated, shifter rod **1** and the actuating rod move relative to this movement.
  Valve lifter **2** presses No.3 spring **3** against valve seal **12** to overcome the combined repercussive forces of the compressed air acting on the valve seal and No.2 spring **4**. The valve seal separates from valve seat **13**, and the compressed air supplied to primary side chamber **A** is let into secondary side chamber **B** via the opening between the valve seat and the valve seal. The compressed air flows into the cylinder through the hole and groove of the valve seal and the vent hole of shifter rod **1** to put pressure on piston **5**, generating output.
- The output given to piston **5** is transmitted to shifter rod **1** via retaining ring **6** to assist striker **8** which is fixed on the shifter rod. This operates the shift fork on the transmission side, shifting the gears. Thus, gear shifting is completed.
- When the power shift operates in the direction of the arrow as illustrated, the input from the gear shift lever is transmitted by actuating rod **7** via cap **9**, pipe **14**, and retainer **15** fixed on retaining ring **16**. For operation in the opposite direction, all operations are the same in principle as in the direction of the arrow as illustrated, except that the end of the cap, fixed on the end of the actuating rod, presses valve lifter **10** directly.

https://truckmanualshub.com/



When releasing

- When gear shifting is completed and the input is released, actuating rod **7** is returned to the valve center position (the condition before operation) by the combined repercussive forces of the compressed air of valve lifter **2**, the steel ball, and valve springs **3**, **4**.
  As the valve lifter returns, valve seal **12** seats against valve seat **13**, cutting off the flow of compressed air from primary side chamber **A** to secondary side chamber **B**. As the input rod returns, clearance is generated between the valve lifter and the valve seal.
- The compressed air in the cylinder of secondary side chamber **B** is discharged into the atmosphere through the clearance between valve lifter **2** and pipe **14**. This eliminates the pressure difference between the chambers on both sides of piston **5**, so output is lost.

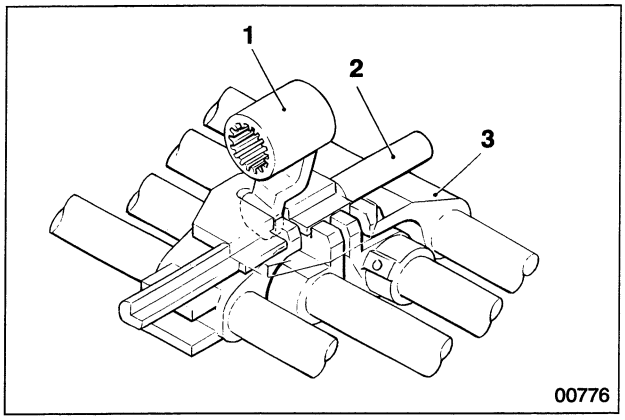


When not operating (non-boosting)

- To operate the power shift, that is, to open the valve and let the compressed air into the output chamber, actuating rod **7** on the input side and shifter rod **1** on the output side must generate relative disengagement.
- When the operating force is transmitted from the gear shift lever to actuating rod **7**, and the resistance on the transmission side is less than the combined repercussive forces working on the relative disengagement of the input side and output side (repercussive forces of No.1 to 3 springs, **3**, **4**, **11**; pressure on valve seal **12**; and sliding resistance on various parts), the mechanism, from the actuating rod to striker **8**, is integrated and does not generate relative disengagement. Therefore, the valve does not open, and without boosting operation, piston **5** moves in the cylinder to shift gears.

https://truckmanualshub.com/

Interlock Mechanism



In the interlock mechanism, the rail beneath interlock plate **2** locks jaws **3**, (apart from the jaws shifted by gear shift slide lever **1**), preventing double engagement of gears.

https://truckmanualshub.com/

Possible causes \ Symptoms		Gears slip out of engagement	Gears hard to engage	Noise when engine is idling	Noise while cruising	Noise when changing gear
Transmission body faulty	Mainshaft rear lock nut loose	○	○			
	Mainshaft thrust washer worn	○	○			
	Mainshaft bearing worn or damaged	○	○			
	Synchronizer ring and synchronizer sleeve spline worn	○				
	Synchronizer ring and gears taper cone area worn		○			
	Mainshaft pilot bearing worn or damaged			○	○	
	Drive pinion bearing worn or damaged			○		
	Countershaft bearing worn or damaged			○		
	Needle bearings of gears worn or damaged			○	○	
	Mainshaft and countershaft bearings worn or damaged				○	
	Mainshaft and countershaft gears backlash excessive				○	
	Spline of gears worn					○
	Gears damaged				○	
	Gear oil insufficient				○	
Control mechanisms faulty	Control cable joint play	○	○

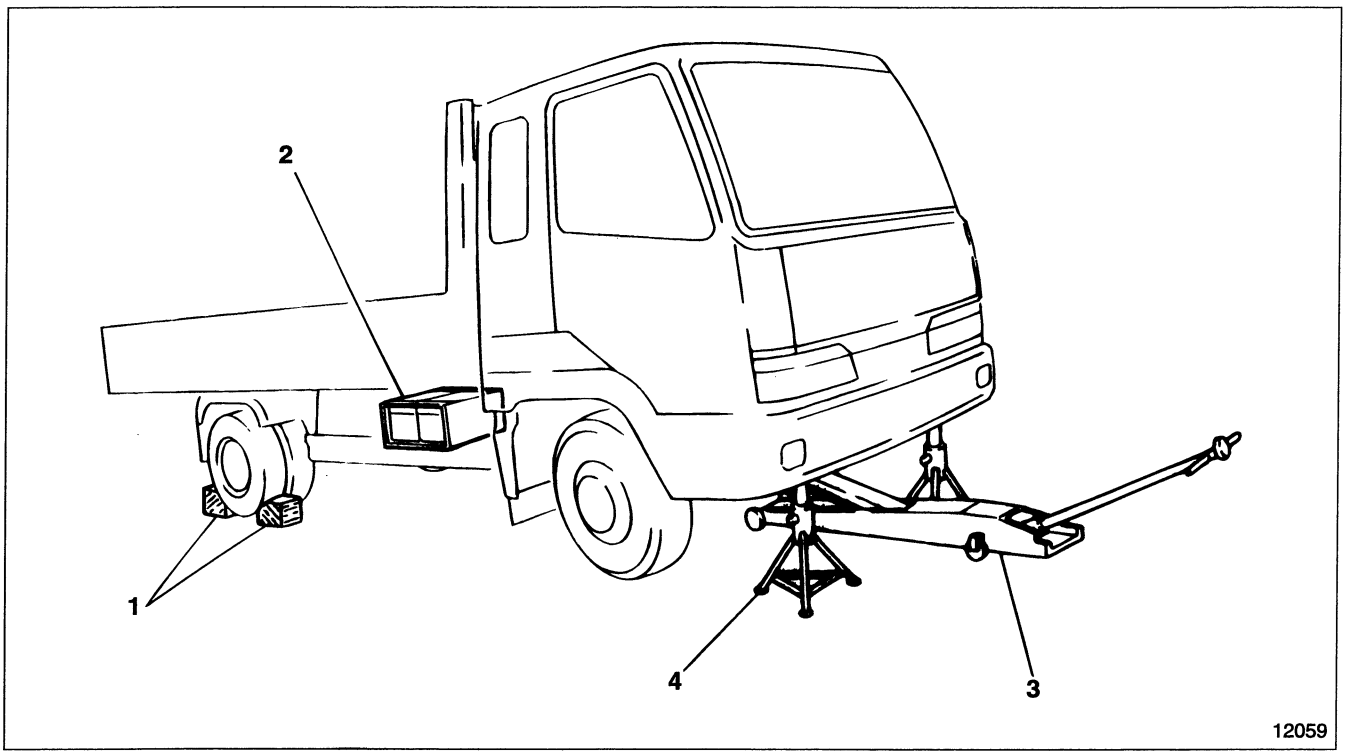
WORK BEFORE REMOVAL AND INSTALLATION OF TRANSMISSION ASSEMBLY



● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect negative battery cable. Gr 54
3 Jack up the front axle on a garage jack.
4 Support the front frame on rigid racks.

WARNING⚠

- **Since the parking brake will be removed, naturally it cannot be used. Therefore, you must chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION⚠

Keep the transmission in neutral throughout the operation.

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

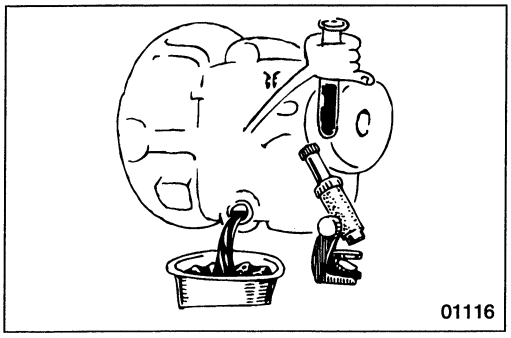
Lubricant and sealant

Location	Points of application	Kinds	Quantity
9	Thread area of inspection plug	THREEBOND 1105D	As required
10, 11	Thread area of drain plug	THREEBOND 1105D	As required
13	Spline of drive pinion	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

◆ Service procedure



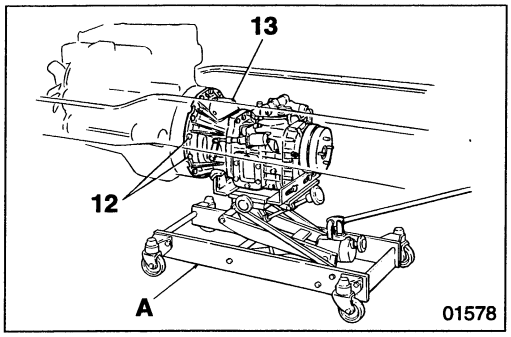
● Oil change

[Draining]

- When draining oil, check the quantity and quality of oil, especially for small pieces of metal and metal dust.
- Clean drain plug **9** before reinstalling it because it is magnetic.

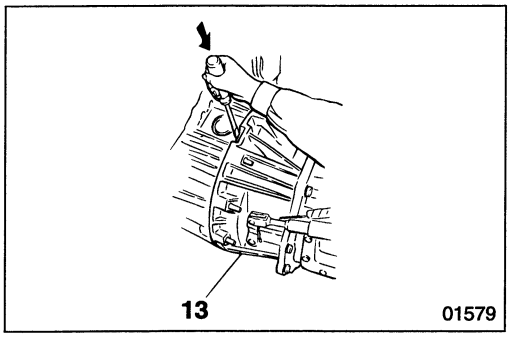
[Filling]

- Check that drain plugs **10**, **11** are tightened at specified torque.
- Pour in gear oil until the oil overflows from the inspection hole. (For oil quantity, see specifications.)



12 Removal of transmission mounting nut or bolt

- Support transmission assembly **13** on transmission jack **A**.
- Tighten transmission mounting nuts or bolts **12**.



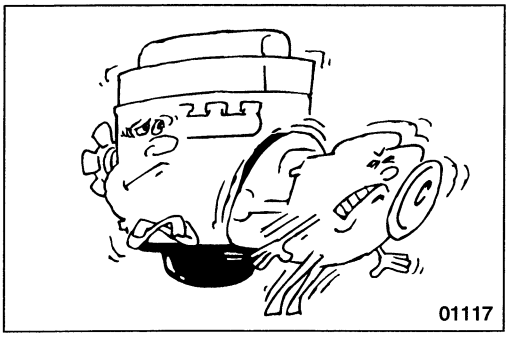
13 Transmission assembly

[Removal]

- Insert a screwdriver into the three removal grooves and pry transmission assembly **13** from the engine.

CAUTION⚠

Make sure that you remove hoses and cables before starting service operations.



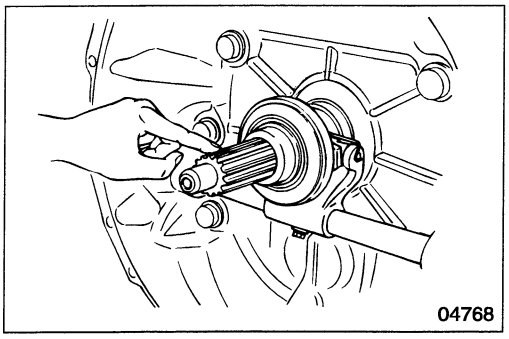
- Move transmission assembly **13** backward until the spline of the drive pinion is detached from the clutch.

CAUTION⚠

Make sure that you pull transmission assembly 13 out in a straight line. If you seesaw the transmission assembly violently, you will damage the spline that connects the drive pinion and the clutch.

https://truckmanualshub.com/

REMOVAL AND INSTALLATION OF TRANSMISSION ASSEMBLY

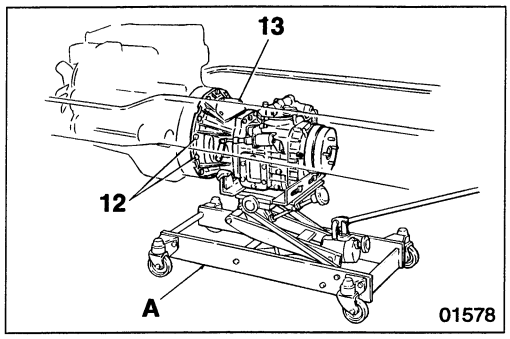


[Installation]

- Check the spline of the drive pinion for rust.
- If rust is found, remove it using a wire brush.
- Rub grease onto the clutch disc sliding surfaces of the drive pinion using your hand.

CAUTION

Make sure that you apply only the necessary amount of grease because too much grease would drip and cause clutch slip.



- Support transmission assembly **13** on transmission jack **A**, and insert the transmission assembly into the pilot bearing of the flywheel paying attention to the drive pinion spline.
- Tighten transmission mounting nuts or bolts **12** at specified torque.

GEAR SHIFTER UPPER AND INTERLOCK PLATE

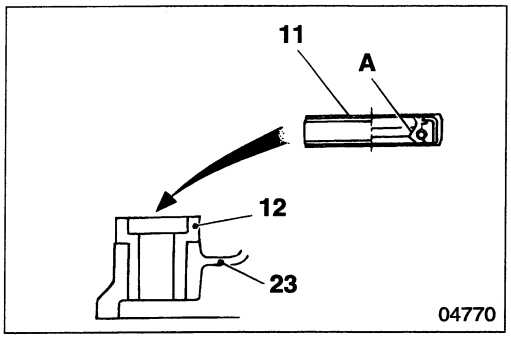
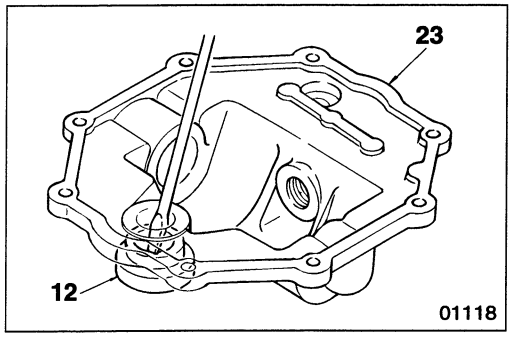
◆ Service procedure



11 Installation of oil seal

- Apply grease to lip area **A** of oil seal **11**.
- Press-fit oil seal **11** into bushing **12** in the direction as illustrated.



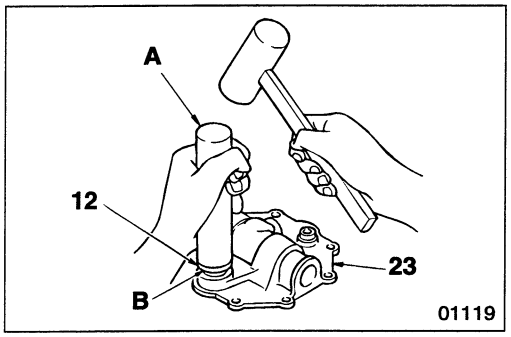
12 Bushing

[Removal]

Remove bushing **12** from selector lever case **23** using a screwdriver.

CAUTION

Be careful not to damage selector lever case 23.

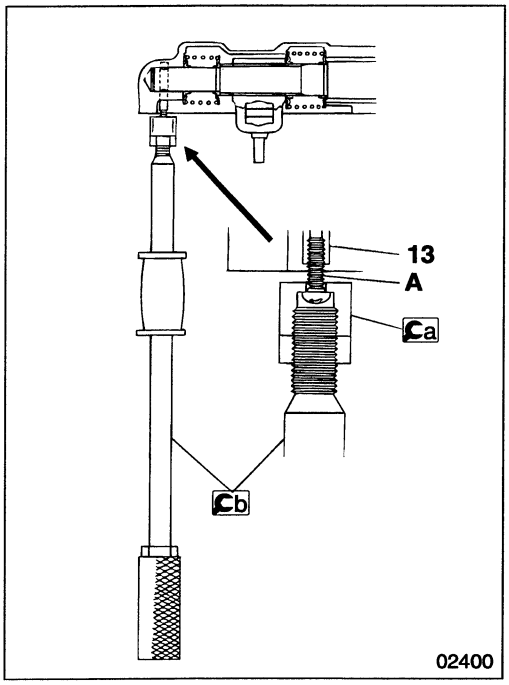


[Installation]

- Clean the inner surface of selector lever case **23**.
- Press-fit bushing **12** into selector lever case **23** using bar **A** (approximately ø40 mm {1.57 in.}).
- When press-fitting bushing **12**, take care not to damage selector lever case **23**.
- After press-fitting, apply sealant to press-fitted side **B** of bushing **12**.

CAUTION

Prevent sealant from sticking to the inner surface of bushing 12.



13 Removal of spring pin

- Tap spring pin **13** using an M4 tap.
- Insert Ca spring pin puller with an M4 thread **A** of appropriate length into spring pin **13**.
- Position Cb reverse shaft puller on Ca spring pin puller.
- Remove spring pin **13** from selector lever case **23** using Ca spring pin puller and Cb reverse shaft puller.

◆ Service Procedure

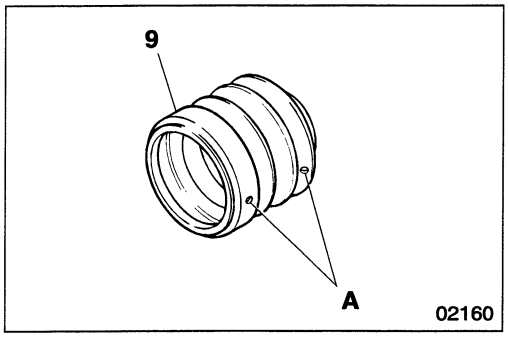
● Inspection before disassembly

(1) Apply 735 kPa {105 lbf/in², 7.5 kgf/cm²} of pressure to the power shift assembly from the connector, check the airtightness when not operating (valve in neutral), and when operating valve is pressed and pulled. If the measured value deviates from the standard value, replace the faulty parts.

Maintenance item	Standard value	
Airtightness when not operating	Decrease of pressure after 15 seconds	9.8 kPa {1.4 lbf/in², 0.1 kgf/cm²}
Airtightness when operating		49 kPa {7.1 lbf/in², 0.5 kgf/cm²}

(2) Measure the sliding resistance in the disengagement direction. If the measured value deviates from the standard value, replace the faulty parts, or grease them.

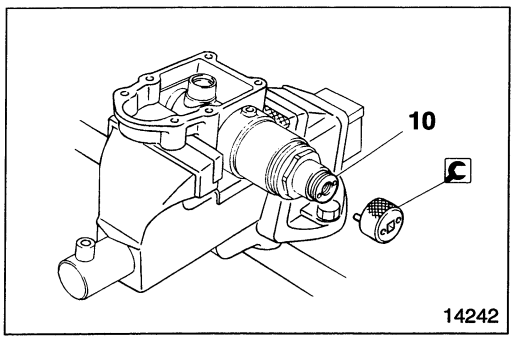
Maintenance item	Standard value
Resistance in shifting direction	39 N {8.8 lbf, 4 kgf}



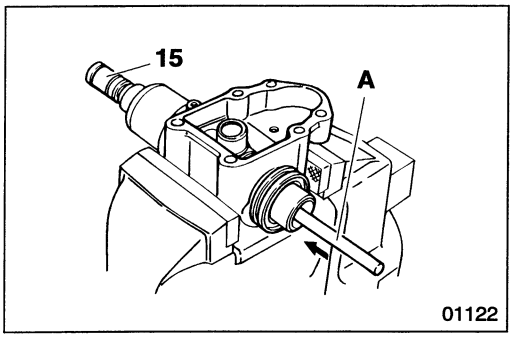
9 **Installation of boot**

When you install boot **9** on housing **52**, point drain holes **A** downward.

https://truckmanualshub.com/



10 Removal and installation of connector



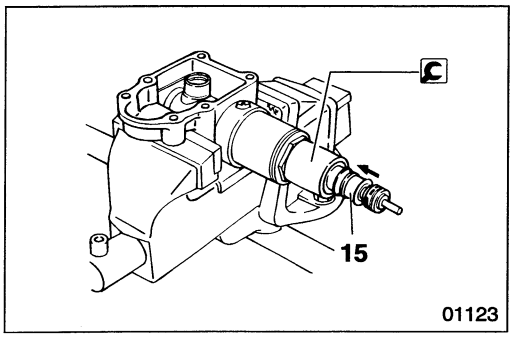
15 Valve assembly

[Removal]

Gently drive valve assembly **15** out from the shifter rod from the lever side using bar **A**.

CAUTION

Do not drive valve assembly 15 too hard or you will damage the valve parts.

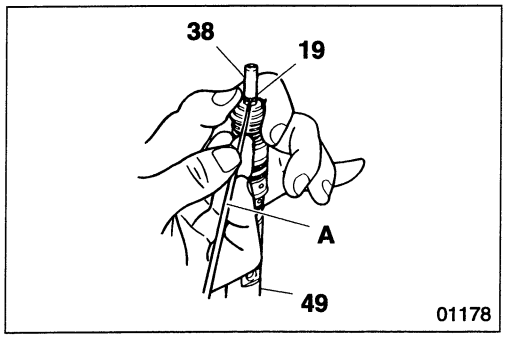


[Installation]

- Apply grease to valve assembly **15**.
- Install valve assembly **15** into the shifter rod using guide, taking care not to damage the seals.

https://truckmanualshub.com/

POWER SHIFT ASSEMBLY



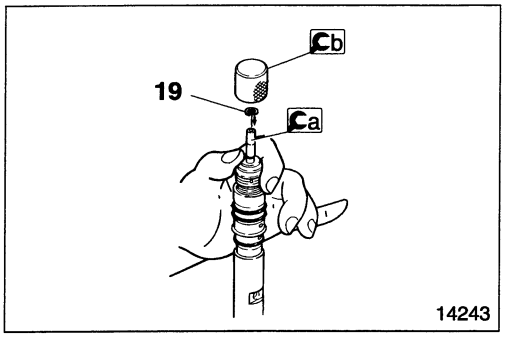
19 **Retaining ring**

[Removal]

- Hold shifter rod **49** in a vise, taking care not to damage the shifter rod.
- Remove retaining ring **19** from pipe **38** using bar **A** as illustrated.

CAUTION

- **After removing retaining ring 19, you can remove all the valve parts.**
- **Keep the valve parts in order to avoid mix ups when installing.**

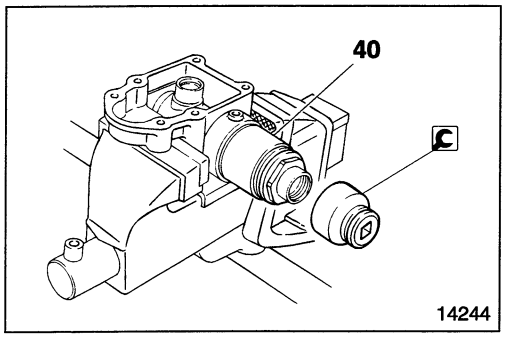


[Installation]

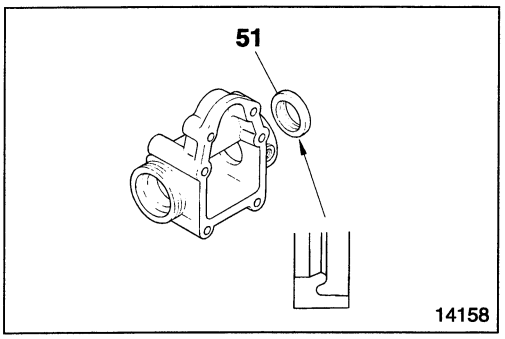
- Install the valve parts on pipe **38**.
- Install Ca insert tool on pipe **38** end.
- Insert retaining ring **19** into pipe **38** groove using Cb insert tool.

CAUTION

Be careful not to apply excessive force to retaining ring 19 when you insert it.



40 **Removal and installation of cylinder**



51 **Installation of cup packing and retainer**

EXTENSION HOUSING, REAR COVER AND PARKING BRAKE ASSEMBLY

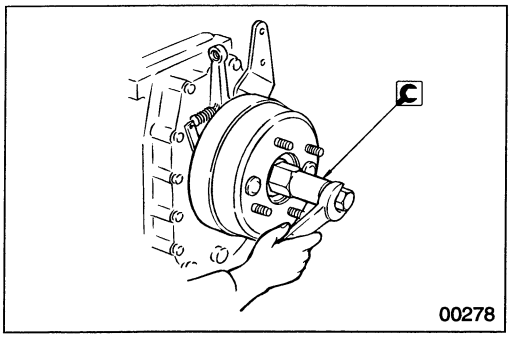
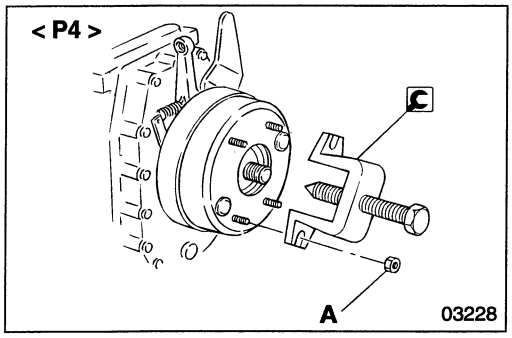
◆ Service procedure

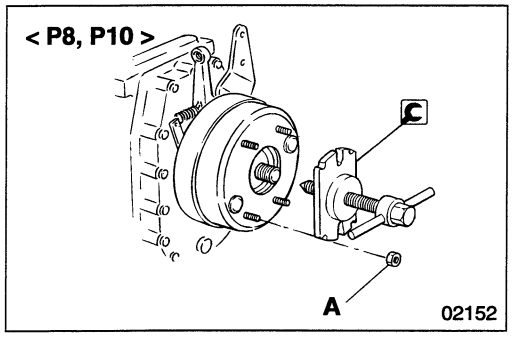


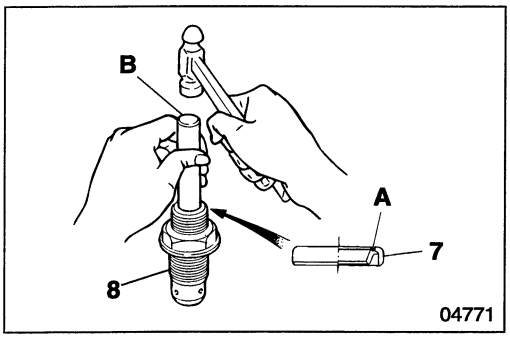
1 **Removal and installation of lock nut**



4 **Removal of companion flange**

A : Propeller shaft mounting nut

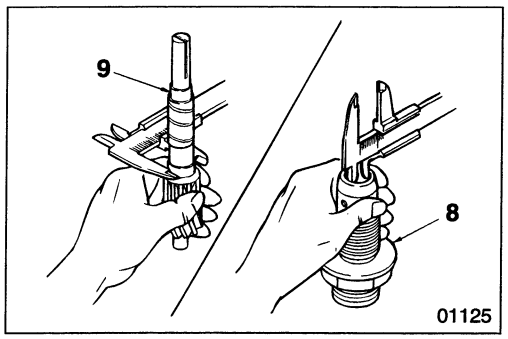




7 **Press-fitting of oil seal**

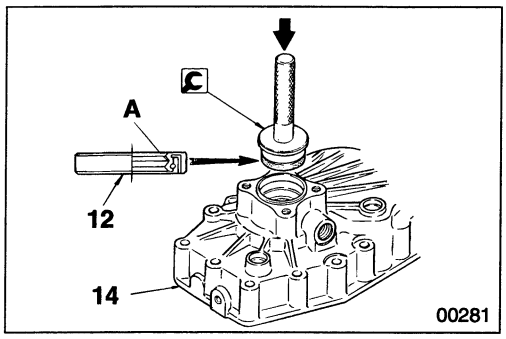
- Apply grease to inside of oil seal **7** packing **A**.
- Press-fit oil seal **7** into speedometer gear bushing **8** in the direction as illustrated using bar **B** (approximately ø15 mm {0.59 in.}).

https://truckmanualshub.com/



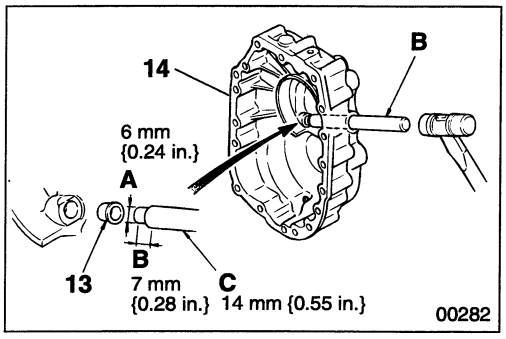
8 **9** **Clearance between speedometer gear bushing and speedometer gear**

If the clearance is higher than the limit, replace the faulty parts.



12 **Installation of oil seal**

- Apply grease to lip area **A** of oil seal **12**.
- Press-fit oil seal **12** into extension housing or rear cover **14** in the direction as illustrated using [C] oil seal installer.



13 **Installation of speedometer gear bushing A**

Press-fit speedometer gear bushing A **13** into extension housing or rear cover **14** using bar **B**, turned to the dimensions as illustrated.

https://truckmanualshub.com/

6TH GEAR < S6 OVER-DRIVE (O/D) > AND REVERSE IDLER GEAR < S5, S6 OVER-DRIVE (O/D) >

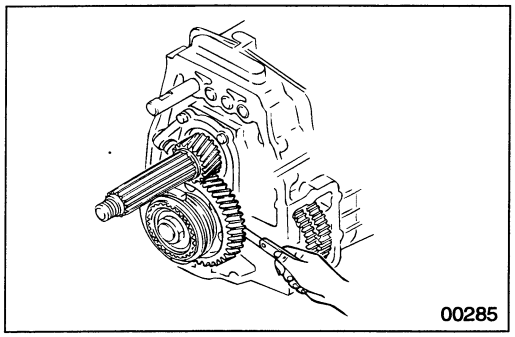
6TH GEAR < S6 OVER-DRIVE (O/D) > AND REVERSE IDLER GEAR < S5, S6 OVER-DRIVE (O/D) >

Special tools

Location	Tool name and shape	Part No.	Application
8	Single spanner 	MH061555 < S6 O/D >	Removal and istallation of countershaft rear lock nut
22	Drive pinion and reverse shaft puller 	03726-82000	Removal of reverse ilder shaft

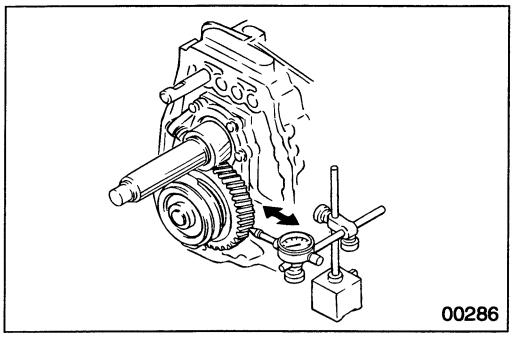
◆ Service procedure



● Inspection before disassembly

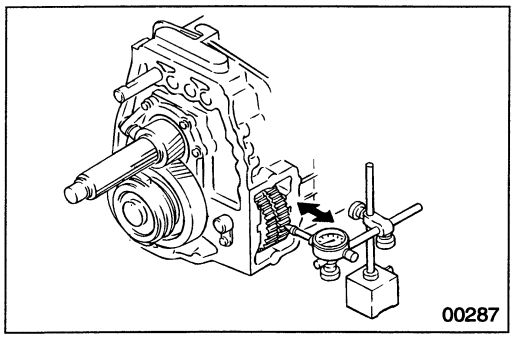
(1) End play of various gears < S6 O/D >

- If the measured value is higher than the limit, replace the faulty parts.
- Reinspect play after assembly to check that the measured value is within the limit.



(2) Play of countershaft O/D gear in the diameter direction < S6 O/D >

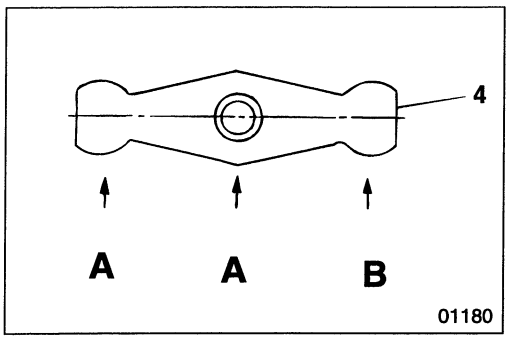
- If the measured value is higher than the limit, replace the faulty parts.
- Reinspect play after assembly to check that the measured value is within the limit.



(3) Play of reverse ilder gear in the diameter direction

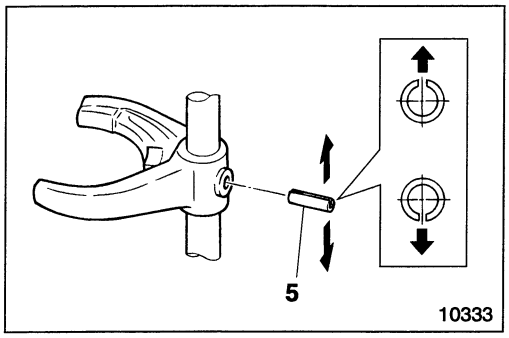
- If the measured value is higher than the limit, replace the faulty parts.
- Reinspect play after assembly to check that the measured value is within the limit.

https://truckmanualshub.com/



4 **Bend of O/D shift lever**

If bend **B** exeeds the limit on the basis of illustrated **A - A**, replace O/D shift lever **4**.

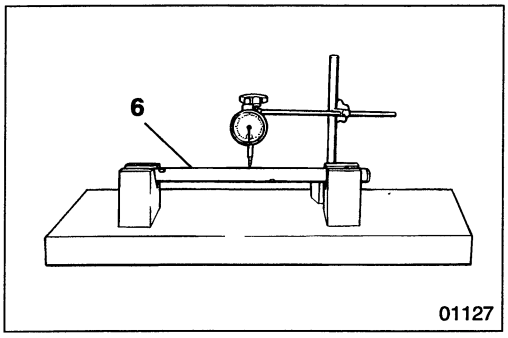


5 **Installation of spring pin**

Install spring pin **5** in O/D gear shift fork **7** in the direction as illustrated.

CAUTION⚠

Make sure you do not drive in spring pin 5 fully, leave 0 to 0.5 mm {0 to 0.020 in.} outside to prevent them from slipping out.

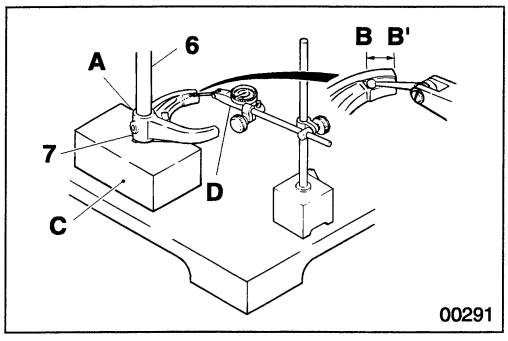


6 **Bend of O/D shift rail C**

If the measured value is higher than the limit, correct or replace O/D shift rail **C6**.

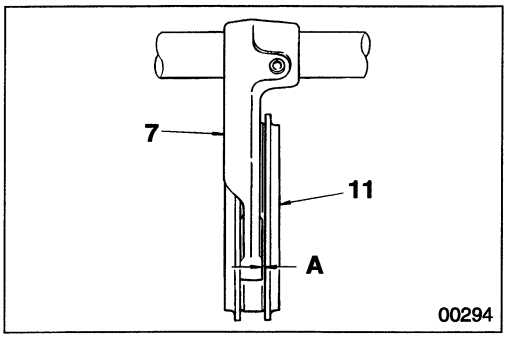
NOTE

Read the dial gauge after turning O/D shift rail C6 one full revolution. The bend is one half of the indicated value.



7 **Tilt of O/D gear shift fork claw**

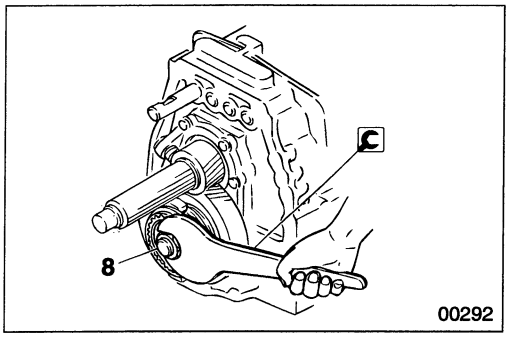
- Measure the tilt (difference between **B** and **B'**) of claw **B-B'** against hole **A** of O/D shift rail **C6** of O/D gear shift fork **7** with the shift rail upright.
- If the measured value is higher than the limit, replace gear shift fork **7**.
  C: V-block
  D: Dial gauge



7 **11** **Clearance between O/D gear shift fork and synchronizer sleeve**

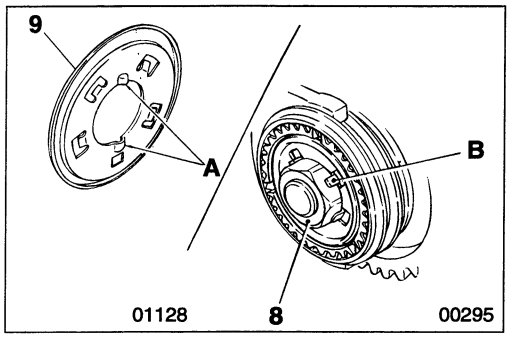
- Measure clearance **A** between O/D gear shift fork **7** and synchronizer sleeve **11**.
- If the measured value is higher than the limit, replace the faulty parts.

https://truckmanualshub.com/



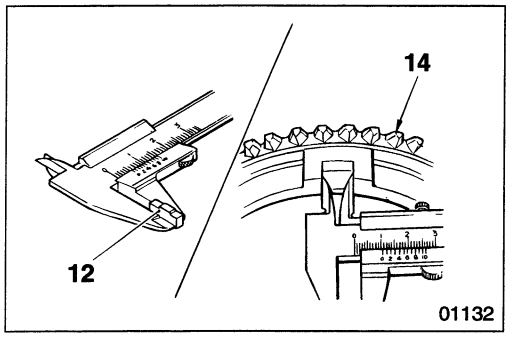
8 **Removal and installation of countershaft rear lock nut**

Have transmissions engaged in double to lock countershaft for this work.



9 **Installation of shifting key retainer**

- Install so that shifting key retainer **9** protrusions **A** (at 2 places) rest in recessions provided on synchronizer hub.
- After tightening of lock nut, caulk the areas with slits **B** at 4 places of shifting retainer, toward lock nut **8**.

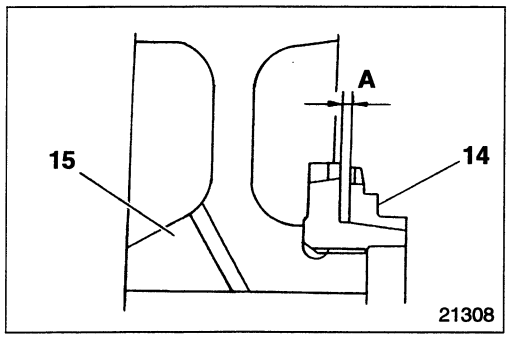


10 to **15** **Synchromesh mechanism and countershaft O/D gear assembly**

[Inspection]

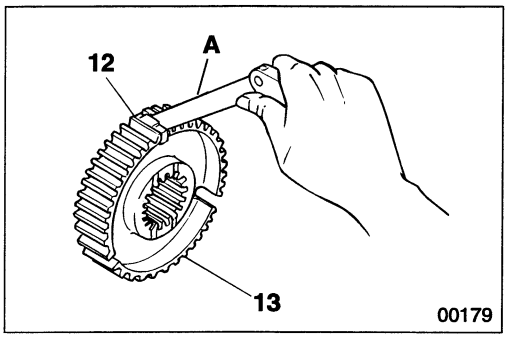
(1) Clearance between synchronizer ring 14 and shifting key 12.

If the measured value is higher than the limit, replace the faulty parts.



(2) Clearance between synchronizer ring 14 and countershaft O/D gear assembly 15

- Measure clearance **A** between synchronizer ring **14** and the gear cone of countershaft O/D gear assembly **15**.
- When measuring this value, press synchronizer ring **14** evenly, and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.

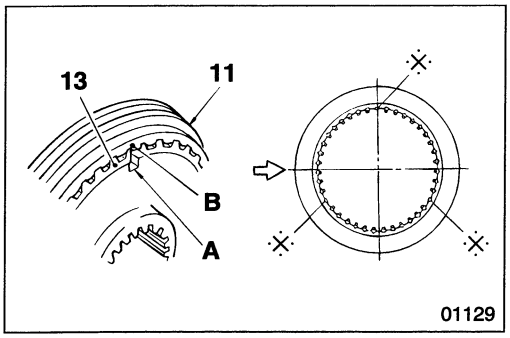


(3) Clearance between shifting key 12 and synchronizer hub 13

If the measured value is higher than the limit, replace the faulty parts.

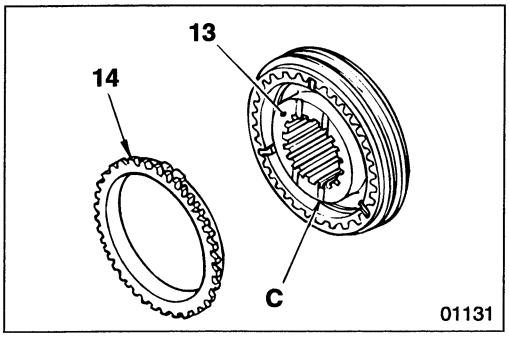
A : Feeler gauge

https://truckmanualshub.com/

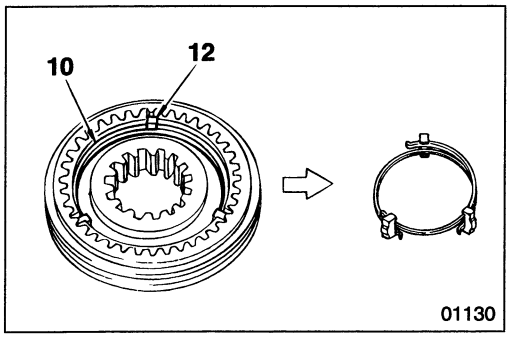


[Installation]

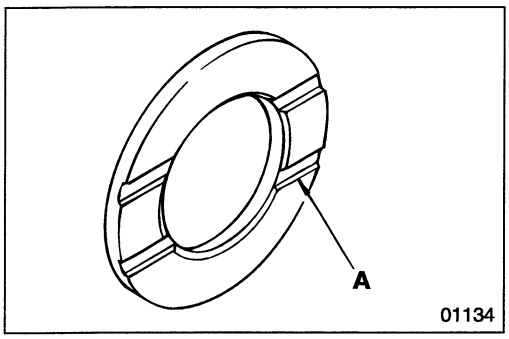
- Align the three keyways **A** of synchronizer hub **13** with the three stub teeth **B** (illustrated by ·⁘· mark) of synchronizer sleeve **11** to install the synchronizer hub.
- To reassemble synchronizer hub **13** and synchronizer sleeve **11**, align the alignment marks made during disassembly.



- Assemble synchronizer ring **14** on synchronizer hub **13** with the keyway aligned to the side where oil groove **C** is located.

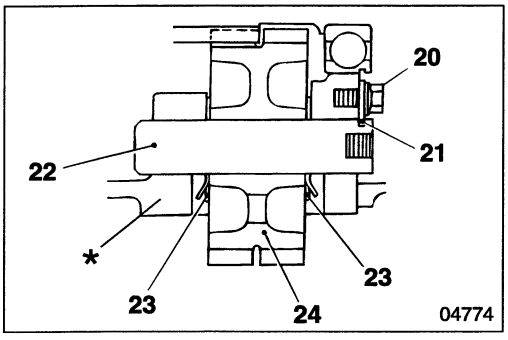


- Insert shifting **12** into the keyway.
- Install shifting key spring **10** so that its opening is offset from the one of the shifting key.
- Make sure that the openings of shifting key springs do not align with each other.



17 Installation of thrust washer

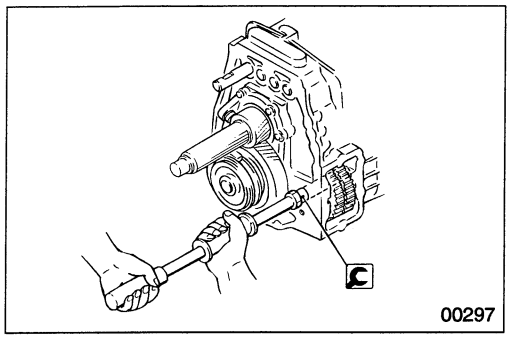
Install with the side having oil grooves **A** facing the side of gear.



20 to 24 Assembly of reverse idler gear

- Install reverse shaft gear side washer **23** and reverse idler gear **24** in trasmission body *.
- Install reverse ilder shaft **22** in transmission body * using a plastic-headed mallet.
- Install reverse shaft lock piece **21** in transmission body * with mounting bolt **20**.

https://truckmanualshub.com/



22 **Removal of reverse ilder shaft.**

https://truckmanualshub.com/

◆ Service procedure

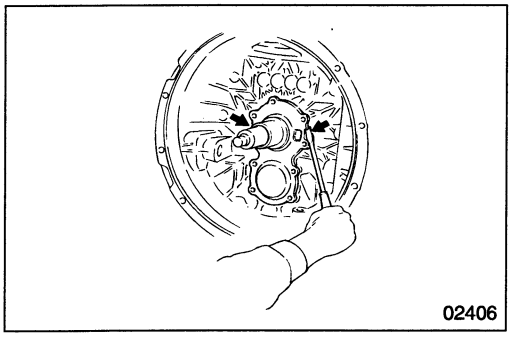
2 Installation of oil seal

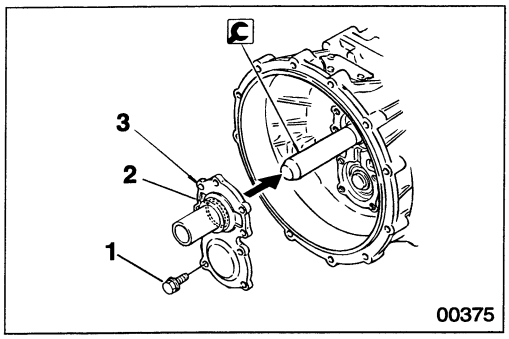
- Apply grease to lip area **A** of oil seal **2**.
- Press-fit oil seal **2** into front bearing retainer **3** in the direction as illustrated using oil seal installer.



3 Front bearing retainer

[Removal]

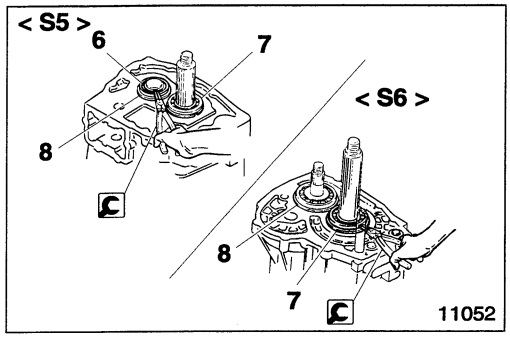
https://truckmanualshub.com/



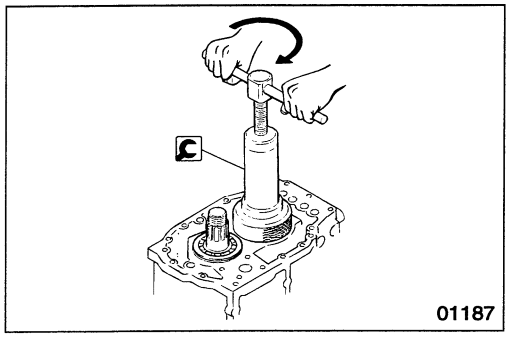
[Installation]
Press-fit front bearing retainer **3** into clutch housing assembly **19** using ⊏ oil seal front guide.

CAUTION⚠

Be careful when installing front bearing retainer 3, that you do not damage oil seal 2 installed on the front bearing retainer.

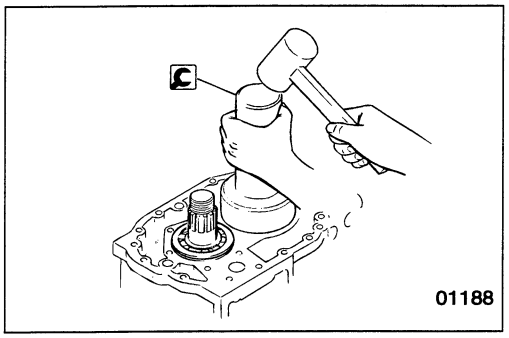


6 to 8 Removal and installation of snap ring

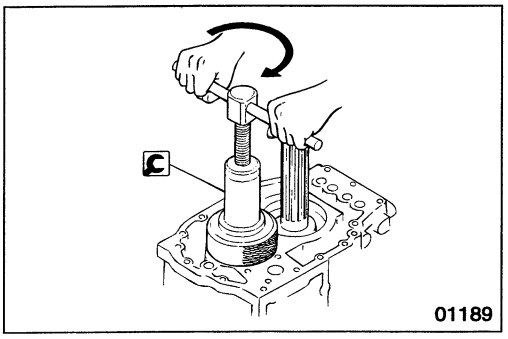


9 Mainshaft rear bearing

[Removal]



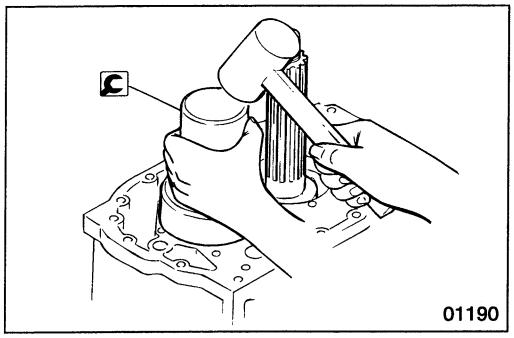
[Installation]



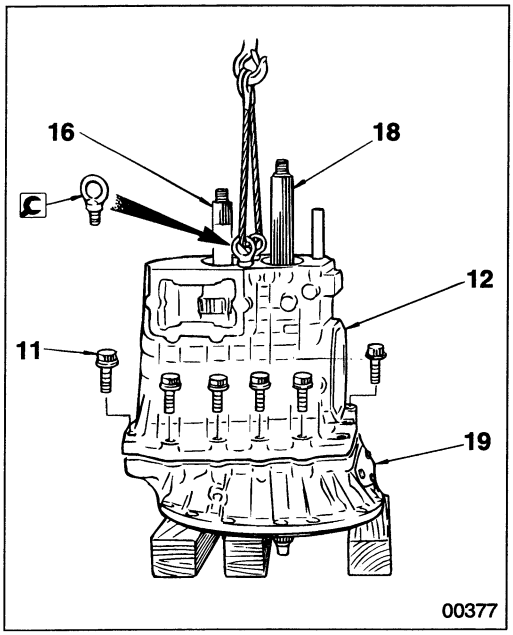
10 Countershaft rear bearing

[Removal]

https://truckmanualshub.com/



[Installation]



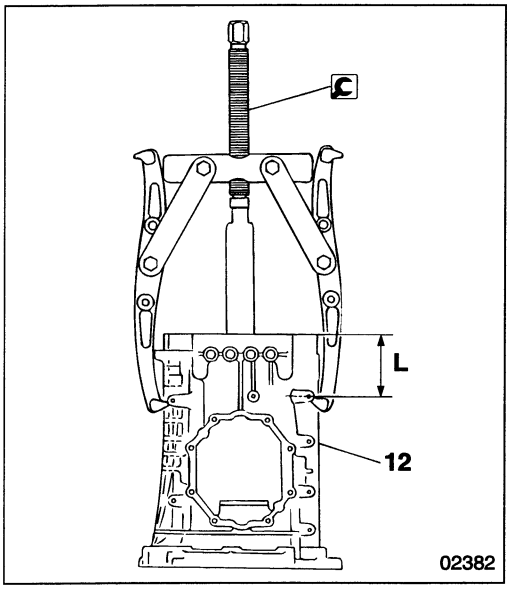
12 Removal and installation of transmission case

[Removal]

● **Remove transmission case 12.**

Method 1

- When lifting up with a crane, install ⓒ eye bolts on transmission case **12** and pass a steel sling through them.
- After removing bolts **11**, lift transmission case **12** up with a crane and keep hitting the rear ends of clutch housing assembly **19**, mainshaft assembly **18** and countershaft assembly **16**. Use a plastic-headed or copper-headed mallet to remove the transmission case.

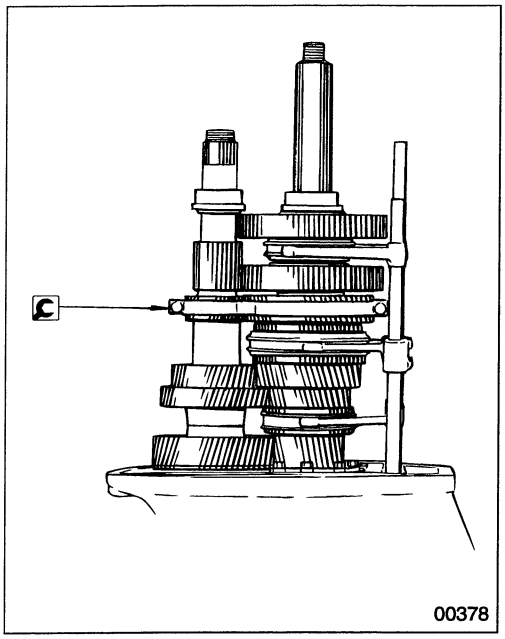


Method 2

- A ⓒ gear puller can be used instead of a crane.
  Puller installation position

Model	Dimension of L mm {in.}
M060S5, S6 O/D	146 {5.75}
M060S6 D/D	36 {1.42}
M070S6	93 {3.66}

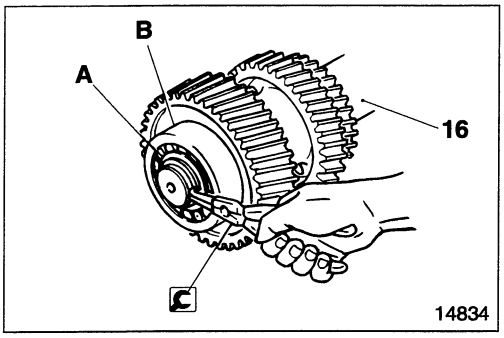
https://truckmanualshub.com/



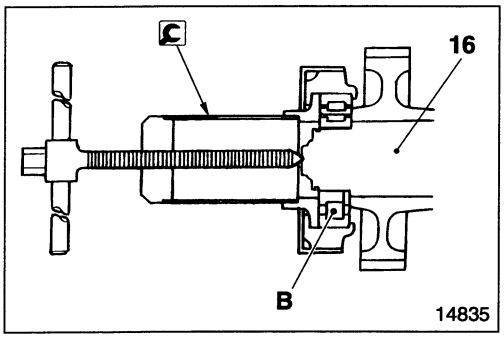
- After removing transmission case **12**, fit the 2nd gear unit < S5, S6 O/D > or 3rd gear unit < S6 D/D > using [C] steel lifting band to ensure safety.

CAUTION⚠

Be sure to tighten [C] steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.



- Remove snap ring **A** from countershaft assembly **16**.
  B : Countershaft front bearing



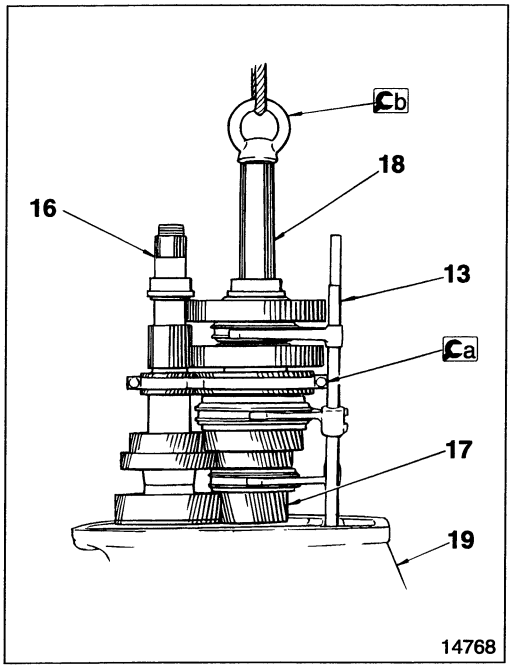
- Remove countershaft bearing **B** from countershaft assembly **16**.

[Installation]
Follow the removal sequence in reverse.

CAUTION⚠

Be careful not to damage mainshaft assembly 18, or rear bearings 9, 10 of countershaft assembly 16 during installation.

https://truckmanualshub.com/



13 16 to 18 Shift rail and shift fork, countershaft assembly, drive pinion assembly, and mainshaft assembly

[Removal]
Remove or install shift rail and shift fork **13**, countershaft assembly **16**, drive pinion assembly **17**, and mainshaft assembly **18** as a group.

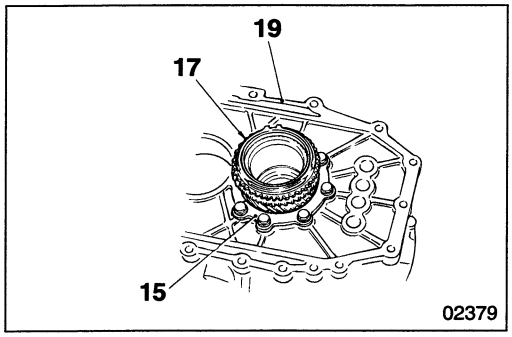
- Before lifting, after removing the case, install Cb eye nut at the end of mainshaft **18**, fitted with Ca steel lifting band.
- Fix shift rail and shift fork **13** to mainshaft assembly **18** with a rubber band.
- Fix a piece of wood to clutch housing assembly **19**, and use a crane to lift the clutch housing together with drive pinion assembly **17** up, at the same time hitting them with a plastic-headed mallet to remove them.

CAUTION

- **Be sure to tighten Ca steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.**
- **Make sure, when lifting mainshaft assembly 18 or other parts, that you support drive pinion assembly 17 with your hand in order to prevent it from falling when the mainshaft assembly and countershaft assembly 16 come apart.**

[Installation]
Method 1

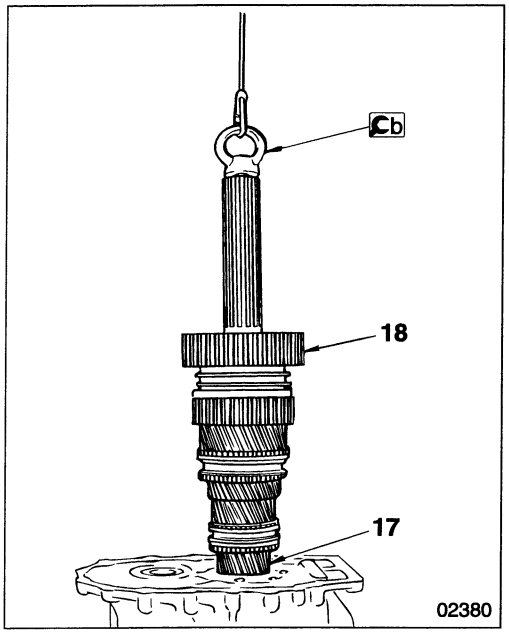
- Follow the removal sequence in reverse.



Method 2

- After installing drive pinion assembly **17** in clutch housing assembly **19**, install drive pinion bearing retainer **15**.

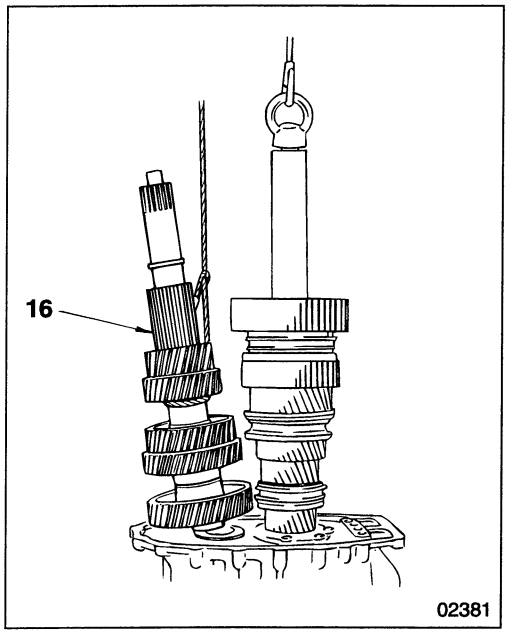
https://truckmanualshub.com/



- Install Cb eye nut at the end of mainshaft assembly **18**.
- Lift mainshaft assembly **18** up using a crane and install the mainshaft assembly on drive pinion assembly **17**.

CAUTION

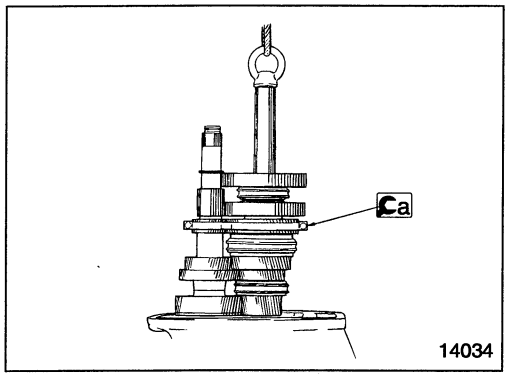
To prevent mainshaft assembly 18 from falling, support it using a crane.



- Install countershaft assembly **16** in clutch housing assembly **19**.

CAUTION

If you use this method of installation, first remove the countershaft front bearing. **P22A-84**

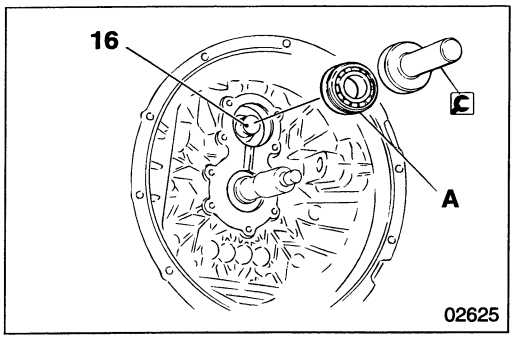


- Fit the 2nd gear unit using Ca steel lifting band to ensure safety.

CAUTION

Be sure to tighten Ca steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.

https://truckmanualshub.com/



- Install shift rail and shift fork **13** and transmission case **12** in clutch housing assembly **19**.
- Place cluch housing assembly **19** horizontally so that countershaft assembly **16** is uppermost.
- Install the countershaft front bearing **A** into clutch housing assembly **19** using C countershaft bearing installer.

CAUTION

Be sure to install the snap ring of the countershaft front bearing.

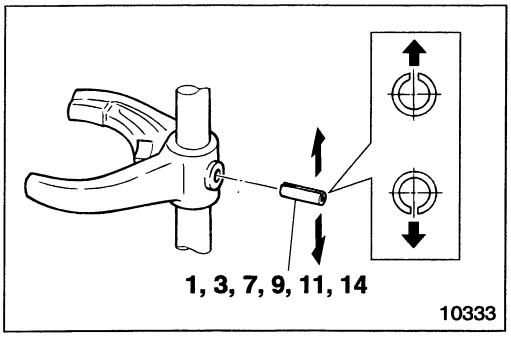
Sealant

Location	Points of application	Kinds	Quantity
1, 3, 7, 9, 11, 14	Spring pin	LOCTITE 601	As required

◆ Service procedure

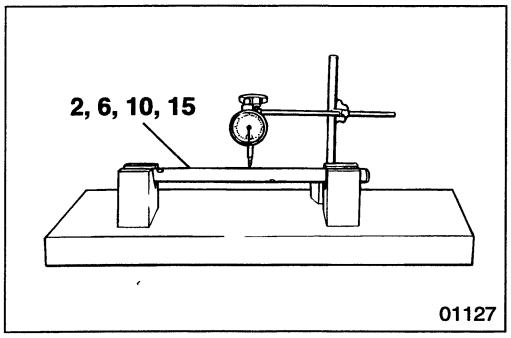


1 **3** **7** **9** **11** **14** **Installation of spring pin**

Install spring pins **1, 3, 7, 9, 11, 14** in the direction as illustrated.

CAUTION

- **Make sure you do not drive in spring pins 1, 3, 7, 9, 11, 14 fully, leave 0 to 0.5 mm {0 to 0.020 in.} outside to prevent them from slipping out.**
- **Do not remove spring pin 9 for 4th and 5th shift fork 13 (made of aluminum), except when replacing shift fork 13 or shift rail 10.**
- **Note that the length of spring pin 9 differs from that of spring pins 1, 3, 7, 11, 14.**
- **Be careful when driving in spring pins 1, 3, 7, 9, 11, 14 that you do not subject shift rails 2, 6, 10, 15 to excessive strain, because this would cause faults such as bent shift rails.**



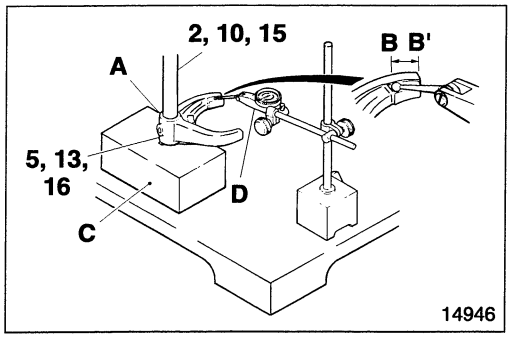
2 **6** **10** **15** **Bend of shift rail**

If the measured value is higher than the limit, correct or replace shift rail **2, 6, 10** or **15**.

NOTE

Read the dial gauge after turning shift rails 2, 6, 10, 15 one full revolution. The bend is one half of the indicated value.

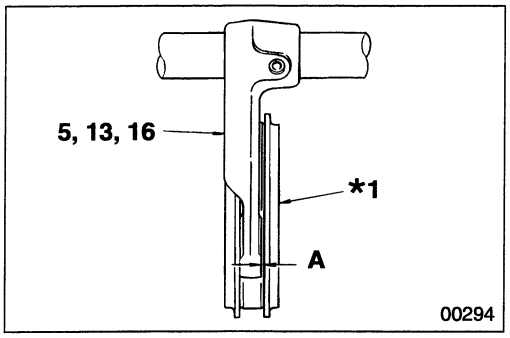
https://truckmanualshub.com/



5 13 16 Tilt of shift fork claws

- Measure the tilt (difference between **B** and **B'**) of claw **B–B'** against hole **A** of shift rails **2, 10, 15** of shift forks **5, 13, 16** with the shift rails upright.
- If the measured value is higher than the limit, replace shift fork **5**, **13**, or **16**.

C : V-block
D : Dial gauge



5 13 16 *1 Clearance between gear shift fork and synchronizer sleeve of mainshaft

If clearance **A** is higher than the limit, replace the faulty parts.

◆ Service procedure

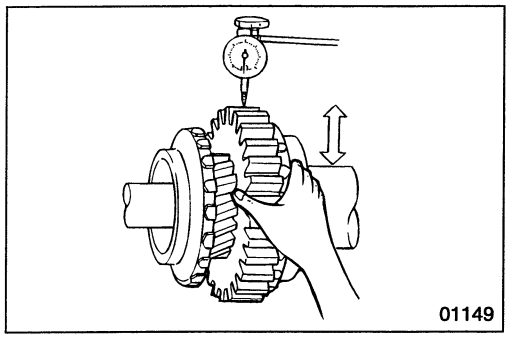
● Work before disassembly

[Inspection]

(1) End play of gears

A : Reverse gear
B : 2nd gear
C : 3rd gear
D : 4th gear
E : 1st gear

If the measured value is higher than the limit, replace the faulty parts.
Also inspect this item after assembly and make sure that the measured value is within the limit.

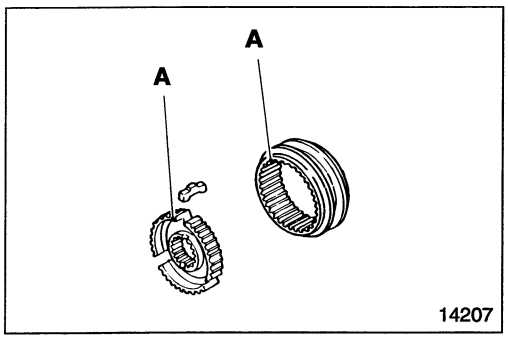


(2) Play of gears in diameter direction

If the measured value is higher than the limit, replace the faulty parts.
Also inspect this item after assembly and make sure that the measured value is within the limit.

CAUTION⚠

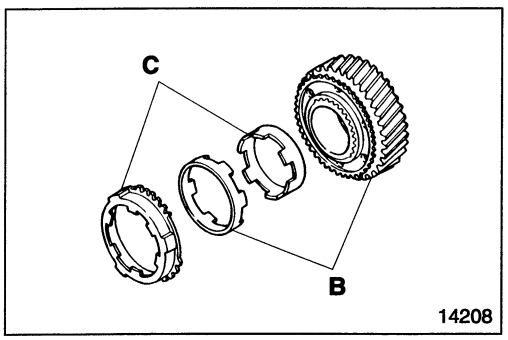
Be sure when you replace the two needle bearings of a gear, that both needle bearings are from the same color package.



[Alignment marks]

(1) Synchronizer sleeve and synchronizer hub

Before disassembling the synchronizer sleeve and the synchronizer hub, put alignment marks **A** on the places where the shifting keys are installed. When reusing parts, align the alignment marks to assemble.



(2) Ring, cone and gear assembly of double cone synchronizer

Before disassembling synchronizer center cone and gear assembly (**B**), and synchronizer center ring and synchronizer outer ring (**C**), put alignment marks on them. When reusing parts, align the alignment marks to assemble.

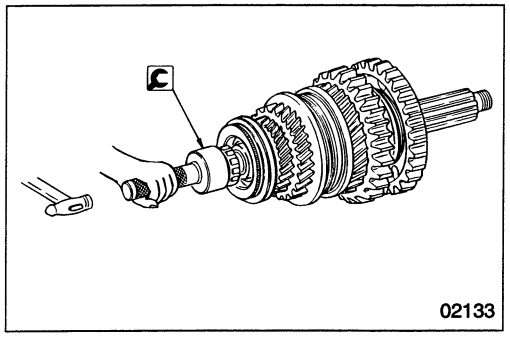
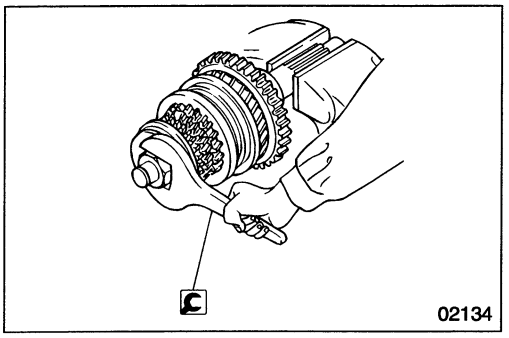
7 Pilot bearing

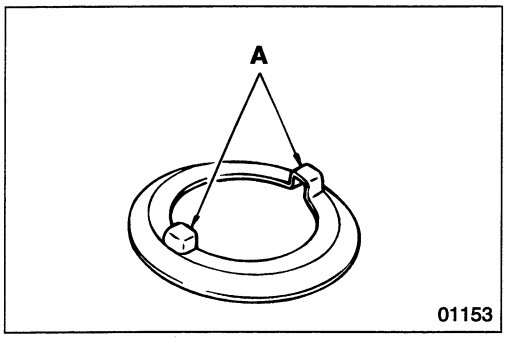
[Removal]



[Installation]



8 Removal and installation of lock nut

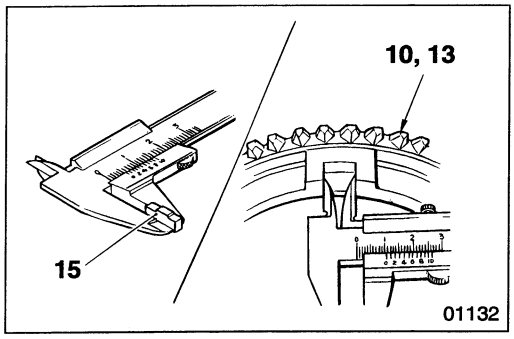


9 Installation of lock washer

Install so that protrusions **A** (two points as illustrated) fit into the grooves of synchronizer hub **17**.

https://truckmanualshub.com/

MAINSHAFT ASSEMBLY < S5, S6 OVER-DRIVE (O/D) >

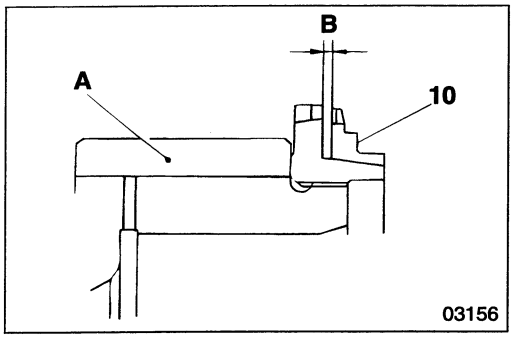


10 to 18 Synchromesh mechanism and 4th gear

[Inspection]

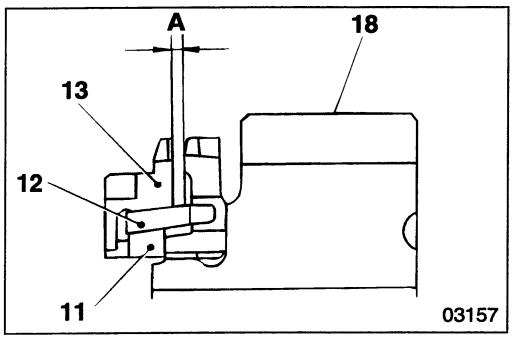
(1) Clearance between synchronizer ring 10 or outer ring 13 and shifting key 15

If the measured value is higher than the limit, replace the faulty parts.



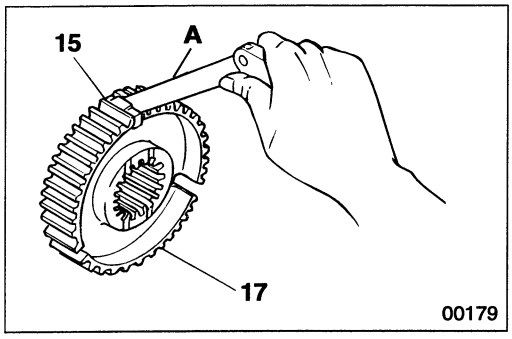
(2) Clearance between synchronizer ring 10 and drive pinion

- Measure clearance **B** between synchronizer ring **10** and the gear cone of drive pinon **A**.
- When measuring this value, press synchronizer ring **10** evenly, and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.



(3) Clearance between synchronizer outer ring and 4th gear

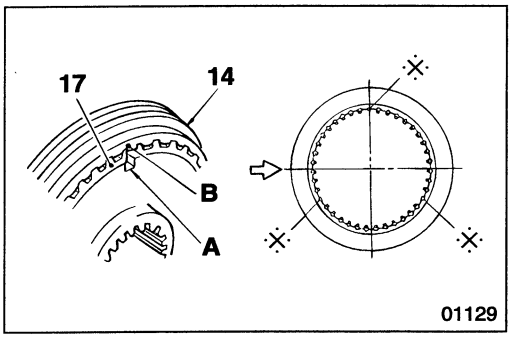
- Measure clearance **A** between synchronizer outer ring **13** and the gear cone of 4th gear **18**.
- When measuring this value, press synchronizer inner ring **11**, center cone **12**, and the outer ring evenly and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.



(4) Clearance between shifting key 15 and synchronizer hub 17

If the measured value is higher than the limit, replace the faulty parts.

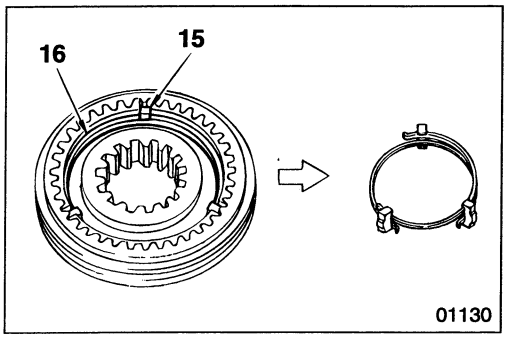
A : Feeler gauge



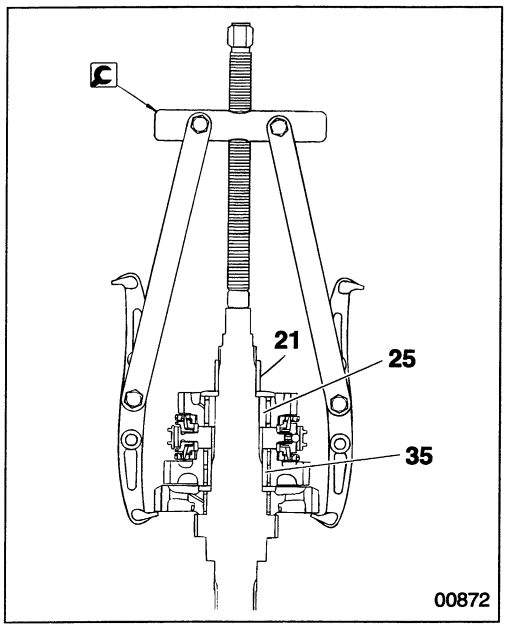
[Installation]

- Align the three keyways **A** of synchronizer hub **17** with the three stub teeth **B** (illustrated by ·⁜· mark) of synchronizer sleeve **14** to install the synchronizer hub.
- To reassemble synchronizer hub **17** and synchronizer sleeve **14**, align the alignment marks made during diassembly.

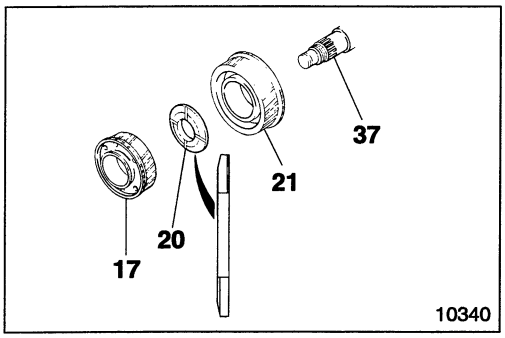
https://truckmanualshub.com/



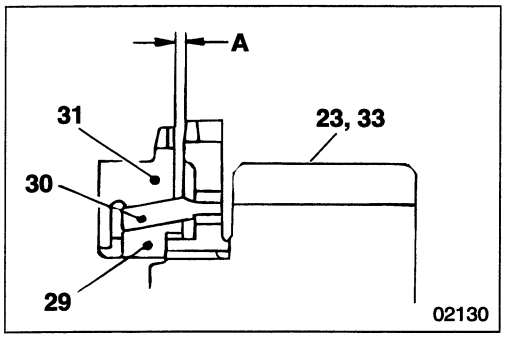
- Insert shifting key **15** into the keyway.
- Install shifting key spring **16** so that its opening is offset from the one of the shifting key.
- Make sure that the openings of shifting key springs do not align with each other.



21 25 35 Removal of 4th, 3rd, 2nd gear bearing sleeves



21 Installation of 3rd and 4th gear thrust washer



23 31 33 Clearance between synchronizer outer ring and 3rd gear assembly or 2nd gear assembly

- Measure clearance **A** between synchronizer outer ring **31** and the cone of 3rd gear assembly **23** or 2nd gear assembly **33**.
- When measuring this value, press synchronizer inner ring **29**, synchronizer outer ring **31** and synchronizer center ring **30** evenly and measure all around the circumference.
- If the measured value is higher than the limit, replace the faulty parts.

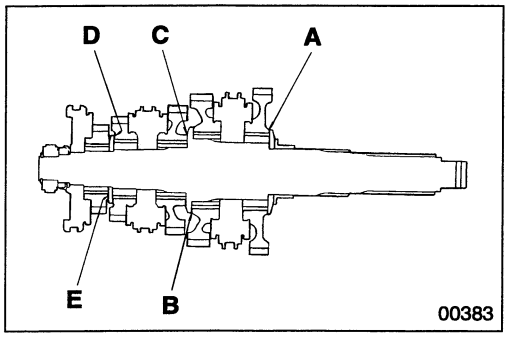
◆ Service procedure

● Work before disassembly

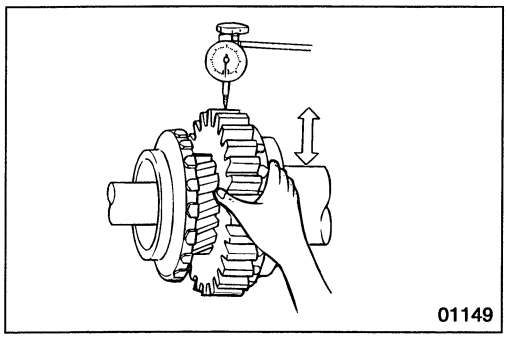
[Inspection]



(1) End play of gears

A : 1st gear
B : 2nd gear
C : 3rd gear
D : 4th gear
E : 5th gear

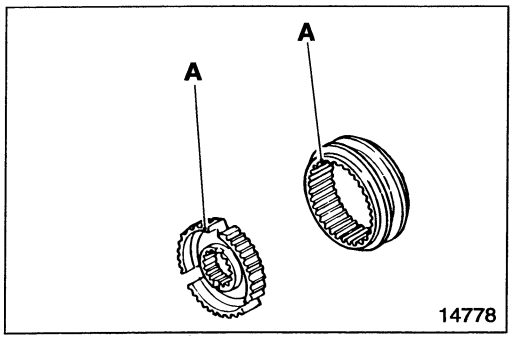
If the measured value is higher than the limit, replace the faulty parts.



(2) Play of gears in diameter direction

If the measured value is higher than the limit, replace the faulty parts.

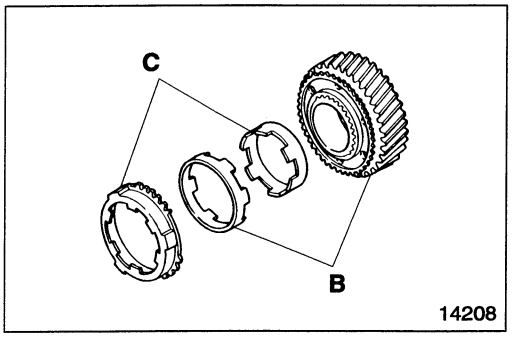
https://truckmanualshub.com/



[Alignment marks]

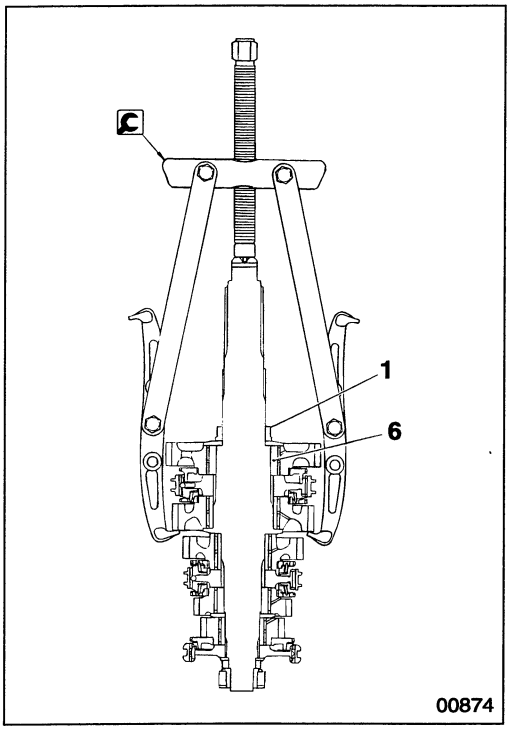
(1) Synchronizer sleeve and synchronizer hub

Before disassembling the synchronizer sleeve and the synchronizer hub, put alignment marks **A** on the places where the shifting keys are installed. When reusing parts, align the alignment marks to assemble.



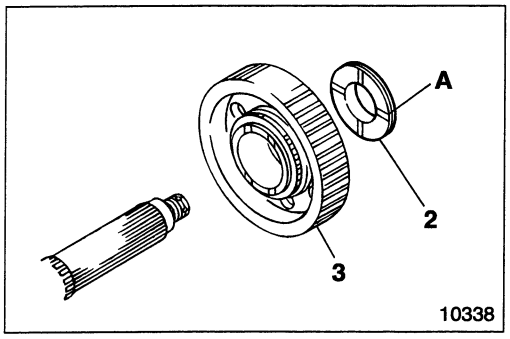
(2) Ring, cone and gear assembly of double cone synchronizer

Before disassembling synchronizer center cone and gear assembly (**B**), and synchronizer center ring and synchronizer outer ring (**C**), put alignment marks on them. When reusing parts, align the alignment marks to assemble.



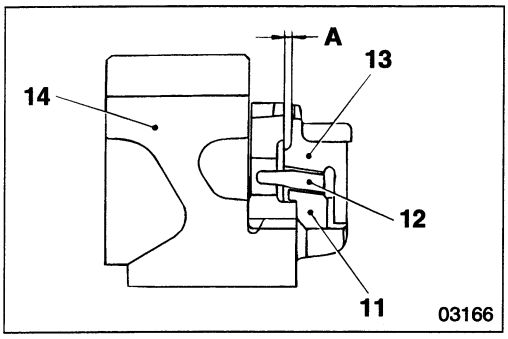
1 6 Removal of mainshaft rear bearing inner race and 1st gear bearing sleeve

https://truckmanualshub.com/



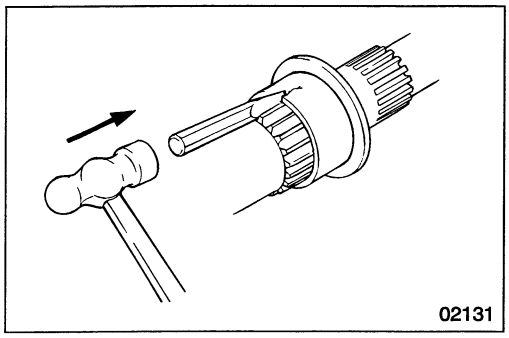
2 **Installation of 1st gear thrust washer**

A : Oil groove

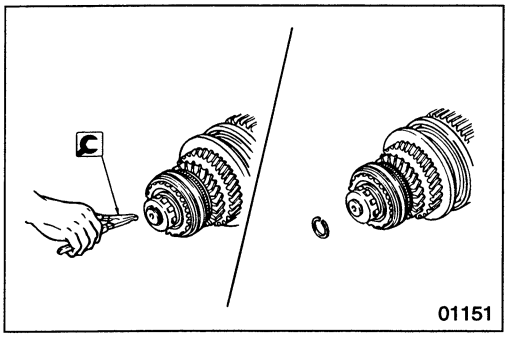


13 **14** **Clearance between synchronizer outer ring and 2nd gear assembly**

- Measure clearance **A** between synchronizer outer ring **13** and the cone of 2nd gear assembly **14**.
- When measuring this value, press synchronizer inner ring **11**, center cone **12** and outer ring **13** evenly and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.

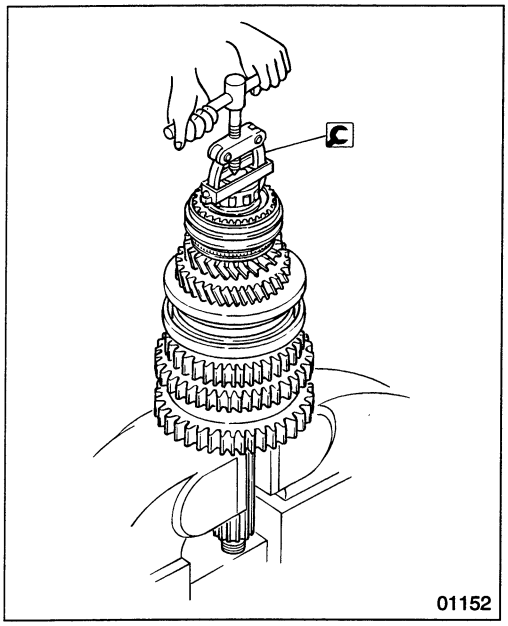


16 **Removal of 2nd gear bearing sleeve**



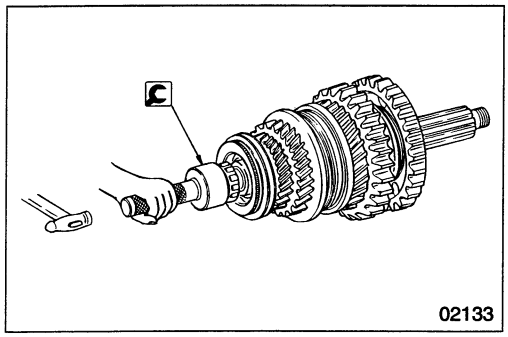
17 **Removal and installation of snap ring**

https://truckmanualshub.com/

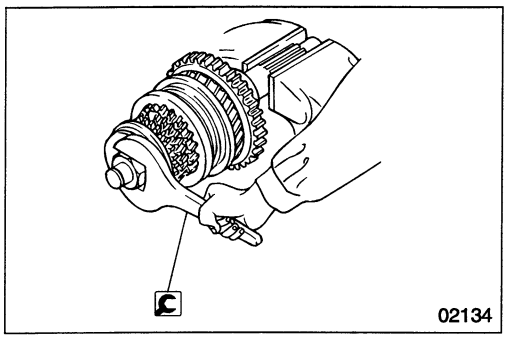


18 **Pilot bearing**

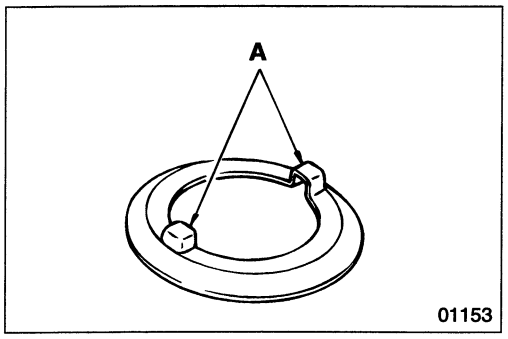
[Removal]



[Installation]



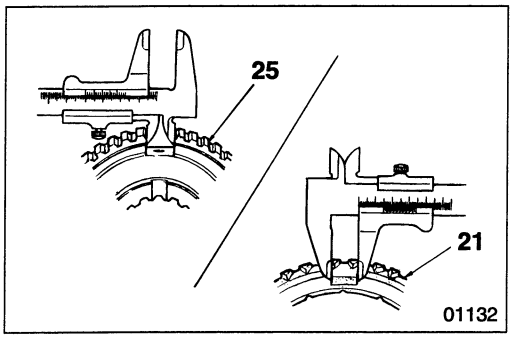
19 **Removal and installation of lock nut**



20 **Installation of lock washer**

Install so that protrusions **A** (two points as illustrated) fit into the grooves of synchronizer hub **25**.

https://truckmanualshub.com/

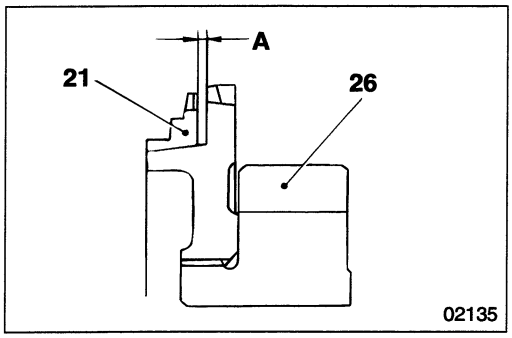


21 to 26 Synchromesh mechanism and 5th gear

[Inspection]

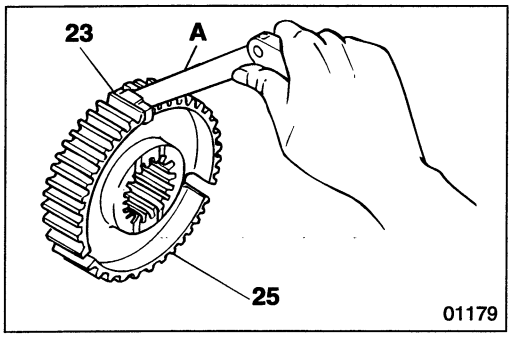
(1) Clearance between the protrusion of synchronizer ring 21 and the groove of synchronizer hub 25

If the measured value is higher than the limit, replace the faulty parts.



(2) Clearance between synchronizer ring 21 and 5th gear assembly 26 or drive pinion

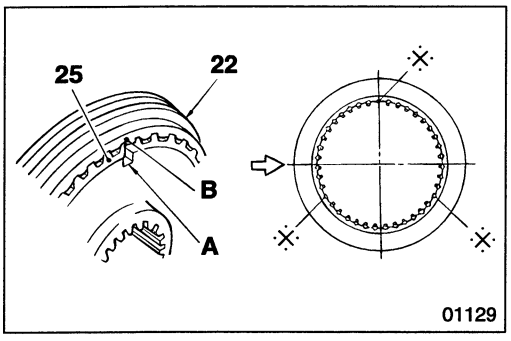
- Measure the clearance between synchronizer ring **21** and the gear cone of 5th gear assembly **26** or drive pinion
- When measuring this value, press synchronizer ring **21** evenly **1** and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.



(3) Clearance between shifting key 23 and synchronizer hub 25.

if the measured value is higher than the limit, replace the faulty parts.

A : Feeler gauge

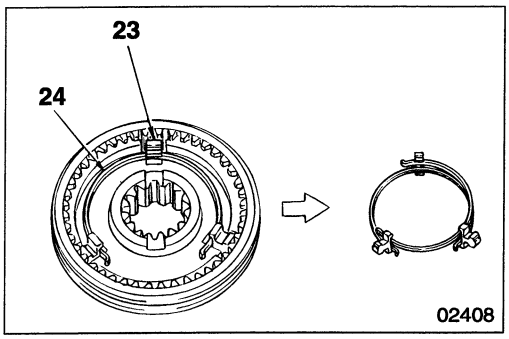


[Installation]

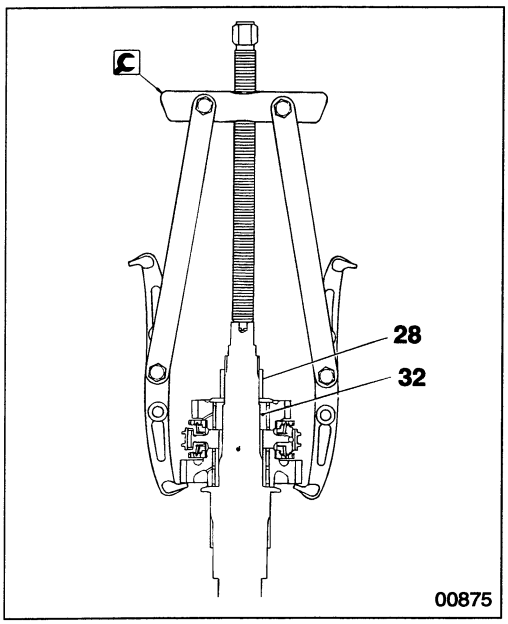
- Align the three keyways **A** of synchronizer hub **25** with the three stub teeth **B** (illustrated by ·⁜· mark) of synchronizer sleeve **22** to install the synchronizer hub.
- To reassemble synchronizer hub **25** and synchronizer sleeve **22**, align the alignment marks made during disassembly.

https://truckmanualshub.com/

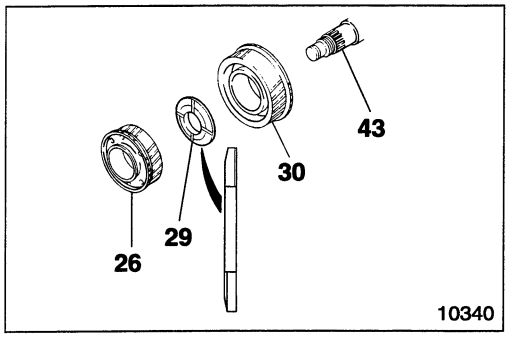
MAINSHAFT ASSEMBLY < S6 DIRECT-DRIVE (D/D) >



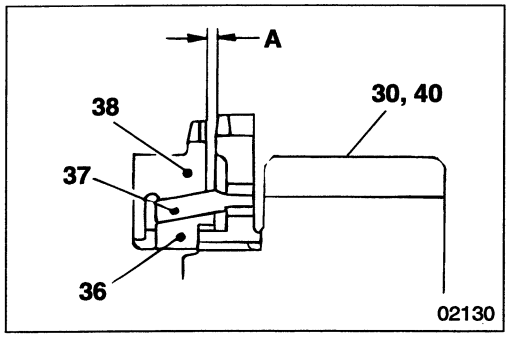
- Insert shifting key **23** into the keyway.
- Install shifting key spring **24** so that its opening is offset from the one on the shifting key.
- Make sure that the openings of shifting key springs do not align with each other.



28 **32** **Removal of 5th gear bearing 4 th sleeves**



29 **Installation of 4th and 5th gear thrust washer**



30 **38** **40** **Clearance between synchronizer outer ring and 3rd gear assembly or 4th gear assembly**

- Measure clearance **A** between synchronizer outer ring **38** and the cone of 3rd gear assembly **40** or 4th gear assembly **30**.
- When measuring this value, press synchronizer inner ring **36**, synchronizer center cone **37** and synchronizer outer ring **38** evenly and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.

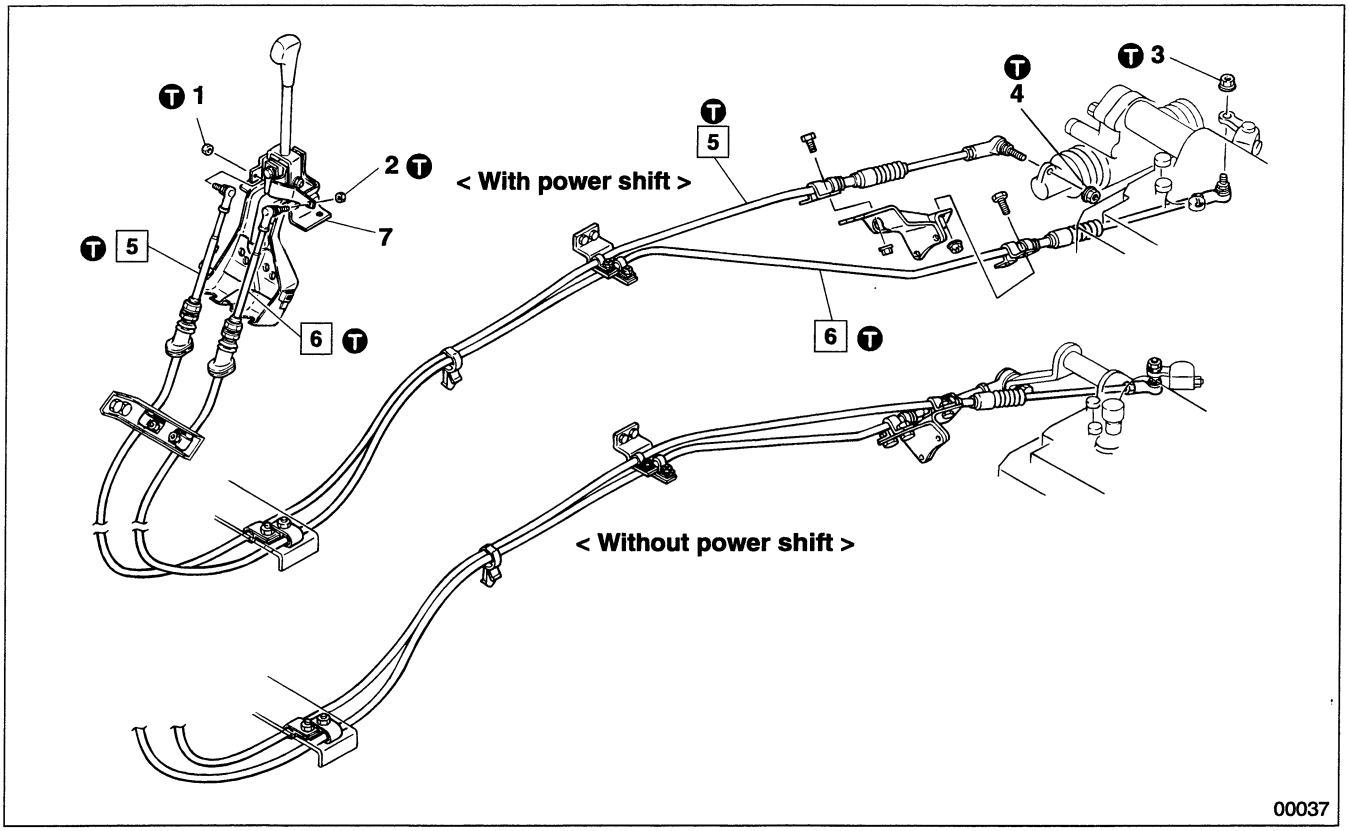
TRANSMISSION CONTROL



For removal and installation of the shift lever console or floor console, refer to Gr 42.

CAUTION

When mounting shift cable 5 and selector cable 6 to the frame, do not mistake the vertical relationship between the shift cable and the selector cable. This relationship is opposite in vehicles with power shift and those without.

● **Disassembly sequence**

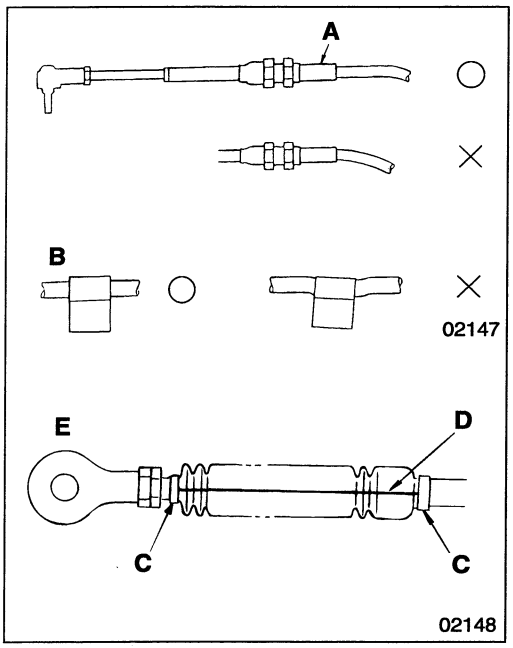
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1 to 4	Nut (Ball joint or rubber damper mounting)	19 to 24 {14 to 17, 1.9 to 2.4}	—
5, 6	Cable lock nut tightening	59 to 83 {43 to 61, 6 to 8.5}	—

https://truckmanualshub.com/

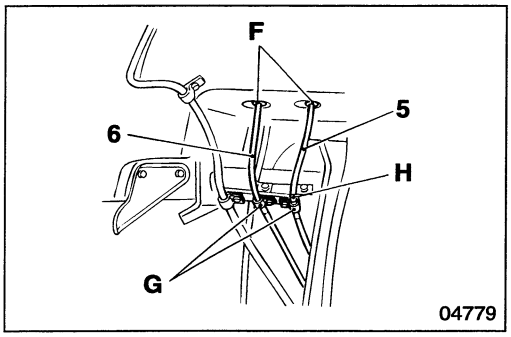
◆ Service procedure



5 **6** **Installation of shift cable and selector cable**

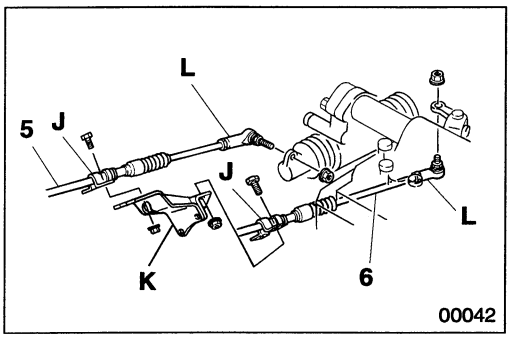
CAUTION⚠

- **Make sure the identification marks on the cable, ball joint L, and rubber damper M point in the right direction when you install the cables. Installing the cables with the identification marks in the wrong direction can remarkably reduce the durability of the cables.**
- **Install casing cap A lengthwise.**
- **Make sure the radius of the bend is 200 mm {7.87 in.} or more.**
- **Make sure the cable operates smoothly.**
- **Install the clamp vertically against the cable. (Figure B)**
- **Do not twist clamps C at both ends of the boot. Make sure that white line D on the boot is straight. (Figure E)**



- Insert shift cable **5** and selector cable **6** under the cab floor and clamp them in the correct place by identifying identification mark **H** on the shift cable. (The selector cable has no identification mark.)
  F : Grommet
  G : Clip

< With Power Shift >



- Install cable clip **J** to bracket **K** temporarily and connect ball joint **L** or rubber damper **M** to the shift lever or selector lever.
- Arrange the cable so that it not twisted, then tighten clip **J** permanently.

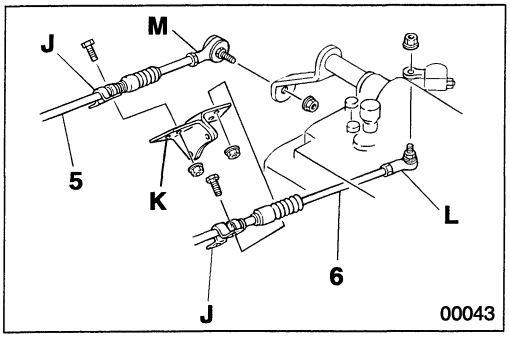
CAUTION⚠

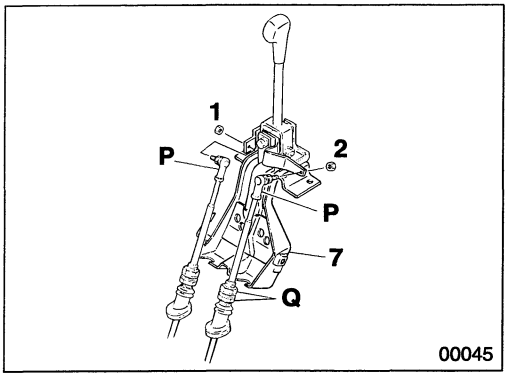
Make sure that ball joint L and rubber dumper M face the correct direction.

https://truckmanualshub.com/

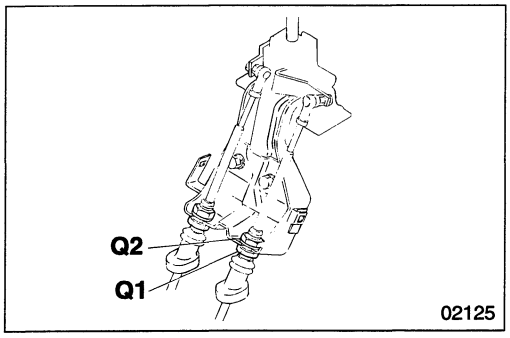
TRANSMISSION CONTROL

< Without Power Shift >





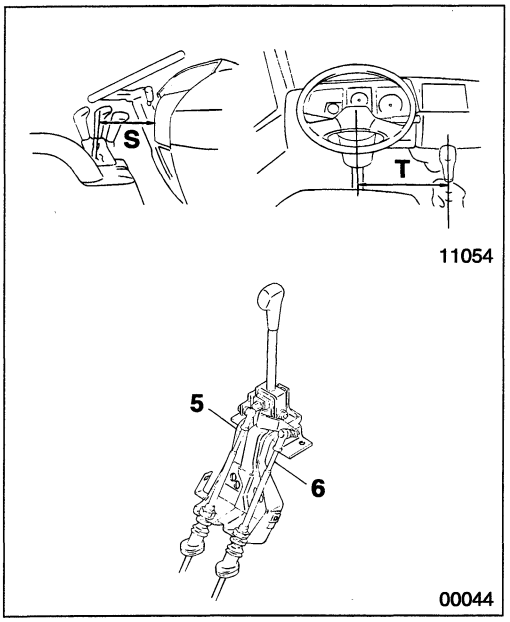
- Tilt the cab down.
- Install the cable on set board assembly **7** temporarily and connect ball joint **P** to shift lever **A** and selector lever **B**.
- Arrange the cable so that it is not twisted, then tighten lock nuts **Q** permanently.



CAUTION⚠

- **Make sure that ball joint L faces the correct direction.**
- **When installing the lock nut, tighten lower nut Q1. Do not move nut Q2.**

- Make sure when you operate the gear shift lever that it shifts smoothly and selects each position.



- If the gear shift lever leans to the front or rear, or to the left or right, excessively, adjust the length of the cable.
- When positioning the gear shift lever, use the distance from the center of the steering wheel or from the instrument panel as the reference distance.

Unit : mm {in.}

Front and rear direction S (Distance from the instrument panel)	Left and right direction T (Distance from the steering wheel center)
214 {8.43}	409 {16.1} (< S5, S6 O/D > 4th and 5th gear position) (< S6 D/D > 3rd and 4th gear position)

12 Mainshaft

The transmission changes revolution and torque generated by the engine into those that match the vehicle's power requirement (driving force). Revolution and torque are increased or decreased by making a selection from several sets of engaged gears. The transmission uses an interlock mechanism to avoid double engagement and the non-backlash mechanism reduces the idling noise of the transmission when the engine is idling.

https://truckmanualshub.com/

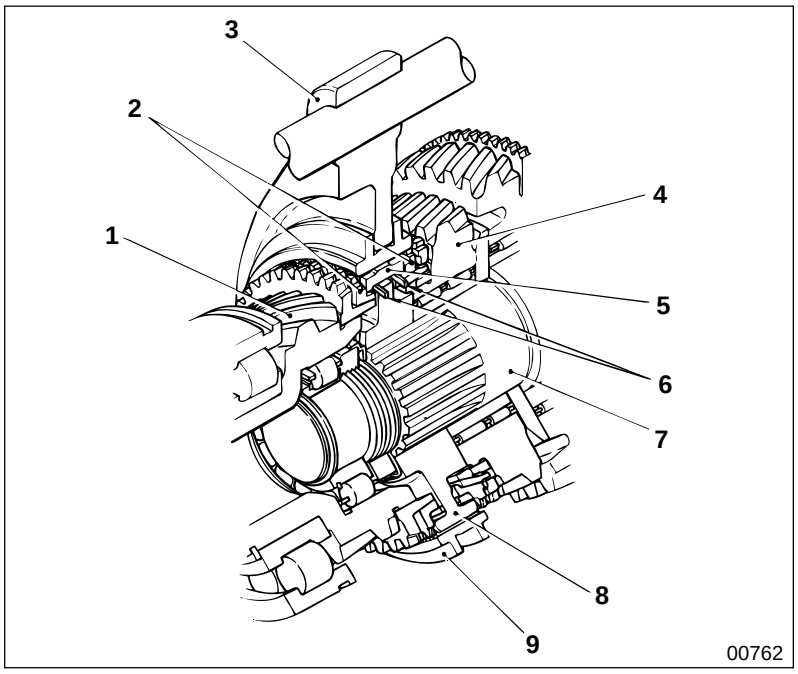
STRUCTURE AND OPERATION

Synchromesh Mechanism

This vehicle has two synchromesh mechanisms, a single cone type, and a double cone type, and uses the key system. The single or double cone type is used depending on the gear positions as shown below:

Transmission model / Synchromesh type	S5	S6
Single cone type	5th	5th, 6th
Double cone type	2nd and 3rd, 4th	2nd, 3rd and 4th

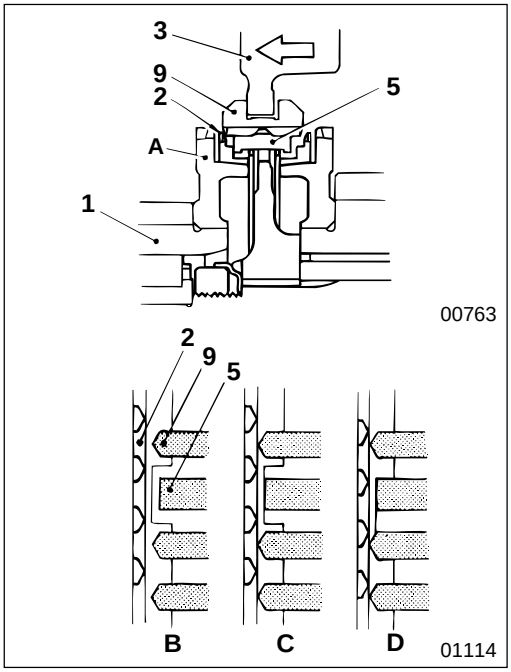
Single Cone Type



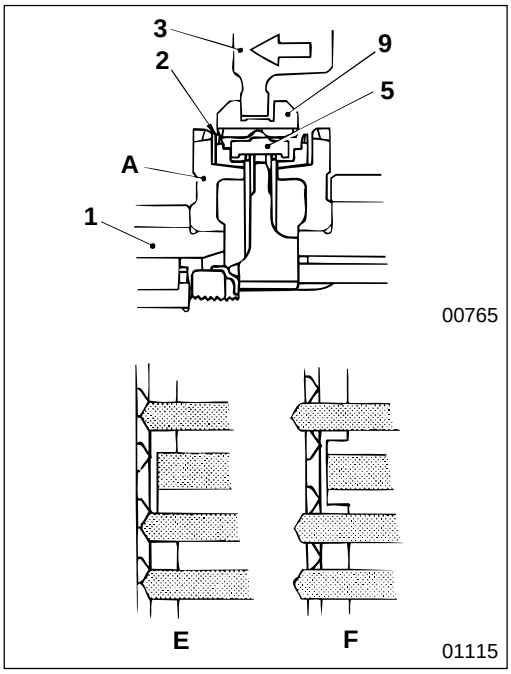
1 Drive pinion (Single cone type)
2 Synchronizer ring
3 4th and 5th shift fork
4 4th gear (Double cone type)
5 Shifting key
6 Shifting key spring
7 Mainshaft
8 Synchronizer hub
9 Synchronizer sleeve

- The following descriptions are for 4th and 5th gear < S5 >
  The inside of synchronizer hub **8** engages the spline of mainshaft **7** and rotates with it. The outside of the synchronizer hub has a spline that engages synchronizer sleeve **9** and three keyways.
- Shifting keys **5** are inserted into these keyways. When the gear shift is in neutral, a protrusion in the center of each shifting key engages a groove inside the synchronizer sleeve and the shifting keys are pressed against the inside of the synchronizer sleeve by shifting key springs **6**.
- Synchronizer rings **2** are inserted into drive pinions **1** in the front and rear of synchronizer hub **8**, and the taper cone of 4th gear **4**.
- The internal tapers of synchronizer rings **2** have fine threads, and the outer splines engage synchronizer sleeve **9**. On the hub side of the synchronizer rings are three keyways in which the ends of shifting keys **5** are inserted. These keyways are wider than the width of the shifting keys.
- Synchronizer rings **2** rotate relative to synchronizer sleeve **9** by the amount of play of the keyways.

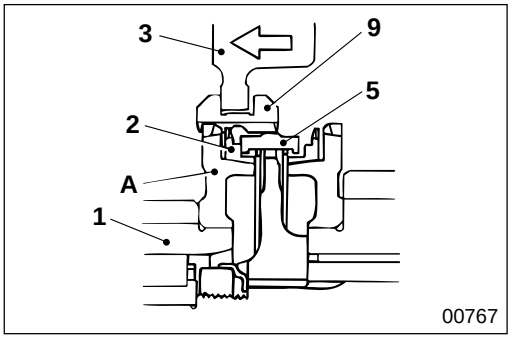
https://truckmanualshub.com/



- When the gear shift is in neutral (Figure **B**), moving shift fork **3** in the direction of the arrow as illustrated, moves synchronizer sleeve **9** slightly to the left. At the same time, shifting key **5**, the central protrusion of which engages the synchronizer sleeve, moves to the left and presses synchronizer rings **2** against taper cone **A** of drive pinion **1**. (Figure **C**)
- When the taper surfaces of synchronizer rings **2** make contact with the taper cone of the drive pinion, the taper surfaces of the synchronizer rings act as cone clutches. This frictional torque rotates the synchronizer rings in the rotating direction of the drive pinion by the amount of play between shifting key **5** and the synchronizer rings. The spline chamfers of the synchronizer rings and the spline chamfer of synchronizer sleeve **9** are offset from each other. (Figure **D**)
- The disengagement direction of synchronizer rings **2** is defined by the speed of rotation of the synchronizer—sleeve **9**, and the synchronized—drive pinion **1**. When increasing the vehicle speed by shifting up, disengagement is made in the opposite direction to rotation, and when decreasing the vehicle speed by shifting down, disengagement is made in the rotating direction.



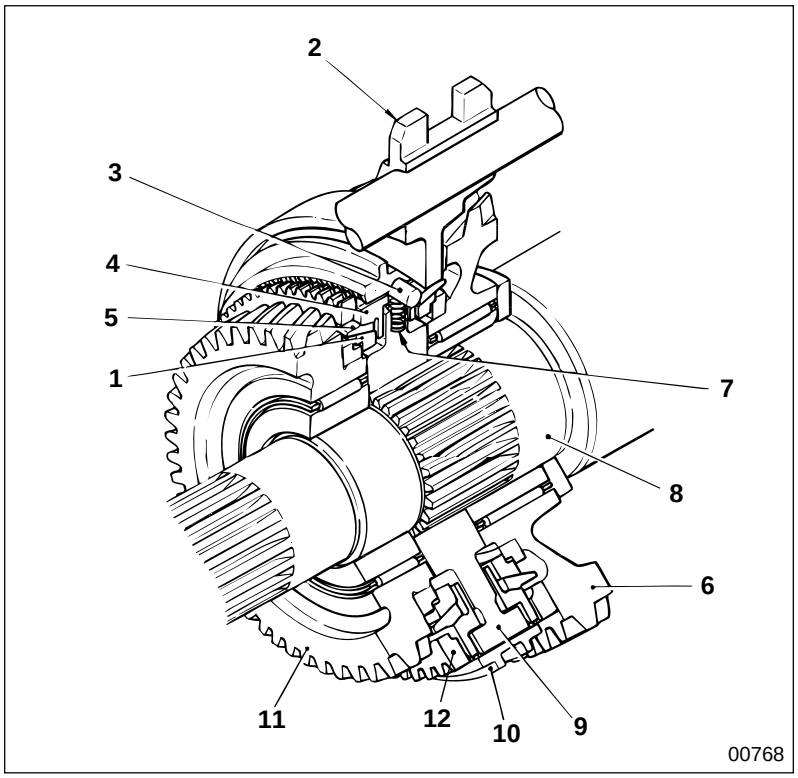
- When synchronizer sleeve **9** moves further to the left, synchronizer rings **2** prevent shifting key **5** from moving, and the synchronizer sleeve disengages from the protrusion of the shifting key.
- Since synchronizer rings **2** remain disengaged, the spline chamfer of synchronizer sleeve **9** presses the spline chamfers of the synchronizer rings, which in turn press the synchronizer rings against taper cone **A** of drive pinion **1**.
- As the frictional torque increases on the taper surfaces, the relative speed of the synchronizer and the synchronized gradually decreases.
  E : In synchronization
  F : After synchronization



- When synchronizer sleeve **9** and drive pinion **1** rotate at the same speed, synchronizer rings **2** no longer prevent the synchronizer sleeve from moving, and the synchronizer sleeve moves further to the left and smoothly engages the spline of taper cone **A** of drive pinion **1**, transmitting the driving force.

https://truckmanualshub.com/

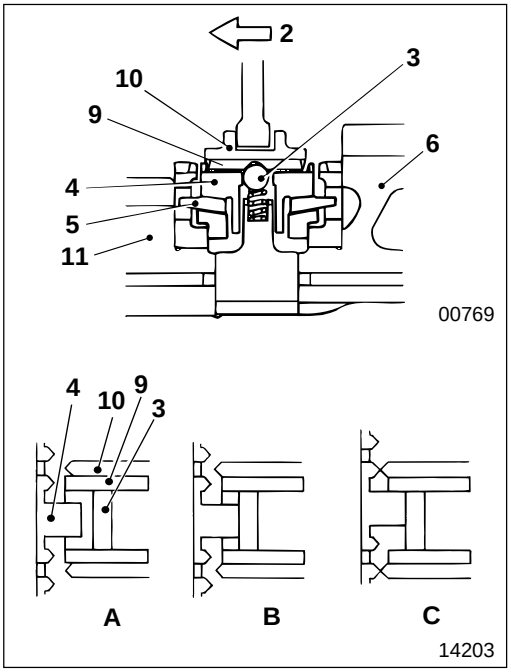
Double Cone Type



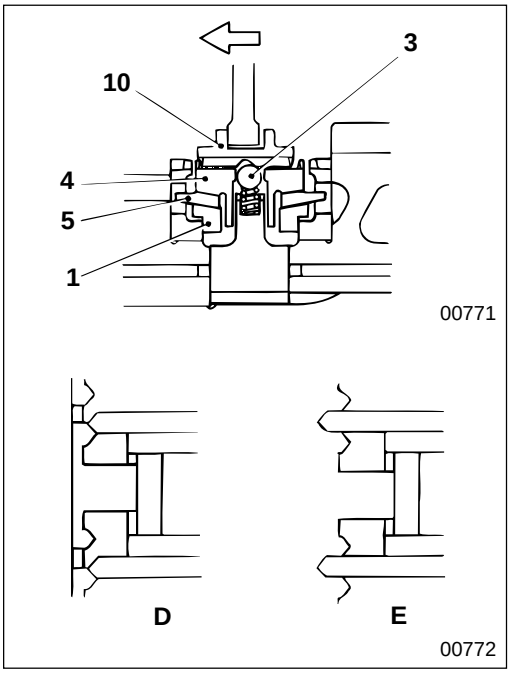
1 Synchronizer inner ring
2 2nd and 3rd shift fork
3 Shifting key
4 Synchronizer outer ring
5 Synchronizer center cone
6 2nd gear
7 Shifting key spring
8 Mainshaft
9 Synchronizer hub
10 Synchronizer sleeve
11 3rd gear
12 Dog clutch

- The following descriptions are for 2nd and 3rd gear < S5 >
  The synchromesh structure and operation of the double cone type are basically the same as for the single cone type.
- Synchronizer center cone **5** is a taper cone independent of 2nd gear **6** and 3rd gear **11**, (both the inside and outside surfaces are tapered). The synchronizer center cone is between synchronizer inner ring **1** and synchronizer outer ring **4** to increase the synchronization capacity.
- Six protrusions on the outside of center cone **5** fit into corresponding gear holes, in the same manner as the taper cone of the single cone type. The center cone and the gear are installed as if integrated.
  Shifting key **3** is a cylinder installed so that the lengthwise direction of the cylinder is at right angles to the diameter direction of synchronizer hub **9**. Shifting key spring **7** is a coil spring inserted in a hole in the synchronizer hub, this spring presses the shifting key against the inside of synchronizer sleeve **10**.
- The 4th gear of the < S5 > model uses the double cone type; however, the structure of shifting key **3** and shifting key spring **7** is the same as for the single cone type.

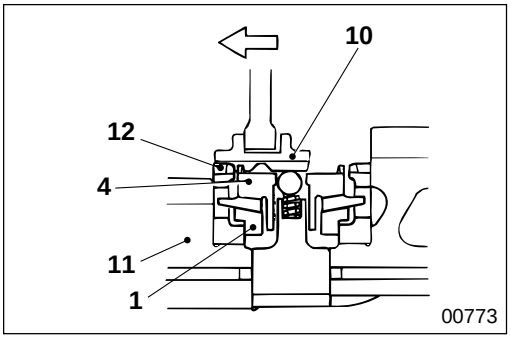
https://truckmanualshub.com/



- When the gear shift is in neutral (Figure **A**), moving shift fork **2** in the direction of the arrow as illustrated, moves synchronizer sleeve **10** slightly to the left. At the same time, shifting key **3**, the central protrusion of which engages the synchronizer sleeve, moves to the left and presses synchronizer outer ring **4** against synchronizer center cone **5**. (Figure **B**)
- When the taper surface of synchronizer outer ring **4** makes contact with the taper cone of synchronizer center cone **5**, the taper surface of the synchronizer outer ring acts as a cone clutch. This frictional torque rotates the synchronizer outer ring in the rotating direction of 3rd gear **11** by the amount of play between the synchronizer outer ring and synchronizer hub **9**. The spline chamfer of the synchronizer outer ring and the spline chamfer of synchronizer sleeve **10** are offset from each other. (Figure **C**)
- The disengagement direction of synchronizer outer ring **4** is defined by the speed of rotation of the synchronizer—the sleeve, and the synchronized—3rd gear **11**. When increasing the vehicle speed by shifting up, disengagement is made in the opposite direction to rotation, and when decreasing the vehicle speed by shifting down, disengagement is made in the rotating direction.



- When synchronizer sleeve **10** moves further to the left, synchronizer outer ring **4** prevents shifting key **3** from moving, and the synchronizer sleeve disengages from the protrusion of the shifting key.
- Since synchronizer outer ring **4** remains disengaged, the spline chamfer of synchronizer sleeve **10** presses the spline chamfer of the synchronizer outer ring, which in turn presses the synchronizer outer ring against the taper cone of synchronizer center cone **5**, and the frictional torque acts on the taper surface.
- As the frictional torque increases on the taper surface of synchronizer inner ring **1**, the relative speed of the synchronizer and the synchronized gradually decreases. The frictional torque acts on both sides of the synchronizer center cone. The double cone type has greater capacity for synchronization than the single cone type.
  D : In synchronization
  E : After synchronization

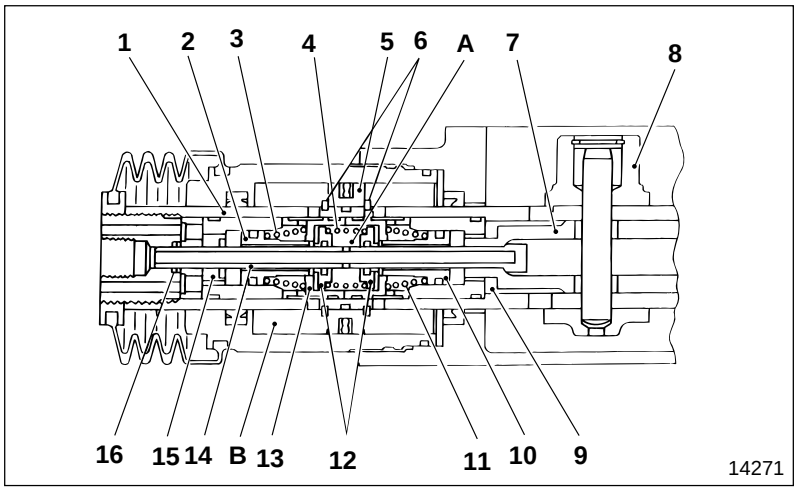


- When synchronizer sleeve **10** and 3rd gear **11** rotate at the same speed, synchronizer outer ring **4** no longer prevents the synchronizer sleeve from moving and the synchronizer sleeve moves further to the left and smoothly engages the spline of dog clutch **12** of the 3rd gear, transmitting the driving force.

https://truckmanualshub.com/

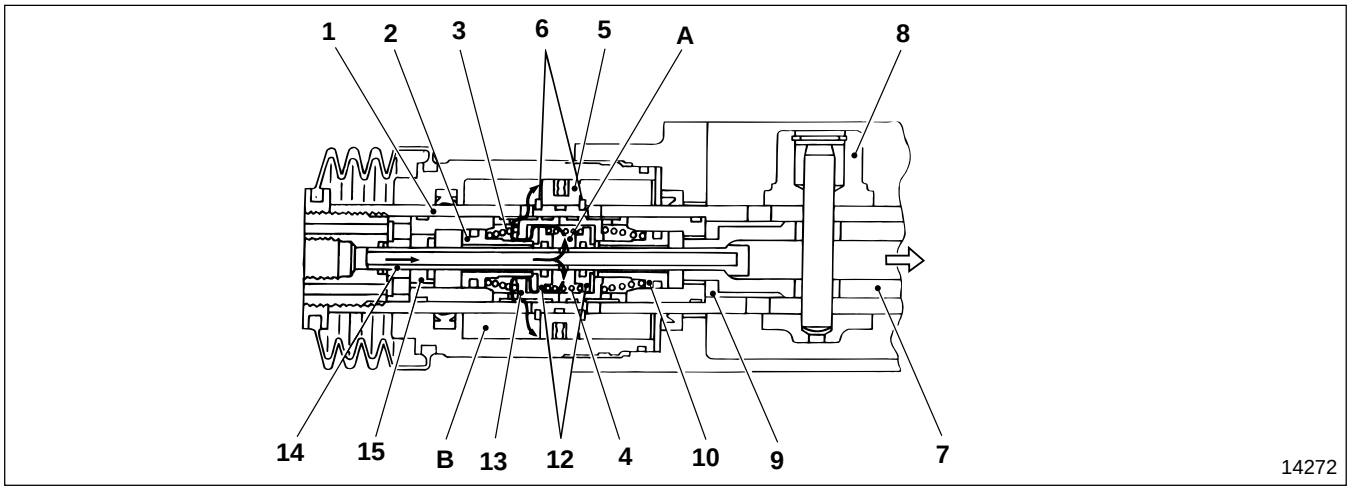
STRUCTURE AND OPERATION

Power Shift



1 Shifter rod
2 Valve lifter
3 No.3 spring
4 No.2 spring
5 Piston
6 Retaining ring
7 Actuating rod
8 Striker
9 Cap
10 Valve lifter
11 No.1 spring
12 Valve seal
13 Valve seat
14 Pipe
15 Retainer
16 Retaining ring

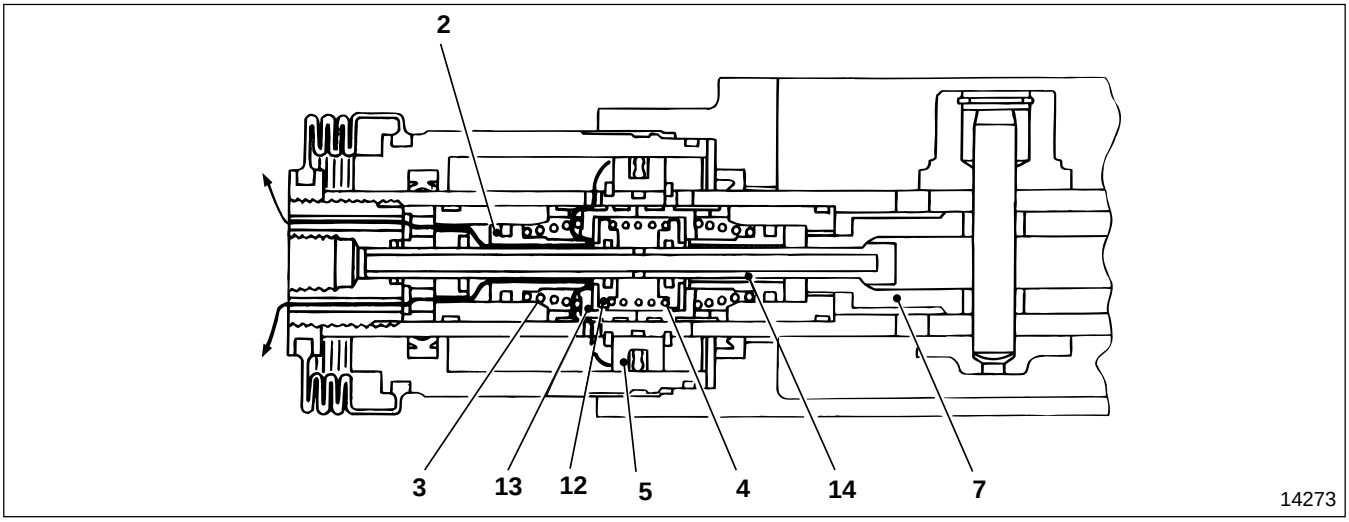
A : Primary side chamber
B : Secondary side chamber



When activated

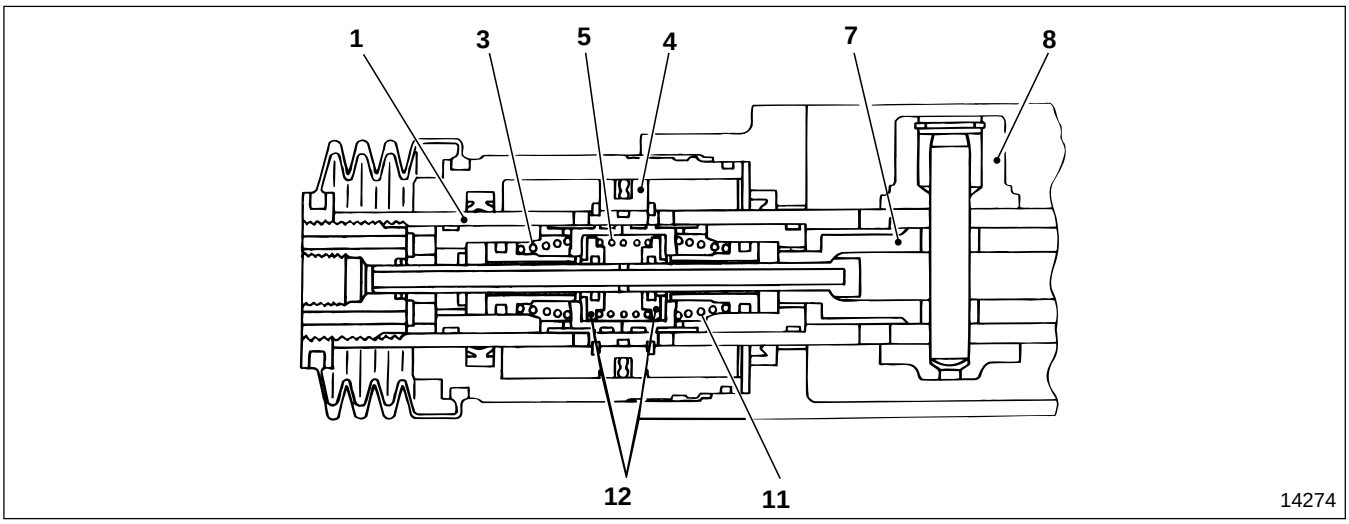
- When actuating rod **7** is moved in the direction of the arrow as illustrated, shifter rod **1** and the actuating rod move relative to this movement.
  Valve lifter **2** presses No.3 spring **3** against valve seal **12** to overcome the combined repercussive forces of the compressed air acting on the valve seal and No.2 spring **4**. The valve seal separates from valve seat **13**, and the compressed air supplied to primary side chamber **A** is let into secondary side chamber **B** via the opening between the valve seat and the valve seal. The compressed air flows into the cylinder through the hole and groove of the valve seal and the vent hole of shifter rod **1** to put pressure on piston **5**, generating output.
- The output given to piston **5** is transmitted to shifter rod **1** via retaining ring **6** to assist striker **8** which is fixed on the shifter rod. This operates the shift fork on the transmission side, shifting the gears. Thus, gear shifting is completed.
- When the power shift operates in the direction of the arrow as illustrated, the input from the gear shift lever is transmitted by actuating rod **7** via cap **9**, pipe **14**, and retainer **15** fixed on retaining ring **16**. For operation in the opposite direction, all operations are the same in principle as in the direction of the arrow as illustrated, except that the end of the cap, fixed on the end of the actuating rod, presses valve lifter **10** directly.

https://truckmanualshub.com/



When releasing

- When gear shifting is completed and the input is released, actuating rod **7** is returned to the valve center position (the condition before operation) by the combined repercussive forces of the compressed air of valve lifter **2**, the steel ball, and valve springs **3**, **4**.
  As the valve lifter returns, valve seal **12** seats against valve seat **13**, cutting off the flow of compressed air from primary side chamber **A** to secondary side chamber **B**. As the input rod returns, clearance is generated between the valve lifter and the valve seal.
- The compressed air in the cylinder of secondary side chamber **B** is discharged into the atmosphere through the clearance between valve lifter **2** and pipe **14**. This eliminates the pressure difference between the chambers on both sides of piston **5**, so output is lost.

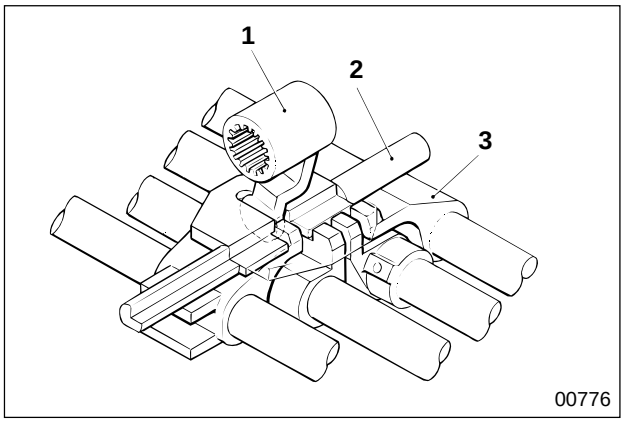


When not operating (non-boosting)

- To operate the power shift, that is, to open the valve and let the compressed air into the output chamber, actuating rod **7** on the input side and shifter rod **1** on the output side must generate relative disengagement.
- When the operating force is transmitted from the gear shift lever to actuating rod **7**, and the resistance on the transmission side is less than the combined repercussive forces working on the relative disengagement of the input side and output side (repercussive forces of No.1 to 3 springs, **3**, **4**, **11**; pressure on valve seal **12**; and sliding resistance on various parts), the mechanism, from the actuating rod to striker **8**, is integrated and does not generate relative disengagement. Therefore, the valve does not open, and without boosting operation, piston **5** moves in the cylinder to shift gears.

https://truckmanualshub.com/

Interlock Mechanism



In the interlock mechanism, the rail beneath interlock plate **2** locks jaws **3**, (apart from the jaws shifted by gear shift slide lever **1**), preventing double engagement of gears.

https://truckmanualshub.com/

Possible causes \ Symptoms			Gears slip out of engagement	Gears hard to engage	Noise when engine is idling	Noise while cruising	Noise when changing gear
Transmission body faulty	Mainshaft rear lock nut loose		○	○			
	Mainshaft thrust washer worn		○	○			
	Mainshaft bearing worn or damaged		○	○			
	Synchronizer ring and synchronizer sleeve spline worn		○				
	Synchronizer ring and gears taper cone area worn			○			
	Mainshaft pilot bearing worn or damaged				○	○	
	Drive pinion bearing worn or damaged				○		
	Countershaft bearing worn or damaged				○		
	Needle bearings of gears worn or damaged				○	○	
	Mainshaft and countershaft bearings worn or damaged					○	
	Mainshaft and countershaft gears backlash excessive					○	
	Spline of gears worn						○
	Gears damaged					○	
	Gear oil insufficient					○	
Control mechanisms faulty	Control cable joint play		○	○			
	Set board assembly bushings worn		○				
	Shift rail steel ball and groove worn		○				
	Shift rail poppet spring fatigued or damaged		○				
	Shift rail sliding movement faulty			○			
	Shift fork jaws worn			○			
	Shift fork bent			○			
Power shift malfunctioning	Air compressor faulty	Gr 35A, B		○			
	Air leakage	Gr 35A, B		○			
	Power shift assembly faulty			○			
Clutch faulty	Clutch disengagement faulty	Gr 21		○			○
	Clutch pedal play faulty	Gr 21		○			
Synchronizer faulty	Contacting surfaces of synchronizer ring and gear taper cone worn						○
	Shifting key worn						○
	Shifting key spring deteriorated or damaged						○
	Synchronizer sleeve worn or damaged					○	○

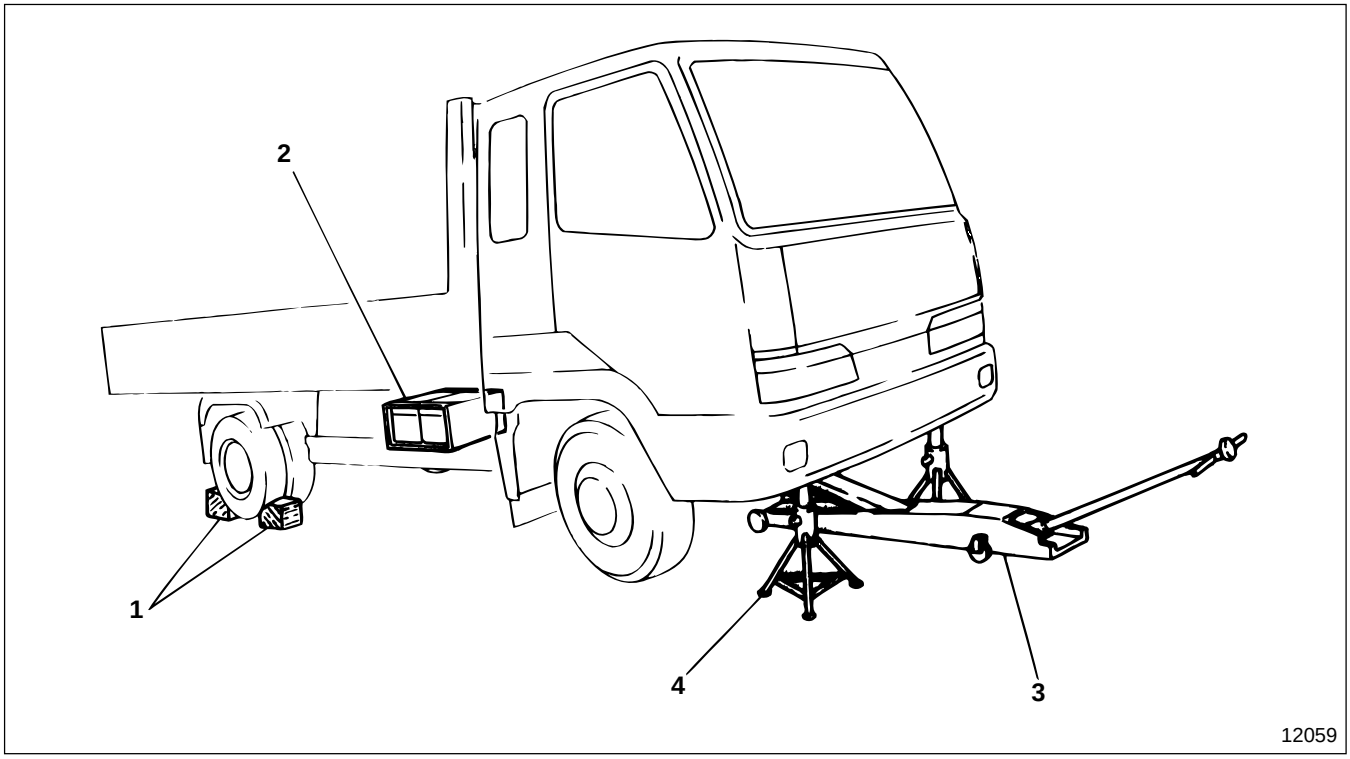
WORK BEFORE REMOVAL AND INSTALLATION OF TRANSMISSION ASSEMBLY



● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect negative battery cable. Gr 54
3 Jack up the front axle on a garage jack.
4 Support the front frame on rigid racks.

WARNING⚠

- **Since the parking brake will be removed, naturally it cannot be used. Therefore, you must chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION⚠

Keep the transmission in neutral throughout the operation.

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

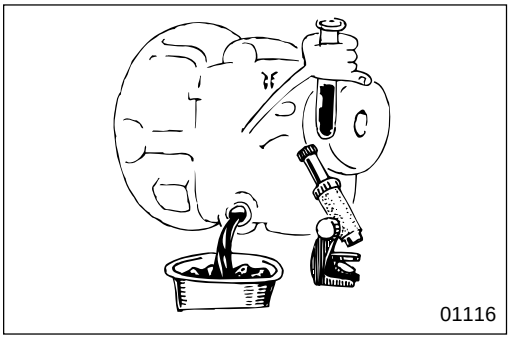
Lubricant and sealant

Location	Points of application	Kinds	Quantity
9	Thread area of inspection plug	THREEBOND 1105D	As required
10, 11	Thread area of drain plug	THREEBOND 1105D	As required
13	Spline of drive pinion	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

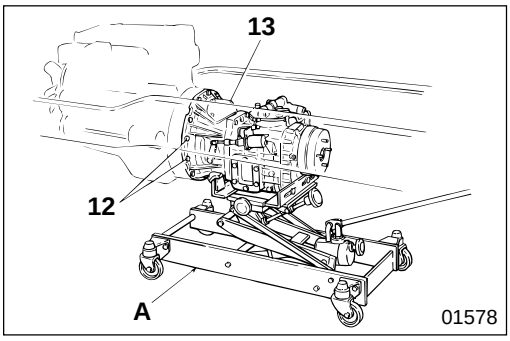
◆ Service procedure



● Oil change

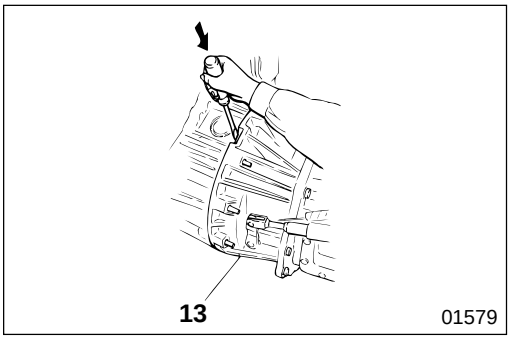
[Draining]
- When draining oil, check the quantity and quality of oil, especially for small pieces of metal and metal dust.
- Clean drain plug **9** before reinstalling it because it is magnetic.

[Filling]
- Check that drain plugs **10**, **11** are tightened at specified torque.
- Pour in gear oil until the oil overflows from the inspection hole. (For oil quantity, see specifications.)



12 Removal of transmission mounting nut or bolt

- Support transmission assembly **13** on transmission jack **A**.
- Tighten transmission mounting nuts or bolts **12**.

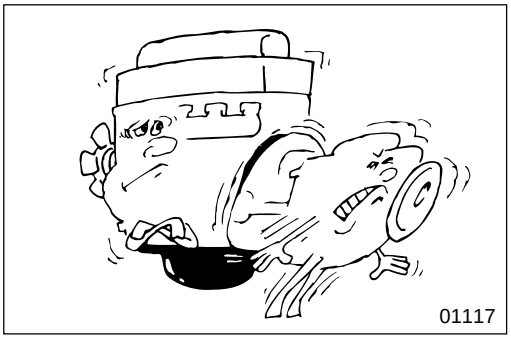


13 Transmission assembly

[Removal]
- Insert a screwdriver into the three removal grooves and pry transmission assembly **13** from the engine.

CAUTION⚠

Make sure that you remove hoses and cables before starting service operations.



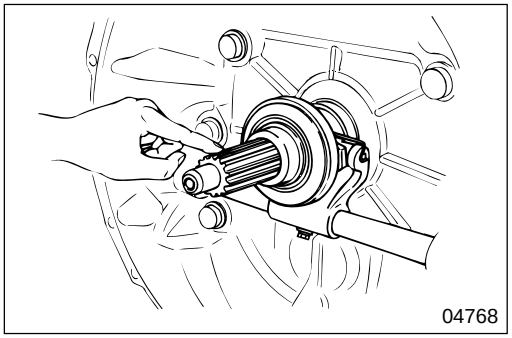
- Move transmission assembly **13** backward until the spline of the drive pinion is detached from the clutch.

CAUTION⚠

Make sure that you pull transmission assembly 13 out in a straight line. If you seesaw the transmission assembly violently, you will damage the spline that connects the drive pinion and the clutch.

https://truckmanualshub.com/

REMOVAL AND INSTALLATION OF TRANSMISSION ASSEMBLY

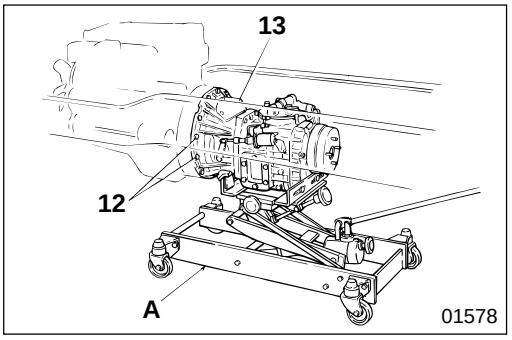


[Installation]

- Check the spline of the drive pinion for rust.
- If rust is found, remove it using a wire brush.
- Rub grease onto the clutch disc sliding surfaces of the drive pinion using your hand.

CAUTION

Make sure that you apply only the necessary amount of grease because too much grease would drip and cause clutch slip.



- Support transmission assembly **13** on transmission jack **A**, and insert the transmission assembly into the pilot bearing of the flywheel paying attention to the drive pinion spline.
- Tighten transmission mounting nuts or bolts **12** at specified torque.

GEAR SHIFTER UPPER AND INTERLOCK PLATE

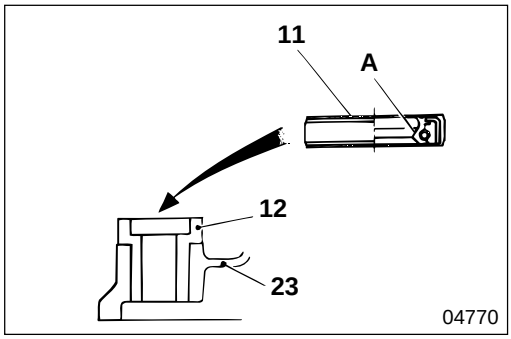
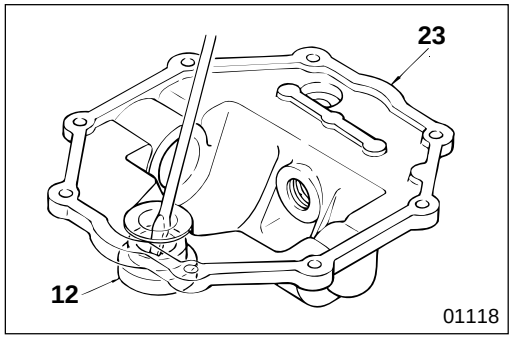
◆ Service procedure



11 Installation of oil seal

- Apply grease to lip area **A** of oil seal **11**.
- Press-fit oil seal **11** into bushing **12** in the direction as illustrated.



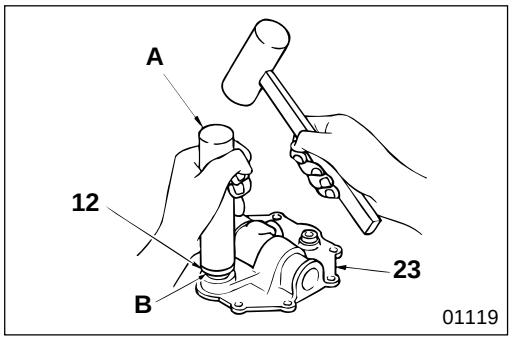
12 Bushing

[Removal]

Remove bushing **12** from selector lever case **23** using a screwdriver.

CAUTION

Be careful not to damage selector lever case 23.

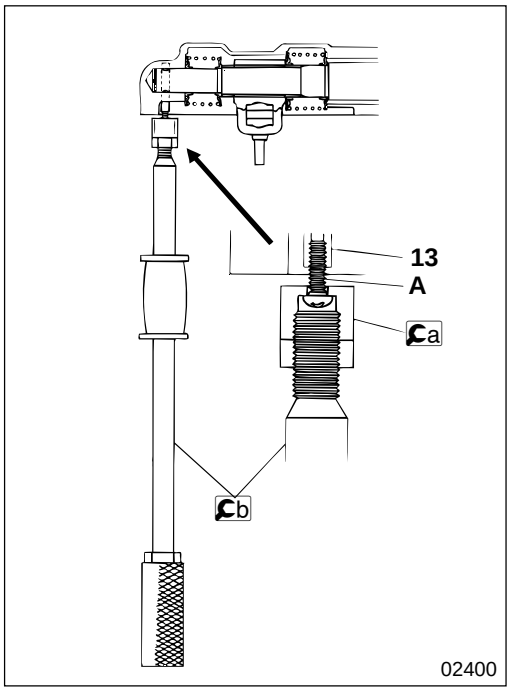


[Installation]

- Clean the inner surface of selector lever case **23**.
- Press-fit bushing **12** into selector lever case **23** using bar **A** (approximately ø40 mm {1.57 in.}).
- When press-fitting bushing **12**, take care not to damage selector lever case **23**.
- After press-fitting, apply sealant to press-fitted side **B** of bushing **12**.

CAUTION

Prevent sealant from sticking to the inner surface of bushing 12.



13 Removal of spring pin

- Tap spring pin **13** using an M4 tap.
- Insert a spring pin puller with an M4 thread **A** of appropriate length into spring pin **13**.
- Position b reverse shaft puller on a spring pin puller.
- Remove spring pin **13** from selector lever case **23** using a spring pin puller and b reverse shaft puller.

◆ Service Procedure

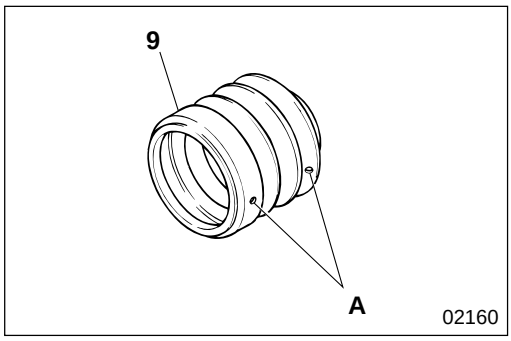
● Inspection before disassembly

(1) Apply 735 kPa {105 lbf/in^2, 7.5 kgf/cm^2} of pressure to the power shift assembly from the connector, check the airtightness when not operating (valve in neutral), and when operating valve is pressed and pulled. If the measured value deviates from the standard value, replace the faulty parts.

Maintenance item	Standard value	
Airtightness when not operating	Decrease of pressure after 15 seconds	9.8 kPa {1.4 lbf/in^2, 0.1 kgf/cm^2}
Airtightness when operating		49 kPa {7.1 lbf/in^2, 0.5 kgf/cm^2}

(2) Measure the sliding resistance in the disengagement direction. If the measured value deviates from the standard value, replace the faulty parts, or grease them.

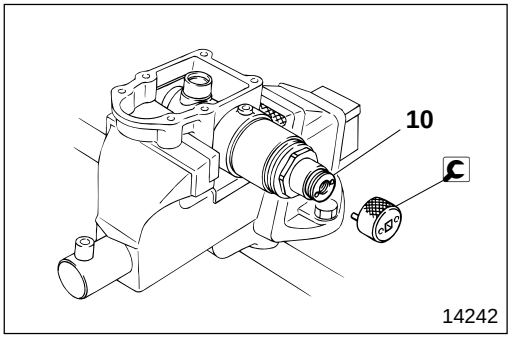
Maintenance item	Standard value
Resistance in shifting direction	39 N {8.8 lbf, 4 kgf}



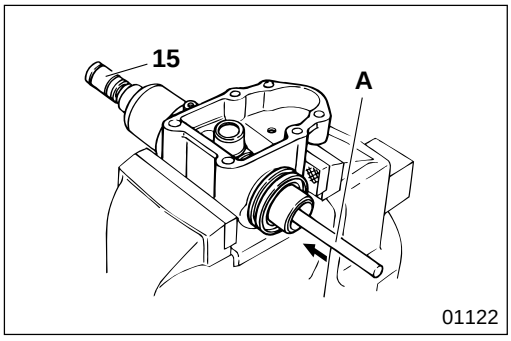
9 **Installation of boot**

When you install boot **9** on housing **52**, point drain holes **A** downward.

https://truckmanualshub.com/



10 Removal and installation of connector

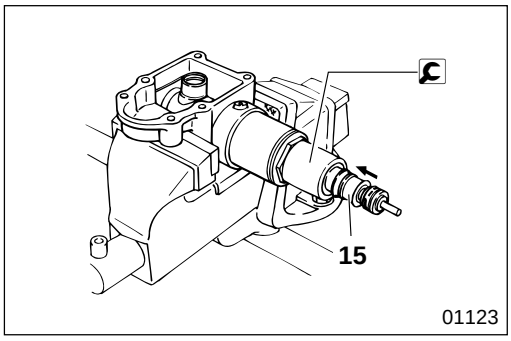


15 Valve assembly

[Removal]
Gently drive valve assembly **15** out from the shifter rod from the lever side using bar **A**.

CAUTION

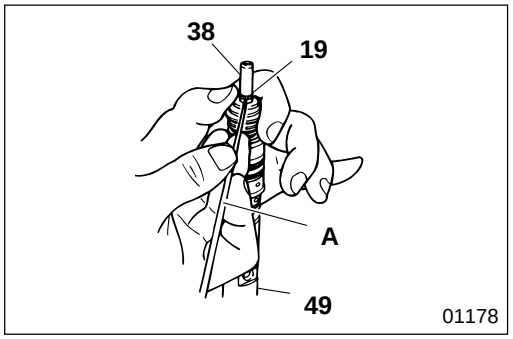
Do not drive valve assembly 15 too hard or you will damage the valve parts.



[Installation]
- Apply grease to valve assembly **15**.
- Install valve assembly **15** into the shifter rod using guide, taking care not to damage the seals.

https://truckmanualshub.com/

POWER SHIFT ASSEMBLY



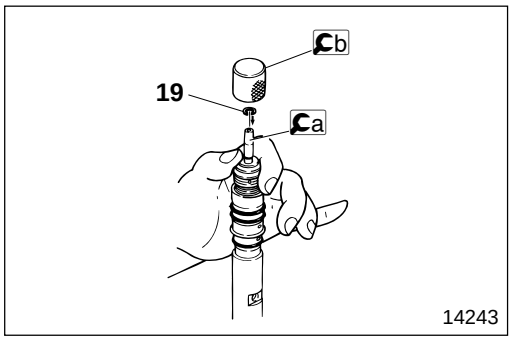
19 **Retaining ring**

[Removal]

- Hold shifter rod **49** in a vise, taking care not to damage the shifter rod.
- Remove retaining ring **19** from pipe **38** using bar **A** as illustrated.

CAUTION

- **After removing retaining ring 19, you can remove all the valve parts.**
- **Keep the valve parts in order to avoid mix ups when installing.**

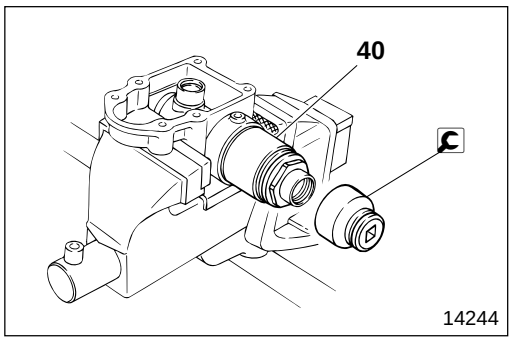


[Installation]

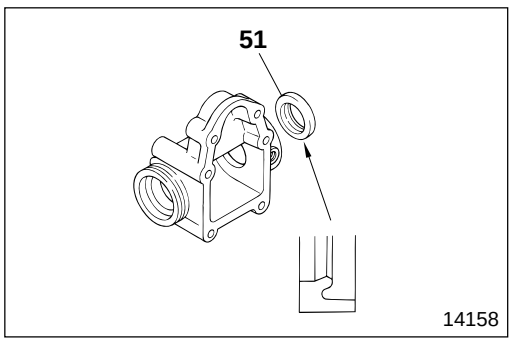
- Install the valve parts on pipe **38**.
- Install a insert tool on pipe **38** end.
- Insert retaining ring **19** into pipe **38** groove using b insert tool.

CAUTION

Be careful not to apply excessive force to retaining ring 19 when you insert it.



40 **Removal and installation of cylinder**



51 **Installation of cup packing and retainer**

◆ Service procedure

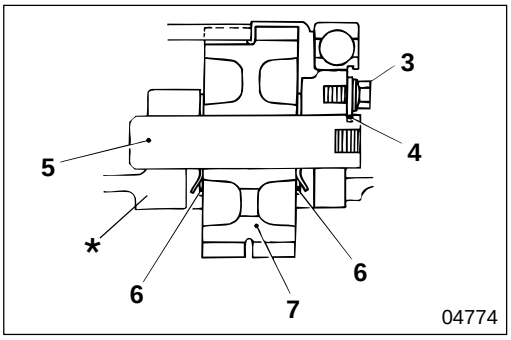
● Inspection before disassembly

Play of reverse idler gear in the diameter direction

- If the measured value is higher than the limit, replace the faulty parts.
- Reinspect play after assembly to check that the measured value is within the limit.



3 to 7 Assembly of reverse idler gear

- Install reverse shaft gear side washer **6** and reverse idler gear **7** in transmission body *****.
- Install reverse idler shaft **5** in transmission body ***** using a plastic-headed mallet.
- Install reverse shaft lock piece **4** in transmission body ***** with mounting bolt **3**.

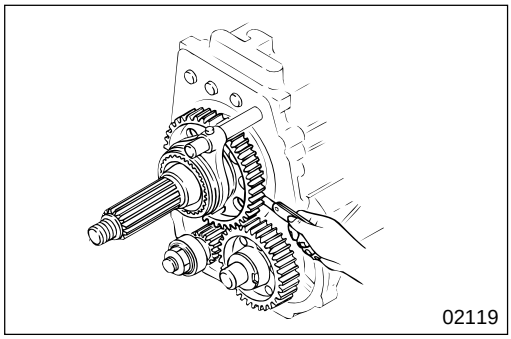
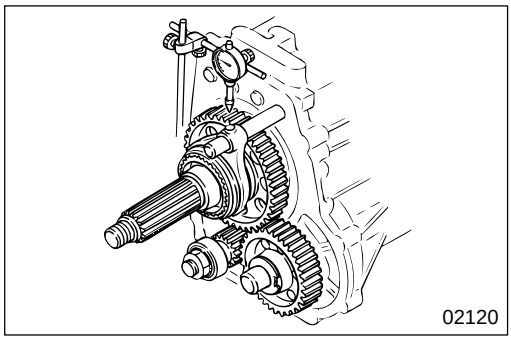
◆ Service procedure



● **Inspection before disassembly**

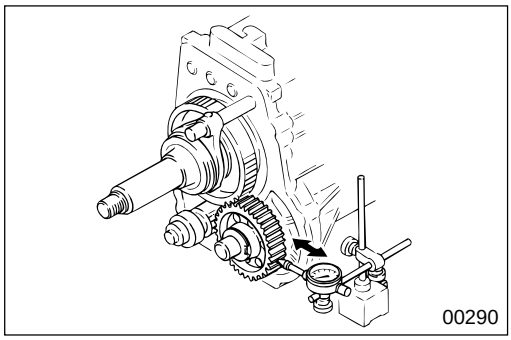
(1) End play of mainshaft reverse gear

- If the measured value is higher than the limit, replace the faulty parts.
- Reinspect play after assembly to check that the measured value is within the limit.



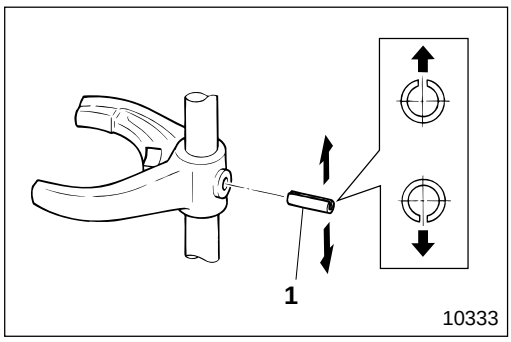
(2) Play of mainshaft reverse gear in diameter direction

- If the measured value is higher than the limit, replace the faulty parts.
- Reinspect play after assembly to check that the measured value is within the limit.



(3) Play of reverse idler gear in diameter direction

- If the measured value is higher than the limit, replace the faulty parts.
- Reinspect play after assembly to check that the measured value is within the limit.



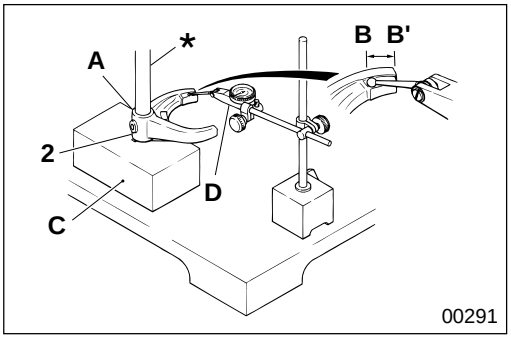
1 **Installation of spring pin**

Install spring pin **1** in reverse gear shift fork **2** in the direction as illustrated.

CAUTION⚠

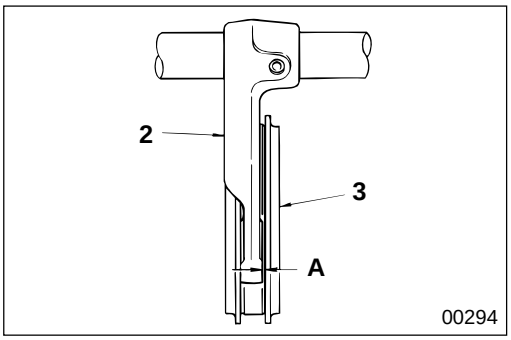
Make sure you do not drive in spring pin 1 fully, leave 0 to 0.5 mm {0 to 0.020 in.} outside to prevent them from slipping out.

https://truckmanualshub.com/



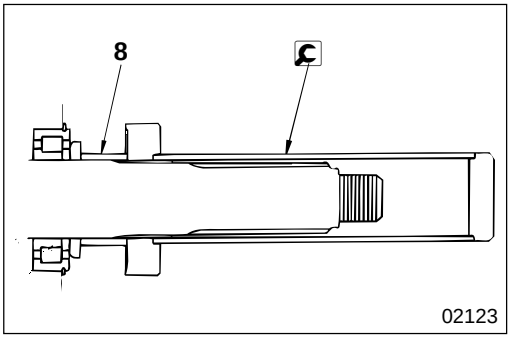
2 **Tilt of reverse gear shift fork claw**

- Measure the tilt (difference between **B** and **B'**) of claw **B**–**B'** against hole **A** of shift rail * of shift fork **2** with the shift rail upright.
- If the measured value is higher than the limit, replace reverse gear shift fork **2**.
  C : V-block
  D : Dial gauge

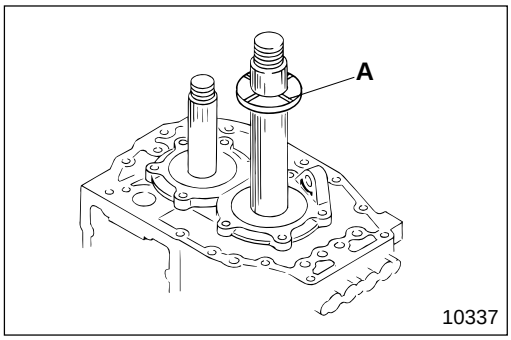


2 **3** **Clearance between reverse gear shift fork and reverse gear shift sleeve**

- Measure clearance **A** between reverse gear shift fork **2** and reverse gear shift sleeve **3**.
- If the measured value is higher than the limit, replace the faulty parts.



8 **Installation of mainshaft reverse gear bearing sleeve**



9 **Installation of thrust washer**

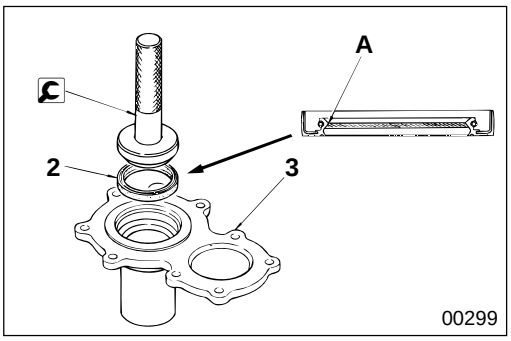
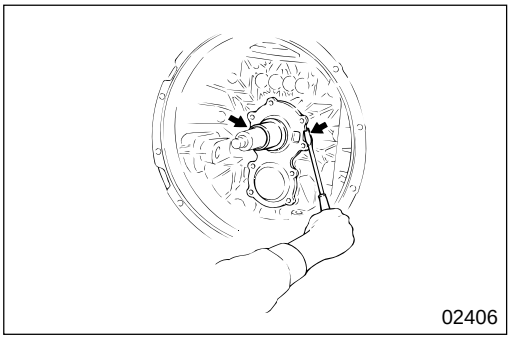
◆ Service procedure



2 Installation of oil seal

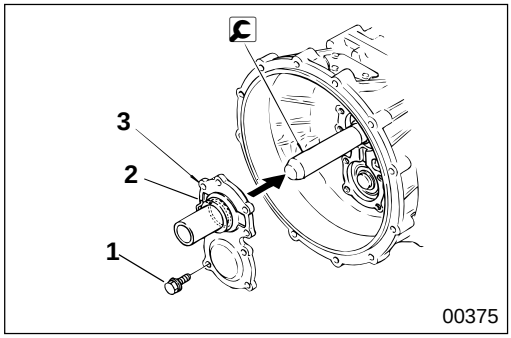
- Apply grease to lip area **A** of oil seal **2**.
- Press-fit oil seal **2** into front bearing retainer **3** in the direction as illustrated using oil seal installer.



3 Front bearing retainer

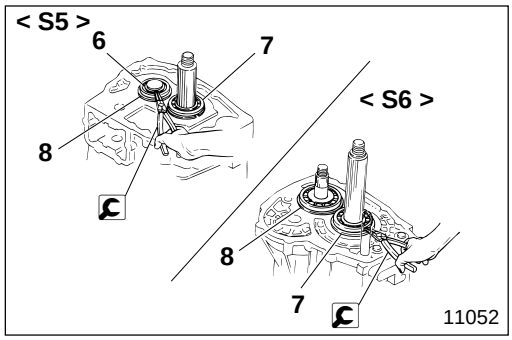
[Removal]

https://truckmanualshub.com/

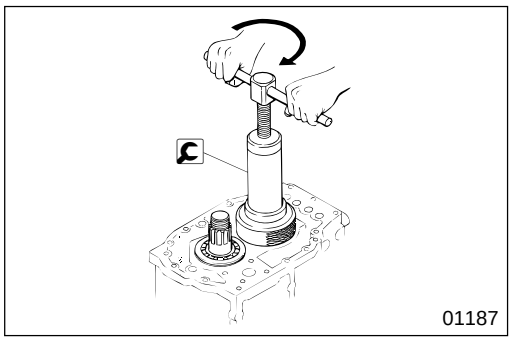


[Installation]
Press-fit front bearing retainer **3** into clutch housing assembly **19** using oil seal front guide.

CAUTION
Be careful when installing front bearing retainer 3, that you do not damage oil seal 2 installed on the front bearing retainer.

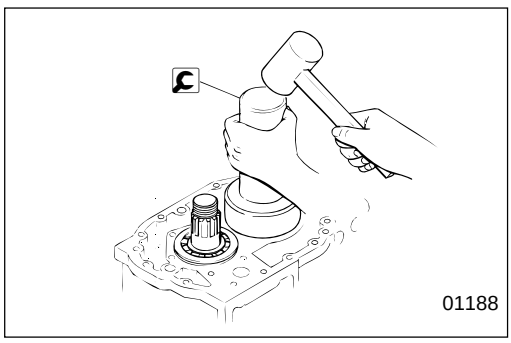


6 to 8 Removal and installation of snap ring

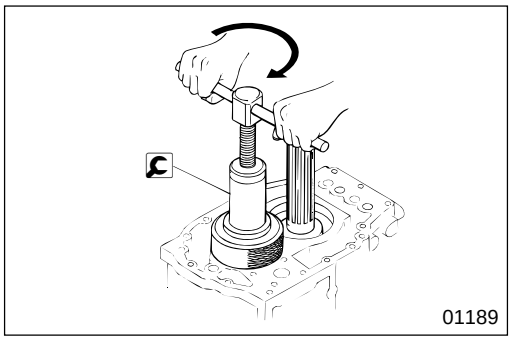


9 Mainshaft rear bearing

[Removal]



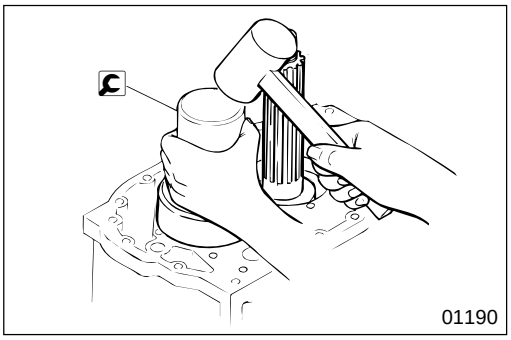
[Installation]



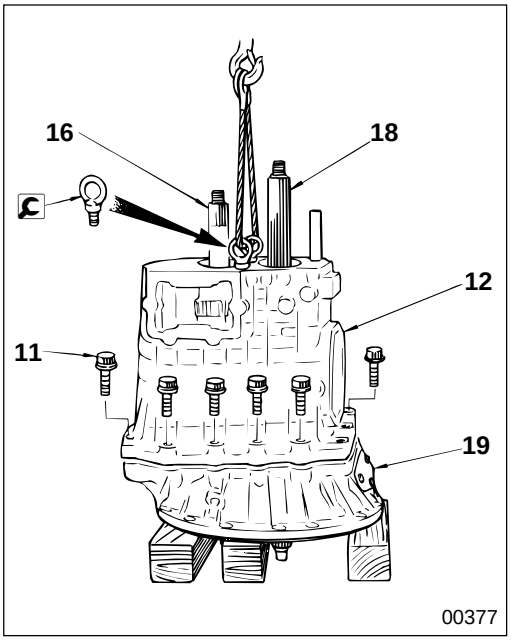
10 Countershaft rear bearing

[Removal]

https://truckmanualshub.com/



[Installation]



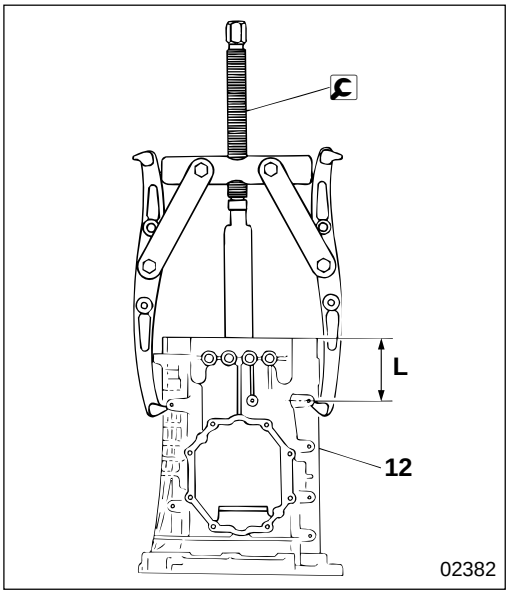
12 Removal and installation of transmission case

[Removal]

● **Remove transmission case 12.**

Method 1

- When lifting up with a crane, install eye bolts on transmission case **12** and pass a steel sling through them.
- After removing bolts **11**, lift transmission case **12** up with a crane and keep hitting the rear ends of clutch housing assembly **19**, mainshaft assembly **18** and countershaft assembly **16**. Use a plastic-headed or copper-headed mallet to remove the transmission case.

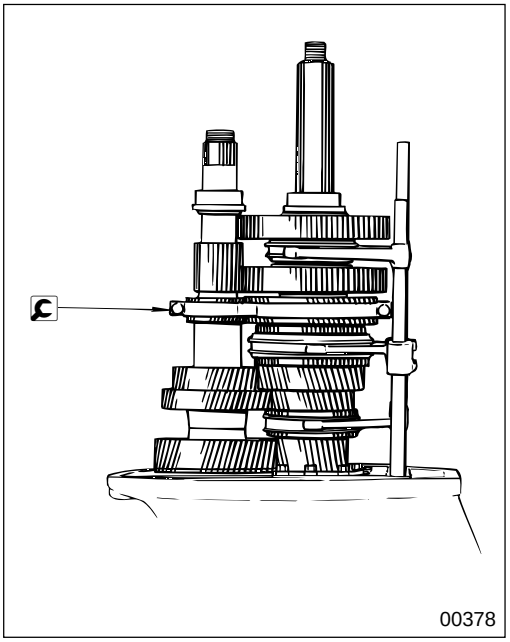


Method 2

- A gear puller can be used instead of a crane.
  Puller installation position

Model	Dimension of L mm {in.}
M060S5	146 {5.75}
M060S6	36 {1.42}
M070S6	93 {3.66}

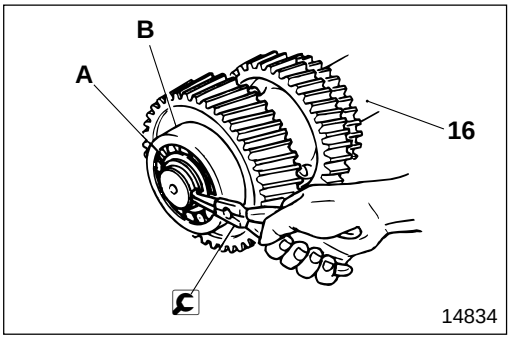
https://truckmanualshub.com/



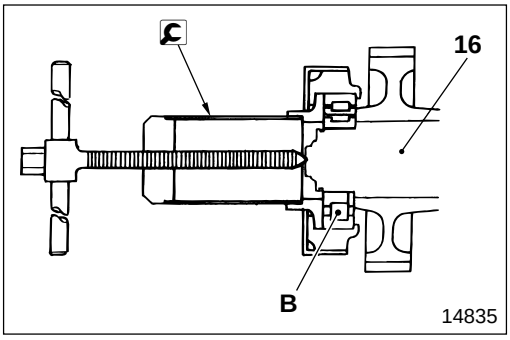
- After removing transmission case **12**, fit the 2nd gear unit < S5 > or 3rd gear unit < S6 > using 🔧 steel lifting band to ensure safety.

CAUTION ⚠

Be sure to tighten 🔧 steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.



- Remove snap ring **A** from countershaft assembly **16**.
  B : Countershaft front bearing



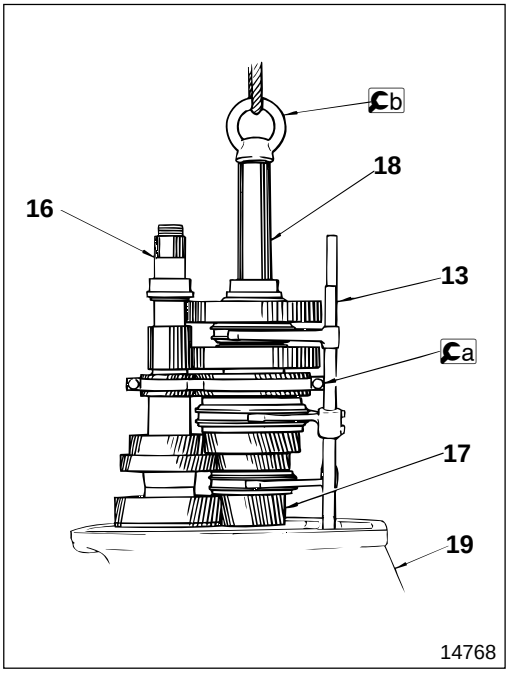
- Remove countershaft bearing **B** from countershaft assembly **16**.

[Installation]
Follow the removal sequence in reverse.

CAUTION ⚠

Be careful not to damage mainshaft assembly 18, or rear bearings 9, 10 of countershaft assembly 16 during installation.

https://truckmanualshub.com/



13 **16** **to** **18** **Shift rail and shift fork, countershaft assembly, drive pinion assembly, and mainshaft assembly**

[Removal]
Remove or install shift rail and shift fork **13**, countershaft assembly **16**, drive pinion assembly **17**, and mainshaft assembly **18** as a group.

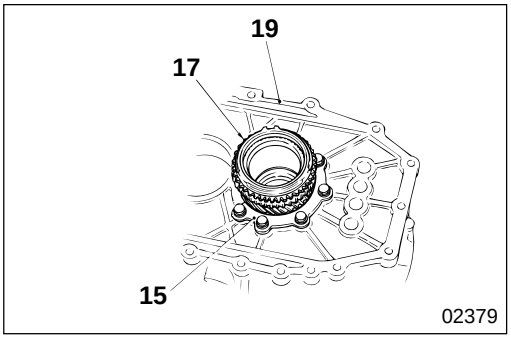
- Before lifting, after removing the case, install b eye nut at the end of mainshaft **18**, fitted with a steel lifting band.
- Fix shift rail and shift fork **13** to mainshaft assembly **18** with a rubber band.
- Fix a piece of wood to clutch housing assembly **19**, and use a crane to lift the clutch housing together with drive pinion assembly **17** up, at the same time hitting them with a plastic-headed mallet to remove them.

CAUTION

- **Be sure to tighten a steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.**
- **Make sure, when lifting mainshaft assembly 18 or other parts, that you support drive pinion assembly 17 with your hand in order to prevent it from falling when the mainshaft assembly and countershaft assembly 16 come apart.**

[Installation]
Method 1

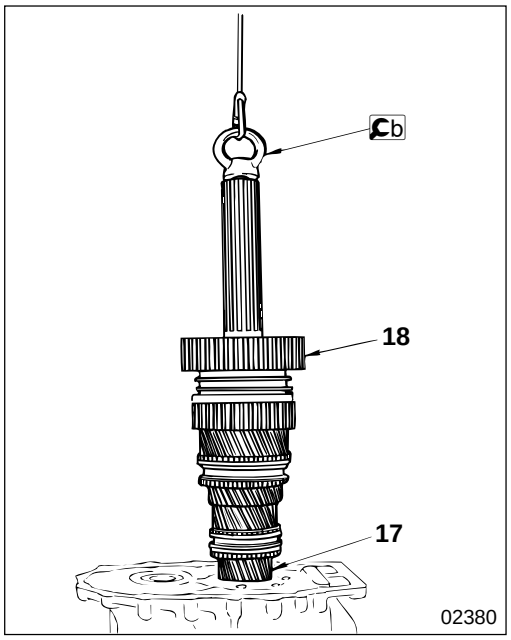
- Follow the removal sequence in reverse.



Method 2

- After installing drive pinion assembly **17** in clutch housing assembly **19**, install drive pinion bearing retainer **15**.

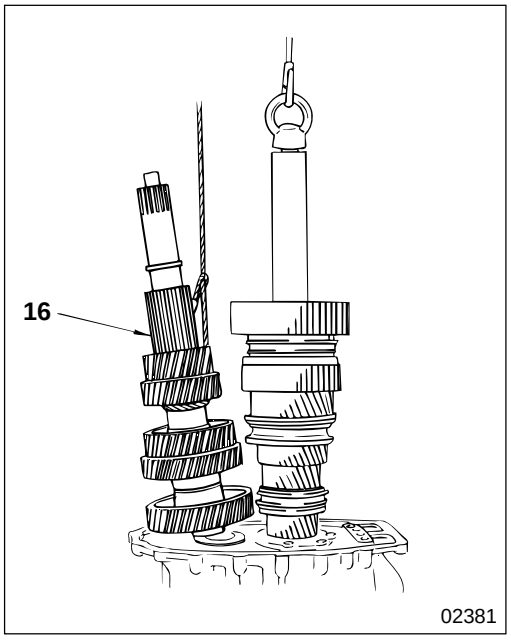
https://truckmanualshub.com/



- Install b eye nut at the end of mainshaft assembly **18**.
- Lift mainshaft assembly **18** up using a crane and install the mainshaft assembly on drive pinion assembly **17**.

CAUTION

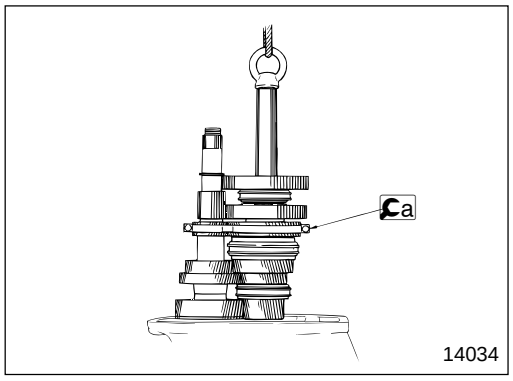
To prevent mainshaft assembly 18 from falling, support it using a crane.



- Install countershaft assembly **16** in clutch housing assembly **19**.

CAUTION

If you use this method of installation, first remove the countershaft front bearing. 🕮 P22A-76

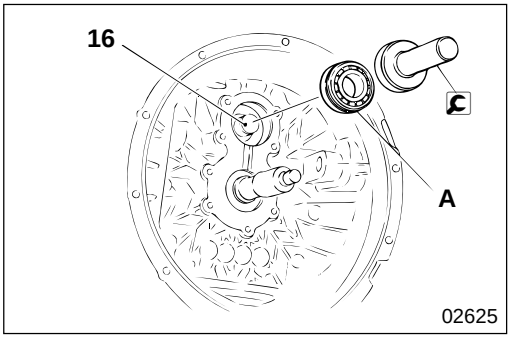


- Fit the 2nd gear unit using a steel lifting band to ensure safety.

CAUTION

Be sure to tighten a steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.

https://truckmanualshub.com/



- Install shift rail and shift fork **13** and transmission case **12** in clutch housing assembly **19**.
- Place cluch housing assembly **19** horizontally so that countershaft assembly **16** is uppermost.
- Install the countershaft front bearing **A** into clutch housing assembly **19** using countershaft bearing installer.

CAUTION

Be sure to install the snap ring of the countershaft front bearing.

https://truckmanualshub.com/

◆ Service procedure

● Work before disassembly

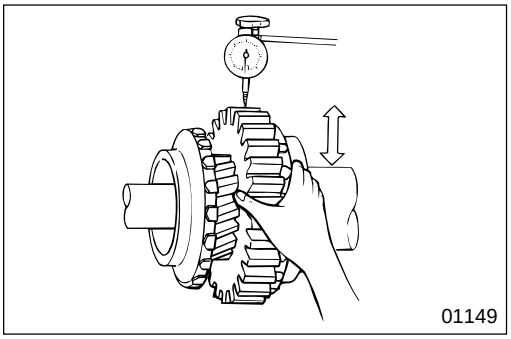
[Inspection]

(1) End play of gears

A : Reverse gear
B : 2nd gear
C : 3rd gear
D : 4th gear
E : 1st gear

If the measured value is higher than the limit, replace the faulty parts.

Also inspect this item after assembly and make sure that the measured value is within the limit.

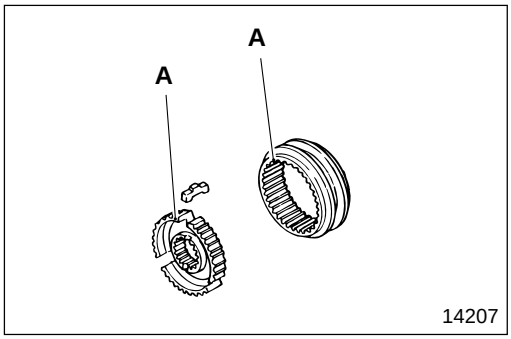


(2) Play of gears in diameter direction

If the measured value is higher than the limit, replace the faulty parts. Also inspect this item after assembly and make sure that the measured value is within the limit.

CAUTION⚠

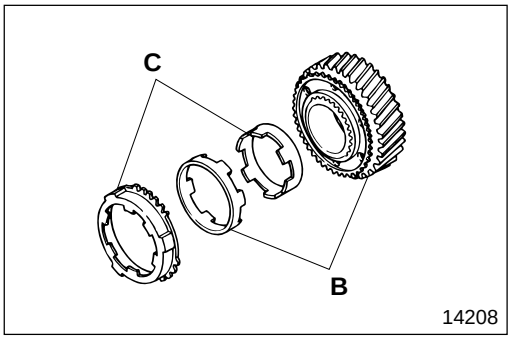
Be sure when you replace the two needle bearings of a gear, that both needle bearings are from the same color package.



[Alignment marks]

(1) Synchronizer sleeve and synchronizer hub

Before disassembling the synchronizer sleeve and the synchronizer hub, put alignment marks **A** on the places where the shifting keys are installed. When reusing parts, align the alignment marks to assemble.

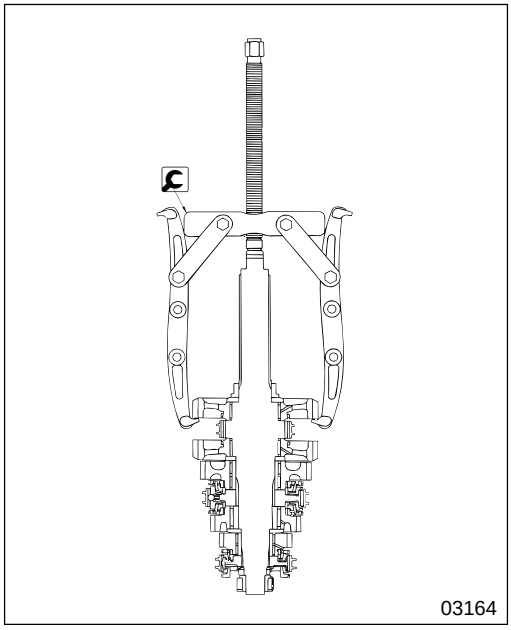


(2) Ring, cone and gear assembly of double cone synchronizer

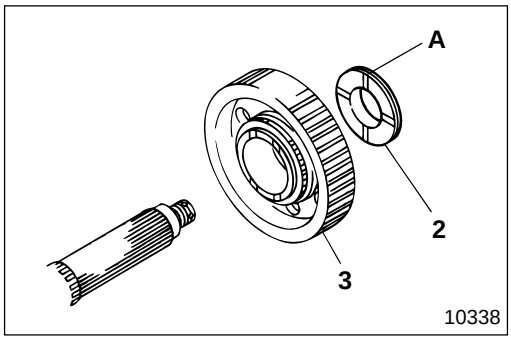
Before disassembling synchronizer center cone and gear assembly (**B**), and synchronizer center ring and synchronizer outer ring (**C**), put alignment marks on them. When reusing parts, align the alignment marks to assemble.

https://truckmanualshub.com/

MAINSHAFT ASSEMBLY < S5 >

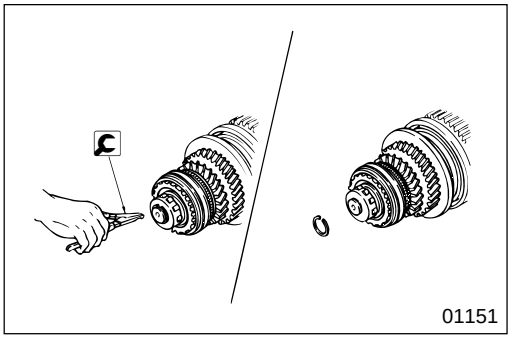


1 **Removal of mainshaft rear bearing inner race**



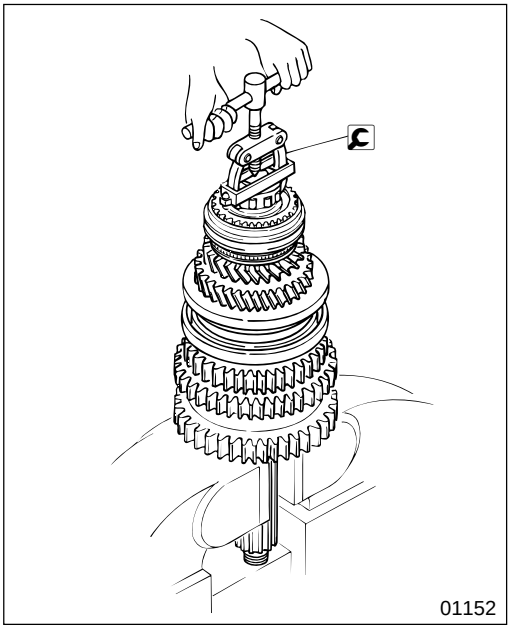
2 **Installation of reverse gear thrust washer**

A : Oil groove



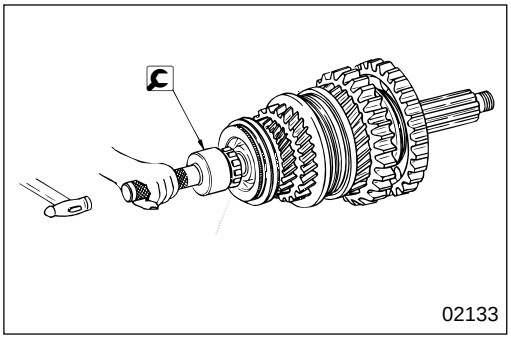
6 **Removal and installation of snap ring**

https://truckmanualshub.com/

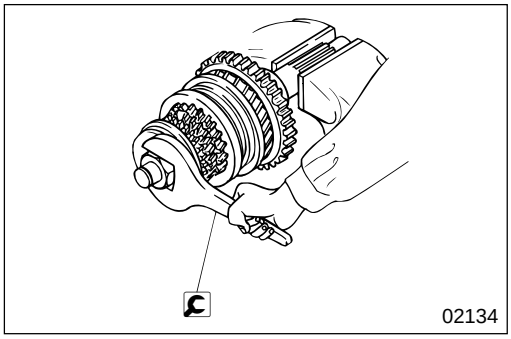


7 **Pilot bearing**

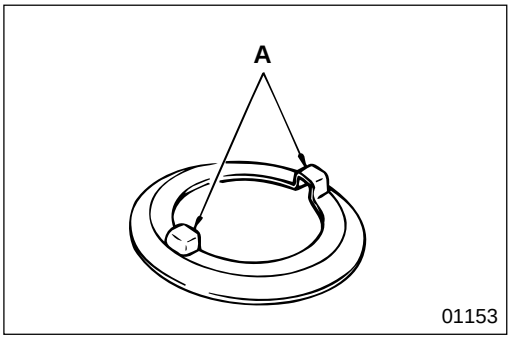
[Removal]



[Installation]



8 **Removal and installation of lock nut**

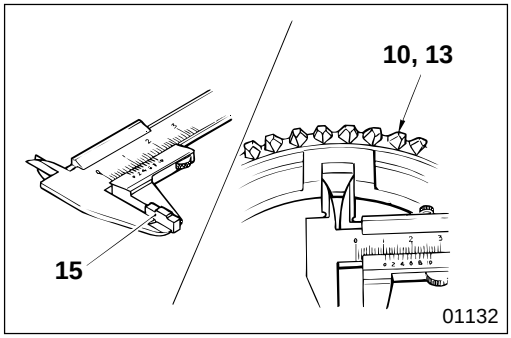


9 **Installation of lock washer**

Install so that protrusions **A** (two points as illustrated) fit into the grooves of synchronizer hub **17**.

https://truckmanualshub.com/

MAINSHAFT ASSEMBLY < S5 >

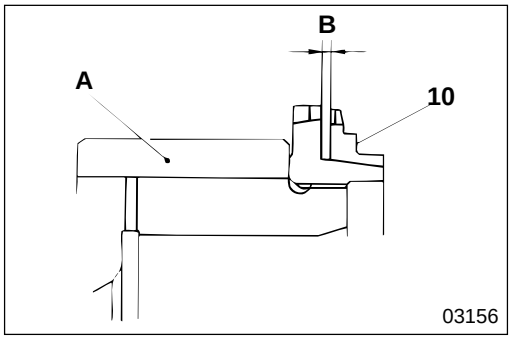


10 to 18 Synchromesh mechanism and 4th gear

[Inspection]

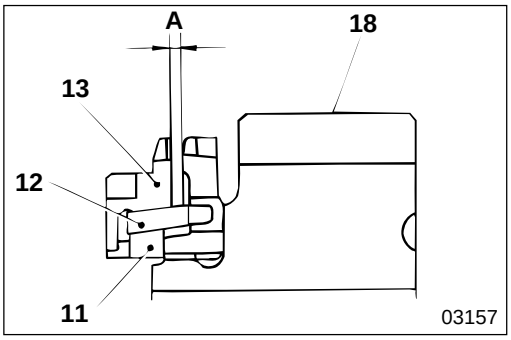
(1) Clearance between synchronizer ring 10 or outer ring 13 and shifting key 15

If the measured value is higher than the limit, replace the faulty parts.



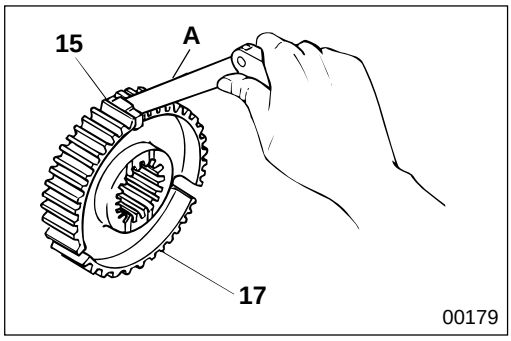
(2) Clearance between synchronizer ring 10 and drive pinion

- Measure clearance **B** between synchronizer ring **10** and the gear cone of drive pinon **A**.
- When measuring this value, press synchronizer ring **10** evenly, and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.



(3) Clearance between synchronizer outer ring and 4th gear

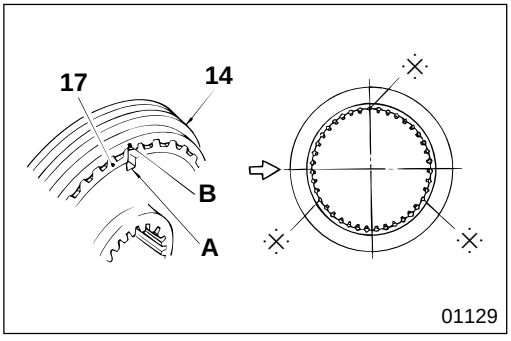
- Measure clearance **A** between synchronizer outer ring **13** and the gear cone of 4th gear **18**.
- When measuring this value, press synchronizer inner ring **11**, center cone **12**, and the outer ring evenly and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.



(4) Clearance between shifting key 15 and synchronizer hub 17

If the measured value is higher than the limit, replace the faulty parts.

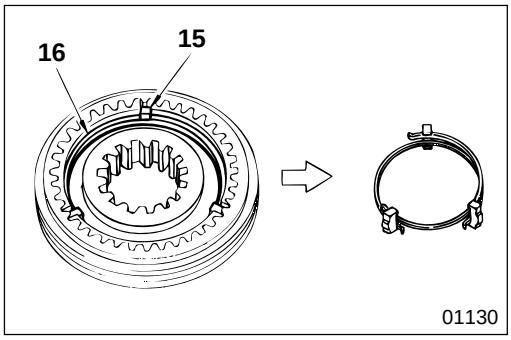
A : Feeler gauge



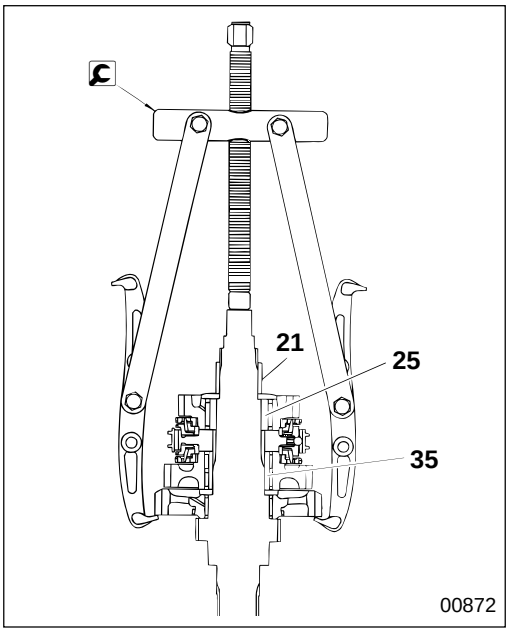
[Installation]

- Align the three keyways **A** of synchronizer hub **17** with the three stub teeth **B** (illustrated by ·⁙· mark) of synchronizer sleeve **14** to install the synchronizer hub.
- To reassemble synchronizer hub **17** and synchronizer sleeve **14**, align the alignment marks made during diassembly.

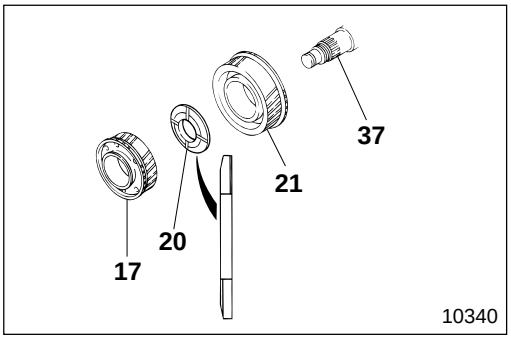
https://truckmanualshub.com/



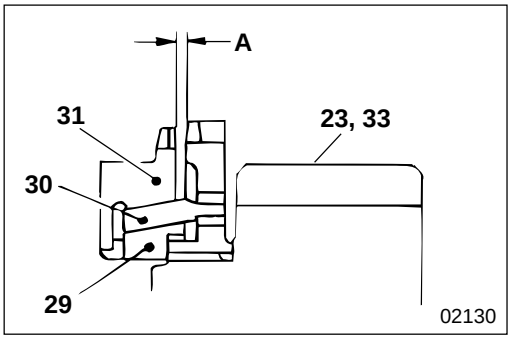
- Insert shifting key **15** into the keyway.
- Install shifting key spring **16** so that its opening is offset from the one of the shifting key.
- Make sure that the openings of shifting key springs do not align with each other.



21 **25** **35** **Removal of 4th, 3rd, 2nd gear bearing sleeves**



21 **Installation of 3rd and 4th gear thrust washer**



23 **31** **33** **Clearance between synchronizer outer ring and 3rd gear assembly or 2nd gear assembly**

- Measure clearance **A** between synchronizer outer ring **31** and the cone of 3rd gear assembly **23** or 2nd gear assembly **33**.
- When measuring this value, press synchronizer inner ring **29**, synchronizer outer ring **31** and synchronizer center ring **30** evenly and measure all around the circumference.
- If the measured value is higher than the limit, replace the faulty parts.

MAINSHAFT ASSEMBLY < S6 >

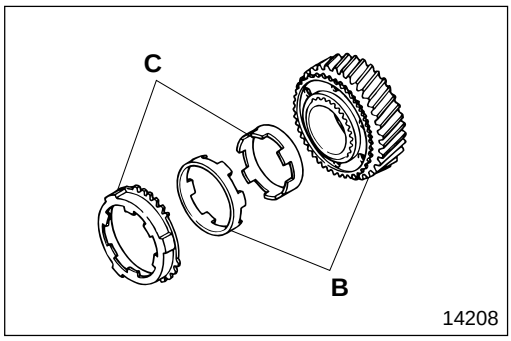
[Alignment marks]

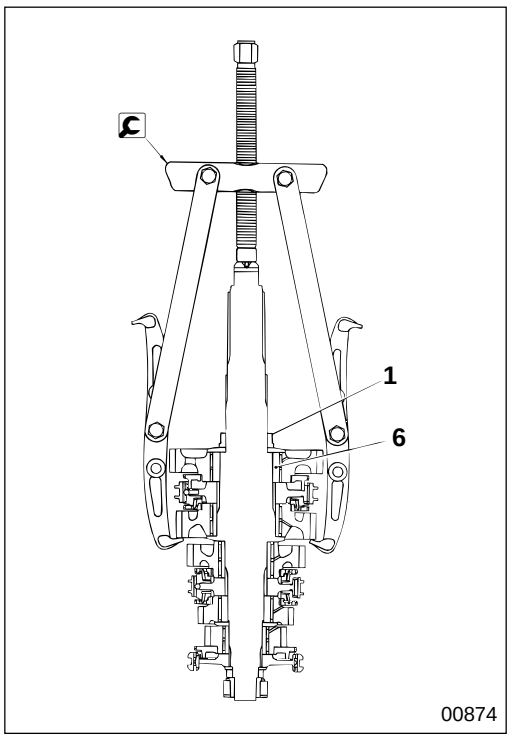
(1) Synchronizer sleeve and synchronizer hub

Before disassembling the synchronizer sleeve and the synchronizer hub, put alignment marks **A** on the places where the shifting keys are installed. When reusing parts, align the alignment marks to assemble.



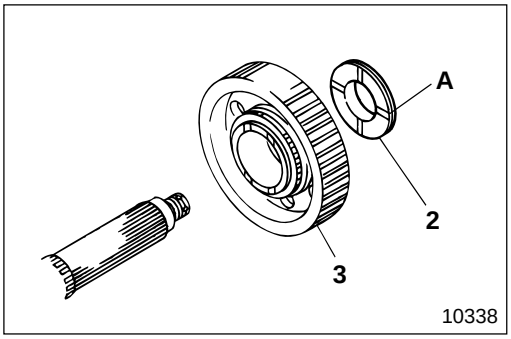
(2) Ring, cone and gear assembly of double cone synchronizer

Before disassembling synchronizer center cone and gear assembly (**B**), and synchronizer center ring and synchronizer outer ring (**C**), put alignment marks on them. When reusing parts, align the alignment marks to assemble.



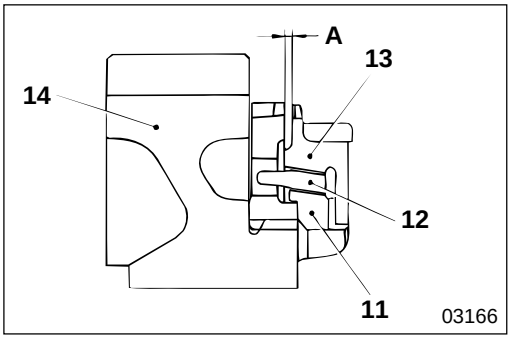
1 6 Removal of mainshaft rear bearing inner race and 1st gear bearing sleeve

https://truckmanualshub.com/



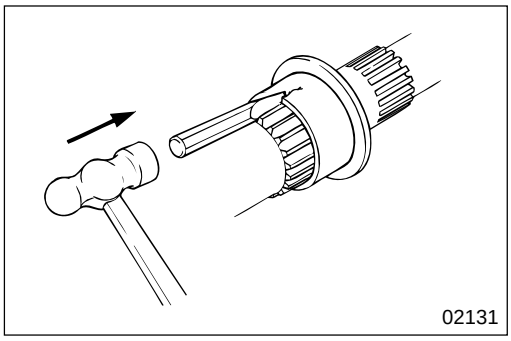
2 **Installation of 1st gear thrust washer**

A : Oil groove

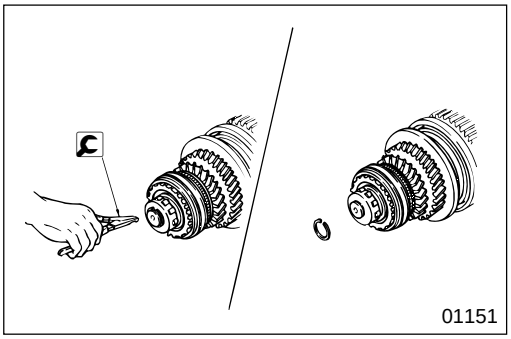


13 **14** **Clearance between synchronizer outer ring and 2nd gear assembly**

- Measure clearance **A** between synchronizer outer ring **13** and the cone of 2nd gear assembly **14**.
- When measuring this value, press synchronizer inner ring **11**, center cone **12** and outer ring **13** evenly and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.

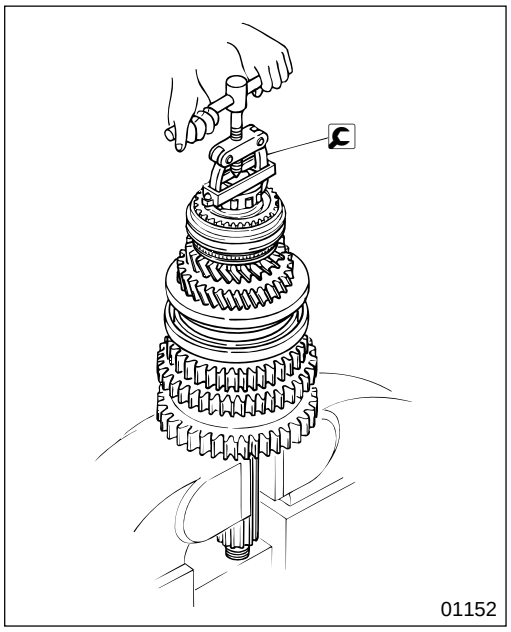


16 **Removal of 2nd gear bearing sleeve**



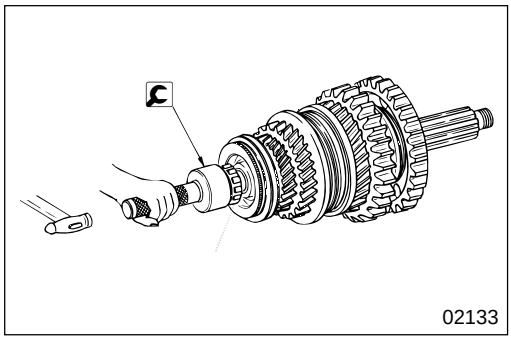
17 **Removal and installation of snap ring**

https://truckmanualshub.com/

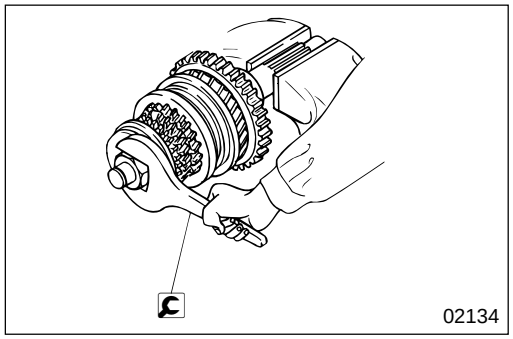


18 **Pilot bearing**

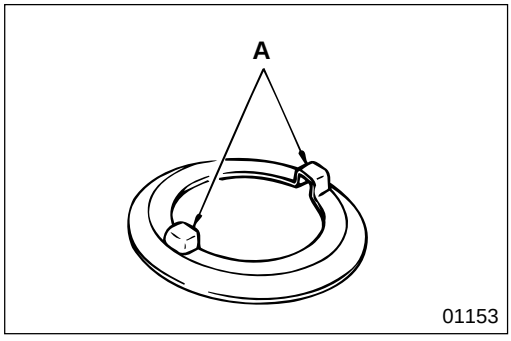
[Removal]



[Installation]



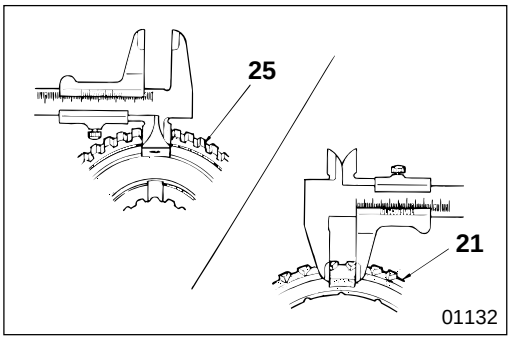
19 **Removal and installation of lock nut**



20 **Installation of lock washer**

Install so that protrusions **A** (two points as illustrated) fit into the grooves of synchronizer hub **25**.

https://truckmanualshub.com/

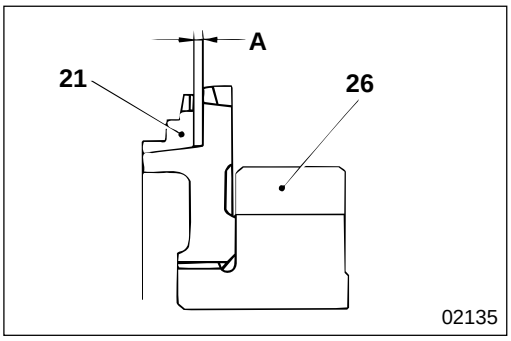


21 to **26** **Synchromesh mechanism and 5th gear**

[Inspection]

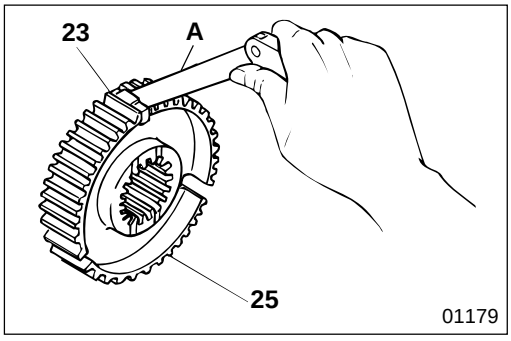
(1) Clearance between the protrusion of synchronizer ring 21 and the groove of synchronizer hub 25

If the measured value is higher than the limit, replace the faulty parts.



(2) Clearance between synchronizer ring 21 and 5th gear assembly 26 or drive pinion

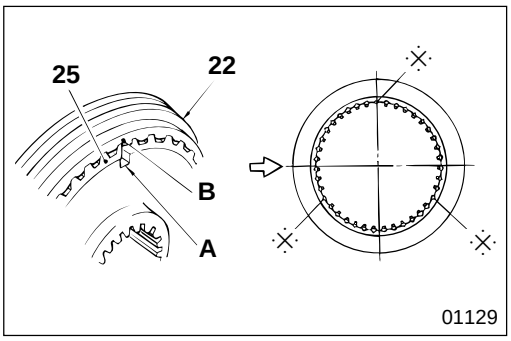
- Measure the clearance between synchronizer ring **21** and the gear cone of 5th gear assembly **26** or drive pinion
- When measuring this value, press synchronizer ring **21** evenly **1** and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.



(3) Clearance between shifting key 23 and synchronizer hub 25.

if the measured value is higher than the limit, replace the faulty parts.

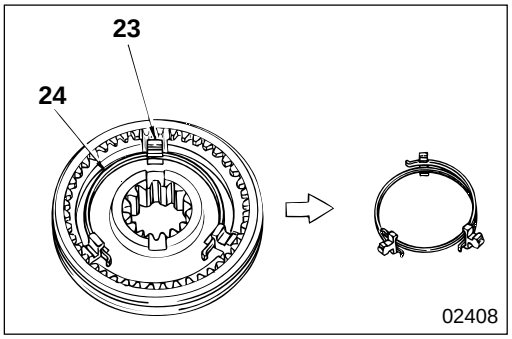
A : Feeler gauge



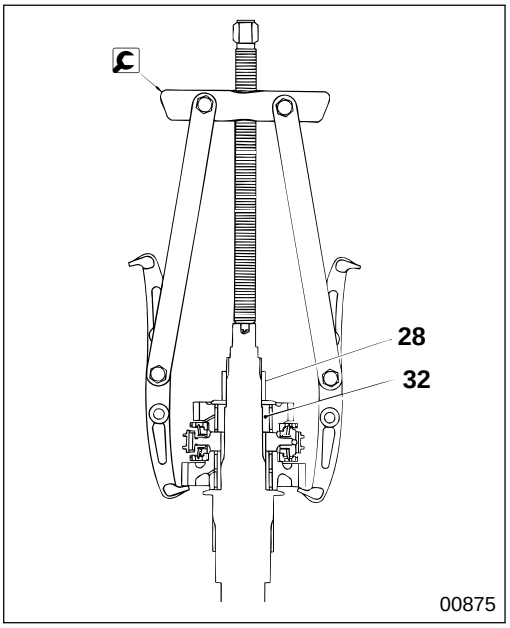
[Installation]

- Align the three keyways **A** of synchronizer hub **25** with the three stub teeth **B** (illustrated by ·⁜· mark) of synchronizer sleeve **22** to install the synchronizer hub.
- To reassemble synchronizer hub **25** and synchronizer sleeve **22**, align the alignment marks made during disassembly.

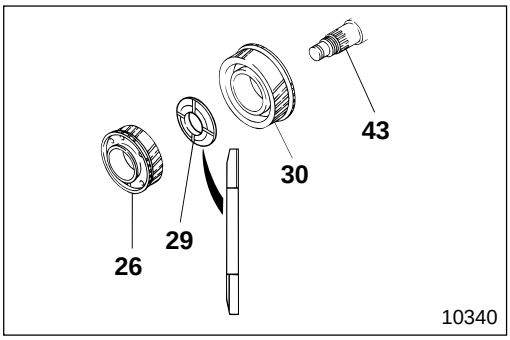
https://truckmanualshub.com/



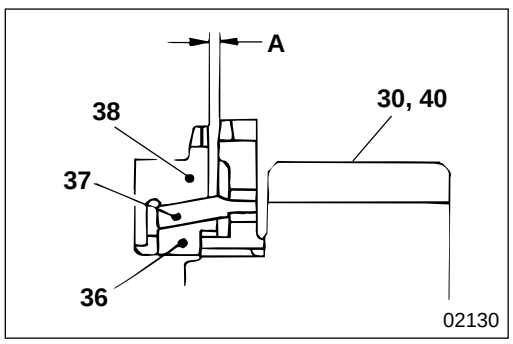
- Insert shifting key **23** into the keyway.
- Install shifting key spring **24** so that its opening is offset from the one on the shifting key.
- Make sure that the openings of shifting key springs do not align with each other.



28 **32** **Removal of 5th gear bearing 4 th sleeves**



29 **Installation of 4th and 5th gear thrust washer**



30 **38** **40** **Clearance between synchronizer outer ring and 3rd gear assembly or 4th gear assembly**

- Measure clearance **A** between synchronizer outer ring **38** and the cone of 3rd gear assembly **40** or 4th gear assembly **30**.
- When measuring this value, press synchronizer inner ring **36**, synchronizer center cone **37** and synchronizer outer ring **38** evenly and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.

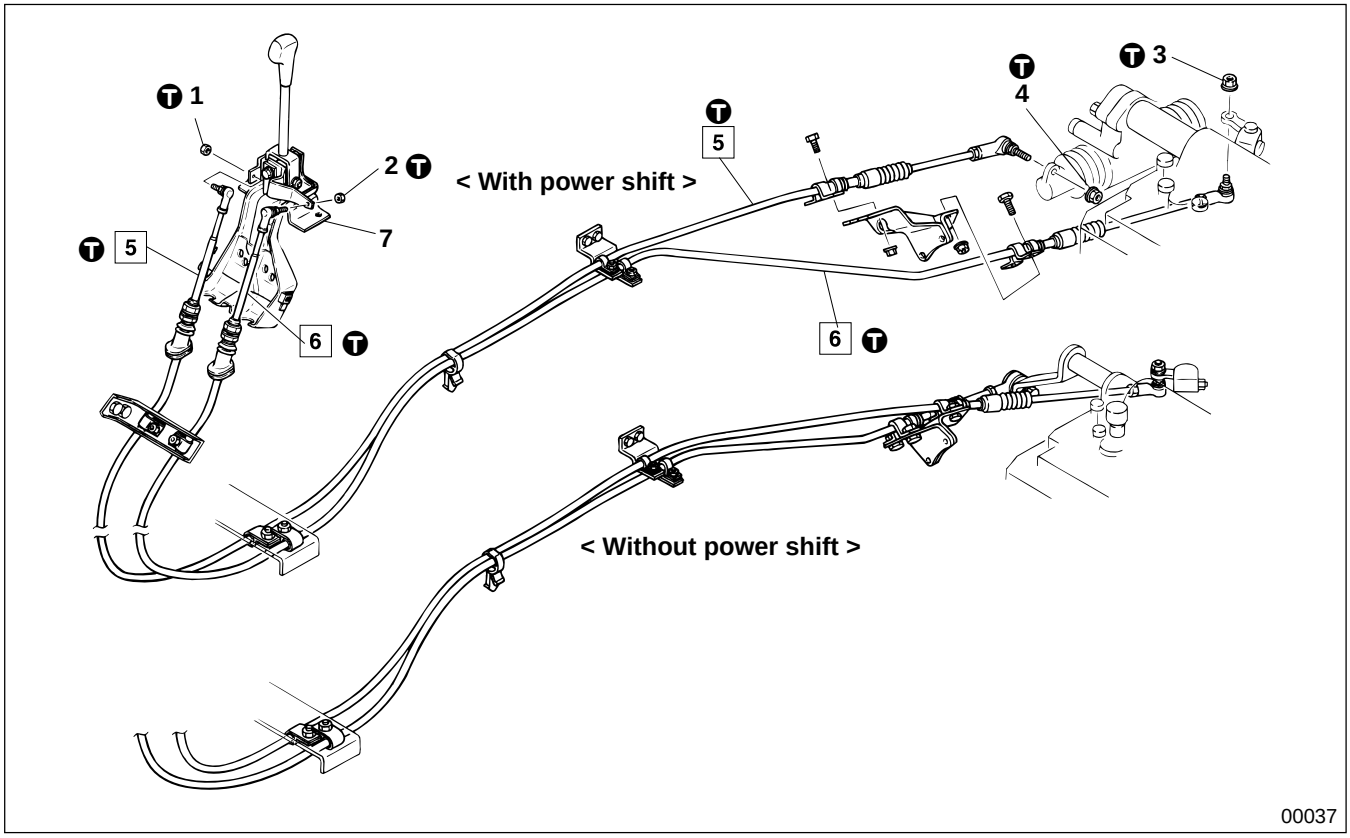
TRANSMISSION CONTROL



For removal and installation of the shift lever console or floor console, refer to Gr 42.

CAUTION

When mounting shift cable 5 and selector cable 6 to the frame, do not mistake the vertical relationship between the shift cable and the selector cable. This relationship is opposite in vehicles with power shift and those without.

● **Disassembly sequence**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

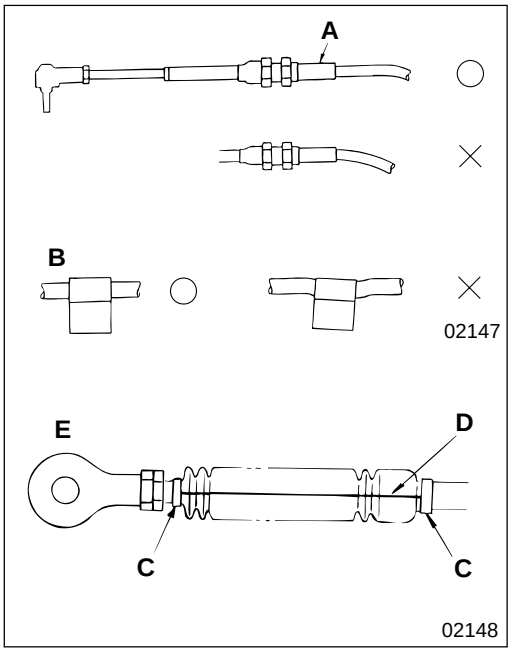
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1 to 4	Nut (Ball joint or rubber damper mounting)	19 to 24 {14 to 17, 1.9 to 2.4}	—
5, 6	Cable lock nut tightening	59 to 83 {43 to 61, 6 to 8.5}	—

https://truckmanualshub.com/

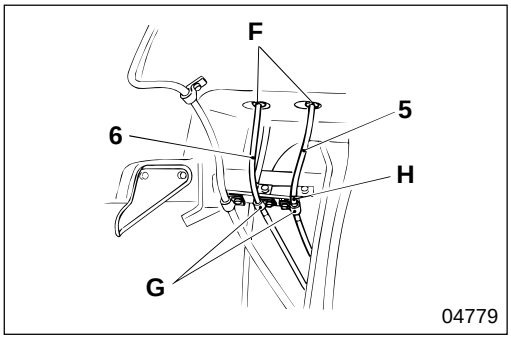
◆ Service procedure



5 **6** **Installation of shift cable and selector cable**

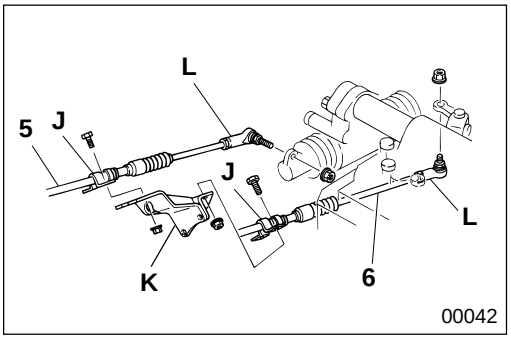
CAUTION⚠

- **Make sure the identification marks on the cable, ball joint L, and rubber damper M point in the right direction when you install the cables. Installing the cables with the identification marks in the wrong direction can remarkably reduce the durability of the cables.**
- **Install casing cap A lengthwise.**
- **Make sure the radius of the bend is 200 mm {7.87 in.} or more.**
- **Make sure the cable operates smoothly.**
- **Install the clamp vertically against the cable. (Figure B)**
- **Do not twist clamps C at both ends of the boot. Make sure that white line D on the boot is straight. (Figure E)**



- Insert shift cable **5** and selector cable **6** under the cab floor and clamp them in the correct place by identifying identification mark **H** on the shift cable. (The selector cable has no identification mark.)
  F : Grommet
  G : Clip

< With Power Shift >



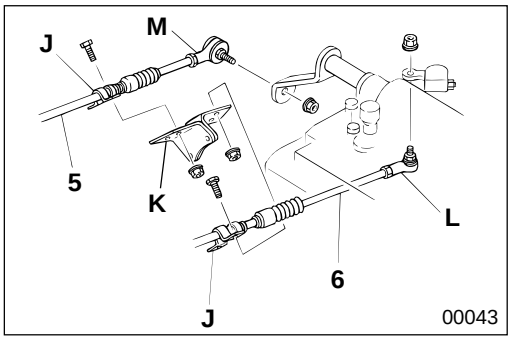
- Install cable clip **J** to bracket **K** temporarily and connect ball joint **L** or rubber damper **M** to the shift lever or selector lever.
- Arrange the cable so that it not twisted, then tighten clip **J** permanently.

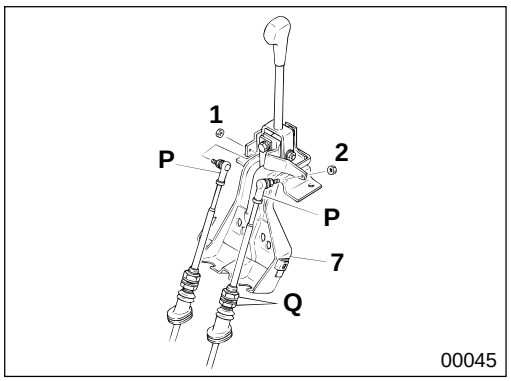
CAUTION⚠

Make sure that ball joint L and rubber dumper M face the correct direction.

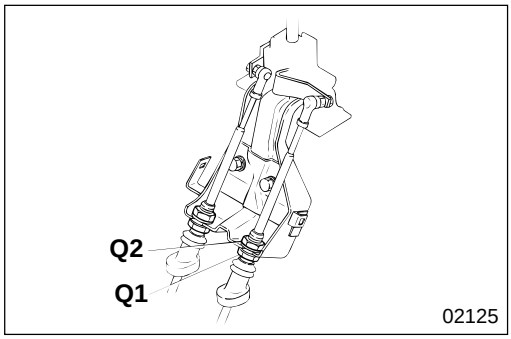
https://truckmanualshub.com/

< Without Power Shift >





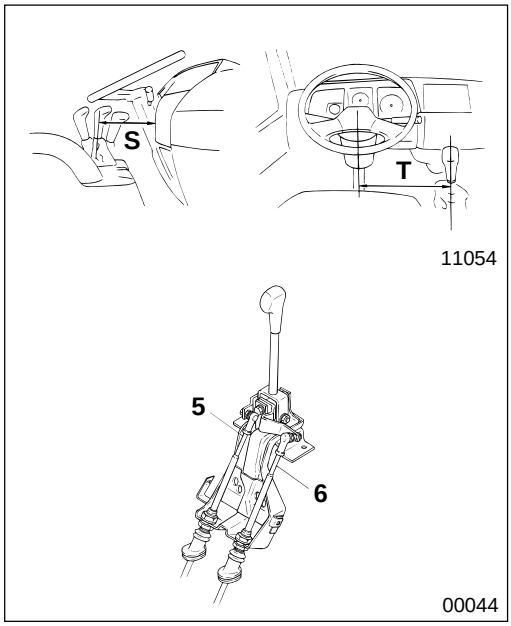
- Tilt the cab down.
- Install the cable on set board assembly **7** temporarily and connect ball joint **P** to shift lever **A** and selector lever **B**.
- Arrange the cable so that it is not twisted, then tighten lock nuts **Q** permanently.



CAUTION⚠

- **Make sure that ball joint L faces the correct direction.**
- **When installing the lock nut, tighten lower nut Q1. Do not move nut Q2.**

- Make sure when you operate the gear shift lever that it shifts smoothly and selects each position.



- If the gear shift lever leans to the front or rear, or to the left or right, excessively, adjust the length of the cable.
- When positioning the gear shift lever, use the distance from the center of the steering wheel or from the instrument panel as the reference distance.

Unit : mm {in.}

Front and rear direction S (Distance from the instrument panel)	Left and right direction T (Distance from the steering wheel center)

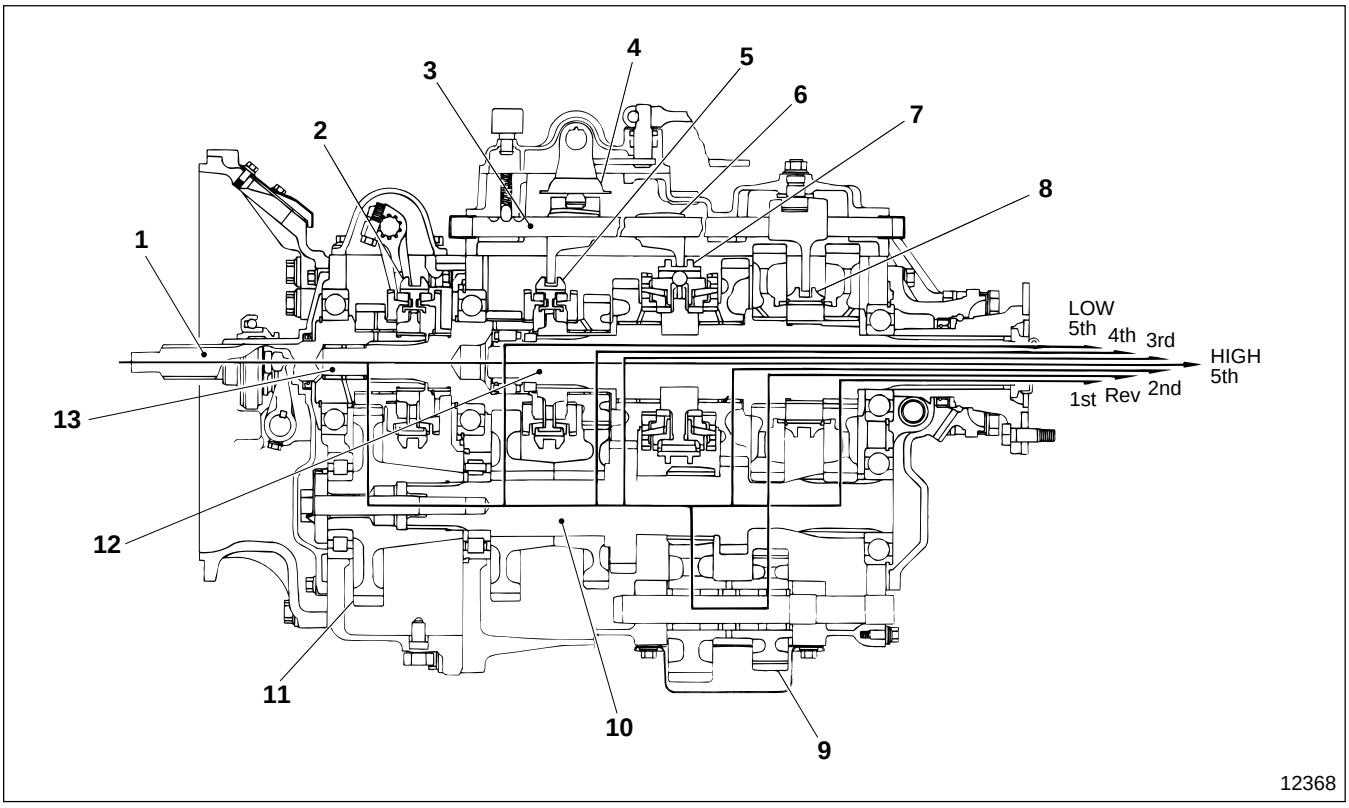
Transmission



1 Input shaft
2 Splitter synchronizer assembly
3 Shift rail
4 Interlocking mechanism
5 4th and 5th synchronizer assembly
6 Shift fork
7 2nd and 3rd synchronizer assembly
8 1st and reverse constant mesh
9 Reverse idler gear
10 Countershaft
11 Splitter gear
12 Mainshaft
13 Drive pinion

The transmission changes revolution and torque produced by the engine into those that match the vehicle's power requirement (driving force). Revolution and torque are increased or decreased by making a selection from several sets of engaged gears.
The transmission can also change the direction of rotation of the engine output. As the engine always turns in one direction, this allows the vehicle to be reversed. The rotation of the drive pinion is transmitted to the countershaft by the constant mesh gear, and a change in speed is made as the gears, or gear sections, on this countershaft engage those on the mainshaft. In 5th speed the drive pinion rotation is transmitted directly. This M8S2×5 transmission is a HIGH and LOW splitter type. The selector switch on the gearshift lever permits selection of ten forward speeds and two reverse gears by combining 2-speed splitter gears and 5-speed transmission gears.
The power shift lightens the shift operating force of the transmission.

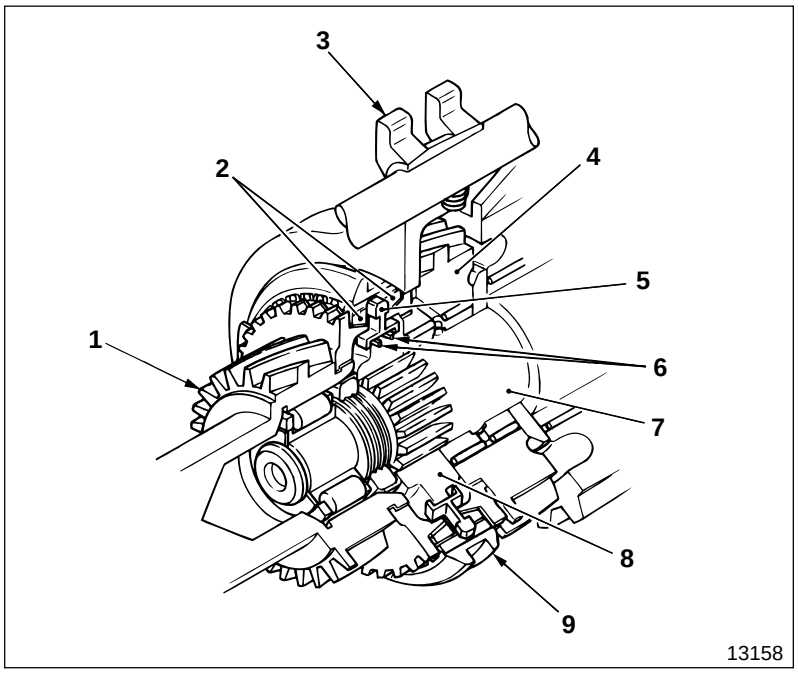
https://truckmanualshub.com/

Synchromesh Mechanism

This vehicle has two synchromesh mechanisms, a single cone type, and a double cone type, and uses the key system. The single or double cone type is used depending on the gear positions as shown below:

Synchronizer type	Parts used
Single cone type	4th and 5th
Double cone type	2nd and 3rd

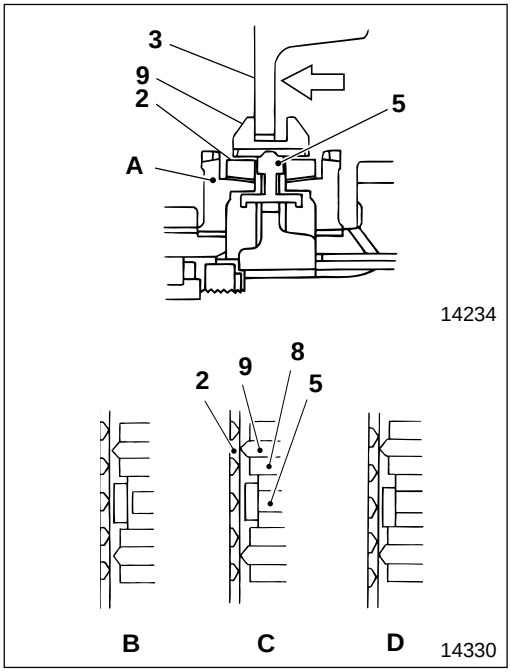
Single Cone Type



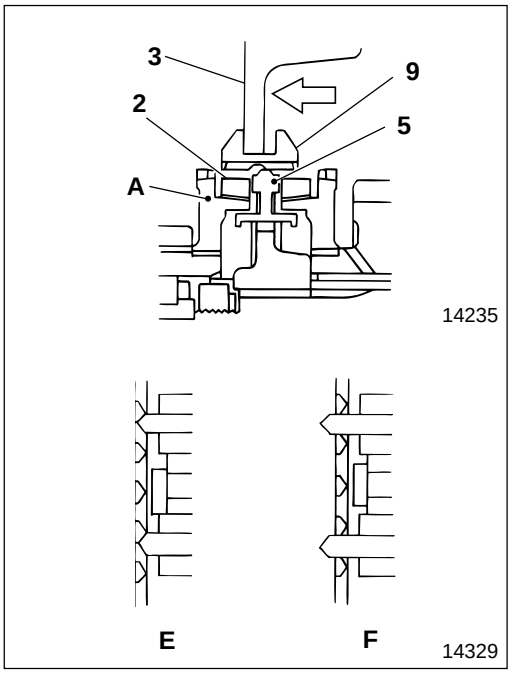
1 Drive pinion
2 Synchronizer ring
3 4th and 5th shift fork
4 4th gear
5 Shifting key
6 Shifting key spring
7 Mainshaft
8 Synchronizer hub
9 Synchronizer sleeve

- The inside of synchronizer hub **8** engages the spline of mainshaft **7** and rotates with it. The outside of the synchronizer hub has a spline that engages synchronizer sleeve **9** and three keyways.
- Shifting keys **5** are inserted into these keyways. When the gear shift is in neutral, a protrusion in the center of each shifting key engages a groove inside the synchronizer sleeve and the shifting keys are pressed against the inside of the synchronizer sleeve by shifting key springs **6**.
- Synchronizer rings **2** are inserted into drive pinions **1** in the front and rear of synchronizer hub **8**, and the taper cone of 4th gear **4**.
- Synchronizer rings **2** rotate relative to synchronizer sleeve **9** by the amount of play of the keyways.

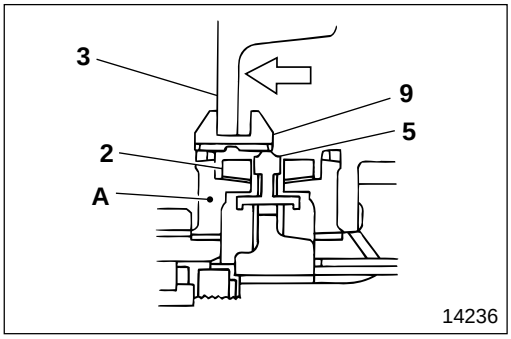
https://truckmanualshub.com/



- When the gear shift is in neutral (Figure **B**), moving shift fork **3** in the direction of the arrow as illustrated, moves synchronizer sleeve **9** slightly to the left. At the same time, shifting key **5**, the central protrusion of which engages the synchronizer sleeve, moves to the left and presses synchronizer rings **2** against taper cone **A** of drive pinion **1**. (Figure **C**)
- When the taper surfaces of synchronizer rings **2** make contact with the taper cone of the drive pinion, the taper surfaces of the synchronizer rings act as cone clutches. This frictional torque rotates the synchronizer rings in the rotating direction of the drive pinion by the amount of play between synchronizer hub **8** and the synchronizer rings. The spline chamfers of the synchronizer rings and the spline chamfer of synchronizer sleeve **9** are offset from each other. (Figure **D**)
- The disengagement direction of synchronizer rings **2** is defined by the speed of rotation of the synchronizer—sleeve **9**, and the synchronized—drive pinion **1**. When increasing the vehicle speed by shifting up, disengagement is made in the opposite direction to rotation, and when decreasing the vehicle speed by shifting down, disengagement is made in the rotating direction.



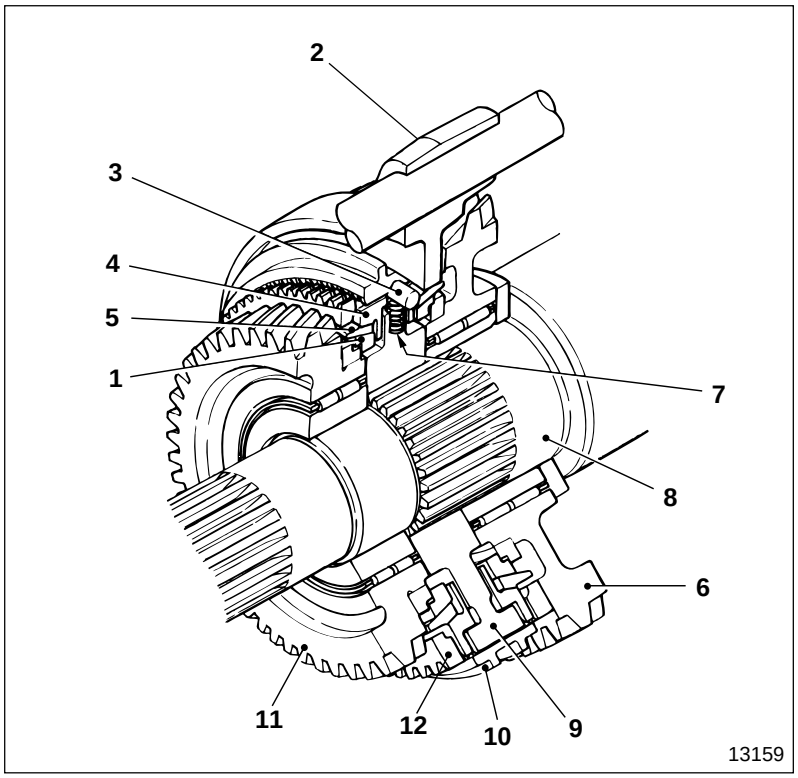
- When synchronizer sleeve **9** moves further to the left, synchronizer rings **2** prevent shifting key **5** from moving, and the synchronizer sleeve disengages from the protrusion of the shifting key.
- Since synchronizer rings **2** remain disengaged, the spline chamfer of synchronizer sleeve **9** presses the spline chamfers of the synchronizer rings, which in turn press the synchronizer rings against taper cone **A** of drive pinion **1**.
- As the frictional torque increases on the taper surfaces, the relative speed of the synchronizer and the synchronized gradually decreases.
  E : In synchronization
  F : After synchronization



- When synchronizer sleeve **9** and drive pinion **1** rotate at the same speed, synchronizer rings **2** no longer prevent the synchronizer sleeve from moving, and the synchronizer sleeve moves further to the left and smoothly engages the spline of taper cone **A** of drive pinion **1**, transmitting the driving force.

https://truckmanualshub.com/

Double Cone Type



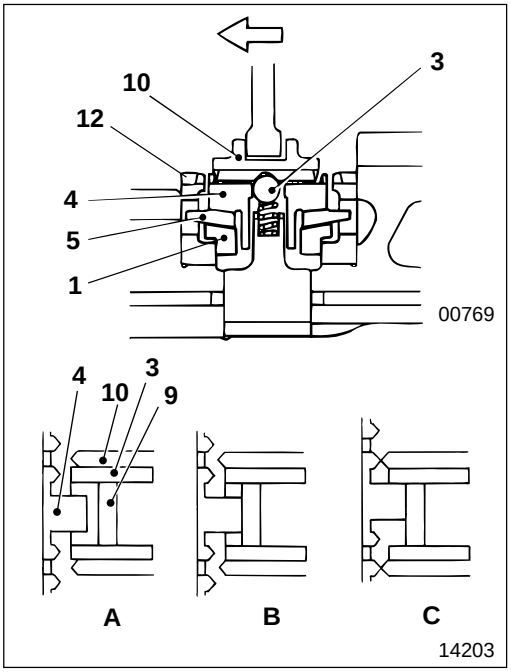
1 Synchronizer inner ring
2 2nd and 3rd shift fork
3 Shifting key
4 Synchronizer outer ring
5 Synchronizer center cone
6 2nd gear
7 Shifting key spring
8 Mainshaft
9 Synchronizer hub
10 Synchronizer sleeve
11 3rd gear
12 Dog clutch

The synchromesh structure and operation of the double cone type are basically the same as for the single cone type.

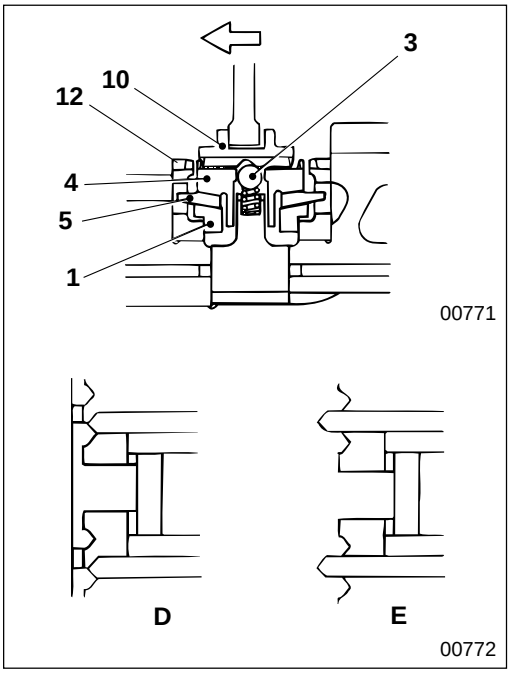
- Synchronizer center cone **5** is a taper cone independent of 2nd gear **6** and 3rd gear **11**, (both the inside and outside surfaces are tapered). The synchronizer center cone is between synchronizer inner ring **1** and synchronizer outer ring **4** to increase the synchronization capacity.
- Six protrusions on the outside of center cone **5** fit into corresponding gear holes, in the same manner as the taper cone of the single cone type. The center cone and the gear are installed as if integrated.

Shifting key **3** is a cylinder installed so that the lengthwise direction of the cylinder is at right angles to the diameter direction of synchronizer hub **9**. Shifting key spring **7** is a coil spring inserted in a hole in the synchronizer hub, this spring presses the shifting key against the inside of synchronizer sleeve **10**.

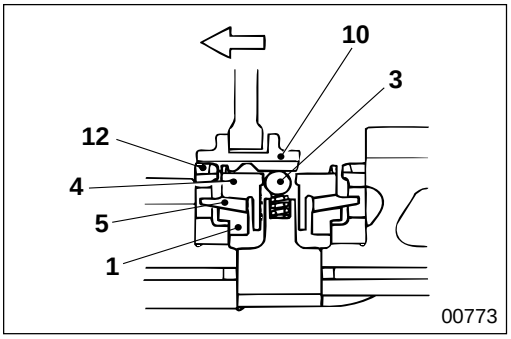
https://truckmanualshub.com/



- When the gear shift is in neutral (Figure **A**), moving shift fork **2** in the direction of the arrow as illustrated, moves synchronizer sleeve **10** slightly to the left. At the same time, shifting key **3**, the central protrusion of which engages the synchronizer sleeve, moves to the left and presses synchronizer outer ring **4** against synchronizer center cone **5**. (Figure **B**)
- When the taper surface of synchronizer outer ring **4** makes contact with the taper cone of synchronizer center cone **5**, the taper surface of the synchronizer outer ring acts as a cone clutch. This frictional torque rotates the synchronizer outer ring in the rotating direction of 3rd gear **11** by the amount of play between the synchronizer outer ring and synchronizer hub **9**. The spline chamfer of the synchronizer outer ring and the spline chamfer of synchronizer sleeve **10** are offset from each other. (Figure **C**)
- The disengagement direction of synchronizer outer ring **4** is defined by the speed of rotation of the synchronizer—the sleeve, and the synchronized—3rd gear **11**. When increasing the vehicle speed by shifting up, disengagement is made in the opposite direction to rotation, and when decreasing the vehicle speed by shifting down, disengagement is made in the rotating direction.



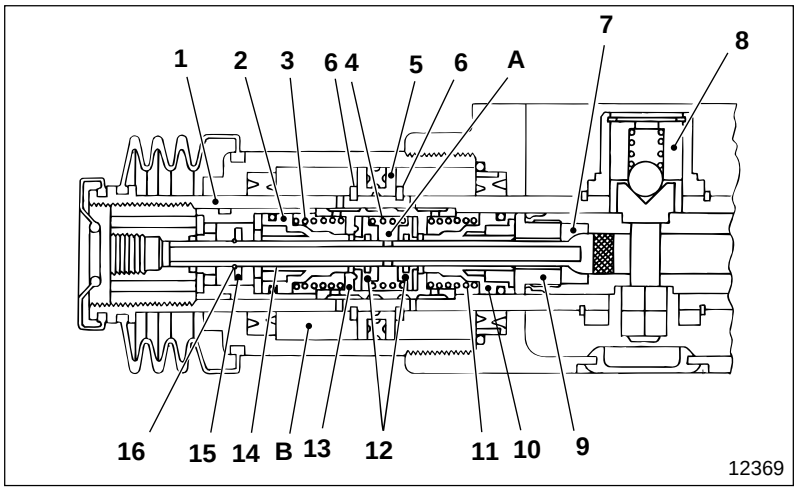
- When synchronizer sleeve **10** moves further to the left, synchronizer outer ring **4** prevents shifting key **3** from moving, and the synchronizer sleeve disengages from the protrusion of the shifting key.
- Since synchronizer outer ring **4** remains disengaged, the spline chamfer of synchronizer sleeve **10** presses the spline chamfer of the synchronizer outer ring, which in turn presses the synchronizer outer ring against the taper cone of synchronizer center cone **5**, and the frictional torque acts on the taper surface.
- As the frictional torque increases on the taper surface of synchronizer inner ring **1**, the relative speed of the synchronizer and the synchronized gradually decreases. The frictional torque acts on both sides of the synchronizer center cone. The double cone type has greater capacity for synchronization than the single cone type.
  D : In synchronization
  E : After synchronization



- When synchronizer sleeve **10** and 3rd gear **11** rotate at the same speed, synchronizer outer ring **4** no longer prevents the synchronizer sleeve from moving and the synchronizer sleeve moves further to the left and smoothly engages the spline of dog clutch **12** of the 3rd gear, transmitting the driving force.

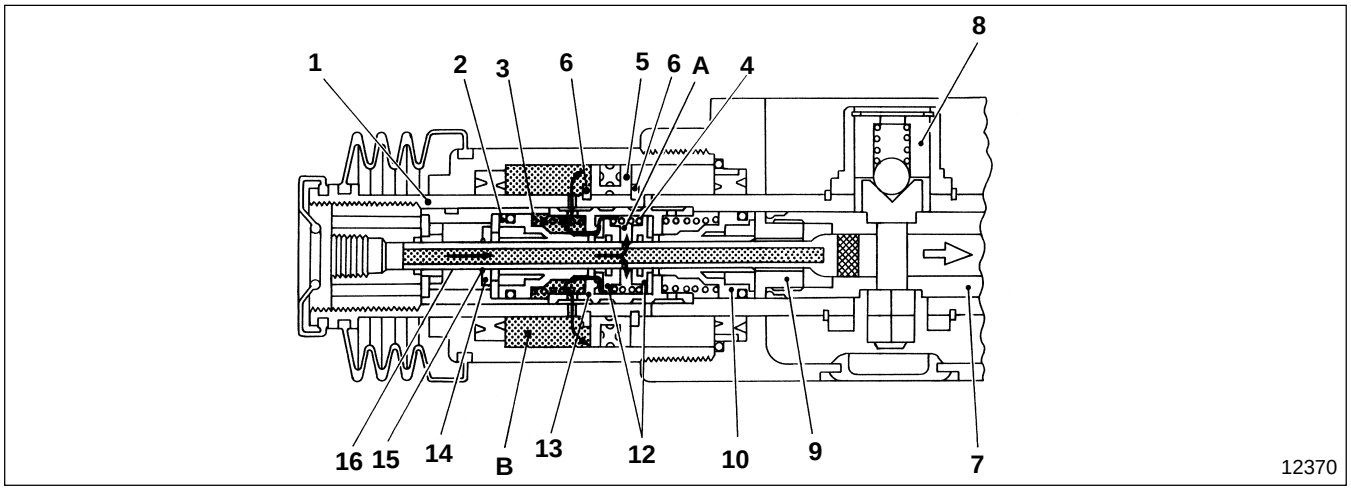
https://truckmanualshub.com/

Power Shift



1 Shifter rod
2 Valve lifter
3 No.3 spring
4 No.2 spring
5 Piston
6 Retaining ring
7 Actuating rod
8 Striker
9 Cap
10 Valve lifter
11 No.1 spring
12 Valve seal
13 Valve seat
14 Pipe
15 Retainer
16 Retaining ring

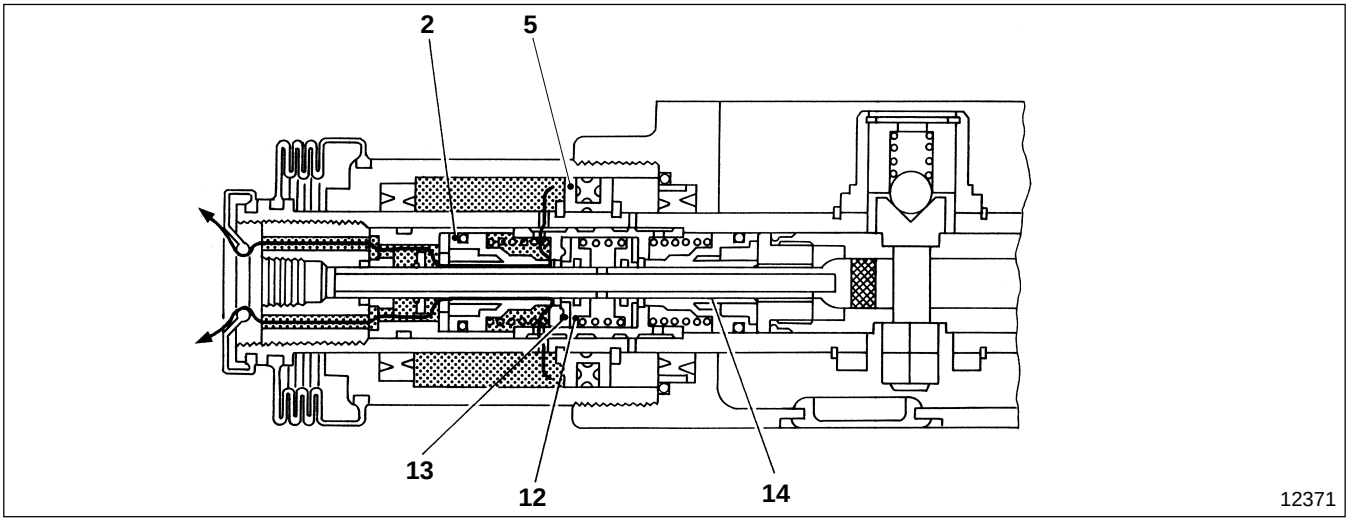
A : Primary side chamber
B : Secondary side chamber



When activated

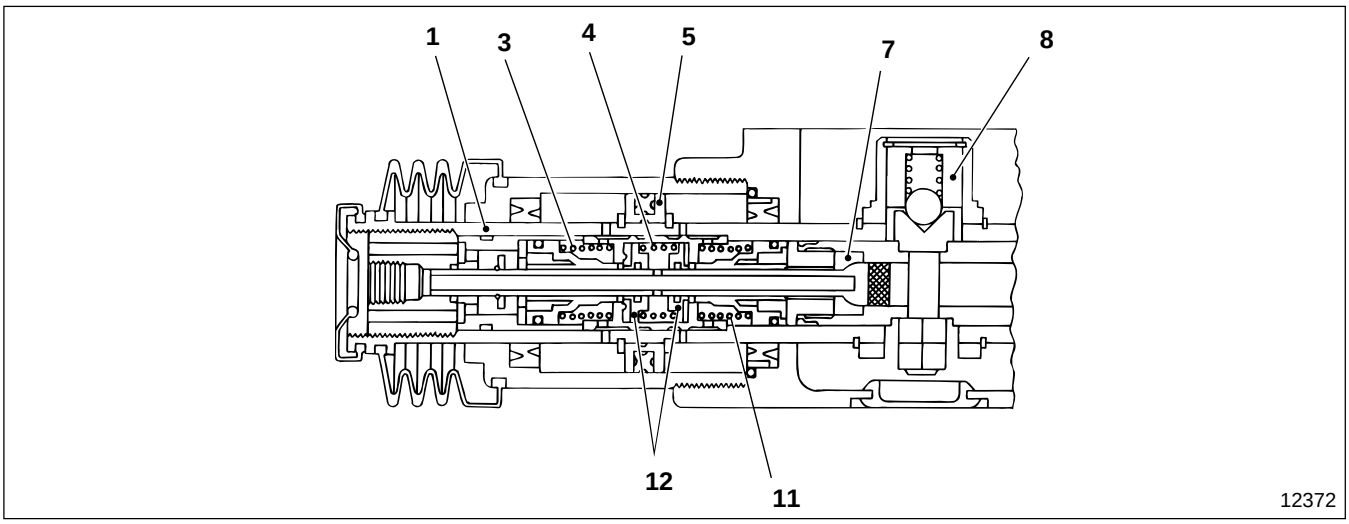
- When actuating rod **7** is moved in the direction of the arrow as illustrated, shifter rod **1** and the actuating rod move relative to this movement.
  Valve lifter **2** presses No.3 spring **3** against valve seal **12** to overcome the combined repercussive forces of the compressed air acting on the valve seal and No.2 spring **4**. The valve seal separates from valve seat **13**, and the compressed air supplied to primary side chamber **A** is let into secondary side chamber **B** via the opening between the valve seat and the valve seal. The compressed air flows into the cylinder through the hole and groove of the valve seal and the vent hole of shifter rod **1**, to put pressure on piston **5**, generating output.
- The output given to piston **5** is transmitted to shifter rod **1** via retaining ring **6** to assist striker **8** which is fixed on the shifter rod. This operates the shift fork on the transmission side, shifting the gears. Thus, gear shifting is completed.
- When the power shift operates in the direction of the arrow as illustrated, the input from the gear shift lever is transmitted by actuating rod **7** via cap **9**, pipe **14**, and retainer **15** fixed on retaining ring **16**. For operation in the opposite direction, all operations are the same in principle as in the direction of the arrow as illustrated, except that the end of the cap, fixed on the end of the actuating rod, presses valve lifter **10** directly.

https://truckmanualshub.com/



When releasing

- When gear shifting is completed and the input is released, actuating rod **7** is returned to the valve center position (the condition before operation) by the combined repercussive forces of the compressed air of valve lifter **2**, the steel ball, and valve springs **3**, **4**.
  As the valve lifter returns, valve seal **12** seats against valve seat **13**, cutting off the flow of compressed air from primary side chamber **A** to secondary side chamber **B**. As the input rod returns, clearance is generated between the valve lifter and the valve seal.
- The compressed air in the cylinder of secondary side chamber **B** is discharged into the atmosphere through the clearance between valve lifter **2** and pipe **14**. This eliminates the pressure difference between the chambers on both sides of piston **5**, so output is lost.

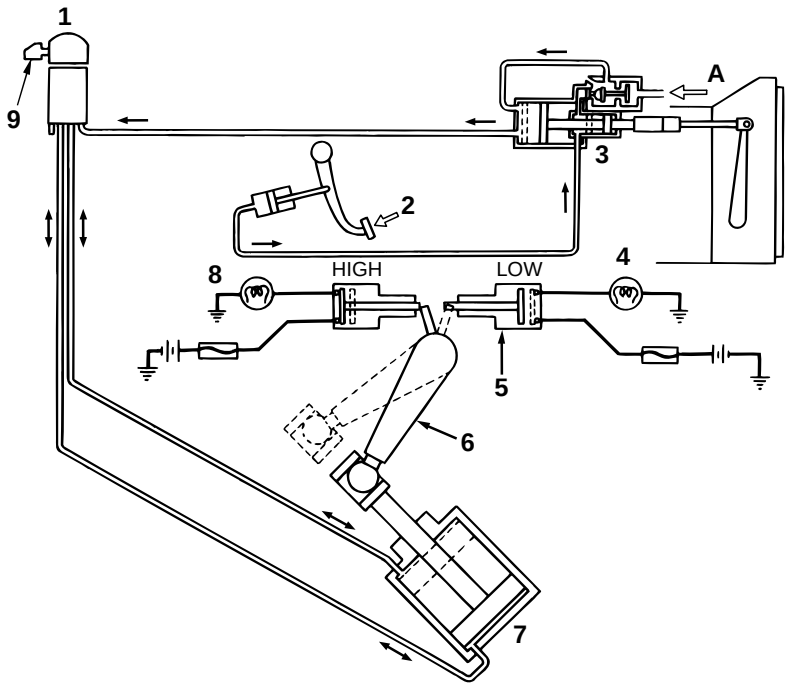


When not operating (non-boosting)

- To operate the power shift, that is, to open the valve and let the compressed air into the output chamber, actuating rod **7** on the input side and shifter rod **1** on the output side must generate relative disengagement.
- When the operating force is transmitted from the gear shift lever to actuating rod **7**, and the resistance on the transmission side is less than the combined repercussive forces working on the relative disengagement of the input side and output side (repercussive forces of No.1 to 3 springs, **3**, **4**, **11**; pressure on valve seal **12**; and sliding resistance on various parts), the mechanism, from the actuating rod to striker **8**, is integrated and does not generate relative disengagement. Therefore, the valve does not open, and without boosting operation, piston **5** moves in the cylinder to shift gears.

https://truckmanualshub.com/

Splitter Control



1 Air control valve
2 Clutch pedal
3 Clutch booster
4 LOW indicator lamp
5 Interlock switch
6 Splitter shift lever
7 Power cylinder
8 HIGH indicator lamp
9 Knob

A : From air tank

- The splitter control allows change over between HIGH and LOW by the operation of power cylinder **7** installed on the splitter, using air pressure taken from the clutch booster.
- Depressing clutch pedal **2** operates clutch booster **3**, supplying air to air control valve **1** installed on the gear shift lever by the driver's seat.
- To change over the supplied air from HIGH to LOW, move the knob of air control valve **1** to H or L respectively.
- This supplied air operates power cylinder **7** changing over the splitter between HIGH and LOW.
- Due to the restriction of the above mechanism, change over of the splitter is possible only when depressing clutch pedal **2**.
- Interlock switch **5** of the splitter upper assembly detects whether splitter shift lever **6** is in HIGH or LOW, and accordingly lights up HIGH indicator lamp **8** or LOW indicator lamp **4** within the meter cluster, to notify the driver.

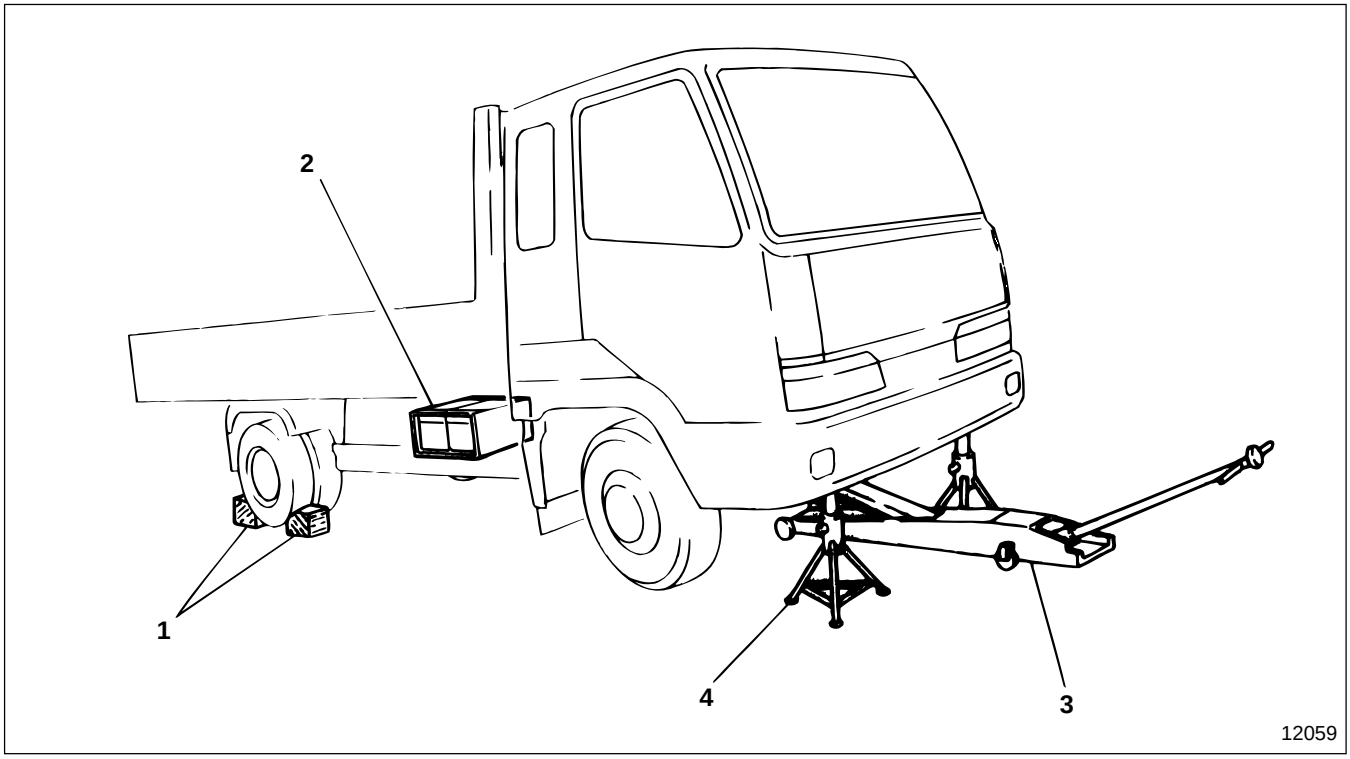
WORK BEFORE REMOVAL AND INSTALLATION OF TRANSMISSION ASSEMBLY



● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect negative battery cable. Gr 54
3 Jack up the front axle on a garage jack.
4 Support the front frame on rigid racks.

WARNING

- **You must chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION

Keep the transmission in neutral throughout the operation.

● **Work sequence after installation**

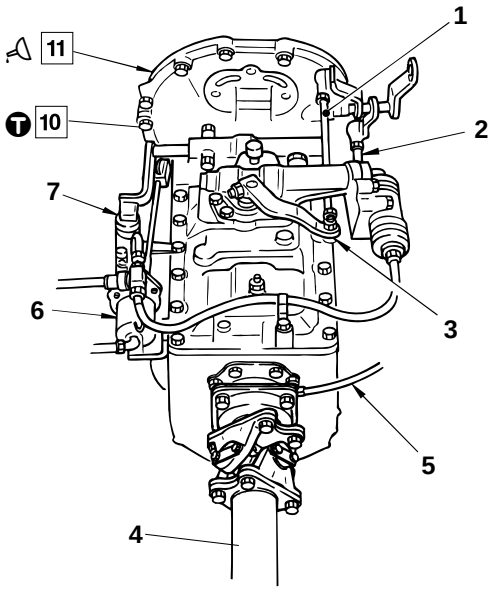
Follow the work sequence before removal in reverse.

https://truckmanualshub.com/

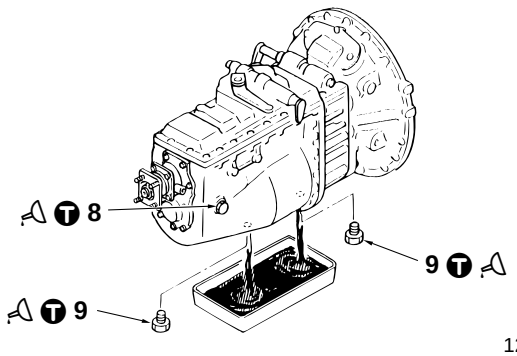
M E M O

https://truckmanualshub.com/

REMOVAL AND INSTALLATION OF TRANSMISSION ASSEMBLY



12046



12047

● **Removal sequence**

1 Selector cable
2 Shift cable
3 Harness connector Gr 54
4 Propeller shaft Gr 25
5 Speed sensor Gr 54
6 Clutch booster Gr 21
7 Splitter control air piping
8 Inspection plug
9 Drain plug
10 Nut or bolt
11 Transmission assembly

NOTE

After removing propeller shaft 4, tie it to the frame temporarily at the height of installation assembly using a piece of rope.

● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

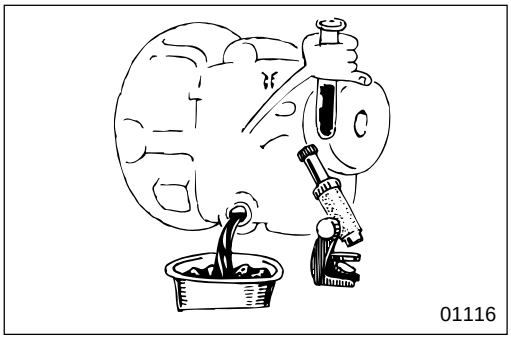
Location	Parts to be tightened	Tightening torque	Remarks
8	Inspection plug	69±15 {51±11, 7±1.5}	—
9	Drain plug	69±15 {51±11, 7±1.5}	—
10	Nut or bolt (Transmission assembly mounting)	40 {30, 4.1}	—

Lubricant and sealant

Location	Points of application	Kinds	Quantity
8	Thread area of inspection plug	THREEBOND 1105D	As required
9	Thread area of drain plug	THREEBOND 1105D	As required
11	Input shaft spline	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

https://truckmanualshub.com/

◆ Service procedure



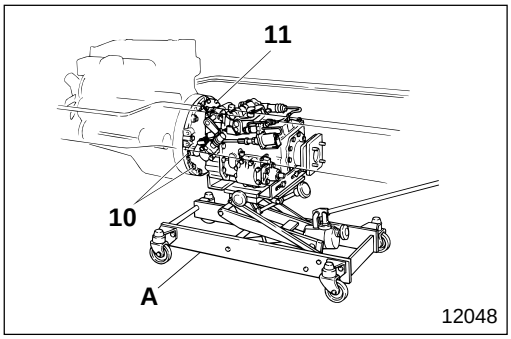
● Oil change

[Draining]

- When draining oil, check the quantity and quality of oil, especially for small pieces of metal and metal dust.
- Clean drain plug **9** before reinstalling it because it is magnetic.

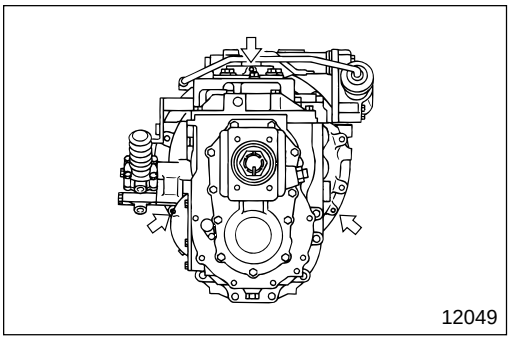
[Filling]

- Check that drain plug **9** is tightened at specified torque.
- Pour in gear oil until the oil overflows from the inspection hole.



10 Removal of transmission assembly mounting nut or bolt

- Support transmission assembly **11** on transmission jack **A**.
- Remove transmission assembly mounting nuts or bolts **10**.



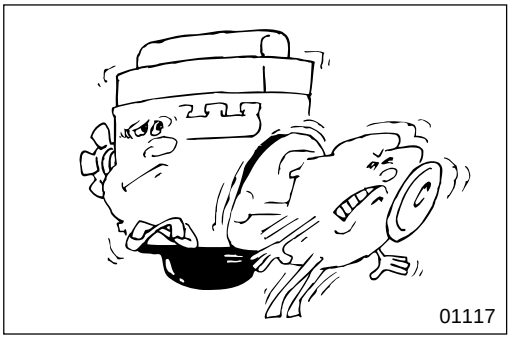
11 Transmission assembly

[Removal]

- Remove transmission assembly **11** from the engine using the screw holes (screw size : M10×1.5 mm) provided for disassembly.

CAUTION⚠

Make sure that you remove hoses and cables before starting service operations.



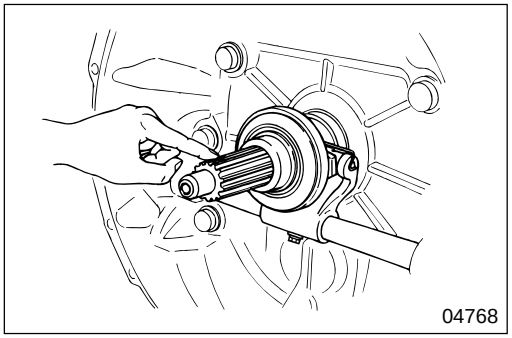
- Move transmission assembly **11** backward until the spline of the input shaft is detached from the clutch.

CAUTION⚠

Make sure that you pull transmission assembly 11 out in a straight line. If you seesaw the transmission assembly violently, you will damage the spline that connects the drive pinion and the clutch.

https://truckmanualshub.com/

REMOVAL AND INSTALLATION OF TRANSMISSION ASSEMBLY

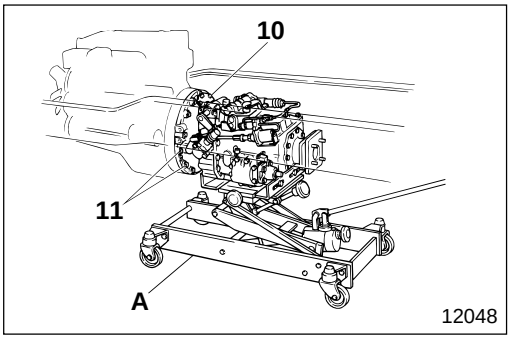


04768

[Installation]
- Check the spline of the input shaft for rust.
- If rust is found, remove it using a wire brush.
- Rub grease onto the clutch sliding surfaces of the input shaft using your hand.

CAUTION

Make sure that you apply only the necessary amount of grease because too much grease would drip and cause clutch slip.



12048

- Support transmission assembly **11** on transmission jack **A**.
- Insert transmission assembly **11** into the pilot bearing of the flywheel paying attention to the input shaft spline.
- Tighten transmission mounting nuts or bolts **10** at specified torque.

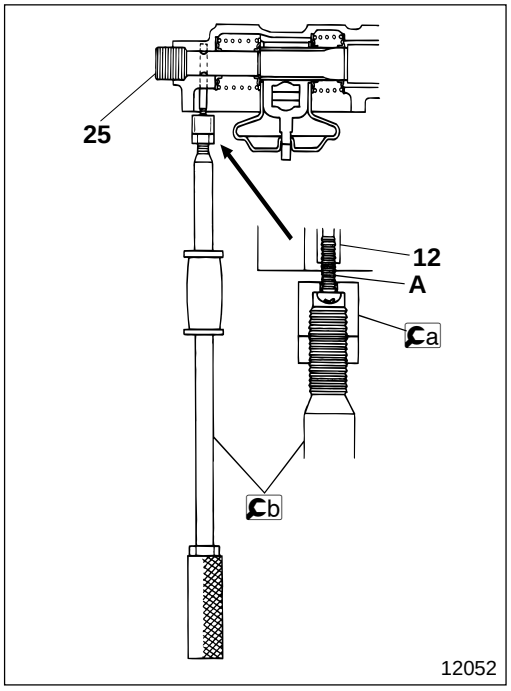
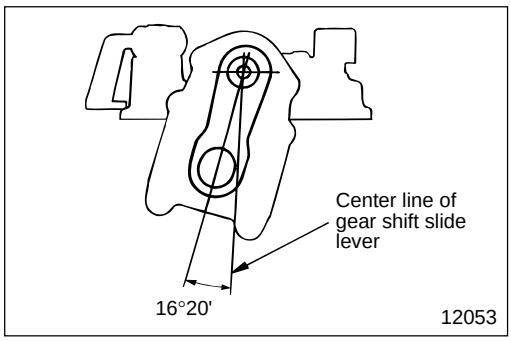
◆ Service procedure



12052

12 Removal of spring pin

- Tap spring pin **12** using an M4 tap.
- Insert a spring pin puller with an M4 thread **A** of appropriate length into spring pin **12**.
- Position b reverse shaft puller on a spring pin puller.
- Remove spring pin **12** from selector lever case **25** using a spring pin puller and b reverse shaft puller.

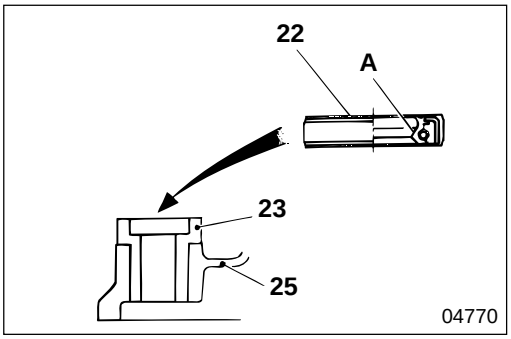


12053

14 18 Installation of gear shift lever and gear shift slide lever

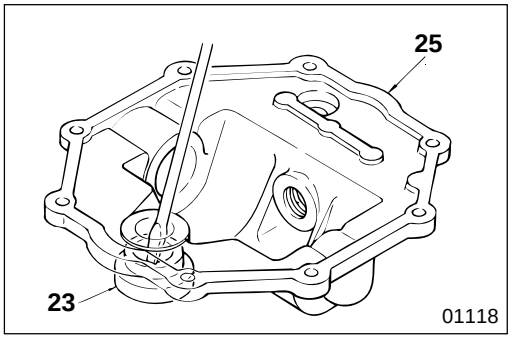
Install gear shift lever **14** and gear shift slide lever **18** as illustrated.

https://truckmanualshub.com/



22 Installation of oil seal

Apply grease to lip area **A** of oil seal **22** and press-fit into bushing **23** in the direction as illustrated.



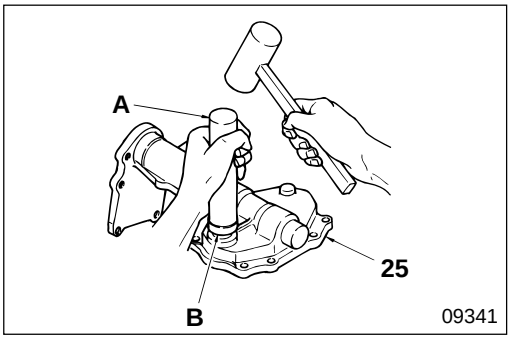
23 Bushing

[Removal]

Remove bushing **23** from selector lever case **25** using a screwdriver.

CAUTION⚠

Be careful not to damage selector lever case 25 .



[Installation]

- Clean the inner surface of selector lever case **25** .
- Press-fit bushing **23** into selector lever case **25** using bar **A** (approximately ø40 mm {1.57 in.}).
- When press-fitting bushing **23** , take care not to damage selector lever case **25**.
- After press-fitting, apply sealant to press-fitted side **B** of bushing **23**.

CAUTION⚠

Prevent sealant from sticking to the inner surface of bushing 23.

◆ Service procedure

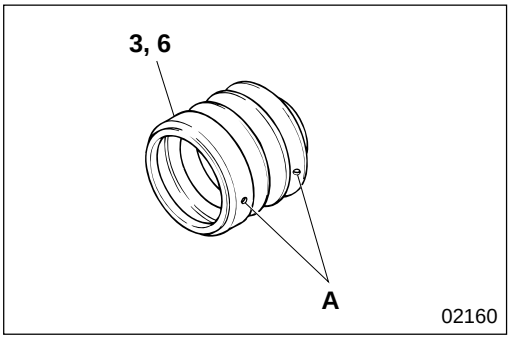
● Inspection before disassembly

(1) Apply 735 kPa {105 lbf/in^2, 7.5 kgf/cm^2} of pressure to the power shift assembly from the connector, check the airtightness when not operating (valve in neutral), and when operating valve is pressed and pulled. If the measured value deviates from the standard value, replace the faulty parts.

Maintenance item	Standard value	
Airtightness when not operating	Decrease of pressure after 15 seconds	9.8 kPa {1.4 lbf/in^2, 0.1 kgf/cm^2}
Airtightness when operating		49 kPa {7.1 lbf/in^2, 0.5 kgf/cm^2}

(2) Measure the sliding resistance in the disengagement direction. If the measured value deviates from the standard value, replace the faulty parts, or grease them.

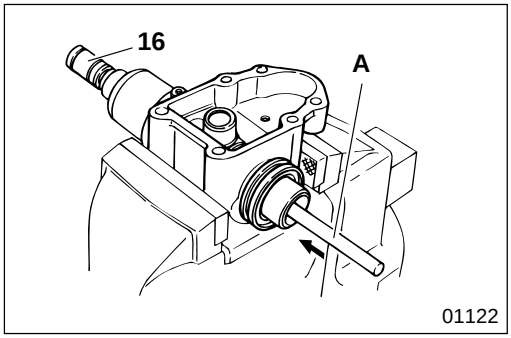
Maintenance item	Standard value
Resistance in shifting direction	59 N {13 lbf, 6 kgf}



3 **6** **Installation of boot**

When you install boots **3**, **6** on housing **55**, point drain holes **A** downward.

https://truckmanualshub.com/



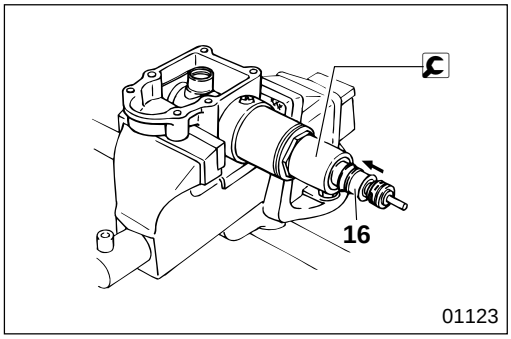
16 Valve assembly

[Removal]

Gently drive valve assembly **16** out from the shifter rod from the lever side using bar **A**.

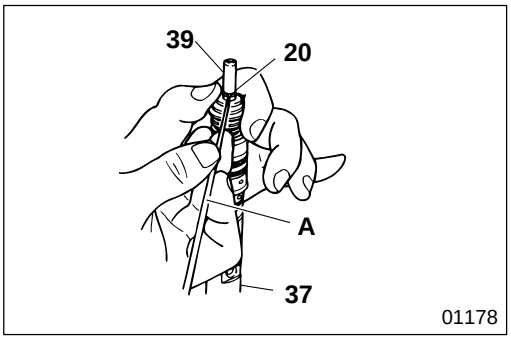
CAUTION

Do not drive valve assembly 16 too hard or you will damage the valve parts.



[Installation]

- Apply grease to valve assembly **16**.
- Install valve assembly **16** into the housing using guide, taking care not to damage the seals.



20 Retaining ring

[Removal]

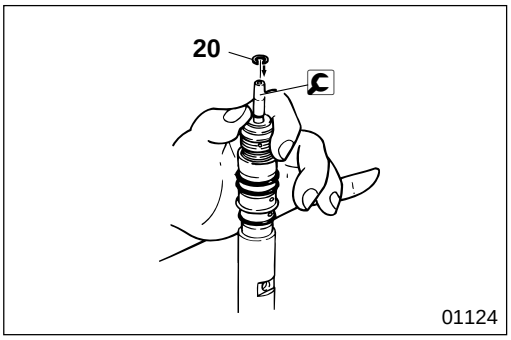
- Hold rod **37** in a vise, taking care not to damage the rod.
- Remove retaining ring **20** from pipe **39** using bar **A** as illustrated.

CAUTION

Keep the valve parts in order to avoid mix ups when installing.

NOTE

After removing retaining ring 20, you can remove all the valve parts.



[Installation]

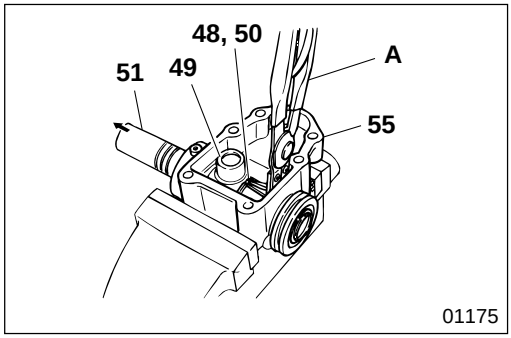
After installing the valve parts on pipe **39**, insert retaining ring **20** into pipe groove using retaining ring insert tool.

CAUTION

Be careful not to apply excessive force to retaining ring 20 when you insert it.

https://truckmanualshub.com/

POWER SHIFT ASSEMBLY



51 Removal and installation of shifter rod

[Removal]

- Remove retaining rings **48**, **50** from the groove of shifter rod **51** using snap ring expander **A**.
- Driving out shifter rod **51** gradually, remove it from housing **55**.
- When you remove shifter rod **51**, remove striker **49** from housing **55**.

[Installation]

CAUTION

Make sure that retaining rings 48, 50 are securely placed in the groove of shifter rod 51.

GEAR SHIFTER LOWER

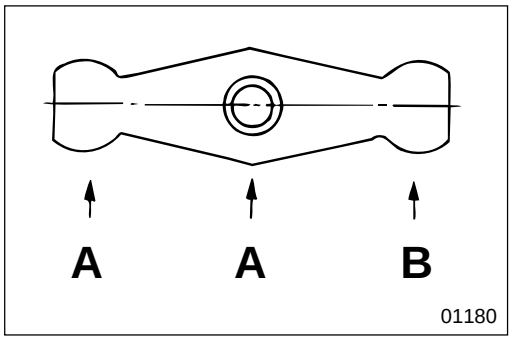
Special tools

Unit : mm {in.}

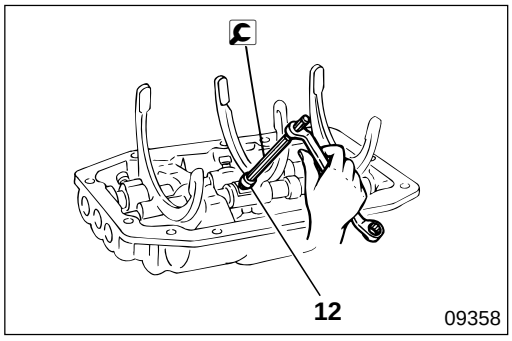
Location	Tool name and shape	Part No.	Application
12	Hexagon bit 	MH061533	Removal and installation of set bolt

◆ Service procedure



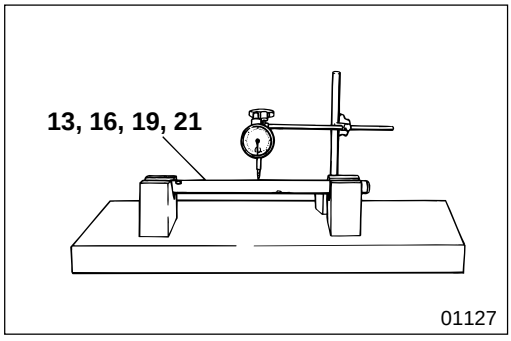
8 **Bend of 1st and reverse shift lever**

If bend **B** (in reference to **A-A** as illustrated) is higher than the limit, replace 1st and reverse shift lever **8**.



12 **Removal and installation of set bolt**

- Use hexagon bit to remove and install set bolt **12**.
- Caulk the thread area of set bolt **8** at three points or more after tightening.



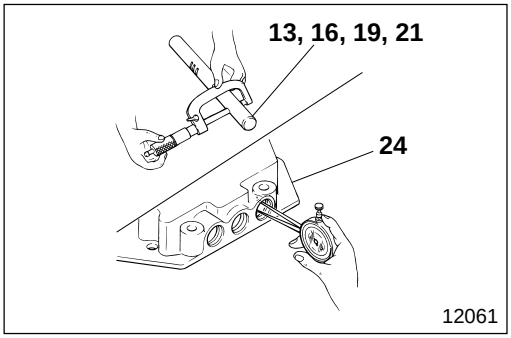
13 **16** **19** **21** **Bend of shift rail**

- If the measured value is higher than the limit, correct or replace the shift rail.

NOTE

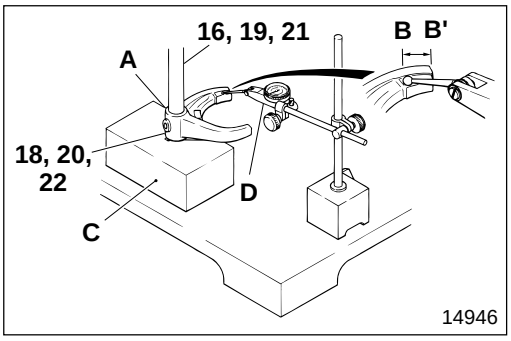
Read the dial gauge after turning shift rails 13, 16, 19, 21 one full revolution. The bend is one half of the indicated value.

https://truckmanualshub.com/



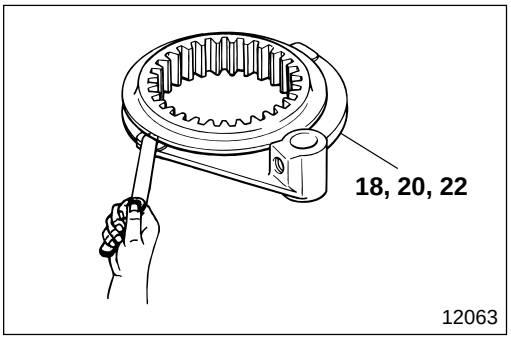
13 **16** **19** **21** **24** **Clearance between shift rail and gear shift lever lower case**

- Measure the outer diameter of the shift rail and the inner diameter of the gear shift lever lower case shift rail hole.
- If the clearance is higher than the limit, replace the faulty parts.



18 **20** **22** **Tilt of shift fork claw**

- Measure the tilt (difference between **B** and **B´**) of claw **B–B´**against hole **A** of shift rails **16**, **19**, **21** of shift forks **18**, **20**, **22** with the shift rails upright.
- If the tilt is higher than the limit, replace shift forks **18**, **20**, or **22**.
  C : V-block
  D : Dial gauge



18 **20** **22** ***** **Clearance between shift fork and synchronizer sleeve**

If the clearance is higher than the limit, replace the faulty parts.

◆ Service procedure

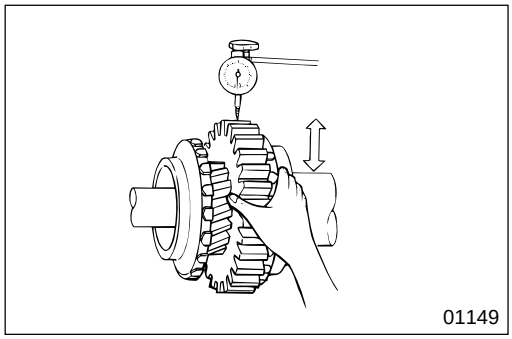
09370

● **Work before disassembly**

[Inspection]

(1) Backlash between splitter pinion assembly and splitter high gear

If the measured value is higher than the limit, replace the faulty parts. Also inspect this item after assembly and make sure that the measured value is within the limit.



01149

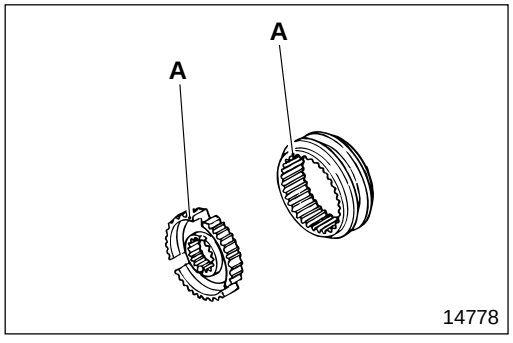
(2) Clearance in the diameter direction between input shaft, and splitter pinion assembly or needle bearing after assembling them on the shaft

If the measured values are higher than the limit, replace the faulty parts.

Also inspect this item after assembly and make sure that the measured value is within the limit.

CAUTION⚠

Be sure when you replace two needle bearings of a gear, that both needle bearings are from the same color package.



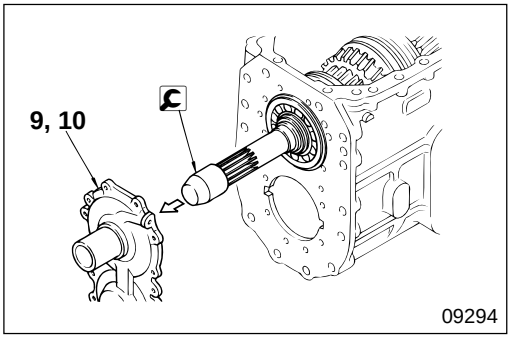
14778

[Alignment marks]

Synchronizer sleeve and synchronizer hub

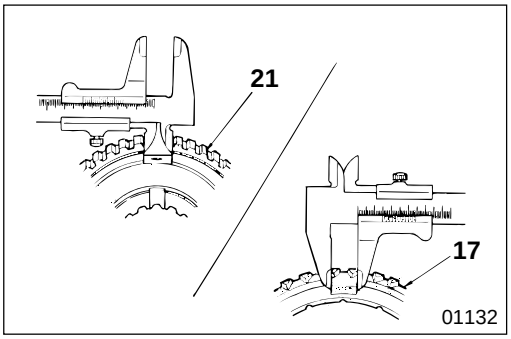
Before disassembling the synchronizer sleeve and the synchronizer hub, put alignment marks **A** on the places where the shifting keys are installed. When reusing parts, align the alignment marks to assemble.

https://truckmanualshub.com/



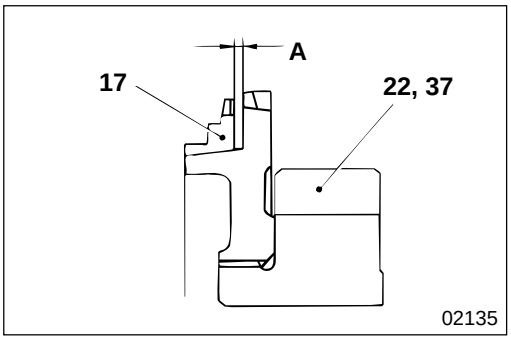
10 **Installation of bearing retainer**

When installing bearing retainer **10**, use oil seal front guide to avoid damage to oil seal **9**, which is installed on the bearing retainer.



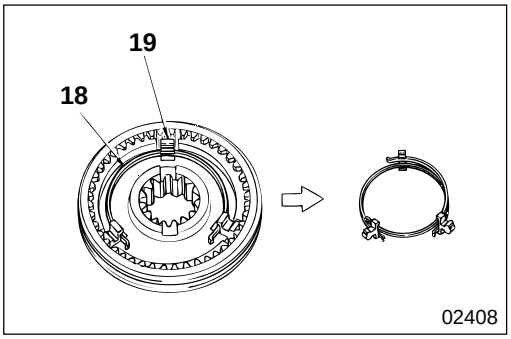
17 **21** **Clearance between synchronizer ring and synchronizer hub**

If the measured value is higher than the limit, replace the faulty parts.



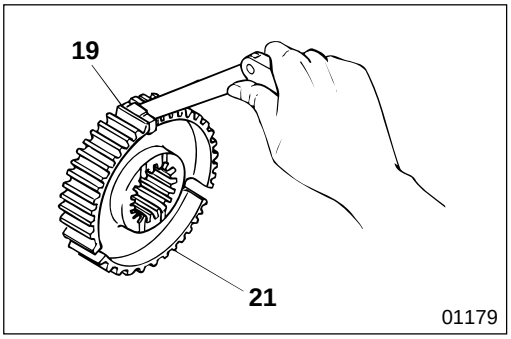
17 **22** **37** **Clearance between synchronizer ring, and splitter pinion or splitter synchronizer cone**

- Measure clearance **A** between synchronizer ring **17** and splitter pinion **22** or splitter synchronizer cone **37**.
- When measuring this value, press synchronizer ring **17** evenly and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.



18 **Installation of shifting key spring**

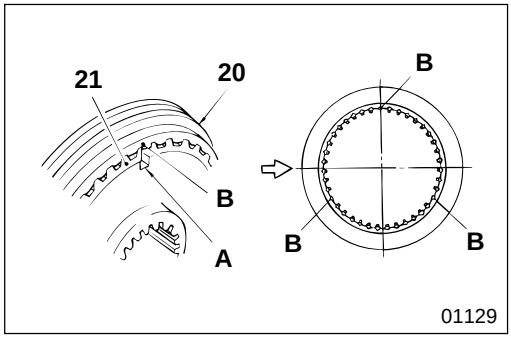
- Insert shifting key **19** into the keyway.
- Install shifting key spring **18** so that its opening is offset from the one on the shifting key.
- Make sure that the opening of shifting key springs **18** do not align with each other.



19 **21** **Clearance between shifting key and synchronizer hub**

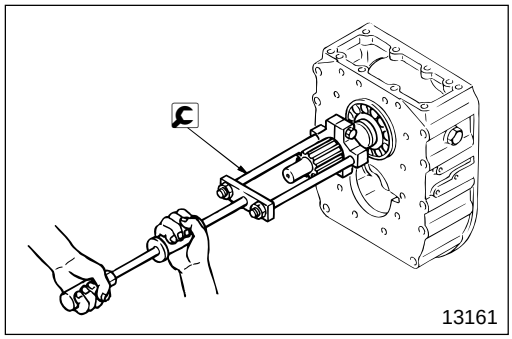
If the measured value is higher than the limit, replace the faulty parts.

https://truckmanualshub.com/



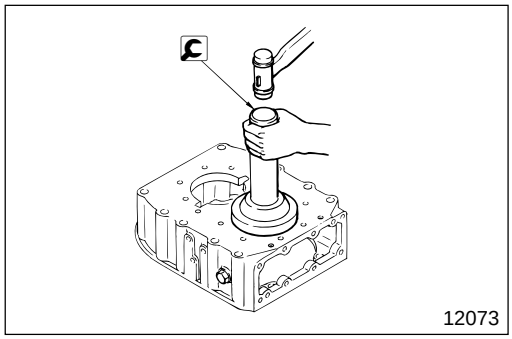
20 **Installation of synchronizer sleeve**

- Align the three keyways **A** of synchronizer hub **21** with the three stub teeth **B** of synchronizer sleeve **20** to install the synchronizer hub.
- To reassemble synchronizer hub **21** and synchronizer sleeve **20**, align the alignment marks made during disassembly.

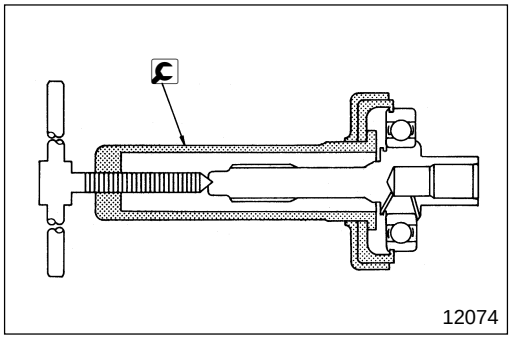


29 **Input shaft**

[Removal]



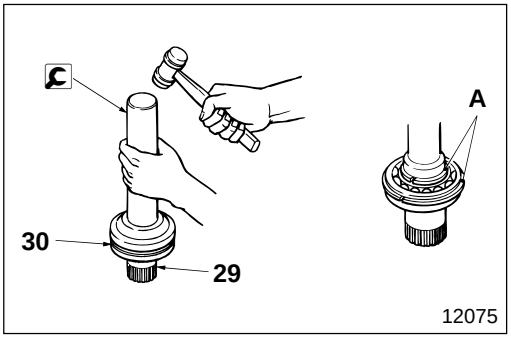
[Installation]



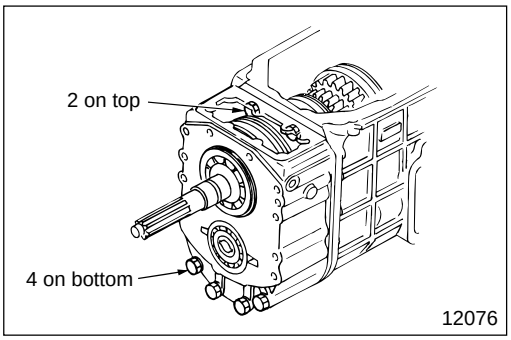
30 **Ball bearing**

[Removal]

https://truckmanualshub.com/



[Installation]
- Install ball bearings **30** on input shaft **29**.
- Install snap ring **A** on ball bearings **30**.



34 Removal and installation of splitter case

When you install splitter case **34**, note that there are two bolts on its top, and four bolts on its bottom.

◆ Service procedure

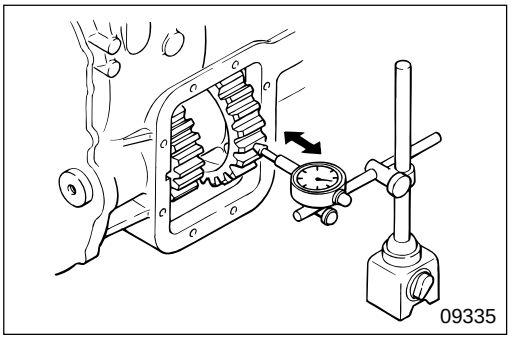
● Inspection before disassembly

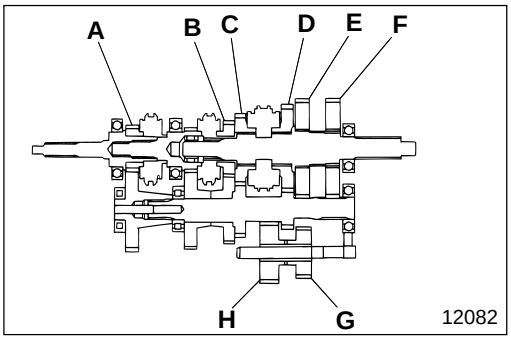


(1) Clearance in the diameter direction after assembling reverse gear

If the measured value is higher than the limit, replace the faulty parts. Also inspect this item after assembly and make sure that the measured value is within the limit.

CAUTION⚠

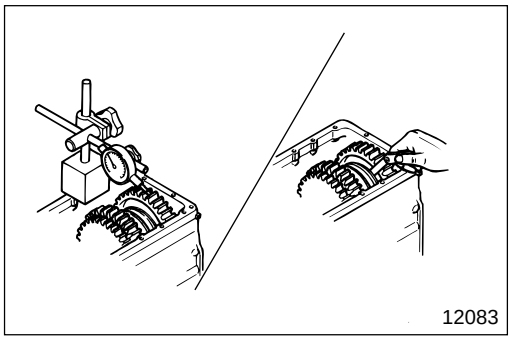
Be sure when you replace two needle bearings of a gear, that both needle bearings are from the same color package.

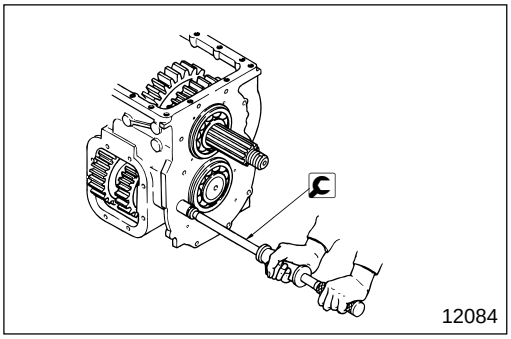


(2) Backlash and end play of gears

A : Drive pinion gear
B : 4th gear
C : 3rd gear
D : 2nd gear
E : Mainshaft reverse gear
F : 1st gear
G : Reverse gear (Mainshaft side)
H : Reverse gear (Countershaft side)

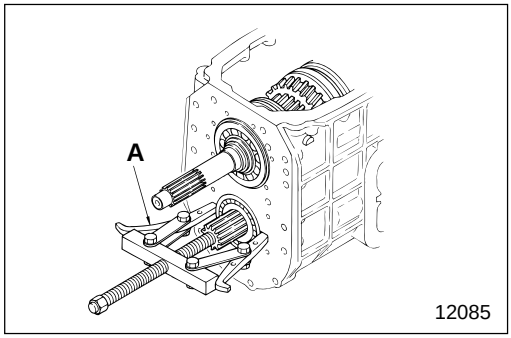
If the measured value is higher than the limit, replace the faulty parts. Also inspect this item after assembly and make sure that the measured value is within the limit.





4 Removal of reverse gear shaft

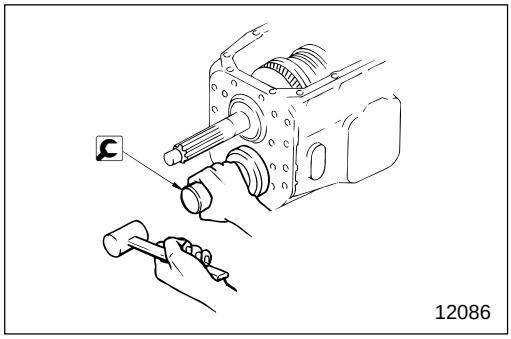
https://truckmanualshub.com/



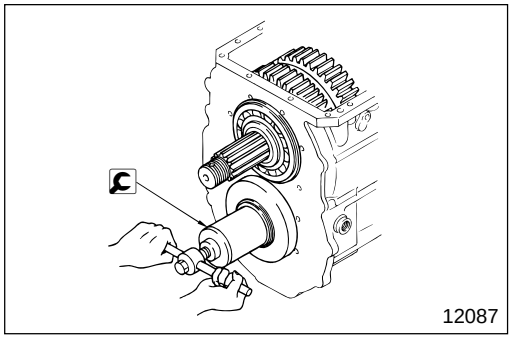
10 **Countershaft front bearing**

[Removal]
Remove countershaft front bearing **10** from transmission case **22** using a commercial gear puller of appropriate size.

A : Gear puller

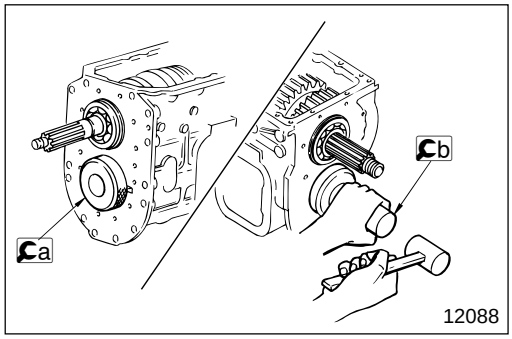


[Installation]



11 **Countershaft rear bearing**

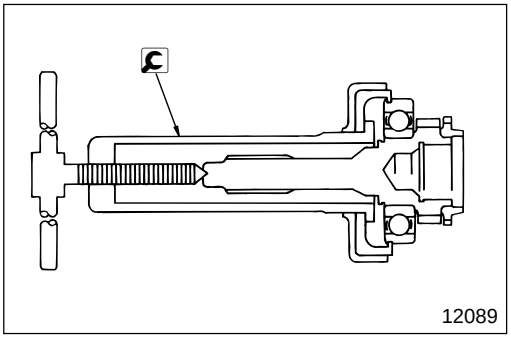
[Removal]



[Installation]

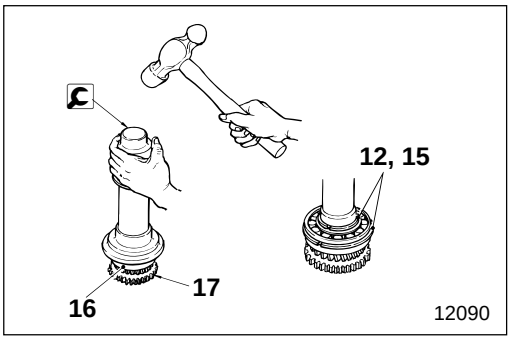
- Support the front end of countershaft **21** using a dummy bearing.
- Install countershaft rear bearing **11** in transmission case **22** using b mainshaft rear and countershaft bearing installer.

https://truckmanualshub.com/



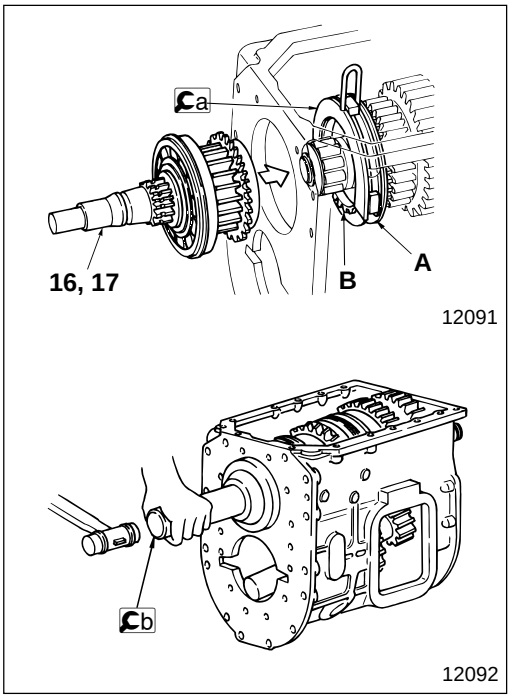
16 Drive pinion bearing

[Removal]



[Installation]

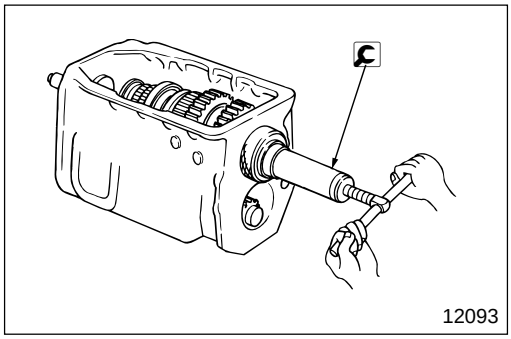
- Install drive pinon bearing **16** on drive pinion **17**.
- Install snap rings **12**, **15** on drive pinion bearing **16** and drive pinion **17** respectively.



17 Installation of drive pinion

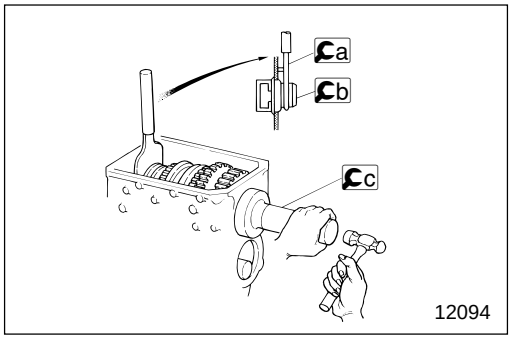
- When installing drive pinion **17** install a synchronizer ring holder to support synchronizer ring **A** and synchronizer sleeve **B**.
- Install drive pinon **17** in transmission case **22** using b drive pinion bearing installer.

https://truckmanualshub.com/



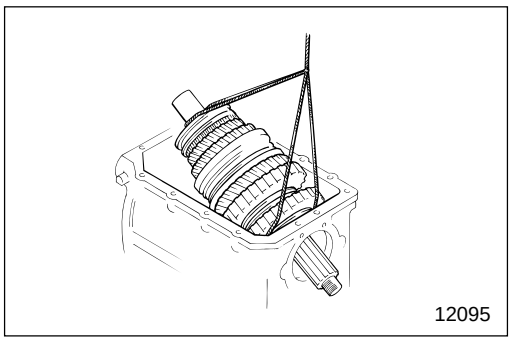
19 **Mainshaft rear bearing**

[Removal]



[Installation]

- Support the front end of mainshaft **20** using a dummy bearing retainer and b dummy bearing.
- Install mainshaft rear bearing **19**, on which snap ring **18** was installed, in transmission case **22** using c mainshaft rear and countershaft bearing installer.



20 **Removal and installation of mainshaft**

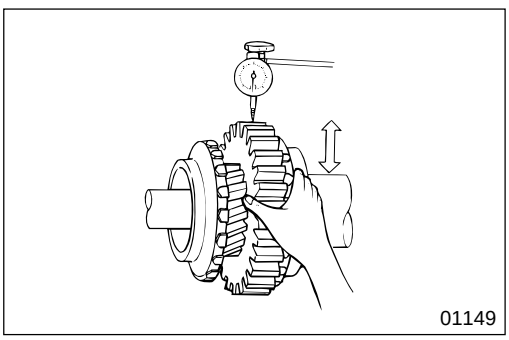
◆ Service procedure



● Work before disassembly

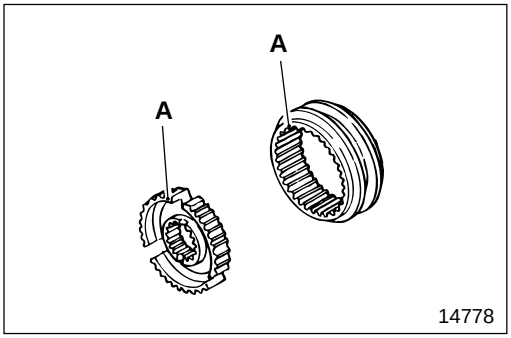
[Inspection]
Play of gears in diameter direction
If the measured value is higher than the limit, replace the faulty parts. Also inspect this item after assembly and make sure that the measured value is within the limit.

CAUTION⚠

Be sure when you replace two needle bearings of a gear, that both needle bearings are from the same color package.

https://truckmanualshub.com/

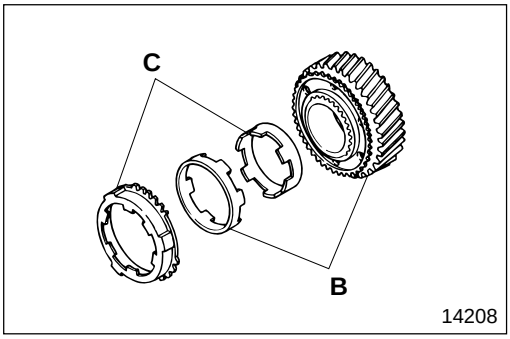
MAINSHAFT ASSEMBLY



[Alignment marks]

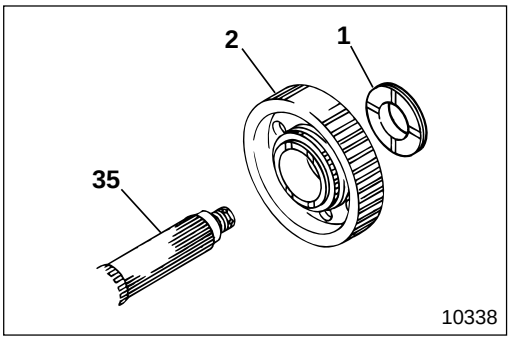
(1) Synchronizer sleeve and synchronizer hub

Before disassembling the synchronizer sleeve and the synchronizer hub, put alignment marks **A** on the places where the shifting keys are installed. When reusing parts, align the alignment marks to assemble.



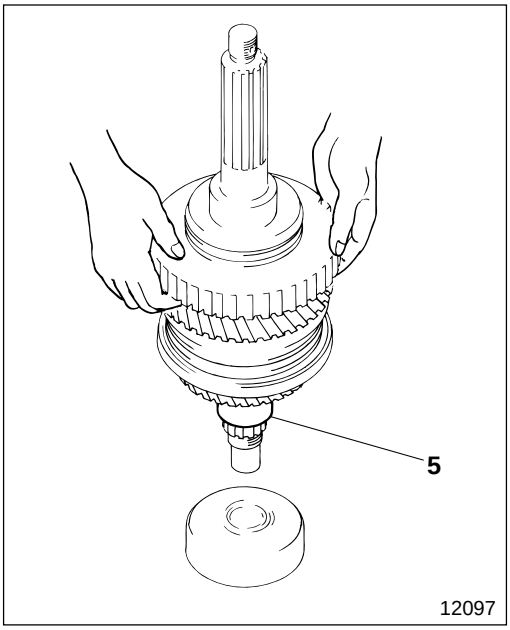
(2) Ring, cone and gear assembly of double cone synchronizer

Before disassembling synchronizer center cone and gear assembly (**B**), and synchronizer center ring and synchronizer outer ring (**C**), put alignment marks on them. When reusing parts, align the alignment marks to assemble.



1 Installation of 1st gear thrust washer

Install 1st gear thrust washer **1** onto mainshaft **35** in the direction as illustrated.



5 21 25 1st, 4th and 3rd gear bearing

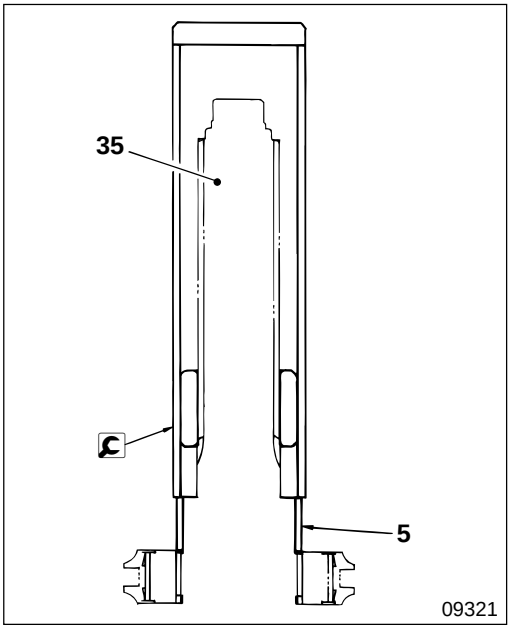
[Removal]

Drop mainshaft **35** on a lead block to remove bearing sleeves **5, 21, 25,** making use of the weight of the gears.

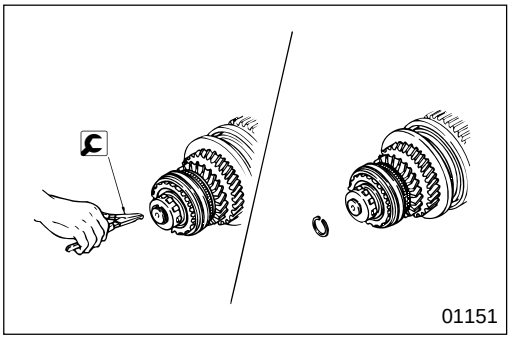
CAUTION

Make sure you use a lead block and be careful you do not damage the end of mainshaft 35.

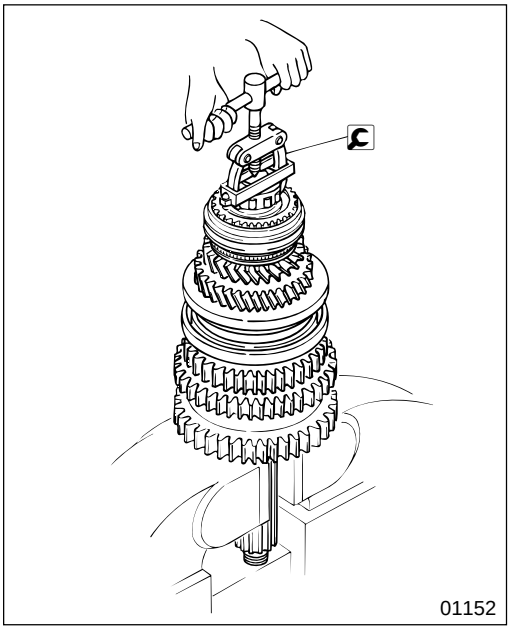
https://truckmanualshub.com/



[Installation]



9 Removal and installation of snap ring

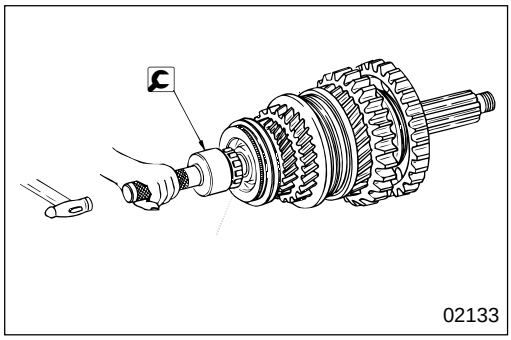


10 Pilot bearing

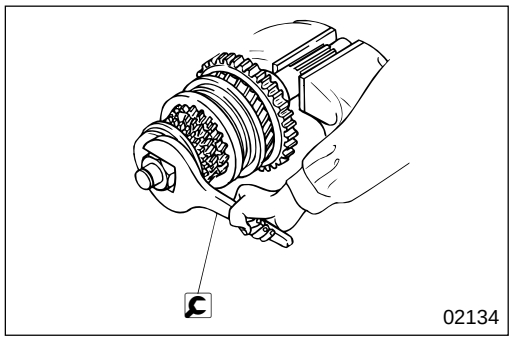
[Removal]

https://truckmanualshub.com/

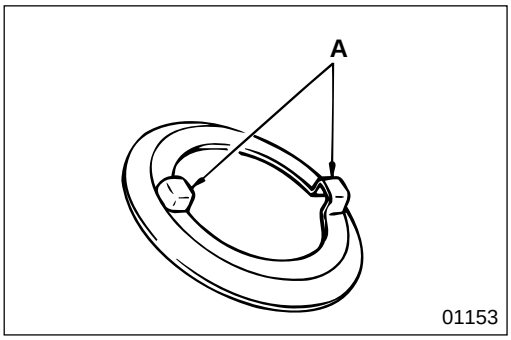
MAINSHAFT ASSEMBLY



[Installation]

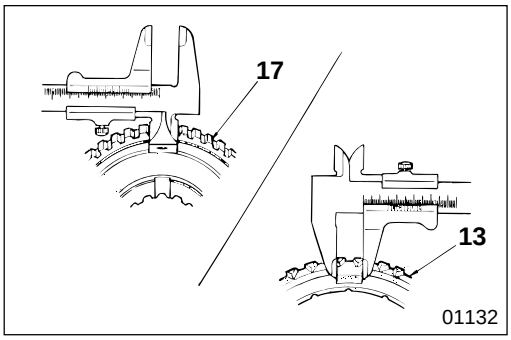


11 Removal and installation of lock nut



12 Installation of lock washer

Align protrusions **A** (two points as illustrated) with the grooves of synchronizer hub **17**.

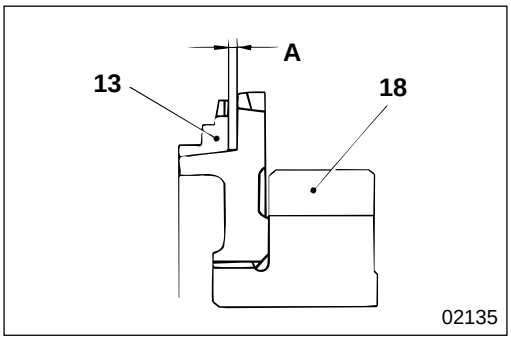


13 to 18 Synchromesh mechanism and 4th gear

[Inspection]

(1) Clearance between the protrusion of synchronizer ring 13 and the groove of synchronizer hub 17

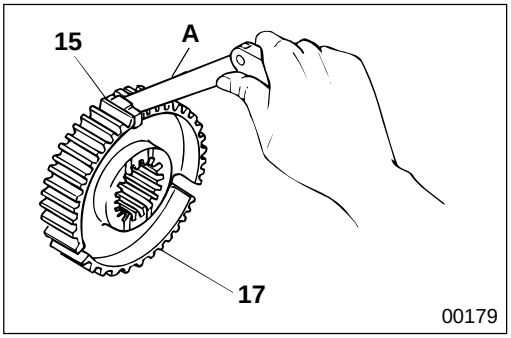
If the measured value is higher than the limit, replace the faulty parts.



(2) Clearance between synchronizer ring 13 and 4th gear assembly 18 or drive pinion

- Measure clearance **A** between synchronizer ring **13** and the gear cone of 4th gear assembly **18** or drive pinion.
- When measuring this value, press synchronizer ring **13** evenly **1** and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.

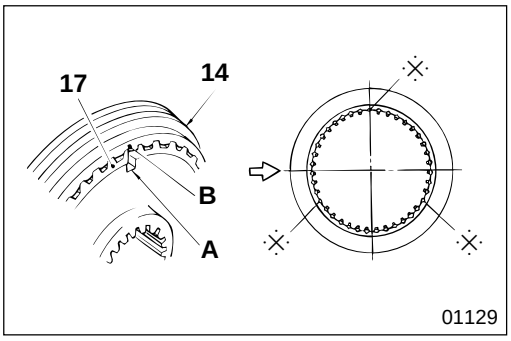
https://truckmanualshub.com/



(3) Clearance between shifting key 15 and synchronizer hub 17

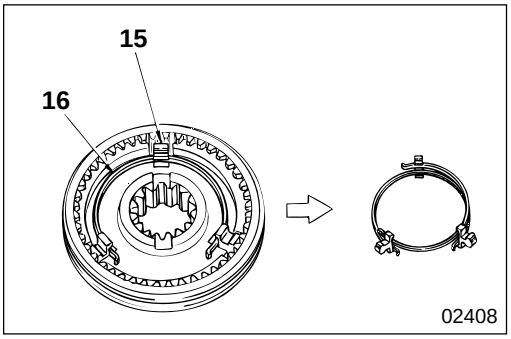
If the measured value is higher than the limit, replace the faulty parts.

A : Feeler gauge

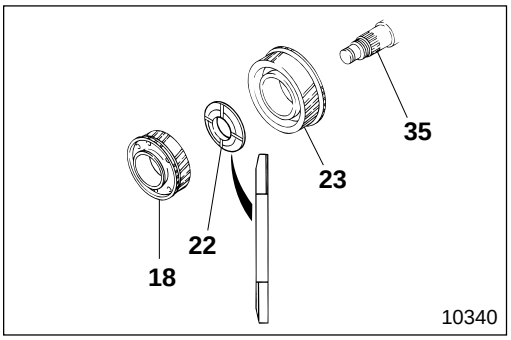


[Installation]

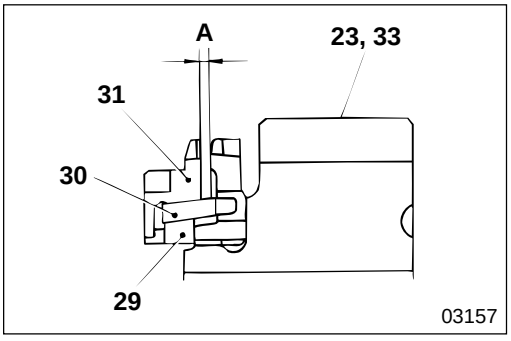
- Align the three keyways **A** of synchronizer hub **17** with the three stub teeth **B** (illustrated by ·⁜· mark) of synchronizer sleeve **14** to install the synchronizer hub.
- To reassemble synchronizer hub **17** and synchronizer sleeve **14**, align the alignment marks made during disassembly.



- Insert shifting key **15** into the keyway.
- Install shifting key spring **16** so that its opening is offset from the one on the shifting key.
- Make sure that the openings of shifting key springs **16** do not align with each other.



22 Installation of thrust washer



23 31 33 Clearance between synchronizer outer ring and 3rd gear assembly or 2nd gear assembly

- Measure clearance **A** between synchronizer outer ring **31** and 3rd gear assembly **23** or 2nd gear assembly cone **33**.
- When measuring this value, press synchronizer inner ring **29**, synchronizer center cone **30** and synchronizer outer ring **31** evenly and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.

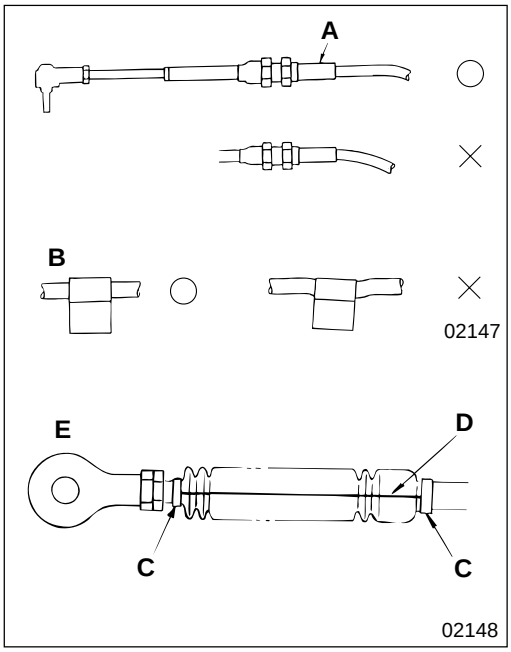
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1 to 4	Nut (Ball joint or rubber damper mounting)	19 to 24 {14 to 17, 1.9 to 2.4}	—
5, 6	Tightening of cable lock nut	59 to 83 {43 to 61, 6 to 8.5}	—

https://truckmanualshub.com/

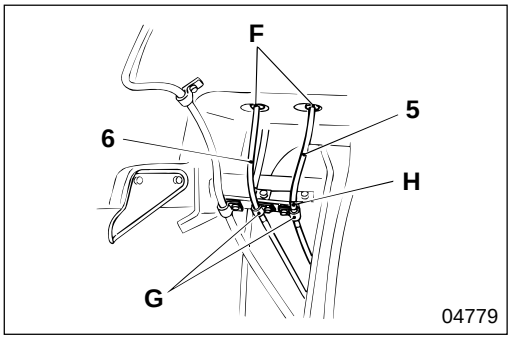
◆ Service procedure



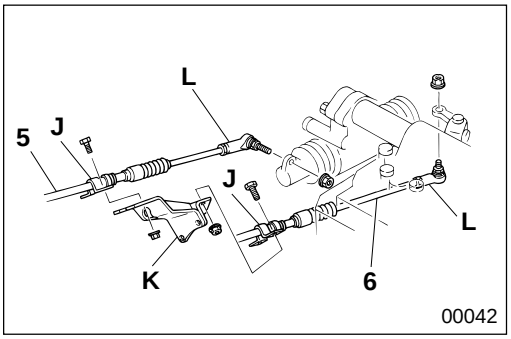
5 **6** **Installation of shift cable and selector cable**

CAUTION⚠

- **Install casing cap A lengthwise.**
- **Make sure the radius of the bend is 200 mm {7.87 in.} or more.**
- **Make sure the cable operates smoothly.**
- **Install the clamp vertically against the cable. (Figure B)**
- **Do not twist clamps C at both ends of the boot. Make sure that white line D on the boot is straight. (Figure E)**



- Insert shift cable **5** and selector cable **6** under the cab floor and clamp them in the correct place by identifying identification mark **H** on the shift cable. (The selector cable has no identification mark.)
  F : Grommet
  G : Clip



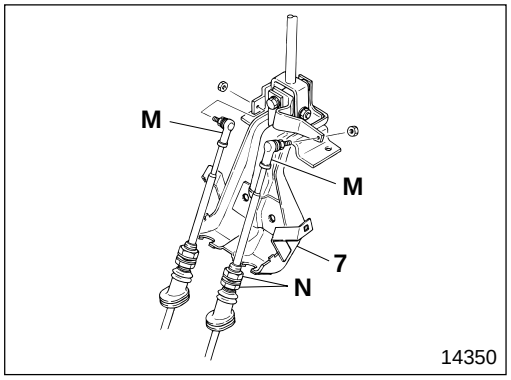
- Install cable clip **J** to bracket **K** temporarily and connect ball joint **L** to the shift lever or selector lever.
- Arrange the cable so that it not twisted, then tighten clip **J** permanently.

CAUTION⚠

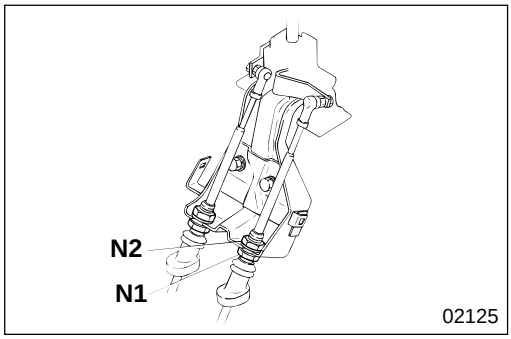
Make sure the identification marks on the cable, ball joint L point in the right direction when you install the cables. Installing the cables with the identification marks in the wrong direction can remarkably reduce the durability of the cables.

https://truckmanualshub.com/

TRANSMISSION CONTROL



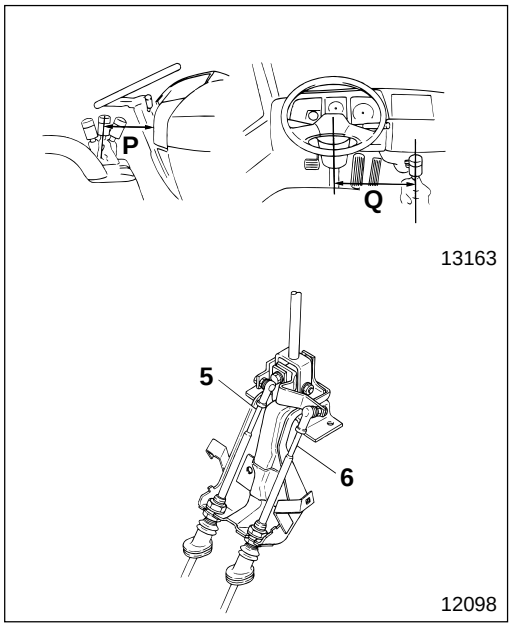
- Tilt the cab down.
- Install the cable on transmission control lever assembly **7** temporarily and connect ball joint **M** to shift lever and selector lever.
- Arrange the cable so that it is not twisted, then tighten lock nuts **N** permanently.



CAUTION⚠

- **Make sure that ball joint P faces the correct direction.**
- **When installing the lock nut, tighten lower nut N1. Do not move nut N2.**

- Make sure when you operate the gear shift lever that it shifts smoothly and selects each position.



- If the gear shift lever leans to the front or rear, or to the left or right, excessively, adjust the length of the cable.
- When positioning the gear shift lever, use the distance from the center of the steering wheel or from the instrument panel as the reference distance.

Unit : mm {in.}

Front and rear direction **P** (Distance from the instrument panel)	Left and right direction **Q** (Distance from the steering wheel center)

SERVICE MANUAL

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of 2001 model Mitsubishi Fuso Truck FM series.
Read this manual carefully as an aid to providing correct, efficient and fast maintenance.
Please note, however, that due to continuous improvements on the specifications, numbers and description for maintenance might be changed without prior notice.
If you have any questions, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso dealer or distributor.

MODEL CHANGES

(For FM657 with Automatic Transmission)

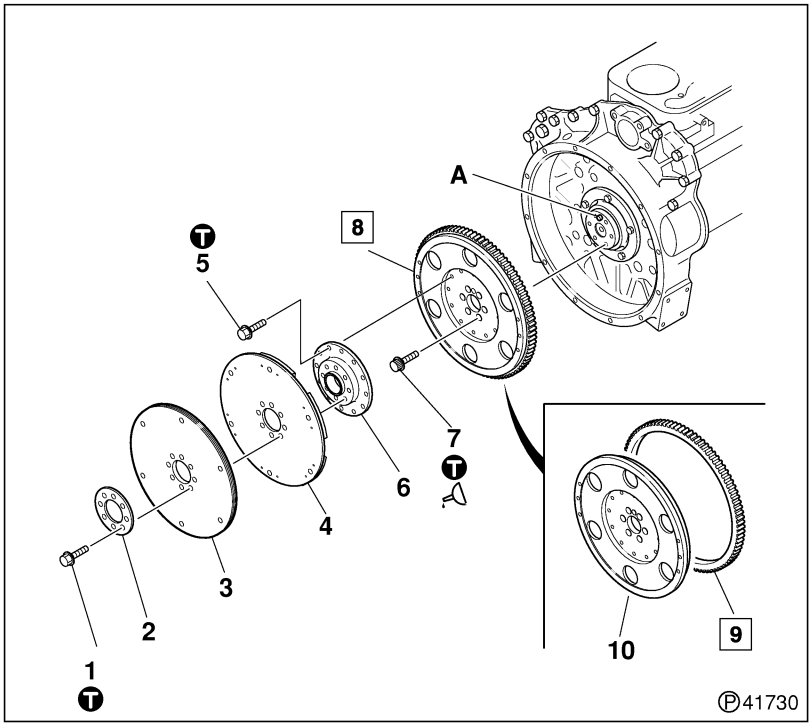
https://truckmanualshub.com/

- This book is the Service Manual for FM657 equipped with an automatic transmission.
- The points of difference compared with FM657 equipped with manual transmission are described.
- For the maintenance, other than services described in this manual, refer to FK/FM 2001 Service Manual (Pub.No.TWME9503-5).

Item	Contents of difference point

Gr 11 Engine

- Except for the flywheel and the flex plate which have been changed, refer to specifications for the automatic transmission in Gr11 Engine of FK/FM Shop Manual (Pub. No. TWME9503-11).



● **Disassembly sequence**

1 Bolt
2 Washer plate
3 Flex plate

0%	1 → 2	9 {5} (300)	9 {5} (300)
	2 → 3	21 {13} (750)	22 {14} (770)
	3 → 4	30 {19} (1050)	31{19} (1090)
	4 → 5	40 {25} (1400)	42 {26} (1450)
	5 → 6	68 {42} (2380)	77 {48} (2680)

https://truckmanualshub.com/

LOCK-UP POINT

Unit: km/h {mph} (rpm)

Accelerator position	Mode switch position / Gearshift	Normal	Power
100%	2C – L	26 {16} (900)	29 {18} (1010)
50%	2C – L	22 {13} (750)	24 {15} (850)
0%	L → 2C	15 {10} (540)	15 {10} (540)

Note: Lock-up point is always set for the gear exceeding the 3rd.

- Revolutions shown in brackets indicates revolutions of transmission.
- The numerical value indicated in Table is calculated for vehicles set with the diff ratio of 6.666 and fitted with 11R22.5 tires. When the diff ratio or the tire size for vehicles is different, the speed of the vehicles varies based on such deviation. So, convert the numerical value in Table based on the applied specifications.

REPLACEMET INTERVALS OF AUTOMATIC TRANSMISSION FLUID AND OIL FILTER ELEMENT

Location	Replacement intervals	Specified fluid
Automatic transmission fluid	8000km (5000 miles) for new vehicle, then every 40000km (25000 miles) or 18 months	DEXRON III
Oil filter element	8000km (5000 miles) for new vehicle, then every 40000km (25000 miles) or 18 months	—

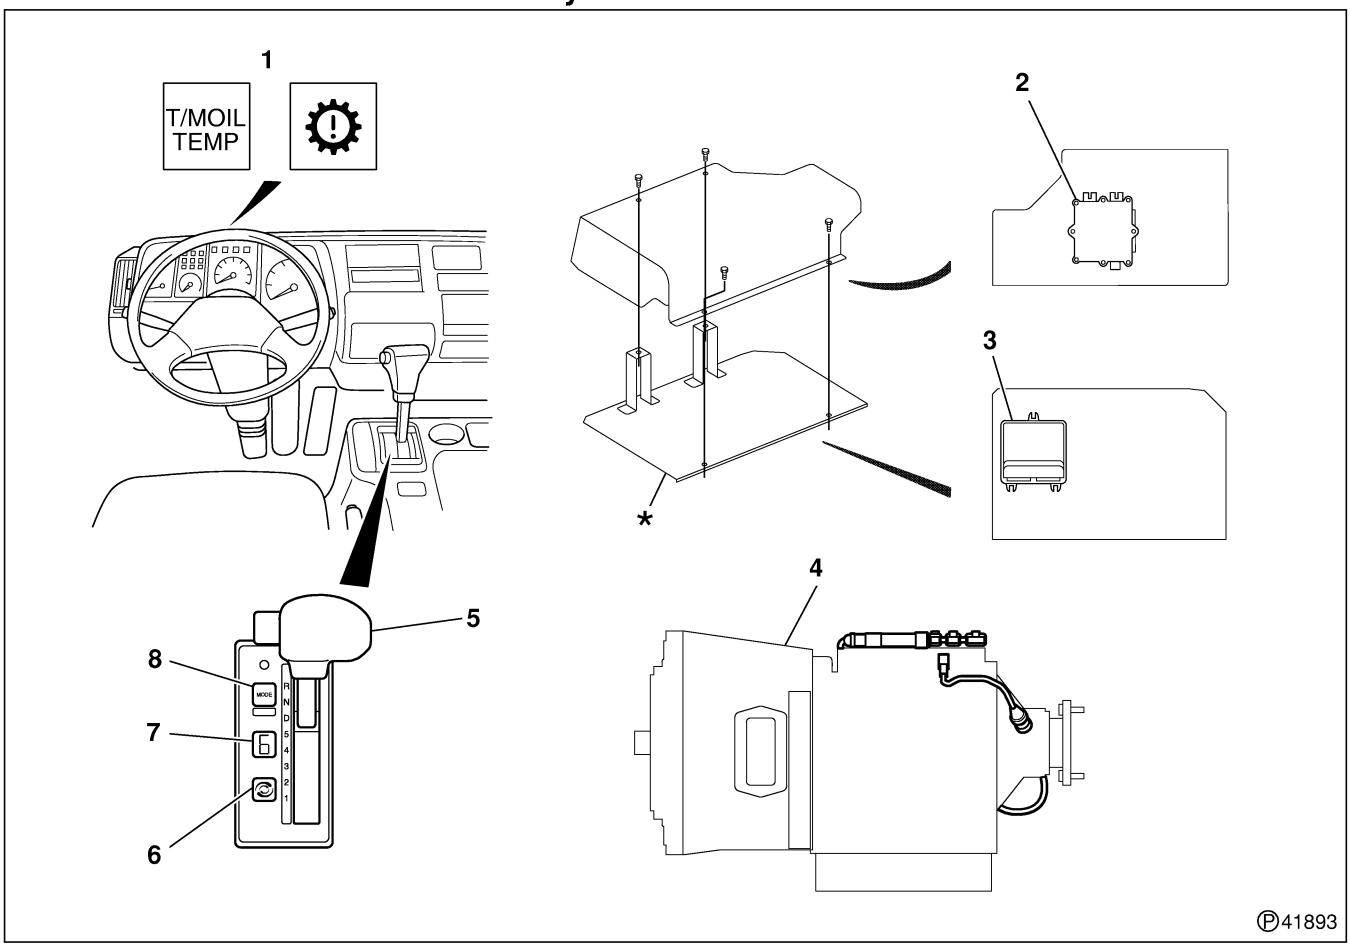
2. Automatic transmission control system



1 Warning lamp
2 Vehicle interface module
3 Automatic transmission control unit
4 Automatic transmission assembly
5 Range selector
6 Display switch button
7 Selector position display
8 Mode button

***** Back of driver's seat

Electronic control (ATEC: Allison Transmission Electronic Control) system is composed of vehicle interface module **2**, automatic transmission control unit **3**, range selector **5**, throttle position sensor, electronic hydraulic valve body, and harnesses connecting these units. The automatic transmission control unit receives electric signals, which are sent by each sensor and shift selector, processes them, transmits the signals to an appropriate solenoid, and thereby controls the transmission.

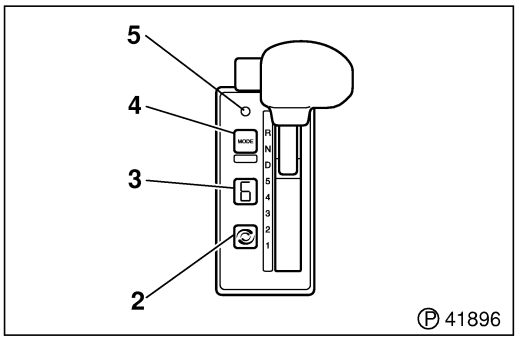
This automatic transmission is equipped with trouble self-diagnosis function. When detecting abnormality, the warning lamp **1**, illuminates and the trouble code is memorized. A maximum of five (5) trouble codes are memorized.

Start of trouble mode (reading trouble codes)

- Push display switch button **2** of range selector twice.
- Trouble code No. is indicated in select position display **3**. If "OL" is indicated, push the display switch button **2** again.
- Record the trouble code No. that is indicated.
  For instance, if indicated in order of "d1", "25", and "11", it shows that main code No. 25 and sub code No. 11 are memorized in the 1st memory. When nothing is recorded, "--" "--" is repeatedly displayed in sequence.
- There are five (5) memories that memorize the code No. When pushing mode button **4**, the 2nd memory code is displayed following "d2".
- Whenever pushing mode button **4**, "d3", "d4", and "d5" are displayed in sequence, and finally "d1" is indicated back.



Clearing of diagnosis trouble codes

After the repair is completed, push the mode button **4** for about 10 seconds, mode lamp **5** will flash for the first 5 seconds and the current malfunction code is cleared. After waiting another 5 seconds, the mode lamp will flash again and the past malfunction codes are cleared.

NOTE:

The code is cleared only after the trouble is repaired.

Release of diagnosis mode (returning to normal operation mode)

There are three (3) methods to return it to normal operation mode.

- Push the display switch button **2** of range selector.
- Switch it to either range of either range, "Reverse", "Neutral", or "Drive".
- Leave things as they are without doing anything (it will automatically release after approximately ten (10) minutes).

TROUBLESHOOTING

Trouble self-diagnosis Table

CAUTION⚠

If a code No. is not listed in the table below, contact GM Allison.

Code No.		Symptoms	Inspection and adjustment
Main	Sub		
13	12 13 23	Automatic transmission control unit voltage: too low Automatic transmission control unit voltage: low Automatic transmission control unit voltage: high	1. Check: a. Battery direct ground and power connections are tight and clean. b. Vehicle batteries are charged. c. Vehicle charging system is not over- or under-charging. d. VIM fuse is good. e. VIM connections are tight, clean, and undamaged. f. Vehicle manufacturer supplied wiring is correct. g. ECU connectors are tight, clean, and undamaged. h. Contact authorized Allison Dealer.
14	12, 13	Oil level sensor	1. Check: a. Engine speed sensor, output speed sensor, temperature sensor, and oil level sensor are working correctly. b. Wiring harness has no opens, shorts to ground, or shorts to battery. c. Contact authorized Allison Dealer.
21	12, 13	Throttle position sensor	1. Check: a. TPS connector is properly connected. b. End of TPS cable is pulled out properly. c. Engine fuel lever is in idle position. d. Engine fuel lever provides proper amount of stroke on TPS cable. e. Wiring harness to TPS has no opens, shorts between wires, or shorts to ground. f. TPS for proper operation and resistance readings. g. Contact authorized Allison Dealer.
22	14, 15, 16	Speed sensor	1. Check: a. Speed sensors and connectors are tight, clean, and undamaged. b. Wiring harness to sensors has no opens, shorts between wires, or shorts to ground. c. Contact authorized Allison Dealer.
23	12, 13, 14, 15	Range selector	1. Check: a. ECU connectors are tight, clean, and undamaged. b. Shift selector connector is tight, clean, and undamaged. c. Wiring harness to sensors has no opens, shorts between wires, or shorts to ground. 2. Shift selector(s) for proper operation. 3. Contact authorized Allison Dealer.
24	12	Temperature of automatic transmission fluid: too low	1. Check: a. Air temperature is below -32°C (-25°F) 1) If yes, this is a correct response for temperature. 2) If no, check that main transmission connector is tight, clean, and undamaged. b. ECU connectors are tight, clean, and undamaged. c. Contact authorized Allison Dealer.

https://truckmanualshub.com/

Code No.		Symptoms	Inspection and adjustment
Main	Sub		
13	23	Temperature of automatic transmission fluid: too high	1. Verify the overheat situation. Check: a. Correct dipstick is installed. b. Fluid level is correct. 1) If fluid level is incorrect — correct fluid level. 2) If fluid level is correct — check for cause of overheating. 2. Check if ECU and transmission connectors are tight, clean, and undamaged. 3. Contact Authorized Allison Dealer.
25	00, 11, 22, 33, 44, 55, 66, 77	Output speed sensor	1. Check: a. Speed sensor connector is tight, clean, and undamaged. b. ECU connectors are tight, clean, and undamaged. c. Fluid level is correct. d. Wiring harness to sensor has no opens, shorts between wires, or shorts to ground. e. Contact authorized Allison Dealer.
32	00, 33, 55, 77	Disconnection of C3 pressure switch	1. Let vehicle idle with parking brake applied, wheels chocked, and vehicle level. Check a. Correct dipstick is installed. b. Fluid level is correct. 2. Check: a. Main transmission connector is tight, clean, and undamaged. b. ECU connectors are tight, clean, and undamaged. c. Wiring harness has no opens, shorts between wires, or shorts to ground. d. Contact authorized Allison Dealer
33	12, 13	Faulty automatic transmission fluid temperature sensor	1. Check: a. Main transmission connector is tight, clean, and undamaged. b. ECU connectors are tight, clean, and undamaged. c. Wiring harness has no opens, shorts between wires, or shorts to ground. d. Contact authorized Allison Dealer.
34	12, 13, 14, 15, 16	Faulty EEPROM (memory chip)	1. If able, recalibrate ECU, if not, replace ECU. 2. Contact authorized Allison Dealer.
35	00, 16	Temporary interruption of power supply EEPROM writing error	1. Check: a. ECU connectors are tight, clean, and undamaged. b. VIM connectors are tight, clean, and undamaged. c. Vehicle manufacturer supplied wiring has correct power and ground connections. d. Power connections are battery direct. e. Ground connections are battery direct. f. Ignition switch connections are correct. g. Contact authorized Allison Dealer.
36	00	Unmatched hardware/software	1. If able, recalibrate ECU, if not, replace ECU. 2. Contact authorized Allison Dealer.
41	12, 13, 14, 15, 16, 21, 22, 23, 24, 25, 26	Disconnection or short-circuit of solenoid line	1. Connections of automatic transmission connector. 2. Connections of automatic transmission control unit connector. 3. Damaged or broken harnesses. 4. Disconnection or short-circuit of harnesses. 5. Replace wiring harnesses. 6. Contact authorized Allison Dealer.
42	12, 13, 14, 15, 16, 21, 22, 23, 24, 25, 26	Short-circuit of solenoid-circuit battery	1. Check: a. Main transmission connector is tight, clean, and undamaged. b. ECU connectors are tight, clean, and undamaged. c. Wiring harness is not pulled too tight, and there is no damage, chafing, or screws through harness. d. Wiring harness has no opens, shorts between wires, or shorts to ground. e. Unauthorized repairs have not been made. 2. Change harness (optional). 3. Contact authorized Allison Dealer.

https://truckmanualshub.com/

Code No.		Symptoms	Inspection and adjustment
Main	Sub		
43	21, 25, 26	Solenoid Lo side circuit Disconnection or short-circuit	1. Connections of automatic transmission connector 2. Connections of ECU connector 3. Disconnection or short-circuit of harnesses 4. Replace ECU 5. Contact authorized Allison Dealer.
42	12, 13, 14, 15, 16, 21, 22, 23, 24, 25, 26	Sort-circuit of solenoid circuit ground	1. Check: a. Main transmission connector is tight, clean, and undamaged. b. ECU connectors are tight, clean, and undamaged. c. Wiring harness is not pulled too tight, and there is no damage, chafing, or screws through harness. d. Wiring harness has no opens, shorts between wires, or shorts to ground. e. Unauthorized repairs have not been made. 2. Change harness (optional). 3. Contact authorized Allison Dealer.
42	12, 13, 14, 15, 16, 21, 22, 23, 24, 25, 26	Disconnection of solenoid circuit	1. Check: a. Main transmission connector is tight, clean, and undamaged. b. ECU connectors are tight, clean, and undamaged. c. Wiring harness is not pulled too tight, and there is no damage, chafing, or screws through harness. d. Wiring harness has no opens, shorts between wires, or shorts to ground. e. Unauthorized repairs have not been made. 2. Change harness (optional). 3. Contact authorized Allison Dealer.
51	01, 10, 12, 21, 23, 24, 35, 42, 43, 45, 46, 53, 64, 65	Off going ratio test	1. Check: a. Output and turbine speed sensor connectors are tight, clean, and undamaged. b. Speed sensor wiring harness has no opens, shorts between wires, or shorts to ground. 2. Let vehicle idle with parking brake applied, wheels chocked, and vehicle level. Check: a. Correct dipstick is installed. b. Fluid level is correct. c. Contact authorized Allison Dealer.
52	01, 08, 32, 34, 54, 56, 71, 72, 78, 79, 99	C3 switch off test	1. Check: a. Output and turbine speed sensor connectors are tight, clean, and undamaged. b. Speed sensor wiring harness has no opens, shorts between wires, or shorts to ground. c. Main wiring harness to transmission has no shorts between wires, or shorts to ground. 2. Let vehicle idle with parking brake applied, wheels chocked, and vehicle level. Check: a. Correct dipstick is installed. b. Fluid level is correct. c. Contact authorized Allison Dealer.
53	08, 18, 28, 29, 38, 39, 48, 49, 58, 59, 68, 69, 78, 99	Off going speed test	1. Check: a. Tubine and engine speed sensor connectors are tight, clean, and undamaged. b. Speed sensor wiring harness has no opens, shorts between wires, or shorts to ground. 2. Let vehicle idle with parking brake applied, wheels chocked, and vehicle level. Check: a. Correct dipstick is installed. b. Fluid level is correct. c. Contact authorized Allison Dealer.
54	01, 07, 10, 12, 17, 21, 23, 24, 27, 32, 34, 35, 42, 43, 45, 46, 53, 54, 56, 64, 65, 70, 71, 72, 80, 81, 82, 83, 85, 86, 92, 93, 95, 96, 97	On comming ratio test (after shift)	1. Check: a. Tubine and engine speed sensor connectors are tight, clean, and undamaged. b. Speed sensor wiring harness has no opens, shorts between wires, or shorts to ground. 2. Let vehicle idle with parking brake applied, wheels chocked, and vehicle level. Check: a. Correct dipstick is installed. b. Fluid level is correct. c. Contact authorized Allison Dealer.

Code No.		Symptoms	Inspection and adjustment
Main	Sub		
55	17, 27, 87, 97	C3 switch on test	1. Let vehicle idle with parking brake applied, wheels chocked, and vehicle level. Check: a. Correct dipstick is installed. b. Fluid level is correct. 2. Check: a. Output and turbine speed sensor connectors are tight, clean, and undamaged. b. Speed sensor wiring harness has no opens, shorts between wires, or shorts to ground. 3. Check: a. Transmission connector is tight, clean, and undamaged. b. ECU connectors are tight, clean, and undamaged. c. C3 pressure switch wiring has no opens, shorts between wires, or shorts to ground. d. Contact authorized Allison Dealer.
56	00, 11, 22, 33, 44, 55, 66, 77	Range check test	1. Check: a. Turbine and output speed sensor connectors are tight, clean, and undamaged. b. Speed sensor wiring harness has no opens, shorts between wires, or shorts to ground. c. Transmission connector is tight, clean, and undamaged. d. ECU connectors are tight, clean, and undamaged. 2. Let vehicle idle with parking brake applied, wheels chocked, and vehicle level. Check: a. Correct dipstick is installed. b. Fluid level is correct. c. Contact authorized Allison Dealer.
57	11, 22, 44, 66, 88, 99	Range check test: C3 switch	1. Let vehicle idle with parking brake applied, wheels chocked, and vehicle level. Check: a. Correct dipstick is installed. b. Fluid level is correct. 2. Check: a. Output and turbine speed sensor connectors are tight, clean, and undamaged. b. Speed sensor wiring harness has no opens, shorts between wires, or shorts to ground. 3. Check: a. Transmission connector is tight, clean, and undamaged. b. ECU connectors are tight, clean, and undamaged. c. C3 pressure switch wiring has no opens, shorts between wires, or shorts to ground. d. Contact authorized Allison Dealer.
63	00, 26, 40	Faulty input function	1. Check input wiring, switches, and connectors to determine why input states fare different. 2. Contact authorized Allison Dealer.
65	00	Engine rating: too high	1. Exceeding the engine rating or maximum speed. 2. Contact authorized Allison Dealer.
66	00	Faulty Serial Communications Interface (SCI)	1. Check: a. Serial connection to engine computer is tight, clean, and undamaged. b. SCI wiring harness has no opens, shorts, or shorts to ground. c. If DDR is not available, also be sure that transmission ECU connections are tight, clean, and undamaged. e. Contact authorized Allison Dealer.
69	12, 13, 14, 15, 16, 21, 22, 23, 24, 25, 26, 32, 33, 34, 35, 36, 41	Trouble of automatic transmission control unit	1. Clear diagnostic code and retry vehicle start. 2. If code recurs, reprogram or replace ECU. 3. Contact authorized Allison Dealer

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Stall test

● **Purpose**

"Stall test" checks the clutches in transmission, operation of one-way clutch in torque converter, operation of torque converter, or overall performance of the engine; thereby investigating the cause when the vehicle is malfunctioning due to insufficient power, performance, or others.

● **Measurement procedure**

Before starting the test, check the cooling water and oil of the engine, and automatic transmission fluid level of automatic transmission. Also, conduct sufficient warm-up operation of the engine and transmission.

- Fit the chocks securely at the front (rear) of the front (rear) wheels and engage the parking brake to prevent the vehicle from moving. In addition, when pushing the accelerator pedal down, depress the foot brake strongly.
- Start the engine and engage the range selector lever into D range.
- Push the accelerator pedal down slowly to the full acceleration; when the engine comes into a stable speed at a constant speed, read the revolutions (the stall revolutions) quickly, and then take off the foot from the accelerator pedal.

CAUTION⚠

- **Be sure to set a full stall acceleration time as less than 5 seconds, and complete the measurement during that time.**
- **Be careful for overheating of the engine and transmission.**

- Put the range selector lever in "N" range, and conduct the cooling for two (2) minutes or more per 1000 rpm.
  Stall revolutions
  1750±150 rpm

● **Result of diagnosis**

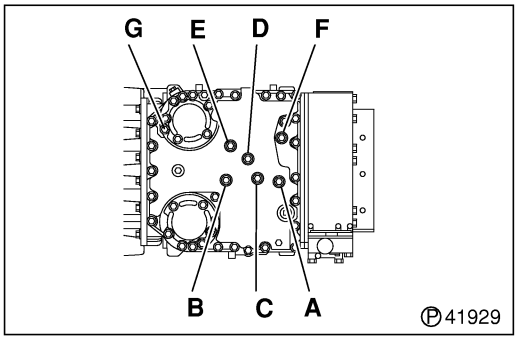
1. If the stall revolution is too low; if the result of measurement is lower by 150 rpm or more than the standard value, the engine will be malfunctioned.
2. If the stall revolution is abnormally low (approximately 1/3 of the specified value) even though the engine has no any trouble like emitting black smoke; there may be some abnormality inside the torque converter (one-way clutch failure).
3. If the stall revolution is too high; if the result of measurement is higher by 150 rpm or more than the standard value, the cause may be due to the slide inside the transmission, cavitations, the bubbling of automatic transmission fluid, or damage of the torque converter.

https://truckmanualshub.com/

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
—	Plug	10 to 13 {7.2 to 9.4, 1.0 to 1.3}	—



● Purpose

"Line pressure test" checks the performance of oil pump, function of control valve, and the internal oil leakage of each component.

● Measurement procedure

Decide which pressure item to check according to the content of troubles, and measure the line pressure based on the following procedure.

- Remove the plug from the pressure detecting port of the gearbox casing, and install the pressure gauge.
  A: Main oil pressure
  B: C1 clutch oil pressure
  C: C2 clutch oil pressure
  D: C3 clutch oil pressure
  E: C4 clutch oil pressure
  F: C5 clutch oil pressure
  G: Lock-up oil pressure
- Conduct a sufficient warm-up operation, and raise oil temperature to 60 to 80°C {140 to176°F}.
- During the idling, measure the oil pressure in each condition when running, and make sure whether the result is within the standard value.
- When confirming the lock-up pressure, remove the propeller shaft, and conduct it in a dummy running condition.
- After finishing the measurement, tighten the plug to the specified torque.

CAUTION⚠

- **Be sure to prevent foreign particles from entering the pressure detecting port.**
- **Remove foreign particles in the pressure detection port before installing the plug.**

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

	Engine speed RPM	Range	Pressure clutch	Main oil pressure KPa {psi, kgf/cm^2}	Clutch oil pressure KPa {psi, kgf/cm^2}	Lock-up clutch oil pressure KPa {psi, kgf/cm^2}
Oil pressure when idling the engine	580-620	Neutral	C5	1400 to 2000 {203 to 290, 14.3 to 20.4}	—	—
		Reverse	C3, C5	1400 to 2000 {203 to 290, 14.3 to 20.4}	—	—
		1C	C1, C5	1300 to 1970 {189 to 286, 13.3 to 20.1}	—	—
		2C	C1, C4	1300 to 1970 {189 to 286, 13.3 to 20.1}	—	—
Oil pressure when operating	1980-2020	Neutral	C5	1900 to 2300 {275 to 334, 19.4 to 23.5}	1860 to 2300 {270 to 334, 19.0 to 23.5}	—
		Reverse	C3, C5	1790 to 2300 {261 to 334, 18.3 to 23.5}	1760 to 2300 {255 to 334, 18.0 to 23.5}	—
		1C	C1, C5	1550 to 1970 {225 to 286, 15.8 to 20.1}	1480 to 1970 {215 to 286, 15.1 to 20.1}	—
		2C	C1, C4	1550 to 1970 {225 to 286, 15.8 to 20.1}	1480 to 1970 {215 to 286, 15.1 to 20.1}	—
		2L	C1, C4	1050 to 1400 {152 to 203, 10.7 to 14.3}	980 to 1400 {142 to 203, 10.0 to 14.3}	1000 to 1400 {145 to 203, 10.2 to 14.3}

		4L	C1, C2	1050 to 1400 {152 to 203, 10.7 to 14.3}	980 to 1400 {142 to 203, 10.0 to 14.3}	1000 to 1400 {145 to 203, 10.2 to 14.3}
		5L	C2, C3	1000 to 1350 {145 to 196, 10.2 to 13.8}	930 to 1350 {135 to 196, 9.5 to 13.8}	950 to 1350 {138 to 196, 9.7 to 13.8}
		6L	C2, C4	1000 to 1350 {145 to 196, 10.2 to 13.8}	930 to 1350 {135 to 196, 9.5 to 13.8}	950 to 1350 {138 to 196, 9.7 to 13.8}

LU: Lock-up
C: In torque converter
L: In lock-up

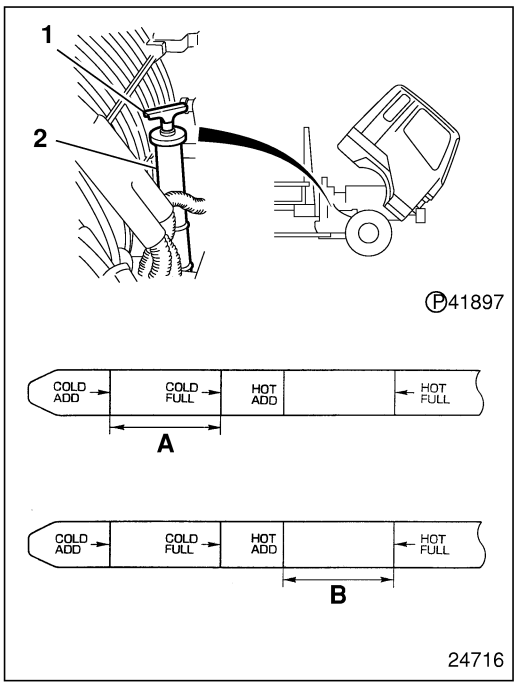
Result of diagnosis

1. The main oil pressure is low in all ranges:
   - ATF level; too low
   - Filter Element; clogged
   - Suction filter; clogged
   - Main oil pressure regulator valve; adhered, and the spring; weakening or broken
   - Inside of control module; leaked
   - Oil pump; worn or broken
2. The oil pressure is low in the specific ranges (each clutch oil pressure):
   - If C1 clutch pressure is low; may cause slippage or shudder at 1st, 2nd, 3rd, or 4th gear.
   - If C2 clutch pressure is low; may cause slippage or shudder at 4th, 5th, or 6th gear.
   - If C3 clutch pressure is low; may cause slippage or shudder at 3rd, 5th, or Rev. gear.

https://truckmanualshub.com/

- If C4 clutch pressure is low; may cause slippage or shudder at 2nd, or 6th gear.
- If C5 clutch pressure is low; may cause slippage or shudder at 1st or Rev. gear.
- If the lock-up clutch pressure is low; the maximum speed of vehicle at 2nd or more gear (in lock-up) may be decreased. Or, the shift will not be performed as it is a shift map.

3. Inspection of automatic transmission fluid



(1) Inspection of properties

If the ATF smells burnt, or if particles of metal or friction material are present, it is necessary to overhaul the transmission completely. Check automatic transmission fluid on the dipstick **1** carefully. If there are some doubts in a state of automatic transmission fluid, check the automatic transmission fluid again by extracting another sample.

(2) Inspection of quantity of automatic transmission fluid

- Put the vehicle on a flat surface, engage the parking brake securely, and fit the chocks securely at the front (rear) of the front (rear) wheels
- To fill automatic transmission fluid in a hydraulic circuit with idling the engine, return the range selector lever to N range after putting it repeatedly in each range approximately five (5) times in sequence.
- Extract the dipstick **1** with idling the engine; insert it again after wiping off automatic transmission fluid; and after pulling it out, check quantity of the automatic transmission fluid.
- When the oil temperature is low (15 to 50°C {59 to 122°F}) after starting the engine; if automatic transmission fluid is within a “COLD” range **A** of the dipstick **1**, it shows that the quantity of automatic transmission fluid is as specified.
- When the oil temperature is high (79 to 95°C, {158 to 203°F}) after running the vehicle ; if automatic transmission fluid is within a “HOT” range **B** of the dipstick **1**, it shows the quantity of automatic transmission fluid is as specified.

WARNING

Since the inspection is conducted while running the engine, be careful of being caught in components, burn hazard, or the safety.

NOTE:

- **Make sure to inspect the quantity of automatic transmission fluid at the horizontal level.**
- **Make sure to inspect the quantity of automatic transmission fluid while idling the engine at N range since the apparent quantity of automatic transmission fluid increases when the engine is stopped.**
- **Remove any dirt from the protection cap and the upper part of filler tube 2 completely before pulling the dipstick 1 out.**
- **Do not raise the engine speed from an idle until the adjustment of quantity of automatic transmission fluid is completed.**
  - Reconfirm the automatic transmission fluid level after the vehicle is driven. If the automatic transmission fluid level is low, add DEXRON III to the specified level of dipstick 1 using filler tube 2.

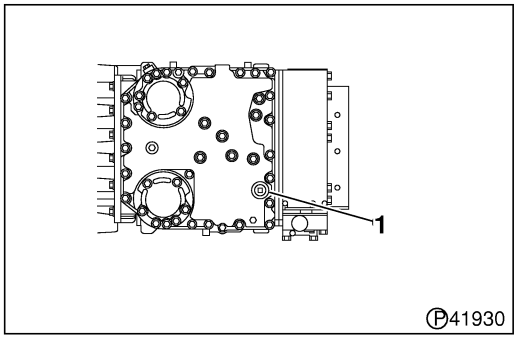
https://truckmanualshub.com/

4. Replacement of automatic transmission fluid

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
—	Drain plug	25 to 32 {18 to 24, 2.6 to 3.3}	—



(1) Draining

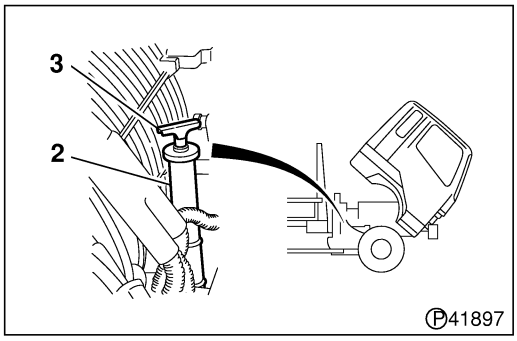
- Put the automatic transmission fluid drain pan under the transmission oil pan; then remove drain plug 1 behind the oil pan to drain automatic transmission fluid.

WARNING

Do not start any work for engine immediately after the engine is shut down. Wait until the engine cools to a safe temperature since a hot engine can cause burns.

NOTE:

- **The draining can be performed more quickly by warming automatic transmission fluid to the operating temperature.**
- **It is impossible to drain automatic transmission fluid from the internal hydraulic circuit, the torque converter, or the oil cooler without disassembling the unit competely.**
- **Check for dirt in the drained automatic transmission fluid, and for existence of metallic powder or metal pieces.**



(2) Filling

- Prepare DEXRON III of 18 dm^3 {18 L} (19 qts).
- Install oil pan drain plug **1** and tighten to specs.
- Fill with automatic transmission fluid through the filler tube **2**.

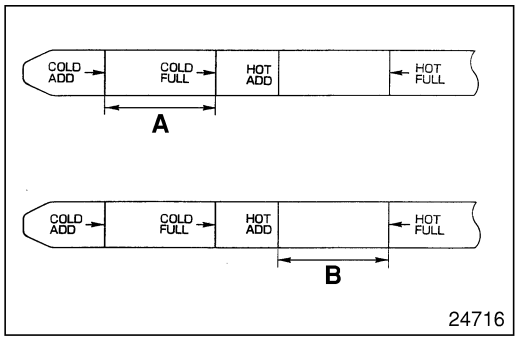
CAUTION

Be careful during filling so that dust or foreign particles do not enter.

- After starting the engine, run at idle RPM for approximately one (1) minute with the range selector to “N” position.
- After moving the range selector to each range, place it to “N” position again.

CAUTION

In this process, run engine at idle speed only — avoid running the engine at higher speeds.



- Add automatic transmission fluid until it reaches the low position of the specified range of dipstick **3**. Then, check the level of automatic transmission fluid. The level of automatic transmission fluid must be within the specified range of the dipstick.
  A: When temperature is low; 15 to 50°C {59 to 122°F}
  B: When temperature is high; 70 to 95°C {158 to 203°F}

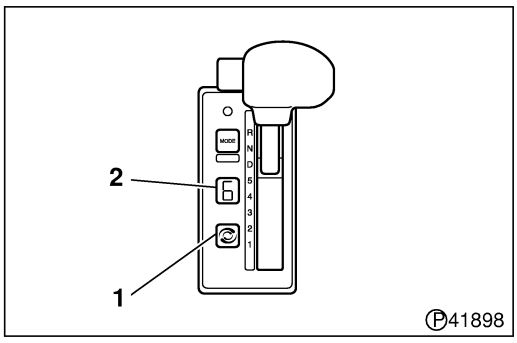
https://truckmanualshub.com/

NOTE:

- **After filling the automatic transmission fluid, it may be difficult to see the level of automatic transmission fluid easily due to the automatic transmission fluid adhering to the inner wall of filler tube 2; therefore, recheck it after a short time.**
- **If the automatic transmission fluid is overfull, the automatic transmission fluid will overflow from the air breather. This might be misunderstood to be an automatic transmission fluid leak.**
- **Fill automatic transmission fluid gradually with letting the engine idle while paying a careful attention to the level of automatic transmission fluid.**

https://truckmanualshub.com/

5. Function checking automatic transmission fluid level



The automatic transmission fluid level can be checked from inside the cab by operating the range selector display.

Conditions required on check

- Stop the vehicle on a flat surface, and put the range selector in “N” position.
  (Neutral must be put in.)
- Automatic transmission fluid must be warm.
  (oil temperature 60 to 104°C {140 to 219°F})
- Stabilize oil level for two (2) minutes or more after stopping the vehicle.
- Run the engine at idle speed.

Check operation

- Push display switch button 1 of the range selector
- Various code No. are displayed in the position display 2 of the selector following “O” and “L” (indicating check mode of automatic transmission fluid level) after approximately two (2) minutes.

Judgment of check result

The code No. indicated means as follows:

- “OL”, “OK”, and “--” ; automatic transmission fluid level is appropriate.
- “OL”, “LO”, and “XX”; automatic transmission fluid must be added by approximately XX liter.
- “OL”, “HI”, and “XX”; automatic transmission fluid must be extracted by approximately XX liter.
- “OL”, “--”, and “XX” ; check the level again based on the following table since the level could not be checked.

Display code No. XX	Contents
“50”	The engine speed is too low.
“59”	The engine speed is too high.
“65”	The neutral has not be put in.
“70”	Oil temperature is too low.
“79”	Oil temperature is too high.
“89”	The output shaft rotates.
“95”	Trouble of oil temperature sensor

Operation after the check has ended.

After the check has ended, put the range selector in either of position, “Reverse”, “Neutral”, or “Drive”.

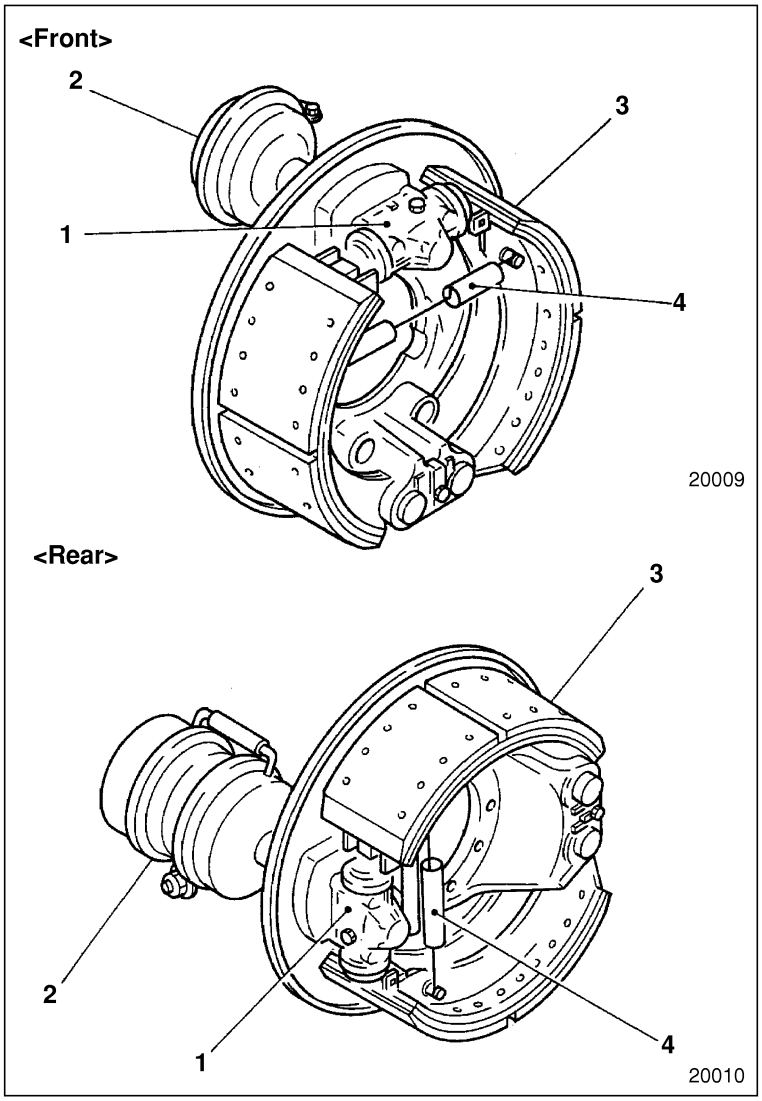
M E M O

https://truckmanualshub.com/

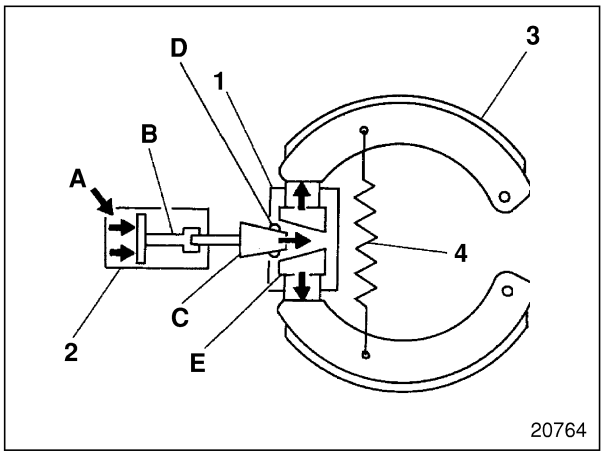
● Wheel brake



1 Expander
2 Brake chamber
3 Brake shoe
4 Return spring

- Drum brake expands brake shoe **3** by a wedge mechanism.
- Expander **1** incorporates an auto adjustment mechanism that automatically adjusts the brake shoe clearance.

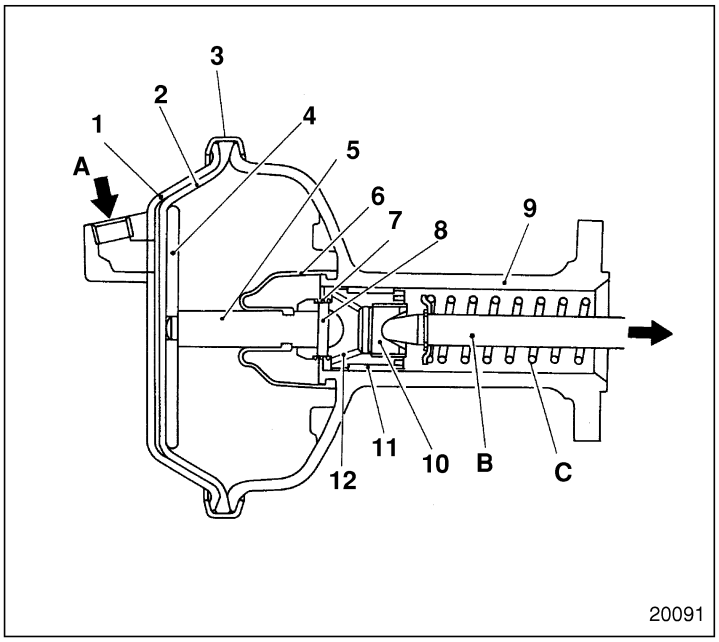
● Wedge mechanism



- When applying air pressure **A** on brake chamber **2**, the push rod **B** pushes wedge **C**.
- The wedge **C** pushes the sleeve **E** of expander **1** through roller **D** to expand brake shoe **3**.

https://truckmanualshub.com/

● **Brake chamber <front>**

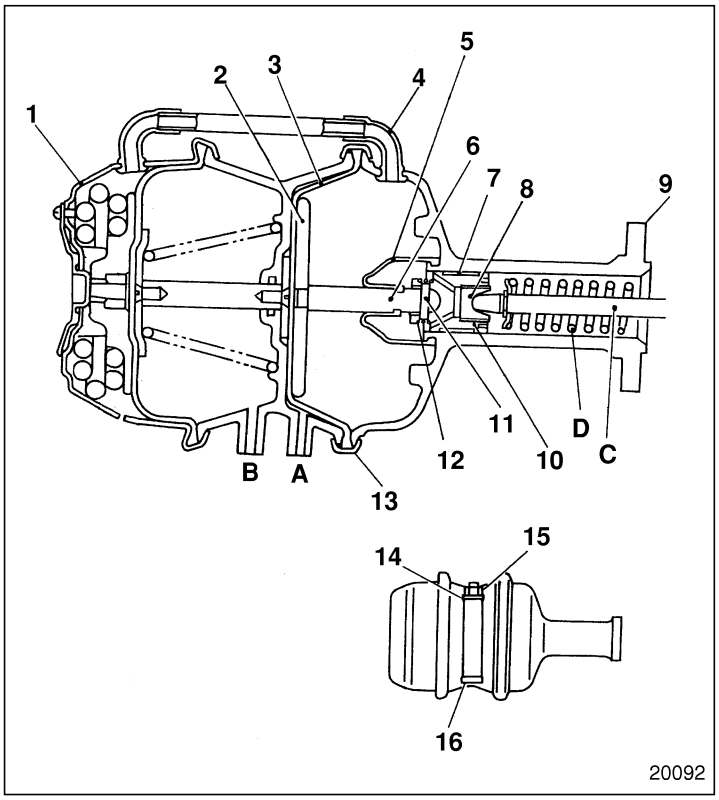


1 Pressure plate
2 Diaphragm
3 Clamp ring
4 Push plate
5 Push rod
6 Dust cover
7 Ring
8 Pin
9 Base
10 Guide head
11 Bushing
12 Push rod guide

A: Air pressure
B: Wedge (expander)
C: Spring (expander)

- When applying air pressure **A** on the brake chamber (front), the push rod **5** and wedge **B** are pushed through diaphragm **2**.
- When releasing air pressure **A**, wedge **B** and push rod **5** are returned by spring force of spring **C**.

● **Brake chamber <rear>**



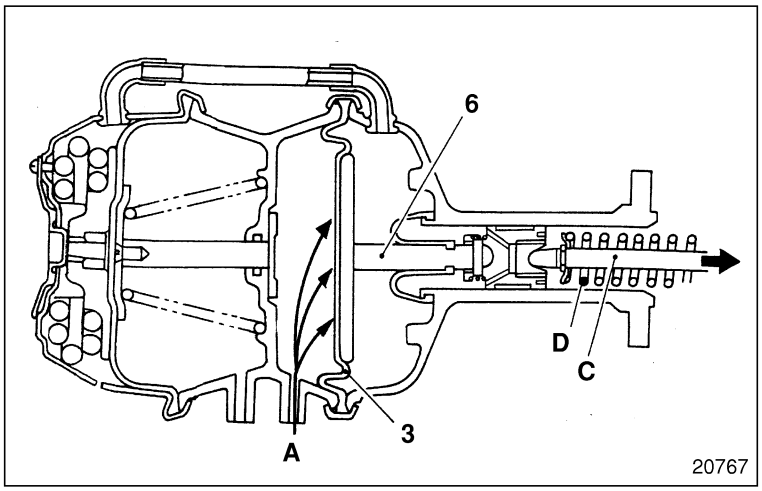
1 Emergency brake chamber
2 Push plate
3 Diaphragm
4 Elbow
5 Dust cover
6 Push rod
7 Bushing
8 Guide head
9 Base
10 Push rod guide
11 Pin
12 Ring
13 Clamp ring
14 Washer
15 Release nut
16 Release bolt

A: Service brake port
B: Spring brake port
C: Wedge (expander)
D: Spring (expander)

- The brake chamber <rear> has a spring brake mechanism other than the service brake.
- The washer **14**, release nut **15**, and release bolt **16** are used when releasing the spring brake by a mechanical release.

https://truckmanualshub.com/

● Service brake



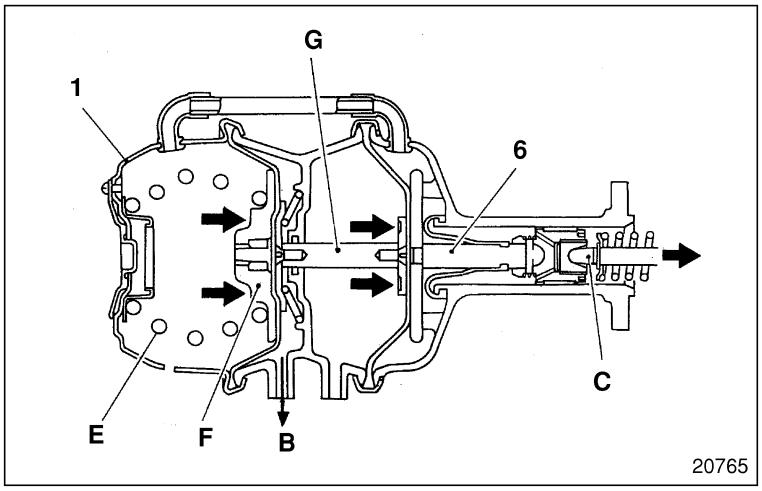
Operation

When applying air pressure on service brake port **A**, the push rod **6** and wedge **C** are pushed through diaphragm **3**.

Release

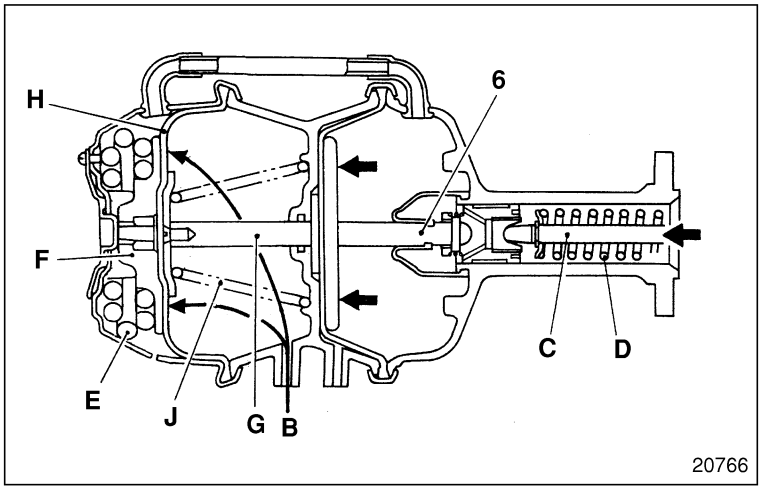
When releasing the air pressure of the service brake port **A**, wedge **C** and push rod **6** are returned by spring force of spring **D**.

● Spring brake



Operation

When releasing the air pressure of spring brake port **B**, piston **F**, push rod **G**, **6**, and wedge **C** are pushed by spring force of spring **E** of emergency brake chamber **1**.

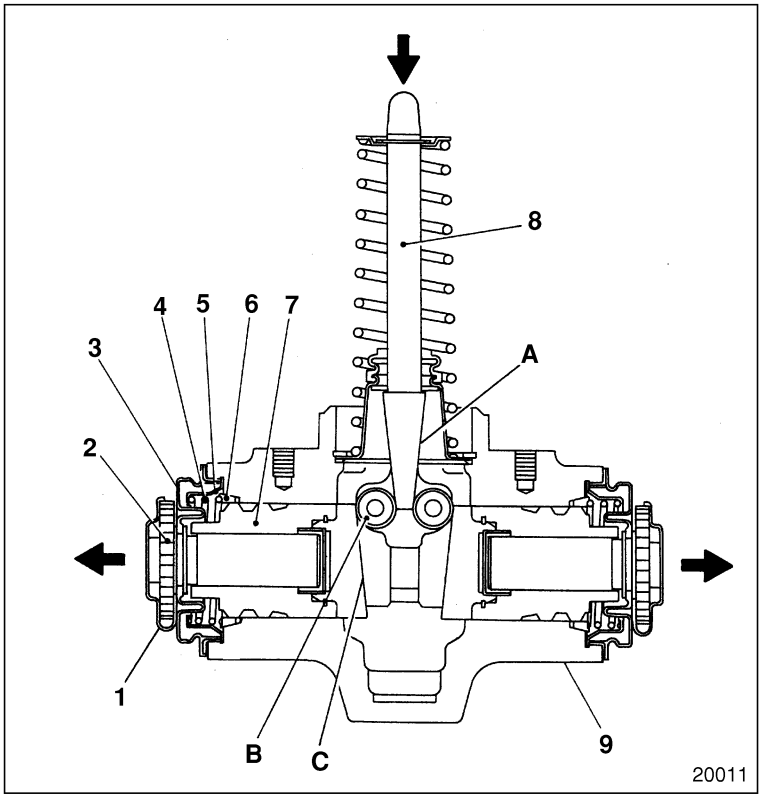


Release

- When applying air pressure on spring brake port **B**, piston **F** is pushed back through diaphragm **H**, and thereby spring **E** is compressed.
- Push rod **G** is returned by spring force of spring **J**.
- Wedge **C** and push rod **6** are returned by spring force of spring **D**.

https://truckmanualshub.com/

● Expander

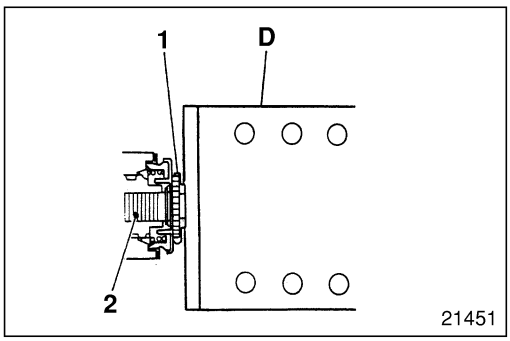


1 Clip
2 Adjusting screw
3 Boot
4 Spring
5 Cage
6 Drive ring
7 Sleeve assembly
8 Wedge
9 Body

A: Inclination part (wedge)
B: Roller
C: Inclination part (sleeve assembly)

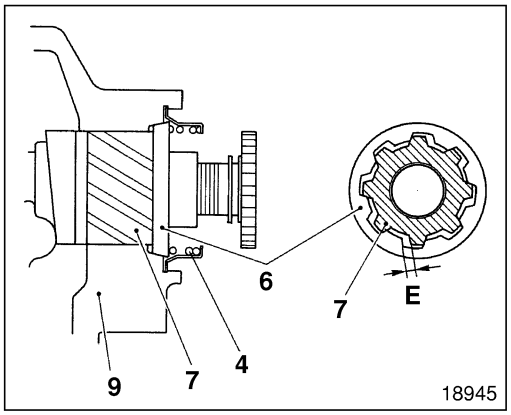
- When wedge **8** being pushed, roller **B** is spread out along inclination part **A** of the wedge.
- Roller **B** pushes out sleeve assembly **7** and adjusting screw **2** along inclination part **C** of sleeve assembly **7**.
- Body **9** of the expander incorporates an auto adjustment mechanism.

● Auto adjustment mechanism



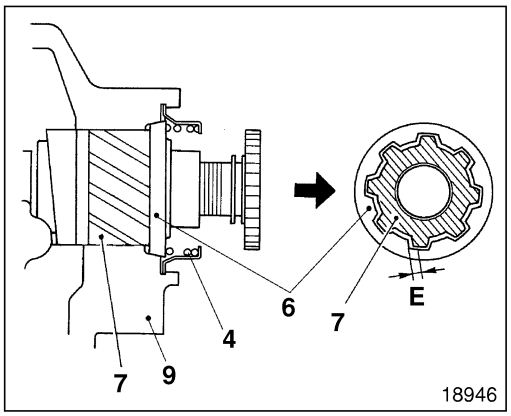
- The rotation direction of adjusting screw **2** is fixed by clip **1**.
- The rotation direction of clip **1** is fixed by brake shoe **D**.

https://truckmanualshub.com/

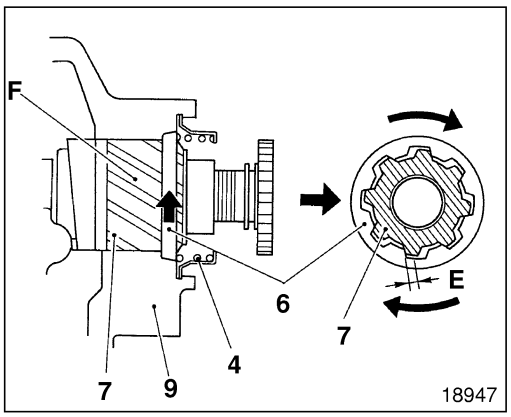


When brake shoe clearance is the standard value

- Before applying the brake, a low part of sleeve assembly **7** strikes body **9**.
- Drive ring **6** is pushed by spring **4**, strikes body **9**, and fixed.
  E: Backlash

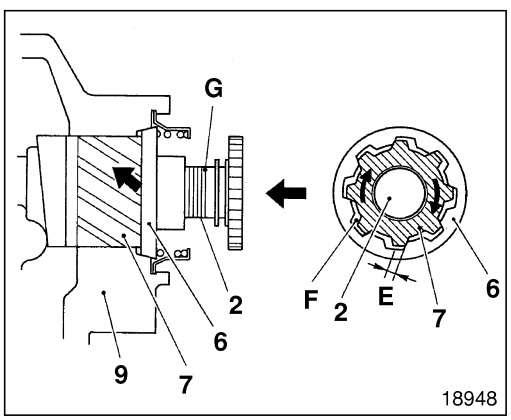


- If applying the brake, sleeve assembly **7** moves within a range of backlash **E**.



When brake shoe clearance exceeds the standard value

- If applying the brake, sleeve assembly **7** moves over backlash **E**, and rotates along screw lead face **F** of the sleeve assembly since drive ring **6** is pushed by spring **4**.
- Drive ring **6** remains to strike body **9** with being pushed to spring **4**.



- If releasing the brake, a low part of sleeve assembly **7** moves until it strikes body **9**.
  Thereby the sleeve assembly moves just to the extent of backlash **E** without any rotation; after that, it rotates along the screw lead face **F** of drive ring **6**; it pushes out the adjusting screw **2** by the action of screw **G**; and it adjusts the brake shoe clearance to the standard value.

https://truckmanualshub.com/

Wheel brake

Possible causes / Symptoms		Brakes do not apply completely although there is no air leakage in air line.	Overheated brake drum: Brake shoe returns improperly when brake pedal is released. (Dragging brake drums)	Unusual noise is emitted when brake pedal is depressed.	Wheel brake is applied only on one side.	Wheel brake is applied sharply.	Brake air warning lamp is illuminated.
Wheel brake	Excessive brake shoe clearance	○			○		○
	Oil/grease and fat on surface of brake linings	○					
	Hardened surface of brake linings	○		○			
	Worn brake linings						○
	Exposed rivets due to worn brake linings			○			
	Uneven wear on inner surface of brake drum			○			
	Improper contact of brake shoe and linings			○			
	Loose installation of brake drum			○	○		
	Uneven material of brake linings				○		
	Improper contact of brake linings				○		
	Run-out of brake drum				○		
	Wheel parking brake activated		○				
	Insufficient brake shoe clearance		○		○	○	
	Fatigued or cracked brake shoe return spring		○		○		
	Faulty return of sleeve assembly of expander		○		○		
	Rusting of wedge or anchor pin		○		○		
	Loose anchor pin			○			
	Air pressure in brake chamber not released		○				
	Uneven air pressure in each brake chamber				○

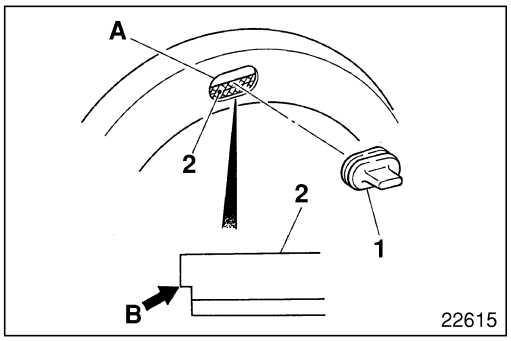
INSPECTION AND ADJUSTMENT ON VEHICLE

● Thickness Inspection and Replacement of Brake Lining

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2	Thickness of lining	16 {0.63}	6 {0.24}	Replace



[Inspection]

NOTE:

Inspect two points on each wheel.

- Remove inspection hole plug **1** of the dust cover.
- Inspect brake linings for wear through the inspection hole **A.**
- When the brake linings are worn to the extent of the off set **B**, they have already reached the replacement limit. Replace brake lining **2** on the entire axle (both sides).
- After inspection is completed, be sure to install inspection hole plug **1**.

[Replace]

FRONT WHEEL BRAKE

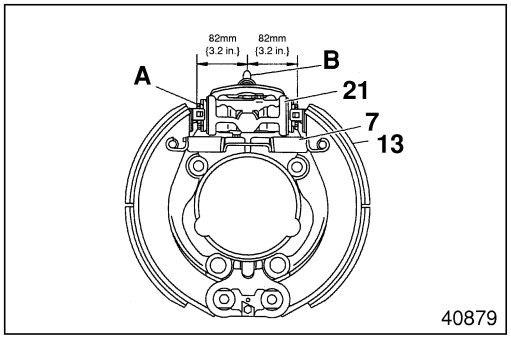
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
7	Return spring setter 	Obtain Locally	Remove return spring
11	Anchor pin puller 	03727-60000	Remove anchor



♦ Maintenance point ♦

● Work after assembly

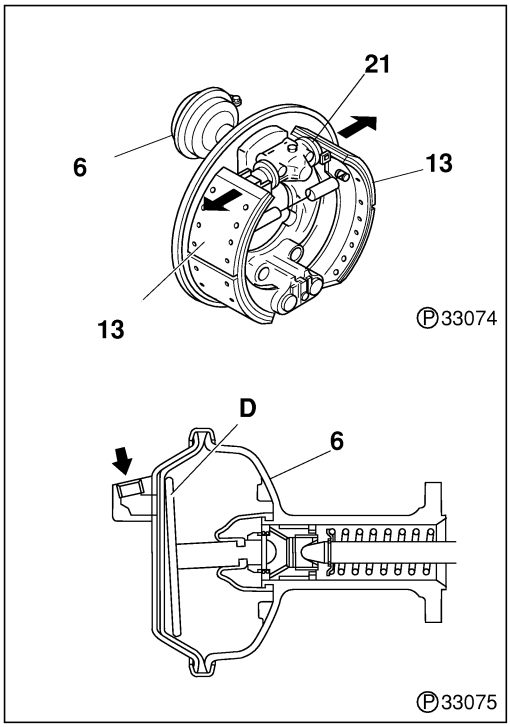
(1) Check for operation

- Confirm whether the installation dimension of expander assembly **21** is 82 mm {3.2 in.}.
  If it is incorrect, adjust it according to the following procedure.
- Set the dimension indicated in Figure to 82 mm {3.2 in.} by rotating the adjusting screw **A**.
- P35B-17
- Expand brake shoe assembly **13** under a full stroke by pushing bush rod **B**.
- Confirm whether expander assembly **21** returns to 82 mm {3.2 in.} when returning push rod **B**.
- If it is incorrect, inspect the spring force of return spring **7**, tightening of brake shoe assembly **13**, and expander assembly **21**.

WARNING ⚠

The auto adjustment mechanism may not operate normally unless the mechanism is properly operated after having assembled it.

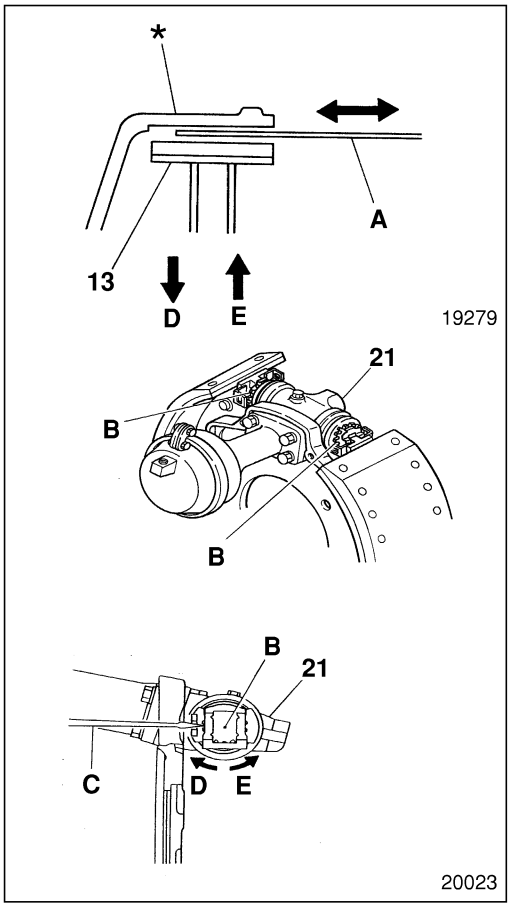
https://truckmanualshub.com/



- When disassembling brake chamber assembly **6**, inspect the following.

<When disassembling brake chamber assembly 6>

- Pull the brake shoe assembly **13** with a force of 20 to 30N {4.4 to 6.6 lbf, 2 to 3 kgf}. Inspect for movement of the expander assembly **21** (there should be **no** movement).
- If brake shoe assembly **13** moves, push rod and pressure plate **D** of brake chamber assembly **6** are not returning properly. Correct the push rod and the pressure plate to a regular position by depressing brake pedal 2 to 3 times with brake drum removed.



(2) Initial adjustment of brake shoe clearance after assembly

<When not replacing brake lining 15 with the new one>

- Remove dust cover **3**.
- Turn adjusting screw **B** of expander assembly **21** until a feeler gauge **A** of 0.3 to 0.5mm {0.012 to 0.02 in.} can be easily pulled in and out at the inspection hole of each shoe.
  C: Screw driver
  D: Increasing brake shoe clearance
  E: Decreasing brake shoe clearance

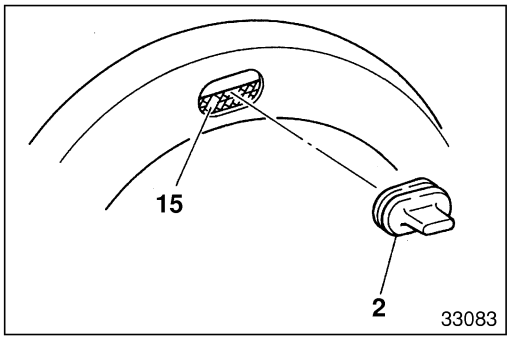
- Install dust cover **3**

CAUTION ⚠

Do not damage the boot of expander assembly 21 when inserting screw driver C.

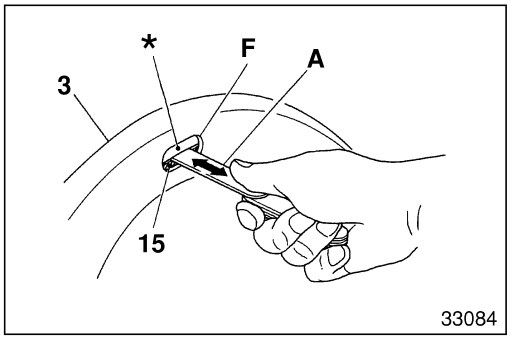
https://truckmanualshub.com/

FRONT WHEEL BRAKE

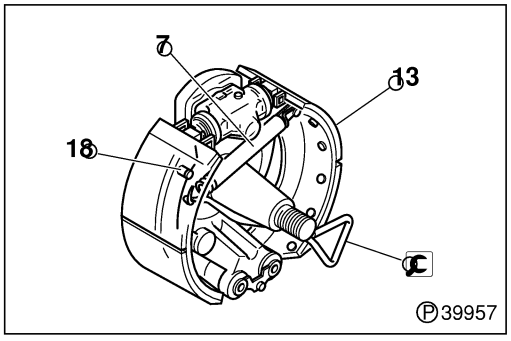


<When replacing brake lining 15 with the new one>

- Adjust expander assembly **21**.
  P35B-17
- Start the engine after having assembled brake drum *, and confirm whether brake air pressure is sufficient.
- Operate auto adjuster by fully depressing brake pedal ten times.
- Remove inspection hole plug **2**.



- Insert feeler gauge **A** into the inspection hole **F** of dust cover **3**, and confirm whether brake shoe clearance is 0.4 to 1.0 mm {0.016 to 0.039 in.}, as well as 0.3mm {0.012 in.} or less in the right and left difference.
- If the clearance is not 0.4 to 1.0 mm {0.016 to 0.039 in.}, adjust it as required.



7 Return spring

[Removal]

Remove the return spring with the return spring setter as shown.

WARNING

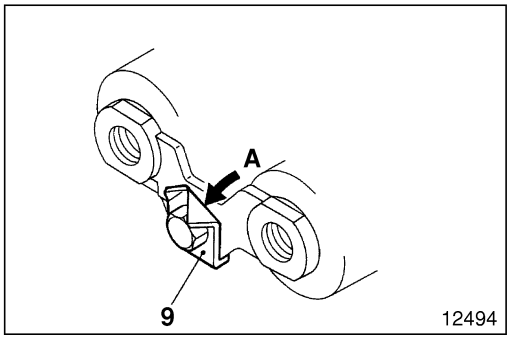
Do not allow return spring setter to contact the mating surface of oil seal.

[Installation]

- Attach one hook of return spring **7** on the pin **18** of brake shoe assembly **13**.
- Attach the other hook on return spring setter, and install it while pressing against pin **18**.

WARNING

Do not allow return spring setter to contact the mating surface of oil seal.

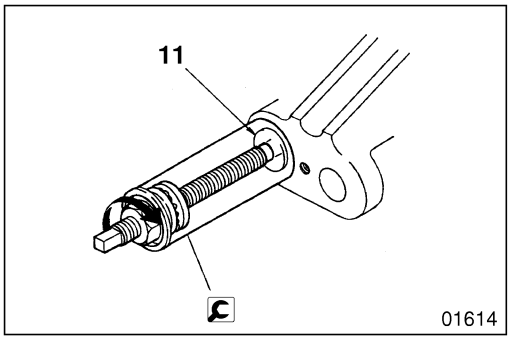


9 Installation of lock washer

A: Bend

- After installing the lock washer, bend the tab over the bolt head as shown in the figure on the left.

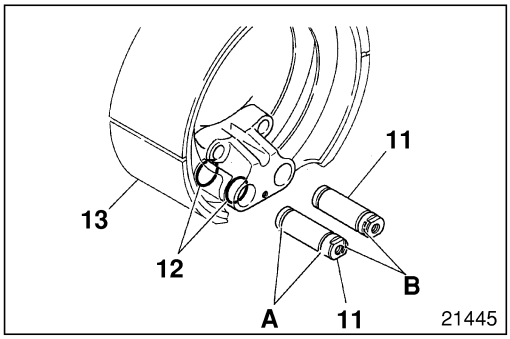
https://truckmanualshub.com/



11 Anchor pin

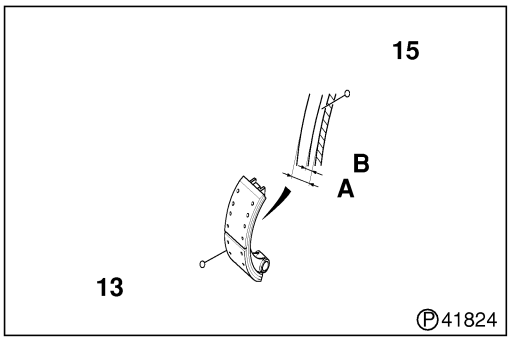
[Removal]
: Anchor pin puller

- Remove the anchor pin using an anchor pin puller as shown in the figure on the left.



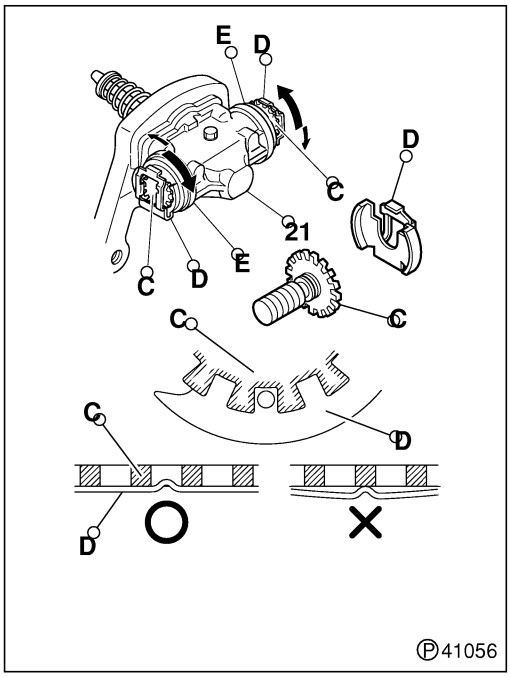
[Installation]
- Apply grease in the grease grooves **A** of anchor pin **11**.
- Install anchor pin **11** in the direction shown in Figure.
  B: Groove installing lock plate

CAUTION
If anchor pin 11 is installed in the wrong direction of the anchor pin, O-ring 12 will be damaged; therefore, be sure to mount it as required.



13 Brake shoe assembly

[Inspection]
If the thickness **A** of brake lining **15** reaches below the limit **B**, replace the brake linings on the entire axle.



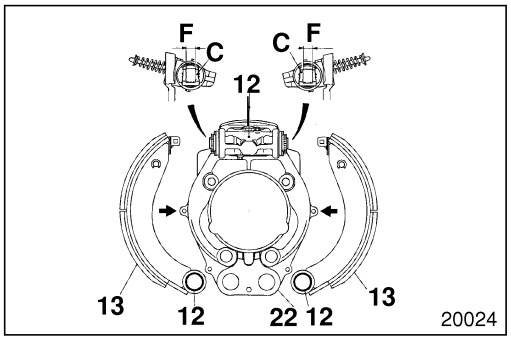
[Installation]
- Turn adjusting screw **C** of expander assembly **21** fully clockwise by hand.
  (Return of a screwing portion of adjusting screw)
- Install clip **D** with the open side facing the drum. Turn adjusting screw **C** further clockwise to match the position if alignment is incorrect.

WARNING
- **Be sure to apply grease appropriately on the contact part of adjusting screw C in boot E; otherwise, the auto adjuster may malfunction due to breakage of boot.**

CAUTION
- **Turn it slowly so that boot E is not jammed.**
- **Be sure to keep the convex part of clip D between teeth of adjusting screw C (2 points).**

- If clip **D** is misaligned, rotate adjusting screw **C** counterclockwise two revolutions to align clip.

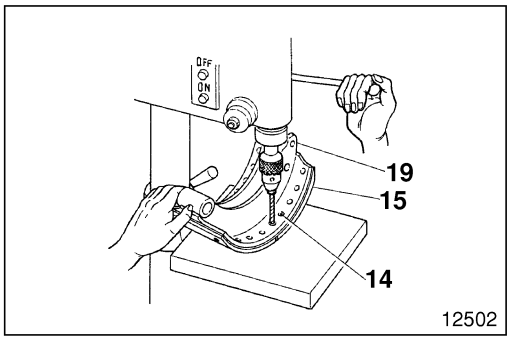
https://truckmanualshub.com/



- Install brake shoe assembly **13** so that it securely enters into the two-sided width **F** of clip **C**.

CAUTION

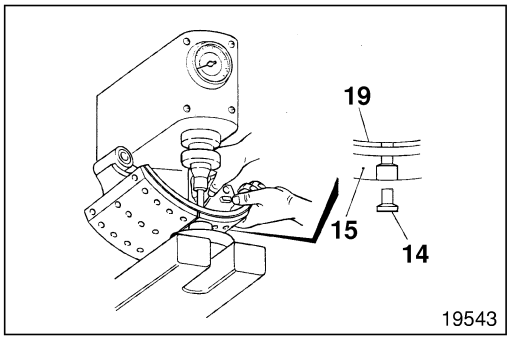
When installing brake shoe assembly 13, do not damage clip C or O-ring 12.



15 Brake lining

[Removal]

- Remove the rivets **14** by drilling, taking care not to damage the brake shoe **19**. Then, remove the brake lining **15**.

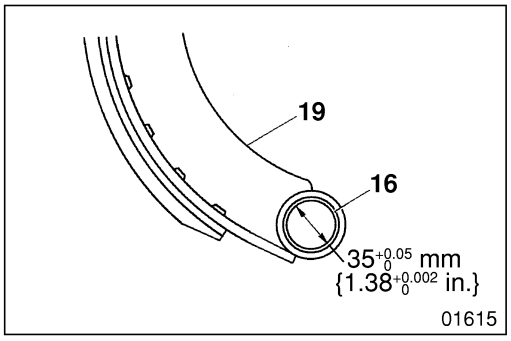


[Installation]

- Clean the surface of the brake lining **15** and brake shoe **19**.
- Insert rivet **14** through brake lining **15**, and stake the rivet in sequence from the center to both ends.
- Stake the rivet **14** with a load of 19.61±0.98 kN {4410±2200 lbf, 2000±1000 kgf}.
- Inspect brake drum * to brake lining **15** contact: correct any faulty points if they are found. Such correction must be performed in a state that the brake has been assembled.

WARNING

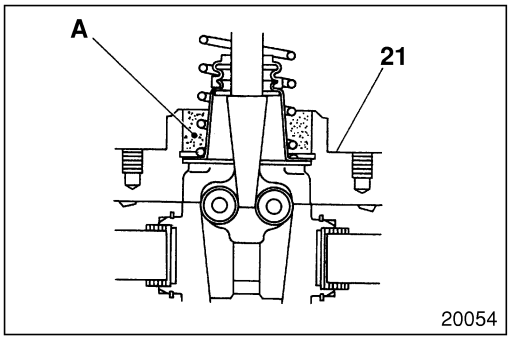
- **Be sure to replace brake lining 15 on the entire axle to prevent uneven braking.**
- **Do not apply oil or grease to the brake lining 15, which may cause the malfunction of the brake system.**



16 Installation of bushing

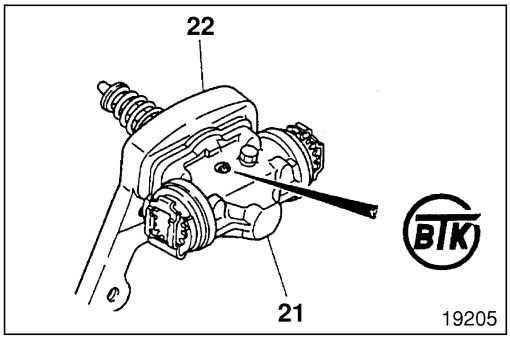
- Install bushing **16** on brake shoe **19**.
- Measure the inside diameter of bushing 1**6**.
- If the inside diameter is not $35^{+0.05}_{0}$ mm {$1.38^{+0.002}_{0}$ in.}; correct by reaming to specification.

https://truckmanualshub.com/



21 Installation of expander assembly

- Fill the grease of the specified amount in **A** part of expander assembly **21**.



- Install expander assembly **21** on anchor bracket **22** in the direction shown in Figure.

*** Correction of brake drum**

If the taper of brake drum * exceeds the limit, or has deep grooves; cut them to the specified limit.

https://truckmanualshub.com/

♦ Maintenance point ♦

● Work before disassembly

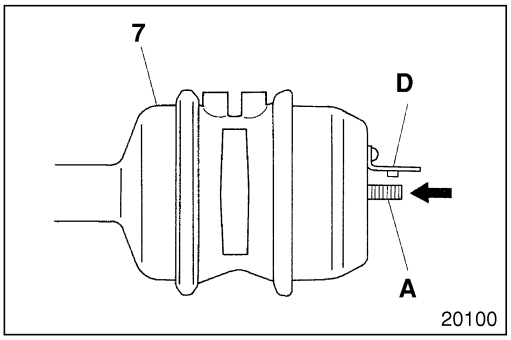
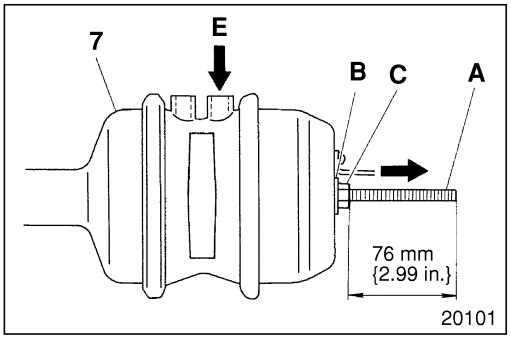
Release of spring brake

Release the spring brake by mechanical release.

- Remove the release bolt **A**, the washer **B**, and the release nut **C** from brake chamber assembly **7**.



- Remove end cap **D**.
- Insert the release bolt **A** into the inner part, and turn it one quarter (1/4) turn.
- Pull up the release bolt **A**, and confirm that the release bolt does not come off.
- If the release bolt **A** comes off, insert the release bolt again into the inner part, and turn it one quarter (1/4) turn.

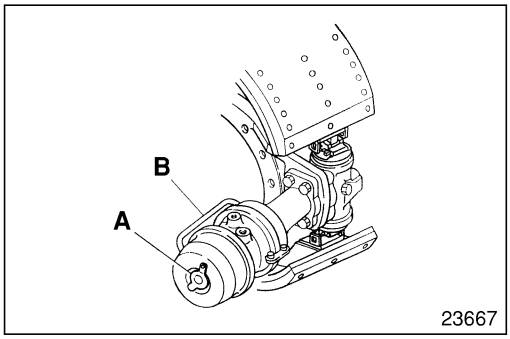


- Install the washer **B** and the release Nut **C**.
- Turn the release nut **C**, and draw out the screw of release bolt **A** by 76 mm {2.99 in.}, while applying air pressure of 640 kPa {92 lbf/in^2, 6.5 kgf/cm^2} to spring brake port **E**, while setting the hand control valve to the release position.

CAUTION ⚠

- **Do not turn the release nut C by a strong torque; (68.6 N·m {51 ft.lbs, 7 kgf·m} or more): because brake chamber assembly 6 may be damaged if turning it by such a strong torque.**
- **Use air pressure E so that the release nut C may be easily turned.**

https://truckmanualshub.com/



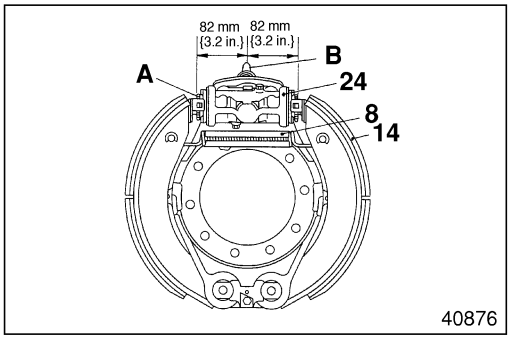
● Work after assembly

(1) Release of spring brake

Follow the work sequence before disassembly in reverse to release the mechanical release of spring brake. P35B-24

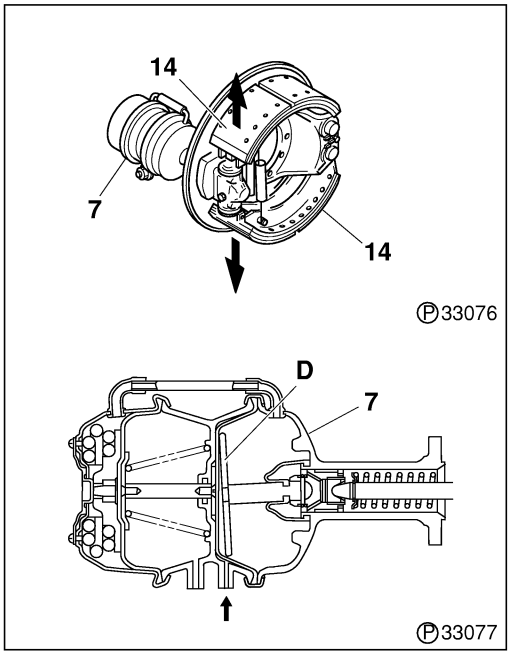
NOTE:

- **Confirm that end cap A is surely installed.**
- **Confirm that there is no damage in bleeder pipe B. Also, confirm that the bleeder pipe is surely installed.**



(2) Confirmation of operation

- Confirm that the installation dimension of expander assembly **24** is 82 mm {3.2 in.}.
  If it is incorrect, reconfirm it according to the following procedure.
- Set the part indicated in Figure to 82 mm {3.2 in.} by adjusting the adjusting screw **A**. P35B-28
- Expand the brake shoe assembly **14** under a full stroke by pushing push rod **B**.
- Confirm that expander assembly **24** returns to 82 mm {3.2 in.} when returning the push rod **B**.
- If it operates incorrectly, inspect the spring force of return spring **8**, inactivation of brake shoe assembly **14**, and expander assembly **24** again.



WARNING

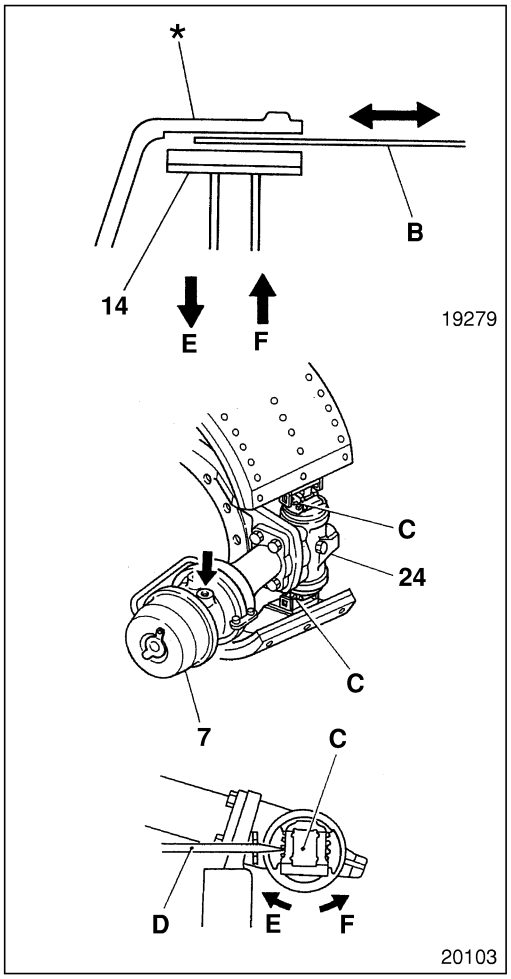
The auto adjustment mechanism might not operate normally if the assembly work is not surely executed.

- When disassembling brake chamber assembly **7**, inspect the following.

<When disassembling brake chamber assembly 7>

- Confirm that brake shoe assembly **14** does not move with the adjusting screw **C** of expander assembly **24** when pulling the brake shoe assembly with a force of 20 to 30N {4.4 to 6.6 lbf, 2 to 3kgf}.
- If brake shoe assembly **14** moves, push rod and pressure plate **D** of brake chamber assembly **7** are diagonally installed; therefore, correct the push rod and the pressure plate to a regular position by depressing brake pedal 2 to 3 times with not installing brake drum *.

https://truckmanualshub.com/



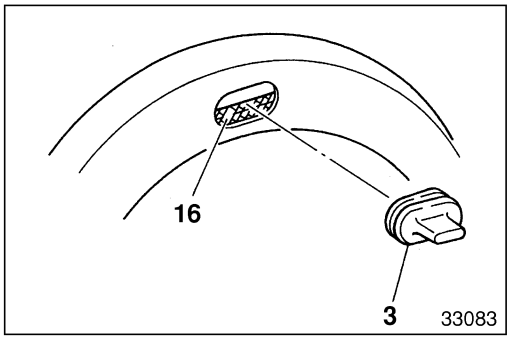
(2) Initial adjustment of brake shoe clearance

<When not replacing brake lining 16 with the new one>

- Remove dust cover **4**.
- Apply air pressure of 640 kPa {92 psi, 6.5kgf/cm^2}) on the spring brake air supply port **A** of brake chamber assembly **7** (thereby putting the hand control valve to the release position), and then release the spring brake.
- Turn adjusting screw **C** of expander assembly **24** until a feeler gauge **B** of 0.4 mm {0.016 in.} can be easily pulled in and out at the inspection hole of each shoe.
  D: Screw driver
  E: Increasing brake shoe clearance
  F: Decreasing brake shoe clearance
- Install dust cover **4**.

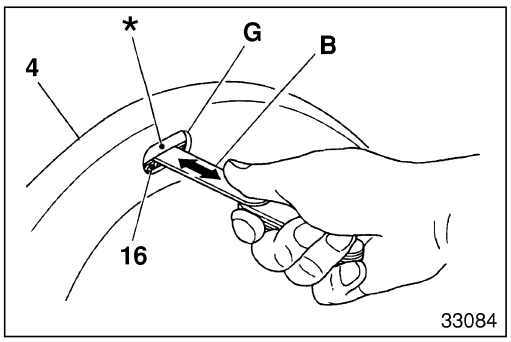
CAUTION

Do not damage the boot of expander assembly 24 when inserting screw driver D.



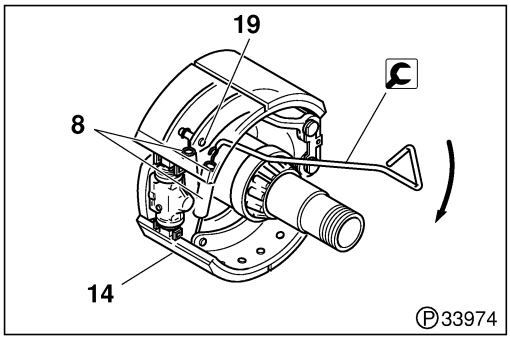
<When replacing brake lining 16 with the new one>

- Adjust expander assembly **24**. P35B-28
- Start the engine after having assembled brake drum *, and confirm whether brake air pressure is sufficient.
- Operate auto adjuster by fully depressing brake pedal ten times.
- Remove inspection hole plug **3**.



- Insert feeler gauge **B** into inspection hole G of dust cover **4**, and confirm whether brake shoe clearance is 0.4 to 1.0 mm {0.016 to 0.039 in.}, as well as 0.3 mm {0.012 in.} or less in the right and left difference.
- If the clearance is not 0.4 to 1.0 mm {0.016 to 0.039 in.}, adjust it again.

https://truckmanualshub.com/



8 Return spring

[Removal]

Remove the return spring with the return spring setter as shown.

WARNING

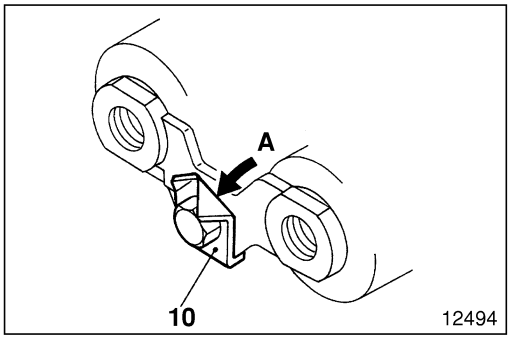
Do not allow the return spring setter to contact the mating surface of oil seal.

[Installation]

- Attach one hook of return spring **8** on the pin **19** of brake shoe assembly **14**.
- Attach the other hook on the return spring setter, and install it while pressing against pin **19**.

WARNING

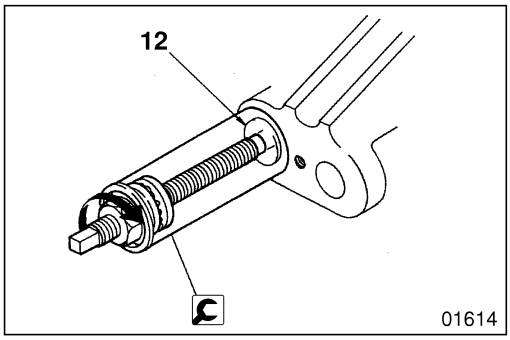
Do not hang the return spring setter on the sliding area of oil seal.



10 Installation of lock washer

A: Bend

- After installing the lock washer, bend the tab over the bolt head as shown in the figure on the left.

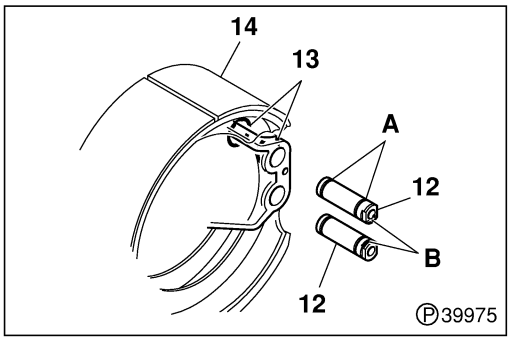


12 Anchor pin

[Removal]

: Anchor pin puller

- Remove the anchor pin using anchor pin puller as shown in the figure on the left.



[Installation]

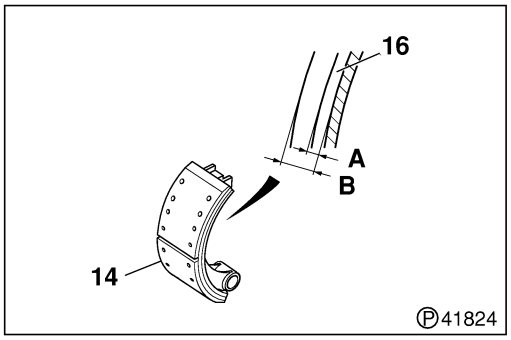
- Apply grease in the grease grooves **A** of anchor pin **12**.
- Install anchor pin **12** in the direction shown in Figure.

B: Groove installing lock plate

CAUTION

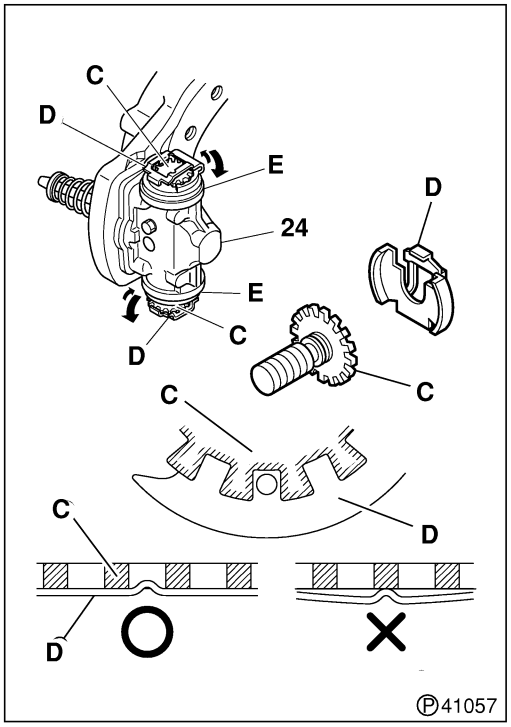
If anchor pin 12 is installed in the wrong direction of the anchor pin, O-ring 13 will be damaged; therefore, be sure to install it as required.

https://truckmanualshub.com/



14 Brake shoe assembly

[Inspection]
If the thickness **A** of brake lining **16** reaches below the limit **B**, replace the brake lining on the entire axle.



[Installation]

- Turn adjusting screw **C** of expander assembly **24** fully clockwise by hand.
- Install clip **D** with the open side facing the drum. Turn adjusting screw **C** further clockwise to match the position if alignment is incorrect.

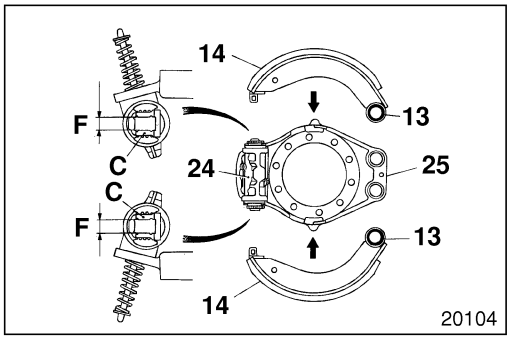
WARNING

Be sure to apply grease as required on the contact part of adjusting screw C in boot E; otherwise the auto adjuster may malfunction due to breakage of boot.

CAUTION

- **Turn it slowly so that boot E is not jammed.**
- **Be sure to keep the convex part of clip D between teeth of adjusting screw C (2 points).**

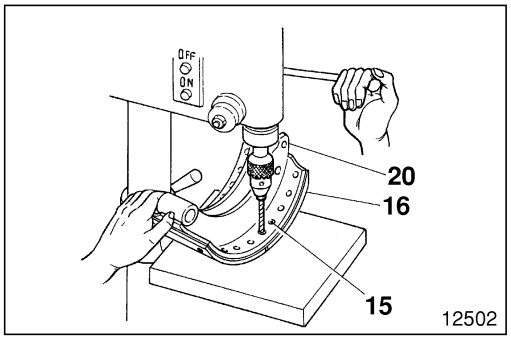
- If clip **D** is misaligned, rotate adjusting screw **C** counterclockwise by two revolutions to center of clip.



- Install brake shoe assembly **14** so that it may securely enters into the two-sided width **F** of clip **C**.

CAUTION

When installing brake shoe assembly 14, do not damage clip C and O-ring 13.

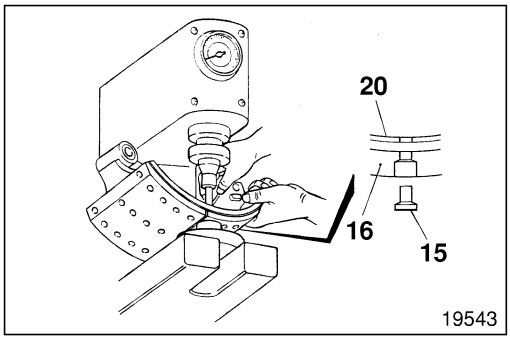


16 Brake lining

[Removal]

- Remove the rivets **15** by drilling, taking care not to damage the brake shoe **20**. Then, remove the brake lining **16**.

https://truckmanualshub.com/

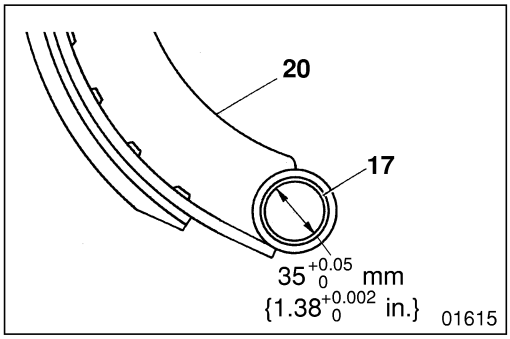


[Installation]

- Clean the surface of the brake lining **16** and brake shoe **20.**
- Insert rivet **15** through brake lining **16**, and stake the rivet in sequence from the center to both ends.
- Stake the rivet **15** with a load of 19.61±0.98 kN {4410±220 lbf, 2000±100 kgf}.
- Inspect brake drum * to brake lining **16** contact: correct any faulty points if they are found. Such correction must be performed in a state that the brake has been assembled.

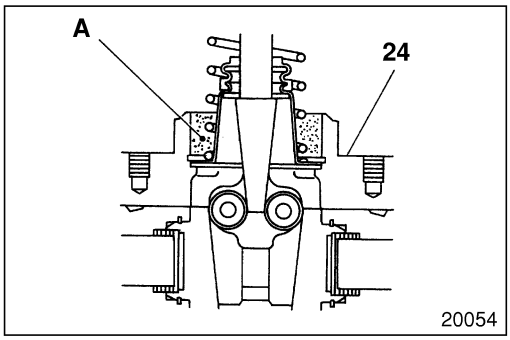
WARNING

- **Be sure to replace brake lining 16 to prevent uneven braking.**
- **Do not apply oil or grease to the brake lining 16, which may cause the malfunctioning of the braking system.**



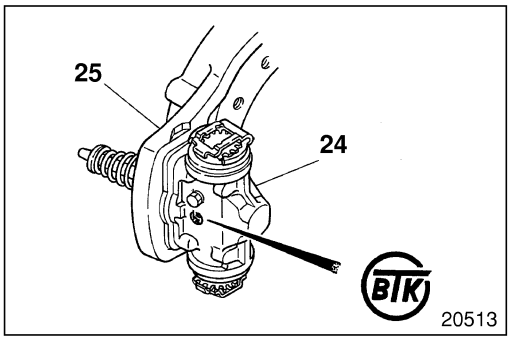
17 Installation of bushing

- Install bushing **17** on brake shoe **20**.
- Measure the inside diameter of bushing **17**.
- If the inside diameter is not $35^{+0.05}_{0}$ mm $\{1.38^{+0.002}_{0}$ in.$\}$; correct by reaming to specification.



24 Installation of expander assembly

- Fill the grease of the specified amount in **A** part of expander assembly **24**.



- Install expander assembly **24** on anchor bracket **25** in the direction shown in Figure.

*** Correction of brake drum**

If the taper of brake drum * exceeds the limit, or has deep grooves, cut them to the specified limit.

6 Diaphragm
7 Push rod assembly
8 Pin
9 Ring
10 Bushing
11 Push rod guide
12 Dust cover
13 Push rod complete
14 Base

⊗: Non-reusable parts

WARNING

Make sure not to disassemble emergency brake chamber 5 since its built-in spring with a very strong spring force may cause a very dangerous result.

CAUTION

When removing clamp ring 3, Do not damage emergency brake chamber 5 and the seat surface of diaphragm 6 of base 14, which may cause air leakage.

● Assembly sequence

Follow the disassembly sequence in reverse.

Repair kit: chamber kit

WARNING

Do not apply oil and grease to diaphragm 6 so that the diaphragm may not come off.

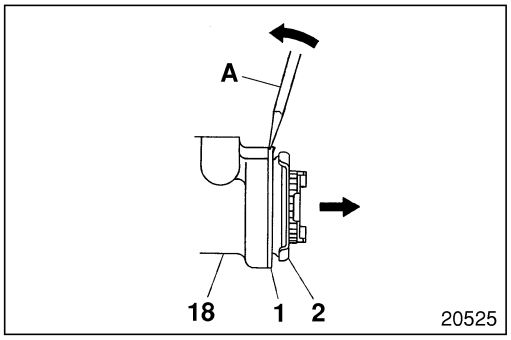
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Boot installer  19000	Use a locally obtained equivalent	Install boot
2, 9	Clip adaptor  19111	Use a locally obtained equivalent	Measure holding torque of clip and rotating torque of sleeve assembly
12	Spring holder  18999	Use a locally obtained equivalent	Remove spring

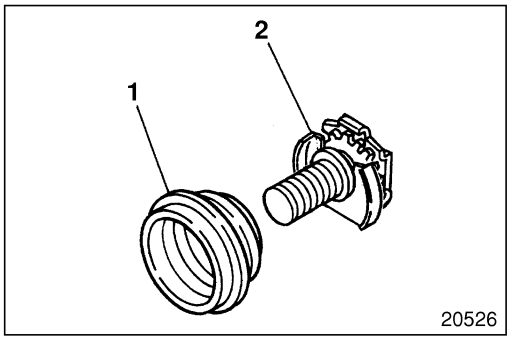


20525

♦ Maintenance point ♦

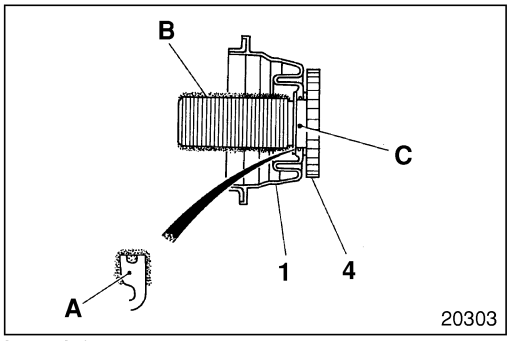
1 2 Removal of boot and adjusting screw assembly

- Remove the boot **1** from the body **18** with screw driver **A**.
- Remove adjusting screw assembly **2** and boot **1** by turning the adjusting screw assembly counterclockwise.



20526

- Remove boot **1** from adjusting screw assembly **2**.

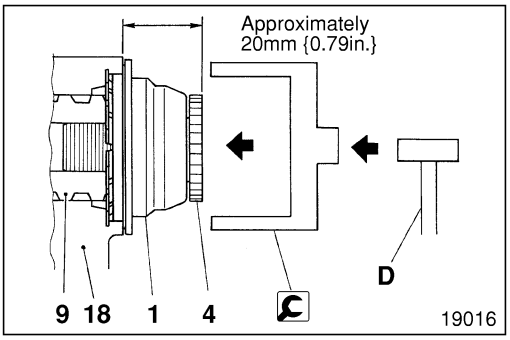


20303

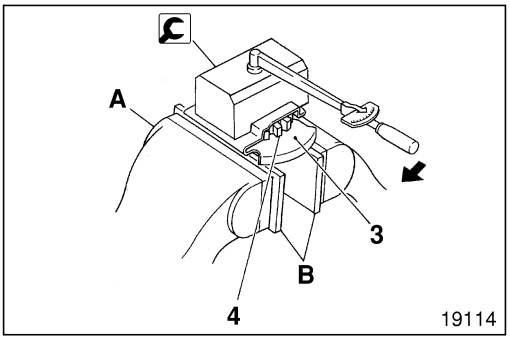
1 4 Installation of boot and adjusting screw

- Apply grease on the contact part **A** of adjusting screw **4** of boot **1** and the threads **B** of the adjusting screw.
- Install boot **1** into groove **C** of adjusting screw **4**.

https://truckmanualshub.com/



- Thread adjusting screw **4** into the sleeve assembly **9** until the adjusting screw reaches a distance of approximately 20 mm {0.79 in.} from the body **18**.
- Confirm that sleeve assembly **9** slides by pulling adjusting screw **4** lightly.
- Press boot **1** fit with 🔧 boot installer.
  D: Plastic hammer



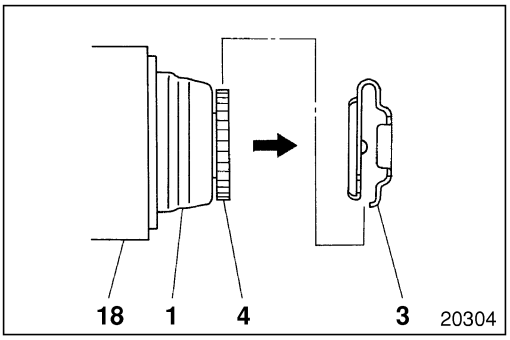
2 Inspection of clip-holding torque of adjusting screw assembly

- Fix adjusting screw **4** with vise **A**.
  B: Buffer (jaw protectors)

CAUTION ⚠

Use buffer B such as jaw protectors so as not to give damage to adjusting screw 4.
Also, the auto adjustment mechanism will not operate when the threaded part of the adjusting screw is damaged.

- Install 🔧 clip adaptor
- The holding torque is a value indicated when clip **3** has began to turn.
- Replace clip **3** if the measurement value comes off from the standard value.

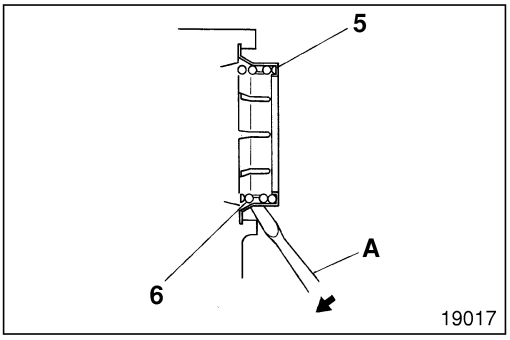


3 Installation of clip

- To install the clip **3** on adjusting screw **4**, extend the adjusting screw out to the extent that it does not come in contact with boot **1**.
- Install clip **3**.

CAUTION ⚠

Do not damage boot 1 when installing clip 3.



5 Spring cage

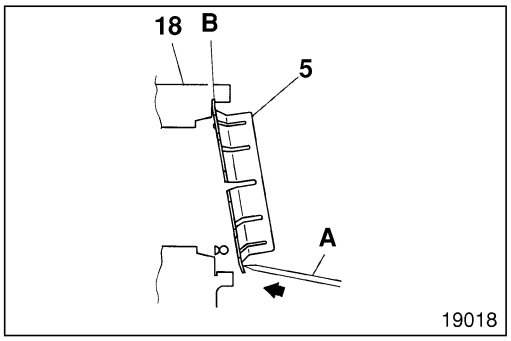
[Removal]
Remove spring cage **5** with holding it by hand so that spring **6** may not pop out.
A: Screw driver

WARNING ⚠

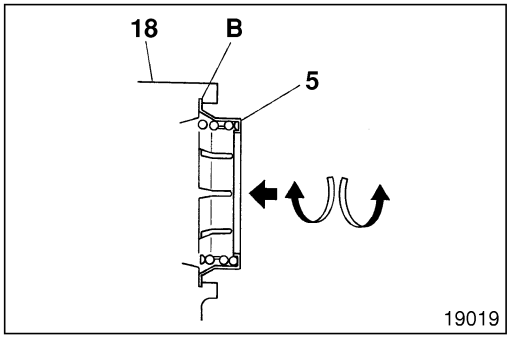
Take care that spring 6 may pop out.

https://truckmanualshub.com/

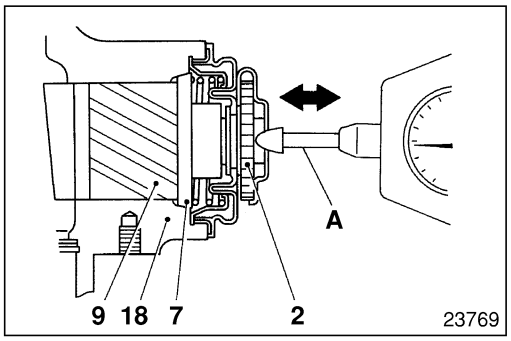
EXPANDER ASSEMBLY



[Installation]
- Fit the one side of spring cage **5** into groove **B** of body **18**.
- Push the other side of spring cage **5** with screw driver **A**.

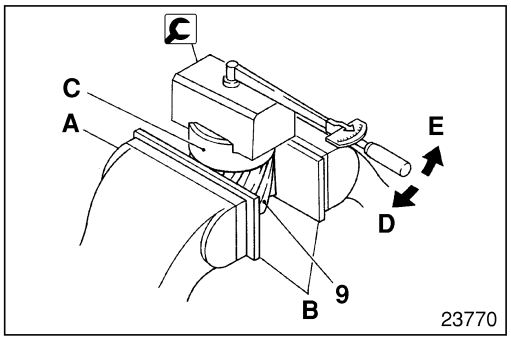


- To check the spring cage **5** for proper installation into the groove of body **18**, push in on the spring cage while rotating the cage. It should rotate smoothly.



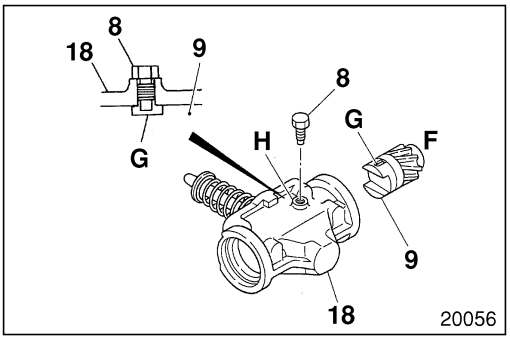
7 **9** **Inspection of backlash between drive ring and sleeve assembly**
- Measure the backlash between drive ring **7** and sleeve assembly **9** with a dial indicator **A** while moving the adjusting screw assembly **2** in the direction of the arrow.
- If the measured value is out of specification, replace drive ring **7** and sleeve assembly **9**.

CAUTION
Measure the backlash with care so that drive ring 7 may not separate from body 18 with being pushed by sleeve assembly 9.



[Inspection]
- Fix sleeve assembly **9** with vise **A**.
  B: Buffer (jaw protectors)
- Install clip adaptor.
- Measure the torque at the time when tappet **C** begins to rotate.
  D: Clockwise
  E: Counterclockwise
- If the measured value is out of specification, replace sleeve assembly **9**.

https://truckmanualshub.com/



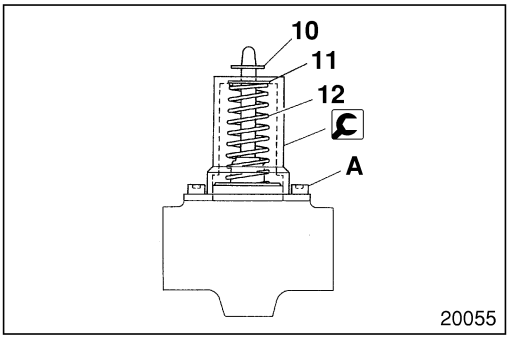
9 Sleeve assembly

[Installation]

- Install sleeve assembly **9** by aligning the identification groove **F** in the tip of the sleeve assembly with the threaded hole **H** of the body **18**.
- Apply grease on the outer, the screw part and the roller contact part of sleeve assembly **9**.
- Install screw **8** after groove **G** is aligned.
- Tighten the sleeve assembly with the specified torque after applying the sealing compound on the screw of screw **8**.
- Confirm whether sleeve assembly **9** does not come off.

NOTE:

- Recheck that the sleeve assembly **9** does not pull out of the housing.



12 Spring

[Removal]

- spring holder with bolt **A**, and compress spring **12**.
- Remove snap ring **10**.
- Remove bolt **A** and spring holder.

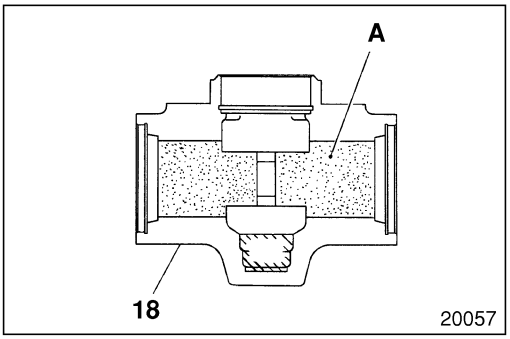
CAUTION

When removing bolt A, use caution as the spring 12 may pop out.

- Remove retainer **11** and spring **12**.

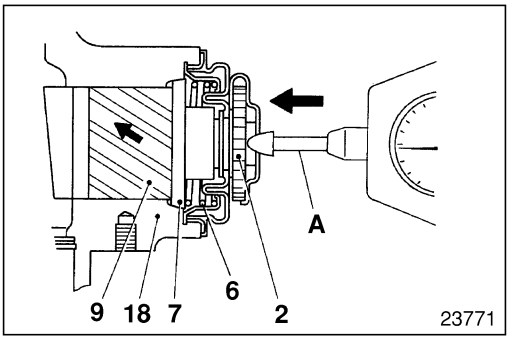
[Installation]

- Follow the removal sequence in reverse.



18 Applying and filling grease on body

- Apply grease on the inside surface **A** of body **18**.
- Fill grease in the **B** part.



— Inspection of auto adjustment mechanism operation of expander assembly

- Pull the adjusting screw assembly **2** as far out as possible by hand.
- Push the adjusting screw assembly **2** back slightly until you feel the resistance change.
- Place the push-pull gauge **A** on the adjusting screw assemlby **2**, then push the gauge **A** in the direction of the arrow as shown in the figure on the left, and measure the maximum moving resistance of the adjusting screw assemlby **2**.
- If the measured value is out of specification, replace the sleeve assembly **9**.

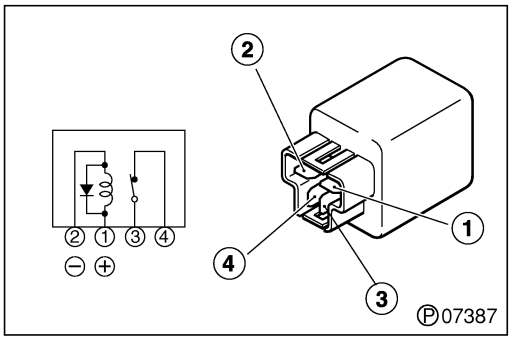
Service standards

Location	Maintenance item		Standard value	Limit	Remedy
18	Output voltage of pulse convertor	Low pulse	0.5V or less	—	Replace
		High pulse	8±1V		

◆ Service procedure



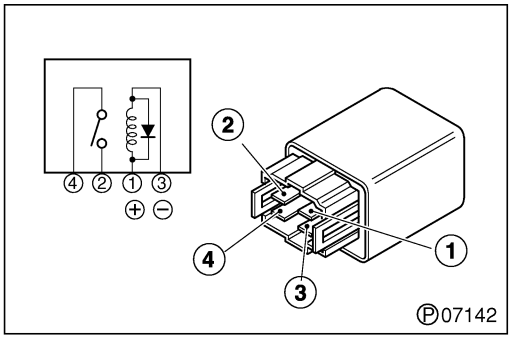
3 Inspection of relay (Close type 4-pin)

- Follow the table below to inspect continuity:

	①	②	③	④
No current	○—○		○—○	
Current	⊕—⊖		○----○	

○—○: There is continuity between terminals ○ and ○.
⊕—⊖: Indicates that 12 volts DC is applied to the line between the terminals.
○----○: Indicates that the continuity between the terminal is lost.

- If any fault is found, replace the relay.



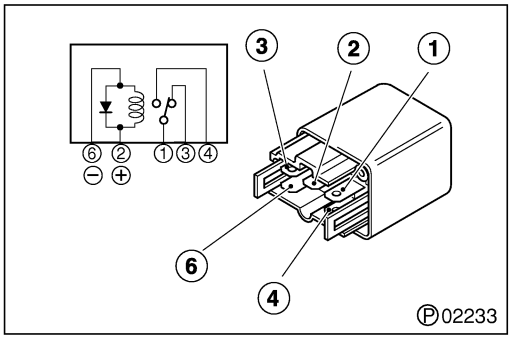
4 5 13 15 17 Inspection of relay (Open type 4-pin)

- Follow the table below to inspect continuity:

	①	②	③	④
No current	○—○			
Current	⊕—⊖	○		○

○—○: There is continuity between terminals ○ and ○.
⊕—⊖: Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.



12 Inspection of relay (Open type 6-pin)

- Follow the table below to inspect continuity:

	①	②	③	④	⑥
No current	○—○	○—○			
Current	○	⊕		○	⊖

○—○: There is continuity between terminals ○ and ○.
⊕—⊖: Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.

The automatic transmission consists of a torque converter and a fully automatic 4-speed gear system.

● **Torque converter**

The torque converter is driven by the engine crankshaft, and functions as the input device for the transmission. The torque converter also acts as the fluid coupling, absorbing shock during engine start up and gear shifting.

● **Transmission (4 forward speeds, 1 reverse speed)**

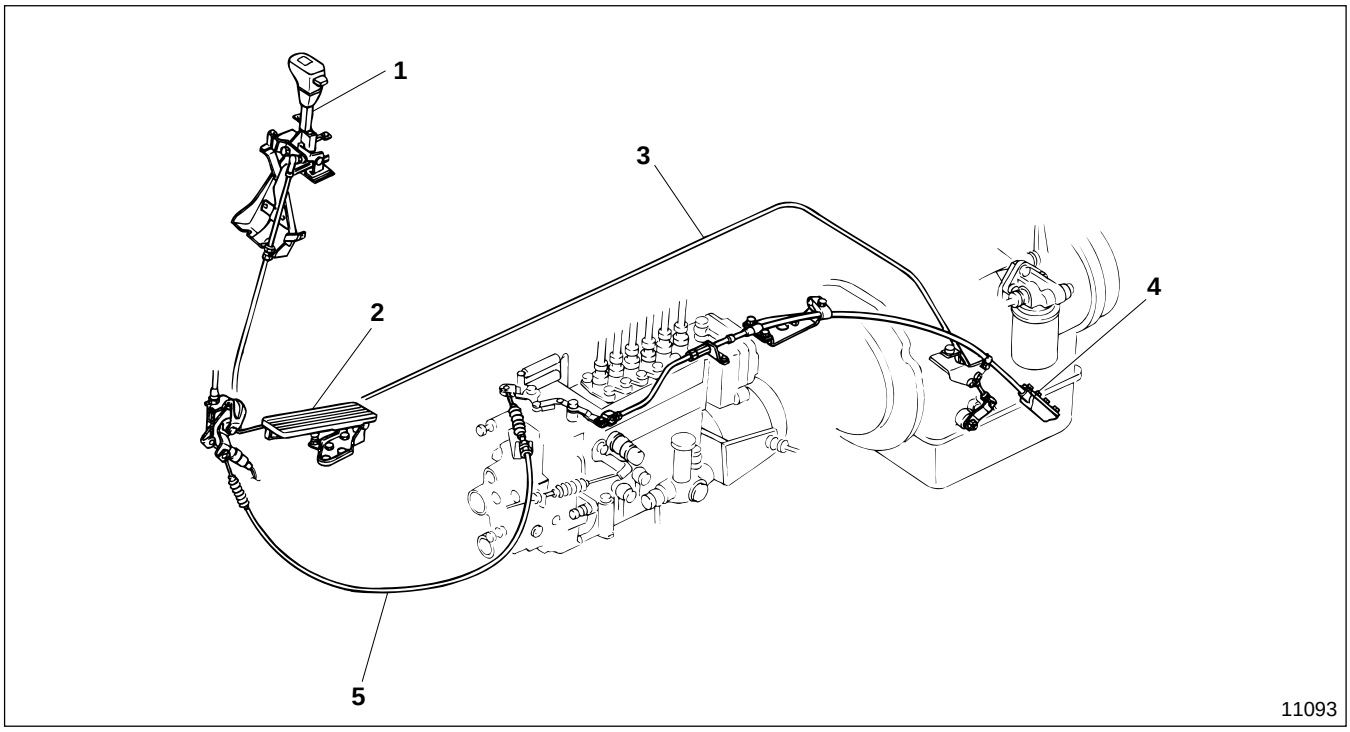
The transmission is accomplished by three sets of planetary gears **18**, **19**, **20** and five sets of oil pressure-operated, wet-type multiple disc clutches **7**, **8**, **9**, **11**, **13**. These oil-cooled clutch discs are self-adjusting to compensate for wear.

● **Oil pressure control area**

This oil pressure control area consists of oil pump **4**, control valve assembly **21** that controls the changeover between clutches **7**, **8**, **9**, **11**, and **13**, the modulator that monitors the amount the accelerator pedal is depressed, and the governor that monitors the vehicle speed. Gear shift is made automatically and depends on how much the accelerator pedal is depressed and how fast the vehicle is travelling.

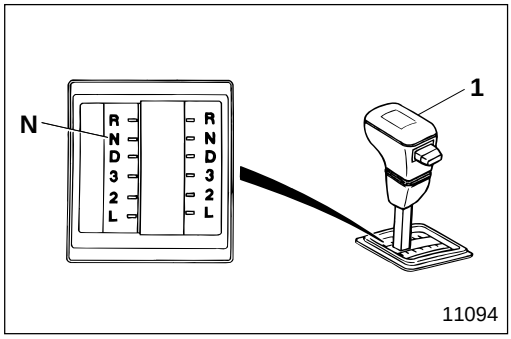
https://truckmanualshub.com/

Automatic Transmission Control



1 Range selector lever
2 Accelerator pedal
3 Selector cable
4 Modulator
5 Accelerator control cable

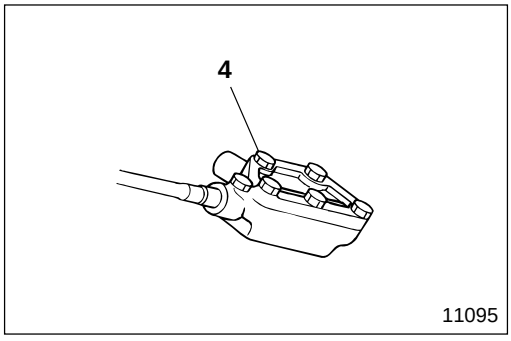
Range Selector Lever



Range selector lever **1** selects the most suitable range for the operating conditions, ensuring optimum service from the automatic transmission. Safety features are incorporated that make sure that the engine cannot be started when the range selector lever is in any position other than neutral (N).

N : Neutral

Modulator



Modulator **4** converts the amount the accelerator pedal is depressed into hydraulic pressure.

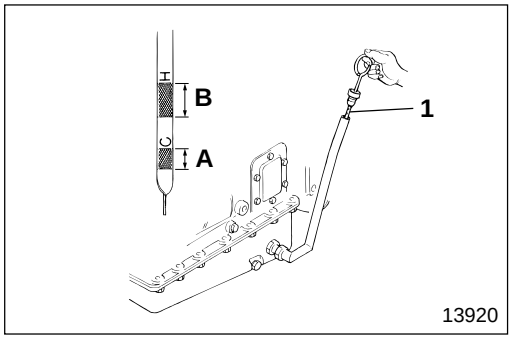
INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection of Automatic Transmission Fluid

(1) Inspection of characteristics

If the automatic transmission fluid smells burnt or if it contains metal particles or sludge as a result of internal friction and wear of metal or other material, the transmission assembly must be completely overhauled. Make sure you carefully examine the automatic transmission fluid on the dipstick. If you find the quality questionable, take a sample and examine it more closely.



(2) Inspection of automatic transmission fluid level

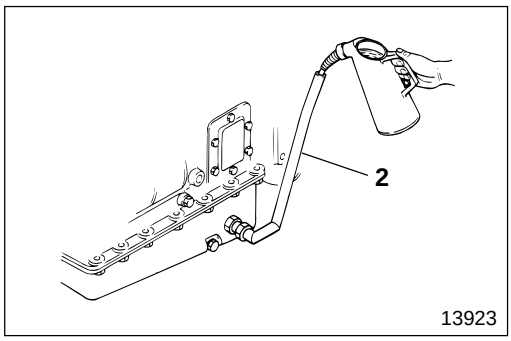
- Park the vehicle on level ground, make sure that the parking brake is fully activated and chock the wheels to keep them from rolling.
- Start the engine and let it idle. To fill the hydraulic circuit with automatic transmission fluid, shift the range selector lever from N → R → N → D → 2 → D → N. Repeat this process five times, finally shifting to N.
- While the engine is still idling, pull out dipstick **1** and wipe off the fluid sticking to it. Reinsert the dipstick, then pull it out again and check the fluid level.
- If the fluid level is inspected right after the engine is started and the fluid temperature is still low (approximately 15 to 49°C {60 to 120°F}), the level should be within area **A** marked COLD on dipstick **1**.
- If the fluid level is inspected after the vehicle has been driven and the fluid temperature is high (approximately 71 to 93°C {160 to 200°F}), the level should be within area **B** marked HOT on dipstick **1**.

WARNING

Take care during the inspection because the engine will be running. Take sufficient care to avoid burns or injuries resulting from contact with moving parts.

NOTE

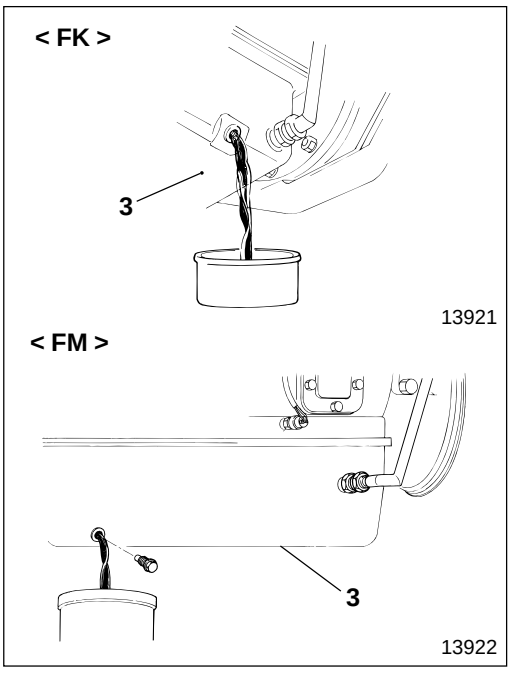
- **Make sure the vehicle is parked on level ground when you are checking the fluid level.**
- **Make sure the selector lever is in the N position and the engine is idling when you are checking the fluid level. When the engine is stopped, the fluid level appears higher than it actually is.**
- **Be sure to wipe off the dust from the safety cap and the upper part of dipstick guide 2 before you pull out dipstick 1.**
- **To ensure the fluid is correct, reinspect the fluid level after an actual drive.**



- If the fluid level is low, add automatic transmission fluid (DEXRON or DEXRON II type) through dipstick guide **2** until the correct level on dipstick **1** is reached.

https://truckmanualshub.com/

Replacement of Automatic Transmission Fluid



(1) Draining

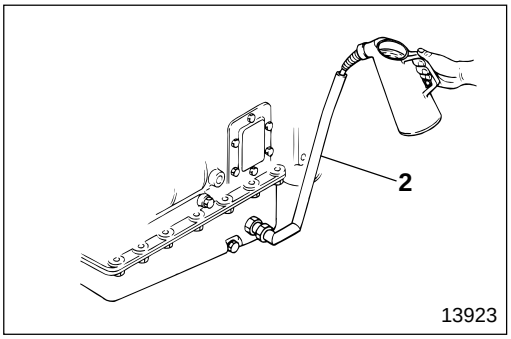
- Park the vehicle on level ground, chock the wheels and shift the selector lever to the **N** position.
- Place a container under oil pan **3**, remove the drain plug and drain the fluid.
- Clean oil pan **3** and the drain plug. Replace the oil filter. P23-19
- Replace the outer oil filter. P23-30

WARNING

Take care because the fluid temperature immediately after the engine has stopped is very high. To avoid scalds, wait until a safe temperature has been reached before draining the fluid.

NOTE

- **The fluid will drain faster if the engine is first run to raise the fluid temperature.**
- **The fluid cannot be drained from the hydraulic circuit, the torque converter or the oil cooler.**
- **Check the drained fluid for dirt, metal particles and metal fragments.**



(2) Supply

- Install the oil filter, oil pan **3** and the drain plug. P23–19
- Add automatic transmission fluid (DEXRON or DEXRON II type) through dipstick guide **2**.
  FK : 8.5 L {9.0 qts}
  FM : 15 L {16 qts}

CAUTION

Make sure that dirt and foreign particles do not become mixed in with the fluid when it is added.

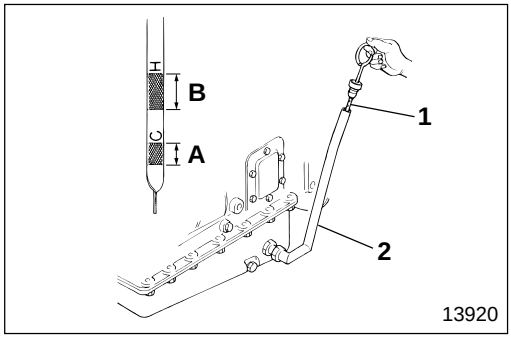
- Shift the range selector lever to the **N** position, start the engine and let it idle for about one minute.
- After shifting the lever through all positions once, shift it back to the **N** position.

CAUTION

To prevent burning out the interior of the automatic transmission assembly, make sure that the engine is not allowed to race when you do the above.

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

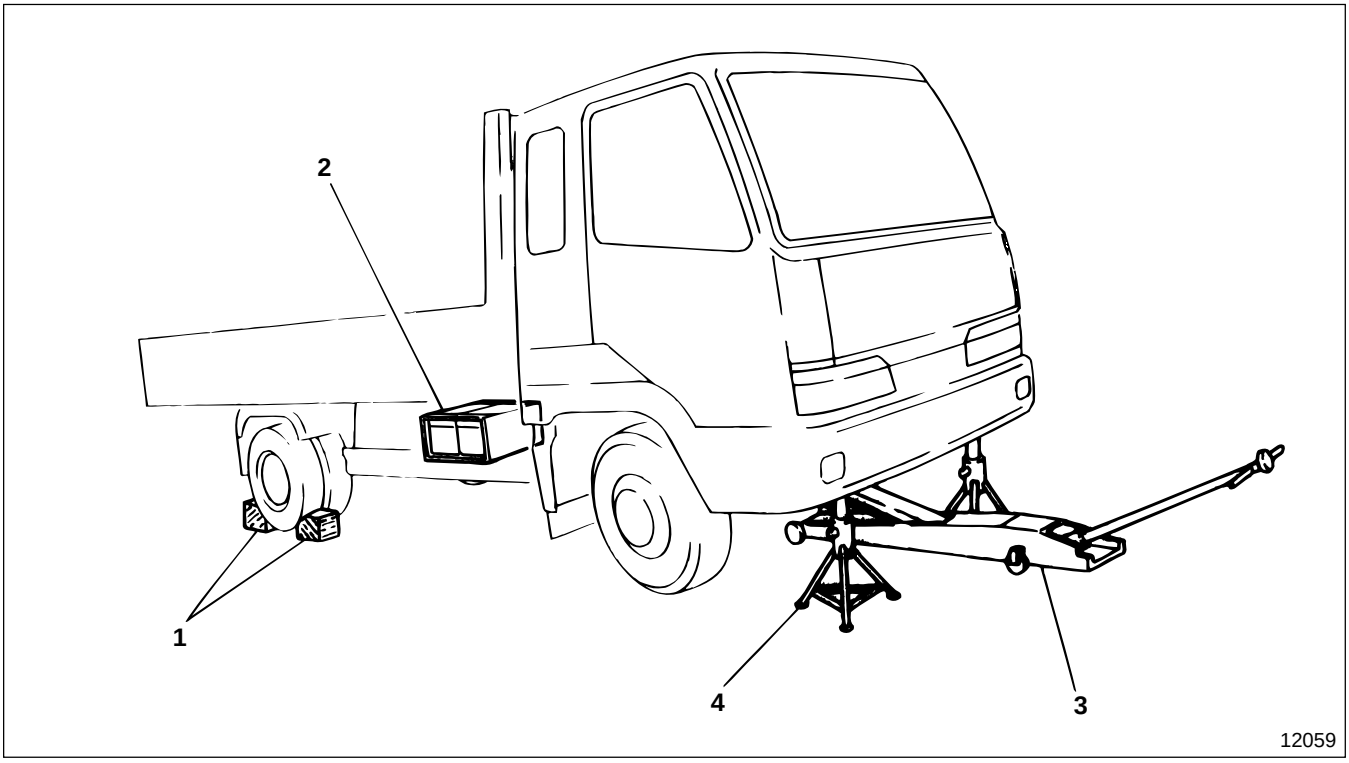


- Check and adjust so that the fluid level is within the specified area on dipstick **1**.

NOTE

- **As the temperature of the fluid rises, so does the fluid level. If you add fluid while the temperature is still low (approximately 15 to 49°C {60 to 120°F}), make sure that the level stays within area A, marked COLD on dipstick 1.**
- **Let the engine idle and, while paying attention to the fluid level, pour in the fluid slowly.**
- **It is sometimes hard to check the fluid level, immediately after supplying fluid, because of the fluid adhering to the interior of dipstick guide 2. If this is the case, check the fluid level several times at intervals.**
- **Be careful not to supply too much fluid because you might mistake the fluid that overflows from the air breather for fluid leakage.**

https://truckmanualshub.com/



● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect the negative battery cable Gr 54
3 Jack up the front axle with a garage jack.
4 Support the front frame on rigid racks.

WARNING

- **The parking brake will be removed so naturally it cannot be used. Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION

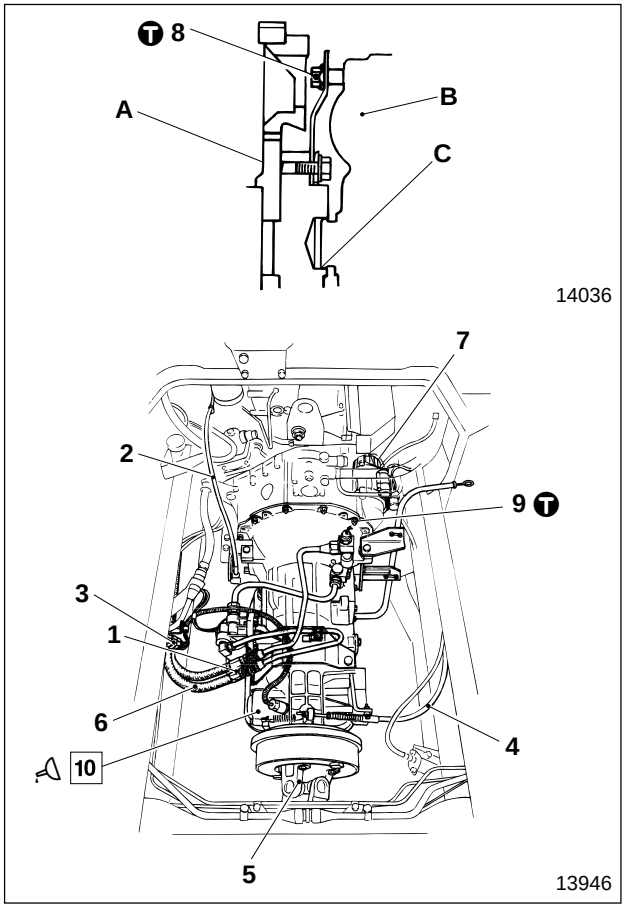
Be sure to keep the automatic transmission in neutral throughout the operation.

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

https://truckmanualshub.com/

REMOVAL AND INSTALLATION OF AUTOMATIC TRANSMISSION ASSEMBLY



● **Removal Sequence**

1 Modulator
2 Selector cable
3 Harness connector
4 Parking brake cable Gr 36A
5 Propeller shaft Gr 25
6 Oil cooler hose
7 Starter Gr 54
8 Bolt
9 Nut
10 Automatic transmission assembly

A : Flywheel
B : Torque converter
C : Torque converter pilot area

● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
8	Bolt (Torque converter and flywheel mounting)	51 to 61 {38 to 45, 5.20 to 6.22}	—
9	Nut (Automatic transmission assembly mounting)	39 to 58 {28 to 43, 3.9 to 6.0}	—

Lubricant

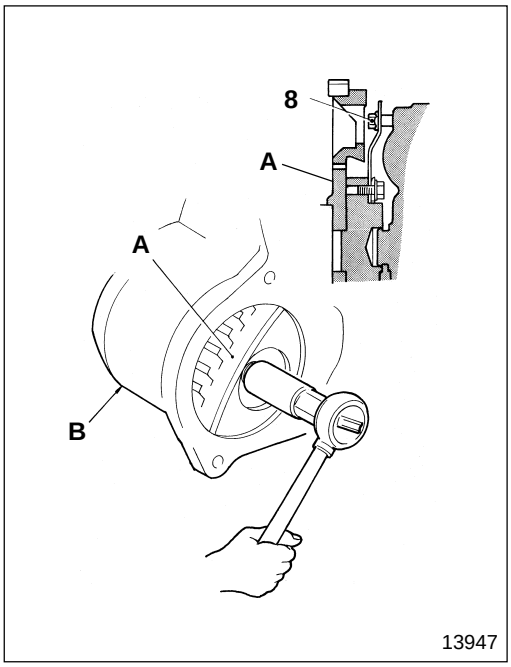
Location	Points of application	Kinds	Quantity
10	Torque converter pilot area (area C)	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

Special tools

Location	Tool name and shape	Part No.	Application
10	Converter installer  03726	ME633437	Automatic transmission assembly installation guide

https://truckmanualshub.com/

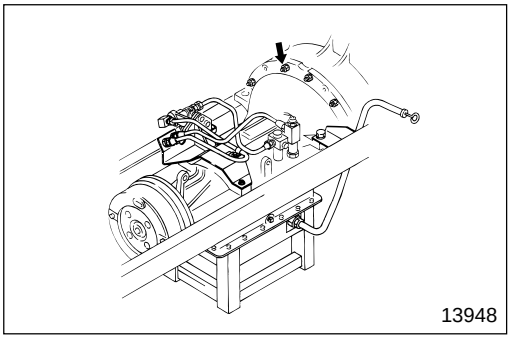
◆ Service procedure



10 **Automatic transmission assembly**

[Removal]

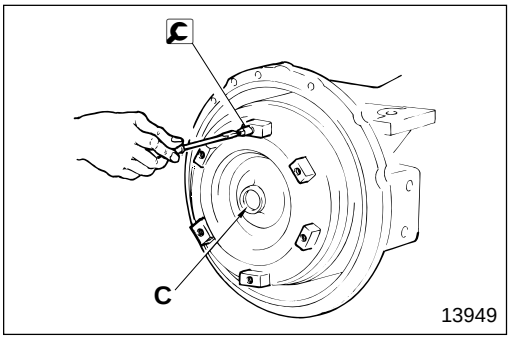
- Rotate flywheel **A** and remove bolts **8** in sequence.
  B : Starter housing



- Use a square bar or a similar object to support the oil pan of automatic transmission assembly **10**, then remove it by pulling it out backward.

CAUTION⚠

- **Be careful not to apply force unevenly to any of the oil pan parts.**
- **Be careful not to let the torque converter fall from the transmission body because as a single unit the torque converter can come loose easily.**

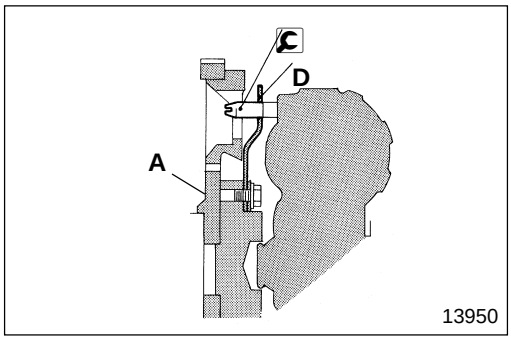


[Installation]

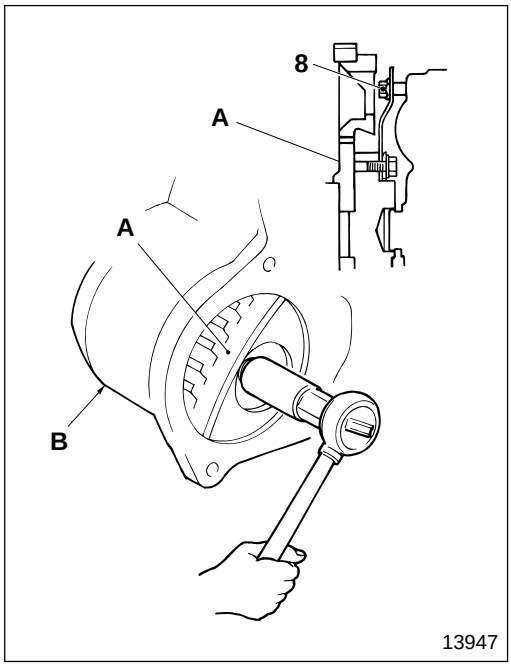
- Apply molybdenum disulfide grease to torque converter pilot area **C**.
- Mount 🔧 torque converter installer in the tapped hole on the torque converter periphery.

https://truckmanualshub.com/

REMOVAL AND INSTALLATION OF AUTOMATIC TRANSMISSION ASSEMBLY



- Install the automatic transmission assembly to the engine flywheel housing, by aligning torque converter installer with the hole in flexplate **D** of flywheel **A**.



- Rotate flywheel **A** and tighten bolts **8**, in sequence, through the working hole of starter housing **B**. (6 points)
- Remove the converter installer and replace it with bolt **8**.
- First tighten all six bolts **8** temporarily, then tighten at specified torque.

NOTE

Be careful not to drop bolts 8 into the gap between flywheel A and the torque converter.

OIL SEAL AND SPEEDOMETER WORM

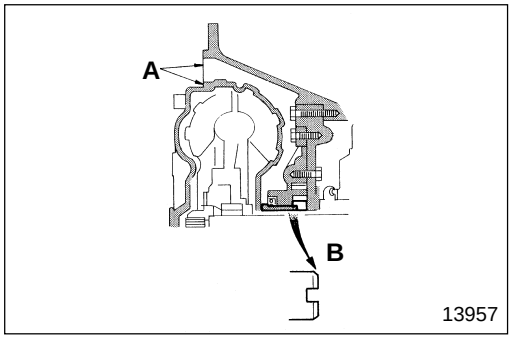
◆ Service procedure

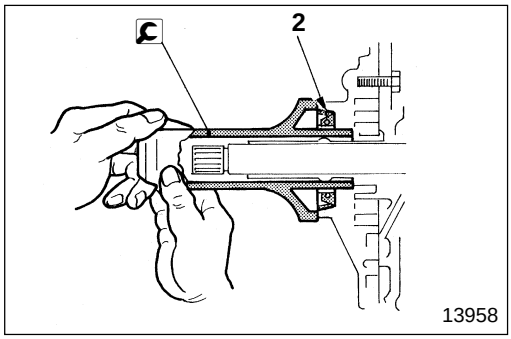


1 **Installation of torque converter**

Align the hub groove of torque converter **1** with the claw of the oil pump, then insert until the welded part on the converter periphery and the housing flange almost coincide.

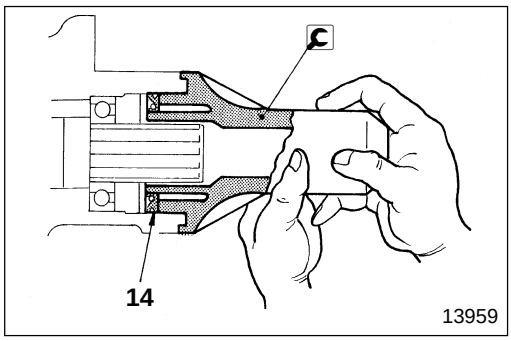
CAUTION
Be careful not to scratch the oil seal.

A : Guide to insertion position (Align faces)
B : Align claw position



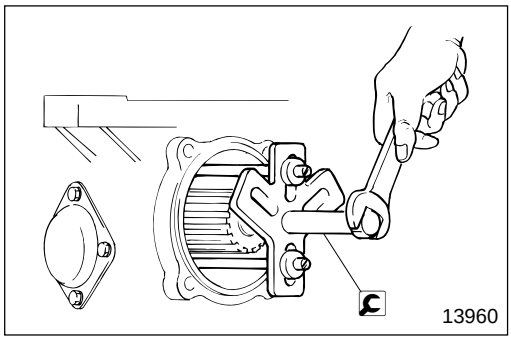
2 **Installation of oil seal**

- Apply grease to the lip area, and apply sealant to the periphery of oil seal **2**.
- Use 🔧 pump seal installer and install oil seal **2**.



14 **Installation of oil seal**

- Apply grease to the lip area, and apply sealant to the periphery of oil seal **14**.
- Use 🔧 rear oil seal installer and install oil seal **14**.



16 **Bearing**

[Removal]

- Insert the claw on the tip of 🔧 bearing remover set rod between the bearing race of bearing **16**.
- Insert the bolt of 🔧 bearing remover set into the automatic transmission output shaft, then remove bearing **16** by tightening the bearing remover.

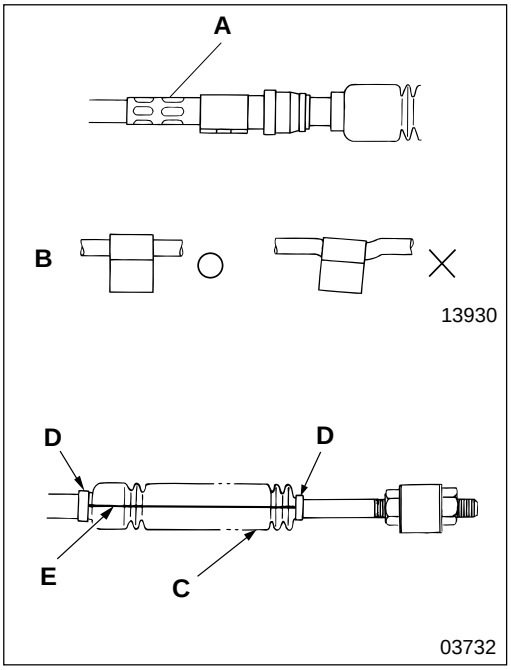
7	Nut (Selector lever mounting)	23.5±3.4 {17±2.5, 2.4±0.35}	—

https://truckmanualshub.com/

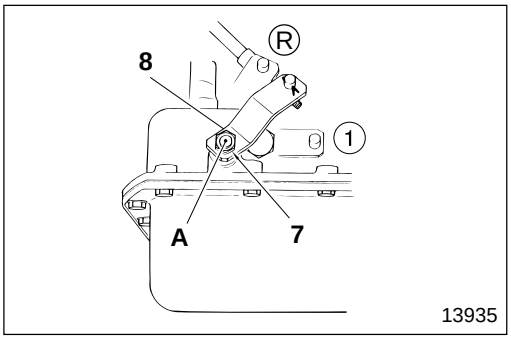
◆ Service procedure



6 **Installation of selector cable**

NOTE

- **Make sure casing cap A is installed in a straight line.**
- **Cable bend radius must be 20 cm {7.87 in.} or more.**
- **Make sure the cable is straight.**
- **Install the clamp at right angles to the cable. (Figure B)**
- **Do not twist clamps D at the ends of boot C. Install so that white line E on the boot is a straight line. (Figure E)**



8 **Installation of selector lever**

If selector lever **8** has been removed, rotate selector shaft **A** and move it to an intermediate position between, but other than, ① and Ⓡ, then tighten nut **7**.

CAUTION ⚠

Be careful not to overtighten nut 7, it might cause the internal lever to malfunction.

● Inspection after installation

- Make sure that when range selector lever * on the driver's side is operated, the detent positions of selector lever **8** on the automatic transmission side agree with the corresponding positions of the range selector lever on the driver's side. Also make sure that the range selector lever on the driver's side and the selector lever on the automatic transmission side are both operating smoothly.
- Make sure the modulator cable moves smoothly.
- Make sure the starter switch can be operated only in the neutral position, and is disabled for all other positions.
- Make sure the backup lamps light when the selector is in the reverse (R) position.
  (The lamps do not light when the engine is stopped.)

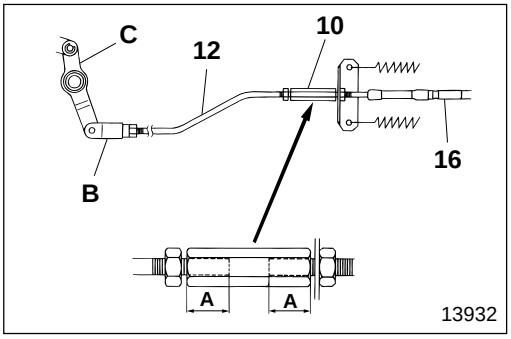
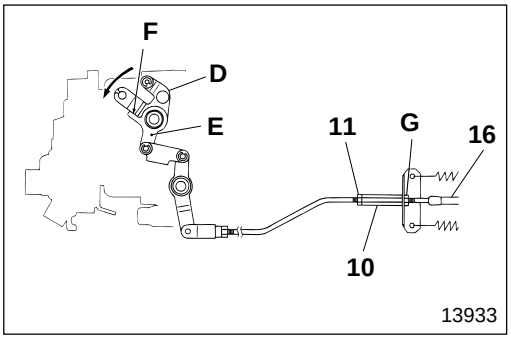
◆ Service Procedure

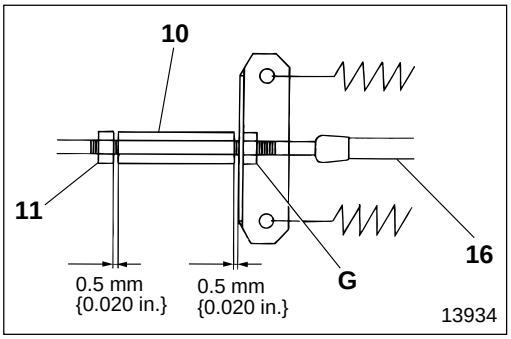


12 **Installation of modulator control rod assembly**

- Install modulator control rod assembly **12** and modulator assembly **16** in the ends of turnbuckle **10** by temporarily screwing them in so that the length of engagement **A** is the same on either side.
- Install clevis **B** of modulator control rod assembly **12** on modulator control lever **C**.



- Move speed control lever **D** to full position.
  In this condition, screw in turnbuckle **10** so that modulator assembly **16** is pulled to the position it would be in the case of maximum stroke.
- Make sure there is no gap in area **F** between speed control lever **D** and link **E**.
- Temporarily tighten nut **11** and nut **G** of modulator assembly **16**.



- Slacken off turnbuckle **10** until there is a 0.5 mm {0.020 in.} gap on either end of the turnbuckle.
- Tighten nuts **11** and **G** of modulator assembly **16** at specified torque.

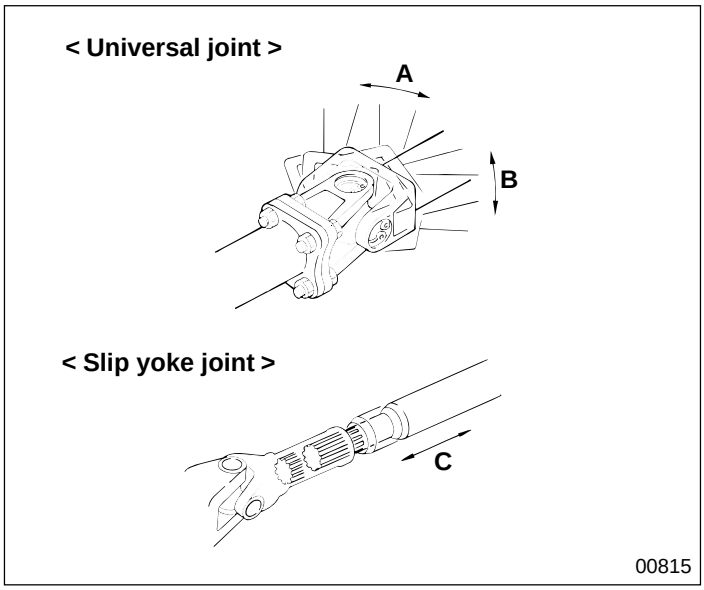
STRUCTURE AND OPERATION

Swing of Propeller Shaft

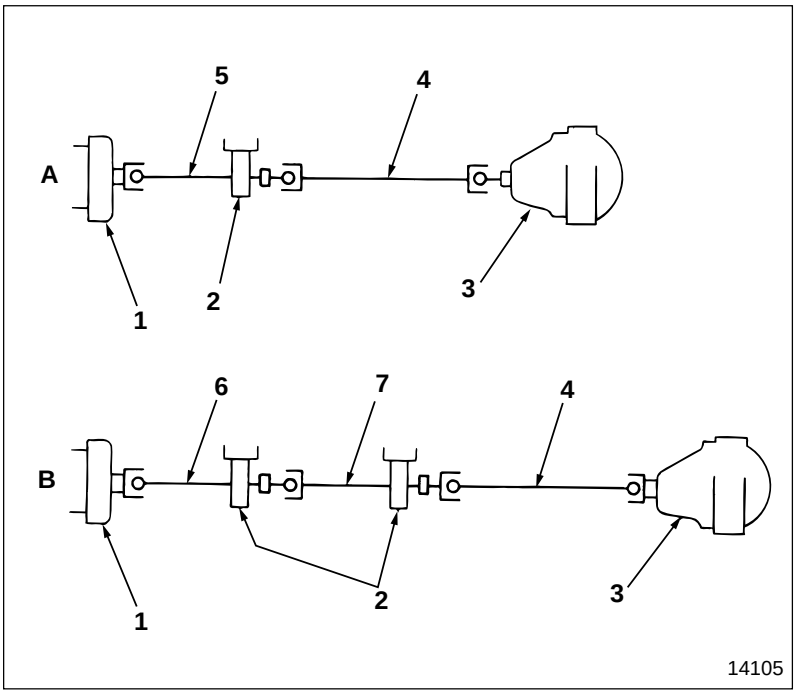


A : Lateral swing
B : Longitudinal swing
C : Fore-and-aft movement

Relative positions of transmission, rear axle and front axle vary depending on the fluctuation of the road surface and load carried when operating the vehicle. The universal joint and the slip yoke joint are provided to absorb these influences.

https://truckmanualshub.com/

Configuration of Propeller Shaft Connection



1 Parking brake drum
2 Center bearing
3 Rear axle
4 Rear propeller shaft
5 Front propeller shaft
6 Front propeller shaft No. 1
7 Front propeller shaft No. 2

A : Twin-shaft connection
B : Triple-shaft connection

TROUBLESHOOTING

Symptoms / Possible causes		Propeller shaft vibrating		Noise from propeller shaft		
		Vibration at high speed	Vibration at low speed	Noise when starting or while coasting	Noise while cruising	Clicking noise
Flange yoke assembly direction incorrect		○				
Companion flange tightening torque excessive						○
Slip yoke joint	Lubrication insufficient				○	
	Spline play excessive		○	○		
Universal joint	Clearance in spider axial direction excessive		○		○	
	Needle bearing lubricated insufficiently				○	
	Needle bearing worn	○		○	○	
Center bearing < Twin-shaft and triple-shaft connection >	Lubrication insufficient				○	
	Seized, worn, or rotation faulty	○			○	
	Cushion rubber deteriorated or deformed			○		
	Bracket mounting bolt loose			○		
Propeller shaft	Mounting bolt loose	○		○		
	Bent	○				
	Dynamic balance adjusted incorrectly	○				
Transmission gear selection too high			○

◆ Service procedure

● **Work before removal**

WARNING⚠

- **Since the propeller shaft will be removed, the parking brake (center parking brake) cannot be used. Therefore, you must chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**

Remember to make alignment marks **A** before removal.

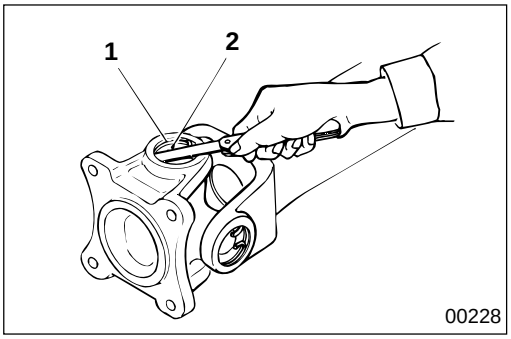
5	Supply via grease nipple	Wheel bearing grease [NLGI No. 2 (Li soap)]	Pack until grease overflows from spider dust cover
9	Inner surface of cork seal	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
10	Supply via grease nipple	Wheel bearing grease [NLGI No. 2 (Li soap)]	Pack until grease overflows from dust plug hole

Special tools

Location	Tool name and shape	Part No.	Application
1	Snap ring expander  00227	MH061001	Removal and installation of snap ring



00228

◆ Service procedure

● **Inspection before disassembly**

Clearance in axial direction for spider

Press needle bearing **2** downward firmly, and measure the clearance between snap ring **1** and the needle bearing. If the measured value is higher than the standard value, adjust it by changing the thickness of the snap ring.

- Available snap ring thicknesses

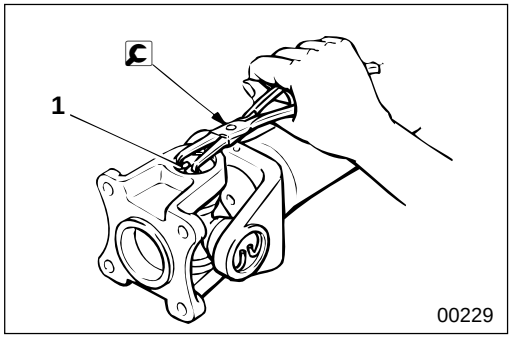
Part name	Thickness	Identification color
Snap ring A	2.5 mm {0.098 in.}	Green
Snap ring B	2.6 mm {0.10 in.}	Red

NOTE

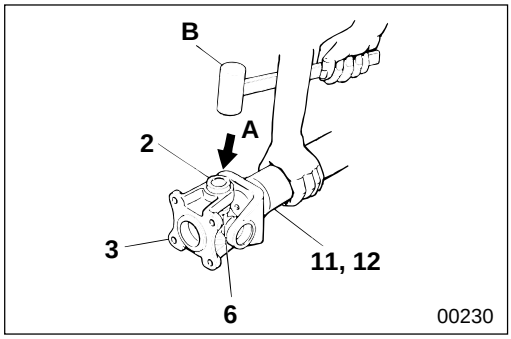
For snap ring 1, it is recommended that you use rings with the same thickness on both ends to ensure balanced revolution.

https://truckmanualshub.com/

REAR PROPELLER SHAFT < P4 >

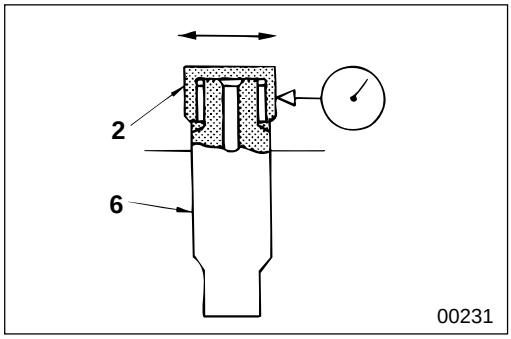


1 **Removal and installation of snap ring**



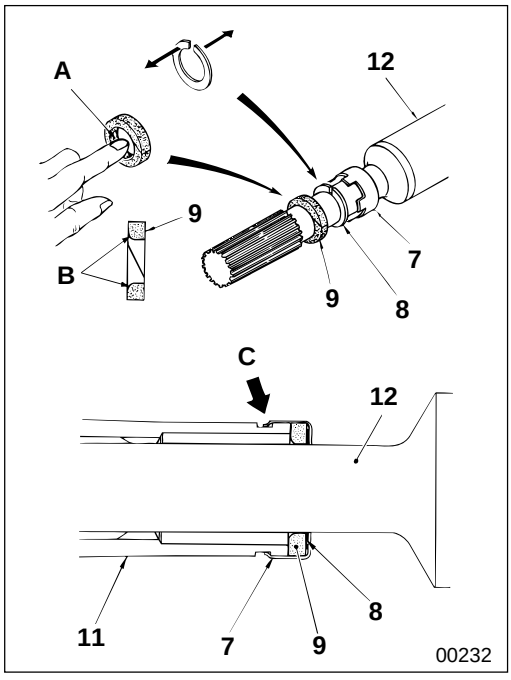
2 **Removal of needle bearing**

- Put alignment marks on needle bearing **2** and spider **6**.
- Put alignment marks across flange yoke **3**, slip yoke joint **11** and rear propeller shaft **12**.
- Hit the yoke lightly at shoulder area **A** so that needle bearing **2** bounces out due to reaction.
  B : Mallet



2 **6** **Clearance between needle bearing and spider**

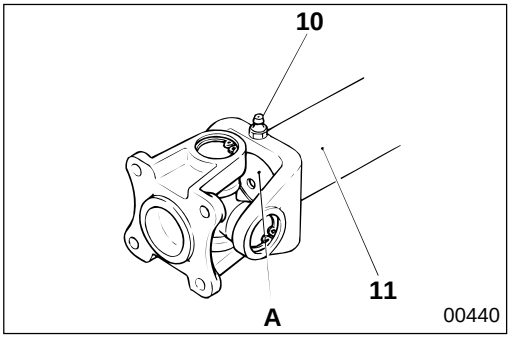
Measure the play towards the diameter direction between needle bearing **2** and spider **6**. If the measured value is higher than the limit, replace with universal joint spider kit.



7 **to** **9** **Assembly of dust cap, retainer and cork seal**

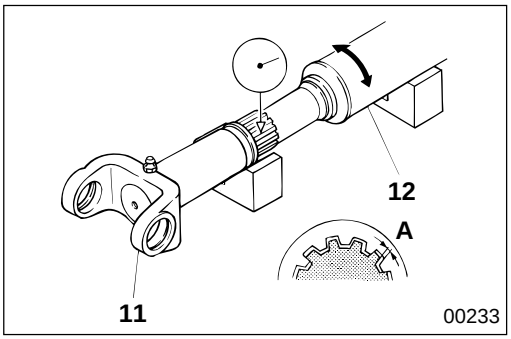
- Insert dust cap **7** into rear propeller shaft **12** and expand retainer **8** carefully to mount it on the propeller shaft. Then, release the retainer and allow it to return to its original shape.
- Apply grease to inner surface **A** of cork seal **9**, face its chamfered side **B** towards the spline and mount in the same way as retainer **8**.
- Press cork seal **9**, compressing it by 1 to 2 mm {0.039 to 0.079 in.}, against slip yoke joint **11**, then caulk pawl area **C**.

https://truckmanualshub.com/



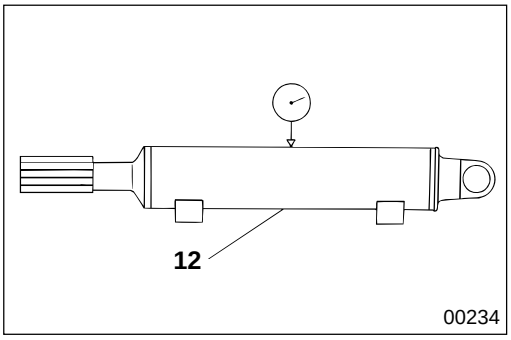
10 **Supply of grease via grease nipple**

Pack grease via grease nipple **10** until grease starts overflowing from the hole in dust plug **A** of slip yoke joint **11**.



11 **12** **Play between slip yoke joint and rear propeller shaft spline in rotating direction**

Measure play **A** in the rotation direction between slip yoke joint **11** and rear propeller shaft **12** at the spline area. If the measured value is higher than the limit, replace the faulty parts.



12 **Bend of rear propeller shaft**

Measure bend of rear propeller shaft **12** at its center. If the measured value is higher than the limit, correct or replace it.

CAUTION

Be sure to check for cracks at the welded area after straightening has been done by means of a press.

NOTE

To measure the bend of rear propeller shaft 12, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

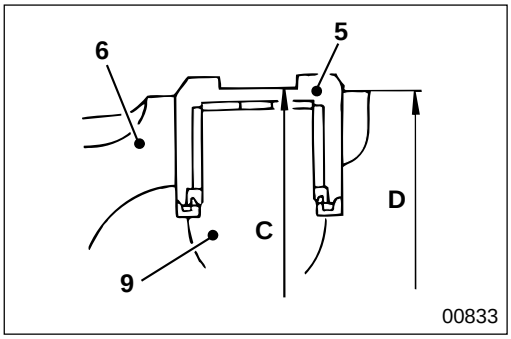
6	Spider assembly rest B 	03724-14000	Press-fitting of needle bearing



◆ Service procedure

● Inspection before disassembly

Clearance in axial direction for spider

Measure the clearance of needle bearing **5** (shim adjustment clearance = **D** – **C**). If the measured value is higher than the standard value, adjust it by changing the thickness of shim **4**.

- Available shim thicknesses

Part name	Thickness
Shim A	0.1 mm {0.0039 in.}
Shim B	0.2 mm {0.0079 in.}

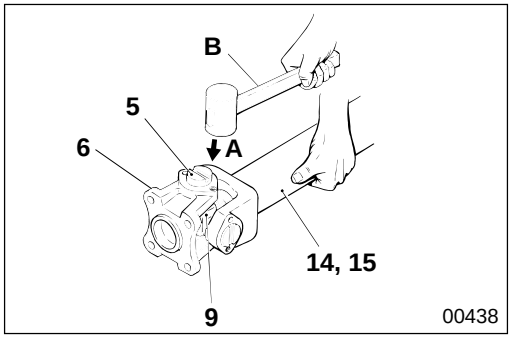
CAUTION

Make sure that shim 4 does not protrude above the surface of flange yoke 6 or needle bearing 5 will seize up.

NOTE

For shim 4, it is recommended that you use shims with the same thickness on both ends to ensure balanced revolution.

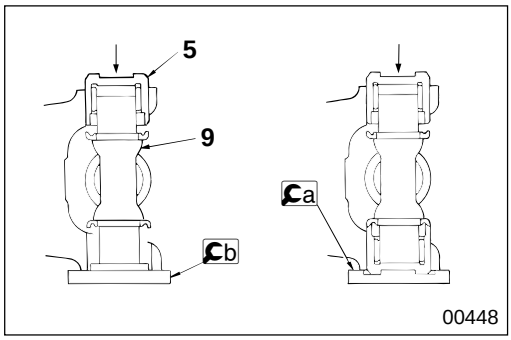
https://truckmanualshub.com/



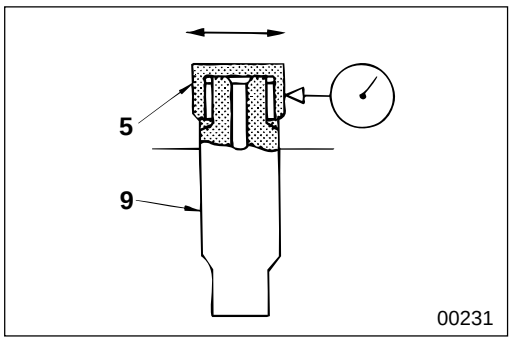
5 **Needle bearing**

[Removal]

- Put alignment marks on needle bearing **5** and spider **9**.
- Put alignment marks across flange yoke **6**, slip yoke joint **14** and rear propeller shaft **15**.
- Hit the yoke lightly at shoulder area **A** so that needle bearing **5** bounces out due to reaction.
  B : Mallet

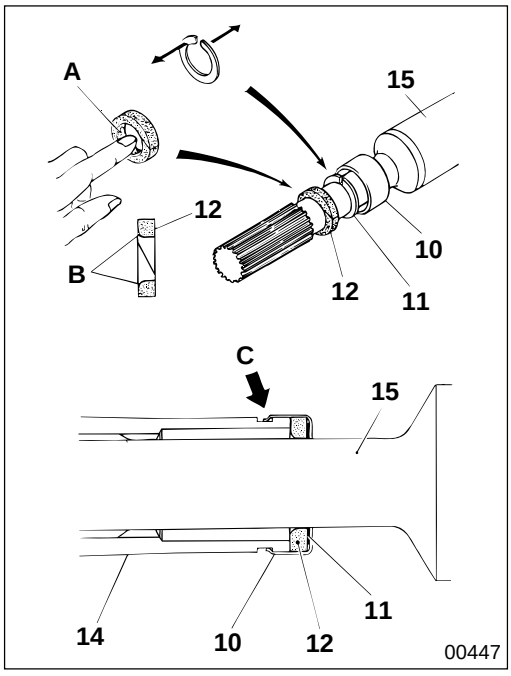


[Installation]



5 **9** **Clearance between needle bearing and spider**

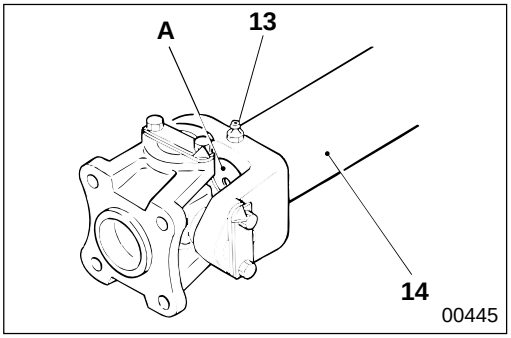
Measure the play towards the diameter direction between needle bearing **5** and spider **9**. If the measured value is higher than the limit, replace with universal joint spider kit.



10 **to** **12** **Assembly of dust cap, retainer and cork seal**

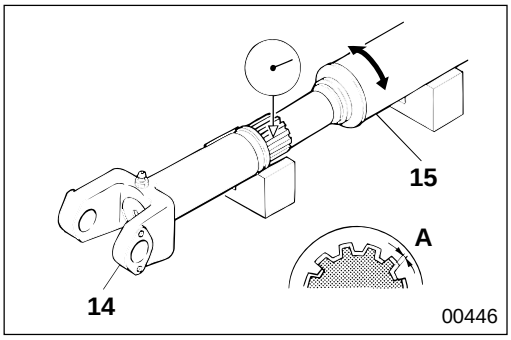
- Insert dust cap **10** into rear propeller shaft **15** and expand retainer **11** carefully to mount it on the propeller shaft. Then, release the retainer and allow it to return to its original shape.
- Apply grease to inner surface **A** of cork seal **12**, face its chamfered side **B** towards the spline and mount in the same way as the retainer.
- Press cork seal **12**, compressing it by 1 to 2 mm {0.039 to 0.079 in.}, against slip yoke joint **14**, then caulk pawl area **C**.

https://truckmanualshub.com/



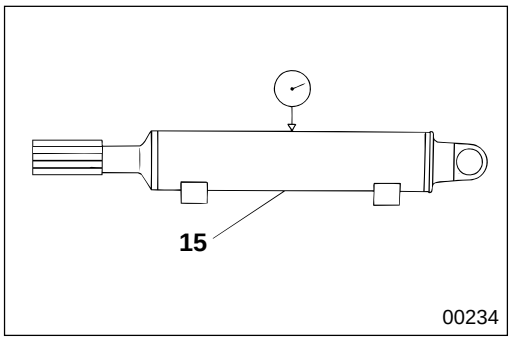
13 **Supply of grease via grease nipple**

Pack grease via grease nipple **13** until grease starts overflowing from the hole in dust plug **A** of slip yoke joint **14**.



14 **15** **Play between slip yoke joint and rear propeller shaft spline in rotating direction**

Measure play **A** in the rotation direction between slip yoke joint **14** and rear propeller shaft **15** at the spline area. If the measured value is higher than the limit, replace the faulty parts.



15 **Bend of rear propeller shaft**

Measure bend of rear propeller shaft **15** at its center. If the measured value is higher than the limit, correct or replace it.

CAUTION

Be sure to check for cracks at the welded area after straightening has been done by means of a press.

NOTE

To measure the bend of rear propeller shaft 15, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

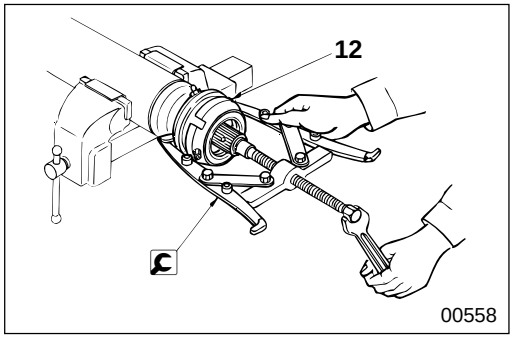
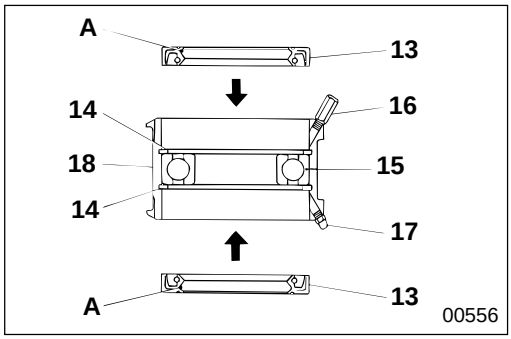
- Assemble center bearing case **18** so that grease nipple mounting hole **D** faces downward.

C : Relief valve mounting hole
D : Grease nipple mounting hole

https://truckmanualshub.com/

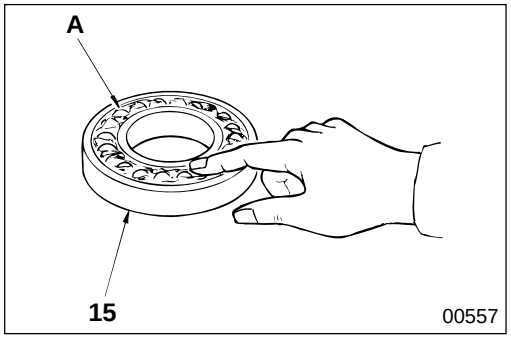


12 **Removal of center bearing housing**



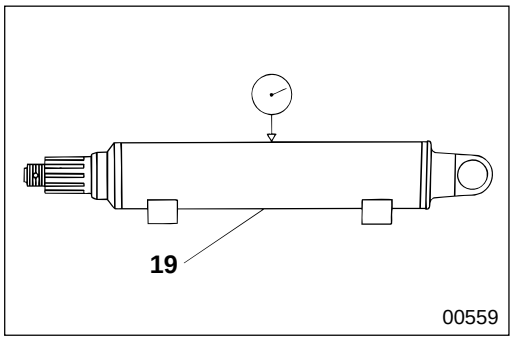
13 **Installation of oil seal**

- Apply grease to lip area **A** of oil seal **13** and install in the direction as illustrated.
- Install oil seal **13** flush with the end of center bearing case **18**.



15 **Packing grease in center bearing**

Pack grease into the area that houses ball bearings **A** of center bearing **15**.



19 **Bend of front propeller shaft**

Measure bend of front propeller shaft **19** at its center. If the measured value is higher than the limit, correct or replace it.

CAUTION

Be sure to check for cracks at the welded area after straightening has been done by means of a press.

NOTE

To measure the bend of front propeller shaft 19, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

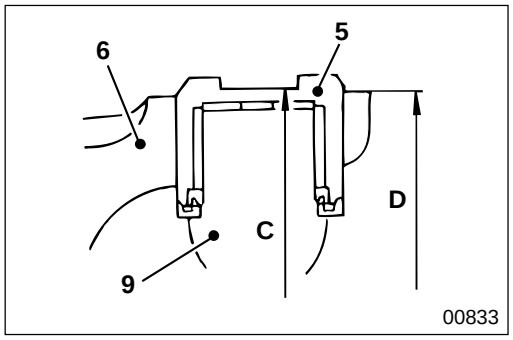
19	Supply via grease nipple	Wheel bearing grease [NLGI No.2 (Li soap)]	Pack until grease overflows from relief valve

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
5	Spider assembly rest A 	03724-13000	Press-fitting of needle bearing
5	Spider assembly rest B 	03724-14000	Press-fitting of needle bearing
10	Socket wrench 	44490-44101	Removal and installation of companion flange nut (Commercially available equivalent can be used)
20	Gear puller 	MH061102	Removal of center bearing assembly

https://truckmanualshub.com/



◆ Service procedure

● Inspection before disassembly

Clearance in axial direction for spider

Measure the clearance of needle bearing **5** (shim adjustment clearance = **D** – **C**). If the measured value is higher than the standard value, adjust it by changing the thickness of shim **4**.

- Available shim thicknesses

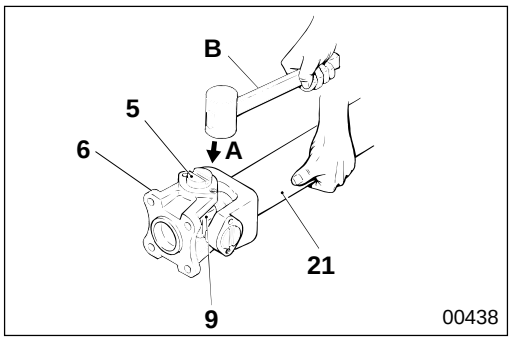
Part name	Thickness
Shim A	0.1 mm {0.0039 in.}
Shim B	0.2 mm {0.0079 in.}

CAUTION⚠

Make sure that shim 4 does not protrude above the surface of flange yoke 6 or needle bearing 5 will seize up.

NOTE

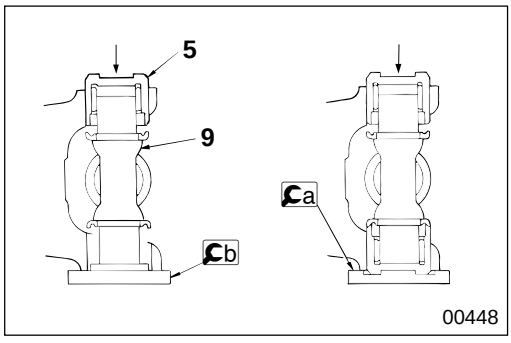
For shim 4, it is recommended that you use shims with the same thickness on both ends to ensure balanced revolution.



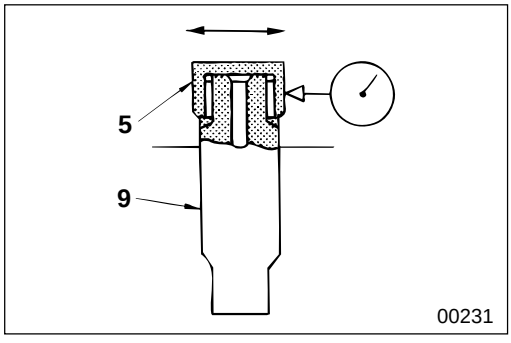
5 **Needle bearing**

[Removal]

- Put alignment marks on needle bearing **5** and spider **9**.
- Put alignment marks across flange yoke **6** and front propeller shaft **21**.
- Hit the yoke lightly at shoulder area **A** so that needle bearing **5** bounces out due to reaction.
  B : Mallet



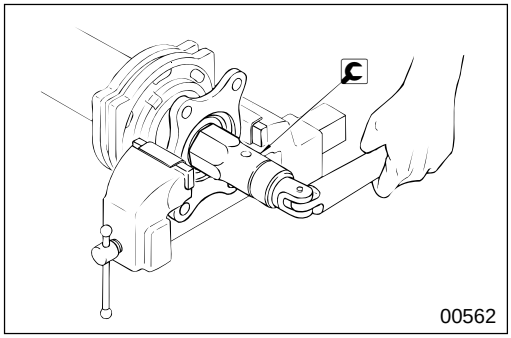
[Installation]



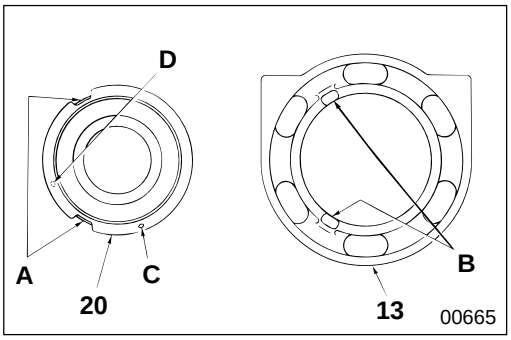
5 **9** **Clearance between needle bearing and spider**

Measure the play towards the diameter direction between needle bearing **5** and spider **9**. If the measured value is higher than the limit, replace with universal joint spider kit.

https://truckmanualshub.com/



10 **Removal and installation of nut**

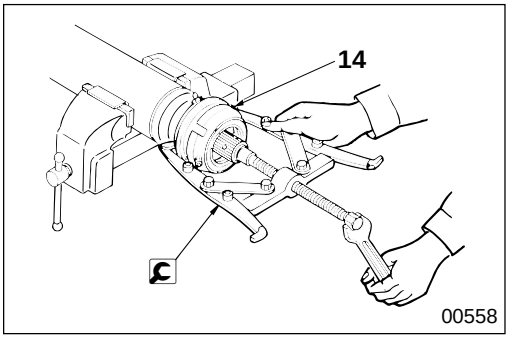


13 **Installation of cushion rubber**

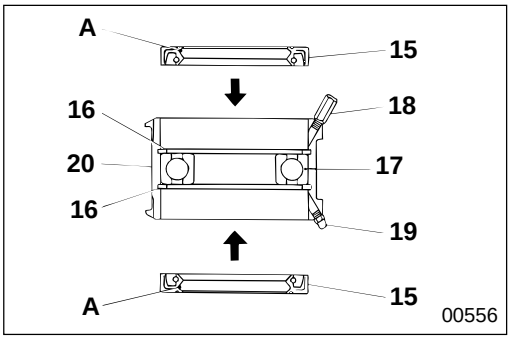
- Align part **A** of center bearing case **20** with part **B** of cushion rubber **13**, and fit them together. If it is difficult to fit them together, use some soap water to make the job easier.

  C : Relief valve mounting hole
  D : Grease nipple mounting hole

- Assemble center bearing case **20** so that grease nipple mounting hole **D** faces downward.

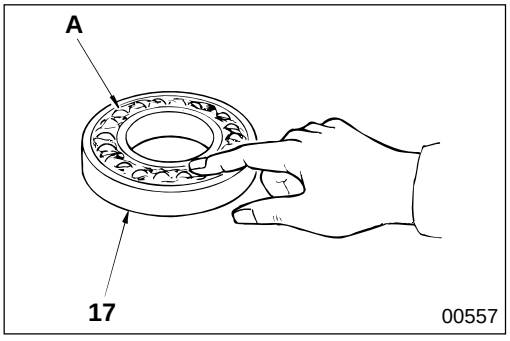


14 **Removal of center bearing housing**



15 **Installation of oil seal**

- Apply grease to lip area **A** of oil seal **15** and install in the direction as illustrated.
- Install oil seal **15** flush with the end of center bearing case **20**.

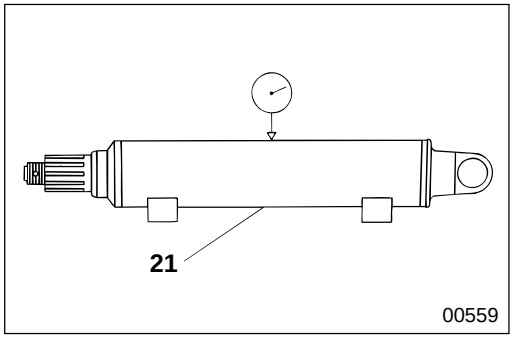


17 **Packing grease in center bearing**

Pack grease into the area that houses ball bearings **A** of center bearing **17**.

https://truckmanualshub.com/

FRONT PROPELLER SHAFT < P10 >



21 **Bend of front propeller shaft**

Measure bend of front propeller shaft **21** at its center. If the measured value is higher than the limit, correct or replace it.

CAUTION

Be sure to check for cracks at the welded area after straightening has been done by means of a press.

NOTE

To measure the bend of front propeller shaft 21, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

https://truckmanualshub.com/

Adjustment after Assembly

(1) After any correction has been made of propeller shaft deflection, or replacement of flange yoke and universal joint, adjust the amount of balance of completed propeller shaft assembly on a balancing machine, and make adjustment by installing a balance piece(s) so that the amount comes within the permissible limit.

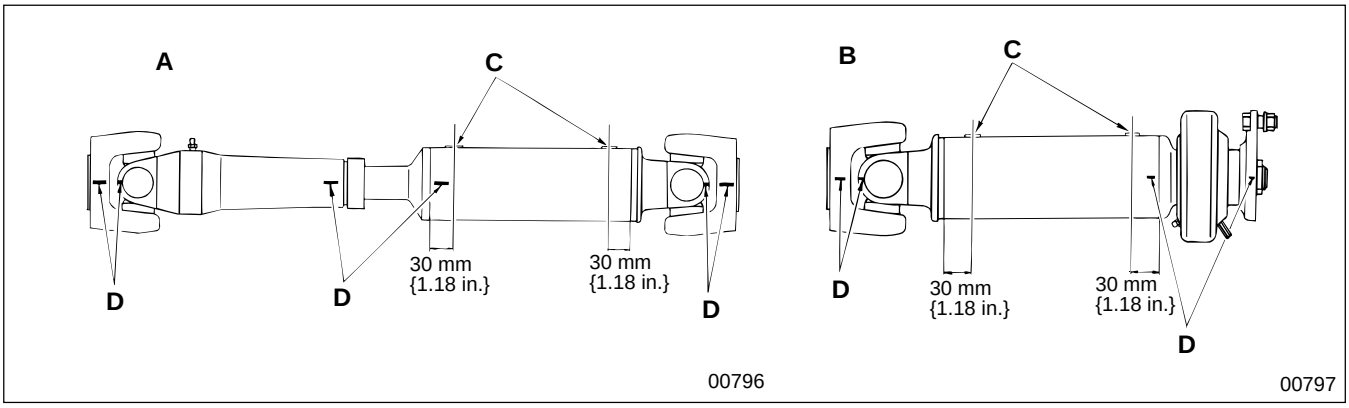
(2) There are two methods of correcting dynamic balance: the polar coordinate system method, and the 90-degree component force method.
Polar coordinate system method: P4, P8, P10
90-degree component force method: P10

(3) Permissible amount of unbalance
0.49 N·cm {0.0036 lbf.ft, 50 gf·cm}/1600 rpm (Pipe outer periphery)

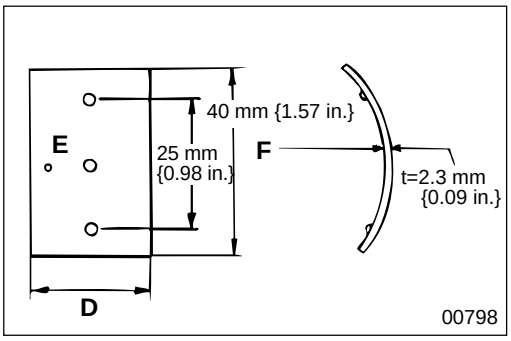
NOTE
When adjusting a propeller shaft with a large amount of deflection, the 90-degree component force < P10 > method is preferred since this method requires a smaller number of balance pieces.

(4) Method of correction by way of polar coordination method

- Balance piece attachment point



A : Rear propeller shaft
B : Front propeller shaft
C : Balance piece attachment point
D : Aligning mark



- Balance pieces available

Part name	P4	P8, P10	Mass g {oz}	Dimension D mm {in.}
Balance piece	G	G	10 {0.35}	14 {0.55}
Balance piece	A	A	20 {0.71}	28 {1.10}
Balance piece	B	B	40 {1.41}	55.7 {2.19}
Balance piece	C	C	60 {2.36}	83.5 {3.29}
Balance piece	H	—	30 {1.06}	42 {1.65}

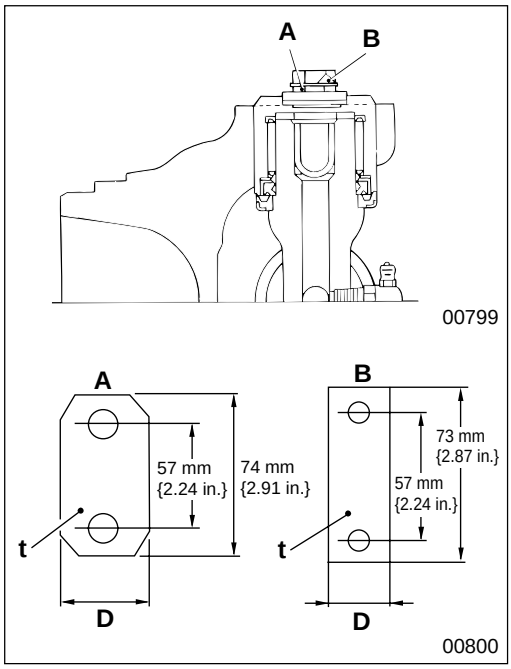
E : Piece punch mark
F : R45 mm {1.77 in.} (R41.3 mm {1.63 in.} only for P8 and P10 balance piece G)

NOTE
- **Maximum balance piece allowed for one point is 120g {4.23 oz}.**
- **Use a combination that keeps balance pieces to the minimum.**

https://truckmanualshub.com/

BALANCING PROPELLER SHAFT

(5) Correction using 90-degree component force method



● **Installation of balance pieces**

Alignment marks are the same as for the polar coordinate system. P25-33

A : Balance piece
B : Lock plate

- Available lock plates and balance pieces

Model	Part name	Mass g {oz.}	Dimension D mm {in.}	Plate thickness t mm {in.}
P10	Lock plate	8 {0.28}	18 {0.71}	0.8 {0.031}
	Balance piece A	20 {0.71}	25 {0.98}	1.6 {0.063}
	Balance piece B	35 {1.23}	21.6 {0.85}	3.2 {0.13}
	Balance piece C	50 {1.76}	32.2 {1.27}	3.2 {0.13}

NOTE

- **Maximum balance piece allowance for one point is 120 g {4.23 oz}.**
- **Use a combination that keeps the number of balance pieces to the minimum.**

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Adjustment of Wheel Alignment

Service standards

Unit : mm {in.}

Location	Maintenance item			Standard value	Limit	Remedy
—	Wheel alignment	Toe-in (with tires on the ground)		0±1 {0±0.039}	—	Adjust
		Camber	FK	1°30'±1°00'	—	Adjust
			FM	1°00'±1°00'	—	Adjust
		Caster		$2°30'^{+1°30'}_{-1°00'}$	—	Adjust
		Kingpin inclination angle		7°00'	7°00'±30'	Replace

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

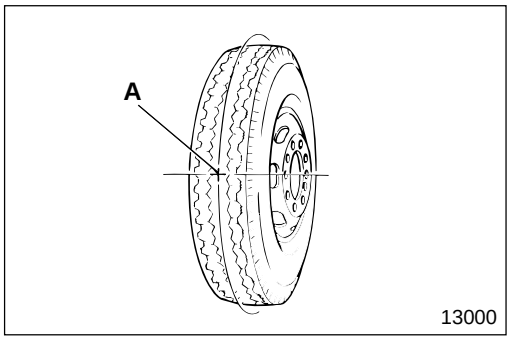
Location	Parts to be tightened		Tightening torque	Remarks
1	Nut (Tie rod end clamp fastening)	FK	78 {58, 8}	Wet
		FM	78 {58, 8}	—

NOTE

- **Measure the wheel alignment when the vehicle is empty and level.**
- **Be sure that each part of the front axle has been serviced perfectly before adjusting the wheel alignment.**

Before adjusting the wheel alignment, check for the following faults:

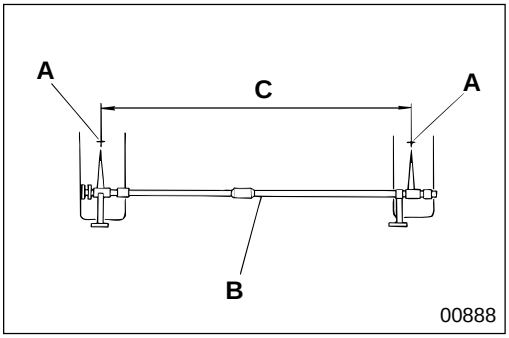
- Play in front wheel hub
- Play or looseness in kingpin
- Play or looseness in the joint between the tie rod and the knuckle arm
- Looseness of any fasteners
- Fatigued or damaged leaf springs
- Incorrect tire pressure
- Incorrect power steering booster backlash



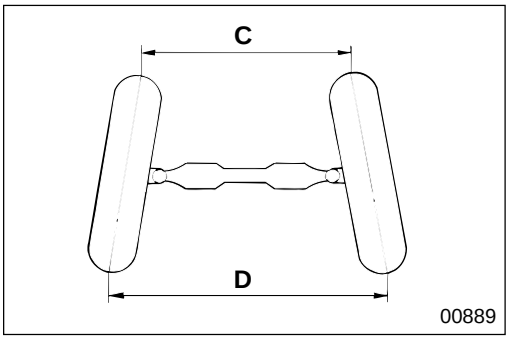
(1) Measurement and adjustment of toe-in

- Point the front wheels exactly forward.
- Put mark **A** on the left and right front tires at the height of front wheel axis and in the middle of the tire width.

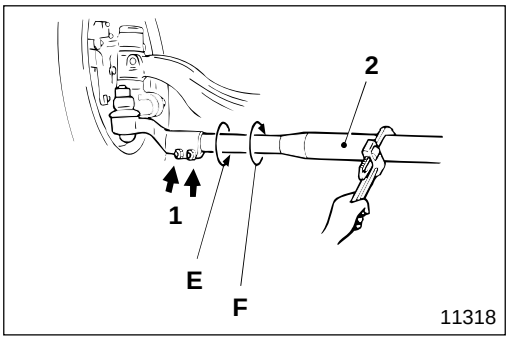
https://truckmanualshub.com/



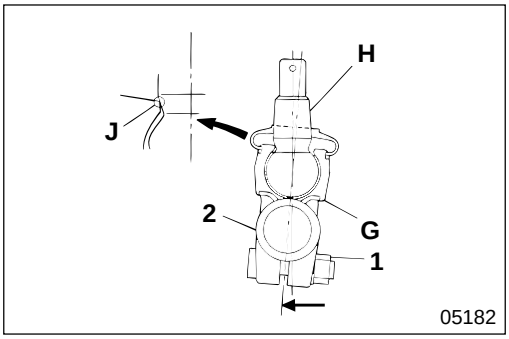
- Align the two points of toe-in gauge **B** to the respective marks **A** on the front tires. Measure the distance **C** between the marks at the front of the vehicle.



- Rotate the tires 180° and measure distance **D** between the marks at the rear of the vehicle with the tires on the ground.
- Check if the difference between distances **C** and **D** is within the standard value.

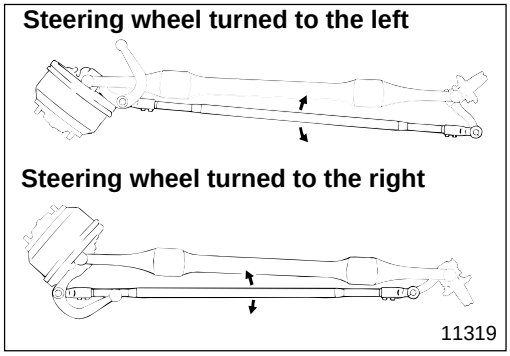


- If the measured value deviates from the standard value, with the tires pointed forward, loosen all four left and right nuts **1**.
- Adjust the toe-in to the standard value by turning tie rod **2** with a pipe wrench.
  E : When adjusting to the toe-out direction
  F : When adjusting to the toe-in direction
  (★ : If tie rod **2** does not swing after the adjustment on 🕮 P26-8, redo from this item.)



- Hold down tie rod **2** toward the front or rear of the vehicle so that left and right tie rod ends **G** are in contact **J** with ball studs **H** at the same time. In this state tighten four nuts **1**.
- When tightening nuts **1**, do not let tie rod ends **G** move toward the front or rear of the vehicle.
- When you are working on your own: first tighten nut **1** on one tie rod end **G**, then tighten the nut on the other tie rod end. When you tighten the nuts, make sure you hold down tie rod **2** towards the same direction each time.

https://truckmanualshub.com/

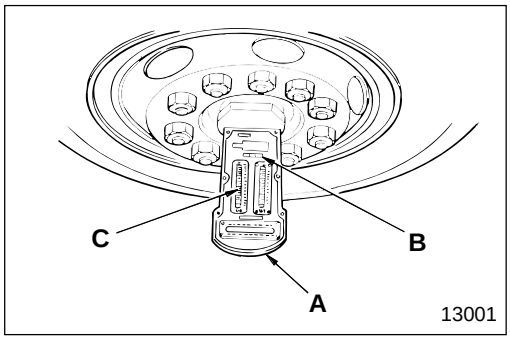


- After adjustment, turn the steering wheel fully to the left until the knuckle stopper bolt is hit. In this state, shake tie rod **2** to check that you can move it toward the front or rear of the vehicle.
  Carry out the same inspection on the right side.
  (Movability of the tie rod indicates that tie rod ends **G** are in contact with ball studs **H** at the same time.)

WARNING⚠

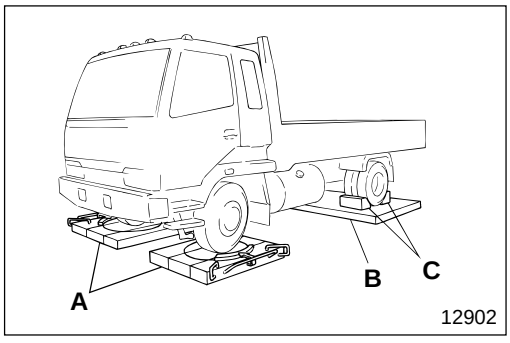
Be very careful that your hand, or anything else, is not caught due to the movement of the tie rod when the steering wheel is turned left and right.

- If tie rod **2** does not swing, redo the procedure from the item marked ★. 🕮 P26-7



(2) Measurement of camber

- Point the front wheels exactly forward.
- Remove the wheel hub caps < FK > or the wheel hub covers < FM >.
- Wipe off grease from the knuckle end, and attach camber/caster /kingpin gauge **A** to the front wheel hub.
- While keeping the bubble in level **B** centered, measure the camber angle by reading the scale mark at the center of the bubble on camber scale **C**. Follow this procedure to measure the camber angles on the left and right sides.



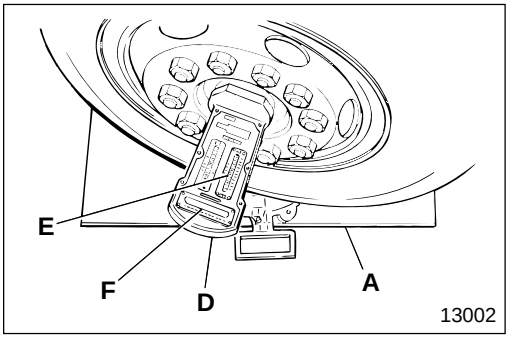
(3) Measurement of caster and kingpin inclination angle

- Align turning radius gauges **A**. Prepare a platform **B** having the same height as the turning radius gauges and place the platform under the rear wheels so that the vehicle is kept level.
- Keep turning radius gauges **A** locked.
- Jack up the vehicle and set the left and right front wheels so that the ground contact area of both front tires and the turntables of turning radius gauge **A** meet at their respective centers.

WARNING⚠

- **After jacking up the vehicle, chock the rear wheels securely with chocks C.**
- **Do not remove chocks C until the entire operation is completed.**

https://truckmanualshub.com/



- Unlock turning radius gauge **A**, and set the scale to 0°.
- As in measuring camber explained previously, attach camber/caster kingpin gauge **D** tightly to the front wheel hub and keep the bubble centered.
- Apply the brake to the front wheels and turn the steering wheel slowly from the 0° point on the scale of turning radius gauge **A**, until direction changes 20° to the left for the left front wheel and 20° to the right for the right front wheel.

NOTE

It is not possible to obtain an exact reading of camber unless the brake is applied to the front wheels because the tires might rotate slightly.

- At the 20° point, align the bubbles in caster scale **E** and kingpin scale **F** to 0° by turning the adjuster.

NOTE

Kingpin scale F has scales for left and right; use the left scale when adjusting the left wheel, and the right scale when adjusting the right wheel.

- Turn the steering wheel slowly until the left front wheel changes its direction 20° to the right, or until the right front wheel changes its direction 20° to the left, past the 0° point of turning radius gauge **A** scale. At this point read the scale marks at the center of the bubbles on caster scale **E** and kingpin scale **F**. The scale marks indicate the caster and kingpin inclination angles.

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Adjustment of Steering Angle

Service standards

Location	Maintenance item			Standard value	Limit	Remedy
—	Steering angle	Inside (Outside : reference)	FK617	43° (33°57')	—	Adjust
			FM617	40° (34°38')	—	Adjust
			FM657	44° (35°44')	—	Adjust

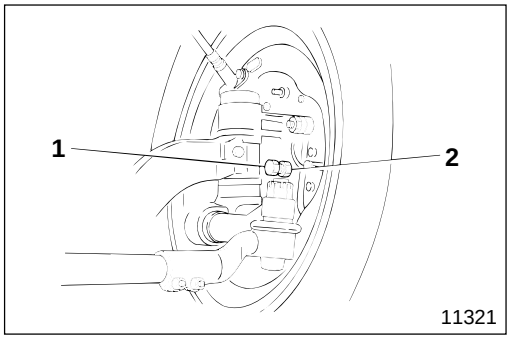
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Lock nut (Knuckle stopper bolt fastening)	71±12 {52±9, 7.25±1.25}	—

NOTE

Be sure that wheel alignment is adjusted perfectly before adjusting the steering angle.

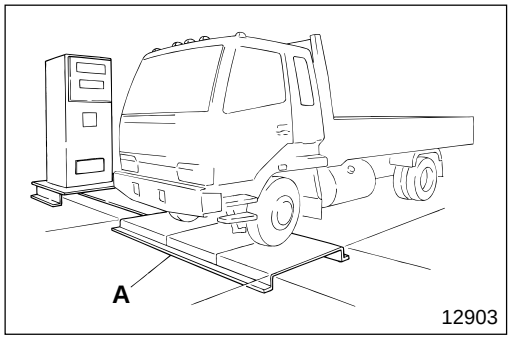


- To adjust the steering angle, set the turning radius gauges and platform in the same way as for caster and kingpin inclination angle measurement.
- Turn the steering wheel to the left or right completely, and from the position where the turning radius gauge is aligned to 0°, adjust knuckle stopper bolt **1**. Adjust so that the steering angle is within the standard inside steering angle value, to the left for the left front wheel, and to the right for the right front wheel. Then, tighten lock nut **2** at specified torque.

Measurement of Side Slip

NOTE

Be sure that wheel alignment is adjusted fully before measuring side slip.



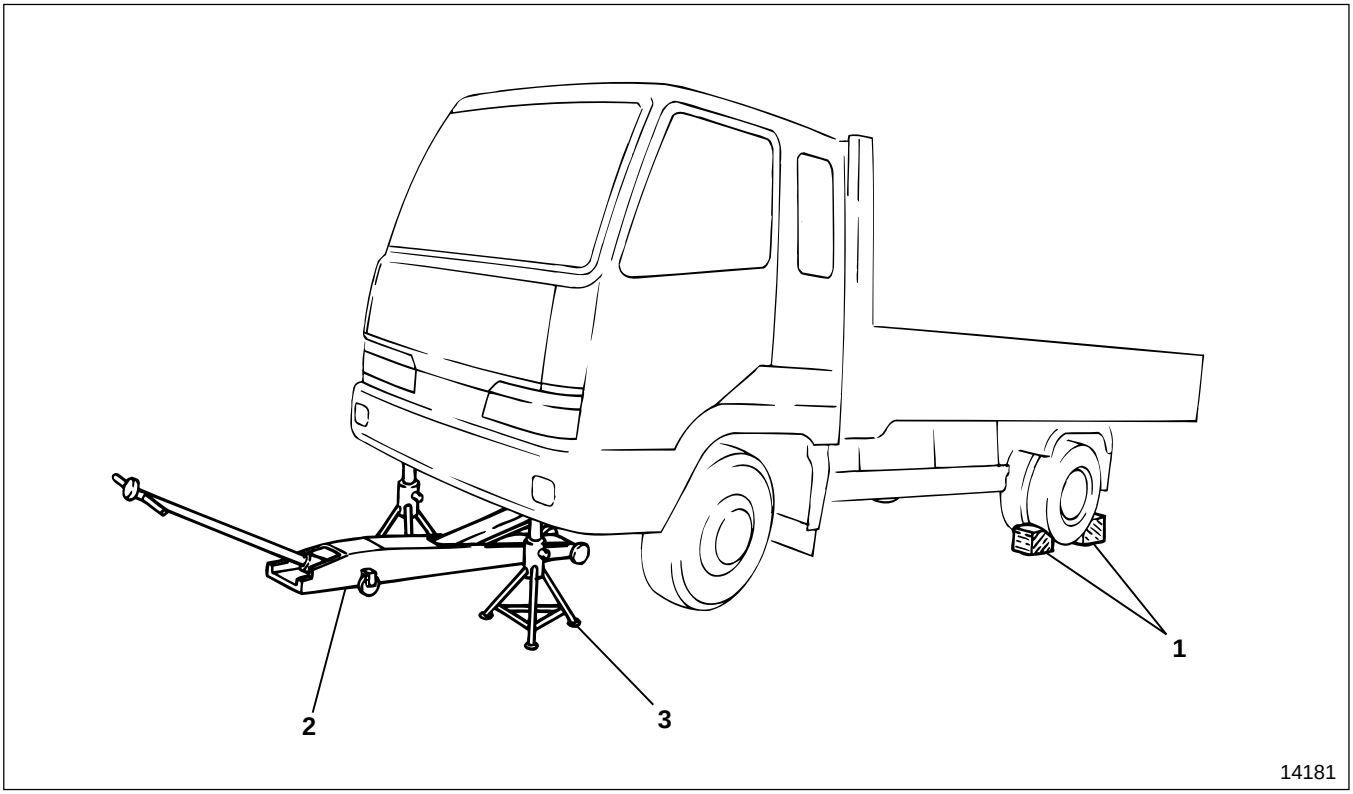
- Point the front wheels exactly forward.
- Maintain this position and slowly move vehicle forward, over side slip tester **A**, as slowly as possible.

NOTE

Make sure, when measuring side slip, that the wheels point exactly forward when the vehicle passes over side slip tester A. Do not allow the wheels to veer from side-to-side.

- The side slip is indicated by side slip tester **A** after the vehicle has passed through the tester. Readjust wheel alignment if slippage is 3 mm {0.12 in.} or more per meter {3.28 ft.}.

https://truckmanualshub.com/



● **Work sequence before removal**

1 Place wheel chocks.
2 Jack up the front axle with a garage jack.
3 Support the front frame on rigid racks.

WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

https://truckmanualshub.com/

WHEEL HUB AND BRAKE DRUM

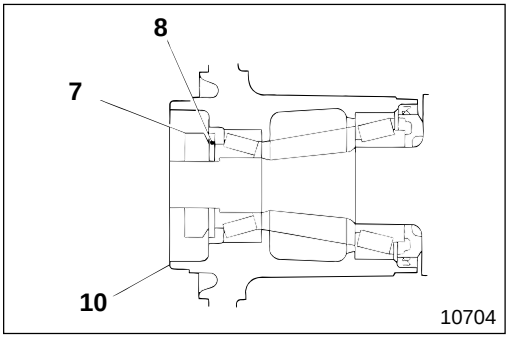
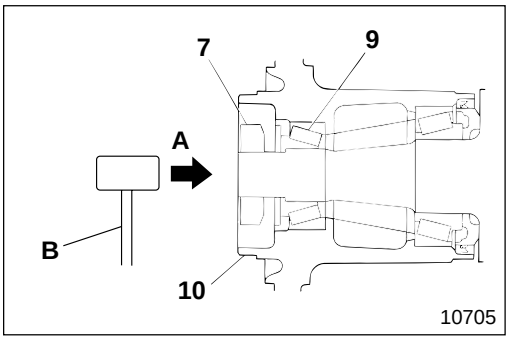
◆ Service procedure



● Starting torque of wheel hub drum

[Adjustment]

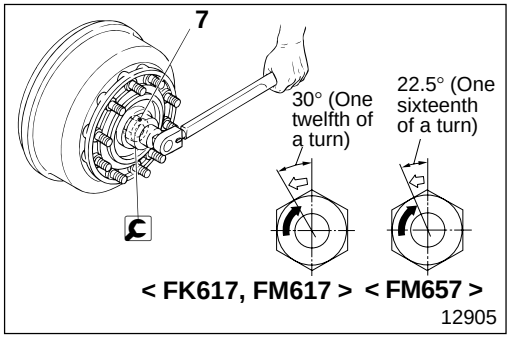
- Install lock washer **8** and lock nut **7**, then tighten the lock nut at specified torque while turning wheel hub and brake drum assembly **10** several times.
- Next, slacken off the lock nut fully until a clearance is obtained between lock nut **7** and lock washer **8**.



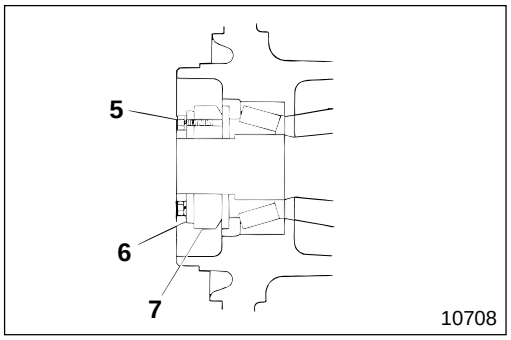
- Return outer bearing **9** toward lock nut **7** by hitting illustrated part **A**, while turning wheel hub and brake drum assembly **10** again.
  B : Copper-headed mallet

https://truckmanualshub.com/

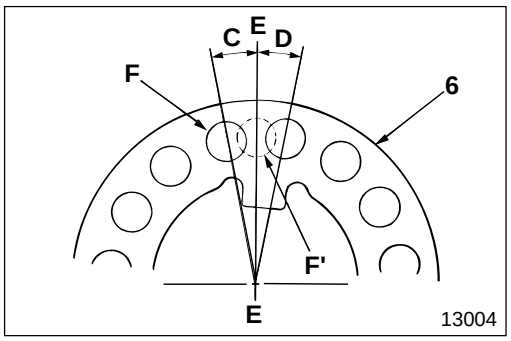
WHEEL HUB AND BRAKE DRUM



★ • After retightening lock nut **7** at specified torque, slacken it off by 30° (one twelfth of a turn) for < FK617, FM617 >, or by 22.5° (one sixteenth of a turn) for < FM657 >.
(★ : If there is any deviation found when you measure the tangential force, carried out following the procedure on 🕮 P26-17, repeat the work.)

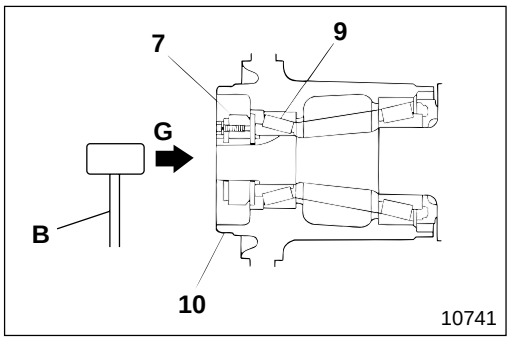


- Install lock plate **6**.
- Make sure that the bolt mounting holes of lock plate **6** and lock nuts **7** align.
- Tighten mounting bolts **5** at specified torque.



- If the mounting holes of lock plate **6** and lock nuts **7** do not align, align as follows:

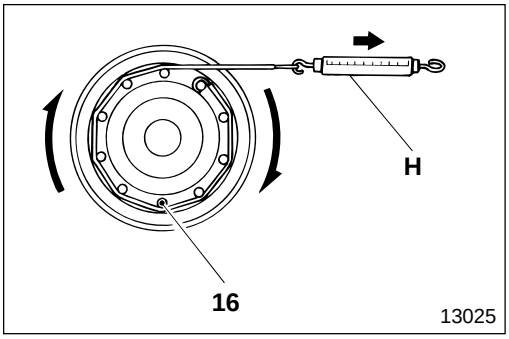
Hole position of lock nut	How to align hole of lock plate
Within range **C**	Loosen lock nuts to align holes
Within range **D**	Turn over lock plate and loosen lock nut to align holes
On **E**–**E** line	Turn over the lock plate to align the holes (Lock nut hole position changes from **F'** to **F**)



- To slide outer bearing **9** towards lock nut **7**, hit end **G** two or three times with a copper-headed mallet, while turning wheel hub and brake drum assembly **10**.
B : Copper-headed mallet

https://truckmanualshub.com/

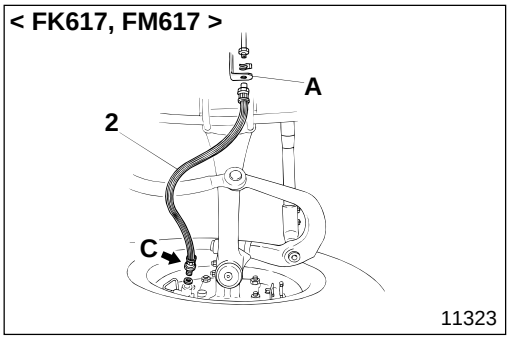
- Once again, hit one end of the knuckle two or three times with a soft-faced mallet while turning the hub and drum assembly so that the outer bearing fits tightly to the lock nut.



[Measurement]
- Fasten spring balance **H** to hub bolt **16** and measure the tangential force.
- If the measured tangential force is the standard value, the starting torque conforms to the standard value.
- Make sure that the starting torque is smaller than the tangential force.
- If the tangential force deviates from the specified value, adjust the starting torque again.
- If the measured value deviates from the specified value, redo the procedure from the item marked ★. P26-16
- If any fault is found after adjustment, replace outer bearings **9**, **13** and inner bearings **12**, **18**.

NOTE
- **Measure the starting torque when oil seal 11 has been installed.**
- **Make sure that the brake lining and brake drum 15 do not drag before measurement.**

< FK617, FM617 >

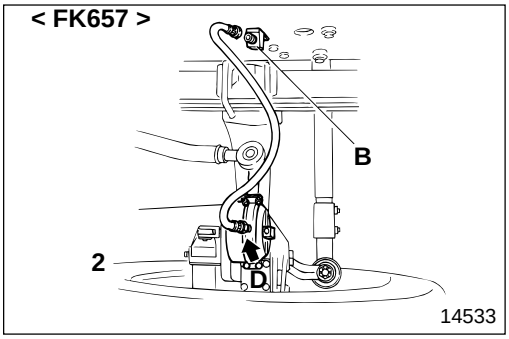


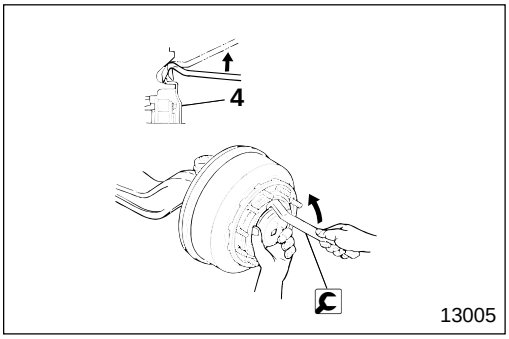
2 Removal and installation of brake hose

First remove brake hose **2** from bracket **A** or connector **B** (on the frame), then remove the brake hose from wheel brake **C** or front brake chamber **D**. For installation, follow this procedure in reverse.

CAUTION ⚠
Make sure that brake hose 2 is not twisted when you install it.

< FK657 >

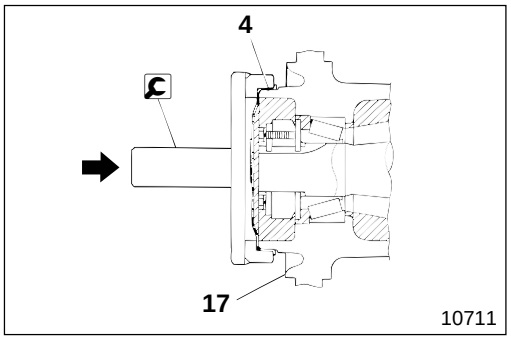




4 Wheel hub cap < FK >

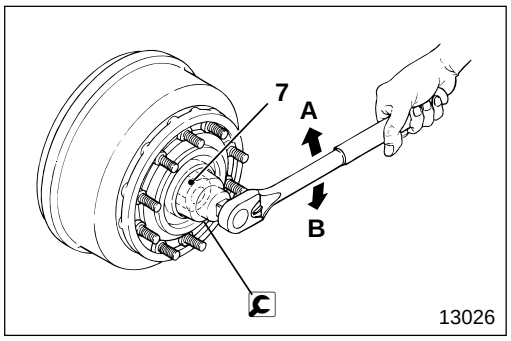
[Removal]

https://truckmanualshub.com/



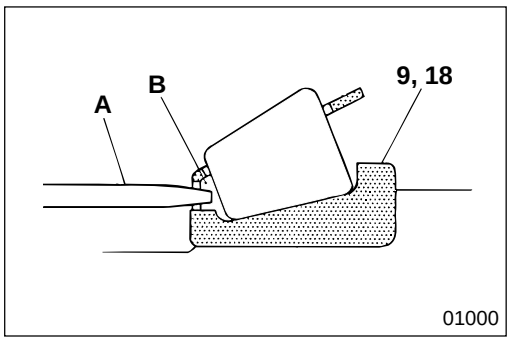
[nstallation]
Pack wheel hub cap **4** with grease, apply sealant to contact surfaces of wheel hub **17**, and press-fit it.

CAUTION
Do not use a hammer, etc. when you install wheel hub cap 4, or you might deform the mating surface, destroying watertightness.



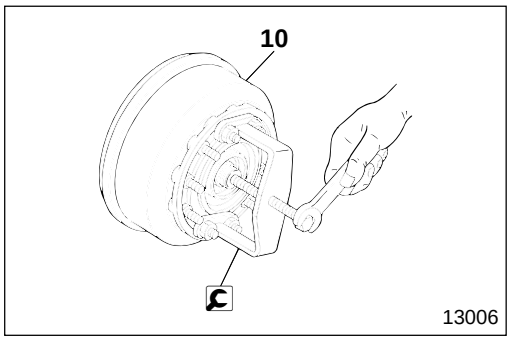
7 **Removal and installation of lock nut**

See adjustment of wheel hub bearing starting torque. P26-15
A : Removal
B : Installation



9 **18** **Packing grease in outer bearing inner race and inner bearing inner race**

A : Grease pump nozzle
B : Between rollers

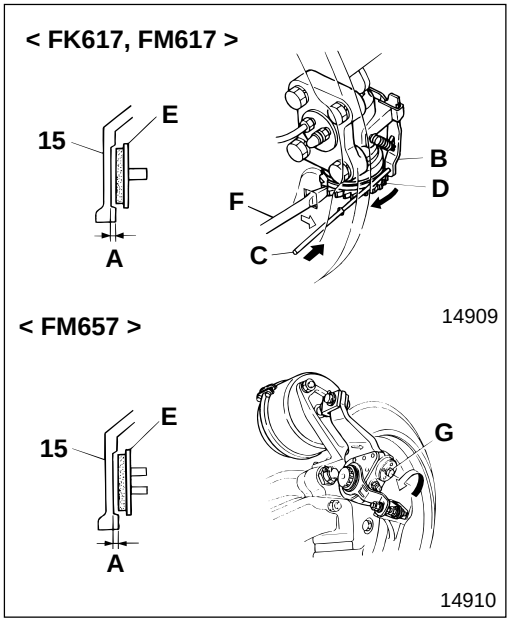


10 **Wheel hub and brake assembly**

[Removal]

CAUTION
Make sure you remove wheel hub and brake drum assembly 10 in a straight line to prevent damage to oil seal 11.

https://truckmanualshub.com/



If wheel hub and brake drum assembly **10** cannot be removed because of stepped wear **A** in brake drum **15**, carry out the following:

< FK617, FM617 >

- Remove the packing plate cover.
- Lift lever **B**.
  C : Wire approximately ø5 mm {0.020 in.}
- Turn adjuster **D** in the opposite direction to the arrow on the packing plate, and expand the clearance between brake drum **15** and brake shoe assembly **E**.
  F : Screwdriver
- Remove wheel hub and brake drum assembly **10**.

< FM657 >

- Turn worm shaft **G** of the automatic slack adjuste counterclockwise, and expand the clearance between brake drum **15** and brake shoe assembly **E**.
- Remove wheel hub and brake drum assembly **10**.

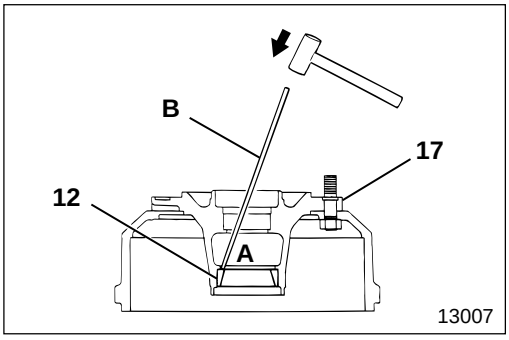
CAUTION

If brake drum 15 is faulty, correct it. Gr 35A, B

[Installation]

After installing wheel hub and brake drum assembly **10**, adjust the brake shoe clearnace.

Gr 35A < FK617, FM617 >
Gr 35B < FM657 >

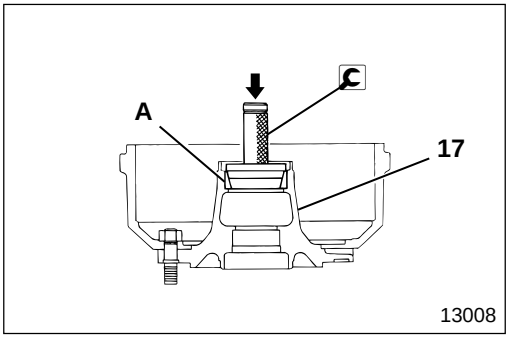


12 **Inner bearing outer race**

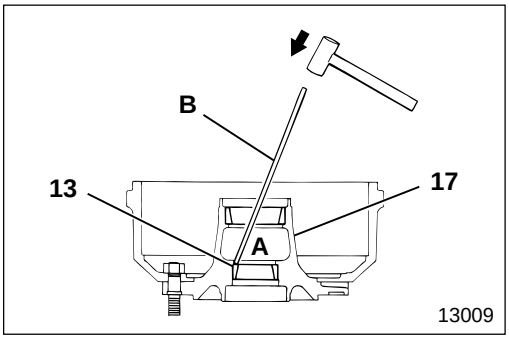
[Removal]

Drive out inner bearing outer race **12** evenly from two indented parts **A** in wheel hub **17**.

B : Pin-punch



[Installation]



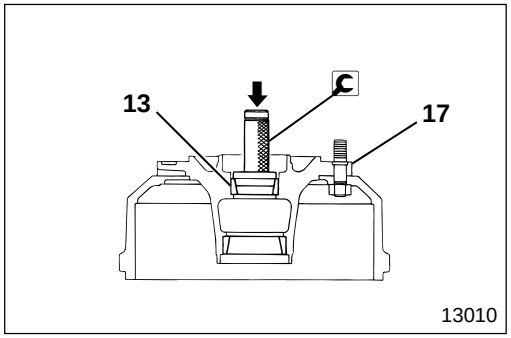
13 **Outer bearing outer race**

[Removal]

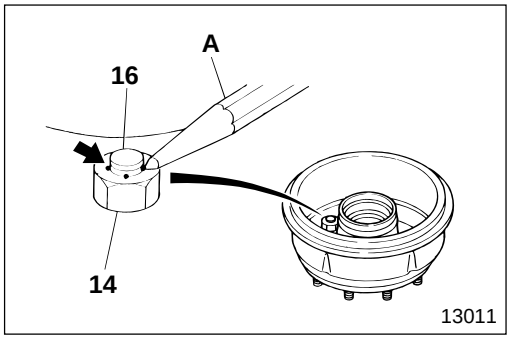
Drive out outer bearing outer race **13** evenly from two indented parts **A** in wheel hub **17**.

B : Pin-punch

https://truckmanualshub.com/

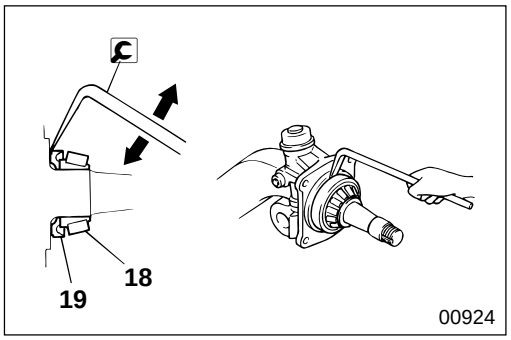


[Installation]



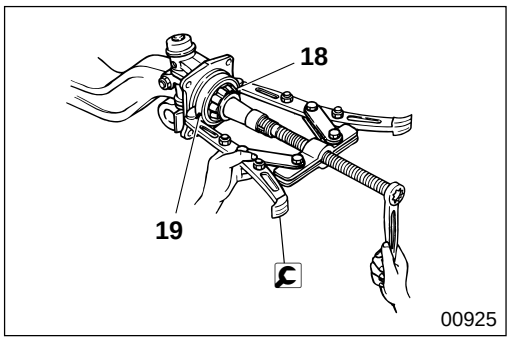
14 **16** **Installation of nut and hub bolts**

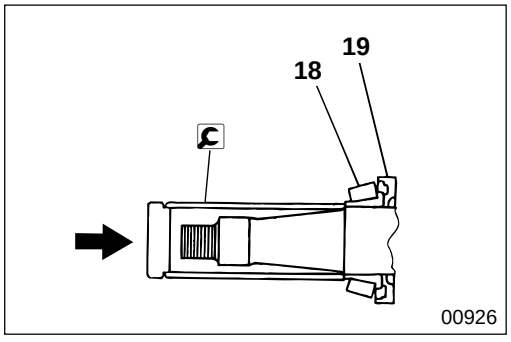
Tighten nut **14** at specified torque, then caulk hub bolt **16** evenly at four points.
A :Punch



18 **19** **Inner bearing inner race and knuckle retainer (Knuckle retainer 19 is installed only on FK617 and FM617.)**

[Removal]





[Installation]

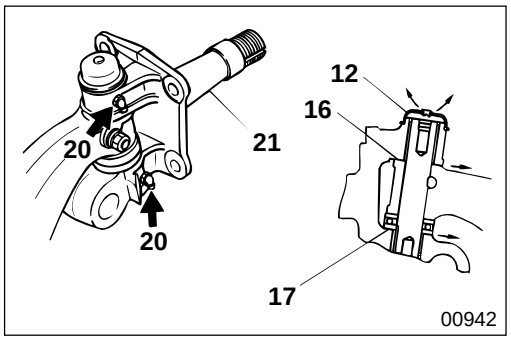
◆ Service procedure

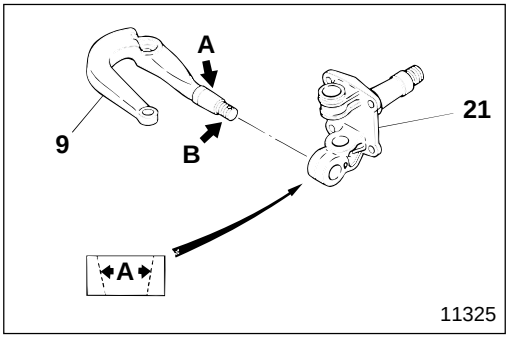


00942

● **Work after assembly**

Supply grease via grease nipple **20** of knuckle **21**. Supply grease until it overflows from the dust plugs of upper cap **12**, thrust washer **16**, and the press side of ball bearing **17**.

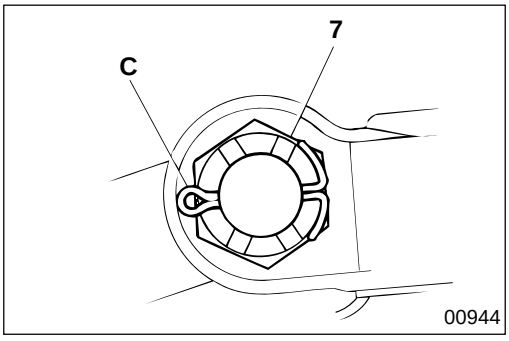
https://truckmanualshub.com/



9 **21** **Installation of knuckle arm and knuckle**

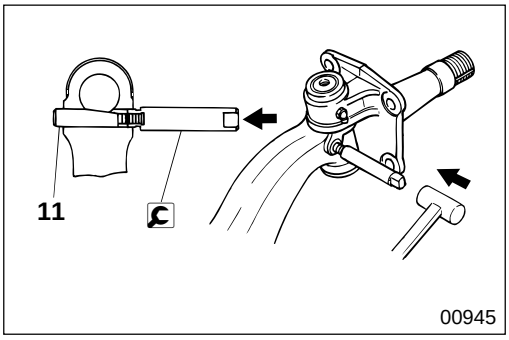
(1) Reassembly of existing knuckle arm 9 and/or knuckle 21

- Evenly polish taper surfaces **A** of knuckle arm **9** and knuckle **21** using emery paper (120 grit or finer), until abrasion traces left by the emery paper are only just visible. For new parts, polishing is not required.
- Clean taper surfaces **A** of knuckle arm **9** and knuckle **21** and thread area **B** of the knuckle arm. (Use a cleaning solvent for acetone color checking or other solvent.)
- Install knuckle arm **9** after applying grease to thread area **B**. (Do not grease the taper surfaces of the knuckle arm and the knuckle.)
- Tighten new nut **7** at specified torque. Without loosening the nut, insert split pin **C** into the pin hole to lock the nut.

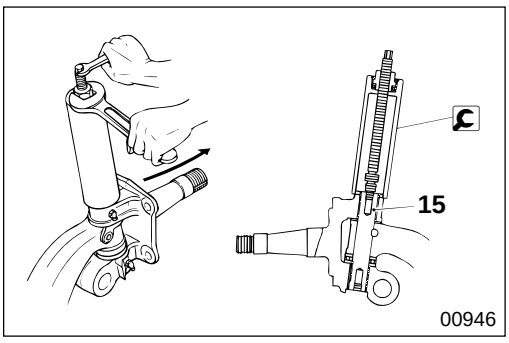


(2) Installation of new knuckle arm 9 and knuckle 21

- Clean taper surfaces **A**, or thread area **B**, of knuckle arm **9** and knuckle **21**, and install them without greasing.
- Tighten new nut **7** at specified torque. Without loosening the nut, insert split pin **C** into the pin hole to lock the nut.

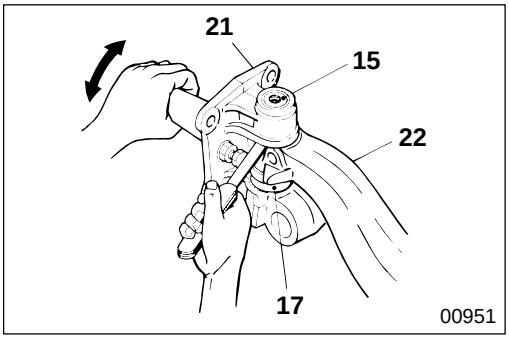


11 **Removal of set bolt**



15 **Removal of kingpin**

- Remove the kingpin cap. Screw the bolt of kingpin puller into the threads of kingpin **15**, and remove the kingpin.

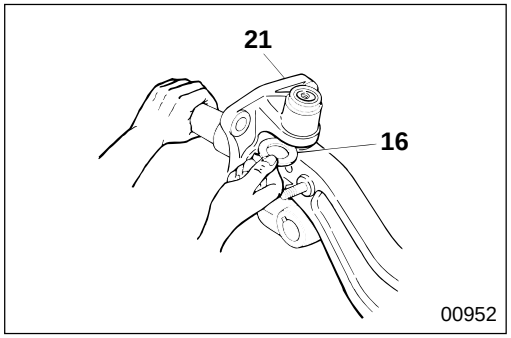


16 **21** **22** **Thrust washer, knuckle, and front axle**

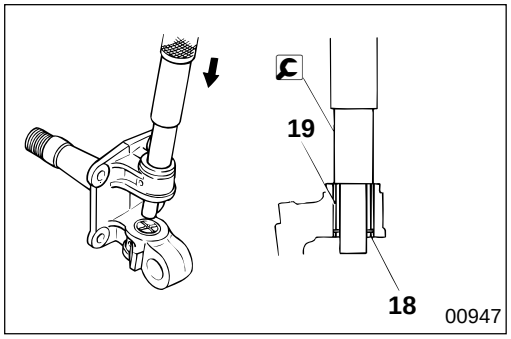
[Inspection]

- Assemble kingpin **15** and bearing **17** temporarily, and turn knuckle **21** a couple of times to smooth its operation.
- Measure the clearance between the upper surface of front axle **22** and the lower part of knuckle **21**.
- If the measured value is higher than the limit, adjust with thrust washer **16**.

https://truckmanualshub.com/

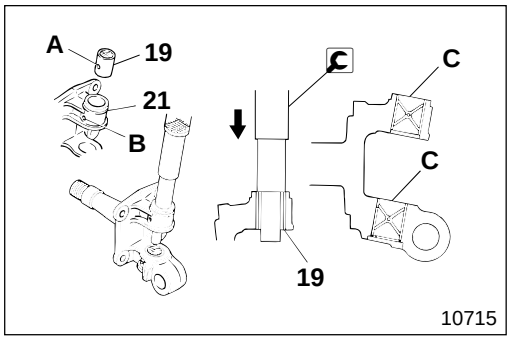


[Adjustment]
- Adjusting thrust washers **16** are available in the following sizes: 2.1 to 2.8 mm {0.083 to 0.11 in.} (eight thicknesses in 0.1 mm {0.0039 in.} increments)
- Be sure to minimize the clearance by selecting appropriate thrust washer **16**.
- Make sure that knuckle **21** moves smoothly after assembly.

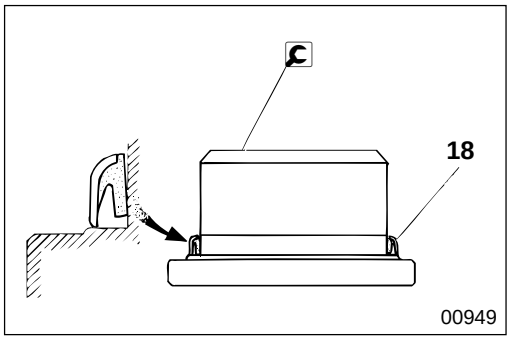


18 **19** **Oil seal and bushing**

[Removal]

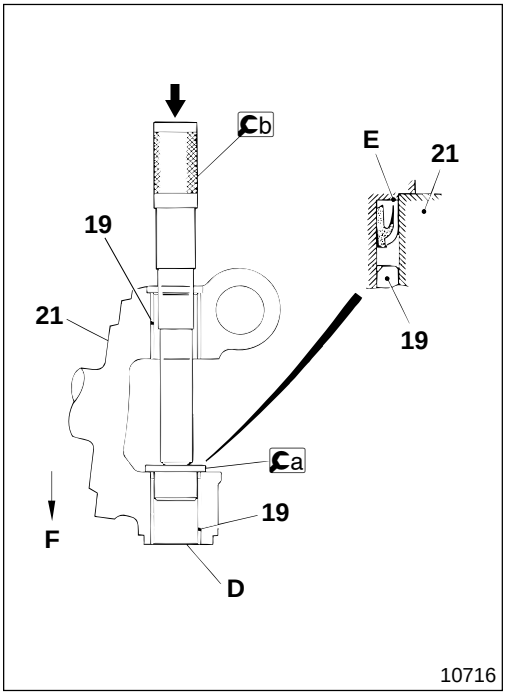


[Installation]
- Press bushing **19** in, with its oil hole **A** aligned to oil hole **B** of knuckle **21**, until end **C** is flush with the knuckle end.



- Apply grease to the lip area of oil seal **18**, and position the oil seal on oil seal installer.

https://truckmanualshub.com/

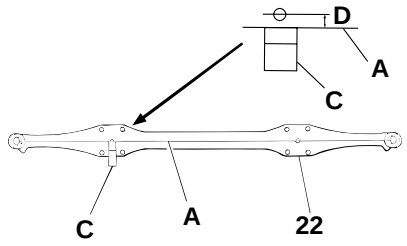


10716

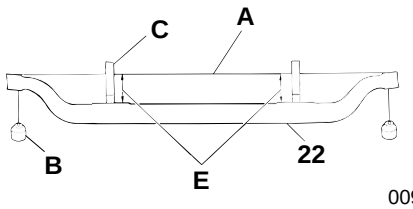
- Next, install a oil seal installer on knuckle **21** in the direction as illustrated.
- Pass b kingpin bushing remover through the kingpin hole and position it on a oil seal installer.
- Hit the head of b kingpin bushing remover until a oil seal installer makes contact with the knuckle.
- Make sure that end **D** of bushing **19** makes contact with knuckle **21** on the same level.
- Make sure that oil seal end **E** does not protrude from knuckle **21**.

F : Upper side of vehicle

< Longitudinal direction >



< Vertical direction >

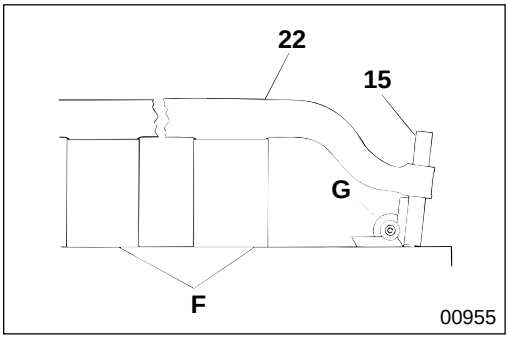


00954

22 Inspection of front axle

(1) Measurement of bend in front axle 22 in longitudinal and vertical directions

- Pass a piece of thread **A** through the kingpin hole of front axle **22** and hang weights **B** on both ends.
- Use square **C** to find the degree of bend in both the longitudinal direction **D** and the vertical direction **E**.
- If the measured value is higher than the limit, replace front axle **22**.



00955

(2) Measurement of kingpin inclination angle

Mount kingpin **15** in front axle **22** as illustrated, and measure the kingpin inclination angle. If the measured value is higher than the limit, replace the front axle.

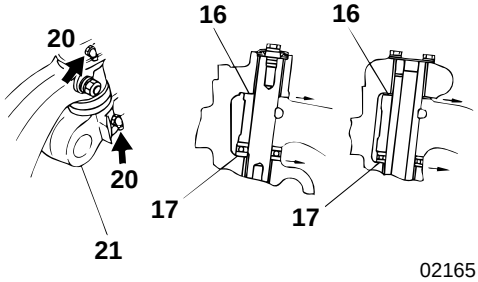
◆ Service procedure

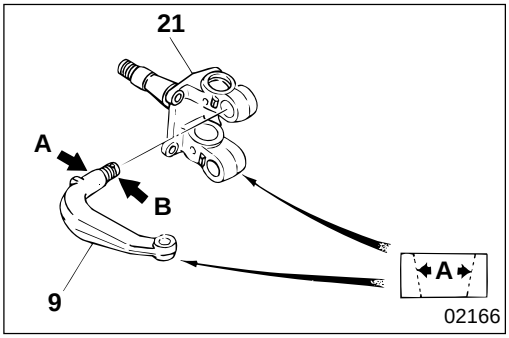


02165

● Work after assembly

Supply grease via grease nipple **20** of knuckle **21**. Supply grease until it overflows from thrust washer **16** and the press side of ball bearing **17**.

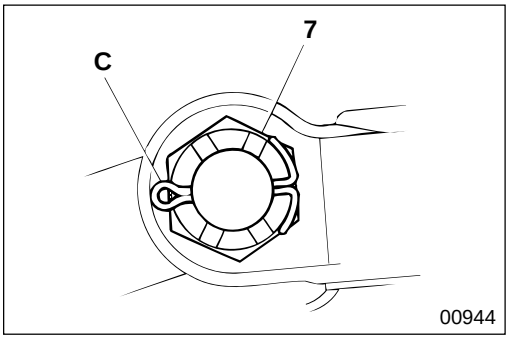
https://truckmanualshub.com/



9 **21** **Installation of knuckle arm and knuckle < FM617 >**

(1) Reassembly of existing knuckle arm 9 and/or knuckle 21

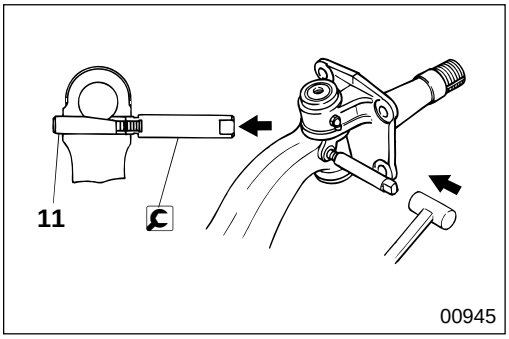
- Evenly polish taper surfaces **A** of knuckle arm **9** and knuckle **21** using emery paper (120 grit or finer), until abrasion traces left by the emery paper are only just visible. For new parts, polishing is not required.
- Clean taper surfaces **A** of knuckle arm **9** and knuckle **21** and thread area **B** of the knuckle arm. (Use a cleaning solvent for acetone color checking or other solvent.)
- Install knuckle arm **9** after applying grease to thread area **B**. (Do not grease the taper surfaces of the knuckle arm and the knuckle.)



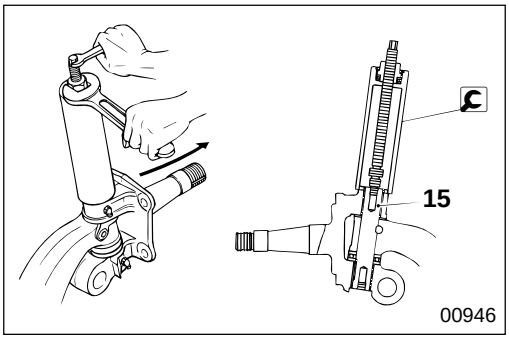
- Tighten new nut **7** at specified torque. Without loosening the nut, insert split pin **C** into the pin hole to lock the nut.

(2) Installation of new knuckle arm 9 and knuckle 21

- Clean taper surfaces **A**, or thread area **B**, of knuckle arm **9** and knuckle **21**, and install them without greasing.
- Tighten new nut **7** at specified torque. Without loosening the nut, insert split pin **C** into the pin hole to lock the nut.



11 **Removal of set bolt**

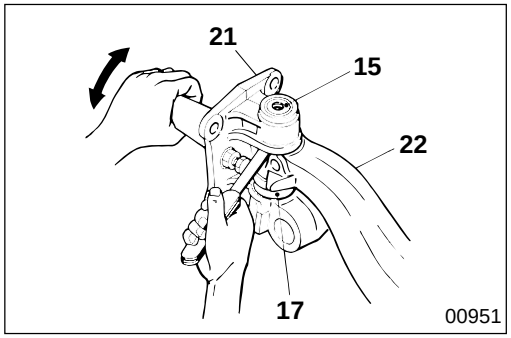


15 **Removal of kingpin**

Remove the kingpin cover and dust seal < FM617 >, or gasket < FM657 >. Screw the bolt of kingpin puller into the threads of kingpin **15**, and remove the kingpin.

https://truckmanualshub.com/

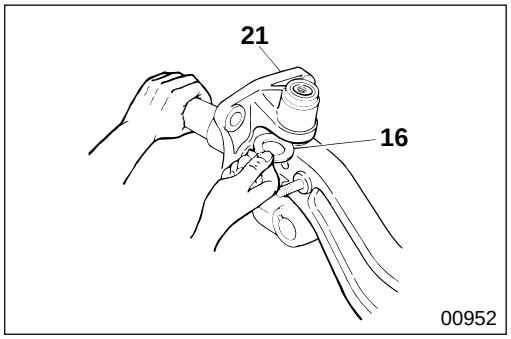
FRONT AXLE, KNUCKLE AND KINGPIN < FM >



16 **21** **22** **Thrust washer, knuckle, and front axle**

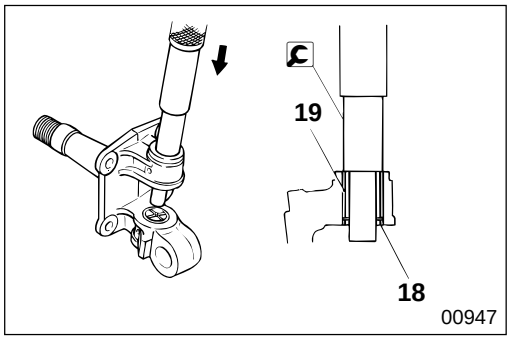
[Inspection]

- Assemble kingpin **15** and bearing **17** temporarily, and turn knuckle **21** a couple of times to smooth its operation.
- Measure the clearance between the upper surface of front axle **22** and the lower part of knuckle **21**.
- If the measured value is higher than the limit, adjust with thrust washer **16**.



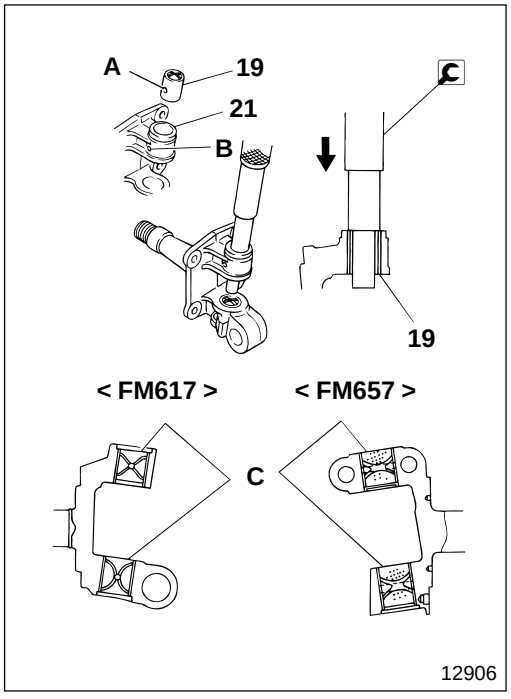
[Adjustment]

- Adjusting thrust washers **16** are available in the following sizes:2.9 to 3.6 mm {0.11 to 0.14 in.} (eight thicknesses in 0.1 mm {0.0039 in.} increments)
- Be sure to minimize the clearance by selecting appropriate thrust washer **16**.
- Make sure that knuckle **21** moves smoothly after assembly



18 **19** **Oil seal and bushing**

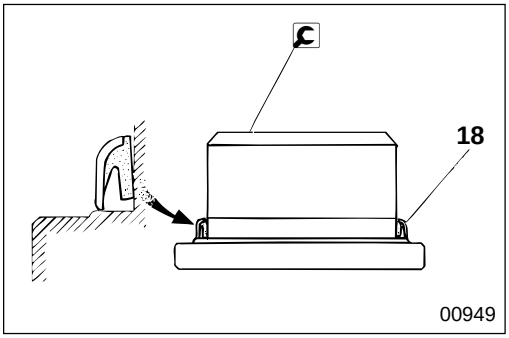
[Removal]



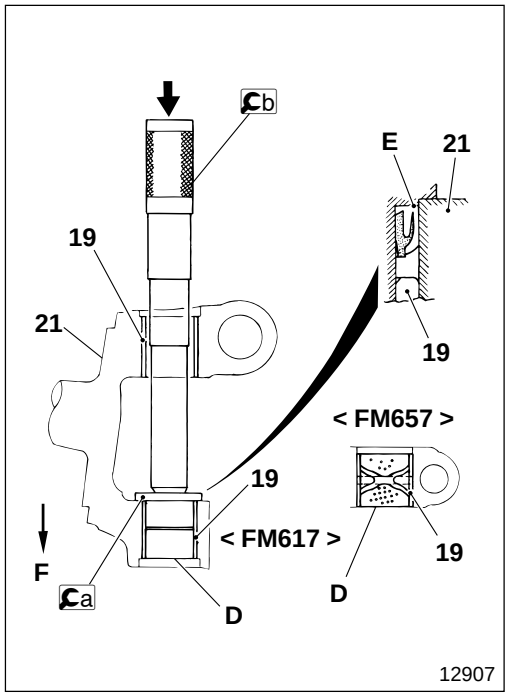
[Installation]

- Press bushing **19** in, with its oil hole **A** aligned to oil hole **B** of knuckle **21**, until end **C** is flush with the knuckle end.

https://truckmanualshub.com/

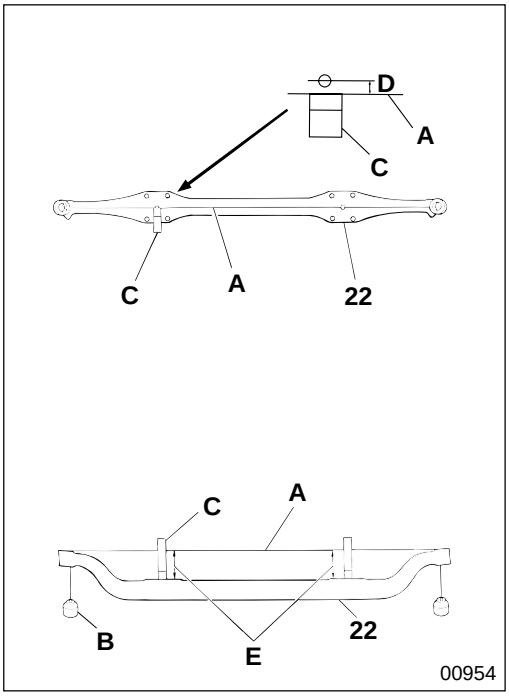


- Apply grease to lip area of oil seal **18**, and position the oil seal on [c] oil seal installer.



- Next, install [a] oil seal installer on knuckle **21** in the direction as illustrated.
- Pass [b] kingpin bushing remover through the kingpin hole and position it on [a] oil seal installer.
- Hit the head of [b] kingpin bushing remover until [a] oil seal installer makes contact with knuckle **21**.
- Make sure that end **D** of bushing **19** makes contact with knuckle **21** on the same level.
- Make sure that oil seal end **E** does not protrude from knuckle **21**.

F : Upper side of vehicle

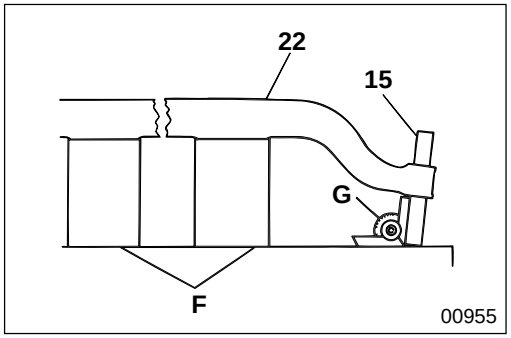


22 Inspection of front axle

(1) Measurement of bend in front axle 22 in longitudinal and vertical directions

- Pass a piece of thread **A** through the kingpin hole of front axle **22** and hang weights **B** on both ends.
- Use square **C** to find the degree of bend in both the longitudinal direction **D** and the vertical direction **E**.
- If the measured value is higher than the limit, replace front axle **22**.

https://truckmanualshub.com/



(2) Measurement of kingpin inclination angle

Mount kingpin **15** in front axle **22** as illustrated, and measure the kingpin inclination angle. If the measured value is higher than the limit, replace the front axle.

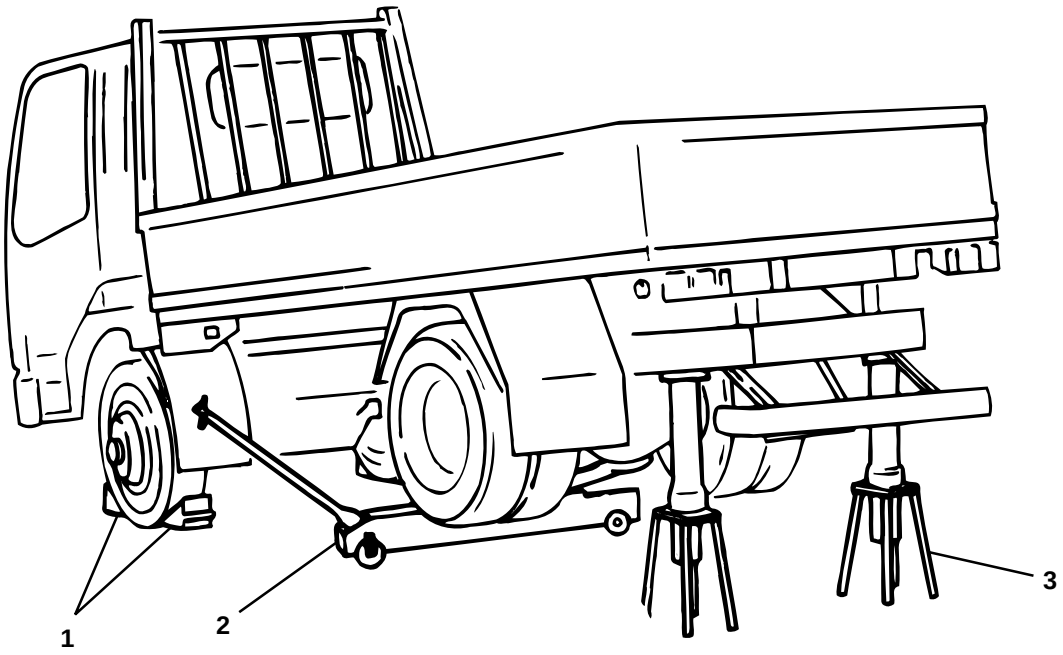
WORK BEFORE REMOVAL AND INSTALLATION OF REAR AXLE



● **Work sequence before removal**

1 Place wheel chocks.
2 Jack up the rear axle using a garage jack.
3 Support the rear frame on rigid racks.

WARNING

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

WHEEL HUB AND BRAKE DRUM

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
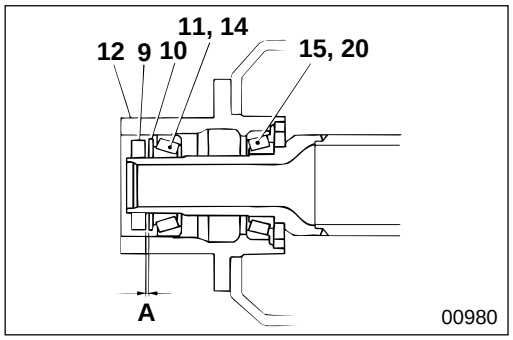
24	Oil seal installer 	< FM > MH062016	Press-fitting of oil seal at axle tube end

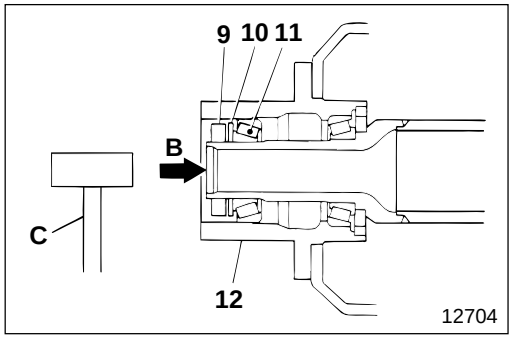
◆ Service procedure

● **Starting torque of wheel hub bearing**

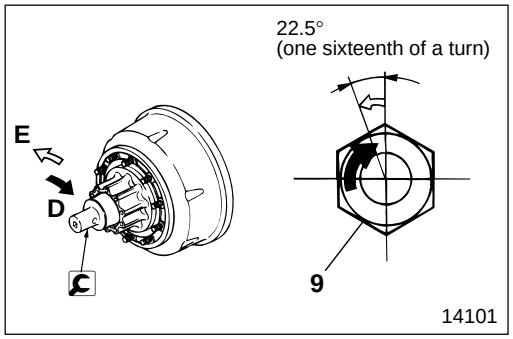


[Adjustment]

- Install lock washer **10** and lock nut **9**.
- Turn wheel hub and brake drum assembly **12** several times to smooth operation of outer bearings **11**, **14** and inner bearings **15**, **20**.
- Tighten lock nut **9** at specified torque.
- Slacken off lock nut **9** to obtain clearance **A** between the lock nut and lock washer **10**.



- To slide outer bearing inner race **11** towards lock nut **9**, hit end **B** of the axle tube two or three times with a mallet, while turning wheel hub and brake drum assembly **12**.
  C : Copper-headed mallet

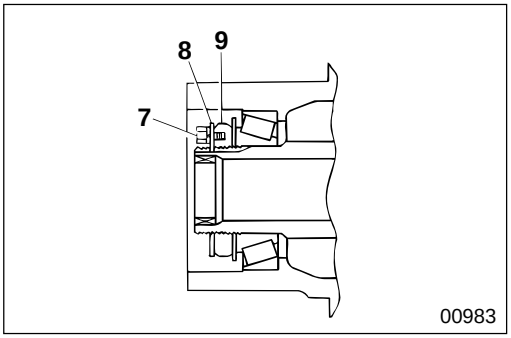


★ • Tighten lock nut **9** at specified torque.
  D : Tightening direction

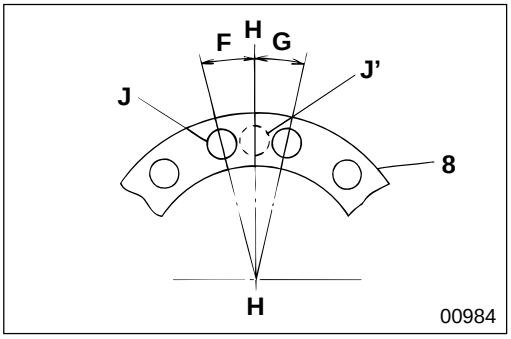
- Slacken off lock nut **9** by 22.5° (one sixteenth of a turn).
  E : Slackening off direction

(★ : If any fault is found when measuring tangential force, redo from this item.)

https://truckmanualshub.com/

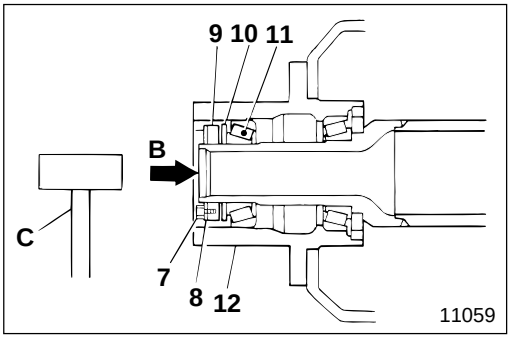


- Install lock plate **8**.
- Make sure that bolt **7** mounting holes of lock nut **9** and lock plate **8** align.
- Tighten bolt **7** at specified torque.

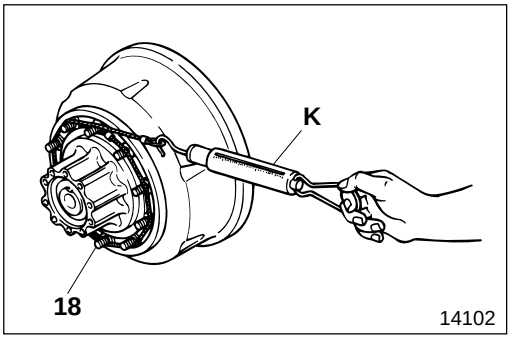


- If mounting holes of lock plate **8** and lock nut **9** do not align, align as follows:

Hole position of lock nut	How to align hole of lock plate
Within range **F**	Loosen lock nut to align holes
Within range **G**	Turn over lock plate and loosen lock nut to align holes
On line **H-H**	Turn over lock plate to align holes (Hole position **J'** changes to **J**)



- To slide outer bearing inner race **11** towards lock nut **9**, hit end **B** of the axle tube two or three times with a mallet, while turning wheel hub and brake drum assembly **12**.
  C : Copper-headed mallet



[Measurement]

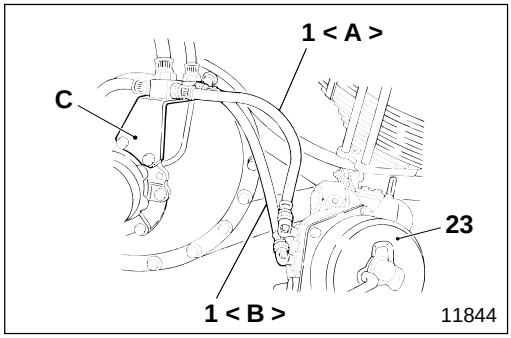
- Install spring balance **K** on hub bolt **18**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- Do not allow the tangential force to become higher than the upper limit of the specified value.
- If the measured value deviates from the specified value, repeat from step ★. 📖 P27-14
- If the result is still not satisfactory, replace outer bearings **11, 14** and inner bearings **15, 20**.

NOTE

- **Make sure that there is no drag in brake lining and brake drum 17 before you measure the tangential force.**
- **Measure the starting torque when oil seal 13 has been installed.**

https://truckmanualshub.com/

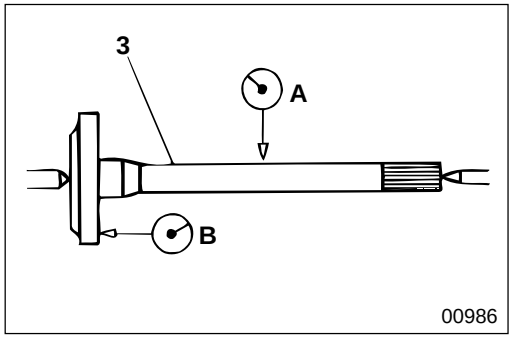
WHEEL HUB AND BRAKE DRUM



1 **Removal and installation of brake hose < FM657 >**

- Remove brake hoses **1** from T-connector **C** side first, then remove from brake assembly **23** side.

- For installation, follow the removal sequence in reverse.
  A : Service brake hose
  B : Spring brake hose



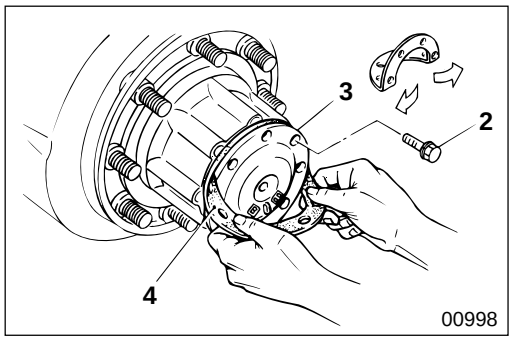
3 **Axle shaft**

[Inspection]
A : Bend of shaft center

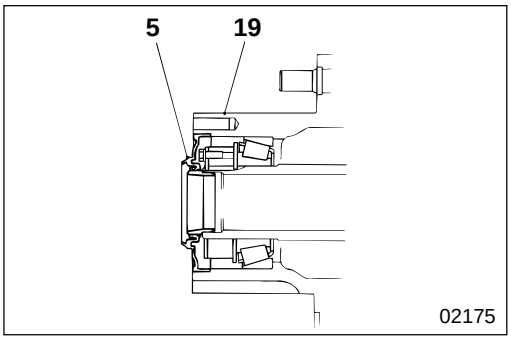
NOTE

To measure the bend of axle shaft 3, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

B : Wobble of flange face



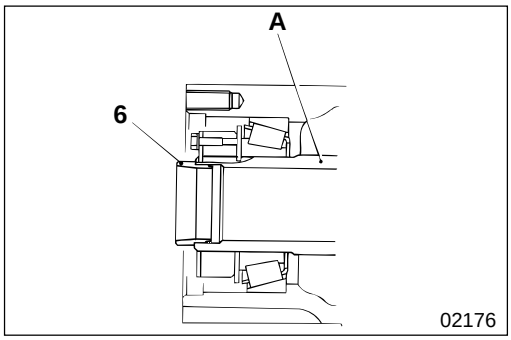
[Installation] < FM >
Install gasket **4** on axle shaft **3**, and tighten bolt **2** at specified torque.



5 **Installation of oil seal**

Press-fit oil seal **5** until it is flush with the end of wheel hub **19**.

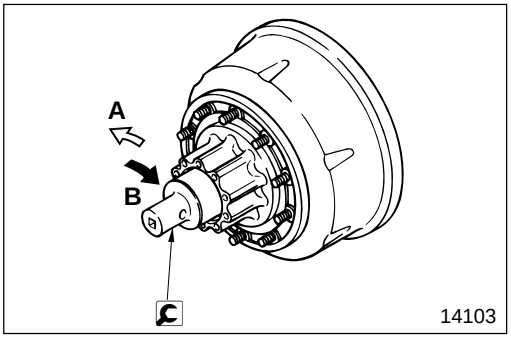
https://truckmanualshub.com/



6 **Oil seal retainer**

[Removal]
It is not necessary to remove oil seal retainer **6** other than for replacement of oil seal **5**.

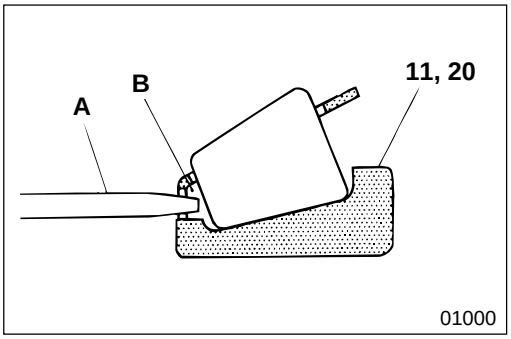
[Installation]
Press-fit oil seal retainer **6** until it is flush with the end of axle tube **A**.



9 **Removal and installation of lock nut**

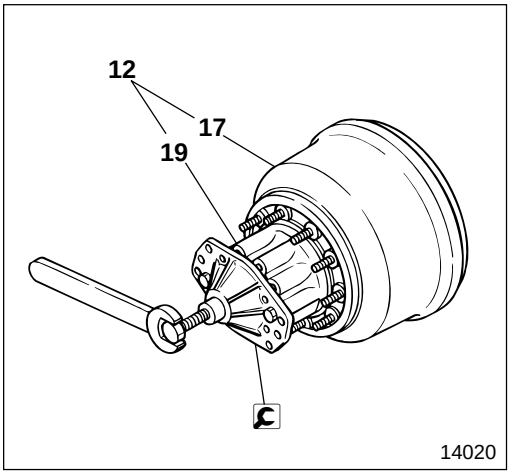
After installation, adjust the starting torque of the wheel hub bearing. See P27-14

A : Removal
B : Installation



11 **20** **Packing grease in outer bearing inner race and inner bearing inner race**

A : Grease pump nozzle
B : Space between rollers



12 **Wheel hub and brake drum assembly**

[Removal]

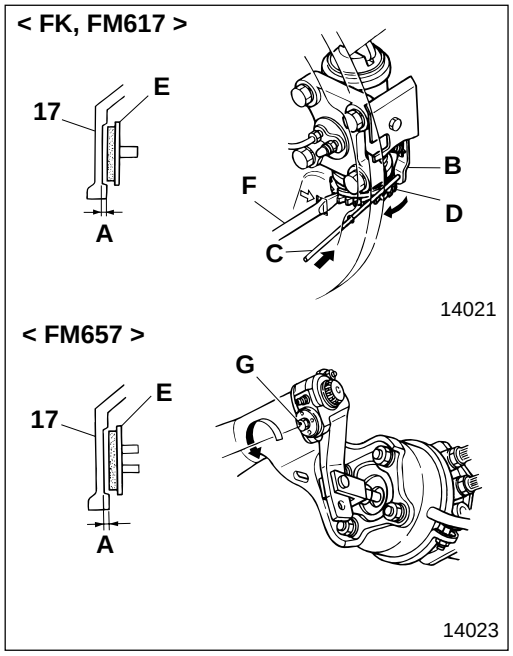
CAUTION

Make sure you remove wheel hub and brake drum assembly 12 in a straight line to prevent damage to oil seal 13.

https://truckmanualshub.com/

WHEEL HUB AND BRAKE DRUM

If wheel hub and brake drum assembly **12** cannot be removed because of stepped wear **A** in brake drum **17**, carry out the following:

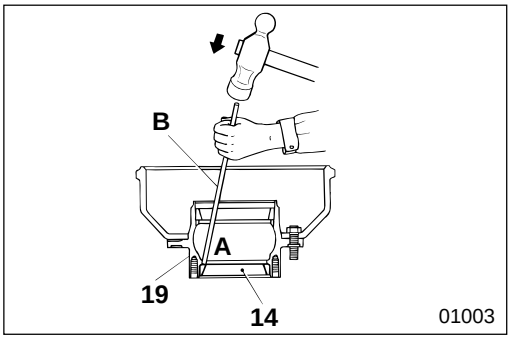


< FK, FM617 >
- Remove the packing plate cover.
- Lift lever **B**.
  C : Wire approximately ø5 mm {0.020 in.}
- Turn adjuster **D** in the opposite direction to the arrow on the packing plate, and expand the clearance between brake drum **17** and brake shoe assembly **E**.
  F : Screwdriver
- Remover wheel hub and brake drum assembly **12**.

< FM657 >
- Turn worm shaft **G** of the automatic slack adjuster counterclockwise, and expand the clearance between brake drum **17** and brake shoe assembly **E**.
- Remove wheel hub and brake drum assembly **12**.

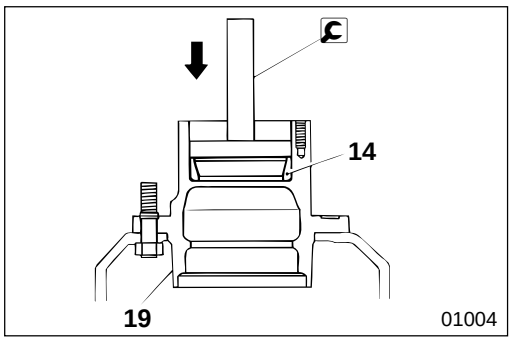
CAUTION
If brake drum 17 is faulty, correct it. Gr 35A, B

[Installation]
After installing wheel hub and brake drum assembly **12**, adjust the brake shoe clearance.
Gr 35A < FK, FM617 >
Gr 35B < FM657 >



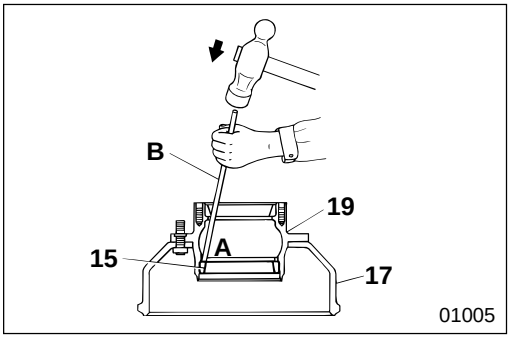
14 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **14** evenly from four indented parts **A** in wheel hub **19**.
B : Pin-punch



[Installation]

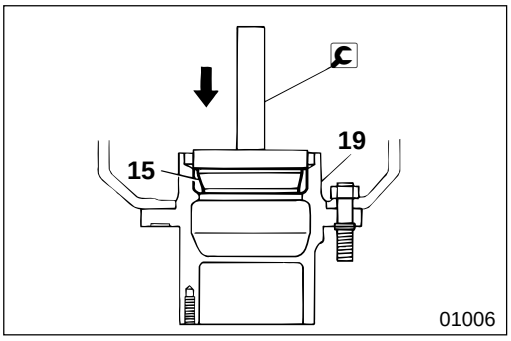
https://truckmanualshub.com/



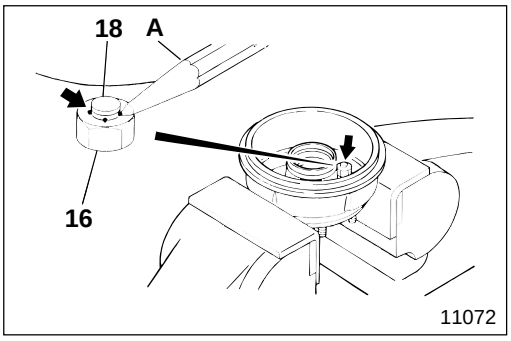
15 **Inner bearing outer race**

[Removal]
Drive out inner bearing outer race **15** evenly from four indented parts **A** in wheel hub **19**.

B : Pin-punch



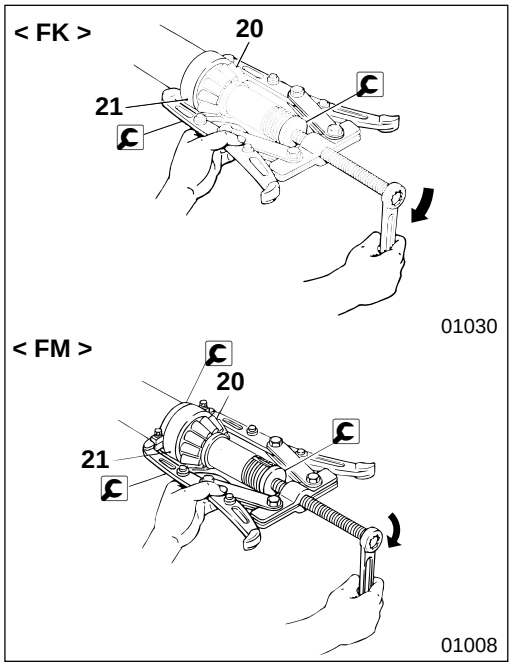
[Installation]



16 **18** **Installation of hub bolt and nut**

- Install hub bolt **18**.
- Tighten nut **16** at specified torque.
- Caulk nut **16** evenly at four points to keep it from turning.

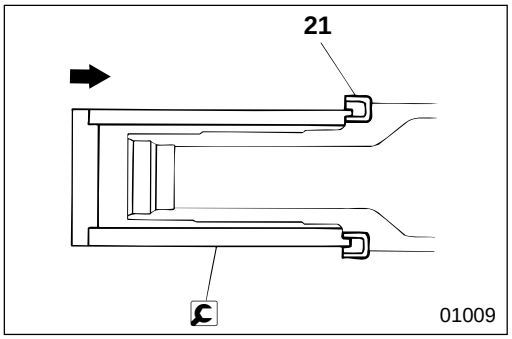
A : Pin-punch



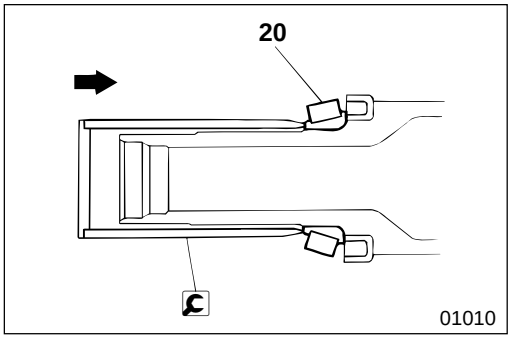
20 **21** **Inner bearing inner race and oil seal retainer**

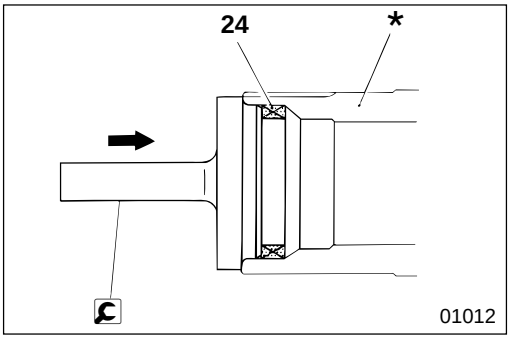
[Removal]

https://truckmanualshub.com/



[Press-fitting]





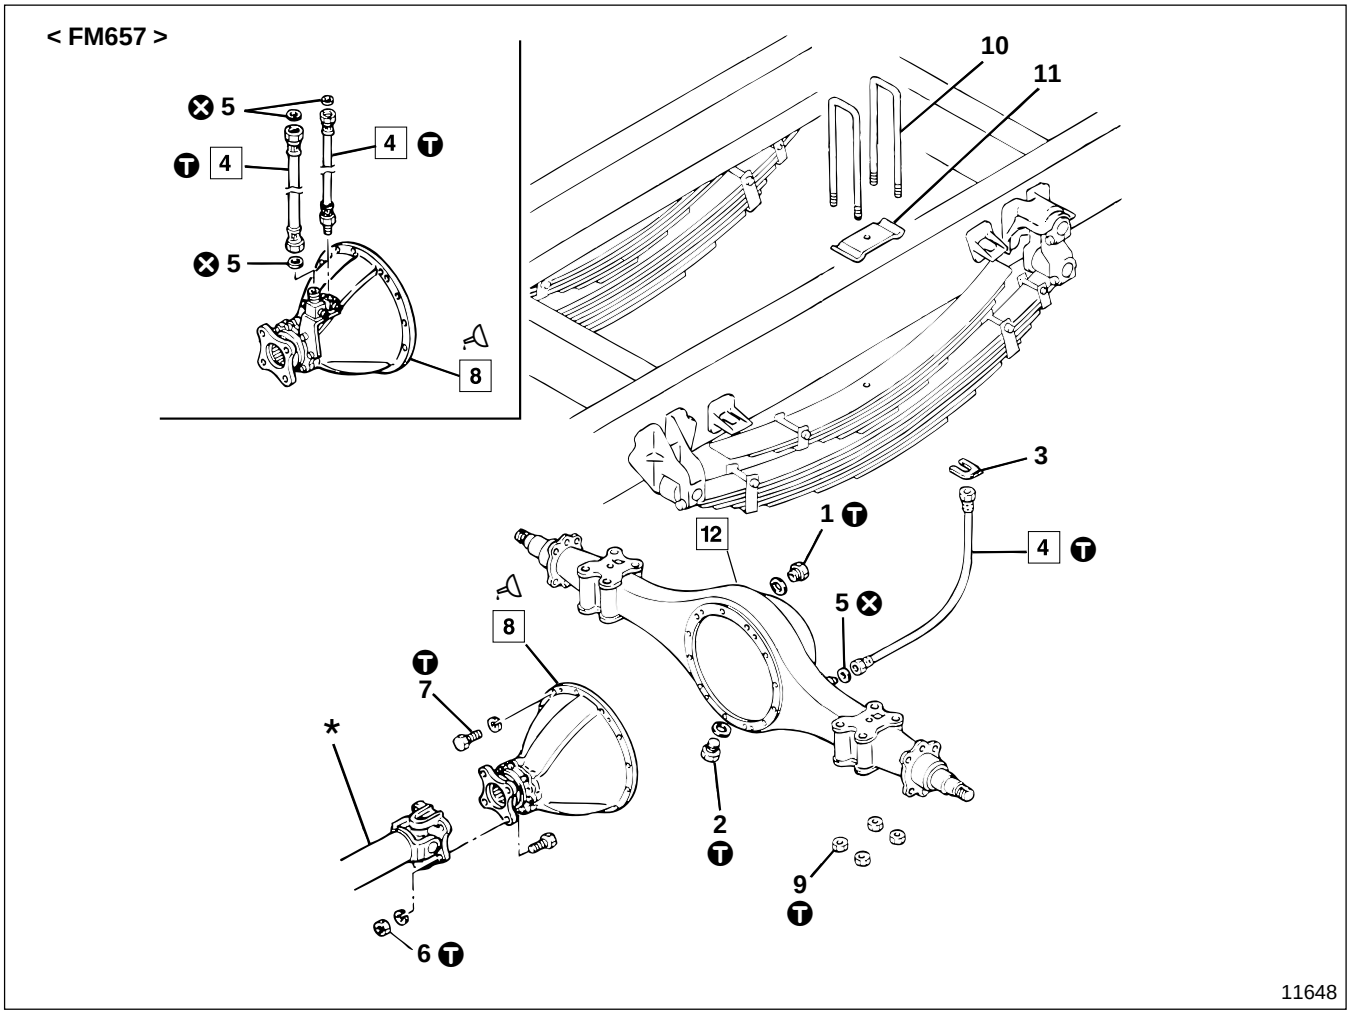
24 **Installation of oil seal < FM >**

https://truckmanualshub.com/

MEMO

https://truckmanualshub.com/

AXLE HOUSING



● **Work before removal** P27-24

● **Removal sequence**

1 Inspection plug
2 Drain plug
3 Clip < FK, FM617 >
4 Brake hose
5 Packing
6 Nut
7 Bolt
8 Reduction and differential assembly P27-26
9 U-bolt nut
10 U-bolt
11 Spring upper pad
12 Axle housing

***** : Propeller shaft Gr 25

CAUTION

Be sure to protect brake hose 4 from dust by fitting blanking plugs after removal.

NOTE

Do not remove axle housing 12 unless it is faulty.

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION

Make sure that brake hose 4 is not twisted when you install it.

NOTE

Do not let sealant ooze from the mounting surfaces of reduction and differential assembly 8 and axle housing 12.

● **Work after installation** P27-24

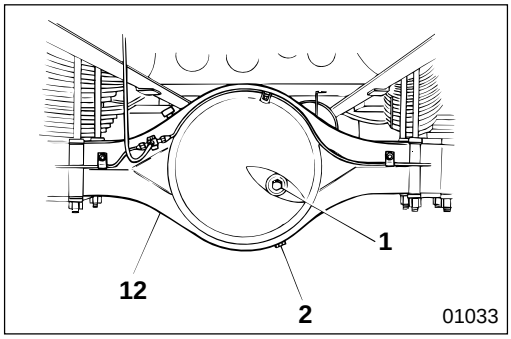
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
12	Measuring bar 	MH061003	Measures bend of axle housing : Two required

https://truckmanualshub.com/

◆ Service procedure



● **Work before removal**

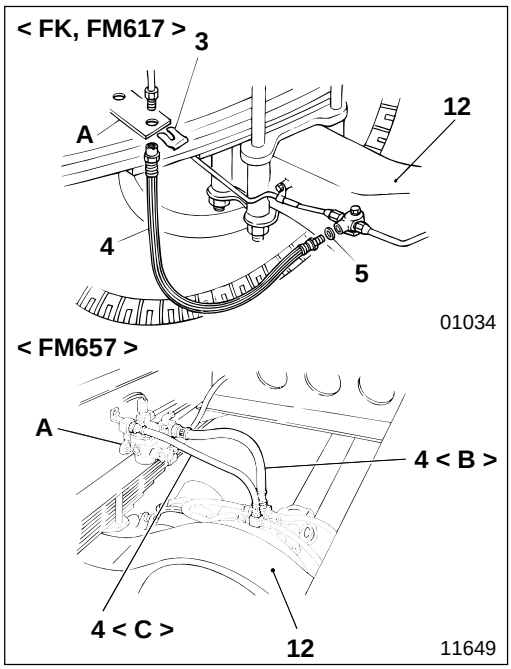
Remove drain plug **2** and drain the gear oil.

WARNING⚠

The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.

● **Work after installation**

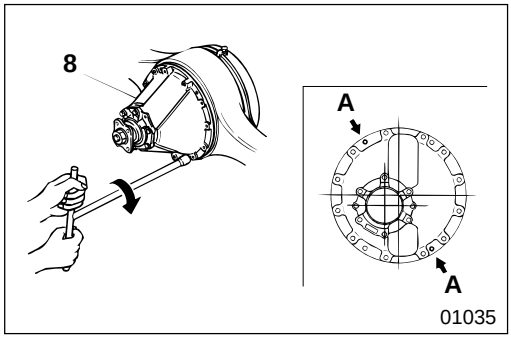
Fill with the specified amount of gear oil via inspection plug **1**.



4 **Removal and installation of brake hose**

- Remove brake hose **4** from frame **A** side first, then from axle housing **12** side.
- For installation, follow the removal sequence in reverse.

B : Service brake hose
C : Spring brake hose

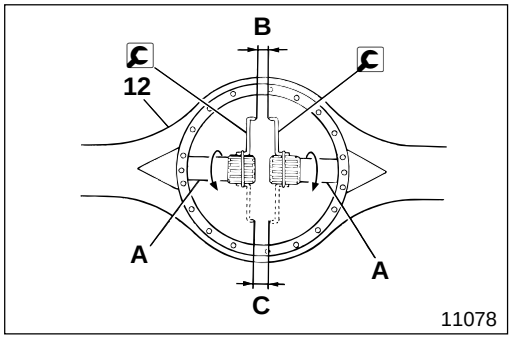


8 **Removal of reduction and differential assembly**

To remove reduction and differential assembly **8**, screw two M12×1.25 mm bolts evenly into two screw holes **A**.

NOTE

Completely remove adhered sealant from the mounting surfaces of reduction differential assembly 8 and axle housing 12.



12 **Bend of axle housing**

- Leave axle shaft **A** installed in axle housing **12**.
- Install measuring bar on axle shaft **A**, and measure clearance **B**.
- Turn axle shaft **A** 180°, and measure clearance **C**.
- The difference between **B** and **C** is the amount of bend of axle housing **12**.
- If the bend of axle housing **12** is higher than the limit, replace the axle housing.

https://truckmanualshub.com/

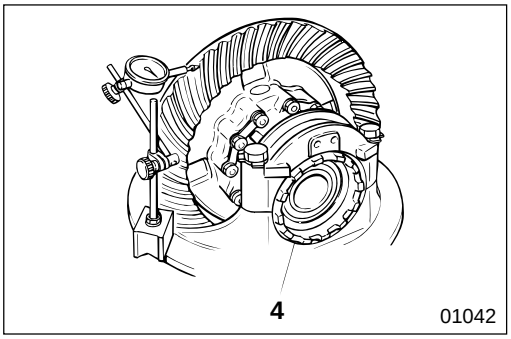
◆ Service procedure

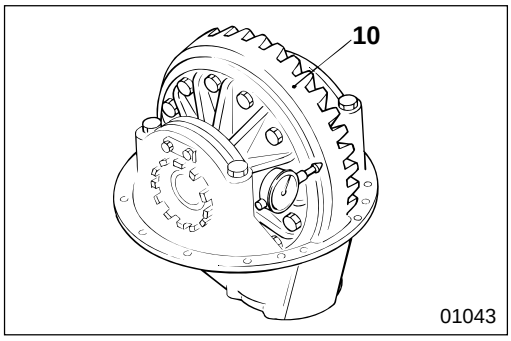


● Inspection before disassembly

Inspect for faulty parts before disassembly.

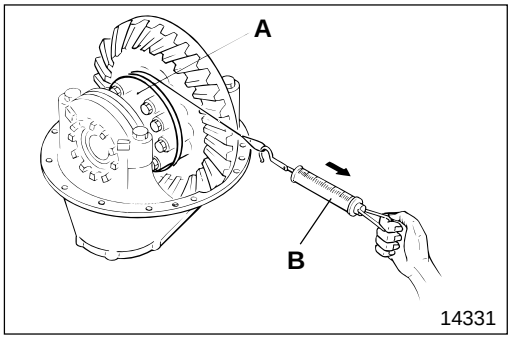
(1) Backlash of reduction gear and reduction pinion

If there is any fault, it is considered to be because of the amount adjusting screw **4** was tightened.



(2) Wobble of back face of reduction gear

Measure wobble at a point 145 mm {5.71 in.} (on the radius) for < D050H >, 185 mm {7.28 in.} for < D8H >, from the center of the reduction gear, turning differential assembly **10** one full revolution.

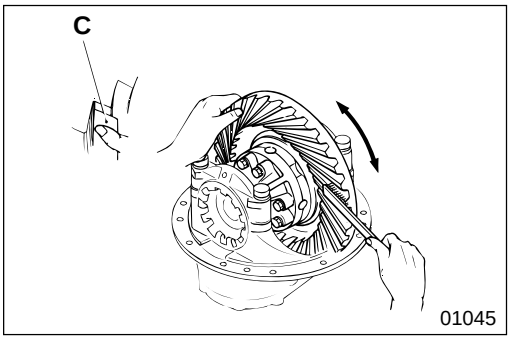


(3) Starting torque of side bearing

- Install spring balance **B** at 170 mm {6.69 in.} for < D050H >, 213 mm {8.39 in.} for < D8H >, outer periphery point of differential case **A**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.

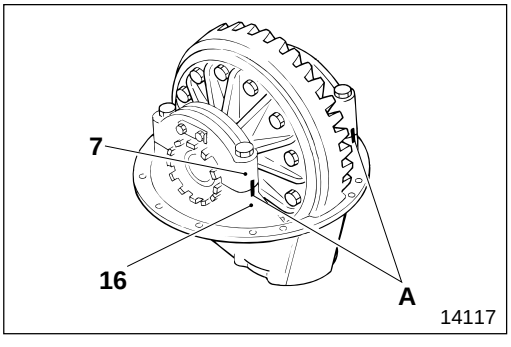
NOTE

Measure the starting torque within reduction gear and reduction pinion backlash range.



(4) Tooth contact of reduction gear

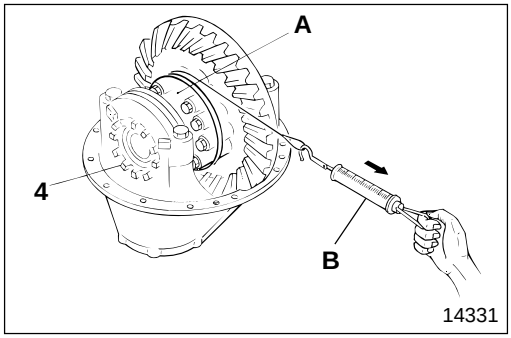
Apply red lead to three or four gear teeth, turn the gear a few times, and examine tooth contact with a piece of paper **C**.



● Work before disassembly

Put alignment marks **A** on bearing cap **7** and differential carrier **16** to identify left and right.

https://truckmanualshub.com/



● **Inspection and adjustment after assembly**

(1) Starting torque of side bearing

[Inspection]

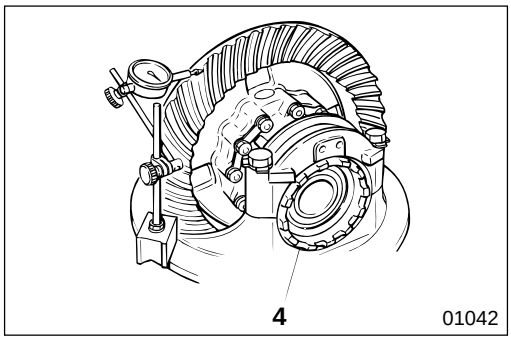
- Install spring balance **B** at 170 mm {6.69 in.} for < D050H >, 213 mm {8.39 in.} for < D8H >, outer periphery point of differential case **A**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the specified value, adjust.

[Adjustment]

If the measured value does not meet the standard value, adjust using left and right adjusting screws **4**.

CAUTION ⚠

- **Tighten left and right adjusting screws 4 the same amount.**
- **Adjust the starting torque within the reduction gear and reduction pinion backlash range.**

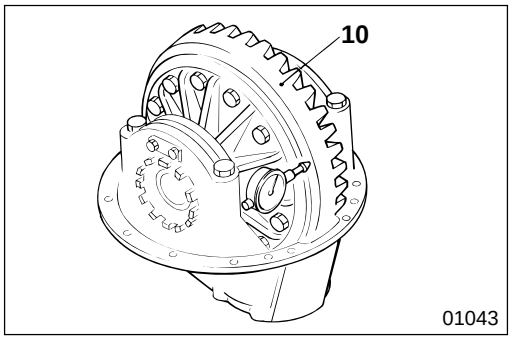


(2) Adjustment of backlash between reduction gear and reduction pinion

Adjust the starting torque of the side bearings using left and right adjusting screws **4**, taking care not to change the starting torque.

CAUTION ⚠

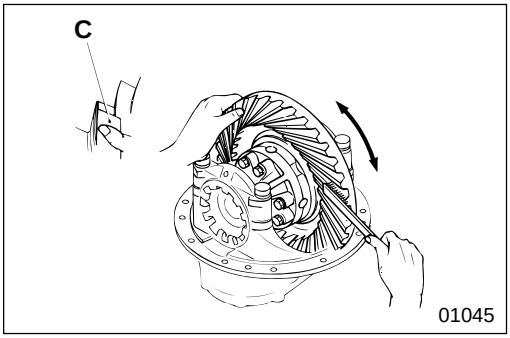
Make sure when you loosen one adjusting screw 4 that you tighten the other adjusting screw by the same amount, because the starting torque of the side bearing changes.



(3) Inspection of wobble of back face of reduction gear

Measure wobble at a point 145 mm {5.71 in.} (on the radius) for < D050H >, 185 mm {7.28 in.} for < D8H >, from the center of the reduction gear, turning differential assembly **10** one full revolution.

https://truckmanualshub.com/



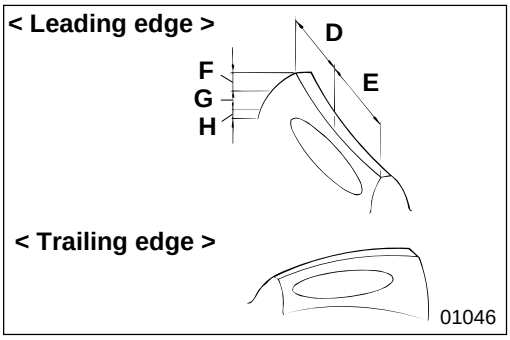
(4) Tooth contact of reduction gear

[Inspection]
Apply red lead to three or four gear teeth, turn the gear a few times, and examine tooth contact with a piece of paper **C**.

[Adjustment]
If contact area is remarkably offset, adjust with reduction pinion mounting adjusting shims to increase or decrease the backlash.

CAUTION

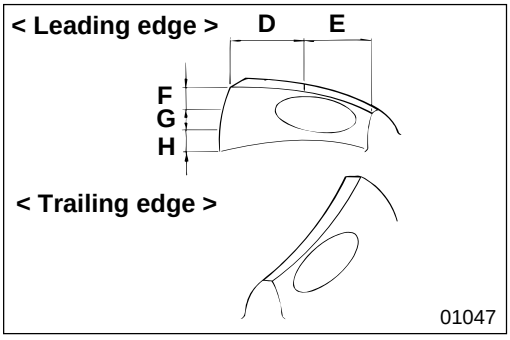
- **Make sure you replace as a reduction gear set (reduction gear and reduction pinion), when you replace the gear because of excessive teeth wear.**
- **When good tooth contact adjustment has been obtained, but backlash does not meet the standard value, tooth contact has priority. It is not necessary to adjust backlash to the standard value if it is less than 0.15 mm {0.0059 in.} out.**



● **Normal tooth contact at no load**

< Reduction gear >

D : Heel
E : Toe
F : Face
G : Flank
H : Clearance



< Reduction pinion >

D : Heel
E : Toe
F : Face
G : Flank
H : Clearance

https://truckmanualshub.com/

REDUCTION AND DIFFERENTIAL

Maintenance item			Assembly standards
At no load	Tooth contact position	Lengthwise direction of tooth	From center toward toe
		Vertical direction	From center toward top of tooth for reduction gear and center of tooth for pinion
	Tooth contact shape	Length	About 50 to 70% of tooth width
		Width	About 50 to 70% of tooth depth
	Degree of tooth contact		Degree of tooth contact becomes weaker as it comes nearer to root or top

NOTE

When tooth contact area is nearer to toe at no load, it becomes middle area contact under load.

Adjustment of Tooth Contact

	Mode of adjustment	Moving direction
Adjustment by adding or reducing shims	Advances reduction pinion to reduction gear (Shims are reduced) 	< Leading edge >  < Trailing edge > Tooth contact moves toward root of tooth
	Retards reduction pinion from reduction gear (Shims are added) 	 Tooth contact moves toward top of tooth
Adjustment by controlling adjusting screw	Advance reduction gear to reduction pinion axis (Less backlash) 	Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to toe and slightly nearer to root of tooth Trailing edge: Nearer to heel and slightly nearer to top of tooth
	Retard reduction gear from reduction pinion axis (More backlash) 	Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to heel and slightly nearer to top of tooth Trailing edge: Nearer to toe and slightly nearer to root of tooth

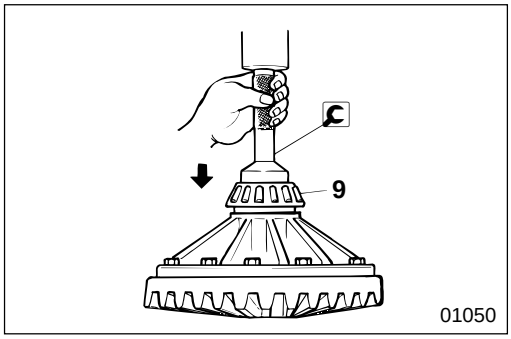
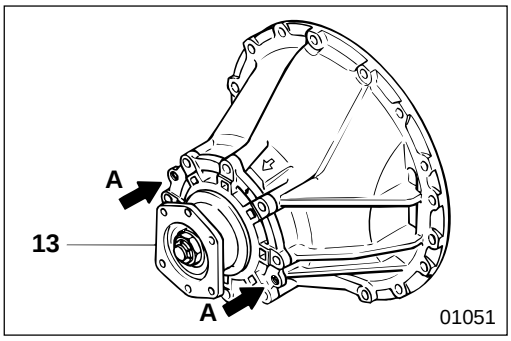
A : Gear puller (General tool)

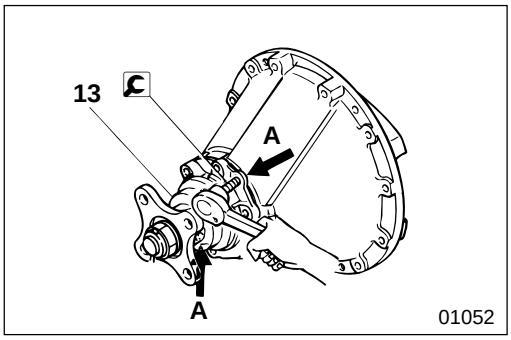


[Installation]



13 **Pinion assembly**

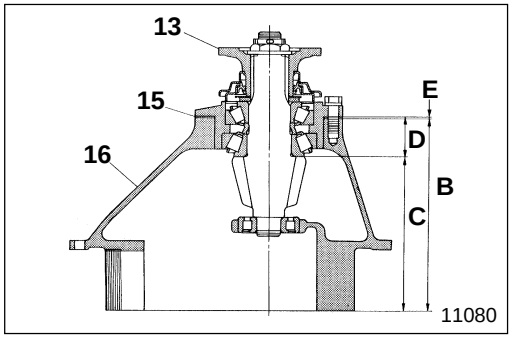
[Removal]
< D050H >
To remove pinion assembly **13**, screw two M12×1.25 mm bolts evenly into the two pinion assembly removal screw holes **A**.



< D8H >
To remove pinion assembly **13**, screw two bearing retainer removers into the two pinion assembly removal screw holes **A**.

https://truckmanualshub.com/

REDUCTION AND DIFFERENTIAL



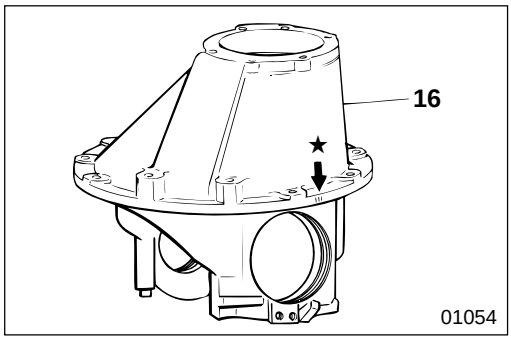
[Adjustment]

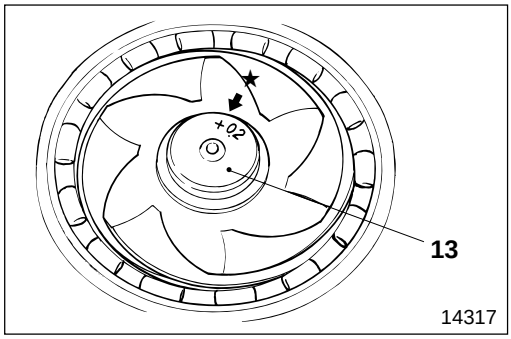
- Carry out the following procedure so that **B**, **C** and **D** conform to the standard dimension.
- Calculate shim thickness **E** according to the following formula based upon the machining error data stamped on pinion assembly **13** and differential carrier **16**.

Formula for calculation

E = 0.5 {0.020}–b+c+d

b : Deviation from basic dimension **B**
c : Deviation from basic dimension **C**
d : Deviation from basic dimension **D**





NOTE

Thickness is stamped in millimeters.

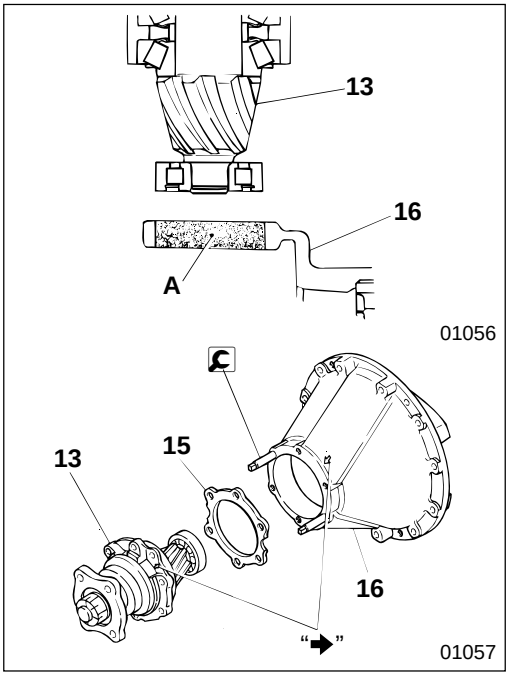
Unit : mm {in.}

Location	Standard dimension		How to calculate deviation
	D050H	D8H	
Shim thickness	0.5 {0.020}		—
B	232 {9.13}	261 {10.3}	The basic dimension, multiplied by 100, is stamped on the periphery of differential carrier **16** flange
C	180 {7.09}	208 {8.19}	The basic dimension is stamped on the top of pinion assembly **13**
D	52 {2.05}	53.5 {2.11}	Measure the deviation from **D** using a dial gauge. However, If it is difficult to measure the actual deviation, assume a value from 0 to 0.2 {0 to 0.0079}

★ : Stamped number position

- Select shim **15** from shim thickness **E**.
  Available thicknesses of shim **15** : 0.1 mm {0.0039 in.} and 0.2 mm {0.0079 in.}

https://truckmanualshub.com/



[Installation]

- Apply lock paint to pinion pilot bearing mounting surface **A** of differential carrier **16**.
- Install pinion assembly **13**.

CAUTION

- **Be sure to let the lock paint harden undisturbed for 30 minutes to two hours after installation.**
- **Be sure to wait at least three hours before running the vehicle, and if possible wait 24 hours to let the lock paint harden.**

◆ Service procedure

● Inspection and adjustment after assembly

Starting torque of pinion bearing

[Inspection]

- Apply load **A** to companion flange **3** or tighten lock nut **1** at specified torque.
  A : Approximately 39.2 kN {8.8 klbf, 4000 kgf} < D050H >
  Approximately 49 kN {11 klbf, 5000 kgf} < D8H >

- Install spring balance **B** at 170 mm {6.69 in.} for < D050H >, 160 mm {6.30 in.} for < D8H >, outer periphery point of differential case **A**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the specified value, adjust.

NOTE

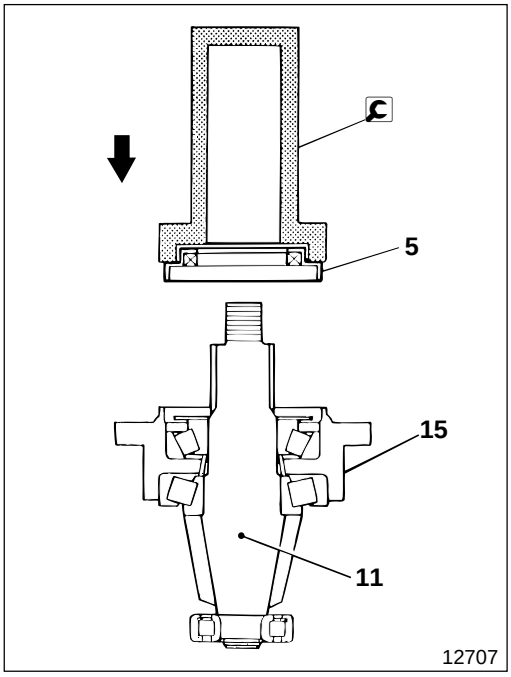
- **Tighten companion flange 3 before measuring.**
- **Oil separator 6 must be installed when you measure. < D8H >**
- **Measure with oil seal 5 removed.**

[Adjustment]

If the measured value does not conform to the specified value, adjust with collar **7** to obtain specified tangential force. Choose an appropriate collar by referring to the table below.

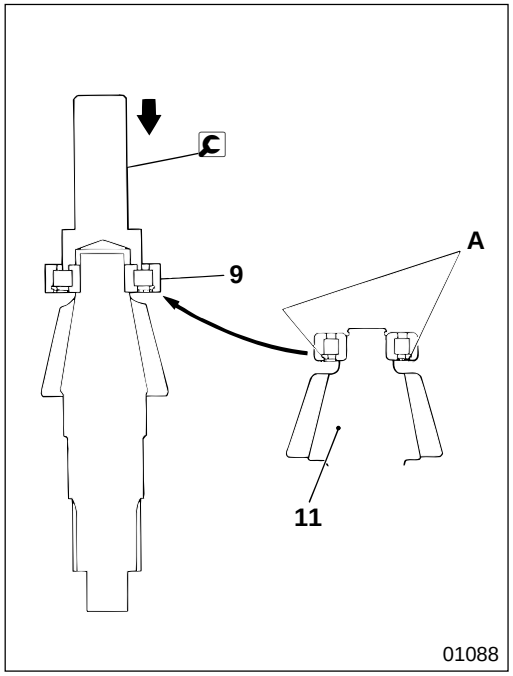
Unit : mm {in.}

Applicable model	Thickness of collar
D050H	13.875 to 14.475 {0.55 to 0.57} (25 thicknesses in 0.025 {0.00098} increments)
D8H	14.975 to 15.575 {0.59 to 0.61} (25 thicknesses in 0.025 {0.00098} increments)



5 **Installation of oil seal**

https://truckmanualshub.com/



9 **Installation of pinion pilot bearing**

Press-fit pinion pilot bearing **9** in the direction as illustrated.

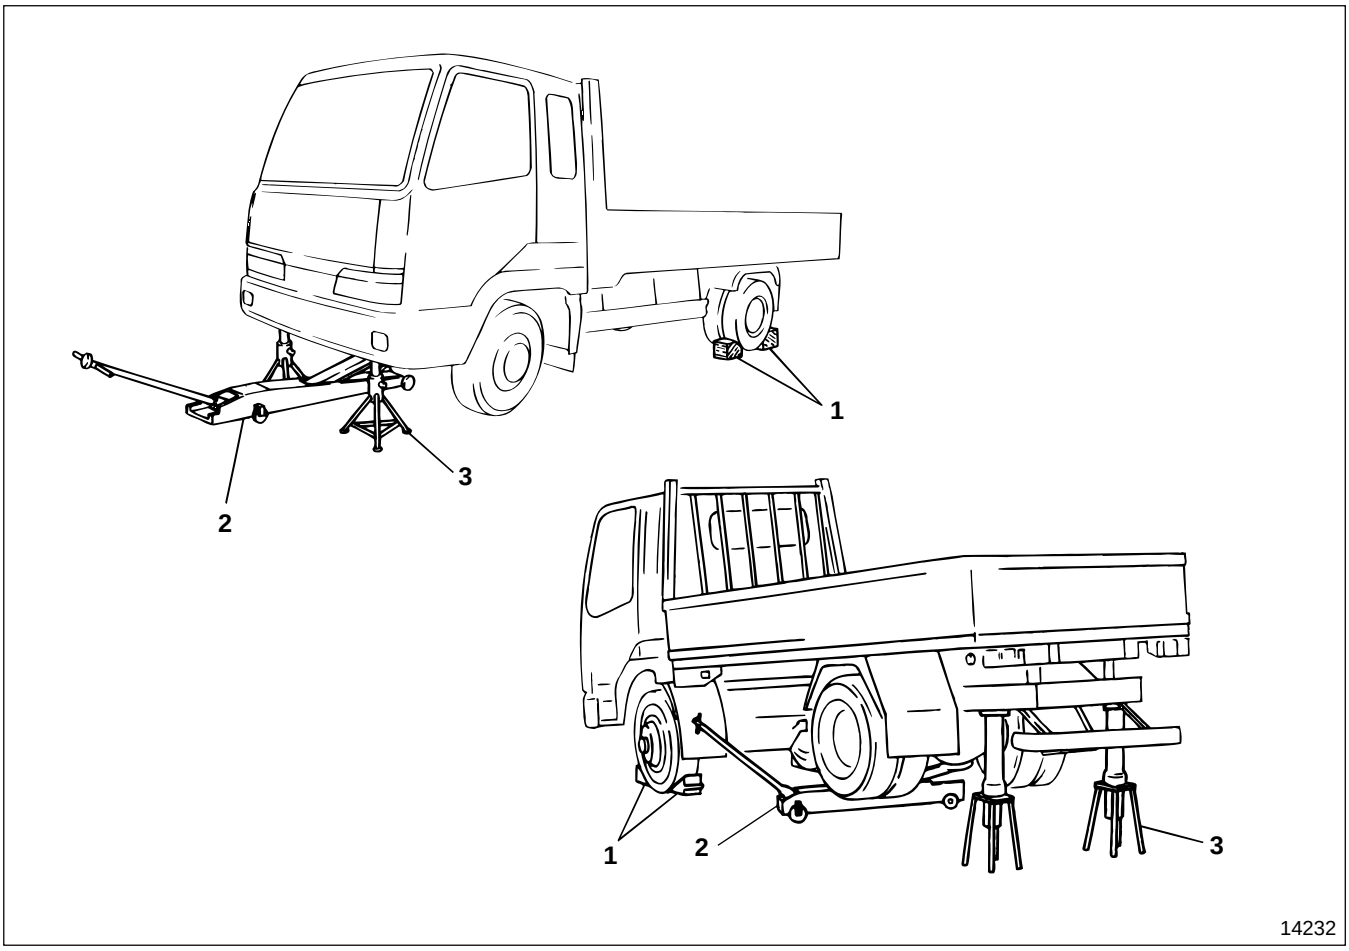
Work for Removal and Installation of Wheel and Tire



● **Work sequence**

1 Place wheel chocks.
2 Jack up the front or rear axle using a garage jack placed under the center of the axle.
3 Support the frame on rigid racks.

WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after removal and installation**

Follow the work sequence in reverse.

https://truckmanualshub.com/

Tightening torque

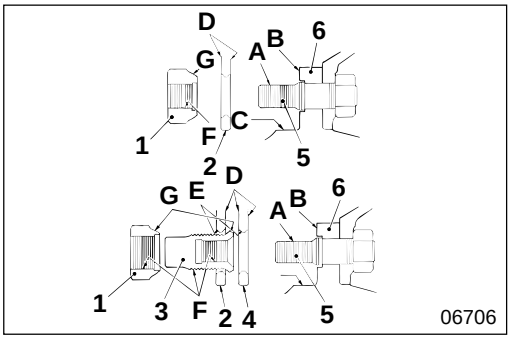
Unit : N·m {lbf.ft, kgf·m}

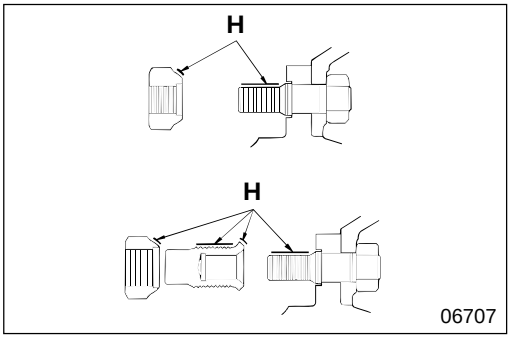
Location	Parts to be tightened	Tightening torque	Remarks
1, 3	Wheel nut	400 to 440 {295 to 325, 41 to 45}	Wet

https://truckmanualshub.com/

Lubricant

Location	Points of application	Kinds	Quantity
1	Wheel nut spherical area	Chassis grease [NLGI No. 1 (Ca soap)] or Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
3	Thread and spherical areas of wheel nut (inner)	Chassis grease [NLGI No. 1 (Ca soap)] or Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
5	Thread area of hub bolt	Chassis grease [NLGI No. 1 (Ca soap)] or Wheel bearing grease [NLGI No. 2 (Li soap)]	As required





◆ Service procedure

● Cleaning and applying grease before installation

[Cleaning]

To prevent wheel nuts **1** and **3** and hub bolt **5** from becoming loose and to prevent mounting parts (tire assemblies **2** and **4** and hub **6**) from being damaged, remove rust, dust, additional coatings of paint, and foreign particles from the following areas:

A : Hub bolt thread area
B : Wheel mounting surface of hub
C : Wheel alignment area of hub
D : Disc wheel mating surface
E : Disc wheel nut mounting surface
F : Wheel nut thread area
G : Wheel nut spherical area

[Applying grease]

H : Grease application location

WARNING⚠

Never use grease containing molybdenum disulfide, since it can cause loosening of fitted screws.

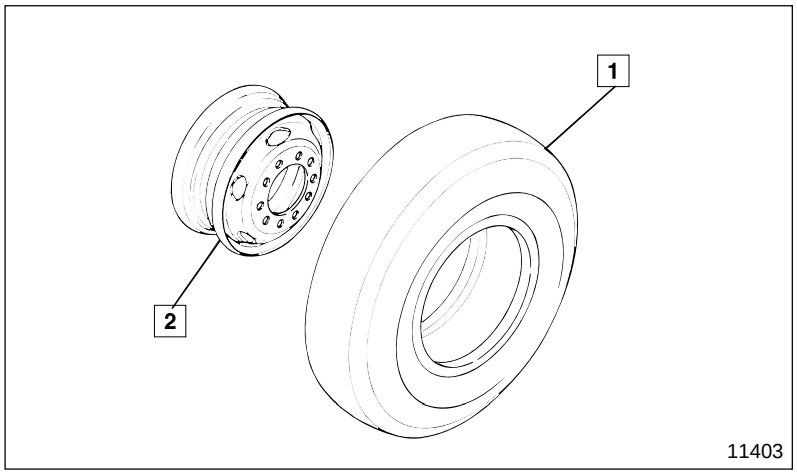
Tire Assembly



● **Disassembly sequence**

1 Tire
2 Disc wheel

● **Assembly sequence**

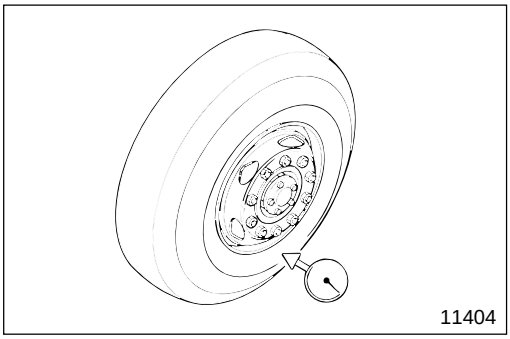
Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1	Horizontal deflection of tire (When assembled)		3.5 {0.14} or less	—	—
2	Disc wheel < 22.5×6.75-152-11 >	Flatness	0.3 {0.012} or less	—	—
		Horizontal deflection	2.0 {0.079} or less	—	—
		Vertical deflection	1.8 {0.071} or less	—	—
	Disc wheel < 22.5×7.50-162-12 >	Flatness	0.25 {0.0098} or less	—	—
		Horizontal deflection	2.0 {0.079} or less	—	—
		Vertical deflection	1.8 {0.071} or less	—	—

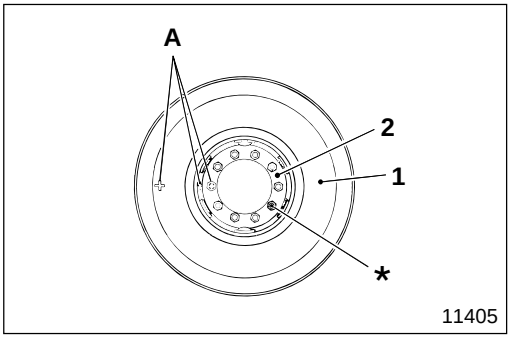
◆ Service procedure



1 **Deflection of tire**

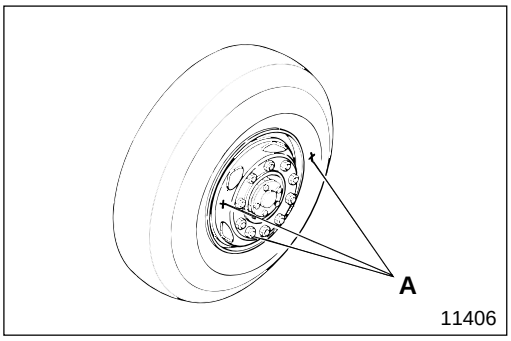
[Inspection]
If the measured value is higher than the limit, make corrections as follows.

https://truckmanualshub.com/

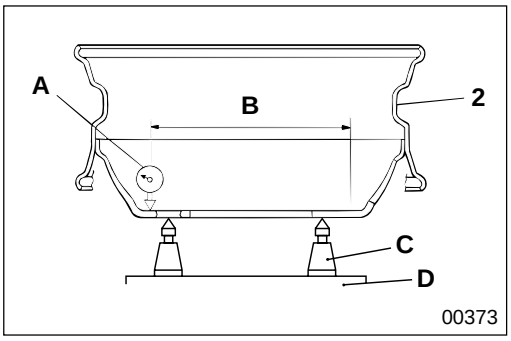


[Correction]

- Put chalk marks on tire **1**, disc wheel **2**, and hub bolt ***** (positions **A** as illustrated).
- Remove tire **1** from disc wheel **2**.



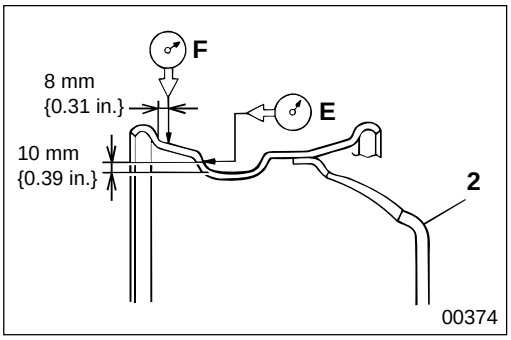
- Measure deflection of disc wheel **2**. If the most deflective position is near the chalk mark, reinstall tire **1** rotating it half a turn from the chalk mark and tighten nuts.
- Remeasure deflection of tire **1**.
- If the measured value is still higher than the limit, replace tire **1** and disc wheel **2** together as an assembly.



2 Inspection of disc wheel

(1) Flatness

- Measure flatness at specified position **B** from the center of disc wheel **2**.
  Measure flatness at ten equidistant points on the wheel.
  A : Dial gauge
  B : ø235 to 340 mm {9.25 to 13.4 in.}
  C : Portable screw jacks (x 4)
  D : Surface plate
- Replace disc wheel **2** if the measured value is higher than the limit.



(2) Deflection

Replace disc wheel **2** if the measured value is higher than the limit.
E : Horizontal deflection measuring point
F : Vertical deflection measuring point

TROUBLESHOOTING 3

WORK BEFORE REMOVAL AND INSTALLATION OF FRONT SUSPENSION 4

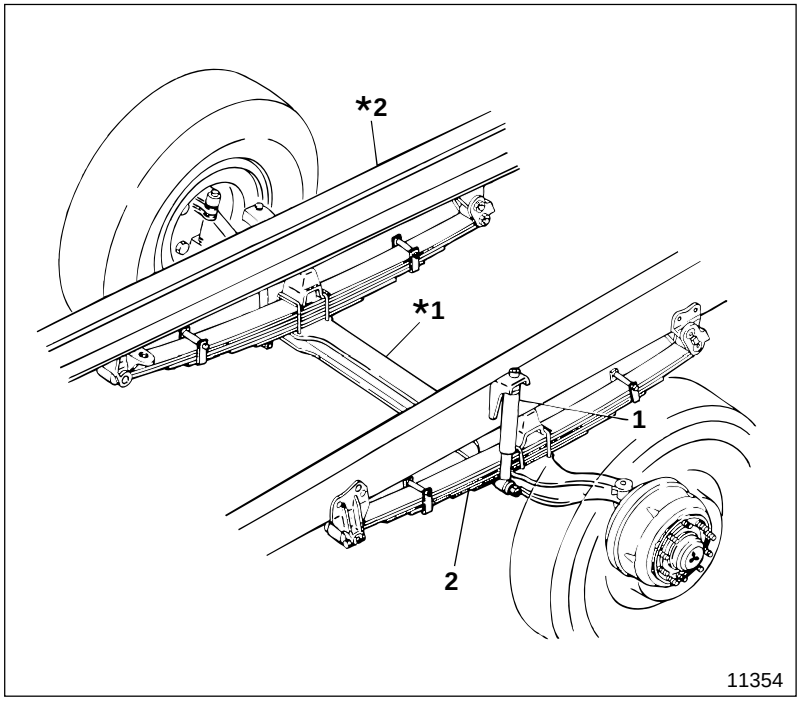
REMOVAL AND INSTALLATION OF LEAF SPRING ASSEMBLY 6

LEAF SPRING ASSEMBLY 10

SHOCK ABSORBER 12

https://truckmanualshub.com/

STRUCTURE AND OPERATION



1 Shock absorber
2 Leaf spring assembly
***1** : Front axle
***2** : Frame

Leaf spring assembly **2** and shock absorber **1** are installed between frame ***2** and front axle ***1** to support the vehicle body mass and absorb vibration and shock from the road surface to prevent them from being directly transmitted to the vehicle body thereby protecting the crew, the vehicle body, and the cargo. In addition, irregular vibration from the wheels is restrained, ensuring driving stability.

https://truckmanualshub.com/

Possible causes / Symptoms		Ride soft with gentle swaying	Noise generated when vehicle is unloaded	Impact transmitted from uneven road surface	Noise generated when vehicle is loaded	Excessive rolling while cruising	Periodic jolts received from the road surface	Remarks
Leaf spring	Cracked or damaged			○				
	Fractured		○

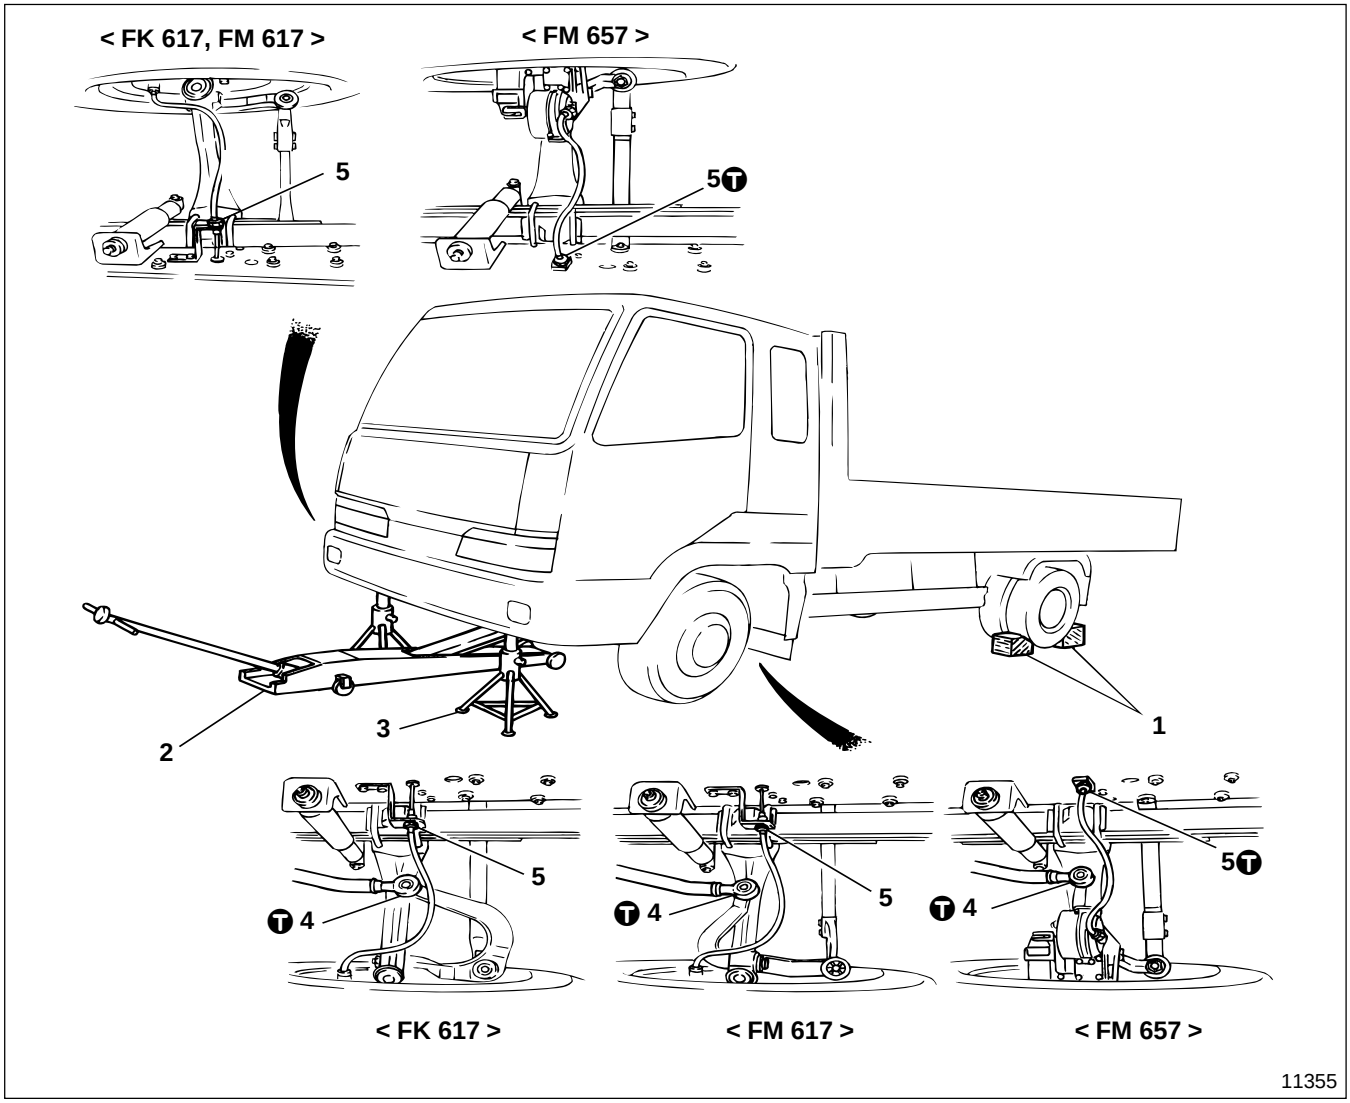
WORK BEFORE REMOVAL AND INSTALLATION OF FRONT SUSPENSION



● **Removal sequence**

1 Place wheel chocks.
2 Jack up the front axle with a garage jack.
3 Support the front frame on rigid racks.
4 Remove the nut (on the joint between the knuckle arm and the drag link).
5 Remove the brake hose joint (on the frame).

WARNING

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame with rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION

Be sure to protect the brake hose from dust by fitting blanking plugs.

● **Installation sequence**

Follow the removal sequence in reverse.

https://truckmanualshub.com/

WARNING

You must bleed air from the brake system after connecting the brake hose, failure to do so would cause the brakes to malfunction. Gr 35A

CAUTION

Be sure that the brake hose is not twisted when you install it.

REMOVAL AND INSTALLATION OF LEAF SPRING ASSEMBLY

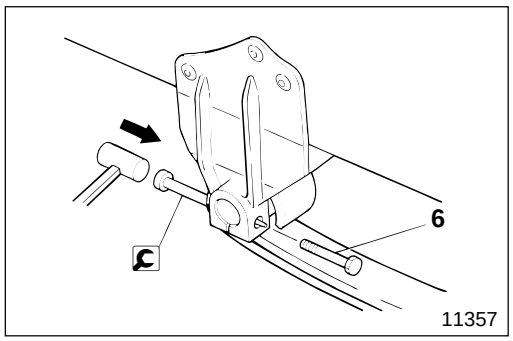
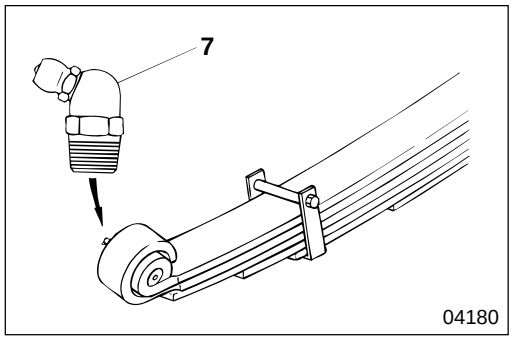
◆ Service procedure

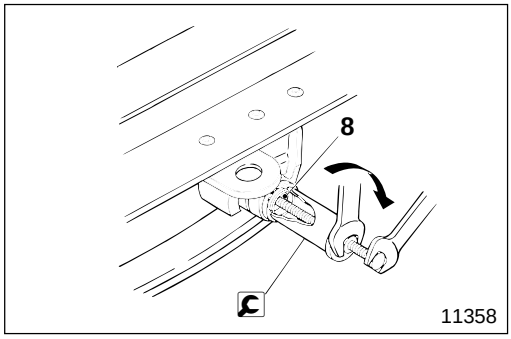


6 **Removal of bolt**



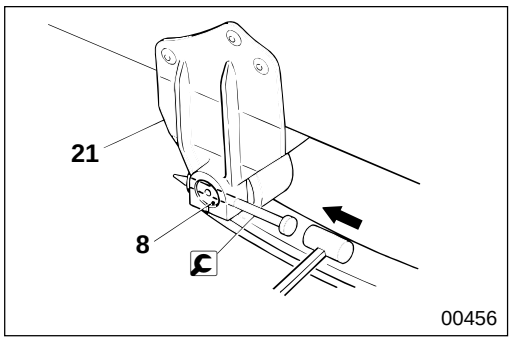
7 **Grease nipple < FK >**

- Install grease nipple **7**, on the driver's side, so that it can be easily accessed for grease supply. This is the only nipple that is installed on • the inner side of the vehicle. Grease nipples, **11**, **16** are straight types and are installed on the outer side of the vehicle.
- Grease nipple **7** at the forward side of the assistant driver's seat is a straight type, and it is installed on the outer side of the vehicle.

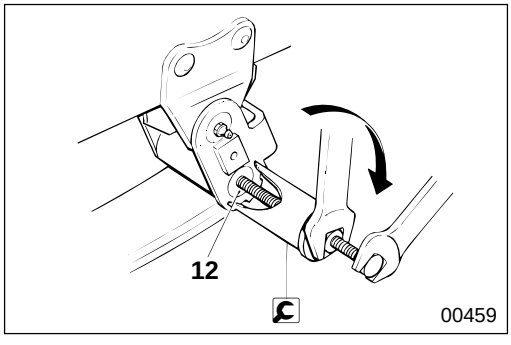


8 **Shackle pin**

[Removal]

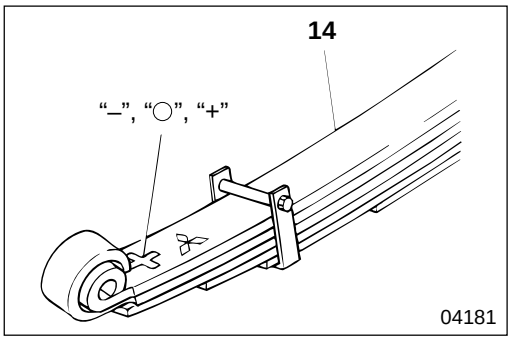


[Installation]
Align the bolt hole of front spring front bracket **21** with the bolt groove of shackle pin **8** using shackle pin setting bar.



12 **Removal of shackle pin**

https://truckmanualshub.com/



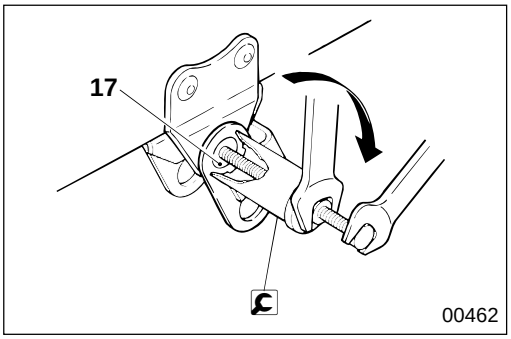
14 **Leaf spring assembly left/right height combinations**

When replacing leaf spring assembly **14**, select the members so that the left and right height marks "+", "○" and "–" are combined as shown below.

Item	Combination				
	1	2	3	4	5
Right leaf spring assembly, passenger's side	–	–	○	○	+
Left leaf spring assembly, driver's side	–	○	○	+	+

CAUTION⚠

Passenger's side leaf spring assembly 14 differs from the driver's side leaf spring assembly in camber (arch). Do not mix them up when mounting, or this would cause vehicle tilt.



17 **Removal of shackle pin**

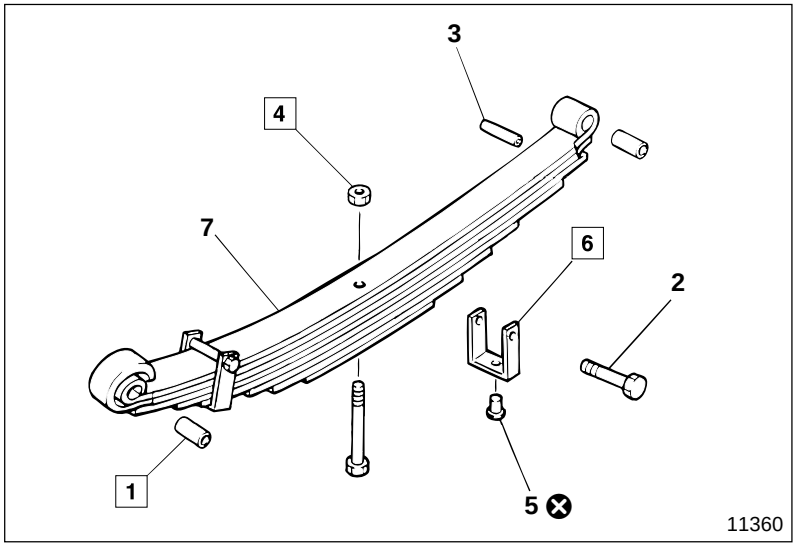
LEAF SPRING ASSEMBLY



● **Disassembly sequence**

1 Spring bushing
2 Clip bolt
3 Pipe < FM >
4 Rivet
5 Clip
6 Leaf spring

⊗ : Non-reusable parts

● **Assembly sequence**

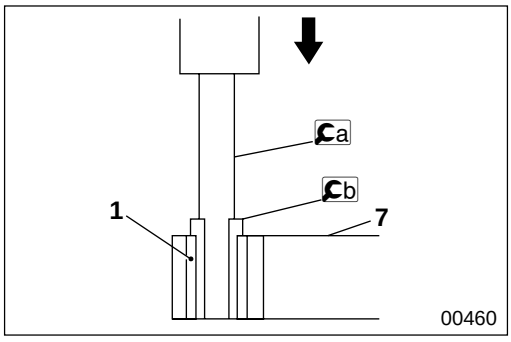
Follow the disassembly sequence in reverse.

Special tools

Unit : mm {in.}

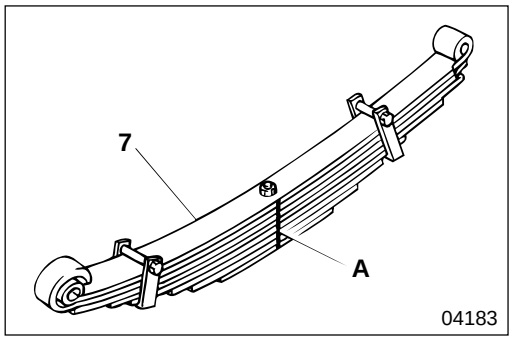
Location	Tool name and shape	Part No.	Application
1	Bushing installer set **A** : Bushing installer A **B** : Bushing installer B 	MB999066 **A** : MB999067 **B** : MB999068	Removal and press-fitting of spring bushing

◆ Service procedure



1 **Removal of spring bushing**

Remove the spring bushing from leaf spring **7** using a bushing installer **A** and b bushing installer **B**. For installation, follow the removal sequence in reverse.

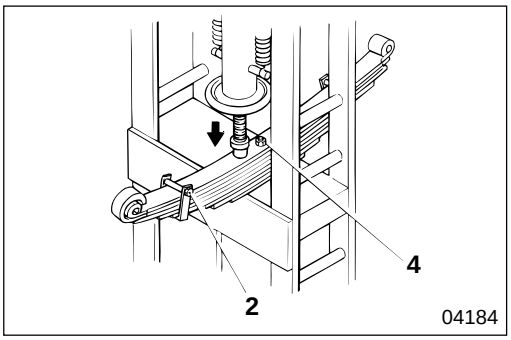


4 **Center nut**

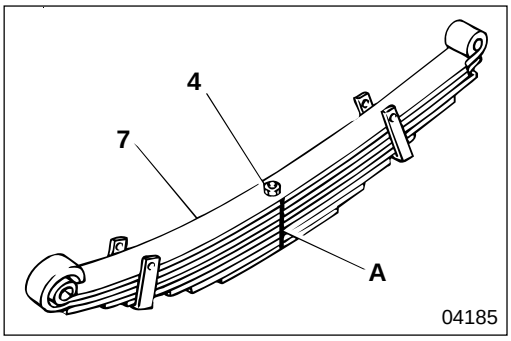
[Removal]

- Put aligning marks **A** across leaves of leaf spring **7**.

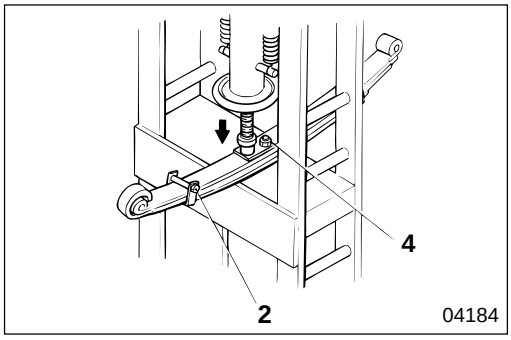
https://truckmanualshub.com/



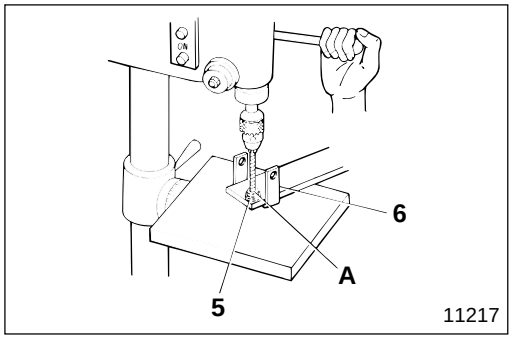
- Compress the leaf springs using a press to remove clip bolt **2** and center nut **4**.



[Installation]
- Align alignment marks **A** on leaf springs **7** and assemble.
- Tighten center nut **4** temporarily.

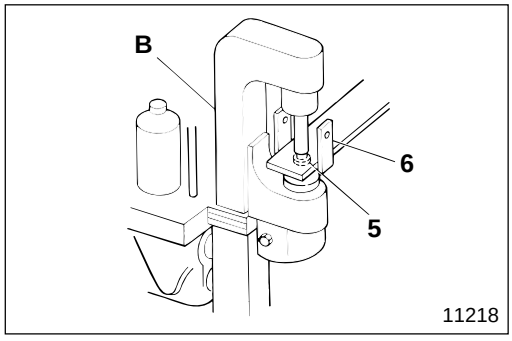


- Compress leaf spring **7** using a press, then install center nut **4**.
- Tighten clip bolt **2**.



6 **Clip**

[Removal]
Drill out caulked ends **A** of rivet **5** on a drill press to remove clip **6**.



[Installation]
Using riveting machine **B**, install clip **6** by caulking rivet **5**.

https://truckmanualshub.com/

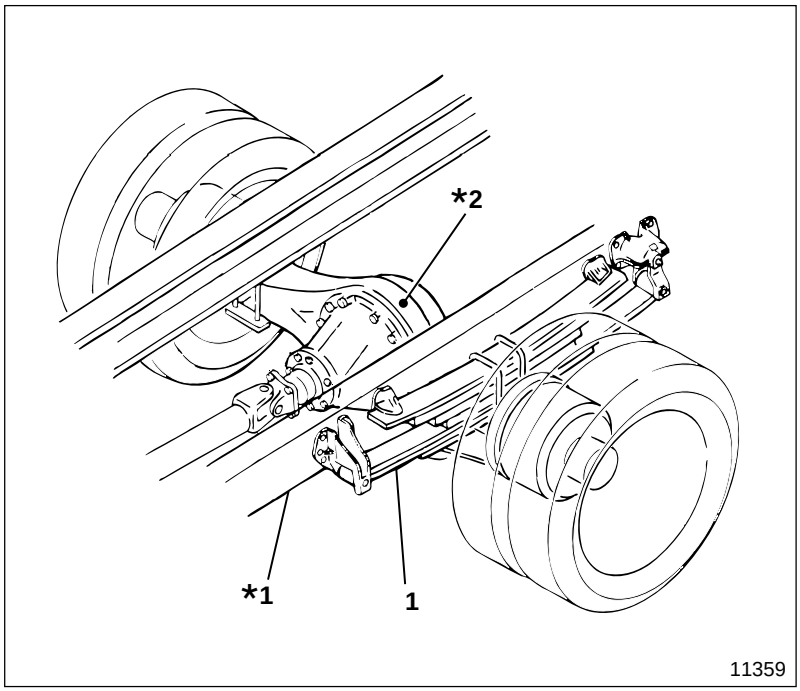
REMOVAL AND INSTALLATION OF LEAF SPRING ASSEMBLY 6

LEAF SPRING ASSEMBLY 12

https://truckmanualshub.com/



1 Leaf spring assembly

***1** : Frame
***2** : Rear axle

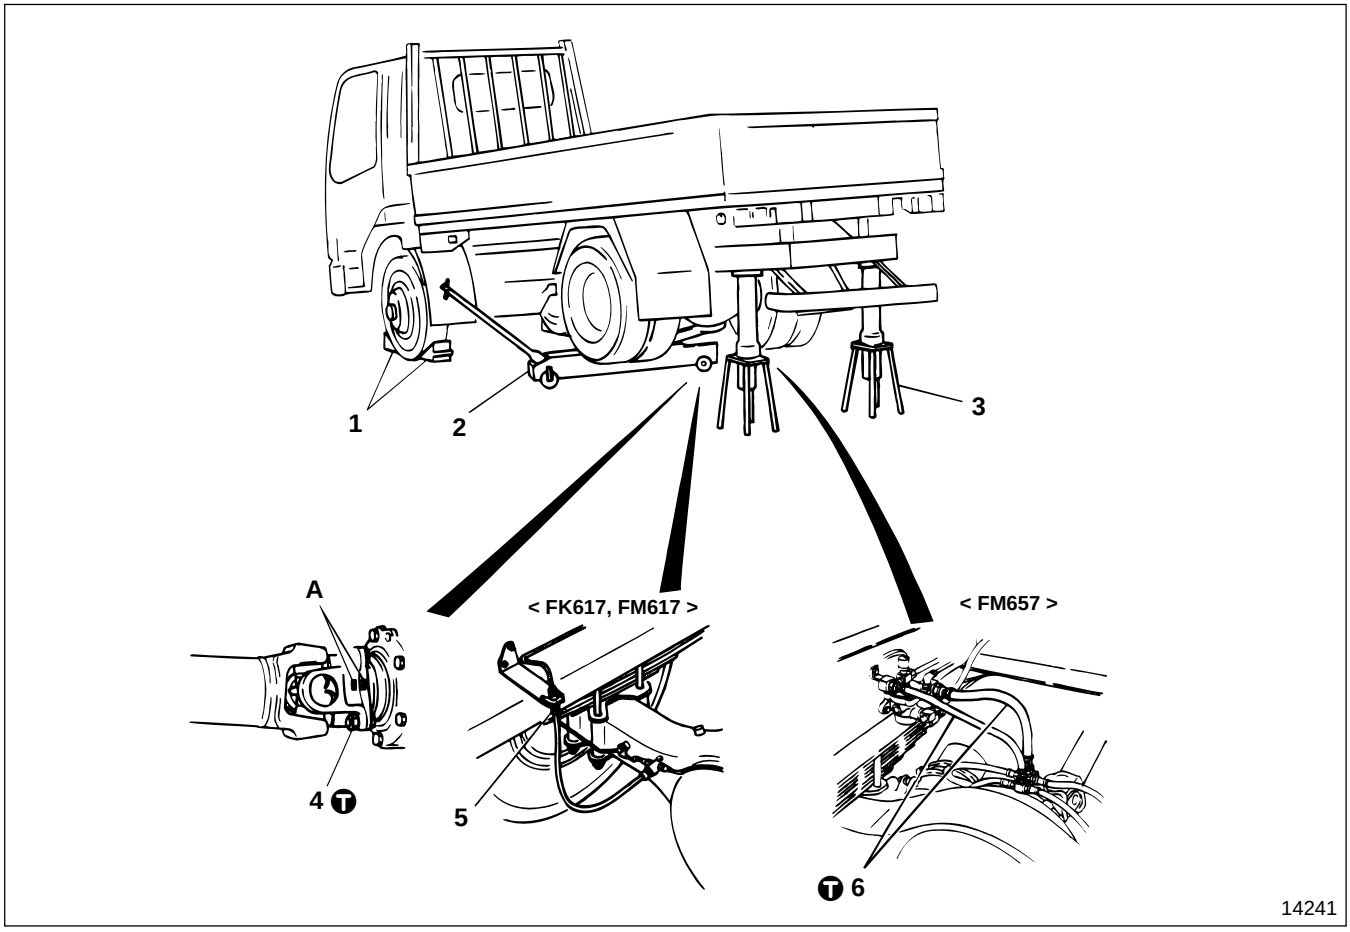
Leaf spring assembly **1** is installed between frame ***1** and rear axle ***2** to support the vehicle body mass and absorb vibration and shock from the road surface to prevent them from being directly transmitted to the vehicle body thereby protecting the crew, the vehicle body, and the cargo. In addition, irregular vibration from the wheels is restrained, ensuring driving stability.

https://truckmanualshub.com/

Possible causes \ Symptoms		Ride spongy	Noise generated when vehicle is unloaded	Impact transmitted from uneven road surface	Noise generated when vehicle is loaded	Excessive rolling while cruising	Periodic jolts caused by the road surface	Remarks
Leaf spring	Cracked or damaged			○				
	Damaged		○					
	Spring bracket broken				○			
	U-bolts loose				○			
	Spring bushing worn		○					
Shackle pins thrust play excessive			○					
Sliding seat < FM > or helper stopper damaged or broken					○			
Tire	Tires worn unevenly						○	
	Tires and wheels unbalanced						○	Gr 31
	Air pressure excessive			○				

https://truckmanualshub.com/

WORK BEFORE REMOVAL AND INSTALLATION OF REAR SUSPENSION



● **Removal sequence**

1. Place wheel chocks.
2. Jack up the rear axle with a garage jack.
3. Support the rear frame on rigid racks.
4. Put alignment marks **A** on the rear axle companion flange and the propeller shaft flange yoke, then remove the nuts (on the joint between the rear axle and the propeller shaft).
5. Remove the brake hose joint (on the frame). < FK617, FM617 >
6. Remove the brake hose joint (on the frame side). < FM657 >

WARNING

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION

Be sure to protect the brake hose from dust by fitting blanking plugs.

● **Installation sequence**

Follow the removal sequence in reverse.

https://truckmanualshub.com/

WARNING

You must bleed air from the brake system after installing the brake hose, failure to do so would cause the brake to malfunction. Gr 35A

CAUTION

Be sure that the brake hose is not twisted when you install it.

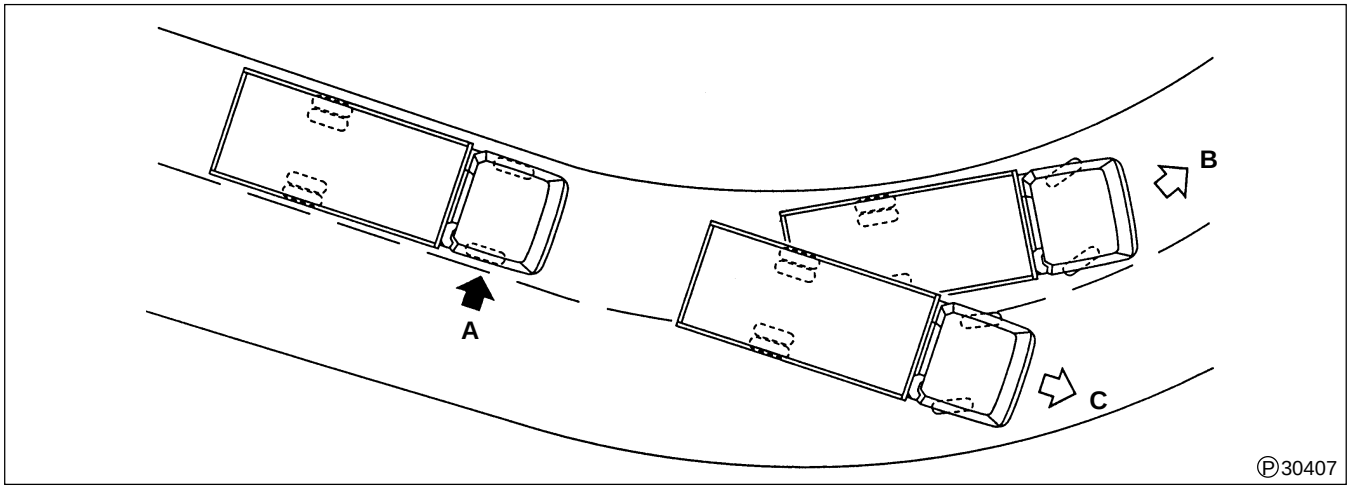
Anti-lock brake system prevents the slippage of tires resulting from wheel lockup that occurs during sudden braking on slippery pavement, thus helping maintain controllability and directional stability of the vehicle.
The following section explains how wheel lockup affects the vehicle's movement and directional stability.

https://truckmanualshub.com/

Wheel lockup

Rotating tires of a moving vehicle have a tendency to travel in the direction of tire rotation. Therefore, a driver can control the vehicle's movement by turning the steering wheel to move the front tires to a desired direction. In a vehicle not equipped with Anti-lock brake system, when a driver presses the brake pedal all the way, wheel lockup occurs and tires stop rotating while the vehicle is still moving. Tires in this condition lose the tendency to maintain the direction of travel and slip in a direction of an externally applied force regardless of the tires' rotating direction. In other words, when wheels lock, the vehicle loses its directional stability, disallowing the driver to control the vehicle's movement. Anti-lock brake system eases the braking force on wheels before wheel lockup occurs, thus maintaining controllability and directional stability.

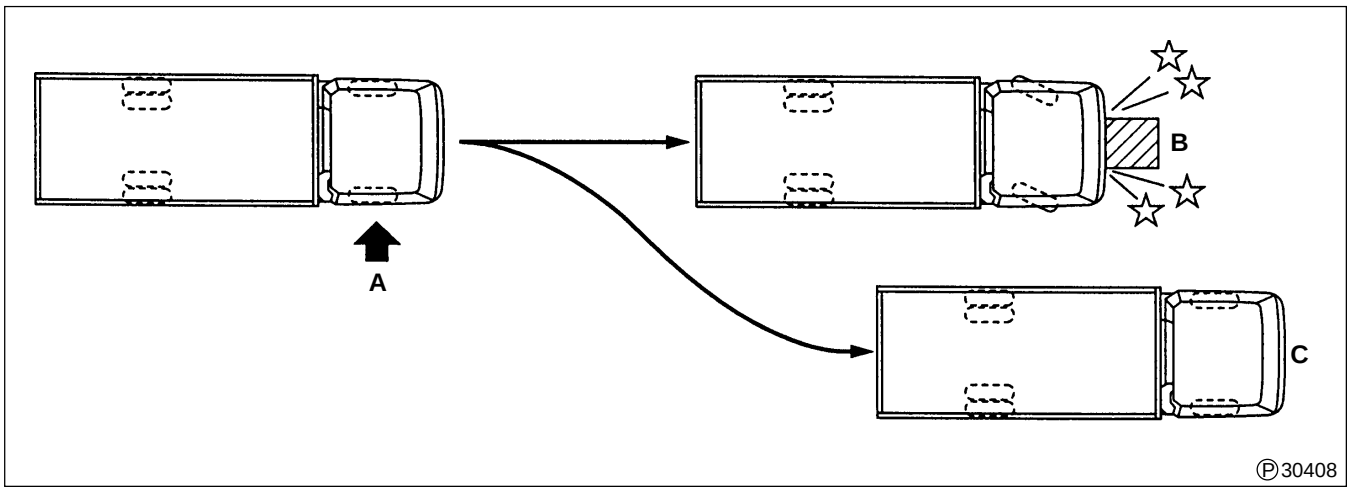
(1) Wheel lockup during cornering on slippery road



When wheel lockup occurs during braking at a curve on slippery pavement, the vehicle loses its directional stability and does not move in the steered direction.

A: Braking point (wheel lockup)
B: Steered direction
C: Vehicle continues to travel straight.

(2)Wheel lockup on straightway on slippery pavement

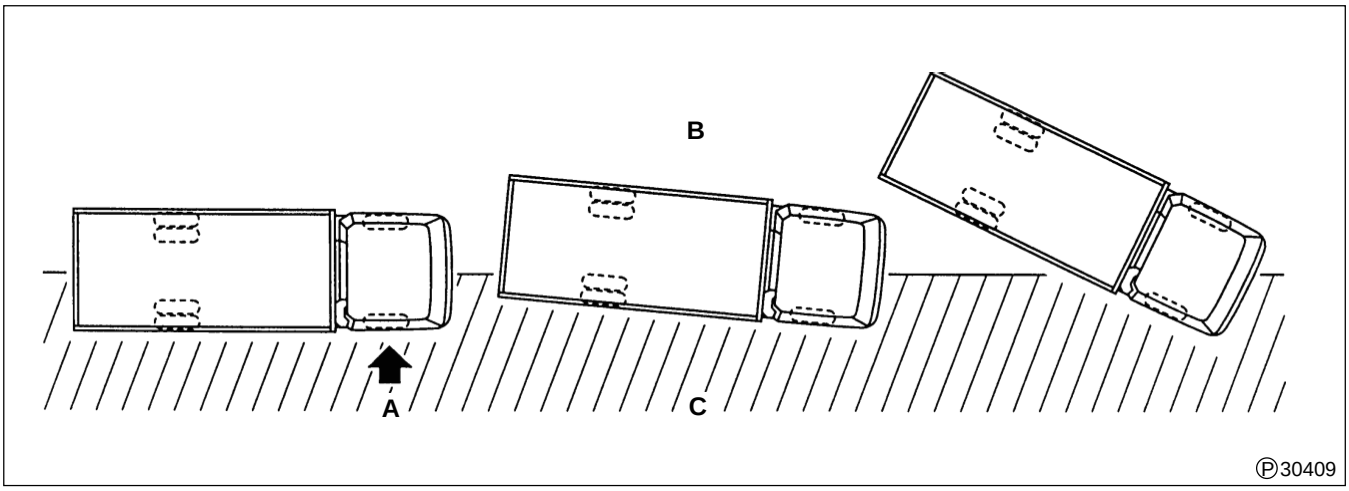


When wheel lockup occurs as a driver applies sudden braking on a straightway to avoid an obstacle ahead, the vehicle loses its directional stability and controllability. When this happens, the driver cannot control the vehicle's movement to avoid hitting the obstacle.

A: Braking point (wheel lockup)
B: Obstacle
C: Intended direction of vehicle movement

https://truckmanualshub.com/

(3) Wheel lockup on surfaces with split μ factors (road surface with different friction coefficients for left and right wheels)



If the brake is applied hard when the friction coefficient of a road surface is different for the left and right tires, the tires which are on a surface with a lower friction coefficient lock up first and start sliding. Since the sliding of the tires on one side of the vehicle causes an imbalance in the stopping power between the left and right tires, one side of the vehicle slows down while the other side continues traveling at the same speed, resulting in the loss of directional stability. In this condition, the driver cannot maneuver the vehicle properly. When this happens during sudden braking, the vehicle spins.

A: Braking point (wheel lockup)
B: Slippery pavement
C: Non-slippery pavement

To prevent the above mentioned conditions, Anti-lock brake system controls the braking force to provide optimum stopping power to each wheel and prevents wheel lockup. Therefore, the vehicle maintains controllability and directional stability during hard braking without slipping or sliding.

https://truckmanualshub.com/

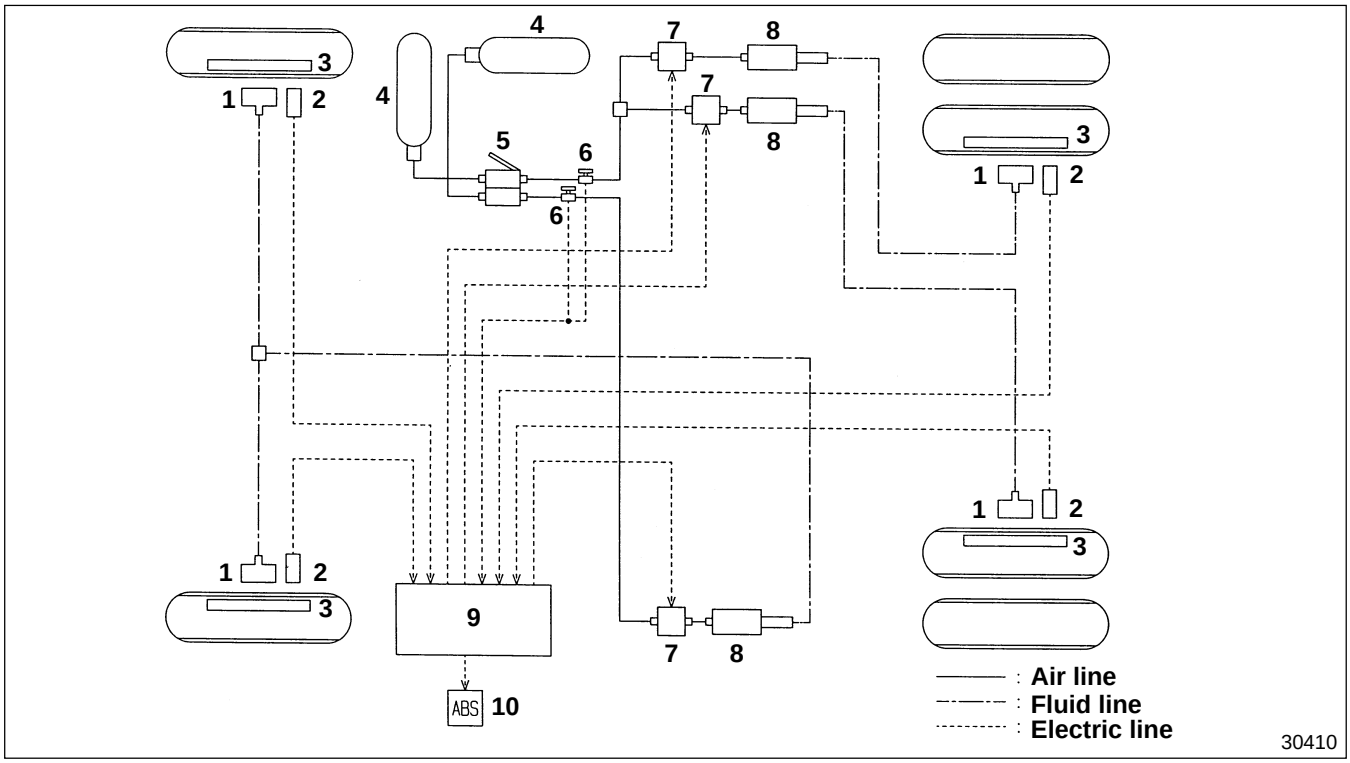
● Anti-lock brake system structure

Anti-lock brake system consists of wheel speed sensors **2** that detect wheel speed, control unit **9** that detects wheel lockup tendencies based on wheel speed data and outputs signals to control the braking force, control valves **7** that physically regulate the braking force, and Anti-lock brake system warning lamp **10** that indicates system abnormalities.

The following shows the Anti-lock brake system control process in a wheel lockup condition.

Schematic system diagram

<Air-over hydraulic brake>



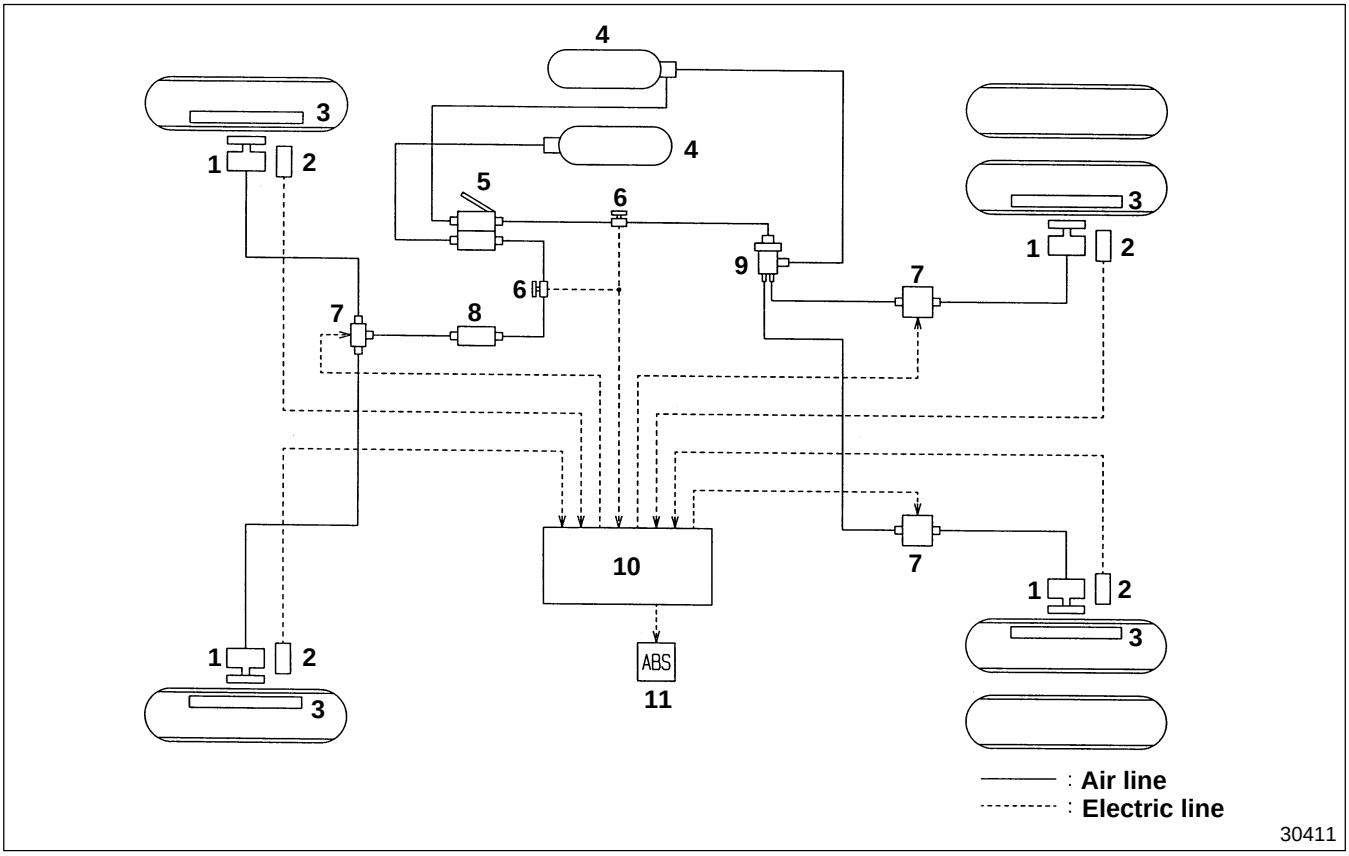
1 Wheel brake
2 Wheel speed sensor
3 Rotor
4 Air tank
5 Dual brake valve
6 Stop lamp switch
7 Control valve
8 Brake booster
9 Electronic control unit
10 Anti-lock brake system warning lamp

- Anti-lock brake system uses wheel speed sensors **2** and Electronic control unit **9** to monitor the rotating speed of wheels. When the wheel speed exceeds the preset deceleration speed or slip rate, the Electronic control unit detects it as the tendency leading to wheel lockup and activates control valves **7** to reduce air pressure inside brake boosters **8**. This decreases the braking force and prevents wheel lockup. Then, when the wheel speed increases, the wheel speed sensors send signals to the control valves by way of the Electronic control unit to increase air pressure in the brake boosters to augment the braking force.
- This control cycle is repeated to prevent wheel lockup on slippery pavements and ensure the vehicle's directional stability during braking. The 4-sensor 3-channel Anti-lock brake system uses four wheel speed sensors **2**, which are located at the front and rear wheels, to control each of the four wheels. For the front wheels, the control function is integrated for the left and right wheels.

https://truckmanualshub.com/

Schematic system diagram

<Full-air brake>



1 Brake chamber

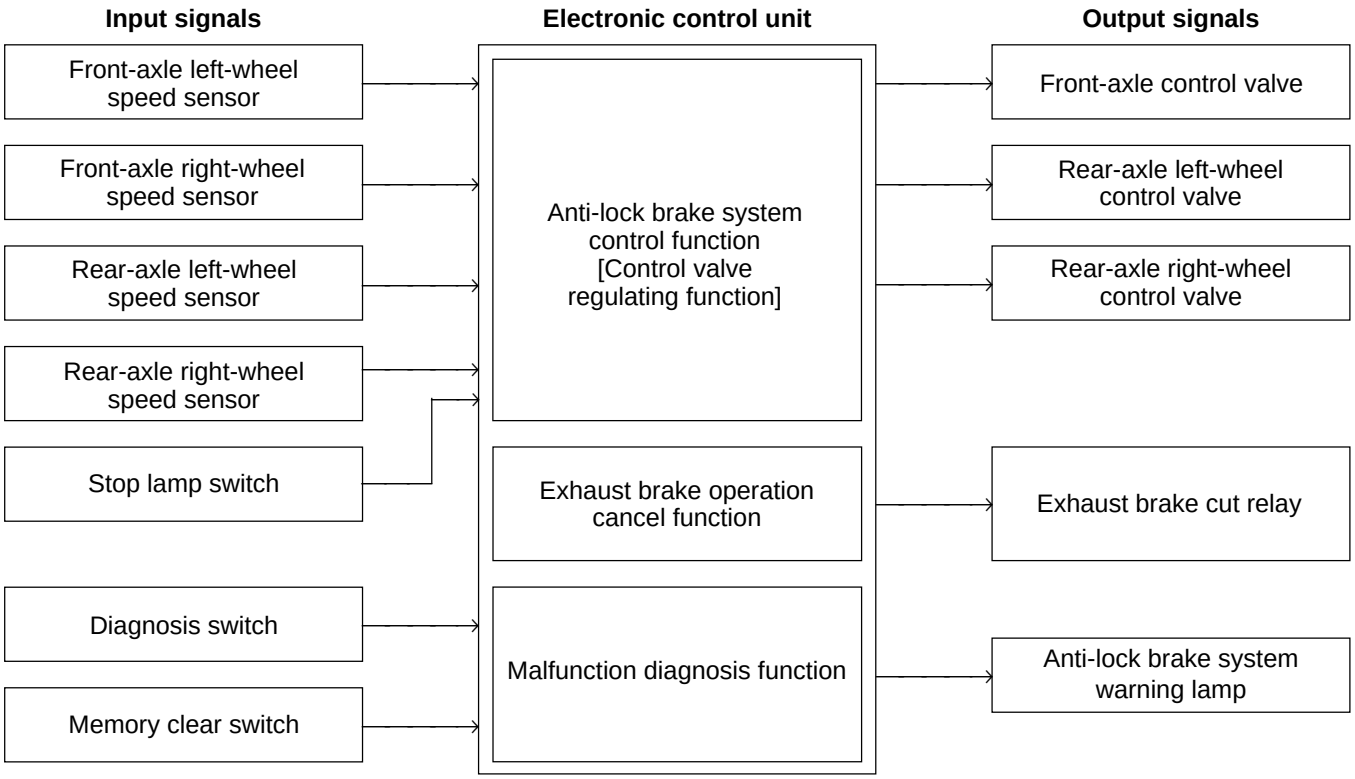
3 Rotor
4 Air tank
5 Dual brake valve
6 Stop lamp switch
7 Control valve
8 Quick release valve
9 Relay valve
10 Electronic control unit
11 Anti-lock brake system warning lamp

- Anti-lock brake system uses wheel speed sensors **2** and Electronic control unit **10** to monitor the rotating speed of wheels. When the wheel speed exceeds the preset deceleration speed or slip rate, the Electronic control unit detects it as a wheel lockup tendency and activates control valves **7** to reduce air pressure inside brake chambers **1**. This decreases the braking force and prevents wheel lockup. Then, when the wheel speed increases, the wheel speed sensors send signals to the control valves by way of the Electronic control unit to increase air pressure in the brake chambers to augment the braking force.
- This control cycle is repeated to prevent wheel lockup on slippery pavements and ensure the vehicle's directional stability during braking. The 4-sensor 3-channel Anti-lock brake system uses four wheel speed sensors **2**, which are located at the front and rear wheels, to control each of the four wheels. For the front wheels, the control function is integrated for the left and right wheels.

https://truckmanualshub.com/

Anti-lock brake system function



Anti-lock brake system malfunction diagnosis function

When the Electronic control unit detects malfunction of the following components, it turns on the Anti-lock brake system warning lamp to indicate the system abnormality.

- Broken wire, short-circuit or output abnormality in wheel speed sensors
- Broken wire or short-circuit in outlet and holding valves of control valves
- Broken wire, short-circuit or power supply voltage abnormality in power relays
- Abnormal detection of Electronic control unit

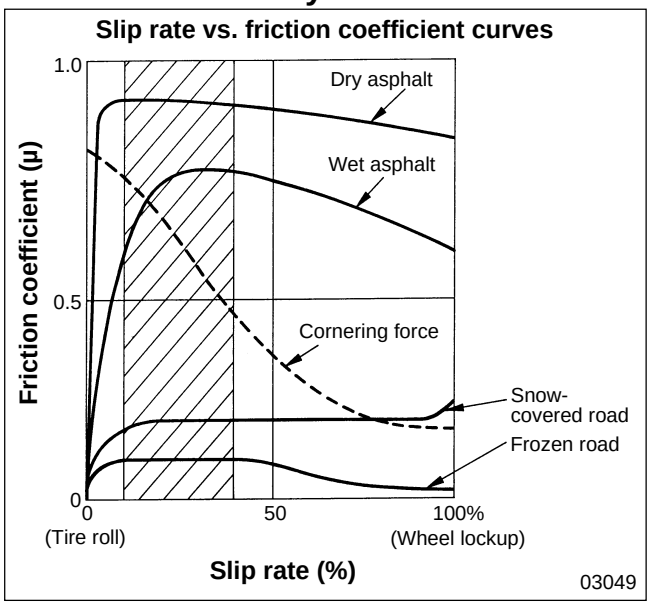
● Anti-lock brake system control



To provide optimum stopping power, Anti-lock brake system controls the braking force based on the slip rate determined by the relationship between the wheel speed and vehicle speed. When the brake is applied, the resulting force creates resistance which slows down the wheel rotation, thus reducing the speed of the vehicle. However, inertia acts on the vehicle and maintains the vehicle's forward movement despite the stopping force applied by the tires. When there is a difference between the wheel speed and vehicle speed, slipping occurs. The degree of slippage is expressed by a slip rate.

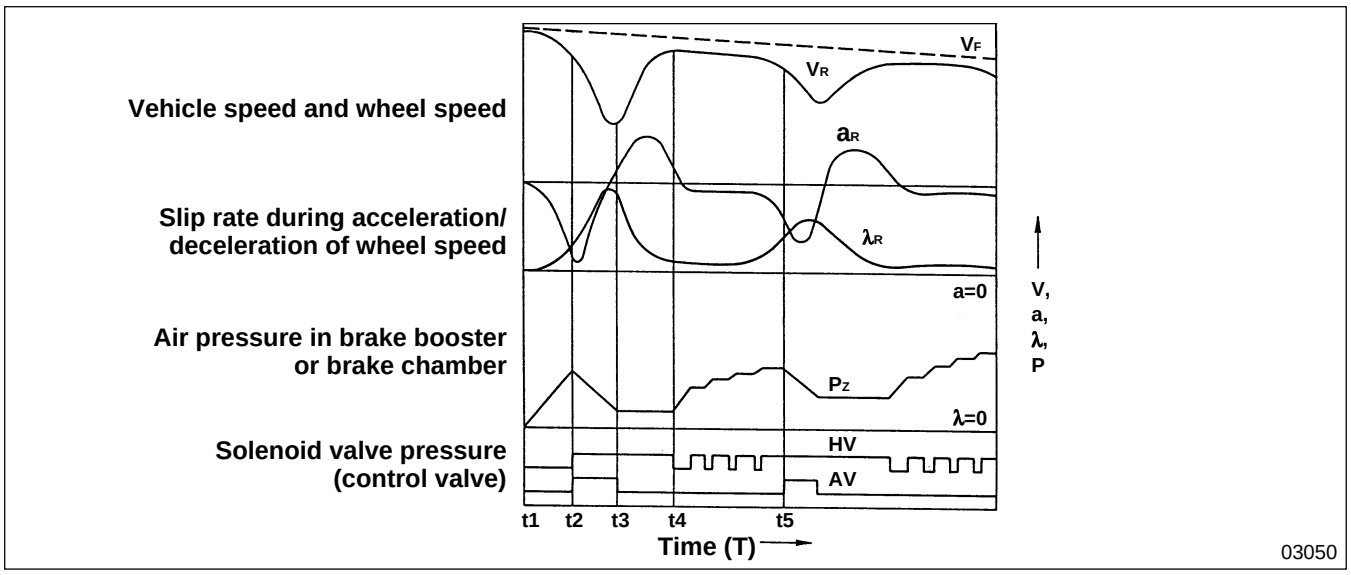
$$\text{Slip rate (\%)} = \frac{\text{Vehicle speed} - \text{Wheel speed}}{\text{Vehicle speed}} \times 100$$

When the slip rate is 0%, there is no slippage between the tires and pavement. The slip rate of 100% refers to a wheel lockup condition.

The graph shows the relationship between the slip rate and the friction coefficient of tire and pavement. In a vehicle equipped with Anti-lock brake system, the Electronic control unit and control valves adjust the braking force and maintains it within the shaded area on the graph where the friction coefficient is high, thus preventing tire slippage and maintaining stability during stopping.

● Anti-lock brake system operation

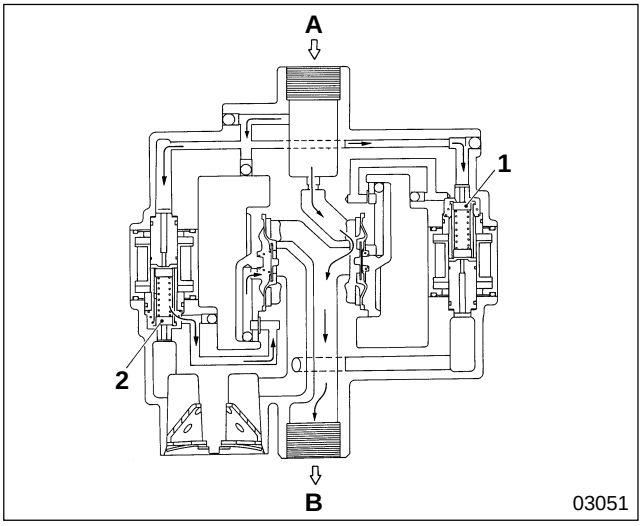
Characteristic curve



The above Anti-lock brake system characteristic graph shows the time-based changes in vehicle speed, wheel speed of individual tires, and brake pressure levels during braking. The Electronic control unit calculates the wheel speed and estimates the vehicle speed based on signals sent from wheel speed sensors, and continuously monitors the slip rate and deceleration speed. When the Electronic control unit detects a tendency toward wheel lockup, it sends a signal to the solenoid valves of the control valves. The following shows the control system.

- **V_F** : Vehicle speed
- **V_R** : Wheel speed
- **a_R** : Acceleration/deceleration of wheel speed
- **λ_R** : Slip rate
- **P_Z** : Air pressure inside brake booster <air-over hydraulic brake> or brake chamber <full-air brake>
- **HV** : Solenoid valve (Pressure holding valve of control valve)
- **AV** : Solenoid valve (Outlet valve of control valve)

https://truckmanualshub.com/

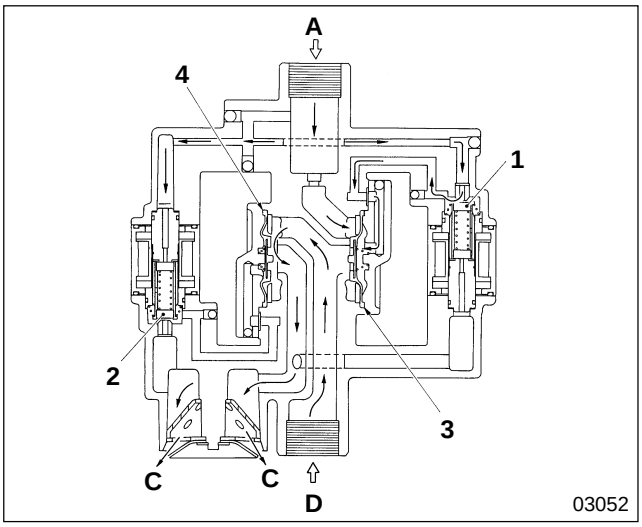


During normal braking

When there is no tendency toward wheel lockup under normal braking, solenoid valves **1**, **2** do not activate, thus air pressure is fed from the dual brake valve to the air master.

A: From dual brake valve < air-over hydraulic brake > From quick release valve (front) and relay valve (rear) < full-air brake >

B: To brake booster < air-over hydraulic brake > To brake chamber < full-air brake >



During depressurizing

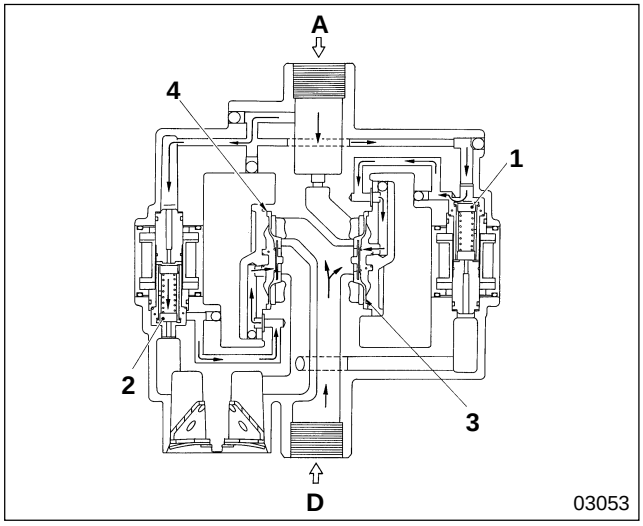
- When the brake is applied at t_1 on the previous Anti-lock brake system characteristic graph, the air pressure inside the brake boosters or brake chambers increases, and the vehicle speed and wheel speed start decreasing. When the wheels show a tendency toward wheel lockup at t_2 on the graph, the Electronic control unit outputs a control signal to turn ON solenoid valve (holding valve) **1** and solenoid valve (outlet valve) **2**.
- Pressure holding valve **3** closes, and outlet valve **4** opens, discharging the air from the brake booster or brake chamber to minimize the wheel lockup tendency. ($t_2 \rightarrow t_3$)

A: From dual brake valve < air-over hydraulic brake > From quick release valve (front) and relay valve (rear) < full-air brake >

C: Pressure discharge

D: From brake booster < air-over hydraulic brake > From brake chamber < full-air brake >

https://truckmanualshub.com/



During pressure holding

- At t_3 on the previous Anti-lock brake system characteristic graph, solenoid valve (outlet valve) **2** turns OFF and closes outlet valve **4**. Therefore, the air pressure inside the brake booster or brake chamber is retained. This makes the slip rate closer to ($\lambda = 0$) and the wheel speed increases.
- At t_4, solenoid valve (holding valve) **1** repeats ON and OFF operations until t_5. Momentary opening and closing of pressure holding valve **3** increase the pressure in steps. This operation reduces the wheel speed. The above control cycle ($t_2 \rightarrow t_5$) is repeated until the vehicle comes to a complete stop.

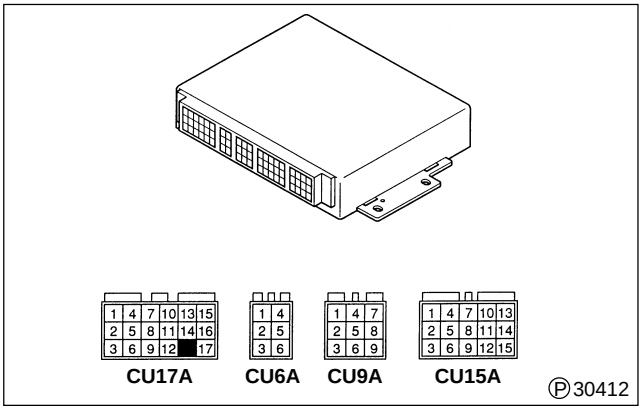
  A: From dual brake valve < air-over hydraulic brake >
  From quick release valve (front) and relay valve (rear) < full-air brake >

  D: From brake booster < air-over hydraulic brake >
  From brake chamber < full-air brake >

Anti-lock brake system and exhaust brake

On slippery pavement, the use of the exhaust brake can result in a condition similar to wheel lockup. Therefore, if the exhaust brake is activated while the Anti-lock brake system control is in operation, it hinders the Anti-lock brake system from providing proper brake control. To prevent this, when the Anti-lock brake system is in operation, the exhaust brake is deactivated even when the exhaust brake switch is turned ON.
When the Anti-lock brake system deactivates, the exhaust brake provides its normal function when the exhaust brake switch is ON.

https://truckmanualshub.com/



● Anti-lock brake system components

Electronic control unit

This component calculates the wheel speed and estimates the vehicle speed based on a signal sent from the wheel speed sensors. Based on the calculation results, it determines a tendency for wheel lockup, and sends a brake pressure control signal to the solenoid valves of the control valves to regulate air pressure accordingly.
The Electronic control unit is equipped with a self-diagnosis function. If an abnormality occurs, the Electronic control unit turns on the warning lamp to indicates the system malfunction and deactivates the Anti-lock brake system control to set the brake system in the normal condition (without Anti-lock brake system control).

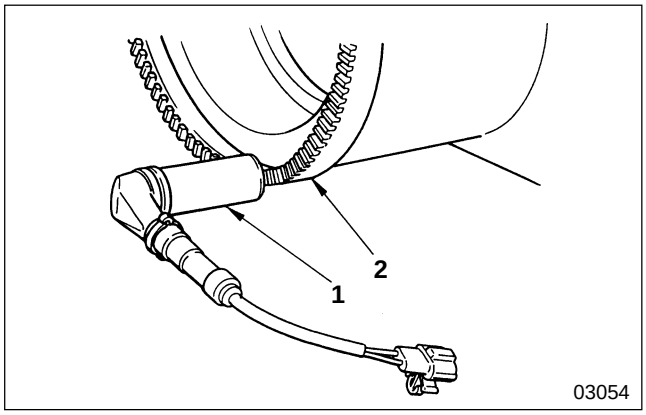
Control valve

The valve is comprised of solenoid valves **3** that receive a signal from the Electronic control unit and controls air pressure supplied from the dual brake valve, and diaphragm valves **4**.

The two solenoid valves operate in different combinations to increase, maintain and decrease air pressure.

A: Inlet port 1 (From dual brake valve < air-over hydraulic brake > or quick release valve (front), and relay valve (rear) < full-air brake >)

B: Outlet port 2 (To brake booster < air-over hydraulic brake > or brake chamber < full-air brake >)



Wheel speed sensor

Wheel speed sensor **1** detects the rotating speed of the wheel and sends a signal to the Electronic control unit. The sensor unit houses an electromagnetic pickup with a permanent magnet core placed inside the coil.

Rotor **2** is connected to the wheel hub. The rotor has a ring gear, and the evenly spaced tooth ridges are positioned perpendicular to the sensor. When the wheel rotates and the rotor teeth cross the magnetic flux of the sensor, the electric potential difference generated by the coil results in an alternate-current voltage that is directly proportional to the rotating speed. The resulting signal is then sent to the Electronic control unit.

ON-VEHICLE INSPECTION AND ADJUSTMENT

Periodic Inspection Procedures

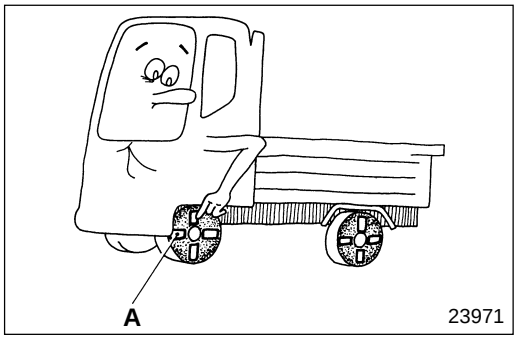
(1) Periodic inspection of Anti-lock brake system

- Inspect the vehicle's Anti-lock brake system following the procedure below.
- If an abnormality is found in this inspection, further inspect the Anti-lock brake system using MUT-II (multi-use tester) or the diagnosis switch by referring to TROUBLESHOOTING section.
P35C-25

- Inspection procedure

① With the vehicle stationary, press the brake pedal and inspect the control valves for air leaks.
If air leaks from the control valve unit, replace it. If air leaks from the air pipe or connector, tighten the joint.
Then, release the brake pedal and inspect the air discharge condition of the control valve. If there is no air discharging operation, replace the control valve.
Conduct the above inspection for each control valve.

② Inspection using brake tester
Check the braking force at each wheel with a brake tester by following the inspection procedure for ordinary vehicles.
If an abnormality is found, inspect the wheel brake units, service brake system and control valves.



③ Drive the vehicle and check the operation of the Anti-lock brake system.
- Conduct a test drive at an open area to ensure safety.
- Conduct a test drive without cargo.

Attach white tape **A** on the sides of tires, so that it is easy to observe the rotation of the front and rear wheels.
- Turn the starter switch from the OFF position to the ON position, and make sure that the ABS warning lamp lights.
Then, check that the ABS warning lamp turns off approximately two seconds after the starter switch is turned on.
- Drive the vehicle at a speed of 20 to 30 km/h {12 to 19 mph}, and apply a sudden brake. Make sure that wheel lockup does not occur in any of the tires.

(2) Operating conditions resulting from Anti-lock brake system malfunction

Lamp condition	Possible causes		Fail-safe functions (operation in the case of malfunction)
ABS warning lamp ABS Warning lamp does not turn off two seconds after starter switch is turned on. ① ABS warning lamp lights when starter switch is turned to ON position, does not turn off two seconds after starter switch is turned on. ② ABS warning lamp lights during driving. ③ ABS warning lamp lights after 30 to 60 minutes regardless of whether vehicle is driven or stationary.	Power supply system (Lamp condition: ①, ②)	Faulty relay (for power supply) inside Electronic control unit	Anti-lock brake system control becomes inactive for all systems, and all wheels operate under normal brake system.
		Blown fuse	
		Broken wire in harness, short-circuit or disconnected connector, faulty contact or faulty grounding	
		Low battery voltage	
	Wheel speed sensor system	Excessive clearance between wheel speed sensor and rotor (Lamp condition: ②)	• When malfunction occurs in one front wheel Properly operating front wheel speed sensor of the other front wheel is used for Anti-lock brake system control of the wheel with malfunctioning sensor. • When malfunction occurs in both front wheels Anti-lock brake system control is deactivated for front wheels. • When malfunction occurs in one rear wheel Anti-lock brake system control is provided only to the rear wheel with properly operating sensor.
		Defective wheel speed sensor (Lamp condition: ①, ②)	
		Broken wire, short-circuit or disconnected connector or faulty contact in wheel speed sensor harness (Lamp condition: ①, ②)	
	Control valve system (Lamp condition: ①, ②)	Short-circuit in coil or power-supply side of harness	Anti-lock brake system control becomes inactive for all systems, and all wheels operate under normal brake system.
		Defective relay (for power supply) inside Electronic control unit	
	Control valve	Broken wire or short-circuit in coil or harness	Only the properly operating control valves are used for Anti-lock brake system control.
	Electronic control unit (Lamp condition: ①, ③)	Electronic control unit internal malfunction or disconnected connector	Anti-lock brake system control becomes inactive for all systems, and all wheels operate under normal brake system.
	ABS warning lamp system (Lamp condition: ①, ②)	Short-circuit in harness	Anti-lock brake system control operates normally.

ON-VEHICLE INSPECTION AND ADJUSTMENT

Adjustment of Wheel Speed Sensor Clearance

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

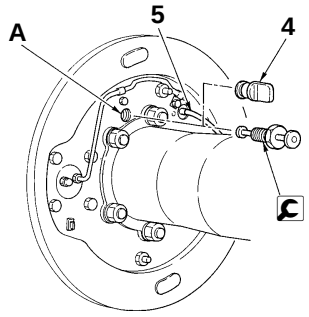
Location	Parts to be tightened	Tightening torque	Remarks
7	Bolt (Anchor bracket mounting)	135 {100, 13.8}	—

Special tools

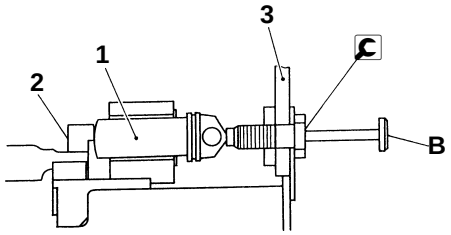
Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Adjuster  14912	MH062080	Adjustment of wheel speed sensor clearance

< Air-over hydraulic brake >



14913



23974

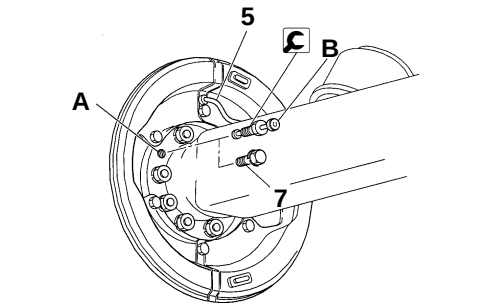
Tighten adjuster to extend wheel speed sensor **1**, and adjust clearance between the sensor and rotor **2**.

- Remove plug **4** located on the back side of back plate **3**.
- Mount adjuster in adjustment hole **A**, and tighten the adjuster.
- Wheel speed sensor **1** contacts the rotor before adjuster is completely tightened. Therefore, do not press shaft **B**, and tighten the adjuster until resistance is felt.
- Be sure to reinstall plug **4** after adjustment.

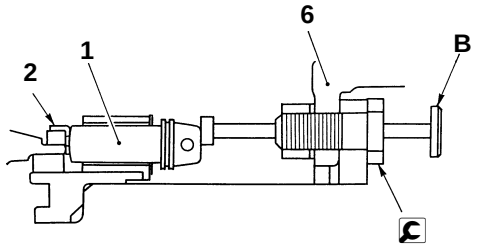
5: Wheel speed sensor harness

https://truckmanualshub.com/

< Full-air brake >



Ⓟ30555



23976

Tighten adjuster to extend wheel speed sensor **1**, and adjust clearance between the sensor and rotor **2**.

- Remove bolt **7** located on the back side of anchor bracket **6**.
- Mount adjuster in adjustment hole **A**, and tighten the adjuster.
- Wheel speed sensor **1** contacts the rotor before adjuster is completely tightened. Therefore, do not press shaft **B**, and tighten the adjuster until resistance is felt.
- After adjustment, tighten bolt **7** to the specified torque.

  5: Wheel speed sensor harness

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

Inspection of Wheel Speed Sensor Signal Waveform Using Oscilloscope

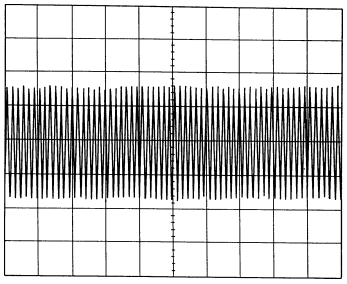
Inspect the rotor for dents using an oscilloscope, since the tester cannot be used for dent detection.

NOTE

Use an oscilloscope with a waveform recording function.

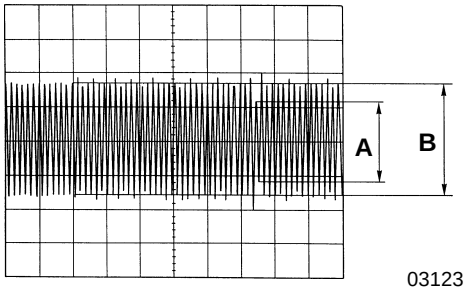
- Lift the wheel to be tested off the ground, and disconnect the connector at the wheel speed sensor.
- Connect the terminal of the oscilloscope to the terminal of the disconnected connector. Rotate the wheel at a constant speed. Check the waveform shown on the oscilloscope to check for dents on the rotor.

Normal waveform (no dent on rotor)



03122

Abnormal waveform (with dents on rotor)



03123

- Rotor dents are often made by the rotor press-fit on the hub end contacting the axle during installation of the hub and brake drum assembly on the axle. When installing the hub & brake drum assembly, pay close attention to prevent the rotor from contacting other parts.

A: Vmin (Minimum peak)

B: Vmean (Average of maximum peaks)

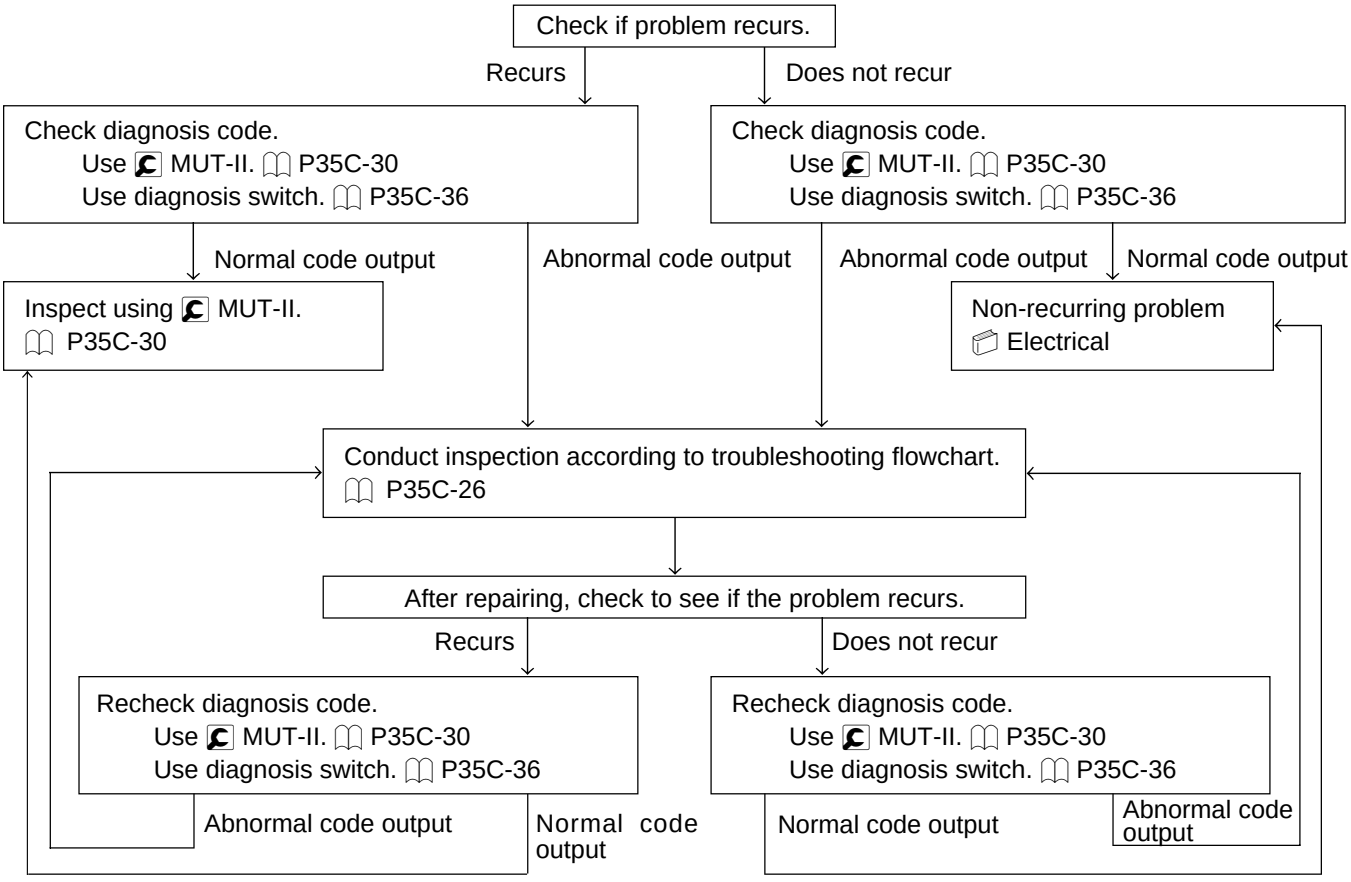
$$\frac{\text{Vmean} - \text{Vmin}}{\text{Vmean}} = 0.2(20\% \text{ or lower})$$

If more than 20%, replace the rotor.

https://truckmanualshub.com/

Troubleshooting Procedures

Inspection the following components when the ABS warning lamp lights.
When the above warning lamp lights, conduct an inspection according to the following flowchart.



https://truckmanualshub.com/

TROUBLESHOOTING

Troubleshooting Flowchart

- The Electronic control unit is equipped with a diagnosis function that monitors system operations. If the diagnosis function detects an abnormality, it turns on the ABS warning lamp on the meter cluster and stores the problem location data.
- The stored problem location data can be recalled by using MUT-II or the diagnosis switch.
- Follow the instruction below to recall diagnosis codes.

(1) MUT-II
MUT-II displays diagnosis codes that indicate problem locations. The MUT-II can also be used to check service data and actuator operations. P35C-30

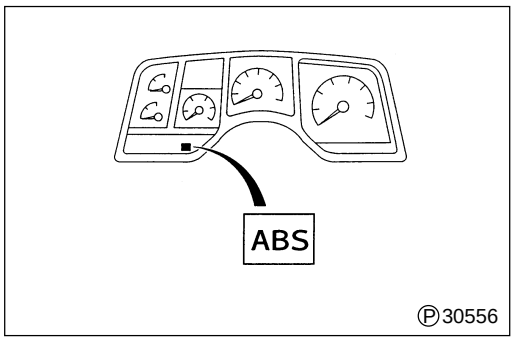
(2) Diagnosis switch
The diagnosis switch allows the indication of diagnosis codes and problem locations. When the diagnosis switch is operated, the ABS warning lamp on the meter cluster flashes. The number of lamp flashing operations indicates the code of problem location stored in the Electronic control unit. P35C-36

(3) Deletion of diagnosis code data
The method of erasing diagnosis code data from the Electronic control unit memory differs from model to model. Follow the procedure below.
- MUT-II P35C-31
- Memory clear switch P35C-37

- Check the following items before conducting the troubleshooting described on the following page.

(1) Check to make sure that air pressure in the air tank is 685 kPa {100 lbf/in^2, 7 kgf/cm^2} or higher.
(2) Check to make sure that the battery voltage is 12 V or higher.
(3) Check harness and connectors for secure connection. Before disconnecting connectors, turn starter switch to the LOCK position and wait for 20 seconds or longer.

- To inspect the ABS warning lamp, follow the procedure below.



- Check to see that the ABS warning lamp turns on and off in the following manner.
- Turn the starter switch to the ON position and check to see that the ABS warning lamp lights.
- The ABS warning lamp turns off approximately two seconds after the starter switch is turned on.
- If the warning lamp does not turn on and off in the above manner, check the diagnosis code. P35C-30, 36

TROUBLESHOOTING

Tester

To inspect Anti-lock brake system, use MUT-II.

(1) The MUT-II displays inspection items on its LCD for easy data reading. It also enables detection of connection errors after rear wheel sensor connectors are repaired.

(2) The following items can be checked by the tester.

Inspection item
Diagnosis code
Service data
Actuator operation
Electronic control unit power supply voltage
Control valve power supply voltage
Stop lamp switch
Exhaust brake cut relay
ABS warning lamp
Control valve function
Wheel speed sensor function
Diagnosis switch

For details of tester inspection items, see the following pages. P35C-30

https://truckmanualshub.com/

Special tools

Unit : mm {in.}

Tool name and shape	Part No.	Application
MUT-II PLUS  19492	MB991496-A	Inspection of Anti-lock brake system
MUT-II harness (for data communication)  19141	MK327601	
ROM pack (MRT-E4)  19493	MK327927	
MUT-II harness (for circuit tester)  20536	MB991499	
Memory card (for MUT-II)  20538	MB991500	

https://truckmanualshub.com/

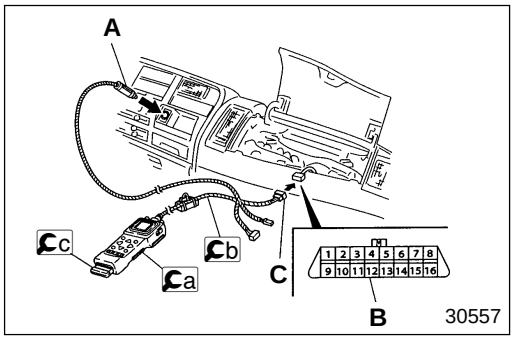
TROUBLESHOOTING

Procedure of Inspection Using MUT-II

Use the MUT-II to conduct necessary service operations listed below.

Test the operations of actuators related to the problem locations indicated by diagnosis codes, and inspect data list.

- Recall of diagnosis codes P35C-31
  Use the self-diagnosis function to recall the diagnosis codes stored in the Electronic control unit.
  Diagnosis codes of both current and previous malfunctions are indicated.
  The diagnosis code of the current malfunction is indicated when the starter switch remains in the ON position after abnormality generation.
  When the starter switch is turned from the ON position to the ACC or LOCK position after abnormality generation, diagnosis codes of previous malfunctions stored in the Electronic control unit are indicated. Diagnosis codes of non-recurring problem malfunctions that generated during vehicle operation but did not reproduce after the starter switch is turned from the ON position to the ACC or LOCK position are also stored as previous malfunctions.
- Deletion of diagnosis codes P35C-31
  Use the diagnosis code delete function in the special test mode to erase diagnosis codes stored in the Electronic control unit.
- Forced drive of devices P35C-35
  Use the actuator test function to forcibly turn devices on and off to check faulty device operations.
- Service data check and switch on/off check P35C-34
  Use the data list function to check the data of voltage and vehicle speed. When each switch is turned on and off in the data list mode using the tester, the MUT-II displays the ON and OFF switch status, thus allowing inspection of switches for proper function after repair or replacement is performed.
- Use the above MUT-II functions to locate causes of malfunctions.
- The following shows how to connect and use the MUT-II. For other MUT-II functions and further details, refer to the MUT-II operation manual.



Connection of MUT-II

- Turn the starter switch to the LOCK position.
- Connect Ca MUT-II and Cb MUT-II harness, and insert Cc ROM pack.
- Insert connector **A** into the cigarette lighter socket.
  Connect connector **C** (16-pin) to MUT-II connector **B** (16-pin) located inside the relay and fuse box.

NOTE

Regarding the operating procedure, refer to the MUT-II operation manual.

https://truckmanualshub.com/

Diagnosis code of current malfunction

- Turn the starter switch to the ON position.
- Check the diagnosis code using the self-diagnosis function of Ca MUT-II to obtain data of the problem location. P35C-32

Diagnosis codes of previous malfunctions

- Turn the starter switch to the ON position.
- With the diagnosis switch disconnected, disengage the memory clear switch to set the Electronic control unit to the previous malfunction indication mode. P35C-35
- Check the diagnosis codes of previous malfunctions using the self-diagnosis function of Ca MUT-II, and obtain data of problem locations. P35C-37
- After checking diagnosis codes, connect the diagnosis switch and memory clear switch in that order.

Deletion of diagnosis codes

- Turn the starter switch to the ON position.
- Delete all diagnosis codes stored in the Electronic control unit by using Ca MUT-II.

CAUTION

- **Before erasing diagnosis codes, test-drive the vehicle after the malfunction is repaired (when system is in normal condition), and make sure the ABS warning lamp is not lit.**
- **If diagnosis codes are deleted when some of the connectors are not connected or the system is still malfunctioning, the Electronic control unit becomes damaged.**

https://truckmanualshub.com/

Diagnosis Code Chart

MUT-II indication		Operation description
Item No.	Item name	
06	F-HV ON	Holding valve of front-axle control valve: ON
07	RL-HV ON	Holding valve of rear-axle left-wheel control valve: ON
08	RR-HV ON	Holding valve of rear-axle right-wheel control valve: ON
09	F-DV ON	Outlet valve of front-axle control valve: ON
11	RL-DV ON	Outlet valve of rear-axle left-wheel control valve: ON
12	RR-DV ON	Outlet valve of rear-axle right-wheel control valve: ON
15	EXB RLY ON	Exhaust brake cut relay: ON
16	EXB RLY OFF	Exhaust brake cut relay: OFF
19	ABS LAMP ON	ABS warning lamp: ON
20	ABS LANP OFF	ABS warning lamp: OFF

Item Nos. 15 and 16 are for vehicles equipped with an exhaust brake system.

https://truckmanualshub.com/

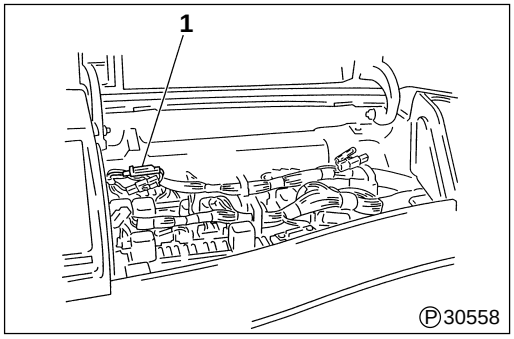
TROUBLESHOOTING

Procedure of Inspection Using Diagnosis Switch

- When the ABS warning lamp lights, analyze the problem by following the procedure below.
- Diagnosis codes are used for the analysis of malfunctions. Diagnosis codes of both current and previous malfunctions are indicated.
- The diagnosis code of the current malfunction is indicated when the starter switch remains in the ON position after abnormality generation.
- When the starter switch is turned from the ON position to the ACC or LOCK position after abnormality generation, diagnosis codes of previous malfunctions stored in the Electronic control unit are indicated. Diagnosis codes of non-recurring malfunctions that generated during vehicle operation but did not reproduce after the starter switch is turned from the ON position to the ACC or LOCK position are also stored as previous malfunctions.

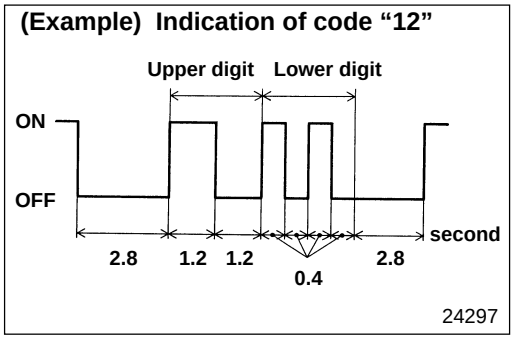
Diagnosis code indications and operations

Diagnosis switch	Memory clear switch		Current malfunction			
			Normal	Malfunction	Normal	Malfunction
			Previous malfunctions			
			Normal	Normal	Malfunction	Malfunction
Connect	Connect	ABS warning lamp	OFF	ON	OFF	ON
Disconnect	Connect		Lamp flashes to indicate diagnosis code for normal condition.	Lamp flashes to indicate diagnosis code of current malfunction.	Lamp flashes to indicate diagnosis code for normal condition.	Lamp flashes to indicate diagnosis code of current malfunction.
Disconnect	Disconnect		Lamp flashes to indicate diagnosis code for normal condition.	Lamp flashes to indicate diagnosis code of current malfunction.	Lamp flashes to indicate diagnosis codes of previous malfunctions.	Lamp flashes to indicate diagnosis codes of current and previous malfunctions.
Connect	Disconnect		OFF	ON	OFF	ON



Diagnosis code indication

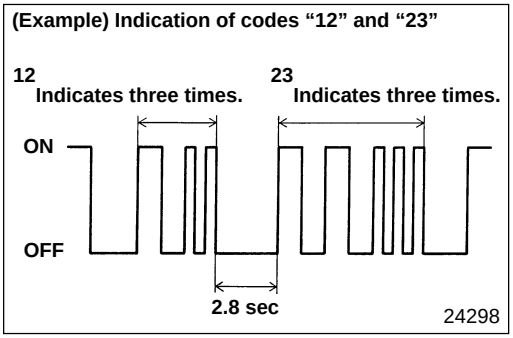
- Turn the starter switch to the ON position.
- Disconnect diagnosis switch **1** (white BN1A connector). The ABS warning lamp on the meter cluster begins flashing.
  The flashing pattern of the warning lamp indicates a diagnosis code. Check the code list to locate the problem location. 📖P35C-38



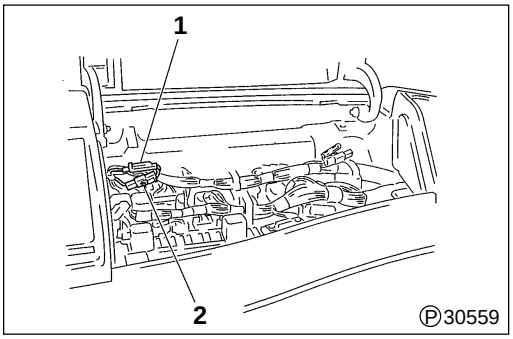
Reading diagnosis code of current malfunction

- After the Electronic control unit completes the self-diagnosis operation, the ABS warning lamp turns off in approximately 2.4 seconds, then starts indicating a diagnosis code.
  Each diagnosis code consists of two digits. The two digits are indicated in the following manner.
  - Tens digit indication
    The lamp remains ON for 1.2 seconds, then remains OFF for 1.2 seconds.
  - Ones digit indication
    The lamp remains ON for 0.4 second, then remains OFF for 0.4 second.
- Each malfunction code is indicated three consecutive times.

https://truckmanualshub.com/



- If there are two or more malfunction codes in the memory, the lamp indicates the first malfunction code three times, turns off for 2.8 seconds, then indicates the next code three times.
  The lamp continues indicating all malfunction codes stored in the memory even if diagnosis switch **1** (white BN1A connector) is disconnected in the middle of code indication.



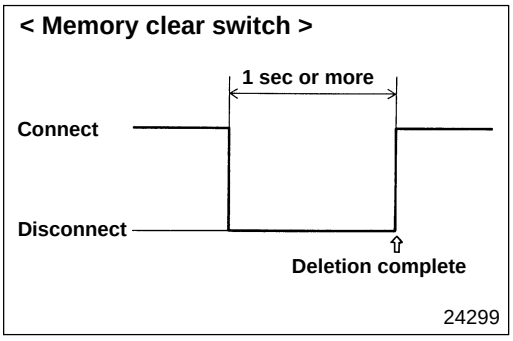
Reading diagnosis codes of previous malfunctions

- After reading the diagnosis code of the current malfunction, read the diagnosis codes of previous malfunctions.

CAUTION⚠

- **Note that connecting memory clear switch 2 (brown AL1A connector) erases diagnosis codes of current and previous malfunctions from the Electronic control unit memory.**
- **If diagnosis codes are deleted when some of the connectors are not connected or the system is still malfunctioning, the Electronic control unit becomes damaged.**

- To indicate diagnosis codes of previous malfunctions, with diagnosis switch **1** (white BN1A connector) disconnected, disengage memory clear switch **2** (brown AL1A connector). The ABS warning lamp starts flashing to indicate a diagnosis code.



Deleting diagnosis codes

CAUTION⚠

- **Before erasing diagnosis codes, test-drive the vehicle after the malfunction is repaired (when system is in normal condition), and make sure the ABS warning lamp is not lit.**
- **If diagnosis codes are deleted when some of the connectors are not connected or the system is still malfunctioning, the Electronic control unit becomes damaged.**

- Leave the starter switch in the ON position.
- After connecting diagnosis switch **1** (white BN1A connector), keep memory clear switch **2** (brown AL1A connector) disconnected for two seconds or more, then reconnect the memory clear switch.

TROUBLESHOOTING

Diagnosis Code Chart

Diagnosis code	Possible cause
11	Normal
21	Front-axle left-wheel speed sensor: Improper clearance
22	Excessive wobbling of front-axle left rotor
23	Damaged front-axle left rotor
24	Front-axle left-wheel speed sensor: Prolonged period of unstable output
25	Front-axle left-wheel speed sensor: Abnormally fast speed drop
26	Front-axle left-wheel speed sensor: Short-circuit to positive (+) wire, short-circuit to grounding wire, broken wire
27	Front-axle left-wheel speed sensor: Electronic control unit internal damage
31	Front-axle right-wheel speed sensor: Improper clearance
32	Excessive wobbling of front-axle right rotor
33	Damaged front-axle right rotor
34	Front-axle right-wheel speed sensor: Prolonged period of unstable output
35	Front-axle right-wheel speed sensor: Abnormally fast speed drop
36	Front-axle right-wheel speed sensor: Short-circuit to positive (+) wire, short-circuit to grounding wire, broken wire
37	Front-axle right-wheel speed sensor: Electronic control unit internal damage
41	Rear-axle left-wheel speed sensor: Improper clearance
42	Excessive wobbling of rear-axle left rotor
43	Damaged rear-axle left rotor
44	Rear-axle left-wheel speed sensor: Prolonged period of unstable output
45	Rear-axle left-wheel speed sensor: Abnormally fast speed drop
46	Rear-axle left-wheel speed sensor: Short-circuit to positive (+) wire, short-circuit to grounding wire, broken wire
47	Rear-axle left-wheel speed sensor: Electronic control unit internal damage
51	Rear-axle right-wheel speed sensor: Improper clearance
52	Excessive wobbling of rear-axle right rotor
53	Damaged rear-axle right rotor
54	Rear-axle right-wheel speed sensor: Prolonged period of unstable output
55	Rear-axle right-wheel speed sensor: Abnormally fast speed drop
56	Rear-axle right-wheel speed sensor: Short-circuit to positive (+) wire, short-circuit to grounding wire, broken wire
57	Rear-axle right-wheel speed sensor: Electronic control unit internal damage
61	Front-axle control valve: Short-circuit of outlet valve to positive (+) wire
62	Front-axle control valve: Short-circuit of outlet valve to grounding wire
63	Front-axle control valve: Broken wire in outlet valve
64	Front-axle control valve: Broken grounding wire
68	Front-axle control valve: Configuration error (*1)
75	Front-axle control valve: Short-circuit of holding valve to positive (+) wire
76	Front-axle control valve: Short-circuit of holding valve to grounding wire
77	Front-axle control valve: Broken wire in holding valve
78	Front-axle control valve: Configuration error (*1)
81	Rear-axle left-wheel control valve: Short-circuit of outlet valve to positive (+) wire
82	Rear-axle left-wheel control valve: Short-circuit of outlet valve to grounding wire
83	Rear-axle left-wheel control valve: Broken wire in outlet valve
84	Rear-axle left-wheel control valve: Broken grounding wire
85	Rear-axle left-wheel control valve: Short-circuit of holding valve to positive (+) wire
86	Rear-axle left-wheel control valve: Short-circuit of holding valve to grounding wire
87	Rear-axle left-wheel control valve: Broken wire in holding valve
89	Control valve grounding 2: Short-circuit to positive (+) wire
8A	Control valve grounding 2: Short-circuit to negative (-) wire

https://truckmanualshub.com/

Diagnosis code	Possible cause
91	Rear-axle right-wheel control valve: Short-circuit of outlet valve to positive (+) wire
92	Rear-axle right-wheel control valve: Short-circuit of outlet valve to grounding wire
93	Rear-axle right-wheel control valve: Broken wire in outlet valve
94	Rear-axle right-wheel control valve: Broken grounding wire
95	Rear-axle right-wheel control valve: Short-circuit of holding valve to positive (+) wire
96	Rear-axle right-wheel control valve: Short-circuit of holding valve to grounding wire
97	Rear-axle right-wheel control valve: Broken wire in holding valve
99	Control valve grounding 1: Short-circuit to positive (+) wire
9A	Control valve grounding 1: Short-circuit to negative (-) wire
D1	Electronic control unit internal damage
D2	Electronic control unit internal damage
D3	Electronic control unit internal damage
D4	Electronic control unit internal damage
D5	Electronic control unit internal damage
E1	Control valve power supply voltage 1: Overvoltage
E2	Control valve power supply voltage 1: Low voltage
E3	Control valve power supply voltage 1: Broken wire
E4	Control valve grounding 1: Broken wire
E5	Control valve power supply voltage 2: Overvoltage
E6	Control valve power supply voltage 2: Low voltage
E7	Control valve power supply voltage 2: Broken wire
E8	Control valve grounding 2: Broken wire
E9	Electronic control unit power supply voltage: Overvoltage
EA	Electronic control unit power supply voltage: Low voltage
EB	Excessive voltage difference between control valve power supply voltages 1 and 2
F1	Exhaust brake cut relay: Short-circuit to positive (+) wire, broken wire
F2	Exhaust brake cut relay: Short-circuit to grounding wire
F5	Wheel arrangement error: Excessive wheel speed difference between front and rear wheels
F6	Wheel arrangement error: Wheel speed difference between front and rear wheels exceeding allowed range
FC	Wheel speed sensor abnormality generated previously. (*2)

*1: Configuration error (mismatch between vehicle system and Electronic control unit system)

*2: When a wheel speed sensor abnormality is generated in the previous driving operation, this diagnosis code is output. When this diagnosis code is generated, the ABS warning lamp does not turn off two seconds after the starter switch is turned on. However, if the wheel speed sensor is restored to its proper condition, the ABS warning lamp turns off and this diagnosis code is reset when the vehicle is operated at a speed of 10 km/h {6.2 mph} or faster.

NOTE

Alphabetic letters in the diagnosis codes indicate the following lighting cycles. A: 10, B:11, C: 12, D: 13, E: 14, F: 15

(Example) Diagnosis code: 8 A

Number of ones

Number of tens

Diagnosis code 8A indicates that the indication lights eight times first, then 10 times.

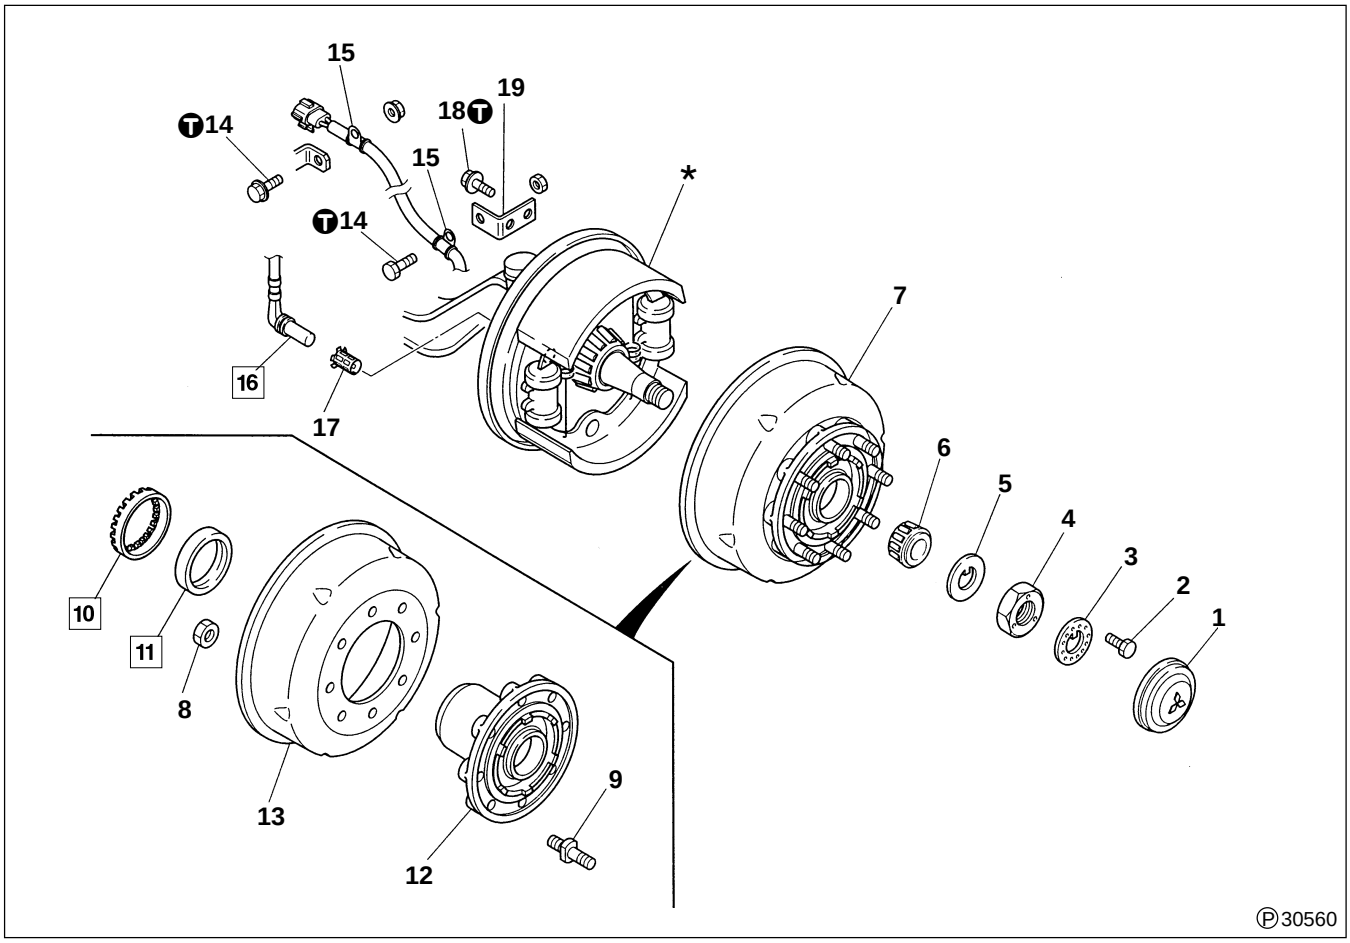
WHEEL SPEED SENSOR AND ROTOR < FRONT AXLE >

<FK>

The following describes the service procedures for wheel speed sensors and rotors only.
Regarding the procedures for servicing other components, refer to Gr 26.



● **Disassembly sequence**

1 Wheel hub cap
2 Bolt
3 Lock plate
4 Lock nut
5 Lock washer
6 Outer bearing inner race
7 Hub and brake drum assembly
8 Nut
9 Hub bolt
10 Rotor
11 Oil seal
12 Wheel hub
13 Brake drum
14 Bolt
15 Clip
16 Wheel speed sensor
17 Spring spacer
18 Bolt
19 Bracket
*: Front brake assembly

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION

- **When removing or installing hub and brake drum assembly 7, handle rotor 10 with care to prevent damage. Also, do not damage oil seal 11 during assembly.**
- **Keep oil and grease off lining surface of front brake assembly * and the inner surface of brake drum 13.**

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
10	Wobbling of rotor		0.1 {0.0039}	—	Replace
16	Wheel speed sensor	Resistance between terminals	950 to 1450Ω	—	Replace
		Insulation resistance	1MΩ or higher	—	Replace

Tightening torque

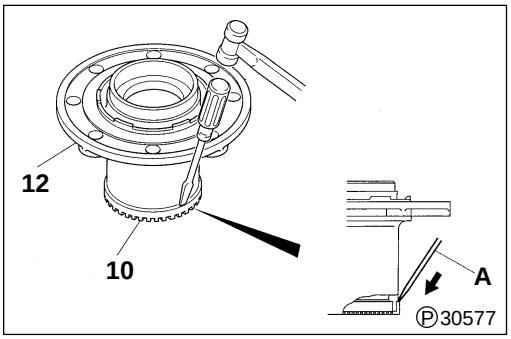
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
14	Bolt (Clip mounting)	39 to 59 {29 to 43, 4 to 6}	—
18	Bolt (Bracket mounting)	9.8 to 14.0 {7 to 10, 1.0 to 1.4}	—

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
11	ABS oil seal installer  02968	MH062305	Press-fitting of oil seal



◆ Service procedure

10 Rotor

[Removal]

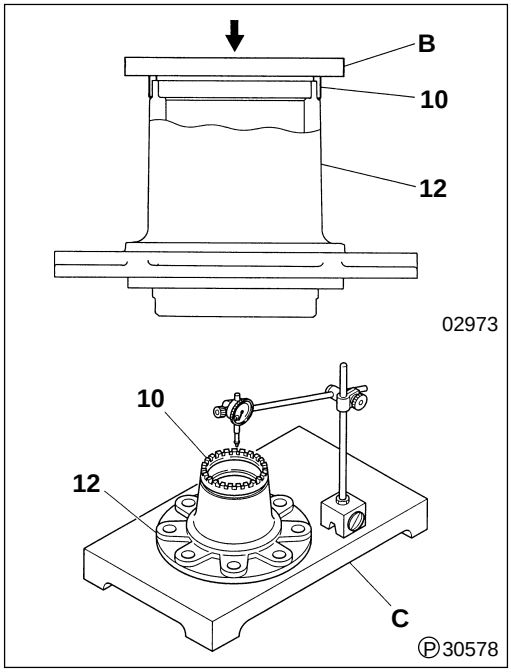
Strike the outer edge of rotor **10** evenly with flat-tip screwdriver **A** to remove the rotor from the wheel hub.

CAUTION⚠

Be careful not to damage wheel hub 12.

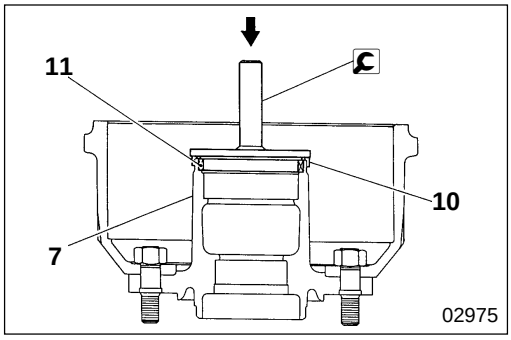
https://truckmanualshub.com/

WHEEL SPEED SENSOR AND ROTOR < FRONT AXLE >



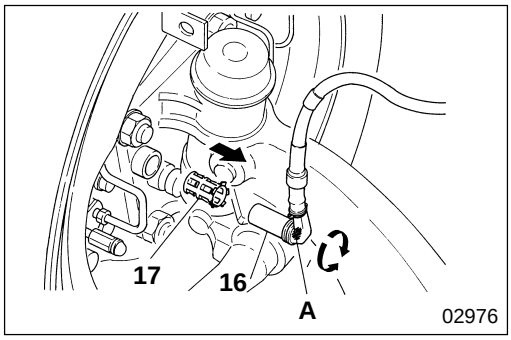
[Installation]
Heat rotor **10** to approximately 150°C {302°F}. Press the rotor evenly with iron plate **B** to press-fit the rotor to wheel hub **12**. Make sure there is no space between the rotor and wheel hub.

[Inspection]
- If the amount of wobbling exceeds the standard value, repeat the assembly procedure from the beginning.
- If the amount of wobbling exceeds the standard value after reassembly, replace defective parts.
  C : Base



11 Installation of oil seal

CAUTION
When hub and brake drum assembly 7 is removed for a service operation and if rotor 10 is still mounted on the wheel hub, use 0 ABS oil seal installer to press-fit oil seal 11.

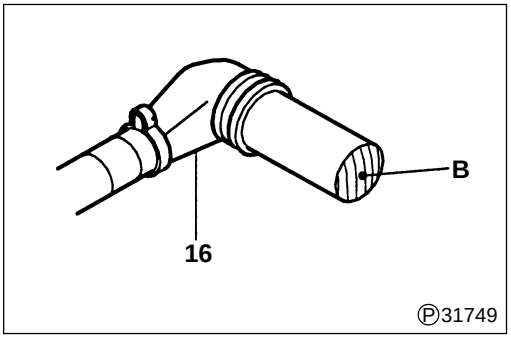


16 Wheel speed sensor

[Removal]
Hold shaded section **A** of wheel speed sensor **16** with pliers, and remove the sensor by twisting it slightly in left and right directions.

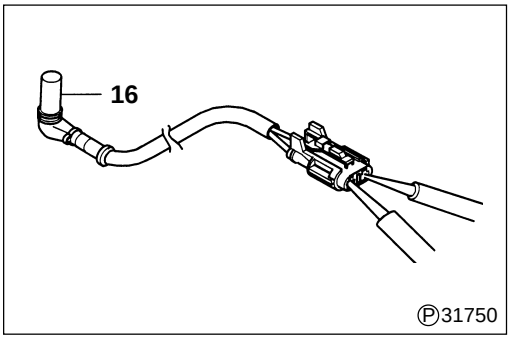
CAUTION
- **When holding wheel speed sensor 16 with pliers, do not grip any section other than shaded area A in the diagram.**
- **When removing wheel speed sensor 16, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **If wheel speed sensor 16 dismounts easily, replace spring spacer 17.**

https://truckmanualshub.com/

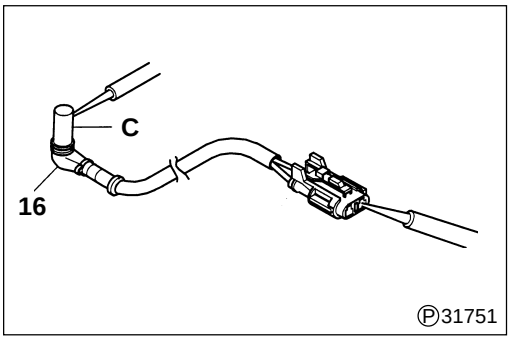


[Inspection]

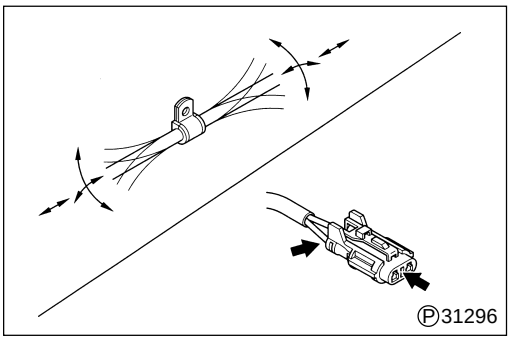
- Since pole piece section **B** is magnetized by the magnet inside wheel speed sensor **16**, it attracts metals. Do not allow the pole piece to collect metallic objects.



- Measure the resistance between the terminals of wheel speed sensor **16**.
  If the measured value deviates from the standard value, replace the wheel speed sensor.



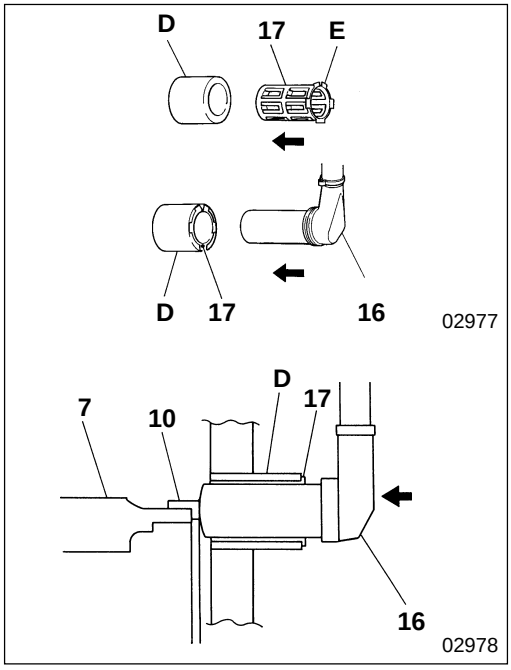
- Measure the insulation resistance between body **C** of wheel speed sensor **16** and each terminal.
  If the measured values deviate from the standard value, replace the wheel speed sensor.



- To check for broken wires, remove the harness clamp section from the vehicle. Bend and extend the harness to check if there is any broken wire in the harness. Also, inspect the connector for proper contact.
  If a defect is found, replace wheel speed sensor **16**.

https://truckmanualshub.com/

WHEEL SPEED SENSOR AND ROTOR < FRONT AXLE >

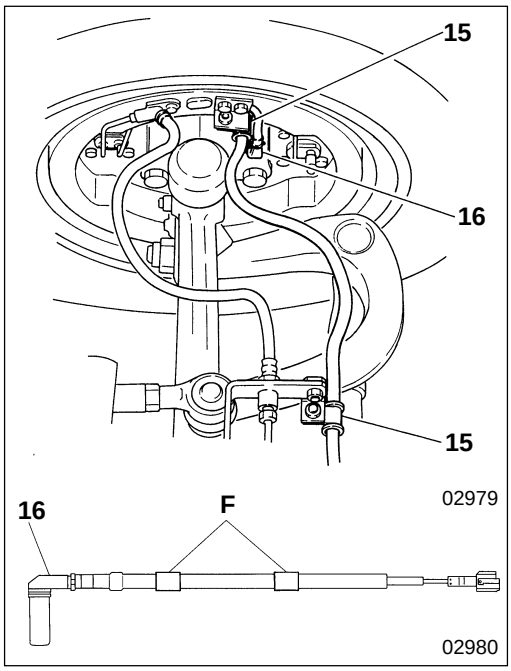


[Installation]

- Insert spring spacer **17** into holder section **D** of the knuckle, and press until stopper section **E** contacts the holder.
- Insert wheel speed sensor **16**, and press until it contacts rotor **10**.
- Rotate hub and brake drum assembly **7** slowly for two or three turns (2 seconds per turn) to make sure it rotates smoothly.

CAUTION

When installing wheel speed sensor 16, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.



- Secure white tape section **F** of the harness of wheel speed sensor **16** in place using clip **15** on the wheel brake side and clip **15** on the frame side.

CAUTION

Be sure to clamp the harness of wheel speed sensor 16 at two white tape sections F. Make sure the harness does not interfere with other parts and there is no twist or slack in the harness.

WHEEL SPEED SENSOR AND ROTOR < REAR AXLE >

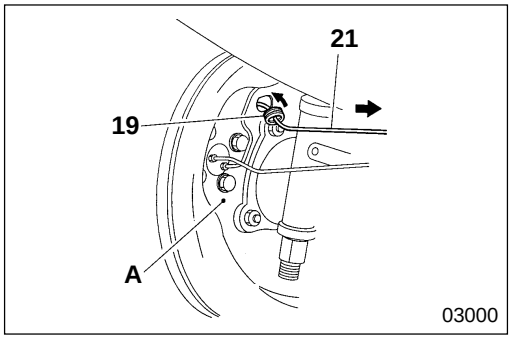
14 Installation of oil seal

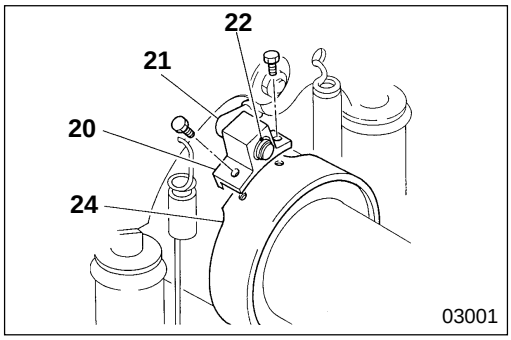
NOTE

When hub and brake drum assembly 10 is removed for a service operation and if rotor 13 is still mounted on the wheel hub, use Anti-lock brake system oil seal installer to press-fit oil seal 14.



19 Installation of grommet

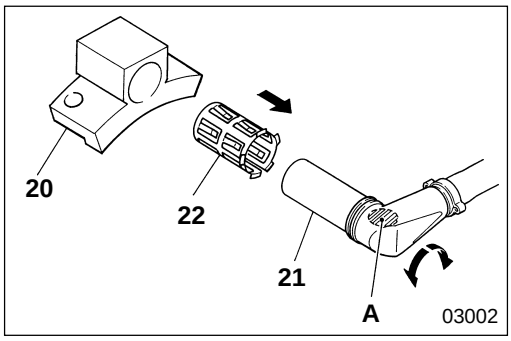
Mount grommet **19** on back plate **A**, and pull the harness of wheel speed sensor **21** to make sure there is no slack inside the wheel brake.



21 Wheel speed sensor

[Removal]

- With wheel speed sensor **21** and spring space **22** installed in sensor holder **20**, remove the sensor holder from oil seal retainer **24**.

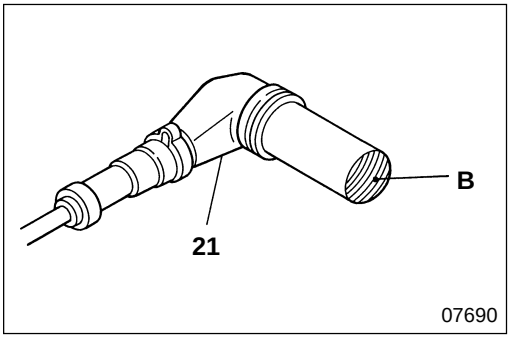


- Hold shaded section **A** of wheel speed sensor **21** with pliers, and remove the sensor by twisting it slightly in left and right directions.

CAUTION

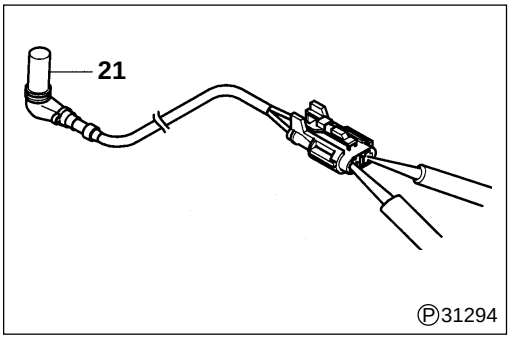
- **When holding wheel speed sensor 21 with pliers, do not grip any section other than shaded area A in the diagram.**
- **When removing wheel speed sensor 21, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **If wheel speed sensor 21 dismounts easily, replace spring spacer 22.**

https://truckmanualshub.com/

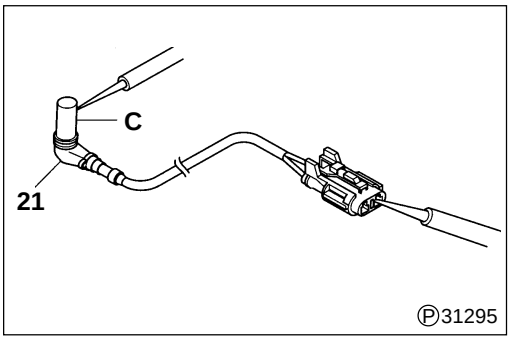


[Inspection]

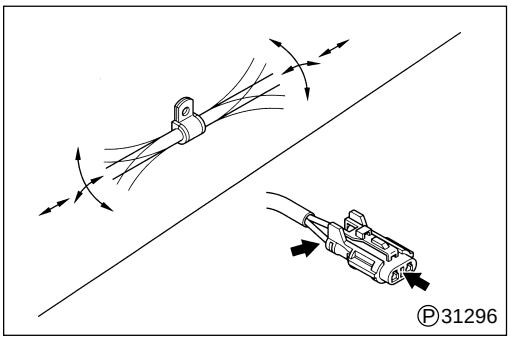
- Since pole piece section **B** is magnetized by the magnet inside wheel speed sensor **21**, it attracts metals. Do not allow the pole piece to collect metallic objects.



- Measure the resistance between the terminals of wheel speed sensor **21**.
  If the measured value deviates from the standard value, replace the wheel speed sensor.



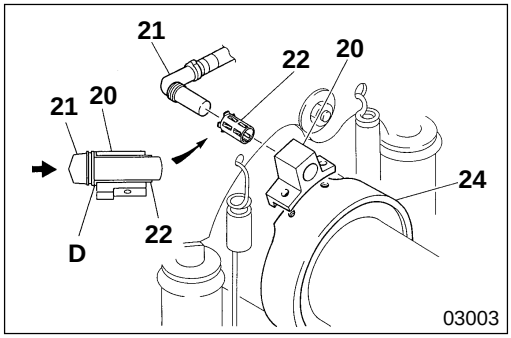
- Measure the insulation resistance between body **C** of wheel speed sensor **21** and each terminal.
  If the measured values deviate from the standard value, replace the wheel speed sensor.



- To check for broken wires, remove the harness clamp section from the vehicle. Bend and extend the harness to check if there is any broken wire in the harness. Also, inspect the connector for proper contact.
  If a defect is found, replace wheel speed sensor **21**.

https://truckmanualshub.com/

WHEEL SPEED SENSOR AND ROTOR < REAR AXLE >



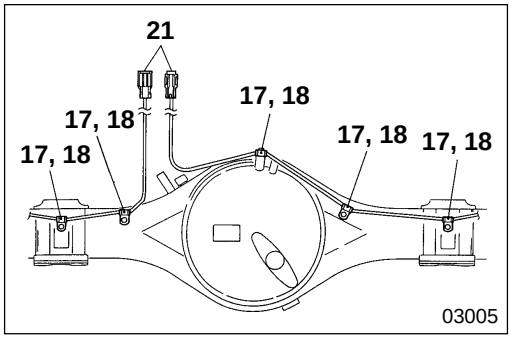
[Installation]

- Insert wheel speed sensor **21** from the back plate, and press until spring spacer **22** and stopper section **D** of the wheel speed sensor contacts sensor holder **20**.
- With wheel speed sensor **21** and spring spacer **22** installed in sensor holder **20**, mount the sensor holder on oil seal retainer **24**.

CAUTION

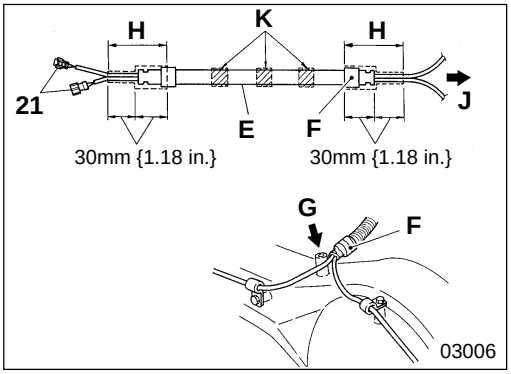
- **When installing wheel speed sensor 21, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **Note that wheel speed sensor 21 is different for left and right wheels.**

Location	Harness connector color	Harness connector shape
Left wheel	Gray	Male
Right wheel	Black	Female

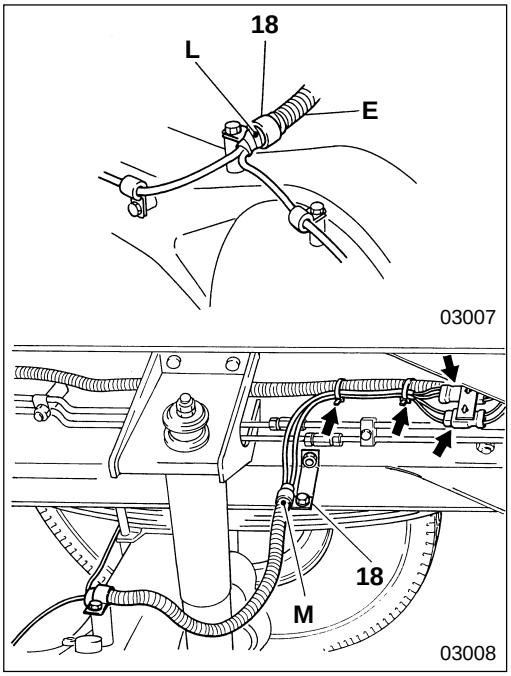


- Rear axle housing section
  Starting from the wheel brake side, secure the harness of wheel speed sensor **21** in place with clip **18** and bolt **17**. Make sure the harness does not interfere with other parts and there is no twist or slack in the harness.

https://truckmanualshub.com/



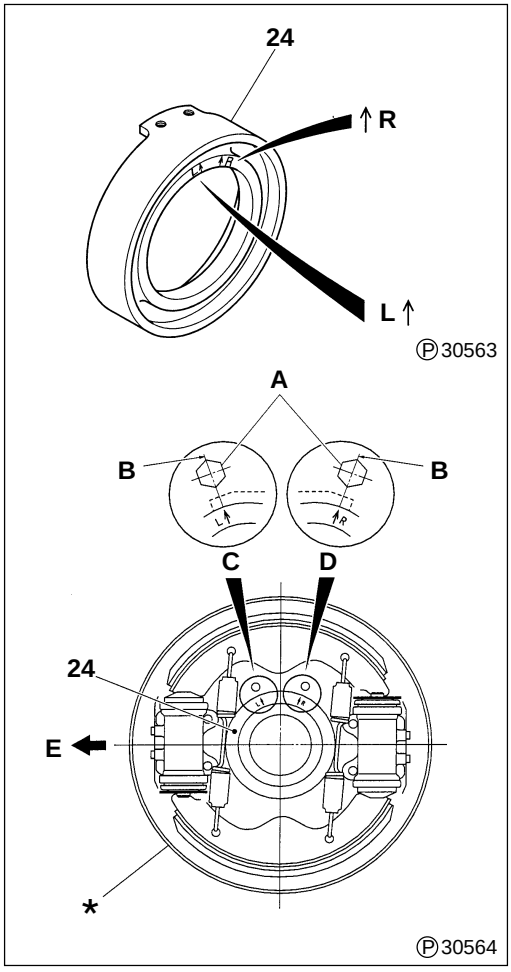
- Binding of harness
  - Gather the harnesses of left and right wheel speed sensors **21**, and bind with corrugated tube **E**.
  - Adjust the position of the corrugated tube **E** so that white tape section **F** is located at clip position **G** on the rear axle housing. Then, turn the corrugated tube so that the slit faces down. Wrap black tape (electric harness tape) on both ends **H** of the corrugated tube. The tape should be placed over the tube end and harness.
    J: Rear axle housing side
  - Wrap tape on the harnesses of wheel speed sensors **21** at sections **K** (three locations at equal intervals).



- Clamping of harness
  - Secure section **L** of corrugated tube **E** to the rear axle housing using clip **18**, and attach section **M** of the corrugated tube to the frame using clip **18**.
  - Connect the wheel speed sensor connector to the harness connector on the chassis side, and secure the connectors in place using the bracket.

https://truckmanualshub.com/

WHEEL SPEED SENSOR AND ROTOR < REAR AXLE >



24 **Installation of oil seal retainer**

- Oil seal retainer **24** is stamped with identification marks “**L**”, “**R**” and “↑” at the locations indicated in the diagram.
  L: For right wheel
  R: For left wheel
  ↑: For position alignment (next to “L” and “R” marks)

- According to the wheel location, align the identification mark “**L**” or “**R**” to center line **B** of mounting bolt **A** of rear brake assembly *****.
  C: For right wheel
  D: For left wheel
  E: Front of vehicle

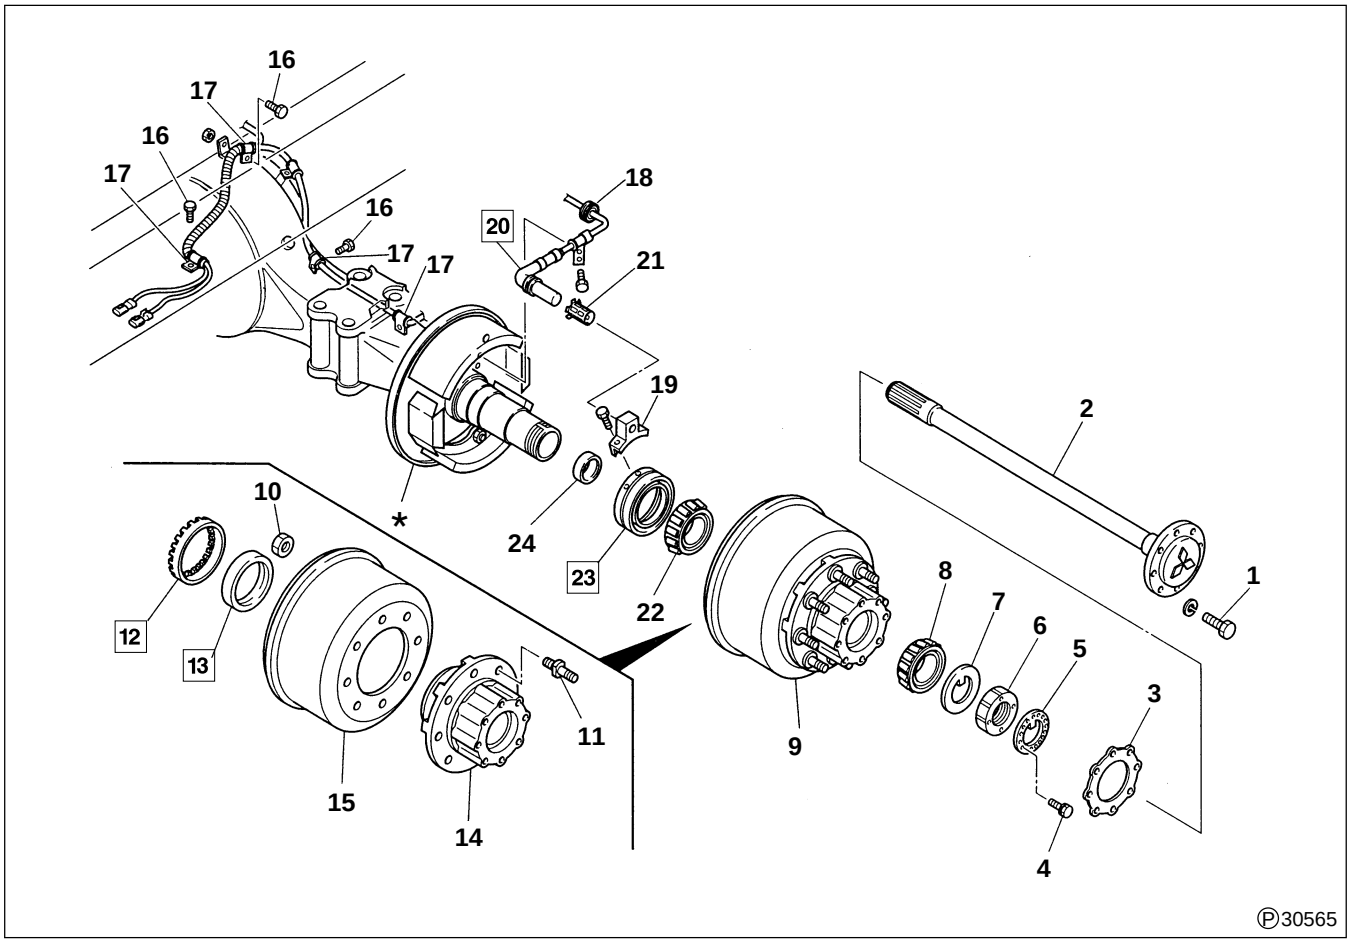
WHEEL SPEED SENSOR AND ROTOR < REAR AXLE >

< FM (Air-Over Hydraulic Brake) >

The following describes the service procedures for wheel speed sensors and rotors only.
Regarding the procedures for servicing other components, refer to Gr 27.



● **Disassembly sequence**

1 Bolt
2 Rear axle shaft
3 Gasket
4 Bolt
5 Lock plate
6 Lock nut
7 Lock washer
8 Outer bearing inner race
9 Hub and brake drum assembly
10 Nut
11 Hub bolt
12 Rotor
13 Oil seal
14 Wheel hub
15 Brake drum
16 Bolt
17 Clip
18 Grommet
19 Sensor holder
20 Wheel speed sensor
21 Spring spacer
22 Inner bearing inner race
23 Oil seal retainer
24 Oil seal

***** : Rear brake assembly

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION

- **When removing or installing hub and brake drum assembly 9, handle rotor 12 with care to prevent damage. Also, do not damage oil seal 13 during assembly.**
- **Keep oil and grease off lining surface of rear brake assembly * and the inner surface of brake drum 15.**

https://truckmanualshub.com/

Service standards

Unit : mm {in.}

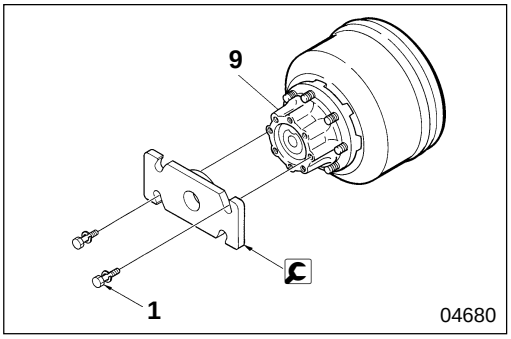
Location	Maintenance item		Standard value	Limit	Remedy
12	Wobbling of rotor		0.1 {0.0039}	—	Replace
20	Wheel speed sensor	Resistance between terminals	950 to 1450	—	Replace
		Insulation resistance	1M or higher	—	Replace

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
9	Anti-lock brake system hub stopper Note: Not being used in U.S. Market  04677	MH062058	Installation of wheel hub & brake drum assembly
13	Anti-lock brake system oil seal installer  04719	MH062057	Press-fitting of oil seal

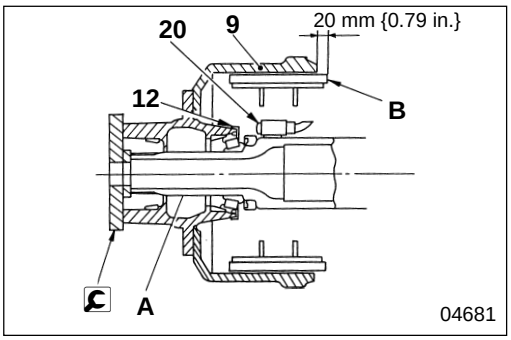
◆ Service procedure



04680

9 Installation of wheel hub and brake drum assembly

- Using two bolts **1**, mount 🔧 ABS hub stopper on wheel hub and brake drum assembly **9**.



04681

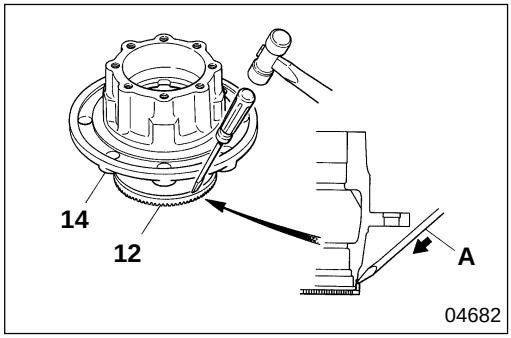
- Mount wheel hub and brake drum assembly **9** on axle housing **A** and press until 🔧 Anti-lock brake system hub stopper contacts the end surface of the axle housing.
- Remove 🔧 Anti-lock brake system hub stopper, and mount outer bearing inner lace **8**, lock washer **7** and lock nut **6**. Tighten the lock nut slowly.

CAUTION ⚠

When installing wheel hub and brake drum assembly 9 without using 🔧 Anti-lock brake system hub stopper, mount the assembly without jiggling until brake lining B extends approximately 20 mm {0.79 in.} from the edge of brake drum. Then, tighten lock nut 6 slowly.

https://truckmanualshub.com/

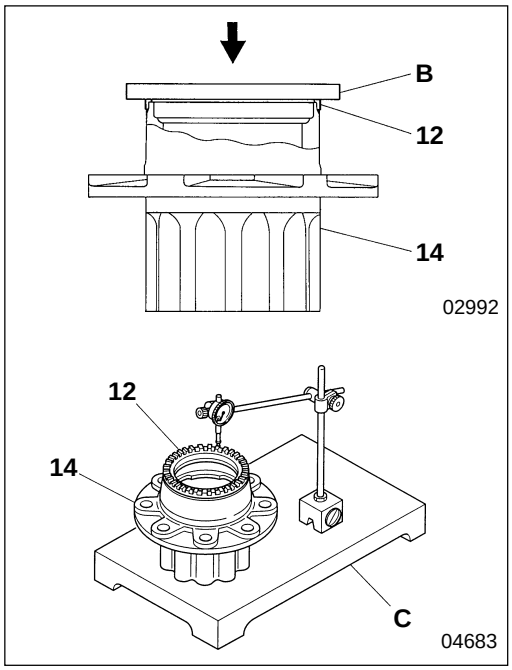
WHEEL SPEED SENSOR AND ROTOR < REAR AXLE >



12 Rotor

[Removal]
Strike the outer edge of rotor **12** evenly with flat-tip screwdriver **A** to remove the rotor from the wheel hub.

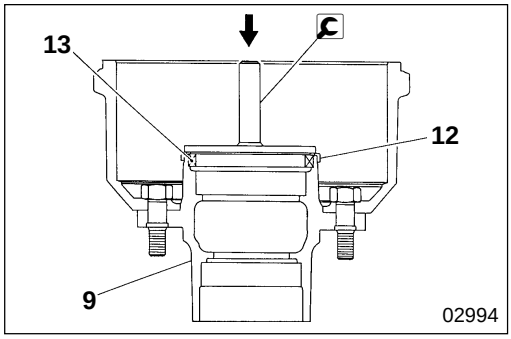
CAUTION
Be careful not to damage wheel hub 14.



[Installation]
Heat rotor **12** to approximately 150°C {302°F}. Press the rotor evenly with iron plate **B** to press-fit the rotor to wheel hub **14**. Make sure there is no space between the rotor and wheel hub.

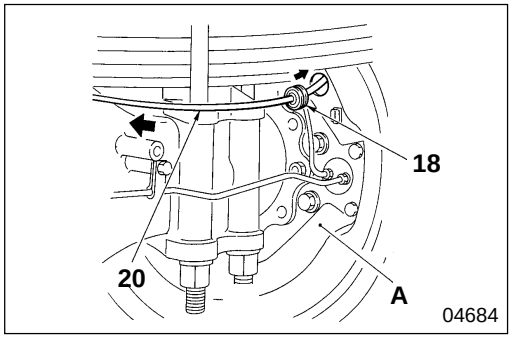
[Inspection]
- If the amount of wobbling exceeds the standard value, repeat the assembly procedure from the beginning.
- If the amount of wobbling exceeds the standard value after reassembly, replace defective parts.

C: Base



13 Installation of oil seal

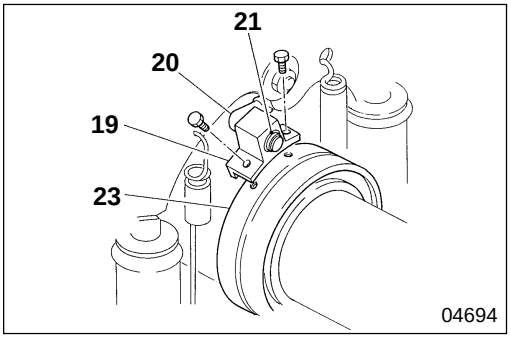
NOTE
When hub and brake drum assembly 9 is removed for a service operation and if rotor 12 is still mounted on the wheel hub, use Anti-lock brake system oil seal installer to press-fit oil seal 13.



18 Installation of grommet

Mount grommet **18** on back plate **A**, and pull the harness of wheel speed sensor **20** to make sure there is no slack inside the wheel brake.

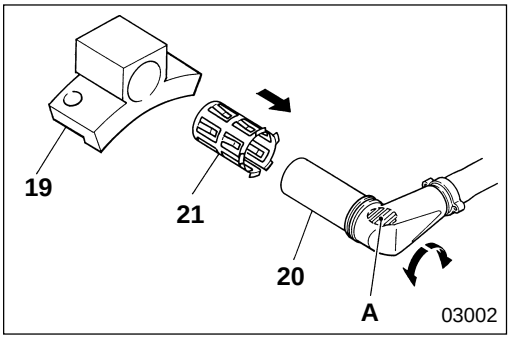
https://truckmanualshub.com/



20 **Wheel speed sensor**

[Removal]

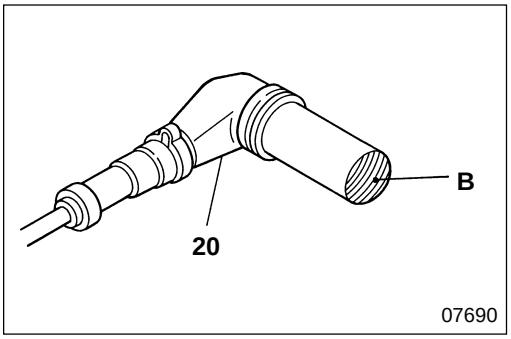
- With wheel speed sensor **20** and spring space **21** installed in sensor holder **19**, remove the sensor holder from oil seal retainer **23**.



- Hold shaded section **A** of wheel speed sensor **20** with pliers, and remove the sensor by twisting it slightly in left and right directions.

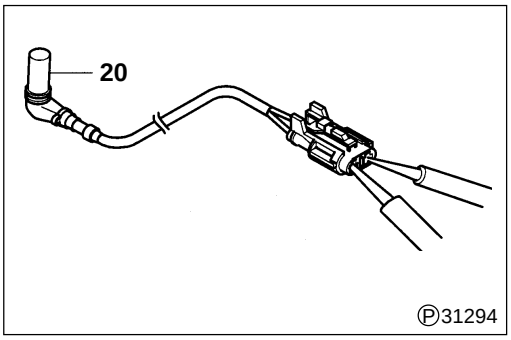
CAUTION

- **When holding wheel speed sensor 20 with pliers, do not grip any section other than shaded area A in the diagram.**
- **When removing wheel speed sensor 20, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **If wheel speed sensor 20 dismounts easily, replace spring spacer 21.**



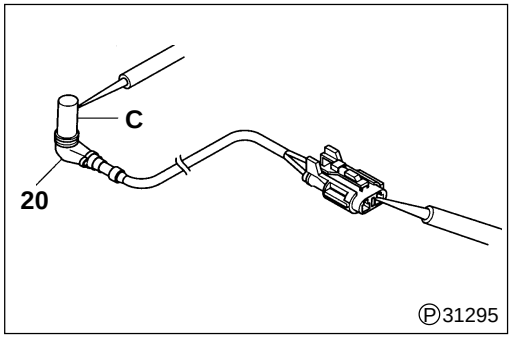
[Inspection]

Since pole piece section **B** is magnetized by the magnet inside wheel speed sensor **20**, it attracts metals. Do not allow the pole piece to collect metallic objects.

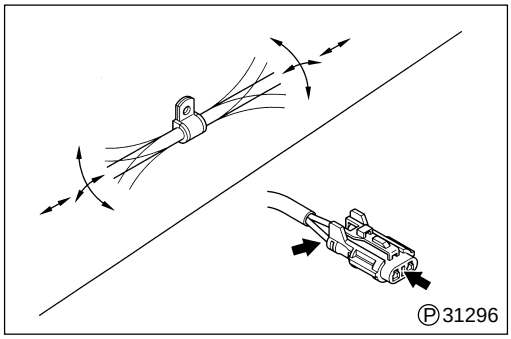


- Measure the resistance between the terminals of wheel speed sensor **20**.
  If the measured value deviates from the standard value, replace the wheel speed sensor.

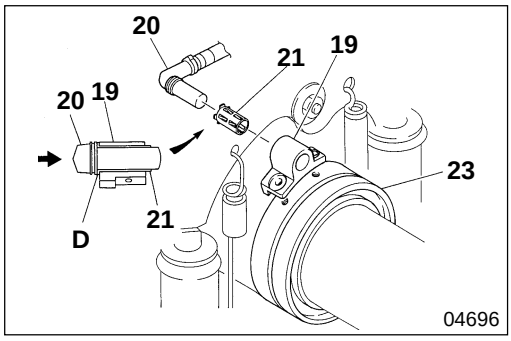
https://truckmanualshub.com/



- Measure the insulation resistance between body **C** of wheel speed sensor **20** and each terminal.
  If the measured values deviate from the standard value, replace the wheel speed sensor.



- To check for broken wires, remove the harness clamp section from the vehicle. Bend and extend the harness to check if there is any broken wire in the harness. Also, inspect the connector for proper contact.
  If a defect is found, replace wheel speed sensor **20**.



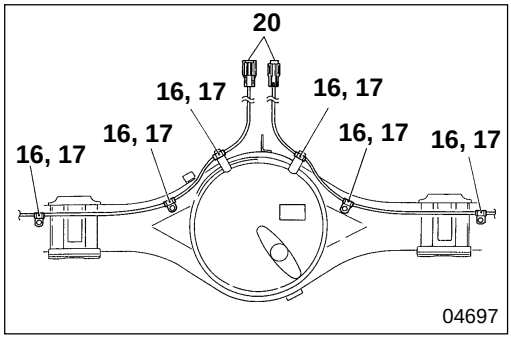
[Installation]

- Insert wheel speed sensor **20** from the back plate, and press until spring spacer **21** and stopper section **D** of the wheel speed sensor contacts sensor holder **19**.
- With wheel speed sensor **20** and spring spacer **21** installed in sensor holder **19**, mount the sensor holder on oil seal retainer **23**.

CAUTION

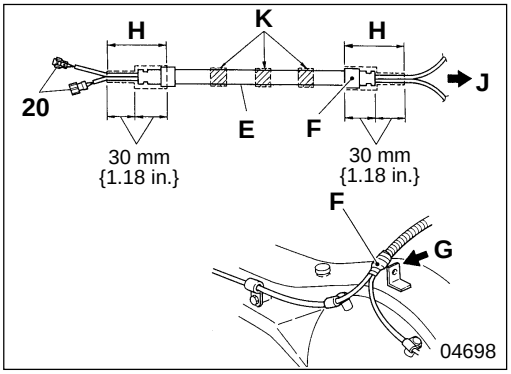
- **When installing wheel speed sensor 20, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **Note that wheel speed sensor 20 is different for left and right wheels.**

Location	Harness connector color	Harness connector shape
Left wheel	Gray	Male
Right wheel	Black	Female

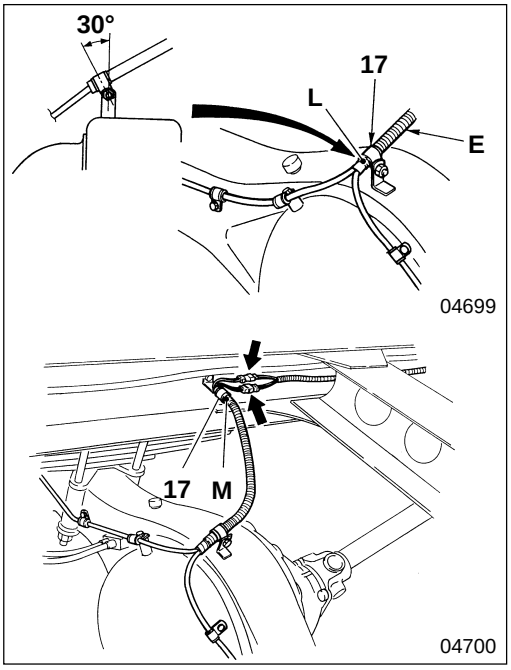


- Rear axle housing section
  Starting from the wheel brake side, secure the harness of wheel speed sensor **20** in place with clip **17** and bolt **16**. Make sure the harness does not interfere with other parts and there is no twist or slack in the harness.

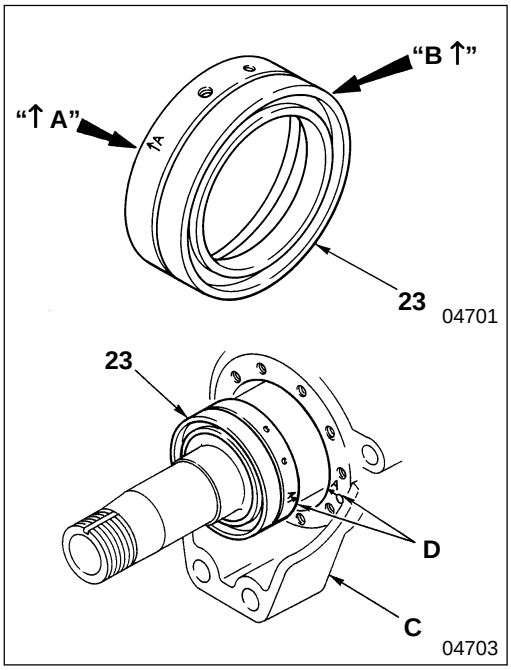
https://truckmanualshub.com/



- Binding of harness
  - Gather the harnesses of left and right wheel speed sensors **20**, and bind with corrugated tube **E**.
  - Adjust the position of the corrugated tube **E** so that white tape section **F** is located at clip position **G** on the rear axle housing. Then, turn the corrugated tube so that the slit faces down. Wrap black tape (electric harness tape) on both ends **H** of the corrugated tube. The tape should be placed over the tube end and harness.
    J: Rear axle housing side
  - Wrap tape on the harnesses of wheel speed sensors **20** at sections **K** (three locations at equal intervals).



- Clamping of harness
  - Position section **L** of corrugated tube **E** so that it forms a 30° angle with clip **17**, then secure it to the rear axle housing.
  - Secure section **M** of the corrugated tube to the frame using the clip.
  - Connect the wheel speed sensor connector to the harness connector on the chassis side.



23 **Installation of oil seal retainer**

- Oil seal retainer **23** is stamped with identification marks "**A**", "**B**" and "↑"at the locations indicated in the diagram.
  A: For left wheel
  B: For right wheel
  ↑: For position alignment

- Check the identification mark ("**A**" or "**B**") to select the proper part. Align the arrow mark on the oil seal retainer with arrow mark **D** of anchor bracket **C**.

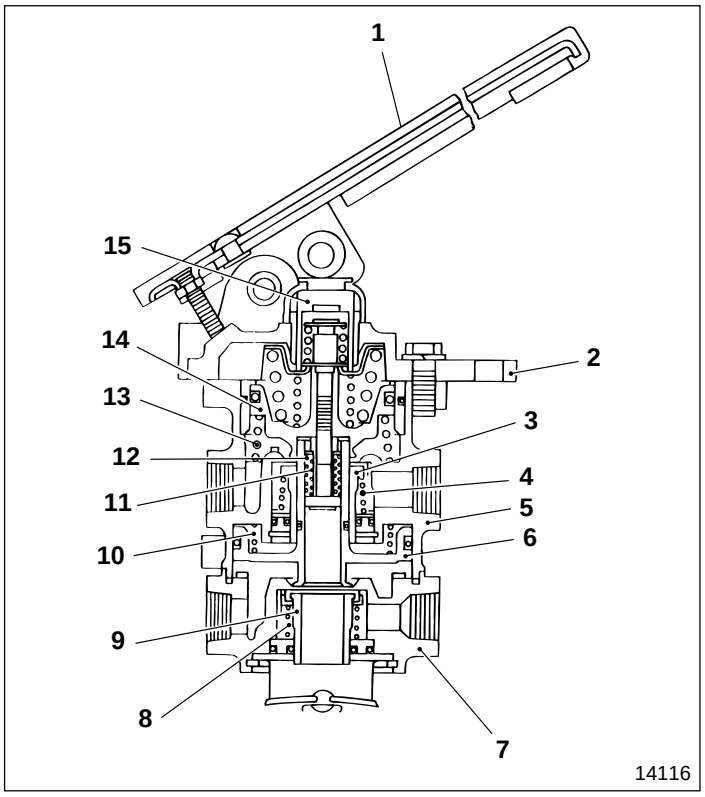
- The brake system is an air over hydraulic, all-wheel brake type consisting of separate front and rear systems.
- The servo system is fitted with airmasters **8**.
- An exhaust brake system, of the exhaust pipe opening and closing valve type, is fitted as a sub-brake system.

https://truckmanualshub.com/

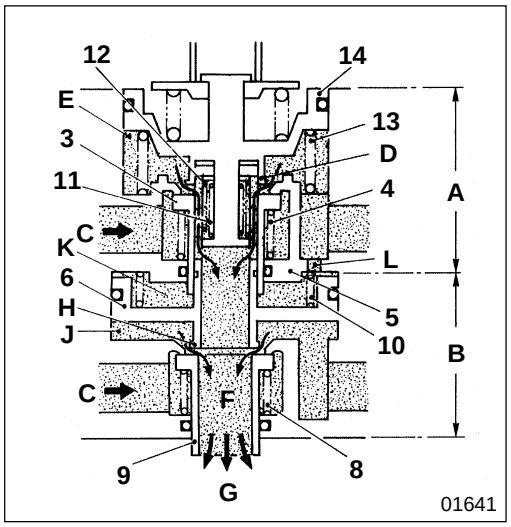
Dual Brake Valve



1 Brake pedal
2 Plate assembly
3 Primary inlet valve
4 Primary valve spring
5 Body
6 Relay piston
7 Cover
8 Secondary valve spring
9 Secondary inlet valve
10 Relay piston spring
11 Inner spring
12 Outer spring
13 Primary piston spring
14 Primary piston
15 Plunger

The dual brake valve controls the braking force of the vehicle by feeding pressurized air to the airmaster in accordance with the brake pedal depression angle of brake pedal **1**.

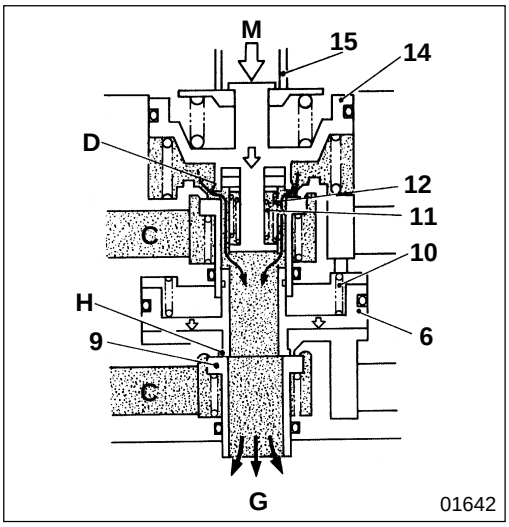
● When brake not operating



- The repercussive forces of primary valve springs **4**, secondary valve spring **8** seat primary inlet valve **3** at primary side **A**, and inlet valve **9** at secondary side **B**, on their respective seats. This shuts off air **C** from the air tank to maintain airtightness.
- The repercussive force of primary piston spring **13** raises primary piston **14** to its upper position. Exhaust valve seat **D** opens and chamber **E** is open to atmosphere **G** via chamber **F**.
- Since the repercussive forces of inner spring **11** and outer spring **12** is stronger than the repercussive force of relay piston spring **10**, relay piston **6** is raised to its upper position and exhaust valve seat **H** is opened. This opens chamber **J** to atmosphere **G** via chamber **F**.
  Chamber **E** at the primary side and chamber **K** at the upper part of relay piston **6** at the secondary side are connected via passage port **L** of body **5**.

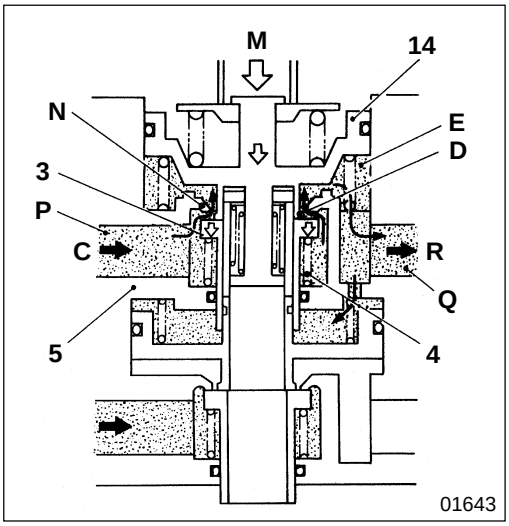
https://truckmanualshub.com/

● When depressing brake pedal (before braking pressure is generated)



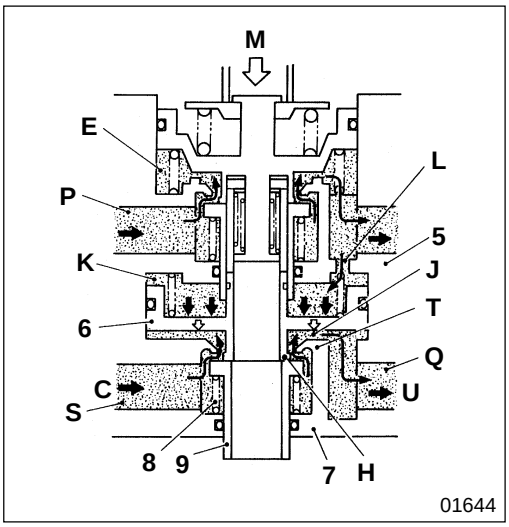
- Depressing the brake pedal (illustrated as pedal action **M**), forces down primary piston **14** via plunger **15**.
- Forcing down primary piston **14** changes the balance between the repercussive forces of inner spring **11** and outer spring **12**, and the repercussive force of relay piston spring **10**, forcing down relay piston **6**. This seats the relay piston on secondary inlet valve **9** and closes exhaust valve seat **H**.
- This closes the secondary side exhaust passage; however, primary side exhaust valve seat **D** remains open. No braking pressure is generated at either primary or secondary sides.

● When depressing brake pedal (braking pressure is generated)



Primary side

- As the brake pedal is depressed further (illustrated as brake pedal action **M**), primary piston **14** is forced down until it is seated on primary inlet valve **3**, closing exhaust valve seat **D**.
- Primary inlet valve **3** is forced down, compressing primary valve spring **4**, and supply valve seat **N** of body **5** separates from the primary inlet valve. The air in chamber **P** flows into chamber **E** and is fed to rear brake system **R** via discharge port **Q** as braking pressure.



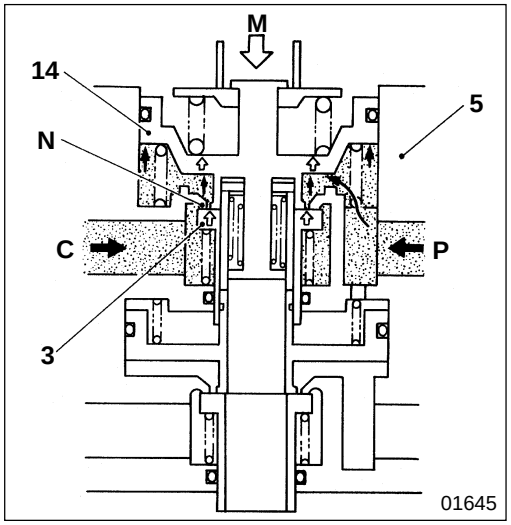
Secondary side

- The air at the primary side flows into chamber **K** via passage port **L** of body **5**.
- The air fed into chamber **K** acts on the upper part of relay piston **6** to force down the relay piston and compress secondary valve spring **8**, forcing down secondary inlet valve **9**.
- This separates supply valve seat **T** and secondary inlet valve **9** of cover **7**.
- The air in supply port chamber **S** flows into chamber **J** and is fed to front brake system **U** via discharge port **Q** as braking pressure.

https://truckmanualshub.com/

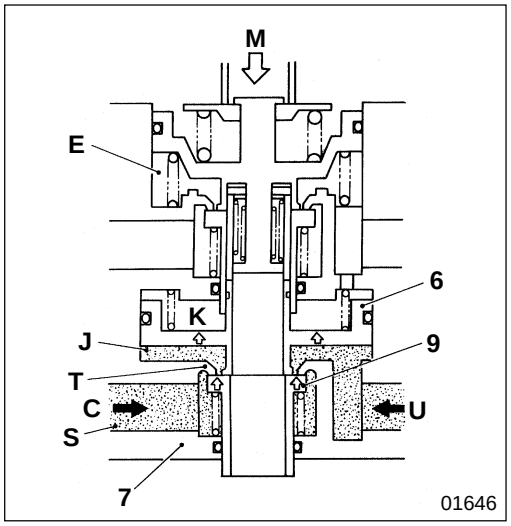
● Stabilization of braking pressure

When the brake pedal remains depressed at the specified depression angle, the braking air pressure stabilizes at the pressure corresponding to the brake pedal depression angle.



Primary side

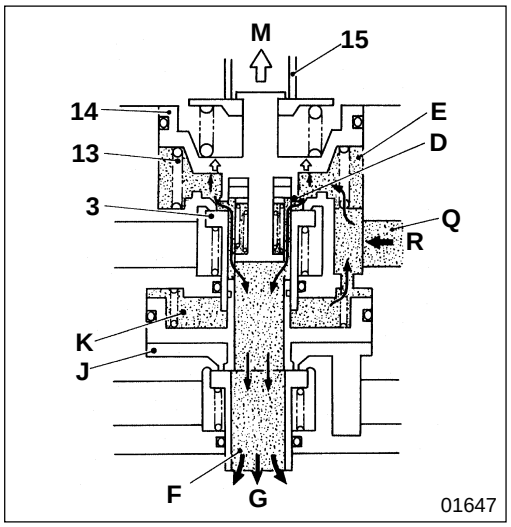
- The braking air pressure fed under the bottom of primary piston **14** raises the primary piston and primary inlet valve **3** together in tandem.
- Primary inlet valve **3** makes contact with supply valve seat **N** of body **5**, then the supply of air **C** from the air tank ceases and the increases in the braking air pressure stops. This stabilizes braking pressure **R** for the rear brake system.



Secondary side

- As the braking pressure (pressure in chamber **J**) for the front brake system balances the pressures in chambers **E** and **K**, the force raising relay piston **6** disappears, and the relay piston rises in tandem with secondary inlet valve **9**.
- Secondary inlet valve **9** makes contact with supply valve seat **T** of cover **7**, then the supply of air from supply port chamber **S** to chamber **J** ceases. This stabilizes brake pressure **U** for the front system.

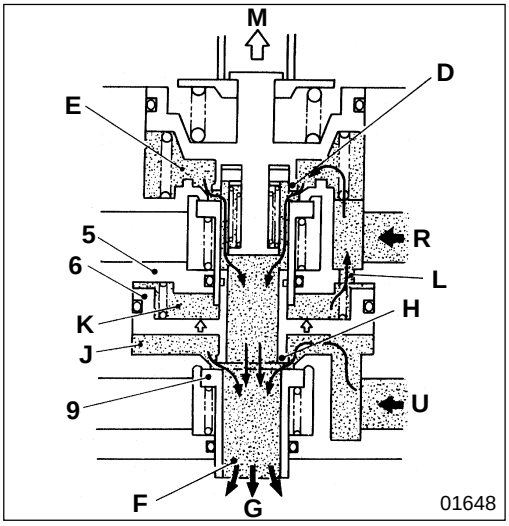
● Release of brake pressure



Primary side

When the brake pedal is released (illustrated as brake pedal action **M**), primary piston spring **13** and air pressure **R** at discharge port **Q** (pressure in chamber **E**) raise plunger **15** and primary piston **14**. Then, exhaust valve seat **D** at the lower end of the primary piston separates from primary inlet valve **3**. The air pressure of the rear brake system flows through chamber **E** to be discharged from exhaust passage chamber **F** into atmosphere **G**.

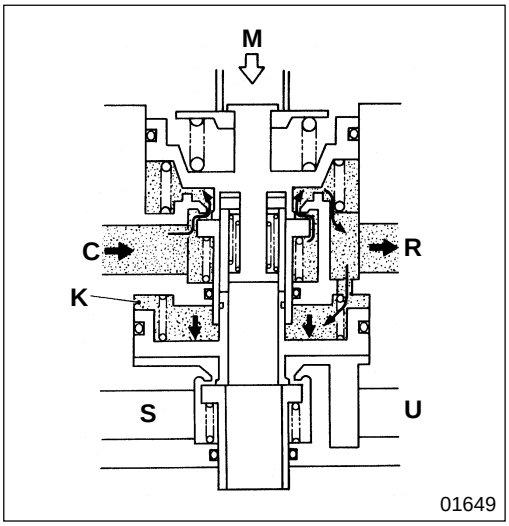
https://truckmanualshub.com/



Secondary side

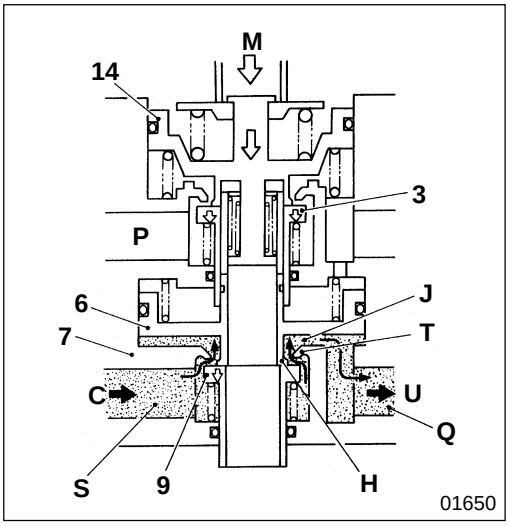
- As the air pressure in the rear brake system drops, the air pressure in chamber **K** is discharged via passage port **L** of body **5**, and chambers **E**, **F** into atmosphere **G**.
- This changes the air pressure balance between chambers **K** and **J**. The air pressure in chamber **J** raises relay piston **6**, and exhaust valve seat **H** at the lower end of the relay piston separates from secondary inlet valve **9**. Air pressure **U** in the front brake system is discharged from exhaust passage chamber **F** into atmosphere **G**.

● When abnormality occurs



Operation when the air pipe of the front brake system fails

- The primary side operates the same as normal, generating braking pressure in rear brake system **R**.
- At the secondary side, even if the primary side generates air pressure in chamber **K**, braking pressure is not generated in front brake system **U**, since no air pressure is generated in supply port **S**.



Operation when the air pipe of the rear brake system fails

- In the rear brake system, air pressure is not generated up to supply port **P**. Therefore, even if the brake pedal is depressed (causing primary piston **14** to force down primary inlet valve **3**), braking pressure is not generated.
- If the brake pedal is depressed further (illustrated as brake pedal action **M**), primary piston **14** makes contact with relay piston **6** and they force down secondary inlet valve **9**.
- This action separates supply valve seat **T** of cover **7** from secondary inlet valve **9**. The air pressure flows into chamber **J** from chamber **S** and is fed to front brake system **U** via discharge port **Q** as braking pressure.

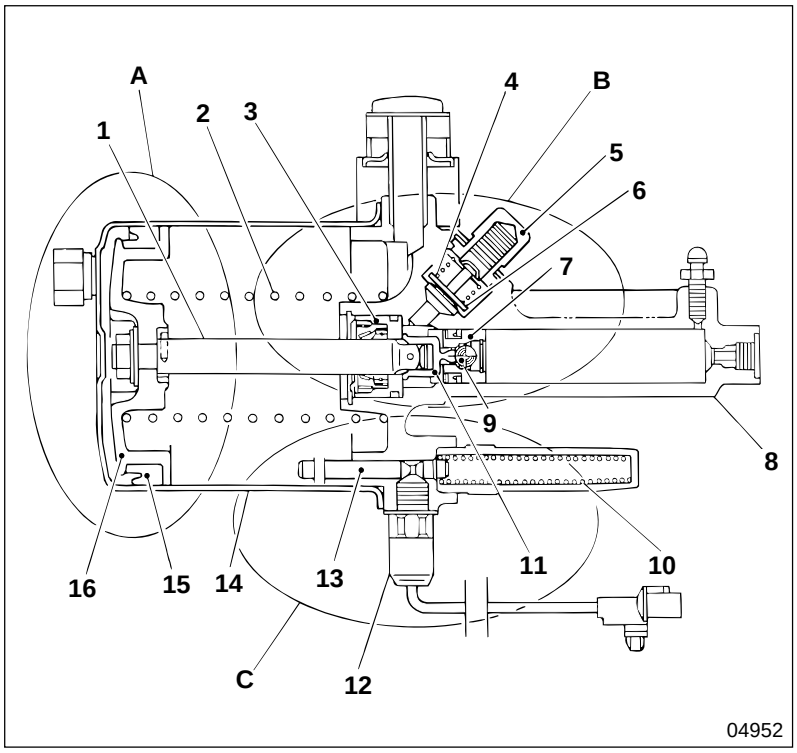
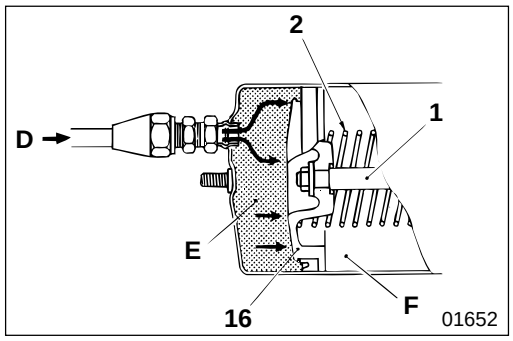
Brake Booster (Airmaster)



1 Push rod
2 Return spring
3 Retainer assembly
4 Spring
5 Connector
6 Residual valve
7 Hydraulic piston
8 Body assembly
9 Steel ball
10 Return spring
11 Yoke
12 Stroke switch
13 Rod
14 Cylinder shell
15 Cup packing
16 Piston plate

A : Power cylinder area
B : Hydraulic piston area
C : Power piston stroke detection switch area

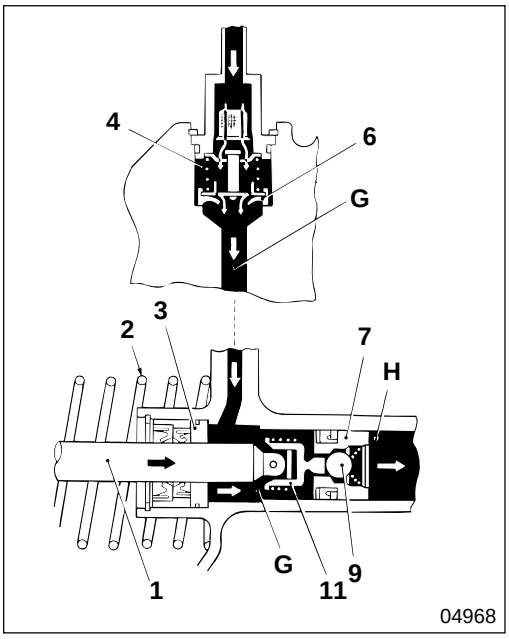
● Power cylinder area



- Operation of the dual brake valve feeds compressed air **D** into chamber **E**, activating piston plate **16**. This opens chamber **F** to the atmosphere, generating a pressure difference between chambers **E** and **F**. When this force becomes greater than the repercussive force of return spring **2**, the piston plate moves to the right.
- Piston plate **16** is fitted with push rod **1** that transmits the force of the compressed air received at the piston plate to hydraulic piston area **B**.

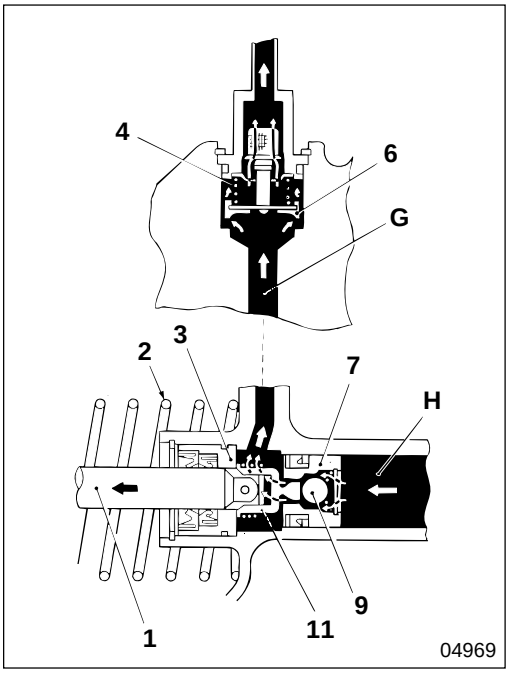
https://truckmanualshub.com/

● **Hydraulic piston area**



When functioning

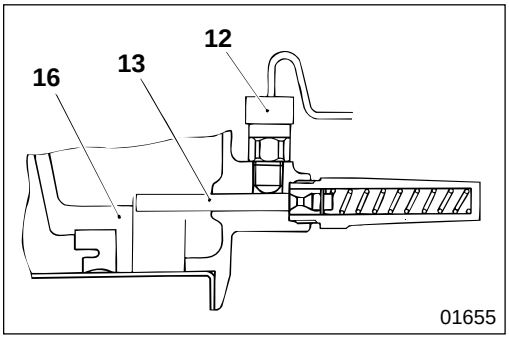
- The movement of the piston plate compresses return spring **2**, which moves push rod **1**, then hydraulic piston **7** to the right. This movement separates yoke **11** from retainer assembly **3**, and seats steel ball **9** at the end of the hydraulic piston. This closes the passage between brake fluid tank chamber **G** and wheel cylinder chamber **H**. The hydraulic piston moves to the right and pressurizes the brake fluid in chamber **H**, transmitting power to the wheel cylinder.
- In residual valve **6**, negative pressure from chamber **G** increases as the volume expands in line with the movement of the hydraulic piston. This opens the residual valve, allowing it to suck brake fluid from the fluid tank.



When released

- Releasing the brake pedal frees the compressed air at the rear side of the piston plate into the atmosphere. Hydraulic piston **7** is returned to its original position by the combined repercussive forces of return spring **2** of push rod **1**, and the brake fluid pressure of chamber **H** yoke **11** hits retainer assembly **3**, connecting chamber **G** and chamber **H**.
- Brake fluid flows through chamber **G** to compress spring **4** of residual valve **6**. The brake fluid passes around the residual valve and returns to the fluid tank.
- Residual valve **6** closes when the repercussive forces of spring **4** and the brake fluid pressure balance.

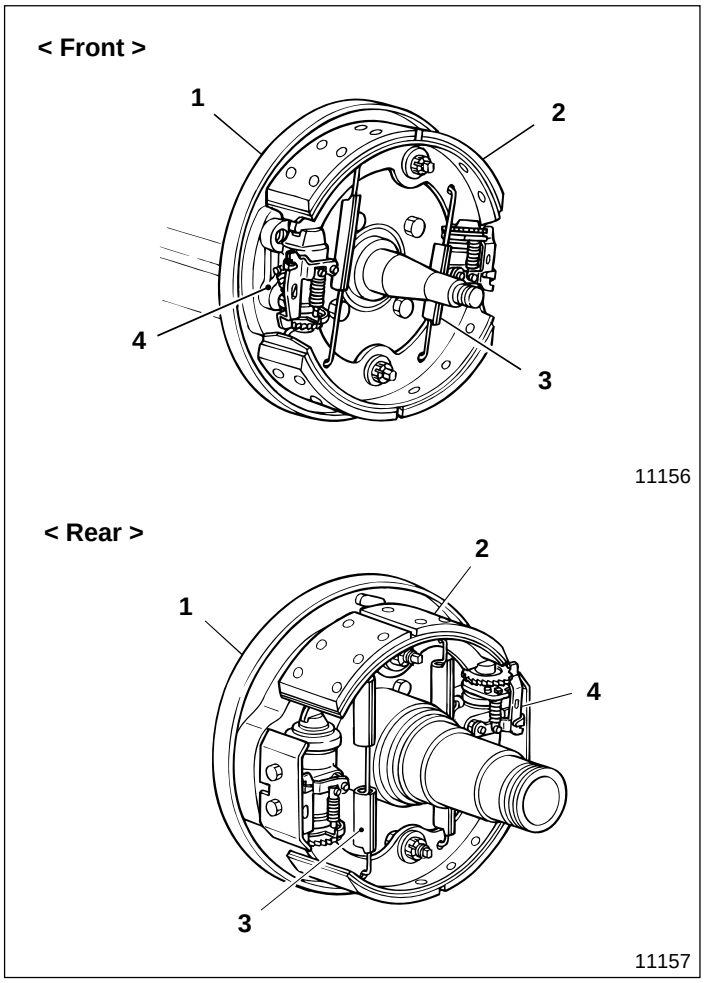
● **Power piston stroke detecting switch area**



- When brake fluid has been lost due to damage to the brake pipe, the stroke of the power piston increases, and piston plate **16** hits the end of rod **13**, and the rod is moved to the right.
- Because of this, stroke switch **12** leaves the recessed area of rod **13**, and turns the stroke switch ON. This turns on a warning lamp within the meter cluster to alert the driver.

https://truckmanualshub.com/

Wheel Brake

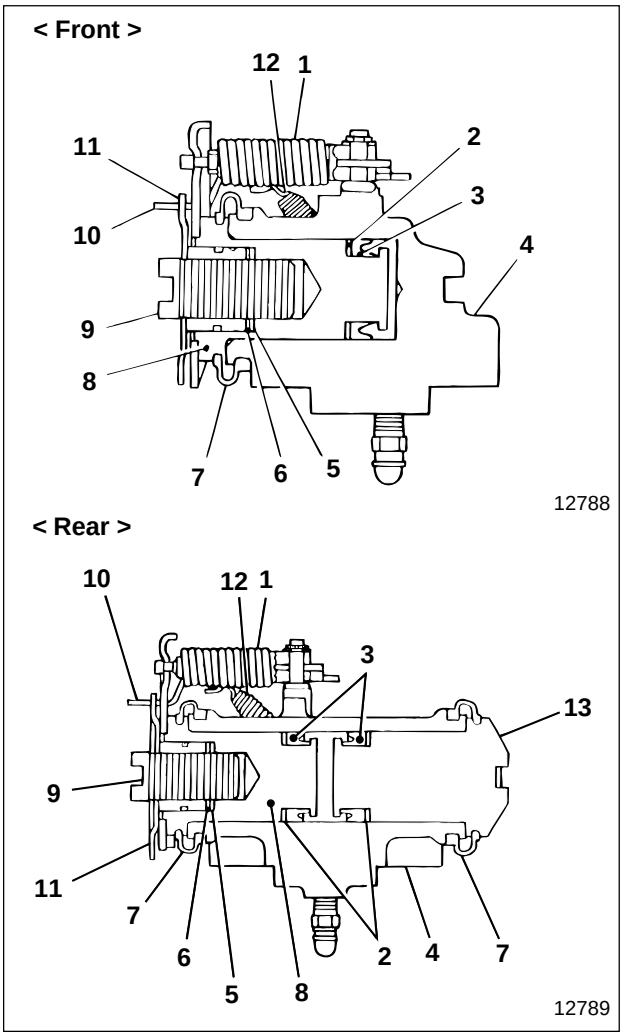


1 Backing plate
2 Brake shoe assembly
3 Return spring
4 Wheel cylinder assembly

- The front wheel brake is an internal expanding 2-leading brake type.
- The rear wheel brake is an internal expanding dual 2-leading brake type.
- Front and rear wheel cylinder assemblies **4** have shoe clearance automatic adjusting mechanisms to maintain the shoe clearance within a specific range.

https://truckmanualshub.com/

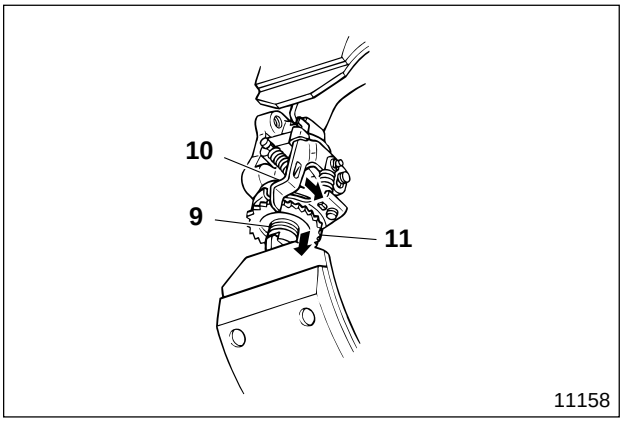
Wheel Cylinder Assembly



1 Spring
2 Backup ring
3 Piston cup
4 Cylinder body
5 Washer (Thick)
6 Washer (Thin)
7 Boot
8 Piston
9 Screw
10 Adjusting lever
11 Adjuster
12 Set spring
13 Piston < Rear wheel cylinder >

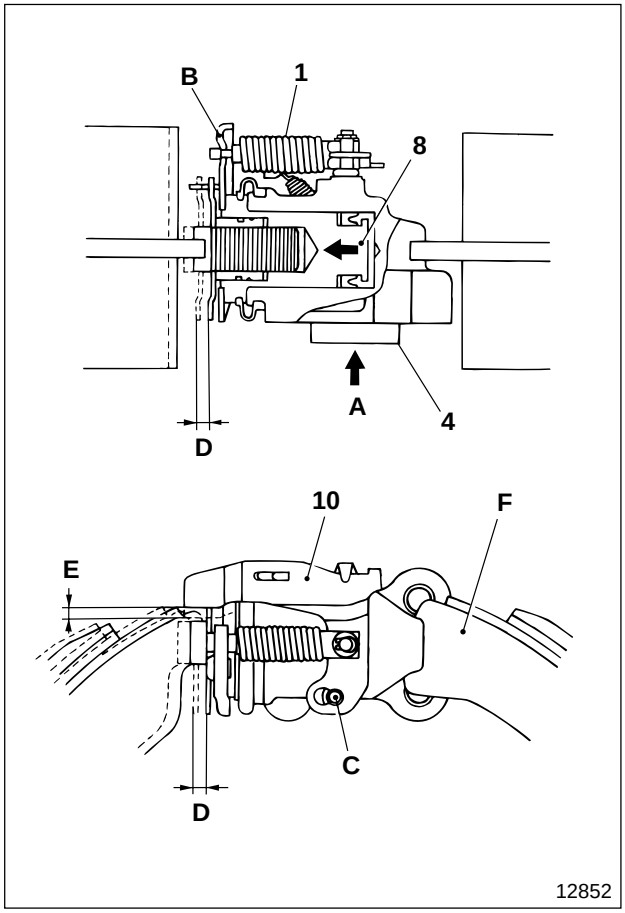
The automatic shoe clearance adjuster automatically adjusts the brake shoe clearance as the lining wears and the brake shoe clearance becomes higher than the specified value.

● **Operation of automatic shoe clearance adjusting mechanism**



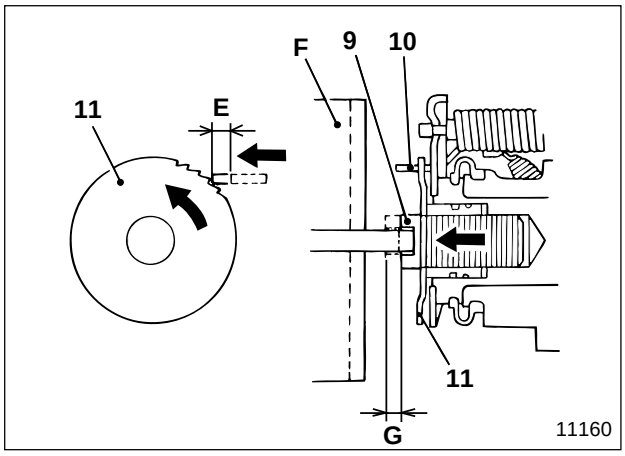
Adjusting lever **10** turns adjuster **11** to push out screw **9**, maintaining correct shoe clearance.

https://truckmanualshub.com/



When depressing brake pedal

- Hydraulic pressure **A** acts on cylinder body **4** to push piston **8** forward.
- As spring hanger **B** of piston **8** is pushed forward, spring **1** which is connected to the spring hanger is pulled, and adjuster lever **10** turns around pin **C**.
  - **D** : Travel of piston **8**
  - **E** : Travel of adjusting lever **10**
  - **F** : Brake shoe assembly

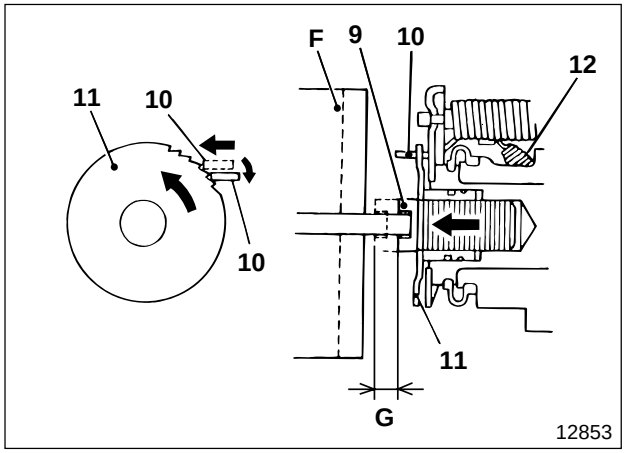


When the brake shoe clearance conforms to the specified value

- When the brake shoe clearance conforms to the specified value, the amount of travel of piston **8** is small. Therefore, the amount adjusting lever **10** turns is less than a one-tooth pitch of adjuster **11** and the adjuster does not turn, so no adjustment is made.
  - **E** : Travel of adjusting lever **10**
  - **F** : Brake shoe assembly
  - **G** : Travel of screw **9**

- When the brake pedal is released, adjusting lever **10** does not climb one tooth of adjuster **11**, so the original engagement is maintained.

https://truckmanualshub.com/



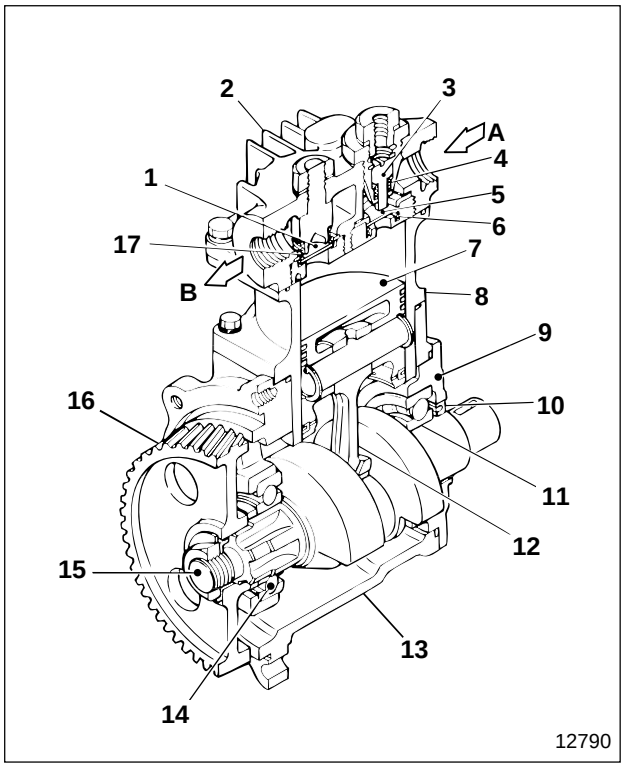
When the brake shoe clearance is higher than the specified value

- When the brake shoe clearance is higher than the specified value, the amount of travel of piston **8** is large. Therefore, adjusting lever **10** and adjuster **11** turn by a greater amount.
- The further adjuster **11** turns, the further screw **9** is pushed out. This regulates the brake shoe clearance to an amount within the specified value.
- When the brake pedal is released, adjuster **11** maintains the position after turning. Adjusting lever **10** climbs one tooth of the adjuster due to the action of set spring **12** to change the engagement, and is returned to the original position.

F : Brake shoe assembly
G : Travel of screw **9**

https://truckmanualshub.com/

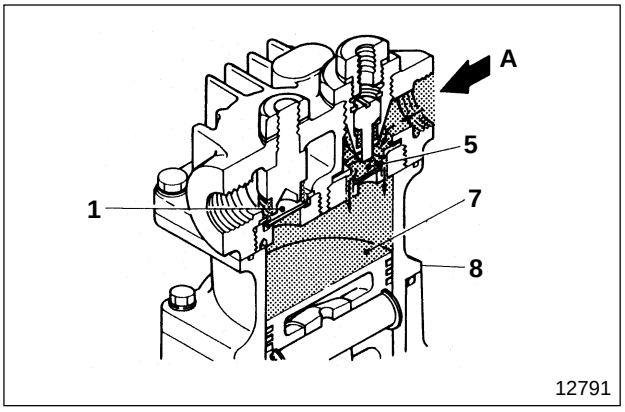
Air Compressor



1 Delivery valve
2 Cylinder head
3 Unloader valve
4 Unloader valve spring
5 Suction valve
6 Suction valve spring
7 Piston
8 Cylinder liner
9 Bearing holder
10 Oil seal
11 Bearing
12 Connecting rod
13 Crankcase
14 Bearing
15 Crankshaft
16 Drive gear
17 Delivery valve spring

A : Air delivery port (From air cleaner)
B : Air discharge port (To air dryer)

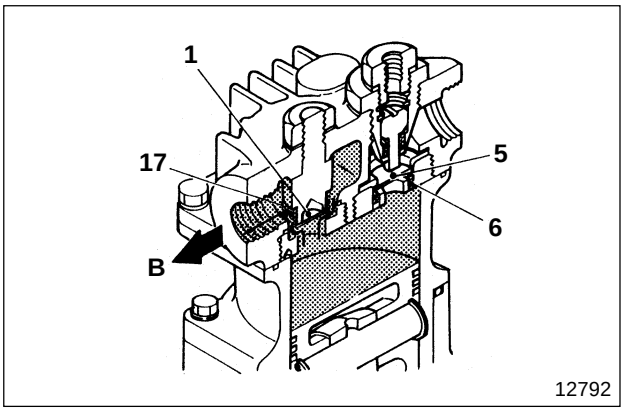
● **During suction**



- When drive gear **16** is driven, crankshaft **15** engaged with the drive gear turns to force down piston **7**.
- The negative pressure generated at this time opens suction valve **5**, sucking air **A** into cylinder liner **8**.

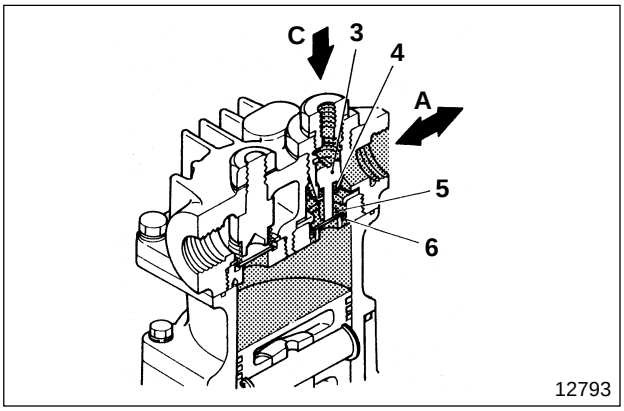
https://truckmanualshub.com/

● **During pressurized delivery**



- As piston **7** rises and enters into the compression stroke, suction valve spring **6** closes suction valve **5**.
- The pressure of the compressed air overcomes the repercussive force of delivery valve spring **17** and opens delivery valve **1** to compress and deliver air **B** to the air dryer.

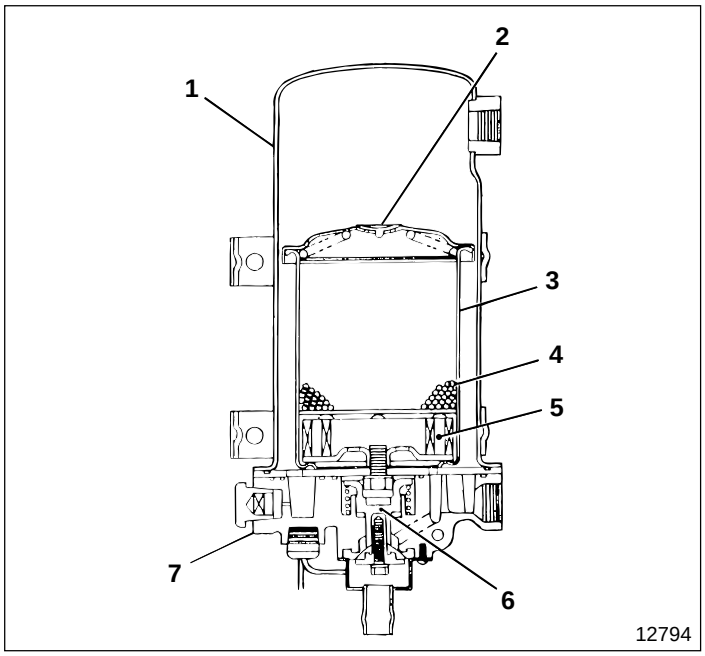
● **When unloader valve operates**



- When the air pressure in the air tank raises higher than the specified value, the air pressure governor operates to feed pressured air **C** to unloader valve **3**. This forces down the unloader valve and holds suction valve **5** open at the same time. Therefore, air **A** is not compressed and the air compressor idles.
- When the air pressure in the air tank drops lower than the specified value, the air pressure governor operates again to discharge pressured air from the upper side of unloader valve **3**. So, unloader spring **4** returns the unloader valve to its original position and the air compressor operates under a load.

https://truckmanualshub.com/

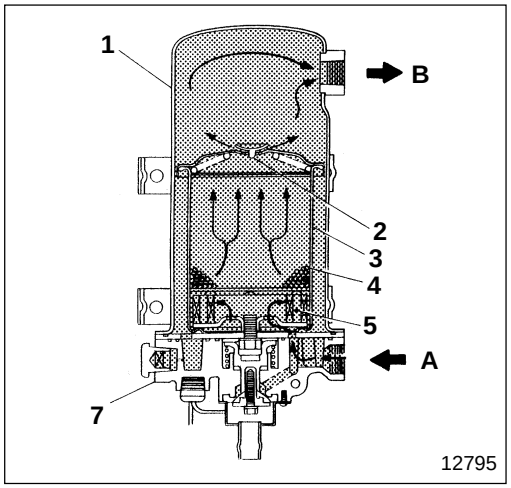
Air Dryer



1 Shell assembly
2 Check valve
3 Cartridge assembly
4 Desiccant
5 Oil filter
6 Valve
7 End cover

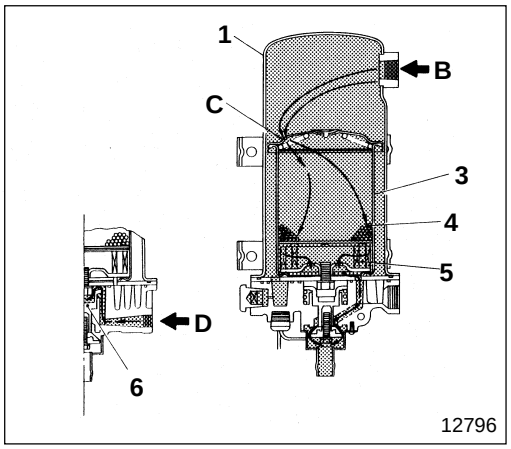
The air dryer removes moisture and oil in the air compressed by the air compressor and protects the brake assembly from rust or faulty operation.

● Dehumidification



- The pressurized air from the air compressor enters delivery side **A** of the air dryer. Once in end cover **7**, moisture and oil are separated from the air and collected in the bottom. Then, the air passes through oil filter **5**, where small oil droplets and dust are removed. Next, the air is delivered into cartridge assembly **3**, where moisture is removed by desiccant **4**.
- As the air travels from the bottom to the top of cartridge assembly **3**, it comes into contact with more dried desiccant. This removes residual moisture from the air, drying the air as it reaches the top of the cartridge assembly. The air passes through check valve **2** and shell assembly **1**, and is delivered to the air tank through exhaust side **B**.

● Regeneration of desiccant



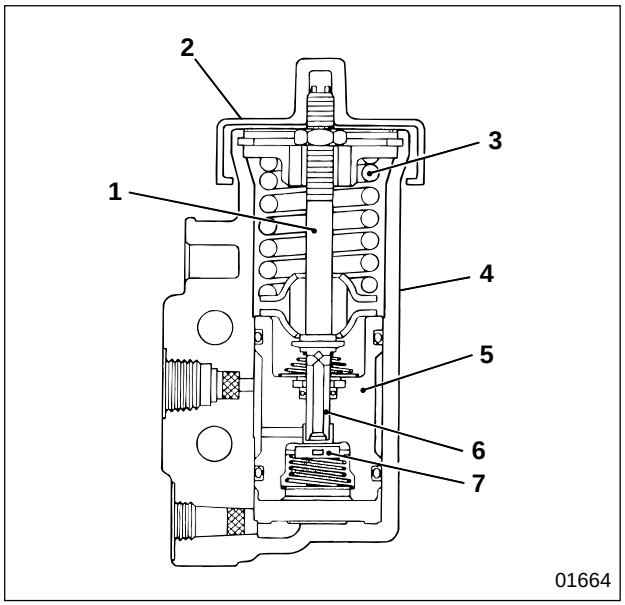
- When the supply of air from the air compressor stops, pressure **D** from the air pressure governor opens valve **6** of the control port of the air dryer. The pressure in cartridge assembly **3** cleans oil filter **5**, releasing the condensed water and oil into the atmosphere.
- After being quickly decompressed, the dry air in shell assembly **1** passes through hole **C**, where the air expands under the reduced pressure, becoming super dry air. This air flows back through cartridge assembly **3** and collects the moisture in desiccant **4**, releasing this moisture into the atmosphere, thereby recycling the desiccant.

https://truckmanualshub.com/

M E M O

https://truckmanualshub.com/

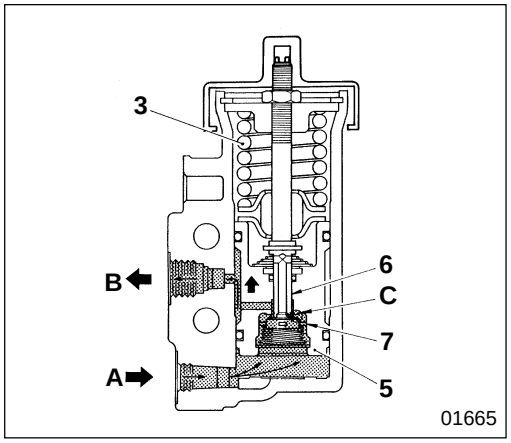
Air Pressure Governor



1 Adjusting screw
2 Cover
3 Spring
4 Body
5 Piston
6 Exhaust stem
7 Valve

The air pressure governor keeps the air pressure in the air tank at the specified pressure, by operating the air compressor with or without load in accordance with the air pressure in the air tank.

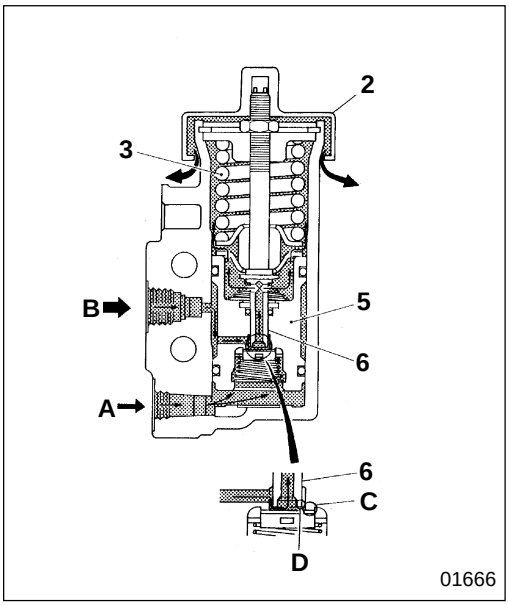
● High specified-pressure



- Pressurized air **A** from the air tank acts constantly on piston **5**. As the pressure in the air tank rises to overcome the repercussive force of spring **3**, the piston rises and valve **7** closes.
- As air pressure **A** from the air tank rises further to become higher than the high specified-pressure, piston **5** rises further. Therefore, exhaust stem **6** opens inlet valve **C** and the air pressure in the air tank flows from unloader port **B** to the unloader valve of the air compressor via the inlet valve. Then the air compressor enters unloaded operation. Pressure also reaches the air dryer to recycle the desiccant

https://truckmanualshub.com/

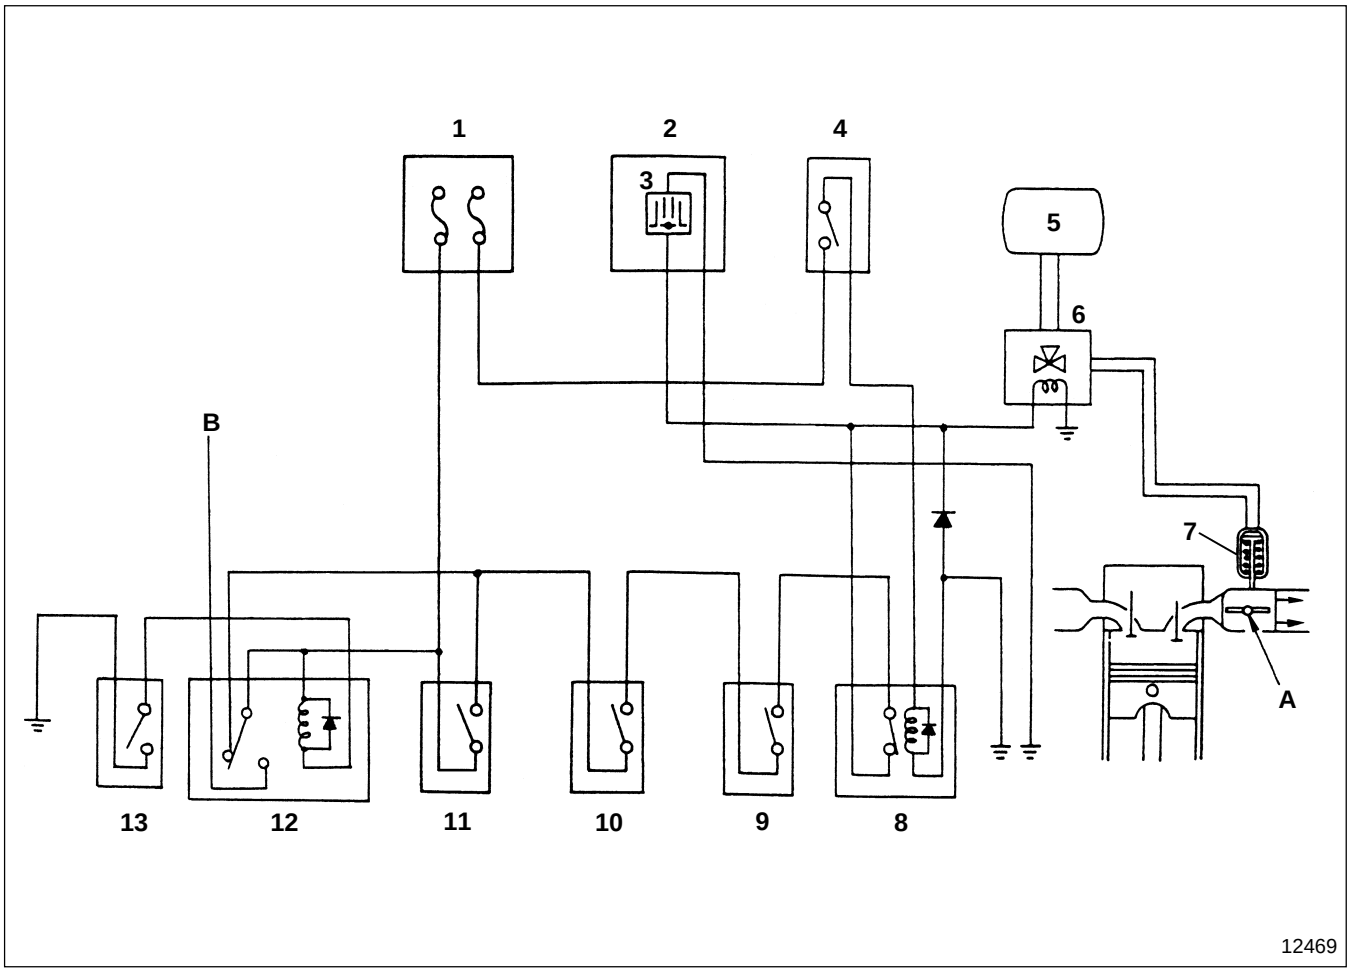
● Low specified-pressure



When pressurized air **A** from the air tank gradually drops below the specified-pressure, spring **3** forces down piston **5**. This closes inlet valve **C** and opens exhaust valve seat **D** so pressurized air **B**, up to the unloader valve of the air compressor, is discharged through the opening of cover **2** via exhaust stem **6**, operating the air compressor at load. The pressurized air up to the air dryer is also discharged into the atmosphere.

https://truckmanualshub.com/

Exhaust Brake System



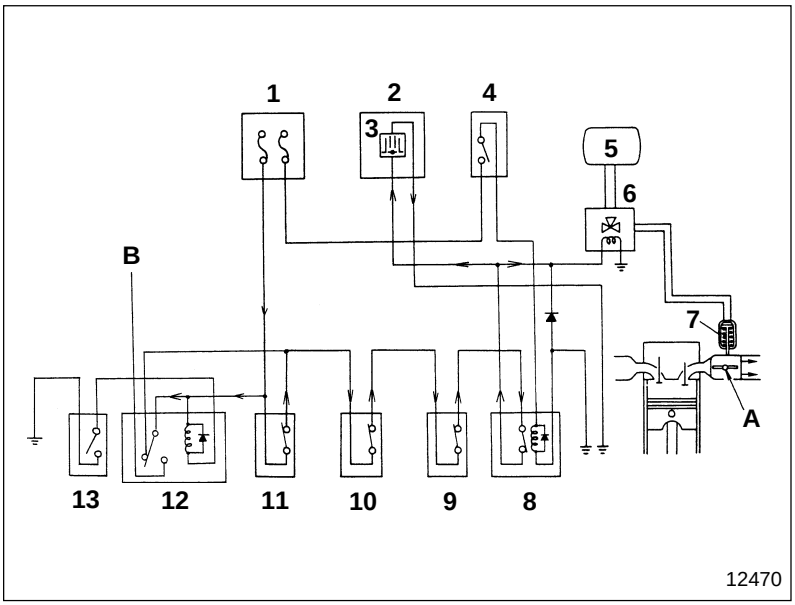
1 Relay and fuse box
2 Meter cluster
3 Exhaust brake indicator lamp
4 Transmission neutral switch
5 Air tank
6 3-way magnetic valve
7 Exhaust brake unit
8 Exhaust brake cut relay
9 Accelerator switch
10 Exhaust brake switch
11 Clutch switch < without power take-off >
12 Power take-off relay < with power take-off >
13 Clutch switch < with power take-off >

A : Butterfly valve
B : To power take-off switch

- Excitation of 3-way magnetic valve **6** causes the air pressure in air tank **5** to act on exhaust brake unit **7** to close butterfly valve **A**, activating the exhaust brake.
- If the exhaust brake is activated while the vehicle is stationary, the coolant temperature can rise excessively, overheating the engine. To avoid this, when the transmission is in neutral, transmission neutral switch **4** turns ON, cutting the exhaust brake system.

https://truckmanualshub.com/

● When exhaust brake system is activated

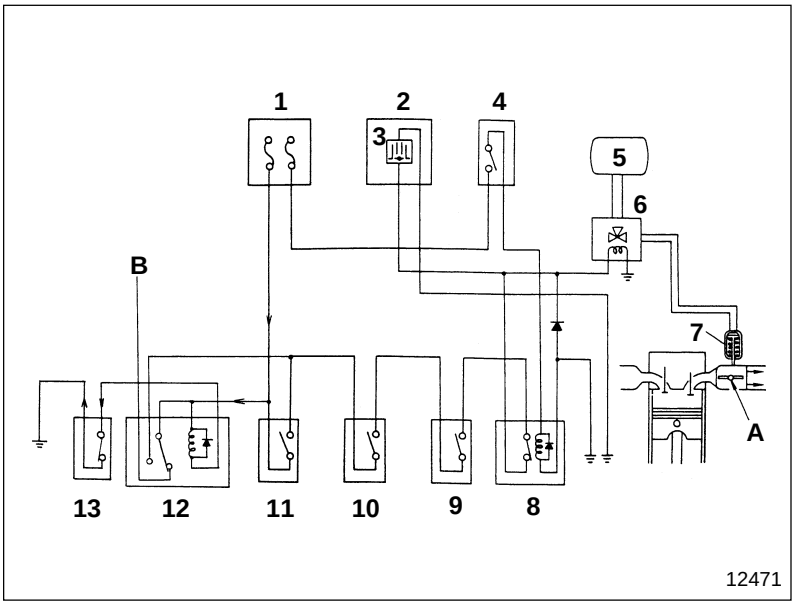


When exhaust brake switch **10** is turned on, the current flows as illustrated to activate the exhaust brake.

Fuse **1** → Power take-off relay **12** → Clutch switch **11** → Exhaust brake switch **10** → Accelerator switch **9** → Exhaust brake cut relay **8** → 3-way magnetic valve **6** → Ground

Fuse **1** → Exhaust brake indicator lamp **3** (ON) → Ground

● When the exhaust brake system is released



When the accelerator pedal or clutch pedal is depressed while the exhaust brake is working, all switches **9**, **11** turn off, shutting off the current, releasing the exhaust brake.

● When clutch pedal is depressed

Fuse **1** → Clutch switch **11** (OFF) → Since no current flows, the circuit turns off and the exhaust brake is released.

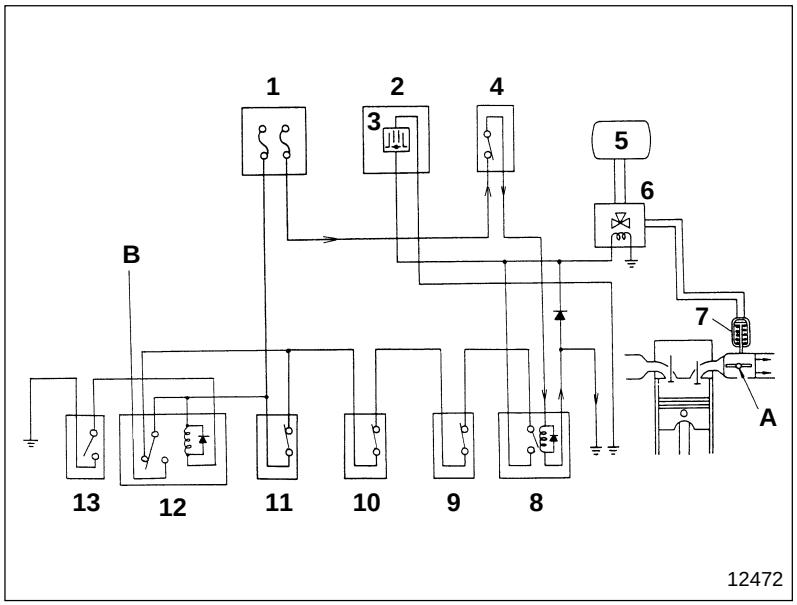
Fuse **1** → Power take-off relay **12** excitation → Clutch switch **13** (ON) → Ground

● When accelerator pedal is depressed

Fuse **1** → Power take-off relay **12** → Clutch switch **11** → Exhaust brake switch **10** → Accelerator switch **9**(OFF) → Since there is no grounding, current does not flow, so the exhaust brake is released.

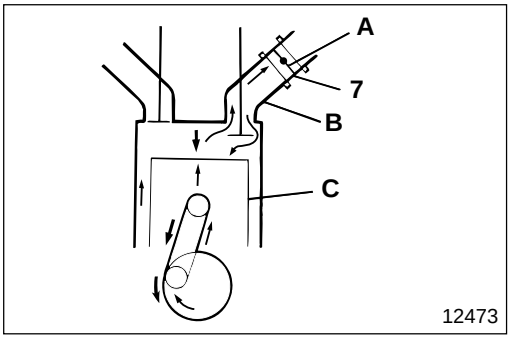
https://truckmanualshub.com/

● Releasing exhaust brake system by placing transmission in neutral



When the transmission is placed in neutral, the current flows as illustrated and the exhaust brake is released.

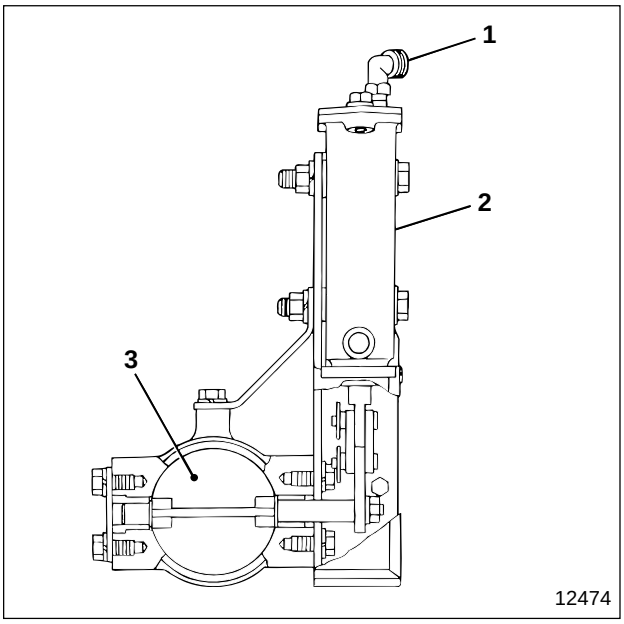
Fuse **1**⟶Transmission neutral switch **4**→Exhaust brake cut relay **8** excitation →Ground
Fuse **1**⟶Clutch switch **11**⟶ Exhaust brake switch **10**→Accelrator switch **9**→Exhaust brake cut relay **8** (OFF)
→Power take-off relay **12**
→Beyond this, current does not flow so the exhaust brake is released.



● Working principle of exhaust brake

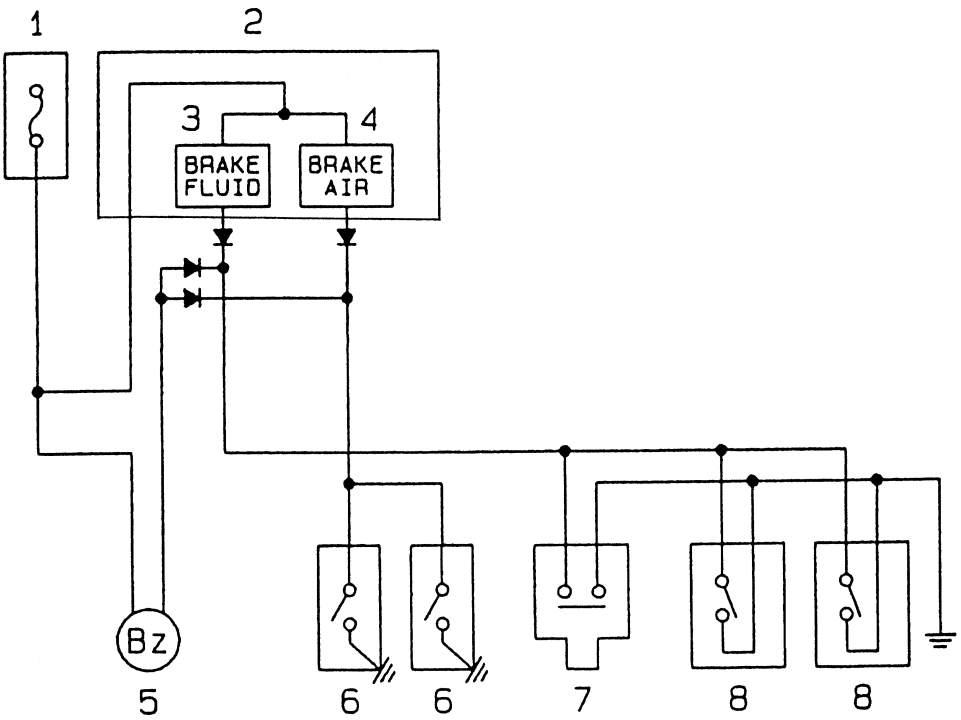
https://truckmanualshub.com/

When butterfly valve **A** of exhaust brake unit **7**, in exhaust pipe **B**, is closed, the pressure in the exhaust pipe rises. The pressure rises further in the exhaust stroke, generating a force that pushes back piston **C**, the exhaust braking force.



● Exhaust brake unit

https://truckmanualshub.com/

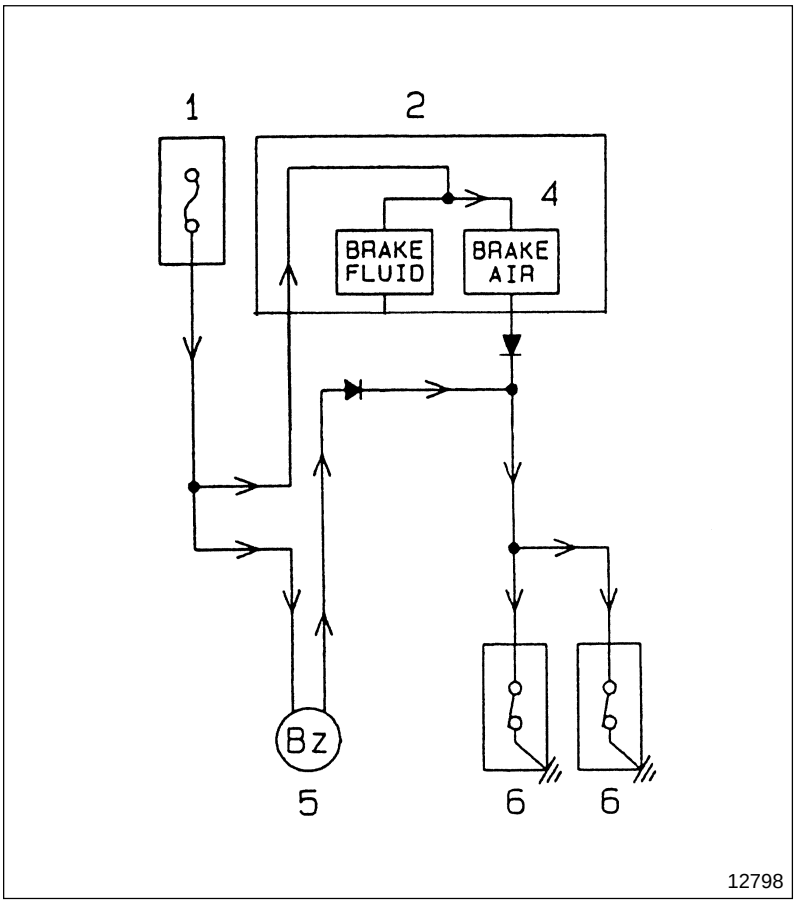


1 Fuse and relay box
2 Meter cluster
3 Brake fluid warning lamp
4 Air warning lamp
5 Warning buzzer
6 Low air pressure switch
7 Brake fluid level switch (installed on fluid tank)
8 Stroke switch (installed on airmaster)

The brake warning system consists of two circuits: the air pressure warning circuit and the brake fluid warning circuit. The first detects decrease of air pressure in the air tank, the second detects decrease in brake fluid in the fluid tank and brake fluid leakage in the brake fluid system. Both circuits light warning lamps and at the same time sound a buzzer to alert the driver.

https://truckmanualshub.com/

● Air pressure warning circuit

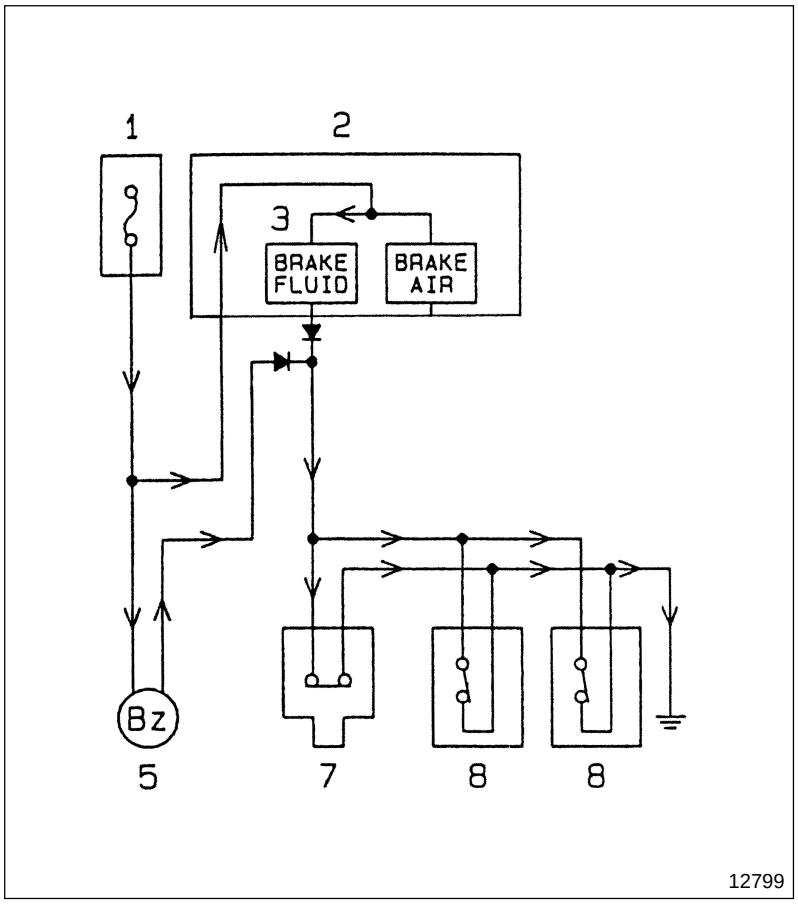


When the air pressure in the air tank drops below the specified value, low air pressure switch **6** turns on to light air warning lamp **4** and sound warning buzzer **5**. The current flows as follows:

Fuse **1** → Air warning lamp **4** → Low air pressure switch **6** → Ground
Fuse **1** → Warning buzzer **5** → Low air pressure switch **6** → Ground

https://truckmanualshub.com/

● Brake fluid warning circuit



- When the brake fluid in the fluid tank drops below the specified level, brake fluid level switch **7** in the fluid tank turns on, brake fluid warning lamp **3** lights and warning buzzer **5** sounds. At this time, current flows as follows:

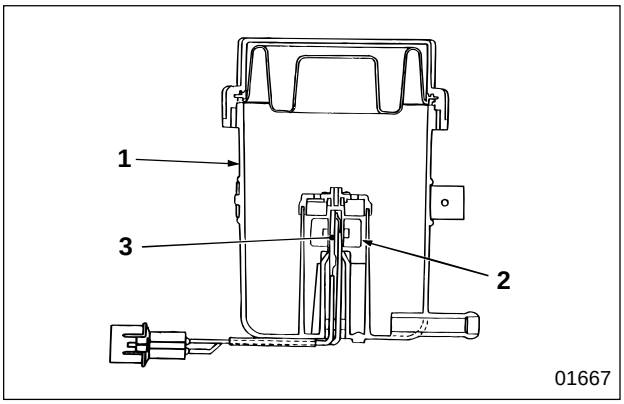
  Fuse **1** → Brake fluid warning lamp **3** → Brake fluid level switch **7** → Ground
  Fuse **1** → Warning buzzer **5** → Brake fluid level switch **7** → Ground

- If brake fluid leaks from the brake fluid system, stroke switch **8** of the airmaster turns on, brake fluid warning lamp **3** lights and warning buzzer **5** sounds. At this time, current flows as follows:

  Fuse **1** → Brake fluid warning lamp **3** → Stroke switch **8** → Ground
  Fuse **1** → Warning buzzer **5** → Stroke switch **8** → Ground

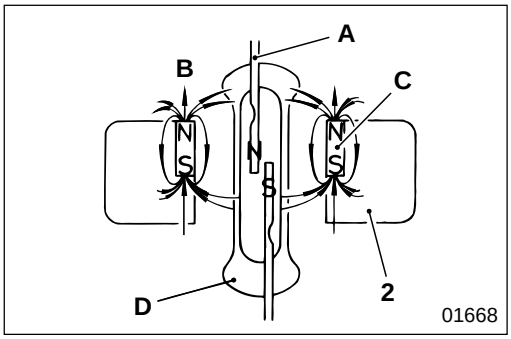
https://truckmanualshub.com/

● Brake fluid level switch



1 Fluid tank
2 Float
3 Brake fluid level switch

- Brake fluid level switch **3**, installed on fluid tank **1**, detects the brake fluid level in the fluid tank. If the brake fluid level drops below the specified level, float **2** moves to turn on the brake fluid level switch and light up the brake fluid warning lamp to alert the driver.



- If the brake fluid level in fluid tank **1** drops and float **2** drops lower than level **L**, magnetic force **B** that passes through the contact points (ferromagnetic material **A**) increase, generating north and south poles at the ends of the contact points. Therefore, the contact points pull each other and overcome the repercussive force of the springs of the contact points, forming an electric circuit.
  C : Permanent magnet
  D : Glass

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Replacement of Brake Fluid

Fluid

Location	Points of application	Kinds	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116, DOT3)	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Vinyl hose 	MH033102	Air bleeding

WARNING

- **You must use new brake fluid (SAE J1703f or FMVSS No. 116, DOT3).**
- **Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the brake system, because this will cause the rubber parts of the brake system to swell, resulting in brake dragging or ineffective braking.**
- **Do not allow foreign particles or water to get mixed in with the brake fluid when you add it.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oil.**

CAUTION

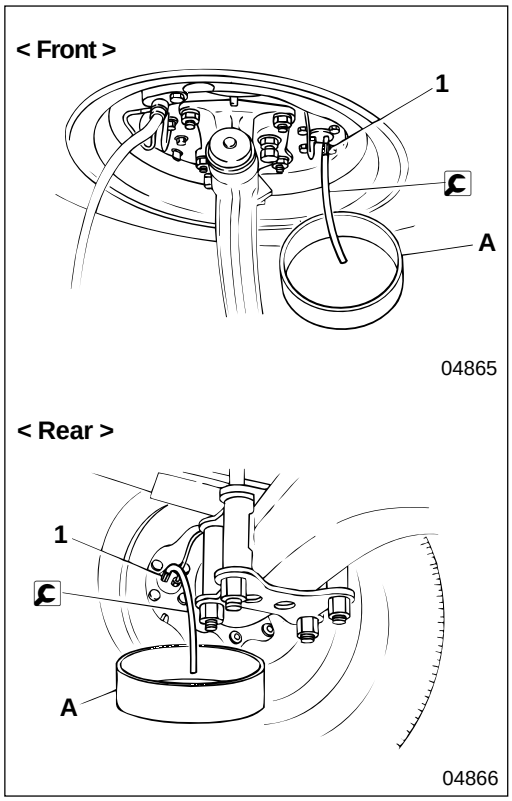
- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

NOTE

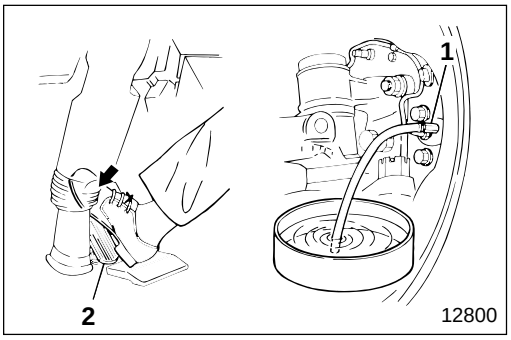
Supply and maintain brake fluid to the “H” level of the fluid tank.

https://truckmanualshub.com/

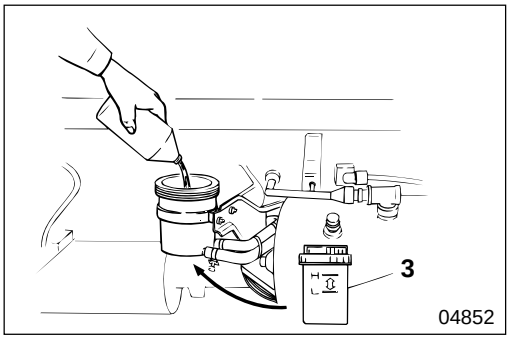
- Start engine and let it idle until brake fluid replacement is completed.



- Attach one end of vinyl hose to air bleeder **1** and place the other end in container **A**.

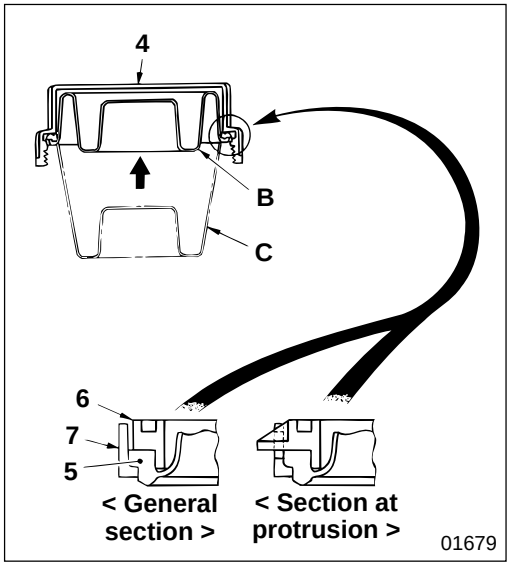


- Loosen air bleeder **1** and depress brake pedal **2** to drain brake fluid completely.



- Maintain a supply of new brake fluid up to the "**H**" level of fluid tank **3**, depress the brake pedal repeatedly until the old brake fluid of the brake system is replaced with new fluid.

https://truckmanualshub.com/



- If diaphragm **5** is not in its normal posture when the brake fluid is supplied, correct it to its normal posture, and install cap **4**. If brake fluid leaks from the cap area after you have supplied brake fluid, check whether the diaphragm is assembled as illustrated.

  6 : Slide ring
  7 : Ring cover
  B : Correct condition of diaphragm when brake fluid is being supplied
  C : Condition when diaphragm is extended when brake fluid has decreased

- Air bleeding of brake system. P35A-36

Air Bleeding of Brake System

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
—	Air bleeder (Airmaster)	6.9 to 12.7 {5.1 to 9.4, 0.7 to 1.3}	—
—	Air bleeder (Wheel brake)	7.8 to 12 {5.8 to 8.5, 0.8 to 1.2}	—

Fluid

Location	Points of application	Kinds	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116, DOT3)	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
2	Vinyl hose 	MH033102	Air bleeding

https://truckmanualshub.com/

WARNING⚠

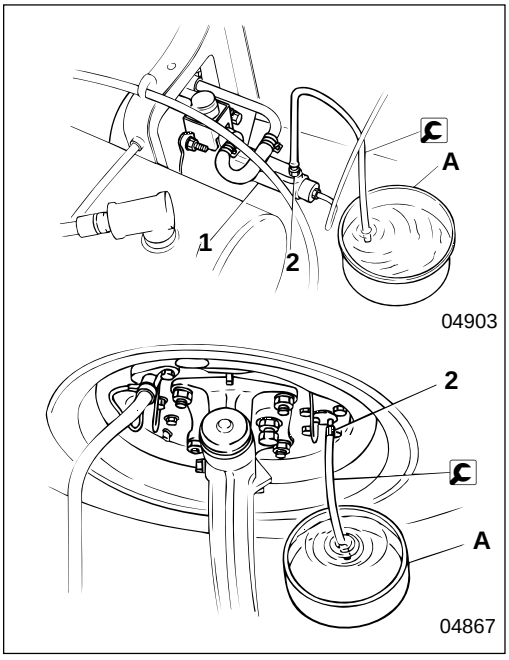
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116, DOT3).**
- **Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the brake system, because this will cause the rubber parts of the brake system to swell, resulting in brake dragging or ineffective braking.**
- **Do not allow foreign particles or water to get mixed in with the brake fluid when you add it.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oil.**

CAUTION⚠

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

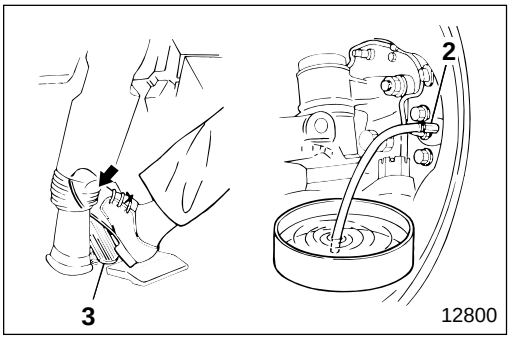
NOTE

- **Supply and maintain brake fluid to the "H" level of the fluid tank.**
- **Make sure you maintain brake fluid at the "H" level of the fluid tank since the brake fluid level drops during air bleeding.**



- Start engine and let it idle until brake fluid replacement is completed.
- Attach one end of vinyl hose to front or rear airmaster **1**. Then, attach one end of another vinyl hose to air bleeder **2** of the wheel brake. Finally, place both free ends in container **A** filled with brake fluid.
- Carry out air bleeding in the following sequence:

Front brake system	Rear brake system
Airmaster for front	Airmaster for rear
↓	↓
Right-hand side wheel brake	Right-hand side wheel brake
↓	↓
Left-hand side wheel brake	Left-hand side wheel brake



- Depress brake pedal **3** slowly a few times, and with the brake pedal depressed, loosen air bleeder **2** to drain brake fluid containing air.

https://truckmanualshub.com/

- Tighten air bleeder **2**, and release brake pedal **3**.
- Repeat this service procedure until air is no longer present in the fluid being drained.
- Tighten air bleeder **2** at specified torque as soon as brake fluid flowing out is free of air bubbles.

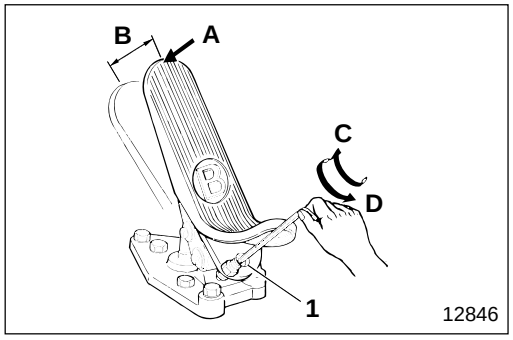
- Adjust brake shoe clearance when you have finished air bleeding. P35A-62
- Check that brake fluid comes up to level "**H**" of fluid tank. If it does not, refill with new brake fluid.
- Depress brake pedal **3** a few times and check for any leakage of brake fluid, then test the brakes.
- When you test the brakes, if the brake fluid warning lamp within the meter cluster lights, it means that air has not been bled completely. Redo air bleeding.

Inspection and Adjustment of Brake Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
—	Free play of pedal	Pedal toe	$12^{+3.0}_{-1.5}\{0.47^{+0.12}_{-0.059}\}$	—	Adjust using set screw
		Depression angle	$3.5°^{+1.0°}_{-0.5°}$	—	



Press pedal toe **A** with your hand and measure free play **B**. If the measured value deviates from the standard value, adjust it by turning set screw **1**.

C : Turning clockwise decreases the free play (For a small angle)

D : Turning counterclockwise increases the free play (For a large angle)

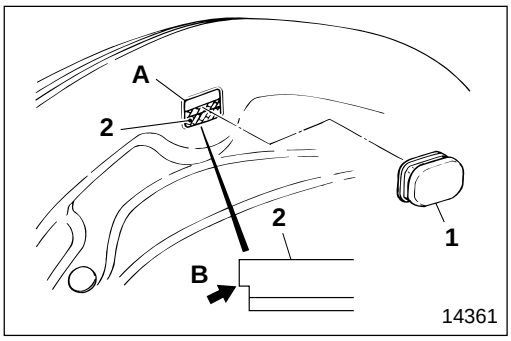
https://truckmanualshub.com/

Thickness Inspection and Replacement of Brake Lining

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2	Thickness of brake lining	—	5.5 {0.22} (Side shoulder means wear limit)	Replace



[Inspection]

NOTE

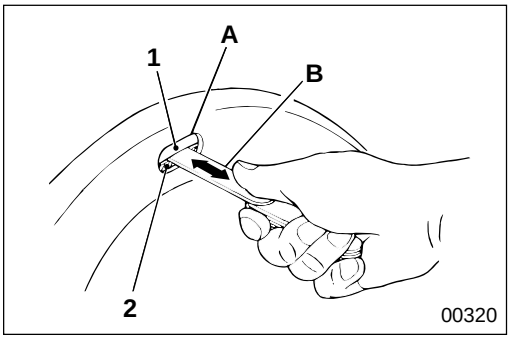
Be sure to inspect at two points for each wheel per side.

- Remove check hole plug **1** from the backing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall check hole plug **1**.

[Replacement]

P35A-60

Inspection of Brake Shoe Clearance



NOTE

When the vehicle is jacked up and the wheel is being turned, make sure that there is no dragging.

- Remove the check hole plug from the backing plate.
  A : Check hole
- Try to insert a 1 mm {0.039 in.} feeler gauge **B** between brake drum **1** and brake lining **2**. Check that the clearance is too small to let the feeler gauge enter.
  If feeler gauge **A** enters the clearance, disassemble the wheel cylinder and inspect.
  P35A-60

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection and Maintenance of Air Dryer

Carry out inspection and maintenance according to the following interval or vehicle milage.

(1) Every 10000 km (6000 miles)

- To check that the air dryer operates correctly, open the drain cock of the tank and see if any drainage comes out.
- If a little drainage comes out, remove the indicator from the unit and check the indicator assembly for color change. If its color has changed to pink, replace with a new cartridge assembly and indicator assembly.
  📖 P35A-88

NOTE

In an operational environment, where the decrease of the ambient temperature in the air tank is higher than 16°C {29°F}, a little moisture might collect.

- Carefully inspect the drainage from the exhaust port of the air dryer body.

(2) Every year or every 60000 km {36000 miles}

Disassemble the air dryer body and replace the cartridge assembly, the indicator assembly and all rubber parts.
📖 P35A-88

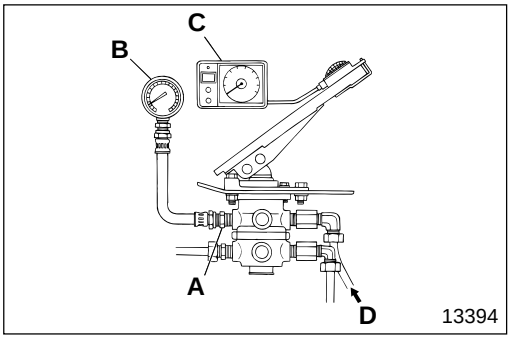
10	Friction surfaces of plunger and other parts	High pressure-resistant, high abrasion-resistant grease [NLGI No.2 (Li soap)]	As required
—	Friction surface and groove of O-ring, friction surfaces of metals	Multipurpose grease [NLGI No.2 (Li soap)]	As required

Special tools

Location	Tool name and shape	Part No.	Application
21	Insert tool	*910-24461	Installation of O-ring
32	Retainer	*910-24590	Holding of primary piston

* : JIDOSHA KIKI part No.

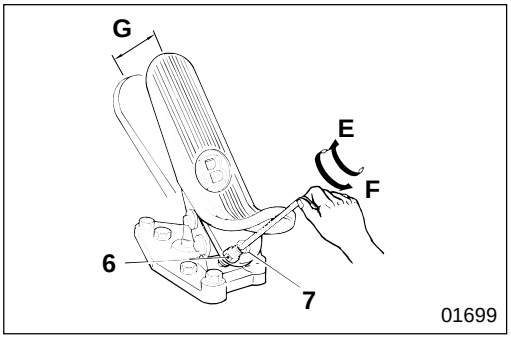
◆ Service procedure



● Inspection of function after assembly

Check that the output air pressure, corresponding to the pedal depression angle, conforms to the specified value.

- Mount pressure gauge **B**, capable of measuring 980 kPa {142 lbf/in^2, 10 kgf/cm^2} or more, on primary output side port **A**.
- Mount depression gauge **C** on the brake pedal.
- Apply air pressure of 685 kPa {100 lbf/in^2, 7 kgf/cm^2} to primary input side port **D** and inspect related parts for air leakage.
- If air leakage is found, do the following:
  - Tighten connectors.
  - Disassemble the dual brake valve and inspect the O-ring assemblies of all parts.



- Turn set screw **7** and adjust brake pedal play **G** to the standard value.
- Tighten lock nut **6** at specified torque to lock set screw **7**.
- Read pressure gauge **B** and make sure that the primary output pressure and brake pedal depression force angle, corresponding to the brake pedal depression angle, conform to the standard values shown in the input/output characteristic curve diagram overleaf.
- If the output air pressure is lower than the standard value, replace the following springs:
  - Spring **15**
  - Outer spring **29**
  - Inner spring **30**

E : Turning clockwise decreases the play (To decrease brake pedal depression angle)

F : Turning counterclockwise increases the play (To increase brake pedal depression angle)

https://truckmanualshub.com/

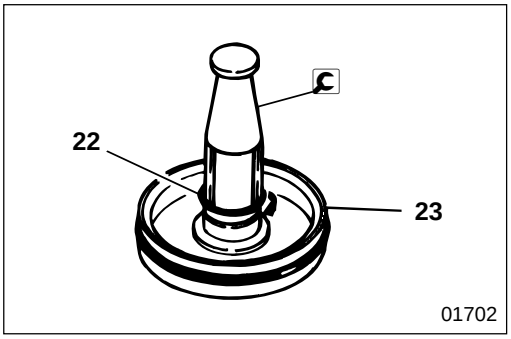
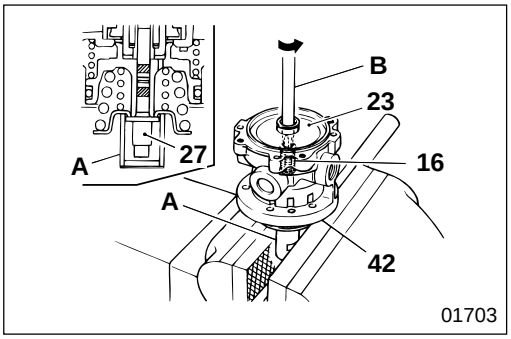
9 **10** **Packing grease between boot and plunger**

Pack area A with **1** cm^3 {0.061 cu in.} of grease.



22 **Installation of O-ring**



23 **Removal of relay piston**

- Grip (14 mm {0.55 in.}) socket wrench **A** in a vise.
- Insert the head of self-locking bolt **27** into socket wrench **A** to tighten body **42**.

WARNING

You must be careful when you loosen screw 16, because the spring in body 42 can forcibly eject relay piston 23. To avoid this hazard, press down on the relay piston with your hand when you carry out the above work.

- Loosen screw **16** gradually to remove relay piston **23**.

1	Brake pipe flare nut	12.75 to 17.65 {9.4 to 13, 1.3 to 1.8}	—
2	Bolt (Joint mounting)	37.27 to 49.03 {27 to 36, 3.8 to 5.0}	—
12	Bolt (Wheel cylinder assembly mounting)	37.27 to 49.03 {27 to 36, 3.8 to 5.0}	M10
		122.58 to 166.7 {90 to 120, 12.5 to 17.0}	M12

Lubricant

Location	Points of application	Kinds	Quantity
7	Brake shoe assembly contact surface of nut	Brake grease	As required
13	Wheel cylinder assembly anchor and screw groove contact area with brake shoe	Brake grease	As required

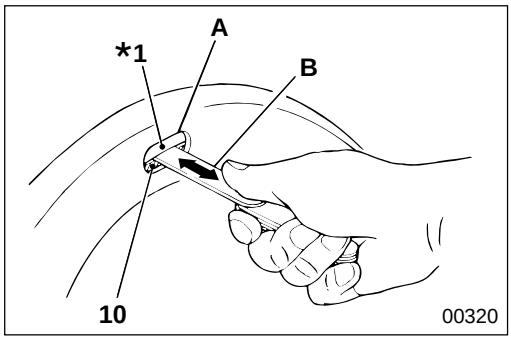
https://truckmanualshub.com/

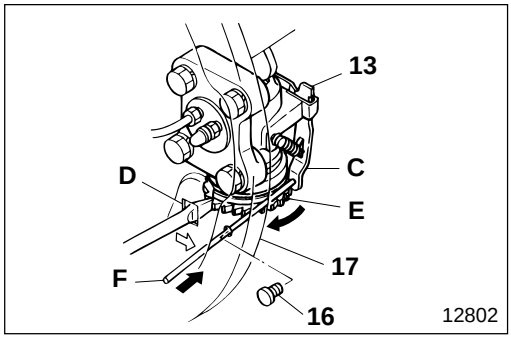
◆ Service procedure

● Initial adjustment of brake shoe clearance after installation

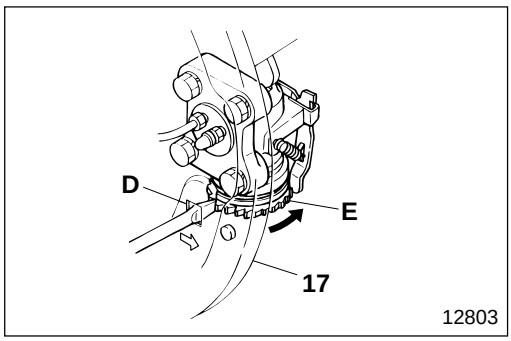
Turning the adjuster of wheel cylinder assembly **13** in arrow ⇨ direction expands brake shoe assembly **8**, narrowing the clearance between brake drum ***1** and brake lining **10**.

- Jack up the vehicle to make sure that the wheel hub bearing has no play. If there is any play, correct it. Gr 26
- Remove adjusting hole plug **15** and check hole plug **14**.
- Adjust the brake shoe clearance as follows, so that 0.3 mm {0.012 in.} feeler gauge **B** can be inserted or extracted through check hole **A**, between brake drum ***1** and brake lining **10** with a little resistance.





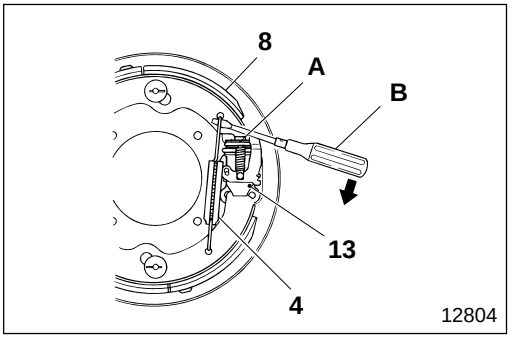
- To increase brake shoe clearance
  - Remove cover **16** on the rear of backing plate **17**.
  - Insert a wire (approximately ø5 mm {0.20 in.}) into the hole of cover **16** and lift adjusting lever **C** of wheel cylinder **13**.
  - Turn adjuster **E** of wheel cylinder **13**, through adjusting hole **D**, in the opposite direction to arrow ⇨ on backing plate **17**.



- To decrease brake shoe clearance
  Turn adjuster **E** in the arrow ⇨ direction marked on backing plate **17** through adjusting hole **D**.

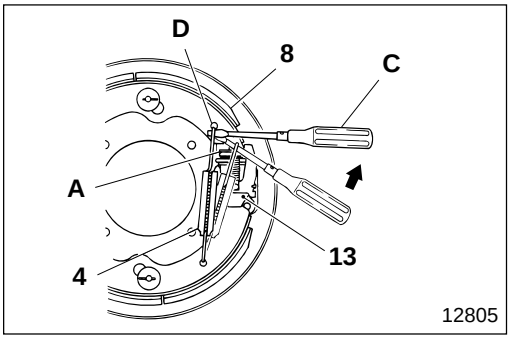
- Extract the feeler gauge and depress the brake pedal two or three times fully, then the specified value brake shoe clearance can be obtained.
- Insert a 0.2 mm {0.0079 in.} feeler gauge through check hole **A** and make sure that it can be inserted or extracted with a little resistance.
  If there is any fault, disassemble and inspect wheel cylinder **13**.
  P35A-66

https://truckmanualshub.com/

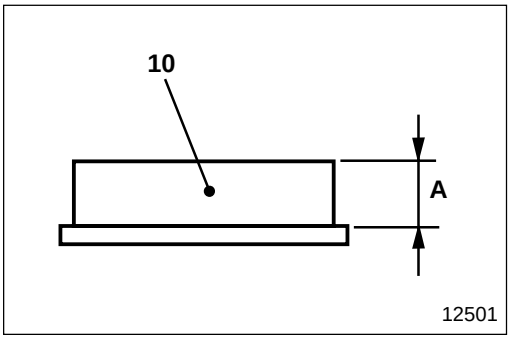


4 Return spring

[Removal]
To remove the return spring, place screwdriver **B** on the hook of the return spring, then pry and remove the return spring making use of wheel cylinder **13** adjusting screw **A** as a fulcrum.

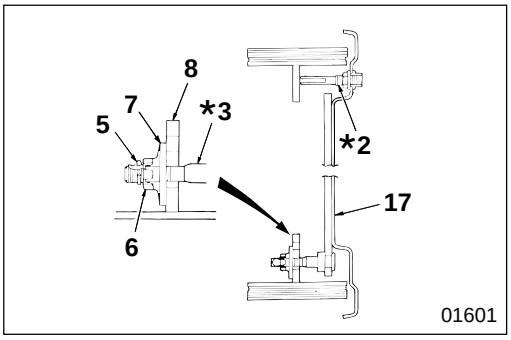


[Installation]
- Install the shorter hook of return spring **4** on brake shoe assembly **8**.
- Insert a small Phillips screwdriver **C** into the hook of return spring **4**, insert the tip of the screwdriver into return spring installation hole **D** of brake shoe assembly **8** to pry on the return spring.



8 Brake shoe assembly

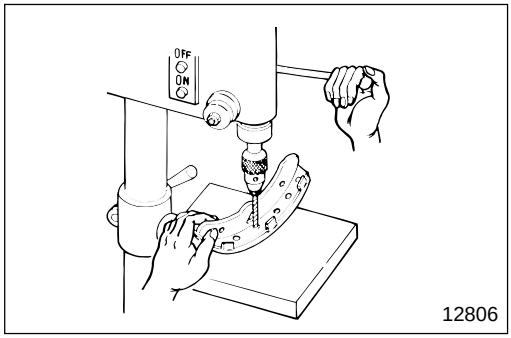
[Inspection]
If thickness **A** of brake lining **10** is lower than the limit replace the brake lining on the same axle as a unit.



[Installation]
- Install brake shoe assembly **8**.
- Tighten nut **7**. When brake shoe assembly **8** makes contact with bolt ***2** of backing plate **17**, slacken off the nut by one third of a turn.
- Slacken off nut **7** until the holes of stud pin ***3** and lock plate **6** align with each other.
- Install cotter pin **5** and bend it.

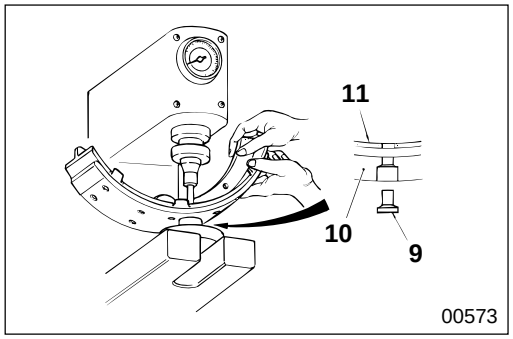
https://truckmanualshub.com/

FRONT WHEEL BRAKE



10 **Brake lining**

[Removal]



[Installation]

- Clean the mounting surfaces of brake lining **10** and brake shoe **11** with cleaning fluid and dry them.
- Insert rivets **9** from brake lining **10** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **11** and the brake lining.

  Caulking load for rivets : 17 to 19 kN {3750 to 4190 lbf, 1700 to 1900 kgf}

- Make sure that you inspect contact with the inner surface of brake drum ***1** after you replace brake linings **10**. If contact is incorrect, correct with the brake assembled.

WARNING

Do not leave lubricant on the surface of brake lining 10 because this reduces braking performance.

CAUTION

Make sure that the type of brake linings 10 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one shaft.

***1** **Correction of brake drum**

If the cylindrical accuracy of brake drum ***1** is higher than the limit, or there are seams, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

1	Brake pipe flare nut	12.75 to 17.65 {9.4 to 13, 1.3 to 1.8}	—
10	Bolt (Wheel cylinder assembly cover mounting)	7.85 to 11.77 {5.8 to 8.7, 0.8 to 1.2}	—
12	Bolt (Wheel cylinder assembly mounting)	122.58 to 166.7 {90 to 120, 12.5 to 17.0}	—

Lubricant

Location	Points of application	Kinds	Quantity
5	Brake shoe assembly contact surface of nut	Brake grease	As required
13	Wheel cylinder assembly anchor and screw groove contact areas with brake shoe	Brake grease	As required

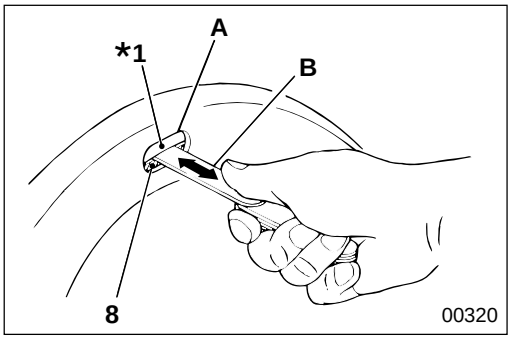
https://truckmanualshub.com/

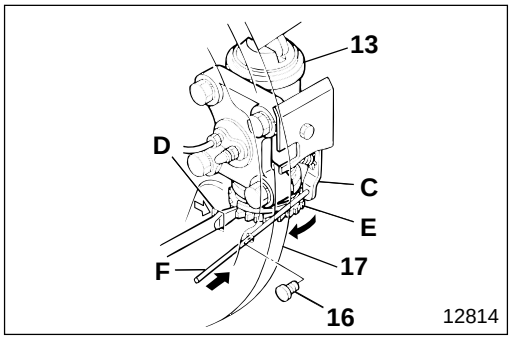
◆ Service procedure

● **Adjustment of initial brake shoe clearance after installation**

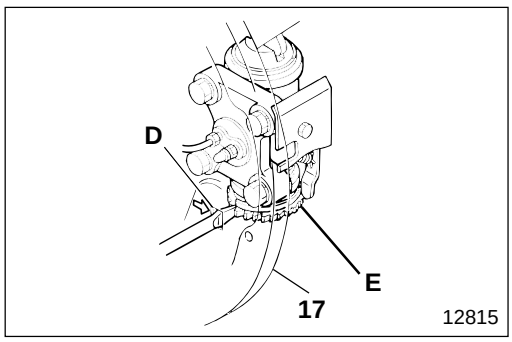
Turning the adjuster of wheel cylinder **13** in arrow ⇨ direction expands brake shoe assembly **6**, narrowing the clearance between brake drum ***1** and brake lining **8**.

- Jack up the vehicle to make sure that the wheel hub bearing has no play. If there is any play, correct it. Gr 27
- Remove adjusting hole plug **15** and check hole plug **14**.
- Adjust the brake shoe clearance as follows, so that 0.3 mm {0.012 in.} feeler gauge **B** can be inserted or extracted through check hole **A**, between brake drum ***1** and brake lining **8** with a little resistance.





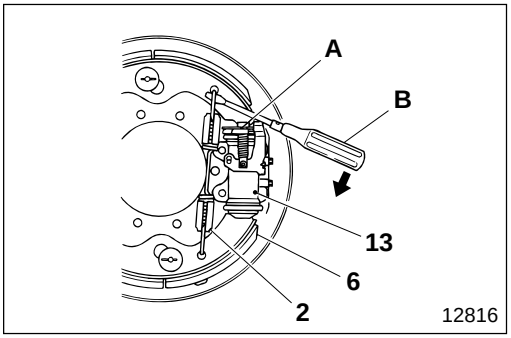
- To increase brake shoe clearance
  - Remove cover **16** on the rear of backing plate **17**.
  - Insert a wire (approximately ø5 mm {0.20 in.}) into the hole of cover **16** and lift adjusting lever **C** of wheel cylinder **13**.
  - Turn adjuster **E** of wheel cylinder **13**, through adjusting hole **D**, in the opposite direction to arrow ⇨ on backing plate **17**.



- To decrease brake shoe clearance
  Turn adjuster **E** in the arrow ⇨ direction marked on backing plate **17** through adjusting hole **D**.

- Extract the feeler gauge and depress the brake pedal two or three times fully, then the specified value brake shoe clearance can be obtained.
- Insert a 0.2 mm {0.0079 in.} feeler gauge through check hole **A** and make sure that it can be inserted or extracted with a little resistance.
  If there is any fault, disassemble and inspect wheel cylinder **13**. P35A-76

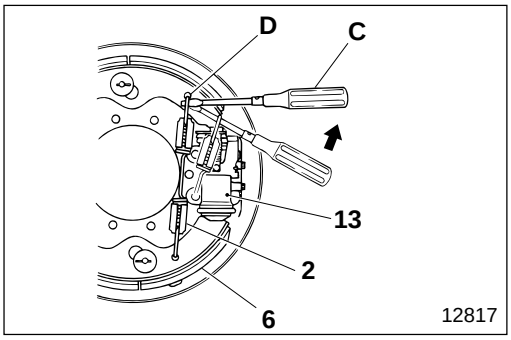
https://truckmanualshub.com/



2 Return spring

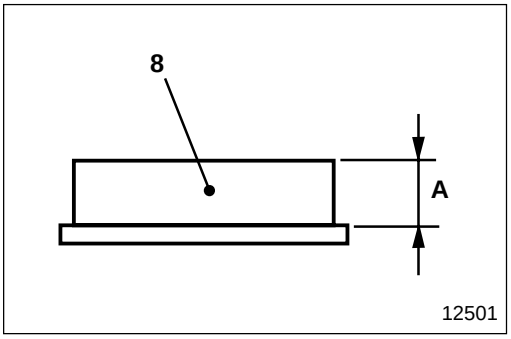
[Removal]

To remove the return spring, place screwdriver **B** on the hook of the return spring, then pry and remove the return spring making use of wheel cylinder assembly **13** adjusting screw **A** as a fulcrum.



[Installation]

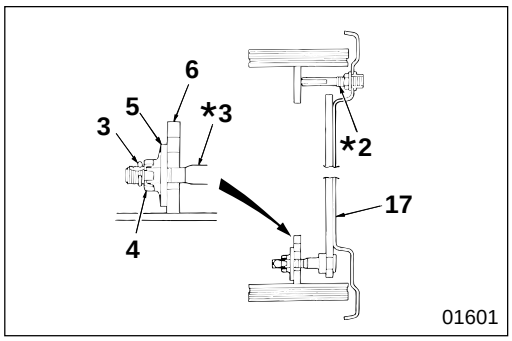
- Install the shorter hook of return spring **2** on brake shoe assembly **6**.
- Insert a small Phillips screwdriver **C** into the hook of return spring **2**, insert the tip of the screwdriver into return spring installation hole **D** of brake shoe assembly **6** to pry on the return spring.



6 Brake shoe assembly

[Inspection]

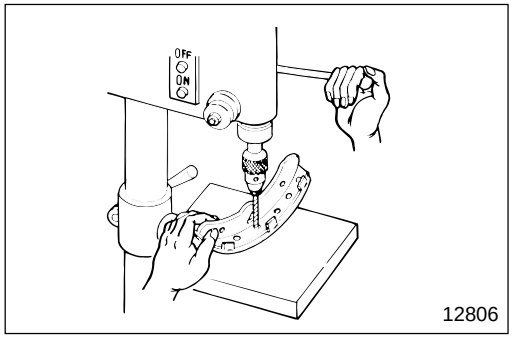
If thickness **A** of brake lining **8** is lower than the limit replace the brake lining on the same axle as a unit.



[Installation]

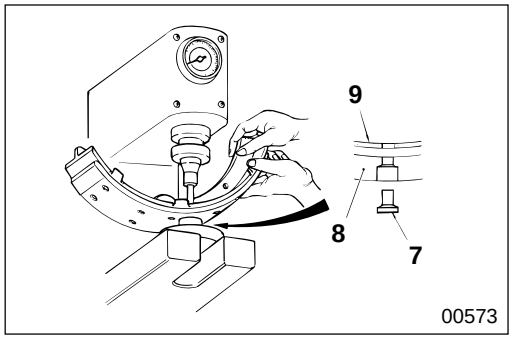
- Install brake shoe assembly **6**.
- Tighten nut **5**. When brake shoe assembly **6** makes contact with bolt ***2** of backing plate **17**, slacken off the nut by one third of a turn.
- Slacken off nut **5** until the holes of stud pin ***3** and lock plate **4** align with each other.
- Install cotter pin **3** and bend it.

https://truckmanualshub.com/



8 **Brake lining**

[Removal]



[Installation]

- Clean the mounting surfaces of brake lining **8** and brake shoe **9** with cleaning fluid and dry them.
- Insert rivets **7** from brake lining **8** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **9** and the brake lining.

  Caulking load for rivets : 17 to 19 kN {3750 to 4190 lbf, 1700 to 1900 kgf}

- Make sure that you inspect contact with the inner surface of brake drum ***1** after you replace brake linings **8**. If contact is incorrect, correct with the brake assembled.

WARNING

Do not leave lubricant on the surface of brake lining 8 because this reduces braking performance.

CAUTION

Make sure that the type of brake linings 8 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one shaft.

***1** **Correction of brake drum**

If the cylindrical accuracy of brake drum ***1** is higher than the limit, or there are seams, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

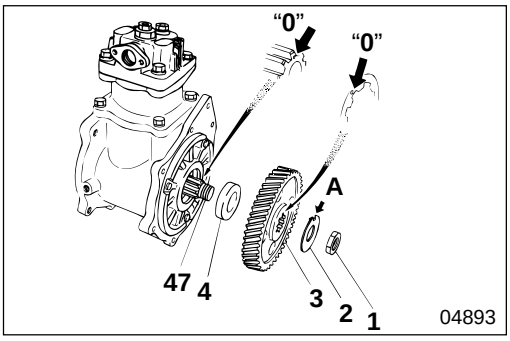
22	Delivery valve tool  04813	MH062014	Removal and installation of delivery valve holder
32 to 35	Piston ring tool  01732	MH060014	Removal and installation of piston ring (Compression ring, oil ring)

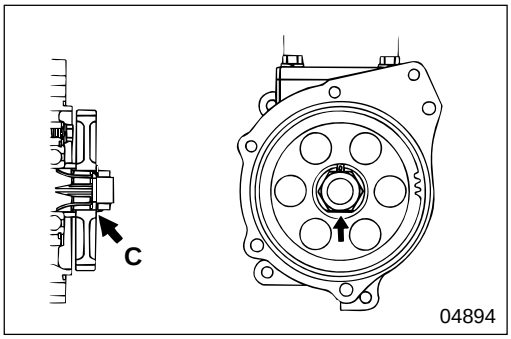
https://truckmanualshub.com/

◆ Service procedure

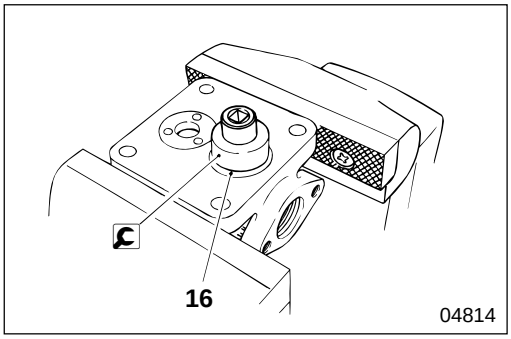


1 **to** **3** **Installation of drive gear**

- To install, align mark "**0**" of crankshaft **47** with alignment mark "**0**" of drive gear **3**.
  Assemble by aligning the alignment mark of the drive gear with indent **A** of lock washer **2**, then tighten nut **1** at specified torque.

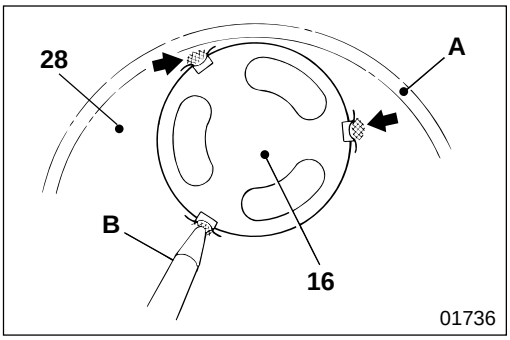


- Bend the lock washer toward nut **C** after assembly.



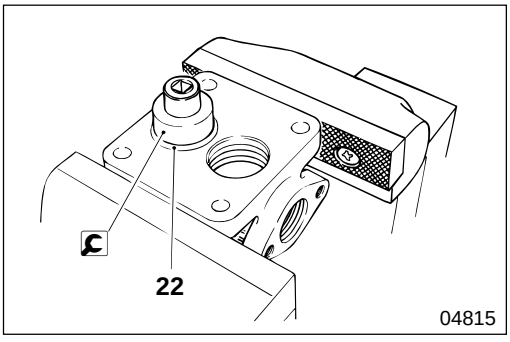
16 **Suction valve holder**

[Removal and installation]



[Caulking]
Caulk cylinder head **28** taking care not to damage seal surface **A** of the O-ring.

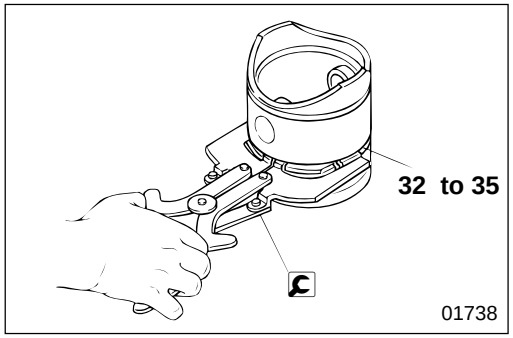
B : Center punch



22 **Removal and installation of delivery valve holder**

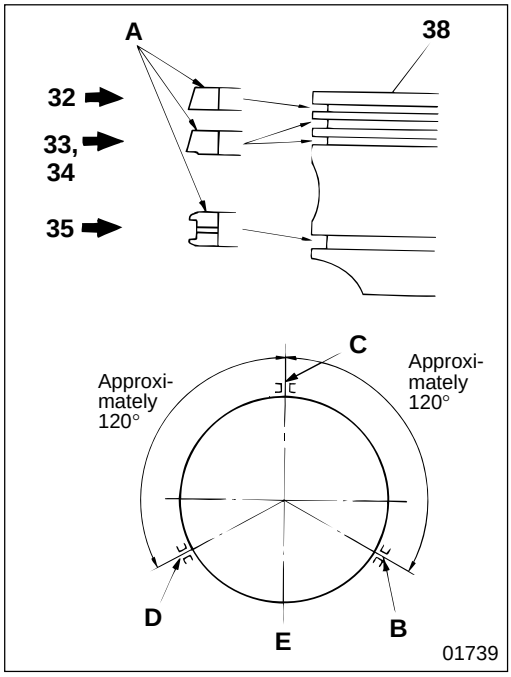
https://truckmanualshub.com/

AIR COMPRESSOR



32 to **35** **Piston ring (Compression ring and oil ring)**

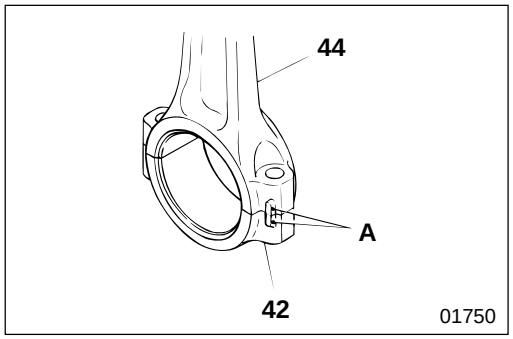
[Removal and installation]



[Mounting position]

- Pay attention to the mounting positions of compression rings **32** to **34** and oil ring **35**. Assemble the piston rings so that lettered side **A** faces toward the top of piston **38**.
- Arrange the piston rings so that each split, **B** to **D**, of the compression rings is offset by 120° from the preceding split.

  B : 1st compression ring split
  C : 2nd compression ring split
  D : 3rd compression ring split
- Position oil ring split **E** so that it comes midway between the splits of the two compression rings.



42 **44** **Installation of connecting rod and connecting rod cap**

Assemble connecting rod **44** and connecting rod cap **42** with alignment marks **A** aligned.

https://truckmanualshub.com/

◆ Service procedure

● **Inspection after installation**

- Make sure that the connector with "**S**" mark is installed at the air supply side.
- Start the engine.
- Make sure that air is exhausted from the port of exhaust cover assembly **16** when the air pressure reaches the specified level and the air compressor is switched to idling.

NOTE

If high air pressure is exhausted first and approximately three seconds later, you cannot hear an exhausting sound, do not worry, it is normal.

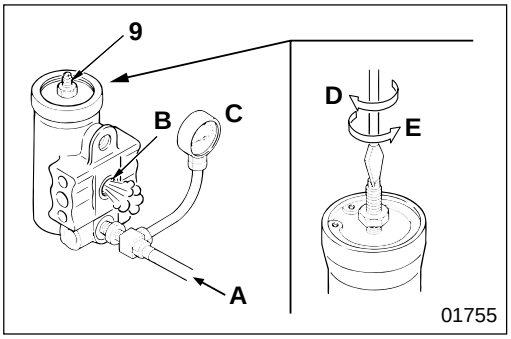
18	Interior of body	Multipurpose grease [NLGI No. 2 (Li soap)]	As required

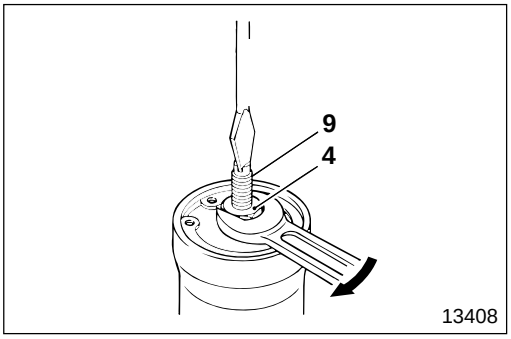
◆ Service procedure



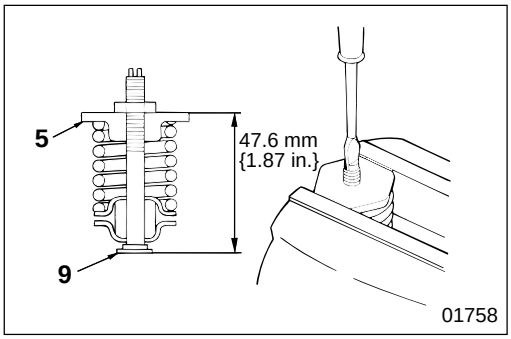
● Inspection of function after assembly

- Increase air pressure **A** gradually and read the value on air pressure gauge **C** when air is discharged from **B**. Adjust by turning adjusting screw **9** so that the reading conforms to the standard value (high specified-pressure).
  D : Turning clockwise decreases the pressure
  E : Turning counterclockwise increases the pressure
- Lower air pressure **A** to 685 kPa {100 lbf/in^2, 7 kgf/cm^2} or less, then raise the air pressure gradually. Read air pressure gauge **C** when it stops and check that the value conforms to the standard value (high specified-pressure). If the value deviates from the standard value, readjust.

- Lower air pressure **A** gradually. When the discharge of air from **B** ceases, read air pressure gauge **C** to check that the valve conforms to the standard value (high specified-pressure). If the value deviates from the standard value, replace the air pressure governor assembly.



- After adjusting, tighten lock nut **4** to prevent adjusting screw **9** being turned accidentally.



3 **Preliminary adjustment of adjusting screw assembly**

It is recommended that you adjust the distance from the upper level of upper spring seat **5** to the lower level of adjusting screw **9** to 47.6 mm {1.87 in.} by turning the adjusting screw, because this makes adjustment to the specified value easier.

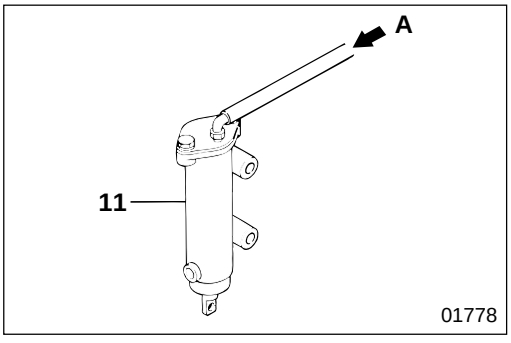
Lubricant and sealant

Location	Points of application	Kinds	Quantity
10	Thread area of connector	THREEBOND No.1211 or No.1213	As required
17	Surface of packing	Molybdenum disulfide bearing grease [NLGI No.2 (Li soap)]	As required
19, 20	Mounting areas of plate and shaft	Sealant [Hermetic GA (SANNOW KOGYO)]	As required
20	Shaft at ø12 {0.47}	Molybdenum disulfide bearing grease [NLGI No.2 (Li soap)]	As required
25	Interior of cylinder	Molybdenum disulfide bearing grease [NLGI No.2 (Li soap)]	2 cm^3 {0.12 cu. in.}

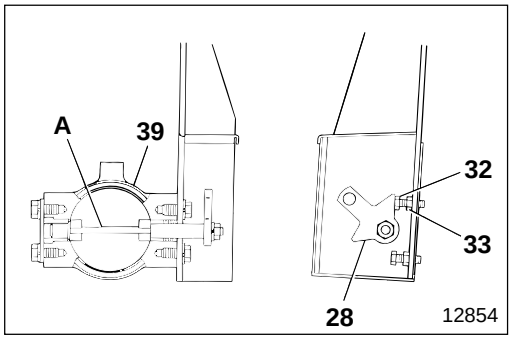


◆ Service procedure

11 **Inspection on airtightness of control cylinder**

Make sure that there is no air leakage when air pressure of 980 kPa {140 lbf/in^2, 10 kgf/cm^2} is applied to control cylinder **11**. If any air leakage is found, replace the control cylinder assembly.

https://truckmanualshub.com/



28 **30** **to** **33** **39** **Lever, adjusting bolt, lock nut, and valve assembly**

[Butterfly valve **A** fully-opened adjustment]

- Turn the adjusting bolt so that lever **28** and the head of adjusting bolt **32** make contact horizontally.
- Tighten lock nut **33** at specified torque.

[Butterfly valve **A** fully-closed adjustment]

- Apply air pressure **B** of 685±49 kPa {100±7.1 lbf/in^2, 7±0.5 kgf/cm^2} to control cylnder **11**.
- Turn adjusting bolt **30** so that the average value of clearances **D**, **E** between butterfly valve **A** and body **C** conforms to the standard value.
- Calculate the average of clearances **D**, **E** by (**D**+**E**)/2.
- Tighten lock nut **31** at specified torque.

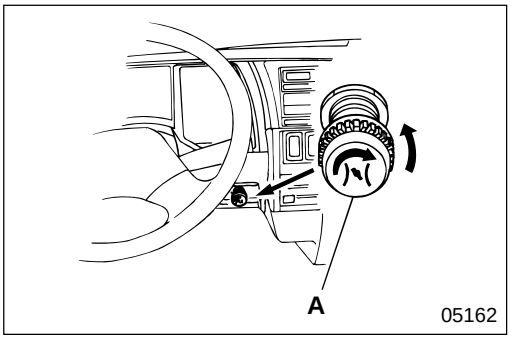
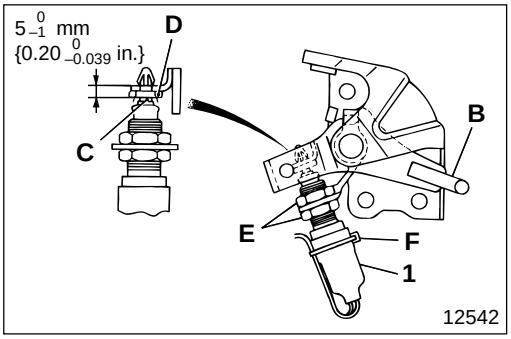
2 Clutch switch
Gr 21, 54
3 Exhaust brake switch
Gr 37, 54
4 3-way magnetic valve
Gr 54
5 Exhaust brake cut relay
Gr 54

◆ Service procedure



1 **Installation of accelerator switch**

- Turn idling control knob **A** in direction ⇨ (counterclockwise) to free the accelerator pedal.



- Screw in accelerator switch **1**, holding accelerator control lever **B** still, until push rod **C** makes contact with stopper **D**. Then screw in by a further 5^{0}_{-1} mm {$0.20^{0}_{-0.039}$ in.} and tighten lock nut **E**.
- Secure accelerator switch **1** harness using band **F**.

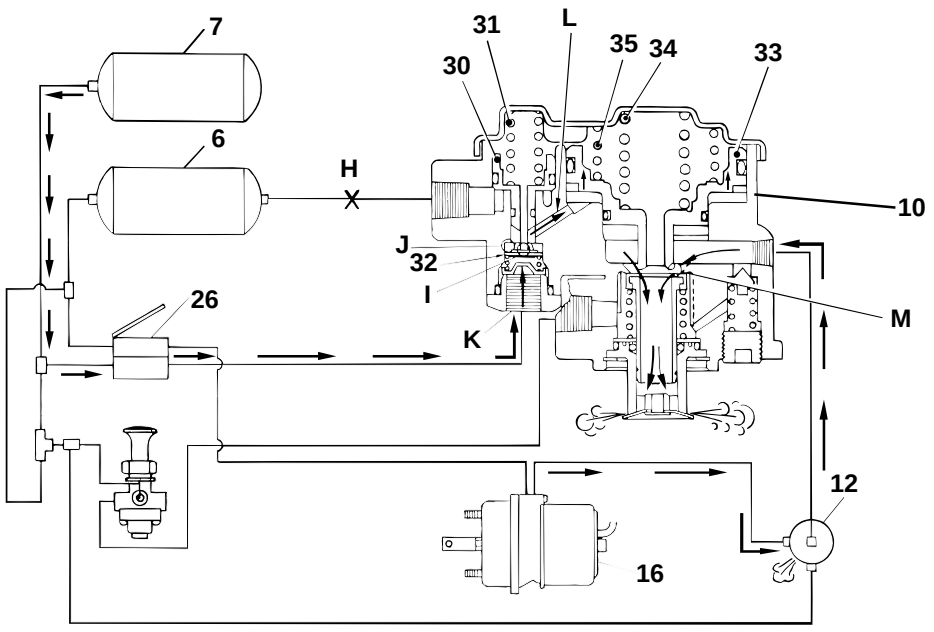
D : Red identification tape
E : Yellow identification tape
F : White identification tape
G : Green identification tape

- The brake system is a full-air, all-wheel brake type consisting of separate front and rear systems.
- Spring brake valve **10** is fitted as a safety mechanism. It provides normal braking action on the spring brake of rear brake chamber **16** even if the rear brake system air line fails.
- An exhaust brake system, of the exhaust pipe opening and closing valve type, is fitted as a sub-brake system.

https://truckmanualshub.com/

● Safety mechanism for rear brake system failure (Spring brake)

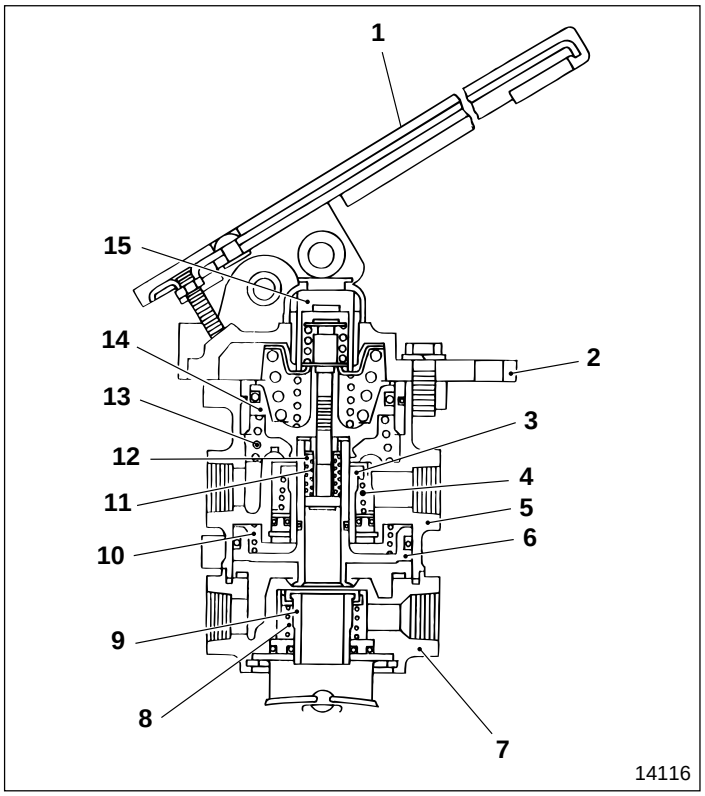


- If any part of the rear brake system fails and the air pressure in air tank **6** (for the rear brake system) drops below the specified pressure, the air pressure under piston **30** of spring brake valve **10** is overcome by the repercussive force of spring **31** and the piston is forced down.
- When forced down, piston **30** makes contact with valve **32** to close exhaust port **I** and open inlet port **J**.
- When brake pedal **26** is depressed, the air pressure in the air tank (for the front brake system) is fed to control port **K** of spring brake valve **10**, and is then fed under piston **33** via inlet port **J** and passage **L**.
- The air pressure under piston **33** overcomes the repercussive force of springs **34**, **35** to raise the piston and open exhaust valve **M**.
- When exhaust valve **M** opens, the pressurized air that flowed from spring brake valve **10** to relay valve **12** is discharged through the exhaust port in accordance with brake pedal **26** depression force.
- Since relay valve **12** opens the exhaust valve when air pressure is lost, and discharges the air in the spring brake of rear brake chamber **16**, the spring brake works to generate braking force.

H : Failure

https://truckmanualshub.com/

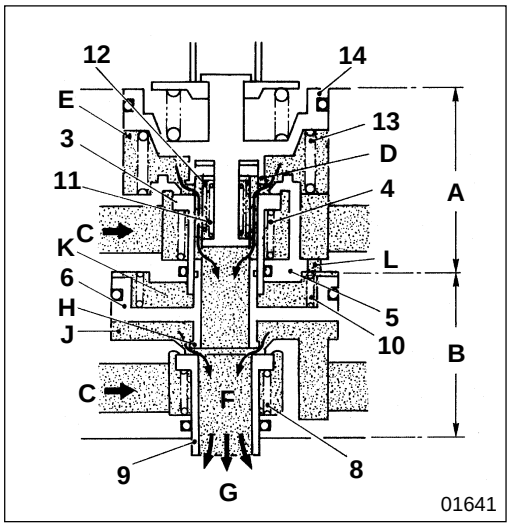
Dual Brake Valve



1 Brake pedal
2 Plate assembly
3 Primary inlet valve
4 Primary valve spring
5 Body
6 Relay piston
7 Cover
8 Secondary valve spring
9 Secondary inlet valve
10 Relay piston spring
11 Inner spring
12 Outer spring
13 Primary piston spring
14 Primary piston
15 Plunger

The dual brake valve controls the braking force of the vehicle by feeding pressurized air to the air master in accordance with the brake pedal depression angle of brake pedal **1**.

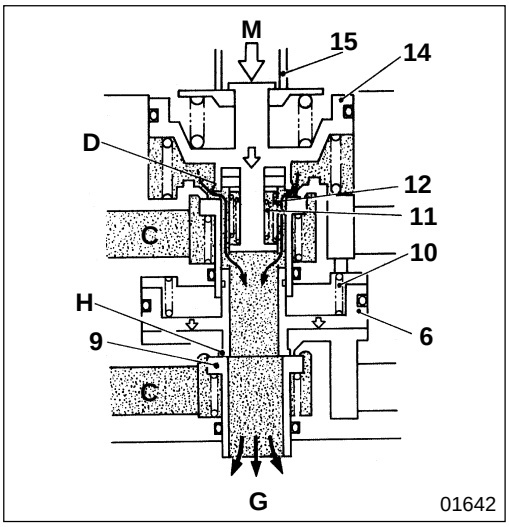
● When brake not operating



- The repercussive forces of primary valve springs **4**, secondary valve spring **8** seat primary inlet valve **3** at primary side **A**, and inlet valve **9** at secondary side **B**, on their respective seats. This shuts off air **C** from the air tank to maintain airtightness.
- The repercussive force of primary piston spring **13** raises primary piston **14** to its upper position. Exhaust valve seat **D** opens and chamber **E** is open to atmosphere **G** via chamber **F**.
- Since the repercussive forces of inner spring **11** and outer spring **12** is stronger than the repercussive force of relay piston spring **10**, relay piston **6** is raised to its upper position and exhaust valve seat **H** is opened. This opens chamber **J** to atmosphere **G** via chamber **F**.
  Chamber **E** at the primary side and chamber **K** at the upper part of relay piston **6** at the secondary side are connected via passage port **L** of body **5**.

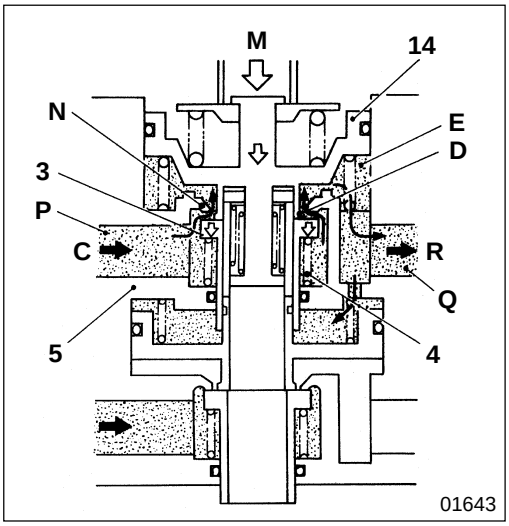
https://truckmanualshub.com/

● When depressing brake pedal (before braking pressure is generated)



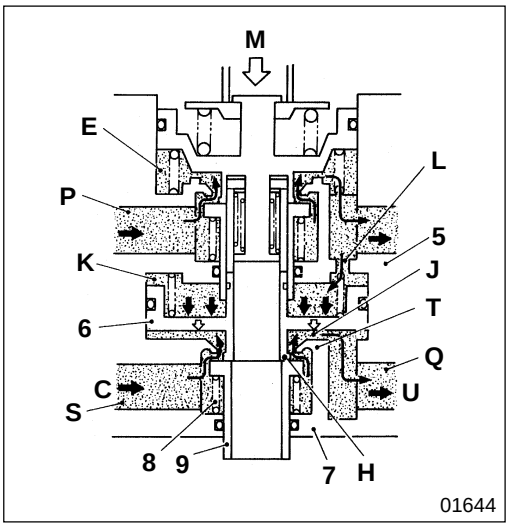
- Depressing the brake pedal (illustrated as pedal action **M**), forces down primary piston **14** via plunger **15**.
- Forcing down primary piston **14** changes the balance between the repercussive forces of inner spring **11** and outer spring **12**, and the repercussive force of relay piston spring **10**, forcing down relay piston **6**. This seats the relay piston on secondary inlet valve **9** and closes exhaust valve seat **H**.
- This closes the secondary side exhaust passage; however, primary side exhaust valve seat **D** remains open. No braking pressure is generated at either primary or secondary sides.

● When depressing brake pedal (braking pressure is generated)



Primary side

- As the brake pedal is depressed further (illustrated as brake pedal action **M**), primary piston **14** is forced down until it is seated on primary inlet valve **3**, closing exhaust valve seat **D**.
- Primary inlet valve **3** is forced down, compressing primary valve spring **4**, and supply valve seat **N** of body **5** separates from the primary inlet valve. The air in chamber **P** flows into chamber **E** and is fed to rear brake system **R** via discharge port **Q** as braking pressure.



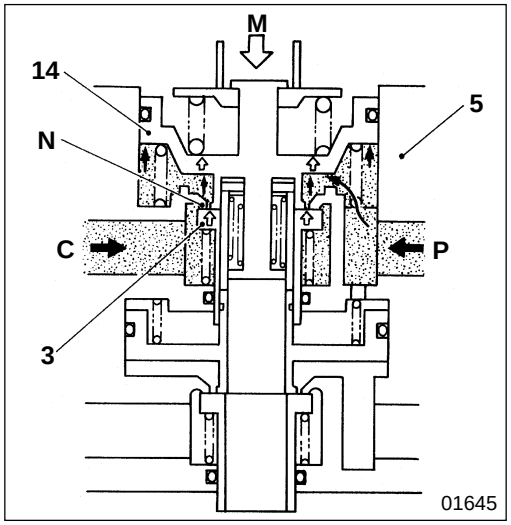
Secondary side

- The air at the primary side flows into chamber **K** via passage port **L** of body **5**.
- The air fed into chamber **K** acts on the upper part of relay piston **6** to force down the relay piston and compress secondary valve spring **8**, forcing down secondary inlet valve **9**.
- This separates supply valve seat **T** and secondary inlet valve **9** of cover **7**.
- The air in supply port chamber **S** flows into chamber **J** and is fed to front brake system **U** via discharge port **Q** as braking pressure.

https://truckmanualshub.com/

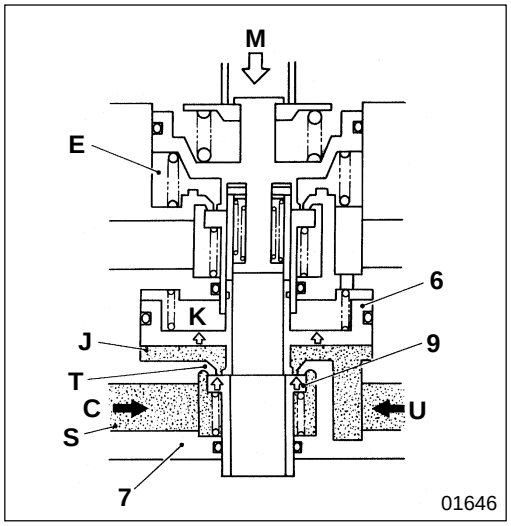
● Stabilization of braking pressure

When the brake pedal remains depressed at the specified depression angle, the braking air pressure stabilizes at the pressure corresponding to the brake pedal depression angle.



Primary side

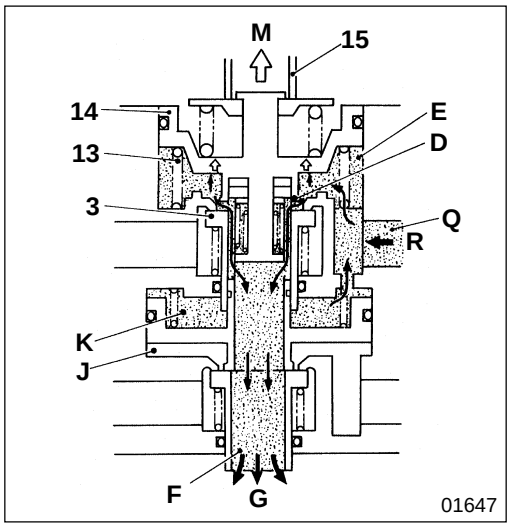
- The braking air pressure fed under the bottom of primary piston **14** raises the primary piston and primary inlet valve **3** together in tandem.
- Primary inlet valve **3** makes contact with supply valve seat **N** of body **5**, then the supply of air **C** from the air tank ceases and the increases in the braking air pressure stops. This stabilizes braking pressure **R** for the rear brake system.



Secondary side

- As the braking pressure (pressure in chamber **J**) for the front brake system balances the pressures in chambers **E** and **K**, the force raising relay piston **6** disappears, and the relay piston rises in tandem with secondary inlet valve **9**.
- Secondary inlet valve 9 makes contact with supply valve seat **T** of cover **7**, then the supply of air from supply port chamber **S** to chamber **J** ceases. This stabilizes brake pressure **U** for the front system.

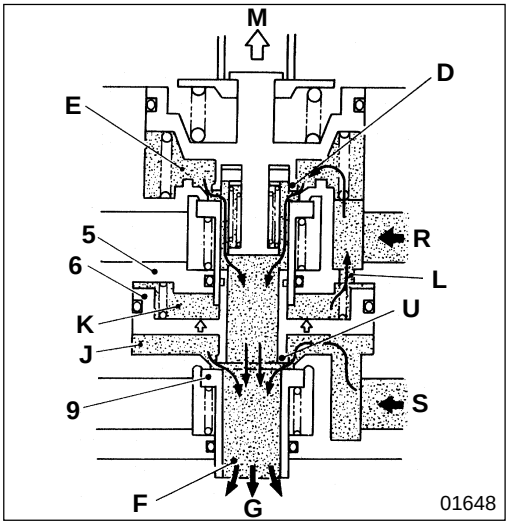
● Release of brake pressure



Primary side

When the brake pedal is released (illustrated as brake pedal action **M**), primary piston spring **13** and air pressure **R** at discharge port **Q** (pressure in chamber **E**) raise plunger **15** and primary piston **14**. Then, exhaust valve seat **D** at the lower end of the primary piston separates from primary inlet valve **3**. The air pressure of the rear brake system flows through chamber **E** to be discharged from exhaust passage chamber **F** into atmosphere **G**.

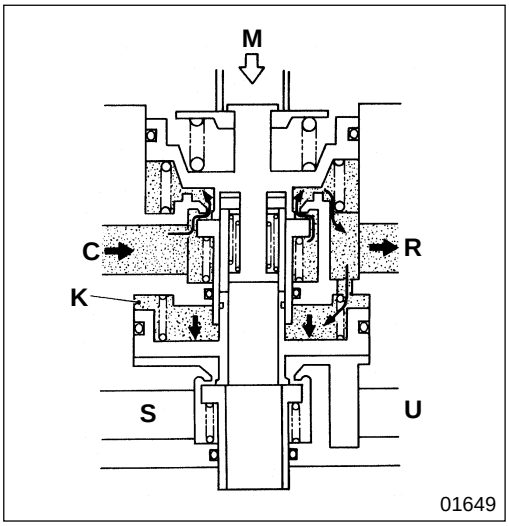
https://truckmanualshub.com/



Secondary side

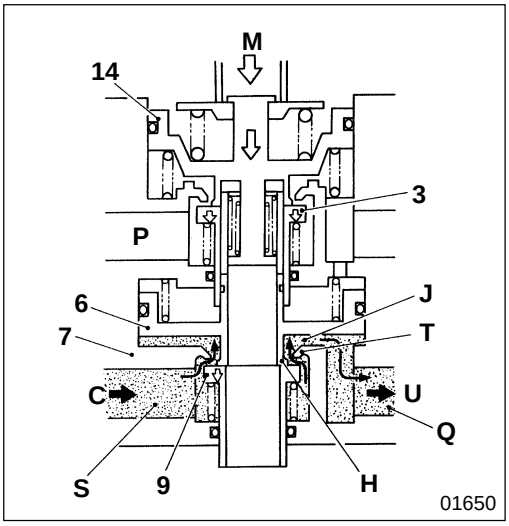
- As the air pressure in the rear brake system drops, the air pressure in chamber **K** is discharged via passage port **L** of body **5**, and chambers **E**, **F** into atmosphere **G**.
- This changes the air pressure balance between chambers **K** and **J**. The air pressure in chamber **J** raises relay piston **6**, and exhaust valve seat **H** at the lower end of the relay piston separates from secondary inlet valve **9**. Air pressure **U** in the front brake system is discharged from exhaust passage chamber **F** into atmosphere **G**.

● When abnormality occurs



Operation when the air pipe of the front brake system fails

- The primary side operates the same as normal, generating braking pressure in rear brake system **R**.
- At the secondary side, even if the primary side generates air pressure in chamber **K**, braking pressure is not generated in front brake system **U**, since no air pressure is generated in supply port **S**.

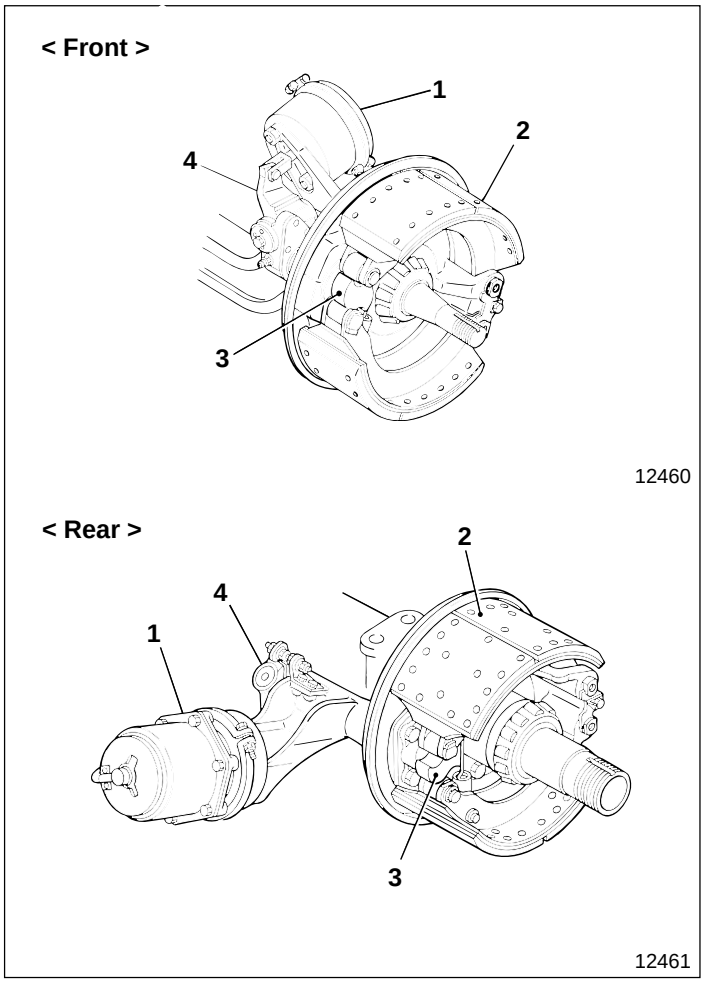


Operation when the air pipe of the rear brake system fails

- In the rear brake system, air pressure is not generated up to supply port **P**. Therefore, even if the brake pedal is depressed (causing primary piston **14** to force down primary inlet valve **3**), braking pressure is not generated.
- If the brake pedal is depressed further (illustrated as brake pedal action **M**), primary piston **14** makes contact with relay piston **6** and they force down secondary inlet valve **9**.
- This action separates supply valve seat **T** of cover **7** from secondary inlet valve **9**. The air pressure flows into chamber **J** from chamber **S** and is fed to front brake system **U** via discharge port **Q** as braking pressure.

https://truckmanualshub.com/

Wheel Brake

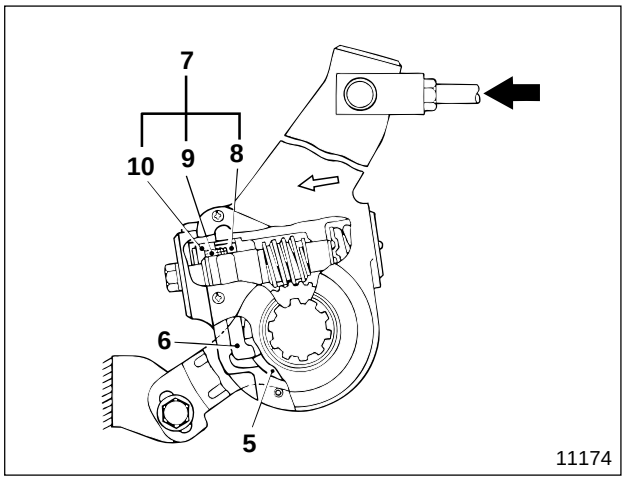


1 Brake chamber
2 Brake shoe assembly
3 Camshaft
4 Automatic slack adjuster

- The wheel brake is an internal expanding leading trailing brake type. Brake chamber **1** turns camshaft **3** to extend and press brake shoe assembly **2** against the brake drum, creating the braking force.
- Automatic slack adjuster **4** automatically adjusts the brake shoe clearance as the lining wears and the brake shoe clearance becomes higher than the specified value.

Automatic slack adjuster

● **When brake is operating**



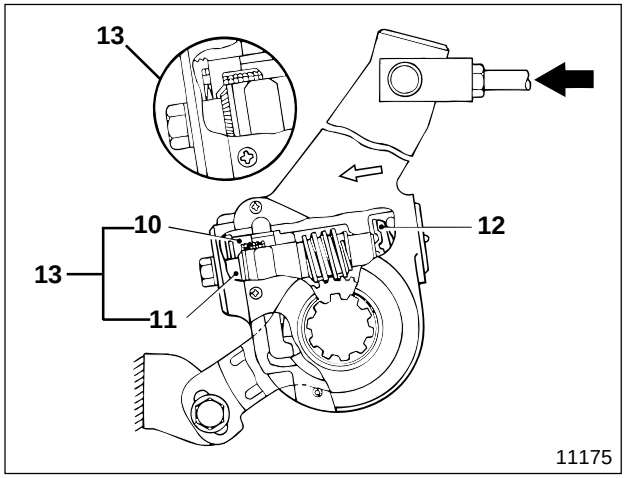
- Control disc **5** raises rack **6** in accordance with the lining wear.
- Rack **6** turns gear wheel **8** of one-way clutch **7**, but the gear wheel runs idle.

NOTE

One-way clutch 7 — **Gear wheel 8**, **Clutch spring 9**, **Clutch ring 10**

- As automatic slack adjuster **4** turns further and the force of the lining that pushes against the brake drum gradually increases, the torque of camshaft **3** of the wheel brake increases.

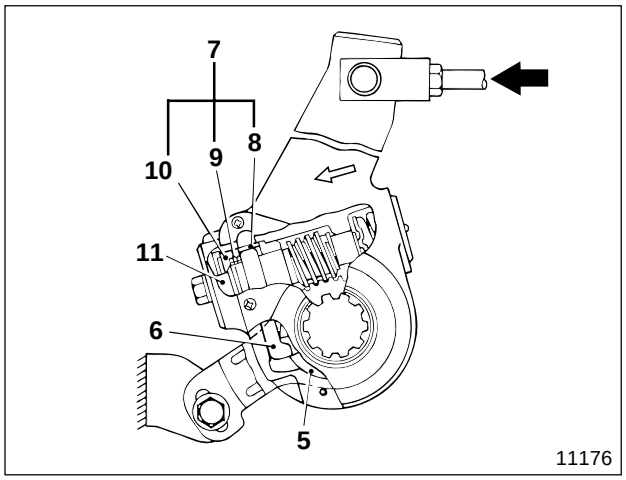
https://truckmanualshub.com/



- As the torque of camshaft **3** of the wheel brake increases, worm screw **11** compresses spring **12** and moves in the axial direction to separate cone clutch **13**.

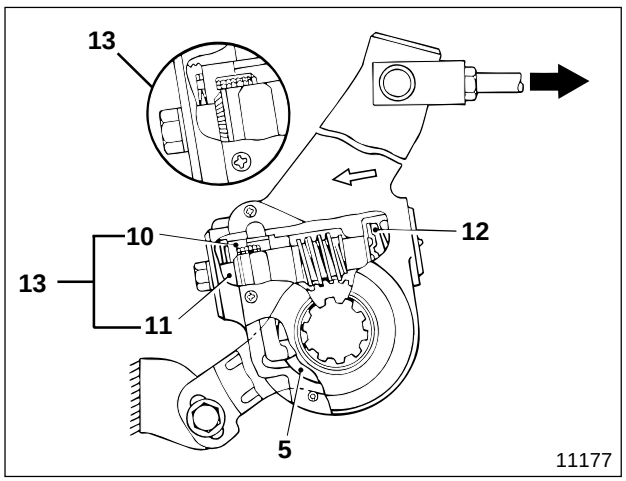
NOTE

Cone clutch 13 — **Clutch ring 10**, **Worm screw 11**



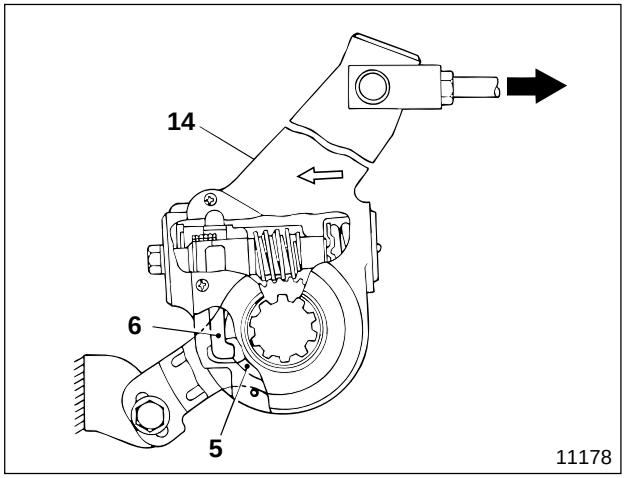
- Although control disc **5** pushes rack **6** further upward, the rack lets one-way clutch **7** idle, since cone clutch **13** is not engaged.

● **When releasing brake pedal**

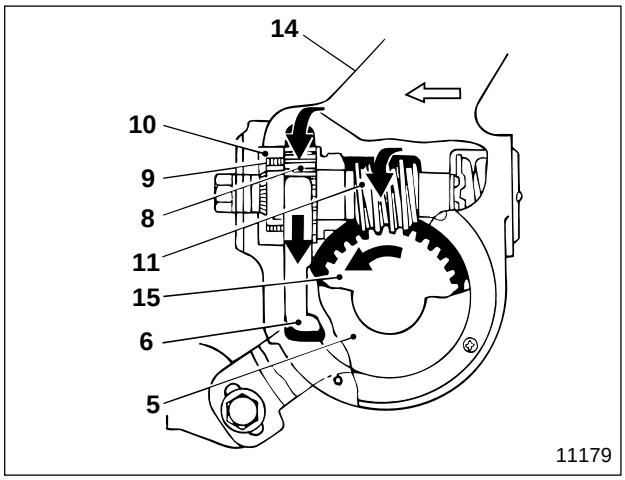


- When the brake pedal is released, the torque from camshaft **3** of the wheel brake disappears, and the repercussive force of spring **12** pushes back worm screw **11**, engaging cone clutch **13**.

https://truckmanualshub.com/



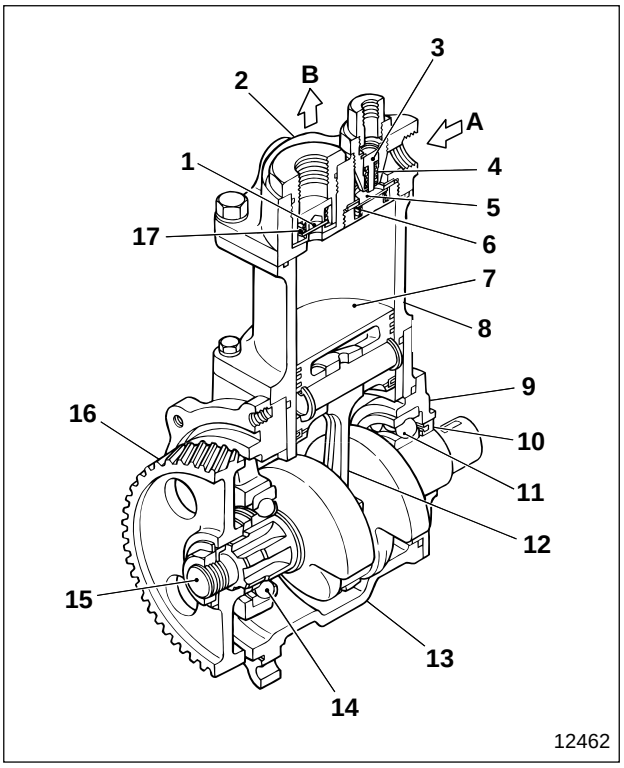
- Rack **6** is to be pushed down by the spring; however, gear wheel **8** engaged with the rack cannot turn because cone clutch **13** is engaged with the gear wheel.
- Therefore, rack **6** turns together with housing **14** until the rack makes contact with control disc **5**.



- When rack **6** makes contact with control disc **5**, the control disc is pushed down to the bottom of the rack under housing **14**.
- When rack **6** is pushed down, since cone clutch **13** is engaged with the rack, it turns worm wheel **15** and worm screw **11**.
- Therefore, since worm screw **11** turns camshaft **3** of the wheel brake in accordance with lining wear, constant brake shoe clearance is maintained.

https://truckmanualshub.com/

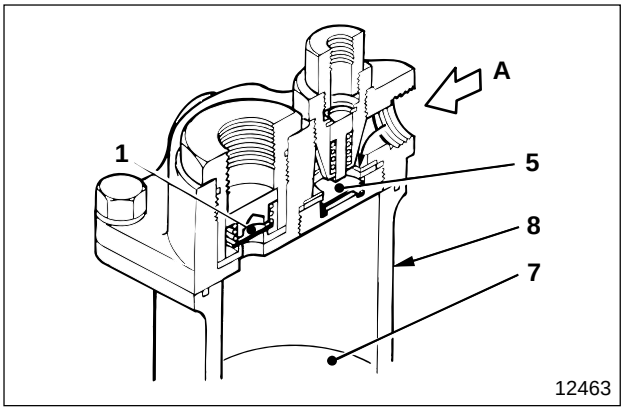
Air Compressor



1 Delivery valve
2 Cylinder head
3 Unloader valve
4 Unloader valve spring
5 Suction valve
6 Suction valve spring
7 Piston
8 Cylinder liner
9 Bearing holder
10 Oil seal
11 Bearing
12 Connecting rod
13 Crankcase
14 Bearing
15 Crankshaft
16 Drive gear
17 Delivery valve spring

A : Air delivery port (From air cleaner)
B : Air discharge port (To air dryer)

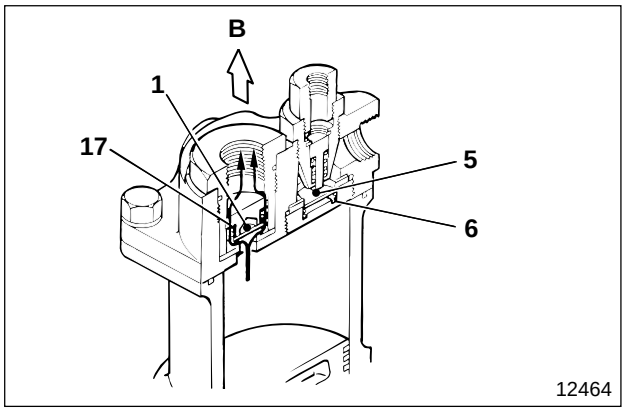
● During suction



- When drive gear **16** is driven, crankshaft **15** engaged with the drive gear turns to force down piston **7**.
- The negative pressure generated at this time opens suction valve **5**, sucking air **A** into cylinder liner **8**.

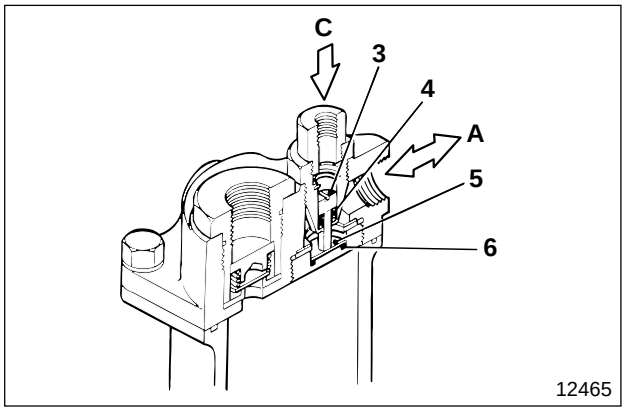
https://truckmanualshub.com/

● During pressurized delivery



- As piston **7** rises and enters into the compression stroke, suction valve spring **6** closes suction valve **5**.
- The pressure of the compressed air overcomes the repercussive force of delivery valve spring **17** and opens delivery valve **1** to compress and deliver air **B** to the air dryer.

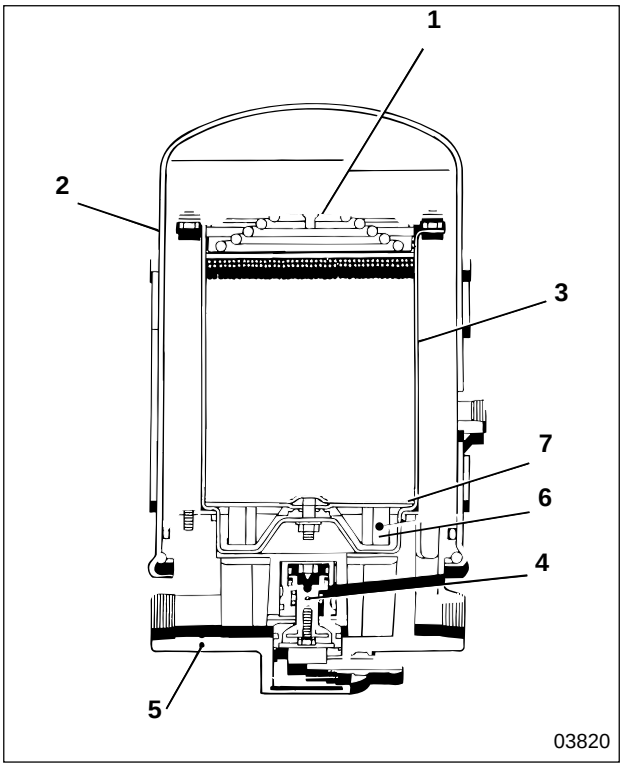
● When unloader valve operates



- When the air pressure in the air tank raises higher than the specified value, the air pressure governor operates to feed pressured air **C** to unloader valve **3**. This forces down the unloader valve and holds suction valve **5** open at the same time. Therefore, air **A** is not compressed and the air compressor idles.
- When the air pressure in the air tank drops lower than the specified value, the air pressure governor operates again to discharge pressured air from the upper side of unloader valve **3**. So, unloader spring **4** returns the unloader valve to its original position and the air compressor operates under a load.

https://truckmanualshub.com/

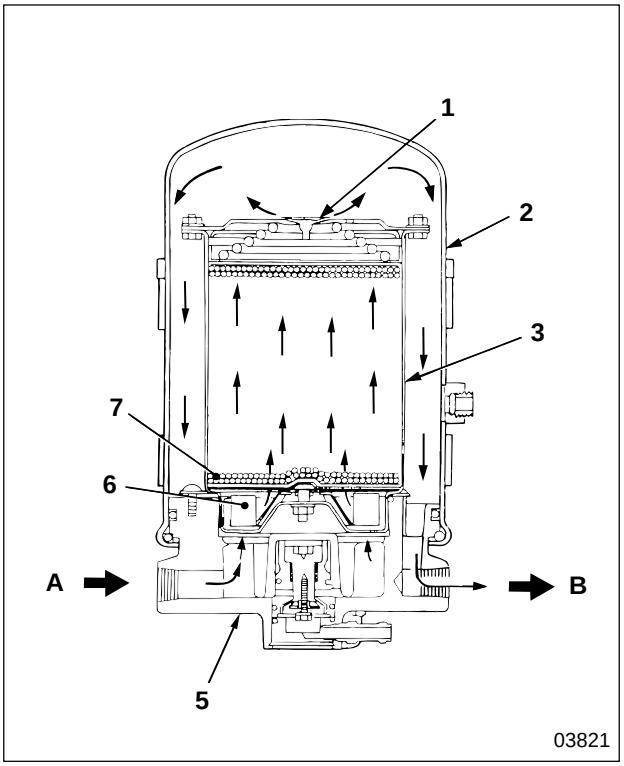
Air Dryer



1 Check valve
2 Case
3 Desiccant
4 Oil filter
5 Valve
6 Body
7 Purge chamber

The air dryer removes moisture and oil in the air compressed by the air compressor and protects the brake assembly from rust or faulty operation.

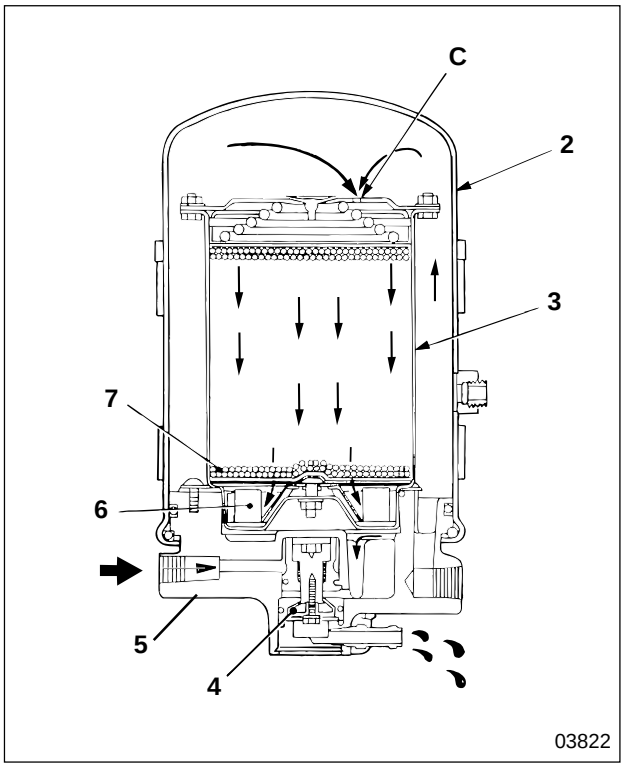
● Dehumidification



- The air from the air compressor enters delivery side **A** of the air dryer. Once in body **6**, moisture and oil are separated from the air and collected in the bottom. Then, the air passes through oil filter **4**, where small oil droplets and dust are removed. Next, the air is delivered into case **2**, where moisture is removed by desiccant **3**.
- As the air travels from the bottom to the top of case **2**, it comes into contact with more dried desiccant. This removes residual moisture from the air, drying the air as it reaches the top of the case. the air passes through check valve **1** and purge chamber **7**, and is delivered to the air tank through exhaust side **B**.

https://truckmanualshub.com/

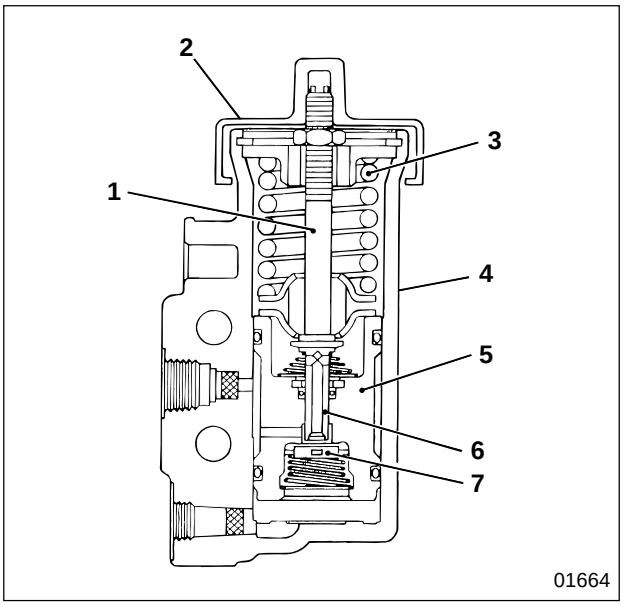
● Regeneration of desiccant



- When the supply of air from the air compressor stops, the pressure from the air pressure governor opens valve **5** of the control port of the air dryer. The pressure in case **2** cleans oil filter **4**, releasing the condensed water and oil into the atmosphere.
- After being quickly decompressed, the dry air in purge chamber **7** passes through hole **C**, where the air expands under the reduced pressure, becoming super dry air. This air flows back through case **2** and collects the moisture in desiccant **3**, releasing this moisture into the atmosphere, thereby recycling the desiccant.

https://truckmanualshub.com/

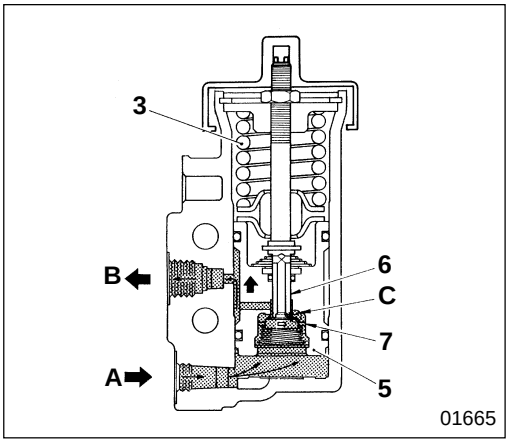
Air Pressure Governor



1 Adjusting screw
2 Cover
3 Spring
4 Body
5 Piston
6 Exhaust stem
7 Valve

The air pressure governor keeps the air pressure in the air tank at the specified pressure, by operating the air compressor with or without load in accordance with the air pressure in the air tank.

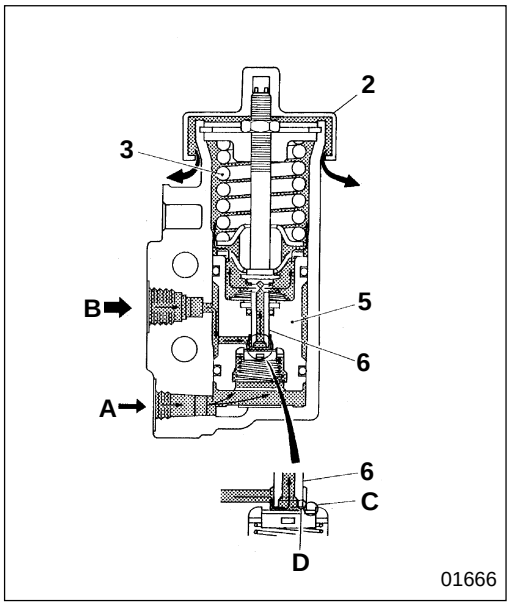
● High specified-pressure



- Pressurized air **A** from the air tank acts constantly on piston **5**. As the pressure in the air tank rises to overcome the repercussive force of spring **3**, the piston rises and valve **7** closes.
- As air pressure **A** from the air tank rises further to become higher than the high specified-pressure, piston **5** rises further. Therefore, exhaust stem **6** opens inlet valve **C** and the air pressure in the air tank flows from unloader port **B** to the unloader valve of the air compressor via the inlet valve. Then the air compressor enters in unloaded operation. Pressure also reaches the air dryer to recycle the desiccant.

https://truckmanualshub.com/

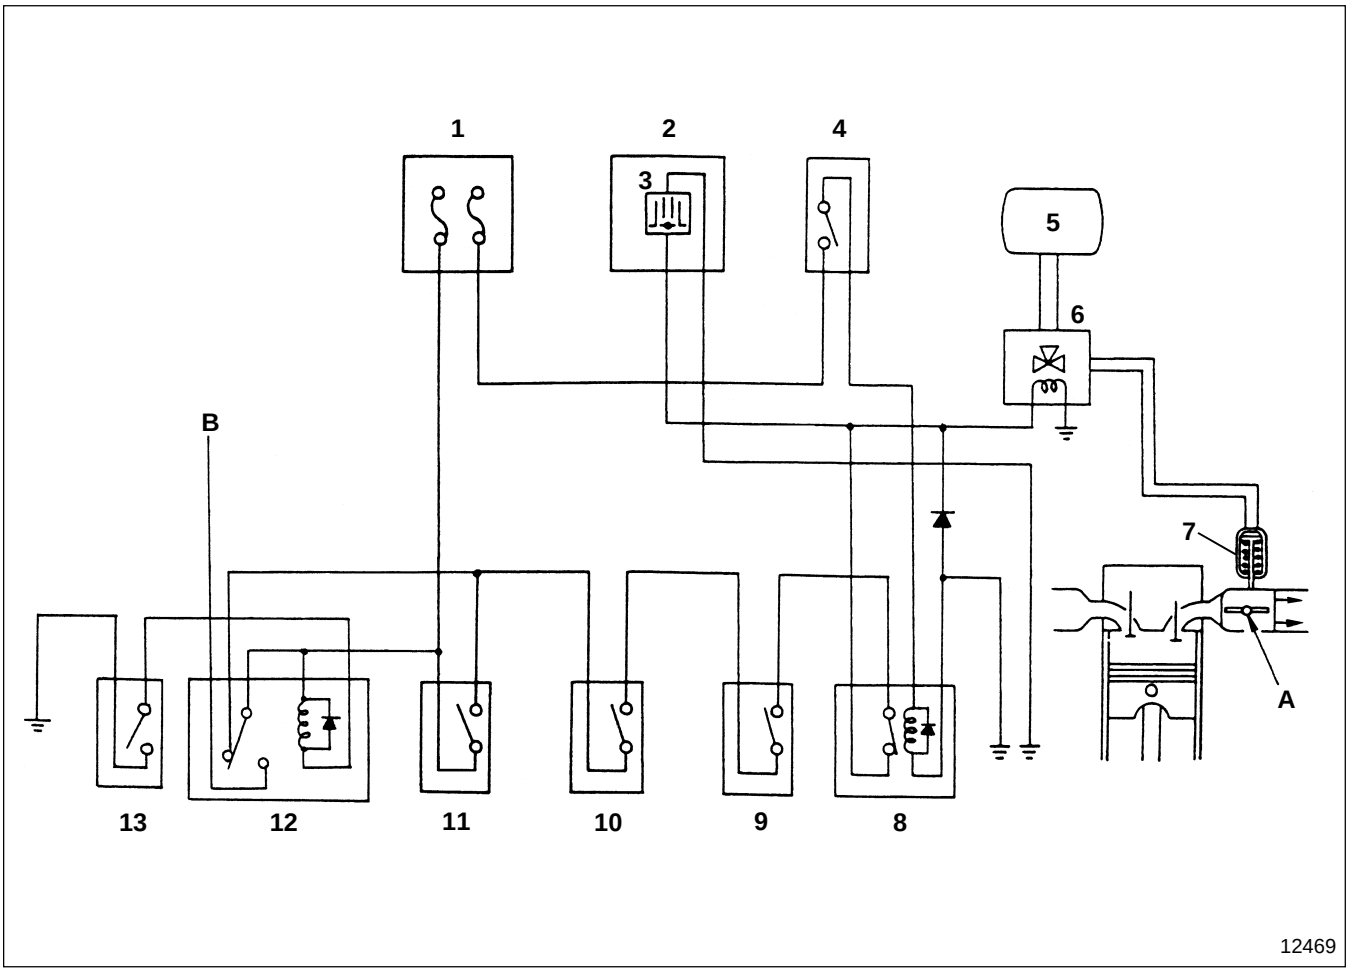
● Low specified-pressure



When pressurized air **A** from the air tank gradually drops below the specified-pressure, spring **3** forces down piston **5**. This closes inlet valve **C** and opens exhaust valve seat **D** so pressurized air **B**, up to the unloader valve of the air compressor, is discharged through the opening of cover **2** via exhaust stem **6**, operating the air compressor at load. The pressurized air up to the air dryer is also discharged into the atmosphere.

https://truckmanualshub.com/

Exhaust Brake System



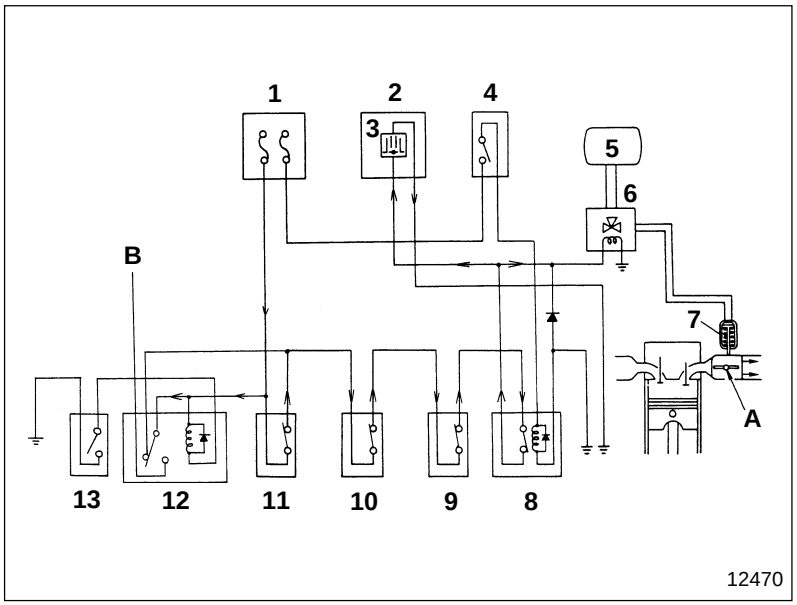
1 Relay and fuse box
2 Meter cluster
3 Exhaust brake indicator lamp
4 Transmission neutral switch
5 Air tank
6 3-way magnetic valve
7 Exhaust brake unit
8 Exhaust brake cut relay
9 Accelerator switch
10 Exhaust brake switch
11 Clutch switch < without power take-off >
12 Power take-off relay < with power take-off >
13 Clutch switch < with power take-off >

A : Butterfly valve
B : To power take-off switch

- Excitation of 3-way magnetic valve **6** causes the air pressure in air tank **5** to act on exhaust brake unit **7** to close butterfly valve **A**, activating the exhaust brake.
- If the exhaust brake is activated while the vehicle is stationary, the coolant temperature can rise excessively, overheating the engine. To avoid this, when the transmission is in neutral, transmission neutral switch **4** turns ON, cutting the exhaust brake system.

https://truckmanualshub.com/

● When exhaust brake system is activated

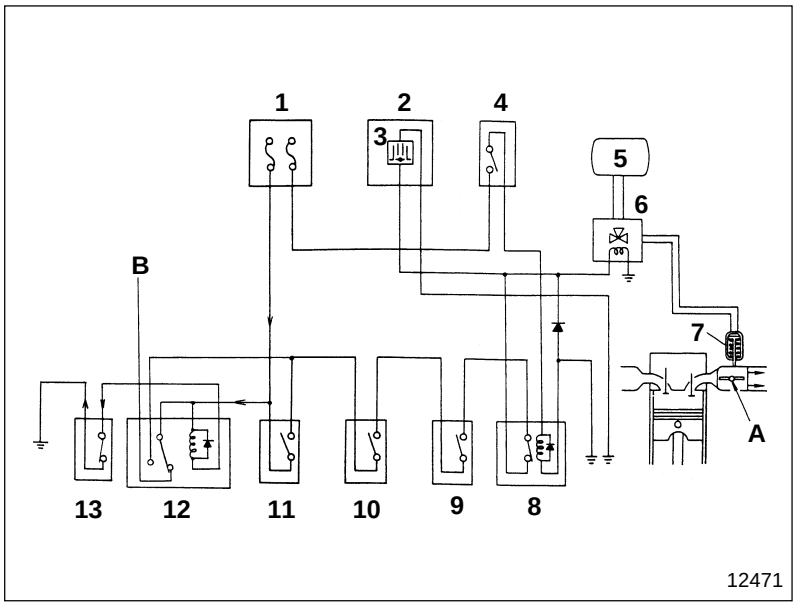


When exhaust brake switch **10** is turned on, the current flows as illustrated to activate the exhaust brake.

Fuse **1** → Power take-off relay **12** → Clutch switch **11** → Exhaust brake switch **10** → Accelerator switch **9** → Exhaust brake cut relay **8** → 3-way magnetic valve **6** → Ground

Fuse **1** → Power take-off relay **12** → Clutch switch **11** → Exhaust brake switch **10** → Exhaust brake cut relay **8** → Exhaust brake indicator lamp **3** (ON) → Ground

● When the exhaust brake system is released



When the accelerator pedal or clutch pedal is depressed while the exhaust brake is working, all switches **9**, **11** turn off, shutting off the current, releasing the exhaust brake.

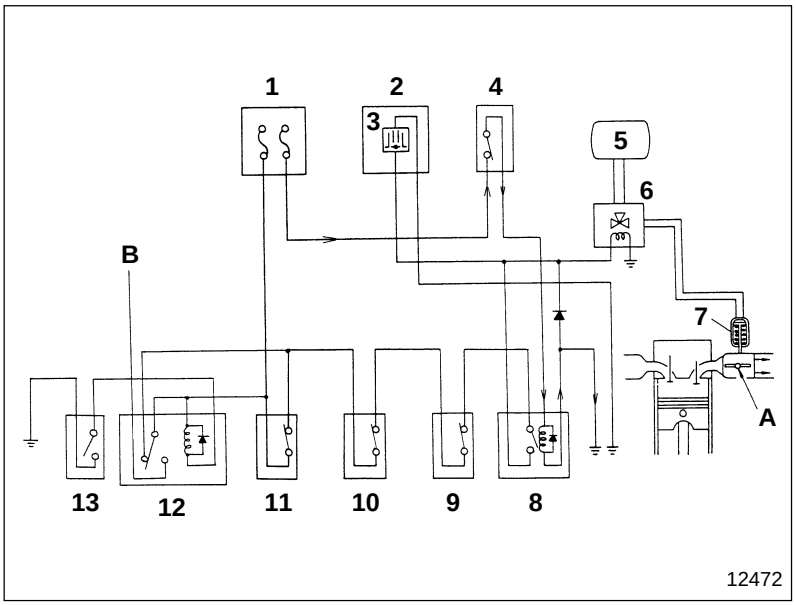
● When clutch pedal is depressed

Fuse **1** → Clutch switch **11** (OFF) → Since no current flows, the circuit turns off and the exhaust brake is released.
Fuse **1** → Power take-off relay **12** excitation → Clutch switch **13** (ON) → Ground

Fuse **1** → Power take-off relay **12** → Clutch switch **11** → Exhaust brake switch **10** → Accelerator switch **9**(OFF) → Since there is no grounding, current does not flow, so the exhaust brake is released.

https://truckmanualshub.com/

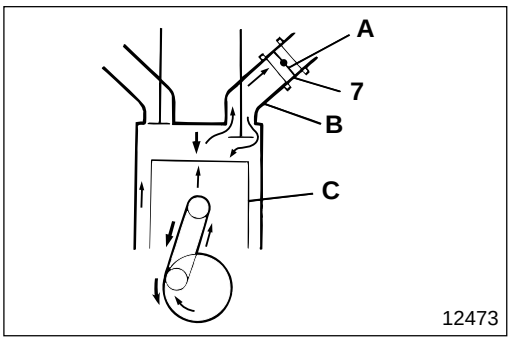
● Releasing exhaust brake system by placing transmission in neutral



Fuse **1**⟶Transmission neutral switch **4**→Exhaust brake cut relay **8** excitation →Ground
Fuse **1**⟶Clutch switch **11**⟶ Exhaust brake switch **10**→Accelrator switch **9**→Exhaust brake cut relay **8** (OFF)
→Power take-off relay **12**

→Beyond this, current does not flow so the exhaust brake is released.

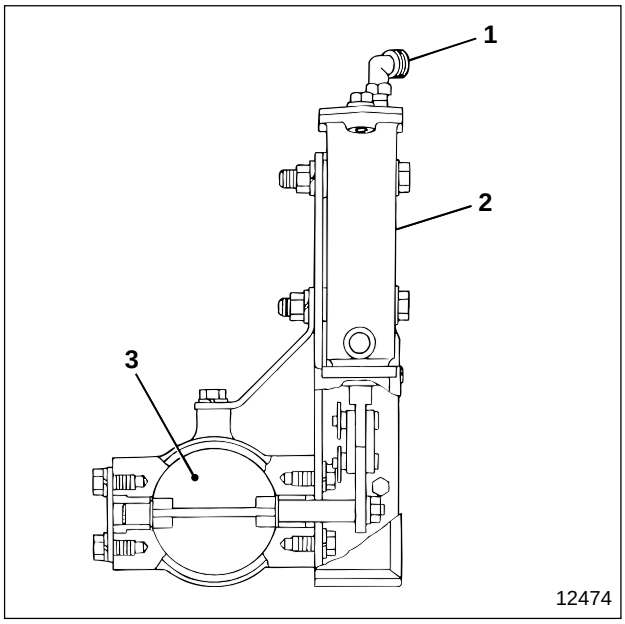
● Working principle of exhaust brake



When butterfly valve **A** of exhaust brake unit **7**, in exhaust pipe **B**, is closed, the pressure in the exhaust pipe rises. The pressure rises further in the exhaust stroke, generating a force that pushes back piston **C**, the exhaust braking force.

https://truckmanualshub.com/

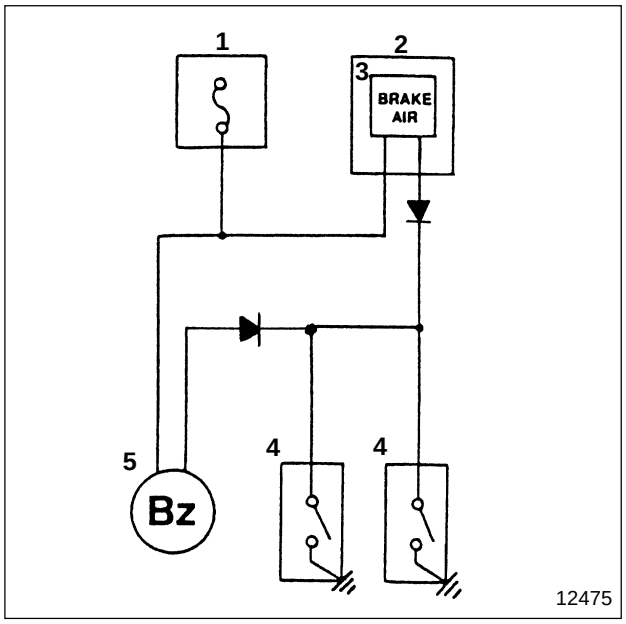
● Exhaust brake unit



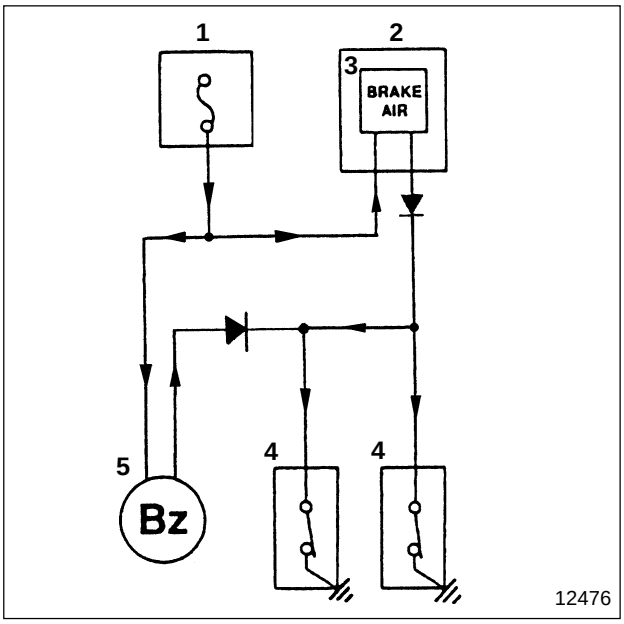
1 Connector
2 Control cylinder
3 Butterfly valve

https://truckmanualshub.com/

Air pressure Warning Circuit



1 Relay and fuse box
2 Meter cluster
3 Air warning lamp
4 Low air pressure switch
5 Warning buzzer



When the air pressure in the air tank drops below the specified value, low air pressure switch **4** turns ON to light air warning lamp **3** and sound warning buzzer **5**. The warning buzzer continues sounding until the starter switch is turned OFF, or until the air pressure in the air tank becomes higher than the specified value and the low air pressure switch is turned OFF.

Fuse **1**→Air warning lamp **3**→Low air pressure switch **4**→Ground
Warning buzzer **5**

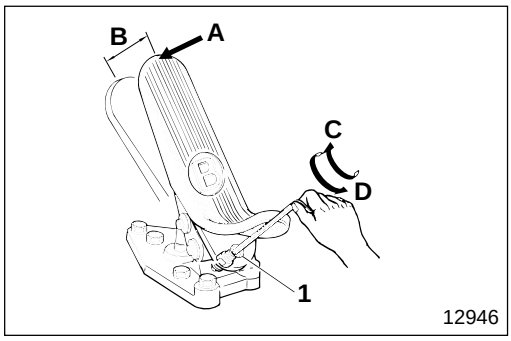
INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection and Adjustment of Brake Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
—	Pedal play	Pedal toe	$12^{+3.0}_{-1.5}$ {$0.47^{+0.12}_{-0.059}$}	—	Adjust using set screw
		Depression angle	$3.5°^{+1.0°}_{-0.5°}$	—	



Press pedal toe **A** with your hand and measure free play **B**. If the measured value deviates from the standard value, adjust it by turning set screw **1**.

C : Turning clockwise decreases the free play (For a small angle)

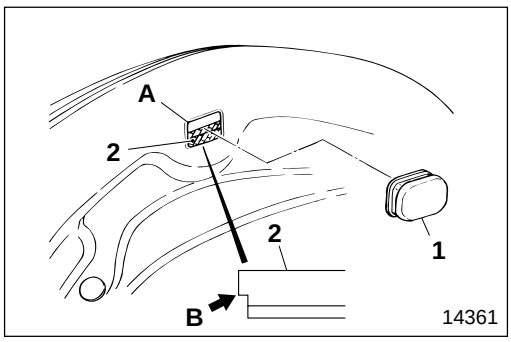
D : Turning counterclockwise increases the free play (For a large angle)

Thickness Inspection and Replacement of Brake Lining

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2	Thickness of brake lining	16 {0.63}	6{0.24} (Side shoulder means wear limit)	Replace



[Inspection]

NOTE

Be sure to inspect at two points for each wheel per side.

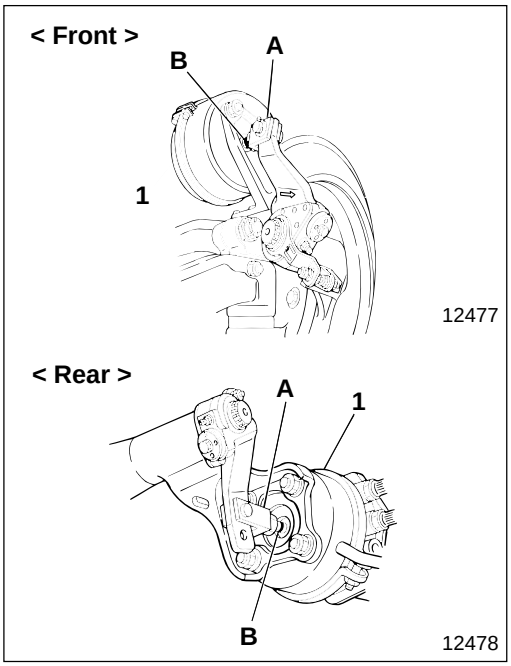
- Remove check hole plug **1** from the backing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall check hole plug **1**.

[Replacement]

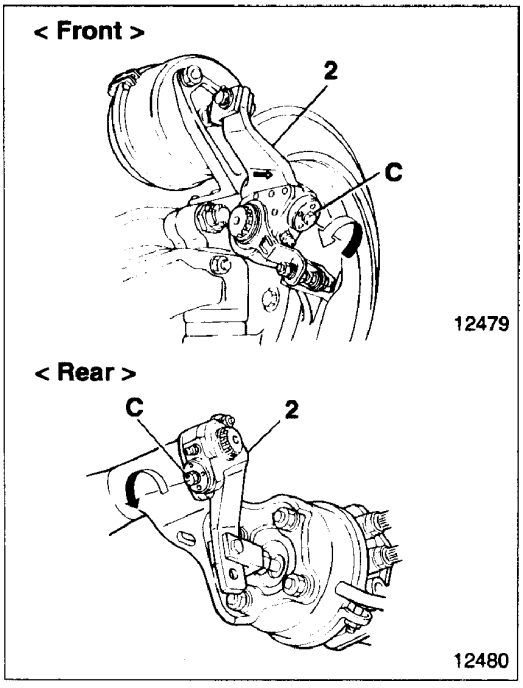
P35B-48, 60

https://truckmanualshub.com/

Inspection of Automatic Slack Adjuster Function



If red painted area **B** of push rod **A** of brake chamber **1** can be seen when the brake pedal is depressed fully, or if any abnormality is sensed in braking, inspect as follows:



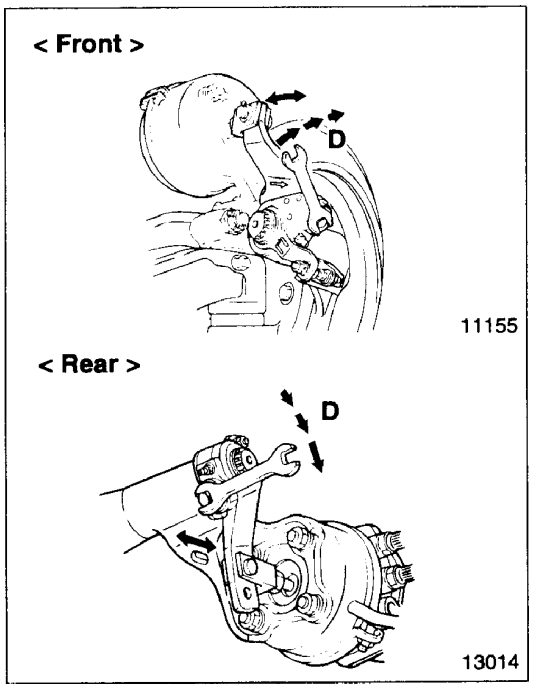
- Increase the air pressure in the air tank to approximately 685 kPa {100 lbf/in^2, 7 kgf/cm^2}.
- Turn worm shaft **C** of automatic slack adjuster **2** in direction ➡ (counterclockwise) to compress the brake shoe assembly and increase the brake shoe clearance to approximately 1.5 mm {0.059 in.}.

NOTE

A large force is required to turn worm shaft A.

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE



- Put a spanner on worm shaft **C** of automatic slack adjuster **2** and inspect operation by watching how far the spanner moves.

NOTE

Hold the spanner so that it does not fall off.

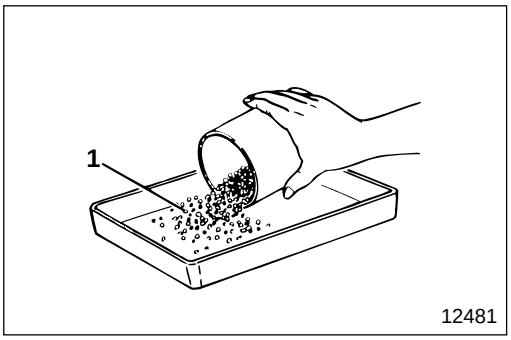
- Depress the brake pedal fully to work the brake, then release it.
- Check that worm shaft **C** of automatic slack adjuster **2** turns clockwise when the brake is released, and check if the turning stroke decreases every time the brake is depressed and released. If the automatic slack adjuster is faulty, replace it.

D : Stroke

https://truckmanualshub.com/

Inspection and Maintenance of Air Dryer

Carry out inspection and maintenance according to the following interval or vehicle milage.

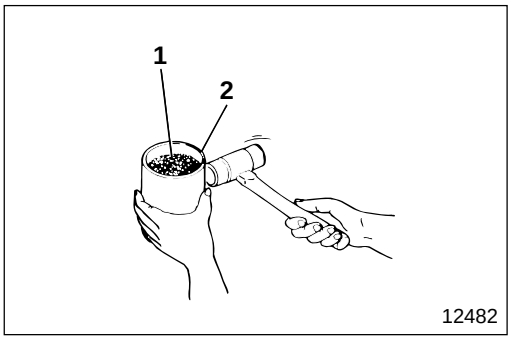


(1) Every 10000 km {6000 miles}

- To check that the air dryer operates correctly, open the drain cock of the air tank and see if any drainage comes out.
- If a little drainage comes out, check if the desiccant **1** is discolored. If more than one fifth of the desiccant has changed color from white to brown, renew desiccant.

NOTE

In an operational environment where the decrease of the ambient temperature in the air tank is higher than 16°C {29°F}, a little moisture might collect.



- Pour desiccant **1** into case **2**, tap around the container lightly to settle the desiccant.
- Carefully inspect the drainage from the exhaust port of the air dryer body. Inspect the air compressor and take appropriate action for abnormal oil consumption.
P35B-74

NOTE

Appropriate action means to inspect the clearance between the oil ring and the cylinder liner.

(2) Every year or every 60000 km {36000 miles}

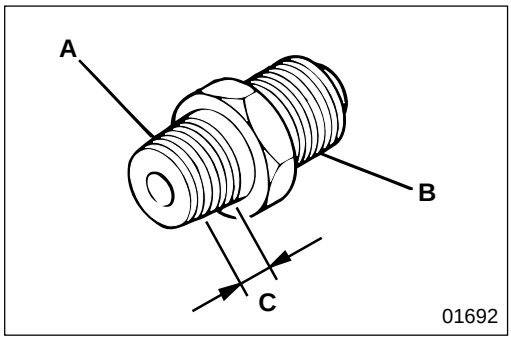
Disassemble the air dryer body. Replace the oil filter, filter and all the rubber parts together with a repair kit.
P35B-82

https://truckmanualshub.com/

HANDLING OF CONNECTOR

Sealant

Location	Points of application	Kinds	Quantity
—	Taper thread of connector	THREEBOND 1110B	As required



- If the connectors for the brake air system are to be reused after removal, thoroughly remove residual sealant, oil, moisture, etc.
- Apply sealant to the threads of the connector taper except for one or two turns from the end, then tighten.
- When positioning, adjust in the tightening direction.
  A : Taper thread
  B : Parallel thread (Do not apply sealant here)
  C : Apply sealant here

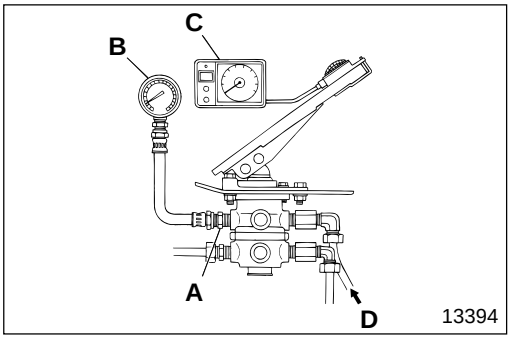
32	Retainer	*910-24590	Holding of primary piston

* : JIDOSHA KIKI part No.

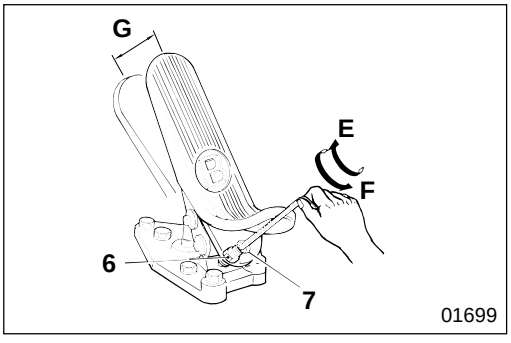
◆ Service procedure



● Inspection of function after assembly

Check that the output air pressure, corresponding to the pedal depression angle, conforms to the specified value.

- Mount pressure gauge **B**, capable of measuring 980 kPa {142 lbf/in^2, 10 kgf/cm^2} or more, on primary output side port **A**.
- Mount depression gauge **C** on the brake pedal.
- Apply air pressure of 685 kPa {100 lbf/in^2, 7 kgf/cm^2} to primary input side port **D** and inspect related parts for air leakage.
- If air leakage is found, do the following:
  - Tighten connectors.
  - Disassemble the dual brake valve and inspect the O-ring assemblies of all parts.



- Turn set screw **7** and adjust brake pedal play **G** to the standard value.
- Tighten lock nut **6** at specified torque to lock set screw **7**.
- Read pressure gauge **B** and make sure that the primary output pressure and brake pedal depression force angle, corresponding to the brake pedal depression angle, conform to the standard values shown in the Input/Output characteristic curve diagram overleaf.
- If the output air pressure is lower than the standard value, replace the following springs:
  - Spring **15**
  - Outer spring **29**
  - Inner spring **30**

  E : Turning clockwise decreases the play (To decrease brake pedal depression angle)

  F : Turning counterclockwise increases the play (To increase brake pedal depression angle)

https://truckmanualshub.com/

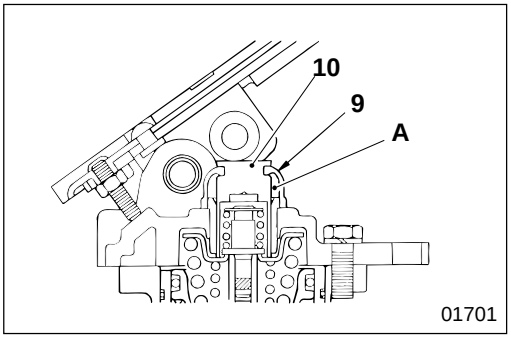
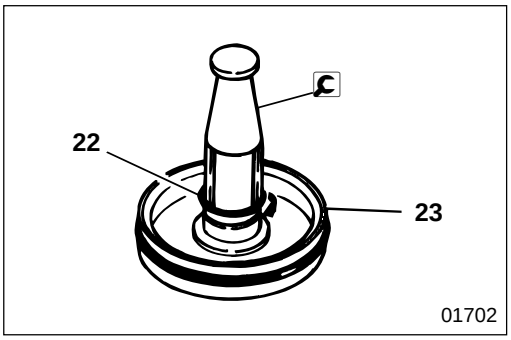
https://truckmanualshub.com/

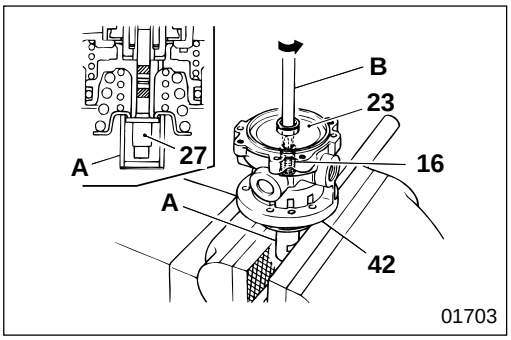


9 **10** **Packing grease between boot and plunger**

Pack area **A** with 1 cm^3 {0.061 cu. in.} of grease.



22 **Installation of O-ring**



23 **Removal of relay piston**

- Grip (14 mm {0.55 in.}) socket wrench **A** in a vise.
- Insert the head of self-locking bolt **27** into socket wrench **A** to tighten body **42**.

WARNING

You must be careful when you loosen screw 16, because the spring in body 42 can forcibly eject relay piston 23. To avoid this hazard, press down on the relay piston with your hand when you carry out the above work.

- Loosen screw **16** gradually to remove relay piston **23**.

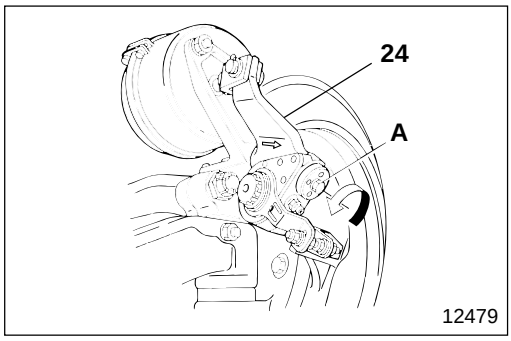
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
4	Anchor pin puller 	03727-60000	Removal of anchor pin



◆ Service procedure

● **Inspection of function after assembly**

- Increase the air pressure in the air tank to approximately 685 kPa {100 lbf/in^2, 7 kgf/cm^2}.
- Turn worm shaft **A** of automatic slack adjuster **24** in direction ➔ (counterclockwise) to compress brake shoe assembly **6** and increase the brake shoe clearance to approximately 1.5 mm {0.059 in}.

NOTE

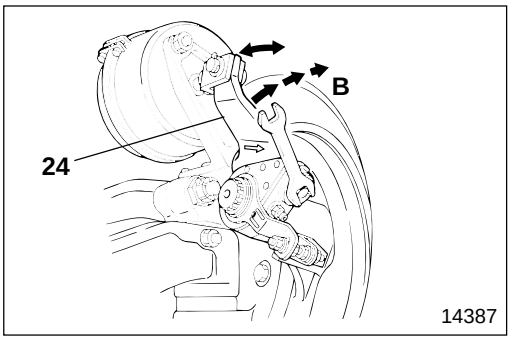
A large force is required to turn worm shaft A.

- Put a spanner on worm shaft **A** of automatic slack adjuster **24** and inspect operation by watching how far the spanner moves.

NOTE

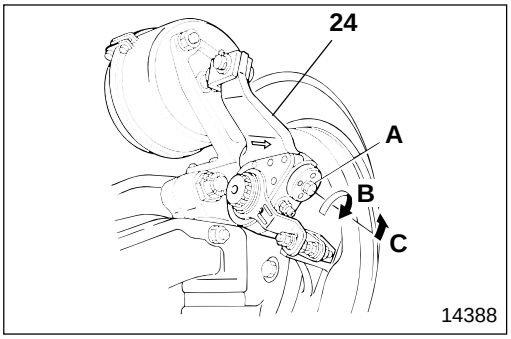
Hold the spanner so that it does not fall off.

https://truckmanualshub.com/



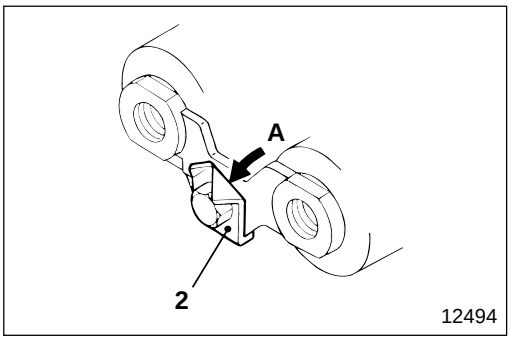
- Depress the brake pedal fully to work the brake, then release it.
- Check that worm shaft **A** of automatic slack adjuster **24** turns clockwise when the brake is released, and if the turning stroke decreases every time the brake is depressed and released. If the automatic slack adjuster is faulty, replace it.

  B : Stroke



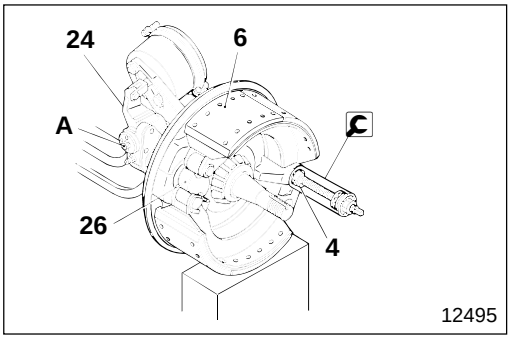
● **Adjustment of initial brake shoe clearance after installation**

- Turn worm shaft **A** of automatic slack adjuster **24** clockwise to open brake shoe assembly **6** until the brake shoe clearance is 0 mm {0 in.}.
- Slacken off worm shaft **A** counterclockwise by one quarter of a turn.
  B : Turn clockwise fully.
  C : Slacken off counterclockwise by one quarter of a turn.



2 **Bending up lock washer**

A : Bend

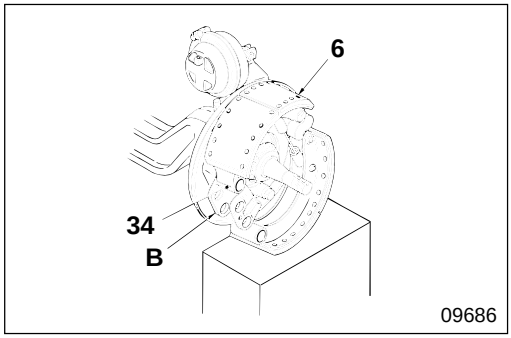


6 **Brake shoe assembly**

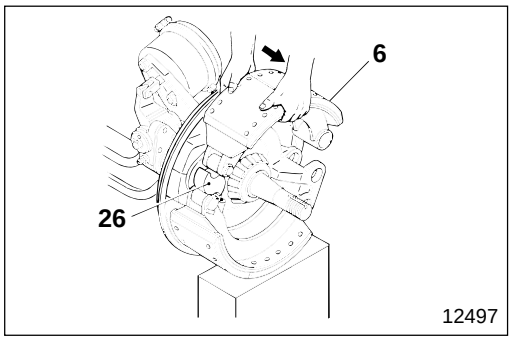
[Removal]

- Turn worm shaft **A** of automatic slack adjuster **24** so that camshaft **26** does not open brake shoe assembly **6**.
- Remove anchor pin **4** using 🔧 anchor pin puller.

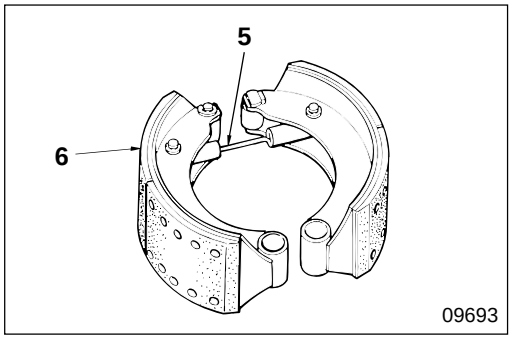
https://truckmanualshub.com/



- Remove heel part **B** of lower brake shoe assembly **6** from anchor bracket **34**.
- Remove heel part **B** of upper brake shoe assembly **6** from anchor bracket **34**.

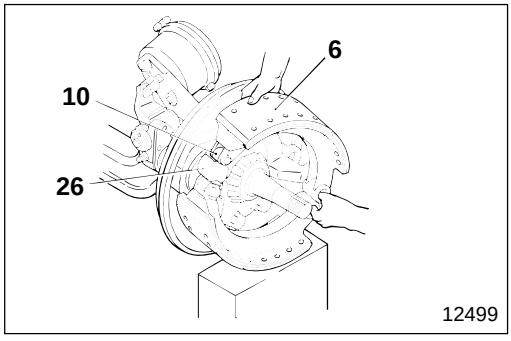


- Hold upper brake shoe assembly **6**, and remove it from camshaft **26** by sliding horizontally.



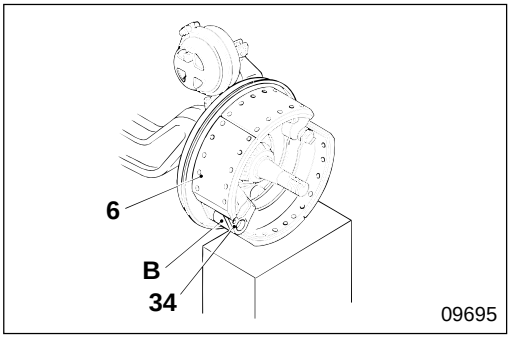
[Installation]

- Install return spring **5** in both brake shoe assemblies **6**.

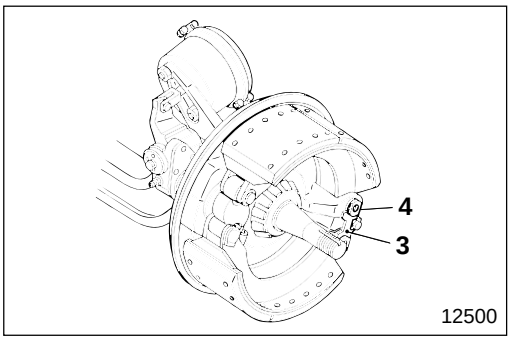


- Insert your thumb and forefinger into the anchor pin hole of both brake shoe assemblies **6**, and lift the upper brake shoe assembly with your other hand.
- Place and slide roller **10** of brake shoe assembly **6** onto camshaft **26**.

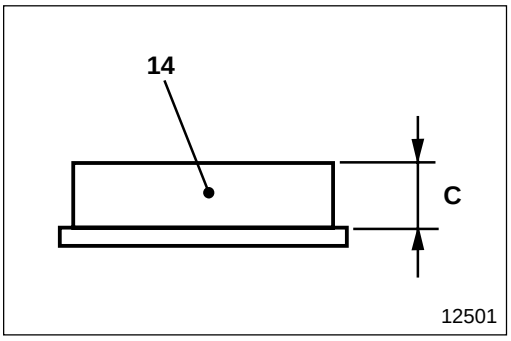
https://truckmanualshub.com/



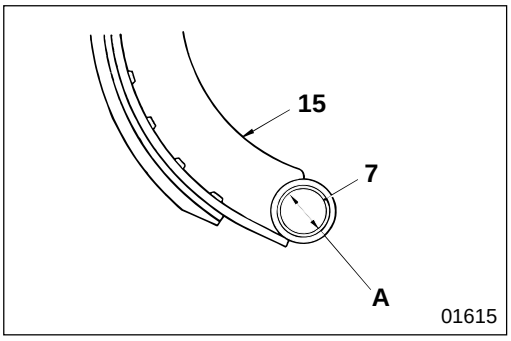
- Install heel part **B** of upper brake shoe assembly **6** in anchor bracket **34**.
- Install heel part **B** of lower brake shoe assembly **6** in anchor bracket **34**.



- Drive in anchor pin **4** and fix it with lock plate **3**.



[Inspection]
If thickness **C** of brake lining **14** is lower than the limit replace the brake lining on the same axle as a unit.

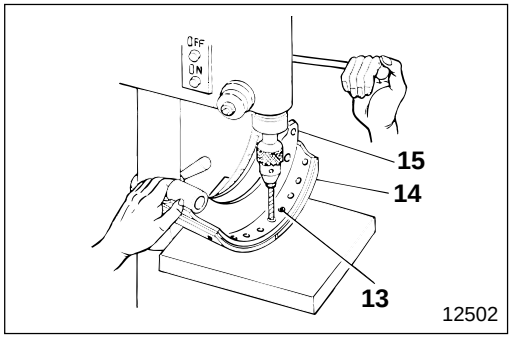


7 **Inner diameter of bushing**

- After installing bushing **7** in brake shoe **15**, measure inner diameter **A** of the bushing.
- If the inner diameter deviates from dimension A ream the diameter to the standard value.

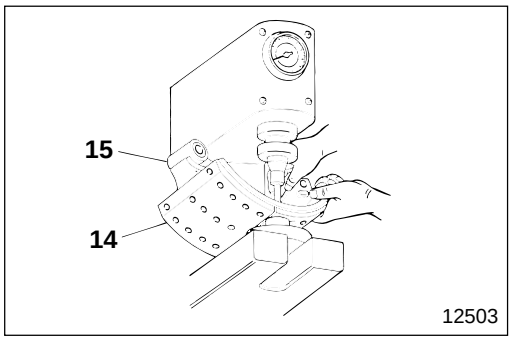
Dimension **A** : $35\ ^{+0.05}_{0}$ mm {$1.4\ ^{+0.0020}_{0}$ in.}

https://truckmanualshub.com/



14 **Rivet, brake lining and brake shoe**

[Removal]



[Installation]

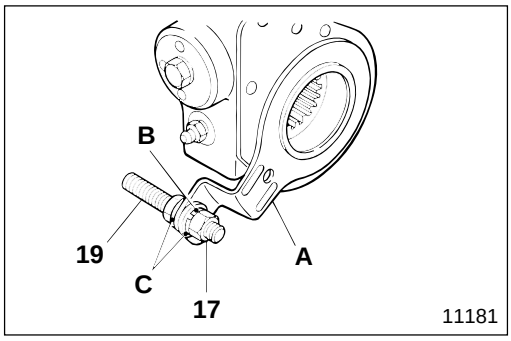
- Clean the mounting surfaces of brake lining **14** and brake shoe **15** with cleaning fluid and dry them.
- Insert rivets **13** from brake lining **14** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **15** and the brake lining.
  Caulking load for rivets : 17 to 19 kN {3750 to 4190 lbf, 1700 to 1900 kgf}

WARNING

Do not leave lubricant on the surface of brake lining 14 because this reduces braking performance.

CAUTION

- **Make sure that the type of brake linings 14 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one shaft.**
- **Make sure that you inspect contact with the inner surface of brake drum *1 after you replace brake linings 14. If contact is incorrect, correct with the brake assembled.**

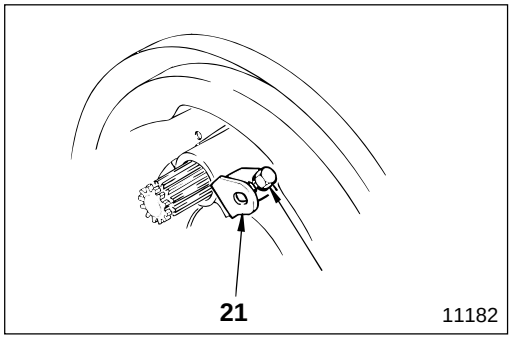


24 **Automatic slack adjuster**

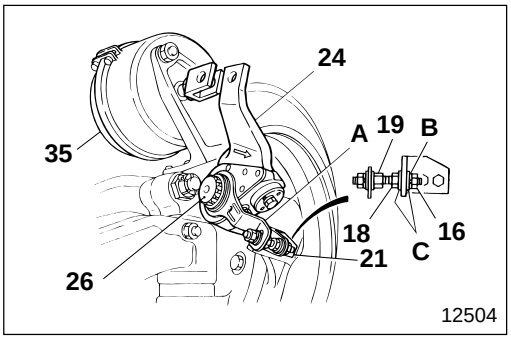
[Installation]

- Install stopper pin **19** in control arm **A** of automatic slack adjuster **24** temporarily.

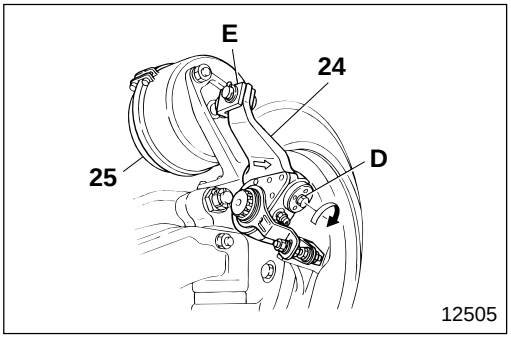
  B : Spring washer
  C : Plain washer



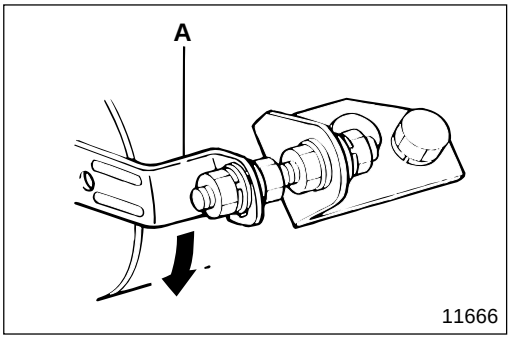
https://truckmanualshub.com/



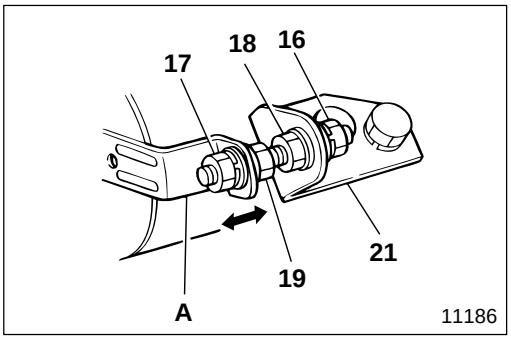
★ • Fit nuts **16**, **18**, spring washer **B** and plain washer **C** on stopper pin **19** that is installed in automatic slack adjuster **24**.
• Position control arm **A** so that stopper pin **19** can be fitted into the hole of stopper pin bracket **21**.
• Install automatic slack adjuster **24** on camshaft **26** of the wheel brake so that mark "⇨" on the arm of the automatic slack adjuster points away from brake chamber **35** as illustrated.



• Turn and align worm shaft **D** of automatic slack adjuster **24** clockwise in the direction of mark "➡" as illustrated, and install push rod **E** of brake chamber **35** in the arm.



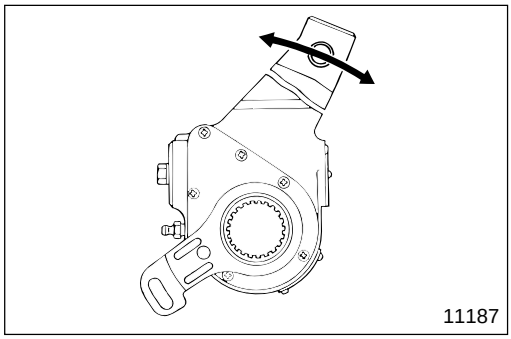
• Push control arm **A** of automatic slack adjuster **24** in direction ➡ as illustrated, and confirm that the arm does not move due to contact with the inner stopper.
If the control arm does move, repeat the operation from step ★.



• First install stopper pin **19** in control arm **A**, then in stopper pin bracket **21**, tighten nuts **16**, **17**, **18** at specified torque. Check that the control arm does not move. When tightening the nuts at specified torque, do not apply force to the control arm in arrow mark direction ⟷ as illustrated.

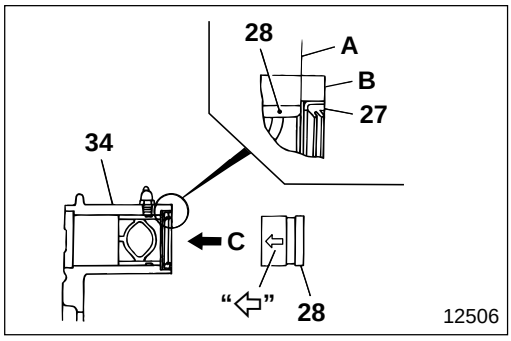
https://truckmanualshub.com/

FRONT WHEEL BRAKE



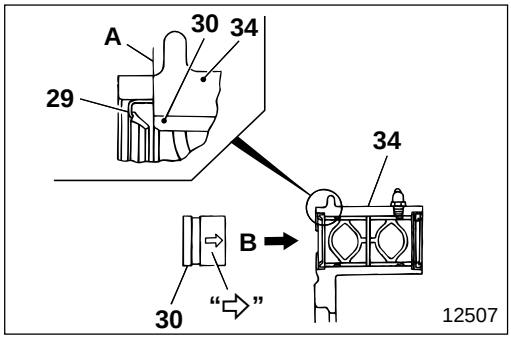
[Inspection of play]

- Inspect automatic slack adjuster **24** when it is disconnected from brake chamber **35**.
- To inspect play, move automatic slack adjuster **24** in direction ⟷ as illustrated. If play is higher than the limit, replace the automatic slack adjuster.
  Limit : 4 mm {0.16 in.} or less



27 **28** **Press-fitting of dust seal and bushing**

A : Press-fit bushing **28** to this level
B : Press-fit dust seal **27** to this level
C : Press-fitting direction for bushing **28**



29 **30** **Press-fitting of oil seal and bushing**

A : Press-fit oil seal **29** and bushing **30** to this level
B : Press-fitting direction for bushing **30**

***1** **Correction of brake drum**

If the cylindrical accuracy of brake drum ***1** is higher than the limit, or there are seams, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

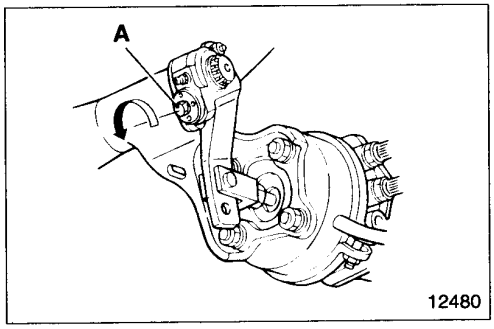
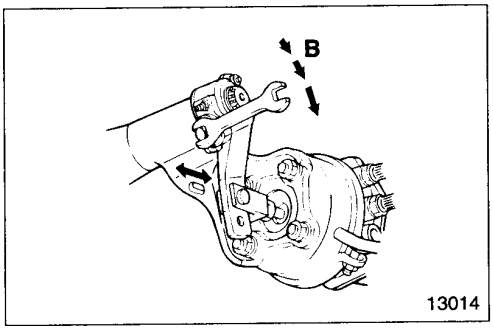
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
4	Anchor pin puller 	03727-60000	Removal of anchor pin





◆ Service procedure

● **Inspection of operation after installation**

- Increase the air pressure in the air tank to approximately 685 kPa {100 lbf/in², 7 kgf/cm²}.
- Turn worm shaft **A** of automatic slack adjuster **25** in direction ➡ (counterclockwise) to compress the brake assembly and increase the brake shoe clearance to approximately 1.5 mm {0.059 in}.

NOTE

A large force is required to turn worm shaft A.

- Put a spanner on worm shaft **A** of automatic slack adjuster **25** and inspect its operation by watching how far the spanner moves.

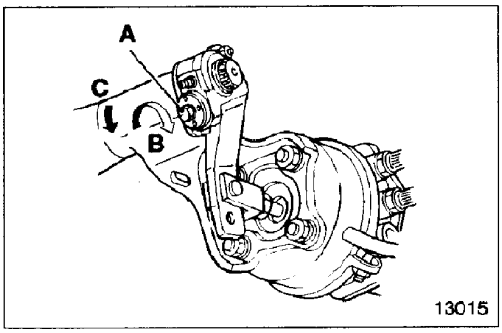
NOTE

Hold the spanner so that it does not fall off.

- Depress the brake pedal fully to work the brake, then release it.
- Check that worm shaft **A** of automatic slack adjuster **25** turns clockwise when the brake is released, and if the turning stroke decreases every time the brake is depressed and released. If the automatic slack adjuster is faulty, replace it.

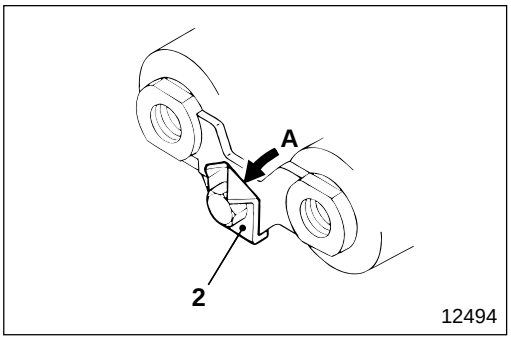
B : Stroke

https://truckmanualshub.com/



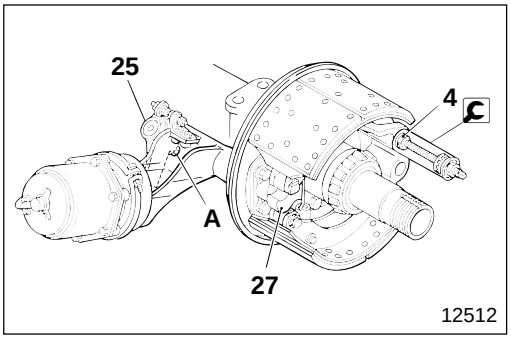
● **Adjustment of initial brake shoe clearance after installation**

- Turn worm shaft **A** of automatic slack adjuster **25** clockwise to open brake shoe assembly **6** until the brake shoe clearance is 0 mm {0 in.}.
- Slacken off worm shaft **A** counterclockwise by one quarter of a turn.
  B : Turn clockwise fully.
  C : Slacken off counterclockwise by one quarter of a turn.



2 **Bending up lock washer**

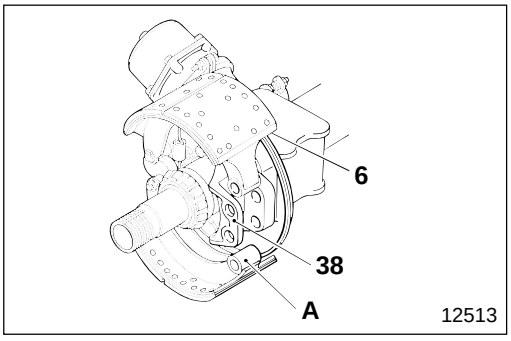
A : Bend



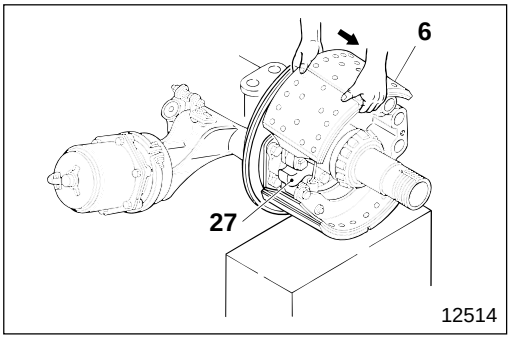
6 **Brake shoe assembly**

[Removal]

- Turn worm shaft **A** of automatic slack adjuster **25** so that camshaft **27** does not open brake shoe assembly **6**.
- Remove anchor pin **4** using 🔧 anchor pin puller.

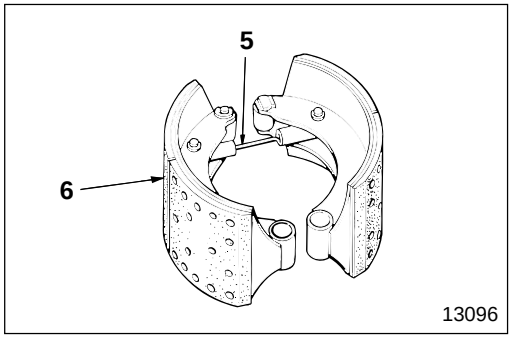


- Remove heel part **A** of lower brake shoe assembly **6** from anchor bracket **38**.
- Remove heel part **A** of upper brake shoe assembly **6** from anchor bracket **38**.



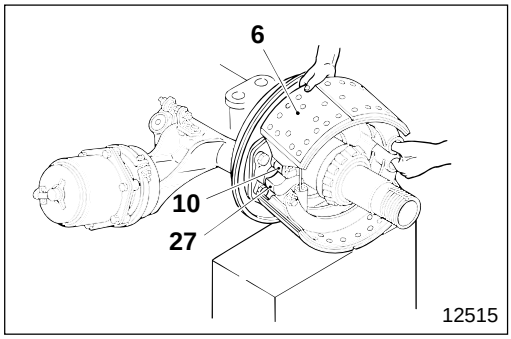
- Hold upper brake shoe assembly **6**, and remove it from camshaft **27** by sliding horizontally.

https://truckmanualshub.com/

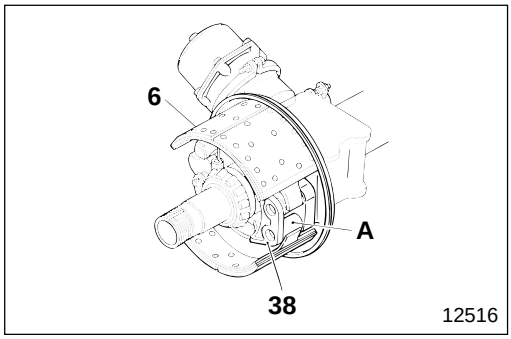


[Installation]

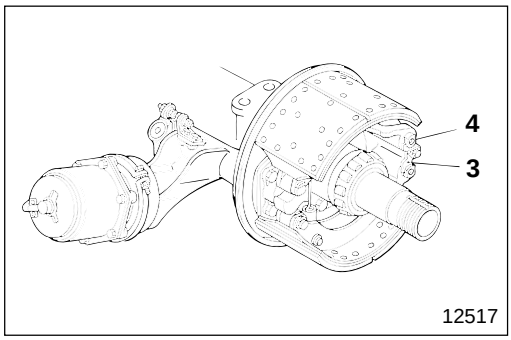
- Install return spring **5** in both brake shoe assemblies **6**.



- Insert your thumb and forefinger into the anchor pin hole of both brake shoe assemblies **6**, and lift the upper brake shoe assembly with your other hand.
- Place and slide roller **10** of brake shoe assembly **6** onto camshaft **27**.

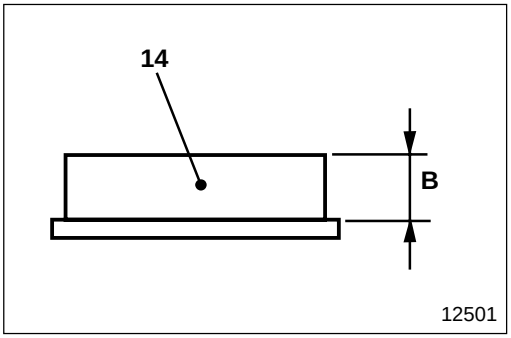


- Install heel part **A** of upper brake shoe assembly **6** in anchor bracket **38**.
- Install heel part **A** of lower brake shoe assembly **6** in anchor bracket **38**.

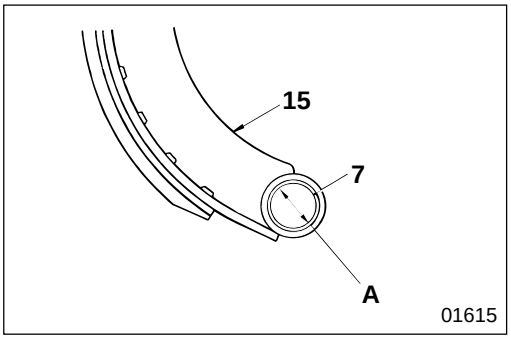


- Drive in anchor pin **4** and fix it with lock plate **3**.

https://truckmanualshub.com/



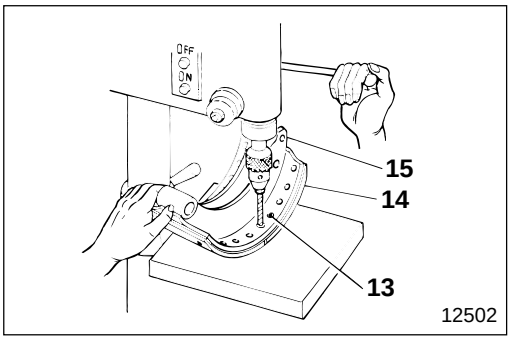
[Inspection]
If thickness **B** of brake lining **14** is lower than the limit replace the brake lining on the same axle as a unit.



7 **Inner diameter of bushing**

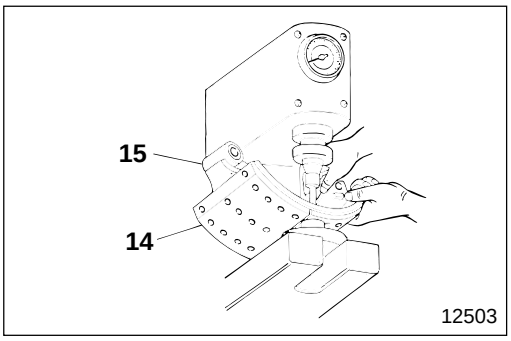
- After installing bushing **7** in brake shoe **15**, measure inner diameter **A** of the bushing.
- If the inner diameter deviates from dimension **A** ream the diameter to the standard value.

  Dimension **A** : $35\ ^{+0.05}_{0}$ mm {$1.4\ ^{+0.0020}_{0}$ in.}



14 **Brake lining**

[Removal]



[Installation]

- Clean the mounting surfaces of brake lining **14** and brake shoe **15** with cleaning fluid and dry them.
- Insert rivets **13** from brake lining **14** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **15** and the brake lining.

  Caulking load for rivets : 17 to 19 kN {3750 to 4190 lbf, 1700 to 1900 kgf}

WARNING

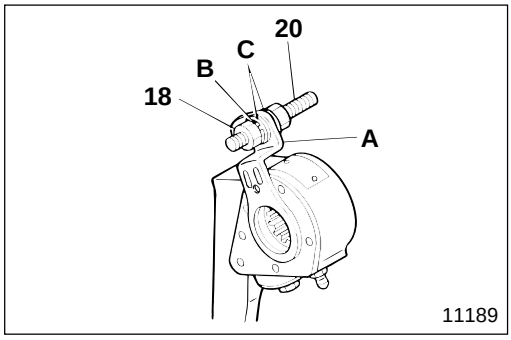
Do not leave lubricant on the surface of brake lining 14 because this reduces braking performance.

https://truckmanualshub.com/

REAR WHEEL BRAKE

CAUTION ⚠

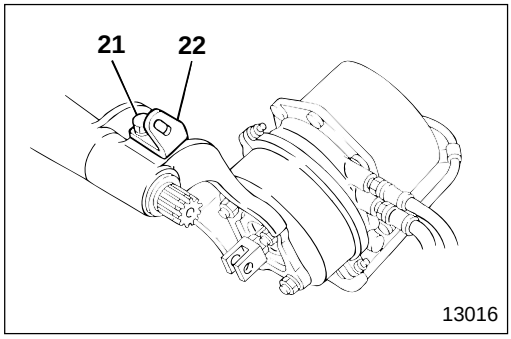
- **Make sure that the type of brake linings 14 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one shaft.**
- **Make sure that you inspect contact with the inner surface of brake drum *1 after you replace brake linings 14. If contact is incorrect, correct with the brake assembled.**

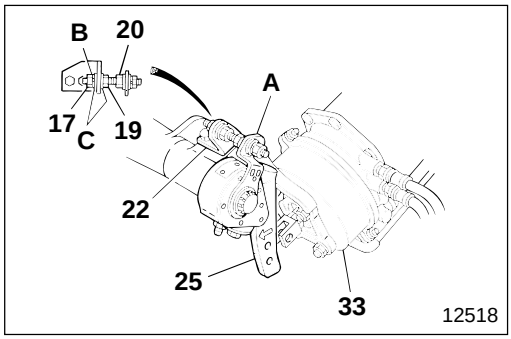


25 Automatic slack adjuster

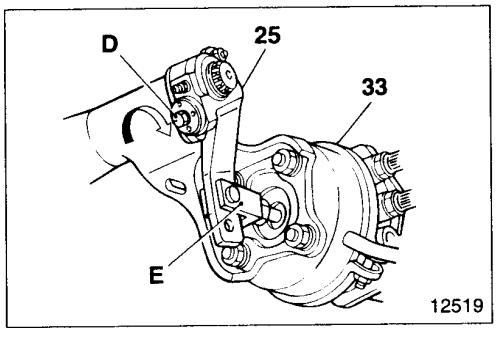
[Installation]

- Install stopper pin **20** in control arm **A** of automatic slack adjuster **25** temporarily.
  B : Spring washer
  C : Plain washer



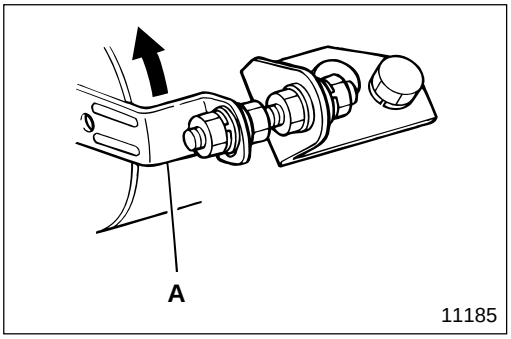


★ • Fit nuts **17**, **19**, spring washer **B** and plain washer **C** on stopper pin **20** that is installed in automatic slack adjuster **25**.
- Position control arm **A** so that stopper pin **20** can be fitted into the hole of stopper pin bracket **22**.
- Install automatic slack adjuster **25** on camshaft **27** of the wheel brake so that mark "⇨" on the arm of the automatic slack adjuster points away from brake chamber **33** as illustrated.

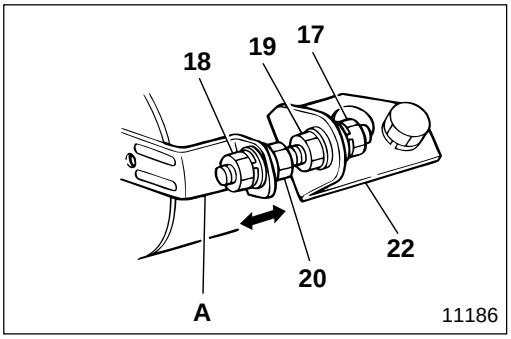


- Turn and align worm shaft **D** of automatic slack adjuster **25** clockwise in the direction of mark "➡" as illustrated, and install push rod **E** of brake chamber **33** in the arm.

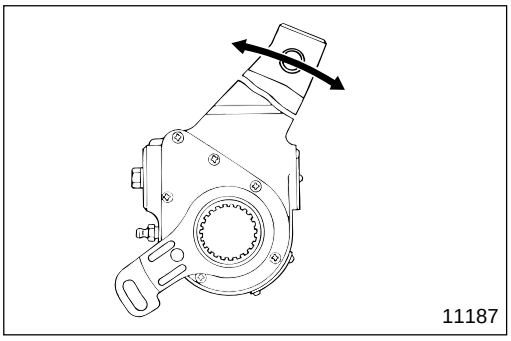
https://truckmanualshub.com/



- Push control arm **A** of automatic slack adjuster **25** in direction ➡ as illustrated, and confirm that the arm does not move due to contact with the inner stopper.
  If the control arm does moves, repeat the operation from step ★.

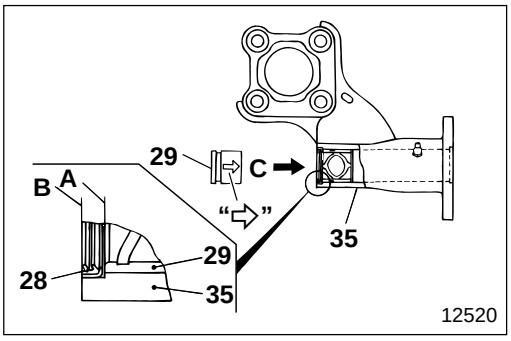


- First install stopper pin **20** in control arm **A**, then in stopper pin bracket **22**, tighten nuts **17**, **18**, **19** at specified torque. Check that the control arm does not move. When tightening the nuts at specified torque, do not apply force to the control arm in arrow mark direction ⟷ as illustrated.



[Inspection of play]

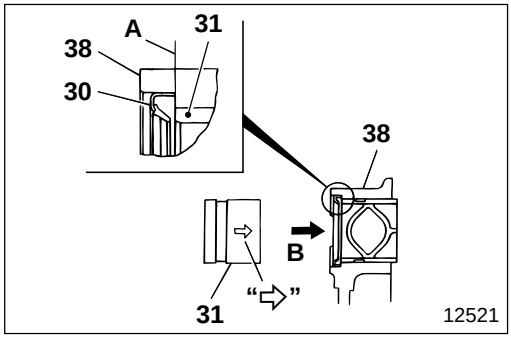
- Inspect automatic slack adjuster **25** when it is disconnected from brake chamber **33**.
- To inspect play, move automatic slack adjuster **25** in direction ⟷ as illustrated. If play is higher than the limit, replace the automatic slack adjuster.
  Limit : 4 mm {0.16 in.} or less



28 **29** **Press-fitting of dust seal and bushing**

A : Press-fit bushing **29** to this level
B : Press and fit dust seal **28** to this level
C : Press-fitting direction for bushing **29**

https://truckmanualshub.com/



30 **31** **Press-fitting of oil seal and bushing**

A : Press-fit oil seal **30** and bushing **31** to this level
B : Press-fitting direction for the bushing

***1** **Correction of brake drum**

If the cylindrical accuracy of brake drum ***1** is higher than the limit, or there are seams, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

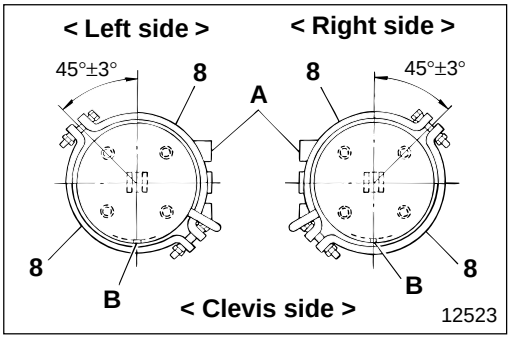
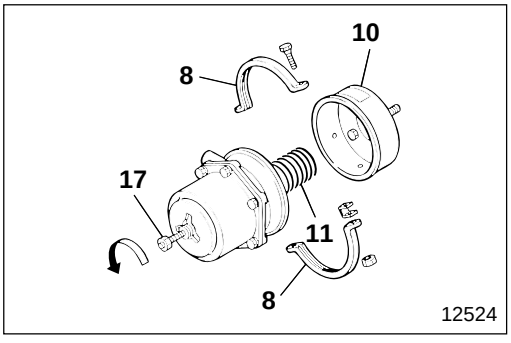
◆ Service procedure



8 **Points of clamp installation**

A : Service port
B : Drain port



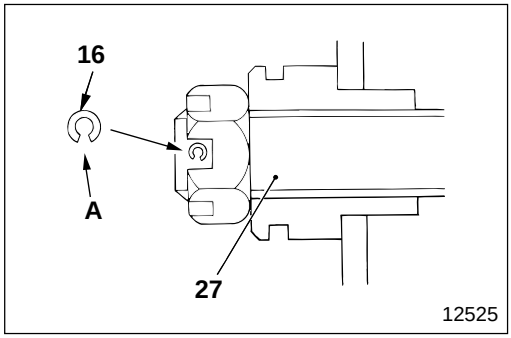
10 **Removal of chamber**

- Turn lock nut **17** in direction ➔ (counterclockwise) fully to compress spring **21**.
- Remove clamp **8** and chamber **10**.

WARNING ⚠

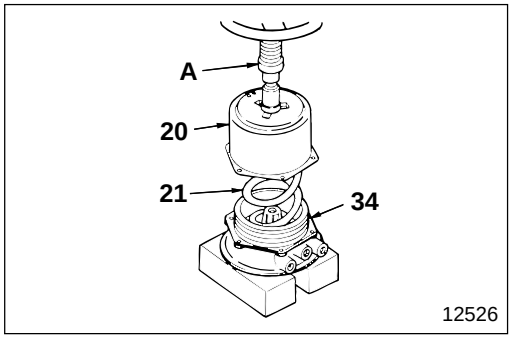
You must be careful when you remove the clamp, because spring 11 in chamber 10 can be forcibly ejected. To avoid this hazard, press down the chamber with your hand when you carry out the above work.

https://truckmanualshub.com/



16 **Installation of spring pin**

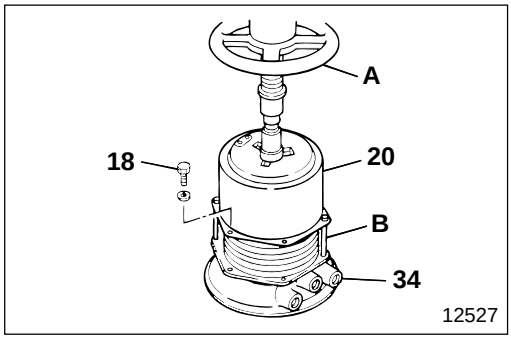
Drive in spring pin **16** so that slit **A** faces release bolt **27** at a right angle.



20 **Cylinder**

[Removal]

When you remove cylinder **20**, spring **21** might spring out. To prevent this, press down the cylinder using press **A** during removal.



[Installation]

- Arrange bolt **B** (M8×1.25) as a guide.
- Install bolt **B** as a guide, pressing down cylinder **20** using press **A**.
- Align the bolt holes of cylinder **20** and bulk head **34**, and press down using press **A**. Tighten bolt **18** at specified torque.

Location	Points of application	Kinds	Quantity
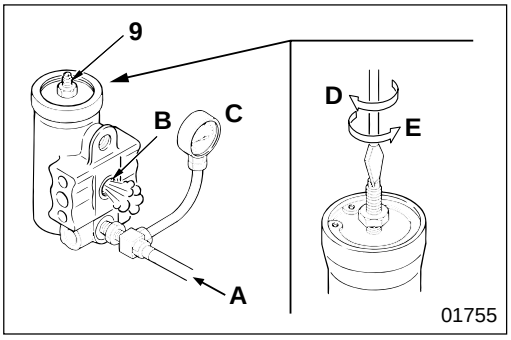
8	Surface of spring guide	Multipurpose grease [NLGI No. 2 (Li soap)]	As required
9	Surface of adjusting screw, except for thread area	Multipurpose grease [NLGI No. 2 (Li soap)]	As required
12, 13	Entire O-ring	Multipurpose grease [NLGI No. 2 (Li soap)]	As required
14	Outer periphery of piston and O-ring groove	Multipurpose grease [NLGI No. 2 (Li soap)]	As required
18	Interior of body	Multipurpose grease [NLGI No. 2 (Li soap)]	As required

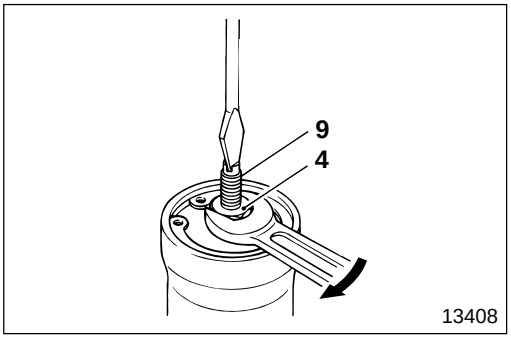
◆ Service procedure

● Inspection of function after assembly

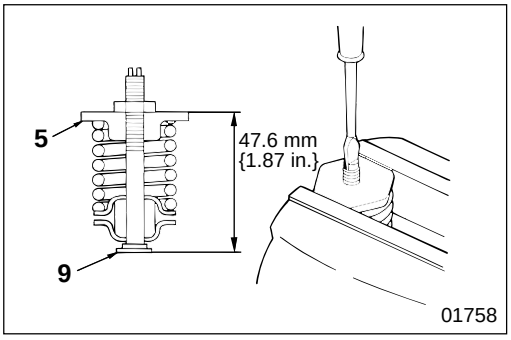


- Increase air pressure **A** gradually and read the value on air pressure gauge **C** when air is discharged from **B**. Adjust by turning adjusting screw **9** so that the reading conforms to the standard value (high specified-pressure).
  D : Turning clockwise decreases the pressure
  E : Turning counterclockwise increases the pressure
- Lower air pressure **A** to 685 kPa {100 lbf/in^2, 7 kgf/cm^2} or less, then raise the air pressure gradually. Read air pressure gauge **C** when it stops and check that the value conforms to the standard value (high specified-pressure). If the value deviates from the standard value, readjust.

- Lower air pressure **A** gradually. When the discharge of air from **B** ceases, read air pressure gauge **C** to check that the valve conforms to the standard value (high specified-pressure). If the value deviates from the standard value, replace the air pressure governor assembly.



- After adjusting, tighten lock nut **4** to prevent adjusting screw **9** being turned accidentally.



3 **Preliminary adjustment of adjusting screw assembly**

It is recommended that you adjust the distance from the upper level of upper spring seat **5** to the lower level of adjusting screw **9** to 47.6 mm {1.87 in.} by turning the adjusting screw, because this makes adjustment to the specified value easier.

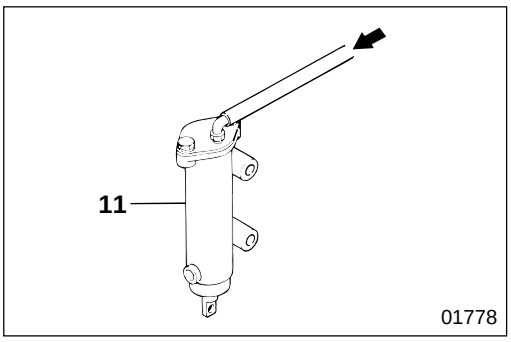
25	Interior of cylinder	Molybdenum disulfide bearing grease [NLGI No.2 (Li soap)]	2 cm^3 {0.12 cu. in.}

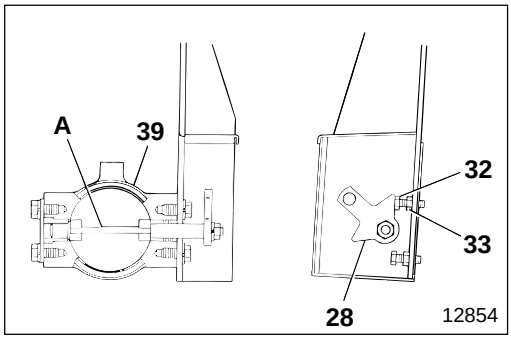


◆ Service procedure

11 **Inspection on airtightness of control cylinder**

Make sure that there is no air leakage when air pressure of 980 kPa {140 lbf/in^2, 10 kgf/cm^2} is applied to control cylinder **11**. If any air leakage is found, replace the control cylinder assembly.

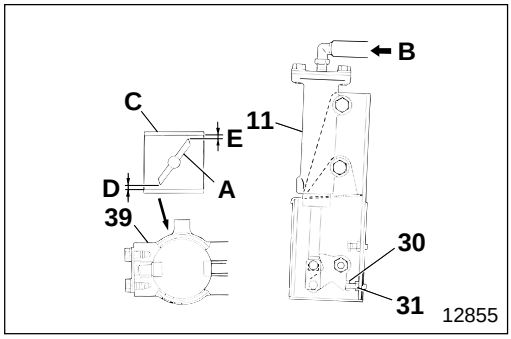
https://truckmanualshub.com/



28 **30** **to** **33** **39** **Lever, adjusting bolt, lock nut, and valve assembly**

[Butterfly valve **A** fully-opened adjustment]

- Turn the adjusting bolt so that lever **28** and the head of adjusting bolt **32** make contact horizontally.
- Tighten lock nut **33** at specified torque.



[Butterfly valve **A** fully-closed adjustment]

- Apply air pressure **B** of 685±49 kPa {100±7.1 lbf/in^2, 7±0.5 kgf/cm^2} to control cylnder **11**.
- Turn adjusting bolt **30** so that the average value of clearances **D**, **E** between butterfly valve **A** and body **C** conforms to the standard value.
- Calculate the average of clearances **D**, **E** by (**D**+**E**)/2.
- Tighten lock nut **31** at specified torque.

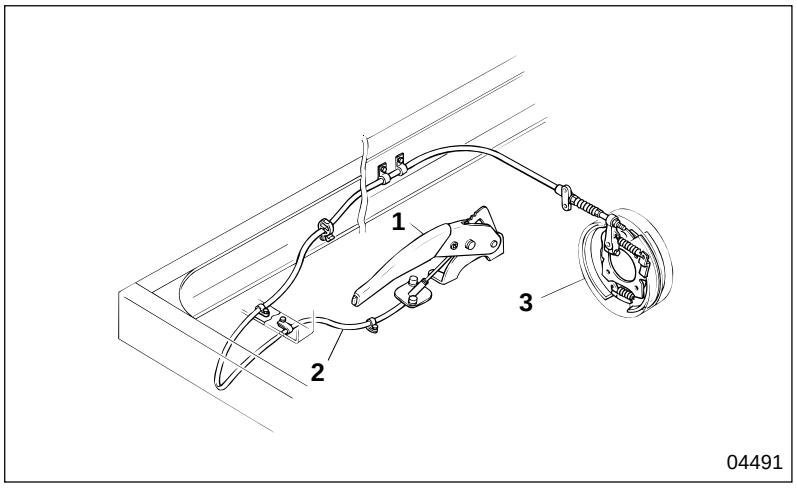
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Item \ Vehicle model		FK617, FM617
Brake	Type	Propeller shaft internal expanding type brake
	Operation type	Mechanical cable type
Parking brake assembly	Type	Dual-servo type
	Inner diameter of drum mm {in.}	ø254 {10}
	Lining width×Thickness mm {in.}	60×5.8 {2.36×0.23}

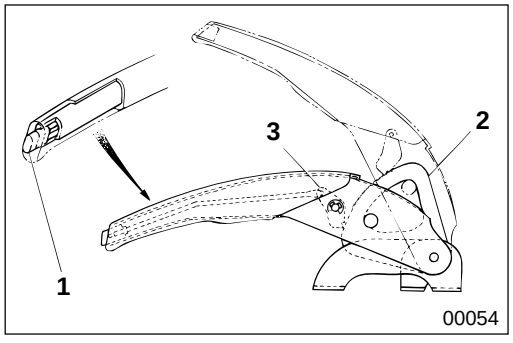
STRUCTURE AND OPERATION

Parking Brake Control



1 Parking brake lever
2 Parking brake cable
3 Parking brake assembly

Parking Brake Lever

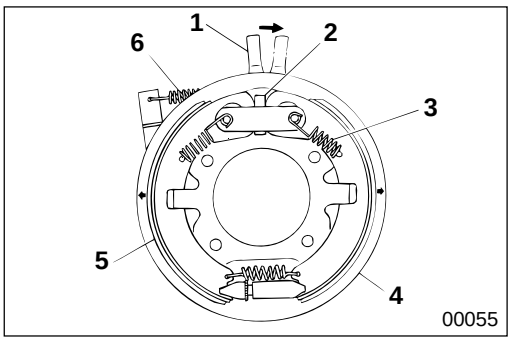


1 Release rod knob
2 Lever bracket
3 Locking latch

The parking brake has a built-in locking mechanism that prevents inadvertent release of the brake.
To release locking, push release rod knob **1** which will disengage from the serration of lever bracket **2** and the tooth of locking latch **3** freeing the parking brake lever and allowing it to return.

https://truckmanualshub.com/

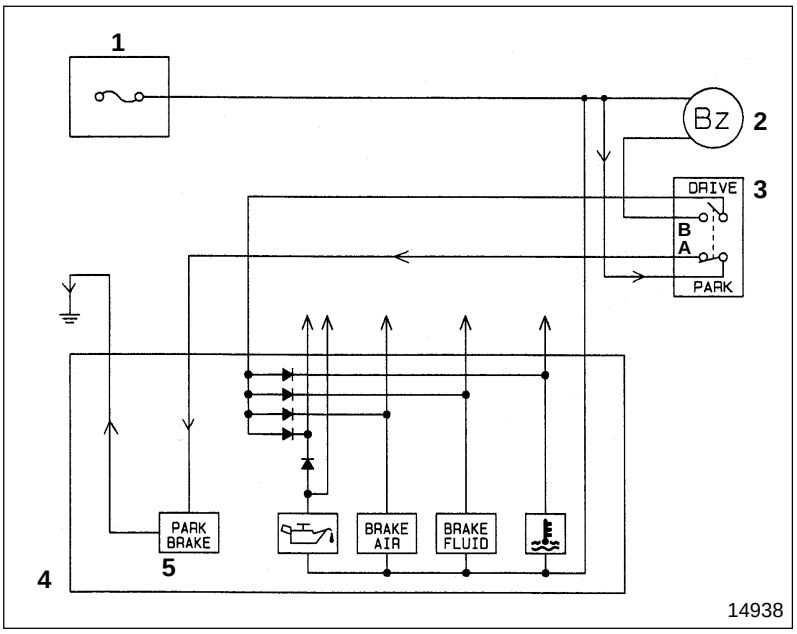
Parking Brake Assembly < Dual-servo Type >



1 Camshaft lever
2 Camshaft
3 Shoe return spring
4 Brake drum
5 Shoe and lining assembly
6 Camshaft lever return spring

Pulling the parking brake lever pulls the parking brake cable, which in turn pulls camshaft lever **1**. At the same time, camshaft **2** rotates in conjunction with the camshaft lever, and expands shoe and lining assembly **5** making it press against brake drum **4**. This frictional force locks the propeller shaft that is connected to the drum. When the brake lever is released, the repercussive force of shoe return spring **3** releases the brake.

Parking Brake System Electric Circuit



1 Relay and fuse box
2 Buzzer
3 Parking brake switch
4 Meter cluster
5 Parking brake indicator lamp

- The parking brake system electrical circuit is provided for indictaing, its detecting and indictaing function is activated by pulling the parking brake lever.
- When the parking brake lever is pulled, contact point **A** of parking brake switch **3** closes (ON), and parking brake indicator lamp **5** is lit, indicating that the parking brake is operating.
  The current flows as below:
  Fuse **1** → Parking brake switch **3** → Parking brake indicator lamp **5** → Ground
- Buzzer **2** sounds and gives a warning when any fault is detected in the engine oil pressure system, brake system or cooling system. Pulling the parking brake lever opens (OFF) contact point **B** of parking brake switch **3** to stop the buzzer from sounding.

https://truckmanualshub.com/

TROUBLESHOOTING

Possible causes / Symptoms		Parking brake does not work	Parking brake does not release smoothly (dragging)	Remarks
Parking brake cable	Inner cable stretched or damaged	○	○	
	Inner cable rusted		○	
Parking brake lever	Locking ratchet and lever bracket serration engagement faulty	○		
	Pulling stroke insufficient	○	○	
	Pulling stroke excessive	○		
Parking brake assembly	Shoe clearance insufficient		○	
	Shoe clearance excessive	○		
	Parking brake drum inner surface deformed or distorted	○		
	Parking brake drum inner surface greasy or oily	○		
	Linings worn unevenly	○		
	Lining surface greasy or oily	○		
	Camshaft lever return spring permanently set or fractured		○	
	Shoe return spring fatigued or fractured		○	

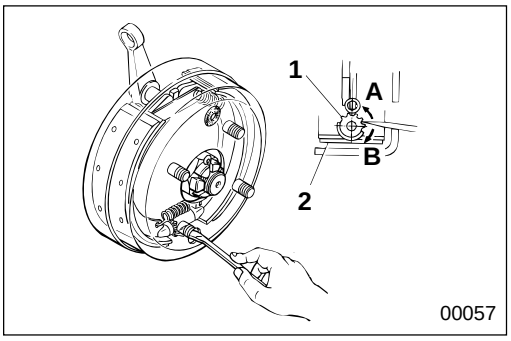
https://truckmanualshub.com/

Adjustment of Parking Brake Shoe Clearance and Lever Stroke

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Brake shoe clearance	0.1 to 0.25 {0.0039 to 0.0098}	—	Adjust
3	Brake lever pulling stroke (at operation force of 490 N {110 lbf, 50 kgf})	7 to 10 notches	—	Adjust

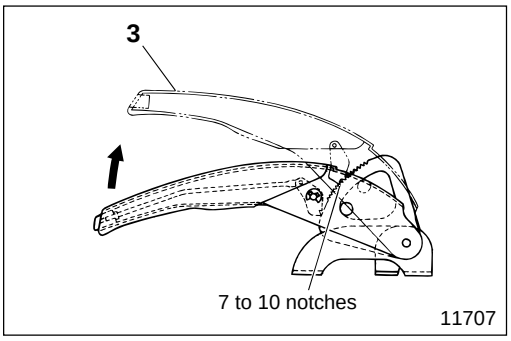


(1) Shoe clearance

When the camshaft lever is released, turn adjusting screw **1** in the expansion direction, using a screwdriver inserted through the shoe adjusting hole of the brake drum, and return 8 notches from the position where shoe **2** is in close contact with the drum. Then, the shoe clearance will be the standard value.

A : Expansion

B : Contraction



(2) Lever pulling stroke

Adjust camshaft lever lock nut **4** so that the number of notches (clicks heard) is the standard value when parking brake lever **3** is pulled from the released position by an operating force of 490 N {110 lbf, 50 kgf}. Operate the parking brake lever two or three times after adjusting to verify the pulling stroke, to make sure that the parking brake is operating properly and that the parking brake drum does not drag when the parking brake is released.

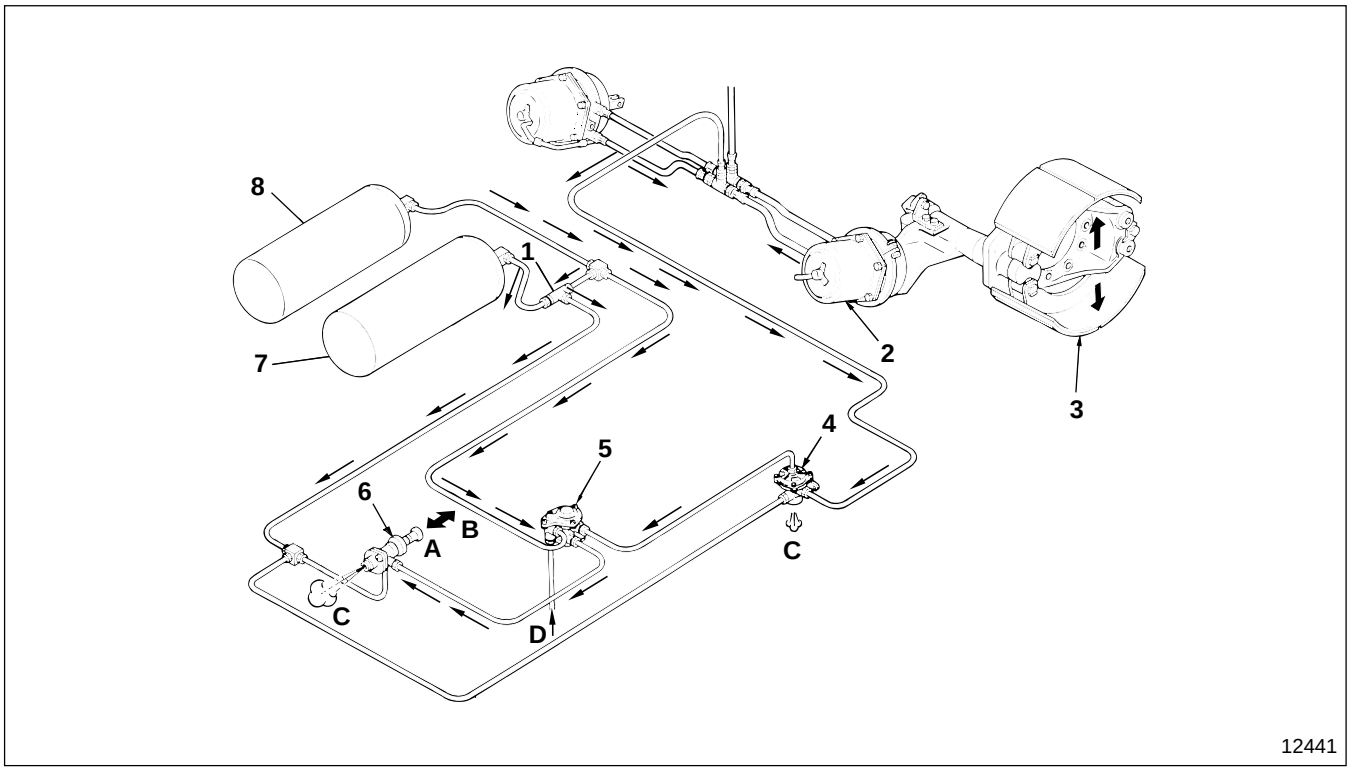
GROUP 36B PARKING BRAKE (WHEEL PARKING BRAKE)

STRUCTURE AND OPERATION 2
TROUBLESHOOTING 7
PARKING BRAKE CONTROL VALVE 8
SPRING BRAKE VALVE 10
DOUBLE CHECK VALVE 13

https://truckmanualshub.com/

STRUCTURE AND OPERATION

Parking Brake System

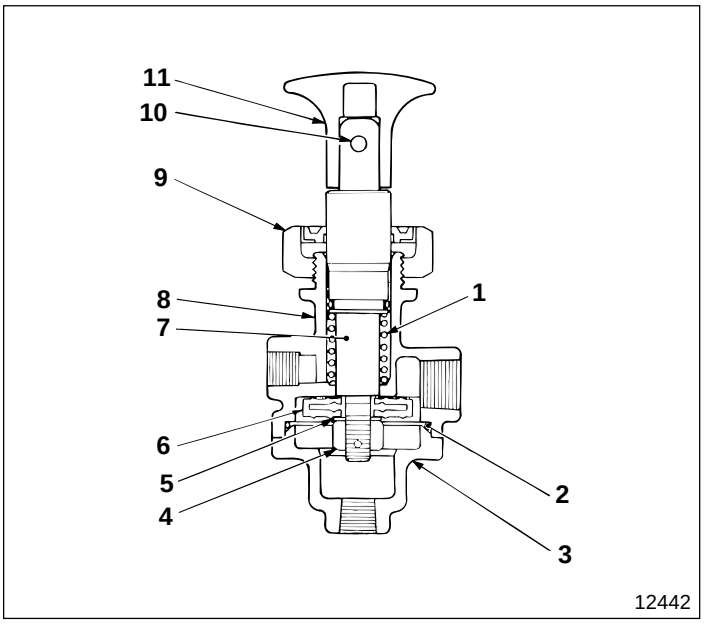


1	Double check valve	**5**	Spring brake valve	**A** :	RELEASE position
2	Rear brake chamber	**6**	Parking brake control valve	**B** :	PARK position
3	Rear wheel brake	**7**	Front brake air tank	**C** :	Pressurized air
4	Relay valve	**8**	Rear brake air tank	**D** :	From front brake system

- In the wheel parking brake system, operating parking brake control valve **6** causes rear brake chamber **2**, which contains a spring brake, to apply rear wheel brake **3**, generating braking force.
- Pulling out the knob of parking brake control valve **6** to the PARK position, feeds pressurized air **C** from the parking brake control valve and spring brake valve **5** to relay valve **4**. This exhausts pressurized air **C** in the spring brake in rear brake chamber **2** through the exhaust port of the relay valve, causing the spring brake to generate braking force.
- Pushing in the knob of parking brake control valve **6** to the RELEASE position, feeds pressurized air from rear brake air tank **8** to relay valve **4** via the parking brake control valve.
  Consequently in the separate air system, pressurized air from the rear brake air tank is fed to the spring brake of rear brake chamber **2** via the relay valve, releasing the wheel parking brake.

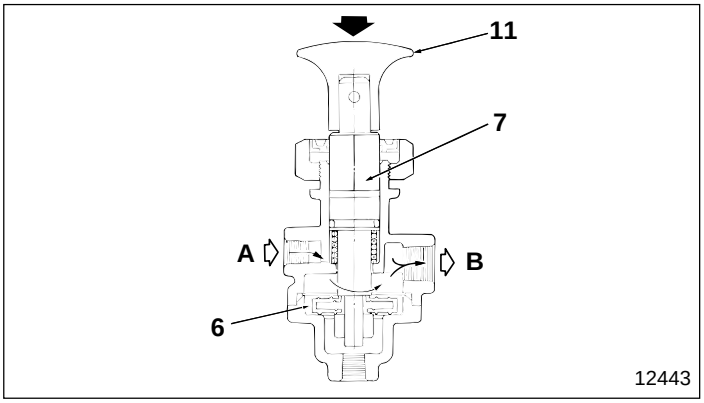
https://truckmanualshub.com/

Parking Brake Control Valve



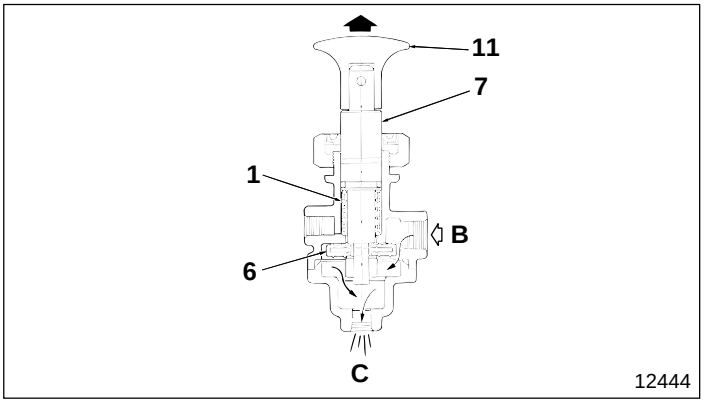
1 Plunger spring
2 Seal ring
3 Cover
4 Nut
5 Washer
6 Valve
7 Plunger
8 Body
9 Seal nut
10 Spring pin
11 Knob

● Feed action (RELEASE)



When the air pressure at feed port **A** reaches 420 kPa {61 lbf/in^2, 4.3 kgf/cm^2} or higher, pushing in knob **11** causes valve **6** at the top of plunger **7** to close the exhaust port, feeding pressurized air to exit port **B**.

● Exhaust action (PARK)



- Pulling out knob **11** causes valve **6** at the top of plunger **7** to open exhaust port **C**, and remains in that position, closing the supply port. This exhausts the air returned from exit port **B** through the air exhaust port.
- When the air pressure at the supply port drops to 275 kPa {40 lbf/in^2, 2.8 kgf/cm^2} or lower, the repercussive force of plunger spring **1** overcomes the air pressure acting on valve **6** pushing out knob **11** automatically. This exhausts the air through exit port **B**.

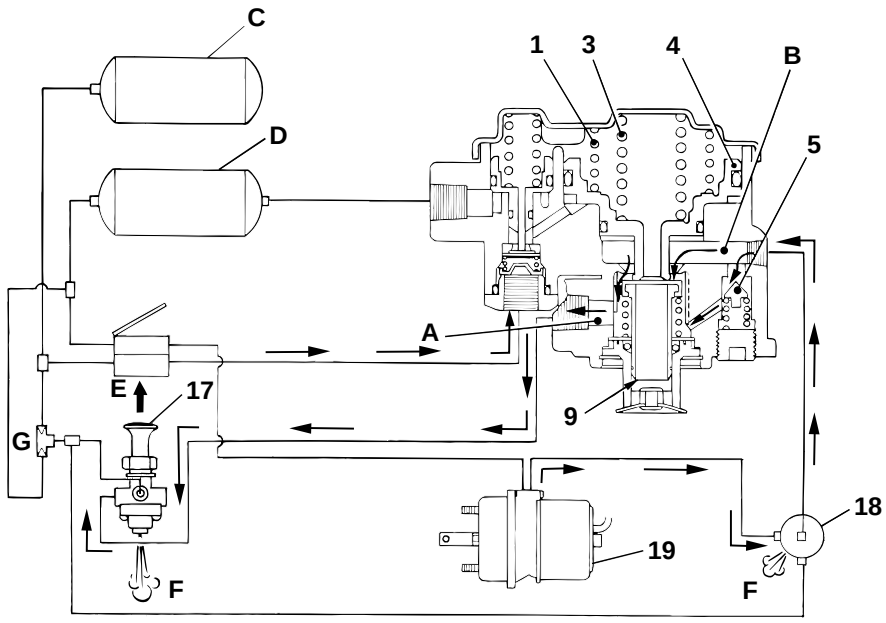
14 Valve
15 Piston
16 Piston spring
A : From rear brake air tank
B : To spring brake
C : From parking brake control valve
D : From front brake system

https://truckmanualshub.com/

● When parking brake is operated

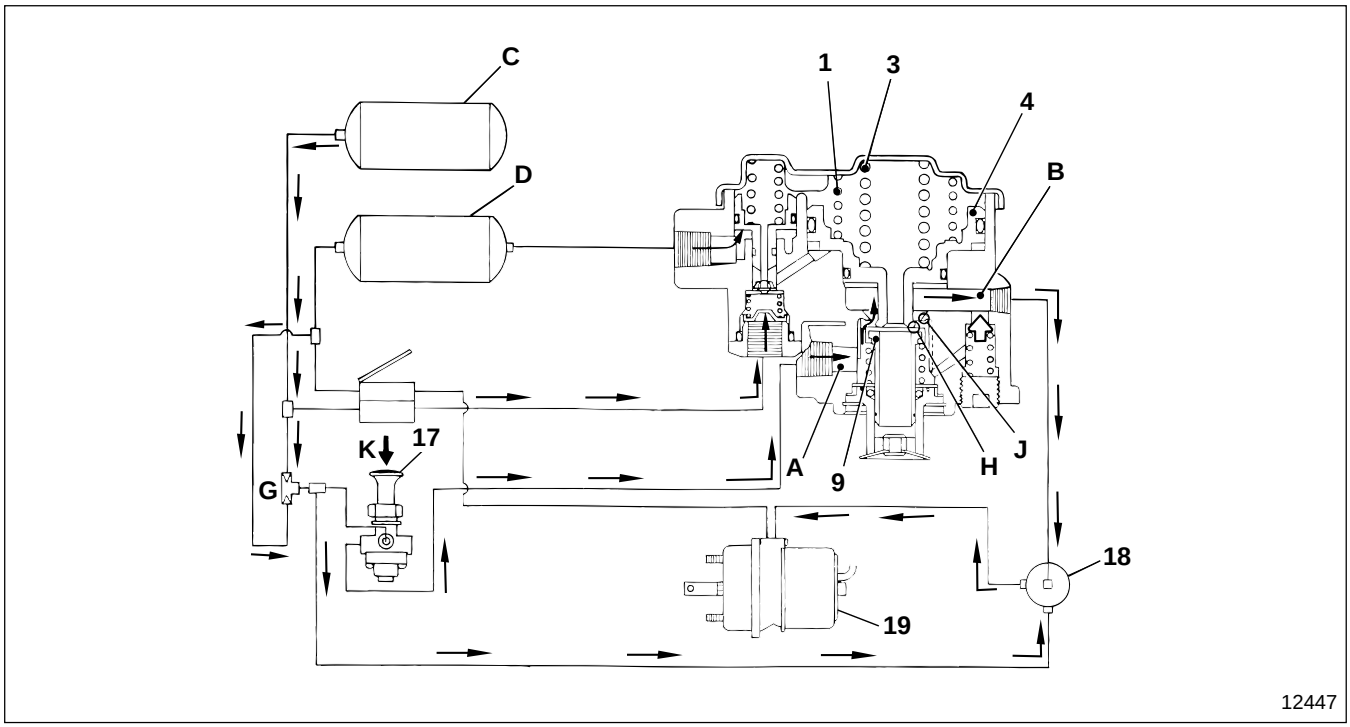


- Pulling out the knob of parking brake control valve **17** to PARK position **E**, exhausts the pressurized air in chamber **A** of the spring brake valve through the parking brake control valve. Then, the pressurized air in chamber **B** of the spring brake valve forces down check valve **5**, passes through chamber **A**, and is exhausted through the parking brake control valve.
- When the air pressure in chamber **B** of the spring brake valve drops sufficiently, springs **1**, **3** at the top of piston **4** force the piston down, opening inlet and exhaust valve **9**. This exhausts the pressurized air, which is fed to relay valve **18**, from the spring brake valve.
- Relay valve **18** exhausts the pressurized air from the spring brake in rear brake chamber **19** through the exhaust port.
- The spring brake of rear brake chamber **19** operates to generate braking force.

  C : Front brake air tank
  D : Rear brake air tank
  E : PARK position
  F : Pressurized air
  G : Double check valve

https://truckmanualshub.com/

● When parking brake is released



- Pushing in the knob of parking brake control valve **17** to RELEASE position **K**, causes the pressurized air to flow through chamber **A** of the spring brake valve to chamber **B**, then the pressurized air is fed to relay valve **18** as air pressure.
- As the air pressure in chamber **B** rises further, the rising force of piston **4** overcomes the repercussive force of springs **1**, **3**. This closes exhaust valve **H** of inlet and exhaust valve **9**, and at the same time lifts the piston and the inlet and exhaust valve together.
- As piston **4** and inlet and exhaust valve **9** rise further, the inlet and exhaust valve closes inlet valve **J**, isolating chambers **A** and **B** from each other, stopping the air flow between them.
- When it receives pressurized air, relay valve **18** feeds pressurized air in the separate air system to the spring brake, releasing the wheel parking brake.
  - **C**: Front brake air tank
  - **D**: Rear brake air tank
  - **G**: Double check valve
  - **K**: RELEASE position

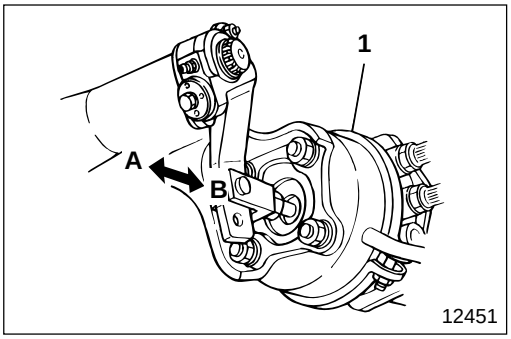
5	Friction surfaces of exhaust cover and inlet and exhaust valve	Silicon grease	As required
20, 24	O-ring groove and outer periphery of piston	Silicon grease	As required
27	Friction surfaces of body and piston	Silicon grease	As required
—	Periphery of O-ring	Silicon grease	As required

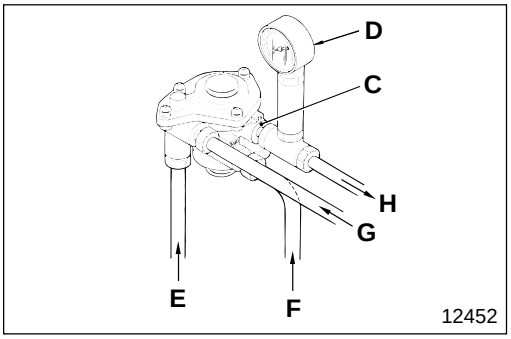
◆ Service procedure

● Inspection of operation after assembly

- Place wheel chocks at the rear wheels to prevent the vehicle from moving.
- Start the engine to raise the air pressure until the air pressure gauge reads 805 $^{+29}_{-20}$ kPa {115 $^{+4.3}_{-2.8}$ lbf/in^2, 8.2 $^{+0.3}_{-0.2}$ kgf/cm^2}.



- Confirm that when the knob of the parking brake control valve is pulled out to the PARK position, rear brake chamber **1** operates immediately, applying the wheel parking brake .
- Confirm that when the knob of the parking brake control valve is pushed in to the RELEASE position, rear brake chamber **1** operates, releasing the wheel parking brake.
  A : Applied
  B : Released

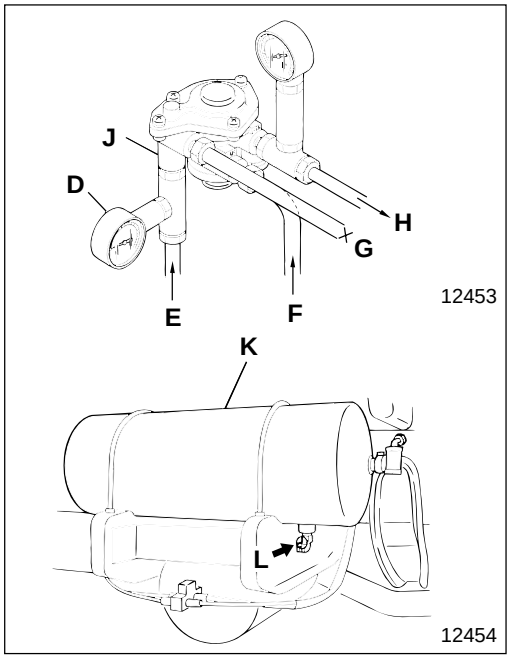


- Mount air pressure gauge **D** on delivery port **C** of the spring brake valve.
- Read air pressure gauge **D** when the knob of the parking brake control valve is pushed to the RELEASE position.
  Specified value: 65 kPa {951 lbf/in^2, 6.67 kgf/cm^2}
  E : From front brake system
  F : From parking brake control valve
  G : From rear brake air tank
  H : To spring brake of rear brake chamber

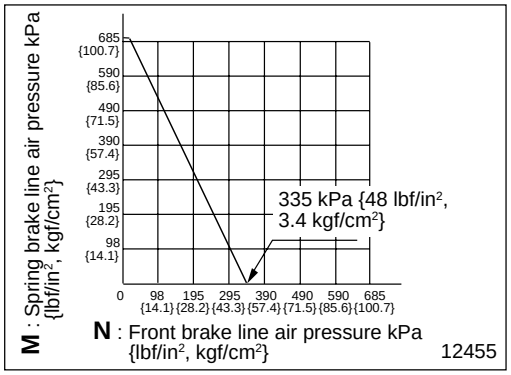
https://truckmanualshub.com/

SPRING BRAKE VALVE

- Confirm that when the knob of the parking brake control valve is pulled out to the PARK position, the reading of air pressure gauge **B** drops immediately to 0 kPa {0 lbf/in^2, 0 kgf/cm^2}. If the air pressure gauge indicator needle drops slowly, replace check valve **3**, since it is probably faulty.



- Mount air pressure gauge **D** on control port **J**.
- Push in the knob of the parking brake control valve to the RELEASE position and pull drain cock **L** to completely bleed tank **K** of the rear brake system.
  - **E** : From front brake system
  - **F** : From parking brake control valve
  - **G** : No pressurized air from rear brake air tank
  - **H** : To spring brake of rear brake chamber



- Have the brake pedal depressed several times and read the drop in the air pressure on both air pressure gauges **D** every time the brake is pressed to confirm that each value conforms to the specified value indicated on the performance curve diagram.
- Press the brake pedal several times to compress the air until rear brake chamber **1** operates on the wheel parking brake locking the rear wheels completely.

https://truckmanualshub.com/

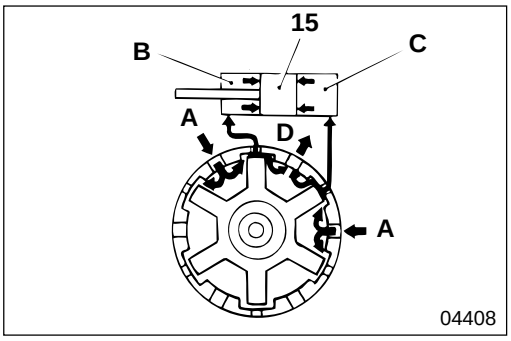
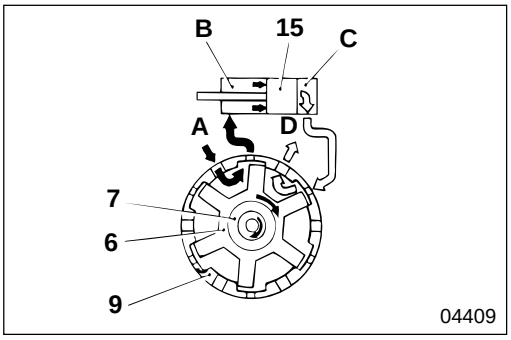
The rotary valve is the central part of the power steering booster. The torsion bar allows the steering reaction force and valve return to operate lightly and smoothly at low speed, and ensures stable steering feel even at high speed.



Straight-ahead operation

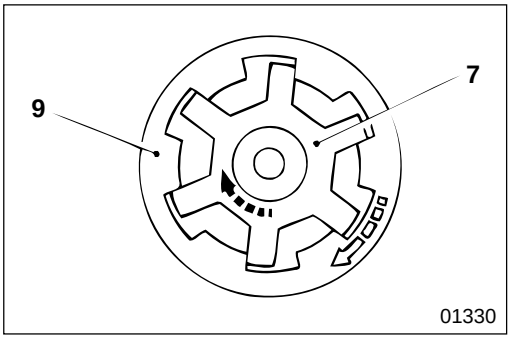
Piston **15** is in the neutral position as chambers **B** and **C** of the piston are under equal pressure.

A : From oil pump
D : To oil tank



Steering operation

Turning the steering wheel rotates stub shaft **7**, causing rotor **6** to close the fluid feed passage to cylinder chamber **C**. This produces a pressure difference between cylinder chambers **B**, **C**, which causes piston **15** to move, and facilitates rotation of worm shaft **9**.



If the hydraulic circuit fails

The safety mechanism allows the vehicle to be steered manually, when the rotating force of stub shaft **7** alone directly turns worm shaft **9**, transmitting the steering force.

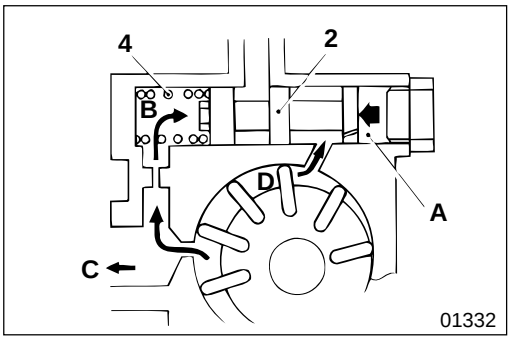
Flow Control Valve Assembly

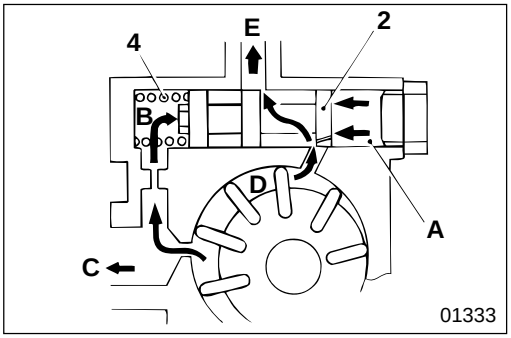


● **Operation of flow control valve**

(1) When not operating (When oil pump rotating at low speed)

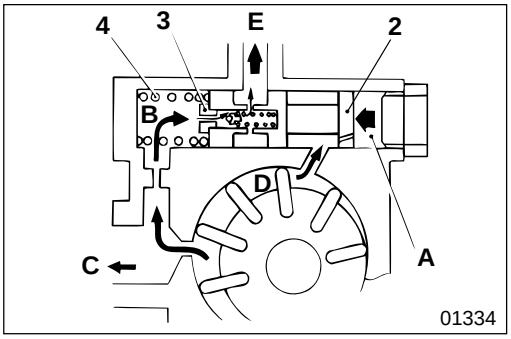
The fluid pressure from chamber **A** does not move flow control valve assembly **2** because the fluid pressure is lower than the combined force of the fluid pressure from chamber **B** and the repercussive force of flow control spring **4**.

C : To power steering booster
D : Pressure chamber



(2) When operating (When oil pump rotating at middle or high speed)

The fluid pressure from chamber **A** moves flow control valve assembly **2** because the fluid pressure is higher than the combined force of the fluid pressure from chamber **B** and the repercussive force of flow control spring **4**. Then, port **E** opens to release the fluid, maintaining the level of flow in chamber **A**.



● **Operation of relief valve**

The combined force of the fluid pressure from chamber **B** and the repercussive force of flow control spring **4** moves flow control valve assembly **2** because the fluid pressure is higher than the fluid pressure from chamber **A**. The fluid pressure in chamber **B** rises further to open relief valve **3** and port **E**, stabilizing the fluid pressure in chamber **B**.

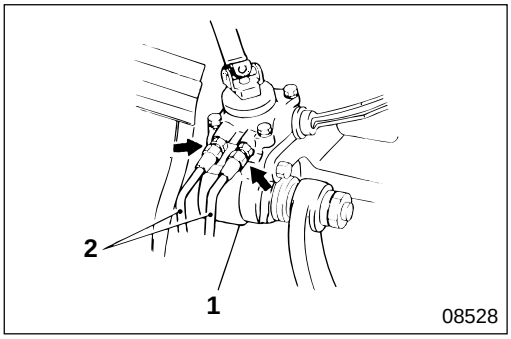
Change of Power Steering Fluid

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Oil pipe	66.69±12.75 {49±9.4, 6.8±1.3}	—



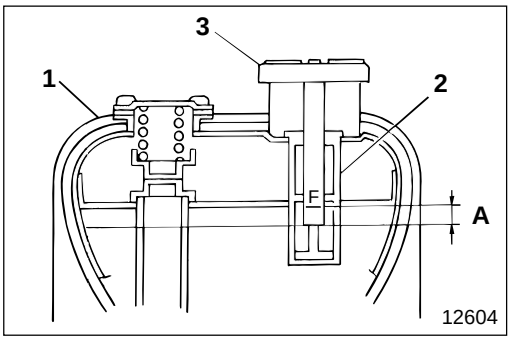
[Draining]
- Jack up the front wheels.
- Loosen oil pipe **2** connected to power steering booster **1**.
- Turn the steering wheel fully left and right repeatedly, and drain the fluid from power steering booster **1**.
- After draining the fluid, tighten oil pipe **2** at specified torque.

[Filling]
P37-13

Bleeding of Power Steering System

Fluid

Location	Points of application	Kinds	Quantity
1	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Filler cap dipstick between end and F



- Pour fluid into power steering oil tank **1** up to the inner port of strainer **2**.
- With the engine stopped, jack up the front wheels and turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.

NOTE

Check the fluid level without screwing on filler cap 3.

- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times to raise the fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise, bleeding is completed.
- When bleeding is finished, check fluid level of power steering oil tank **1**, and pipe and hose connections for fluid leaks.

https://truckmanualshub.com/

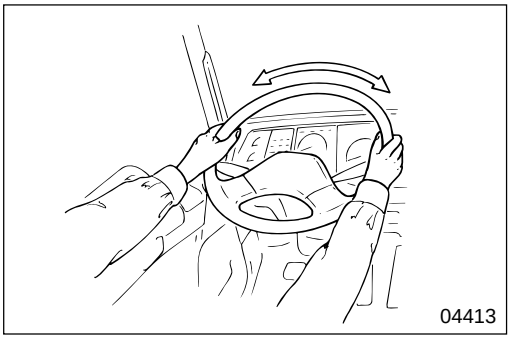
INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Steering Wheel Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Steering wheel play (Measure at the outer circumference of steering wheel)	10 to 40 {0.39 to 1.57}	—	Adjust



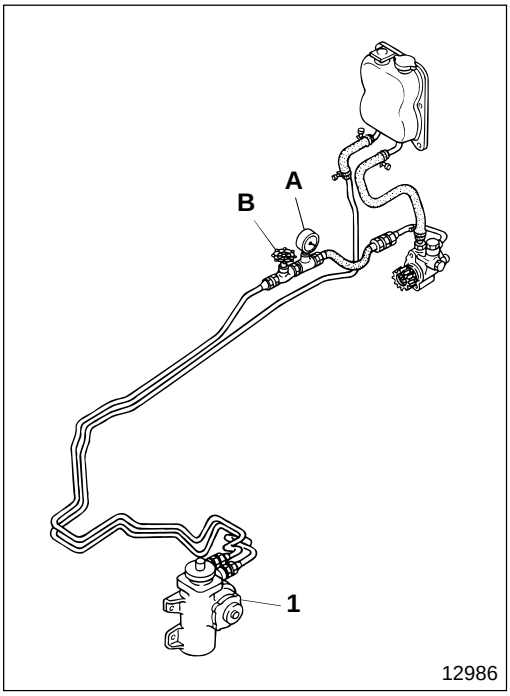
Point the wheels directly forward and gently turn the steering wheel left and right and measure the outer circumference play. If the play deviates from the standard value, adjust tightening points and power steering booster backlash. P37-27

https://truckmanualshub.com/

Performance Verification Test of Power Steering System

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Steering system fluid pressure (With hands off steering wheel)	490 kPa {71 lbf/in^2, 5 kgf/cm^2}	—	Repair
—	Relief set pressure (Measure with engine speed at 1000 to 1500 rpm and stop valve closed)	< FK617, FM617 >: 13.2 MPa {1920 lbf.ft, 135 kgf/cm^2}, < FM657 >: 12.3 MPa {1780 lbf.in^2, 125 kgf/cm^2},	Maximum +785 KPa {115 lbf/in^2, 8 kgf/cm^2} Minimum –1180 KPa {170 lbf/in^2, 12 kgf/cm^2}	Adjust or replace



Verify that the power steering booster and the power steering oil pump are operating properly by testing the following items.

NOTE

If the fluid pressure is higher than 490 kPa {71 lbf/in^2, 5 kgf/cm^2} with engine idling and the steering wheel free, inspect power steering booster 1 and fluid circuit for clogging.

Test item	Test procedure	Assembly standards
Verification of smooth operation	Jack up the front wheels and turn steering wheel fully left and right	Smooth operation throughout test
Measurement conditions	• Install oil pressure gauge **A** capable of measuring above 14.7 MPa {2130 lbf/in^2, 150 kgf/cm^2} and stop valve **B**, then bleed air • With engine idling, turn steering wheel left and right several times to raise fluid temperature to 50 to 60°C {122 to 140°F} • With the engine idling, open stop valve **B**	
Measurement of fluid pressure	Measure fluid pressure with hands off steering wheel	490 kPa {71 lbf/in^2, 5 kgf/cm^2}
Measurement of relief pressure	• Gradually increase engine speed and maintain it at 1000 to 1500 rpm, and close stop valve **B** to measure maximum fluid pressure • Do not keep stop valve **B** closed for more than fifteen seconds	Relief set pressure < FK617, FM617 >: 13.2 MPa {1920 lbf.in^2, 135 kgf/cm^2}, < FM657 >: 12.3 MPa {1780 lbf.in^2, 125 kgf/cm^2}

Lubricant

Location	Points of application	Kinds	Quantity
7	Contact area between combination switch and horn	Wheel bearing grease [NLGI No.2 (Li soap)]	As required
21	Supply via grease nipple after assembling spline	Chassis grease [NLGI No.1 (Ca soap)]	Supply until grease overflows from grease escape hole
22	Spline	Chassis grease [NLGI No.1 (Ca soap)]	As required

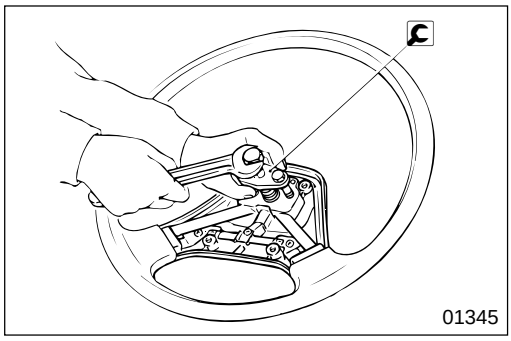
https://truckmanualshub.com/

Special tools

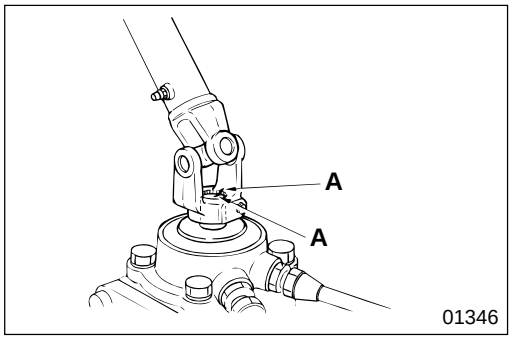
Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
3	Steering wheel puller 	MH062421	Removal of steering wheel

◆ Service procedure

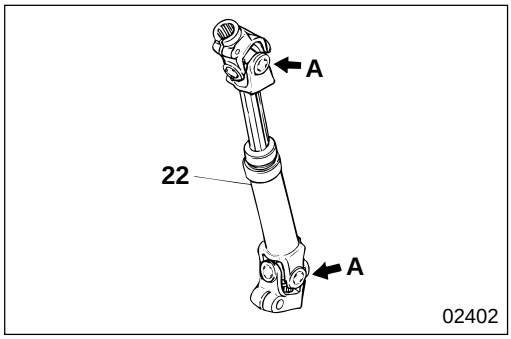


3 **Removal of steering wheel**



18 **Removal of steering shaft assembly**

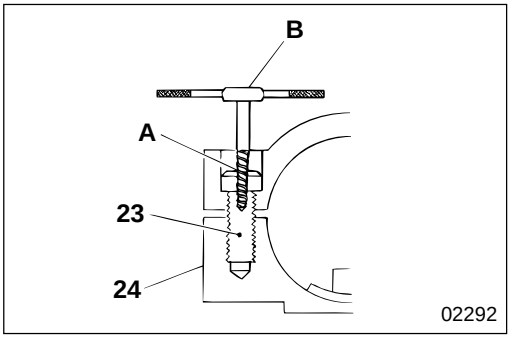
A : Alignment mark



22 **Steering lower shaft assembly**

When the spline of steering lower shaft assembly **22** has been disconnected, align marks **A** on the yokes to face the same direction.

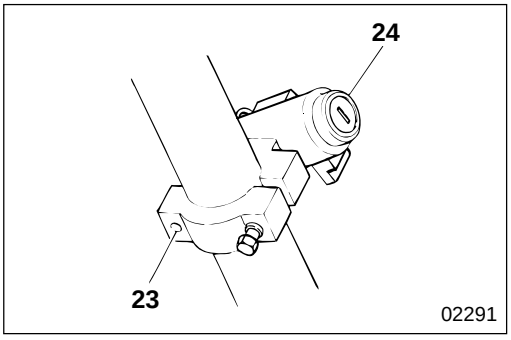
https://truckmanualshub.com/



24 **Starter switch**

[Removal]

- Grip one end of the column in a vise, then drill a ø5.5 to 6 mm {0.22 to 0.24 in.} hole 10 to 15 mm {0.39 to 0.59 in.} deep in surface **A**, where the head was cut off, of head cutting bolt **23** for mounting starter switch **24**.
- Screw in screw extractor **B** counterclockwise, then remove head cutting bolt **23** from the steering column.



[Installation]

- Tighten new head cutting bolt **23** at specified torque to cut the head off the bolt.
- Check the steering lock mechanism after installation.

◆ Service procedure

● **Work before disassembly**

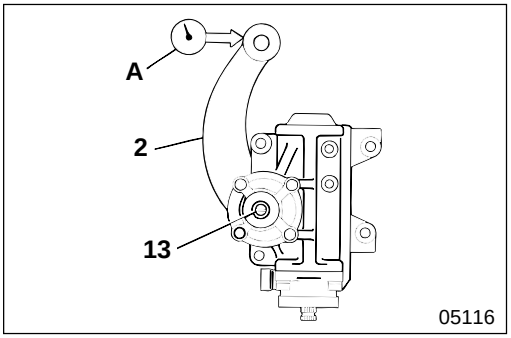
Move pitman arm **2**, and align slit **A** of the V-groove of sector shaft **14** to the center of body **50** so that the gears are in neutral position.

https://truckmanualshub.com/

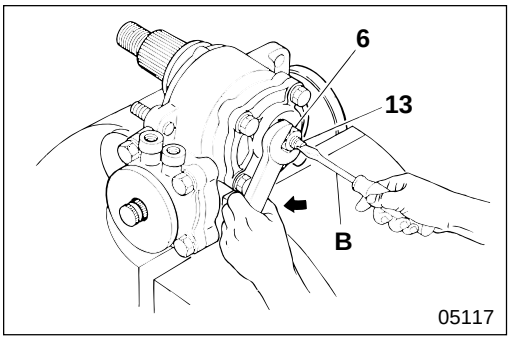


● **Adjustment after assembly**

Adjustment of backlash

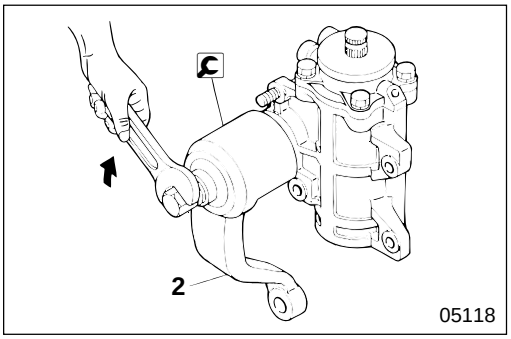
- (Carry out this work with the gears in neutral position.)
  Measure play at the end of pitman arm **2** with dial gauge **A**, and adjust adjusting screw **13** so that reading meets the standard value.

Measuring load : < FK617, FM617 > ±15 N {3.3 lbf, 1.5 kgf}
< FM657 > ±20 N {4.4 lbf, 2 kgf}



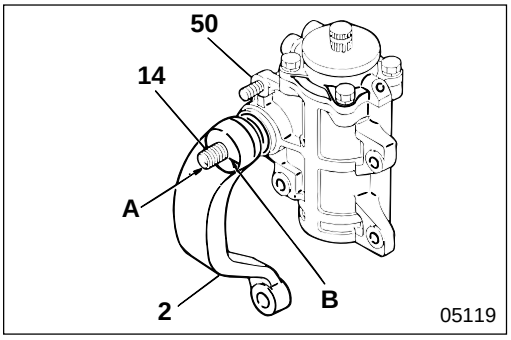
Tightening nut

- After adjusting backlash, apply sealer to thread area of adjusting screw **13**. Hold it in place with screwdriver **B** and tighten nut **6** at specified torque.



2 Pitman arm

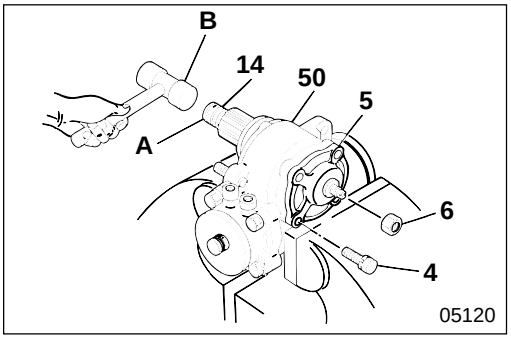
[Removal]



[Installation]
Align slit **A** of the V-groove of sector shaft **14** to the center of body **50**, and align slit **B** of the V-groove of pitman arm **2** on the same line.

NOTE

Have pitman arm 2 make a full stroke of the piston to make sure that the piston moves smoothly.



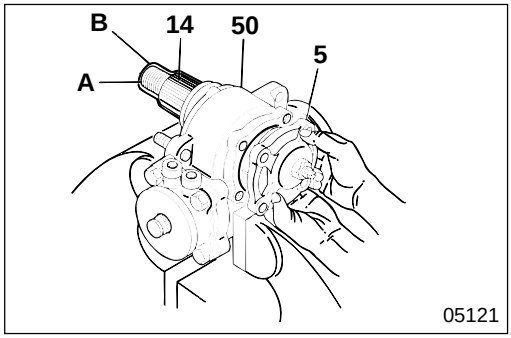
5 Sector shaft assembly and side cover assembly

[Removal]

- Make sure that the piston is in the neutral position (slit **A** of the V-groove at one end of sector shaft **14** is aligned with the center of body **50**).
- Tap the end of sector shaft **14** and pull out sector shaft assembly and side cover assembly **5**.
  B : Plastic-headed mallet

https://truckmanualshub.com/

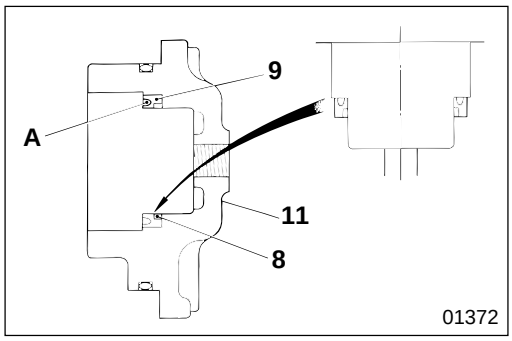
POWER STEERING BOOSTER



[Installation]
Position sector shaft **14** of sector shaft assembly and side cover assembly **5** so that slit **A** of its V-groove is aligned with the center of body **50**, and the piston gear and sector shaft gear engage at their centers.

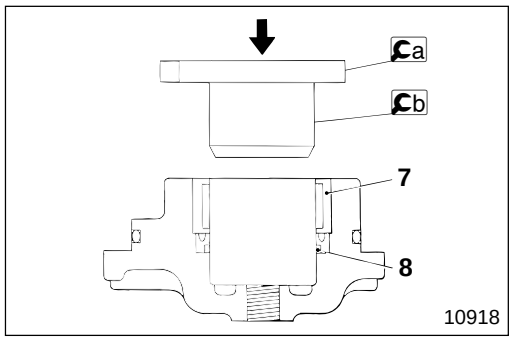
CAUTION

Before installation, apply tape B to the Y-packing to prevent it being damaged by the threads of sector shaft 14.

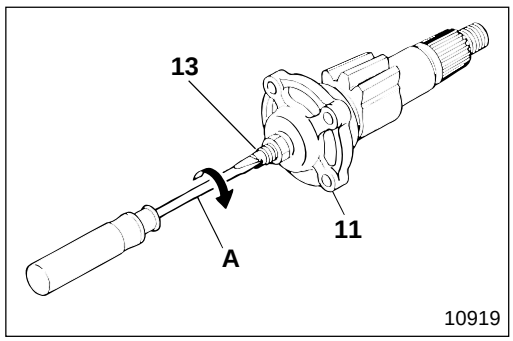


8 **9** **Backup ring, Y-packing**

[Installation]
- Install Y-packing **9** into side cover **11** in the direction as illustrated.
- After installing backup ring **8**, pack groove **A** of Y-packing **9** with grease.



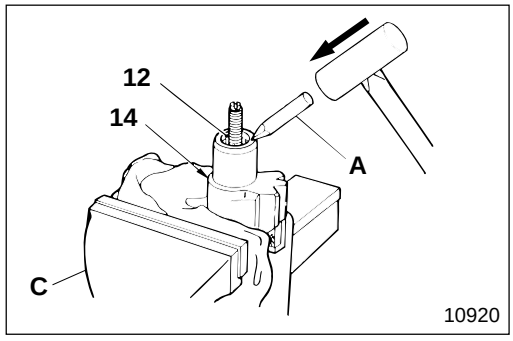
- After installing needle bearing **7** into backup ring **8**, form the bent up part of the backup ring using a insert tool assembly and b insert tool.



11 **Removal of side cover**

Screw in adjusting screw **13** and remove side cover **11.**

A : Screwdriver



12 **Retainer**

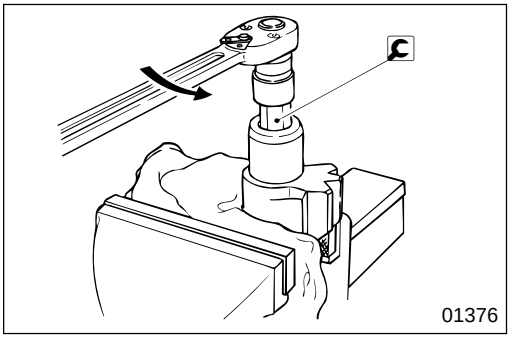
Disassemble sector shaft **14**, as follows, only if it is faulty :
[Removal]
- Pry up (2 points) of retainer **12**.

A : Chisel

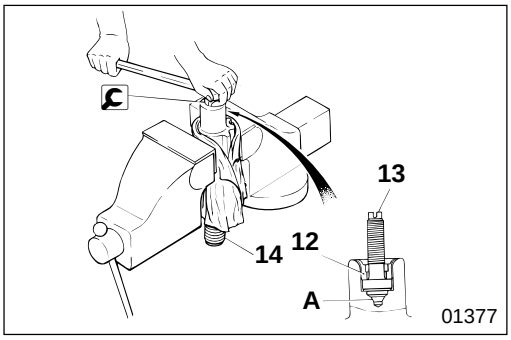
CAUTION

Make sure you use a cloth when you grip sector shaft 14 in vise C to prevent damage.

https://truckmanualshub.com/

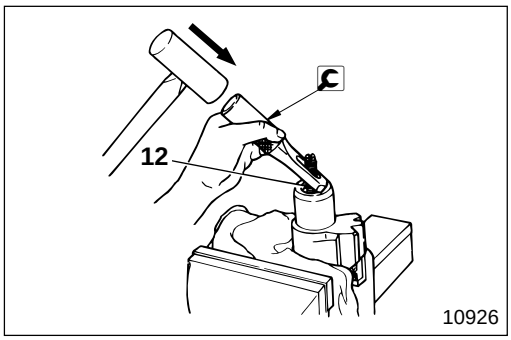


- Remove retainer **12** using [C] bar.

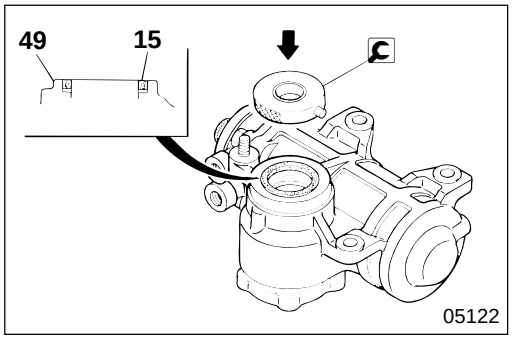


[Installation]

- Pack adjusting screw **13** mounting hole **A** of sector shaft **14** with grease.
- Install adjusting screw **13** into sector shaft **14**.
- Install retainer **12** into sector shaft **14** using [C] bar.
- After installation, slacken off by 180°, retighten at 39 N·m {29 lbf.ft, 4 kgf·m}, then slacken off by 20°.
- Make sure that adjusting screw **13** turns smoothly.

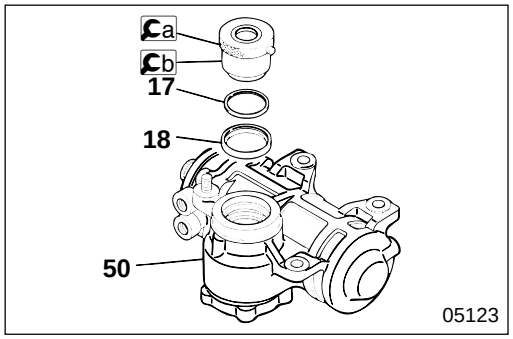


- After installing retainer **12**, caulk the retainer (2 points) using [C] squeeze tool.



15 Installation of oil seal

Install oil seal **15** into body **50** in the direction as illustrated.

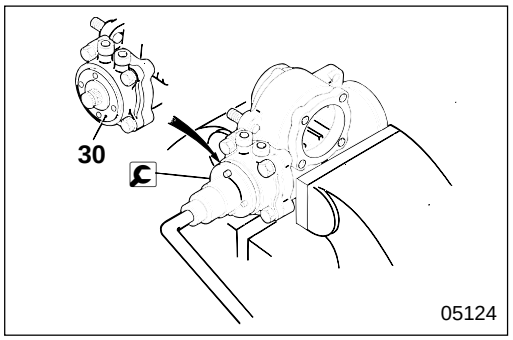


17 18 Installation of backup ring and Y-packing

- Install Y-packing **18** and backup ring **17** to body **50**.
- Pack the groove of Y-packing **18** with grease.
- Form the shape of backup ring **17** using [Ca] insert tool assembly and [Cb] insert tool.

https://truckmanualshub.com/

POWER STEERING BOOSTER



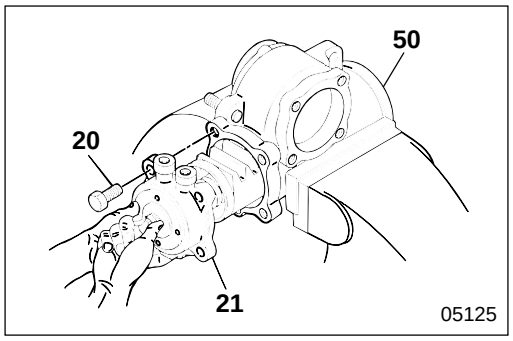
21 **Ball screw assembly**

[Removal]

- Loosen adjusting plug assembly **30** by approximately 180° using wrench assembly.

CAUTION

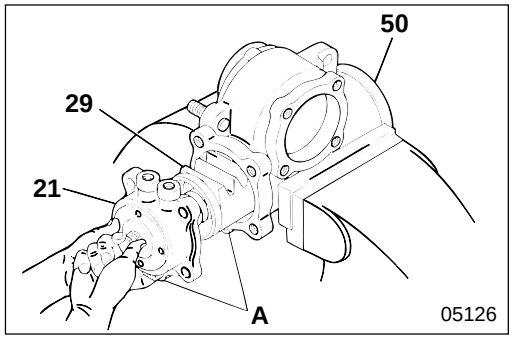
Make sure you only loosen adjusting plug assembly 30, do not undo it completely because the bearing inside the valve housing might spring out.



- Loosen bolt **20** and remove ball screw assembly **21** from body **50**.

CAUTION

- **Make sure that the balls of the ball screw do not spring out.**
- **Be careful not to damage the piston or the interior of body 50.**



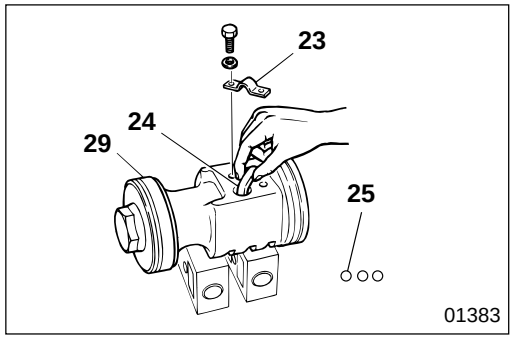
[Installation]

- Install ball screw assembly **21** into body **50**, holding piston **29** so it will not turn.

CAUTION

Be careful not to damage the piston seal ring or the interior of body 50.

- Align oil passage ports **A** of ball screw assembly **21** and body **50**, then tighten.

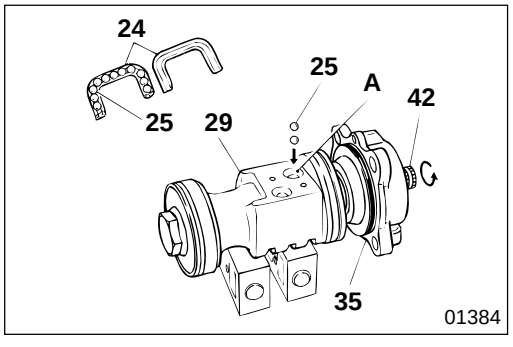


24 **25** **Ball tube and steel ball**

First remove steel balls **25** from piston **29** and place them in the receiving tray, remove ball clip **23**, grip ball tube **24** with your fingers and pull it out gently.

CAUTION

Be careful not to loose any steel balls 25.
< FK617, FM617 (×30) >
< FM657 (×32) >



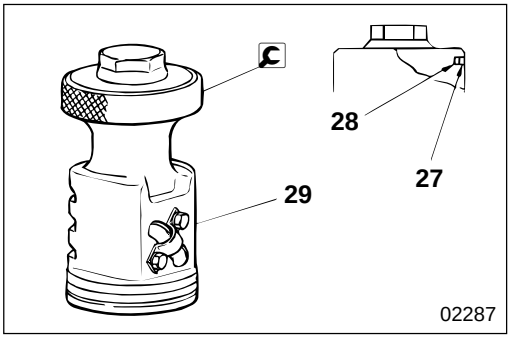
[Installation]

- Pack the interior of ball tube **24** with grease, lay 10 or 11 steel balls **25** in place, then mount the other side of the ball tube.
- Place piston **29** on a level surface, align assembled worm shaft assembly and valve housing assembly **35** and the piston ball race, then drop steel balls **25** through ball tube hole **A** while turning stub shaft **42**.

CAUTION

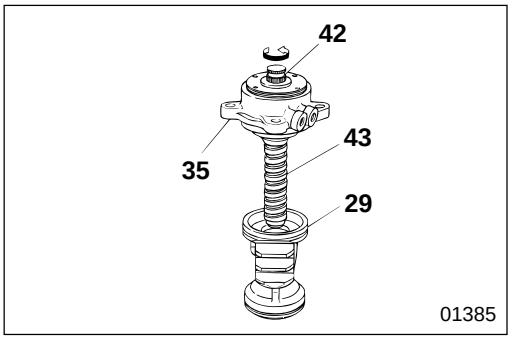
Make sure that you do not pull out worm shaft assembly and valve housing assembly 35 too far, or steel balls 25 will drop out of the ball race.

https://truckmanualshub.com/



27 **28** **Installation of O-ring and seal-ring**

Install O-ring **28** and seal ring **27** in the outside grooves of piston **29**, then form the shape of the seal ring with 🔧 inserting tool.



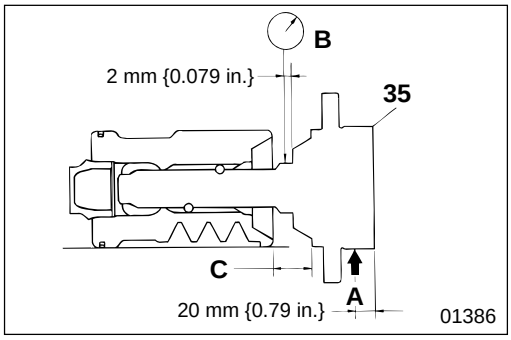
29 **Piston**

[Removal]

Holding worm shaft assembly and valve housing assembly **35** so that piston **29** is at the bottom, turn stub shaft **42** and remove the piston.

CAUTION⚠

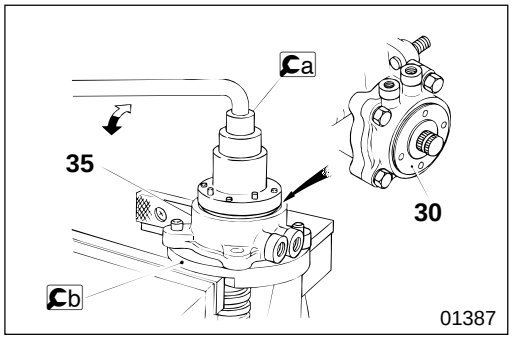
Be careful not to tilt piston 29 when you do this, otherwise steel balls 25 in the races of the piston and worm shaft 43, will drop into the piston.



[Inspection]

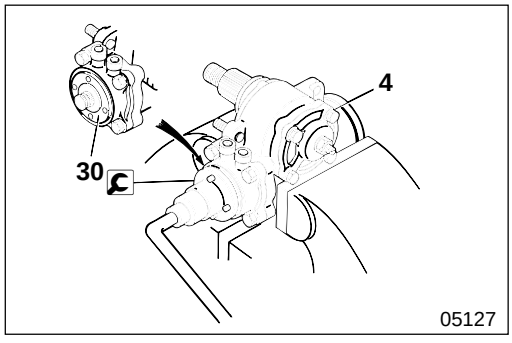
Measure side play (play in axial direction) **B** of worm shaft assembly and valve housing assembly **35** when 49 N {11 lbf, 5 kgf} is applied to **A** as illustrated.

C :	< FK617 >	30.45 mm {1.20 in.}
	< FM617 >	30.24 mm {1.19 in.}
	< FM657 >	42.8 mm {1.69 in.}



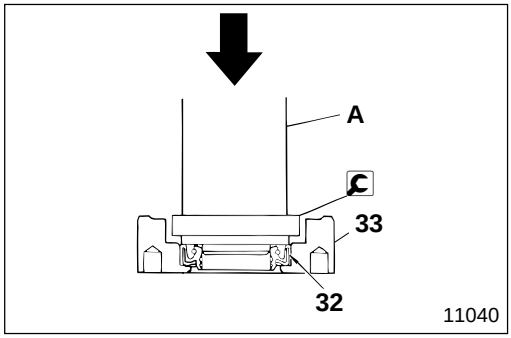
30 **Installation of adjusting plug assembly**

- After tightening adjusting plug assembly **30** of worm shaft assembly and valve housing assembly **35** at specified torque, slacken off by approximately 180°.



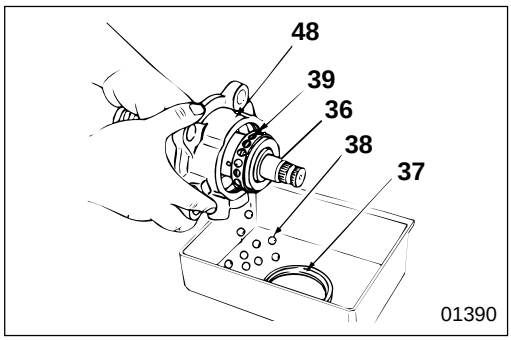
- Tighten bolt **4** at specified torque, then retighten adjusting plug assembly **30** at specified torque using 🔧 wrench assembly.

https://truckmanualshub.com/



32 **Installation of oil seal**

Install oil seal **32** into adjusting plug **33** in the direction as illustrated.
A : Hand press



36 **Worm shaft assembly**

[Removal]
Push out worm shaft assembly **36** from valve housing **48** by pushing out the side of the worm shaft assembly where the piston is assembled.

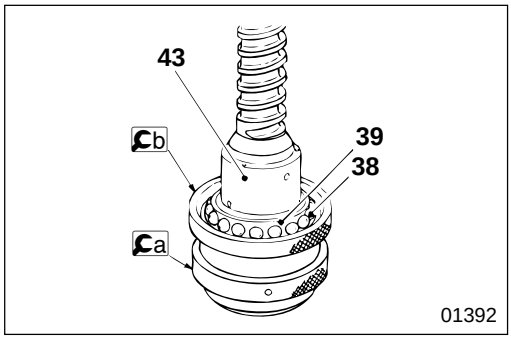
NOTE

Have a tray or box ready to catch side race 37, steel balls 38, and bearing cage 39 as these items separate on removal.

[Installation]

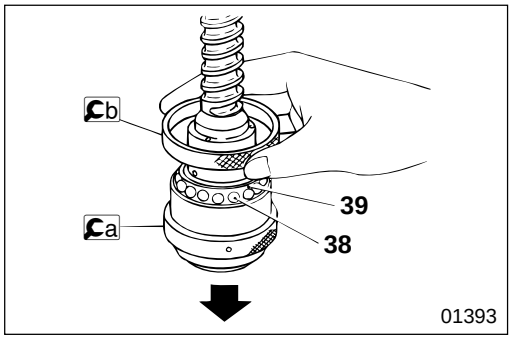
CAUTION

Be careful that worm shaft assembly 36 ball race does not damage seal ring 44.



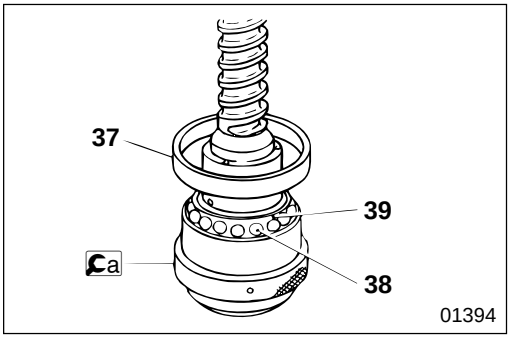
37 **to** **39** **Installation of side race, steel ball, and bearing cage**

- Install b guide assembly on a tool assembly, and insert worm shaft **43** in the direction as illustrated.
- Assemble bearing cage **39** and steel balls **38** on worm shaft **43**.

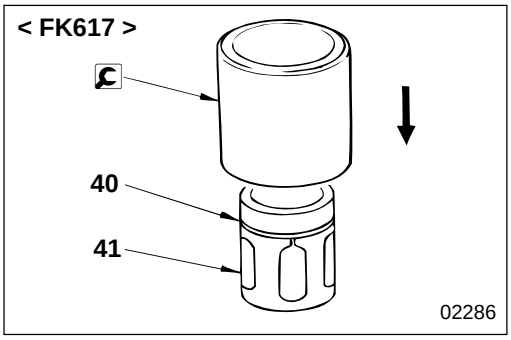


- Hold down b with your hand and slide a downward, so that you can position steel balls **38** as specified.

https://truckmanualshub.com/

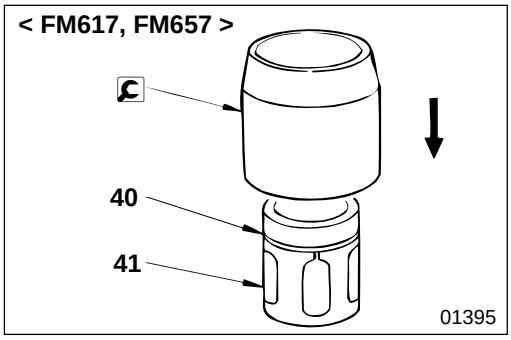


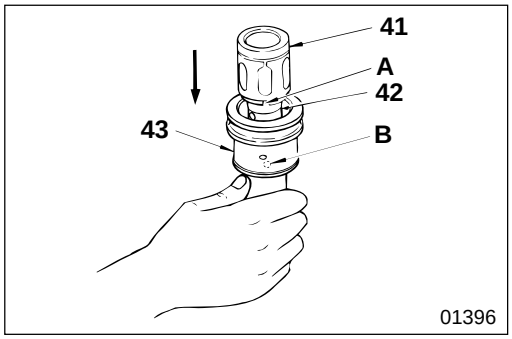
- Install side race **37** on top of steel balls **38** and bearing cage **39**.



40 **Installation of seal ring**

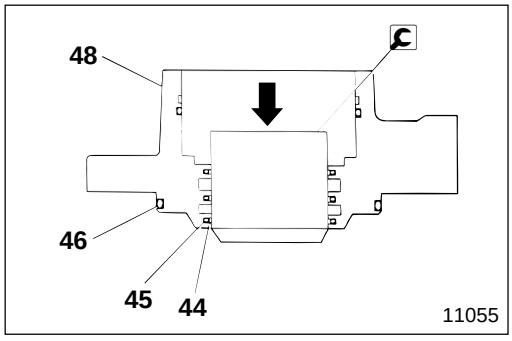
- Install seal ring **40** onto rotor **41**.
- Form seal ring **40** using insert tool.





41 **Installation of rotor**

Install rotor **41** between stub shaft **42** and worm shaft **43** so that indent **A** of the rotor fits positioning pin **B** of the worm shaft.



44 **to** **46** **Installation of seal ring and O-ring**

- Install seal ring **44** and O-rings **45**, **46** into valve housing **48**.
- Form seal ring **44** using insert tool.

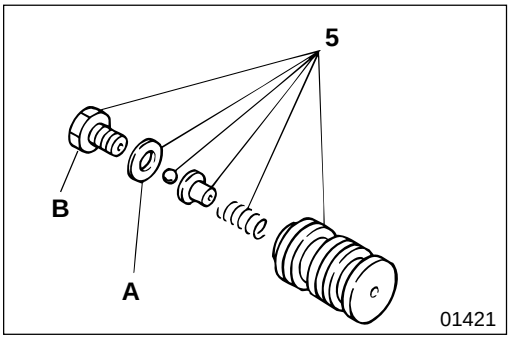
* JIDOSHA KIKI part No.



◆ Service procedure

5 Adjustment of flow control valve assembly

When you reassemble flow control valve assembly **5**, adjust the assembly so that the relief pressure conforms to the standard value. Do this with shim **A**. The thick shim lowers pressure, and the thin shim increases pressure.
After adjustment, tighten relief valve **B** at specified torque.

Shim thickness	Pressure variation
0.5mm {0.020 in.}	Approximately 1310 kPa {190 lbf/in², 13.4 kgf/cm²}
0.2mm {0.0079 in.}	Approximately 520 kPa {75 lbf/in², 5.3 kgf/cm²}

P37-15

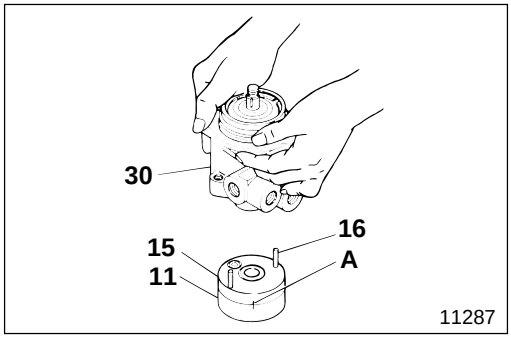
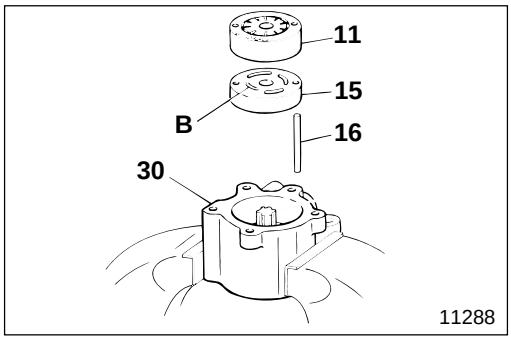
POWER STEERING OIL PUMP



11 **Removal and installation of cartridge assembly**

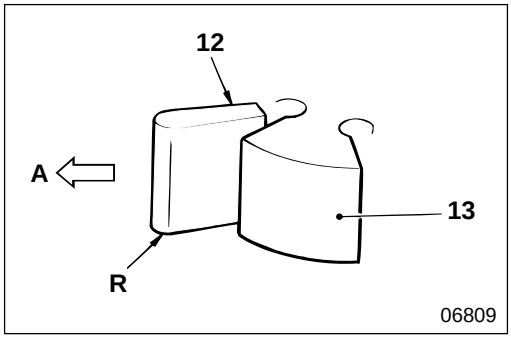
[Removal]

- Remove cartridge assembly **11**, pressure plate **15** and straight pin **16** together from front body **30**.
- Put alignment marks **A** around the outer circumferences of cartridge assembly **11** and pressure plate **15**.



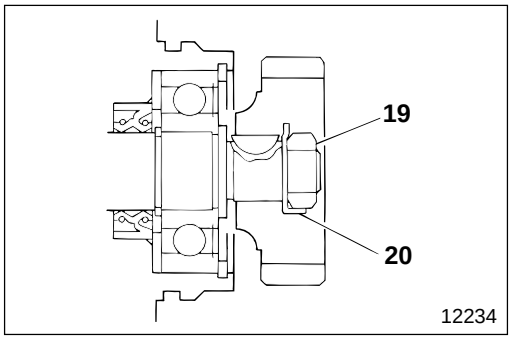
[Installation]

- Install straight pin **16** into front body **30**.
- Install pressure plate **15** onto front body **30**, so that groove **B** of the pressure plate faces the direction as illustrated.
- Align cartridge assembly **11** with straight pin **16**, then install the cartridge assembly.



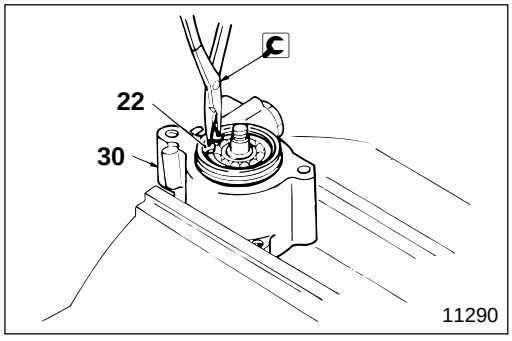
12 **Installation of vane**

With point **R** of vane **12** facing outside **A**, install it into rotor **13** and make sure that the vane moves smoothly. If it is faulty, replace the cartridge assembly.



20 **Installation of lock washer**

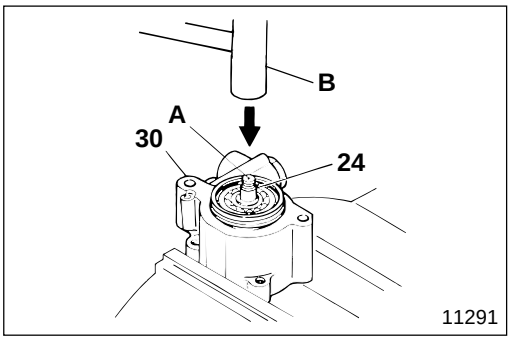
After installing nut **19**, bend up one lug on the circumference of lock washer **20**.



22 **Removal of retaining ring**

Remove retaining ring **22** using pliers.

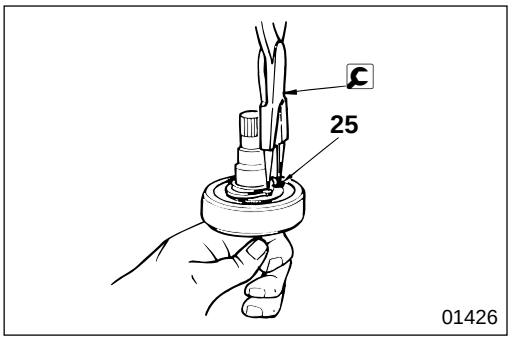
https://truckmanualshub.com/



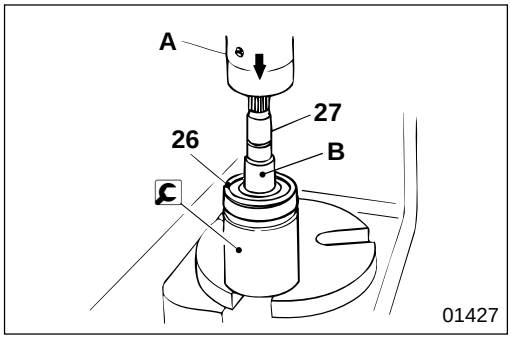
24 **Installation of drive shaft assembly**

If it is hard to install drive shaft assembly **24** in the correct position of front body **20** by hand, tap the shaft to install it.

B : Plastic-headed mallet



25 **Removal of retaining ring**



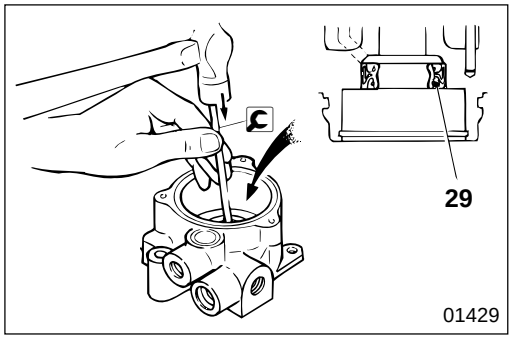
26 **Removal and installation of ball bearing**

Remove ball bearing **26** from shaft **27** using press-fitting tool. **A** : Hand press

For installation, follow the removal sequence in reverse.

CAUTION

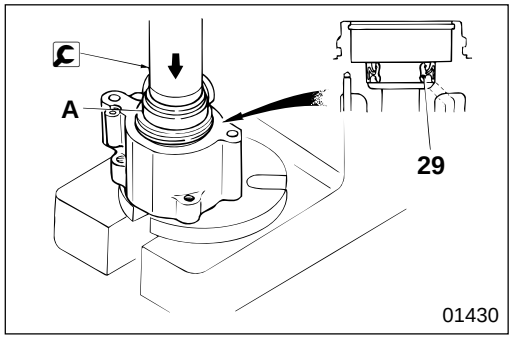
Be careful not to damage oil seal contact surface B.



29 **Oil seal**

[Removal]

Remove oil seal **29** using stick.



[Installation]

Install oil seal **29** in the direction as illustrated using press-fitting tool.

A : Hand press

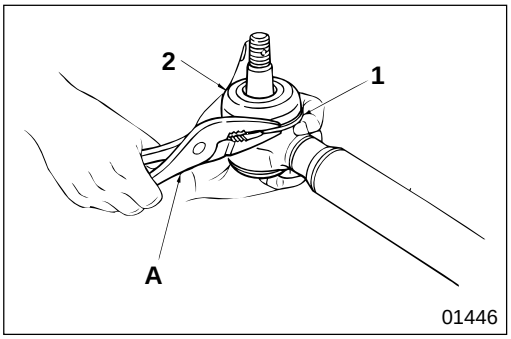
◆ Service procedure



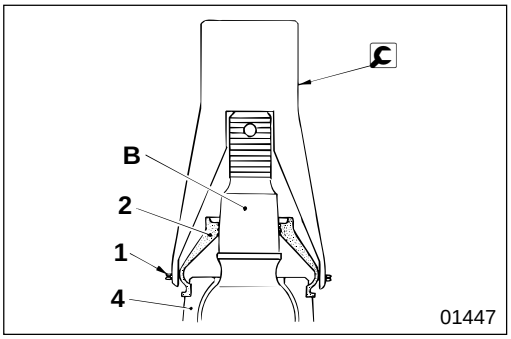
1 Clip <FK617 >

A : Long nose pliers

[Removal]

CAUTION

- **Be careful not to damage clip 1 or dust cover 2 when you remove the clip.**
- **If clip 1 is deformed, do not reuse it.**

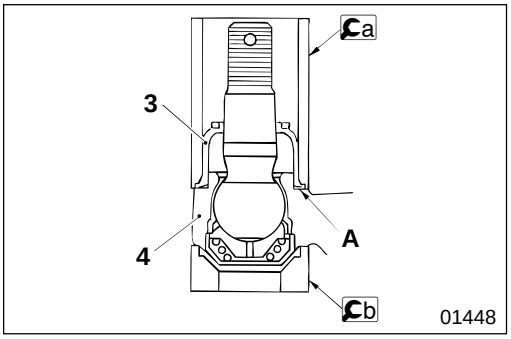


[Installation]

- Position the assembly so ball stud **B** is vertical.
- Place [C] clip guide on drag link **4**.
- Install clip **1** into the groove of dust cover **2**.

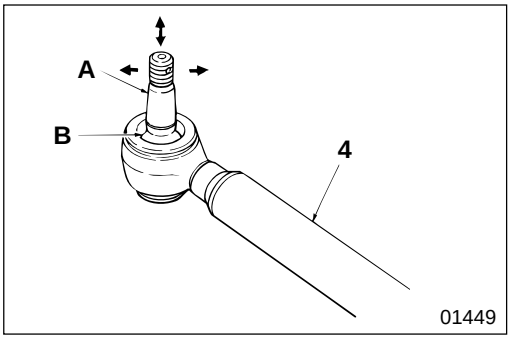
CAUTION

- **Be careful that [C] clip guide end does not dig into dust cover 2.**
- **Be especially careful that clip 1 end does not damage dust cover 2.**



3 Installation of dust cover < FM617, FM657 >

- Place dust cover **3** on drag link **4**.
- Hold drag link **4** between [Ca] dust cover installer and [Cb] end cover.
- Using a vise, press-fit dust cover **3** onto drag link **4** so as the dust cover is perpendicular to the drag link, and reinforcing ring **A** is in close contact with the drag link.



4 Inspection of drag link

Move ball stud area **A** of drag link **4** vertically and horizontally to make sure that there is no play. Also, check that ball section **B** moves evenly. If any fault is found, replace the tie rod assembly.

https://truckmanualshub.com/

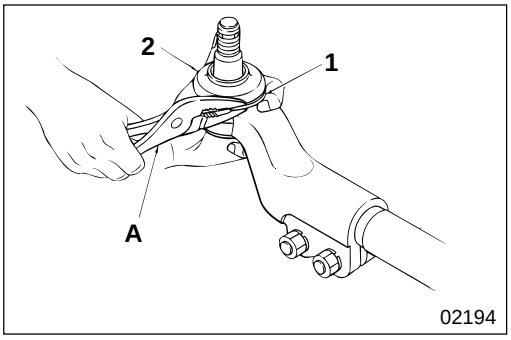
Location	Tool name and shape	Part No.	Application
1	Clip guide 	< FK617 > MH061831	Installation of clip
2	Dust cover installer A: MH061828 ø60.3 {2.37}, MH061827 ø65 {2.56} B: MH061828 ø45 {1.77}, MH061827 ø51 {2.01} C: MH061828 80 {3.15}, MH061827 ø100 {3.94} 	< FM617 > MH061828 < FM657 > MH061827	Installation of dust cover
	End holder A: MH061830 ø60 {2.36}, MH061829 ø64 {2.56} B: MH061830 ø50.5 {1.99}, MH061829 ø55.7 {2.19} 	< FM617 > MH061830 < FM657 > MH061829	

◆ Service procedure



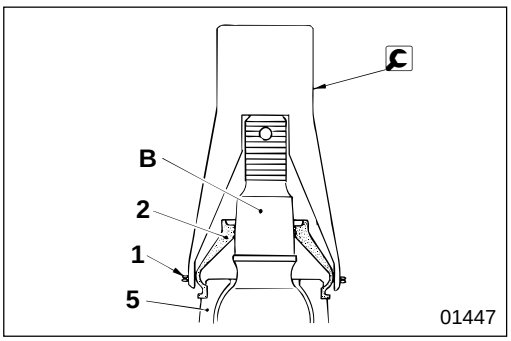
1 Clip < FK617 >

[Removal]

A : Long nose pliers

CAUTION

- **Be careful not to damage clip 1 or dust cover 2 when you remove the clip.**
- **If clip 1 is deformed, do not reuse it.**



[Installation]

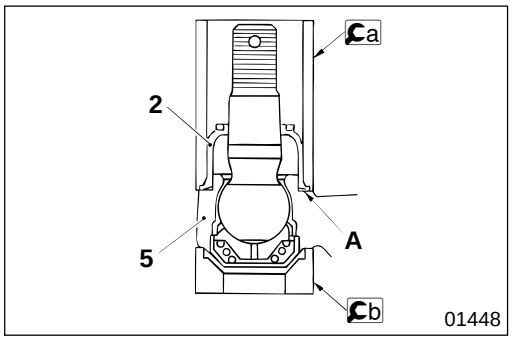
- Position the assembly so ball stud **B** is vertical.
- Place clip guide on tie rod end assembly **5**.
- Install clip 1 into the groove of dust cover **2**.

CAUTION

- **Be careful that clip guide end does not dig into dust cover 2.**
- **Be especially careful that clip 1 end does not damage dust cover 2.**

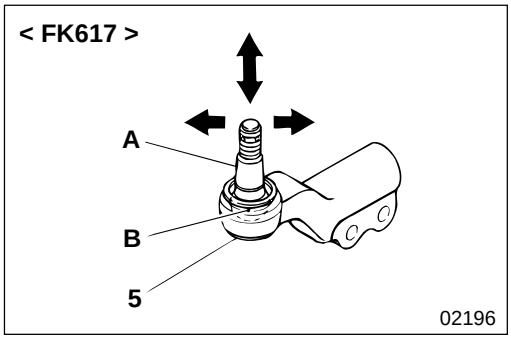
https://truckmanualshub.com/

TIE ROD ASSEMBLY



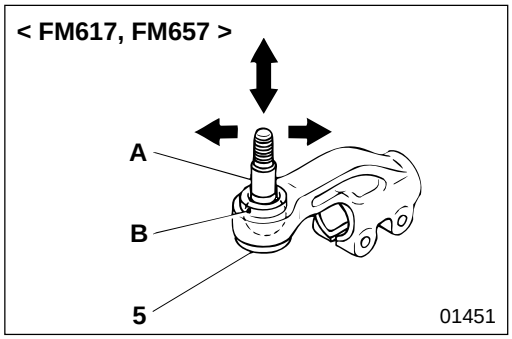
2 **Installation of dust cover < FM617, FM657 >**

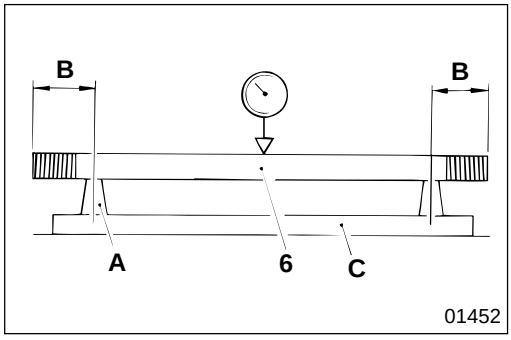
- Place dust cover **2** on tie rod end assembly **5**.
- Hold tie rod end assembly **5** between a dust cover installer and b end cover.
- Using a vise, press-fit dust cover **2** onto tie rod end assembly **5** so as the dust cover is perpendicular to the tie rod end assembly, and reinforcing ring **A** is in close contact with the tie rod end assembly.



5 **Inspection of tie rod end assembly**

Move ball stud area **A** of tie rod end assembly **5** vertically and horizontally to make sure that there is no play. Also, check that ball section **B** moves evenly. If any fault is found, replace the tie rod end assembly.





6 **Bend of tie rod**

Measure the bend of tie rod **6** at the center point. If the measured value exceeds the limit, correct or replace the tie rod.

NOTE

To measure the deflection of tie rod 6, turn it one full rotation and read the dial gauge indicator. The deflection is one half of the indicated value.

A : V-block
B : Approximately 300 mm {11.8 in.} < FK617 >
Approximately 250 mm {9.84 in.} < FM617, FM657 >
C : Surface plate

◆ Service procedure

● Cleaning of frame

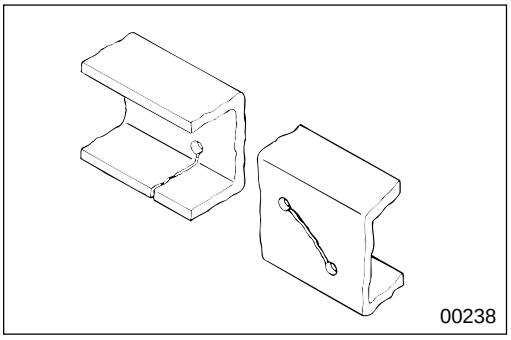
Carefully remove mud, grease, rust, etc. that is stuck to the outer and inner surfaces of the frame.

● Inspection for frame deformation

If any fault such as deformation is found, repair the frame.

● Inspection for cracks in frame

- Remove paint from any areas that are seemingly faulty and carefully inspect.
- If visual inspection is difficult, inspect using color contrast penetrant examination or other methods.
  If a crack is found, repair as follows.

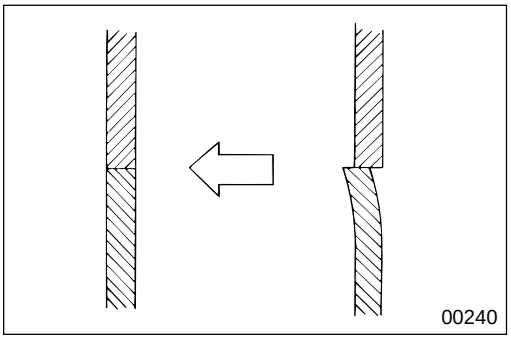


● Repair of crack in frame

- With the vehicle unloaded, level the frame.
- Drill a hole, about twice the thickness of the frame, 10 mm {0.39 in.} from the end of the crack.

NOTE

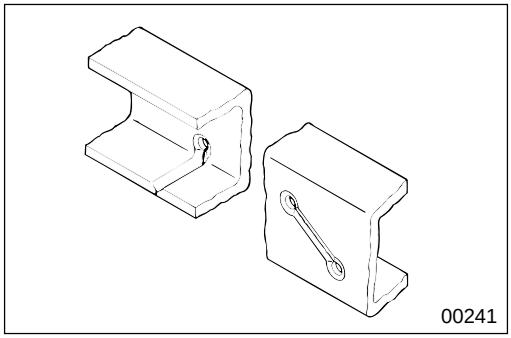
If a crack is found inside the frame, drill holes at both ends of the crack.

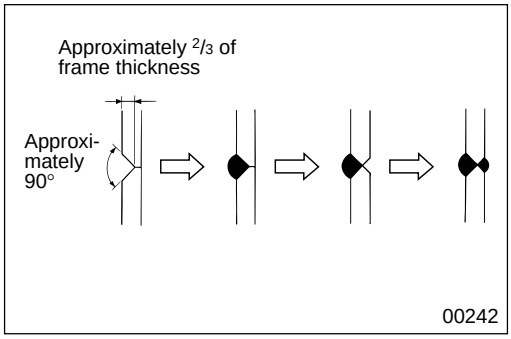


- If the edges of the crack are not flush, make them flush with each other.

https://truckmanualshub.com/

INSPECTION AND REPAIR OF FRAMES





- Using a grinder, etc., grind a 90° V-section channel, two-thirds of the frame thickness, then weld.

WARNING

You must cover any inflammable materials, such as pipelines, wiring harnesses, rubber parts, and the fuel tank, that are near the welding site.

CAUTION

- **Do not use gas welding because the high temperature produced alters the material properties and weakens the welded area. Be sure, therefore, to use electric welding.**
- **Be sure to remove the negative terminal of the battery, then ground the welder near the area to be welded to prevent reversed flow of current from the welder which might burn out electrical components.**
- **Be sure to protect mountings such as main sills that can be damaged by heat, by using heat insulators, etc.**

NOTE

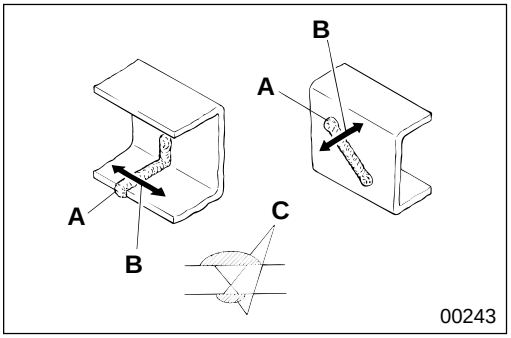
- **Use low-hydrogen type coated CO_2 and arc welding electrodes for welding to prevent harmful defects such as undercutting, blow holes, etc.**
- **Preheat the area to be welded to approximately 50 to 350°C {122 to 662°F} before welding when the workshop temperature is below 0°C {32°F}.**

- Next, grind a V-section channel, as described above, on the opposite side of the weld and weld. At the same time, fill the holes at both ends of the crack by welding.

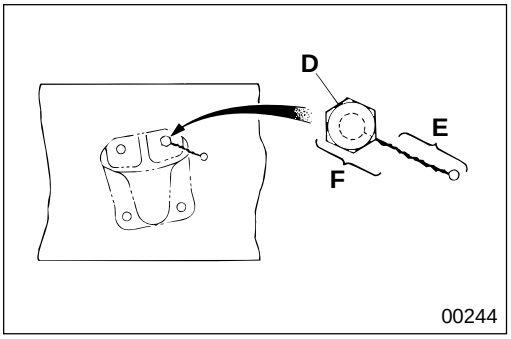
NOTE

In cold districts, heat the welded area to approximately 200°C {392°F} after welding.

https://truckmanualshub.com/

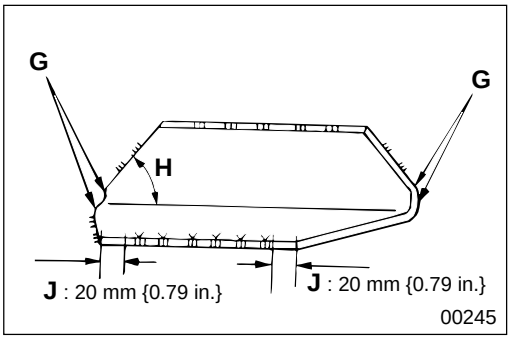


- After welding, grind bead **A** at right angles **B** to remove shaded area **C** as illustrated and grind the area flat.
- Finish the surface so that the frame thickness is identical to the original thickness.



[Repairing cracks caused by rivets or bolt holes]

- To make the edges of the holes flush at the cracked area, temporarily tighten bolt **D** in the hole.
- Weld cracked point **E** at least 20 mm {0.79 in.} from the center of the bolt.
  For welding method refer to the above-mentioned procedures for repairing cracks. P41-3.
- After removing the bolt and making the edges flush, weld remaining area **F** and fill the hole.
- After drilling a hole in the filled area, install a rivet or bolt.

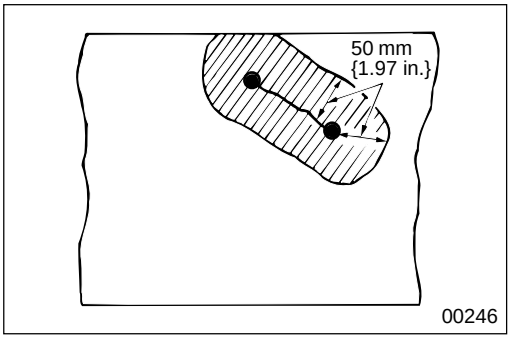


[Repairing using reinforcement plate]

- To prevent concentrated stress being produced at ends **G** of the reinforcement plate, weld the plate with angle **H** at both ends opened 30° or less.
  Do not weld area **J**.
- The reinforcement plate must have enough strength for the cracked area.

NOTE

- **Thickness of reinforcement plate : same as frame thickness**
- **Reinforcement plate material : HTP540 (high tensile strength steel) or equivalent strength.**



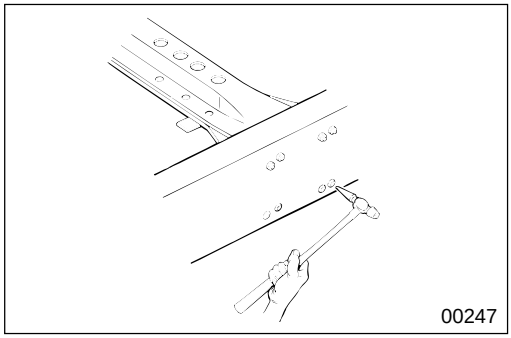
- After welding, heat the shaded area to 600 to 700°C {1112 to 1292°F}.

CAUTION

Be sure to protect mountings such as main sills that can be damaged by heat, by using heat insulators, etc.

https://truckmanualshub.com/

INSPECTION AND REPAIR OF FRAMES

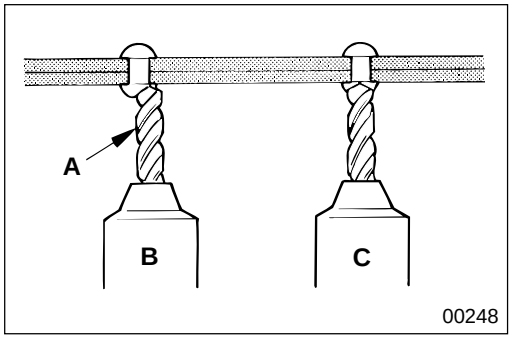


● **Inspection for loose rivets**

- Gently tap the rivet head using an inspection hammer and judge the condition by checking the vibration using the tip of your finger, or by listening to the sound.
- Rust between rivet and frame indicates that the rivet is loose.

CAUTION

Be sure to replace loose rivets because they can break or cause cracking of the frame in the area around the rivet hole, causing accidents.

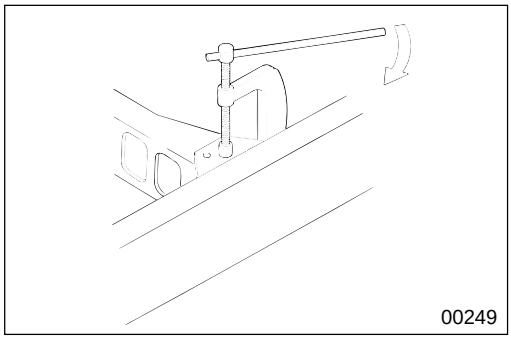


● **Repair of rivet**

- When removing rivets, use a center punch to make an indent in the center of the rivet head; then, drill out using drill **A** or grind.
  B : Incorrect
  C : Correct

CAUTION

Make sure that you do not damage the rivet hole.



- When rivetting, first clamp both plates tightly near the rivet hole using a clamp to eliminate gaps between plates.

- Using a rivetting machine, insert the rivet (cold rivet).
- If rivetting is impossible, ream the rivet hole, drive in a reamer bolt, fully tightening the nut, then weld it in place.
  A flange bolt and flange nut should be used for the reamer bolt and nut.

● **Inspection for loose bolts and nuts**

- Inspect the mounting bolts of the cross member, the helper stopper < FK > and the rear spring bracket < FM > for looseness. Loosened bolts should be tightened at specified torque. P41-2, Gr 34

NOTE

Tighten the nut side when working on the helper stopper < FK > and the rear spring bracket < FM > mounting bolts.

  Wiper motor **6** rotates at low speed.

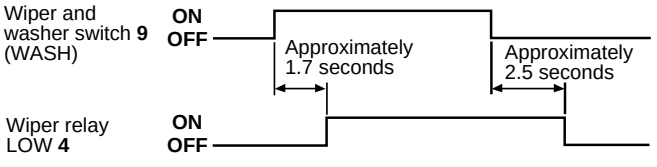
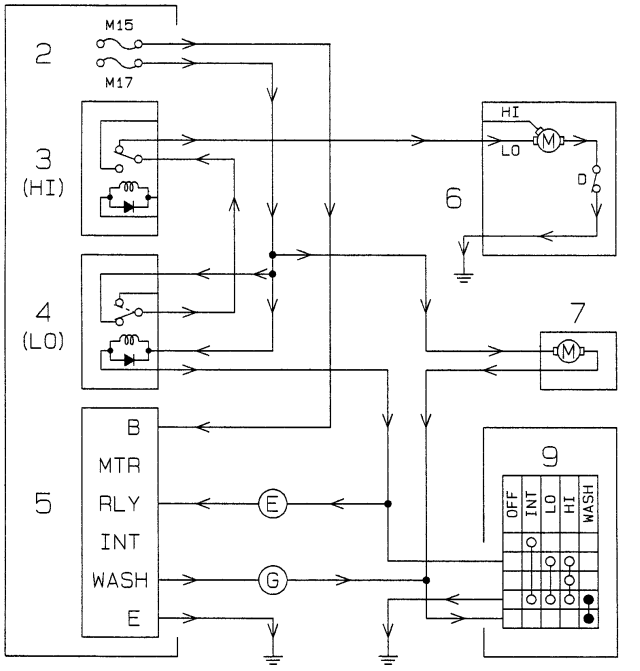
11948

- Multipurpose timing control unit **5** turns wiper motor driving signal Ⓔ OFF for specified time.
  The illustrated part ⊣⊢ of the circuit turns OFF.
- Wiper motor **6** stops. 🕮 Gr 42-12
- After specified time has passed, multipurpose timing control unit **5** sends wiper motor driving signal Ⓔ again.
- Wiper motor **6** rotates at low speed.

https://truckmanualshub.com/



12201



11949

When washer operating

Operation mode with multipurpose timing control unit **5**

Position of wiper and washer switch **9** : WASH

- **2** (M15) → **5** (B) → Ground
- **2** (M17) → **7** → **9** → Ground
  5 (WASH) - Ⓖ

When washer motor **7** operates to spray washer fluid, multipurpose timing control unit **5** transmits washer switch signal Ⓖ.

- **2** (M17) → **4** (coil) —Ⓔ→ **5** (RLY)
  Washer switch signal Ⓖ makes multipurpose timing control unit **5** input wiper motor drive signal Ⓔ.
- **2** (M17) → **4** (contact point) → **3** (contact point)

  → **6** (LO) → **6** (D) → Ground
  Wiper motor **6** operates at LOW speed.
- When wiper and washer switch **9** is turned to OFF, washer motor **7** stops. ◯
- Then, washer switch signal G is turned off and multipurpose timing control unit **5** turns off wiper motor drive signal Ⓔ after specified time.
- Wiper motor **6** automatically stops.

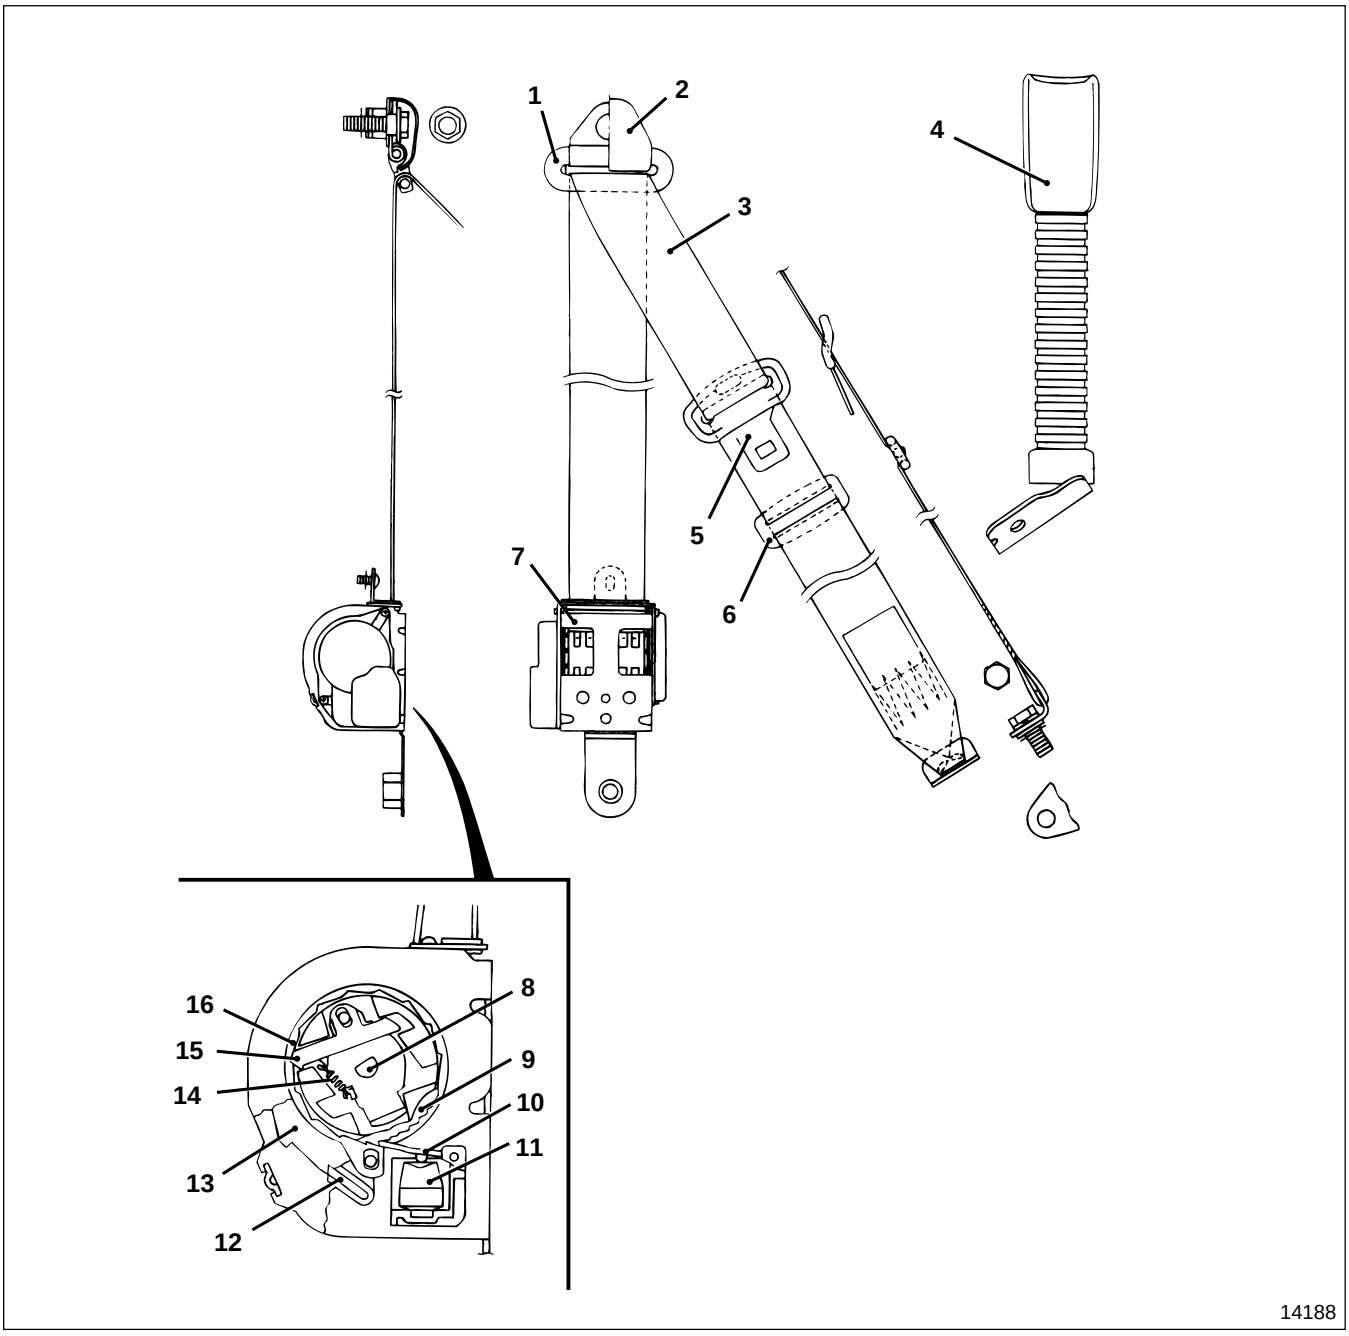
Emergency Locking Retractor (ELR) Type Seat Belt

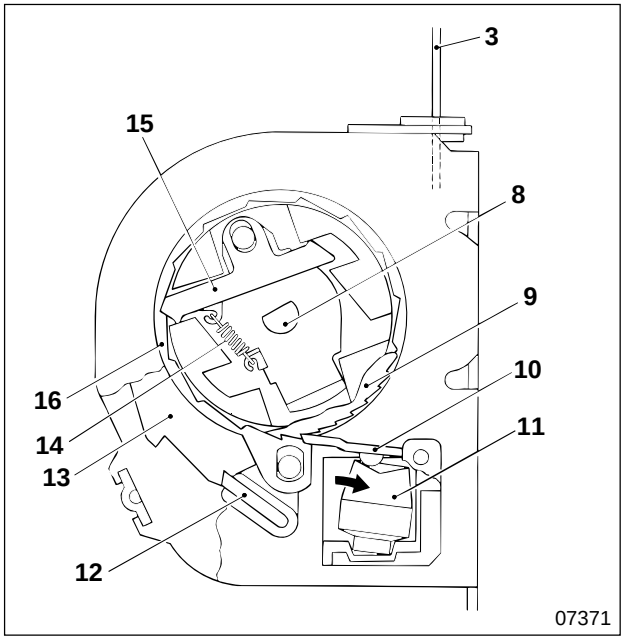


1 Sash guide
2 Cover
3 Webbing
4 Buckle assembly
5 Tongue plate
6 Tongue stopper
7 Emergency locking retractor assembly
8 Spindle
9 Locking gear
10 Mechanism lever
11 Mechanism weight
12 Pawl
13 Ratchet gear
14 Sensor spring
15 Lock arm
16 Clutch

CAUTION⚠

Do not disassemble emergency locking retractor assembly 7, or malfunctions might occur.

https://truckmanualshub.com/



Webbing detecting lock

- When the vehicle is subjected to a sudden impact, such as a crash, webbing **3** retracts according to the movement of passengers, and spindle **8** rotates.
- As the rotation of spindle **8** is higher than the specified value, the repercussive force of sensor spring **14** can no longer retain lock arm **15**. Then, the arm is pulled out from the specified position and is locked by clutch **16**.
- If spindle **8** further rotates, clutch **16** lifts pawl **12** to lock with ratchet gear **13**, making spindle rotation impossible.

Body detecting lock

- When the body is tilted excessively, mechanism weight **11** is tilted, engaging mechanism lever **10** with locking gear **9**, locking it.
- If spindle **8** further rotates, clutch **16** operates as described above, and the spindle cannot rotate.

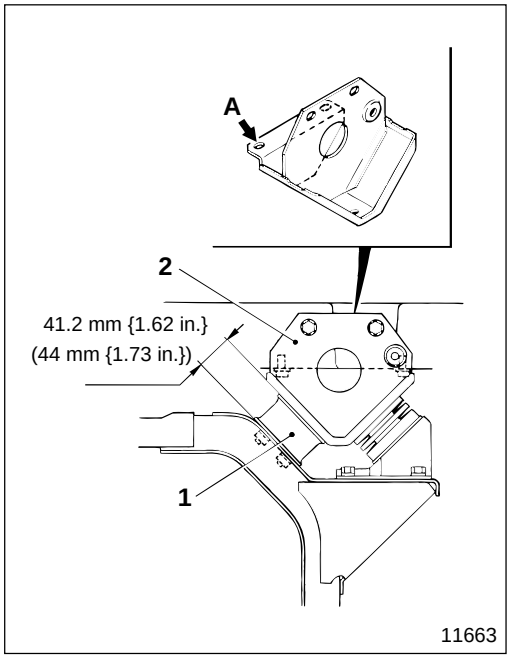
INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Adjustment of Cab Tilt

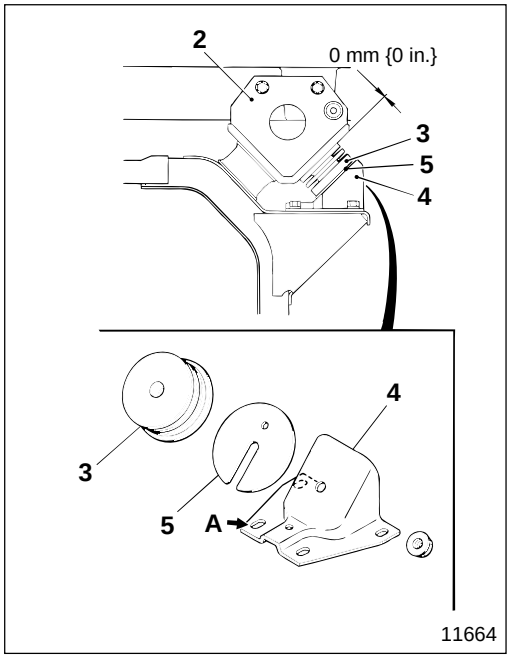
Lubricant

Location	Points of application	Kinds	Quantity
1	Contact surfaces between side cushion and bottom bracket	Molybdenum disulfide grease [NLGI No.2 (Li soap)] (Molykote BR 2 plus)	As required



(1) Contact adjustment between bottom bracket and side cushion

- Tilt the cab down and lock securely.
- To position side cushion **1** as high as illustrated, move it horizontally to install bottom bracket **2**.
  A : Oval hole for adjustment (4 points)
  ( ): Indicates free length.

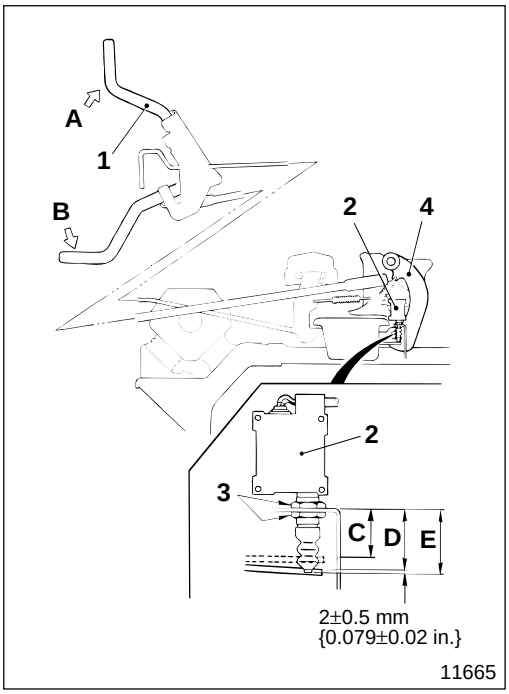


(2) Contact adjustment between bottom bracket and compression cushion

- Tilt the cab down and lock.
- Adjust the clearance between compression cushion **3** and bottom bracket **2** to 0 mm {0 in.} as follows:
  - Adjust the installation position of mounting bracket **4** by moving it horizontally.
    A : Oval hole for adjustment (4 points)
  - Adjust by changing the thickness of shim **5**.
    Available shim thicknesses: 1.0 mm {0.039 in.}, 2.0 mm {0.079 in.}

https://truckmanualshub.com/

Adjustment of Cab Tilt Lock Switch



- Turn the starter switch to ON.
- Use nut **3** to adjust the position of cab tilt lock switch **2** so that when you operate hook control lever **1**, warning lamp in the meter cluster turns on or off in accordance with the following conditions.

• Position of hook control lever **1** : **A** (Main hook **4** is locked.)

State of cab tilt		Adjustment dimension of cab tilt lock switch **2**
When tilted down	OFF	**C** : 31 mm {1.22 in.}

•Position of hook control lever **1** : **B** (Main hook **4** is released.)

State of cab tilt		Adjustment dimension of cab tilt lock switch **2**
When tilted down	ON	**D** : 37 mm {1.46 in.}
When tilted up	ON	**E** : 39 mm {1.54 in.}

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

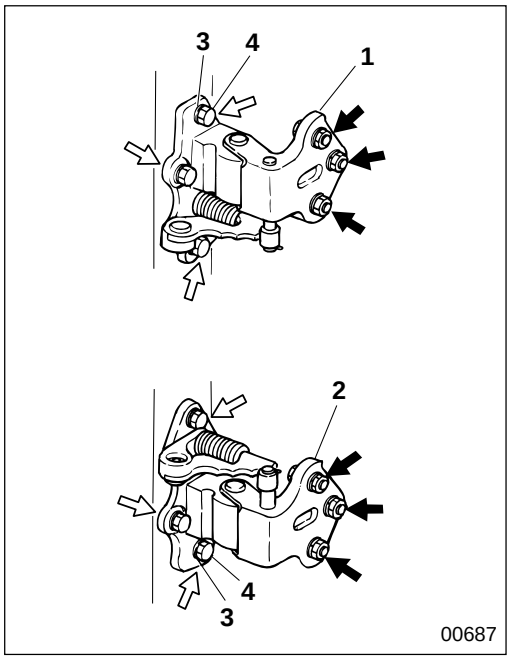
Adjustment of Door Fitting

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Bolt (Upper and lower hinge mounting)	17 to 25 {12 to 19, 1.7 to 2.6}	—
6	Screw (Striker mounting)	8.8 to 14 {6.5 to 10, 0.9 to 1.4}	—

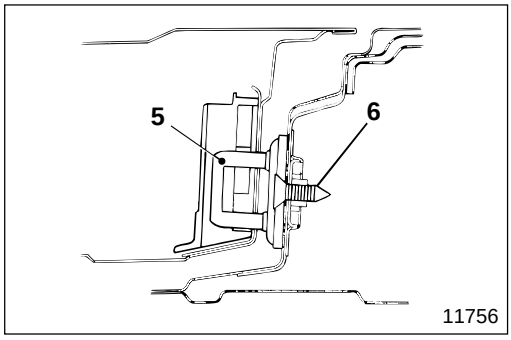
Adjust door fitting at hinge and striker.
(For door fitting dimensions : 🕮 P42-25)



(1) Adjustment of hinge

Adjust upper hinge **1** and lower hinge **2**. Adjustment depends on whether washer **3** is welded or unwelded.

- For washer **3** that is welded:
  Adjust bolts **4** indicated by ➡.
- For washer **3** that is not welded:
  Adjust bolts **4** indicated by ⇨.



(2) Adjustment of striker

Adjust installation screw **6** of striker **5**.

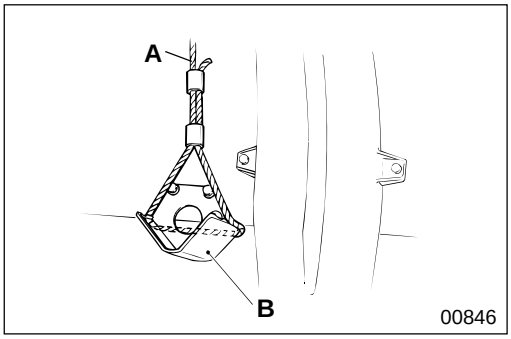
P42-22

Lubricant

Location	Points of application	Kinds	Quantity
6, 8	Contact area of torsion bar arm with torsion bar support	Chassis grease [NLGI No.1 (Ca soap)]	As required

https://truckmanualshub.com/

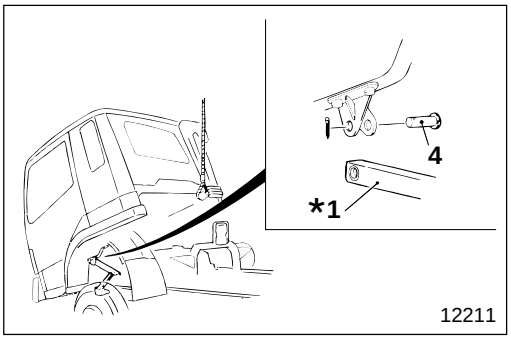
◆ Service procedure



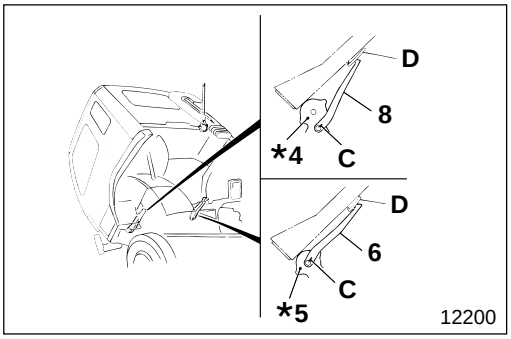
9 **Cab assembly**

[Removal]

- Tilt the cab, then fasten the hoist attachment of crane **A** around bottom bracket **B** of the cab.



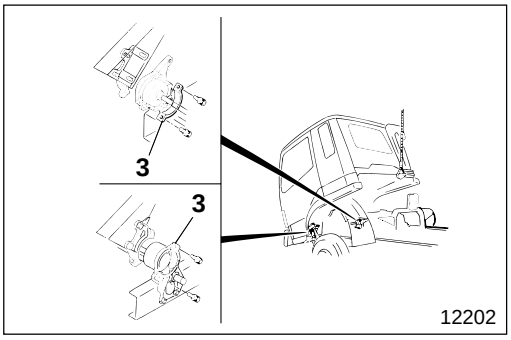
- Lower the cab until cab stay ***1** is no longer locked.
- Remove clevis pin **4** of cab stay ***1**, and separate the cab stay from the cab.



- Before removing torsion bar arm RH **6**, LH **8**, make alignment marks **C** across the torsion bar arm, cab hinge bracket ***5**, and gear box bracket ***4**.
  Remove the torsion bar arm by lifting up the cab with the crane until the torsion bar arm separates from torsion bar support **D**. If necessary, remove the torsion bar support first.

WARNING⚠

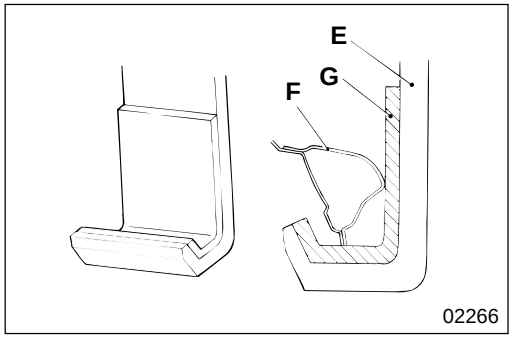
- **You must pay close attention to the tilt angle when tilting the cab. It is very dangerous to tilt the cab excessively because it will topple over.**
- **Lower the cab as soon as the torsion bar arm has been removed.**



- When you remove cab hinge cap **3**, tilt the cab only by the barest minimum needed to carry out the work.

https://truckmanualshub.com/

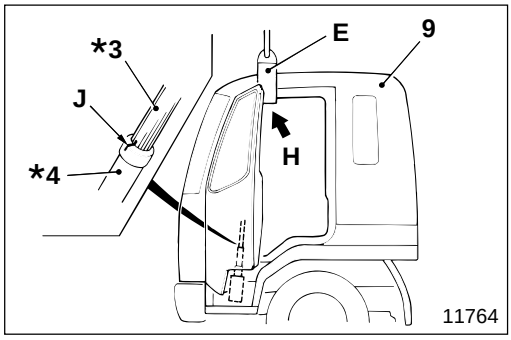
REMOVAL AND INSTALLATION OF CAB



- Set up hoist attachment **E** for the cab as illustrated.

CAUTION

- **Make sure when you set up hoist attachment E that it is capable of lifting cab assembly 9 which weighs approximately 440 kg {970 lb}.**
- **Make sure you install rubber G on hoist attachment E to prevent cab roof F being deformed when the cab is lifted.**



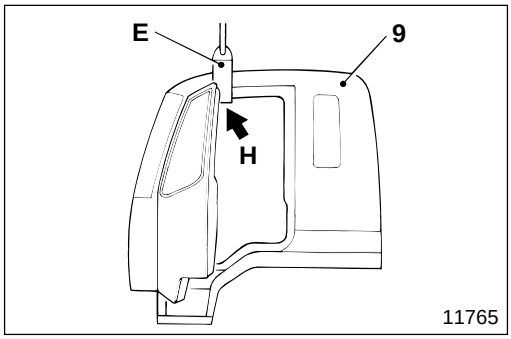
- Mount hoist attachment **E** at center-of-gravity point **H** of cab assembly **9**. Verify the position at which the cab can be lifted horizontally when the cab is lifted slightly.
- Slowly lift cab assembly **9** straight up, and finish lifting when steering yoke ***3** is pulled out from steering shaft ***4**. Make alignment mark **J** before the steering yoke is pulled out from the steering shaft.

WARNING

Never get under cab assembly 9 when it is being lifted.

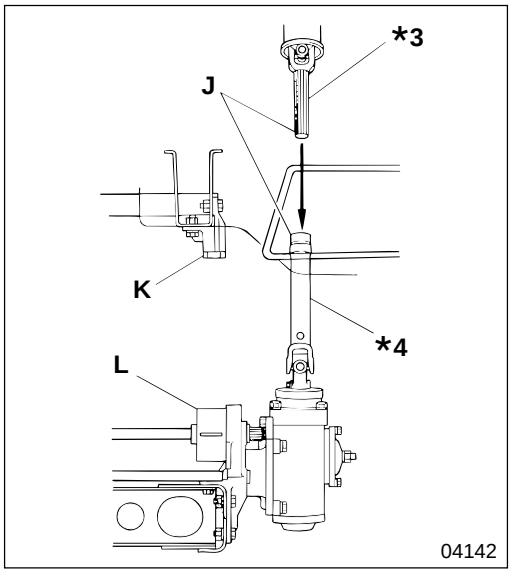
CAUTION

Make sure, when lifting cab assembly 9, that the wiring harness, cable, hoses, etc. are completely disconnected when the cab is lifted slightly.



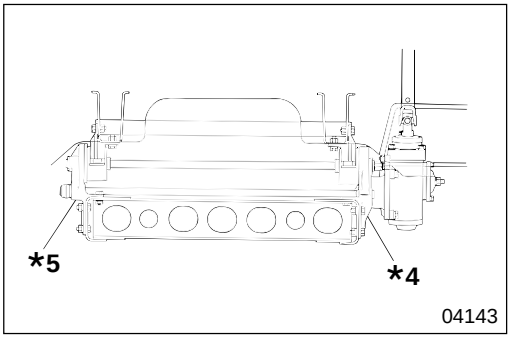
[Installation]

- Mount hoist attachment **E** at center-of-gravity point **H** of cab assembly **9**.

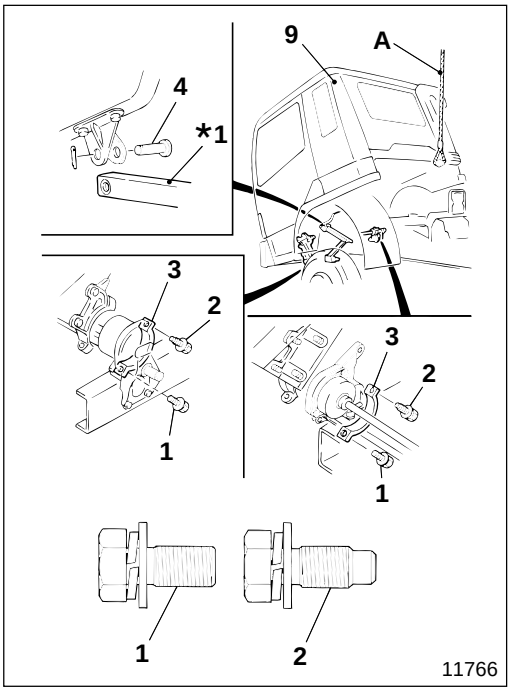


- Slowly lower cab assembly **9** horizontally to insert steering yoke ***3** into steering shaft ***4**, aligning alignment mark **J**.
- Install cab hinge upper bracket **K** aligning it to cab hinge cushion **L**.

https://truckmanualshub.com/



- Check if the cab is installed one-sided in relation to cab hinge bracket ***5** or gear box bracket ***4**, and correct as necessary.



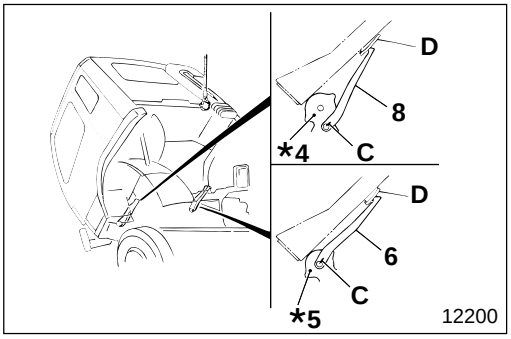
- Securely support the cab on crane **A** to tilt cab assembly **9**.
- Using crane **A** tilt cab assembly **9**, and install cab hinge cap **3** and clevis pin **4**.

WARNING ⚠

You must pay close attention to the tilt angle when tilting cab assembly 9 using crane A. It is very dangerous to tilt the cab excessively because it will topple over.

NOTE

The cab hinge cap mounting bolts have different shapes, so pay close attention when you install them.



- Install torsion bar arm LH **6**, RH **8** aligning alignment marks **C** on the torsion bar arm, cab hinge bracket ***5**, and gear box bracket ***4**.
  If torsion bar support **D** has been removed, reinstall it after installing the torsion bar arm.

- After installation, tilt cab assembly **9** slowly until it is completely tilted, securely lock the cab stay, then detach the cab from crane **A**.

25 Cab hinge upper bracket, RH
26 Cab hinge upper bracket, LH

⊗ : Non-reusable parts

NOTE

Do not remove bushing 23 unless it is faulty.

● **Assembly sequence**

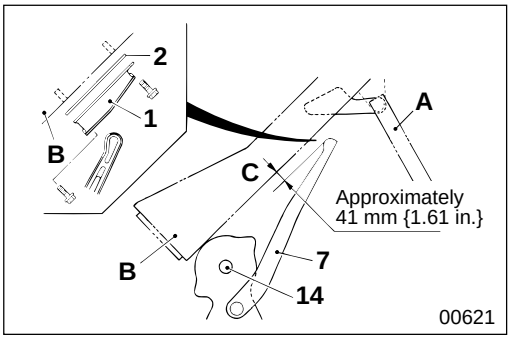
Follow the disassembly sequence in reverse.

https://truckmanualshub.com/

Lubricant

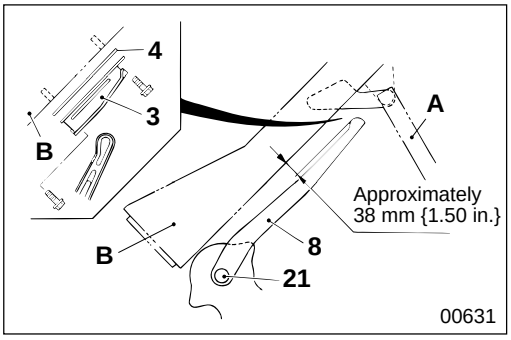
Location	Points of application	Kinds	Quantity
1	Torsion bar arm at the area which receives torsion bar support RH	Chassis grease [NLGI No. 1 (Ca soap)]	As required
3	Torsion bar arm at the area which receives torsion bar support LH	Chassis grease [NLGI No. 1 (Ca soap)]	As required
15, 22	Supply via grease nipple	Chassis grease [NLGI No. 1 (Ca soap)]	As required
17, 20	Interior of cab hinge cushion	Chassis grease [NLGI No. 1 (Ca soap)]	As required

◆ Service procedure



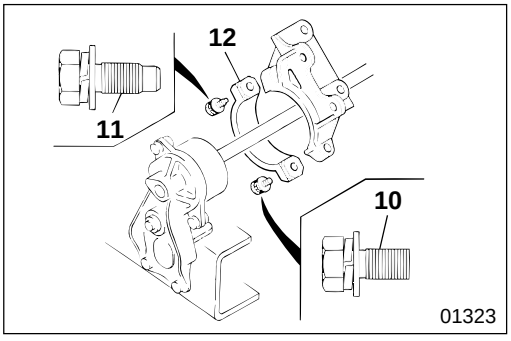
7 Installation of torsion bar arm RH

- Tilt up the cab and support using cab stay **A**.
- Install torsion bar arm RH **7** to lower torsion bar **14** so that clearance **C** between main sill **B** of the cab and the torsion bar arm conforms to the value as illustrated.
- If clearance **C** deviates from the value as illustrated, adjust using shim **2**. The shim must be installed between torsion bar support RH **1** and the cab when torsion bar support RH is installed.



8 Installation of torsion bar arm LH

- Tilt up the cab and support using cab stay **A**.
- Install torsion bar arm LH **8** to lower torsion bar **21** so that clearance **C** between main sill **B** of the cab and the torsion bar arm conforms to the value as illustrated.
- If clearance **C** deviates from the value as illustrated, adjust using shim **4**. The shim must be installed between torsion bar support LH **3** and the cab when torsion bar LH is installed.



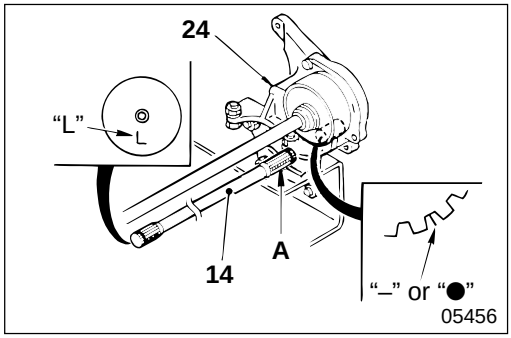
12 Installation of cab hinge cap

NOTE

Bolts 10, 11 have different shapes, so pay close attention when you install them.

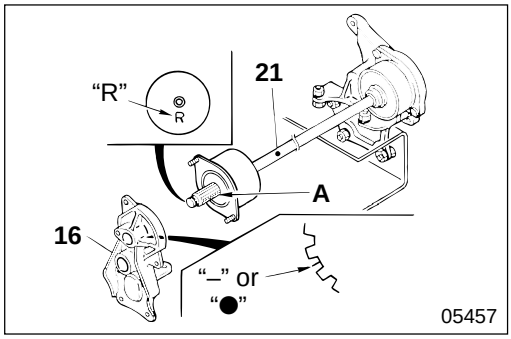
https://truckmanualshub.com/

FRONT CAB MOUNTING



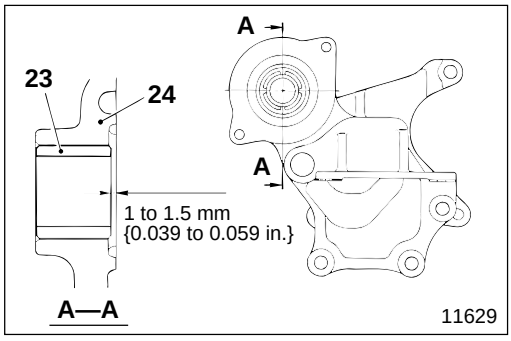
14 **Installation of lower torsion bar**

Install lower torsion bar **14** in gear box bracket **24** in the direction as illustrated. At this point, align white paint mark **A** on the torsion bar with alignment mark "–" or "●" on the gear box bracket.



21 **Installation of upper torsion bar**

Install upper torsion bar **21** to cab hinge bracket **16** in the direction as illustrated. At this point, align white paint mark **A** on the torsion bar with alignment mark "–" or "●" on the cab hinge bracket.



23 **Installation of bushing**

Install bushing **23** in gear box bracket **24** so that the illustrated dimension is obtained.

Tightening torque

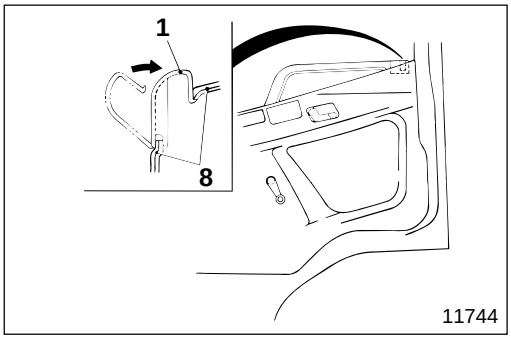
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
13	Screw (Door latch mounting)	4 to 6 {2.9 to 4.3, 0.4 to 0.6}	—
17	Nut (Outside handle mounting)	4 to 6 {2.9 to 4.3, 0.4 to 0.6}	—
24	Bolt (Regulator and rail assembly mounting)	6.9 to 10.8 {5.1 to 8.0, 0.7 to 1.1}	—

Sealant

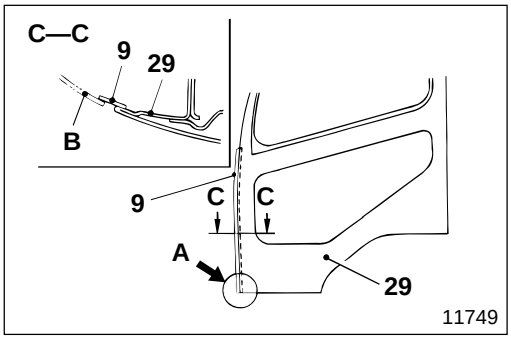
Location	Points of application	Kinds	Quantity
11	Door panel waterproof cover mounting surface	BUTYL TAPE	As required
21	Thread area of bolt	LOCTITE DRYLOCK No. 203	As required

◆ Service procedure



1 **Installation of door lock knob cover**

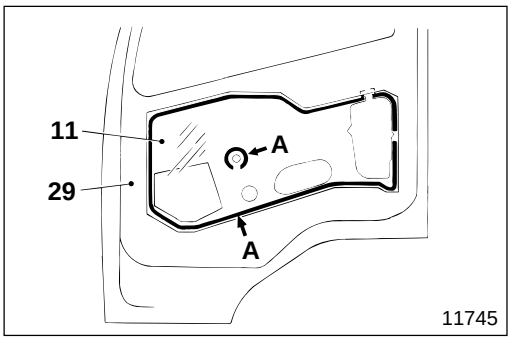
Install door lock knob cover **3** in door trim **8** in the direction as illustrated.



9 **Installation of door outer weatherstrip**

Install door outer weatherstrip **9** aligning it with lower edge **A** of door panel **29**.

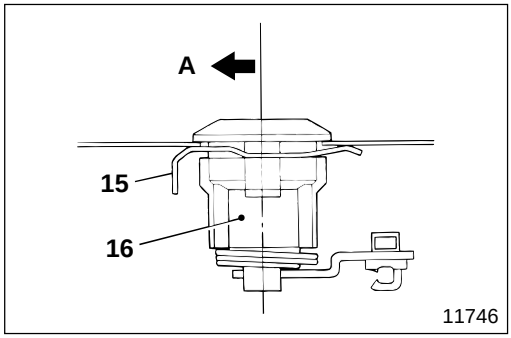
B : Corner panel



11 **Installation of waterproof cover**

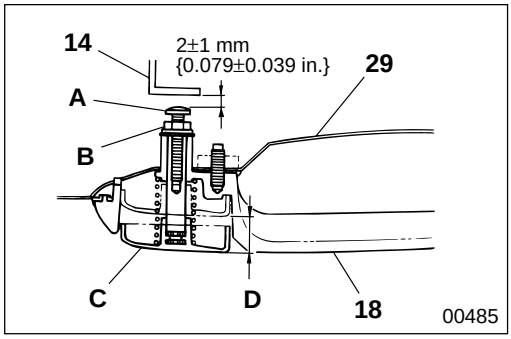
- Apply butyl tape **A** to door panel **29** as illustrated.
- Stick waterproof cover **11** over butyl tape **A**.

https://truckmanualshub.com/



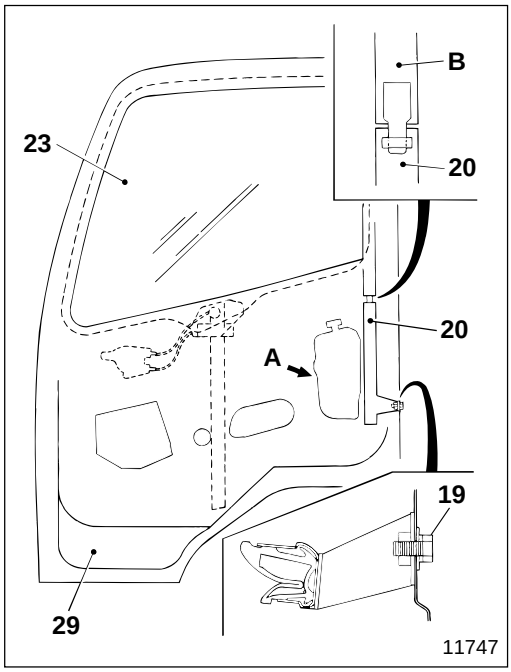
16 **Installation of door lock cylinder**

15 : Clip
A : Front of the vehicle



18 **Adjustment of outside handle**

- Adjust the clearance between push bolt **A** of outside handle **18** and door latch **14** to the illustrated value by turning the push bolt.
  29 : Door panel
  B : Lock nut
- After adjustment, check stroke **D** of push button **C**.
  - Maximum stroke (with push button fully depressed)
    12 mm {0.47 in.}
  - Door lock releasing stroke
    10 mm {0.39 in.}

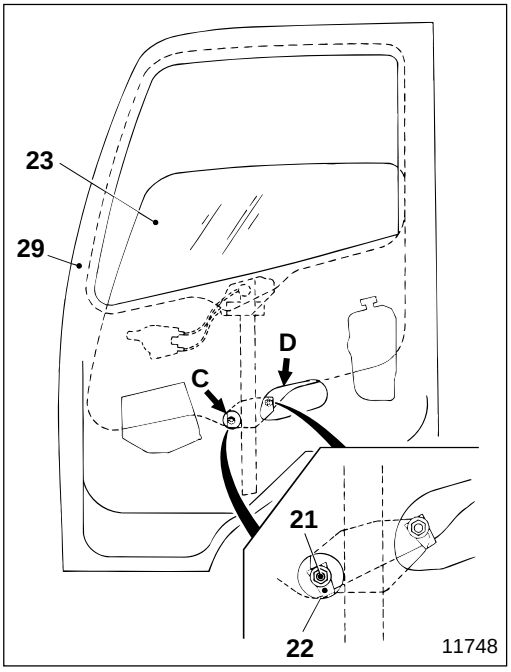


23 **Removal and installation of door glass**

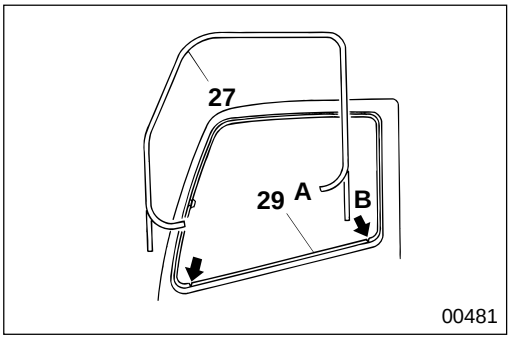
Remove all parts supporting door glass **23** and remove the door glass from the door opening.

- Raise door glass **23** to the upper limit.
- Remove bolt **19** through hole **A** of door panel **29** to remove lower sash **20** which is inserted into upper sash **B**.

https://truckmanualshub.com/



- Lower door glass **23** to the level where bolt **21** can be seen through holes **C** and **D** of door panel **29** respectively.
- Hold door glass **23** with your hands and remove glass holder **22**.
- Remove door glass **23** via the door opening.
- For installation, follow the removal sequence in reverse.



27 **Installation of run channel**

Install run channel aligning end **A** of run channel **27** to slit **B** of door panel **29**.

⊗ : Non-reusable parts

● **Installation sequence**

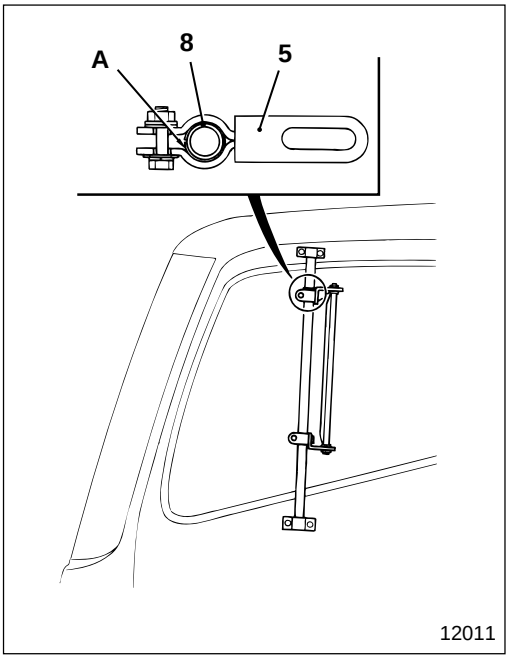
Follow the removal sequence in reverse.

NOTE

For outside mirror stay assembly LH 13, follow the same service procedure as for outside mirror stay assembly RH 3.

https://truckmanualshub.com/

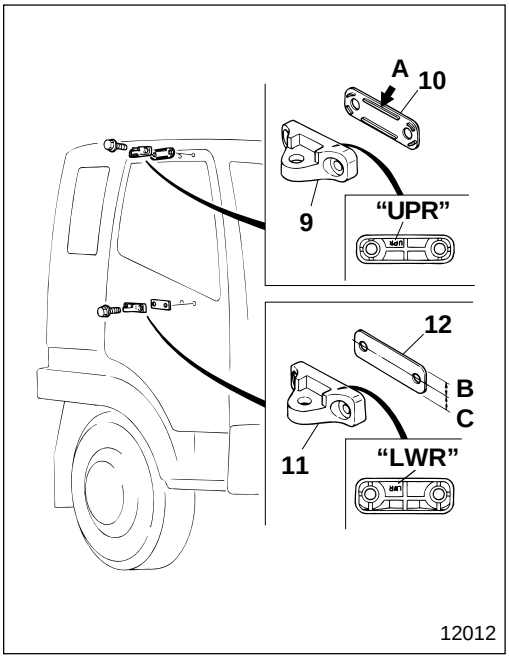
◆ Service procedure



5 **Installation of mirror holder**

Install mirror holder **5** onto mirror stay **8** in the direction as illustrated.

A : Indent of mirror stay **8**



9 **to** **12** **Installation of mirror stay bracket and packing**

- "**UPR**" and "**LWR**" identification marks are marked on mirror stay upper bracket **9** and mirror stay lower bracket **11** respectively.
- Install indent **A** on packing **10**, facing mirror stay upper bracket **9**.
- Installation hole is offset on packing **12**.

B : 13.8 mm {0.54 in.}

C : 17.2 mm {0.68 in.}

NOTE

Since crank arm 20 is installed corresponding to the wiper stop position of wiper motor 18, do not remove the crank arm unless it is faulty.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
2, 9	Wiping force of wiper arm	7.65±0.49 N {1.72±0.11 lbf, 0.78±0.05 kgf}	—	Replace

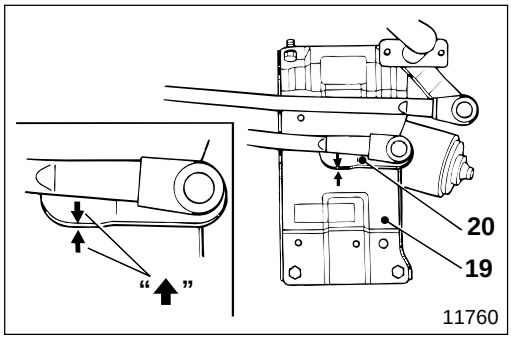
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Wiper arm and blade assembly mounting)	17 to 23 {12.3 to 16.6, 1.7 to 2.3}	—
11	Nut (Wiper link and motor assembly mounting)	17 to 23 {12.3 to 16.6, 1.7 to 2.3}	—
13	Bolt (Wiper motor bracket mounting)	9 to 14 {6.5 to 10.1, 0.9 to 1.4}	—
14	Bolt (Link assembly mounting)	10 to 15 {7.2 to 10.8, 1.0 to 1.5}	—
16	Nut (Crank arm mounting)	16.7 to 23.5 {12.3 to 17.4, 1.7 to 2.4}	—
24	Nut (Hose joint connecting)	0.6 to 0.9 {0.43 to 0.65, 0.06 to 0.09}	—
28	Bolt (Washer tank mounting)	7.8 to 11.8 {5.8 to 8.7, 0.8 to 1.2}	—

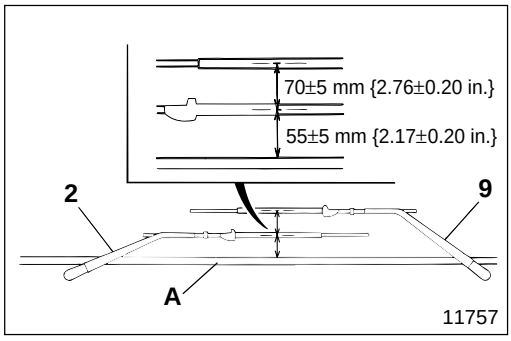
https://truckmanualshub.com/

◆ Service procedure

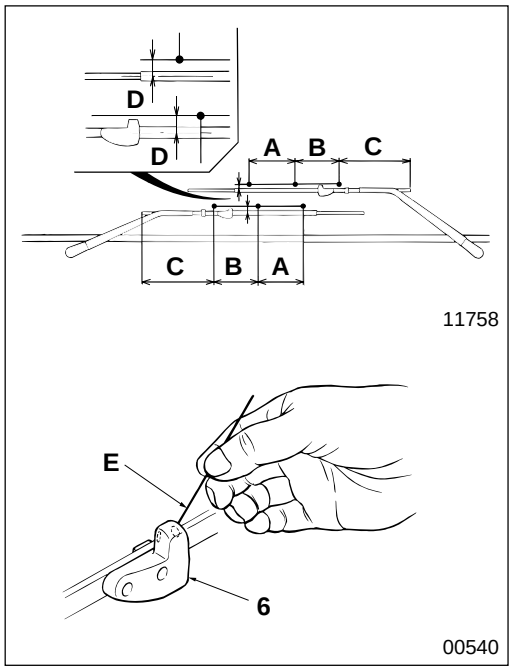


2 **9** **Installation of wiper arm and blade assembly**

- Align alignment marks "⬆" on wiper motor bracket **19** and crank arm **20**.



- Install wiper arm and blade assembly RH **2**, LH **9** so that dimensions from the edges of weatherstrip **A** are as illustrated.



6 **Inspection of washer nozzle**

Make sure that washer fluid spreading target positions ("●" as illustrated) are within dimensions **A** to **D**.

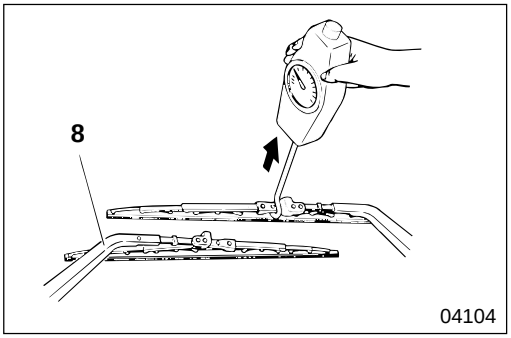
A	130 mm {5.12 in.}
B	130 mm {5.12 in.}
C	210 mm {8.27 in.}
D	15 mm {0.59 in.}

If the washer fluid spreading target positions deviate from these dimensions, adjust the jet hole angle of washer nozzle **6** using wire **E**.

CAUTION⚠

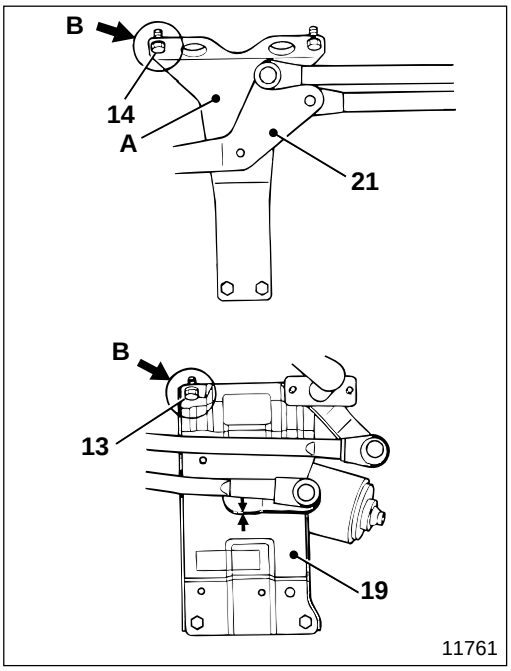
Be careful not to damage the jet hole of washer nozzle 6 with wire E when adjusting the angle.

https://truckmanualshub.com/



8 **Inspection of wiper arm**

If the measured value deviates from the standard value, replace wiper arm **8**.



15 **Installation of wiper link and wiper motor assembly**

- Wiper motor bracket **19** and idler bracket **A** of link assembly **21** have reference holes **B** for installation.
- Tighten installation bolts **13**, **14** for wiper motor bracket **19** and idler bracket **A** starting from reference holes **B**.

◆ Service procedure

3 **Removal of cab and spot lamp**

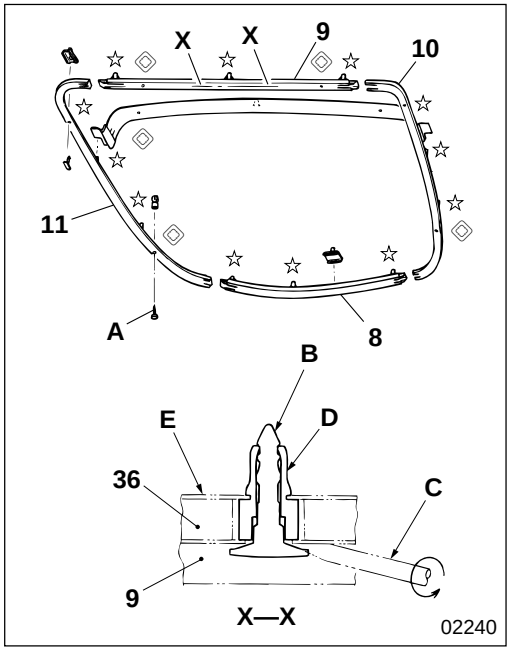
Insert the tip of a screwdriver in groove area **B** of lens **A**, and use the screwdriver as a pry bar.

CAUTION

Make sure that you do not pry at any area other than B or you will damage the lens.

https://truckmanualshub.com/

CAB INTERIOR FITTING



8 to 11 Removal of curtain rail

- Remove tapping screws **A**. (six points in ◇ mark)
- Insert screwdriver **C** into the taper of rail pins **B** and lever out curtain rails **8** to **11** from rail clips **D** by turning the screwdriver. (13 points in ☆ mark)

36 : Rear head lining
E : Cab metal

CAUTION ⚠

- **Be sure that you remove rail pins B first because the curtain rails would be deformed if you were to remove the rail pins after levering out curtain rails 8 to 11.**
- **Prepare extra fittings in advance because rail pins B and rail clips D might be damaged during removal.**

Follow the disassembly sequence in reverse.

NOTE

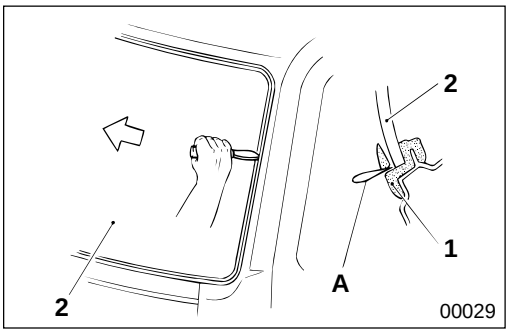
The illustration shows the left side. The right side is symmetrical to the left side.

Lubricant and sealant

Location	Points of application	Kinds	Quantity
1, 6	Lip area of weatherstrip	Soapy water	As required
3	Fill the area around the drain hose mounting flange on cab	CEMEDINE 3061-D	As required

https://truckmanualshub.com/

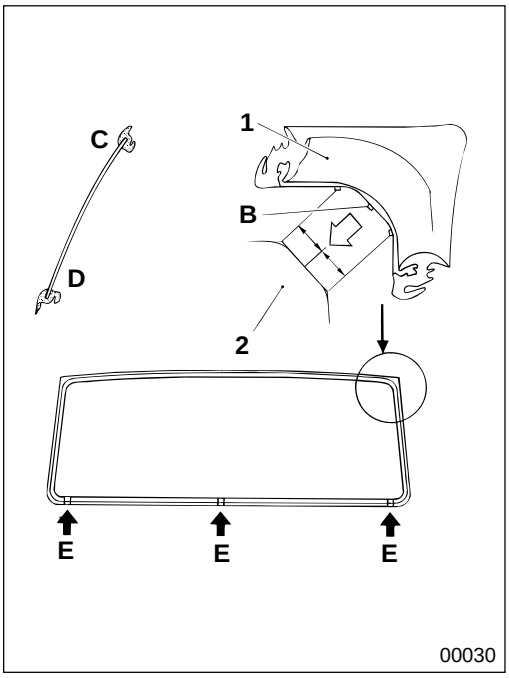
◆ Service procedure



1 **2** **Weatherstrip and windshield**

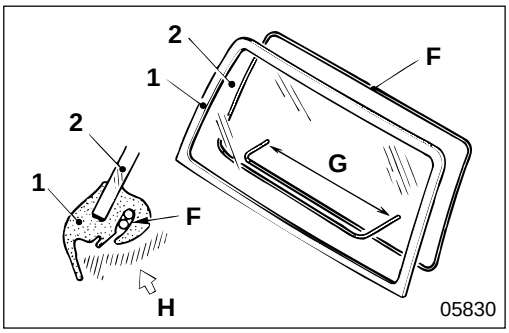
[Removal]

- Cut weatherstrip **1** with knife **A** at the area as illustrated.
- Support windshield **2**, and remove by pressing it from inside the cab.

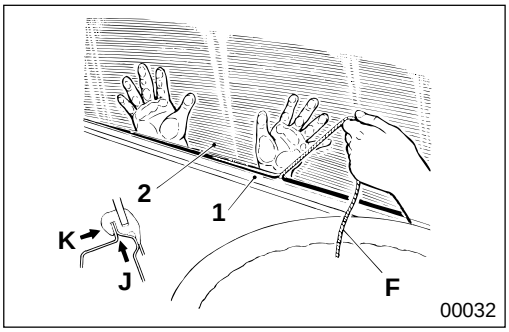


[Installation]

- Install weatherstrip **1** so that central basic point **B** meets the middle at the chamfered part of windshield **2**.
  - **C** : Outside
  - **D** : Inside
  - **E** : Water drain hole



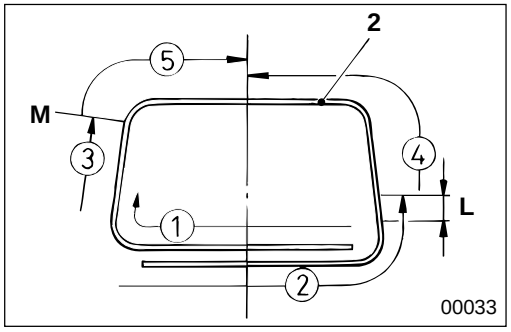
- Lay cord **F** in the cab mounting groove of weatherstrip **1** as illustrated, and overlap the cord at the lower side of the glass by the specified length, see **G**.
- Apply soapy water **H** to weatherstrip **1**.
- Align windshield **2** with the cab.



- Push windshield **2** inward from the outside of the cab firmly.
- Inside the cab, pull one end of cord **F** to install lip **K** of weatherstrip **1** into flange lip **J** of the cab.

https://truckmanualshub.com/

WINDOW GLASS

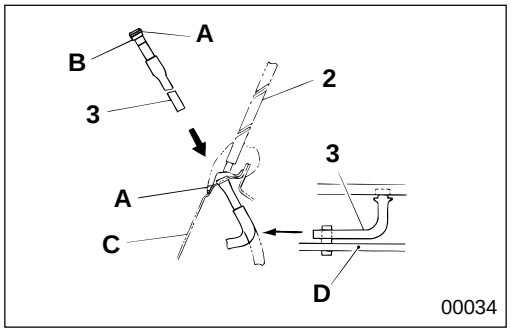


- Pull cord **F** in the numbered order as illustrated and at the same time have someone push windshield **2** into weatherstrip **1**, tapping the windshield with a rubber-headed mallet.

  L : approximately 100 mm {3.94 in.} from the starting point of the straight section
  M : up to the end of the straight section

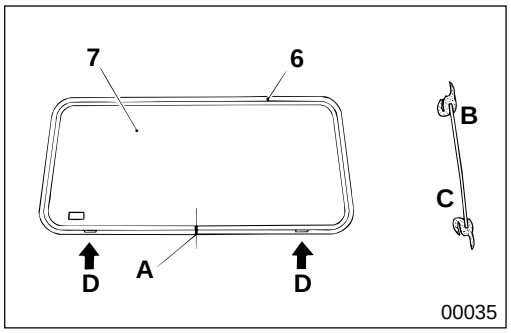
CAUTION

Make sure that windshield 2 is installed correctly into the cab before hitting the windshield with the rubber-headed mallet, otherwise the windshield might be broken.



3 **Installation of drain hose**

- Fill the area around the flange of drain hose **3** with sealant **A**, and press the drain hose in until its flared area **B** fits into cab **C**. Carefully smooth down excess sealant that is squeezed out so that the hose opening is not clogged.
- Secure drain hose **3** at the middle of the vehicle together with windshield washer hose **D**.



6 **7** **Weatherstrip and rear window glass**

- Install so that joint **A** of weatherstrip **6** is at the bottom center of rear window glass **7**.

  B : Outside
  C : Inside
  D : Drain hole

- Except for the point mentioned above, follow the same service procedure as for installation of the windshield.

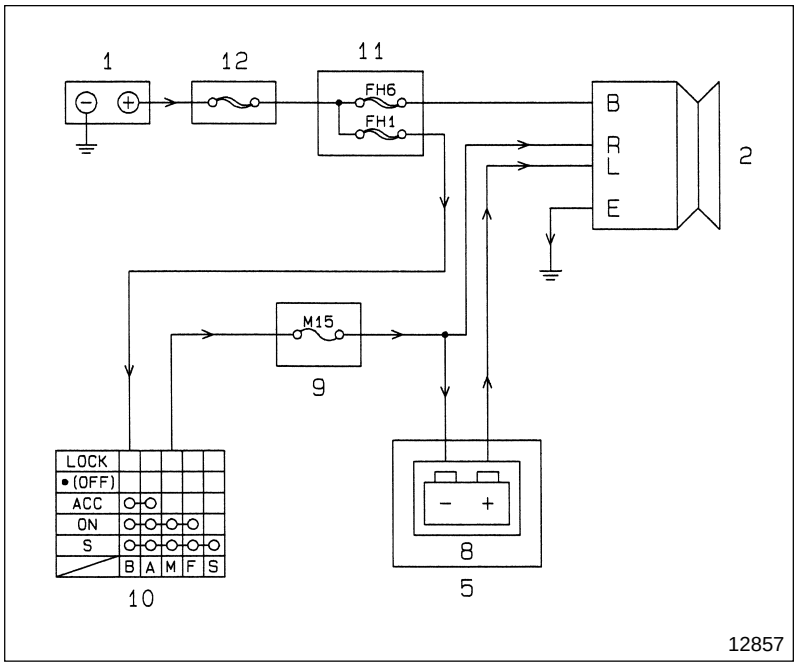
A : To parking brake warning lamp
B : Terminal B
C : To brake fluid switch and airmaster stroke switch
D : To low air pressure switch
E : Terminal E
F : To each unit
L : Terminal L
R : Terminal R

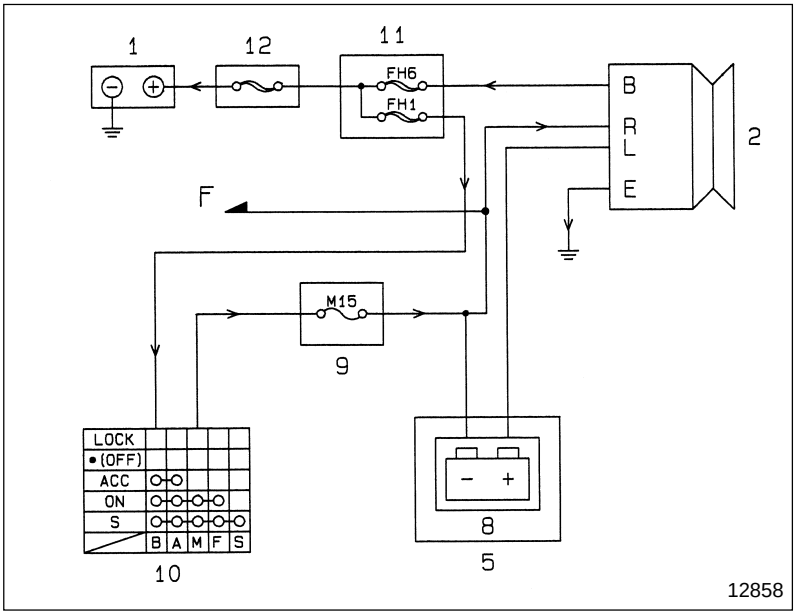


At engine standstill (before starting)

Position of starter switch **10** : ON

- 1→12→11 (FH1)→10→9 (M15)
  ——→2 (R→E)→Ground
  └→8→2 (L→E)→Ground
- Charge warning lamp [- +] **8** lights up.
  To improve the low-speed power generation build-up performance of alternator **2**, current is fed to terminal **R** immediately after the engine is started.

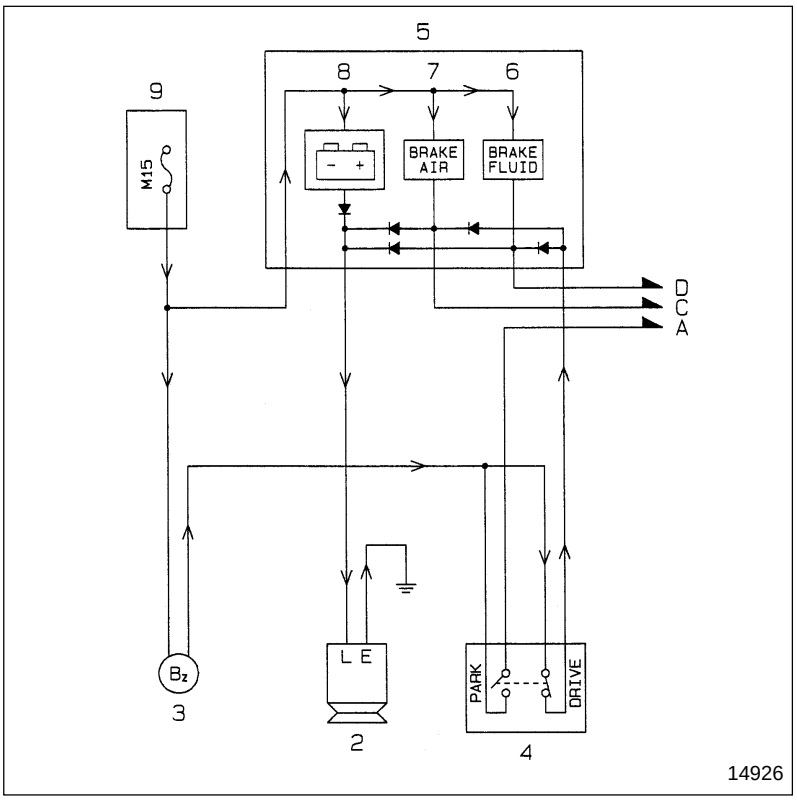
https://truckmanualshub.com/



After engine start-up

Position of starter switch **10** : ON

- Alternator **2** starts to generate power.
- The voltage at terminal **B** of alternator **2** rises higher than the voltage of battery **1**.
- As alternator **2** starts to charge battery **1**, units **F** are supplied with power.
  2 (B)→11 (FH6)→12→1→Ground
  →11 (FH1)→10→9 (M15)→F
- Since there is no electric potential difference between the output voltage of terminal **L** of alternator **2** and the voltage of battery **1**, charge warning lamp [- +] **8** goes off.



If V-belt snaps while driving

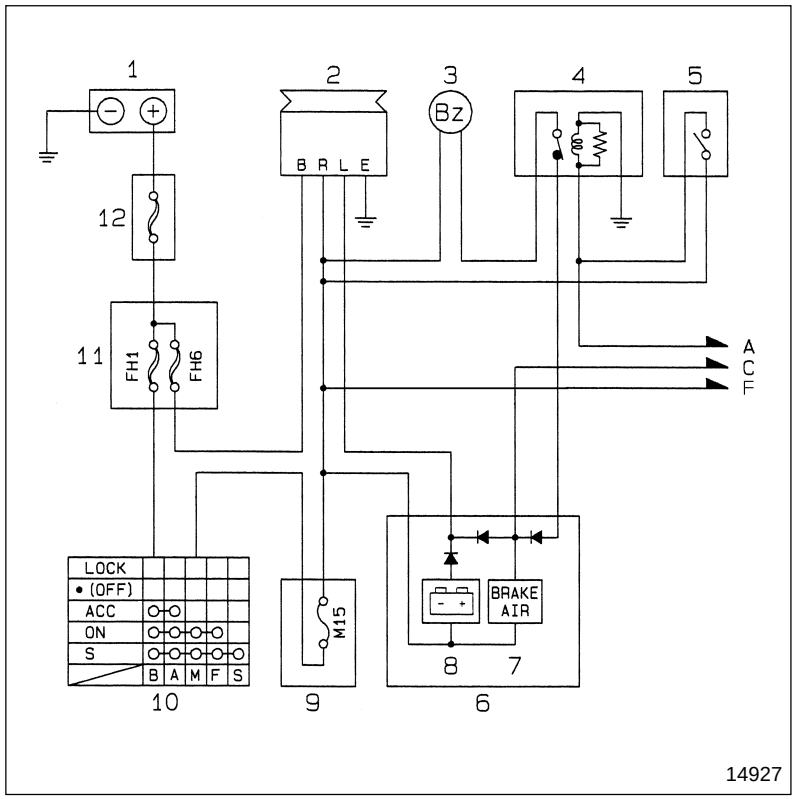
Position of starter switch **10** : ON
Position of parking brake switch **4** : DRIVE

- Alternator **2** stops generating power and battery **1** becomes the power source.
  9 (M15)→8→2 (L→E)→Ground
  →3→4 (DRIVE)
  →2 (L→E)→Ground
- Charge warning lamp [- +], brake warning lamp [BRAKE FLUID] and air pressure warning lamp [BRAKE AIR] light up.
  At the same time, warning buzzer **3** sounds.

https://truckmanualshub.com/

STRUCTURE AND OPERATION

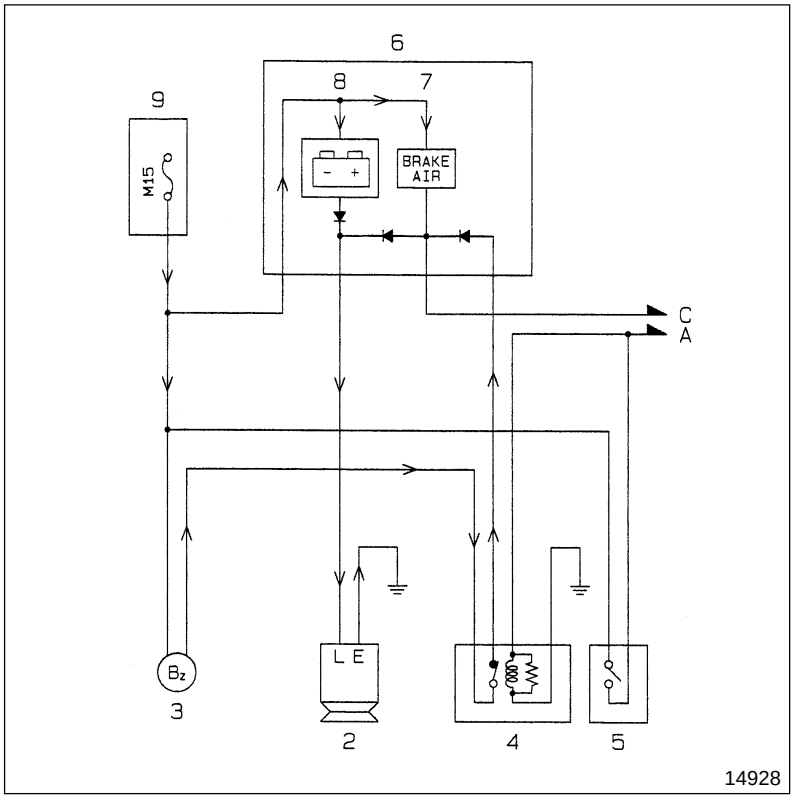
< Full air brake >



1 Battery
2 Alternator
3 Warning buzzer
4 Parking brake relay
5 Parking brake switch
6 Meter cluster
7 Air pressure warning lamp
8 Charge warning lamp
9 Relay and fuse box
10 Starter switch
11 High-current fuse box
12 Main high-current fuse

A : To parking brake warning lamp
B : Terminal B
C : To low air pressure switch
E : Terminal E
F : To each unit
L : Terminal L
R : Terminal R

With the exception of the parking brake system, the battery charging circuit for the full air brake is the same as for the air over hydraulic brake system. P54-1-2



When V-belt snaps while driving

Position of starter switch **10** : ON
Position of parking brake switch **5** : OFF

- Alternator **2** stops generating power and battery **1** becomes the power source.
  9 (M15)⟶8→2 (L→E)→Ground
  └→3→4 (Contact point)→2 (L→E)
  →Ground
- Charge warning lamp [-+] and air pressure warning lamp [BRAKE AIR] light up.
  At the same time, warning buzzer **3** sounds.

https://truckmanualshub.com/

Possible causes \ Symptoms		Battery electrolyte decreases too early	Battery overheating	Battery is normal but overdischarged	Charge warning lamp [-+] does not light when turning starter switch ON, with engine stopped	Alternator is normal but battery overdischarged	< Air over hydraulic brake > Warning buzzer does not stop sounding although parking brake lever is pulled	< Full air brake > Warning buzzer does not stop sounding although hand control valve is pulled	Remarks

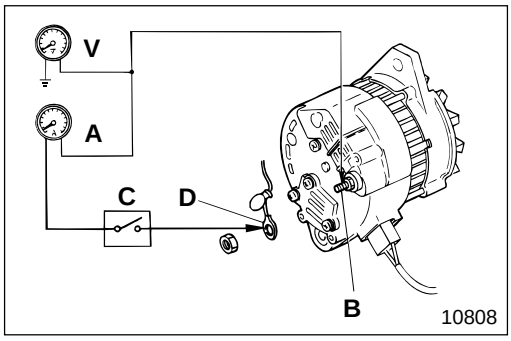
100 INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection of Alternator



Performance test

- Connect the meters to the alternator as illustrated.
  A : Ammeter (100 amperes class)
  B : Terminal B on alternator
  C : Switch
  D : Terminal
  V : Voltmeter

WARNING

- **Terminal D is always loaded with voltage from the battery.**
- **You must handle terminal D carefully, it will short-circuit if it touches any part other than terminal B on the alternator.**

- Turn switch **C** ON to supply battery voltage to terminal **B** on the alternator.
- Start the engine.
- Turn the switches ON of all the lamps on the vehicle immediately.
- Measure the current when the engine speed reaches approximately 2420 rpm.
- The alternator is assumed to be normal if the measured value is higher than 70% of the specified output.

Specified output of alternator

Alternator model	Voltage	Output
A4TU0286	12 V	80 A

NOTE

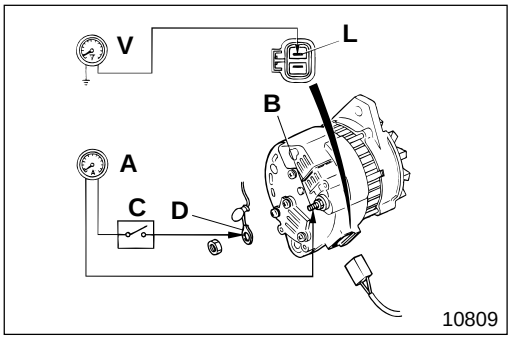
Since the above inspection is only a simplified check, it is necessary to conduct a stringent test bench for an official check.
P54-1-19

https://truckmanualshub.com/

Inspection of Regulator

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Adjustment voltage of regulator	14.7±0.3 V	—	Replace



- Connect the meters to the alternator as illustrated.
  A : Ammeter (100 amperes class)
  B : Terminal B on alternator
  C : Switch
  D : Terminal
  L : Terminal L on alternator
  V : Voltmeter

WARNING⚠

- **Terminal D is always loaded with voltage from the battery.**
- **You must handle terminal D carefully, it will short-circuit if it touches any part other than terminal B on the alternator.**

- Turn switch **C** ON and make sure that voltmeter **V** indicates 0 volt.
- If the needle of voltmeter **V** oscillates, something is wrong with the alternator or the wiring.
- Turn switch **C** OFF and start the engine.

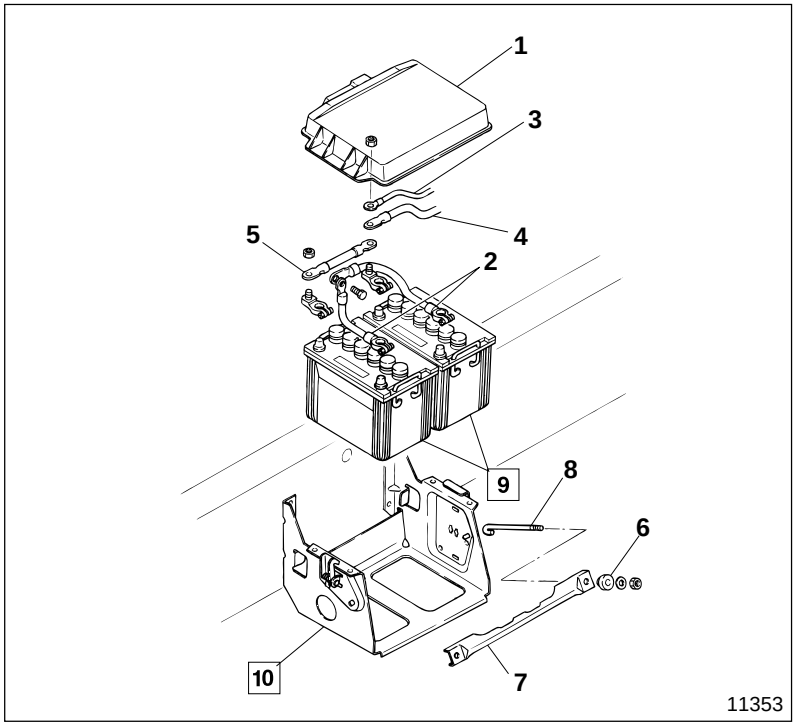
CAUTION⚠

Do not start the engine with switch C turned ON because the starter current will flow into ammeter A and damage it.

- If the charge current is five amperes or less and the engine speed is approximately 2420 rpm, measure the adjustment voltage.
- If the charge voltage is five amperes or more, do one of the following :
  - Run the engine for a while to charge the battery.
  - Replace the old battery with a fully-charged one.
  - Connect a $^1/_4$ Ω (25 W) resistor in series with the battery to limit the charge current.
- If the measured value deviates from the standard value, change the regulators.

https://truckmanualshub.com/

101 BATTERY



● **Removal sequence**

1 Battery cover
2 Battery cable ⊖
3 Harness (Main high-current fuse)
4 Starter cable
5 Battery cable ⊕
6 Rubber
7 Angle frame
8 Set bolt
9 Battery
10 Battery box

● **Installation sequence**

Follow the removal sequence in reverse.

DANGER⚠

- **Since flammable hydrogen gas is generated by battery 9, be sure to obey the following warnings :**
  - **Do not short-circuit the ⊕ and ⊖ terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over battery 9.**
- **Because the battery electrolyte is diluted sulfuric acid and is corrosive, when handling battery 9 wear safety glasses and rubber gloves to protect the eyes and hands.**

WARNING⚠

To prevent a short-circuit be sure that disconnected battery cables 2 and 5 do not accidentally touch the battery terminals.

CAUTION⚠

- **Make sure that you disconnect battery cable ⊖ 2 first when you disconnect battery cables 2 and 5.**
- **Make sure that all electrical switches of the vehicle are OFF before connecting battery cables 2 and 5.**
- **Make sure that you connect battery cable ⊕ 5 before you connect battery cable ⊖ 2.**

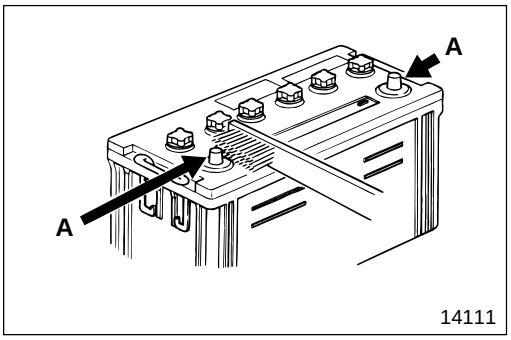
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
9	Specific gravity of battery electrolyte (20°C {68°F})	1.280	1.220	Charge or replace

https://truckmanualshub.com/

◆ Service procedure

9 Inspection of battery

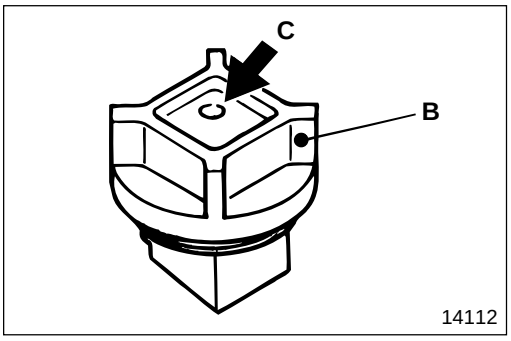


(1) Visual inspection

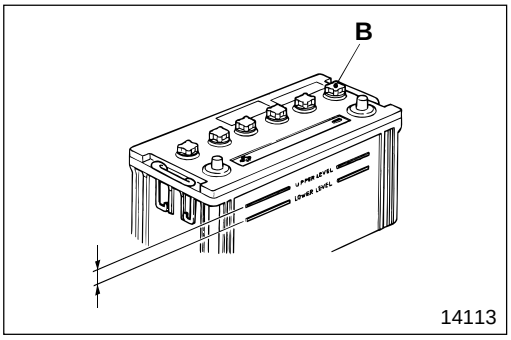
- If terminal **A** is corroded, scrub off the corrosion from it using a wire brush.
- If cracks or defects are found on battery **9**, replace it since the cracks or defects can cause liquid spills.

CAUTION

Make sure you grease the ⊕ side of terminal A because it is easily corroded.

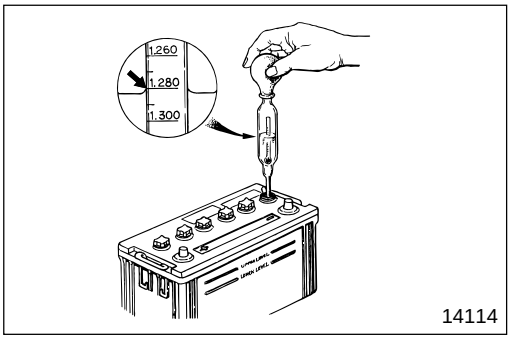


- If bleed hole **C** of vent plug **B** is clogged, clean the hole.



(2) Inspection of fluid level

- Make sure that the battery electrolyte level is between UPPER and LOWER.
- If the level is below LOWER, remove vent plug **B** and fill the battery with distilled water or battery replenisher to UPPER.



(3) Measurement of specific gravity

Measure the specific gravity of the battery electrolyte. If the measured value is lower than the limit, charge the battery.

NOTE

The specific gravity of the battery electrolyte depends on the liquid temperature. Use the following formula to convert the actual value to the value were the temperature 20°C {68°F}.

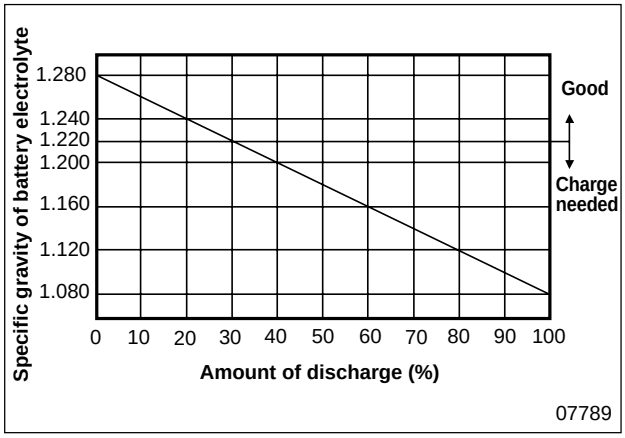
$$S_{20}\{68\} = S_t + 0.0007\,(t - 20\,\{68\})$$

S_{20} {68} : Specific gravity were the temperature 20°C {68°F}

S_t : Specific gravity actually measured with the temperature at t°C {t°F}

t : Temperature of battery electrolyte

https://truckmanualshub.com/



(4) Charging

- Although, as a rule, charging of battery **9** should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect battery cable ⊖ **2**.
- Remove vent plug **B** before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	$\frac{\text{Value of 5-hour rating capacity}}{10}$	$\frac{*\text{Amount of discharge (Ah)}}{\text{Charge current (A)}} \times 1.2\text{(to 1.5)}$	45 {113}
Quick charge	$\frac{\text{Value of 5-hour rating capacity}}{1.5}$	0.5	55 {131}

* Amount of discharge (Ah)=5-hour rating capacity (Ah)$\times \frac{\text{Amount of discharge (\%)}}{100}$

- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep naked lights away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because its dangerous.**
- **After charging the battery, tighten vent plug B, wash away sulfuric acid from the battery using water, and dry the surface.**

10 Inspection of battery box

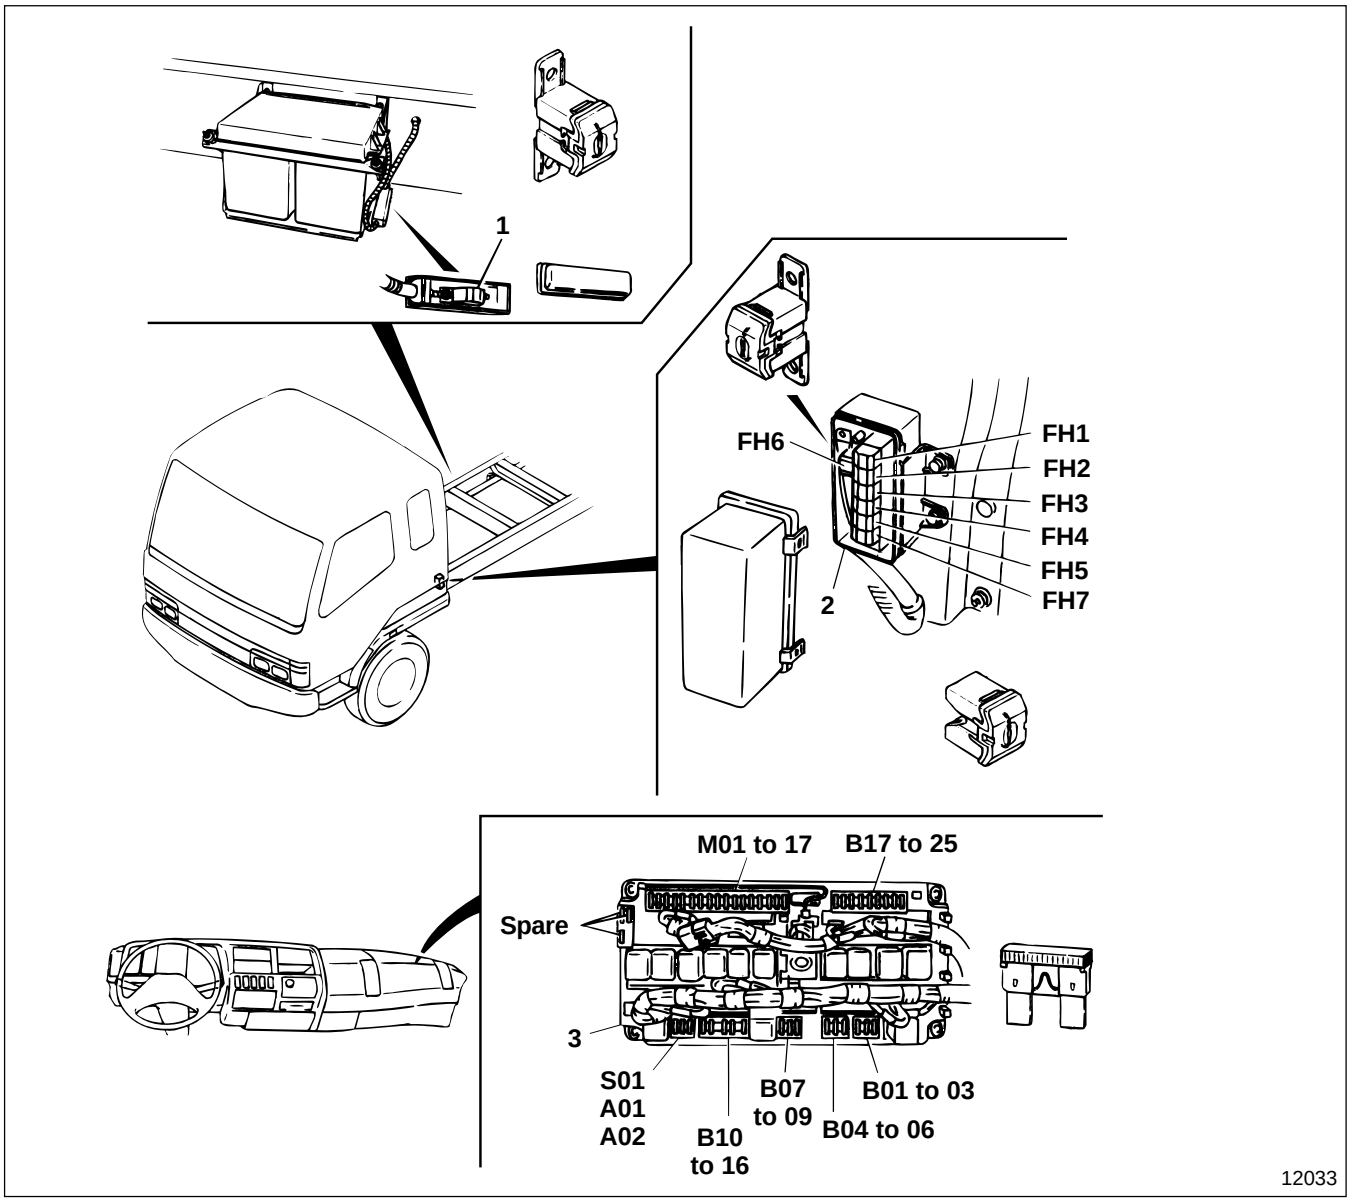
- If battery box **10** is corroded, scrub off the corrosion from it using a wire brush and apply acid resistant coating.
- If battery box **10** is corroded excessively or if it is broken or cracked, replace it.

https://truckmanualshub.com/

M E M O

https://truckmanualshub.com/

Installation Position



1 Main high-current fuse
2 High-current fuse box
3 Relay and fuse box

CAUTION ⚠

- **If a fuse blows, make sure you identify and remedy the cause, then replace the fuse.**
- **Make sure that you replace the fuse with one having the same rating.**
- **Make sure that you remove the ⊖ terminal of the battery cable before removing main high-current fuse 1 and high-current fuses FH1 to 7.** 🕮 101

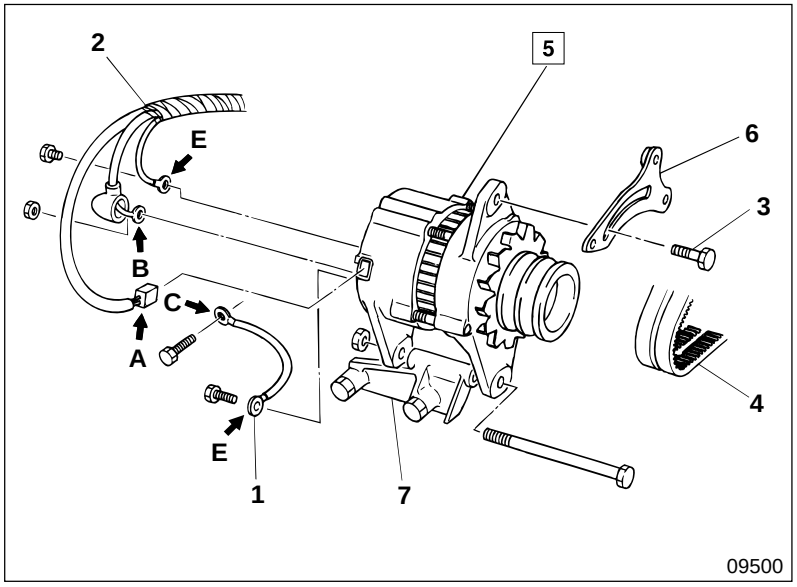
106 ALTERNATOR



● **Removal sequence**

1 Ground cable
2 Chassis harness
3 Adjusting bolt
4 V-belts
5 Alternator P54-1-18
6 Adjusting plate
7 Alternator bracket

A : To terminals L and R
B : To terminal B
C : Connected to crankcase
E : To terminal E

WARNING

- **Terminal B is always loaded with voltage from the battery, supplied via chassis harness 2. Therefore when you remove the harness from terminal B, make sure that tools do not touch any adjacent parts because this would cause a short-circuit.**
- **Make sure that you disconnect terminal ⊖ of the battery before removing the harness and insulate the terminal with tape.**

● **Installation sequence**

Follow the removal sequence in reverse.

● **Adjustment after installation**

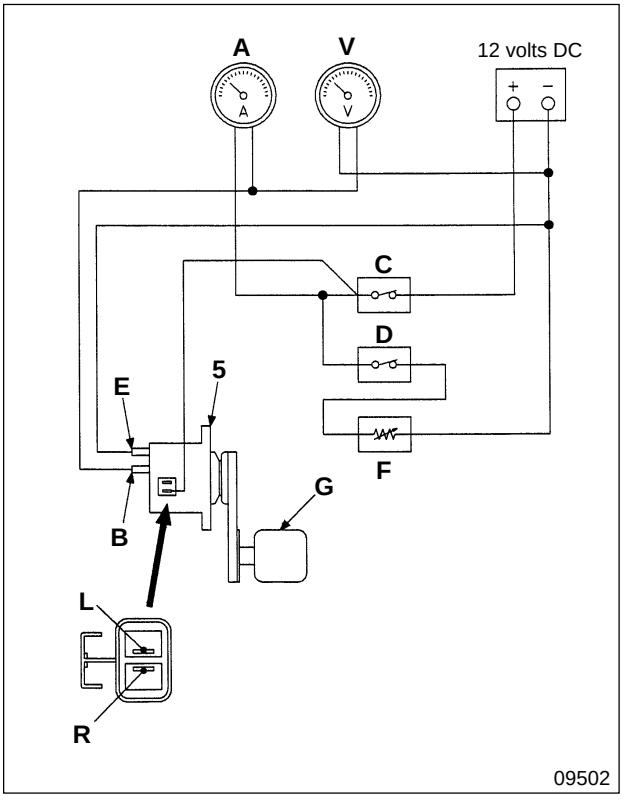
Adjustment of V-belt **4** tension Gr 14

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
5	Output current (* When engine is hot and 13.5 V is loaded)	At 1500 rpm	38 A or more	—	Inspect
		At 2500 rpm	65 A or more	—	
		At 5000 rpm	76 A or more	—	
	Adjustment voltage of regulator (At 5000 rpm, 5 A is loaded)		14.7±0.3 V	—	Replace

* The value of the ambient temperature is measured after running the engine at maximum power (5000 rpm) for 30 minutes.

https://truckmanualshub.com/



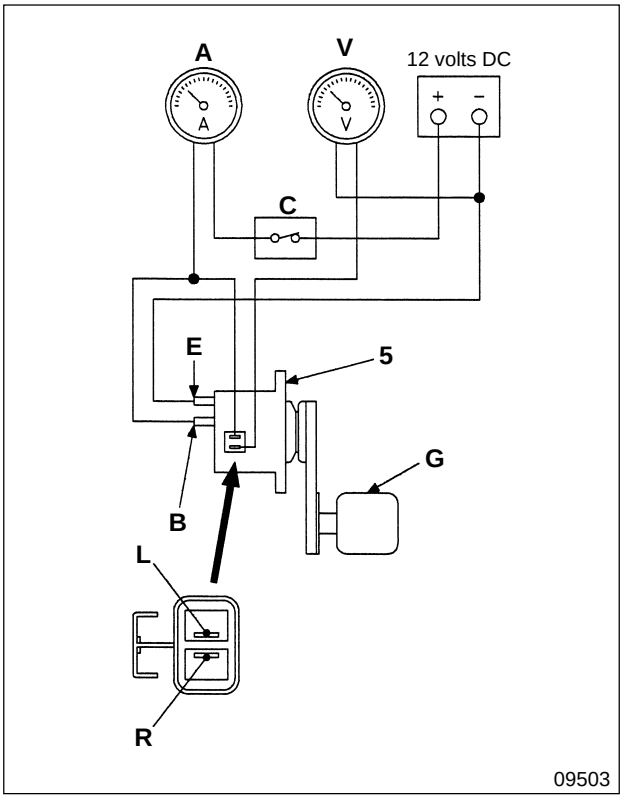
5 Inspection of alternator

(1) Inspection of alternator performance (bench test)

- Connect each unit to the alternators as illustrated.
  A : Ammeter
  B : Terminal B on alternator
  C : Switch
  D : Switch
  E : Terminal E on alternator
  F : Load resistance (variable resistance)
  G : Alternator drive motor
  L : Terminal L on alternator
  R : Terminal R on alternator
  V : Voltmeter
- Turn switches **C**, **D** OFF.
- Run alternator **5** at 5000 rpm.
- Adjust load resistance **F** to maintain the specified current.

  Specified output of the alternator : 12 V-80 A

- After adjustment, run alternator **5** for 30 minutes.
- Maximize load resistance **F** (current hardly flows).
- Turn switches **C**, **D** ON.
- Increase the rotation of alternator **5** gradually and measure current at specified rpm.
- If the measured value deviates from the standard value, disassemble and inspect alternator **5**. P54-1-20



(2) Inspection of regulator (bench test)

- Connect each unit to the alternators as illustrated.
  A : Ammeter
  B : Terminal B on alternator
  C : Switch
  E : Terminal E on alternator
  G : Alternator drive motor
  L : Terminal L on alternator
  R : Terminal R on alternator
  V : Voltmeter
- Turn switch **C** ON.
- Run alternator **5**.
- Make sure that the value of the current at 5000 rpm is five amperes or less.
- Measure voltage (adjustment voltage).
- If the measured value deviates from the standard value, replace the regulator (in alternator **5**).

14 Field coil
15 Regulator
16 Rectifier
17 Rear bracket

⊗ : Non-reusable parts

NOTE

Do not remove parts 6, 9, 13 unless they are faulty.

● **Assembly sequence**

12 → 1

12 : 17 → 16 → 15 → 14 → 13

1 : 11 → 10 → 9 → 8 → 7 → 6 → 5 → 4 → 3 → 2

https://truckmanualshub.com/

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
14	Field coil resistance (20°C {68°F})	2.6 to 3.4 Ω	—	Replace

Tightening torque

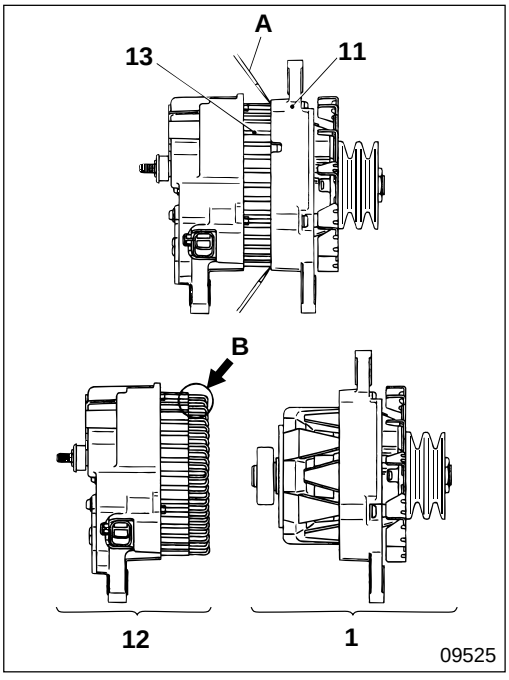
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Nut (Pulley mounting)	132 to 162 {98 to 120, 13.5 to 16.5}	—

Lubricant

Location	Points of application	Kinds	Quantity
6	Rear bearing inner periphery	Engine oil	As required
7	Front bearing installation part of rotor assembly	Engine oil	As required
9	Front bearing outer periphery	Engine oil	As required

◆ Service procedure



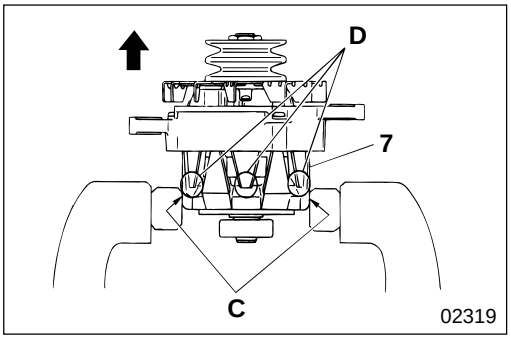
1 Rotor and front bracket assembly

[Removal]

- Insert screwdriver **A** between front bracket **11** and stator assembly **13**.
- Use screwdriver **A** to pry rotor and front bracket assembly **1** away from stator and rear bracket assembly **12**.

CAUTION

Be careful not to insert the screwdriver too deep or it will damage coil B of stator assembly 13 and might cause a short-circuit.

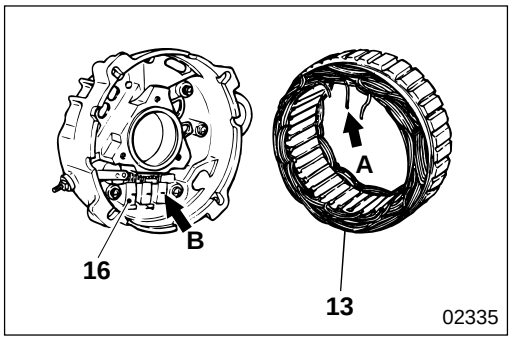


[Disassembly]

CAUTION

Make sure, when you hold rotor assembly 7 in a vise, to grip root C of the core claws. Gripping claws D can damage them.

https://truckmanualshub.com/



13 Stator assembly

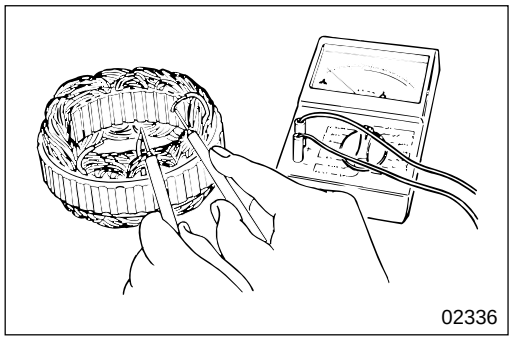
[Removal and installation]

- Disconnect lead **A** of stator assembly **13** from rectifier **16**. The lead is soldered to diode **B** of rectifier **16** at three points.

CAUTION

Make sure that you desolder within five seconds because the diode is heat sensitive.

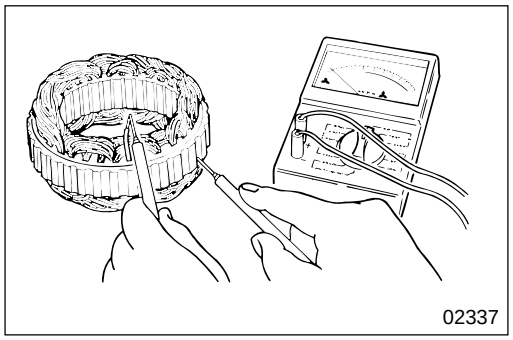
- To install, follow the removal sequence in reverse.



[Inspection]

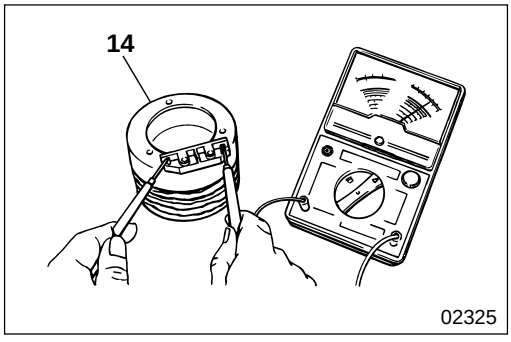
(1) Continuity of each lead wire

- Make sure that each lead wire has continuity.
- If there is no continuity, the lead wire is broken. Replace stator assembly **13**.



(2) Continuity between lead wires and the core

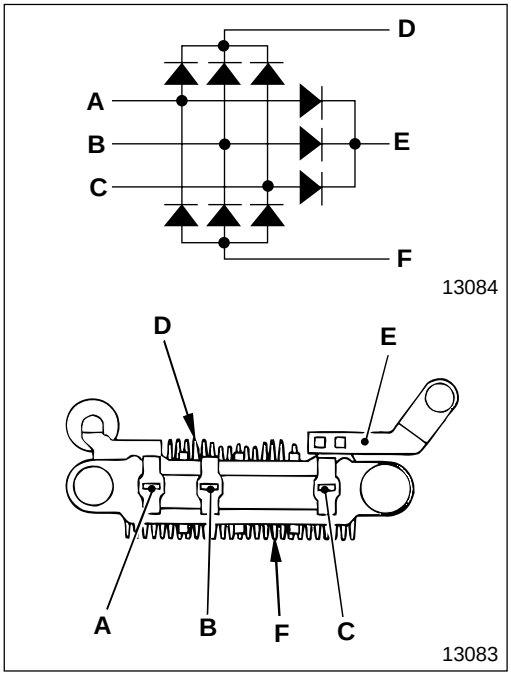
- Make sure that there is no continuity between lead wires and the core.
- If there is continuity, replace stator assembly **13**, since it might be short-circuited.



14 Inspection of field coil

- Measure the resistance between the terminals of field coil **14**.
- If the measured value deviates from the standard value, replace field coil **14**.

https://truckmanualshub.com/



16 **Inspection of rectifier**

- Inspect whether the diode inside rectifier **16** functions properly, and if any fault is found, replace the rectifier.
  A, **B**, **C** : Lead connecting area of stator coil
  D, **E** : Heat sink area
  F : Regulator connecting area
- Inspect the rectifier twice, before and after the ⊕ side and ⊖ side of the tester have been changed over.

CAUTION ⚠

When inspecting using a tester, the current becomes weaker than the usual current flowing through rectifier 16. Therefore, an incomplete resistance value might be indicated.
Also, this tendency increases as the range of the tester gets smaller. Therefore, use as big a range as possible.

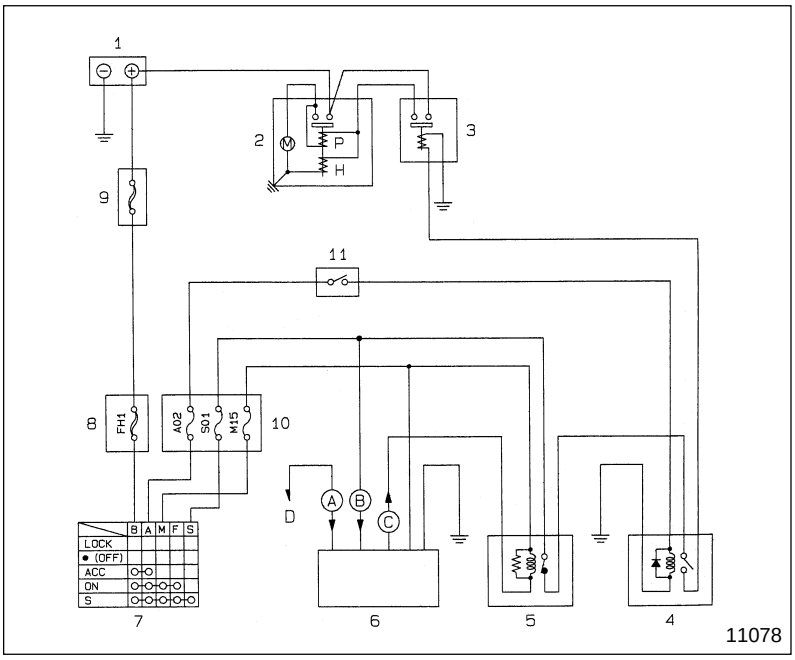
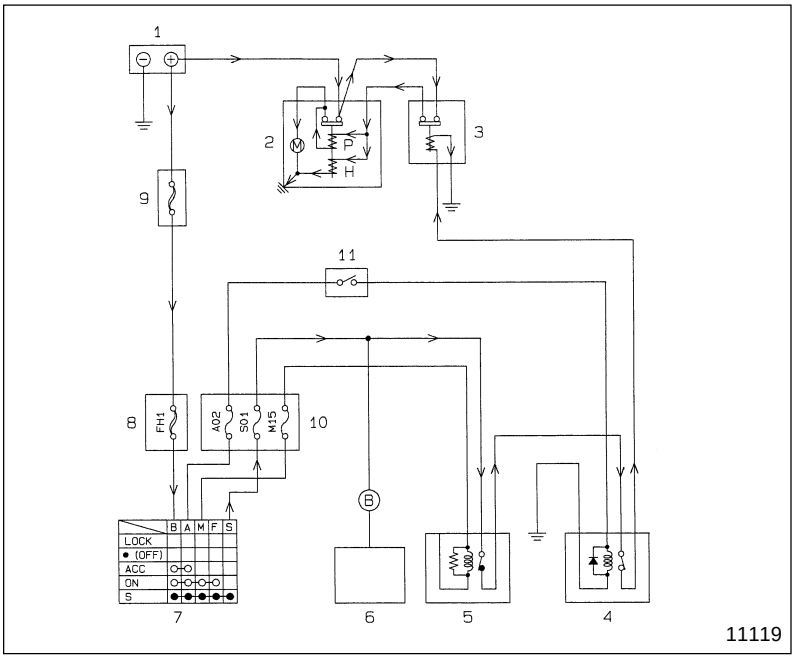
Engine Starting Circuit < Manual Transmission >



1 Battery
2 Starter
3 Starter relay
4 Transmission neutral relay
5 Safety relay
6 Multipurpose timing control unit
P54-9-2
7 Starter switch
8 High-current fuse box
9 Main high-current fuse
10 Relay and fuse box
11 Transmission neutral switch

A : Alternator L signal
B : Starter switch S signal
C : Safety relay operating signal
D : To alternator L terminal
H : Holding coil
P : Pull-in coil

- The engine starting circuit lets starter **2** rotate only when the transmission is in neutral.
- When current flows from starter switch **7** terminal S to starter relay **3** for longer than the specified period when starter **2** is rotating, multipurpose timing control unit **6** cuts off the current, preventing the starter from seizing up.

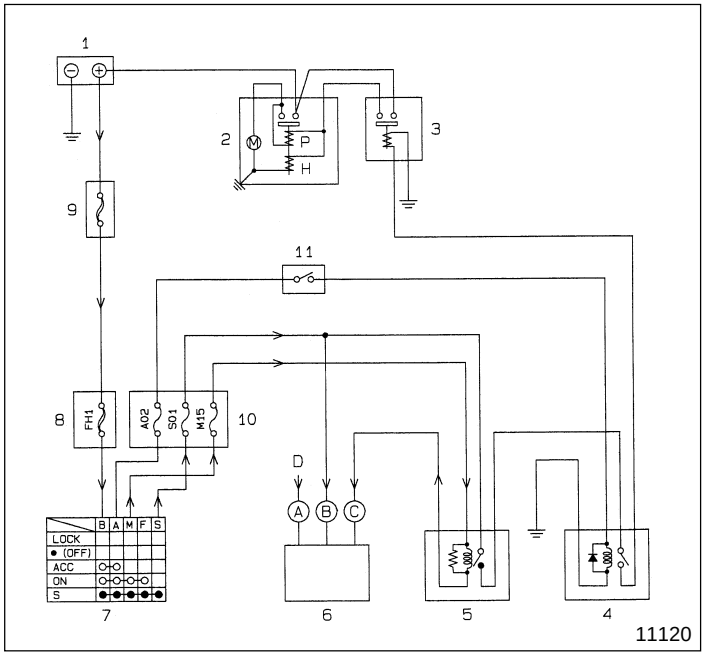


When starter operation is normal

Position of starter switch **7** : S

- 1→9→8→7→10 (S01)→5 (contact point) →4 (contact point)→3 (coil)→Ground
  Starter relay **3** is activated.
- 1→2 (contact point)→3 (contact point)
  →2 (P)→2 (Ⓜ)
  →2 (F)→Ground
  Current that has flowed through pull-in coil **P** rotates starter **2** at low revolution. When the contact point of the starter closes, the current at the pull-in coil cuts off and holding coil **H** holds the contact point.
- 1→2 (contact point)→2 (Ⓜ)→Ground
  Starter rotates at high revolution.

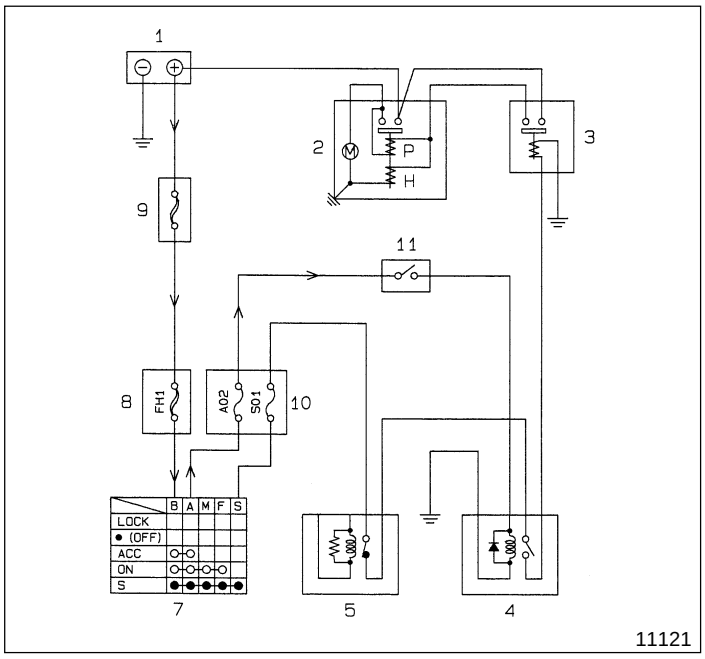
https://truckmanualshub.com/



When starter rotates for a long period

Position of starter switch **7** : S

- Starter rotates at high revolution. (See previous section.)
- 1→9→8→7→10 (S01)—Ⓑ→6
  Starter switch S signal Ⓑ is transmitted to multipurpose timing control unit **6**.
- D—Ⓐ→6
  Alternator L signal Ⓐ is transmitted to multipurpose timing control unit **6** through alternator L terminal **D** by the revolution of the engine.
- When signals Ⓐ and Ⓑ are continuously transmitted to multipurpose timing control unit **6** for the specified period, the multipurpose timing control unit activates safety relay **5** by transmitting safety relay activation signal Ⓒ.
  1→9→8→7→10 (M15)→5 (coil)—Ⓒ→6
- Activation of safety relay **5** cuts off the flow of current to starter relay **3**, stopping starter **2**.



When the starter is activated when the transmission is in a position other than in neutral

Position of transmission neutral switch **11** : OFF
The flow of the current from terminal S of starter switch **7** is cut off and starter relay **3** is not activated.

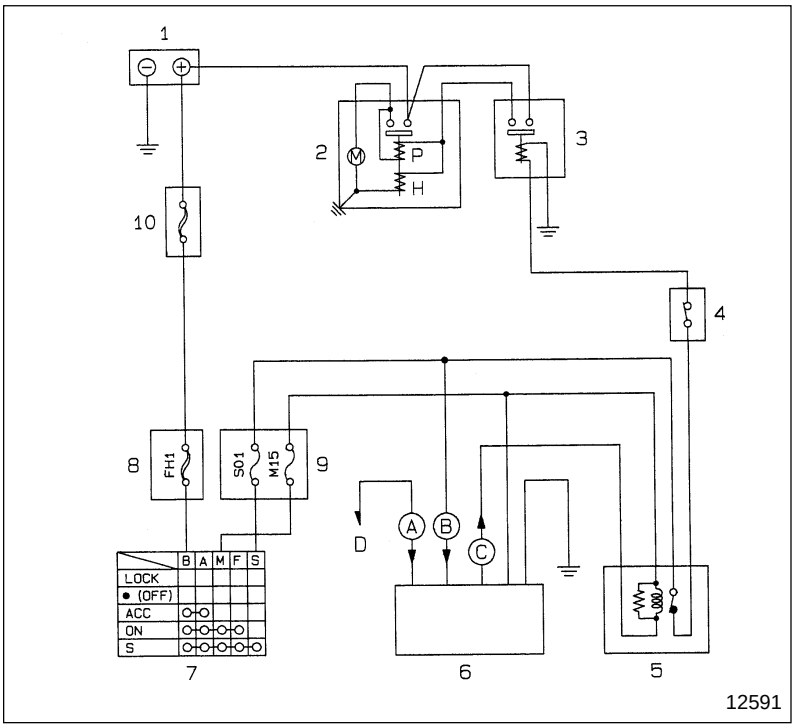
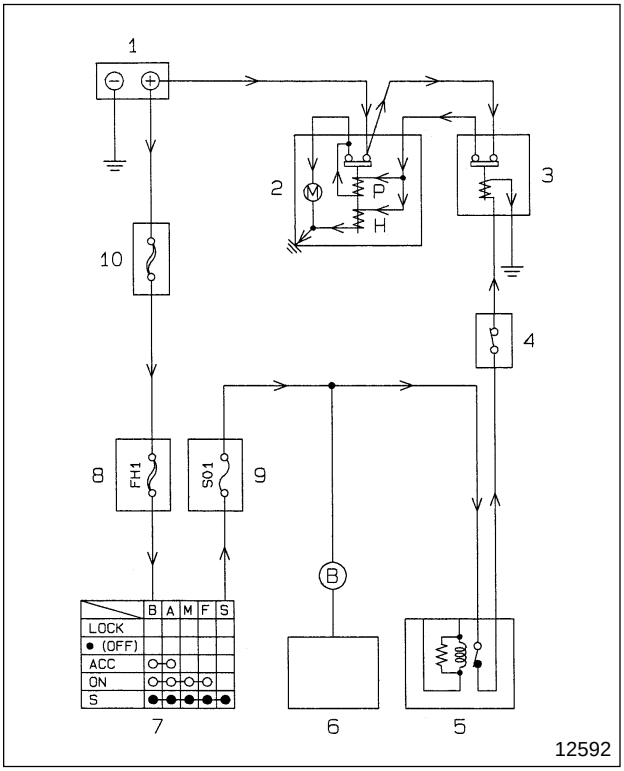
Engine Starting Circuit < Automatic Transmission >



1 Battery
2 Starter
3 Starter relay
4 Transmission neutral switch
5 Safety relay
6 Multipurpose timing control unit
7 Starter switch
8 High-current fuse box
9 Relay and fuse box
10 Main high-current fuse box

A : Alternator L signal
B : Starter switch S signal
C : Safety relay operating signal
D : To alternator L terminal
H : Holding coil
P : Pull-in coil

- The engine starting circuit lets starter **2** rotate only when the transmission is in neutral.
- When current flows from starter switch **7** terminal S to starter relay **3** for longer than the specified period when starter **2** is rotating, multipurpose timing control unit **6** cuts off the current, preventing the starter from seizing up.

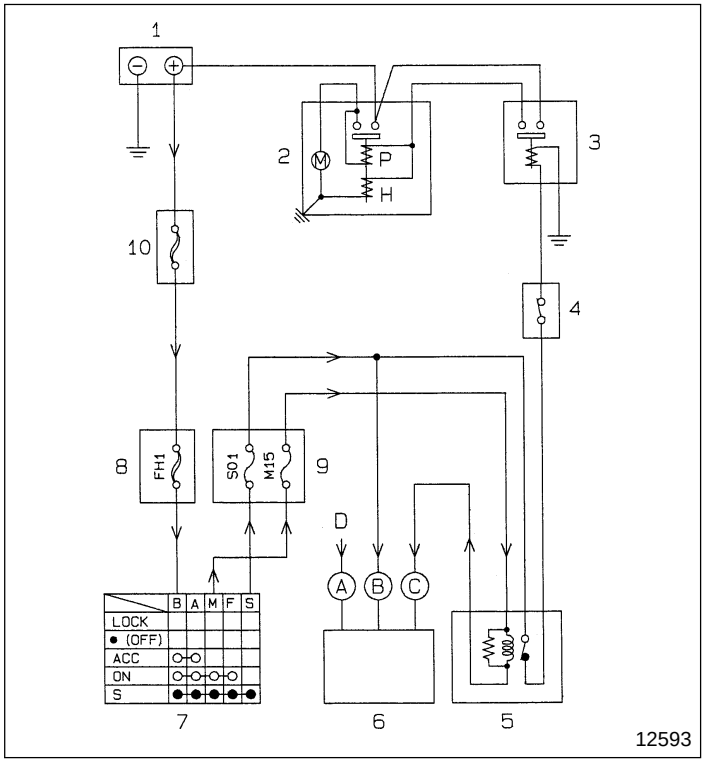


When starter operation is normal

Position of starter switch **7** : S

- 1→10→8→7→9 (S01)→5 (contact point)→4 →3 (coil)→Ground
  Starter relay **3** is activated.
- 1→2 (contact point)→3 (contact pint)→2 (P)→2 (Ⓜ)→2 (F)→Ground
  Current that has flowed through pull-in coil **P** rotates starter **2** at low revolution. When the contact point of the starter closes, the current at the pull-in coil cuts off and holding coil **H** holds the contact point.
- 1→2 (contact point)→2 (Ⓜ)→Ground
  Starter rotates at high revolution.

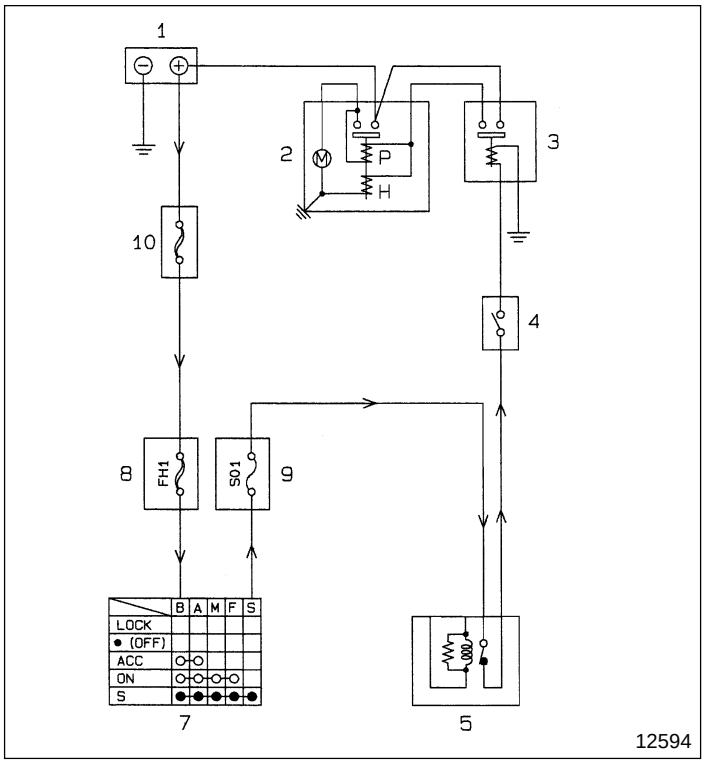
https://truckmanualshub.com/



When starter rotates for a long period

Position of starter switch **7** : S

- Starter rotates at high revolution. (See previous section.)
- 1→10→8→7→9 (S01)—Ⓑ→6
  Starter switch S signal Ⓑ is transmitted to multipurpose timing control unit **6**.
- D—Ⓐ→6
  Alternator L signal Ⓐ is transmitted to multipurpose timing control unit **6** through alternator L terminal **D** by the revolution of the engine.
- When signals Ⓐ and Ⓑ are continuously transmitted to multipurpose timing control unit **6** for the specified period, the multipurpose timing control unit activates safety relay **5** by transmitting safety relay activation signal Ⓒ.
  1→10→8→7→9 (M15)→5 (coil)—Ⓒ→6
- Activation of safety relay **5** cuts off the flow of current to starter relay **3**, stopping starter **2**.



When the starter is activated when the transmission is in a position other than in neutral

Position of transmission neutral switch **4** : OFF

The flow of current from terminal S of starter switch **7** is cut off and starter relay **3** is not activated.

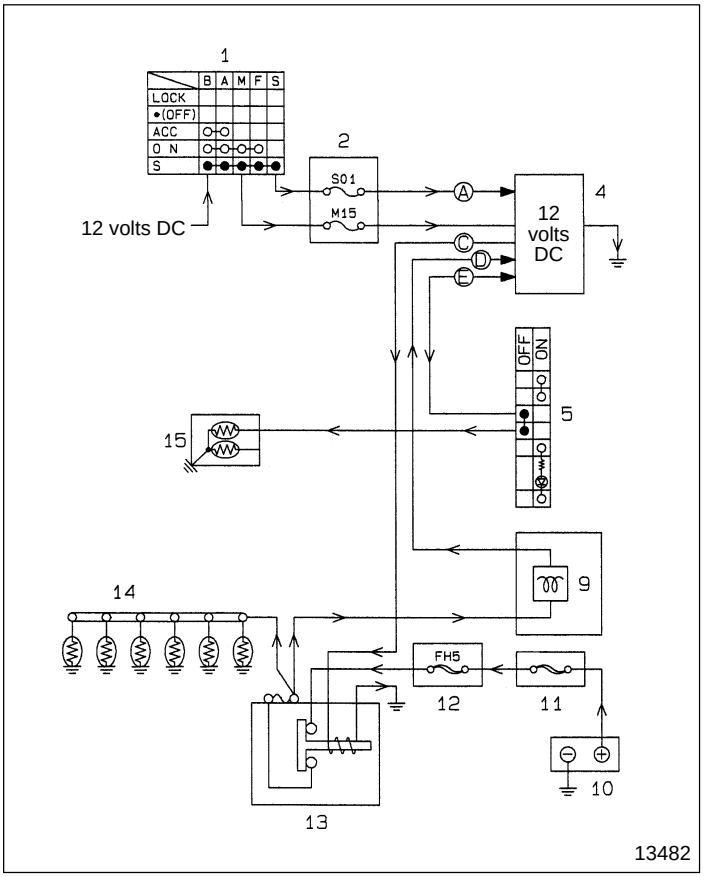
Ⓐ Engine start signal
Ⓑ Alternator charge signal
Ⓒ Glow relay activation signal
Ⓓ lighting-up signal
Ⓔ Engine coolant temperature signal

https://truckmanualshub.com/



● Engine preheating circuit

This circuit improves the engine starting performance when the engine coolant temperature is low. The preheating system is controlled by multipurpose timing control unit **4**. P54-9-2

Basic preheating operation

Operation mode P54-2-10

When engine coolant temperature is low (Approximately 60°C {140°F} or less)

- Position of starter switch **1** : ON
  1→2 (M15)→4→Ground
  └Ⓔ→5→15→Ground

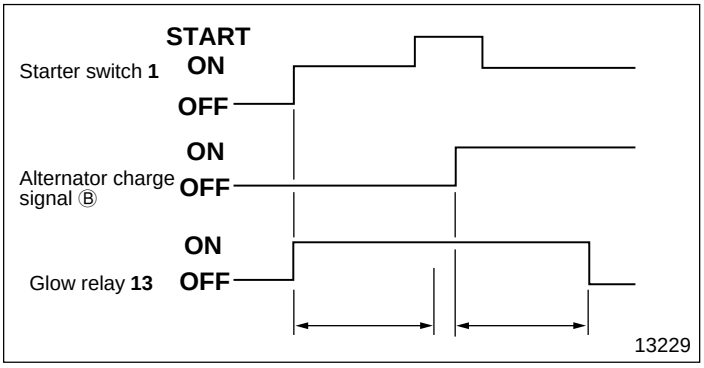
  Multipurpose timing control unit **4** detects the engine coolant temperature.
- When the engine coolant temperature is low, multipurpose timing control unit **4** outputs glow relay activation signal Ⓒ.
  4 —Ⓒ→13→Ground

- Glow relay **13** operates to feed power to glow plug **14** and lights up engine preheating indicator lamp **9**.
  10→11→12→13 (contact point)→14→Ground
  └→9—Ⓓ→4→Ground

When engine coolant temperature is high (Approximately 60°C {140°F} or more)

- Position of starter switch **1** : ON
  1→2 (M15)→4→Ground
  └Ⓔ→5→15→Ground

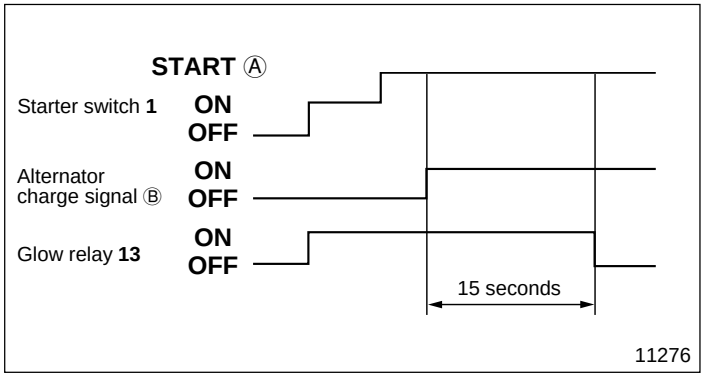
  Multipurpose timing control unit **4** detects the engine coolant temperature.
- When the engine coolant temperature is high, multipurpose timing control unit **4** does not output glow relay activation signal Ⓒ, so no preheating is performed.



Pre-glow and after-glow

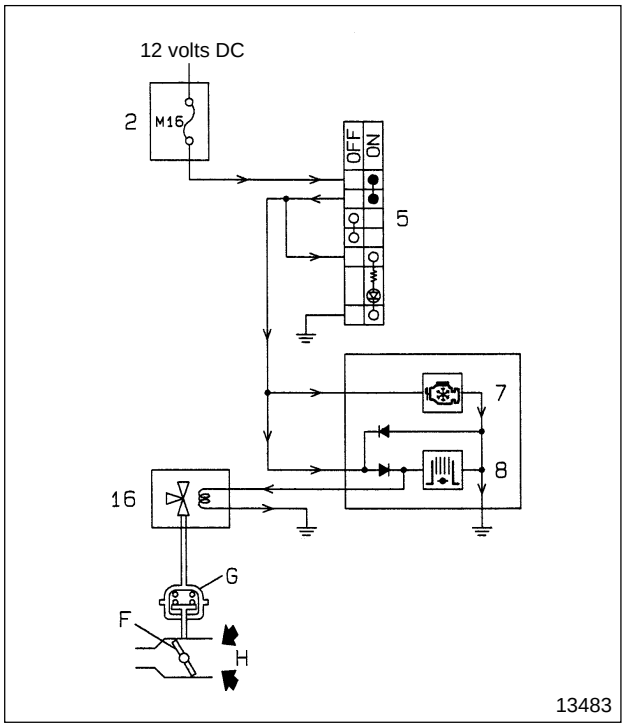
There are two types of preheating: one is pre-glow, performed before starting the engine; the other is after-glow, performed after starting the engine. They are both controlled by start signal Ⓐ and alternator charge signal Ⓑ.

https://truckmanualshub.com/



Fail-safe

- If the contacts of the glow relay driving relay in multipurpose timing control unit **4** are welded, engine preheating indicator lamp **9** blinks to alert the driver of the fault.
- When all of the following conditions are satisfied, the fail-safe function turns off glow relay **13**.
  - Coolant temperature is 60°C {140°F} or less.
  - Engine start signal Ⓐ is ON.
  - Alternator charge signal Ⓑ is ON for 15 seconds.



Cold start circuit

This circuit helps the engine preheating performance when the ambient temperature is low.

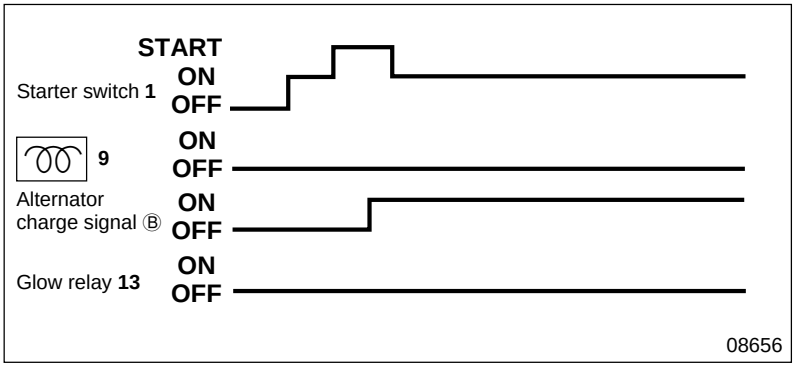
- Position of cold start switch **5** : ON

2→5→7
→8→Ground
→16→Ground

This circuit forces exhaust brake 3-way magnetic valve **16** to operate, closing exhaust brake butterfly valve **F**.
This decreases incoming cool air **H** from the engine exhaust system and reduces preheating time.

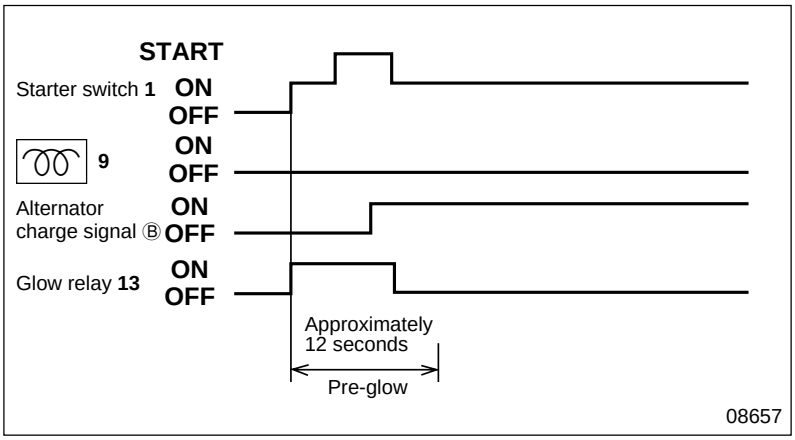
F : Exhaust brake butterfly valve
G : Exhaust brake unit
H : Cool air from engine exhaust system

https://truckmanualshub.com/

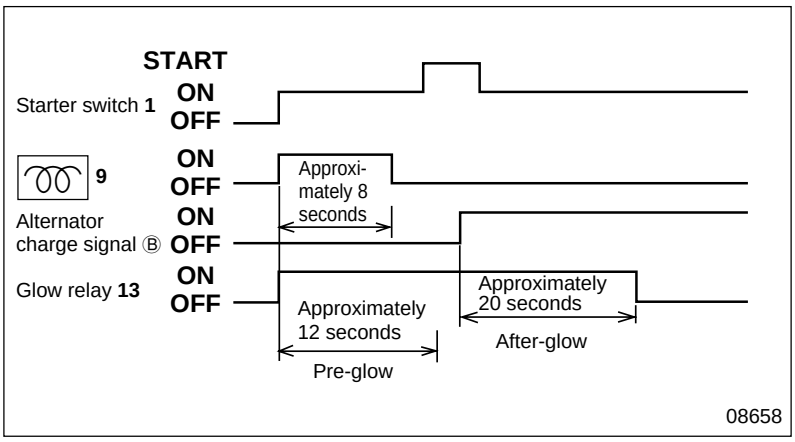


Operation mode

- Where the engine coolant temperature is 60°C {140°F} or more.

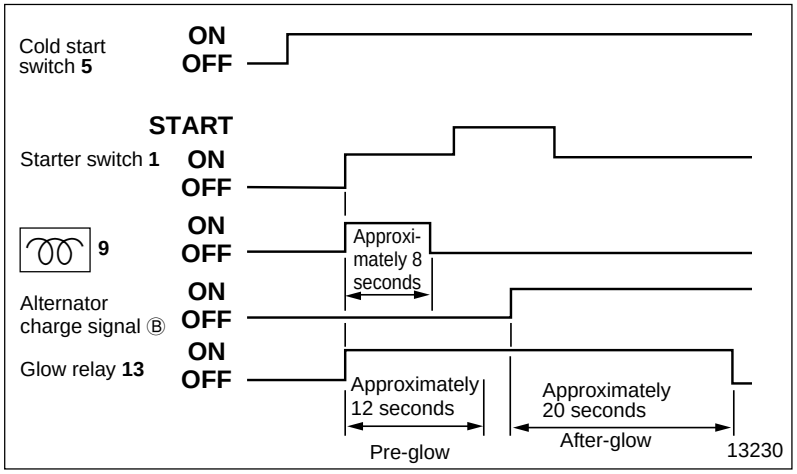


- Where the engine coolant temperature is 0 to 60°C {32 to 140°F}.



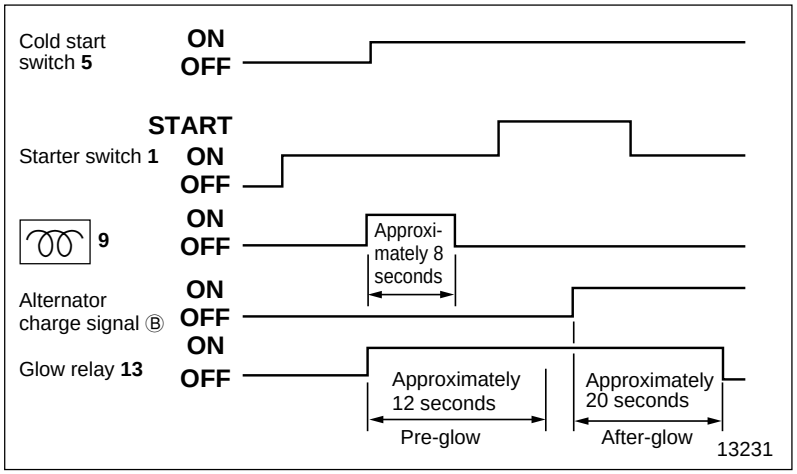
- Where the engine coolant temperature is 0°C {32°F} or less.

https://truckmanualshub.com/



Operation mode when cold start switch is used

- When starter switch **1** is turned ON after cold start switch **5** is turned ON.



- When cold start switch **5** is turned ON after starter switch **1** is turned ON.
  (Where the engine coolant temperature is 0°C {32°F} or more.)

https://truckmanualshub.com/

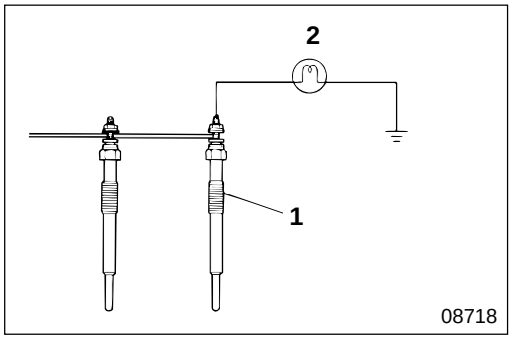
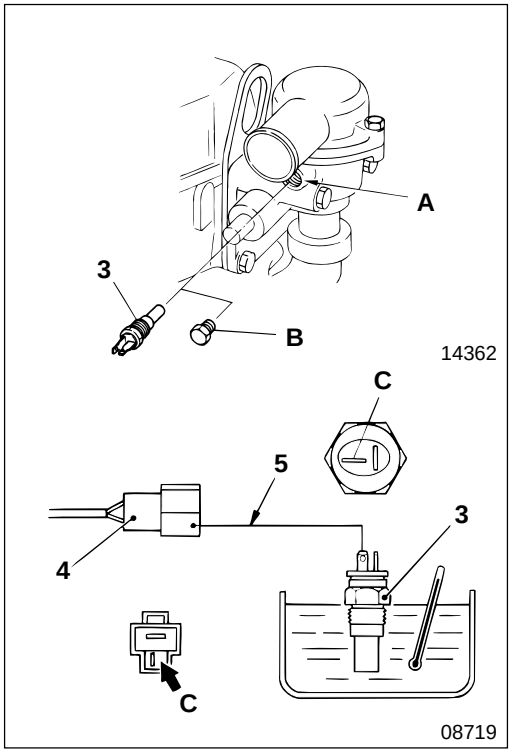
Inspection of Engine Preheating System

Service standards

Location	Maintenance item			Standard value	Limit	Remedy
—	Pre-glow time	Water temperature	60°C {140°F} or more	Does not pre-glow	—	Inspect
			0 to 60°C {32 to 140°F}	Approximately 12 seconds	—	
			0°C {32°F} or less	Approximately 12 seconds	—	
	After-glow time	Water temperature	60°C {140°F} or more	Does not after-glow	—	
			0 to 60°C {32 to 140°F}	Does not after-glow	—	
			0°C {32°F} or less	Approximately 20 seconds	—	
	Indicator lamp lighting time	Water temperature	60°C {140°F} or more	Does not light	—	
			0 to 60°C {32 to 140°F}	Does not light	—	
			0°C {32°F} or less	Approximately 8 seconds	—	



- Turn the starter switch OFF.
- Turn the cold start switch OFF.
- Connect inspection lamp **2** to glow plug **1**.



- Remove water temperature sensor **3** from the engine and plug sensor mounting part **A** with plug **B** (M16×1.5 mm).
  Removal and installation of water temperature sensor **3** Gr 14
- Connect extension harness **5** between water temperature sensor **3** and connector **4**.

NOTE

Connect extension harness 5 to terminal C of the multipurpose timing control unit.

- Put water temperature sensor **3** into a container filled with water.
- Carry out the following inspection while changing the water temperature in the container. If any fault is found, inspect each unit.

(1) Inspection of pre-glow time and indicator lamp lighting time

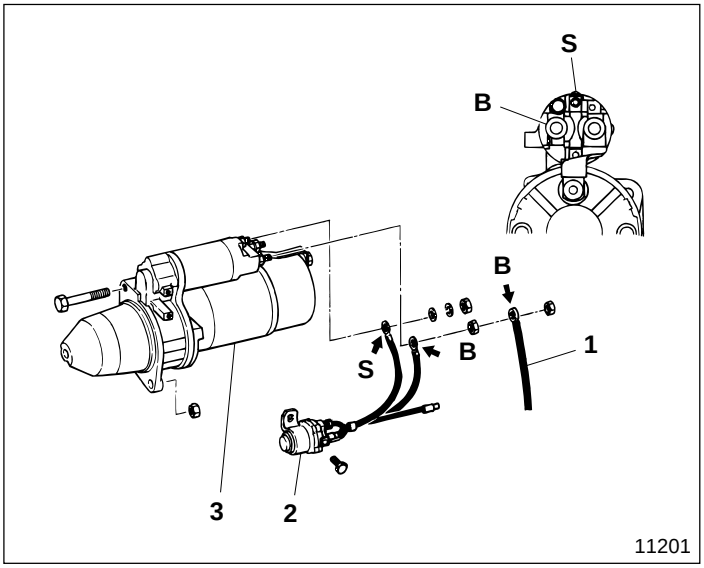
Turn the starter switch ON but do not start the engine. Make sure that the pre-glow time and the indicator lamp lightning time at each water temperature conform to the standard value.

- For pre-glow time inspection, measure the lighting time of inspection lamp **2**.
- For indicator lamp lightning time inspection, measure the lighting time of lamp within the meter cluster directly.

(2) Inspection of after-glow time

Start the engine and measure the lighting time of inspection lamp **2** from the point lamp within the meter cluster goes off, and make sure that the after-glow time conforms to the standard value.

https://truckmanualshub.com/



● **Removal sequence**

1 Starter cable (to battery connection)
2 Starter relay
3 Starter 📖 54-2-20

B : Terminal B
S : Terminal S

WARNING⚠

Never touch the starter with tools when you remove the harness from terminal B. This is because voltage is always supplied to it from starter cable 1, and you will short-circuit the starter. Before removing the harness from terminal B, remove the ⊖ battery terminal and tape it up to insulate it.

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION⚠

- **Do not remove bearings 15, 21, 22 unless they are faulty.**
- **Make sure you do not drop armature assembly 20 when you remove yoke and rear bracket assembly 25 from front bracket assembly 4.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

After replacing magnetic switch 2 adjust the gap of the pinion

● **Inspection after assembly**

🕮 P54-2-22

Service standards

Unit : mm {in.}

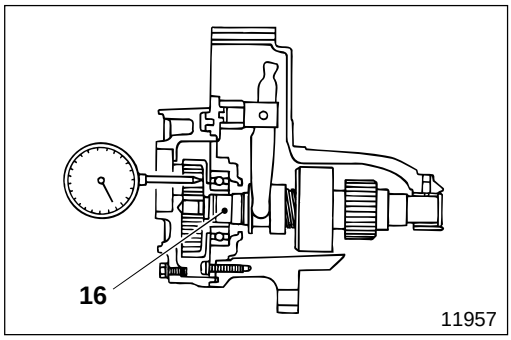
Location	Maintenance item		Standard value	Limit	Remedy
—	Thrust gap of gear shaft assembly		0.1 to 0.5 {0.0039 to 0.02}	—	Adjust
—	Pinion gap		0.5 to 2.0 {0.02 to 0.079}	—	Adjust
—	No-load characteristic (11 V when current flowing)	Current	220 A or less	—	Inspect
		Number of revolutions	3200 rpm or more	—	
2	Magnetic switch operating voltage		16 V or less	—	Replace
20	Armature assembly	Outer diameter of commutator	43.2 {1.7}	42.2 {1.66}	Replace
		Deflection of commutator periphery	0 to 0.03 {0 to 0.0012}	0.1 {0.0039}	Replace
		Mica depth between segments	0.4 to 0.6 {0.016 to 0.024}	0.3 {0.012} or less	Replace
29	Pressure of brush spring		25 to 34 N {5.6 to 7.6 lbf, 2.55 to 3.45 kgf}	18 N {4 lbf, 1.8 kgf}	Replace
30, 31	Length of brush		23 {0.91}	14 {0.55}	Replace

Lubricant

Location	Points of application	Kinds	Quantity
2	Contact surface between lever and magnetic switch	Multipurpose grease [NLGI No.2 (Ca soap)]	As required
5	Gear shaft mounting surface of center bracket	Grease for heavy load at low temperature [NLGI No.2 (Li soap)]	As required
13	Friction surfaces of overrunning clutch and lever	Multipurpose grease [NLGI No.2 (Ca soap)]	As required
16	Clutch spline of gear shaft	Grease for heavy load at low temperature [NLGI No.2 (Li soap)]	As required
	Friction surfaces of gear shaft and sleeve bearing	Grease for heavy load at low temperature [NLGI No.2 (Li soap)]	As required

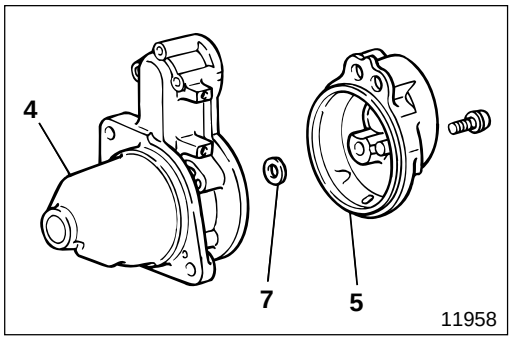
https://truckmanualshub.com/

◆ Service procedure



● Inspection before disassembly

Thrust gap of gear shaft
[Inspection]
- Measure the thrust gap of gear shaft **16** in the axial direction.
- If the measured value deviates from the standard value, adjust the thrust gap as follows.

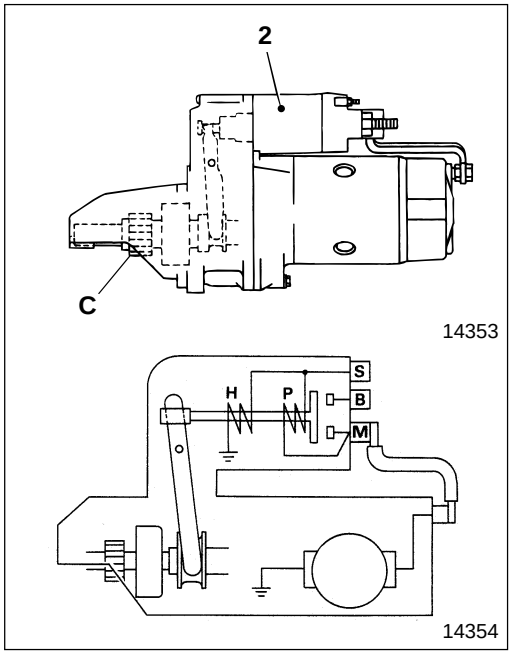


[Adjustment]
- Remove center bracket **5** from front bracket assembly **4**.
- Change the thickness of adjusting washer **7** for adjustment.
  Available adjustment washers thicknesses: 0.25, 0.5 mm {0.0098, 0.02 in.}

● Inspection after assembly

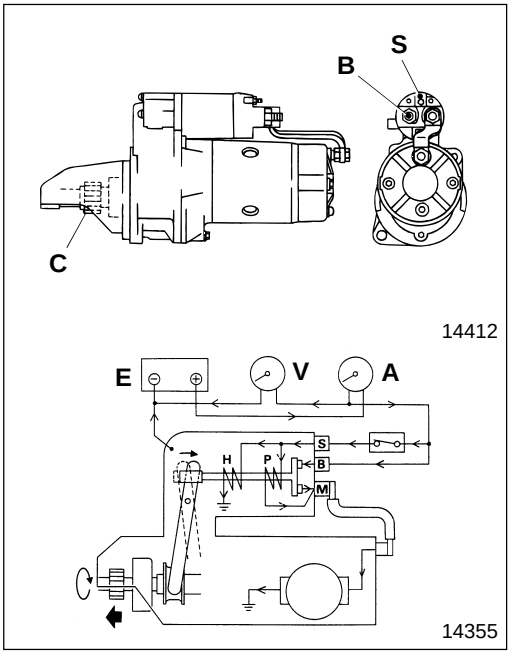
Inspections after assembling the starter should be carried out with current fed to the starter.

WARNING
- **Do not touch pinion C because it jumps out and turns when current is fed to the starter.**
- **Take care not to burn your hand, magnetic switch 2 might be hot after inspection.**



CAUTION
- **The current feeding time to the starter should be within 10 seconds at pull-in coil P side and within 30 seconds at holding coil H side. If the current feeding time exceeds these limits the coil might burn due to overheating.**
- **When current is flowing into the starter, a current of over 100 amperes is fed. When inspecting, use thick cable, such as a booster cable, and make secure connections.**

https://truckmanualshub.com/



(1) Performance test

- Connect the starter as illustrated.
  - **A** : Ammeter
  - **B** : Terminal B of starter
  - **D** : Switch
  - **E** : DC power supply (12 volts)
  - **S** : Terminal S of starter
  - **V** : Voltmeter
- Set the voltage to 11 volts DC.

CAUTION⚠

Up to 12 volts can be loaded.

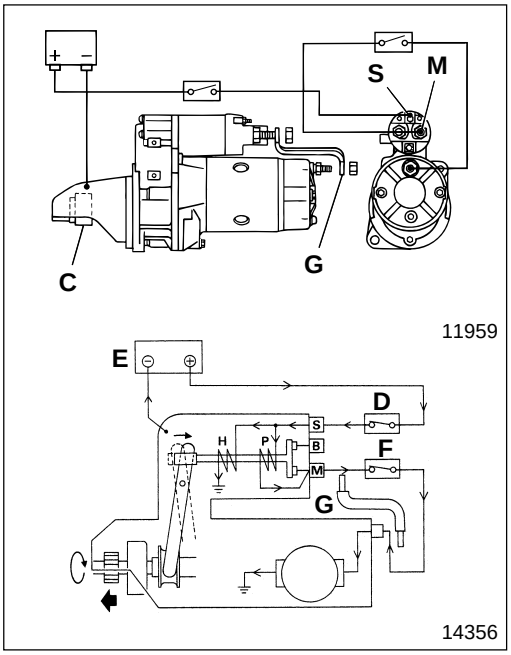
- The following work should be done with current fed to the starter. You must complete the full procedure of measuring the intensity of the current and the number of revolutions within 30 seconds.
  - Turn switch **D** ON and feed current into the starter. In this state, pinion **C** jumps out and rotates.

CAUTION⚠

When switch D is turned ON, current is fed both to pull-in coil P and holding coil H. When a large amount of current is fed into terminal M from DC power supply E, via terminal B of the starter, the current stops flowing into the pull-in coil but continues to flow into the holding coil.

To avoid burning the holding coil, be sure to carry out the performance test within 30 seconds.

  - Measure the intensity of the current and the number of revolutions of the starter. Train a strobe light on pinion **C** to measure the revolutions.
  - Turn switch **D** OFF to stop current to the starter.
- If the measured value deviates from the standard value, disassemble the starter again and inspect it.

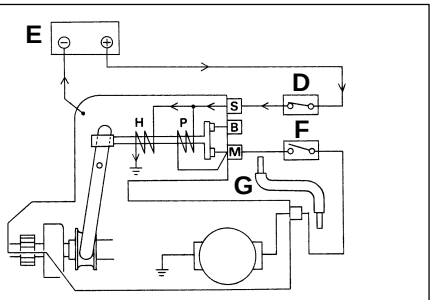


(2) Pinion gap

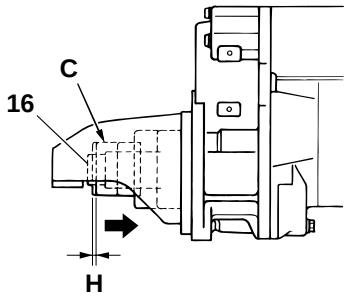
[Inspection]

- Connect the starter as illustrated.
  - **D** : Switch
  - **E** : 12 volts DC
  - **F** : Switch
  - **G** : Cable
  - **M** : Terminal M of starter
  - **S** : Terminal S of starter
- The following work should be done with current fed to the starter. You must complete the full procedure for measuring the pinion gap within 30 seconds.
  - Turn switches **D** and **F** ON and feed current to the starter. In this state, pinion **C** jumps out and rotates.

https://truckmanualshub.com/



14357



12413

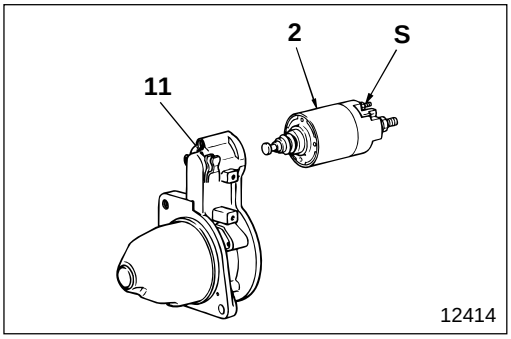
- Within five seconds of pinion **C** rotating, turn switch **F** OFF to stop rotation of the pinion.

CAUTION

When switches D and F are turned ON, current is fed both to pull-in coil P and holding coil H. The circuit is wired in such a way that the voltage is not applied to terminal B of the starter, so the current continues to flow into the pull-in coil while pinion C rotates.

To avoid burning the pull-in coil, be sure to turn switch F OFF within five seconds after the pinion rotates.

  - Push the tip of gear shaft **16** lightly and measure pinion gap **H** in the axial direction.
  - Turn switch **D** OFF to stop current to the starter.
- If the measured value deviates from the standard value, this means the starter was assembled incorrectly, so disassemble and reassemble the starter.



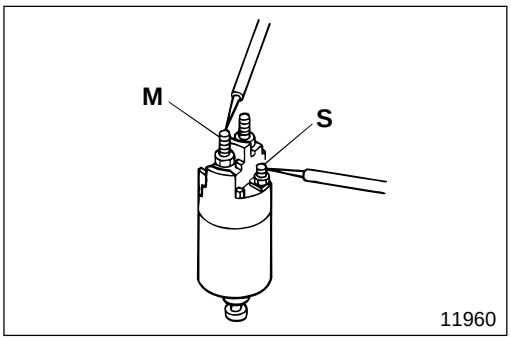
12414

2 Magnetic switch

[Installation]

Install magnetic switch **2** onto lever **11** in the direction as illustrated.

S : Terminal S



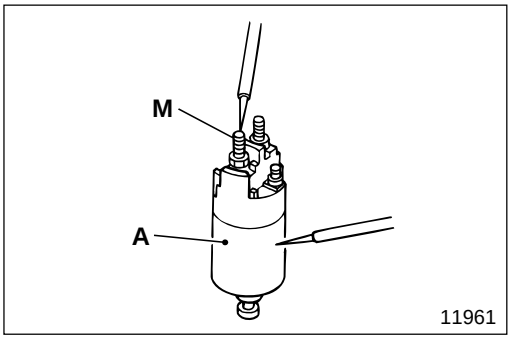
11960

[Inspection]

Carry out the inspection as follows. If any fault is found, replace magnetic switch **2**.

(1) Testing for coil discontinuity

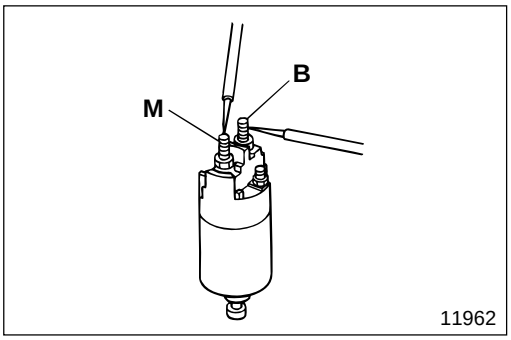
- Check that there is continuity between terminals **S** and **M**.



11961

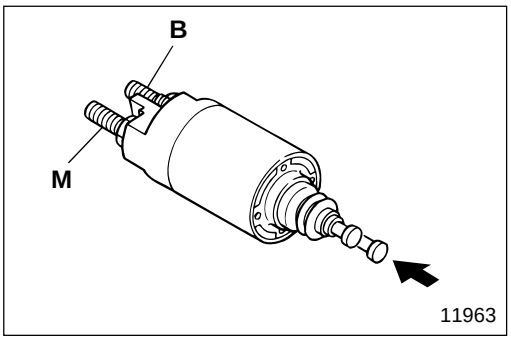
- Check that there is continuity between terminal **M** and the body **A** of magnetic switch **2**.

https://truckmanualshub.com/



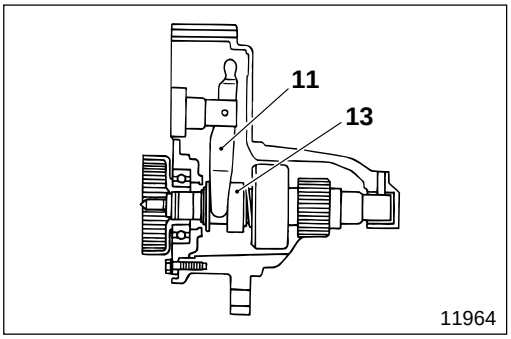
(2) Inspection of welded connections

- Check that there is no continuity between terminals **B** and **M**.



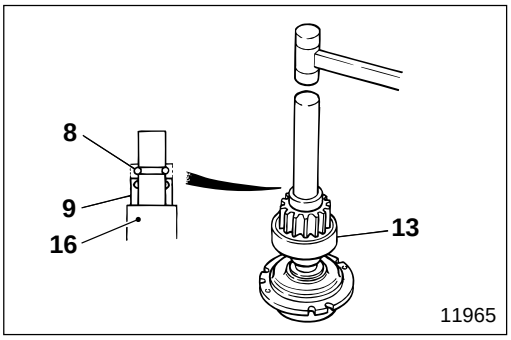
(3) Inspection of connections

- Push the tip of magnetic switch **2** to close the internal connection.
- Check that there is continuity between terminals **B** and **M**.



11 Installation of lever

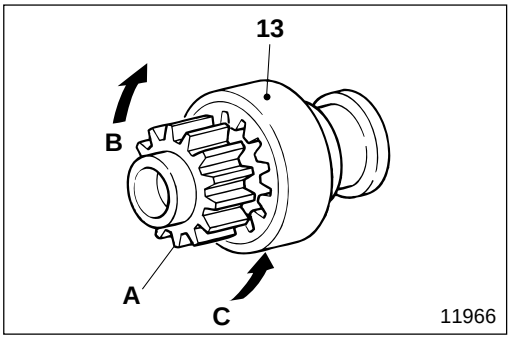
Install lever **11** onto overrunning clutch **13** in the direction as illustrated.



13 Overrunning clutch

[Removal]

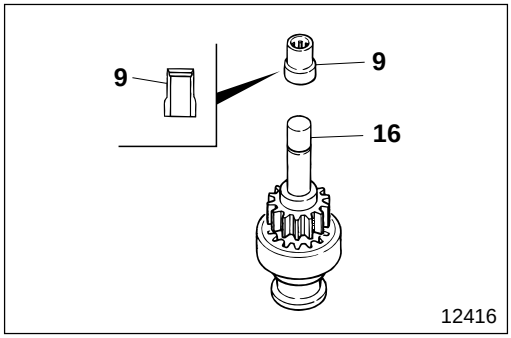
- Apply pipe-shaped tool **A** to pinion stopper **9**.
- Hammer pipe-shaped tool **A** gently to remove stopper ring **8** from pinion stopper **9**.
- Remove pinion stopper ring **8** from gear shaft assembly **16** to withdraw pinion stopper **9**.



[Inspection]

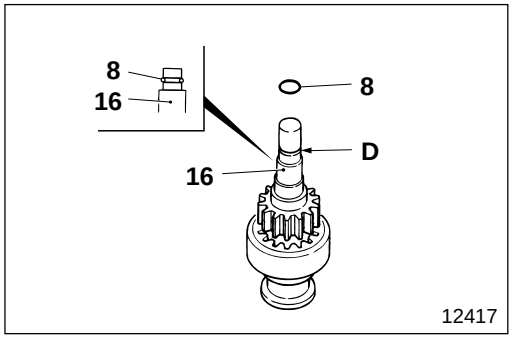
- Make sure that pinion **A** of overrunning clutch **13** turns toward direction **B** but does not turn toward direction **C**.
- If any fault is found, replace overrunning clutch **13**.

https://truckmanualshub.com/

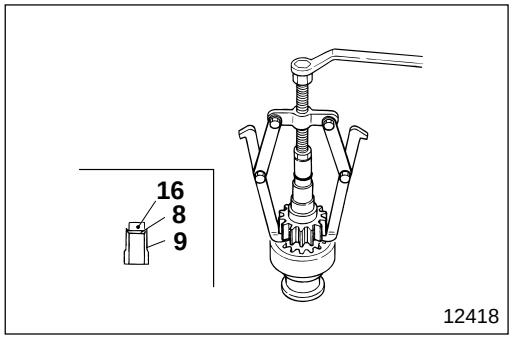


[Installation]

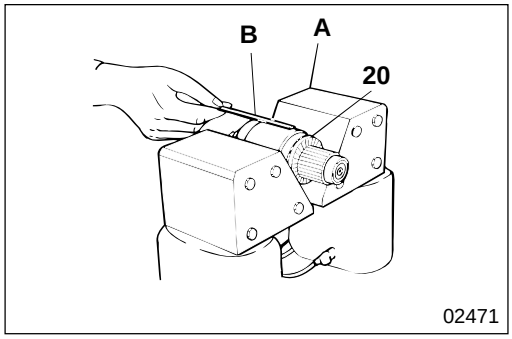
- Install pinion stopper **9** onto gear shaft **16** in the direction as illustrated.



- Install stopper ring **8** onto ring groove **D** of gear shaft **16**.



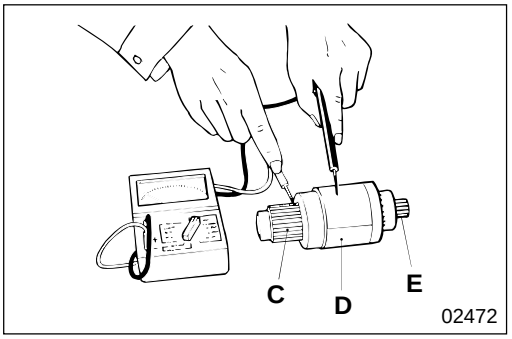
- Pull pinion gear **E** firmly and set pinion stopper **9** on stopper ring **8** securely.



20 Inspection of armature assembly

(1) Testing for coil short-circuit

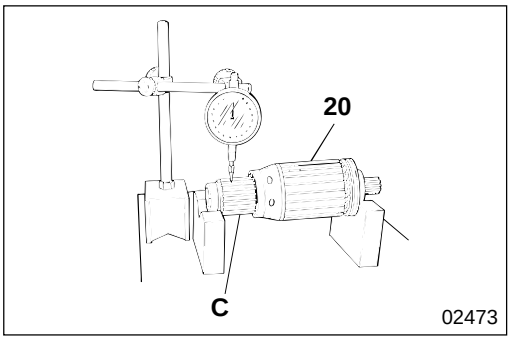
- Place iron rod **B** parallel to armature assembly **20**.
  A : Armature tester
- Rotate armature assembly **20** slowly.
- If iron rod **B** is pulled or shakes, it indicates that armature assembly **20** is short-circuited, so replace it.



(2) Testing for coil grounding

- Check that there is no continuity between commutator **C** and core **D** (or shaft **E**).
- If there is continuity between them, they are short-circuited. Replace armature assembly **20**.

https://truckmanualshub.com/

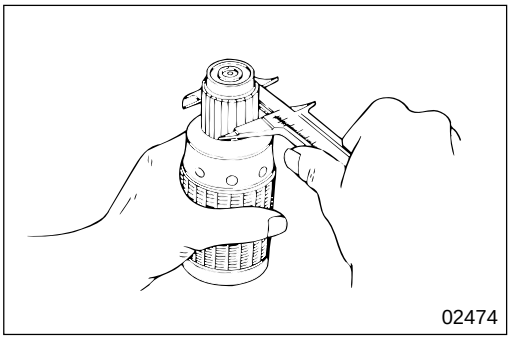


(3) Deflection of commutator

If the measured value is higher than the limit, adjust the outer diameter of commutator **C** within the limit.

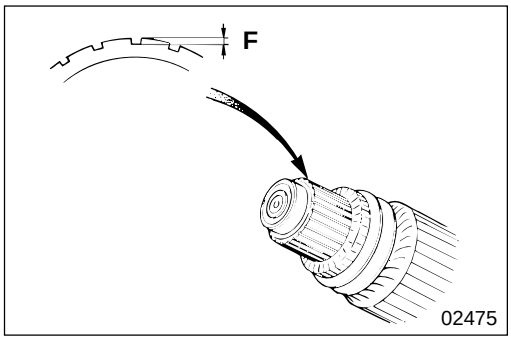
(4) Rough commutator surface

- If the surface is rough or has stepped wear, polish the surface with emery paper (300 to 500 grit).
- After polishing, check deflection of commutator **C**.



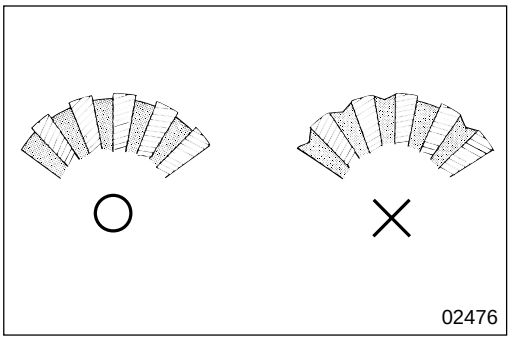
(5) Outer diameter of commutator

If the measured value is higher than the limit, replace armature assembly **20**.

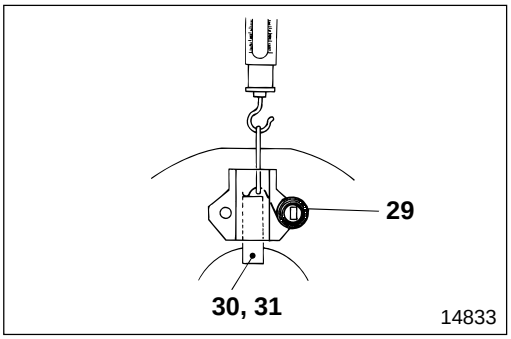


(6) Mica depth between segments

- If the measured value is lower than the limit, correct or replace armature assembly **20**.
  F : Mica depth



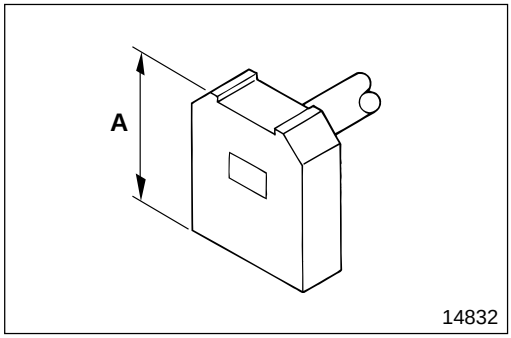
- If the mica is worn as illustrated, replace armature assembly **20**.
  ○ : Good
  × : Faulty



29 Inspection of brush spring

- Use new brushes **30**, **31** and measure the load when brush spring **29** is detached from the brushes.
- If the measured value is higher than the limit, replace brush spring **29**.

https://truckmanualshub.com/



30 **31** **Inspection of brush**

(1) Length of brush

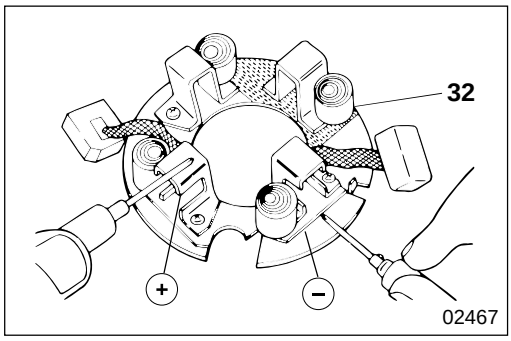
If the measured value is lower than the limit, replace brushes **30**, **31**.
A : Length of brush

(2) Contact surface with commutator

If the surface where the brushes contact the commutator is rough or is worn unevenly, polish the surface with emery paper (300 to 500 grit).

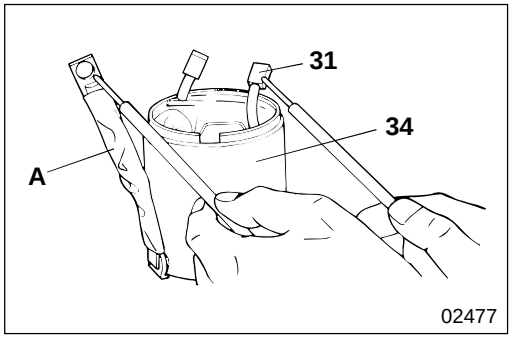
CAUTION ⚠

Make sure that the curvature of the surface is finished just like that of the commutator.



32 **Inspection of brush holder assembly**

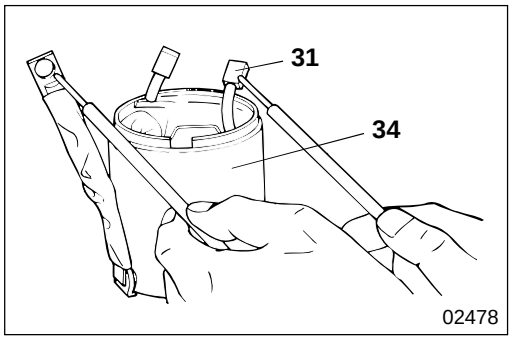
- Check that there is no continuity between the ⊕ side of the brush holder and the ⊖ side of the holder plate.
- If there is continuity, they are grounded. Replace brush holder assembly **32**.



34 **Inspection of yoke assembly**

(1) Testing for coil disconnection

- Check that there is continuity between cable **A** and brush ⊕ **31**.
- If there is no continuity, they are disconnected. Replace brush ⊕ **31** or yoke assembly **34**.



(2) Testing for coil grounding

- Check that there is no continuity between yoke assembly **34** and brush ⊕ **31**.
- If there is continuity, they are grounded. Locate the disconnection. If it is hard to repair, replace brush ⊕ **31** or yoke assembly **34**.

◆ Service procedure

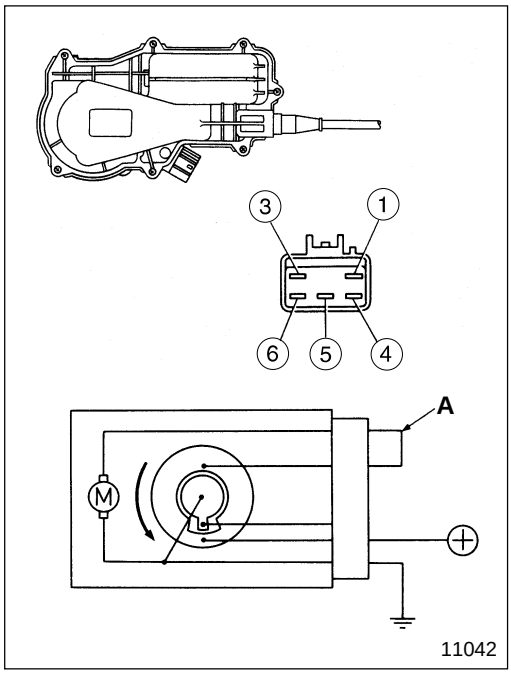
4 Inspection of fuel-cut motor

Inspect the following. If any fault is found, replace fuel-cut motor **4**.

(1) When starter switch is OFF (Fuel-cut state)

- Connect inspection harness **A** between terminals ③ and ⑤.
- Apply 12 volts DC between terminals ⑥ and ① to ensure that fuel-cut motor **4** works correctly.



(2) When starter switch is ON (Fuel-cut reset state)

- Connect inspection harness **A** between terminals ③ and ④.
- Apply 12 volts DC between terminals ⑥ and ① to ensure that fuel-cut motor **4** works correctly.

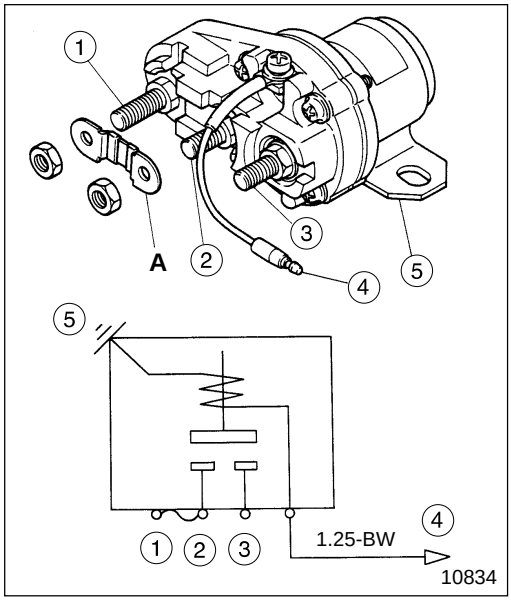
◆ Service procedure



9 **Inspection of glow relay**

(1) Inspection of fuse

If any fault is found, replace fuse **A** (127 amperes).

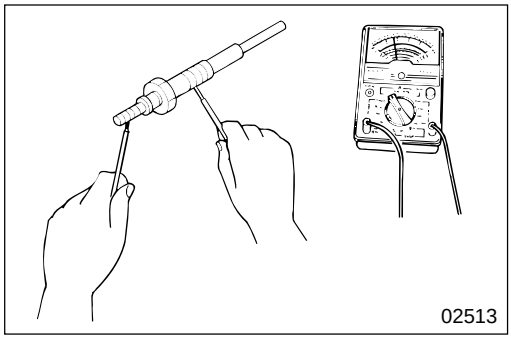
(2) Inspection of body

- Follow the table below to inspect continuity :

	①	②	③	④	⑤
No current	○—○				
Current	○—○	○—○	○—○	⊕—⊖	

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.
A : Fuse (127 amperes)

- If any fault is found, replace glow relay **9**.



11 **Inspection of glow plug**

- Measure the resistance of glow plug **11** as illustrated.
- If the measured value deviates from the standard value, replace glow plug **11**. Gr 11

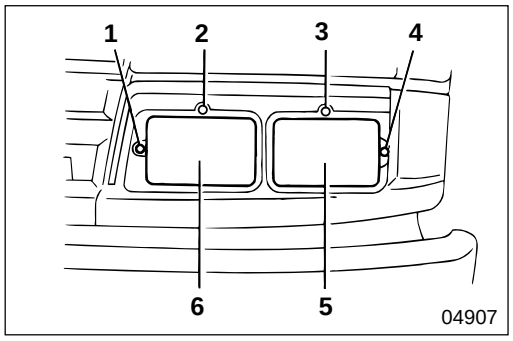
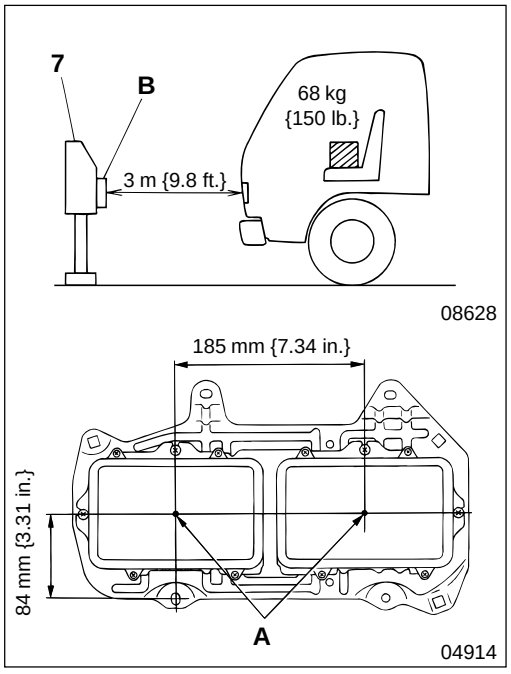
Headlamp Aiming



1 Screw (HIGH beam, horizontal adjustment)
2 Screw (HIGH beam, vertical adjustment)
3 Screw (HIGH/LOW beam, vertical adjustment)
4 Screw (HIGH/LOW beam, holizontal adjustment)
5 HIGH/LOW beam
6 HIGH beam

To adjust the headlamp move the optical axis of HIGH beam **6** by turning screws **1, 2**; and move the optical axis of HIGH/LOW beam **5** by turning screws **3, 4.** You need to adjust the aiming of both the HIGH and the HIGH/LOW beams on both the left and right headlamps.



(1) Preparatory work before adjustment

- Park the vehicle on a level place.

WARNING

You must put wheel chocks securely in place.

- Unload the vehicle and make sure no one is in it.
- Inflate the tires to specified pressure. Gr 31
- Seat one person or an equivalent mass (68 kg {150 lb}) in the vehicle.
- Start the engine and check that the battery is being charged.
- Place convergent headlamp tester **7** in line with HIGH beam **6** or HIGH/LOW beam **5** of either the left or right headlamp at a distance of **3** m {9.8 ft}.
- Align the center of convergent lens **B** of convergent headlamp tester **7** with lamp center **A** of HIGH beam **6** or HIGH/LOW beam **5**. (The illustration shows a left headlamp.)
- When adjusting one headlamp, mask the other to avoid light leakage.

(2) Adjustment

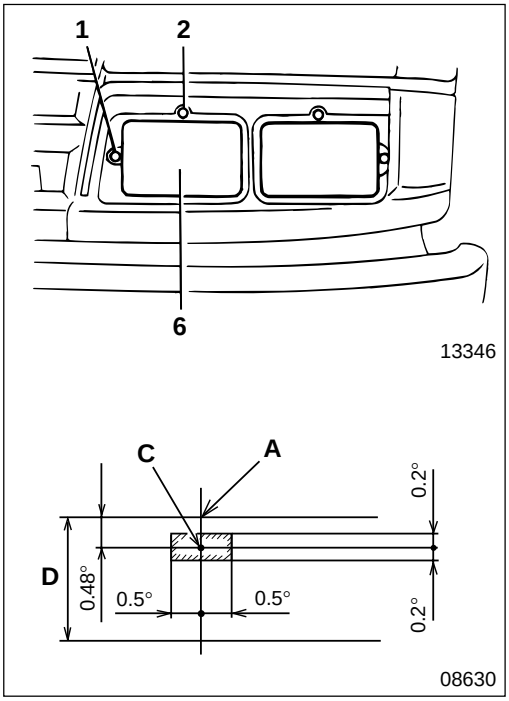
WARNING

Do not mask a lit headlamp for more than 10 minutes or the heat generated might cause a fire.

CAUTION

When completing the adjustment using screws 1 to 4, the action must be finished in the tightening direction.

https://truckmanualshub.com/



● **Adjustment of HIGH beam unit**

- Turn on HIGH beam **6**.
- Adjust as follows so that the optical axis (maximum illumination point) **C** of HIGH beam **6** is located as illustrated:
  - Vertical adjustment: Turn screw **2** to adjust.
  - Horizontal adjustment: Turn screw **1** to adjust.

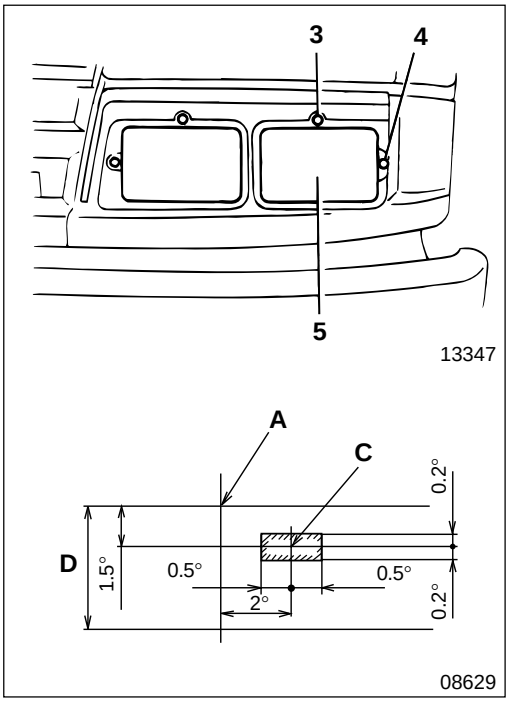
  The aiming of both left and right HIGH beams **6** should be adjusted to the position as illustrated.

▨ : Tolerance of adjustment

A : Center of headlamp
D : Height from the ground to headlamp center

	Adjusting direction for optical axis			
	Upward	Downward	Leftward	Rightward
Screw 1	—	—	(Counter-clockwise)	(Clockwise)
Screw 2	(Clockwise)	(Counter-clockwise)	—	—

Turning direction of the screws in the table is as viewed from the front.



● **Adjustment of HIGH/LOW beam unit**

- Turn on the LOW beam of HIGH/LOW beam **5**.
- Adjust as follows so that the optical axis (maximum illumination point) **C** of HIGH/LOW beam is located as illustrated:
  - Vertical adjustment: Turn screw **3** to adjust.
  - Horizontal adjustment: Turn screw **4** to adjust.

  The aiming of both left and right HIGH/LOW beams **5** should be adjusted to the position as illustrated.

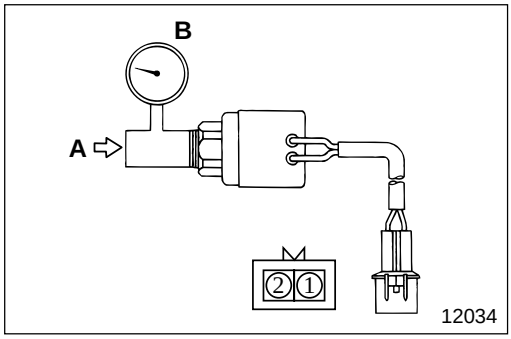
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
3, 6, 7	Operating pressure of stop lamp switch	29±9.8 kPa {4.3±1.4 lbf/in², 0.3±0.1 kgf/cm²}	—	Replace



◆ Service procedure

3 6 7 Inspection of stop lamp switch

Carry out the following inspection. If any fault is found, replace stop lamp switches **3**, **6**, **7**.

- Make sure that there is no continuity between terminals ① and ② when air pressure **A** is not applied to stop lamp switches **3**, **6**, **7**.
- Apply air pressure **A** to stop lamp switches **3**, **6**, **7** gradually starting from 0 kPa {0 lbf/in², 0 kgf/cm²}.
  Measure air pressure **A** when continuity is present between terminals ① and ② to make sure that the value conforms to the standard value.

340 BACKUP LAMP CIRCUIT

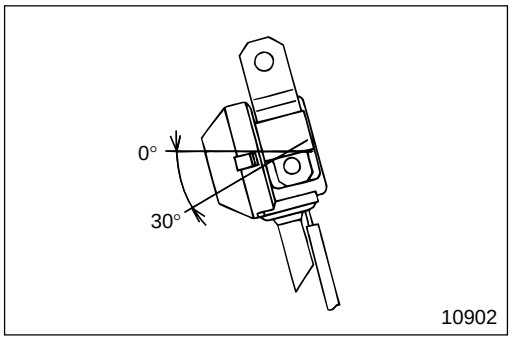
◆ Service procedure

3 **Back buzzer**

[Inspection]

- Make sure that back buzzer **3** sounds intermittently when you apply 12 volts DC between terminals ① and ②.
- If any fault is found, replace back buzzer **3**.



[Installation]

Install back buzzer **3** to the frame within the angle range as illustrated.

CAUTION⚠

Be careful to install back buzzer 3 within the illustrated angle range or the back buzzer will not be drained normally.

			At 100 km/h	100^{+5}_{0} km/h		

◆ Service procedure

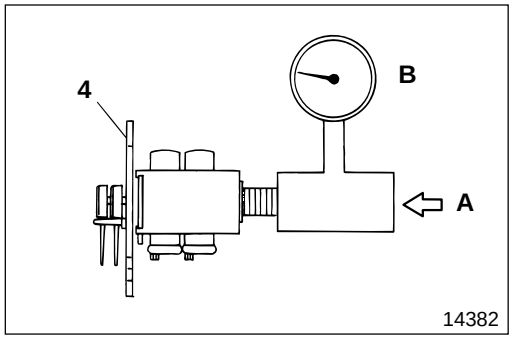
3 Inspection of tachometer

- Measure the indication area of tachometer **3** at various revolution ranges using an engine revolution counter.
- If the measured value deviates from the standard value, carry out the following inspection. If the inspection does not indicate a fault, replace tachometer **3**.

(1) Inspection of the engine revolution sensor body 801

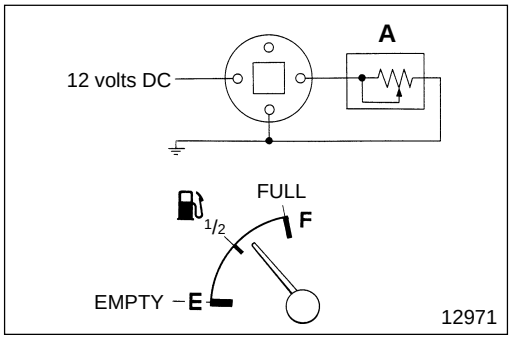
(2) Inspection of the installed condition of the engine revolution sensor Gr 13

https://truckmanualshub.com/



4 Inspection of air pressure gauge

- Apply air pressure **A** to air pressure gauge **4**.
  B : Air pressure gauge
- Measure the indication range of air pressure gauge **4** at standard pressure.
- If the measured value deviates from the standard value, replace air pressure gauge **4**.



5 Inspection of fuel gauge and water temperature gauge

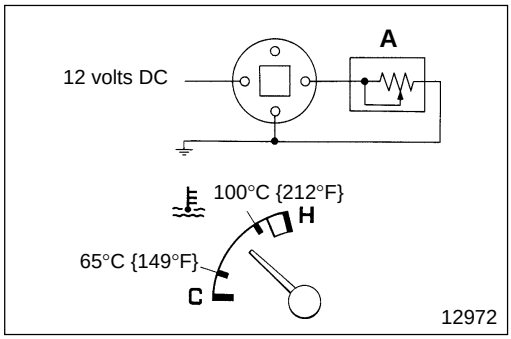
(1) Fuel gauge

- Connect a variable resistor to fuel gauge **5** as illustrated.
  A : Variable resistor
- Measurement order
  FULL → 1/2 → EMPTY

NOTE

The movement of the gauge needle is subject to hysteresis (oscillation). Be sure to measure following the measurement order.

- Increase the value of variable resistor **A** gradually from 0 Ω.
- Measure the resistance respectively when the needle of fuel gauge indicates FULL, 1/2 and EMPTY.
- If the measured value deviates from the standard value, replace fuel gauge and water temperature gauge **5**.



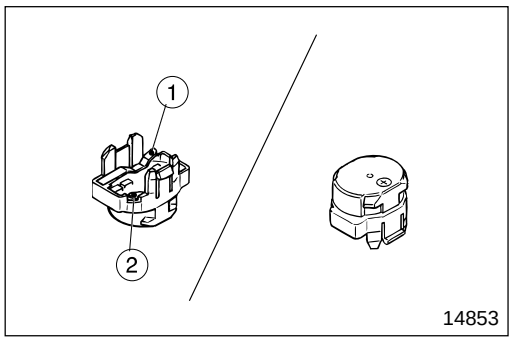
(2) Water temperature gauge

- Connect a variable resistor to water temperature gauge as illustrated.
  A : Variable resistor
- Measurement order
  Low temperature → High temperature

NOTE

The movement of the gauge needle is subject to hysteresis (oscillation). Be sure to measure following the measurement order.

- Increase the value of variable resistor **A** gradually from 0 Ω.
- Measure the resistance respectively when the needle of water temperature gauge **5** indicates 65°C {149°F} and 100°C {212°F}.
- If the measured value deviates from the standard value, replace fuel gauge and water temperature gauge **5**.



8 Inspection of meter warning buzzer

- Apply 12 volts DC between terminals ① and ② to check if meter warning buzzer **8** sounds.

CAUTION ⚠

- **Be careful not to mix up ⊕ and ⊖ when you apply voltage to meter warning buzzer 8, because this would damage the meter warning buzzer.**
- **Make sure you check ⊕ and ⊖ on the top of meter warning buzzer 8.**

- If any fault is found, replace meter warning buzzer **8**.

https://truckmanualshub.com/

11 **Inspection of speedometer**

- Measure the indication area of speedometer **11** at various speed ranges using a speedometer tester.
- If the measured value deviates from the standard value, carry out the following inspection. If the inspection does not indicate a fault, replace speedometer **11**.

(1) Inspection of vehicle speed sensor body 802

(2) Inspection of installed condition of vehicle speed sensor

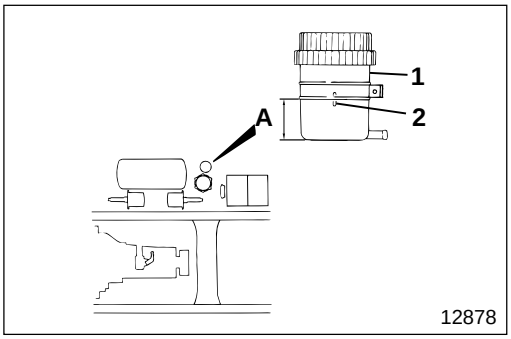
Inspection of Brake Fluid Level Switch < Air over hydraulic brake >

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Warning lamp lighting position for brake fluid level switch	$57^{+3.5}_{-0.5}$ {$2.24^{+0.14}_{-0.02}$}	—	Replace



- Start engine.
- Drain the brake fluid gradually from fluid tank assembly **1**.

CAUTION

If brake fluid is spilt on any part of the vehicle, wipe it off immediately, since the solvent in the fluid can damage the paintwork.

- Measure height **A** of brake fluid level switch **2** when BRAKE FLUID warning lamp within the meter cluster lights.
- If the measured value deviates from the standard value, remove and check fluid tank assembly **1**.

Removal and installation : Gr 35A

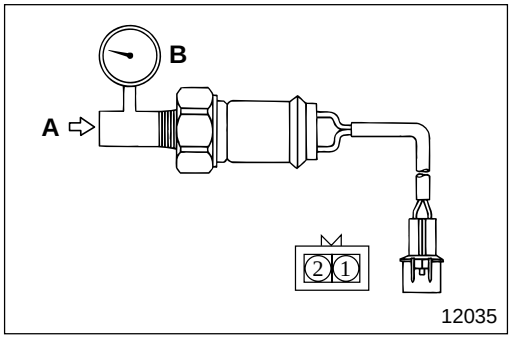
Service standards

Location	Maintenance item		Standard value	Limit	Remedy
5	Operating pressure of parking brake switch	When applying pressure	441 to 539 kPa {64 to 72 lbf/in², 4.5 to 5.5 kgf/cm²}	—	Replace
		When releasing pressure	461 to 559 kPa {67 to 81 lbf/in², 4.7 to 5.7 kgf/cm²}	—	Replace



◆ Service procedure

5 **Inspection of parking brake switch**

Carry out the following inspections. If any fault is found, replace parking brake switch **5**.

- Make sure that there is continuity between terminals ① and ② when air pressure **A** is not applied to parking brake switch **5**.
- Apply air pressure **A** to parking brake switch **5** gradually starting from 0 kPa {0 lbf/in², 0 kgf/cm²}.
  Measure the air pressure when continuity is lost between terminals ① and ② to make sure that the measured value conforms to the standard value.
  B : Air pressure gauge
- When air pressure **A** of 785 kPa {115 lbf/in², 8 kgf/cm²} has been applied to parking brake switch **5**, gradually release the air pressure.
  Measure the air pressure when continuity is present between terminals ① and ②, and make sure that the measured value conforms to the standard value.

515 BRAKE WARNING CIRCUIT

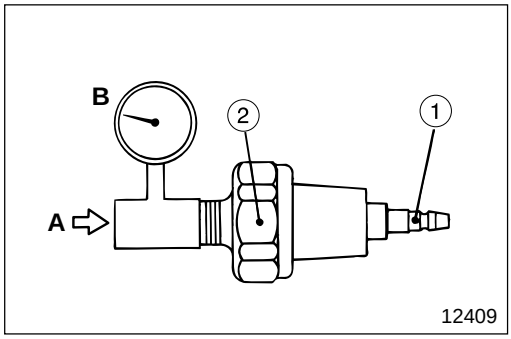
Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
6	Operating pressure of low air pressure switch	When applying pressure	470 to 510 kPa {68 to 74 lbf/in², 4.8 to 5.2 kgf/cm²}	—	Replace
		When releasing pressure	470 to 560 kPa {68 to 81 lbf/in², 4.8 to 5.7 kgf/cm²}	—	
10	Continuity position of brake fluid level switch		57 $^{+3.5}_{-0.5}$ {2.24 $^{+0.14}_{-0.02}$} (Equivalent to 345 cm³ {21.1 cu.in., 345 cc})	—	Replace

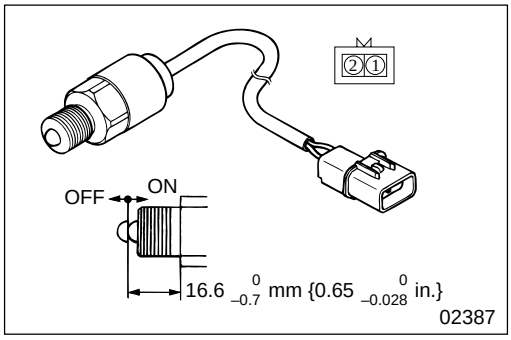
◆ Service procedure



6 Inspection of low air pressure switch

Carry out the following inspection. If any fault is found, replace low air pressure switch **6**.

- Make sure that there is continuity between terminals ① and ② (Body) when air pressure **A** is not applied to low air pressure switch **6**.
- Apply air pressure **A** to low air pressure switch **6** gradually starting from 0 kPa {0 lbf/in², 0 kgf/cm²}.
  Measure the air pressure when continuity is lost between terminals ① and ② (Body) to make sure that the measured value conforms to the standard value.
  B : Air pressure gauge
- When air pressure **A** of 785 kPa {115 lbf/in², 8 kgf/cm²} has been applied to low air pressure switch **6**, gradually release the air pressure.
  Measure the air pressure when continuity is present between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.



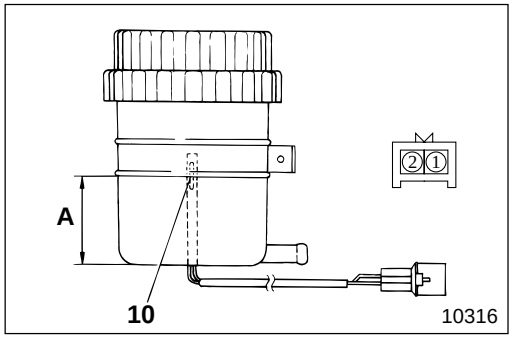
9 Inspection of air master stroke switch

- Follow the table below to inspect continuity:

	①	②
OFF		
ON	○	○

○——○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace air master stroke switch **9**. Gr 35A



10 Inspection of brake fluid level switch

- Drain the brake fluid gradually from the brake fluid tank assembly.

CAUTION ⚠

If brake fluid is spilt on any part of the vehicle, wipe it off immediately, since the solvent in the fluid can damage the paintwork.

- Measure height **A** of brake fluid level switch **10** when continuity is present between terminals ① and ②.
- If the measured value deviates from the standard value, replace the fluid tank assembly. Gr 35A

547 AUTOMATIC TRANSMISSION FLUID TEMPERATURE WARNING CIRCUIT

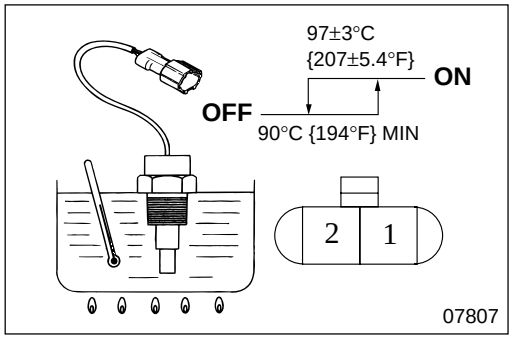
Service standards

Location	Maintenance item		Standard value	Limit	Remedy
7	Operating temperature of automatic transmission fluid thermostat switch	When increases (OFF→ON)	97±3°C {207±5.4°F}	—	Replace
		When decreases (ON→OFF)	90°C {194°F} MIN		

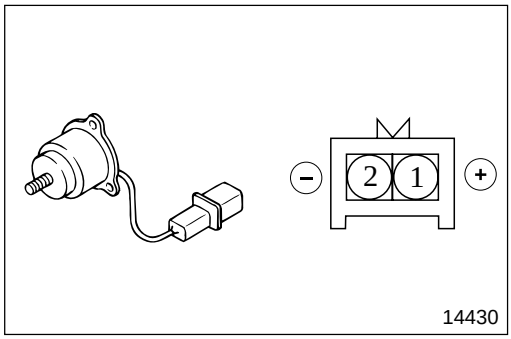
◆ Service procedure



7 **Inspection of automatic transmission fluid thermostat switch**

Carry out the following inspection. If any fault is found, replace automatic transmission fluid thermostat switch **7**. Gr 23

- Make sure that there is no continuity between terminals ① and ② at room temperature (20±5°C {68±9°F}).
- Place automatic transmission fluid thermostat switch **7** in a container filled with engine oil and raise the oil temperature while stirring the oil. Measure the temperature when there is continuity between terminals ① and ②, and make sure that the measured value conforms to the standard value.
- Lower the oil temperature and measure the temperature when continuity is lost between terminals ① and ②, and make sure that the measured value conforms to the standard value.



8 **Inspection of cooler fan motor assembly**

- Make sure that cooler fan motor assembly **8** activates when applying battery voltage to terminals ① and ②.
- If any fault is found, replace cooler fan motor assembly **8**.

TROUBLESHOOTING

Symptoms / Possible causes	Cigarette lighter		Audio					Remarks
	Does not glow	Does not return	Specific frequency band does not work	Spurious noise generated	Sound quality poor	Sound from one side only	Left and right volume different	
Connector connection faulty, harness broken, grounding faulty	○			○		○		
Fuse blown	○							
Cigarette lighter faulty	○	○						
Antenna and antenna cable connection faulty				○				
Speaker faulty			○	○	○	○	○	
Left and right speaker impedance different							○	

https://truckmanualshub.com/

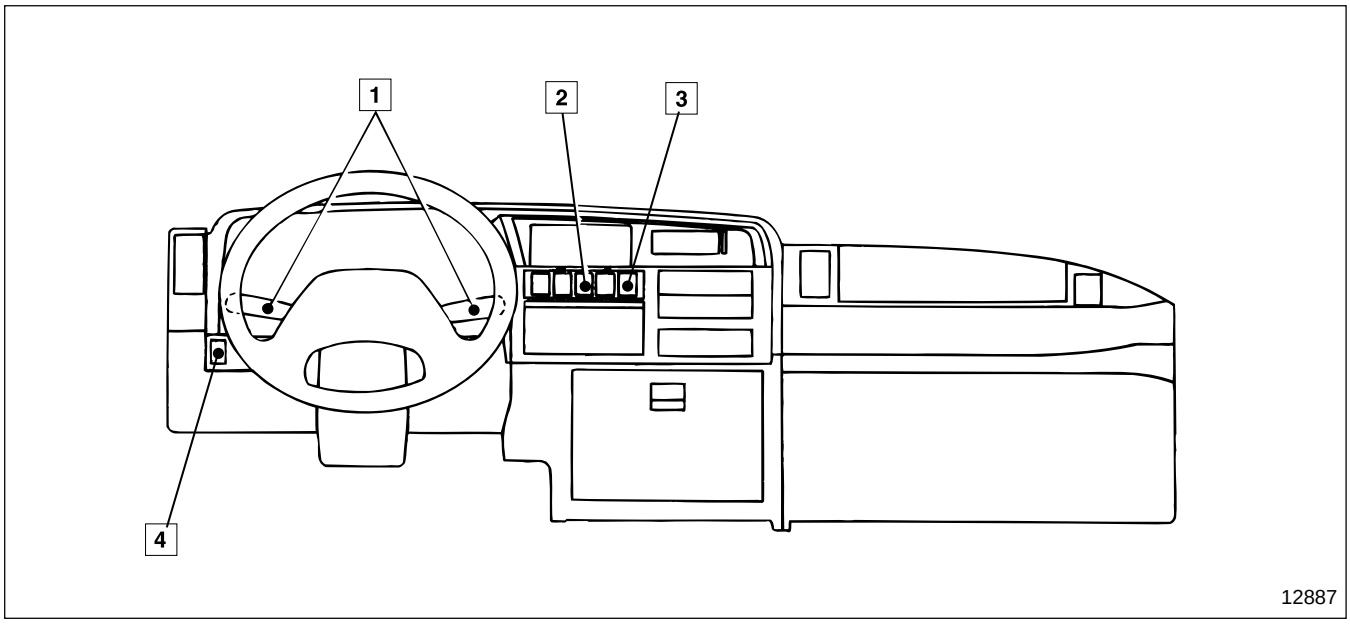
Accessory noise generation source

Accessory	Noise	Symptoms
Alternator	Whistling	High pitch sound when accelerator pedal suddenly depressed (Stops soon after engine stopped)
Water temperature gauge	Scratching	Occurs when engine running (Continues for a while after engine stops)
Engine oil pressure switch	Rattling	Depends on engine speed (Does not occur during idling)
Fuel gauge unit	Scratching	Occurs when engine suddenly revved, while running on rough roads, or starter switch turned ON
Flasher unit	Banging	When turn signal blinks
Horn	Hissing	Occurs when horn button pressed or released
Wiper motor	Whining	Depends on windshield wiper speed
Washer motor	Whining	When windshield washer operates

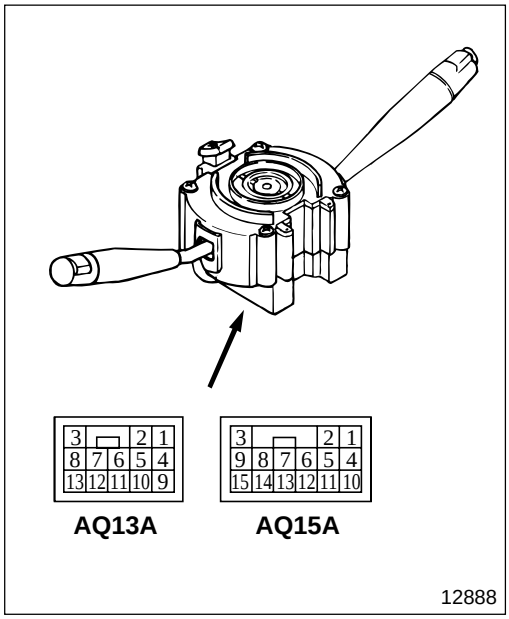
Symptoms / Possible causes	Horn				Remarks
	No Sound	Continuous sound	Small sound	Sound quality poor	
Connector connection faulty, harness broken, grounding faulty	○				
Fuse blown	○				
Horn switch faulty	○	○			
Horn faulty	○		○	○	
Horn stay warped			○	○	
Battery voltage insufficient	○		○		
Air leaking from air system	○		○	○	

https://truckmanualshub.com/

Installation Position



1 Combination switch
2 Cold start switch
3 Van body dome light switch
4 Rheostat switch



◆ Service procedure

1 Inspection of combination switch

- Operate combination switch **1**.
- Check for continuity between connector terminals, referring to the connector connection table.
  There is continuity between terminals ○ and ○ in the table.

- If any fault is found, replace combination switch **1**.

https://truckmanualshub.com/

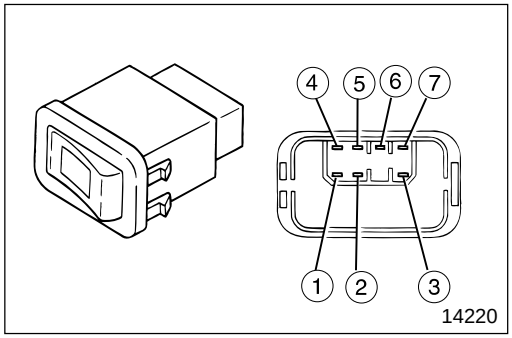
https://truckmanualshub.com/



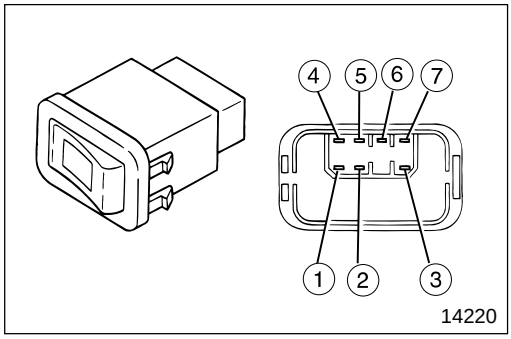
2 **Inspection of cold start switch**

- Follow the table below to inspect continuity:

	①	⑤	②	④	⑦	LED (Operation indication light)	③
ON	○—○				○	—/\/\/\—▷—	○
OFF			○—○				

○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace cold start switch **2**.



3 **Inspection of van body dome light switch**

- Follow the table below to inspect continuity:

	①	⑤	⑦	LED (Operation indication light)	③
ON	○—○		○	—/\/\/\—▷—	○
OFF					

○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace van body dome light switch **3**.

4 **Inspection of rheostat switch**

- Rheostat switch **4** contains a control circuit, because of this it is difficult to inspect rheostat switch **4** independently, therefore you should inspect the rheostat switch indirectly, by inspecting the system harness and the related parts.
- If no fault is found in the related parts but the system is faulty, replace rheostat switch **4**.

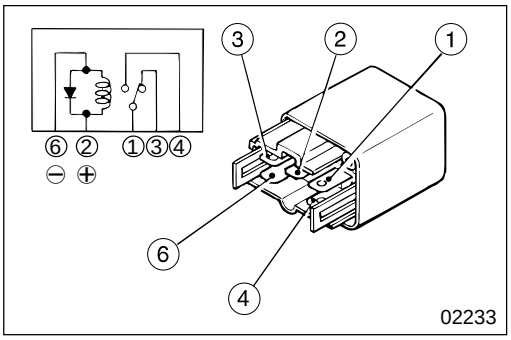
◆ Service procedure



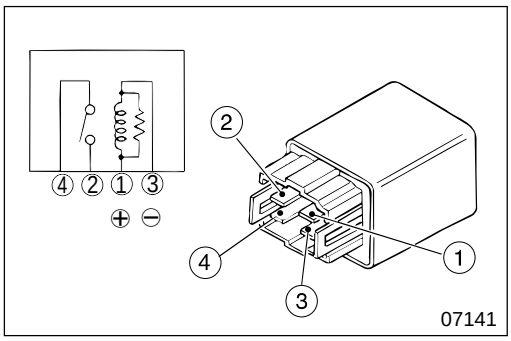
1 2 3 18 Inspection of relay (Open type 5-pin)

- Follow the table below to inspect continuity:

	①	②	③	④	⑥
No current	○	○	○		
		○			○
Current	○			○	
		⊕			⊖

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.



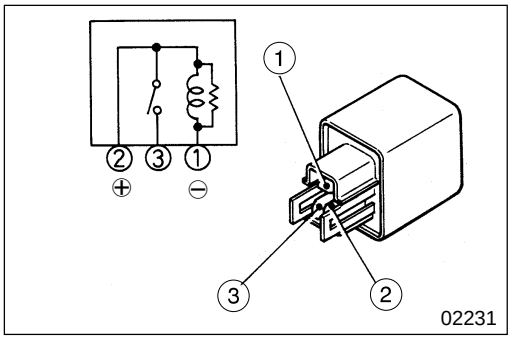
4 5 Inspection of relay (Open type 4-pin)

- Follow the table below to inspect continuity:

	①	②	③	④
No current	○		○	
Current		○		○
	⊕		⊖	

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.



6 7 8 Inspection of relay (Open type 3-pin)

- Follow the table below to inspect continuity:

	①	②	③
No current	○	○	
Current		○	○
	⊖	⊕	

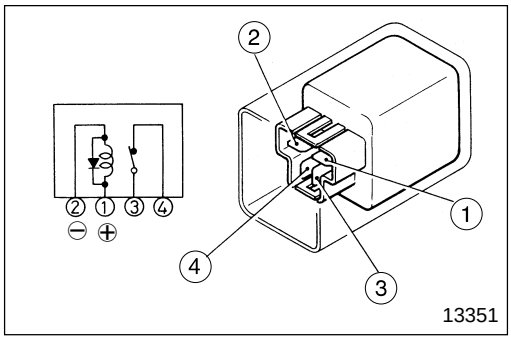
○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.

https://truckmanualshub.com/

9 10 17 Inspection of control unit

Since it is difficult to check each unit separately, judge the soundness of each unit indirectly by checking switches, harnesses, and related parts in the system.



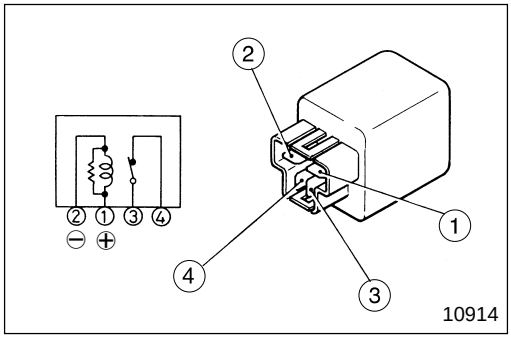
11 Inspection of relay (Close type 4-pin)

- Follow the table below to inspect continuity:

	①	②	③	④
No current	○—○		○—○	
Current	⊕—⊖		◌----◌	

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.
◌----◌ : Indicates that the continuity between the terminals is lost.

- If any fault is found, replace the relay.



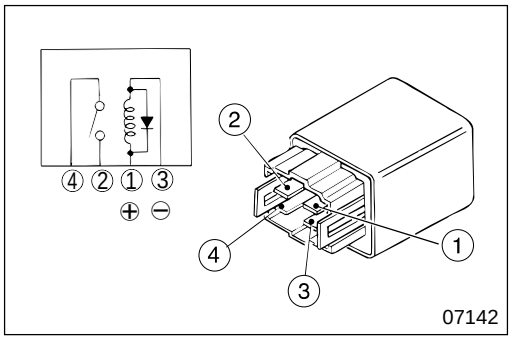
12 13 Inspection of relay (Close type 4-pin)

- Follow the table below to inspect continuity:

	①	②	③	④
No current	○—○		○—○	
Current	⊕—⊖		◌----◌	

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.
◌----◌ : Indicates that the continuity between the terminals is lost.

- If any fault is found, replace the relay.



14 15 16 Inspection of relay (Open type 4-pin)

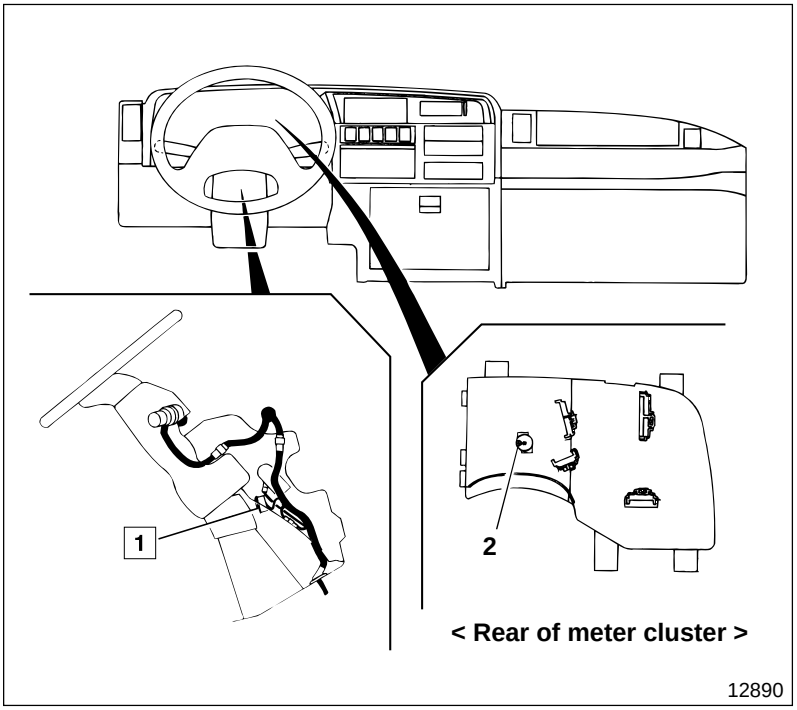
- Follow the table below to inspect continuity:

	①	②	③	④
No current	○—○			
Current	⊕—⊖	○—○		○—○

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

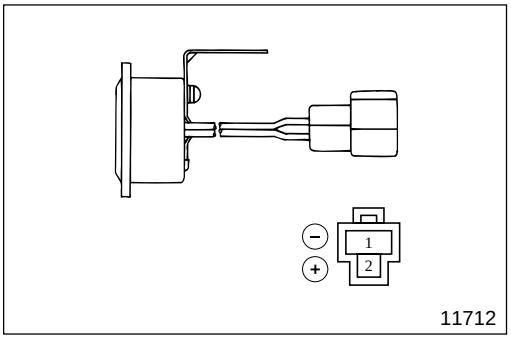
- If any fault is found, replace the relay.

https://truckmanualshub.com/



1 Warning buzzer
2 Meter warning buzzer (Overrunning buzzer) < 10-speed transmission > 401

◆ Service procedure



1 Inspection of warning buzzer

- Make sure that warning buzzer **1** sounds when you apply 12 volts DC between terminals ① and ②.
- If any fault is found, replace warning buzzer **1**.

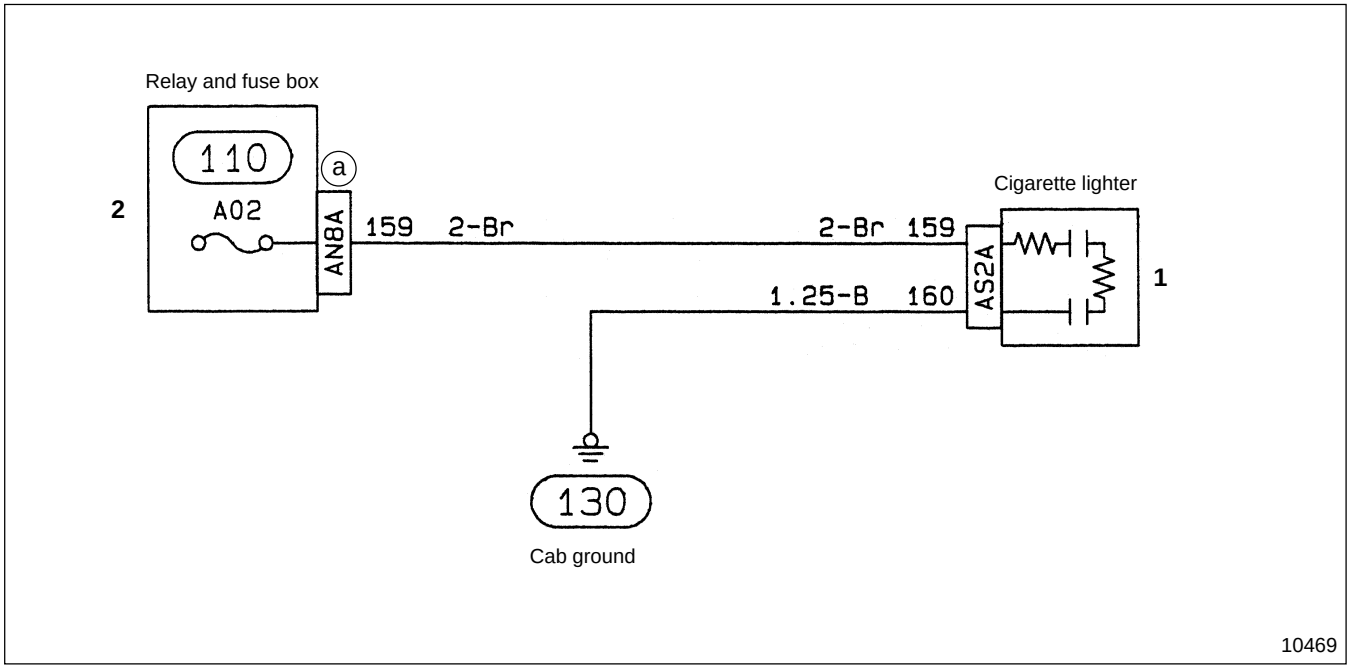
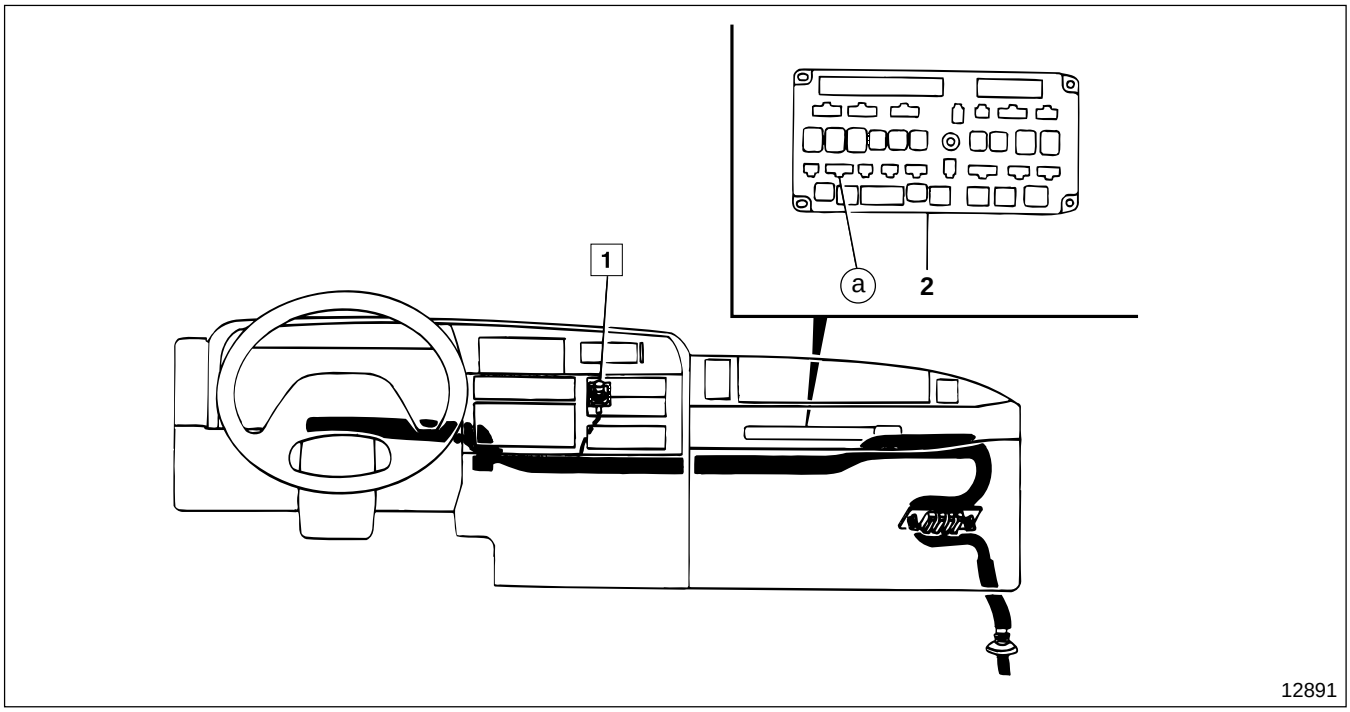
610 CIGARETTE LIGHTER CIRCUIT





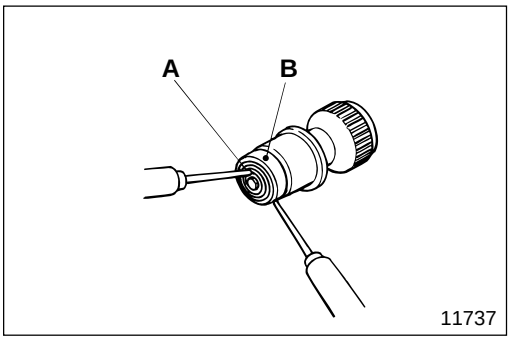
1 Cigarette lighter
2 Relay and fuse box 📖 (104)

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
1	Cigarette lighter plug return time	15±5 seconds	—	Replace

https://truckmanualshub.com/

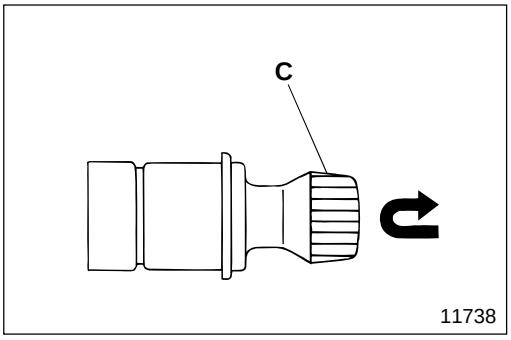
◆ Service procedure



1 Inspection of cigarette lighter

Carry out the following inspection. If any fault is found, replace cigarette lighter **1** :

- Make sure that there is continuity between heater element **A** and body **B**.



- Make sure that plug **C** returns to its original position quickly when it is pushed in.

- Turn the starter switch to ACC or ON.
- Push plug **C** into the socket of the vehicle.
- Measure the time required for pushed-in plug **C** to return to its original position.
- Make sure that heater element **A** is glowing.

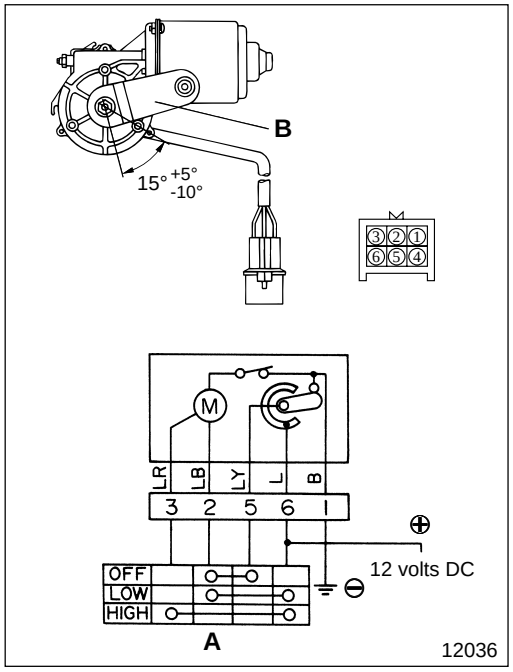
4 Combination switch 🕮 (601)
5 Wiper motor
6 Diode unit
7 Washer motor
8 Multipurpose timing control unit 🕮 (604)

https://truckmanualshub.com/

◆ Service procedure



5 Inspection of wiper motor

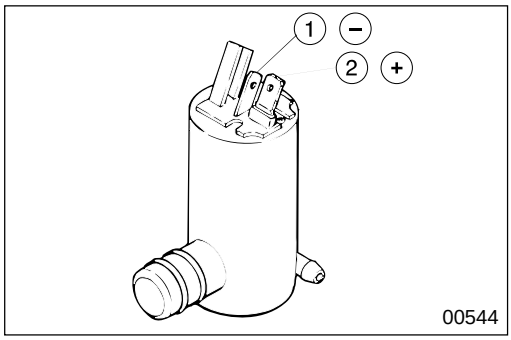
- Connect wiper motor **5** as illustrated.
  A : Switch
- Carry out the following inspection. If any fault is found, replace wiper motor **5**. Gr 42

(1) Inspection of motor operation

- Make sure that wiper motor **5** turns at high speed when you turn switch **A** to HIGH.
- Make sure that wiper motor **5** turns at low speed when you turn switch **A** to LOW.

(2) Inspection of automatic stopping position

- Turn switch **A** to LOW to turn wiper motor **5** at low speed.
- When crank arm **B** is at any position other than the automatic stopping position (other than the illustrated angle), turn switch **A** to OFF.
- Make sure that crank arm **B** stops at the automatic stopping position (within the illustrated angle).



7 Inspection of washer motor

- Apply 12 volts DC between terminals ① and ② and make sure that washer motor **7** operates.
- If washer motor **7** does not operate, replace it. Gr 42

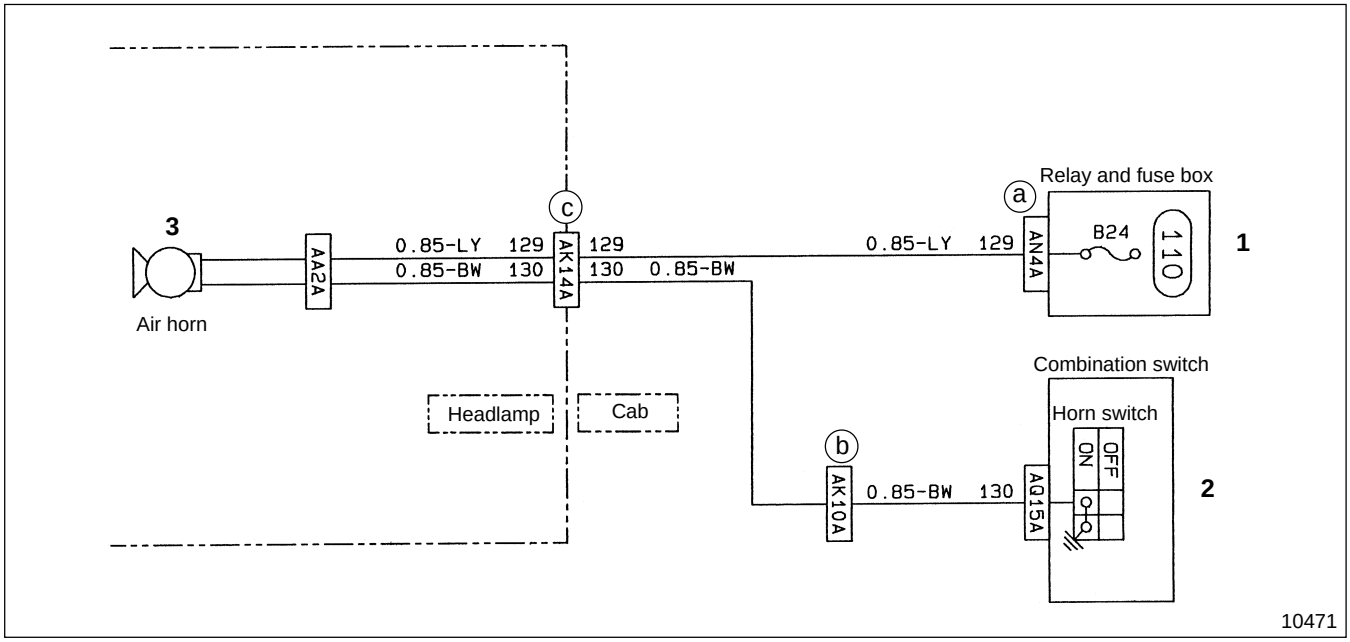
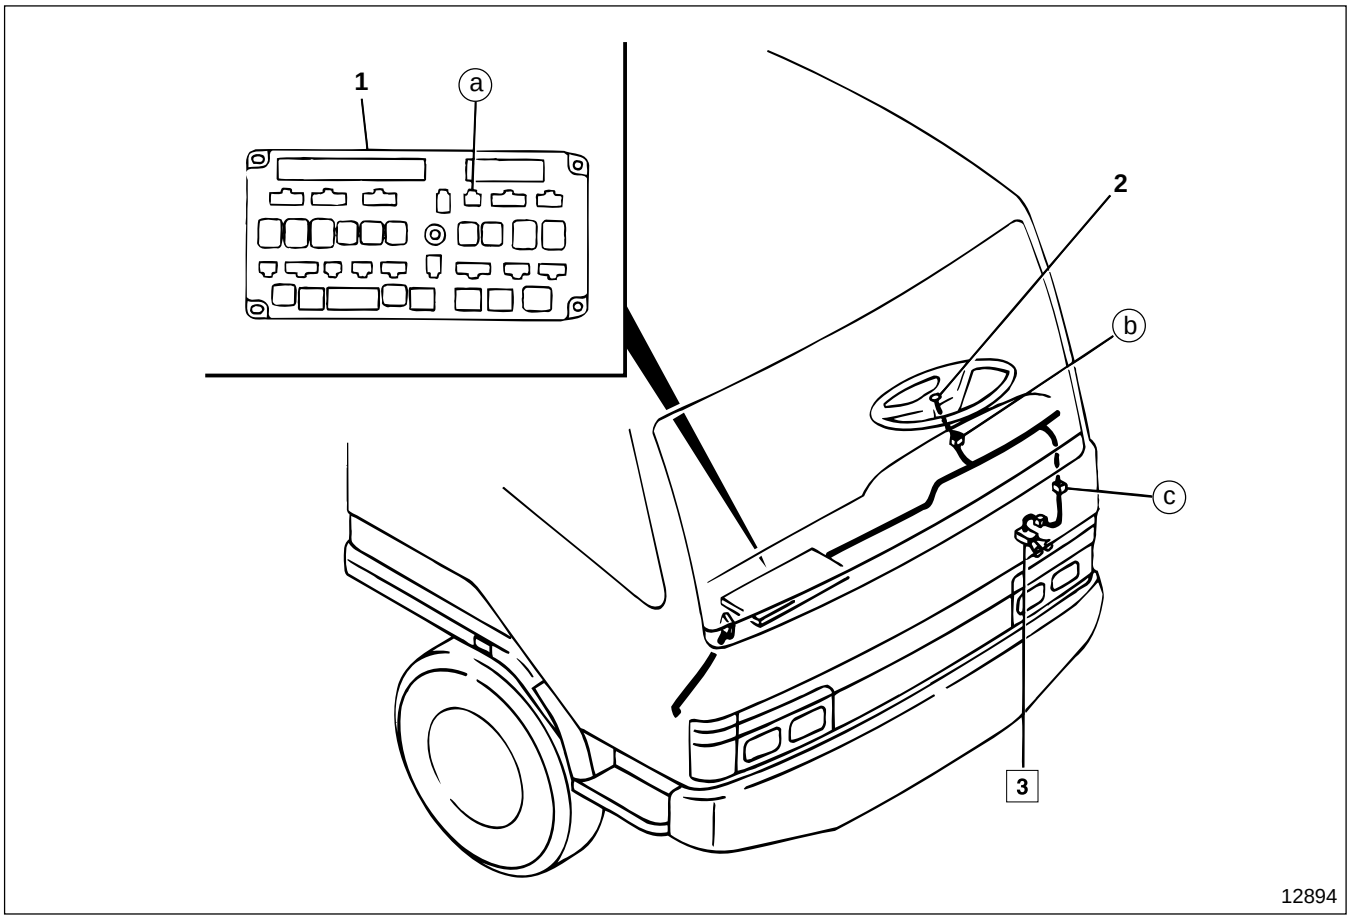
MEMO

https://truckmanualshub.com/

616 HORN CIRCUIT



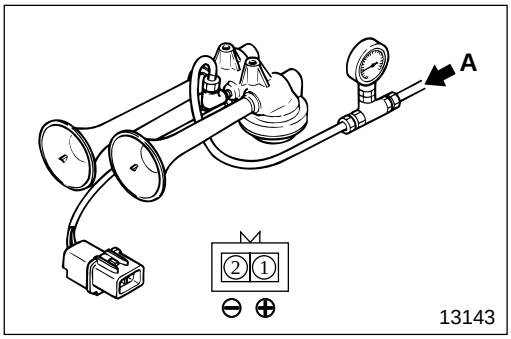


1 Relay and fuse box 104
2 Combination switch 601
3 Air horn

https://truckmanualshub.com/

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
3	Minimum operating voltage of air horn valve  14318	10 V or less	—	Replace
	Operating pressure of horn	195 to 980 kPa {28 to 142 lbf/in², 2 to 10 kgf/cm²}	—	Replace



13143

◆ Service procedure

3 Inspection of air horn

Carry out the following inspection. If any fault is found, replace air horn **3**.

(1) Minimum operating voltage of air horn valve

- Apply air pressure **A** of 785 kPa {115 lbf/in², 8 kgf/cm²} to air horn **3**.
- Apply voltage between terminals ① and ② starting from 0 volt DC gradually.
- Measure the voltage when air horn **3** sounds.

(2) Operating pressure of horn

- Apply 12 volts DC between terminals ① and ②.
- Apply air pressure **A** to air horn **3** starting from 0 kPa {0 lbf/in², 0 kgf/cm²} gradually.
- Measure air pressure **A** when air horn **3** sounds.

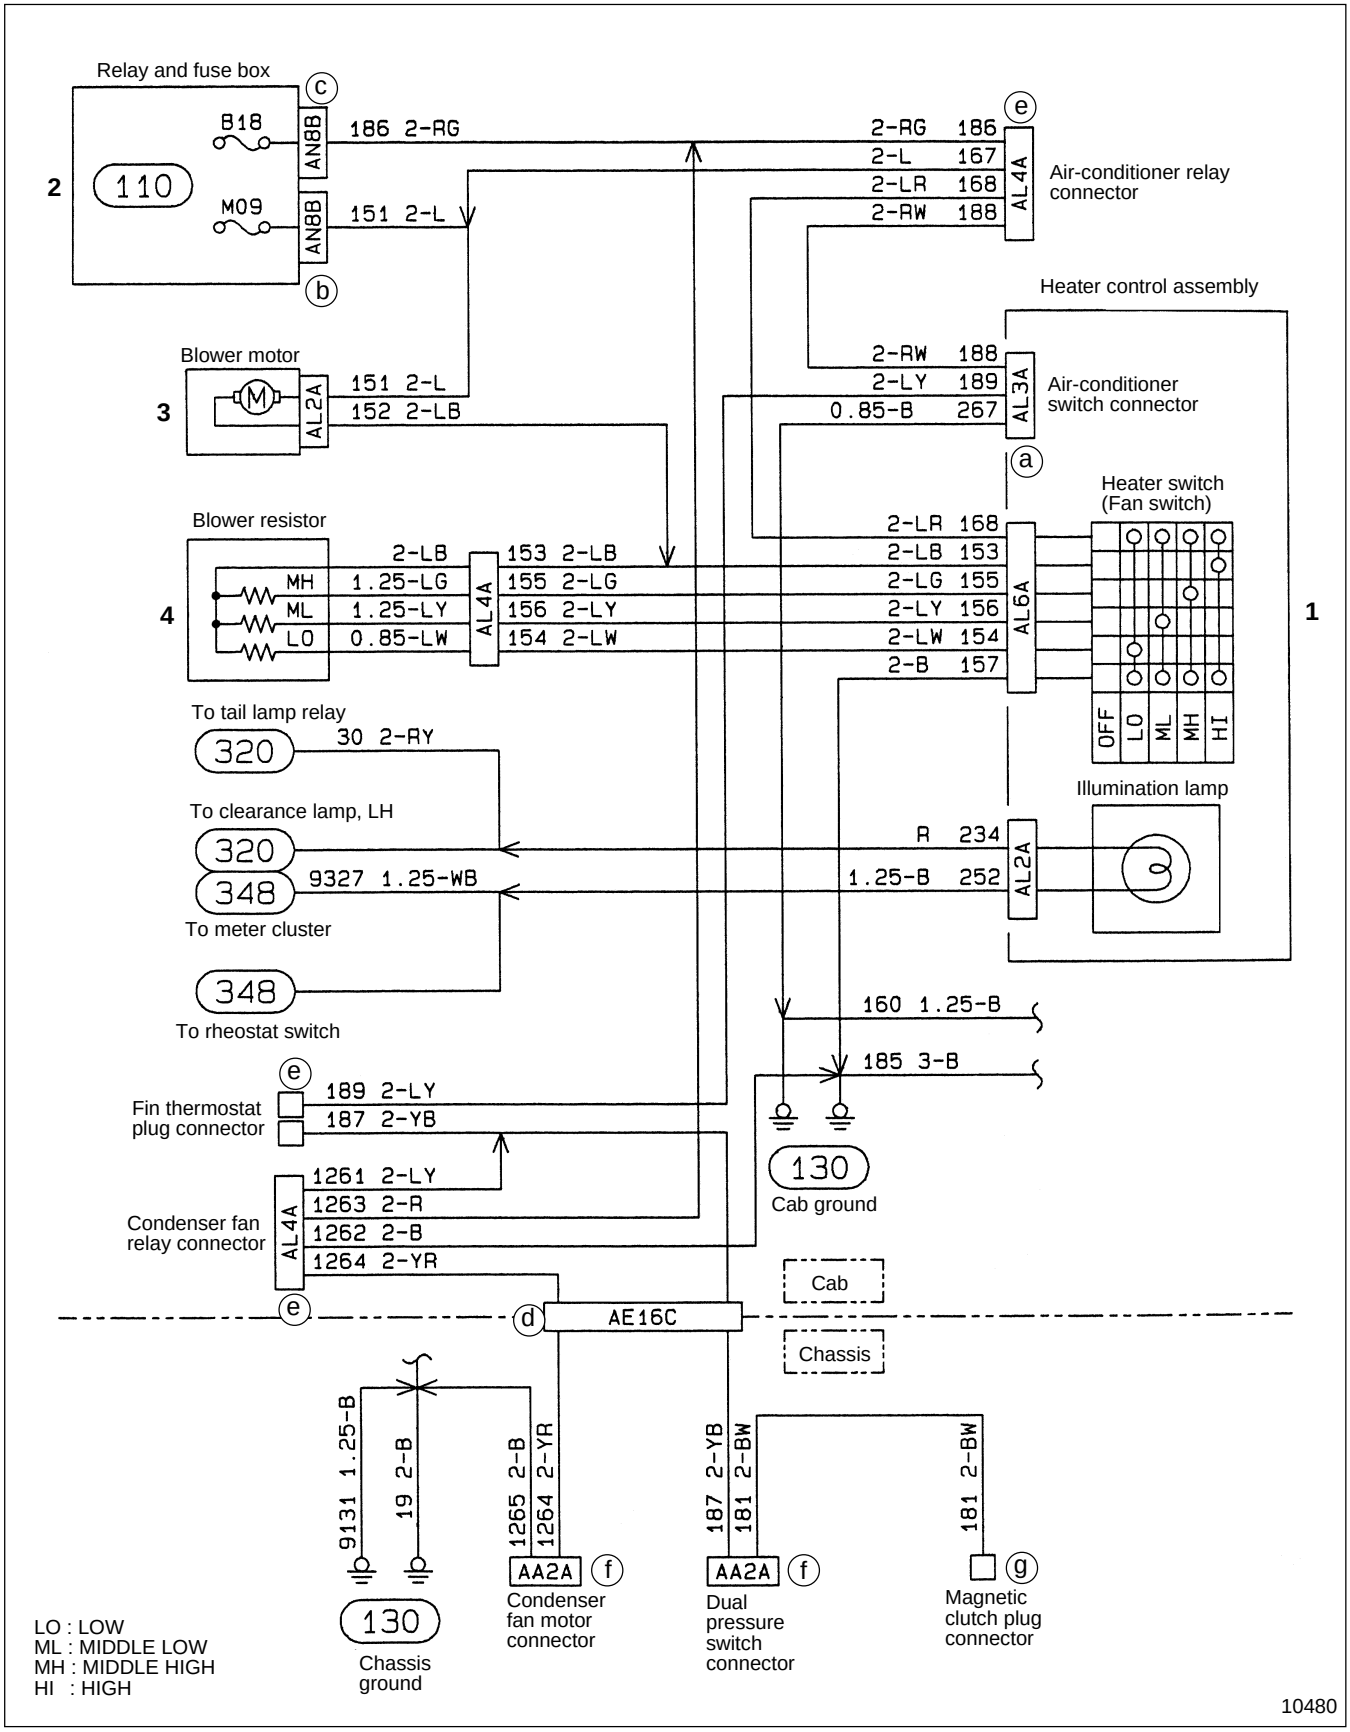
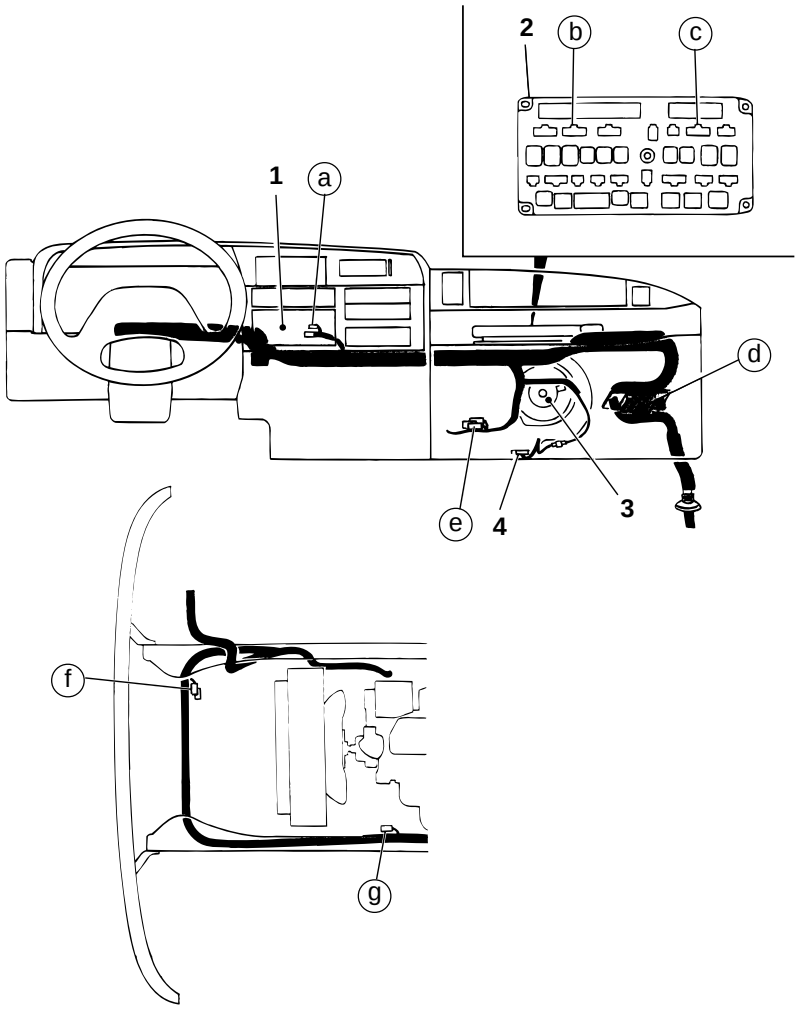
618 HEATER CIRCUIT



https://truckmanualshub.com/



12895

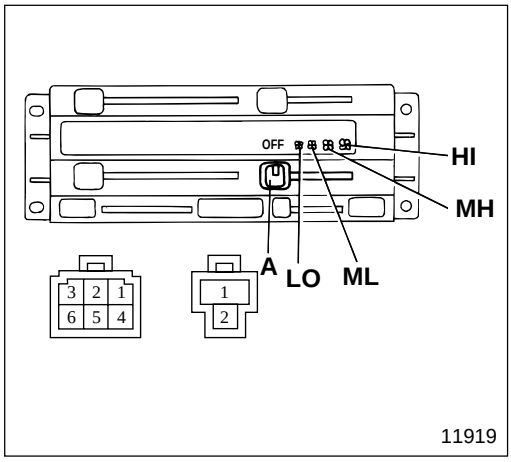
1 Heater control assembly
2 Relay and fuse box 104
3 Blower motor
4 Blower resistor

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
4	Resistance of blower resistor  14364	③–④	0.88	—	Replace
		②–③	0.27		
		①–④	1.78		

https://truckmanualshub.com/

◆ Service procedure



1 **Inspection of heater control assembly**

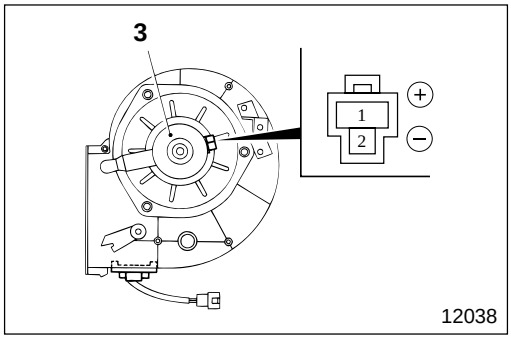
Inspection of blower switch A

- Follow the table below to inspect continuity:

	AL6A						AL2A	
	①	③	②	⑤	⑥	④	①	②
OFF								
LOW	○	○				○		
MIDDLE LOW	○		○			○		
MIDDLE HIGH	○			○		○		
HIGH	○				○	○		
	C	L	ML	MH	H	E	ILL	

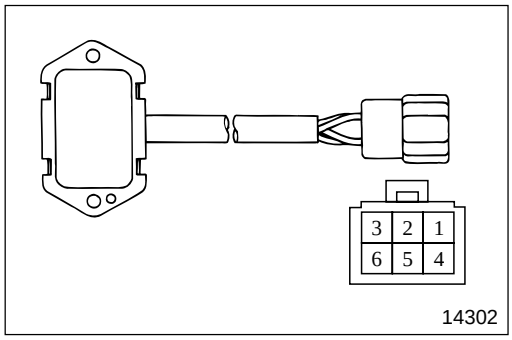
○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace heater control assembly **1**.



3 **Inspection of blower motor**

- Make sure that blower motor **3** operates when 12 volts DC is applied between terminals ① and ②.
- If any fault is found, replace blower motor **3**.



4 **Inspection of blower resister**

- Measure resistance between terminals ③ and ④ (MIDDLE LOW), ② and ④ (MIDDLE HIGH) and ① and ④ (LOW).
- If the measured value deviates from the standard value, replace blower resistor **4**.

https://truckmanualshub.com/

7 CHASSIS ELECTRICS

701 MAGNETIC VALVE 54-7-2

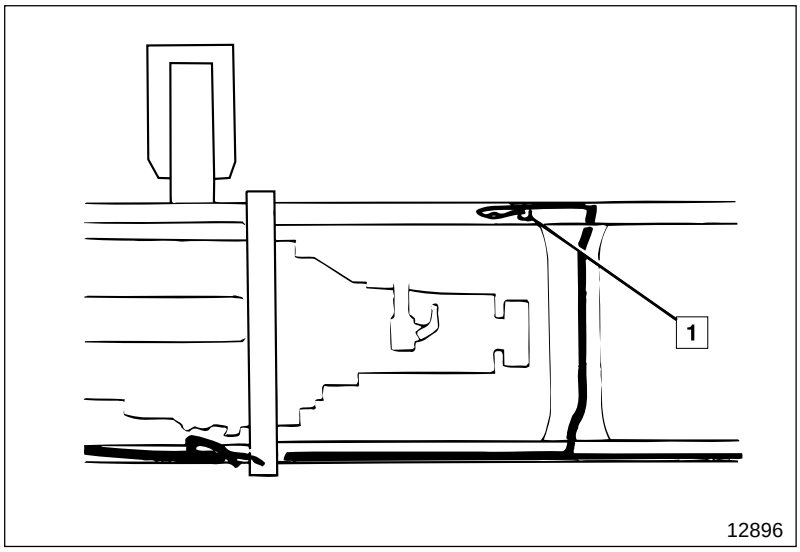
< Manual Transmission >

718 AIR DRYER CIRCUIT 54-7-8

https://truckmanualshub.com/

701 MAGNETIC VALVE

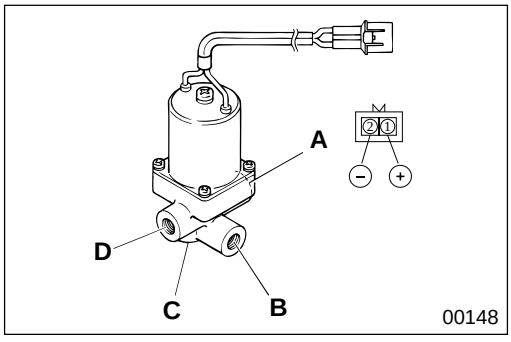
Installation Position



1 3-way magnetic valve

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
1	Minimum operating voltage of 3-way magnetic valve  14318	10 V or less	—	Replace



◆ Service procedure

1 **Inspection of 3-way magnetic valve**

Carry out the following inspection. If any fault is found, replace 3-way magnetic valve **1** :

Air circuit table (There is air continuity between terminals ○ and ○.)

	Input port B	Output port D	Unused A	Exhaust port C
ON	○	○		
OFF		○		○

(1) Operation inspection

- Apply voltage between terminals ① and ②, increasing gradually from 0 volt.
- Measure voltage (minimum operating voltage) when magnetic valve **1** starts operating. (You can tell if the magnetic valves are ON or OFF by listening for an operating sound.)

https://truckmanualshub.com/

(2) Airtightness inspection

- When magnetic valve is ON :
  - Close output port **D**.
  - Apply **12** volts DC between terminals ① and ②.
  - Make sure that there is no air leaking from exhaust port **C** when air pressure (295 to 980 kPa {43 to 140 lbf/in^2, 3 to 10 kgf/cm^2}) is applied to input port **B**.
- When magnetic valve is OFF :
  - Make sure that there is no air leaking from exhaust port **C** or output port **D** when air pressure (295 to 980 kPa {43 to 140 lbf/in^2, 3 to 10 kgf/cm^2}) is applied to input port **B**.

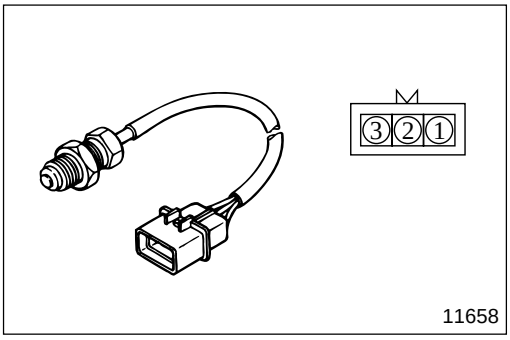
			60°C {140°F}	(620)		
			80°C {176°F}	(300)		

The values in ( ) are reference values.



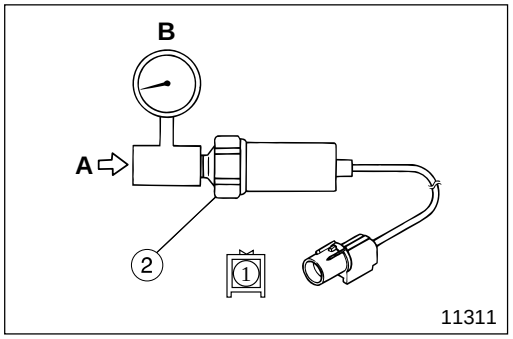
11658

◆ Service procedure

5 **Inspection of engine revolution sensor**

- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace engine revolution sensor **5**. Gr 13

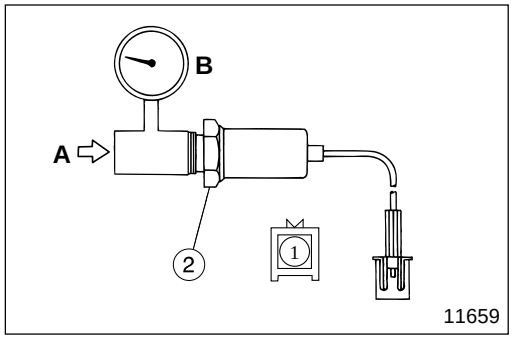
https://truckmanualshub.com/



6 Inspection of engine oil pressure switch

Carry out the following inspection. If any fault is found, replace engine oil pressure switch **6**. Gr 12

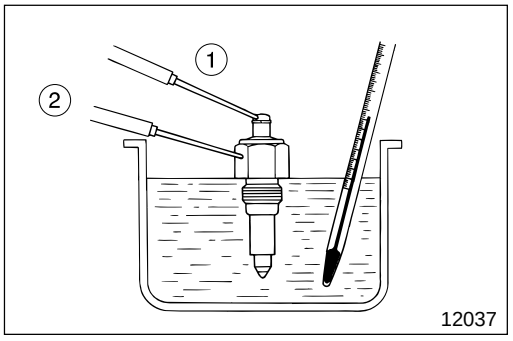
- Make sure that there is continuity between terminals ① and ② (Body) when air pressure **A** is not applied to engine oil pressure switch **6**.
- Apply air pressure **A** to engine oil pressure switch **6** gradually starting from 0 kpa {0 lbf/in^2, 0 kgf/cm^2}.
  Measure the air pressure when continuity is lost between terminals ① and ② (body), and make sure that the measured value conforms to the standard value.
  B : Air pressure gauge



7 Inspection of engine oil bypass alarm switch

Carry out the following inspection. If any fault is found, replace engine oil bypass alarm switch **7**. Gr 12

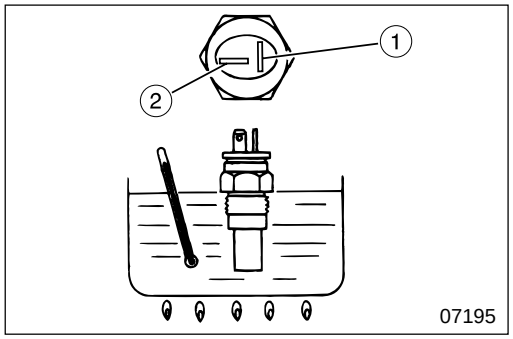
- Make sure that there is no continuity between terminals ① and ② (Body) when air pressure **A** is not applied to engine oil bypass alarm switch **7**.
- Apply air pressure **A** to engine oil bypass alarm switch **7** gradually starting from 0 kpa {0 lbf/in^2, 0 kgf/cm^2}.
  Measure the air pressure when continuity is present between terminals ① and ② (Body), and make sure that the measured valve conforms to the standard value.
  B : Air pressure gauge



8 Inspection of overheating switch

Carry out the following inspection. If any fault is found, replace overheating switch **8**. Gr 14

- Make sure that there is no continuity between terminals ① and ② (Body) at room temperature (20°C {68°F}).
- Place overheating switch **8** in a container filled with engine oil and raise the oil temperature while stirring the oil.
  Measure the temperature when there is continuity between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.
- Lower the oil temperature and measure the temperature when continuity is lost between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.



9 Inspection of water temperature sensor

- Place water temperature sensor **9** in engine oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the resistance between terminal ① and the body, and terminal ② and the body.
  Terminal ① : Water temperature gauge connection
  Terminal ② : Multipurpose timing control unit connection
- If the measured value deviates from the standard value, replace water temperature sensor **9**. Gr 14

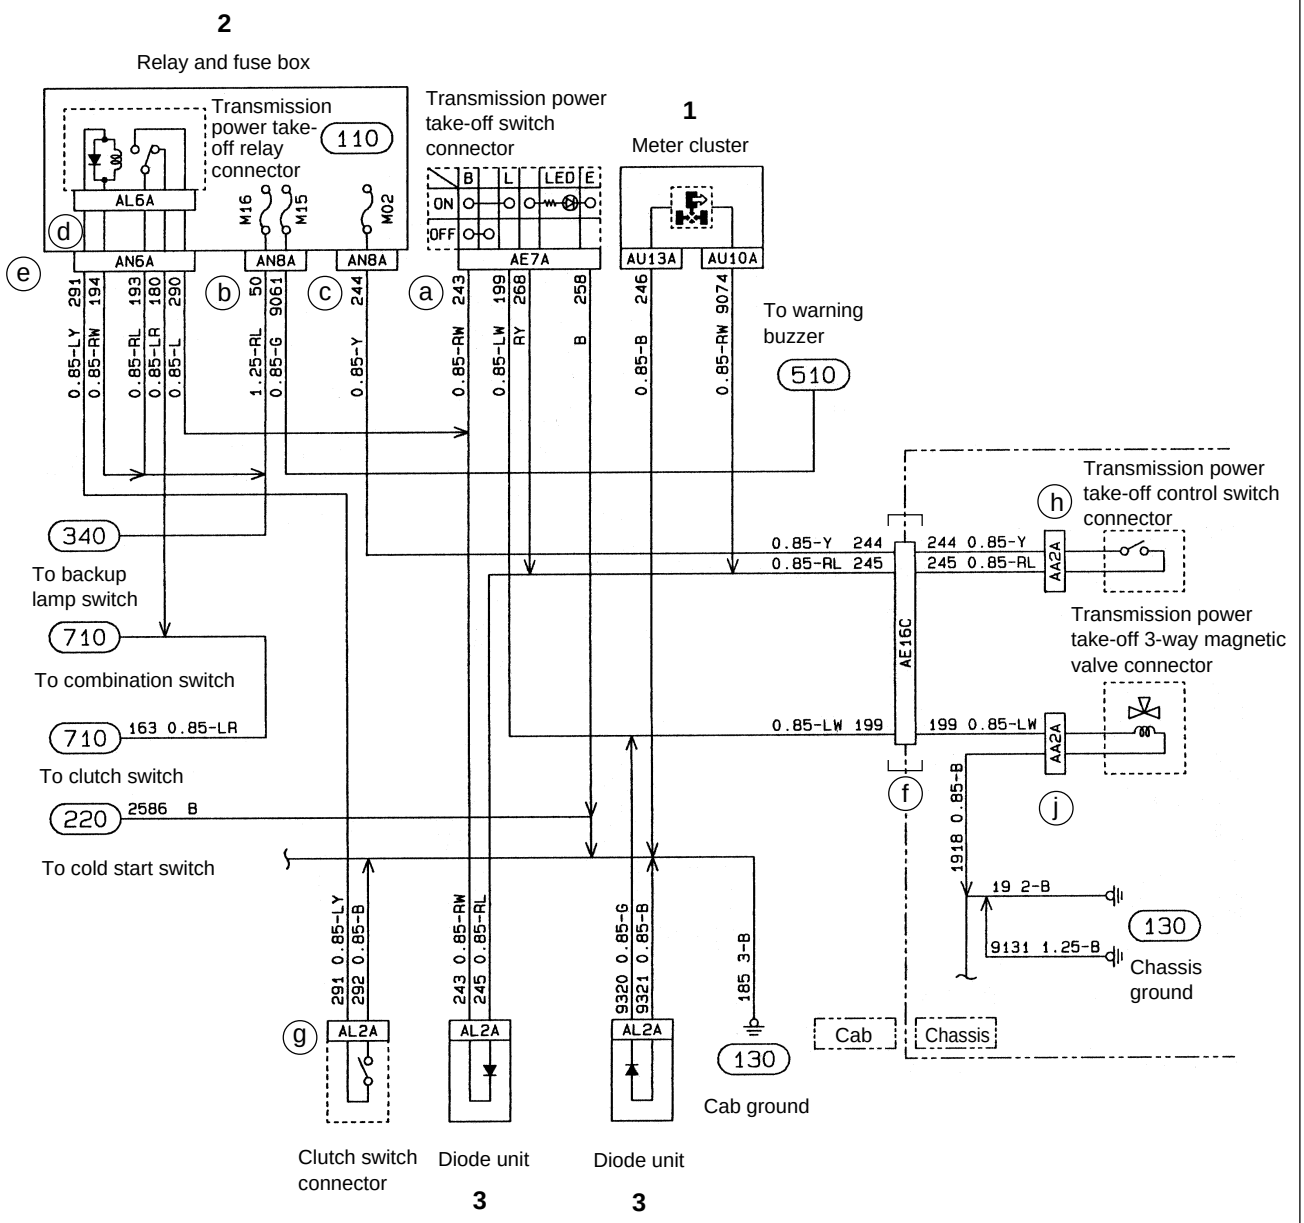
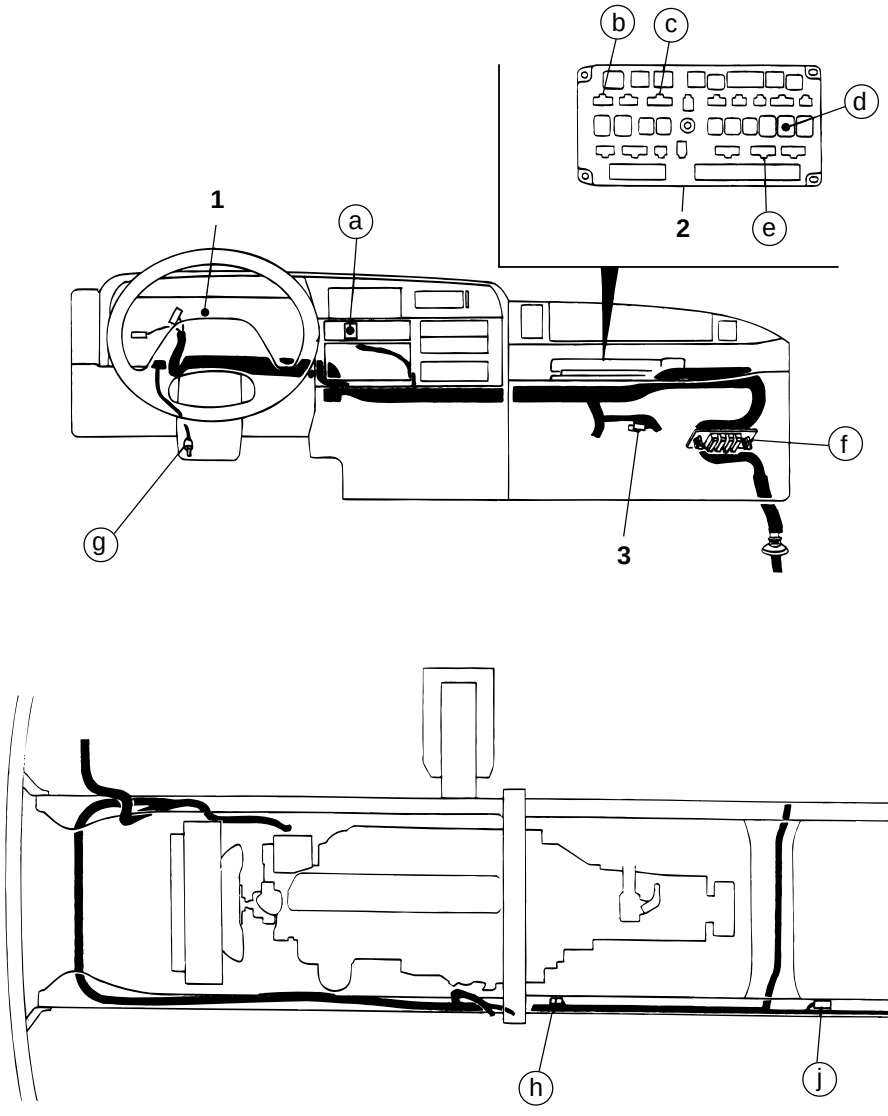
850 TRANSMISSION POWER TAKE-OFF CIRCUIT < Option >



https://truckmanualshub.com/



1 Meter cluster 401
2 Relay and fuse box 104
3 Diode unit

https://truckmanualshub.com/

9 OTHERS

STRUCTURE AND OPERATION 54-9-2

910 MULTIPURPOSE TIMING CONTROL UNIT CIRCUIT 54-9-6

https://truckmanualshub.com/

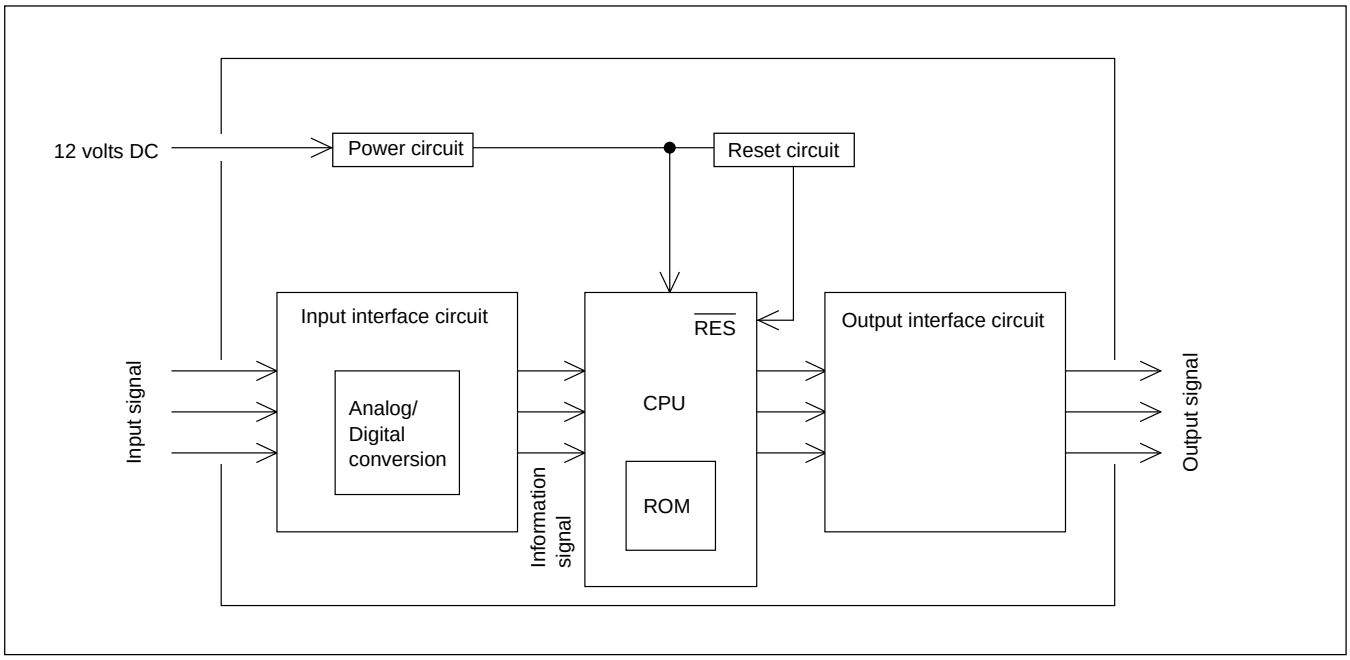
Multipurpose Timing Control Unit

- The multipurpose timing control unit controls the following functions:

Intermittent wiper operating function	Gr 42
Wiper activation function (Even if the wiper switch is OFF, this function automatically activates the wiper when the window washer works.	Gr 42
Preheating function	P 54-2-10
Starter continuity interruption function	P54-2-4
Water level warning function	Gr 14

- Sensors and switches are fitted to these systems as information sources for the multipurpose timing control unit.
- Using the information provided, circuits in the multipurpose timing control unit control the functions mentioned above.

● **Internal structure of multipurpose timing control unit**



- The internal structure mainly consists of the input interface circuit, *1CPU, *2ROM, and the output interface circuit.
  - *1CPU : Central Processing Unit. Compares the input information with information stored in the memory to output commands.
  - *2ROM : Read Only Memory. Stores fixed data and programs that are not erased even after the power is turned off.
- Input signals are transmitted from information sources, such as sensors and switches, to the input interface circuit.
- The input interface circuit converts these input signals from analog signals to digital signals. This enables the CPU to calculate data and transmits them to the CPU as information signals.
- The CPU compares the information signals with the data in the ROM, calculates the signals, and sends them to the output interface circuit.
- The output interface circuit issues commands to systems, based on the above comparison and calculated results, as output signals.
- Sequential execution of the above processes allows optimum control over functions.

1. SPECIFICATIONS

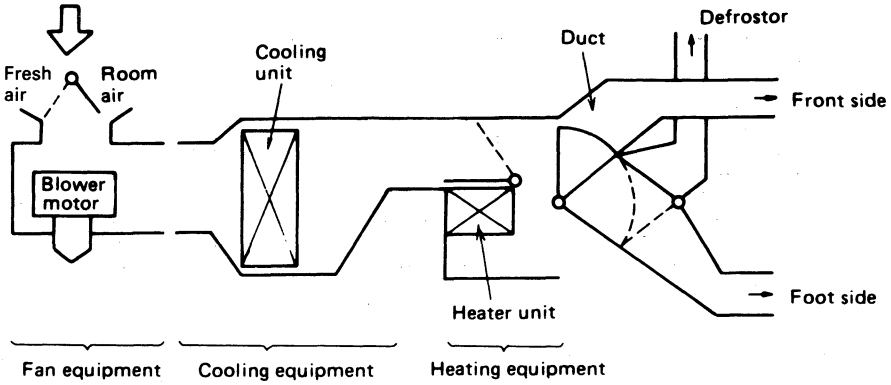
Item			Description
Vehicle name & model			FE
*Cooling capacity (on JIS conditions)			4,200 W (3,600 kcal/h, 14,300 B.T.U/h)
Compresssor	Model		MSC90T
	Displacement		90 cc
	Maximum revolution		MAX 9,000 min^{-1} (9,000 rpm)
	Compressor oil		SUNPAG 56, 120cc (7.3 cu.in)
Magnetic clutch	Type		Dry single disc magnet
	Voltage & input		DC 12V, 38 W
Cooling unit assembly	Type		Laminated type
Controls	Air flow control		Rotary switch, Four step type
	Temperature control		Electric thermostat
Condenser	Type		Corrugated fin type
Receiver assembly			Cylinder type, approx 350 cc (21.4 cu.in)
Protective equipment	Frost prevention (thermostat)		OFF : 33 °F (0.5 °C) ON : 38 °F (3.5 °C)
	Relief valve		Open : 3.50 ~ 4.10 MPaG (508 ~ 594 Lb/in^2G, 35.7 ~ 41.8 kgf/cm^2G) Close : 2.94 MPaG (427 Lb/in^2G, 30 kgf/cm^2G)
	Dual pressure switch	Low pressure switch	OFF : 0.2 MPaG (28 Lb/in^2G, 2 kgf/cm^2G) ON : 0.225 MPaG (32 Lb/in^2G, 2.25 kgf/cm^2G)
		High pressure switch	OFF : 2.94 MPaG (418 Lb/in^2G, 30 kgf/cm^2G) ON : 2.35 MPaG (334 Lb/in^2G, 24 kgf/cm^2G)
	Fuse (Blower fan) Fuse (Magnetic clutch)		15 A 15 A
Refrigerant and quantity			HFC - 134a, 1.4 lb (650 g)

*The * marked cooling capacity is based on JIS conditions
Compressor speed : 1,800 rpm
Condensing temperature : 131 °F (55 °C)
Cooling unit inlet air dry bulb temperature : 80.6 °F (27 °C)
Cooling unit inlet air wet bulb temperature : 67.1 °F (19.5 °C)
Terminal voltage : DC 12V

https://truckmanualshub.com/

2. OUTLINES OF REFRIGERATION SYSTEM

2.1 Air system



Cooling operation

Fresh air is induced to the cooling unit assembly by a blower fan, where it is cooled down and dehydrated, then discharged at the front side outlet through a duct.

Heating operation

Fresh air is induced to the heater unit by a blower fan through the cooling unit assembly, where it is heated, then discharged at the foot side outlet through a duct.

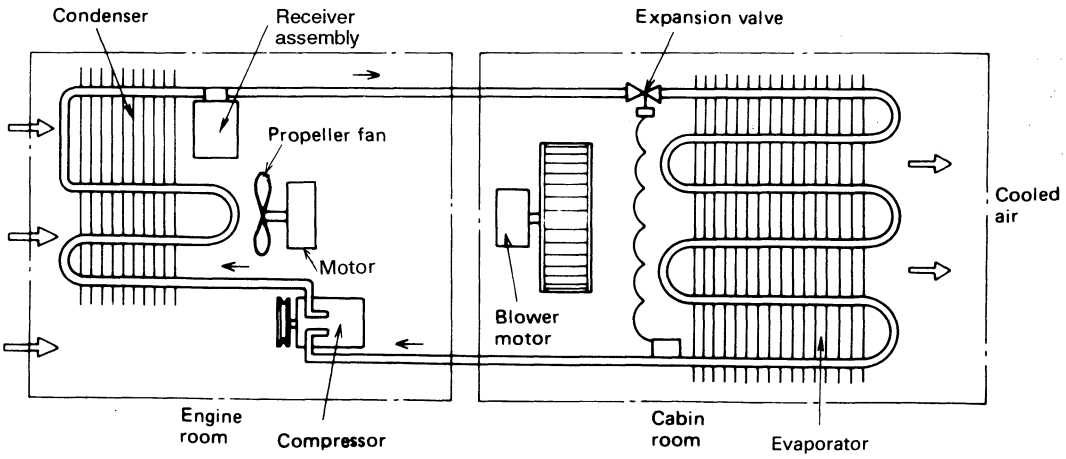
Dehumidifying operation

Fresh air is induced to the cooling by a blower fan,where it is cooled down and dehydrated,and succeedingly to the heater unit for warming, then discharged at the front side outlet through a duct.

Temperaure control

Cooled air and warmed air are mixed for temperature control of the room inside.

2.2 Refrigerating cycle



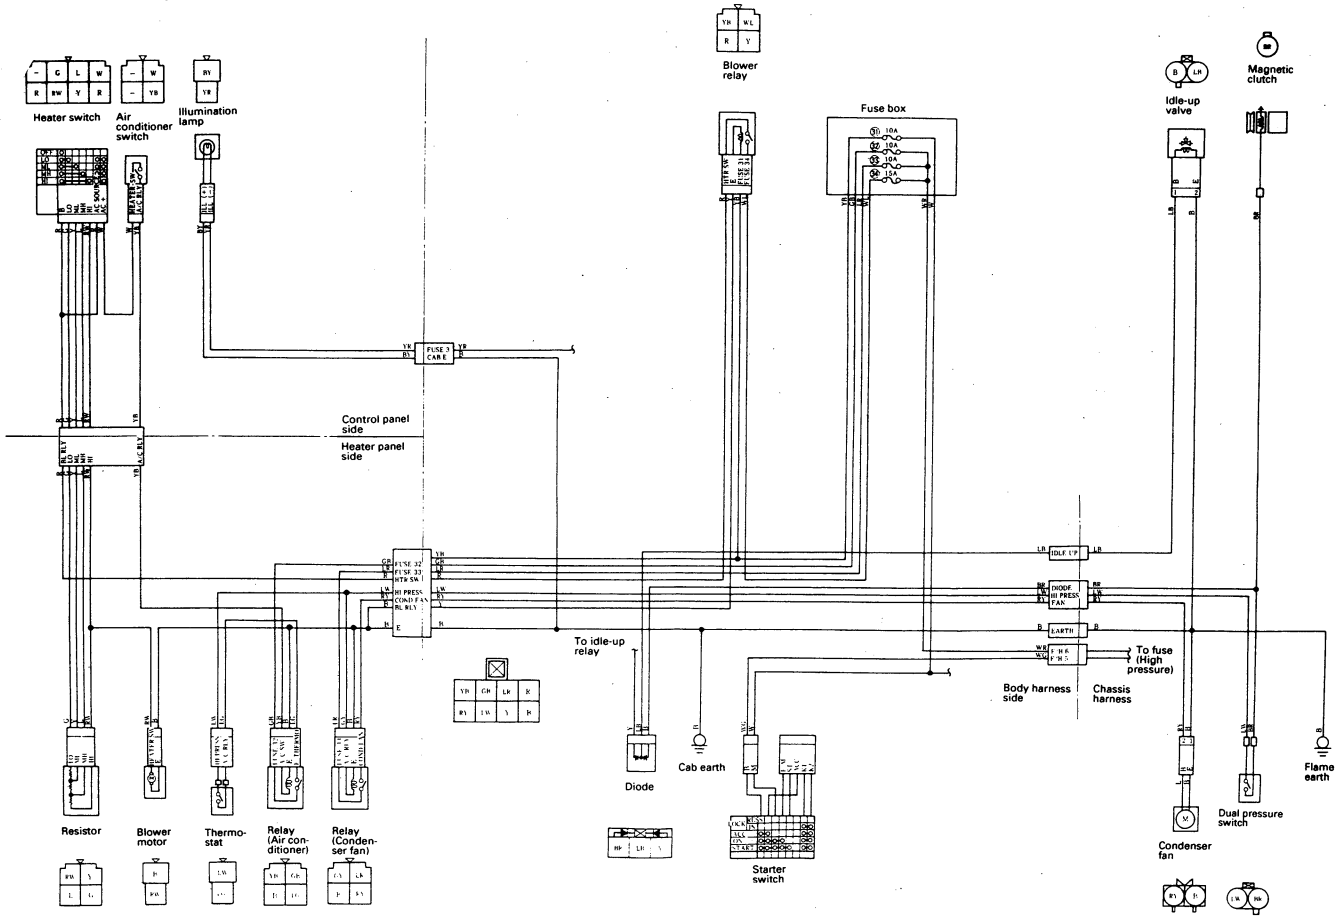
https://truckmanualshub.com/

While the refrigerant, HFC-134a is cooling the air drawn into the evaporator, it evaporates and becomes a gas. This gas is compressed to high pressure and temperature in the compressor, and sent into the condenser where it is cooled and becomes liquid.

This cooling in the condenser is carried out by the open air passing through the condenser sucked by radiator fan and vehicle motion of the vehicle. The liquid refrigerant flows through the receiver assembly where water and dirt are removed, and then it enters the expansion valve. Here the liquid refrigerant is throttled and changed to a mixture of liquid and gas in low temperature and low pressure, and is sent to the evaporator.

In the evaporator, the refrigerant absorbs heat from the surroundings and becomes a gas. That is, because the evaporator itself is cooled at this time, the return air to the cooling unit is cooled, and the interior of the vehicle becomes cool. In this way the refrigerant flow makes a complete circuit.

2.3 Electrical system



The power source is supplied from the TRUCK battery. When the blower switch is put ON, the power relay becomes ON, and electricity is connected to the magnetic clutch of the compresssor. The magnetic clutch switches ON or OFF by air conditioner switch, thermostat, and low pressure switch as the controls for operation service, or safety protection.

The cabin room air temperature is set to a preset point by adjusting the temp.control lever, and the opening degree of the air mix damper.

https://truckmanualshub.com/

3.3 Control system

(1) Controls in panel
Do not run the air conditioner when it is child.

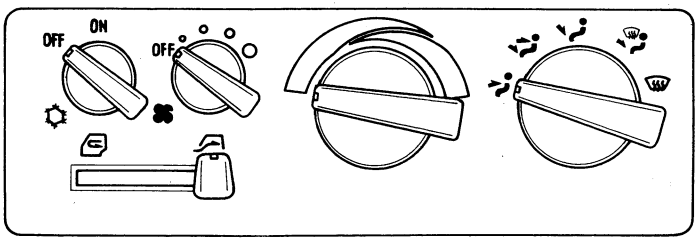
Air conditioner switch
By select the air conditioner switch initially in cooling or drying operation, the compressor starts running.

Fan switch
The air flow is selectable, out of the below four volume.

OFF	No air flow
○	Gentle
○	Low
○	Medium
○	High

Air outlet mode select switch
The air outlet is selected by positioning in cooling and heating operation.

- .....The conditioned air is discharged at the center and both side outlets directed by the louvers as required.
- .....The conditioned air is discharged at the center and both side and foot outlets directed by the louvers as required.
- .....The conditioned air is discharged at the foot outlets directed by the louvers as required.
- .....The conditioned air for dehumidifying is discharged at the foot outlets and to the front glass.
- .....The conditioned air for dehumidifying is discharged to the front glass.



Shift lever, air sirculation
The resirculation air is selectable out of the below sirculation models.

- .....ROOM AIR CIRCULATION
- .....FRESH AIR INTAKE

Temperature control switch
The discharged air temperature is controllable by selecting the position of the control lever in cooling, heating or drying operation.

BLUE ZONE ..... For cool air blow

RED ZONE ..... For warm air blow

By turning the switch toward the BLUE and RED ZONE sides, the supply air temperature becomes more cooler and warmer respectively.

https://truckmanualshub.com/

(2) Oeration control

Operation mode	Setting control lever	Air delivery	Remarks
COOL			Earlier cooling service, or conditioning at dusty, polluted air prevailing places: Shift lever, air circulation
HEAT			Earlier cooling service, or conditioning at dusty, polluted air prevailing places: Shift lever, air circulation Air outlet mode select switch
DEHUMIDIFY			Wetty conditioning in head cooled, and foot warmed : Shift lever, air outlet Air outlet mode select switch
DEFROST			
VENTILATION

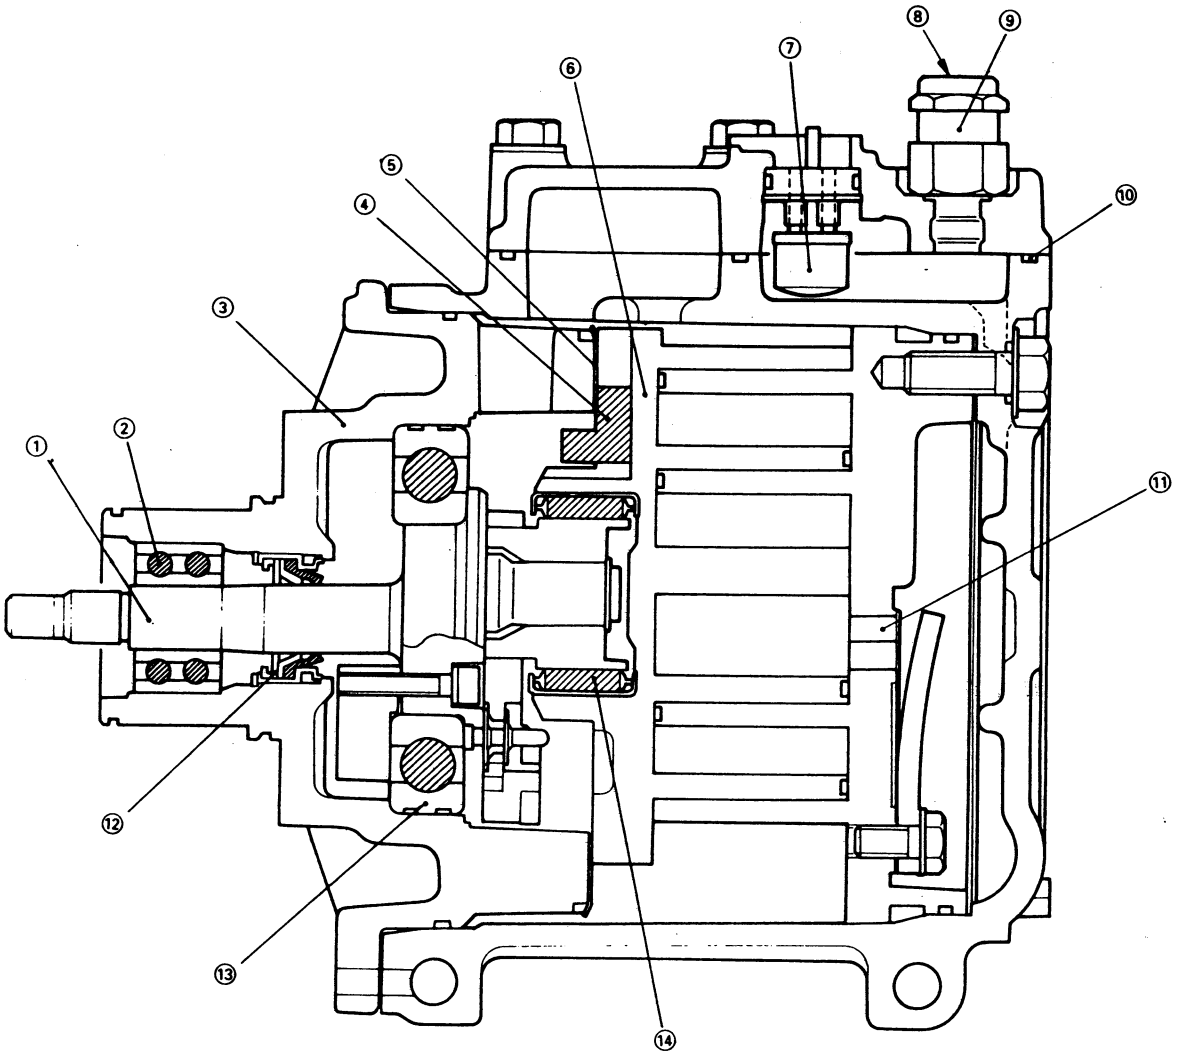
3.4 Compressor and clutch assembly

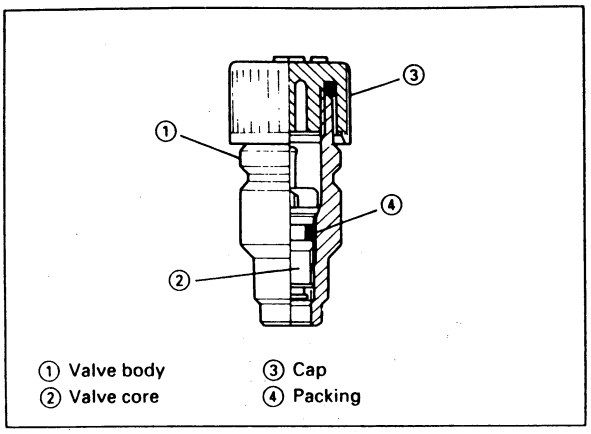
3.4.1 Compressor



① Crankshaft
② Bearing
③ Front case assembly
④ Housing assembly
⑤ Thrust plate
⑥ Orbit scroll assembly
⑦ Thermostat
⑧ Dust seal
⑨ H/P relief valve
⑩ O ring
⑪ Port hole
⑫ Shaft seal
⑬ Bearing
⑭ Needle bearing

https://truckmanualshub.com/

3.4.2 Check valve

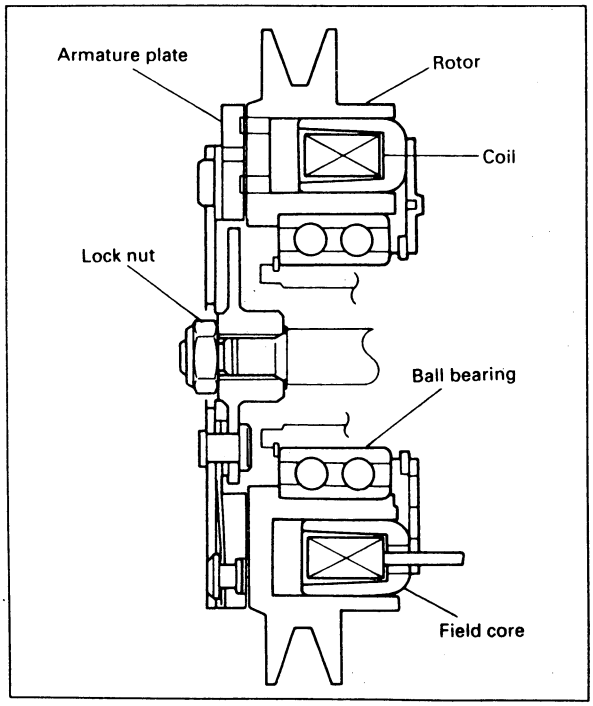


The suction hose and discharge hose are provided with check valve, and designed for gas evacuation and charging service. (shown above)

In the valves, a valve rubber tube, as in automobile tire tubes, is provided as shown in the figure.

Slackening the flare nut on the gauge manifold causes the passage to close automatically by the spring force, and tightening the flare nut causes the passage to open while pressing the compressed spring.

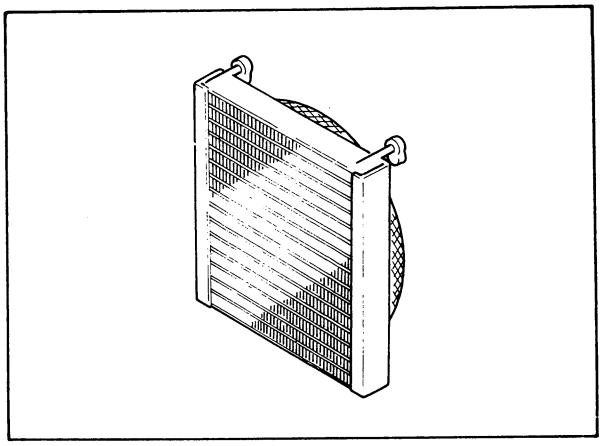
3.4.3 Magnetic clutch



The magnetic clutch is mounted on the compressor crankshaft to start and stop the compressor.

This means that the magnetic clutch is actuated to control the compressor operation electrically by the thermostat.

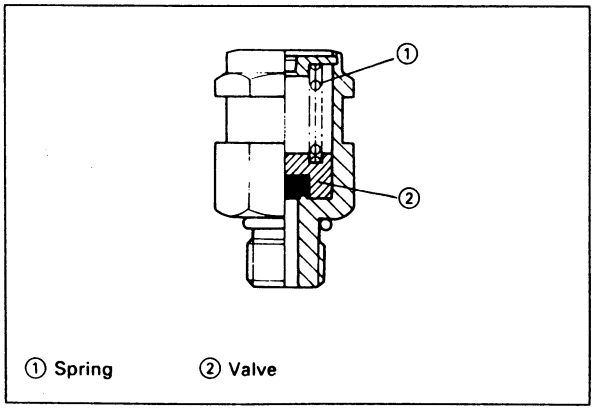
3.5 Side condenser assembly



The condenser is a means to liquefy the refrigerant gas. As the condenser is cooled by the air pulled in by the condenser fan, the refrigerant in the condenser is cooled into liquid. Therefore, when any obstacle prevents the air from flowing evenly to the condenser or the air flow is short circuited, the cooling effect is reduced, with a decrease in the performance of the condenser. When the vehicle is driven at a high speed, the air flow increases resulting in an increase of the cooling effect, and performance of the condenser.

3.6 Relief valve

The relief valve is mounted to the compressor & clutch assembly. The relief valve is usually closed by spring. If pressure of refrigerant in air conditioner system is higher than spring pressure, refrigerant is discharged from relief valve. The pressure drop due to discharge refrigerant, and relief valve is closed again.

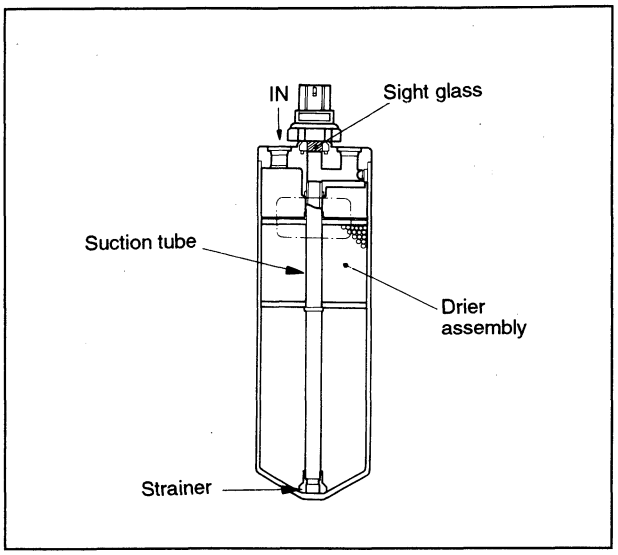


Preset : MPaG (Lb/in²G, kgf/cm²G)

Open	3.50~4.10 (508~594, 35.7~41.8)
Close	2.94 (427, 30)

https://truckmanualshub.com/

3.7 Receiver assembly



A receiver assembly is served as a refrigerant reservoir located between the condenser and the expansion valve.

The receiver assembly consists of a filter and a sight glass. The filter is used to remove dust, the drier is used to remove moisture from the refrigerant in the circuit, and the sight glass is used to check the refrigerant charge.

Any moisture in the refrigerant may not only corrode metal surfaces in the refrigerant circuit, but also cause the throttle of the expansion valve to be frosted, resulting in the interruption of refrigerant circulation.

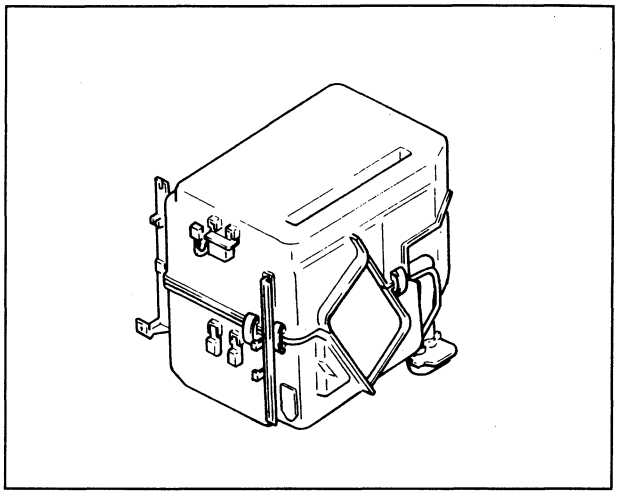
Therefore,the receiver assembly must be handled very carefully. When storing or installing it,care should be taken to protect it from the deterioration of drying performance due to exposure to the air.

The retardation of heat exchange, or any fire around the refrigerant circuit will cause excessive pressurization or heating of the refrigerant. Should such an accident occur, the refrigerant in the circuit must be expelled to the outside to prevent the above hazards.

The sight glass is a sort of peep window used to check the refrigerant flow in the refrigerant circuit.

The sight glass appears clear when the refrigerant flow is enough, and shows bubbles flowing when the refrigerant flow is short.

3.8 Cooling unit assembly



Evaporator core

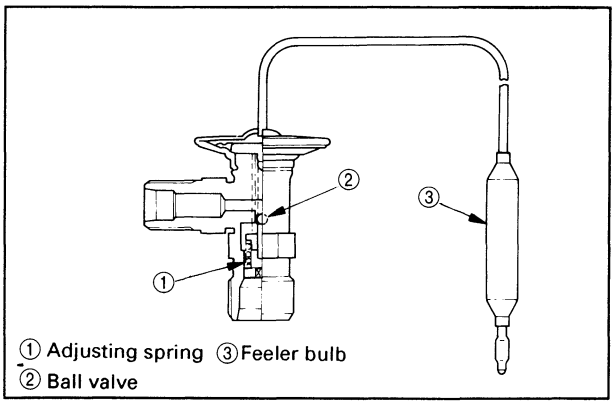
The evaporator core is a type of corrugated fin and tube.

The tube is arranged in zigzag to achieve high efficiency, and to make the core system compact.

A thicker reinforced plastic plate is used as the enclosure to inclease heat and shock resistance,and to protect the core from humidity. This case is a split type, and in a simple design to facilitate installation on the floor panel and the instrument panel frame of the vehicle.

3.9 Expansion valve

The expansion valve is mounted at the inlet of the cooling unit. The liquid refrigerant from the receiver is led to it through a narrow passage (for throttle action), where-in, the liquid refrigerant is condensed with pressure dropping and at the same time the flow rate is adjusted before the refrigerant is sent to the cooling unit. The refrigeration load in the cooling unit is not constant, but usually fluctuates over a certain range. So the refrigerant flow should undergo the control in design. An automatic expansion valve performs this function automatically. The air conditioner uses a thermal type automatic expansion valve.



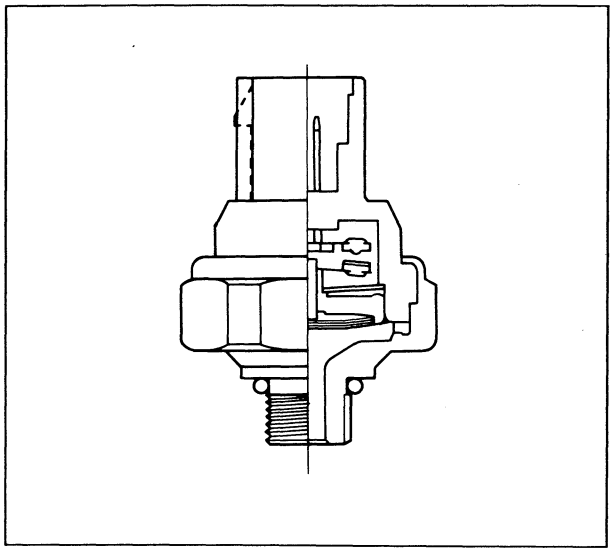
https://truckmanualshub.com/

3.10 Dual pressure switch

The dual pressure switch, fixed to the receiver functions as a protector for stopping the compressor (OFF) at a preset value of pressure in the refrigerant circuit.

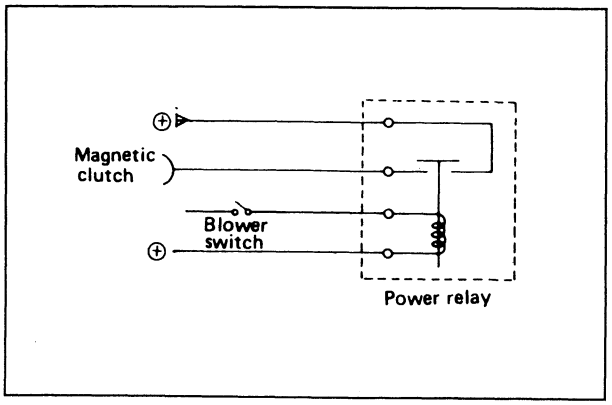
Preset : MPaG (Lb/in²G, kgf/cm²G)

	L.P.SW	H.P.SW
OFF	0.2 (28, 2)	2.94 (418, 30)
ON	0.225 (32, 2.25)	2.35 (334, 24)



3.11 Power relay

The power relay is excited at a closed position of the micro switch and enables the magnetic clutch to be ready for engaging electrically.

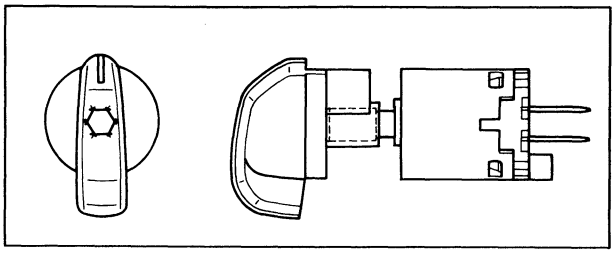


3.12 Air conditioner switch

The air conditioner switch functions as an operation controller for starting or stopping the compressor in cooling and dehumidifying

Set the it to the "ON" position, the magnetic clutch becomes engaged and the compresssor starts.

Set the it to the "OFF" position, the magnetic clutch becomes disengaged and the compresssor stops.



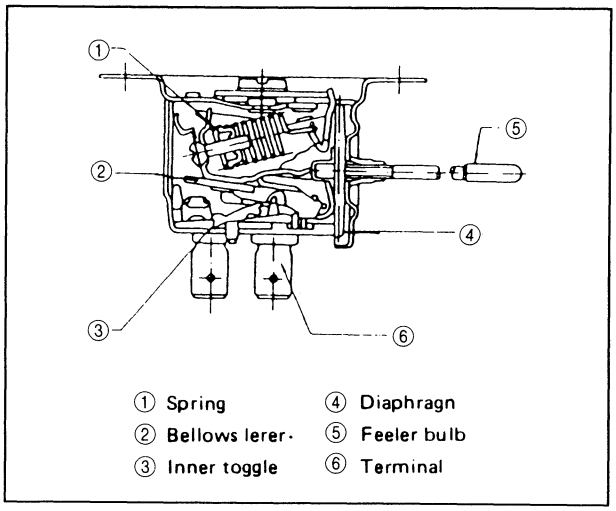
3.13 Thermostat

The thermostat is mounted on the evaporator case.

It senses the temperature of the evaporator fins, and controls the compressor operation for ON or OFF as specified below.

Preset : °F(°C)

OFF	33 (0.5)
ON	38 (3.5)



https://truckmanualshub.com/

4. TROUBLE SHOOTING

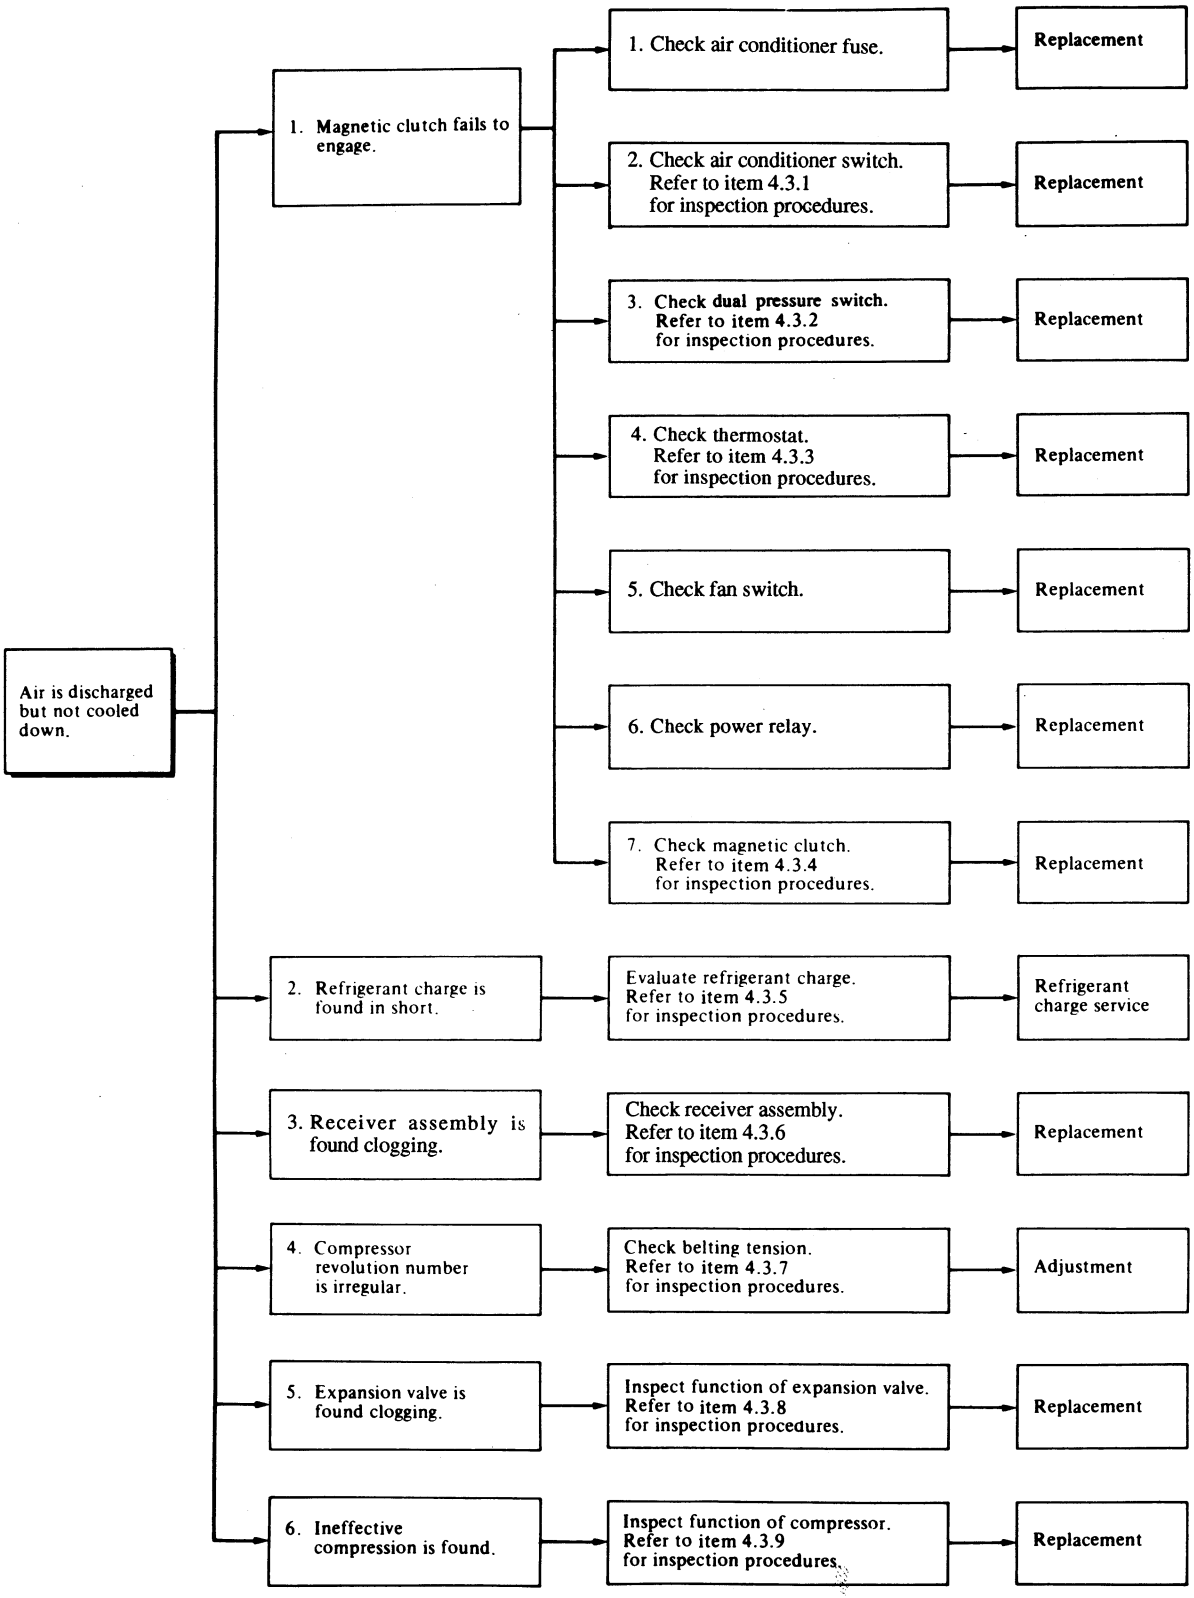
4.1 General precautions

(1) When handling refrigerant (HFC-134a), the following precautions must be observed.
   a. Always wear eye protection and a pair of gloves which handling refrigerant.
   b. Be careful the liquid refrigerant dose not contact the skin.
   c. Keep the refrigerant container blow 100 degrees F (40 degrees C).
   d. Do not handle the refrigerant in an enclosed area having an open flame.The refrigerant may produce a poisonous gas.
   e. When dumping the refrigerant from the system, release it slowly so as not to expell all the compressor oil.

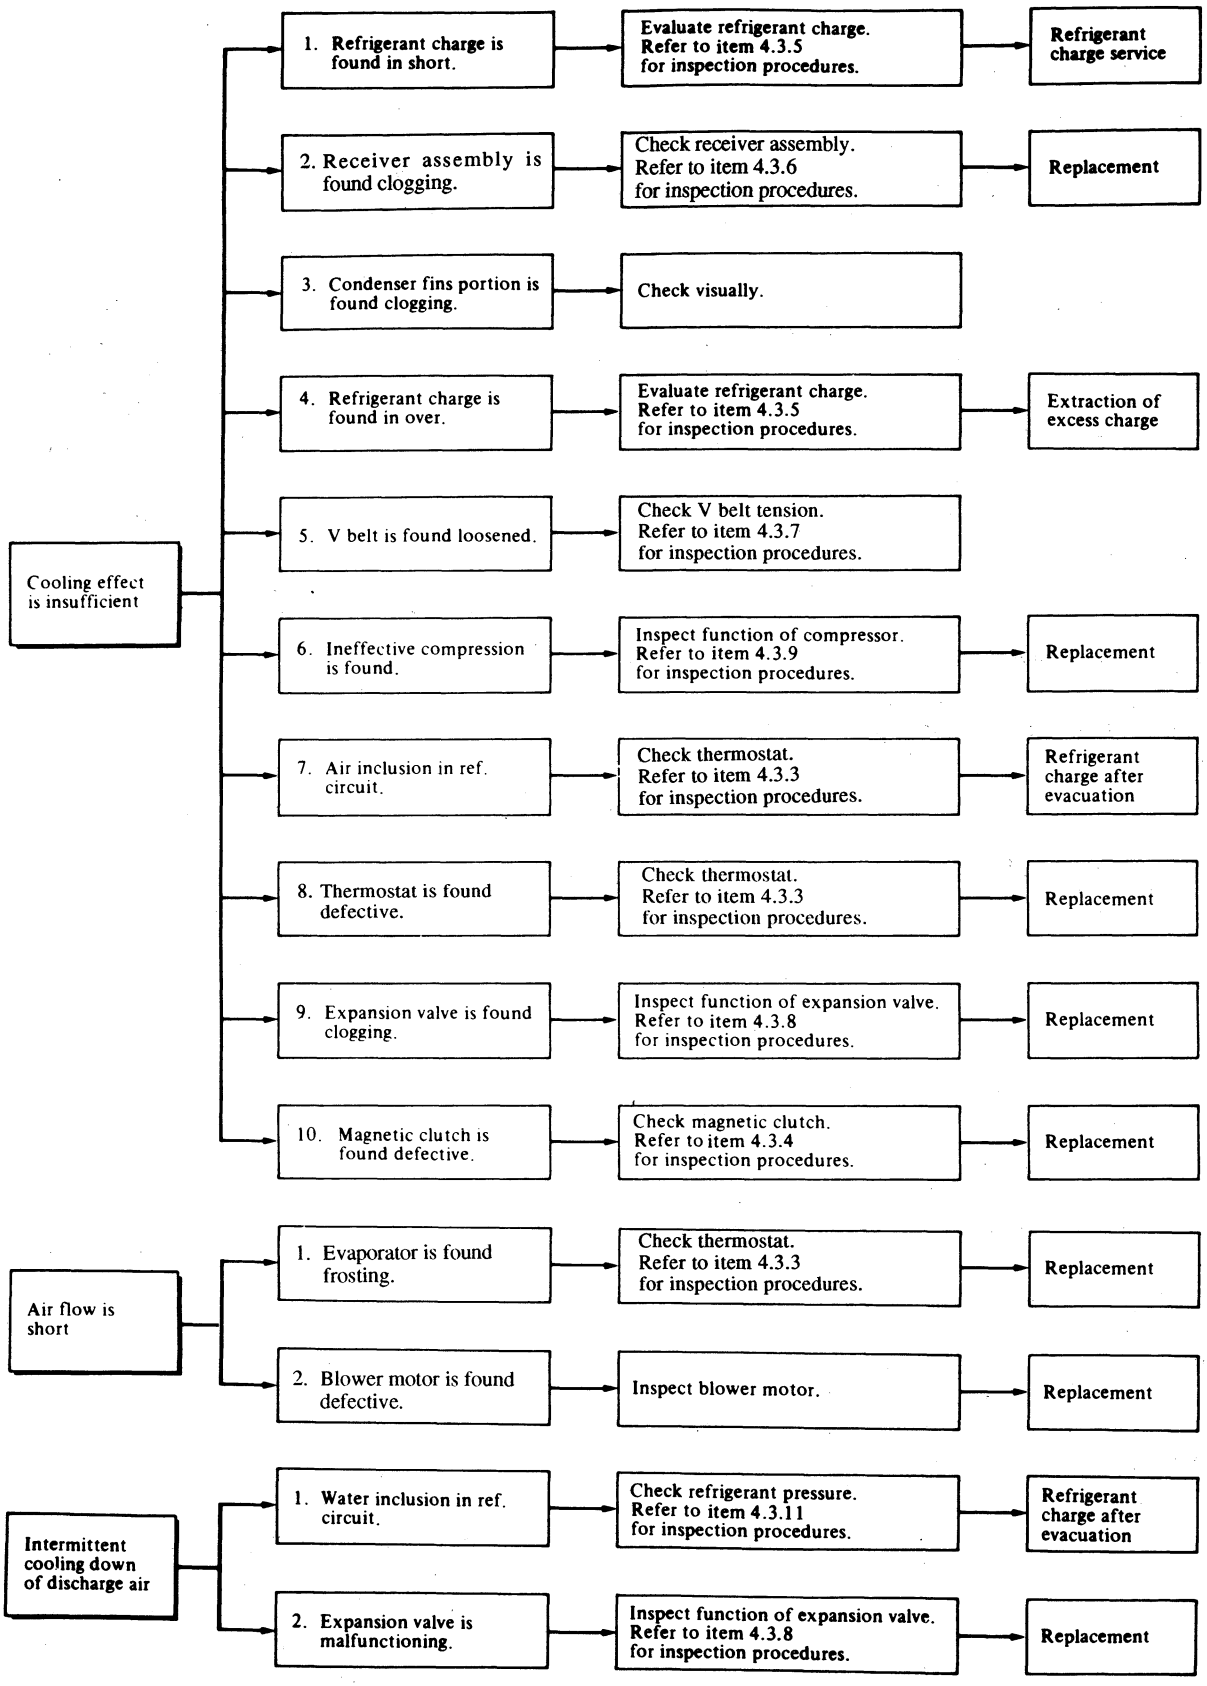
(2) If liquid refrigerant strikes eye or skin.
   a. Do not rub eye or skin.
   b. Splash large quantities of cool water on the eye or skin.
   c. Rush to a physician or hospital for immediate professional treatment.

https://truckmanualshub.com/

4.2 Trouble cause and remedy



https://truckmanualshub.com/



https://truckmanualshub.com/

ection procedures

r conditioner switch

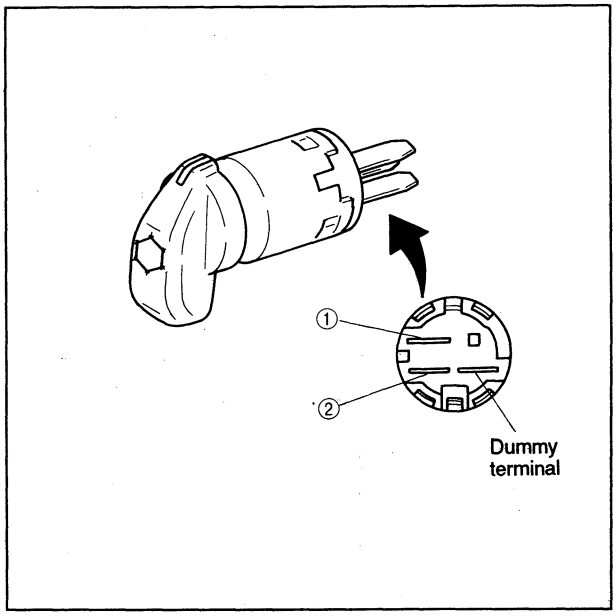
ug the air conditioner switch.

:k the continuity between terminals of the air itioner switch with a tester.

inuity

itch position	Terminal's number	Result, in normal
OFF	①—②	No
ON	①—②	Yes

Terminal's number / h ion	1	2
OFF	○	
ON	○—○	

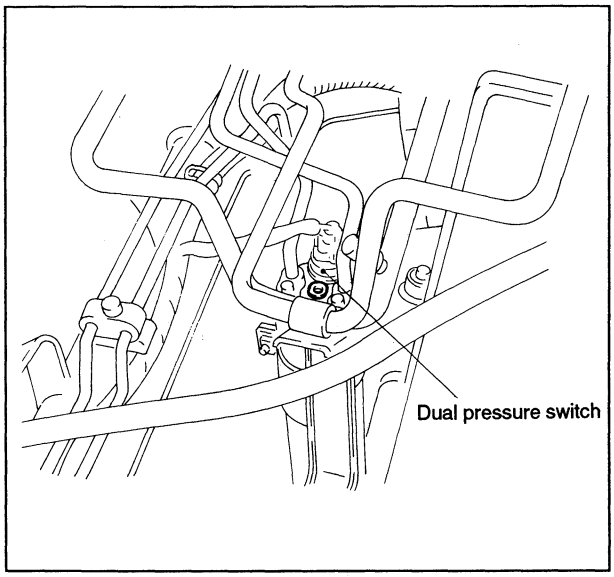


)ual pressure switch

dual pressure switch is attached to the receiver)ly for controlling the operation of the air oner by checking the inside pressure of the r assembly.

MPaG (Lb/in²G, kgf/cm²G)

High side	Low side
2.94 (418, 30)	0.2 (28, 2)
2.35 (334, 24)	0.225 (32, 2.25)



ıplug the connector at the receiver assembly.

ıeck the continuity between terminals of the nnector with a tester.

hen electric continuity is found, connect the nnector to the high pressure switch.

ttach the high pressure gauge and low pressure ıuge.

perate the air conditioner.

)ver the surface of the condenser by using a piece ' paper.

'hen the high pressure exceeds 2.94 MPaG (418 b/in²G, 30 kgf/cm²G), if the magnetic clutch is ırned off, the switch is normal.

' the magnetic clutch is not turned off, replace ressure switch with new one.

Check the accuracy of the preset as below.

ı) Stop the air conditioner.

)) Purge the air conditioner of refrigerant slowly starting at over 0.225 MPaG (32 Lb/in²G, 2.25kgf/cm²G).

(c) At reading the pressure 0.2 MPaG (28 Lb/in²G, 2 kgf/cm²G), the switch opens.

(d) Here, stop the purging, then turn it to charging.

(e) At reading the pressure 0.225 MPaG (32 Lb/in²G, 2.25 kgf/cm²G), the switch closes.

If the dual pressure switch does not meet specifications, replace the switch.

https://truckmanualshub.com/

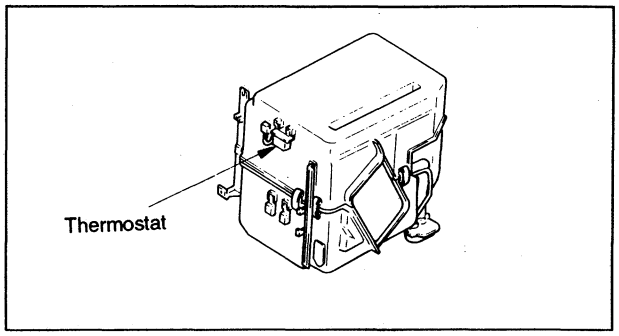
4.3.3 Thermostat

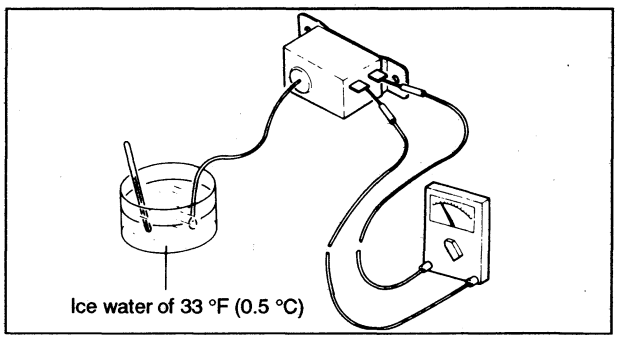
The thermostat is mounted on the evaporator case. It controls the operation of the air conditioner by sensing the temperature of the evaporator fins.

Preset : °F (°C)

OFF	33 (0.5)
ON	38 (3.5)

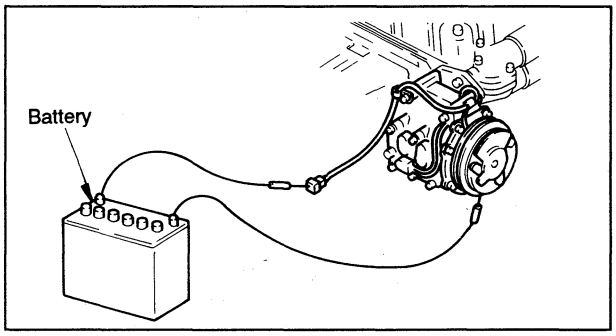
(1) Check the accuracy of the preset as below.
  (a) Soak the sensor of the thermostat in ice-water of below 33 °F (0.5 °C).
  (b) Check the cotinuity between the switch terminals.
  (c) Pull the sensor out of the ice-water, and check the continuity at over 38 °F (3.5 °C) of the sensor.





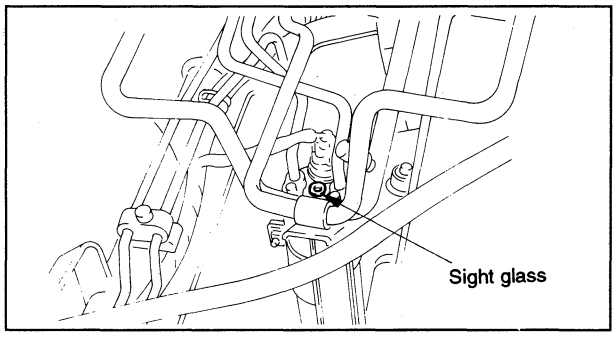
4.3.4 Magnetic clutch

(1) Disconnect the wiring to the magnetic clutch.
(2) Apply a positive side power voltage to the magnetic clutch through the wiring.
(3) In the case of regular functioning, the pulley and magnetic clutch are engaged with a clicking sound. The failing means any malfunction of the magnetic clutch.



4.3.5 Refrigerant charge

(1) Set the temperature control lever at the cool position.
(2) Open doors of the room.
(3) Set the blower switch at the ON position.
(4) Adjust the engine revolution at 1500 rpm.
(5) Operate the air conditioner switch for comp. ON.
(6) Watch the sight glass of the receiver assembly at the inside of the engine room.
  (a) If judged as insufficient refrigerant charging, repair the leaks, then charge it additionally.
  (b) If judged as over charging of refrigerant, extract an excess refrigerant.
(7) Diagnosis by pressure reading
  (a) Short of refrigerant :
  Lower pressure for both L.P. and H.P. reading
  (b) Express of refrigerant :
  Higher pressure for L.P. and H.P. reading



Sight glass		Remarks
Proper refrigerant level	Bubble	1. Bubble occasionally appears. 2. Bubble disappear if speed is a little increased.

Insufficient refrigerant	Bubble	Considerable bubbles appear. If the system is extremely short of refrigerant, the sight glass appear white.
Excessive refrigerant		1. No bubbles appear. 2. Slight bubbles appear if speed is decreased.

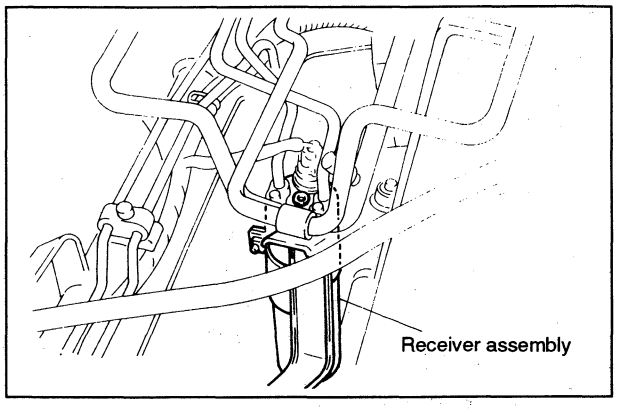
https://truckmanualshub.com/

4.3.6 Receiver assembly

(1) While operating the air conditioner, touch the refrigerant piping with a hand at the inlet and outlet portions.

(a) Sensed temperature difference :

It is possible that clogging is happening at the inside, liquid receiver assembly is to be replaced with a new one.



4.3.7 Belt tension

(1) Depress the V belt with a thumb at the ⬅ marked position, and adjust the stretching as below.

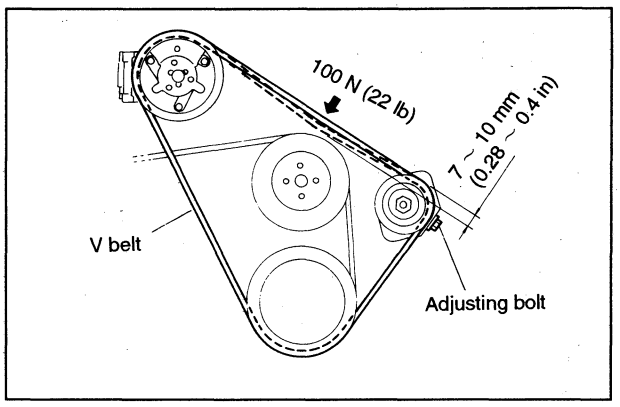
Stretching degree : 7 ~ 10 mm (0.28 ~ 0.40 in) (deflection)

(2) Adjustment

(a) Loosen the nut of the tension pulley.

(b) Control the belting tension by the adjusting bolt.

(c) After finishing, retighten the nut as before.



4.3.8 Expansion valve

⚠CAUTION

The test should be applied to only the case of the other components being free from troubles, and the expansion malfunctioning singly.

(1) Build up the test circuit with a gauge manifold.

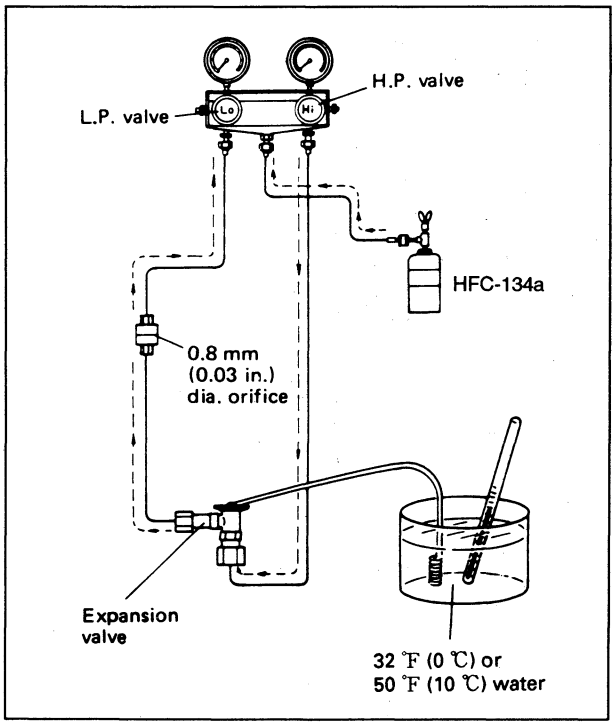
(2) Soak the sensor bulb in ice water of 32 °F (0 °C), and of 50 °F (10 °C) respectively.

(3) Pressurize the H.P. side with dry nitrogen gas of 1.03MPaG (10.5 kgf/cm²G).

(4) Check the reading of the L.P. side pressure gauge for the standard range.

At 32 °F (0 °C) --- 0.127 MPaG (18.4 Lb/in²G, 1.3 kgf/cm²G)

At 50 °F (10 °C) --- 0.23 MPaG (33.4 Lb/in²G, 2.35 kgf/cm²G)



https://truckmanualshub.com/

4.3.9 Pressure check

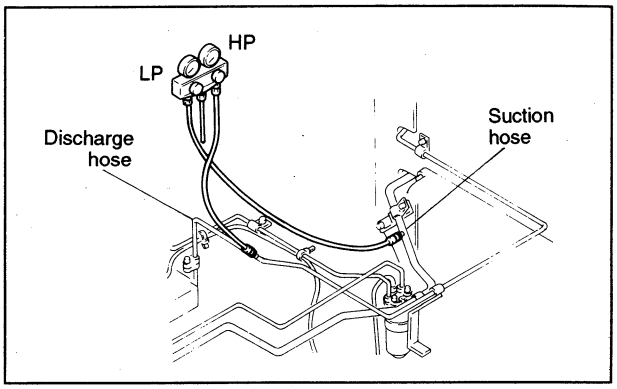
(1) Mount a low pressure gauge hose and a high pressure gauge hose on the check valve.

(2) Drive the air conditioner.

(3) Showing of higher L.P. side pressure and lower H.P. side pressure evidences ineffective compression.

Standard pressure

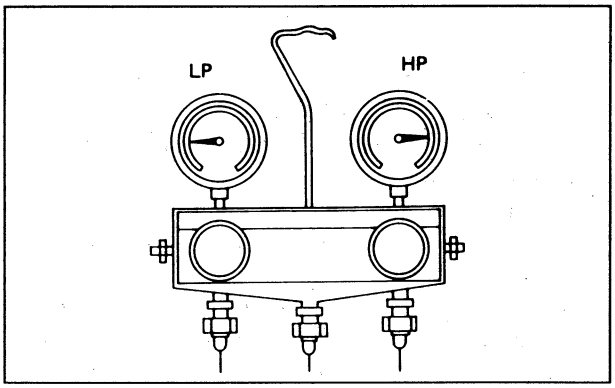
L.P. side pressure	About 0.26 MPaG (38.4 Lb/in²G, 2.7 kgf/cm²G)
H.P. side pressure	About 1.42 MPaG (207.6 Lb/in²G, 14.6 kgf/cm²G)



4.3.10 Air inclusion in ref.circuit

The abnormal reading of the refrigerant circuit evidences afraid air inclusion.

A little higher L.P. side pressure Noticeably higher H.P. side pressure

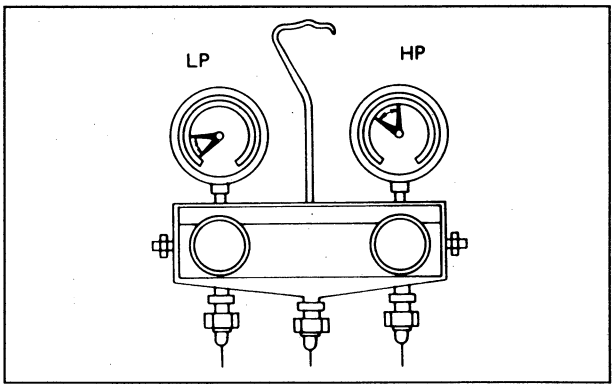


4.3.11 Moisture inclusion in ref. circuit

(1) During the operation, cooled air supply is interrupted periodically with a time interval.
This phenomenon evidences afraid water inclusion.

(2) Check the refrigerant pressure at a stop of the cooled air supply to make sure of the water inclusion.

L.P. side pressure ..... Almost vacuum
H.P. side pressure ..... Noticeably low

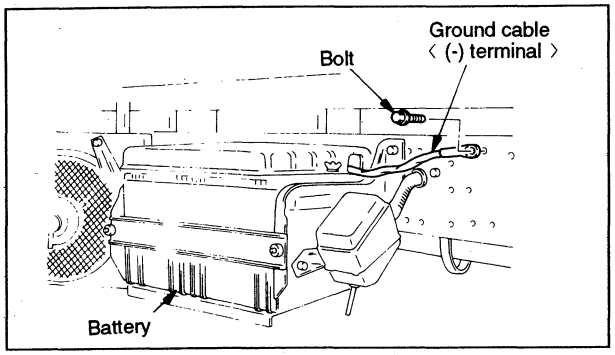


https://truckmanualshub.com/

5. REMOVAL AND INSTALLATION

5.1 Precaution for removal and installation.

1. Disconnect the (-) ground cable from the battery, and place a cover on the battery.



2. Make certain all the openings are covered with caps in order to prevent entry of foreign substances such as dust and dirt.
3. Never tamper with the brake and fuel systems, including the brake tubes and hoses.
4. Avoid doing the work in a dusty place or outdoors in rainy weather. If tubes or functional parts are removed, put a cap in position immediately in order to prevent entry of dust and moisture.
5. Connect the charging hose of the gauge manifold to the check valves (suction and discharge) of the suction hose and discharge hose, and recover the refrigerant by refrigerant recovery unit until its pressure is reduced to 0 kPaG (0 psiG, 0 kgf/cm²G). (Make sure that there is no internal pressure in the equipment.)

   Abrupt discharging might result in the discharge of the refrigerant oil from the compressor.
6. When coupling the flared tube, coat the flared portion with the compressor oil at the inner side.
7. Make sure to use the wheel chocks.

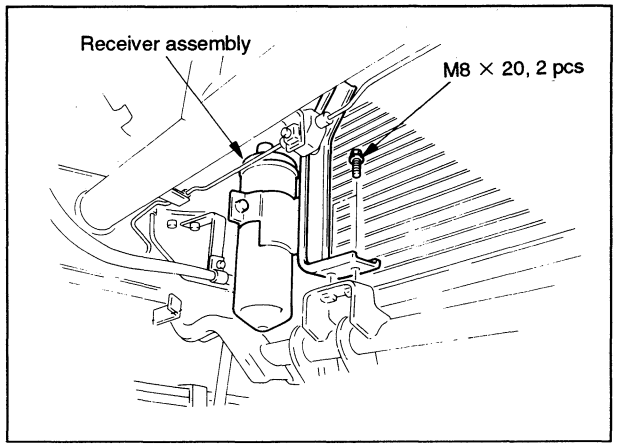
5.2 Removal

5.2.1 Inside the engine room

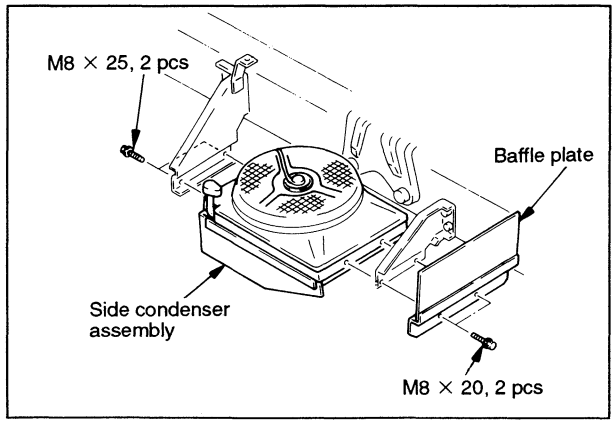
(1) Compressor & clutch assembly
   (a) Withdraw the wiring of the magnetic clutch at the connector.
   (b) Remove the V belt by loosening fixature of the tension pulley.
   (c) Take of the archor bolts : M8 × 100, 3 pcs and M8 × 130, 1 pc.
   (d) Dismount the compressor.

(2) Receiver assembly
   (a) Unplug the dual pressure switch at the connector.
   (b) Separate the interconnecting refrigerant pipe of the receiver assembly.

   (c) Take off the fixing bolt : M8 × 20, 2 pcs.
   (d) Dismount the receiver assembly.



(3) Side condenser assembly
   (a) Unplug the condencer fan harness at the vehicle side harness.
   (b) Take off the fixing bolt : M8 × 20, 2 pcs and M8 × 25, 2 pcs.
   (c) Dismount the side condenser assembly (and baffle plate).

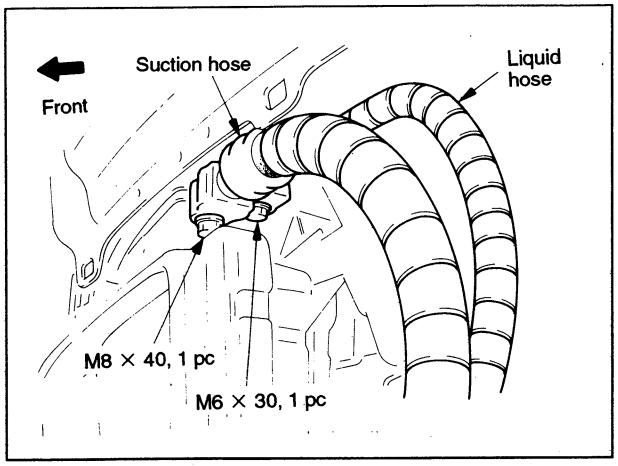


https://truckmanualshub.com/

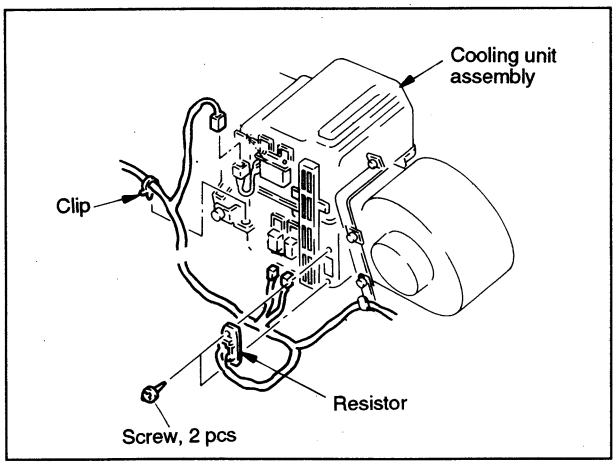
5.2.2 Cabin room

(1) Cooling unit assembly

(a) Separate the interconnecting refrigerant pipes of the cooling unit assembly.



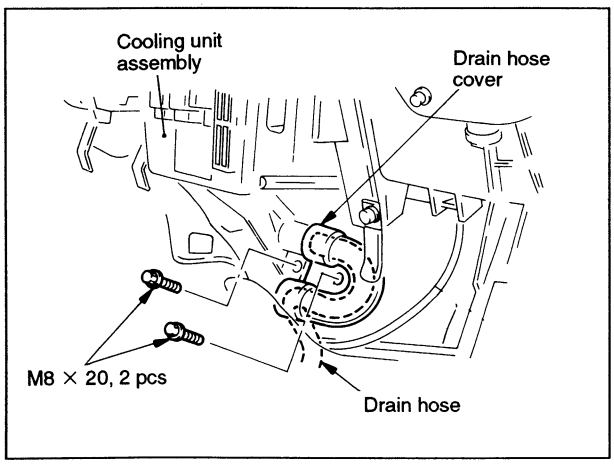
(b) Withdraw the wiring of the cooling unit assembly at the connectors.



(c) Take off the fixing bolts : M8 × 20, 2 pcs.

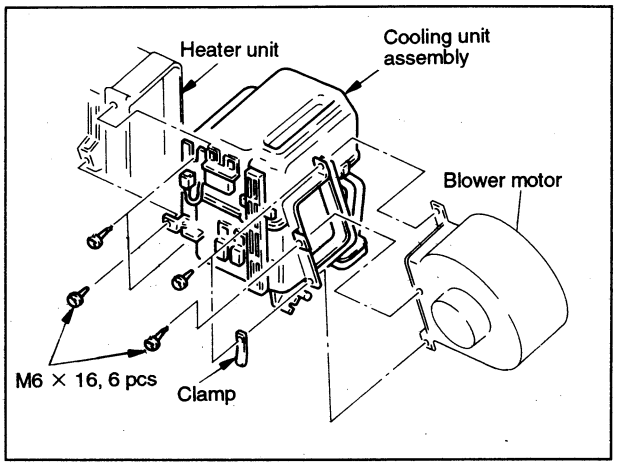
(d) Dismount the drain hose cover.

(e) Reconnect the drain hose from the cooling unit assembly.



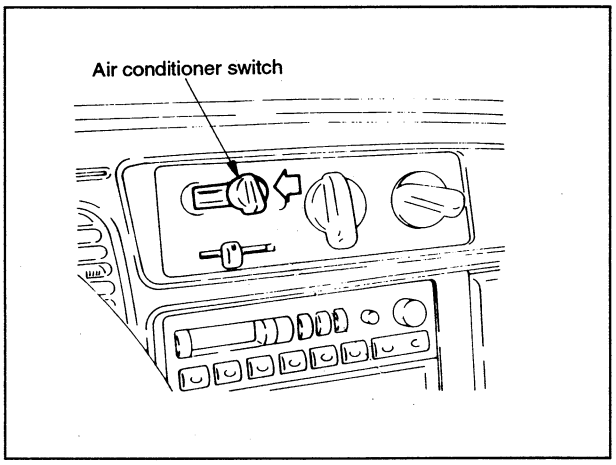
(f) Take off the fixing screws : M6 × 16, 6 pcs.

(g) Dismount the cooling unit assembly.



(2) Air conditioner switch

Pull out the air conditioner switch.



https://truckmanualshub.com/

5.3 Installation

Installation is performed in the opposite sequence of removal.

○ Torques for tightening coupler of refrigerant tubing.

Nm (Lb.ft.kgm)

Compressor suction hose	29-34 (21 ~ 24, 3.0 ~ 3.5)
Compressor discharge hose	20-25 (14 ~ 18, 2.0 ~ 2.5)
Compressor inlet hose	20-25 (14 ~ 18, 2.0 ~ 2.5)
Compressor outlet hose	12-14 (8.6 ~ 10, 1.2 ~ 1.5)
Liquid receiver assembly inlet and outlet hoses	12-14 (8.6 ~ 10, 1.2 ~ 1.5)
Cooling unit inlet hose	12-14 (8.6 ~ 10, 1.2 ~ 1.5)
Cooling unit outlet hose	29-34 (21 ~ 24, 3.0 ~ 3.5)

○ Torques for tightening general bolt and nut

Nm (Lb.ft. kgm)

Nominal size	Pitch	Tightening torque		
		Head mark 4	Head mark 7	Head mark 8
M 5	0.8	3-4 (2.1 ~ 2.9, 0.3 ~ 0.4)	5-6 (3.6 ~ 4.3, 0.5 ~ 0.6)	5-7 (3.6 ~ 5, 0.5 ~ 0.7)
M 6	1.0	5-6 (3.6 ~ 4.3, 0.5 ~ 0.6)	9-11 (6.4 ~ 7.9, 0.9 ~ 1.1)	8-12 (5.7 ~ 8.6, 0.8 ~ 1.2)
M 8	1.25	12-14 (8.6 ~ 10, 1.2 ~ 1.5)	19-24 (13.6 ~ 17, 2.0 ~ 2.5)	19-29 (13.6 ~ 21, 2.0 ~ 3.0)
M10	1.25	24-29 (17 ~ 21, 2.5 ~ 3.0)	38-48 (27 ~ 34, 4.0 ~ 5.0)	43-58 (30.7 ~ 41.4, 4.5 ~ 6.0)
M10	1.5	17-26 (12 ~ 18.6, 1.8 ~ 2.7)	32-48 (23 ~ 34.3, 3.3 ~ 5.0)	41-58 (29.3 ~ 41.4, 4.3 ~ 6.0)
M12	1.25	34-43 (24.3 ~ 31, 3.5 ~ 4.5)	58-77 (41 ~ 55, 6.0 ~ 8.0)	82-106 (58.6 ~ 75.7, 8.5 ~ 11.0)
M14	1.5	72-82 (51 ~ 59, 7.5 ~ 8.5)	115-134 (82 ~ 96, 12.0 ~ 14.0)	125-173 (89.3 ~ 123.6, 13.0 ~ 18.0)

NOTE

For the cases of spring washer seated, and thread or seating surface coated with oil, the value shall be reduced down to 85 percent of the data listed.

https://truckmanualshub.com/

6. TREATMENT AFTER INSTALLATION

6.1 Check and adjustment

After installation, check the following points and confirm that everything is normal, then charge the gas, and do the performance and operation tests.

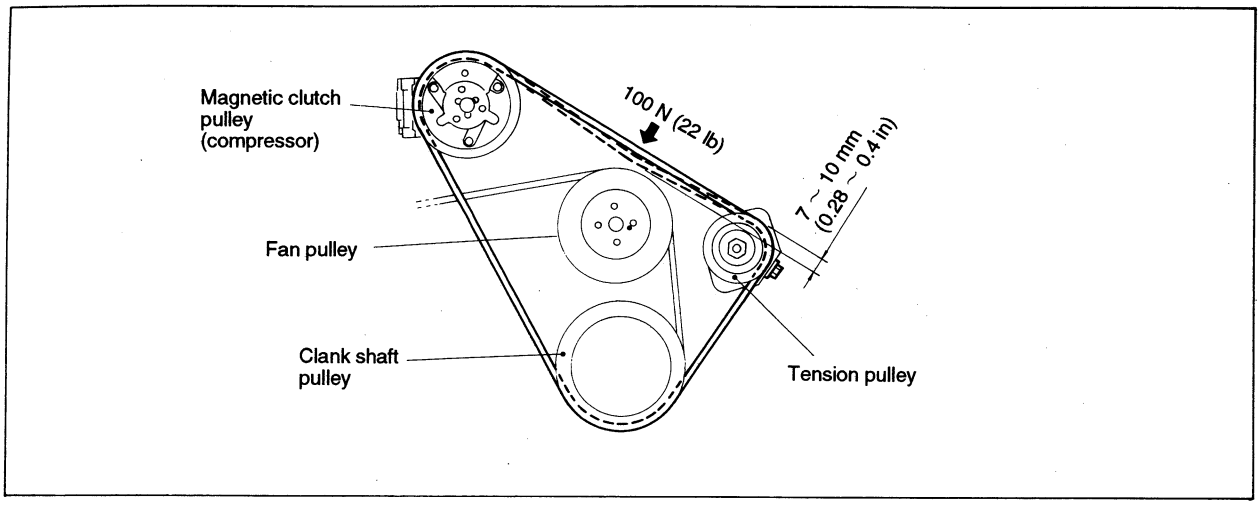
(1) Check if any abnormal vehicle performance, happens or not by installing the air conditioner.

(2) Check the operation of the magnetic clutch. (with the compressor disengaged)

(3) Check if any parts left unmounted or any tool left in the vehicle.

(4) Check to ensure that the temperature control lever operates properly.

(5) Check the tension of the belt.



6.2 Leak test

After all the piping works are completed, conduct an leak test by the following procedure to check any leaks at the flare coupling, etc. and then evacuate the system. If this leak test is omitted and evacuation is immediately started, there is no way of detecting possible leak. If there are leaks, the specified vacuum cannot be attained. In order to save the service time be sure to conduct the leak test before evacuation.

6.2.1 Test points

(1) All pipe joint.

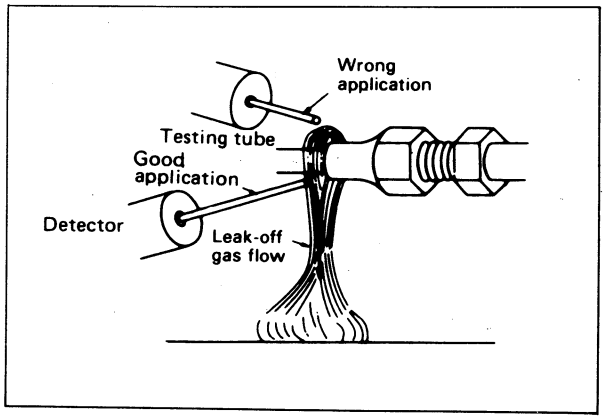
(2) Shaft seal and check valve on the compressor.

6.2.2. Test procedure

(1) For the gas leak test, the use of an electric gas leak detector is recommended. (HFC-134a SAE Approved)

(2) Perform the test at a place as in free from air flowing.

(3) The refrigerant is heavier than air. Leaks will concentrate at the bottom. Make certain that the testing tube is applied below the check point.



(4) The test should be performed patiently. Make certain that testing tube is moved slowly [approx. 10 mm/sec. (0.4 in./sec.)].

(5) The high pressure side refrigerant circuit should be tested for gas leaks during operation. Those areas which are dangerous or hard to test during operation (including areas around the compressor and condenser) should be tested direct after shutdown.

https://truckmanualshub.com/

(6) The low pressure side refrigerant circuit should be tested during shutdown after the gas pressure has balanced.

(7) The test should be performed on the basis of the following standards:

Gas leak test standards

Test Point / Instrument	Compressor shaft seal	Other parts
Electric gas leak detector	Pointer shall not swing more than 0.1 mA at the low sensitivity.	Pointer must not swing more than 0.1 mA at the high sensitivity.
Halide torch gas leak detector	Flame colour (moss green) shall not change.	

⚠ WARNING

- **Smoking should be forbidden if a gas leak is detected.**
- **If a flame is applied to the refrigerant, toxic phosgene gas will be produced. Do not keep the detector in contact with a leaky point for a long time.**

- Leak test procedure

1. Attach refrigerant supply and gauge set as shown with all valves closed. Open refrigerant supply valve on can.
2. Loosen the center charging hose fitting at the manifold gauge end to blow any air from the hose until it hisses for a few seconds, then retighten it.
3. Open both gauge valves to partially charge the system and then close both valves.
4. The system can then be checked for leaks using an electronic leak detector.
5. If leaks are found that require the system to be opened (to repair or replace hoses, fittings, etc.), release any charge in the system.
6. After checking and repairing leaks, system must be evacuated.

6.3 System Charging

GENERAL PRECAUTIONS

⚠WARNING

When handling refrigerant (HFC-134a), the following precautions must be observed.

— Always wear eye protection and gloves while handling refrigerant.

— Be careful that liquid refrigerant does not contact the skin.

If liquid refrigerant strikes eye or skin:

— Do not rub on skin.

— Splash large quantities of cool water on the eye or skin.

— Flush eyes or skin with cool water for 5 minutes.

— Rush to a physician or hospital for immediate professional treatment.

— Do not attempt to treat it yourself.

— Keep the refrigerant (HFC-134a) container below 104°F (40°C).

— Do not handle the refrigerant in an enclosed area having an open flame; the refrigerant may produce a poisonous gas.

— Use approved recovery equipment to recover HFC-134a refrigerant before attempting service of this or any other HFC-134a system.

— Do not attempt to leak test an HFC-134a system with high pressure air or nitrogen. Mixing HFC-134a with a concentrated quantity of air may be combustible in the presence of ignition.

https://truckmanualshub.com/

6.3.1 Evacuation

INSTALLATION OF SIMPLE HFC-134a EQUIPMENT

(1) Connect the manifold gauge to the service valves.

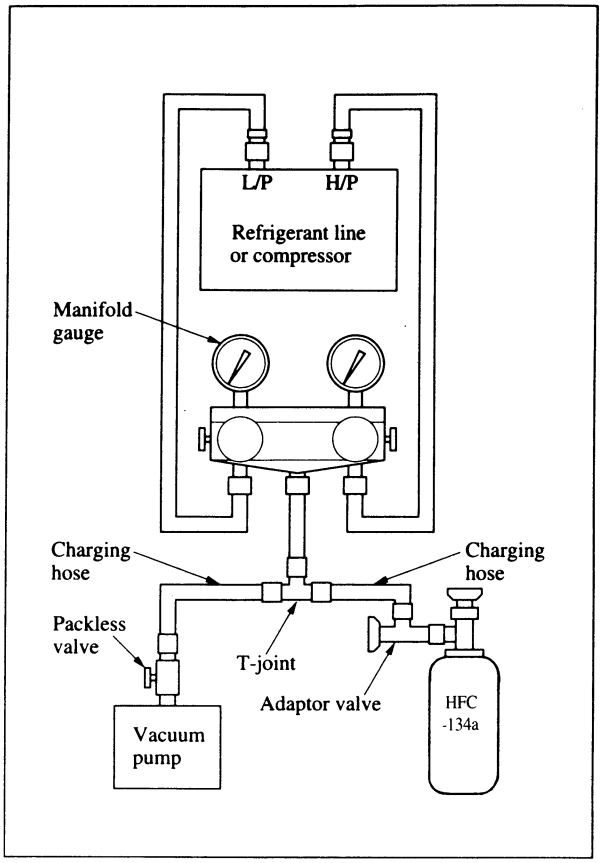
(2) Connect the packless valve to the vacuum pump.

(3) With the charge valve handle turned back all the way, install the service can.

(4) Connect the equipment as illustrated.

⚠CAUTION

1. **Do not connect the high and low pressure sides adversely. (Connect high pressure side to the condenser and low pressure side to the cooling unit assembly)**
2. **The indications "DIS" and "SUC" on the compressor indicate high and low pressure sides respectively.**

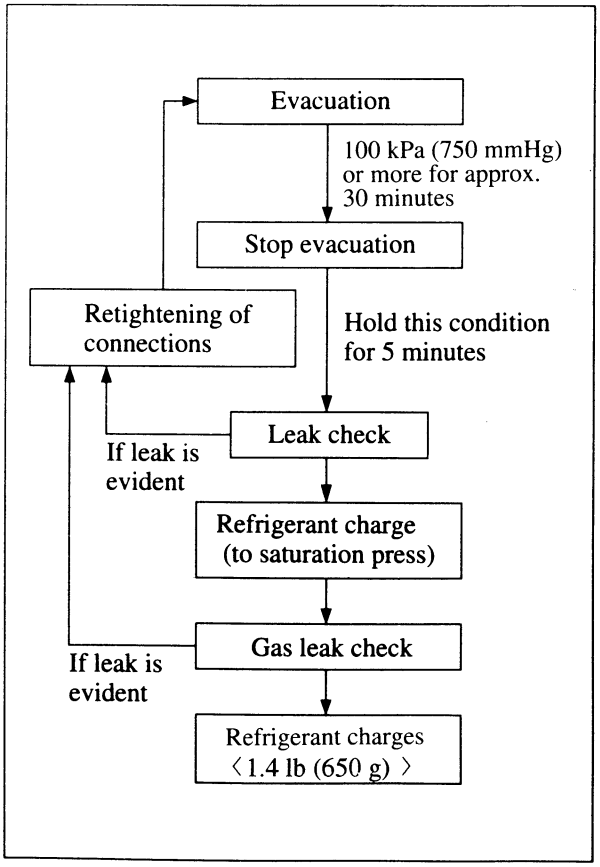


6.3.2 Evacuate the System

The refrigerant system must be evacuated before charging. Charge using HFC-134a refrigerant only. HFC-134a is available in bulk tanks. Follow the safety precautions for handling HFC-134a as listed in this section.

Follow the evacuation procedure below and at right.

This procedure assumes no HFC-134a refrigerant has been introduced into the system. If evacuating a charged system, it is necessary to recover the existing HFC-134a refrigerant before continuing with these instructions. Refer to the recovery equipment manufacturer's instructions for proper refrigerant recovery.



https://truckmanualshub.com/

(1) Start up the vacuum pump.

⚠CAUTION

1. **Do not use the compressor for evacuation.**
2. **Do not operate the compressor in the vacuum condition; damage may occur.**

(2) Open the manifold gauge handles and the packless valve.

(3) Evacuate to a vacuum reading of 100 kPa (750 mmHg) or higher (approx. 30 minutes).

(4) Turn back the packless valve all the way and close the service valve.

(5) Stop the vacuum pump and allow to stand for 5 minutes.

(6) Check for leak. (Good if the vacuum is held.)

CHARGING WITH BULK TANK

(1) Open the charge valve to charge the system with refrigerant.

(2) When the refrigerant is no longer drawn in, turn back the high pressure side manifold gauge handle.

(3) Check for refrigerant leaks using a leak detector.

(4) Start the engine.

(5) Operate the air conditioner and set at the lowest temperature (MAX. COOL).

(6) Fix the engine speed at 1,500 rpm.

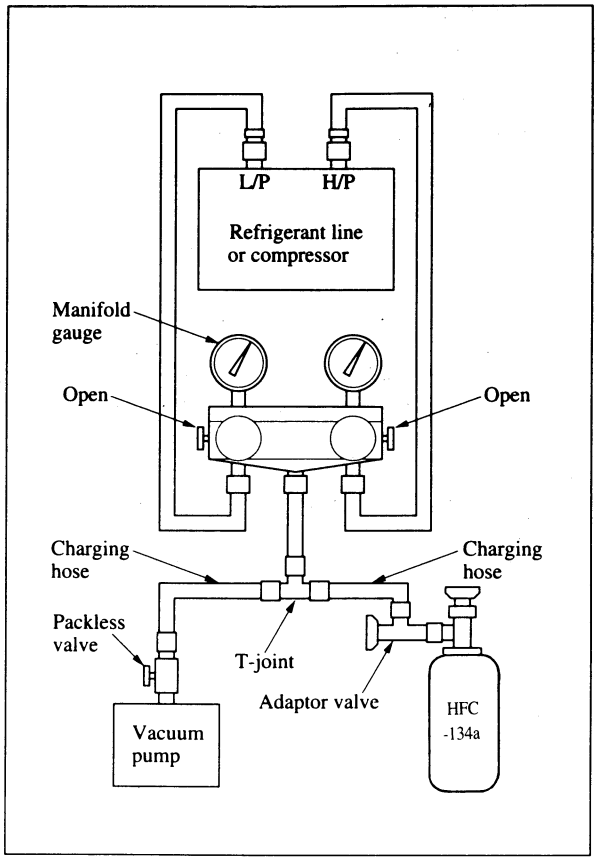
(7) Continue charging system until proper refrigerant quantity is introduced into the system.

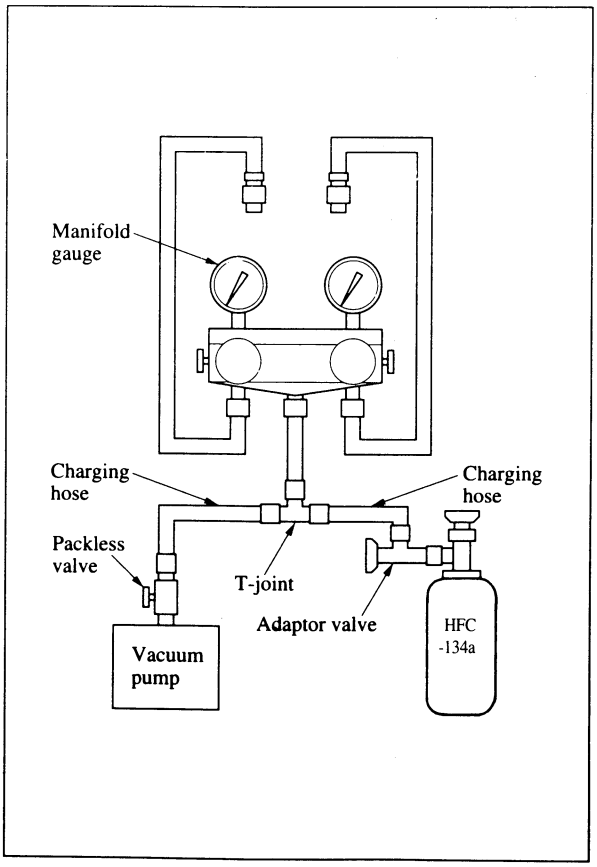
⚠CAUTION

If the bulk tank is inverted, liquid refrigerant may be drawn into the compressor damaging it by liquid compression.

Keep the bulk tank upright to ensure that refrigerant is charged in gas state.

(8) Upon completion of charging, turn back the low pressure side manifold gauge handles.





https://truckmanualshub.com/

6.3.3 Removal of Charge Equipment

(1) Close the charge valve.

(2) Remove the manifold gauge from each service valve.

⚠CAUTION

Do not remove the bulk tank, T-joints and adaptor valves but keep them connected for next charge operation.

CORRECTING LOW REFRIGERANT LEVEL

Locate the source of the low refrigerant level, recover system, repair system, evacuate system, charge system, check for leaks.

⚠CAUTION

If the bulk tank is not emptied completely, keep the charge valve connected to the can for next charging.

6.3.4 Discharging System

Use the refrigerant recovery unit which can be purchased in local market to discharge refrigerant gas from the system.

⚠CAUTION

Refer to that Refrigerant Recovery Unit Instruction Manual for operation which is attached on the unit.

LIQUID CHARGE, through high side using charging station:

⚠CAUTION

Do not run engine when performing liquid charge; compressor will be damaged.

(1) After the system is evacuated, close gauge valves, connect center hose to refrigerant supply. Loosen center fitting at gauge to blow any air out of the hose and then retighten.

(2) Following charging station manufacturer's instructions charge the system until 1.4 lb (650 g) of refrigerant is pumped into the system.

(3) When system is fully charged, close high gauge valve and refrigerant supply valve, then quickly disconnect gauge hoses from service valves.

(4) After charging the system, refer to Pre-Delivery Inspection.

https://truckmanualshub.com/

6.4 Performance test

6.4.1 Preparation

Reinstall all vehicle parts that were removed for installation of the air conditioner at their original positions, adjust the mounting, and test the following items.

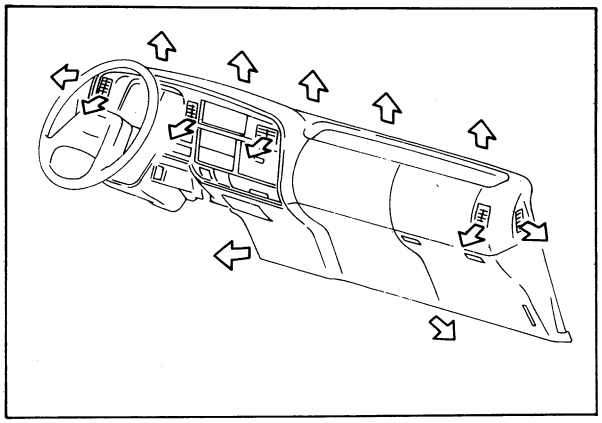
1. Installation of grommets
   Install the specified grommets

6.4.2 Stationary performance test

1. Operating conditions
   a. Place the vehicle in the shade with doors open.
   b. Keep the return air temperature between 77 to 86°F (25 to 30°C). (Adjust by changing the opening degree of the doors).
   c. Set the fan switch to the max position.
   d. Turn the thermostat control lever to the cool position.
   e. Set the engine speeed to approx. 1,500 rpm.
   f. Set the high pressure at 1.17 to 1.37 MPa (170 to 200 Lb/in²G, 12 to 14 kgf/cm²G). (If the high side pressured does not rise up, place paper or the like in front of the condenser.)

2. Test procedure

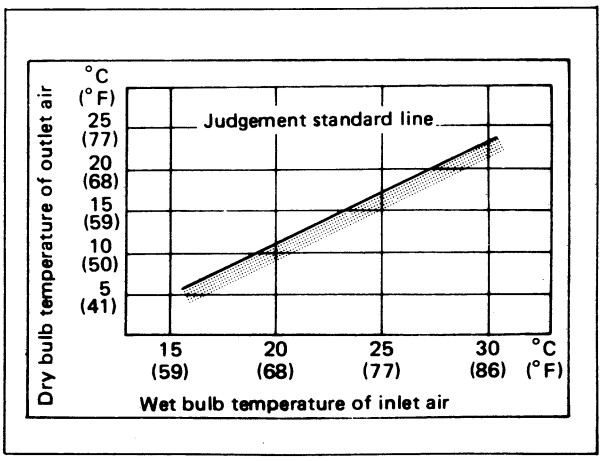
Operate the air conditioner for more than 10 minutes under the above operating conditions in order to stabilize the high and low pressures. Then perform the test by the following procedure:



a. Measure the outlet air temperature at the inside space of the outlet grille.

b. Measure the air conditioner intake air temperature, humidity, etc., and the items shown in the Table of Measuring Items at a position free from the effects of cool outlet air.

c. The intersecting point of the plotted line perpendicular to the point which corresponds to the air conditioner intake and outlet air temperature difference and the plotted line perpendicular to the point which corresponds to the relative humidity of intake air should be between the oblique lines in bigure.



https://truckmanualshub.com/

7. MAINTENANCE

No.	Check point	Service and inspection intervals				
		When used only in summer (approx. for three months)		When used in all seasons		
		At the beginning of season	At the end of season	Every 5,000 km (3,000 miles)	Every 10,000 km (6,000 miles)	Every 20,000 km (12,000 miles)
1	Check condenser and radiator fin for clogging.	○	○	○		
2	Retighten all bolts.	○			○	
3	Check for refrigerant leaks.	○			○	
4	Check refrigerant level.	○		○		
5	Check V-belt tension.	○		○		
6	Check operation of magnetic clutch.	○			○	
7	Check operation of thermostat.	○				○
8	Cooling unit assembly performance test.	○		○		
9	Compressor overhaul.		Every four years			Every 40,000 km (24,000 miles)

⚠ CAUTION

Even after the hot season is over, the air conditioner should be kept ready for operation all year round. Do not remove the V-belt or other parts.
This is because the air conditioner must be operated once a week for several minutes regardless of the season in order to prevent gas leaks caused by drying of the compressor shaft seal, and also to maintain the compressor itself in the best condition.

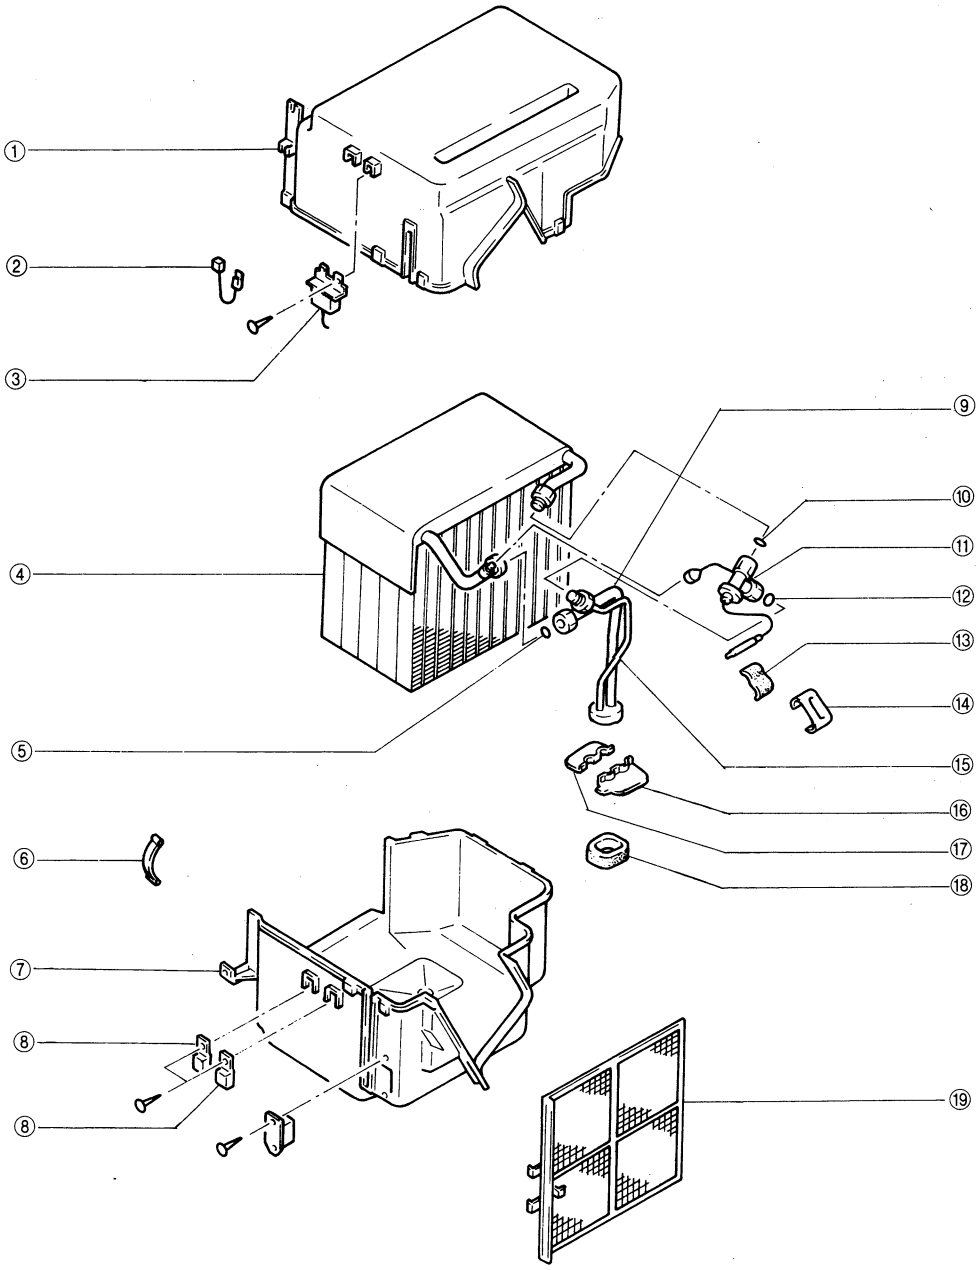
8. COOLING UNIT ASSEMBLY

8.1 Components



① Cooler case (upper)
② Joint harness
③ Thermostat
④ Evaporator
⑤ O-ring
⑥ Clip
⑦ Cooler case (lower)
⑧ Power relay
⑨ Pipe
⑩ O-ring
⑪ Expansion valve
⑫ O-ring
⑬ Insulation rubber
⑭ Clip
⑮ Baffle plate
⑯ Battle plate
⑰ Insulation rubber
⑱ Air filter

https://truckmanualshub.com/

8.2 Cautions in disassembling

(1) Direct after disconnecting the refrigerant piping blind the opening to prevent dust and moisture etc. from entering in it.

(2) When disconnecting the expansion valve, surely apply two spanners to prevent unstable twisting from applying with the one for supporting and the other for torquing at the connection.

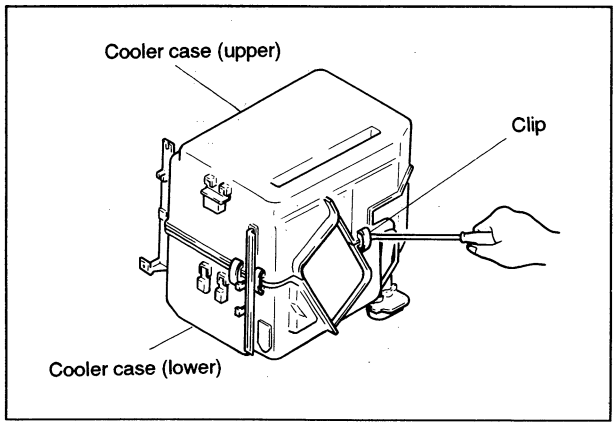
(3) Pipings in the cooling unit assembly should be handled gently. Particularly, the ingress and egress portions should be from any bending trouble in carrying it.

(4) If the cooling unit assembly is stored, or transported on disassembled condition, be careful not to deform the fins.

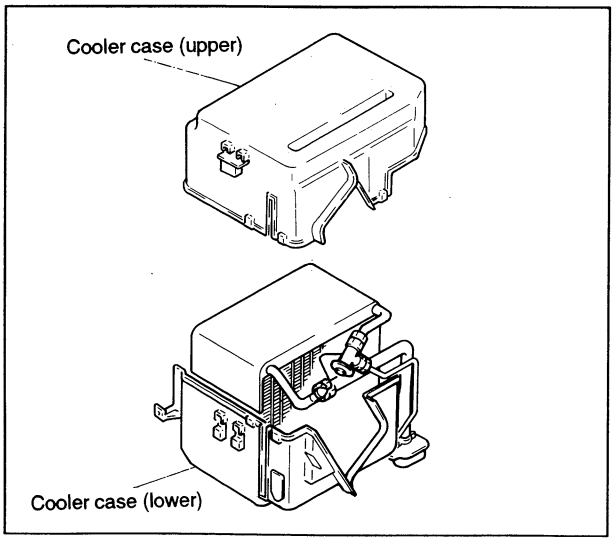
(5) When disconnecting the wirring, avoid pulling it with the insulation cover catched, but apply force by pinching the terminals or by catching the connectors.

8.3 Disassembling

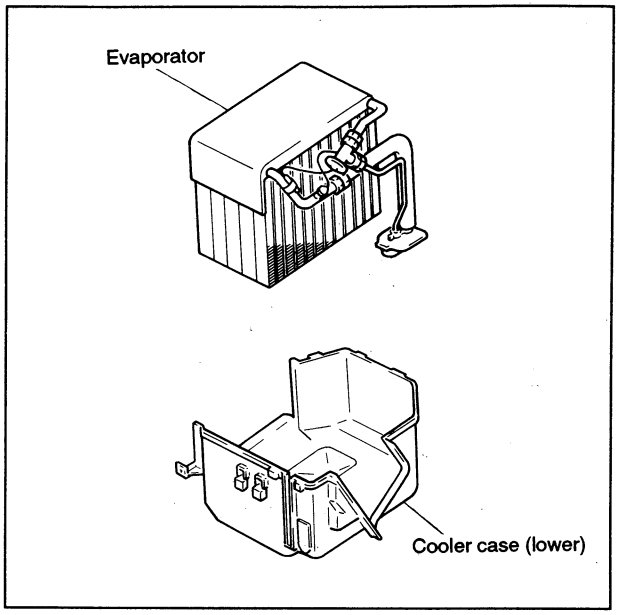
(1) Remove the clips for jointings the upper & lower side cooler case with a flat type screwdriver.



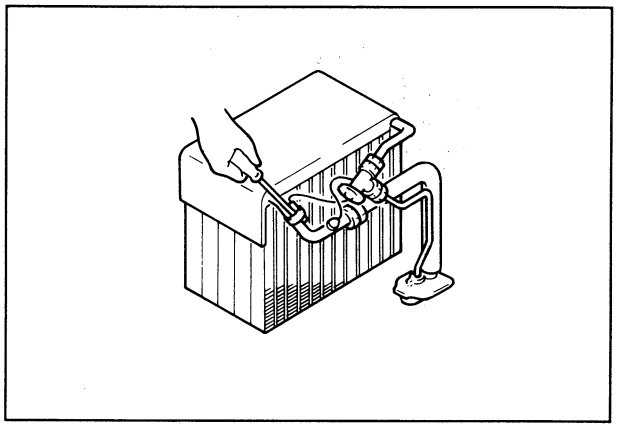
(2) Dismount the cooler case (upper).



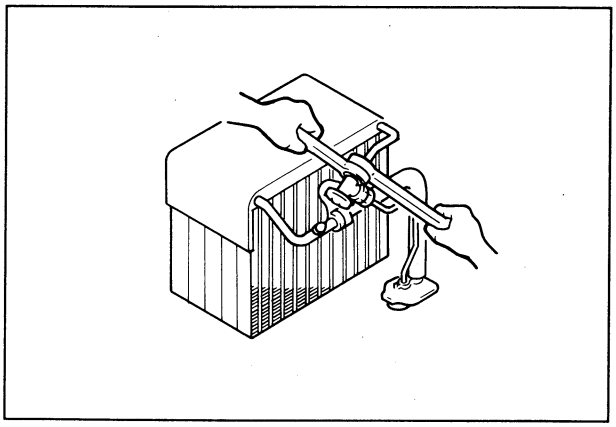
(3) Dismount the evaporator.



(4) Separate the expantion valve.
Dismount the feeler bulb at the suction side.



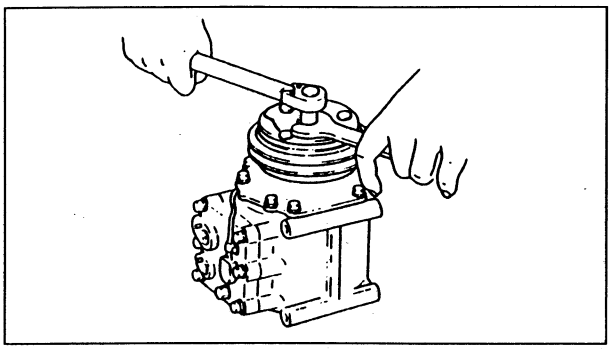
(5) Disconnect the expansion valve from the circuit.



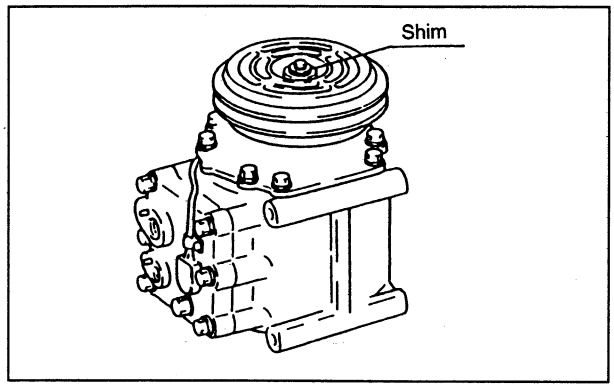
https://truckmanualshub.com/

9. COMPRESSOR & CLUTCH ASSEMBLY

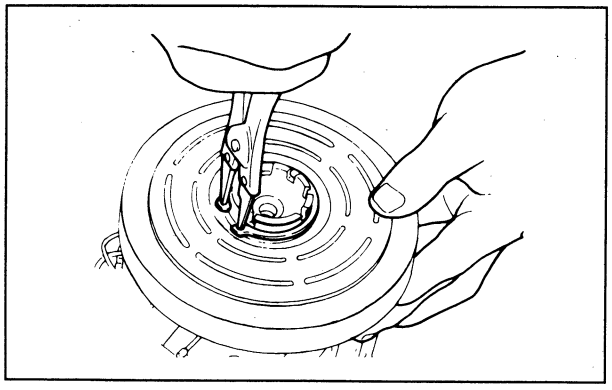
9.1 Disassembling the clutch.



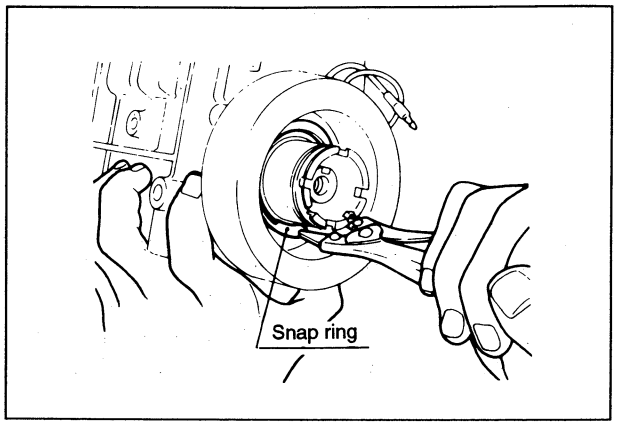
(1) Removal of armature plate.
   (a) Lock up the armature plate with a armature plate fixture and remove the lock nut.
   (b) Remove the armature plate.



(2) Remove the shim.



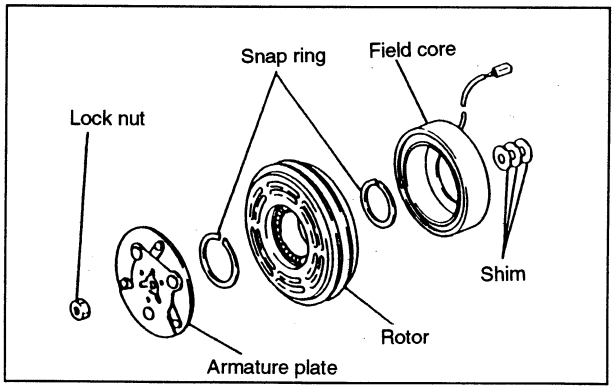
(3) Withdrawing rotor.
   (a) Remove the snap ring at the front case side with snap ring pliers.
   (b) Withdraw the rotor toward you and remove it from the front case.



(4) Removal of field core.
   (a) Remove the snap ring for fixing the field core with snap ring pliers.

   (b) Remove the ground wire with a cross point screwdriver and withdraw the field core toward you to remove it from the crankcase.

(5) Removal of key.
   Remove the key from the shaft using the top of a flat type screwdriver.



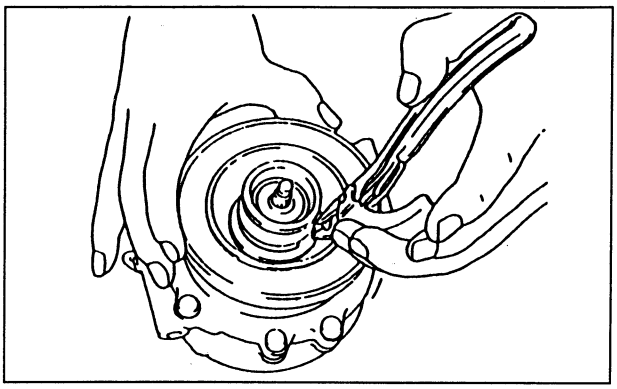
(6) Components of magnetic clutch.

https://truckmanualshub.com/

9.2 Reassembly the clutch.

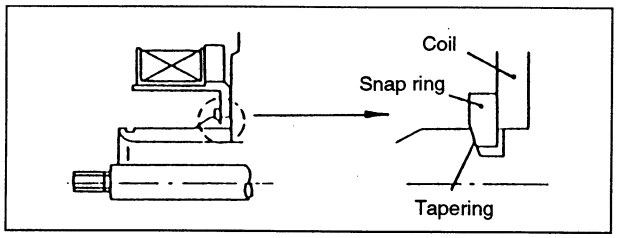
(1) Insert the key into the crankshaft.

(2) Insert the field core.



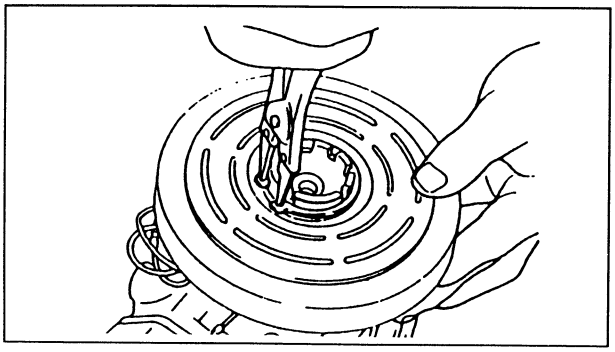
(a) Insert the field core into the front case and position it with a knock pin.

(b) Insert the snap ring for fixing field core into the groove and fix it with snap ring pliers as shown the below.

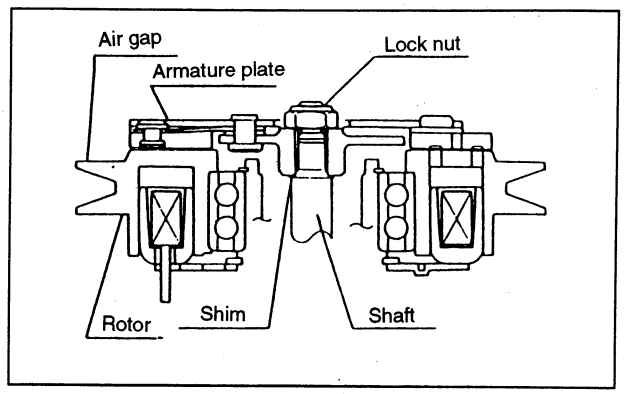


(c) Connect the ground wire.

(3) Insert the rotor into the front case.



(4) Insert the snap ring for the front case side into the groove with snap ring pliers.



(5) Install the armature plate.

(a) Place a shim on the end of the shaft and insert the armature plate, adjusting to the key.

(b) Tighten the center bolt to the specified torque, 15.7 N.m (160 kgf.cm), with in-between plain washer.

(c) Measure the air gap.
The air gap shoud be within 0.4 to 0.65 mm (0.016 ~ 0.026 in).
Adjust it by shim if it is not within the specifications. Adjusting shim : 0.1, 0.3, 0.5, or 0.8 mm (0.004, 0.012, 0.02, or 0.03 in).

SPECIFICATIONS/STRUCTURE AND OPERATION

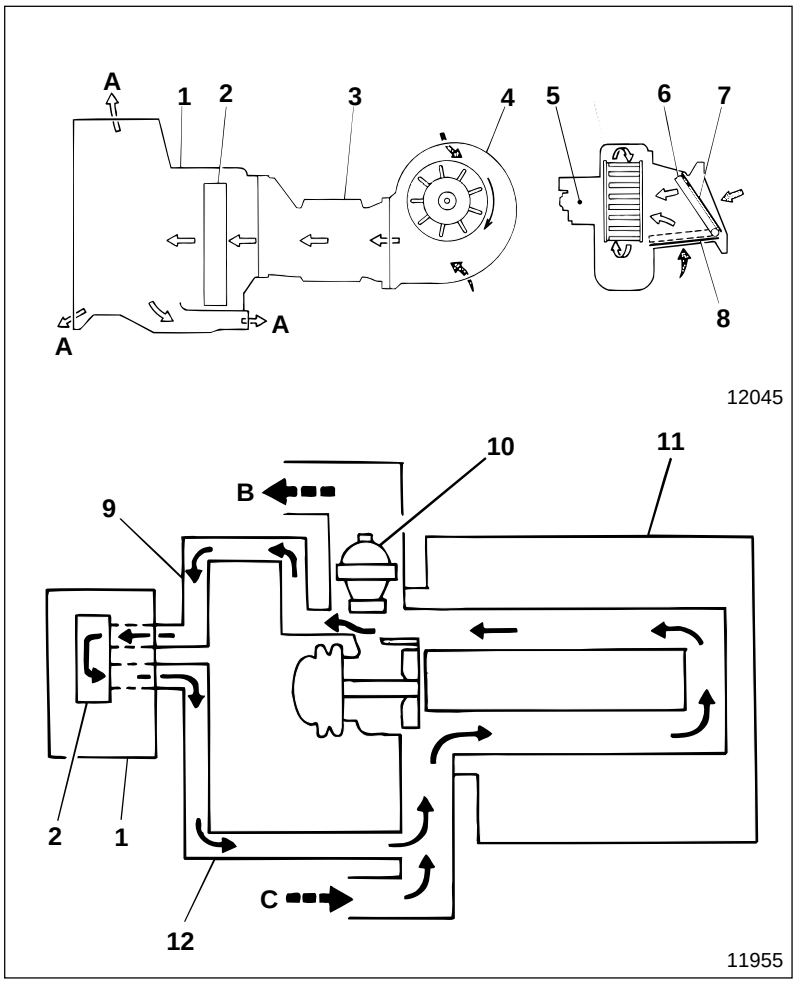
SPECIFICATIONS

Items			Specifications
System	Type		Inside/outside air combining, hot-water type heating system
	Standard voltage	V	12
	Damper changeover system		Manual cable type
Blower assembly	Manufacturer		NIPPONDENSO
	Power consumption	W	170
	Maximum rotation	rpm	3550
Heater unit assembly	Manufacturer		NIPPONDENSO
	Temperature control system		Air mixing type
	*Heating performance kW {BTU/h, kcal/h}		*4.31{14720, 3710}

* : Heating performance is shown under the following conditions.
Temperature difference : 65°C {119°F}
Water flow : 6 L/min {0.0035 ft^3/s}
Voltage : 12 V DC

STRUCTURE AND OPERATION

Heater



1 Heater unit
2 Heater core
3 Joint duct
4 Blower assembly
5 Blower motor
6 Damper
7 Air filter (Outside air)
8 Air filter (Inside air)
9 Heater hose (Heater in)
10 Thermostat
11 Engine
12 Heater hose (Heater out)

A : To duct
B : To radiator
C : From radiator

Outside air (Intake)

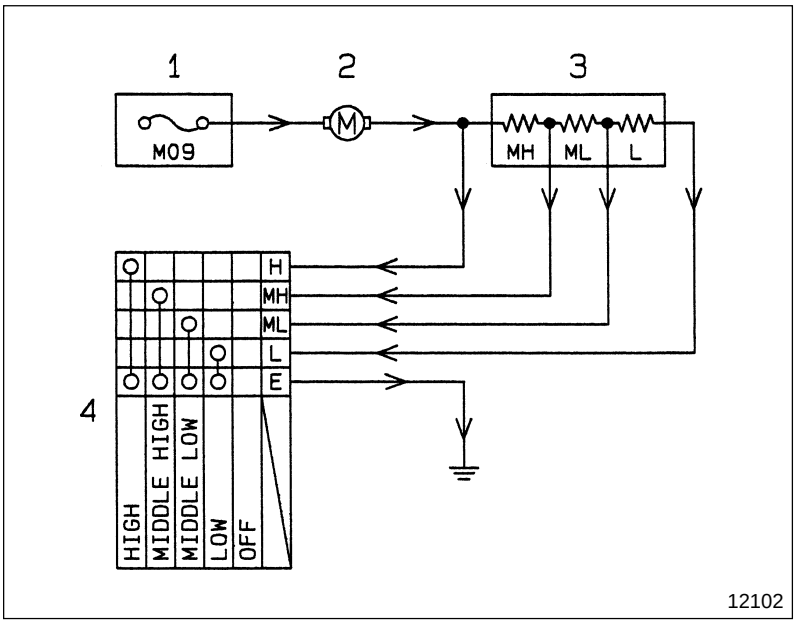
Inside air (Circulation)

Filtered air

- Warm engine coolant that has absorbed heat from engine **11** does not flow through thermostat **10** but circulates as follows:
  9→2→12→11
  ↑_____↓
- Air sent to heater unit **1** from blower assembly **4** is warmed by heater core **2** (heat exchanger). Then the ducts deliver the warmed air to the cab.

https://truckmanualshub.com/

Heater Electric Circuit



1 Relay and fuse box
2 Blower motor
3 Blower resistor
4 Fan switch (Heater switch)

- The resistance of blower resistor **3** controls blower motor **2**, which in turn controls the air flow, except when the air flow is set to H (high speed). When the air flow is set to H, the current does not flow through the blower resistor.

Fan switch 4 set to L position

- 1→2→3 (L)→4 (L)→Ground

Fan switch 4 set to H position

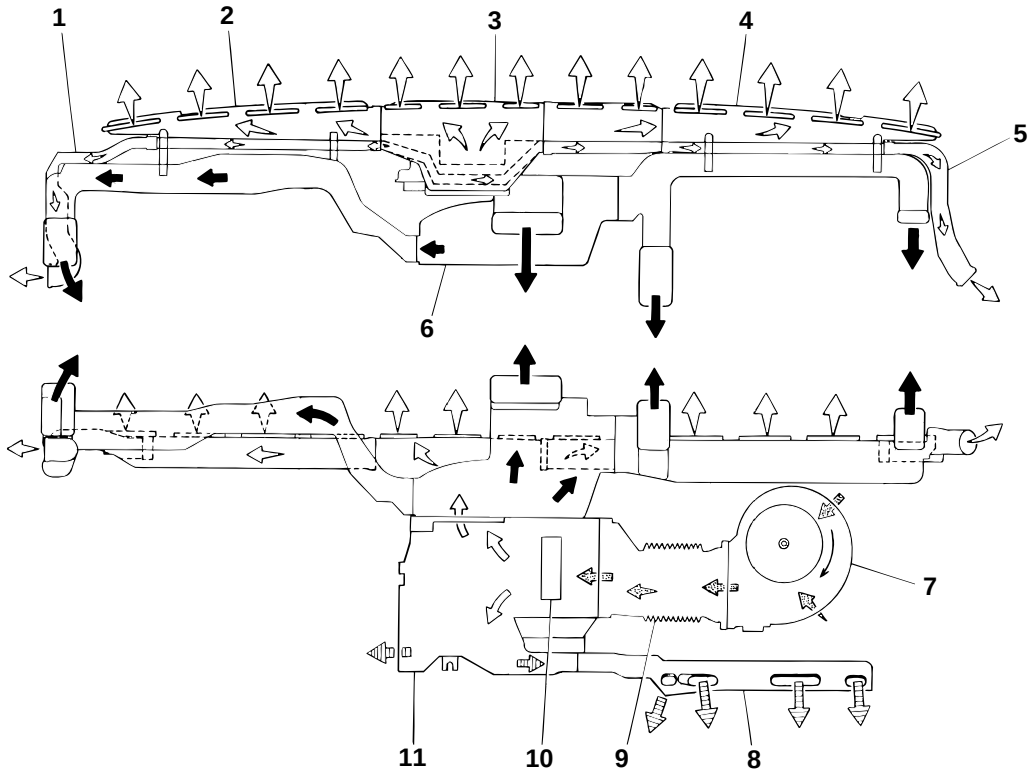
- 1→2→4 (H)→Ground

Fan switch 4 set to either ML or MH position

The current flows through blower resistor **3** in the same way as when set to L position, routing ML or MH respectively instead of L.

https://truckmanualshub.com/

Air Duct



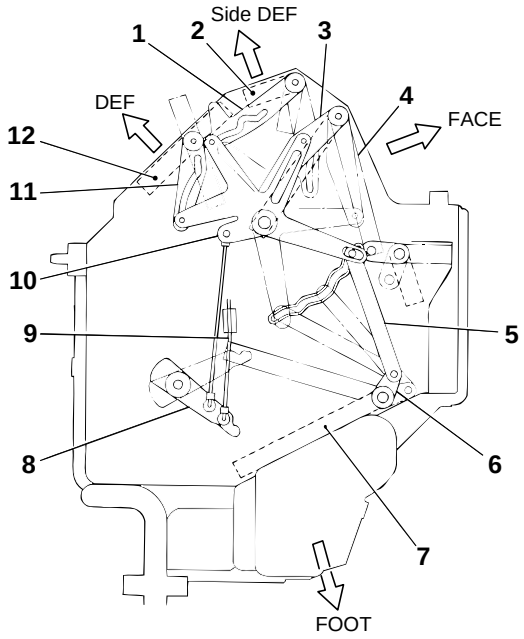
1 Defroster side duct, LH
2 Front duct, LH
3 Center duct
4 Front duct, RH
5 Defroster side duct, RH
6 Face center duct
7 Blower assembly
8 Foot duct
9 Joint duct
10 Heater core
11 Heater unit

Outside air (Intake) Inside air (Circulation) Filtered air (in heater and cooling unit)

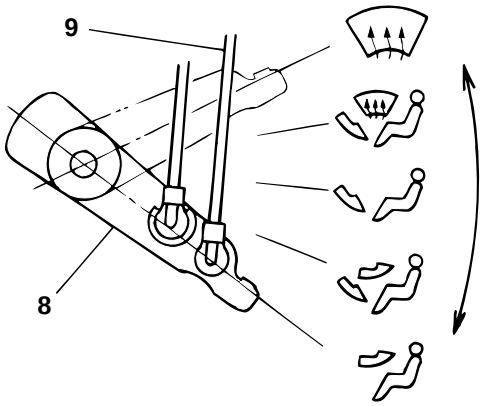
Air (FACE) ( )Air (DEF) Air (FOOT)

Since the opening and closing of the dampers of heater unit **11** is controlled by the switching operation of the heater unit assembly, the outside air and the inside air from blower assembly **7** flow as illustrated.

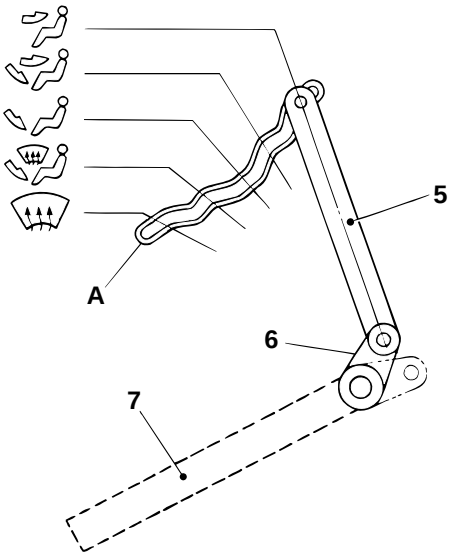
https://truckmanualshub.com/



12203



12204



12205

● **Mode changeover system**

1 Plate
2 Damper (Side DEF)
3 Plate
4 Damper (FACE)
5 Plate
6 Plate
7 Damper (FOOT)
8 Lever (MODE-SUB)
9 Mode changeover control cable
10 Lever (MODE-MAIN)
11 Plate
12 Damper (DEF)

A : Rail

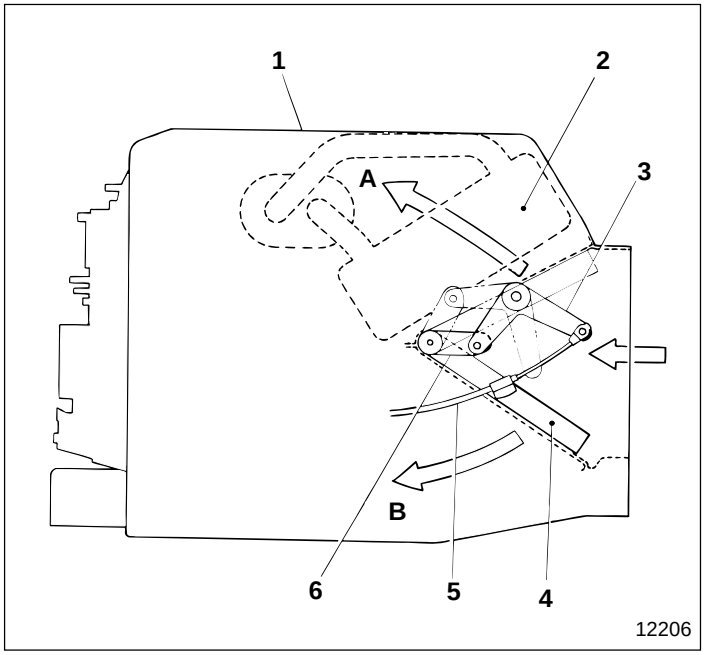
- The opening and closing of dampers **2**, **4**, **7, 12** is mechanically controlled by the movement of mode changeover control cable **9**, transmitted as follows:

  9→8→10→11→12 (DEF)
  →1→2 (Side DEF)
  →3→4 (FACE)
  →5→6→7 (FOOT)

  Plates **1, 3, 5, 6, 11** move together with lever **10**. Dampers **2, 4 , 7, 12** move together with plates 1, **3, 5, 6, 11,** but the degree of opening of the dampers is determined by the shape of the plate grooves.

- Plate **5** is connected to rail **A**. Since the plate moves along the groove of the rail, damper **7** (FOOT) can be opened and closed in combination with other modes to activate bi-level mode.

https://truckmanualshub.com/

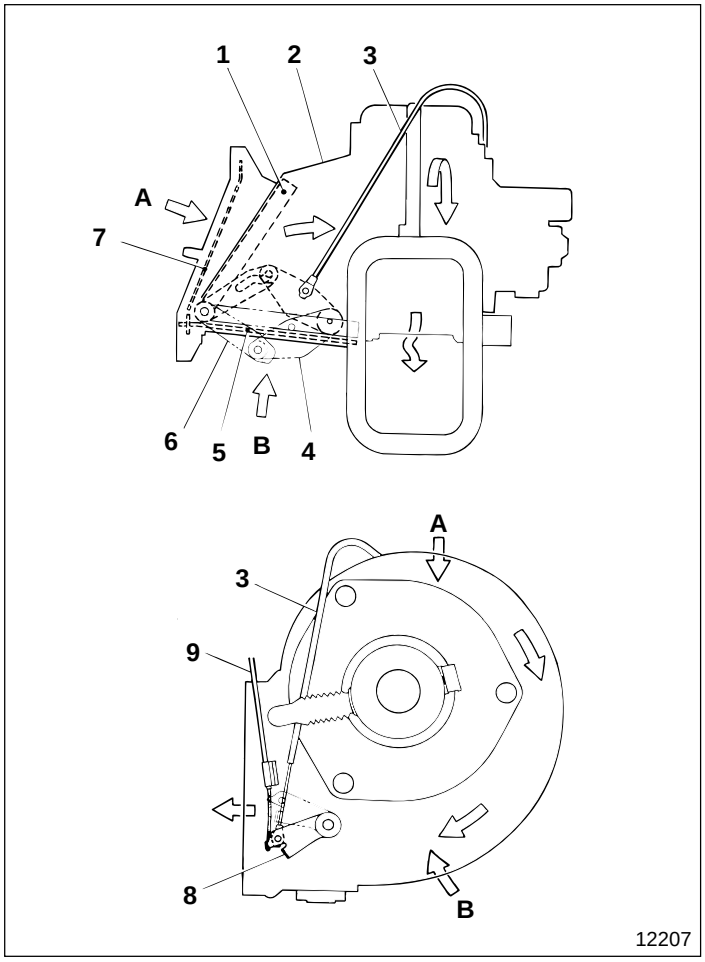


● **Air mixing control**

1 Heater unit
2 Heater core
3 Lever
4 Damper
5 Air mixing control cable
6 Plate

A : Warm air
B : Unwarmed air

- The degree of opening of damper **4** controls the flow of both air **A** that has passed through and been warmed by heater core **2**, and air **B** that has not been warmed.
- Damper **4** is mechanically operated by the movement of air mixing control cable **5**, transmitted as follows:
  5→3→6→4
  Plate **6** moves together with damper **4**.



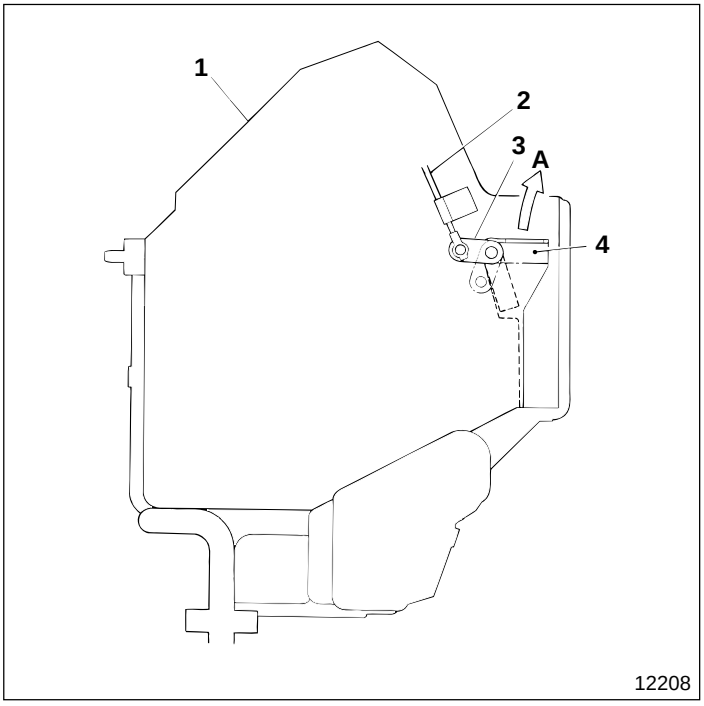
● **Air intake control**

1 Damper
2 Blower assembly
3 Control cable
4 Lever
5 Air filter (Inside air)
6 Shaft
7 Air filter (Outside air)
8 Lever
9 Air intake control cable

A : Outside air
B : Inside air

- Changeover of air intake from inside to outside is controlled by the opening and closing of damper **1**.
- Damper **1** is mechanically operated by the movement of air intake control cable **9**.
  9→8→3→4→6→1
  Shaft **6** moves together with damper **1**.

https://truckmanualshub.com/



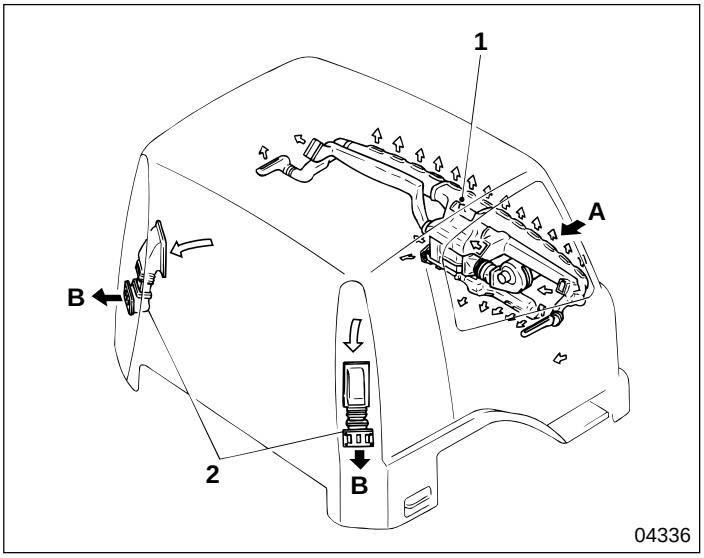
● **Air flow bypass changeover**

1 Heater unit
2 Air bypass changeover control cable
3 Plate
4 Damper

A : Air not warmed by heater unit

- Damper **4** is opened and closed to change the air flow from warm air to air that has not passed through and been warmed by the heater core.
- Damper **4** is mechanically operated by the movement of air flow bypass changeover control cable **2**, transmitted as follows:
  2→3→4
  Plate 3 moves together with damper **4**.

Ventilation System



1 Heater and duct assembly
2 Air outlet ventilation

A : Incoming outside air
B : Outgoing inside air

The ventilation system replaces the air in the cabin using frontal air pressure, generated when the vehicle is in motion.

https://truckmanualshub.com/

TROUBLESHOOTING

Symptoms / Possible causes	Air does not flow from vents	Heater does not work well	Airflow control setting cannot be changed	Drafts from vents	Temperature control setting cannot be adjusted	Outside/inside air control cannot be changed	Air volume from vents unstable	Control switches operation heavy	Air flow bypass cannot be changed	Remarks
Blower motor coil broken or short-circuited	○									
Blower resistor operation malfunctioning							○			
Mode damper opening and closing faulty			○	○				○		
Air mixing damper opening and closing faulty				○	○			○		
Inside/outside air changeover damper opening and closing faulty				○		○		○		
Heater control assembly faulty	○	○	○	○	○	○			○	
Thermostat does not close		○								Gr 14
Engine coolant insufficient		○								Gr 14
Connector connection faulty, harness broken or grounding faulty	○		○	○	○	○				
Fuse blown	○									
Heater pipes clogged, loose or connection faulty		○								
Duct connection faulty				○						
Heater unit clogged		○								
Control cable sliding movement faulty, installation faulty			○	○		○		○	○	
Control cable connecting lever of units bent			○	○		○		○		
Control cable connecting lever sliding parts of units worn or lubricated insufficiently			○	○		○		○		
Air flow bypass changeover damper opening and closing faulty									○

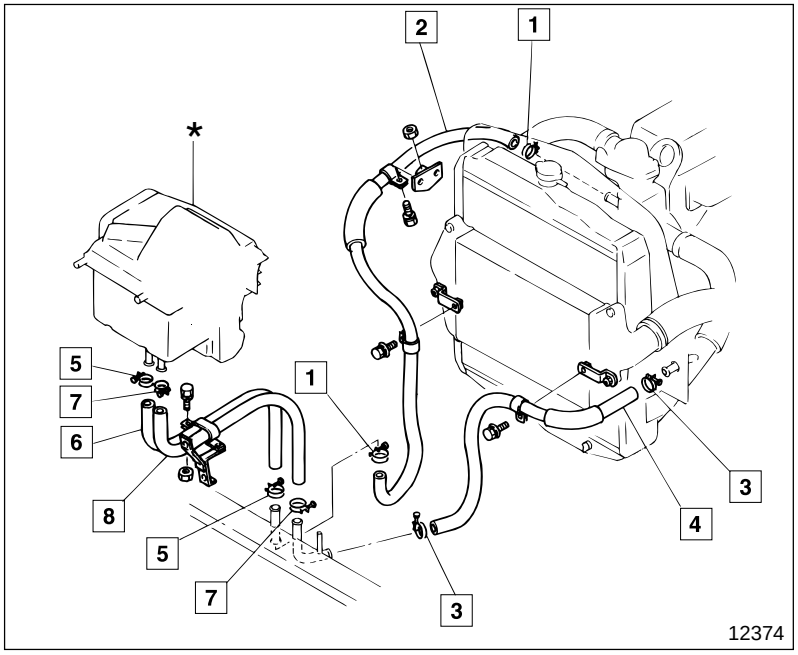
HEATER HOSE



● **Disassembly sequence**

1 Hose clamp
2 Heater hose (Engine out)
3 Hose clamp
4 Heater hose (Engine in)
5 Hose clamp
6 Heater hose (Heater in)
7 Hose clamp
8 Heater hose (Heater out)

***** : Heater unit

NOTE

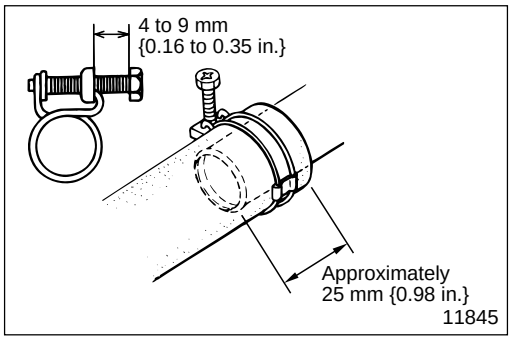
Drain engine coolant from radiator before removing the hoses. **Gr 14**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Be sure that hoses are inserted securely to prevent coolant leaking.**
- **Make sure not to mix up heater hoses 2, 4, 6, 8 when connecting them because mistaken connection would damage the heater unit.**



◆ Service procedure

1 to 8 Installation of heater hose and hose clamp

- Install heater hoses **2, 4, 6, 8** to conform to the dimension as illustrated.
- Tighten hose clamps **1, 3, 5, 7** to conform to the dimension as illustrated.

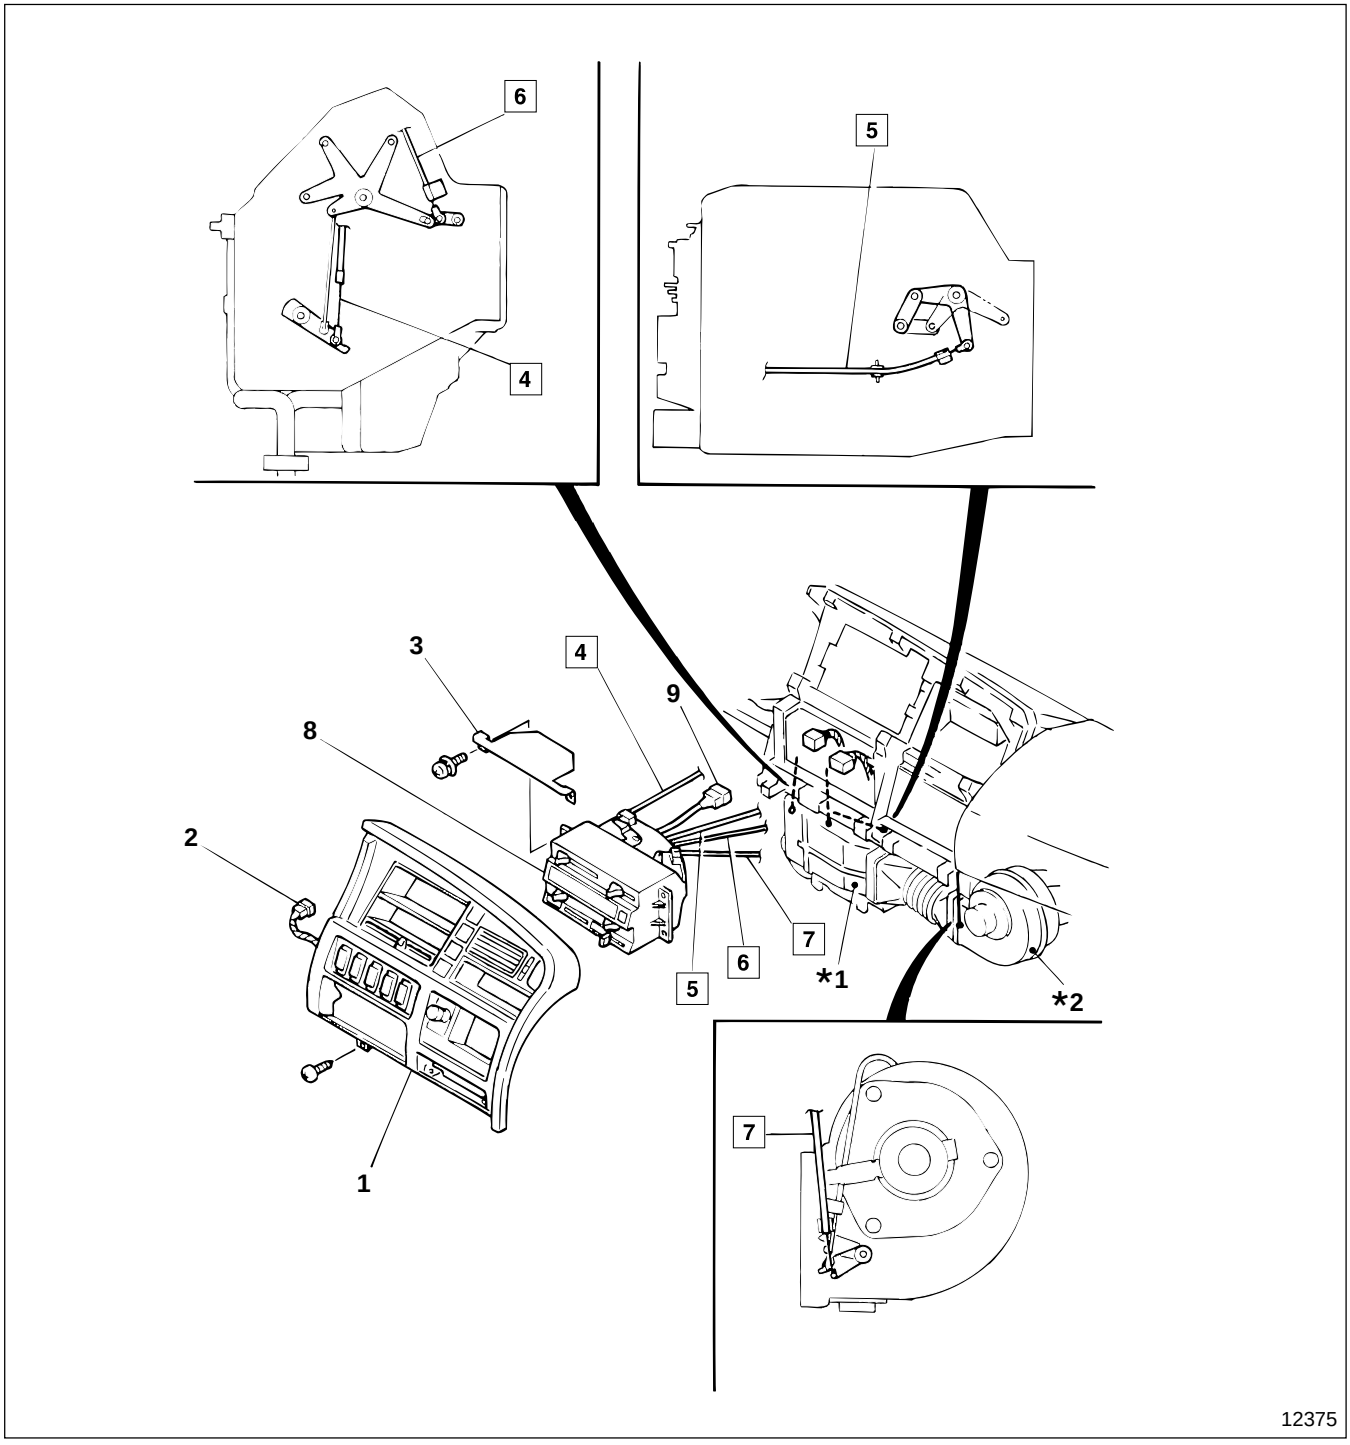
HEATER CONTROL



● **Disassembly sequence**

1. Center panel
2. Harness
3. Harness protector
4. Mode changeover control cable
5. Air mixing control cable
6. Air bypass changeover control cable
7. Inside/outside air changeover control cable
8. Heater control assembly 🕮 Gr 54
9. Harness

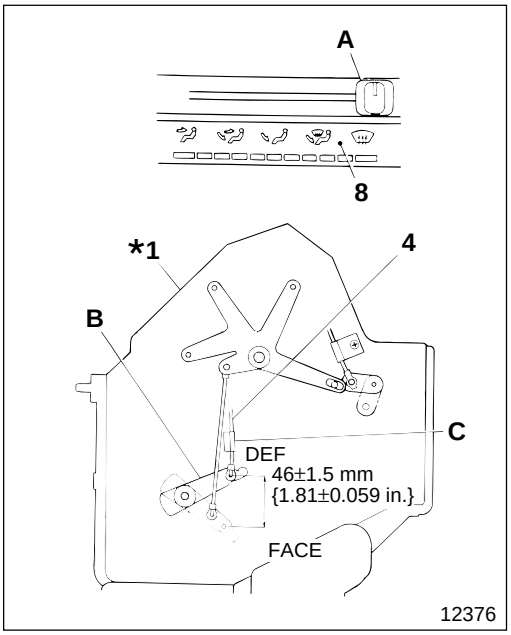
*1 : Heater unit 🕮 P55B-16
*2 : Blower assembly 🕮 P55B-16

● **Assembly sequence**

Follow the disassembly sequence in reverse.

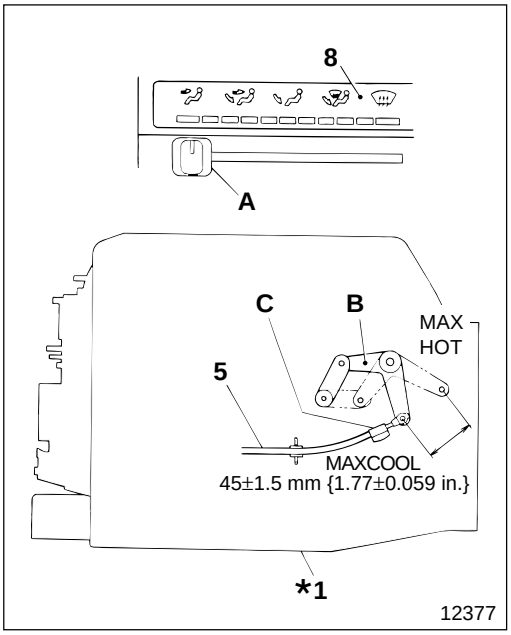
https://truckmanualshub.com/

◆ Service procedure



4 Installation of mode changeover control cable

- Set mode changeover lever **A** of heater control assembly **8** to (DEF).
- Set lever **B** of heater unit assembly ***1** to DEF.
- Under these conditions, install mode changeover control cable **4** onto lever **B**.
- Gently pull outer shield of mode changeover control cable **4** to DEF side (load of 4.9 N {1.1 lbf, 0.5 kgf} and fasten by locking clamp **C**.

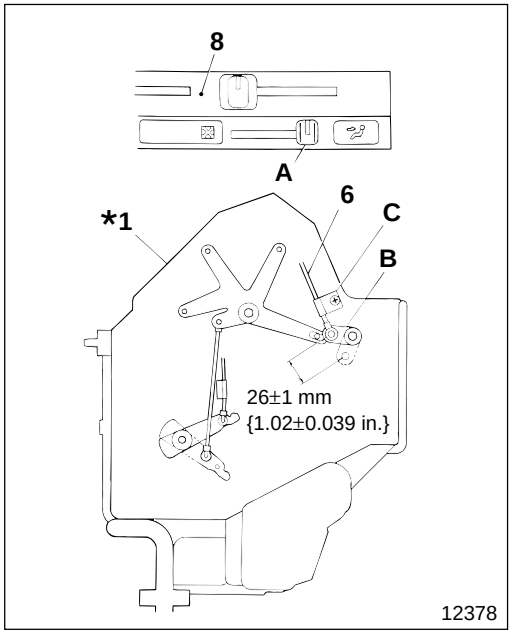


5 Installation of air mixing control cable

- Set temperature control lever **A** of heater control assembly **8** to MAX COOL.
- Set lever **B** of heater unit assembly ***1** to MAX COOL.
- Under these conditions, install air mixing control cable **5** onto lever **B**.
- Gently pull outer shield of air mixing control cable **5** to MAX COOL side (load of 4.9 N {1.1 lbf, 0.5 kgf} and fasten by locking clamp **C**.

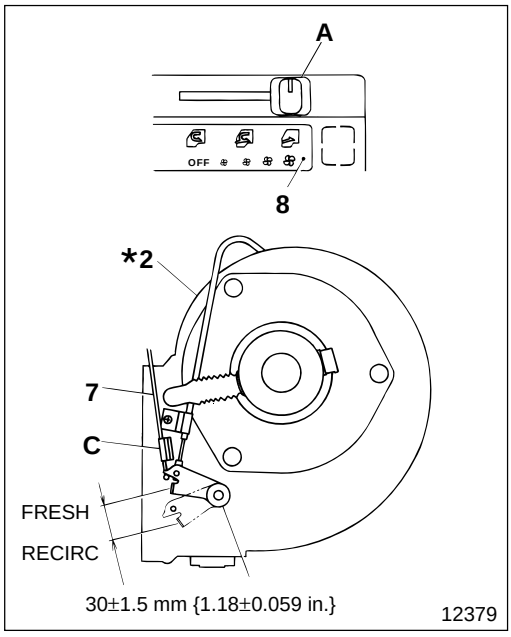
https://truckmanualshub.com/

HEATER CONTROL



6 Installation of air bypass changeover control cable

- Set air bypass changeover control lever **A** of heater control assembly **8** to (OPEN).
- Set plate **B** of heater unit assembly ***1** to OPEN.
- Under these conditions, install air bypass changeover control cable **6** onto plate **B**.
- Gently pull outer shield of air bypass changeover control cable **6** to OPEN side (load of 4.9 N {1.1 lbf, 0.5 kgf} and fasten by locking clamp **C**.



7 Installation of inside/outside air changeover control cable

- Set inside/outside air changeover lever **A** of heater control assembly **8** to (FRESH).
- Set lever **B** of blower assembly ***2** to FRESH.
- Under these conditions, install inside/outside air changeover control cable **7** onto lever **B**.
- Gently pull outer shield of inside/outside air changeover control cable **7** to FRESH side (load of 4.9 N {1.1 lbf, 0.5 kgf} and fasten by locking clamp **C**.
