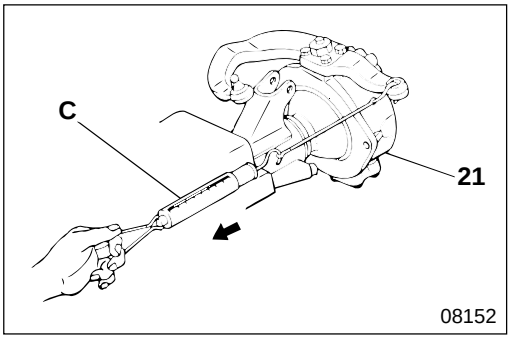
- Measure clearance **B** between steering knuckle **21** and kingpin, lower **15**. Select spacer **8** based on the measured clearance.

Clearance B	Thickness of spacer
0.6 mm {0.024 in.} or more	3.2 mm {0.13 in.}
Less than 0.6 mm {0.024 in.}	3.6 mm {0.14 in.}

- If clearance **B** is 0.6 mm {0.024 in.} or more, tighten bolt **14** at specified torque.
  If clearance **B** is less than 0.6 mm {0.024 in.}, replace with spacer **8** (thickness=3.6 mm {0.14 in.}) and remeasure the clearance.

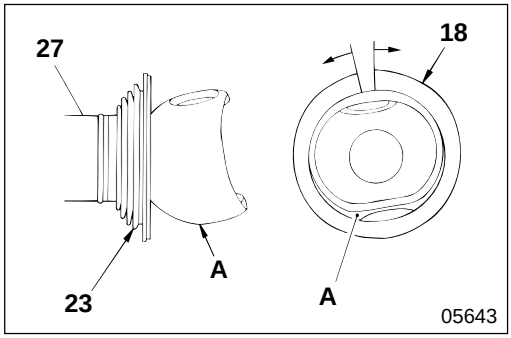


[Starting torque of steering knuckle]
- Fasten spring balancer **C** to steering knuckle **21** and measure whether the starting torque of the steering knuckle conforms to the standard value.
- If the measured value deviates from the standard value, adjust the starting torque of the steering knuckle according to the procedure described above. If any fault is found after adjustment, replace trunnion bearings **24**, **25**.

NOTE

Be sure to measure the starting torque before installing dust seal 18 and dust boot 23.

https://truckmanualshub.com/

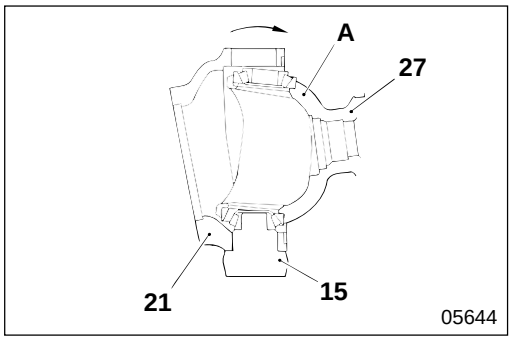


18 **23** **Installation of dust seal and dust boot**

Install dust boot **23** on kingpin ball yoke area **A** in axle housing **27**. Then, mount dust seal **18** while widening its end part.

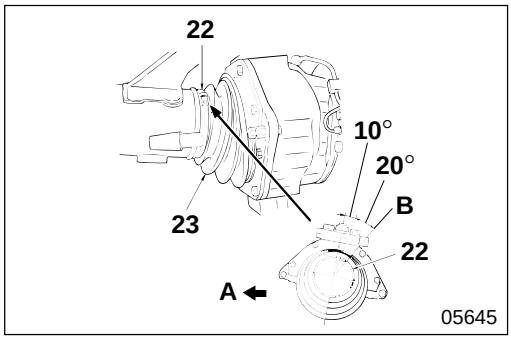
CAUTION

Do not widen dust seal 18 too much.



21 **Assembly of steering knuckle**

Install kingpin, lower **15** into steering knuckle **21**.
While turning the steering knuckle, install it into kingpin ball yoke area **A** in axle housing **27**.



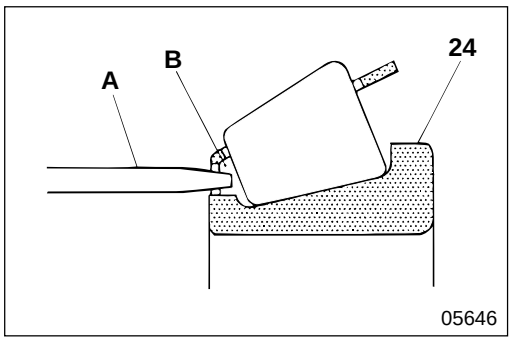
22 **Tightening of boot band**

Install boot band **22** at an angle within 20° as illustrated. Then, tighten and caulk it.

A : Front of the vehicle

CAUTION

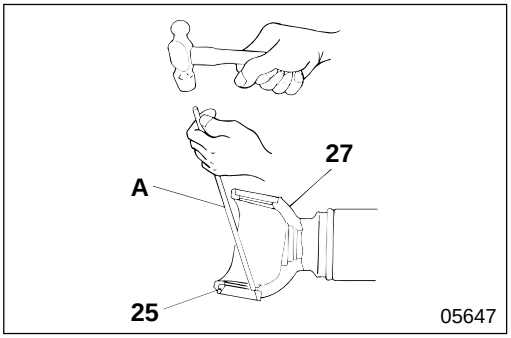
Be careful not to overtighten dust boot 23, and make sure that the rubber does not protrude too much from the joint surface.



24 **Packing grease in trunnion bearing inner race**

A : Grease pump nozzle
B : Between rollers

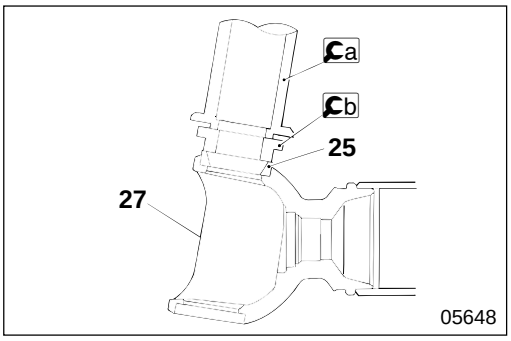
https://truckmanualshub.com/



25 **Trunnion bearing outer race**

[Removal]

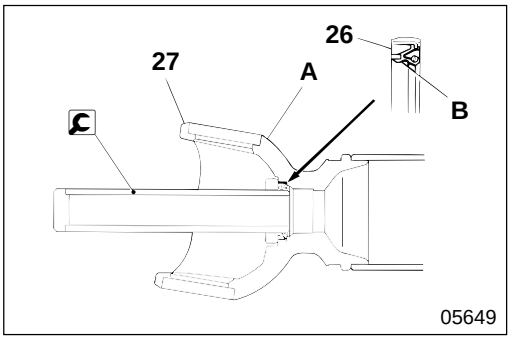
A : Pin-punch



[Press-fitting]

a : Bearing installer

b : Bearing installer



26 **Press-fitting of oil seal**

- Apply grease to lip area **B** of oil seal **26**.
- Press-fit oil seal **26** in the direction as illustrated so that the oil seal is level with the end of kingpin ball yoke **A** of axle housing **27**.

: Oil seal installer

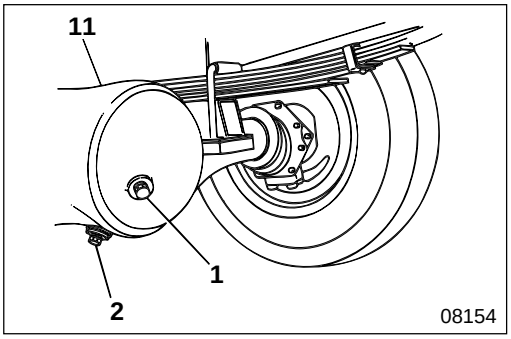
Sealant

Location	Points of application	Specified sealant	Quantity
11	Reduction and differential assembly mounting surface of axle housing	THREEBOND 1215	As required

◆ Service procedure

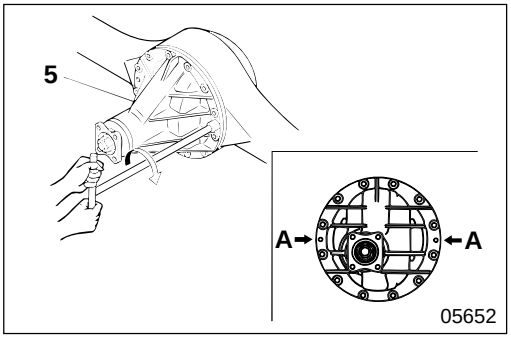


● Service operations before removal and after installation

(1) Before removing any part, remove inspection plug **1** and drain plug **2** and drain the gear oil from axle housing **11**.

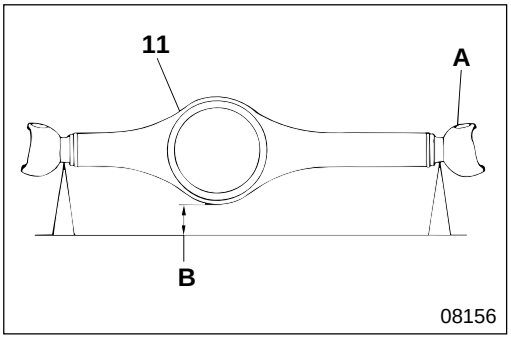
(2) After installing all parts, fill axle housing **11** with the specified amount of gear oil.

(3) Tighten drain plug **2** and inspection plug **1** at specified torque.



5 **Removal of reduction and differential assembly**

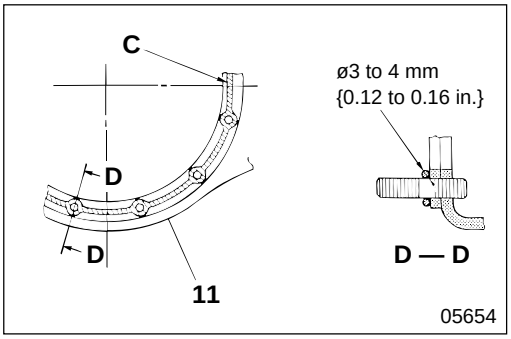
Tighten M10×1.25 mm bolts evenly into two screw holes **A** provided for removing reduction and differential assembly **5**.



11 **Axle housing**

[Inspection for deflection]

- Support both ends of kingpin ball yoke part **A** of axle housing **11** horizontally and measure axle housing height **B**.
- Turn axle housing **11** through 180° to measure height **B**.
- If the height difference is higher than the limit, replace axle housing **11**.



[Applying sealant]

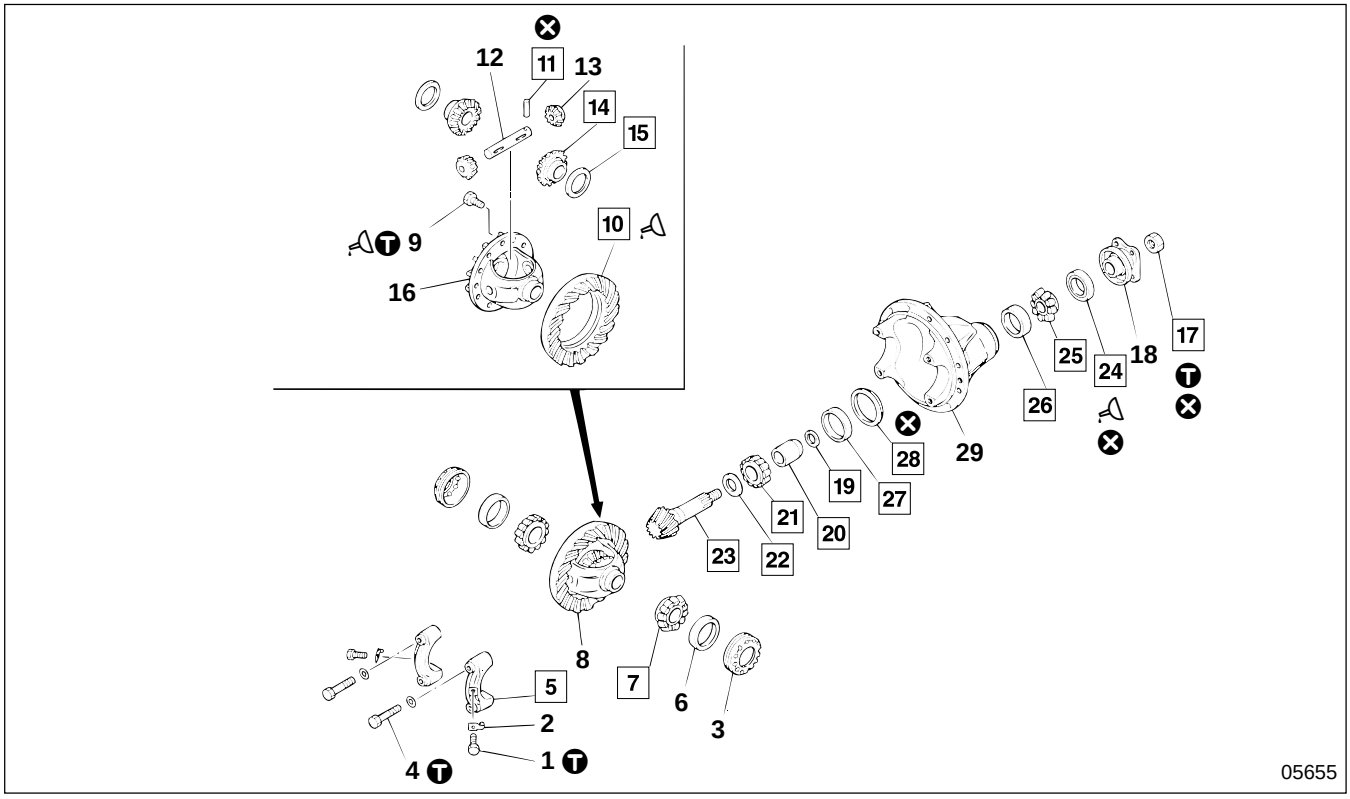
- Apply sealant to reduction and differential assembly **5** mounting surface of axle housing **11**.
- Apply sealant linearly for part **C** and for the position that is symmetrical to an imaginary center line.

CAUTION⚠

Make sure that sealant does not ooze from the mating surface after installing reduction and differential assembly 5.

https://truckmanualshub.com/

REDUCTION AND DIFFERENTIAL



- **Work before disassembly** P26B-33
- **Inspection before disassembly** P26B-33
- **Disassembly sequence**

1	Bolt	**12**	Pinion shaft	**22**	Rear bearing shim
2	Lock plate	**13**	Differential pinion	**23**	Final drive pinion
3	Side bearing nut	**14**	Differential gear	**24**	Oil seal
4	Bolt	**15**	Spacer	**25**	Front bearing inner race
5	Bearing cap	**16**	Differential case	**26**	Front bearing outer race
6	Side bearing outer race	**17**	Lock nut	**27**	Rear bearing outer race
7	Side bearing inner race	**18**	Companion flange assembly	**28**	Oil stopper
8	Differential assembly			**29**	Differential carrier
9	Bolt	**19**	Front bearing shim		
10	Final drive gear	**20**	Pinion spacer	⊗	: Non-reusable parts
11	Lock pin	**21**	Rear bearing inner race		

- **Assembly sequence**

  Follow the disassembly sequence in reverse.

- **Inspection and adjustment after assembly** P26B-34

CAUTION ⚠

Be sure when replacing any of the following parts, to replace both it and its associated parts as a set :

- **For bolt 4, bearing cap 5 or differential carrier 29, replace the carrier assembly.**
- **For final drive gear 10 or final drive pinion 23, replace the gear set.**
- **Make sure you keep left and right side bearings 6, 7 separate after remove, and be careful not to mix then up when installing them.**

NOTE

Write down the thickness of front bearing shim 19, pinion spacer 20 and rear bearing shim 22 when disassembling to use it as reference when assembly.

https://truckmanualshub.com/

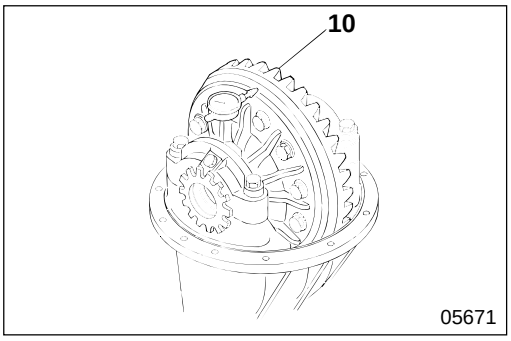
● **Work before disassembly**

Mount differential carrier **29** on c differential working base assembly.

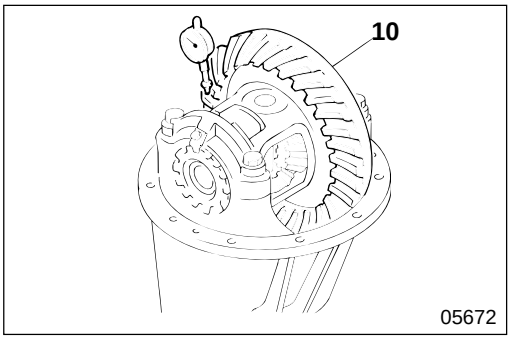
a : Attachment
b : Holder
c : Holder
d : Working base



● **Inspection before disassembly**

(1) Deflection of rear surface of final drive gear

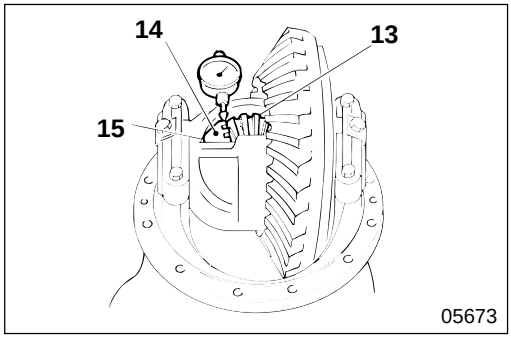
Measure at the point of maximum diameter of final drive gear **10**.



(2) Backlash between final drive gear and final drive pinion

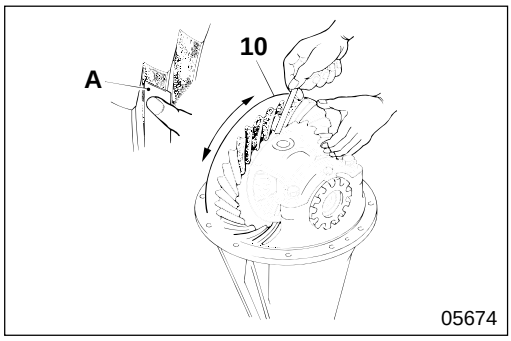
Measure at three points on the circumference of final drive gear **10**.

https://truckmanualshub.com/



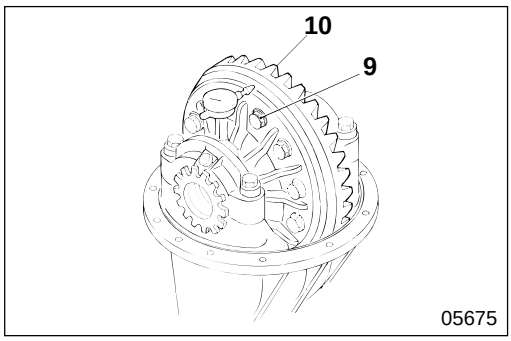
(3) Backlash between differential pinion and differential gear

Measure backlash between differential pinion **13** and differential gear **14**.



(4) Tooth contact of final drive gear

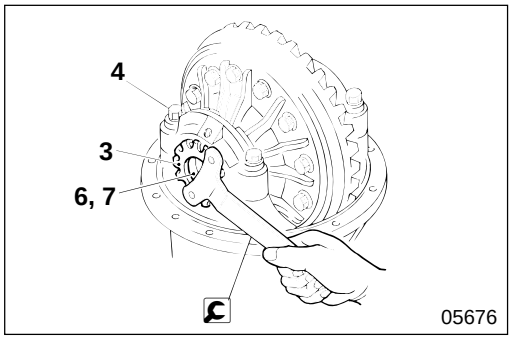
Apply red lead primer to the surfaces of three or four teeth of final drive gear **10**, examine tooth contact by turning the gears a few times.
A : Examine tooth contact using paper.



● **Inspection and adjustment after assembly**

(1) Deflection of rear surface of final drive gear

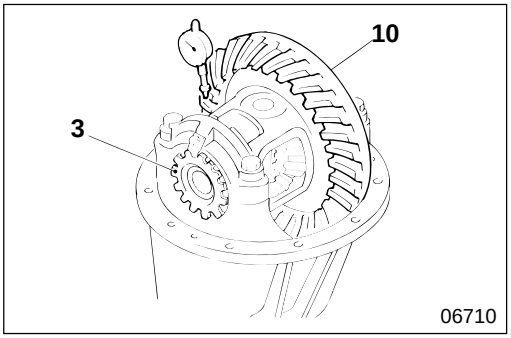
- Measure at the point of maximum diameter of final drive gear **10**.
- If the measured value deviates from the standard value, check tightening torque of bolt **9** or replace along with the gear set.



(2) Backlash of final drive gear

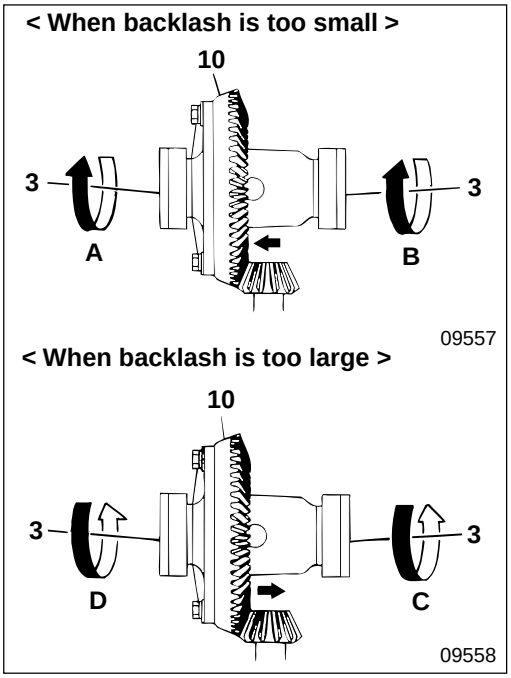
[Adjustment]
Before adjusting, tighten bolt **4** temporarily. Then, tighten side bearing nut **3** using 🔧 differential side bearing adjustment tool until just before pre-pressure is exerted on side bearings **6**, **7**.

https://truckmanualshub.com/



[Measurement]

- Measure final drive gear **10** backlash at three points on the circumference of the final drive gear.



- If backlash deviates from the standard value, rotate left and right side bearing nuts **3** and move final drive gear **10** as illustrated using 🔧 side bearing adjusting tool to adjust backlash.

  < When backlash is too small >

  Adjust in order of **A** to **B**.

  A : Loosen

  B : Tighten

  < When backlash is too great >

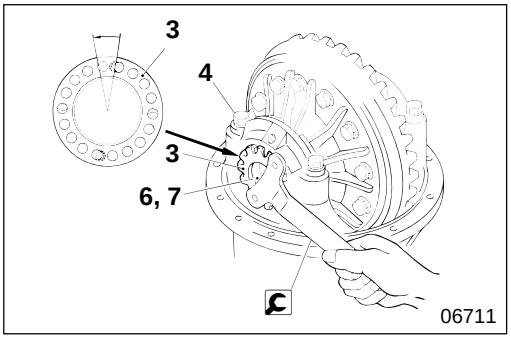
  Adjust in order of **C** to **D**.

  C : Loosen

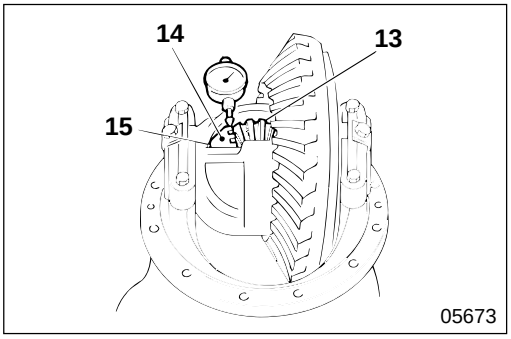
  D : Tighten

CAUTION ⚠

Be sure, when side bearing nut 3 on one side is loosened, to tighten the other side by the same amount.



- Tighten right and left side bearing nuts **3**, by half the pitch between the centers of adjacent holes, using 🔧 differential side bearing adjustment tool to add pre-pressure to side bearings **6**, **7**.
- Tighten bolt **4** at specified torque.



(3) Backlash between differential pinion and differential gear

Measure backlash between differential pinion **13** and differential gear **14**. If the measured value deviates from the standard value, adjust with spacer **15**.

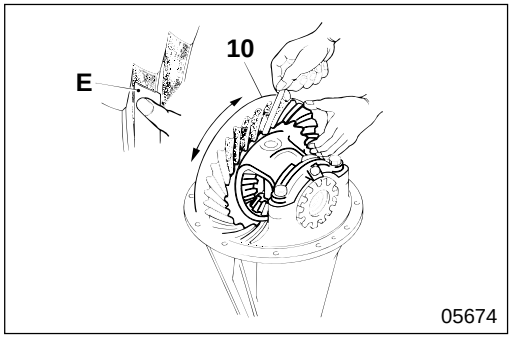
CAUTION ⚠

Make sure that the thickness of right spacer 15 is identical to that of the left spacer.

Spacer thicknesses :

1.4 to 1.6 mm {0.055 to 0.063 in.} (three thicknesses available in 0.1 mm {0.0039 in.} increments)

https://truckmanualshub.com/



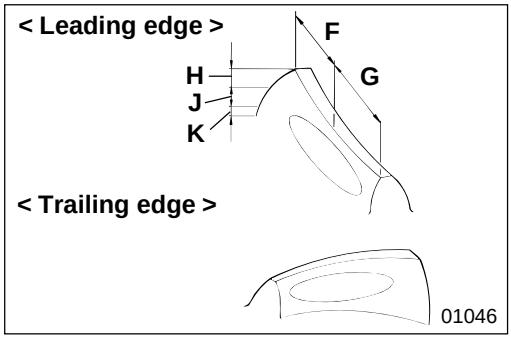
(4) Tooth contact of final drive gear

[Inspection]
Apply red lead primer to the surfaces of three or four teeth of final drive gear **10**, examine tooth contact by turning the gears a few times.
E : Examine tooth contact using paper.

[Adjustment]
If tooth contact deviates excessively from the standard value, adjust by increasing or decreasing backlash and rear bearing shim **22**.

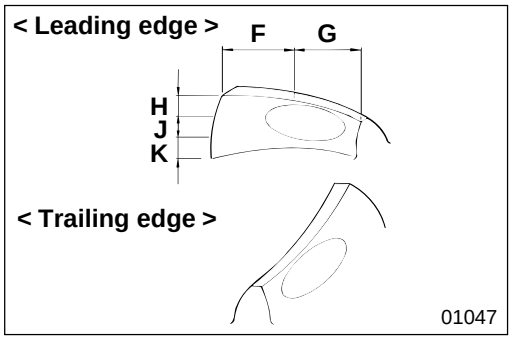
CAUTION

Be sure when replacing the gear because of abnormally worn teeth to replace the gear set of final drive gear 10 and final drive pinion 23 together.



● **Normal tooth contact at no load**

< Final drive gear >
F : Heel
G : Toe
H : Face
J : Flank
K : Clearance



< Final drive pinion >
F : Heel
G : Toe
H : Face
J : Flank
K : Clearance

https://truckmanualshub.com/

Maintenance item			Assembly standards
At no load	Tooth contact position	Lengthwise direction of tooth	From center towards edge
		Vertical direction	From center towards top of tooth for final drive gear and center for final drive pinion
	Tooth contact shape	Length	Approximately 50 to 70% of tooth width
		Width	Approximately 50 to 70% of tooth depth
	Degree of tooth contact		It becomes weaker as it nears tooth root or tooth tip

NOTE

When tooth contact is near the toe at no load it becomes middle area contact at load.

Adjustment of tooth contact

	Method of adjustment	Moving direction
Adjustment by adding or reducing shims	Advance final drive pinion to final drive gear (Shims are added) 	 Tooth contact moves towards tooth root
	Retard final drive pinion from final drive gear (Shims are reduced) 	 Tooth contact moves towards tooth tip
Adjustment using side bearing nut	Advance final drive gear to final drive pinion center (Less backlash) 	 Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to toe and slightly nearer to root of tooth Trailing edge: Nearer to heel and slightly nearer to top of tooth
	Retard final drive gear from final drive pinion center (More backlash) 	 Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to heel and slightly nearer to top of tooth Trailing edge: Nearer to toe and slightly nearer to root of tooth

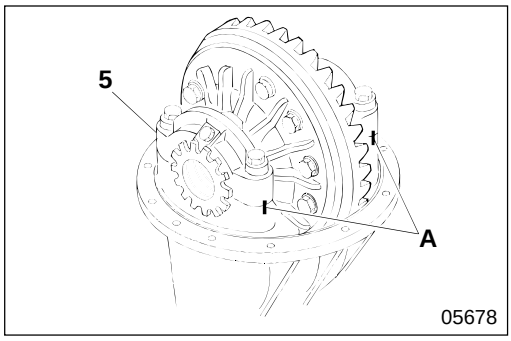
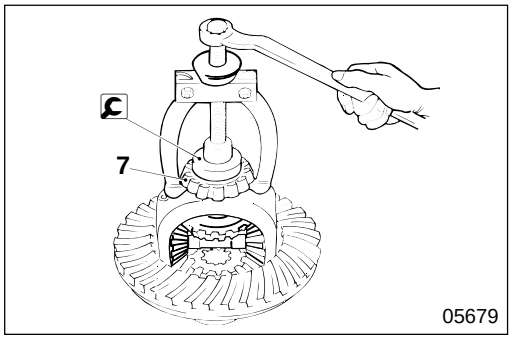
https://truckmanualshub.com/

◆ Service procedure



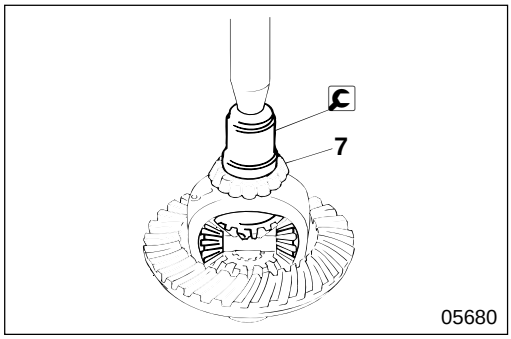
5 **Removal of bearing cap**

Put alignment marks **A** on bearing cap **5** to distinguish left and right.

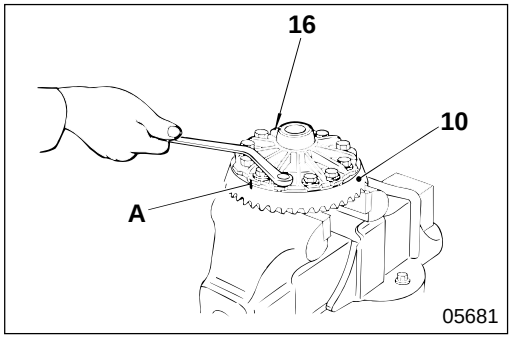


7 **Side bearing inner race**

[Removal]
: Adapter

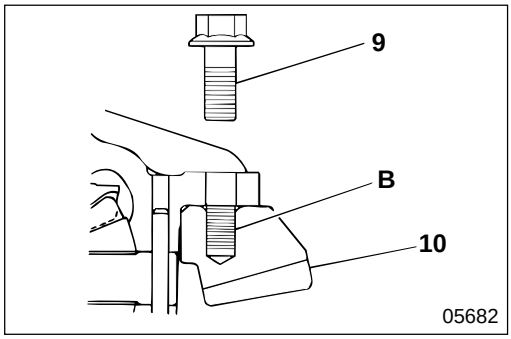


[Press-fitting]
: Bearing installer



10 **Final drive gear**

[Removal]
Put alignment marks **A** on final drive gear **10** and differential case **16**.

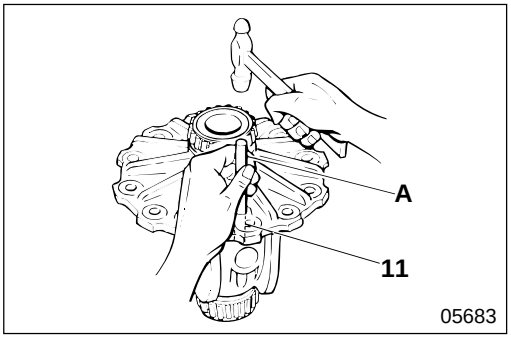


[Installation]
Apply LOCTITE to thread area of all bolt holes **B** of final drive gear **10** and tighten bolts **9** at specified torque.

CAUTION

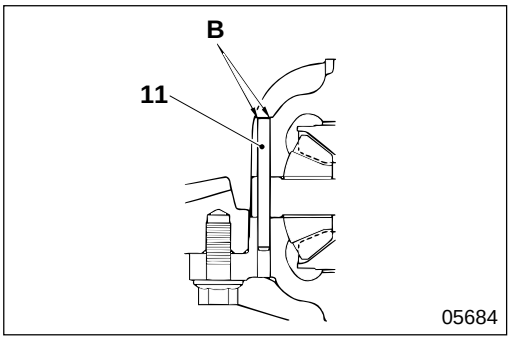
- **Be sure to let bolts 9 harden for at least an hour, after installation, before driving.**
- **Furthermore, be sure to let bolts 9 harden for at least four hours before running at full torque.**

https://truckmanualshub.com/

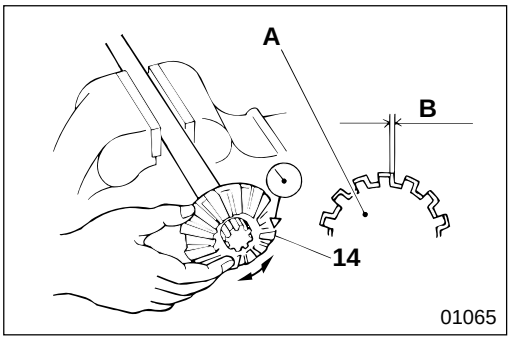


11 **Lock pin**

[Removal]
A : Punch

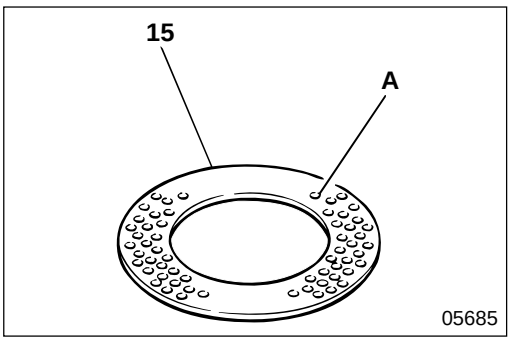


[Press-fitting]
After press-fitting lock pin **11**, stake part **B** at two points.



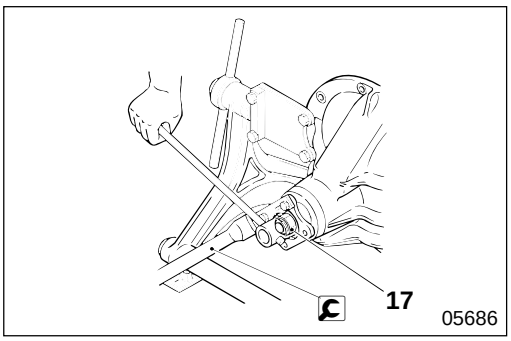
14 **Play between differential gear and drive shaft spline in the rotating direction**

If the measured value is higher than the limit, replace faulty parts.
A : Rear axle shaft
B : Play



15 **Installation of spacer**

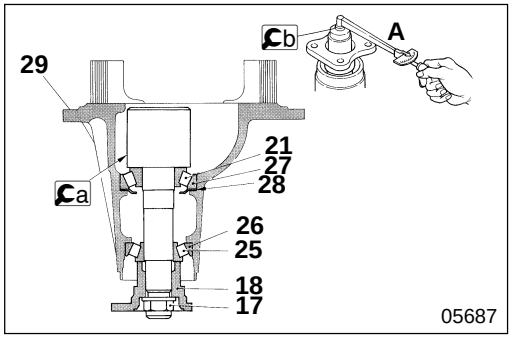
Install spacer **15** with oil grooves **A** side facing the differential gear.



17 **Removal and installation of lock nut**

: Flange stopper

https://truckmanualshub.com/



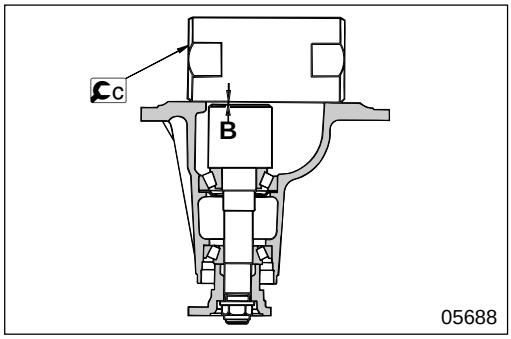
19 to 23 25 to 28 Final drive pinion assembly

[Selection of rear bearing shim]

- Install a pinion gauge temporarily in differential carrier **29** together with the parts illustrated.
- Tighten lock nut **17** using b socket to adjust starting torque **A** of the pinion gauge to the standard value.

CAUTION

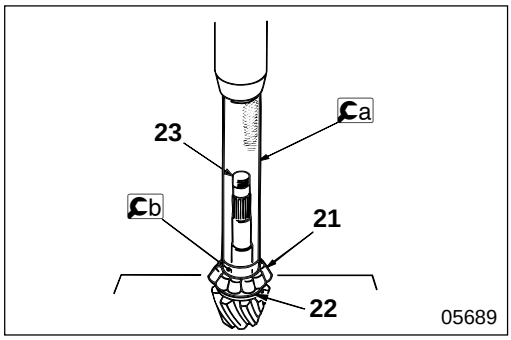
Do not assemble parts other than those illustrated.



- Set c cylinder gauge to standard starting torque to measure gap **B** as illustrated.
  Select rear bearing shim **22** using the calculation given below.
  < Calculation of rear bearing shim thickness C >
  C=B–1.5 mm {0.059 in.}
  Rear bearing shim thicknesses :
  0.3 mm {0.012 in.} and 1.38 to 1.65 mm {0.054 to 0.065 in.}
  (10 thicknesses available in 0.03 {0.0012 in.} mm increments)

CAUTION

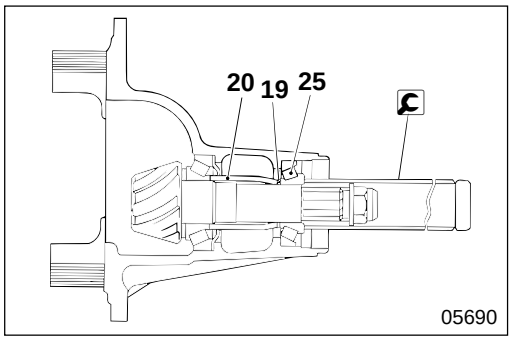
Be sure to keep the number of rear bearing shims 22 to the minimum and keep them as close to the standard value as possible.



[Installation of rear bearing shim]
Install selected rear bearing shim **22** onto final drive pinion **23** and press-fit rear bearing inner race **21** using a b bearing installer.

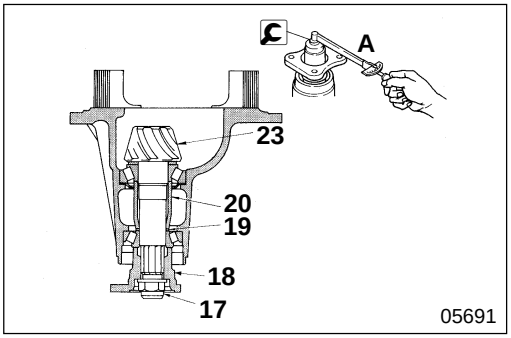
CAUTION

Be sure, when installing rear bearing shim 22 comprised of a 0.3 mm {0.012 in.} shim and another shim, that the 0.3 mm {0.012 in.} shim is installed next to the bearing.



[Press-fitting of front bearing inner race]
Assemble pinion spacer **20** and front bearing shim **19** for press-fitting of front bearing inner race **25** using bearing installer.

https://truckmanualshub.com/



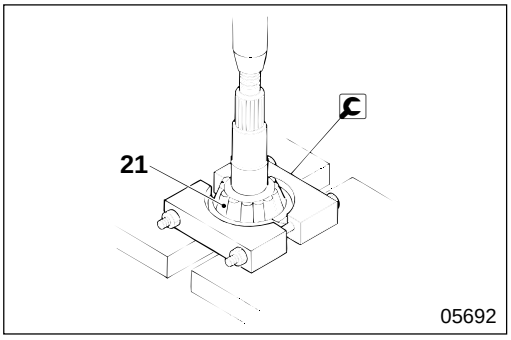
[Measurement of starting torque]

- After installing companion flange assembly **18**, tighten lock nut **17** at specified torque.
  Measure starting torque **A** of final drive pinion **23** using [E] socket.
- If the measured value deviates from the standard value, select pinion spacer **20** and front bearing shim **19** to adjust the starting torque to the standard value.

CAUTION

- **Do not install the oil seal before measuring the starting torque.**
- **Be sure to keep the number of shims to the minimum when selecting pinion spacers 20.**

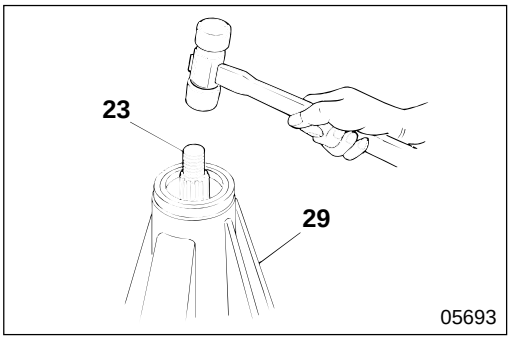
Pinion spacer heights:
64.07 mm {2.52 in.} and 64.40 mm {2.54 in.} (Painted white)
Front bearing shim thicknesses:
0.30 mm {0.012 in.} and 2.00 to 2.33 mm {0.079 to 0.092 in.}, (12 thicknesses available in 0.03 mm {0.0012 in.} increments)



21 Rear bearing inner race

[Removal]
[E] : Pinion rear bearing remover

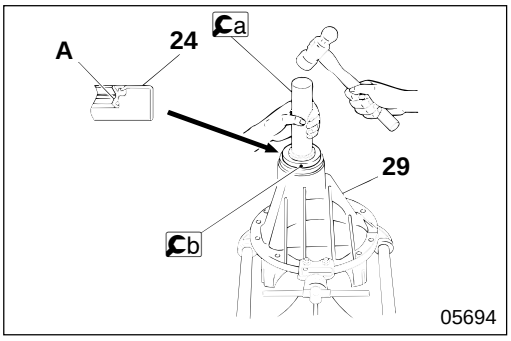
[Press-fitting]
P26B-40



23 Removal of final drive pinion

CAUTION

Be sure to use a plastic mallet when driving out final drive pinion 23, and prevent it from dropping to the ground by holding it.

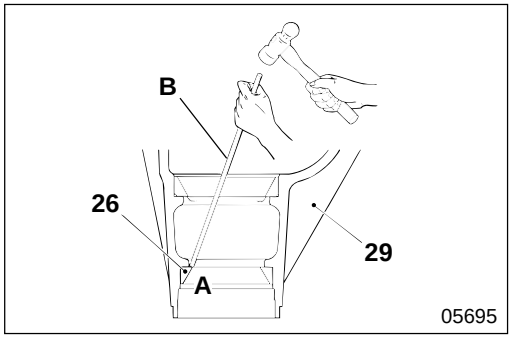


24 Press-fitting of oil seal

Apply grease to lip area **A** of oil seal **24** and press-fit the oil seal into differential carrier **29**.

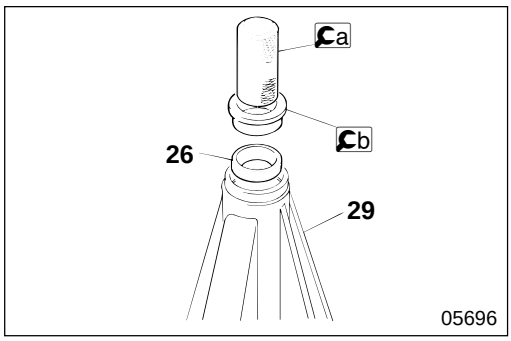
[Ea] : Bearing installer
[Eb] : Bearing installer adapter

https://truckmanualshub.com/

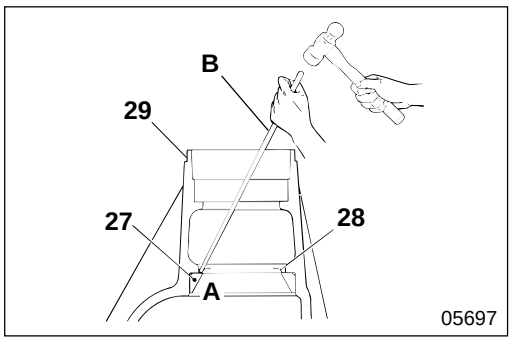


26 **Front bearing outer race**

[Removal]
Drive out front bearing outer race **26** evenly from three indented parts **A** of differential carrier **29**.
B : Pin-punch

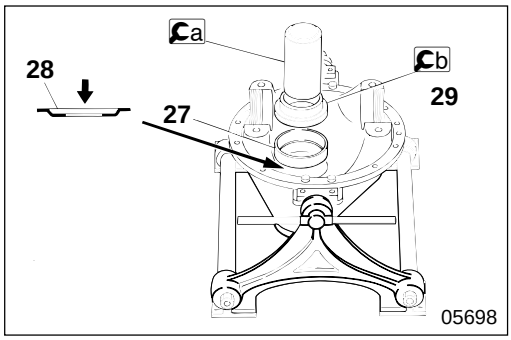


[Press-fitting]
a : Bearing installer
b : Bearing installer



27 **28** **Rear bearing outer race and oil stopper**

[Removal]
Drive out rear bearing outer race **27** and oil stopper **28** evenly from three indented parts **A** of differential carrier **29**.
B : Pin-punch



[Press-fitting]
Insert oil stopper **28** in the direction of the arrow as illustrated.
a : Bearing installer
b : Bearing installer

● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect the negative terminal of the battery cable. Gr 54
3 Jack up the rear axle using a garage jack.
4 Support the rear frame on rigid racks.

WARNING

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

https://truckmanualshub.com/

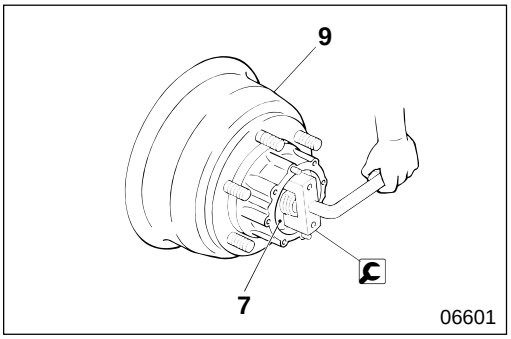
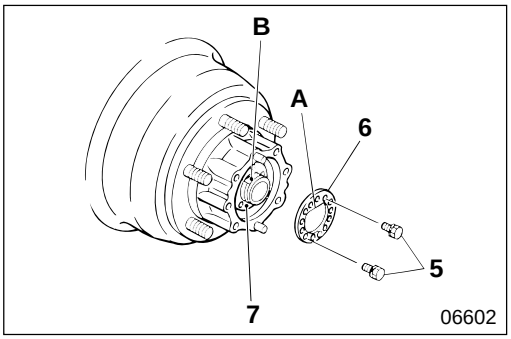
◆ Service procedure



● Starting torque of wheel hub bearing

[Adjustment]

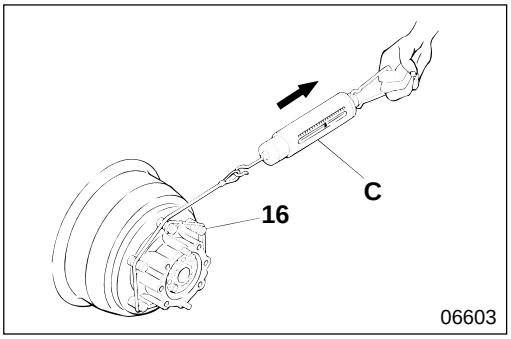
- Tighten lock nut **7** at specified torque for primary tightening, while turning wheel hub and brake drum assembly **9**.
- Slacken off lock nut **7** completely.
- Turn wheel hub and brake drum assembly **9** several times to smooth operation of outer bearings **8**, **13** and inner bearings **11**, **12.**
- Retighten lock nut **7** at specified torque for secondary tightening.



- Align flat area **A** with notch **B** to install lock washer **6**.
- Make sure that the mounting holes of lock washer **6** and lock nut **7** align. If they do not, slacken off the lock nut and align them.
- Install bolts **5** at the position as illustrated, aligning lock nut **7**.
- Tighten bolts **5** at specified torque.

CAUTION⚠

After adjustment, make sure that there is no play in the axial direction of wheel hub and brake drum assembly 9.

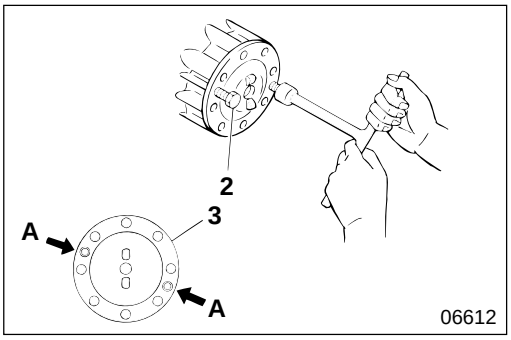


[Measurement]

- Install spring balance **C** on hub bolt **16**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- Do not allow the starting torque to become higher than the tangential force.
- If the measured value deviates from the specified value, readjust.
- If any fault is found after readjustment, replace outer bearings **8**, **13** and inner bearings **11**, **12**.

NOTE

- **Measure the starting torque with inner oil seal 10 installed.**
- **Measure the starting torque with rear axle shaft 3 and outer oil seal 4 removed.**
- **Make sure that there is no drag in brake lining and brake drum 15 before you measure the tangential force.**

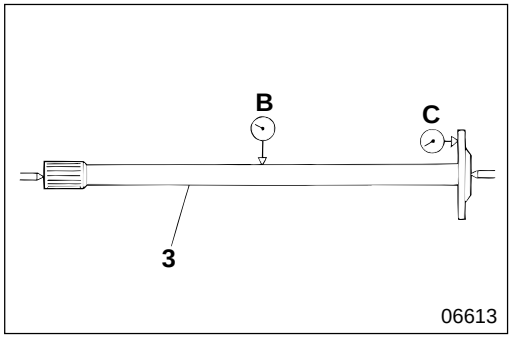


3 Axle shaft

[Removal]

Insert two mounting bolts **2** of axle shaft **3** into two screw holes **A**, provided for disassembly, of the flange. Then, remove the rear shaft.

https://truckmanualshub.com/



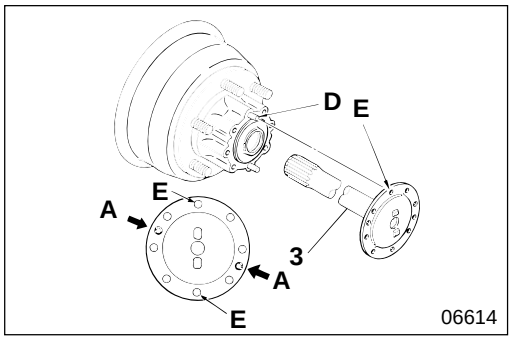
[Inspection]

B : Bend at the shaft center

NOTE

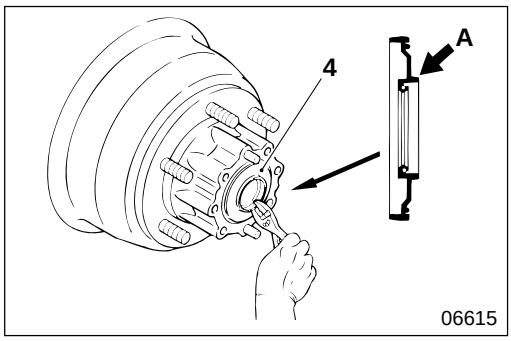
To measure the bend of axle shaft 3, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

C : Bend of flange surface



[Installation]

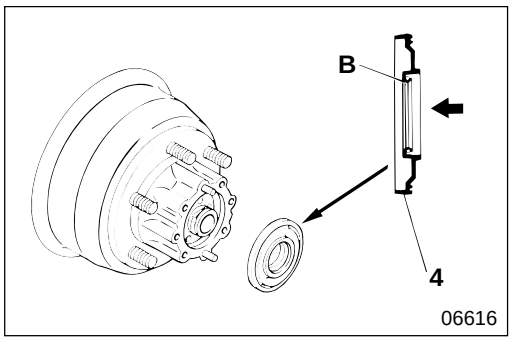
- Knock pin hole **E** of axle shaft **3** is the second hole clockwise from disassembly screw hole **A**.
- To mount axle shaft **3**, align knock pin **D** with knock pin hole **E**.



4 **Outer oil seal**

[Removal]

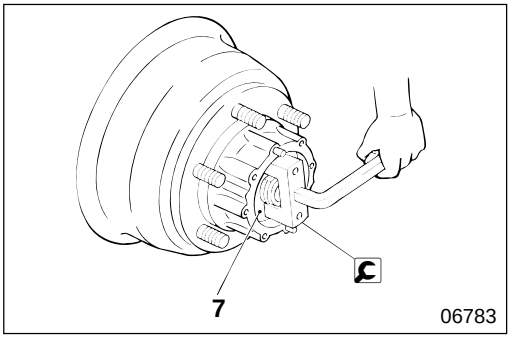
To remove outer oil seal **4**, use a pair of pliers and pull protrusion **A** of the outer oil seal circumference evenly.



[Installation]

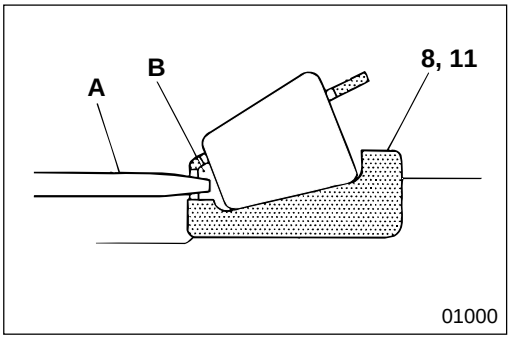
Apply grease to lip area **B** of outer oil seal **4** and press-fit the outer oil seal in the direction as illustrated.

https://truckmanualshub.com/



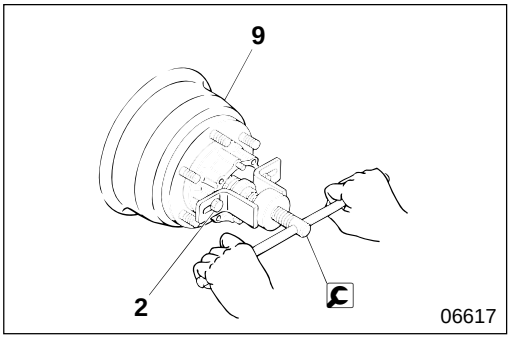
7 **Removal and installation of lock nut**

Adjust and measure the starting torque of wheel hub bearing during installation. P27-11



8 **11** **Packing grease in outer bearing inner race and inner bearing inner race**

A : Grease pump nozzle
B : Space between rollers



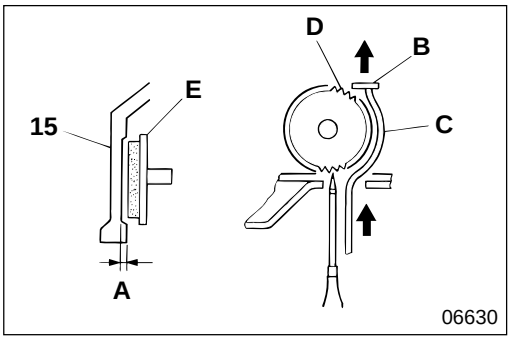
9 **Wheel hub and brake drum assembly**

[Removal]

- Remove wheel hub and brake drum assembly **9** using mounting bolt **2** of axle shaft **3**.

CAUTION

Make sure you remove wheel hub and brake drum assembly 9 in a straight line to prevent damage to oil seal 10.



- If wheel hub and brake drum assembly **9** cannot be removed because of stepped wear **A** in brake drum **15**, do the following:
- Remove the backing plate cover.
- Lift lever **B**.
  C : Wire approximately ø2 mm {0.079 in.}
- Turn adjuster **D** in the opposite direction to the arrow on the backing plate to retract brake shoe assembly **E**.
- Remove wheel hub and brake drum assembly **9**.

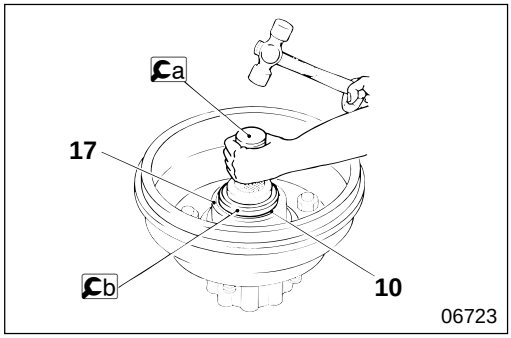
CAUTION

Correct brake drum 15 if any fault is found. **Gr 35**

[Installation]

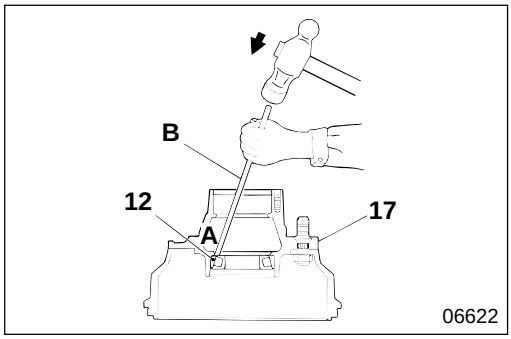
After installing wheel hub and brake drum assembly **9**, adjust the brake shoe clearance. Gr 35

https://truckmanualshub.com/



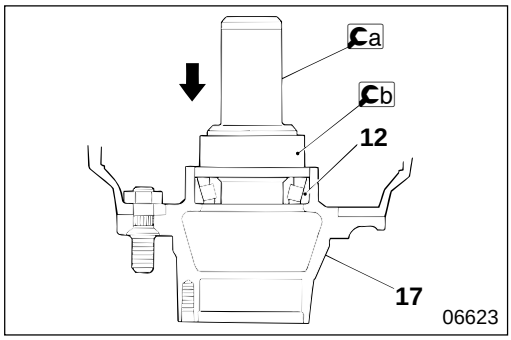
10 **Installation of inner oil seal**

Press-fit inner oil seal **10** until it is flush with the end of wheel hub **17**.

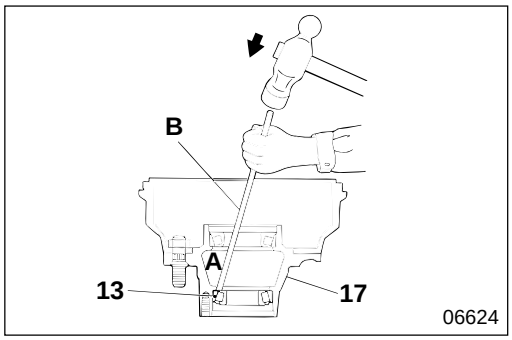


12 **Inner bearing outer race**

[Removal]
Drive out inner bearing outer race **12** evenly from three indented parts **A** in wheel hub **17**.
B : Pin-punch



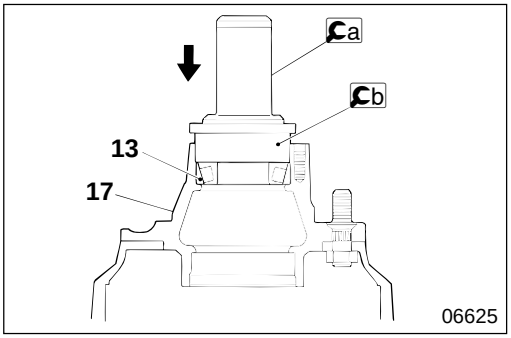
[Installation]



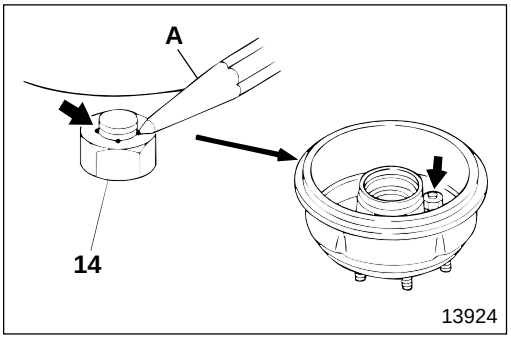
13 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **13** evenly from three indented parts **A** in wheel hub **17**.
B : Pin-punch

https://truckmanualshub.com/



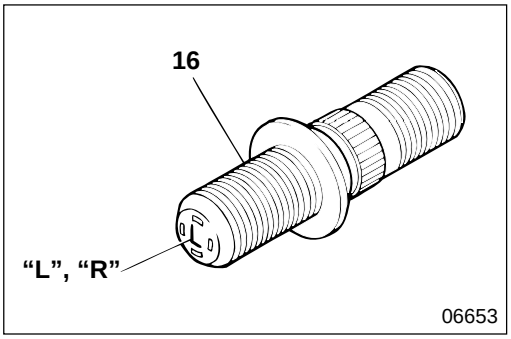
[Installation]



14 **Installation of nut**

Tighten nut **14** at specified torque, then caulk the nut to keep it from turning.

A : Punch



16 **Installation of hub bolt**

Hub bolt **16** is marked with **L** (left) or **R** (right) to indicate the side it is to be mounted on. Check this symbol before press-fitting the bolt.

*2 : Brake pad wear indicator
Gr 54
⊗ : Non-reusable parts

WARNING

Disc brake assembly 11 and disc rotor 28 are hot immediately after the vehicle has stopped, so take care not to burn yourself.

CAUTION

Be sure to protect brake pipe 1 and brake hoses 3, 7 from dust by fitting blanking plugs after removal.

NOTE

Do not disassemble wheel hub 27 and disc rotor 28 unless they are faulty.

https://truckmanualshub.com/

● **Assembly sequence**

Follow the disassembly sequence in reverse.

WARNING⚠

You must bleed air from the brake system after assembly, failure to do so would cause the brake to malfunction. Gr 35

CAUTION⚠

Be careful not to damage inner oil seal 20 when installing wheel hub and rotor assembly 19 in axle housing *1.

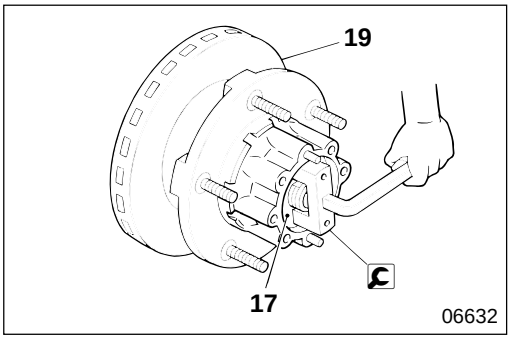
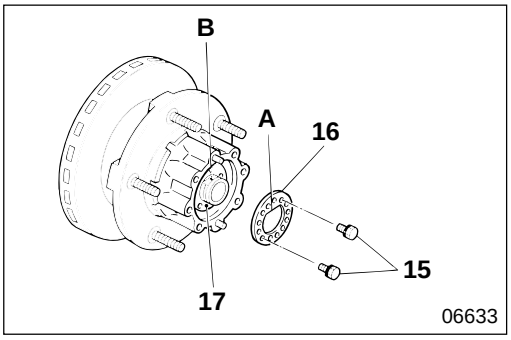
◆ Service procedure



● Starting torque of wheel hub bearing

[Adjustment]

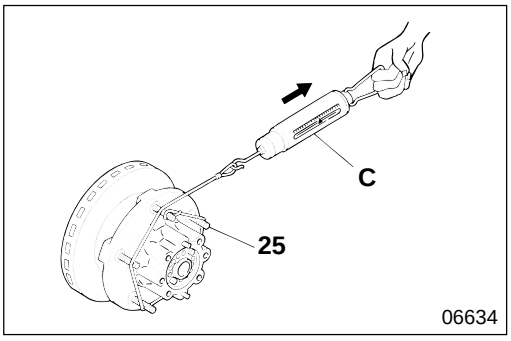
- Tighten lock nut **17** at specified torque for primary tightening, while turning wheel hub and rotor assembly **19**.
- Slacken off lock nut **17** completely.
- Turn wheel hub and rotor assembly **19** several times to smooth operation of outer bearings **18**, **23** and inner bearings **21, 22**.
- Tighten lock nut **17** at specified torque for secondary tightening.



- Insert lock washer **16** so that flat area **A** fits onto notch **B**.
- Make sure that the mounting holes of lock washer **16** and lock nut **17** align. If they do not, slacken off the lock nut and align them.
- Install bolts **15** at the positions as illustrated, aligning lock nut **17**.
- Tighten bolts **15** at specified torque.

CAUTION

After adjustment, make sure that there is no play in the axial direction of wheel hub and rotor assembly 19.



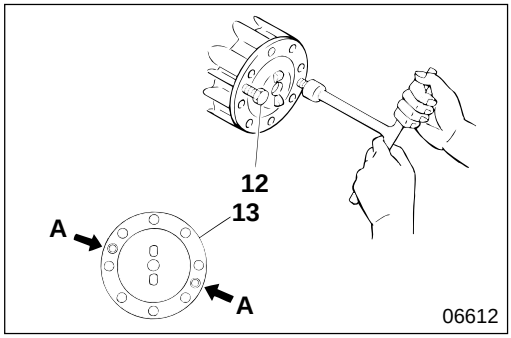
[Measurement]

- Install spring balance **C** on hub bolt **25**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- Do not allow the starting torque to become higher than the tangential force.
- If the measured value deviates from the specified value, readjust.
- If any fault is found after readjustment, replace outer bearings **18, 23** and inner bearings **21, 22**.

NOTE

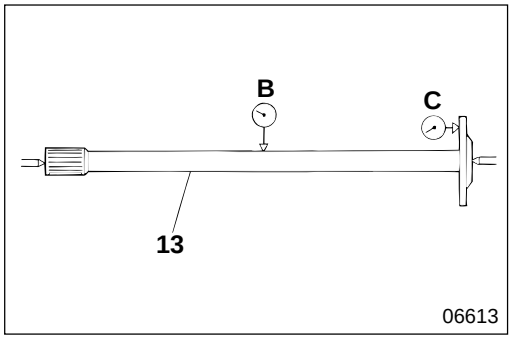
- **Measure the starting torque with inner oil seal 20 installed.**
- **Measure the starting torque with disc brake assembly 11, outer oil seal 14 and axle shaft 13 removed.**

https://truckmanualshub.com/



13 **Axle shaft**

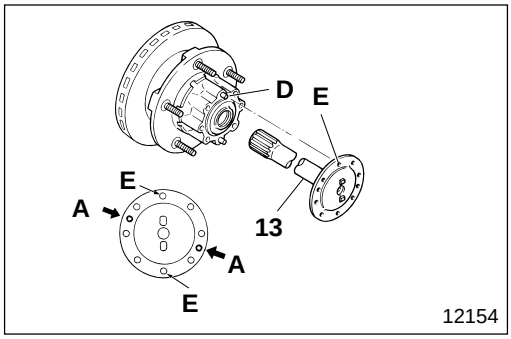
[Removal]
Insert bolts **12** into screw holes **A** of axle shaft **13**. Then, remove the axle shaft.



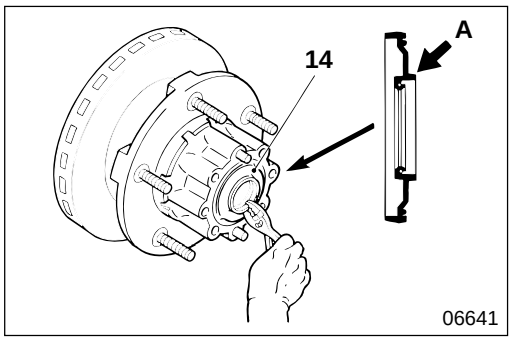
[Inspection]
B : Bend of shaft center

NOTE
To measure the bend of axle shaft 13, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

C : Wobble of flange face

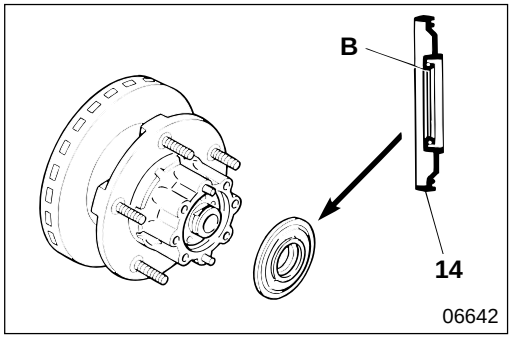


[Installation]
- Knock pin hole **E** of axle shaft **13** is the second hole clockwise from disassembly screw hole **A**.
- To mount axle shaft **13**, align knock pin **D** with knock pin hole **E**.



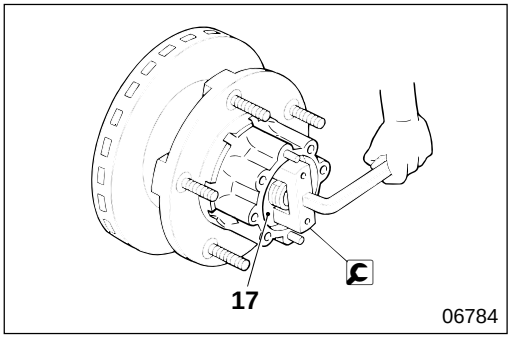
14 **Outer oil seal**

[Removal]
To remove outer oil seal **14**, use pliers and pull protrusion **A** of the outer oil seal circumference evenly.



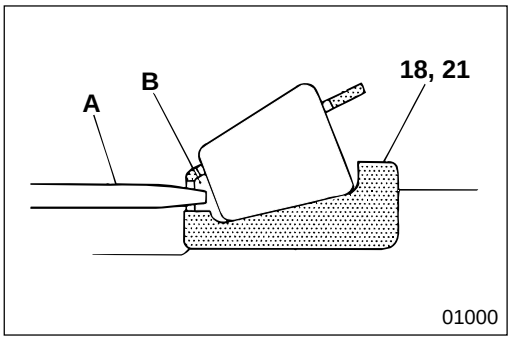
[Installation]
- Apply grease to lip area **B** of outer oil seal **14**.
- Press-fit outer oil seal **14** in the direction as illustrated.

https://truckmanualshub.com/



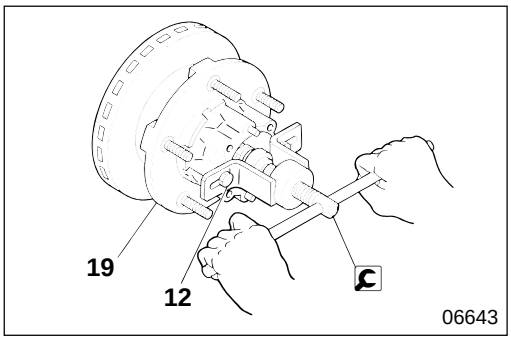
17 **Removal and installation of lock nut**

Adjust starting torque of wheel hub bearing during installation.
P27-19



18 **21** **Packing grease in outer bearing inner race and inner bearing inner race**

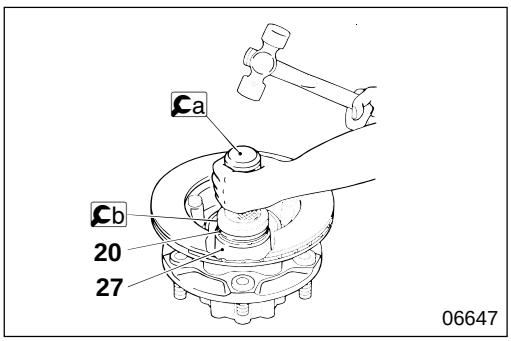
A : Grease pump nozzle
B : Space between rollers



19 **Removal of wheel hub and rotor assembly**

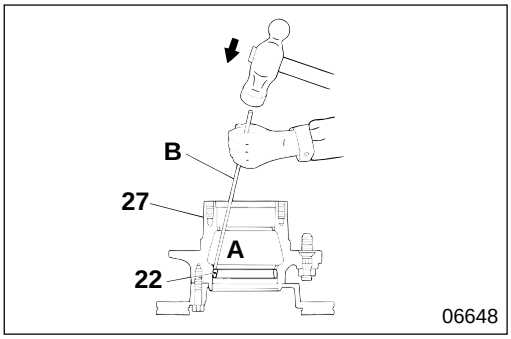
Remove wheel hub and rotor assembly **19** using mounting bolt **12** of axle shaft **13**.

CAUTION
Make sure you remove wheel hub and rotor assembly 19 in a straight line to prevent damage to inner oil seal 20.



20 **Installation of inner oil seal**

Press-fit inner oil seal **20** so that it is flush with the end of wheel hub **27**.

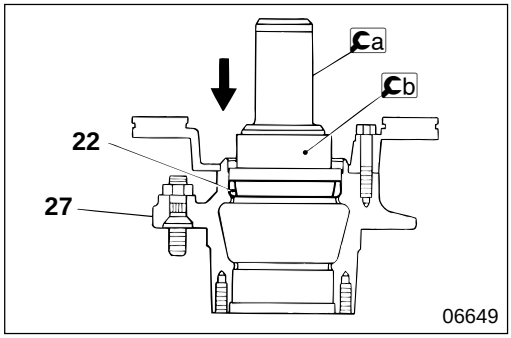


22 **Inner bearing outer race**

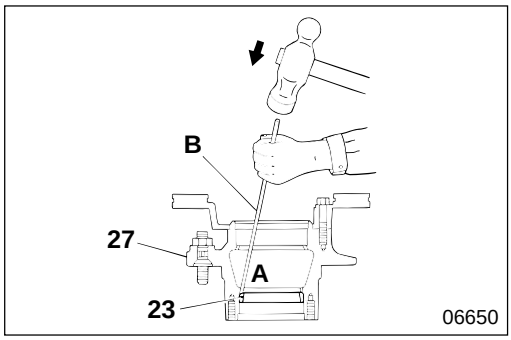
[Removal]
Drive out inner bearing outer race **22** evenly from three indented parts **A** in wheel hub **27**.

B : Pin-punch

https://truckmanualshub.com/



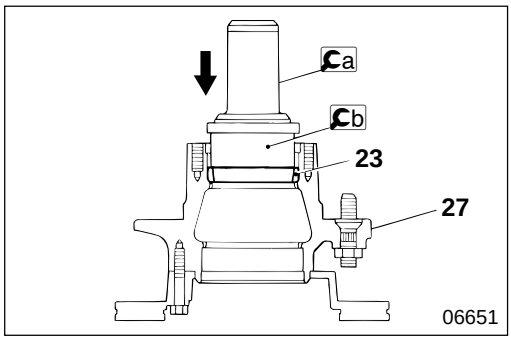
[Installation]



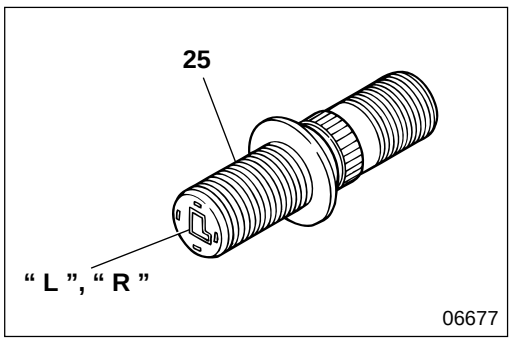
23 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **23** evenly from three indented parts **A** in wheel hub **27**.

B : Pin-punch

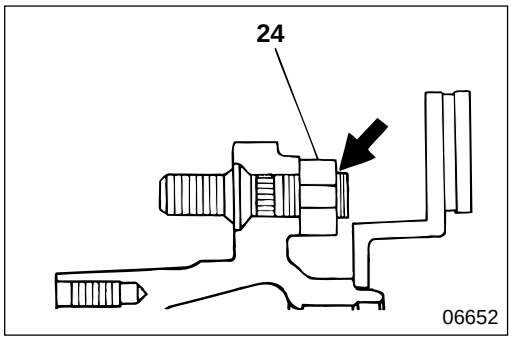


[Installation]



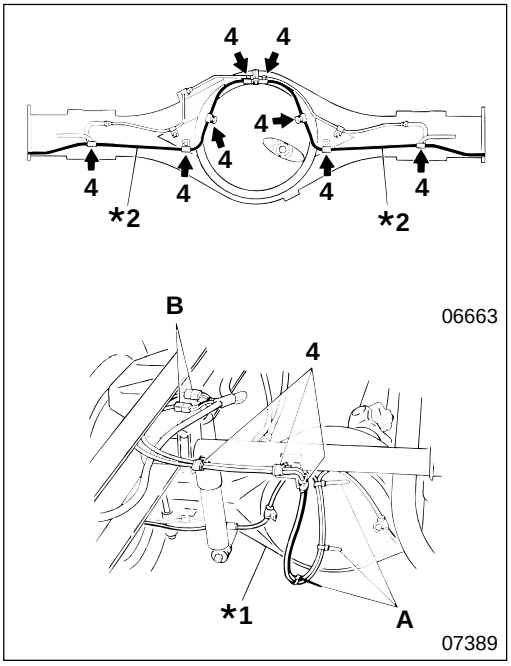
24 **25** **Installation of nut, hub bolt**

- Hub bolt **25** is marked with **L** (left) or **R** (right) to indicate the side it is to be mounted on. Check this symbol before press-fitting the bolt.



- Tighten nut **24** at specified torque.
- Drive nut **24** in using a punch to lock the nut.

https://truckmanualshub.com/



[*2] Installation of brake pad wear indicator

- Wire brake pad wear indicator ***2** from disc brake assembly **11** in the direction as illustrated and install using clips **4**.

- Wire brake pad wear indicator ***2** from axle housing ***1** to the frame in the direction as illustrated and install using clips **4**.
  A : Tie-wrap
  B : Connector

CAUTION⚠

Make sure that brake pad wear indicator *2 is not twisted or unnecessarily slack when you install it.

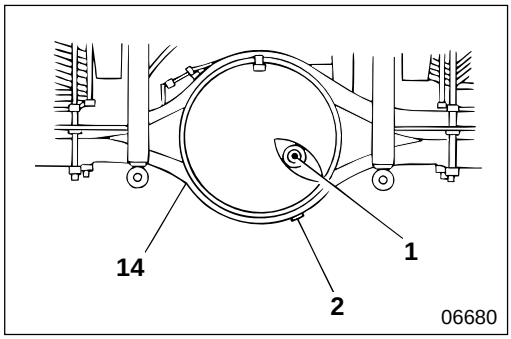
Location	Tool name and shape	Part No.	Application
10	Differential carrier base  06679	MB999102	Removal and installation of reduction and differential assembly

https://truckmanualshub.com/

◆ Service procedure



● **Work before disassembly**

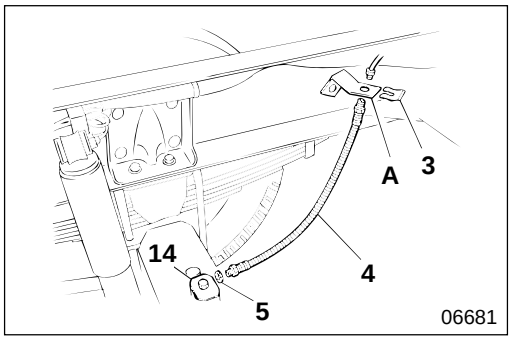
Remove inspection plug **1** and drain plug **2**, then drain the gear oil from axle housing **14**.

WARNING⚠

The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.

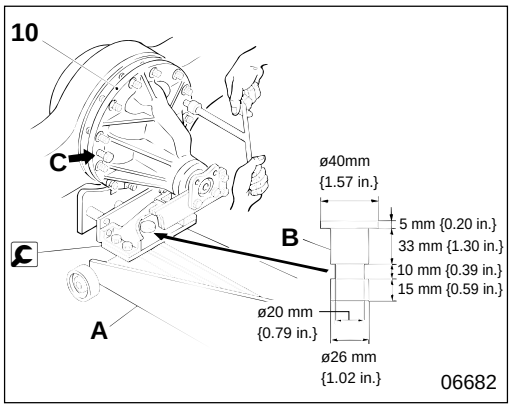
● **Work after assembly**

Fill axle housing **14** with the specified amount of gear oil via inspection plug **1**.



4 **Removal and installation of brake hose**

Remove brake hose **4** from bracket **A** (on the frame) first, then remove the brake hose from axle housing **14**. To assemble the brake hose follow the disassembly sequence in reverse.

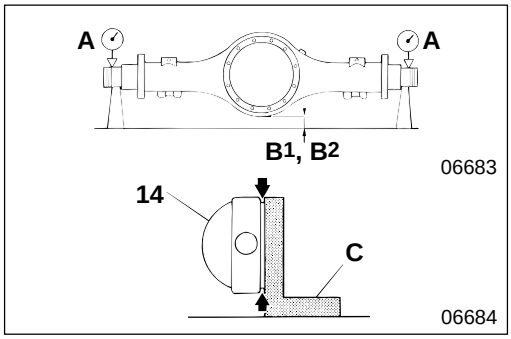


10 **Removal and installation of reduction and differential assembly**

- Remove the lift pad from garage jack **A** and mount differential carrier base, after turning pin **B** to the dimensions as illustrated insert it and secure it with the bolt which secured the lift pad.
- Tighten two bolts in screw holes **C** used for removing reduction and differential assembly **10** evenly, and remove the reduction and differential assembly.
  Bolt size : M12×1.25 mm

NOTE

Be sure to completely remove adhered sealant from the mounting surface of the axle housing and carrier.

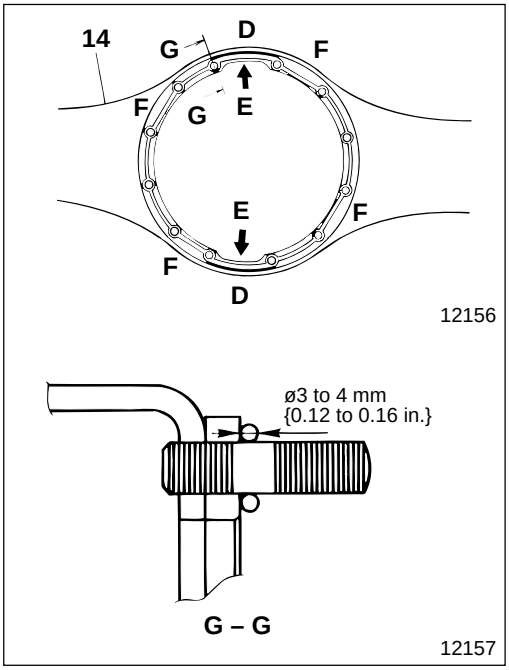


14 **Axle housing**

[Inspection]

- Support the inner bearing mating parts at both ends of the housing spindle of axle housing **14** horizontally.
- Set the dial gauge against outer bearing mating part **A** and turn it 360° to measure bend.
- Set axle housing **14** vertical using square **C**. After measuring B_1, turn the axle housing 180° and measure B_2 to find the difference.
- If the measured value is higher than the limit, replace axle housing **14**.

https://truckmanualshub.com/



[Application of sealant]

- Apply sealant to reduction and differential assembly **10** mounting surface of axle housing **14**.
- Apply sealant around the periphery of indented area **E** for part **D**.
- Apply sealant linearly to part **F**.

NOTE

Make sure that sealant does not ooze from the mounting surface after installing reduction and differential assembly 10.

https://truckmanualshub.com/

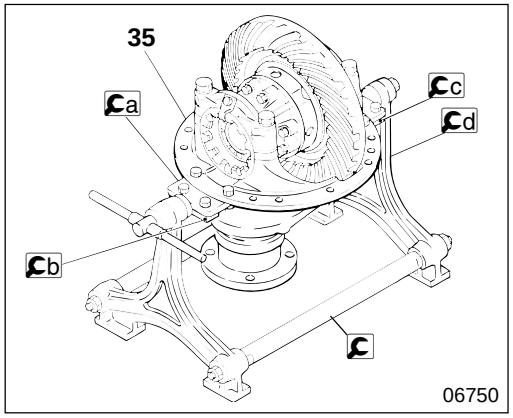
32	Pinion bearing installer 	MH061264	Press-fitting of rear bearing outer race

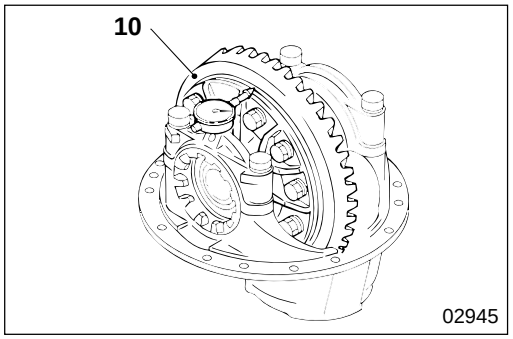
https://truckmanualshub.com/



◆ Service procedure

● **Work before disassembly**

Mount differential carrier **35** on [c] differential working base assembly.

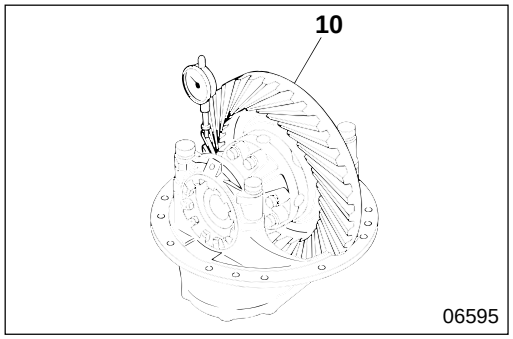


● **Inspection before disassembly**

Inspect for faulty parts before disassembly.

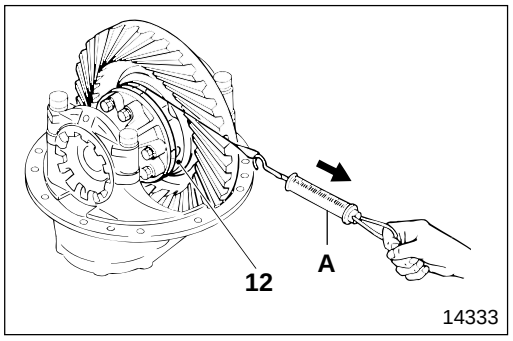
(1) Wobble of rear face of final drive gear

Measure wobble at a point 132 mm {5.20 in.} (on the radius) from the center of final drive gear **10**.



(2) Backlash of final drive gear and final drive pinion

Measure at three points on the circumference of final drive gear **10**.



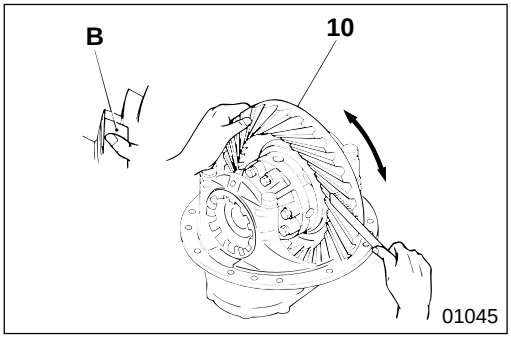
(3) Starting torque of side bearing

- Install spring balance **A** at 152 mm {5.98 in.} outer periphery point of differential case LH **12**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.

NOTE

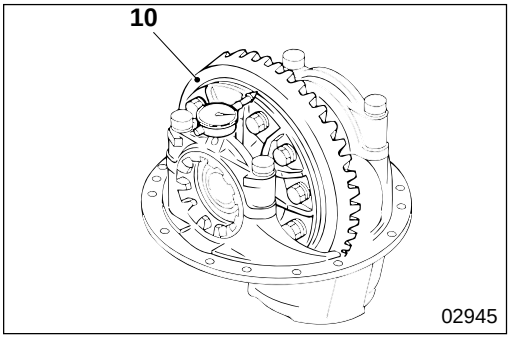
Measure the starting torque within final drive gear 10 and final drive pinion 28 backlash range.

https://truckmanualshub.com/



(4) Tooth contact of final drive gear

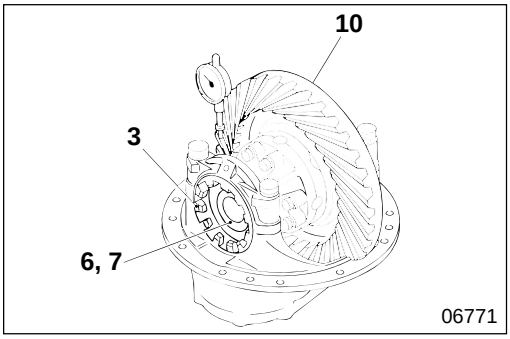
Apply red lead to three or four teeth of final drive gear **10**, examine tooth contact by turning the gears a few times.
B : Examine tooth contact using paper.



● **Inspection and adjustment after assembly**

(1) Inspection of wobble of back face of final drive gear

Measure wobble at a point 132 mm {5.20 in.} (on the radius) from the center of final drive gear **10**.



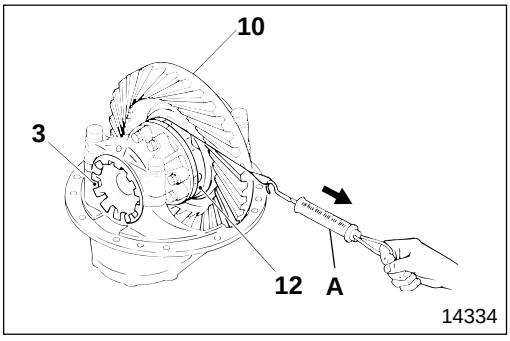
(2) Backlash of final drive gear and final drive pinion

[Adjustment]

- Adjust backlash using left and right adjusting screws **3** with the adjusted starting torques of side bearings **6**, **7** unchanged.
- Measure backlash at three points around the circumference of final drive gear **10**.

CAUTION

Make sure when you loosen one adjusting screw 3 that you tighten the other adjusting screw by the same amount, because the starting torque of the side bearings 6, 7 changes.



(3) Starting torque of side bearing

[Inspection]

- Install spring balance **A** at 152 mm {5.98 in.} outer periphery point of differential case LH **12**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the specified value, adjust.

[Adjustment]

If the measured value deviates from the specified value, adjust it using left and right adjusting screws **3**.

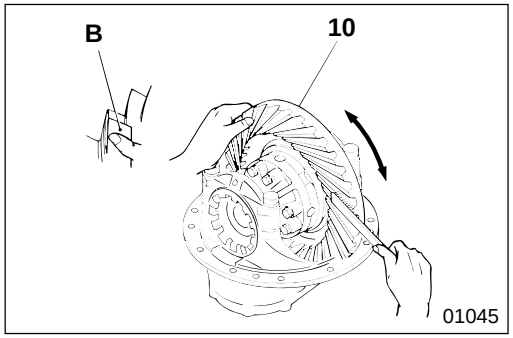
CAUTION

Be sure to tighten left and right adjusting screws 3 by the same amount of pitch.

NOTE

Adjust the backlash to within the standard backlash of final drive gear 10 and final drive pinion 28.

https://truckmanualshub.com/



(4) Tooth contact of final drive gear

[Inspection]

Apply red lead to three or four teeth of final drive gear **10**, examine tooth contact by turning the gears a few times.

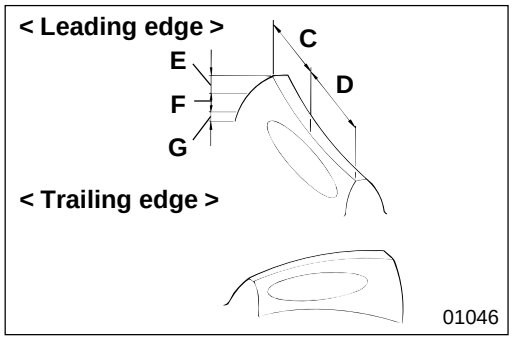
B : Examine tooth contact using paper.

[Adjustment]

If tooth contact has deteriorated, adjust by increasing or decreasing backlash and shim **34**.

CAUTION

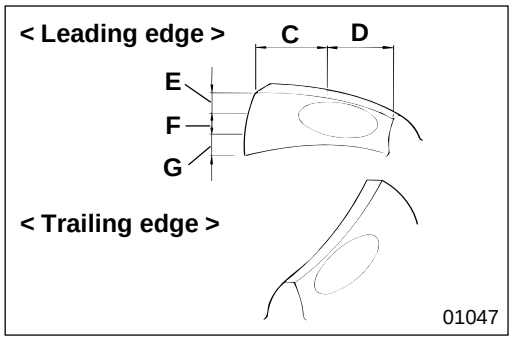
Be sure when replacing the gear because of abnormally worn teeth to replace the reduction gear set of final drive gear 10 and final drive pinion 28.



● **Normal tooth contact at no load**

< Final drive gear >

C : Heel
D : Toe
E : Face
F : Flank
G : Clearance



< Final drive pinion >

C : Heel
D : Toe
E : Face
F : Flank
G : Clearance

Maintenance item			Assembly standards
At no load pinion	Tooth contact position	Lengthwise direction of tooth	From center towards edge
		Vertical direction	From center towards top of tooth for final drive gear and center for final drive
	Tooth contact shape	Length	Approximately 50 to 70% of tooth width
		Width	Approximately 50 to 70% of tooth depth
	Degree of tooth contact		It becomes weaker as it nears tooth root or tooth tip

NOTE

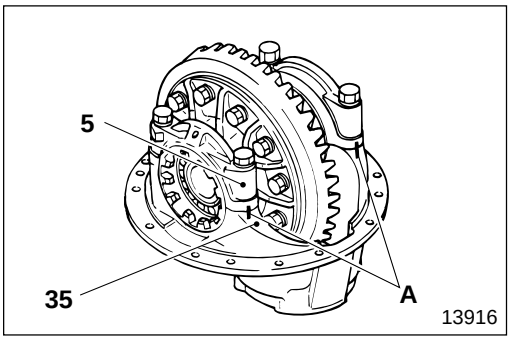
When tooth contact is near the toe at no load it becomes middle area contact at load.

https://truckmanualshub.com/

Adjustment of tooth contact

	Method of adjustment	Moving direction
Adjustment by adding or reducing shims	Advance final drive pinion to final drive gear (Shims are reduced) 	 Tooth contact moves towards tooth root
	Retard final drive pinion from final drive gear (Shims are added) 	 Tooth contact moves towards tooth tip
Adjustment using adjusting screw	Advance final drive gear to final drive pinion center (Less backlash) 	 Tooth contact moves in lengthwise direction of tooth Leading edge : Nearer to toe and slightly nearer to root of tooth Trailing edge : Nearer to heel and slightly nearer to top of tooth
	Retard final drive gear from final drive pinion center (More backlash) 	 Tooth contact moves in lengthwise direction of tooth Leading edge : Nearer to heel and slightly nearer to top of tooth Trailing edge : Nearer to toe and slightly nearer to root of tooth

01048

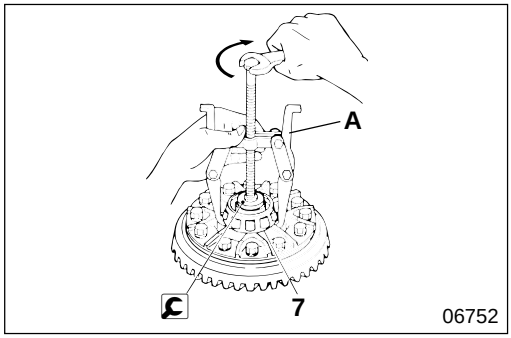


13916

5 Removal of bearing cap

Put alignment marks **A** on bearing cap **5** and differential carrier **35** to distinguish left and right.

https://truckmanualshub.com/



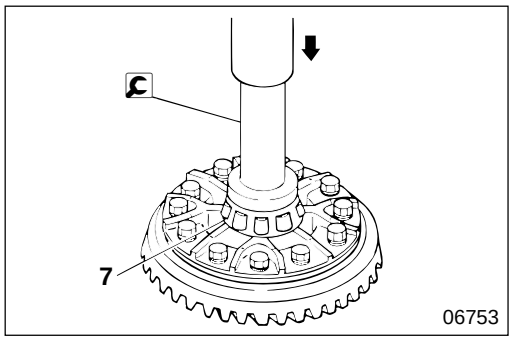
7 **Side bearing inner race**

[Removal]

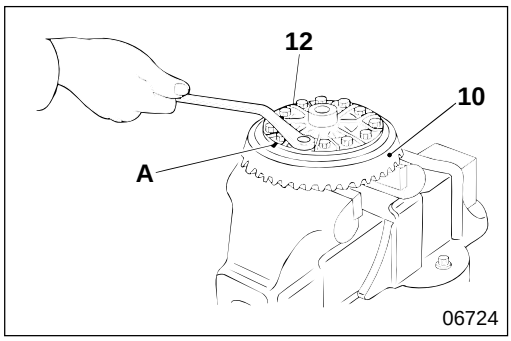
A : Gear puller (General tool)

NOTE

Make sure you keep left and right side bearings 6, 7 separate after removal, and be careful not to mix them up when installing them.



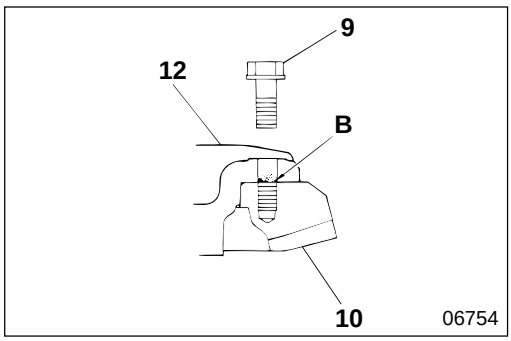
[Installation]



10 **12** **Final drive gear and differential case LH**

[Removal]

Put alignment marks **A** on final drive gear **10** and differential case LH **12**.



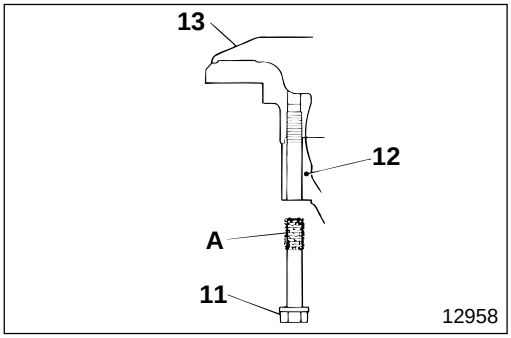
[Installation]

- Apply rust preventive to the entire surface of bolts **9**.
- Apply lock paint to the threads of all bolt holes **B** of final drive gear **10**.
- Tighten bolts **9** at specified torque.

CAUTION

- **Be sure to apply rust preventive because of the need to tighten bolt 9 at specified torque.**
- **Be sure not to operate the vehicle for at least one hour after installation in order to let the lock paint harden.**
- **Be sure not to operate the vehicle at full torque for at least four hours after installation in order to let the lock paint harden.**

https://truckmanualshub.com/

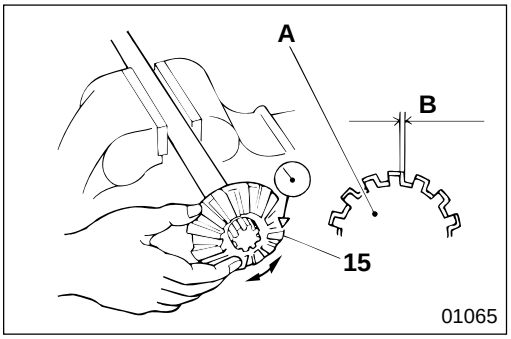


12 **13** **Installation of differential case RH and differential case LH**

- Apply rust preventive to the entire surface of bolts **11**.
- Apply lock paint to thread area **A** of bolts **11**.
- Tighten bolts **11** at specified torque.

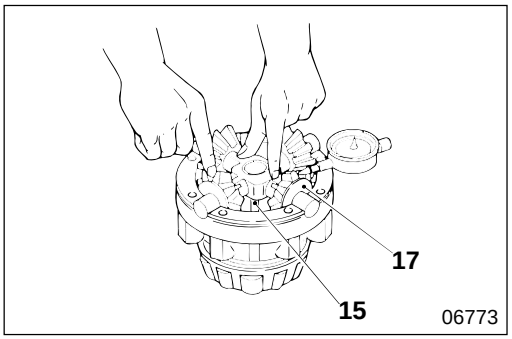
CAUTION

- **Be sure to apply rust preventive because of the need to tighten bolts 11 at specified torque.**
- **Be sure not to operate the vehicle for at least one hour after installation in order to let the lock paint harden.**
- **Be sure not to operate the vehicle at full torque for at least four hours after installation in order to let the lock paint harden.**

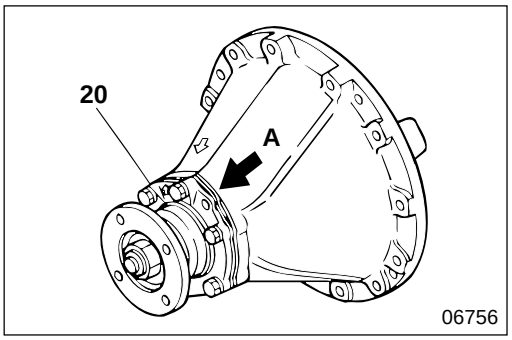


15 **Play between differential gear and axle shaft spline area in the rotating direction**

If the measured value is higher than the limit, replace the faulty parts.
A : Axle shaft
B : Play



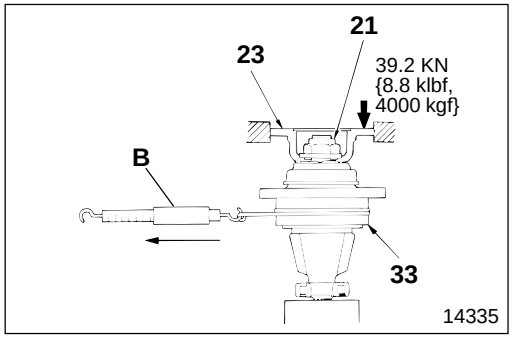
15 **17** **Backlash between differential gear and differential pinion**



20 **Pinion assembly**

[Removal]
Screw M12×1.25 mm bolts into two holes **A** provided for removing pinion assembly **20**, then tighten bolts uniformly until the pinion assembly is removed.

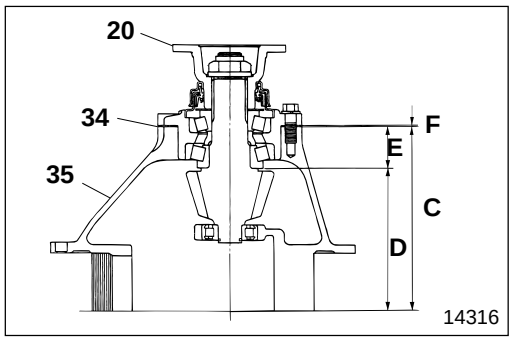
https://truckmanualshub.com/



[Inspection of starting torque after installation]
- Apply load of approximately 39.2 kN {8.8 klbf, 4000 kgf} to companion flange **3** or tighten lock nut **21** at specified torque.
- Install spring balance **B** at 114 mm {4.49 in.} outer periphery point of bearing retainer **33**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the specified value, adjust.

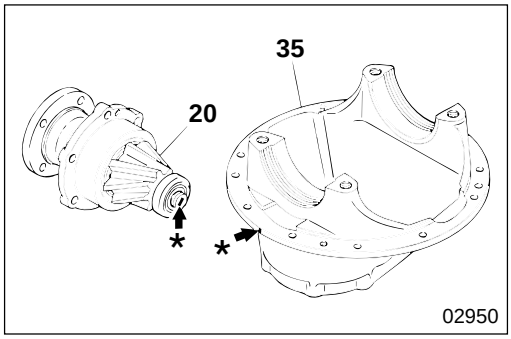
NOTE
- **Be sure to secure companion flange 23 before measurement.**
- **Be sure to remove oil seal 29 before measurement.**

[Adjustment of starting torque]
If the measured value deviates from the specified value, replace collar **24** so that the tangential force conforms to the standard value.
Collar thicknesses :
15.600 to 16.200 mm {0.61 to 0.64 in.} (25 thicknesses available in 0.025 mm {0.00098 in.} increments)



[Adjustment when installing]
- Carry out the following procedure so that **C**, **D** and **E** conform to the standard dimension.
- Calculate shim thickness **F** according to the following formula based upon the machining error data stamped on pinion assembly **20** and differential carrier **35**.
  Formula for calculation:
  F = 0.5 {0.020}–b+c+d

  c : Deviation from basic dimension **C**
  d : Deviation from basic dimension **D**
  e : Deviation from basic dimension **E**



Unit : mm {in.}

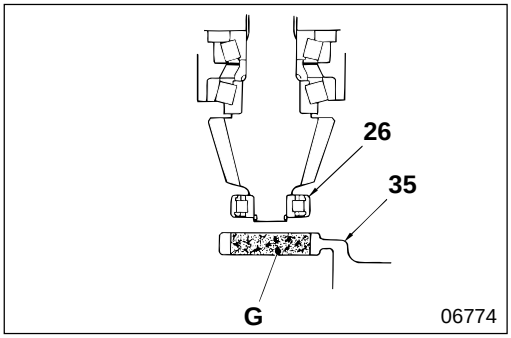
Location	Standard dimension	How to calculate deviation
Shim thickness	0.5 {0.020}	—
C	203 {7.99}	The basic dimension, multiplied by 100, is stamped on the periphery of differential carrier **35** flange
D	157 {0.18}	The basic dimension is stamped on the top of pinion assembly **20**
E	46.5 {1.8}	Measure the deviation from **E** using a dial gauge. However, if it is difficult to measure the actual deviation, assume a value from 0 to 0.2 {0 to 0.0079}

***** : Stamped number position

NOTE
Thickness is stamped in millimeters.

- Select shim **34** from shim thickness **F**.
  Available thicknesses of shim **34** : 0.1 mm {0.0039 in.} and 0.2 mm {0.0079 in.}

https://truckmanualshub.com/

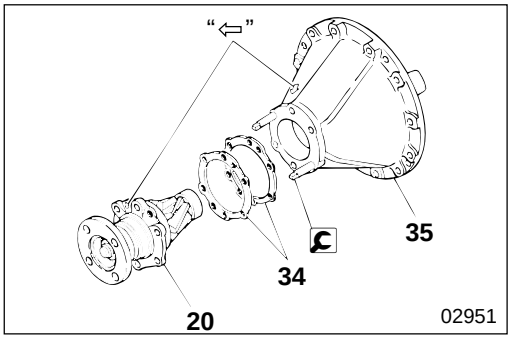


[Installation]

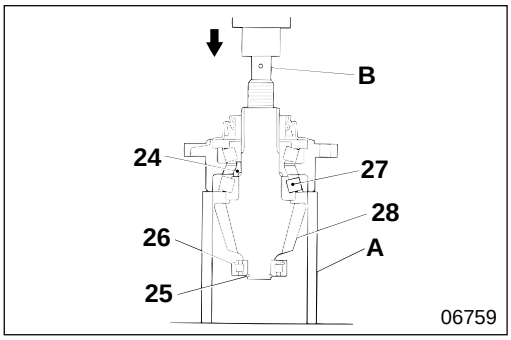
- Apply lock paint to entire mounting surface **G** of pinion pilot bearing **26** of differential carrier **35**.

CAUTION

- **Be sure to let the lock paint harden undisturbed for 30 minutes to two hours after installation.**
- **Be sure to wait at least three hours before running the vehicle, and if possible wait 24 hours to let the lock paint harden.**

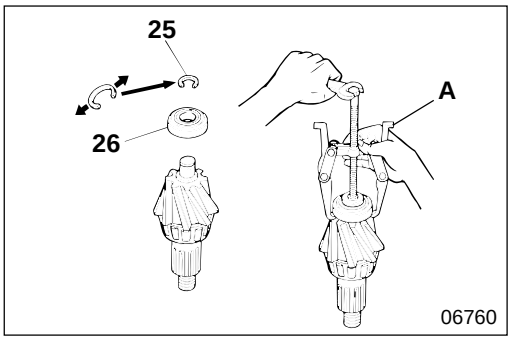


- Assemble differential carrier **35** and pinion assembly **20** with their alignment marks "⇦" aligned.



20 **Removal of pinion assembly**

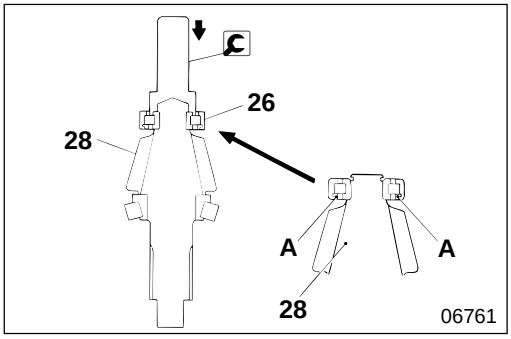
Using an appropriate cylinder **A** and press **B**, remove collar **24**, lock ring **25**, pinion pilot bearing **26**, rear bearing inner race **27**, and final drive pinion **28** together.



25 **26** **Lock ring and pinion pilot bearing**

[Removal]

A : Gear puller (General tool)

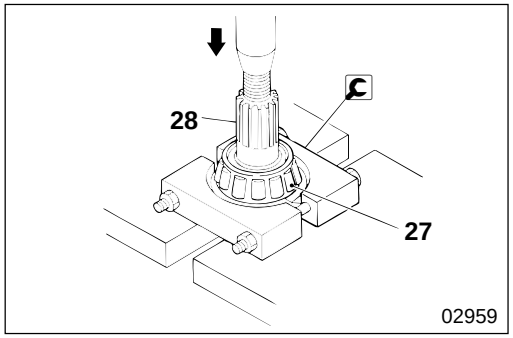


[Installation]

Press-fit pinion pilot bearing **26** in the direction as illustrated.

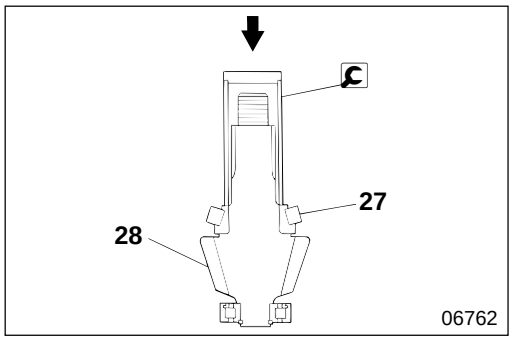
A : Lock ring

https://truckmanualshub.com/

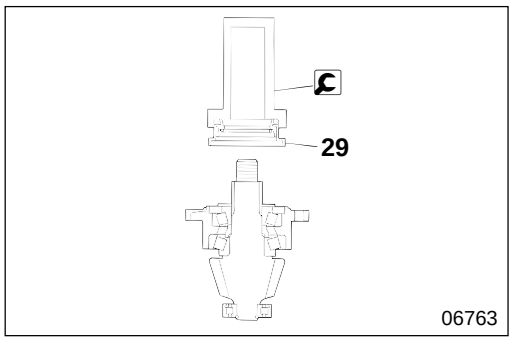


27 **Rear bearing inner race**

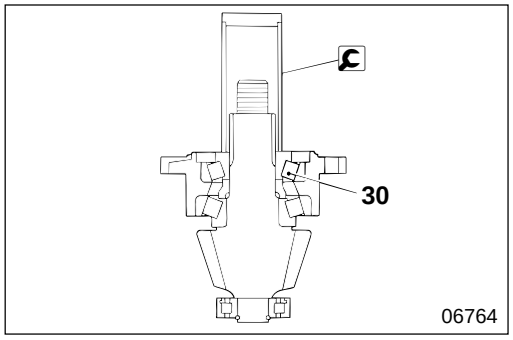
[Removal]



[Installation]

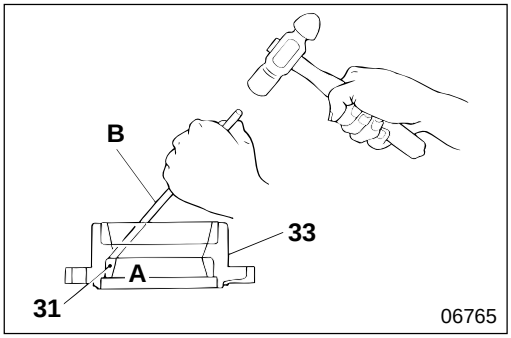


29 **Installation of oil seal**



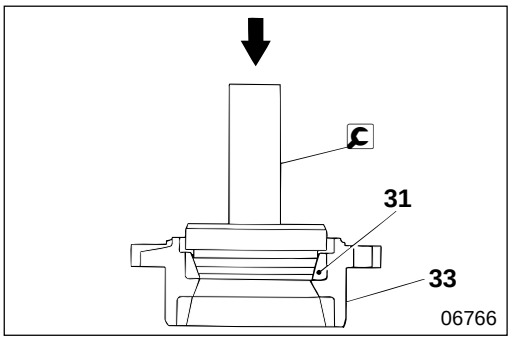
30 **Installation of front bearing inner race**

https://truckmanualshub.com/

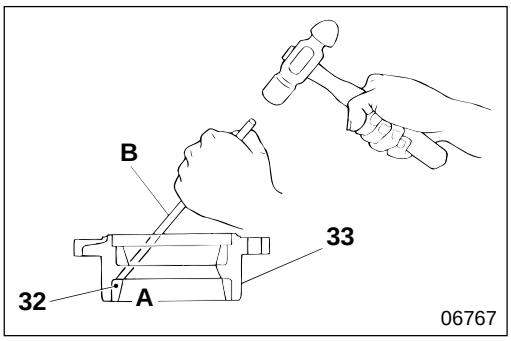


31 **Front bearing outer race**

[Removal]
Drive out front bearing outer race **31** evenly from three indented parts **A** in bearing retainer **33**.
B : Pin-punch

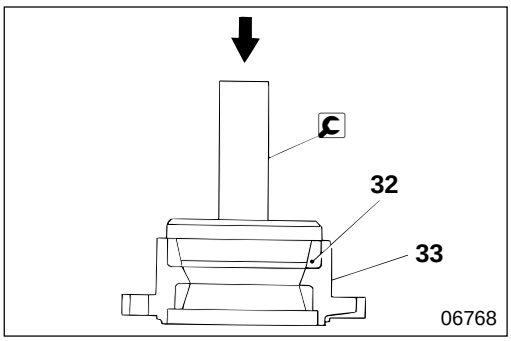


[Installation]



32 **Rear bearing outer race**

[Removal]
Drive out rear bearing outer race **32** evenly from three indented parts **A** in bearing retainer **33**.
B : Pin-punch



[Installation]

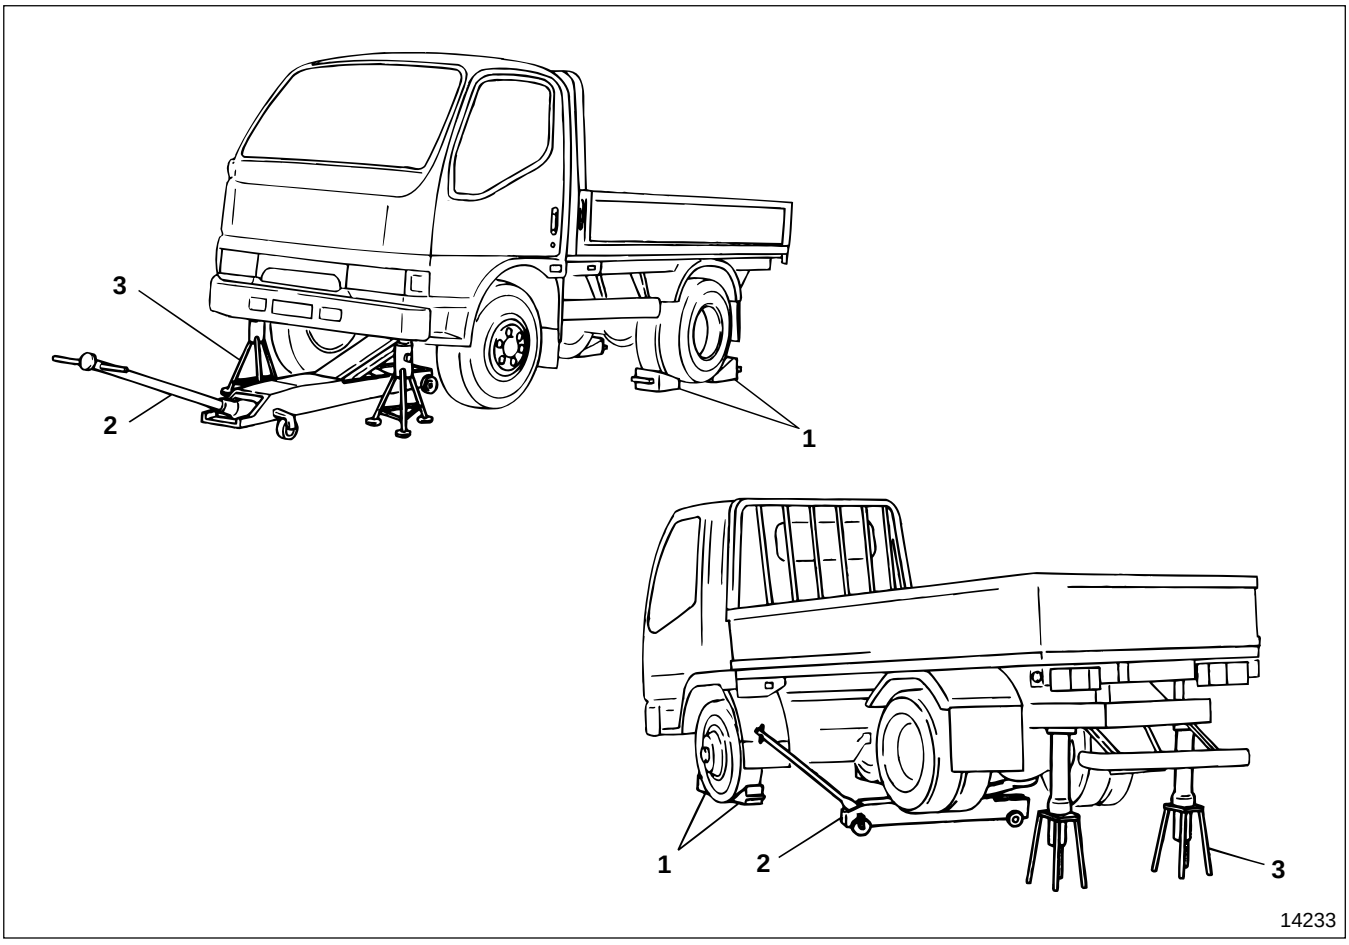
Work for Removal and Installation of Wheel and Tire



● **Work sequence**

1 Place wheel chocks.
2 Jack up the front or rear axle using a garage jack placed under the center of the axle.
3 Support the frame on rigid racks.

WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after removal and installation**

Follow the work sequence in reverse.

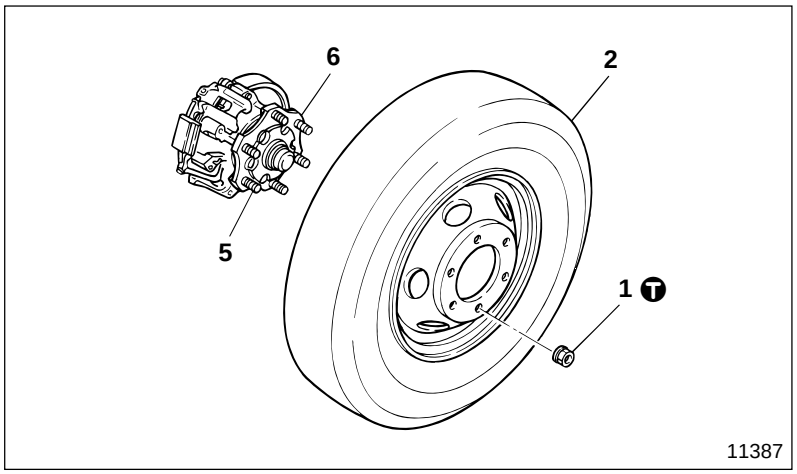
https://truckmanualshub.com/

WHEEL AND TIRE

NOTE

Use right-hand threaded wheel nuts marked “R” for right side wheel and left-hand threaded wheel nuts marked “L” for left side wheel.

< Single tire >



● **Removal sequence**

● **Removal sequence**

1 Wheel nut (outer)
2 Tire assembly P31-5
3 Wheel nut (inner)
4 Tire assembly P31-5
5 Hub bolt
6 Hub

● **Cleaning before installation**

P31-4

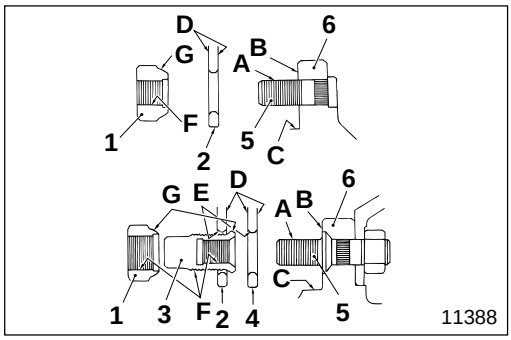
● **Installation sequence**

Follow the removal sequence in reverse.

T Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1, 3	Wheel nut	490±49 {360±36, 50±5}	—



◆ Service procedure

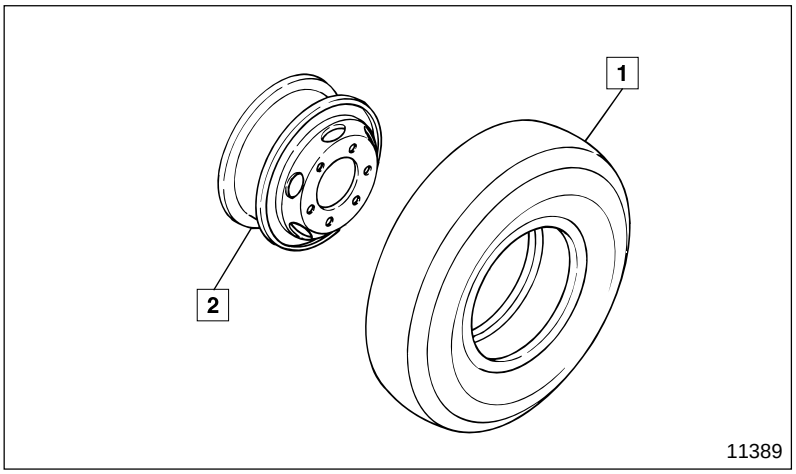
● **Cleaning before installation**

To prevent wheel nuts **1** and **3** and hub bolt **5** from becoming loose and to prevent mounting parts (tire assemblies **2** and **4** and hub **6**) from being damaged, remove rust, dust, additional coatings of paint, and foreign particles from the following areas:

A : Hub bolt thread area
B : Wheel mounting surface of hub
C : Wheel alignment area of hub
D : Disc wheel mating surface
E : Disc wheel nut mounting surface
F : Wheel nut thread area
G : Wheel nut spherical area

https://truckmanualshub.com/

Tire Assembly



● **Disassembly sequence**

1 Tire
2 Disc wheel

● **Assembly sequence**

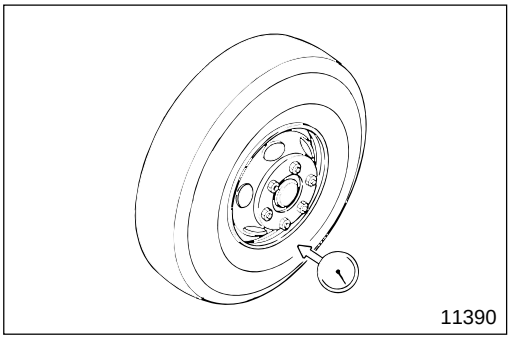
Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1	Horizontal deflection of tire (When assembled)		3.5 {0.14} or less	—	—
2	Disc wheel (wheel with 5 studs)	Flatness	0.4 {0.016} or less	—	—
		Horizontal deflection	1.5 {0.059} or less	—	—
		Vertical deflection	1.5 {0.059} or less	—	—
	Disc wheel (wheel with 6 studs)	Flatness	0.3 {0.012} or less	—	—
		Horizontal deflection	1.5 {0.059} or less	—	—
		Vertical deflection	1.5 {0.059} or less	—	—

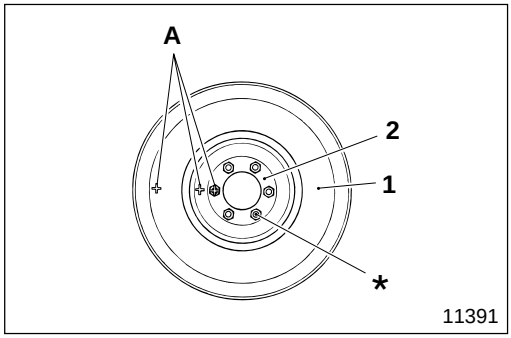
◆ Service procedure



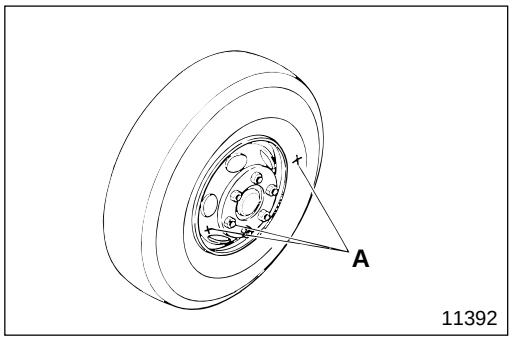
1 **Deflection of tire**

[Inspection]
If the measured value is higher than the limit, make corrections as follows.

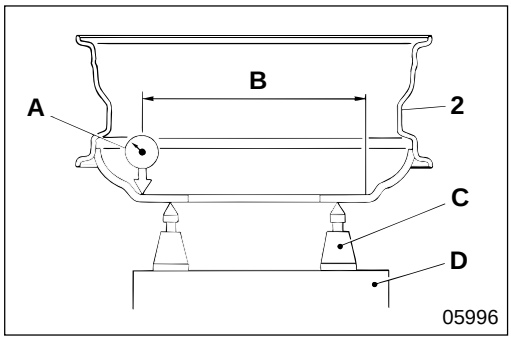
https://truckmanualshub.com/



[Correction]
- Put chalk marks on tire **1**, disc wheel **2**, and hub bolt * (positions **A** as illustrated).
- Remove tire **1** from disc wheel **2**.



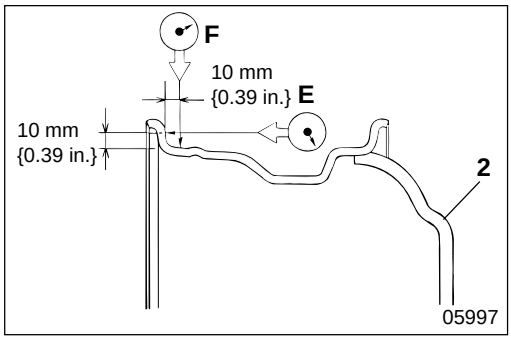
- Measure deflection of disc wheel **2**. If the most deflective position is near the chalk mark, reinstall tire **1** rotating it half a turn from the chalk mark and tighten nuts.
- Remeasure deflection of tire **1**.
- If the measured value is still higher than the limit, replace tire **1** and disc wheel **2** together as an assembly.



2 Inspection of disc wheel

(1) Flatness

- Measure flatness at specified position **B** from the center of disc wheel **2**.
  Measure flatness at five equidistant points (wheel with 5 studs) or six equidistant points (wheel with 6 studs) on the wheel.
  A : Dial gauge
  B : ø165 to 250 mm {6.50 to 9.84 in.}
  (wheel with 5 studs)
  ø170 to 270 mm {6.69 to 10.6 in.}
  (wheel with 6 studs)
  C : Portable screw jacks (x 4)
  D : Surface plate
- Replace disc wheel **2** if the measured value is higher than the limit.



(2) Deflection

Replace disc wheel **2** if the measured value is higher than the limit.
E : Horizontal deflection measuring point
F : Vertical deflection measuring point

1 Shock absorber
2 Leaf spring assembly
3 Stabilizer < FE >

***a** : Front axle
***b** : Frame

Leaf spring assembly **2**, shock absorber **1**, and stabilizer **3** < FE > are installed between frame ***b** and front axle ***a** to support the vehicle body mass and absorb vibration and shock from the road surface to prevent them from being directly transmitted to the vehicle body thereby protecting the crew, the vehicle body, and the cargo. In addition, irregular vibration from the wheels is restrained, ensuring driving stability.

https://truckmanualshub.com/

Possible causes \ Symptoms		Ride spongy	Noise generated when vehicle is unloaded	Impact transmitted from uneven road surface	Noise generated when vehicle is loaded	Excessive rolling while cruising	Periodic jolts received from the road surface	Remarks

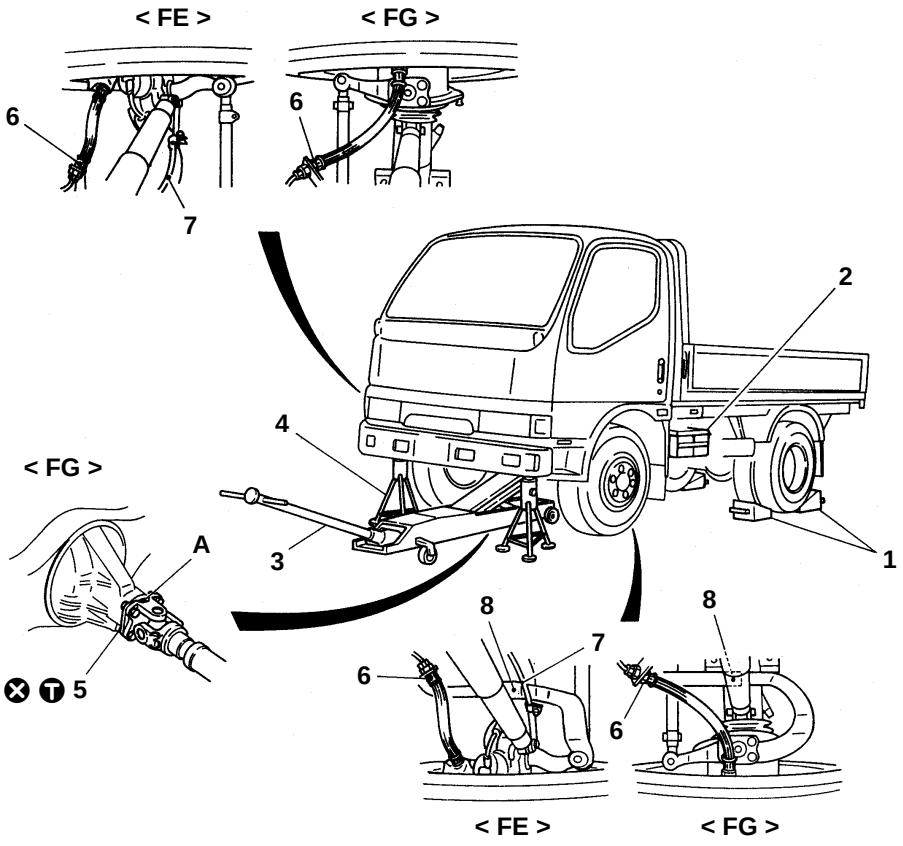
https://truckmanualshub.com/

WORK BEFORE REMOVAL AND INSTALLATION OF FRONT SUSPENSION



● **Removal sequence**

1. Place wheel chocks.
2. Disconnect the negative battery cable. Gr 54
3. Jack up the front axle with a garage jack.
4. Support the frame on rigid racks.
5. Put alignment marks **A** on the front axle companion flange and the propeller shaft flange yoke, then remove the nuts (on the joint between the front axle and the propeller shaft). < FG >
6. Remove the brake hose joint (on the frame).
7. Remove the clamp of the brake pad wear indicator harness and disconnect the connector on the frame side. < FE >
8. Remove the drag link. Gr 37

⊗ : Non-reusable parts

WARNING

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION

Be sure to protect the brake hose from dust by fitting plugs.

● **Installation sequence**

Follow the removal sequence in reverse.

https://truckmanualshub.com/

WARNING

You must bleed air from the brake system after installing the brake hose, failure to do so would cause the brake to malfunction. Gr 35

CAUTION

Be sure that the brake hose is not twisted when you install it.

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

***a** : Front axle Gr 26B
***b** : Engine mounting support Gr 41

NOTE

Do not remove front spring hanger 14 or front shackle hanger 15 unless they are faulty. Gr 41

● **Installation sequence**

Follow the disassembly sequence in reverse.

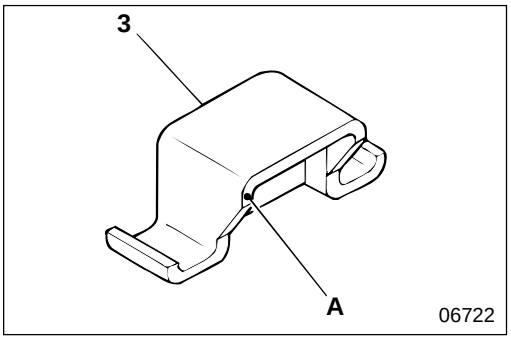
T Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	U-bolt nut (U-bolt mounting)	106±7.8 {78±5.8, 10.8±0,8}	—
4	Nut (Spring pin mounting)	93 to 127 {69 to 94, 9.5 to 13.0}	—
7	Nut (Spring shackle mounting)	93 to 127 {69 to 94, 9.5 to 13.0}	—
12	Nut (Front axle bumper mounting)	21 to 30 {15 to 22, 2.1 to 3.1}	—

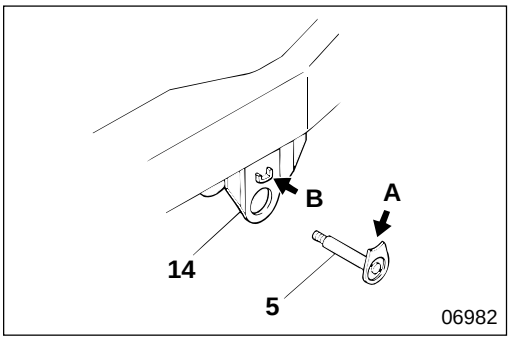
https://truckmanualshub.com/

◆ Service procedure



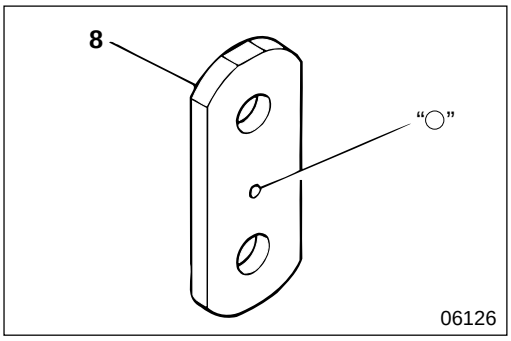
3 Front spring pad

Mount front spring pad **3** with protrusion **A** facing the outside of the vehicle.



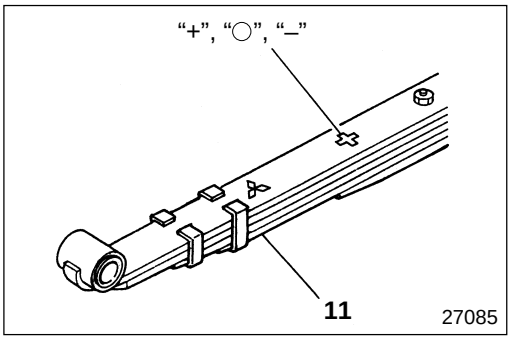
5 Installation of spring pin

Install spring pin **5** to front spring hanger **14** with indent **A** of the spring pin fitted to protrusion **B** of the front spring hanger.



8 Installation of shackle plate

Install shackle plate **8** with stamped mark "○" facing the leaf spring.



11 Leaf spring assembly left/right height combinations

When replacing leaf spring assembly **11**, select the members so that the left and right height marks "+", "○" and "–" are combined as shown below.

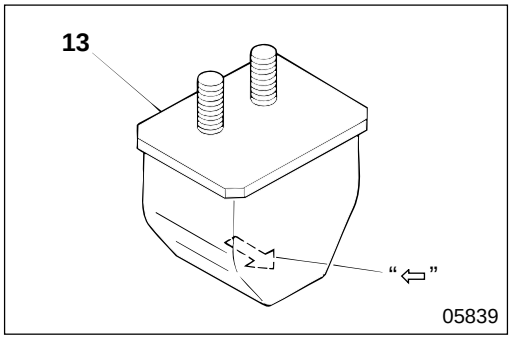
Item	Combination				
	1	2	3	4	5
Right leaf spring assembly, assistant driver's seat side	–	–	○	○	+
Left leaf spring assembly, driver's seat side	–	○	○	+	+

CAUTION⚠

Passenger's side leaf spring assembly 11 differs from the driver's side leaf spring assembly in camber (arch). Do not mix them up when mounting, or this world couse vehicle tilt.

https://truckmanualshub.com/

REMOVAL AND INSTALLATION OF LEAF SPRING ASSEMBLY < FG >



13 **Front axle bumper**

Mount front axle bumper **13** with arrow mark “⇦” facing the outside of the vehicle.

https://truckmanualshub.com/

MEMO

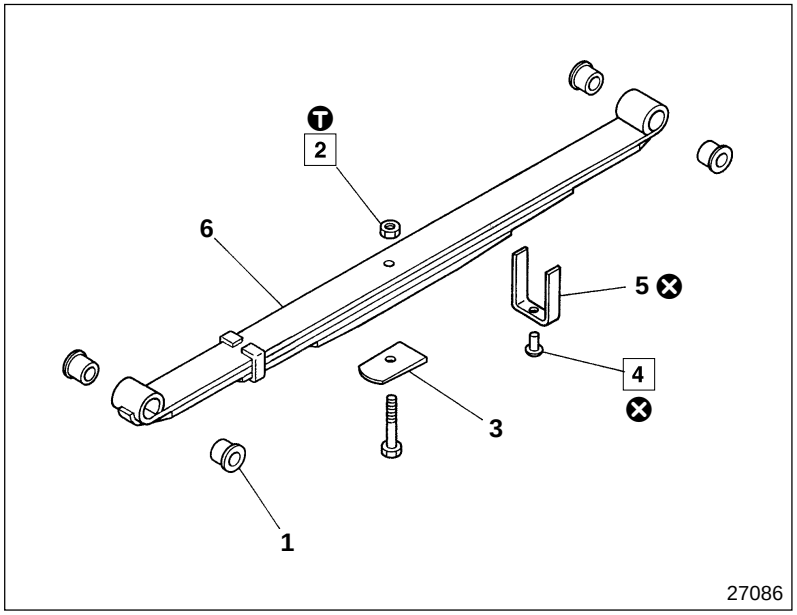
LEAF SPRING ASSEMBLY < FE >



● **Disassembly sequence**

1 Collar
2 Center nut
3 Caster shim
4 Rivet
5 Clip
6 Leaf spring

⊗ : Non-reusable parts

● **Assembly sequence**

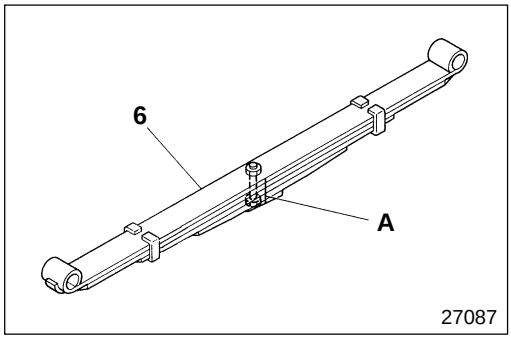
Follow the disassembly sequence in reverse.

ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Center nut (Leaf spring mounting)	34 to 54 {25 to 40, 3.5 to 5.5}	—

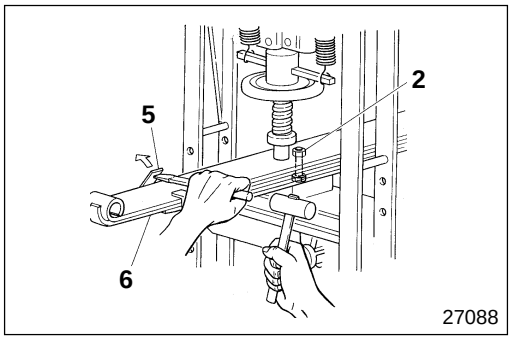
◆ Service procedure



2 **Center nut**

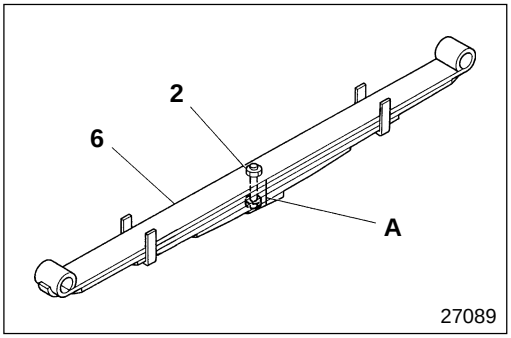
[Removal]

- Put alignment marks **A** on the side of leaf springs **6**.

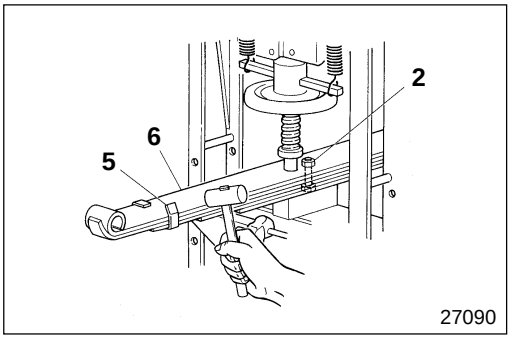


- Compress leaf springs **6** using a press, lever up the bent parts of clips **5** using a cold chisel, then remove center nut **2**.

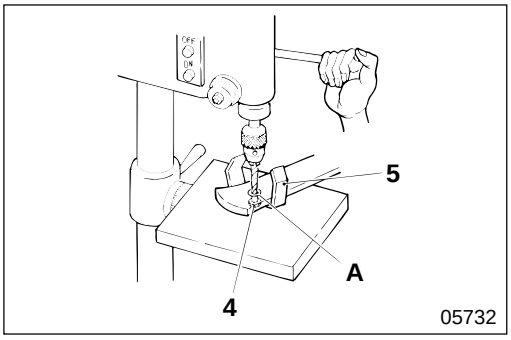
https://truckmanualshub.com/



[Installation]
- Align alignment marks **A** on the side of leaf springs **6**, assemble the component leaf springs, then tighten center nut **2** temporarily.

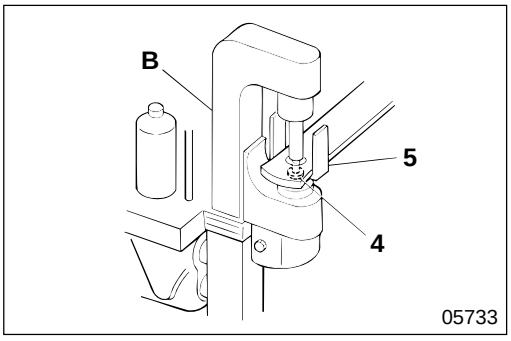


- Compress leaf springs **6** using a press, tighten center nut **2** at specified torque, then bend over clips **5**.



4 **Rivet**

[Removal]
- Drill out staked end **A** of rivet **4** on a drill press, then remove clip **5**.



[Installation]
- Using riveting machine **B**, mount inner clip **5** by staking rivet **4**.

https://truckmanualshub.com/

LEAF SPRING ASSEMBLY < FG >

REMOVAL AND INSTALLATION OF LEAF SPRING ASSEMBLY 6

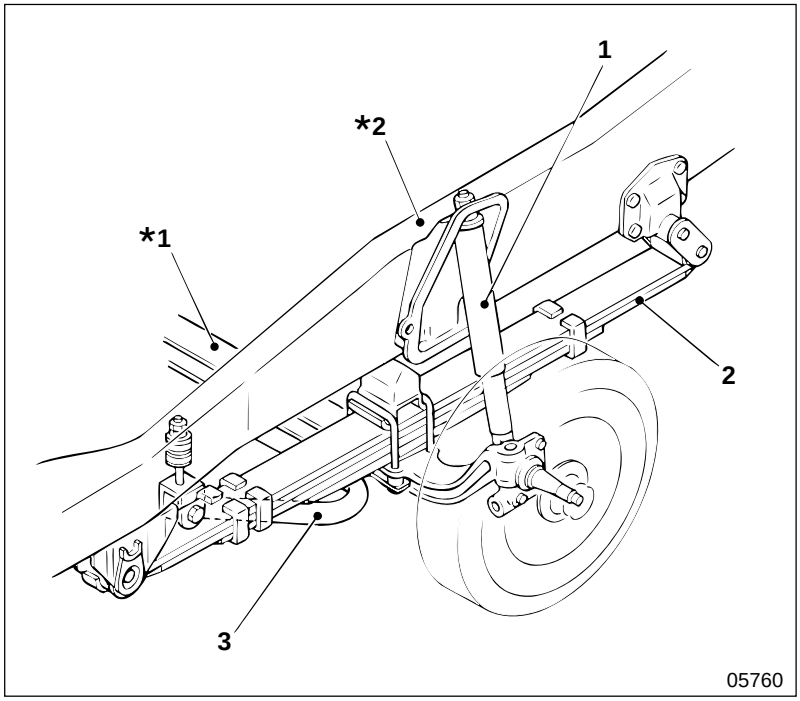
LEAF SPRING ASSEMBLY 8

SHOCK ABSORBER 10

STABILIZER 12

https://truckmanualshub.com/

STRUCTURE AND OPERATION



1 Shock absorber
2 Leaf spring assembly
3 Stabilizer

***1** : Front axle
***2** : Frame

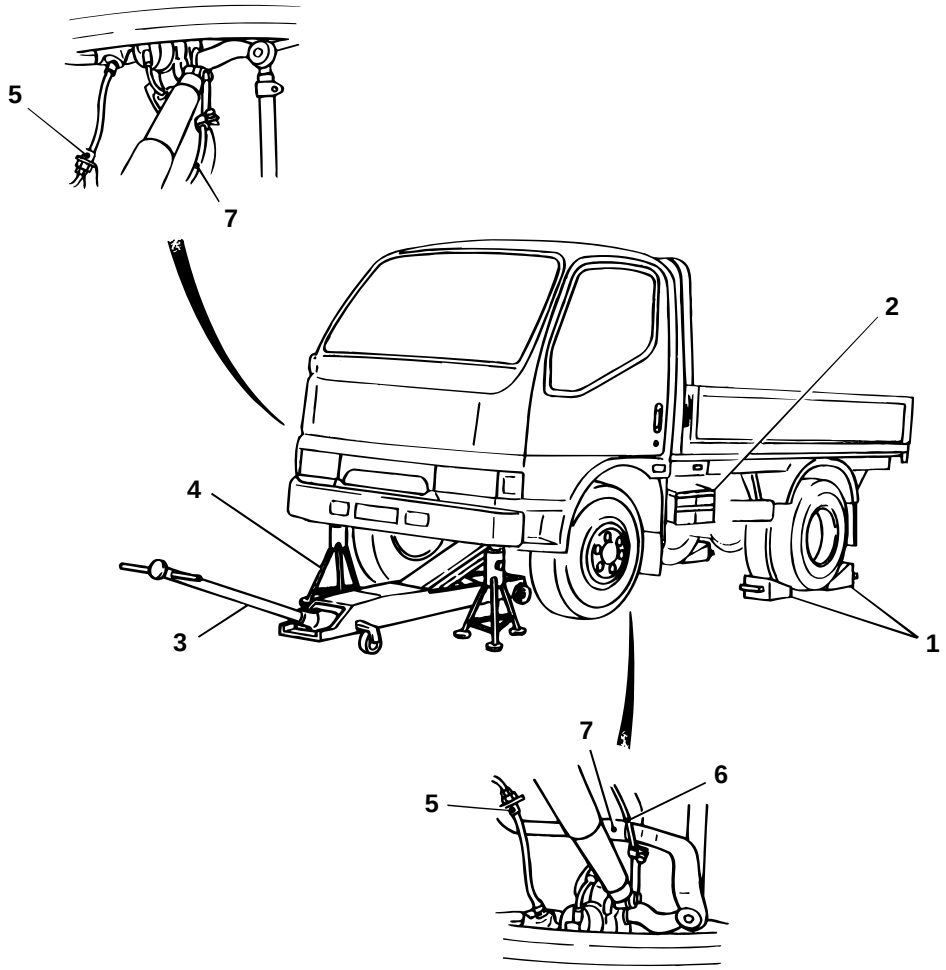
Leaf spring assembly **2**, shock absorber **1**, and stabilizer **3** are installed between frame ***2** and front axle ***1** to support the vehicle body mass and absorb vibration and shock from the road surface to prevent them from being directly transmitted to the vehicle body thereby protecting the crew, the vehicle body, and the cargo. In addition, irregular vibration from the wheels is restrained, ensuring driving stability.

https://truckmanualshub.com/

Possible causes / Symptoms		Ride spongy	Noise generated when vehicle is unloaded	Impact transmitted from uneven road surface	Noise generated when vehicle is loaded	Excessive rolling while cruising	Periodic jolts received from the road surface	Remarks
Leaf spring	Cracked or damaged			○				
	Fractured		○					
	Spring hanger damaged				○			
	U-bolts loose				○			
	Spring bushing worn		○					
Front axle bumper	Damaged or broken				○			
Shock absorber	Oil leaking noticeable or damping force decreased	○						
	Rubber bushing worn		○					
	Installation loose		○					
Stabilizer	Stabilizer deformed or bushing worn					○		
Tire	Tires worn unevenly						○	
	Tires and wheels unbalanced						○	Gr 31
	Air pressure excessive			○				

https://truckmanualshub.com/

WORK BEFORE REMOVAL AND INSTALLATION OF FRONT SUSPENSION



● **Removal sequence**

1. Place wheel chocks.
2. Disconnect the negative battery cable. Gr 54
3. Jack up the front axle with a garage jack.
4. Support the frame on rigid racks.
5. Remove the brake hose joint (on the frame).
6. Remove the clamp of the brake pad wear indicator harness and disconnect the connector on the frame side.
7. Remove the drag link. Gr 37

WARNING

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION

Be sure to protect the brake hose from dust by fitting blanking plugs.

● **Installation sequence**

Follow the removal sequence in reverse.

https://truckmanualshub.com/

WARNING

You must bleed air from the brake system after installing the brake hose, failure to do so would cause the brake to malfunction. Gr 35

CAUTION

Be sure that the brake hose is not twisted when you install it.

◆ Service procedure

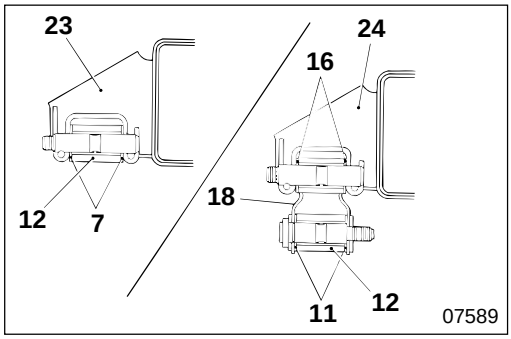
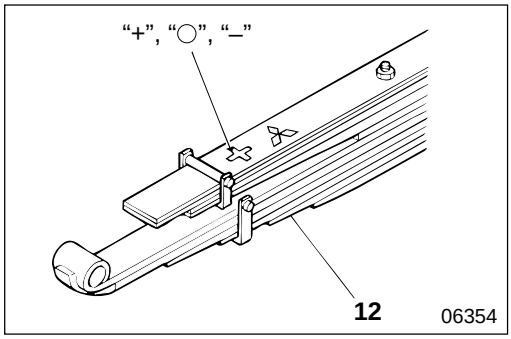
6 **10** **15** **Removal of spring pin and shackle pin**

- Remove spring pins **6**, **15** using 🔧 spring pin remover.
- Knock shackle pin **10** out from the inside of the vehicle using a hammer.



7 **11** **16** **Adjustment of side washer (for adjustment)**

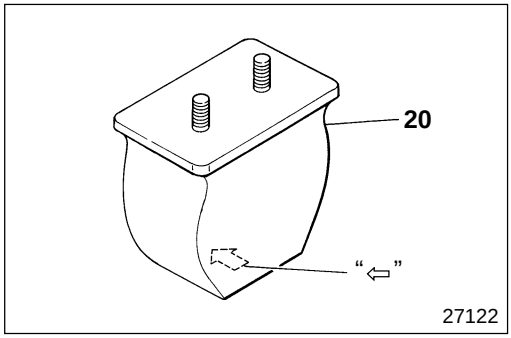
- Using side washer **11**, adjust the clearance between leaf spring assembly **12** and spring shackle **18** to the standard value.
- Using side washer **7**, adjust the clearance between leaf spring assembly **12** and rear spring hanger **23** to the standard value.
- Using side washer **16**, adjust the clearance between spring shackle **18** and rear shackle hanger **24** to the standard value.
- Two different thicknesses are available for side washers **7**, **11**, **16** : 0.5 mm {0.020 in.} and 1.0 mm {0.039 in.}



12 **Leaf spring assembly left/right height combinations**

When replacing leaf spring assembly **12**, select the members so that left and right height marks "+", "○" and "–" are combined as shown below.

Item	Combination		
	1	2	3
Right leaf spring assembly, assistant driver's seat side	+	○	–
Left leaf spring assembly, driver's seat side	+	○	–



20 **Installation of helper rubber**

Install helper rubber **20** with installation mark "⇦" facing to the inside of the vehicle.

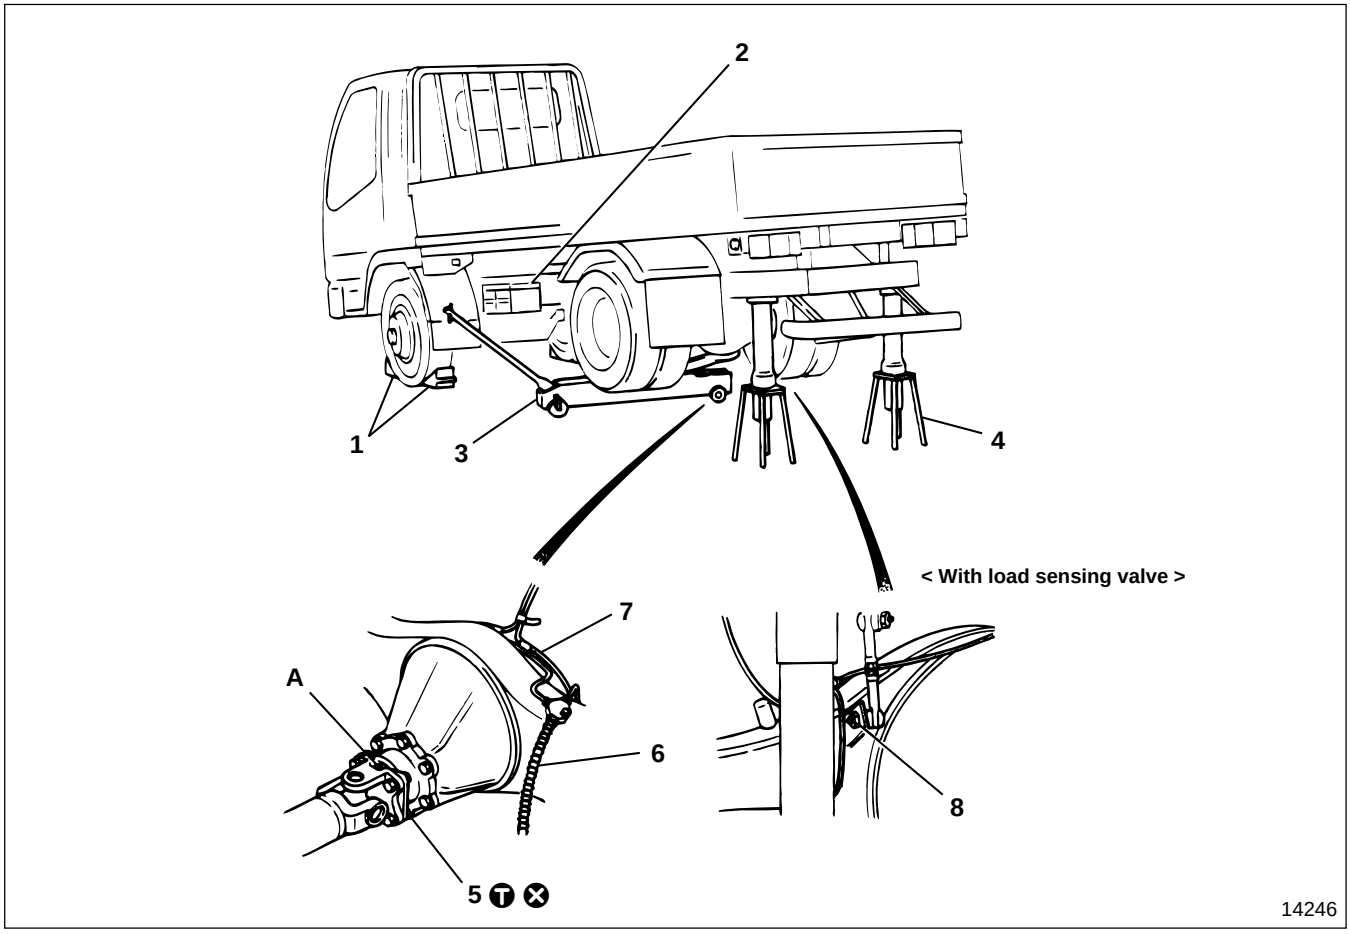
WORK BEFORE REMOVAL AND INSTALLATION OF REAR SUSPENSION



● **Removal sequence**

1. Place wheel chocks.
2. Disconnect the negative battery cable. Gr 54
3. Jack up the rear axle with a garage jack.
4. Support the rear frame on rigid racks.
5. Put alignment marks **A** on the rear axle companion flange and the propeller shaft flange yoke, then remove the nuts (on the joint between the rear axle and the propeller shaft).
6. Remove the brake hose joint (on the frame).
7. Remove the clamp of the brake pad wear indicator harness and disconnect the connector on the frame side. < with disc brake >
8. Remove the nut (joint part of rear axle housing and the load sensing valve). < with load sensing valve >

⊗ : Non-reusable parts

WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION⚠

Be sure to protect the brake hose from dust by fitting blanking plugs.

https://truckmanualshub.com/

● **Installation sequence**

Follow the removal sequence in reverse.

WARNING⚠

You must bleed air from the brake system and install the load sensing valve (with load sensing valve) after installing the brake hose, failure to do so would cause the brake to malfunction. Gr 35

CAUTION⚠

Be sure that the brake hose is not twisted when you install it.

SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Item	Specifications
Brake system	Vacuum servo
Anti-lock brake system (number of sensors/number of channels)	ABS (4S/4K)
Manufacturer	NIPPON ABS

STRUCTURE AND OPERATION
Anti-lock Brake System (ABS)

The anti-lock brake system (ABS) prevents tire slippage due to wheel lockup caused by sudden braking and braking on slippery road surfaces. The ABS provides a driver with vehicle controllability and directional stability in braking.

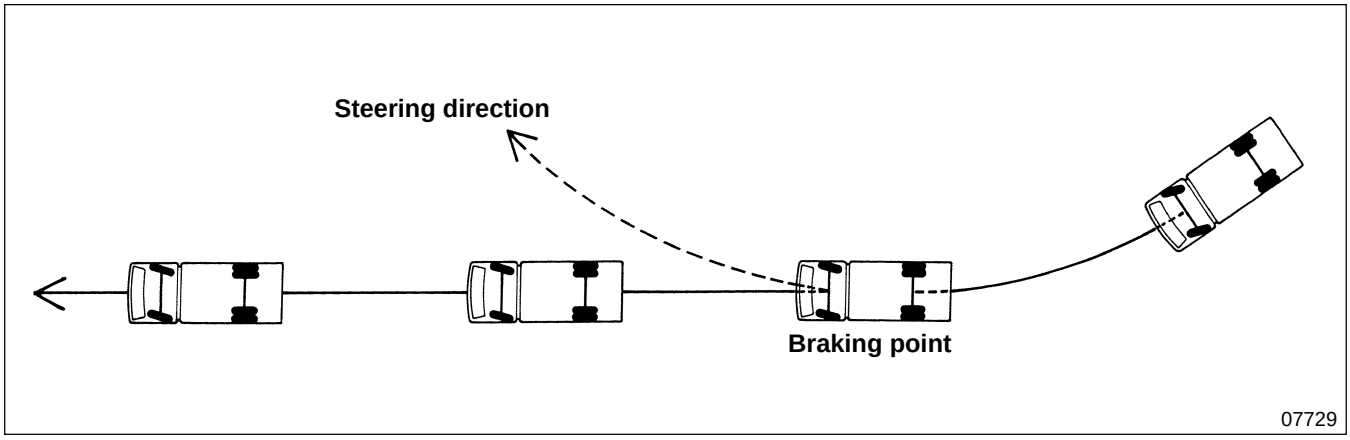
● Wheel lockup

Rotating tires of a moving vehicle have a tendency to continue traveling in the direction of tire rotation. Because of this characteristic, a driver can control the vehicle's traveling direction by moving the front wheels to a desired direction using the steering wheel.

In a vehicle not equipped with an anti-lock brake system, when a driver depresses the brake pedal with full force, the wheels can lock up under certain conditions. Tires in a wheel lockup condition lose the tendency to maintain directional characteristic, and the vehicle starts sliding in a direction of an externally applied force regardless of the tire direction. In other words, when wheel lockup occurs, the vehicle loses its directional stability, disallowing the driver to control the vehicle's movement.

The following shows how a vehicle without ABS loses its directional stability when different tires lock up on slippery road surfaces.

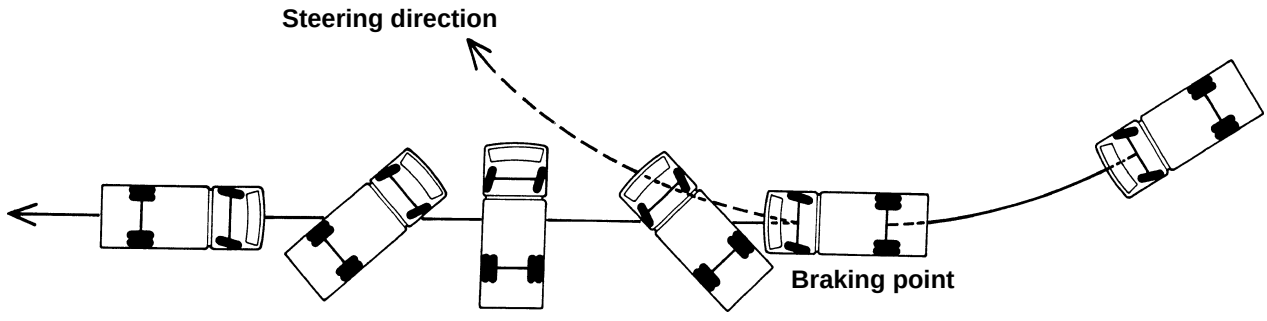
● Front wheel lockup (both front tires)



The front tires lose directional stability, but the rear tires try to travel in the direction of rotation since they are not locked up. Because of the front wheel lockup, a steering wheel operation does not change the vehicle's moving direction.

https://truckmanualshub.com/

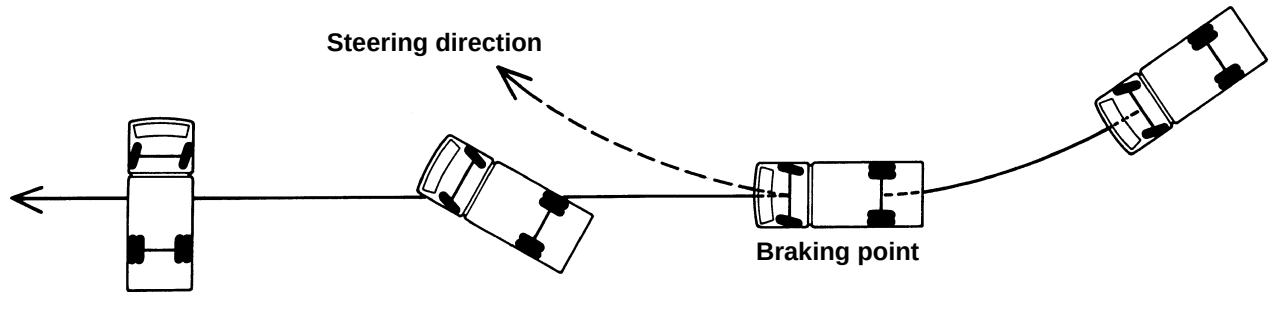
● **Rear wheel lockup (both rear tires)**



07730

When the steering wheel is operated with the rear wheels in a lockup condition, the front tires try to change the vehicle's traveling direction, but the rear tires slide sideways, causing the vehicle to spin. If wheel lockup occurs in a vehicle traveling in a straight direction, the force of inertia continues to push the vehicle straight ahead from the back of the vehicle due to the lack of stopping force in the rear tires, and the vehicle can spin.

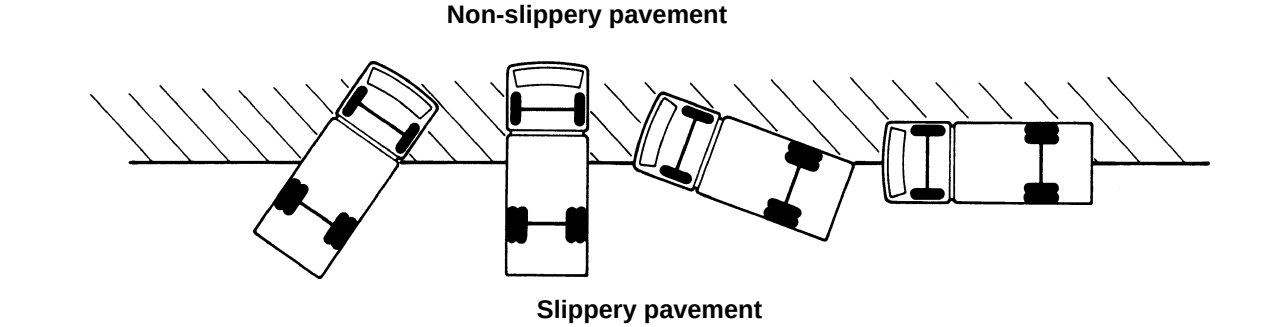
● **All wheel lock up (front and rear tires)**



07731

When wheel lockup occurs in both front and rear tires, all four tires lose directional stability. Therefore, the vehicle slips in the direction of inertia regardless of the steering direction.

● **Wheel lockup on surfaces with split μ factors (road surface with different friction coefficients for right and left tires)**

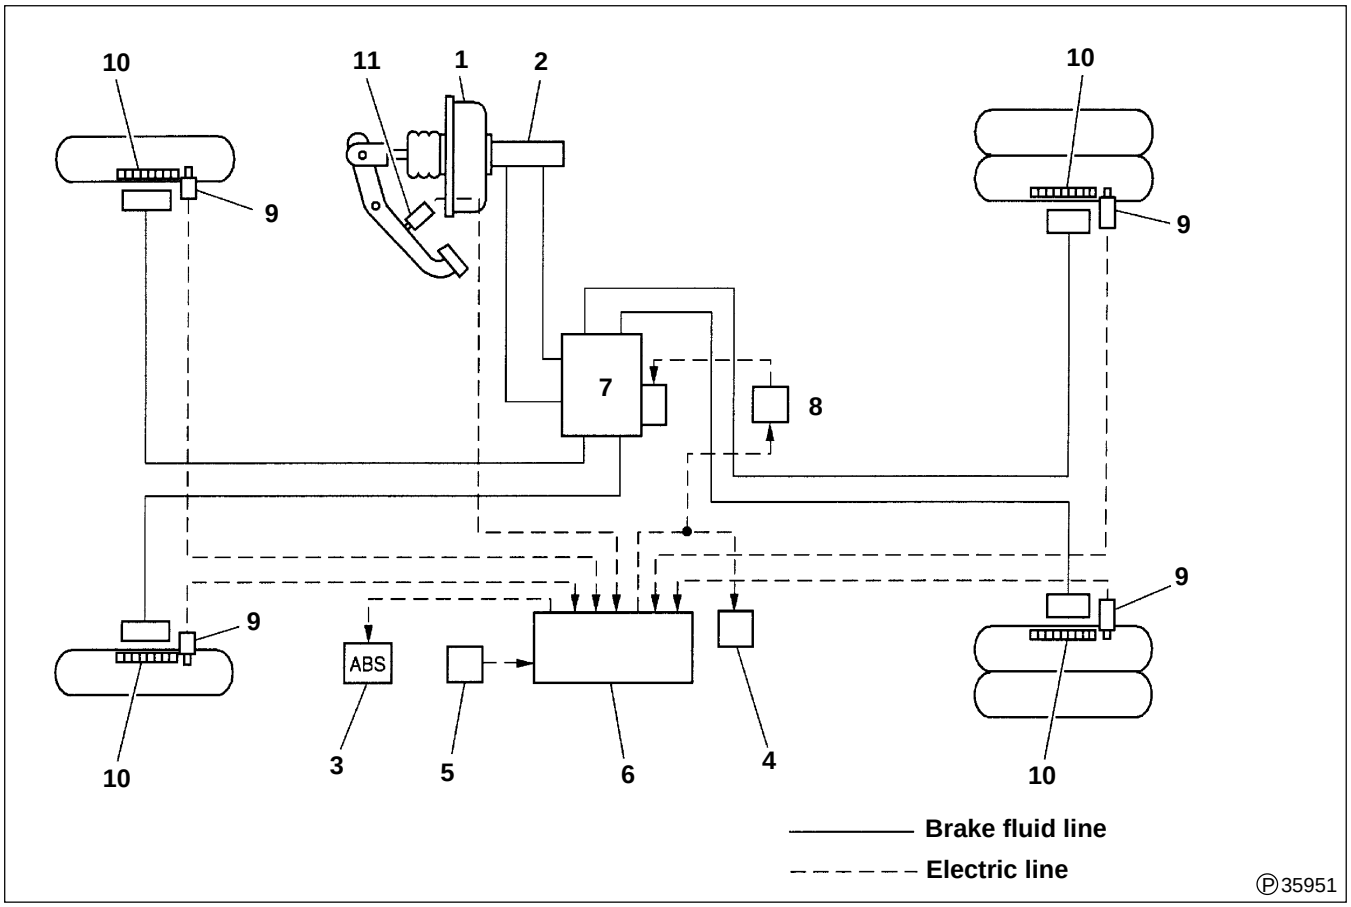


07732

The tires on a surface with a lower friction coefficient lock up first. The tires in a lockup condition start sliding, thus failing to provide effective stopping force. Due to this imbalance in the stopping power between the right and left tires, one side of the vehicle slows down while the other side continues traveling, thus resulting in the loss of directional stability. When this happens during sudden braking, the vehicle spins.

https://truckmanualshub.com/

Structure of ABS

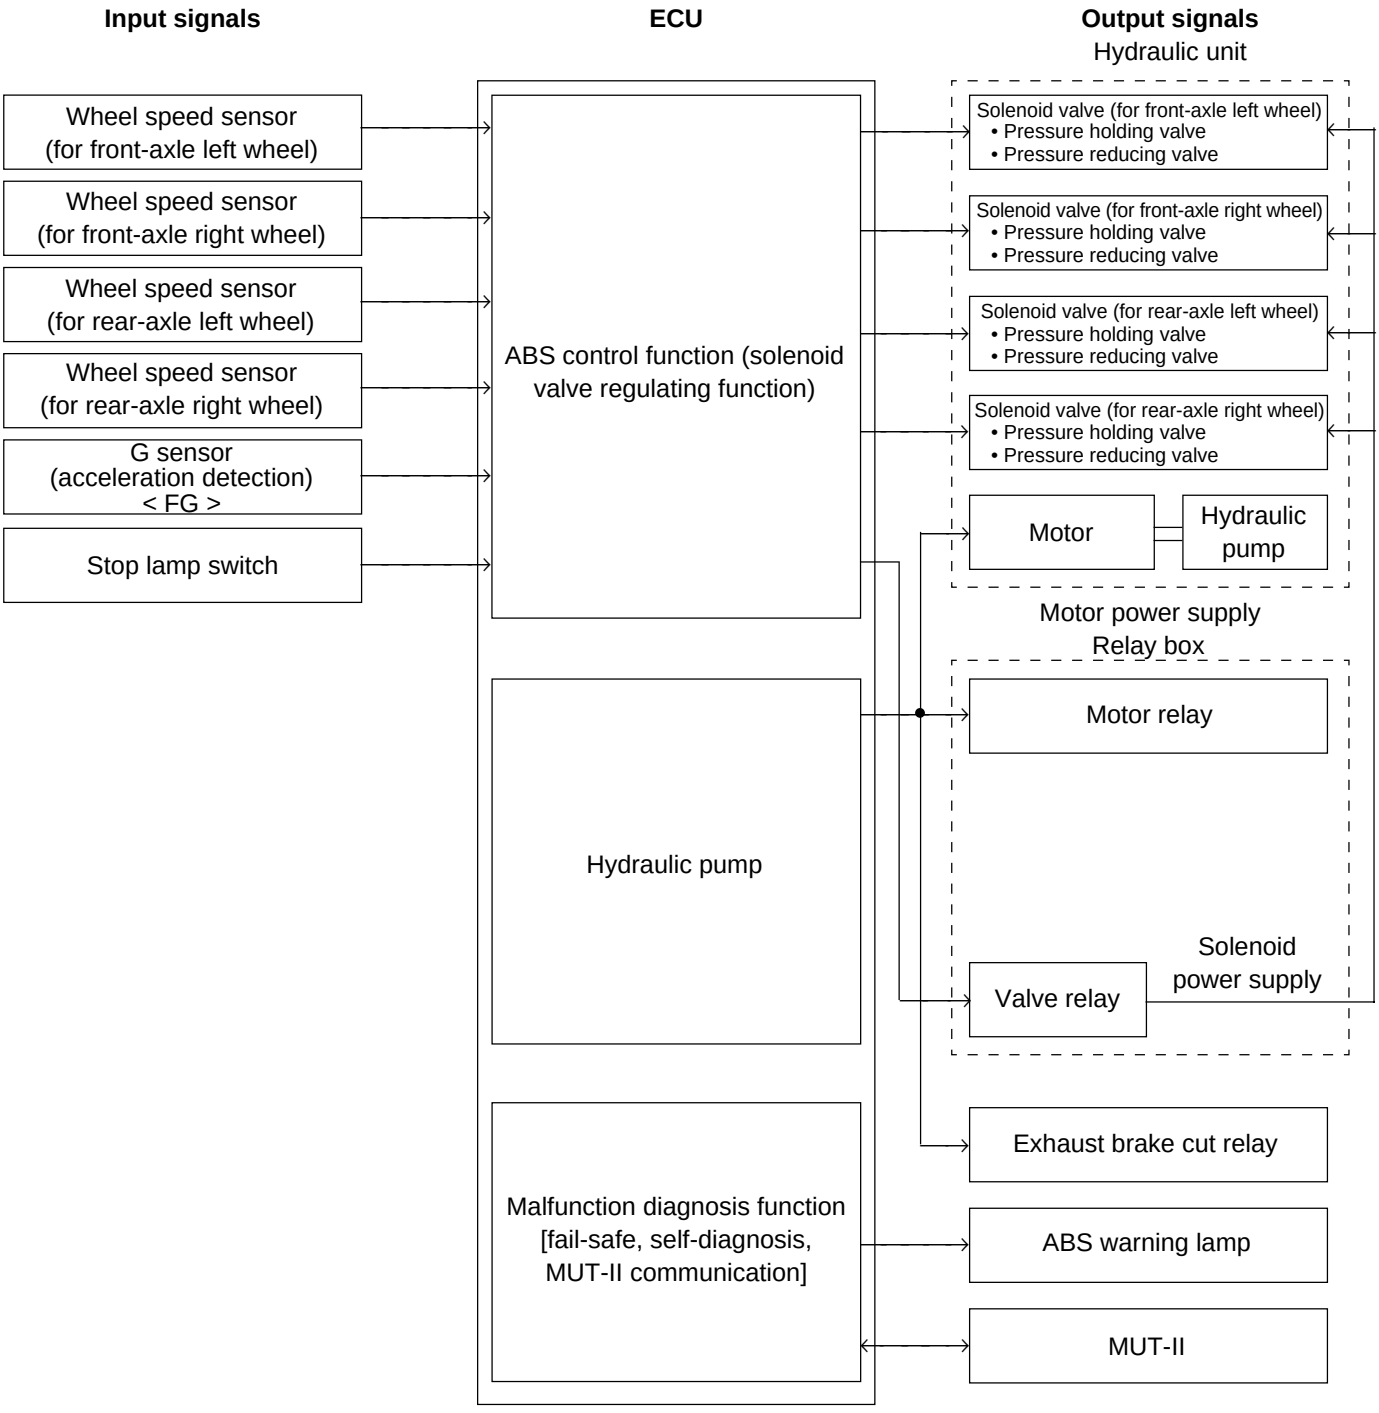


1 Brake booster (Mastervac)
2 Brake master cylinder
3 ABS warning lamp
4 Exhaust brake cut relay
5 G sensor < FG >
6 ECU
7 Hydraulic unit
8 Relay box
9 Wheel speed sensor
10 Rotor
11 Stop lamp switch

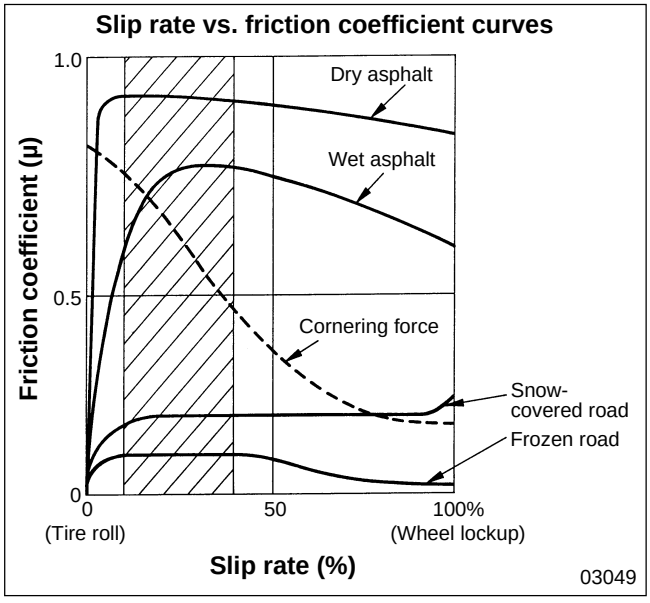
The ABS uses wheel speed sensors **9** and ECU **6** to monitor the rotating speed of each wheel. The FG models are also equipped with G sensor **5** for the detection of the degree of vehicle's forward and backward acceleration. When the wheel speed exceeds the preset deceleration speed or slip rate during braking, the ECU detects it as a tendency leading to wheel lockup, and sends control signals to hydraulic unit **7** and relay box **8**. The signals activate the solenoid valves to reduce the brake fluid pressure in the wheel brakes and ease the braking force to prevent wheel lockup. Then, when the wheel speed increases, wheel speed sensors **9** send signals to the solenoid valves in hydraulic unit **7** by way of ECU **6** to increase the brake fluid pressure in the wheel brakes to augment the braking force. This control cycle is repeated to prevent wheel lockup on slippery pavements and ensure the vehicle's directional stability during braking. The 4-sensor 4-channel anti-lock brake system uses four wheel speed sensors **9**, which are located at the front and rear wheels, to control each of the four wheels.

https://truckmanualshub.com/

● **ABS function**



https://truckmanualshub.com/



● ABS control function

To provide optimum stopping power, the ABS controls the braking force based on the slip rate determined by the relationship between the wheel speed and the vehicle speed. When the brake is applied, the resulting force slows down the wheel rotation, thus reducing the vehicle speed. However, inertia acts on the vehicle and tries to maintain the vehicle's forward movement despite the stopping force applied by the tires. When there is a difference between the wheel speed and vehicle speed, slipping occurs. The degree of slippage is expressed by a slip rate.

$$\text{Slip rate (\%)} = \frac{\text{Vehicle speed} - \text{Wheel speed}}{\text{Vehicle speed}} \times 100$$

When the slip rate is 0%, there is no slippage between the tires and pavement. The slip rate of 100% refers to a wheel lockup condition.

The graph shows the time-based changes in the friction coefficient of a rolling tire during the process of wheel lockup. When the brake is applied gradually while the tires are rotating on pavement, the tires begin to slip while in rotation.

When the brake is applied harder, the tires stop rotating and start to slide on the pavement. This condition is called wheel lockup.

The friction coefficient is highest when the slip rate is within the shaded area on the graph.

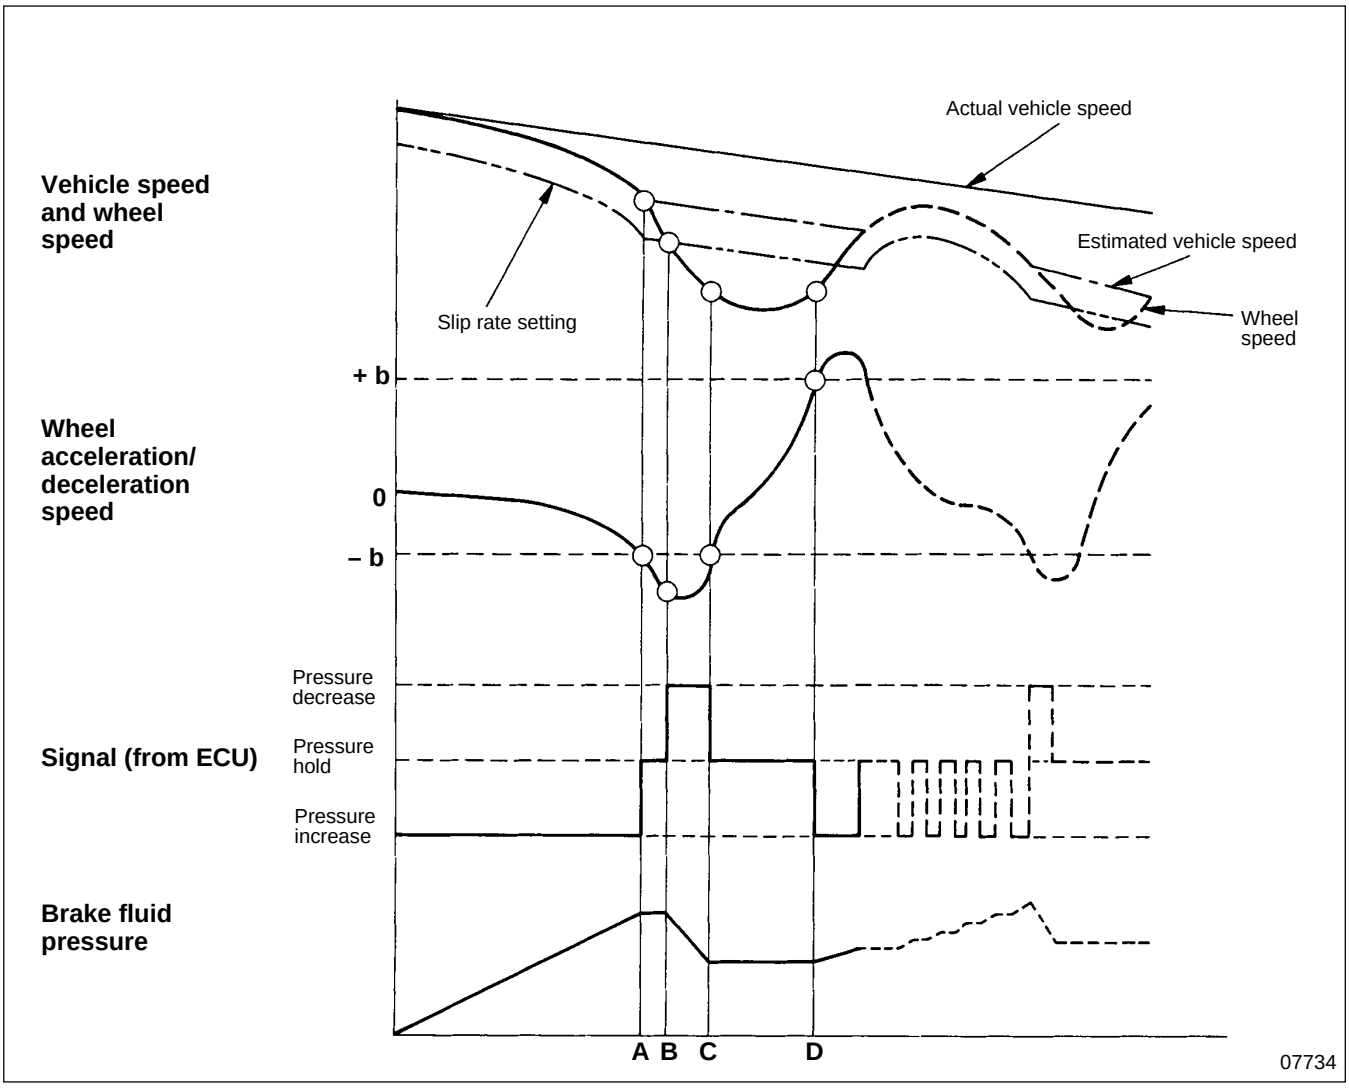
In other words, tires provide maximum friction when the braking force is appropriately controlled to maintain the slip rate in the range indicated by the shaded area on the graph, rather than when the brake is applied at full force.

In a vehicle equipped with ABS, the ECU and hydraulic unit adjust the braking force and maintain it within the shaded area on the graph where the friction coefficient is high, thus preventing tire slippage and ensuring braking stability.

https://truckmanualshub.com/

ABS Operation

● **ABS control characteristic curve**



The above ABS control characteristic graph shows the time-based changes in vehicle speed, wheel acceleration/ deceleration speed and brake fluid pressure level during braking.

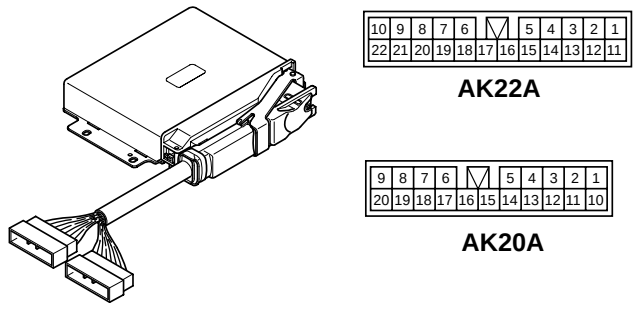
- When the wheel deceleration speed exceeds the speed setting **– b** at point **A**, the ECU sends a signal to maintain the brake fluid pressure at the same level.
  At the same time, the ECU estimates the vehicle speed according to a programmed calculation method.
- When the vehicle speed decreases further and the slip rate exceeds the setting at point **B**, the ECU detects it as a tendency leading to wheel lockup, and sends a signal to reduce the brake fluid pressure.
- When the wheel speed increases because of the reduced brake fluid pressure and the wheel speed exceeds the setting **– b** at point **C**, the ECU sends a signal to maintain the brake fluid pressure at the same level.
- When the wheel speed increases further and the wheel speed exceeds the setting **+ b** at point **D**, the ECU determines that there is no risk of wheel lockup and sends a signal to increase the brake fluid pressure.

By repeating the above control cycle, the ABS prevents wheel lockup and provides maximum friction between the tires and pavement to ensure high stability during braking.

● **ABS and exhaust brake system**

On slippery road surfaces, activation of the exhaust brake system can result in wheel lockup. If the exhaust brake activates during an ABS braking operation, proper braking function cannot be provided by the ABS.
To prevent this, the exhaust brake system is deactivated during ABS operation even when the exhaust brake switch is turned ON.
When the ABS stops providing its function, the exhaust brake system becomes operable if the exhaust brake switch is ON.

https://truckmanualshub.com/



Ⓟ36208

● **ECU**

This component calculates the wheel speed and estimates the vehicle speed based on signals sent from the wheel speed sensors. Based on the calculation results, it determines the degree of wheel lockup tendency, and sends brake fluid pressure control signals to the solenoid valves of the hydraulic unit to regulate brake fluid pressure accordingly.

The ECU is equipped with a self-diagnosis function. Should an abnormality occur, the ECU turns on the warning lamp on the instrument panel to indicate the system malfunction and deactivates the ABS control to set the brake system in normal condition (without anti-lock brake system control).

Periodic Inspection Procedures

(1) Periodic inspection of Anti-lock brake system

- Inspect the vehicle's Anti-lock brake system following the procedure below.
- If an abnormality is found in this inspection, further inspect the Anti-lock brake system using MUT-II (multi-use tester) by referring to TROUBLESHOOTING section.
P35A-14

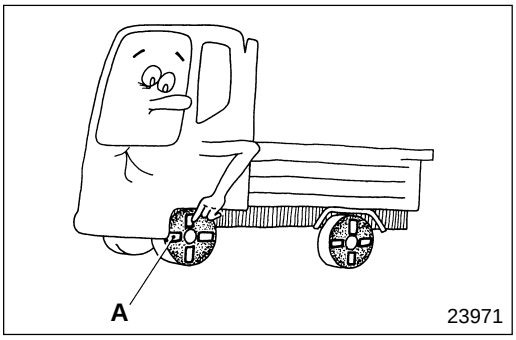
- Inspection procedure

① With the vehicle stationary, press the brake pedal and inspect the hydraulic unit for fluid leaks.
If fluid leaks from the hydraulic unit, replace the unit. If fluid leaks from the fluid pipe or connector, tighten the joint.

② Inspection using brake tester
Check the braking force at each wheel with a brake tester by following the inspection procedure for ordinary vehicles.
If an abnormality is found, inspect the wheel brake units, service brake system and hydraulic unit.

③ Drive the vehicle and check the operation of the Anti-lock brake system.
- Conduct a test drive at an open area to ensure safety.
- Conduct a test drive without cargo.

Attach white tape **A** on the sides of tires, so that it is easy to observe the rotation of the front and rear wheels.
- Turn the starter switch from the OFF position to the ON position, and make sure that the ABS warning lamp lights.
Then, check that the ABS warning lamp turns off approximately two seconds after the starter switch is turned on.
- Drive the vehicle at a speed of 20 to 30 km/h {12 to 19 mph}, and apply a sudden brake. Make sure that wheel lockup does not occur in any of the tires.



https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

Inspection of Wheel Speed Sensor Signal Waveform Using Oscilloscope

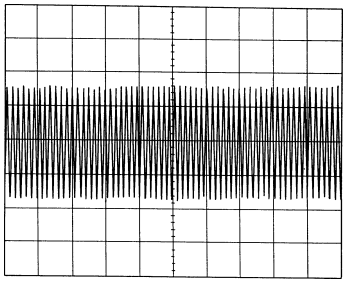
Inspect the rotor for dents using an oscilloscope, since the tester cannot be used for dent detection.

NOTE

Use an oscilloscope with a waveform recording function.

- Lift the wheel to be tested off the ground, and disconnect the connector at the wheel speed sensor.
- Connect the terminal of the oscilloscope to the terminal of the disconnected connector. Rotate the wheel at a constant speed. Check the waveform shown on the oscilloscope to check for dents on the rotor.

Normal waveform (no dent on rotor)



03122

- Rotor dents are often made by the rotor press-fit on the hub end contacting the axle during installation of the hub and brake drum assembly on the axle. When installing the hub & brake drum assembly, pay close attention to prevent the rotor from contacting other parts.
- If the wave is noticeably narrower in width than other observed waves, the rotor may be chipped. Visually inspect the rotor.

https://truckmanualshub.com/

Hydraulic Unit Operation Check

Operation check using MUT-II

- Lift the vehicle using a jack and support it with rigid racks, or position the tires on brake tester rollers.

WARNING⚠

- **The brake tester rollers and tires must be dry during inspection.**
- **To test the front brakes, apply the parking brake. To test the rear brakes, place wheel chocks at the front tires to secure them in position.**

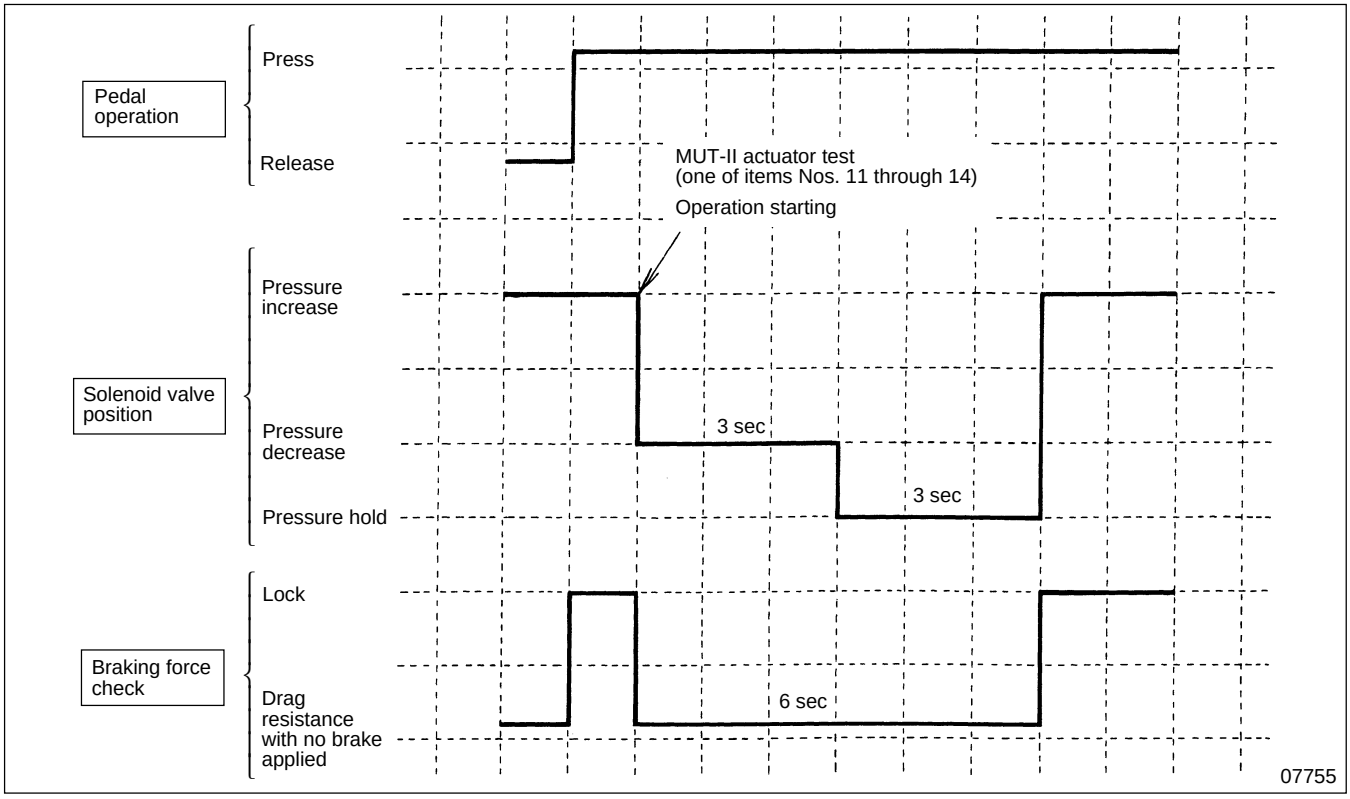
- Disengage the parking brake, and feel the drag resistance of the brake on each wheel.
  When using a brake tester, record the indicated drag resistance of the brake.
- Set the starter switch to the OFF position, then connect the MUT-II.
- Set the testing equipment and system on the MUT-II.
- After making sure that the transmission is in the neutral position, start the engine.

NOTE

- **When the engine is turned on, the ABS switches to the MUT-II mode and the ABS warning lamp flashes.**
- **When the ABS function is deactivated due to the ECU's fail-safe function, the actuator test cannot be performed with the MUT-II.**

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT



- If an abnormality is found during the inspection, take appropriate measures described in the following operating condition evaluation chart.

Operating condition evaluation chart

Item No.	MUT-II indication	Operation	Judgment		Cause	Remedy
			Normal	Malfunction		
11	FR ABS MV ON	(1) Depress the brake pedal to lock wheels. (2) On the MUT-II, select the wheel to be tested and forcibly drive the actuator. (3) Rotate the selected wheel using the brake tester or by hand, and check the change in braking power.	Braking force eases for 6 seconds from locked condition.	Wheel does not lock when brake pedal is depressed.	Clogging in brake line other than HU	Inspect and clean brake lines.
12	FL ABS MV ON				Clogging in hydraulic line inside HU	Replace HU assembly.
13	RR ABS MV ON			Braking force does not ease.	Erroneous HU brake tube connection	Correct tube connection.
14	RL ABS MV ON				Faulty HU solenoid valve	Replace HU assembly.

HU: Hydraulic unit

- After inspection, set the starter switch to OFF before disconnecting the MUT-II.

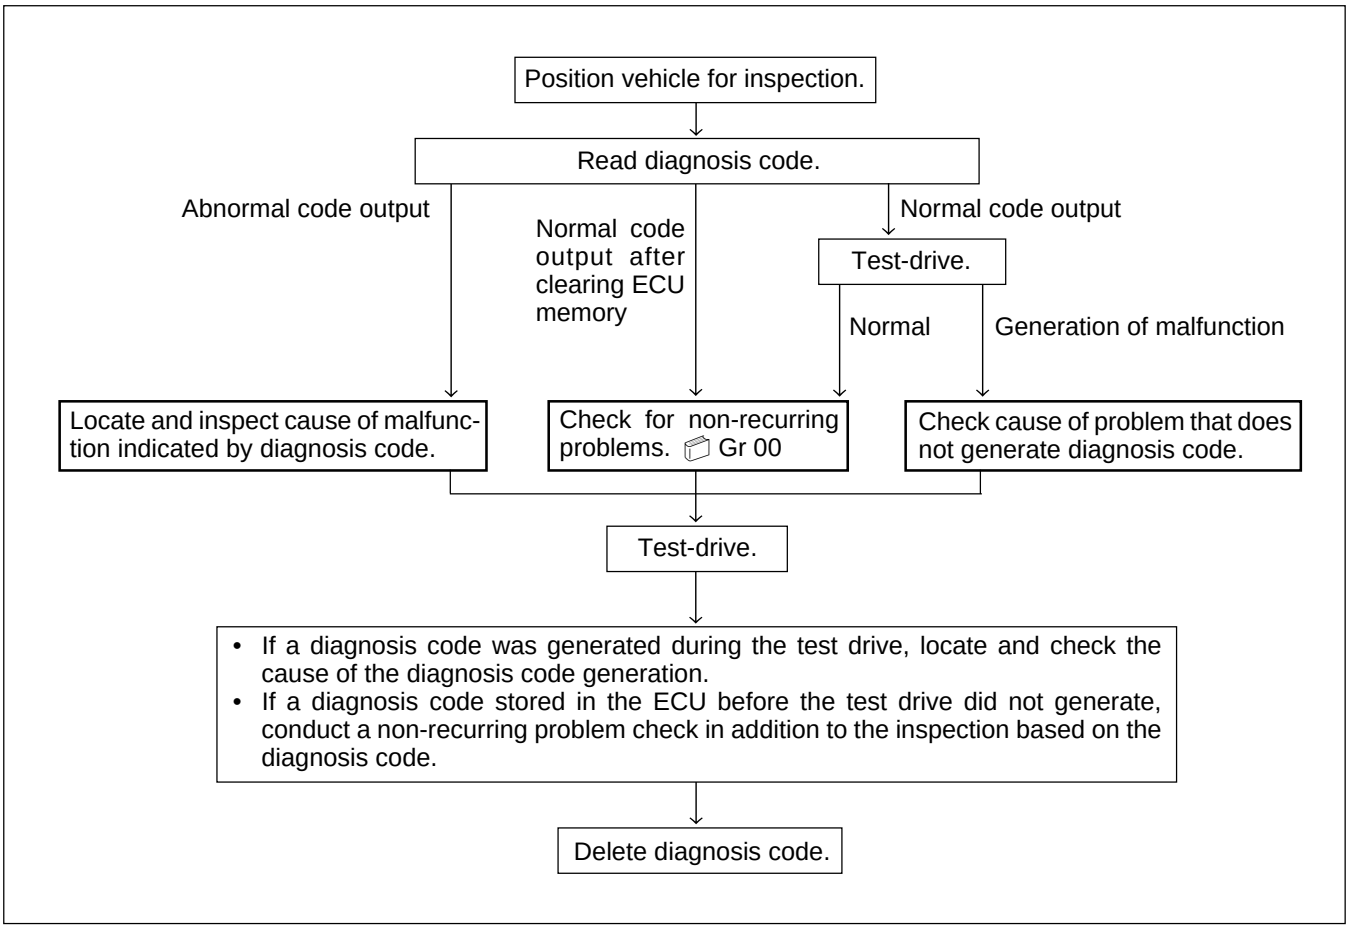
https://truckmanualshub.com/

Troubleshooting Procedures

Inspection flow chart

The MUT-II allows efficient inspection of the ABS.
The types of system inspections can be roughly divided according to the malfunction condition and diagnosis code, as shown below.

- Inspection based on individual malfunction diagnosis codes stored in the ECU
- Inspection based on symptoms not indicated by diagnosis codes
- Correcting non-recurring problems

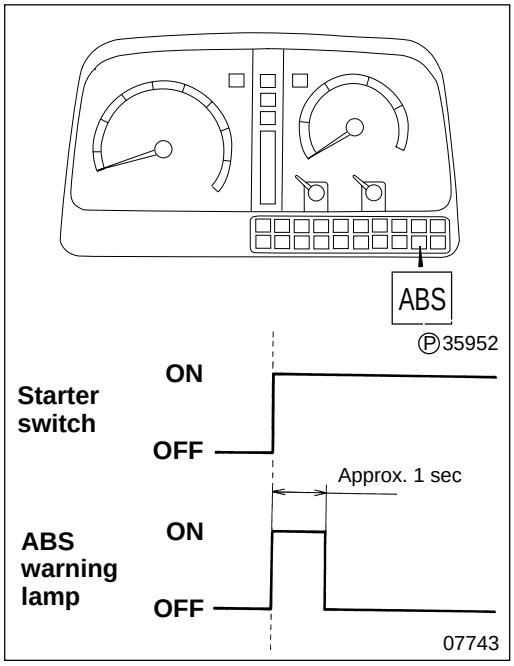


Cautions in malfunction diagnosis

- The ABS uses electronic control to regulate the braking system. The following phenomena may occur during normal ABS operation, but they do not denote a malfunction.

Phenomenon	Description
System checking sound	When the engine starts, a slight clunking sound may be generated in the left side of the frame near the cargo bed. This sound is produced by the system conducting an operation check, and does not denote a malfunction.
ABS operating sound	• Motor noise from the hydraulic unit (humming sound) • Noise generated as the brake pedal feel changes (grinding sound) • Noise from the chassis produced by repeated ON and OFF operations of the ABS (wheels: short squeak, suspension: slight thud)
ABS operation effect (longer stopping distance)	On snow-covered surfaces and gravel roads, a vehicle equipped with ABS may require a longer distance to come to a complete stop. Therefore, when driving on such road surfaces, reduce the speed sufficiently and drive carefully to minimize the use of brakes.

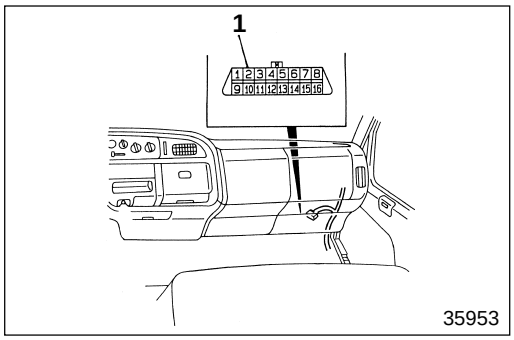
https://truckmanualshub.com/



● **Inspection of ABS warning lamp**

Check the ABS warning lamp to make sure that the following operation turns on the lamp.

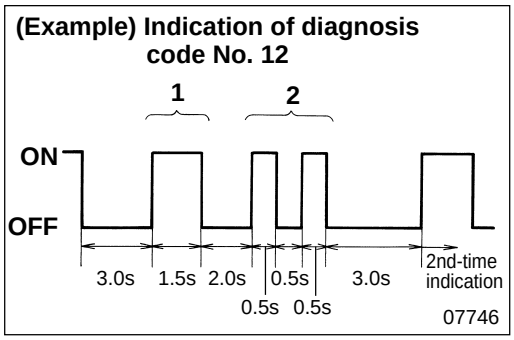
- Set the starter switch to the ON position, and check that the ABS warning lamp lights for about 1 second and turns off.
- If the lamp does not light as described above, check diagnosis codes stored in the ECU.



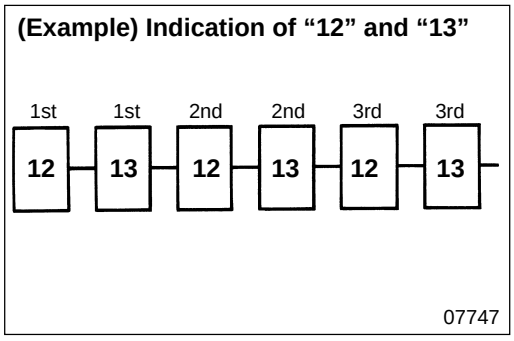
Diagnosis Code Indication

• Without MUT-II

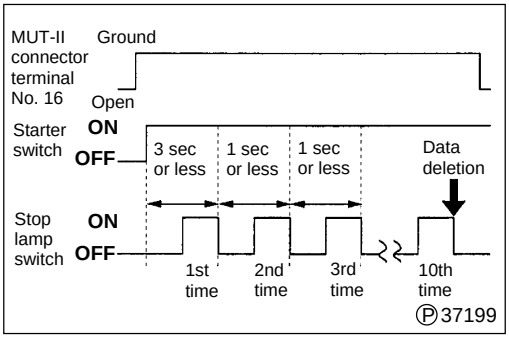
- With the vehicle stationary, ground terminal No. 16 of MUT-II connector **1**, then turn the starter switch to the ON position. The ABS warning lamp will flash to indicate a diagnosis code.
- The ABS warning lamp starts flashing 3.0 seconds after the starter switch is turned ON. The flashing pattern of the warning lamp indicates a diagnosis code.



- A diagnosis code is indicated in the following manner.
  - To indicate the tens digit (left digit), the lamp remains ON for 1.5 seconds, then remains OFF for 0.5 seconds. To indicate the ones digit (right digit), the lamp remains ON for 0.5 second, then remains OFF for 0.5 second.
  - For multiple diagnosis codes, each code is indicated one time, insequence. When there is no other diagnosis code to indicate, the lamp repeats the diagnosis code indication from the beginning for 7 cycles.
  - When there is no diagnosis code stored in the memory (normal condition), the ABS warning lamp repeats On/Off in 0.25-second intervals.
  - When two or more diagnosis codes are stored in the ECU.



https://truckmanualshub.com/



● **Deletion of diagnosis codes**

With key off, connect terminal No. 16 of the MUT-II connector to the chassis for grounding. Depress the brake pedal and turn on the starter switch and turn the stop lamp switch on and off ten times in intervals of 1 second or less by depressing the brake pedal. Turn the key off. disconnect the ground wire. This erases diagnosis codes from the memory.

● **Completion of diagnosis code check**

The diagnosis code check completes when diagnosis codes are erased from the ECU of terminal No. 16 of the MUT-II connector is disconnected.

NOTE

The diagnosis code check also ends when the vehicle moves from a stationary condition during the diagnosis code check.

With MUT-II

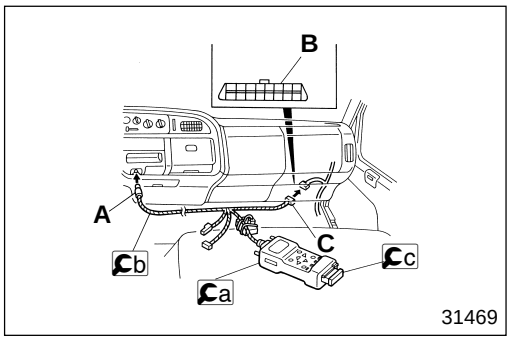
Special tools

Tool name and shape	Part No.	Application
MUT-II  19492	MB991496	Inspection of Anti-lock brake system
MUT-II harness (for data communication)  19141	MK327601	
ROM pack (MRT-E6)  19493	MK344606	

https://truckmanualshub.com/

TROUBLESHOOTING

Tool name and shape	Part No.	Application
MUT-II harness (for circuit tester)  20536	MB991499	Inspection of Anti-lock brake system
Memory card (for MUT-II)  20538	MB991500	



31469

Connecting the MUT-II
- Turn the starter switch to the LOCK position.
- Connect the b MUT Communication Harness to the a MUT-II, and insert the c ROM Pack.
- Plug connector **A** into the cigarette lighter socket.
- Fit connector **C** onto MUT connector **B** (16 pin) in the relay box.

NOTE

Instructions for operation of the MUT-II are given in the separate MUT-II Reference Manual.

Current diagnosis codes
- Turn the starter switch to the ON position.
- Determine the fault location(s) in accordance with the MUT-II diagnosis code(s).

Past diagnosis codes
- Turn the starter switch to the ON position.
- Determine the fault location(s) in accordance with the past MUT-II diagnosis code(s).

Diagnosis code erasure
- Turn the starter switch to the ON position.
- Using the MUT-II, erase all diagnosis codes stored in the control unit.

https://truckmanualshub.com/

Diagnosis Code Chart

Diagnosis codes can be read by using the MUT-II or ABS warning lamp.

Diagnosis code	Malfunction location		
	MUT-II display	Description of malfunction	
11	FR-SNSR OPEN	Wheel speed sensor	Broken wire to front-axle right-wheel speed sensor
12	FL-SNSR OPEN		Broken wire to front-axle left-wheel speed sensor
13	RR-SNSR OPEN		Broken wire to rear-axle right-wheel speed sensor
14	RL-SNSR OPEN		Broken wire to rear-axle left-wheel speed sensor
*15	ROTA OR SNSR		Broken wire
16	ECU VOLTAGE	Drop in power supply voltage	
21	FR-SNSR SHORT	Wheel speed sensor	No broken wire to front-axle right-wheel speed sensor
22	FL-SNSR SHORT		No broken wire to front-axle left-wheel speed sensor
23	RR-SNSR SHORT		No broken wire to rear-axle right-wheel speed sensor
24	RL-SNSR SHORT		No broken wire to rear-axle left-wheel speed sensor
26	G SENSOR	G sensor	
35	EXB RLY	Exhaust brake cut relay	
38	STOP LAMP SW	Stop lamp switch	
41	FR-EV VALVE	Hydraulic unit	Front-axle right-wheel solenoid valve (pressure decrease)
42	FL-EV VALVE		Front-axle left-wheel solenoid valve (pressure decrease)
43	RR-EV VALVE		Rear-axle right-wheel solenoid valve (pressure decrease)
44	RL-EV VALVE		Rear-axle left-wheel solenoid valve (pressure decrease)
45	FR-AV VALVE		Front-axle right-wheel solenoid valve (pressure hold)
46	FL-AV VALVE		Front-axle left-wheel solenoid valve (pressure hold)
47	RR-AV VALVE		Rear-axle right-wheel solenoid valve (pressure hold)
48	RL-AV VALVE		Rear-axle left-wheel solenoid valve (pressure hold)
51	VALVE RLY	Relay box	Valve relay
53	MOTOR RLY		Motor relay or motor
			Motor monitor line
63	ECU ERR	ABS ECU

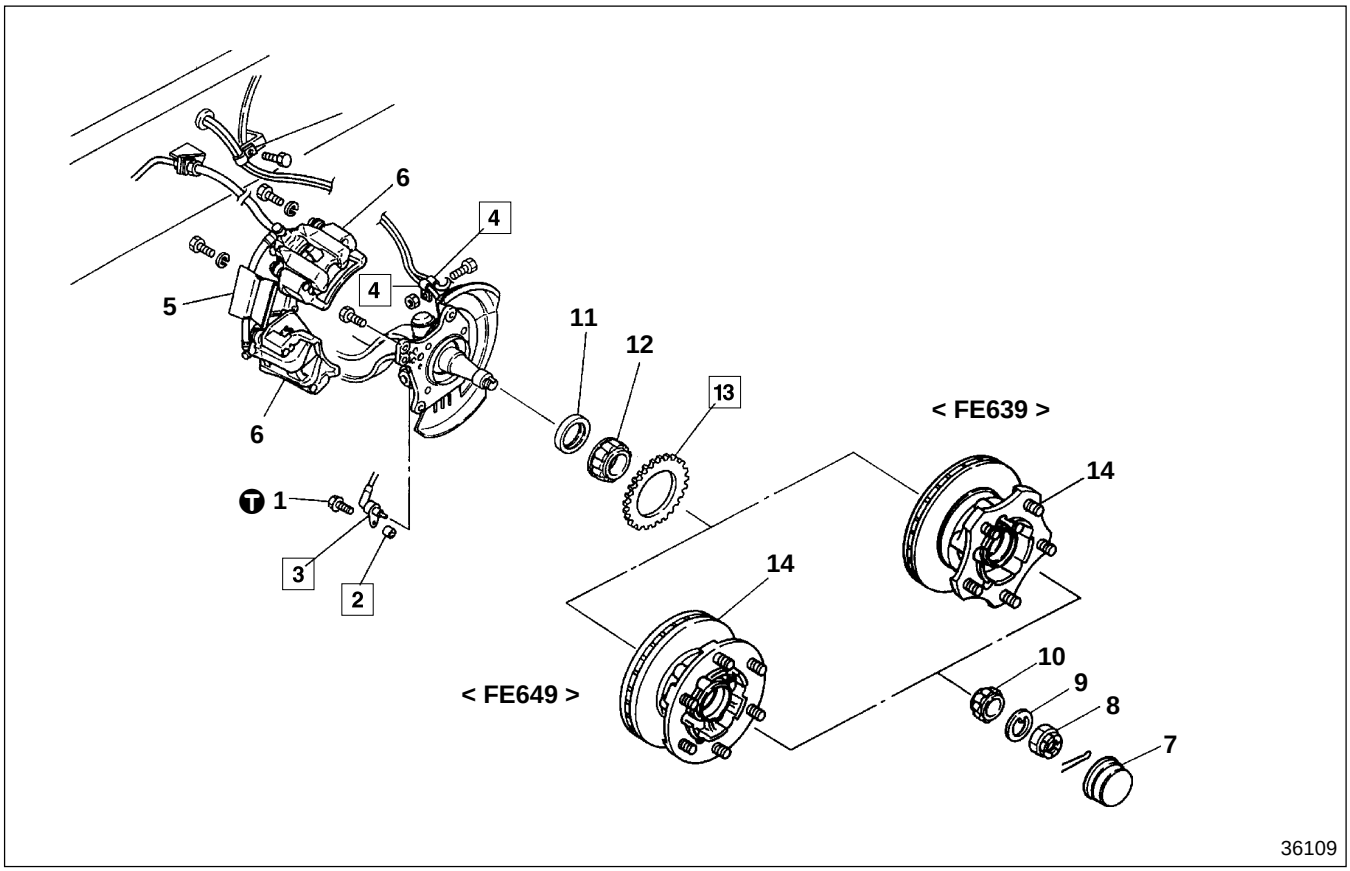
WHEEL SPEED SENSOR AND ROTOR < FRONT AXLE : DISC BRAKE >

The following section describes the service procedures for the wheel speed sensors and rotor. For the service procedures of related parts, refer to Gr 26A. The illustration below shows the front-axle left wheel.



● **Removal sequence**

1 Bolt
2 Spacer
3 Wheel speed sensor
4 Clips
5 Dust cover < FE639■4 >
6 Disc brake assembly
7 Hub cap
8 Lock nut
9 Lock washer
10 Outer bearing inner race
11 Oil seal
12 Inner bearing inner race
13 Rotor (ABS)
14 Wheel hub & rotor assembly

CAUTION

Before removing disc brake assembly 6, secure the disc brake assembly to the frame using wires, and do not disconnect the brake hose. Never allow the weight of the disk brake caliper assembly to hang from the hydraulic brake hose. Be sure to remove the harness clips to prevent damaging the pad wear indicator harness during the removal process.

● **Installation sequence**

Follow the removal sequence in reverses.

WARNING

Do not allow oil or grease to adhere on the pad surface of disc brake assembly 6 or the rotor surface of wheel hub & rotor assembly 14.

CAUTION

When installing wheel hub & rotor assembly 14, be careful not to damage rotor 13 or oil seal 11.

https://truckmanualshub.com/

Service standards

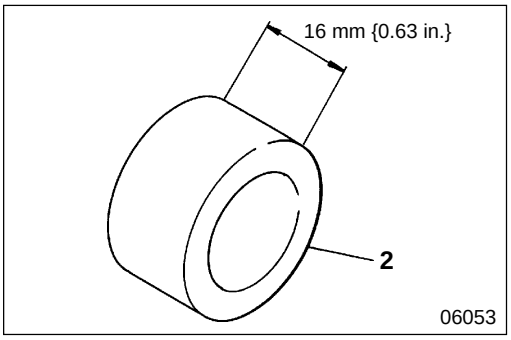
Location	Maintenance item		Standard value	Limit	Remedy
3	Wheel speed sensor	Resistance between terminals	1600 ± 10% Ω	—	—
		Insulation resistance	100 kΩ minimum	—	—

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (wheel speed sensor mounting)	9.8 to 14.8 {7.2 to 11, 1.0 to 1.5}	—

◆ Service procedure

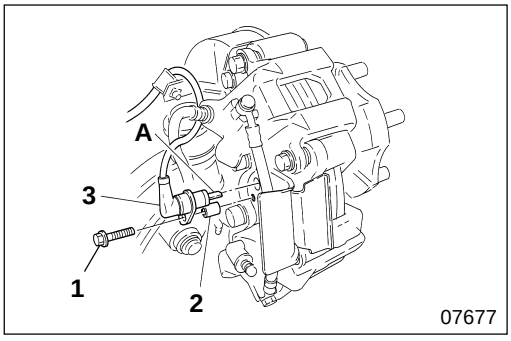


2 Installation of spacer

Check the thickness of spacer **2** before installation.

CAUTION ⚠

Installation of spacer 2 with an improper thickness results in inaccurate wheel speed detection, thus causing faulty ABS operation.



3 Wheel speed sensor

[Removal]

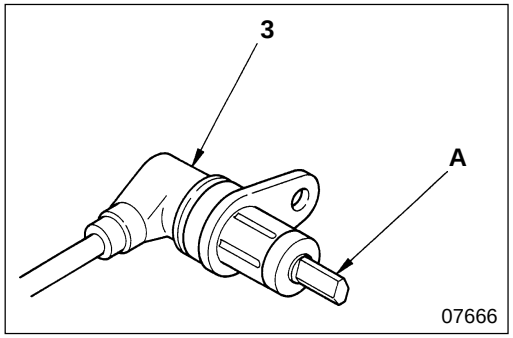
To prevent damaging pole piece **A** in wheel speed sensor **3**, remove the wheel speed sensor before removing wheel hub & rotor assembly **14**.

[Installation]

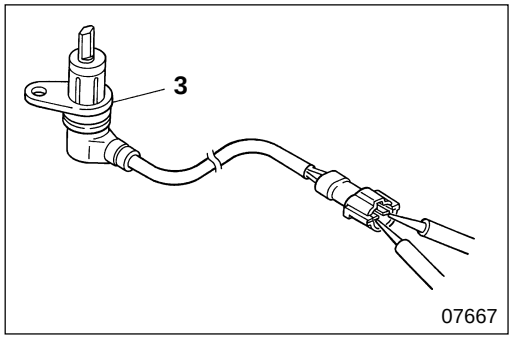
The connector of wheel speed sensor **3** is color-coded. Install the wheel speed sensors to the proper wheels according to the following table.

Installation location	Connector color
Left wheel	Gray
Right wheel	Black

https://truckmanualshub.com/

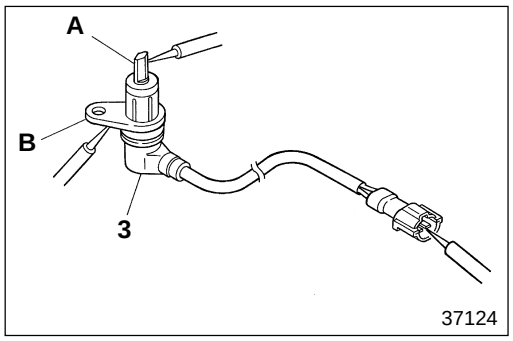


[Inspection]
Pole piece **A** in wheel speed sensor **3** is magnetized by a built-in magnet and attracts metals. Do not allow metal particles to stick to the pole piece.



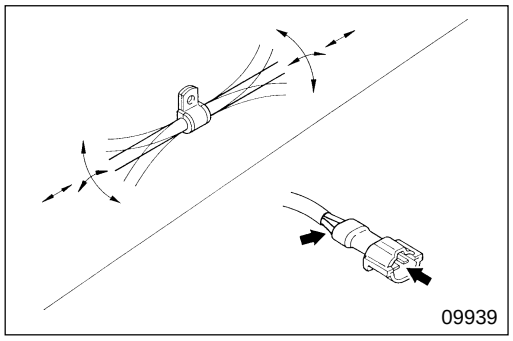
● **Measurement of resistance between terminals**

Measure resistance between the terminals of wheel speed sensor **3**.
If the measured value deviates from the standard value, replace the wheel speed sensor.



● **Measurement of insulation resistance**

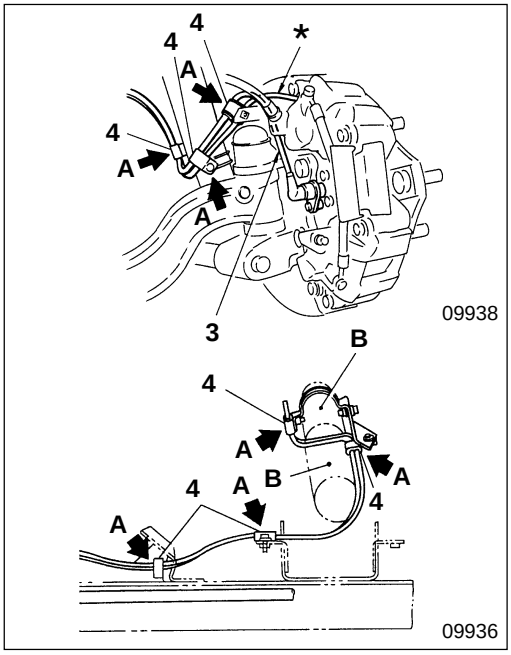
Measure resistance between pole piece **A**, bracket **B** and each terminal of wheel speed sensor **3**.
If the measured value deviates from the standard value, replace the wheel speed sensor.



● **Inspection of open circuit in harness**

To check the harness for an open circuit, disconnect the harness clamp from the vehicle side, then bend and pull harness at the clamp to check if a momentary open circuit results. Also inspect the terminal contact conditions in the connector.
If an abnormality is found, replace wheel speed sensor **3**.

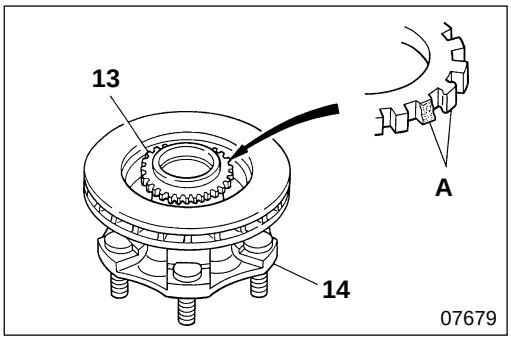
https://truckmanualshub.com/



3 **4** **Installation of wheel speed sensor harness and clips**

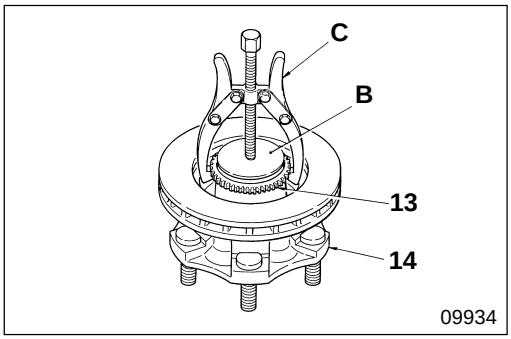
Starting from the wheel brake side, secure the harness of wheel speed sensor **3** in place at white tape sections **A** using clips **4**, while making sure that there is no interference, twisting or excessive sagging of the harness.

B : Shock absorber
***** : Pad wear indicator harness



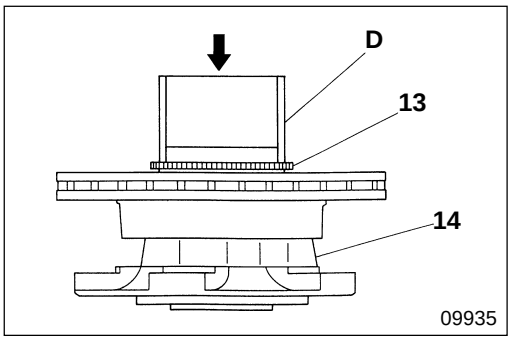
13 **Rotor**

[Inspection]
Check rotor **13** for chipped or crushed teeth (see section **A** in the diagram).
If an abnormality is found, replace the rotor.



[Removal]

B : Iron plate
C : Gear puller

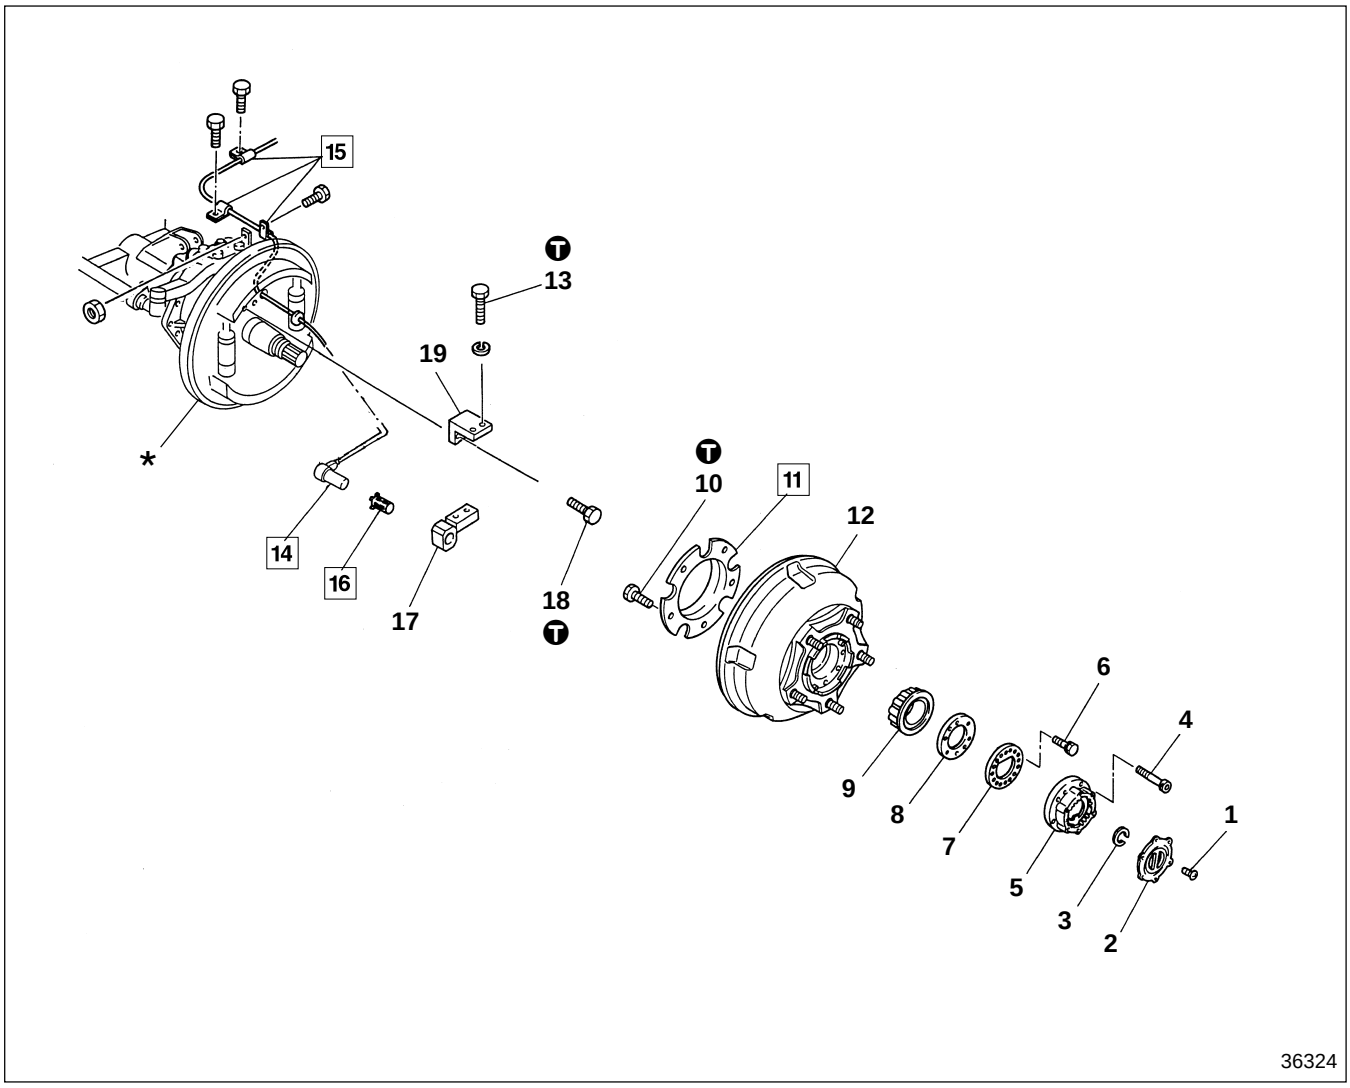


[Installation]
Before installing rotor **13** to wheel hub & rotor assembly **14**, heat the rotor to approximately 150°C {302°F}. Using pipe **D**, install the rotor to the wheel hub & rotor assembly by applying uniform pressure to prevent the rotor from tilting.

https://truckmanualshub.com/

WHEEL SPEED SENSOR AND ROTOR < FRONT AXLE : DRUM BRAKE > FG

The following section describes the service procedures for the wheel speed sensors and rotor. For the service procedures of related parts, refer to Gr 26B. The illustration below shows the front-axle left wheel.



● **Removal sequence**

1 Screw
2 Cover assembly
3 Snap ring
4 Bolt
5 Housing assembly
6 Bolt
7 Lock washer
8 Lock nut
9 Outer bearing
10 Bolt
11 Rotor (ABS)
12 Wheel hub & brake drum assembly
13 Bolt
14 Wheel speed sensor
15 Clips
16 Spring spacer
17 Sensor holder
18 Bolt
19 Sensor bracket
***** : Front brake assembly

● **Installation sequence**

*****→**19**→**18**
17→**16**→**14**
→**13**→**15**
12→**11**→**10**
→**9**→**8**→**7**→**6**→**5**→**4**→**3**→**2**→**1**

https://truckmanualshub.com/

WARNING ⚠

Do not allow oil or grease to adhere on the lining surface of front brake assembly * or the inside surface of wheel hub & brake drum assembly 12.

CAUTION ⚠

When installing wheel hub & brake drum assembly 12, be careful not to damage rotor 11, wheel speed sensor 14 or oil seal in the wheel hub.

Service standards

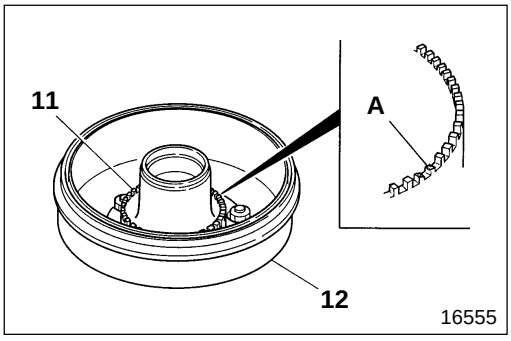
Location	Maintenance item		Standard value	Limit	Remedy
14	Wheel speed sensor	Resistance between terminals	1750 ± 10% Ω	—	—
		Insulation resistance	1000 kΩ minimum	—	—

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

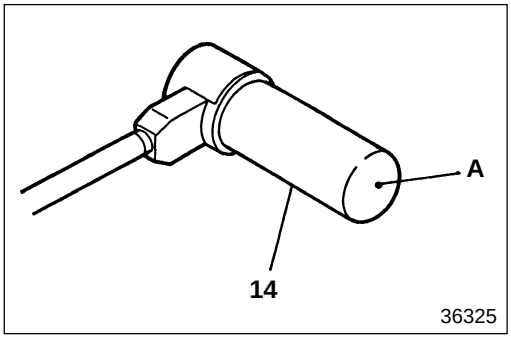
Location	Parts to be tightened	Tightening torque	Remarks
10	Bolt (rotor mounting)	8.8 to 13.8 {6.5 to 10, 0.9 to 1.4}	—
13	Bolt (sensor holder mounting)	8.8 to 13.8 {6.5 to 10, 0.9 to 1.4}	—
18	Bolt (sensor bracket mounting)	11.8 to 12.8 {8.7 to 9.4, 1.2 to 1.3}	—

◆ Service procedure



11 Rotor

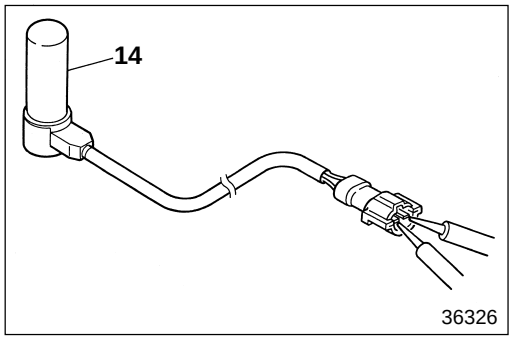
[Inspection]
Check rotor **11** for chipped or crushed teeth (see section **A** in the diagram).
If an abnormality is found, replace the rotor.



14 Wheel speed sensor

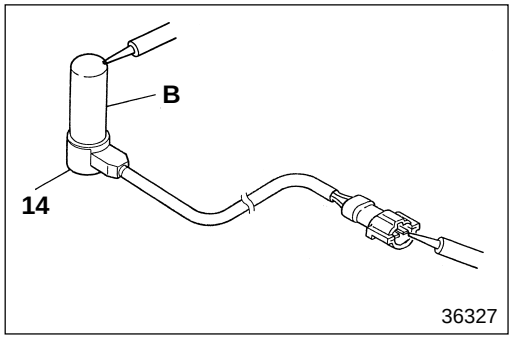
[Inspection]
Pole piece **A** in wheel speed sensor **14** is magnetized by a built-in magnet and attracts metals. Do not allow metal particles to stick to the pole piece.

https://truckmanualshub.com/



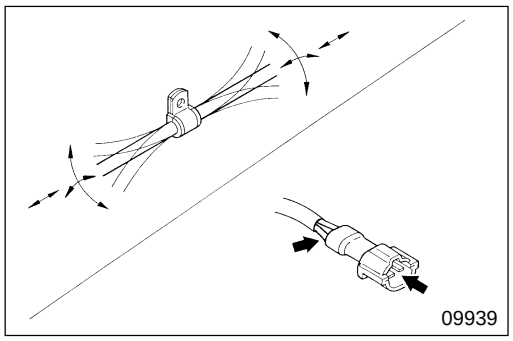
● **Measurement of resistance between terminals**

Measure resistance between the terminals of wheel speed sensor **14**.
If the measured value deviates from the standard value, replace the wheel speed sensor.



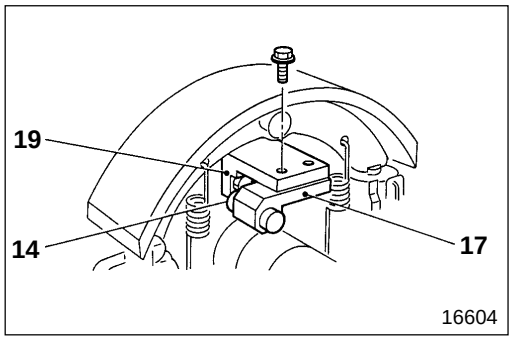
● **Measurement of insulation resistance**

Measure resistance between body **B** and each terminal of wheel speed sensor **14**.
If the measured value is lower than the standard value, replace the wheel speed sensor.



● **Inspection of open circuit in harness**

To check the harness for an open circuit, disconnect the harness clamp from the vehicle side, then bend and pull harness at the clamp to check if a momentary open circuit results. Also inspect the terminal contact conditions in the connector.
If an abnormality is found, replace wheel speed sensor **14**.

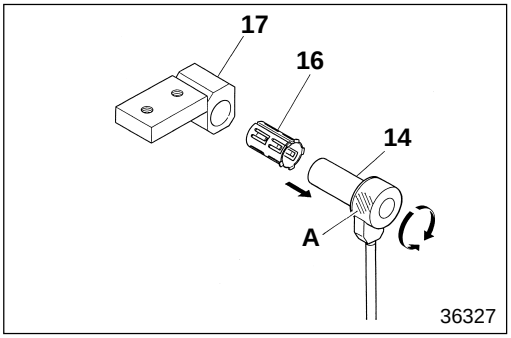


14 **16** **Wheel speed sensor and spring spacer**

The illustration shows the front-axle left wheel. The right wheel is symmetrical to the one shown in the diagram.
[Removal]

- Remove wheel speed sensor **14** and sensor holder **17** as an assembly.

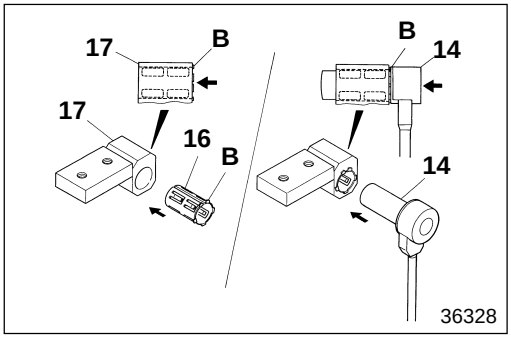
https://truckmanualshub.com/



- Using pliers, hold wheel speed sensor **14** at shaded section **A** in the diagram, and remove it by turning it slightly.

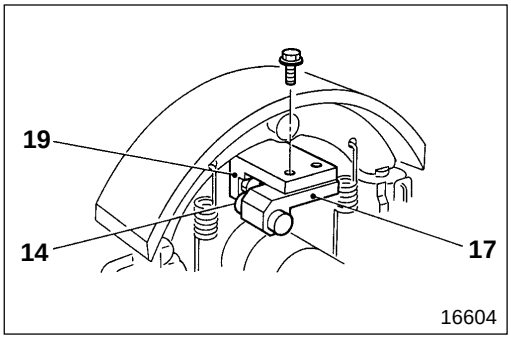
CAUTION ⚠

- **Do not hold wheel speed sensor 14 with pliers at positions other than shaded section A shown in the diagram.**
- **Do not apply excessive force to remove wheel speed sensor 14, such as by striking with a hammer, prying with a screwdriver, and pulling the harness. Excessive force can break wires in the wheel speed sensor.**
- **If only slight force is necessary to remove wheel speed sensor 14, replace spring spacer 16.**

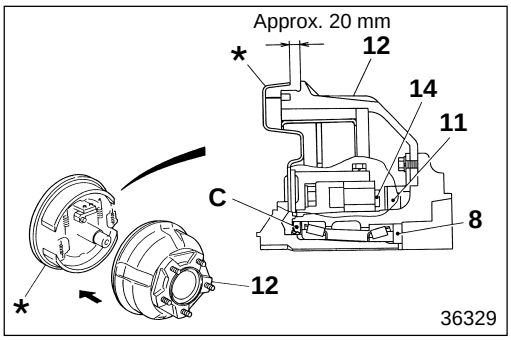


[Installation]

- Insert spring spacer **16** into sensor holder **17** until section **B** of the spring spacer contacts the sensor holder.
- Insert wheel speed sensor **14** until it contacts section **B**.



- Install wheel speed sensor **14** and sensor **17** as an assembly.



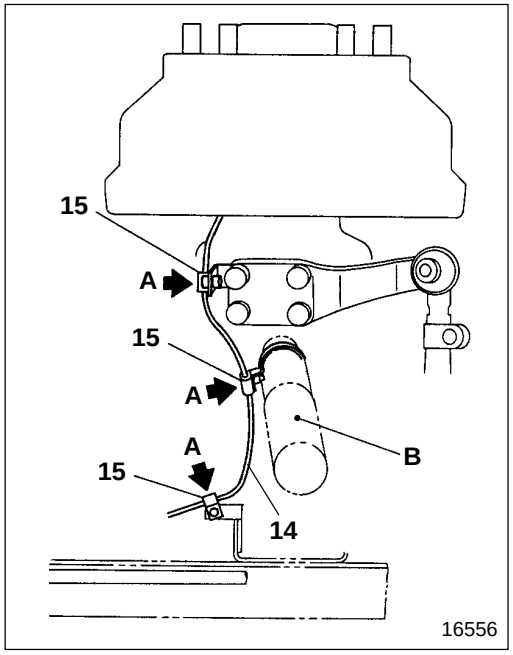
- Carefully install wheel hub & brake drum assembly **12** to avoid damaging oil seal **C**. Position the wheel hub & brake drum assembly at the location where the distance indicated in the illustration is approximately 20 mm (to prevent wheel speed sensor **14** from contacting rotor **11**).
- Slowly tighten lock nut **8** to the specified torque (primary tightening). Adjust and measure the starting torque of the wheel hub bearing.
  Gr 26B

CAUTION ⚠

Do not apply excessive force to install wheel speed sensor 14, such as by striking with a hammer, prying with a screwdriver, and pulling the harness. Excessive force can break wires in the wheel speed sensor.

https://truckmanualshub.com/

WHEEL SPEED SENSOR AND ROTOR < FRONT AXLE : DRUM BRAKE > FG



14 **15** **Installation of wheel speed sensor harness and clips**

Starting from the wheel brake side, secure the harness of wheel speed sensor **14** in place at white tape sections **A** using clips **15**, while making sure that there is no interference, twisting or excessive sagging of the harness.

B : Shock absorber

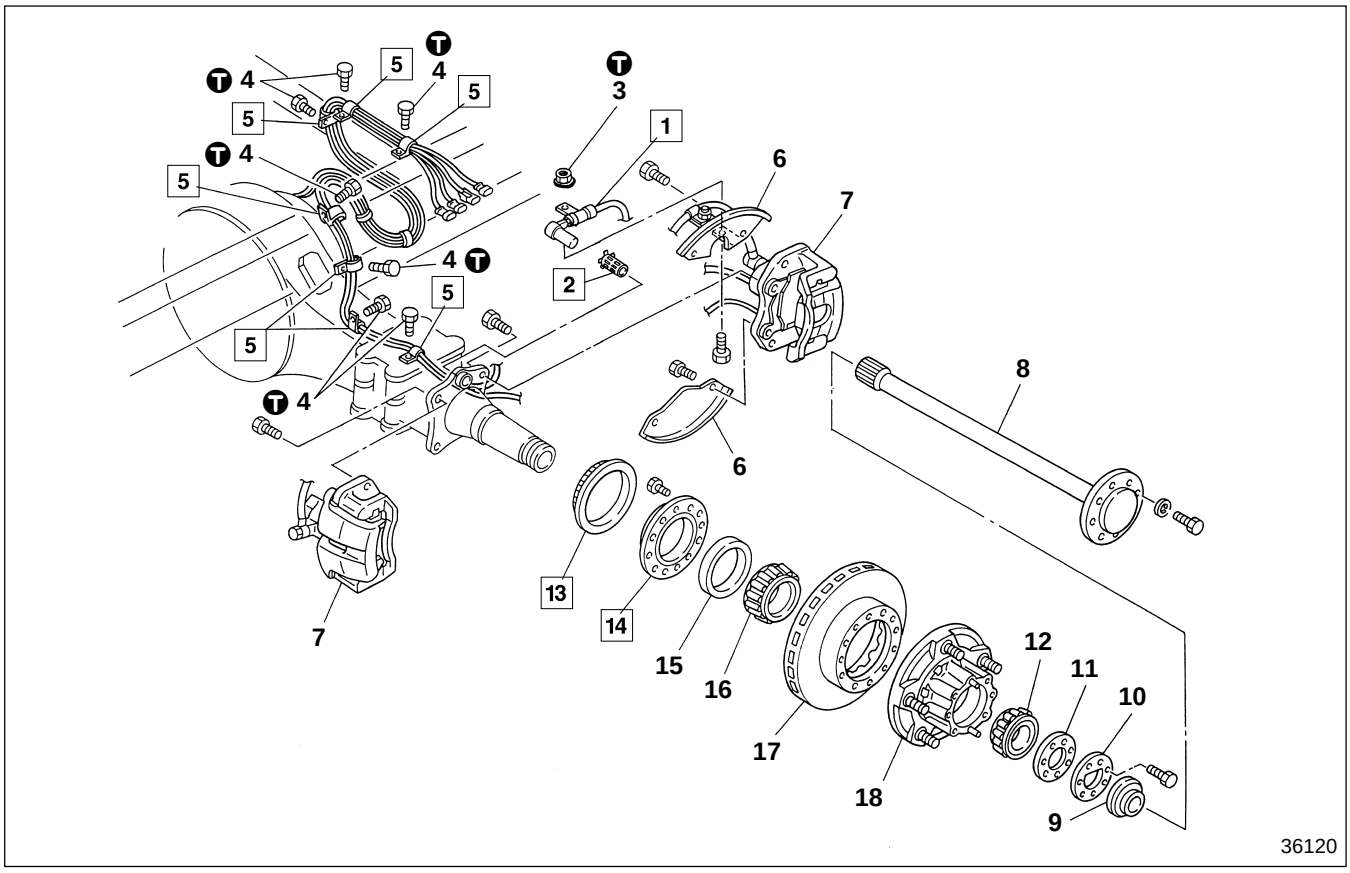
https://truckmanualshub.com/

M E M O

https://truckmanualshub.com/

WHEEL SPEED SENSOR AND ROTOR < REAR AXLE : DISC BRAKE >

The following section describes the service procedures for the wheel speed sensors and rotor. For the service procedures of related parts, refer to Gr 27. The illustration below shows the rear-axle left wheel.



● **Removal sequence**

1 Wheel speed sensor
2 Spring spacer
3 Nut
4 Bolt
5 Clips
6 Dust shield
7 Disc brake assembly
8 Rear axle shaft
9 Outer oil seal
10 Lock washer
11 Lock nut
12 Outer bearing
13 Rotor (ABS)
14 Rotor flange
15 Inner oil seal
16 Inner bearing
17 Rotor (brake)
18 Rear wheel hub

CAUTION

Before removing disc brake assembly 7, secure the disc brake assembly to the frame using wires, and do not disconnect the brake hose. Never allow the weight of the disk brake caliper assembly to hang from the hydraulic brake hose. Be sure to remove the harness clips to prevent damaging the pad wear indicator harness during the removal process.

● **Installation sequence**

Follow the removal sequence in reverses.

WARNING

Do not allow oil or grease to adhere on the pad surface of disc brake assembly 7 or the surface of rotor 17.

CAUTION

When installing rear wheel hub 18 to the rear axle, be careful not to damage rotor 13 or inner oil seal 15.

https://truckmanualshub.com/

Service standards

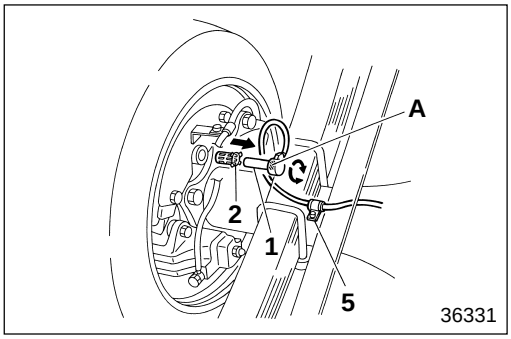
Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1	Wheel speed sensor	Resistance between terminals	1750 ± 10% Ω	—	—
		Insulation resistance	1000 kΩ minimum	—	—
13	Rotor runout (ABS)		0.0039	—	—

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Nut (clip mounting)	10 to 15 {72 to 108, 1.0 to 1.5}	—
4	Bolt (clip mounting)	12 to 15 {87 to 108, 1.2 to 1.5}	—



◆ Service procedure

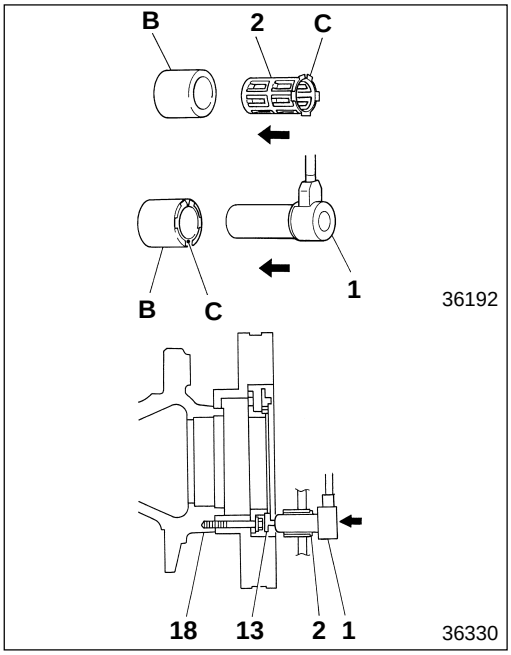
1 **2** **Wheel speed sensor and spacer**

[Removal]

Using pliers, hold wheel speed sensor **1** at shaded section **A** in the diagram, and remove it by turning it slightly.

CAUTION

- **Do not hold wheel speed sensor 1 with pliers at positions other than shaded section A shown in the diagram.**
- **Do not apply excessive force to remove wheel speed sensor 1, such as by striking with a hammer, prying with a screwdriver, and pulling the harness. Excessive force can break wires in the wheel speed sensor.**
- **If only slight force is necessary to remove wheel speed sensor 1, replace spring spacer 2.**



[Installation]

The connector of wheel speed sensor **1** is color-coded. Install the wheel speed sensors to the proper wheels according to the following table.

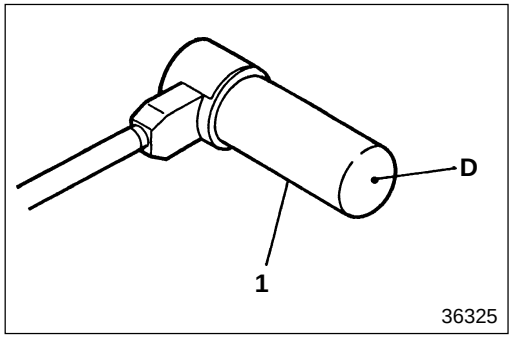
Installation location	Connector color	Connector shape	Right/left identification tape
Left wheel	Gray	Female	Yellow
Right wheel	Black	Male	None

- Insert spring spacer **2** into holder section **B** of the backplate until stopper section **C** contacts the holder section.
- Insert wheel speed sensor **1** until it firmly contacts rotor **13**.
- Slowly rotate rear wheel hub **18** two or three turns (1 rotation per 2 seconds) to make sure it rotates smoothly.

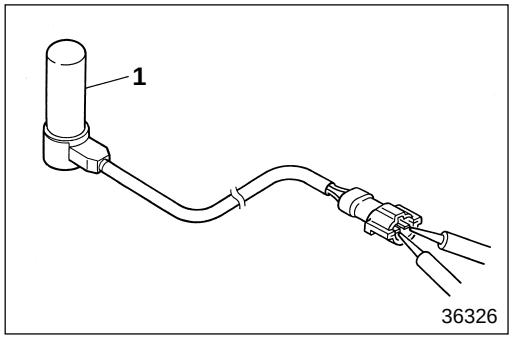
CAUTION

Do not apply excessive force to install wheel speed sensor 1, such as by striking with a hammer, prying with a screwdriver, and pulling the harness. Excessive force can break wires in the wheel speed sensor.

https://truckmanualshub.com/

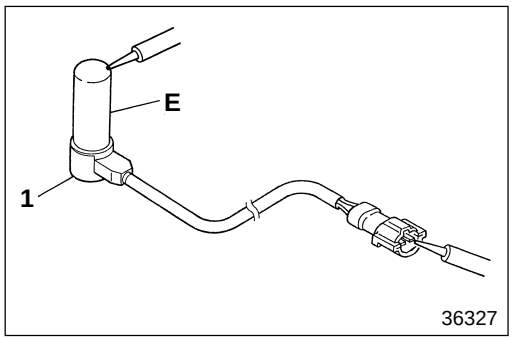


[Inspection]
Pole piece **D** in wheel speed sensor **1** is magnetized by a built-in magnet and attracts metals. Do not allow metal particles to stick to the pole piece.



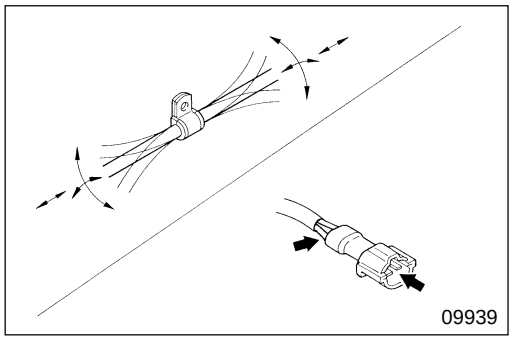
● **Measurement of resistance between terminals**

Measure resistance between the terminals of wheel speed sensor **1**.
If the measured value deviates from the standard value, replace the wheel speed sensor.



● **Measurement of insulation resistance**

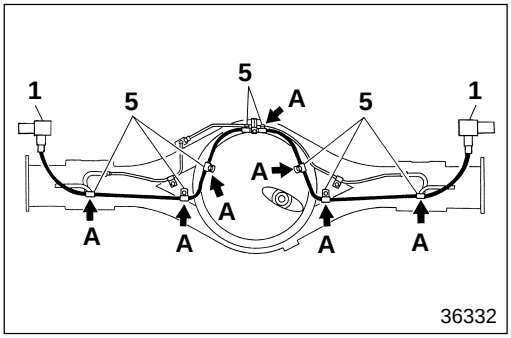
Measure resistance between body **E** and each terminal of wheel speed sensor **1**.
If the measured value is lower than the standard value, replace the wheel speed sensor.



● **Inspection of open circuit in harness**

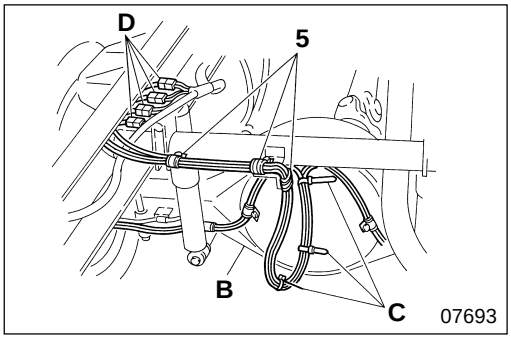
To check the harness for an open circuit, disconnect the harness clamp from the vehicle side, then bend and pull harness at the clamp to check if a momentary open circuit results. Also inspect the terminal contact conditions in the connector.
If an abnormality is found, replace wheel speed sensor **1**.

https://truckmanualshub.com/

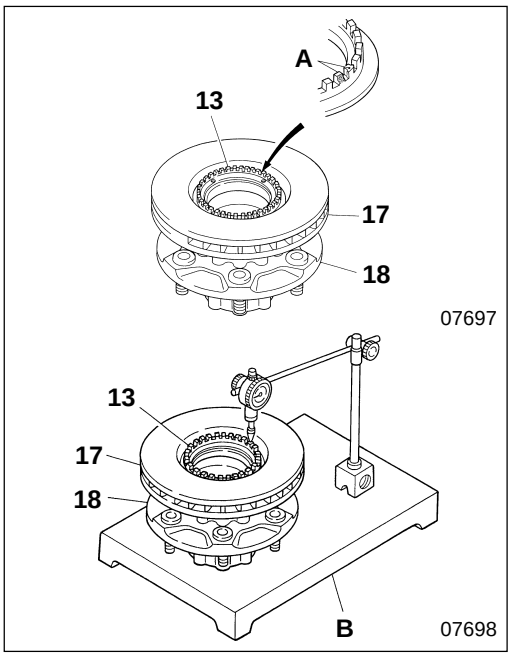


1 **5** **Installation of wheel speed sensor harness and clips**

- Starting from the wheel brake side, secure the harness of wheel speed sensor **1** and the pad wear indicator harness in place at tape sections **A** using clips **5**, while making sure that there is no interference, twisting or excessive sagging of the harnesses.



- As shown in the diagram, position the harness of speed sensor **1** and the pad wear indicator harness, starting from housing section **B** and moving toward the frame, making sure that there is no twisting or excessive sagging of the harnesses. Use clips **5** and cable ties **C** to secure the harnesses in place, then connect connectors **D**.



13 **Rotor**

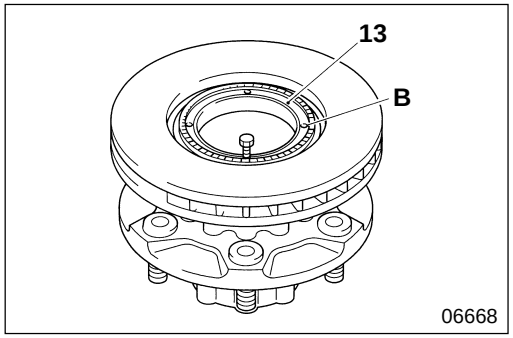
[Inspection]

- Check rotor **13** for chipped or crushed teeth (see section **A** in the diagram).
  If an abnormality is found, replace the rotor.

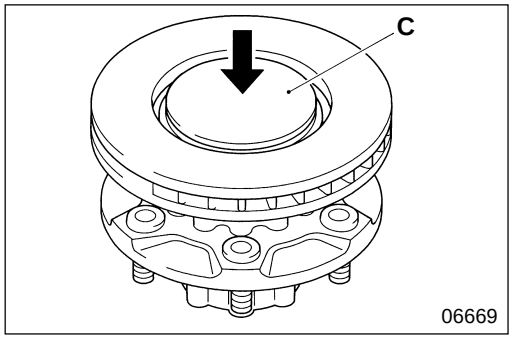
- If the amount of runout of rotor **13** deviates from the standard value, repeat the disassembly and reassembly procedures. If the amount of runout still deviates from the standard value after the reassembly, replace faulty parts.

  B : Platform

https://truckmanualshub.com/



[Removal]
Install bolts (M6 × 1.0) in threaded holes **B** (holes for rotor removal) on rotor **13**, and tighten them evenly to remove the rotor.



[Installation]
Before installing rotor **13** to rotor flange **14**, heat the rotor to approximately 150°C {302°F}. Using iron plate **C**, press-fit the rotor into the rotor flange by applying uniform pressure, making sure that there is no gap between the rotor and the rotor flange.

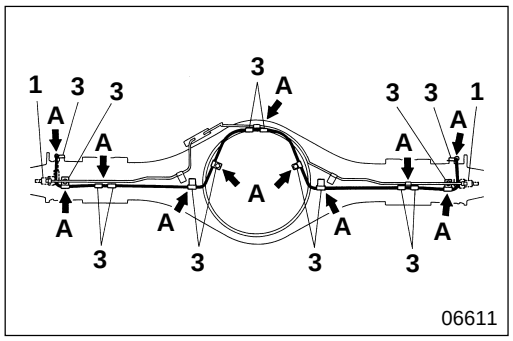
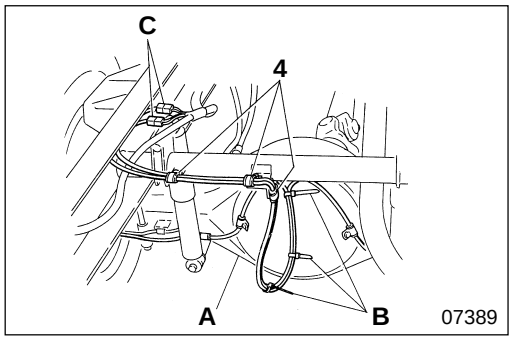
If an abnormality is found, replace wheel speed sensor **1**.



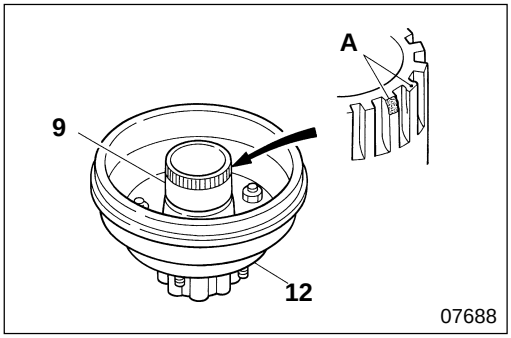
1 **3** **Installation of wheel speed sensor harness and clips**

Starting from the wheel brake side, secure the harness of wheel speed sensor **1** in place at tape sections **A** using clips **3**, while making sure that there is no interference, twisting or excessive sagging of the harness.



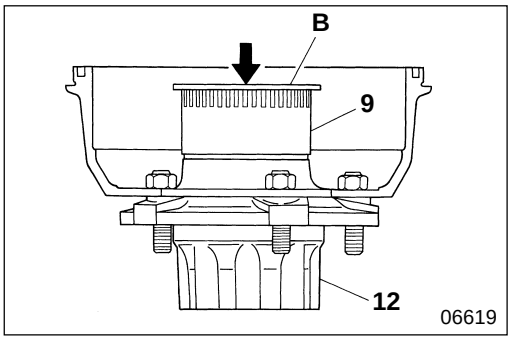
- As shown in the diagram, position the harness of speed sensor **2**, starting from rear axle housing section **A** and moving toward the frame, making sure that there is no twisting or unnecessary slack in the harness. Use clips **4** and cable ties **B** to secure the harness in place, then connect connectors **C**.

https://truckmanualshub.com/



9 **Rotor**

[Inspection]
Check rotor **9** for chipped or crushed teeth (see section **A** in the diagram).
If an abnormality is found, replace the rotor.



[Installation]
Before installing rotor **9** to wheel hub & drum assembly **12**, heat the rotor to approximately 150°C {302°F}. Using iron plate **B**, install the rotor to the wheel hub & drum assembly by applying uniform pressure, making sure that there is no gap between the rotor and the wheel hub & drum assembly.

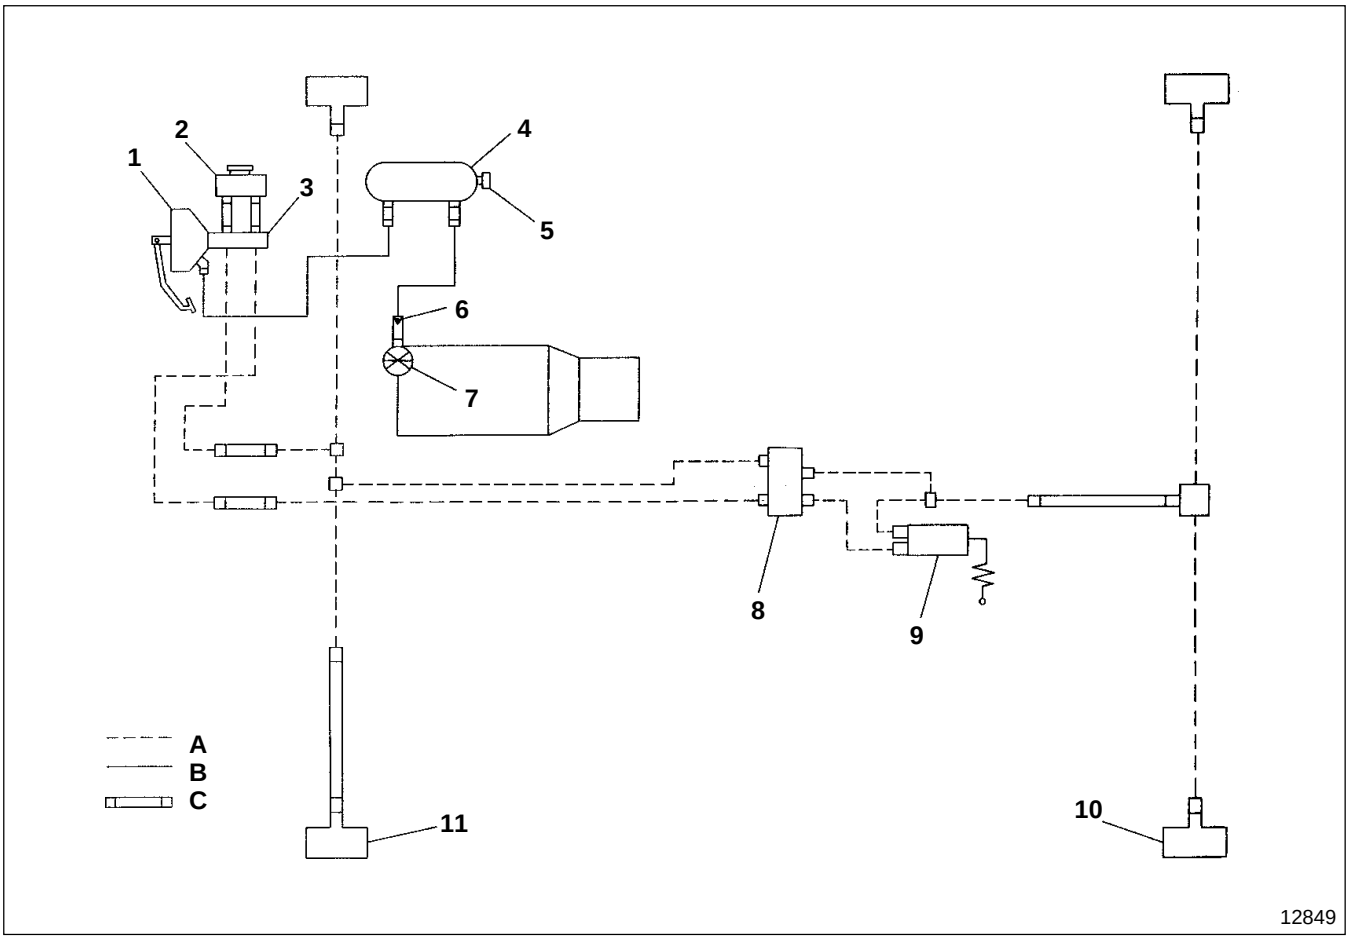
Brake System



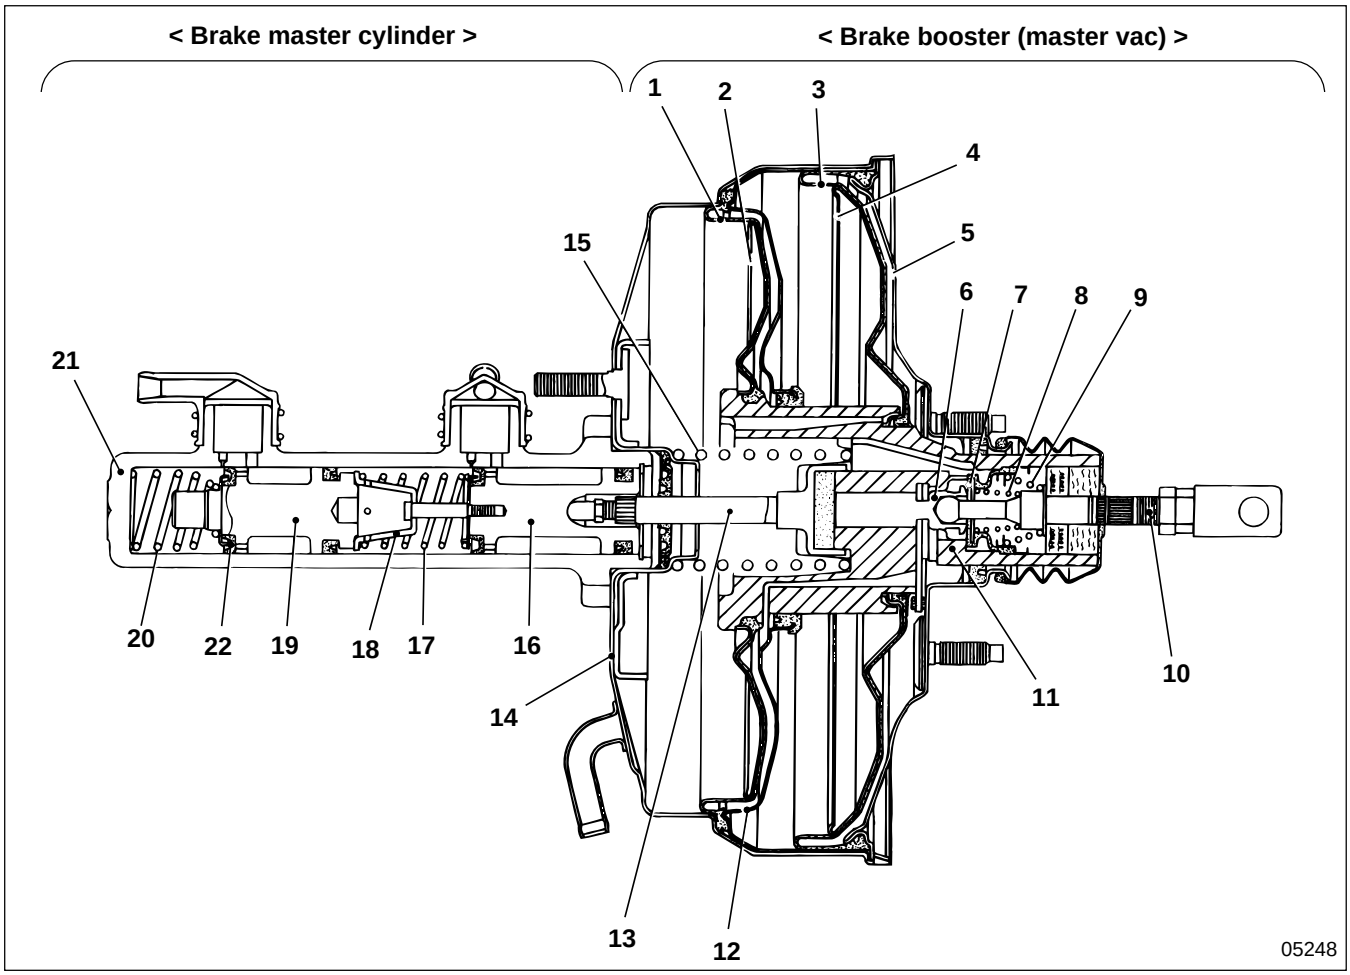
1 Brake booster (master vac)
2 Fluid tank
3 Brake master cylinder
4 Vacuum tank
5 Vacuum switch
6 Check valve
7 Vacuum pump
8 Bypass valve
9 Load sensing valve
10 Rear wheel brake
11 Front wheel brake

A : Fluid line
B : Air line
C : Hose

- The brake system is a vacuum servo all-wheel brake type, with brake booster (master vac) **1**.
- Load sensing valve **9** automatically changes the oil pressure of the rear wheel brakes according to the load changes, preventing the rear wheels from locking too early.
- Bypass valve **8** is fitted as a safety mechanism. It provides braking force if the front brake system is damaged and loses hydraulic pressure. The bypass valve does this by making the hydraulic pressure of the rear brake system bypass load sensing valve **9** and act directly on rear wheel brake **10**.

https://truckmanualshub.com/

Brake Booster (Master Vac) and Brake Master Cylinder



< Brake booster (master vac) >

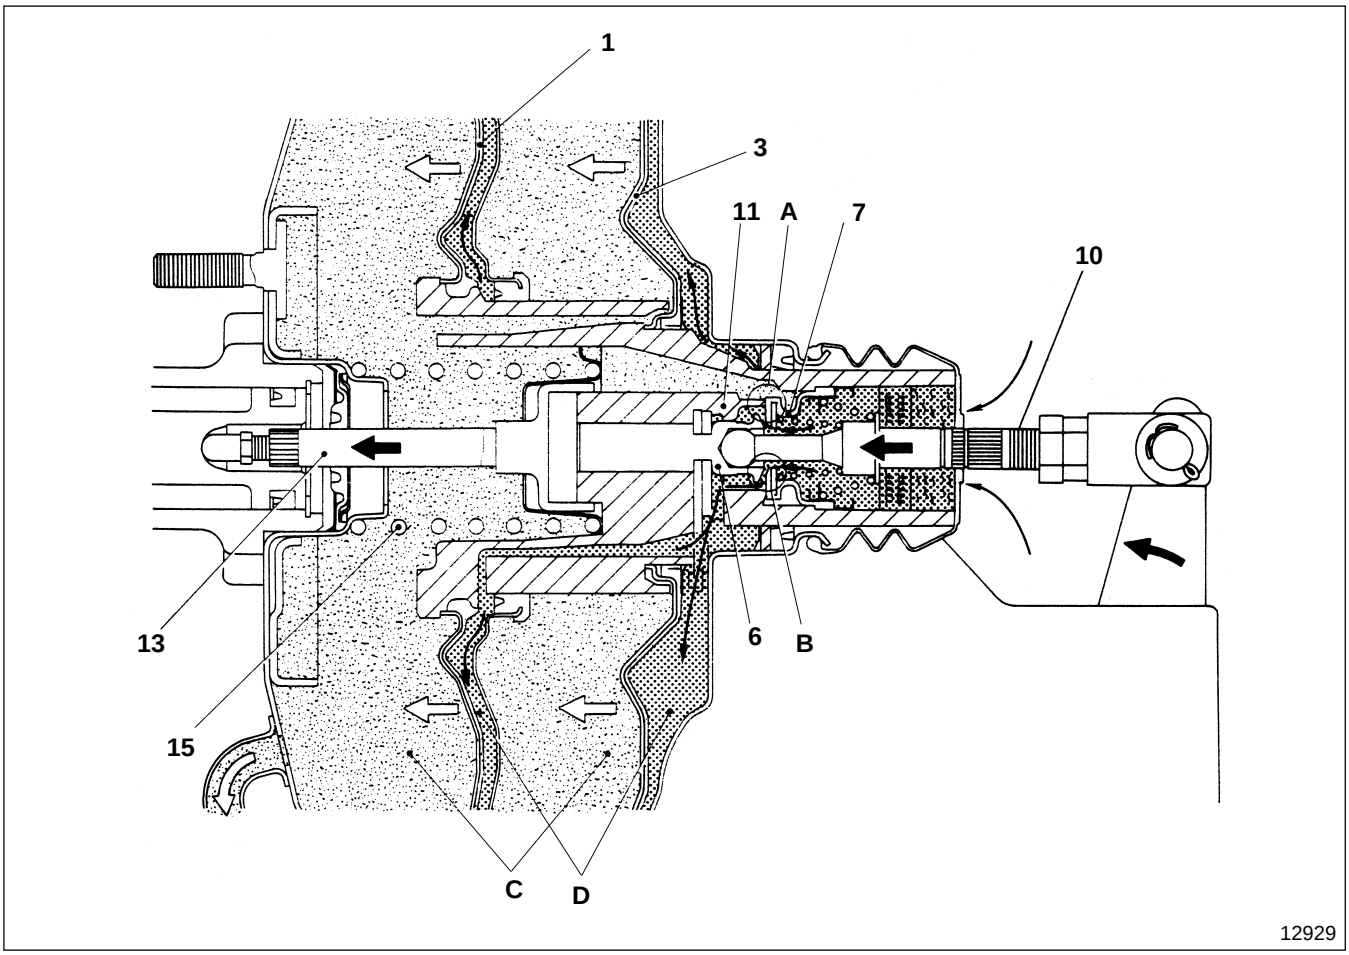
- **1** Front diaphragm
- **2** Front diaphragm plate
- **3** Rear diaphragm
- **4** Rear diaphragm plate
- **5** Rear shell
- **6** Valve plunger
- **7** Poppet
- **8** Poppet spring
- **9** Valve return spring
- **10** Operating rod
- **11** Valve body
- **12** Center plate
- **13** Push rod
- **14** Front shell
- **15** Diaphragm plate spring

< Brake master cylinder >

- **16** Primary piston
- **17** Primary piston return spring
- **18** Retainer
- **19** Secondary piston
- **20** Secondary piston return spring
- **21** Cylinder body
- **22** Packing cup

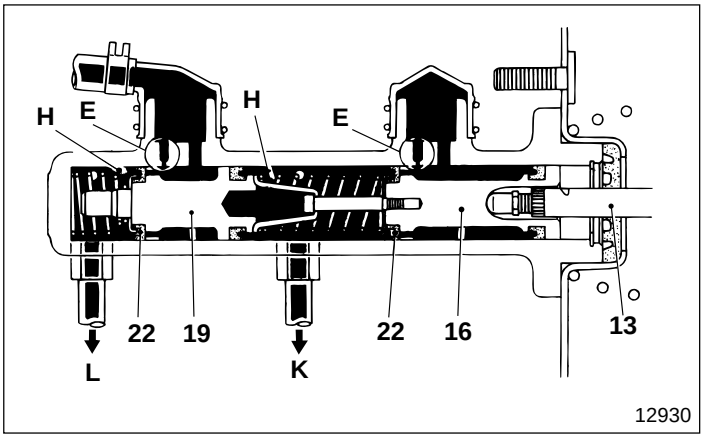
https://truckmanualshub.com/

● **When depressing brake pedal**



Action of brake booster (master vac)

- When the brake pedal is released, chambers **C** and **D** are subjected to the vacuum created by the vacuum pump.
- Depressing the brake pedal activates operating rod **10**, placing poppet **7** in tight contact with the seat of valve body **11**. This action closes vacuum valve **A**, cutting off the vacuum to chamber **D**.
- Depressing the brake pedal further separates valve plunger **6** from poppet **7**, opening breather valve **B** permitting atmospheric pressure to flow into chamber **D**, producing a pressure difference between chambers **C** and **D**.
- This pressure difference between chambers **C** and **D** presses front diaphragm **1** and rear diaphragm **3**, boosting the depressing force.
- This boosted pedal depression force overcomes the repercussive force of diaphragm plate spring **15**, presses push rod **13**, and actuates the brake master cylinder.

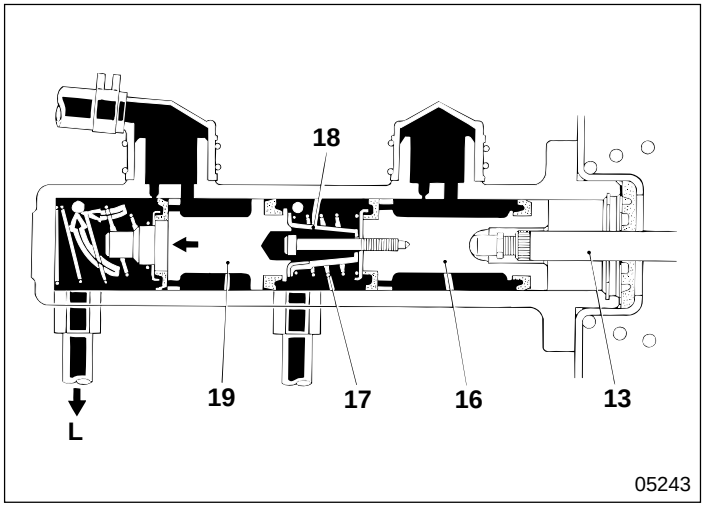


Action of brake master cylinder

- Push rod **13** pushes in primary piston **16** and secondary piston **19**, and packing cup **22** passes return port **E**, generating hydraulic pressure in chamber **H**, feeding the fluid to the respective brake systems.

  K : To the front brake system
  L : To the rear brake system

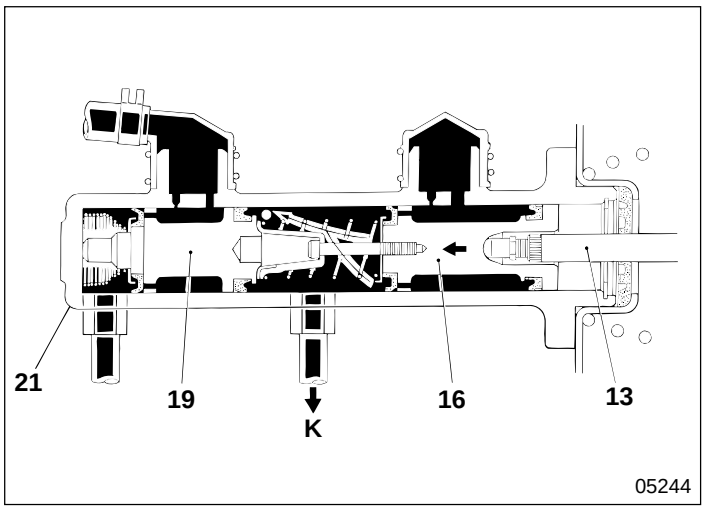
https://truckmanualshub.com/



● **Fluid leakage in the front brake system**

- Depressing the brake pedal makes push rod **13** push in primary piston **16**. However, if the brake fluid in the front brake system leaks, hydraulic pressure is not generated in the front brake system.
- Depressing the brake pedal further makes primary piston **16** compress primary piston return spring **17**, causing retainer **18** to push secondary piston **19**, thus generating hydraulic pressure only in the rear brake system.

L : To the rear brake system



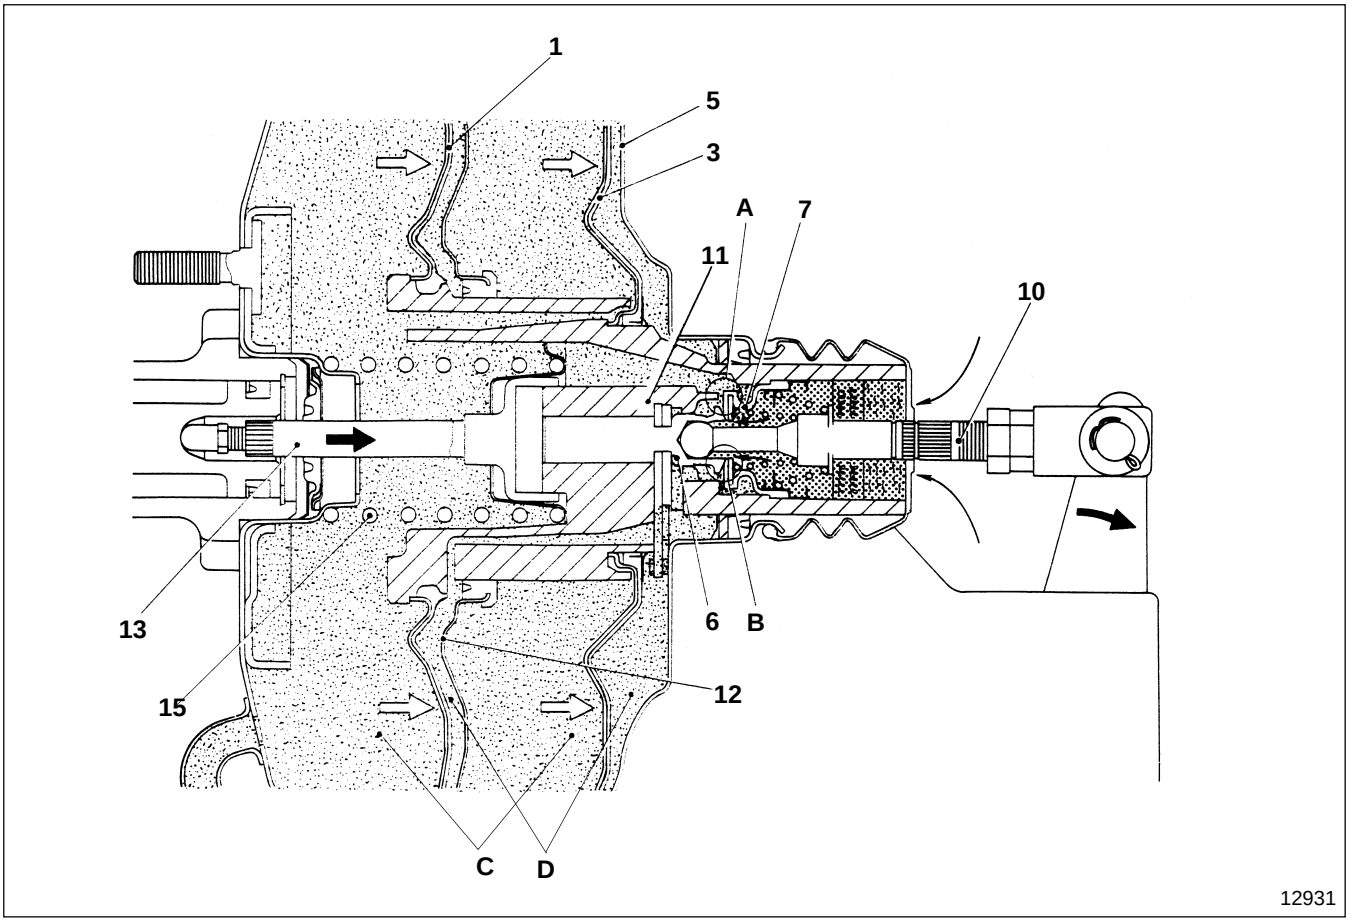
● **Fluid leakage in the rear brake system**

- Depressing the brake pedal makes push rod **13** push in primary piston **16** and secondary piston **19**. However, if the brake fluid in the rear brake system leaks, hydraulic pressure is not generated in the rear brake system.
- Depressing the brake pedal further makes the end of secondary piston **19** contact cylinder body **21**, pushing primary piston **16**, thus generating hydraulic pressure only in the front brake system.

K : To the front wheel brake system

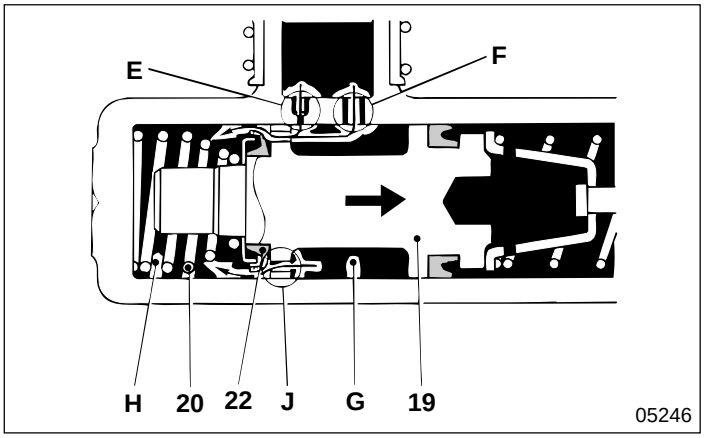
https://truckmanualshub.com/

● **When releasing brake pedal**



Action of brake booster (master vac)

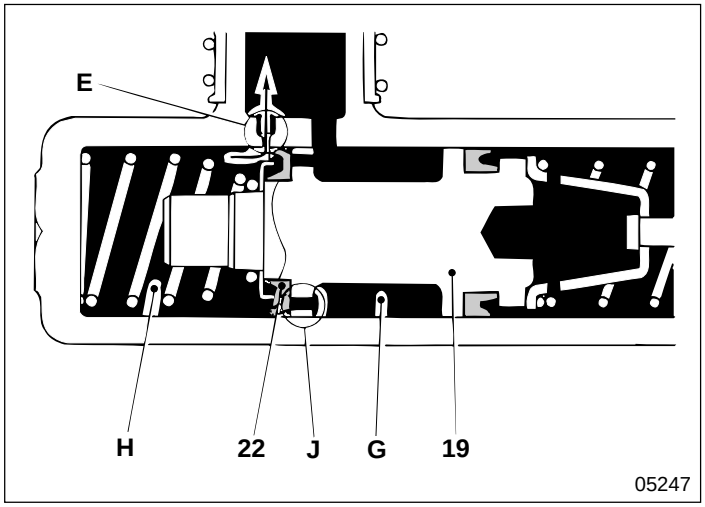
- When the brake pedal is depressed, atmospheric air flows into chamber **D** as chamber **C** is subjected to negative pressure generated by the vacuum pump.
- When the brake pedal is released, since the pressing force acting on the operating rod **10** also is released, valve plunger **6** contacts poppet **7** tightly, closing breather valve **B** to cut off the flow of atmospheric air into chamber **D**. In addition, valve plunger separates from valve body **11** to open vacuum valve **A**. Then, the negative pressure generated by the vacuum pump creates a vacuum in chamber **D**, and the pressure difference between chambers **C** and **D** diminishes.
- This absence of a pressure difference between chambers **C** and **D**, allows rear diaphragm **3** to be pushed against the rear shell **5** by the repercussive force of diaphragm plate return spring **15**, and push rod **13** returns to its original position.



Action of brake master cylinder

- When push rod **13** returns to its original position, the repercussive force of the secondary piston return spring **20** immediately begins to return secondary piston **19**. However, the brake fluid delivered from the brake master cylinder cannot return quickly due to the absence of a pressure difference between chambers **H** and **G**.
- As secondary piston **19** begins to return, the pressure in chamber **H** becomes lower than that in chamber **G**, and this pressure difference deforms packing cup **22** to open a small passage **J**. Then, the brake fluid in chamber **G** is drawn into chamber **H**.

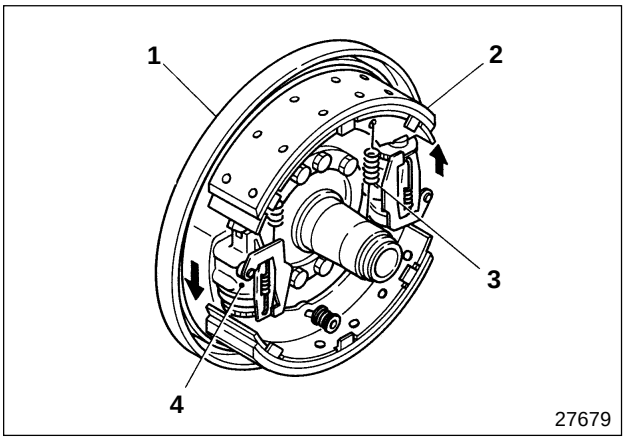
https://truckmanualshub.com/



- When secondary piston **19** returns to its original position, the pressure difference between chambers **G** and **H** is diminished, and packing cup **22** closes the small passage **J**. The hydraulic oil in the brake pipe flows from chamber **H** to the fluid tank via return port **E**.
- The same operation takes place also on the primary side.

https://truckmanualshub.com/

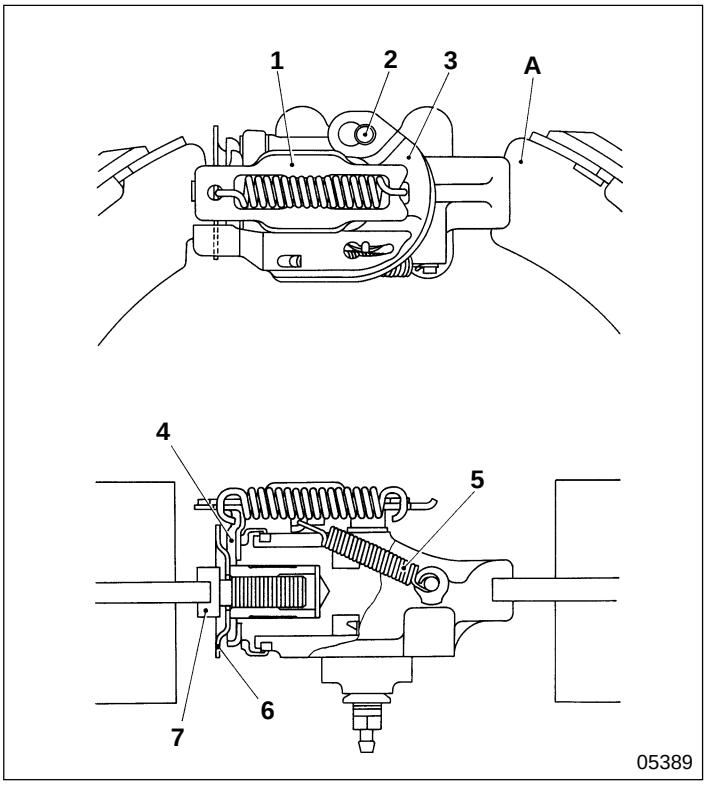
Front Drum Brake Assembly



1 Back plate
2 Brake shoe assembly
3 Return spring
4 Wheel cylinder assembly

The front drum brake assembly has two-leading brakes installed, and with single action wheel cylinder assembly **4**, the action coming from leading shoes when brake shoe assembly **2** is forward provides increased braking force through its independent double action.

● **Wheel cylinder assembly**

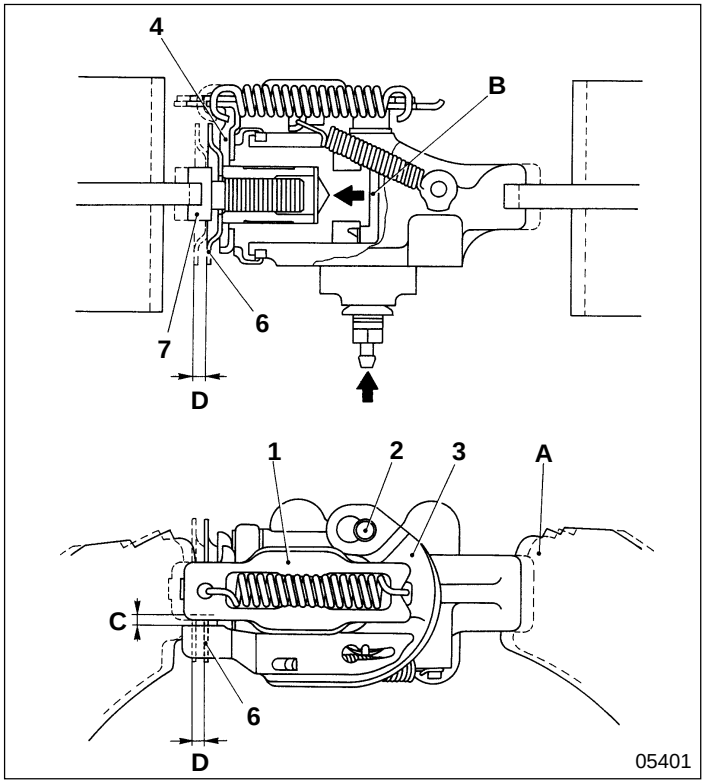


1 Spring and fitting
2 Pin
3 Lever
4 Piston assembly
5 Set spring
6 Adjuster assembly
7 Adjusting screw

A : Brake shoe assembly

The wheel cylinder assembly is equipped with an auto adjusting mechanism to adjust the gap resulting from wear between the break lining and brake drum, each time the brakes are applied.

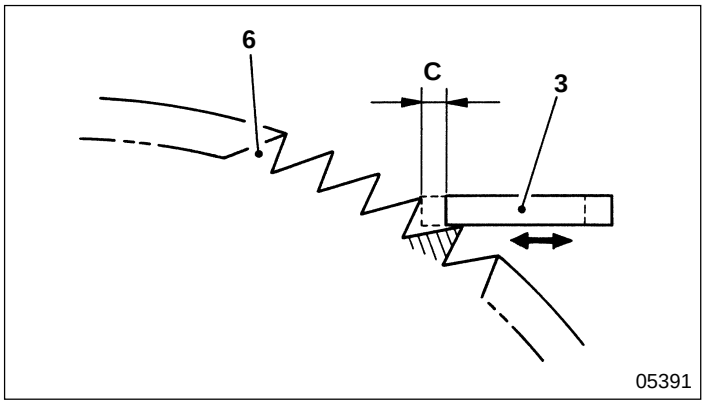
https://truckmanualshub.com/



● **Automatic adjustment mechanism**

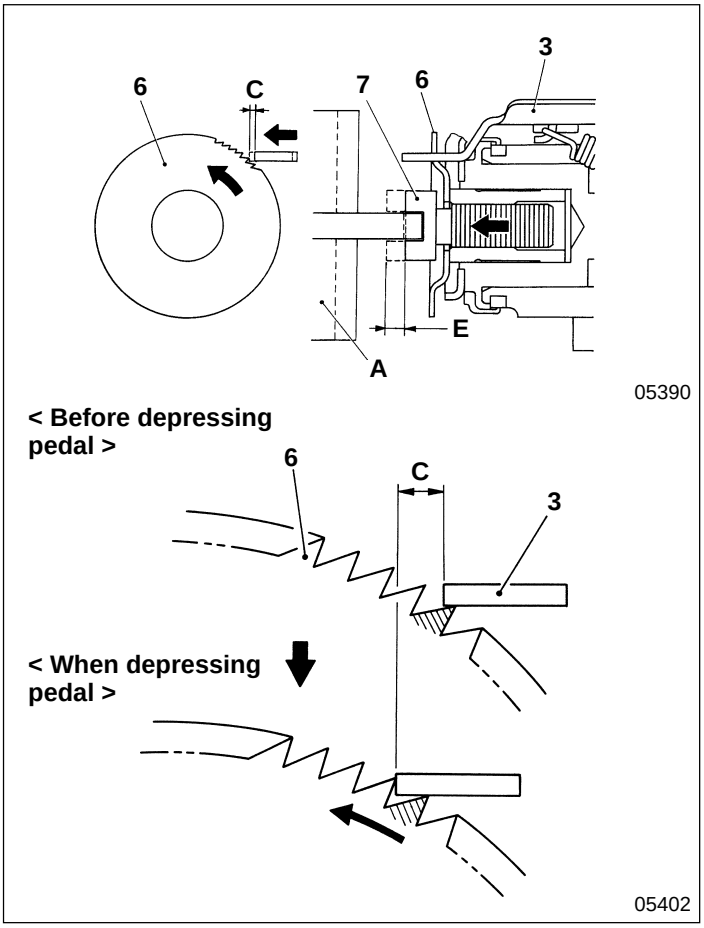
Operation

- When the brake pedal is pushed, hydraulic pressure from the brake master cylinder enters chamber **B**, driving out piston assembly **4** and pulling spring and fitting **1**. Lever **3** interlocks with spring and fitting **1**, rotating on pin **2**.
  C : Level travel
  D : Protrusion of piston assembly



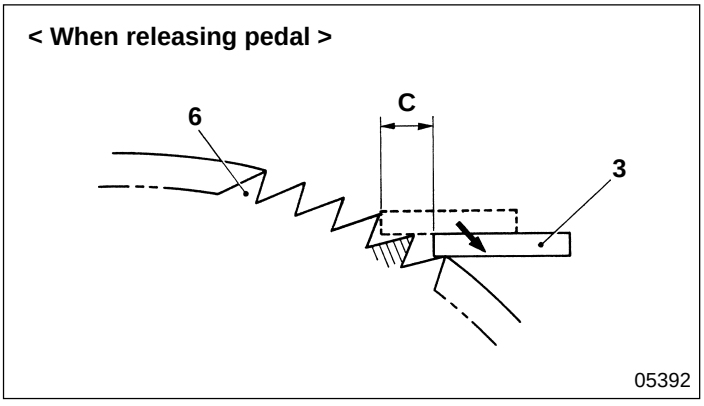
- When the clearance between the brake drum and brake lining is correct, adjuster assembly **6** does not rotate even when brakes are applied, as there is no action from lever **3**.
  C : Lever travel

https://truckmanualshub.com/



- When the clearance between the brake drum and brake lining increases, movement of piston assembly **4** and lever **3** increase.
  C : Lever travel
  E : portrusion of adjustor screw

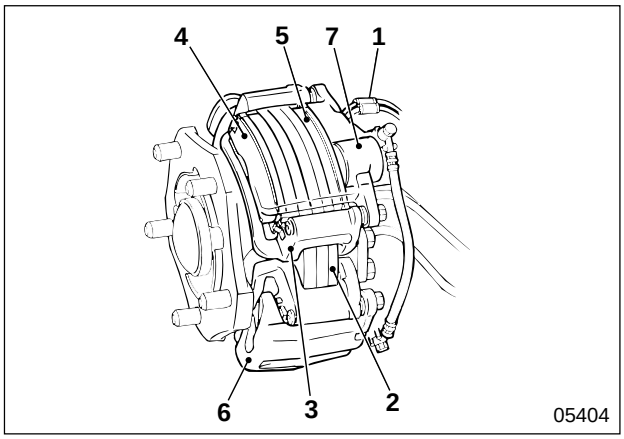
- The force of lever **3** increases the rotation of adjuster assembly **6** and the force of screw of adjuster assembly ejects adjusting screw **7**, and brake shoe assembly **A** expands.



- By depressing break pedal adjuster assembly **6** keep its rotated position while lever **3** goes back to the position deviated one step, and adjust the gap between the brake drum and brake lining correctly.
  C : Lever travel

https://truckmanualshub.com/

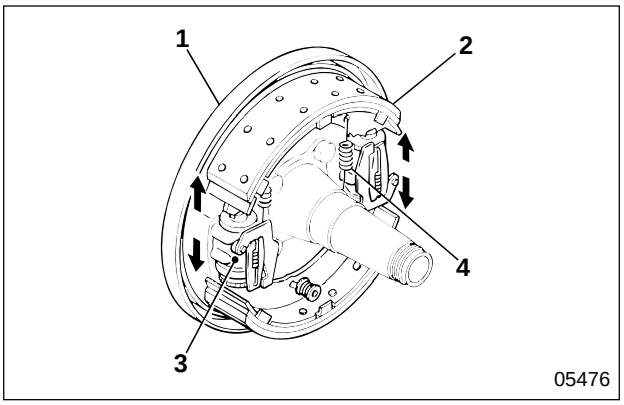
Front Disc Brake



1 Brake pad wear indicator
2 Disc rotor
3 Torque member
4 Outer pad
5 Inner pad
6 Caliper
7 Piston

Inner pad **5** is fitted with brake pad wear indicator **1** that gives warning when it is time to replace outer pad **4** and the inner pad.

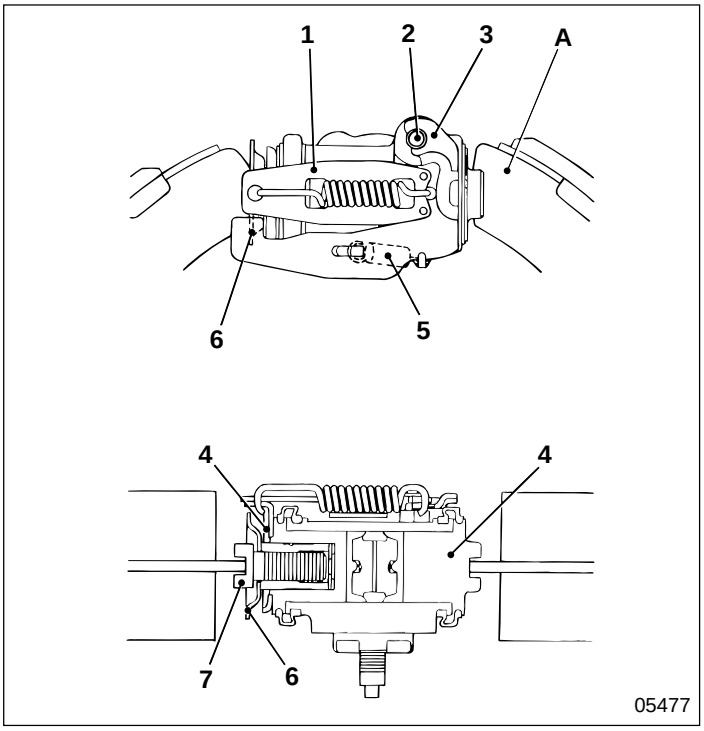
Rear Drum Brake Assembly



1 Backing plate
2 Brake shoe assembly
3 Wheel cylinder assembly
4 Return spring

The rear drum brake assembly is a dual 2-leading type brake and is fitted with wheel cylinder assembly **3**, the self-servo action of which produces a great braking force by using brake shoe assembly **2** as the leading shoe when the vehicle is travelling forwards.

● **Wheel cylinder assembly**

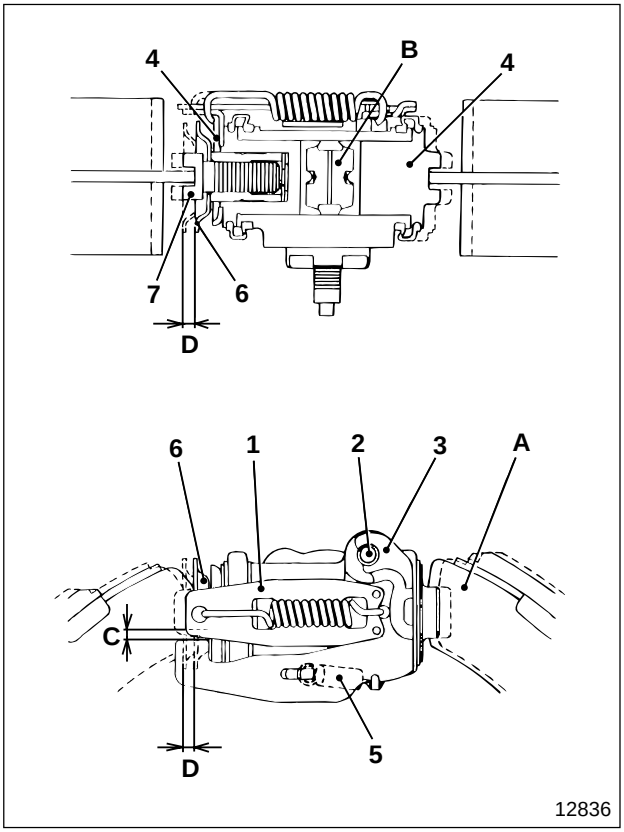


1 Spring and fitting
2 Pin
3 Lever
4 Piston assembly
5 Set spring
6 Adjuster assembly
7 Adjusting screw

A : Brake shoe assembly

The wheel cylinder assembly has an automatic adjuster that corrects the increase in clearance that occurs between the brake lining and the brake drum, an increase caused by the wear of the brake lining. This increase occurs whenever the brake pedal is depressed.

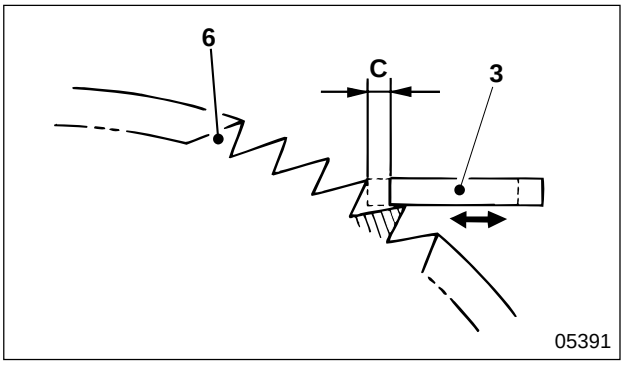
https://truckmanualshub.com/



● **Automatic adjustment mechanism**

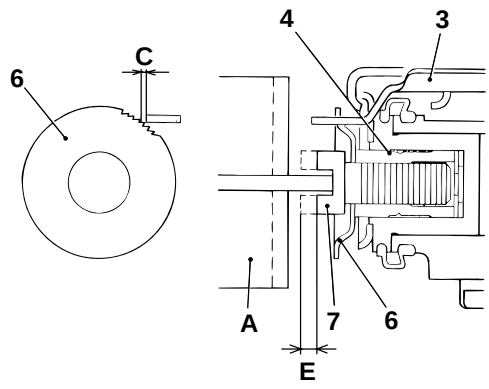
Operation

- When the brake pedal is pushed, hydraulic pressure from the brake master cylinder enters chamber **B**, driving out piston assembly **4** and pulling spring and fitting **1**. Lever **3** interlocks with spring and fitting **1**, rotating on pin **2**.
  C : Level travel
  D : Protrusion of piston assembly



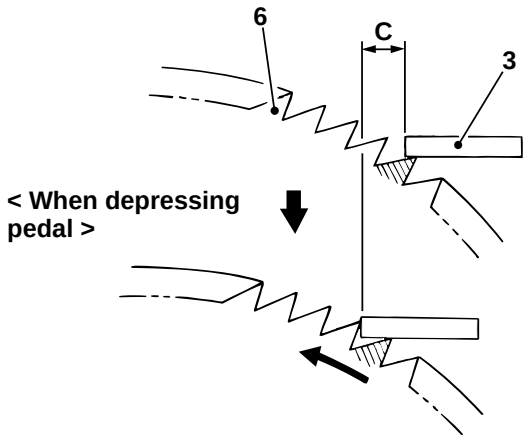
- When the clearance between the brake drum and brake lining is correct, adjuster assembly **6** does not rotate even when brakes are applied, as there is no action from lever **3**.
  C : Lever travel

https://truckmanualshub.com/



12837

< Before depressing pedal >

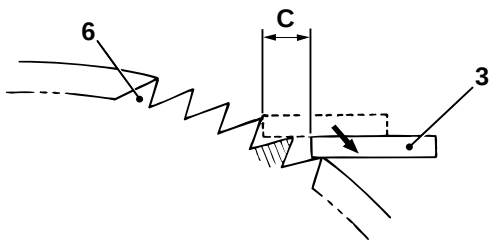


05402

- As the clearance between the brake drum and the brake lining increases, the amount of protrusion of piston assembly **4** also increases, as does the amount of travel of lever **3**.
  C : Lever travel
  E : Protrusion of adjuster screw

- The action of lever **3** increases the rotation of adjuster assembly **6**, the screw action pushes out adjuster screw **7**, expanding brake shoe assembly **A**.

< When releasing pedal >

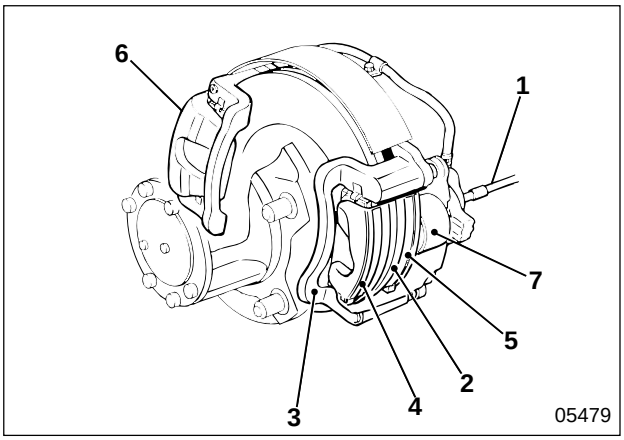


05392

- When the brake pedal is released, since adjuster assembly **6** remains in its new position after turning, returned lever **3** enters the next position, moved by one notch. This assures correct clearance between the brake drum and the brake lining.
  C : Lever travel

https://truckmanualshub.com/

Rear Disc Brake

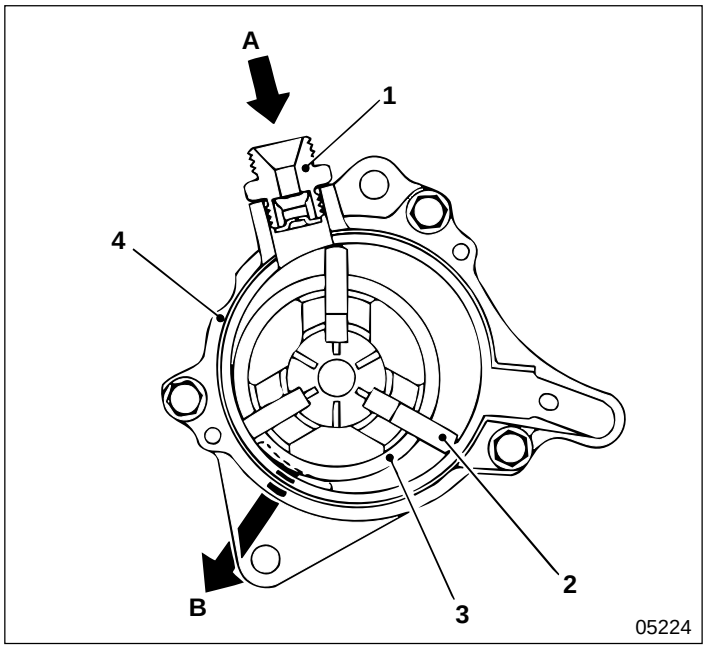


1 Brake pad wear indicator
2 Disc rotor
3 Torque member
4 Outer pad
5 Inner pad
6 Caliper
7 Piston

Inner pad **5** is fitted with brake pad wear indicator **1** that gives warning when it is time to replace outer pad **4** and the inner pad.

https://truckmanualshub.com/

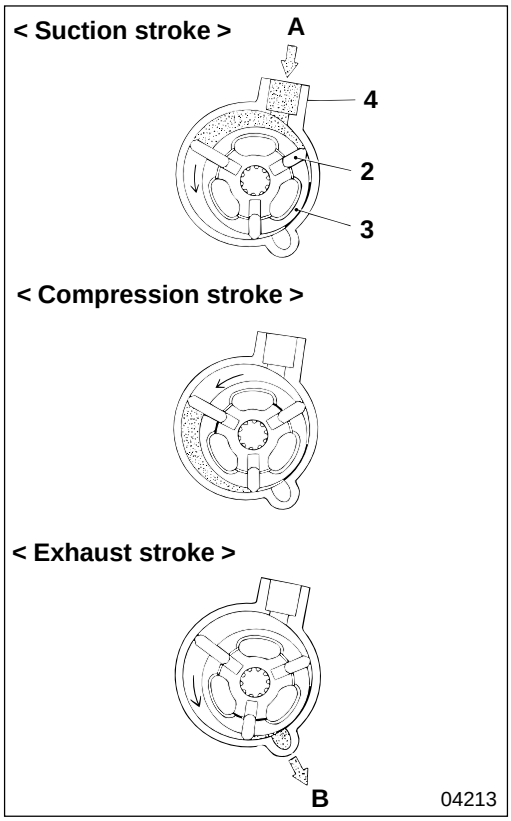
Vacuum Pump



1 Check valve assembly
2 Vane
3 Rotor
4 Housing

A : Inlet
B : Outlet

- The vacuum pump is installed on the timing gear case and is rotated by the injection pump gear or camshaft gear.
- Check valve assembly **1** is fitted to prevent the atmospheric pressure and the lubricating oil from flowing in reverse from the vacuum pump to the vacuum tank when the engine is stopped.

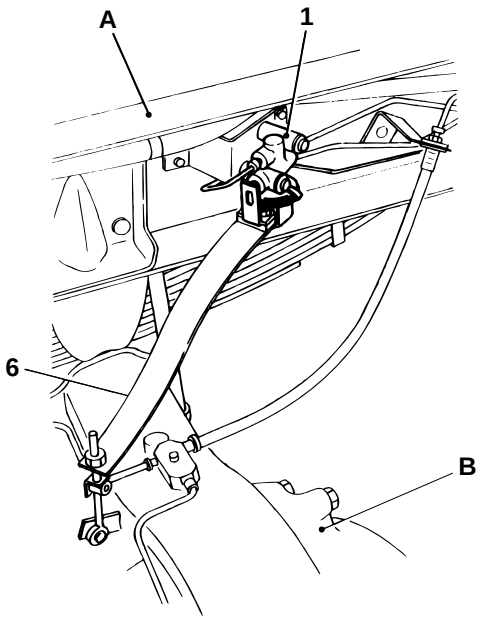


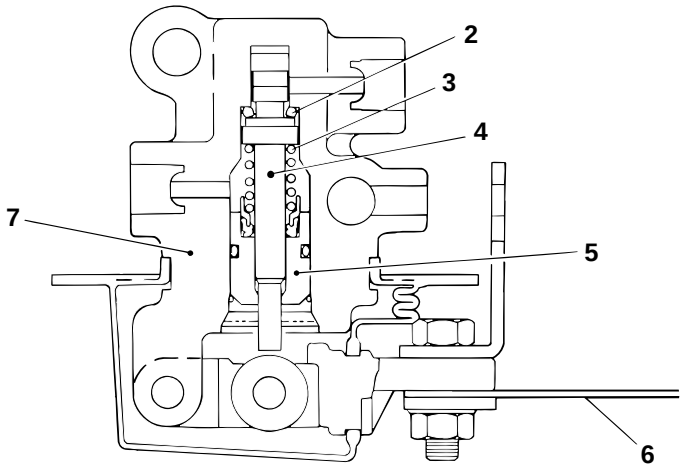
● **Operation**

- Inside cylindrical housing **4**, rotor **3** equipped with three vanes (movable blades) **2** rotates, pressing the vanes against the inside surface of the housing by centrifugal force.
- Since rotor **3** is eccentric with respect to housing **4**, as the rotor rotates, the atmospheric pressure of the vacuum tank is drawn in from inlet **A** and discharges from outlet **B** by the gradual compression of the air. This repetition of the suction, compression and exhaust strokes generates a vacuum, realizing a near-vacuum in the vacuum tank.
- The engine oil that lubricates and cools the inside of housing **4** is returned, along with air pressure, through outlet **B** to the oil pan.

https://truckmanualshub.com/

Load Sensing Valve





12932 05589

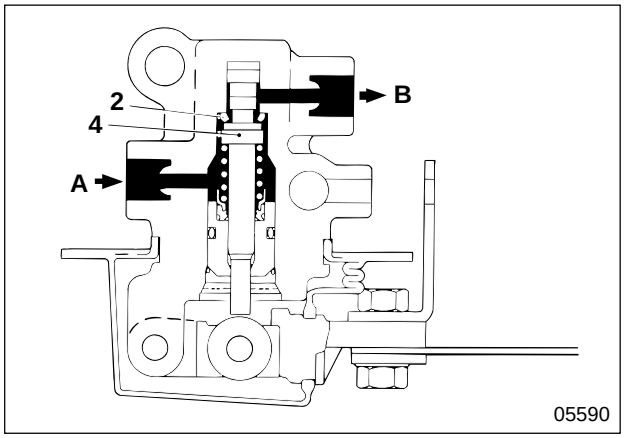
1 Load sensing valve
2 Packing cup
3 Spring
4 Plunger
5 Retainer
6 Leaf spring
7 Valve body

A : Frame
B : Rear axle

The deflection of leaf spring **6**, fixed on rear axle **B**, notifies load sensing valve **1** of any shifts in the load. This decreases hydraulic pressure to the rear wheel brakes compared to the front wheel brakes. This maintains adequate braking performance that corresponds to any shift in the load, preventing premature rear wheel lock.

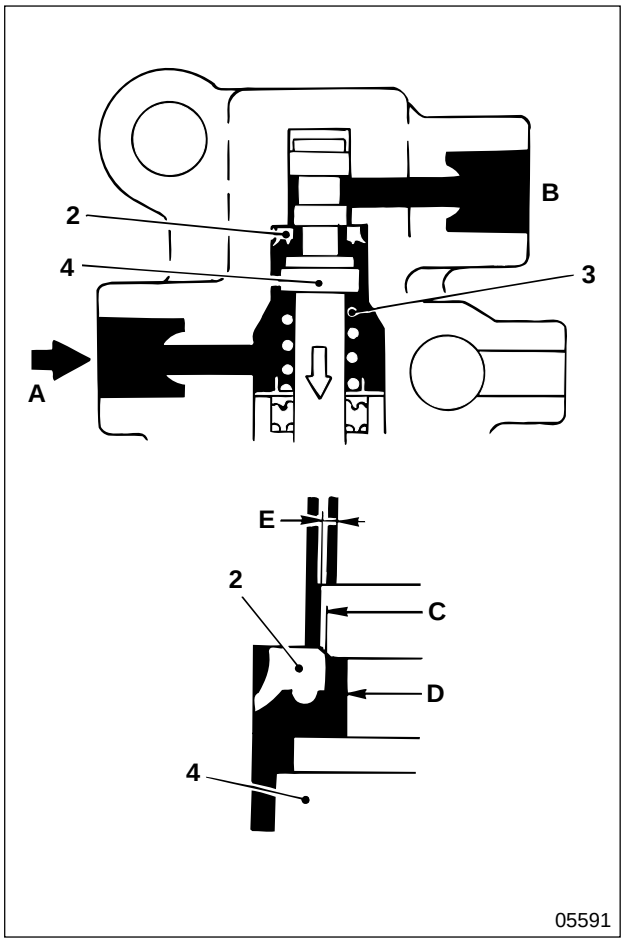
https://truckmanualshub.com/

● **Valve unit**



When depressing brake pedal

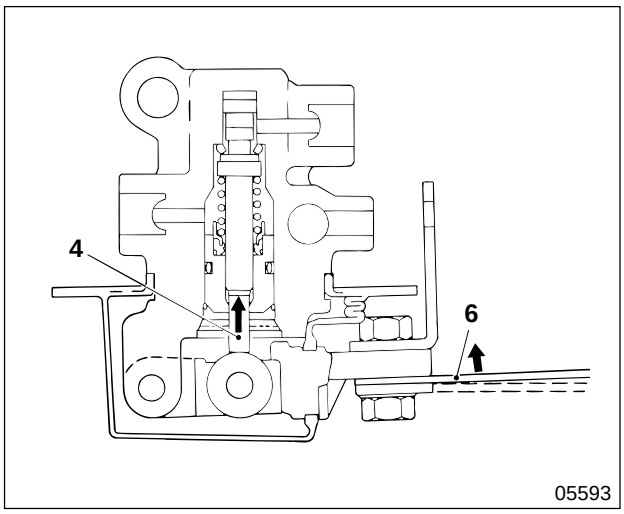
- Brake fluid is supplied from the brake master cylinder to the rear wheel brakes via chamber **A**, the clearance between packing cup **2** and plunger **4**, and chamber **B**.



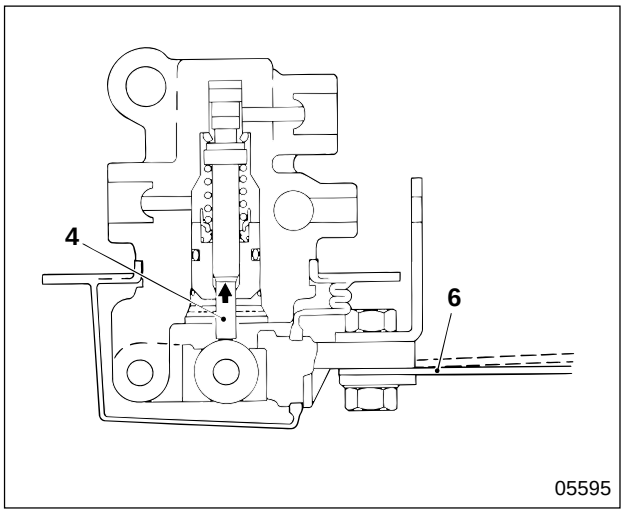
- Hydraulic pressure **A**, supplied by the brake master cylinder, gradually increases on seal cross-section **E** of plunger **4**. This increase depresses spring **3** pushing the plunger down onto packing cup **2** and cuts off the passage between chambers **A** and **B**. This is called the decompression point.
  🕮 P35-19 (Performance characteristics chart)
- Hydraulic pressure **A** at the brake master cylinder pushing plunger **4** up when the decompression point is passed. On the other hand, hydraulic pressure **B** at the rear wheel brakes works as a depressing force, so hydraulic pressure **A** and **B** balance, cutting off the passage between chambers **A** and **B**.
  At this time, hydraulic pressure at the brake master cylinder works at the donut-shaped cross-section (formed by the removal of cross-section **D** from cross-section **C** of plunger **4**). However, because hydraulic pressure **B** at the rear wheels works on the whole cross-section **E** of the plunger seal, and the rear wheel brake side remains at low hydraulic, balance is maintained.
- Therefore, hydraulic pressure **B** at the rear wheel brakes is lower than hydraulic pressure **A** at the brake master cylinder.
  The gradient of the performance characteristics of hydraulic pressure **B** is lower than that of hydraulic pressure **A**.
  🕮 P35-19 (Performance characteristics chart)

https://truckmanualshub.com/

● **Sensor unit**

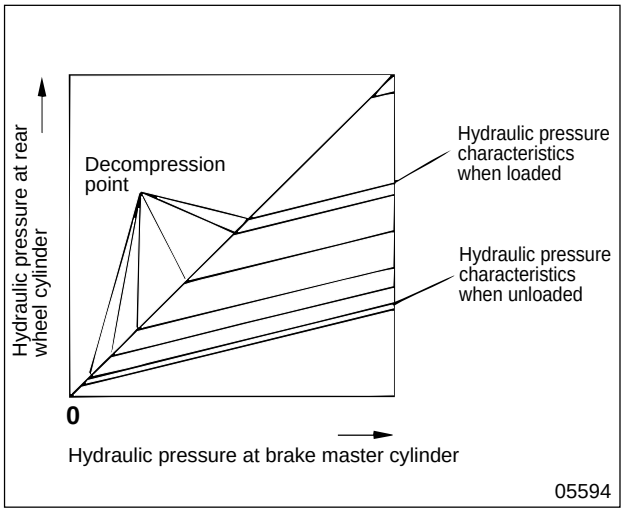


- **When the vehicle is loaded**
  When the vehicle is loaded, since the deflection of leaf spring **6** is large and the amount of upward travel of plunger **4** is also large, the amount of plunger downward travel is small. Therefore, the decompression point rises to supply higher brake pressure to the rear wheels, compared to the unloaded state.



- **When the vehicle is unloaded**
  When the vehicle is unloaded, since the deflection of leaf spring **6** is small and the amount of upward travel of plunger **4** is also small, the amount of plunger downward travel is large. Therefore, the decompression point drops to supply lower brake pressure to the rear wheels, compared to the loaded state.

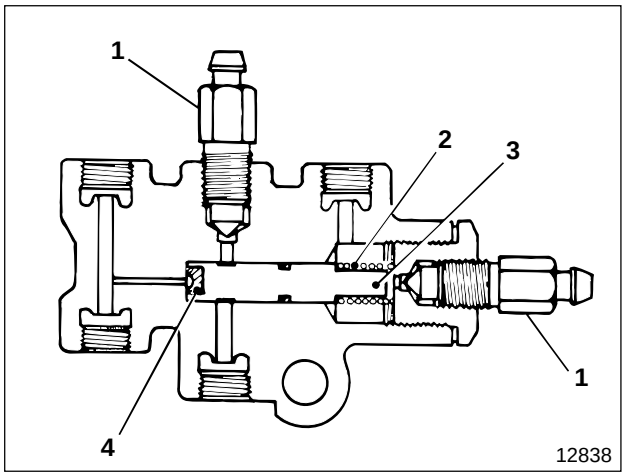
● **Performance characteristics**



The figure on the left shows the changes in braking performance characteristics of the rear wheels. These changes depend on the vehicle load and any shifts in the load caused by sudden deceleration while cruising.

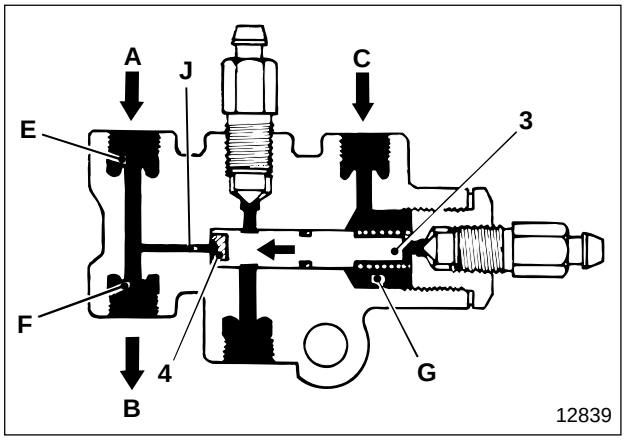
https://truckmanualshub.com/

Bypass Valve



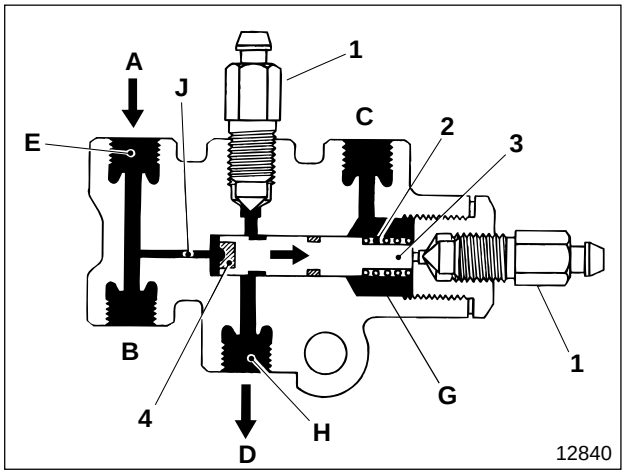
1 Bleeder screw
2 Spring
3 Piston
4 Seal

- If any failure occurred in the front brake system that decreased the hydraulic pressure, the decompression effect of the load sensing valve would affect the hydraulic pressure in the rear brake system. This would reduce the braking force of the rear brake system. The bypass valve is fitted to prevent this from happening.
- If the hydraulic pressure in the front brake system decreases, the hydraulic pressure in the rear brake system bypasses the load sensing valve and is fed directly to the rear wheel brake.



● **When the hydraulic pressure in the front brake system is normal**

- The hydraulic pressure flows through chamber **G**, pushes piston **3**, and cuts off bypass **J** with seal **4**.
  C : From front brake system
- The hydraulic pressure in the rear brake system flows from chamber **E** into chamber **F**.
  A : From the rear brake system of the brake master cylinder
  B : To the load sensing valve



● **When the hydraulic pressure in the front brake system decreases abnormally.**

- The hydraulic pressure in chamber **G** decreases, reducing the force pushing piston **3**.
  C : From the front brake system
- The hydraulic pressure of the rear brake system pushes seal **4**, and overcomes the repercussive force of spring **2** to push piston **3**, opening bypass pass **J**.
- The hydraulic pressure of the rear brake system flows from chamber **E** into chamber **H**.
  A : From the rear brake system of the brake master cylinder
  D : To the rear wheel brake

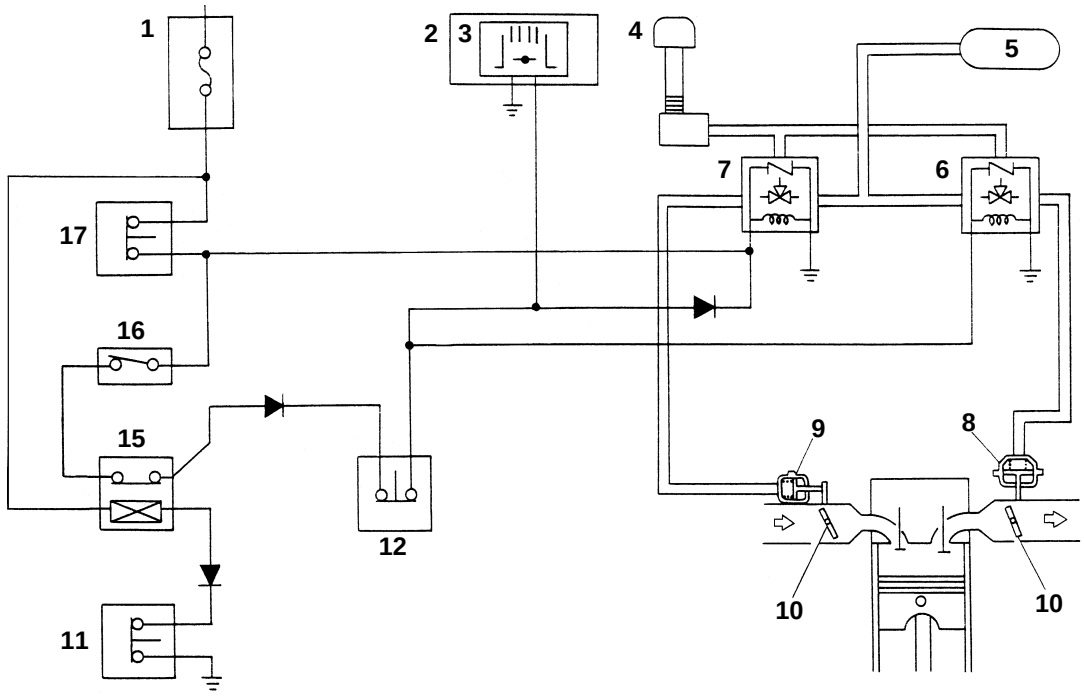
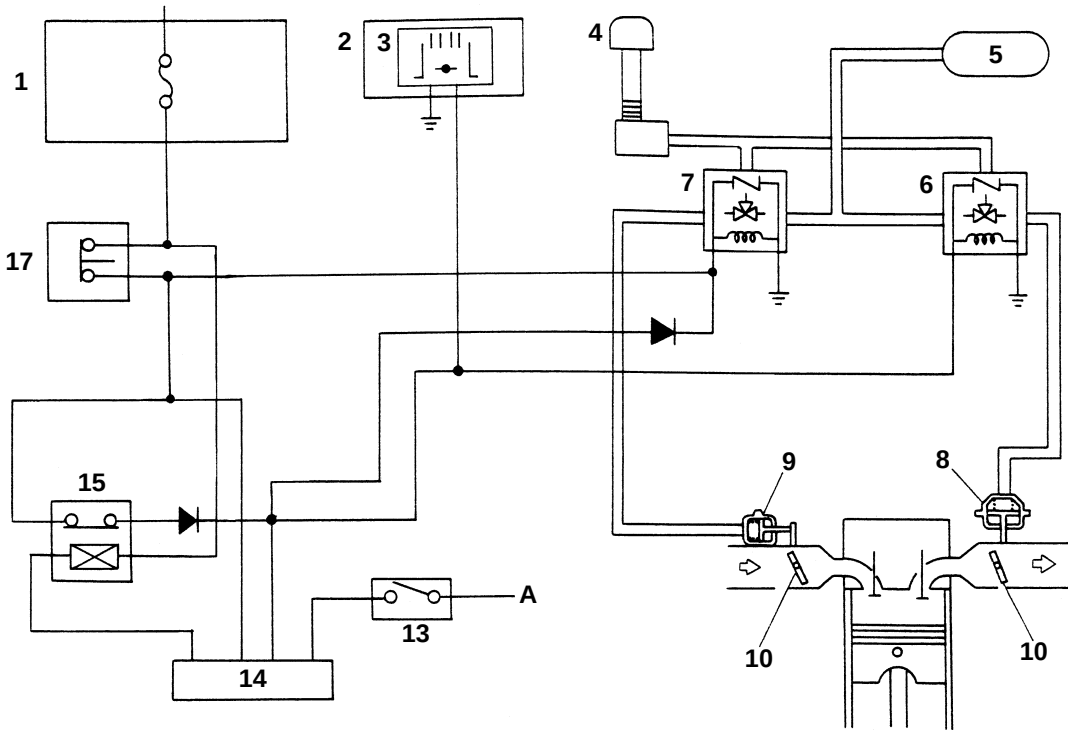
Exhaust Brake System

< Manual transmission >



12841

< Automatic transmission >



12842

https://truckmanualshub.com/

1 Fuse box
2 Meter cluster
3 Exhaust brake indicator lamp
4 Air cleaner
5 Vacuum tank
6 Exhaust brake 3-way magnetic valve
7 Intake shutter 3-way magnetic valve
8 Exhaust brake unit
9 Intake shutter
10 Butterfly valve
11 Neutral switch < Manual transmission >
12 Clutch switch < Manual transmission >
13 Inhibiter switch < Automatic transmission >
14 Automatic transmission electric control unit < Automatic transmission >
15 Exhaust brake cut relay
16 Exhaust brake switch < Manual transmission >
17 Accelerator switch
18 Clutch switch < Manual transmission >

A : From starter switch

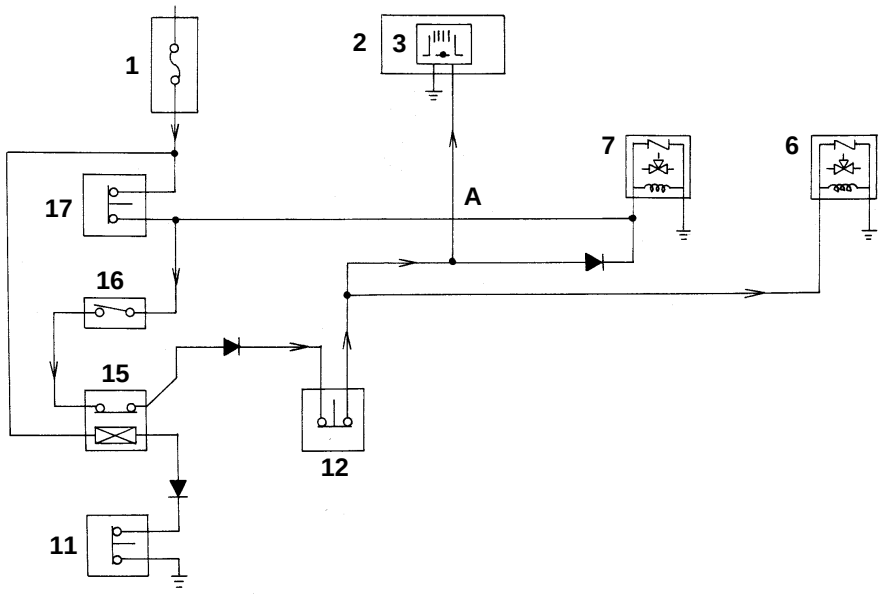
- The exhaust brake uses pressure to push and return the piston in the exhaust stroke. This pressure is generated when the exhaust pipe is shut and the pressure in the exhaust pipe increases.
- A butterfly valve type exhaust brake unit **8** is fitted as an auxiliary brake to assist the foot brake. Intake shutter **9** is fitted to reduce the suction noise generated when the exhaust brake is operated.
- When the exhaust brake switch **16** is turned ON, excitation of the coil of exhaust brake 3-way magnetic valve **6** closes the atmospheric valve and opens the vacuum valve. This makes the vacuum in the vacuum tank act on exhaust brake unit **8** which closes butterfly valve **10**, activating the exhaust brake.

https://truckmanualshub.com/

● **Operation**

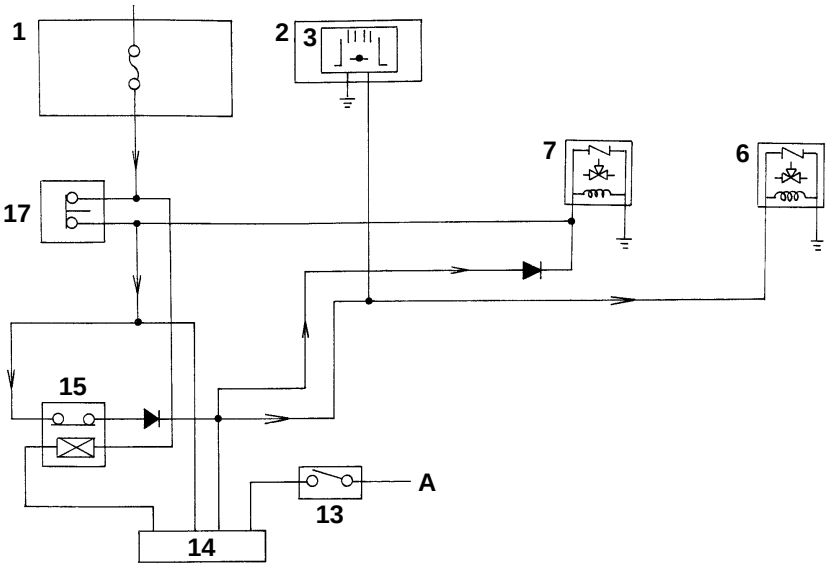
Electrical System

< Manual transmission >



12843

< Automatic transmission >



12844

When exhaust brake switch **16** is turned ON, exhaust brake indicator lamp **3** within meter cluster **2** lights up and the exhaust brake 3-way magnetic valve **6** operates.
At this time, depressing the clutch pedal (clutch switch **12** OFF) or the accelerator pedal (accelerator switch **17** OFF) temporarily releases the exhaust brake. When the transmission is in neutral (neutral switch **11** or inhibiter switch **13** ON) because the vehicle is stopped or for some other reason, exhaust brake cut relay **15** operates, releasing the exhaust brake after approximately 10 seconds.
If the accelerator pedal is depressed and released after the exhaust brake is released by the exhaust brake cut relay, the exhaust brake operates again, and after approximately 10 seconds is released.

https://truckmanualshub.com/

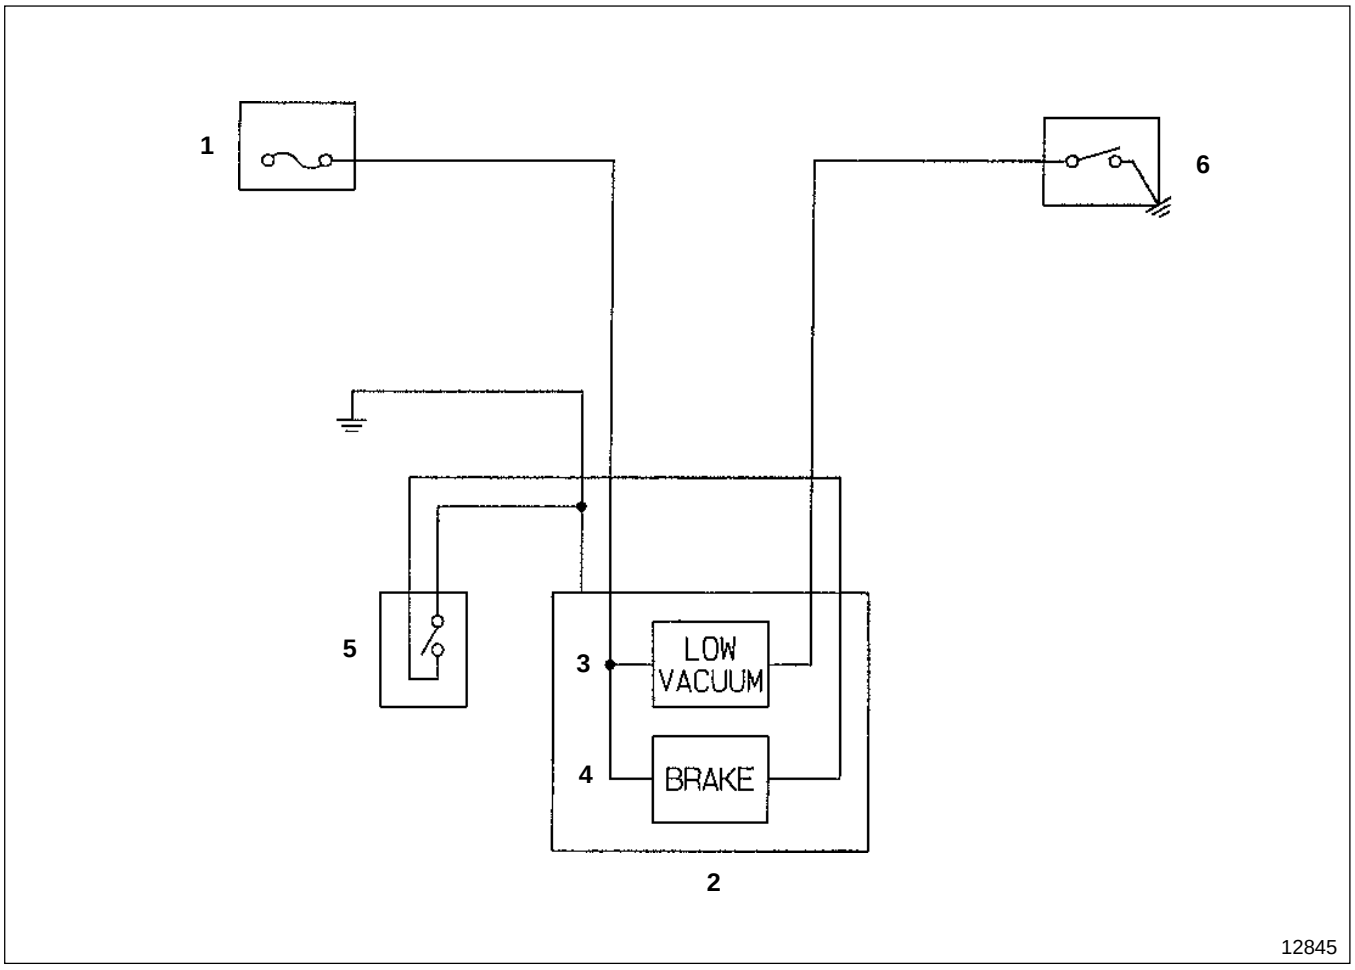
Brake Warning System

● **Vacuum system electric circuit, brake fluid level system electric circuit**

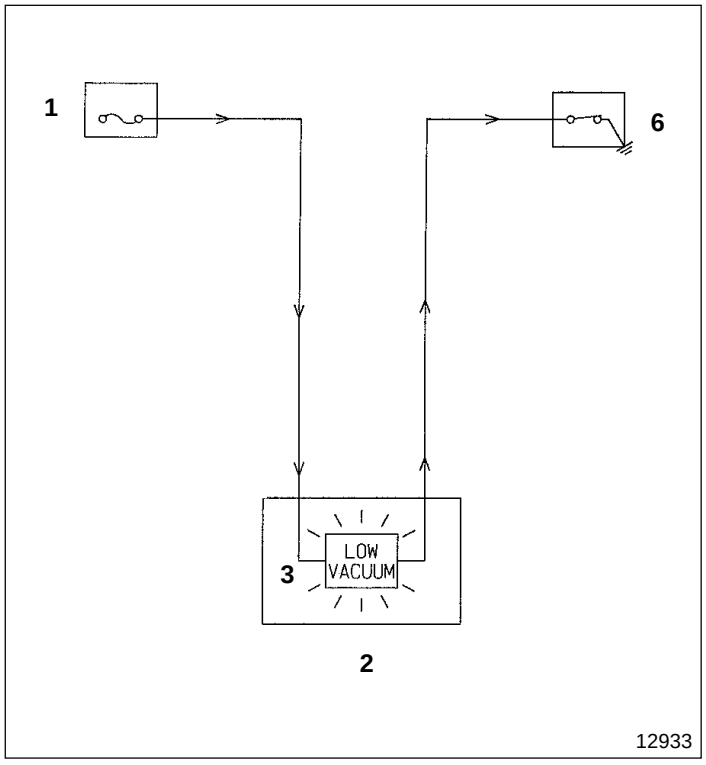


1 Fuse box
2 Meter cluster
3 Vacuum warning lamp
4 Brake warning lamp
5 Brake fluid level switch
6 Vacuum switch

The brake warning system consists of a vacuum system electric circuit which detects the drop in negative pressure inside the vacuum tank, and a brake fluid level system electric circuit which detects the drop in the level of brake fluid inside the fluid tank. In both cases a warning lamp lights up to give warning.

https://truckmanualshub.com/

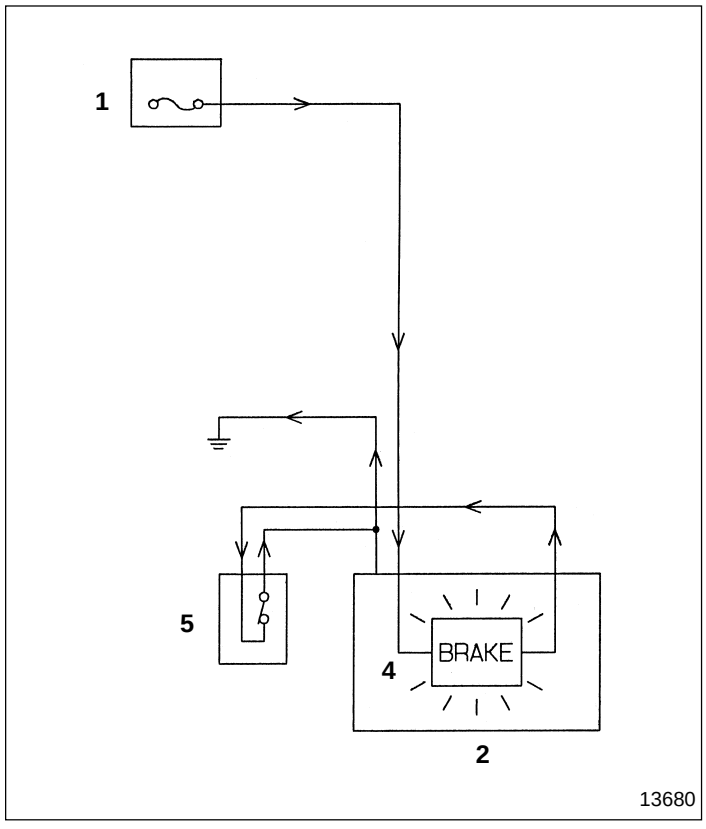
● **Vacuum system electric circuit**



If the negative pressure in the vacuum tank drops below the specified pressure, vacuum switch **6** turns ON lighting vacuum warning lamp **3**. The flow of current at such time is as follows.

Fuse **1**→Vacuum warning lamp **3**→Vacuum switch **6**→Ground

● **Brake fluid level system electric circuit**

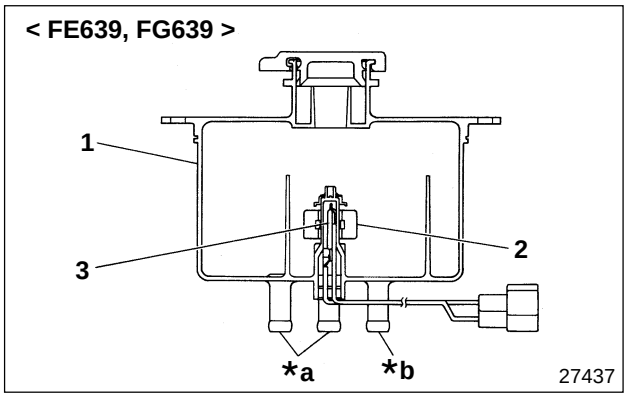


If the amount of brake fluid in the fluid tank drops below the specified amount, brake fluid level switch **5** turns ON lighting brake warning lamp **4**. The flow of current at such time is as follows.

Fuse **1**→Brake warning lamp **4**→Brake fluid level switch **5**→Ground

https://truckmanualshub.com/

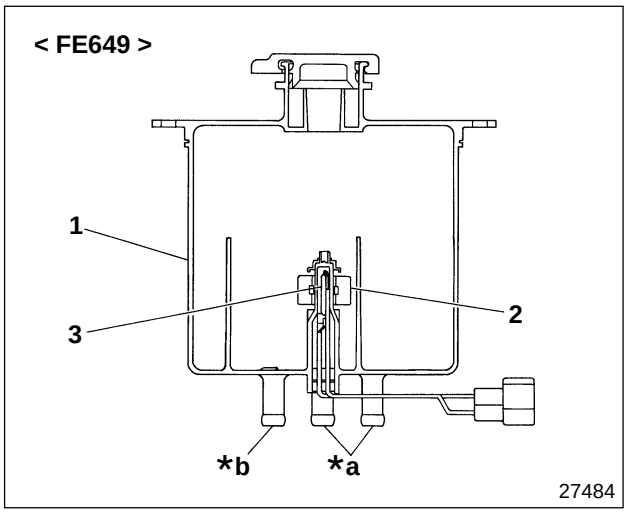
● **Brake fluid level switch**

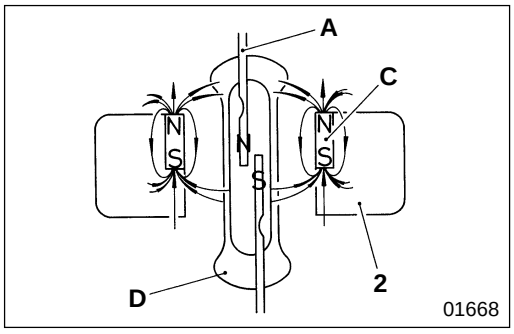


1 Fluid tank
2 Float
3 Brake fluid level switch

***a** : For brakes
***b** : For clutch

- Brake fluid level switch **3**, installed on fluid tank **1**, monitors the brake fluid level in the fluid tank. If the brake fluid level drops below the specified level, float **2** moves and lights up the warning lamp within the meter cluster to alert the driver.

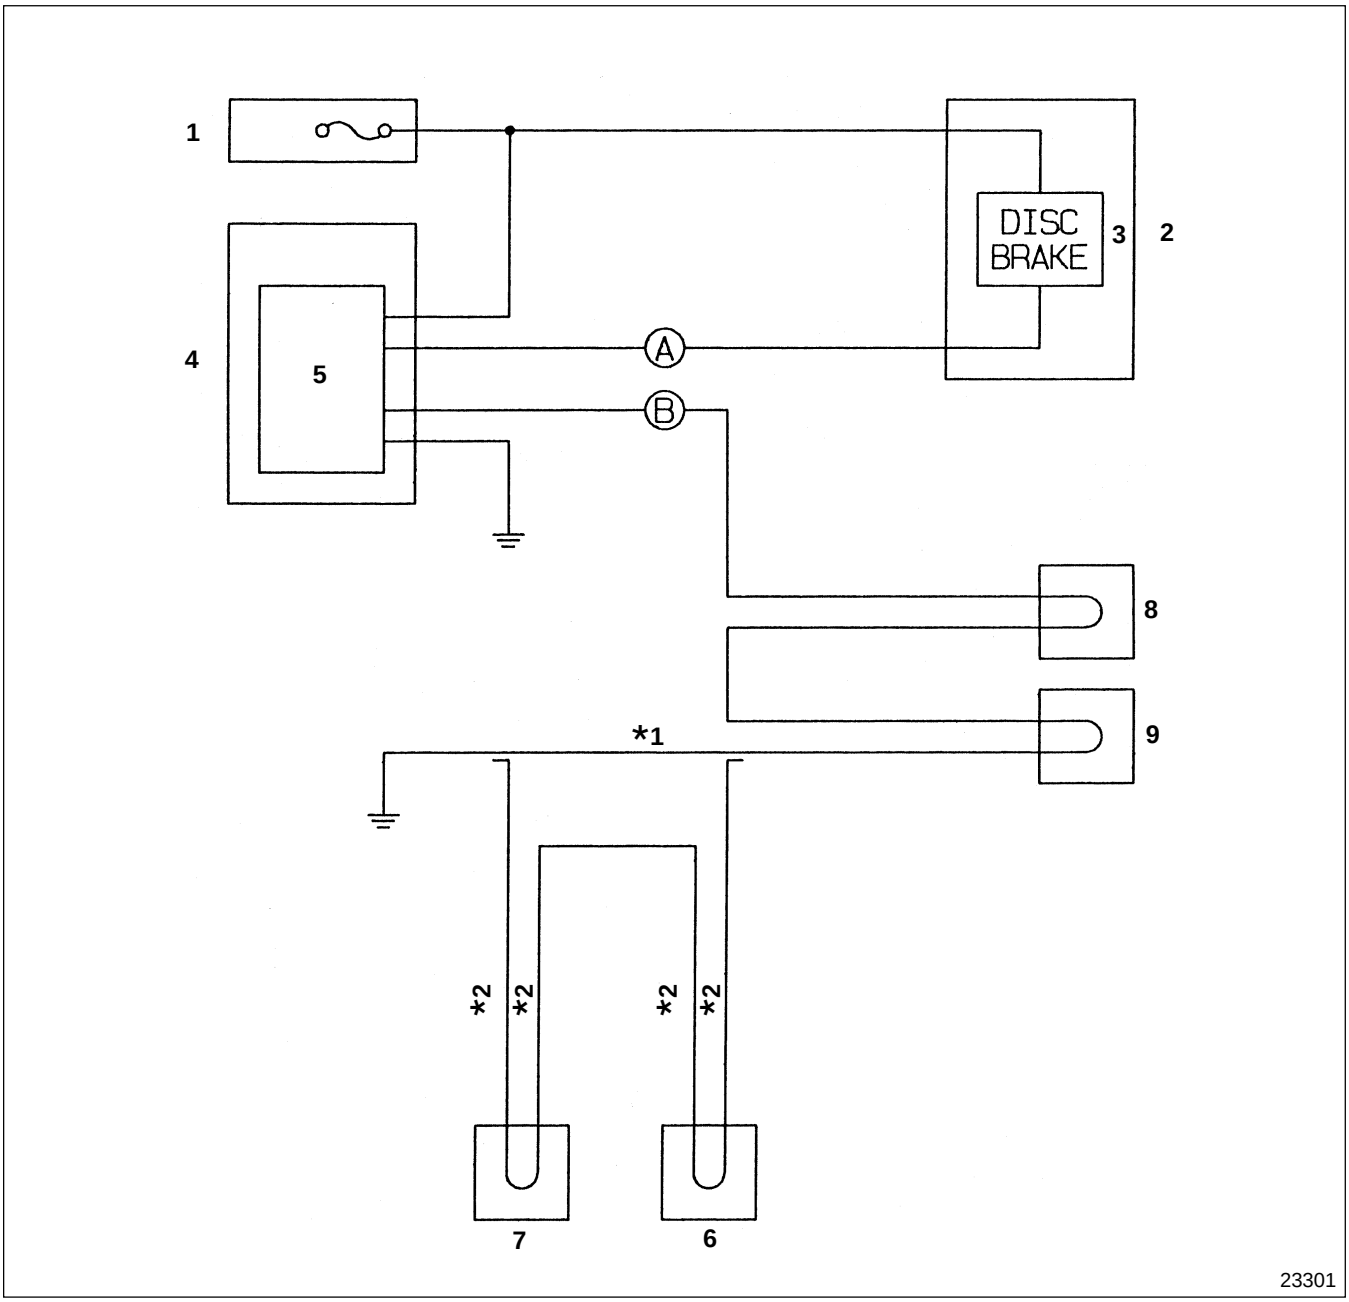




- If the brake fluid level in fluid tank **1** drops and float **2** drops lower than level **L**, magnetic force **B** that passes through the contact point (ferromagnetic body **A**), increases generating north and south poles at the ends of the contact points. Therefore, the contact points pull each other and overcome the repercussive force of the springs of the contact points, forming an electric circuit.
  C : Magnet
  D : Glass

https://truckmanualshub.com/

Wear Indicator System Electric Circuit



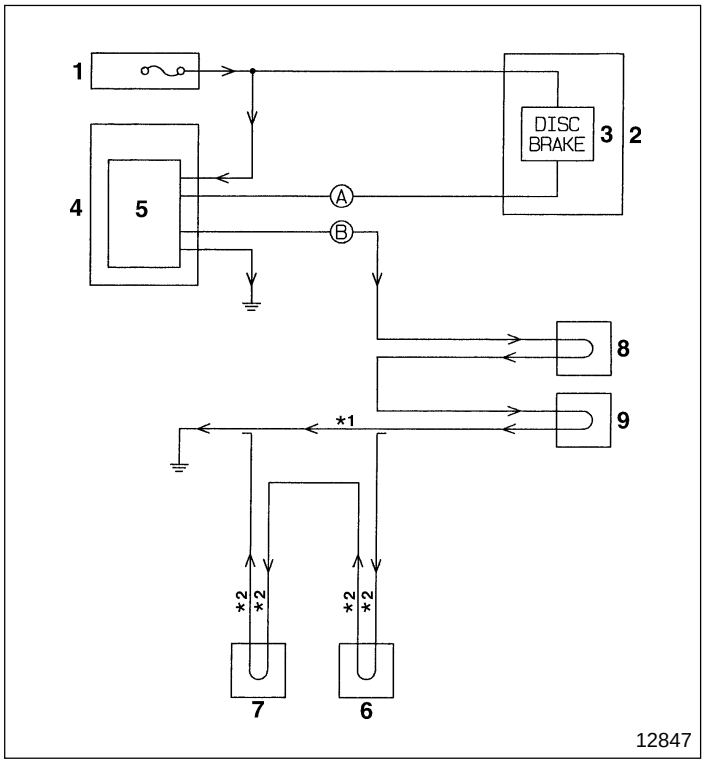
1 Fuse box
2 Meter cluster
3 Disc brake warning lamp
4 Relay box
5 Lighting and alarm control unit
6 Rear brake pad wear indicator, LH < FE649 >
7 Rear brake pad wear indicator, RH < FE649 >
8 Front brake pad wear indicator, LH
9 Front brake pad wear indicator, RH

***1** : < FE639 >
***2** : < FE649 >
Ⓐ : Warning signal
Ⓑ : Wear indicator signal

- The brake pad wear indicator system electrical circuit is provided for warning. When the brake pad is worn out, the disc rotor disconnects wear indicators **6** to **9**. Lighting and alarm control unit **5** detects this and gives a warning.
- If one of pad wear indicators **6** to **9** is disconnected, lighting and alarm control unit **5** operates, lighting disc brake warning lamp **3**.

https://truckmanualshub.com/

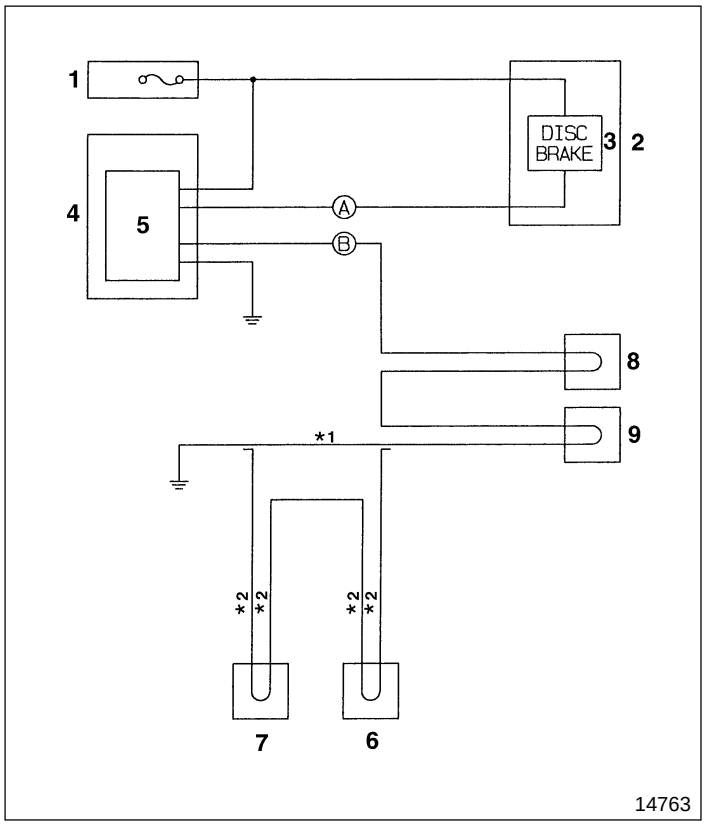
● **When normal operating**



- While lighting alarm control unit **5** is sending out wear indicator signal Ⓐ, warning signal Ⓐ is not input.
- Since warning signal Ⓐ is not being input, disc brake warning lamp **3** will not light up.
- The flow of current at such time is as follows.

Fuse **1**→Lighting alarm control unit **5**→Ground
→Wear indicator signal Ⓑ→Brake pad wear indicator **6** to **9**→Ground

● **When brake pad wear indicator cut off**



- When lighting alarm control unit **5** stops sending out wear indicator signal Ⓑ, warning signal Ⓐ is input.
- When warning signal Ⓐ is input, disc brake warning lamp **3** lights up.
- The flow of current at such time is as follows.

Fuse **1** → →Lighting alarm control unit **5**→Ground
→Disc brake warning lamp **3**
→Warning signal Ⓐ

ON-VEHICLE INSPECTION AND ADJUSTMENT

Replacement of Brake Fluid

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened		Tightening torque	Remarks
1	Air bleeder	Front disc brake < FE >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Front wheel cylinder < FG >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Rear wheel cylinder < FE639, FG639 >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Rear disc brake < FE649 >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Bypass valve	8.8 to 13.0 {6.5 to 9.4, 0.9 to 1.3}	—

Fluid

Location	Points of application	Specified fluid	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No. 116 DOT3)	As required

WARNING

- **The clutch fluid system and the brake fluid system use the fluid tank in common. Therefore, replacement and air bleeding of the clutch fluid must be carried out simultaneously with that of the brake fluid. Gr 21**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a container for adding brake fluid, keep it solely for that purpose.**

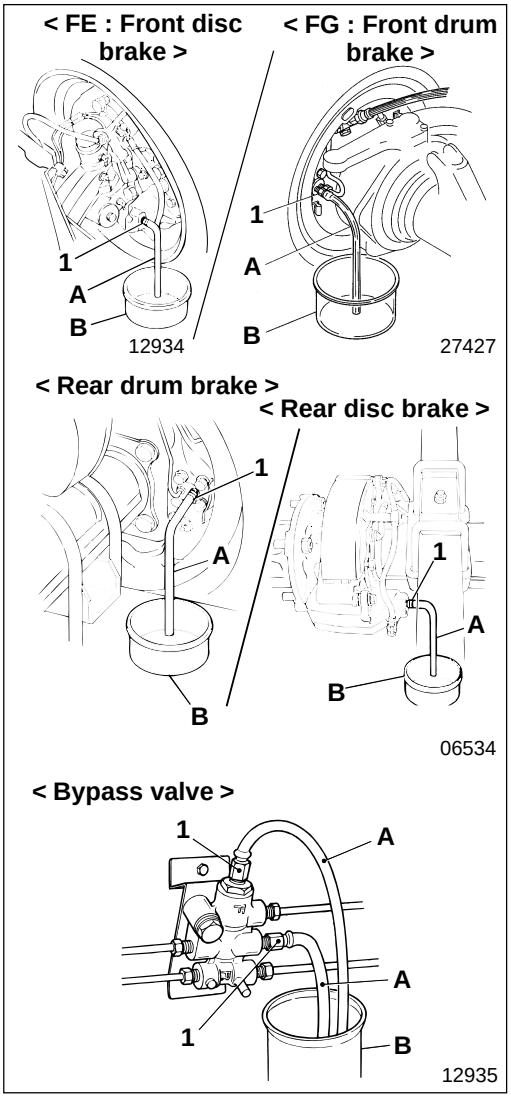
CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

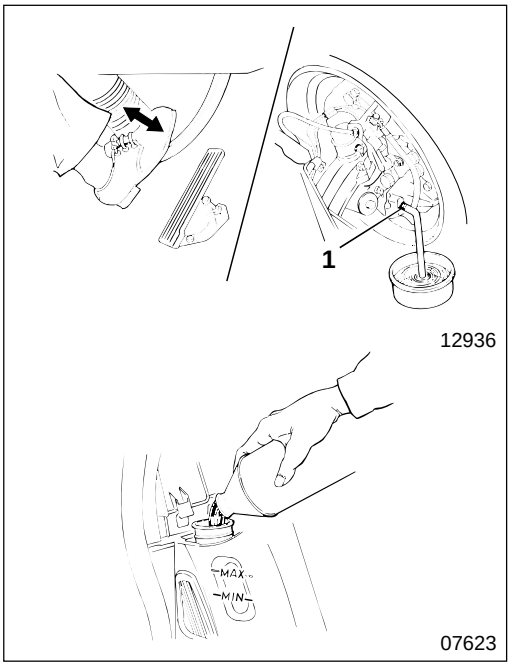
NOTE

Supply and maintain the brake fluid level to the “MAX” level of the fluid tank.

https://truckmanualshub.com/



- Start the engine and let it idle until you complete brake fluid replacement.
- Connect vinyl pipes **A** : one to the front disc brake < FE >, the front drum brake < FG > one to the rear drum brake < FE639, FG639 > or the rear disc brake < FE649 >, and two to the bypass valve.
- Put the free ends of vinyl pipes **A** into containers **B**.



- Loosen air bleeders **1** and depress the brake pedal several times to drain brake fluid completely.
- Maintaining a supply of new brake fluid up to the “MAX” level of the fluid tank, depress the brake pedal repeatedly until the old brake fluid of the brake system is replaced with new fluid, and after you complete the work, tighten each air bleeder **1** at specified torque.

- Bleed air from the brake system.
P35-40

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

Air Bleeding of Brake System

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened		Tightening torque	Remarks
1	Air bleeder	Front disc brake < FE >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Front wheel cylinder < FG >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Rear wheel cylinder < FE639, FG639 >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Rear disc brake < FE649 >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Bypass valve	8.8 to 13.0 {6.5 to 9.4, 0.9 to 1.3}	—

Fluid

Location	Points of application	Specified fluid	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No. 116 DOT3)	As required

WARNING

- **The clutch fluid system and the brake fluid system use the fluid tank in common. Therefore, replacement and air bleeding of the clutch fluid must be carried out simultaneously with that of the brake fluid. Gr 21**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a container for adding brake fluid, keep it solely for that purpose.**

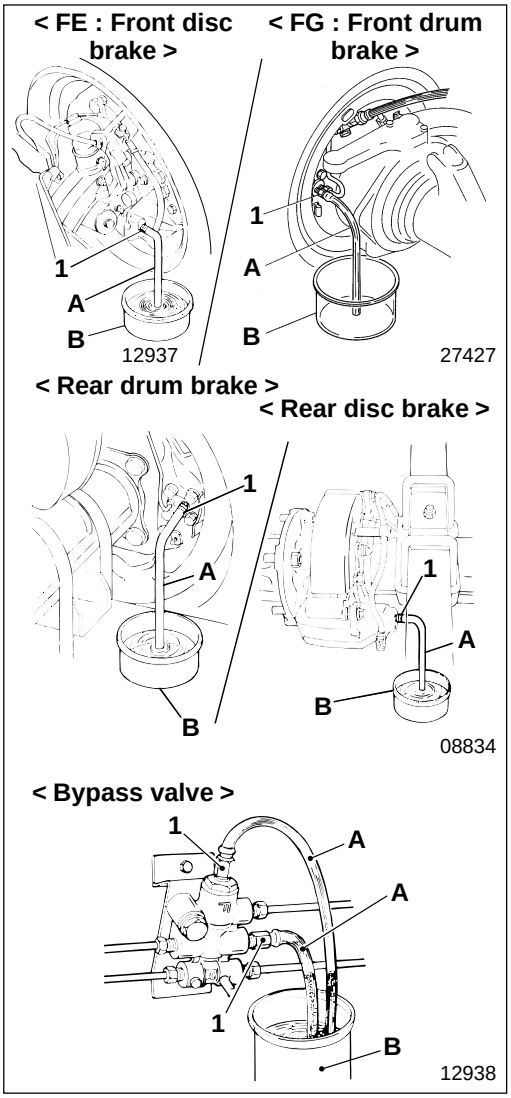
CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

NOTE

- **Supply and maintain the brake fluid level to the “MAX” level of the fluid tank.**
- **Make sure you maintain brake fluid at the “MAX” level of the fluid tank since the brake fluid level drops during air bleeding.**

https://truckmanualshub.com/



- Start the engine and let it idle until you complete air bleeding of the brake system.
- Connect vinyl pipes **A** : one to the front disc brake < FE >, the front drum brake < FG >, one to the rear drum brake < FE639, FG639 > or the rear disc brake < FE649 >, and two to the bypass valve.
- Put the free ends of vinyl pipes **A** into containers **B** and bleed the brake system as follows:

< Front brake system >

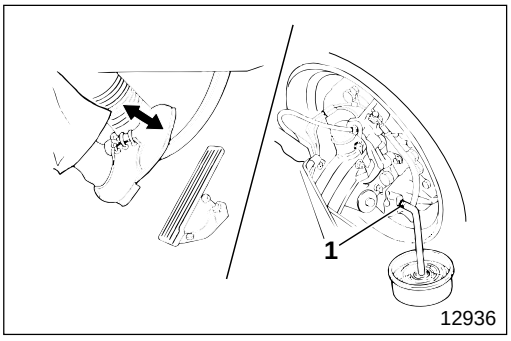
FG639	FE639, FE649
Drum brake, RH	Disc brake, RH
↓	↓
Drum brake, LH	Disc brake, LH

< Rear brake system >

FE639, FG639	FE649
Drum brake, RH	Disc brake, RH
↓	↓
Drum brake, LH	Disc brake, LH

< Bypass valve system >

Bypass valve



- Depress the brake pedal slowly several times, and with the brake pedal depressed, loosen air bleeder **1** to discharge air together with the brake fluid. After closing the air bleeder, release the brake pedal.
- Repeat the above operation until air bubbles are no longer present in the brake fluid discharged from air bleeder **1**.
- When the discharged fluid is free of air bubbles, tighten air bleeder **1** at specified torque.
- Make sure that the brake fluid level is at the “MAX” level of the fluid tank, and depress the brake pedal several times to ensure that the brake fluid does not leak from anywhere. Then, conduct a brake test.

https://truckmanualshub.com/

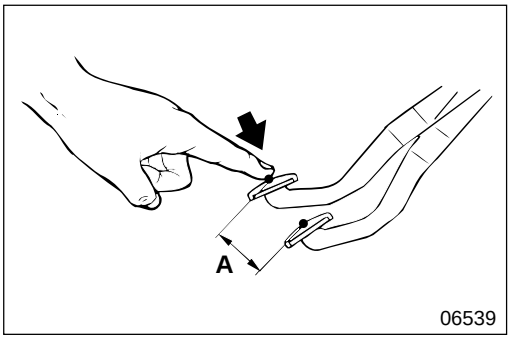
ON-VEHICLE INSPECTION AND ADJUSTMENT

Inspection and Adjustment of Brake Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Free play of brake pedal	10 to 15 {0.39 to 0.59}	—	Adjust



[Inspection]
Check if brake pedal free play **A** confirms to the standard valve with the engine stopped. If the measured value deviates from the standard value, adjust the position of the brake pedal.

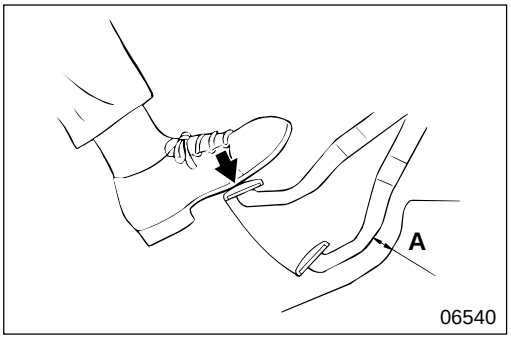
[Adjustment]
P35-57

Inspection and Adjustment of Clearance between Brake Pedal and Floor Panel

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Clearance between brake pedal and floor panel (with pedal depressed at 490 N {110 lbf, 50 kgf})	45 {1.77} or more	—	Adjust



[Inspection]
Depress the brake pedal using 490 N {110 lbf, 50 kgf} when the engine is idling to check if clearance **A** between the brake pedal and the floor panel conforms to the standard value. If the measured value deviates from the standard value, adjust the position of the brake pedal.

[Adjustment]
P35-57

https://truckmanualshub.com/

Inspection and Replacement of Disc Brake Pad

Service standards

Unit : mm {in.}

Location	Maintenance item			Standard value	Limit	Remedy
5, 6	Thickness of outer and inner pads	FE639	Front disc brake	12 {0.47}	4 {0.16}	Replace
		FE649	Front disc brake	14 {0.55}	4 {0.16}	Replace
			Rear disc brake	14 {0.55}	4 {0.16}	Replace

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Slide pin bolt tightening	83.3 to 93.1 {61 to 69, 8.5 to 9.5}	Wet

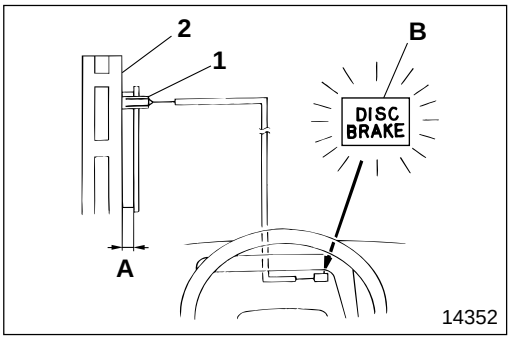
Fluid

Location	Points of application	Specified fluid	Quantity
3	Thread area of slide pin bolt	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
—	Piston expander 	MB990520	Pushing back of piston when replacing brake pad

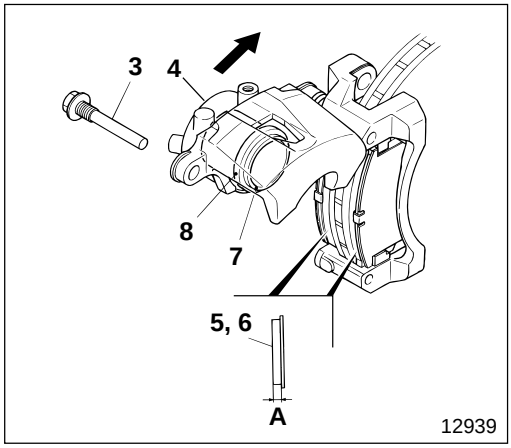


[Inspection]

- When brake pad thickness **A** decreases to approximately 4 mm {0.16 in.}, brake pad wear indicator **1** makes contact with disc rotor **2** and is disconnected. This lights up brake warning lamp **B** within the meter cluster, indicating that the brake pad should be replaced.

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

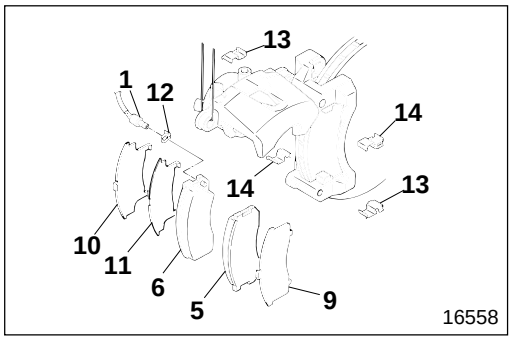


- Remove lower slide pin bolt **3**.
- Turn caliper **4** upward and secure it using wire.

CAUTION

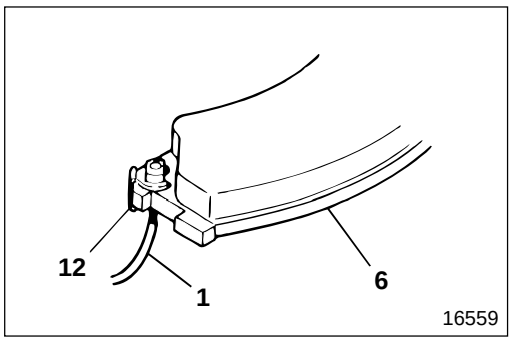
- **Make sure that you do not smear, or get dust on, the grease applied to slide pin bolt 3.**
- **Be careful when you secure caliper 4 that you do not use excessive force on the brake hose or brake pad wear indicator 1.**
- **Make sure that you secure caliper 4 securely.**

- Check thickness **A** of outer pad **5** and inner pad **6** and if the thickness is lower than the limit, replace the pads on the same axle as a unit.
- Check if any fluid is leaking from piston **7**, and check if piston boot **8** is damaged. If any fault is found, replace the faulty parts.

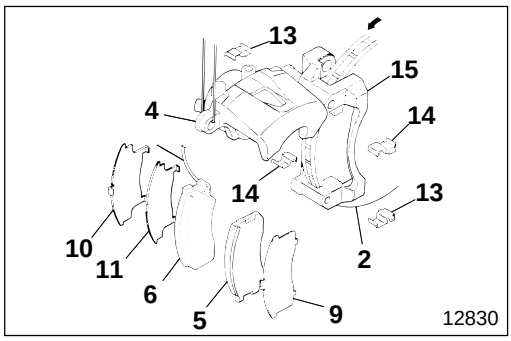


[Replacement]

- Remove the following parts:
  - **9** Outer shim
  - **5** Outer pad
  - **10** Inner shim A
  - **11** Inner shim B
  - **12** Clip
  - **1** Brake pad wear indicator
  - **6** Inner pad
  - **13** Pad liner A
  - **14** Pad liner B

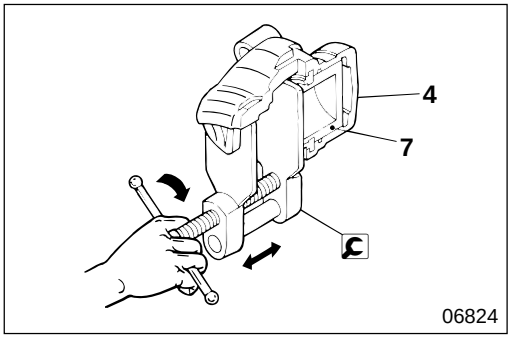


Install brake pad wear indicator **1** on inner pad **6** in the pad kit using clip **12**.

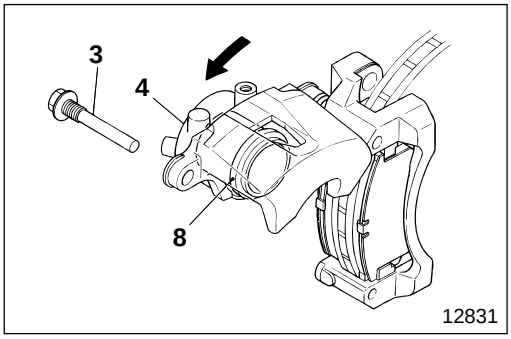


- Clean torque member **15**.
- Install the kit parts onto torque member **15** in the following order:
  - Install pad liner A **13** and pad liner B **14** on torque member **15**.
  - Install outer shim **9** on outer pad **5**.
  - Install inner shims **10**, **11** on inner pad **6**.
  - Install outer pad **5** on torque member **15**.
  - Install inner pad **6** on torque member **15**.
  - Install inner pad **6** so that brake pad wear indicator **1** faces the entrance side (when the vehicle is moving forwards) of disc rotor **2** of caliper **4**.

https://truckmanualshub.com/



- Push piston **7** until it makes contact with the bottom of caliper **4**.
  : Piston expander



- Slacken off caliper **4**, taking care not to damage piston boot **8**.
- Bleed the bushing.
- Apply rubber grease thinly to the outer periphery of slide pin **3**. Apply brake fluid thinly to the thread area of slide pin bolt.
- Tighten slide pin bolt **3** at specified torque.
- Wire up the harness of brake pad wear indicator **1**. Gr 26, 27
- Inspect drag torque. P35-60, 64, 82
- Depress the brake pedal several times.
- Make sure that brake fluid is maintained at the “MAX” level of the fluid tank. If the level drops, add brake fluid. P35-38

https://truckmanualshub.com/

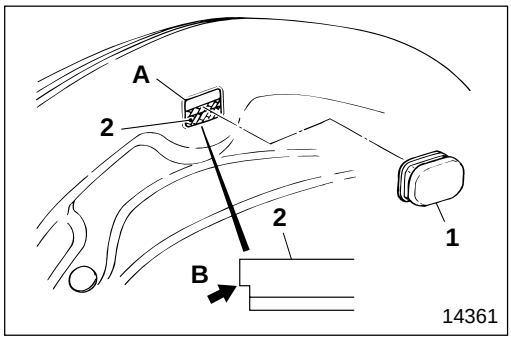
ON-VEHICLE INSPECTION AND ADJUSTMENT

Drum Brake Lining Thickness Inspection and Replacement

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Thickness of brake lining	—	4 {0.16} (Side shoulder means wear limit)	Replace



[Inspection]

NOTE

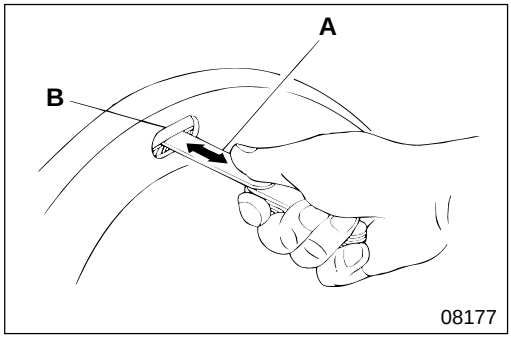
Be sure to inspect at two points for each wheel per side.

- Remove cover **1** from the backing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall cover **1**.

[Replacement]

P35-69, 75

Inspection of Brake Shoe Clearance



Insert 0.2 mm {0.0079 in.} feeler gauge **A** into inspection hole **B** of the backing plate, and make sure that you can move the gauge in and out feeling some resistance. After this inspection, adjust the clearance if any abnormality is found.

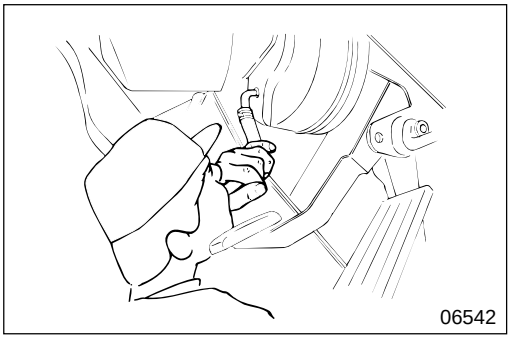
P35-67, 73

https://truckmanualshub.com/

Inspection of Brake Booster (Master Vac)

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Air tightness with no load (with vacuum meter at 67 kPa {19.7 in. Hg, 500 mmHg} and engine stopped)		Vacuum drop after 15 seconds should be 3.3 kPa {0.98 in. Hg, 25 mmHg} or less	—	Replace
	Airtightness with load (with brake pedal slightly depressed, vacuum meter at 67 kPa {19.7 in. Hg, 500 mmHg} and engine stopped)				
—	Boosting action (Fluid pressure with vacuum meter at 67 kPa {19.7 in. Hg, 500 mmHg} and brake pedal depressed at specified foot pressure)	8 in.+9 in.	4410 kPa {640 lbf/in^2, 45 kgf/cm^2} (98 N {22 lbf, 10 kgf})	—	Replace
			8340 kPa {1210 lbf/in^2, 85 kgf/cm^2} (295 N {66 lbf, 30 kgf})		
		9 in.+10 in.	3920 kPa {570 lbf/in^2, 40 kgf/cm^2} (98 N {22 lbf, 10 kgf})		
			8830 kPa {1280 lbf/in^2, 90 kgf/cm^2} (295 N {66 lbf, 30 kgf})		
	No boosting action (Fluid pressure after vacuum meter falls to 0 kPa {0 in. Hg, 0 mmHg} and brake pedal depressed at specified foot pressure)	8 in.+9 in.	295 kPa {43 lbf/in^2, 3 kgf/cm^2} (98 N {22 lbf, 10 kgf})	—	Replace
			1670 kPa {240 lbf/in^2, 17 kgf/cm^2} (295 N {66 lbf, 30 kgf})		
		9 in.+10 in.	195 kPa {28 lbf/in^2, 2 kgf/cm^2} (98 N {22 lbf, 10 kgf})		
			1470 kPa {215 lbf/in^2, 15 kgf/cm^2} (295 N {66 lbf, 30 kgf})		



06542

[Inspection]
Two types of inspection are used to inspect the brake booster (master vac) operation, inspection without a tester and inspection with a simple tester. Make sure that there is no fluid leak or damage at the joints of the brake pipes and hoses before inspection.

(1) Inspection of check valve operation

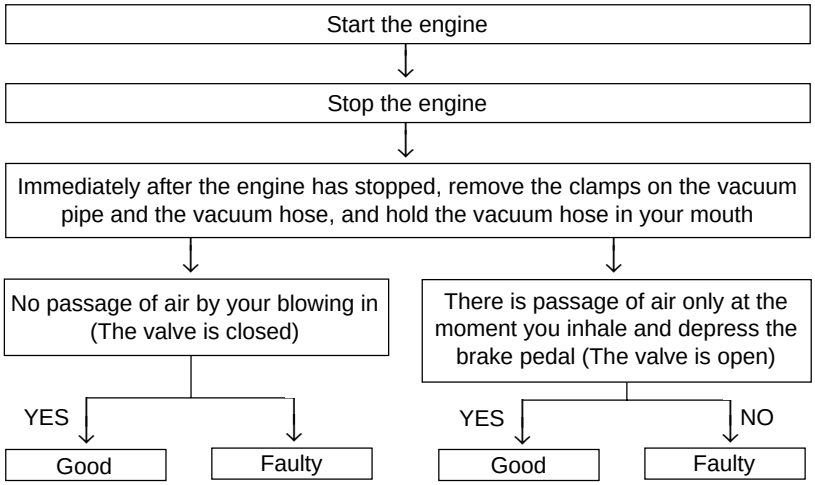
Be sure to inspect the check valve both when opened and when closed.

CAUTION

Make sure that your saliva does not enter the check valve when blowing air through the vacuum hose as this would cause the check valve to malfunction.

NOTE

The check valve fitted to the vacuum hose cannot be removed.



https://truckmanualshub.com/

(2) Inspection of brake booster (master vac) operation

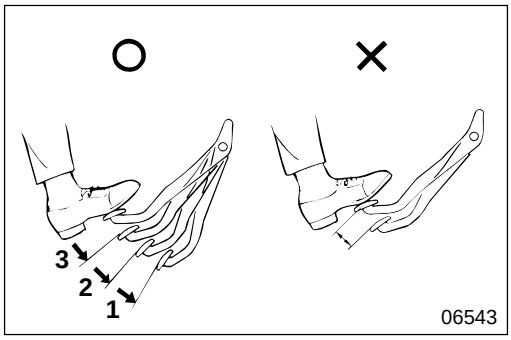
NOTE

If the brake booster (master vac) is faulty, determine the quality of the brake booster (master vac) as an independent device by means of a bench test specified by the maker's service station. This is because the above inspection of the brake booster (master vac) operation is merely a simplified inspection. If any fault is found, hand the device over to the service station without disassembling it, and replace the whole assembly. P35-56

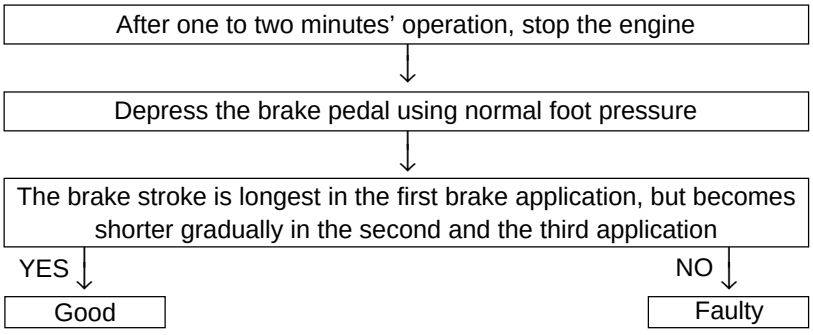
● **Inspection method without a tester**

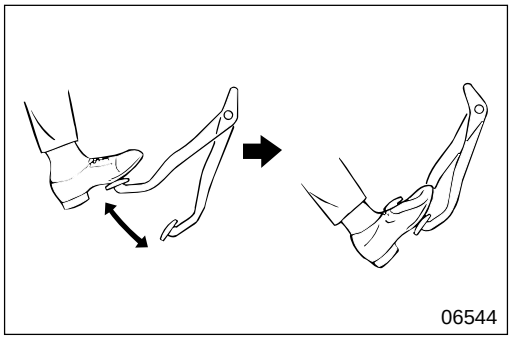
If the brake booster (master vac) is determined to be good by inspections 1 to 3 below, its operation is normal. If any fault is detected in any of the three inspections, the following parts are likely to be faulty.

- Check valve
- Vacuum hose
- Brake booster (master vac)
- Vacuum pump

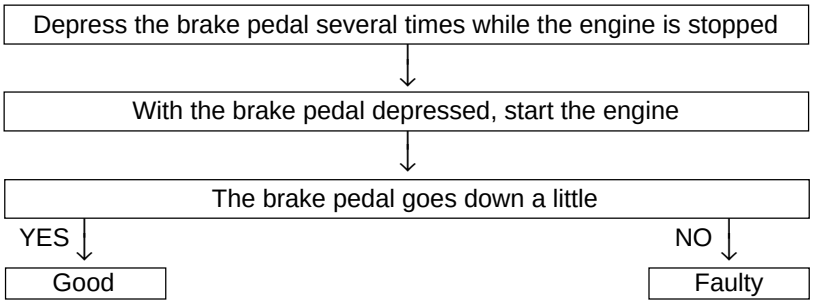


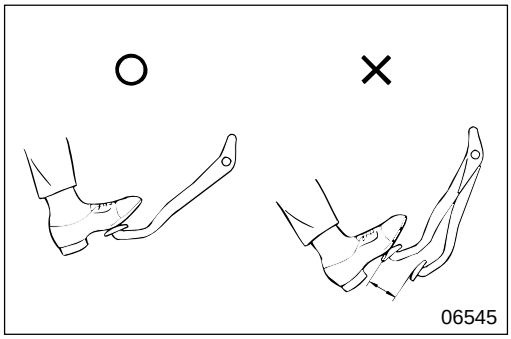
[Inspection 1]



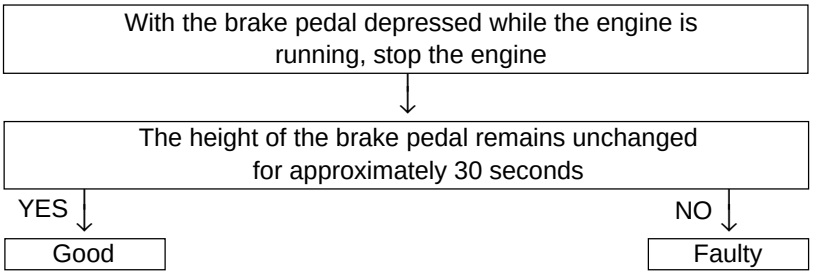


[Inspection 2]

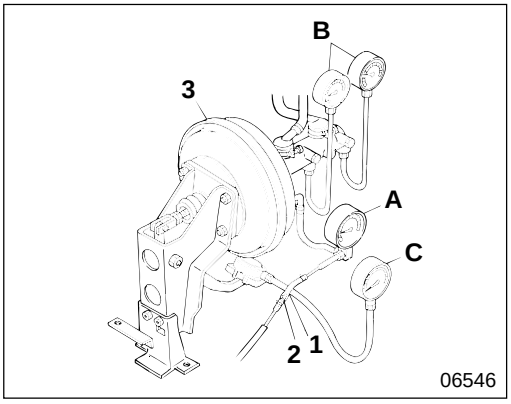




[Inspection 3]



https://truckmanualshub.com/

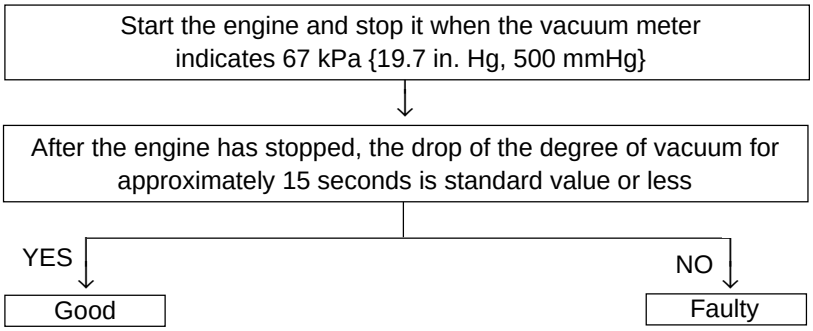


● Inspection with a simplified tester

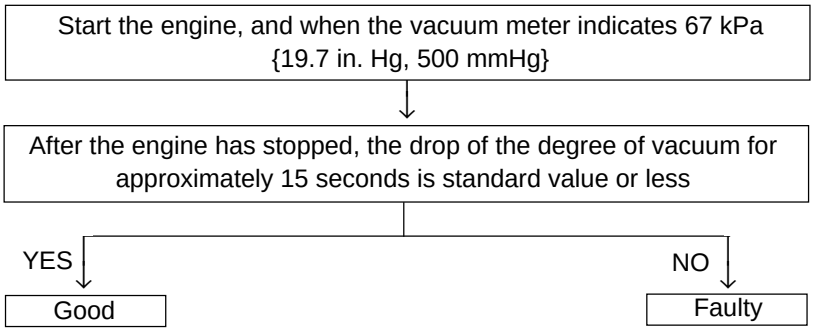
● Airtightness inspection

- Before inspection, observe the operation of check valve **2** fitted to vacuum hose **1**. P35-47
- Remove vacuum hose **1** from brake booster (master vac) **3**, place the end without the white ○ mark on the brake booster (master vac) and connect it to vacuum meter **A**. Connect another vacuum hose (without a built-in check valve) between the vacuum meter and the brake booster (master vac).
  Connect pressure gauges **B** and foot pressure meter **C** as illustrated, and bleed the air from the pressure gauges.
- If the results of the following two airtightness inspections are satisfactory, the operation is normal. If any fault is found in any of the two inspections, the following parts are likely to be faulty.
  - Vacuum hose
  - Brake booster (master vac)

[No-load airtightness inspection]



[At load airtightness inspection]



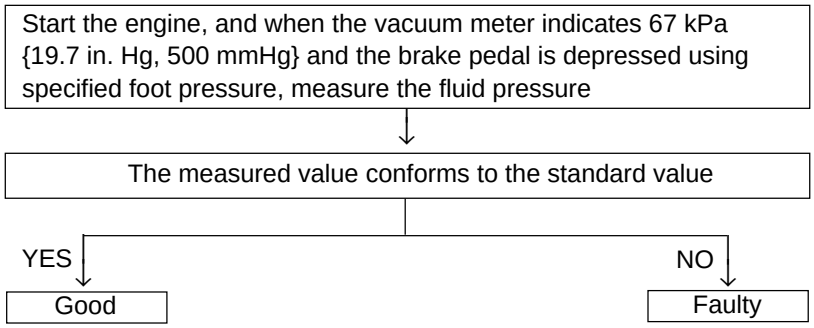
- Be sure when you attach vacuum hose **1** to brake booster (master vac) **3** after the inspection, that the end without the white ○ mark faces brake booster (master vac) **3**.

https://truckmanualshub.com/

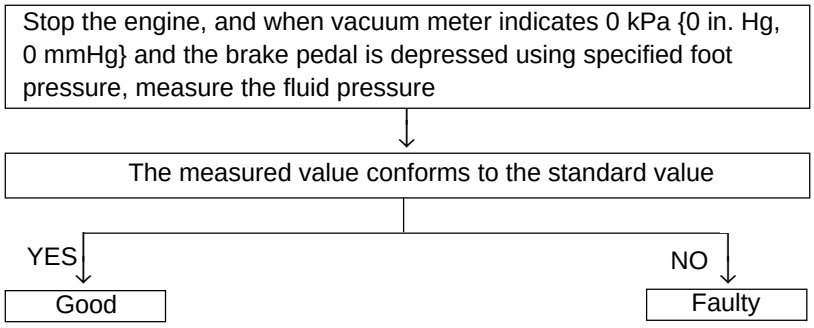
● **Inspection of characteristics**

- Inspect characteristics after the airtightness inspection is finished.
- If the results of the following two inspections are good, the operation is normal. If any fault is found in any of the two inspections, the following parts are likely to be faulty.
  - Vacuum hose
  - Brake booster (master vac)

[Boosting action inspection]



[No boosting action inspection]



Be sure when you attach vacuum hose **1** to brake booster (master vac) **3** after the inspection, that the end without the white ○ mark faces brake booster (master vac) **3**.

ON-VEHICLE INSPECTION AND ADJUSTMENT

Inspection of Bypass Valve

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Fluid pressure (when master cylinder and bypass outlet pressures balance) when the front brake system fails	3920 kPa {570 lbf/in^2, 40 kgf/cm^2} or less	—	Replace

Fluid

Location	Points of application	Specified fluid	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No. 116 DOT3)	As required

WARNING

- **Before inspection do the following to prevent the vehicle from moving accidently.**
- **Carry out inspection on a level area.**
- **Place chocks securely in place at the left and right front wheels.**
- **Pull up the parking brake.**
- **The clutch fluid system and the brake fluid system use the fluid tank in common. Therefore, replacement and air bleeding of the clutch fluid must be carried out simultaneously with that of the brake fluid. Gr 21**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a container for adding brake fluid, keep it solely for that purpose.**

CAUTION

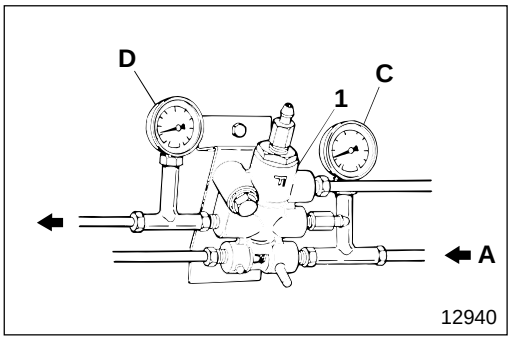
- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

NOTE

- **Supply and maintain the brake fluid level to the “MAX” level of the fluid tank.**
- **Make sure you maintain brake fluid at the “MAX” level of the fluid tank since the brake fluid level drops during inspection.**

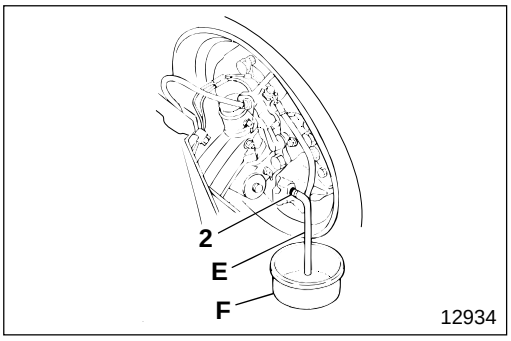
- Make sure you maintain brake fluid at the “MAX” level of the fluid tank since the brake fluid level drops during replacement.

https://truckmanualshub.com/

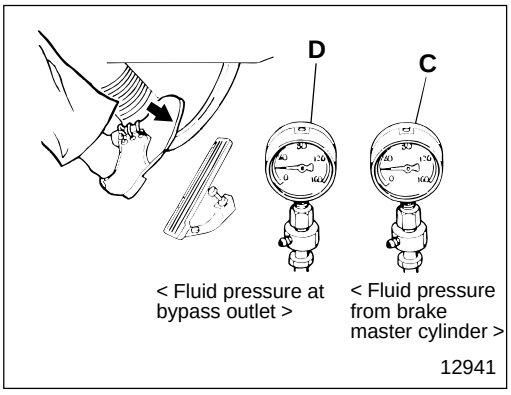


- Install oil pressure gauges **C**, **D** on inlet **A** of the master cylinder of the bypass valve, and outlet **B** of the bypass respectively.

- Bleed the brake system. P35-40



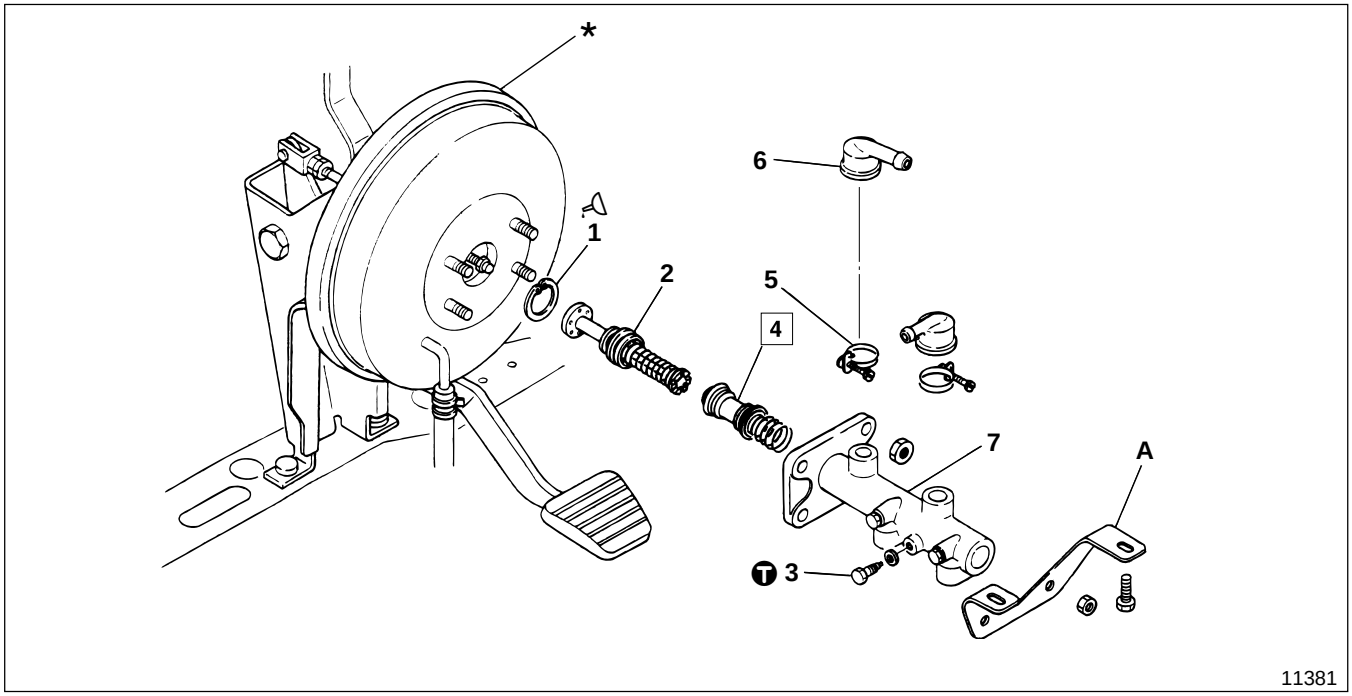
- Connect vinyl pipes **E** to air bleeders **2** on the left and right front disc brakes.
- Put the free ends of vinyl pipes **E** into containers **F**.
- Loosen air bleeder **2** by 90° to open the front brake system.



- Start the engine and let it idle.
- Depress the brake pedal gradually and read the gauges when the fluid pressure from the brake master cylinder equals that from the bypass outlet.
- If the measured value deviates from the standard value, replace bypass valve **1**.

https://truckmanualshub.com/

BRAKE MASTER CYLINDER



● **Disassembly sequence**

1 Retaining ring
2 Primary piston assembly
3 Set bolt
4 Secondary piston assembly
5 Clamp
6 Connector
7 Cylinder body
A : Master vac support
***** : Brake pedal and brake booster assembly 🕮 P35-56

WARNING⚠

Be sure not to damage the inner surface of cylinder body 7, since it will cause air to get mixed in or will result in brake fluid leakage during the removal and installation of primary piston assembly 2 and secondary piston assembly 4.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

Location	Maintenance item			Standard value (Basic diameter in [ ])	Limit	Remedy
2	Primary piston assembly spring load	FE639, FG639 (Installed length 37.7 {1.48})		99 to 120 N {22 to 27 lbf, 10.1 to 12.3 kgf}	93 N {21 lbf, 9.5 kgf}	Replace
		FE649 (Installed length 36.3 {1.43})		100 to 125 N {23 to 28 lbf, 10.5 to 12.7 kgf}	97 N {22 lbf, 9.9 kgf}	Replace
2, 4, 7	Clearance between primary and secondary piston assemblies and cylinder body		FE639 FG639	[30.16] 0.02 to 0.10 {[1.19] 0.00079 to 0.0039}	0.2 {0.0079}	Replace
			FE649	[31.75] 0.02 to 0.10 {[1.25] 0.00079 to 0.0039}	0.2 {0.0079}	Replace
4	Secondary piston assembly spring load	FE639, FG639 (Installed length 30.7 {1.21})		76 to 92 N {17 to 21 lbf, 7.8 to 9.4 kgf}	72 N {16 lbf, 7.3 kgf}	Replace
		FE649 (Installed length 31.0 {1.22})		76 to 92 N {17 to 21 lbf, 7.8 to 9.4 kgf}	72 N {16 lbf, 7.3 kgf}	Replace

https://truckmanualshub.com/

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

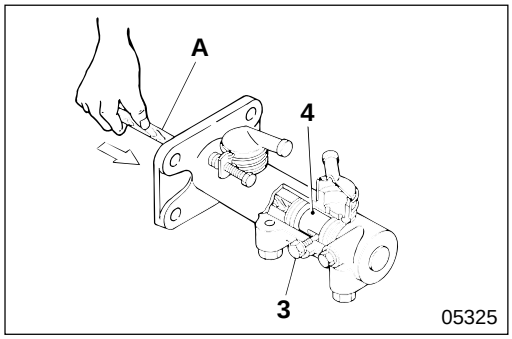
Location	Parts to be tightened	Tightening torque	Remarks
3	Set bolt	6.86 to 8.82 {5.1 to 6.5, 0.7 to 0.9}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
1	Periphery of retaining ring	Rubber grease	As required

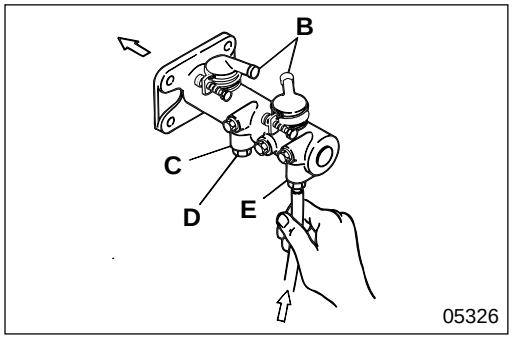
◆ Service procedure

4 **Secondary piston assembly**



[Removal]

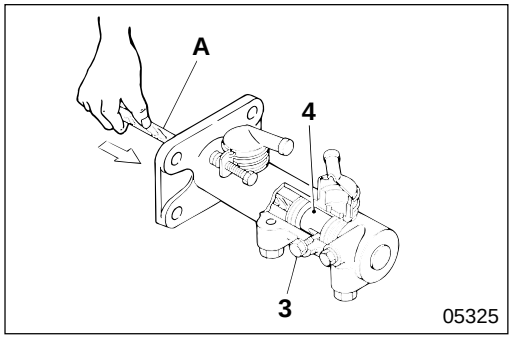
- Using rod **A**, push in secondary piston assembly **4**, then loosen set bolt **3**.



- Put plugs **D** into brake fluid filling port **B** and discharge port **C** that leads to the rear wheel brakes, then feed compressed air via discharge port **E** to the front wheel brakes to extract the secondary piston assembly.

WARNING⚠

You must apply compressed air gradually when you remove secondary piston assembly 4. If you applied compressed air strongly at one time, the secondary piston assembly would be violently ejected.



[Installation]

Using rod **A**, push in secondary piston assembly **4**, then tighten set bolt **3** at specified torque.

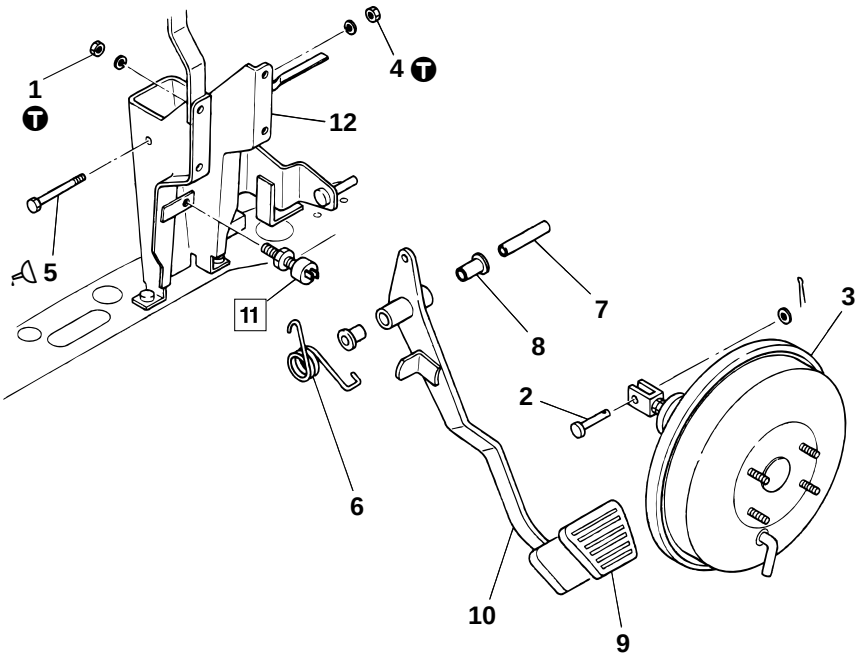
BRAKE PEDAL AND BRAKE BOOSTER (MASTER VAC)



● **Disassembly sequence**

1 Nut
2 Clevis pin
3 Brake booster (master vac)
4 Nut
5 Bolt
6 Spring
7 Collar
8 Bushing
9 Pedal pad
10 Brake pedal
11 Stop lamp switch
Gr 54
12 Support assembly

NOTE

Do not disassemble brake booster (master vac) 3 because it is a non-disassemble type.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

● **Adjustment after assembly** P35-57

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value (Basic diameter in [ ])	Limit	Remedy
7, 8	Clearance between collar and bushing		[16] 0.02 to 0.26 {0.00079 to 0.010}	0.5 {0.020}	Replace
10	Brake pedal	Height from pedal pad center to instrument panel underside	264 {10.4}	—	Adjust
		Full stroke	170 {6.69}	—	Adjust
10, 11	Clearance between brake pedal stopper and tip of stop lamp switch thread area		0 to 0.1 {0 to 0.0039}	—	Adjust

https://truckmanualshub.com/

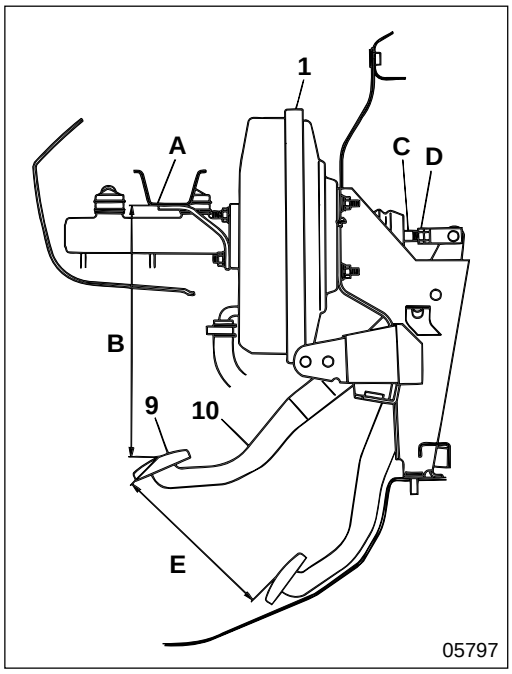
Tightening torque

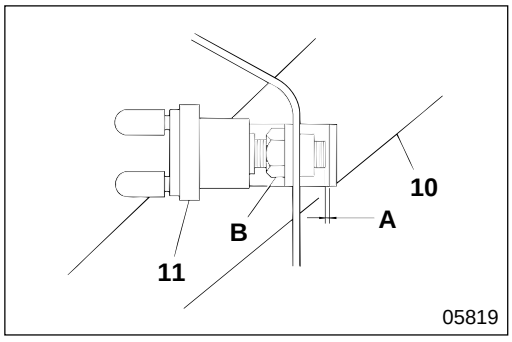
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Brake booster mounting)	8.8 to 14 {6.5 to 10, 0.9 to 1.4}	—
4	Nut (Brake pedal mounting)	34.3 to 53.9 {25 to 40, 3.5 to 5.5}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
5	Friction surface of bolt bushing	Chassis grease [NLGI No.1 (Ca soap)]	As required





◆ Service procedure

● **Adjustment after assembly**

- Adjustment of brake pedal installation height
  By turning operating rod **C** of brake booster (master vac) **1**, adjust height **B** from the center of pedal pad **9** to the underside of instrument panel **A** to the standard value, then secure in place using nut **D**.

  WARNING

  Make sure, when brake pedal 10 is depressed fully, that operating rod C of brake booster (master vac) 1 functions as the stopper and the pedal does not come to a stop by hitting against the floor panel, since this will reduce brake effectiveness.

- Inspection of brake pedal full stroke
  Make sure that full stroke **E** when brake pedal **10** is depressed fully conforms to the standard value.
  If there is any fault, adjust the installation height of the brake pedal.

- Inspection of play towards brake pedal Ⓜ Gr 35-42

11 **Adjustment of stop lamp switch**

Turn stop lamp switch **11** to adjust clearance **A** between the top of the thread area of the stop lamp switch and the stopper of brake pedal **10** to the standard value, and fasten with lock nut **B**.

WARNING

Make sure, when brake pedal 10 is released, that stop lamp switch 11 does not stop the pedal, since this will cause the brake to drag.

FRONT WHEEL BRAKE < FE639 : DISC BRAKE >

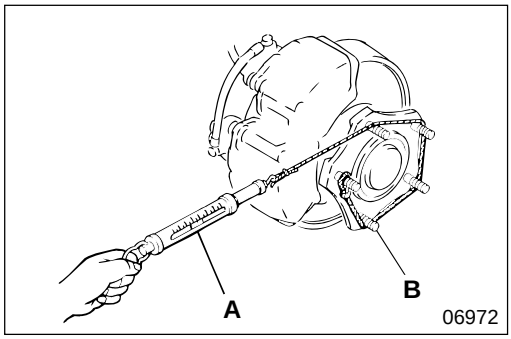
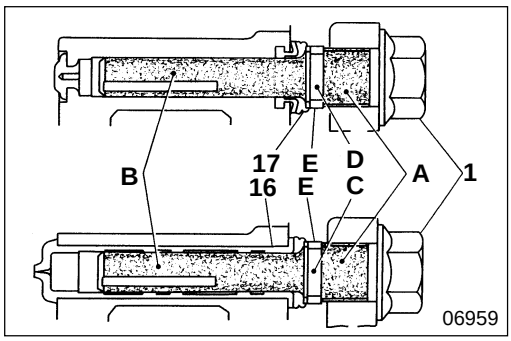
◆ Service procedure



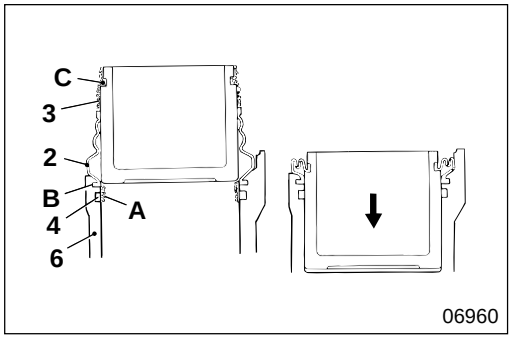
● Measurement of dragging torque

- Fasten spring balance **A** to hub bolt **B** and measure the tangential force.
- If the measured value is the specified value, the torque conforms to the standard value.
- If the measured value deviates from the specified value, inspect the friction surface between piston seal **4** and piston **3**.



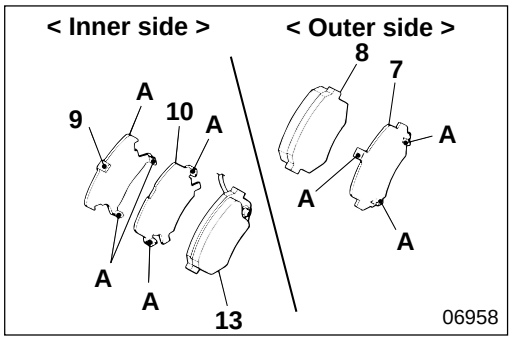
1 Installation of slide pin bolt

- Apply brake fluid to thread area **A** lightly, and apply grease to slide outer periphery **B**, bushing groove **C** or connecting surface **D** of pin boot **17**, then tighten slide pin bolt **1** at specified torque.
- Bleed bushing **16** or pin boot **17**.
- Check that seal **E** of bushing **16** or pin boot **17** is installed in bushing groove **C** of slide pin bolt **1** or connecting surface **D** of the pin boot.



2 to 4 Installation of piston boot, piston and piston seal

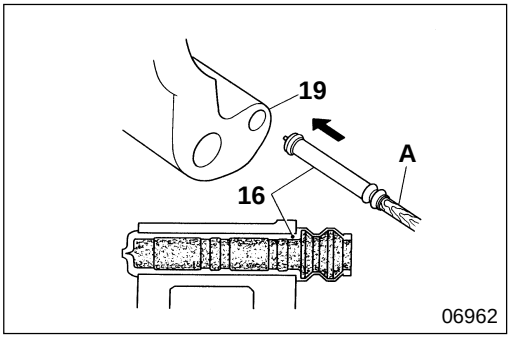
- Apply brake fluid to the periphery of piston **3** to insert piston boot **2**.
- Spread the grease applied to piston seal **4** evenly and install it into the seal groove of caliper **6**.
- Apply grease to cylinder lip area **A** of caliper **6** evenly.
- Install the caliper side seal of piston boot **2** to the boot groove **B** of caliper **6**, then press in piston **3** slowly.
- Make sure that the piston side seal of piston boot **2** is installed in the boot groove **C** of piston **3**.



7 to 10 13 Installation of pad and shim

Make sure that you install the shims with pawls **A** facing the right way.

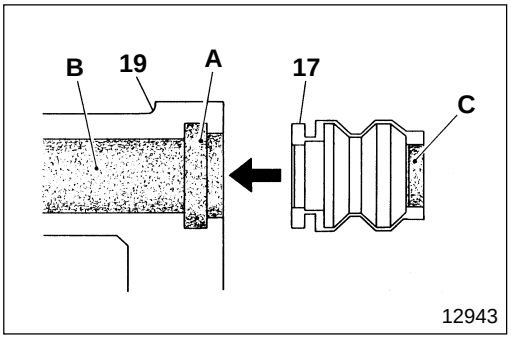
https://truckmanualshub.com/



16 **Installation of bushing**

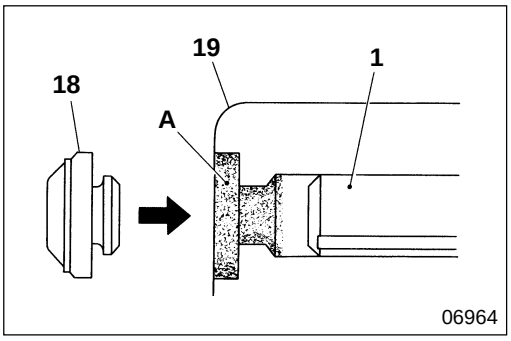
A : Push bar approximately ø8 mm {0.31 in.} long

After installation, apply grease to the whole inner periphery of bushing **16** and its contact surface with slide pin bolt **1**.



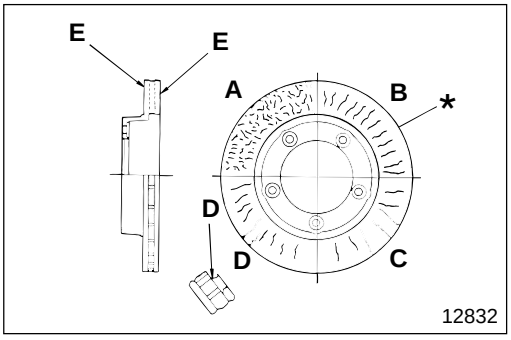
17 **Installation of pin boot**

- Apply grease to pin boot groove **A** of torque member **19**, the whole surface of guide hole **B**, and contact surface **C** between slide pin bolt **1** and pin boot **17**.
- Install pin boot **17**.



18 **Installation of cap**

- Apply grease to cap seat surface **A**.
- Install cap **18**.



***** **Inspection of disc rotor**

- Inspect the friction surface **E** of disc rotor * visually.
- If any cracks are found, correct or replace disc rotor *.
  - **A** : Net pattern cracks (Correct or replace)
  - **B** : Radial cracks that do not reach the outer periphery (Correct or replace)
  - **C** : Radial cracks that have reached the outer periphery (Replace)
  - **D** : Through cracks (Replace)

https://truckmanualshub.com/

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value		Limit	Remedy
1	Return spring load (Installed length 190 {7.48})		195 to 235 N {44 to 53 lbf, 19.8 to 24.2 kgf}		175 N {40 lbf, 18 kgf}	Replace
5	Brake shoe assembly (Thickness of brake lining)		10.0 {0.39}		4.0 {0.16} (Side shoulder means wear limit)	Replace brake lining
*	Brake drum	Inner diameter	320 {12.60}	*321 {12.64}	322 {12.68} or replace	Correct
		Cylindrical accuracy	0.05 {0.0020}		0.2 {0.0079}	Correct or replace

*Refers to the correction limit.

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
9	Pipe assembly	12.75 to 14.71 {9.4 to 11, 1.3 to 1.5}	—
11	Extension	12.75 to 14.71 {9.4 to 11, 1.3 to 1.5}	—
12	Bolt (Connector mounting)	7.85 to 11.77 {5.8 to 8.7, 0.8 to 1.2}	—
14	Bolt (Wheel cylinder assembly mounting)	37.27 to 49.03 {27 to 36, 3.8 to 5.0}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
5, 18	Contact surfaces between backing plate ledge and shoe rim, wheel cylinder assembly anchor area of shoe web, and adjusting screw contact point	Brake grease	As required

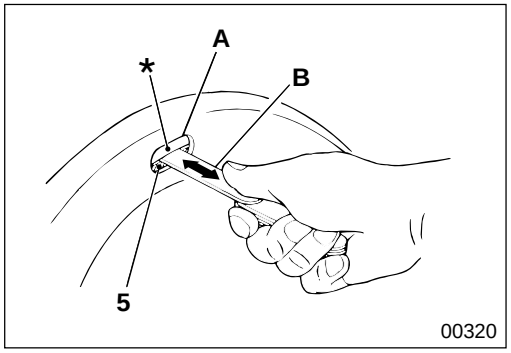
◆ Service procedure

● **Initial adjustment of brake shoe clearance after installation**

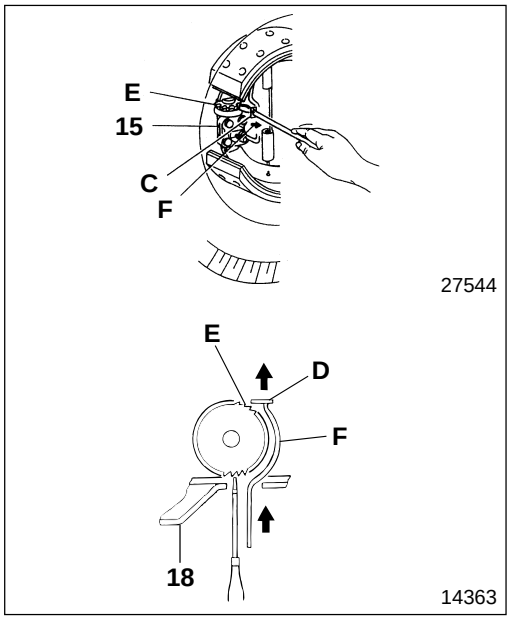
Turning the adjuster of wheel cylinder assembly **15** in arrow direction expands brake shoe assembly **5**, narrowing the clearance between brake drum * and brake lining **7**.

- Jack up the vehicle to make sure that the wheel hub bearing has no play. If there is any play, correct it. Gr 26B
- Remove covers **16** and **17**.

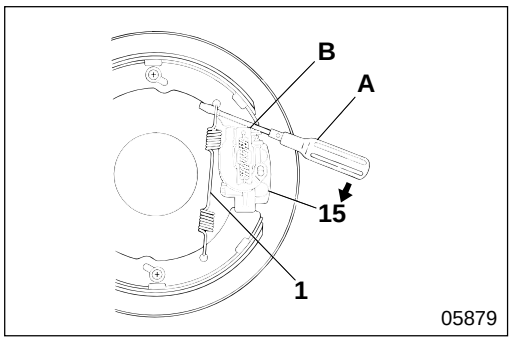
https://truckmanualshub.com/



- Adjust the brake shoe clearance as follows, so that 0.3 mm {0.012 in.} feeler gauge **B** can be inserted or extracted through check hole **A**, between brake drum * and brake lining **7** with a little resistance.



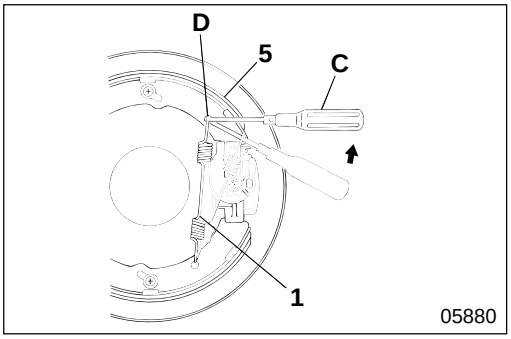
- To increase brake shoe clearance
  - Insert a wire (approximately ø2 mm {0.079 in.}) into the adjusting hole **C** and lift adjusting lever **D** of wheel cylinder assembly **15**.
  - Turn adjuster **E** of wheel cylinder assembly **15**, through adjusting hole **C**, in the opposite direction to arrow **F** on backing plate **15**.
- To decrease brake shoe clearance
  Turn adjuster **E** in the arrow **F** direction marked on backing plate **18** through adjusting hole **C**.
- Extract the feeler gauge and depress the brake pedal two or three times fully, then the specified value brake shoe clearance can be obtained.
- Insert a 0.2 mm {0.0079 in.} feeler gauge through check hole **A** and make sure that it can be inserted or extracted with a little resistance. If there is any fault, disassemble and inspect wheel cylinder assembly **15**. P35-71



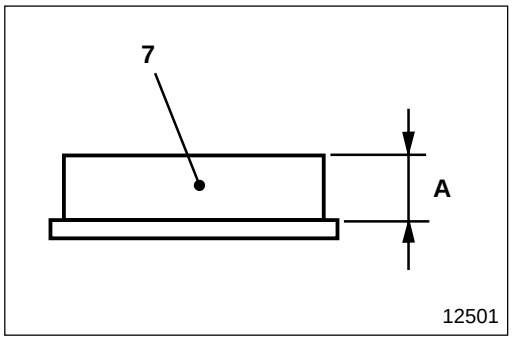
1 **Return spring**

[Removal]
To remove return spring **1**, place screwdriver **A** into the hook of the return spring, then pry and remove the return spring making use of wheel cylinder assembly **15** adjusting screw **B** as a fulcrum.

https://truckmanualshub.com/

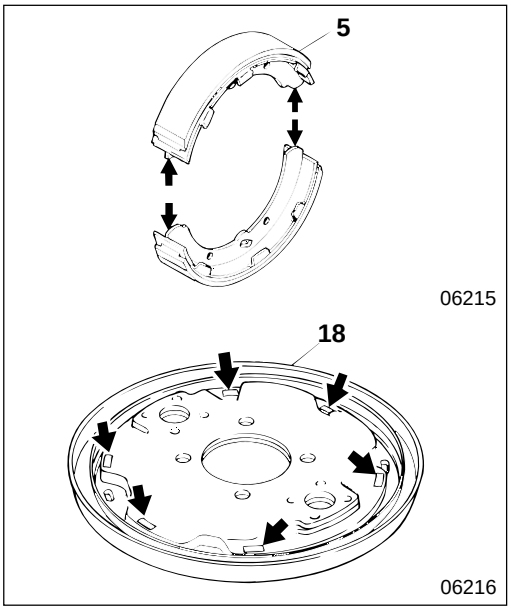


[Installation]
Insert a small cross-point screwdriver **C** into the hook of return spring **1**, insert the tip of the screwdriver into return spring installation hole **D** of brake shoe assembly **5** to pry on the return spring.



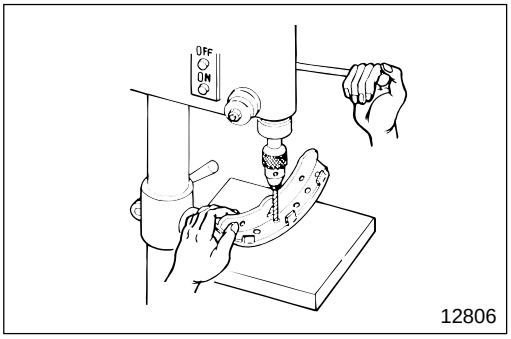
5 **Inspection of brake shoe assembly**

If thickness **A** of brake lining **7** is lower than the limit, replace the brake lining on the same axle as a unit.



5 **18** **Installation of brake shoe assembly and backing plate**

Apply grease to the points as illustrated, and install brake shoe assembly **5** and backing plate **18**.

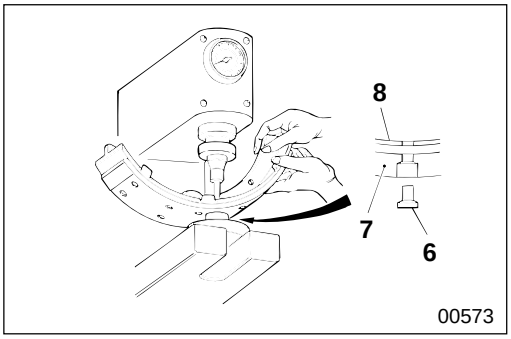


7 **Brake lining**

[Removal]

https://truckmanualshub.com/

FRONT WHEEL BRAKE < FG639 : DRUM BRAKE >



[Installation]

- Clean the mounting surfaces of brake lining **7** and brake shoe **8** with cleaning fluid and dry them.
- Insert rivets **6** from brake lining **7** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **8** and the brake lining.

  Staking load for rivets : 21±1 kN {4630±220 lbf, 2100±100 kgf}

- Make sure that you inspect contact with the inner surface of brake drum * after you replace brake linings **7**. If contact is incorrect, correct with the brake assembled.

WARNING⚠

Do not leave lubricant on the surface of brake lining 7 because this reduces braking performance.

CAUTION⚠

Make sure that the type of brake linings 7 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one axle.

*** Correction of brake drum**

If the cylindrical accuracy of brake drum * is higher than the limit, or there are grooves, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

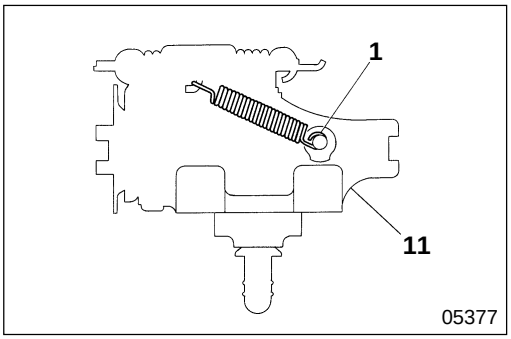
◆ Service procedure



1 **Installation of spring**

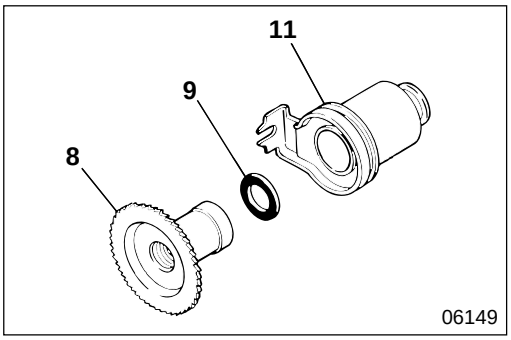
Install the closed hook of spring **1** on body **14** side.



9 **Installation of washer**

Install the washer with its black side facing adjuster **8**.

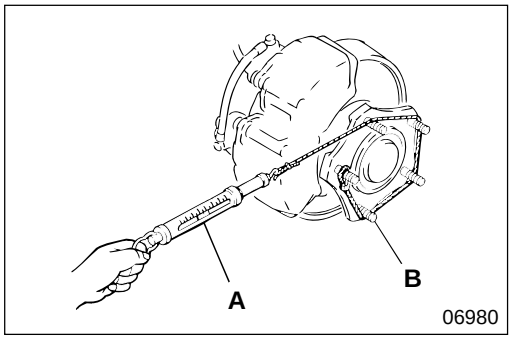
		Guide hole of main side	Rubber grease	As required

* : Rubber grease should be compatible with DOT3 brake fluid.

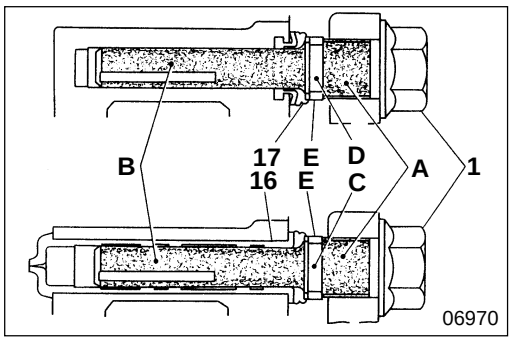
https://truckmanualshub.com/

◆ Service procedure



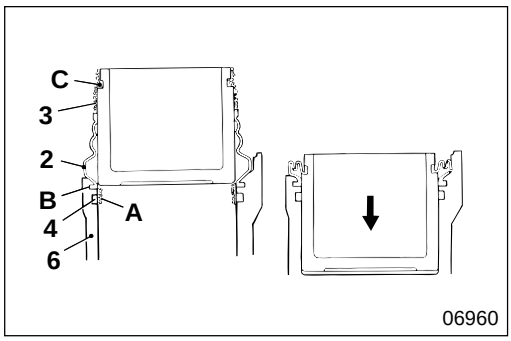
● Measurement of dragging torque

- Fasten spring balance **A** to hub bolt **B** and measure the tangential force.
- If the measured value is the specified value, the torque conforms to the standard value.
- If the measured value deviates from the specified value, inspect the friction surface between piston seal **4** and piston **3**.



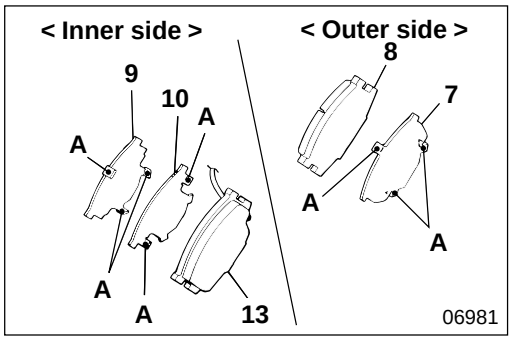
1 Installation of slide pin bolt

- Apply brake fluid to thread area **A** lightly, and apply grease to slide outer periphery **B**, bushing groove **C** or connecting surface **D** of pin boot **17**, then tighten slide pin bolt 1 at specified torque.
- Bleed bushing **16** or pin boot **17**.
- Check that seal **E** of bushing **16** or pin boot **17** is installed in bushing groove **C** of slide pin bolt **1** or connecting surface **D** of the pin boot.



2 to 4 Installation of piston boot, piston and piston seal

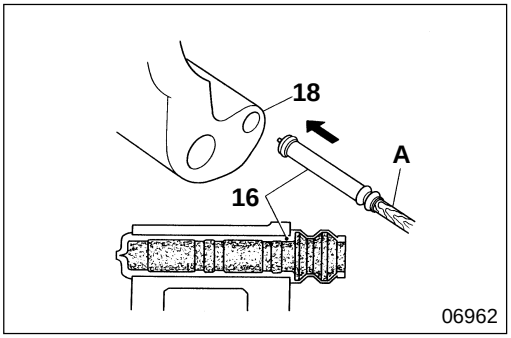
- Apply brake fluid to the periphery of piston **3** to insert piston boot **2**.
- Spread the grease applied on piston seal **4** evenly to install it into the seal groove of caliper **6**.
- Apply grease to cylinder lip area **A** of caliper **6** evenly.
- Install the caliper side seal of piston boot **2** to the boot groove **B** of caliper **6**, then press in piston **3** slowly.
- Make sure that the piston side seal of piston boot **2** is installed in the boot groove **C** of piston **3**.



7 to 10 13 Installation of pad and shim

Make sure that you install the shims with pawls **A** facing the right way.

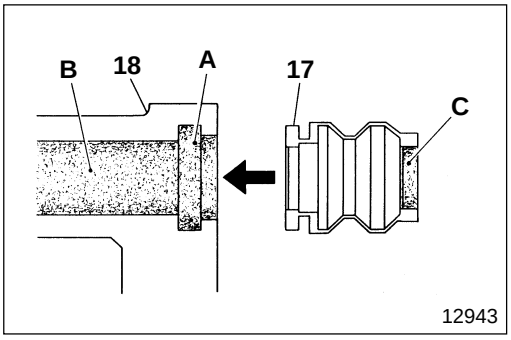
https://truckmanualshub.com/



16 **Installation of bushing**

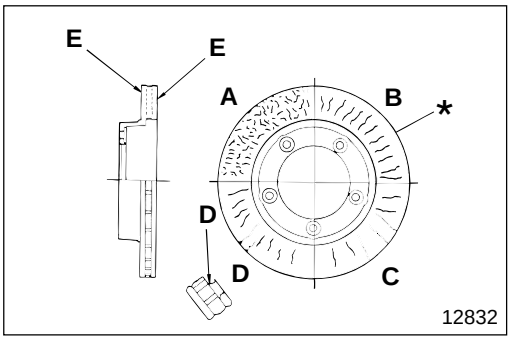
A : Push bar approximately ø8 mm {0.31 in.} long

After installation, apply grease to the whole inner periphery of bushing **16** and its contact surface with slide pin bolt **1**.



17 **Installation of pin boot**

- Apply grease to pin boot groove **A** of torque member **18**, the whole surface of guide hole **B**, and contact surface **C** between slide pin bolt **1** and pin boot **17**.
- Install pin boot **17**.



***** **Inspection of disc rotor**

- Inspect the friction surface **E** of disc rotor ***** visually.
- If any cracks are found, correct or replace disc rotor *****.
  - **A** : Net pattern cracks (Correct or replace)
  - **B** : Radial cracks that do not reach the outer periphery (Correct or replace)
  - **C** : Radial cracks that have reached the outer periphery (Replace)
  - **D** : Through cracks (Replace)

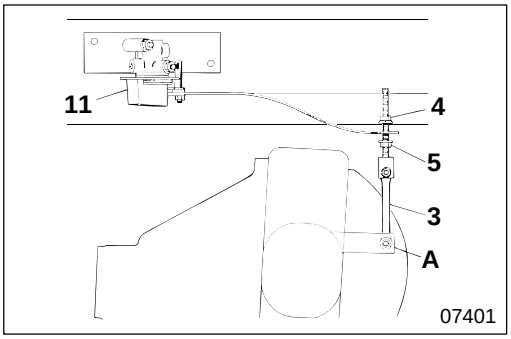
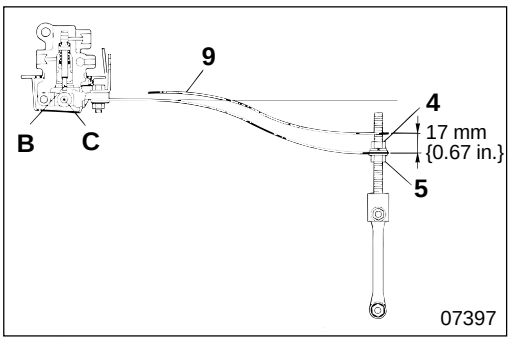
7	Nut (Leaf spring mounting)	5.9 to 7.9 {4.3 to 5.8, 0.6 to 0.8}	—

◆ Service procedure

[Installation]

- Install load sensing valve **11** on the vehicle when it is unloaded and mount ball joint part **A** of rod assembly **3** to rear axle bracket *****.
- Loosen nut **4** and nut **5** and adjust as follows.





[Adjustment]

- Free leaf spring **9** to lift up the leaf spring and fit plunger **B** to roller **C**.
- In this condition, position nut **5** 17 mm {0.67 in.} below the tip of leaf spring **9**, then tighten nut **4** at specified torque.

https://truckmanualshub.com/

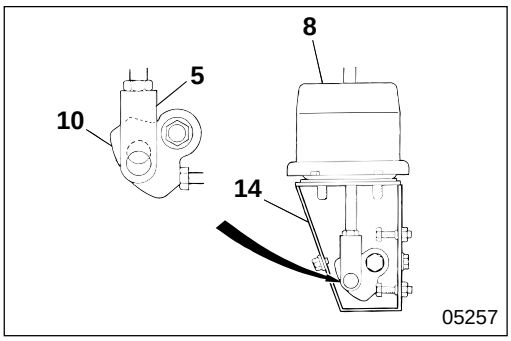
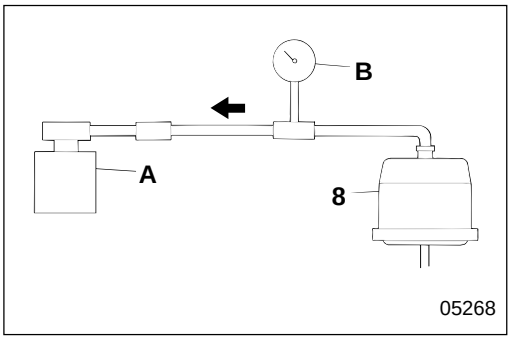
◆ Service procedure



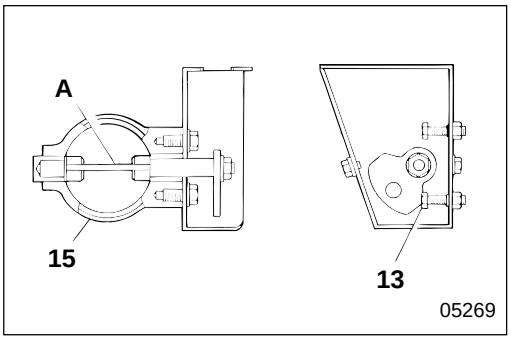
5 Adjustment of clevis

Install vacuum chamber **8** on bracket **14**, and adjust the position of clevis **5** so that the hole of the clevis is half the pitch of the hole of lever **10**.



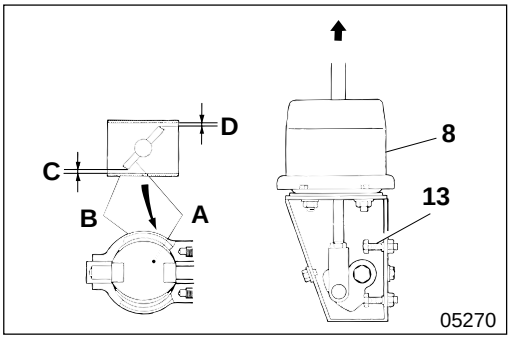
8 Test of vacuum chamber airtightness

Arrange piping as illustrated, and apply vacuum of 67 kPa {19.7 in. Hg, 500 mmHg} or more to vacuum chamber **8**, then stop vacuum pump **A**. After 15 seconds, ensure that the value of vacuum gauge **B** is the standard value. If the measured value deviates from the standard value, replace the vacuum chamber.



15 Adjustment of valve assembly

[Fully-opened adjustment]
Adjust using adjusting bolt **13** so that butterfly valve **A** of valve assembly **15** is fully opened.



[Fully-closed adjustment]
While applying vacuum 87 to 93 kPa {25.6 to 27.6 in. Hg, 650 to 700 mmHg} to vacuum chamber **8**, adjust using adjusting bolt **13** so that the average value of clearance **C** and **D** between butterfly valve **A** and body **B** is within the standard value.

< Exhaust Brake System >

Item	Specifications
Control system	Combined electric and vacuum
Valve type	Butterfly valve type

https://truckmanualshub.com/

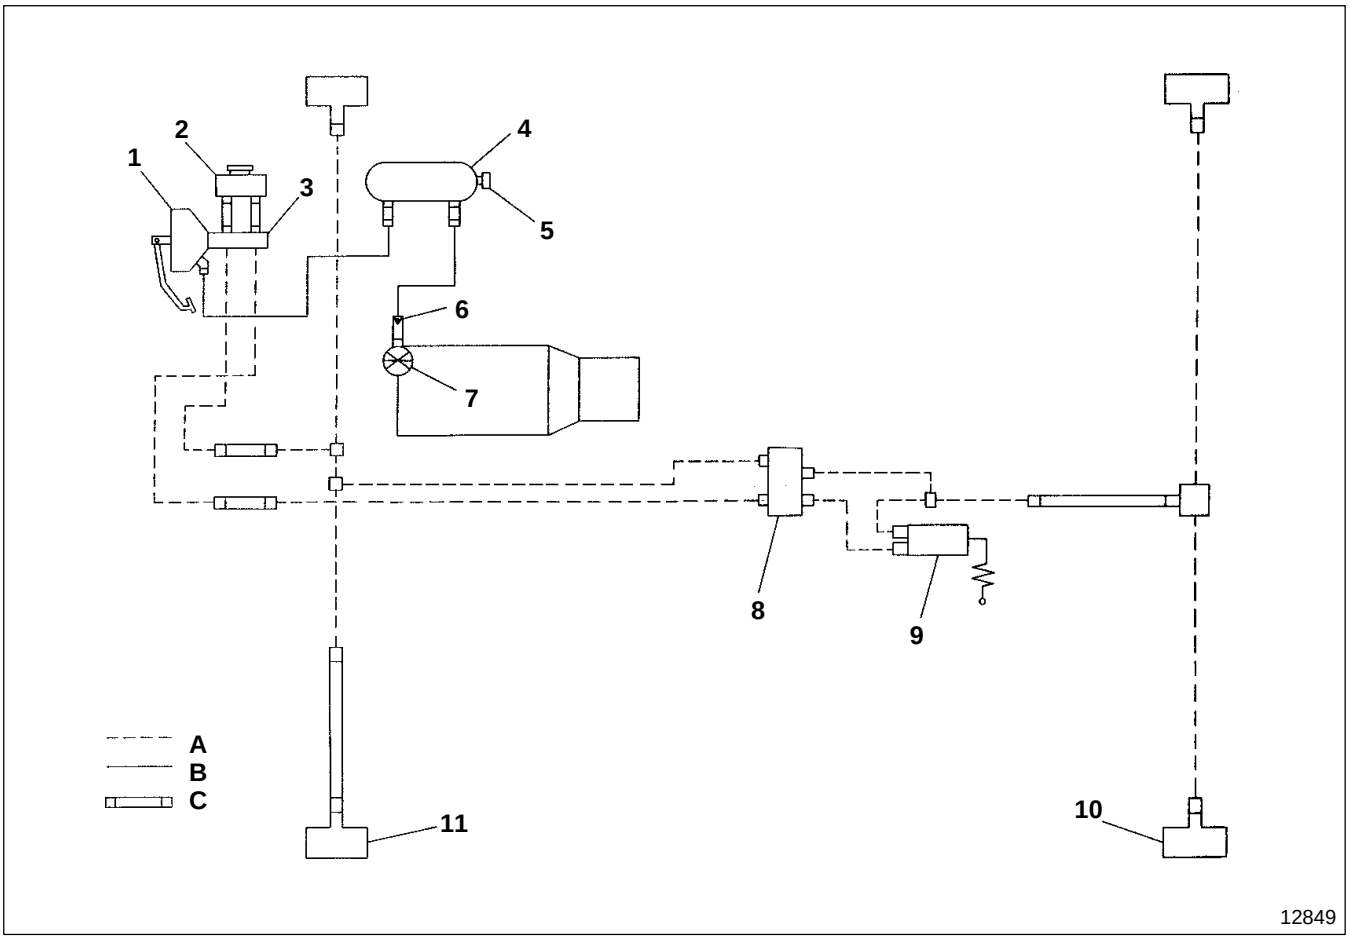
Brake System



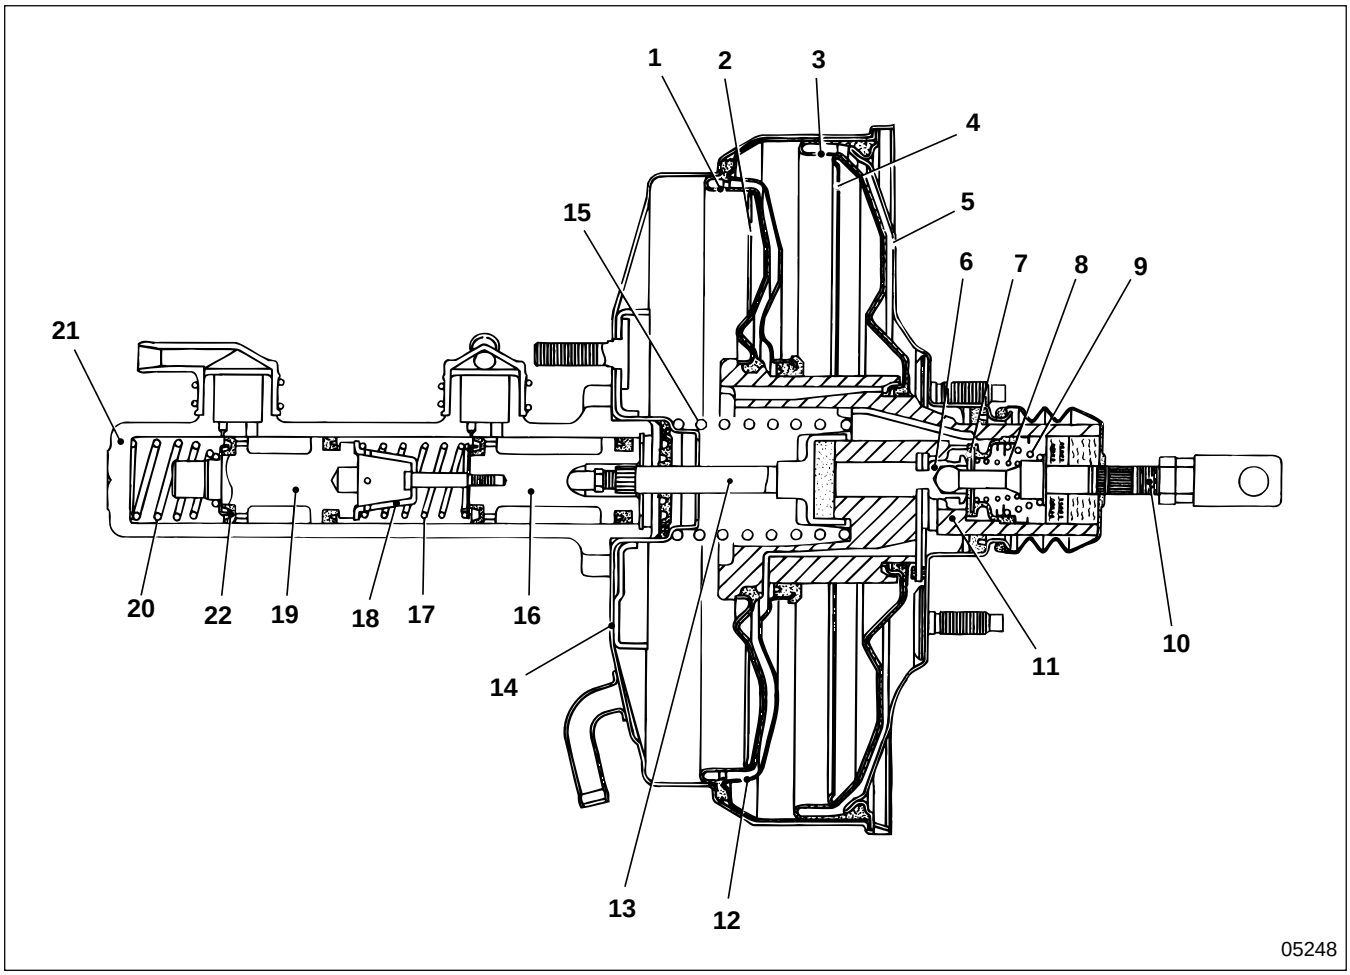
1 Master vac
2 Fluid tank
3 Brake master cylinder
4 Vacuum tank
5 Vacuum switch
6 Check valve
7 Vacuum pump
8 Bypass valve
9 Load sensing valve
10 Rear wheel brake
11 Front wheel brake

A : Fluid line
B : Air line
C : Hose

- The brake system is a vacuum servo all-wheel brake type, with master vac **1**.
- Load sensing valve **9** automatically changes the oil pressure of the rear wheel brakes according to the load changes, preventing the rear wheels from locking too early.
- Bypass valve **8** is fitted as a safety mechanism. It provides braking force if the front brake system is damaged and loses hydraulic pressure. The bypass valve does this by making the hydraulic pressure of the rear brake system bypass load sensing valve **9** and act directly on rear wheel brake **10**.

https://truckmanualshub.com/

Brake Booster (Master Vac) and Brake Master Cylinder



< Master vac >

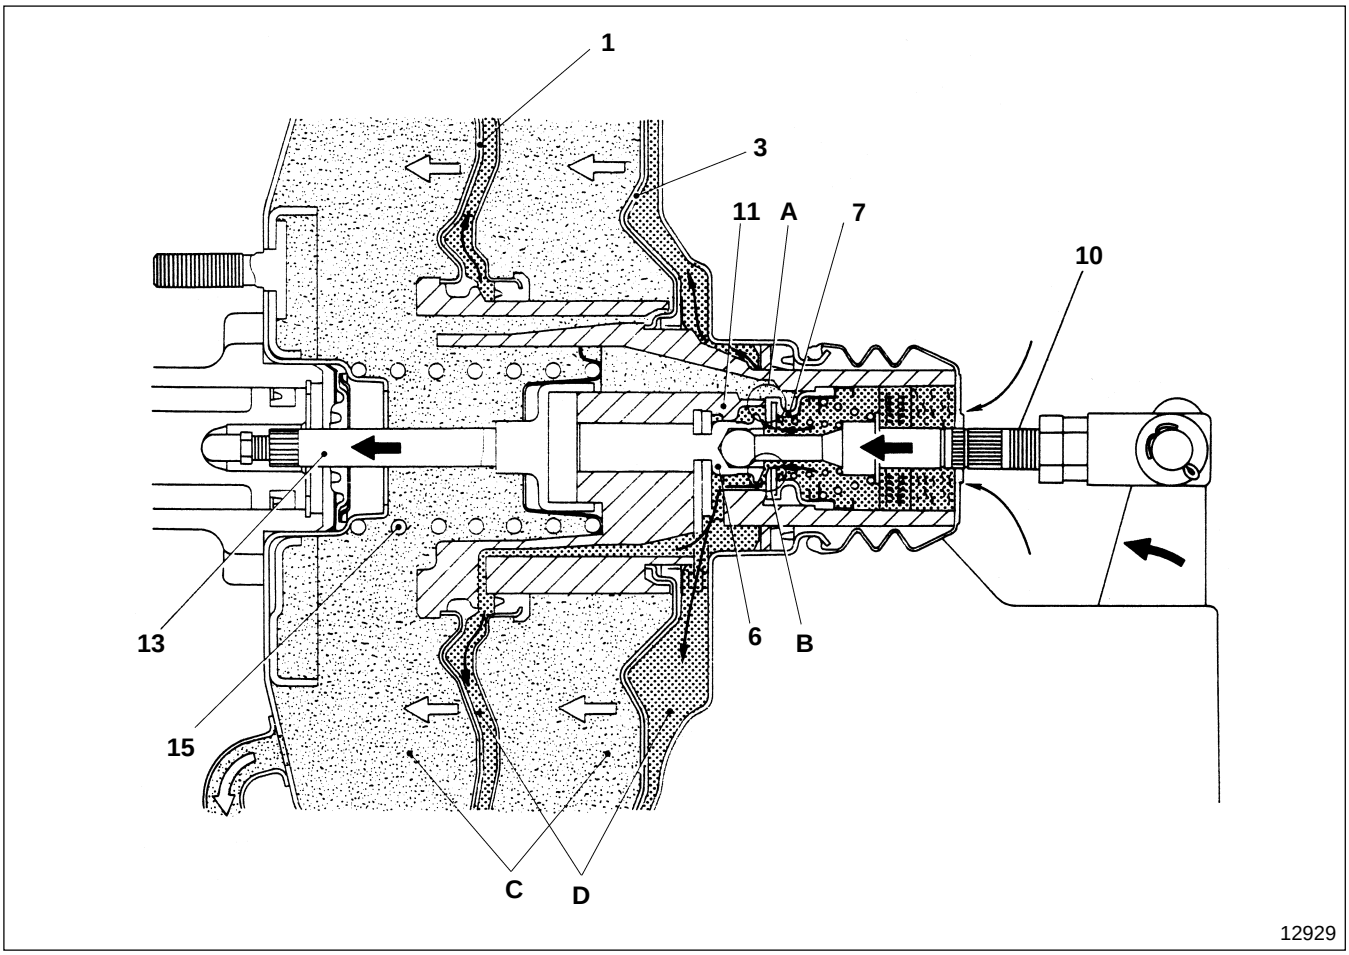
- **1** Front diaphragm
- **2** Front diaphragm plate
- **3** Rear diaphragm
- **4** Rear diaphragm plate
- **5** Rear shell
- **6** Valve plunger
- **7** Poppet
- **8** Poppet spring
- **9** Valve return spring
- **10** Operating rod
- **11** Valve body
- **12** Center plate
- **13** Push rod
- **14** Front shell
- **15** Diaphragm plate spring

< Brake master cylinder >

- **16** Primary piston
- **17** Primary piston return spring
- **18** Retainer
- **19** Secondary piston
- **20** Secondary piston return spring
- **21** Cylinder body
- **22** Packing cup

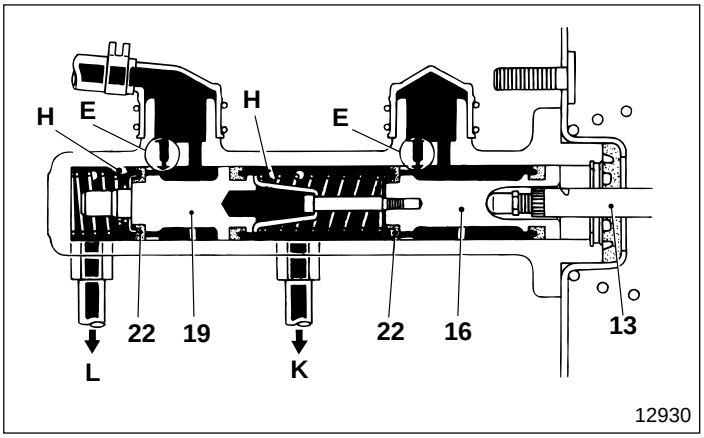
https://truckmanualshub.com/

● **When depressing brake pedal**



Action of master vac

- When the brake pedal is released, chambers **C** and **D** are subjected to the vacuum created by the vacuum pump.
- Depressing the brake pedal activates operating rod **10**, placing poppet **7** in tight contact with the seat of valve body **11**. This action closes vacuum valve **A**, cutting off the vacuum to chamber **D**.
- Depressing the brake pedal further separates valve plunger **6** from poppet **7**, opening breather valve **B** permitting atmospheric pressure to flow into chamber **D**, producing a pressure difference between chambers **C** and **D**.
- This pressure difference between chambers **C** and **D** presses front diaphragm **1** and rear diaphragm **3**, boosting the depressing force.
- This boosted pedal depression force overcomes the repercussive force of diaphragm plate spring **15**, presses push rod **13**, and actuates the brake master cylinder.

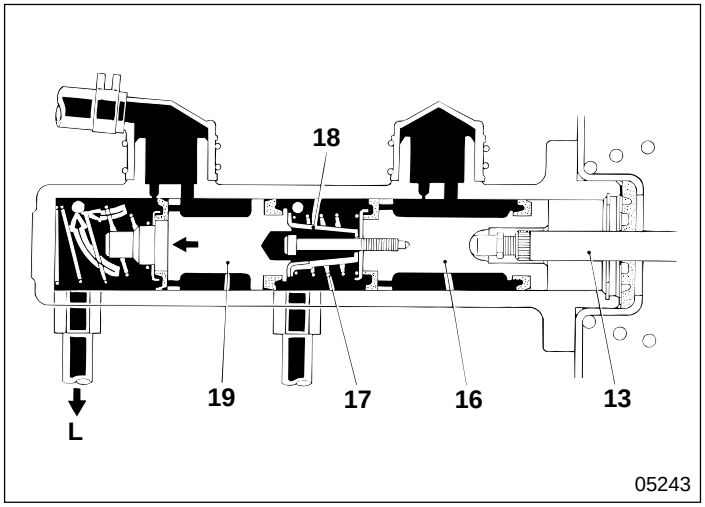


Action of brake master cylinder

- Push rod **13** pushes in primary piston **16** and secondary piston **19**, and packing cup **22** passes return port **E**, generating hydraulic pressure in chamber **H**, feeding the oil to the respective brake systems.

  K : To the front brake system
  L : To the rear brake system

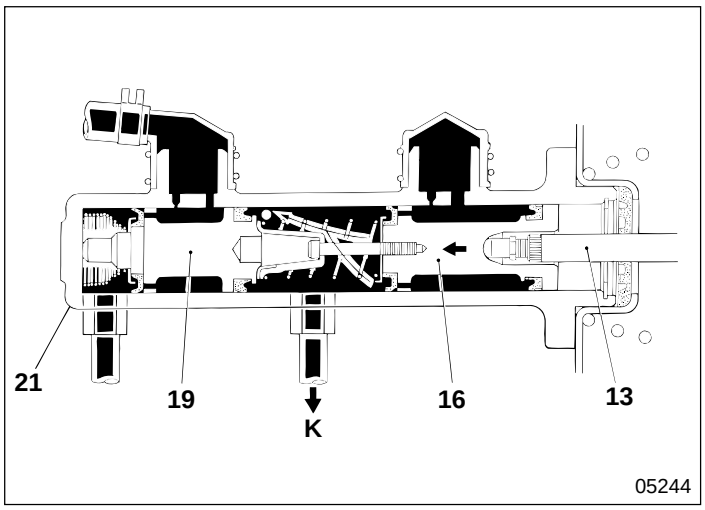
https://truckmanualshub.com/



● **Oil leakage in the front brake system**

- Depressing the brake pedal makes push rod **13** push in primary piston **16**. However, if the brake fluid in the front brake system leaks, hydraulic pressure is not generated in the front brake system.
- Depressing the brake pedal further makes primary piston **16** compress primary piston return spring **17**, causing retainer **18** to push secondary piston **19**, thus generating hydraulic pressure only in the rear brake system.

L : To the rear brake system



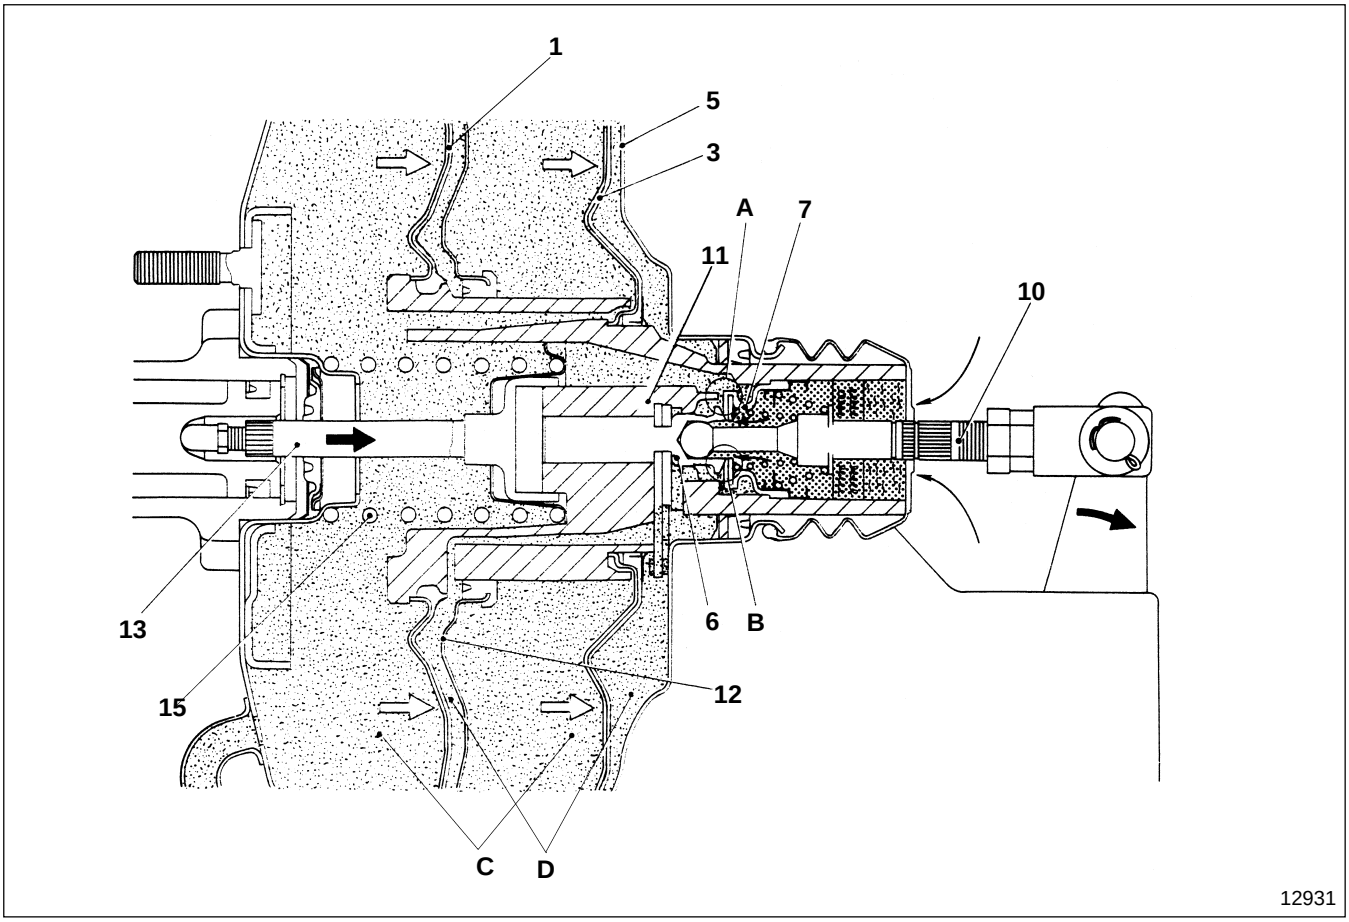
● **Oil leakage in the rear brake system**

- Depressing the brake pedal makes push rod **13** push in primary piston **16** and secondary piston **19**. However, if the brake fluid in the rear brake system leaks, hydraulic pressure is not generated in the rear brake system.
- Depressing the brake pedal further makes the end of secondary piston **19** contact cylinder body **21**, pushing primary piston **16**, thus generating hydraulic pressure only in the front brake system.

K : To the front wheel brake system

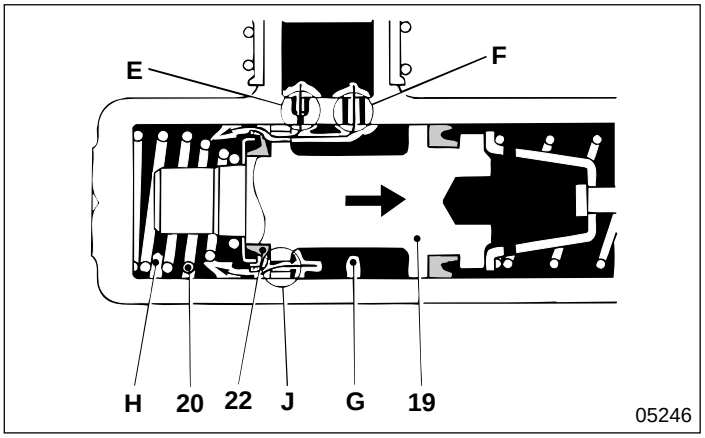
https://truckmanualshub.com/

● **When releasing brake pedal**



Action of master vac

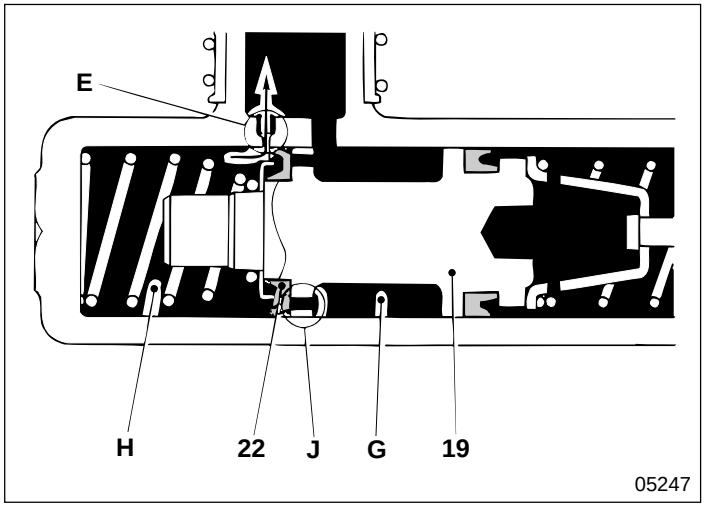
- When the brake pedal is depressed, atmospheric air flows into chamber **D** as chamber **C** is subjected to negative pressure generated by the vacuum pump.
- When the brake pedal is released, since the pressing force acting on the operating rod **10** also is released, valve plunger **6** contacts poppet **7** tightly, closing breather valve **B** to cut off the flow of atmospheric air into chamber **D**. In addition, valve plunger separates from valve body **11** to open vacuum valve **A**. Then, the negative pressure generated by the vacuum pump creates a vacuum in chamber **D**, and the pressure difference between chambers **C** and **D** diminishes.
- This absence of a pressure difference between chambers **C** and **D**, allows rear diaphragm **3** to be pushed against the rear shell **5** by the repercussive force of diaphragm plate return spring **15**, and push rod **13** returns to its original position.



Action of brake master cylinder

- When push rod **13** returns to its original position, the repercussive force of the secondary piston return spring **20** immediately begins to return secondary piston **19**. However, the brake fluid delivered from the brake master cylinder cannot return quickly due to the absence of a pressure difference between chambers **H** and **G**.
- As secondary piston **19** begins to return, the pressure in chamber **H** becomes lower than that in chamber **G**, and this pressure difference deforms packing cup **22** to open a small passage **J**. Then, the brake fluid in chamber **G** is drawn into chamber **H**.

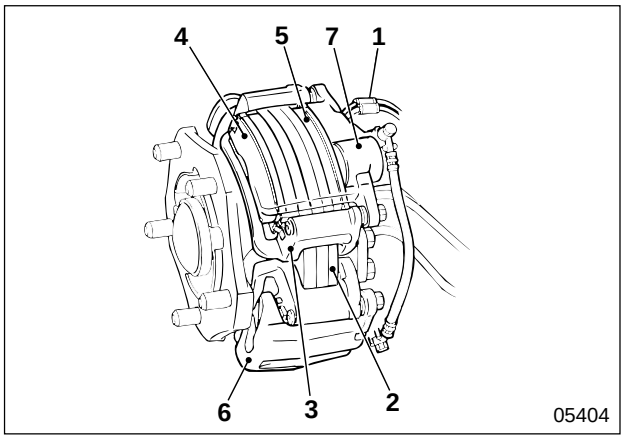
https://truckmanualshub.com/



- When secondary piston **19** returns to its original position, the pressure difference between chambers **G** and **H** is diminished, and packing cup **22** closes the small passage **J**. The hydraulic oil in the brake pipe flows from chamber **H** to the fluid tank via return port **E**.
- The same operation takes place also on the primary side.

https://truckmanualshub.com/

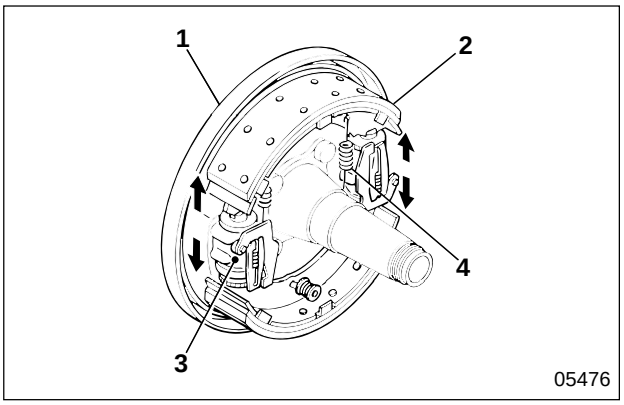
Front Disc Brake



1 Brake pad wear indicator
2 Disc rotor
3 Torque member
4 Outer pad
5 Inner pad
6 Caliper
7 Piston

Inner pad **5** is fitted with brake pad wear indicator **1** that gives warning when it is time to replace outer pad **4** and the inner pad.

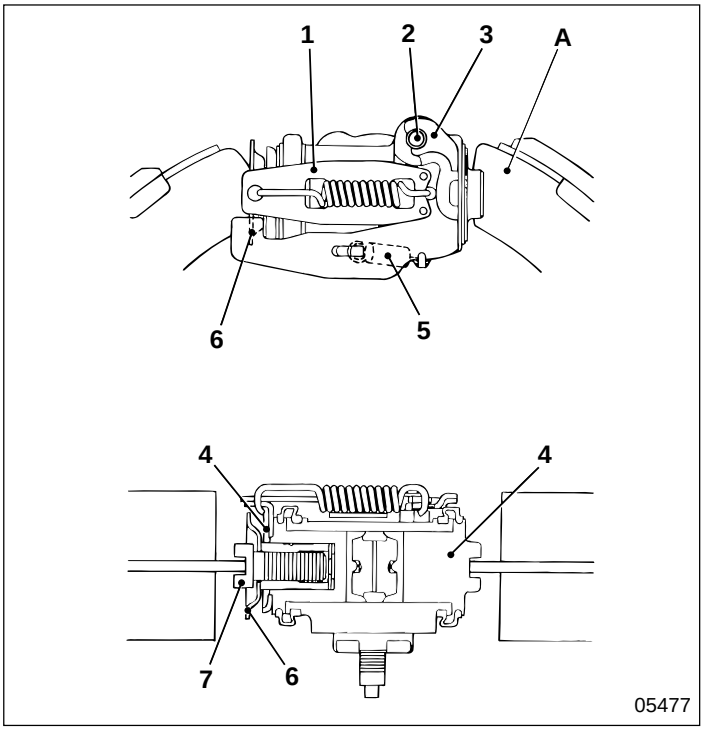
Rear Drum Brake Assembly



1 Backing plate
2 Brake shoe assembly
3 Wheel cylinder assembly
4 Return spring

The rear drum brake assembly is a dual 2-leading type brake and is fitted with wheel cylinder assembly **3**, the self-servo action of which produces a great braking force by using brake shoe assembly **2** as the leading shoe when the vehicle is travelling forwards.

● **Wheel cylinder assembly**

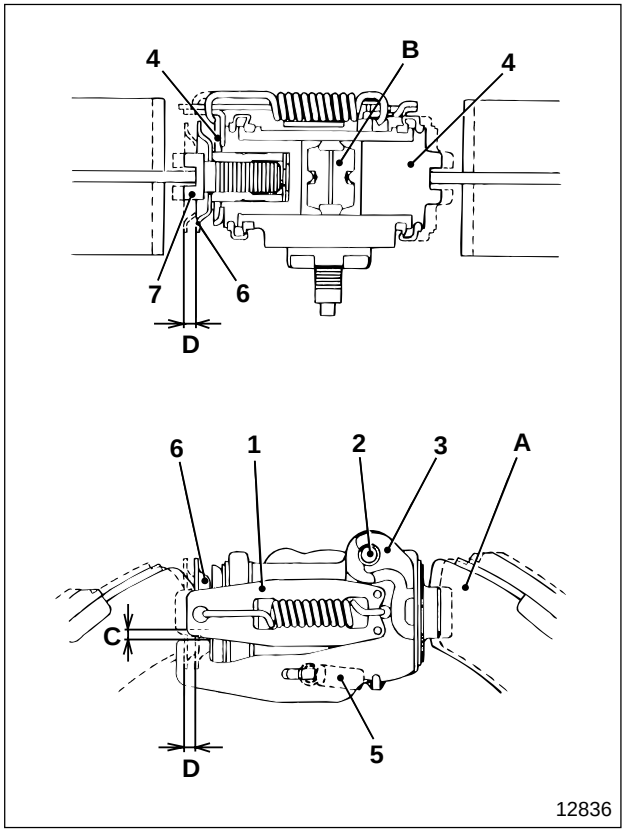


1 Spring and fitting
2 Pin
3 Lever
4 Piston assembly
5 Set spring
6 Adjuster assembly
7 Adjusting screw

A : Brake shoe assembly

The wheel cylinder assembly has an automatic adjuster that corrects the increase in clearance that occurs between the brake lining and the brake drum, an increase caused by the wear of the brake lining. This increase occurs whenever the brake pedal is depressed.

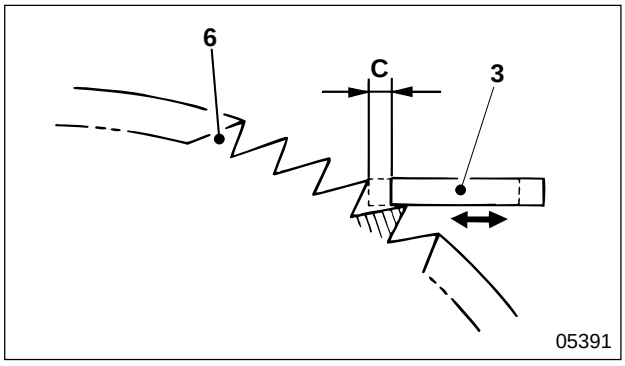
https://truckmanualshub.com/



● **Automatic adjustment mechanism**

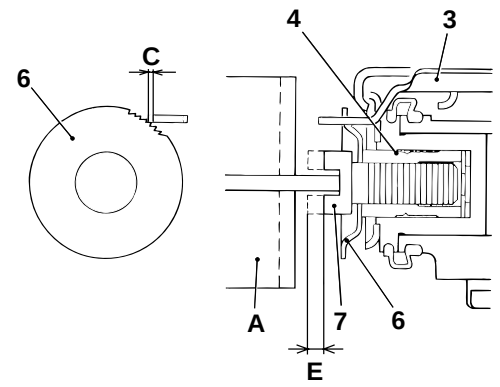
Operation

- When the brake pedal is depressed, the reduced pressure from the brake master cylinder enters chamber **B** and pushes out piston assembly **4**, which in turn pulls spring and fitting **1**.
- Therefore lever **3** turns around pin **2** that is linked to spring and fitting **1**.
  C : Lever travel
  D : Protrusion of piston assembly



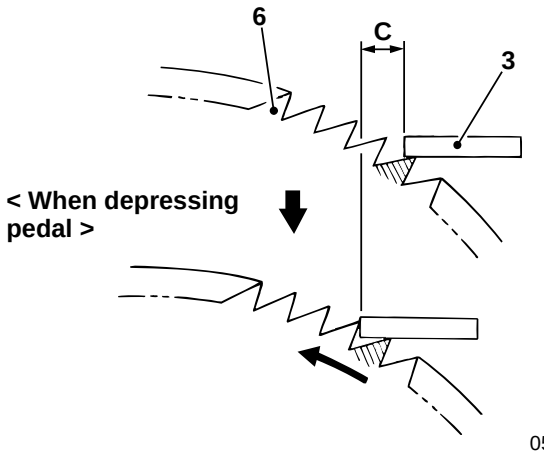
- When the clearance between the brake drum and the brake lining is correct, depression of the brake pedal does not affect lever **3**, so adjuster assembly **6** does not turn.
  C : Lever travel

https://truckmanualshub.com/



12837

< Before depressing pedal >

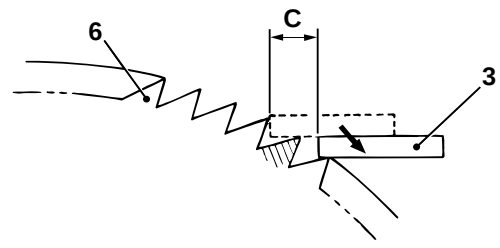


05402

- As the clearance between the brake drum and the brake lining increases, the amount of protrusion of piston assembly **4** also increases, as does the amount of travel of lever **3**.
  C : Lever travel
  E : Protrusion of adjuster screw

- The action of lever **3** increases the rotation of adjuster assembly **6**, the screw action pushes out adjuster screw **7**, expanding brake shoe assembly **A**.

< When releasing pedal >

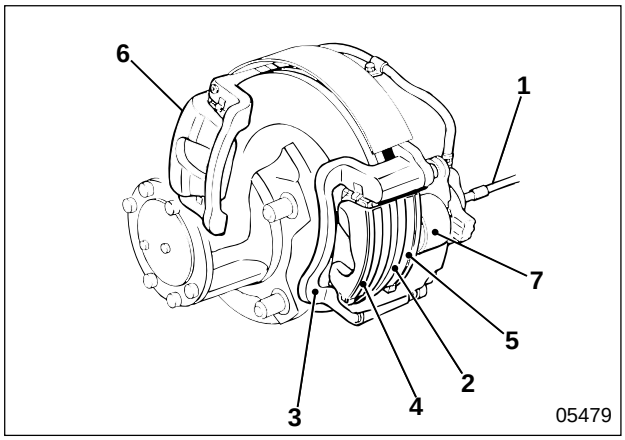


05392

- When the brake pedal is released, since adjuster assembly **6** remains in its new position after turning, returned lever **3** enters the next position, moved by one notch. This assures correct clearance between the brake drum and the brake lining.
  C : Lever travel

https://truckmanualshub.com/

Rear Disc Brake

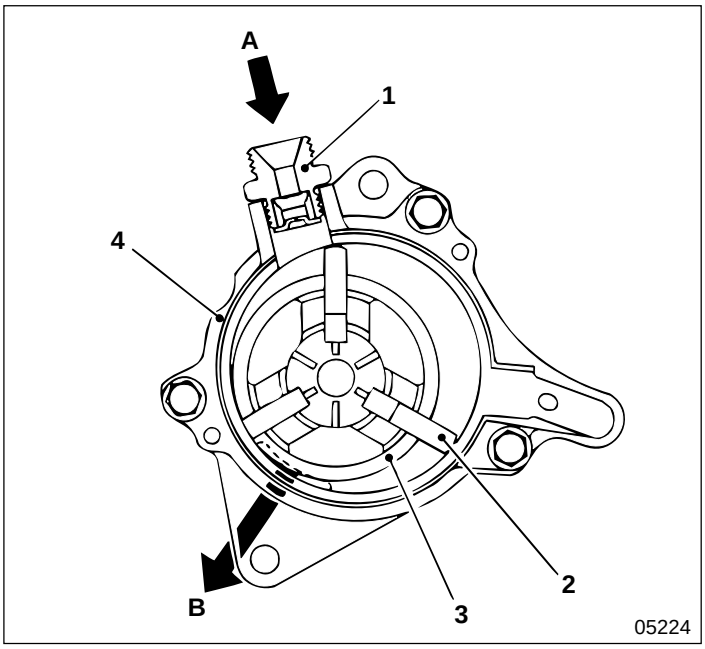


1 Brake pad wear indicator
2 Disc rotor
3 Torque member
4 Outer pad
5 Inner pad
6 Caliper
7 Piston

Inner pad **5** is fitted with brake pad wear indicator **1** that gives warning when it is time to replace outer pad **4** and the inner pad.

https://truckmanualshub.com/

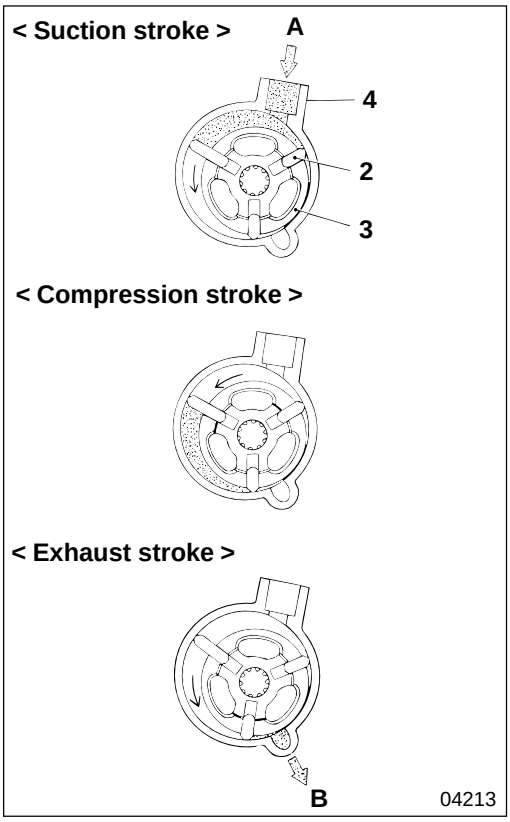
Vacuum Pump



1 Check valve assembly
2 Vane
3 Rotor
4 Housing

A : Inlet
B : Outlet

- The vacuum pump is installed on the timing gear case and is rotated by the injection pump gear or camshaft gear.
- Check valve assembly **1** is fitted to prevent the atmospheric pressure and the lubricating oil from flowing in reverse from the vacuum pump to the vacuum tank when the engine is stopped.

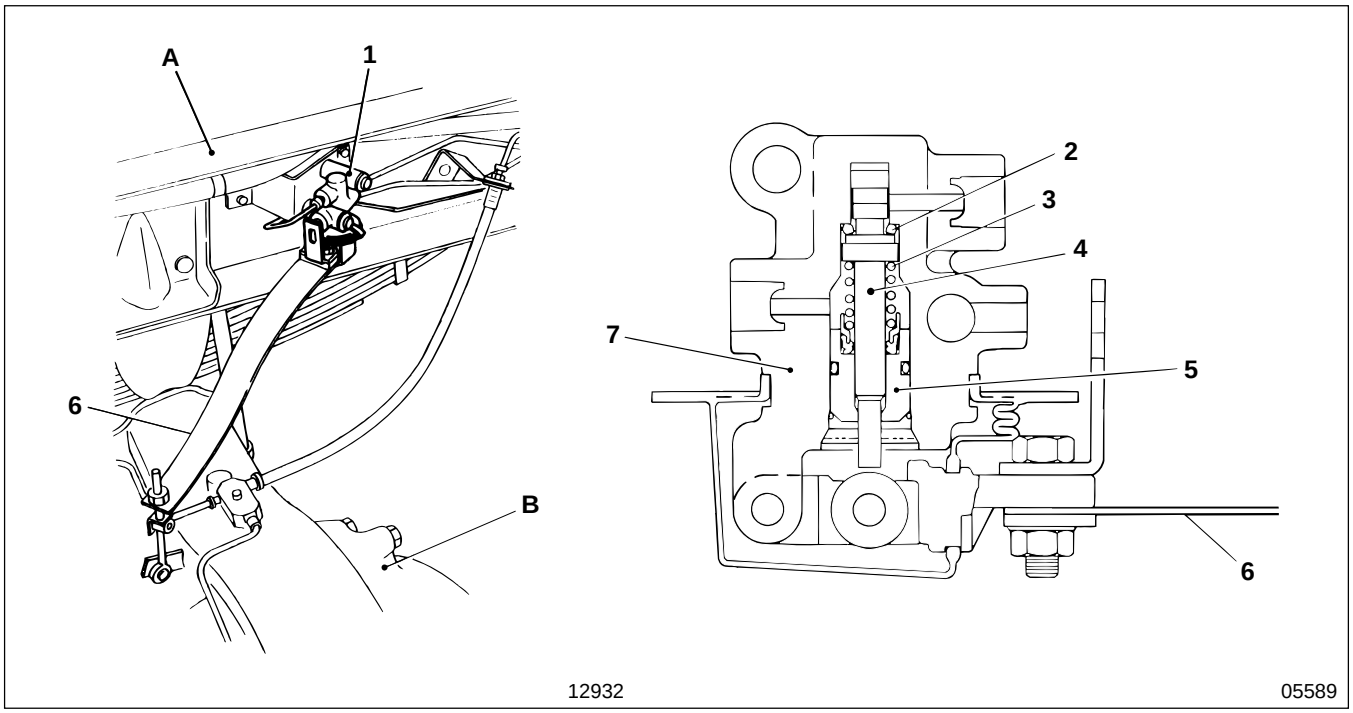


● **Operation**

- Inside cylindrical housing **4**, rotor **3** equipped with three vanes (movable blades) **2** rotates, pressing the vanes against the inside surface of the housing by centrifugal force.
- Since rotor **3** is eccentric with respect to housing **4**, as the rotor rotates, the atmospheric pressure of the vacuum tank is drawn in from inlet **A** and discharges from outlet **B** by the gradual compression of the air. This repetition of the suction, compression and exhaust strokes generates a vacuum, realizing a near-vacuum in the vacuum tank.
- The engine oil that lubricates and cools the inside of housing **4** is returned, along with air pressure, through outlet **B** to the oil pan.

https://truckmanualshub.com/

Load Sensing Valve



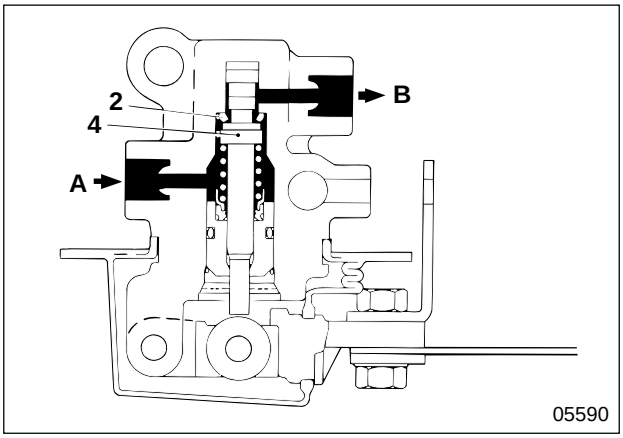
1 Load sensing valve
2 Packing cup
3 Spring
4 Plunger
5 Retainer
6 Leaf spring
7 Valve body

A : Frame
B : Rear axle

The deflection of leaf spring **6**, fixed on rear axle **B**, notifies load sensing valve **1** of any shifts in the load. This decreases hydraulic pressure to the rear wheel brakes compared to the front wheel brakes. This maintains adequate braking performance that corresponds to any shift in the load, preventing premature rear wheel lock.

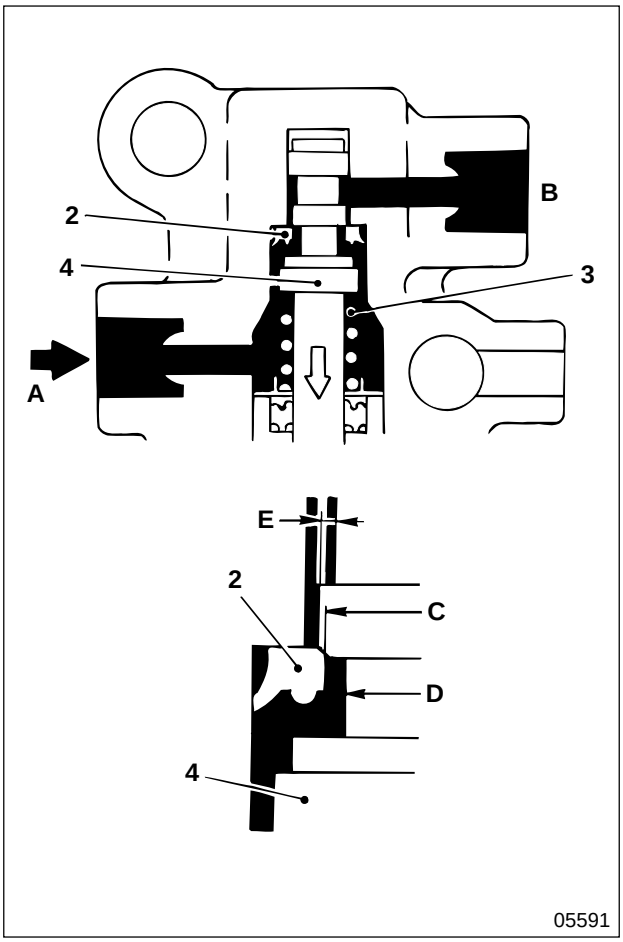
https://truckmanualshub.com/

● **Valve unit**



When depressing brake pedal

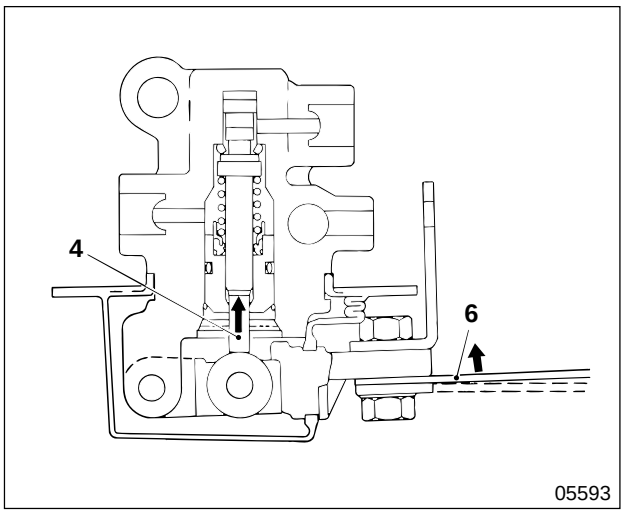
- Brake fluid is supplied from the brake master cylinder to the rear wheel brakes via chamber **A**, the clearance between packing cup **2** and plunger **4**, and chamber **B**.



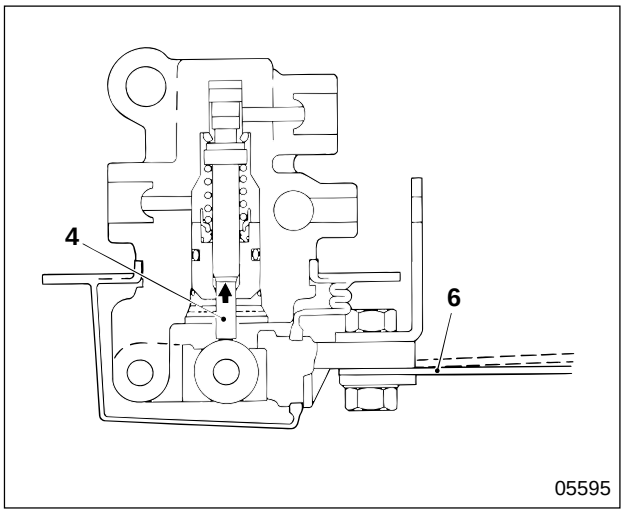
- Hydraulic pressure **A**, supplied by the brake master cylinder, gradually increases on seal cross-section **E** of plunger **4**. This increase depresses spring **3** pushing the plunger down onto packing cup **2** and cuts off the passage between chambers **A** and **B**. This is called the decompression point.
  🕮 P35-16 (Performance characteristics chart)
- Hydraulic pressure **A** at the brake master cylinder pushing plunger **4** up when the decompression point is passed. On the other hand, hydraulic pressure **B** at the rear wheel brakes works as a depressing force, so hydraulic pressure **A** and **B** balance, cutting off the passage between chambers **A** and **B**.
  At this time, hydraulic pressure at the brake master cylinder works at the donut-shaped cross-section (formed by the removal of cross-section **D** from cross-section **C** of plunger **4**). However, because hydraulic pressure **B** at the rear wheels works on the whole cross-section **E** of the plunger seal, and the rear wheel brake side remains at low hydraulic, balance is maintained.
- Therefore, hydraulic pressure **B** at the rear wheel brakes is lower than hydraulic pressure **A** at the brake master cylinder.
  The gradient of the performance characteristics of hydraulic pressure **B** is lower than that of hydraulic pressure **A**.
  🕮 P35-16 (Performance characteristics chart)

https://truckmanualshub.com/

● **Sensor unit**

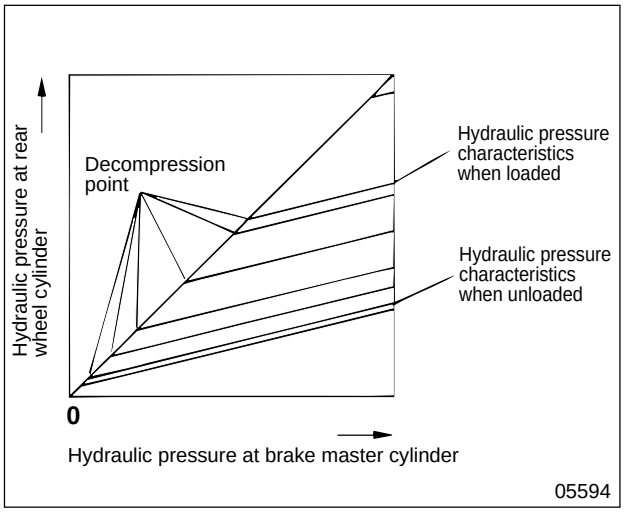


- **When the vehicle is loaded**
  When the vehicle is loaded, since the deflection of leaf spring **6** is large and the amount of upward travel of plunger **4** is also large, the amount of plunger downward travel is small. Therefore, the decompression point rises to supply higher brake pressure to the rear wheels, compared to the unloaded state.



- **When the vehicle is unloaded**
  When the vehicle is unloaded, since the deflection of leaf spring **6** is small and the amount of upward travel of plunger **4** is also small, the amount of plunger downward travel is large. Therefore, the decompression point drops to supply lower brake pressure to the rear wheels, compared to the loaded state.

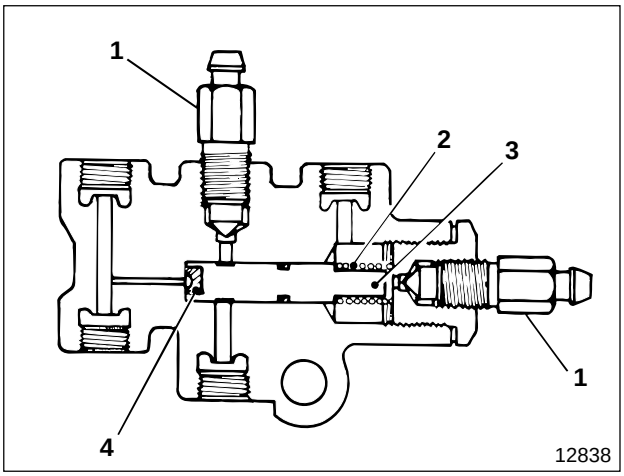
● **Performance characteristics**



The figure on the left shows the changes in braking performance characteristics of the rear wheels. These changes depend on the vehicle load and any shifts in the load caused by sudden deceleration while cruising.

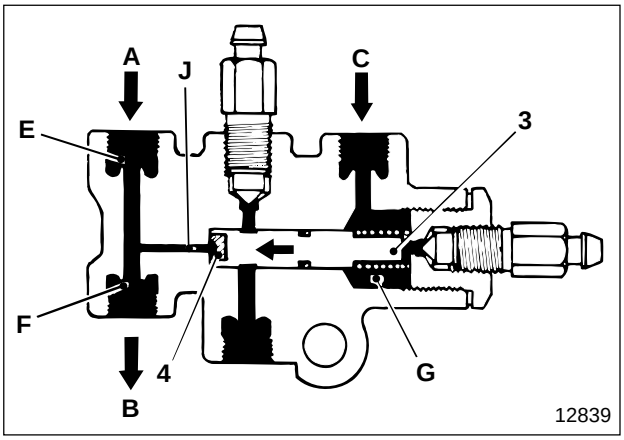
https://truckmanualshub.com/

Bypass Valve



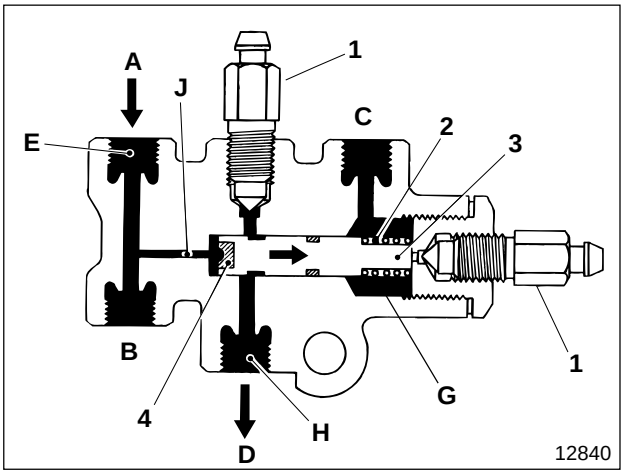
1 Bleeder screw
2 Spring
3 Piston
4 Seal

- If any failure occurred in the front brake system that decreased the hydraulic pressure, the decompression effect of the load sensing valve would affect the hydraulic pressure in the rear brake system. This would reduce the braking force of the rear brake system. The bypass valve is fitted to prevent this from happening.
- If the hydraulic pressure in the front brake system decreases, the hydraulic pressure in the rear brake system bypasses the load sensing valve and is fed directly to the rear wheel brake.



● **When the hydraulic pressure in the front brake system is normal**

- The hydraulic pressure flows through chamber **G**, pushes piston **3**, and cuts off bypass **J** with seal **4**.
  C : From front brake system
- The hydraulic pressure in the rear brake system flows from chamber **E** into chamber **F**.
  A : From the rear brake system of the brake master cylinder
  B : To the load sensing valve



● **When the hydraulic pressure in the front brake system decreases abnormally.**

- The hydraulic pressure in chamber **G** decreases, reducing the force pushing piston **3**.
  C : From the front brake system
- The hydraulic pressure of the rear brake system pushes seal **4**, and overcomes the repercussive force of spring **2** to push piston **3**, opening bypass pass **J**.
- The hydraulic pressure of the rear brake system flows from chamber **E** into chamber **H**.
  A : From the rear brake system of the brake master cylinder
  D : To the rear wheel brake

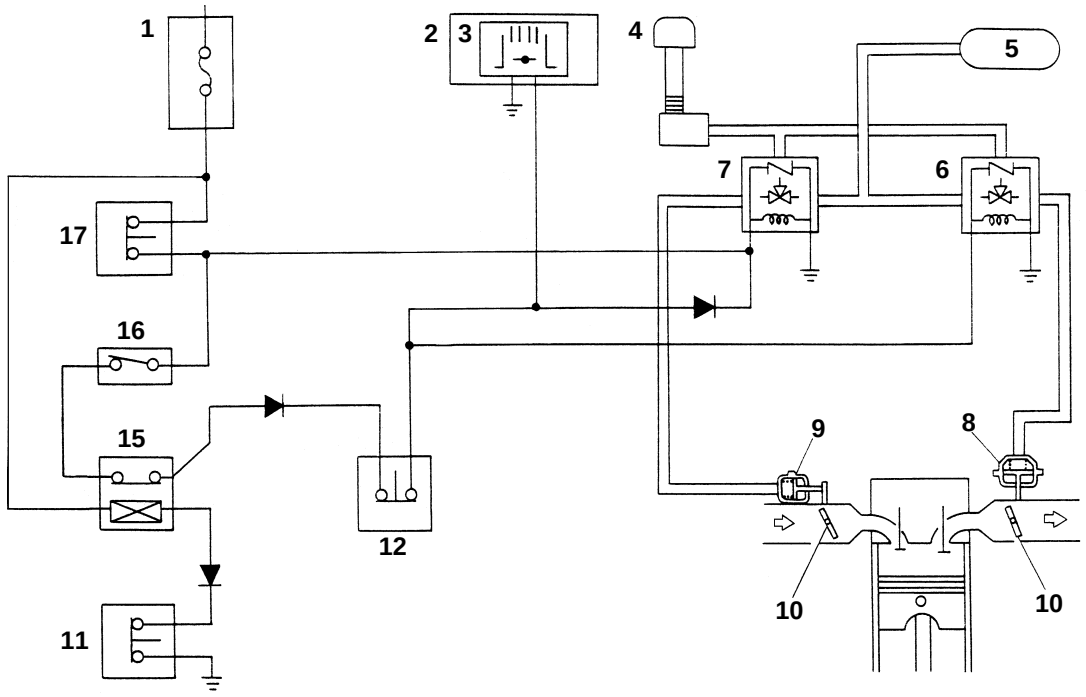
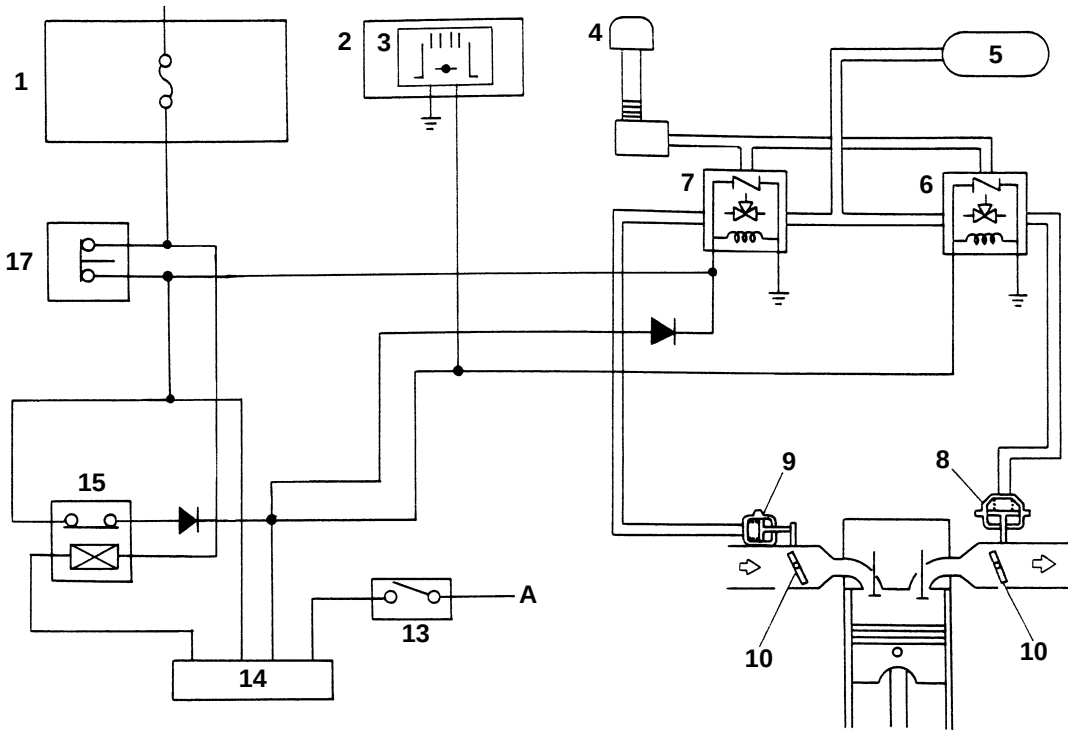
Exhaust Brake System

< Manual transmission >



12841

< Automatic transmission >



12842

https://truckmanualshub.com/

1 Fuse box
2 Meter cluster
3 Exhaust brake indicator lamp
4 Air cleaner
5 Vacuum tank
6 Exhaust brake 3-way magnetic valve
7 Intake shutter 3-way magnetic valve
8 Exhaust brake unit
9 Intake shutter
10 Butterfly valve
11 Neutral switch < Manual transmission >
12 Clutch switch < Manual transmission >
13 Inhibiter switch < Automatic transmission >
14 Automatic transmission electric control unit < Automatic transmission >
15 Exhaust brake cut relay
16 Exhaust brake switch < Manual transmission >
17 Accelerator switch
18 Clutch switch < Manual transmission >

A : From starter switch

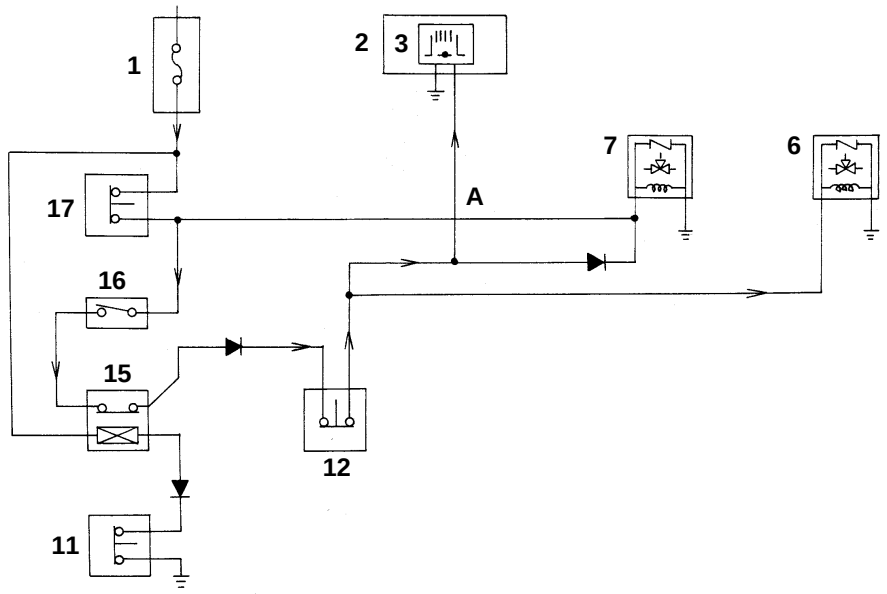
- The exhaust brake uses pressure to push and return the piston in the exhaust stroke. This pressure is generated when the exhaust pipe is shut and the pressure in the exhaust pipe increases.
- A butterfly valve type exhaust brake unit **8** is fitted as an auxiliary brake to assist the foot brake. Intake shutter **9** is fitted to reduce the suction noise generated when the exhaust brake is operated.
- When the exhaust brake switch **16** is turned ON, excitation of the coil of exhaust brake 3-way magnetic valve **6** closes the atmospheric valve and opens the vacuum valve. This makes the vacuum in the vacuum tank act on exhaust brake unit **8** which closes butterfly valve **10**, activating the exhaust brake.

https://truckmanualshub.com/

● **Operation**

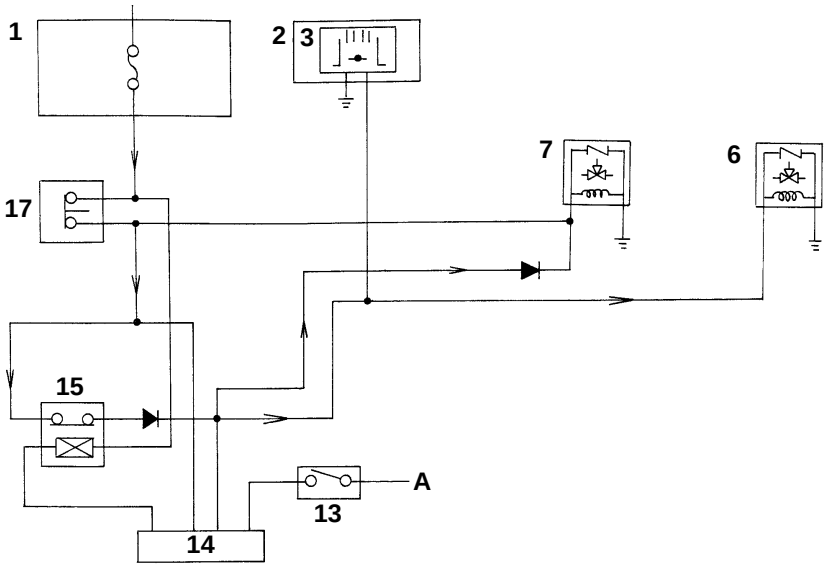
Electrical System

< Manual transmission >



12843

< Automatic transmission >



12844

When exhaust brake switch **16** is turned ON, exhaust brake indicator lamp **3** within meter cluster **2** lights up and the exhaust brake 3-way magnetic valve **6** operates.
At this time, depressing the clutch pedal (clutch switch **12** OFF) or the accelerator pedal (accelerator switch **17** OFF) temporarily releases the exhaust brake. When the transmission is in neutral (neutral switch **11** or inhibiter switch **13** ON) because the vehicle is stopped or for some other reason, exhaust brake cut relay **15** operates, releasing the exhaust brake after approximately 10 seconds.
If the accelerator pedal is depressed and released after the exhaust brake is released by the exhaust brake cut relay, the exhaust brake operates again, and after approximately 10 seconds is released.

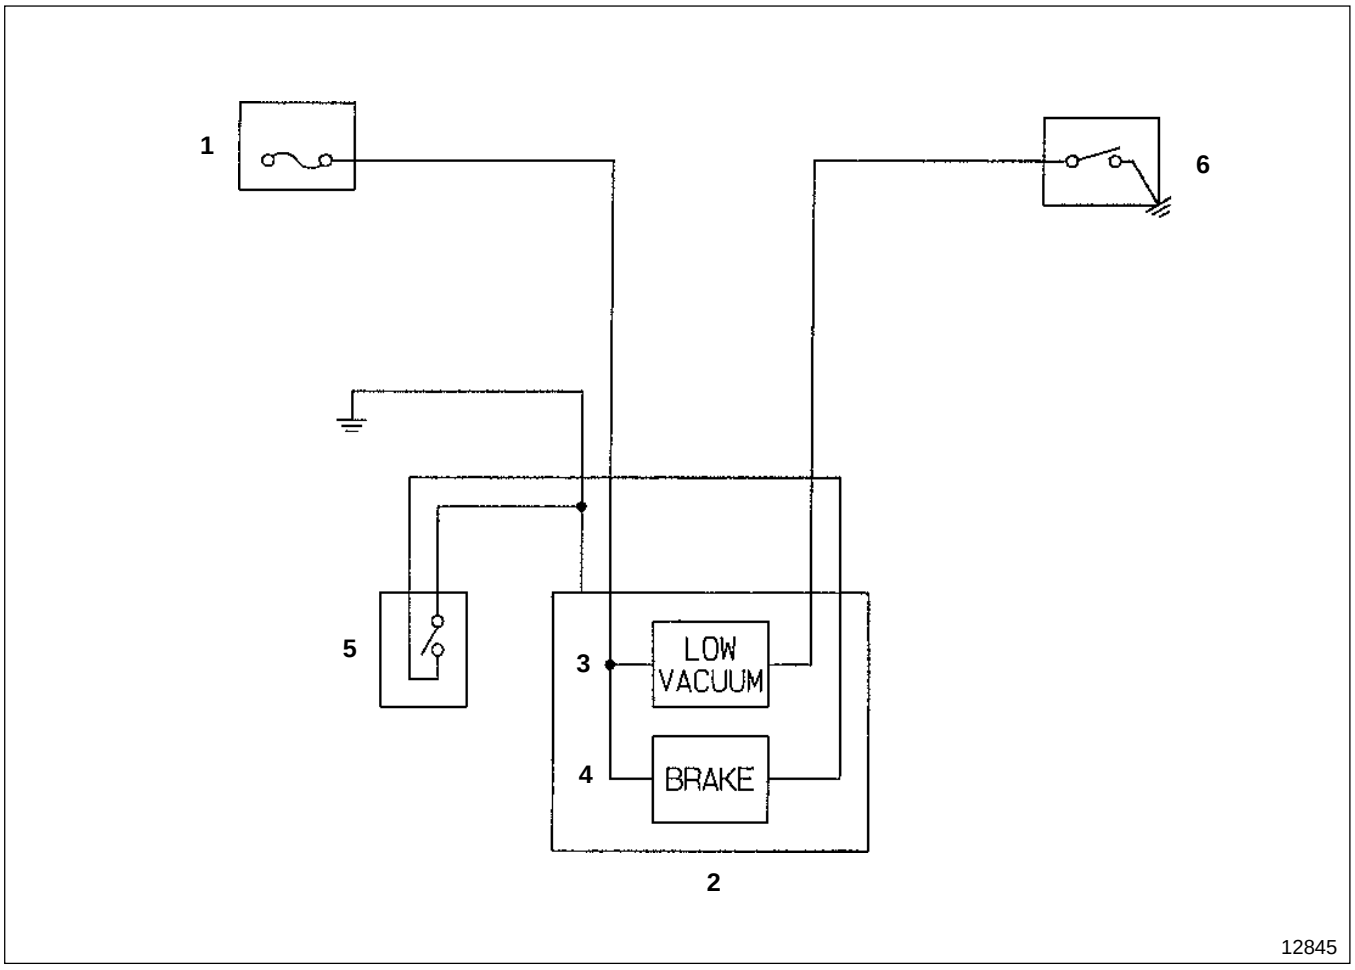
Brake Warning System

● **Vacuum system electric circuit, brake fluid level system electric circuit**

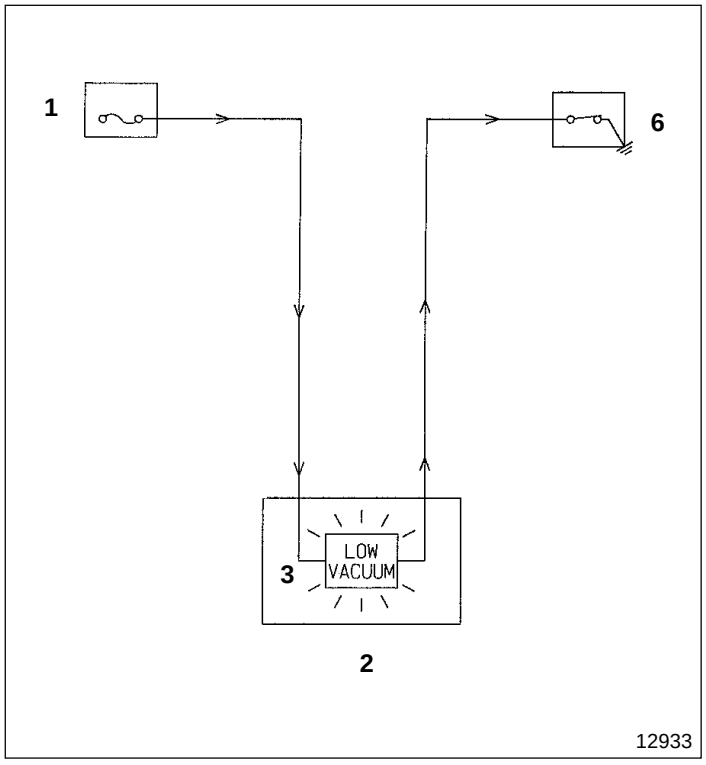


1 Fuse box
2 Meter cluster
3 Vacuum warning lamp
4 Brake warning lamp
5 Brake fluid level switch
6 Vacuum switch

The brake warning system consists of a vacuum system electric circuit which detects the drop in negative pressure inside the vacuum tank, and a brake fluid level system electric circuit which detects the drop in the level of brake fluid inside the fluid tank. In both cases a warning lamp lights up to give warning.

https://truckmanualshub.com/

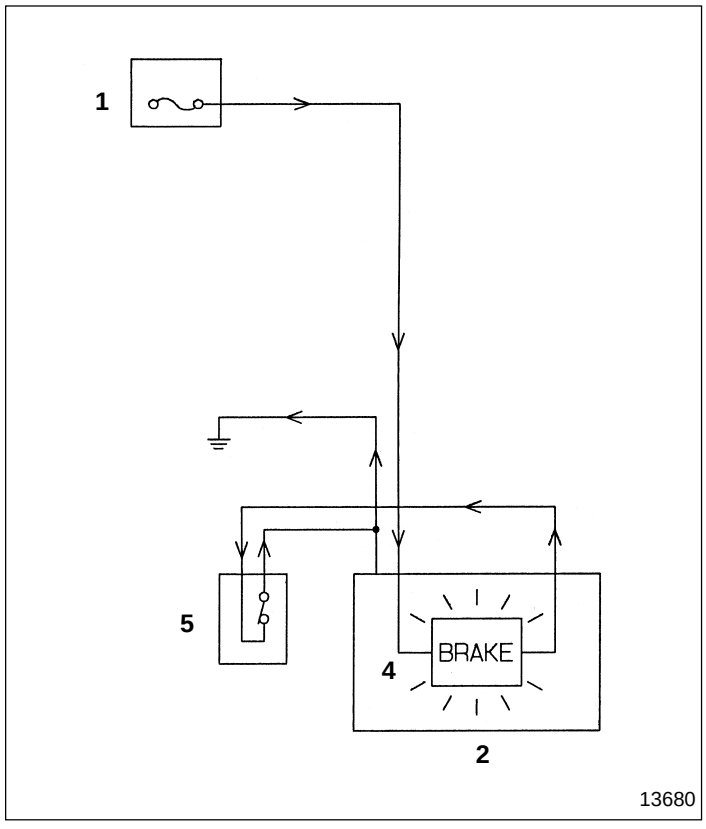
● **Vacuum system electric circuit**



If the negative pressure in the vacuum tank drops below the specified pressure, vacuum switch **6** turns ON lighting vacuum warning lamp **3**. The flow of current at such time is as follows.

Fuse **1**→Vacuum warning lamp **3**→Vacuum switch **6**→Ground

● **Brake fluid level system electric circuit**

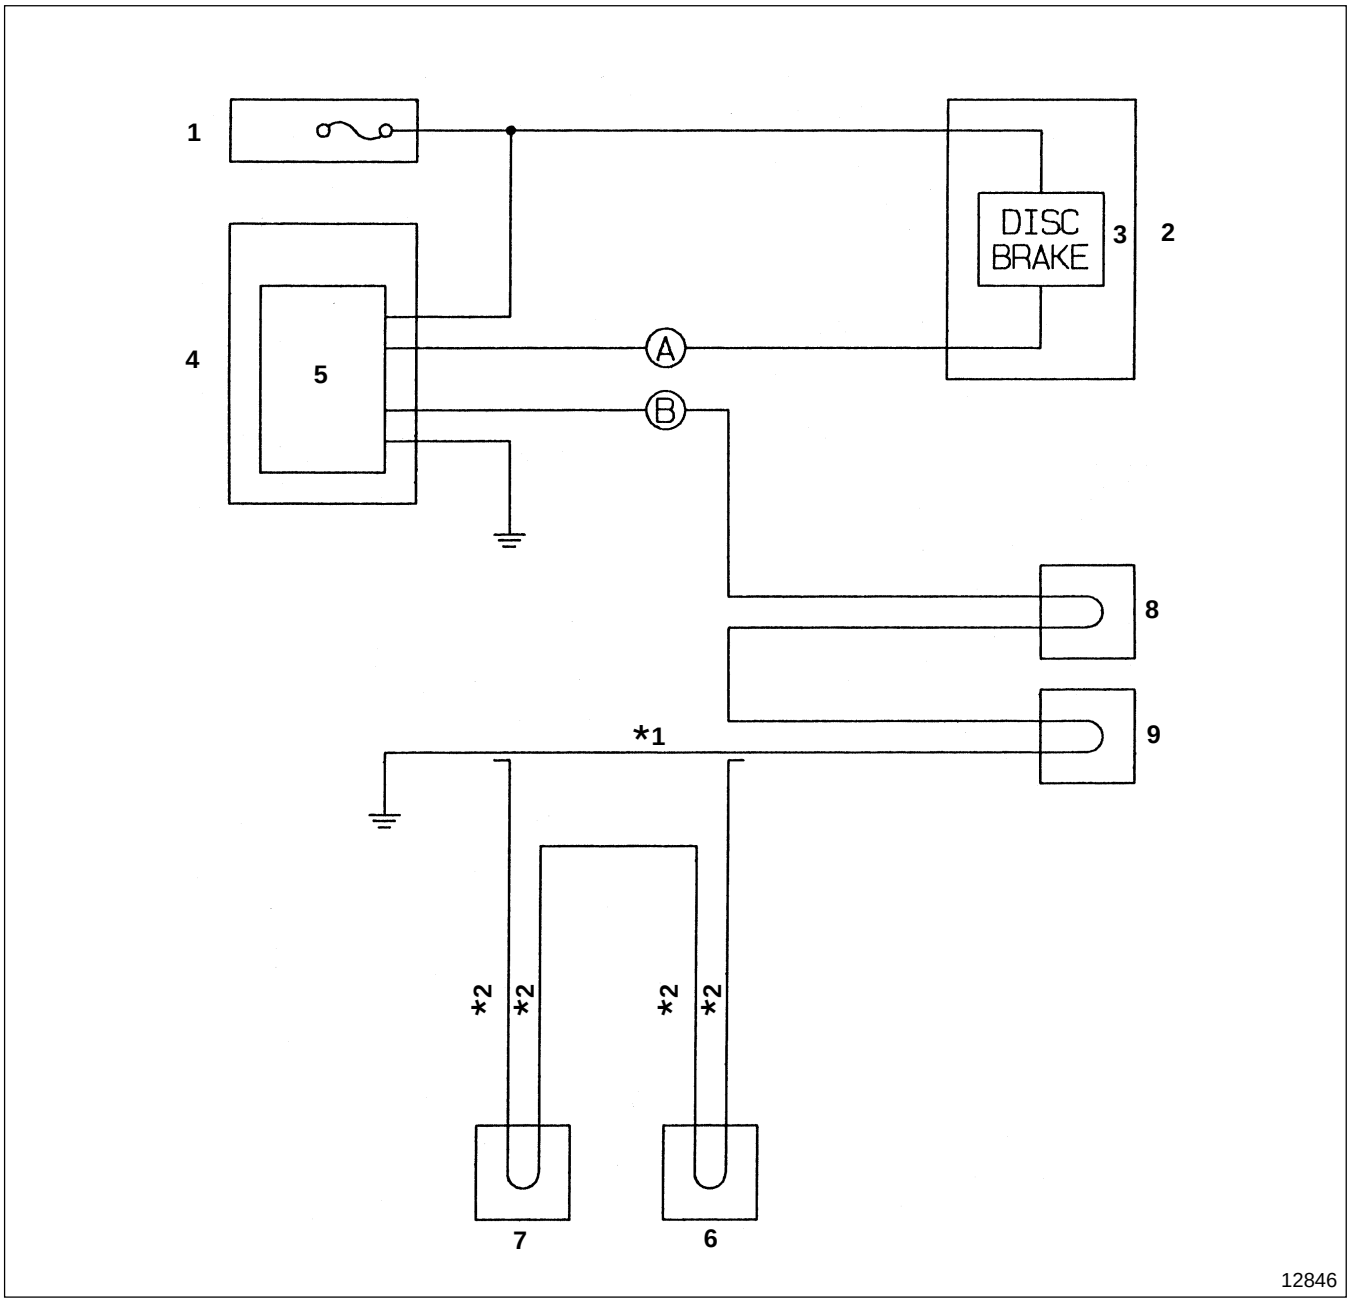


If the amount of brake fluid in the fluid tank drops below the specified amount, brake fluid level switch **5** turns ON lighting brake warning lamp **4**. The flow of current at such time is as follows.

Fuse **1**→Brake warning lamp **4**→Brake fluid level switch **5**→Ground

https://truckmanualshub.com/

Wear Indicator System Electric Circuit



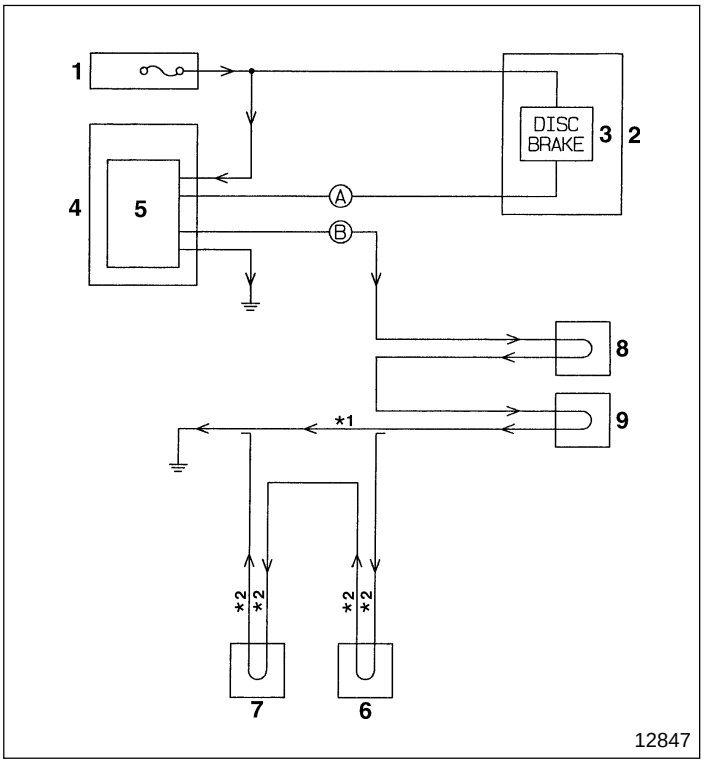
1 Fuse box
2 Meter cluster
3 Disc brake warning lamp
4 Relay box
5 Lighting and alarm control unit
6 Rear brake pad wear indicator, LH < FE649 >
7 Rear brake pad wear indicator, RH < FE649 >
8 Front brake pad wear indicator, LH
9 Front brake pad wear indicator, RH

***1** : < FE639 >
***2** : < FE649 >
Ⓐ : Warning signal
Ⓑ : Wear indicator signal

- The brake pad wear indicator system electrical circuit is provided for warning. When the brake pad is worn out, the disc rotor disconnects wear indicators **6** to **9**. Lighting and alarm control unit **5** detects this and gives a warning.
- If one of pad wear indicators **6** to **9** is disconnected, lighting and alarm control unit **5** operates, lighting disc brake warning lamp **3**.

https://truckmanualshub.com/

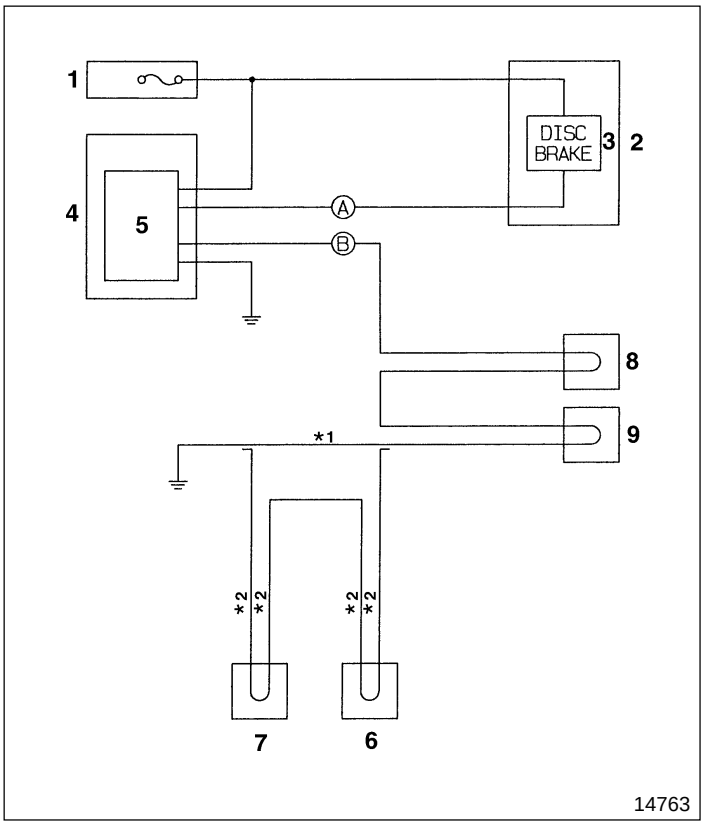
● **When normal operating**



- While lighting alarm control unit **5** is sending out wear indicator signal Ⓐ, warning signal Ⓐ is not input.
- Since warning signal Ⓐ is not being input, disc brake warning lamp **3** will not light up.
- The flow of current at such time is as follows.

Fuse **1**→Lighting alarm control unit **5**→Ground
→Wear indicator signal Ⓑ→Brake pad wear indicator **6** to **9**→Ground

● **When brake pad wear indicator cut off**



- When lighting alarm control unit 5 stops sending out wear indicator signal Ⓑ, warning signal Ⓐ is input.
- When warning signal Ⓐ is input, disc brake warning lamp **3** lights up.
- The flow of current at such time is as follows.

Fuse **1** → →Lighting alarm control unit **5**→Ground
→Disc brake warning lamp **3**
→Warning signal Ⓐ

Replacement of Brake Fluid

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened		Tightening torque	Remarks
1	Air bleeder	Front disc brake	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Rear wheel cylinder < FE639 >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Rear disc brake < FE649 >	6.9 to 8.8 {5.1 to 6.5, 0.7 to 0.9}	—
		Bypass valve	8.8 to 13 {6.5 to 9.4, 0.9 to 1.3}	—

Fluid

Location	Points of application	Kinds	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No. 116 DOT3)	As required

WARNING

- **The clutch fluid system and the brake fluid system use the fluid tank in common. Therefore, replacement and air bleeding of the clutch fluid must be carried out simultaneously with that of the brake fluid. Gr 21**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose.**

CAUTION

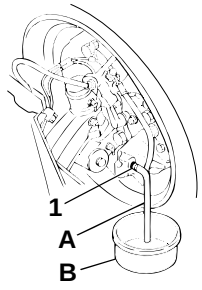
- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

NOTE

Supply and maintain the brake fluid level to the “MAX” level of the fluid tank.

https://truckmanualshub.com/

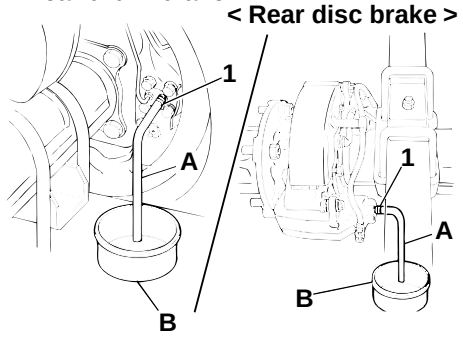
< Front disc brake >



12934

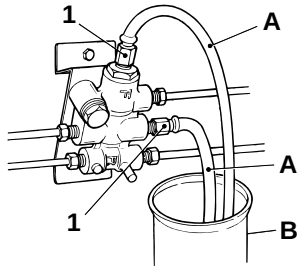
< Rear drum brake >

< Rear disc brake >



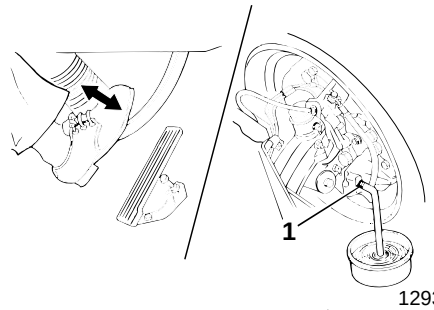
06534

< Bypass valve >

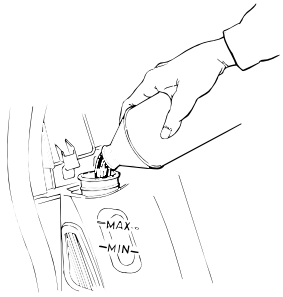


12935

- Start the engine and let it idle until you complete brake fluid replacement.
- Connect vinyl pipes **A** : one to the front disc brake, one to the rear drum brake < FE639 > or the rear disc brake < FE649 >, and two to the bypass valve.
- Put the free ends of vinyl pipes **A** into containers **B**.



12936



07623

- Loosen air bleeders **1** and depress the brake pedal several times to drain brake fluid completely.
- Maintaining a supply of new brake fluid up to the “MAX” level of the fluid tank, depress the brake pedal repeatedly until the old brake fluid of the brake system is replaced with new fluid, and after you complete the work, tighten each air bleeder **1** at specified torque.
- Bleed air from the brake system.

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

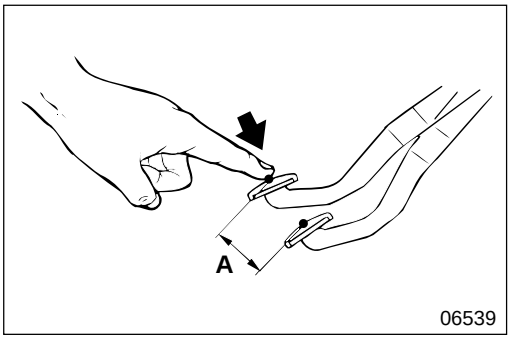
Inspection and Adjustment of Brake Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Free play of brake pedal	10 to 15 {0.39 to 0.59}	—	Adjust



[Inspection]
Check if brake pedal free play **A** confirms to the standard valve with the engine stopped. If the measured value deviates from the standard value, adjust the position of the brake pedal.

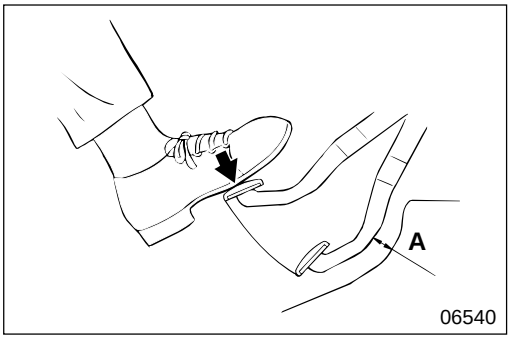
[Adjustment]
P35-51

Inspection and Adjustment of Clearance between Brake Pedal and Floor Panel

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Clearance between brake pedal and floor panel (with pedal depressed at 490 N {110 lbf, 50 kgf})	45 {1.77} or more	—	Adjust



[Inspection]
Depress the brake pedal using 490 N {110 lbf, 50 kgf} when the engine is idling to check if clearance **A** between the brake pedal and the floor panel conforms to the standard value. If the measured value deviates from the standard value, adjust the position of the brake pedal.

[Adjustment]
P35-51

https://truckmanualshub.com/

Inspection and Replacement of Disc Brake Pad

Service standards

Unit : mm {in.}

Location	Maintenance item			Standard value	Limit	Remedy
5, 6	Thickness of outer and inner pads	FE639	Front disc brake	12 {0.47}	4 {0.16}	Replace
		FE649	Front disc brake	14 {0.55}	4 {0.16}	Replace
			Rear disc brake	14 {0.55}	4 {0.16}	Replace

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Slide pin bolt tightening	83.3 to 93.1 {61 to 69, 8.5 to 9.5}	Wet

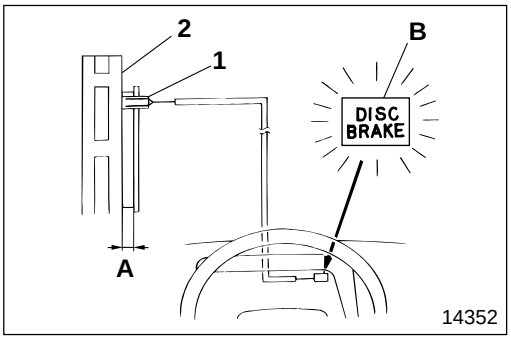
Fluid

Location	Points of application	Kinds	Quantity
3	Thread area of slide pin bolt	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
—	Piston expander 	MB990520	Pushing back of piston when replacing brake pad

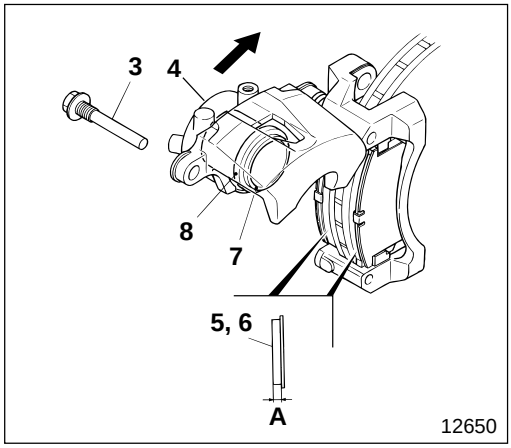


[Inspection]

- When brake pad thickness **A** decreases to approximately 4 mm {0.16 in.}, brake pad wear indicator **1** makes contact with disc rotor **2** and is disconnected. This lights up brake warning lamp **B** within the meter cluster, indicating that the brake pad should be replaced.

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

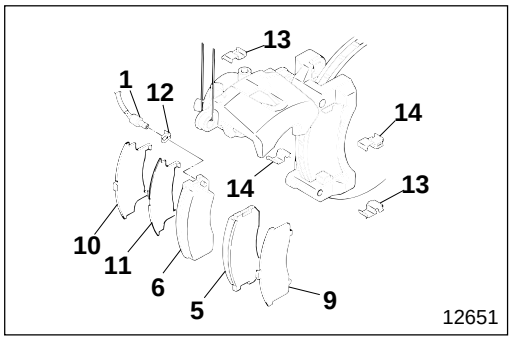


- Remove lower slide pin bolt **3**.
- Turn caliper **4** upward and secure it using wire.

CAUTION

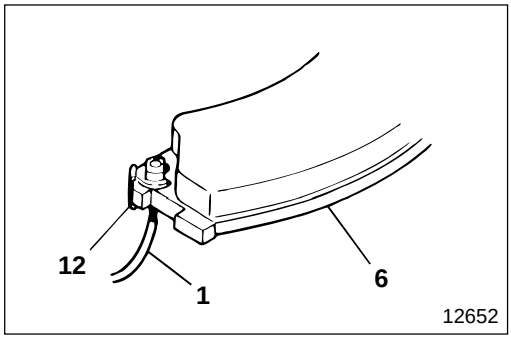
- **Make sure that you do not smear, or get dust on, the grease applied to slide pin bolt 3.**
- **Be careful when you secure caliper 4 that you do not use excessive force on the brake hose or brake pad wear indicator 1.**
- **Make sure that you secure caliper 4 securely.**

- Check thickness **A** of outer pad **5** and inner pad **6** and if the thickness is lower than the limit, replace the pads on the same axle as a unit.
- Check if any fluid is leaking from piston **7**, and check if piston boot **8** is damaged. If any fault is found, replace the faulty parts.

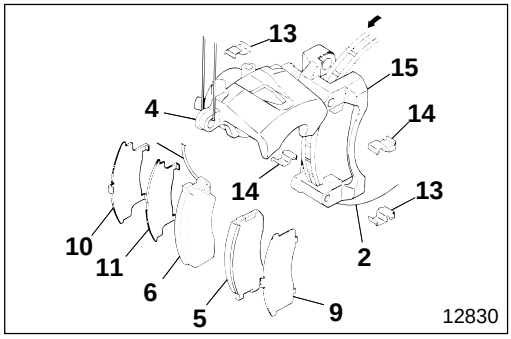


[Replacement]

- Remove the following parts:
  - **9** Outer shim
  - **5** Outer pad
  - **10** Inner shim A
  - **11** Inner shim B
  - **12** Clip
  - **1** Brake pad wear indicator
  - **6** Inner pad
  - **13** Pad liner A
  - **14** Pad liner B

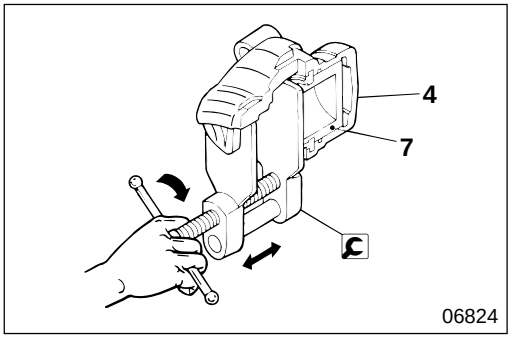


Install brake pad wear indicator **1** on inner pad **6** in the pad kit using clip **12**.

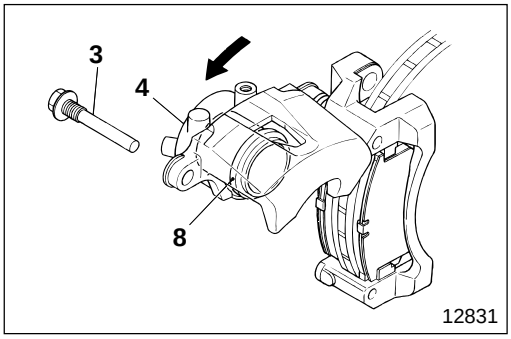


- Clean torque member **15**.
- Install the kit parts onto torque member **15** in the following order:
  - Install pad liner A **13** and pad liner B **14** on torque member **15**.
  - Install outer shim **9** on outer pad **5**.
  - Install inner shims **10**, **11** on inner pad **6**.
  - Install outer pad **5** on torque member **15**.
  - Install inner pad **6** on torque member **15**.
  - Install inner pad **6** so that brake pad wear indicator **1** faces the entrance side (when the vehicle is moving forwards) of disc rotor **2** of caliper **4**.

https://truckmanualshub.com/



- Push piston **7** until it makes contact with the bottom of caliper **4**.



- Slacken off caliper **4**, taking care not to damage piston boot **8**.
- Bleed the bushing.
- Apply brake fluid to the periphery of slide pin bolt **3** and its thread area.
- Tighten slide pin bolt **3** at specified torque.
- Wire up the harness of brake pad wear indicator **1**. Gr 26, 27
- Inspect drag torque. P35-54, 58, 70
- Depress the brake pedal several times.
- Make sure that brake fluid is maintained at the “MAX” level of the fluid tank. If the level drops, add brake fluid. P35-32

https://truckmanualshub.com/

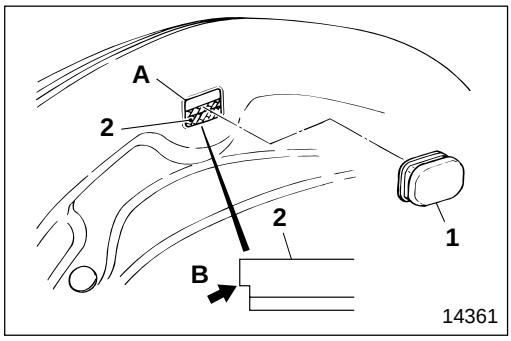
INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Drum Brake Lining Thickness Inspection and Replacement

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Thickness of brake lining	—	4 {0.16} (Side shoulder means wear limit)	Replace



[Inspection]

NOTE

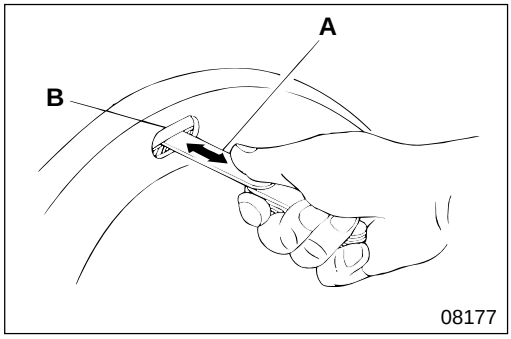
Be sure to inspect at two points for each wheel per side.

- Remove cover **1** from the backing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall cover **1**.

[Replacement]

P35-63

Inspection of Brake Shoe Clearance



Insert 0.2 mm {0.0079 in.} feeler gauge **A** into inspection hole **B** of the back plate, and make sure that you can move the gauge in and out feeling some resistance. After this inspection, adjust the clearance if any abnormality is found.

P35-61

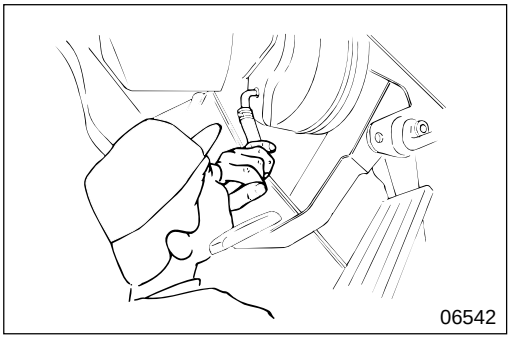
https://truckmanualshub.com/

Inspection of Brake Booster (Master Vac)

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Air tightness with no load (with vacuum meter at 67 kPa {19.7 in. Hg, 500 mmHg} and engine stopped)		Vacuum drop after 15 seconds should be 3.3 kPa {0.98 in. Hg, 25 mmHg} or less	—	Replace
	Airtightness with load (with brake pedal slightly depressed, vacuum meter at 67 kPa {19.7 in. Hg, 500 mmHg} and engine stopped)				
—	Boosting action (Fluid pressure with vacuum meter at 67 kPa {19.7 in. Hg, 500 mmHg} and brake pedal depressed at specified foot pressure)	8 in.+9 in.	4410 kPa {640 lbf/in^2, 45 kgf/cm^2} (98 N {22 lbf, 10 kgf})	—	Replace
			8340 kPa {1210 lbf/in^2, 85 kgf/cm^2} (295 N {66 lbf, 30 kgf})		
		9 in.+10 in.	3920 kPa {570 lbf/in^2, 40 kgf/cm^2} (98 N {22 lbf, 10 kgf})		
			8830 kPa {1280 lbf/in^2, 90 kgf/cm^2} (295 N {66 lbf, 30 kgf})		
	No boosting action (Fluid pressure after vacuum meter falls to 0 kPa {0 in. Hg, 0 mmHg} and brake pedal depressed at specified foot pressure)	8 in.+9 in.	295 kPa {43 lbf/in^2, 3 kgf/cm^2} (98 N {22 lbf, 10 kgf})	—	Replace
			1670 kPa {240 lbf/in^2, 17 kgf/cm^2} (295 N {66 lbf, 30 kgf})		
		9 in.+10 in.	195 kP---a {28 lbf/in^2, 2 kgf/cm^2} (98 N {22 lbf, 10 kgf})		
			1470 kPa {215 lbf/in^2, 15 kgf/cm^2} (295 N {66 lbf, 30 kgf})		

[Inspection]
Two types of inspection are used to inspect the master vac operation, inspection without a tester and inspection with a simple tester. Make sure that there is no fluid leak or damage at the joints of the brake pipes and hoses before inspection.



06542

(1) Inspection of check valve operation

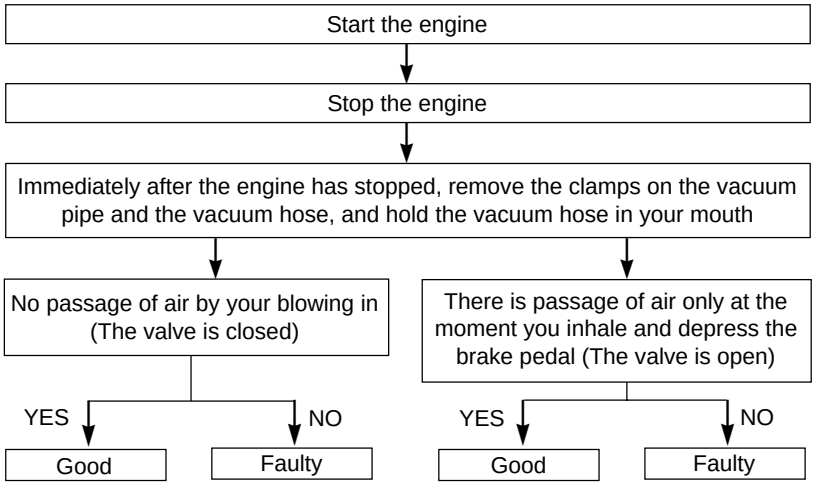
Be sure to inspect the check valve both when opened and when closed.

CAUTION

Make sure that your saliva does not enter the check valve when blowing air through the vacuum hose as this would cause the check valve to malfunction.

NOTE

The check valve fitted to the vacuum hose cannot be removed.



https://truckmanualshub.com/

(2) Inspection of master vac operation

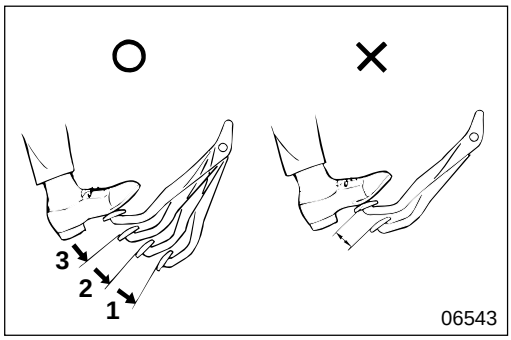
NOTE

If the master vac is faulty, determine the quality of the master vac as an independent device by means of a bench test specified by the maker's service station. This is because the above inspection of the master vac operation is merely a simplified inspection. If any fault is found, hand the device over to the service station without disassembling it, and replace the whole assembly. P35-50

● **Inspection method without a tester**

If the master vac is determined to be good by inspections 1 to 3 below, its operation is normal. If any fault is detected in any of the three inspections, the following parts are likely to be faulty.

- Check valve
- Vacuum hose
- Master vac
- Vacuum pump



[Inspection 1]

After one to two minutes' operation, stop the engine

↓

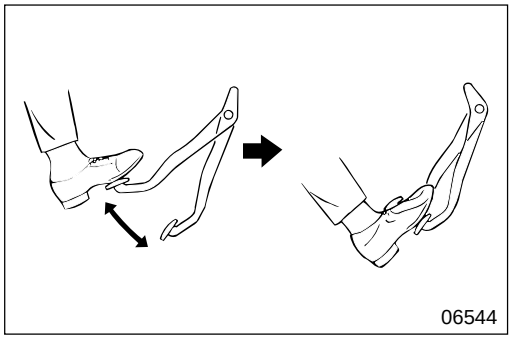
Depress the brake pedal using normal foot pressure

↓

The brake stroke is longest in the first brake application, but becomes shorter gradually in the second and the third application

YES ↓ Good

NO ↓ Faulty



[Inspection 2]

Depress the brake pedal several times while the engine is stopped

↓

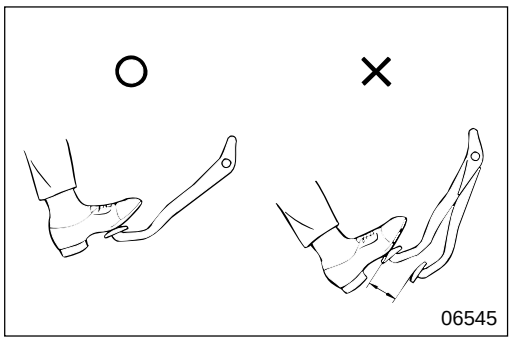
With the brake pedal depressed, start the engine

↓

The brake pedal goes down a little

YES ↓ Good

NO ↓ Faulty



[Inspection 3]

With the brake pedal depressed while the engine is running, stop the engine

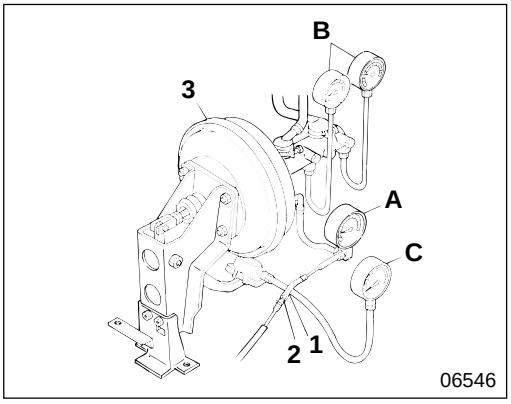
↓

The height of the brake pedal remains unchanged for approximately 30 seconds

YES ↓ Good

NO ↓ Faulty

https://truckmanualshub.com/

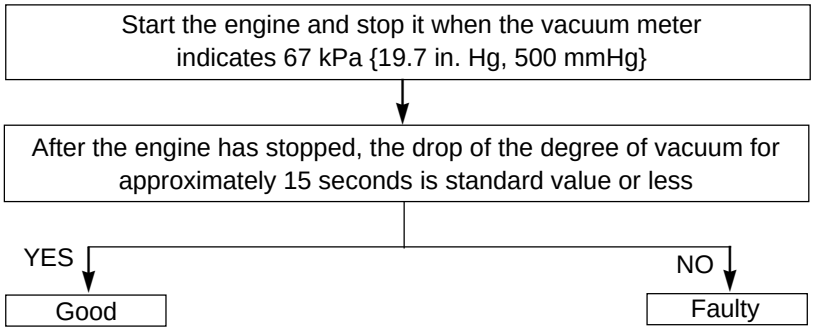


● Inspection with a simplified tester

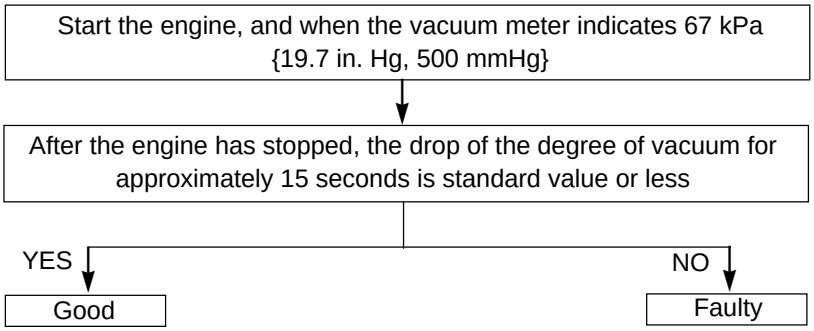
● Airtightness inspection

- Before inspection, observe the operation of check valve **2** fitted to vacuum hose **1**. P35-41
- Remove vacuum hose **1** from master vac **3**, place the end without the white ○ mark on the master vac and connect it to vacuum meter **A**. Connect another vacuum hose (without a built-in check valve) between the vacuum meter and the master vac.
  Connect pressure gauges **B** and foot pressure meter **C** as illustrated, and bleed the air from the pressure gauges.
- If the results of the following two airtightness inspections are satisfactory, the operation is normal. If any fault is found in any of the two inspections, the following parts are likely to be faulty.
  - Vacuum hose
  - Master vac

[No-load airtightness inspection]



[At load airtightness inspection]



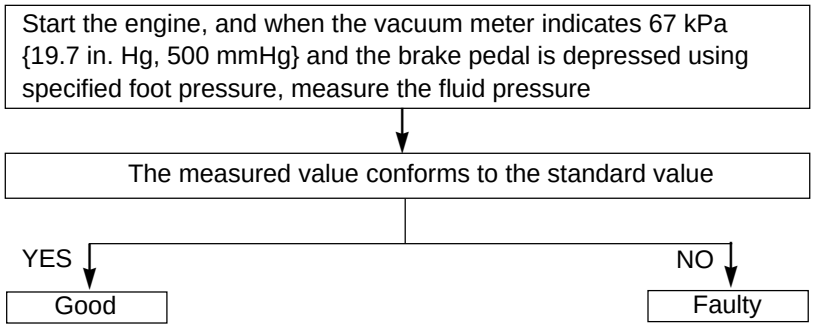
- Be sure when you attach vacuum hose 1 to master vac 3 after the inspection, that the end without the white ○ mark faces the master vac.

https://truckmanualshub.com/

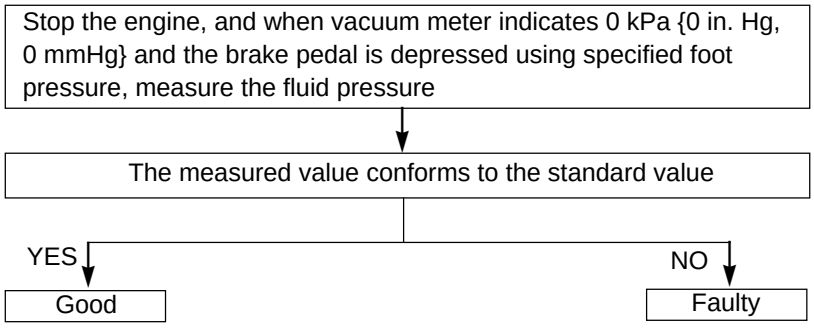
● **Inspection of characteristics**

- Inspect characteristics after the airtightness inspection is finished.
- If the results of the following two inspections are good, the operation is normal. If any fault is found in any of the two inspections, the following parts are likely to be faulty.
  - Vacuum hose
  - Master vac

[Boosting action inspection]



[No boosting action inspection]



Be sure when you attach vacuum hose 1 to master vac 3 after the inspection, that the end without the white ○ mark faces the master vac.

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection of Bypass Valve

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Fluid pressure (when master cylinder and bypass outlet pressures balance) when the front brake system fails	3920 kPa {570 lbf/in^2, 40 kgf/cm^2} or less	—	Replace

Fluid

Location	Points of application	Kinds	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No. 116 DOT3)	As required

WARNING

- **Before inspection do the following to prevent the vehicle from moving accidently.**
- **Carry out inspection on a level area.**
- **Place chocks securely in place at the left and right front wheels.**
- **Pull up the parking brake.**
- **The clutch fluid system and the brake fluid system use the fluid tank in common. Therefore, replacement and air bleeding of the clutch fluid must be carried out simultaneously with that of the brake fluid. Gr 21**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose.**

CAUTION

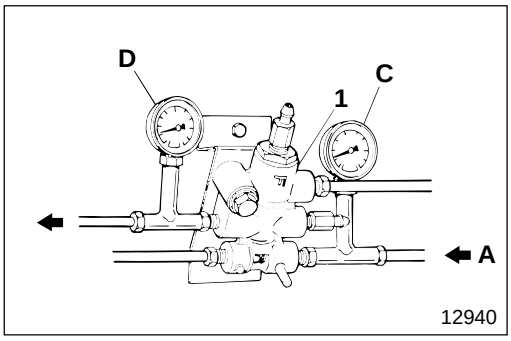
- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

NOTE

- **Supply and maintain the brake fluid level to the “MAX” level of the fluid tank.**
- **Make sure you maintain brake fluid at the “MAX” level of the fluid tank since the brake fluid level drops during inspection.**

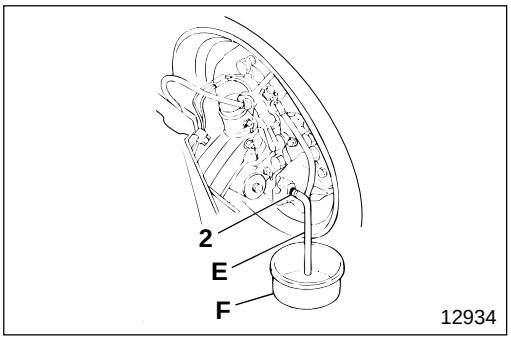
- Make sure you maintain brake fluid at the “MAX” level of the fluid tank since the brake fluid level drops during replacement.

https://truckmanualshub.com/

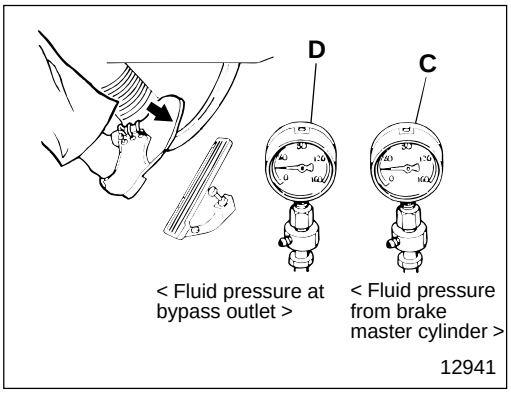


- Install oil pressure gauges **C**, **D** on inlet **A** of the master cylinder of the bypass valve, and outlet **B** of the bypass respectively.

- Bleed the brake system. P35-34



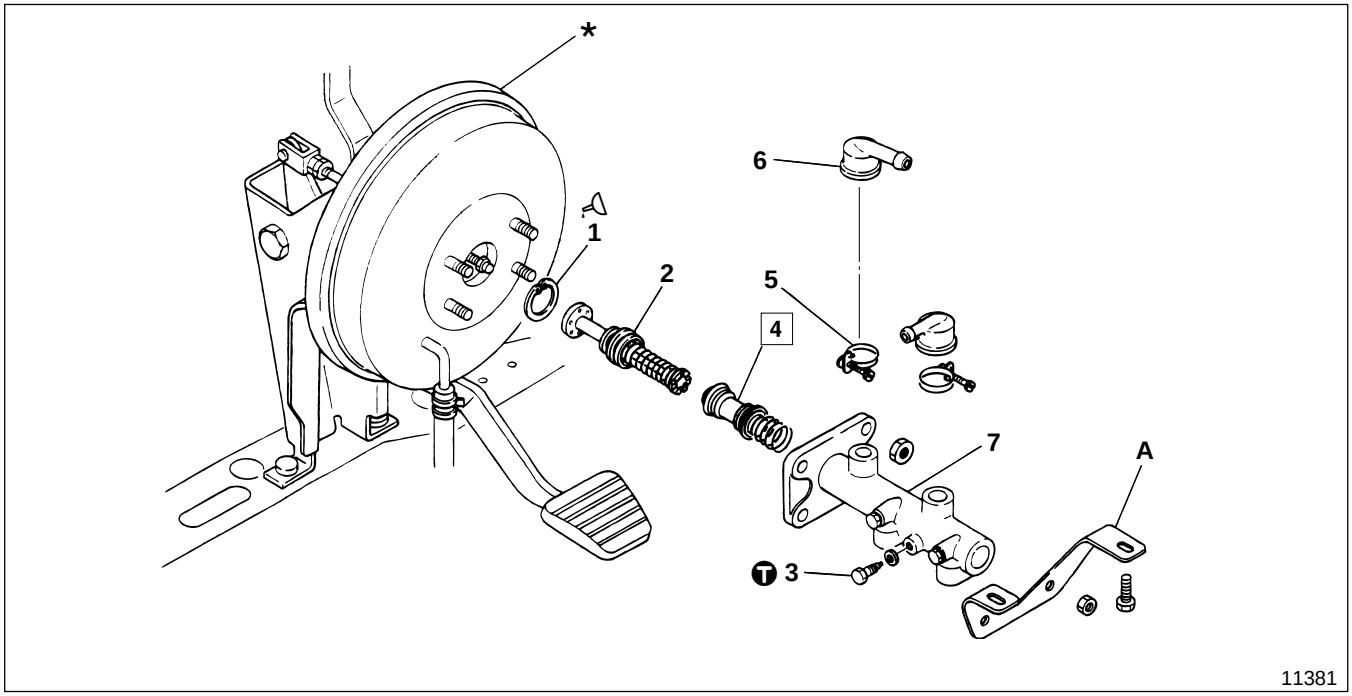
- Connect vinyl pipes **E** to air bleeders **2** on the left and right front disc brakes.
- Put the free ends of vinyl pipes **E** into containers **F**.
- Loosen air bleeder **2** by 90° to open the front brake system.



- Start the engine and let it idle.
- Depress the brake pedal gradually and read the gauges when the fluid pressure from the brake master cylinder equals that from the bypass outlet.
- If the measured value deviates from the standard value, replace bypass valve **1**.

https://truckmanualshub.com/

BRAKE MASTER CYLINDER



● **Disassembly sequence**

1 Retaining ring
2 Primary piston assembly
3 Set bolt
4 Secondary piston assembly
5 Clamp
6 Connector
7 Cylinder body

A : Master vac support
***** : Master vac and brake pedal assembly 🕮 P35-50

WARNING⚠

Be sure not to damage the inner surface of cylinder body 7, since it will cause air to get mixed in or will result in brake fluid leakage during the removal and installation of primary piston assembly 2 and secondary piston assembly 4.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

Location	Maintenance item			Standard value (Basic diameter in [ ])	Limit	Remedy
2	Primary piston assembly spring load	FE639 (Installed length 37.7 {1.48})		99 to 120 N {22 to 27 lbf, 10.1 to 12.3 kgf}	93 N {21 lbf, 9.5 kgf}	Replace
		FE649 (Installed length 36.3 {1.43})		100 to 125 N {23 to 28 lbf, 10.5 to 12.7 kgf}	97 N {22 lbf, 9.9 kgf}	Replace
2, 4, 7	Clearance between primary and secondary piston assemblies and cylinder body		FE639	[30.16] 0.02 to 0.10 {[1.19] 0.00079 to 0.0039}	0.2 {0.0079}	Replace
			FE649	[31.75] 0.02 to 0.10 {[1.25] 0.00079 to 0.0039}	0.2 {0.0079}	Replace
4	Secondary piston assembly spring load	FE639 (Installed length 30.7 {1.21})		76 to 92 N {17 to 21 lbf, 7.8 to 9.4 kgf}	72 N {16 lbf, 7.3 kgf}	Replace
		FE649 (Installed length 31.0 {1.22})		76 to 92 N {17 to 21 lbf, 7.8 to 9.4 kgf}	72 N {16 lbf, 7.3 kgf}	Replace

https://truckmanualshub.com/

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

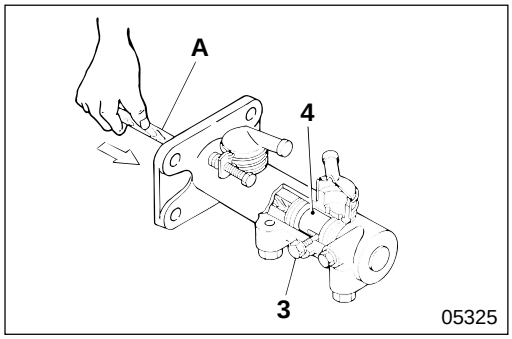
Location	Parts to be tightened	Tightening torque	Remarks
3	Set bolt	6.86 to 8.82 {5.1 to 6.5, 0.7 to 0.9}	—

Lubricant

Location	Points of application	Kinds	Quantity
1	Periphery of retaining ring	Rubber grease	As required

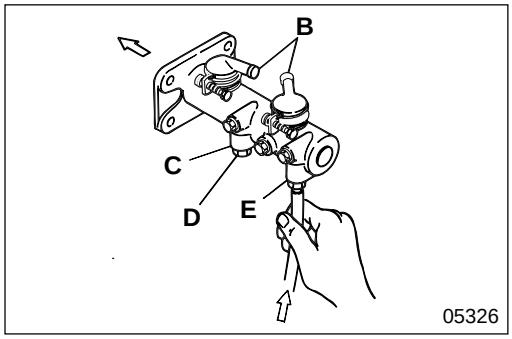
◆ Service procedure

4 **Secondary piston assembly**



[Removal]

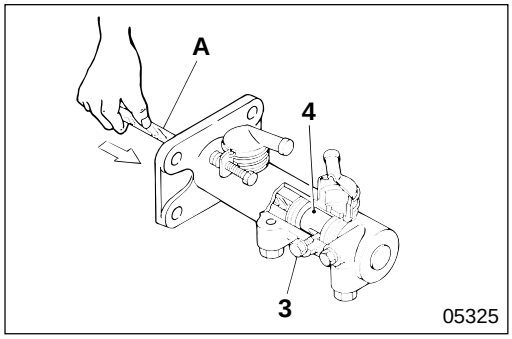
- Using rod **A**, push in secondary piston assembly **4**, then loosen set bolt **3**.



- Put plugs **D** into brake fluid filling port **B** and discharge port **C** that leads to the rear wheel brakes, then feed compressed air via discharge port **E** to the front wheel brakes to extract the secondary piston assembly.

WARNING⚠

You must apply compressed air gradually when you remove secondary piston assembly 4. If you applied compressed air strongly at one time, the secondary piston assembly would be violently ejected.

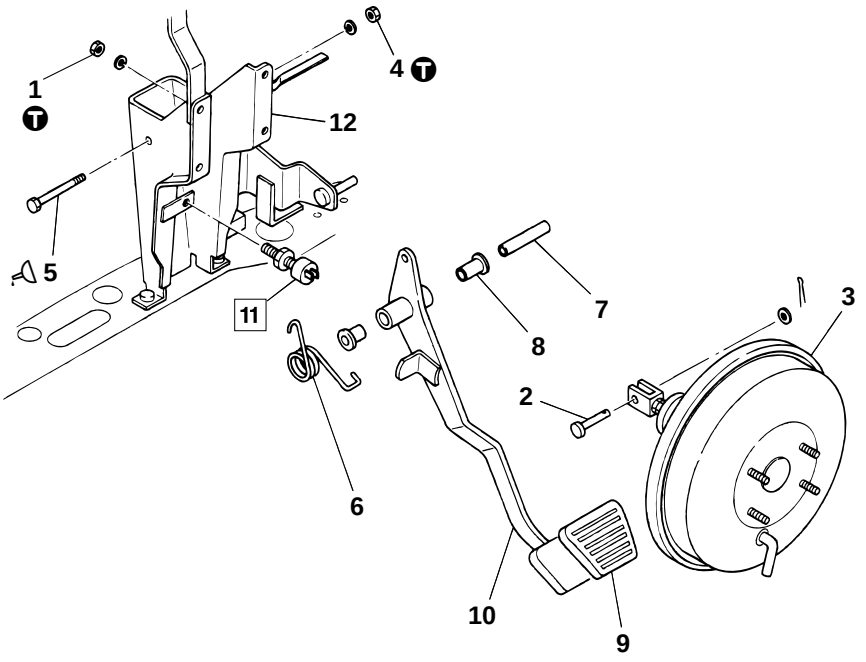


[Installation]

Using rod **A**, push in secondary piston assembly **4**, then tighten set bolt **3** at specified torque.

https://truckmanualshub.com/

BRAKE PEDAL AND BRAKE BOOSTER (MASTER VAC)



● **Disassembly sequence**

1 Nut
2 Clevis pin
3 Master vac
4 Nut
5 Bolt
6 Spring
7 Collar
8 Bushing
9 Pedal pad
10 Brake pedal
11 Stop lamp switch
Gr 54
12 Support assembly

NOTE

Do not disassemble master vac 3 because it is a non-disassemble type.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

● **Adjustment after assembly** P35-51

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value (Basic diameter in [ ])	Limit	Remedy
7, 8	Clearance between collar and bushing		[16] 0.02 to 0.26 {0.00079 to 0.010}	0.5 {0.020}	Replace
10	Brake pedal	Height from pedal pad center to instrument panel underside	264 {10.4}	—	Adjust
		Full stroke	170 {6.69}	—	Adjust
10, 11	Clearance between brake pedal stopper and tip of stop lamp switch thread area		0 to 0.1 {0 to 0.0039}	—	Adjust

https://truckmanualshub.com/

Tightening torque

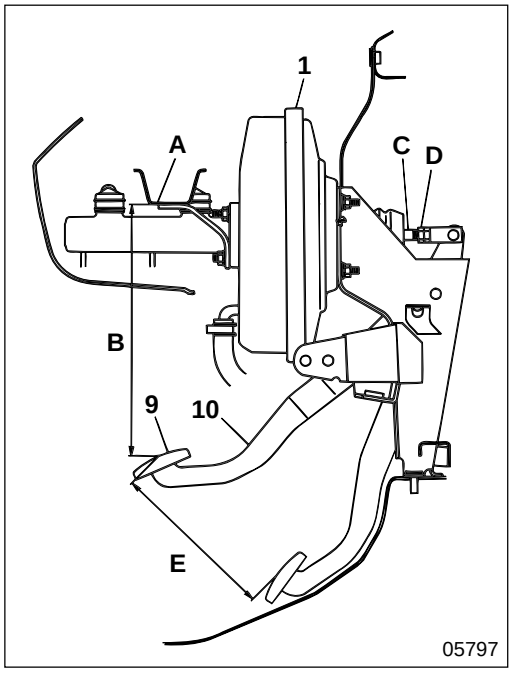
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Master vac mounting)	8.8 to 14 {6.5 to 10, 0.9 to 1.4}	—
4	Nut (Brake pedal mounting)	34.3 to 53.9 {25 to 40, 3.5 to 5.5}	—

Lubricant

Location	Points of application	Kinds	Quantity
5	Friction surface of bolt bushing	Chassis grease [NLGI No.1 (Ca soap)]	As required

◆ Service procedure



● **Adjustment after assembly**

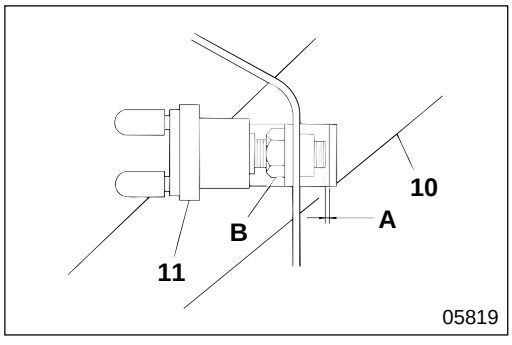
- Adjustment of brake pedal installation height
  By turning operating rod **C** of master vac **1**, adjust height **B** from the center of pedal pad **9** to the underside of instrument panel **A** to the standard value, then secure in place using nut **D**.

WARNING

Make sure, when brake pedal 10 is depressed fully, that operating rod C of master vac 1 functions as the stopper and the pedal does not come to a stop by hitting against the floor panel, since this will reduce brake effectiveness.

- Inspection of brake pedal full stroke
  Make sure that full stroke **E** when brake pedal **10** is depressed fully conforms to the standard value.
  If there is any fault, adjust the installation height of the brake pedal.

- Inspection of play towards brake pedal Ⓜ Gr 35-36



11 **Adjustment of stop lamp switch**

Turn stop lamp switch **11** to adjust clearance **A** between the top of the thread area of the stop lamp switch and the stopper of brake pedal **10** to the standard value, and fasten with lock nut **B**.

WARNING

Make sure, when brake pedal 10 is released, that stop lamp switch 11 does not stop the pedal, since this will cause the brake to drag.

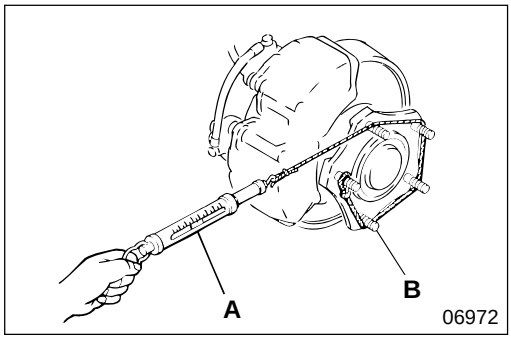
19	Torque member	Groove of pin boot	Rubber grease	As required
		Guide hole of main side	Rubber grease	As required
		Seat of cap	Rubber grease	As required

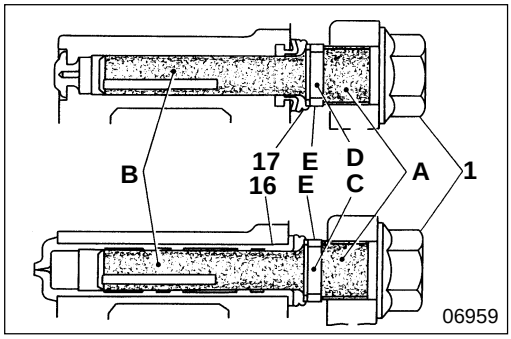
https://truckmanualshub.com/

◆ Service procedure



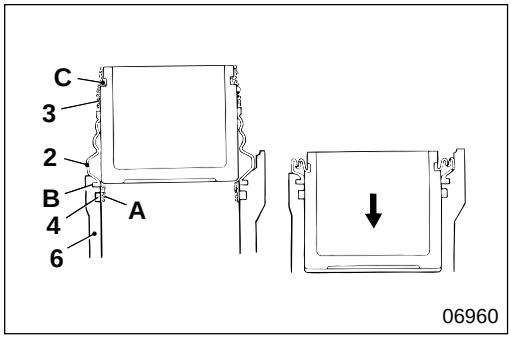
● Measurement of dragging torque

- Fasten spring balance **A** to hub bolt **B** and measure the tangential force.
- If the measured value is the specified value, the torque conforms to the standard value.
- If the measured value deviates from the specified value, inspect the friction surface between piston seal **4** and piston **3**.



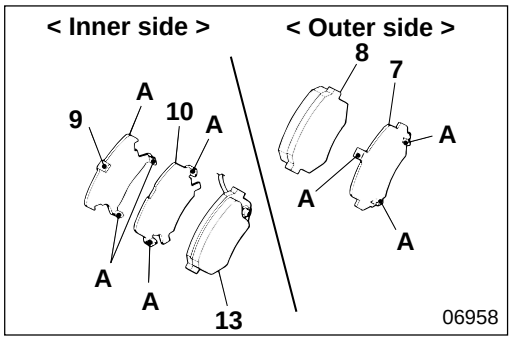
1 Installation of slide pin bolt

- Apply brake fluid to thread area **A** lightly, and apply grease to slide outer periphery **B**, bushing groove **C** or connecting surface **D** of pin boot **17**, then tighten slide pin bolt **1** at specified torque.
- Bleed bushing **16** or pin boot **17**.
- Check that seal **E** of bushing **16** or pin boot **17** is installed in bushing groove **C** of slide pin bolt **1** or connecting surface **D** of the pin boot.



2 to 4 Installation of piston boot, piston and piston seal

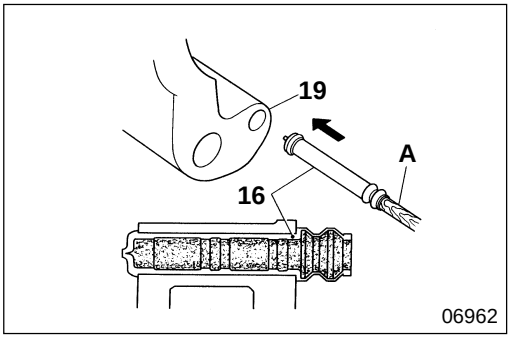
- Apply brake fluid to the periphery of piston **3** to insert piston boot **2**.
- Spread the grease applied to piston seal **4** evenly and install it into the seal groove of caliper **6**.
- Apply grease to cylinder lip area **A** of caliper **6** evenly.
- Install the caliper side seal of piston boot **2** to the boot groove **B** of caliper **6**, then press in piston **3** slowly.
- Make sure that the piston side seal of piston boot **2** is installed in the boot groove **C** of piston **3**.



7 to 10 13 Installation of pad and shim

Make sure that you install the shims with pawls **A** facing the right way.

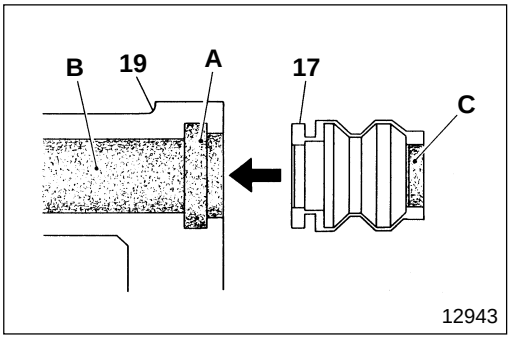
https://truckmanualshub.com/



16 **Installation of bushing**

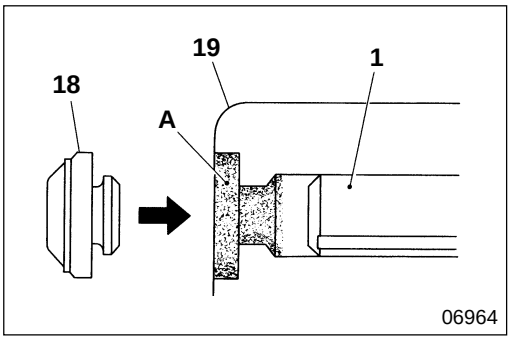
A : Push bar approximately ø8 mm {0.31 in.} long

After installation, apply grease to the whole inner periphery of bushing **16** and its contact surface with slide pin bolt **1**.



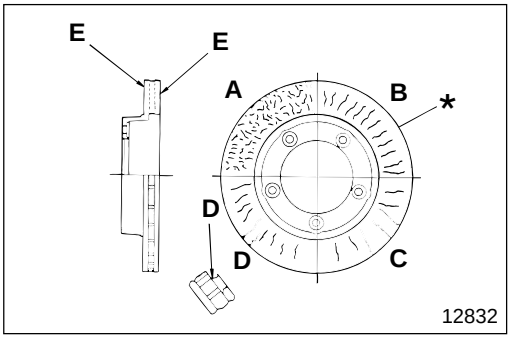
17 **Installation of pin boot**

- Apply grease to pin boot groove **A** of torque member **19**, the whole surface of guide hole **B**, and contact surface **C** between slide pin bolt **1** and pin boot **17**.
- Install pin boot **17**.



18 **Installation of cap**

- Apply grease to cap seat surface **A**.
- Install cap **18**.



***** **Inspection of disc rotor**

- Inspect the friction surface **E** of disc rotor * visually.
- If any cracks are found, correct or replace disc rotor *.
  - **A** : Net pattern cracks (Correct or replace)
  - **B** : Radial cracks that do not reach the outer periphery (Correct or replace)
  - **C** : Radial cracks that have reached the outer periphery (Replace)
  - **D** : Through cracks (Replace)

FRONT WHEEL BRAKE < FE649 : DISC BRAKE >

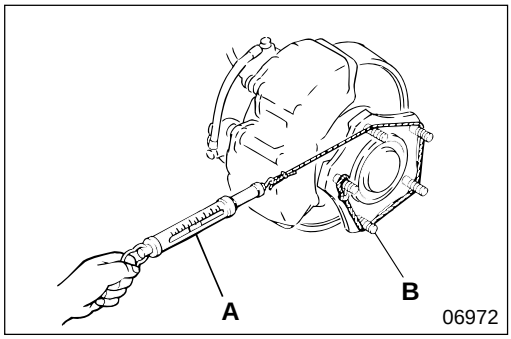
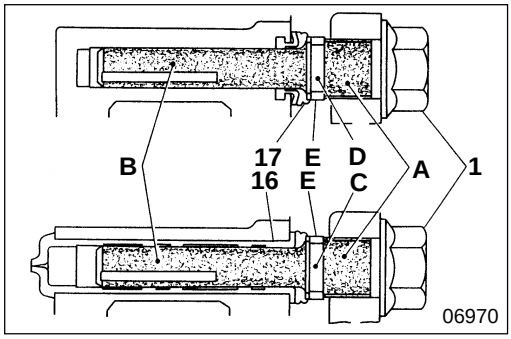
◆ Service procedure



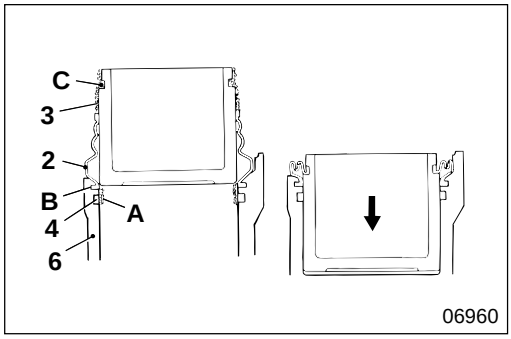
● Measurement of dragging torque

- Fasten spring balance **A** to hub bolt **B** and measure the tangential force.
- If the measured value is the specified value, the torque conforms to the standard value.
- If the measured value deviates from the specified value, inspect the friction surface between piston seal **4** and piston **3**.



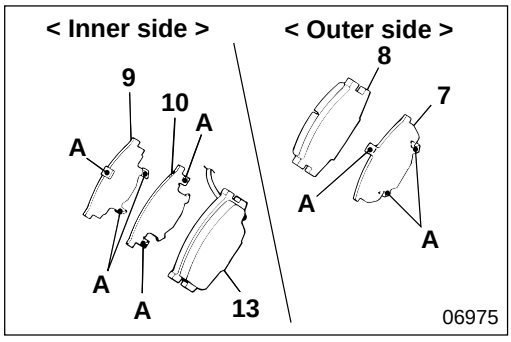
1 Installation of slide pin bolt

- Apply brake fluid to thread area **A** lightly, and apply grease to slide outer periphery **B**, bushing groove **C** or connecting surface **D** of pin boot **17**, then tighten slide pin bolt **1** at specified torque.
- Bleed bushing **16** or pin boot **17**.
- Check that seal **E** of bushing **16** or pin boot **17** is installed in bushing groove **C** of slide pin bolt **1** or connecting surface **D** of the pin boot.



2 to 4 Installation of piston boot, piston and piston seal

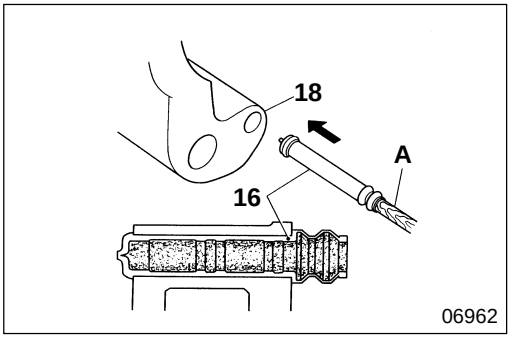
- Apply brake fluid to the periphery of piston **3** to insert piston boot **2**.
- Spread the grease applied to piston seal **4** evenly and install it into the seal groove of caliper **6**.
- Apply grease to cylinder lip area **A** of caliper **6** evenly.
- Install the caliper side seal of piston boot **2** to the boot groove **B** of caliper **6**, then press in piston **3** slowly.
- Make sure that the piston side seal of piston boot **2** is installed in the boot groove **C** of piston **3**.



7 to 10 13 Installation of pad and shim

Make sure that you install the shims with pawls **A** facing the right way.

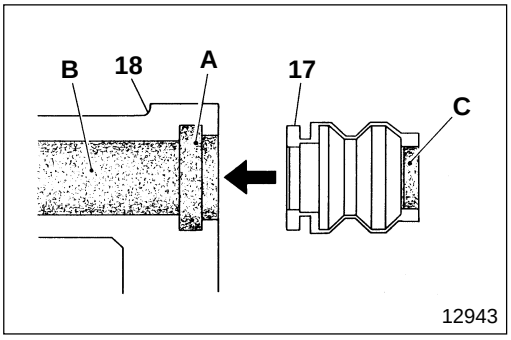
https://truckmanualshub.com/



16 **Installation of bushing**

A : Push bar approximately ø8 mm {0.31 in.} long

After installation, apply grease to the whole inner periphery of bushing **16** and its contact surface with slide pin bolt **1**.



17 **Installation of pin boot**

*Refers to the correction limit.

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
9	Pipe assembly	12.75 to 14.71 {9.4 to 11, 1.3 to 1.5}	—
11	Bolt (Wheel cylinder assembly mounting)	37.27 to 49.03 {27 to 36, 3.8 to 5.0}	—

Lubricant

Location	Points of application	Kinds	Quantity
5, 15	Contact surfaces between backing plate ledge and shoe rim, wheel cylinder assembly anchor area of shoe web, and adjusting screw contact point	Brake grease	As required

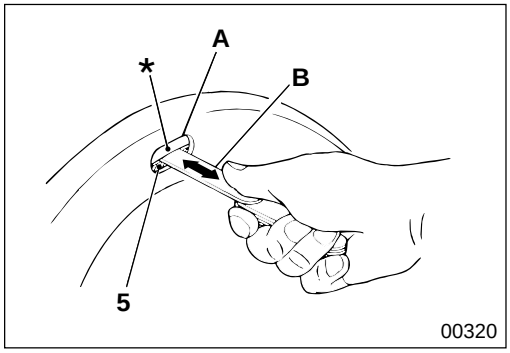
◆ Service procedure

● **Initial adjustment of brake shoe clearance after installation**

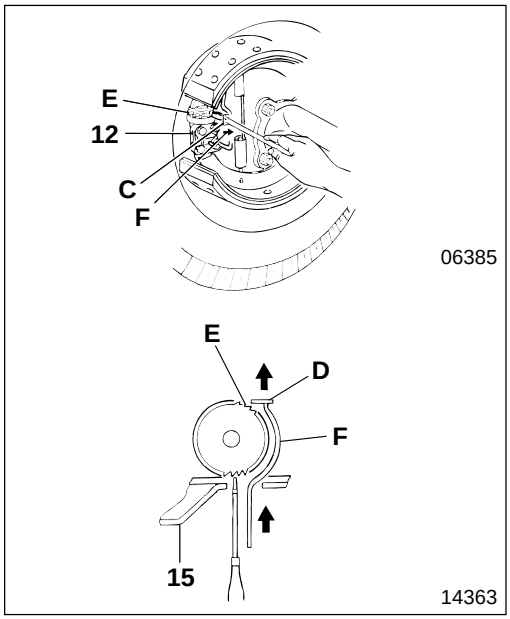
Turning the adjuster of wheel cylinder assembly **12** in arrow direction expands brake shoe assembly **5**, narrowing the clearance between brake drum * and brake lining **7**.

- Jack up the vehicle to make sure that the wheel hub bearing has no play. If there is any play, correct it. Gr 27
- Remove covers **13** and **14**.

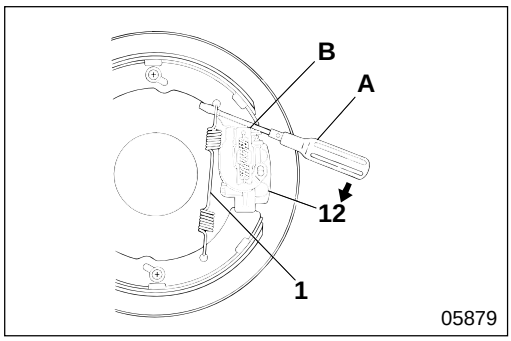
https://truckmanualshub.com/



- Adjust the brake shoe clearance as follows, so that 0.3 mm {0.012 in.} feeler gauge **B** can be inserted or extracted through check hole **A**, between brake drum * and brake lining **7** with a little resistance.



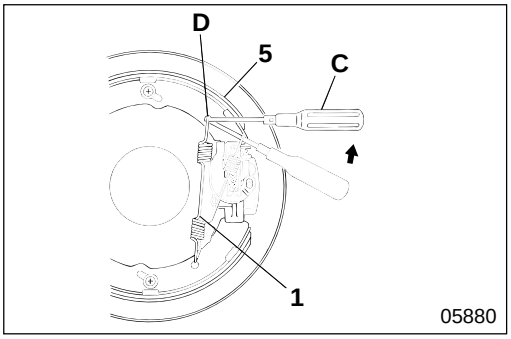
- To increase brake shoe clearance
  - Insert a wire (approximately ø2 mm {0.079 in.}) into the adjusting hole **C** and lift adjusting lever **D** of wheel cylinder assembly **12**.
  - Turn adjuster **E** of wheel cylinder assembly **12**, through adjusting hole **C**, in the opposite direction to arrow **F** on backing plate **15**.
- To decrease brake shoe clearance
  Turn adjuster **E** in the arrow **F** direction marked on backing plate **15** through adjusting hole **C**.
- Extract the feeler gauge and depress the brake pedal two or three times fully, then the specified value brake shoe clearance can be obtained.
- Insert a 0.2 mm {0.0079 in.} feeler gauge through check hole **A** and make sure that it can be inserted or extracted with a little resistance. If there is any fault, disassemble and inspect wheel cylinder assembly **12**. P35-65



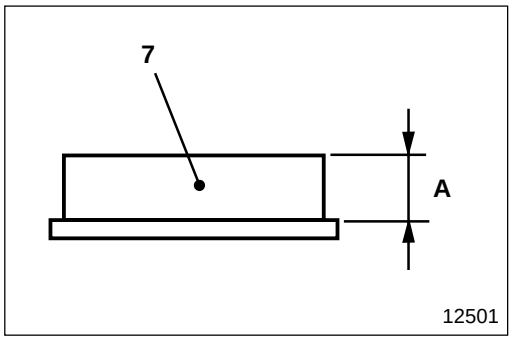
1 **Return spring**

[Removal]
To remove return spring **1**, place screwdriver **A** into the hook of the return spring, then pry and remove the return spring making use of wheel cylinder assembly **12** adjusting screw **B** as a fulcrum.

https://truckmanualshub.com/

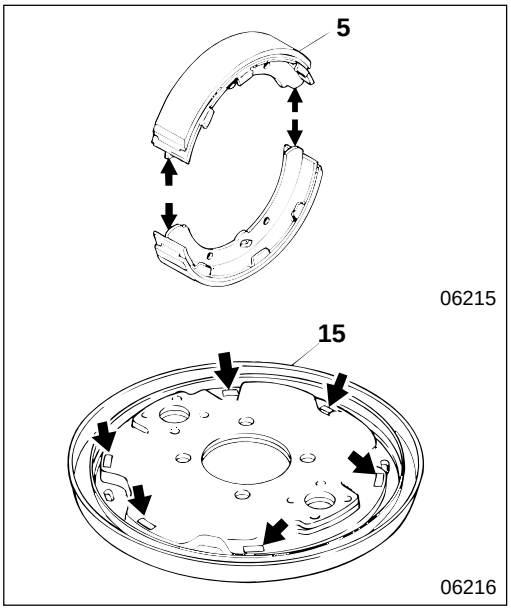


[Installation]
Insert a small cross-point screwdriver **C** into the hook of return spring **1**, insert the tip of the screwdriver into return spring installation hole **D** of brake shoe assembly **5** to pry on the return spring.



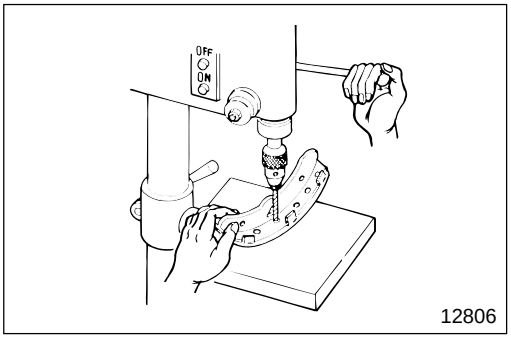
5 **Inspection of brake shoe assembly**

If thickness **A** of brake lining **7** is lower than the limit, replace the brake lining on the same axle as a unit.



5 **15** **Installation of brake shoe assembly and backing plate**

Apply grease to the points as illustrated, and install brake shoe assembly **5** and backing plate **15**.

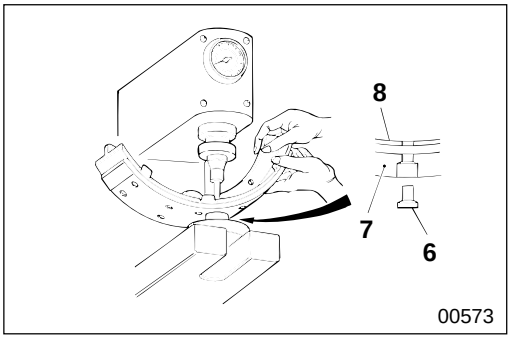


7 **Brake lining**

[Removal]

https://truckmanualshub.com/

REAR WHEEL BRAKE < FE639 : DRUM BRAKE >



[Installation]

- Clean the mounting surfaces of brake lining **7** and brake shoe **8** with cleaning fluid and dry them.
- Insert rivets **6** from brake lining **7** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **8** and the brake lining.

  Caulking load for rivets : 21±1 kN {4630±220 lbf, 2100±100 kgf}

- Make sure that you inspect contact with the inner surface of brake drum * after you replace brake linings **7**. If contact is incorrect, correct with the brake assembled.

WARNING⚠

Do not leave lubricant on the surface of brake lining 7 because this reduces braking performance.

CAUTION⚠

Make sure that the type of brake linings 7 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one shaft.

*** Correction of brake drum**

If the cylindrical accuracy of brake drum * is higher than the limit, or there are seams, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

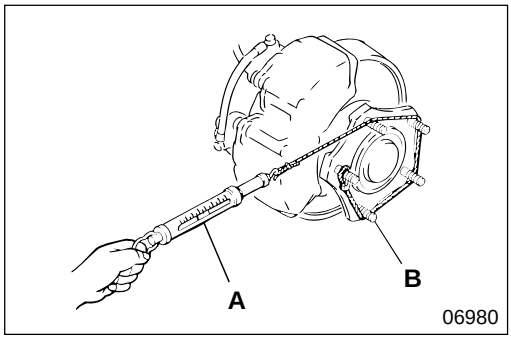
		Contact surface with slide pin bolt	Rubber grease	As required
17	Contact surfaces of pin boot and slide pin bolt		Rubber grease	As required
18	Torque member	Groove of pin boot	Rubber grease	As required
		Guide hole of main side	Rubber grease	As required

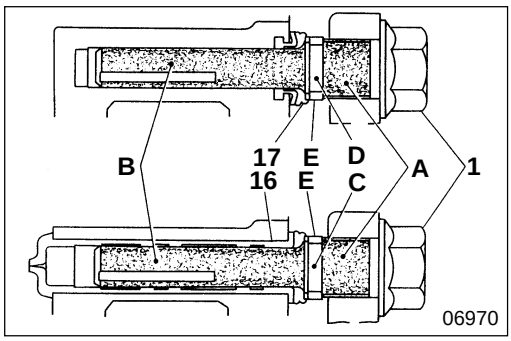
https://truckmanualshub.com/

◆ Service procedure



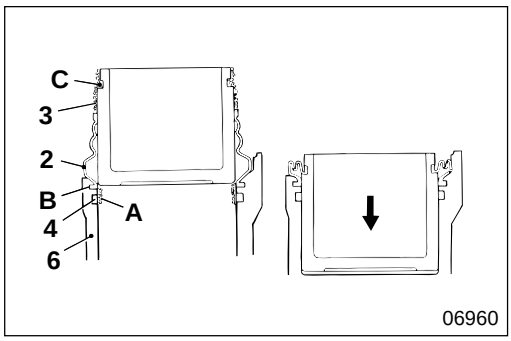
● Measurement of dragging torque

- Fasten spring balance **A** to hub bolt **B** and measure the tangential force.
- If the measured value is the specified value, the torque conforms to the standard value.
- If the measured value deviates from the specified value, inspect the friction surface between piston seal **4** and piston **3**.



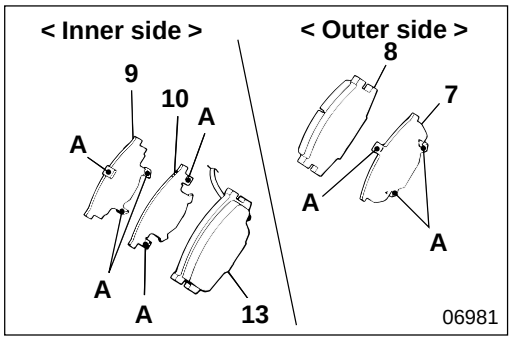
1 Installation of slide pin bolt

- Apply brake fluid to thread area **A** lightly, and apply grease to slide outer periphery **B**, bushing groove **C** or connecting surface **D** of pin boot **17**, then tighten slide pin bolt 1 at specified torque.
- Bleed bushing **16** or pin boot **17**.
- Check that seal **E** of bushing **16** or pin boot **17** is installed in bushing groove **C** of slide pin bolt **1** or connecting surface **D** of the pin boot.



2 to 4 Installation of piston boot, piston and piston seal

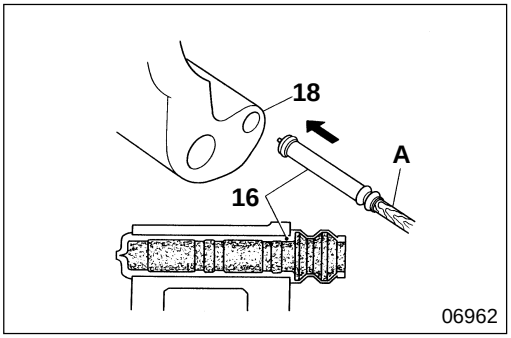
- Apply brake fluid to the periphery of piston **3** to insert piston boot **2**.
- Spread the grease applied on piston seal **4** evenly to install it into the seal groove of caliper **6**.
- Apply grease to cylinder lip area **A** of caliper **6** evenly.
- Install the caliper side seal of piston boot **2** to the boot groove **B** of caliper **6**, then press in piston **3** slowly.
- Make sure that the piston side seal of piston boot **2** is installed in the boot groove **C** of piston **3**.



7 to 10 13 Installation of pad and shim

Make sure that you install the shims with pawls **A** facing the right way.

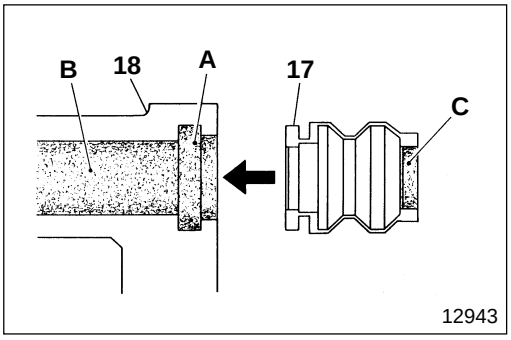
https://truckmanualshub.com/



16 **Installation of bushing**

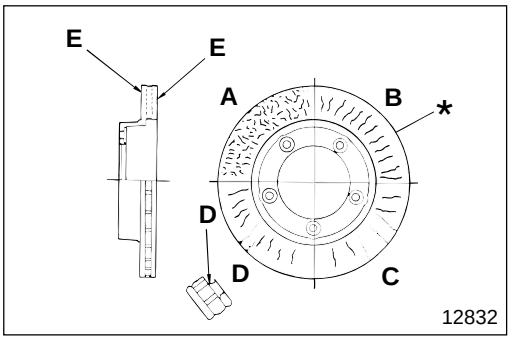
A : Push bar approximately ø8 mm {0.31 in.} long

After installation, apply grease to the whole inner periphery of bushing **16** and its contact surface with slide pin bolt **1**.



17 **Installation of pin boot**

- Apply grease to pin boot groove **A** of torque member **18**, the whole surface of guide hole **B**, and contact surface **C** between slide pin bolt **1** and pin boot **17**.
- Install pin boot **17**.



***** **Inspection of disc rotor**

- Inspect the friction surface **E** of disc rotor ***** visually.
- If any cracks are found, correct or replace disc rotor *****.
  - **A** : Net pattern cracks (Correct or replace)
  - **B** : Radial cracks that do not reach the outer periphery (Correct or replace)
  - **C** : Radial cracks that have reached the outer periphery (Replace)
  - **D** : Through cracks (Replace)

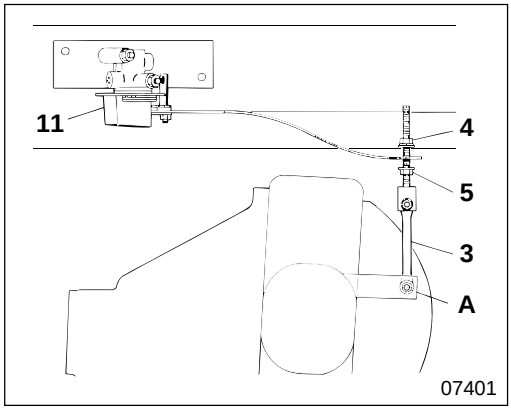
2	Nut (Rod assembly mounting)	5.9 to 7.9 {4.3 to 5.8, 0.6 to 0.8}	—
4, 5	Nut (Leaf spring adjusting)	11.8 to 17.6 {8.7 to 13, 1.2 to 1.8}	—
7	Nut (Leaf spring mounting)	5.9 to 7.9 {4.3 to 5.8, 0.6 to 0.8}	—

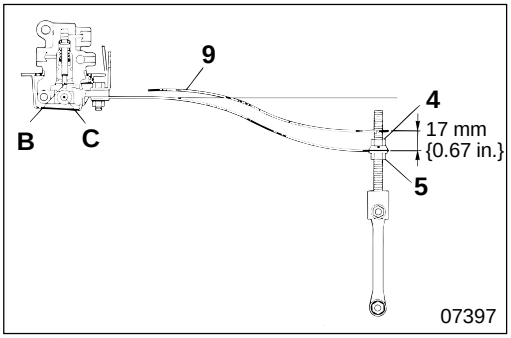


◆ Service procedure

[Installation]

- Install load sensing valve **11** on the vehicle when it is unloaded and mount ball joint part **A** of rod assembly **3** to rear axle bracket *****.
- Loosen nut **4** and nut **5** and adjust as follows.

https://truckmanualshub.com/



[Adjustment]

- Free leaf spring **9** to lift up the leaf spring and fit plunger **B** to roller **C**.
- In this condition, position nut **5** 17 mm {0.67 in.} below the tip of leaf spring **9**, then tighten nut **4** at specified torque.

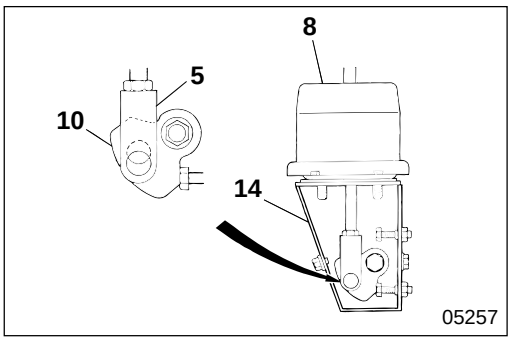
12	Nut (Adjusting bolt fixing)	4.9 to 6.9 {3.6 to 5.1, 0.5 to 0.7}	—

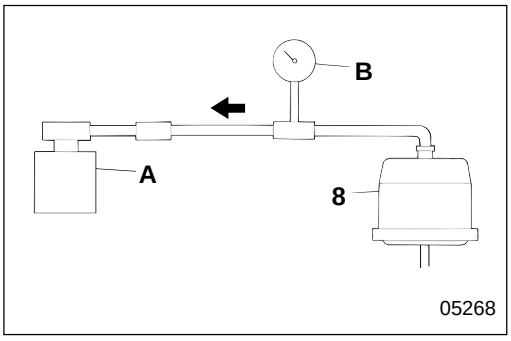
https://truckmanualshub.com/

◆ Service procedure



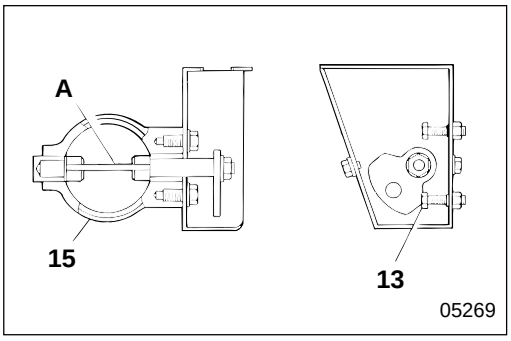
5 Adjustment of clevis

Install vacuum chamber **8** on bracket **14**, and adjust the position of clevis **5** so that the hole of the clevis is half the pitch of the hole of lever **10**.



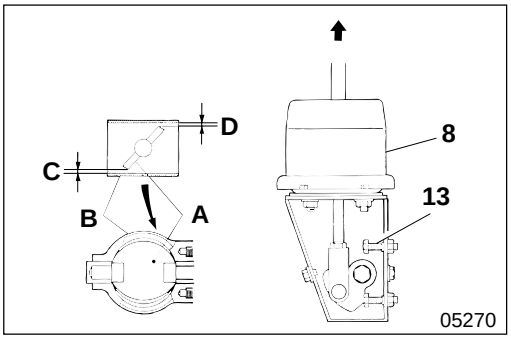
8 Test of vacuum chamber airtightness

Arrange piping as illustrated, and apply vacuum of 67 kPa {19.7 in. Hg, 500 mmHg} or more to vacuum chamber **8**, then stop vacuum pump **A**. After 15 seconds, ensure that the value of vacuum gauge **B** is the standard value. If the measured value deviates from the standard value, replace the vacuum chamber.



15 Adjustment of valve assembly

[Fully-opened adjustment]
Adjust using adjusting bolt **13** so that butterfly valve **A** of valve assembly **15** is fully opened.



[Fully-closed adjustment]
While applying vacuum 87 to 93 kPa {25.6 to 27.6 in. Hg, 650 to 700 mmHg} to vacuum chamber **8**, adjust using adjusting bolt **13** so that the average value of clearance **C** and **D** between butterfly valve **A** and body **B** is within the standard value.

- Adjustment of Parking Brake Shoe Clearance and Ratchet Bar Pulling Stroke 5

PARKING BRAKE CONTROL 6

PARKING BRAKE ASSEMBLY 8

BACKING PLATE AND SHOE ASSEMBLY 10

https://truckmanualshub.com/

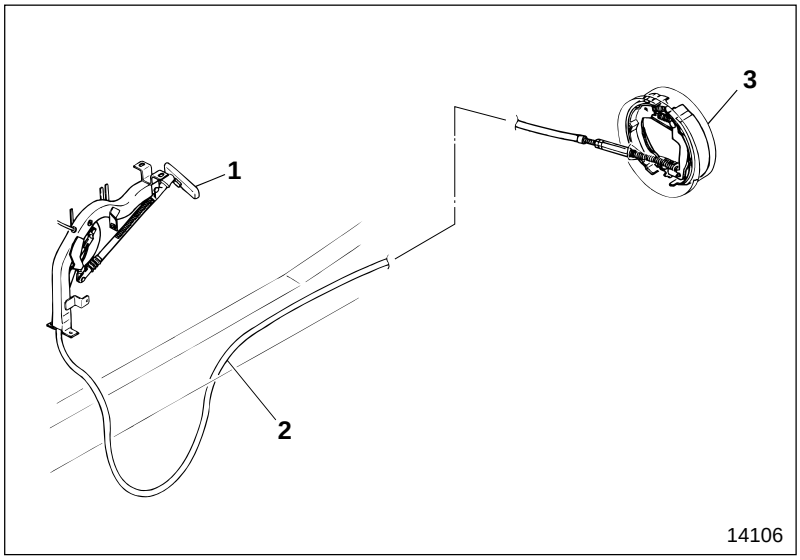
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Item		Specifications
Brake	Type	Propeller shaft internal expanding type brake
	Operation type	Mechanical cable type
Parking brake assembly	Type	Dual-servo type
	Inner diameter of drum mm {in.}	ø190 {7.48}
	Lining width × Thickness mm {in.}	45×4.0 {1.77×0.16}

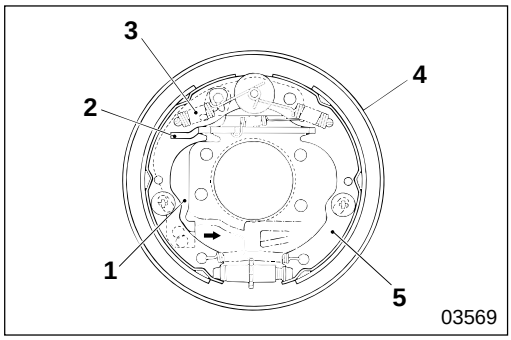
STRUCTURE AND OPERATION

Parking Brake Control



1 Parking brake ratchet bar
2 Parking brake cable
3 Parking brake assembly

Parking Brake Assembly < Dual-servo Type >

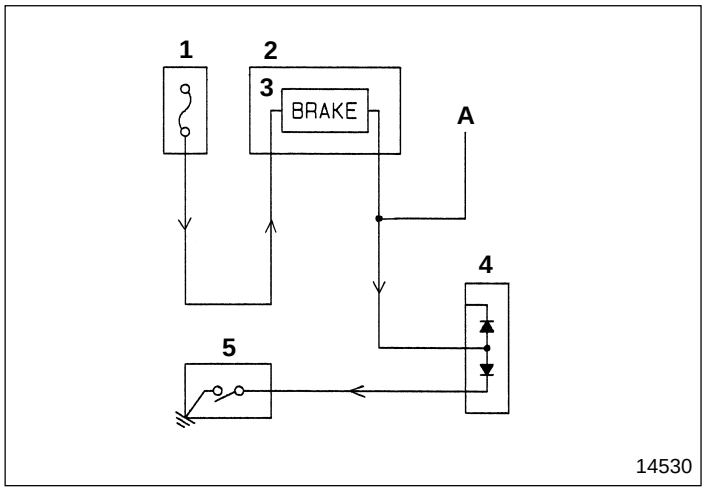


1 Parking lever
2 Strut
3 Shoe return spring
4 Backing plate
5 Shoe and lining assembly

- Pulling the parking brake ratchet bar pulls the parking brake cable, which in turn pulls parking brake lever **1** installed in the parking brake body, operating shoe and lining assembly **5**.
- Activation of parking lever **1** expands one shoe and lining assembly **5** via strut **2**, the parking lever itself expands the other shoe and lining assembly. Therefore, both shoe and lining assemblies function as leading shoes.
- When the ratchet bar (parking lever) is returned, the repercussive force of shoe return spring **3** releases the brake.

https://truckmanualshub.com/

Parking Brake Electrical System



1 Fuse box
2 Meter cluster
3 Brake indicator lamp
4 Diode unit
5 Parking brake switch

A : To the brake fluid level switch

- The parking brake electrical system is provided for indicating, its detecting and indicating function is activated by pulling the parking brake ratchet bar.
- When the parking brake ratchet bar is pulled, the contact point of parking brake switch **5** closes (ON), and brake indicator lamp **3** is lit, indicating that the parking brake is operating.

  The current flows as below:
  Fuse **1** → Brake indicator lamp **3** → Diode unit **4** → Parking brake switch **5** → Ground

https://truckmanualshub.com/

TROUBLESHOOTING

Possible causes / Symptoms		Parking brake does not work	Parking brake does not release smoothly (dragging)	Remarks
Parking brake cable	Inner cable stretched or damaged	○	○	
	Inner cable rusted		○

	Shoe clearance excessive	○		
	Parking brake drum inner surface deformed or distorted	○		
	Parking brake drum inner surface greasy or oily	○		
	Linings worn unevenly	○		
	Lining surface greasy or oily	○		
	Shoe return spring deteriorated, fractured		○	

https://truckmanualshub.com/

Adjustment of Parking Brake Shoe Clearance and Ratchet Bar Pulling Stroke

Service standards

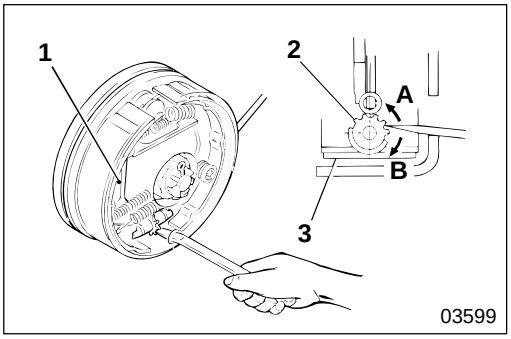
Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Brake shoe clearance	0.2 to 0.25 {0.0079 to 0.0098}	—	Adjust
4	Ratchet bar pulling stroke (Operating force : 295 N {66 lbf, 30 kgf})	80 to 120 {3.15 to 4.72}	—	Adjust

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
6	Lock nut	19 to 27 {14 to 20, 1.9 to 2.8}	—

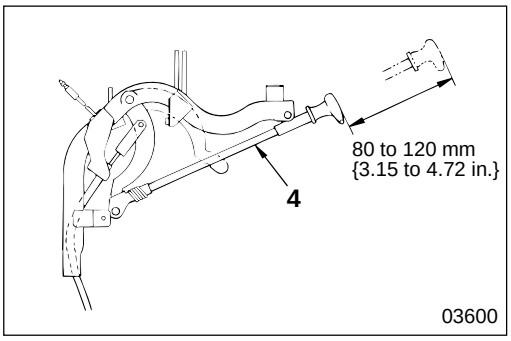


(1) Shoe clearance

When parking lever **1** is released, turn adjuster **2** in the expansion direction, using a screwdriver inserted through the shoe adjusting hole of the parking brake drum, and return 8 to 10 notches from the position where shoe **3** is in close contact with the drum. Then, the shoe clearance will be the standard value.

A : Contraction

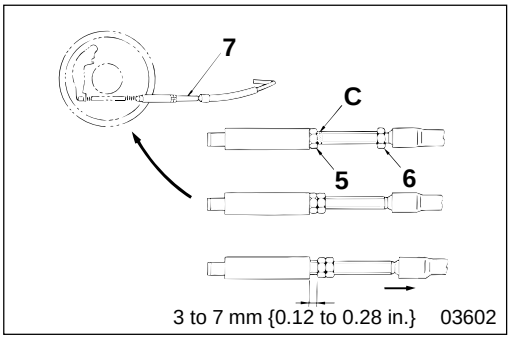
B : Expansion



(2) Ratchet bar pulling stroke

Adjust the adjusting nut of the parking brake cable so that the ratchet bar pulling stroke is the standard value when parking brake ratchet bar **4** is pulled from the released position by an operating force of 295 N {66 lbf, 30 kgf}.

Operate ratchet bar two or three times after adjusting to verify the pulling stroke, to make sure that the parking brake is operating properly and that the parking brake drum does not drag when the parking brake is released.



[Adjustment]

- Tighten adjusting nut **5** until mark **C** can be seen.
- Tighten lock nut **6** to the position of adjusting nut **5**.
- Tighten lock nut **6** at specified torque.
- Check clearance when the outer cable of parking brake cable **7** is pulled by an operating force of 59 to 98 N {13 to 22 lbf.ft, 6 to 10 kgf·m}.

Location	Points of application	Kinds	Quantity
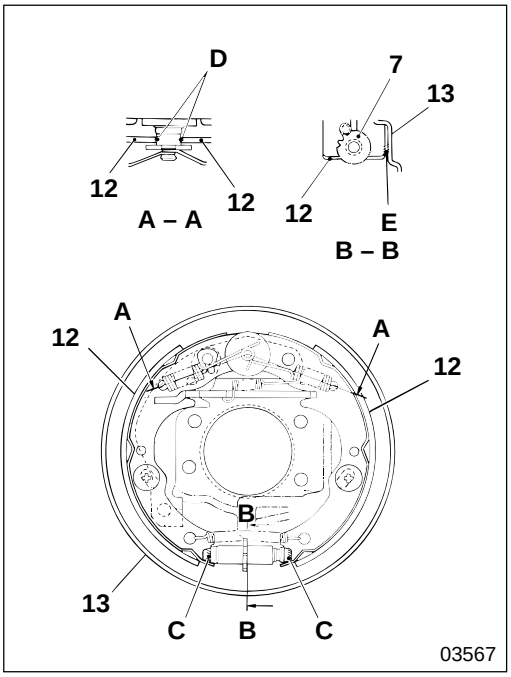
7	Contact surfaces of both ends of adjuster with shoe and lining assembly	Brake grease	As required
13	Anchor pin area and sliding face (6 points) of backing plate	Brake grease	As required

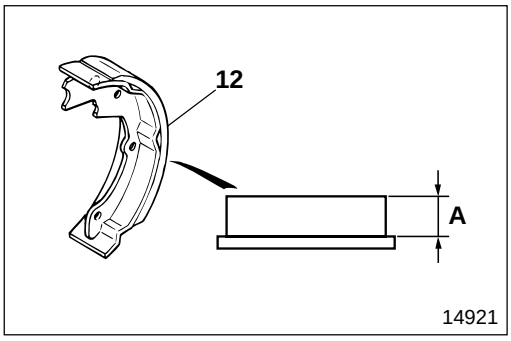
https://truckmanualshub.com/

◆ Service procedure



7 **13** **Applying grease to adjuster and backing plate**

- Apply grease to contact surface **C** between both ends of adjuster **7** and shoe and lining assembly **12**.
- Apply grease to area **D** of the anchor pin and sliding face **E** (6 points) of backing plate **13**.



12 **Inspection of shoe and lining assembly**

Measure thickness **A** of the lining. If the measured value is lower the limit, replace shoe and lining assembly **12**.

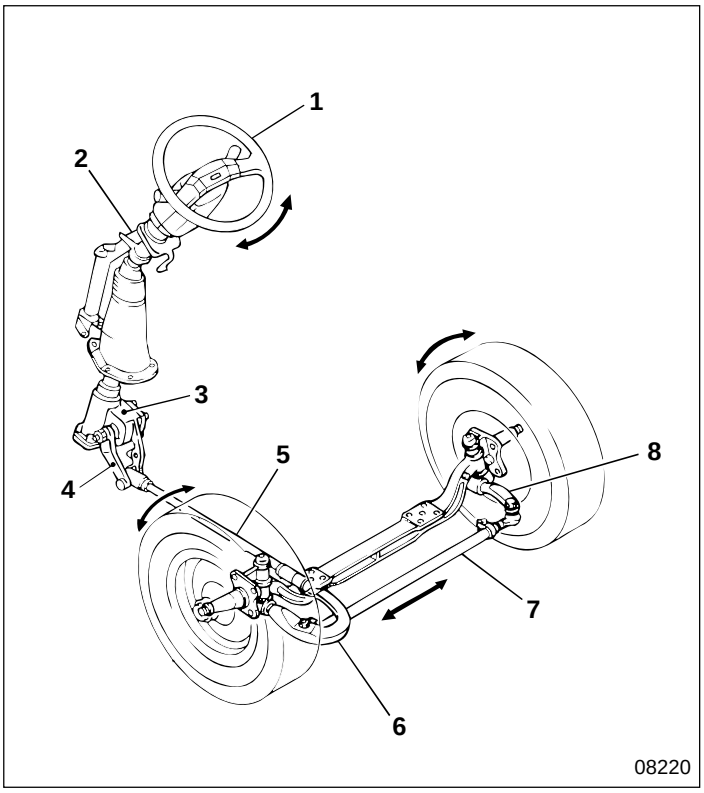
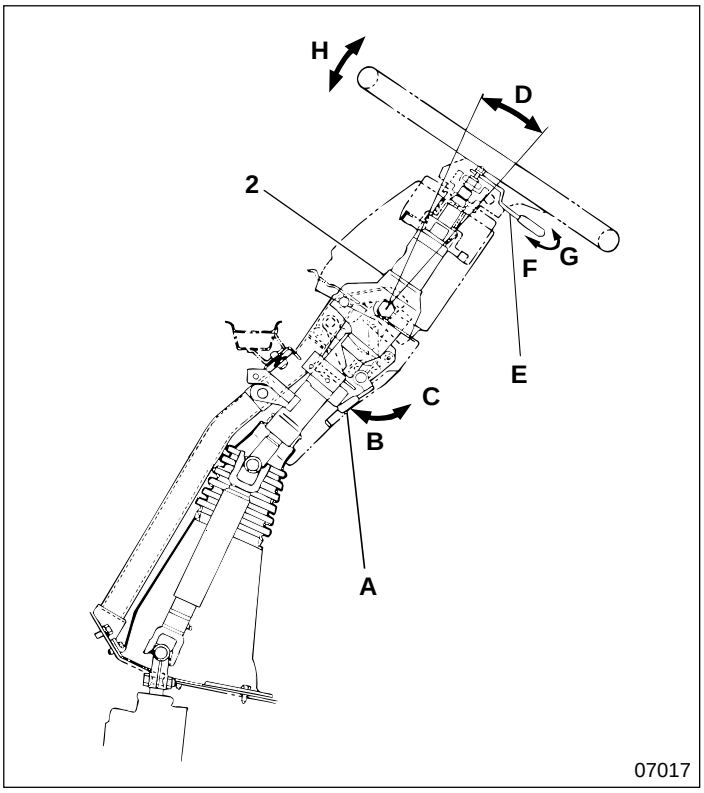
Steering System



1 Steering wheel
2 Steering column subassembly
3 Power steering booster
4 Pitman arm
5 Drag link
6 Knuckle arm
7 Tie rod
8 Tie rod arm



Shifting lock lever **A** from lock position **B** to release position **C** produces high tilt **D**, and turning telescopic lever **E** (counterclockwise) from lock position **F** to release position **G** allows telescopic movement **H**. In this way, the structure of steering column subassembly **2** can be adjusted for optimum driving position.

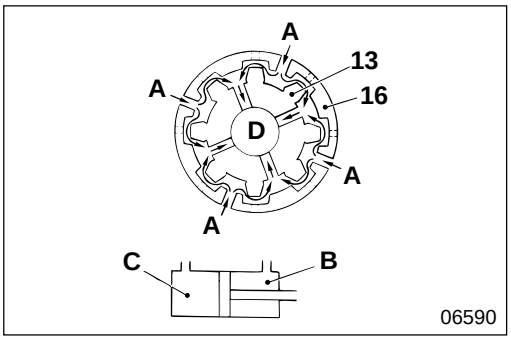
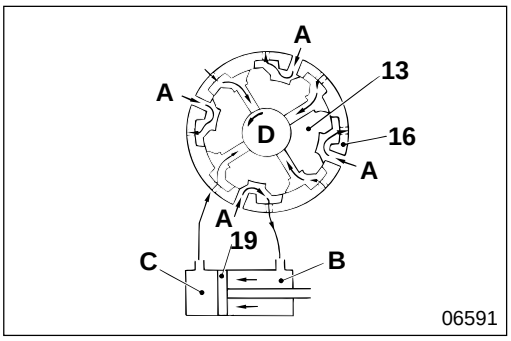
26 Backup ring
27 Oil seal
28 Dust cover
29 Pitman arm

Rotary valve **16** is the central part of the power steering booster. Torsion bar **9** allows the steering reaction force and valve return to operate lightly and smoothly at low speed, and ensures stable steering feel even at high speed.



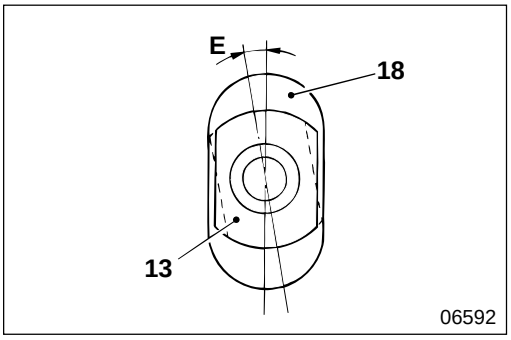
● **Straight-ahead drive operation**

When steering torque is not applied by the steering wheel, input shaft **13** is not activated and remains in neutral. At this time, pressurized fluid from the oil pump flows through the input shaft and the hole of rotary valve **16**, and returns to the oil tank without flowing into cylinder chambers **B**, **C**.
A : From the oil pump
D : To the oil tank



● **Steering operation**

Turning the steering wheel rotates input shaft **13**, causing rotary valve **16** to close the fluid feed passage to cylinder chamber **C**. This produces a pressure difference between cylinder chambers **B**, **C**, which causes rack piston **19** to move, and facilitates rotation of main shaft **18**.
The illustration shows right-turn steering, and should be reversed for left-turn steering.



● **Operation when hydraulic circuit is faulty**

The safety structure means that when the fluid circuit is faulty, the stopper of input shaft **13** directly contacts the groove at the large end of main shaft **18** to transmit steering force, enabling manual operation.

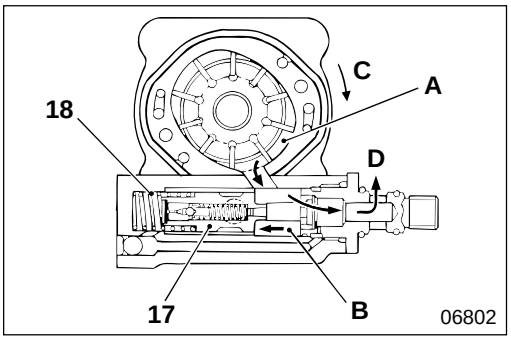
16 Connector
17 Relief valve assembly
18 Flow control spring
19 Bolt
20 Body

A : Direction of rotation

https://truckmanualshub.com/

Relief Valve Assembly



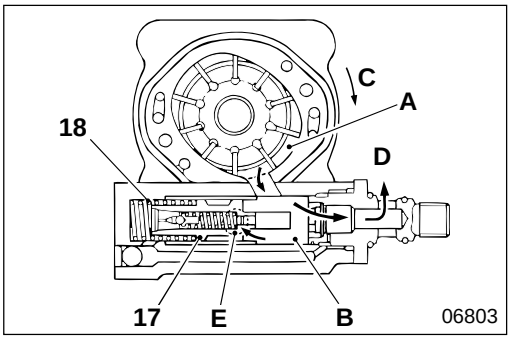
● **Operation of flow control valve**

(1) When not operating (Oil pump rotating at low speed)

Since pressure generated from pressure chamber **A** is low when the oil pump is rotating at low speed, fluid pressure in chamber **B** is also low. Therefore, relief valve assembly **17**, which is pressed by the repercussive force of flow control spring **18** is not activated.

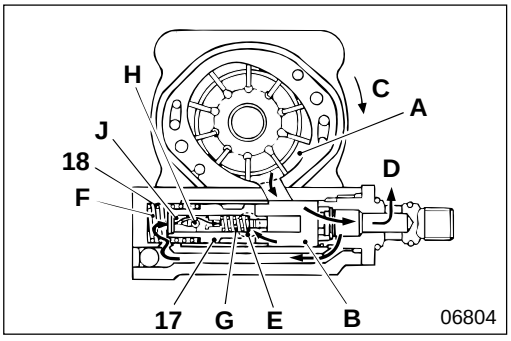
C : Direction of rotation

D : To the power steering booster



(2) When operating (Oil pump rotating at middle or high speed)

Since pressure generated from pressure chamber **A** is high when the oil pump is rotating at middle or high speed, fluid pressure in chamber **B** is also high. This will activate relief valve assembly **17**, overcoming the repercussive force of flow control spring **18**, and open port **E**, making excess fluid return to the inlet port to adequately regulate the flow of fluid to power steering booster **D**.



● **Operation of relief valve**

When the steering is lock-to-lock, pressure in chambers **B** and **F** increases and overcomes the repercussive force of relief spring **G** opening relief valve **J**, which was closed by steel ball **H**, causing the fluid to be returned to the inlet port through port **E**. Thus, if pressure in chamber **F** decreases, the relief valve closes again.

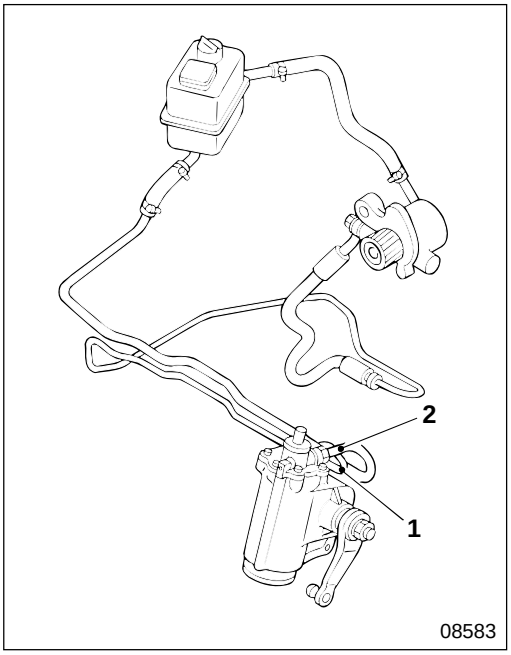
Change of Power Steering Fluid

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Pressure tube	29 to 39 {22 to 29, 3 to 4}	—
2	Return tube	39 to 49 {29 to 36, 4 to 5}	—



[Draining]

- Jack up the front wheels.
- Release pressure tube **1** and return tube **2** connected to the power steering booster.
- Turn the steering wheel fully left and right repeatedly, and drain the fluid from the power steering booster.
- After draining the fluid, tighten pressure tube **1** and return tube **2** at specified torque.

[Filling]

P37-12

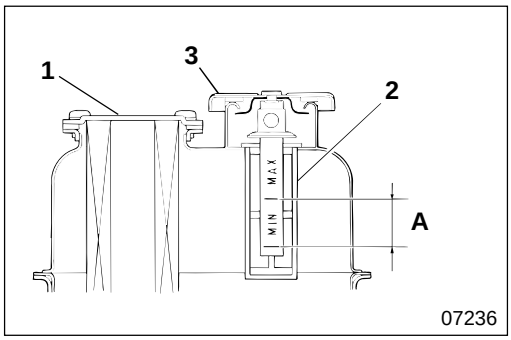
https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

Bleeding of Power Steering System

Fluid

Location	Points of application	Kinds	Quantity
1	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Filler cap dipstick between MIN and MAX



CAUTION

Do not keep the steering wheel turned fully to the left or right for more than fifteen seconds when the engine is running, as this can cause the power steering oil pump to seize up.

- Pour fluid into power steering oil tank **1** up to the inner port of strainer **2**.
- With the engine stopped, jack up the front wheels and turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.

NOTE

Check the fluid level without screwing on filler cap 3.

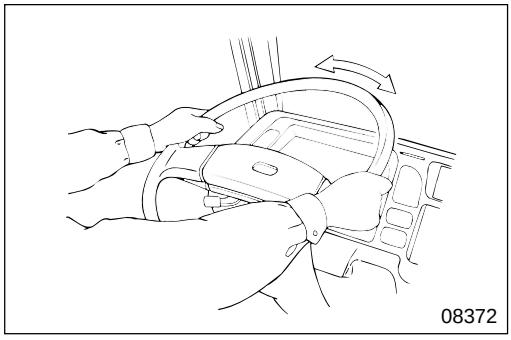
- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add the fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times to raise fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise, bleeding is completed.
- When bleeding is finished, check fluid level of power steering oil tank **1**, and pipe and hose connections for fluid leaks.

Steering Wheel Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Steering wheel play (Measure at the outer circumference of steering wheel)	0 to 50 {0 to 1.97}	—	Adjust



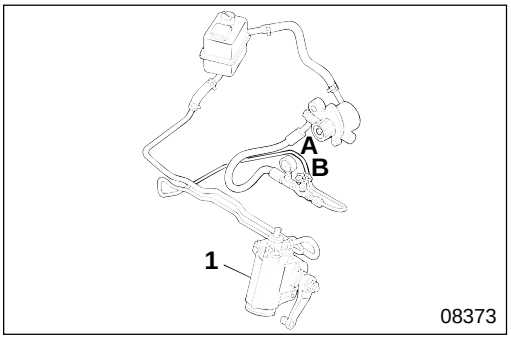
Point the wheels directly forward, start the engine and gently turn the steering wheel left and right to measure play at the outer circumference. If the play deviates from the standard value, adjust tightening points and power steering booster backlash. P37-26, 33

https://truckmanualshub.com/

Performance Verification Test of Power Steering System

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Steering system fluid pressure (With hands off steering wheel)		490 kPa {71 lbf/in^2, 5 kgf/cm^2}	—	Repair
—	Relief set pressure (Measure with engine speed at 1000 to 1500 rpm and stop valve closed)	FE	9.3 MPa {1350 lbf/in^2, 95 kgf/cm^2}	Maximum +195 kPa {28 lbf/in^2, 2 kgf/cm^2} Minimum –295 kPa {43 lbf/in^2, 3 kgf/cm^2}	Replace
		FG	10.3 MPa {1490 lbf/in^2, 105 kgf/cm^2}	Maximum 0 kPa {0 lbf/in^2, 0 kgf/cm^2} Minimum –490 kPa {–71 lbf/in^2, –5 kgf/cm^2}	Replace



Verify that the power steering booster and the power steering oil pump are operating properly by testing the following items.

CAUTION

Do not keep the steering wheel turned fully to the left or right for more than fifteen seconds when the engine is running, as this can cause the power steering oil pump to seize up.

NOTE

If the fluid pressure is higher than 490 kPa {71 lbf/in^2, 5 kgf/cm^2} with engine idling and the steering wheel free, inspect power steering booster 1 and fluid circuit for clogging.

Test item	Test procedure	Assembly standards
Verification of smooth operation	Jack up the front wheels and turn steering wheel fully left and right	Smooth operation throughout test
Measurement conditions	• Install oil pressure gauge **A** capable of measuring above 10.8 MPa {1560 lbf/in^2, 110 kgf/cm^2} and stop valve **B**, then bleed air • With engine idling, turn steering wheel left and right several times to raise fluid temperature to 50 to 60°C {122 to 140°F} • With the engine idling, open stop valve **B**	
Measurement of fluid pressure	• Measure fluid pressure with hands off steering wheel	490 kPa {71 lbf/in^2, 5 kgf/cm^2}
Measurement of relief pressure	• Gradually increase engine speed and maintain it at 1000 to 1500 rpm, and close stop valve **B** to measure maximum fluid pressure	Relief set pressure 9.3 MPa {1350 lbf/in^2, 95 kgf/cm^2} < FE >, 10.3 MPa {1490 lbf/in^2, 105 kgf/cm^2} < FG >

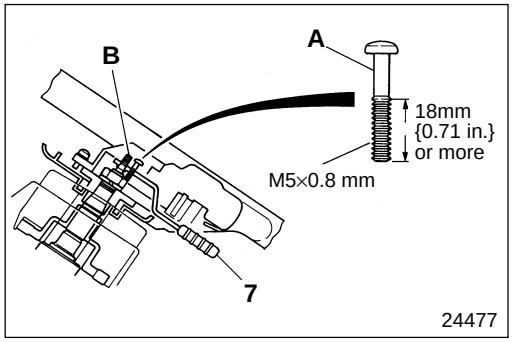
Lubricant

Location	Points of application	Specified lubricant	Quantity
11	Contact area between combination switch of cover assembly and horn contact	Wheel bearing grease [NLGI No.2 (Li soap)]	As required

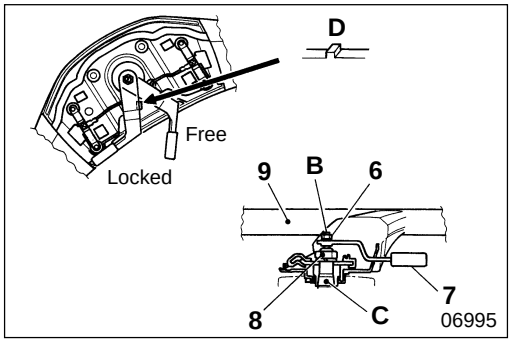
https://truckmanualshub.com/

◆ Service procedure



7 **Telescopic lever**

[Removal]
Secure screw **A** (M5×0.8 mm) in tapped hole in telescopic lever **7** and remove telescopic lever from telescopic shaft **B**.



[Installation]
Locate telescopic lever **7** at the specified position (locked), and adjust until the specified torque is applied to telescopic shaft **B**.

CAUTION⚠
Do not crush the screw tip of telescopic shaft B.

https://truckmanualshub.com/

Start procedure

Install steering wheel assembly **9**. Using a long socket wrench, tighten nut **8** at specified torque 39 to 49 N·m {29 to 36 lbf.ft, 4 to 5 kgf·m}

Rotate telescopic shaft **B** counterclockwise with your fingers and check for looseness

Looseness found

No looseness

Using a flat-blade screwdriver turn telescopic shaft **B** clockwise and drive it in until it hits lightly with a "clunk", but do not turn it any further

CAUTION

Be careful not to tighten too forcibly or you will crush the end of the telescopic shaft, requiring replacement of telescopic shaft assembly C

Install telescopic lever **7** at a location that allows easy tightening, then tighten nut **6** until the telescopic lever will not slip

Tighten telescopic shaft **B** at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 lbf.ft, 0.7 to 0.8 kgf·m}. (Tighten telescopic bar **7** at torque 69 to 78 N {15 to 18 lbf, 7 to 8 kgf} 100 mm {3.94 in.}from the center of steering wheel assembly **9**

To maintain lock, hold telescopic lever **7** clockwise, then loosen and remove lock nut **6**

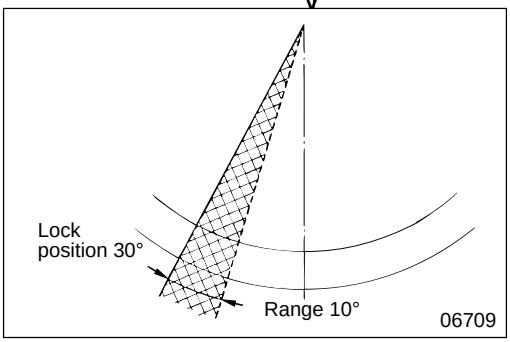
Remove telescopic lever **7**

NOTE

Remove telescopic lever 7 following the description under [Removal], taking care not to loosen telescopic shaft B.

Set telescopic lever **7** to specified lock position **D**, marked "凸"

Tighten nut **6** at specified torque 8.8 to 9.8 N·m {6.5 to 7.2 lbf.ft, 0.9 to 1.0 kgf·m}



When telescopic lever **7** is released, and telescopic shaft **B** is retightened at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 lbf.ft, 0.7 to 0.8 kgf·m}, the telescopic lever should lock in the 10° range this side of specified lock position 30°

Out of the range

Within the range

Joggle steering wheel assembly **9** up and down and check for looseness

Looseness found

No looseness

Remove nut **6**

Procedure is completed

Remove telescopic lever **7**

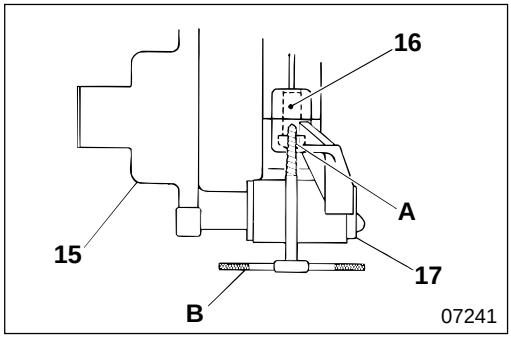
CAUTION

Be sure not to operate telescopic shaft B while steering wheel assembly 9 is removed.

NOTE

Be sure to assemble telescopic lever 7 only after steering wheel assembly 9 has been installed.

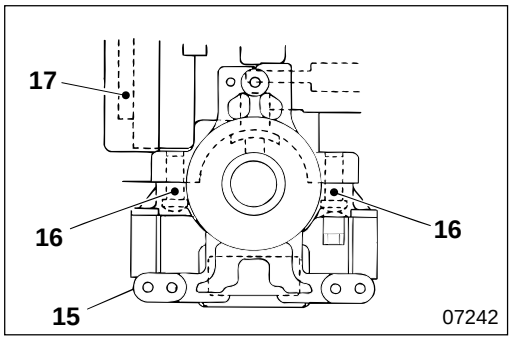
https://truckmanualshub.com/



16 **17** **Head cutting bolt, starter switch**

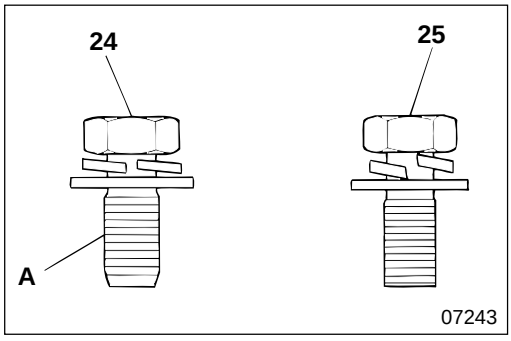
[Removal]

- After removing bracket **15**, drill a ø5.5 to 6.0 mm {0.22 to 0.24 in.} hole 10 to 15 mm {0.39 to 0.59 in.} deep on cutting face **A** of head cutting bolt **16** for mounting starter switch **17**.
- Screw in screw extractor **B** counterclockwise, then pull out head cutting bolt **16**.



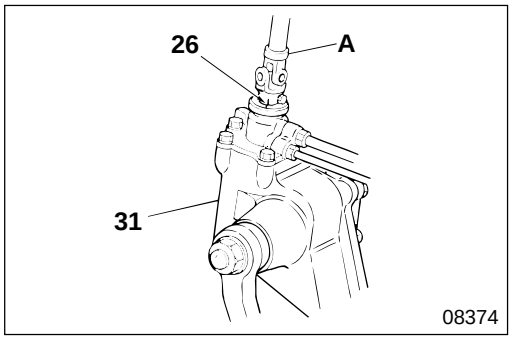
[Installation]

- With new head cutting bolt **16**, tighten starter switch **17** at specified torque to cut the head off the bolt.
- After installing bracket **15**, verify operation of the steering lock function of starter switch **17**.



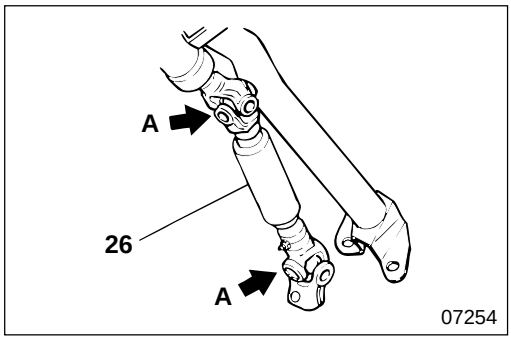
24 **25** **Installation of bolt**

- Bolts **24** and **25**, differ in shape. Do not mix them up when installing.
- Thread area **A** of bolt **24** is elliptical to facilitate grounding of the horn circuit.



26 **31** **Removal and installation of steering column subassembly and power steering booster**

Before removing steering column subassembly **26**, power streering booster **31**, be sure to make alignment mark **A**.



26 **Steering column subassembly**

When the spline of steering column subassembly **26** is disconnected, align the yokes to the same direction **A**.

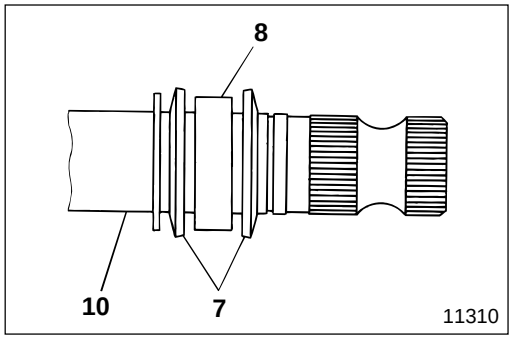
	Friction surface of column support upper and bolt	Wheel bearing grease [NLGI No.2 (Li soap)]	As required

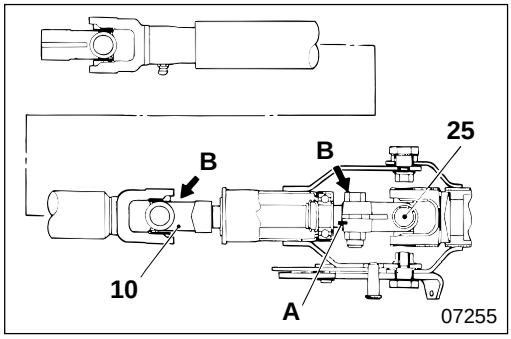
https://truckmanualshub.com/

◆ Service procedure



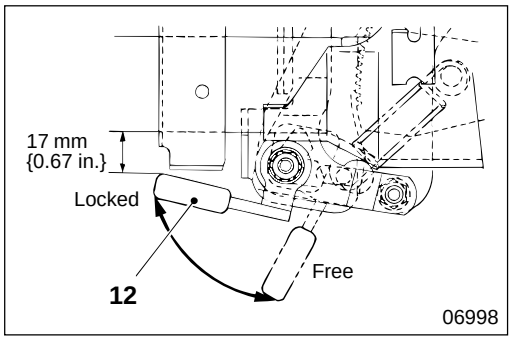
7 Installation of stopper

Install stoppers **7** on steering shaft assembly **10** in the direction as illustrated so that they straddle bearing spacer **8**.



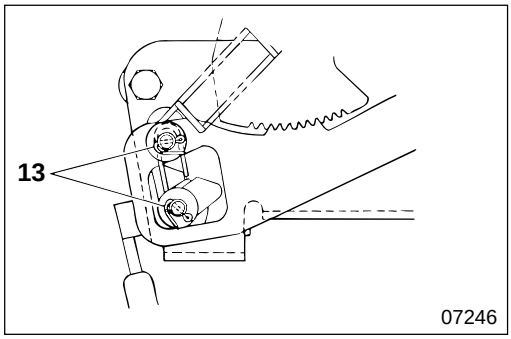
10 Steering shaft assembly

- Before removing steering shaft assembly **10**, be sure to make alignment mark **A**.
- Install the steering shaft with direction **B** of the telescopic shaft assembly **25** yoke and steering shaft assembly **10** yoke aligned or at phase angle of 90°.



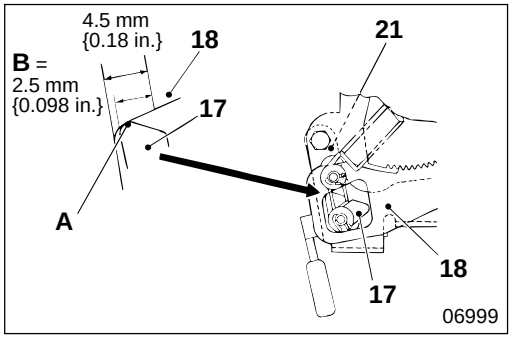
12 Installation of lock lever

- Install lock lever **12** so it is within the working angle when locked.
- After installing lock lever **12**, make sure that the lever operates smoothly (operating force less than 49 N {11 lbf, 5 kgf}). With the lever free, make sure that high tilt operates smoothly.



13 Installation of split pin

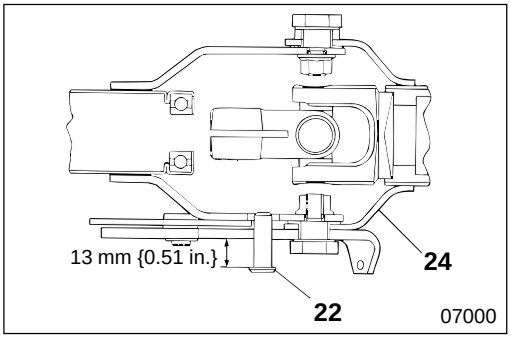
Bend split pin **13** to face outwards as illustrated.



17 Installation of cam

Adjust lever support **21** so that the top surface **A** of cam **17** is within dimension **B** of lock plate **18** to install the cam.

https://truckmanualshub.com/



22 **Installation of clevis pin**

Drive clevis pin **22** into column support upper **24** so that the drive dimension is obtained.

POWER STEERING BOOSTER < FE >

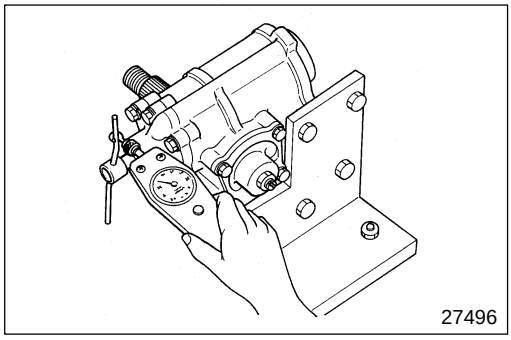
Special tools

Unit : mm {in.}

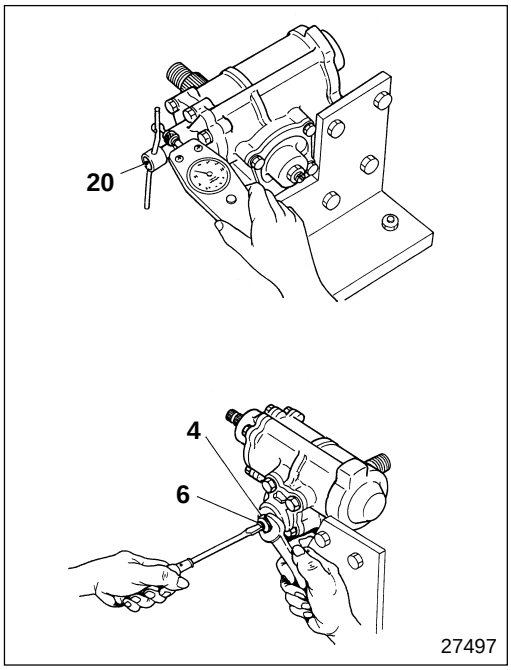
Location	Tool name and shape	Part No.	Application
2	Pitman arm puller 	MH062472	Removal of pitman arm

◆ Service procedure



● **Inspection before disassembly**

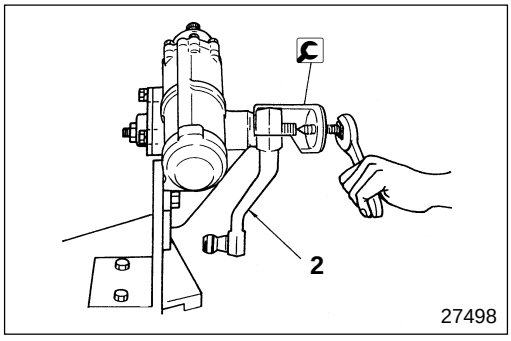
[Measurement of total starting torque]
Before disassembly, measure the total starting torque for a reference during assembly.



● **Inspection after assembly**

[Measurement of total starting torque]

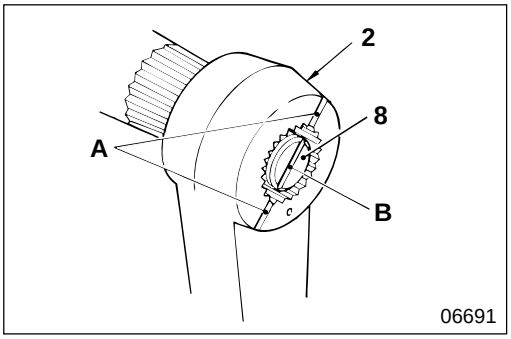
- While turning ball screw set shaft **20**, one quarter of a turn left and right from the neutral position using a torque meter, drive adjusting bolt **6** in, then adjust so that the total starting torque or the engagement torque is within the standard value.
- After adjustment, tighten nut **4** at specified torque.



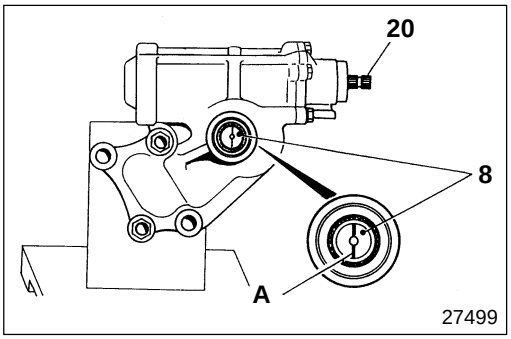
2 **Pitman arm**

[Removal]
: Pitman arm puller

https://truckmanualshub.com/



[Installation]
Align slit **B** of the V-groove of sector shaft **8** on the same line as slit **A** of the V-groove of pitman arm **2** when installing it.



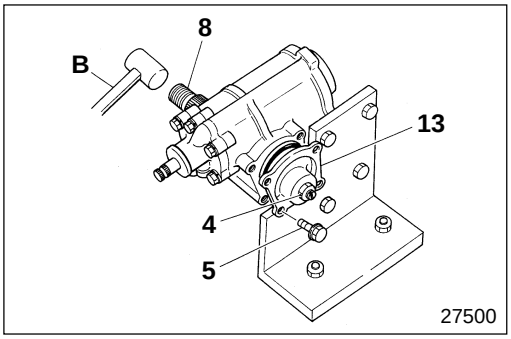
8 **13** **Sector shaft and side cover**

[Removal]

- Turn ball screw set shaft **20** counterclockwise to the lock position, then turn it clockwise approximately 2.6 turns, so that slit **A** of the V-groove at the end of sector shaft **8** is in the neutral position as illustrated.

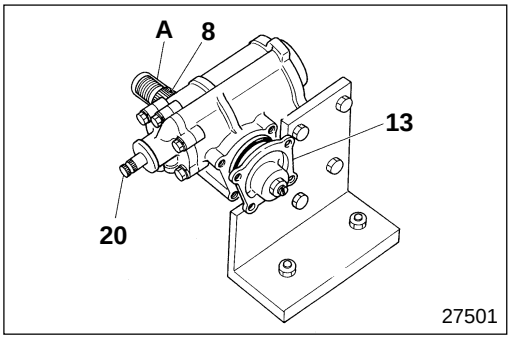
NOTE

At this time, make sure that slit A of the V-groove at the end of sector shaft 8 is at right angles to the axial line of ball screw set shaft 20.



- Loosen nut **4** and remove bolt **5**. After making sure that sector shaft **8** is in the neutral position, tap the end of the sector shaft, and pull out side cover **13** together with the sector shaft.

B : Plastic-headed mallet



[Installation]
With ball screw set shaft **20** in the neutral position, insert sector shaft **8** and side cover **13**.

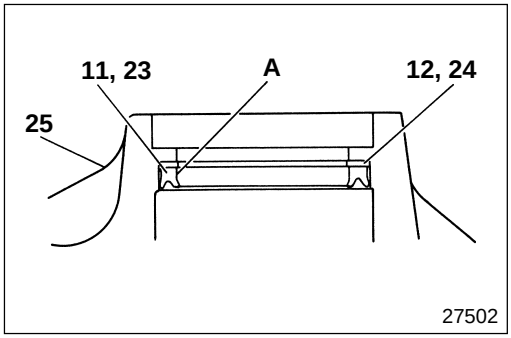
CAUTION⚠

Insert sector shaft 8 with the thread area of the shaft end and serration area protected by cover A to prevent damage to the oil seal.

NOTE

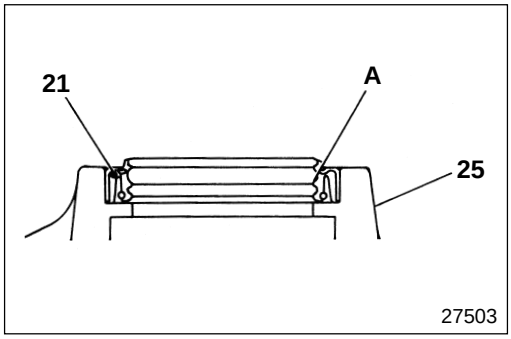
- **Turn ball screw set shaft 20, and make sure that the shaft rotates approximately five turns lock-to-lock.**
- **If the number of turns is less, inspect engagement of ball screw set shaft 20 and sector shaft 8.**

https://truckmanualshub.com/



11 **23** **Installation of U-packing**

Apply grease to lip area **A** of U-packing **11, 23** and install into gear box **25** as illustrated.



21 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **21** and install into gear box **25** as illustrated.

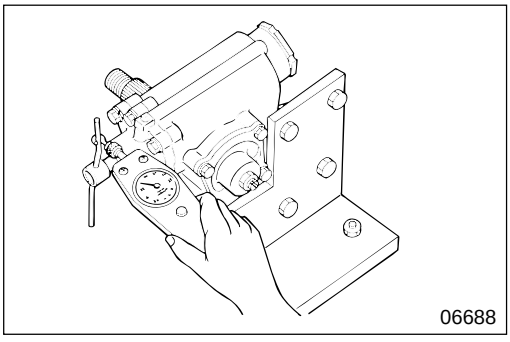
13	Special nut wrench 	MH061594	Removal and installation of special nut
16	End cover wrench 	MH061593	Removal and installation of end cover

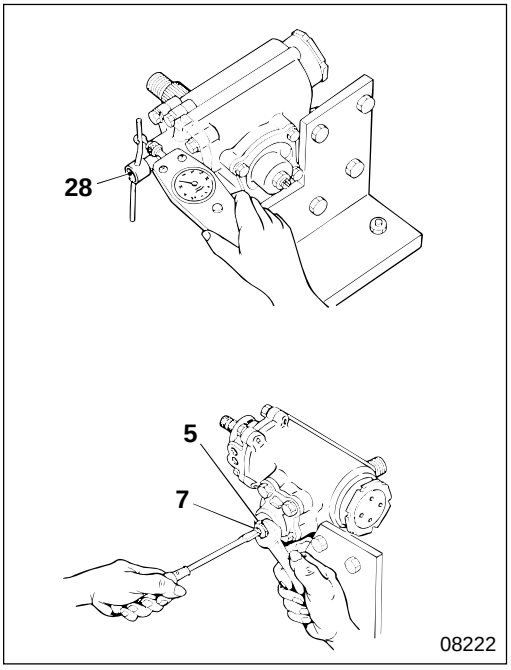


◆ Service procedure

● **Inspection before disassembly**

[Measurement of total starting torque]
Before disassembly, measure the total starting torque for a reference during assembly.

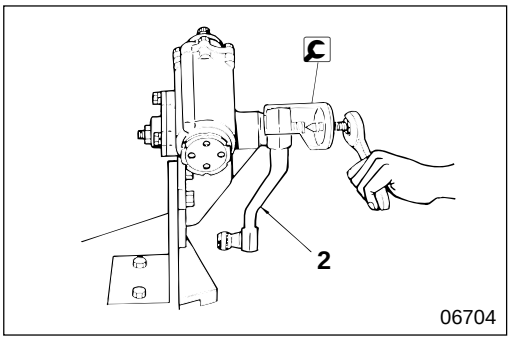
https://truckmanualshub.com/



● **Inspection after assembly**

[Measurement of total starting torque]

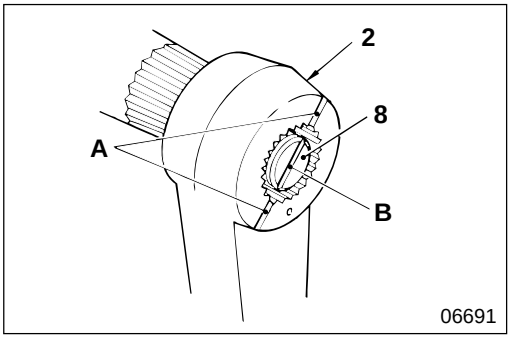
- While turning ball screw set shaft **28**, one quarter of a turn left and right from the neutral position using a torque meter, drive adjusting bolt **7** in, then adjust so that the total starting torque or the engagement torque is within the standard value.
- After adjustment, tighten nut **5** at specified torque.



2 **Pitman arm**

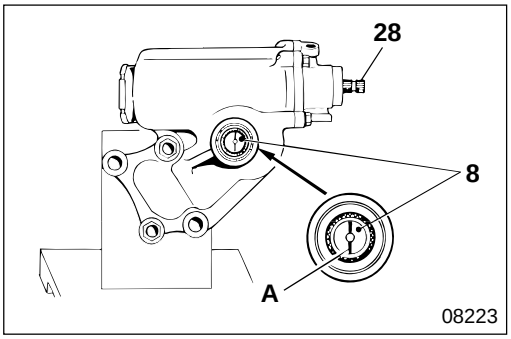
[Removal]

: Pitman arm puller



[Installation]

Align slit **B** of the V-groove of sector shaft **8** on the same line as slit **A** of the V-groove of pitman arm **2** when installing it.



8 **12** **Sector shaft and side cover**

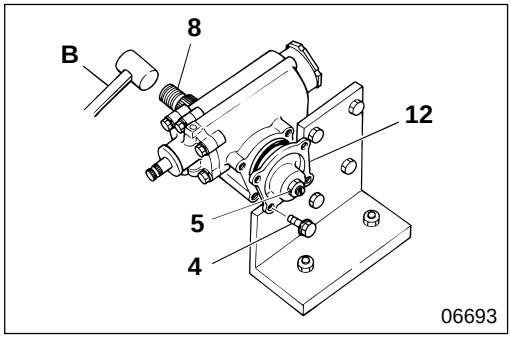
[Removal]

- Turn ball screw set shaft **28** counterclockwise to the lock position, then turn it clockwise approximately 2.6 turns, so that slit **A** of the V-groove at the end of sector shaft **8** is in the neutral position as illustrated.

NOTE

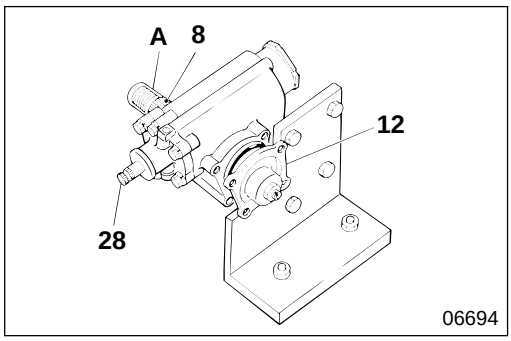
At this time, make sure that slit A of the V-groove at the end of sector shaft 8 is at right angles to the axial line of ball screw set shaft 28.

https://truckmanualshub.com/



- Loosen nut **5** and remove bolt **4**. After making sure that sector shaft **8** is in the neutral position, tap the end of the sector shaft, and pull out side cover **12** together with the sector shaft.

  B : Plastic-headed mallet



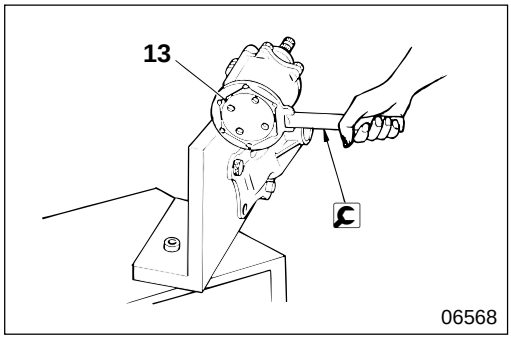
[Installation]
With ball screw set shaft **28** in the neutral position, insert sector shaft **8** and side cover **12**.

CAUTION

Insert sector shaft 8 with the thread area of the shaft end and serration area protected by cover A to prevent damage to the oil seal.

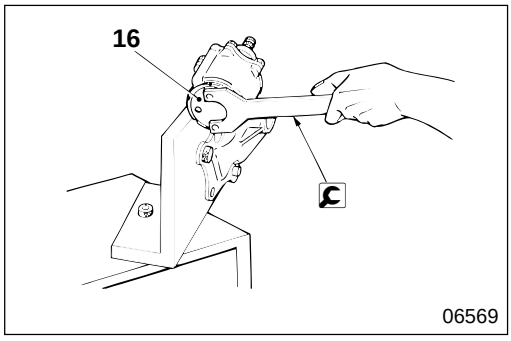
NOTE

- **Turn ball screw set shaft 28, and make sure that the shaft rotates approximately five turns lock-to-lock.**
- **If the number of turns is less, inspect engagement of ball screw set shaft 28 and sector shaft 8.**



13 Removal and installation of special nut

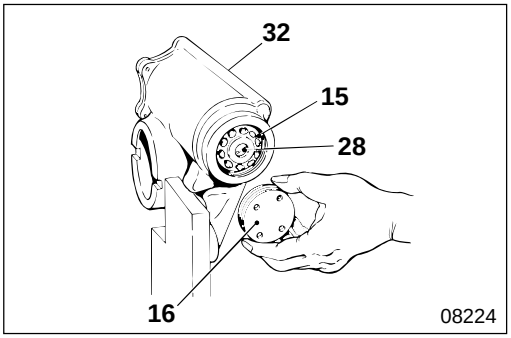
: Special nut wrench



16 End cover

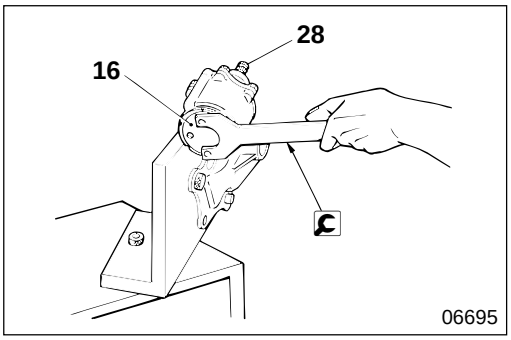
[Removal]
: End cover wrench

https://truckmanualshub.com/

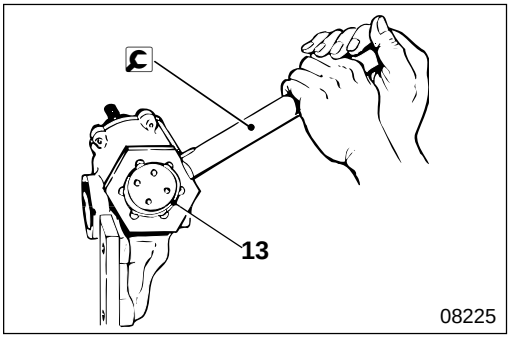


[Installation]

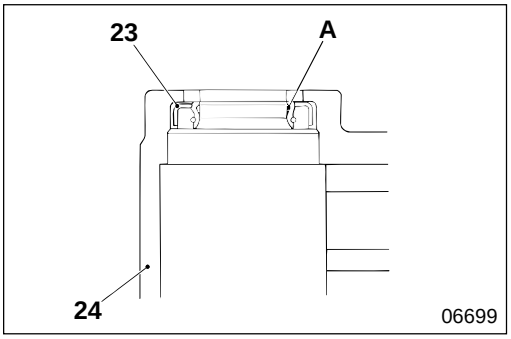
- Install inner race of bearing **15** onto the end of ball screw set shaft **28**, then install the outer race of the bearing onto end cover **16** and screw into gear box **32**.



- Making sure that the rotation torque of ball screw set shaft 28 is not uneven, drive in end cover **16**, using 🔧 end cover wrench, until the rotation torque is within the standard value.

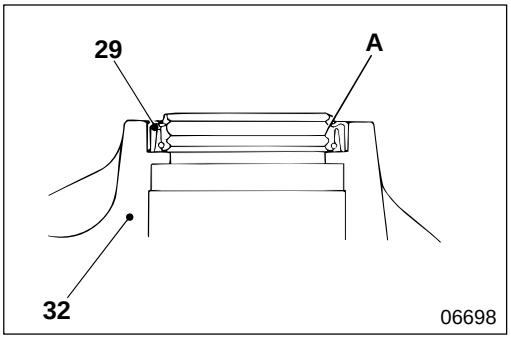


- At the point where the rotation torque is fixed, tighten special nut **13** at specified torque, using 🔧 special nut wrench.



23 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **23** and install into valve housing **24** as illustrated.



29 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **29** and install into gear box **32** as illustrated.

Tightening torque

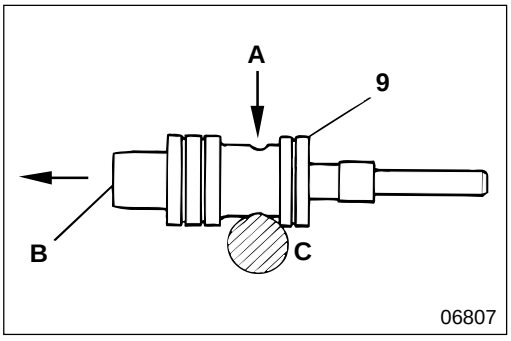
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Lock nut (Gear mounting)	34 to 45 {25 to 33, 3.5 to 4.6}	Wet
3	Bolt (Suction connector mounting)	6 to 10 {4.3 to 7.2, 0.6 to 1.0}	—
8	Connector	49 to 69 {36 to 51, 5 to 7}	—
11	Bolt (Cover mounting)	18 to 22 {13 to 16, 1.8 to 2.2}	—

Lubricant and/or sealant

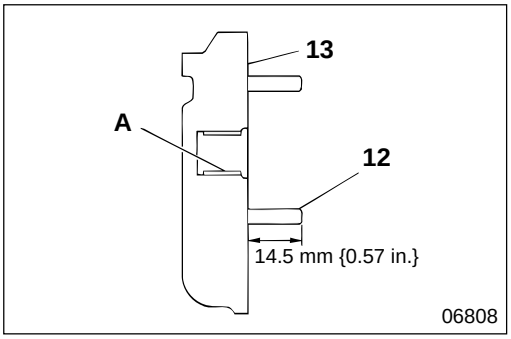
Location	Points of application	Specified lubricant and/or sealant	Quantity
13	Bushing of cover	Automatic transmission fluid (DEXRON or DEXRON II type)	As required

◆ Service procedure



9 **Inspection of relief valve assembly**

Block one side of the hole of relief valve assembly **9**, with your finger **C**, then when air pressure **A** of 390 to 490 kPa {57 to 71 lbf/in^2, 4 to 5 kgf/cm^2} is applied from the other side, check whether air is released from small hole **B** at the rear. If air is not released, it is normal.

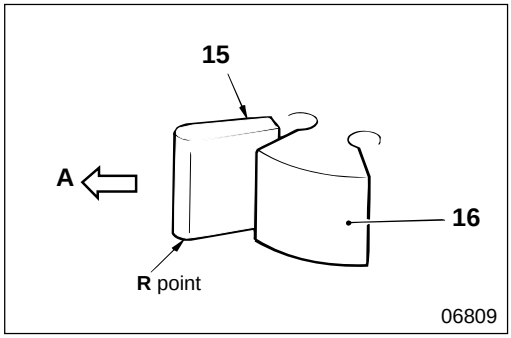


12 **13** **Installation of pin and cover**

- Press-fit pin **12** into cover **13**, to the press-fitting height.
- Apply hydraulic oil to bushing area **A** of the cover.

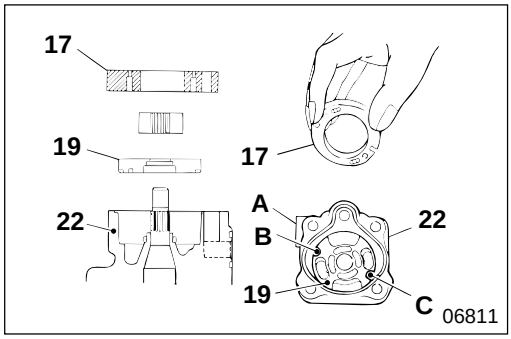
https://truckmanualshub.com/

POWER STEERING OIL PUMP



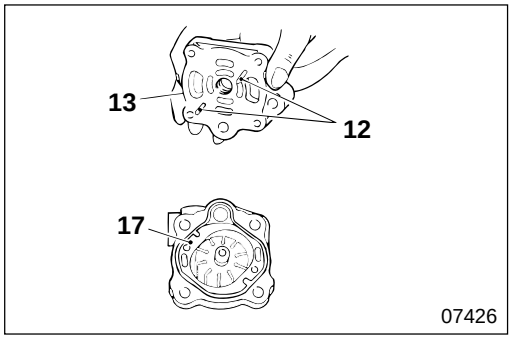
15 **Installation of vane**

With **R** point of vane **15** facing outside **A**, install it on rotor **16** and make sure that the vane moves smoothly. If it is faulty, replace cartridge **14**.



17 **19** **Installation of cam ring and side plate**

- Since the mounting direction of side plate **19** is determined, mount the side plate, so that relief valve side **A** is aligned with round hole **B** (standard pin side) and slotted hole **C** is located on a diagonal.



- Align cam ring **17** with pin **12** of cover **13**, then install the cam ring.

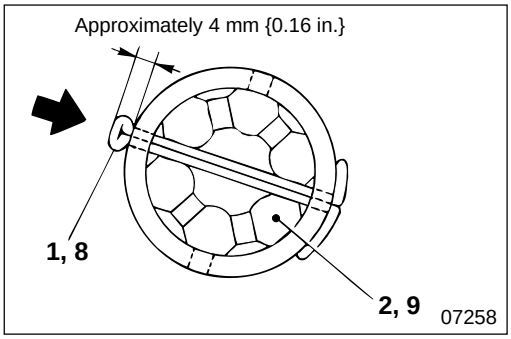
Lubricant

Location	Points of application	Specified lubricant	Quantity
4, 5, 10, 11	Whole area of ball stud seat	Chassis grease [NLGI No.1 (Ca soap)]	As required
6, 13	Supply via grease nipple	Chassis grease [NLGI No.1 (Ca soap)]	As required
7, 14	Arm mounting port of dust cover	Chassis grease [NLGI No.1 (Ca soap)]	As required
15	Pack interior of drag link	Chassis grease [NLGI No.1 (Ca soap)]	As required

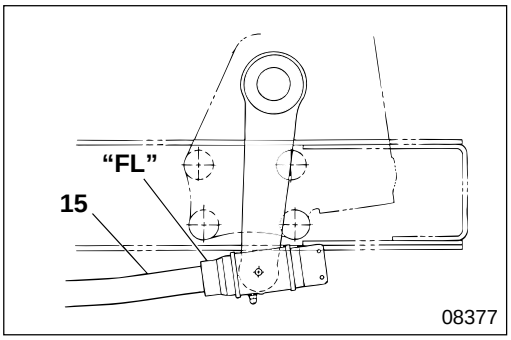
https://truckmanualshub.com/

◆ Service procedure



1 **2** **8** **9** **Installation of split pin and end plug**

- Tighten end plug **2, 9** fully, then slacken it off by one half of a turn.
- Place split pins **1**, **8** so that the heads face the outside of the vehicle.
- Stake the heads of split pins **1**, **8** until they are approximately 4 mm {0.16 in.} thick.

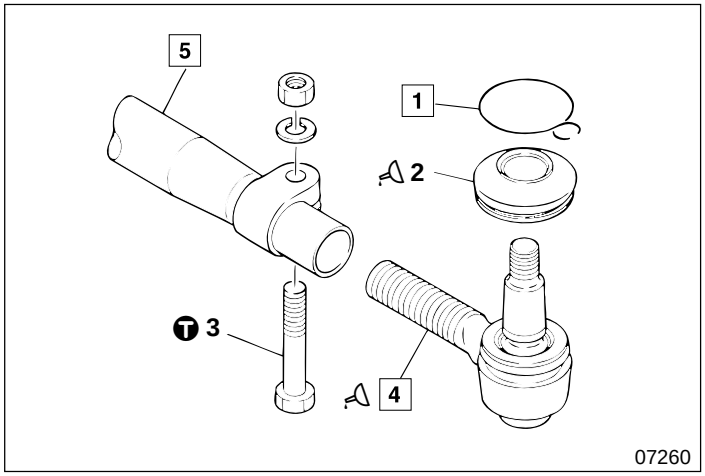


15 **Installation of drag link**

Install drag link **15** with front mark **"FL"** facing the front of the vehicle.

https://truckmanualshub.com/

TIE ROD ASSEMBLY



● **Disassembly sequence**

1 Clip
2 Dust cover
3 Clamp bolt
4 Tie rod end
5 Tie rod

NOTE

Do not remove clip 1 or dust cover 2 unless they are faulty.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
5	Bend of tie rod	1 {0.039} or less	1 {0.039}	Replace

Tightening torque

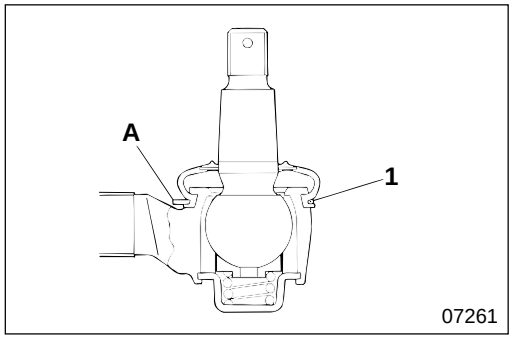
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Clamp bolt (Tie rod end clamp tightening)	25±5 {18±3.6, 2.5±0.5}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
2	Lip area of dust cover	Wheel bearing grease [NLGI No.2 Li soap]	As required
4	Pack interior of dust cover of tie rod end	Wheel bearing grease [NLGI No.2 Li soap]	As required

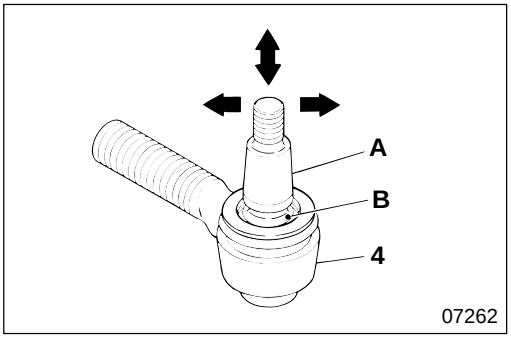
◆ Service procedure



1 **Installation of clip**

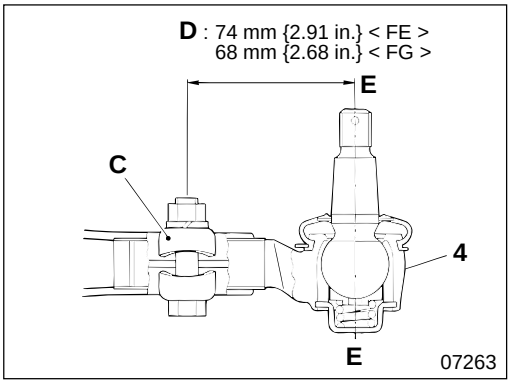
Install clip **1** with alignment port **A** in the direction as illustrated.

https://truckmanualshub.com/



4 **Tie rod end**

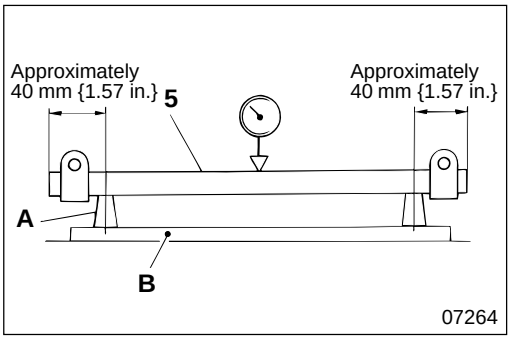
[Inspection]
Move ball stud area **A** vertically and horizontally to inspect for looseness. Ensure that ball **B** rotates evenly.



[Installation]
- Screw in tie rod end **4** so that dimension **D** of the tie rod end and clamp **C** differs by 1.5 mm {0.059 in.} or less between left and right.
- Secure axis **E – E** so that it is parallel both left and right.

NOTE

Deviation of the left and right screw-in amount of tie rod end 4 should be within one turn.



5 **Bending of tie rod**

Measure the bend of tie rod **5** at the center point. If the measured value exceeds the limit, correct or replace the tie rod.

NOTE

To measure the deflection of tie rod 5, turn it one full rotation and read the dial gauge indicator. The deflection is one half of the indicated value.

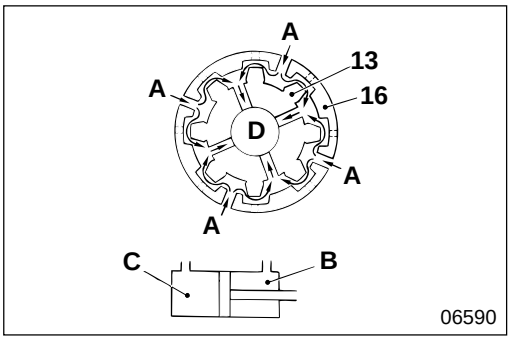
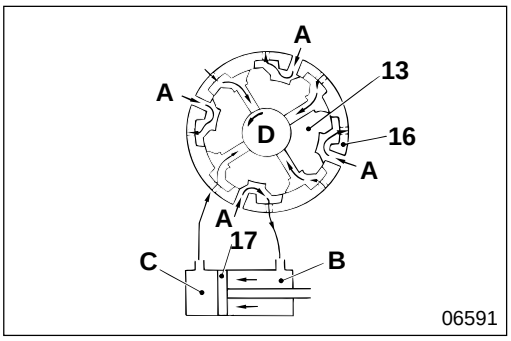
28 Dust cover
29 Pitman arm

Rotary valve **16** is the central part of the power steering booster. Torsion bar **9** allows the steering reaction force and valve return to operate lightly and smoothly at low speed, and ensures stable steering feel even at high speed.



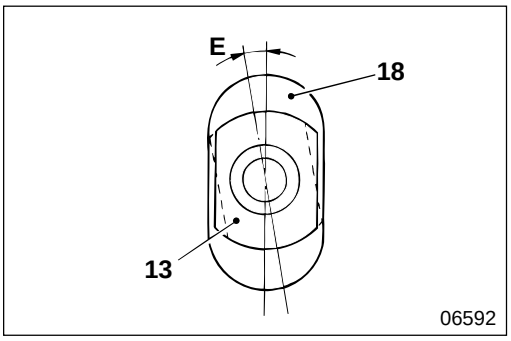
● **Straight-ahead drive operation**

When steering torque is not applied by the steering wheel, input shaft **13** is not activated and remains in neutral. At this time, pressurized fluid from the oil pump flows through the input shaft and the hole of rotary valve **16**, and returns to the oil tank without flowing into cylinder chambers **B**, **C**.
A : From the oil pump
D : To the oil tank



● **Steering operation**

Turning the steering wheel rotates input shaft **13**, causing rotary valve **16** to close the fluid feed passage to cylinder chamber **C**. This produces a pressure difference between cylinder chambers **B**, **C**, which causes rack piston **17** to move, and facilitates rotation of main shaft **18**.
The illustration shows right-turn steering, and should be reversed for left-turn steering.



● **Operation when hydraulic circuit is faulty**

The safety structure means that when the fluid circuit is faulty, the stopper of input shaft **13** directly contacts the groove at the large end of main shaft **18** to transmit steering force, enabling manual operation.

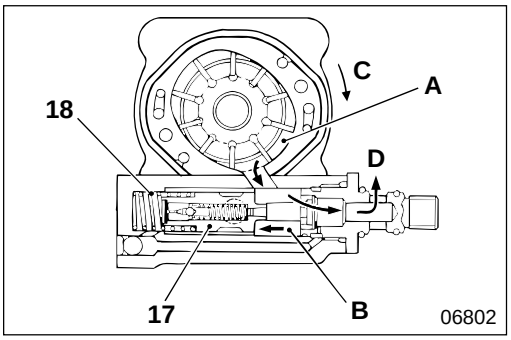
17 Relief valve assembly
18 Flow control spring
19 Bolt
20 Body

A : Direction of rotation

https://truckmanualshub.com/

Relief Valve Assembly



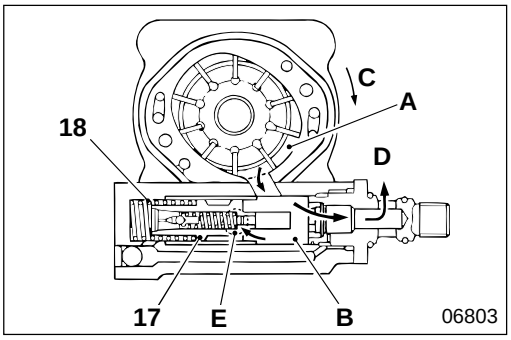
● **Operation of flow control valve**

(1) When not operating (Oil pump rotating at low speed)

Since pressure generated from pressure chamber **A** is low when the oil pump is rotating at low speed, fluid pressure in chamber **B** is also low. Therefore, relief valve assembly **17**, which is pressed by the repercussive force of flow control spring **18** is not activated.

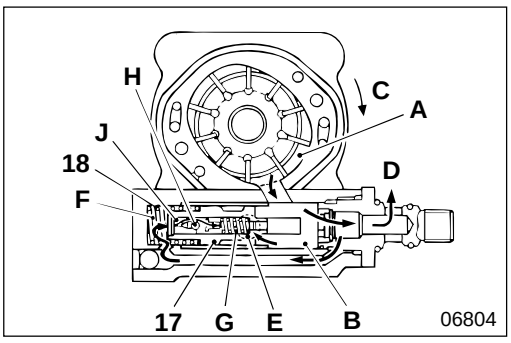
C : Direction of rotation

D : To the power steering booster



(2) When operating (Oil pump rotating at middle or high speed)

Since pressure generated from pressure chamber **A** is high when the oil pump is rotating at middle or high speed, fluid pressure in chamber **B** is also high. This will activate relief valve assembly **17**, overcoming the repercussive force of flow control spring **18**, and open port **E**, making excess fluid return to the inlet port to adequately regulate the flow of fluid to power steering booster **D**.



● **Operation of relief valve**

When the steering is lock-to-lock, pressure in chambers **B** and **F** increases and overcomes the repercussive force of relief spring **G** opening relief valve **J**, which was closed by steel ball **H**, causing the fluid to be returned to the inlet port through port **E**. Thus, if pressure in chamber **F** decreases, the relief valve closes again.

https://truckmanualshub.com/

TROUBLESHOOTING

Possible causes \ Symptoms		Steering wheel operation heavy	Steering wheel play excessive and unstable	Steering wheel pulls to one side	Steering wheel vibration	Steering wheel self-return bad	Steering wheel does not turn	Steering angle insufficient or difference between right and left	Fluid leaking	Oil pump fluid pressure abnormal	Oil pump gurgles	Oil pump squeaks	Oil pump growls	Remarks

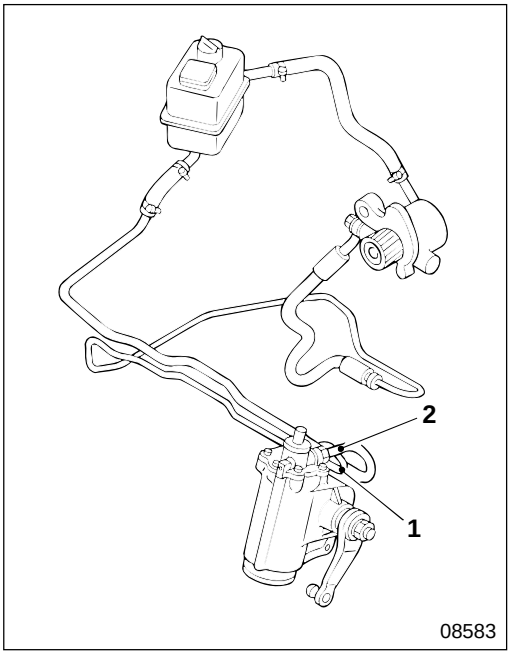
Change of Power Steering Fluid

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Pressure tube	29 to 39 {22 to 29, 3 to 4}	—
2	Return tube	39 to 49 {29 to 36, 4 to 5}	—



[Draining]
- Jack up the front wheels.
- Release pressure tube **1** and return tube **2** connected to the power steering booster.
- Turn the steering wheel fully left and right repeatedly, and drain the fluid from the power steering booster.
- After draining the fluid, tighten pressure tube **1** and return tube **2** at specified torque.

[Filling]
P37-12

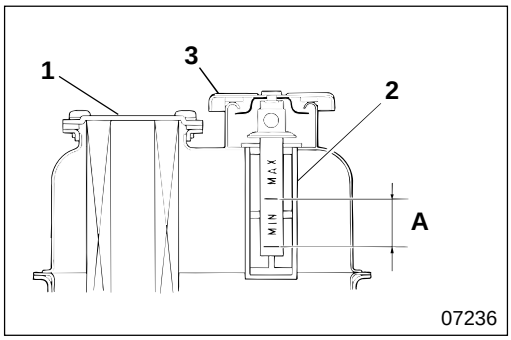
https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Bleeding of Power Steering System

Fluid

Location	Points of application	Kinds	Quantity
1	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Filler cap dipstick between MIN and MAX



- Pour fluid into power steering oil tank **1** up to the inner port of strainer **2**.
- With the engine stopped, jack up the front wheels and turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.

NOTE

Check the fluid level without screwing on filler cap 3.

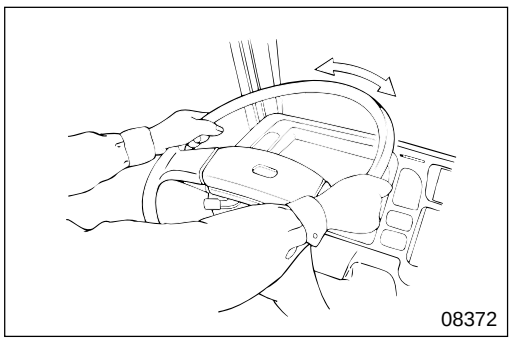
- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add the fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times to raise fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise, bleeding is completed.
- When bleeding is finished, check fluid level of power steering oil tank **1**, and pipe and hose connections for fluid leaks.

Steering Wheel Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Steering wheel play (Measure at the outer circumference of steering wheel)	0 to 50 {0 to 1.97}	—	Adjust



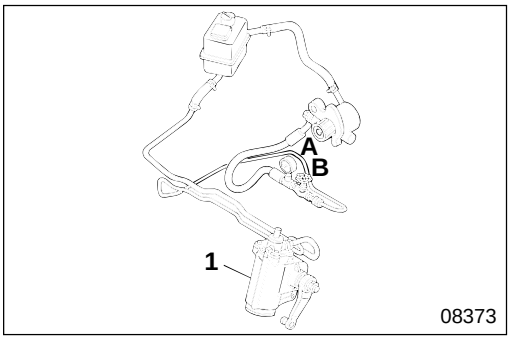
Point the wheels directly forward, start the engine and gently turn the steering wheel left and right to measure play at the outer circumference. If the play deviates from the standard value, adjust tightening points and power steering booster backlash. P37-25

https://truckmanualshub.com/

Performance Verification Test of Power Steering System

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Steering system fluid pressure (With hands off steering wheel)	490 kPa {71 lbf/in^2, 5 kgf/cm^2}	—	Repair
—	Relief set pressure (Measure with engine speed at 1000 to 1500 rpm and stop valve closed)	10.3 MPa {1490 lbf/in^2, 105 kgf/cm^2}	Maximum +490 kPa {71 lbf/in^2, 5 kgf/cm^2} Minimum –195 kPa {28 lbf/in^2, 2 kgf/cm^2}	Replace



Verify that the power steering booster and the power steering oil pump are operating properly by testing the following items.

NOTE

If the fluid pressure is higher than 490 kPa {71 lbf/in^2, 5 kgf/cm^2} with engine idling and the steering wheel free, inspect power steering booster 1 and fluid circuit for clogging.

Test item	Test procedure	Assembly standards
Verification of smooth operation	Jack up the front wheels and turn steering wheel fully left and right	Smooth operation throughout test
Measurement conditions	• Install oil pressure gauge **A** capable of measuring above 10.8 MPa {1560 lbf/in^2, 110 kgf/cm^2} and stop valve **B**, then bleed air • With engine idling, turn steering wheel left and right several times to raise fluid temperature to 50 to 60°C {122 to 140°F} • With the engine idling, open stop valve **B**	
Measurement of fluid pressure	• Measure fluid pressure with hands off steering wheel	490 kPa {71 lbf/in^2, 5 kgf/cm^2}
Measurement of relief pressure	• Gradually increase engine speed and maintain it at 1000 to 1500 rpm, and close stop valve **B** to measure maximum fluid pressure • Do not keep stop valve **B** closed for more than fifteen seconds	Relief set pressure 10.3 MPa {1490 lbf/in^2, 105 kgf/cm^2}

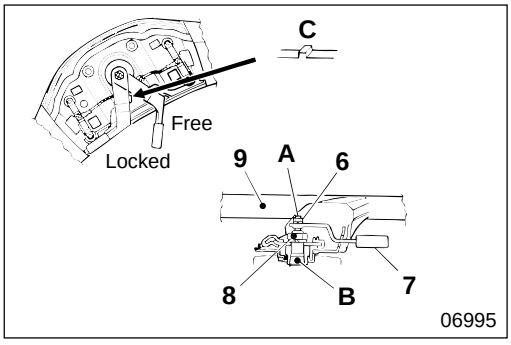
28	Return tube	39 to 49 {29 to 36, 4 to 5}	—
30	Nut (Power steering booster mounting)	83.5 to 108 {61 to 80, 8.5 to 11}	—
32	Nut (Tie rod assembly mounting)	93±25 {69±18, 9.5±2.5}	—

Lubricant

Location	Points of application	Kinds	Quantity
11	Contact area between combination switch of cover assembly and horn contact	Wheel bearing grease [NLGI No.2 (Li soap)]	As required



◆ Service procedure

7 **Installation of telescopic lever**

Locate telescopic lever **7** at the specified position, and adjust until the specified torque is applied to telescopic shaft **A**.

CAUTION

Do not crush the screw tip of telescopic shaft A.

https://truckmanualshub.com/

Start procedure

Install steering wheel assembly **9**. Using a long socket wrench, tighten nut **8** at specified torque 39 to 49 N·m {29 to 36 lbf.ft, 4 to 5 kgf·m}

Looseness found / No looseness

Rotate telescopic shaft **A** counterclockwise with your fingers and check for looseness

Using a flat-blade screwdriver turn telescopic shaft **A** clockwise and drive it in until it hits lightly with a "clunk", but do not turn it any further

CAUTION

Be careful not to tighten too forcibly or you will crush the end of the telescopic shaft, requiring replacement of telescopic shaft assembly B

Install telescopic lever **7** at a location that allows easy tightening, then tighten nut **6** until the telescopic lever will not slip

Tighten telescopic shaft **A** at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 lbf.ft, 0.7 to 0.8 kgf·m}. (Tighten telescopic bar **7** at torque 69 to 78 N {15 to 18 lbf, 7 to 8 kgf} 100 mm {3.94 in.}from the center of steering wheel assembly **9**

To maintain lock, hold telescopic lever **7** clockwise, then loosen and remove lock nut **6**

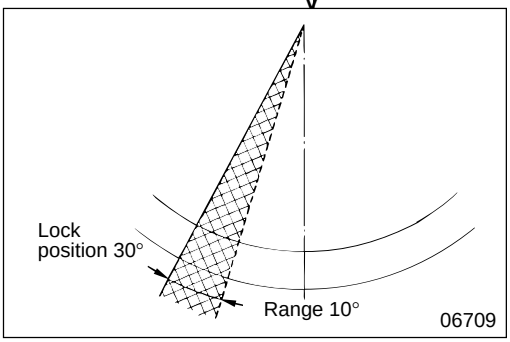
Remove telescopic lever **7**

NOTE

Remove telescopic lever 7 by prying it out vertically, taking care not to loosen telescopic shaft A. Prying the lever horizontally can loosen the telescopic shaft

Set telescopic lever **7** to specified lock position **C**, marked "⏃"

Tighten nut **6** at specified torque 8.8 to 9.8 N·m {6.5 to 7.2 lbf.ft, 0.9 to 1.0 kgf·m}



When telescopic lever **7** is released, and telescopic shaft **A** is retightened at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 lbf.ft, 0.7 to 0.8 kgf·m}, the telescopic lever should lock in the 10° range this side of specified lock position 30°

Out of the range / Within the range

Joggle steering wheel assembly **9** up and down and check for looseness

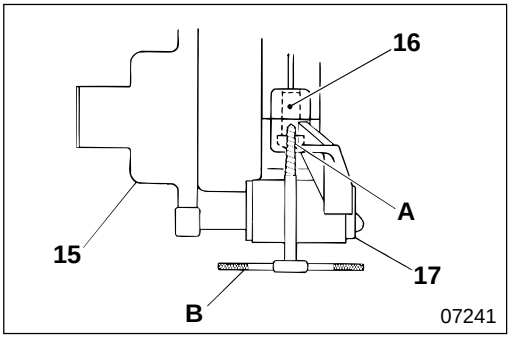
Looseness found / No looseness

Remove nut **6**

Remove telescopic lever **7**

Procedure is completed

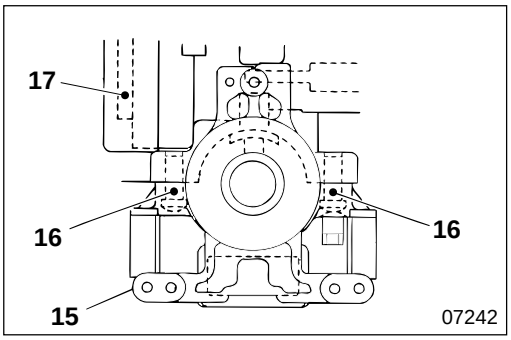
https://truckmanualshub.com/



16 **17** **Head cutting bolt, starter switch**

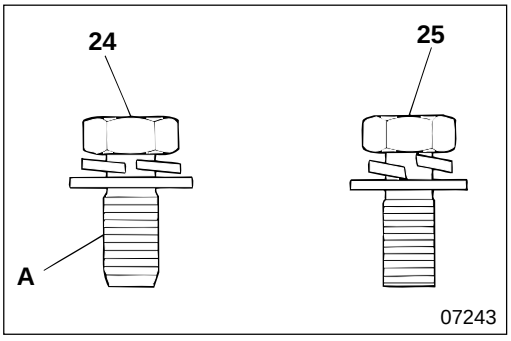
[Removal]

- After removing bracket **15**, drill a ø5.5 to 6.0 mm {0.22 to 0.24 in.} hole 10 to 15 mm {0.39 to 0.59 in.} deep on cutting face **A** of head cutting bolt **16** for mounting starter switch **17**.
- Screw in screw extractor **B** counterclockwise, then pull out head cutting bolt **16**.



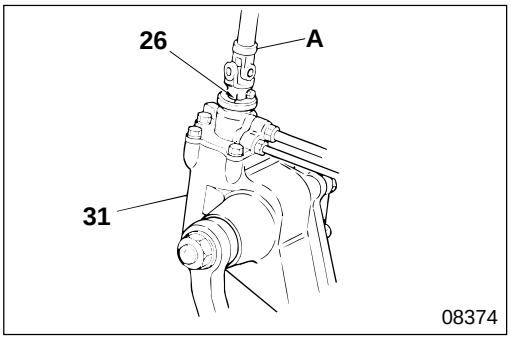
[Installation]

- With new head cutting bolt **16**, tighten starter switch **17** at specified torque to cut the head off the bolt.
- After installing bracket **15**, verify operation of the steering lock function of starter switch **17**.



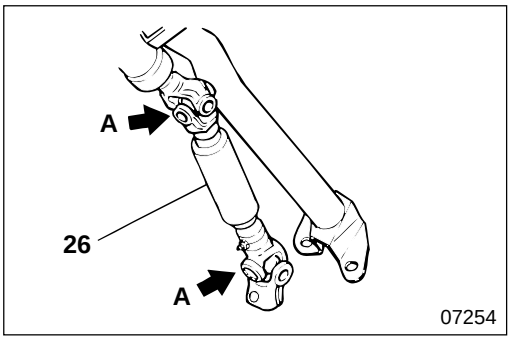
24 **25** **Installation of bolt**

- Bolts **24** and **25**, differ in shape. Do not mix them up when installing.
- Thread area **A** of bolt **24** is elliptical to facilitate grounding of the horn circuit.



26 **31** **Removal and installation of steering column subassembly and power steering booster**

Before removing steering column subassembly **26**, power streering booster **31**, be sure to make alignment mark **A**.



26 **Steering column subassembly**

When the spline of steering column subassembly **26** is disconnected, align the yokes to the same direction **A**.

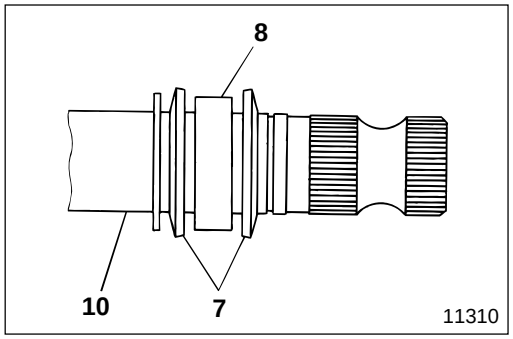
	Friction surface of column support upper and bolt	Wheel bearing grease [NLGI No.2 (Li soap)]	As required

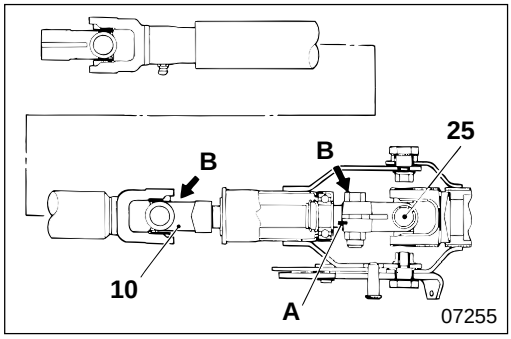
https://truckmanualshub.com/

◆ Service procedure



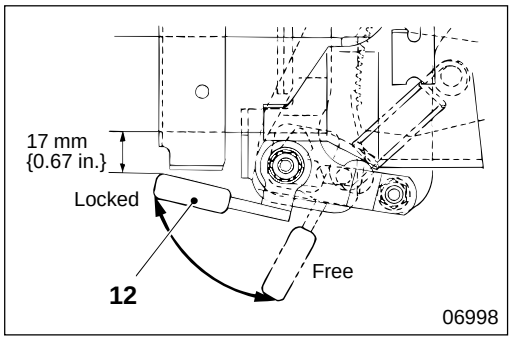
7 **Installation of stopper**

Install stoppers **7** on steering shaft assembly **10** in the direction as illustrated so that they straddle bearing spacer **8**.



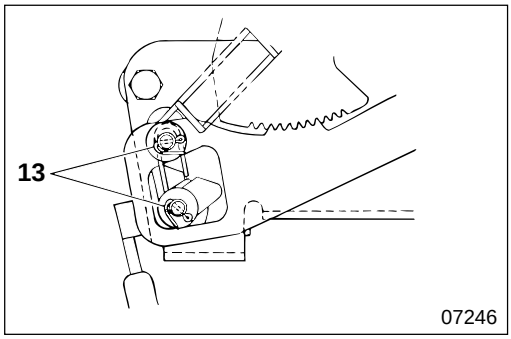
10 **Steering shaft assembly**

- Before removing steering shaft assembly **10**, be sure to make alignment mark **A**.
- Install the steering shaft with direction **B** of the telescopic shaft assembly **25** yoke and steering shaft assembly **10** yoke aligned or at phase angle of 90°.



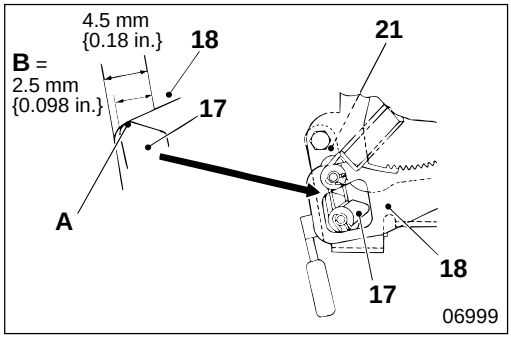
12 **Installation of lock lever**

- Install lock lever **12** so it is within the working angle when locked.
- After installing lock lever **12**, make sure that the lever operates smoothly (operating force less than 49 N {11 lbf, 5 kgf}). With the lever free, make sure that high tilt operates smoothly.



13 **Installation of split pin**

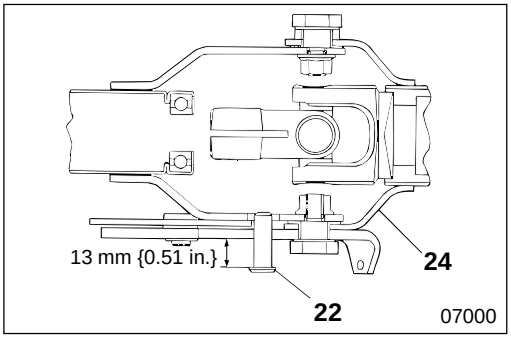
Bend split pin **13** to face outwards as illustrated.



17 **Installation of cam**

Adjust lever support **21** so that the top surface **A** of cam **17** is within dimension **B** of lock plate **18** to install the cam.

https://truckmanualshub.com/



22 **Installation of clevis pin**

Drive clevis pin **22** into column support upper **24** so that the drive dimension is obtained.

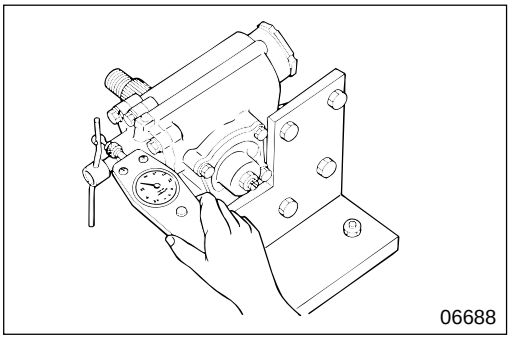
13	Special nut wrench 	MH061594	Removal and installation of special nut
16	End cover wrench 	MH061593	Removal and installation of end cover

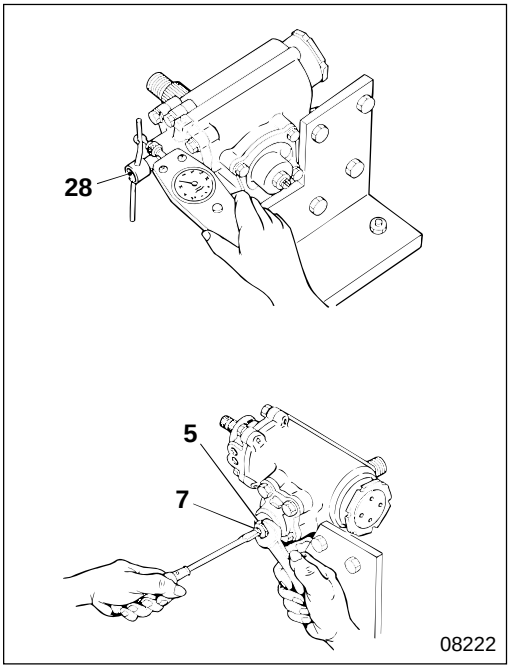


◆ Service procedure

● **Inspection before disassembly**

[Measurement of total starting torque]
Before disassembly, measure the total starting torque for a reference during assembly.

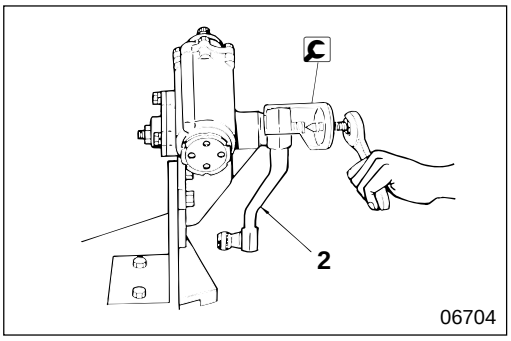
https://truckmanualshub.com/



● **Inspection after assembly**

[Measurement of total starting torque]

- While turning ball screw set shaft **28**, one quarter of a turn left and right from the neutral position using a torque meter, drive adjusting bolt **7** in, then adjust so that the total starting torque or the engagement torque is within the standard value.
- After adjustment, tighten nut **5** at specified torque.

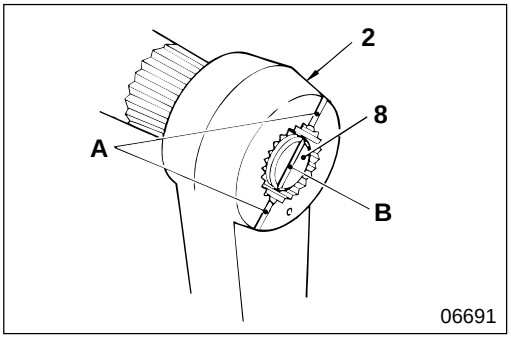


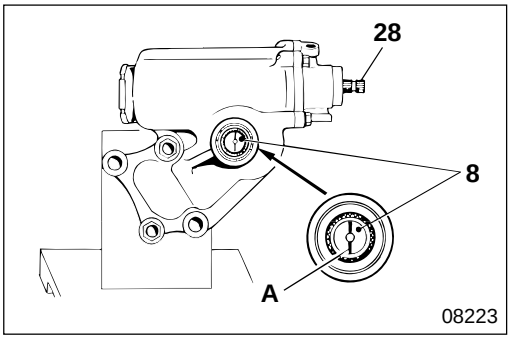
2 **Pitman arm**

[Removal]

[Installation]

Align slit **B** of the V-groove of sector shaft **8** on the same line as slit **A** of the V-groove of pitman arm **2** when installing it.





8 **12** **Sector shaft and side cover**

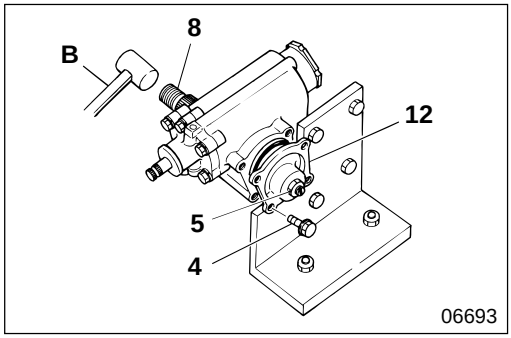
[Removal]

- Turn ball screw set shaft **28** counterclockwise to the lock position, then turn it clockwise approximately 2.6 turns, so that slit **A** of the V-groove at the end of sector shaft **8** is in the neutral position as illustrated.

NOTE

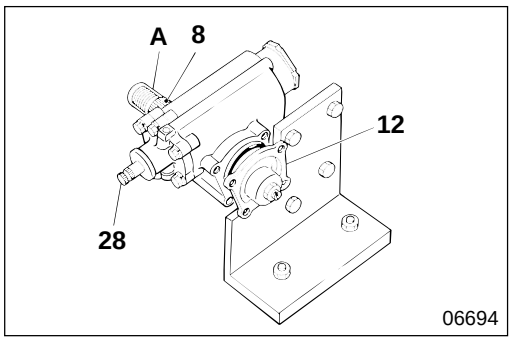
At this time, make sure that slit A of the V-groove at the end of sector shaft 8 is at right angles to the axial line of ball screw set shaft 28.

https://truckmanualshub.com/



- Loosen nut **5** and remove bolt **4**. After making sure that sector shaft **8** is in the neutral position, tap the end of the sector shaft, and pull out side cover **12** together with the sector shaft.

  B : Plastic-headed mallet



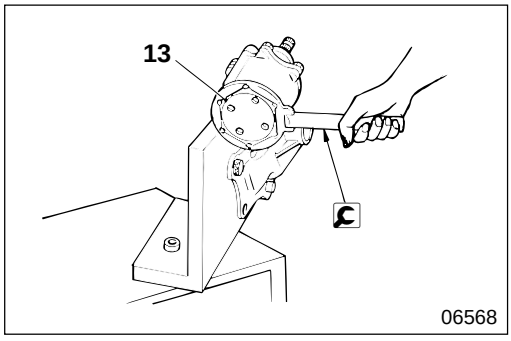
[Installation]
With ball screw set shaft **28** in the neutral position, insert sector shaft **8** and side cover **12**.

CAUTION

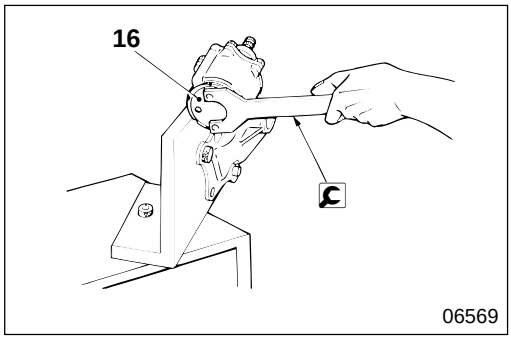
Insert sector shaft 8 with the thread area of the shaft end and serration area protected by cover A to prevent damage to the oil seal.

NOTE

- **Turn ball screw set shaft 28, and make sure that the shaft rotates approximately five turns lock-to-lock.**
- **If the number of turns is less, inspect engagement of ball screw set shaft 28 and sector shaft 8.**



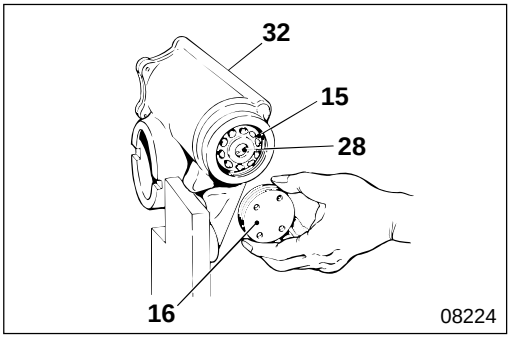
13 **Removal and installation of special nut**



16 **End cover**

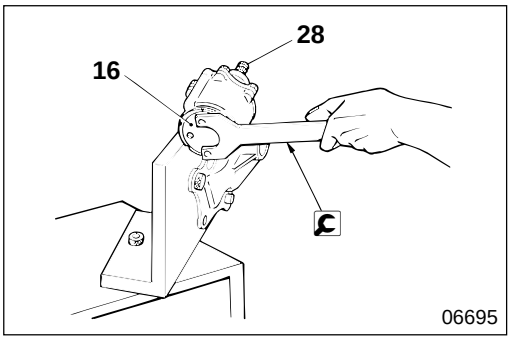
[Removal]

https://truckmanualshub.com/

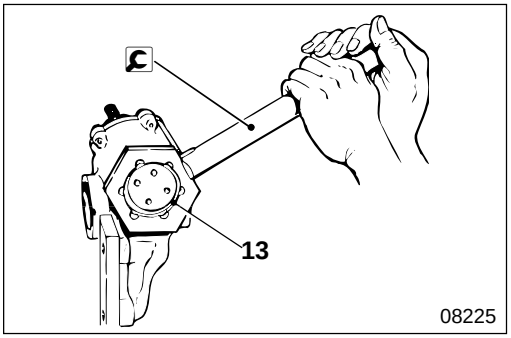


[Installation]

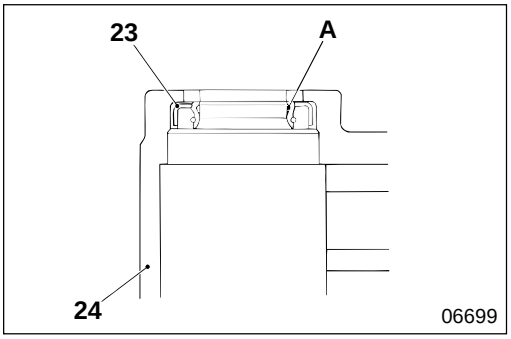
- Install inner race of bearing **15** onto the end of ball screw set shaft **28**, then install the outer race of the bearing onto end cover **16** and screw into gear box **32**.



- Making sure that the rotation torque of ball screw set shaft 28 is not uneven, drive in end cover **16**, using 🔧 end cover wrench, until the rotation torque is within the standard value.

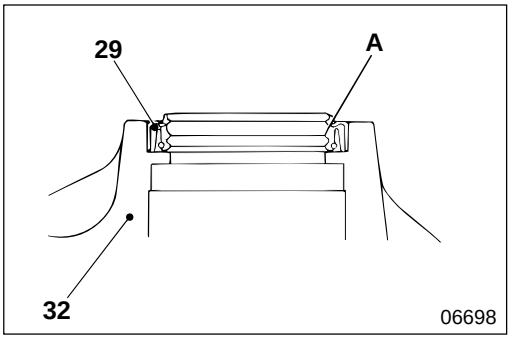


- At the point where the rotation torque is fixed, tighten special nut **13** at specified torque, using 🔧 special nut wrench.



23 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **23** and install into valve housing **24** as illustrated.



29 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **29** and install into gear box **32** as illustrated.

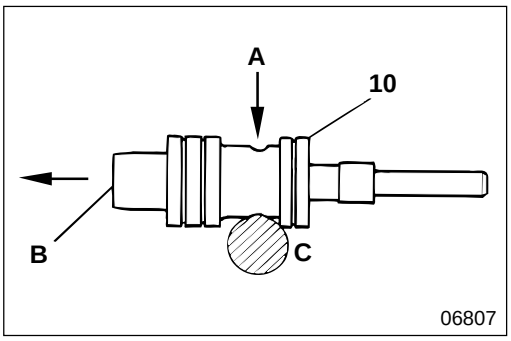
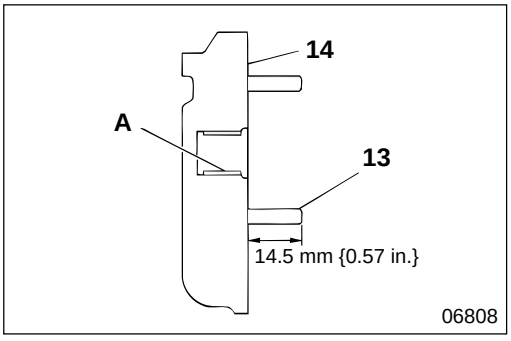
14	Bushing of cover	Automatic transmission fluid (DEXRON or DEXRON II type)	As required
26	Periphery of lip area of oil seal	Wheel bearing grease [NLGI No. 2 (Li Soap)]	As required

◆ Service procedure



10 **Inspection of relief valve assembly**

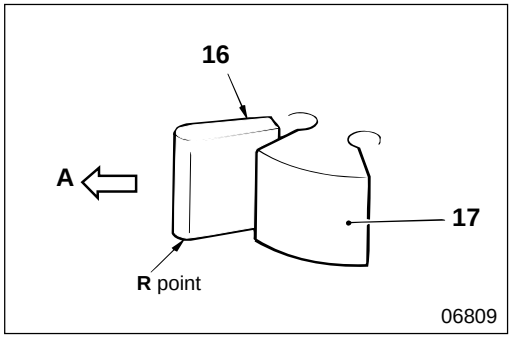
Block one side of the hole of relief valve assembly **10**, with your finger **C**, then when air pressure **A** of 390 to 490 kPa {57 to 71 lbf/in^2, 4 to 5 kgf/cm^2} is applied from the other side, check whether air is released from small hole **B** at the rear. If air is not released, it is normal.



13 **14** **Installation of pin and cover**

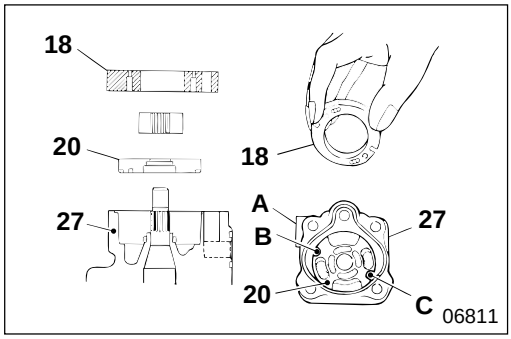
- Press-fit pin **13** into cover **14**, to the press-fitting height.
- Apply hydraulic oil to bushing area **A** of the cover.

https://truckmanualshub.com/



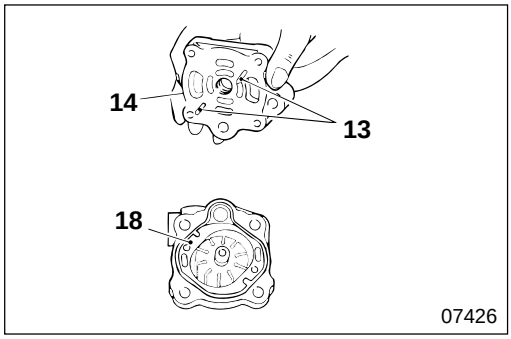
16 **Installation of vane**

With **R** point of vane **16** facing outside **A**, install it on rotor **17** and make sure that the vane moves smoothly. If it is faulty, replace cartridge **15**.

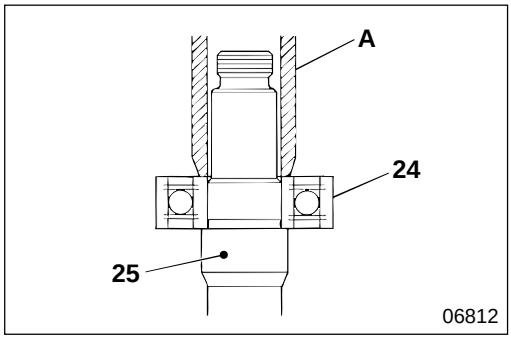


18 **20** **Installation of cam ring and side plate**

- Since the mounting direction of side plate **20** is determined, mount the side plate, so that relief valve side **A** is aligned with round hole **B** (standard pin side) and slotted hole **C** is located on a diagonal.

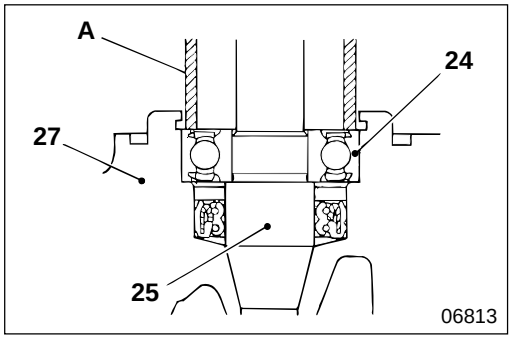


- Align cam ring **18** with pin **13** of cover **14**, then install the cam ring.



24 **Press-fitting of bearing**

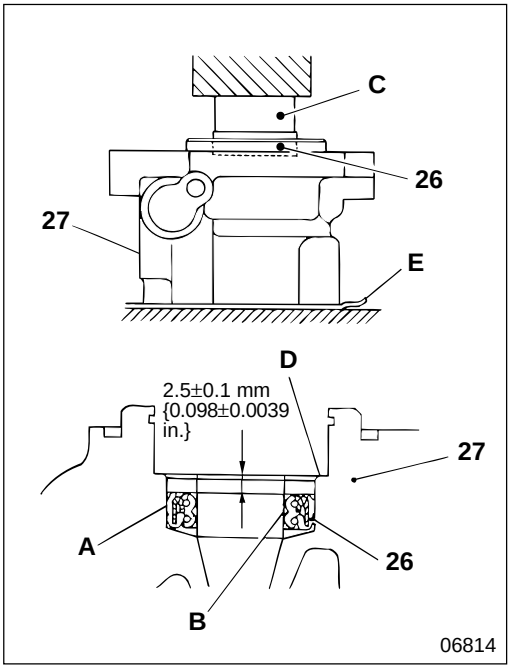
With a suitable pipe **A** on the inner race of bearing **24**, press-fit onto the stepped part of the shaft **25**.



25 **Installation of shaft**

With bearing **24** installed on shaft **25**, press-fit the shaft into body **27** using a suitable pipe **A** on the outer race of the bearing.

https://truckmanualshub.com/



26 **Press-fitting of oil seal**

- Apply grease to periphery **A** of oil seal **26** and lip **B**, then press-fit the oil seal into body **27**, using jig **C** (ring-type plate).
- Press-fit oil seal **26** so that the press-fitting amount from seat surface **D** is as illustrated.

CAUTION⚠

To prevent damage to the lapped surface of body 27 protect it with a soft cloth E.

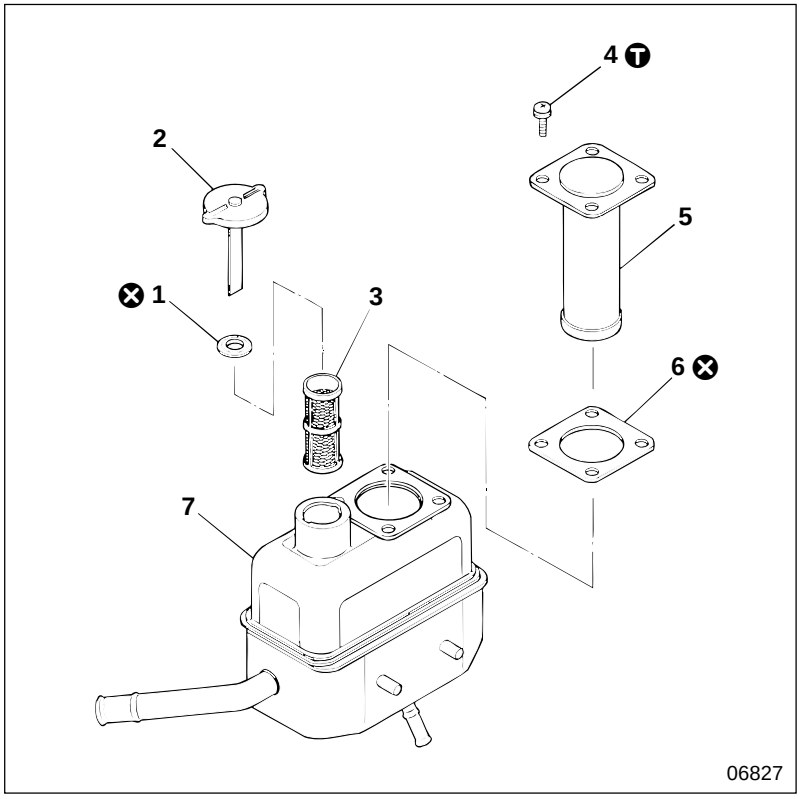
POWER STEERING OIL TANK



● **Disassembly sequence**

1 Packing
2 Filler cap
3 Strainer
4 Screw
5 Filter
6 Packing
7 Tank

⊗ : Non-reusable parts

● **Assembly sequence**

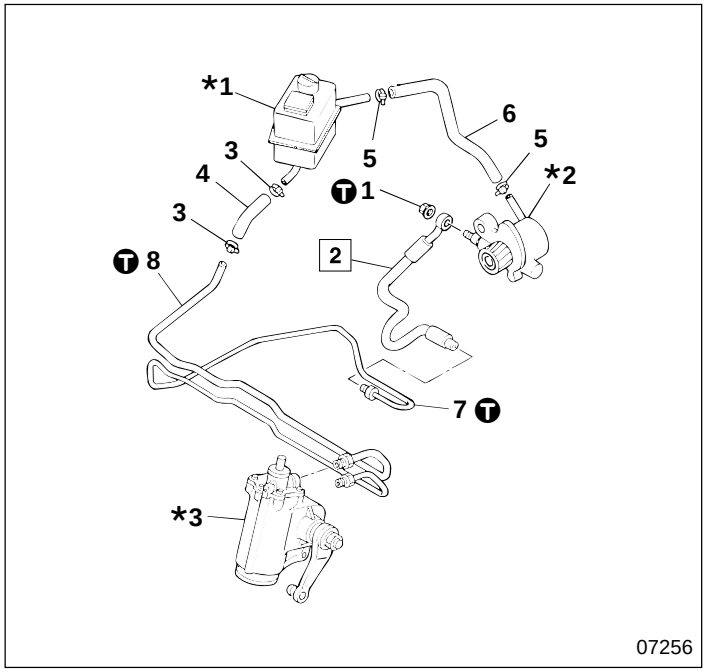
Follow the disassembly sequence in reverse.

T Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Screw (Filter mounting)	1.27±0.29 {0.94±0.22, 0.13±0.03}	—

https://truckmanualshub.com/



● **Removal sequence**

1 Nut
2 Pressure hose
3 Clamp
4 Rubber hose
5 Clamp
6 Rubber hose
7 Pressure tube
8 Return tube

***1** : Power steering oil tank
***2** : Power steering oil pump
***3** : Power steering booster

● **Installation sequence**

Follow the removal sequence in reverse.

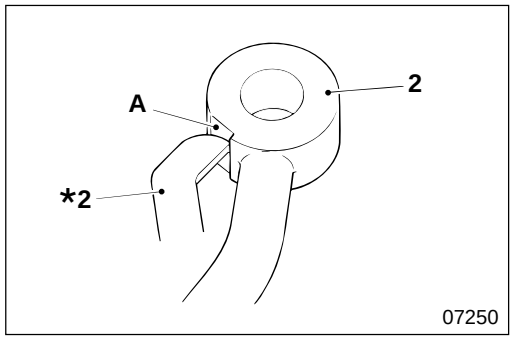
CAUTION⚠

Be sure to bleed air if the fluid line was removed, failure to do so would cause the power steering to malfunction. 🕮 P37-12

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Pressure hose mounting)	29 to 39 {22 to 2.9, 3 to 4}	—
7	Pressure tube (Pressure hose and power steering booster connection)	29 to 39 {22 to 29, 3 to 4}	—
8	Return tube (Power steering booster connection)	39 to 49 {29 to 36, 4 to 5}	—



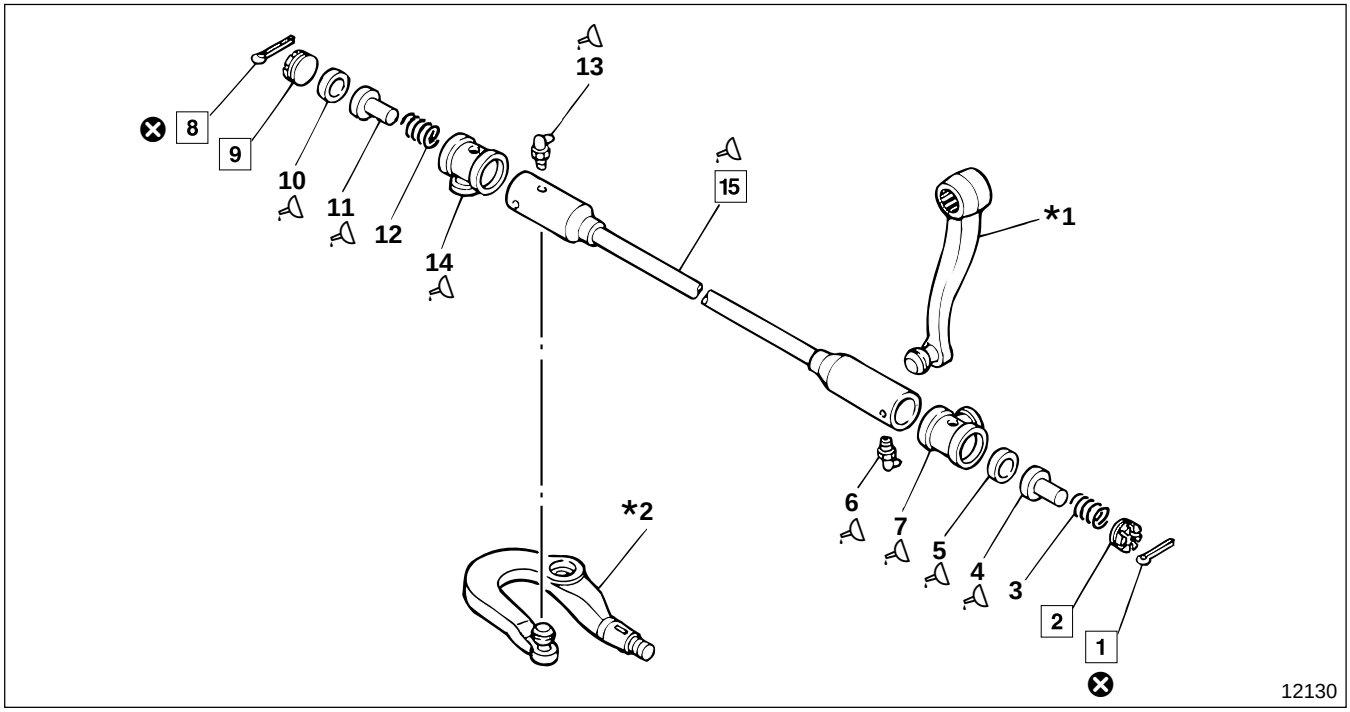
◆ Service procedure

2 **Installation of pressure hose**

Install pressure hose **2** so indent **A** of pressure hose **2** contacts the suction connector of power steering oil pump ***2**.

https://truckmanualshub.com/

DRAG LINK



● **Disassembly sequence**

1 Split pin
2 End plug
3 Spring
4 Ball stud seat
5 Ball stud seat
6 Grease nipple
7 Dust cover
8 Split pin
9 End plug
10 Ball stud seat
11 Ball stud seat

13 Grease nipple
14 Dust cover
15 Drag link

***1** : Pitman arm
📖 P37-22
***2** : Knuckle arm
Gr 26
⊗ : Non-reusable parts

● **Assembly sequence**

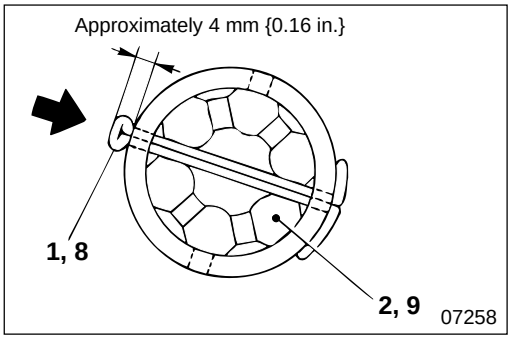
Follow the disassembly sequence in reverse.

Lubricant

Location	Points of application	Kinds	Quantity
4, 5, 10, 11	Whole area of ball stud seat	Chassis grease [NLGI No.1 (Ca soap)]	As required
6, 13	Supply via grease nipple	Chassis grease [NLGI No.1 (Ca soap)]	As required
7, 14	Arm mounting port of dust cover	Chassis grease [NLGI No.1 (Ca soap)]	As required
15	Pack interior of drag link	Chassis grease [NLGI No.1 (Ca soap)]	As required

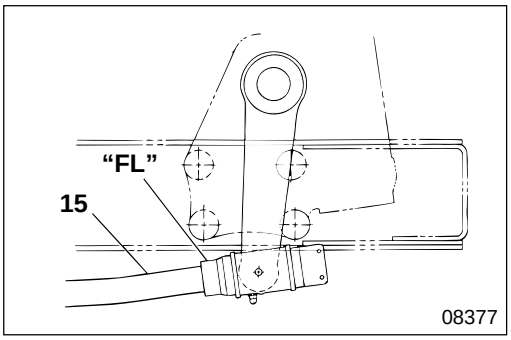
https://truckmanualshub.com/

◆ Service procedure



1 **2** **8** **9** **Installation of split pin and end plug**

- Tighten end plug **2, 9** fully, then slacken it off by one half of a turn.
- Place split pins **1**, **8** so that the heads face the outside of the vehicle.
- Caulk the heads of split pins **1**, **8** until they are approximately 4 mm {0.16 in.} thick.

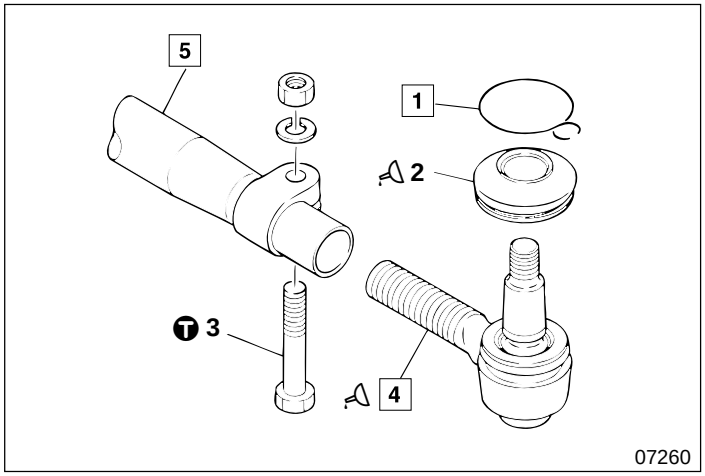


15 **Installation of drag link**

Install drag link **15** with front mark **"FL"** facing the front of the vehicle.

https://truckmanualshub.com/

TIE ROD ASSEMBLY



● **Disassembly sequence**

1 Clip
2 Dust cover
3 Clamp bolt
4 Tie rod end
5 Tie rod

NOTE

Do not remove clip 1 or dust cover 2 unless they are faulty.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
5	Bend of tie rod	1 {0.039} or less	1 {0.039}	Replace

Tightening torque

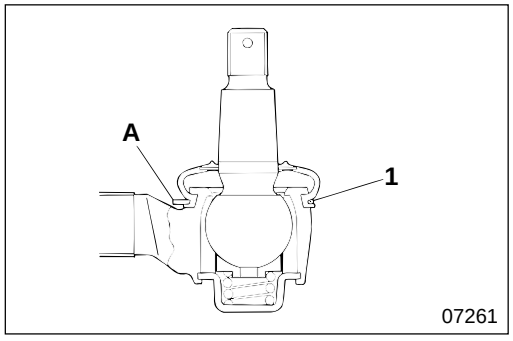
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Clamp bolt (Tie rod end clamp tightening)	25±5 {18±3.6, 2.5±0.5}	—

Lubricant

Location	Points of application	Kinds	Quantity
2	Lip area of dust cover	Wheel bearing grease [NLGI No.2 Li soap]	As required
4	Pack interior of dust cover of tie rod end	Wheel bearing grease [NLGI No.2 Li soap]	As required

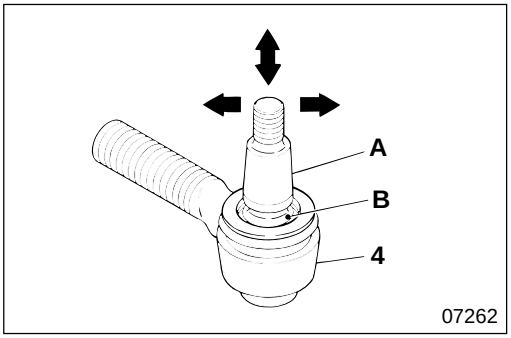
◆ Service procedure



1 **Installation of clip**

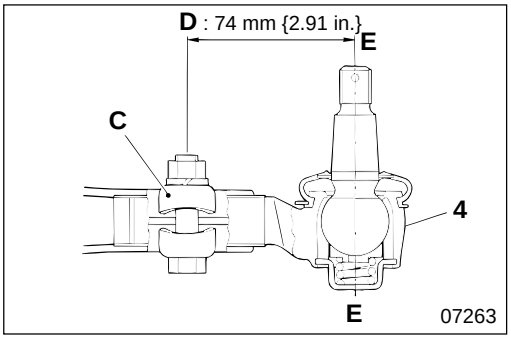
Install clip **1** with alignment port **A** in the direction as illustrated.

https://truckmanualshub.com/



4 **Tie rod end**

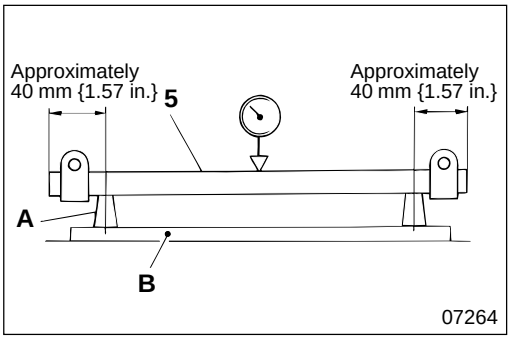
[Inspection]
Move ball stud area **A** vertically and horizontally to inspect for looseness. Ensure that ball **B** rotates evenly.



[Installation]
- Screw in tie rod end **4** so that dimension **D** of the tie rod end and clamp **C** differs by 1.5 mm {0.059 in.} or less between left and right.
- Secure axis **E – E** so that it is parallel both left and right.

NOTE

Deviation of the left and right screw-in amount of tie rod end 4 should be within one turn.



5 **Bending of tie rod**

Measure the bend of tie rod **5** at the center point. If the measured value exceeds the limit, correct or replace the tie rod.

NOTE

To measure the deflection of tie rod 5, turn it one full rotation and read the dial gauge indicator. The deflection is one half of the indicated value.

A : V-block
B : Surface plate

—	Bolt (⇦ area bolt : M12×1.25)	98 to 120 {72 to 87, 10 to 12}	—

◆ Service procedure

● Cleaning of frame

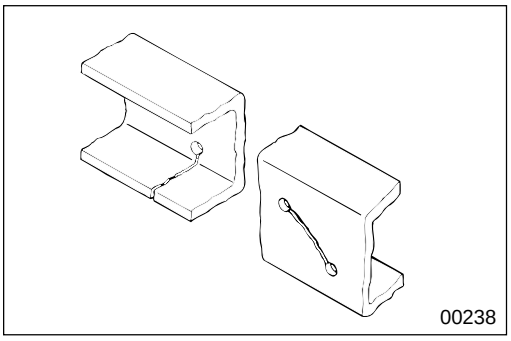
Carefully remove mud, grease, rust, etc. that is stuck to the outer and inner surfaces of the frame.

● Inspection for frame deformation

If any fault such as deformation is found, repair the frame.

● Inspection for cracks in frame

- Remove paint from any areas that are seemingly faulty and carefully inspect.
- If visual inspection is difficult, inspect using color contrast penetrant examination or other methods.
  If a crack is found, repair as follows.

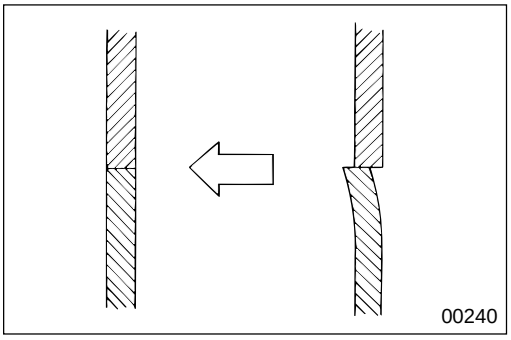


● Repair of crack in frame

- With the vehicle unloaded, level the frame.
- Drill a hole, about twice the thickness of the frame, 10 mm {0.39 in.} from the end of the crack.

NOTE

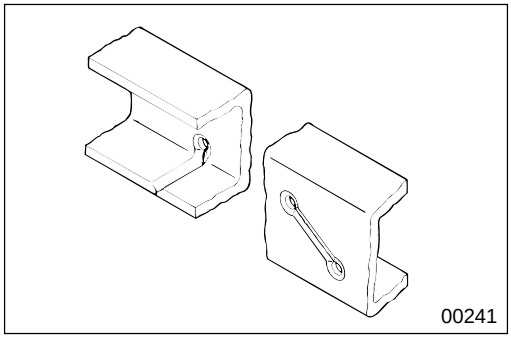
If a crack is found inside the frame, drill holes at both ends of the crack.

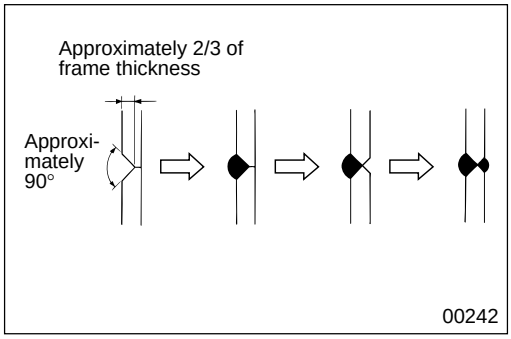


- If the edges of the crack are not flush, make them flush with each other.

https://truckmanualshub.com/

INSPECTION AND REPAIR OF FRAMES





- Using a grinder, etc., grind a 90° V-section channel, two-thirds of the frame thickness, then weld.

WARNING

You must cover any inflammable materials, such as pipelines, wiring harnesses, rubber parts, and the fuel tank, that are near the welding site.

CAUTION

- **Do not use gas welding because the high temperature produced alters the material properties and weakens the welded area. Be sure, therefore, to use electric welding.**
- **Be sure to remove the negative terminal of the battery, then ground the welder near the area to be welded to prevent reversed flow of current from the welder which might burn out electrical components.**
- **Be sure to protect mountings such as main sills that can be damaged by heat, by using heat insulators, etc.**

NOTE

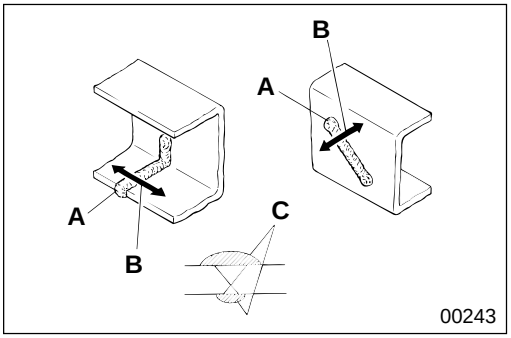
- **Use low-hydrogen type coated CO_2 and arc welding electrodes for welding to prevent harmful defects such as undercutting, blow holes, etc.**
- **Preheat the area to be welded to approximately 50 to 350°C {122 to 662°F} before welding when the workshop temperature is below 0°C {32°F}.**

- Next, grind a V-section channel, as described above, on the opposite side of the weld and weld. At the same time, fill the holes at both ends of the crack by welding.

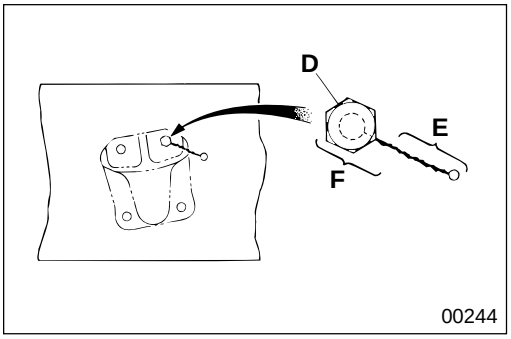
NOTE

In cold districts, heat the welded area to approximately 200°C {392°F} after welding.

https://truckmanualshub.com/

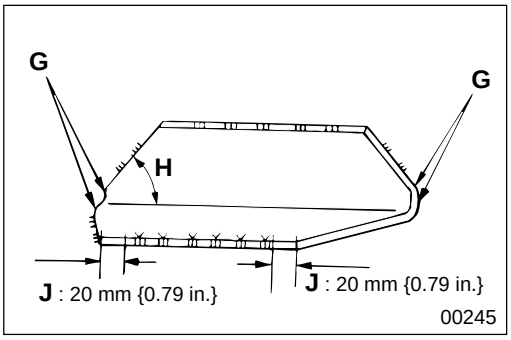


- After welding, grind bead **A** at right angles **B** to remove shaded area **C** as illustrated and grind the area flat.
- Finish the surface so that the frame thickness is identical to the original thickness.



[Repairing cracks caused by rivets or bolt holes]

- To make the edges of the holes flush at the cracked area, temporarily tighten bolt **D** in the hole.
- Weld cracked point **E** at least 20 mm {0.79 in.} from the center of the bolt.
  For welding method refer to the above-mentioned procedures for repairing cracks. P41-3.
- After removing the bolt and making the edges flush, weld remaining area **F** and fill the hole.
- After drilling a hole in the filled area, install a rivet or bolt.

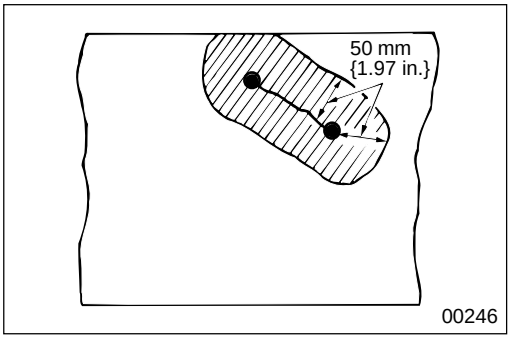


[Repairing using reinforcement plate]

- To prevent concentrated stress being produced at ends **G** of the reinforcement plate, weld the plate with angle **H** at both ends opened 30° or less.
  Do not weld area **J**.
- The reinforcement plate must have enough strength for the cracked area.

NOTE

- **Thickness of reinforcement plate : same as frame thickness**
- **Reinforcement plate material : SAPH440 (hot-rolled sheet steel for automobiles), SS400 (sheet steel for general construction), or equivalent strength.**



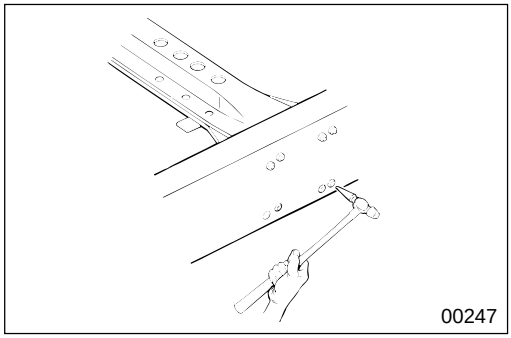
- After welding, heat the shaded area to 600 to 700°C {1112 to 1292°F}.

CAUTION

Be sure to protect mountings such as main sills that can be damaged by heat, by using heat insulators, etc.

https://truckmanualshub.com/

INSPECTION AND REPAIR OF FRAMES

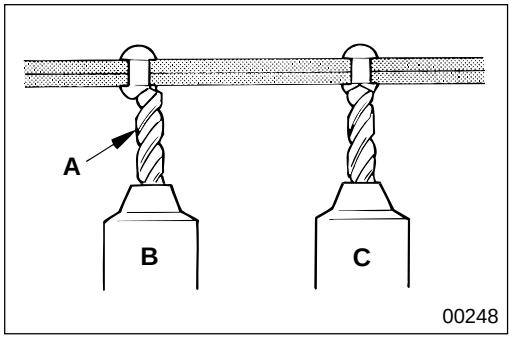


● **Inspection for loose rivets**

- Gently tap the rivet head using an inspection hammer and judge the condition by checking the vibration using the tip of your finger, or by listening to the sound.
- Rust between rivet and frame indicates that the rivet is loose.

CAUTION⚠

Be sure to replace loose rivets because they can break or cause cracking of the frame in the area around the rivet hole, causing accidents.

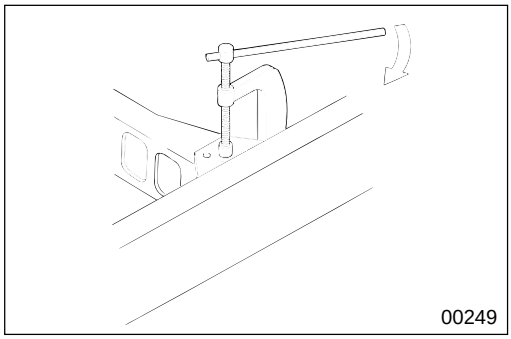


● **Repair of rivet**

- When removing rivets, use a center punch to make an indent in the center of the rivet head; then, drill out using drill **A** or grind.
  B : Incorrect
  C : Correct

CAUTION⚠

Make sure that you do not damage the rivet hole.



- When rivetting, first clamp both plates tightly near the rivet hole using a clamp to eliminate gaps between plates.

- Using a rivetting machine, insert the rivet (cold rivet).
- If rivetting is impossible, ream the rivet hole, drive in a reamer bolt, fully tightening the nut, then weld it in place.
  A flange bolt and flange nut should be used for the reamer bolt and nut.

● **Inspection for loose bolts and nuts**

- Inspect the mounting bolts in all areas for looseness. Loosened bolts should be tightened at specified torque. 🕮 P41-2

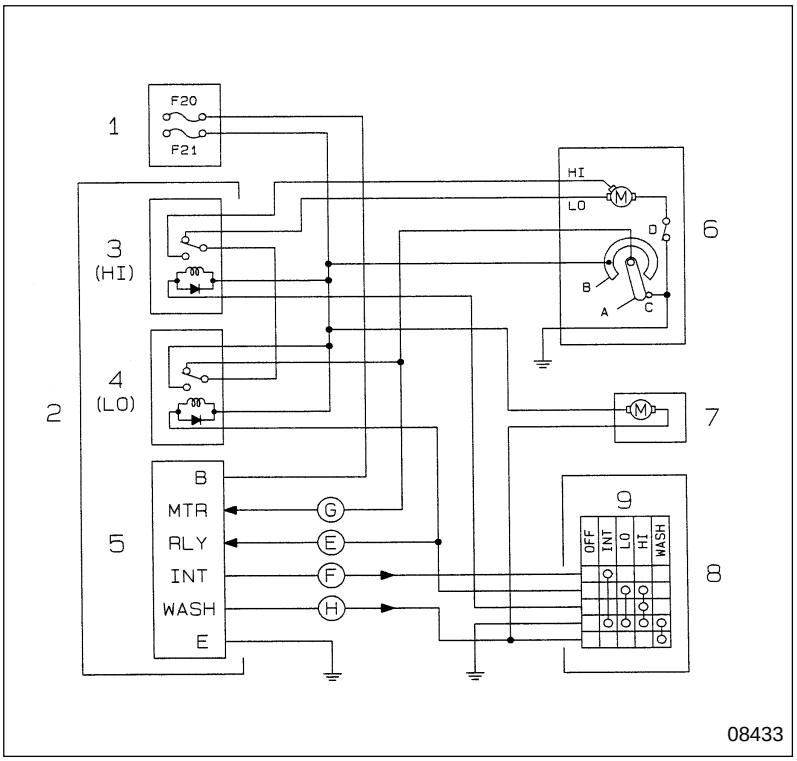
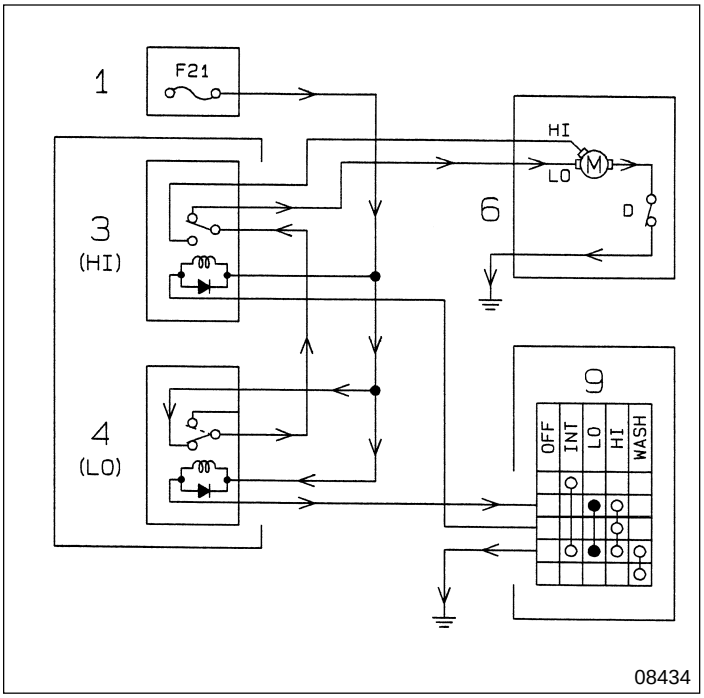
Wiper and Washer Electric Circuit



1 Fuse box
2 Relay box
3 Wiper relay (HIGH)
4 Wiper relay (LOW)
5 Multipurpose timing control unit
6 Wiper motor
7 Washer motor
8 Combination switch
9 Wiper and washer switch

Wiper motor **6** section
A : Cam
B : Plate
C : Contact point
D : Circuit breaker

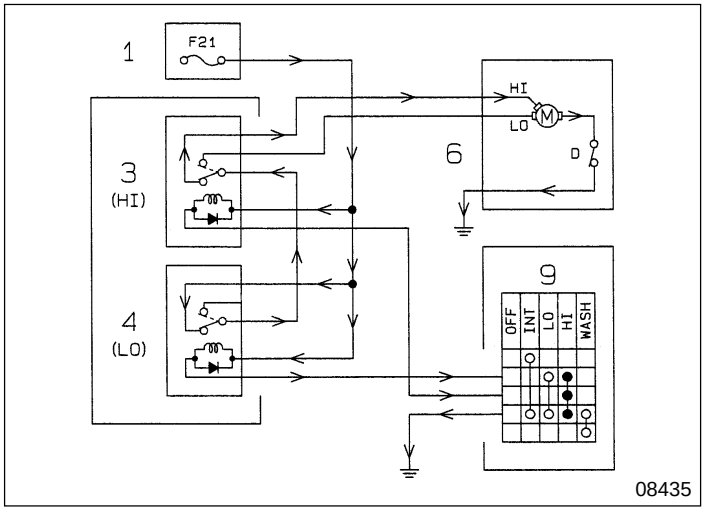
Ⓔ : Wiper motor driving signal (when wiper operating intermittently)
Ⓕ : Intermittent switch signal (when wiper operating intermittently)
Ⓖ : Cam signal (when wiper stops)
Ⓗ : Washer switch signal



When wiper operating at LOW speed

Position of wiper and washer switch **9** : LO
- **1** (F21) → **4** (coil) → **9** (LO) → Ground
- **1** (F21) → **4** (contact point) → **3** (contact point) → **6** (LO) → **6** (D) → Ground
  Wiper motor **6** rotates at low speed.

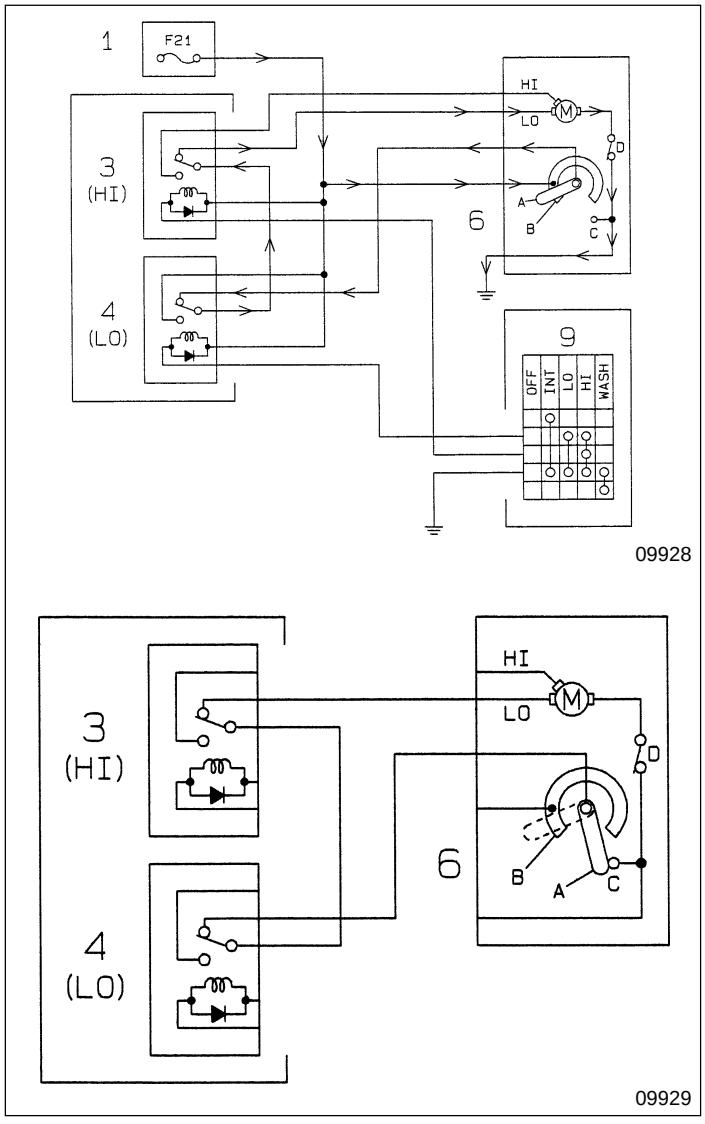
https://truckmanualshub.com/



When wiper operating at HIGH speed

Position of wiper and washer switch **9** : HI

- **1** (F21) → **3** (coil) → **9** (HI) → Ground
  → **4** (coil) → **6** (HI) → **6** (D) → Ground
  Wiper motor **6** rotates at high speed.



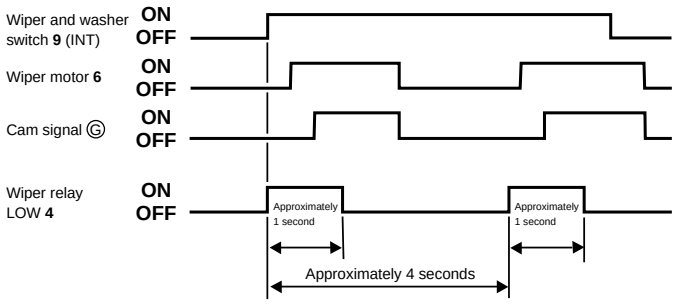
When wiper stops

Position of wiper and washer switch **9** : OFF

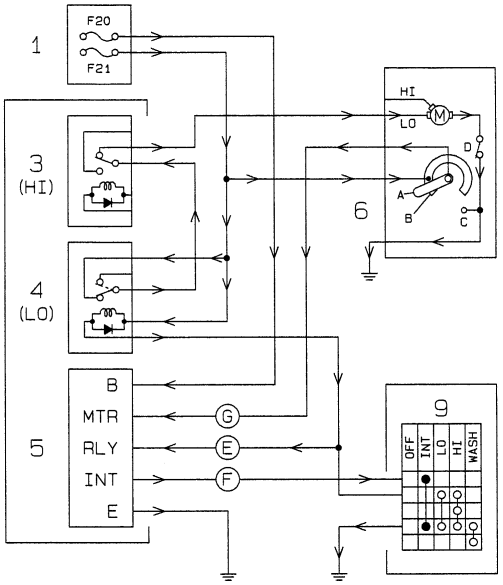
- **1** (F21) → **6** (B) → **6** (A) → **4** (contact point) → **3** (contact point) → **6** (LO) → **6** (D) → Ground
  Wiper motor **6** continues to rotate at low speed.

- When cam **A** is separated from plate **B** by rotation of wiper motor **6**, the current to the motor is cut off.
- Wiper motor **6** continues to rotate due to the inertia force of the motor and the wiper link.
- When cam **A** of wiper motor **6** makes contact with contact point **C**, the following ungrounded circuit is formed.
  → **6** (LO) → **6** (D) → **6** (C) → **3** (contact point) ← **4** (contact point) ← **6** (A) ←
- Wiper motor **6** stops by dynamic (electric) braking because of this circuit.

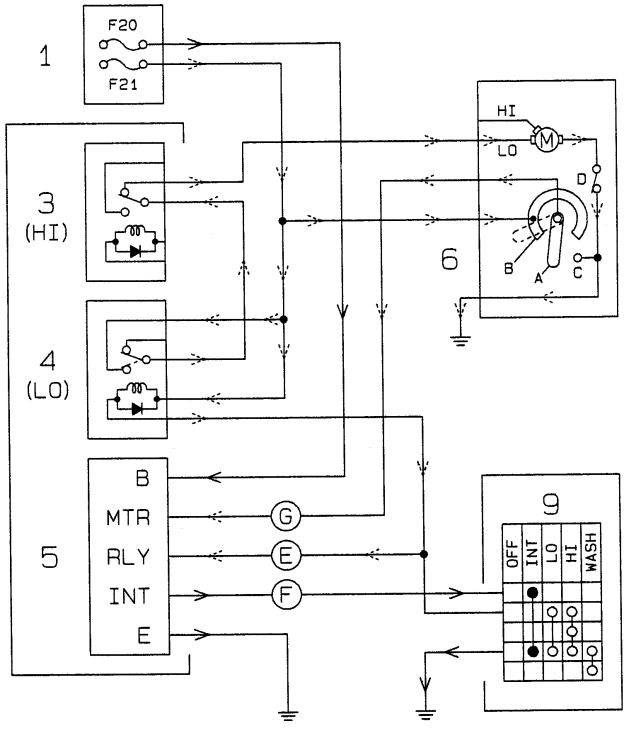
https://truckmanualshub.com/



08654



09931



09932

When wiper operating intermittently

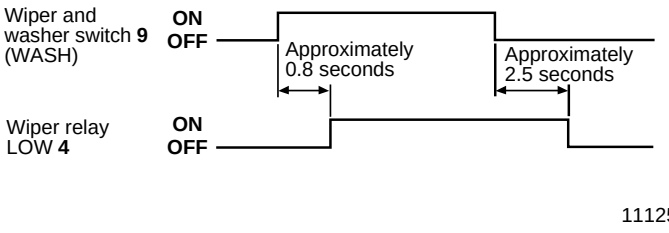
Operation mode with multipurpose timing control unit **5**

Position of wiper and washer switch **9** : INT

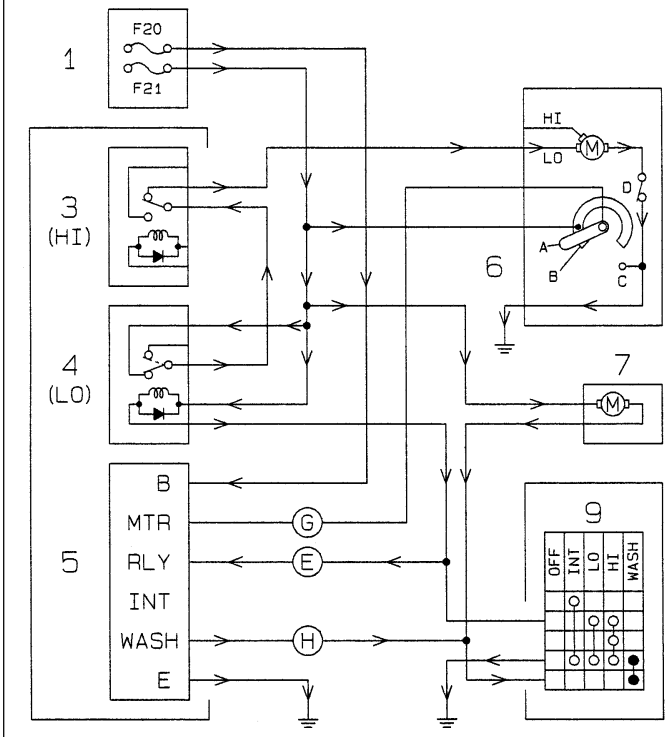
- **1** (F20) → **5** (B) → Ground
- **5** (INT) —Ⓕ→ **9** (INT) → Ground
- Multipurpose timing control unit **5** sends wiper motor driving signal Ⓔ when it receives intermittent switch signal Ⓕ.
  1 (F21) → **4** (coil) —Ⓔ→ 5 (RLY)
- **1** (F21) → **4** (contact point) → **3** (contact point) → **6** (LO) → **6** (D) → Ground
  Wiper motor **6** rotates at low speed.
- Multipurpose timing control unit **5** sends wiper motor driving signal Ⓔ, then sends cam signal Ⓖ.
  1 (F21) → **6** (B) → **6** (A) –Ⓖ→ **5** (MTR)

- When cam **A** of wiper motor **6** is separated from plate **B**, cam signal Ⓖ turns OFF.
- When cam signal Ⓖ is turned OFF, multipurpose timing control unit **5** turns wiper motor driving signal Ⓔ OFF for specified time.
  The illustrated part ⊣ of the circuit turns OFF.
- Wiper motor **6** stops. 🕮 Gr 42-8
- After specified time has passed, multipurpose timing control unit **5** sends wiper motor driving signal Ⓔ again.
- Wiper motor **6** rotates at low speed.

https://truckmanualshub.com/



11125



11126

When washer operating

Operation mode with multipurpose timing control unit **5**

Position of wiper and washer switch **9** : WASH

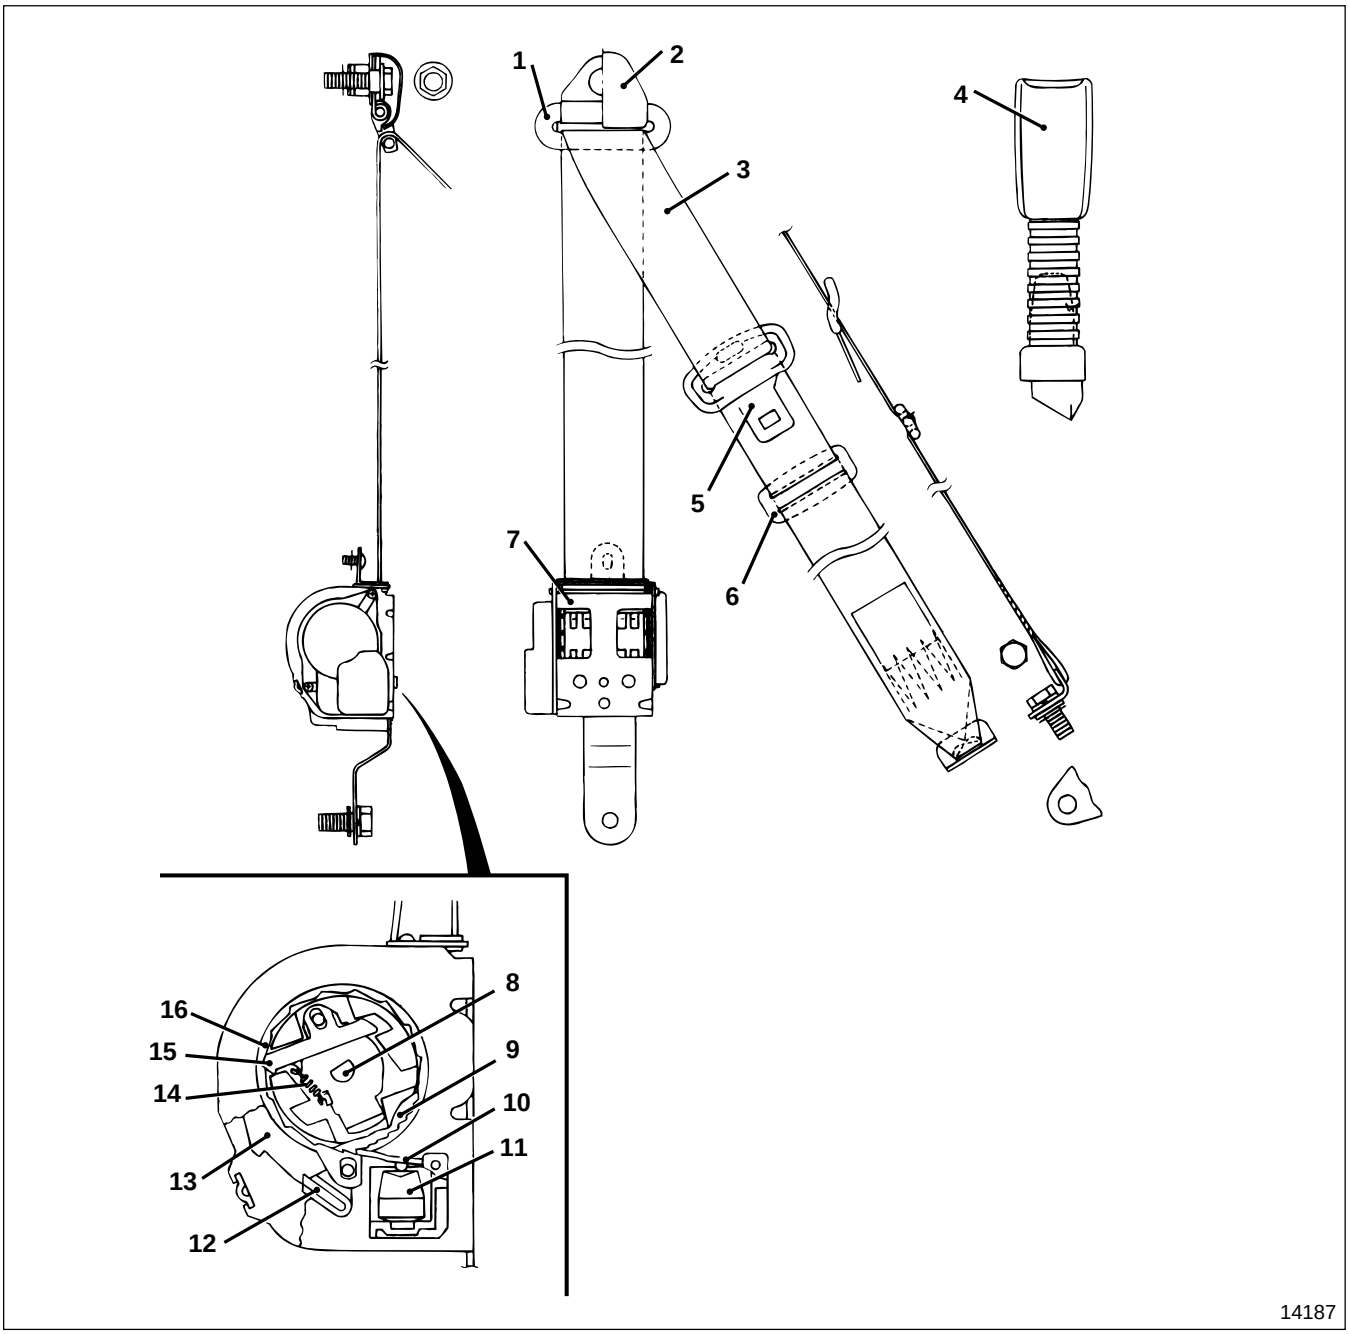
- **1** (F20) → **5** (B) → Ground
- **1** (F21) → **7** → **9** → Ground
  5 (WASH) - Ⓗ

When washer motor **7** operates to spray washer fluid, multipurpose timing control unit **5** transmits washer switch signal Ⓗ.

- 1 (F21) → **4** (coil) —Ⓔ→ **5** (RLY)
  Washer switch signal Ⓗ makes multipurpose timing control unit **5** input wiper motor drive signal Ⓔ.
- 1 (F21) → **4** (contact point) → **3** (contact point) → **6** (LO) → **6** (D) → Ground
  Wiper motor **6** operates at LOW speed.
- When wiper and washer switch **9** is turned to OFF, washer motor **7** stops.
- Then, washer switch signal Ⓗ is turned off and multipurpose timing control unit **5** turns off wiper motor drive signal Ⓔ after specified time.
- Wiper motor **6** automatically stops.
  P42-8

https://truckmanualshub.com/

Emergency Locking Retractor (ELR) Type Seat Belt

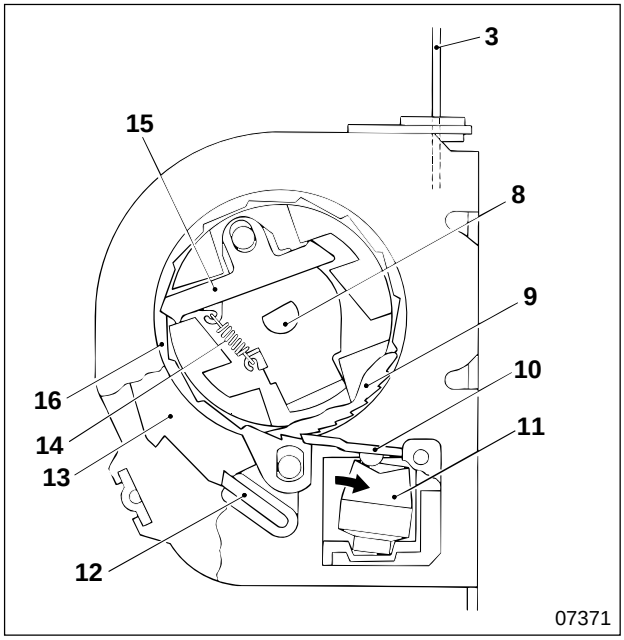


1 Sash guide
2 Cover
3 Webbing
4 Buckle assembly
5 Tongue plate
6 Tongue stopper
7 Emergency locking retractor assembly
8 Spindle
9 Locking gear
10 Mechanism lever
11 Mechanism weight
12 Pawl
13 Ratchet gear
14 Sensor spring
15 Lock arm
16 Clutch

CAUTION⚠

Do not disassemble emergency locking retractor assembly 7, or malfunctions might occur.

https://truckmanualshub.com/



Webbing detecting lock

- When the vehicle is subjected to a sudden impact, such as a crash, webbing **3** retracts according to the movement of passengers, and spindle **8** rotates.
- As the rotation of spindle **8** is higher than the specified value, the repercussive force of sensor spring **14** can no longer retain lock arm **15**. Then, the arm is pulled out from the specified position and is locked by clutch **16**.
- If spindle **8** further rotates, clutch **16** lifts pawl **12** to lock with ratchet gear **13**, making spindle rotation impossible.

Body detecting lock

- When the body is tilted excessively, mechanism weight **11** is tilted, engaging mechanism lever **10** with locking gear **9**, locking it.
- If spindle **8** further rotates, clutch **16** operates as described above, and the spindle cannot rotate.

https://truckmanualshub.com/

Cab as a Whole

Possible causes \ Symptoms		Cab shimmy (pitching and rolling vibration)	Cab or steering wheel high-frequency vibration (above 20 Hz) or noise	Cab cannot be tilted up	Cab cannot be locked to rear mounting post	Cab tilt warning lamp does not light	Cab tilt warning lamp does not go out	Remarks
Cab-related	Cab mounting loose or play	○						
	Front rubber, rear rubber deteriorated		○					
	Cab mounted incorrectly		○					
	Link assembly from anchor hook does not release			○				
	L-lever release faulty			○				
	Torsion bar damaged or fatigued			○				
	Torsion bar arm installation position incorrect			○				
	Link assembly not hooked to anchor hook				○

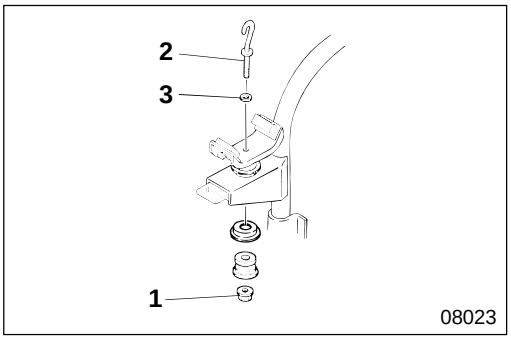
Adjustment of Cab Tilt

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Lock nut (Anchor hook mounting)	83 to 98 {61 to 72, 8.5 to 10.0}	—
4	Bolt (Lock handle mounting)	29 to 39 {22 to 29, 3.0 to 4.0}	—



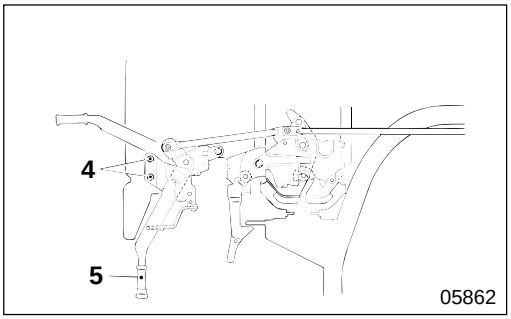
(1) Adjustment of lock handle operating force

Adjust the lock handle operating force by increasing or decreasing the number of spacers **3** as follows:

1 : Lock nut

2 : Anchor hook

	Number of spacers
Heavy operating force	Increased
Light operating force	Decreased



(2) Adjustment for unsmooth latch

If latch operation is not smooth, loosen bolt **4**, and adjust installation of lock handle **5**.

https://truckmanualshub.com/

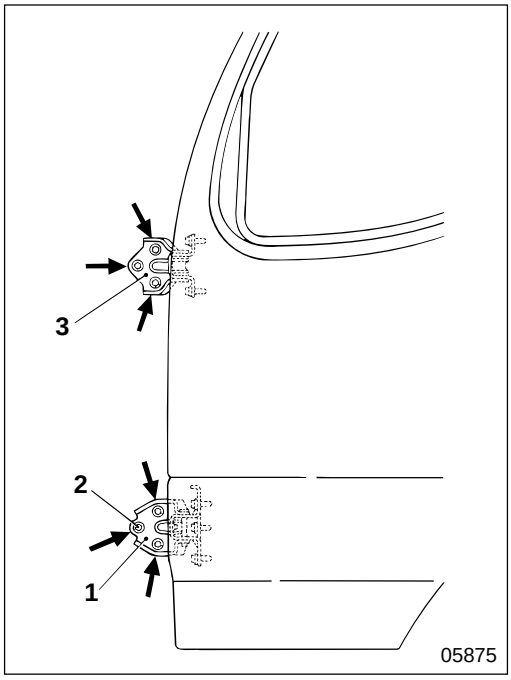
INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Adjustment of Door Fitting

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Bolt (Upper and lower hinge mounting)	17 to 25 {12 to 19, 1.7 to 2.6}	—
7	Screw (Striker mounting)	8.8 to 14 {6.5 to 10, 0.9 to 1.4}	—

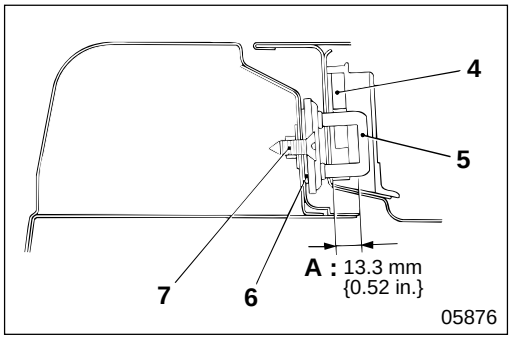


Adjust door fitting at hinge and striker.
(For door fitting dimensions: 🕮 P42-19.)

(1) Adjustment of hinge

For adjustment, use front-side bolt **2** of lower hinge **1** as the reference point.

3 : Upper hinge



(2) Adjustment of striker

Engagement condition between door lock latch **4** and striker **5** should be adjusted with shim **6** within illustrated range **A**.

7 : Screw

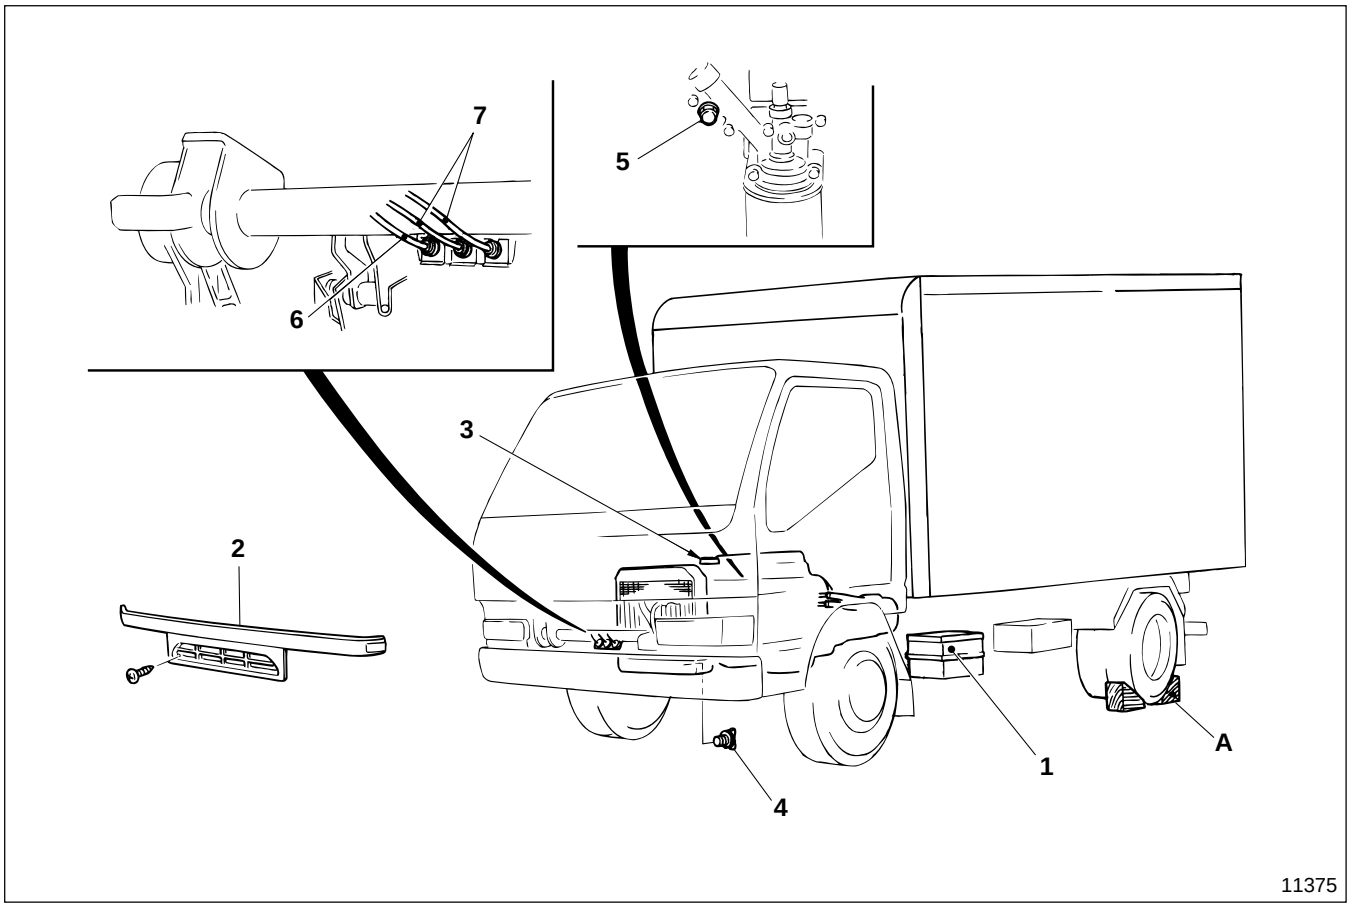
REMOVAL AND INSTALLATION OF CAB

Preliminary Work



● **Disassembly sequence**

1 Battery (negative terminal) Gr 54
2 Front grille P42-40
3 Pressure cap Gr 14
4 Radiator drain plug Gr 14
5 Crankcase drain plug Gr 14
6 Clutch fluid pipe
< Manual transmission > Gr 21
7 Brake fluid pipe Gr 35

A : Wheel chock

Work items

- Draining, filling, and air bleeding of clutch fluid and brake fluid Gr 21, Gr 35A
- Draining, filling, and air bleeding of coolant Gr14

WARNING

- **Put chocks A securely in place because the vehicle cannot be maintained at a standstill just by using the parking brake during removal and installation of the cab.**
- **Do not remove chocks A until the entire operation is completed.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

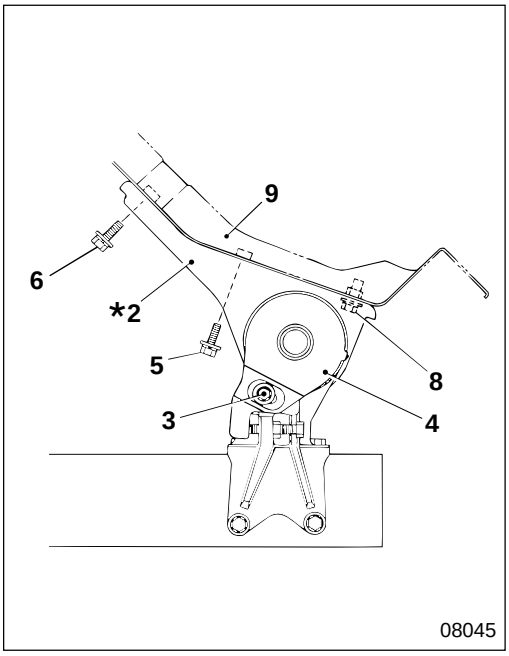
T Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Anchor lever adjusting bolt locking)	59 to 83 {43 to 60, 6 to 8.5}	—
3	Bolt (Anchor lever mounting)	34 to 54 {25 to 40, 3.5 to 5.5}	—
5, 6, 8	Bolt (Front floor cross member mounting)	70 to 95 {51 to 70, 7.1 to 9.7}	—
7	Bolt (Cab stay mounting)	19 to 27 {14 to 21, 1.9 to 2.8}	—

https://truckmanualshub.com/

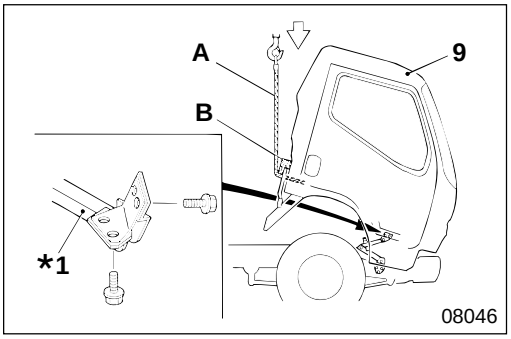
◆ Service procedure



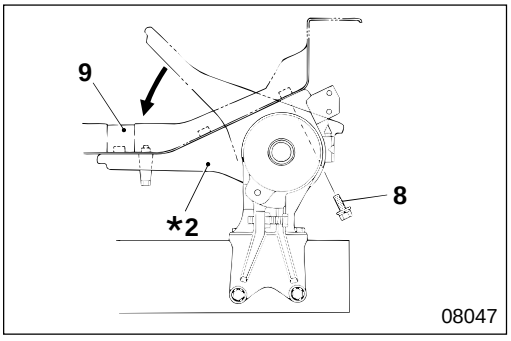
9 **Cab assembly**

[Removal]

- Tilt cab assembly **9** and lock cab stay ***1** securely.
- Remove bolt **3**, and remove anchor lever **4**.
- Of the three bolts that retain front floor cross member ***2**, remove bolts **5**, **6** at rear side, leaving bolt **8** at front side.



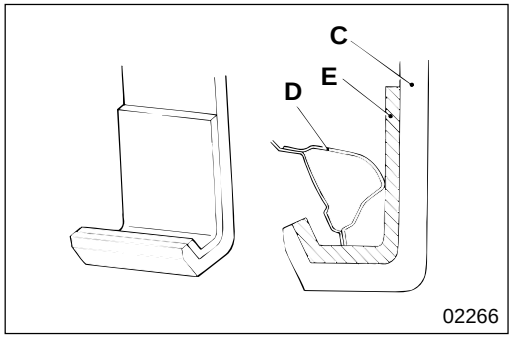
- To separate cab stay ***1** from cab assembly **9**, support the cab securely using crane **A** that is capable of lifting the cab.
  B : Use a wood block for protecting the rear of the cab
- Using crane **A**, lower cab assembly **9** until cab stay ***1** can be removed, then remove it.



- Fully lower cab assembly **9** to remove remaining bolt **8** that retains front floor cross member ***2**.

https://truckmanualshub.com/

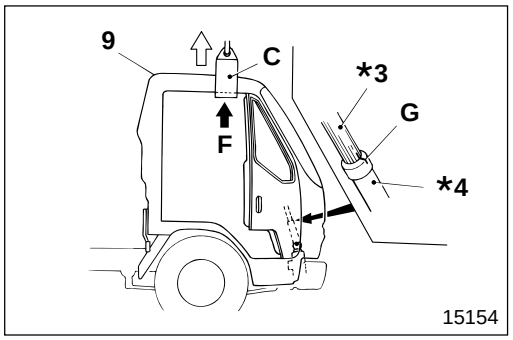
REMOVAL AND INSTALLATION OF CAB



- Set up hoist attachment **C** for the cab as illustrated.

CAUTION

- **Make sure when you set up hoist attachment C that it is capable of lifting cab assembly 9 which weighs approximately 390 kg {860 lb}.**
- **Make sure you install rubber E on hoist attachment C to prevent cab roof D being deformed when the cab is lifted.**



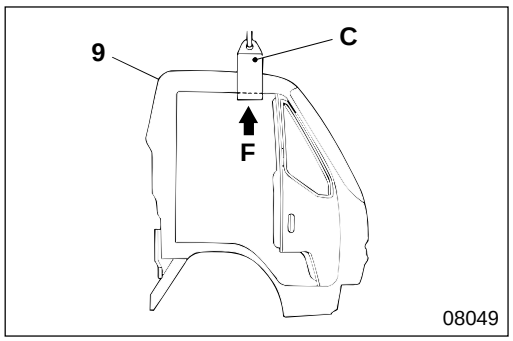
- Mount hoist attachment **C** at center-of-gravity point **F** of cab assembly **9**. Verify the position at which the cab can be lifted horizontally when the cab is lifted slightly.
- Slowly lift cab assembly **9** straight up, and finish lifting when steering yoke ***3** is pulled out from steering shaft ***4**. Make alignment mark **G** before the steering yoke is pulled out from the steering shaft.

WARNING

Never get under cab assembly 9 when it is being lifted.

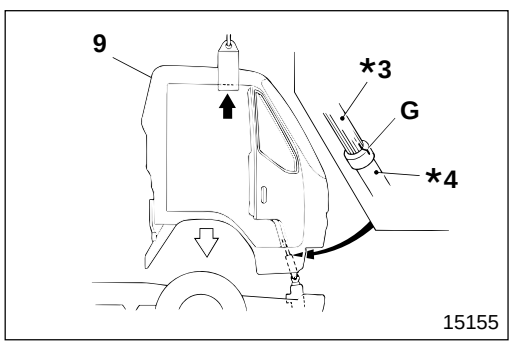
CAUTION

Make sure, when lifting cab assembly 9, that the wiring harness, cable, hoses, etc. are completely disconnected when the cab is lifted slightly.



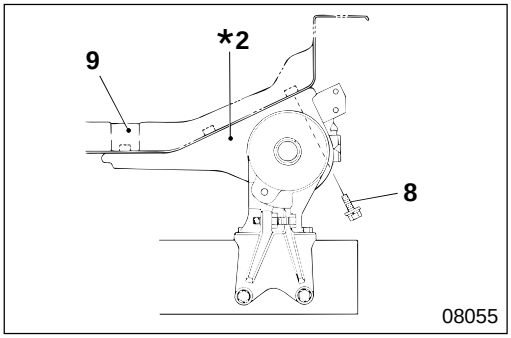
[Installation]

- Mount hoist attachment **C** at center-of-gravity point **F** of cab assembly **9**.

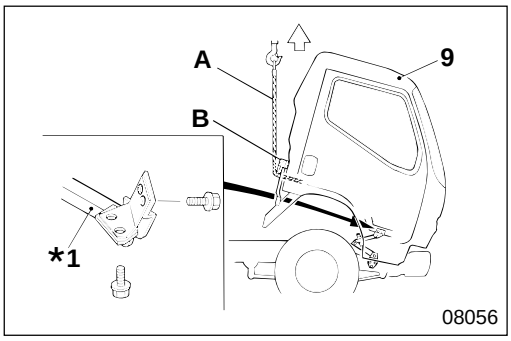


- Slowly lower cab assembly **9** horizontally to insert steering yoke ***3** into steering shaft ***4**, aligning alignment mark **G**.

https://truckmanualshub.com/



- Slowly lower cab assembly **9** further, and remove hoist attachment **C** after it comes down fully.
- Tighten front bolt **8**, one of the three bolts used for installing front floor cross member ***2**.

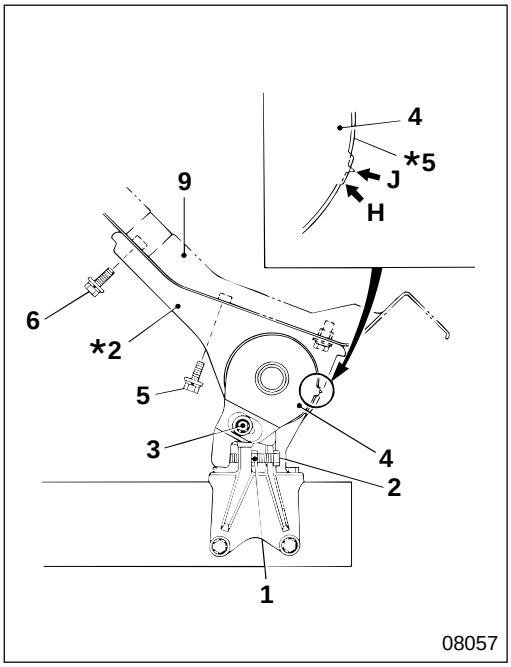


- Securely support cab on crane **A** to tilt cab assembly **9**.
  B : Use a wood block for protecting the rear of the cab
- Using crane **A** tilt cab assembly **9**, and install cab stay ***1**.

WARNING ⚠

You must pay close attention to the tilt angle when tilting cab assembly 9 using crane A. It is very dangerous to tilt the cab excessively because it will topple over.

- After installing cab stay ***1**, tilt cab assembly **9** slowly until it is completely tilted, securely lock cab stay, then detach the cab from crane **A**.



- Tilt cab assembly **9**, and securely lock cab stay ***1**.
- Tighten bolts **5**, **6** to install front floor cross member ***2**.
- Position and install pointer **J** of front cab mounting bracket ***5** in convex area **H** of anchor lever **4** and fix it with bolt **3**.
- Position bolt **2** on anchor lever **4** and lock it with nut **1**.
- After mounting cab assembly **9**, check and adjust the operating force required for the lock handle. 🕮 P42-17

13 Front rubber assembly, LH
14 Front cab mounting bracket, LH

⊗ : Non-reusable parts
* : Frame

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

Since the following parts are assembled at the time the cab is mounted, see removal and installation of cab (P42-24) for assembly procedure.
1 : Bolt (Connection of front floor cross member assembly and cab assembly)
2 : Bolt (Adjustment of anchor lever)
3 : Nut
4 : Bolt (Installation of anchor lever)
5 : Anchor lever

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

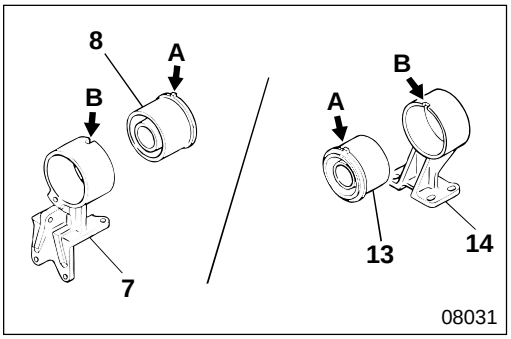
Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Front floor cross member assembly and cab assembly mounting)	70 to 95 {51 to 70, 7.1 to 9.7}	—
3	Nut (Lock of anchor lever adjustment bolt)	59 to 83 {43 to 61, 6 to 8.5}	—
4	Bolt (Anchor lever mounting)	34 to 54 {25 to 40, 3.5 to 5.5}	—
6	Bolt (Front cab mounting bracket mounting)	70 to 85 {51 to 63, 7.1 to 8.7}	—

https://truckmanualshub.com/

Lubricant

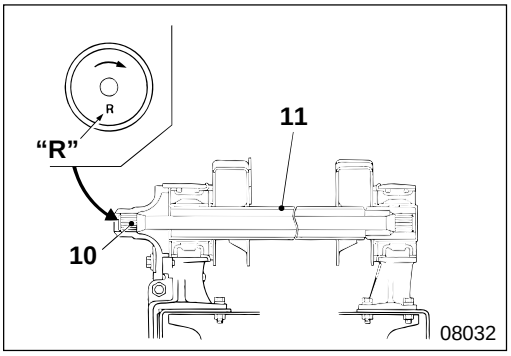
Location	Points of application	Kinds	Quantity
8, 13	Contact area between front rubber assemblies and front floor cross member assembly	Rubber grease	As required

◆ Service procedure



8 **13** **Installation of front rubber assembly**

Install front rubber assembly RH **8** and LH **13** fitting protrusions **A** to the indents **B** of mounting bracket RH **7** and LH **14** respectively.

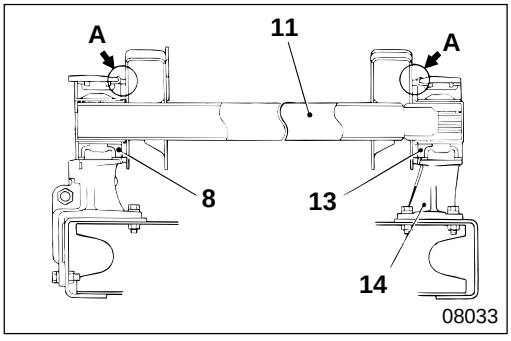


10 **Installation of torsion bar**

Install torsion bar **10** to front floor cross member assembly **11** in the direction as illustrated.

CAUTION⚠

Be sure not to mistake the left side for the right side, when installing torsion bar 10, because the torsion bar will be damaged if its torsion direction is reversed.



11 **Installation of front floor cross member assembly**

Install front floor cross member assembly **11**, adjusting front cab mounting bracket LH **14** so there is no gap between the front floor cross member assembly and front rubber assembly RH **8** and LH **13** at points **A**.

https://truckmanualshub.com/

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Lock handle assembly mounting)	29 to 39 {22 to 29, 3 to 4}	—
5	Bolt (Link assembly, LH mounting)	29 to 39 {22 to 29, 3 to 4}	—
7	Bolt (L-lever assembly mounting)	29 to 39 {22 to 29, 3 to 4}	—
9	Bolt (Link assembly, RH mounting)	29 to 39 {22 to 29, 3 to 4}	—

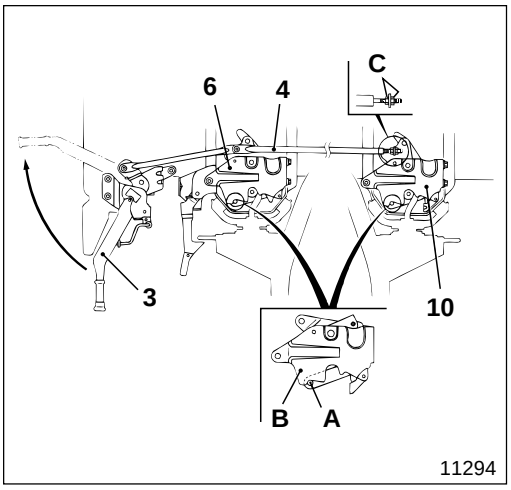
Lubricant

Location	Points of application	Kinds	Quantity
4	Connecting area between center rod link assembly, LH and lock handle assembly	Wheel bearing grease [NLGI No2 (Li soap)]	As required

◆ Service procedure

● Inspection after assembly

Make sure that operating force for lock handle assembly **3** is correct. If it is too heavy or too light, adjust. P42-17



4 **Installation of center rod**

Adjust the length of center rod **4** using lock nut **C** to optimize locking and unlocking of rear cab mounting.

- Raise lock handle assembly **3** all the way, unlocking it.
- Turn and adjust lock nut **C** so that shafts **A** of link assembly LH **6** and RH **10** contact brackets **B**.

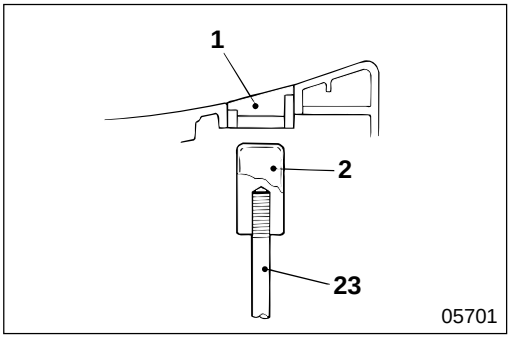
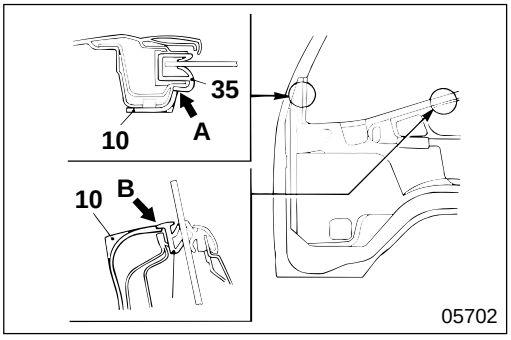
31, 32	Thread area of bolt	LOCTITE DRYLOCK No.203	As required
37	Friction part of regulator and rail assembly	DYNAMIC GB	As required
38	Door panel waterproof cover mounting surface	BUTYL TAPE	As required

◆ Service procedure



2 **Installation of door lock knob**

- Screw door lock knob **2** onto door lock rod **23** and turn to the right fully.
- Slacken off door lock knob **2** to the left by one or two turns.
- Install cover **1** to prevent door lock knob **2** from turning excessively.

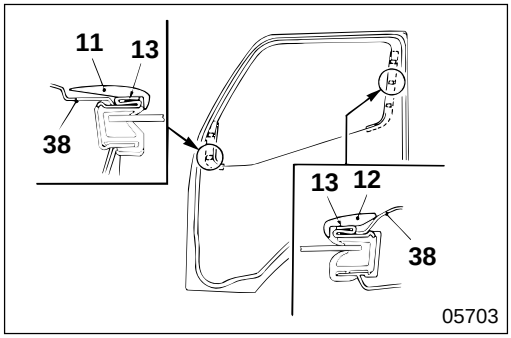


10 **Installation of door trim**

- At front pillar, tap door trim **10** against lip area **A** of run channel **35** .
- In belt line, insert door trim **10** into lip area **B** of inner weatherstrip **17** and install.

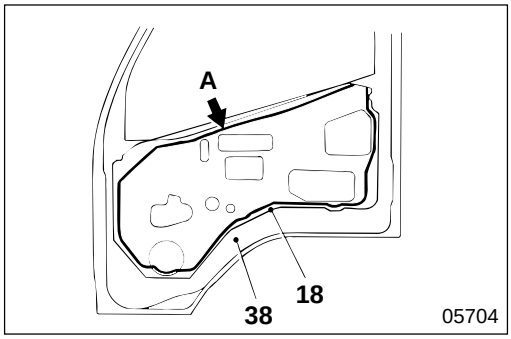
https://truckmanualshub.com/

DOOR



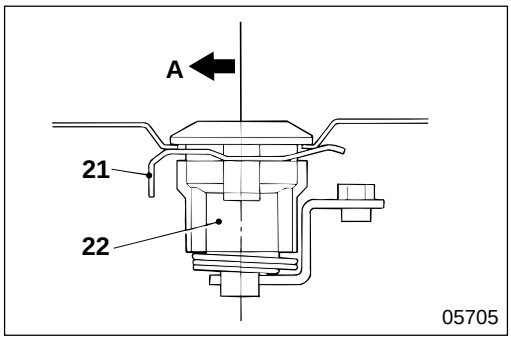
11 **12** **Installation of front garnish and rear garnish**

- Install clips **13** on door panel **38**.
- Install front garnish **11** and rear garnish **12** on clips **13**.



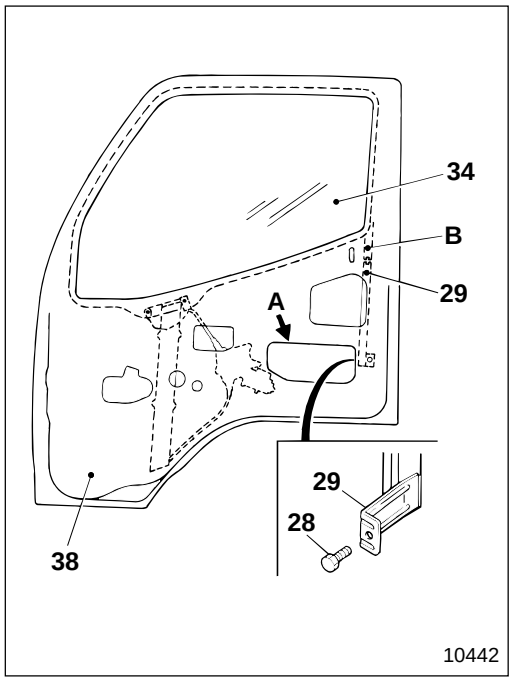
18 **Installation of waterproof cover**

- Apply butyl tape **A** to door panel **38** as illustrated.
- Stick waterproof cover **18** over butyl tape **A**.



22 **Installation of door lock cylinder**

21 : Clip
A : Front of the vehicle

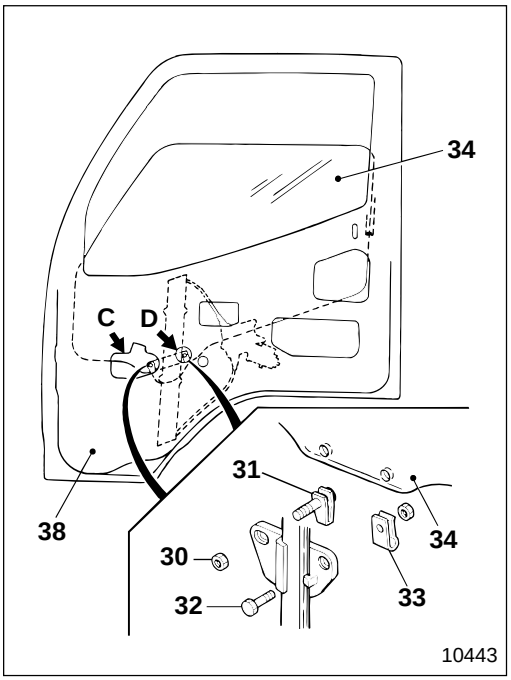


34 **Removal and installation of door glass**

Remove all parts supporting door glass **34** and remove the door glass from the door opening.

- Raise door glass **34** to the upper limit.
- Remove bolt **28** through hole **A** of door panel **38** to remove lower sash **29** which is inserted into upper sash **B**.

https://truckmanualshub.com/



- Lower door glass **34** to the level where nut **30** and bolt **32** can be seen through holes **C** and **D** of door panel **38** respectively.
- Hold door glass **34** with your hands and remove glass holders **31, 33**.
- Remove door glass **34** via the door opening.
- For installation, follow the removal sequence in reverse.

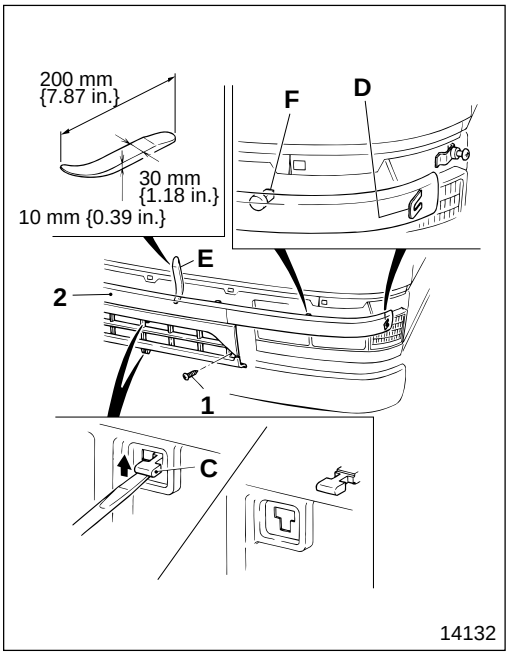
14	Nut (Hose joint connecting)	0.59 to 0.88 {0.43 to 0.65, 0.06 to 0.09}	—

https://truckmanualshub.com/

◆ Service procedure



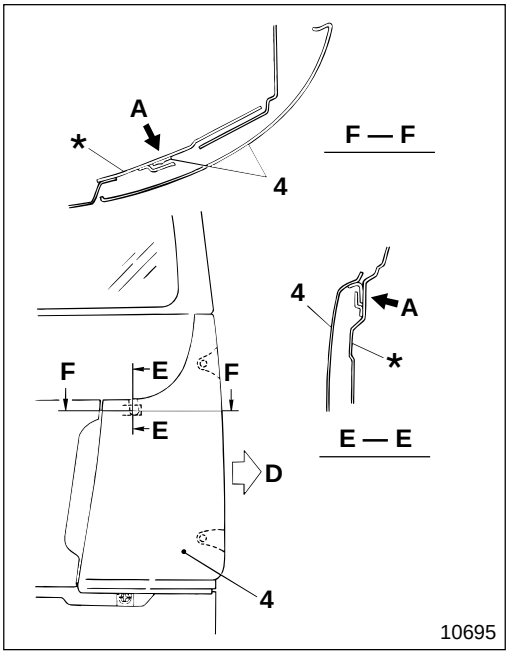
2 **Removal and installation of front grille**

- Remove screws **1** (two points) from front grilles **2**.
- Lift up the ends of clips **C** (two points), located in the center of front grilles **2**, using a screwdriver, and unlock them from the clips.
- Pull out front grilles **2** horizontally, in the vehicle forward running direction, to remove them.

CAUTION

- **Be careful not to apply too much force to front grilles 2, because this would damage them. Be especially careful to avoid applying force to clips D at both sides, support the clips using your hands. If it is hard to remove the front grilles, remove them using nylon jig E as illustrated.**
- **Be careful not to use force when you pull out clips F (five points) from the tops of front grilles 2, because this would damage them.**

- For installation, follow the removal sequence in reverse.



3 **4** **Installation and removal of front side panels RH, LH**

- Move front side panels RH **3**, LH **4** to the outside of the vehicle to remove them from the cab assembly ***.**

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
2	Wiping force of wiper arm	5.7±0.49 N {1.28±0.11 lbf, 0.58±0.05 kgf}	—	Replace

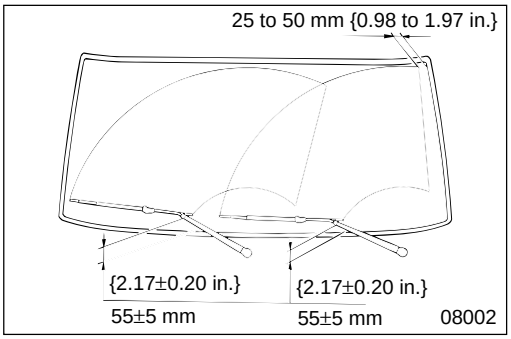
https://truckmanualshub.com/

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

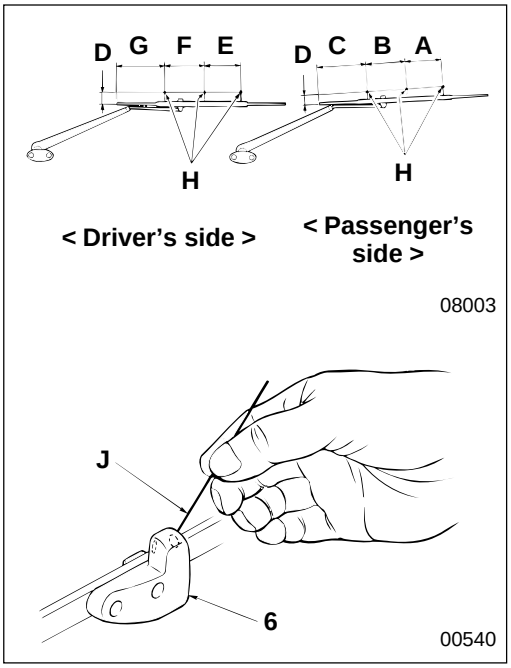
Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Wiper arm and blade assembly mounting)	9.8 to 15 {7.2 to 11, 1 to 1.5}	—
10	Nut (Packing washer mounting)	14 to 20 {10 to 14, 1.4 to 2}	—
12	Nut (Hose joint mounting)	0.6 to 0.9 {0.4 to 0.7, 0.06 to 0.09}	—
19	Nut (Wiper link mounting)	9.8 to 15 {7.2 to 11, 1 to 1.5}	—
23	Nut (Wiper motor and wiper link mounting)	1.7 to 2.4 {1.2 to 1.7, 0.17 to 0.24}	—
24, 25	Bolt (Wiper motor bracket mounting)	9.8 to 15 {7.2 to 11, 1 to 1.5}	—
27	Bolt (Wiper motor mounting)	5.4 {4, 0.55}	—

◆ Service procedure



2 **Installation of wiper arm and blade assembly**

Install wiper arm and blade assembly **2** so that dimensions from the edges of the weatherstrip are as illustrated.



6 **Inspection of washer nozzle assembly**

Make sure that washer fluid spreading target positions **H** are within dimensions **A** to **G**. (Illustration shows the view from inside cab.)

Unit : mm {in.}

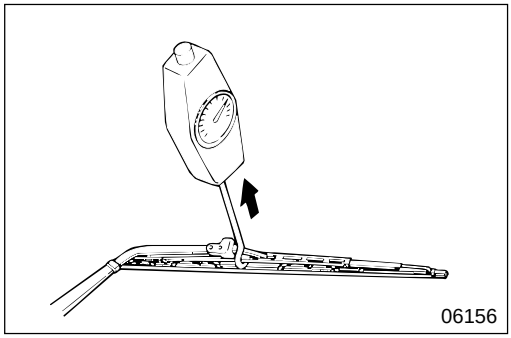
		H
Passenger's side	A	110 {4.33}
	B	90 {3.54}
	C	170 {6.69}
Driver's side	D	15 {0.59}
	E	90 {3.54}
	F	90 {3.54}
	G	160 {6.30}

If washer fluid spreading target positions **H** deviate from these dimensions, adjust the jet hole angle of washer nozzle assembly **6** using wire **J**.

CAUTION

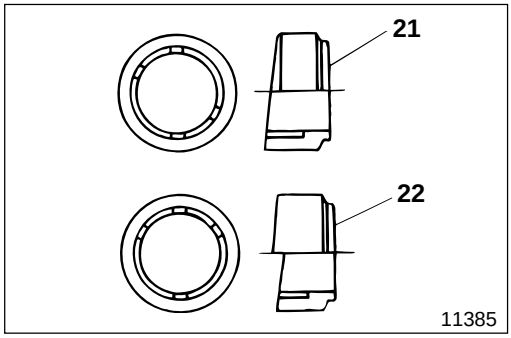
Be careful not to damage the jet hole of washer nozzle assembly 6 with wire J when adjusting the angle.

https://truckmanualshub.com/



8 **Inspection of wiper arm**

If the measured value deviates from the standard value, replace wiper arm **8**.



21 **22** **Packing washer**

Because the shape of packing washer **21** for the passenger's side and packing washer **22** for the driver's side are different, be careful not to mix them up during assembly.

https://truckmanualshub.com/

1 Weatherstrip
2 Windshield
3 Weatherstrip
4 Rear window glass

⊗ : Non-reusable parts

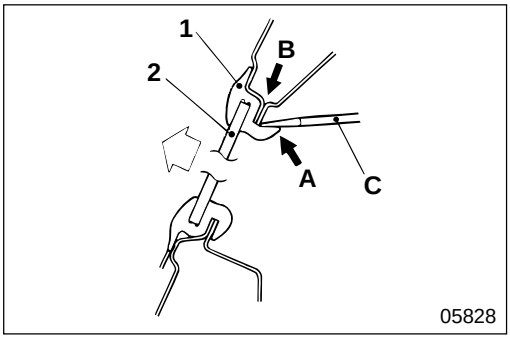
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Lubricant

Location	Points of application	Kinds	Quantity
1, 3	Lip area of weatherstrip	Soapy water	As required

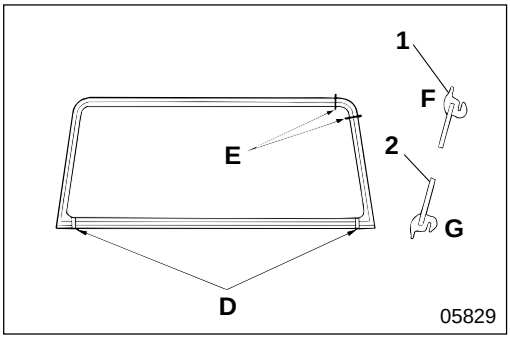
◆ Service procedure



1 **2** **Weatherstrip and windshield**

[Removal]

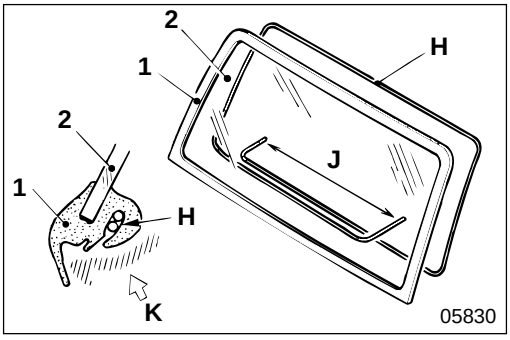
- From the inside of the cab, separate lip **A** of weatherstrip **1** from flange lip **B** of the cab.
  C : Screwdriver
- Push windshield **2** outward to remove it from the cab.



[Installation]

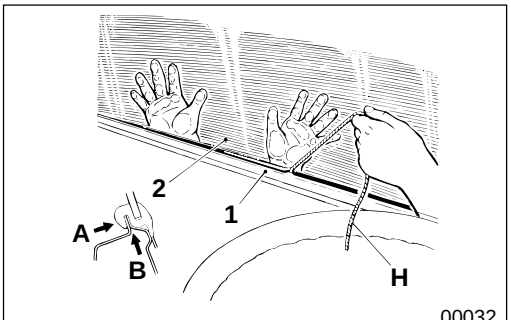
When installing the windshield, pull cord **H** attached to weatherstrip **1** and turn over lip **A**, following the procedure below:

- Position drain hole **D** and joint part **E** of weatherstrip **1** as illustrated and install them on windshield **2**.
  F : Outside
  G : Inside



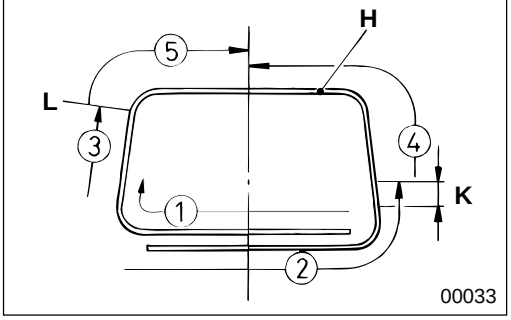
- Lay cord **H** in the cab mounting groove of weatherstrip **1** as illustrated, and overlap the cord at the lower side of the glass by the specified length, see **J**.
- Apply soapy water **K** to weatherstrip **1**.
- Align windshield **2** with the cab.

https://truckmanualshub.com/



00032

- Push windshield **2** inward from the outside of the cab firmly.
- Inside the cab, pull one end of cord **H** to install lip **A** of weatherstrip **1** into flange lip **B** of the cab.

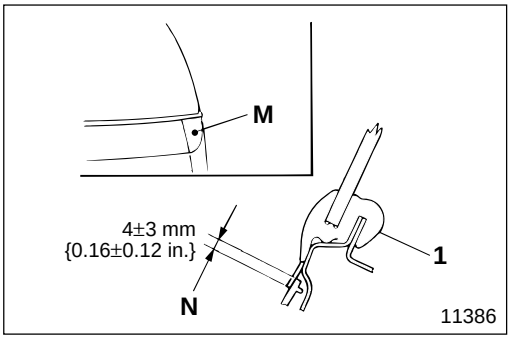


00033

- Pull cord **H** in the numbered order as illustrated and at the same time have someone push windshield **2** into weatherstrip **1**, tapping the windshield with a rubber-headed mallet.
  K : approximately 100 mm {3.94 in.} from the starting point of the straight section
  L : up to the end of the straight section

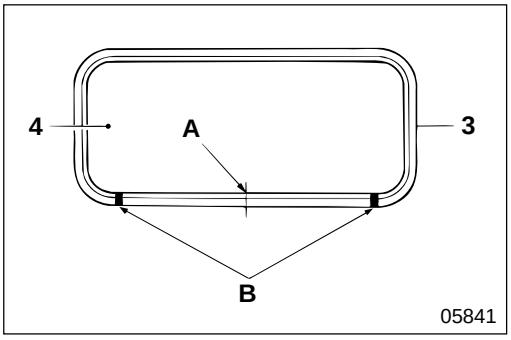
CAUTION⚠

Make sure that windshield 2 is installed correctly into the cab before hitting the windshield with the rubber-headed mallet, otherwise the windshield might be broken.



11386

- Provide an overlapped margin **N** on weatherstrip **1** and side garnish **M** to prevent water flowing backwards from the water drain hole.



05841

3 **4** **Weatherstrip, rear window glass**

- Install so that joint **A** of weatherstrip **3** is at the bottom center of rear window **4**.
  B : Water drain hole
- Except for the point mentioned above, follow the same service procedure as for installation of the windshield. 🕮 P42-54

https://truckmanualshub.com/

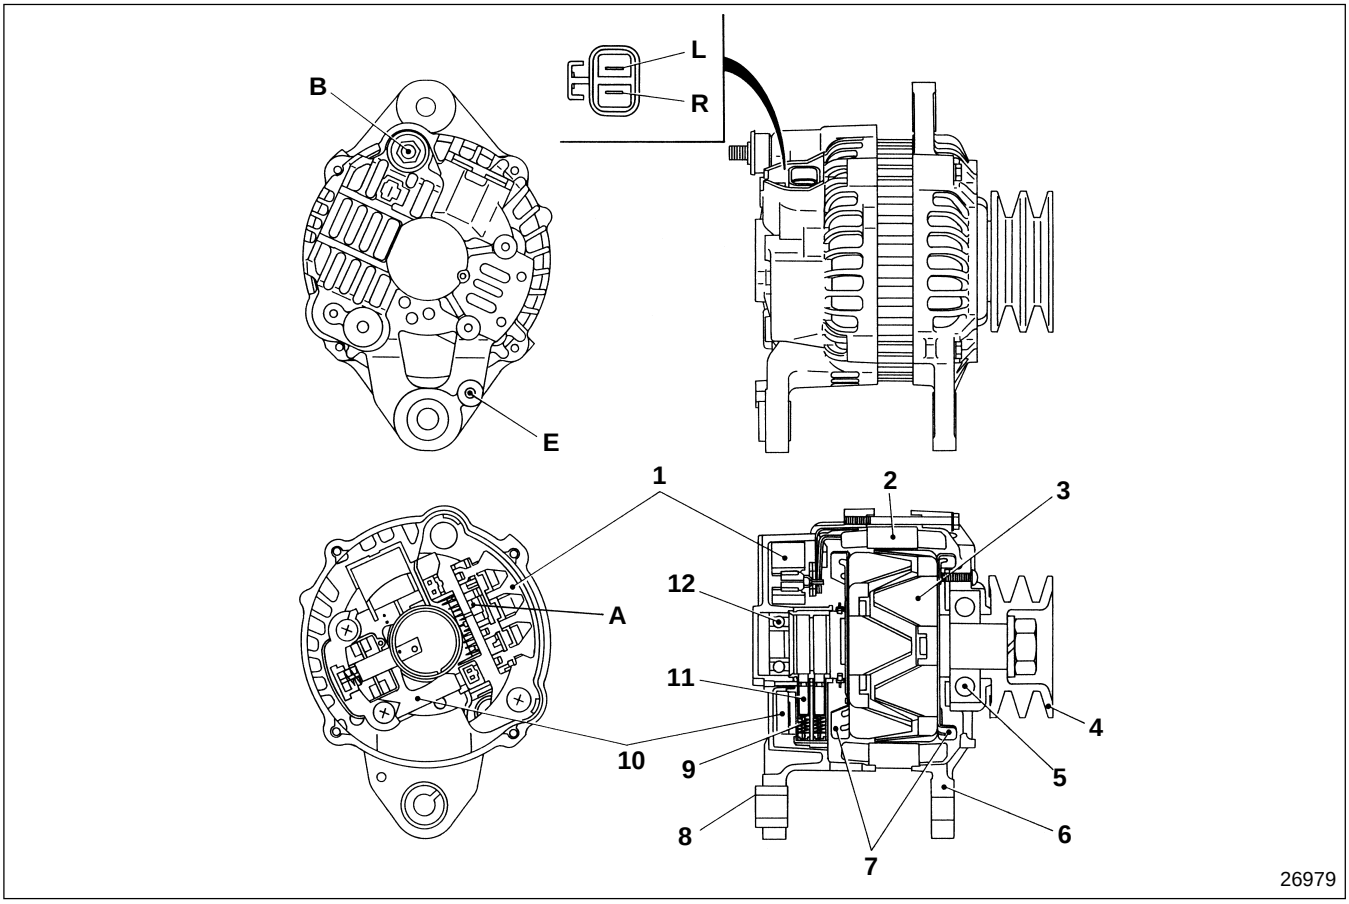
SPECIFICATIONS < ALTERNATOR >

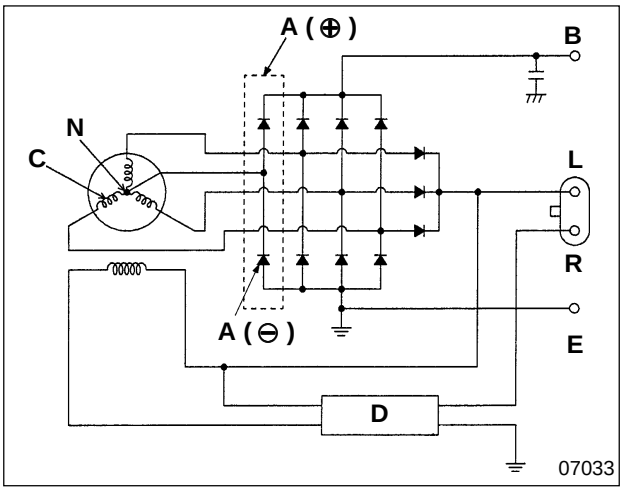
Item	Specifications
Manufacturer	MITSUBISHI ELECTRIC
Type	Alternator with built-in regulator (with brush and built-in fan)
Model	A3TN1988
Output V-A	12–100

https://truckmanualshub.com/



1 Rectifier
2 Stator assembly
3 Rotor assembly
4 Pulley
5 Front bearing
6 Front bracket
7 Fan
8 Rear bracket
9 Brush spring
10 Regulator and brush holder
11 Brush
12 Rear bearing

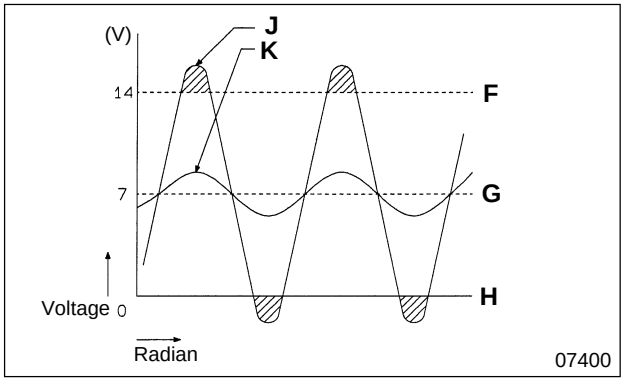
A : Neutral diode
B : Terminal B
E : Terminal E
L : Terminal L
R : Terminal R



Features

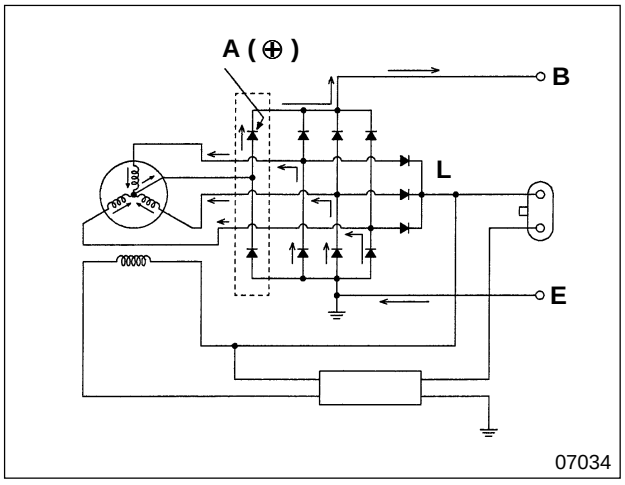
- In addition to the present alternator, this alternator has a neutral diode **A** (⊕ diode, ⊖ diode).
- With this neutral diode **A**, direct output during high speed rotation has increased in contrast to alternators without a neutral diode.
  B : Alternator terminal **B**
  C : Starter coil
  D : IC regulator
  E : Alternator terminal **E**
  L : Alternator terminal **L**
  N : Neutral
  R : Alternator terminal **R**

https://truckmanualshub.com/

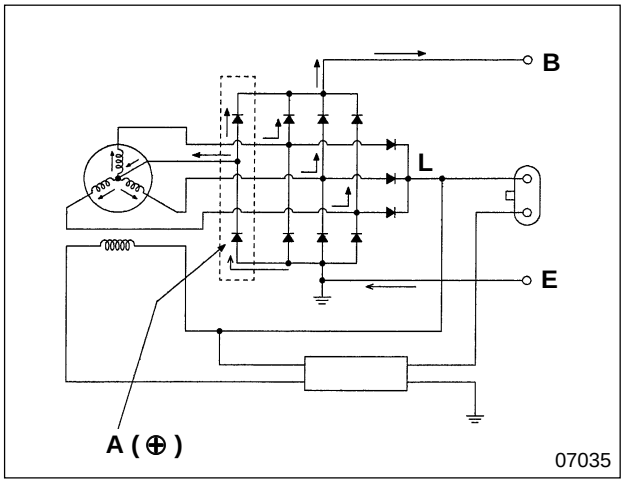


Neutral electrical fluctuation and neutral diode operation

- Electrical potential of the neutral point **N** fluctuate vertically around the neutral point of direct current voltage (1/2 **G** of the output voltage) as shown.
- The area (shown as ▨) indicates where neutral **N** voltage taken out of neutral diode A, rises to exceed output voltage **F** (14V), and the area (shown as ▨) shows where it falls below ground electric potential **H** (0 V), when the alternator is rotating at high speed. Previous direct current output has been exceeded.
  F : Output voltage
  G : Average neutral voltage (1/2 of output voltage)
  H : Ground electric potential
  J : {Neutral voltage} waves at times of high speed revolution
  K : {Neutral voltage} waves at times of low speed revolution
  All voltage and electrical potential conditions for neutral diode **A** are as follows:
- When {neutral points voltage} exceeds 0 V, and is less than 14 V:
  The existing diodes (six units) operate.



- When {neutral voltage} exceeds 14 V:
  Neutral diode **A** (⊕ side) conducts, adding to the existing direct current output and supply all mechanisms.



- When {neutral voltage} is below 0 V
  Neutral diode **A** (⊖ side) conducts, passing via the existing diodes (three units) and supply neutral output.

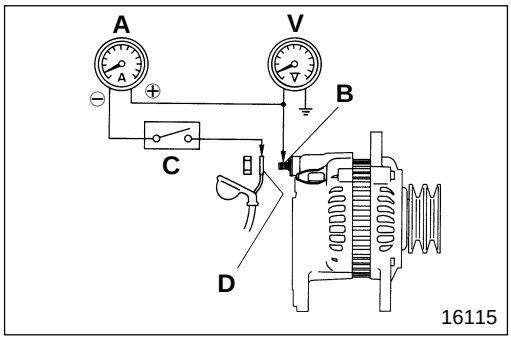
Inspection of Alternator



Performance test

- Connect the meters to the alternator as illustrated.
  A : Ammeter (150 amperes class)
  B : Terminal B on alternator
  C : Switch
  D : Terminal
  V : Voltmeter

WARNING

- **Terminal D is always loaded with voltage from the battery.**
- **You must handle terminal D carefully, it will short-circuit if it touches any part other than terminal B on the alternator.**

CAUTION

The wire connected to switch C should be thicker than the chassis side harness connected to terminal B.

- Turn switch **C** on, and check that battery voltage is displayed on the voltmeter.
- Start the engine.
- Turn the switches ON of all the lamps on the vehicle immediately.
- Increase engine revolution immediately, and measure current flow at about 2600 rpm.
- The alternator is assumed to be normal if the measured value is higher than 70% of the specified output.

Specified output of alternator

Voltage	Output
12 V	100 A

NOTE

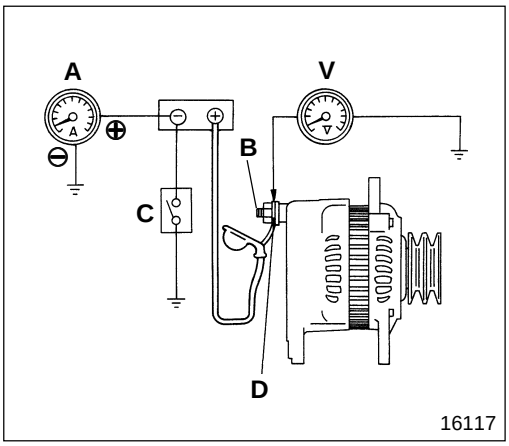
Since the above inspection is only a simplified check, it is necessary to conduct a stringent test bench for an official check. **P54-10**

https://truckmanualshub.com/

Inspection of Regulator

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Adjustment voltage of regulator	14.7±0.3 V	—	Replace



- Connect the meters to the alternator as illustrated.
  A : Ammeter (150 amperes class)
  B : Terminal B on alternator
  C : Switch
  D : Terminal
  L : Terminal L on alternator
  V : Voltmeter

WARNING

- **Terminal D is always loaded with voltage from the battery.**
- **You must handle terminal D carefully, it will short-circuit if it touches any part other than terminal B on the alternator.**

CAUTION

The wire connected to switch C should be thicker than the chassis side harness connected to B terminal.

- To ensure the current consumer is not activated during the inspection, the lamp and heater switches etc., should be turned off.
- Turn switch **C** on and start the engine.
- Measure voltage at **B** terminal, when output current is less than 5A with engines revolution at about 2600 rpm.

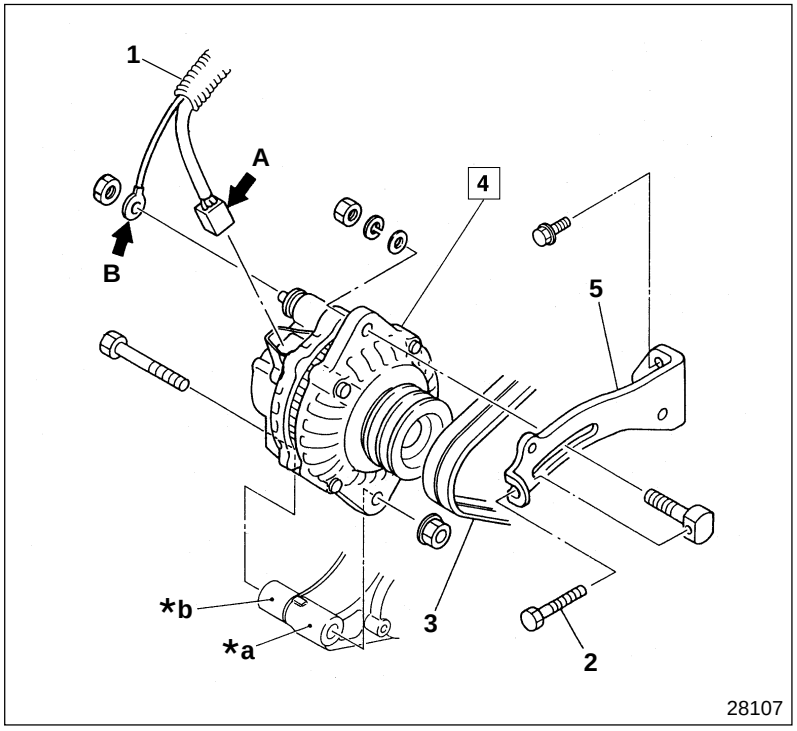
NOTE

When output current is between 5A - 10A, values measured (adjustment voltage) may be slightly low.
14V- 0.2-0.3V

- When output voltage exceeds 5A, do either of the following.
  - Turn the engine on and charge the battery.
  - Replace the battery with a fully charged one.
- Where the measured value deviates the limits, reconfirm with the test bench.

https://truckmanualshub.com/

106 ALTERNATOR



● **Removal sequence**

1 Chassis harness
2 Adjusting bolt
3 V-belts
4 Alternator P54-10
5 Adjusting plate

***a** : Timing gear case Gr 11
***b** : Power steering oil pump Gr 37

A : To terminals L and R
B : To terminal B

WARNING

- **Terminal B is always loaded with voltage from the battery, supplied via chassis harness 1. Therefore when you remove the harness from terminal B, make sure that tools do not touch any adjacent parts because this would cause a short-circuit.**
- **Make sure that you disconnect terminal ⊖ of the battery before removing the harness and insulate the terminal with tape.**

● **Installation sequence**

Follow the removal sequence in reverse.

● **Adjustment after installation**

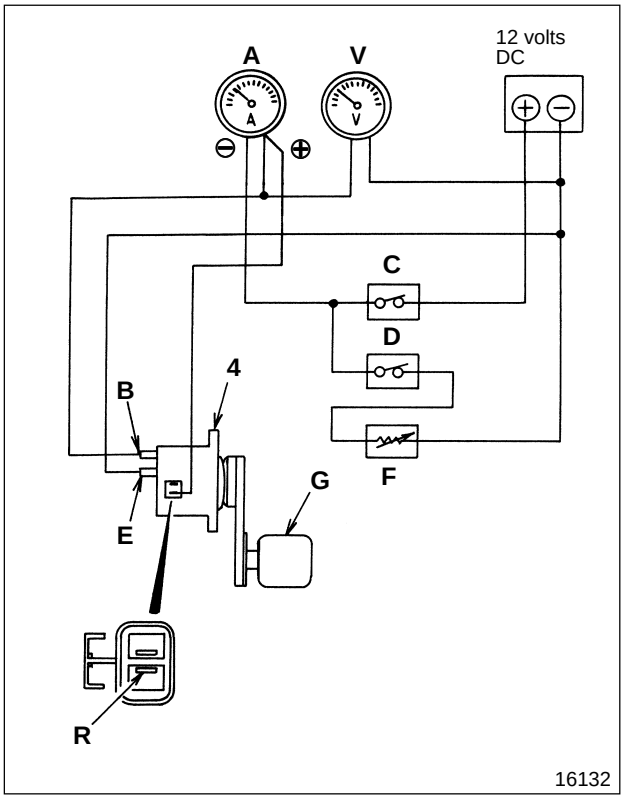
Adjustment of V-belt **3** tension Gr 14

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
4	Output current (* When alternator is hot and 13.5 V is loaded)	At 1500 rpm	41 A or more	—	Inspect
		At 2500 rpm	73 A or more	—	
		At 5000 rpm	95 A or more	—	
	Adjustment voltage of regulator (When alternator rotates at 5000 rpm and load is 5 A or less)		14.7±0.3 V	—	Replace

* : The value is measured after running the alternator at 5000 rpm (at ambient temperature) with maximum output for 30 minutes.

https://truckmanualshub.com/



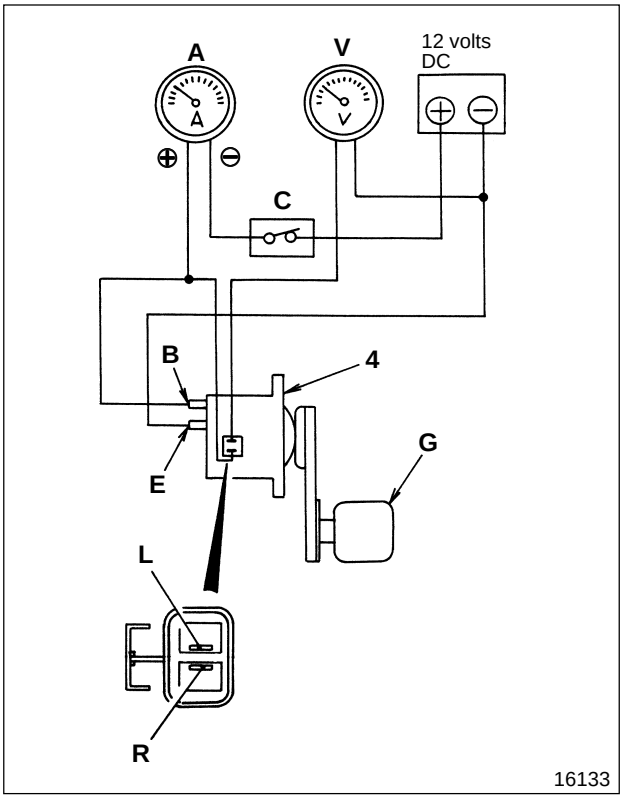
◆ Service procedure

4 Inspection of alternator

(1) Inspection of alternator performance (bench test)

- Connect each unit to the alternators as illustrated.
  A : Ammeter (150 amperes class)
  B : Terminal B on alternator
  C : Switch
  D : Switch
  E : Terminal E on alternator
  F : Load resistance (variable resistance)
  G : Alternator drive motor
  L : Terminal L on alternator
  R : Terminal R on alternator
  V : Voltmeter
- Set load resistance to MAX (almost no load current flows).
- Turn switches **C** and **D** ON.
- Run the alternator at 5000 rpm for 30 minutes to warm it.
- Adjust load resistance **F** until nominal current is achieved.
  Alternator nominal current: 12V-100A

- Measure current of alternator **4** at each specified rpm.
  - If the measured value deviates from the standard value, disassemble and inspect alternator **4**.
    P54-10



(2) Inspection of regulator (bench test)

- Connect each unit to the alternators as illustrated.
  A : Ammeter
  B : Terminal B on alternator
  C : Switch
  E : Terminal E on alternator
  G : Alternator drive motor
  L : Terminal L on alternator
  R : Terminal R on alternator
  V : Voltmeter
- Turn switch **C** ON.
- Operate alternator **4** at low speed.
- Measure the voltage (adjustment voltage) while increasing revolution rate of alternator **4** up to 5000 rpm. At the same time check that current remains at under 5A.
- Where the measured values are outside the limits do the following:
  - Measured values exceed the limits:
    Replace the regulator
  - Measured values are below the limits:
    Check all parts of the alternator before replacing the regulator.

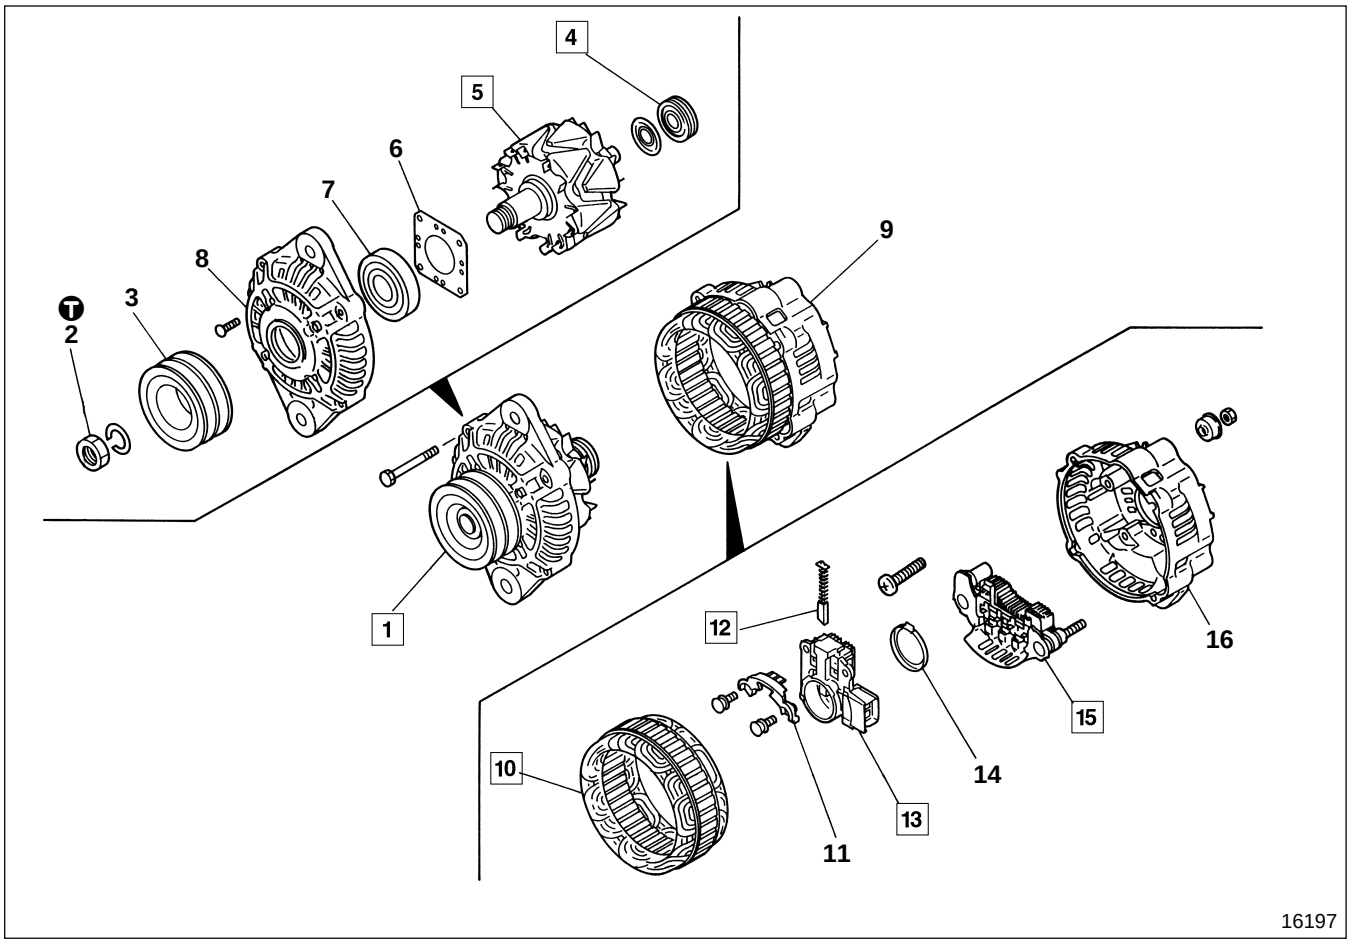
106 ALTERNATOR

Alternator



● **Disassembly sequence**

1 Rotor and front bracket assembly
2 Nut
3 Pulley
4 Rear bearing
5 Rotor assembly
6 Cover
7 Front bearing
8 Front bracket
9 Stator and rear bracket assembly
10 Stator assembly
11 Cover
12 Brush
13 Regulator and brush holder
14 Slinger
15 Rectifier
16 Rear bracket

NOTE

Do not remove parts 4, 7, 10, 12 unless they are faulty.

● **Assembly sequence**

9 → 1 9 : 14 → 13 → 12 → 11 → 16 ← 10 (15)

1 : 8 → 7 → 6 → 3 → 2 (5 → 4)

https://truckmanualshub.com/

Service standards

Unit : mm {in.}

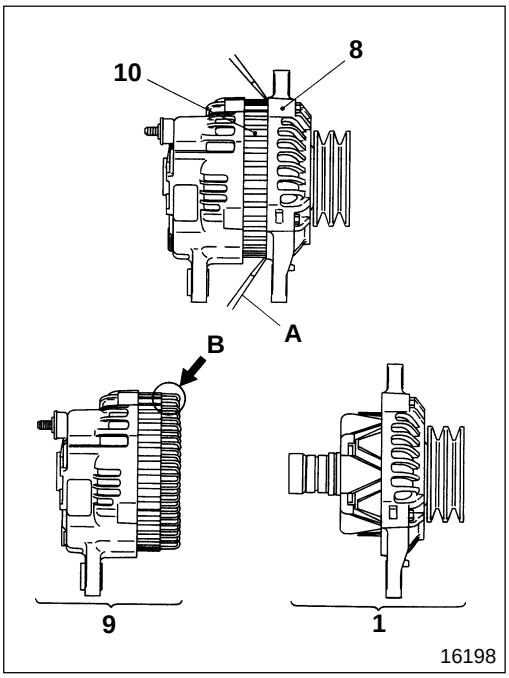
Location	Maintenance item		Standard value	Limit	Remedy
5	Rotor assembly	Field coil resistance (At 20°C)	2.1 to 2.5	—	Replace
		Slip ring outer diameter	33 {1.30}	32.4 {1.28}	
12	Length of brush		23 {0.91}	8 {0.31}	Replace

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Nut (pulley mounting)	132 to 162 {98 to 120, 13.5 to 16.5}	—

◆ Service procedure



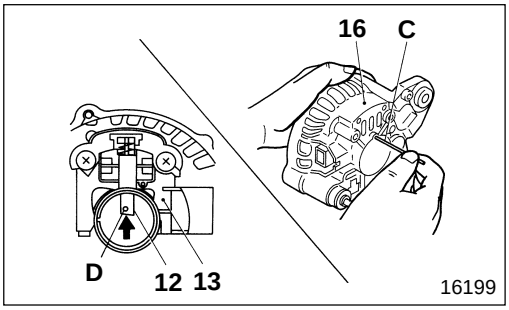
1 Rotor and front bracket assembly

[Removal]

- Insert screwdriver **A** between front bracket **8** and stator assembly **10**.
- Use screwdriver **A** to pry rotor and front bracket assembly **1** away from stator and rear bracket assembly **8**.

CAUTION

Be careful not to insert the screwdriver too deep or it will damage coil B of stator assembly 10 and might cause a short-circuit.

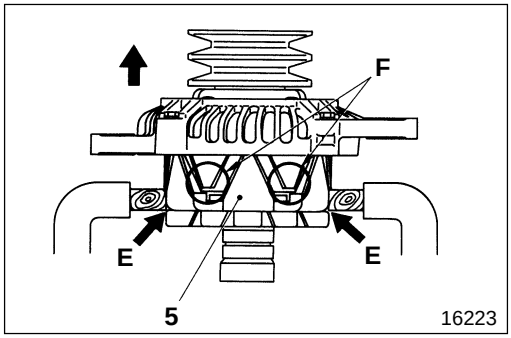


[Installation]

When brush **12** is protruding out of regulator and brush holder **13**, rotor assembly **5** cannot be installed on rear bracket **16**, so perform the following.

- Insert brush **12** into regulator and brush holder **13**.
- Insert pin **C** from the rear end of rear bracket **16**, attach the pin against pin hole **D** and secure the brush **12**.
  If the pin hole **D** is gone due to worn brush **12**, secure front end of the brush with pin.
- After installation, remove pin **C** carefully.

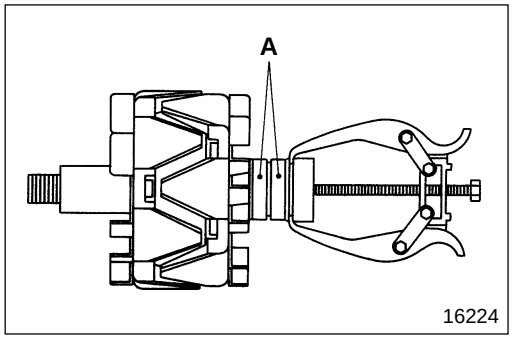
https://truckmanualshub.com/



[Disassembly]

CAUTION

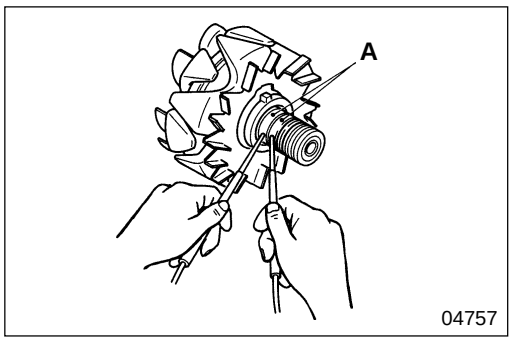
Make sure, when you hold rotor assembly 5 in a vise, to grip root E of the core claws. Gripping claws F can damage them.



4 Removal of rear bearing

CAUTION

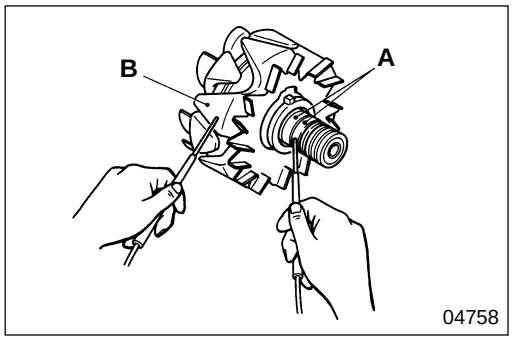
- **Do not damage slip ring A when mounting the bearing puller.**
- **If the slip ring is damaged, brushes will not fit properly.**



5 Inspection of rotor assembly

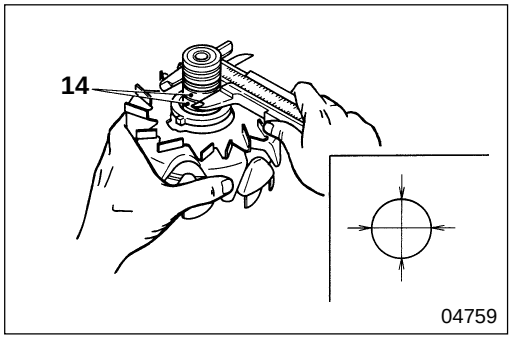
(1) Field coil resistance

- Measure resistance between gaps of slip ring **A**.
- If the measured value deviates from the limits, replace rotor assembly **5**.



(2) Continuity between slip ring and core

- Check there is no continuity between slip ring **A** and core **B**.
- If continuity is found, replace rotor assembly **5** as there is a short circuit.



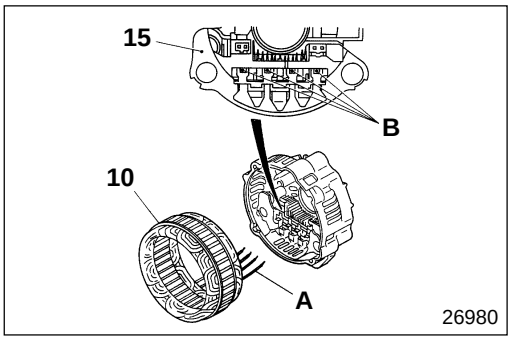
(3) Outer diameter of slip ring

- If outside diameter of slip ring **A** is less than the limit, replace rotor assembly **5**.
- If the outer peripheral diameter of slip ring **A** is rough or worn on one side, polish it smooth with sandpaper or a lathe.

CAUTION

Do not polish slip ring until its outer diameter deviates from the specified limits.

https://truckmanualshub.com/



10 Stator assembly

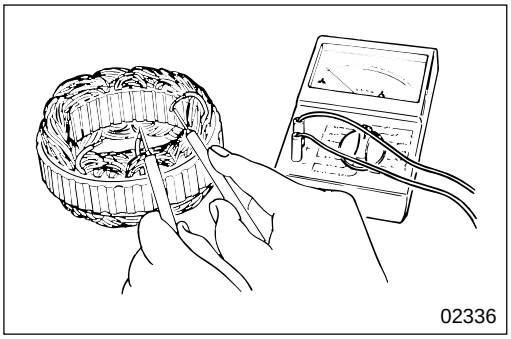
[Removal and installation]

- Disconnect lead **A** of stator assembly **10** from rectifier **15**. The lead is soldered to diode **B** of rectifier **16** at four points.

CAUTION

Make sure that you desolder within five seconds because the diode is heat sensitive.

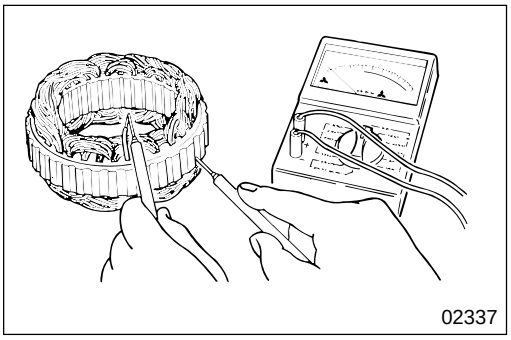
- To install, follow the removal sequence in reverse.



[Inspection]

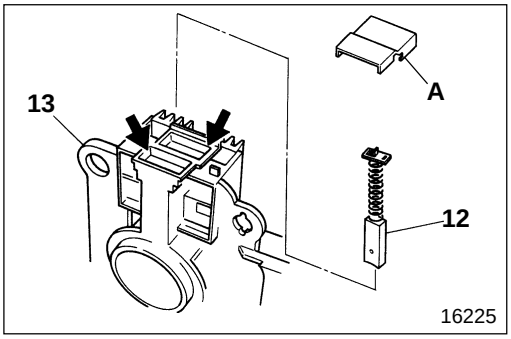
(1) Continuity of each lead wire

- Make sure that each lead wire has continuity.
- If there is no continuity, the lead wire is broken. Replace stator assembly **10**.



(2) Continuity between lead wires and the core

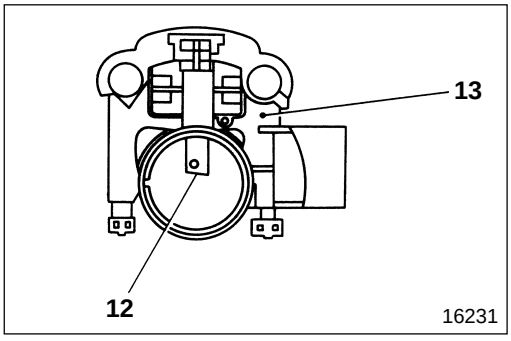
- Make sure that there is no continuity between lead wires and the core.
- If there is continuity, replace stator assembly **10**, since it might be short-circuited.



12 Brushes

[Removal]

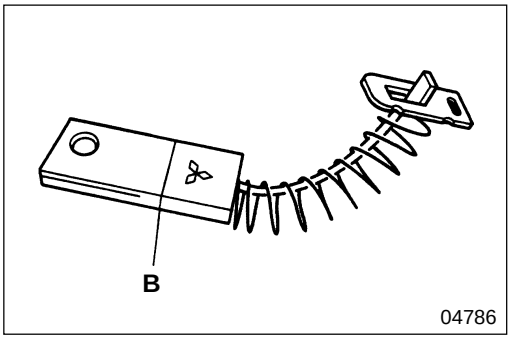
Remove cover **A**, separate the soldered connection on the lead wire to brush **12** and remove brush from regulator and brush holder **13**.



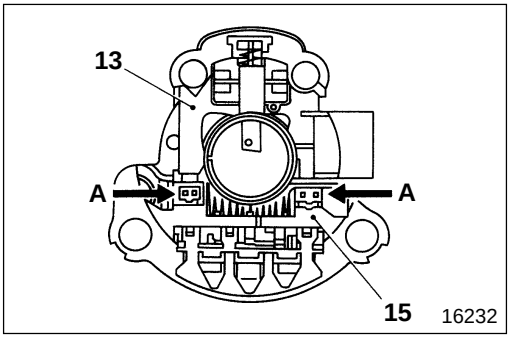
[Installation]

- Install brush **12** in regulator and brush holder **13** facing the direction indicated.
- After installation solder the lead wire to brush **12** onto regulator and brush holder **13**.
  Replace cover **A** to it's original position.

https://truckmanualshub.com/



[Inspection]
If the length of brush **B** is approaching permissible wear line **B**, it must be replaced.



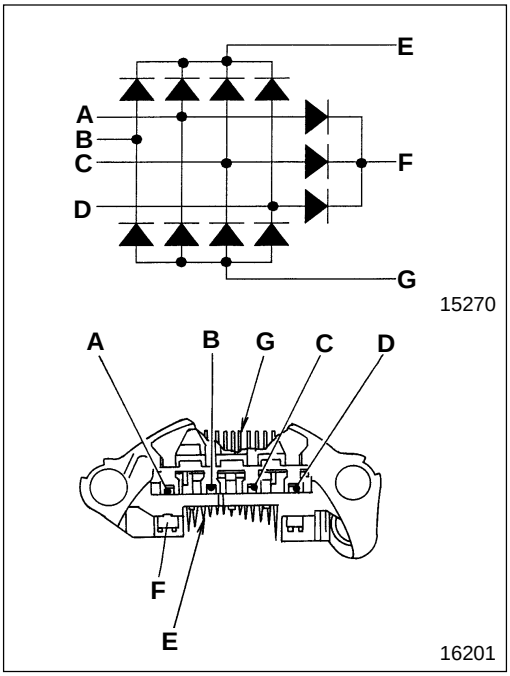
13 **Removal of regulator and brush holder**

- Disconnect regulator and brush holder **13** from the 2 soldered joints **A** on rectifier **15**, as illustrated.

CAUTION

When the soldered joints are removed, the operation must be performed quickly, (within 5 seconds.)
The diode may be damaged if heat is applied for long period.

- For installation, follow the removal sequence in reverse.



15 **Inspection of rectifier**

- Inspect whether the diode inside rectifier **15** functions properly, and if any fault is found, replace the rectifier.
  Resistance is infinite at both ends .....open
  Resistance is near 0 at both ends .....short-circuited
  A, **B**, **C**, **D** : Lead connecting area of stator coil
  E, **G** : Heat sink area
  F : Regulator connecting area
- Inspect the rectifier twice, before and after the ⊕ side and ⊖ side of the tester have been changed over.

CAUTION

When inspecting using a tester, the current becomes weaker than the usual current flowing through rectifier 15. Therefore, an incomplete resistance value might be indicated.
Also, this tendency increases as the range of the tester gets smaller. Therefore, use as large a range as possible.

SPECIFICATIONS

Battery

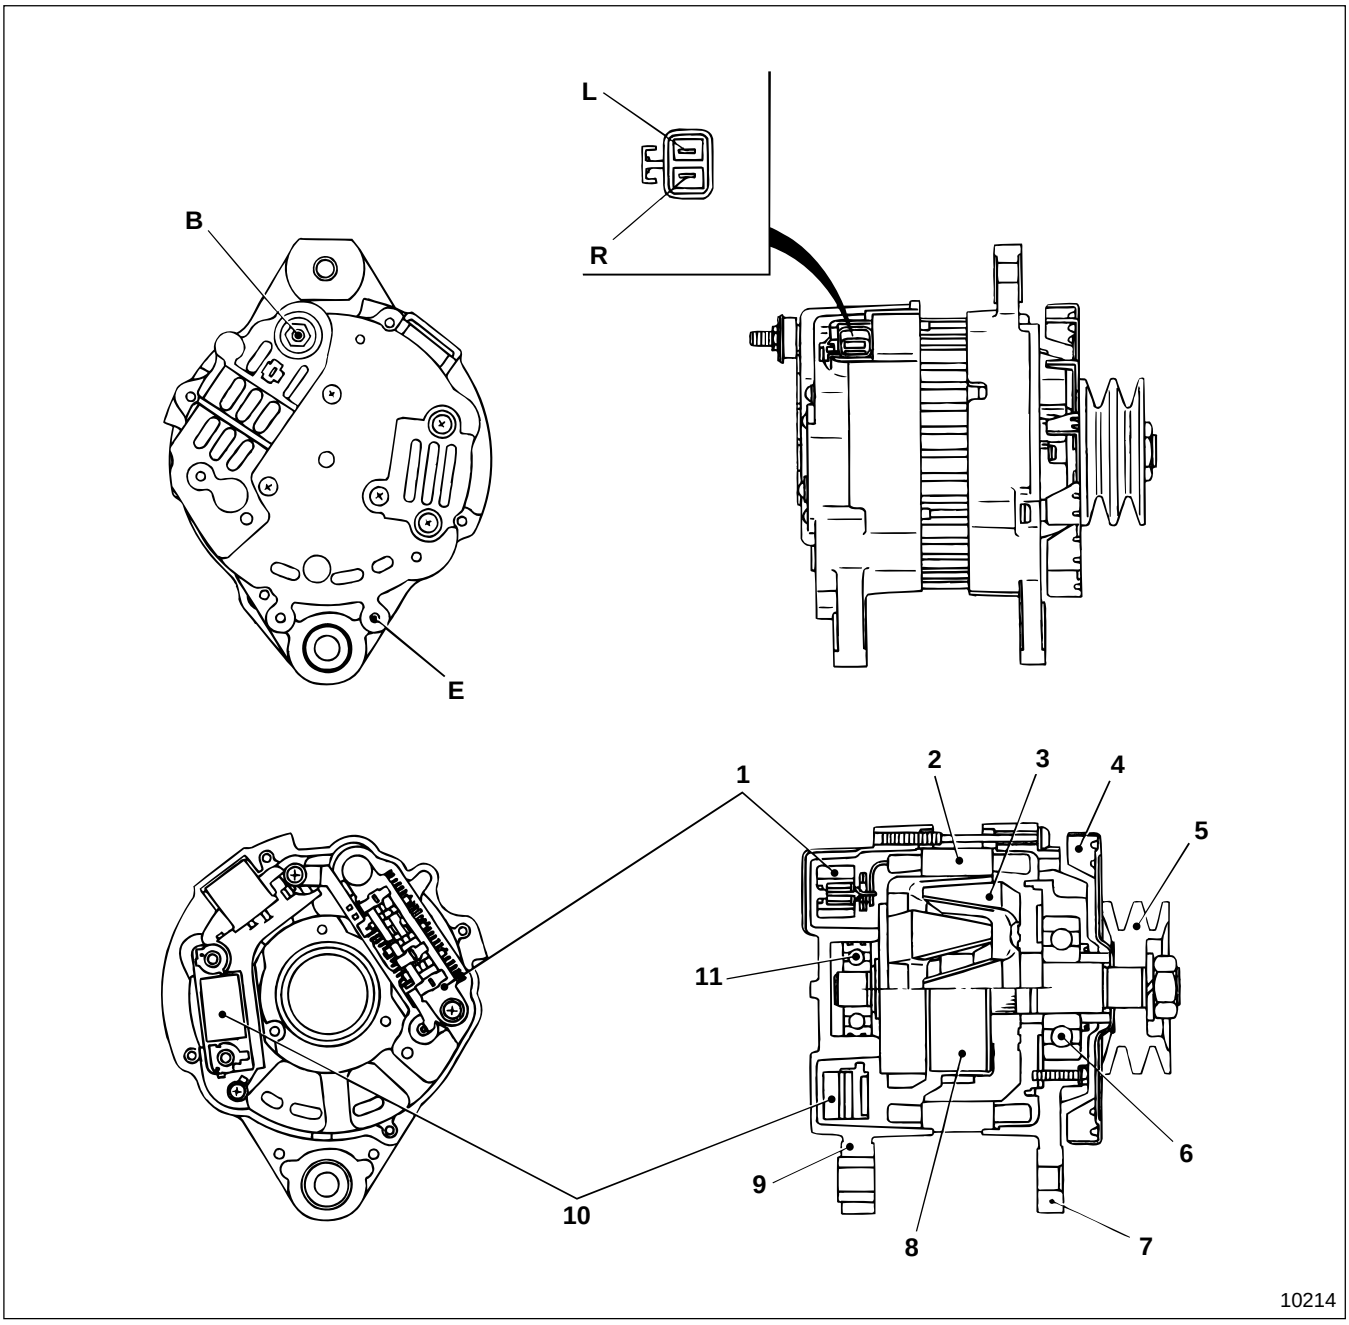
Item		Specifications
Model		95D31R
Voltage×No.	V	12×2 (Parallel connection)
Capacity (5-hour rating)	Ah	70

Alternator

Item		Specifications
Manufacturer		MITSUBISHI ELECTRIC
Type		Alternator with built-in regulator (without brush, external fan)
Model		A4TU0088
Output	V-A	12–80

https://truckmanualshub.com/

Alternator

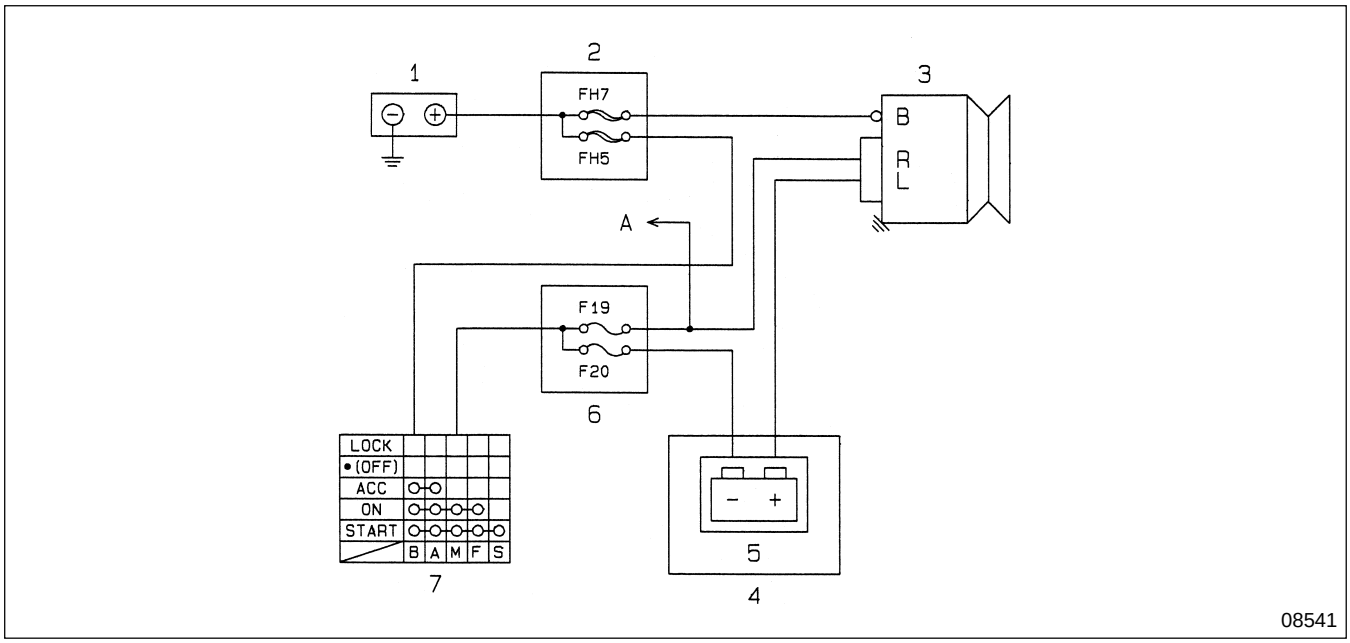


1 Rectifier
2 Stator assembly
3 Rotor assembly
4 Fan
5 Pulley
6 Front bearing
7 Front bracket
8 Field coil
9 Rear bracket
10 Regulator
11 Rear bearing

B : Terminal B
E : Terminal E
L : Terminal L
R : Terminal R

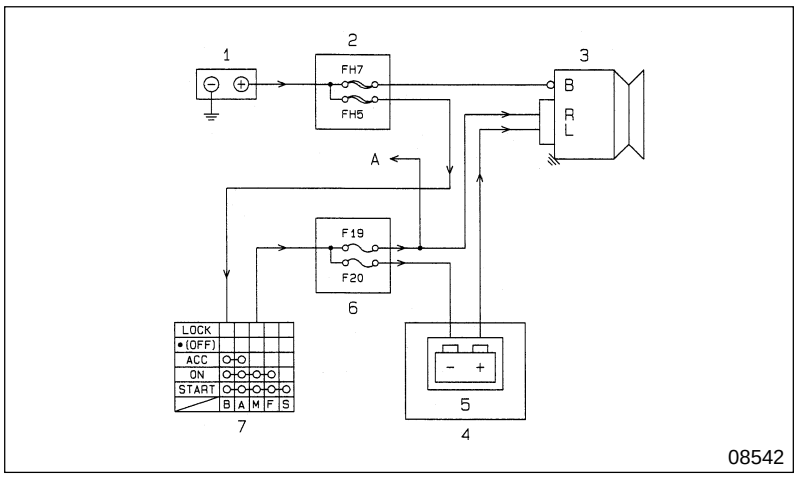
https://truckmanualshub.com/

Battery Charging Circuit



1 Battery
2 High-current fuse box
3 Alternator
4 Meter cluster
5 Charge warning lamp
6 Fuse box
7 Starter switch

A : To each unit
B : Terminal B
L : Terminal L
R : Terminal R



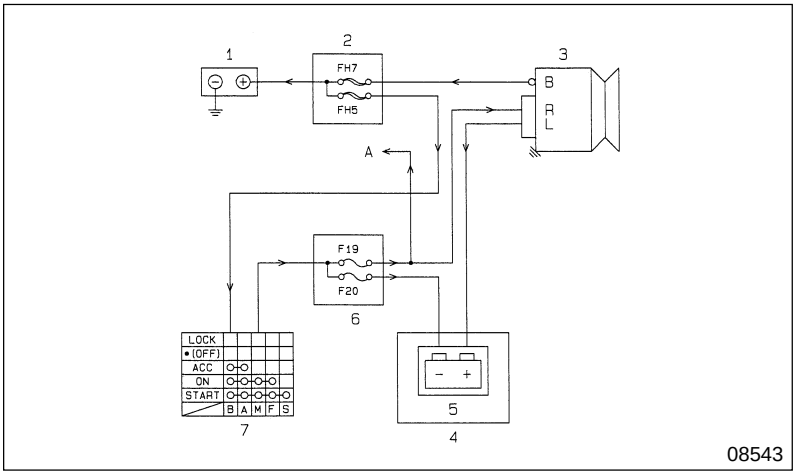
At engine standstill (before starting)

Position of starter switch **7** : ON

- 1→2 (FH5)→7→6 (F19)
  →6 (F20)
  →3 (R→Body ground)
  →5→3 (L→Body ground)

- Charge warning lamp [−+] **5** lights up.
  To improve the low-speed power generation build-up performance of alternator **3**, current is fed to terminal **R** immediately after the engine is started.

https://truckmanualshub.com/



After engine start-up

Position of starter switch **7** : ON

- Alternator **3** starts to generate power.
- The voltage at terminal **B** of alternator **3** rises higher than the voltage of battery **1**.
- As alternator **3** starts to charge battery **1**, units **A** are supplied with power.
  3(B)→2(FH7)→1→Ground
  →(FH5)→7→6(F19)→A
- Since there is no electric potential difference between the output voltage of terminal **L** of alternator **3** and the voltage of battery **1**, charge warning lamp **5** goes off.

https://truckmanualshub.com/

TROUBLESHOOTING

Possible causes \ Symptoms		Battery electrolyte decreases too early	Battery overheating	Battery is normal but discharged	Charge warning lamp does not light when turning starter switch ON, with engine stopped	Alternator is normal but battery discharged	Remarks

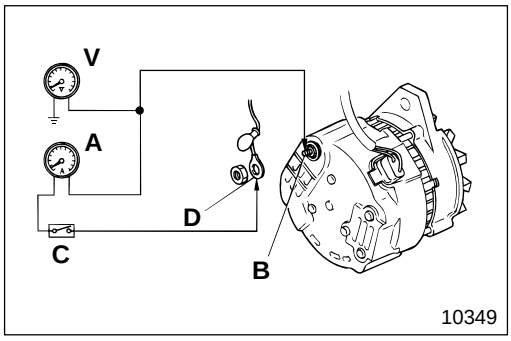
100 INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection of Alternator



Performance test

- Connect the meters to the alternator as illustrated.
  A : Ammeter (100 amperes class)
  B : Terminal B on alternator
  C : Switch
  D : Terminal
  V : Voltmeter

WARNING

- **Terminal D is always loaded with voltage from the battery.**
- **You must handle terminal D carefully, it will short-circuit if it touches any part other than terminal B on the alternator.**

- Turn switch **C** ON to supply battery voltage to terminal **B** on the alternator.
- Start the engine.
- Turn the switches ON of all the lamps on the vehicle immediately.
- Measure the current when the engine speed reaches approximately 2260 rpm.
- The alternator is assumed to be normal if the measured value is higher than 70% of the specified output.

Specified output of alternator

Alternator model	Voltage	Output
A4TU0088	12 V	80 A

NOTE

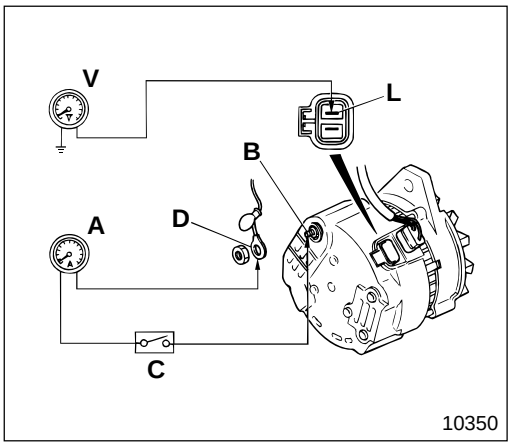
Since the above inspection is only a simplified check, it is necessary to conduct a stringent test bench for an official check.
P54-1-17

https://truckmanualshub.com/

Inspection of Regulator

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Adjustment voltage of regulator	14.7±0.3 V	—	Replace



- Connect the meters to the alternator as illustrated.
  A : Ammeter (100 amperes class)
  B : Terminal B on alternator
  C : Switch
  D : Terminal
  L : Terminal L on alternator
  V : Voltmeter

WARNING

- **Terminal D is always loaded with voltage from the battery.**
- **You must handle terminal D carefully, it will short-circuit if it touches any part other than terminal B on the alternator.**

- Turn switch **C** ON and make sure that voltmeter **V** indicates 0 volt.
- If the needle of voltmeter **V** oscillates, something is wrong with the alternator or the wiring.
- Turn switch **C** OFF and start the engine.

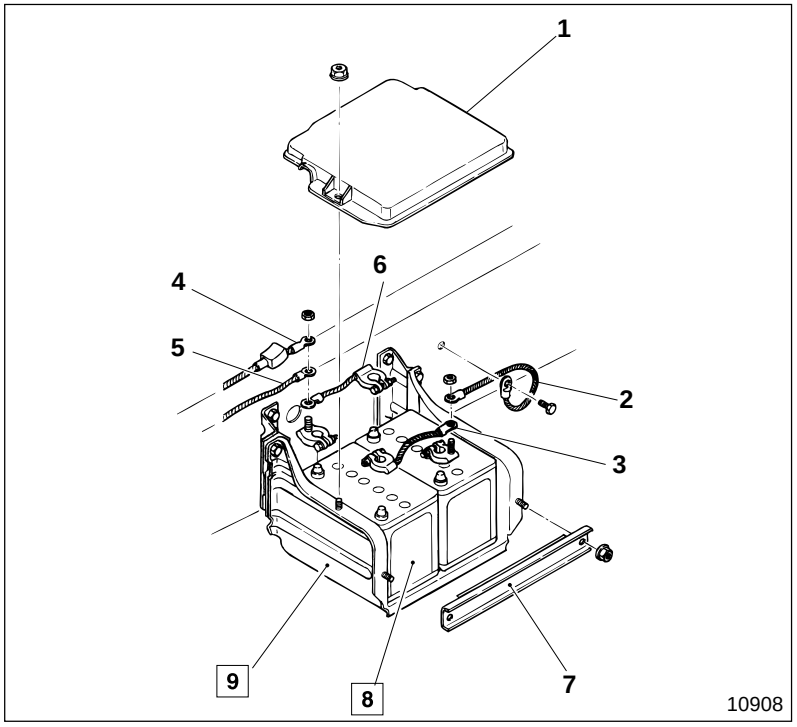
CAUTION

Do not start the engine with switch C turned ON because the starter current will flow into ammeter A and damage it.

- If the charge current is five amperes or less and the engine speed is approximately 2260 rpm, measure the adjustment voltage.
- If the charge voltage is five amperes or more, do one of the following :
  - Run the engine for a while to charge the battery.
  - Replace the old battery with a fully-charged one.
  - Connect a 1/4 Ω (25 W) resistor in series with the battery to limit the charge current.
- If the measured value deviates from the standard value, change the regulators.

https://truckmanualshub.com/

101 BATTERY



● **Removal sequence**

1 Battery cover
2 Ground cable
3 Battery cable ⊖
4 Starter cable
5 Chassis harness
6 Battery cable ⊕
7 Battery side cover
8 Battery
9 Battery box

● **Installation sequence**

Follow the removal sequence in reverse.

DANGER⚠

- **Since flammable hydrogen gas is generated by battery 8, be sure to obey the following warnings :**
  - **Do not short-circuit the ⊕ and ⊖ terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over battery 8.**
- **Because the battery electrolyte is diluted sulfuric acid and is corrosive, when handling battery 8 wear safety glasses and rubber gloves to protect the eyes and hands.**

WARNING⚠

To prevent a short-circuit be sure that disconnected battery cables 3 and 6 do not accidentally touch the battery terminals.

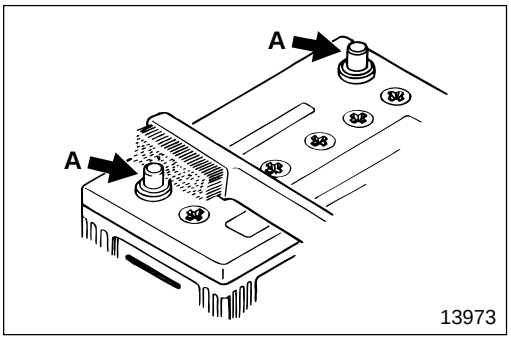
CAUTION⚠

- **Make sure that you disconnect battery cable ⊖ 3 first when you disconnect battery cables 3 and 6.**
- **Make sure that all electrical switches of the vehicle are OFF before connecting battery cables 3 and 6.**
- **Make sure that you connect battery cable ⊕ 6 before you connect battery cable ⊖ 3.**

https://truckmanualshub.com/

◆ Service procedure

8 Inspection of battery



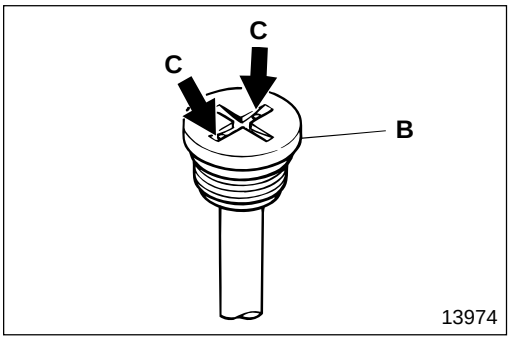
13973

(1) Visual inspection

- If terminal **A** is corroded, scrub off the corrosion from it using a wire brush.
- If cracks or defects are found on battery **8**, replace it since the cracks or defects can cause liquid spills.

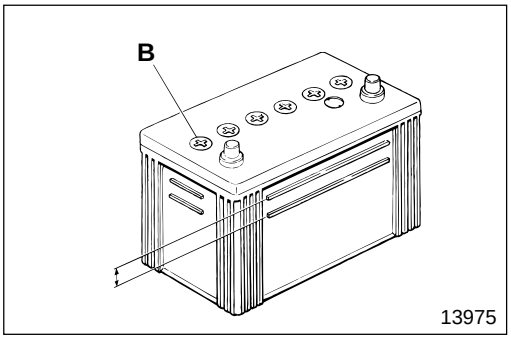
CAUTION⚠

Make sure you grease the ⊕ side of terminal A because it is easily corroded.



13974

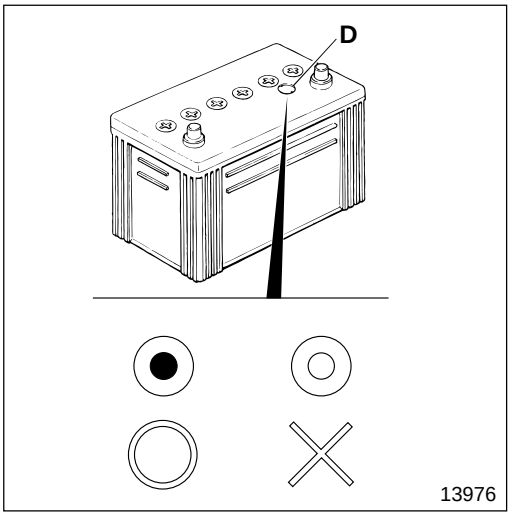
- If bleed hole **C** of vent plug **B** is clogged, clean the hole.



13975

(2) Inspection of fluid level

- Make sure that the battery electrolyte level is between UPPER and LOWER.
- If the level is below LOWER, remove vent plug **B** and fill the battery with distilled water or battery replenisher to UPPER.



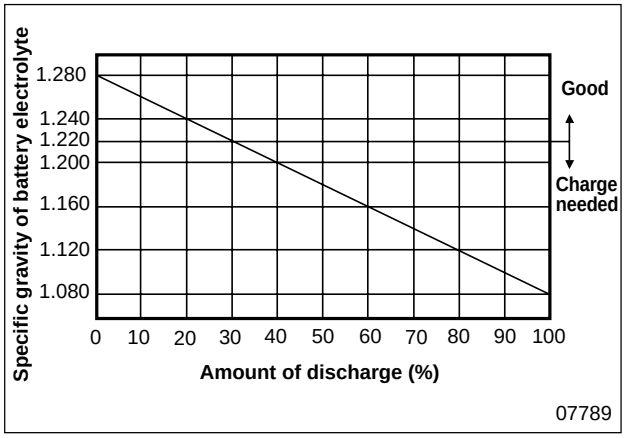
13976

(3) Measurement of specific gravity

You can tell the specific gravity of the battery electrolyte by the color shown in indicator **D**.

Blue : Good
White : Charge or replace

https://truckmanualshub.com/



(4) Charging

- Although, as a rule, charging of battery **8** should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect battery cable ⊖ **3**.
- Remove vent plug **B** before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity / 10 {113}	*Amount of discharge (Ah) / Charge current (A) ×1.2(to 1.5)	45
Quick charge	Value of 5-hour rating capacity / 1.5 {131}	0.5	55

* Amount of discharge (Ah)=5-hour rating capacity (Ah)× Amount of discharge (%) / 100

- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep naked lights away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because its dangerous.**
- **After charging the battery, tighten vent plug B, wash away sulfuric acid from the battery using water, and dry the surface.**

9 Inspection of battery box

- If battery box **9** is corroded, scrub off the corrosion from it using a wire brush and apply acid resistant coating.
- If battery box **9** is corroded excessively or if it is broken or cracked, replace it.

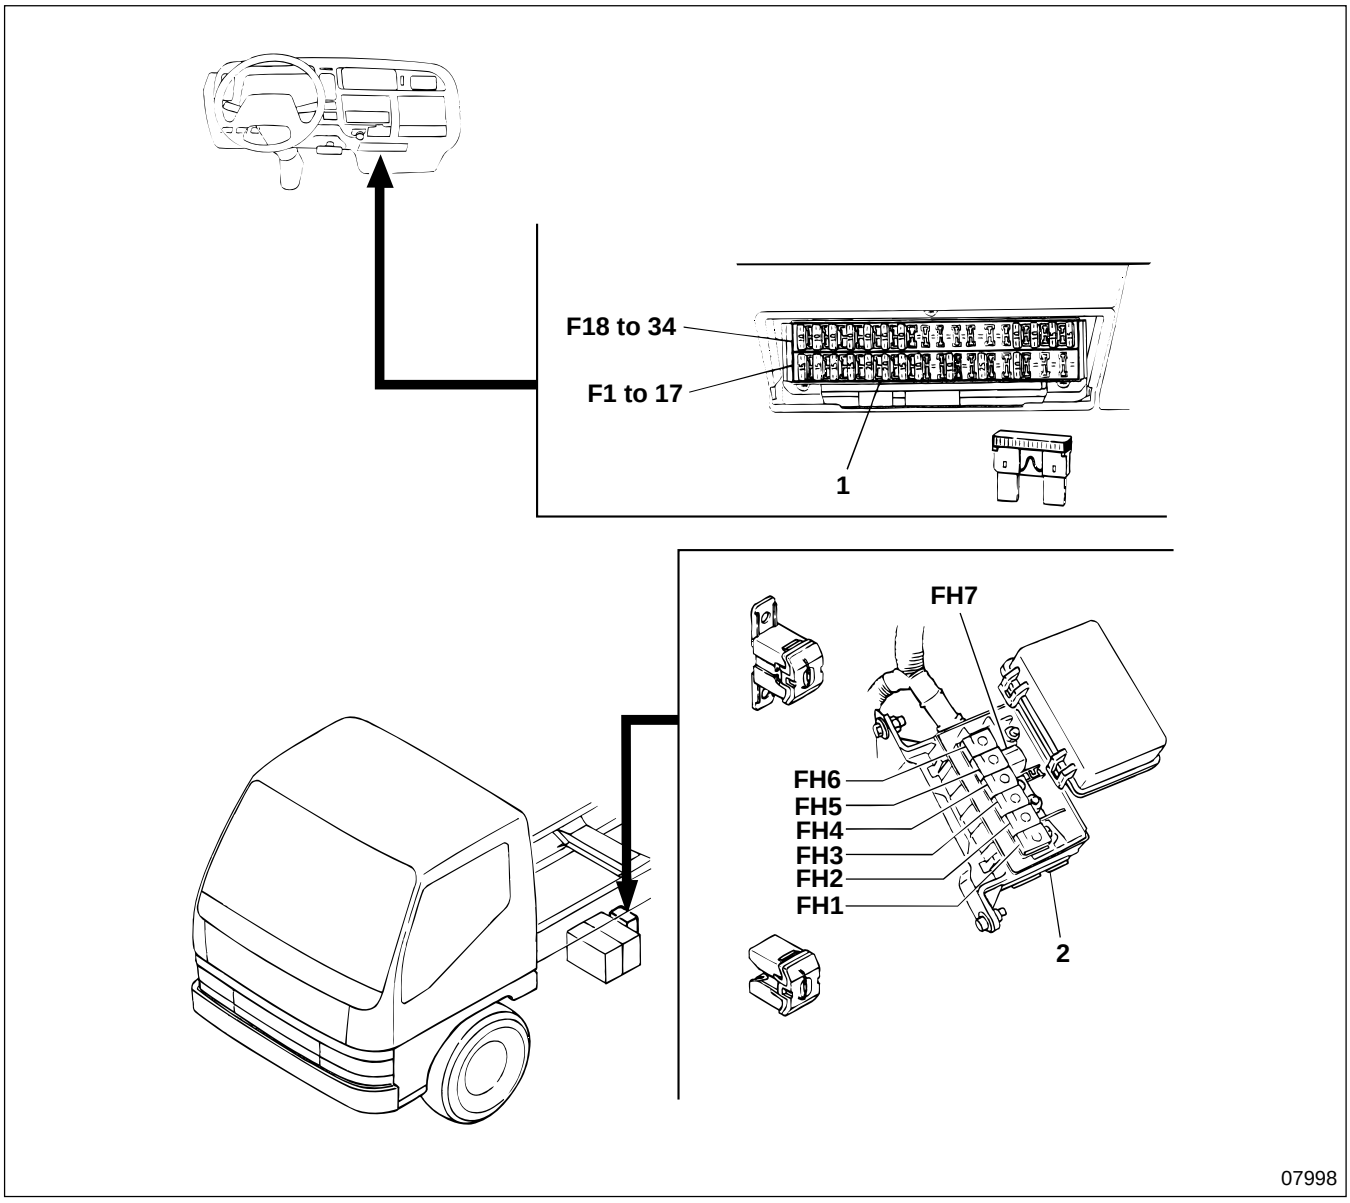
https://truckmanualshub.com/

M E M O

https://truckmanualshub.com/

104 FUSE

Installation Position



1 Fuse box
2 High-current fuse box

CAUTION

- **If a fuse blows, make sure you identify and remedy the cause, then replace the fuse.**
- **Make sure that you replace the fuse with one having the same rating.**
- **Make sure that you remove the ⊖ terminal of the battery cable before removing high-current fuses FH1 to 7.** 101

https://truckmanualshub.com/

High-current fuse box

Fuse No.	Main load	Capacity
FH1	Fuse box (F1 to F4)	50 A
FH2	Fuse box (F5 to F7)	50 A
FH3	—	—
FH4	—	—
FH5	Starter switch (Terminal B)	50 A
FH6	Fuse box (F32 to F34)	50 A
FH7	Alternator	100 A

Fuse box

Fuse No.	Main load	Capacity

F32	* Condenser fan	15 A
F33	Blower fan	25 A
F34	Tail lamp	15 A

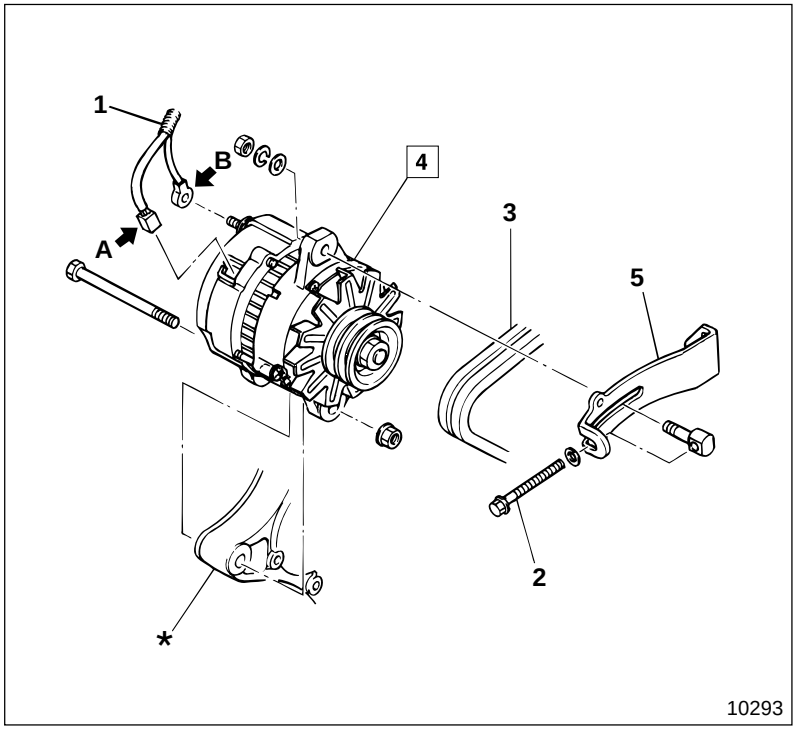
* : Fuses are provided for these pieces of equipment only where they are installed.

NOTE

Fuses F4, F10 are also parts of the electric power circuit used to memorize the diagnostic codes that are transmitted if the electrical controlling system (Pre-stroke control injection pump, automatic transmission) malfunctions.

https://truckmanualshub.com/

106 ALTERNATOR



● **Removal sequence**

1 Chassis harness
2 Adjusting bolt
3 V-belts
4 Alternator 📖 P54-1-18
5 Adjusting plate

***** : Timing gear case and front plate Gr 11
A : To terminals L and R
B : To terminal B

WARNING ⚠

- **Terminal B is always loaded with voltage from the battery, supplied via chassis harness 1. Therefore when you remove the harness from terminal B, make sure that tools do not touch any adjacent parts because this would cause a short-circuit.**
- **Make sure that you disconnect terminal ⊖ of the battery before removing the harness and insulate the terminal with tape.**

● **Installation sequence**

Follow the removal sequence in reverse.

● **Adjustment after installation**

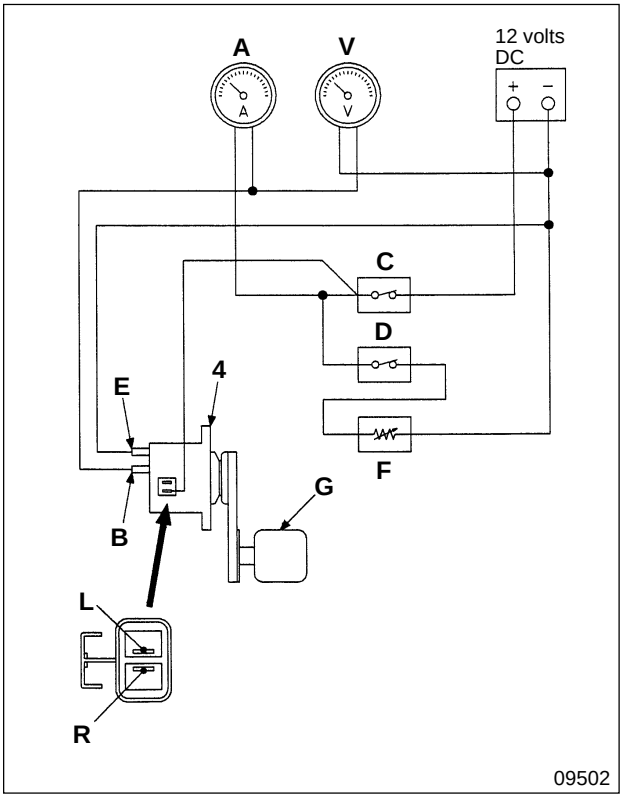
Adjustment of V-belt **3** tension Gr 14

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
4	Output current (* When alternator is hot and 13.5 V is loaded)	At 1500 rpm	38 A or more	—	Inspect
		At 2500 rpm	65 A or more	—	
		At 5000 rpm	76 A or more	—	
	Adjustment voltage of regulator (When alternator rotates at 5000 rpm and load is 5 A or less)		14.7±0.3 V	—	Replace

***** : The value is measured after running the alternator at 5000 rpm (at ambient temperature) with maximum output for 30 minutes.

https://truckmanualshub.com/



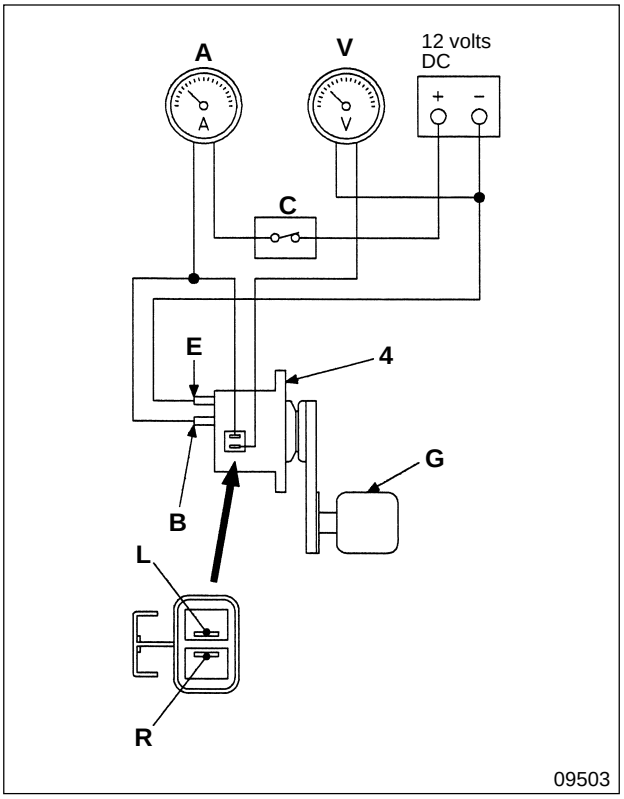
4 Inspection of alternator

(1) Inspection of alternator performance (bench test)

- Connect each unit to the alternators as illustrated.
  A : Ammeter
  B : Terminal B on alternator
  C : Switch
  D : Switch
  E : Terminal E on alternator
  F : Load resistance (variable resistance)
  G : Alternator drive motor
  L : Terminal L on alternator
  R : Terminal R on alternator
  V : Voltmeter
- Turn switches **C**, **D** OFF.
- Run alternator **4** at 5000 rpm.
- Adjust load resistance **F** to maintain the specified current.

  Specified output of the alternator : 12 V-80 A

- After adjustment, run alternator **4** for 30 minutes.
- Maximize load resistance **F** (current hardly flows).
- Turn switches **C**, **D** ON.
- Increase the rotation of alternator **4** gradually and measure current at specified rpm.
- If the measured value deviates from the standard value, disassemble and inspect alternator **4**. P54-1-18



(2) Inspection of regulator (bench test)

- Connect each unit to the alternators as illustrated.
  A : Ammeter
  B : Terminal B on alternator
  C : Switch
  E : Terminal E on alternator
  G : Alternator drive motor
  L : Terminal L on alternator
  R : Terminal R on alternator
  V : Voltmeter
- Turn switch **C** ON.
- Run alternator **4**.
- Make sure that the value of the current at 5000 rpm is five amperes or less.
- Measure voltage (adjustment voltage).
- If the measured value deviates from the standard value, replace the regulator (in alternator **4**).

https://truckmanualshub.com/

106 ALTERNATOR

1 : 11 → 10 → 9 → 8 → 7 → 6 → 5 → 4 → 3 → 2

https://truckmanualshub.com/

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
14	Field coil resistance (20°C {68°F})	2.6 to 3.4 Ω	—	Replace

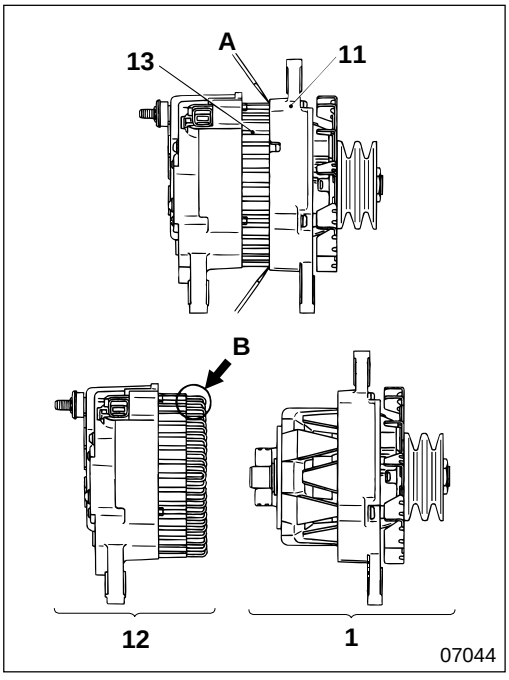
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Nut (pulley mounting)	132 to 162 {98 to 120, 13.5 to 16.5}	—

Lubricant

Location	Points of application	Kinds	Quantity
6	Rear bearing inner periphery	Engine oil	As required
7	Front bearing installation part of rotor assembly	Engine oil	As required
9	Front bearing outer periphery	Engine oil	As required



◆ Service procedure

1 Rotor and front bracket assembly

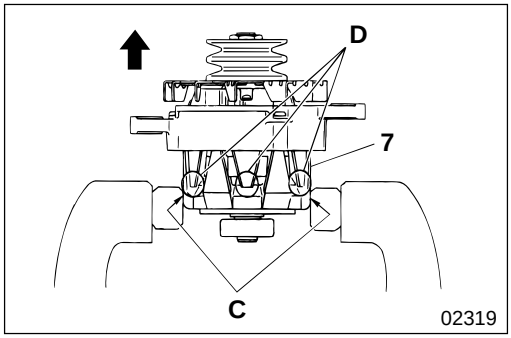
[Removal]

- Insert screwdriver **A** between front bracket **11** and stator assembly **13**.
- Use screwdriver **A** to pry rotor and front bracket assembly **1** away from stator and rear bracket assembly **12**.

CAUTION

Be careful not to insert the screwdriver too deep or it will damage coil B of stator assembly 13 and might cause a short-circuit.

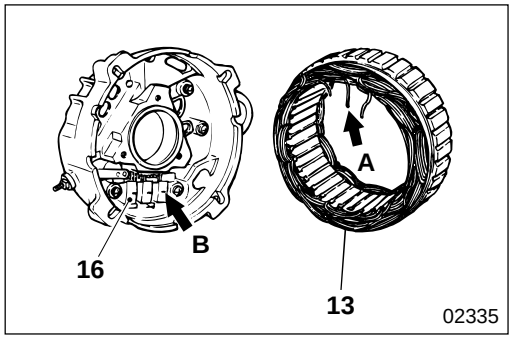
https://truckmanualshub.com/



[Disassembly]

CAUTION

Make sure, when you hold rotor assembly 7 in a vise, to grip root C of the core claws. Gripping claws D can damage them.



13 Stator assembly

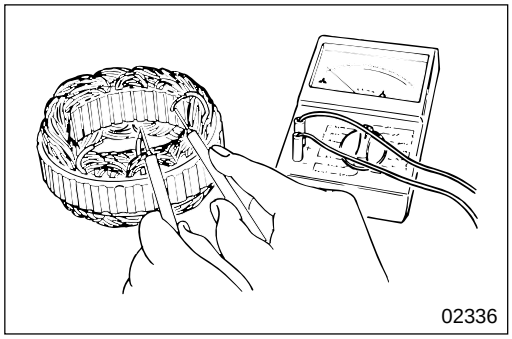
[Removal and installation]

- Disconnect lead **A** of stator assembly **13** from rectifier **16**. The lead is soldered to diode **B** of rectifier **16** at three points.

CAUTION

Make sure that you desolder within five seconds because the diode is heat sensitive.

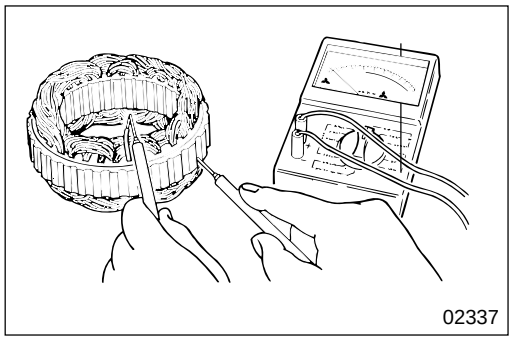
- To install, follow the removal sequence in reverse.



[Inspection]

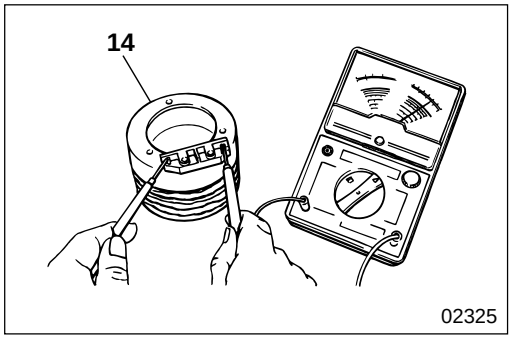
(1) Continuity of each lead wire

- Make sure that each lead wire has continuity.
- If there is no continuity, the lead wire is broken. Replace stator assembly **13**.



(2) Continuity between lead wires and the core

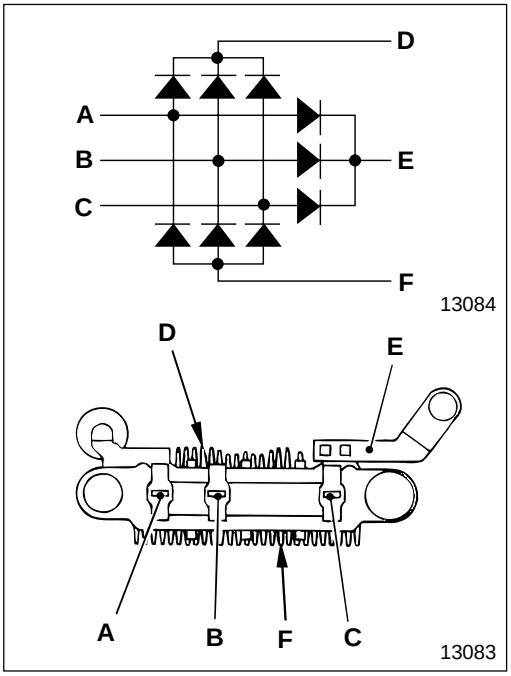
- Make sure that there is no continuity between lead wires and the core.
- If there is continuity, replace stator assembly **13**, since it might be short-circuited.



14 Inspection of field coil

- Measure the resistance between the terminals of field coil **14**.
- If the measured value deviates from the standard value, replace field coil **14**.

https://truckmanualshub.com/



16 **Inspection of rectifier**

- Inspect whether the diode inside rectifier **16** functions properly, and if any fault is found, replace the rectifier.
  A, **B**, **C** : Lead connecting area of stator coil
  D, **E** : Heat sink area
  F : Regulator connecting area
- Inspect the rectifier twice, before and after the ⊕ side and ⊖ side of the tester have been changed over.

CAUTION⚠

When inspecting using a tester, the current becomes weaker than the usual current flowing through rectifier 16. Therefore, an incomplete resistance value might be indicated.
Also, this tendency increases as the range of the tester gets smaller. Therefore, use as big a range as possible.

● Engine Preheating Circuit

This circuit improves the engine starting performance when the engine coolant temperature is low. The preheating system is controlled by multipurpose timing control unit **5**. 📖 P54-9-2

Basic preheating operation

Operation mode 📖 P54-2-8

When engine coolant temperature is low (Approximately 60°C {140°F} or less)

- Position of starter switch **1** : ON
  1→2 (F20)→5→Ground
  |—Ⓔ→11→Ground

  Multipurpose timing control unit **5** detects the engine coolant temperature.
- When the engine coolant temperature is low, multipurpose timing control unit **5** outputs glow relay activation signal Ⓒ.

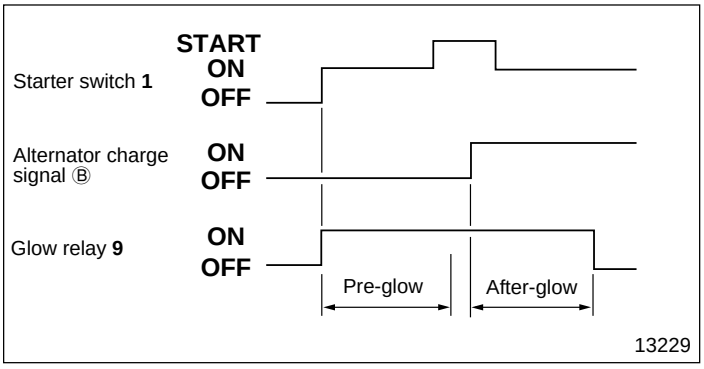
  5—Ⓒ→9→Ground

- Glow relay **9** operates to feed power to glow plug **10** and lights up engine preheating indicator lamp **7**.
  8→9 (contact point)—→10→Ground
  →7—Ⓓ→5→Ground

When engine coolant temperature is high (Approximately 60°C {140°F} or more)

- Position of starter switch 1 : ON
  1→2 (F20)→5→Ground
  |—Ⓔ→11→Ground

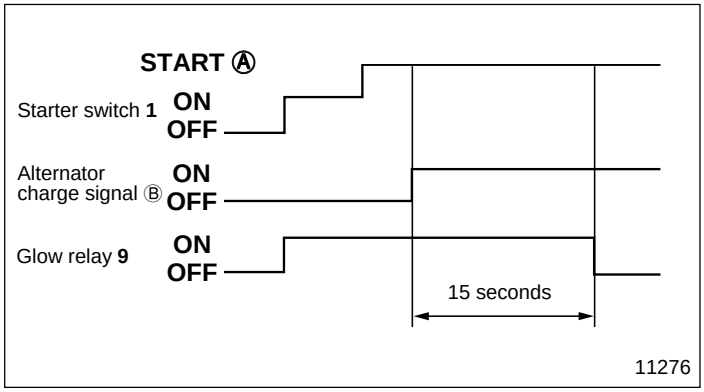
  Multipurpose timing control unit **5** detects the engine coolant temperature.
- When the engine coolant temperature is high, multipurpose timing control unit **5** does not output glow relay activation signal Ⓒ, so no preheating is performed.



Pre-glow and after-glow

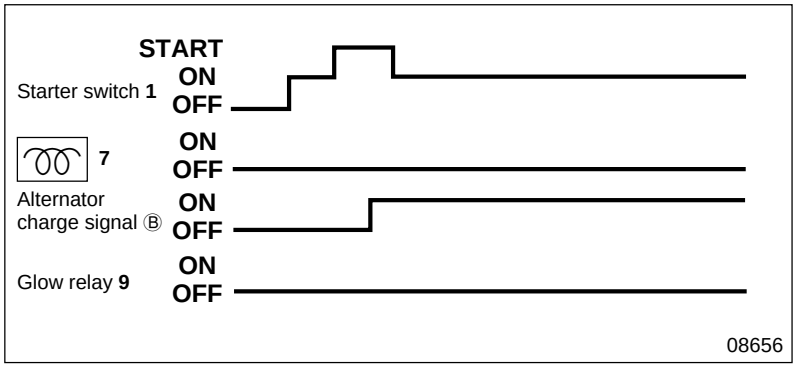
- There are two types of preheating: one is pre-glow, performed before starting the engine; the other is after-glow, performed after starting the engine. They are both controlled by start signal Ⓐ and alternator charge signal Ⓑ.

https://truckmanualshub.com/



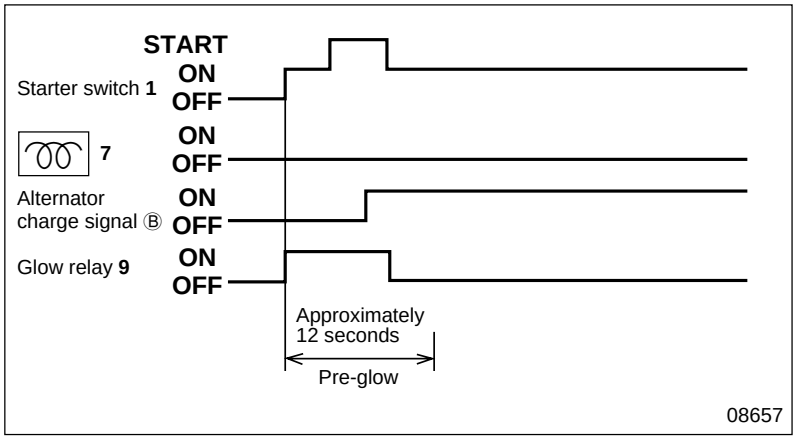
Fail-safe

- If the contacts of the glow relay driving relay in multipurpose timing control unit **5** are welded, preheating indicator lamp 7 **7** blinks to alert the driver of the fault.
- When all of the following conditions are satisfied, the fail-safe function turns off glow relay **9**.
  - Coolant temperature is 60°C {140°F} or less.
  - Engine start signal Ⓐ is ON.
  - Alternator charge signal Ⓑ is ON for **15** seconds.

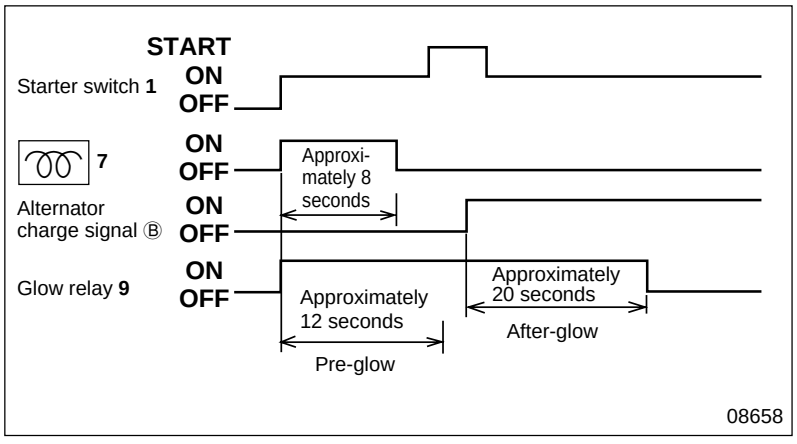


Operation mode

- Where the engine coolant temperature is 60°C {140°F} or more.



- Where the engine coolant temperature is 0 to 60°C {32 to 140°F}.



- Where the engine coolant temperature is 0°C {32°F} or less.

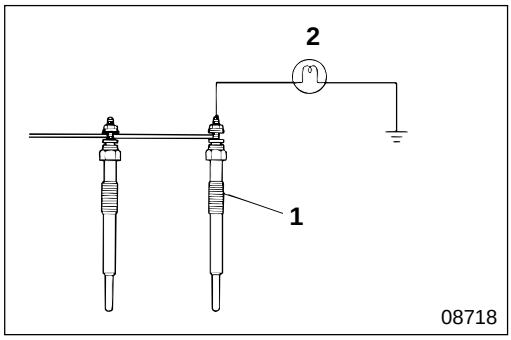
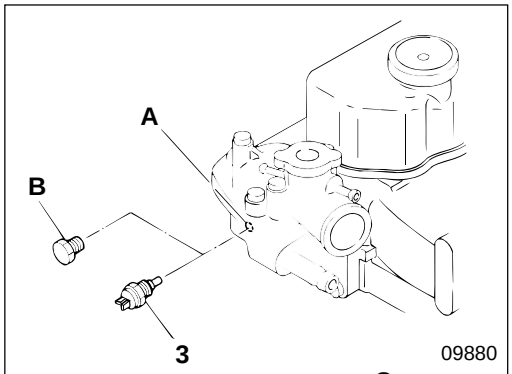
Inspection of Engine Preheating System

Service standards

Location	Maintenance item			Standard value	Limit	Remedy
—	Pre-glow time	Water temperature	60°C {140°F} or more	Does not pre-glow	—	Inspect
			0 to 60°C {32 to 140°F}	Approximately 12 seconds	—	
			0°C {32°F} or less	Approximately 12 seconds	—	
	After-glow time	Water temperature	60°C {140°F} or more	Does not after-glow	—	
			0 to 60°C {32 to 140°F}	Does not after-glow	—	
			0°C {32°F} or less	Approximately 20 seconds	—	
	Indicator lamp lighting time	Water temperature	60°C {140°F} or more	Does not light	—	
			0 to 60°C {32 to 140°F}	Does not light	—	
			0°C {32°F} or less	Approximately 8 seconds	—	



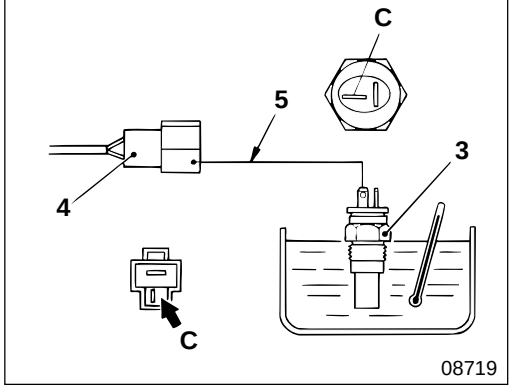
- Turn the starter switch OFF.
- Turn the cold start switch OFF.
- Connect inspection lamp **2** to glow plug **1**.



- Remove water temperature sensor **3** from the engine and plug sensor mounting part **A** with plug **B** (M16×1.5 mm).
  Removal and installation of water temperature sensor **3** Gr 14
- Connect extension harness **5** between water temperature sensor **3** and connector **4**.

NOTE

Connect extension harness 5 to terminal C of the multipurpose timing control unit.



- Put water temperature sensor **3** into a container filled with water.
- Carry out the following inspection while changing the water temperature in the container. If any fault is found, inspect each unit.

(1) Inspection of pre-glow time and indicator lamp lighting time

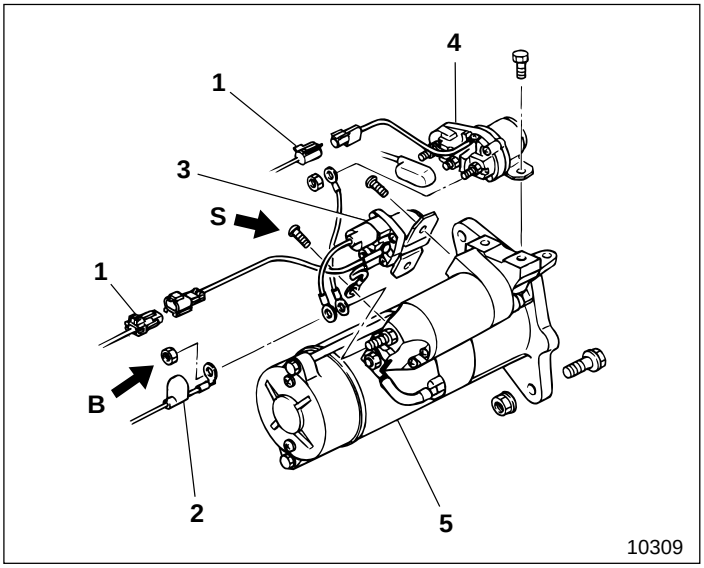
Turn the starter switch ON but do not start the engine. Make sure that the pre-glow time and the indicator lamp lightning time at each water temperature conform to the standard value.

- For pre-glow time inspection, measure the lighting time of inspection lamp **2**.
- For indicator lamp lightning time inspection, measure the lighting time of lamp within the meter cluster directly.

(2) Inspection of after-glow time

Start the engine and measure the lighting time of inspection lamp **2** from the point lamp within the meter cluster goes off, and make sure that the after-glow time conforms to the standard value.

https://truckmanualshub.com/



● **Removal sequence**

1 Chassis harness
2 Starter cable (to battery connection)
3 Starter relay
4 Glow relay
5 Starter P54-2-14

B : To terminal B
S : To terminal S

WARNING⚠

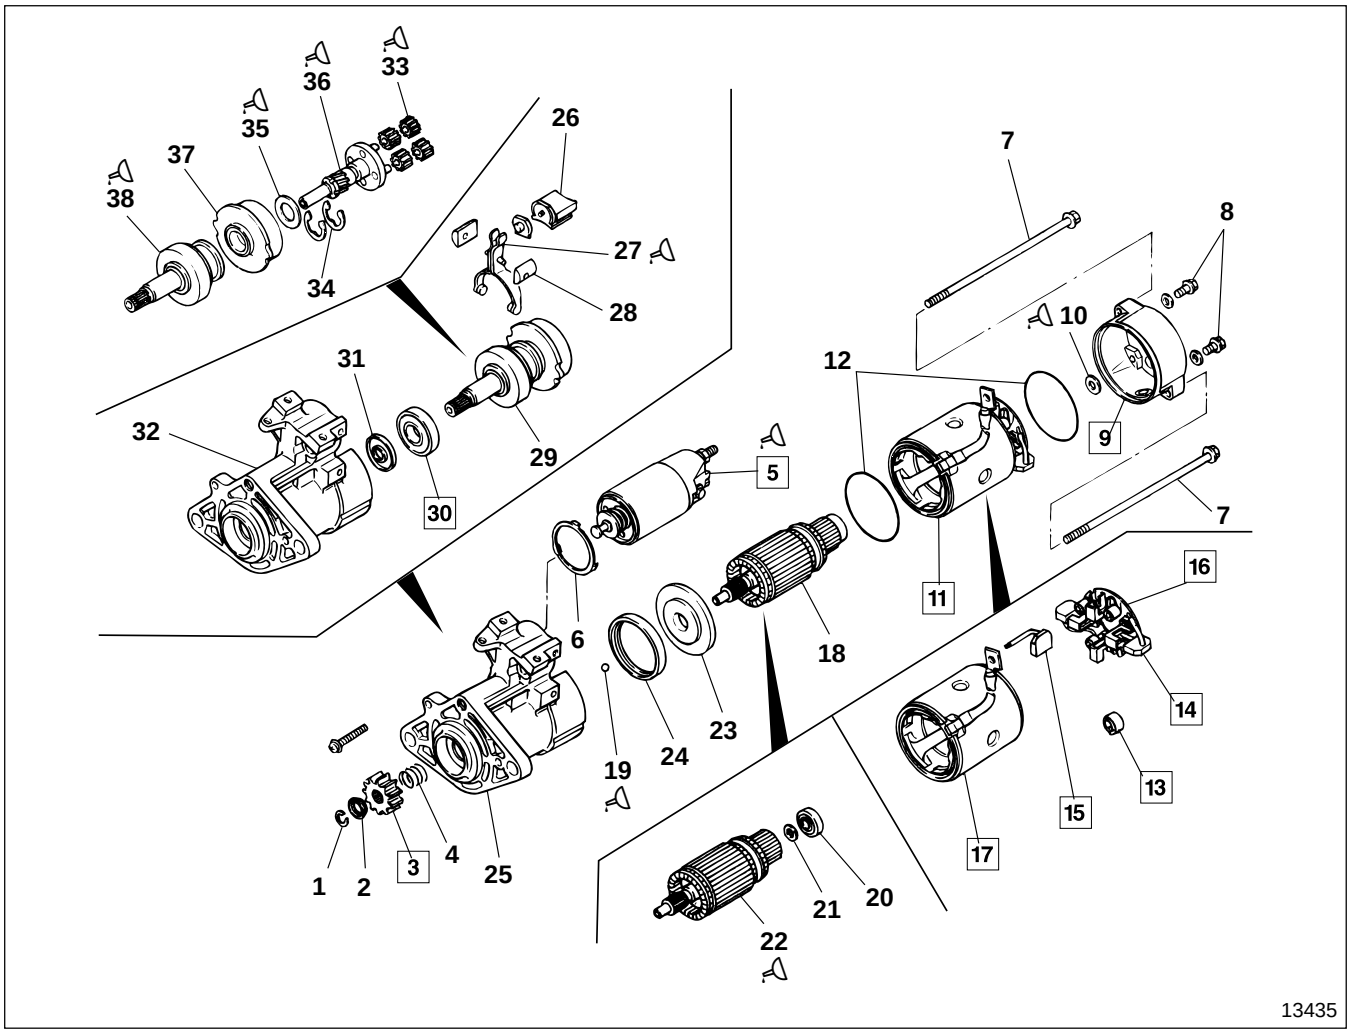
Never touch the starter with tools when you remove the harness from terminal B. This is because voltage is always supplied to it from starter cable 2, and you will short-circuit the starter. Before removing the harness from terminal B, remove the ⊖ battery terminal and tape it up to insulate it.

● **Installation sequence**

Follow the removal sequence in reverse.

https://truckmanualshub.com/

Starter



● **Disassembly sequence**

1 Stopper ring
2 Pinion stopper
3 Pinion
4 Spring
5 Magnetic switch
6 Shim
7 Bolt
8 Screw
9 Rear bracket
10 Conical washer
11 Yoke and brush holder assembly
12 Rubber packing
13 Brush spring
14 Brush ⊖
15 Brush ⊕
16 Brush holder assembly
17 Yoke assembly
18 Armature assembly
19 Ball
20 Rear bearing
21 Washer
22 Armature
23 Cover
24 Rubber packing
25 Front bracket assembly
26 Rubber packing
27 Lever
28 Bushing
29 Gear shaft and overrunning clutch assembly
30 Front bearing
31 Dust seal
32 Front bracket
33 Planetary gear
34 Washer
35 Washer
36 Gear shaft
37 Internal gear
38 Overrunning clutch

https://truckmanualshub.com/

CAUTION⚠

- **When removing yoke and brush holder assembly 11, make sure you first pull out brushes 14, 15 from brush holder assembly 16 to avoid damaging the commutator of armature 22.**
- **Do not remove bearings 20, 30 unless they are faulty.**
- **Make sure you do not drop armature assembly 18 when you remove yoke and brush holder assembly 11 from front bracket assembly 25.**
- **Be careful not to lose ball 19, since it might come out together with armature assembly 18 when you remove it.**

NOTE

- **You do not have to remove pinion 3 when you disassemble or inspect only the motor assembly, for example: when inspection of the brush assembly is required.**
- **Except for the above, make sure you remove pinon 3 before disassembling any parts.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

Whenever magnetic switch 5 has been replaced, be sure to adjust the pinion gap.

● **Inspection after assembly**

🕮 P54-2-16

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
—	Pinion gap		0.5 to 2.0 {0.02 to 0.079}	—	Adjust
—	No-load characteristic (11 V when current flowing)	Current	180 A or less	—	Inspect
		Revolutions per minute	3800 rpm or more	—	
13	Pressure of brush spring		29 to 39 N {6.6 to 8.8 lbf, 3 to 4 kgf}	20 N {4.4 lbf, 2 kgf}	Replace
14, 15	Length of brush		18 {0.71}	11 {0.43}	Replace
18	Armature assembly	Outer diameter of commutator	32 {1.26}	31.4 {1.24}	Replace
		Deflection of commutator periphery	—	0.05 {0.002} or more	Replace
		Mica depth between segments	0.5	0.2 {0.0079} or less	Correct or replace

Lubricant

Location	Points of application	Kinds	Quantity
5	Contact surface between lever and magnetic switch	Multipurpose grease [NLGI No.2 Li soap]	As required
10	Conical washer	Multipurpose grease [NLGI No.2 Li soap]	As required
19	Ball	MOLYKOTE ® AG650	As required
22, 33	Teeth of armature gear and planetary gear	MOLYKOTE ® AG650	As required

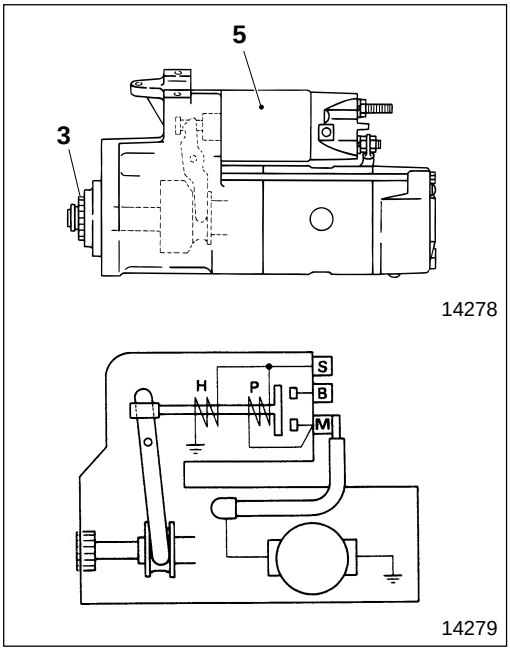
27	Friction surfaces of lever and overrunning clutch	Multipurpose grease [NLGI No.2 Li soap]	As required
35	Washer	MOLYKOTE ® AG650	As required
36, 38	Friction surfaces of gear shaft and overrunning clutch	Multipurpose grease [NLGI No.2 Li soap]	As required
38	Spline of overrunning clutch	Multipurpose grease [NLGI No.2 Li soap]	As required

https://truckmanualshub.com/



◆ Service procedure

● **Inspection after assembly**

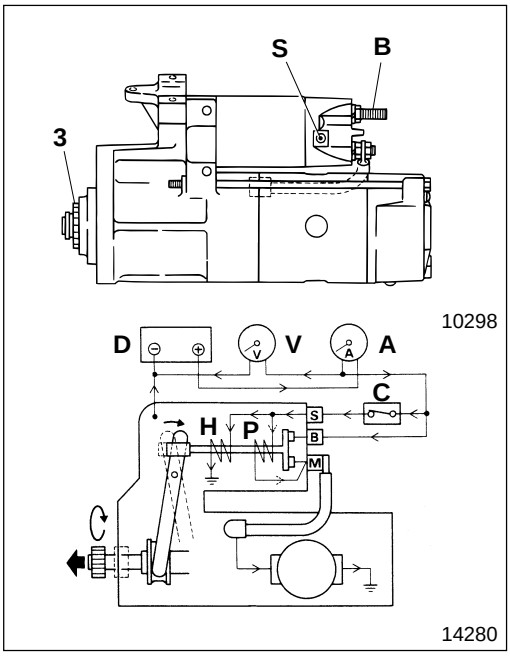
Inspections after assembling the starter should be carried out with current fed to the starter.

WARNING

- **Do not touch pinion 3 because it jumps out and turns when current is fed to the starter.**
- **Take care not to burn your hand, magnetic switch 5 might be hot after inspection.**

CAUTION

- **The current feeding time to the starter should be within 10 seconds at pull-in coil P side and within 30 seconds at holding coil H side. If the current feeding time exceeds these limits the coil might burn due to overheating.**
- **When current is flowing into the starter, a current of over 100 amperes is fed. When inspecting, use thick cable, such as a booster cable, and make secure connections.**



(1) Performance test

- Connect the starter as illustrated.
  A : Ammeter
  B : Terminal B of starter
  C : Switch
  D : DC power supply (12 volts)
  S : Terminal S of starter
  V : Voltmeter
- Set the voltage to **11** volts DC.

CAUTION

Up to 12 volts can be loaded.

- The following work should be done with current fed to the starter. You must complete the full procedure of measuring the intensity of the current and the number of revolutions within 30 seconds.
  - Turn switch **C** ON and feed current into the starter. In this state, pinion **3** jumps out and rotates.

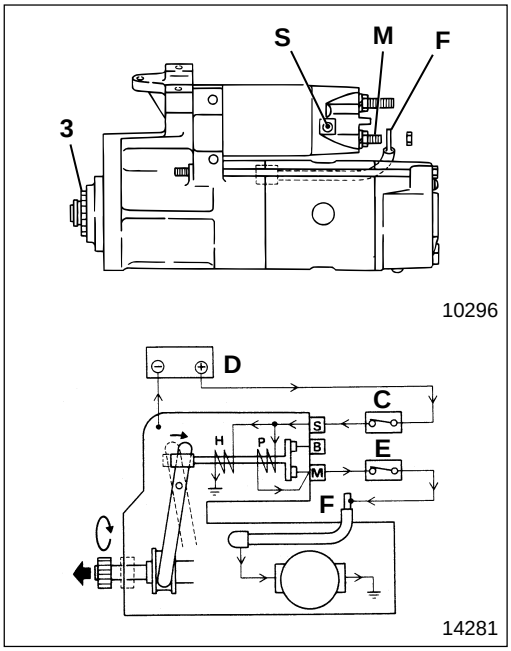
CAUTION

When switch C is turned ON, current is fed both to pull-in coil P and holding coil H. When a large amount of current is fed into terminal M from DC power supply D, via terminal B of the starter, the current stops flowing into the pull-in coil but continues to flow into the holding coil.

To avoid burning the holding coil, be sure to carry out the performance test within 30 seconds.

  - Measure the intensity of the current and the number of revolutions of the starter. Train a strobe light on pinion **3** to measure the revolutions.
  - Turn switch **C** OFF to stop current to the starter.
- If the measured value deviates from the standard value, disassemble the starter again and inspect it.

https://truckmanualshub.com/



(2) Pinion gap

[Inspection]

- Connect the starter as illustrated.

C : Switch	**F** : Cable
D : 12 volts DC	**M** : Terminal M of starter
E : Switch	**S** : Terminal S of starter

- The following work should be done with current fed to the starter. You must complete the full procedure for measuring the pinion gap within 30 seconds.
  - Turn switches **C** and **E** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.

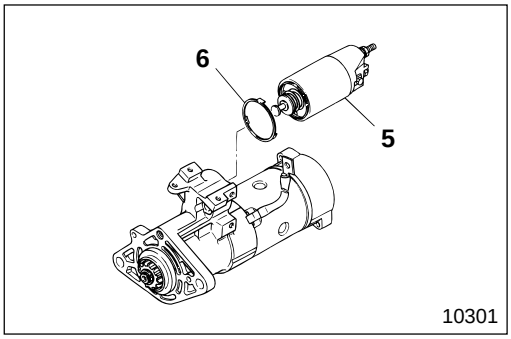
  - Within five seconds of pinion **3** rotating, turn switch **E** OFF to stop rotation of the pinion.

CAUTION

When switches C and E are turned ON, current is fed both to pull-in coil P and holding coil H. The circuit is wired in such a way that the voltage is not applied to terminal B of the starter, so the current continues to flow into the pull-in coil while pinion 3 rotates.

To avoid burning the pull-in coil, be sure to turn switch E OFF within five seconds of the pinion rotating.

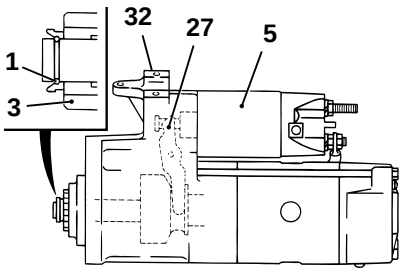
  - Push the tip of overrunning clutch **38** lightly and measure pinion gap **G** in the axial direction.
  - Turn switch **C** OFF to stop current to the starter.
- If the measured value deviates from the standard value, adjust the pinion gap as follows.



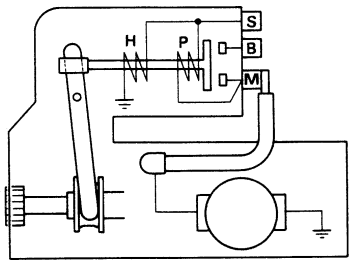
[Adjustment]

- Remove magnetic switch **5** from front bracket assembly **25**.
- Change the thickness of shims **6**. Adding shims decreases pinion gap **G**.
- Type of shim : 0.5, 0.25 mm {0.02, 0.0098 in.}

https://truckmanualshub.com/



14283



14279

3 Pinion

[Removal]

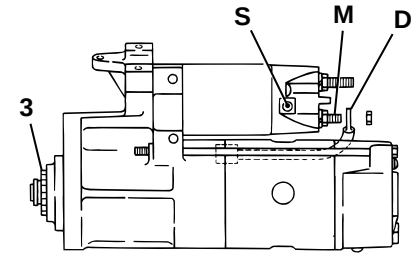
Feed current to the starter and protrude pinion **3** to remove the pinion.

WARNING

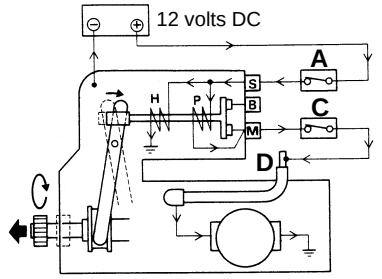
- **Do not touch pinion 3 because it jumps out and turns when current is fed to the starter.**
- **Take care not to burn your hand, magnetic switch 5 might be hot after inspection.**

CAUTION

- **The current feeding time to the starter should be within 10 seconds at pull-in coil P side and within 30 seconds at holding coil H side. If the current feeding time exceeds these limits, the coil might burn due to overheating.**
- **Before making pinion 3 jump out, be sure to feed current to the starter to obtain the correct state. If current is not fed to the starter and lever 27 is pulled to protrude the pinion, front bracket 32 or the lever might be damaged due to the shock produced on removal of stopper ring 1.**
- **The current, when fed to the starter, is over 100 amperes. When inspecting, use thick cable, such as a booster cable, and make secure connections.**



10296

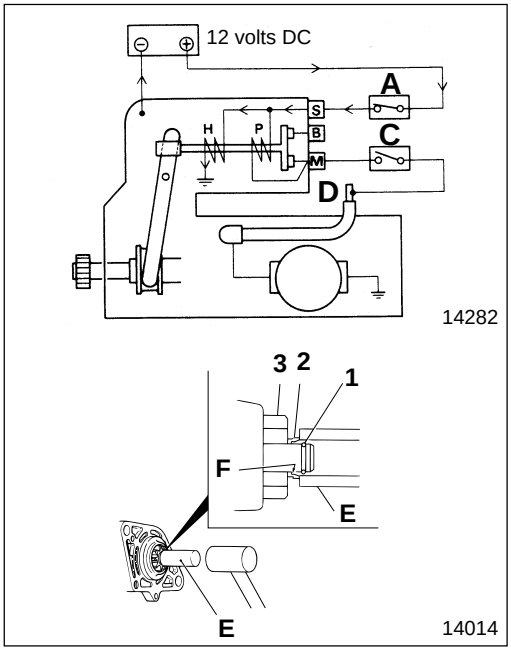


14281

- Connect the starter as illustrated.
  A : Switch
  C : Switch
  D : Cable
  M : Terminal M of starter
  S : Terminal S of starter

- The following work should be done while current is flowing into the starter. You must complete the full procedure for removing pinion **3** within 30 seconds.
  - Turn switches **A** and **C** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.

https://truckmanualshub.com/



- Within 5 seconds of pinion **3** rotating, turn switch **C** OFF to stop rotation of the pinion.

CAUTION

When switches A and C are turned ON, current is fed both to pull-in coil P and holding coil H. The circuit is wired in such a way that the voltage is not applied to terminal B of the starter, so the current continues to flow into the pull-in coil while pinion 3 rotates.

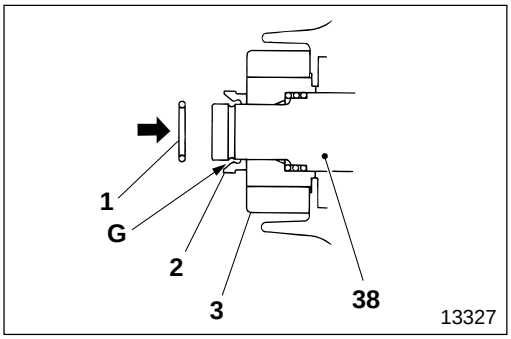
To avoid burning the pull-in coil, be sure to turn switch C OFF within five seconds after the pinion rotates.

- Apply pipe-shaped tool **E** onto pinion stopper **2**.
- Hit tool **E** lightly using a mallet to remove stopper ring **1** from ring groove **F** of pinion stopper **2**.
- Remove stopper ring **1** and pinion **3**.
- Turn switch **A** OFF to stop current to the starter.

NOTE

When the current to the starter is stopped, stopper ring 1 might fall back into ring groove F of pinion stopper 2 because pinion 3 is pushed inside.

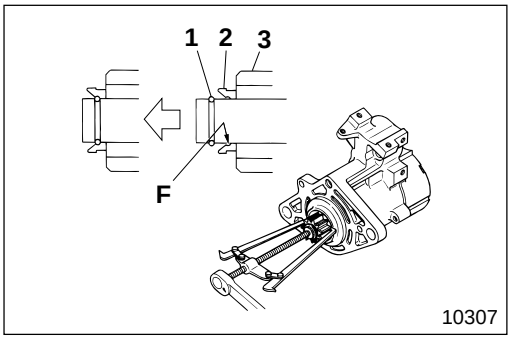
If this occurs, feed current to the starter again and carry out the work.



[Installation]

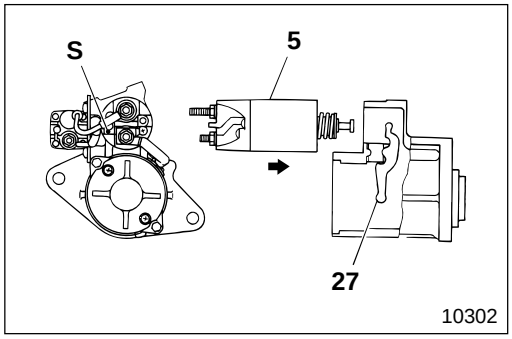
When installing pinion **3**, it is not necessary to feed current to the starter.

- Install pinion stopper **2** and pinion **3** onto overrunning clutch **38** in the direction as illustrated.
- Fit stopper ring **1** into ring groove **G** of overrunning clutch **38**.



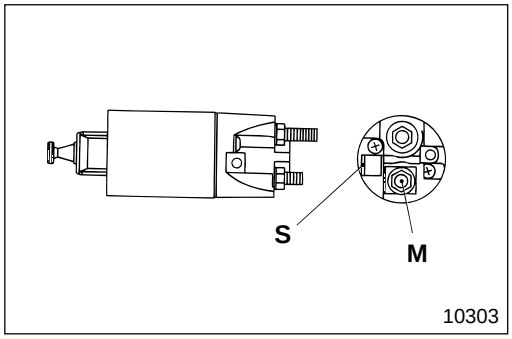
- Pull pinion **3** firmly and set stopper ring **1** on groove **F** of pinion stopper **2**.

https://truckmanualshub.com/



5 Magnetic switch

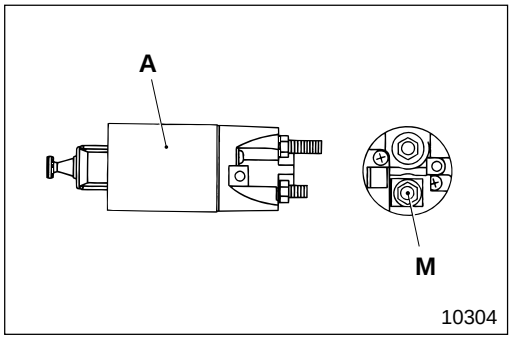
[Installation]
Install magnetic switch **5** to lever **27**, with terminal **S** facing the direction as illustrated.



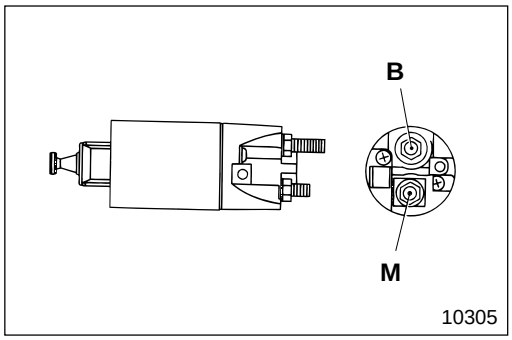
[Inspection]

(1) Testing for coil discontinuity

- Make sure that there is continuity between terminals **S** and **M**.
- If there is no continuity, replace magnetic switch **5**.

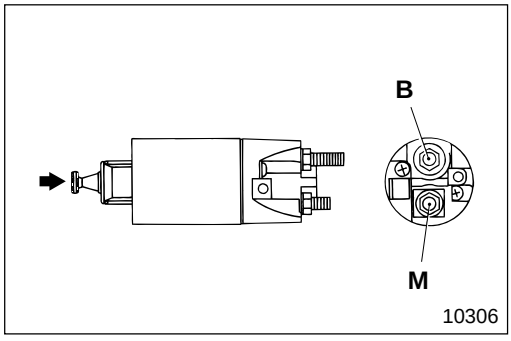


- Make sure that there is continuity between terminal **M** and body **A** of magnetic switch **5**.
- If there is no continuity, replace magnetic switch **5**.



(2) Inspection of welded connections

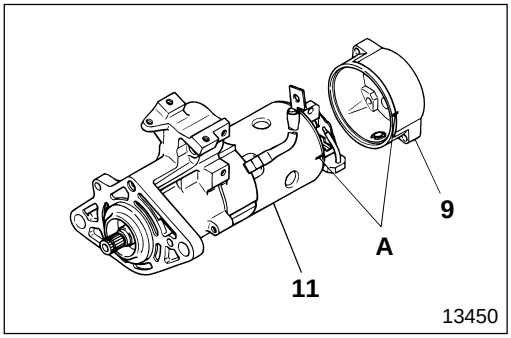
- Make sure that there is no continuity between terminals **B** and **M**.
- If there is continuity, replace magnetic switch **5**.



(3) Inspection of connections

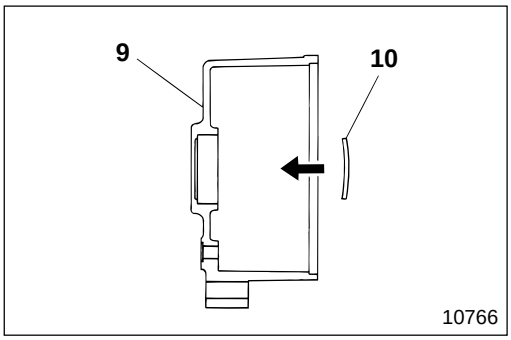
- Push the tip of magnetic switch **5** to close the internal connection.
- Make sure that there is continuity between terminals **B** and **M**.
- If there is no continuity, replace magnetic switch **5**.

https://truckmanualshub.com/



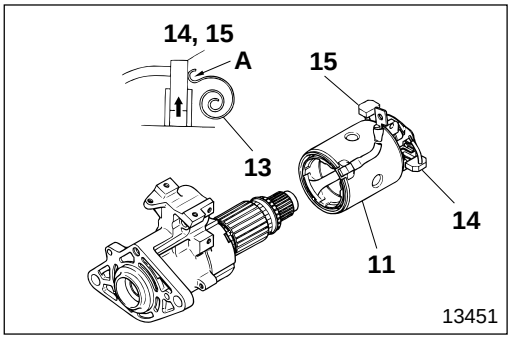
9 **Installation of rear bracket**

A : Alignment mark



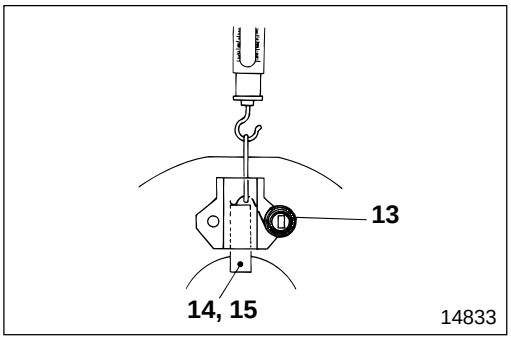
10 **Installation of conical washer**

Install conical washer **10** to rear bracket **9** in the direction as illustrated.



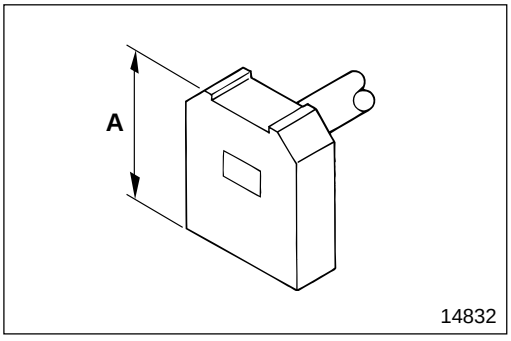
11 **Removal and installation of yoke and brush holder assembly**

- Pull point **A** of brush spring **13** to pull out brushes **14**, **15**.
- After pulling out brushes **14**, **15**, secure them with brush spring **13** as illustrated.
- Remove yoke and brush holder assembly **11**.
- For installation, reverse the removal procedure.



13 **Inspection of brush spring**

- Use new brushes **14**, **15** and measure the load when brush spring **13** is detached from the brushes.
- If the measured value is higher than the limit, replace brush spring **13**.



14 **15** **Inspection of brush**

(1) Length of brush

If the measured value is lower than the limit, replace brushes **14**, **15**.

A : Length of brush

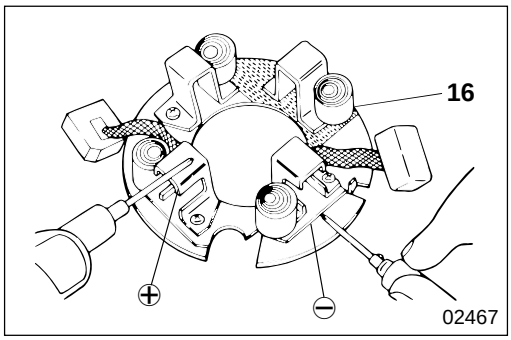
NOTE

To replace brush ⊖ 14, replace entire brush holder assembly 16.

(2) Contact surface with commutator

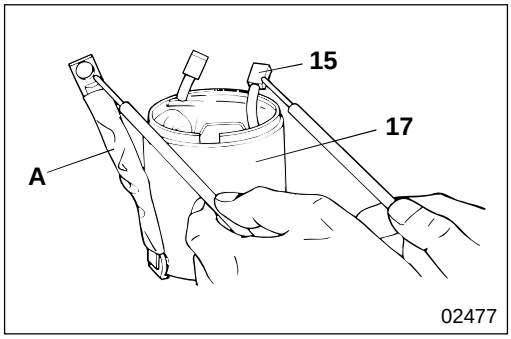
If the surface where the brushes contact the commutator is rough or is worn unevenly, polish the surface with emery paper (300 to 500 grit).

https://truckmanualshub.com/



16 Inspection of brush holder assembly

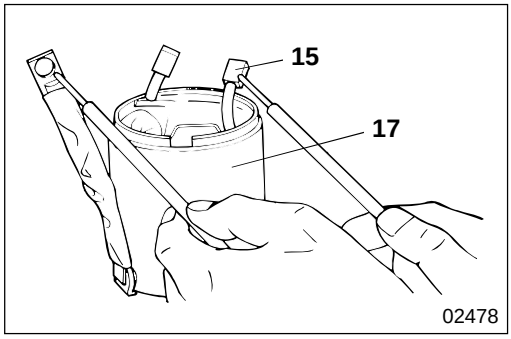
- Make sure that there is no continuity between the ⊕ side of the brush holder and the ⊖ side of the holder plate.
- If there is continuity, they are grounded. Replace brush holder assembly **16**.



17 Inspection of yoke assembly

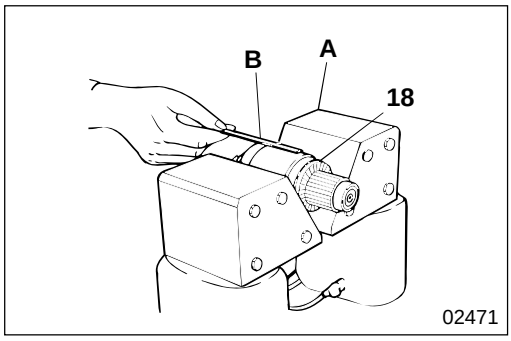
(1) Testing for coil disconnection

- Make sure that there is continuity between cable **A** and brush ⊕ **15**.
- If there is no continuity, they are disconnected. Replace brush ⊕ **15** or yoke assembly **17**.



(2) Testing for coil grounding

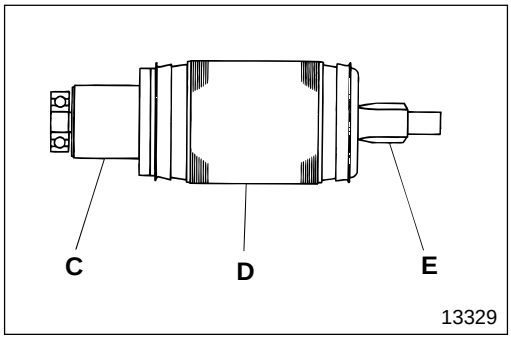
- Make sure that there is no continuity between yoke assembly **17** and brush ⊕ **15**.
- If there is continuity, they are short-circuited. Inspect the insulated point. If it is hard to repair, replace brush ⊕ **15** or yoke assembly **17**.



18 Inspection of armature assembly

(1) Testing for coil short-circuit

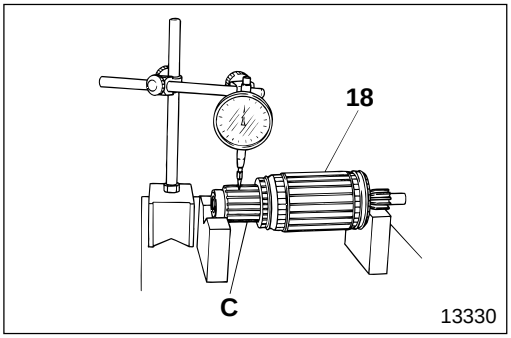
- Place iron rod **B** parallel to armature assembly **18**.
  A : Armature tester
- Rotate armature assembly **18** slowly.
- If iron rod **B** is pulled or shakes, it indicates that armature assembly **18** is short-circuited, so replace it.



(2) Testing for coil grounding

- Make sure that there is no continuity between commutator **C** and core **D** (or shaft **E**).
- If there is continuity between them, they are short-circuited. Replace armature assembly **18**.

https://truckmanualshub.com/

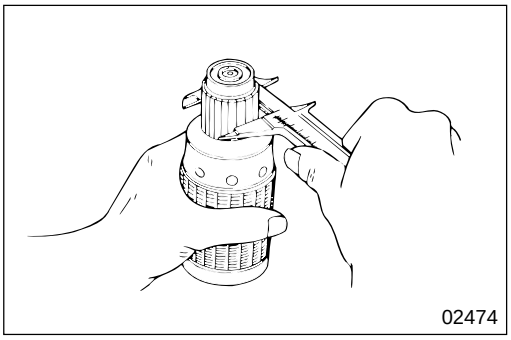


(3) Deflection of commutator

If the measured value is higher than the limit, adjust the outer diameter of commutator **C** within the limit.

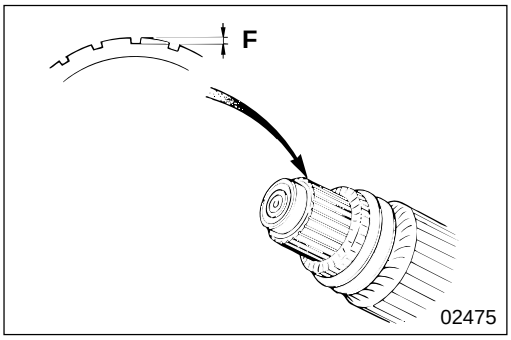
(4) Rough commutator surface

- If the surface is rough or has stepped wear, polish the surface with emery paper (300 to 500 grit).
- After polishing, check deflection of commutator **C**.



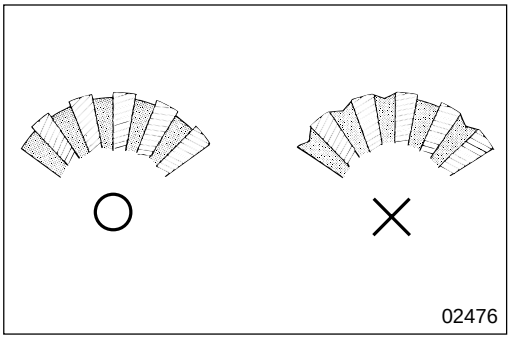
(5) Outer diameter of commutator

If the measured value is higher than the limit, replace armature assembly **18**.



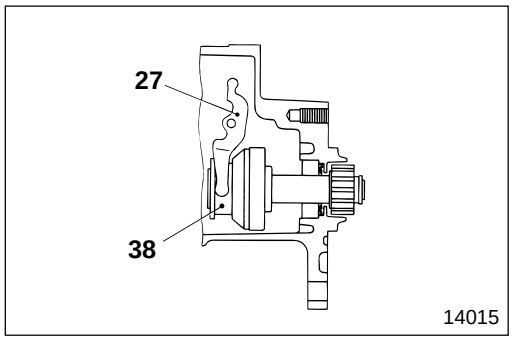
(6) Mica depth between segments

- If the measured value is lower than the limit, correct or replace armature assembly **18**.
  F : Mica depth



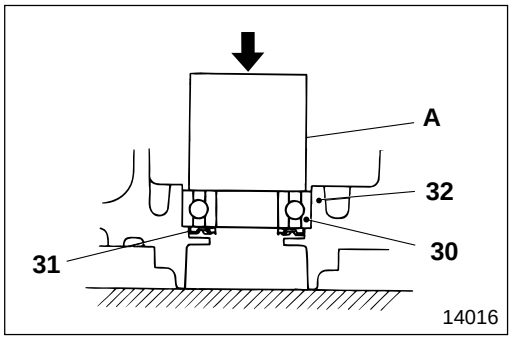
- If the mica is worn as illustrated, replace armature assembly **18**.
  ○ : Good
  × : Faulty

https://truckmanualshub.com/



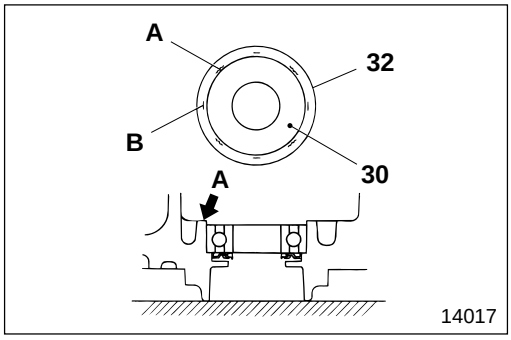
27 **Installation of lever**

Install lever **27** onto overrunning clutch **38** in the direction as illustrated.



30 **Installation of front bearing**

- Install dust seal **31** before press-fitting front bearing **30**.
- Press-fit front bearing **30** into front bracket **32** using pipe-shaped tool **A**.

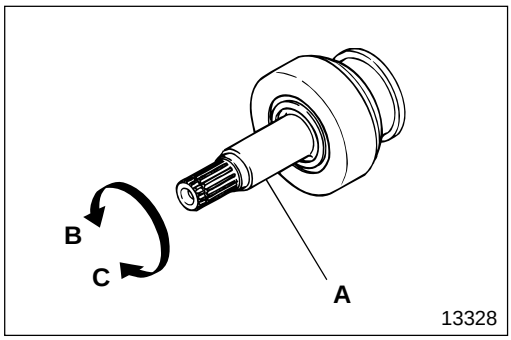


- Re-caulk front bracket **32**.

NOTE

Do not re-caulk previously caulked points B.

A : Caulking points (4 points)



38 **Installation of overrunning clutch**

Carry out the following inspection. If any fault is found, replace overrunning clutch **38**.

- Make sure that shaft **A** turns smoothly when turned in direction **B**.
- Make sure that shaft **A** locks when turned in direction **C**.

◆ Service procedure

1 Starter switch

Carry out the following inspection. If any fault is found, replace starter switch **1**. Gr 37

(1) Inspection of continuity

- Follow the table below to inspect continuity:

	AP2A		AN6A		
	②	①	③	④	②
LOCK					
• (OFF)					
ACC	○		○		
ON	○	○	○	○	
START	○	○	○	○	○
	B	M	A	F	S

○—○ : There is continuity between terminals ○ and ○.

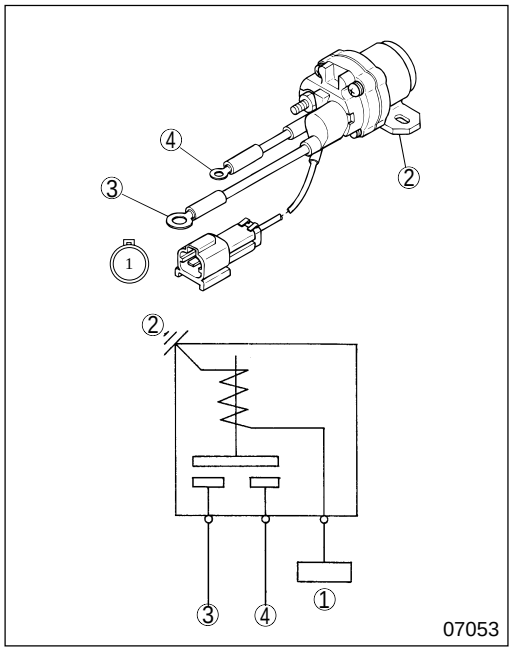
- If any fault is found, replace starter switch **1**. Gr 37

(2) Inspection of key interlock solenoid

Feed voltage to terminals ① and ② of connector AN2A to inspect the motion of starter key **D**.

E : Interlock solenoid

Voltage between terminals ① and ②	Motion of starter key D	Condition of plunger C
12 V DC	Turns from ACC to START	Plunger C is locked and starter key D cannot be pulled out
0 V DC	Turns from LOCK to START	Plunger C is free and starter key D can be pulled out



3 Inspection of starter relay

- Follow the table below to inspect continuity :

	③	④	①	②
No current			○	○
Current	○	○	⊕	⊖

○—○ : There is continuity between terminals ○ and ○.

⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace starter relay **3**. 54-2-13

220 ENGINE PREHEATING CIRCUIT

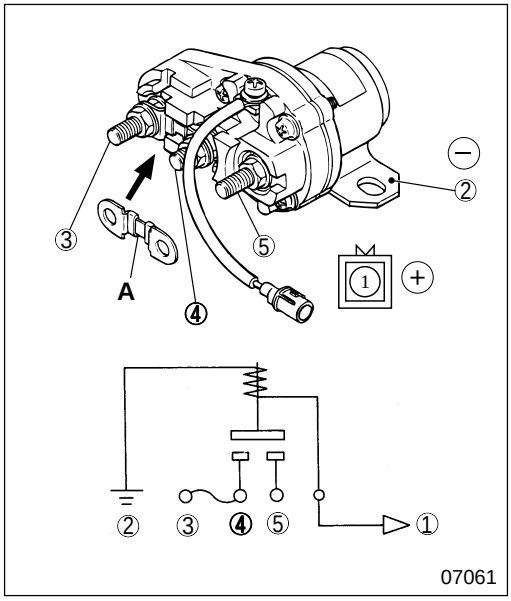
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
8	Resistance of glow plug (at ambient temperature)	1.0 Ω (Reference value)	—	Replace

◆ Service procedure



7 Inspection of glow relay

(1) Inspection of fuse

If any fault is found, replace fuse **A** (127 amperes).

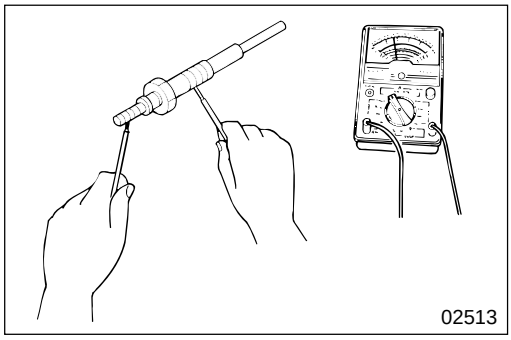
(2) Inspection of body

- Follow the table below to inspect continuity :

	③	④	⑤	①	②
No current	○—○				
Current	○—○	—○	—○	⊕	⊖

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.
A : Fuse (127 amperes)

- If any fault is found, replace glow relay **7**.



8 Inspection of glow plug

- Measure the resistance of glow plug **8** as illustrated.
- If the measured value deviates from the standard value, replace glow plug **8**.

1 Sealed beam unit (HIGH beam)
2 Sealed beam unit (HIGH/LOW beam)
3 Screw (HIGH/LOW beam, vertical adjustment)
4 Screw (HIGH/LOW beam, horizontal adjustment)
5 Screw (HIGH beam, vertical adjustment)
6 Screw (HIGH beam, horizontal adjustment)
7 Housing
8 Extension spring
9 Extension spring

- The headlamp unit consists of sealed beam units **1, 2** separately installed in housing **7**. Sealed beam unit **1** is for HIGH beam, and sealed beam unit **2** is for HIGH/LOW beam.
- The headlamp aiming can be adjusted by changing the installation angle of sealed beam units **1, 2**.
- To adjust the installation angle of sealed beam unit **1**, turn screws **5, 6**. Extension spring **8** sets the angle of the sealed beam unit.
- To adjust the installation angle of sealed beam unit **2**, turn screws **3, 4**. Extension spring **9** sets the angle in the same way as for sealed beam unit **1**.

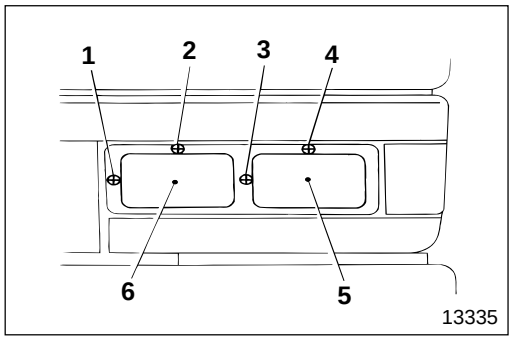
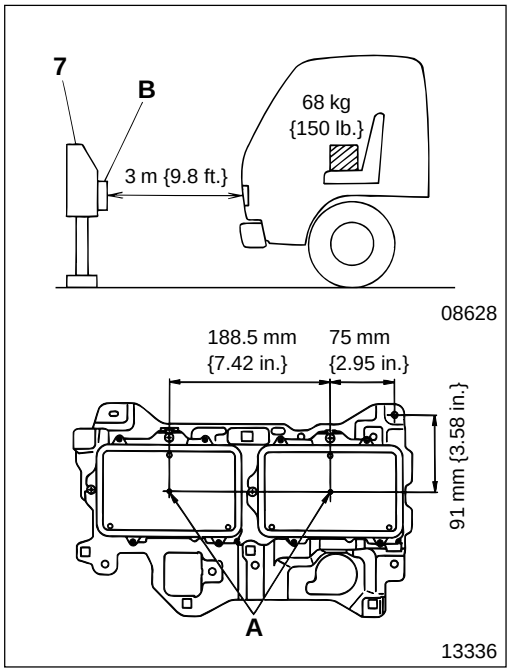
Headlamp Aiming



1 Screw (HIGH beam, horizontal adjustment)
2 Screw (HIGH beam, vertical adjustment)
3 Screw (HIGH/LOW beam, horizontal adjustment)
4 Screw (HIGH/LOW beam, vertical adjustment)
5 HIGH/LOW beam
6 HIGH beam

To adjust the headlamp move the optical axis of HIGH beam **6** by turning screws **1, 2**; and move the optical axis of HIGH/LOW beam **5** by turning screws **3, 4.** You need to adjust the aiming of both the HIGH and the HIGH/LOW beams on both the left and right headlamps.



(1) Preparatory work before adjustment

- Park the vehicle on a level place.

WARNING

You must put wheel chocks securely in place.

- Unload the vehicle and make sure no one is in it.
- Inflate the tires to specified pressure. Gr 31
- Seat one person or an equivalent mass (68 kg {150 lb}) in the vehicle.
- Start the engine and check that the battery is being charged.
- Place convergent headlamp tester **7** in line with HIGH beam **6** or HIGH/LOW beam **5** of either the left or right headlamp at a distance of **3** m {9.8 ft}.
- Align the center of convergent lens **B** of convergent headlamp tester **7** with lamp center **A** of HIGH beam **6** or HIGH/LOW beam **5** . (The illustration shows a left headlamp.)
- When adjusting one headlamp, mask the other to avoid light leakage.

(2) Adjustment

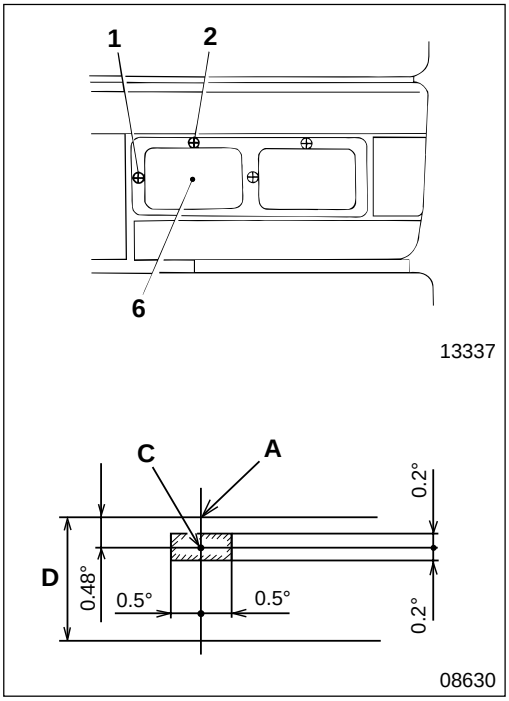
WARNING

Do not mask a lit headlamp for more than 10 minutes or the heat generated might cause a fire.

CAUTION

When completing the adjustment using screws 1 to 4, the action must be finished in the tightening direction.

https://truckmanualshub.com/



● **Adjustment of HIGH beam unit**

- Turn on HIGH beam **6**.
- Adjust as follows so that the optical axis (maximum illumination point) **C** of HIGH beam **6** is located as illustrated:
  - Vertical adjustment: Turn screw **2** to adjust.
  - Horizontal adjustment: Turn screw **1** to adjust.

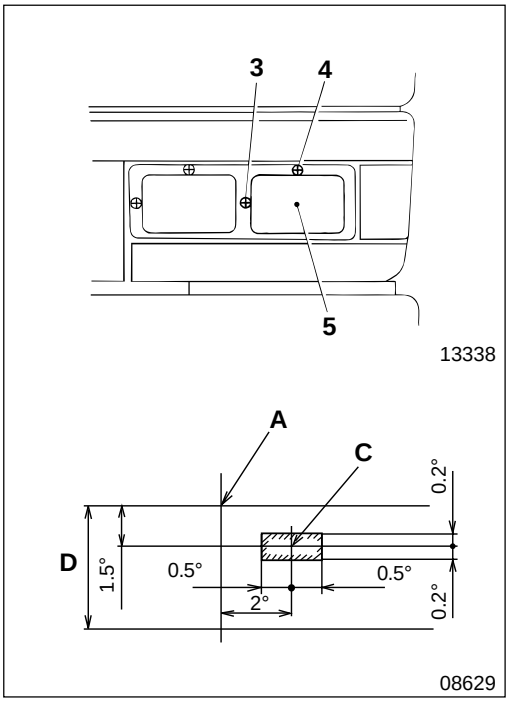
  The aiming of both left and right HIGH beams **6** should be adjusted to the position as illustrated.

▨ : Tolerance of adjustment

A : Center of headlamp
D : Height from the ground to headlamp center

	Adjusting direction for optical axis			
	Upward	Downward	Leftward	Rightward
Screw 1	—	—	(Counter-clockwise)	(Clockwise)
Screw 2	(Clockwise)	(Counter-clockwise)	—	—

Turning direction of the screws in the table is as viewed from the front.



● **Adjustment of HIGH/LOW beam unit**

- Turn on the LOW beam of HIGH/LOW beam **5**.
- Adjust as follows so that the optical axis (maximum illumination point) **C** of HIGH/LOW beam is located as illustrated:
  - Vertical adjustment: Turn screw **4** to adjust.
  - Horizontal adjustment: Turn screw **3** to adjust.

  The aiming of both left and right HIGH/LOW beams **5** should be adjusted to the position as illustrated.

▨ : Tolerance of adjustment

A : Center of lamp

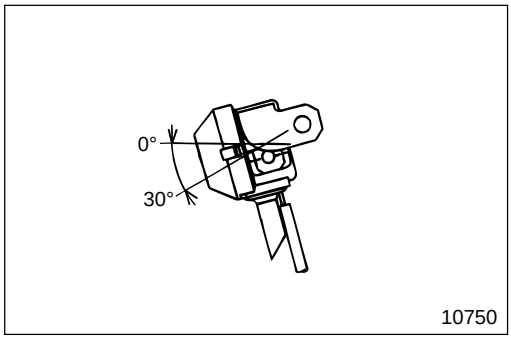
10748

◆ Service procedure

4 **Back buzzer**

[Inspection]

- Make sure that back buzzer **4** sounds intermittently when you apply 12 volts DC between terminals ① and ②.
- If any fault is found, replace back buzzer **4**.



10750

[Installation]

Install back buzzer **4** to the frame within the angle range as illustrated.

CAUTION

Be careful to install back buzzer 4 within the illustrated angle range or the back buzzer will not be drained normally.

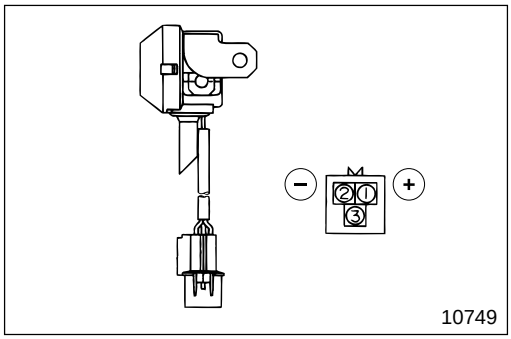
◆ Service procedure



10749

5 **Back buzzer**

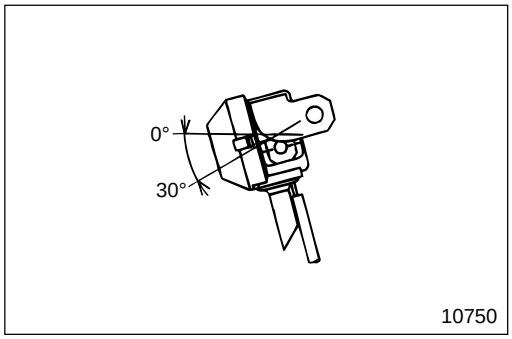
[Inspection]
Carry out the following inspection.
If any fault is found, replace back buzzer **5**.

(1) Back buzzer terminal

Make sure that back buzzer **5** sounds intermittently when you apply 12 volts DC between terminals ① and ②.

(2) Automatic transmission reverse buzzer terminal

Make sure that there is continuity between terminals ② and ③.



10750

[Installation]
Install back buzzer **5** to the frame within the angle range as illustrated.

CAUTION

Be careful to install back buzzer 5 within the illustrated angle range or the back buzzer will not be drained normally.

			At 2500 rpm	2500±110 rpm		
			At 3000 rpm	3000±110 rpm		
			At 4500 rpm	4500±125 rpm		

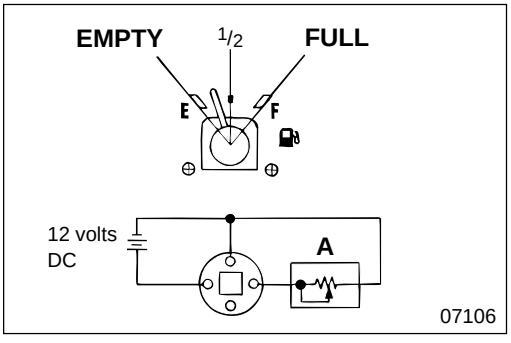
◆ Service procedure

3 Inspection of speedometer

- Measure the indication area of speedometer **3** at various speed ranges using a speedometer tester.
- If the measured value deviates from the standard value, carry out the following inspection. If the inspection does not indicate a fault, replace speedometer **3**.

(1) Inspection of installed condition of speedometer cable

Gr 22 < Manual transmission >
Gr 23 < Automatic transmission >



4 Inspection of fuel gauge

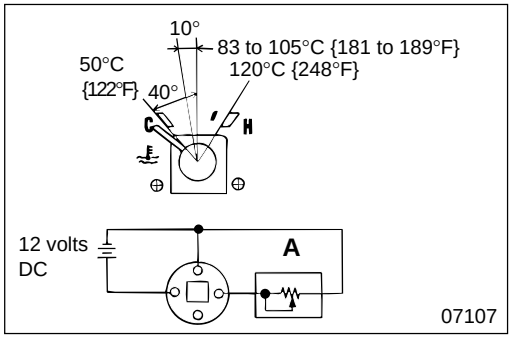
- Connect a variable resistor to fuel gauge **4** as illustrated.
  A : Variable resistor
- Measurement order
  FULL → 1/2 → EMPTY

NOTE

The movement of the gauge needle is subject to hysteresis (oscillation). Be sure to measure following the measurement order.

- Increase the value of variable resistor **A** gradually from 0 Ω.
- Measure the resistance respectively when the needle of fuel gauge **4** indicates FULL, 1/2 and EMPTY.
- If the measured value deviates from the standard value, replace fuel gauge **4**.

https://truckmanualshub.com/



5 **Inspection of water temperature gauge**

- Connect a variable resistor to water temperature gauge **5** as illustrated.
  A : Variable resistor
- Measurement order
  Low temperature → High temperature

NOTE

The movement of the gauge needle is subject to hysteresis (oscillation). Be sure to measure following the measurement order.

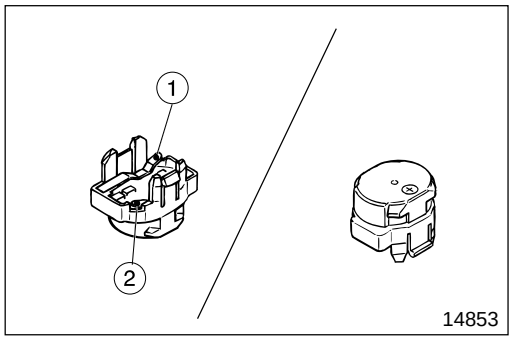
- Increase the value of variable resistor **A** gradually from 0 Ω.
- Measure the resistance respectively when the needle of water temperature gauge **5** indicates 50°C {122°F}, 83 to 105°C {181 to 189°F}, and 120°C {248°F}.
- If the measured value deviates from the standard value, replace water temperature gauge **5**.

6 **Inspection of tachometer**

- Measure the indication area of tachometer **6** at various revolution ranges using an engine revolution counter.
- If the measured value deviates from the standard value, carry out the following inspection. If the inspection does not indicate a fault, replace tachometer **6**.

(1) Inspection of the engine revolution sensor body 801

(2) Inspection of the installed condition of the engine revolution sensor Gr 13



12 **Inspection of meter warning buzzer**

- Apply 12 volts DC between terminals ① and ② to check if meter warning buzzer **12** sounds.
- If any fault is found, replace meter warning buzzer **12**.

CAUTION

- **Be careful not to mix up ⊕ and ⊖ when you apply voltage to meter warning buzzer 12, because this would damage the meter warning buzzer.**
- **Make sure you check ⊕ and ⊖ on the top of meter warning buzzer 12.**

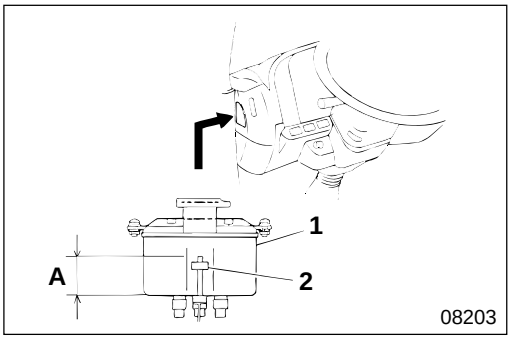
Inspection of Brake Fluid Level Switch

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
—	Warning lamp lighting position for brake fluid level switch	FE 639	41.0±3 {1.61±0.12}	—	Replace
		FE649	49.5 {1.95}		



- Start engine.
- Drain the brake fluid gradually from fluid tank assembly **1**.

CAUTION

If brake fluid is spilt on any part of the vehicle, wipe it off immediately, since the solvent in the fluid can damage the paintwork.

- Measure height **A** of brake fluid level switch **2** when BRAKE warning lamp within the meter cluster lights.
- If the measured value deviates from the standard value, remove and check fluid tank assembly **1**.

Removal and installation : Gr 42
Inspection : 515

515 BRAKE WARNING CIRCUIT

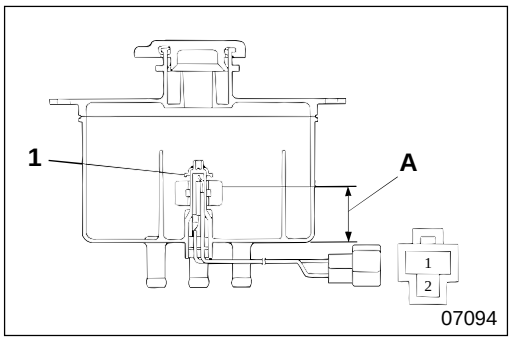
Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1	Continuity position of brake fluid level switch	FE 639	41.0±3 {1.61±0.12} (Equivalent to 120 cm^3 {7.32 cu. in., 120 cc})	—	Replace
		FE 649	49.5 {1.95} (Equivalent to 170±15 cm^3 {10.4±0.92 cu. in., 170±15 cc})	—	Replace
5	Vacuum switch operating pressure		$-47^{+3.3}_{-4.0}$ kPa {$-13.78^{+0.98}_{-1.18}$ in.Hg, -350^{+25}_{-30} mmHg}	—	Replace

◆ Service procedure



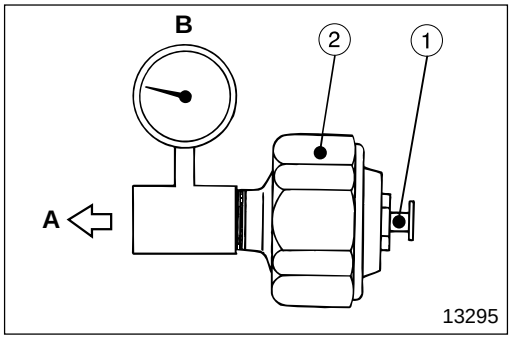
1 Inspection of brake fluid level switch

- Drain the brake fluid gradually from the fluid tank assembly.

CAUTION ⚠

If brake fluid is spilt on any part of the vehicle, wipe it off immediately, since the solvent in the fluid can damage the paintwork.

- Measure height **A** of brake fluid level switch **1** when continuity is present between terminals ① and ②.
- If the measured value deviates from the standard value, replace the fluid tank assembly. Gr 42



5 Inspection of vacuum switch

Carry out the following inspection. If any fault is found, replace vacuum switch **5**.

- Make sure that there is no continuity between terminals ① and ② (Body) when negative pressure **A** is not applied to vacuum switch **5**.
- Apply negative pressure **A** to vacuum switch **5** gradually starting from 0 kPa {0 in.Hg, 0 mmHg}.
  Measure the negative pressure when continuity is present between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.

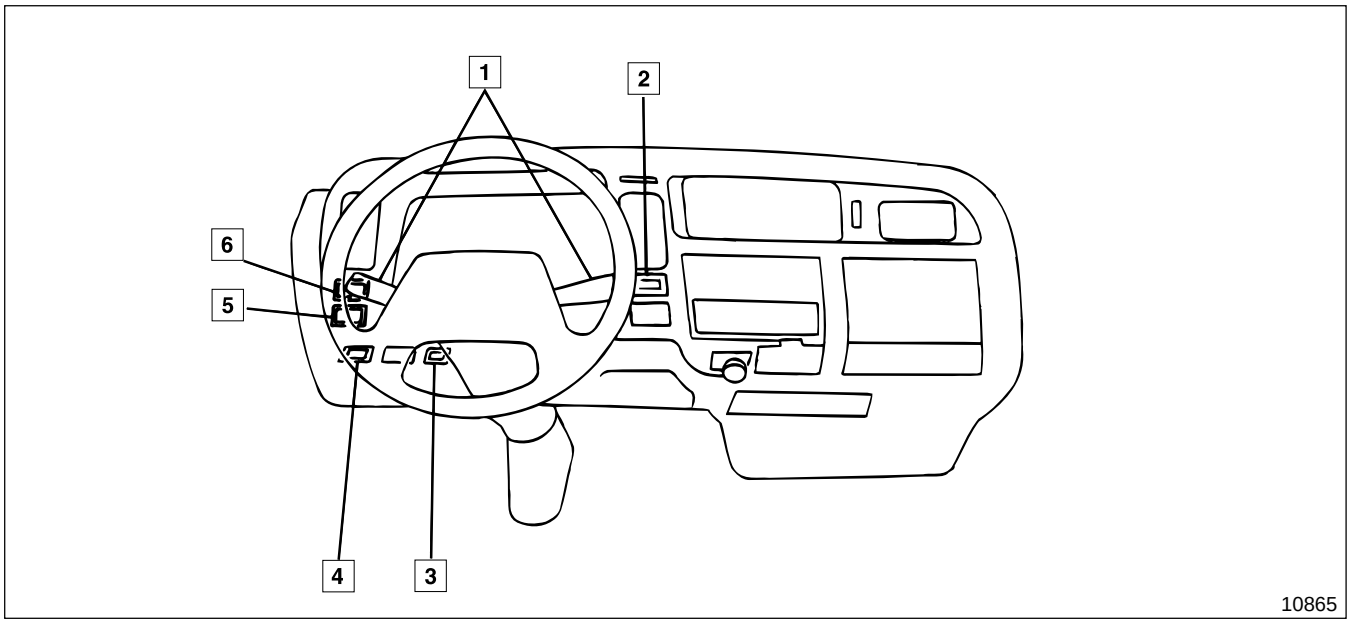
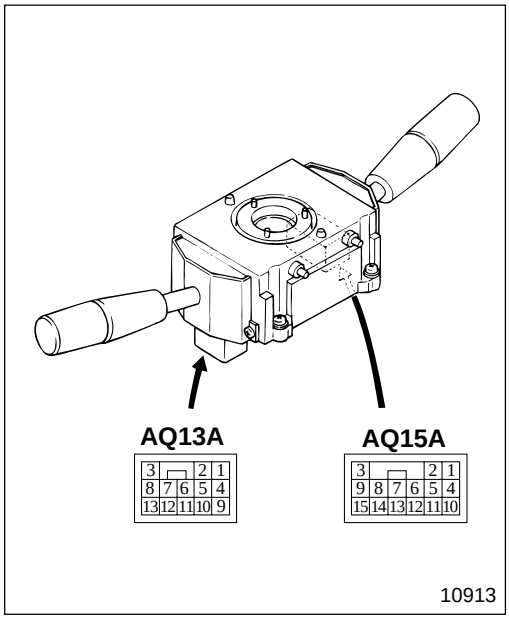
601 SWITCH

Installation Position



1 Combination switch
2 Van body dome light switch
3 Engine oil level switch
4 Rheostat switch
5 Power mode switch < Automatic transmission >
6 Warming up switch



◆ Service procedure

1 Inspection of combination switch

- Operate combination switch **1**.
- Check for continuity between connector terminals, referring to the connector connection table.
  There is continuity between terminals ○ and ○ in the table.

- If any fault is found, replace combination switch **1**.

https://truckmanualshub.com/

AQ13A Connector connection table

		①	②	③	⑦	⑧	⑨	⑩	⑪	Body ground	Internal connection
Lighting switch	OFF										
	I	○						○			
	II	○						○			○

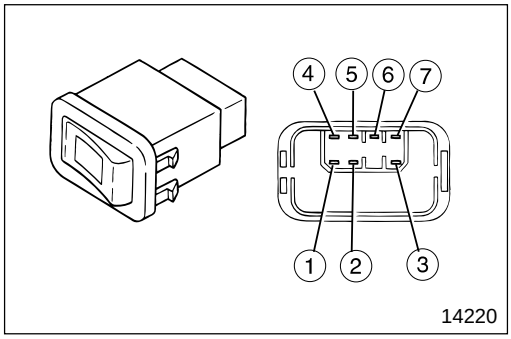
		①	②	③	⑤	⑥	⑦	⑧	⑨	⑭	⑮
Wiper switch	OFF										
	INT (intermittent)			○							○
	LO (LOW)		○								○
	HI (HIGH)	○	○								○
	WASH (washer)									○	○
Exhaust brake switch	OFF										
	ON				○	○					
Hazard switch	OFF										
	ON						○	○	○		

https://truckmanualshub.com/



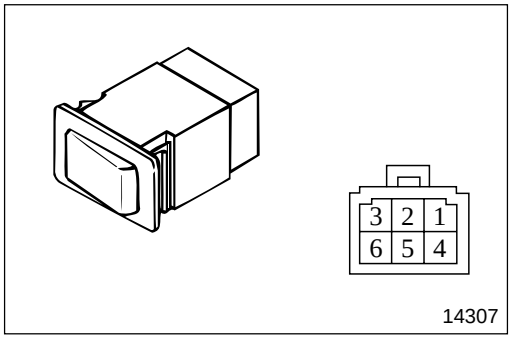
2 **Inspection of van body dome light switch**

- Follow the table below to inspect continuity:

	①	⑤	⑦	LED (Operation indication light)	③
ON	○	○	○		○
OFF					

○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace van body dome light switch **2**.



3 **Inspection of engine oil level switch**

- Follow the table below to inspect continuity:

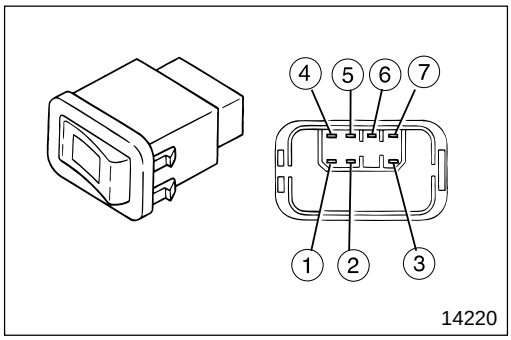
	①	③
ON(CHECK)	○	○
OFF		

○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace engine oil level switch **3**.

4 **Inspection of rheostat switch**

- Rheostat switch **4** contains a control circuit, because of this it is difficult to inspect rheostat switch **4** independently, therefore you should inspect the rheostat switch indirectly, by inspecting the system harness and the related parts.
- If no fault is found in the related parts but the system is faulty, replace rheostat switch **4**.



5 **Inspection of power mode switch**

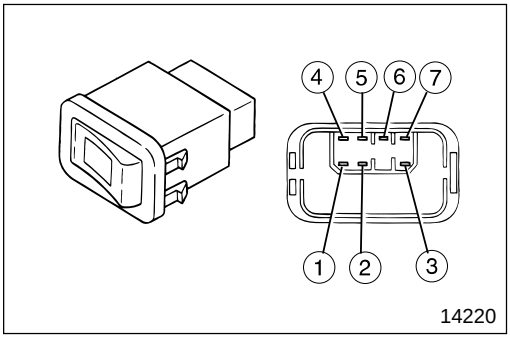
- Follow the table below to inspect continuity:

	①	⑤	⑦	LED (Operation indication light)	③
PWR	○	○	○		○
ECO					

○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace power mode switch **5**.

https://truckmanualshub.com/



6 **Inspection of warming up switch**

- Follow the table below to inspect continuity:

	①	⑤
ON	○—○	
OFF		

○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace warming up switch **6**.

23 Automatic transmission control unit Gr 23

* : Passenger's seat

Service standards

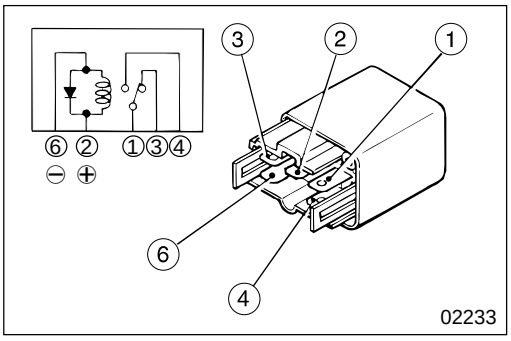
Location	Maintenance item	Standard value	Limit	Remedy
21	Exhaust brake cut relay time lag (Time lag relay)	10±3.5 sec.	—	Replace

https://truckmanualshub.com/

◆ Service procedure

1 8 to 10 23 Inspection of control unit

Since it is difficult to check each unit separately, judge the soundness of each unit indirectly by checking switches harnesses and related parts in the system.



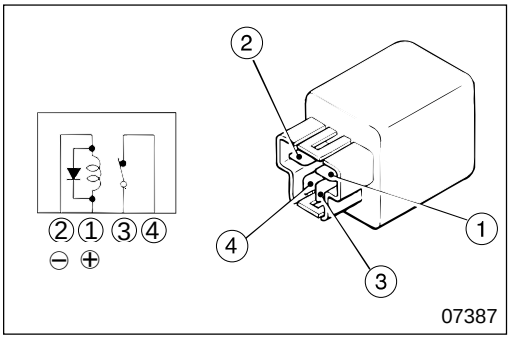
2 4 6 19 Inspection of relay (Open type 5-pin)

- Follow the table below to inspect continuity:

	①	②	③	④	⑥
No current	○	○	○		○
Current	○	⊕	○		⊖

○——○ : There is continuity between terminals ○ and ○.
⊕——⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.



3 5 7 Inspection of relay (Close type 4-pin)

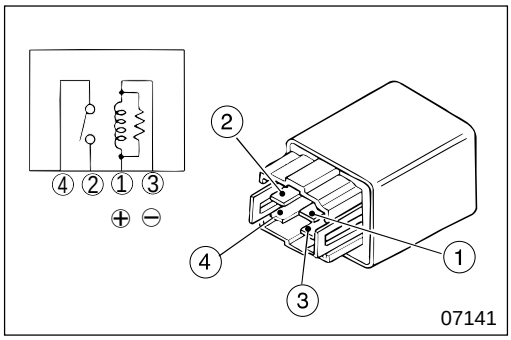
- Follow the table below to inspect continuity:

	①	②	③	④
No current	○	○		
			○	○
Current	⊕	⊖	◌	◌

○——○ : There is continuity between terminals ○ and ○.
⊕——⊖ : Indicates that 12 volts DC is applied to the line between the terminals.
◌----◌ : Indicates that the continuity between the terminals is lost.

- If any fault is found, replace the relay.

https://truckmanualshub.com/



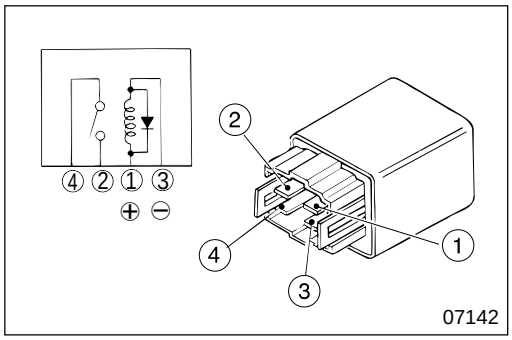
11 to 16 Inspection of relay (Open type 4-pin)

- Follow the table below to inspect continuity:

	①	②	③	④
No current	○		○	
Current	⊕		⊖	○

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.



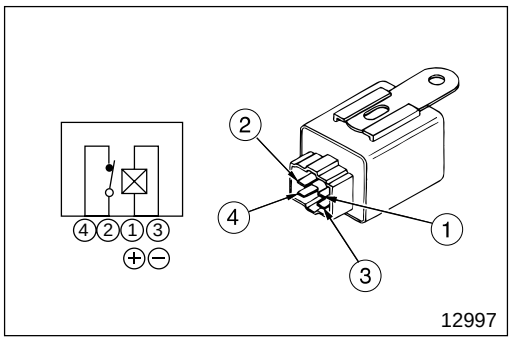
17 18 20 22 Inspection of relay (Open type 4-pin)

- Follow the table below to inspect continuity:

	①	②	③	④
No current	○		○	
Current	⊕		⊖	○

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.



21 Inspection of relay (Close type 4-pin time lag relay)

- Follow the table below to inspect continuity:

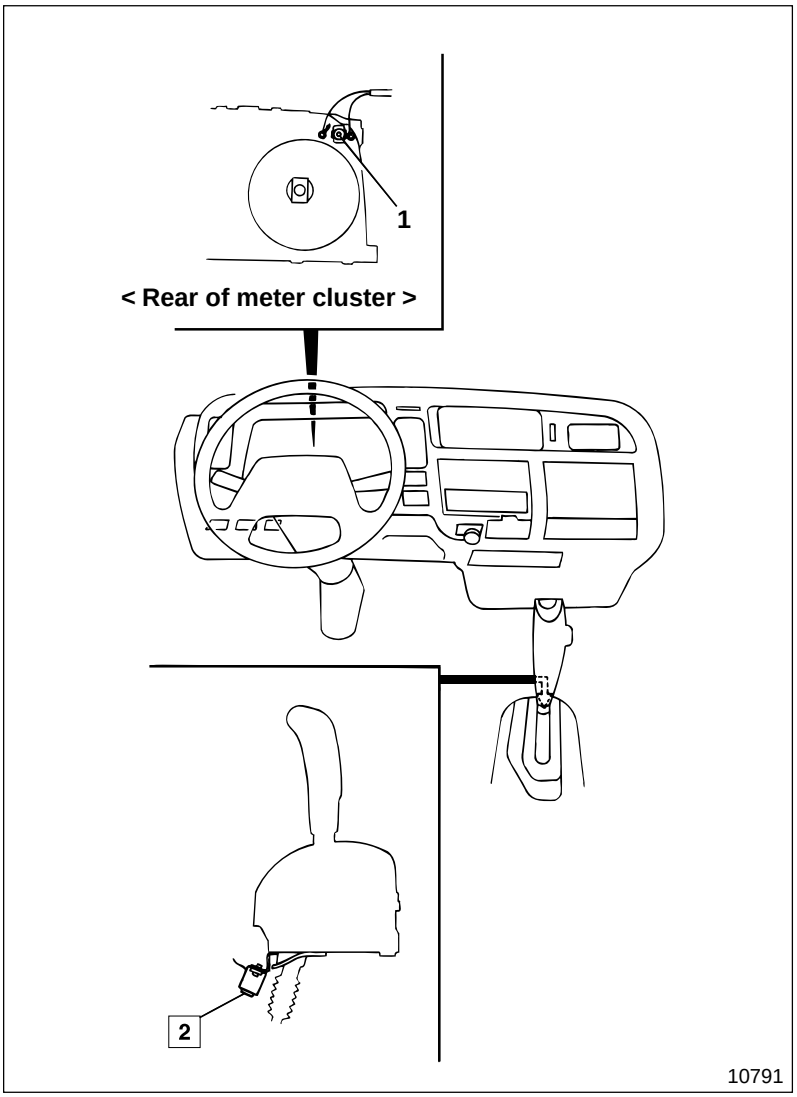
	①	②	③	④	Remarks
No current	○		○		—
Current	⊕	◌	⊖	◌	Measure time lag until continuity between the terminals is lost

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.
◌---◌ : Indicates that continuity between the terminals is lost.

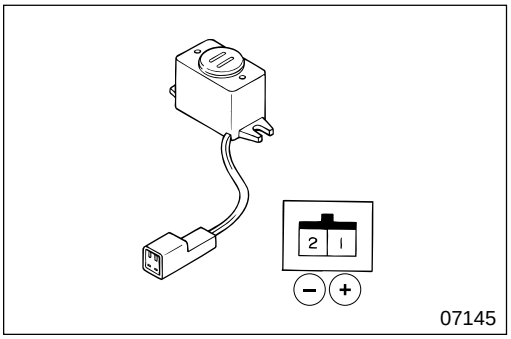
- If any fault is found, replace the relay.

https://truckmanualshub.com/

Installation Position



1 Meter warning buzzer 401
2 Automatic transmission reverse buzzer
< Automatic transmission >



◆ Service procedure

2 Inspection of automatic transmission reverse buzzer

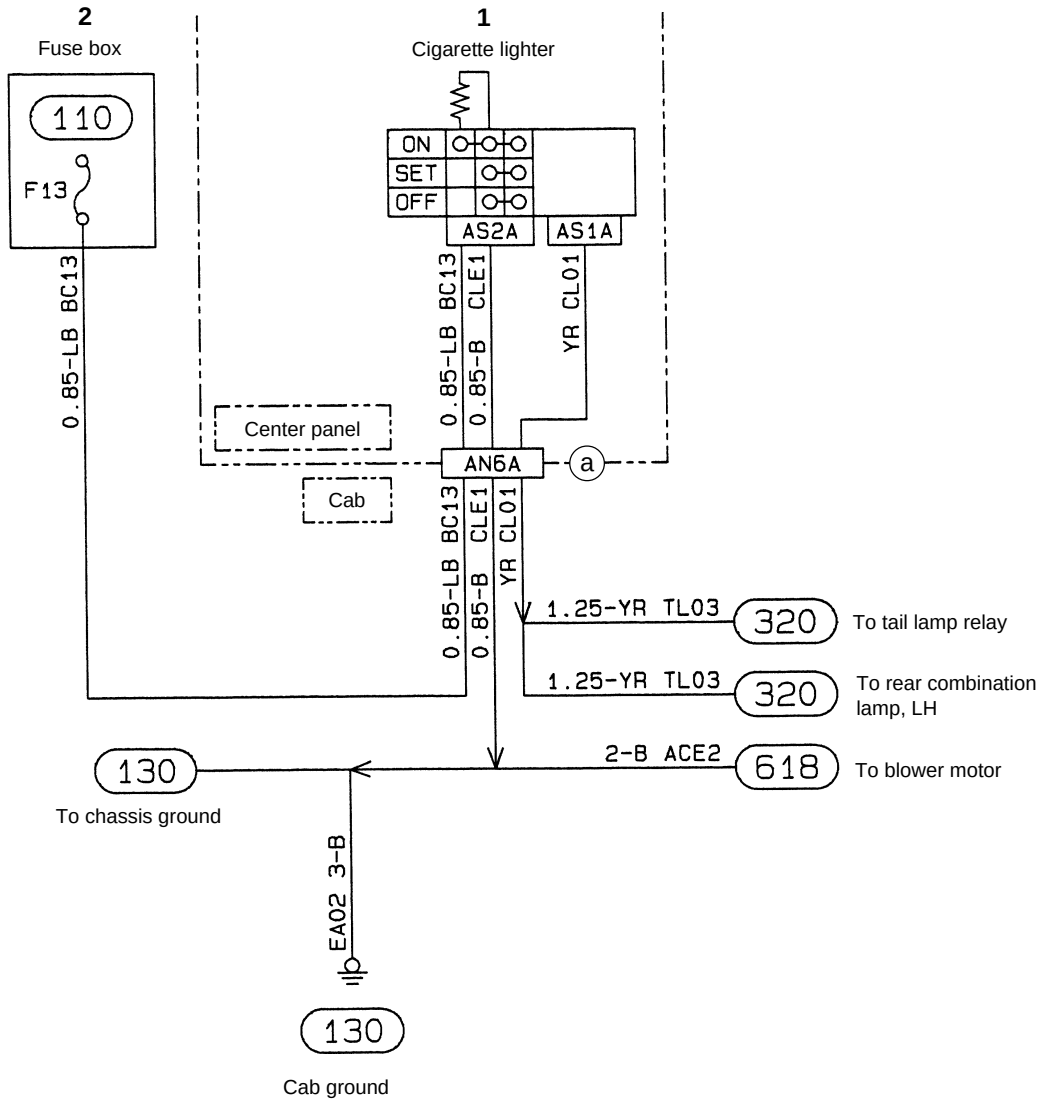
- Make sure that automatic transmission reverse buzzer **2** sounds when you apply 12 volts DC between terminals ① and ②.
- If any fault is found, replace automatic transmission reverse buzzer **2**. Gr 23

NOTE

- **Automatic transmission reverse buzzer 2 sounds continuously when you apply voltage.**
- **If you want to make automatic transmission buzzer 2 sound intermittently, use the automatic transmission reverse buzzer and the back buzzer in combination.**

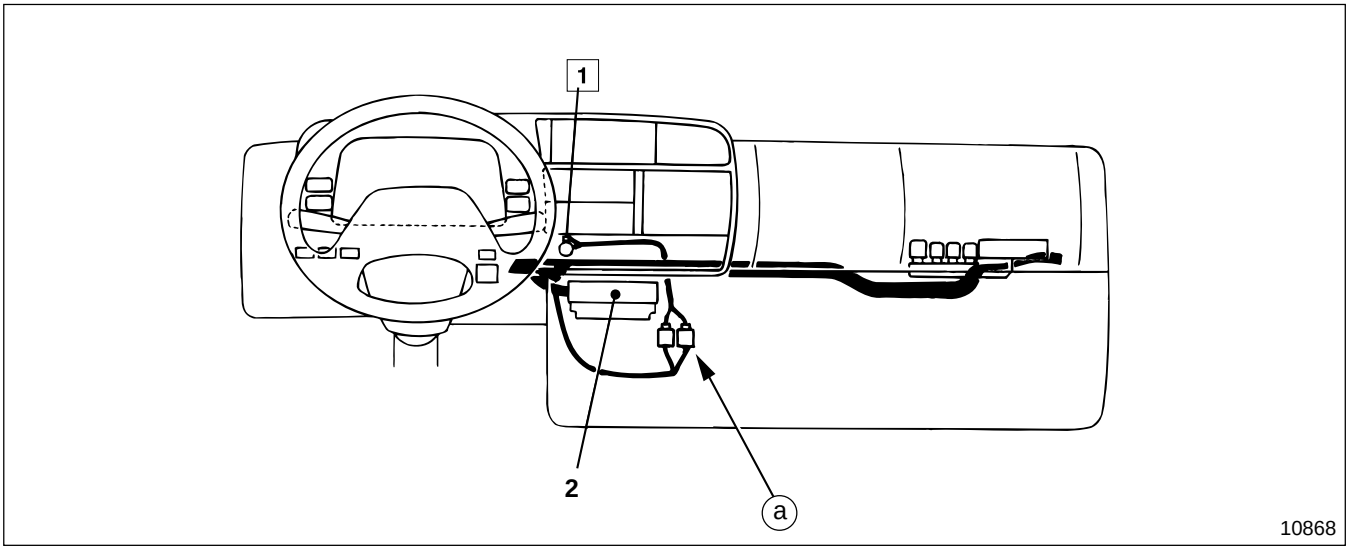
https://truckmanualshub.com/

610 CIGARETTE LIGHTER CIRCUIT



10571

https://truckmanualshub.com/

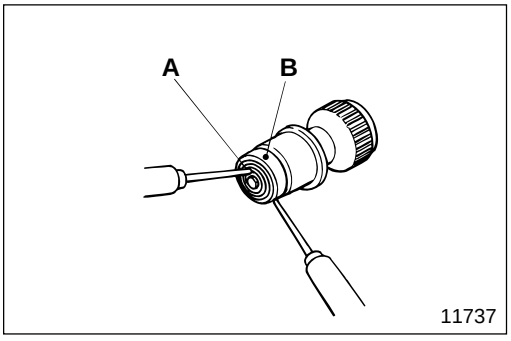


1 Cigarette lighter
2 Fuse box 104

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
1	Cigarette lighter plug return time	15±5 seconds	—	Replace

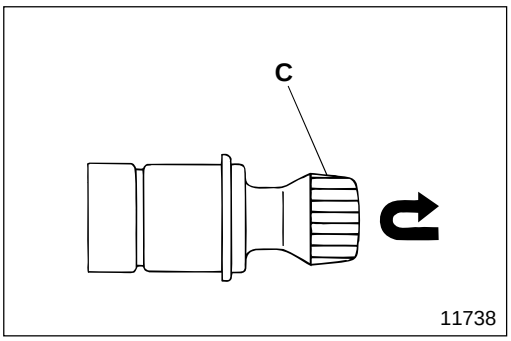
◆ Service procedure



1 **Inspection of cigarette lighter**

Carry out the following inspection. If any fault is found, replace cigarette lighter **1** :

- Make sure that there is continuity between heater element **A** and body **B**.



- Make sure that plug **C** returns to its original position quickly when it is pushed in.
- Turn the starter switch to ACC or ON.
- Push plug **C** into the socket of the vehicle.
- Measure the time required for pushed-in plug **C** to return to its original position.
- Make sure that heater element **A** is glowing.

https://truckmanualshub.com/

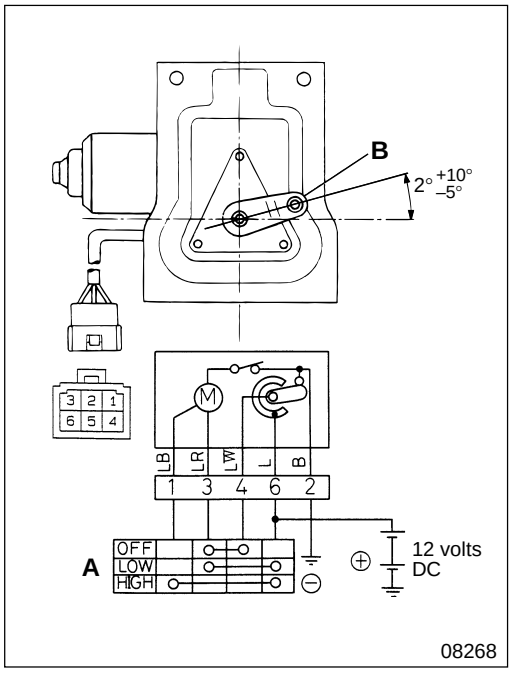
1 Combination switch 601
2 Wiper motor
3 Relay box 604
4 Washer motor
5 Fuse box 104

https://truckmanualshub.com/

◆ Service procedure



2 Inspection of wiper motor

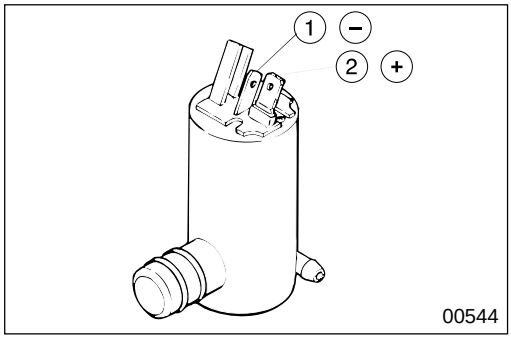
- Connect wiper motor **2** as illustrated.
  A : Switch
- Carry out the following inspection. If any fault is found, replace wiper motor **2**. Gr 42

(1) Inspection of motor operation

- Make sure that wiper motor **2** turns at high speed when you turn switch **A** to HIGH.
- Make sure that wiper motor **2** turns at low speed when you turn switch **A** to LOW.

(2) Inspection of automatic stopping position

- Turn switch **A** to LOW to turn wiper motor **2** at low speed.
- When crank arm **B** is at any position other than the automatic stopping position (other than the illustrated angle), turn switch **A** to OFF.
- Make sure that crank arm **B** stops at the automatic stopping position (within the illustrated angle).



4 Inspection of washer motor

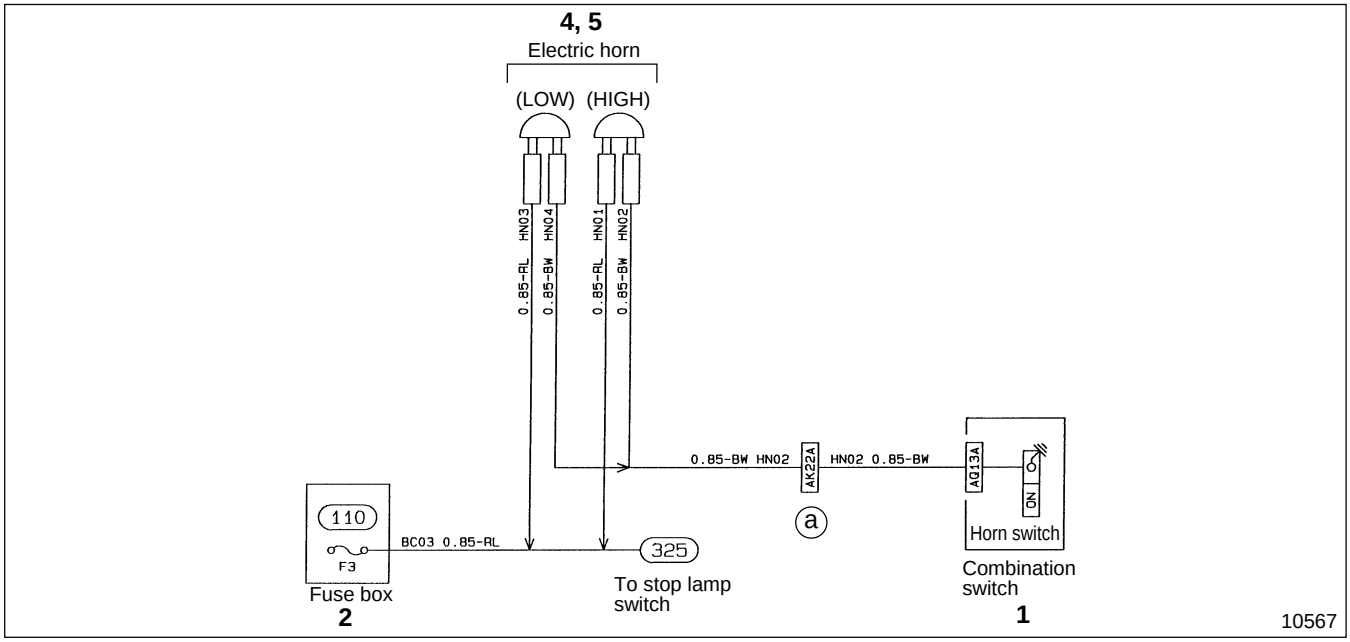
- Apply 12 volts DC between terminals ① and ② and make sure that washer motor **4** operates.
- If washer motor **4** does not operate, replace it. Gr 42

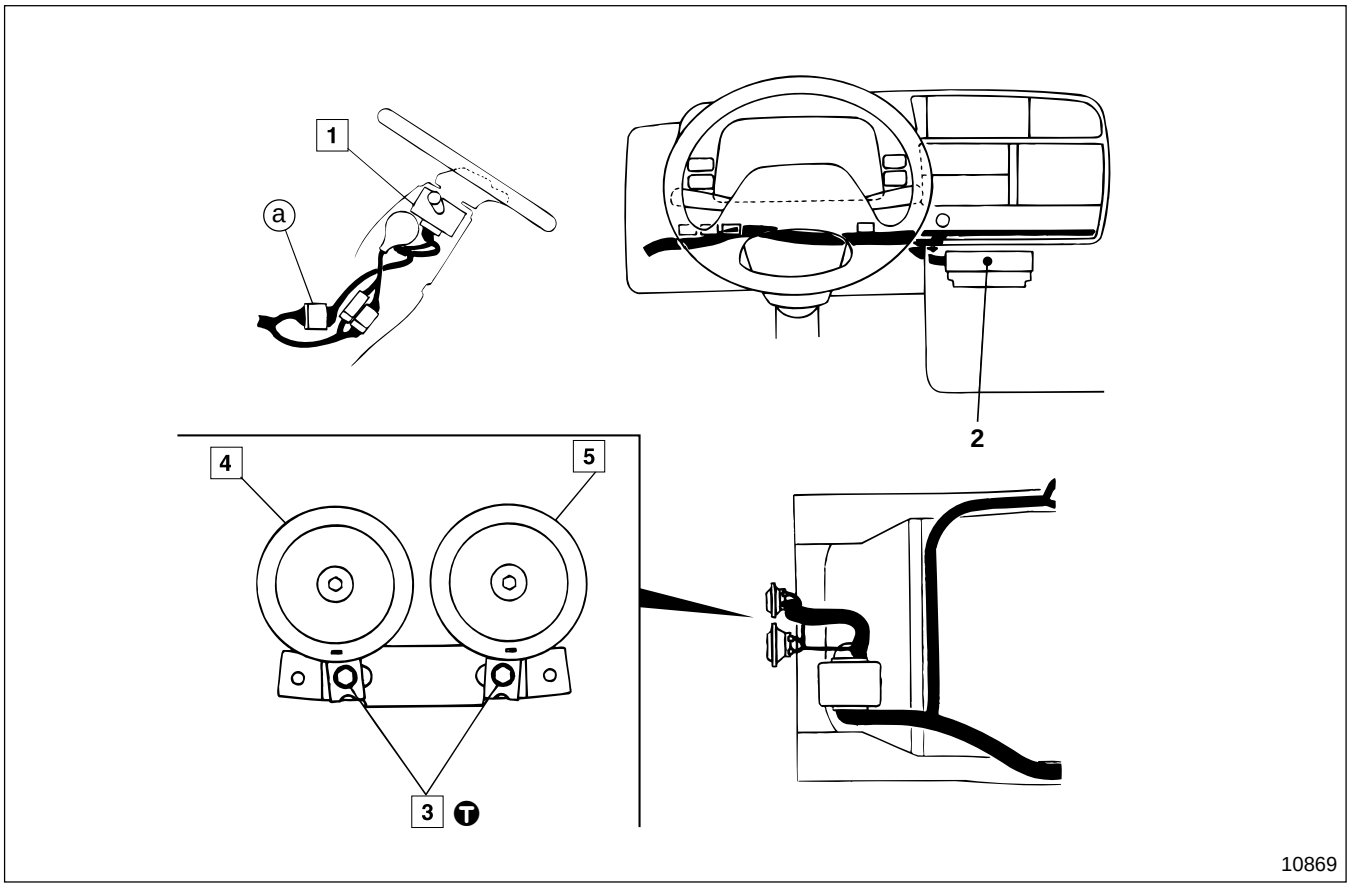
https://truckmanualshub.com/

MEMO

https://truckmanualshub.com/

616 HORN CIRCUIT





1 Combination switch 601
2 Fuse box 104
3 Bolt
4 Electric horn (HIGH)
5 Electric horn (LOW)

https://truckmanualshub.com/

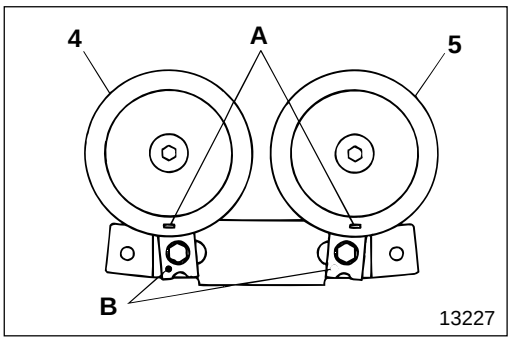
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Bolt (Electric horn mounting)	11.8 to 15.6 {8.7 to 11.6, 1.2 to 1.6}	—

◆ Service procedure

4 **5** **Electric horn**



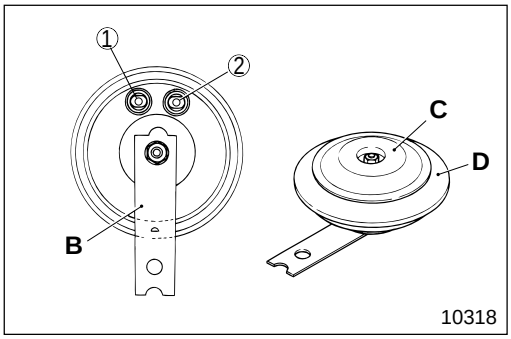
[Installation]

Install electric horns **4**, **5** as illustrated.

A : Drain hole

CAUTION

- **Do not bend or damage stay B or the sound quality of electric horns 4, 5 can be changed and the horn capacity can deteriorate.**
- **Be careful to install the horn correctly as illustrated, or the horn cannot be drained normally.**

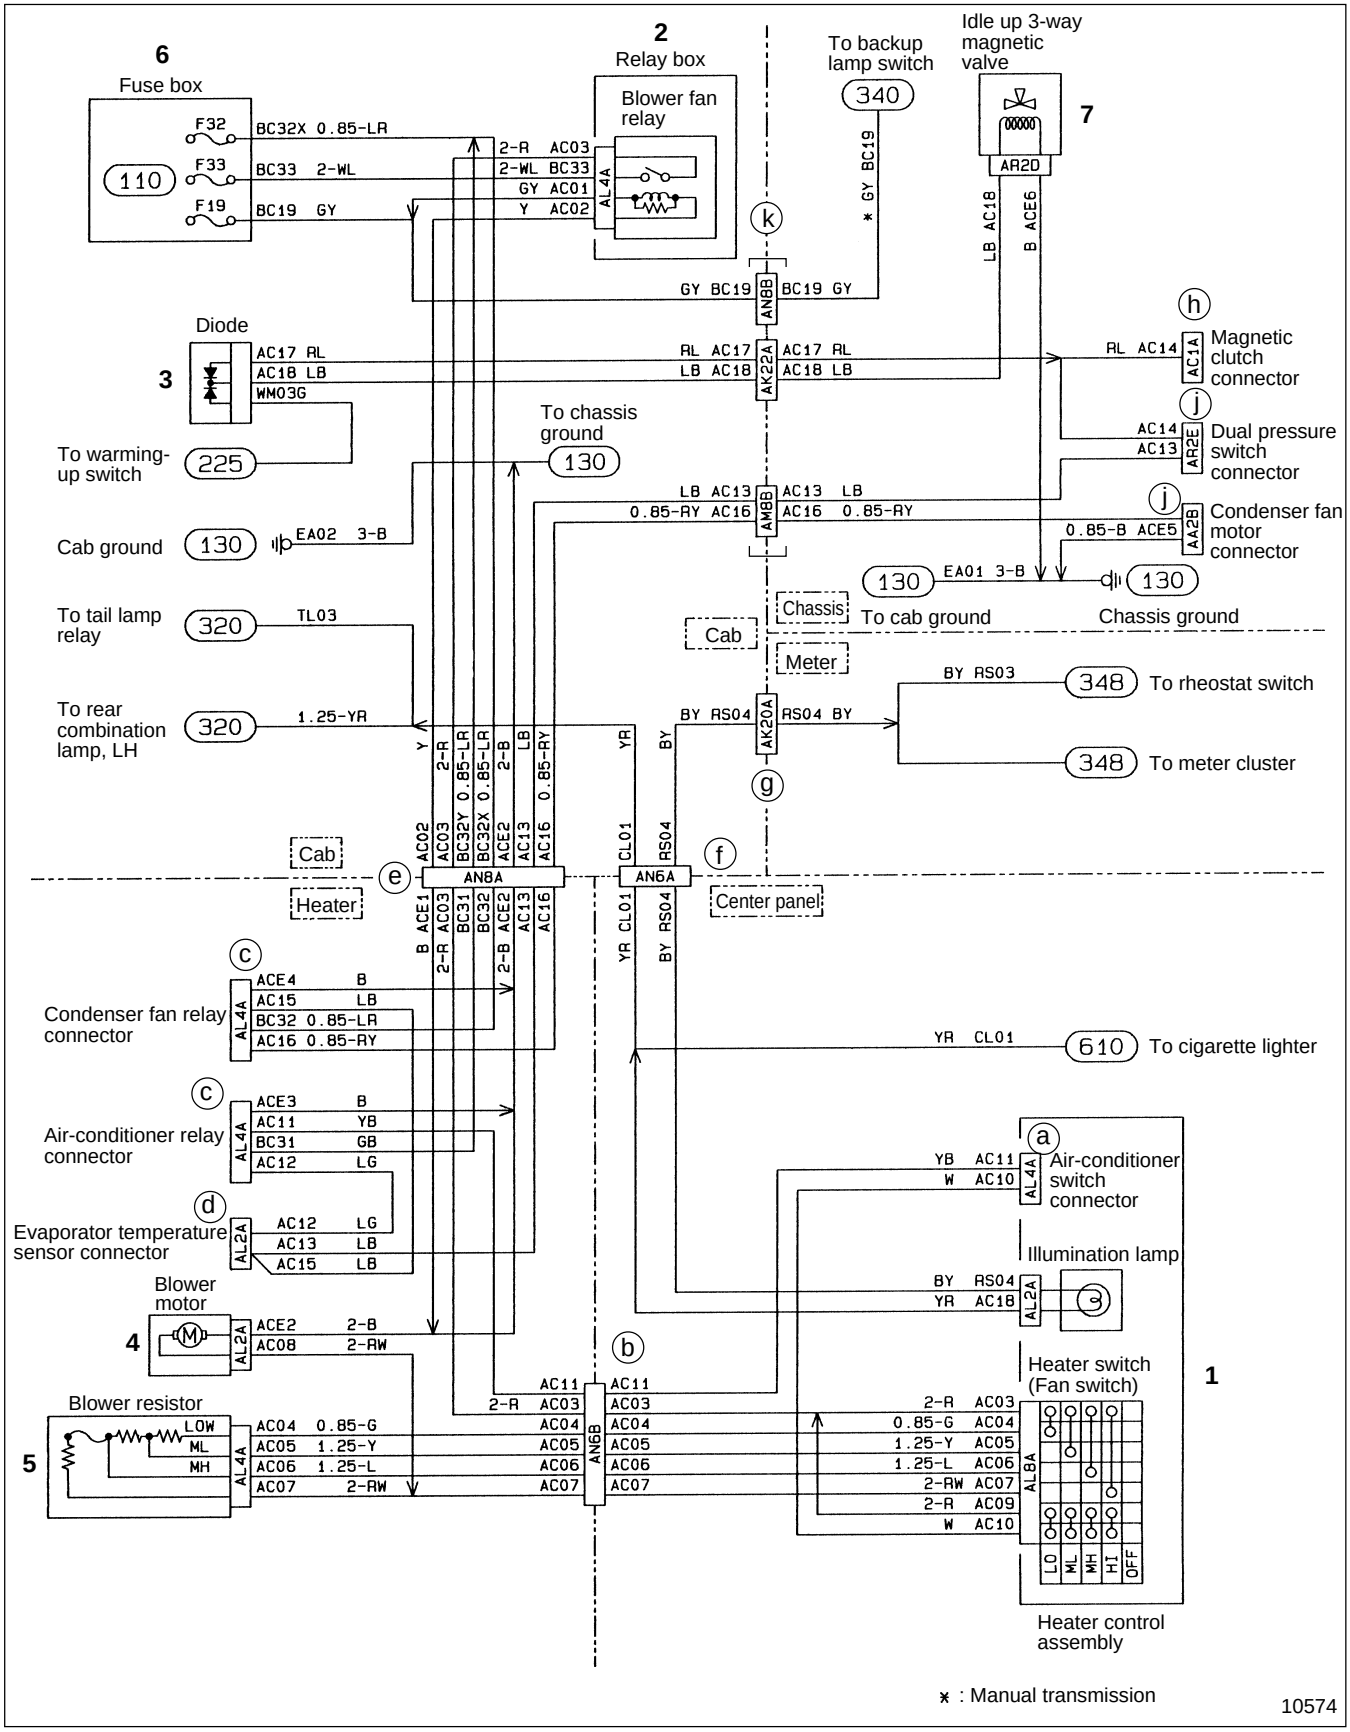


[Inspection]

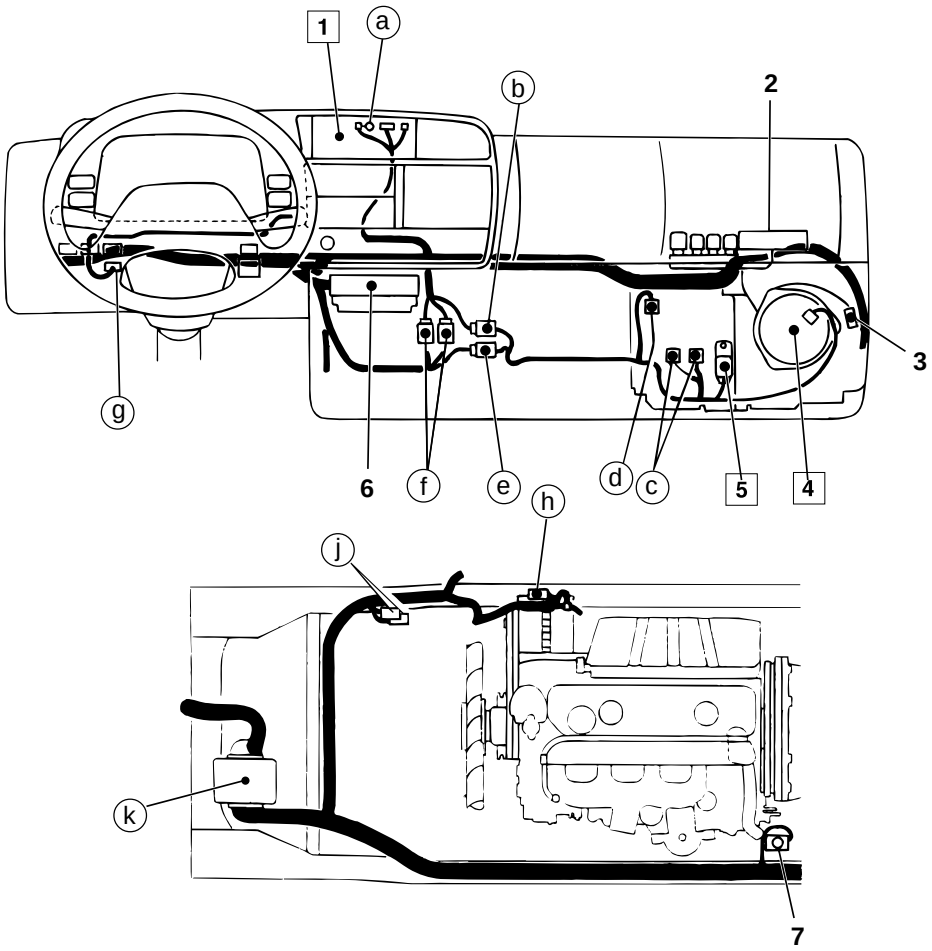
- Make sure that electric horns **4, 5** sound when you apply 12 volts DC between terminals ① and ②. (No polarity)
- If any fault is found, replace electric horns **4, 5**.
- Remove any foreign particles from resonator **C** or vibration plate **D**.

https://truckmanualshub.com/

618 HEATER CIRCUIT



https://truckmanualshub.com/



1 Heater control assembly
2 Relay box (604)
3 Diode
4 Blower motor
5 Blower resistor
6 Fuse box (104)

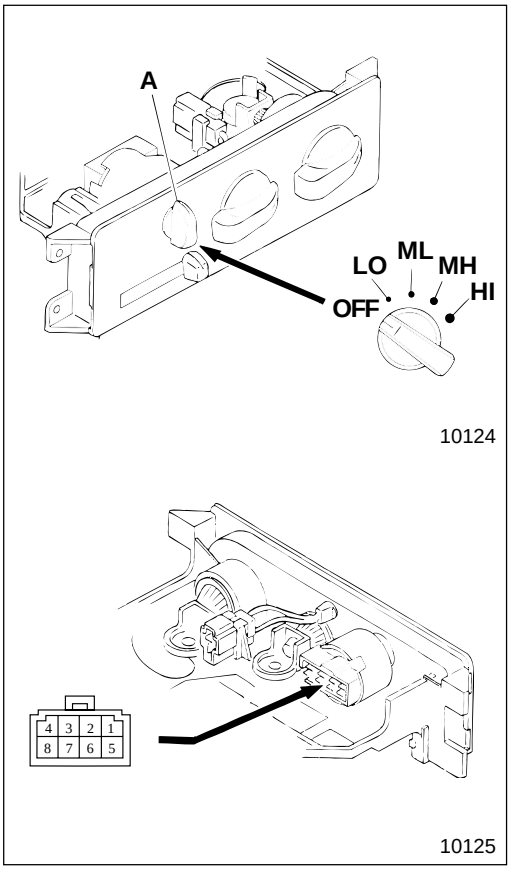
Service standards

Location	Maintenance item		Standard value	Limit	Remedy
5	Resistance of blower resistor 14315	① - ②	0.81 Ω	—	Replace
		① - ③	0.28 Ω		
		① - ④	1.94 Ω		

https://truckmanualshub.com/

◆ Service procedure



1 Inspection of heater control assembly

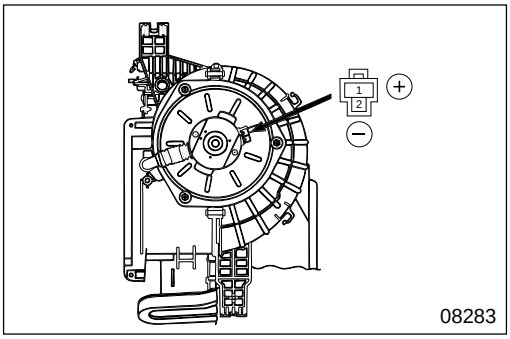
Inspection of blower switch A

- Follow the table below to inspect continuity:

	⑧	②	⑦	③	⑥	⑤	④
OFF							
LO (LOW)	○—○					○—○	
ML (MIDDLE LOW)	○—	——	—○			○—○	
MH (MIDDLE HIGH)	○—	——	——	—○		○—○	
HI (HIGH)	○—	——	——	——	—○	○—○	

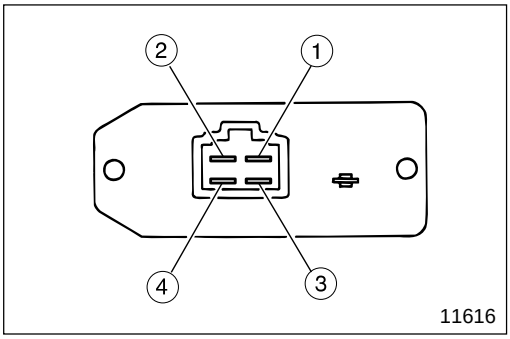
○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace blower switch **A**.



4 Inspection of blower motor

- Make sure that blower motor **4** operates when 12 volts DC is applied between terminals ① and ②.
- If any fault is found, replace blower motor **4**.



5 Inspection of blower resistor

- Measure resistance between terminals ① and ② (MIDDLE LOW), ① and ③ (MIDDLE HIGH) and ① and ④ (LOW).
- If the measured value deviates from the standard value, replace blower resistor **5**.

7 CHASSIS ELECTRICS

701 MAGNETIC VALVE 54-7-2

710 EXHAUST BRAKE CIRCUIT

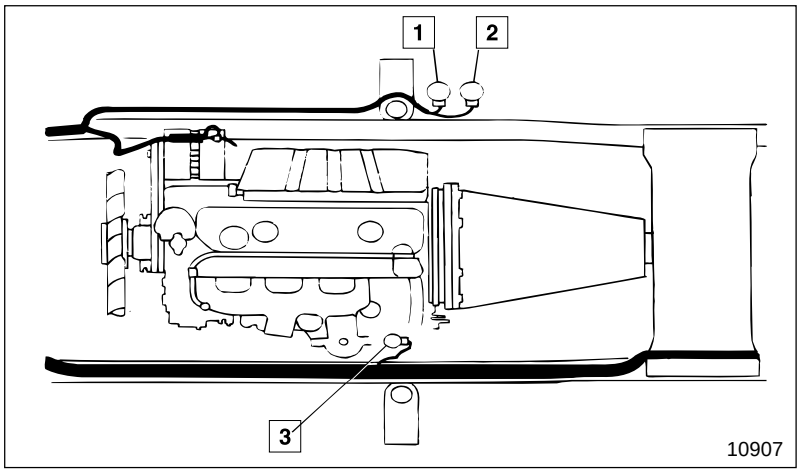
< Manual Transmission > 54-7-4

< Automatic Transmission > 54-7-8

https://truckmanualshub.com/

701 MAGNETIC VALVE

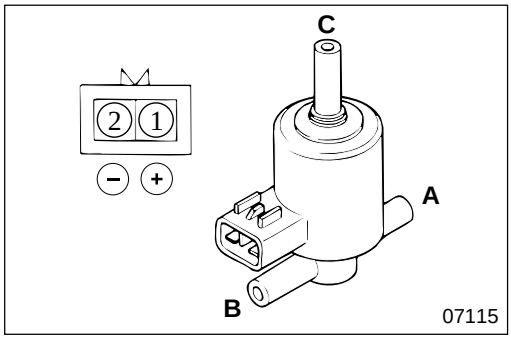
Installation Position



1 Intake shutter 3-way magnetic valve
2 Exhaust brake 3-way magnetic valve
3 Idle up 3-way magnetic valve

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
1, 2	Minimum operating voltage of 3-way magnetic valve  14318	11 V or less	—	Replace
3	Minimum operating voltage of 3-way magnetic valve  15024	8 V or less	—	Replace



◆ Service procedure

1 **2** **Inspection of 3-way magnetic valve**

Carry out the following inspection. If any fault is found, replace 3-way magnetic valves **1, 2** :

Air circuit table (There is air continuity between terminals ○ and ○.)

	Input port A	Output port B	Exhaust port C
ON	○	○	
OFF		○	○

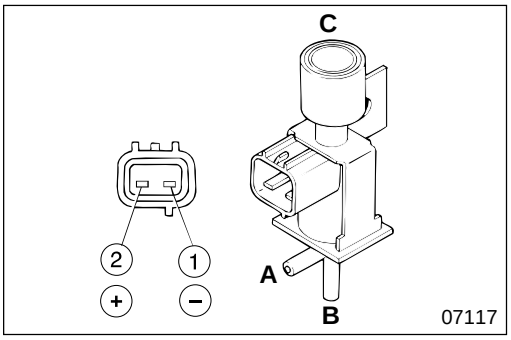
(1) Operation inspection

- Apply voltage between terminals ① and ②, increasing gradually from 0 volt.
- Measure voltage (minimum operating voltage) when magnetic valves **1, 2** starts operating. (You can tell if the magnetic valves are ON or OFF by listening for an operating sound.)

https://truckmanualshub.com/

(2) Airtightness inspection

- When magnetic valve is ON :
  - Close output port **B**.
  - Apply 12 volts DC between terminals ① and ②.
  - Make sure that there is no air suction from exhaust port **C** when negative pressure (–100 kPa {–30 in.Hg, –750 mmHg}) is applied to input port **A**.
- When magnetic valve is OFF :
  - Close exhaust port **C**.
  - Make sure that there is no air suction from output port **B** when negative pressure (–100 kPa {–30 in.Hg, –750 mmHg}) is applied to input port **A**.



3 Inspection of 3-way magnetic valve

Carry out the following inspection. If any fault is found, replace 3-way magnet valve **3** :
Air circuit table (There is air continuity between terminals ○ and ○.)

	Input port **A**	Output port **B**	Exhaust port **C**
ON	○	○	
OFF		○	○

(1) Operation inspection

- Apply voltage between terminals ① and ②, increasing gradually from 0 volt.
- Measure voltage (minimum operating voltage) when 3-way magnetic valve **3** starts operating. (You can tell if the magnetic valves are ON or OFF by listening for an operating sound.)

(2) Airtightness inspection

- When magnetic valve is ON :
  - Close output port **B**.
  - Apply 12 volts DC between terminals ① and ②.
  - Make sure that there is no air suction from exhaust port **C** when negative pressure (–60 kPa {–18 in.Hg, –450 mmHg}) is applied to input port **A**.
- When magnetic valve is OFF :
  - Close exhaust port **C**.
  - Make sure that there is no air suction from output port **B** when negative pressure (–60 kPa {–18 in.Hg, –450 mmHg}) is applied to input port **A**.

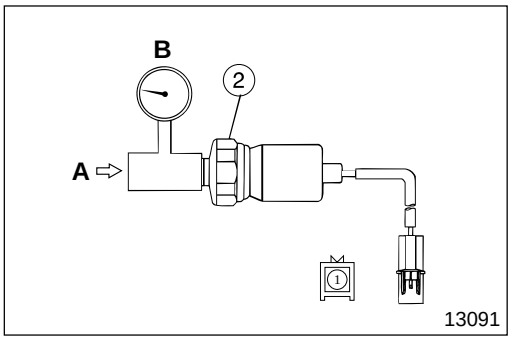
11	Resistance of engine revolution sensor (At room temperature 25°C {77°F})  14366		① - ②	2.1 to 2.5 k Ω	—	Replace

The values in ( ) are reference values.



13091

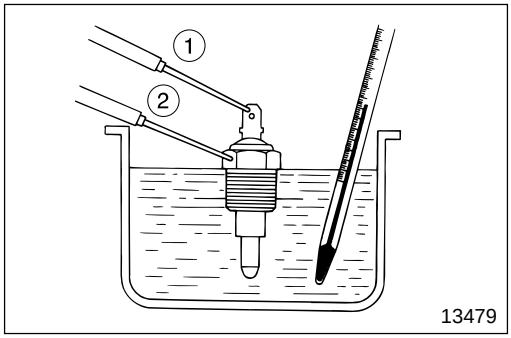
◆ Service procedure

1 Inspection of engine oil pressure switch

Carry out the following inspection. If any fault is found, replace engine oil pressure switch **1**. Gr 12

- Make sure that there is continuity between terminals ① and ② (Body) when air pressure **A** is not applied to engine oil pressure switch **1**.
- Apply air pressure **A** to engine oil pressure switch **1** gradually starting from 0 kpa {0 lbf/in², 0 kgf/cm²}.
  Measure the air pressure when continuity is lost between terminals ① and ② (body), and make sure that it conforms the measured valve the standard value.
  B : Air pressure gauge

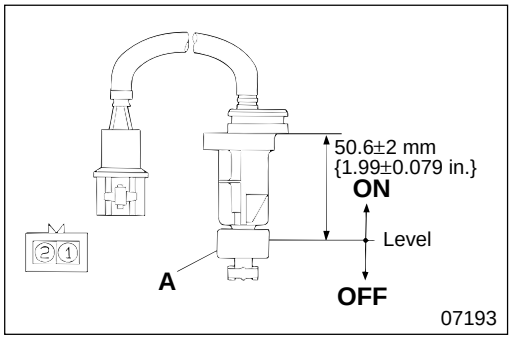
https://truckmanualshub.com/



3 Inspection of thermostat switch

Carry out the following inspection. If any fault is found, replace thermostat switch **3**. Gr 12

- Make sure that there is continuity between terminals ① and ② (Body) at room temperature (20°C{68°F}).
- Place thermostat switch **3** in a container filled with engine oil and raise the oil temperature while stirring the oil.
  Measure the temperature when continuity is lost between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.
- Lower the oil temperature and measure the temperature when continuity is present between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.



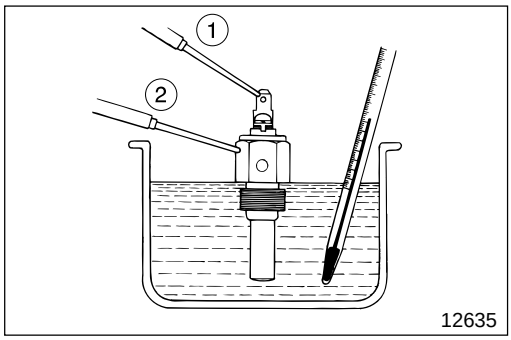
5 Inspection of engine oil level sensor

- Follow the table below to inspect continuity:

	①	②
ON	○	○
OFF		

○—○ : There is continuity between terminals ○ and ○.

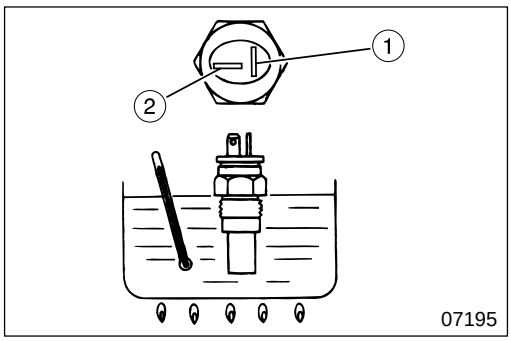
- If any fault is found, replace engine oil level sensor **5**. Gr 12
  A : Float



6 Inspection of overheating switch

Carry out the following inspection. If any fault is found, replace overheating switch **6**. Gr 14

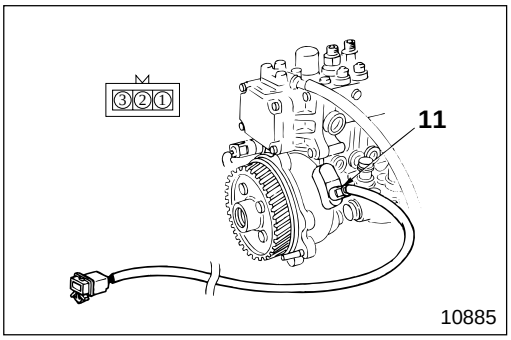
- Make sure that there is no continuity between terminals ① and ② (Body) at room temperature (20°C {68°F}).
- Place overheating switch **6** in a container filled with engine oil and raise the oil temperature while stirring the oil.
  Measure the temperature when there is continuity between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.
- Lower the oil temperature and measure the temperature when continuity is lost between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.



7 Inspection of water temperature sensor

- Place water temperature sensor **7** in engine oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the resistance between terminal ① and the body, and terminal ② and the body.
  Terminal ① : Water temperature gauge connection
  Terminal ② : Multipurpose timing control unit connection
- If the measured value deviates from the standard value, replace water temperature sensor **7**. Gr 14

https://truckmanualshub.com/



11 **Inspection of engine revolution sensor**

- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace engine revolution sensor **11**. Gr 13

https://truckmanualshub.com/

STRUCTURE AND OPERATION 54-9-2

910 MULTIPURPOSE TIMING CONTROL UNIT CIRCUIT 54-9-8

https://truckmanualshub.com/

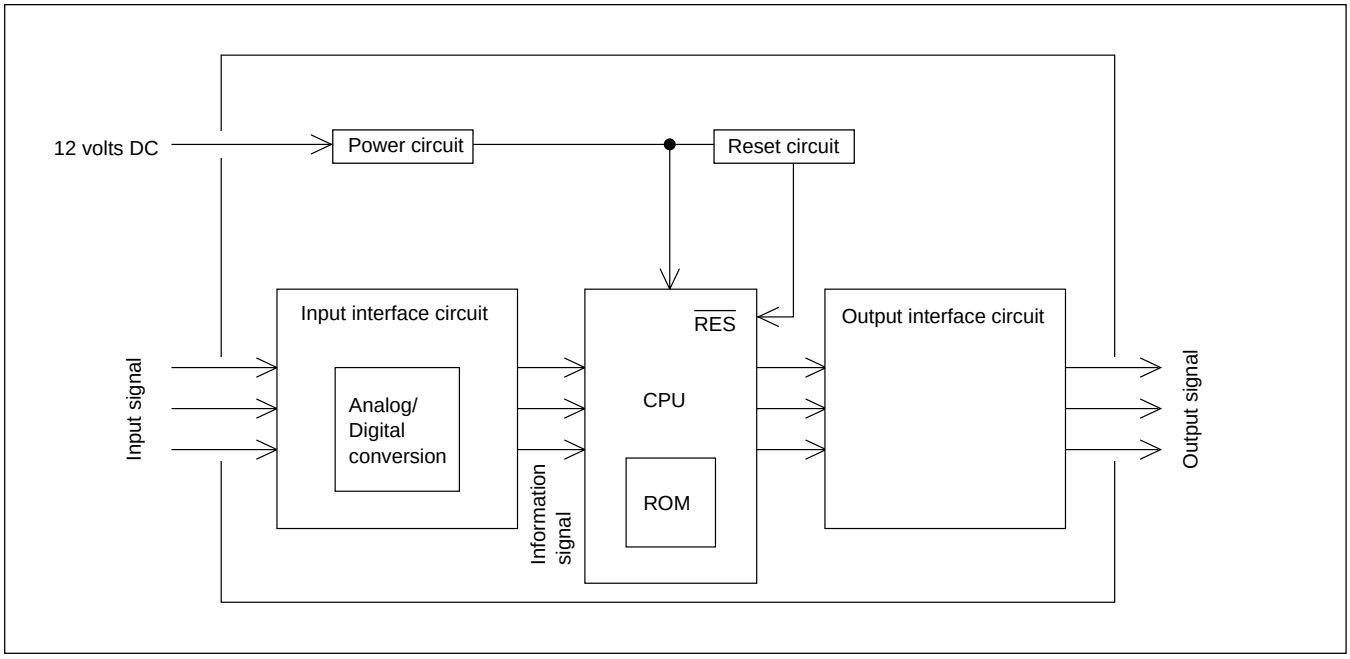
Multipurpose Timing Control Unit

- The multipurpose timing control unit controls the following functions:

Intermittent wiper activation function	Gr 42
Engine preheating function	Gr 54-2-6

- Sensors and switches are fitted to these systems as information sources for the multipurpose timing control unit.
- Using the information provided, circuits in the multipurpose timing control unit control the functions mentioned above.

● Internal structure of multipurpose timing control unit



- The internal structure mainly consists of the input interface circuit, *1CPU, *2ROM, and the output interface circuit.
  - *1CPU : Central Processing Unit. Compares the input information with information stored in the memory to output commands.
  - *2ROM : Read Only Memory. Stores fixed data and programs that are not erased even after the power is turned off.
- Input signals are transmitted from information sources, such as sensors and switches, to the input interface circuit.
- The input interface circuit converts these input signals from analog signals to digital signals. This enables the CPU to calculate data and transmits them to the CPU as information signals.
- The CPU compares the information signals with the data in the ROM, calculates the signals, and sends them to the output interface circuit.
- The output interface circuit issues commands to systems, based on the above comparison and calculated results, as output signals.
- Sequential execution of the above processes allows optimum control over functions.

1. SPECIFICATIONS

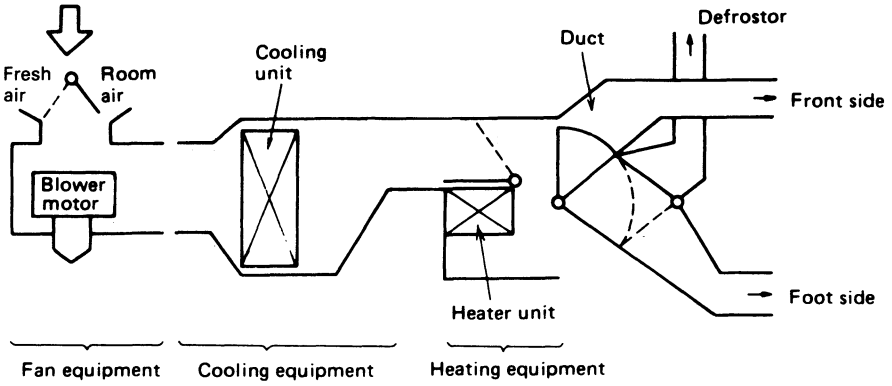
Item			Description
Vehicle name & model			FE
*Cooling capacity (on JIS conditions)			4,200 W (3,600 kcal/h, 14,300 B.T.U/h)
Compresssor	Model		MSC90T
	Displacement		90 cc
	Maximum revolution		MAX 9,000 min^{-1} (9,000 rpm)
	Compressor oil		SUNPAG 56, 120cc (7.3 cu.in)
Magnetic clutch	Type		Dry single disc magnet
	Voltage & input		DC 12V, 38 W
Cooling unit assembly	Type		Laminated type
Controls	Air flow control		Rotary switch, Four step type
	Temperature control		Electric thermostat
Condenser	Type		Corrugated fin type
Receiver assembly			Cylinder type, approx 350 cc (21.4 cu.in)
Protective equipment	Frost prevention (thermostat)		OFF : 33 °F (0.5 °C) ON : 38 °F (3.5 °C)
	Relief valve		Open : 3.50 ~ 4.10 MPaG (508 ~ 594 Lb/in^2G, 35.7 ~ 41.8 kgf/cm^2G) Close : 2.94 MPaG (427 Lb/in^2G, 30 kgf/cm^2G)
	Dual pressure switch	Low pressure switch	OFF : 0.2 MPaG (28 Lb/in^2G, 2 kgf/cm^2G) ON : 0.225 MPaG (32 Lb/in^2G, 2.25 kgf/cm^2G)
		High pressure switch	OFF : 2.94 MPaG (418 Lb/in^2G, 30 kgf/cm^2G) ON : 2.35 MPaG (334 Lb/in^2G, 24 kgf/cm^2G)
	Fuse (Blower fan) Fuse (Magnetic clutch)		15 A 15 A
Refrigerant and quantity			HFC - 134a, 1.4 lb (650 g)

*The * marked cooling capacity is based on JIS conditions
Compressor speed : 1,800 rpm
Condensing temperature : 131 °F (55 °C)
Cooling unit inlet air dry bulb temperature : 80.6 °F (27 °C)
Cooling unit inlet air wet bulb temperature : 67.1 °F (19.5 °C)
Terminal voltage : DC 12V

https://truckmanualshub.com/

2. OUTLINES OF REFRIGERATION SYSTEM

2.1 Air system



Cooling operation

Fresh air is induced to the cooling unit assembly by a blower fan, where it is cooled down and dehydrated, then discharged at the front side outlet through a duct.

Heating operation

Fresh air is induced to the heater unit by a blower fan through the cooling unit assembly, where it is heated, then discharged at the foot side outlet through a duct.

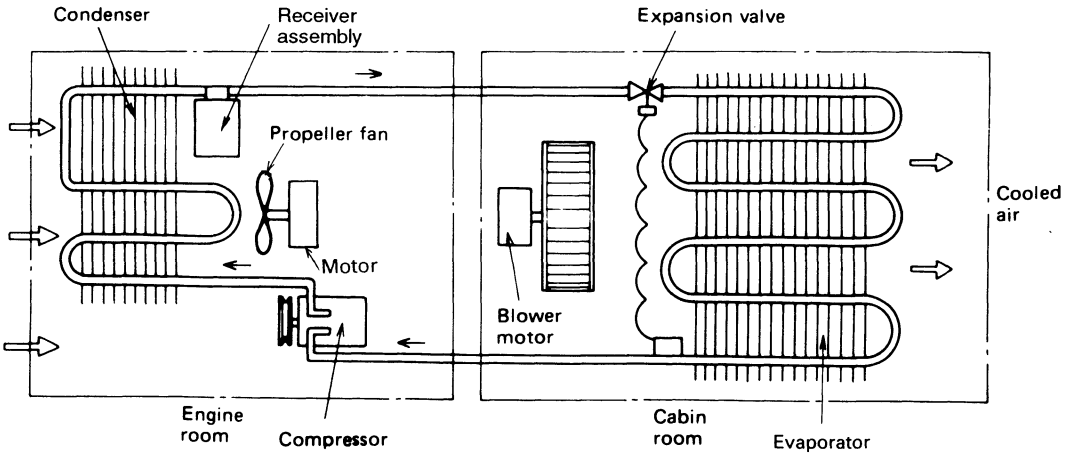
Dehumidifying operation

Fresh air is induced to the cooling by a blower fan,where it is cooled down and dehydrated,and succeedingly to the heater unit for warming, then discharged at the front side outlet through a duct.

Temperaure control

Cooled air and warmed air are mixed for temperature control of the room inside.

2.2 Refrigerating cycle



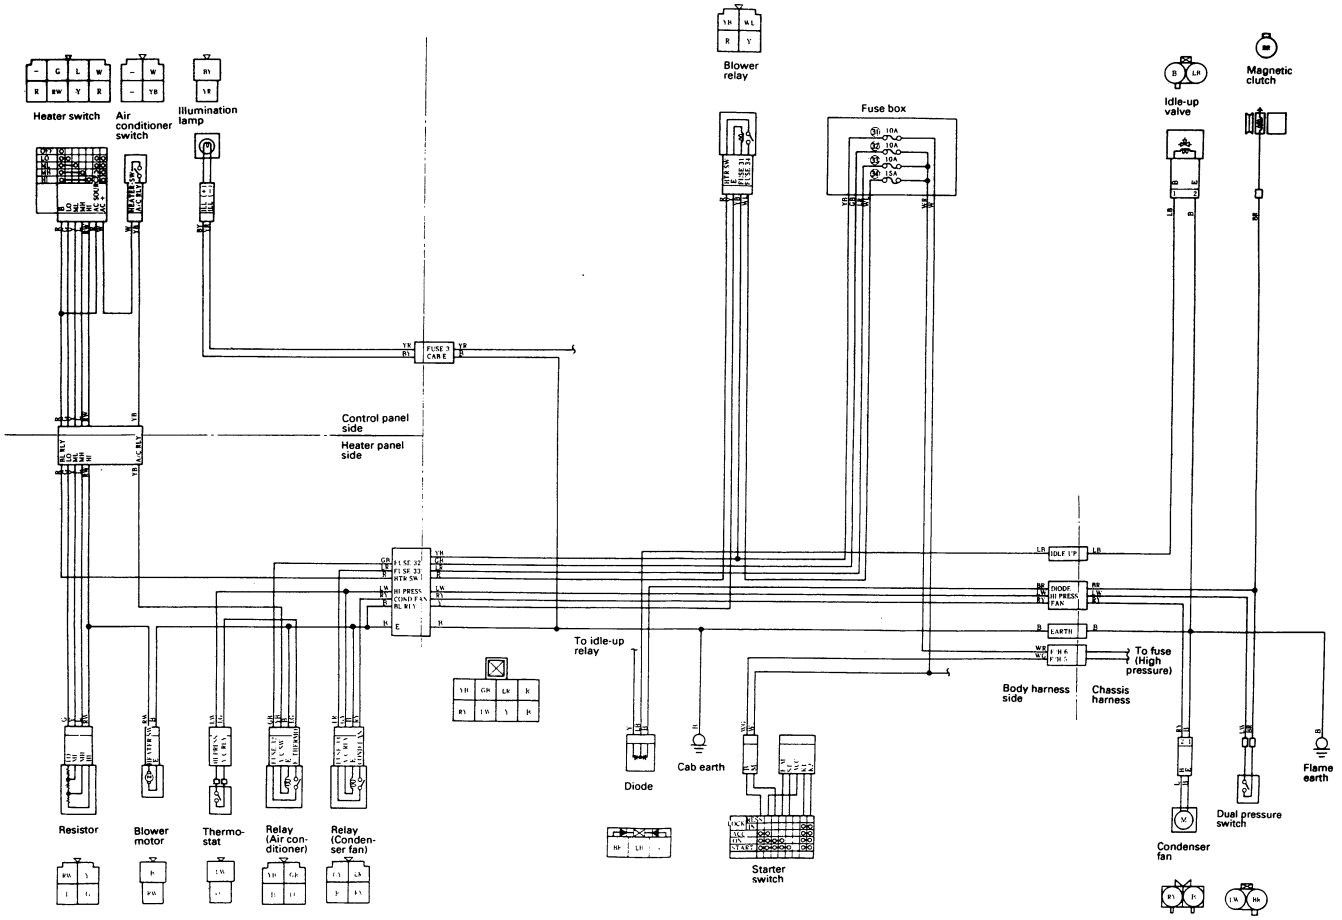
https://truckmanualshub.com/

While the refrigerant, HFC-134a is cooling the air drawn into the evaporator, it evaporates and becomes a gas. This gas is compressed to high pressure and temperature in the compressor, and sent into the condenser where it is cooled and becomes liquid.

This cooling in the condenser is carried out by the open air passing through the condenser sucked by radiator fan and vehicle motion of the vehicle. The liquid refrigerant flows through the receiver assembly where water and dirt are removed, and then it enters the expansion valve. Here the liquid refrigerant is throttled and changed to a mixture of liquid and gas in low temperature and low pressure, and is sent to the evaporator.

In the evaporator, the refrigerant absorbs heat from the surroundings and becomes a gas. That is, because the evaporator itself is cooled at this time, the return air to the cooling unit is cooled, and the interior of the vehicle becomes cool. In this way the refrigerant flow makes a complete circuit.

2.3 Electrical system



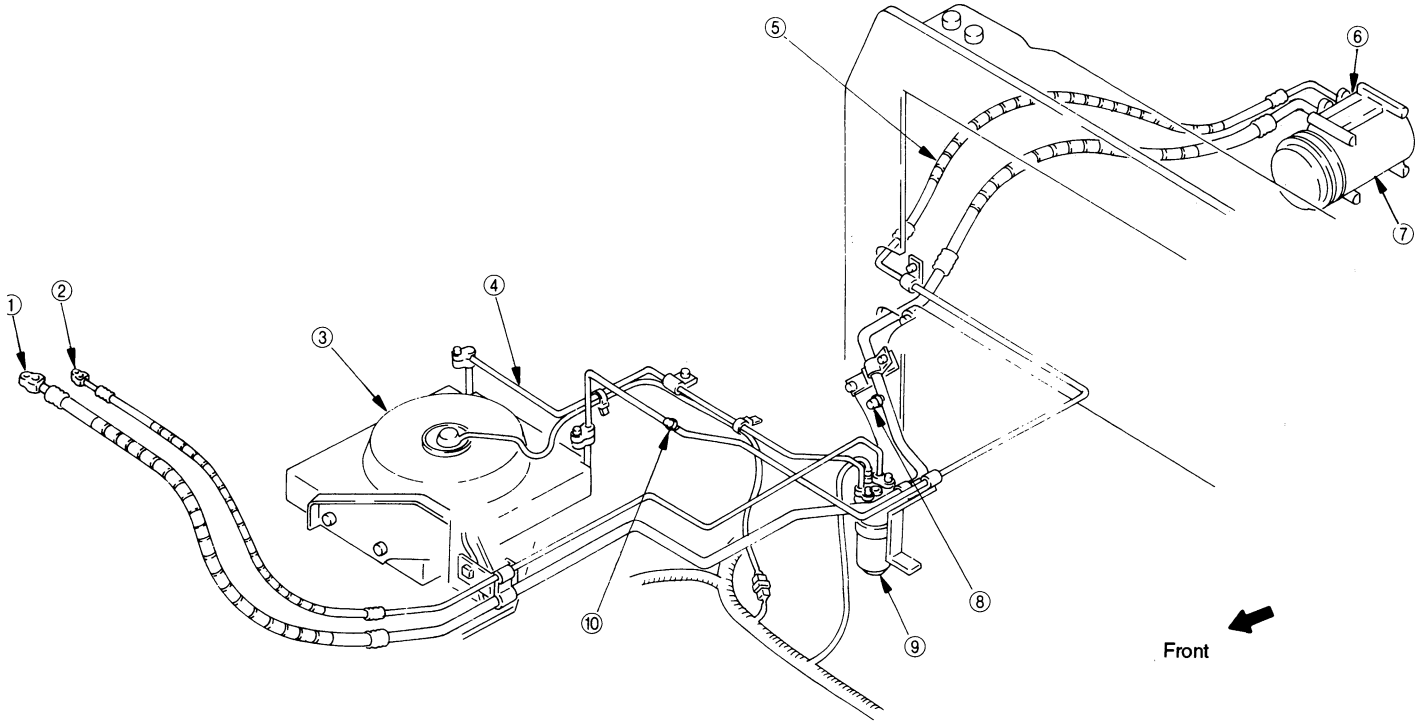
The power source is supplied from the TRUCK battery. When the blower switch is put ON, the power relay becomes ON, and electricity is connected to the magnetic clutch of the compresssor. The magnetic clutch switches ON or OFF by air conditioner switch, thermostat, and low pressure switch as the controls for operation service, or safety protection.

The cabin room air temperature is set to a preset point by adjusting the temp.control lever, and the opening degree of the air mix damper.

https://truckmanualshub.com/

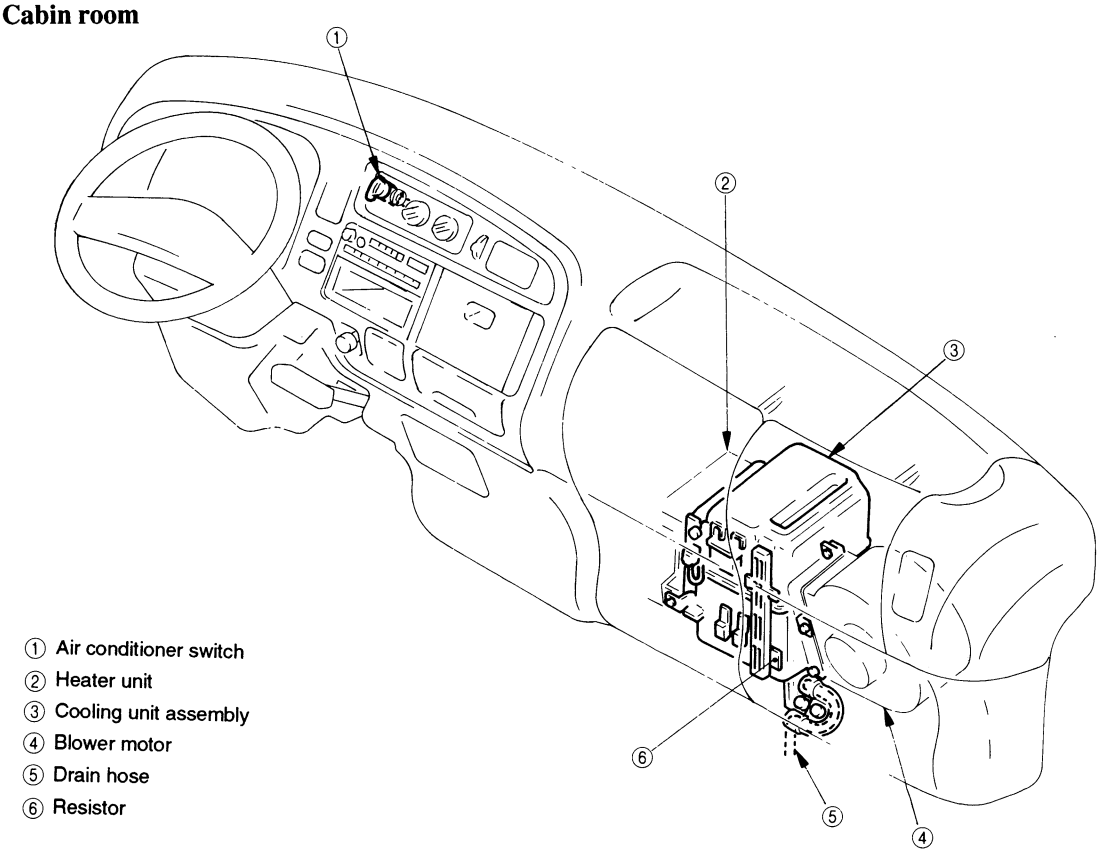
3. CONSTRUCTION

3.1 Engine room



① Suction hose
② Liquid hose
③ Side condenser assembly
④ Pipe (LQ)
⑤ Discharge hose
⑥ Relief valve
⑦ Compressor & clutch assembly
⑧ Check valve (LP)
⑨ Receiver assembly
⑩ Check valve (HP)

3.2 Cabin room



① Air conditioner switch
② Heater unit
③ Cooling unit assembly
④ Blower motor
⑤ Drain hose
⑥ Resistor

https://truckmanualshub.com/

3.3 Control system

(1) Controls in panel
Do not run the air conditioner when it is child.

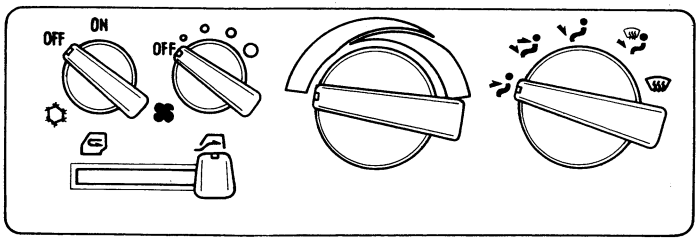
Air conditioner switch
By select the air conditioner switch initially in cooling or drying operation, the compressor starts running.

Fan switch
The air flow is selectable, out of the below four volume.

OFF	No air flow
○	Gentle
○	Low
○	Medium
○	High

Air outlet mode select switch
The air outlet is selected by positioning in cooling and heating operation.

- .....The conditioned air is discharged at the center and both side outlets directed by the louvers as required.
- .....The conditioned air is discharged at the center and both side and foot outlets directed by the louvers as required.
- .....The conditioned air is discharged at the foot outlets directed by the louvers as required.
- .....The conditioned air for dehumidifying is discharged at the foot outlets and to the front glass.
- .....The conditioned air for dehumidifying is discharged to the front glass.



Shift lever, air sirculation
The resirculation air is selectable out of the below sirculation models.

- .....ROOM AIR CIRCULATION
- .....FRESH AIR INTAKE

Temperature control switch
The discharged air temperature is controllable by selecting the position of the control lever in cooling, heating or drying operation.

BLUE ZONE ..... For cool air blow

RED ZONE ..... For warm air blow

By turning the switch toward the BLUE and RED ZONE sides, the supply air temperature becomes more cooler and warmer respectively.

https://truckmanualshub.com/

(2) Oeration control

Operation mode	Setting control lever	Air delivery	Remarks
COOL			Earlier cooling service, or conditioning at dusty, polluted air prevailing places: Shift lever, air circulation
HEAT			Earlier cooling service, or conditioning at dusty, polluted air prevailing places: Shift lever, air circulation Air outlet mode select switch
DEHUMIDIFY			Wetty conditioning in head cooled, and foot warmed : Shift lever, air outlet Air outlet mode select switch
DEFROST			
VENTILATION

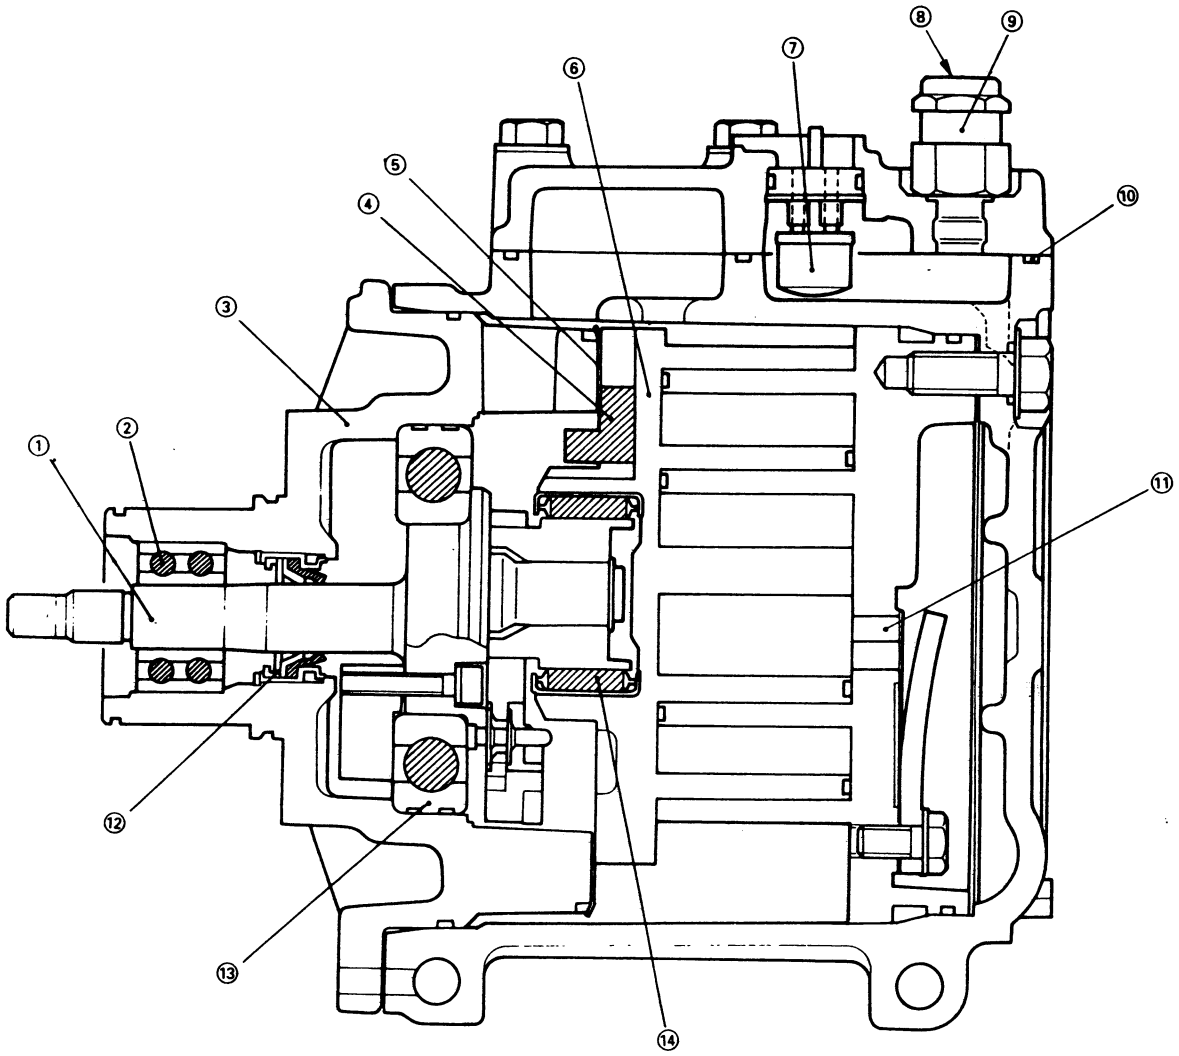
3.4 Compressor and clutch assembly

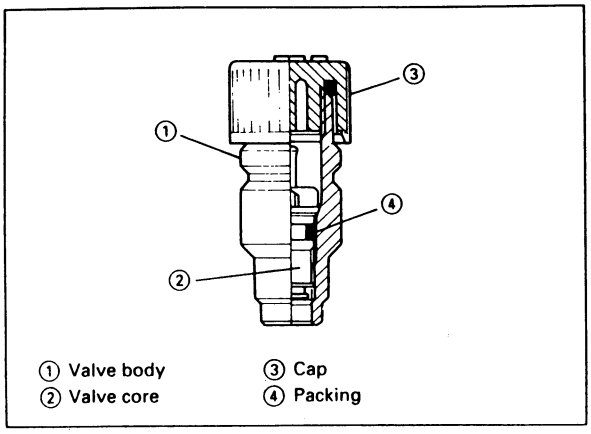
3.4.1 Compressor



① Crankshaft
② Bearing
③ Front case assembly
④ Housing assembly
⑤ Thrust plate
⑥ Orbit scroll assembly
⑦ Thermostat
⑧ Dust seal
⑨ H/P relief valve
⑩ O ring
⑪ Port hole
⑫ Shaft seal
⑬ Bearing
⑭ Needle bearing

https://truckmanualshub.com/

3.4.2 Check valve

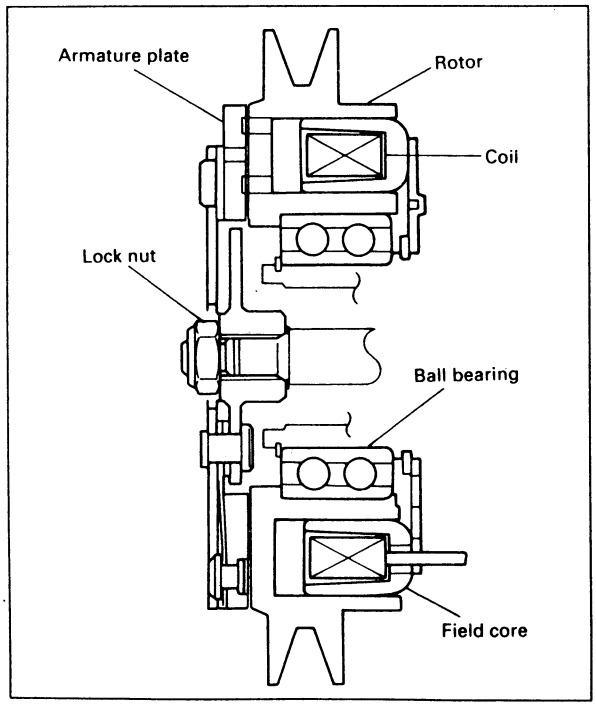


The suction hose and discharge hose are provided with check valve, and designed for gas evacuation and charging service. (shown above)

In the valves, a valve rubber tube, as in automobile tire tubes, is provided as shown in the figure.

Slackening the flare nut on the gauge manifold causes the passage to close automatically by the spring force, and tightening the flare nut causes the passage to open while pressing the compressed spring.

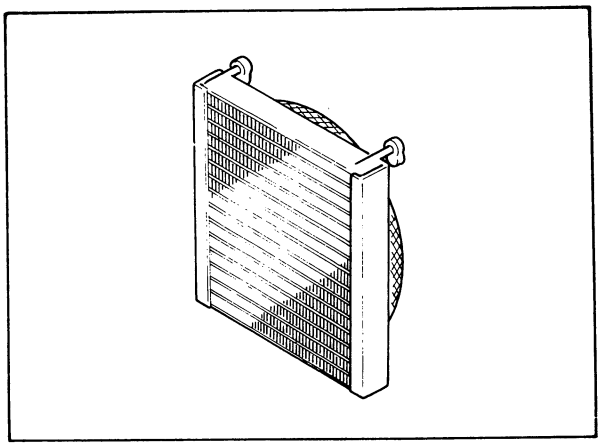
3.4.3 Magnetic clutch



The magnetic clutch is mounted on the compressor crankshaft to start and stop the compressor.

This means that the magnetic clutch is actuated to control the compressor operation electrically by the thermostat.

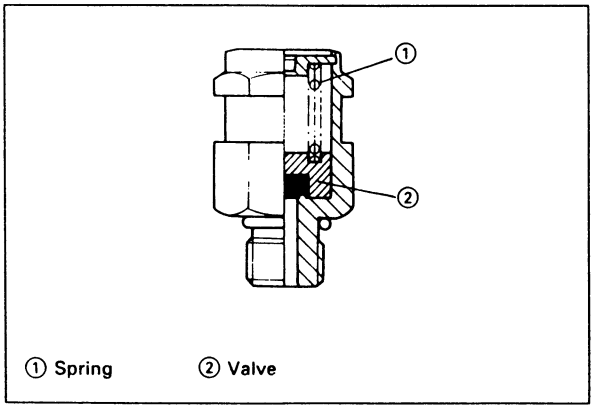
3.5 Side condenser assembly



The condenser is a means to liquefy the refrigerant gas. As the condenser is cooled by the air pulled in by the condenser fan, the refrigerant in the condenser is cooled into liquid. Therefore, when any obstacle prevents the air from flowing evenly to the condenser or the air flow is short circuited, the cooling effect is reduced, with a decrease in the performance of the condenser. When the vehicle is driven at a high speed, the air flow increases resulting in an increase of the cooling effect, and performance of the condenser.

3.6 Relief valve

The relief valve is mounted to the compressor & clutch assembly. The relief valve is usually closed by spring. If pressure of refrigerant in air conditioner system is higher than spring pressure, refrigerant is discharged from relief valve. The pressure drop due to discharge refrigerant, and relief valve is closed again.

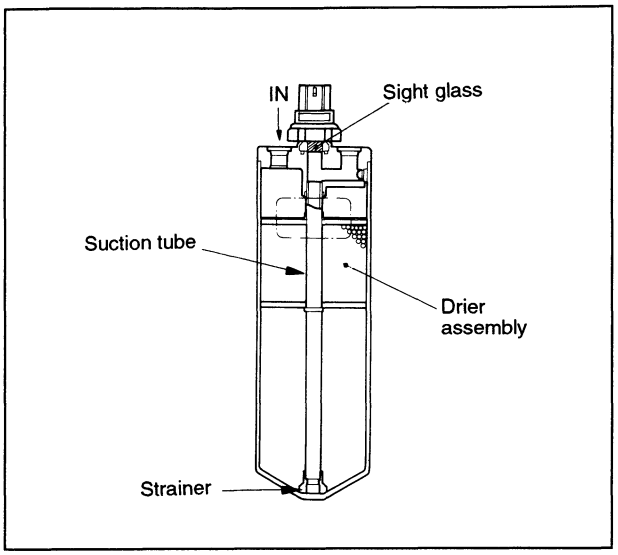


Preset : MPaG (Lb/in²G, kgf/cm²G)

Open	3.50～4.10 (508～594, 35.7～41.8)
Close	2.94 (427, 30)

https://truckmanualshub.com/

3.7 Receiver assembly



A receiver assembly is served as a refrigerant reservoir located between the condenser and the expansion valve.

The receiver assembly consists of a filter and a sight glass. The filter is used to remove dust, the drier is used to remove moisture from the refrigerant in the circuit, and the sight glass is used to check the refrigerant charge.

Any moisture in the refrigerant may not only corrode metal surfaces in the refrigerant circuit, but also cause the throttle of the expansion valve to be frosted, resulting in the interruption of refrigerant circulation.

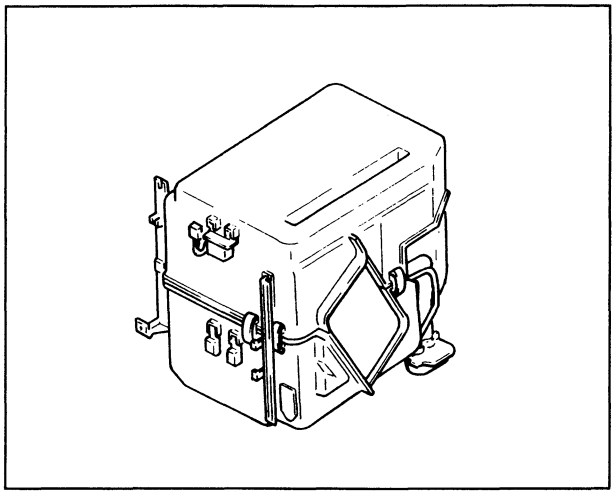
Therefore,the receiver assembly must be handled very carefully. When storing or installing it,care should be taken to protect it from the deterioration of drying performance due to exposure to the air.

The retardation of heat exchange, or any fire around the refrigerant circuit will cause excessive pressurization or heating of the refrigerant. Should such an accident occur, the refrigerant in the circuit must be expelled to the outside to prevent the above hazards.

The sight glass is a sort of peep window used to check the refrigerant flow in the refrigerant circuit.

The sight glass appears clear when the refrigerant flow is enough, and shows bubbles flowing when the refrigerant flow is short.

3.8 Cooling unit assembly



Evaporator core

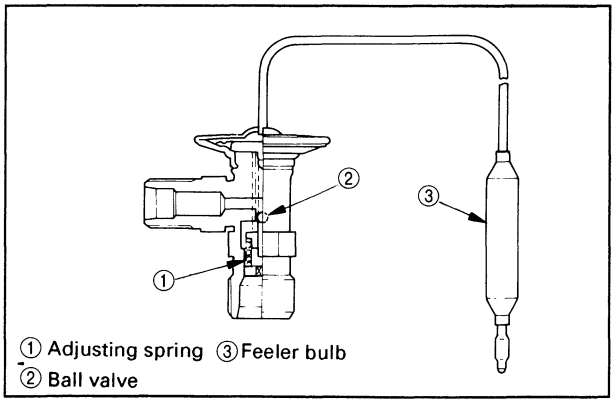
The evaporator core is a type of corrugated fin and tube.

The tube is arranged in zigzag to achieve high efficiency, and to make the core system compact.

A thicker reinforced plastic plate is used as the enclosure to inclease heat and shock resistance,and to protect the core from humidity. This case is a split type, and in a simple design to facilitate installation on the floor panel and the instrument panel frame of the vehicle.

3.9 Expansion valve

The expansion valve is mounted at the inlet of the cooling unit. The liquid refrigerant from the receiver is led to it through a narrow passage (for throttle action), where-in, the liquid refrigerant is condensed with pressure dropping and at the same time the flow rate is adjusted before the refrigerant is sent to the cooling unit. The refrigeration load in the cooling unit is not constant, but usually fluctuates over a certain range. So the refrigerant flow should undergo the control in design. An automatic expansion valve performs this function automatically. The air conditioner uses a thermal type automatic expansion valve.



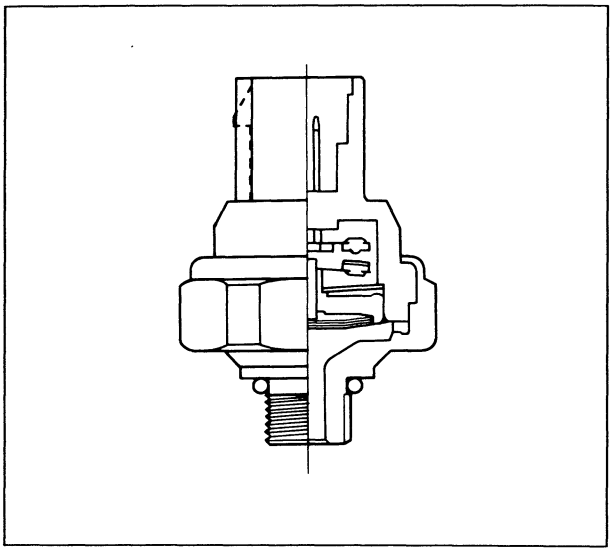
https://truckmanualshub.com/

3.10 Dual pressure switch

The dual pressure switch, fixed to the receiver functions as a protector for stopping the compressor (OFF) at a preset value of pressure in the refrigerant circuit.

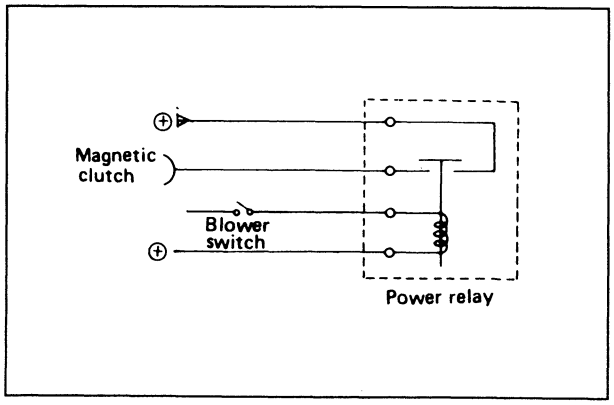
Preset : MPaG (Lb/in²G, kgf/cm²G)

	L.P.SW	H.P.SW
OFF	0.2 (28, 2)	2.94 (418, 30)
ON	0.225 (32, 2.25)	2.35 (334, 24)



3.11 Power relay

The power relay is excited at a closed position of the micro switch and enables the magnetic clutch to be ready for engaging electrically.

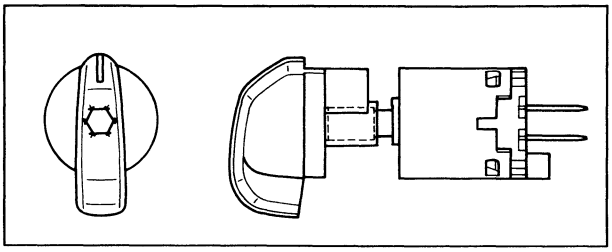


3.12 Air conditioner switch

The air conditioner switch functions as an operation controller for starting or stopping the compressor in cooling and dehumidifying

Set the it to the "ON" position, the magnetic clutch becomes engaged and the compresssor starts.

Set the it to the "OFF" position, the magnetic clutch becomes disengaged and the compresssor stops.



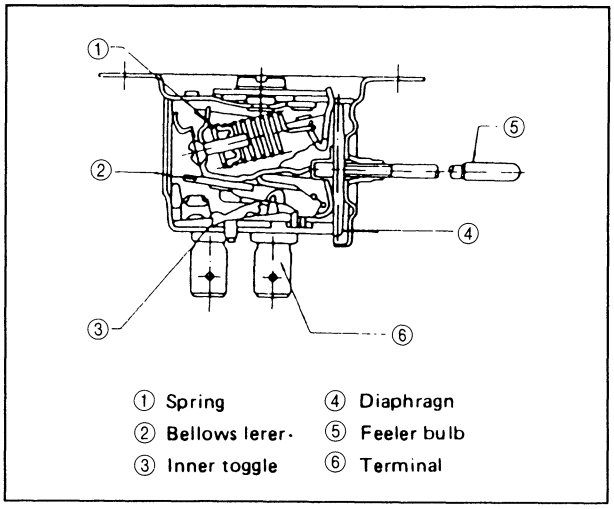
3.13 Thermostat

The thermostat is mounted on the evaporator case.

It senses the temperature of the evaporator fins, and controls the compressor operation for ON or OFF as specified below.

Preset : °F(°C)

OFF	33 (0.5)
ON	38 (3.5)



https://truckmanualshub.com/

4. TROUBLE SHOOTING

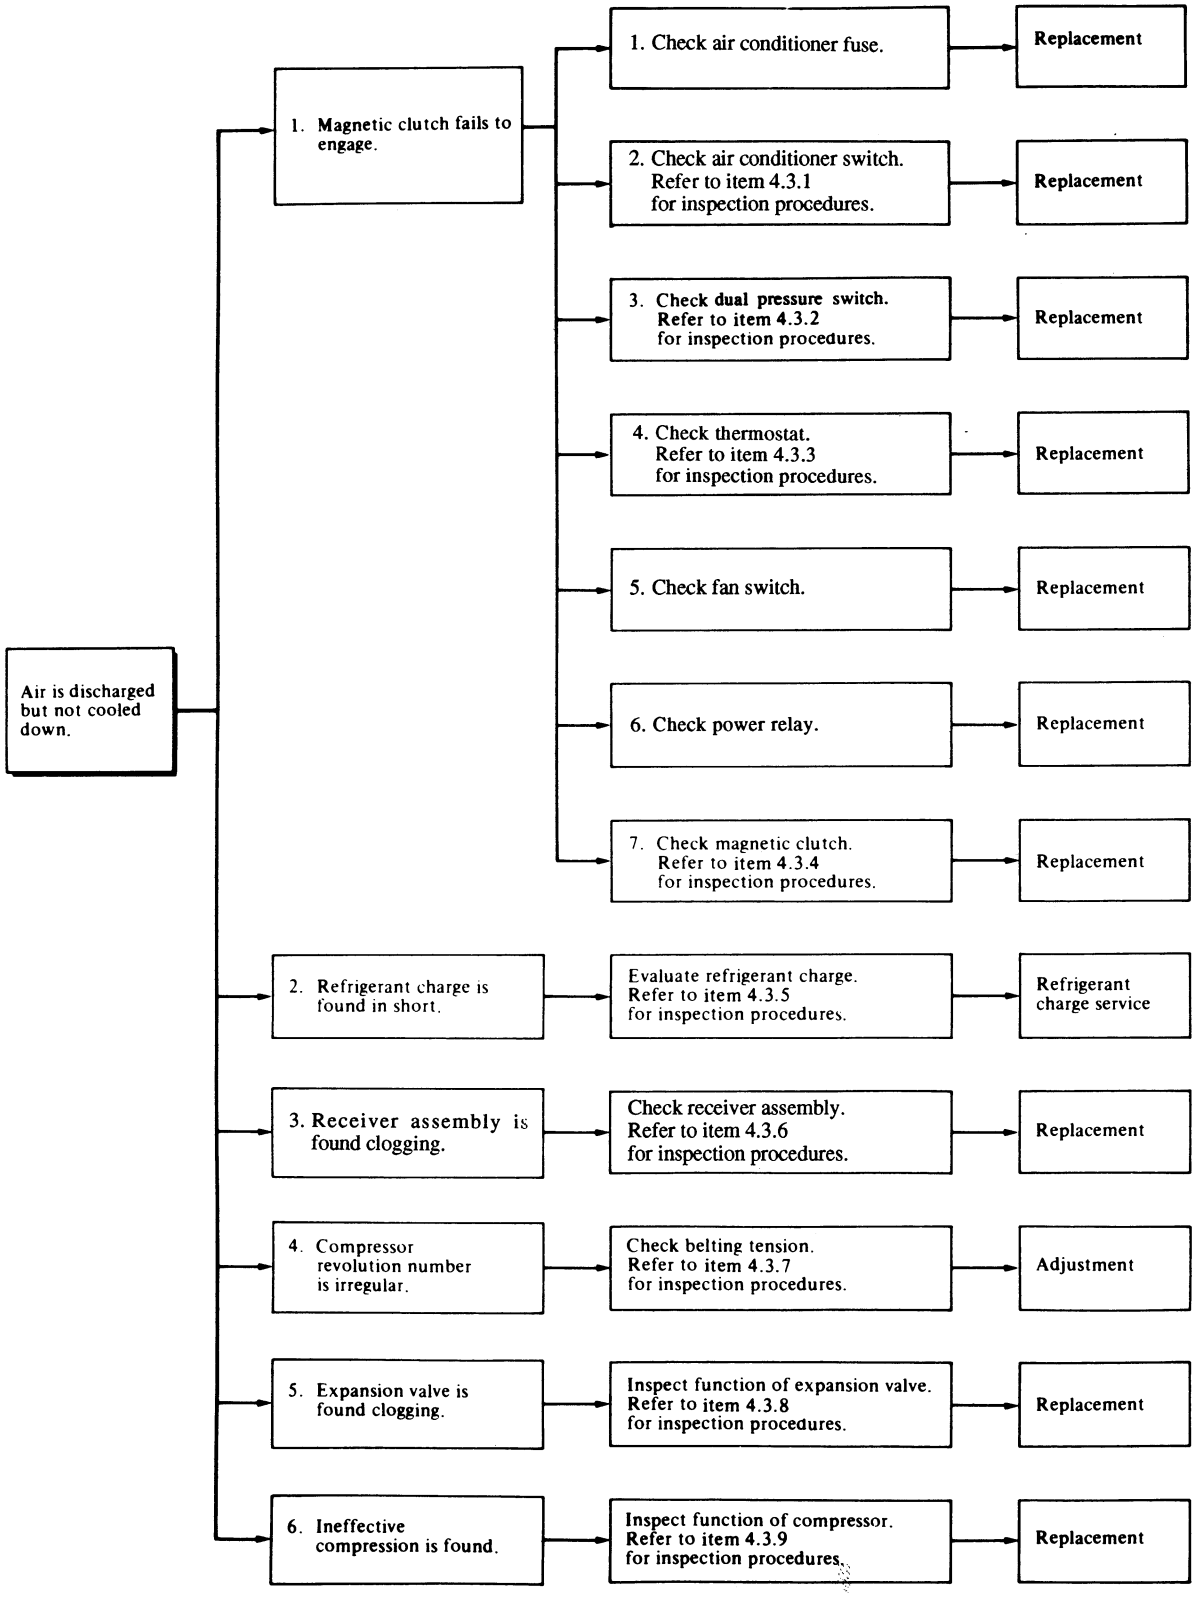
4.1 General precautions

(1) When handling refrigerant (HFC-134a), the following precautions must be observed.
   a. Always wear eye protection and a pair of gloves which handling refrigerant.
   b. Be careful the liquid refrigerant dose not contact the skin.
   c. Keep the refrigerant container blow 100 degrees F (40 degrees C).
   d. Do not handle the refrigerant in an enclosed area having an open flame.The refrigerant may produce a poisonous gas.
   e. When dumping the refrigerant from the system, release it slowly so as not to expell all the compressor oil.

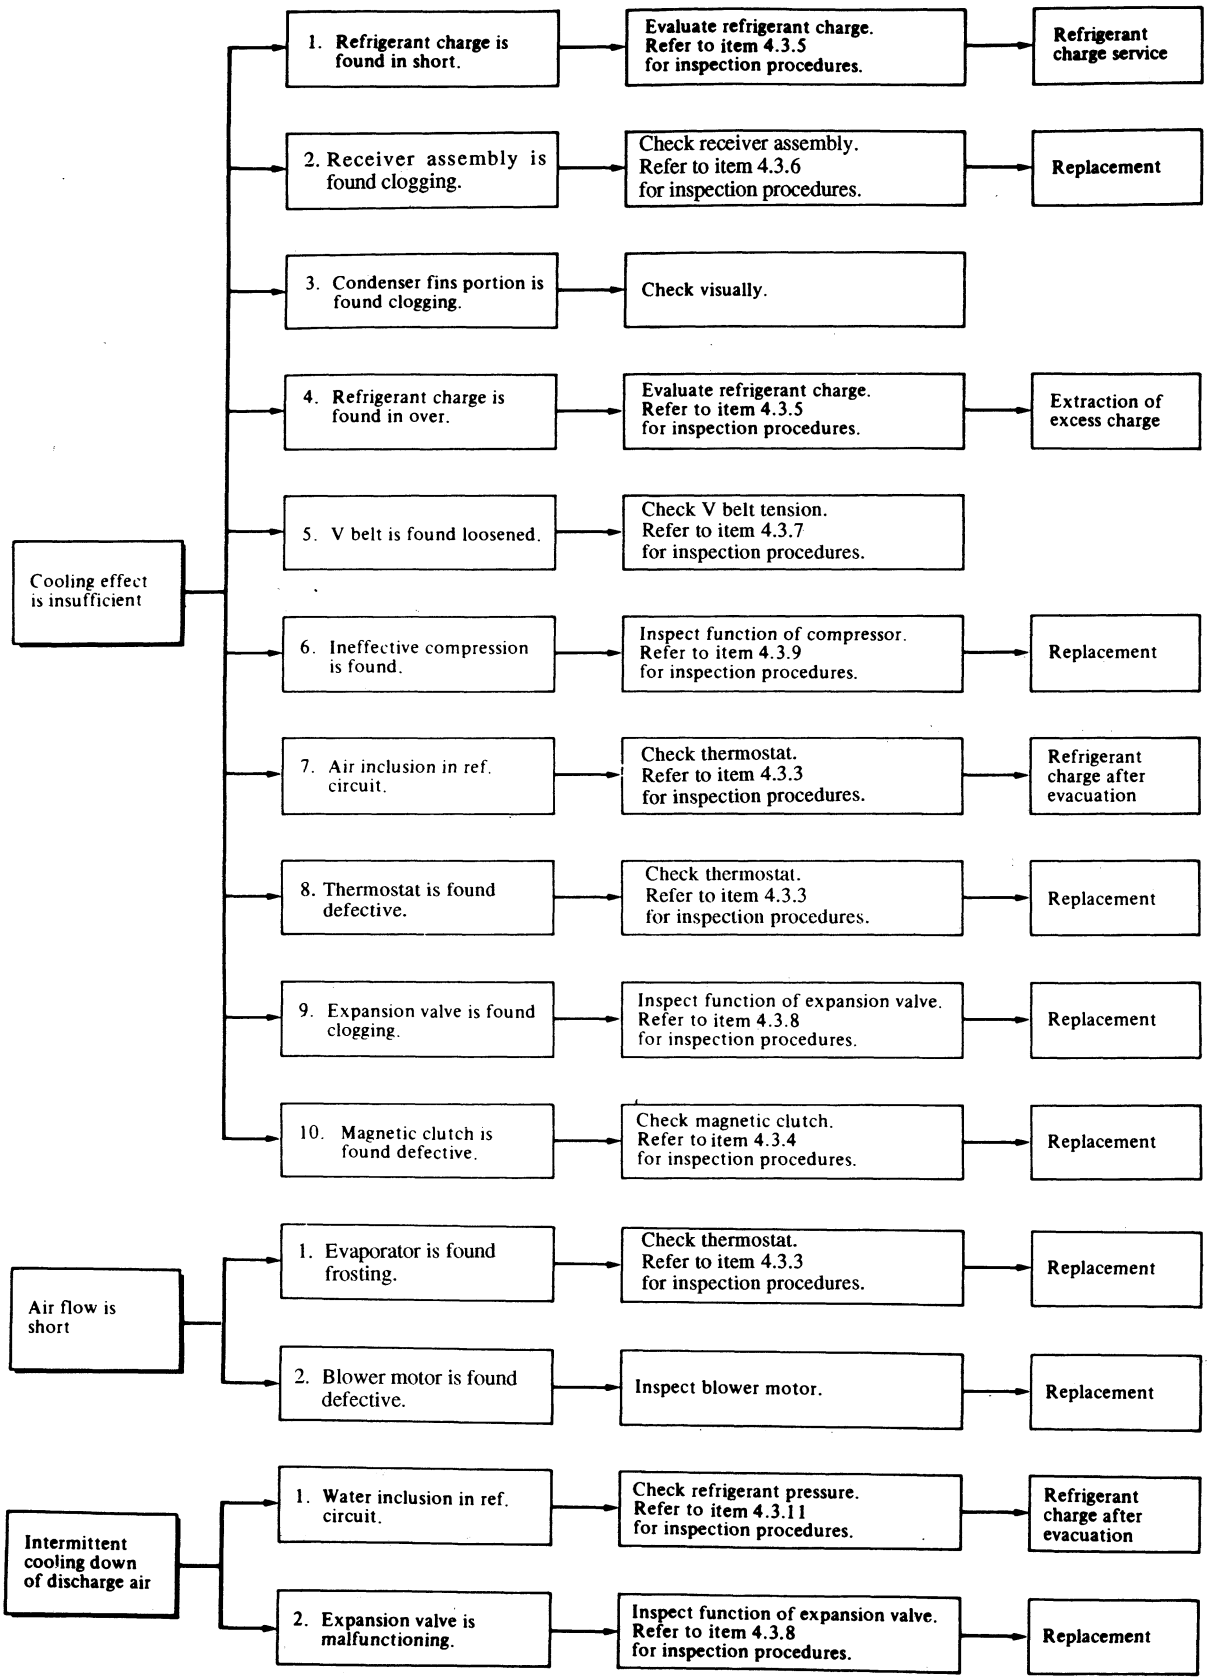
(2) If liquid refrigerant strikes eye or skin.
   a. Do not rub eye or skin.
   b. Splash large quantities of cool water on the eye or skin.
   c. Rush to a physician or hospital for immediate professional treatment.

https://truckmanualshub.com/

4.2 Trouble cause and remedy



https://truckmanualshub.com/



https://truckmanualshub.com/

ɛction procedures

r conditioner switch

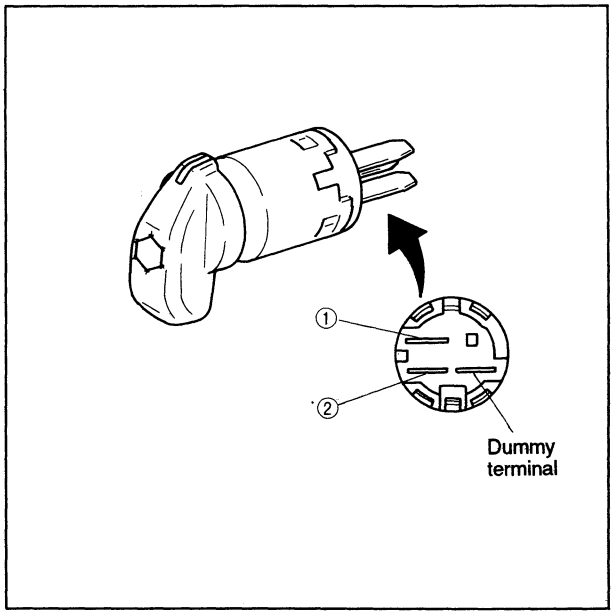
ug the air conditioner switch.

:k the continuity between terminals of the air itioner switch with a tester.

inuity

itch position	Terminal's number	Result, in normal
OFF	①—②	No
ON	①—②	Yes

Terminal's number / h ion	1	2
OFF	○	
ON	○—○	



ɔual pressure switch

dual pressure switch is attached to the receiver ɔly for controlling the operation of the air oner by checking the inside pressure of the r assembly.

MPaG (Lb/in²G, kgf/cm²G)

High side	Low side
2.94 (418, 30)	0.2 (28, 2)
2.35 (334, 24)	0.225 (32, 2.25)

ıplug the connector at the receiver assembly.

ıeck the continuity between terminals of the nnector with a tester.

hen electric continuity is found, connect the nnector to the high pressure switch.

ttach the high pressure gauge and low pressure ıuge.

perate the air conditioner.

ɔver the surface of the condenser by using a piece paper.

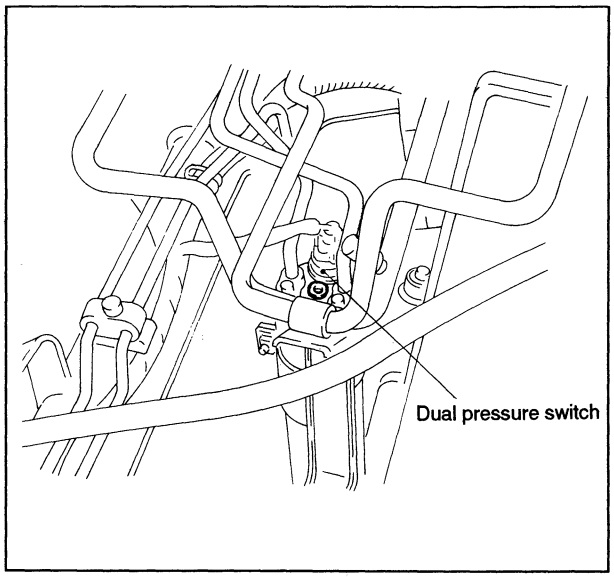
hen the high pressure exceeds 2.94 MPaG (418 b/in²G, 30 kgf/cm²G), if the magnetic clutch is ırned off, the switch is normal.

the magnetic clutch is not turned off, replace ressure switch with new one.

heck the accuracy of the preset as below.

ı) Stop the air conditioner.

ɔ) Purge the air conditioner of refrigerant slowly starting at over 0.225 MPaG (32 Lb/in²G, 2.25kgf/cm²G).



(c) At reading the pressure 0.2 MPaG (28 Lb/in²G, 2 kgf/cm²G), the switch opens.

(d) Here, stop the purging, then turn it to charging.

(e) At reading the pressure 0.225 MPaG (32 Lb/in²G, 2.25 kgf/cm²G), the switch closes.

If the dual pressure switch does not meet specifications, replace the switch.

https://truckmanualshub.com/

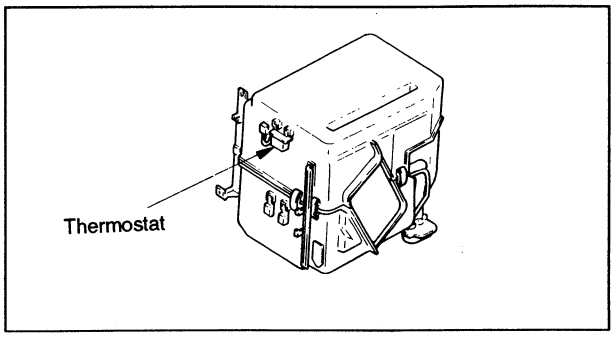
4.3.3 Thermostat

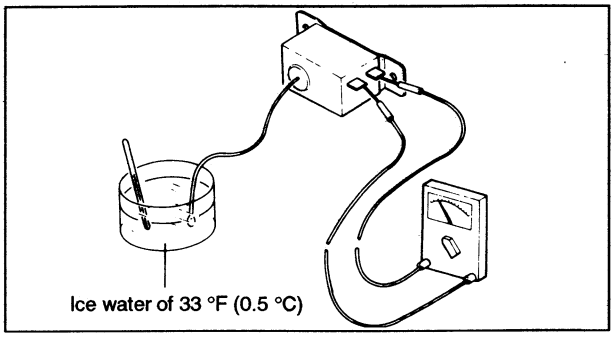
The thermostat is mounted on the evaporator case. It controls the operation of the air conditioner by sensing the temperature of the evaporator fins.

Preset : °F (°C)

OFF	33 (0.5)
ON	38 (3.5)

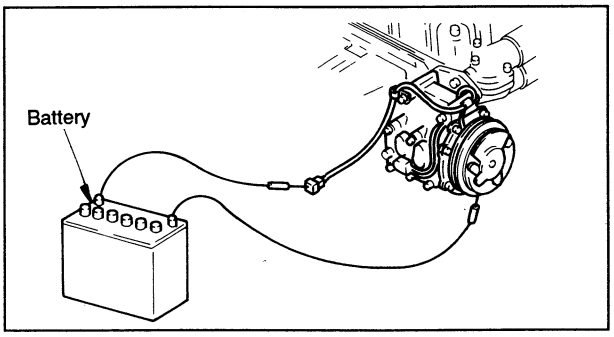
(1) Check the accuracy of the preset as below.
  (a) Soak the sensor of the thermostat in ice-water of below 33 °F (0.5 °C).
  (b) Check the cotinuity between the switch terminals.
  (c) Pull the sensor out of the ice-water, and check the continuity at over 38 °F (3.5 °C) of the sensor.





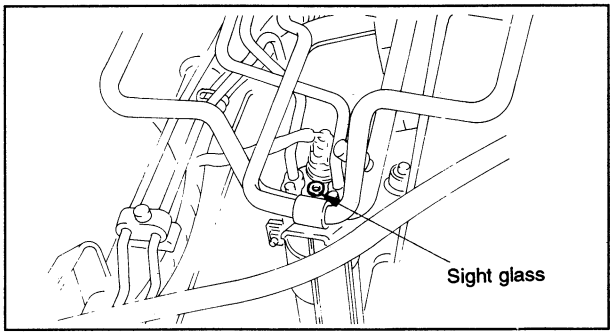
4.3.4 Magnetic clutch

(1) Disconnect the wiring to the magnetic clutch.
(2) Apply a positive side power voltage to the magnetic clutch through the wiring.
(3) In the case of regular functioning, the pulley and magnetic clutch are engaged with a clicking sound. The failing means any malfunction of the magnetic clutch.



4.3.5 Refrigerant charge

(1) Set the temperature control lever at the cool position.
(2) Open doors of the room.
(3) Set the blower switch at the ON position.
(4) Adjust the engine revolution at 1500 rpm.
(5) Operate the air conditioner switch for comp. ON.
(6) Watch the sight glass of the receiver assembly at the inside of the engine room.
  (a) If judged as insufficient refrigerant charging, repair the leaks, then charge it additionally.
  (b) If judged as over charging of refrigerant, extract an excess refrigerant.
(7) Diagnosis by pressure reading
  (a) Short of refrigerant :
  Lower pressure for both L.P. and H.P. reading
  (b) Express of refrigerant :
  Higher pressure for L.P. and H.P. reading



Sight glass		Remarks
Proper refrigerant level	Bubble	1. Bubble occasionally appears. 2. Bubble disappear if speed is a little increased.

Insufficient refrigerant	Bubble	Considerable bubbles appear. If the system is extremely short of refrigerant, the sight glass appear white.
Excessive refrigerant		1. No bubbles appear. 2. Slight bubbles appear if speed is decreased.

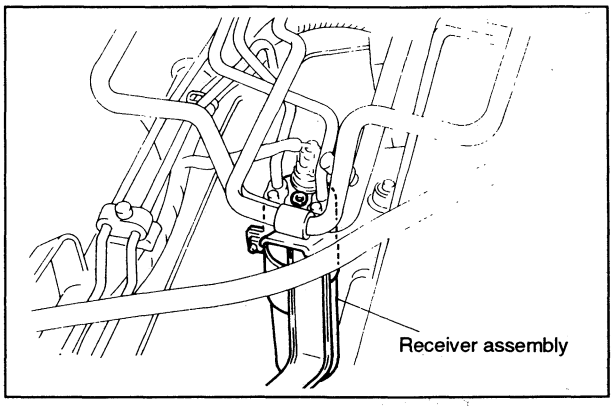
https://truckmanualshub.com/

4.3.6 Receiver assembly

(1) While operating the air conditioner, touch the refrigerant piping with a hand at the inlet and outlet portions.

(a) Sensed temperature difference :

It is possible that clogging is happening at the inside, liquid receiver assembly is to be replaced with a new one.



4.3.7 Belt tension

(1) Depress the V belt with a thumb at the ⬅ marked position, and adjust the stretching as below.

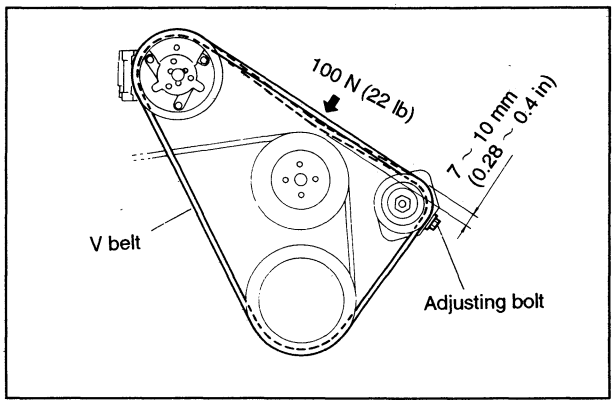
Stretching degree : 7 ~ 10 mm (0.28 ~ 0.40 in) (deflection)

(2) Adjustment

(a) Loosen the nut of the tension pulley.

(b) Control the belting tension by the adjusting bolt.

(c) After finishing, retighten the nut as before.



4.3.8 Expansion valve

⚠CAUTION

The test should be applied to only the case of the other components being free from troubles, and the expansion malfunctioning singly.

(1) Build up the test circuit with a gauge manifold.

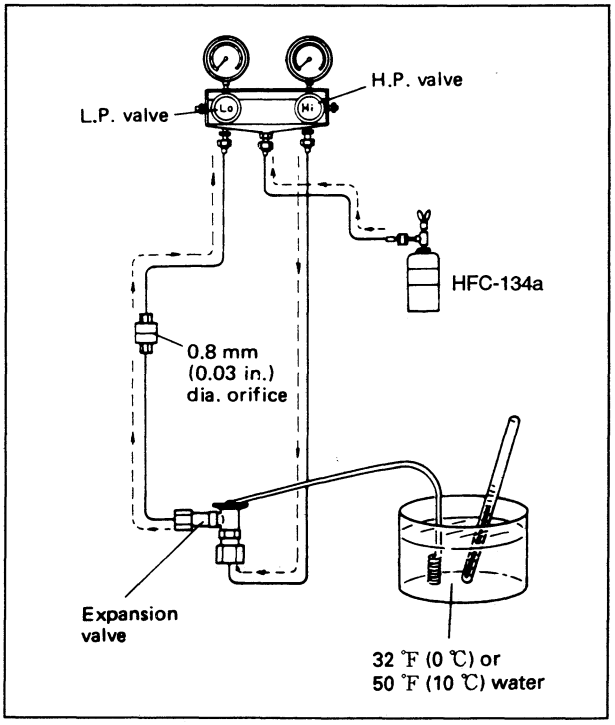
(2) Soak the sensor bulb in ice water of 32 °F (0 °C), and of 50 °F (10 °C) respectively.

(3) Pressurize the H.P. side with dry nitrogen gas of 1.03MPaG (10.5 kgf/cm²G).

(4) Check the reading of the L.P. side pressure gauge for the standard range.

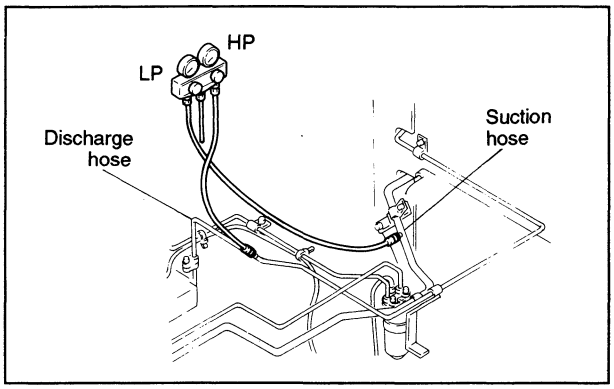
At 32 °F (0 °C) --- 0.127 MPaG (18.4 Lb/in²G, 1.3 kgf/cm²G)

At 50 °F (10 °C) --- 0.23 MPaG (33.4 Lb/in²G, 2.35 kgf/cm²G)



https://truckmanualshub.com/

4.3.9 Pressure check

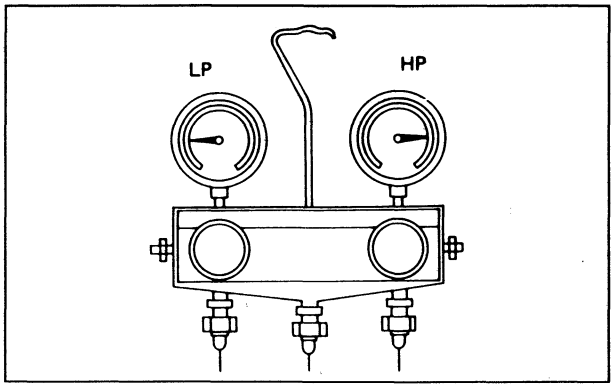


(1) Mount a low pressure gauge hose and a high pressure gauge hose on the check valve.
(2) Drive the air conditioner.
(3) Showing of higher L.P. side pressure and lower H.P. side pressure evidences ineffective compression.

Standard pressure

L.P. side pressure	About 0.26 MPaG (38.4 Lb/in²G, 2.7 kgf/cm²G)
H.P. side pressure	About 1.42 MPaG (207.6 Lb/in²G, 14.6 kgf/cm²G)

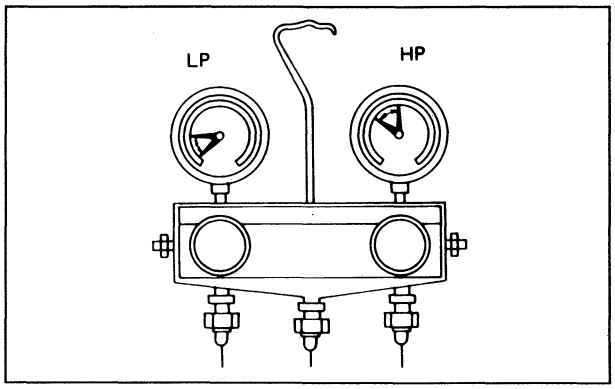
4.3.10 Air inclusion in ref.circuit



The abnormal reading of the refrigerant circuit evidences afraid air inclusion.

A little higher L.P. side pressure Noticeably higher H.P. side pressure

4.3.11 Moisture inclusion in ref. circuit



(1) During the operation, cooled air supply is interrupted periodically with a time interval.
This phenomenon evidences afraid water inclusion.
(2) Check the refrigerant pressure at a stop of the cooled air supply to make sure of the water inclusion.

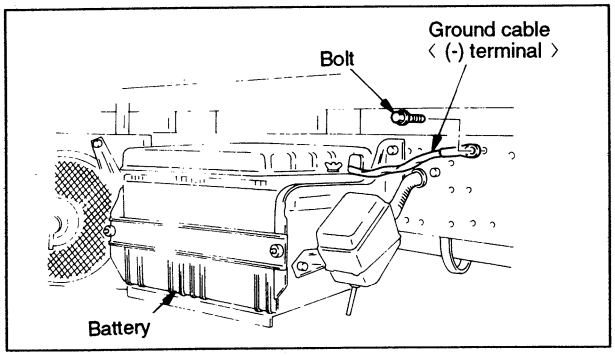
L.P. side pressure ..... Almost vacuum
H.P. side pressure ..... Noticeably low

https://truckmanualshub.com/

5. REMOVAL AND INSTALLATION

5.1 Precaution for removal and installation.

1. Disconnect the (-) ground cable from the battery, and place a cover on the battery.



2. Make certain all the openings are covered with caps in order to prevent entry of foreign substances such as dust and dirt.
3. Never tamper with the brake and fuel systems, including the brake tubes and hoses.
4. Avoid doing the work in a dusty place or outdoors in rainy weather. If tubes or functional parts are removed, put a cap in position immediately in order to prevent entry of dust and moisture.
5. Connect the charging hose of the gauge manifold to the check valves (suction and discharge) of the suction hose and discharge hose, and recover the refrigerant by refrigerant recovery unit until its pressure is reduced to 0 kPaG (0 psiG, 0 kgf/cm²G). (Make sure that there is no internal pressure in the equipment.)

   Abrupt discharging might result in the discharge of the refrigerant oil from the compressor.
6. When coupling the flared tube, coat the flared portion with the compressor oil at the inner side.
7. Make sure to use the wheel chocks.

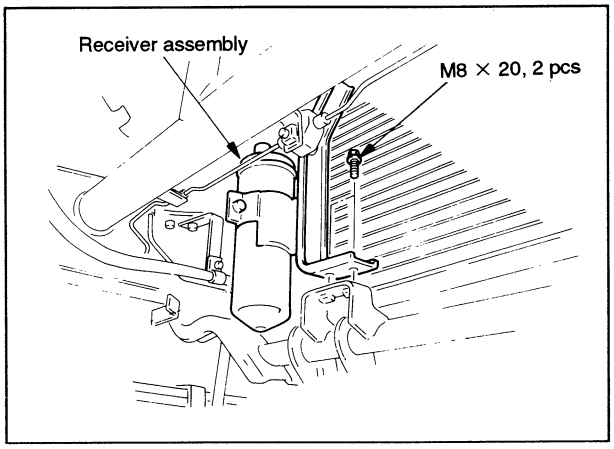
5.2 Removal

5.2.1 Inside the engine room

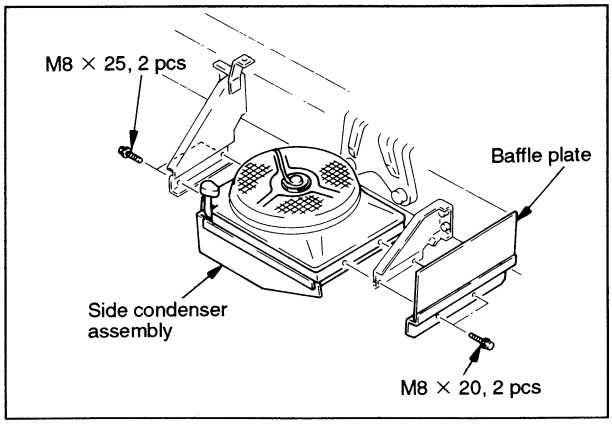
(1) Compressor & clutch assembly
   (a) Withdraw the wiring of the magnetic clutch at the connector.
   (b) Remove the V belt by loosening fixature of the tension pulley.
   (c) Take of the archor bolts : M8 × 100, 3 pcs and M8 × 130, 1 pc.
   (d) Dismount the compressor.

(2) Receiver assembly
   (a) Unplug the dual pressure switch at the connector.
   (b) Separate the interconnecting refrigerant pipe of the receiver assembly.

   (c) Take off the fixing bolt : M8 × 20, 2 pcs.
   (d) Dismount the receiver assembly.



(3) Side condenser assembly
   (a) Unplug the condencer fan harness at the vehicle side harness.
   (b) Take off the fixing bolt : M8 × 20, 2 pcs and M8 × 25, 2 pcs.
   (c) Dismount the side condenser assembly (and baffle plate).

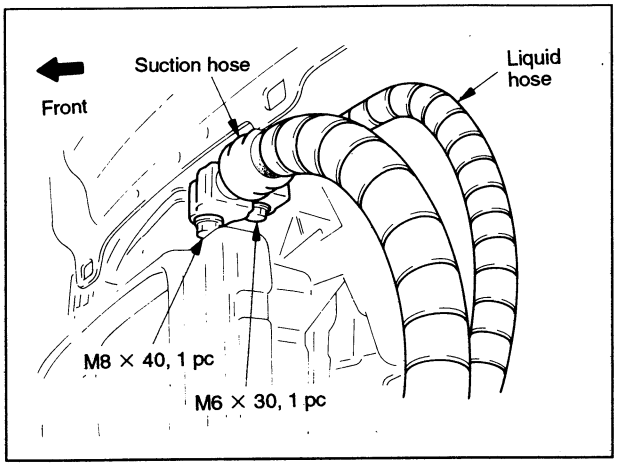


https://truckmanualshub.com/

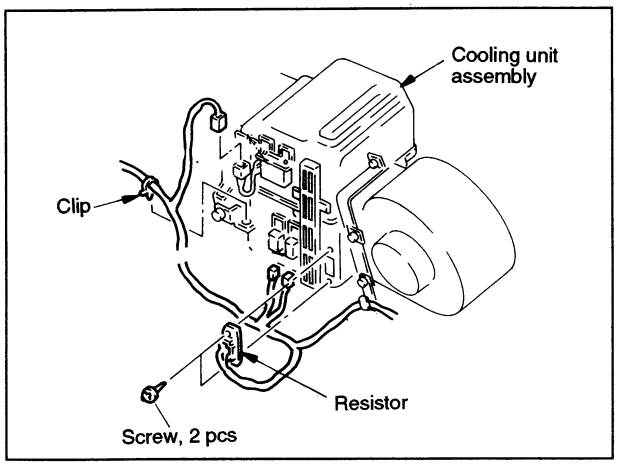
5.2.2 Cabin room

(1) Cooling unit assembly

(a) Separate the interconnecting refrigerant pipes of the cooling unit assembly.



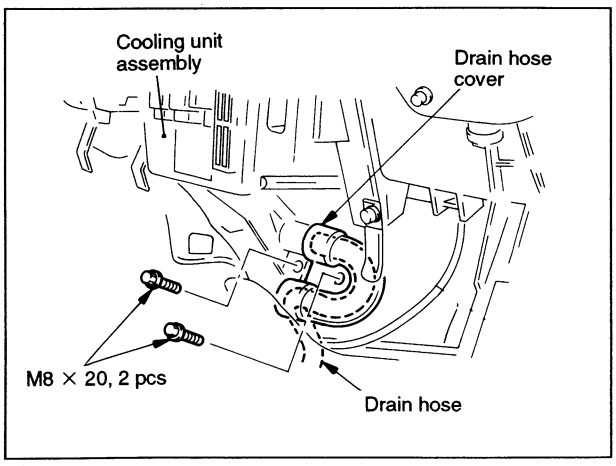
(b) Withdraw the wiring of the cooling unit assembly at the connectors.



(c) Take off the fixing bolts : M8 × 20, 2 pcs.

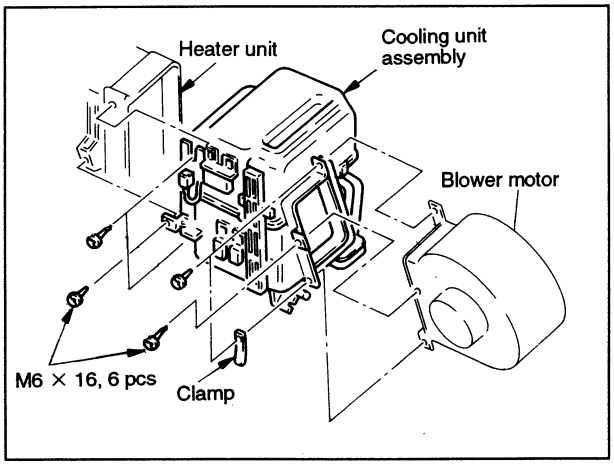
(d) Dismount the drain hose cover.

(e) Reconnect the drain hose from the cooling unit assembly.



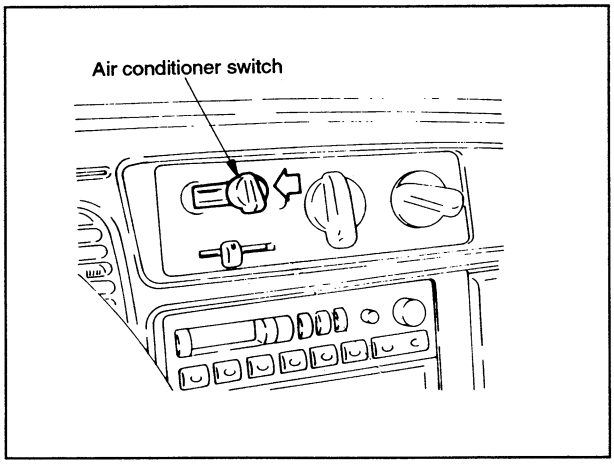
(f) Take off the fixing screws : M6 × 16, 6 pcs.

(g) Dismount the cooling unit assembly.



(2) Air conditioner switch

Pull out the air conditioner switch.



https://truckmanualshub.com/

5.3 Installation

Installation is performed in the opposite sequence of removal.

○ Torques for tightening coupler of refrigerant tubing.

Nm (Lb.ft.kgm)

Compressor suction hose	29-34 (21 ~ 24, 3.0 ~ 3.5)
Compressor discharge hose	20-25 (14 ~ 18, 2.0 ~ 2.5)
Compressor inlet hose	20-25 (14 ~ 18, 2.0 ~ 2.5)
Compressor outlet hose	12-14 (8.6 ~ 10, 1.2 ~ 1.5)
Liquid receiver assembly inlet and outlet hoses	12-14 (8.6 ~ 10, 1.2 ~ 1.5)
Cooling unit inlet hose	12-14 (8.6 ~ 10, 1.2 ~ 1.5)
Cooling unit outlet hose	29-34 (21 ~ 24, 3.0 ~ 3.5)

○ Torques for tightening general bolt and nut

Nm (Lb.ft. kgm)

Nominal size	Pitch	Tightening torque		
		Head mark 4	Head mark 7	Head mark 8
M 5	0.8	3-4 (2.1 ~ 2.9, 0.3 ~ 0.4)	5-6 (3.6 ~ 4.3, 0.5 ~ 0.6)	5-7 (3.6 ~ 5, 0.5 ~ 0.7)
M 6	1.0	5-6 (3.6 ~ 4.3, 0.5 ~ 0.6)	9-11 (6.4 ~ 7.9, 0.9 ~ 1.1)	8-12 (5.7 ~ 8.6, 0.8 ~ 1.2)
M 8	1.25	12-14 (8.6 ~ 10, 1.2 ~ 1.5)	19-24 (13.6 ~ 17, 2.0 ~ 2.5)	19-29 (13.6 ~ 21, 2.0 ~ 3.0)
M10	1.25	24-29 (17 ~ 21, 2.5 ~ 3.0)	38-48 (27 ~ 34, 4.0 ~ 5.0)	43-58 (30.7 ~ 41.4, 4.5 ~ 6.0)
M10	1.5	17-26 (12 ~ 18.6, 1.8 ~ 2.7)	32-48 (23 ~ 34.3, 3.3 ~ 5.0)	41-58 (29.3 ~ 41.4, 4.3 ~ 6.0)
M12	1.25	34-43 (24.3 ~ 31, 3.5 ~ 4.5)	58-77 (41 ~ 55, 6.0 ~ 8.0)	82-106 (58.6 ~ 75.7, 8.5 ~ 11.0)
M14	1.5	72-82 (51 ~ 59, 7.5 ~ 8.5)	115-134 (82 ~ 96, 12.0 ~ 14.0)	125-173 (89.3 ~ 123.6, 13.0 ~ 18.0)

NOTE

For the cases of spring washer seated, and thread or seating surface coated with oil, the value shall be reduced down to 85 percent of the data listed.

https://truckmanualshub.com/

6. TREATMENT AFTER INSTALLATION

6.1 Check and adjustment

After installation, check the following points and confirm that everything is normal, then charge the gas, and do the performance and operation tests.

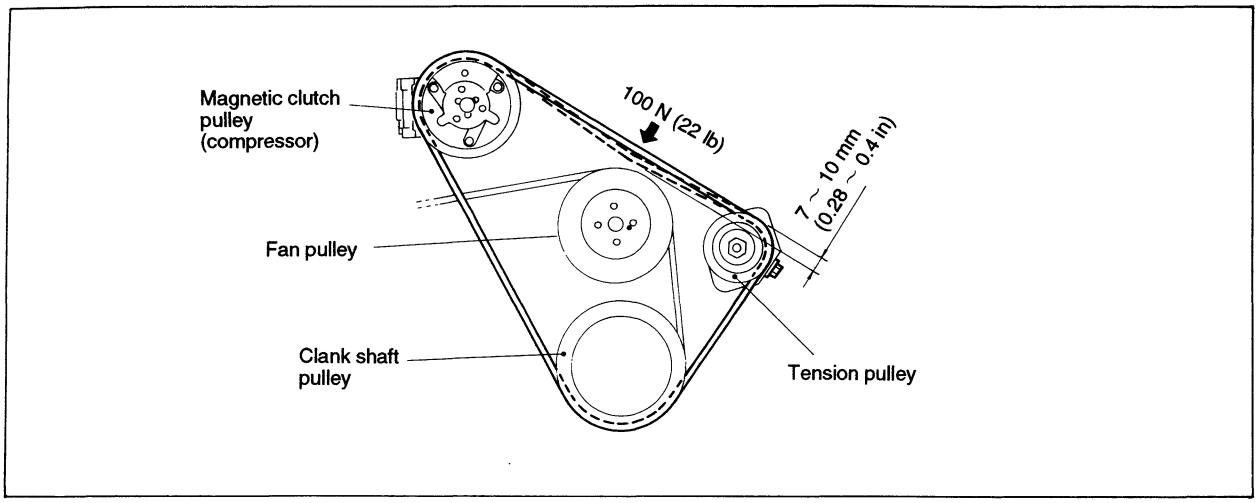
(1) Check if any abnormal vehicle performance, happens or not by installing the air conditioner.

(2) Check the operation of the magnetic clutch. (with the compressor disengaged)

(3) Check if any parts left unmounted or any tool left in the vehicle.

(4) Check to ensure that the temperature control lever operates properly.

(5) Check the tension of the belt.



6.2 Leak test

After all the piping works are completed, conduct an leak test by the following procedure to check any leaks at the flare coupling, etc. and then evacuate the system. If this leak test is omitted and evacuation is immediately started, there is no way of detecting possible leak. If there are leaks, the specified vacuum cannot be attained. In order to save the service time be sure to conduct the leak test before evacuation.

6.2.1 Test points

(1) All pipe joint.

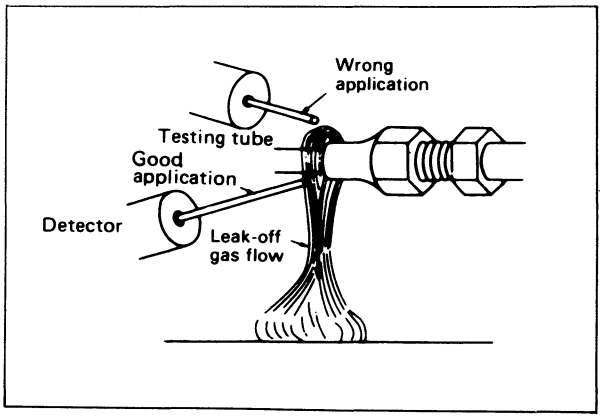
(2) Shaft seal and check valve on the compressor.

6.2.2. Test procedure

(1) For the gas leak test, the use of an electric gas leak detector is recommended. (HFC-134a SAE Approved)

(2) Perform the test at a place as in free from air flowing.

(3) The refrigerant is heavier than air. Leaks will concentrate at the bottom. Make certain that the testing tube is applied below the check point.



(4) The test should be performed patiently. Make certain that testing tube is moved slowly [approx. 10 mm/sec. (0.4 in./sec.)].

(5) The high pressure side refrigerant circuit should be tested for gas leaks during operation. Those areas which are dangerous or hard to test during operation (including areas around the compressor and condenser) should be tested direct after shutdown.

https://truckmanualshub.com/

(6) The low pressure side refrigerant circuit should be tested during shutdown after the gas pressure has balanced.

(7) The test should be performed on the basis of the following standards:

Gas leak test standards

Test Point / Instrument	Compressor shaft seal	Other parts
Electric gas leak detector	Pointer shall not swing more than 0.1 mA at the low sensitivity.	Pointer must not swing more than 0.1 mA at the high sensitivity.
Halide torch gas leak detector	Flame colour (moss green) shall not change.	

⚠ WARNING

- **Smoking should be forbidden if a gas leak is detected.**
- **If a flame is applied to the refrigerant, toxic phosgene gas will be produced. Do not keep the detector in contact with a leaky point for a long time.**

- Leak test procedure

1. Attach refrigerant supply and gauge set as shown with all valves closed. Open refrigerant supply valve on can.
2. Loosen the center charging hose fitting at the manifold gauge end to blow any air from the hose until it hisses for a few seconds, then retighten it.
3. Open both gauge valves to partially charge the system and then close both valves.
4. The system can then be checked for leaks using an electronic leak detector.
5. If leaks are found that require the system to be opened (to repair or replace hoses, fittings, etc.), release any charge in the system.
6. After checking and repairing leaks, system must be evacuated.

6.3 System Charging

GENERAL PRECAUTIONS

⚠WARNING

When handling refrigerant (HFC-134a), the following precautions must be observed.

— Always wear eye protection and gloves while handling refrigerant.

— Be careful that liquid refrigerant does not contact the skin.

If liquid refrigerant strikes eye or skin:

— Do not rub on skin.

— Splash large quantities of cool water on the eye or skin.

— Flush eyes or skin with cool water for 5 minutes.

— Rush to a physician or hospital for immediate professional treatment.

— Do not attempt to treat it yourself.

— Keep the refrigerant (HFC-134a) container below 104°F (40°C).

— Do not handle the refrigerant in an enclosed area having an open flame; the refrigerant may produce a poisonous gas.

— Use approved recovery equipment to recover HFC-134a refrigerant before attempting service of this or any other HFC-134a system.

— Do not attempt to leak test an HFC-134a system with high pressure air or nitrogen. Mixing HFC-134a with a concentrated quantity of air may be combustible in the presence of ignition.

https://truckmanualshub.com/

6.3.1 Evacuation

INSTALLATION OF SIMPLE HFC-134a EQUIPMENT

(1) Connect the manifold gauge to the service valves.

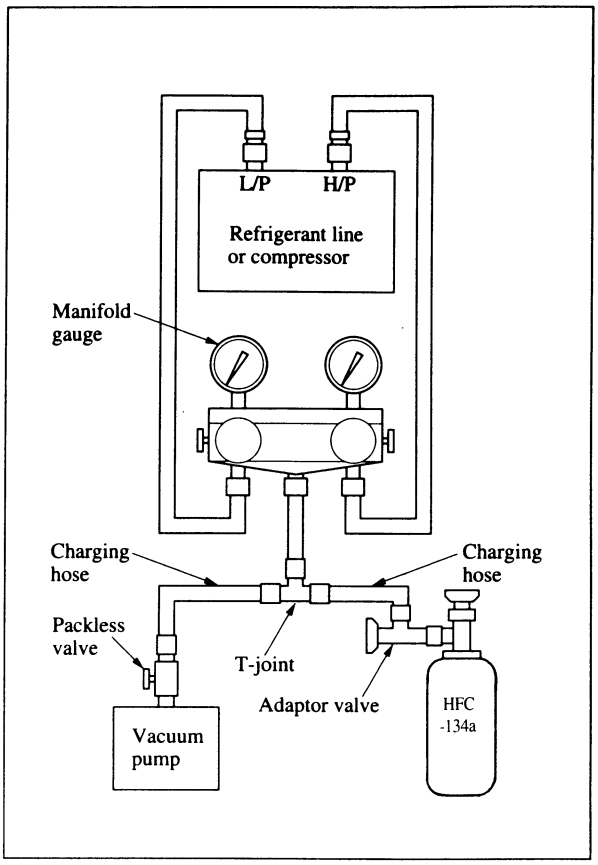
(2) Connect the packless valve to the vacuum pump.

(3) With the charge valve handle turned back all the way, install the service can.

(4) Connect the equipment as illustrated.

⚠CAUTION

1. **Do not connect the high and low pressure sides adversely. (Connect high pressure side to the condenser and low pressure side to the cooling unit assembly)**
2. **The indications "DIS" and "SUC" on the compressor indicate high and low pressure sides respectively.**

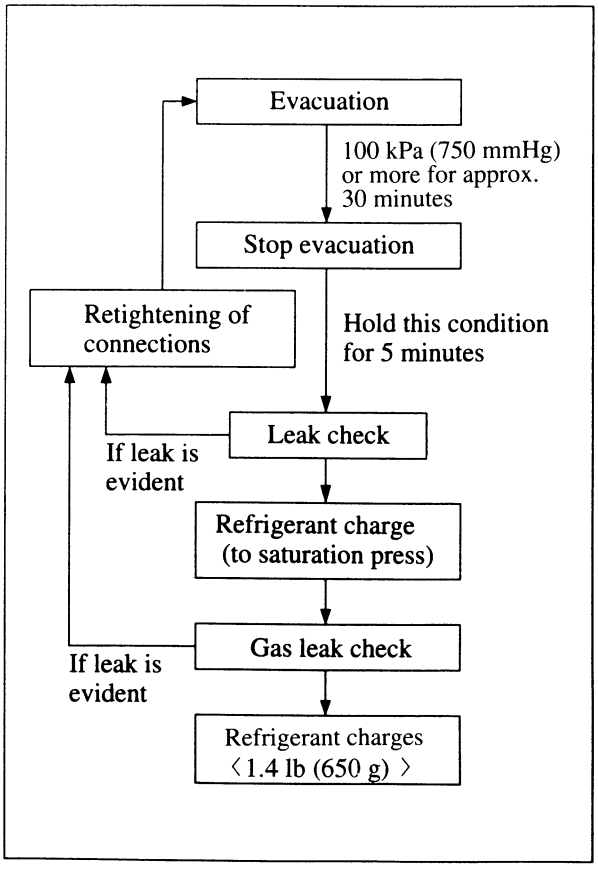


6.3.2 Evacuate the System

The refrigerant system must be evacuated before charging. Charge using HFC-134a refrigerant only. HFC-134a is available in bulk tanks. Follow the safety precautions for handling HFC-134a as listed in this section.

Follow the evacuation procedure below and at right.

This procedure assumes no HFC-134a refrigerant has been introduced into the system. If evacuating a charged system, it is necessary to recover the existing HFC-134a refrigerant before continuing with these instructions. Refer to the recovery equipment manufacturer's instructions for proper refrigerant recovery.



https://truckmanualshub.com/

(1) Start up the vacuum pump.

⚠CAUTION

1. **Do not use the compressor for evacuation.**
2. **Do not operate the compressor in the vacuum condition; damage may occur.**

(2) Open the manifold gauge handles and the packless valve.

(3) Evacuate to a vacuum reading of 100 kPa (750 mmHg) or higher (approx. 30 minutes).

(4) Turn back the packless valve all the way and close the service valve.

(5) Stop the vacuum pump and allow to stand for 5 minutes.

(6) Check for leak. (Good if the vacuum is held.)

CHARGING WITH BULK TANK

(1) Open the charge valve to charge the system with refrigerant.

(2) When the refrigerant is no longer drawn in, turn back the high pressure side manifold gauge handle.

(3) Check for refrigerant leaks using a leak detector.

(4) Start the engine.

(5) Operate the air conditioner and set at the lowest temperature (MAX. COOL).

(6) Fix the engine speed at 1,500 rpm.

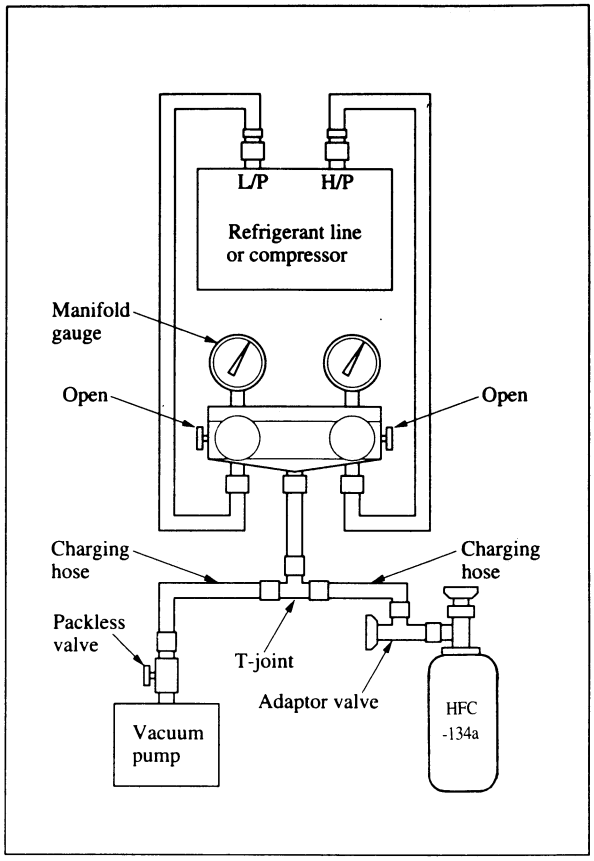
(7) Continue charging system until proper refrigerant quantity is introduced into the system.

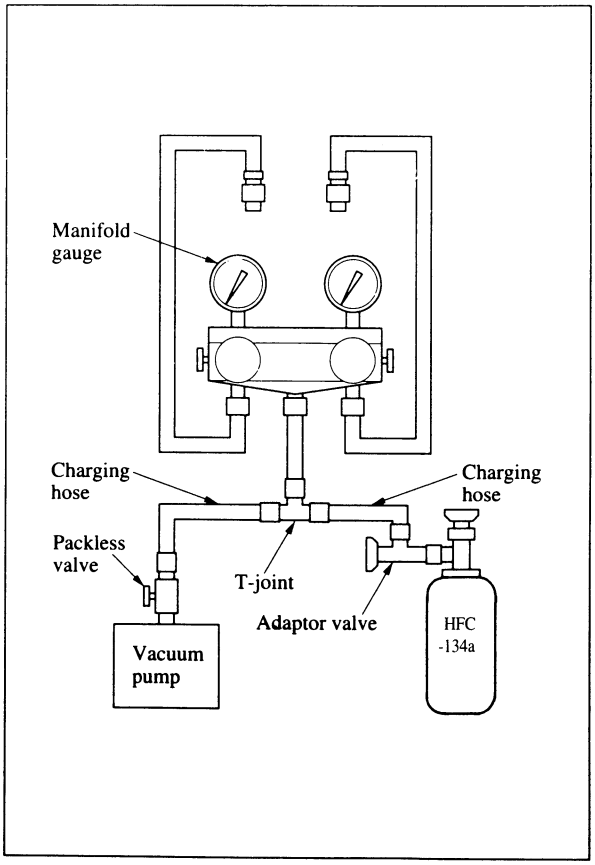
⚠CAUTION

If the bulk tank is inverted, liquid refrigerant may be drawn into the compressor damaging it by liquid compression.

Keep the bulk tank upright to ensure that refrigerant is charged in gas state.

(8) Upon completion of charging, turn back the low pressure side manifold gauge handles.





https://truckmanualshub.com/

6.3.3 Removal of Charge Equipment

(1) Close the charge valve.

(2) Remove the manifold gauge from each service valve.

⚠CAUTION

Do not remove the bulk tank, T-joints and adaptor valves but keep them connected for next charge operation.

CORRECTING LOW REFRIGERANT LEVEL

Locate the source of the low refrigerant level, recover system, repair system, evacuate system, charge system, check for leaks.

⚠CAUTION

If the bulk tank is not emptied completely, keep the charge valve connected to the can for next charging.

6.3.4 Discharging System

Use the refrigerant recovery unit which can be purchased in local market to discharge refrigerant gas from the system.

⚠CAUTION

Refer to that Refrigerant Recovery Unit Instruction Manual for operation which is attached on the unit.

LIQUID CHARGE, through high side using charging station:

⚠CAUTION

Do not run engine when performing liquid charge; compressor will be damaged.

(1) After the system is evacuated, close gauge valves, connect center hose to refrigerant supply. Loosen center fitting at gauge to blow any air out of the hose and then retighten.

(2) Following charging station manufacturer's instructions charge the system until 1.4 lb (650 g) of refrigerant is pumped into the system.

(3) When system is fully charged, close high gauge valve and refrigerant supply valve, then quickly disconnect gauge hoses from service valves.

(4) After charging the system, refer to Pre-Delivery Inspection.

https://truckmanualshub.com/

6.4 Performance test

6.4.1 Preparation

Reinstall all vehicle parts that were removed for installation of the air conditioner at their original positions, adjust the mounting, and test the following items.

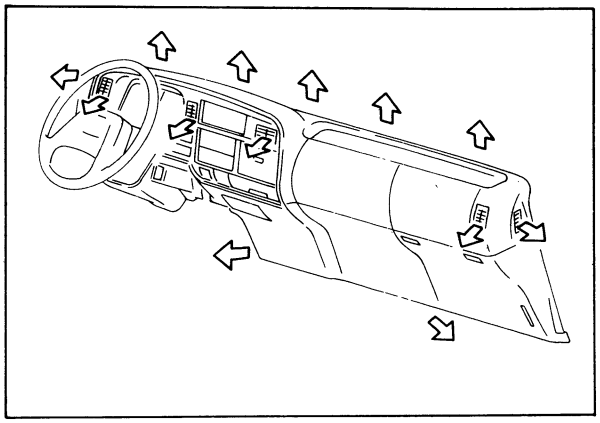
1. Installation of grommets
   Install the specified grommets

6.4.2 Stationary performance test

1. Operating conditions
   a. Place the vehicle in the shade with doors open.
   b. Keep the return air temperature between 77 to 86°F (25 to 30°C). (Adjust by changing the opening degree of the doors).
   c. Set the fan switch to the max position.
   d. Turn the thermostat control lever to the cool position.
   e. Set the engine speeed to approx. 1,500 rpm.
   f. Set the high pressure at 1.17 to 1.37 MPa (170 to 200 Lb/in²G, 12 to 14 kgf/cm²G).
   (If the high side pressured does not rise up, place paper or the like in front of the condenser.)

2. Test procedure

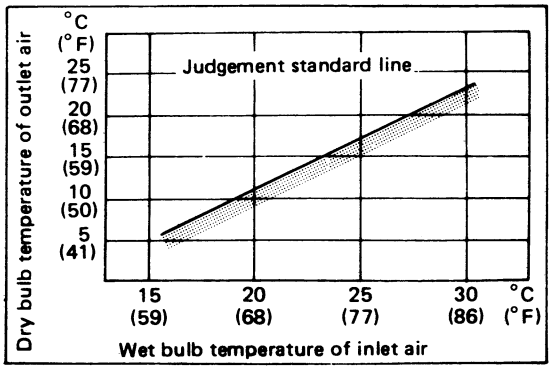
Operate the air conditioner for more than 10 minutes under the above operating conditions in order to stabilize the high and low pressures. Then perform the test by the following procedure:



a. Measure the outlet air temperature at the inside space of the outlet grille.

b. Measure the air conditioner intake air temperature, humidity, etc., and the items shown in the Table of Measuring Items at a position free from the effects of cool outlet air.

c. The intersecting point of the plotted line perpendicular to the point which corresponds to the air conditioner intake and outlet air temperature difference and the plotted line perpendicular to the point which corresponds to the relative humidity of intake air should be between the oblique lines in bigure.



https://truckmanualshub.com/

7. MAINTENANCE

No.	Check point	Service and inspection intervals				
		When used only in summer (approx. for three months)		When used in all seasons		
		At the beginning of season	At the end of season	Every 5,000 km (3,000 miles)	Every 10,000 km (6,000 miles)	Every 20,000 km (12,000 miles)
1	Check condenser and radiator fin for clogging.	○	○	○		
2	Retighten all bolts.	○			○	
3	Check for refrigerant leaks.	○			○	
4	Check refrigerant level.	○		○		
5	Check V-belt tension.	○		○		
6	Check operation of magnetic clutch.	○			○	
7	Check operation of thermostat.	○				○
8	Cooling unit assembly performance test.	○		○		
9	Compressor overhaul.		Every four years			Every 40,000 km (24,000 miles)

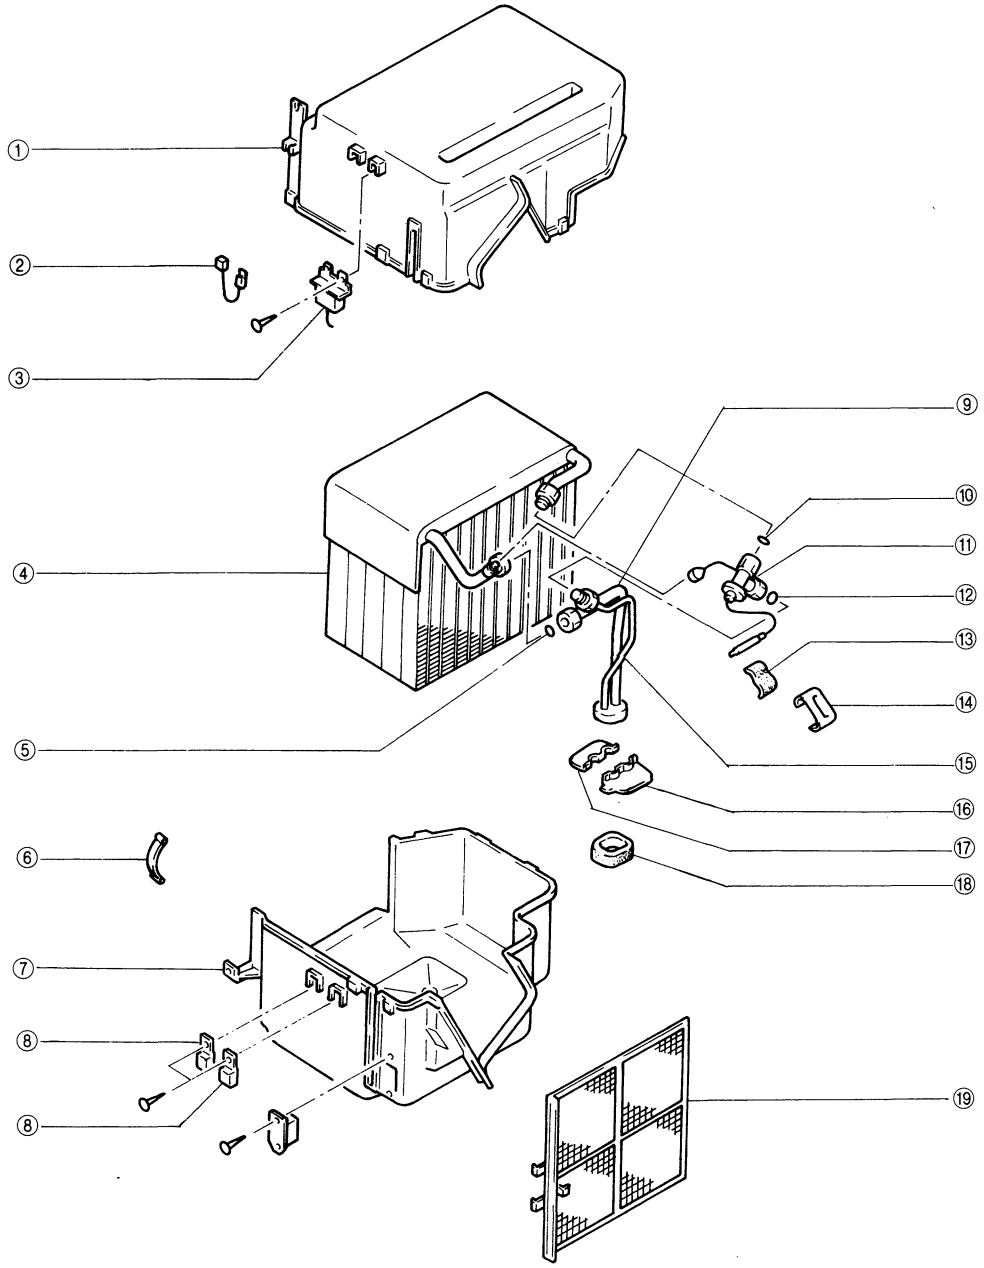
⚠ CAUTION

Even after the hot season is over, the air conditioner should be kept ready for operation all year round. Do not remove the V-belt or other parts.
This is because the air conditioner must be operated once a week for several minutes regardless of the season in order to prevent gas leaks caused by drying of the compressor shaft seal, and also to maintain the compressor itself in the best condition.

https://truckmanualshub.com/

8. COOLING UNIT ASSEMBLY

8.1 Components



① Cooler case (upper)
② Joint harness
③ Thermostat
④ Evaporator
⑤ O-ring
⑥ Clip
⑦ Cooler case (lower)
⑧ Power relay
⑨ Pipe
⑩ O-ring
⑪ Expansion valve
⑫ O-ring
⑬ Insulation rubber
⑭ Clip
⑮ Baffle plate
⑯ Battle plate
⑰ Insulation rubber
⑱ Air filter

https://truckmanualshub.com/

8.2 Cautions in disassembling

(1) Direct after disconnecting the refrigerant piping blind the opening to prevent dust and moisture etc. from entering in it.

(2) When disconnecting the expansion valve, surely apply two spanners to prevent unstable twisting from applying with the one for supporting and the other for torquing at the connection.

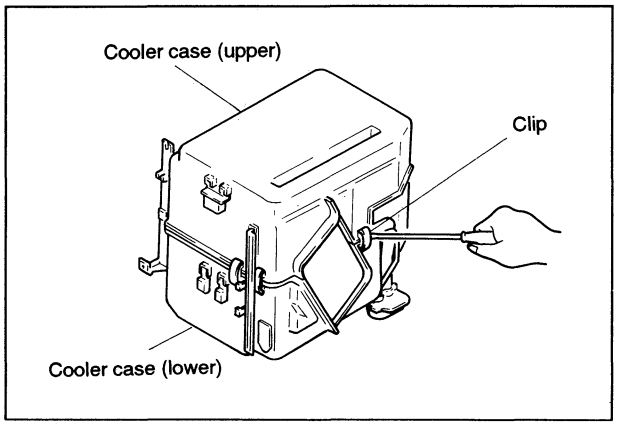
(3) Pipings in the cooling unit assembly should be handled gently. Particularly, the ingress and egress portions should be from any bending trouble in carrying it.

(4) If the cooling unit assembly is stored, or transported on disassembled condition, be careful not to deform the fins.

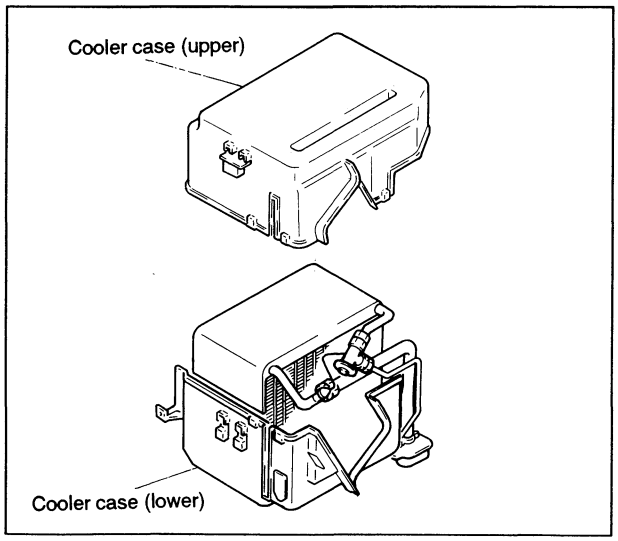
(5) When disconnecting the wirring, avoid pulling it with the insulation cover catched, but apply force by pinching the terminals or by catching the connectors.

8.3 Disassembling

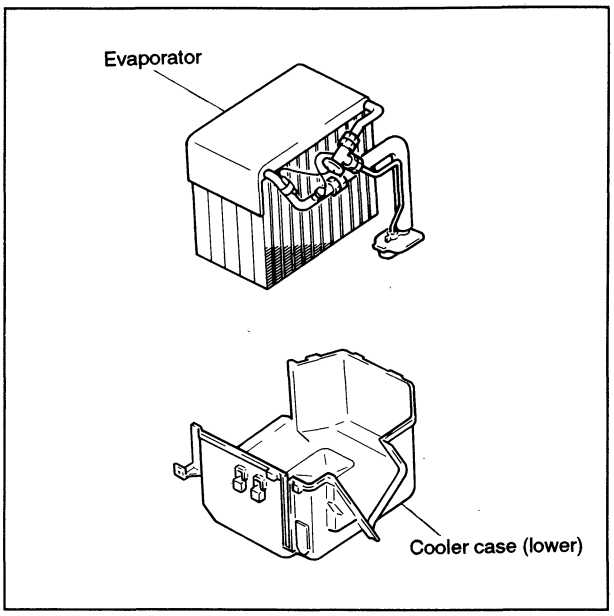
(1) Remove the clips for jointings the upper & lower side cooler case with a flat type screwdriver.



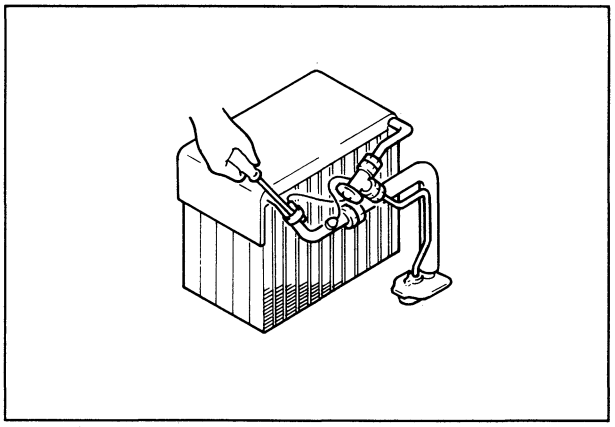
(2) Dismount the cooler case (upper).



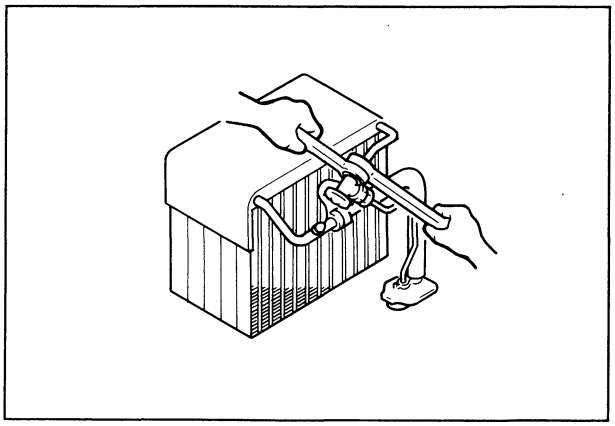
(3) Dismount the evaporator.



(4) Separate the expantion valve.
Dismount the feeler bulb at the suction side.



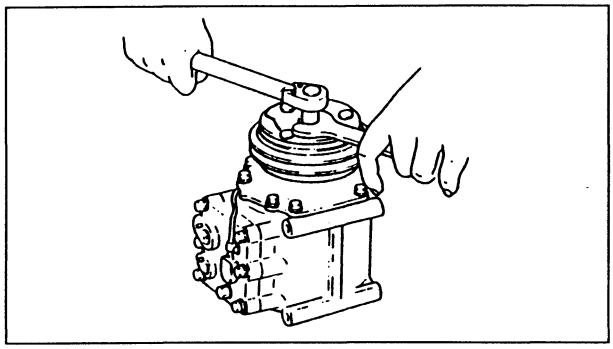
(5) Disconnect the expansion valve from the circuit.



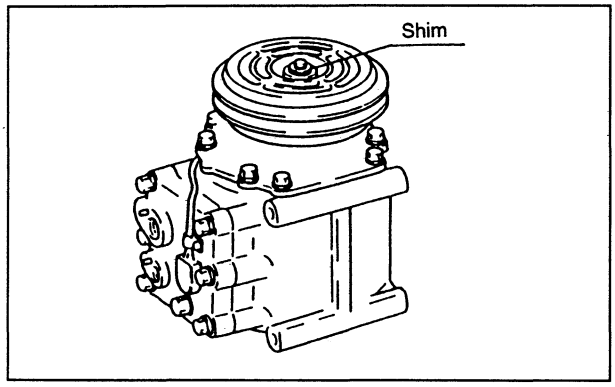
https://truckmanualshub.com/

9. COMPRESSOR & CLUTCH ASSEMBLY

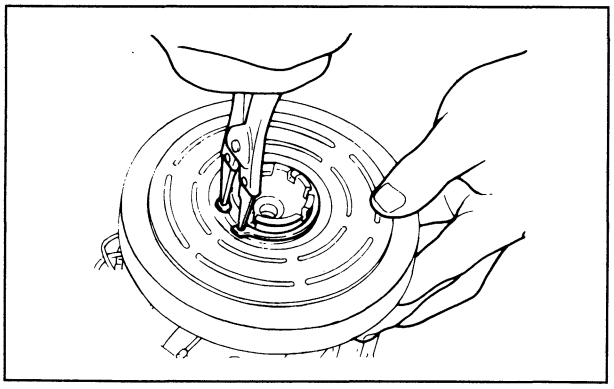
9.1 Disassembling the clutch.



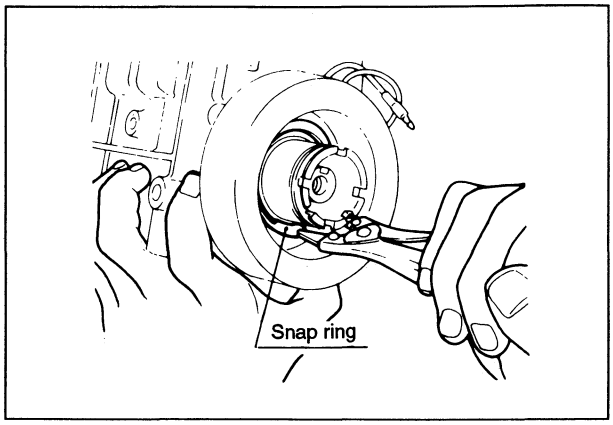
(1) Removal of armature plate.
   (a) Lock up the armature plate with a armature plate fixture and remove the lock nut.
   (b) Remove the armature plate.



(2) Remove the shim.



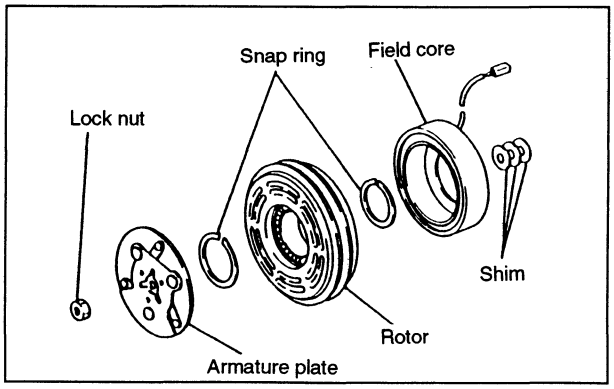
(3) Withdrawing rotor.
   (a) Remove the snap ring at the front case side with snap ring pliers.
   (b) Withdraw the rotor toward you and remove it from the front case.



(4) Removal of field core.
   (a) Remove the snap ring for fixing the field core with snap ring pliers.

   (b) Remove the ground wire with a cross point screwdriver and withdraw the field core toward you to remove it from the crankcase.

(5) Removal of key.
   Remove the key from the shaft using the top of a flat type screwdriver.



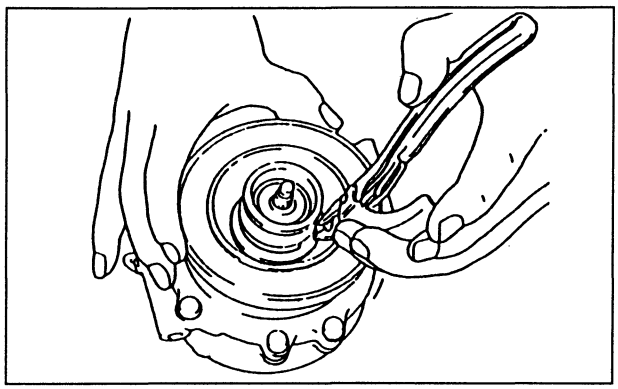
(6) Components of magnetic clutch.

https://truckmanualshub.com/

9.2 Reassembly the clutch.

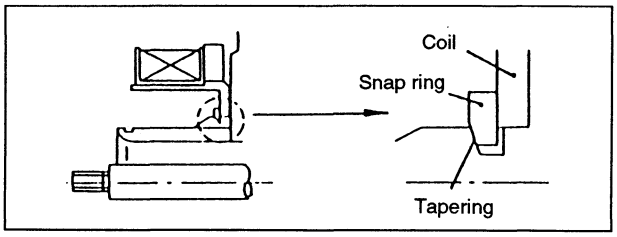
(1) Insert the key into the crankshaft.

(2) Insert the field core.



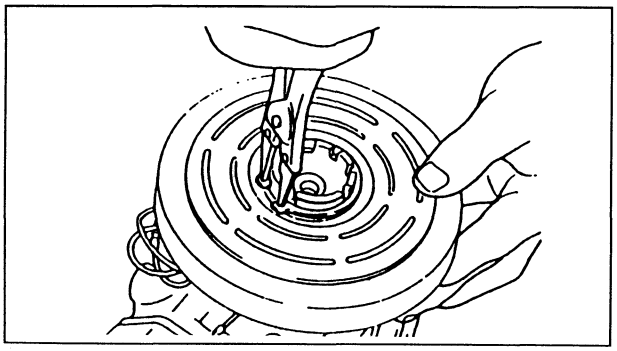
(a) Insert the field core into the front case and position it with a knock pin.

(b) Insert the snap ring for fixing field core into the groove and fix it with snap ring pliers as shown the below.

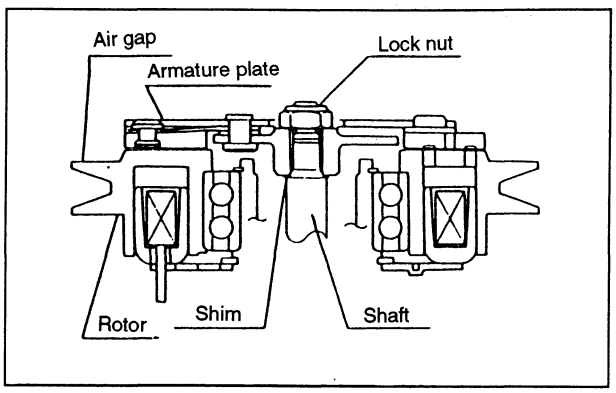


(c) Connect the ground wire.

(3) Insert the rotor into the front case.



(4) Insert the snap ring for the front case side into the groove with snap ring pliers.



(5) Install the armature plate.

(a) Place a shim on the end of the shaft and insert the armature plate, adjusting to the key.

(b) Tighten the center bolt to the specified torque, 15.7 N.m (160 kgf.cm), with in-between plain washer.

(c) Measure the air gap.
The air gap shoud be within 0.4 to 0.65 mm (0.016 ~ 0.026 in).
Adjust it by shim if it is not within the specifications. Adjusting shim : 0.1, 0.3, 0.5, or 0.8 mm (0.004, 0.012, 0.02, or 0.03 in).

A : To duct
B : To radiator
C : From radiator

tside air (Intake)

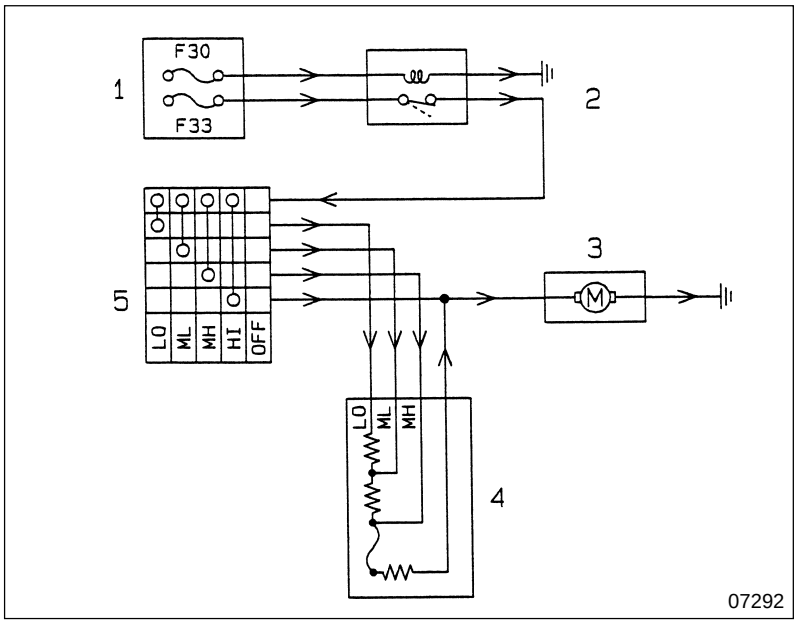
de air (Circulation)

ered air

- Warm engine coolant that has absorbed heat from engine **9** does not flow through thermostat **8** but circulates as follows:
  7→2→10→9
  ↑ ↓
- Air sent to heater unit **1** from blower assembly **3** is warmed by heater core **2** (heat exchanger). Then the ducts deliver the warmed air to the cab.

https://truckmanualshub.com/

Heater Electric Circuit



1 Fuse box
2 Blower fan relay
3 Blower motor
4 Blower resistor
5 Fan switch (Heater switch)

- The resistance of blower resistor **4** controls blower motor **3**, which in turn controls the air flow, except when the air flow is set to HI (high speed). When the air flow is set to HI, the current does not flow through the blower resistor.

Fan switch 5 set to LO position

- 1 (F30)→2 (coil)→Ground
- 1 (F33)→2 (contact point)→5 (LO)→4 (LO)→3→Ground

Fan switch 5 set to HI position

- 1 (F30)→2 (coil)→Ground
- 1 (F33)→2 (contact point)→5 (HI)→3→Ground

Fan switch 5 set to either ML or MH position

The current flows through blower resistor **4** in the same way as when set to LO position, routing ML or MH respectively instead of LO.

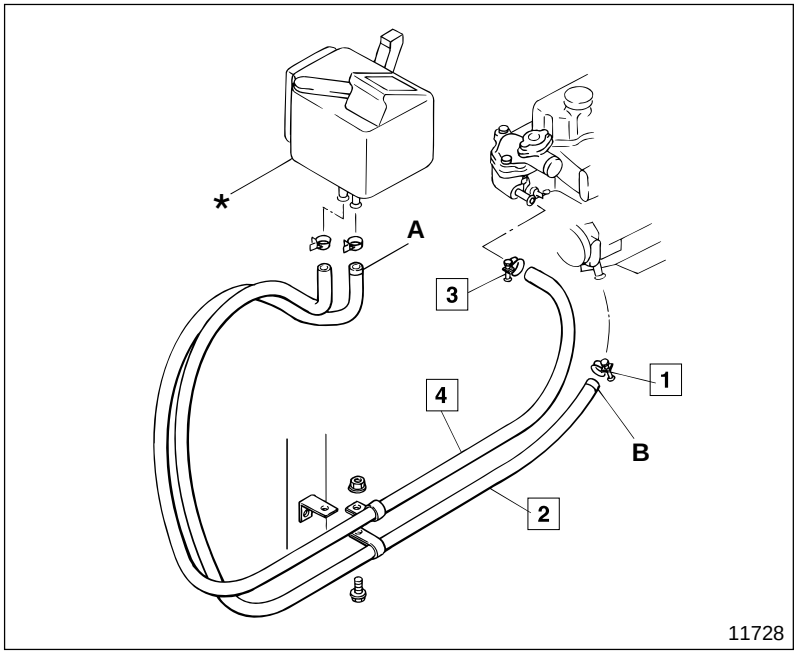
HEATER HOSE



● **Disassembly sequence**

1 Hose clamp
2 Heater hose (Heater out)
3 Hose clamp
4 Heater hose (Heater in)

***** : Heater unit
A : White mark
B : Yellow mark

NOTE

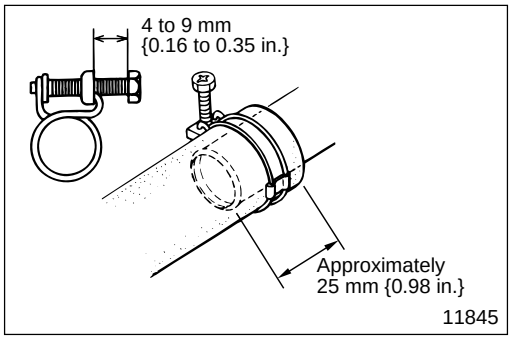
- **Drain engine coolant from radiator before removing hoses.** **Gr 14**
- **Make sure that yellow mark B on heater hose 2 and white mark A on heater hose 4 are clearly visible before removing parts. If there are no marks, make identification marks before removing parts.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Be sure that hoses are inserted securely to prevent coolant leaking.**
- **Make sure not to mix up heater hoses 2, 4 when connecting them because mistaken connection would damage the heater unit.**



◆ Service procedure

1 **to** **4** **Installation of heater hose and hose clamp**

- Install heater hoses **2**, **4** to conform to the dimension as illustrated.
- Tighten hose clamps **1**, **3** to conform to the dimension as illustrated.

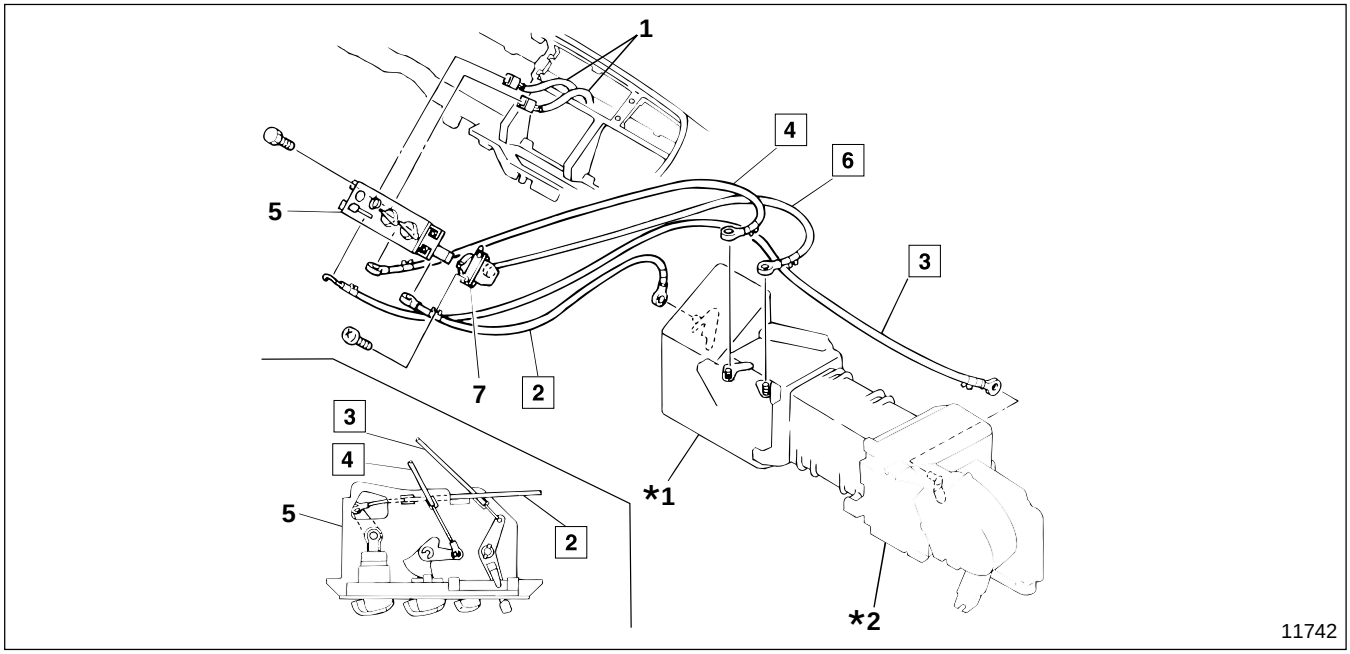
HEATER CONTROL



● **Disassembly sequence**

1 Harness
2 Mode changeover control cable
3 Inside/outside air changeover control cable
4 Air mixing control cable
5 Heater control assembly Gr 54
6 Air bypass changeover control cable
7 Air bypass control lever

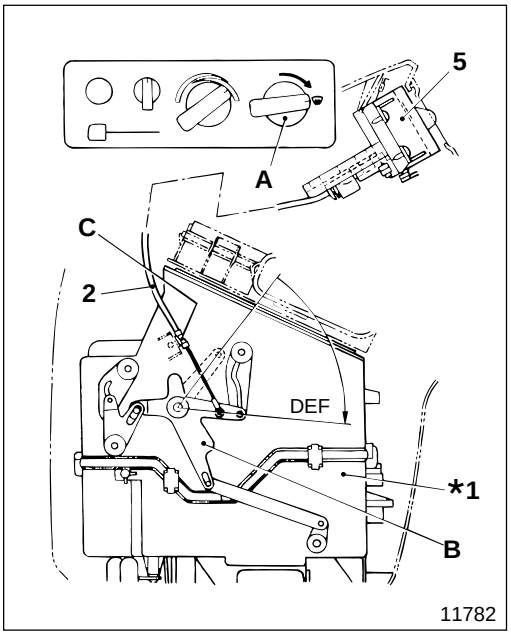
***1** : Heater unit assembly P55-16
***2** : Blower assembly P55-16

● **Assembly sequence**

Follow the disassembly sequence in reverse.

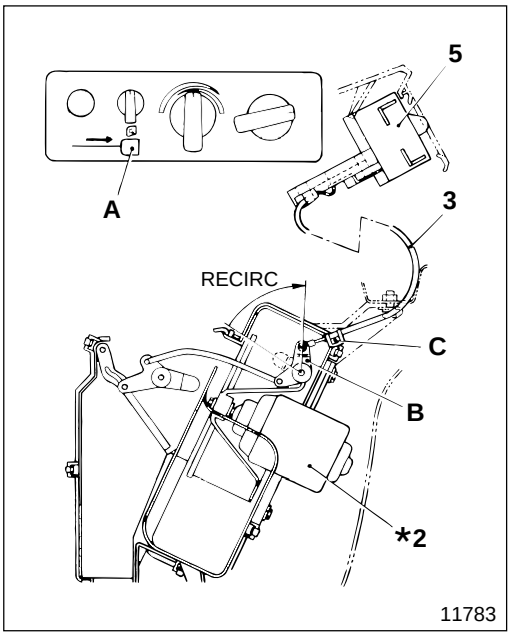
https://truckmanualshub.com/

◆ Service procedure



2 Installation of mode changeover control cable

- Turn mode changeover control dial **A** of heater control assembly **5** to (DEF).
- Turn mode changeover damper lever **B** of heater unit assembly ***1** to DEF.
- Under these conditions, install mode changeover control cable **2** onto mode changeover damper lever **B** and fasten it with clip **C**.

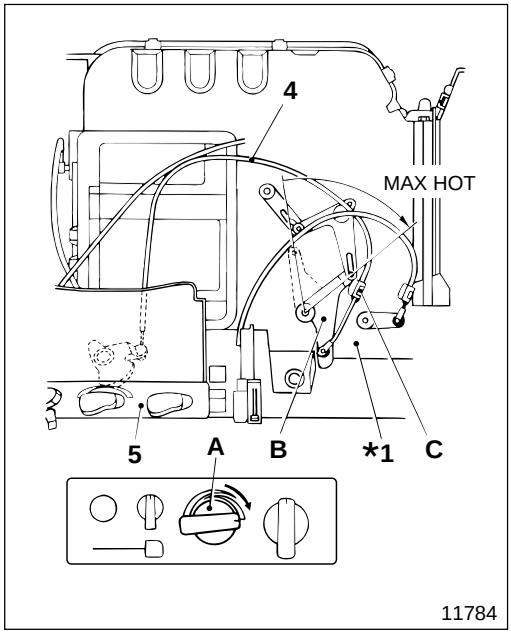


3 Installation of inside/outside air changeover control cable

- Set inside/outside changeover lever **A** of heater control assembly **5** to (RECIRC : Inside air).
- Turn inside/outside air changeover damper lever **B** of blower assembly ***2** to RECIRC.
- Under these conditions, install inside/outside air changeover control cable **3** onto inside/outside air changeover damper lever **B** and fasten it with clip **C**.

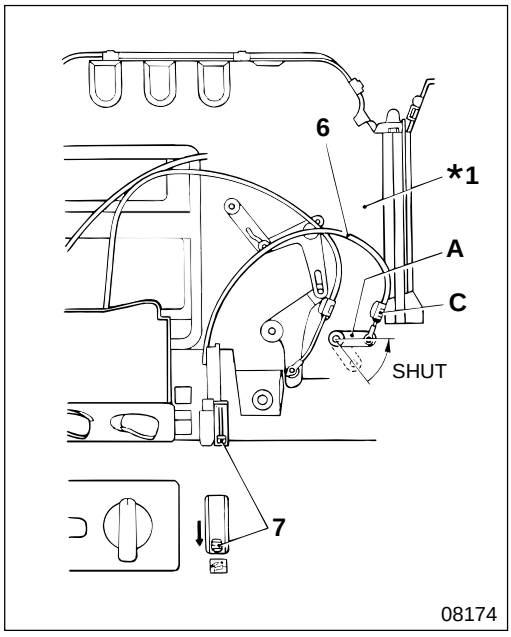
https://truckmanualshub.com/

HEATER CONTROL



4 Installation of air mixing control cable

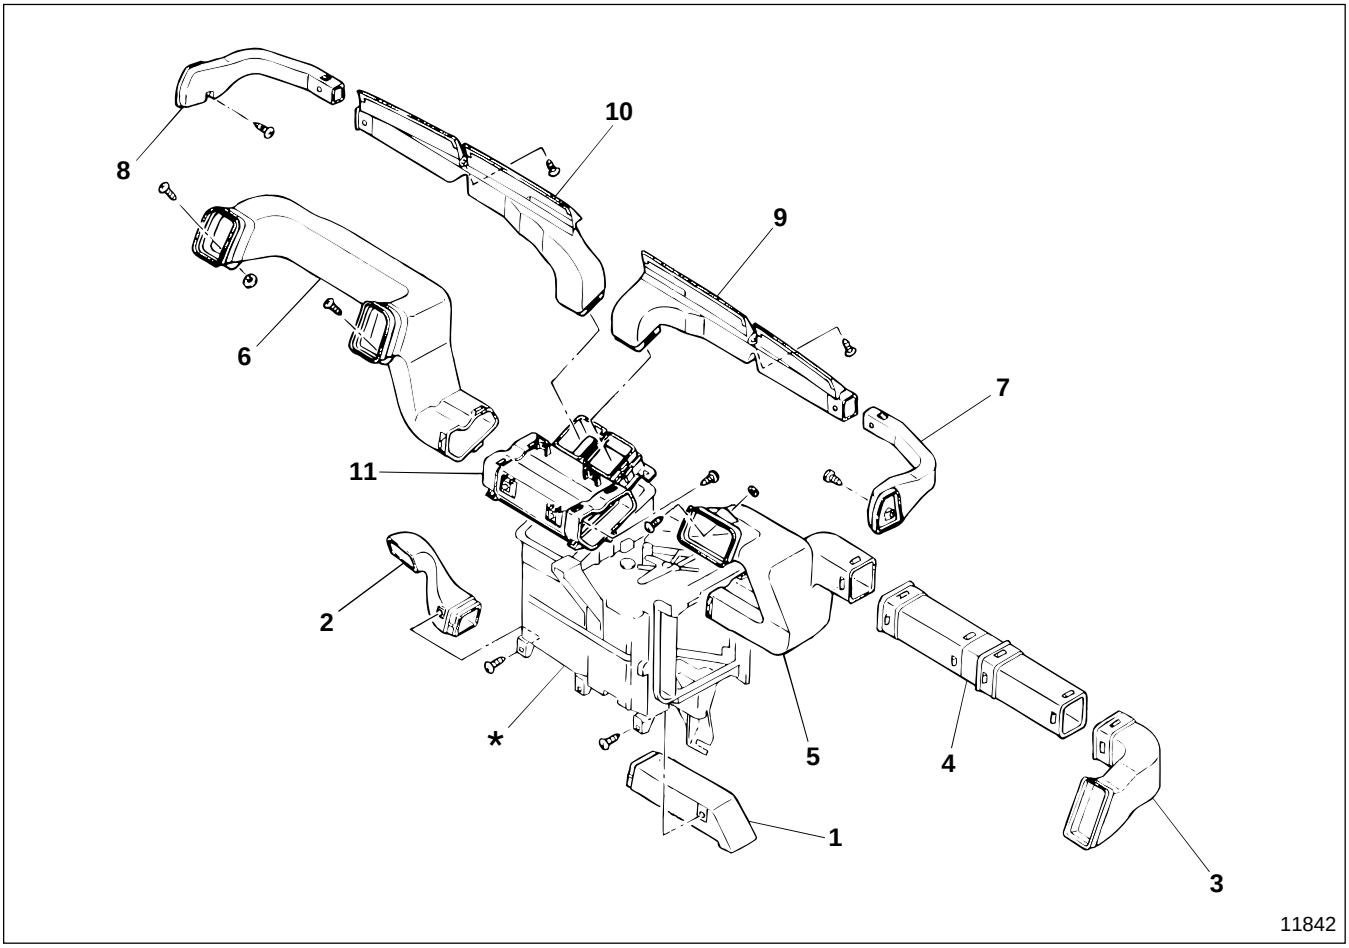
- Fully turn temperature control dial **A** of heater control assembly **5** clockwise to MAX HOT (maximum heating).
- Turn air mixing damper lever **B** of heater unit assembly ***1** to MAX HOT (maximum heating).
- Under these conditions, install air mixing control cable **4** onto air mixing damper lever **B** and fasten it with clip **C**.



6 Installation of air bypass changeover control cable

- Set air bypass changeover control lever **7** to SHUT.
- Set air bypass lever **A** of heater unit assembly ***1** to SHUT.
- Under these conditions, install air bypass changeover control cable **6** onto air bypass lever **7** and fasten it with clip **C**.

https://truckmanualshub.com/



● **Disassembly sequence**

1. Foot duct, RH
2. Foot duct, LH
3. Face duct A
4. Face duct B
5. Center face duct
6. Face duct, LH
7. Defroster side duct, RH
8. Defroster side duct, LH
9. Front defroster duct, RH
10. Front defroster duct, LH
11. Center duct

* : Heater unit

● **Assembly sequence**

Follow the disassembly sequence in reverse.

SERVICE MANUAL

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of the Mitsubishi Fuso Truck FH Series. Read this manual carefully as an aid to providing correct, efficient and fast maintenance. Please note, however, that due to continued vehicle improvements the specifications and numbers given for use in maintenance might change without notice. If you have any questions, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso Dealer or Distributor.

1. GROUP CLASSIFICATIONS

This Manual is divided into Groups, one for each system of the vehicle.

Gr. No.	Group Name	Description
00	General	External views, major specifications, power train table, operation performance curves, engine performance curves, servicing precautions, standard bolt and nut tightening torque table, towing precautions, vehicle identification numbers.
01	Maintenance Schedule	Maintenance schedule, simple maintenance, lubrication chart, oils and greases to use.
11	Engine	Cylinder head, valve mechanism, camshaft, pistons, crankshaft, timing gear, flywheel
12	Lubrication	Oil pump, oil filter, oil cooler
13	Fuel and Engine Control	Injection pump, injection nozzles, fuel filter, fuel tank, water separator, engine control, accelerator pedal, throttle button.
14	Cooling	Water pump, thermostat, radiator, fan.
15	Intake and Exhaust	Air cleaner, intake shutter, turbocharger.
16	Engine electrical	Starter, alternator, vacuum pump, pre-heat system
21	Clutch	Clutch, clutch control (master cylinder, power cylinder)
22	Manual Transmission	Transmission, transmission control.
23A	Automatic Transmission	Maintenance and inspection, removal, installation, oil seal replacement.
23B	Automatic Transmission (Body unit)	Automatic transmission body.
25	Propeller Shaft	Propeller shaft, universal joint, center bearing.
26	Front Axle	Front axle, kingpins, knuckles, hub bearings.
27A, B	Rear Axle	Rear axle, reduction and differential, hub bearings.
31	Wheels and Tires	Tire, disc wheel.
33	Front Suspension	Front suspension, leaf springs, shock absorbers, stabilizers.
34	Rear Suspension	Rear suspension, leaf springs, shock absorbers, stabilizers.
35	Brake	Brake pedal, master-vac, wheel brake (wheel cylinder, brake drum, brake shoes), exhaust brake (exhaust brake valve, power chamber).
36	Parking Brake	Parking brake (brake drum, brake shoe), parking brake control.
37	Steering	Steering wheel, power steering booster, power steering oil pump, steering linkage, tie-rods.
41	Frame	Frame inspection and maintenance.
42	Cab	Body, window glass, doors, seats.
54	Chassis electrical	Meters, gauges, switches, lamps, warning and indicator lamps, wipers
55A	Air Conditioner	Air conditioner ventilation system.
55B	Heater	Heater

Page numbers start at "1" for each section.

https://truckmanualshub.com/

2. TERMINOLOGY AND UNITS

The terminology and units used in this manual are as follows.

(1) Front and back

The direction in which the vehicle normally travels is the front, the opposite end is the back.

(2) Left and right

Left and right are as usual when looking toward the front of the vehicle from the direction in which it moves.

(3) Maintenance standards terminology

- Nominal value

  Standard values are used to indicate nominal design dimensions, design dimensions for single parts, standard gap between parts when assembled, and the standard performance of assemblies. Values in brackets are basic diameters.

- Limit

  These are performance and strength values which cannot be exceeded. These values are necessary when repairing or replacing parts.

(4) Tightening torque

Tightening bolts and nuts too much or too little can have a large influence on performance and functions. Thus, tightening torque is specified for each location that must be tightened. When tightening must be performed in a wet condition, this is specified. If not specified, tightening is performed dry.

When tightening is not specified, tighten according to the standard bolts and nuts tightening torque table.

(5) Units

Length, weight surface area and capacity are in accordance with SI. Foot pounds and metric units are indicated in brackets. Temperatures are given in degree Celsius with degrees in Fahrenheit in brackets.

HOW TO READ THIS MANUAL

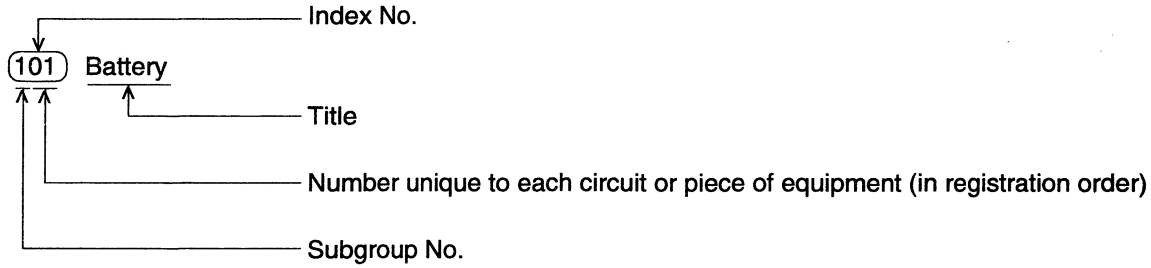
How This Manual Is Compiled

- This manual is compiled by classifying various systems into certain groups.
- Each group contains specifications; troubleshooting; maintenance service standards; tightening torque; lubricant, fluid and sealant; special tools; and service procedure.
- Group 54 Electrical is divided into subgroups 1 to 9 and each subgroup has its own index No. ((100) to (999)) for systematic documentation.

The index No. has the following format:



- Page enumeration is independent by every group where first page is always 1.

Group No.	Group denomination	Contents
00	General	Model coding system, power train table, chassis No., engine No., power train label, vehicle identification No., precautions for maintenance operation, table of standard tightening torques, connector configuration chart
01	Maintenance schedule	Maintenance schedule tables, maintenance operations, lubrication
10	Removal and installation of engine	Removal and installation of engine from vehicle
11	Engine	Engine body
12	Lubrication	Lubrication system, oil pressure system
13	Fuel and engine control	Fuel system, engine control, pre-stroke control injection pump system
14	Cooling	Cooling system
15	Intake and exhaust	Intake and exhaust system, turbocharger, intercooler
21	Clutch	Clutch body and clutch control system
22A	Manual transmission < M060S5, S6, M070S6 >	Transmission body and transmission control system
22B	Manual transmission < M8S2×5 >	Transmission body and transmission control system
23	Automatic transmission	Transmission control system, oil cooler system
25	Propeller shaft	Front and rear propeller shafts, center bearing assembly
26	Front axle	Front axle and wheel alignment
27	Rear axle	Axle drive mechanism
31	Wheel and tire	Wheel and tire
33	Front suspension	Leaf suspension mechanism
34	Rear suspension	Leaf suspension mechanism

https://truckmanualshub.com/

Group No.	Group denomination	Contents
35A	Brake < Air over hydraulic brake >	Brake mechanism, dual brake valve, brake booster (airmaster), air compressor, air dryer, exhaust brake system
35B	Brake < Full air brake >	Brake mechanism, dual brake valve, air compressor, air dryer, exhaust brake system
36A	Parking brake < Center parking brake >	Control system, center brake body
36B	Parking brake < Wheel parking brake >	Control system, parking brake control valve, spring brake valve
37	Steering	Steering system, power steering booster, oil pump
41	Frame	Frame repair
42	Cab	Cab mounting and tilt, door, exterior fittings, interior fittings
54	Electrical	Power supply, charging and grounding system, engine start and stop systems, lighting system, meter system, indicator and warning systems, cab electric devices, chassis electric devices, engine and transmission electric devices
55A	Air-conditioner	Air-conditioner
55B	Heater	Heater

General Explanation of This Manual

● **Specifications**
Particulars relative to maintenance service are made.

● **Structure and operation**
(1) Regarding conventional equipment, descriptions are made in brief.
(2) Regarding new equipment, descriptions of system and operating condition are made in detail.

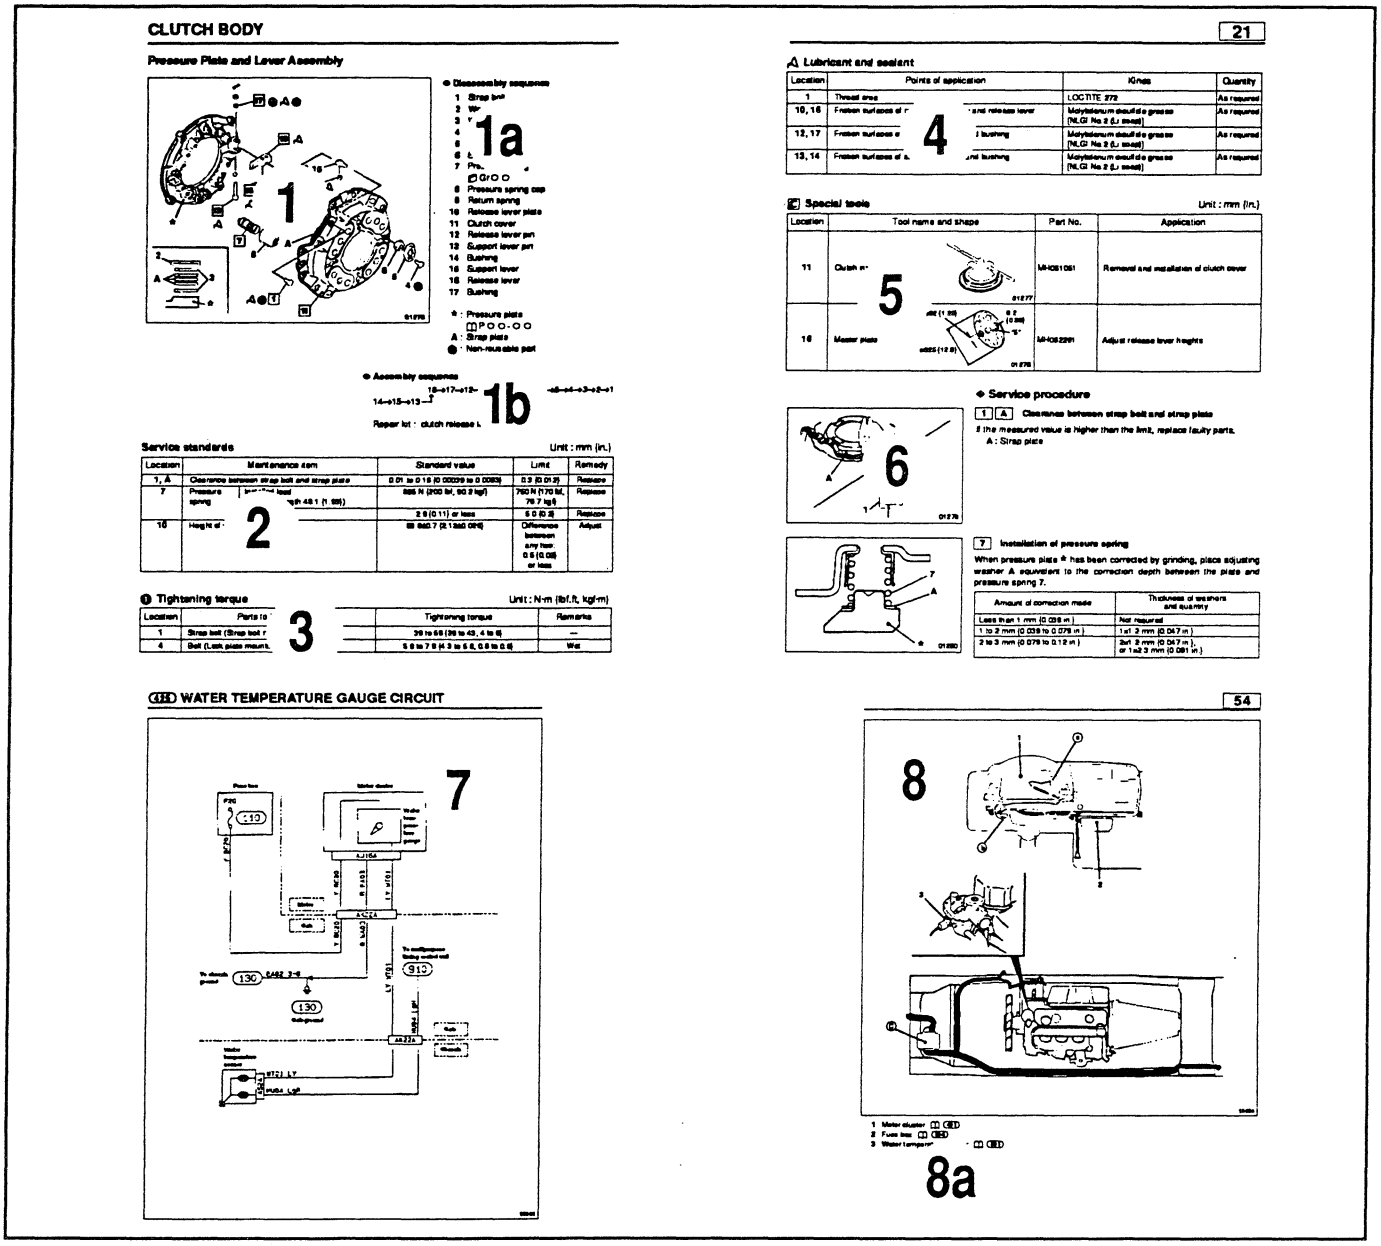
● **Troubleshooting**
Symptoms of troubles and possible causes are described comparatively.

● **Inspection and adjustment mounted in vehicle**
Descriptions are made regarding inspection and adjustment of units mounted in vehicle.

● **Service procedure**
In principle, an explanation is given at the spread title page so that the service procedure can be understood. Servicing points are explained as a supplementary explanation.

https://truckmanualshub.com/

Regarding the design of this manual



1. .....Illustration for disassembly and assembly or removal and installation : 3-D exploded view of component parts is displayed.
   1a. .....Names of parts show an example of the disassembly (removal) sequence.
   1b. .....When the assembly (installation) sequence differs from the disassembly (removal) sequence, an example of the assembly (installation) sequence is shown.
2. .....Service standards are shown collectively, classified by location.
3. .....Tightening torques are shown collectively, classified by location.
4. .....Points of lubricant, fluid and sealant application are shown collectively, classified by location.
5. .....Special tools to be used are shown collectively, classified by location.
6. .....When it is considered hard to understand the service procedure, just by the foregoing description, a supplementary description of the service procedure is given.
7. .....Various system circuits are illustrated starting from the fuses. Battery to fuse wiring is treated as a power supply circuit.
8. .....Circuit diagram of parts, connectors and harnesses.
   8a. .....Part names.

https://truckmanualshub.com/

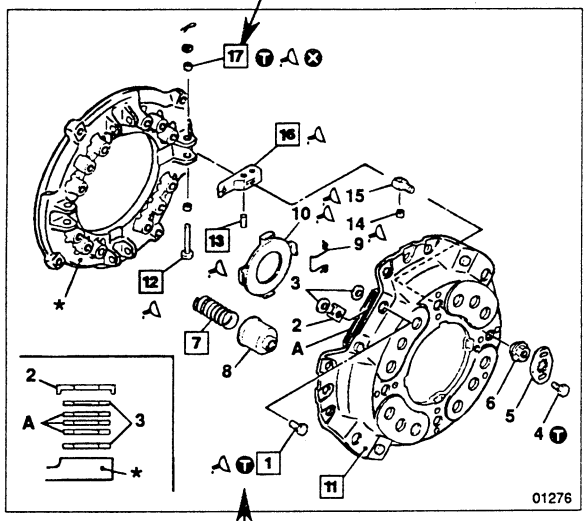
1. Illustration for disassembly and assembly or removal and installation

This shows that the appropriate service procedure is described in the text.

This shows the key No. of the part. In the text, this No., is referred to uniformly throughout.

CLUTCH BODY

Pressure Plate and Lever Assembly



● Disassembly sequence

1 Strap bolt
2 Washer
3 Washer
4 Bolt
5 Lock plate
6 Support nut
7 Pressure spring
Gr ○ ○
8 Pressure spring cap
9 Return spring
10 Release lever plate
11 Clutch cover
12 Release lever pin
13 Support lever pin
14 Bushing
15 Support lever
16 Release lever
17 Bushing

* : Pressure plate
P ○ ○ - ○ ○
A : Strap plate
⊗ : Non-reusable part

● Assembly sequence

16→17→12→10→9→8→7→6→5→4→3→2→1
14→15→13→┘

Repair kit: clutch rel e lever kit

This shows an example of the disassembly (removal) sequence.

This shows that the service procedure is described in another section.

P ○ ○ - ○ ○
: shows reference page within the same group.

Gr ○ ○
: shows reference group within the same book.

No service procedure is referred to in this section, but the item can be an objective of various procedures.

Meaning of symbols

- T : shows that the tightening torque is specified.
- : shows that application of lubricant, fluid or sealant is required.
- ⊗ : shows that the part should not be reused.

This is shown when the assembly (installation) sequence is not the reverse of the disassembly (removal) sequence.

This shows that a repair kit is available.

https://truckmanualshub.com/

2. Service standards table

Only the relevant service standards are shown.

Service standards Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1, 11	Clearance between strap bolt and strap plate		0.01 to 0.16 {0.00039 to 0.0063}	0.3 {0.012}	Replace
7	Pressure spring	Installed load (Installed length 49.1 {1.93})	835 N {185 lbf, 85 kgf}	710 N {160 lbf, 72.3 kgf}	Replace
		Tilt	2.9 {0.11} or less	5.0 {0.20}	Replace

This shows the key No. of the relevant part.

3. Tightening torque table

This shows specified tightening torque.

T Tightening torque Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Strap bolt (Strap bolt mounting)	39 to 59 {29 to 43, 4 to 6}	—
4	Bolt (Lock plate mounting)	5.9 to 7.8 {4.3 to 5.8, 0.6 to 0.8}	Wet

This shows that the item is to be tightened wet.

This shows the key No. of the relevant part.

4. Lubricant, fluid and sealant table

Only the relevant lubricant, fluid and sealant are shown.

This shows the application point.

Lubricant, fluid and sealant

Location	Points of application	Kinds	Quantity
1	Thread area of bolt	LOCTITE 272	As required
10, 16	Friction surfaces of release lever plate and release lever	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

This shows the key No. of the relevant part.

This shows the specified brand.

https://truckmanualshub.com/

5. Special tools table

Only the relevant special tools are shown.

Purpose of special tools is shown.

Special tools

Unit : mm {in.}

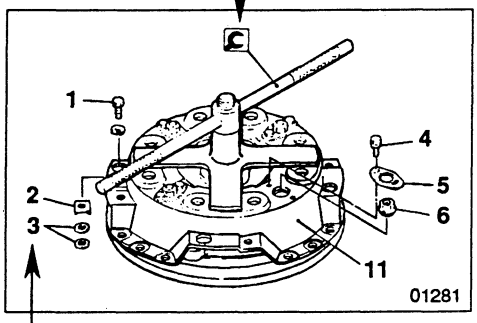
Location	Tool name and shape	Part No.	Application
11	Clutch installer  01277	MH061051	Removal and installation of clutch cover
16	Master plate  01278	MH062291	Adjust release lever heights

This shows the key No. of the relevant part.

Quote this number when placing an order for the part.

6. Service procedure

This indicates a special service tool.



01281

This shows the key No. of the relevant part.

11 Removal and installation of clutch cover

- Depress pressure spring **7** using clutch installer, then remove the following parts:
  Strap bolt **1**, washer **2**, washer **3**, bolt **4**, lock plate **5**, support nut **6**
- Loosen the clutch installer gradually, then remove clutch cover **11** when the pressure spring is fully released.
- For installation, follow the removal sequence in reverse.

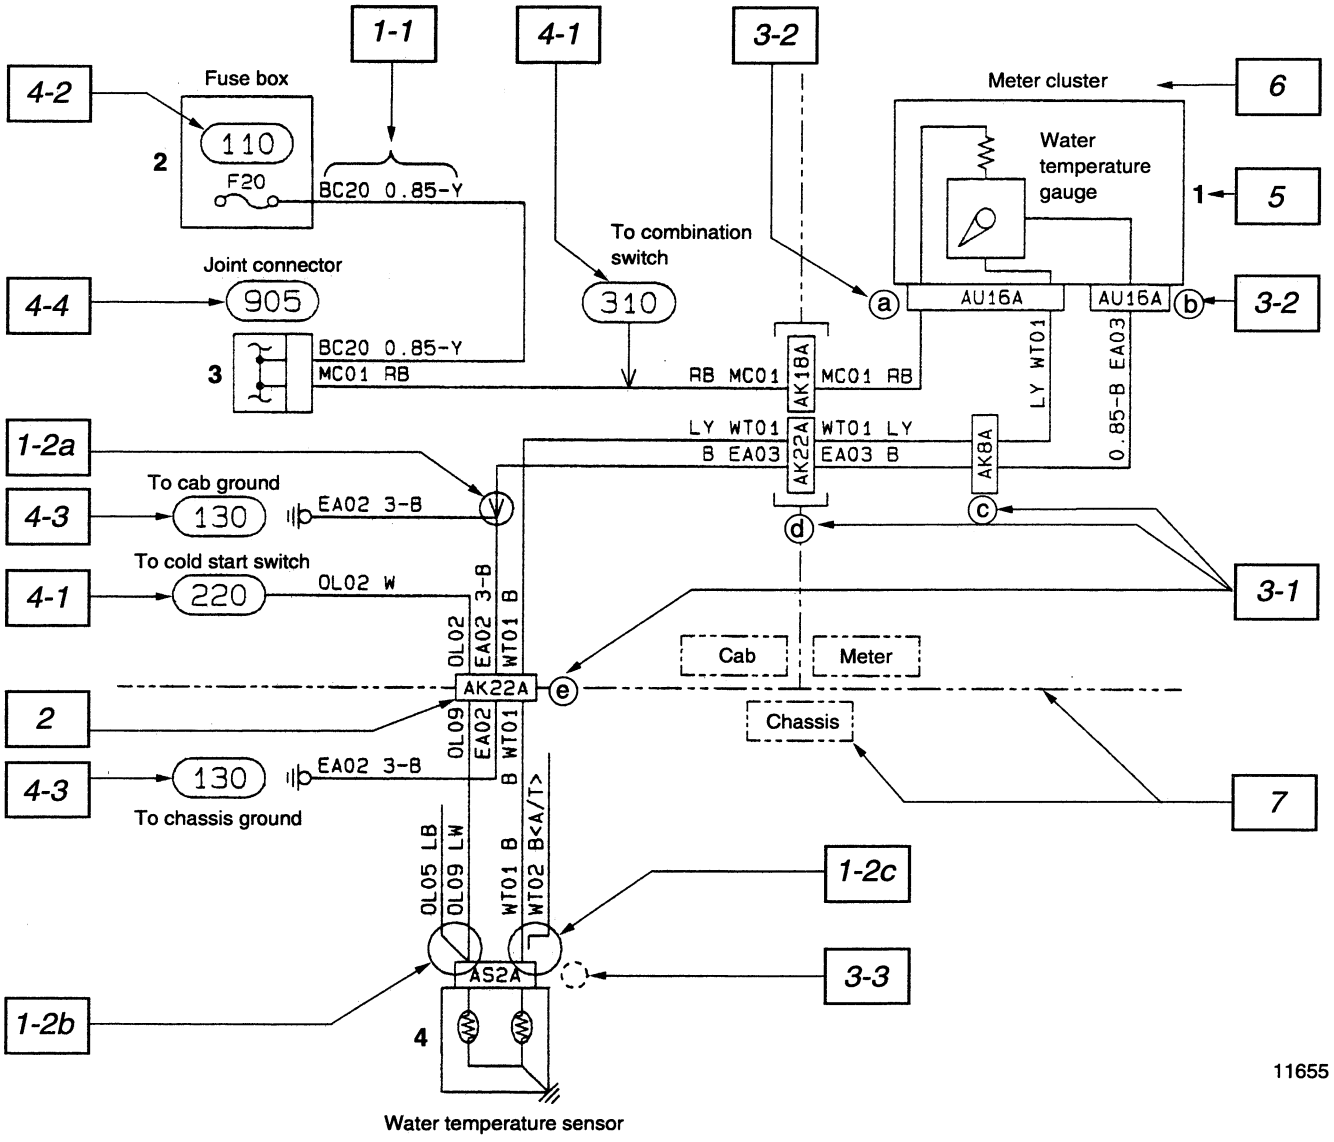
Servicing procedures of disassembly (removal), assembly (installation), inspection, adjustment, etc. are shown collectively.

The key No. referred to in the text is always the same as the key No. shown in the illustration.

https://truckmanualshub.com/

7. Circuit Description

- The circuits show systems classified by index numbers.
- Only the functioning wires in the system are described. When a wire is connected to the system circuit, but does not function in the system, the wire is referred to by an index number. (*4-1*)
- The connector installation point mark corresponds to the marks in the vehicle layout so that the connector installation points can be checked during inspection. (*3-1, 3-2*)
- In basic descriptions, the fuse box is considered as the power source for a circuit. The circuit from the battery to the fuse box is separately described as a power circuit and referred to by the index number in each circuit. (*4-2*)
  However, for circuits that require a description of the circuit from the battery, the battery is considered as the power source.
- Switches and relays in the circuit diagram are shown in the state where no current flows through the circuit.



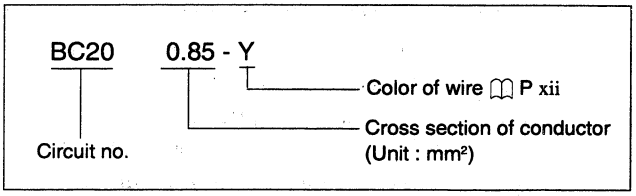
- Items described in circuit diagram
  - *1* Wire
  - *2* Connector
  - *3* Connector installation point mark
  - *4* Index number
  - *5* Key number
  - *6* Part name
  - *7* Indication of harness installation area on the vehicle

For details, see overleaf.

https://truckmanualshub.com/

1 Wire

1-1 Circuit number, cross section of conductor and color of wire are indicated for each wire.



As 0.5 mm² cross section wire is the most commonly used, the cross section indication is omitted when it is 0.5 mm². All the other figures are indicated as illustrated.

Example : 0.5 mm²; BC20 Y 0.85 mm²; BC20 0.85-Y 5 mm²; BC20 5-Y

1-2 Different types of wire connection are indicated as follows:

1-2a When wire is connected normally.

(Indicated by an arrow. The arrow direction, however, does not indicated the current flow direction.)

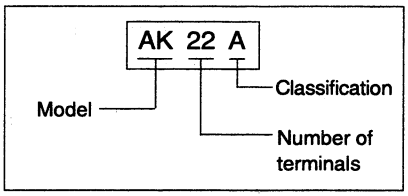
1-2b When two or more wires are connected to a connector terminal.

1-2c When the type of wire or connection differs according to specifications.

2 Connector

Connector type is indicated in a box □ . Whether the connector is female or male is not indicated. 🖻 Gr ○○

Though several connectors can be installed in one point on an actual vehicle, only the connector related to the system is indicated in the circuit diagram.



3 Connector installation point mark ○○○

Connector installation point marks (a , b , c ...) indicate the installation positions on a vehicle corresponding to the vehicle layout. The marks are indicated only where the actual installation position on the vehicle is difficult to check or when you need to distinguish the connector in question from among several other connectors at the same point.

3-1 When the actual position on the vehicle is difficult to check.

A mark is indicated for each connector. When several connectors are installed at one point they are indicated by a mark in [ ].

3-2 When it is difficult to identify the connector in question because there are several connectors of the same type.

3-3 When the connector installation point is clear enough, the mark is not indicated.

4 Index number ⬭

The index number 110 in a circuit diagram shows the connecting destination that is not directly used in the system or indicates another diagram that provides a detailed description of each unit. This can be used as a reference to check the relationship with other circuits. Different types of index numbers are indicated as follows:

4-1 To show the connecting destination with another circuit.

4-2 To show the power circuit from the battery and the connecting destination with another circuit connected to the fuse.

4-3 To show the grounding position on the vehicle and the connecting destination of another circuit that is grounded.

4-4 To show a diagram that describes the details of a unit that has complex wiring.

5 Key number

Key numbers correspond to those in the vehicle layout.

6 Part name

Part names are preceded by key numbers.

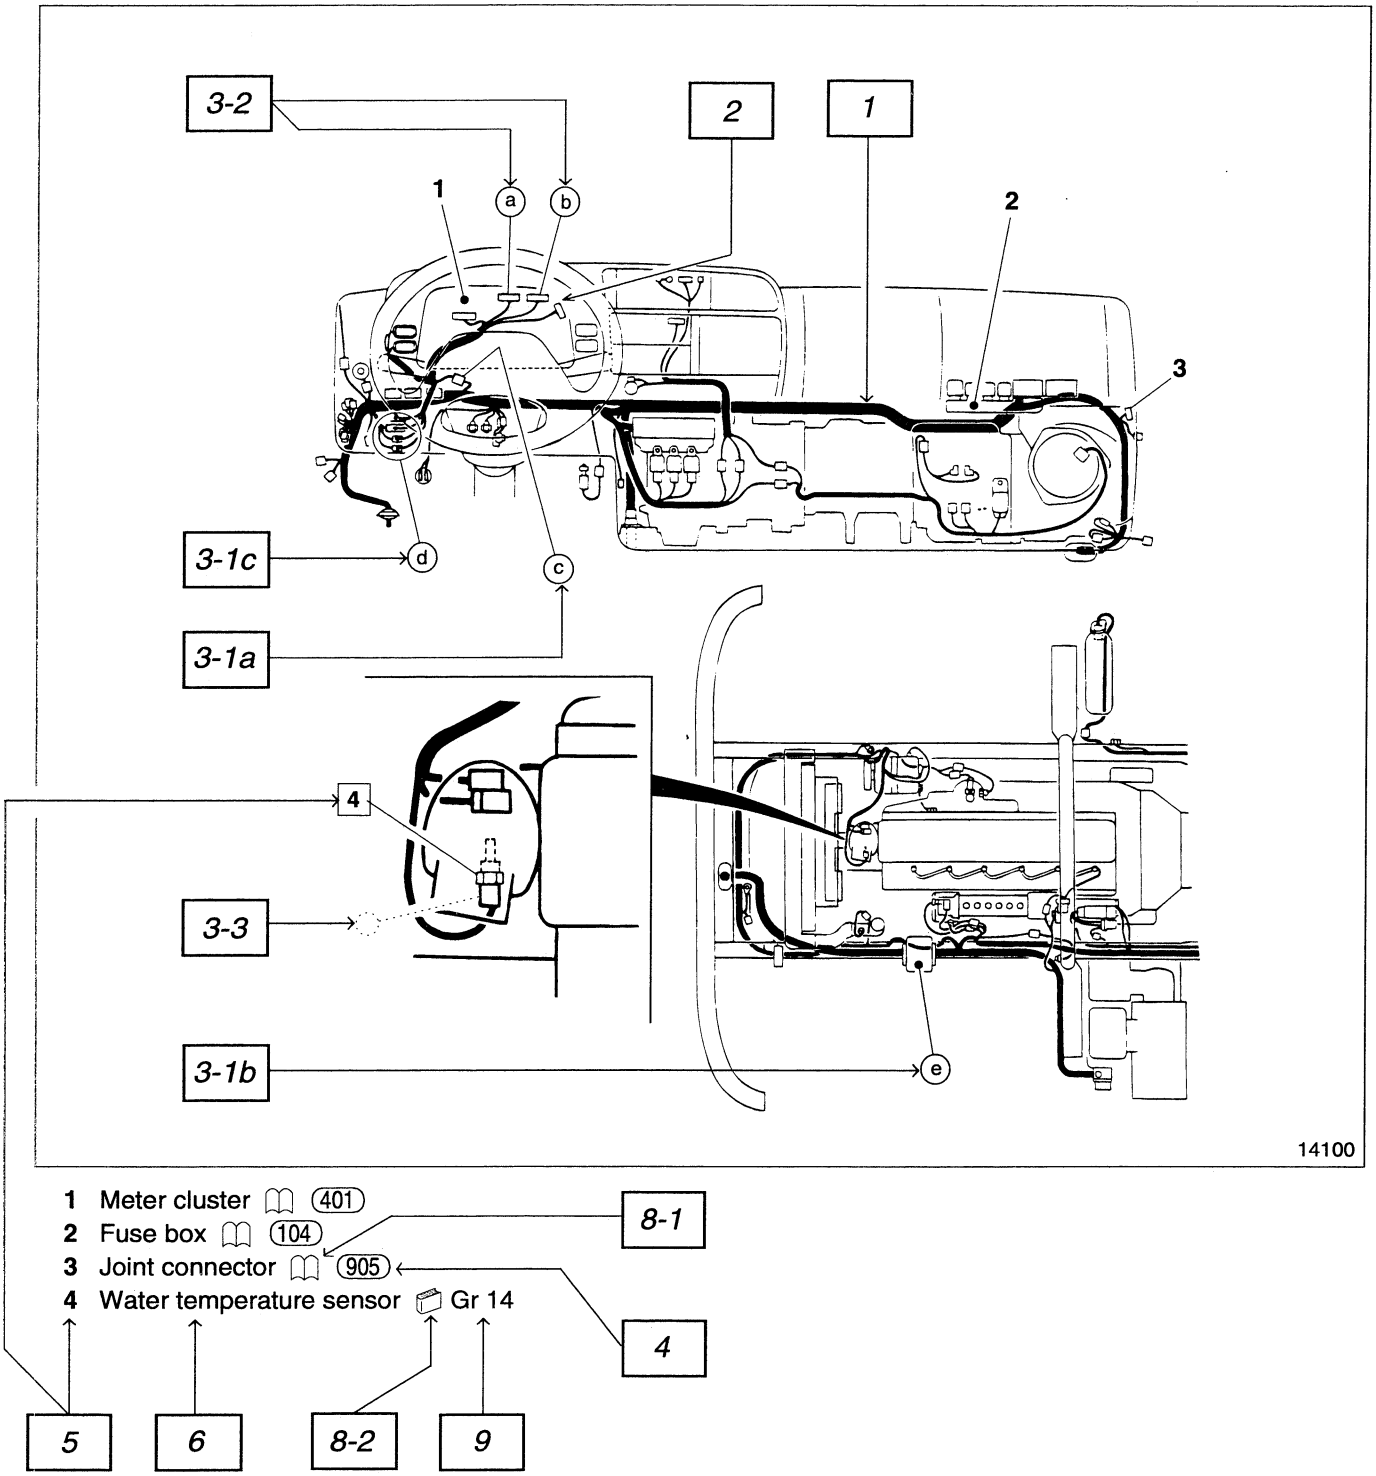
7 Installation area of harness on the vehicle

This indicates the area where the harness is installed on the vehicle using border lines so that the connector installation positions can be checked easily.

https://truckmanualshub.com/

8. Vehicle layout description

• Vehicle layout describes installation points of parts, connectors and harnesses.



• Items described in vehicle layout

1 Wire	*4* Index number	(*7* Described only in circuit diagram)
2 Connector	*5* Key number	*8* Reference mark
3 Connector installation point mark	*6* Part name	*9* Reference group

For details, see overleaf.

https://truckmanualshub.com/

1 Wire

This indicates the wiring status of the harness actually installed on the vehicle.

2 Connector

The connector installation point is indicated briefly (in a two dimensional or three dimensional drawing).

3 Connector installation point mark

The connector installation point marks are normally indicated clockwise, starting from the top left of the layout. The marks correspond to those in the circuit diagram. However, some of the marks directly indicated in the circuit diagram are indicated indirectly as follows in the vehicle layout.

3-1 When it is difficult to recognize the connector position on the actual vehicle

3-1a Indicates the connector in question.

3-1b Indicates the connector box or bracket for the connector in question, but does not indicate the connector itself.

3-1c Indicates the area where connectors, including the one in question, are located, but does not indicate the connector itself.

(This indication is used when several connectors are installed in one area and the connectors are not fixed with clips, and it is difficult to identify the actual position of the connector in question solely by the wiring status of the harness.)

3-2 When connectors of the same type are located closely together, and it is difficult to identify which is the one in question

3-3 Marks are not indicated when the connector position is clear enough.

4 Index number

In the vehicle layout, the index number is indicated so that parts can be easily inspected. For this reason, index numbers do not indicate the connecting destination of a circuit, as in the circuit diagram, but indicate the numbers where removal and installation, inspection, or adjustment procedures are described.

5 Key number

Key numbers are normally indicated clockwise, starting from the top left of the layout. The numbers correspond to those in the circuit diagram. When the key number is enclosed in a box, the service procedure for the part is described.

6 Part name

(*7* Described only in circuit diagram)

8 Reference mark

Two types of reference mark are indicated as follows:

8-1 When referring to a part in the same group : 🕮

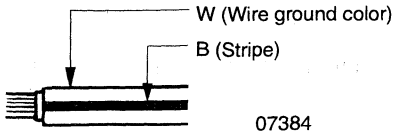
8-2 When referring to a part in another group : 🗀

9 Reference group

http://autohandbook.com/

● Wire Colors

Example: WB means a wire whose ground color is white and whose stripe is black.



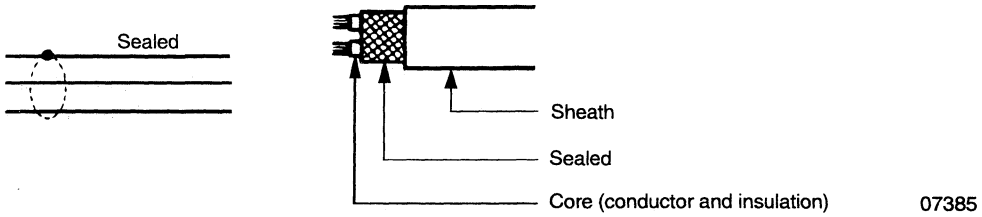
Wire ground color		Wire ground color + Stripe							
W	White	WR	White red	WB	White black	WL	White blue	WG	White green
B	Black	BW	Black white	BY	Black yellow	BR	Black red		
R	Red	RW	Red white	RB	Red black	RY	Red yellow	RG	Red green
Y	Yellow	YR	Yellow red	YB	Yellow black	YG	Yellow green	YL	Yellow blue
G	Green	GW	Green white	GR	Green red	GY	Green yellow	GB	Green black
Br	Brown	BrW	Brown white						
L	Blue	LW	Blue white	LR	Blue red	LY	Blue yellow	LB	Blue black
Lg	Yellow green	LgR	Yellow green red	LgY	Yellow green yellow	LgB	Yellow green black	LgW	Yellow green white
O	Orange								
P	Pink	PB	Pink black						

RL	Red blue
YW	Yellow white
GL	Green blue
LO	Blue orange

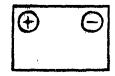
● Sealed Wire

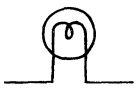
A sealed wire is clearly identified as follows:

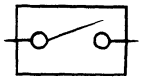
Example

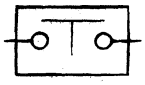


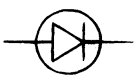
● Symbol Mark

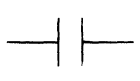
Battery	Fuse	High current fuse	Motor	Lamp	Switch
					


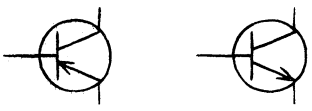


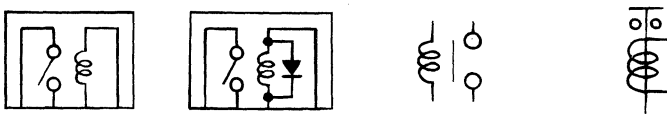


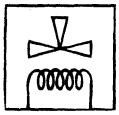
Switch	Ground	Diode	Emitting diode	Zener diode	Condenser
					






Transistor	Relay	3-way magnetic valve
		






https://truckmanualshub.com/

Terms and Units

The terms and units in this manual are defined as follows.

- This service manual contains important cautionary instructions and supplementary information under the following four headings which identify the nature of the instructions and information:

DANGER ⚠	Precautions that should be taken in handling potentially dangerous substances such as battery fluid and coolant additives.
WARNING ⚠	Precautionary instructions, which, if not observed, could result in serious injury or death.
CAUTION ⚠	Precautionary instructions, which, if not observed, could result in damage to or destruction of equipment or parts.
NOTE	Suggestions or supplementary information for more efficient use of equipment or a better understanding.

- **Front and rear**

  The forward running direction of the vehicle is the front and the reversing direction is the rear.

- **Left and right**

  Left hand side and right hand side, when facing the forward running direction of the vehicle, are respectively left and right.

- **Terms of service standards**

  (1) Standard value

  Standard value dimensions in designs indicating: the design dimensions of individual parts, the standard clearance between two parts when assembled, and the standard value for an assembly part, as the case may be.

  The figure in [ ] is the basic diameter.

  (2) Limit

  When the value of a part exceeds this, it is no longer serviceable in respect of performance and strength and must be replaced or repaired.

- **Tightening torque**

  Excessive or insufficient tightening torque has particular importance in respect of performance. Accordingly, tightening torque is specified in locations that are to be tightened.

  Where there is no specified figure for tightening torque, follow the table covering standard tightening torques.

  When the item is to be tightened in a wet state, wet is indicated. Where there is no indication, read it as dry, and tighten at specified torque.

- **Unit**

  Length, weight, surface area and capacity are in SI units. Imperial and metric units are given in brackets. Temperatures are given in degrees Celsius with degrees Fahrenheit given in brackets.

DANGER ⚠

This product contains or emits chemicals known to the State of California to cause cancer and birth defects or other reproductive harm.

https://truckmanualshub.com/

GROUP 01 MAINTENANCE SCHEDULE

MAINTENANCE OPERATIONS

- **Battery 01-2**
- **Fuse 01-6**

https://truckmanualshub.com/

MAINTENANCE OPERATIONS

Battery

DANGER ⚠

- **Since flammable hydrogen gas is generated by the battery, be sure to obey the following warnings:**
  - **Do not short-circuit the ⊕ and ⊖ terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over the battery.**
- **Because the battery electrolyte is diluted sulfuric acid and is corrosive, when handling the battery wear safety glasses and rubber gloves to protect the eyes and hands.**
- **Battery posts, terminals and related accessories contain lead and lead compounds. Wash hands after handling.**

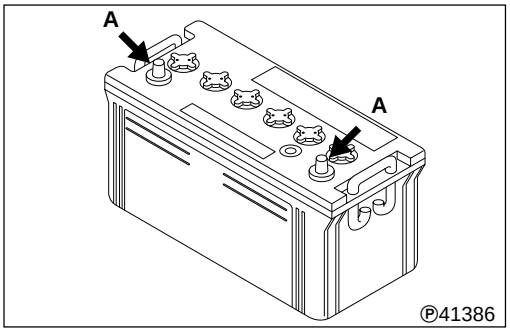
WARNING ⚠

To prevent a short-circuit be sure that the disconnected the battery cables do not accidentally touch the battery terminals.

CAUTION ⚠

- **Make sure that you disconnect the battery cable ⊖ first when you disconnect the battery cables.**
- **Make sure that all electrical switches of the vehicle are OFF before connecting the battery cables.**
- **Make sure that you connect the battery cable ⊕ before you connect the battery cable ⊖.**

https://truckmanualshub.com/

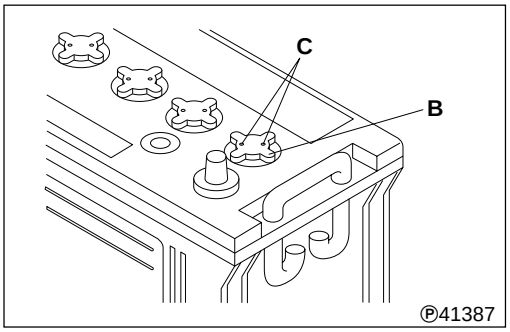


Visual inspection

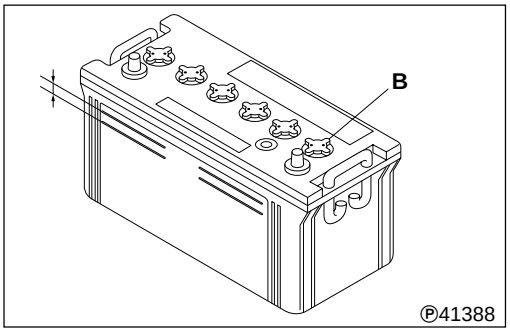
- If terminal **A** is corroded, scrub the corrosion off of it using a wire brush.
- If cracks or defects are found on the battery, replace it since the cracks or defects can cause liquid spills.

CAUTION ⚠

Make sure you grease the ⊕ side of terminal A because it is easily corroded.

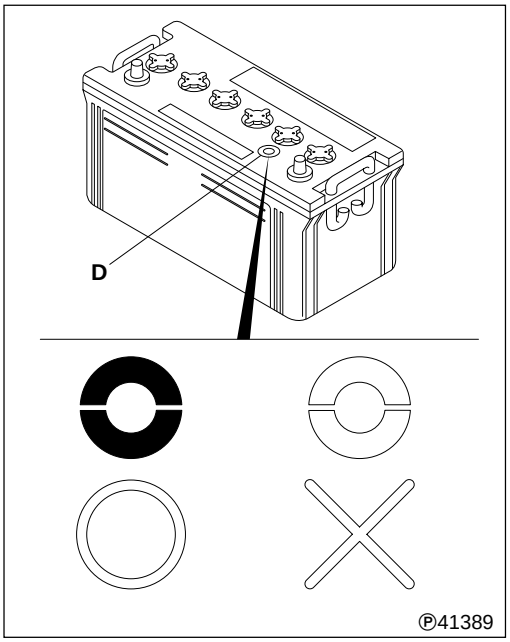


- If bleed hole **C** of vent plug **B** is clogged, clean the hole.



Inspection of fluid level

- Make sure that the battery electrolyte level is between the UPPER and LOWER level lines.
- If the level is below the LOWER level line, remove vent plug **B** and fill the battery with distilled water or battery replenisher to the UPPER level.

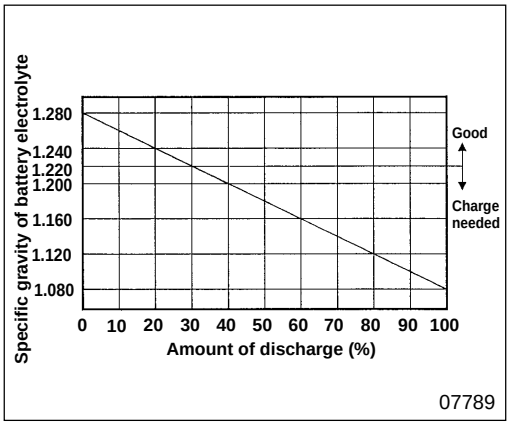


Measurement of specific gravity

You can tell the specific gravity of the battery electrolyte by the color shown in indicator **D**.

Blue : Good
White : Charge or replace

https://truckmanualshub.com/



Charging

- Although, as a rule, charging of the battery should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect the battery cable ⊖.
- Remove vent plug **B** before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	$\frac{\text{Value of 5-hour rating capacity}}{10}$	$\frac{\text{* Amount of discharge (Ah)}}{\text{charge current (A)}} \times 1.2$ (to 1.5)	45 {113}
Quick charge	$\frac{\text{Value of 5-hour rating capacity}}{1.5}$	0.5	55 {131}

* Amount of discharge (Ah) = 5-hour rating capacity (Ah) $\times \frac{\text{Amount of discharge (\%)}}{100}$

- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER ⚠

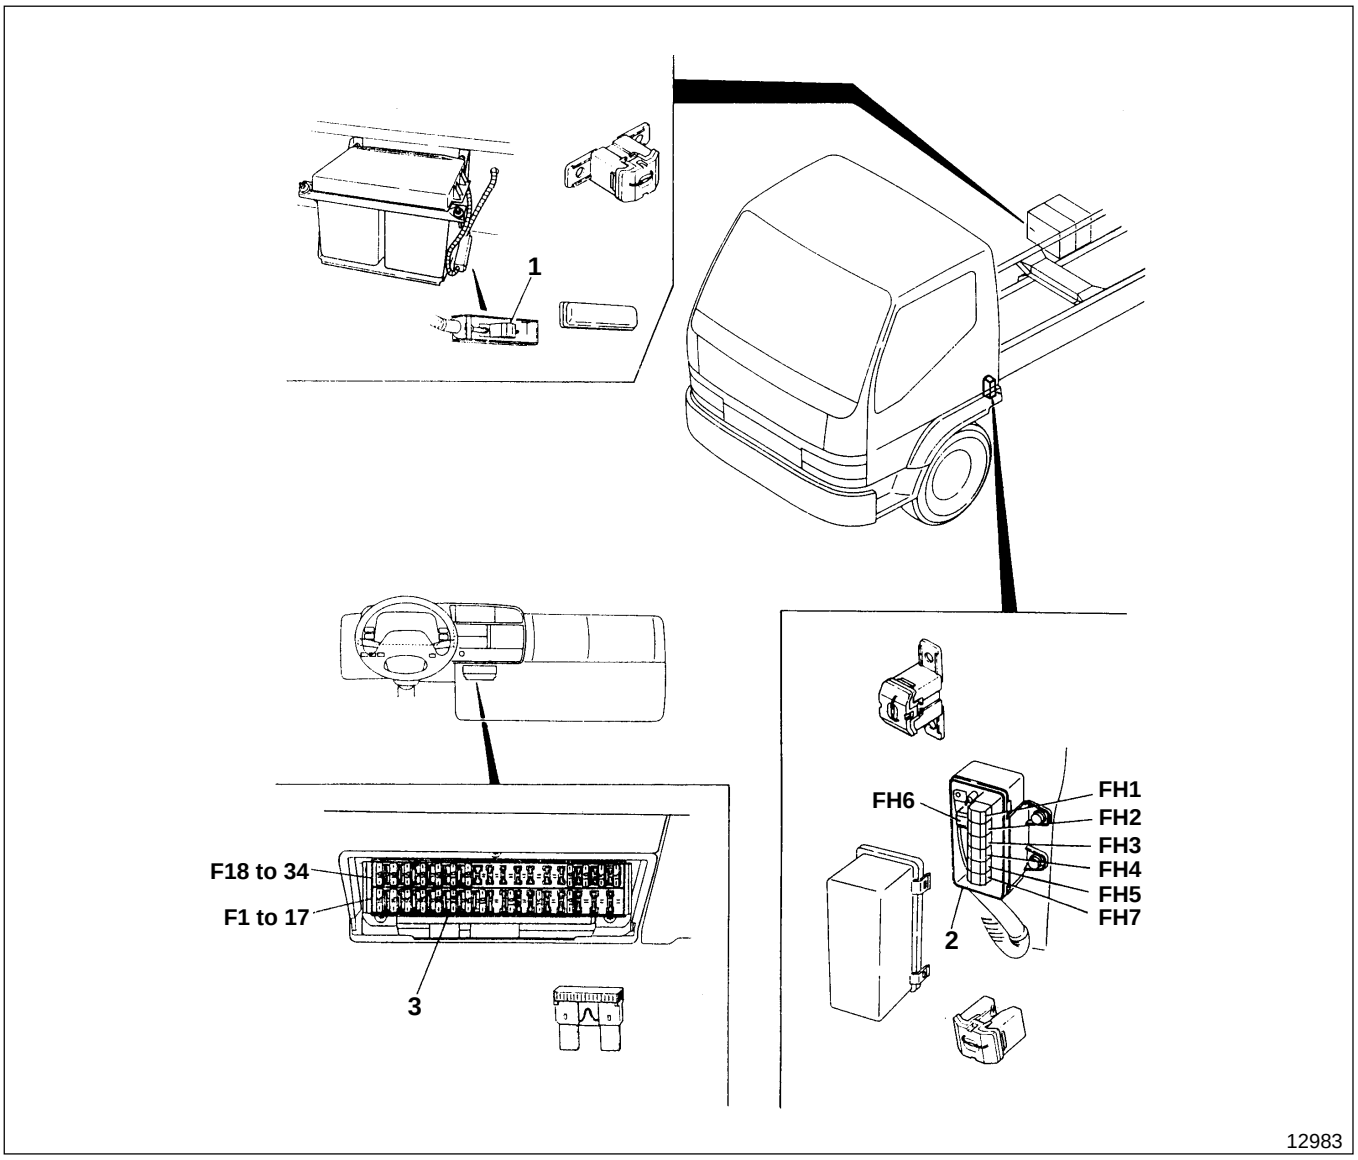
- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep unprotected lights away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because it is dangerous.**
- **After charging the battery, tighten vent plug B, wash away sulfuric acid from the battery using water, and dry the surface.**
- **Be sure to check the electrolyte level before charging the battery. Charging with the electrolyte level below the lower limit (LOWER LEVEL) can cause premature deterioration, heat generation and explosion of the battery.**

https://truckmanualshub.com/

MEMO

https://truckmanualshub.com/

Fuse



1 Main high-current fuse
2 High-current fuse box
3 Fuse box

CAUTION ⚠

- **If a fuse blows, make sure you identify and remedy the cause, then replace the fuse.**
- **Make sure that you replace the fuse with one having the same rating.**
- **Make sure that you remove the ⊖ terminal of the battery cable before removing main high-current fuse 1 and high-current fuses FH1 to 7.**

https://truckmanualshub.com/

Main high-current fuse

Fuse No.	Main load		Capacity
—	High-current fuse box	—	140A
		For ABS	50A

High-current fuse box

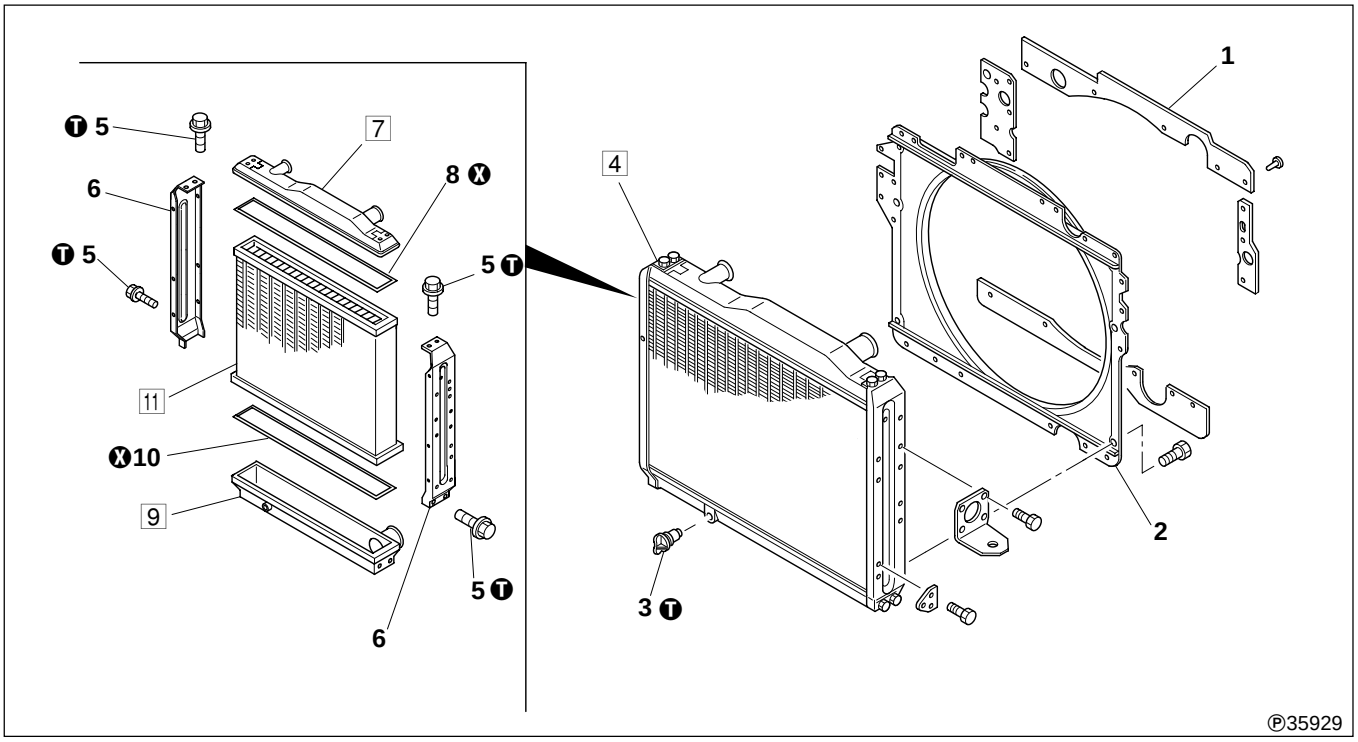
GROUP 14 COOLING

RADIATOR, FAN SHROUD 14-2

https://truckmanualshub.com/

RADIATOR, FAN SHROUD

Radiator Assembly



● **Disassembly sequence**

1 Baffle plate
2 Radiator shroud
3 Drain cock
4 Radiator assembly
5 Bolt
6 Side member
7 Upper tank
8 O-ring
9 Lower tank
10 O-ring
11 Core

Ⓧ : Non-reusable part

CAUTION ⚠

- **Do not disassemble the radiator assembly 4 unless defects are evident.**
- **The upper tank 7 and lower tank 9 are made of plastic and could crack if subjected to undue shock. Handle them with care.**
- **Replace the core 11 if the clinching tabs that hold the upper tank 7 or lower tank 9 have two paint marks, showing that the tabs have been bent back twice.** 🕮 **P.14-3**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
4	Radiator assembly air leakage (with air pressure of 150 kPa {21 psi, 1.5 kgf/cm²})	0 cm³ {0 cu. in.}	—	Rectify or replace

https://truckmanualshub.com/

Tightening torque

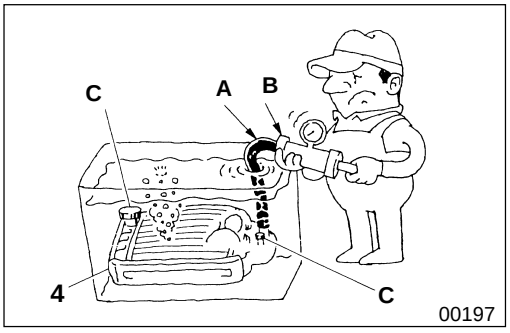
Unit: N·m{ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Drain cock	2 {1.4, 0.2}	—
5	Bolt (side member mounting)	13 {9, 1.3}	—

Special tool

Location	Tool name and shape	Part No.	Application
7, 9	Lock & break tool	Obtain locally or use sublet repair	Upper tank, lower tank removal

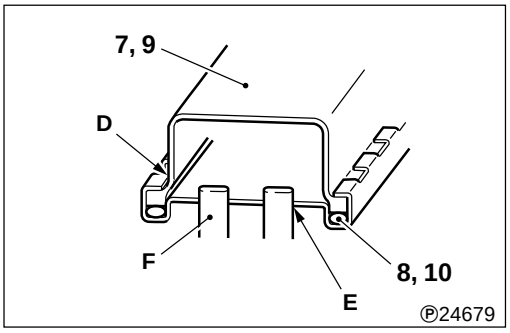
The part number given is Toyo Radiator's one.



Service procedure

4 **Radiator inspection**

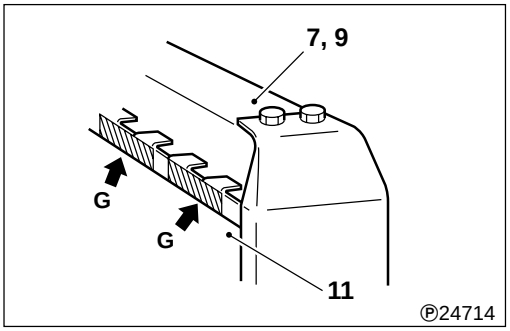
- Fit a hose **A**, radiator cap tester **B** and plug **C** onto the radiator upper tank **7**.
- Fit a plug **C** onto the radiator lower tank **9**, then immerse the radiator in a tank of water.
- Using the radiator cap tester **B**, apply the specified air pressure of 150 kPa {21 psi, 1.5 kgf/cm^2}, and check for air leakage.
- If air leakage is apparent, repair or replace the radiator assembly **4**.



- Replace the following parts according to the leaking locations.

Leaking location	Part to replace
Tank root **D**	O-ring **8** or **10**
Tank **7**	Tank **7**, O-ring **8**
Tank **9**	Tank **9**, O-ring **10**
Tube fitted area **E**	Core **11**, O-ring **8**, **10**
	* Tube **F** (TIG welded), O-ring **8**, **10**
Tube **F**	Core **11**, O-ring **8**, **10**

* : When repaired

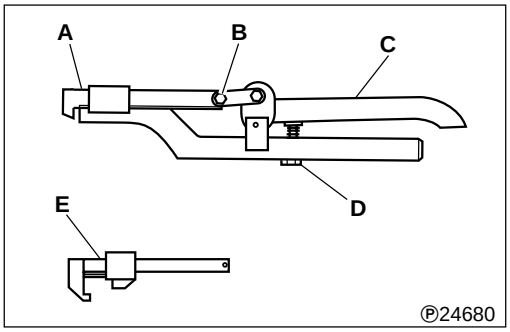


CAUTION ⚠

- **Replace the core 11 if its clinching tabs that hold the upper tank 7 or lower tank 9 have two paint marks G, evidence of the tabs having been bent back twice.**
- **The tabs are provided with one paint mark each time they are bent back. Count the paint marks on each of upper and lower tabs separately.**

https://truckmanualshub.com/

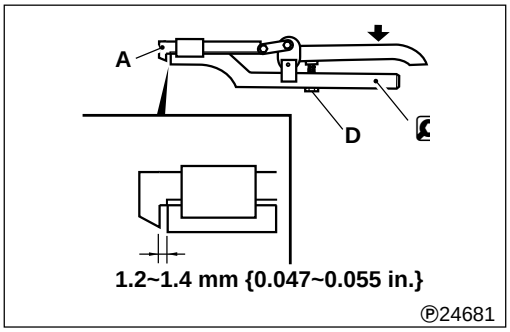
RADIATOR, FAN SHROUD



7 9 **Upper tank and lower tank**

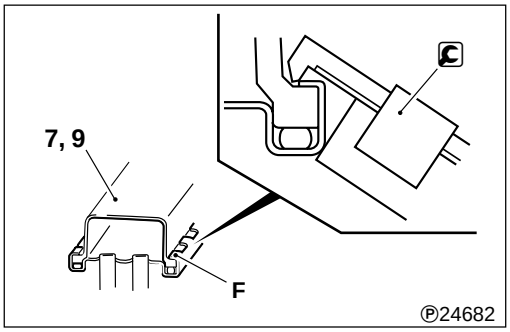
Remove and reinstall the tanks using the Lock and Break Tool.

A: Attachment (for tank removal)
B: Attachment locking bolt
C: Slide handle
D: Stopper/adjuster bolt
E: Attachment (for tank installation)

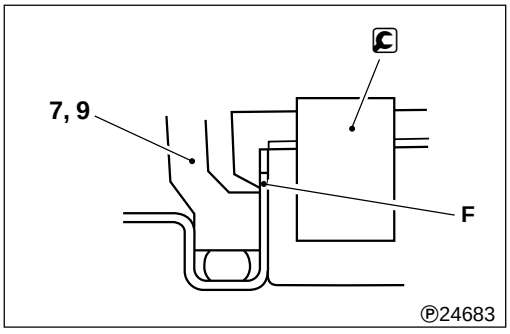


[Removal]

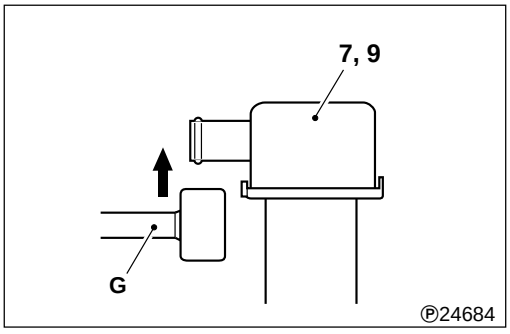
- Fit attachment **A** onto the end of the Lock and Break Tool, set it to the illustrated dimension and lock it in position with the stopper/adjuster bolt **D**.



- Using the Lock and Break Tool, bend up the tabs **F** of the core **11** that hold the tank **7**, **9**.



- Straighten the tabs **F** completely as shown by gripping the Lock and Break Tool.
- After straightening all the tabs **F**, grasp the inlet or outlet pipe and remove the tank **7**, **9**.

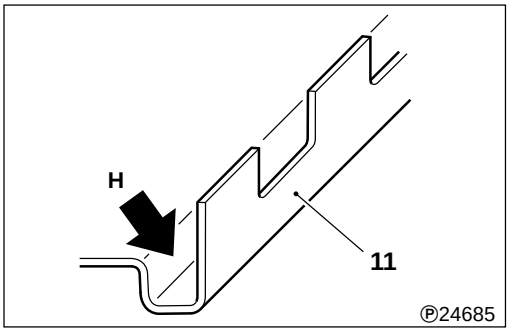


- If the tank **7**, **9** is difficult to remove, tap it with a rubber or plastic hammer **G**.

CAUTION ⚠

The tanks 7 and 9 are made of plastic and may crack if subjected to undue shock. Handle them with care.

https://truckmanualshub.com/

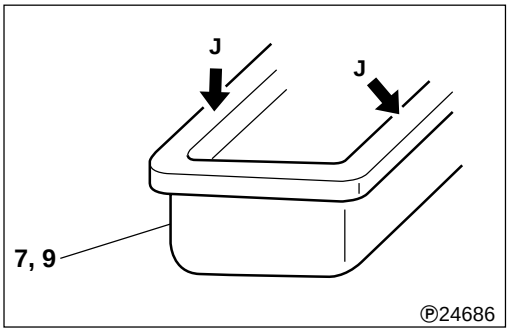


[Inspection]

- Check the tank mounting channels **H** of the core **11** for foreign matter.
- If foreign matter is stuck inside the mounting channels, rub it away with sandpaper (approx. #1000) or blow it out with compressed air.

CAUTION ⚠

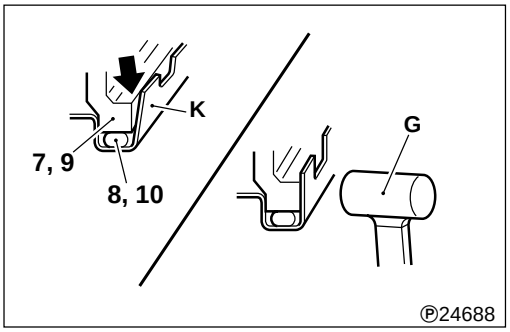
If any foreign matter (even a single hair) remains when the O-ring 8, 10 and tank 7, 9 are fitted, leakage can occur. Carefully inspect and clean each tank mounting channel H entirely.



- Clean the core contacting surface **J** of the tank **7**, **9** and inspect it for damage. Replace the tank if any defect is evident.

CAUTION ⚠

Perform works with bare hands to prevent foreign matter from sticking to the surface J.

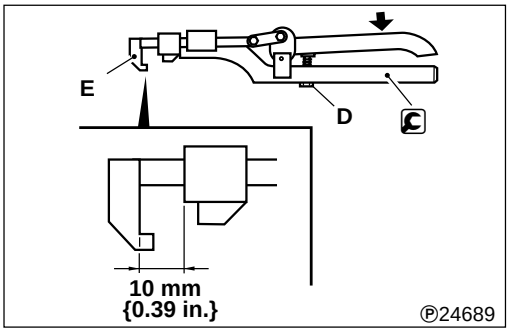


[Installation]

- Install the tank **7**, **9** in position. Check that the sub-plate **K** of the core is in close contact with the tank. If there is any space, tap the sub-plate lightly with a rubber or plastic hammer to eliminate space.

CAUTION ⚠

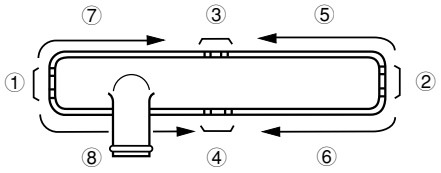
Handle the parts with bare hands to prevent foreign matter from sticking to the O-ring 8, 10 and tank 7, 9.



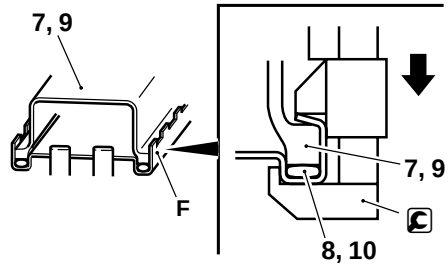
- Fit attachment **E** onto the end of the C Lock and Break Tool, set it to the illustrated dimension and lock it in position with the stopper/adjuster bolt **D**.

https://truckmanualshub.com/

RADIATOR, FAN SHROUD



Ⓟ24690



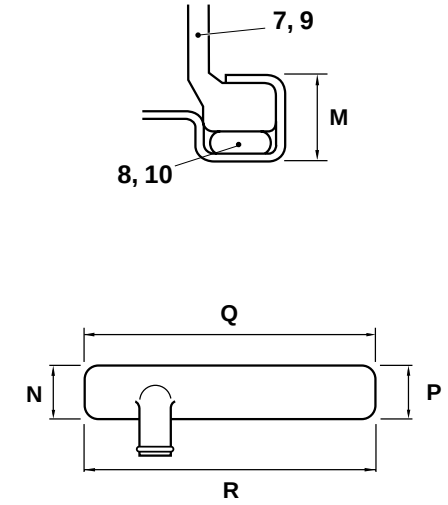
Ⓟ24691

- Clinch the tabs **F** of the core **11** to hold the tank **7**, **9** in the illustrated order.

  ① ~ ④ :Two center tabs on each side
  ⑤ ~ ⑧ : Remaining tabs in illustrated sequence
  : Lock and Break Tool (with attachment **E**)

CAUTION ⚠

The sides ① and ② do not allow the Lock and Break Tool to be used for clinching. Clinch these sides using a pair of pliers with tape wrapped around its jaws.



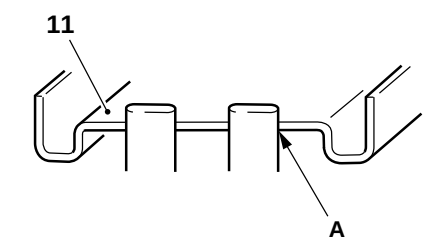
Ⓟ24692

- Check that the tabs have been clinched to the following dimensions.

  M : 14.65 ~ 15.05 mm {0.576 ~ 0.592 in.} (Sides **N** and **P**)
  10.05 ~ 10.45 mm {0.395 ~ 0.411 in.} (Sides **Q** and **R**)
- Check for leaks. P.14-3
- Provide a paint mark to the sub-plate **K** of the core **11** to indicate that the tabs have been bent up and then down. P.14-3

CAUTION ⚠

Provide one paint mark after each removal of the tank.



Ⓟ24693

11 Core

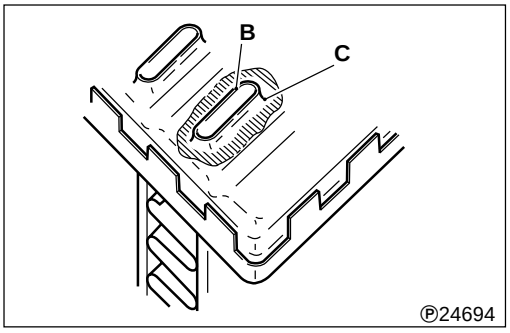
If water leaks from the tube fitted area **A**, replace the core **11** or repair it by the following method.

https://truckmanualshub.com/

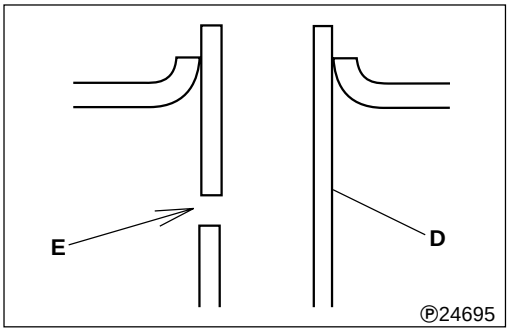
[Repair]

WARNING ⚠

- **Repair is carried out by tungsten inert gas arc (TIG) welding, which requires the skill of a trained welder.**
- **To avoid danger, dry the core 11 completely before welding.**



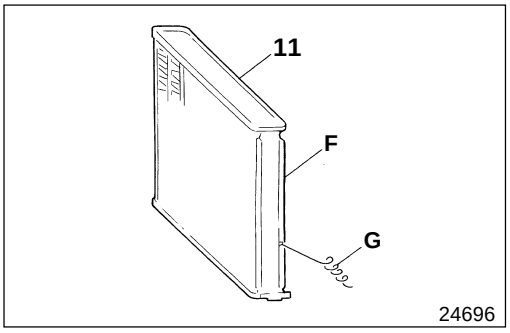
- Clean both edges **B** of the leaky tube and their surroundings **C** using a stainless steel wire brush. Scrub the surface until it glistens with exposed aluminum.



- Since both ends of the tube are covered with weld metal, make a small hole **E** in the tube **D** to allow air venting.

CAUTION ⚠

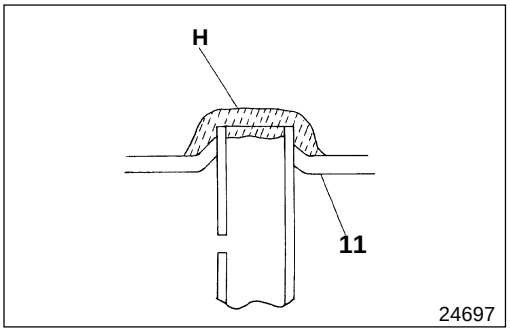
Absence of the small hole E causes escaping air to produce small pin holes in the weld.



- Connect a grounding wire **G** from the support **F** of the core **11** to an appropriate object.

CAUTION ⚠

Improper connection of the grounding wire G causes a short circuit during welding work and the core could be fused at the welded portion.



- Cover both ends of the tube with welding metal.
  H : Tungsten inert gas arc weld (TIG)
  Welding conditions:
  Welding rod: A4043 (approx. 2 mm {0.0079 in.} in diameter)
  Welding current: 80A AC
- After welding, check for the following defects. Rectify the weld or replace the core **11** if any of the defects is evident.
  - Undercut
  - Bead crack
  - Crack in base metal

CAUTION ⚠

Weld with sufficient care. Poor welding may cause leakage to reoccur.

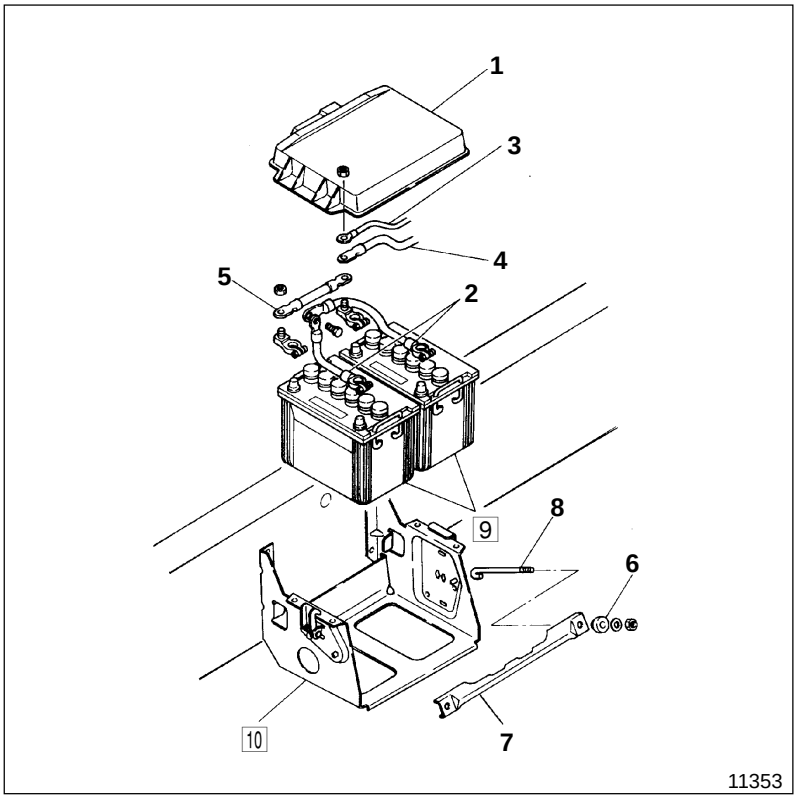
MEMO

https://truckmanualshub.com/

101 BATTERY



● **Removal sequence**

1 Battery cover
2 Battery cable ⊖
3 Harness (Main high-current fuse)
4 Starter cable
5 Battery cable ⊕
6 Rubber grommet
7 Angle frame
8 Set bolt
9 Battery
10 Battery box

● **Installation sequence**

Follow the removal sequence in reverse.

DANGER ⚠

- **Because flammable hydrogen gas is generated from battery 9, be sure to obey the following.**
  - **Never attempt to short-circuit the positive an negative terminals of battery 9, and generate sparks, or smoke a cigarette near it.**
  - **Do not wear metal objects on your arms or do not lean over battery 9.**
- **Sulfuric acid of the electrolyte is very corrosive. Whenever handling battery 9, wear safety goggles and rubber gloves to protect your eyes and hands.**
- **Battery posts, terminals and related accessories contain lead and lead compounds. Wash hands after handling.**

WARNING ⚠

When you disconnect battery cables 2 to 5, disconnect battery cable ⊖ 2 first.

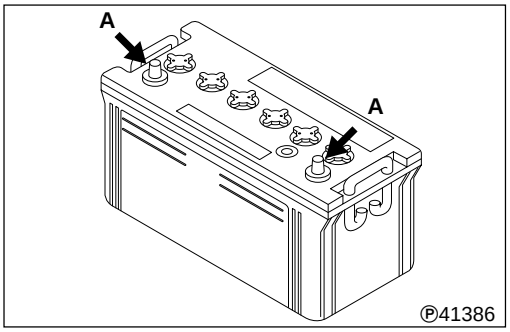
CAUTION ⚠

- **Make sure that all electrical switches of the vehicle are off before connecting battery cables 2 and 5.**
- **Be sure to connect battery cable ⊕ 5 first before you connect battery cable ⊖ 2.**
- **To prevent a short-circuit, take care that disconnected battery cables 2 and 5 do not accidentally touch the battery terminals.**

Service standards

Location	Inspection item	Standard value	Limit	Remedy
9	Specific gravity of battery electrolyte (20°C {68°F})	1.220 to 1.290	—	Charge or replace

https://truckmanualshub.com/



◆ Service procedure

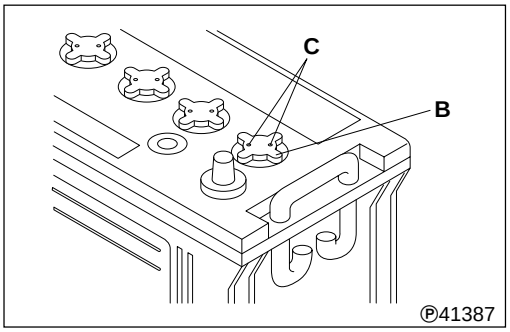
9 Inspection of battery

(1) Visual inspection

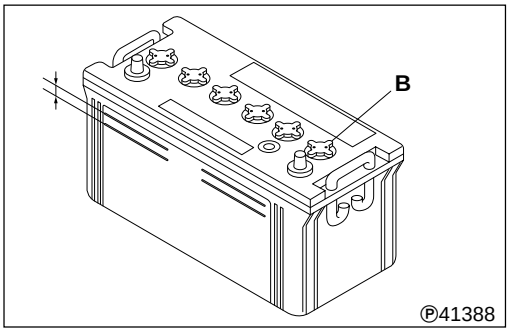
- If terminal **A** is corroded, scrub the corrosion off of it using a wire brush.
- If cracks or defects are found on battery **9**, replace it because the cracks or defects can cause liquid spills.

CAUTION ⚠

Be sure to apply grease to the ⊕ side of terminal A because it is easily corroded.

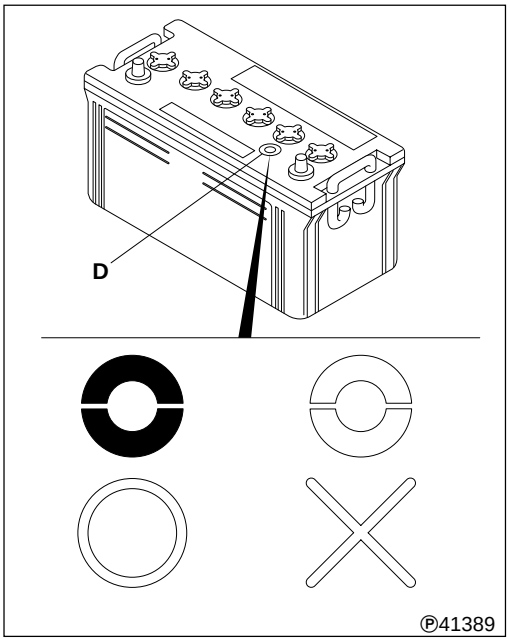


- If the air bleed hole **C** of vent plug **B** is clogged, clean the hole.



(2) Inspection of fluid level

- Confirm that the level of battery electrolyte is between the UPPER and LOWER LEVEL lines.
- If the level is below the LOWER LEVEL line, remove vent plug **B** and replenish the distilled water or battery fluid to the UPPER LEVEL.

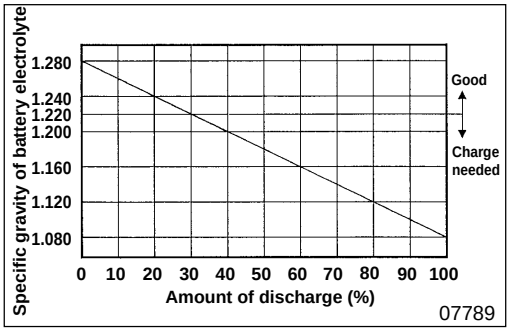


(3) Specific gravity measurement

You can tell the specific gravity of the battery electrolyte by the color shown in indicator **D**.

Blue : Good
White : Charge or replace

https://truckmanualshub.com/



(4) Charging

- Battery **9** must be, as a rule, charged in the off-vehicle condition. If it is charged on vehicle, however, be sure to remove the grounding cable before starting the procedure.
- The battery must be charged with its all of vent plugs removed.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity/10	{* Amount of discharge (Ah)/ Charge current (A)} × 1.2 (to 1.5)	45 {113}
Quick charge	Value of 5-hour rating capacity/1.5	0.5	55 {131}

* Amount of discharge (Ah) = 5-hour rating capacity (Ah) × [Amount of discharge (%)] / 100

- Use the graph shown on the left to calculate the amount of discharge (%).
- For the battery electrolyte, use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water.
- The specific gravity of fully-charged battery electrolyte is 1.280 at the liquid temperature of 20°C {68°F}.

DANGER ⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep open flame away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because it is dangerous.**
- **After charging the battery, tighten the vent plugs, wash away sulfuric acid from the battery using water, and dry the surface.**
- **Be sure to check the electrolyte level before charging the battery. Charging with the electrolyte level below the lower limit (LOWER LEVEL) can cause premature deterioration, heat generation and explosion of the battery.**

10 Inspection of battery box

- If battery box **10** is corroded, scrub the corrosion off of it using a wire brush and apply acid resistant coating.
- If the battery box **10** is corroded excessively, deformed or cracked, replace it with a new one.

SERVICE MANUAL

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of 2000 model Mitsubishi Fuso Truck FH Series.
Read this manual carefully as an aid to providing correct, efficient and fast maintenance.
Please note, however, that due to continuous improvements on the specifications, numbers and description for maintenance might change without prior notice.
If you have any questions, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso dealer or distributor.

2000 MODEL CHANGES

Item	’00 Model ⇦	’99 Model
Gr 00 General • Manual transmission of FH211 E, G, H, J, K has been changed to 6-speed, and differential gear ratio has also been changed accordingly. • The vehicle identification number has changed.	🕮 Gr 00 General	—
Gr 13 Fuel and engine control • Components of throttle position sensor assembly have been changed.	**< ’00 Model >**  ● **Removal sequence** **1** Return spring **2** Shaft cover **3** Spring **4** Accelerator control arm **5** Bushing **6** Throttle position sensor **7** Accelerator control extension **8** Bushing **9** Bracket ● **Installation sequence** Follow the removal sequence in reverse. **Lubricant** Location | Points of application | Specified lubricant | Quantity **5, 8** | Slide-contacting surfaces of bushing and support assembly | Chassis grease [NLGI No.1 (Ca soap)] | As required **< ’99 Model >**  ● **Removal sequence** **1** Return spring **2** Accelerator control arm **3** Bushing **4** Bushing **5** Accelerator control extension **6** Throttle position sensor **7** Bracket ● **Installation sequence** Follow the removal sequence in reverse. **Lubricant** Location | Points of application | Specified lubricant | Quantity **3, 4** | Slide-contacting surfaces of bushing and support assembly | Chassis grease [NLGI No.1 (Ca soap)] | As required
• Part No. and type of ROM pack have been changed.	MK 344606 (MRT-E6)	MK 327927 (MRT-E4)

https://truckmanualshub.com/

Item	'00 Model ⇦	'99 Model
Gr 22 Manual Transmission • 6-speed transmission has been added.	Gr 22 Manual Transmission < M050S5, S6 > '00 Minor Change (Pub. No. TWME9502-422)	—
Gr 35 Brake System • Procedures for bleeding brake system are added because of anti-lock brake system (ABS).	[Procedure for bleeding hydraulic unit] • Ordinary bleeding procedure is used for the primary side (non-hydraulic system). However, when the solenoid valve of the hydraulic unit operates (ABS operation) with air mixed in the primary side, air enters the secondary side (hydraulic system). Therefore, be sure to bleed air from the secondary side using the MUT-II by following the procedures described below. • Regarding the use of the MUT-II, refer to Gr 35A. < Bleeding front brakes > • Bleed the primary side of the front brake system. (Ordinary bleeding procedure) • Depress the brake pedal, and select the actuator drive mode, "FL ABS MV ON," on the MUT-II to force-drive the brake. • Bleed air from the secondary side of the front left wheel brake system. • Repeat the above two steps until air is completely removed. • Depress the brake pedal, and select the actuator drive mode, "FR ABS MV ON," on the MUT-II to force-drive the brake. • Bleed air from the secondary side of the front right wheel brake system. • Repeat the above two steps until air is completely removed. < Bleeding rear brakes > • Bleed the primary side of the rear brake system. (Ordinary bleeding procedure) • Depress the brake pedal, and select the actuator drive mode, "RL ABS MV ON," on the MUT-II to force-drive the brake. • Bleed air from the secondary side of the rear left wheel brake system. • Repeat the above two steps until air is completely removed. • Depress the brake pedal, and select the actuator drive mode, "RR ABS MV ON," on the MUT-II to force-drive the brake. • Bleed air from the secondary side of the rear right wheel brake system. • Repeat the above two steps until air is completely removed.	
Gr 35A Anti-lock Brake System • Anti-lock brake system (ABS) is added.	Gr 35A Anti-lock brake system (ABS) '00 Minor Change (Pub. No. TWME9502-435A)	—
Gr 42 Cab • Power window system equipped with central door lock switch is used for door windows.	Gr 42 Cab	—

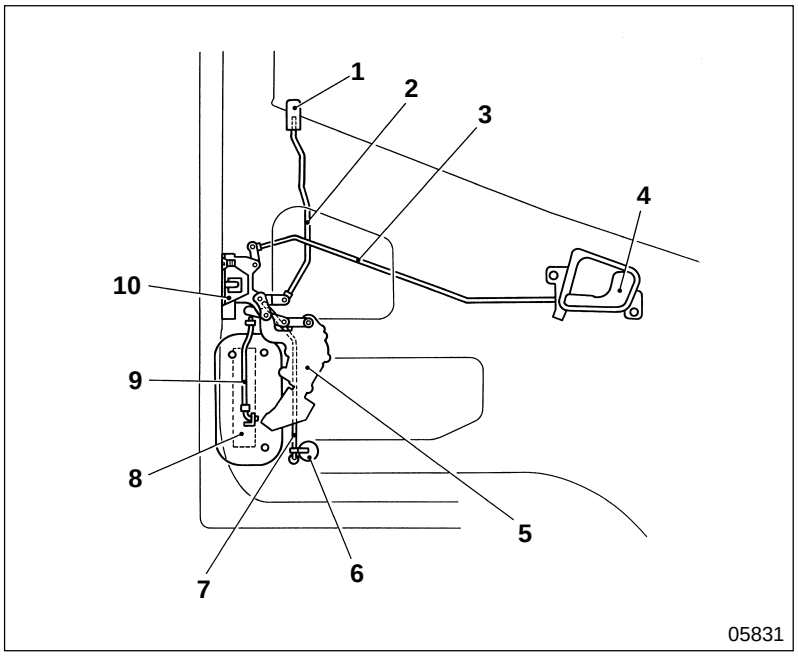
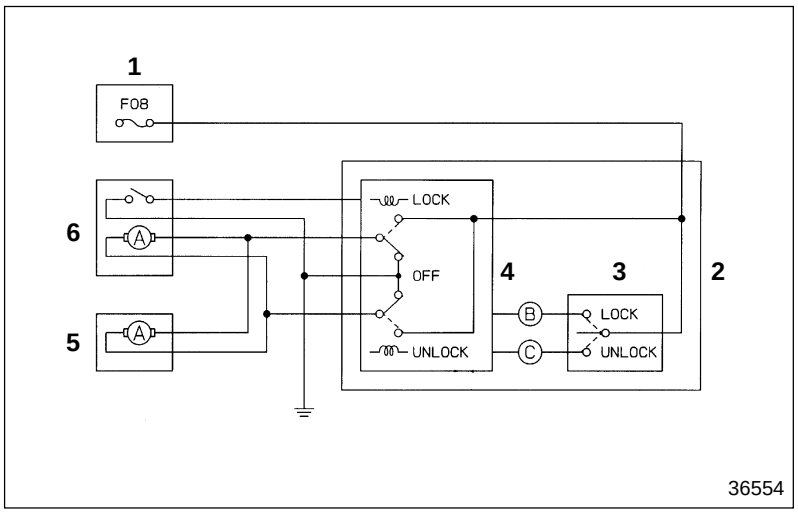
STRUCTURE AND OPERATION

Door Locking System



1 Door lock knob
2 Door lock rod
3 Door opening rod
4 Inside handle
5 Door lock actuator
6 Door lock cylinder
7 Door lock cylinder rod
8 Outside handle
9 Door opening rod
10 Door lock latch

Auto Door Lock Electric Circuit



1 Fuse box
2 Driver’s side power window switch
3 Auto door lock switch
4 Door lock relay
5 Passenger's side door lock actuator
6 Driver's side door lock actuator

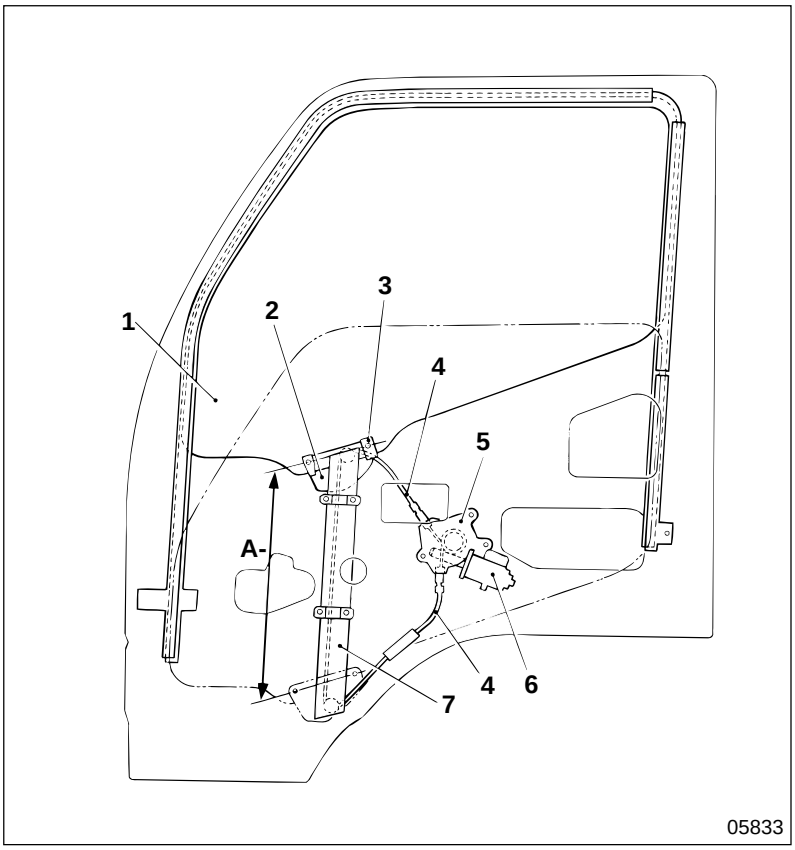
A : Actuator

Ⓑ : Lock signal
Ⓒ : Unlock signal

From the driver’s side, the doors can be locked and unlocked by auto door lock switch **3** as well as by door lock actuator **6**.

https://truckmanualshub.com/

Door Glass Opening System

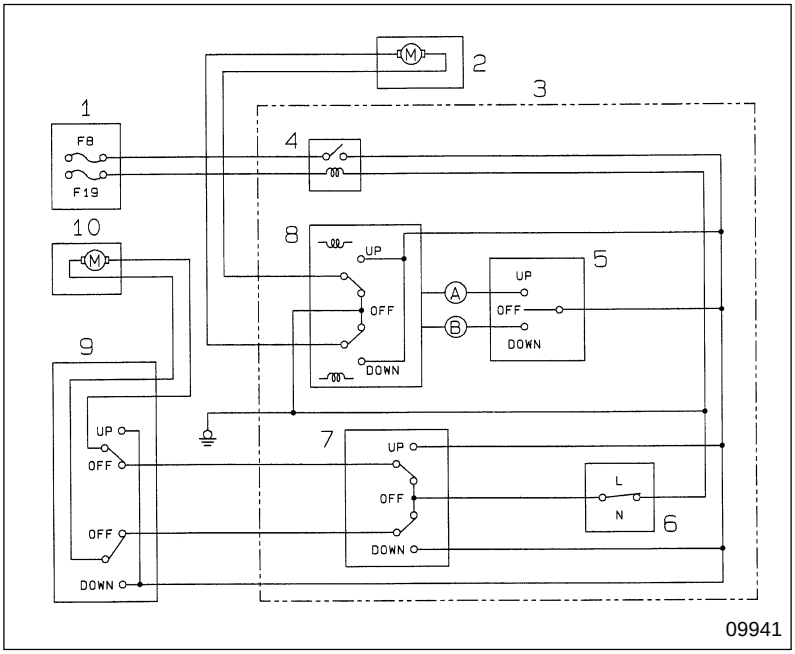


1 Door glass
2 Carrier plate
3 Glass holder
4 Cable
5 Regulator
6 Power window motor
7 Rail

A : Carrier plate moving range

- Both ends of cable **4** are secured to carrier plate **2**, and regulator **5** is installed to the wire at a midpoint.
- Regulator **5** rotates, thus winding cable **4** and moving carrier plate **2** in a vertical direction to raise or lower door glass **1**.

Power Window Electric Circuit



1 Fuse box
2 Driver's side power window motor
3 Driver's side power window switch assembly
4 Relay
5 Driver's side power window switch
6 Power window lock switch
7 Driver's side power window switch (for opening and closing passenger's side door glass)
8 Power window relay
9 Passenger's side power window switch
10 Passenger's side power window motor

M : Motor

Ⓐ : UP signal
Ⓑ : DOWN signal

- Power window switch assembly **3** on the driver's side is integrated with power window switches **5**, **7** and power window lock switch **6**.
- When power window lock switch **6** is set to the LOCK position, the door glass on the passenger's side cannot be operated by power window switches **7**, **9**.

TROUBLESHOOTING

Door Lock

Symptoms / Possible causes	Door latch does not engage, and door does not close	Door does not lock when door lock knob is pressed	Door does not lock when key is turned	Remote door lock does not operate	Door does not open when outside door handle is operated	Door does not open when inside door handle is operated	Inside door handle does not return properly to original position	There is interference between door and cab	Remarks
Door installation faulty	○							○	
Striker installation faulty	○								
Faulty door locking mechanism of door latch	○	○	○		○	○			
Door latch rod deformed		○				○			
Door latch rod disconnected		○	○			○			
Door latch rod interference							○		
Door lock cylinder deformed			○						
Faulty auto door lock switch in power window & door lock switch				○					🕮 Gr 54
Door lock actuator faulty				○					
Fuse or high-current fuse blown				○					
Open circuit or faulty connection of wire				○					
Left-side outside door handle faulty					○				
Inside door handle installation faulty						○			
Spring fatigue in inside door handle							○		

https://truckmanualshub.com/

Power Window

Symptoms / Possible causes	Door window glass drops of its own accord while cruising	Abnormal noise from power window regulator while cruising	Power window does not operate	Power window does not stop	Abnormal noise while power window operating	After the starter switch has been turned OFF the window does not operate within 30 seconds of the power window switch being operated	After the starter switch has been turned OFF and although the doors have been opened within 30 seconds, the window does not operate within 30 seconds of the power window switch being operated	Remarks
Power window switch faulty			○	○		○	○	
Power window regulator faulty	○		○	○	○			
Power window regulator mounting faulty					○			🕮 Gr 54
Fuse and high-current fuse burnt-out			○					
Wiring broken or connection faulty			○					
Power window glass and door belt line molding rattling		○

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

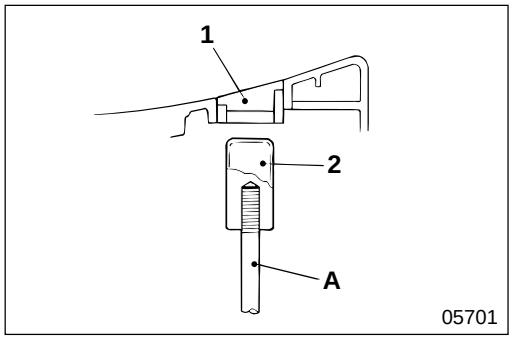
Location	Parts to be tightened	Tightening torque	Remarks
20	Screw (Door lock actuator mounting)	4 to 6 {2.9 to 4.3, 0.4 to 0.6}	—
28	Bolt (Regulator & rail assembly mounting)	6.9 to 10.8 {5.1 to 8.0, 0.7 to 1.1}	—

Lubricant and/or sealant

Location	Points of application	Specified lubricant and/or sealant	Quantity
17	Rotating surface of inside handle	Multipurpose grease [NLGI No.2 (Li soap)]	As required
21	Sliding surface of door lock actuator	Multipurpose grease [NLGI No.2 (Li soap)]	As required
22	Sliding surface of outside handle	Multipurpose grease [NLGI No.2 (Li soap)]	As required
24	Threads of nut	Loctite (Japan) Drylock No. 203	As required
25	Threads of glass holder bolt	Loctite (Japan) Drylock No. 203	As required
29	Sliding surfaces of regulator & rail assembly	Dynamic GB	As required
31	Waterproof cover installation surface of door panel	Butyl tape	As required

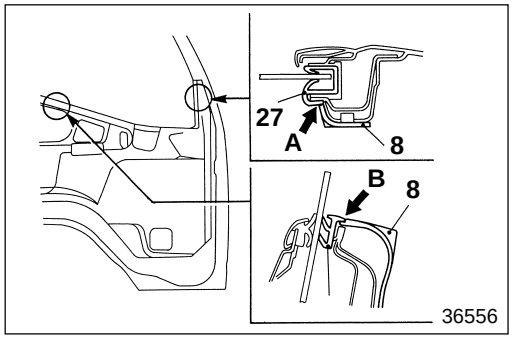
https://truckmanualshub.com/

◆ Service procedure



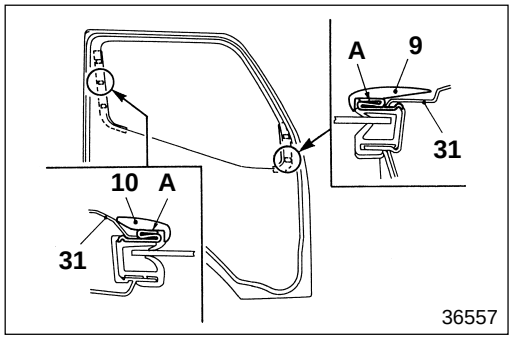
2 **Installation of door lock knob**

- Install door lock knob **2** to door lock rod A of door lock actuator **21**, and turn the knob fully in clockwise direction.
- Back off door lock knob **2** by turning it 1 or 2 turns in counterclockwise direction.
- Position cover **1** to prevent door lock knob **2** from turning.



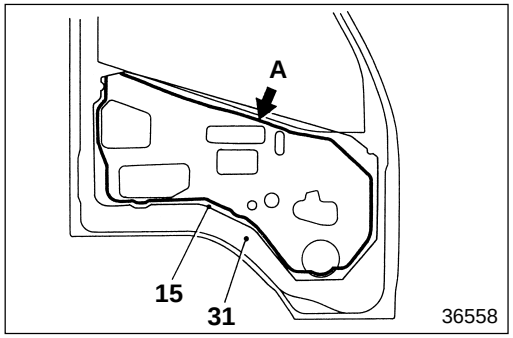
8 **Installation of door trim**

- On the front pillar section, install door trim **8** by pressing it to lip section **A** of run channel **27**.
- On the belt line section, install door trim **8** by pressing it to lip section **B** of inner weather strip **14**.



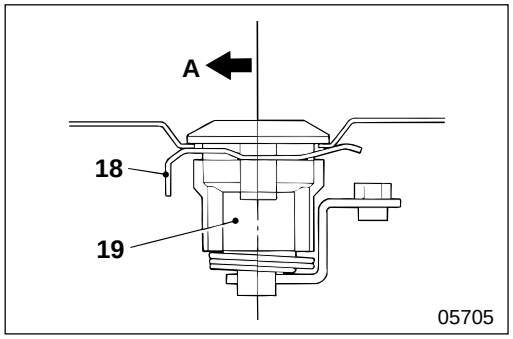
9 **10** **Installation of front and rear garnishes**

- Install clips **A** to door panel **31** prior to the installation of the garnishes.
- Install front garnish **9** and rear garnish **10** to clips **A**.



15 **Installation of waterproof cover**

- Apply butyl tape **A** to door panel **31**, as indicated in the illustration.
- Install waterproof cover **15** by pasting onto butyl tape **A**.

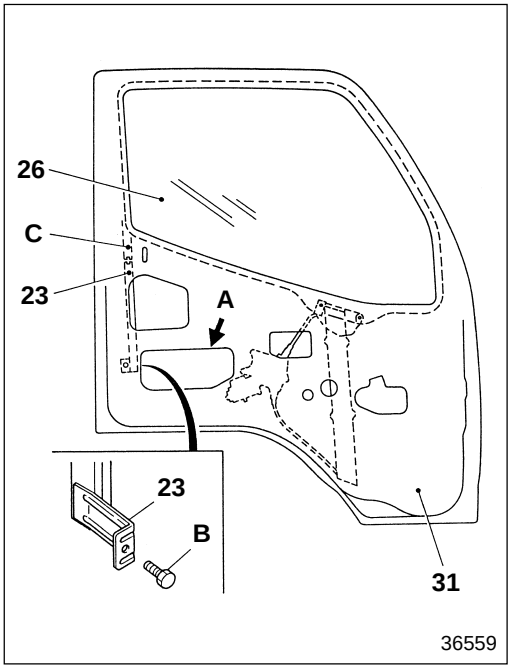


19 **Installation of door lock cylinder**

Install door lock cylinder **19** to clip **18** in the direction indicated in the illustration.

A : Vehicle front side

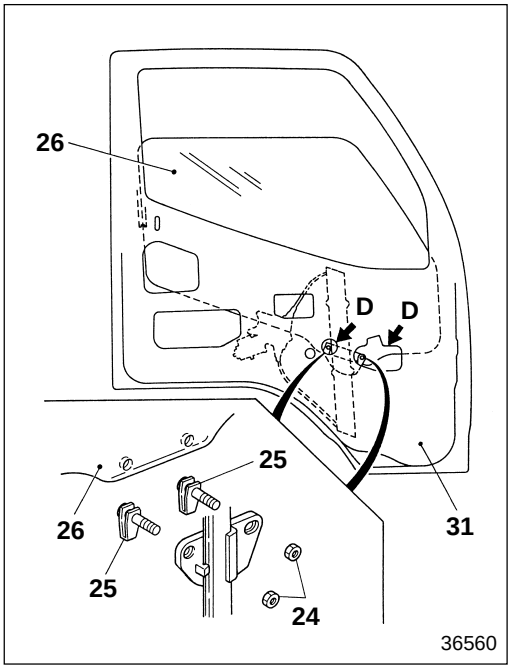
https://truckmanualshub.com/



26 **Removal and installation of door glass**

Remove all parts supporting door glass **26**, then remove the door glass through the open space in the door.

- Pull door glass **26** all the way to the top.
- Remove bolt **B** through hole **A** in door panel **31**, and remove lower sash **23**.
  Note that the lower sash is inserted in upper sash **C**.



- Lower door glass **26** until nut **24** becomes visible through hole **D** in door panel **31**.
- Support door glass **26** by hand, then remove glass holder **25**.
- Remove door glass **26** through the open space in the door.
- To install door glass **26**, follow the removal procedure in reverse.

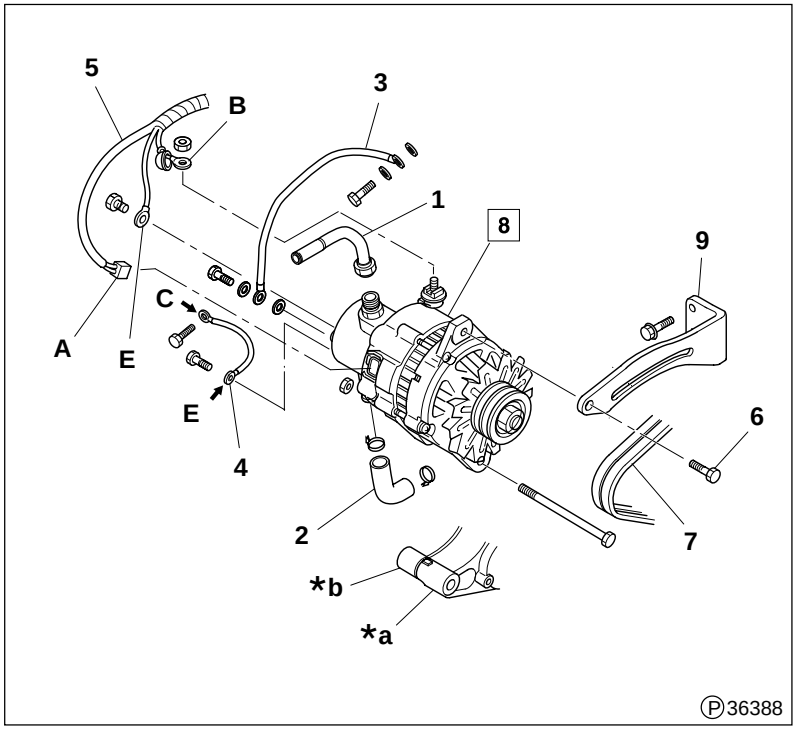
106 ALTERNATOR



● **Removal sequence**

1 Vacuum pipe
2 Oil return hose
3 Oil inlet hose
4 Ground cable
5 Chassis harness
6 Adjusting bolt
7 V-belts
8 Alternator P54-8
9 Adjusting plate

***a** : Timing gear case and front plate Gr 11
***b** : Power steering oil pump
A : To terminals L and R
B : To terminal B
C : Connected to crankcase
E : To terminal E

WARNING

- **Terminal B is always loaded with voltage from the battery, supplied via chassis harness 5. Therefore when you remove the harness from terminal B, make sure that tools do not touch any adjacent parts because this would cause a short-circuit.**
- **Make sure that you disconnect terminal ⊖ of the battery before removing the harness and insulate the terminal with tape.**

● **Installation sequence**

Follow the removal sequence in reverse.

● **Adjustment after installation**

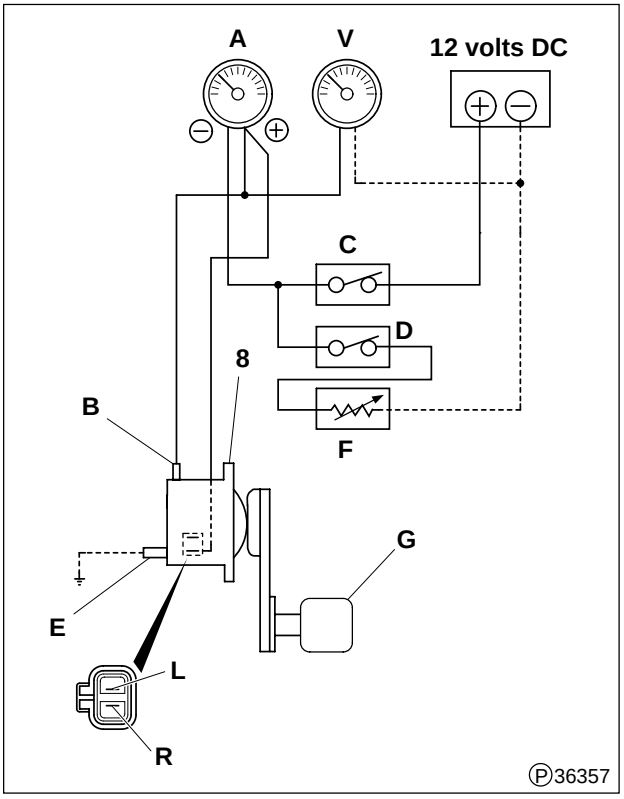
Adjustment of V-belt **7** tension Gr 14

Service standards

Location	Maintenance item			Standard value	Limit	Remedy
8	Output current (* When engine is hot and 13.5 V is loaded)	Without vacuum pump	At 1500 rpm	53 A or more	—	Inspect
			At 2500 rpm	84 A or more	—	
			At 5000 rpm	102 A or more	—	
		With vacuum pump	At 1500 rpm	51 A or more	—	Inspect
			At 2500 rpm	81 A or more	—	
			At 5000 rpm	98 A or more	—	
	Adjustment voltage of regulator (At 5000 rpm, 5 A is loaded)			14.7±0.3 V	—	Replace

* : The value of the ambient temperature is measured after running the alternator drive motor at maximum power (5000 rpm) for 30 minutes.

https://truckmanualshub.com/



8 Inspection of alternator

(1) Inspection of alternator performance (bench test)

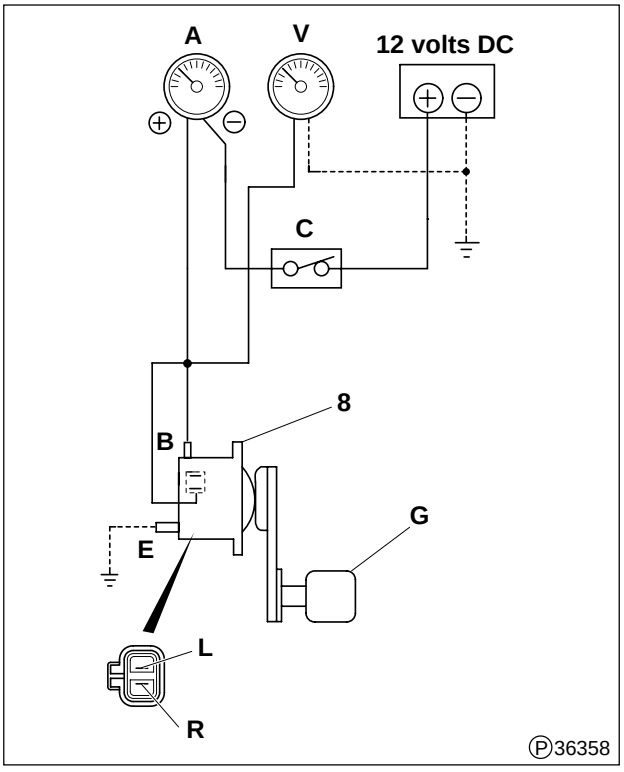
- Connect each unit to alternators **8** as illustrated.

CAUTION⚠

Use sufficiently thick wires for the wiring and make sure all connecting parts are securely connected.

A : Ammeter
B : Terminal B on alternator
C : Switch
D : Switch
E : Terminal E on alternator
F : Load resistance (variable resistance)
G : Alternator drive motor
L : Terminal L on alternator
R : Terminal R on alternator
V : Voltmeter

- Maximize load resistance **F** (load current hardly flows).
- Turn switches **C**, **D** ON.
  With the alternator **8** rotating at 5000 rpm, adjust load resistance **F** to the current specified in the Service Standards table. Then, operate the alternator for 30 minutes.
  Specified output of the alternator : Approx. 100 A
- Increase the rotation of alternator **8** gradually and measure current at specified rpm.
- If the measured value deviates from the standard value, disassemble and inspect alternator **8**. 🕮 P54-8



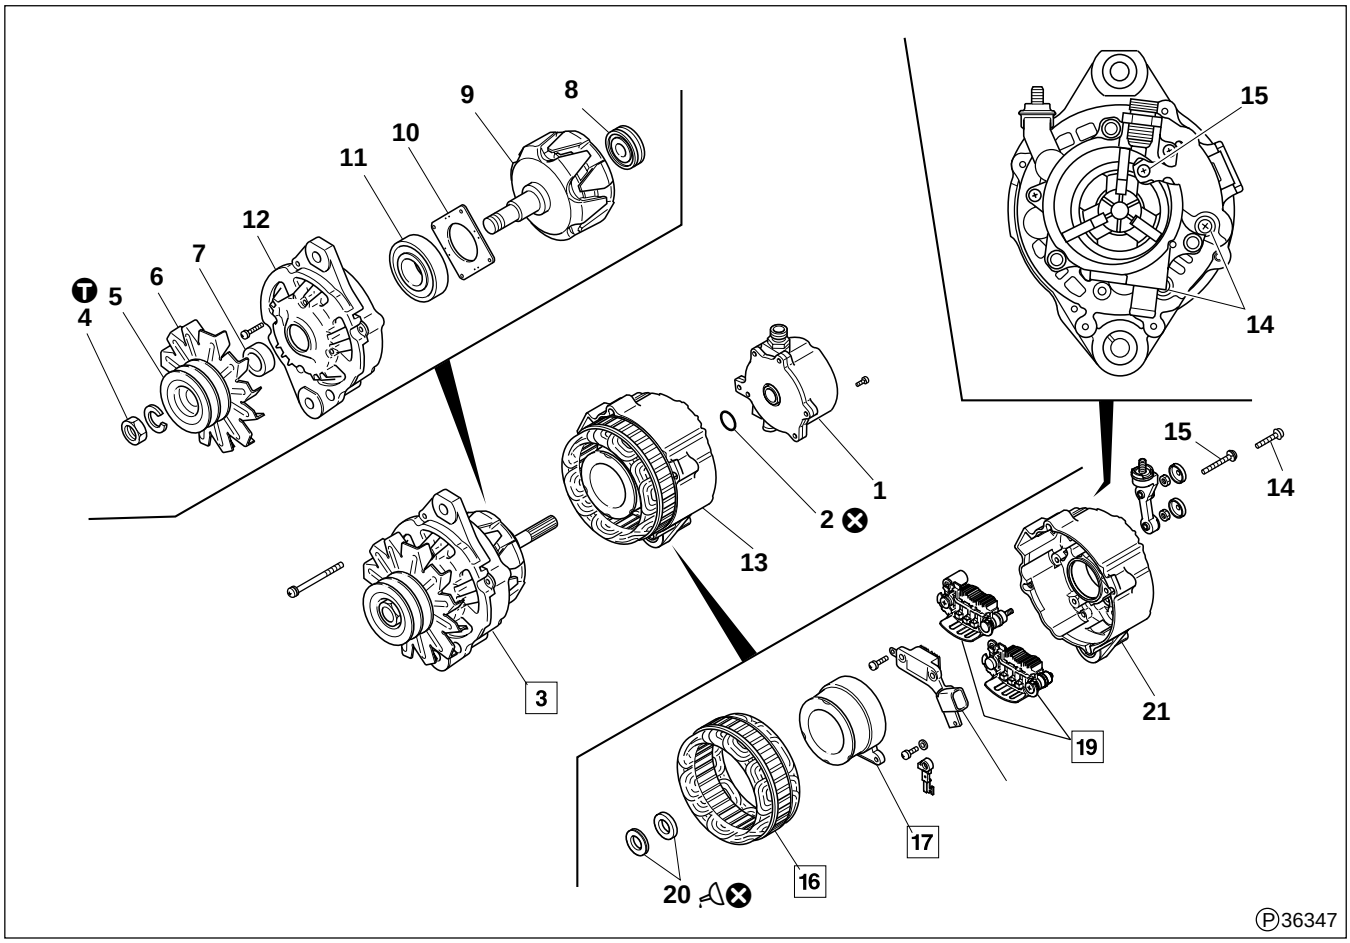
(2) Inspection of regulator (bench test)

- Connect each unit to the alternators as illustrated.
  A : Ammeter
  B : Terminal B on alternator
  C : Switch
  E : Terminal E on alternator
  G : Alternator drive motor
  L : Terminal L on alternator
  R : Terminal R on alternator
  V : Voltmeter
- Turn switch **C** ON.
- Run alternator **8** at low speed.
- Measure the voltage (adjustment voltage) when alternator **8** has reached a speed of 5000 rpm. Make sure at such time that the value of the current is five amperes or less.
- If the measured value deviates from the standard value, perform either of the following.
  - If the measured value is higher than the standard value : Replace the regulator
  - If the measured value is lower than the standard value : Before replacing the regulator check the alternator area.

https://truckmanualshub.com/

106 ALTERNATOR

Alternator



● **Disassembly sequence**

1 Vacuum pump Gr 35
2 O-ring
3 Rotor and front bracket assembly
4 Nut
5 Pulley
6 Fan
7 Spacer
8 Rear bearing
9 Rotor assembly
10 Cover
11 Front bearing
12 Front bracket
13 Stator and rear bracket assembly
14 Screw
15 Screw
16 Field coil
17 Stator assembly
18 Regulator
19 Rectifier
20 Oil seal
21 Rear bracket

⊗ : Non-reusable parts

CAUTION

When removing field coil 16, support the field coil by hand or with a stand to prevent it from falling due to its own weight.

NOTE

Do not remove parts 8, 11, 16 unless they are faulty.
Alternator without vacuum pump is not equipped with parts 1 and 2.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

https://truckmanualshub.com/

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
16	Field coil resistance (20°C {68°F})	2.0 to 2.4 Ω	—	Replace

Tightening torque

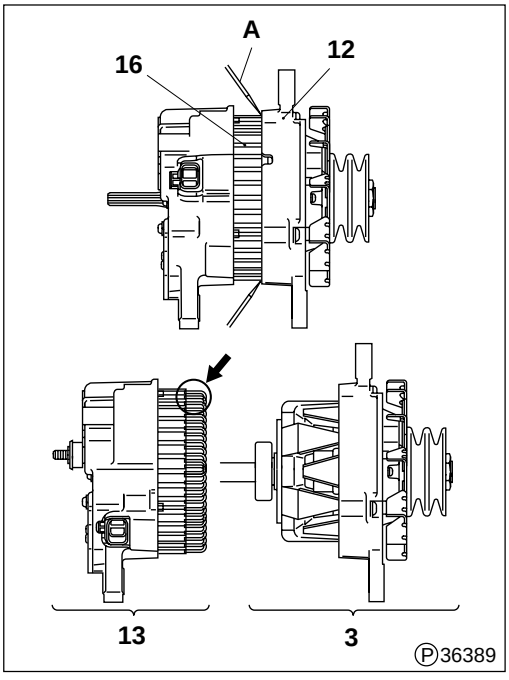
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Nut (Pulley mounting)	132 to 162 {98 to 120, 13.5 to 16.5}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
20	Oil seal lip area	Idemistu Autolux or lubricant supplied with oil seal	As required

◆ Service procedure



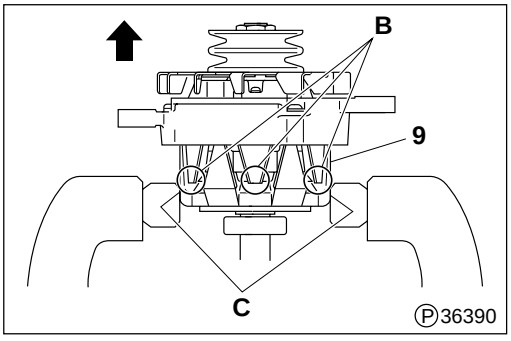
3 **Rotor and front bracket assembly**

[Removal]

- Insert screwdriver **A** between front bracket **12** and stator assembly **17**.
- Use screwdriver **A** to pry rotor and front bracket assembly **3** away from stator and rear bracket assembly **13**.

CAUTION

Be careful not to insert the screwdriver too deep or it will damage coil B of stator assembly 17 and might cause a short-circuit.

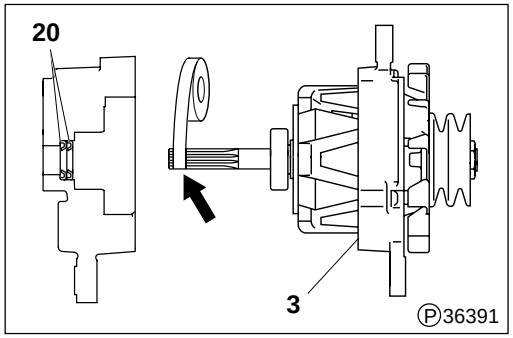


[Disassembly]

CAUTION

Make sure, when you hold rotor assembly 9 in a vise, to grip root C of the core claws. Gripping claws D can damage them.

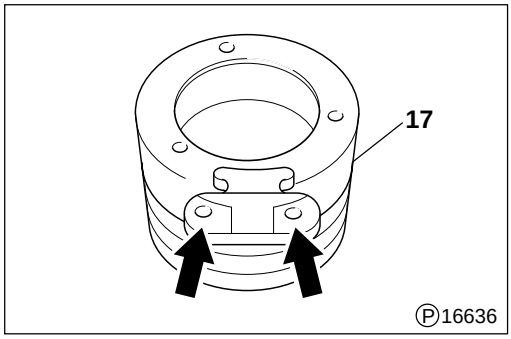
https://truckmanualshub.com/



[Installation]

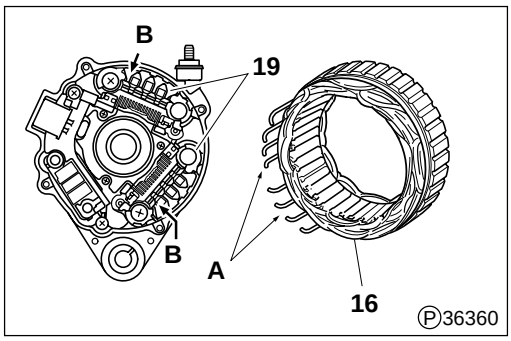
CAUTION⚠

To prevent damaging oil seal 20 during assembly, cover spline area E of the shaft of rotor and front bracket assembly 3 with tape.



17 Inspection of stator

- Measure the resistance between the terminals of field coil **17**.
- If the measured value deviates from the standard value, replace stator **17**.



16 Field coil assembly

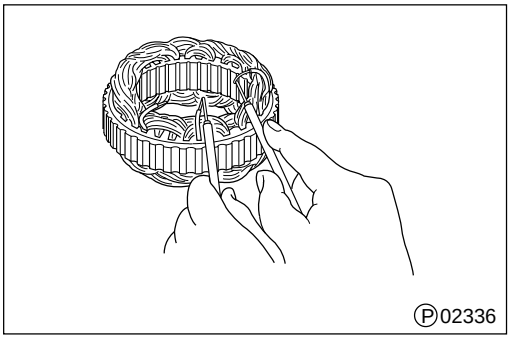
[Removal and installation]

- Disconnect lead **A** of field coil assembly **16** from rectifier **19**. The lead is soldered to diode **B** of rectifier **19** at eight points. (Each of the two rectifiers has 4 soldered sections.)

CAUTION⚠

Make sure that you desolder within five seconds because the diode is heat sensitive.

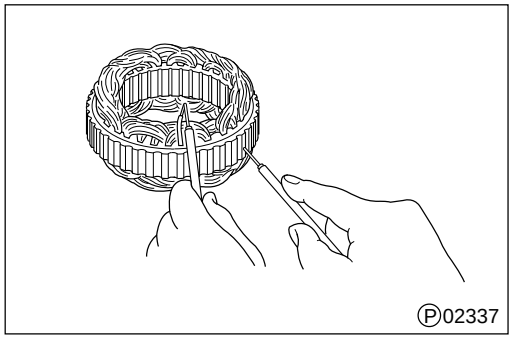
- To install, follow the removal sequence in reverse.



[Inspection]

(1) Continuity of each lead wire

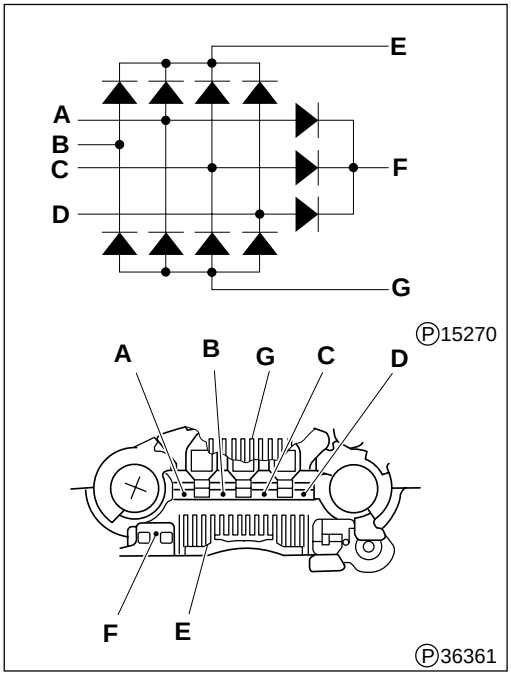
- Check electrical conductivity between individual lead wires of the four wires soldered to each rectifier.
- If there is no continuity, the lead wire is broken. Replace field coil assembly **16**.



(2) Continuity between lead wires and the core

- Make sure that there is no continuity between all lead wires and the core.
- If there is continuity, replace field coil assembly **16**, since it might be short-circuited.

https://truckmanualshub.com/



19 **Inspection of rectifier**

- Inspect whether the diode inside rectifier **19** functions properly, and if any fault is found, replace the rectifier.
  Infinite resistance in both.....Open circuit
  Near-zero Ω resistance in both.....Short circuit
  A, B, C, D : Lead connecting area of stator coil
  E, G : Heat sink area
  F : Regulator connecting area
- Inspect the rectifier twice, before and after the ⊕ side and ⊖ side of the tester have been changed over.

CAUTION

When inspecting using a tester, the current becomes weaker than the usual current flowing through rectifier 19. Therefore, an incomplete resistance value might be indicated.
Also, this tendency increases as the range of the tester gets smaller. Therefore, use as large range as possible.

[Outline]
The daytime running light system (DRL) turns on head lamps **13**, **14** in low beam as soon as the engine starts even if the light switch is in the OFF position.
Headlamps **13**, **14** repeat On/Off operations at 120 Hz according to the above timing chart. Because of the cyclic On/Off operations, the headlamps are dimmer than when the headlamp switch is ON.
Explanation of timing chart
- After the engine starts, when alternator **18** begins generating electricity with starter switch **3** in the ON position, headlamps **13**, **14** light.
- When parking brake switch **12** is ON, the DRL turns off to switch off the headlamps.

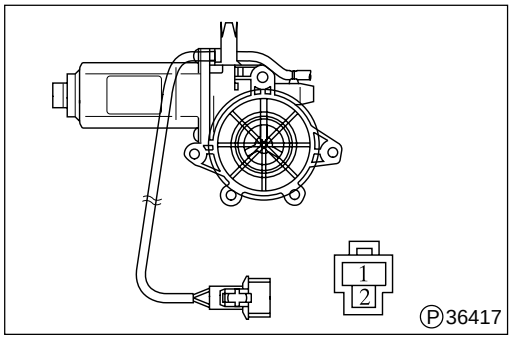
◆ Service procedure

2 **5** **Inspection of power window switch & controller**

- Since the units alone cannot be readily checked in the off-vehicle state, check the harness, switch and other related parts in each system.
- If any fault is not found in the related parts, and the problem still remains in the system, replace the control unit or other units.



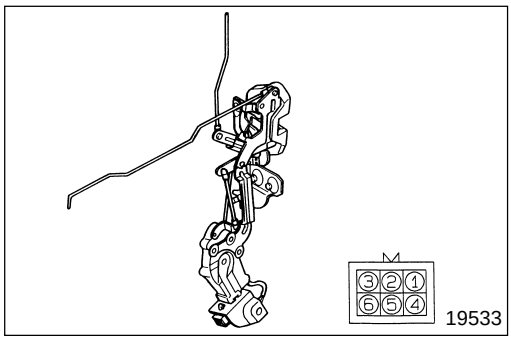
3 **7** **Inspection of power window motors**

- Follow the table below to check for operation.

	①	②
UP (Close)	⊕	⊖
Down (Open)	⊖	⊕

⊕—⊖ : Indicates the terminals where 12 volts DC is to be applied.

- If any fault is found, replace power window motors **3**, **7**. 🕮 Gr42



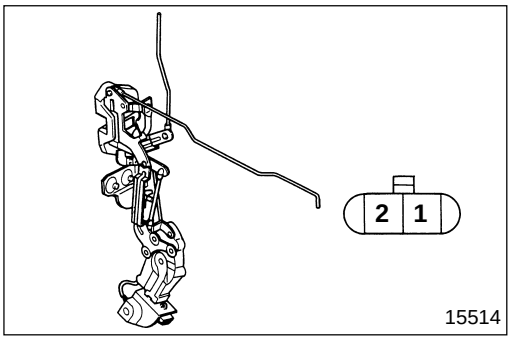
4 **Inspection of door lock actuator (driver's seat side)**

- Follow the table below to check for continuity and operation.

	①	②	③	④	⑤
LOCK		○—○		⊖	⊕
UNLOCK	○	○		⊕	⊖

○—○ : There is continuity between terminals.
⊕—⊖ : Indicates the terminals where 12 volts DC is to be applied

- If any fault is found, replace door lock actuator (driver's seat side) **4**. 🕮 Gr42



6 **Inspection of door lock actuator (passenger's seat side)**

- Follow the table below to check for operation.

	①	②
LOCK	⊖	⊕
UNLOCK	⊕	⊖

⊕—⊖ : Indicates the terminals where 12 volts DC is to be applied.

- If any fault is found, replace door lock actuator (passenger's seat side) **6**. 🕮 Gr42

SERVICE MANUAL

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of 1999 model Mitsubishi Fuso Truck FH Series.
Read this manual carefully as an aid to providing correct, efficient and fast maintenance.
Please note, however, that due to continuous improvements on the specifications, numbers and description for maintenance might change without prior notice.
If you have any question, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso dealer or distributor.

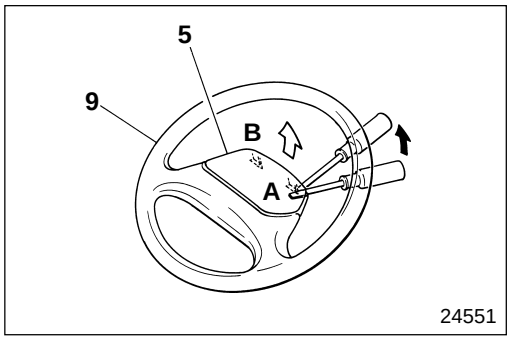
Lubricant

Location	Points of application	Specified lubricant	Quantity
12	Contact area between combination switch of cover assembly and horn contact	Wheel bearing grease [NLGI No.2 (Li soap)]	As required

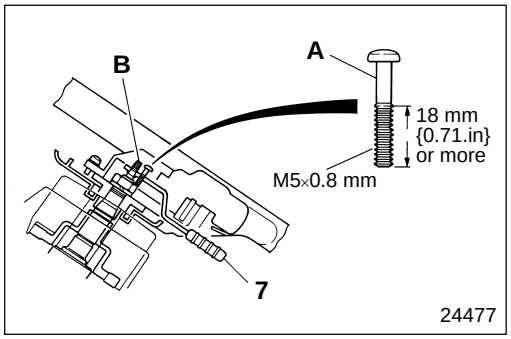
https://truckmanualshub.com/

◆ Service procedure



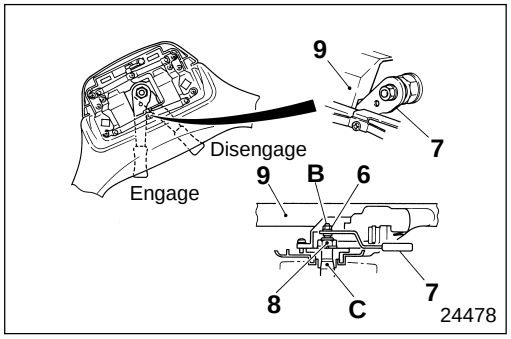
5 **Removal of horn pad**

- Insert a flat-tip screwdriver into the space between steering wheel assembly **9** and shoulder sections **A**, **B** of horn pad **5**, and disengage the latch by prying open the horn pad with the screwdriver until a clicking sound is produced.
- Insert a finger into the space behind horn pad **5** and remove the horn pad.



7 **Telescopic lever**

[Removal]
Secure screw **A** (M5×0.8 mm) in tapped hole in telescopic lever **7** and remove telescopic lever from telescopic shaft **B**.



[Installation]

- Make adjustment so that telescopic lever **7** positioned at the designated location applies the specified torque on telescopic shaft **B**.

CAUTION ⚠
Be careful not to damage the threads on the tip of telescopic shaft B.

C : Telescopic shaft assembly

https://truckmanualshub.com/

Start procedure

Install steering wheel assembly **9**. Using a long socket wrench, tighten nut **8** at specified torque 39 to 49 N·m {29 to 36 lbf.ft, 4 to 5 kgf·m}

Rotate telescopic shaft **B** counterclockwise with your fingers and check for looseness

Looseness found

No looseeness

Using a flat-blade screwdriver turn telescopic shaft **B** clockwise and drive it in until it hits lightly with a “clunk”, but do not turn it any further

CAUTION

Be careful not to over tighten or you will crush the end of the telescopic shaft, requiring replacement of telescopic shaft assembly C

Install telescopic lever **7** at a location that allows easy tightening, then tighten nut **6** until the telescopic lever will not slip

Tighten telescopic shaft **B** at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 lbf.ft, 0.7 to 0.8 kgf·m}. (Tighten telescopic bar **7** at torque 69 to 78 N {15 to 18 lbf, 7 to 8 kgf} at 100 mm {3.94 in.} from the center of steering wheel assembly **9**

To maintain lock, hold telescopic lever **7** clockwise, then loosen and remove lock nut **6**

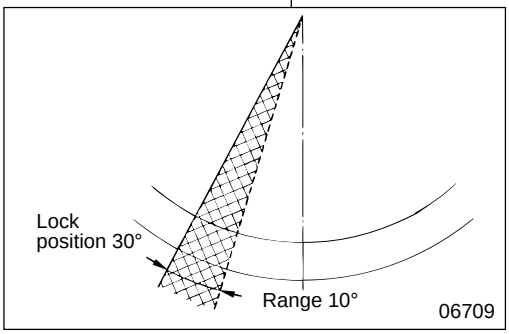
Remove telescopic lever **7**

NOTE

Remove telescopic lever 7 following the description under [Removal], taking care not to loosen telescopic shaft B.

Set telescopic lever **7** to specified lock position (within **10°** before the position at which telescopic lever contacts steering wheel assembly **9**).

Tighten nut **6** at specified torque 8.8 to 9.8 N·m {6.5 to 7.2 lbf.ft, 0.9 to 1.0 kgf·m}



When telescopic lever **7** is released, and telescopic shaft **B** is retightened at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 lbf.ft, 0.7 to 0.8 kgf·m}, the telescopic lever should lock in the 10° range this side of specified lock position 30°

Out of the range

Within the range

Jiggle steering wheel assembly **9** up and down and check for looseness

Looseness found

No looseness

Remove nut **6**

Procedure is completed

Remove telescopic lever **7**

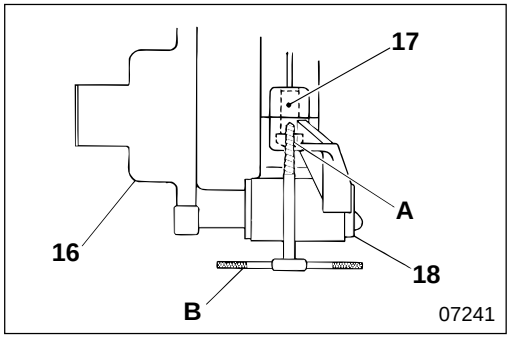
CAUTION

Be sure not to operate telescopic shaft B while steering wheel assembly 9 is removed.

NOTE

Be sure to assemble telescopic lever 7 only after steering wheel assembly 9 has been installed.

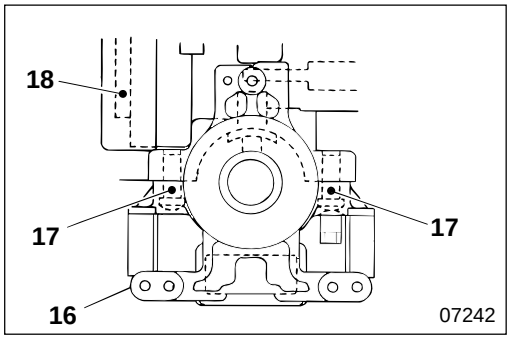
https://truckmanualshub.com/



17 **18** **Head cutting bolt, starter switch**

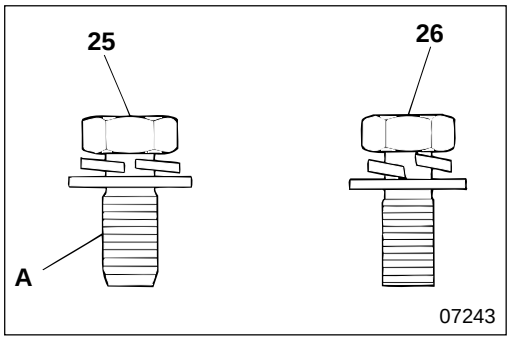
[Removal]

- After removing bracket **16**, drill a 5.5 to 6.0 mm {0.22 to 0.24 in.} hole 10 to 15 mm {0.39 to 0.59 in.} deep in surface **A** of head cutting bolt **17** for mounting starter switch **18**.
- Screw in screw extractor **B** counterclockwise, then remove head cutting bolt **17**.



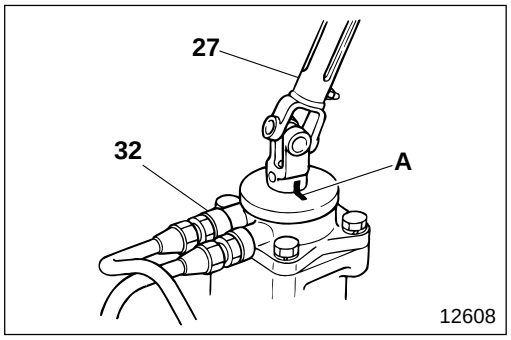
[Installation]

- With new head cutting bolt **17**, tighten starter switch **18** at specified torque to cut the head off the bolt.
- After installing bracket **16**, verify operation of the steering lock function of starter switch **18**.



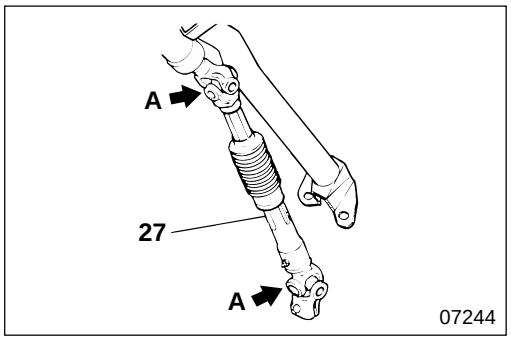
25 **26** **Installation of bolt**

- Bolts **25** and **26**, differ in shape. Do not mix them up when installing.
- Thread area **A** of bolt **25** is elliptical to facilitate grounding of the horn circuit.



27 **32** **Removal and Installation of steering column subassembly, and power steering booster**

Before removing steering column subassembly **27** or power steering booster **32**, be sure to make alignment mark **A**.



27 **Steering column subassembly**

When the spline of steering column subassembly **27** has been disconnected, align marks **A** on the yokes to face the same direction.

◆ Service procedure

1 Inspection of relay (Open type 4-pin)

- Follow the table below to check for continuity and operation.

	①	②	③	④
No current	○		○	
Current	⊕	○	⊖	○

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.

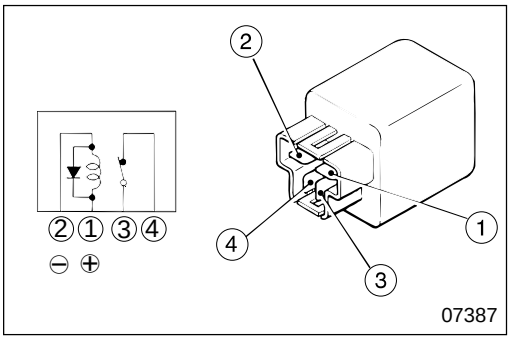
◆ Service procedure



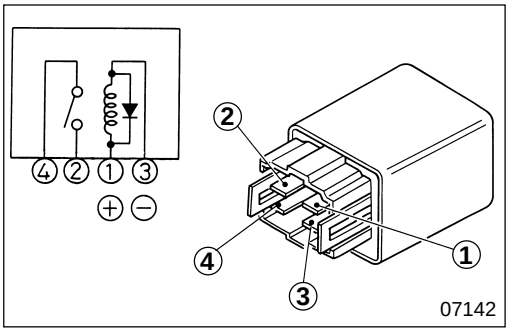
2 Inspection of relay (Close type 4-pin)

- Follow the table below to check for continuity and operation.

	①	②	③	④
No current	○—○			○—○
Current	⊕—⊖		◌----◌	

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.
◌----◌ : Indicates that continuity between the terminals is lost.

- If any fault is found, replace the relay.

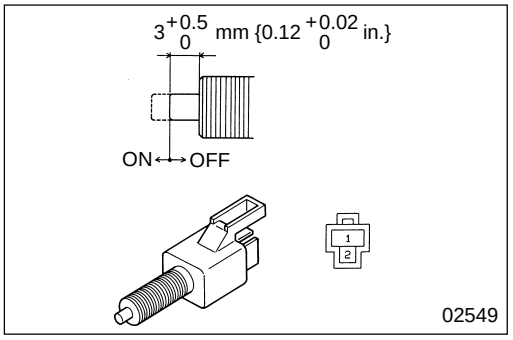


4 Inspection of relay (Open type 4-pin)

- Follow the table below to check for continuity and operation.

	①	②	③	④
No current	○—○			
Current	⊕	○	⊖	○

○—○ : There is continuity between terminals ○ and ○
⊕—○



9 Inspection of clutch switch

- Follow the table below to check for continuity.

	①	②
OFF		
ON	○—○	

○—○: There is continuity between terminals.

- If any fault is found, replace the clutch switch.

SERVICE MANUAL

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of 1998 model Mitsubishi Fuso Truck FH Series.
Read this manual carefully as an aid to providing correct, efficient and fast maintenance.
Please note, however, that due to continuous improvements on the specifications, numbers and description for maintenance might be changed without prior notice.
If you have any question, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso dealer or distributor.

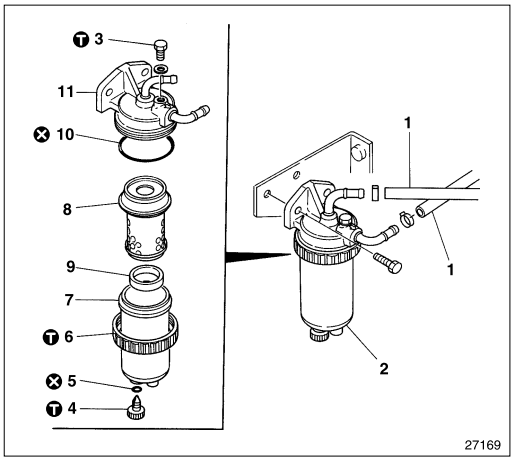
1998 MODEL CHANGES

Item	’98 Model	⇦	’97 Model
Gr 00 General • The vehicle identification number has changed.	See page 11 in this manual.		—
Gr 01 Maintenance Schedule • The brake is changed from an air over hydraulic brake type to a hydraulic brake type using the fluid pressure of the power steering system.	Gr 01 Maintenance schedule ’98 Minor change (Pub. No. TWME9502-201)		—
Gr 13 Fuel and Engine control • Water separator is changed from a dual type to a single type.	 27241		 27242



27169

● **Disassembly sequence**

1 Fuel feed hose
2 Water separator assembly
3 Air vent plug
4 Drain plug
5 O-ring
6 Ring nut
7 Case
8 Screen assembly
9 Water level ring
10 O-ring
11 Head

⊗ : Non-reusable parts

WARNING ⚠
- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any spilled diesel fuel because it can cause a fire.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

T Tightening torque Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Air vent plug	8 to 12 {5.8 to 8.7, 0.8 to 1.2}	—
4	Drain plug	3 to 4 {2.2 to 2.9, 0.3 to 0.4}	—
6	Ring nut	23 to 27 {17 to 20, 2.3 to 2.8}	—

https://truckmanualshub.com/

Item	’98 Model	⇦	’97 Model
• Air vent cock is added to fuel filter head.	**T 7.8 to 12 N·m {5.8 to 8.7 lbf·ft, 0.8 to 1.2 kgf·m}**  27991		**T 7.8 to 12 N·m {5.8 to 8.7 lbf·ft, 0.8 to 1.2 kgf·m}**  27306
• Injection pump drive is changed from an air compressor drive to an injection pump drive case.	 See page 12 to 15 in this manual. 27552		 27553
Gr 14 Cooling • Level marks and sight glasses have been added to the surge tank.	 27554		 27555
Gr 15 Intake and exhaust • The exhaust brake unit is changed from an air type to a vacuum type. (For details on the exhaust brake unit refer to Gr 35 Brake)	 27606		 27607

SERVICE MANUAL

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of 1997 model Mitsubishi Fuso Truck FH series.
Read this manual carefully as an aid to providing correct, efficient and fast maintenance.
Please note, however, that due to continuous improvements on the specifications, numbers and description for maintenance might be changed without prior notice.
If you have any question, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso dealer or distributor.

1997 MODEL CHANGES

Item	'97 Model ⇦	'96 Model
Gr 13 Fuel and engine control • Seals have been added to injection pumps to fit within the legal restriction. **CAUTION⚠** **Injection pumps should not be adjusted by anyone other than the specified ZEXEL service stations.**	 20779 *** : Sealed part**	 13817 *** : Sealed part**
Gr 15 Intake and exhaust • The intake silencer on the air inlet pipe assembly has been eliminated.	 20768 **6** Air inlet pipe assembly (without intake silencer)	 12684 **6** Air inlet pipe assembly (with intake silencer)
Gr 34 Rear suspension • The shock absorber and stabilizer on the rear suspension have been eliminated.	 20780	 **2** Shock absorber **3** Stabilizer 00495

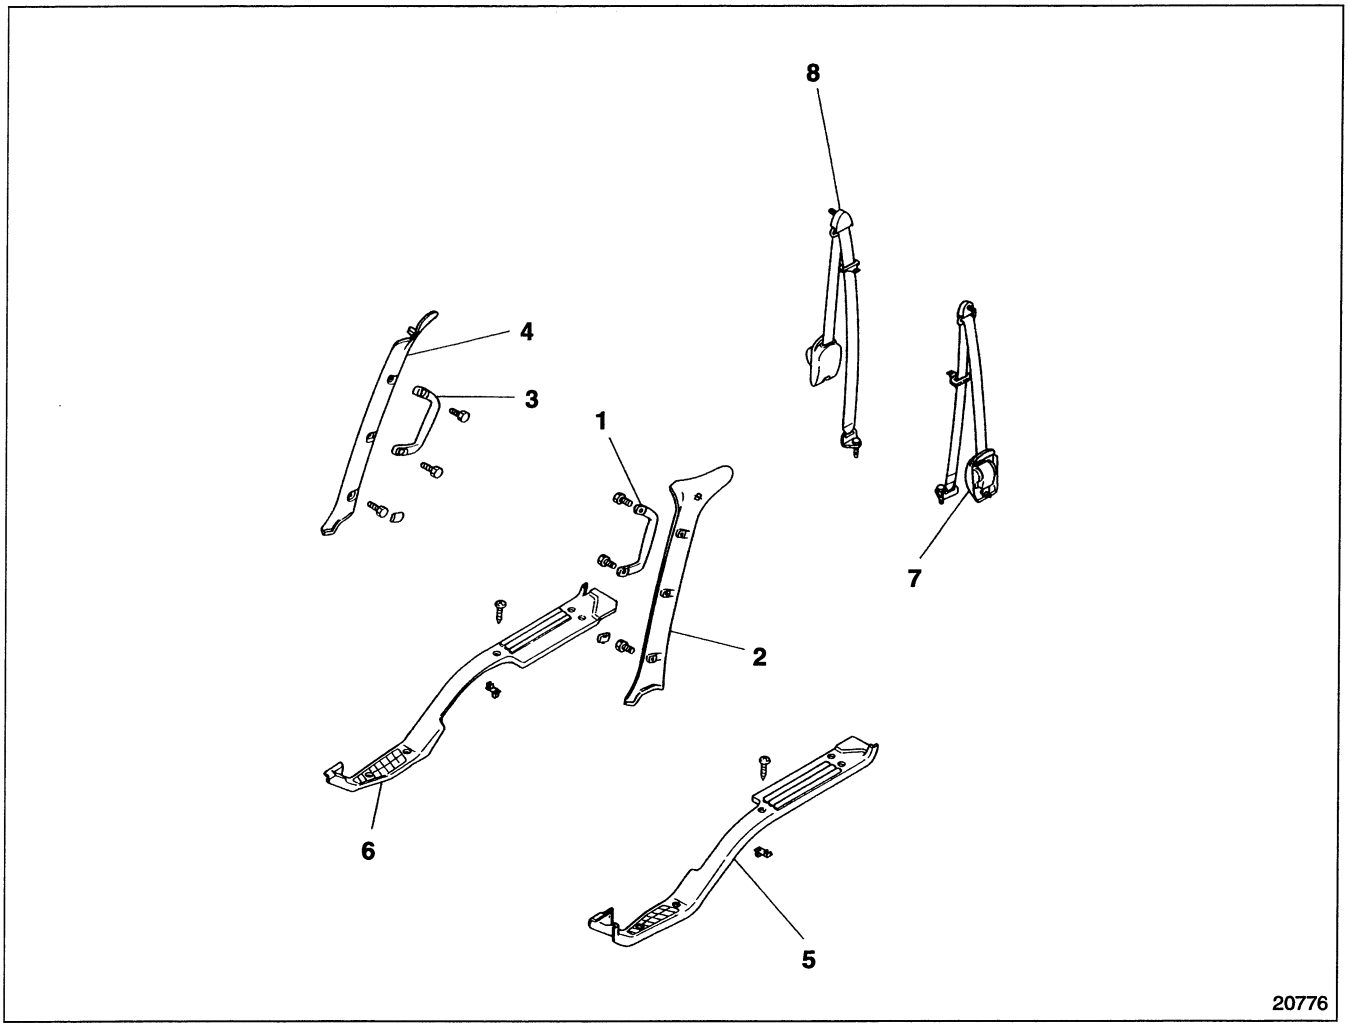
https://truckmanualshub.com/

Item	'97 Model ⇦	'96 Model
Gr 42 Cab • The trim inside the cab has been changed from the full trim type to the semi trim type.	See pages 4 to 5 in this manual	–
Gr 54 Electrical • The sub-starter switch and circuit have been eliminated.	The circuit now is the same as the engine starter circuit described in Gr 54 ('96 Model).	–
• The cold starter switch, cold starter 3-way magnetic valve (automatic transmission only), and cold start indicator lamp have been eliminated.	See pages 6 to 9 in this manual	

https://truckmanualshub.com/

CAB INTERIOR FITTING

Trim ('97 model)



● **Removal sequence**

1 Front pillar grip, LH
2 Front pillar trim, LH
3 Front pillar grip, RH
4 Front pillar trim, RH
5 Scuff plate, LH
6 Scuff plate, RH
7 Seat belt assembly, LH
8 Seat belt assembly, RH

CAUTION⚠

Do not disassemble seat belt assemblies 7, 8 because this might cause malfunction of the emergency locking reactor.

● **Installation sequence**

Follow the removal sequence in reverse.

MODEL CODING SYSTEM

Equipment Model Code

Equipment name	Model description	Code description
Engine		With turbocharger Stands for automobile Remodeling sequence } These are omitted in the Service Manual Version number Series number Stands for diesel engine No. of cylinders (6 : Six cylinders)
Clutch		Disc outer diameter Facing material (M : Cera-metallic) Loading capacity of major type (tonnage) Stands for clutch
Transmission		No. of forward speeds Meshing (S : Synchromesh, A : Automatic) Loading capacity of major type (tonnage) Stands for transmission
Propeller shaft		Loading capacity of major type (tonnage) Stands for propeller shaft
Reduction and differential		Teeth shape (H : hypoid gear) Loading capacity of major type (tonnage) Stands for reduction and differential

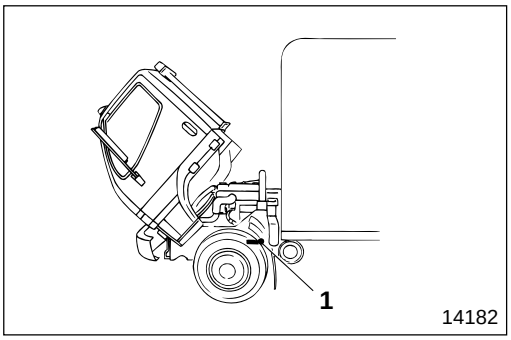
https://truckmanualshub.com/

POWER TRAIN TABLE

Model	Engine model	Clutch model	Transmission model	Propeller shaft	Rear axle model	Final reduction and gear ratio
FH211C, E, G, H, J G.V.W. 8160 kg {17995 lb}	6D34T2 175 HP/2900 rpm 325 lbf.ft/2000 rpm (SAE, Gross)	C5M33	M050S5 6.875/1.000	P4	R040T	D040H 4.111
		Torque converter (TC290-1.72)	M4A4 (Allison AT542) 3.454/1.000			

CHASSIS NUMBER AND ENGINE NUMBER

The serial numbers for chassis and engines are assigned to the respective vehicles and engines in manufacturing sequence: every vehicle and engine has its own numbers. These numbers are required for registration and incidental inspection of the vehicle. Please do not fail to mention these numbers to the dealers when ordering spare parts.



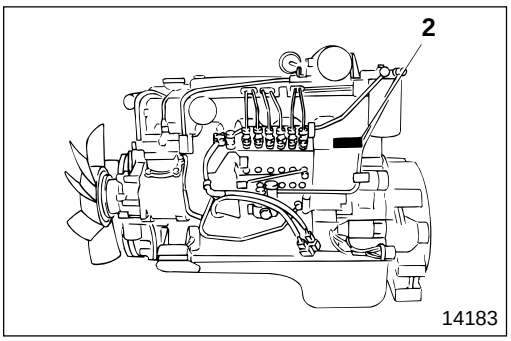
Chassis number

Chassis number **1** is punch-marked on the frame by the left-side front wheel.

Example : FH211C–□□□□□□

Vehicle model

Chassis number



Engine number

Engine number **2** is punch-marked on the left of the crankcase.

Example : 6D34–□□□□□□

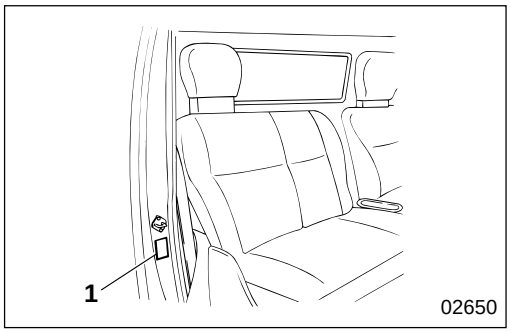
Engine number

Engine model

https://truckmanualshub.com/

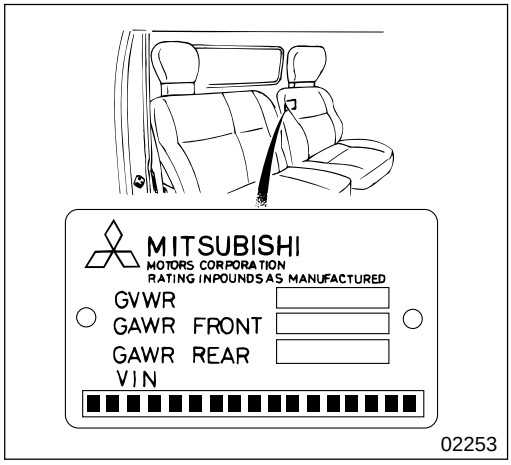
POWER TRAIN LABEL/VEHICLE IDENTIFICATION NUMBER

POWER TRAIN LABEL



Power train label **1** located in the position illustrated indicates the vehicle model, chassis number and information relevant to the vehicle's power transmission components.

VEHICLE IDENTIFICATION NUMBER



The vehicle identification number is punch-marked on the plate, which is attached in the position as illustrated.
The vehicle identification number consists of a 17-digit set of alphanumeric characters. Each digit represents the following specifications.

J W 6 C C C 1 G □ T L □ □ □ □ □ □

① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨ ⑩ ⑪ ⑫

①	Country	J :	Japan
②	Make	W :	Mitsubishi Fuso
③	Vehicle type	6 :	Incomplete Vehicle
④	Gross vehicle weight/Brake system	C :	7258 to 8845 kg {16001 to 19500 lbs} /Air over hydraulic
⑤	Line	C :	FH211
⑥	Series (Wheelbase)	C :	2.6 to 2.9 m {8.6 to 9.5 ft.}
		E :	3.2 to 3.5 m {10.5 to 11.5 ft.}
		G :	3.8 to 4.1 m {12.5 to 13.4 ft.}
		H :	4.1 to 4.4 m {13.5 to 14.4 ft.}
		J :	4.4 to 4.7 m {14.5 to 15.4 ft.}

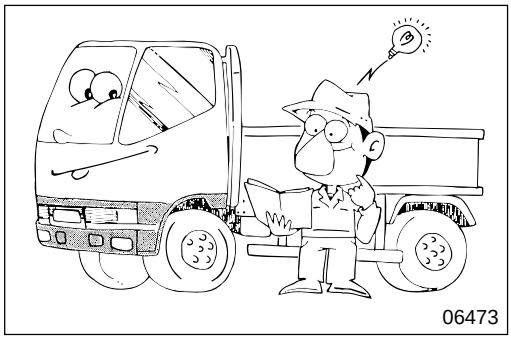
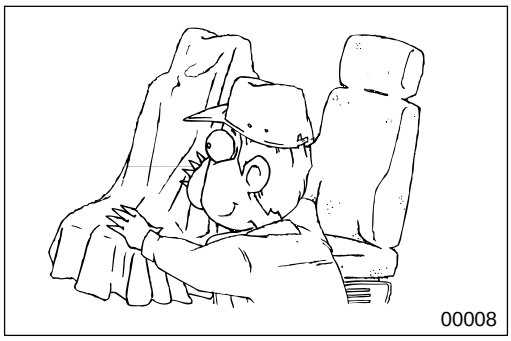
PRECAUTIONS FOR MAINTENANCE OPERATION

In order to determine the condition of the vehicle adequately, attend the vehicle beforehand to find and keep record of the accumulated mileage, operating condition, what the customer's demand is, and other information that may be necessary. Prepare the steps to be taken and perform efficient and wasteless maintenance procedure.

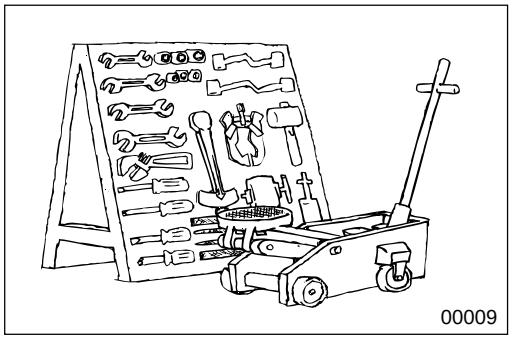


Determine where the fault exists and check for the cause to see whether removal or disassembly of the part is necessary. Then follow the procedure specified by this manual.



Perform maintenance work at a level area.
Prepare the following.

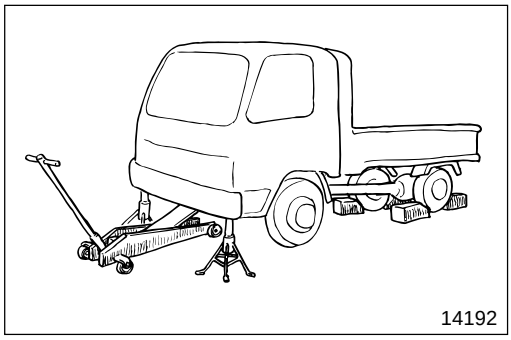
- To prevent the seats, upholstery, floor and bodywork from being spoiled or scratched, cover with workshop sheet cover(s).



- Prepare general and special tools necessary for the maintenance work.

WARNING⚠

Do not attempt to use tools other than special tools where use of special tools is specified in this manual. This will avoid injury or damage.



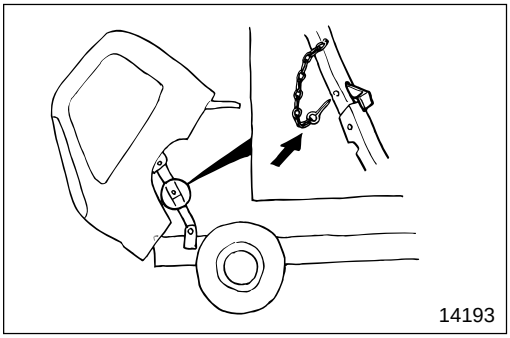
When jacking up the vehicle to work under the vehicle, carry out the following preparatory work:

- Chock the wheels on both sides.
- Jack up the vehicle using a garage jack.
- Support the frame on rigid racks.

WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

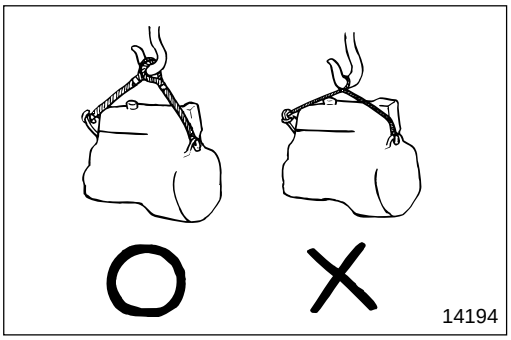
https://truckmanualshub.com/



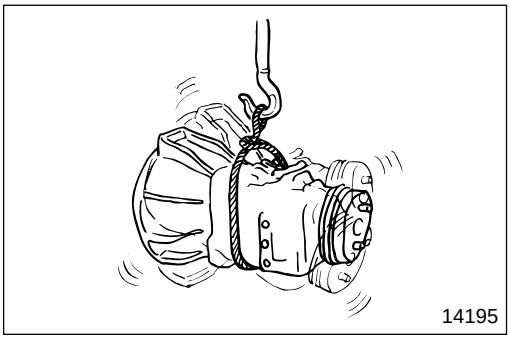
When tilting the cab, be sure to insert the safety pin into the cab stay so that the cab stay remains locked and is not released when the cab is tilted.

Pay special attention to safety when removing or installing heavy items such as engines, transmissions and axles.

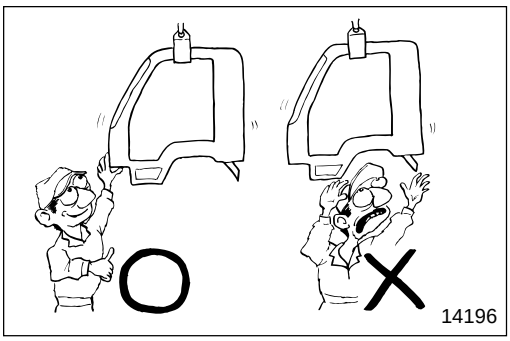
When lifting up heavy items using cables, pay special attention to the following points:



- Check the mass of the item to be lifted and use a cable capable of lifting that mass.



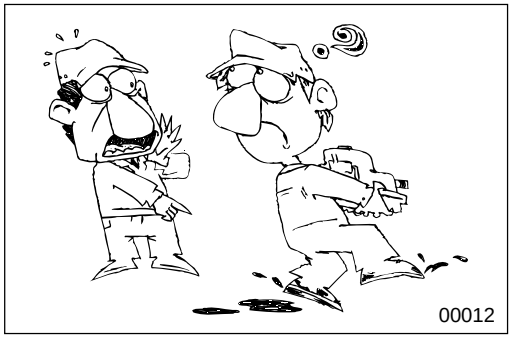
- If you do not have the specified lifting hanger, secure the item using cable taking the point-of-balance of the item into consideration.



- You must work in a position where you will not be injured even if the cable comes undone and the lifted item falls.

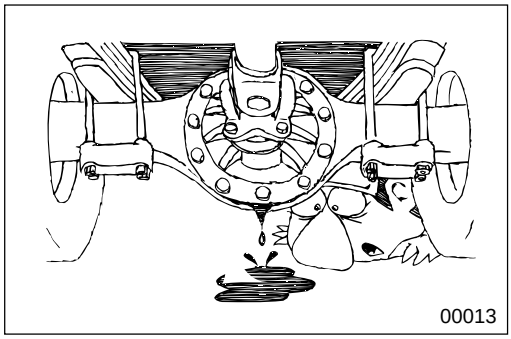
https://truckmanualshub.com/

PRECAUTIONS FOR MAINTENANCE OPERATION



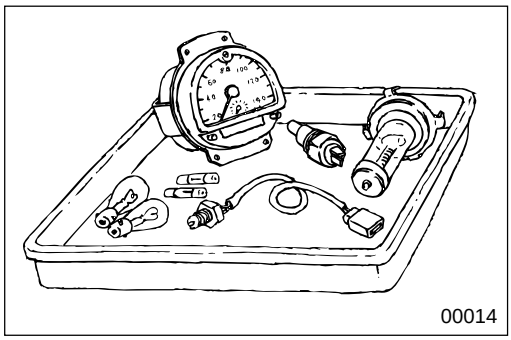
00012

Be particularly careful not to work in shoes that have oily soles and are slippery. When working as a team of two or more, arrange signals in advance and keep confirming safety. Be careful not to accidentally bump switches or levers.



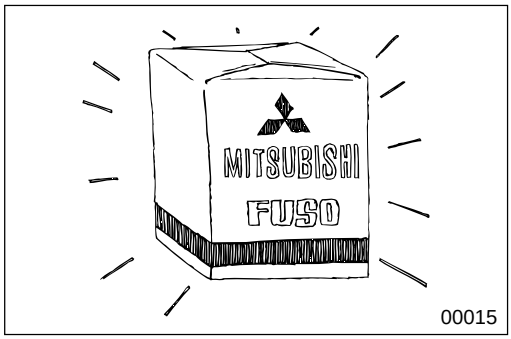
00013

Check for oil leakage before cleaning the area having the fault otherwise you might miss detecting the leakage.



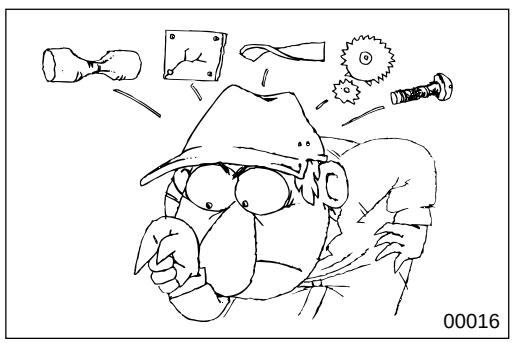
00014

Prepare replacement part(s) beforehand.



00015

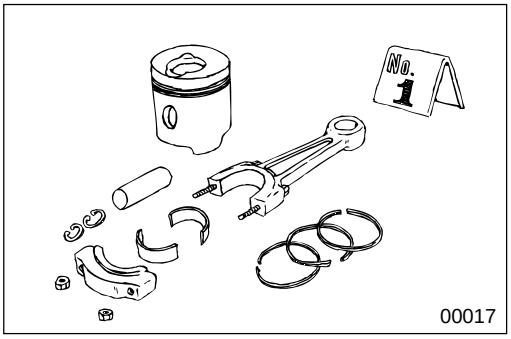
Replace oil seals, packing, O-rings and other rubber parts; gaskets and split pins with new parts whenever any of them has been removed. Use only genuine MITSUBISHI replacement parts.



00016

On disassembly, visually inspect all parts for wear and tear, cracks, damage, deformation, degradation, rust, corrosion, smoothness in rotation, fatigue, clogging and any other possible defect.

https://truckmanualshub.com/

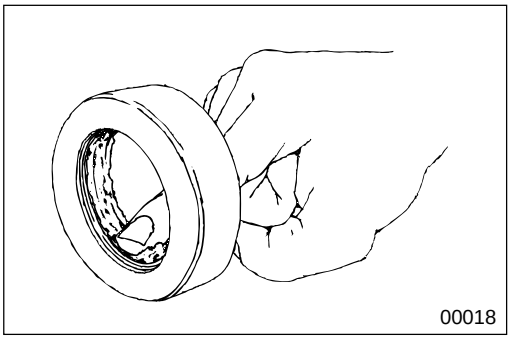


00017

Put alignment marks on part combinations before disassembly and arrange the disassembled parts neatly. This will help avoid mismating of the parts later.
Put the alignment marks, punch marks, etc. where performance and appearance will not be affected.
Cover the area left open after removal of parts to keep it free from dust.

CAUTION⚠

- **Take care to avoid mixing up numerous parts, similar parts, left and right, etc.**
- **Keep new parts for replacement and original (removed) parts separate.**

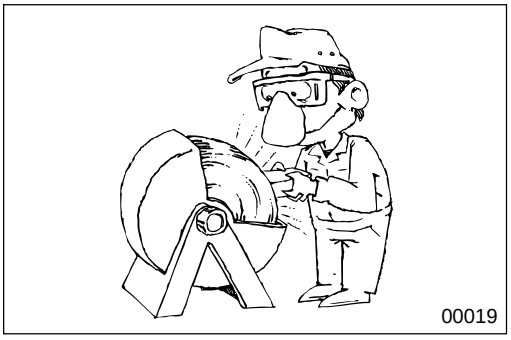


00018

Apply the specified oil or grease to U-packings, oil seals, dust seals and bearings during assembly.
Use only the specified oil, grease, etc. for lubricant, remove the excess immediately after application with a piece of waste, etc.

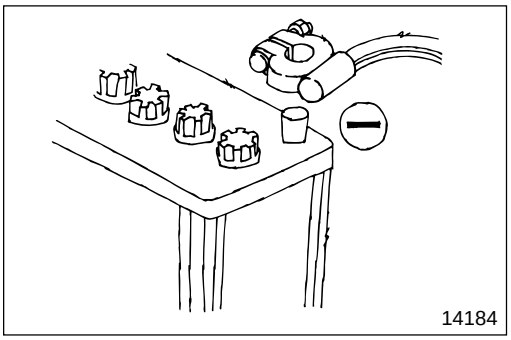
CAUTION⚠

When the specified lubricant, fluid and sealant is not available, you may use an equivalent.



00019

Wear goggles when using a grinder or welder. Pay full attention to safety by wearing gloves when necessary. Watch out for sharp edges, etc. that might injure your hands or fingers.



14184

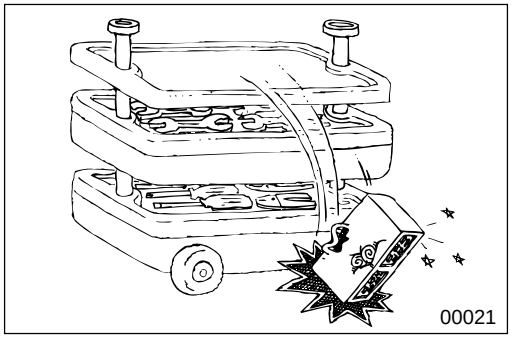
Before carrying out maintenance work on the electric system, disconnect the negative terminals of the batteries to prevent them from short-circuiting and burning-out.

CAUTION⚠

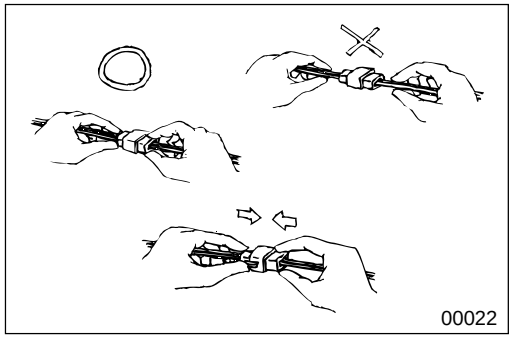
Be sure to turn starter and lighting switches, etc. off before disconnecting or connecting battery terminals, because the semiconductors can be damaged.

https://truckmanualshub.com/

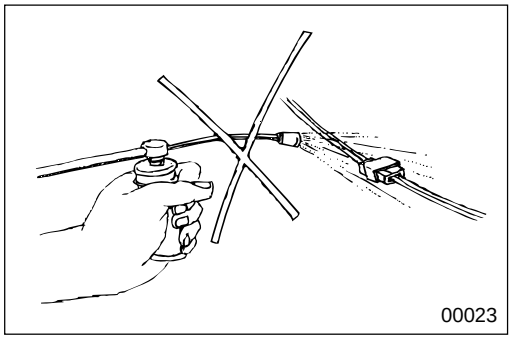
PRECAUTIONS FOR MAINTENANCE OPERATION



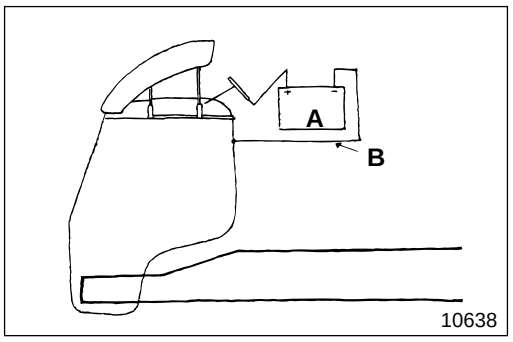
Take care when handling sensors, relays, etc. which are vulnerable to shock and heat. Do not attempt to remove the cover from, or apply paint to, the electronic control unit.



Pull the connector, and not the harness lead, to separate connectors. To separate a lock-type connector, first push toward arrow mark. To reconnect a lock-type connector, press the separated parts until they click together.



When washing the vehicle, cover the electric system parts and instruments with waterproof material beforehand (Cover with vinyl sheet or the like). Keep water away from harness wire connectors and sensors. If any of them should get wet, wipe them off immediately.

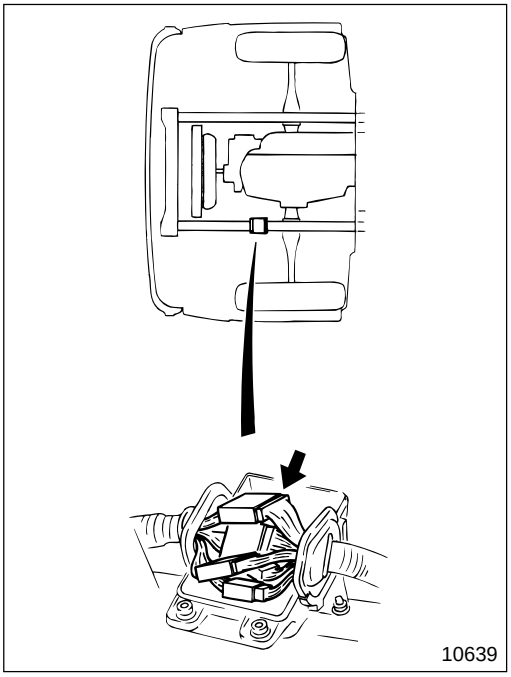


When using an electric welder, such electronic parts that are directly connected to the batteries might be damaged due to the flow of current from the welder that flows through the negative circuit. Parts that have switches might be subject to the same danger if the switches are left on. Therefore, do not fail to observe the following.

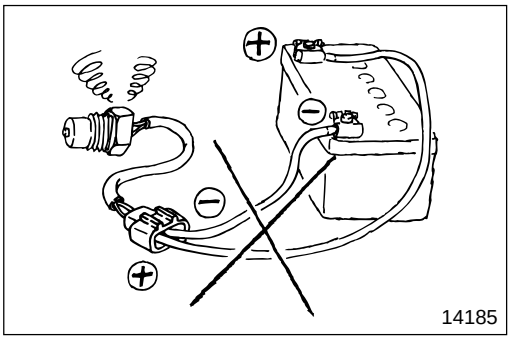
A : Welder

B : Connect the negative terminal of the welder as near as possible to the area that is to be welded.

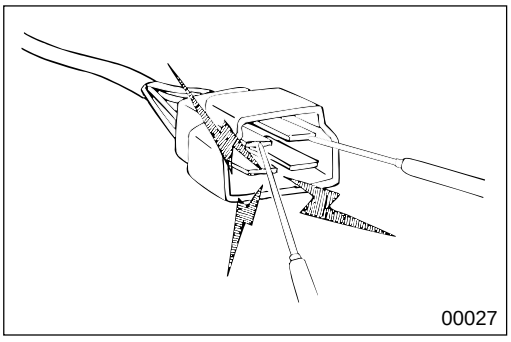
https://truckmanualshub.com/



- Disconnect the negative terminals of batteries.
- Disconnect connections between the cab harness wires and the chassis harness wires.

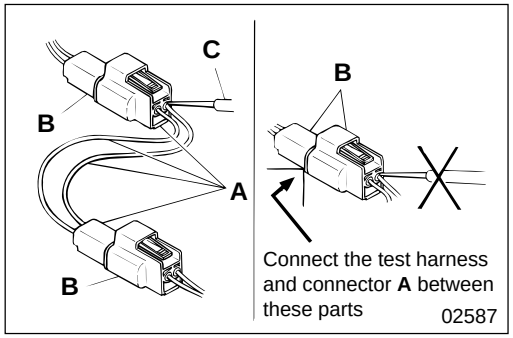


To apply voltage for testing, check that the positive and negative cables are connected properly, then increase voltage gradually from 0 volt. Do not apply voltage higher than the specified value.
In particular, pay close attention to the electronic control unit and sensors, since they are not always fed the battery voltage.



When using testers or the like for continuity tests, be careful not to allow test probes to touch the wrong terminals.

https://truckmanualshub.com/



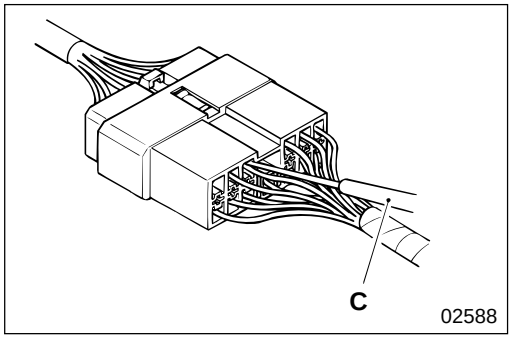
Measurement procedures using connectors

- **Test with connectors engaged (continuity through circuit obtained)**

  < Waterproof connector >

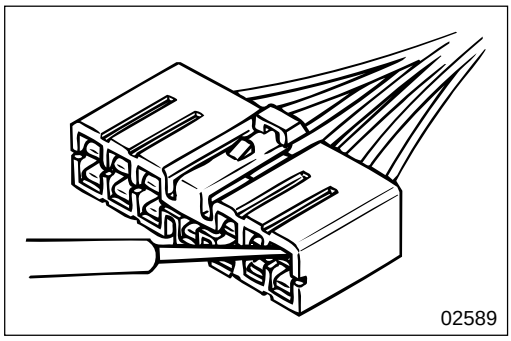
  Prepare a test harness and connectors **A**, then connect if between the two parts of harness **B** that is to be tested. Check the circuit by touching test probe **C** to the test connector.

  Never insert the test probe from the harness side of the waterproof connection, or waterproof performance might be diminished causing corrosion of the connector.



< Non-waterproof connector >

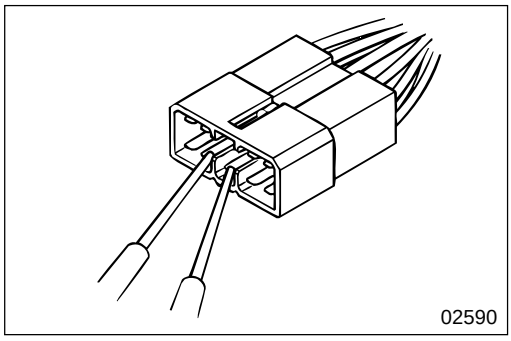
Insert test probe **C** from the harness side of the connector. Where control units, etc. have connectors that are too small to accept the test probe, do not force the test probe into them.



- **Test with connectors disengaged**

  Using female pins

  Insert a test probe into a terminal. However, do not force the probe into the terminal, or it will cause a poor contact.



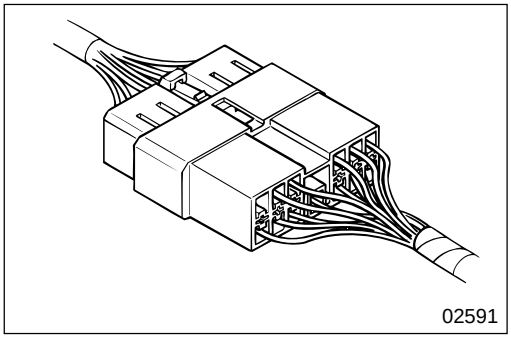
Using male pins

Touch the pins directly using test probes.

CAUTION⚠

Be sure that you do not short circuit the connector pins when you use the test probe because this could damage the internal circuit of the electronic control unit.

https://truckmanualshub.com/

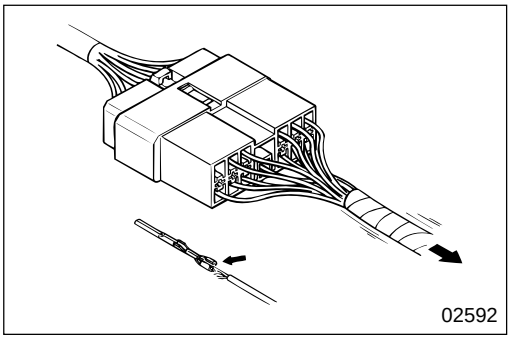


02591

Connector inspection procedures

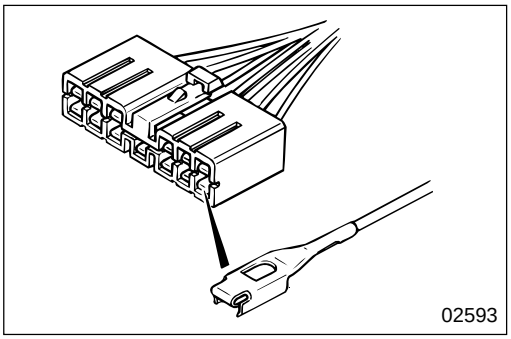
- **Visual inspection**

  Check for loose connection and poor engagement.



02592

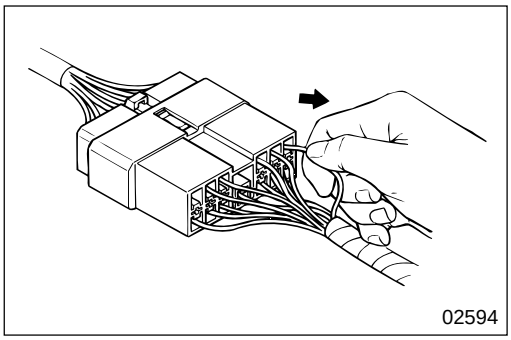
Check if harnesses are broken by pulling gently around the terminals.



02593

Check for a decrease in contact pressure between the male and female terminals.

Check for poor contact caused by connector pins having fallen out, rusted terminals or foreign particles.



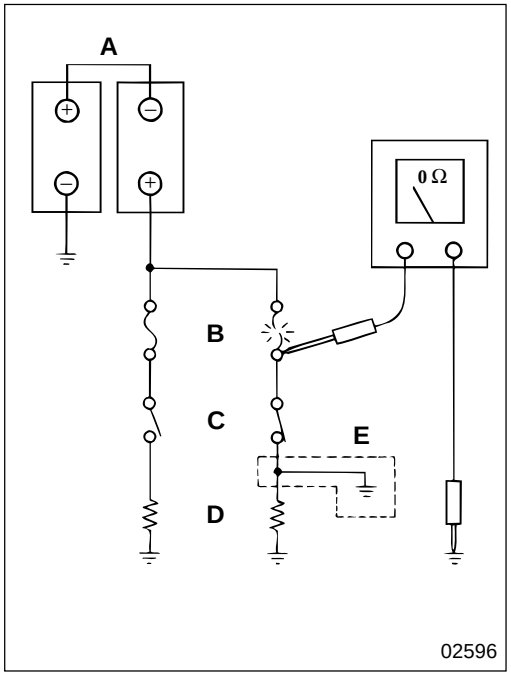
02594

- **Connector pin fall out inspection**

  Damaged connector pin stoppers can cause poor engagement of the terminals (male and female pins) even if the connector body is secured, and might cause some pins to fall out. Check if the pins have fallen out from the connector by pulling each harness gently.

https://truckmanualshub.com/

PRECAUTIONS FOR MAINTENANCE OPERATION



Inspection procedures for blown fuses

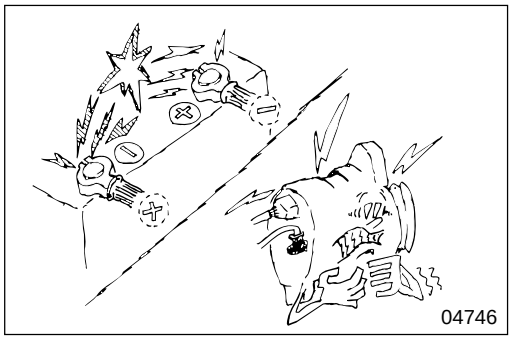
Remove fuse **B** and measure resistance between the loaded side of the fuse and ground.

Turn on all circuit switches (connected to the fuse). If the resistance value reading is approximately 0 Ω, a short has occurred between the switch and the loaded point. A value of other than zero may indicate that the fuse was blown by a temporary short but the short is no longer present.

The major causes of a short circuit are as follows:

- Harness stuck onto the vehicle body.
- Harness sheath damaged by friction or heat.
- Water in connectors or circuits.
- Mistakes (accidental short circuits)

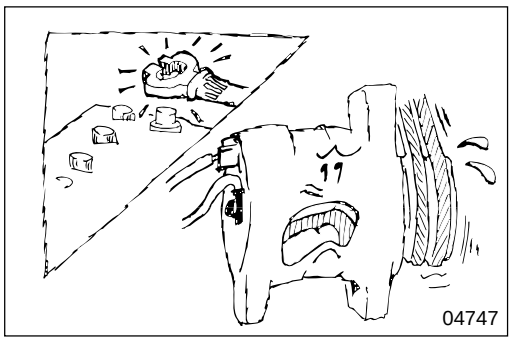
A : Battery
B : Fuse
C : Loaded switch
D : Load
E : Short circuit



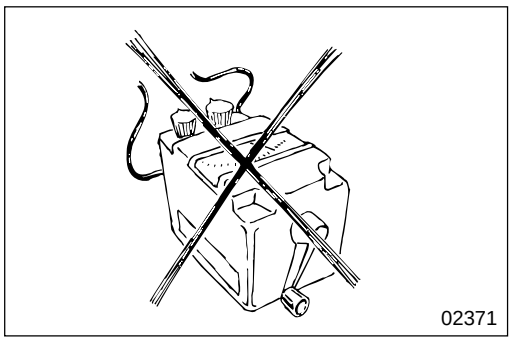
Precautions for handling alternator

When servicing the alternator, pay attention to the following :

- Do not connect the alternator with battery polarities reversed.
  If the alternator is connected with reversed polarities, a large current flow from the battery to the alternator occurs, and the diode or regulator might be damaged.

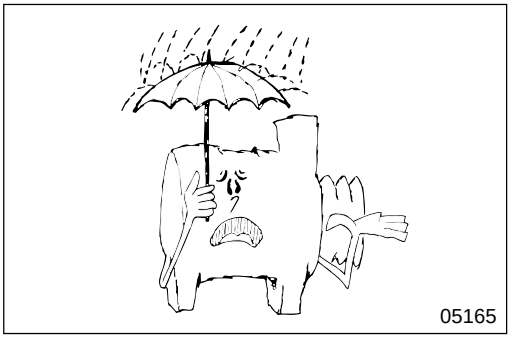


- While the engine is running, do not remove the battery terminals. If the battery terminals are removed at that time, a surge voltage is generated and the diode or regulator might be weakened.

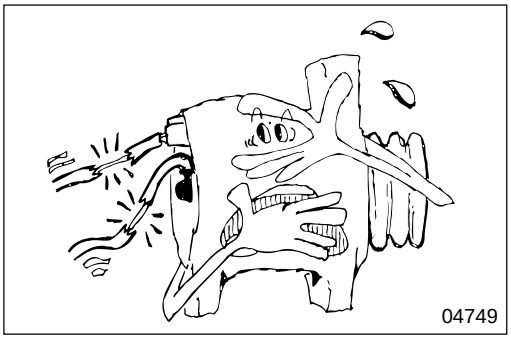


- Do not use a high-voltage tester such as a megger for inspection.
  If a high-voltage tester is used, the diode or regulator might be destroyed.

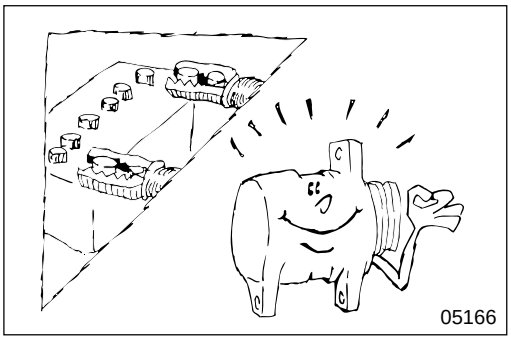
https://truckmanualshub.com/



- Do not splash water over the alternator.
  If water is directly splashed over the alternator, individual components will be short-circuited and might be destroyed.

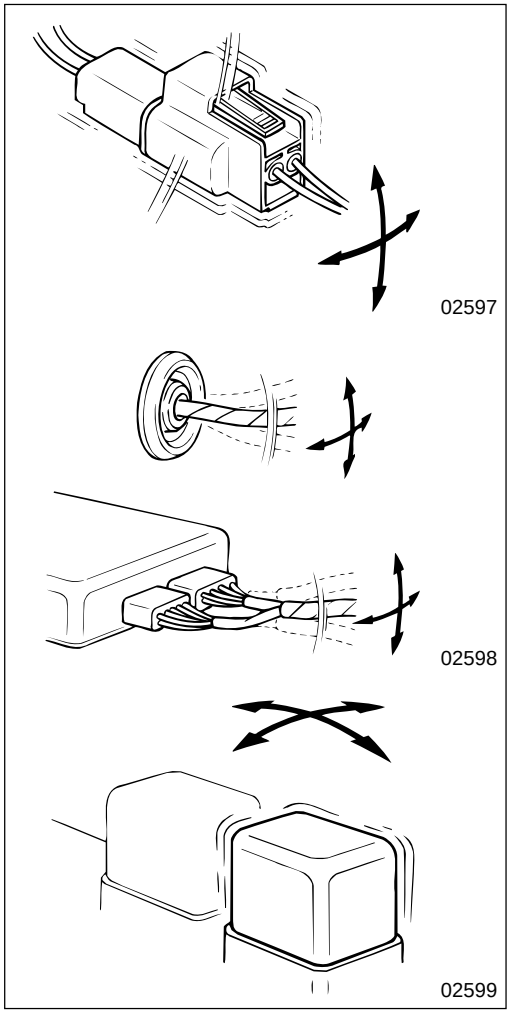


- Do not short-circuit terminal B and terminal L while running the alternator.
  If the terminals are short-circuited while the alternator is running, the diode trio might be destroyed.



- Disconnect the battery terminals before quick-charging the battery. Quick-charging without disconnecting the battery terminals might damage the diode or regulator.

https://truckmanualshub.com/



Measures for temporary faults

Temporary faults often occur under certain conditions. So identifying those conditions helps to find possible causes. To find the conditions under which temporary faults occurred, you need to reproduce the faults after interviewing customers in detail about actual driving conditions, weather, frequency of occurence and fault phenomena.
Then determine if the faults were caused by vibration, temperature or other possible elements depending on the actual conditions identified.
If vibration is suspected as a possible cause, inspect individual connectors as follows to check if the fault will occur:

- Shake the connector gently in all four directions of the arrows as illustrated.
- Shake the wiring harness gently in all four directions of the arrows as illustrated.
- Wiggle each sensor or piece of equipment by hand.
- Gently shake the wiring harnesses near movable parts such as suspensions.

The inspection subjects include possible causes related to the diagnosis code outputs and faults, as well as the connectors and other parts in the inspection procedure.

https://truckmanualshub.com/

https://truckmanualshub.com/

TABLE OF STANDARD TIGHTENING TORQUES

- Use specified bolts and nuts and tighten them at specified torques according to the following table, unless otherwise specified.
- Threads and contact seats shall be dry.
- Where there is a difference in strength classification between the nut and bolt (or stud bolt), the torque specified for the bolt shall apply.

Hex-head Bolt and Stud Bolt

Unit : N·m {lbf.ft, kgf·m}

Strength classification	4 T		7 T		8 T	
Repre-sentation / Diameter symbol	 (Stud)		 (Stud)		 (Stud)

MAINTENANCE SCHEDULE

HOW TO READ THE MAINTENANCE SCHEDULE TABLES 01- 2

MAINTENANCE SCHEDULE TABLES 01- 3

MAINTENANCE OPERATIONS 01- 7
- Replacement of Oil Filter 01- 7
- Replacement of Fuel Filter 01- 8
- Draining of Water Separator Condensation 01- 9
- Cleaning of Fuel Feed Pump Gauze Filter 01- 9
- Bleeding of Air from Fuel Line 01- 10
- Adjustment of V-Belt Tension 01- 11
- Cleaning and Replacement of Air Cleaner Element 01- 13
- Inspection of Clutch Pedal Free Play 01- 14
- Tire 01- 14
- Inspection of Brake Pedal Free Play 01- 20
- Inspection of Clearance between Brake Pedal and Floor Panel 01- 20
- Inspection of Brake Lining Thickness 01- 21
- Battery 01- 21
- Fuse 01- 24

LUBRICATION 01- 26
- Engine Oil 01- 27
- Clutch Fluid (Brake Fluid) 01- 29
- Manual Transmission Gear Oil 01- 31
- Automatic Transmission Fluid and Oil Filter 01- 32
- Rear Axle Gear Oil 01- 35
- Power Steering Fluid 01- 36
- Brake Fluid 01- 38
- Greasing Various Areas of Chassis 01- 42

HOW TO READ THE MAINTENANCE SCHEDULE TABLES

Example Table :

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.
*2 : 60000 km/36000 miles or 12 months, whichever occurs first.
Ⓔ : Exhaust emission items
Ⓝ : Noise control items

Inspection and maintenance (1)		Time of inspection and maintenance (2)					Working procedures (3)	Remarks (4)
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Inspection interval: Every 10000 km/6000 miles	Inspection interval: Every 30000 km/18000 miles *1	Inspection interval: Every 60000 km/36000 miles *2		
ENGINE								
1	Air, fuel, oil or coolant leakage from engine			×			Check engine for air, fuel, oil and coolant leakage	Gr 11, 12, 13, 14
2	Ⓔ Ⓝ Engine starting performance, speed, noise and exhaust gas conditions			×			Check for engine starting performance, idling speed, abnormal engine noise, dark smoke or other abnormal exhaust gas during idling and acceleration. Check engine speed on tachometer	Gr 11, 13, 15
3	Retightening of inlet and exhaust manifold bolts					×	Check manifold bolts for looseness	Gr 15
4	Ⓔ Valve clearance		×			×	Check valve clearance with feeler	Gr 11
5				Every 20000 km /12000 miles			Replace element	

(1) This column contains the maintenance and inspection items.
(2) The periods between inspection and service are based on the assumption that the vehicle will be driven approximately 60000 kilometers (36000 miles) per year.
Inspections which must be made are indicated by an "×" or by the appropriate period between servicing.
(3) This column provides a simplified explanation of the operational procedures involved for each inspection or maintenance item.
(4) The Gr. No. refers to the "group number" in this vehicle Service Manual. For visual checks and simple inspections, see the sections labelled "Working Procedures".

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.
*2 : 60000 km/36000 miles or 12 months, whichever occurs first.
Ⓔ : Exhaust emission items
Ⓝ : Noise control items

	Inspection and maintenance	Time of inspection and maintenance					Working procedures	Remarks
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Inspection interval: Every 10000 km/6000 miles	Inspection interval: Every 30000 km/18000 miles *1	Inspection interval: Every 60000 km/36000 miles *2		
ENGINE								
1	Air, fuel, oil or coolant leakage from engine			×			Check engine for air, fuel, oil and coolant leakage	Gr 11, 12, 13, 14
2	Ⓔ Ⓝ Engine starting performance, speed, noise and exhaust gas conditions			×			Check for engine starting performance, idling speed, abnormal engine noise, dark smoke or other abnormal exhaust gas during idling and acceleration. Check engine speed on tachometer	Gr 11, 13, 15
3	Retightening of inlet and exhaust manifold bolts					×	Check manifold bolts for looseness	Gr 15
4	Ⓔ Valve clearance		×			×	Check valve clearance with feeler gauge	Gr 11
5	Ⓔ Oil filter replacement			Every 20000 km/12000 miles On new vehicles, replace the first filter at 10000 km/6000 miles			Replace element	Gr 12
6	Ⓔ Ⓝ Check injection nozzles			Every 90000 km/54000 miles			Check injection nozzles	Gr 13
7	Ⓔ Ⓝ Fuel injection pressure and spray pattern of injection nozzles			Every 250000 km/150000 miles			Remove injection nozzle and check with nozzle tester	Gr 13
8	Ⓔ Ⓝ Fuel injection timing					×	Turn crankshaft in normal running direction and check injection starting timing of No.1 cylinder	Gr 13
9	Ⓔ Cleaning fuel feed pump filter					×	Remove connector from fuel feed pump inlet and clean filter inside connector with gas oil	
10	Ⓔ Fuel filter replacement				×		Replace element	Gr 13
11	Ⓔ Water separator water discharge	×					Loosen water separator drain plug to discharge water	Gr 13
12	Ⓔ Removal of water and sediment from fuel tank			Every 24 months			Remove fuel tank drain plug and remove water and sediment	Gr 13
13	Retightening of fuel tank bracket bolts			×			Check mounting bolts for looseness and retighten to a torque of 34 to 54 N·m {25 to 40 lbf.ft, 3.5 to 5.5 kgf·m}	Gr 13
14	Ⓔ Replacing fuel line in engine compartment			Every 24 months			Replace fuel line in engine compartment	Gr 13
15	Ⓔ Check fuel line outside of engine compartment			Every 24 months			Check fuel line outside of engine compartment. Replace if necessary	Gr 13
16	Ⓔ Ⓝ V-belt tension and damage	×		×			Press midpoint of V-belt firmly with your finger to measure deflection and check for belt damage	Gr 14
17	Coolant level and leakage from cooling system	×					Check coolant level and if level is low, check for coolant leakage	Gr 14
18	Coolant replacement			Every 24 months			Replace with new coolant	Gr 14
19	Installed condition of surge tank cap			×			Check surge tank cap for sealing and mounting condition	Gr 14
20	Ⓔ Cooling system hose clamp position and clamping condition			×			Check clamp position and clamping condition of cooling system hose	Gr 14
21	Ⓔ Turbocharger rotor play			Every 250000 km/150000 miles			Check whether rotor has excessive end play using a dial indicator	Gr 15
22	Ⓔ Ⓝ Cleaning of air cleaner	×					Check air cleaner dust indicator. If the red signal appears, clean the element	Gr 15
23	Ⓔ Ⓝ Air cleaner element replacement			Every 50000 km/30000 miles			Replace element	Gr 15
24	Ⓔ Ⓝ Damage of inlet system, looseness of clamp and loss of parts			×			Check inlet system for damage and check that all parts are installed	Gr 15
25	Ⓝ Looseness and damage of exhaust pipe and muffler			×			Check installation and connections for looseness and damage, check for exhaust gas leakage	Gr 15
26	Starter function					×	Operate starter switch and check the switch functions properly	Gr 54
27	Alternator function					×	Check function with a circuit tester	Gr 54

https://truckmanualshub.com/

MAINTENANCE SCHEDULE TABLES

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.
*2 : 60000 km/36000 miles or 12 months, whichever occurs first.
Ⓔ : Exhaust emission items
Ⓝ : Noise control items

Inspection and maintenance		Time of inspection and maintenance					Working procedures	Remarks
				Inspection interval				
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Every 10000 km/ 6000 miles	Every 30000 km/ 18000 miles *1	Every 60000 km/ 36000 miles *2		
POWER TRAIN								
28	Oil leakage from power train			×			Check power train for oil leakage	
29	Clutch pedal play			×			Press clutch lightly and check that play is adequate	Gr 21
30	Clutch function			×			(1) Press the clutch pedal to check for unusual noise or stiffness. Also check if gearshift engages quietly (2) Check the clutch does not slip and engages smoothly	Gr 21
31	Manual transmission gearshift control looseness				×		In NEUTRAL position, check shift lever for looseness. With shift lever in each gear position, check engagement condition and degree of looseness. Also check if control cable is damaged	Gr 22
32	Automatic transmission range selector linkage and throttle (modulator) linkage condition				×		Shifting to each shift range must be done firmly and securely	Gr 23
33	Propeller shaft couplings and bearings looseness		×	×			(1) Check flange yoke bolt and center bearing attaching bolt for looseness (2) Turn propeller shaft manually to check for spline looseness (3) Check looseness between spider and needle roller bearing	Gr 25
FRONT AND REAR AXLES								
34	Axle shaft torsion and cracks					×	Remove axle shaft and check for torsion, bending, and cracks	Gr 27
35	Front wheel hub bearing looseness				×		With front axle jacked up, move the wheel up and down holding the top and bottom of the tire to check for bearing looseness	Gr 26
36	Rear wheel hub bearing damage					×	Disassemble rear wheel and check for hub bearing wear and damage	Gr 27
37	Retightening wheel nuts		×	×			Check wheel nuts for looseness after replacing tires, also after 1000 km/600 miles	Gr 31
38	Disc wheel damage			×			Check disc wheel for corrosion, deformation and cracks	Gr 31
39	Tire inflation pressure, cracking, tread groove depth, abnormal wear, etc.	×		×			(1) Measure inflation pressure with tire gauge, and check that tire tread groove is deep enough (2) Check tire tread and side walls for cracks, damage, uneven wear, stepped wear and other abnormal wear	Gr 31
40	Tire rotation			×			Rotate all tires	Gr 31
SUSPENSION SYSTEM								
41	Looseness, play and damage of suspension system				×		Check suspension system for looseness, play and damage	Gr 33, 34
42	Damage and looseness of leaf springs	×			×		Check leaf springs for damage and looseness	Gr 33, 34
43	Retightening U-bolts		×		×		Check U-bolts for looseness	Gr 33, 34
44	Oil leakage and damage of shock absorbers				×		Check for oil leakage and damage of cylinder, etc.	Gr 33, 34
BRAKING SYSTEM								
45	Fluid leakage from braking system and power steering system			×			Check braking system and power steering system for fluid leakage	Gr 35, 37
46	Looseness, play and damage of braking system parts			×			Check braking system parts for looseness, play and damage	Gr 35
47	Brake pedal play and stroke	×		×			Depress the brake pedal lightly and check that play is not as specified. While the engine is idling, fully depress the brake pedal and check the distance between pedal and floor	Gr 35
48	Brake booster (hydraulic booster) emergency pump	×					With the engine stopped, depress the brake pedal and check the operating sound of the emergency pump	Gr 35

https://truckmanualshub.com/

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.
*2 : 60000 km/36000 miles or 12 months, whichever occurs first.
Ⓔ : Exhaust emission items
Ⓝ : Noise control items

Inspection and maintenance		Time of inspection and maintenance					Working procedures	Remarks
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Inspection interval: Every 10000 km/6000 miles	Inspection interval: Every 30000 km/18000 miles *1	Inspection interval: Every 60000 km/36000 miles *2		
49	Service brake effectiveness	×		×			While driving the vehicle at low speed, check braking effect and check for uneven braking	Gr 35
50	Operation of exhaust brake	×		×			Check exhaust brake operation	Gr 35
51	Exhaust brake vacuum chamber diaphragm replacement			Every 12 months			Check exhaust brake vacuum chamber diaphragm; replace if necessary	Gr 35
52	Brake shoe clearance				×		Measure clearance with feeler gauge	Gr 35
53	Brake lining wear				×		Check lining wear	Gr 35
54	Brake drum wear					×	Disassemble and check drum for wear, cracks and damage	Gr 35
55	Parking brake effectiveness			×			On a slope, check that vehicle can be held stationary	Gr 36
56	Parking brake lever stroke	×		×			With lever fully pulled, check that lever is locked completely and that there is allowance in pulling stroke	Gr 36
57	Parking brake drum and lining wear					×	Disassemble and check drum for wear, cracks and damage and check lining for wear	Gr 36
58	Wheel cylinder piston cup and dust seal replacement			Every 12 months			Check wheel cylinder piston cup and dust seal; replace if necessary	Gr 35
59	Brake hose replacement			Every 12 months			Check brake hose; replace if necessary	Gr 35
60	Brake fluid reservoir tank tube replacement			Every 24 months			Check and replace brake fluid reservoir tank tube	Gr 35
STEERING SYSTEM								
61	Fluid leakage from steering system			×			Check steering system for fluid leakage	Gr 37
62	Steering wheel play	×		×			Turn steering wheel right and left to measure play at steering wheel rim. Measure while engine is running	Gr 37
63	Steering operating condition	×		×			Check steering wheel to see if it vibrates, pulls to one side or requires unusual steering effort	Gr 37
64	Looseness and play of steering system (including hoses and pipes)			×			(1) Check steering system for looseness and play (2) Check power steering hoses and pipes for looseness	Gr 37
65	Wheel alignment					×	Measure toe-in, camber, caster and kingpin inclination angles	Gr 26
66	Right and left turning angles and power steering function					×	Check that stopper bolt is sufficiently tight, without damage, and that steering linkage operates smoothly until blocked by stopper bolt. Also check that steering wheel does not make contact with other parts	Gr 26
67	Power steering booster and oil pump internal rubber parts replacement			Every 48 months			Replace internal rubber parts	Gr 37
68	Power steering hose replacement			Every 48 months			Replace power steering hose	Gr 37
CAB AND FRAME								
69	Looseness and damage of chassis and body			×			(1) Check frame, cross members and other parts for loose rivets (2) Also check for body damage and loose mounting bolts	Gr 41, 42
70	Heater and defroster operation			×			Check operation and installation of defroster	Gr 55
71	Reflection of rearview mirrors and reflectors	×					Check for reflecting condition, stains and damage	Gr 42
72	Door lock function			×			Check door lock mechanism functions properly	Gr 42
73	Seat belt mounting condition			×			Check seat belt for damage, buckle and retracting function and mounting condition	Gr 42
ELECTRICAL SYSTEM								
74	Looseness and damage of electrical wiring and connections			×			Check wiring, connectors and battery terminals for looseness and corrosion	Gr 54

*2 : 60000 km/36000 miles or 12 months, whichever occurs first.
Ⓔ : Exhaust emission items
Ⓝ : Noise control items

Inspection and maintenance		Time of inspection and maintenance					Working procedures	Remarks
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Inspection interval: Every 10000 km/6000 miles	Inspection interval: Every 30000 km/18000 miles *1	Inspection interval: Every 60000 km/36000 miles *2		
75	Battery electrolyte level and specific gravity			Every 20000 km/12000 miles			(1) Check electrolyte level (2) Measure electrolyte specific gravity with hydrometer	Gr 54
76	Operation and damage of lighting system	×		×			Check operation, damage and installation of each lighting unit	Gr 54
77	Operation of horn and turn signal lamps	×		×			Check operation, damage and mounting condition. Also check turn signal lamps are operated by turn signal switch	Gr 54
78	Operation and fluid level of windshield wiper and washer	×		×			Check operation, damage and mounting condition. Check if fluid level in washer tank is okay	Gr 42
79	Gauges and pilot lamps function	×		×			Check function of gauges and pilot lamps	Gr 54
80	Switch function					×	Check operation, damage and installation of each switch	Gr 54
OTHER								
81	Road test of vehicle			×			Drive the vehicle to check for overall vehicle operating condition	

https://truckmanualshub.com/

This section explains simple maintenance procedures. See the relevant Group in this manual for further details.

Replacement of Oil Filter

Lubricant

Location	Points of application	Specified lubricant	Quantity
2	Inside oil filter	Engine oil	Approximately 1 L {1.1 qts}
	Gasket area of oil filter with thin application	Engine oil	As required

Special tools

Unit : mm {in.}

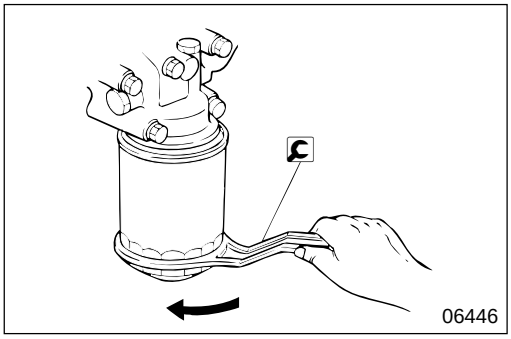
Location	Tool name and shape	Part No.	Application
2	Oil filter wrench  06478	MH061587	Removal of oil filter

WARNING

- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**

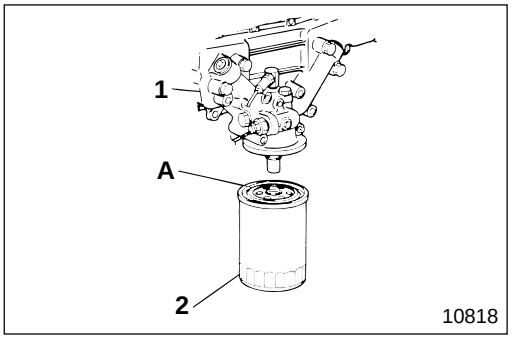
CAUTION

Take care not to spill engine oil on the V-belts, because this would cause them to slip, reducing service life.



06446

[Removal]



10818

[Installation]

- Clean the surface of oil cooler body **1** that makes contact with oil filter **2**.
- Apply engine oil thinly and evenly to gasket area **A** of oil filter **2**.
- Screw oil filter **2** into oil cooler body **1** until gasket area **A** sits on the body. From this position, tighten further by rotating by three quarters of a turn.
- After installation, run the engine and check that there is no oil leakage from gasket area **A**.
- Check the oil level and if it is low, top it up.

https://truckmanualshub.com/

Replacement of Fuel Filter

Lubricant

Location	Points of application	Specified lubricant	Quantity
2	Gasket contact surfaces of fuel filter and fuel filter head	Engine oil	As required

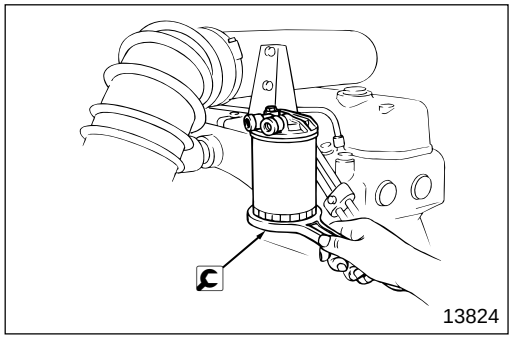
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
2	Filter wrench  01882	MH061572	Removal of fuel filter

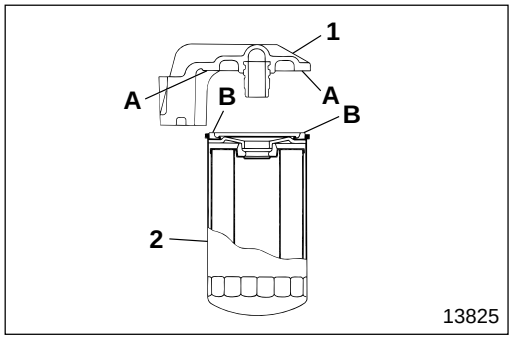
WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any diesel fuel that has been spilled because it can cause a fire.**
- **Do not use an unsuitable filter because it can cause a fire.**



13824

[Removal]



13825

[Installation]

- Install by tightening three quarters to one full turn after contact surface **A** of fuel filter head **1** makes contact with gasket **B** of fuel filter **2**. Be sure to tighten by hand.
- After installation, run the engine and check for fuel leakage.

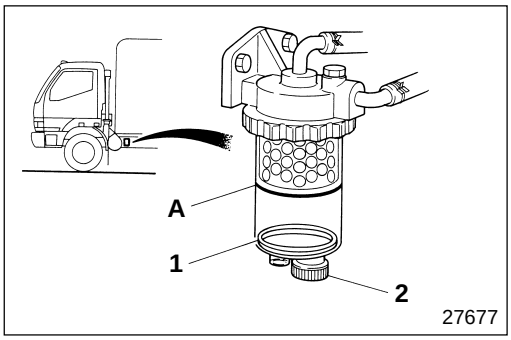
https://truckmanualshub.com/

Draining of Water Separator Condensation

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Drain plug	3 to 4 {2.2 to 2.9, 0.3 to 0.4}	—



Visually inspect the water separator before driving.
When float **1** reaches red line **A**, drain the condensation as follows:

- Loosen drain plug **2** and drain out the condensation.
- When float **1** has dropped to the bottom, tighten drain plug **2**.
- Carefully wipe the water separator and the surrounding area.
- Check for fuel leakage.

Cleaning of Fuel Feed Pump Gauze Filter

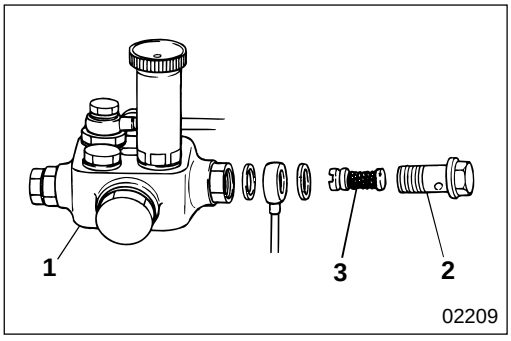
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Eye bolt	25 to 29 {18 to 22, 2.5 to 3}	—

WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any diesel fuel that has been spilled because it can cause a fire.**



- Remove eye bolt **2** on the inlet side of fuel feed pump **1**.
- Remove gauze filter **3** from eye bolt **2**.
- Clean gauze filter **3** with gas oil.
- Follow the removal sequence in reverse and reinstall gauze filter **3**. Install eye bolt **2** in the fuel feed pump.
- Bleed the air from the fuel line.
- Start the engine and check for fuel leakage.

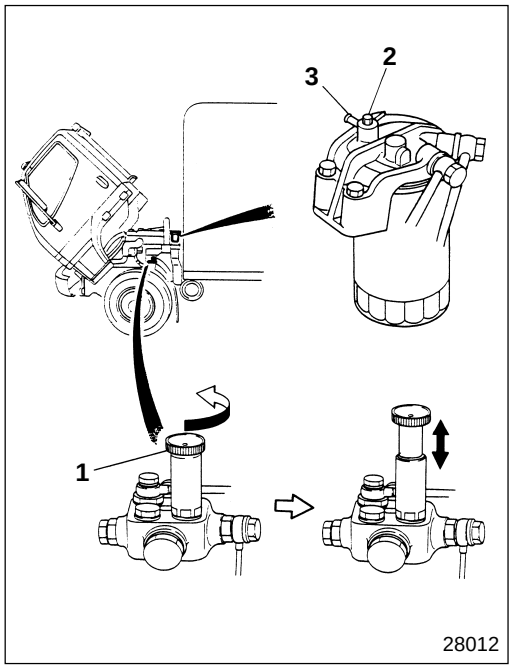
https://truckmanualshub.com/

Bleeding of Air from Fuel Line

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Air vent plug	7.8 to 12 {5.8 to 8.7, 0.8 to 1.2}	—



WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any diesel fuel that has been spilled because it can cause a fire.**

- Turn the top of priming pump **1** of the injection pump counterclockwise and pull it up so the top protrudes.
- Loosen air vent plug **2** of the fuel filter and move the top part of priming pump **1** up and down.
- Move priming pump **1** up and down repeatedly until air bubbles are no longer present in the fuel drained from air vent cock **3**.
- When the fuel being drained is free of air bubbles, tighten air vent plug **2**.
- After moving priming pump **1** up and down another five or six times, push the top down and turn clockwise tighten.
- After bleeding the air, carefully wipe up spilled fuel and start the engine.
- Check for fuel leakage.

https://truckmanualshub.com/

Adjustment of V-Belt Tension

Newly installed V-belts can stretch during their initial running-in period. To prevent this from becoming a problem, run the engine for several minutes after installing the V-belt, then readjust. Perform this cycle several times.

WARNING⚠

You must take special precautions to prevent the engine from rotating while a V-belt is being inspected or adjusted.

CAUTION⚠

- **Make sure that you turn off the engine before attempting to inspect or adjust the V-belts.**
- **Make sure that you fasten all bolts and nuts securely after adjusting the V-belts. Remember that too much tension can damage the V-belts and bearings.**
- **Do not grease V-belts. This causes them to slip, which reduce service life.**

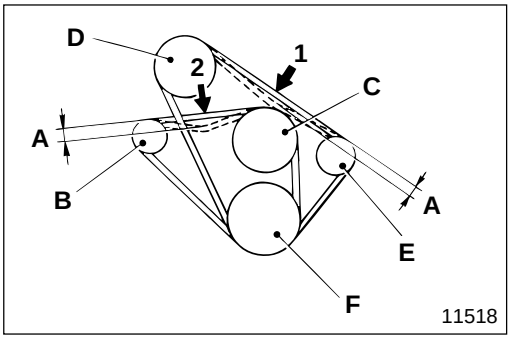
Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1, 2	V-belt tension (Each one)	Fan	12 to 16 {0.47 to 0.63}	—	Adjust
		Air-conditioner	16 to 20 {0.63 to 0.79}		

Special tools

Location	Tool name and shape	Part No.	Application
1, 2	Belt tension gauge 03612	MH062345	Measurement of tension of V-belt

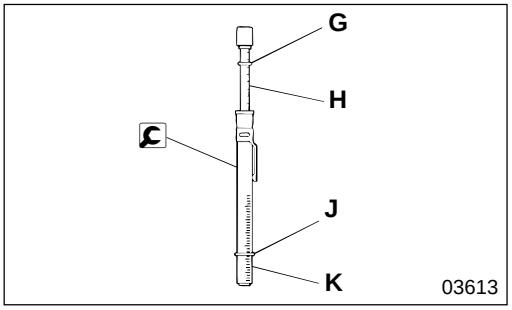


[Inspection]

Measure the extent of flex **A** when the center of V-belts **1**, **2** as illustrated is depressed with a force of 98 N·m {72 lbf.ft, 10 kgf·m}.

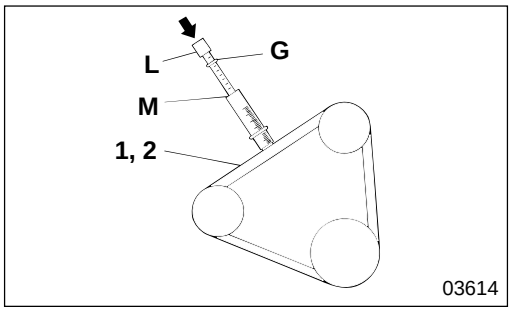
B : Alternator pulley
C : Water pump pulley
D : Cooler compressor pulley (Air-conditioner)
E : Tension pulley
F : Crankshaft pulley

https://truckmanualshub.com/

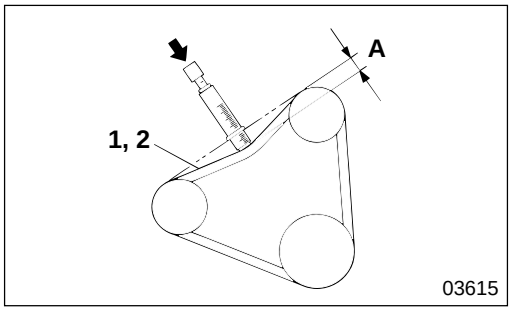


Use of special tool belt tension gauge

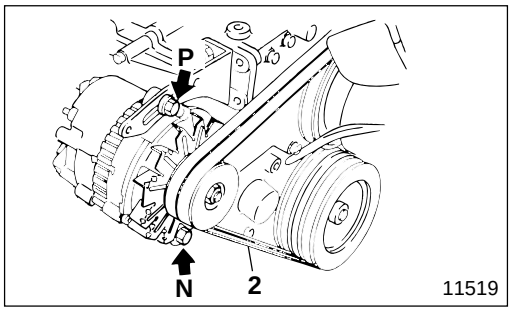
- Set upper O-ring **G** of 🔧 belt tension gauge to 98 N·m {72 lbf.ft, 10 kgf·m} (push load) on graduation **H**.
- Set lower O-ring **J** of 🔧 belt tension gauge to graduation **K** (maximum flex of belt).



- Place 🔧 belt tension gauge at the center of V-belts **1**, **2** perpendicularly as illustrated and push top **L** all the way down until upper O-ring **G** hits upper edge **M**.



- Measure the extent of flex **A** of V-belts **1**, **2** at this point, and if the measured value deviates from the standard value, adjust as follows:



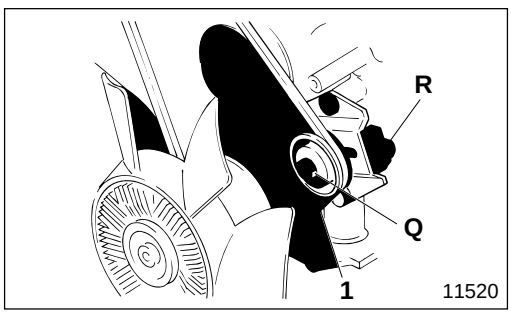
[Adjustment]

(1) Adjustment of tension of V-belt for fan

- Loosen alternator mounting bolts **N** (two points), and adjust the tension of V-belts **2** by moving adjusting bolt **P**.
- After adjustment, tighten the bolts **N**, **P** securely.

CAUTION ⚠

- **Bear in mind that excessive tension of V-belts 2 might damage the belts and bearings that engage with the V-belts.**
- **Be sure to replace V-belts 2 as a set to maintain even tension between them.**
- **Be careful not to let oil stick to V-belts 2. If oil gets onto the belts, it causes slipping, resulting in overheating and insufficient battery charging.**



(2) Adjustment of tension of V-belt for air-conditioner

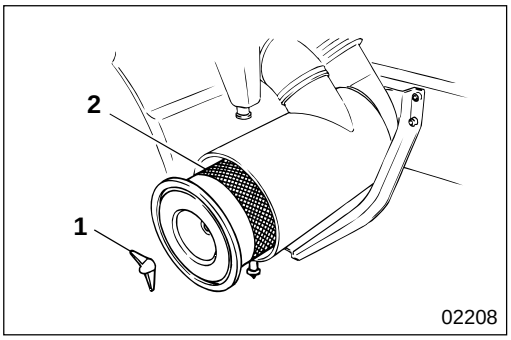
- Loosen tension pulley mounting nut **Q**, and adjust the tension of V-belt **1** moving adjusting bolt **R**.
- After adjustment, tighten mounting nut **Q** securely.

CAUTION ⚠

- **Bear in mind that excessive tension of V-belt 1 might damage the belt and bearings that engage with the V-belt.**
- **Be careful not to let oil stick to V-belt 1. If oil gets onto the belt, it causes slipping, resulting in poor performance of the air conditioner.**

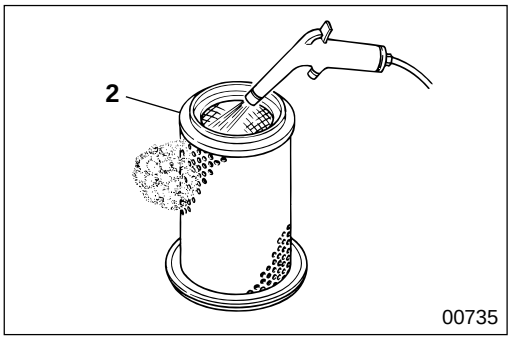
https://truckmanualshub.com/

Cleaning and Replacement of Air Cleaner Element



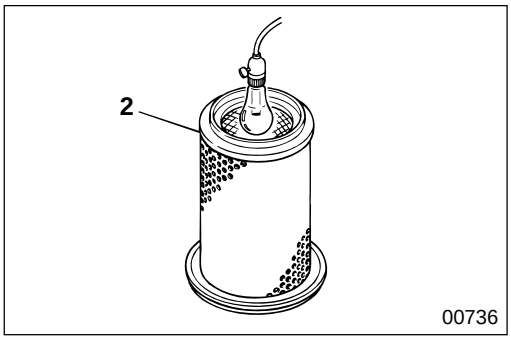
[Removal]
Remove wing nut **1** to remove element **2**.

[Installation]
Install element **2** securely.



[Cleaning]
- Blow compressed air of 685 kPa {100 lbf/in^2, 7 kgf/cm^2} or less through air cleaner element **2** from the inside.
- When using compressed air, move the blower's nozzle up and down along the pleats of air cleaner element **2** evenly.

CAUTION
- **Do not tap or hit air cleaner element 2 to remove dust.**
- **Do not blow compressed air through air cleaner element 2 from the outside.**



[Inspection]
- Illuminate the inside of air cleaner element **2**.
- If parts of the filter paper are torn or thin, or if the packing of the upper surface of air cleaner element **2** is damaged, replace the air cleaner element.

NOTE

If the dust on air cleaner element 2 is wet due to oil smoke or soot, replace the air cleaner regardless of the scheduled replacement interval.

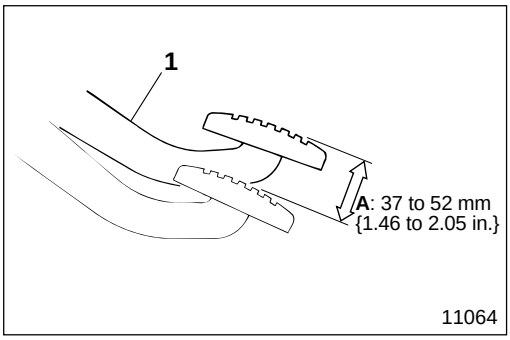
https://truckmanualshub.com/

Inspection of Clutch Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	Clutch pedal free play	37 to 52 {1.46 to 2.05}	—	Adjust or replace



[Confirmation]
Push clutch pedal **1** with your hand and measure the amount of movement **A** (free play) until you meet resistance. If the measured value does not conform to the standard value, adjust by stroke of clutch power cylinder push rod, or replace the clutch disc.

[Clutch operation]
- Check for unusual noises when clutch pedal **1** is pressed while the engine is idling, and also for abnormally heavy clutch operation. Also check to be certain that it is not difficult to shift the vehicle into first and reverse gears.
- Gradually release clutch pedal **1** to set the vehicle in motion.
  Check to be sure there is no slippage, and that the clutch engages smoothly.

Tire

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	Depth of tire tread grooves	—	1.6 {0.063}	Replace

Tightening torque

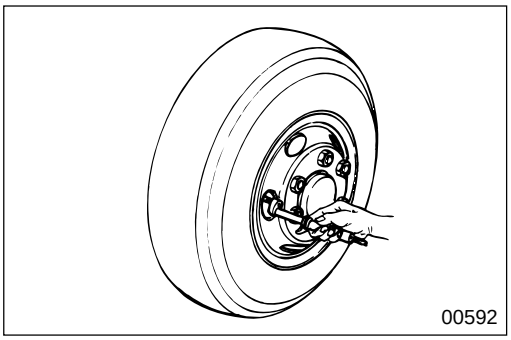
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Wheel nut	370 to 410 {275 to 305, 38 to 42}	Wet

Lubricant

Location	Points of application	Specified lubricant	Quantity
2	Wheel nut spherical area	Chassis grease [NLGI No.1 (Ca soap)] or Wheel bearing grease [NLGI No.1 (Li soap)]	As required
4	Wheel nut (inner) at thread area and spherical area		
6	Thread area of hub bolt		

https://truckmanualshub.com/



00592

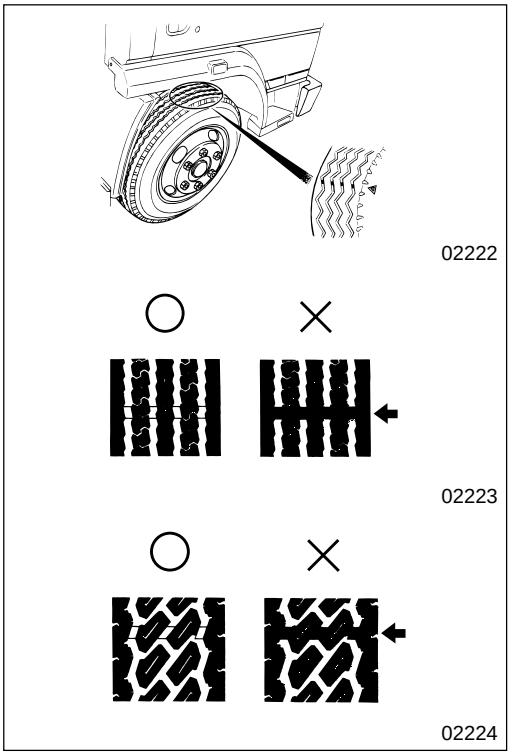
Air pressure

Tire air pressure should be checked before the vehicle is driven, while the tires are still cool.

Tire Size	Air Pressure kPa {Psi, kgf/cm^2}
215/75R 17.5 124/123L	700 {100, 7.00}

CAUTION

- **Make certain that there is no difference in the air pressure between the inner and outer rear tires.**
- **Make certain you use valve caps on the air valves.**
- **It is not necessary to increase the air pressure for high-speed driving.**



02222

02223

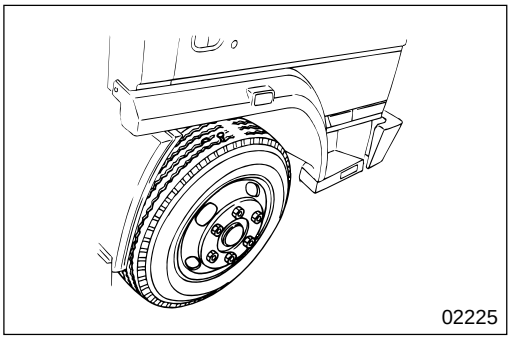
02224

Checking tread depth

- Check all around the tire treads to make sure that the depth of the tread grooves is above the wear limit.
- If the tread grooves are not deep enough, slip sign **A** appears at the position of the ⚠ mark, where the tread groove has worn away.

WARNING

If the depth of the tread grooves is not adequate, the tires will slip on wet roads and present a hazard. Such tires are also extremely dangerous because they are more susceptible to hydroplaning when the vehicle is running at high speeds in the rain. Such tires must be replaced with new ones as soon as possible.



02225

Checking for cracks, damage, and objects embedded in the treads

- Check the tire treads and walls for cracks and damage.
- Check tire treads for uneven wear or other abnormal wear.
- Check if metal objects or nails have penetrated the tires.
- Check for stones embedded between double tires.

WARNING

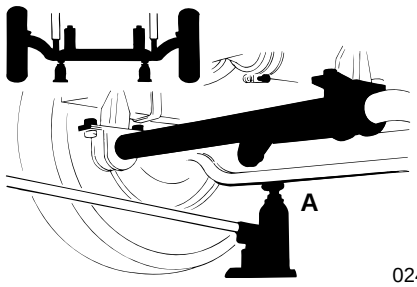
Badly damaged or worn tires are extremely dangerous, because they can be punctured more easily when the vehicle is running, they must be replaced with new ones as soon as possible.

https://truckmanualshub.com/

Removing tires

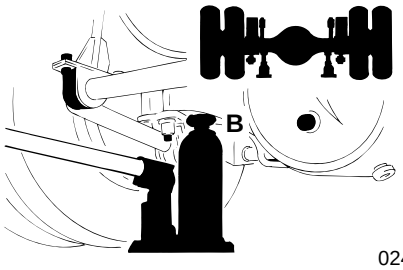
- Jacking up point
  - For front wheels : Front axle bottom A
  - For rear wheels : Rear axle tube bottom B

< Front wheel >



02476

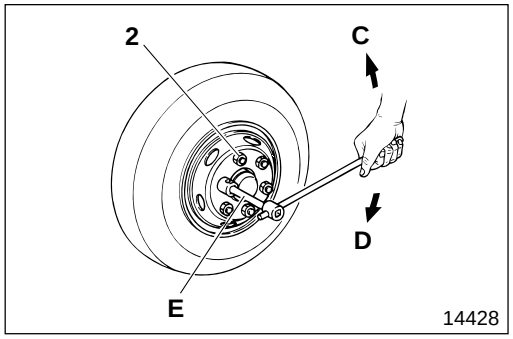
< Rear wheel >



02479

WARNING

- **The jack should be placed on flat, solid ground, and should not be used to raise the vehicle higher than necessary.**
- **Do not use the jack at vehicle locations other than those illustrated.**
- **Keep in mind the danger of a slipping jack. Never crawl under the vehicle while the jack is in use or rock the vehicle. Also, do not start the engine while the vehicle is jacked up.**
- **To increase safety, use supports for the vehicle when it is necessary to leave it jacked up for long periods.**
- **Chock both the tire to be removed and the tire diagonally opposite to it so that they will not rotate when you are removing the tire.**



14428

- Loosen wheel nuts **2** slightly. The wheel nuts for right tires **C** have right-hand threads "**R**", and the wheel nuts for left tires **D** have left-hand threads "**L**".

WARNING

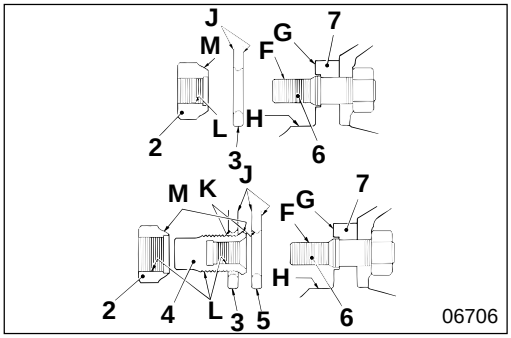
Make certain that wheel nut wrench E is fully engaged, all the way to the back of nuts 2. If it is not, it could slip.

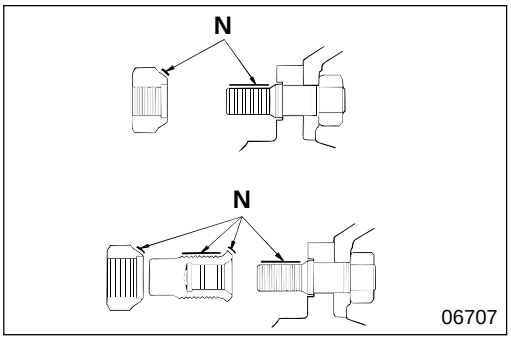
CAUTION

Only loosen wheel nuts 2 slightly. Do not remove them.

- Jack up the vehicle carefully, until the tire is slightly off the ground. Remove wheel nuts **2**, then remove the tire.
- When working on the double tires at the rear of the vehicle, first remove the outside tire, then lower the vehicle and loosen the nuts on the inside tire. After doing this, jack the vehicle back up and remove the tire.

https://truckmanualshub.com/



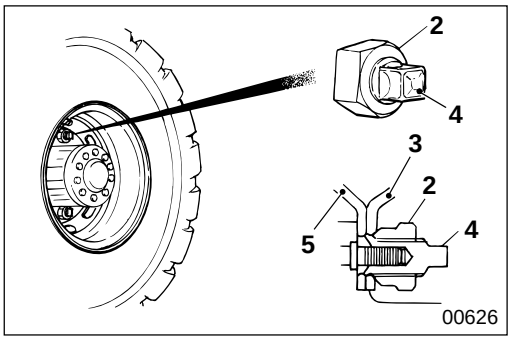


Mounting tires

- To prevent wheel nuts **2**, **4** and hub bolt **6** from becoming loose and to prevent mounting parts (tire assemblies **3**, **5** and hub **7**) from being damaged, remove rust, dust, additional coatings of paint, and foreign particles from the following areas:
  F : Hub bolt thread area
  G : Wheel mounting surface of hub
  H : Wheel alignment area of hub
  J : Disc wheel mating surface
  K : Disc wheel nut mounting surface
  L : Wheel nut thread area
  M : Wheel nut spherical area
  N : Grease application area

WARNING⚠

Never use grease containing molybdenum disulfide, since it can cause loosening of fitted screws.



- Put on the double rear tires as follows:
  - After mounting inner tire **5** and fully tightening inner wheel nuts **4**, jack the vehicle up and mount on outer tire **3**, then tighten outer wheel nuts **2**.
  - Even if only outside tire **3** is to be changed, do not mount it until inner wheel nuts **4** have been fastened at the specified torque.
  - Slide the air valves on the inside and outside tires down when mounting the tires.

WARNING⚠

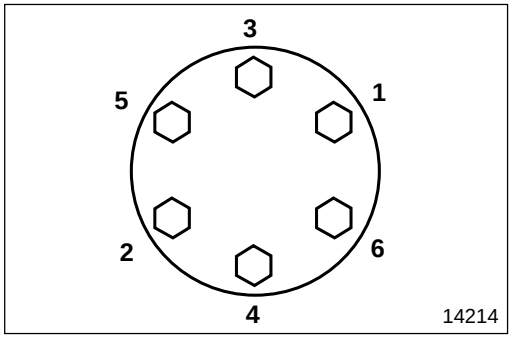
If the threads are scored, or the disc wheel is deformed or cracked, change bolts 6, nuts 2, 4 and disc. Driving the truck before correcting such problems can cause the tire in question to come loose, which could be the source of major accidents.

CAUTION⚠

Check hub bolt 6 threads carefully for scratches before putting the tire on.

- Place the tapered end of wheel nuts **2, 4** towards the disc wheel and fasten temporarily. Center so that there is no eccentricity between bolts **6** and the disc wheel bolt holes.
- Lower the vehicle.

https://truckmanualshub.com/



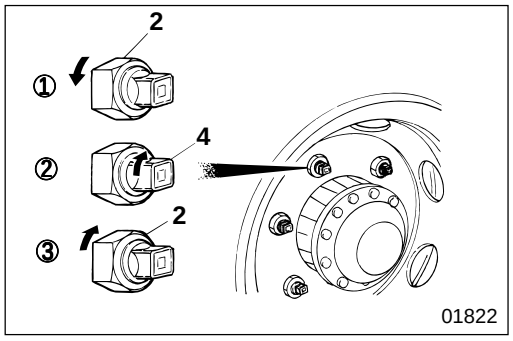
- Tighten the nuts in the order as illustrated, tightening each nut two or three times. To finish, tighten each nut at the specified torque.

WARNING

Always use the specified torque when tightening the wheel nuts. If the wheel nuts are not tightened properly, the wheels could come loose while the vehicle is being driven, which could result in life threatening accidents or the truck being disabled.

CAUTION

Over-tightening the wheel nuts can damage them.



Checking the wheel nuts for looseness

The wheel nuts should be checked for looseness every 10000 km (6000 miles). All nuts should be tightened at the specified torque.

- Check the double rear tires for looseness as follows:

① Loosen outer wheel nuts **2**.
② Tighten inner wheel nuts **4** at specified torque.
③ Tighten outer wheel nuts **2** at specified torque.

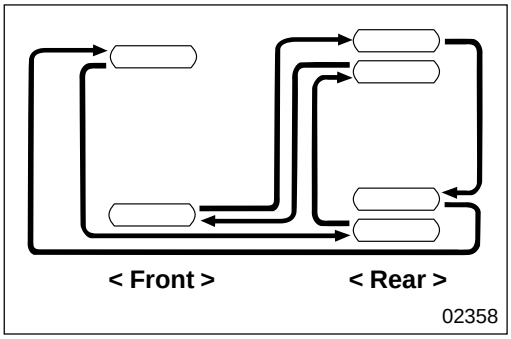
CAUTION

If outer wheel nuts 2 are tightened without first being loosened, it might not be possible to tighten them at the specified torque.

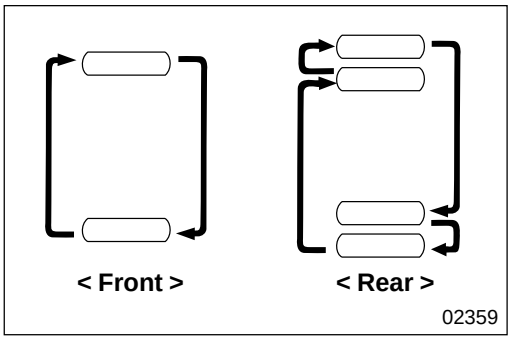
https://truckmanualshub.com/

Tire rotation

Tires wear differently, according to the location where they are mounted. To make this wear uniform and prolong the life of your tires, they should be rotated every 10000 km (6000 miles) in the rotation order shown below:



- When the tread patterns for all tires are identical:



- When the tread patterns are different for the front and rear tires:

CAUTION⚠

- **Always adjust air pressure after running-in new tires.**
- **When using tires of different tread patterns, use rib-type patterns for the front tires and traction type patterns for the rear tires.**
- **Avoid using both radial and biased tires on the same vehicle.**

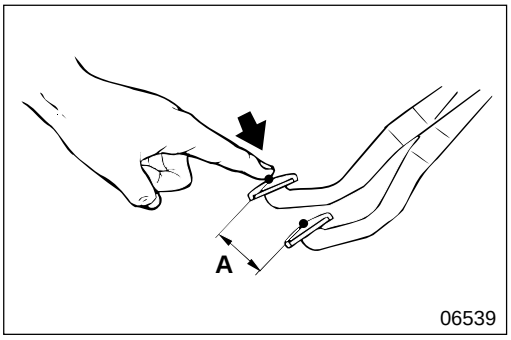
https://truckmanualshub.com/

Inspection of Brake Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Free play of brake pedal	10 to 15 {0.39 to 0.59}	—	Adjust



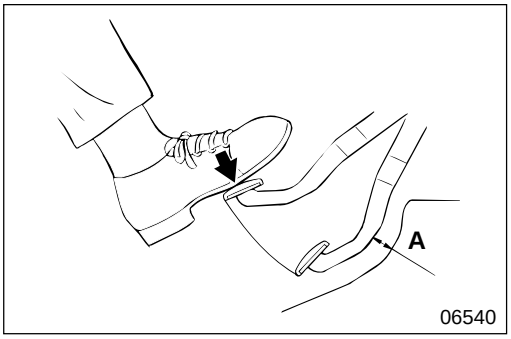
[Inspection]
Check if brake pedal free play **A** confirms to the standard valve with starter switch OFF. If the measured value deviates from the standard value, adjust the position of the brake pedal.

Inspection of Clearance between Brake Pedal and Floor Panel

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Clearance between brake pedal and floor panel (with pedal depressed at 490 N {110 lbf, 50 kgf}	52 {2.05} or more	—	Adjust



[Inspection]
Depress the brake pedal using 490 N {110 lbf, 50 kgf} when the engine is idling to check if clearance **A** between the brake pedal and the floor panel conforms to the standard value. If the measured value deviates from the standard value, adjust the position of the brake pedal.

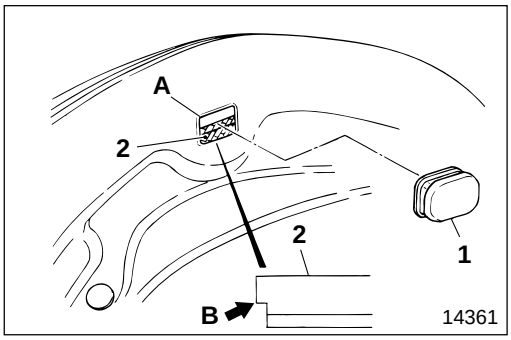
https://truckmanualshub.com/

Inspection of Brake Lining Thickness

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2	Thickness of brake lining	—	5 {0.20} (Wear limit at side step)	Replace



NOTE

Be sure to inspect at two points for each wheel per side.

- Remove check hole plug **1** from the packing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall check hole plug **1**.

Battery

DANGER⚠

- **Since flammable hydrogen gas is generated by the battery, be sure to obey the following warnings :**
  - **Do not short-circuit the ⊕ and ⊖ terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over the battery.**
- **Because the battery electrolyte is diluted sulfuric acid and is corrosive, when handling the battery wear safety glasses and rubber gloves to protect the eyes and hands.**

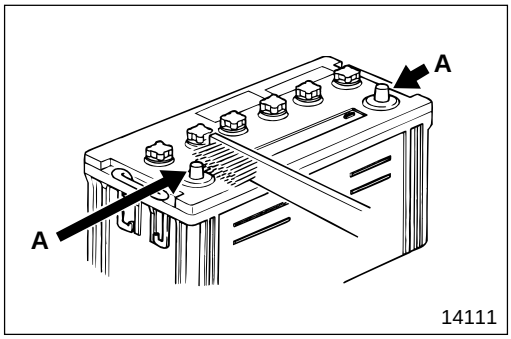
WARNING⚠

To prevent a short-circuit be sure that disconnected the battery cables do not accidentally touch the battery terminals.

CAUTION⚠

- **Make sure that you disconnect the battery cable ⊖ first when you disconnect the battery cables.**
- **Make sure that all electrical switches of the vehicle are OFF before connecting the battery cables.**
- **Make sure that you connect the battery cable ⊕ before you connect the battery cable ⊖.**

https://truckmanualshub.com/

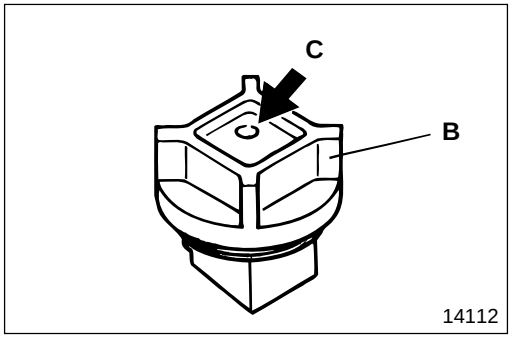


Visual inspection

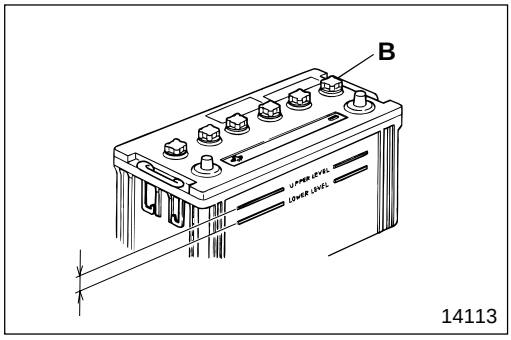
- If terminal **A** is corroded, scrub off the corrosion from it using a wire brush.
- If cracks or defects are found on the battery, replace it since the cracks or defects can cause liquid spills.

CAUTION

Make sure you grease the ⊕ side of terminal A because it is easily corroded.

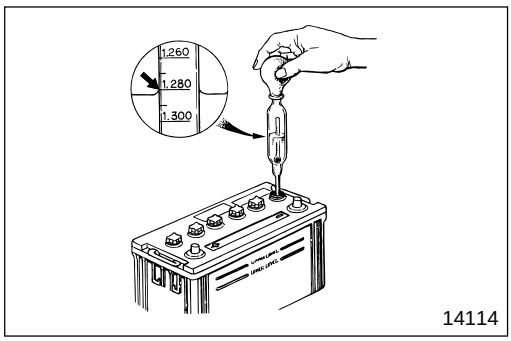


- If bleed hole **C** of vent plug **B** is clogged, clean the hole.



Inspection of fluid level

- Make sure that the battery electrolyte level is between UPPER and LOWER.
- If the level is below LOWER, remove vent plug **B** and fill the battery with distilled water or battery replenisher to UPPER.



Measurement of specific gravity

Measure the specific gravity of the battery electrolyte. If the measured value is lower than the limit, charge the battery.

NOTE

The specific gravity of the battery electrolyte depends on the liquid temperature. Use the following formula to convert the actual value to the value were the temperature 20°C {68°F}.

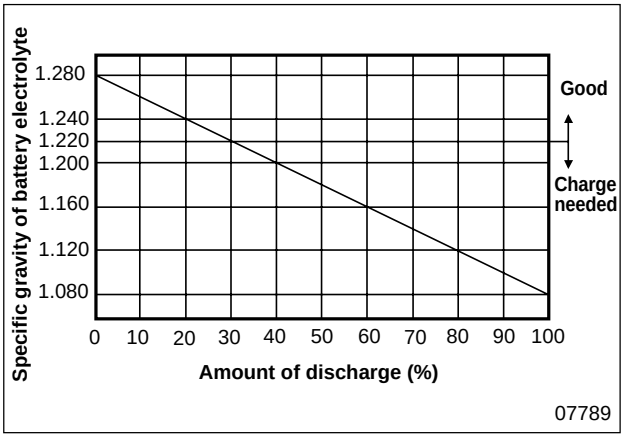
$S_{20}\{68\} = S_t + 0.0007\,(t - 20\{68\})$

S_{20}{68}: Specific gravity were the temperature 20°C {68°F}

S_t : Specific gravity actually measured with the temperature at t°C {t°F}

t : Temperature of battery electrolyte

https://truckmanualshub.com/



Charging

- Although, as a rule, charging of the battery should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect the battery cable ⊖.
- Remove vent plug **B** before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity / 10	*Amount of discharge (Ah) / Charge current (A) ×1.2(to 1.5)	45 {113}
Quick charge	Value of 5-hour rating capacity / 1.5	0.5	55 {131}

* Amount of discharge (Ah)=5-hour rating capacity (Ah)× Amount of discharge (%) / 100

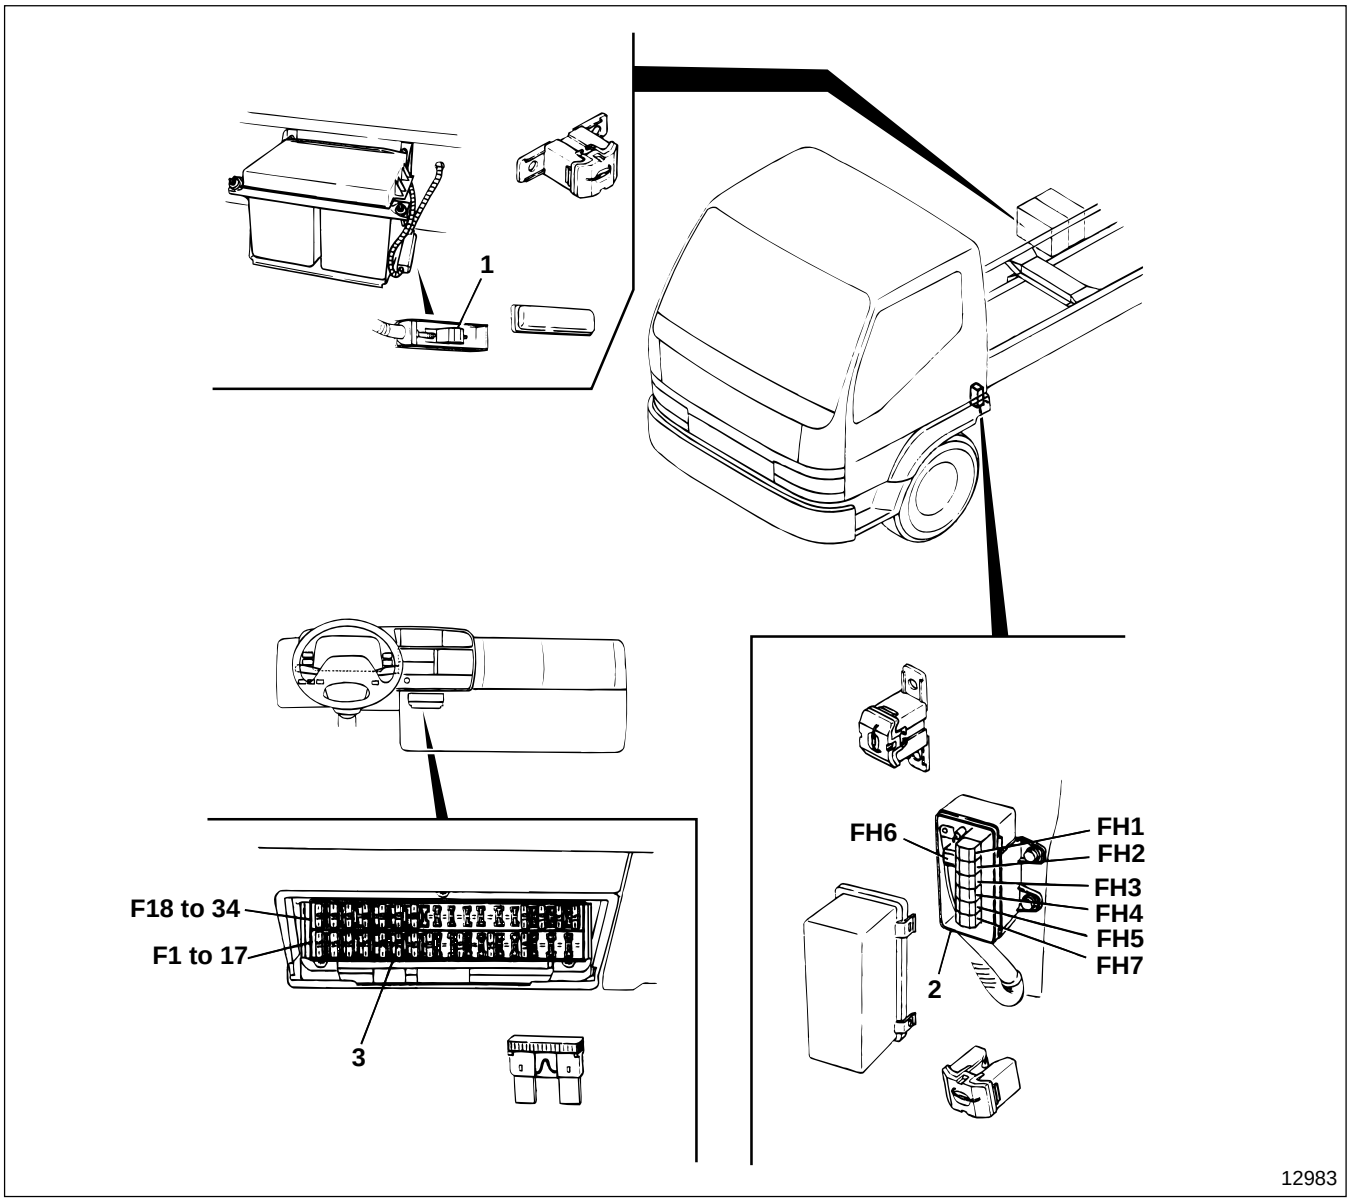
- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep naked lights away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because its dangerous.**
- **After charging the battery, tighten vent plug B, wash away sulfuric acid from the battery using water, and dry the surface.**

https://truckmanualshub.com/

Fuse



1 Main high-current fuse
2 High-current fuse box
3 Fuse box

CAUTION ⚠

- **If a fuse blows, make sure you identify and remedy the cause, then replace the fuse.**
- **Make sure that you replace the fuse with one having the same rating.**
- **Make sure that you remove the ⊖ terminal of the battery cable before removing main high-current fuse 1 and high-current fuses FH1 to 7.**

https://truckmanualshub.com/

Main high-current fuse

Fuse No.	Main load	Capacity

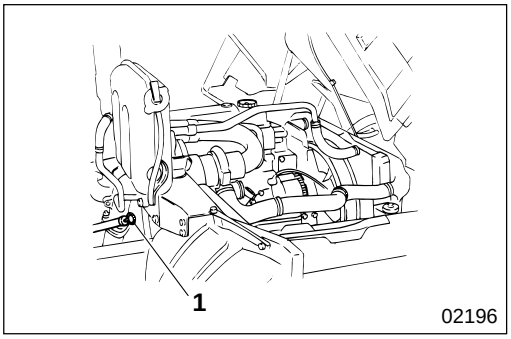
Engine Oil

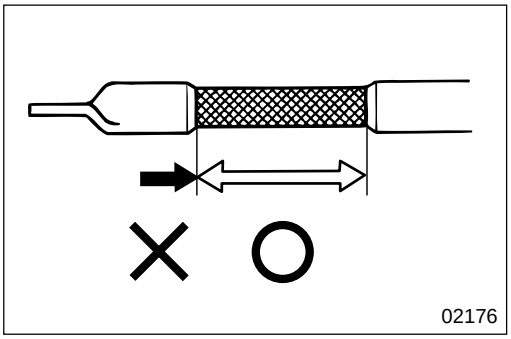
Tightening torque

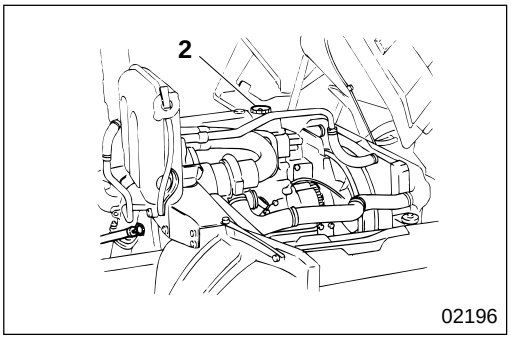
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Oil pan drain plug	69 {51, 7}	—



[Inspection]
- Pull out dipstick **1**, wipe off the oil with a cloth.
- Reinsert dipstick **1**, then pull it out carefully.
- Oil level is correct if there is oil sticking to dipstick **1** within the hatched area.
- If the level is low, top it up.
- Tilt the cab.





[Replenishment]
- Clean the area surrounding oil filler cap **2** and prevent dust from entering through the filler.
- Remove oil filler cap **2** and top up with engine oil.
- Wait five minutes before checking the oil level.
- Replace filler cap **2**.

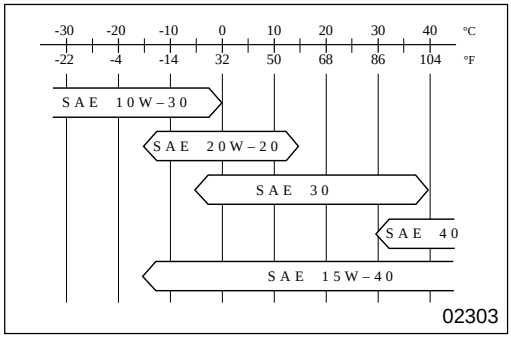
WARNING
- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot as it will burn you.**

CAUTION

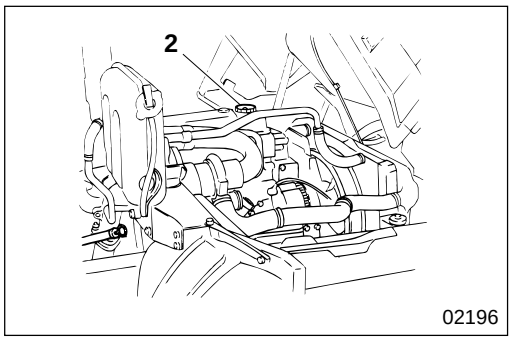
Take care not to spill engine oil on the V-belts, because this would cause them to slip, reducing service life.

https://truckmanualshub.com/

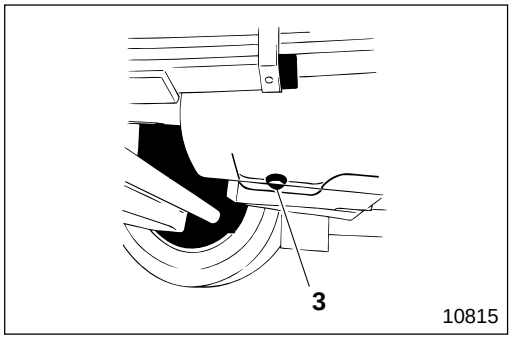
LUBRICATION



[Replacement]
Since engine oil greatly influences the performance, the life expectancy, and the ability to start the engine, use only oil of the specified grade and viscosity.
The chart illustrates the relationship between oil viscosity and the ambient air temperature.



- Clean the area surrounding oil filler cap **2** and prevent dust from entering through the filler.
- Remove oil filler cap **2**.
- Remove oil pan drain plug **3**, and drain the oil. At the same time replace the oil filter.
- After reinstalling drain plug **3**, slowly add engine oil through the oil filler.
- Using the dipstick, check the oil level after more than six minutes have passed.
- Start the engine and let it idle. When the oil has reached all parts, stop the engine. Let 30 minutes pass before checking the oil level again.



https://truckmanualshub.com/

Clutch Fluid (Brake Fluid)

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Air bleeder	25 to 34 {18 to 25, 2.5 to 3.5}	—

Fluid

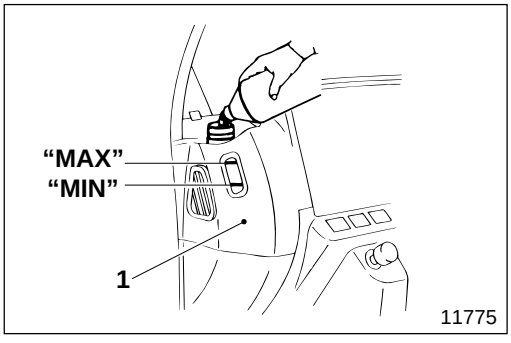
Location	Points of application	Specified fluid	Quantity
1	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

WARNING

- **The clutch fluid system and the brake fluid system use the fluid tank in common.**
- **You must use new brake fluid (SAE J1703f or FMVSS No.116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose.**

CAUTION

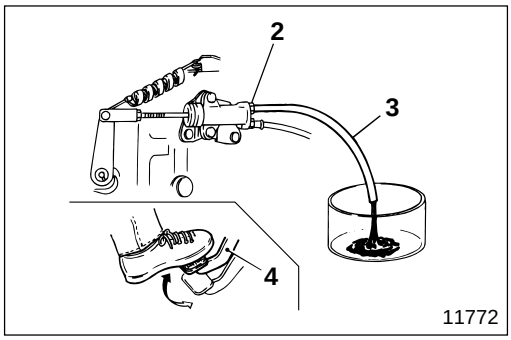
- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**



[Inspection and replenishment]

- Inspect the level of the brake fluid in fluid tank **1**. It should fall between the "**MAX**" and "**MIN**" levels.
- If it is below the "**MIN**" level, lift up the lid flap and remove the cap from fluid tank **1**, then supply the specified brake fluid until the level has come up to the "**MAX**" level. Do not fill above the "**MAX**" level.

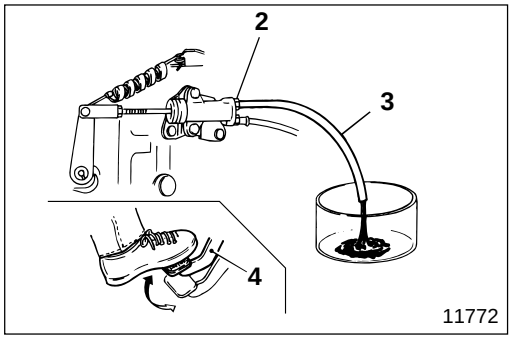
https://truckmanualshub.com/



[Replacement]

- Attach vinyl pipe **3** to air bleeder **2** of the clutch power cylinder.
- Loosen air bleeder **2** and depress clutch pedal **4** several times to drain brake fluid completely.

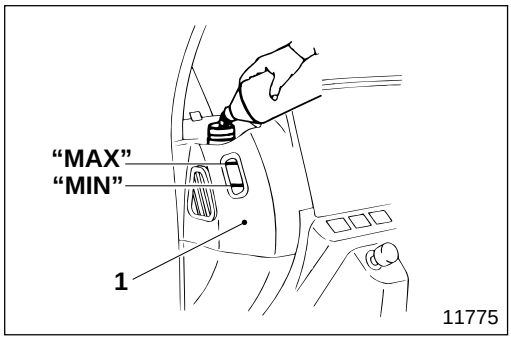
- Supply new brake fluid to the **"MAX"** level of fluid tank **1**. Depress clutch pedal **4** repeatedly until the old brake fluid discharged from vinyl pipe **3** is replaced by the new brake fluid.



NOTE

Carry out this operation maintaining the brake fluid level in fluid tank 1 between "MAX" and "MIN".

- Attach vinyl pipe **3** to air bleeder **2** of the clutch power cylinder as in the replacement procedure.
- Fill fluid tank **1** with brake fluid, and loosen air bleeder **2** of the clutch power cylinder then depress clutch pedal **4** continuously.
- Keep depressing clutch pedal **4**, and tighten air bleeder **2** when air is bled completely.
- Depress clutch pedal **4** several times again, then keep it depressed at its fullest extent.
- With clutch pedal **4** depressed, loosen air bleeder **2** to drain brake fluid containing air. Release the pedal after tightening the air bleeder.



- Repeat this operation until air is no longer present in the fluid being drained.
- When this operation is completed, tighten air bleeder **2** at specified torque.
- Check that brake fluid is at the "**MAX**" level of fluid tank **1**, and supply new brake fluid if necessary.
- Check for brake fluid leakage from each of the parts with clutch pedal **4** depressed.

Manual Transmission Gear Oil

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

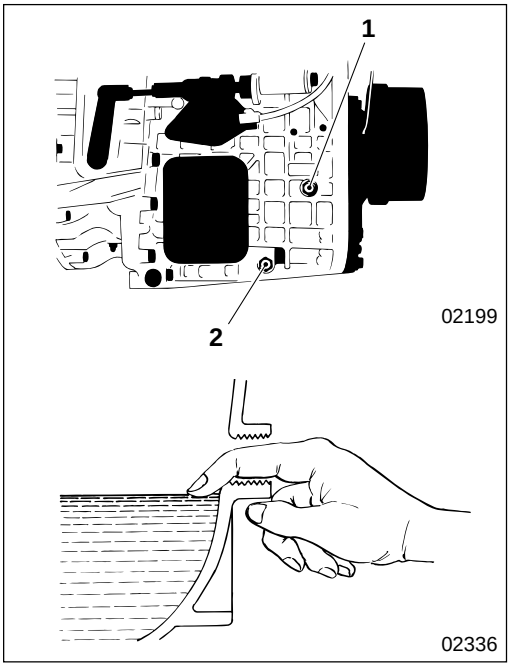
Location	Parts to be tightened	Tightening torque	Remarks
1	Inspection plug	69±15 {51±11, 7±1.5}	—
2	Drain plug	69±15 {51±11, 7±1.5}	—

Sealant

Location	Points of application	Specified sealant	Quantity
1	Thread area of inspection plug	THREEBOND 1105D	As required
2	Thread area of drain plug	THREEBOND 1105D	As required

WARNING

The engine is hot immediately after the vehicle stopped, so take care not to burn yourself.



[Inspection and replenishment]

- Remove inspection plug **1** and check whether the oil level is up to the edge of the entrance.
- If the level is low, add oil through the inspection plug hole until the level comes up to the edge of the entrance.

[Replacement]

- Drain the oil after removing inspection plug **1** and drain plug **2**.
- Remove any metal particles sticking to the magnetic part of drain plug **2** before reinstalling the plug.
- Add oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Insert inspection plug **1**.

LUBRICATION

Automatic Transmission Fluid and Oil Filter

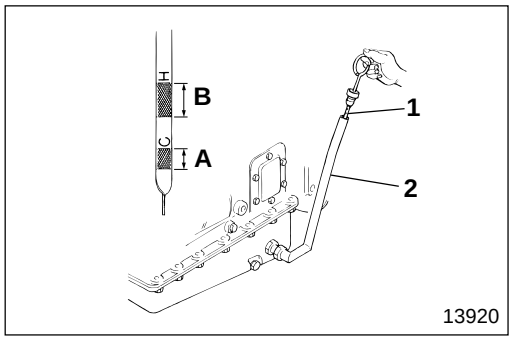
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Drain plug	20 to 27 {15 to 20, 2.05 to 2.75}	—
5	Dipstick guide connector	125 to 135 {91 to 100, 12.55 to 13.76}	—
6	Bolt (Oil pan mounting)	14 to 18 {10 to 13, 1.4 to 1.8]	—
8	Bolt (Oil filter mounting)	14 to 18 {10 to 13, 1.4 to 1.8]	—
12	Oil filter	9.8 to 20 {7 to 14, 1 to 2}	—

Fluid

Location	Points of application	Specified fluid	Quantity
11	Body of O-ring	Automatic transmission fluid (DEXRON or DEXRON II type)	As required
12	Gasket of oil filter with thin application	Automatic transmission fluid (DEXRON or DEXRON II type)	As required



[Inspection and replenishment]

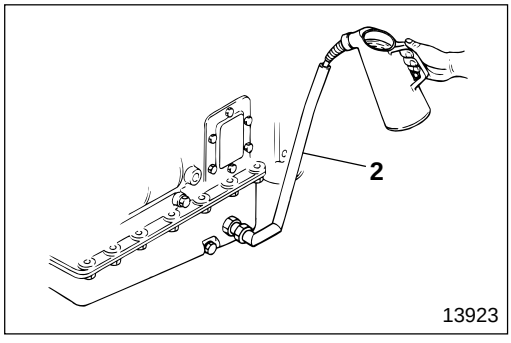
- Park the vehicle on level ground, make sure that the parking brake is fully activated and chock the wheels to keep them from rolling.
- Start the engine and let it idle. To fill the hydraulic circuit with automatic transmission fluid, shift the range selector lever from N → R → N → D → 2 → D → N. Repeat this process five times, finally shifting to N.
- While the engine is still idling, pull out dipstick **1** and wipe off the fluid sticking to it. Reinsert the dipstick, then pull it out again and check the fluid level.
- If the fluid level is inspected right after the engine is started and the fluid temperature is still low (approximately 15 to 49°C {60 to 120°F}), the level should be within area **A** marked COLD on dipstick **1**.
- If the fluid level is inspected after the vehicle has been driven and the fluid temperature is high (approximately 71 to 93°C {160 to 200°F}), the level should be within area **B** marked HOT on dipstick **1**.

WARNING

Take care during the inspection because the engine will be running. Take sufficient care to avoid burns or injuries resulting from contact with moving parts.

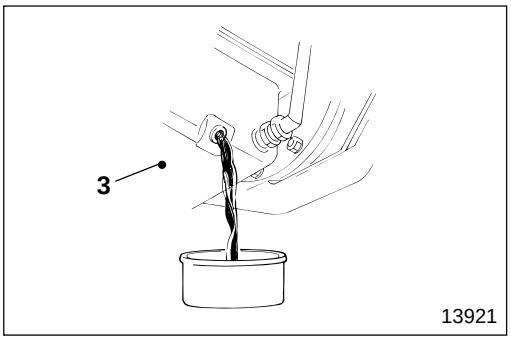
NOTE

- **Make sure the vehicle is parked on level ground when you are checking the fluid level.**
- **Make sure the range selector lever is in the N position and the engine is idling when you are checking the fluid level. When the engine is stopped, the fluid level appears higher than it actually is.**
- **Be sure to wipe off the dust from the safety cap and the upper part of dipstick guide 2 before you pull out dipstick 1.**
- **To ensure the fluid is correct, reinspect the fluid level after an actual drive.**



- If the fluid level is low, add automatic transmission fluid (DEXRON or DEXRON II type) through dipstick guide **2** until the correct level on dipstick **1** is reached.

https://truckmanualshub.com/



[Replacement]

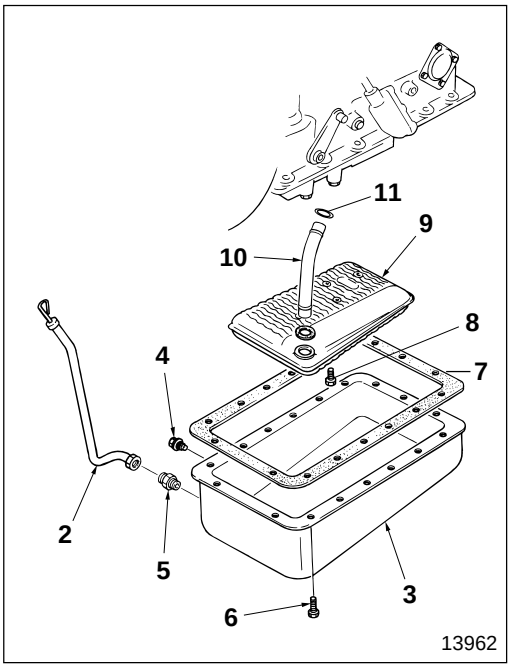
- Park the vehicle on level ground, chock the wheels and shift the range selector lever to the N position.
- Place a container under oil pan **3**, remove drain plug **4** and drain the fluid.

WARNING⚠

Take care because the fluid temperature immediately after the engine has stopped is very high. To avoid scalds, wait until a safe temperature has been reached before draining the fluid.

NOTE

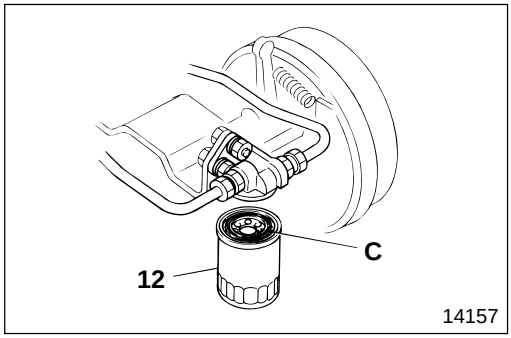
- **The fluid will drain faster if the engine is first run to raise the fluid temperature.**
- **The fluid cannot be drained from the hydraulic circuit, the torque converter or the oil cooler.**
- **Check the drained fluid for dirt, metal particles and metal fragments.**



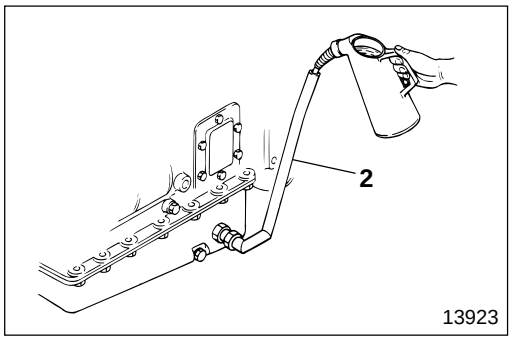
- Remove oil pan **3**, intake pipe **10**, O-ring **11**, gasket **7** and oil filter **9**.
- Clean oil pan **3**.
- Replace O-ring **11**, gasket **7** and oil filter **9**.

2 : Dipstick guide
4 : Drain plug
5 : Dipstick guide connector
6 : Bolt
8 : Bolt

https://truckmanualshub.com/



- Remove oil filter **12** (for oil cooler) by turning it counterclockwise.
- Lightly coat gasket **C** with the fluid before installing oil filter **12**. Then tighten the oil filter.



- Supply fluid through dipstick guide **2**.

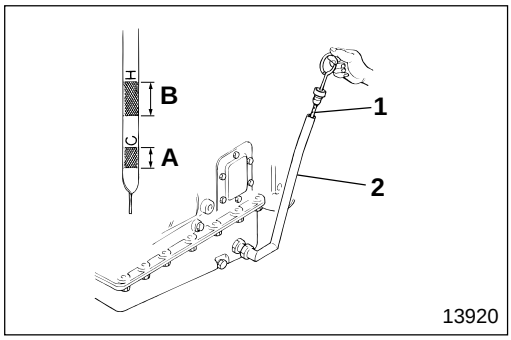
CAUTION

Make sure that dirt and foreign particles do not become mixed in with the fluid when it is added.

- Shift the range selector lever to the N position, start the engine and let it idle for about one minute.
- After shifting the lever through all positions once, shift it back to N position.

CAUTION

To prevent burning out the interior of the automatic transmission assembly, make sure that the engine is not allowed to race when you do the above.



- Check and adjust so that the fluid level is within the specified area on dipstick **1**.

NOTE

- **As the temperature of the fluid rises, so does the fluid level. If you add fluid while the temperature is still low (approximately 15 to 49°C {60 to 120°F}), make sure that the level stays within area A, marked COLD on dipstick 1.**
- **Let the engine idle and, while paying attention to the fluid level, pour in the fluid slowly.**
- **It is sometimes hard to check the fluid level, immediately after supplying fluid, because of the fluid adhering to the interior of dipstick guide 2. If this is the case, check the fluid level several times at intervals.**
- **Be careful not to supply too much fluid because you might mistake the fluid that overflows from the air breather for fluid leakage.**

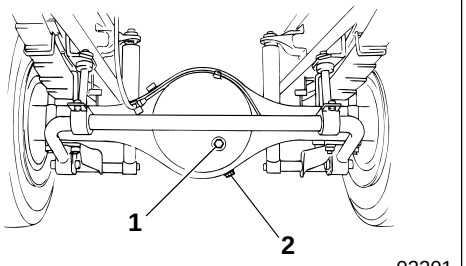
https://truckmanualshub.com/

Rear Axle Gear Oil

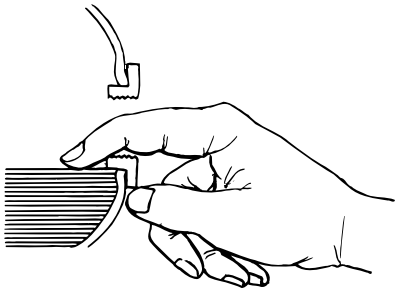
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Inspection plug	98 to 115 {72 to 87, 10 to 12}	—
2	Drain plug	98 to 115 {72 to 87, 10 to 12}	—



02201



02340

[Inspection and replenishment]

WARNING

The oil temperature is high immediately after the vehicle stopped, so take care not to scald yourself.

- Remove inspection plug **1**, check the oil level and make sure it is up to the edge of the entrance.
- If the oil level is low, add oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Insert inspection plug **1**.

[Replacement]

- Drain the oil after removing inspection plug **1** and drain plug **2**.
- Remove any metal particles sticking to the magnetic part of drain plug **2** before reinstalling the plug.
- Supply oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Reinstall the inspection plug.

https://truckmanualshub.com/

LUBRICATION

Power Steering Fluid

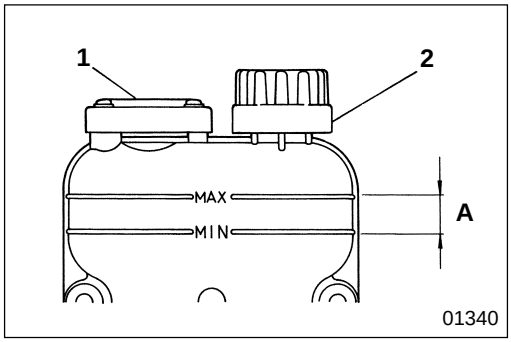
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Oil pipe	66.69±12.75 {49±9.4, 6.8±1.3}	—

Fluid

Location	Points of application	Specified fluid	Quantity
1	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Between "MAX" and "MIN" on the power steering oil tank



WARNING

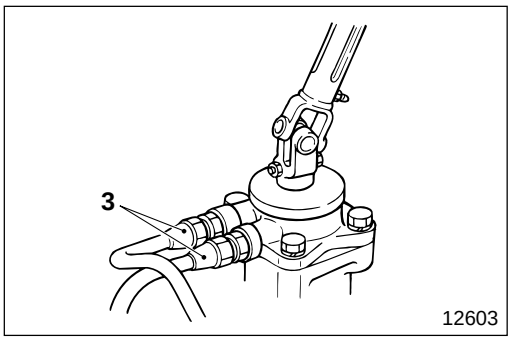
Because the brake booster (hydraulic booster) uses power steering fluid, do not let other fluids such as brake fluid, etc. get mixed with the power steering fluid inside the power steering oil tank.

[Inspection and replenishment]

- Straighten the front wheels and stop the engine.
- Inspect the level of the fluid in power steering oil tank **1**. It should fall between fluid level range **A**.
- If it is below the **"MIN"** level, remove filler cap **2** from power steering oil tank **1**, then supply the specified fluid until the level has come up to the **"MAX"** level. Do not fill above the **"MAX"** level.

CAUTION

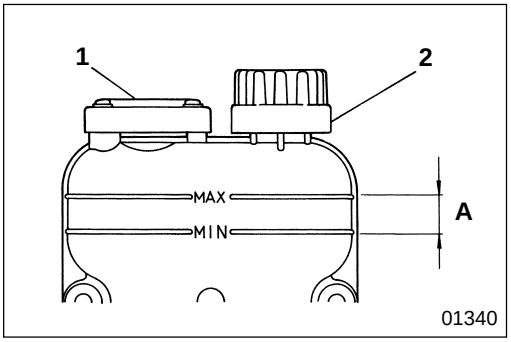
If the fluid level is far below the recommended range, the fluid may be leaking.



[Replacement]

- Drainage
  - Jack up the front wheels.
  - Disconnect oil pipe **3** connected to the power steering booster.
  - Turn the steering wheel fully left and right repeatedly, and drain the fluid from the power steering booster.
  - After draining the fluid, tighten oil pipe **3** at specified torque.

https://truckmanualshub.com/



[Supply]

- Supply fluid into power steering oil tank **1** up to filler cap **2**.
- With the engine stopped, jack up the front wheels and turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.
- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- Depress the brake pedal fully several times repeatedly, until as in the case of the steering wheel, the fluid level does not drop anymore. (The steering wheel at such time does not need to be operated)
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times, next depress the brake pedal several times to raise the fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times to make sure there is no abnormal noise.
- With the engine stopped, depress the brake pedal several times, activate the brake booster (hydraulic booster) emergency pump and bleed air.
- When there is no abnormal noise after the above procedure has been performed, bleeding is completed. Check oil tank **1** fluid level, and pipe and hose connections for fluid leakage.
- After bleeding is completed, inspect brake booster (hydraulic booster) performance (input and output characteristics). Gr 35

https://truckmanualshub.com/

Brake Fluid

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Air bleeder	7.8 to 12 {5.8 to 8.5, 0.8 to 1.2}	—

Fluid

Location	Points of application	Specified fluid	Quantity
1	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
2	Vinyl hose 	MH033102	Air bleeding

WARNING

- **The clutch fluid system and the brake fluid system use the fluid tank in common.**
- **You must use new brake fluid (SAE J1703f or FMVSS No.116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose.**

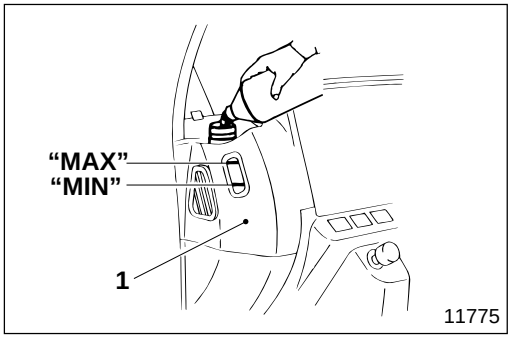
CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

NOTE

Supply and maintain brake fluid level to the "MAX" level of the fluid tank .

https://truckmanualshub.com/

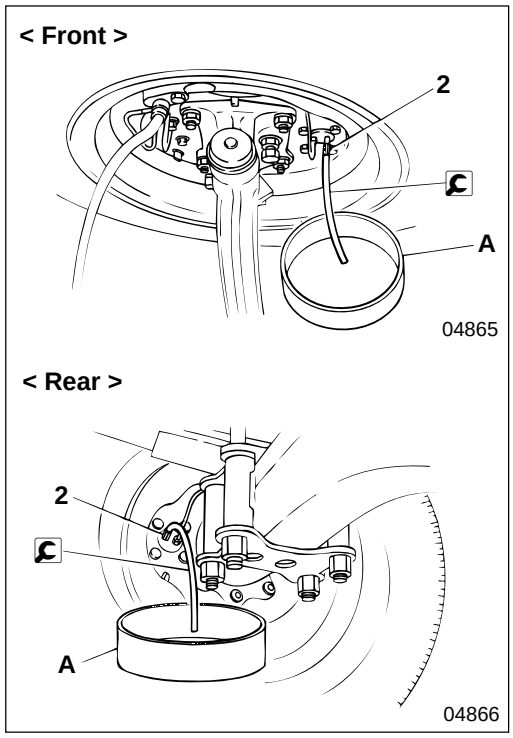


[Inspection and replenishment]

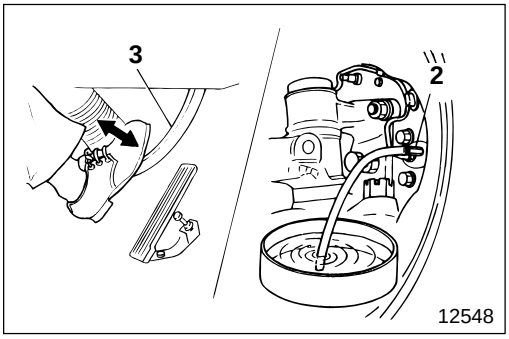
- Inspect the level of the brake fluid in fluid tank **1**. It should fall between the "**MAX**" and "**MIN**" levels.
- If it is below the "**MIN**" level, remove the cap from fluid tank **1**, then supply the specified brake fluid until the level comes up to the "**MAX**" level. Do not fill above the "**MAX**" level.

[Replacement]

- Start engine and let it idle until brake fluid replacement is completed.



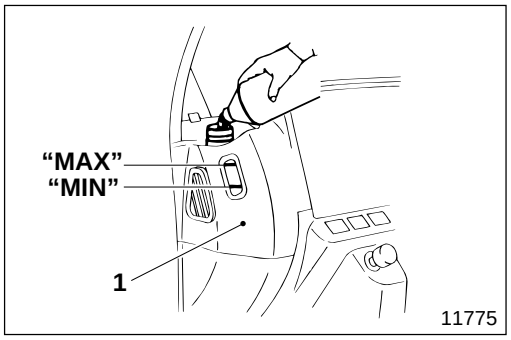
- Attach one end of vinyl hose to air bleeder **2** and place the other end in container **A**.



- Loosen air bleeders **2** and depress brake pedal **3** several times to drain brake fluid completely.

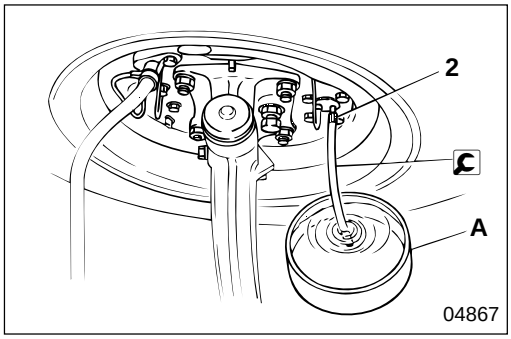
https://truckmanualshub.com/

LUBRICATION



- Maintaining a supply of new brake fluid up to the "**MAX**" level of fluid tank **1**, depress brake pedal **3** repeatedly until the old brake fluid of the brake system is replaced with new fluid.
- Carry out air bleeding of the brake system.

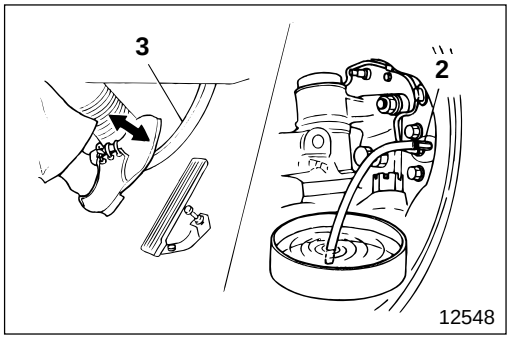
[Air bleeding]



- Start the engine and let it idle until brake fluid replacement is completed.
- Attach one end of vinyl hose to air bleeder **2** of the wheel brake. Place free end in container **A** filled with brake fluid.

- Carry out air bleeding in the following sequence:

Front brake system	Rear brake system
Right-hand side wheel brake	Right-hand side wheel brake
↓	↓
Left-hand side wheel brake	Left-hand side wheel brake



- Depress brake pedal **3** slowly a few times, and with the brake pedal depressed, loosen air bleeder **2** to drain brake fluid containing air.

- Tighten air bleeder **2**, and release brake pedal **3**.
- Repeat this service procedure until air is no longer present in the fluid being drained.
- Tighten air bleeder **2** at specified torque as soon as brake fluid flowing out is free of air bubbles.

- Adjust brake shoe clearance when you have finished air bleeding.
- Check that brake fluid comes up to level "**MAX**" of fluid tank **1**. If it does not, refill with new brake fluid.
- Depress brake pedal **3** a few times and check for any leakage of brake fluid, then test the brakes.

HOW TO READ THE MAINTENANCE SCHEDULE TABLES

Example Table :

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.
*2 : 60000 km/36000 miles or 12 months, whichever occurs first.
Ⓔ : Exhaust emission items
Ⓝ : Noise control items

	Inspection and maintenance (1)	Time of inspection and maintenance (2)					Working procedures (3)	Remarks (4)
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Inspection interval: Every 10000 km/6000 miles	Every 30000 km/18000 miles *1	Every 60000 km/36000 miles *2		
ENGINE								
1	Air, fuel, oil or coolant leakage from engine			×			Check engine for air, fuel, oil and coolant leakage	Gr 11, 12, 13, 14
2	Ⓔ Ⓝ Engine starting performance, speed, noise and exhaust gas conditions			×			Check for engine starting performance, idling speed, abnormal engine noise, dark smoke or other abnormal exhaust gas during idling and acceleration. Check engine speed on tachometer	Gr 11, 13, 15
3	Retightening of inlet and exhaust manifold bolts					×	Check manifold bolts for looseness	Gr 15
4	Ⓔ Valve clear…		×			×	Check valve clearance with feeler …	…r 11
5	…			Every 20000 km /12000 miles			Replace element	

(1) This column contains the maintenance and inspection items.
(2) The periods between inspection and service are based on the assumption that the vehicle will be driven approximately 60000 kilometers (36000 miles) per year.
Inspections which must be made are indicated by an "×" or by the appropriate period between servicing.
(3) This column provides a simplified explanation of the operational procedures involved for each inspection or maintenance item.
(4) The Gr. No. refers to the "group number" in this vehicle Service Manual. For visual checks and simple inspections, see the sections labelled "Working Procedures".

https://truckmanualshub.com/

3	Retightening of inlet and exhaust manifold bolts					×	Check manifold bolts for looseness	Gr 15
4	Ⓔ Valve clearance		×			×	Check valve clearance with feeler gauge	Gr 11
5	Ⓔ Oil filter replacement			Every 20000 km/12000 miles On new vehicles, replace the first filter at 10000 km/6000 miles			Replace element	Gr 12
6	Ⓔ Ⓝ Check injection nozzles			Every 90000 km/54000 miles			Check injection nozzles	Gr 13
7	Ⓔ Ⓝ Fuel injection pressure and spray pattern of injection nozzles			Every 250000 km/150000 miles			Remove injection nozzle and check with nozzle tester	Gr 13
8	Ⓔ Ⓝ Fuel injection timing					×	Turn crankshaft in normal running direction and check injection starting timing of No.1 cylinder	Gr 13
9	Ⓔ Cleaning fuel feed pump filter					×	Remove connector from fuel feed pump inlet and clean filter inside connector with gas oil	
10	Ⓔ Fuel filter replacement				×		Replace element	Gr 13
11	Ⓔ Water separator water discharge	×					Loosen water separator drain plug to discharge water	Gr 13
12	Ⓔ Removal of water and sediment from fuel tank			Every 24 months			Remove fuel tank drain plug and remove water and sediment	Gr 13
13	Retightening of fuel tank bracket bolts			×			Check mounting bolts for looseness and retighten to a torque of 34 to 54 N·m {25 to 40 lbf.ft, 3.5 to 5.5 kgf·m}	Gr 13
14	Ⓔ Replacing fuel line in engine compartment			Every 24 months			Replace fuel line in engine compartment	Gr 13
15	Ⓔ Check fuel line outside of engine compartment			Every 24 months			Check fuel line outside of engine compartment. Replace if necessary	Gr 13
16	Ⓔ Ⓝ V-belt tension and damage	×		×			Press midpoint of V-belt firmly with your finger to measure deflection and check for belt damage	Gr 14
17	Coolant level and leakage from cooling system	×					Check coolant level and if level is low, check for coolant leakage	Gr 14
18	Coolant replacement			Every 24 months			Replace with new coolant	Gr 14
19	Installed condition of surge tank cap			×			Check surge tank cap for sealing and mounting condition	Gr 14
20	Ⓔ Cooling system hose clamp position and clamping condition			×			Check clamp position and clamping condition of cooling system hose	Gr 14
21	Ⓔ Turbocharger rotor play			Every 250000 km/150000 miles			Check whether rotor has excessive end play using a dial indicator	Gr 15
22	Ⓔ Ⓝ Cleaning of air cleaner	×					Check air cleaner dust indicator. If the red signal appears, clean the element	Gr 15
23	Ⓔ Ⓝ Air cleaner element replacement			Every 50000 km/30000 miles			Replace element	Gr 15
24	Ⓔ Ⓝ Damage of inlet system, looseness of clamp and loss of parts			×			Check inlet system for damage and check that all parts are installed	Gr 15
25	Ⓝ Looseness and damage of exhaust pipe and muffler			×			Check installation and connections for looseness and damage, check for exhaust gas leakage	Gr 15
26	Starter function					×	Operate starter switch and check the switch functions properly	Gr 54
27	Alternator function					×	Check function with a circuit tester	Gr 54

Inspection and maintenance		Time of inspection and maintenance					Working procedures	Remarks
				Inspection interval				
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Every 10000 km/ 6000 miles	Every 30000 km/ 18000 miles *1	Every 60000 km/ 36000 miles *2		
POWER TRAIN								
28	Air or oil leakage from power train			×			Check power train for air and oil leakage	
29	Clutch pedal play			×			Press clutch lightly and check that play is adequate	Gr 21
30	Clutch function			×			(1) Press the clutch pedal to check for unusual noise or stiffness. Also check if gearshift engages quietly (2) Check the clutch does not slip and engages smoothly	Gr 21
31	Manual transmission gearshift control looseness				×		In NEUTRAL position, check shift lever for looseness. With shift lever in each gear position, check engagement condition and degree of looseness. Also check if control cable is damaged	Gr 22
32	Automatic transmission range selector linkage and throttle (modulator) linkage condition					×	Shifting to each shift range must be done firmly and securely	Gr 23
33	Propeller shaft couplings and bearings looseness		×	×			(1) Check flange yoke bolt and center bearing attaching bolt for looseness (2) Turn propeller shaft manually to check for spline looseness (3) Check looseness between spider and needle roller bearing	Gr 25
FRONT AND REAR AXLES								
34	Axle shaft torsion and cracks					×	Remove axle shaft and check for torsion, bending, and cracks	Gr 27
35	Front wheel hub bearing looseness				×		With front axle jacked up, move the wheel up and down holding the top and bottom of the tire to check for bearing looseness	Gr 26
36	Rear wheel hub bearing damage					×	Disassemble rear wheel and check for hub bearing wear and damage	Gr 27
37	Retightening wheel nuts		×	×			Check wheel nuts for looseness after replacing tires, also after 1000 km/600 miles	Gr 31
38	Disc wheel damage			×			Check disc wheel for corrosion, deformation and cracks	Gr 31
39	Tire inflation pressure, cracking, tread groove depth, abnormal wear, etc.	×		×			(1) Measure inflation pressure with tire gauge, and check that tire tread groove is deep enough (2) Check tire tread and side walls for cracks, damage, uneven wear, stepped wear and other abnormal wear	Gr 31
40	Tire rotation			×			Rotate all tires	Gr 31
SUSPENSION SYSTEM								
41	Looseness, play and damage of suspension system				×		Check suspension system for looseness, play and damage	Gr 33, 34
42	Damage and looseness of leaf springs	×			×		Check leaf springs for damage and looseness	Gr 33, 34
43	Retightening U-bolts		×		×		Check U-bolts for looseness	Gr 33, 34
44	Oil leakage and damage of shock absorbers				×		Check for oil leakage and damage of cylinder, etc.	Gr 33, 34
BRAKING SYSTEM								
45	Discharge of condensed water from air tank	×					Discharge condensed water from air tank by opening drain cock	Gr 35
46	Air pressure and its charging speed	×					After discharging air from air tank, start and run the engine at idle and measure time taken to charge air to specified pressure in air tank	Gr 35
47	Air and fluid leakage from braking system			×			Check braking system for air and fluid leakage	Gr 35
48	Looseness, play and damage of braking system parts			×			Check braking system parts for looseness, play and damage	Gr 35

	Air dryer desiccant replacement			Every 24 months			Disassemble the air dryer and replace the desiccant and rubber parts	Gr 35
56	Brake shoe clearance				×		Measure clearance with feeler gauge	Gr 35
57	Brake lining wear				×		Check lining wear	Gr 35
58	Brake drum wear					×	Disassemble and check drum for wear, cracks and damage	Gr 35
59	Parking brake effectiveness			×			On a slope, check that vehicle can be held stationary	Gr 36
60	Parking brake lever stroke	×		×			With lever fully pulled, check that lever is locked completely and that there is allowance in pulling stroke	Gr 36
61	Parking brake drum and lining wear					×	Disassemble and check drum for wear, cracks and damage and check lining for wear	Gr 36
62	Wheel cylinder piston cup and dust seal replacement			Every 12 months			Check wheel cylinder piston cup and dust seal; replace if necessary	Gr 35
63	Brake booster packing, cup and rubber parts replacement			Every 12 months			Check brake booster packing, cup and rubber parts; replace if necessary	Gr 35
64	Brake hose replacement			Every 12 months			Check brake hose; replace if necessary	Gr 35
65	Check valve packing and rubber parts replacement			Every 12 months			Check the check valve packing and rubber parts; replace if necessary	Gr 35
66	Brake valve packing and rubber parts replacement			Every 12 months			Check brake valve packing and rubber parts; replace if necessary	Gr 35
67	Air compressor and pressure gauge hoses replacement			Every 24 months			Replace air compressor and pressure gauge hoses	Gr 35
68	Brake booster power cylinder packing replacement			Every 24 months			Replace brake booster power cylinder packing	Gr 35
69	Brake fluid reservoir tank tube replacement			Every 24 months			Check and replace brake fluid reservoir tank tube	Gr 35
STEERING SYSTEM								
70	Fluid leakage from steering system			×			Check steering system for fluid leakage	Gr 37
71	Steering wheel play	×		×			Turn steering wheel right and left to measure play at steering wheel rim. Measure while engine is running	Gr 37
72	Steering operating condition	×		×			Check steering wheel to see if it vibrates, pulls to one side or requires unusual steering effort	Gr 37
73	Looseness and play of steering system (including hoses and pipes)			×			(1) Check steering system for looseness and play (2) Check power steering hoses and pipes for looseness	Gr 37
74	Wheel alignment					×	Measure toe-in, camber, caster and kingpin inclination angles	Gr 26

https://truckmanualshub.com/

MAINTENANCE SCHEDULE TABLES

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.
*2 : 60000 km/36000 miles or 12 months, whichever occurs first.
Ⓔ : Exhaust emission items
Ⓝ : Noise control items

Inspection and maintenance		Time of inspection and maintenance					Working procedures	Remarks
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Inspection interval: Every 10000 km/6000 miles	Every 30000 km/18000 miles *1	Every 60000 km/36000 miles *2		
75	Right and left turning angles and power steering function					×	Check that stopper bolt is sufficiently tight, without damage, and that steering linkage operates smoothly until blocked by stopper bolt. Also check that steering wheel does not make contact with other parts	Gr 26
76	Power steering booster and oil pump internal rubber parts replacement			Every 24 months			Replace internal rubber parts	Gr 37
77	Power steering hose replacement			Every 24 months			Replace power steering hose	Gr 37
CAB AND FRAME								
78	Looseness and damage of chassis and body			×			(1) Check frame, cross members and other parts for loose rivets (2) Also check for body damage and loose mounting bolts	Gr 41, 42
79	Heater and defroster operation			×			Check operation and installation of defroster	Gr 55
80	Reflection of rearview mirrors and reflectors	×					Check for reflecting condition, stains and damage	Gr 42
81	Door lock function			×			Check door lock mechanism functions properly	Gr 42
82	Seat belt mounting condition			×			Check seat belt for damage, buckle and retracting function and mounting condition	Gr 42
ELECTRICAL SYSTEM								
83	Looseness and damage of electrical wiring and connections			×			Check wiring, connectors and battery terminals for looseness and corrosion	Gr 54
84	Battery electrolyte level and specific gravity			Every 20000 km/12000 miles			(1) Check electrolyte level (2) Measure electrolyte specific gravity with hydrometer	Gr 54
85	Operation and damage of lighting system	×		×			Check operation, damage and installation of each lighting unit	Gr 54
86	Operation of horn and turn signal lamps	×		×			Check operation, damage and mounting condition. Also check turn signal lamps are operated by turn signal switch	Gr 54
87	Operation and fluid level of windshield wiper and washer	×		×			Check operation, damage and mounting condition. Check if fluid level in washer tank is okay	Gr 42
88	Gauges and pilot lamps function	×		×			Check function of gauges and pilot lamps	Gr 54
89	Switch function					×	Check operation, damage and installation of each switch	Gr 54
OTHER								
90	Road test of vehicle			×			Drive the vehicle to check for overall vehicle operating condition	

https://truckmanualshub.com/

This section explains simple maintenance procedures. See the relevant Group in this manual for further details.

Replacement of Oil Filter

Lubricant

Location	Points of application	Kinds	Quantity
2	Inside oil filter	Engine oil	Approximately 1 L {1.1 qts}
	Gasket area of oil filter with thin application	Engine oil	As required

Special tools

Unit : mm {in.}

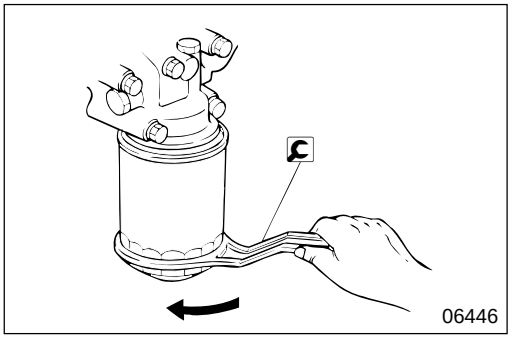
Location	Tool name and shape	Part No.	Application
2	Oil filter wrench  06478	MH061587	Removal of oil filter

WARNING

- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**

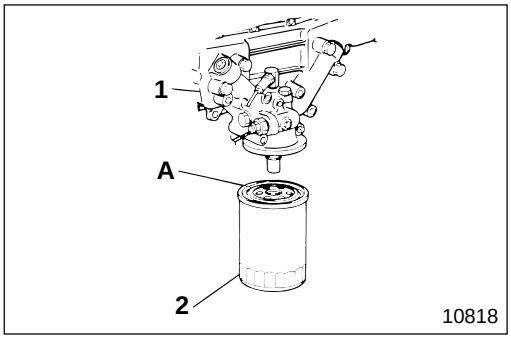
CAUTION

Take care not to spill engine oil on the V-belts, because this would cause them to slip, reducing service life.



06446

[Removal]



10818

[Installation]

- Clean the surface of oil cooler body **1** that makes contact with oil filter **2**.
- Apply engine oil thinly and evenly to gasket area **A** of oil filter **2**.
- Screw oil filter **2** into oil cooler body **1** until gasket area **A** sits on the body. From this position, tighten further by rotating by three quarters of a turn.
- After installation, run the engine and check that there is no oil leakage from gasket area **A**.
- Check the oil level and if it is low, top it up.

https://truckmanualshub.com/

Replacement of Fuel Filter

Lubricant

Location	Points of application	Kinds	Quantity
2	Gasket contact surfaces of fuel filter and fuel filter head	Engine oil	As required

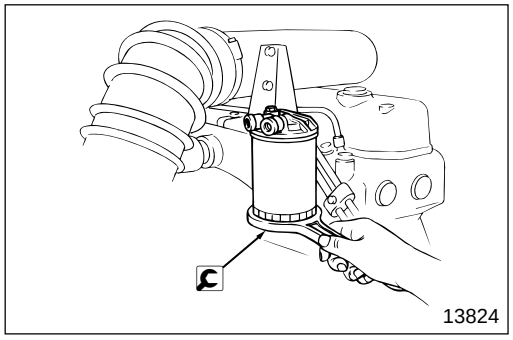
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
2	Filter wrench  01882	MH061572	Removal of fuel filter

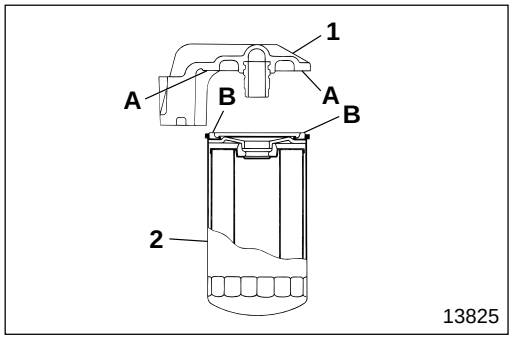
WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any gas oil that has been spilled because it can cause a fire.**
- **Do not use an unsuitable filter because it can cause a fire.**



13824

[Removal]



13825

[Installation]

- Install by tightening three quarters to one full turn after contact surface **A** of fuel filter head **1** makes contact with gasket **B** of fuel filter **2**. Be sure to tighten by hand.
- After installation, run the engine and check for fuel leakage.

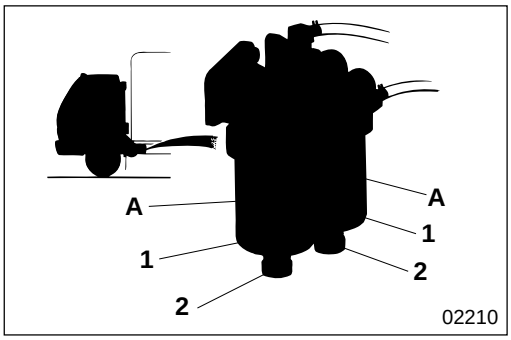
https://truckmanualshub.com/

Draining of Water Separator Condensation

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Drain plug	2.9 to 3.9 {2.2 to 2.9, 0.3 to 0.4}	—



Visually inspect the water separator before driving.
When float **1** reaches red line **A**, drain the condensation as follows:

- Loosen drain plug **2** and drain out the condensation.
- When float **1** has dropped to the bottom, tighten drain plug **2**.
- Carefully wipe the water separator and the surrounding area.
- Check for fuel leakage.

Cleaning of Fuel Feed Pump Gauze Filter

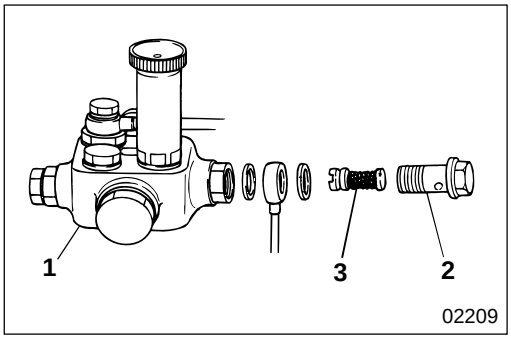
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Eye bolt	25 to 29 {18 to 22, 2.5 to 3}	—

WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any gas oil that has been spilled because it can cause a fire.**



- Remove eye bolt **2** on the inlet side of fuel feed pump **1**.
- Remove gauze filter **3** from eye bolt **2**.
- Clean gauze filter **3** with gas oil.
- Follow the removal sequence in reverse and reinstall gauze filter **3**. Install eye bolt **2** in the fuel feed pump.
- Bleed the air from the fuel line.
- Start the engine and check for fuel leakage.

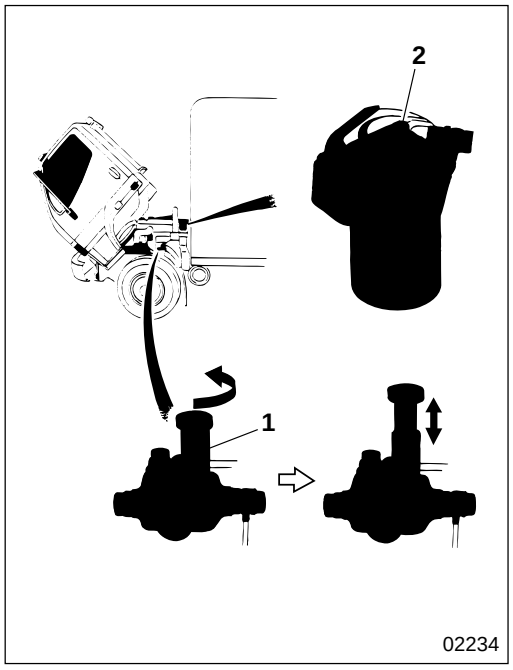
https://truckmanualshub.com/

Bleeding of Air from Fuel Line

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Air vent plug	7.8 to 12 {5.8 to 8.7, 0.8 to 1.2}	—



WARNING⚠

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any gas oil that has been spilled because it can cause a fire.**

- Turn the top of priming pump **1** of the injection pump counterclockwise and pull it up so the top protrudes.
- Loosen air vent plug **2** of the fuel filter and move the top part of priming pump **1** up and down.
- Move priming pump **1** up and down repeatedly until air bubbles are no longer present in the fuel drained from air vent plug **2**.
- When the fuel being drained is free of air bubbles, tighten air vent plug **2**.
- After moving priming pump **1** up and down another five or six times, push the top down and turn clockwise to drive it in fully.
- After bleeding the air, carefully wipe up spilled fuel and start the engine.
- Check for fuel leakage.

https://truckmanualshub.com/

Adjustment of V-Belt Tension

Newly installed V-belts can stretch during their initial running-in period. To prevent this from becoming a problem, run the engine for several minutes after installing the V-belt, then readjust. Perform this cycle several times.

WARNING⚠

You must take special precautions to prevent the engine from rotating while a V-belt is being inspected or adjusted.

CAUTION⚠

- **Make sure that you turn off the engine before attempting to inspect or adjust the V-belts.**
- **Make sure that you fasten all bolts and nuts securely after adjusting the V-belts. Remember that too much tension can damage the V-belts and bearings.**
- **Do not grease V-belts. This causes them to slip, which reduce service life.**

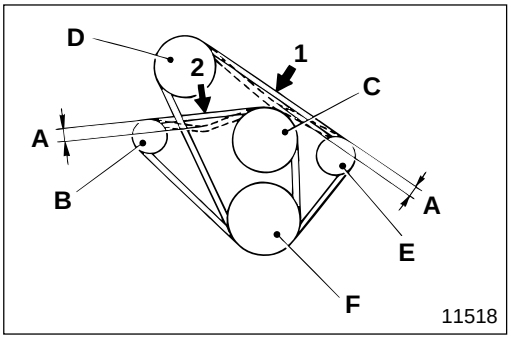
Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1, 2	V-belt tension (Each one)	Fan	12 to 16 {0.47 to 0.63}	—	Adjust
		Air-conditioner	16 to 20 {0.63 to 0.79}		

Special tools

Location	Tool name and shape	Part No.	Application
1, 2	Belt tension gauge 03612	MH062345	Measurement of tension of V-belt

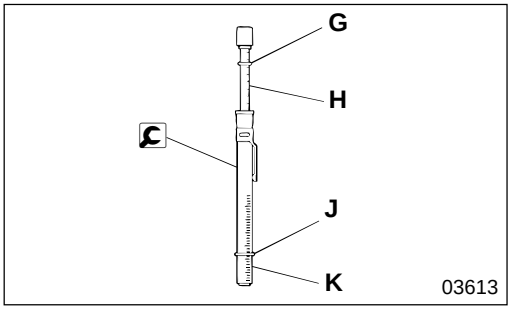


[Inspection]

Measure the extent of flex **A** when the center of V-belts **1**, **2** as illustrated is depressed with a force of 98 N·m {72 lbf.ft, 10 kgf·m}.

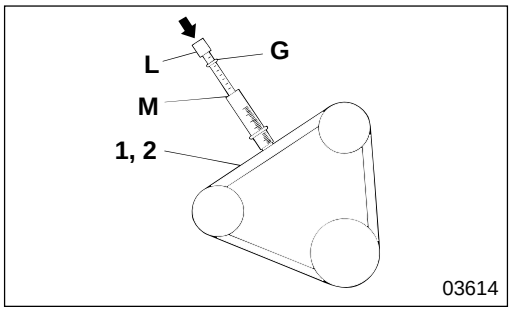
- **B** : Alternator pulley
- **C** : Water pump pulley
- **D** : Cooler compressor pulley (Air-conditioner)
- **E** : Tension pulley
- **F** : Crankshaft pulley

https://truckmanualshub.com/

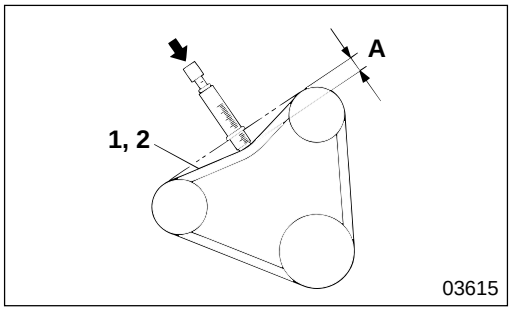


Use of special tool belt tension gauge

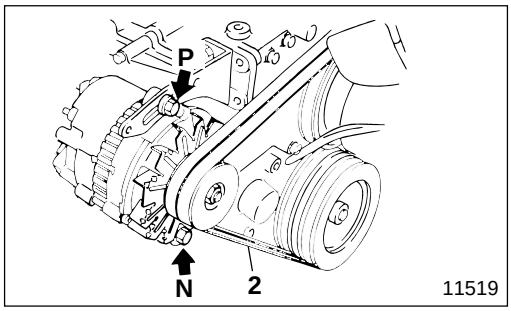
- Set upper O-ring **G** of 🔧 belt tension gauge to 98 N·m {72 lbf.ft, 10 kgf·m} (push load) on graduation **H**.
- Set lower O-ring **J** of 🔧 belt tension gauge to graduation **K** (maximum flex of belt).



- Place 🔧 belt tension gauge at the center of V-belts **1**, **2** perpendicularly as illustrated and push top **L** all the way down until upper O-ring **G** hits upper edge **M**.



- Measure the extent of flex **A** of V-belts **1**, **2** at this point, and if the measured value deviates from the standard value, adjust as follows:



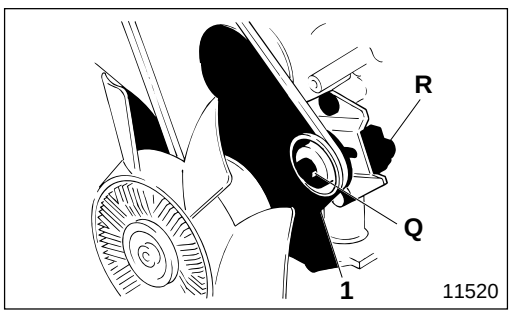
[Adjustment]

(1) Adjustment of tension of V-belt for fan

- Loosen alternator mounting bolts **N** (two points), and adjust the tension of V-belts **2** by moving adjusting bolt **P**.
- After adjustment, tighten the bolts **N**, **P** securely.

CAUTION ⚠

- **Bear in mind that excessive tension of V-belts 2 might damage the belts and bearings that engage with the V-belts.**
- **Be sure to replace V-belts 2 as a set to maintain even tension between them.**
- **Be careful not to let oil stick to V-belts 2. If oil gets onto the belts, it causes slipping, resulting in overheating and insufficient battery charging.**



(2) Adjustment of tension of V-belt for air-conditioner

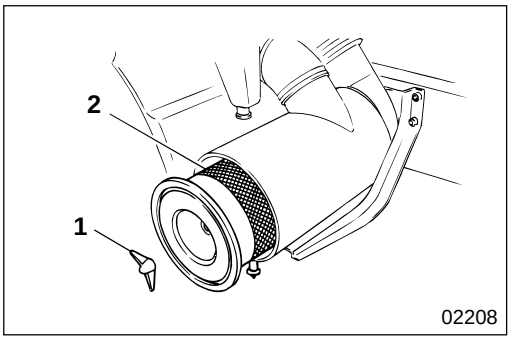
- Loosen tension pulley mounting nut **Q**, and adjust the tension of V-belt **1** moving adjusting bolt **R**.
- After adjustment, tighten mounting nut **Q** securely.

CAUTION ⚠

- **Bear in mind that excessive tension of V-belt 1 might damage the belt and bearings that engage with the V-belt.**
- **Be careful not to let oil stick to V-belt 1. If oil gets onto the belt, it causes slipping, resulting in poor performance of the air conditioner.**

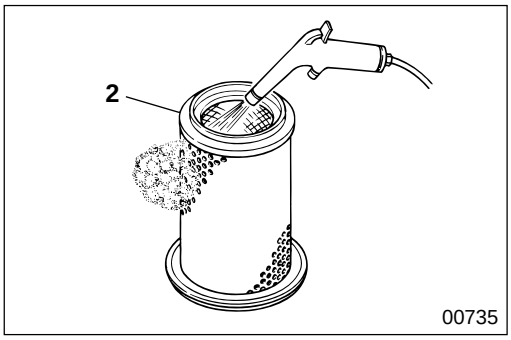
https://truckmanualshub.com/

Cleaning and Replacement of Air Cleaner Element



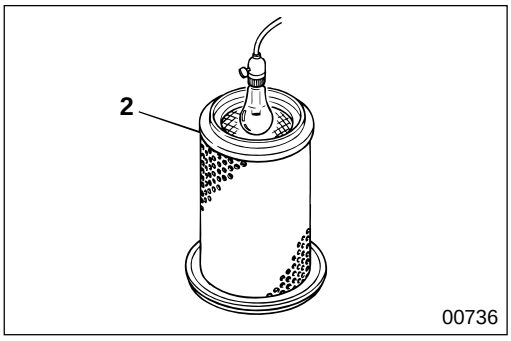
[Removal]
Remove wing nut **1** to remove element **2**.

[Installation]
Install element **2** securely.



[Cleaning]
- Blow compressed air of 685 kPa {100 lbf/in^2, 7 kgf/cm^2} or less through air cleaner element **2** from the inside.
- When using compressed air, move the blower's nozzle up and down along the pleats of air cleaner element **2** evenly.

CAUTION
- **Do not tap or hit air cleaner element 2 to remove dust.**
- **Do not blow compressed air through air cleaner element 2 from the outside.**



[Inspection]
- Illuminate the inside of air cleaner element **2**.
- If parts of the filter paper are torn or thin, or if the packing of the upper surface of air cleaner element **2** is damaged, replace the air cleaner element.

NOTE

If the dust on air cleaner element 2 is wet due to oil smoke or soot, replace the air cleaner regardless of the scheduled replacement interval.

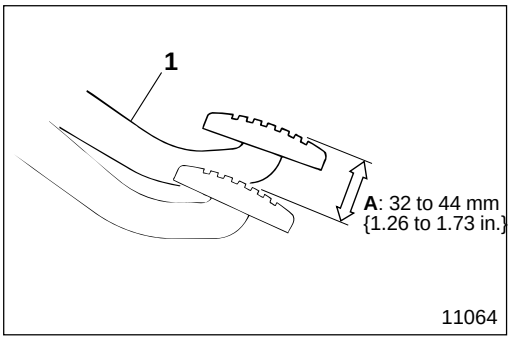
https://truckmanualshub.com/

Inspection of Clutch Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	Clutch pedal free play	32 to 44 {1.26 to 1.73}	—	Adjust or replace



[Confirmation]
Push clutch pedal **1** with your hand and measure the amount of movement **A** (free play) until you meet resistance. If the measured value does not conform to the standard value, adjust by stroke of clutch power cylinder push rod, or replace the clutch disc.

[Clutch operation]
- Check for unusual noises when clutch pedal **1** is pressed while the engine is idling, and also for abnormally heavy clutch operation. Also check to be certain that it is not difficult to shift the vehicle into first and reverse gears.
- Gradually release clutch pedal **1** to set the vehicle in motion.
  Check to be sure there is no slippage, and that the clutch engages smoothly.

Tire

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	Depth of tire tread grooves	—	1.6 {0.063}	Replace

Tightening torque

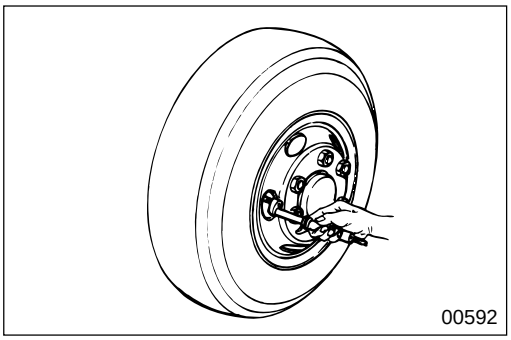
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Wheel nut	370 to 410 {275 to 305, 38 to 42}	Wet

Lubricant

Location	Points of application	Kinds	Quantity
2	Wheel nut spherical area	Chassis grease [NLGI No.1 (Ca soap)] or Wheel bearing grease [NLGI No.1 (Li soap)]	As required
4	Wheel nut (inner) at thread area and spherical area		
6	Thread area of hub bolt		

https://truckmanualshub.com/



00592

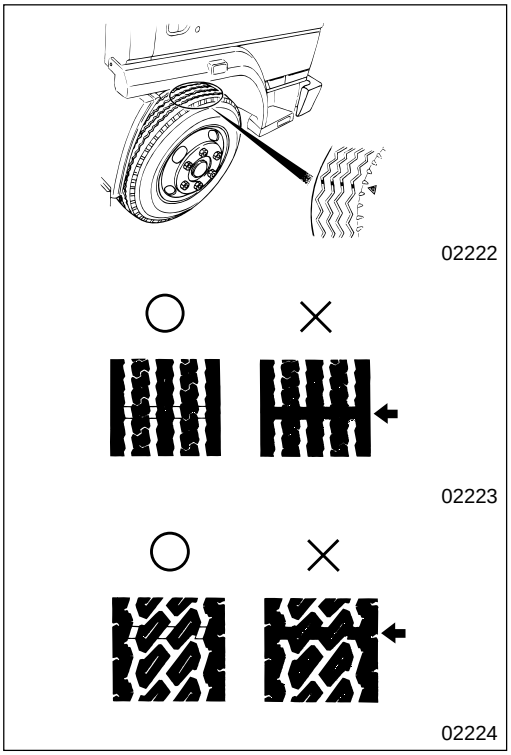
Air pressure

Tire air pressure should be checked before the vehicle is driven, while the tires are still cool.

Tire Size	Air Pressure kPa {Psi, kgf/cm^2}
215/75R 17.5 124/123L	700 {100, 7.00}

CAUTION

- **Make certain that there is no difference in the air pressure between the inner and outer rear tires.**
- **Make certain you use valve caps on the air valves.**
- **It is not necessary to increase the air pressure for high-speed driving.**



02222

02223

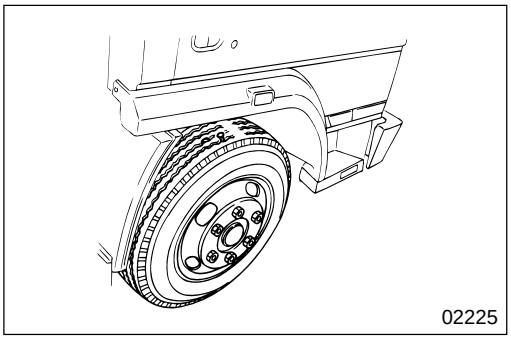
02224

Checking tread depth

- Check all around the tire treads to make sure that the depth of the tread grooves is above the wear limit.
- If the tread grooves are not deep enough, slip sign **A** appears at the position of the ⚠ mark, where the tread groove has worn away.

WARNING

If the depth of the tread grooves is not adequate, the tires will slip on wet roads and present a hazard. Such tires are also extremely dangerous because they are more susceptible to hydroplaning when the vehicle is running at high speeds in the rain. Such tires must be replaced with new ones as soon as possible.



02225

Checking for cracks, damage, and objects embedded in the treads

- Check the tire treads and walls for cracks and damage.
- Check tire treads for uneven wear or other abnormal wear.
- Check if metal objects or nails have penetrated the tires.
- Check for stones embedded between double tires.

WARNING

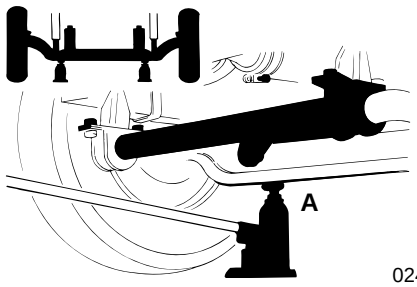
Badly damaged or worn tires are extremely dangerous, because they can be punctured more easily when the vehicle is running, they must be replaced with new ones as soon as possible.

https://truckmanualshub.com/

Removing tires

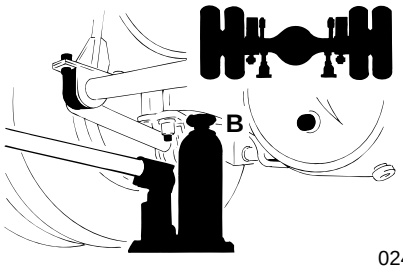
- Jacking up point
  - For front wheels : Front axle bottom A
  - For rear wheels : Rear axle tube bottom B

< Front wheel >



02476

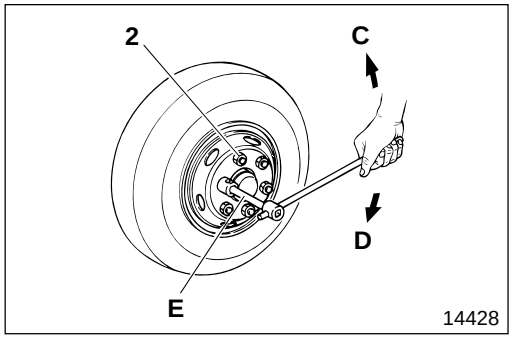
< Rear wheel >



02479

WARNING

- **The jack should be placed on flat, solid ground, and should not be used to raise the vehicle higher than necessary.**
- **Do not use the jack at vehicle locations other than those illustrated.**
- **Keep in mind the danger of a slipping jack. Never crawl under the vehicle while the jack is in use or rock the vehicle. Also, do not start the engine while the vehicle is jacked up.**
- **To increase safety, use supports for the vehicle when it is necessary to leave it jacked up for long periods.**
- **Chock both the tire to be removed and the tire diagonally opposite to it so that they will not rotate when you are removing the tire.**



14428

- Loosen wheel nuts **2** slightly. The wheel nuts for right tires **C** have right-hand threads "**R**", and the wheel nuts for left tires **D** have left-hand threads "**L**".

WARNING

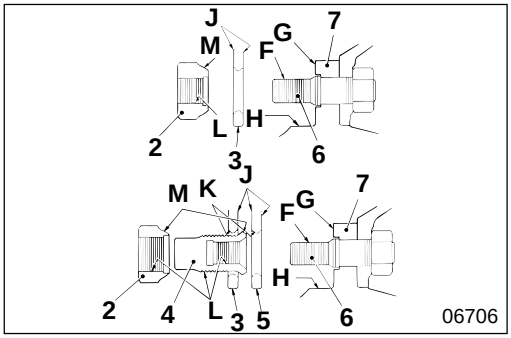
Make certain that wheel nut wrench E is fully engaged, all the way to the back of nuts 2. If it is not, it could slip.

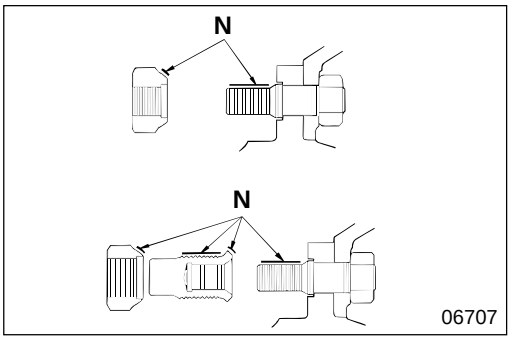
CAUTION

Only loosen wheel nuts 2 slightly. Do not remove them.

- Jack up the vehicle carefully, until the tire is slightly off the ground. Remove wheel nuts **2**, then remove the tire.
- When working on the double tires at the rear of the vehicle, first remove the outside tire, then lower the vehicle and loosen the nuts on the inside tire. After doing this, jack the vehicle back up and remove the tire.

https://truckmanualshub.com/



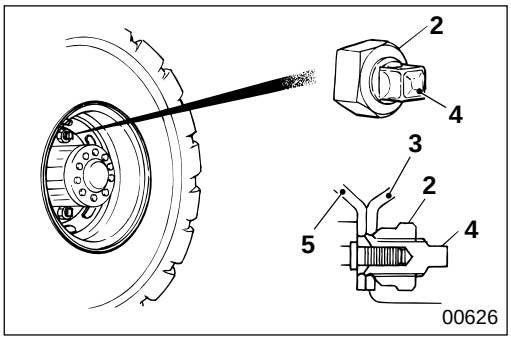


Mounting tires

- To prevent wheel nuts **2**, **4** and hub bolt **6** from becoming loose and to prevent mounting parts (tire assemblies **3**, **5** and hub **7**) from being damaged, remove rust, dust, additional coatings of paint, and foreign particles from the following areas:
  F : Hub bolt thread area
  G : Wheel mounting surface of hub
  H : Wheel alignment area of hub
  J : Disc wheel mating surface
  K : Disc wheel nut mounting surface
  L : Wheel nut thread area
  M : Wheel nut spherical area
  N : Grease application area

WARNING⚠

Never use grease containing molybdenum disulfide, since it can cause loosening of fitted screws.



- Put on the double rear tires as follows:
  - After mounting inner tire **5** and fully tightening inner wheel nuts **4**, jack the vehicle up and mount on outer tire **3**, then tighten outer wheel nuts **2**.
  - Even if only outside tire **3** is to be changed, do not mount it until inner wheel nuts **4** have been fastened at the specified torque.
  - Slide the air valves on the inside and outside tires down when mounting the tires.

WARNING⚠

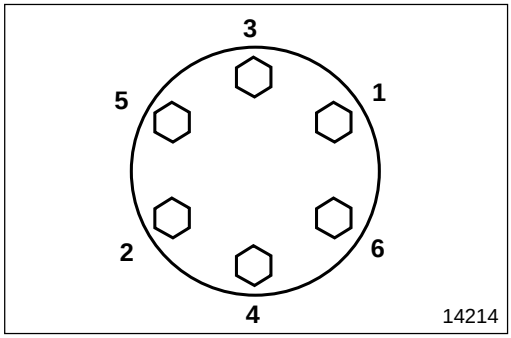
If the threads are scored, or the disc wheel is deformed or cracked, change bolts 6, nuts 2, 4 and disc. Driving the truck before correcting such problems can cause the tire in question to come loose, which could be the source of major accidents.

CAUTION⚠

Check hub bolt 6 threads carefully for scratches before putting the tire on.

- Place the tapered end of wheel nuts **2, 4** towards the disc wheel and fasten temporarily. Center so that there is no eccentricity between bolts **6** and the disc wheel bolt holes.
- Lower the vehicle.

https://truckmanualshub.com/



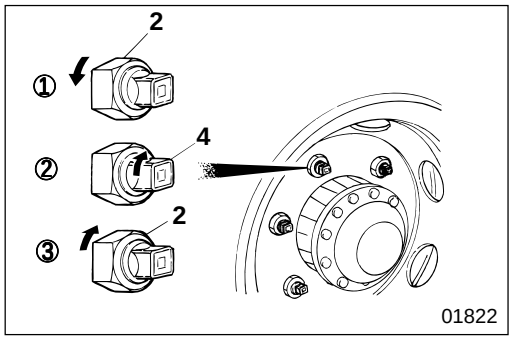
- Tighten the nuts in the order as illustrated, tightening each nut two or three times. To finish, tighten each nut at the specified torque.

WARNING

Always use the specified torque when tightening the wheel nuts. If the wheel nuts are not tightened properly, the wheels could come loose while the vehicle is being driven, which could result in life threatening accidents or the truck being disabled.

CAUTION

Over-tightening the wheel nuts can damage them.



Checking the wheel nuts for looseness

The wheel nuts should be checked for looseness every 10000 km (6000 miles). All nuts should be tightened at the specified torque.

- Check the double rear tires for looseness as follows:

① Loosen outer wheel nuts **2**.
② Tighten inner wheel nuts **4** at specified torque.
③ Tighten outer wheel nuts **2** at specified torque.

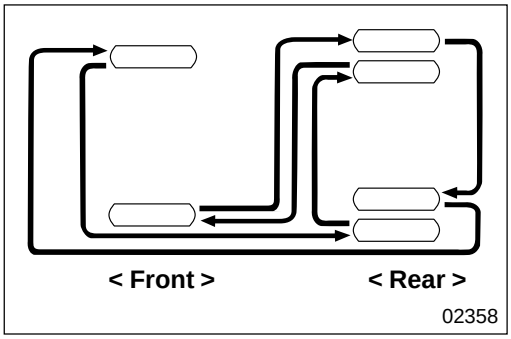
CAUTION

If outer wheel nuts 2 are tightened without first being loosened, it might not be possible to tighten them at the specified torque.

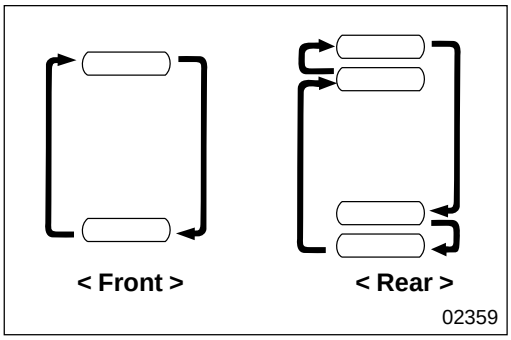
https://truckmanualshub.com/

Tire rotation

Tires wear differently, according to the location where they are mounted. To make this wear uniform and prolong the life of your tires, they should be rotated every 10000 km (6000 miles) in the rotation order shown below:



- When the tread patterns for all tires are identical:



- When the tread patterns are different for the front and rear tires:

CAUTION⚠

- **Always adjust air pressure after running-in new tires.**
- **When using tires of different tread patterns, use rib-type patterns for the front tires and traction type patterns for the rear tires.**
- **Avoid using both radial and biased tires on the same vehicle.**

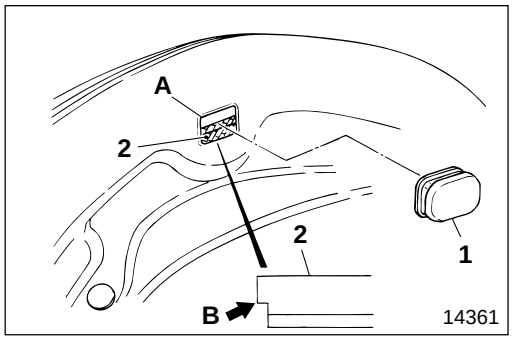
https://truckmanualshub.com/

Inspection of Brake Lining Thickness

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2	Thickness of brake lining	—	5 {0.20} (Wear limit at side step)	Replace



NOTE

Be sure to inspect at two points for each wheel per side.

- Remove check hole plug **1** from the packing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall check hole plug **1**.

Battery

DANGER⚠

- **Since flammable hydrogen gas is generated by the battery, be sure to obey the following warnings :**
  - **Do not short-circuit the ⊕ and ⊖ terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over the battery.**
- **Because the battery electrolyte is diluted sulfuric acid and is corrosive, when handling the battery wear safety glasses and rubber gloves to protect the eyes and hands.**

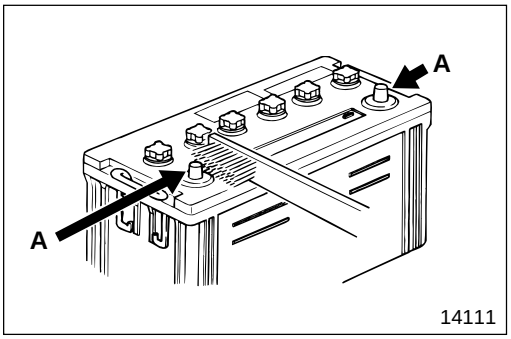
WARNING⚠

To prevent a short-circuit be sure that disconnected the battery cables do not accidentally touch the battery terminals.

CAUTION⚠

- **Make sure that you disconnect the battery cable ⊖ first when you disconnect the battery cables.**
- **Make sure that all electrical switches of the vehicle are OFF before connecting the battery cables.**
- **Make sure that you connect the battery cable ⊕ before you connect the battery cable ⊖.**

https://truckmanualshub.com/

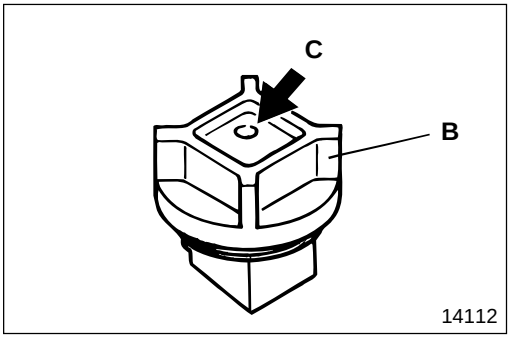


Visual inspection

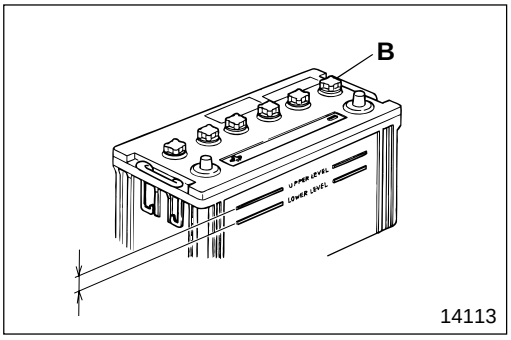
- If terminal **A** is corroded, scrub off the corrosion from it using a wire brush.
- If cracks or defects are found on the battery, replace it since the cracks or defects can cause liquid spills.

CAUTION

Make sure you grease the ⊕ side of terminal A because it is easily corroded.

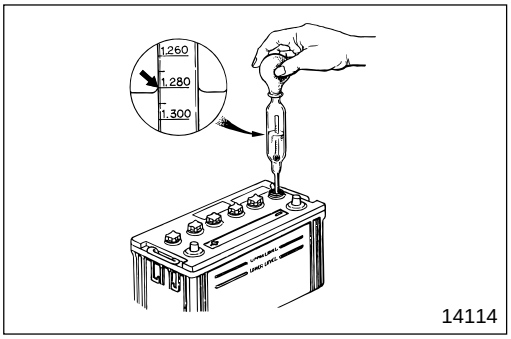


- If bleed hole **C** of vent plug **B** is clogged, clean the hole.



Inspection of fluid level

- Make sure that the battery electrolyte level is between UPPER and LOWER.
- If the level is below LOWER, remove vent plug **B** and fill the battery with distilled water or battery replenisher to UPPER.



Measurement of specific gravity

Measure the specific gravity of the battery electrolyte. If the measured value is lower than the limit, charge the battery.

NOTE

The specific gravity of the battery electrolyte depends on the liquid temperature. Use the following formula to convert the actual value to the value were the temperature 20°C {68°F}.

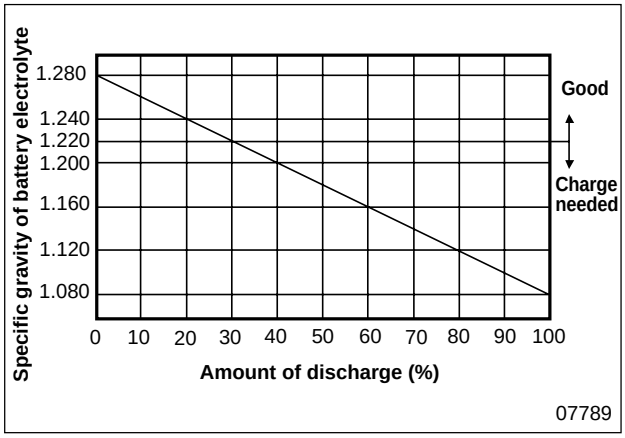
$$S_{20}\{68\} = S_t + 0.0007\,(t - 20\{68\})$$

$S_{20}\{68\}$: Specific gravity were the temperature 20°C {68°F}

S_t : Specific gravity actually measured with the temperature at t°C {t°F}

t : Temperature of battery electrolyte

https://truckmanualshub.com/



Charging

- Although, as a rule, charging of the battery should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect the battery cable ⊖.
- Remove vent plug **B** before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity / 10 {113}	*Amount of discharge (Ah) / Charge current (A) ×1.2(to 1.5)	45
Quick charge	Value of 5-hour rating capacity / 1.5 {131}	0.5	55

* Amount of discharge (Ah)=5-hour rating capacity (Ah)× Amount of discharge (%) / 100

- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER

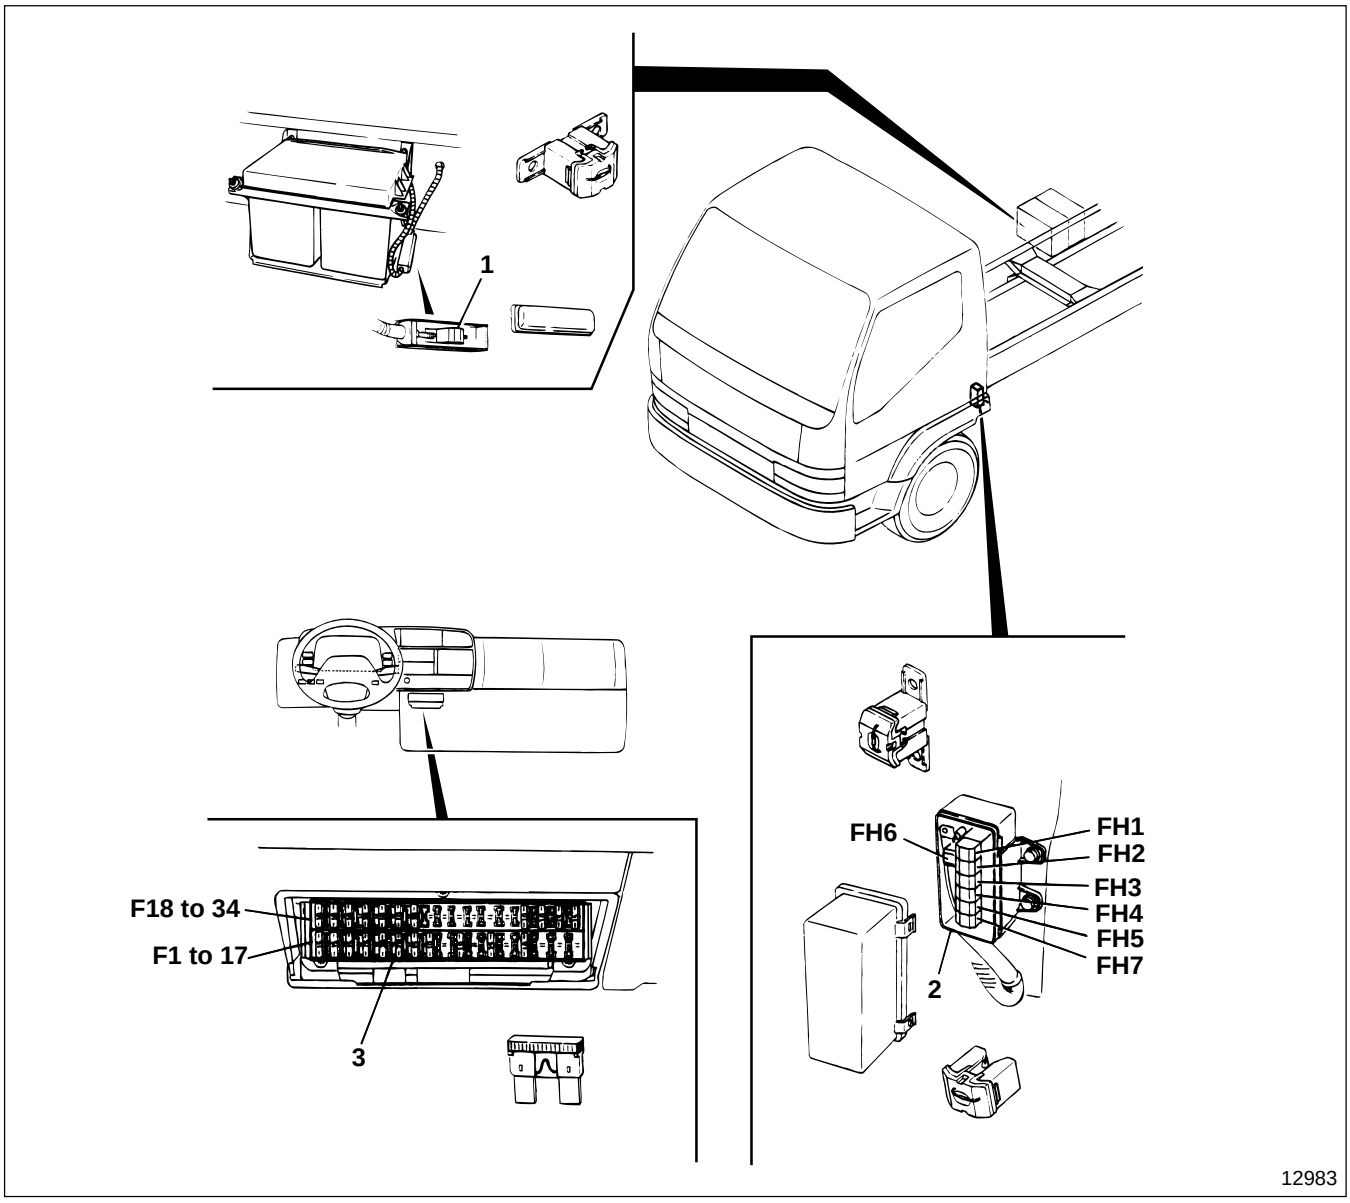
- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep naked lights away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because its dangerous.**
- **After charging the battery, tighten vent plug B, wash away sulfuric acid from the battery using water, and dry the surface.**

https://truckmanualshub.com/

M E M O

https://truckmanualshub.com/

Fuse



1 Main high-current fuse
2 High-current fuse box
3 Fuse box

CAUTION ⚠

- **If a fuse blows, make sure you identify and remedy the cause, then replace the fuse.**
- **Make sure that you replace the fuse with one having the same rating.**
- **Make sure that you remove the ⊖ terminal of the battery cable before removing main high-current fuse 1 and high-current fuses FH1 to 7.**

https://truckmanualshub.com/

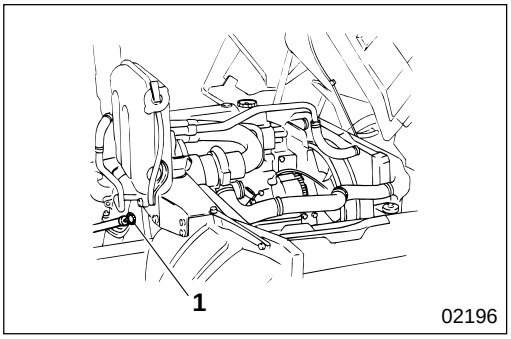
Engine Oil

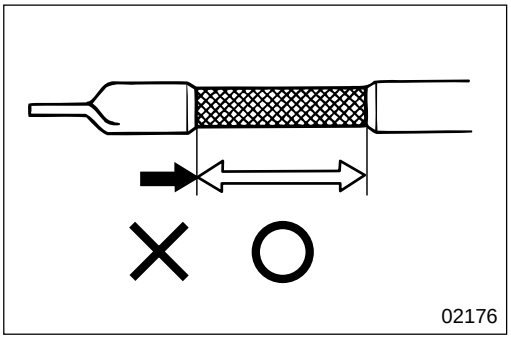
Tightening torque

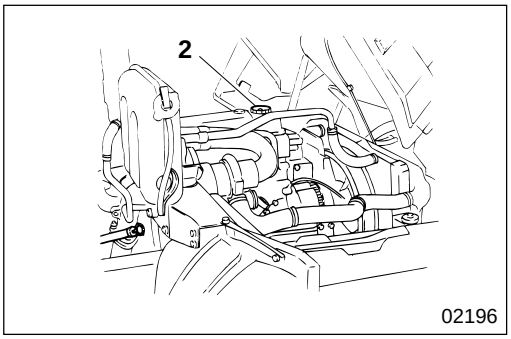
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Oil pan drain plug	69 {51, 7}	—



[Inspection]
- Pull out dipstick **1**, wipe off the oil with a cloth.
- Reinsert dipstick **1**, then pull it out carefully.
- Oil level is correct if there is oil sticking to dipstick **1** within the hatched area.
- If the level is low, top it up.
- Tilt the cab.





[Replenishment]
- Clean the area surrounding oil filler cap **2** and prevent dust from entering through the filler.
- Remove oil filler cap **2** and top up with engine oil.
- Wait five minutes before checking the oil level.
- Replace filler cap **2**.

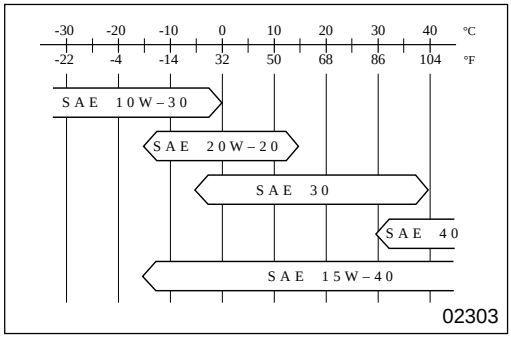
WARNING
- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot as it will burn you.**

CAUTION

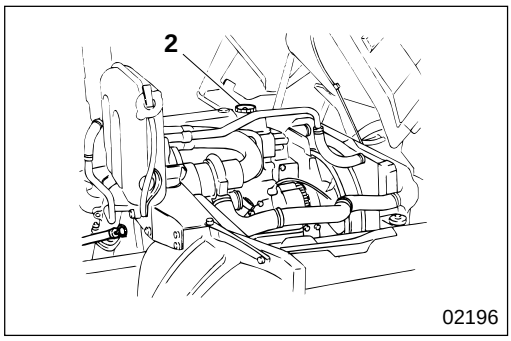
Take care not to spill engine oil on the V-belts, because this would cause them to slip, reducing service life.

https://truckmanualshub.com/

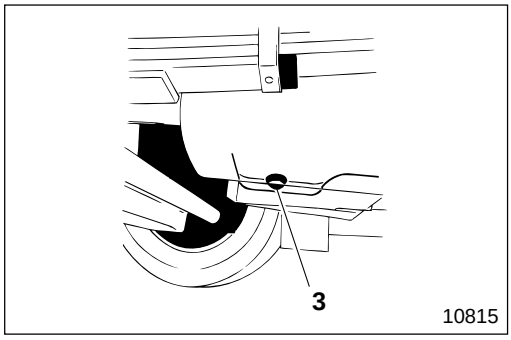
LUBRICATION



[Replacement]
Since engine oil greatly influences the performance, the life expectancy, and the ability to start the engine, use only oil of the specified grade and viscosity.
The chart illustrates the relationship between oil viscosity and the ambient air temperature.



- Clean the area surrounding oil filler cap **2** and prevent dust from entering through the filler.
- Remove oil filler cap **2**.
- Remove oil pan drain plug **3**, and drain the oil. At the same time replace the oil filter.
- After reinstalling drain plug **3**, slowly add engine oil through the oil filler.
- Using the dipstick, check the oil level after more than six minutes have passed.
- Start the engine and let it idle. When the oil has reached all parts, stop the engine. Let 30 minutes pass before checking the oil level again.



https://truckmanualshub.com/

Clutch Fluid (Brake Fluid)

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

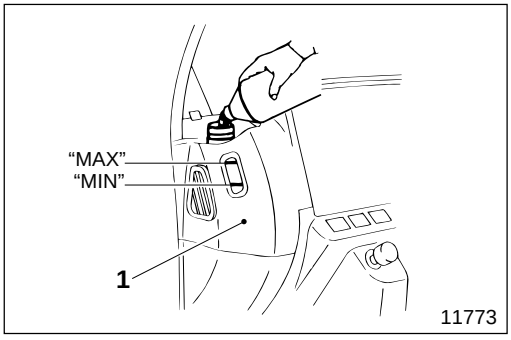
Location	Parts to be tightened	Tightening torque	Remarks
2	Air bleeder	25 to 34 {18 to 25, 2.5 to 3.5}	—

Fluid

Location	Points of application	Kinds	Quantity
1	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

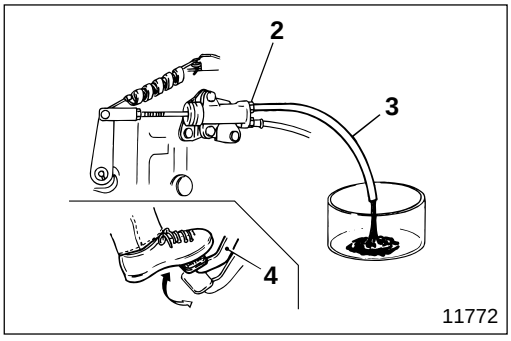
CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**
- **You must use new brake fluid (SAE J1703f or FMVSS No.116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system to swell, resulting in faulty clutch operation.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will cause faulty clutch operation.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oils.**



[Inspection and replenishment]

- Inspect the level of the brake fluid in fluid tank **1**. It should fall between the "**MAX**" and "**MIN**" levels.
- If it is below the "**MIN**" level, lift up the lid flap and remove the cap from fluid tank **1**, then supply the specified brake fluid until the level has come up to the "**MAX**" level. Do not fill above the "**MAX**" level.

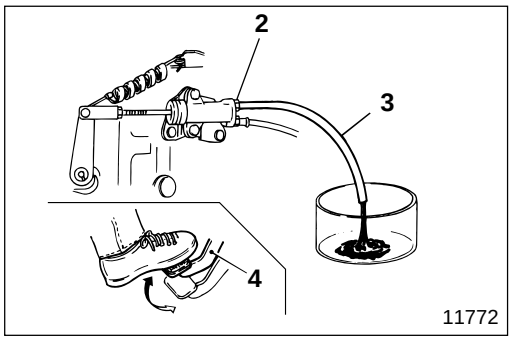


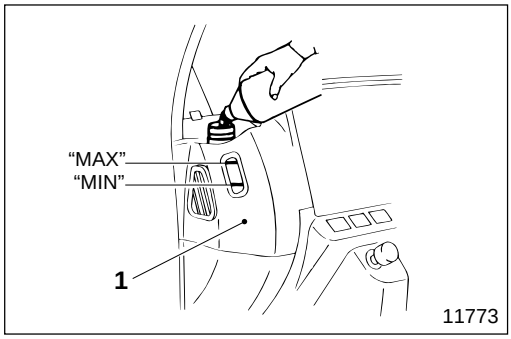
[Replacement]

- Attach vinyl pipe **3** to air bleeder **2** of the clutch power cylinder.
- Loosen air bleeder **2** and depress clutch pedal **4** several times to drain brake fluid completely.

https://truckmanualshub.com/

- Supply new brake fluid to the “MAX” level of fluid tank **1**. Depress clutch pedal **4** repeatedly until the old brake fluid discharged from vinyl pipe **3** is replaced by the new brake fluid.





NOTE

Carry out this operation maintaining the brake fluid level in fluid tank 1 between “MAX” and “MIN”.

- Attach vinyl pipe **3** to air bleeder **2** of the clutch power cylinder as in the replacement procedure.
- Fill fluid tank **1** with brake fluid, and loosen air bleeder **2** of the clutch power cylinder then depress clutch pedal **4** continuously.
- Keep depressing clutch pedal **4**, and tighten air bleeder **2** when air is bled completely.
- Depress clutch pedal **4** several times again, then keep it depressed at its fullest extent.
- With clutch pedal **4** depressed, loosen air bleeder **2** to drain brake fluid containing air. Release the pedal after tightening the air bleeder.

- Repeat this operation until air is no longer present in the fluid being drained.
- When this operation is completed, tighten air bleeder **2** at specified torque.
- Check that brake fluid is at the “**MAX**” level of fluid tank **1**, and supply new brake fluid if necessary.
- Check for brake fluid leakage from each of the parts with clutch pedal **4** depressed.

https://truckmanualshub.com/

Manual Transmission Gear Oil

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

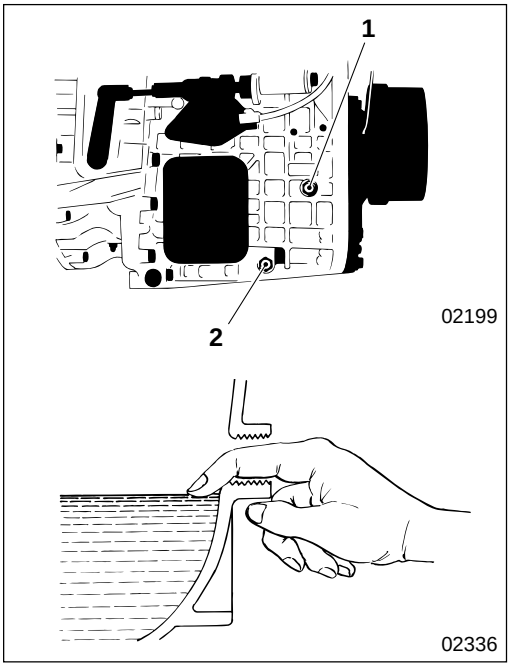
Location	Parts to be tightened	Tightening torque	Remarks
1	Inspection plug	69±15 {51±11, 7±1.5}	—
2	Drain plug	69±15 {51±11, 7±1.5}	—

Sealant

Location	Points of application	Kinds	Quantity
1	Thread area of inspection plug	THREEBOND 1105D	As required
2	Thread area of drain plug	THREEBOND 1105D	As required

WARNING

The engine is hot immediately after the vehicle stopped, so take care not to burn yourself.



[Inspection and replenishment]

- Remove inspection plug **1** and check whether the oil level is up to the edge of the entrance.
- If the level is low, add oil through the inspection plug hole until the level comes up to the edge of the entrance.

[Replacement]

- Drain the oil after removing inspection plug **1** and drain plug **2**.
- Remove any metal particles sticking to the magnetic part of drain plug **2** before reinstalling the plug.
- Add oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Insert inspection plug **1**.

https://truckmanualshub.com/

LUBRICATION

Automatic Transmission Fluid and Oil Filter

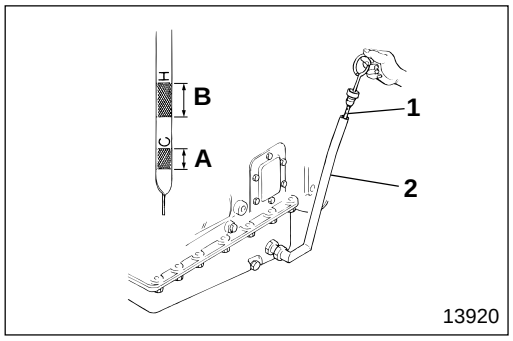
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Drain plug	20 to 27 {15 to 20, 2.05 to 2.75}	—
5	Dipstick guide connector	125 to 135 {91 to 100, 12.55 to 13.76}	—
6	Bolt (Oil pan mounting)	14 to 18 {10 to 13, 1.4 to 1.8]	—
8	Bolt (Oil filter mounting)	14 to 18 {10 to 13, 1.4 to 1.8]	—
12	Oil filter	9.8 to 20 {7 to 14, 1 to 2}	—

Fluid

Location	Points of application	Kinds	Quantity
11	Body of O-ring	Automatic transmission fluid (DEXRON or DEXRON II type)	As required
12	Gasket of oil filter with thin application	Automatic transmission fluid (DEXRON or DEXRON II type)	As required



13920

[Inspection and replenishment]

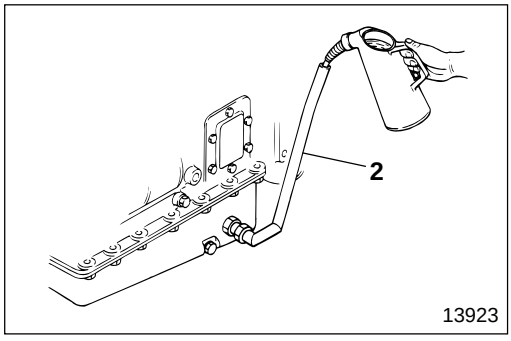
- Park the vehicle on level ground, make sure that the parking brake is fully activated and chock the wheels to keep them from rolling.
- Start the engine and let it idle. To fill the hydraulic circuit with automatic transmission fluid, shift the range selector lever from N → R → N → D → 2 → D → N. Repeat this process five times, finally shifting to N.
- While the engine is still idling, pull out dipstick **1** and wipe off the fluid sticking to it. Reinsert the dipstick, then pull it out again and check the fluid level.
- If the fluid level is inspected right after the engine is started and the fluid temperature is still low (approximately 15 to 49°C {60 to 120°F}), the level should be within area **A** marked COLD on dipstick **1**.
- If the fluid level is inspected after the vehicle has been driven and the fluid temperature is high (approximately 71 to 93°C {160 to 200°F}), the level should be within area **B** marked HOT on dipstick **1**.

WARNING

Take care during the inspection because the engine will be running. Take sufficient care to avoid burns or injuries resulting from contact with moving parts.

NOTE

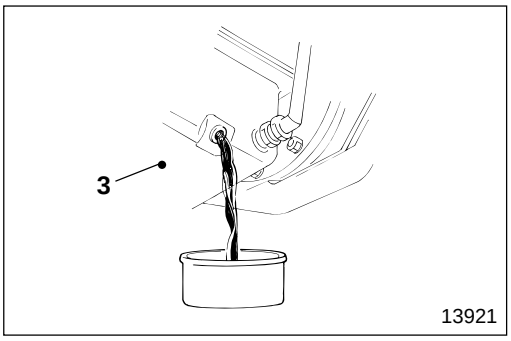
- **Make sure the vehicle is parked on level ground when you are checking the fluid level.**
- **Make sure the range selector lever is in the N position and the engine is idling when you are checking the fluid level. When the engine is stopped, the fluid level appears higher than it actually is.**
- **Be sure to wipe off the dust from the safety cap and the upper part of dipstick guide 2 before you pull out dipstick 1.**
- **To ensure the fluid is correct, reinspect the fluid level after an actual drive.**



13923

- If the fluid level is low, add automatic transmission fluid (DEXRON or DEXRON II type) through dipstick guide **2** until the correct level on dipstick **1** is reached.

https://truckmanualshub.com/



[Replacement]

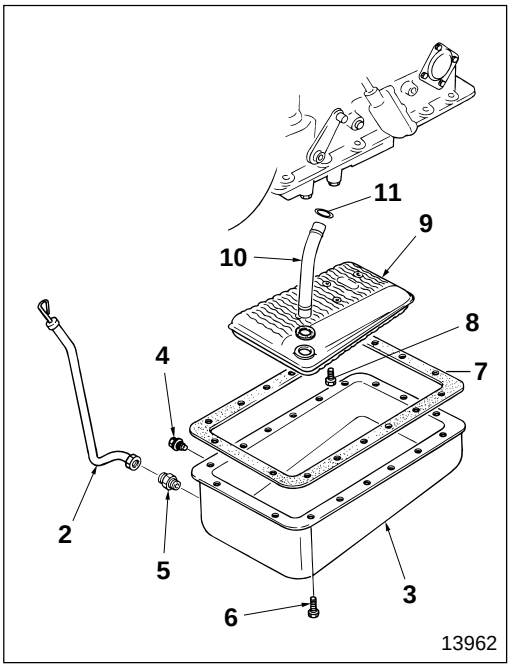
- Park the vehicle on level ground, chock the wheels and shift the range selector lever to the N position.
- Place a container under oil pan **3**, remove drain plug **4** and drain the fluid.

WARNING

Take care because the fluid temperature immediately after the engine has stopped is very high. To avoid scalds, wait until a safe temperature has been reached before draining the fluid.

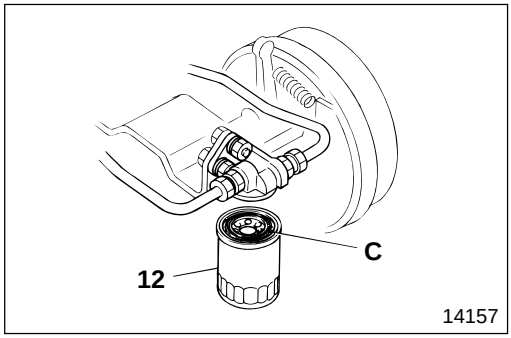
NOTE

- **The fluid will drain faster if the engine is first run to raise the fluid temperature.**
- **The fluid cannot be drained from the hydraulic circuit, the torque converter or the oil cooler.**
- **Check the drained fluid for dirt, metal particles and metal fragments.**

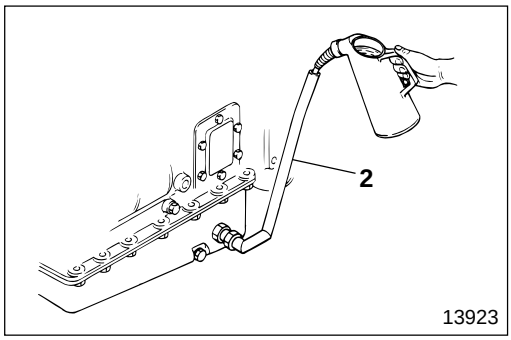


- Remove oil pan **3**, intake pipe **10**, O-ring **11**, gasket **7** and oil filter **9**.
- Clean oil pan **3**.
- Replace O-ring **11**, gasket **7** and oil filter **9**.

https://truckmanualshub.com/



- Remove oil filter **12** (for oil cooler) by turning it counterclockwise.
- Lightly coat gasket **C** with the fluid before installing oil filter **12**. Then tighten the oil filter.



- Supply fluid through dipstick guide **2**.

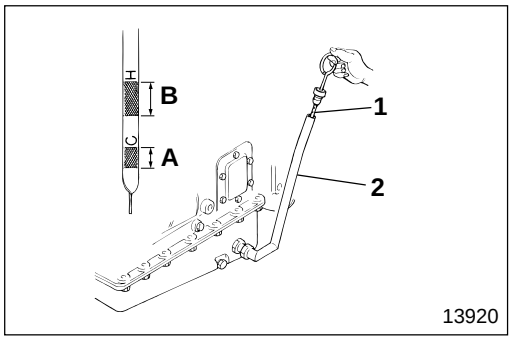
CAUTION

Make sure that dirt and foreign particles do not become mixed in with the fluid when it is added.

- Shift the range selector lever to the N position, start the engine and let it idle for about one minute.
- After shifting the lever through all positions once, shift it back to N position.

CAUTION

To prevent burning out the interior of the automatic transmission assembly, make sure that the engine is not allowed to race when you do the above.



- Check and adjust so that the fluid level is within the specified area on dipstick **1**.

NOTE

- **As the temperature of the fluid rises, so does the fluid level. If you add fluid while the temperature is still low (approximately 15 to 49°C {60 to 120°F}), make sure that the level stays within area A, marked COLD on dipstick 1.**
- **Let the engine idle and, while paying attention to the fluid level, pour in the fluid slowly.**
- **It is sometimes hard to check the fluid level, immediately after supplying fluid, because of the fluid adhering to the interior of dipstick guide 2. If this is the case, check the fluid level several times at intervals.**
- **Be careful not to supply too much fluid because you might mistake the fluid that overflows from the air breather for fluid leakage.**

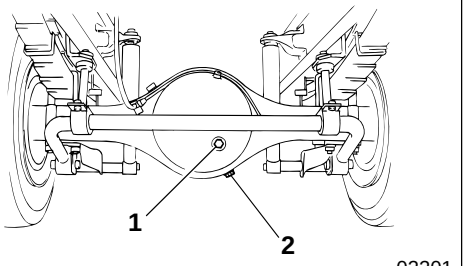
Rear Axle Gear Oil

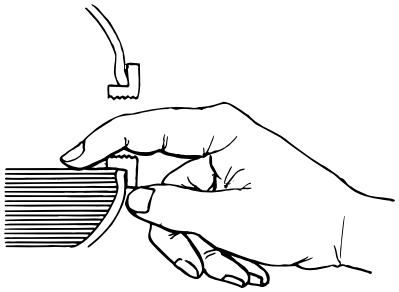
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Inspection plug	98 to 115 {72 to 87, 10 to 12}	—
2	Drain plug	98 to 115 {72 to 87, 10 to 12}	—



02201



02340

[Inspection and replenishment]

WARNING

The oil temperature is high immediately after the vehicle stopped, so take care not to scald yourself.

- Remove inspection plug **1**, check the oil level and make sure it is up to the edge of the entrance.
- If the oil level is low, add oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Insert inspection plug **1**.

[Replacement]

- Drain the oil after removing inspection plug **1** and drain plug **2**.
- Remove any metal particles sticking to the magnetic part of drain plug **2** before reinstalling the plug.
- Supply oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Reinstall the inspection plug.

https://truckmanualshub.com/

LUBRICATION

Power Steering Fluid

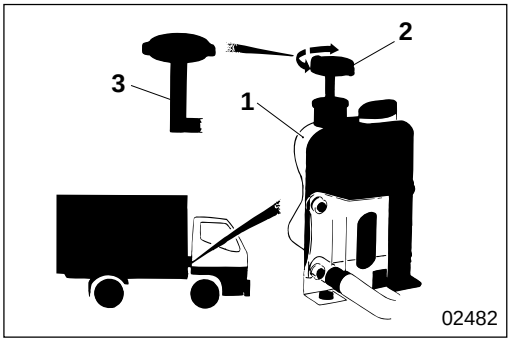
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Oil pipe	66.69±12.75 {49±9.4, 6.8±1.3}	—

Fluid

Location	Points of application	Kinds	Quantity
1	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Between end and **F** on filler cap dipstick



[Inspection and replenishment]

- Straighten the front wheels and stop the engine.
- Remove filler cap **2** of power steering oil tank **1** by turning the filler cap counterclockwise.
- Wipe off the fluid sticking to dipstick **3** on filler cap **2**. Replace the filler cap.

NOTE

Check the fluid level without screwing on filler cap 2.

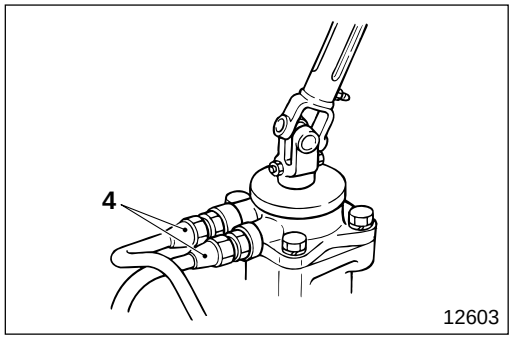
- Carefully lit up filler cap **2** and check the fluid sticking to dipstick **3** to make sure that the fluid is at a point between the end and **F** on the dipstick. If the level is low, add fluid.
- After inspection install filler cap **2** by turning it clockwise.

WARNING

Close filter cap 2 firmly; otherwise power steering fluid will leak and could catch fire. Also wipe up spilled fluid.

CAUTION

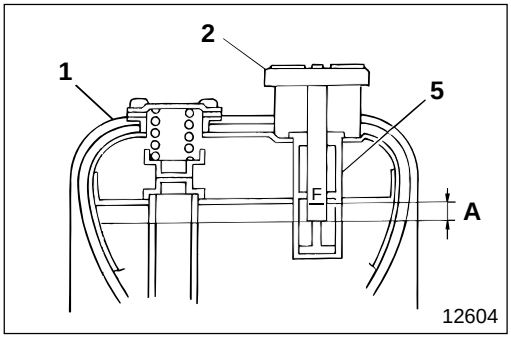
If the fluid level is far below the recommended range, the fluid may be leaking.



[Replacement]

- Drainage
  - Jack up the front wheels.
  - Disconnect oil pipe **4** connected to the power steering booster.
  - Turn the steering wheel fully left and right repeatedly, and drain the fluid from the power steering booster.
  - After draining the fluid, tighten oil pipe **4** at specified torque.

https://truckmanualshub.com/



[Supply]

- Pour fluid into power steering oil tank **1** up to the inner port of strainer **5**.
- With the engine stopped, jack up the front wheels and turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.

NOTE

Check the fluid level without screwing on filler cap 2.

- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times to raise the fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise, bleeding is completed.
- When bleeding is finished, check fluid level of power steering oil tank **1**, and pipe and hose connections for fluid leakage.

Brake Fluid

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
—	Air bleeder (Airmaster)	6.9 to 12.7 {5.1 to 9.4, 0.7 to 1.3}	—
—	Air bleeder (Wheel brake)	7.8 to 12 {5.8 to 8.5, 0.8 to 1.2}	—

Fluid

Location	Points of application	Kinds	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
—	Vinyl hose 	MH033102	Air bleeding

WARNING

- **You must use new brake fluid (SAE J1703f or FMVSS No.116 DOT3).**
- **Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the brake system, because this will cause the rubber parts of the brake system to swell, resulting in brake dragging or ineffective braking.**
- **Be sure not to allow dirt or water to become mixed into brake fluid when refilling, because this will cause the brake to malfunction.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oils.**

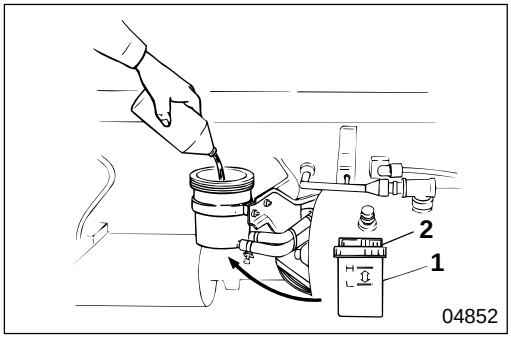
CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

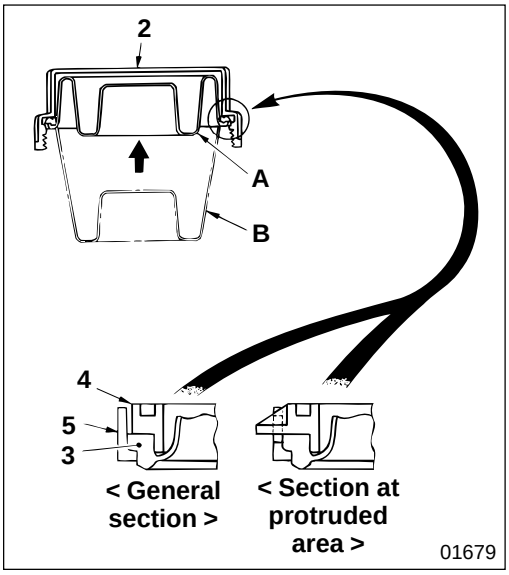
NOTE

Supply brake fluid to maintain the “H” level of the brake fluid tank always.

https://truckmanualshub.com/



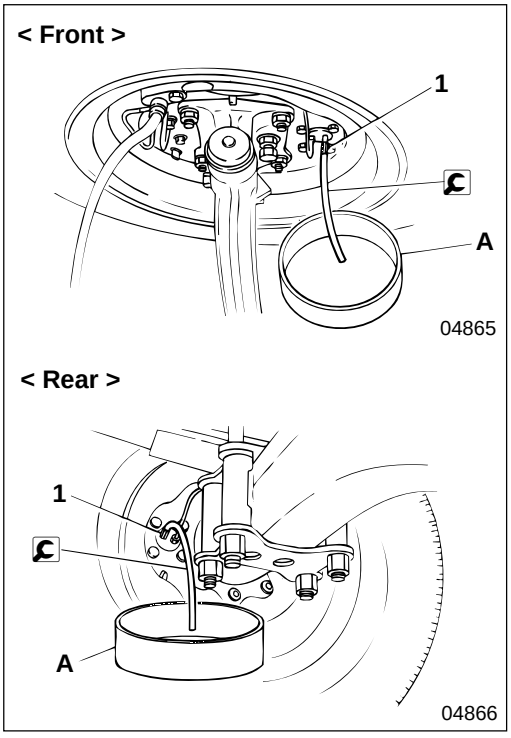
[Inspection and replenishment]
Inspect the level of the brake fluid in fluid tank **1**. It should fall between the "**L**" and "**H**" levels. If it is below the "**L**" level, remove cap **2** from the fluid tank, then supply the specified brake fluid until the level comes up to the "**H**" level. Do not fill above the "**H**" level.



- If diaphragm **3** is not in its normal posture when the brake fluid is supplied, correct it to its normal posture, and install cap **2**. If brake fluid leaks from the cap area after you have supplied brake fluid, check whether the diaphragm is assembled as illustrated.

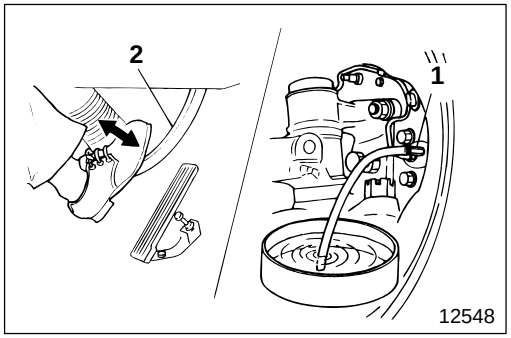
  4 : Slide ring
  5 : Ring cover
  A : Correct condition of diaphragm when brake fluid is being supplied
  B : Condition when diaphragm is extended when brake fluid has decreased

[Replacement]
- Start engine and let it idle until brake fluid replacement is completed.

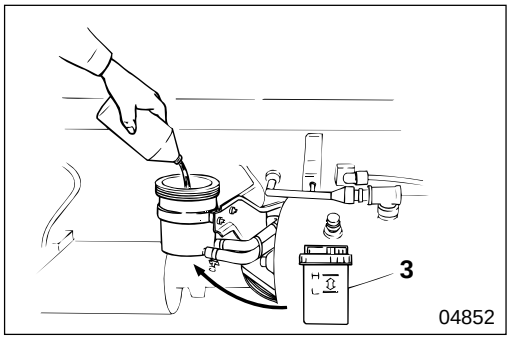


- Attach one end of vinyl hose to air bleeder **1** and place the other end in container **A**.

https://truckmanualshub.com/

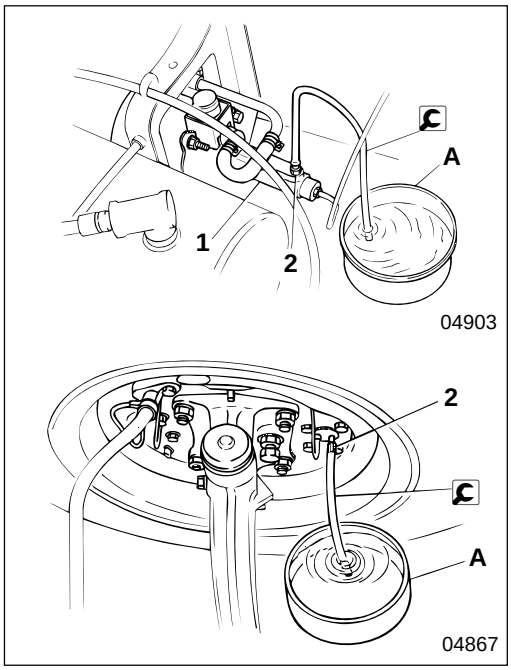


- Loosen air bleeders **1** and depress brake pedal **2** several times to drain brake fluid completely.



- Maintaining a supply of new brake fluid up to the "**H**" level of fluid tank **3**, depress the brake pedal repeatedly until the old brake fluid of the brake system is replaced with new fluid.
- Carry out air bleeding of the brake system.

[Air bleeding]

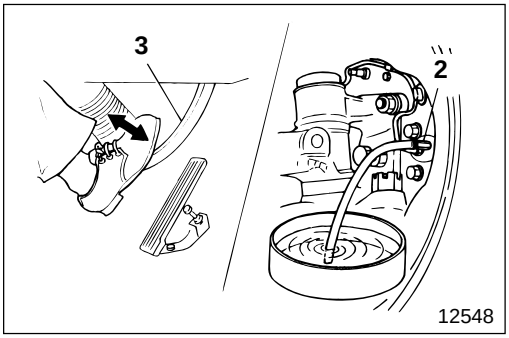


- Start the engine and let it idle until brake fluid replacement is completed.
- Attach one end of vinyl hose to front or rear airmaster **1**. Then, attach one end of another vinyl hose to air bleeder **2** of the wheel brake. Finally, place both free ends in container **A** filled with brake fluid.

- Carry out air bleeding in the following sequence:

Front brake system	Rear brake system
Airmaster for front	Airmaster for rear
Right-hand side wheel brake	Right-hand side wheel brake
Left-hand side wheel brake	Left-hand side wheel brake

https://truckmanualshub.com/



- Depress brake pedal **3** slowly a few times, and with the brake pedal depressed, loosen air bleeder **2** to drain brake fluid containing air.

- Tighten air bleeder **2**, and release brake pedal **3**.
- Repeat this service procedure until air is no longer present in the fluid being drained.
- Tighten air bleeder **2** at specified torque as soon as brake fluid flowing out is free of air bubbles.

- Adjust brake shoe clearance when you have finished air bleeding.
- Check that brake fluid comes up to lebel "**H**" of the fluid tank. If it does not, refill with new brake fluid.
- Depress brake pedal **3** a few times and check for any leakage of brake fluid, then test the brakes.
- When you test the brakes, if the brake warning lamp within the meter cluster lights, it means that air has not been bled completely. Redo air bleeding.

Inspection of Engine Compression

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Engine Compression	Each cylinder (200 rpm)	2550 kPa {370 lbf/in^2, 26 kgf/cm^2}	1960 kPa {285 lbf/in^2, 20 kg/cm^2}	Inspect
		Pressure difference between each cylinder	—	within 390 kPa {57 lbf/in^2, 4 kgf/cm^2}	Inspect

Special tools

Unit : mm {in.}

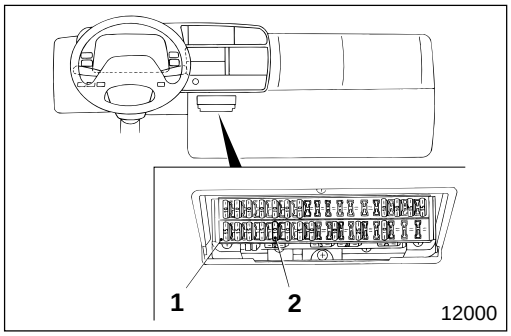
Location	Tool name and shape	Part No.	Application
—	Compression gauge adapter  06197	MH061460	Measurement of engine compression

The decrease of engine compression is a signal that it is time to overhaul the engine. It is strongly recommended that this item is inspected periodically and that you record the history of deterioration in engine performance as this will help you to diagnose causes of future irregularities.
When the vehicle is still new or immediately after installation of new parts, there may be a slight increase in engine compression, but normal performance will be restored soon.

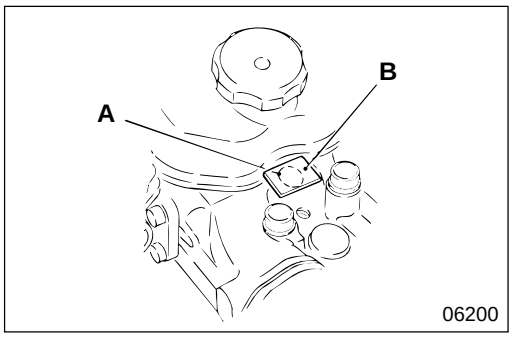
- Before inspection make sure that engine oil, starter and battery are in normal condition.
- Before inspecting the vehicle do the following:
  - Run the engine to bring the temperature of the coolant up to approximately 75 to 85°C {167 to 185°F}.
  - Turn all the lights and accessory equipment OFF.
  - Put transmission in neutral. (N range for automatic transmission)
  - Set the steering wheel at center and straight position.

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE



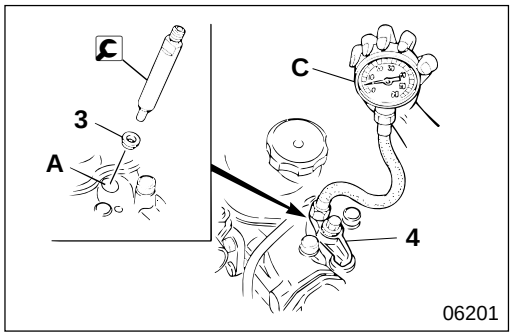
- Remove fuse **2** for the fuel-cut motor from fuse box **1** inside the cab to prevent the fuel from being injected when the engine is cranked by the starter.



- Remove all the injection nozzles. Gr 13
- Check that no foreign particles are sticking to waste cloth **B** covering injection nozzle mounting hole **A** after cranking the engine.

WARNING

You must stay clear of injection nozzle mounting hole A when you crank the engine during this inspection. Assume that all cylinders have cracked, and that coolant, engine oil, fuel, etc. have seeped into the cylinder chambers. If this is the state when the engine is cranked, there is an extreme danger of these substances being injected out of the injection nozzle mounting hole at high temperature.



- Mount gasket **3** and compression gauge adaptor in injection nozzle mounting hole **A** and fasten them with nozzle bridge **4**, then mount compression gauge **C**.
- Measure engine compression while cranking the engine.
- Measure engine compression of cylinders and calculate the difference among the cylinders.
- If the engine compression and pressure difference between each cylinder deviate from the limit, reinspect by pouring a small amount of engine oil into injection nozzle mounting hole **A**.
  - When pressure is high : It is likely that either wear or damage of the slide-contact area of both the piston ring and the cylinder inner surface has taken place.
  - When pressure is low : It is likely that burning of the valve, faulty contact of valve surfaces and/or faults in the cylinder head gasket have developed.

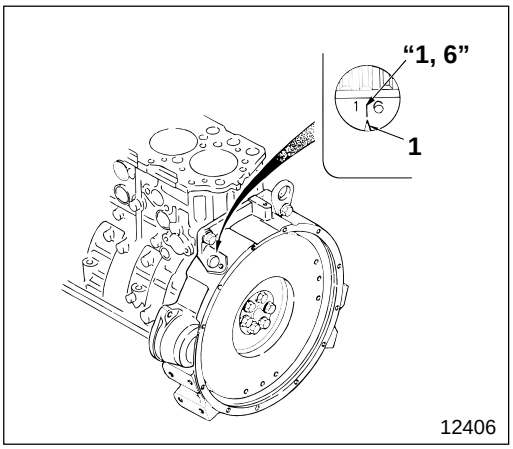
https://truckmanualshub.com/

Inspection and Adjustment of Valve Clearance

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Valve clearance (When engine is cold)	0.4 {0.016}	—	Adjust



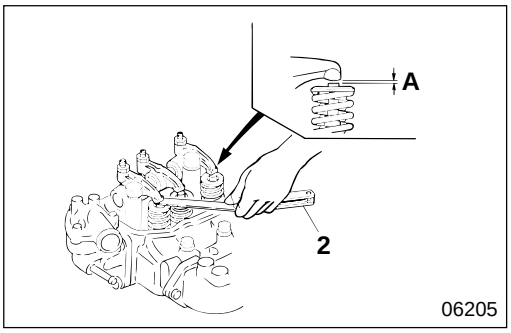
Inspect and adjust the valve clearance while the engine is cold in the following way.

[Inspection]

- Crank the engine to move No.1 or No.6 piston to top dead center, and align stamped marks "**1**, **6**" on the flywheel with pointer **1** on the flywheel housing.

NOTE

The cylinder whose push rod is not pushing up the inlet/outlet rocker is the one whose piston is at top dead center.



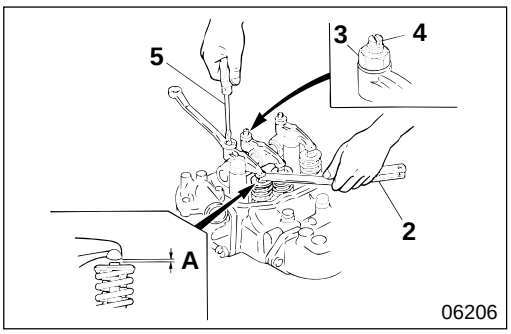
- Measure valve clearance **A** when either No.1 or No.6 piston is at top dead center in accordance with the following tabulated sequence of each valve.

Piston No.	1		2		3		4		5		6	
Valve arrangement	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust
No.1 piston at top dead center	○	○	○	×	×	○	○	×	×	○	×	×
No.6 piston at top dead center	×	×	×	○	○	×	×	○	○	×	○	○

NOTE

Be sure when taking measurements using feeler gauge 2 that some resistance is felt when inserting the gauge. If the gauge can be inserted freely without any resistance, an accurate measurement cannot be obtained.

- If the measured value deviates from the limit, adjust as follows:



[Adjustment]

- Adjust valve clearance **A** so that feeler gauge **2** encounters some resistance when it is inserted. Do this by loosening lock nut **3** and turning adjusting screw **4**.
- After adjusting, tighten adjusting screw **4** using screwdriver **5** and tighten lock nut **3**. Reinspect valve clearance **A** using feeler gauge **2**.

Location	Parts to be tightened	Tightening torque	Remarks
4	Cylinder head bolt	145 {110, 15}+90°	Wet Reuse up to three times

Lubricant

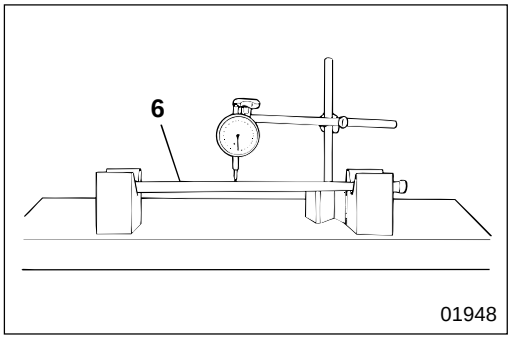
Location	Points of application	Kinds	Quantity
4	Thread area of cylinder head bolt	Engine oil	As required
6	Both ends of push rod	Engine oil	As required
9	External periphery of tappet	Engine oil	As required

https://truckmanualshub.com/

Special tools

Location	Tool name and shape	Part No.	Application
7	Socket wrench  01984	MH061560	Installation of cylinder head and valve assembly
9	Tappet extractor  03320	MH063329	Removal of tappet

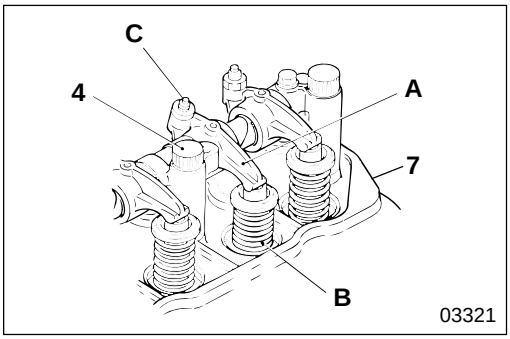
◆ Service procedure



01948

6 **Push rod deflection**

If the measured value is higher than the limit, replace push rod **6**.

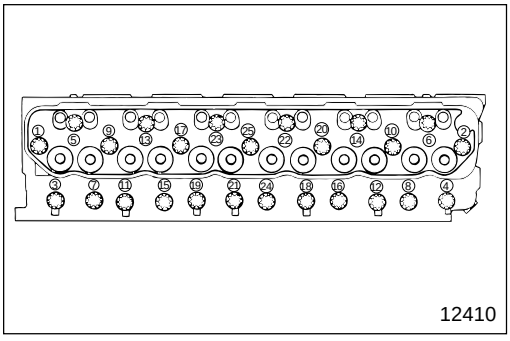


03321

7 **Cylinder head and valve assembly**

[Removal]

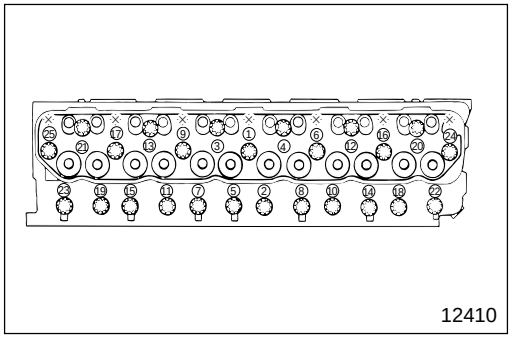
- Before undoing cylinder head bolts **4**, first loosen adjusting screw **C** of rocker **A** that pushes down valve spring **B**.



12410

- First loosen cylinder head bolts **4** in the numbered order as illustrated, then remove them.

https://truckmanualshub.com/



12410

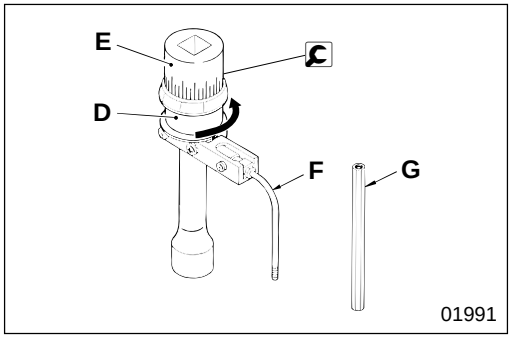
[Installation]

- Center punch the heads of cylinder head bolts **4** before installation.

CAUTION

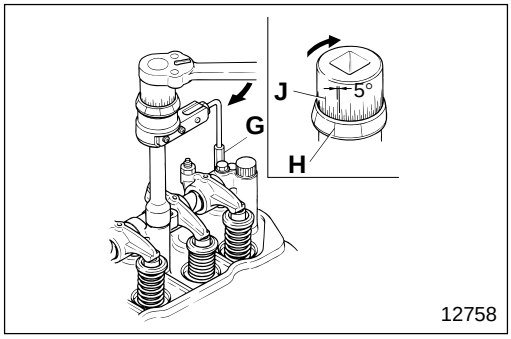
If there are already three center-punch marks, replace the cylinder head bolt with a new one.

- After tightening cylinder head bolts **4** at specified torque in the numbered order as illustrated, tighten further as follows:
  ·⁜· : Tightened simultaneously with rocker and bracket assembly



01991

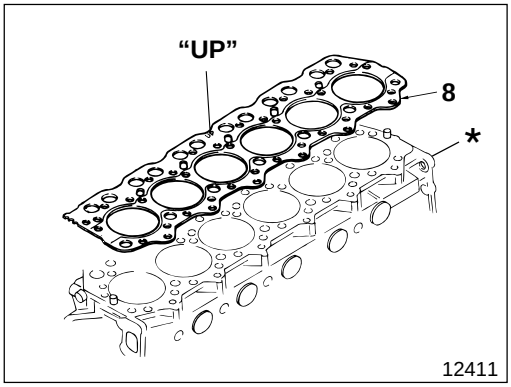
- Turn socket wrench holder **D** counterclockwise and keep the spring in the wrench compressed.
  E : Socket
  F : Rod
  G : Rod (for connection)



12758

- Set socket wrench holder **D** so that the repercussive force of the spring presses rod **G** (for connection) against adjacent parts such as, the rocker shaft bracket or the injection pipe.
- Select a scale that is convenient for reading graduation **H** on holder **D**.
- Tighten further by turning socket **H** clockwise by 90° (setting is in 5° increments), referring to graduation **J** on the selected scale.

https://truckmanualshub.com/



8 **Cylinder head gasket**

[Removal]

CAUTION

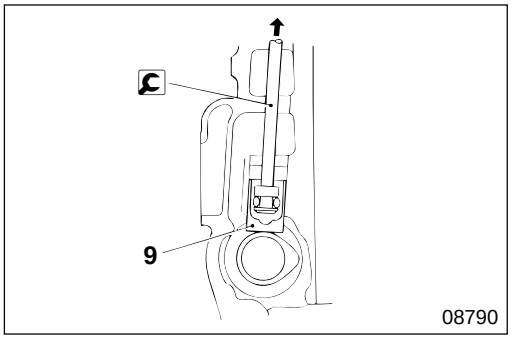
Be careful not to scratch the cylinder head or crankcase * when you remove cylinder head gasket 8.

[Installation]

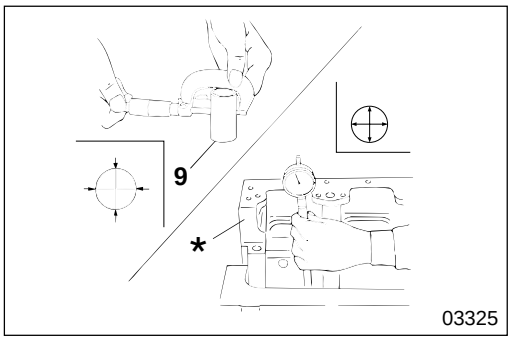
- Install cylinder head gasket **8** onto crankcase * in the direction as illustrated.

CAUTION

Be sure to measure the amount of protrusion whenever a piston or connecting rod is replaced, since replacement changes the amount of protrusion.



9 **Removal of tappet**



9 ***** **Clearance between tappet and crankcase tappet hole**

If the measured value is higher than the limit, replace the faulty parts.

https://truckmanualshub.com/

https://truckmanualshub.com/

◆ Service procedure

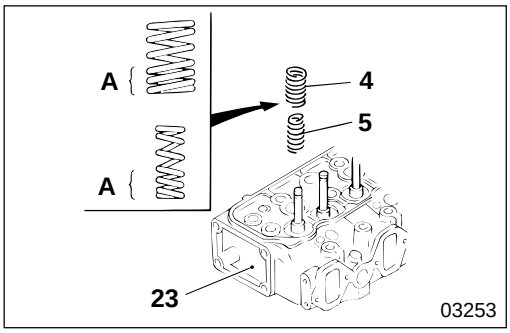
2 **Valve cotter**

[Removal]
Remove valve cotter **2** making sure that valve springs **4**, **5** are squarely and evenly pressed down by 🔧 valve lifter.

[Installation]
Follow the removal procedure in reverse.

CAUTION⚠

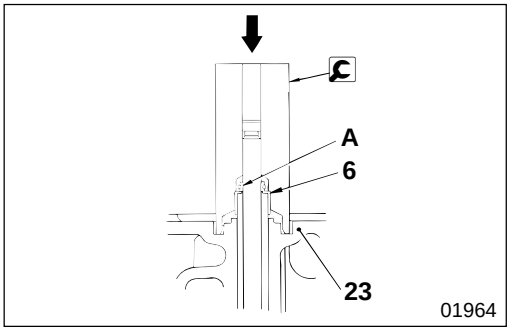
Be sure not to press down on valve springs 4, 5 too hard because this would cause upper retainer 3 to contact valve stem seal 6 and damage it.



4 **5** **Installation of outer and inner valve springs**

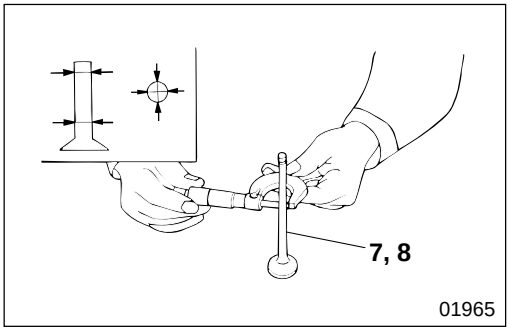
Install outer springs **4** and inner springs **5** in cylinder head **23** in the direction as illustrated.

A : Closely wound area



6 **Installation of valve stem seal**

- Apply engine oil to lip **A** of valve stem seal **6**.
- Tap down 🔧 valve stem seal installer until it hits cylinder head **23**.



7 **8** **Inlet valve and exhaust valve**

[Inspection]

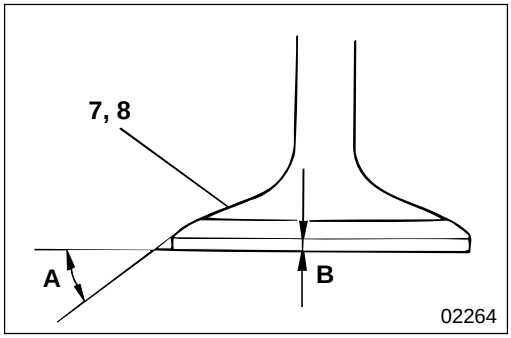
(1) Inspection of stems

If the measured value is lower than the limit or in the case of excessive wear, replace valves **7**, **8**.

CAUTION⚠

Be sure to lap valve seats 19, 20 when valves 7, 8 are replaced with new ones. 🕮 **P11-21**

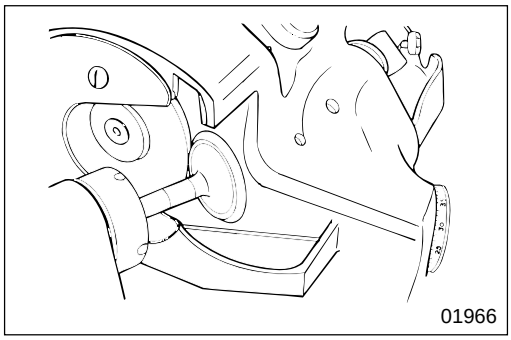
https://truckmanualshub.com/



(2) Valve seat angle and valve margin

If the measured value is higher than the limit, correct or replace valves **7**, **8**.

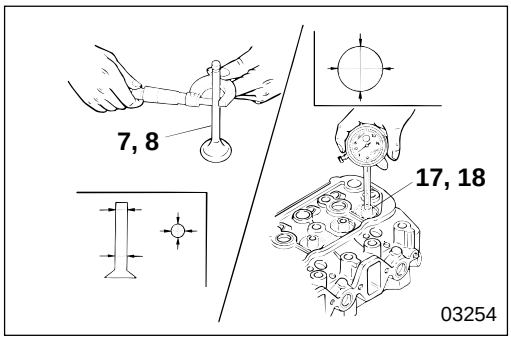
A : Valve seat angle
B : Valve margin



[Correction]

NOTE

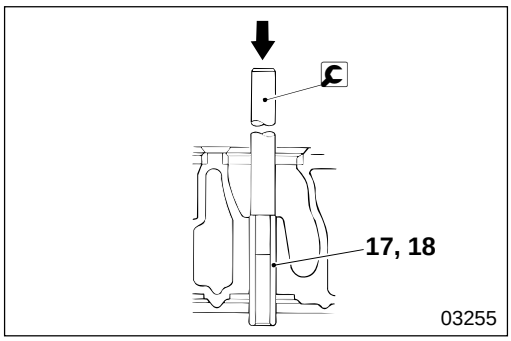
- **Be sure to keep the grinding work as light as possible.**
- **Be sure to replace valves 7, 8 after grinding if valve margin deviates from the limit.**
- **Be sure to lap valve 7, 8 and valve seats 19, 20 after grinding.** **P11-21**



7 **8** **17** **18** **Valve and valve guide**

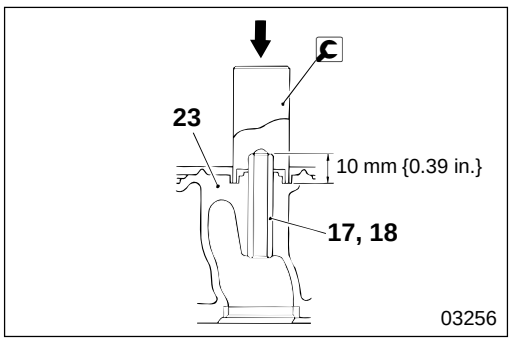
[Inspection]

When the clearance is higher than the limit, replace the faulty parts.



Valve guide

[Removal]



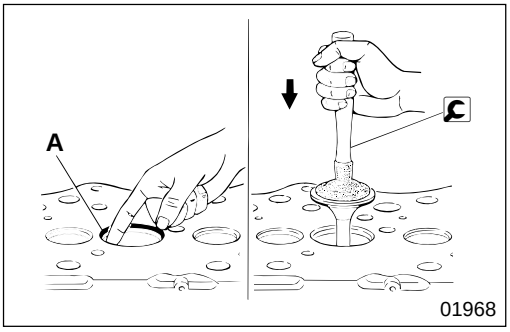
[Installation]

- Tap down valve guides **17**, **18** with valve guide installer until it hits cylinder head **23**.

CAUTION

- **The length of fit of valve guides 17, 18 is standardized. Be sure to use valve guide installer.**
- **Be sure to distinguish between valve guides 17, 18. Exhaust valve guide 18 is longer.**

https://truckmanualshub.com/



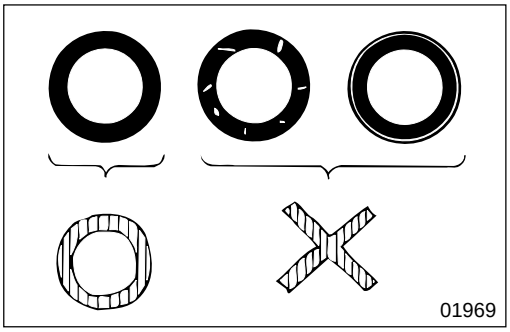
7 **8** **19** **20** **Valve and valve seat**

[Inspection]

- Apply red lead evenly to entire surface **A** of valve seats **19**, **20** that contact valves **7**, **8**.
- Fit valves **7**, **8** to valve seats **19**, **20** and tap once without rotating.

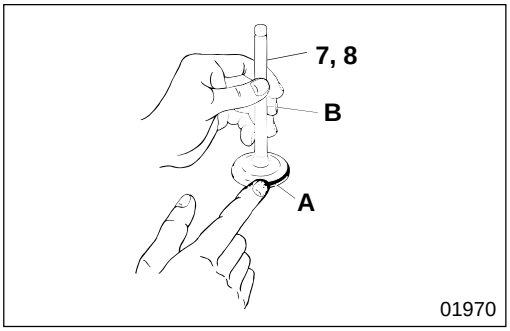
NOTE

Be sure to carry out inspection under the condition that valves 7, 8 and all parts of valve guides 17, 18 are normal.



- Check how much red lead has transferred to valves **7**, **8** to determine the contact of the valve and the seat. According to the degree of abnormality, take proper measures to correct it.

Contact conditions	Correction measures
Minor fault	Valve lapping
Major fault	Repair of valve and seat or replacement of both



[Correction]

Valve polishing is done in the following manner:

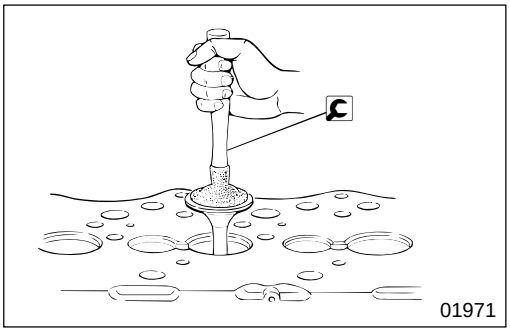
- Apply valve lapping compound thinly to contact surface **A** of valves **7**,**8** with valve seats **19**, **20**.

CAUTION ⚠

Take care not to smear stems B of valves 7, 8 with the compound.

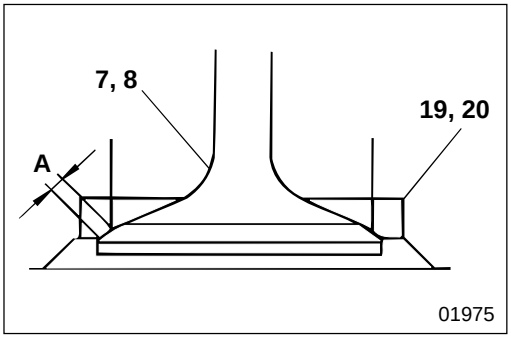
NOTE

- **Start with medium grit compound (120 to 150 grit) and for finishing up, use finer grit (200 grit or finer).**
- **Mixing with a small amount of engine oil will make the compound consistent and make even application easier.**



- Tap valves **7**, **8** against valve seats **19**, **20** several times while rotating the valves slightly at each strike.
- Clean off the compound with gas oil.
- Apply engine oil to contact surface **A** of valve seats **19**, **20** and smooth the surface.
- Check the contact of valves **7**, **8** and valve seats **19**, **20**.
- If contact does not take place completely around the seat, replace valve seats **19**, **20**.

https://truckmanualshub.com/



19 **20** **Valve seat**

[Inspection]

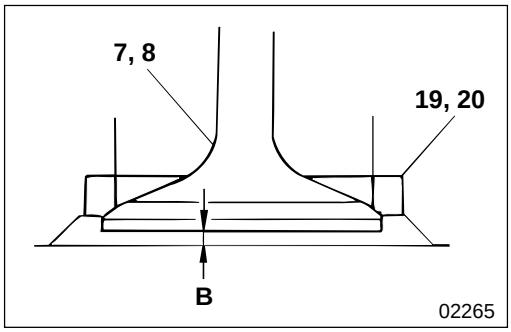
(1) Valve seat width

If the measured value is higher than the limit, replace valve seats **19**, **20**.

A : Valve seat width

NOTE

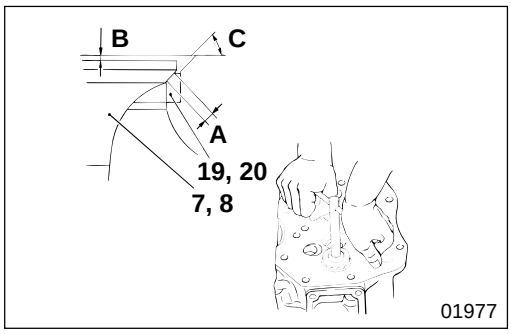
Be sure to lap and fit valves 7, 8 and valve seats 19, 20 after correction or replacement.



(2) Extent of valve recess from the bottom surface of cylinder head

If the measured value is higher than the limit, correct or replace the faulty parts.

B : Extent of valve recess



[Correction]

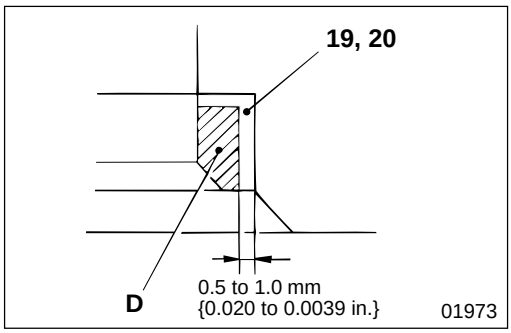
- Grind valve seats **19**, **20** using valve seat cutter or valve seat grinder.
- After grinding, do another light abrasion using 400 grit emery paper placed between the cutter and the seat.
- Adjust the seat width **A** of valves **7**, **8** using 15° or 75° cutter to make seat width conform to the standard value.

C : Valve seat angle

CAUTION ⚠

Be sure that as a result of grinding, recess B of valves 7, 8 does not become higher than the limit.

- After correction is done, be sure to carry out lapping and fitting on valves **7**, **8** and valve seats **19**, **20**.

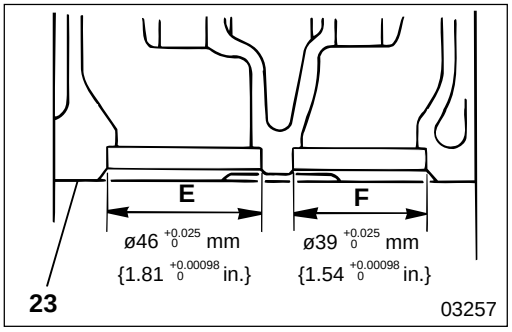


[Removal]

- Valve seats **19**, **20** have been set in by the cooling-off-process, and have to be thinned by grinding off the inner side for removal under normal temperature.

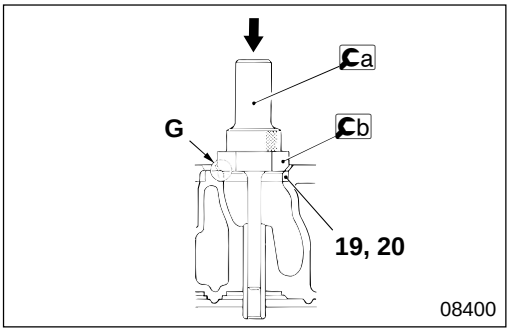
D : Part to be ground

https://truckmanualshub.com/



[Installation]

- Make sure that the diameter of valve seat hole of cylinder head **23** conforms to the standard value.
  E : Inlet valve seat hole diameter
  F : Exhaust valve seat hole diameter

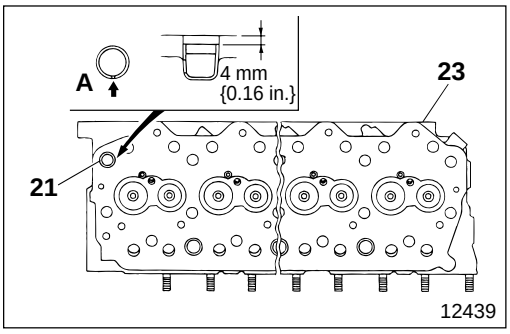


- Immerse valve seats **19**, **20** in liquid nitrogen and cool them substantially. Press-fit into the cylinder head using Ca caulking tool body and Cb caulking rings inlet and exhaust.

CAUTION

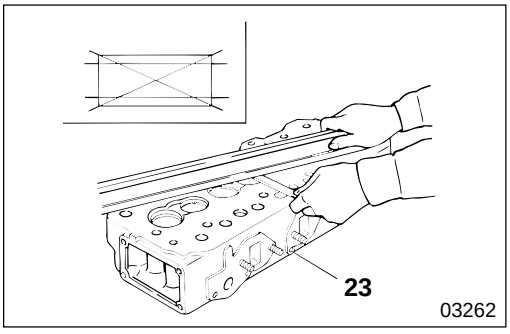
Be sure, when press-fitting, to place the chamfered side G of Cb caulking rings inlet and exhaust against valve seats 19, 20.

- After installation of valve seats **19**, **20**, work until they contact valves **7**, **8** smoothly.



21 Installation of water director

- With indent **A** set in the direction as illustrated, press-fit water director **21** into cylinder head **23** to the specified depth.



23 Inspection of cylinder head

Measure the extent of distortion of the bottom of cylinder head **23**, and if the measured value is higher than the standard value, grind using a surface grinder.

CAUTION

Be sure to keep the amount of grinding within the limit of the height of cylinder head 23.

https://truckmanualshub.com/

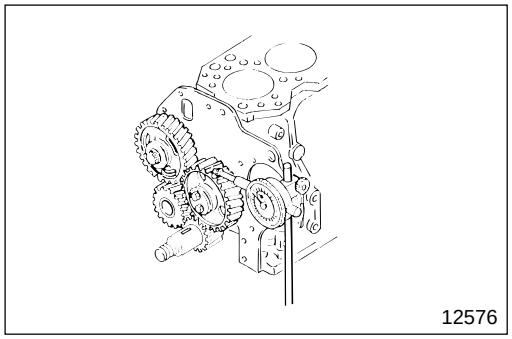
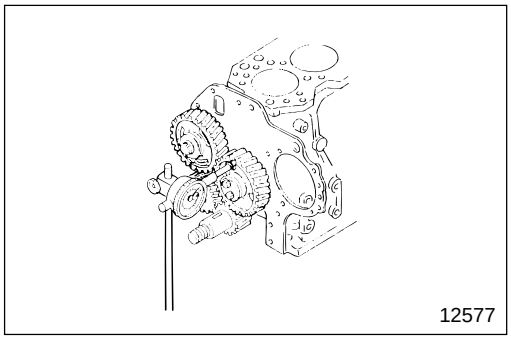
◆ Service procedure



● **Inspection before disassembly**

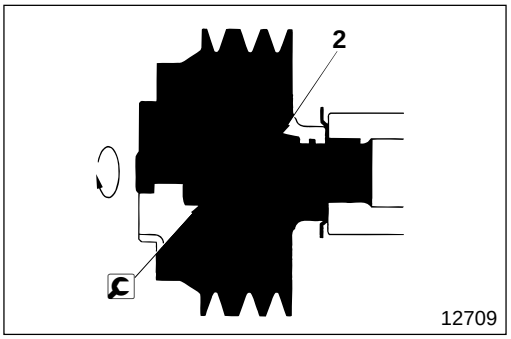
(1) Backlash of each gear

Measure three or more locations on the pairing gears and if the measurements are higher than the limit, replace the faulty parts.

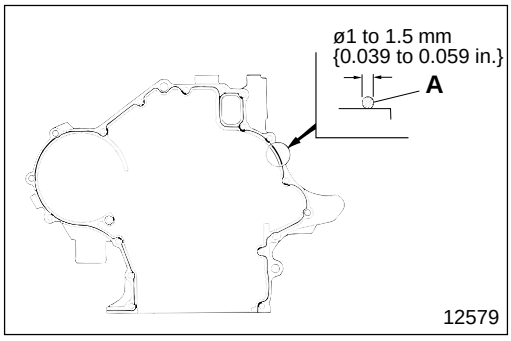


(2) End play of idler gear

If the measured value is higher than the limit, replace the faulty parts.



2 **Removal of taper cone**



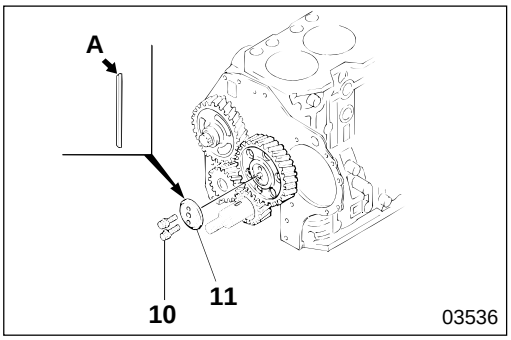
9 **Installation of timing gear case**

Apply sealant **A** to the mounting surface of timing gear case **9** evenly without break. After applying sealant, within three minutes, mount to the front plate.

CAUTION⚠

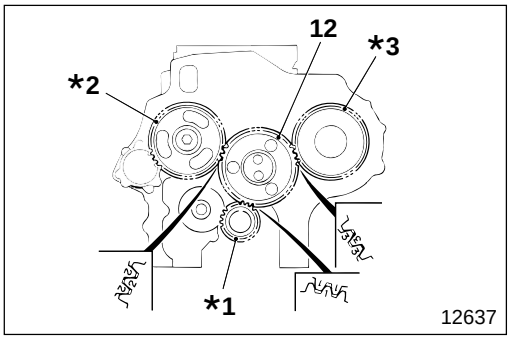
- **Be sure to clean and wipe off oily substances from the surface where sealant A is to be applied.**
- **Make sure that sealant A is not transferred to other areas while the mounting work is being done.**
- **Be sure to reapply sealant A if the bolts are loosened or removed by any cause whatsoever after mounting.**
- **Do not start the engine within an hour of mounting.**

https://truckmanualshub.com/



11 **Installation of thrust plate**

A : Chamfered side



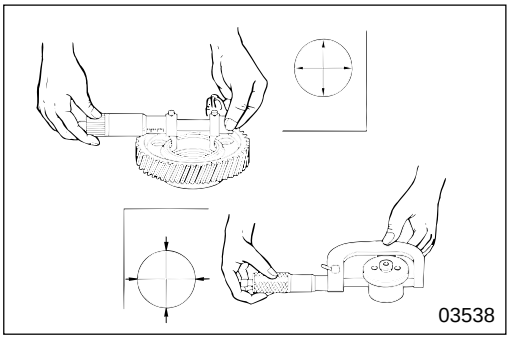
12 **Installation of idler gear assembly**

Install idler gear assembly **12** by matching alignment marks **"1"**, **"2"**, **"3"** on the gears that engage with those on the assembly.

***1** : Crankshaft gear
***2** : Camshaft gear
***3** : Air compressor gear

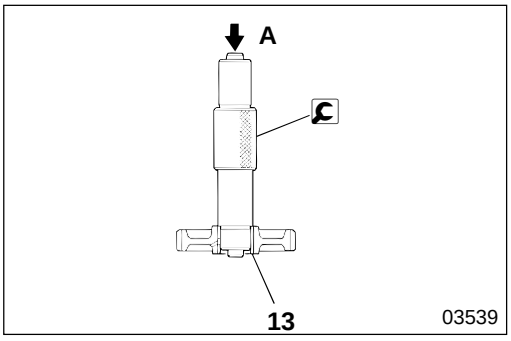
NOTE

When aligning each gear with its alignment mark, make sure that pistons No.1, 6 are higher than top dead center.



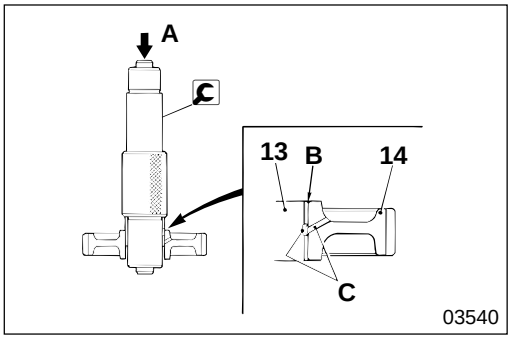
13 **15** **Idler gear bushing and idler shaft**

[Inspection]
If the clearance is higher than the limit, replace the faulty parts.



Idler gear bushing

[Removal]
A : Press



[Press-fitting]

- Press-fit idler gear bushing **13** from chamfered side **B** of idler gear **14** and align oil holes **C** of the idler gear and the bushing.
- After press-fitting, finish the fitting by bringing the clearance between idler gear bushing **13** and the idler shaft to the standard value.

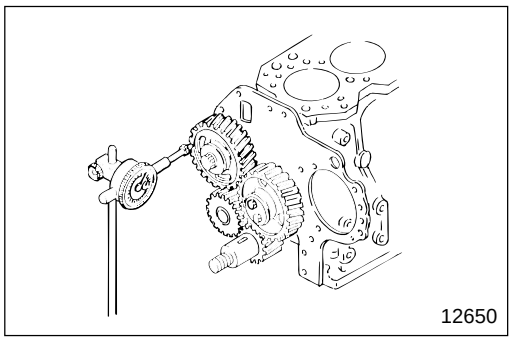
◆ Service procedure

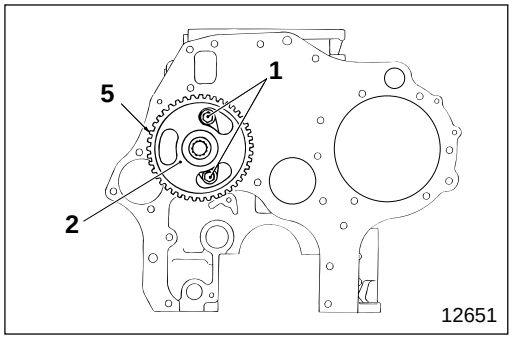


12650

● Inspection before disassembly

Camshaft end play

If the measured value is higher than the limit, replace the faulty parts.



12651

2 Camshaft assembly

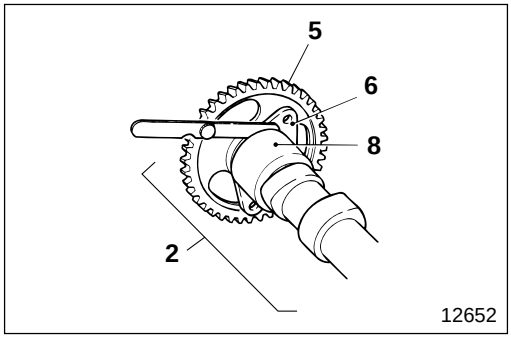
[Removal]

Remove camshaft assembly **2** by undoing bolts **1** through the holes in camshaft gear **5**.

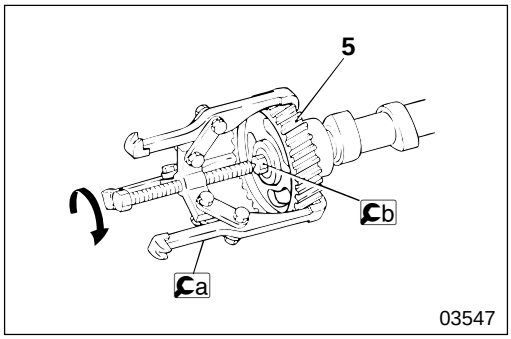
CAUTION

Be careful not to damage the camshaft bushings when you remove camshaft assembly 2.

https://truckmanualshub.com/

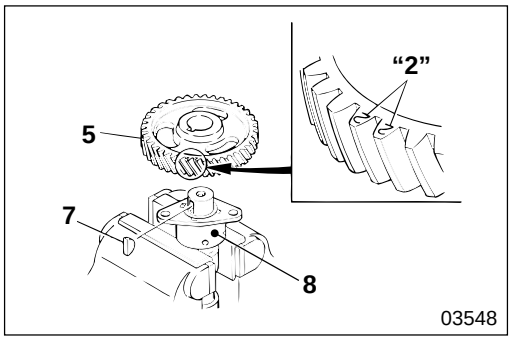


[Installation]
- Before installing camshaft assembly **2**, measure the end play between thrust plate **6** and camshaft **8**.
- If the measured value is higher than the limit, replace the faulty parts.
- Install the camshaft assembly by matching the alignment mark on camshaft gear **5** with the alignment mark on the idler gear. P11-

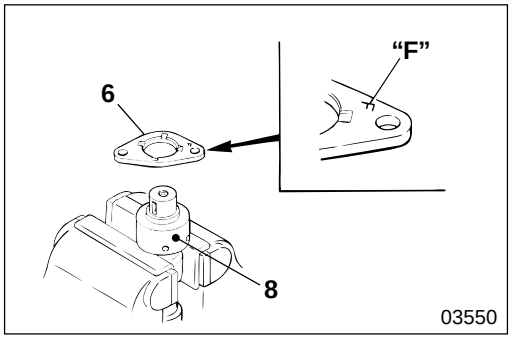


5 **Camshaft gear**

[Removal]
- Never remove camshaft gear **5** by striking, hitting, or hammering it.



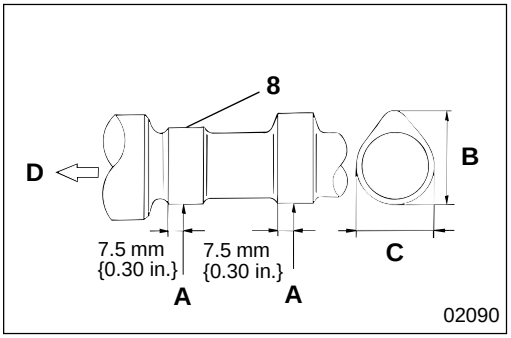
[Installation]
- Install camshaft gear **5** onto camshaft **8** in the direction as illustrated.
- Be sure when finishing the installation to install key **7**.



6 **Installation of thrust plate**

Install thrust plate **6** onto camshaft **8** in the direction as illustrated.

https://truckmanualshub.com/



8 Inspection of camshaft

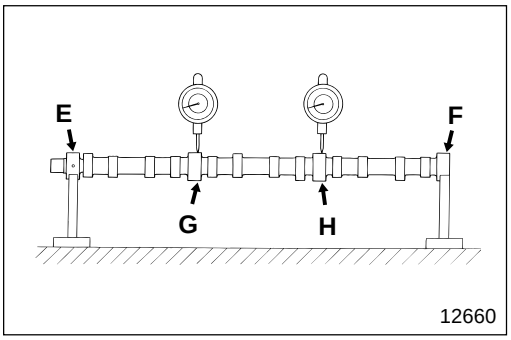
(1) Difference between long diameter and short diameter

If the measured value is lower than the limit, replace camshaft **8**.

NOTE

Measure at point A, as illustrated, because the cam is tapered.

B : Long diameter
C : Short diameter
D : Front of the engine

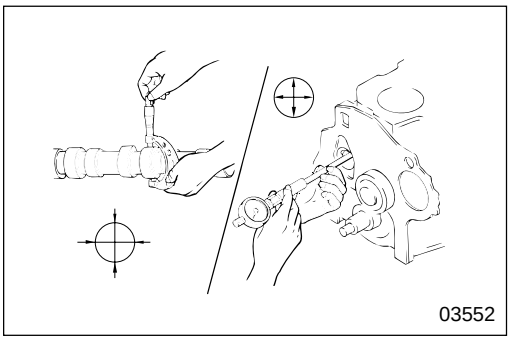


(2) Degree of bend

To measure deflection, support camshaft **8** at area **E** of No.1 journal, and area **F** of No.4 journal . Then, measure the amount of deflection at area **G** of No.2 journal, and area **H** of No.3 journal. If any of the measured values is higher than the limit, replace the camshaft.

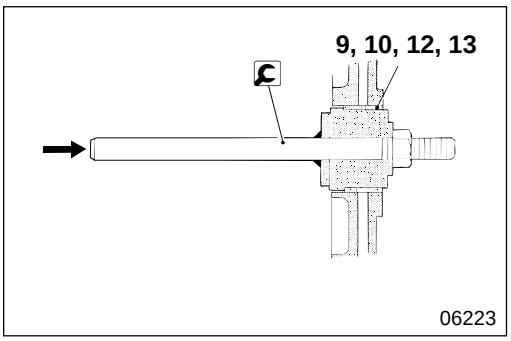
NOTE

Degree of bend of camshaft 8 is a half of the indicated value of the gauge after rotating the shaft 360°.



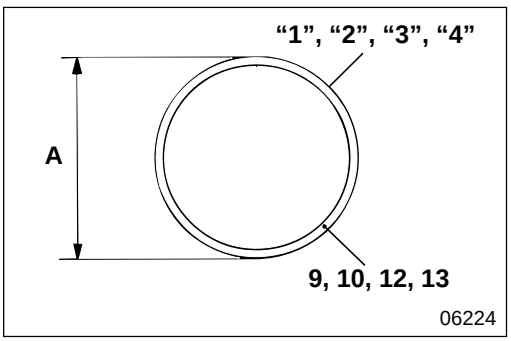
8 to 10 12 13 Camshaft and camshaft bushing

[Inspection]
If the clearance is greater than the limit, replace the faulty parts.



Camshaft bushing

[Removal]
Remove No.3 camshaft bushing **13**, and No.4 camshaft bushing **12** from the rear end of the crankcase.



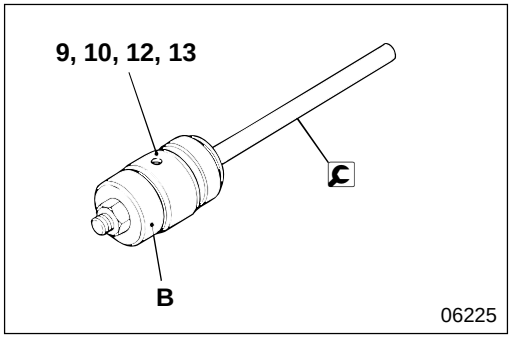
[Press-fitting]

- Identify, by referring to the table below, No.1 to No.4 camshaft bushings by noting marks **"1"**, **"2"**, **"3"**, **"4"** on camshaft bushings **9**, **10**, **12**, **13**. If you cannot identify the mark, measure outer diameter **A** of the bushing and refer to the table below.

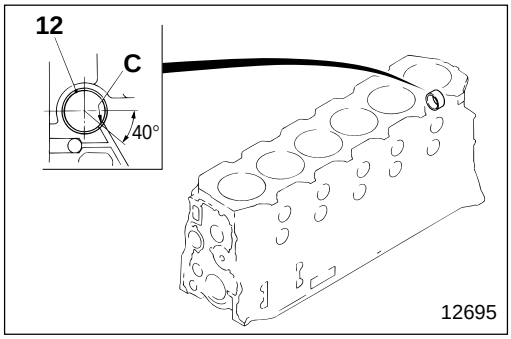
Bushing No. (from the front of the engine)	Mark	Outer diameter A (mm {in.})
No.1	1	ø58.50 {2.30}
No.2	2	ø58.06 {2.28}
No.3	3	ø57.5 {2.26}
No.4	4	ø57.06 {2.25}

https://truckmanualshub.com/

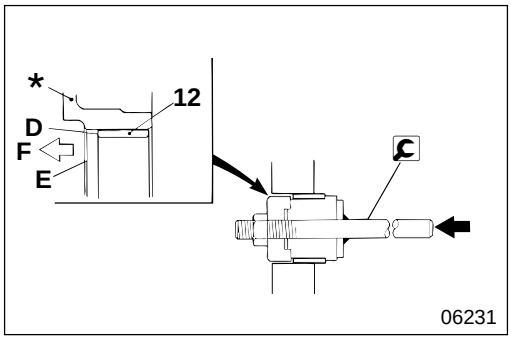
CAMSHAFT



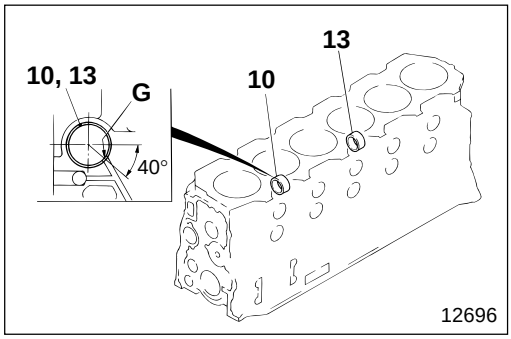
- For press-fitting, mount guide **B** to camshaft bushing installer and extractor.
- Install camshaft bushings **9**, **10**, **12**, **13** in descending order, from No.4 to No.1.
- Install No.4 camshaft bushing **12** from the rear end of the engine, and No.3 to No.1 camshaft bushings **9**, **10**, **13** from the front end of the engine.



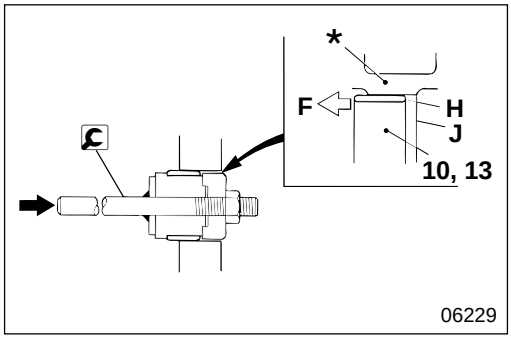
- Align oil hole **C** of No.4 camshaft bushing **12** in the direction as illustrated.



- Press in until surface **D** of No.4 camshaft bushing **12** is flush with chamfered part **E** of crankcase *.
  F : Front of the engine

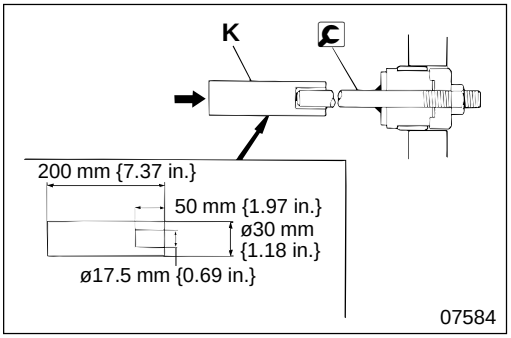


- Align oil hole **G**, of No.2 to No.3 camshaft bushings **10**, **13**, in the direction as illustrated, and press-fit in the order of No.3, 2.

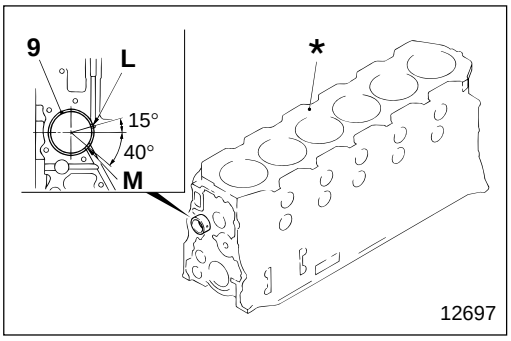


- Press in until surface **H** of No.2 to No.3 camshaft bushings **10**, **13** is flush with surface **J** of crankcase *.
  F : Front of the engine

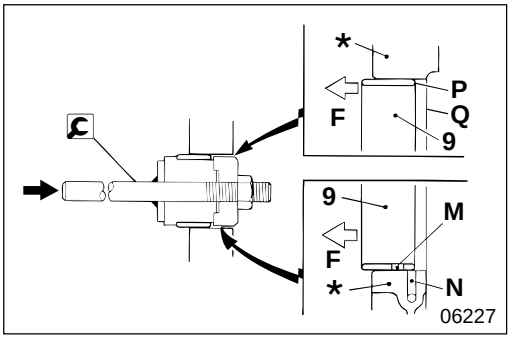
https://truckmanualshub.com/



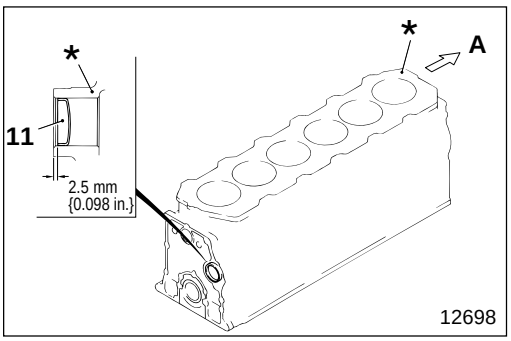
- For press-fitting of No.3 camshaft bushing **13**, use tool **K** as illustrated.



- Align oil holes **L**, **M** of No.1 camshaft bushing **9** in the direction as illustrated.
  L : ø3 mm {0.11 in.}
  M : ø8 mm {0.31 in.}
  ***** : Crankcase



- Align oil hole **M** of No.1 camshaft bushing **9** with oil hole **N** of crankcase ***** and press in until camshaft bushing surface **P** is flush with crankcase surface **Q**.
  F : Front of the engine



11 Installation of sealing cap

Press-fit sealing cap **11** into crankcase ***** to the specified depth.
A : Front of the engine

https://truckmanualshub.com/

PISTON, CONNECTING ROD AND CYLINDER SLEEVE

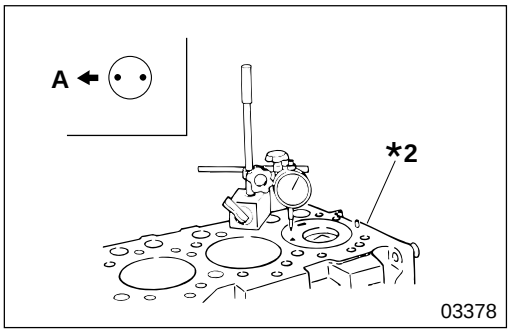
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
5	Socket wrench  01984	MH061560	Installation of piston and connecting rod assembly
	A : Piston guide clamp **B** : Piston guide lever  01981	**A** : MH061890 **B** : MF061658	
6	Cylinder sleeve installer  ø103 {4.06} 03377	MH062200	Installation of cylinder sleeve

◆ Service procedure



03378

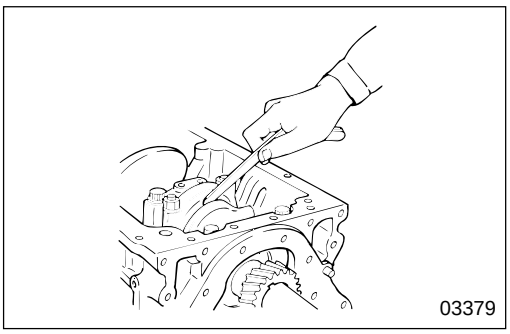
● **Inspection before disassembly**

(1) Extent of piston protrusion from the upper surface of crankcase *2

NOTE

Always inspect the extent of piston protrusion because it affects the engine performance greatly.

- Measure piston protrusion at two points on the top of the piston, and produce the average value.
  A : Front of the engine
- If the average valve deviates from the limit, inspect clearance of the related parts.

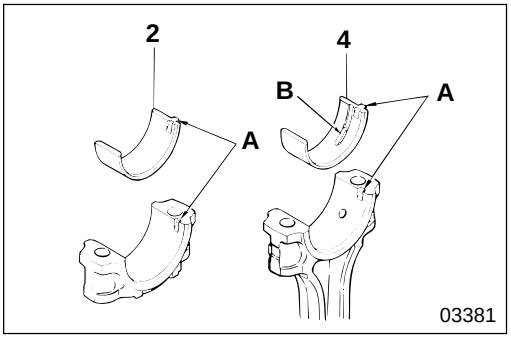


03379

(2) End play of connecting rod

- Measure the end play of each connecting rod.
- If the measured value is higher than the limit, replace the faulty parts.

https://truckmanualshub.com/



2 **4** **Connecting rod bearing**

[Installation]
Install connecting rod bearings **2**, **4** by matching lugs **A** to the connecting rods.

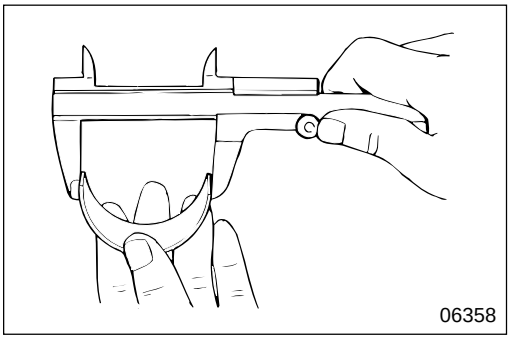
CAUTION

Be sure to distinguish between upper and lower connecting rod bearings 2, 4. The upper bearing has oil opening B while the lower bearing has no oil opening.

[Inspection]

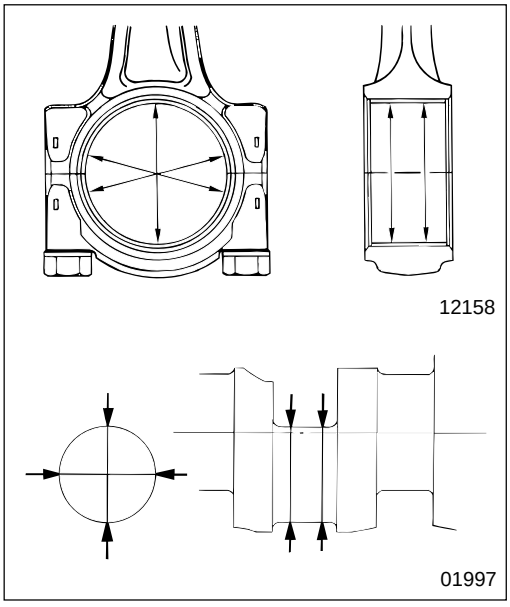
CAUTION

- **Do not forcibly open or expand connecting rod bearings 2, 4.**
- **When either upper or lower connecting rod bearings 2, 4 needs replacing, replace as a set.**



(1) Expansion at free state

If the measured value is lower than the limit, replace connecting rod bearings **2**, **4**.

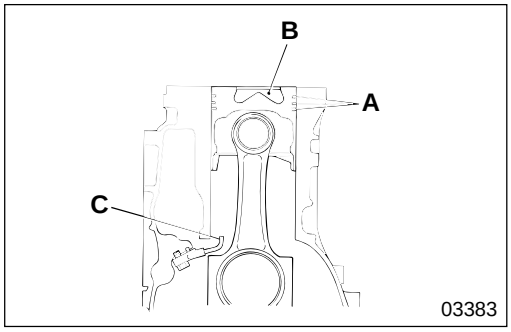


(2) Clearance between connecting rod bearing and crankshaft

If the clearance between connecting rod bearing **2**, **4** and crankshaft ***1** is lower than the limit, replace the faulty parts.

https://truckmanualshub.com/

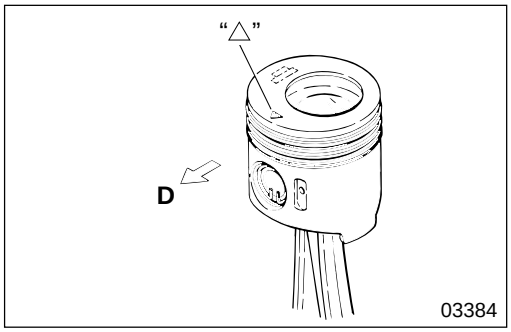
PISTON, CONNECTING ROD AND CYLINDER SLEEVE



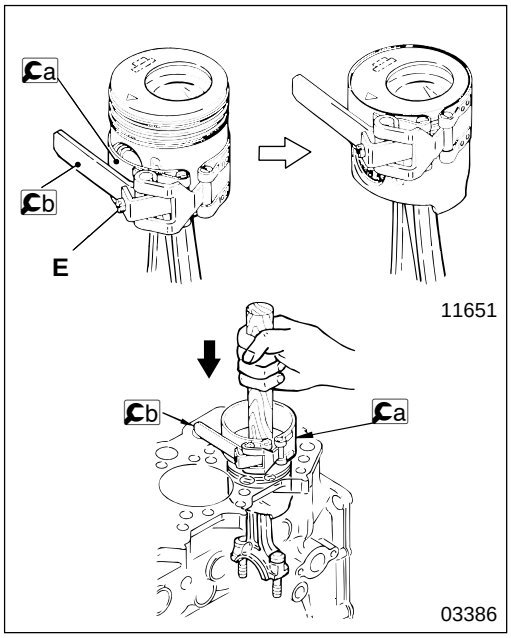
5 Installation of piston and connecting rod assembly

CAUTION

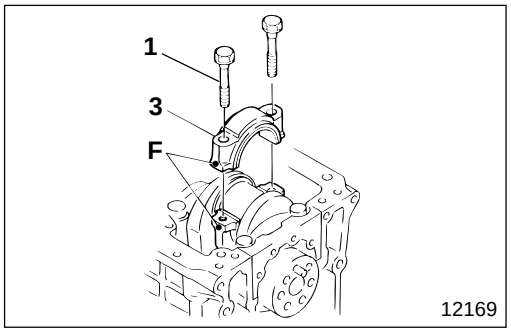
- **Be sure to fit piston ring A in the correct position.**
  P11-46
- **Be careful not to scratch or damage head B of the piston (a part of the combustion chamber).**
- **Make sure that the connecting rod does not hit oil jet C.**



- Install piston front mark "△" directed towards the front of the engine using the following procedure.
  D : Front of the engine

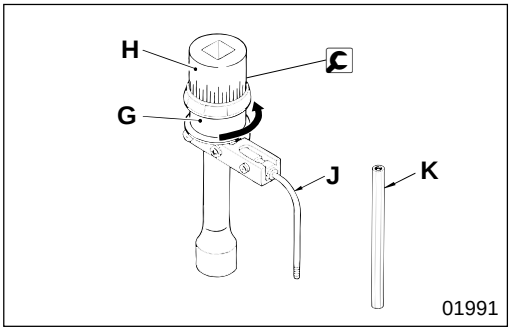


- Match the inner diameter of a piston guide clamp to the outer diameter of the piston skirt by turning adjusting bolt **E** of b piston guide lever.
- After adjusting, set a piston guide clamp and b piston guide lever at the top of the piston so that the clamp is flush with the top of the piston.

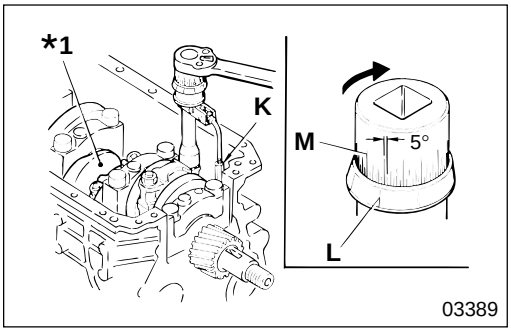


- After the piston is inserted, align alignment marks **F** on the connecting rod with the alignment marks on connecting rod cap **3** and tighten bolt **1** at specified torque. Then tighten the bolt further as follows:

https://truckmanualshub.com/



- Turn socket wrench holder **G** counterclockwise and keep the spring in the wrench compressed.
  H : Socket
  J : Rod
  K : Rod (for connection)

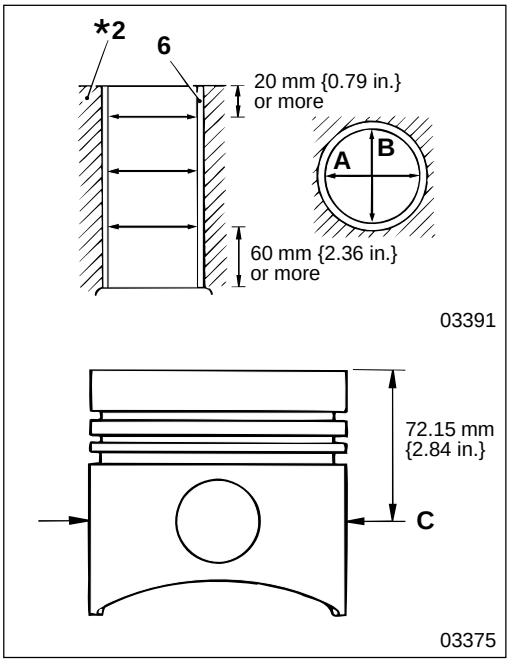


- Set socket wrench holder **G** so that the repercussive force of the spring presses rod **K** (for connection) against crankshaft ***1**.
- Select a scale that is convenient for reading graduation **L** on holder **G**.
- Tighten further by turning socket **H** clockwise by 90°±5° (setting is in 5° increments), referring to graduation **M** on the selected scale.

NOTE

After installation of connecting rod cap 3, inspect the following points :

- **End play of the connecting rod : 🕮 P11-36**
- **Piston protrusion : 🕮 P11-36**



5 **6** **Piston and connecting rod assembly, and cylinder sleeve**

[Inspection]

- If the inner diameter of cylinder sleeve **6** is higher than the limit, bore the cylinder sleeve oversize and use an oversized piston.
  A : In the direction of the crankshaft axis
  B : At right angles to the crankshaft axis

- If the clearance between piston **5** and cylinder sleeve **6** deviates from the standard value, even when the inner diameter of the cylinder sleeve is within the limit, replace the piston.

[Selection of oversized piston]

Extent of oversize : 0.50, 1.00 mm {0.020, 0.039 in.}

- Determine the extent of oversize by measuring the inner diameters of all the cylinders and calculating the maximum wear amount of all the cylinders.
- Measure the outer diameter of the oversized piston to be used.
  C : Position to measure the outer diameter of the piston

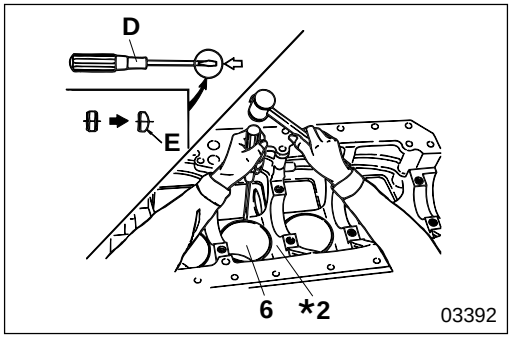
- Bore cylinder sleeve **6** and hone it to make the clearance between piston **5** and the cylinder sleeve conform to the standard value.

NOTE

- **Even if only one cylinder sleeve 6 requires boring, all the other cylinder sleeves must be bored to the identical oversize.**
- **Piston rings must be replaced with the corresponding oversized ones.**

https://truckmanualshub.com/

PISTON, CONNECTING ROD AND CYLINDER SLEEVE



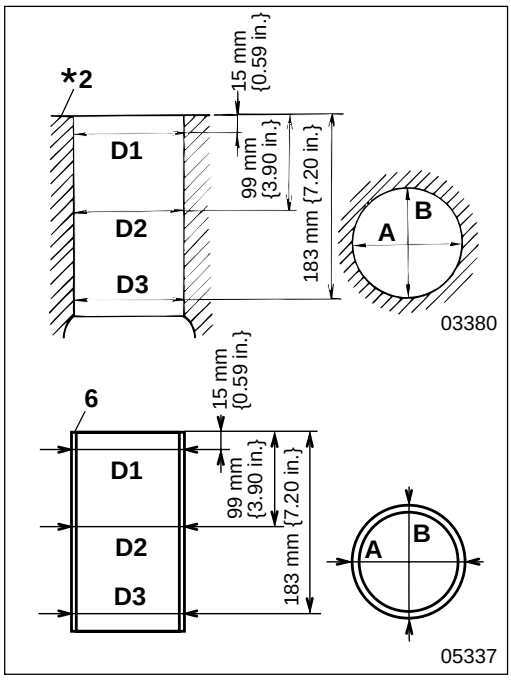
Cylinder sleeve

[Removal]

- Mount a boring machine on crankcase ***2** and center. Centering must be done at the lower part of cylinder sleeve **6** which is less unevenly worn.
- Bore until the thickness of cylinder sleeve **6** is approximately 0.5 mm {0.020 in.}.
- Insert tool **D** (a modified screwdriver) between crankcase ***2** and cylinder sleeve **6**, break the sleeve by tapping it gently, then remove.

CAUTION

Make sure when inserting tool D that round part E is facing crankcase *2.



[Installation]

- Inspect sleeve hole of crankcase ***2** before installing cylinder sleeve **6**. If there are irregularities, such as defects or insufficient interference, correct them by boring.

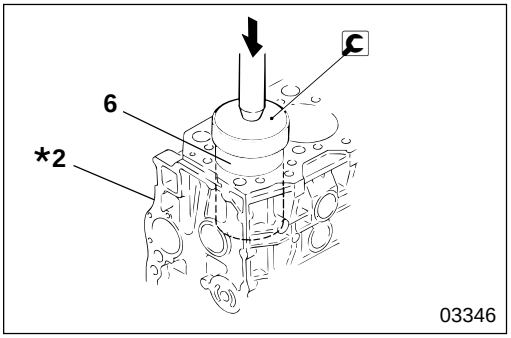
NOTE

- **Pull out cylinder sleeve 6 of all cylinders and bore the sleeve holes perfectly round when you bore the sleeve holes of crankcase *2.**
- **Apply spindle oil (ISO VG 32) when you push cylinder sleeve 6 into the sleeve hole of crankcase *2.**

Inspection of interference must be carried out as follows.

- Measure the inner diameter of the sleeve hole of crankcase ***2** and the outer diameter of cylinder sleeve **6** at the specified positions illustrated.
- Take the average value at the top, middle and bottom (**D1**, **D2**, **D3**) and across the diameter (**A**, **B**). If the interference is lower than the limit, bore the sleeve hole of crankcase ***2** oversize.

https://truckmanualshub.com/



< If interference is sufficient >

- Press-fit cylinder sleeve **6** into crankcase ***2** from the chamfered end using cylinder sleeve installer.

NOTE

Align the top of cylinder sleeve 6 with the top of crankcase *2 when press-fitting.

- After press-fitting, make the inner diameter of cylinder sleeve **6** conform to the standard value by honing the surface.

< If interference is insufficient >

- Prepare cylinder sleeve **6** which is 0.5 mm {0.020 in.} oversize in diameter.
- Hone crankcase ***2**, making the clearance between the outer diameter of cylinder sleeve **6** and the sleeve hole of crankcase ***2** conform to the standard value.
- Press-fit cylinder sleeve **6** into crankcase ***2** from the chamfered end using cylinder sleeve installer.

NOTE

Align the upper face of cylinder sleeve 6 with the upper face of crankcase *2 when press-fitting.

- After press-fitting, make the inner diameter of cylinder sleeve **6** conform to the standard value by honing the surface.

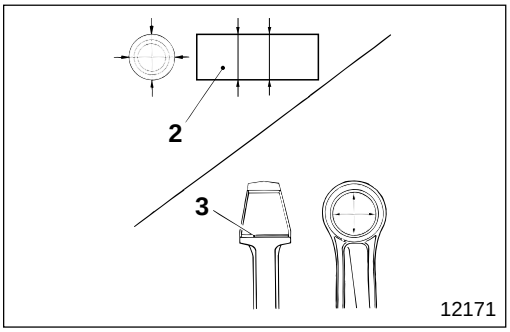
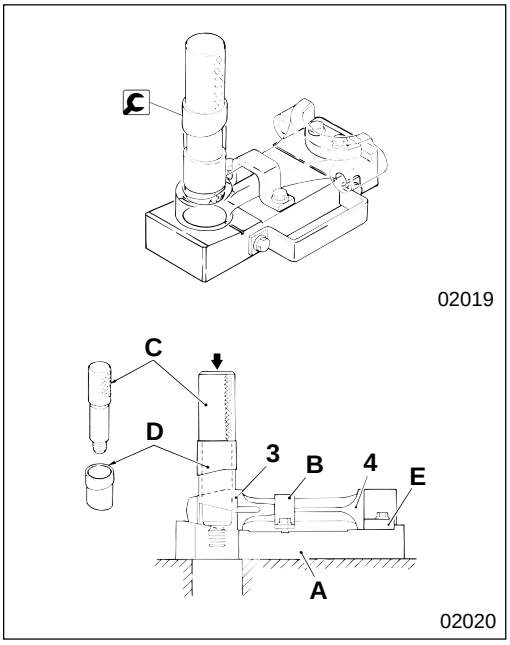
◆ Service procedure



12171

2 **3** **Piston pin and connecting rod bushing**

[Inspection]
If the clearances are higher than the limit, replace the faulty parts.



02019
02020

Connecting rod bushing

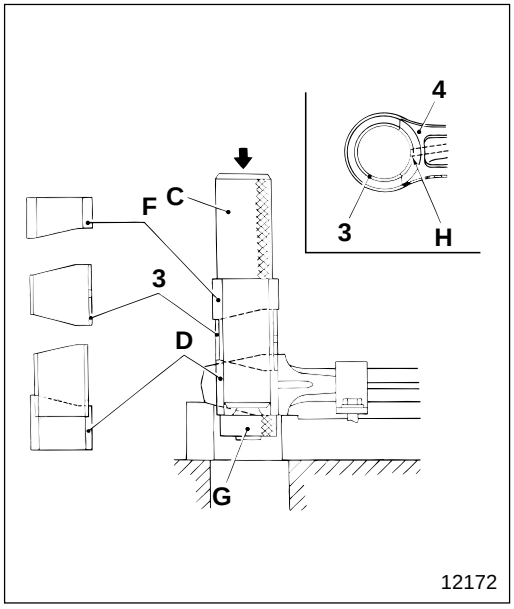
Use 🔧 connecting rod bushing puller kit to replace connecting rod bushing **3**.
(Components of 🔧 connecting rod bushing puller kit)
A : Base **B** : Bracket **C** : Puller **D** : Collar **E** : Plate **F** : Collar **G** : Nut

[Pulling-out]

- Remove upper connecting rod bearing from the big end of connecting rod **4**.
- Place connecting rod **4** on base **A** and fix it to the base at two points, bracket **B** and plate **E**.
- Fit collar **D** in puller **C** in the direction as illustrated, and pull out connecting rod bushing **3** with a gradual load of approximately 49 kN {11020 lbf, 5000 kgf}.

https://truckmanualshub.com/

PISTON, CONNECTING ROD AND CYLINDER SLEEVE

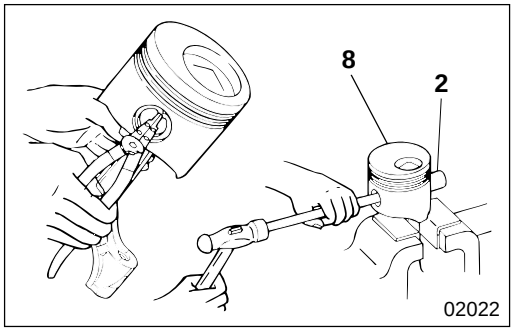


[Press-fitting]

- Apply engine oil to the exterior peripheral area of connecting rod bushing **3** and the inner area of the bushing fitting ring of connecting rod **4**.
- Fit collar **F**, connecting rod bushing **3** and collar **D** in puller **C** in the arrangement and direction as illustrated and mount them with nut **G**.
- Align oiling holes **H** of connecting rod bushing **3** and connecting rod **4**, and gradually press in the bushing with approximately 49 kN {11023 lbf, 5000 kgf} load.
- After press-fitting, ream connecting rod bushing **3** to make its clearance with piston pin **2** conform to the standard value.

NOTE

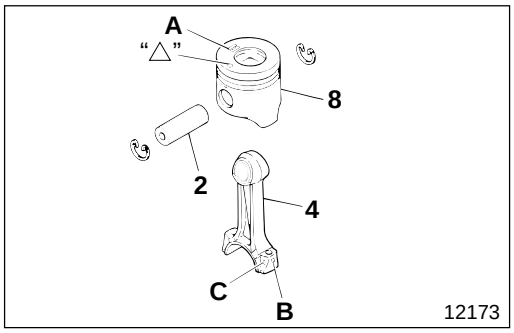
After press-fitting bushing 3, insert piston pin 2 and make sure that the rod moves smoothly without any excessive play.



2 **4** **8** **Piston pin and connecting rod and piston**

[Disassembly]

- Drift out piston pin **2** using a rod.
- When removal of piston pin **2** is difficult, warm piston **8** using a piston heater or hot water.



[Installation]

- Apply engine oil to piston pin **2** and assemble connecting rod **4** and piston **8** in the direction as illustrated.
  A : Piston mass (Mass of piston is marked)
  B : Connecting rod mass mark (Alphabetical: A, B, C, D, E, F, G)

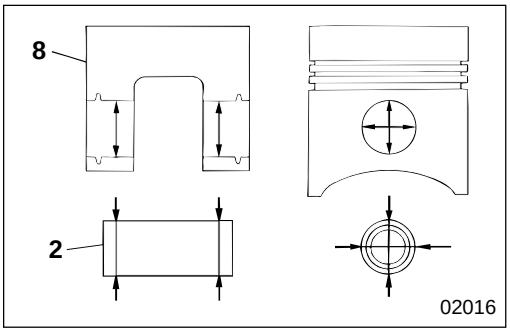
  C : Mounting base of connecting rod cap
  △ : Front mark

- When piston pin **2** insertion is difficult, warm piston **8** using a piston heater or hot water.

CAUTION⚠

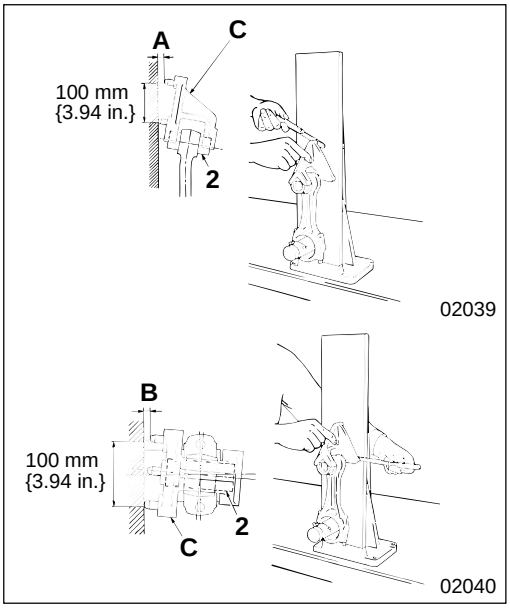
- **Make sure that the total mass error of all pistons 8 in one engine is 10 g {0.35oz} or less.**
- **Be sure to install connecting rods 4, to be used in one engine, that have identical mass mark B.**
- **Be sure that after inserting piston pin 2 the connecting rod operates smoothly without excessive play.**

https://truckmanualshub.com/



2 **8** **Clearance between piston pin and piston**

If the clearance is higher than the limit, replace the faulty parts.



4 **Degree of bend or distortion of connecting rod**

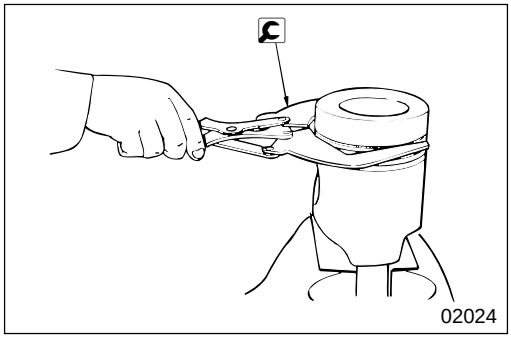
- Mount connecting rod bushing **3** and piston pin **2** to connecting rod **4**.
- Measure degree of bend **A** and distortion **B** of connecting rod **4**. If the measured value is higher than the limit, repair or replace the connecting rod.
  C : Connecting rod aligner (Measuring instrument)

NOTE

- **When making measurements by mounting connecting rod 5 to connecting rod aligner C, make sure that the upper connecting rod bearing and the lower connecting rod bearing are mounted on the rod.**
- **Mount the connecting rod cap by tightening the bolt at specified torque.** 🕮 **P11-34**

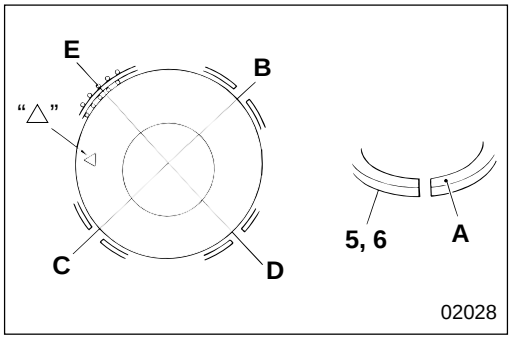
https://truckmanualshub.com/

PISTON, CONNECTING ROD AND CYLINDER SLEEVE

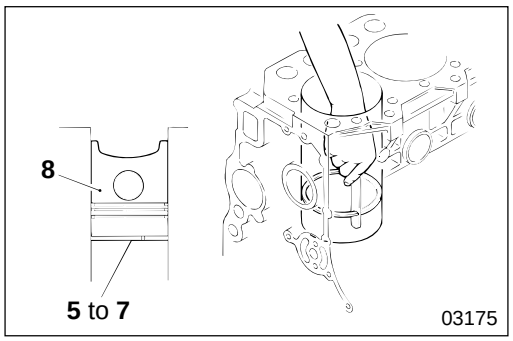


5 to **8** **Piston ring and piston**

Piston ring
[Removal]



[Installation]
- Install oil ring **8** so that split **D** and the butting joint of expander spring **E** come to the points as illustrated.
- Compression rings **5** and **6** have a manufacturer's mark **A** at the split, and installation should be made with the mark outward.
  B : The split of the 1st compression ring
  C : The split of the 2nd compression ring
  D : Oil ring slit
  E : Oil ring expander spring butt joint
  △ : Front mark of piston

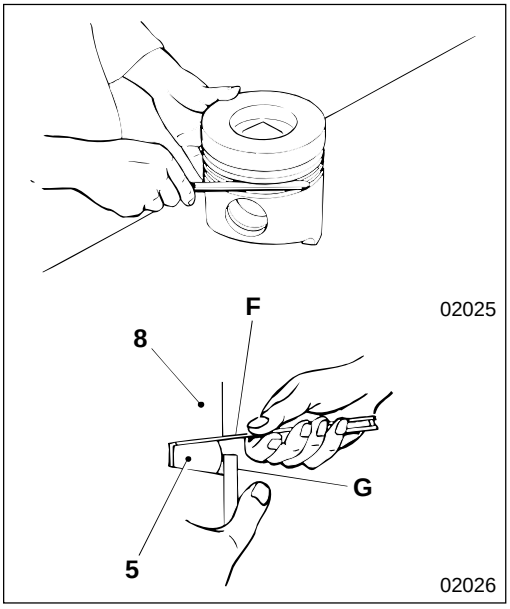


[Inspection]

(1) Clearance of piston ring slit
- Install piston rings **5** to **7** into the crankcase cylinder sleeve using the head of piston **8** to level the piston ring.
- Measure the clearance of the piston ring split while keeping them level and stationary. If the measured value is higher than the limit, replace the piston ring.

NOTE
- **Use piston 8 to ensure that piston rings 5 to 7 are kept level when inserting them into the crankcase cylinder sleeve.**
- **Insert piston rings 5 to 7 into the lower part of the crankcase cylinder sleeve, where the area is less worn, when measuring clearance of piston ring split 5 to 7.**
- **Exchange the whole set of piston rings 5 to 7 as a set if any of the rings is faulty.**

https://truckmanualshub.com/



02025

02026

(2) Clearance between piston ring and ring groove

- If the measured value is higher than the limit, replace the faulty parts.
- Measure using feeler gauge **F**, by pressing 1st compression ring **5** against piston **8** with straight edge **G**.

NOTE

- **Measurement has to be conducted around the whole periphery of piston 8 after removing carbon deposits.**
- **Be sure to exchange the whole set of piston rings 5 to 7 as a set if any of the rings is faulty.**

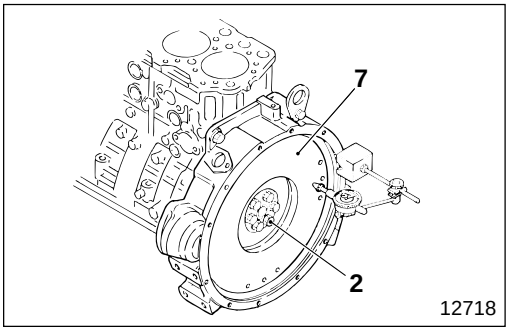
11	Lip area of rear oil seal	Engine oil	As required
	Crankcase mounting surface of rear oil seal	THREEBOND 1207C	As required

◆ Service procedure

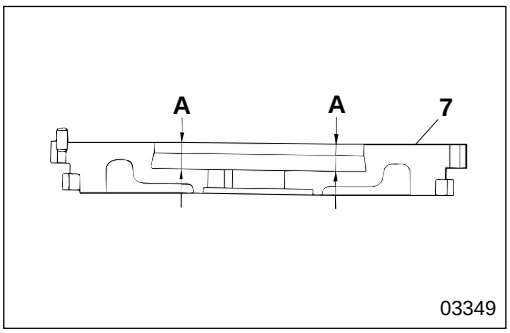


7 Flywheel assembly

[Inspection]

(1) Wobble

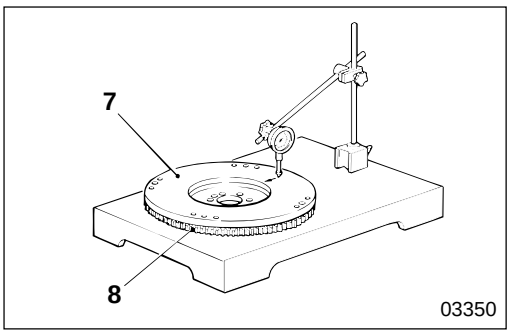
If the measured value is higher than the limit, check the fastening of bolt **2**, the attachment surface of crankshaft assembly, and depending on the condition found, either repair or replace flywheel assembly **7**.



(2) Height of friction surfaces

If the measured value is lower than the limit, repair or replace flywheel assembly **7**.

A : Height from bolt mounting surface to friction surface

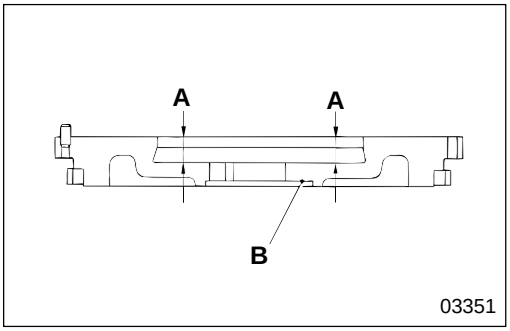


(3) Distortion of friction surface

If the measured value is lower than the limit, repair or replace flywheel assembly **7**.

NOTE

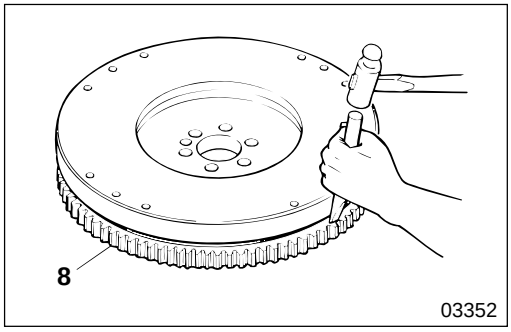
If any fault is found in ring gear 8, replace it first, then begin the inspection.



[Correction]

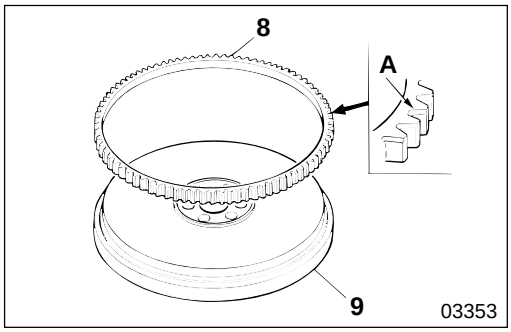
Make sure when grinding the friction surfaces for correction, that height **A** is not lower than the limit while maintaining the degree of parallel with surface **B** within 0.1 mm {0.0039 in.}.

https://truckmanualshub.com/

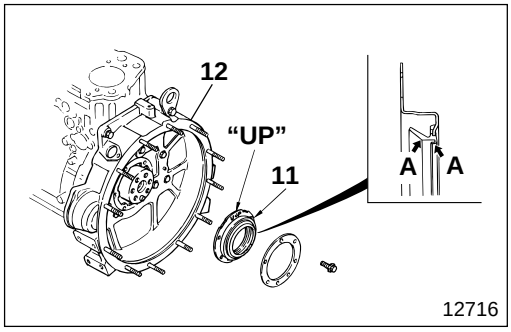


8 **Ring gear**

[Inspection]
Check and see if there is any damage, wear or other fault, and if any fault is found, replace ring gear **8**.
[Removal]
- Heat up ring gear **8** evenly using an acetylene torch.
- Hammer the outer edge of ring gear **8** evenly until it drops off.

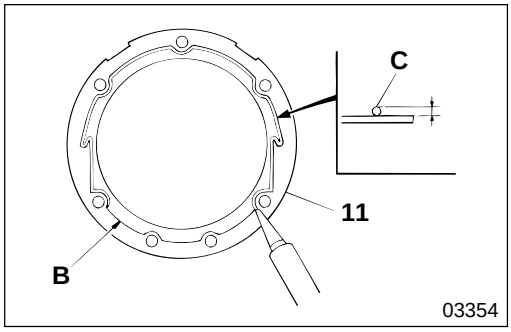


[Installation]
- Heat up ring gear **8** using a piston heater to approximately 100°C {212°F} for three minutes.
- With the side of the chamfered teeth of ring gear **8** facing you, mount it on flywheel **9**.
  A : Chamfered ring gear side



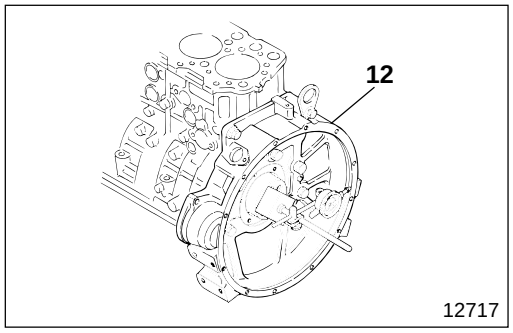
11 **Mounting of rear oil seal**

- Apply engine oil to lip area **A** of rear oil seal **11**.
- Install rear oil seal **11** in flywheel housing **12** in the direction as illustrated.



- Apply sealant **C** along line **B** on rear oil seal **11** evenly without break
- After applying sealant **C**, within three minutes, mount rear oil seal **11**.

CAUTION
- **Do not start the engine within an hour of installing rear oil seal 11.**
- **Be sure to reapply sealant C if the bolts (for mounting rear oil seal 11) are loosened or removed by any cause whatsoever after mounting.**



12 **Inspection of flywheel housing**

Mount of eccentricity
- If the measured value is higher than the limit, reassemble flywheel housing **12**.
- After reassembly, if the measured value is still higher than the limit, replace the faulty parts.

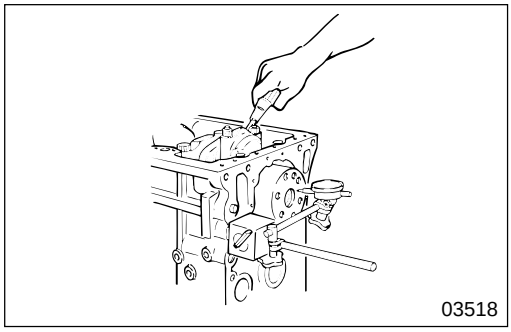
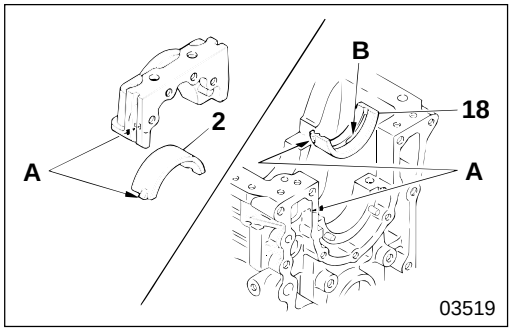
◆ Service procedure



● **Inspection before disassembly**

Crankshaft assembly end play
If the measured value is higher than the limit, replace thrust plates **10** with oversized ones. 🕮 P11-56
< Available oversize ones >
+0.15, +0.30, +0.45 mm
{+0.0059, +0.012, +0.018 in.}

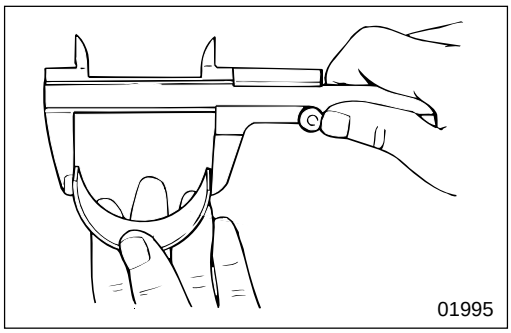


2 **18** **Main bearing**

[Installation]
When installing main bearings **2**, **18**, align lugs **A**.

CAUTION⚠

Be sure to distinguish between main bearings 2, 18. The upper bearing has oil opening B while the lower bearing has no oil opening.



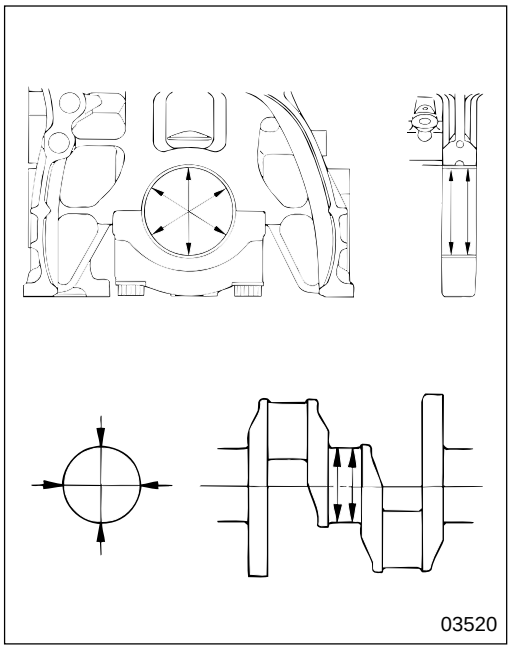
[Inspection]

CAUTION⚠

- **Do not forcibly expand main bearings 2, 18.**
- **Be sure to replace both upper and lower main bearings 2, 18 as a pair when replacement is necessary.**

(1) Expansion at free state

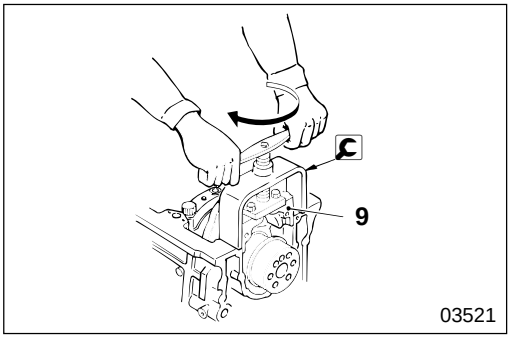
If the measured value is lower than the limit, replace main bearings **2**, **18**.



(2) Clearance between main bearing and crankshaft

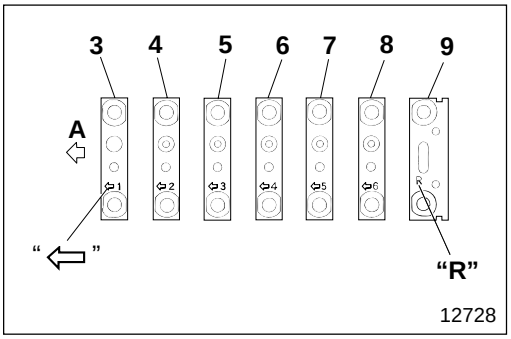
If the measured value is lower than the limit, replace faulty parts.

https://truckmanualshub.com/

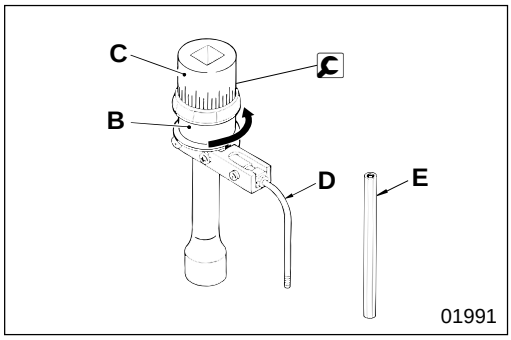


3 to **9** **Main bearing cap**

[Removal]
Use bearing cap extractor to remove rear main bearing cap **9** because side seal **11** is installed between crankcase **21** and the rear main bearing.



[Installation]
- Install main bearing caps **3** to **9** in the direction as illustrated.
  A : Front of engine

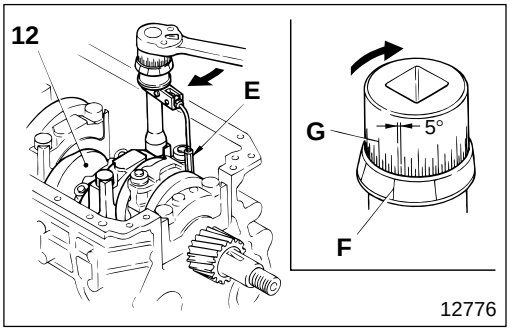


- Center punch the head of bolt **1** before installation.

CAUTION

If there are already three center-punch marks, replace the cylinder head bolt with a new one.

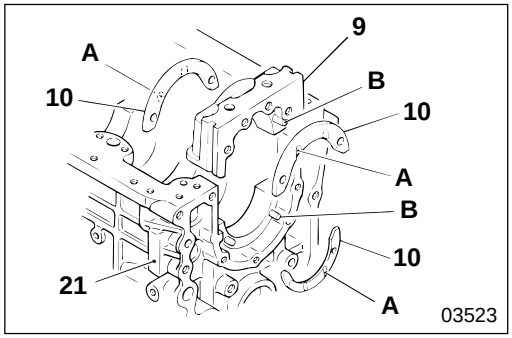
- After tightening bolt **1** at specified torque, tighten further as follows:
- Turn socket wrench holder **B** counterclockwise and keep the spring in the wrench compressed.
  C : Socket
  D : Rod
  E : Rod (for connection)



- Set socket wrench holder **B** so that the repercussive force of the spring presses rod **E** (for connection) against crankshaft assembly **12**.
- Select a scale that is convenient for reading graduation **F** on holder **B**.
- Tighten further by turning socket **C** clockwise by 90° (setting is in 5° increments), referring to graduation **G** on the selected scale.
- After installation, check the following points :
  - Crankshaft assembly **12** can be rotated easily by hand.
  - The end play of crankshaft assembly **12**. P11-54

https://truckmanualshub.com/

CRANKSHAFT AND CRANKCASE



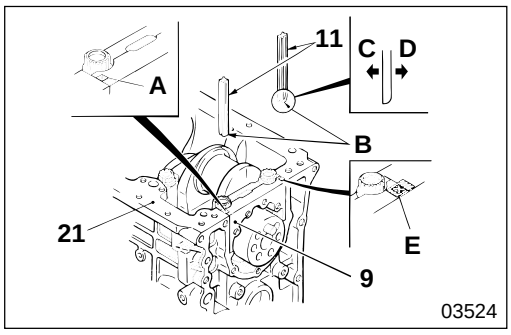
10 Installation of thrust plate

Install thrust plates **10** on both ends of rear main bearing **9** and the rear end of crankcase **21** in the direction as illustrated.

A : Oil groove
B : Positioning pin

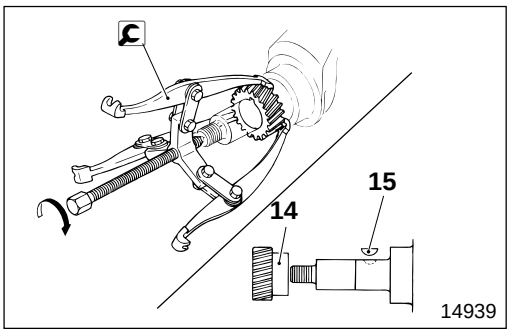
CAUTION

When installing oversized thrust plates 10, mount them on the front and rear of rear main bearing cap 9. It is not necessary that the thrust plates used are all of the same size, but use the same-size-combination of thrust plates for mounting on the rear of crankcase 21 and on the rear of the rear bearing cap.



11 Installation of side seal

- Supply sealant in side seal mounting groove **A** of rear main bearing cap **9**.
- Apply sealant at end **B** of side seal **11**.
- Press in side seal **11** between rear main bearing cap **9** and crankcase **21** in the direction as illustrated.
  C : Rear main bearing cap side
  D : Crankcase side
- After pressing in, apply sealant to side seal mounting **E** of rear main bearing cap **9**.



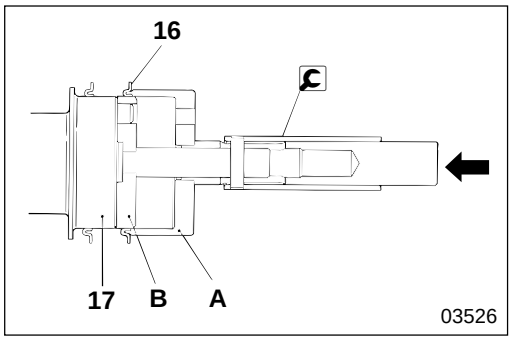
14 Crankshaft gear

[Removal]
Never remove crankshaft gear **14** by striking, hitting or hammering it.

[Installation]
Before installing heat up crankshaft gear **14** using a piston heater or similar device to approximately 100°C {212°F}.

NOTE

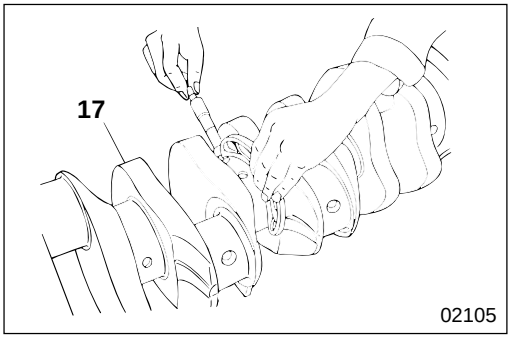
Install key 15 to prevent rotation.



16 Installation of rear oil seal slinger

Install rear oil seal slinger **16** using oil seal slinger installer. Strike installer **A** until it hits guide **B** positively.

https://truckmanualshub.com/

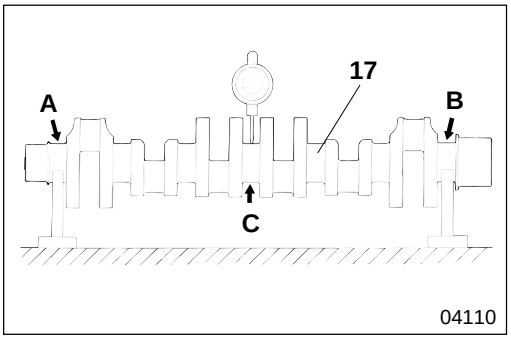


17 Crankshaft

[Inspection]

(1) Cylindrical and circular accuracy of the journal and the pin

If the measured value is higher than the limit, grind and correct crankshaft **17** to convert it to the undersize specifications or replace it.

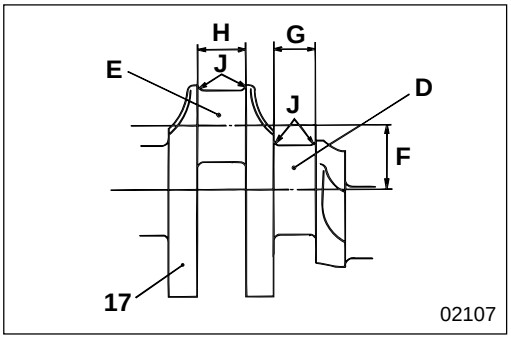


(2) Degree of bend

The degree of bend of crankshaft **17** is measured at No.4 journal **C** by supporting No.1 journal **A** and No.7 journal **B.** If the measured value is higher than the limit, replace the crankshaft.

NOTE

The degree of bend of crankshaft 17 is half of the indicated value of the gauge after rotating the shaft 360°.



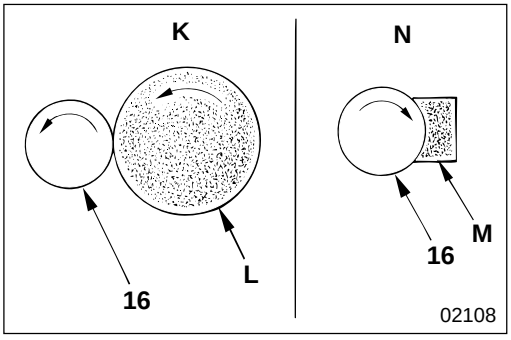
[Correction]

NOTE

Be sure to replace main bearings 2, 18 with those that meet the undersize specifications after crankshaft 17 is corrected by grinding.

- Set **F**, distance between the center line of the journal **D** and that of the pin **E**, constant.
  F : 57.5±0.075 mm {2.26±0.0030 in.}
- Set the width of journal **G** and pin **H** so they are constant.
  G : 35 mm {1.38 in.} (32 mm {1.26 in.} for No.1 journal)
  H : $41\ ^{+0.2}_{0}$ mm
  {$1.61\ ^{+0.0079}_{0}$ in.}

- Finish the fillet **J** smoothly.
  J : R4±0.2 mm {0.0079 in.}
- Check and confirm that there has been no cracking caused by grinding using the magnetic particle inspection method (Magnafluxing). Also make sure the surface hardness has not deteriorated (Shore hardness to be maintained at not less than Hs 75).
- When grinding **K**, set crankshaft **17** and grinder **L** so that they both rotate counterclockwise as viewed from the front of the crankshaft.
- To finish grinding **M** using a grindstone or emery paper **N,** rotate crankshaft **17** clockwise.

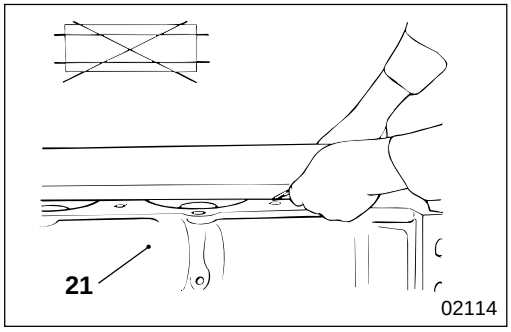


https://truckmanualshub.com/

Undersize specifications of crankshaft

Unit : mm {in.}

	Undersize scales			
	0.25 {0.0098}	0.50 {0.020}	0.75 {0.030}	1.00 {0.039}
Finish outer diameter of journal	77.69 to 77.70 {3.058 to 3.059}	77.44 to 77.45 {3.048 to 3.049}	77.19 to 77.21 {3.038 to 3.039}	76.94 to 76.95 {3.0291 to 3.0295}
Finish outer diameter of pin	64.69 to 64.71 {2.546 to 2.547}	64.44 to 64.46 {2.5370 to 2.5377}	64.19 to 64.21 {2.5271 to 2.5279}	63.94 to 63.96 {2.517 to 2.518}
Circular accuracy	0.01 {0.00039} or less			
Cylindrical accuracy	0.006 {0.00024} or less			



21 **Crankcase top surface distortion**

If the measured value is higher than the limit, grind and correct using a surface grinder.

CAUTION

When grinding crankcase 21 be sure that the extent of piston protrusion does not deviate from the standard value.
Piston protrusion : P11-36

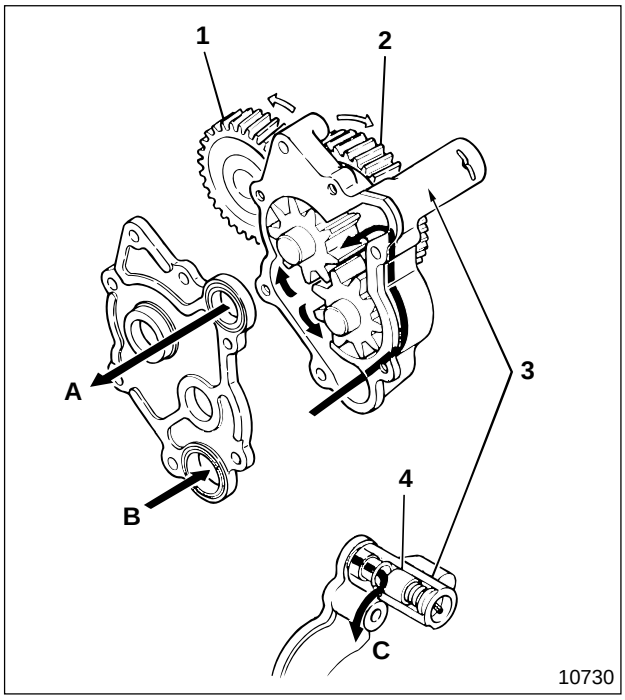
22 Bypass valve
23 Regulator valve
24 Oil pump
25 Relief valve (Built-in within oil pump)
26 Oil strainer
27 Oil pan

https://truckmanualshub.com/

Oil Pump



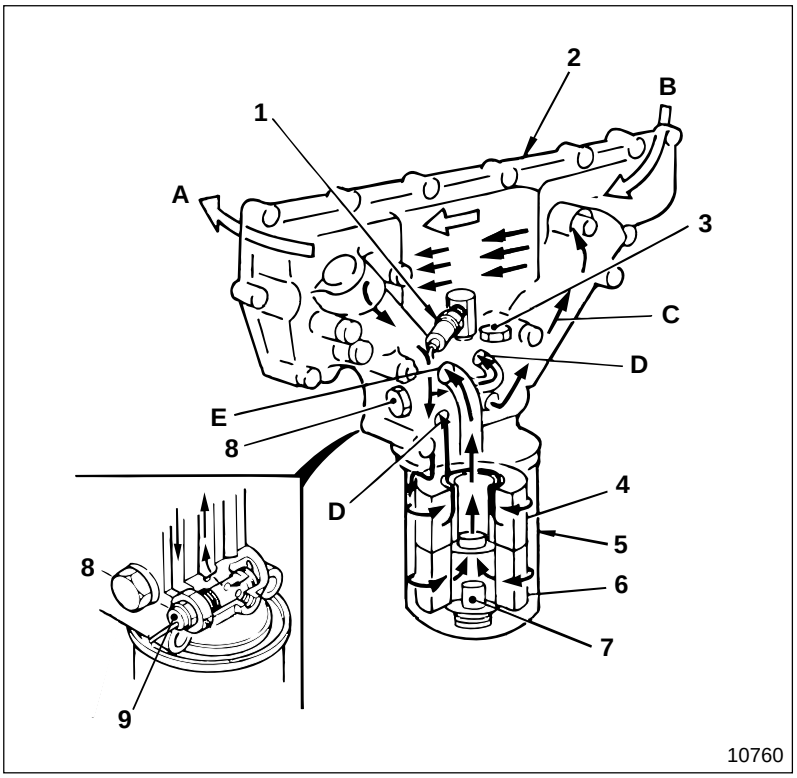
1 Crankshaft gear
2 Oil pump gear
3 Oil pump
4 Relief valve

A : To oil cooler
B : From oil strainer
C : To oil pan

Oil pump **3** is a gear type, driven by rotation of the crankshaft transmitted by crankshaft gear **1** that engages oil pump gear **2**. Relief valve **4** is installed on the oil pump and when the oil pump discharge pressure becomes higher than the standard pressure level, part of the engine oil is returned to the oil pan by relief action of the valve, protecting the lubricating system from breakdown caused by excessive oil pressure.

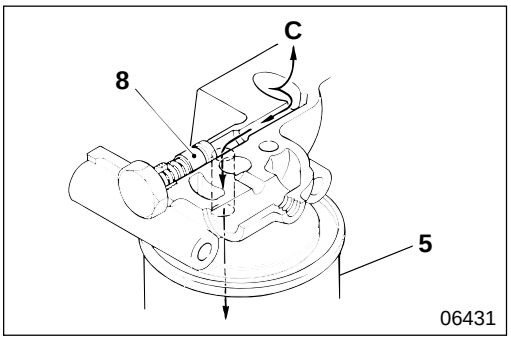
https://truckmanualshub.com/

Oil Cooler and Oil Filter



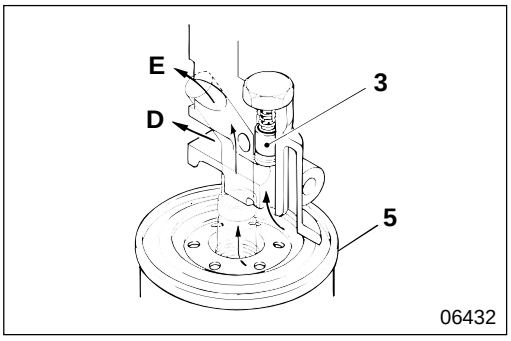
1 Engine oil pressure switch
2 Oil cooler
3 Regulator valve
4 Bypass filter element
5 Oil filter
6 Full-flow filter element
7 Bypass valve
8 Bypass valve
9 Engine oil bypass alarm switch

A : Coolant exit port
B : Coolant entry port
C : To oil cooler
D : To oil pan
E : To main oil gallery



Operation of bypass valve

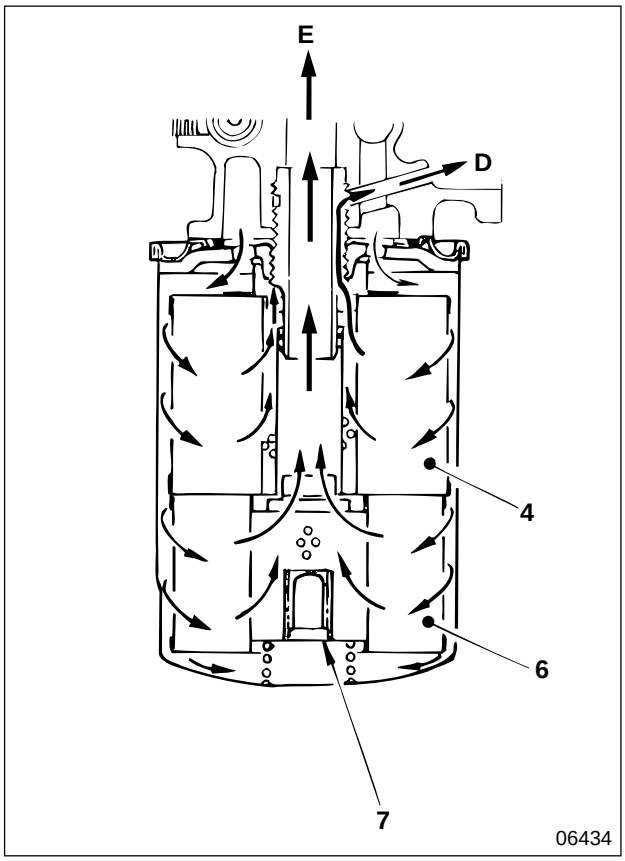
When the viscosity of the engine oil is high at low temperatures, or when oil cooler **2** element is clogged, flow resistance is high, and if this happens, bypass valve **8** opens to let the engine oil return directly to oil filter **5** without going through the oil cooler.



Operation of regulator valve

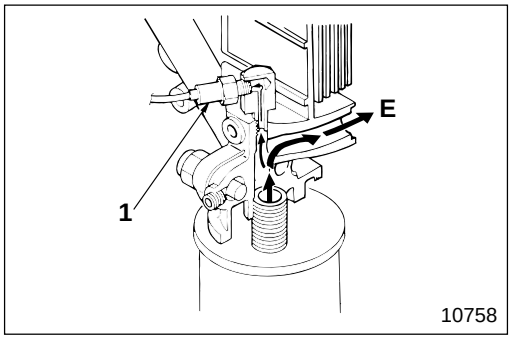
When the oil pressure in the main oil gallery becomes higher than standard, regulator valve **3** opens to let part of the oil return to oil pan **D**, thereby regulating the oil pressure.

https://truckmanualshub.com/



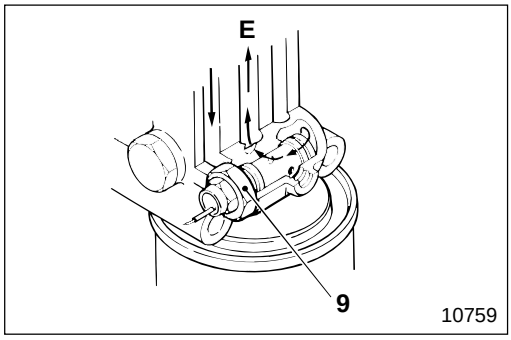
● **Oil filter element**

This oil filter uses a spin-on, filter paper type element, that integrates full-flow filter element **6** and bypass filter element **4**. When the filter element is clogged, bypass valve **7**, installed at the base of the filter, opens to let the oil bypass the element and flow directly to main oil gallery **E**, preventing engine seizure.



Operation of engine oil pressure switch

When pressure for delivering the oil to main oil gallery **E** becomes lower than standard, the built-in electric contact point of engine oil pressure switch **1** closes to light warning lamp in the meter cluster, warning the driver that the oil pressure is abnormal.

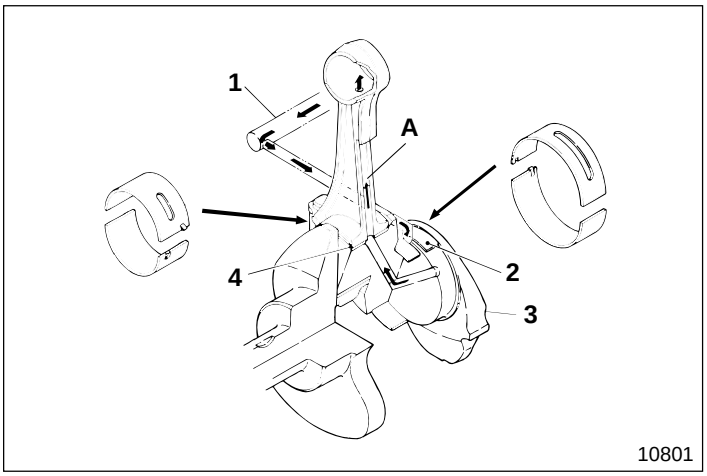


Operation of engine oil bypass alarm switch

- When the oil filter element is clogged, the engine oil level becomes low and might cause seizure of engine parts, engine oil bypass alarm switch **9** is installed to prevent this.
- When the oil filter element is clogged, engine oil bypass alarm switch **9** lets the oil flow directly to main oil gallery **E**, bypassing full-flow filter element **6**. When the engine oil bypass alarm switch is activated it lights the warning lamp, warning the driver that the oil filter element is clogged.

https://truckmanualshub.com/

Lubrication of Related Parts

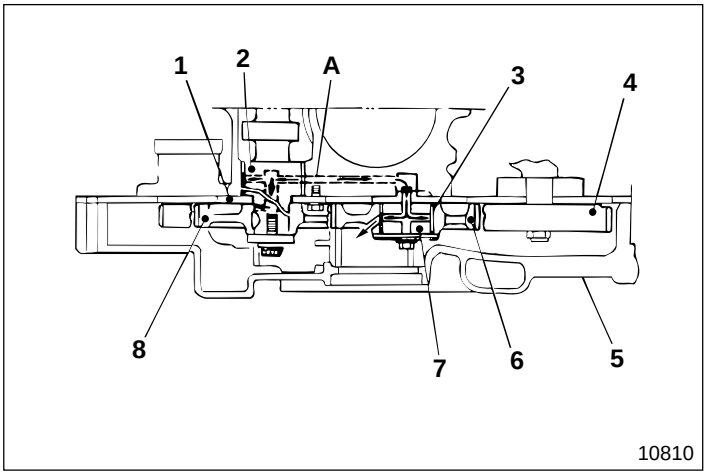


● **Main bearing and connecting rod bearing**

1 Main oil gallery
2 Main bearing
3 Crankshaft
4 Connecting rod bearing

A : Connecting rod oil passage

Engine oil supplied through the oil passage drilled in crankshaft **3** flows through connecting rod oil passage **A** to lubricate the small end of the connecting rod.



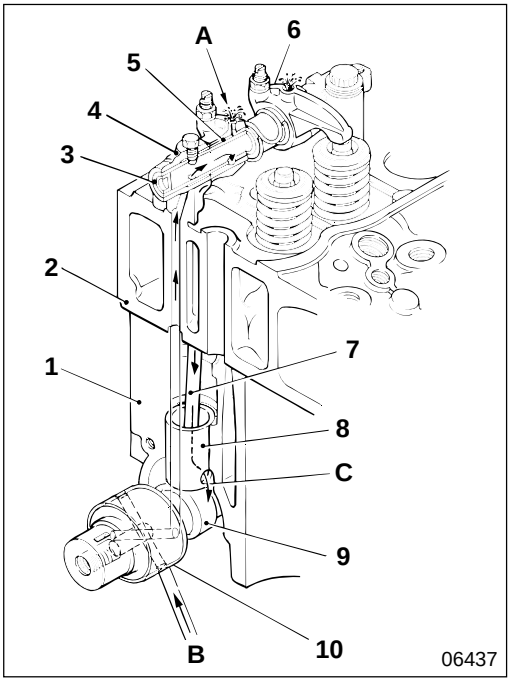
● **Timing gear**

1 Thrust plate
2 Camshaft
3 Idler gear bushing
4 Air compressor gear
5 Timing gear case
6 Idler gear
7 Idler shaft
8 Camshaft gear

A : From main oil gallery

Engine oil from main oil gallery **A** flows through the inside of camshaft **2** and idler shaft **6** and lubricates each gear.

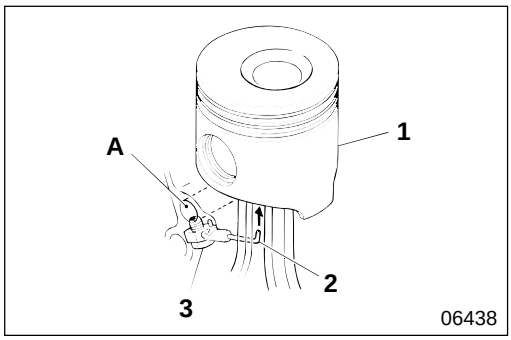
https://truckmanualshub.com/



● **Valve mechanism**

1 Crankcase
2 Cylinder head
3 Rocker shaft
4 Rocker shaft bracket
5 Rocker bushing
6 Rocker
7 Push rod
8 Tappet
9 Camshaft
10 No. 1 camshaft bushing

A : Rocker oil hole
B : From main oil gallery
C : To oil pan

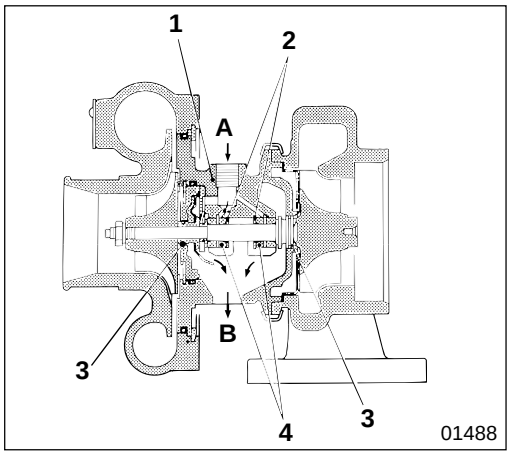


● **Oil jet**

1 Piston
2 Oil jet
3 Check valve

A : Main oil gallery

An oil jet **2** is installed, in the lower part of main oil gallery **A**, for each cylinder and cools piston **1** by injecting engine oil toward the inside of the piston. The oil jet is fitted with check valve **3** which opens and closes at standard oil pressure levels. This prevents a decrease of oil volume at low oil pressure as well as a decrease of oil pressure itself.



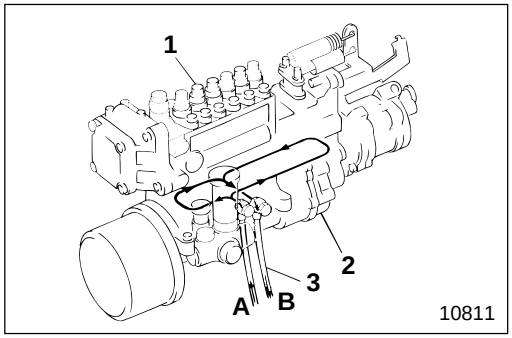
● **Turbocharger**

1 Bearing housing
2 Snap ring
3 Piston ring
4 Bearing

A : From main oil gallery
B : To oil pan

Engine oil is delivered from the main oil gallery to bearing housing **1** through the oil pipe to lubricate bearing **4**. Piston ring **3** installed at both ends of the turbine wheel shaft works as an oil seal.

https://truckmanualshub.com/

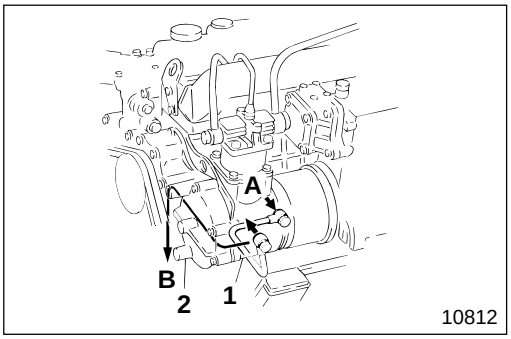


● **Injection pump**

1 Injection pump
2 Governor
3 Oil return pipe

A : From main oil gallery
B : To oil pan

Engine oil that has lubricated injection pump **1** and governor **2** returns to the oil pan through oil return pipe **3**.



● **Air compressor**

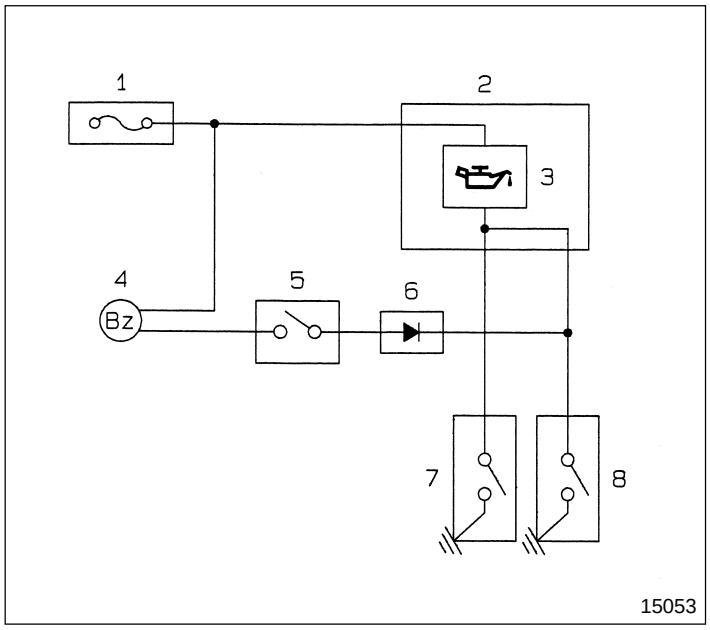
1 Air compressor
2 Timing gear case

A : From main oil gallery
B : To oil pan

Engine oil from the main oil gallery lubricates the inside of air compressor **1** and returns to the oil pan through timing gear case **2**.

https://truckmanualshub.com/

Lubrication System Electric Circuit



1 Fuse box
2 Meter cluster
3 Engine oil pressure/clogged oil filter warning lamp

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Replacement of Oil Filter

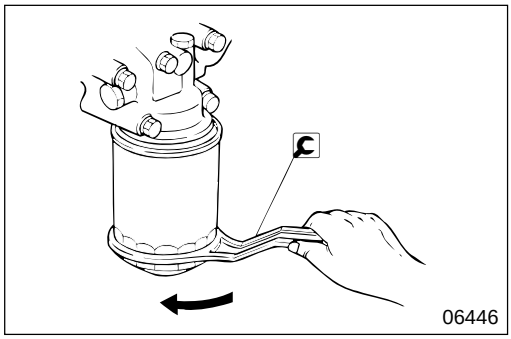
Special tools

Unit : mm {in.}

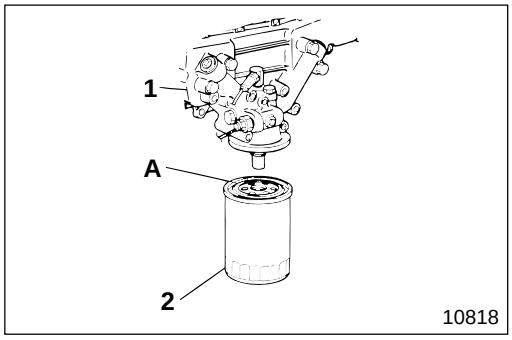
Location	Tool name and shape	Part No.	Application
2	Oil filter wrench  06478	MH061587	Removal of oil filter

WARNING

- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**
- **When replacing oil filter 2, take care not to spill oil on the V-belt.**



[Removal]



[Installation]

- Clean the surface of oil cooler body **1** that makes contact with oil filter **2**.
- Apply engine oil thinly and evenly to gasket area **A** of oil filter **2**.
- Screw in oil filter **2** to oil cooler body **1** until gasket area **A** sits on the body. From this position, tighten further by rotating by five eighths of a turn.
- After installation, run the engine and check that there is no oil leakage from gasket area **A**.
- Check the oil level and if it is low, top it up.

https://truckmanualshub.com/

Replacement of Engine Oil

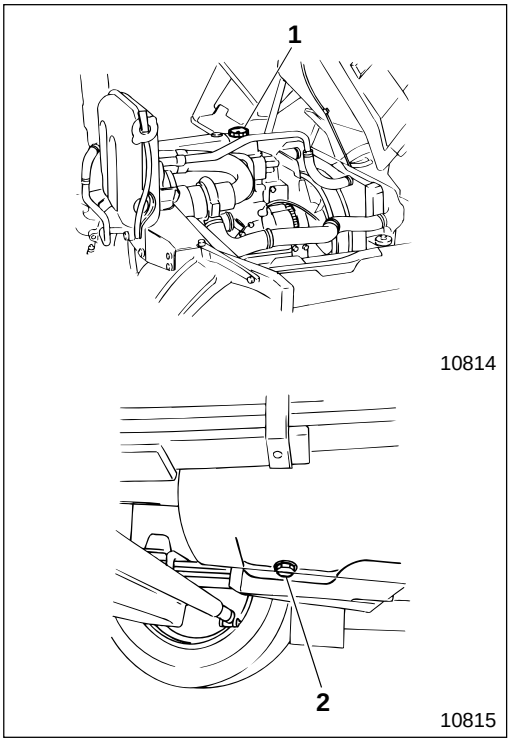
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Oil pan drain plug	69 {51, 7}	—

Lubricant

Location	Points of application	Kinds	Quantity
—	Oil pan	Engine oil (Grade CD or above as per API Classification)	Approximately 9.5 L {10 qts}
—	Oil filter	Engine oil (Grade CD or above as per API Classification)	Approximately 1 L {1.1 qts}



[Draining]
After warming-up the engine, remove oil filler cap **1** and remove drain plug **2** of the oil pan and drain the engine oil.

[Refilling]
Tighten drain plug **2** of the oil pan at specified torque and fill with the specified quantity of engine oil.

WARNING

- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**
- **When replacing engine oil take care not to spill oil on the V-belt.**

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Measurement of Oil Pressure

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Oil pressure (Oil temperature 70 to 90°C {158 to 194°F})	At no-load minimum revolution	145 kPa {21 lbf/in^2, 1.5 kgf/cm^2}	49 kPa {7.1 lbf/in^2, 0.5 kgf/cm^2}	Inspect
		At no-load maximum revolution	295 to 490 kPa {43 to 71 lbf/in^2, 3 to 5 kgf/cm^2}	195 kPa {28 lbf/in^2, 2 kgf/cm^2}	

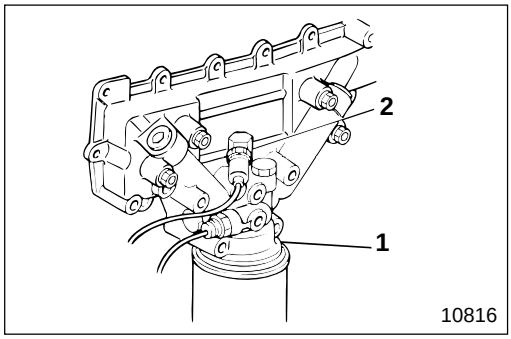
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

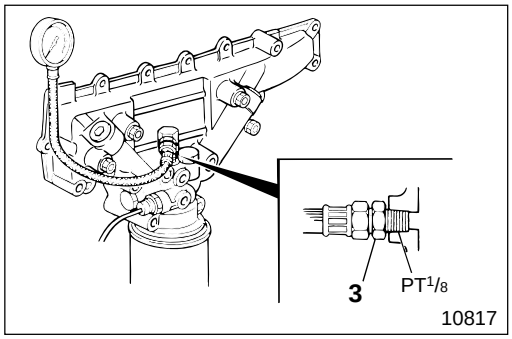
Location	Parts to be tightened	Tightening torque	Remarks
2	Engine oil pressure switch	15 to 22 {11 to 16, 1.5 to 2.2}	When engine is cold

Sealant

Location	Points of application	Kinds	Quantity
2	Thread area of engine oil pressure switch	Teflon tape	3 1/2 turns



- Remove oil pressure switch **2** from oil cooler **1**.
- Mount the oil pressure gauge after installing adaptor **3** onto oil cooler **1**.
- Warm up the engine until the oil temperature reaches 70 to 90°C {158 to 194°F}.
- Measure oil pressure at no-load minimum revolution and at no-load maximum revolution. If the measured values are lower than the limit, overhaul the lubricating system.



- After measurement, install engine oil pressure switch **2** and tighten at specified torque.

CAUTION

Be sure to install oil pressure switch 2 when the engine is cold.

Inspection of engine oil pressure switch

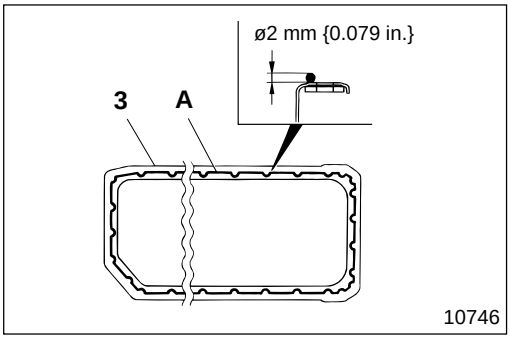
Lubricant and sealant

Location	Points of application	Kinds	Quantity
3	Oil pan to crankcase connecting surface	THREEBOND 1207C	As required
5	Body of O-ring	Engine oil	As required
6	Thread area of check valve	Engine oil	As required



◆ Service procedure

3 **Installation of oil pan**

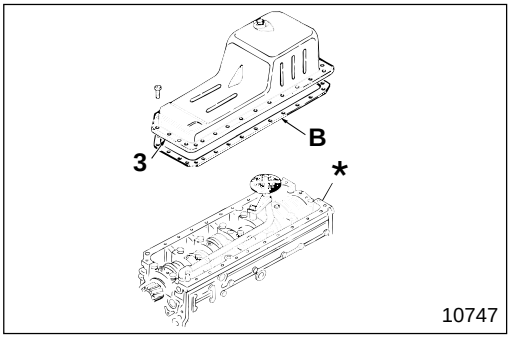
< When using sealant >

- Apply sealant **A** to lower connecting surface of oil pan **3** as illustrated evenly without break.
- After applying sealant **A**, within three minutes, mount oil pan **3** to crankcase *****.

CAUTION

- **Be sure to clean and wipe off oily substances from the surface where sealant A is to be applied.**
- **Make sure that sealant A is not transferred to other areas while the mounting work is being done.**
- **Do not start the engine within an hour of mounting oil pan 3.**
- **Be sure to reapply sealant A if bolts 2 (for mounting oil pan 3) are loosened or removed by any cause whatsoever after mounting.**

https://truckmanualshub.com/



< When not using sealant >

NOTE

If sealant is not available, install oil pan 3 to crankcase * using sheet gasket B.

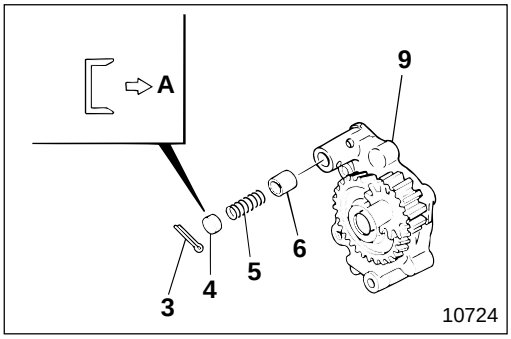
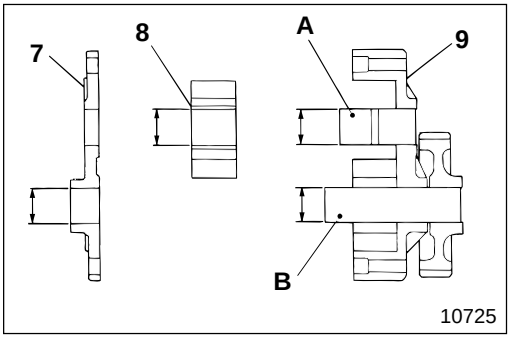
◆ Service procedure



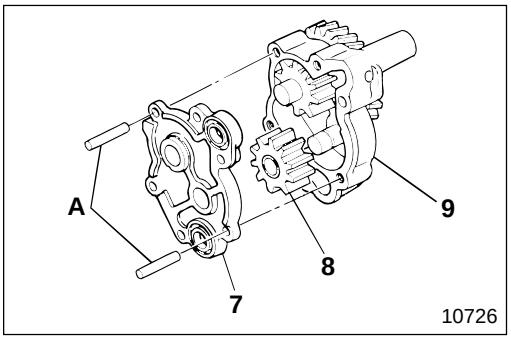
4 **Installation of seat**

A : Oil pump case assembly side



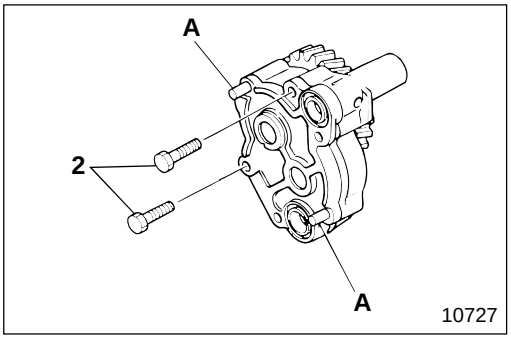
7 **to** **9** **Inspection of oil pump cover, driven gear assembly, and oil pump case assembly**

- Measure the clearance between oil pump cover **7** and drive gear shaft **B**, and between driven gear assembly **8** and driven gear shaft **A**.
- If the measured value is lower than the limit, replace the faulty parts.



7 **9** **Installation of oil pump cover and oil pump case assembly**

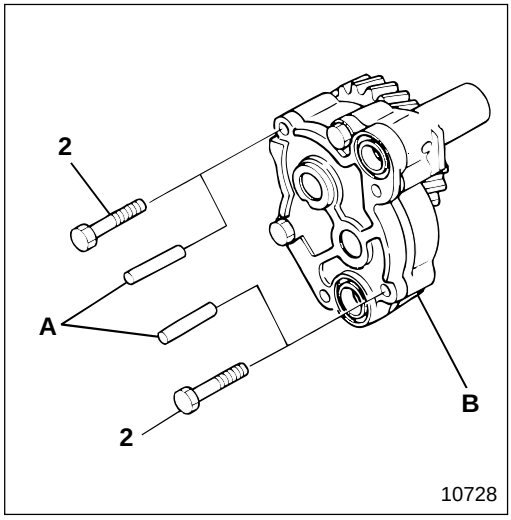
- Prepare two pins **A** of 9 mm {0.35 in.} in outer diameter and position oil pump cover **7** and oil pump case assembly **9** as illustrated.



- Tighten the illustrated bolts **2** at specified torque.

https://truckmanualshub.com/

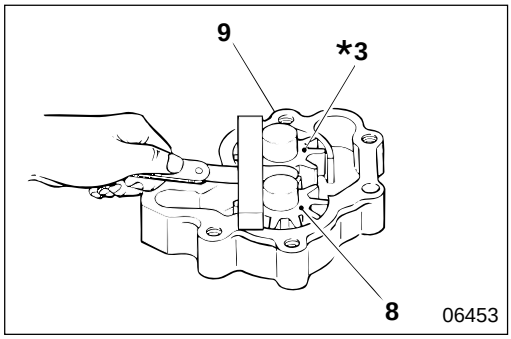
OIL PUMP



- Remove pins **A**, replacing them with bolts **2** and tighten at specified torque.

NOTE

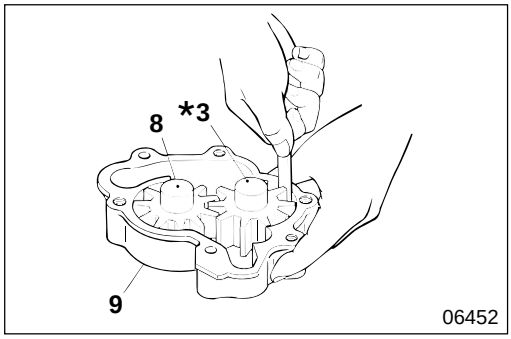
Confirm smooth movement by rotating oil pump gear B by hand. If it catches, disassemble and reassemble it.



8 9 *3 Inspection of driven gear assembly, and oil pump case assembly

(1) Difference between height of each gear and depth of oil pump case

If the measured value is higher than the limit, replace the faulty parts.



(2) Clearance between tooth tip and oil pump case

If the measured value is higher than the limit, replace the faulty parts.

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
5	Oil cooler element air leakage (Air pressure 980 kPa {140 lbf/in^2, 10 kgf/cm^2}, 15 seconds)	0 cm^3 {0 cu. in.}	—	Replace
10	Regulator valve opening pressure	440±29 kPa {64±4.3 lbf/in^2, 4.5±0.3 kgf/cm^2}	—	Replace
15	Bypass valve opening pressure	390±29 kPa {57±4.3 lbf/in^2, 4.0±0.3 kgf/cm^2}	—	Replace
16	Engine oil bypass alarm switch	190+60/-0 kPa {27+8.3/-0 lbf/in^2, 1.9+0.6/-0 kgf/cm^2}	—	Replace

Tightening torque

Unit : N-m {lbf.ft, kgf-m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Nut (oil cooler element mounting)	19.5±5 {14±3.6, 2.0±0.5}	—
6	Engine oil pressure switch	15 to 22 {11 to 16, 1.5 to 2.2}	When engine is cold
7	Plug (Regulator valve spring mounting)	19.5±5 {14±3.6, 2.0±0.5}	—
11	Drain plug (Oil cooler)	34 {25, 3.5}	—
12	Plug (Bypass valve spring mounting)	19.5±5 {14±3.6, 2.0±0.5}	—
16	Engine oil bypass alarm switch	12 to 18 {8.7 to 13, 1.2 to 1.8}	—

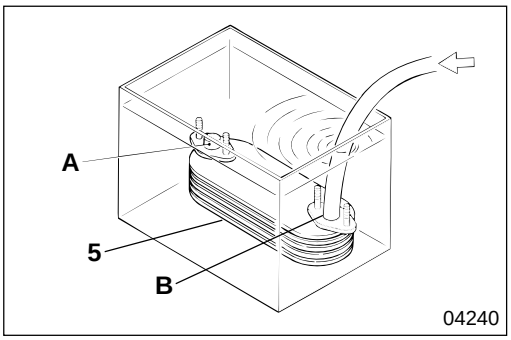
Lubricant and sealant

Location	Points of application	Kinds	Quantity
1	Gasket area of oil filter with thin application P12-12	Engine oil	As required
4	Body of O-ring	Engine oil	As required
6	Thread area of engine oil pressure switch	Teflon tape	3 1/2 turns

◆ Service procedure

● Cleaning

- Check and see if any carbon deposits or sludge have developed in the oil passage of oil cooler element **5** or its bypass. Clean any deposits off thoroughly with cleaning solvent.
- Also clean any water scale or fur found in oil cooler element **5** or oil cooler body **17**.



5 **Inspection of oil cooler element**

- Immerse oil cooler element **5** in a water tank after plugging exit port **A** and connecting the hose to engine oil entry port **B**.
- Apply air pressure of 980 kPa {140 lbf/in^2, 10 kgf/cm^2} via the hose and see if there is any air leakage from any part of oil cooler element **5**.
- If you see any leakage, replace oil cooler element **5**.

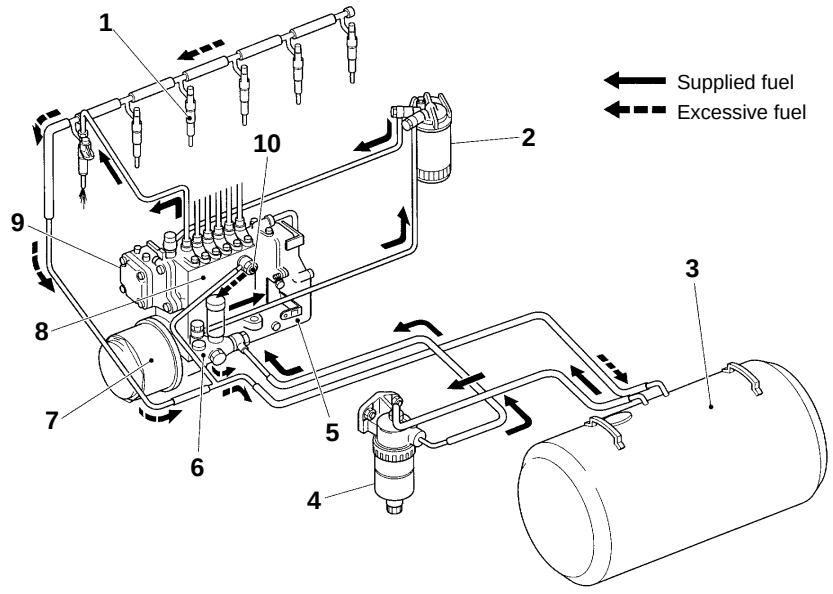
Fuel System (Flow of Fuel)



Ⓟ 31102

1 Injection nozzle
2 Fuel filter
3 Fuel tank
4 Water separator
5 Governor
6 Feed pump
7 Automatic timer
8 Injection pump
9 Pre-stroke actuator
10 Overflow valve

Fuel in fuel tank **3** is sucked up by feed pump **6** which is driven by the cam action of injection pump **8** and is filtered through fuel filter **2** which removes dirt and other foreign particles.
Filtered fuel is sent to the injection pump where the fuel pressure is boosted and injected through injection nozzle **1** into the combustion chamber.
When fuel pressure is higher than the specified value, overflow valve **10** opens to let the fuel return to the fuel tank.

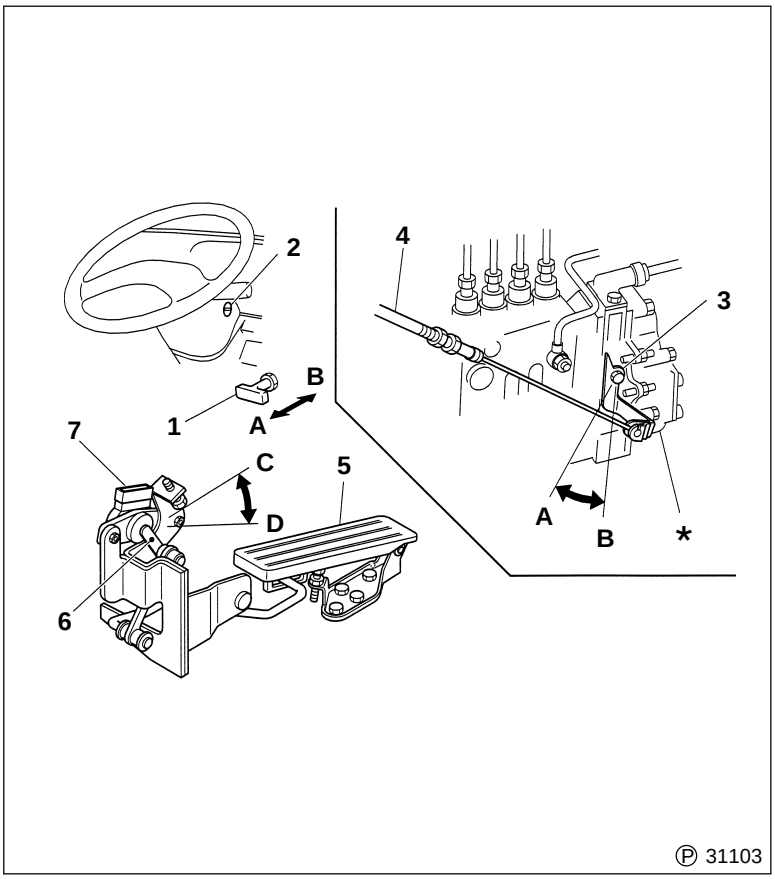
Engine Control



1 Emergency engine stop handle
2 Starter switch
3 Engine stop lever
4 Engine stop cable
5 Accelerator pedal assembly
6 Lever
7 Accelerator pedal position sensor

***** : Electronic governor

A : Engine-stop position
B : Engine start-up position
C : Full-load position
D : Idling position

● **Accelerator switch**

The accelerator switch is integrated in the accelerator pedal position sensor **7**. It detects the pressing of accelerator pedal assembly **5**.

● **Accelerator pedal position sensor**

Accelerator pedal position sensor **7** detects the movement of accelerator pedal assembly **5**, and sends an electric signal to the electronic governor control unit. Lever **6** of the accelerator pedal position sensor is constantly pulled by the return spring towards idle position **D**.

● **Emergency engine stop button**

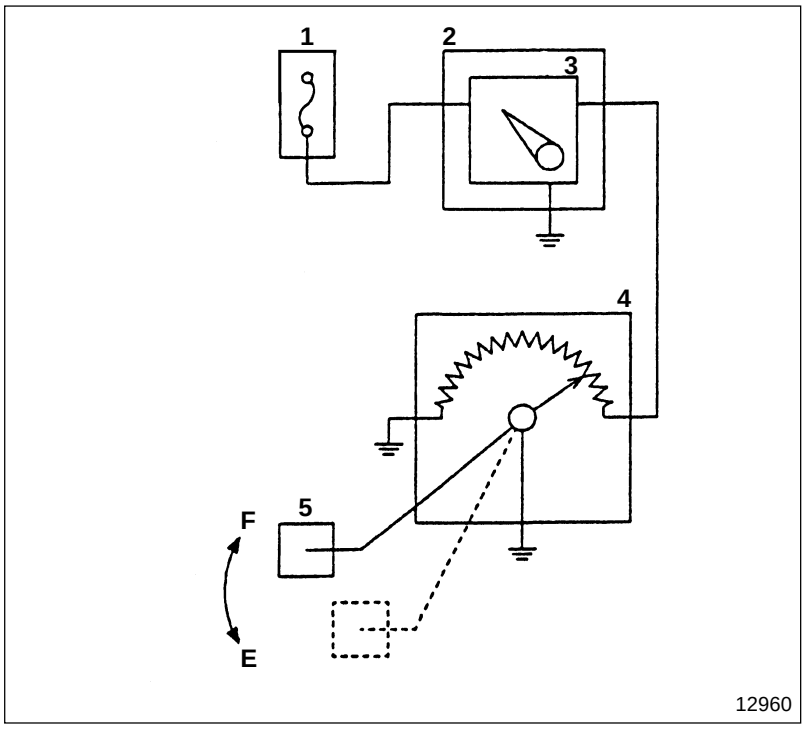
In normal condition, turn starter switch **2** to the ACC position to electrically shut down the engine operation.
In the case the engine does not stop when the starter switch is turned to the ACC position due to malfunction of the electronic governor system or other cause, stop the engine by pulling emergency engine stop handle **1** to move stop lever **3** of electronic governor ***** to engine stop position **A**.

CAUTION ⚠

When the engine is stopped by pulling engine stop handle 1, set starter switch 2 to the ACC or LOCK position to reset the control unit computer.
Restarting the engine without resetting the computer results in unstable engine speed control.

https://truckmanualshub.com/

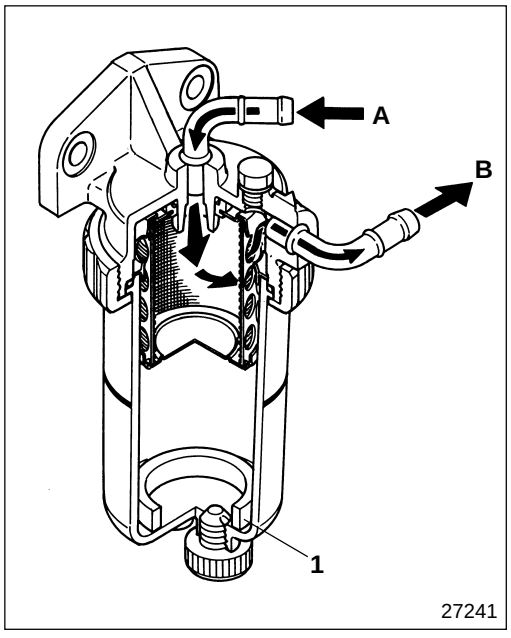
Fuel Gauge Electric Circuit



1 Fuse box
2 Meter cluster
3 Fuel gauge
4 Fuel gauge sending unit
5 Float

The fuel gauge circuit indicates the amount of fuel remaining in the fuel tank by means of a gauge.

Water Separator



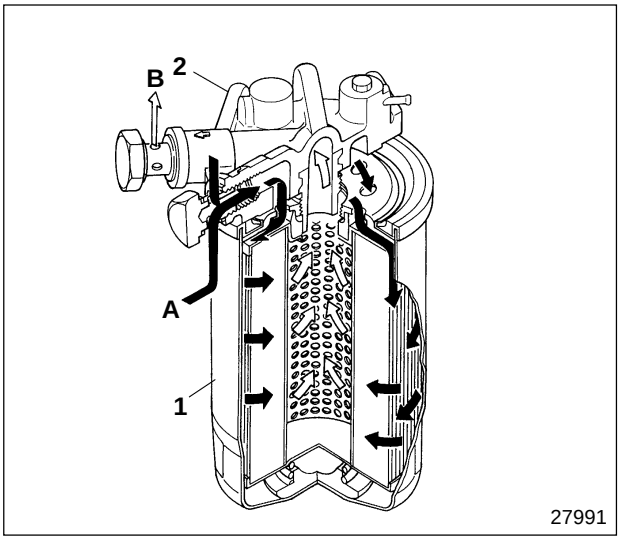
1 Water level ring

A : From fuel tank
B : To feed pump

The water separator is installed between the fuel tank and the feed pump. Any water present in the fuel is separated by the baffle plate and the screen assembly.

https://truckmanualshub.com/

Fuel Filter



1 Fuel filter
2 Fuel filter head

A : From feed pump
B : To injection pump

Pressurized fuel is delivered from the feed pump of the injection pump to the fuel filter which separates water from the fuel. Dirt and other foreign particles are removed from the fuel by fuel filter **1**.

https://truckmanualshub.com/

- The electronic governor and pre-stroke control injection pump system combines an electronic governor **10** with an injection pump **6** that has an electronically controlled pre-stroke adjustment feature.
- The injection pump's plunger lift speed varies in accordance with the engine speed, causing concomitant variations in the injection pipe pressure.
- Variations in the injection pipe pressure make it difficult to achieve an optimum spray from the injection nozzles and the optimum air/fuel mixture.
- To compensate for changes in the injection pipe pressure, the injection pump plunger pre-stroke is increased at low and mid- range speeds, thus ensuring that fuel injection takes place late in the cam lift, when plunger movement is relatively fast.
- At high speeds, the plunger pre-stroke is decreased, thus ensuring that fuel injection takes place in early in the cam lift, when plunger movement is relatively slow. Excessive increases in injection pipe pressure are thus prevented.
- By adjusting the plunger pre-stroke in this manner, the pre-stroke control injection pump **6** ensures that the spray and air/ fuel mixture are always optimally suited to combustion.
- The overall benefits are higher engine torque and cleaner exhaust emissions than are possible with a conventional injection pump.
- Control operations are performed by the electronic governor control unit **35**, which receives data from sensors on the engine and other vehicle components, processes them, and issues appropriate drive signals to the pre-stroke actuator **5** (located at the rear of the injection pump) and to the linear DC motor **9** (located inside the electronic governor).

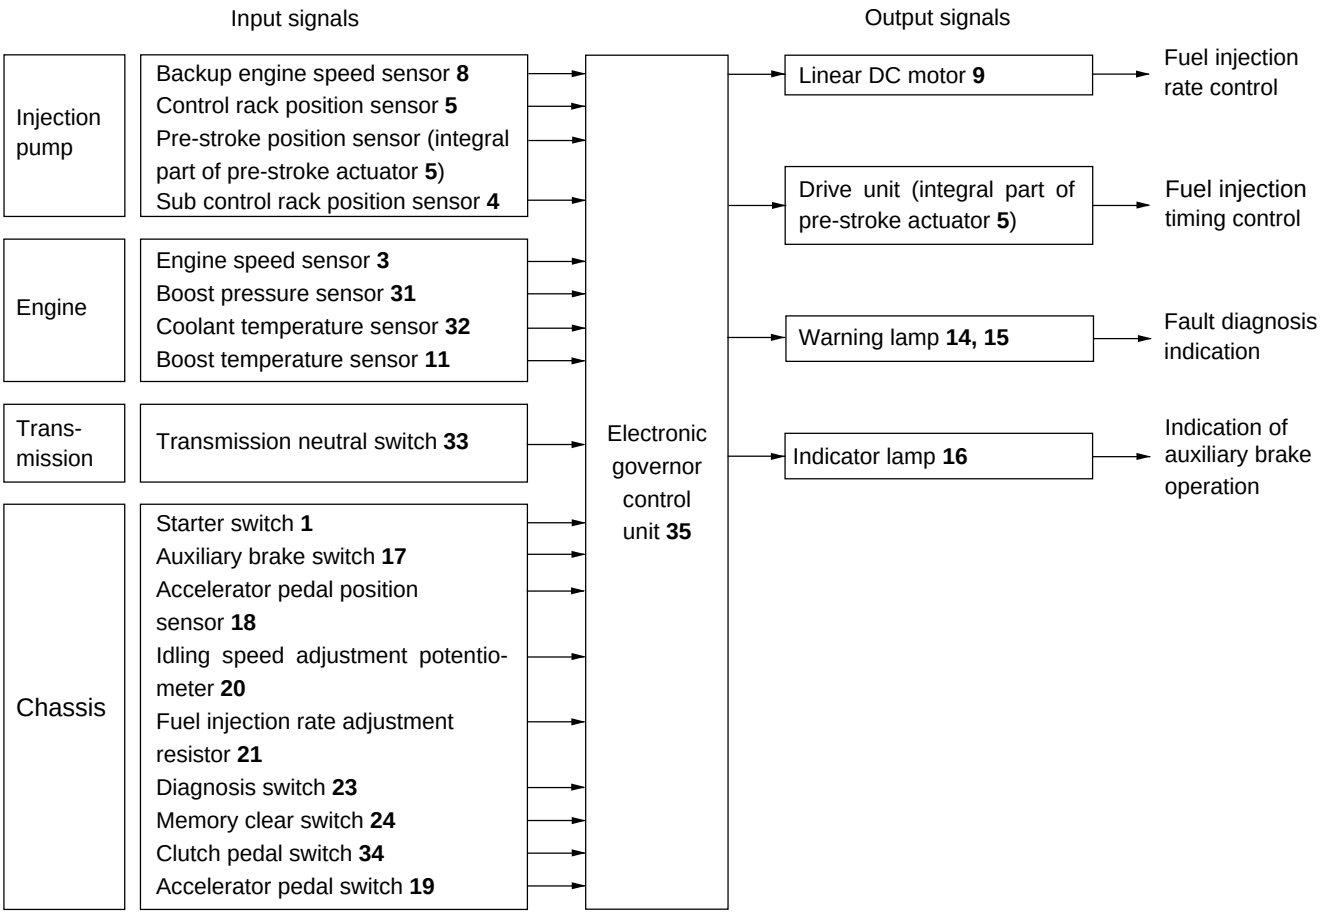
The system's control functions (including auxiliary functions) are shown in the following table.

Item	Operation	Data source	
		Sensor(s)	Data signal(s)
Fuel injection rate control	The fuel injection rate is optimized to match engine operating conditions. P13-12	3, 7, 18, 19, 21, 31	Ⓓ, Ⓖ, Ⓠ, Ⓡ, Ⓣ, ⓐ
Pre-stroke control	The timing sleeve position is altered, thereby changing the pre-stroke and advancing the fuel injection timing. P13-13	3, 5, 7, 18, 32	Ⓓ, Ⓐ, Ⓑ, Ⓖ, Ⓠ, ⓑ
* Control rack preliminary operation	In cold weather and other conditions that are unfavorable for engine startup, the control rod is caused to move slightly in the fuel increase direction, thus enhancing startability. This operation takes place when the starter switch is turned ON.	1, 18, 19, 32	ⓔ, Ⓠ, Ⓡ, ⓑ
* Warmup time shortening function	In cold weather, the engine's idling speed is increased to shorten the time required for warmup. P13-14	18, 19, 20	Ⓠ, Ⓡ, Ⓢ
* Overrun prevention function	In the event of an abnormal increase in engine speed, the control rack is pulled in the fuel decrease direction to prevent the engine from overrunning.	3	Ⓓ
* Emergency vehicle operation function (used in event of control rack position sensor fault)	In the event of a fault in the control rack position sensor **7**, the control rack position is sensed by the sub control rack position sensor **4**. If both rack position sensors develop faults, thus preventing detection of the rack position and optimization of the fuel injection rate, the fuel injection rate is controlled in accordance with engine speed signals only. P13-16	3, 4, 7	Ⓓ, Ⓒ, Ⓖ
* Auxiliary brake control function	The auxiliary braking devices (exhaust brake) are controlled by the electronic governor control unit **35**. (In a conventional system, the auxiliary braking devices are controlled by switches, relays, and dedicated controllers.) P13-17	3, 16, 18, 19, 28, 33, 34	Ⓓ, Ⓝ, Ⓠ, Ⓡ, Ⓧ, ⓓ
* Fault diagnosis function	The status of each system sensor is monitored continuously during engine operation. In the event of a fault, a warning lamp is illuminated to alert the driver and data related to the fault are stored in memory. P13-36	ALL	ALL
* Fail-safe function	In the event of a fault, a backup mode is selected and remedial action is taken in accordance with the type of fault. P13-40	ALL	ALL
* Reverse engine operation prevention function	In the event of reverse engine operation, the control rack is pulled in the fuel decrease direction to stop the engine	3	Ⓓ

* : Auxiliary function

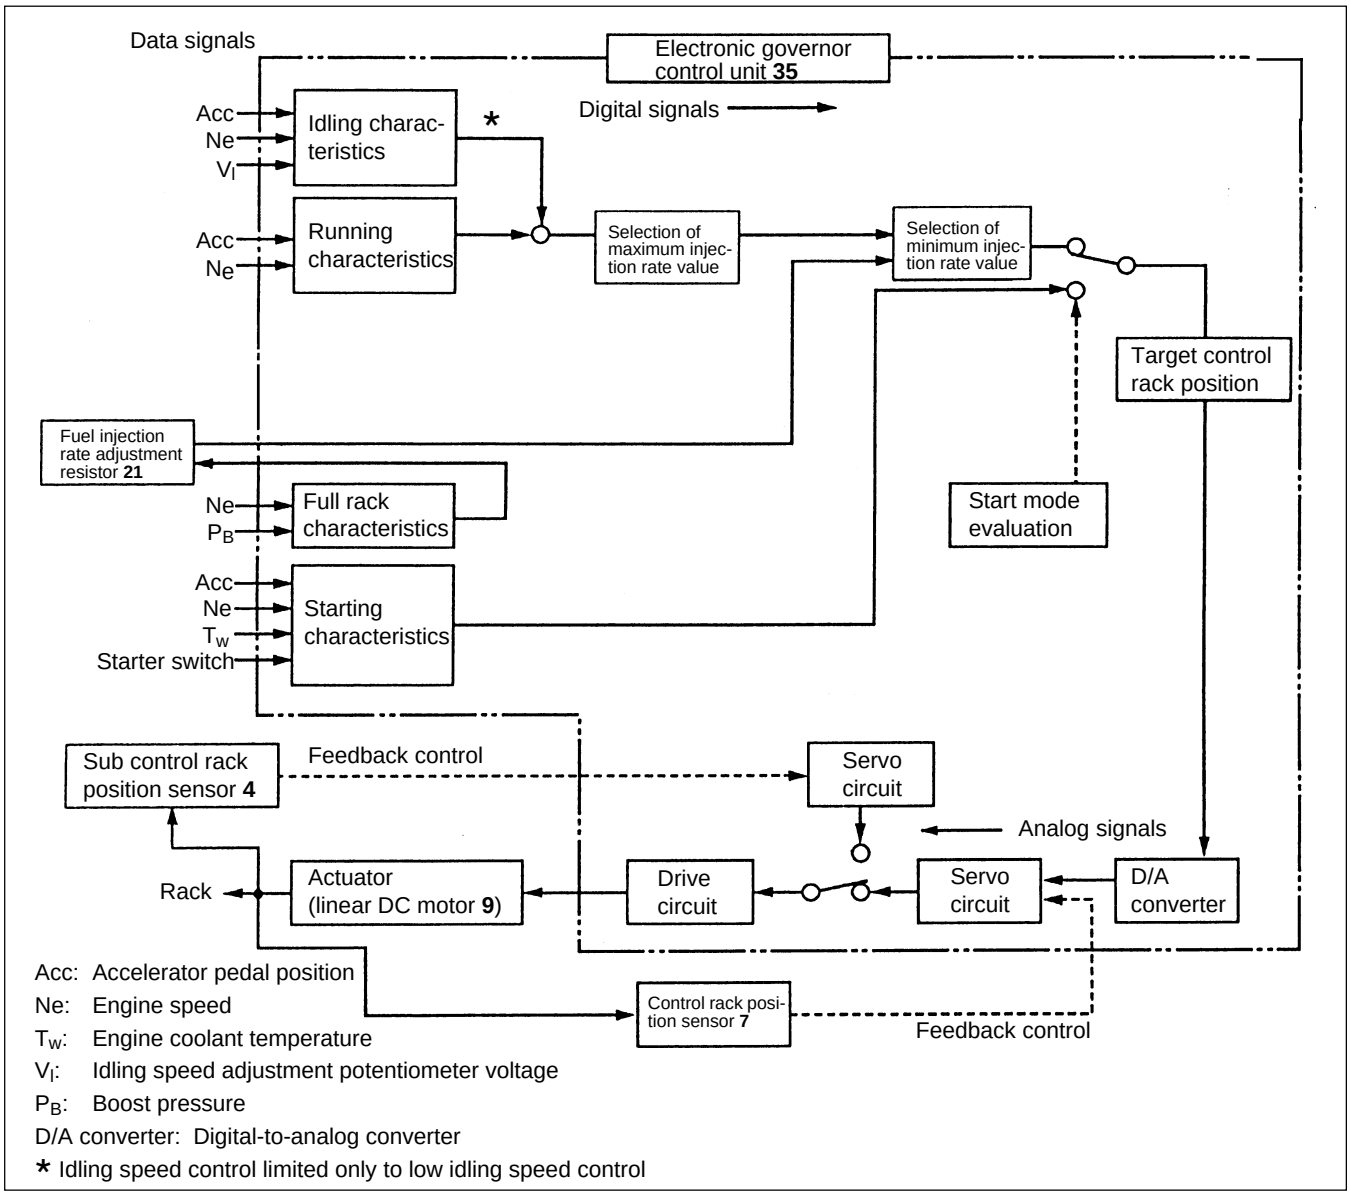
https://truckmanualshub.com/

System Block Diagram



https://truckmanualshub.com/

● Fuel Injection Rate Control



Operation of electronic governor control unit 35

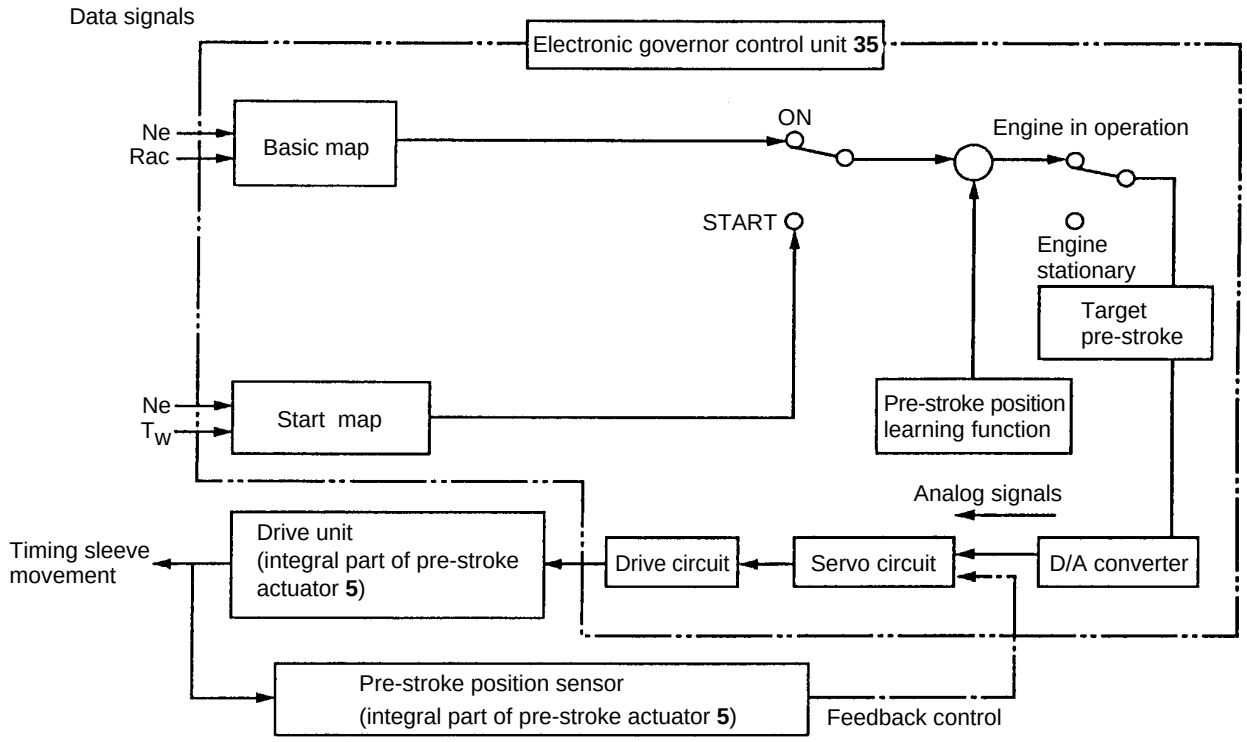
- During engine operation, control is effected in accordance with the idling characteristics and running characteristics. The maximum fuel injection rate value is selected in accordance with the output signals.
- After this selection, the control unit calculates and determines the minimum injection rate to prevent the injection rate selected in accordance with the full rack characteristics from exceeding the maximum injection rate. The target control rack position is thus determined. (During engine startup, control is effected in accordance with the starting characteristics with the target rack position determined directly in accordance with the data signals.)
- The determined control rack position signal is converted into a continuous analog signal. By way of the servo circuit and drive circuit, the signal is applied to the linear DC motor **9**, which moves the rack.

Operation of control rack position sensor 7

- The control rack position sensor **7** monitors the operation of the linear DC motor **9**. In accordance with the position of the control rack, the sensor determines whether the linear DC motor is operating in accordance with the target, and it transmits feedback signals to the electronic governor control unit **35**.
- In accordance with the feedback signals, the electronic governor control unit **35** calculates the actual control rack position. If the actual position differs from the target, the control unit issues a correction command.
- Through repetition of this process, the system ensures that the control rack position complies with the target at all times.

https://truckmanualshub.com/

● Pre-stroke control



Rac: Control rack position
Ne: Engine speed
T_W: Engine coolant temperature
D/A converter: Digital-to-analog converter

Operation of electronic governor control unit 35

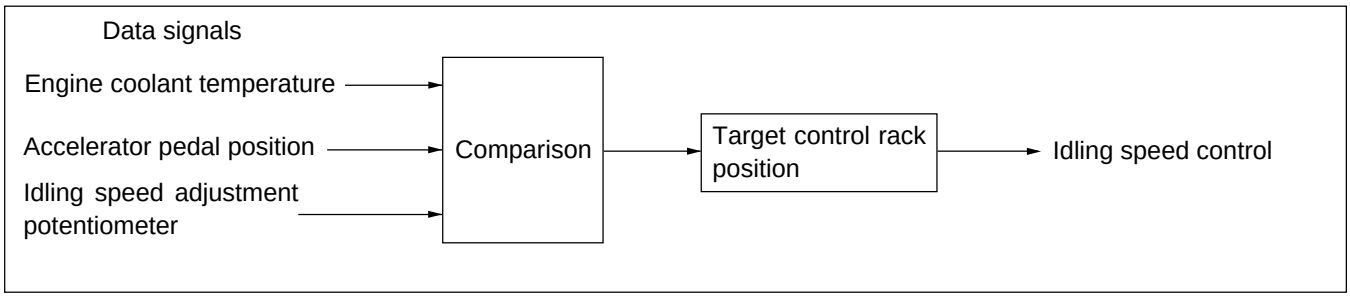
- During engine operation, control is effected in accordance with the basic map.
- The pre-stroke position learning function compensates for pre-stroke position sensor adjustment errors and other injection pump errors using the pre-stroke position sensor output voltage, thereby enabling determination of the target pre-stroke.
- The determined target pre-stroke value is converted into a continuous analog signal. By way of the servo circuit and drive circuit, the signal is applied to the drive unit. The drive unit moves the timing sleeve to alter the pre-stroke.
- During engine startup, control is effected in accordance with the start map.

Operation of pre-stroke position sensor (integral part of pre-stroke actuator 5)

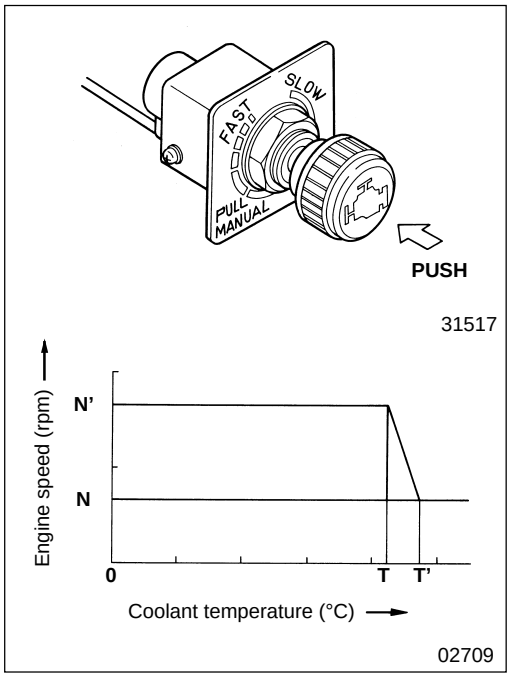
- The pre-stroke position sensor monitors the operation of the drive unit. In accordance with the position of the timing sleeve, the sensor determines whether pre-stroke control is being performed in accordance with the target, and it transmits feedback signals to the electronic governor control unit **35**.
- In accordance with the feedback signals, the electronic governor control unit **35** calculates the actual timing sleeve position. If the actual position differs from the target, the control unit issues a correction command.
- Through repetition of this process, the system ensures that the timing sleeve position complies with the target at all times. The appropriate pre-stroke is achieved as a result.

https://truckmanualshub.com/

● Warmup time shortening function



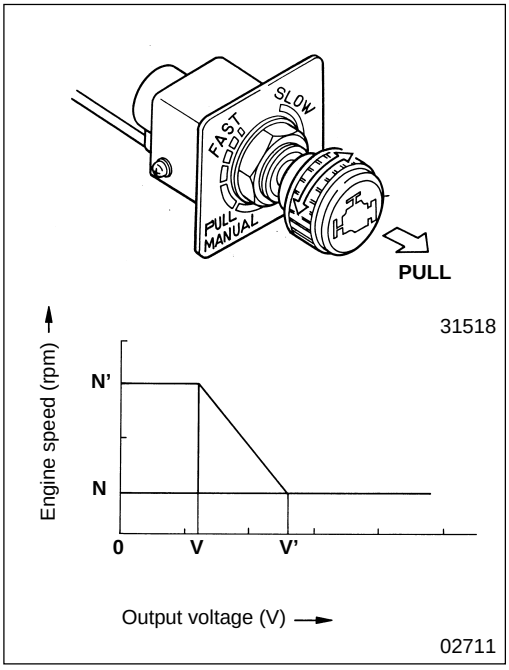
The warmup time shortening function increases the engine's idling speed in accordance with the coolant temperature, thereby shortening the time required for the engine to warm up. Control is effected automatically or manually in accordance with the position of the idling speed adjustment potentiometer **20**. Automatic control is selected by pushing the potentiometer, and manual control is selected by pulling it.



Automatic control (Potentiometer pushed)

- Automatic control is selected when the idling speed adjustment potentiometer **20** is pushed.
- When the coolant temperature is low, the engine's idling speed is automatically increased to shorten the time required for warmup.
- If the coolant temperature increases from **T** to **T'** (see the graph), the engine speed is decreased from **N'** to **N**, thus returning to its standard idling level.

https://truckmanualshub.com/



Manual control (Potentiometer pulled)

- When the idling speed adjustment potentiometer **20** is pulled, the automatic mechanism is deselected. The driver can then adjust the idling speed as desired by rotating the potentiometer. (Rotation of the potentiometer causes the potentiometer's output voltage to change accordingly.)
- With the output voltage between **0** and **V**, the engine speed stays at the **N** to **N'** level.
- If the output voltage is increased from **V** to **V'** (see the graph), the engine speed decreases from **N'** until it reaches its standard idling level **N**.

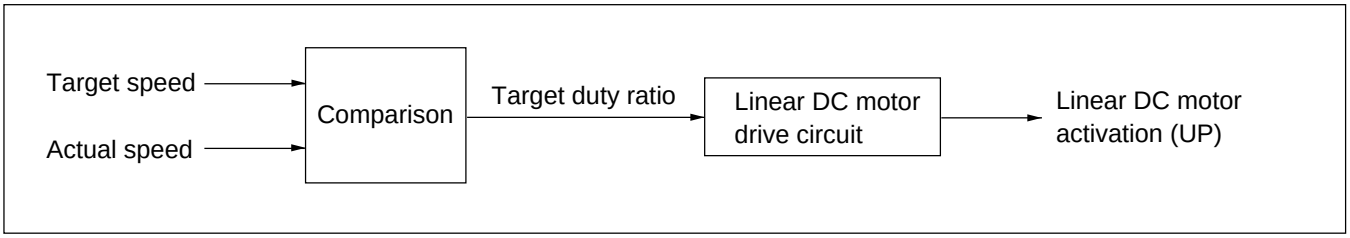
https://truckmanualshub.com/

● Emergency vehicle operation function (Used of event in control rack position sensor fault)

Fault in Control rack position sensor 7

In the event of a fault in the control rack position sensor **7**, detection of the control rack position is performed using the sub control rack position sensor **4**. This enables more-or-less normal vehicle operation.

Fault in control rack position sensor 7 and sub control rack position sensor 4



In the event of faults in both the control rack position sensor **7** and sub control rack position sensor **4**, the position of the rack, which is controlled by the linear DC motor **9**, cannot be sensed directly. The fuel injection rate cannot be controlled normally with the engine in this condition. As an emergency measure, therefore, control operations are performed in accordance with engine speed data signals only. For this function, target engine speeds for given degrees of accelerator pedal depression are pre-programmed into the electronic governor control unit **35**. Control is effected as follows:

- The target engine speed is compared with the actual engine speed (this is indicated by the engine speed sensor **3**).
- The target duty ratio is determined in accordance with the result of the comparison. In accordance with the target duty ratio, a drive signal is transmitted to the UP-side (speed increasing side) circuit to effect control over the engine speed. If the target engine speed exceeds the actual engine speed or vice versa, the UP-side circuit's ON time period is altered such that the target engine speed is maintained.

The target duty ratio is the ratio of the time periods during which the linear DC motor's UP-side and DOWN-side (speed decreasing side) circuits are energized. It is calculated as follows:

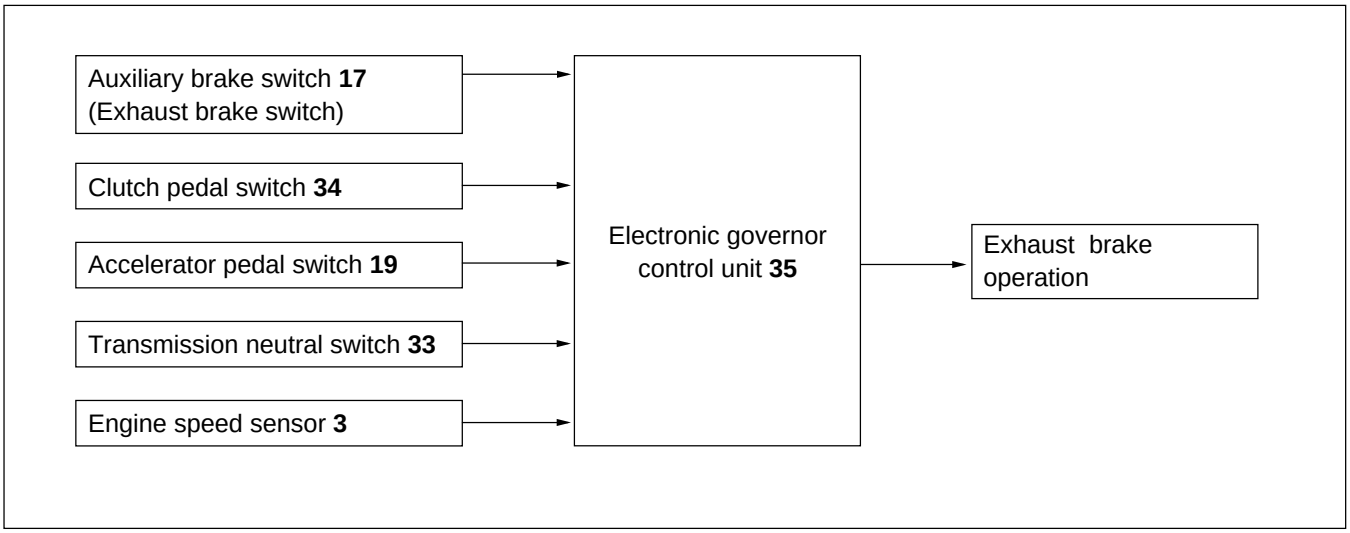
$$\text{Duty ratio} = \frac{\text{UP-side circuit ON time period}}{\text{UP-side circuit ON time period + DOWN-side circuit ON time period}} \times 100\%$$

CAUTION ⚠

When this function is activated, the warning lamp 14, 15 flashes to indicate that the engine must be inspected immediately. 🕮 **P13-36**

https://truckmanualshub.com/

● Auxiliary brake control function



The auxiliary brake control function acts upon the auxiliary braking devices, i.e., the exhaust brake, when the following conditions are satisfied:

- Clutch pedal switch **34**: OFF (clutch pedal released)
- Accelerator pedal switch **19**: ON (accelerator pedal released)
- Transmission neutral switch **33**: ON (transmission not in neutral)

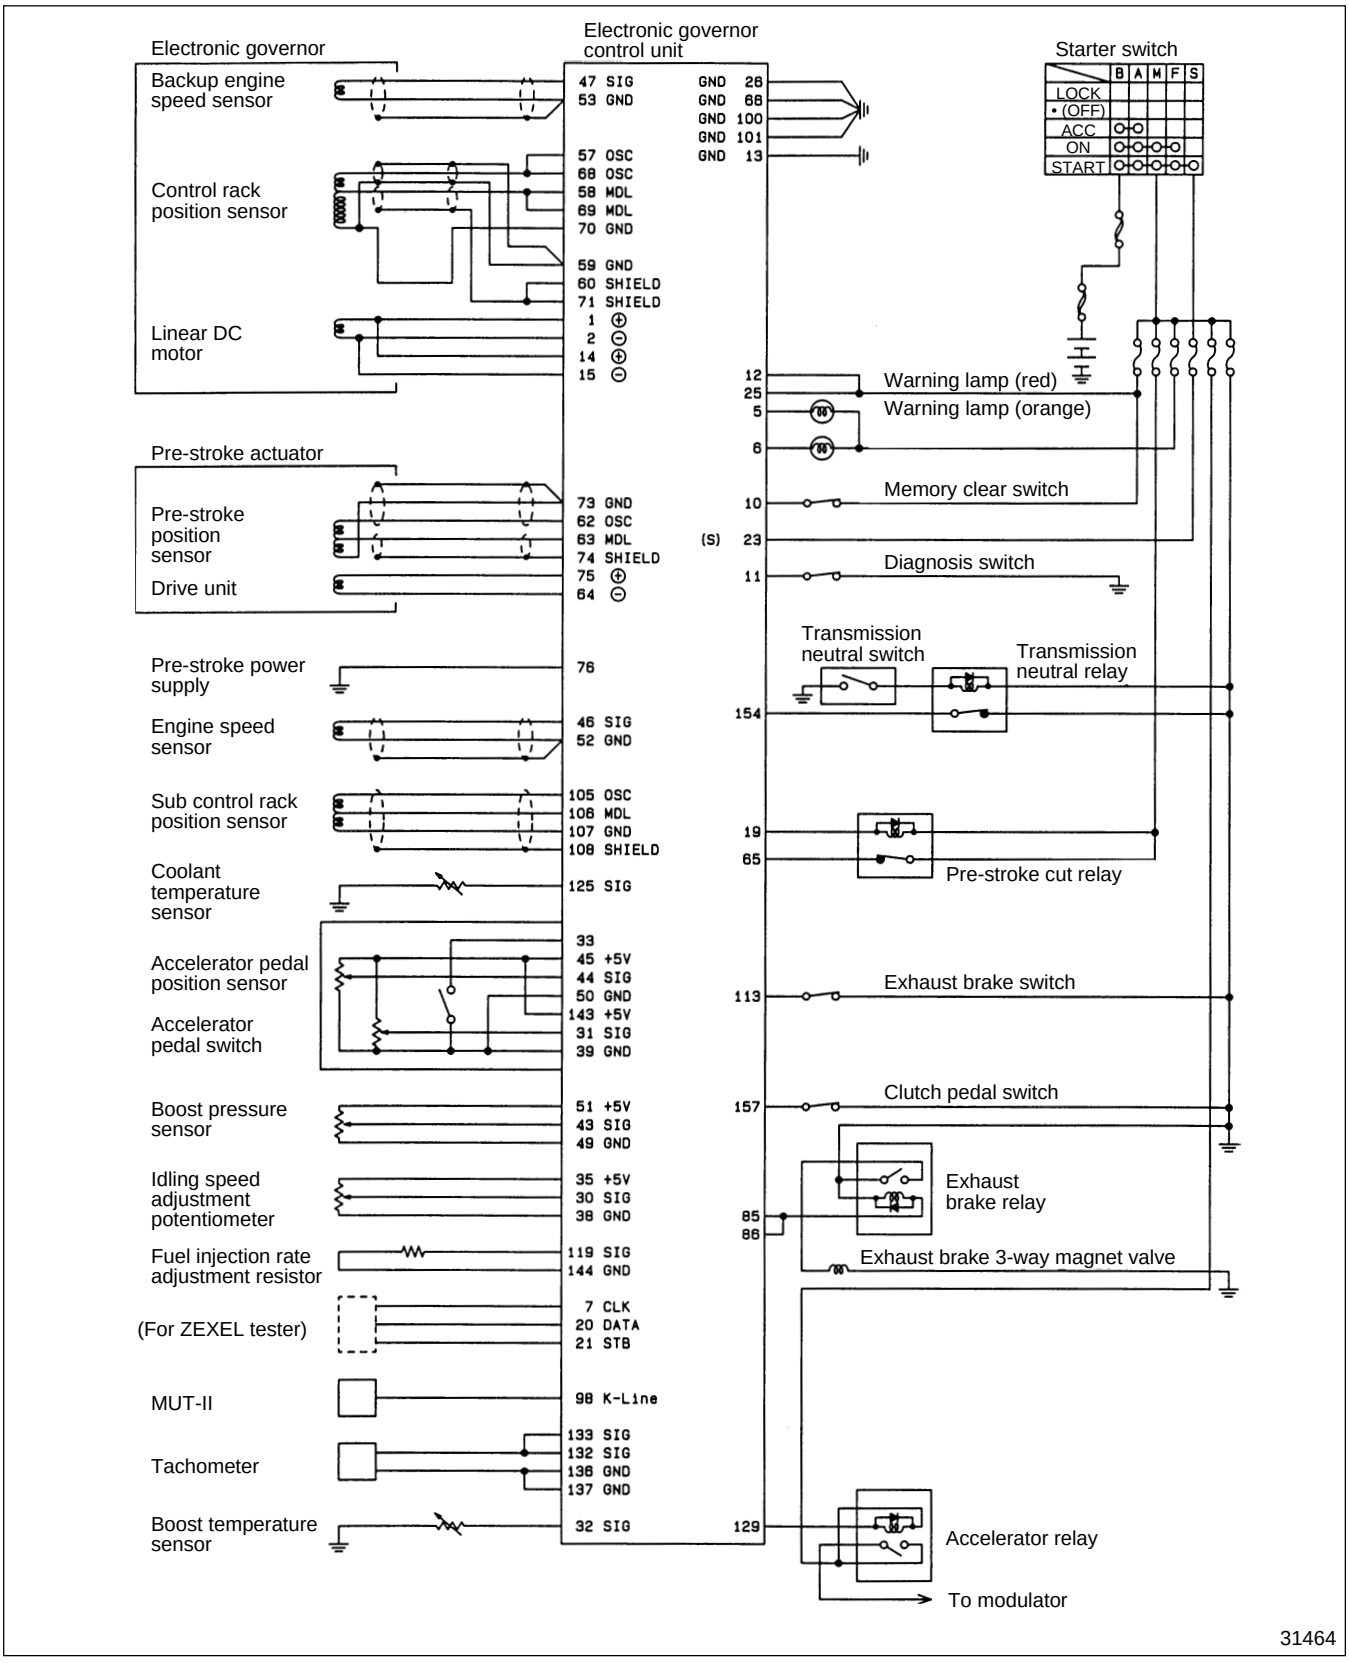
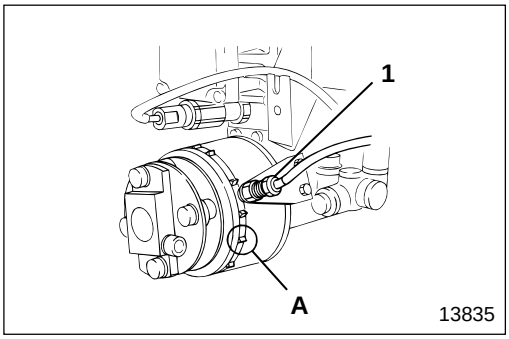
Electronic governor control unit



https://truckmanualshub.com/

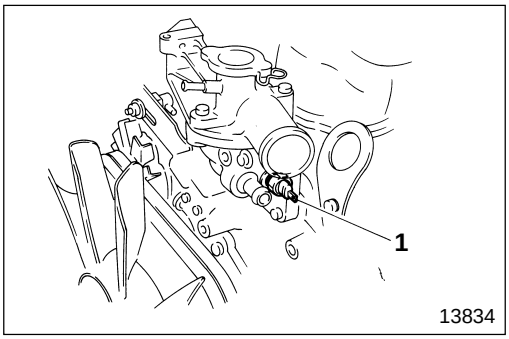
Engine speed sensor



- The engine speed sensor **1** is a pickup type. It converts the rotation speed of a injection pump into electric signals.
- Signals generated by the engine speed sensor are fed to the electronic governor control unit which uses them as correction values in its calculation of the target pre-stroke position.

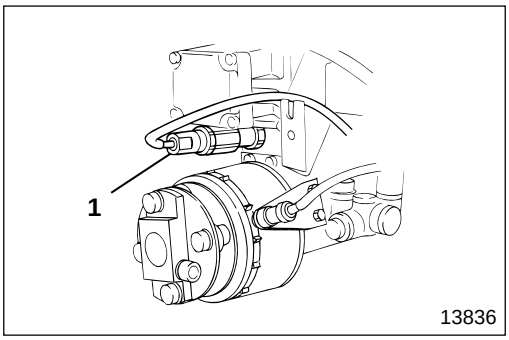
A : Timer housing protrusion

Coolant temperature sensor



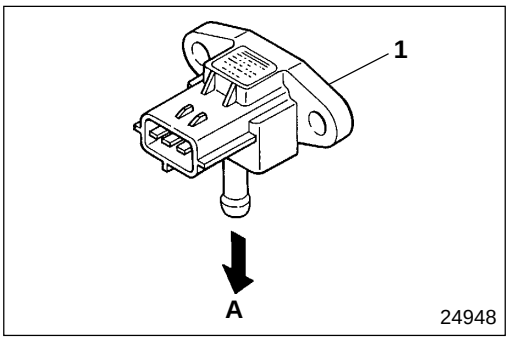
- The coolant temperature sensor **1** is a thermistor type. It converts the engine coolant temperature into electric signals.
- Signals generated by the coolant temperature sensor are fed to the electronic governor control unit which uses them as correction values in its calculation of the target rack position.

Sub control rack position sensor



- The sub control rack position sensor **1** provides backup detection of the control rack position in the event of a fault in the control rack position sensor.
- The sub control rack position sensor **1** converts the degree of control rack movement into electric signals.
- Signals generated by the sub control rack position sensor are fed to the electronic governor control unit which uses them as correction values in its calculation of the target rack position.

Boost pressure sensor

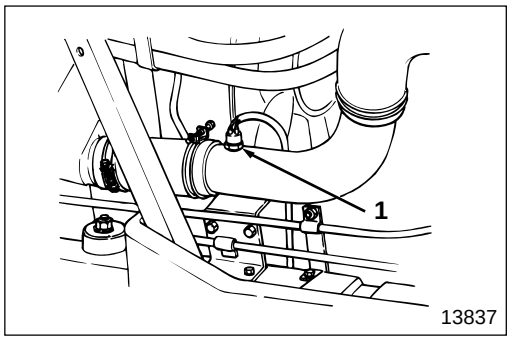


The boost pressure sensor **1** feeds boost pressure information to the electronic governor control unit. During turbocharged engine operation, it enables the full rack signal (maximum fuel injection rate value) characteristics to be selected by the control unit in accordance with the engine speed.

A : To intake manifold

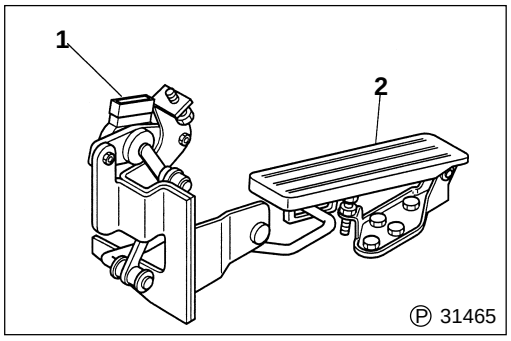
https://truckmanualshub.com/

Boost Air temperature sensor



- Boost air temperature sensor **1** is a thermistor type that converts the intake air temperature, immediately after its passage through the intercooler, into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the boost air temperature signal, which is used as the correction value by the electronic governor control unit to determine the desired pre-stroke position value.

Accelerator pedal position sensor and accelerator pedal switch



- The accelerator pedal position sensor **1** provides the electronic governor control unit with information on the degree to which the accelerator pedal **2** is depressed.
- The accelerator pedal switch detects whether the accelerator pedal is currently depressed or released.
  Accelerator switch is integrated in accelerator pedal position sensor **1**.

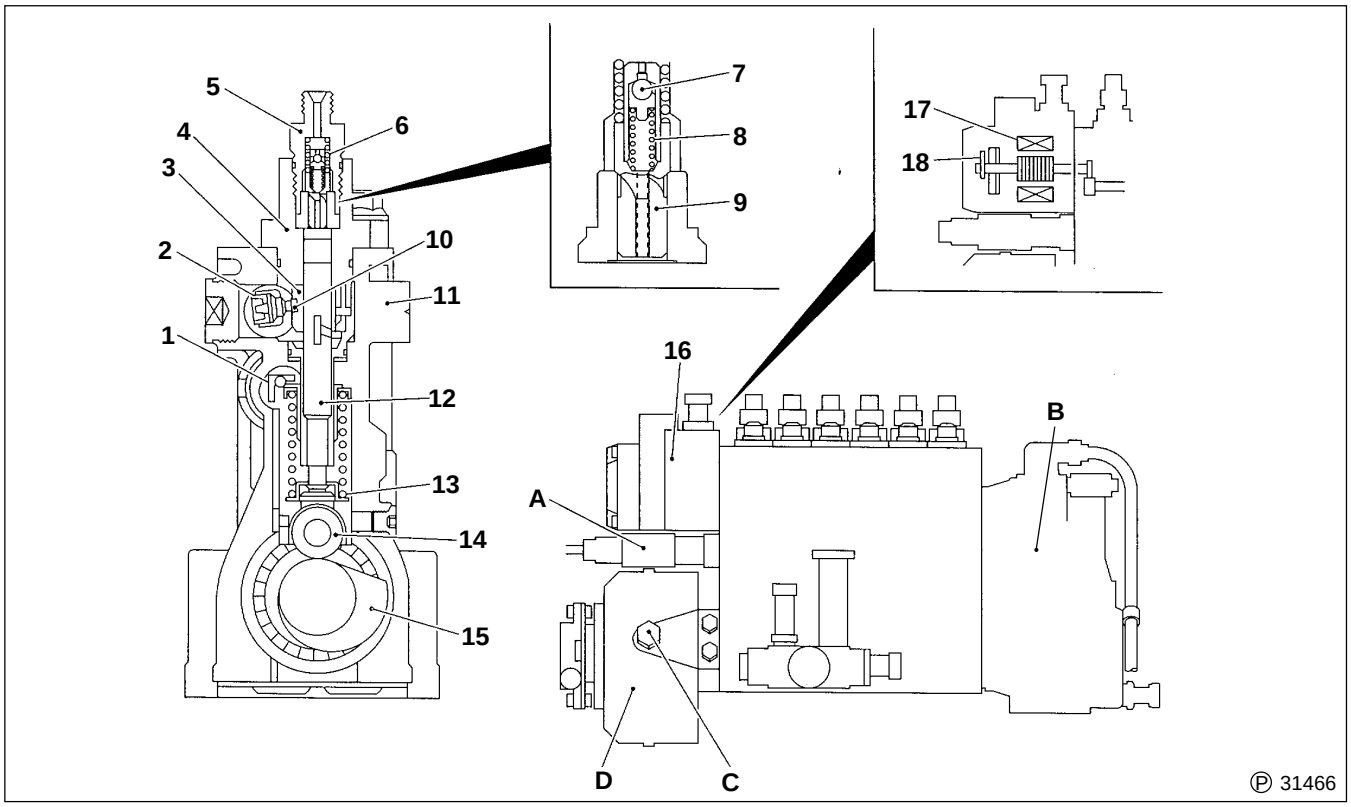
Pre-stroke Control Injection Pump Unit

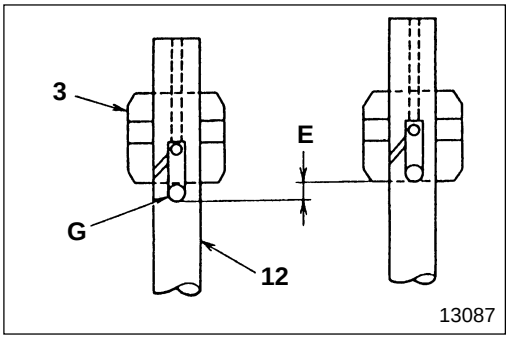


1 Control rod
2 Timing rod
3 Timing sleeve
4 Plunger barrel
5 Delivery valve holder
6 Delivery valve spring
7 Ball
8 Spring
9 Delivery valve
10 Pin
11 Pump housing
12 Plunger
13 Plunger spring
14 Tappet
15 Camshaft
16 Pre-stroke actuator
17 Drive unit
18 Pre-stroke position sensor

A : Sub-control rod position sensor
B : Electronic governor
C : Engine speed sensor
D : Mechanical timer

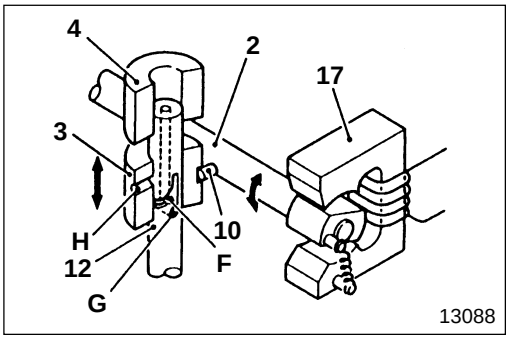
- The injection pump is provided with a mechanism that enables variation of the plunger pre-stroke.
- Variation of the plunger pre-stroke enables the creation of air/fuel mixture and spray conditions that are optimally suited to combustion. The overall benefits are higher engine torque and cleaner exhaust emissions than are possible with a conventional injection pump.

https://truckmanualshub.com/



Pre-stroke

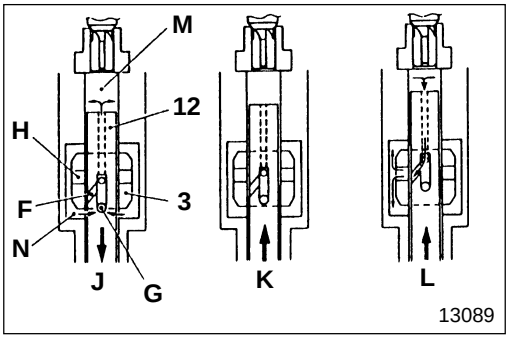
The term “pre-stroke” refers to the stroke dimension **E** of a plunger **12** from the plunger’s bottom dead center position to the point at which its fuel inlet hole **G** is closed by the timing sleeve **3** and fuel feed begins. This stroke dimension is constant in a conventional injection pump.



Variable pre-stroke mechanism

F : Lead
G : Inlet hole
H : Outlet hole

- In contrast to the fixed plunger barrel arrangement of a conventional injection pump, each plunger barrel **4** in the pre-stroke control type injection pump incorporates a vertically moveable timing sleeve **3**.
- Movement of the timing sleeve is effected by the timing rod **2**, pin **10**, and drive unit **17**.
- When the drive unit **17** rotates the timing rod **2**, the pin **10** moves the timing sleeve **3** up or down accordingly.
- Since the timing sleeve **3** incorporates a fuel outlet hole **H**, the pre-stroke changes in accordance with the movement of the timing sleeve.

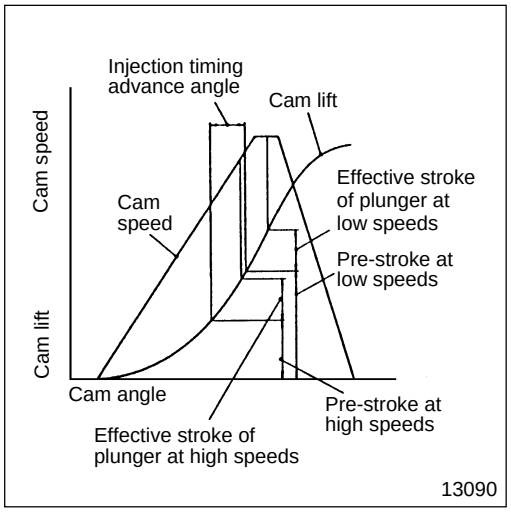


Fuel feed action

J : Fuel intake
K : Start of pressurization
L : End of pressure feed

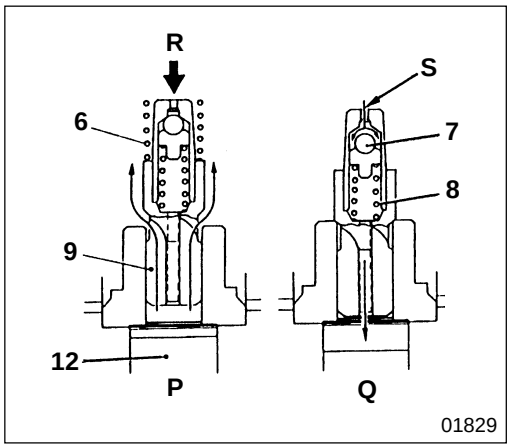
- As the plunger **12** moves downward from its top dead center position and its inlet hole **G** opens, fuel flows into the pressure chamber **M** owing to the vacuum pressure created by the plunger’s downward movement and the fuel pressure produced by the feed pump.
- When the plunger **12** moves upward but its lift dimension is still small, the fuel in the pressure chamber **M** escapes into the sump **N** through the inlet hole **G** in the plunger. Thus, the pressure in the pressure chamber does not increase.
- As the plunger **12** moves further upward and the inlet hole **G** is closed by the timing sleeve **3**, the fuel starts to be pressurized. The pressure increases as the plunger moves upward, and the injection pump starts to feed the pressurized fuel to each injector.
- When the lead **F** in the plunger **12** becomes aligned with the outlet hole **H** in the timing sleeve **3**, the fuel in the pressure chamber **M** returns to the sump **N**, thus completing the pressure feed cycle.
- Adjustment of the injected fuel volume is achieved by rotation of the plunger **12**, which alters the position of the outlet hole **H** in the timing sleeve **3** relative to the lead **F** in the plunger.

https://truckmanualshub.com/



Fuel injection timing and fuel injection characteristics

- Changes in the position of the timing sleeve **3** cause concomitant changes in the pre-stroke, which in turn alter the fuel injection timing.
- A decrease in the pre-stroke causes the fuel inlet hole **G** in the plunger **12** to close earlier such that the fuel injection timing is advanced.
- This arrangement provides highly responsive control over the injection timing and thus enhances the engine's cold startability.



Delivery valve

P : Start of pressure feed
Q : End of pressure feed

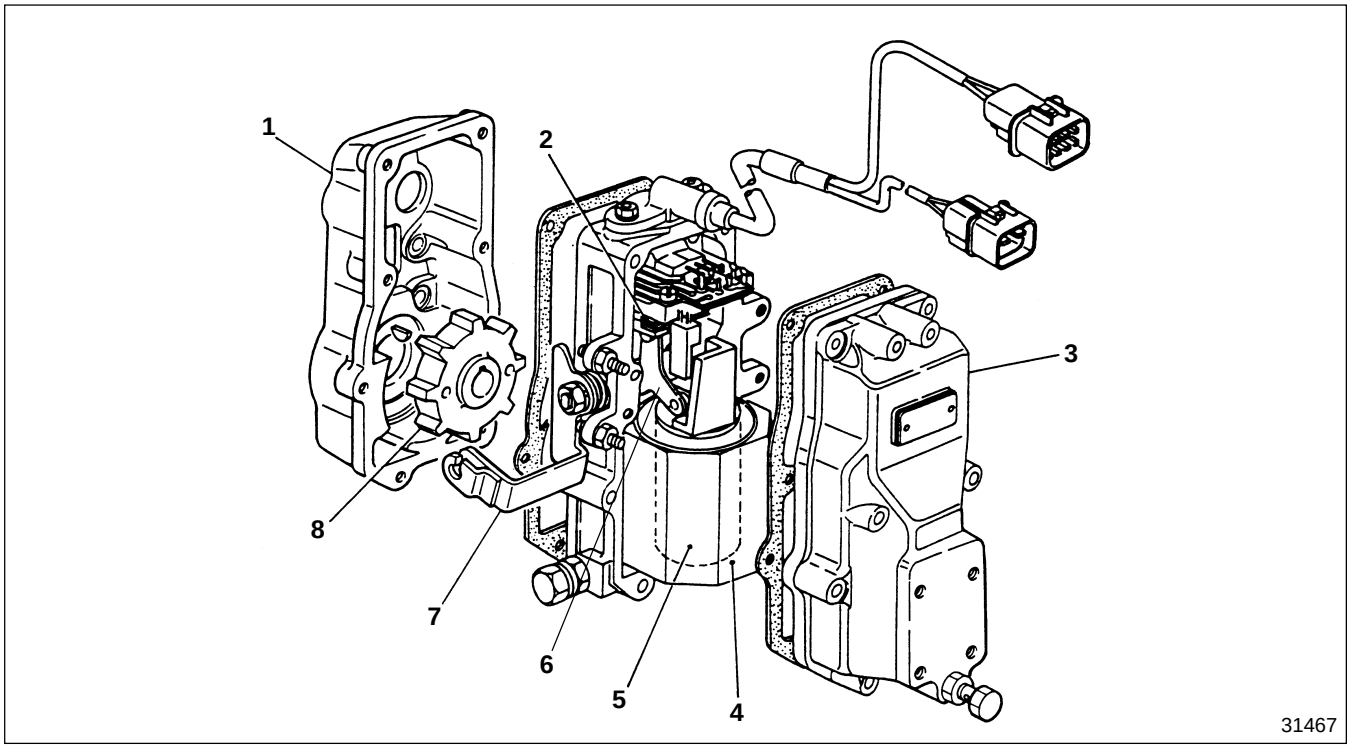
- The delivery valve **9** keeps constant the residual pressure **R** in the injection pipe at all engine speeds. This operation prevents the generation of bubbles in the fuel (this is known as "cavitation") and thus enables fuel injection at a high pressure.
- When the plunger **12** moves upward and the pressure of the fuel pushed by the plunger overcomes the residual pressure **R** in the injection pipe and the preset force of the delivery valve spring **2**, the delivery valve is pushed upward and delivery of the pressurized fuel begins.
- As soon as fuel delivery is complete, the fuel in the injection pipe rapidly returns to the plunger side and the delivery valve closes.
- Surplus fuel slowly returns through the orifice **S**, thus reducing the pressure in the injection pipe.
- When the preset force of the spring **8** in the delivery valve **9** is exactly offset by the pressure in the injection pipe, the ball **7** closes the orifice **S**, thus ensuring that the residual pressure **R** in the injection pipe remains constant.

https://truckmanualshub.com/

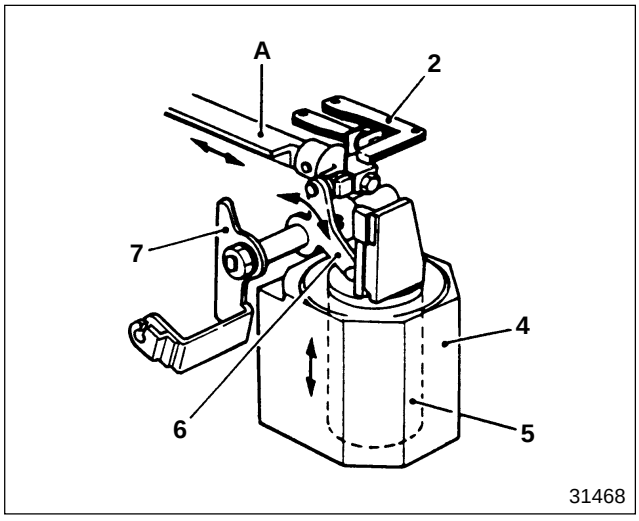
M E M O

https://truckmanualshub.com/

Electronic Governor



1 Housing
2 Control rack position sensor
3 Cover
4 Coil assembly
5 Linear DC motor
6 Link
7 Emergency engine stop lever
8 Sensing gear



● Linear DC motor

The linear DC motor **5** moves the coil assembly **4** vertically in accordance with signals from the electronic governor control unit. Via the link **6**, this movement is transmitted to the control rack **A**, which moves longitudinally to increase and decrease the fuel quantity.

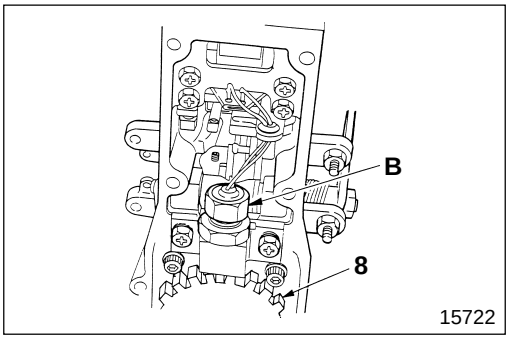
● Control rack position sensor

The control rack position sensor **2** senses whether the control rack **A** is moved to the correct position by the linear DC motor **5**. In the event of a discrepancy between the actual control rack position and the target control rack position (this is determined by the electronic governor control unit), the control unit instructs the linear DC motor to perform a corrective movement.

https://truckmanualshub.com/

● **Emergency engine stop lever**

The emergency engine stop lever **7** is connected to the link **6**. Via a cable, it enables the link to be moved from the driver's seat. In the event of a system fault that prevents the engine from being stopped normally, operation of the emergency engine stop lever forces the control rack **A** to move to the position at which fuel injection is terminated. This operation takes place irrespective of the position of the linear DC motor **5**.

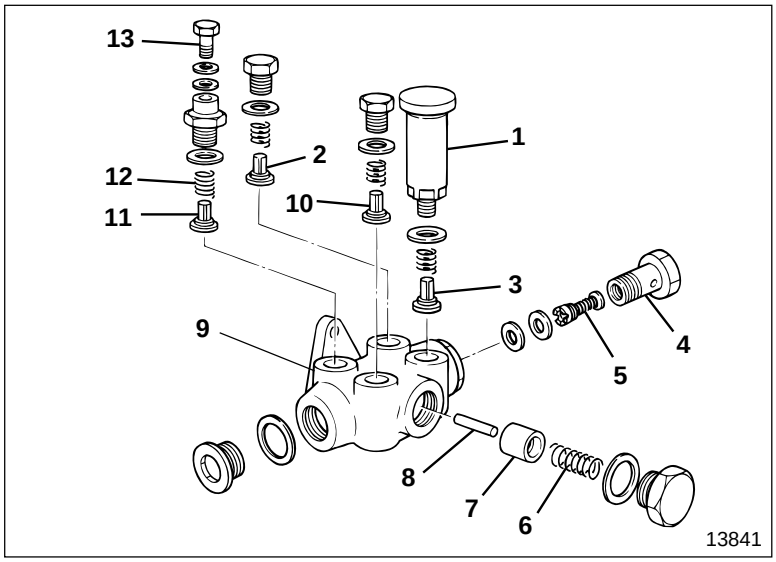


● **Backup engine speed sensor**

The backup engine speed sensor **B** is fitted inside the governor. It converts the rotation speed of the sensing gear **8** into electric signals and feeds the signals to the electronic governor control unit to provide an indication of the engine speed.

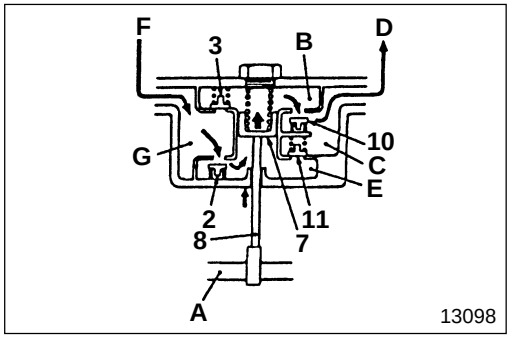
https://truckmanualshub.com/

Feed Pump



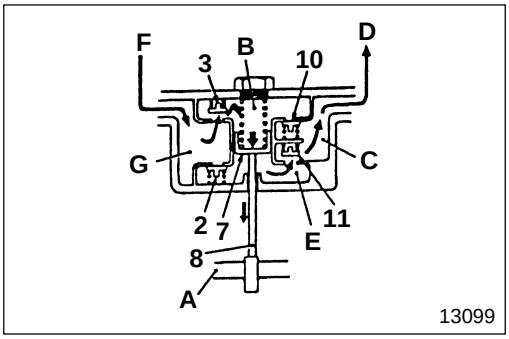
1 Priming pump
2 Check valve
3 Check valve
4 Eye bolt on fuel inlet side
5 Gauze filter
6 Piston spring
7 Piston
8 Push rod
9 Feed pump housing
10 Check valve
11 Check valve
12 Check valve spring
13 Eye bolt on fuel outlet side

- The feed pump is a double-action type pump which, with four check valves operating, sucks and discharges fuel during both strokes of pistons **7**.
- Push rod **8** makes contact with the injection pump camshaft directly, moving piston **7**.
- Priming pump **1** can be manually operated, when the injection pump is not operating, to suck up fuel and thus can be used for air bleeding.
- Gauze filter **5** eliminates large foreign particles from the fuel sucked up from the fuel tank to prevent clogging of the feed pump. This gauze filter must be cleaned with diesel fuel periodically.



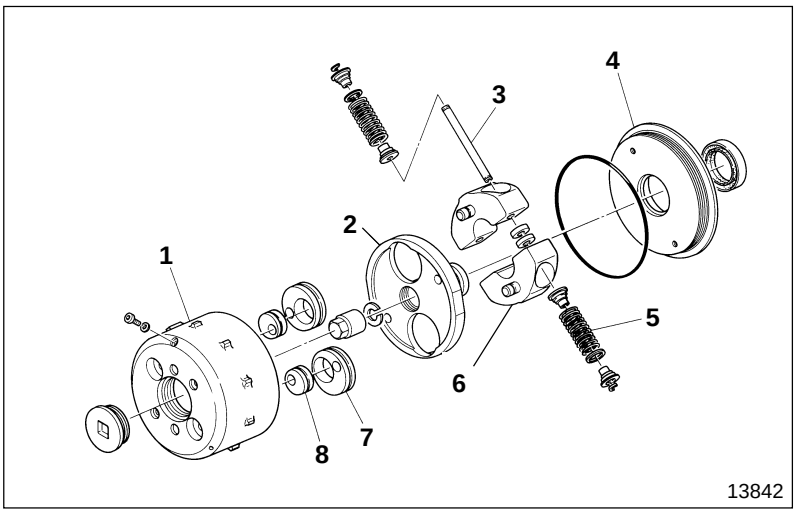
The rotation of injection pump camshaft **A**, pushes up push rod **8** and piston **7**, and the pressure in inner chamber **B** increases. This closes check valve **3**, and check valve **10** opens to let the fuel in inner chamber **B** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **E** decreases, check valve **11** closes, and check valve **2** opens to let fuel flow from fuel tank **F** through outer chamber **G** to inner chamber **E**.

https://truckmanualshub.com/



When injection pump camshaft **A** rotates further, it pushes down push rod **8** and piston **7**, and the pressure in inner chamber **E** increases. This closes check valve **2**, and check valve **11** opens to let the fuel in inner chamber **E** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **B** decreases, check valve **10** closes, and check valve **3** opens to let fuel from fuel tank **F** flow through outer chamber **G** to inner chamber **B**.

Automatic Timer

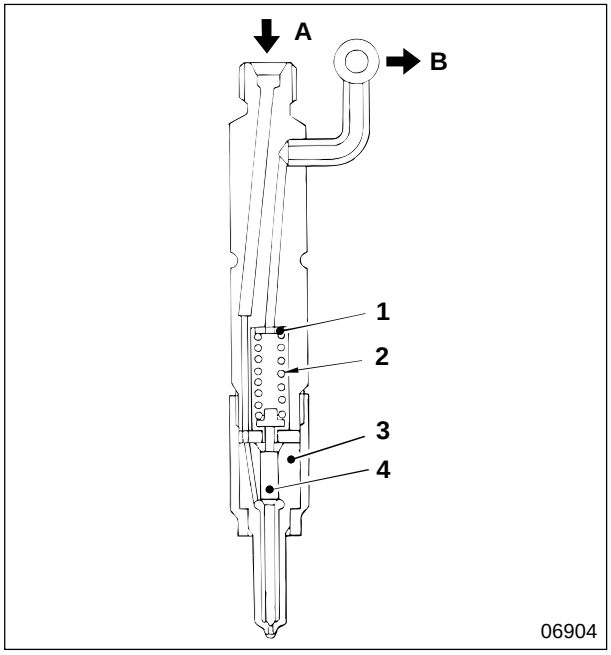


1 Timer housing
2 Timer holder
3 Pilot pin
4 Cover
5 Timer spring
6 Flyweight
7 Eccentric cam (Large)
8 Eccentric cam (Small)

- The mechanical type automatic timer changes fuel injection timing automatically when the engine revolution reaches the specified rate.
- The automatic timer controls the retard of fuel injection timing. The pre-stroke control unit controls the advance of fuel injection timing.

https://truckmanualshub.com/

Injection Nozzle



1 Washer
2 Spring
3 Nozzle tip
4 Needle valve

A : From injection pump
B : To fuel tank

- As the pressure of the fuel delivered from the injection pump overcomes the repercussive force of spring **2**, needle valve **4** is pushed up to allow the fuel to spray out the opening at the tip of the nozzle.
- Injection pressure can be adjusted by increasing or decreasing the number of washers **1**.

TROUBLESHOOTING

Fault Diagnosis Function

- While the starter switch is in the ON position, the fault diagnosis function continuously monitors relevant sensors for faults.
  In the event that a fault is detected, the function illuminates a warning lamp (red or orange) in the meter cluster to alert the driver, memorizes the location of the fault, and switches to a backup mode.
- The memorized fault location can be read as a diagnosis code using an MUT-II or the diagnosis switch.

Warning lamp illumination

	(Orange)	(Red)
1. Safety-critical error (vehicle must not be driven)	OFF	ON
2. Non-safety-critical error (vehicle can be driven despite poor control feeling)	ON	OFF

CAUTION

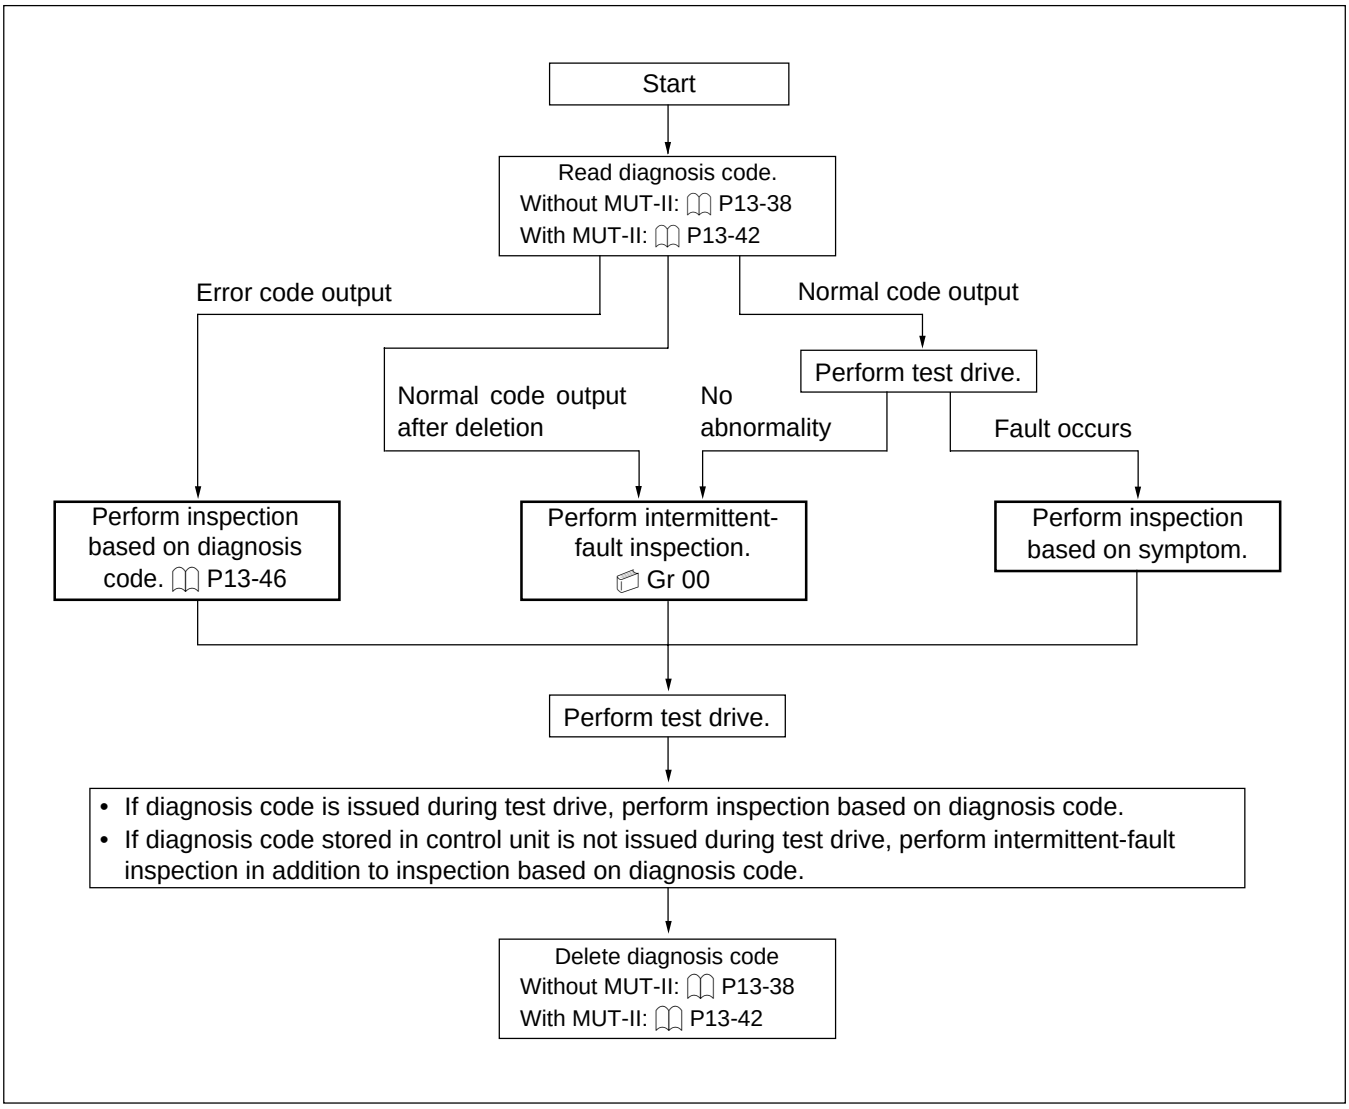
- **The fault diagnosis function requires a battery voltage of 12 V or higher.**
- **In the event of fault detection, check the harnesses and connectors for looseness. Before undoing any connector, turn the starter switch to the LOCK position and wait for 20 seconds.**
- **After rectifying a fault, delete the fault code using the MUT-II or memory clear switch.**
- **As a general rule, inspections should be performed with the starter switch in the LOCK position. If any inspection requires that the starter switch be in the ON position, be careful to avoid short circuits between connector terminals and with the vehicle body.**
- **All component resistances shown in this manual assume a temperature range of 10 to 35°C {50 to 95°F}. In practice, component values may not comply with standard values owing to temperature effects and/or to inaccuracy in the test instrument.**
- **After the rectification of a fault, the system's ability to return to normal operation automatically depends upon the diagnosis code, i.e., the fault location. When the system returns to normal operation, the warning lamp goes out.**
- **When the system returns to normal operation after the rectification of a fault, the diagnosis code remains stored in electronic governor control unit.**

https://truckmanualshub.com/

Inspection Procedure

Inspection of the electronic governor and pre-stroke control injection pump system can be performed most effectively using an MUT-II. Types of system inspection can, in accordance with fault systems and diagnosis codes, be broadly classified as follows:

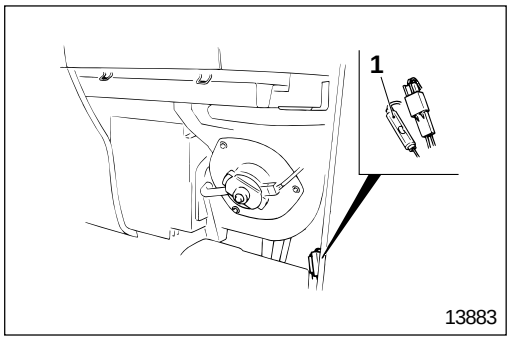
- Inspections based on diagnosis codes stored in the control unit
- Inspections based on symptoms
- Inspections of intermittent faults



https://truckmanualshub.com/

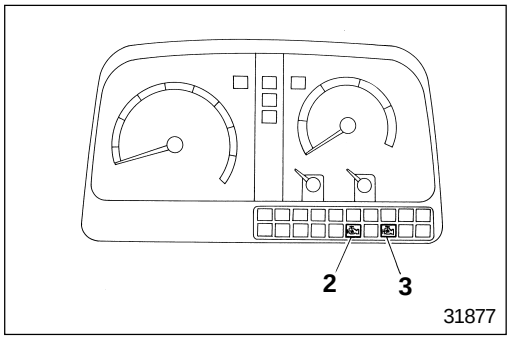
READING AND ERASING DIAGNOSIS CODES

Without MUT-II

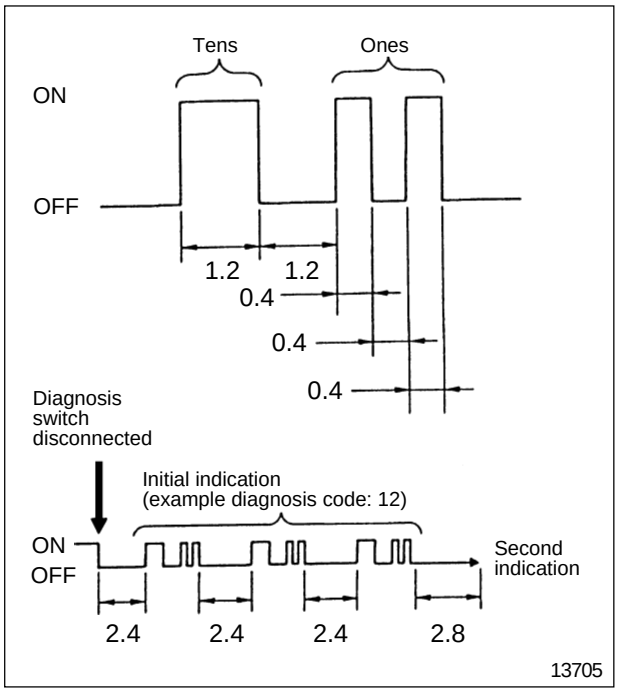


Current diagnosis code

- Turn ON the starter switch.
- Disconnect the diagnosis switch **1**.



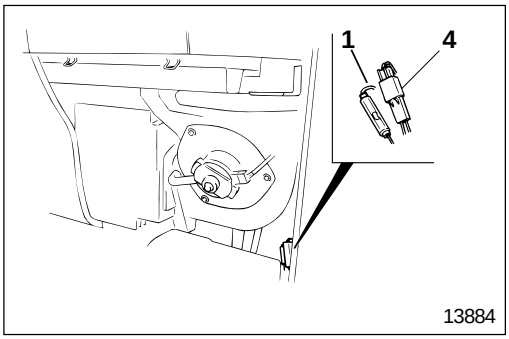
- The diagnosis code is indicated by flashing of the warning lamp **2** (red) or warning lamp **3** (orange).



Diagnosis code indication

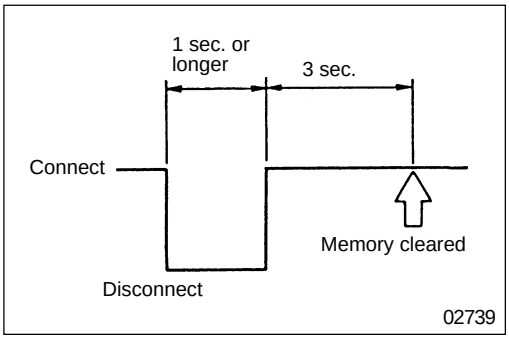
- Diagnosis codes are indicated by the numbers and durations of the warning lamp flashes.
  - Flashes for units of ten and units of one have different lengths, as follows:
    Units of ten: 1.2 seconds
    Units of one: 0.4 second
  - For each diagnosis code, units of ten are given first, followed by units of one. For a code that has no units of ten, only units of one are given.
- Each diagnosis code is indicated three times. If there are no new codes, the sequence is then repeated from the beginning with each code indicated three times.
- When the diagnosis switch **1** is connected, the control unit immediately stops the indication of codes.

https://truckmanualshub.com/



Past diagnosis codes

With the diagnosis switch **1** disconnected, disconnect the memory clear switch **4** after reading the current diagnosis code(s). The warning lamp will begin to flash again, this time to indicate any past diagnosis code(s). Verify the fault location in accordance with the code(s).



Diagnosis code eraser

To erase all stored diagnosis codes from the control unit, disconnect and reconnect the memory clear switch **4**.

CAUTION

- **Stored codes are cleared only by disconnection and reconnection of the memory clear switch 4.**
- **To prevent the memory contents from being cleared after the indication of stored codes, turn OFF the starter switch with the memory clear switch 3 disconnected then connect the memory clear switch.**

https://truckmanualshub.com/

READING AND ERASING DIAGNOSIS CODES

Diagnosis codes table

Diagnosis code	Fault location	Warning lamp	Electronic control unit countermeasure(s) in the case of failure (back-up mode)	Drive ability
01	Normal	—	—	○
03	Pre-stroke actuator learning function	Orange	Provides control with “0” as correction value.	○
06	Sub-control rack position sensor	Orange	Normal control using the main control rack position sensor	○
11	Governor servo	Red	*1 Engine stopped by the pull-down function.	×
12	Pre-stroke servo	Orange	Pre-stroke control stop engine revolution speed limit (approximately 1800 rpm)	△
13	Pre-stroke sensor	Orange	Pre-stroke control stop engine revolution speed limit (approximately 1800 rpm)	△
14	Back-up engine speed sensor	Orange	Control using the main engine speed sensor	○
15	Engine speed sensor	Orange	Calculate the engine revolution speed from the pulse count of the back-up engine speed sensor.	○
14+15	Both the back-up engine sensor and the main engine speed sensors are faulty upon start-up.	Red	Do not start the engine.	×
16	Accelerator pedal position sensor II	Orange	Control using the accelerator pedal sensor I	○
21	Water temperature sensor	Orange	Set the water temperature to 80 °C {176°F}.	○
22	Control rack position sensor	Orange	Switch to the sub-control rack position sensor control.	△
24	Accelerator pedal position sensor I	Orange	Control using the accelerator pedal position sensor II.	○
24+16	Both accelerator pedal position sensor I and accelerator pedal position sensor II are faulty	Red	Set the maximum accelerator depression angle to 30 degrees even if the accelerator pedal is depressed.	△
31	Idling adjustment volume	Orange	Set to auto idling.	○
32	Boost pressure sensor	Orange	Set the boost pressure to 0 kpa {0 mmHg, 0 in. Hg}.	△*2
33	RAM (ECU internal memory circuit)	Red	Do not start the engine.	×
41	Boost temperature sensor	Orange	Normal control assuming the boost temperature is 80 °C {176 °F}.	○
45	Reverse engine operation	Orange	*1 Engine stopped by the pull-down function.	×*2
65	Accelerator switch	Orange	Limited accelerator depressing angle (Approximately 30%)	○

*1 : The pull-down function indicates the rack pull-back action. In the event of an engine over-run or severe accident, the rack is pulled back immediately to the no-injection direction in order to protect the engine.

*2 : Driveable if the starter switch is turned OFF once and then restarted again.

○ : Driveable
△ : Back-up mode driving possible
× : Undriveable

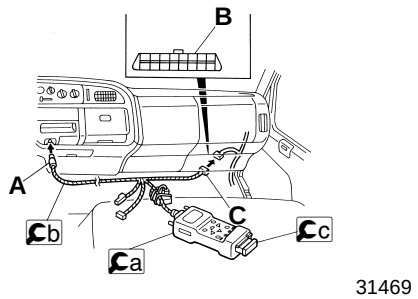
READING AND ERASING DIAGNOSIS CODES

With MUT-II

Special tools

Location	Tool name and shape	Part No.	Application
—	MUT-II PLUS  19492	MB991496-A	Inspection of electronic governor and pre-stroke control injection pump system
—	MUT Communication Harness  19141	MK327601	
—	ROM Pack (MRT-E4)  19493	MK327927	



31469

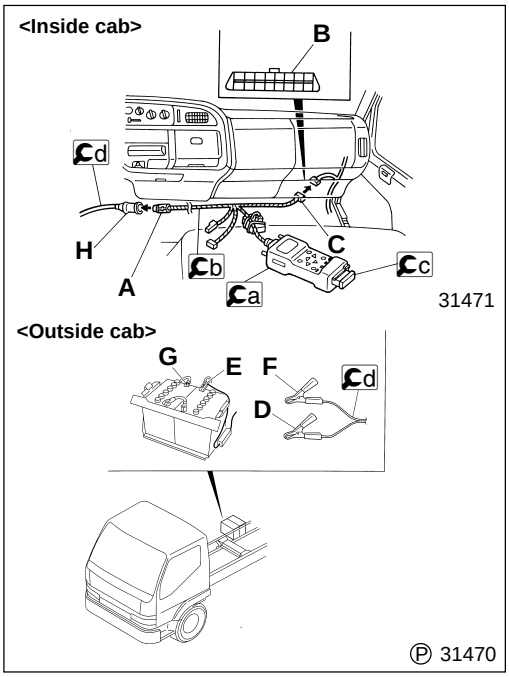
Connecting the MUT-II

- Turn the starter switch to the LOCK position.
- Connect the b MUT Communication Harness to the a MUT-II, and insert the c ROM Pack.
- Plug connector **A** into the cigarette lighter socket.
- Fit connector **C** onto MUT connector **B** (16 pin) in the relay box.

NOTE

Instructions for operation of the MUT-II are given in the separate MUT-II Reference Manual.

https://truckmanualshub.com/



- To verify the service data “START SIG”, connect the MUT-II as follows:
- Turn the starter switch to the LOCK position.
- Connect the b MUT Communication Harness to the a MUT-II, and insert the c ROM Pack.
- Attach the (+) clamp **D** (red) of the d Battery Clamp Harness to the battery’s (+) terminal **E**. Attach the (–) clamp **F** (black) of the d Battery Clamp Harness to the battery’s (–) terminal **G**.
- Fit the connector **A** into the socket **H** of the d Battery Clamp Harness.
- Fit connector **C** onto MUT connector **B** (16 pin) in the relay box.

CAUTION ⚠

Connect the (+) clamp D (red) of the b Battery Clamp Harness before connecting the (–) clamp F (black).

Current diagnosis codes
- Turn the starter switch to the ON position.
- Determine the fault location(s) in accordance with the MUT-II diagnosis code(s).

Past diagnosis codes
- Turn the starter switch to the ON position.
- Determine the fault location(s) in accordance with the past MUT-II diagnosis code(s).

Diagnosis code erasure
- Turn the starter switch to the ON position.
- Using the MUT-II, erase all diagnosis codes stored in the control unit.

Diagnosis codes

Diagnosis codes are indicated as shown in the following table. For details of these codes, refer to the “Without MUT-II” section. 🕮 P13-40

Display item			
Diagnosis code	Fault	Diagnosis code	Fault
03	PS OFFSET	**22**	RACK SNSR
06	SUB RACK SNSR	**24**	ACCEL. SNSR-1
11	GOV. SERVO	**31**	IDLE VOLUME
12	PS SERVO	**32**	BST PRES SNSR
13	PS SNSR	**33**	RAM
14	SUB NE SNSR	**41**	BST TEMP SNSR
15	NE SNSR	**45**	ENG. REVERSE
16	ACCEL. SNSR-2	**65**	ACCEL SW
21	WTR TEMP SNSR		

https://truckmanualshub.com/

SERVICE PROCEDURES USING MUT-II

Service operations can be performed most effectively using the following MUT-II functions:

● Reading of diagnosis codes

Using the diagnosis code function, it is possible to read diagnosis codes stored in the control unit.

● Erasure of diagnosis codes

By selecting the diagnosis code erasure function from the special function menu, it is possible to erase diagnosis codes stored in the control unit.

● Indication of service data

When required for service operations, data in the control unit's random-access memory can be displayed as numeric values or graphs.

ON-VEHICLE INSPECTION AND ADJUSTMENT

Checking and Adjusting Injection Timing

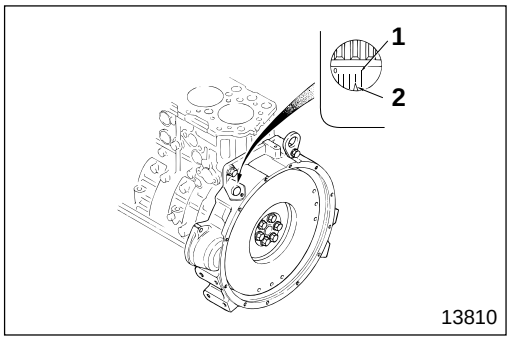
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Fuel injection timing (BTDC)	3° ± 0.5°	—	Adjust

Tightening torque

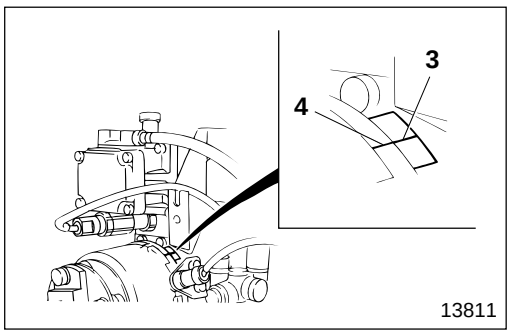
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
5	Adjusting bolt	59 to 64 {43 to 47, 6 to 6.5}	—

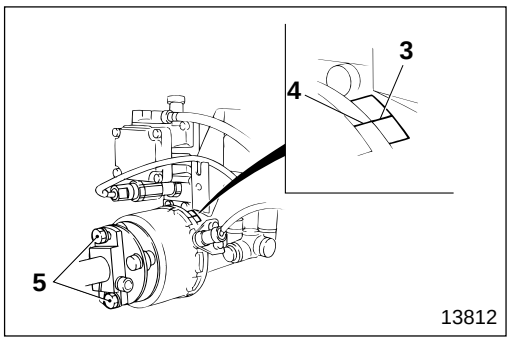


[Inspection]

- Turn the crankshaft more than 180° in the direction of engine rotation. Check if notch **1** on the flywheel and pointer **2** on the flywheel housing show the standard fuel injection timing.



- When pointer **3** on the injection pump and notch **4** on the automatic timer align, the fuel injection timing is standard.
- If the fuel injection timing is not standard, adjust as follows.



[Adjustment]

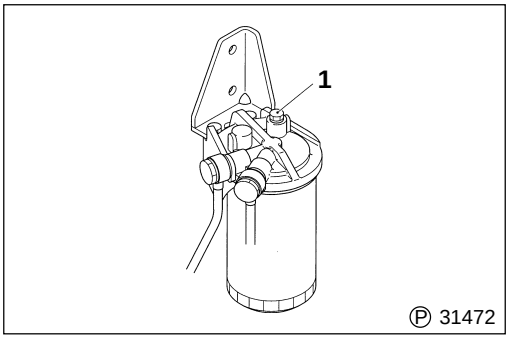
- Loosen adjusting bolts **5** and turn the automatic timer to align pointer **3** and notch **4**.
- Tighten adjusting bolts **5** at specified torque.
- Reinspect the fuel injection timing.

CAUTION ⚠

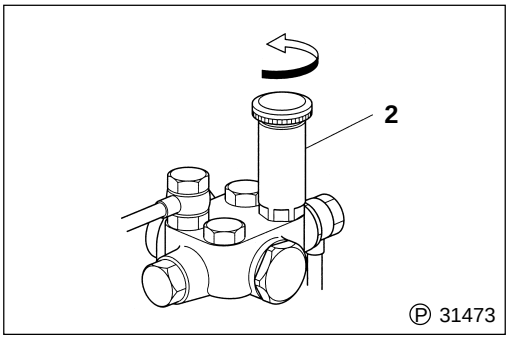
Do not loosen any bolts other than adjusting bolts 5.

https://truckmanualshub.com/

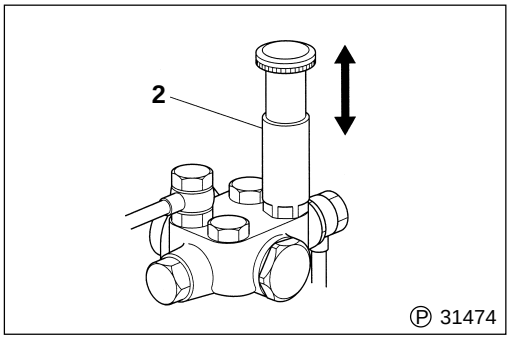
Bleeding Air from Fuel System



- Loosen the fuel filter air plug **1**.



- Turn the priming pump knob **2** counterclockwise until it pops up.
- Move the priming pump knob **2** up and down to feed fuel through the fuel filter.
- When fuel emerging from the fuel filter air plug **1** no longer contains air bubbles, tighten the air plug securely.

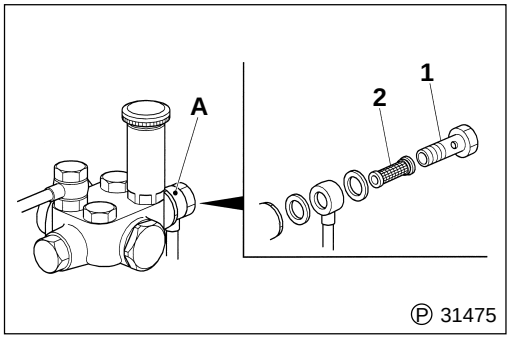


- Move the priming pump knob **2** up and down five or six more times. Then, press the knob down and screw it clockwise to lock it in position.
- Wipe up all spilled fuel, then start the engine.
- Check that no fuel leakage occurs.

WARNING

- **Be sure to wipe up all spilled fuel. Unless it is wiped up, it could catch fire.**
- **Fuel is highly flammable. Keep it away from flames and sources of heat.**

Cleaning Gauze Filter



- Remove the eyebolt **1** from the suction port side **A** of the fuel feed pump.
- Remove the gauze filter **2** from the eyebolt **1**.
- Clean the gauze filter **2** in diesel fuel.
- Refit the gauze filter **2** and eyebolt **1** in the opposite order to that in which they were removed.
- Bleed all air out of the fuel system. P13-51
- Start the engine and check that no fuel leakage occurs.

WARNING

- **To minimize the risk of fire, wipe up any spilled fuel.**
- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **After refitting the gauze filter, check that no fuel leakage occurs.**

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

Replacing Fuel Filter

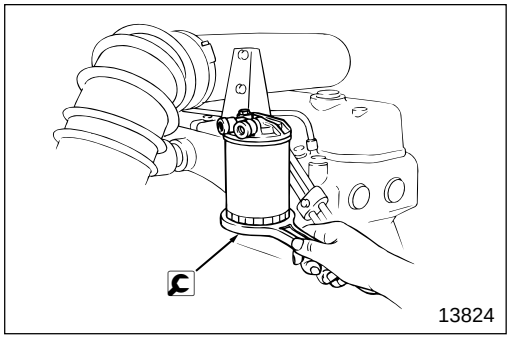
Lubricant

Location	Points of application	Specified lubricant	Quantity
1	Gasket between fuel filter and fuel filter head	Engine oil	As required

Special tool

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Filter wrench  01882	MH061572	Fuel filter removal



13824

[Removal]

: Filter Wrench

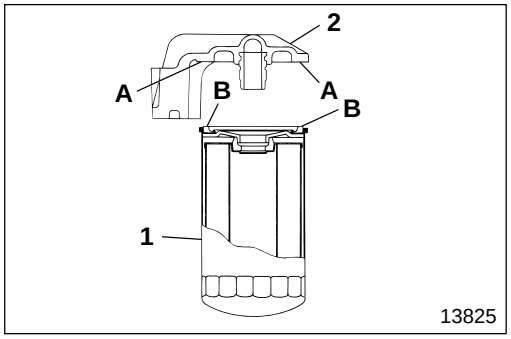
WARNING

- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **To minimize the risk of fire, wipe up any spilled fuel.**

[Installation]

WARNING

Use of an unsuitable fuel filter 1 can lead to fuel leaks and fires. Be sure to use a genuine filter.



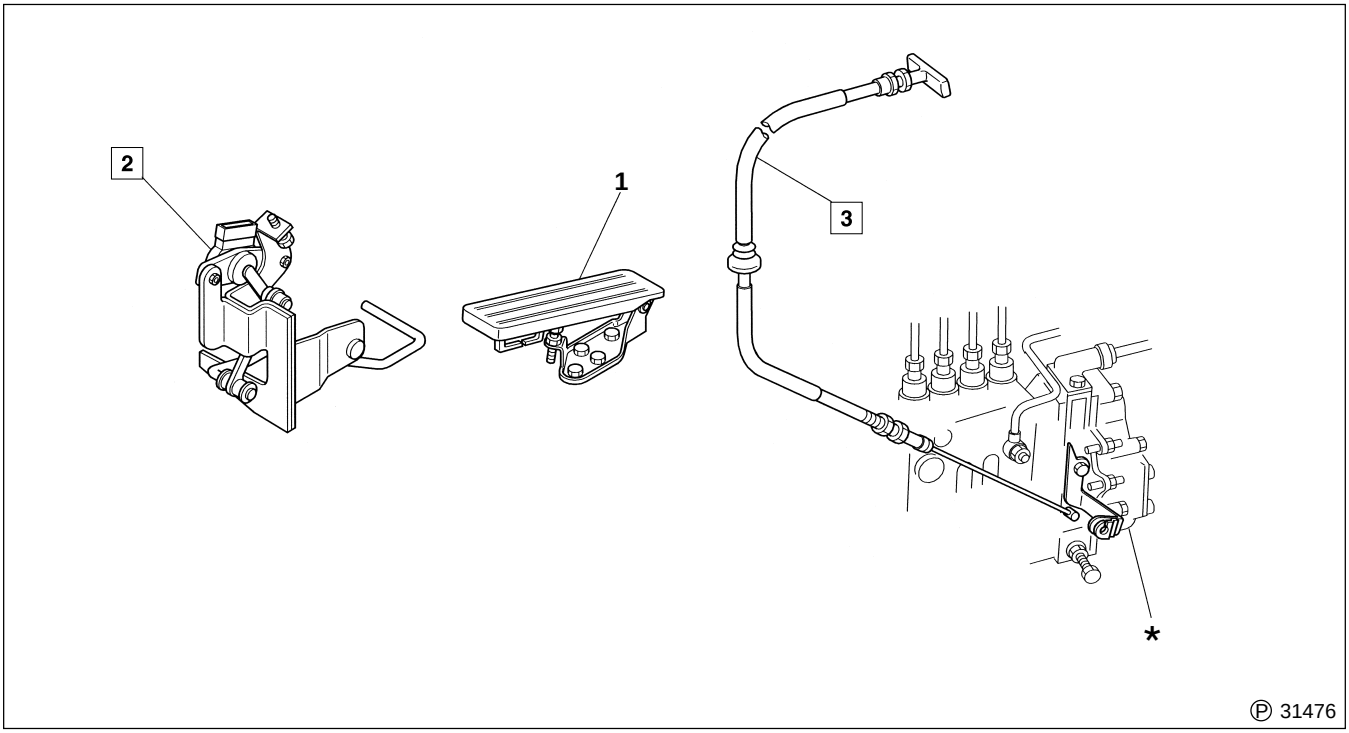
13825

- To fit the fuel filter **1**, turn it until the gasket **B** touches surface **A** of the fuel filter head **2**. Then, tighten the filter by 1 to $1\frac{1}{8}$ turn. Be sure to turn the filter by hand.
- Bleed all air out of the fuel system. P13-51

WARNING

After fitting the fuel filter 1, start the engine and check that no fuel leakage occurs. Any leaking fuel could cause a fire.

https://truckmanualshub.com/



● **Removal sequence**

1 Accelerator pedal assembly
2 Accelerator pedal position sensor assembly
3 Emergency engine stop cable
***** : Injection pump assembly

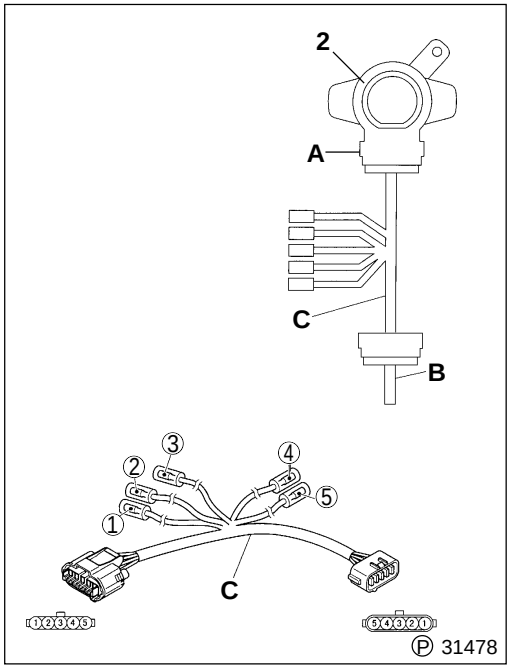
● **Installation sequence**

Follow the removal sequence in reverse.

Service standards

Location	Maintenance item			Standard value	Limit	Remedy
4	Output voltage of accelerator pedal position sensor  Ⓟ 31477	Sensor II: ① – ④	Idle position	0.85 ± 0.1 V	—	Adjust or replace
		Sensor I: ④ – ⑤	Full-load position	4.15 ± 0.1 V	—	Adjust or replace
	Output voltage of accelerator switch  Ⓟ 31477		Electrical conduction between terminals ② and ③ of accelerator switch	1.00 ± 0.24 V	—	Adjust or replace

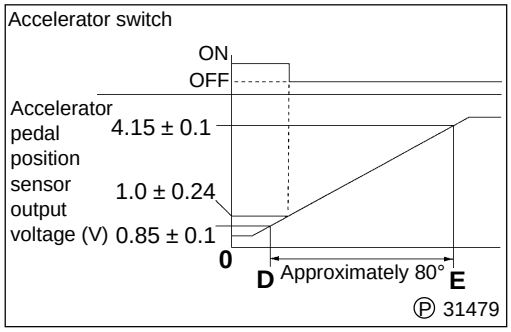
https://truckmanualshub.com/



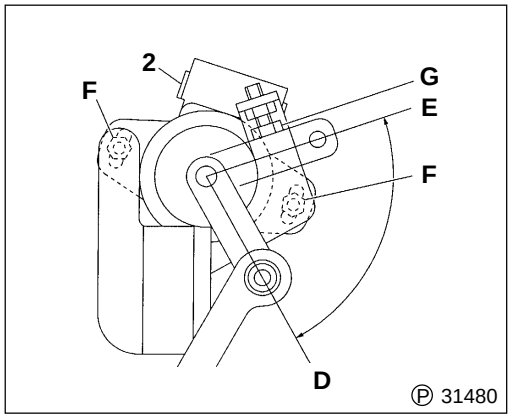
2 **Inspection of accelerator pedal position sensor assembly**

- Disconnect connector **A** of accelerator pedal position sensor **2** from harness **B** on the cab side. Prepare inspection harness **C,** and connect it between the above two connectors. (Not required with MUT-II PLUS)
- Set the starter switch to the **ON** position.
- Measure the output voltages of accelerator pedal position sensor **4** and the accelerator switch according to the table below. Adjust, if necessary.

Item	Connector terminal					
	Accelerator position sensor inspection harness					
	Sensor II		Sensor I		Accelerator switch	
	①	④	④	⑤	②	③
Output voltage ***a** (Idle position)	⊖	⊕	⊖	⊕		
Output voltage ***b** (Full-load position)	⊖	⊕	⊖	⊕		
Output voltage ***c** (Accelerator switch activating point)					⊖	⊕



***a** : Measure voltage with accelerator pedal at idle position.
***b** : Measure voltage with the accelerator pedal at full-load position.
***c** : Press accelerator pedal gradually from idle position. Measure voltage when electrical conduction stops between connector terminals ② and ③ of accelerator pedal position sensor **2**.
D : Idle position
E : Full-load position

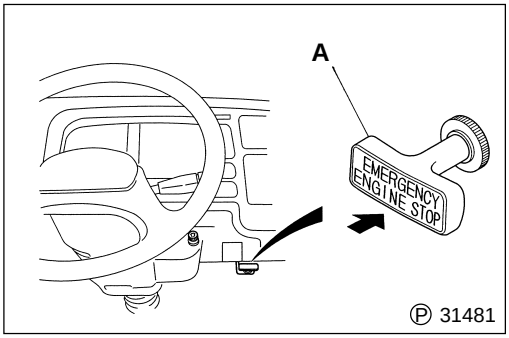


- If measured value ***a** and ***b** deviate from the standard values, adjust the following adjusting bolts.

Adjustment item	Adjusting bolt
***a** Idle position output voltage	Screw **F**
***b** Full-load position output voltage	Full-load stopper bolt **G**

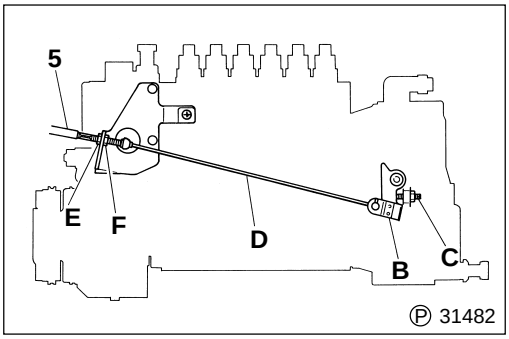
- If the measured output voltage at accelerator switch activating point ***c** deviates from the standard value, replace accelerator pedal position sensor **2**.

https://truckmanualshub.com/



5 Installation of emergency engine stop cable

- Mount stop button **A** on emergency engine stop cable **5** and press the button firmly in position.



- With stop lever **B** of the governor contacting stopper bolt **C**, adjust nut **E** so that inner cable **D** of emergency stop cable **5** is taut. Then, tighten nut **F** to secure it in place.
- After installation, start the engine. Pull the stop button to make sure that the engine stops operating.

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
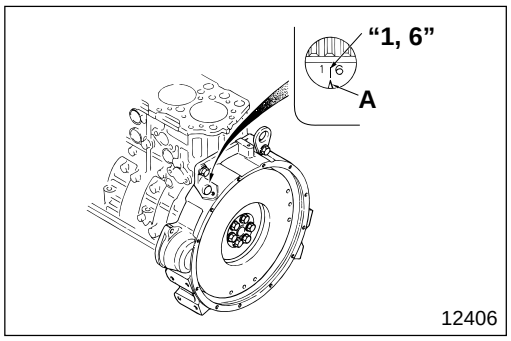
28	Injection pump centering tool  14311	MH063336	Positioning of injection pump bracket

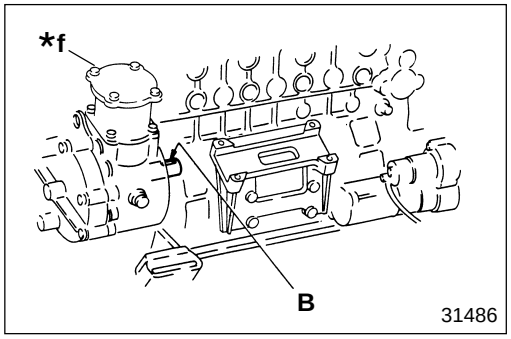
https://truckmanualshub.com/

◆ Service procedure

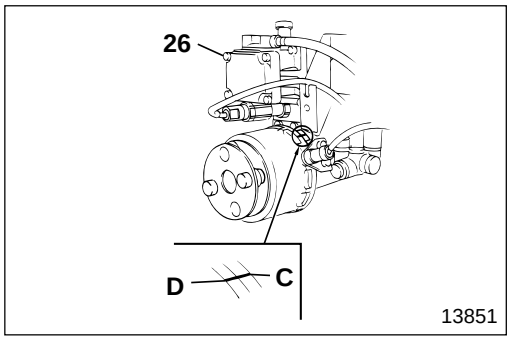


26 **Installation of injection pump assembly**

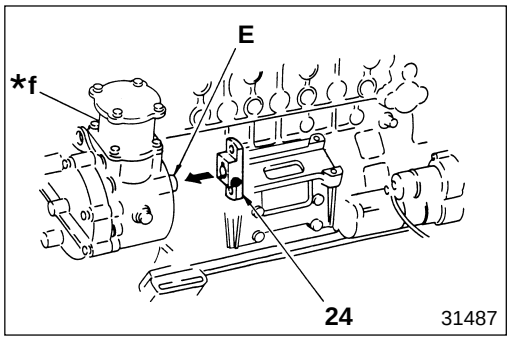
- Turn the engine to bring No.1 cylinder piston to top dead center in the compression cycle, and align mark "**1, 6**" of the flywheel with pointer **A** on the flywheel housing.



- In this state, make sure that keyway **B** in the crankshaft of injection pump drive case ***f** faces upward.
- If keyway **B** is not facing upward, turn the engine crankshaft by one turn.

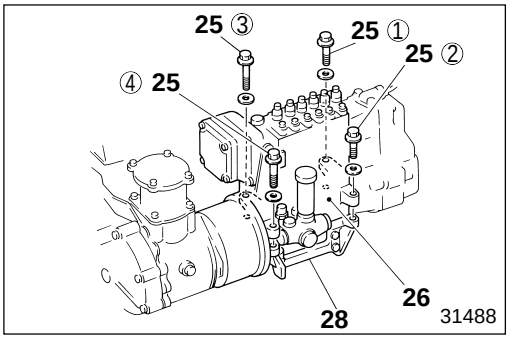


- Align pointer **C** on injection pump assembly **26** with notch **D** on the automatic timer.

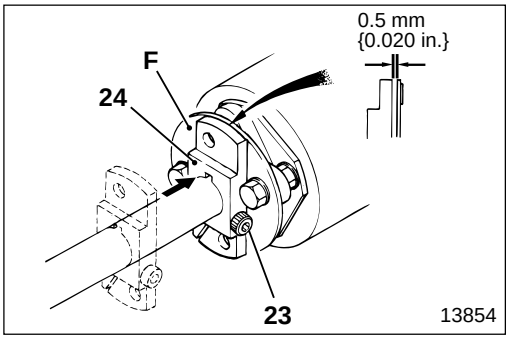


- Install driving coupling **24** to crankshaft **E** of injection pump drive case ***f** and place the driving coupling on the air compressor side.
- Install injection pump assembly **26** on the injection pump bracket.

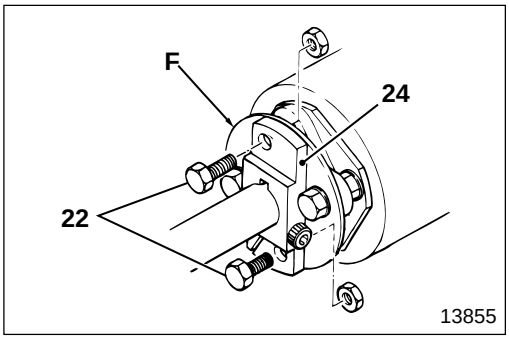
https://truckmanualshub.com/



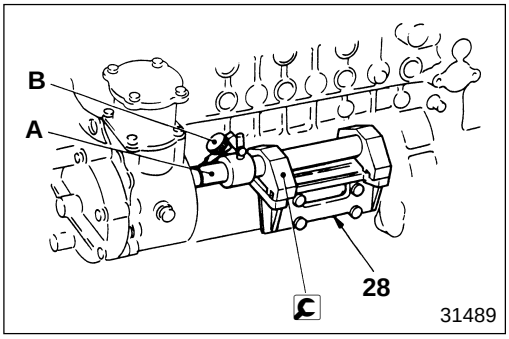
- Install injection pump assembly **26** on injection pump bracket **28**.
- Tighten bolts **25** in the order as illustrated at specified torque for primary tightening.
- Retighten bolts **25** in the order as illustrated at specified torque for secondary tightening.



- Move driving coupling **24** to adjust the clearance between the driving coupling and coupling plate **F** as illustrated, then tighten cotter bolt **23** at specified torque.



- Attach driving coupling **24** and coupling plate **F** using bolts **22** and tighten the bolts temporarily.
- In this state, adjust the fuel injection timing.
  Adjustment of fuel injection timing : P13-50
  After adjusting the fuel injection timing, tighten bolts **22** at specified torque.



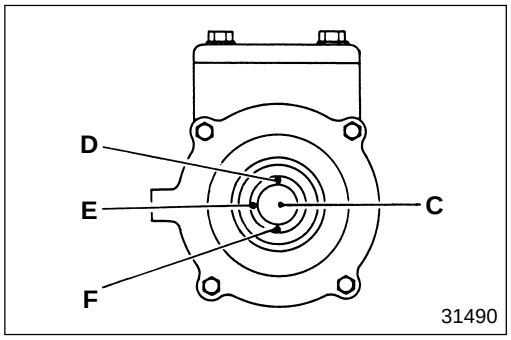
28 **Injection pump bracket**

[Inspection]

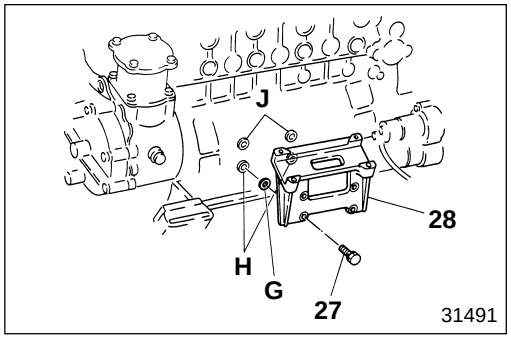
- Attach dial gauge **B** to arbor **A** of injection pump centering tool and adjust to gauge to zero setting.

https://truckmanualshub.com/

INJECTION PUMP



- Slide dial gauge **B** toward injection pump drive case ***f** and measure the eccentricity of crankshaft **C** against arbor **A** at points **D**, **E** and **F**.
- If the measured value is higher than the standard value, adjust as follows.



[Adjustment]

- When the measured value at point **E** is higher than the standard value:
  Insert shims **G** into four points equally.
- When the measured value at point **D** is higher than the standard value:
  Insert shims **G** into lower side **H**.
- When the measured value at point **F** is higher than the standard value:
  Insert shims **G** into upper side **J**.

CAUTION ⚠

Insert shims G observing the following conditions:

- **Number of shims per point is three or less.**
- **The same number of shims should be used for the front and the rear.**
- **The difference in number of shims used for bottom and top is none or one.**

- Tighten bolt **27** at specified torque, then reinspect.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

WARNING ⚠

Wipe up any spilled fuel because it can cause a fire.

CAUTION ⚠

- **Be sure not to touch slide-contact area of needle valve 10 because any scratches or corrosion might spoil the airtightness of nozzle 11. It must be handled with utmost care.**
- **Never change the combination of needle valve 10 and nozzle 11 for each cylinder.**
  Be sure to protect all openings by covering them after removal of hoses and pipes because the engine performance is adversely affected if dirt and foreign particles enter injection nozzle assembly 6.

NOTE

Remove carbon deposits and clean injection nozzle assembly 6 before working on it, then test the injection pressure and jet spray condition, and check for fuel leakage before disassembly. If no fault is found, do not disassemble.

—	Nozzle cleaning tool	★105789-0010	Cleaning of injection nozzle assembly

★ ZEXEL code number

◆ Service procedure

● Inspection before disassembly

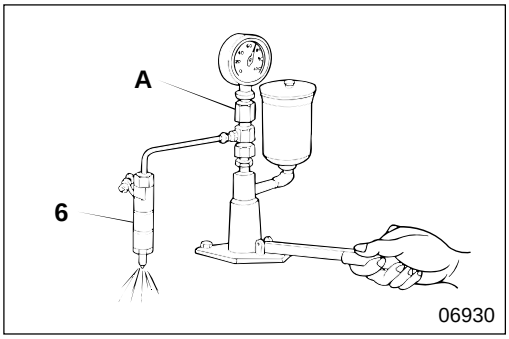
Attach injection nozzle assembly **6** to nozzle tester **A**, and conduct the following inspection.

WARNING ⚠

Never touch the spray from nozzle 11 or let your hands get too close to the spray point during the test.

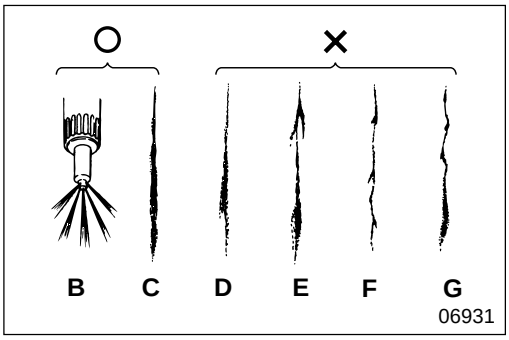
NOTE

Before inspection, bleed the air out in a couple of bursts by pressing nozzle tester A lever.



(1) Valve opening pressure

- Raise the pressure of nozzle tester **A** by operating the lever, an measure the pressure that the gauge registers when the pressure is released which will be observed by the sudden movement of the gauge indicator.
- If the measured value deviates from the standard value, disassemble the nozzle and clean, and adjust it using adjusting shims **14**.
- Variation of 0.05 mm {0.0020 in.} thickness in adjusting shims **14** causes a difference of 735 kPa {105 lbf/in^2, 7.5 kgf/cm^2} of pressure, for example, to alter the pressure for 98 kPa {14 lbf/in^2, 1 kgf/cm^2}, a thickness of 0.0067 mm {0.00026 in.} is required.
- If the performance cannot reach the standard value even after adjustment, replace injection nozzle assembly **6**.

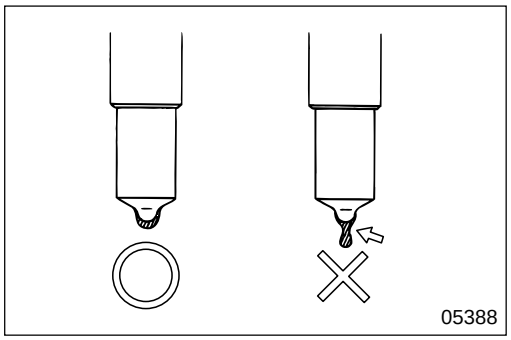


(2) Spray condition

- Test injection spray condition by quick lever actions of nozzle tester **A**, 4 to 6 actions per second.
  - **B** : Even spray from all five orifices (Good)
  - **C** : Even and symmetrical spray (Good)
  - **D** : Asymmetrical spray (Faulty)
  - **E** : Spray direction deviates from the nozzle axis line (Faulty)
  - **F** : Thin and insufficient spray (Faulty)
  - **G** : Irregular spray (Faulty)
- If faulty spray cannot be corrected, disassemble injection nozzle assembly **6** and clean every part and repeat the test.
  If faulty spray still occurs after repeating test, replace the injection nozzle assembly.
- Make sure that there is no post-spray dripping after injection.

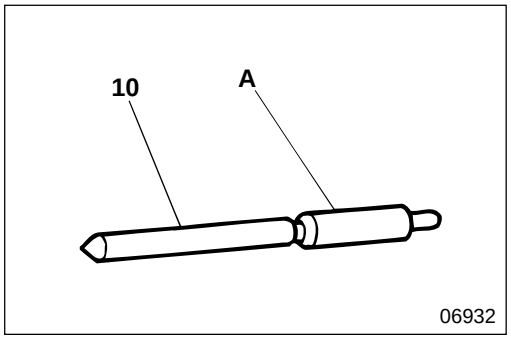
https://truckmanualshub.com/

INJECTION NOZZLE



(3) Fuel air tightness and leakage at related contact points

- Maintain interior pressure of nozzle at 1960 kPa {285 lbf/in^2, 20 kgf/cm^2} lower than the valve opening pressure, and check and see if any fuel seeps out of the nozzle tip within 10 seconds.
- If any fault is found, disassemble injection nozzle assembly **6** and clean every part and repeat the test. If any fault is still found, replace the injection nozzle assembly.

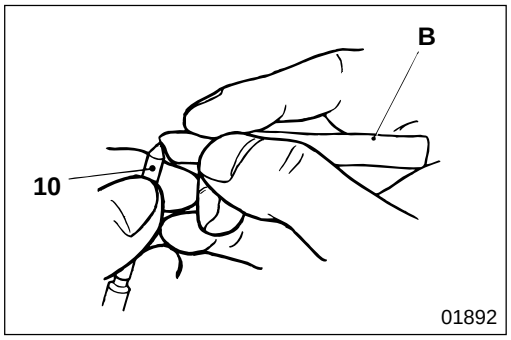


6 Injection nozzle assembly

[Disassembly]

CAUTION

- **Be sure not to touch sliding part A of needle valve 10 with your hands.**
- **Never change the combination of removed needle valve 10 and nozzle 11 for each cylinder.**



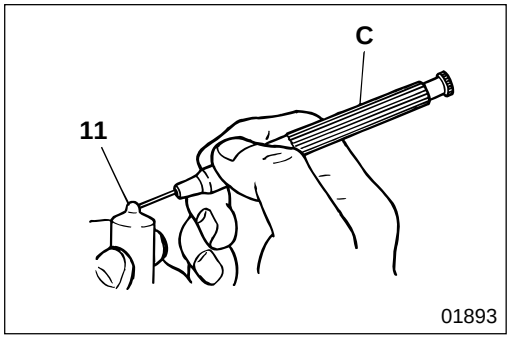
[Cleaning]

Clean needle valve **10** and nozzle **11** with diesel fuel (cleaning solvent). Remove carbon deposits with [C] cleaning tool in the following manner:

- Clean needle valve **10** by removing carbon deposits from its tip using cleaning bar **B** of [C] cleaning tool.

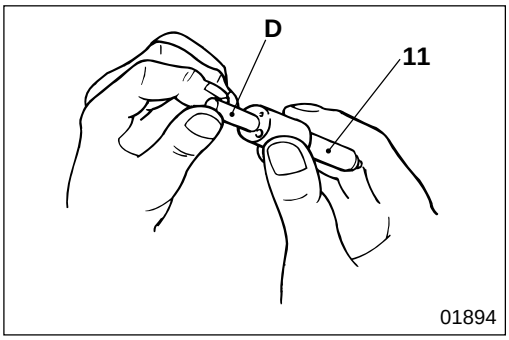
CAUTION

Never use a wire brush or hard steel for cleaning.

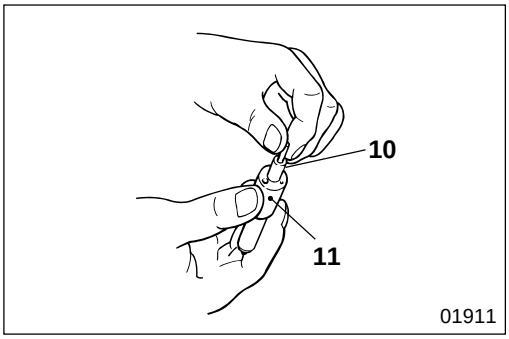


- To clean nozzle **11**, remove carbon deposits from the orifices of the nozzle using needle cleaner **C** of [C] cleaning tool, by inserting it into the orifices and turning it.
  Needle cleaner diameter : ø 0.25 mm {0.0098 in.} or less

https://truckmanualshub.com/



- Clean the seat of nozzle **11** using cleaning needle **D** of [C] cleaning tool.
- Use FUSO carbon remover to remove hard-to-remove, burnt-on carbon deposits.



[Inspection]

- Immerse needle valve **10** and nozzle **11** in diesel fuel (cleaning solvent) and clean them thoroughly.
- Check and see if needle value **10** drops by its own weight into the nozzle from the position where a third of its length is pulled out. (Repeat this several times rotating the needle valve.)
- If needle valve **10** does not drop smoothly, repeat cleaning and repeat the test. If any fault is still found, replace both the needle valve and nozzle **11** together as a set.

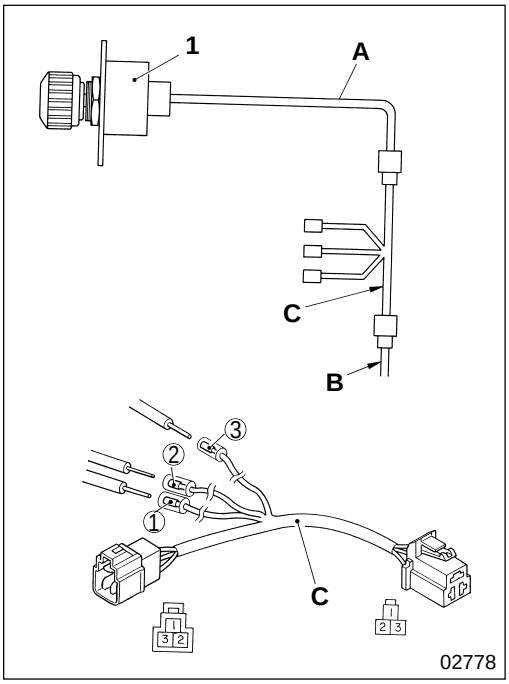
◆ Service procedure

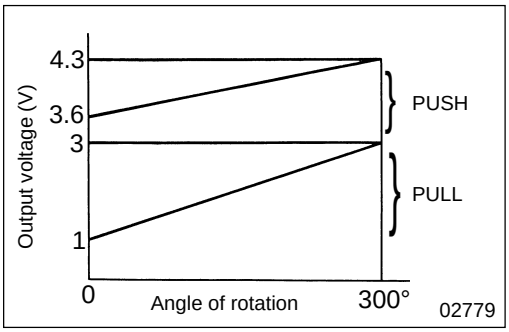


1 **Inspection of idling speed adjustment potentiometer**

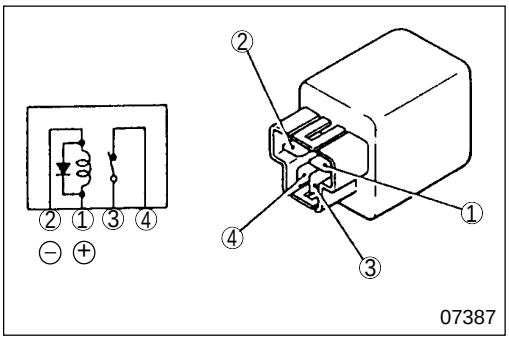
- Disconnect the harness **A** of the idling speed adjustment potentiometer **1** from the cab-side harness **B**. Then, connect an inspection harness **C** between harnesses **A** and **B.** (The inspection harness must be made specially for this procedure.)
- Turn the starter switch to the ON position.
- Check the output voltages of the idling speed adjustment potentiometer **1** in accordance with the following table.

Item	Connector terminal		
	Accelerator pedal position sensor inspection harness		
	①: Power supply (+)	②: GND (–)	③: Output (+)
Output voltage with knob pulled		⊖	⊕
Output voltage with knob pushed			

Output characteristics



- If the output voltages are out of specification, replace the idling speed adjustment potentiometer **1**.



2 **3** **Inspection of pre-stroke cut relay and transmission neutral relay (normally-closed type with 4 pin connector)**

- Perform continuity checks in accordance with the following table.

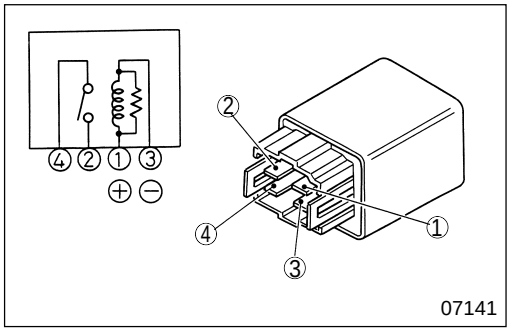
	①	②	③	④
Not energized	○——○		○——○	
Energized	⊕——⊖		〔⊢ - - -⊣〕	

○——○ : Continuity exists between terminals.
⊕——⊖ : Terminals across which 12 V DC is applied
〔⊢ - - -⊣〕 : Continuity no longer exists between terminals

- Replace the relay if any abnormality is evident.

https://truckmanualshub.com/

INSPECTION OF OTHER DEVICES



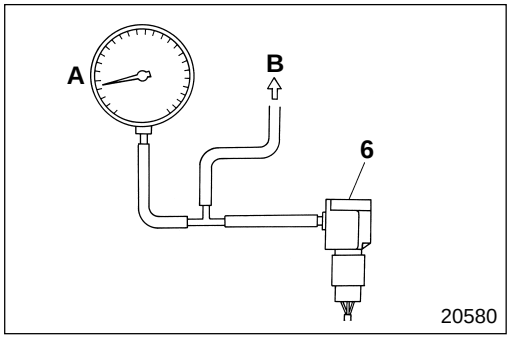
4 15 Inspection of exhaust brake relay and accelerator relay

- Check the electrical conduction and operation according to the table below.

	①	②	③	④
Electric current not supplied	○		○	
Electric current supplied	⊕	○	⊖	○

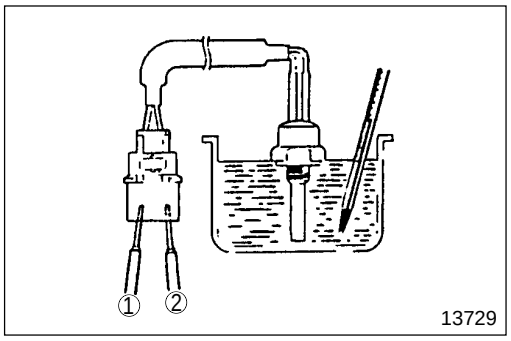
○—○ Electric conduction between terminals.
⊕—⊖ Terminals applied with 12 VDC.

- If an abnormality is found, replace the relay.



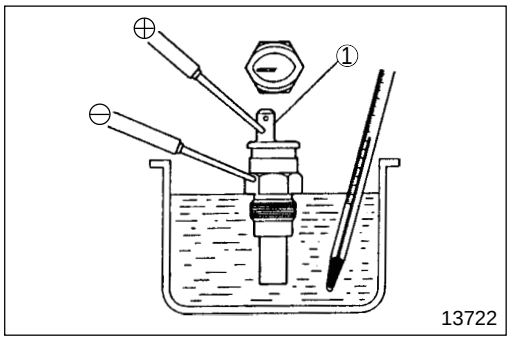
6 Inspection of boost pressure sensor

- Install pressure gauge **A** for boost pressure measurement as shown in the diagram.
- Connect the MUT-II 📖 P13-42
- Set the MUT-II for boost pressure measurement
- Start the engine. Compare the value displayed on the MUT-II and the value indicated by pressure gauge **A**. If the values are different, replace boost pressure sensor **6**.
  B : To the inlet manifold



7 Inspection of boost temperature sensor

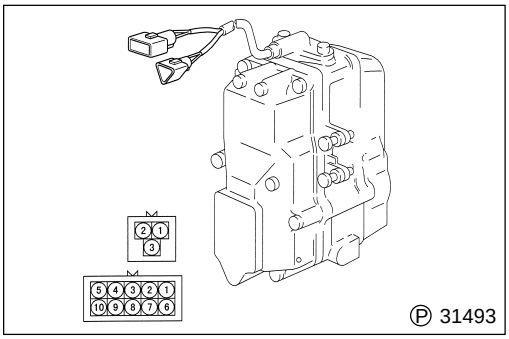
- Place boost temperature sensor **7** in glycerin in a container.
- Raise the glycerin temperature to the specified values and stir the glycerin.
- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace boost temperature sensor **7**. Gr 15



8 Inspection of engine coolant temperature sensor

- Put the engine coolant temperature sensor **8** in a container of engine oil.
- Heat the oil to each of the specified temperatures. Stir the oil to ensure that it heats up evenly.
- At each of the specified temperatures, measure the resistance between the terminal ① and body of the engine coolant temperature sensor **8**.
- If the measurements are out of specification, replace the engine coolant temperature sensor **8**.

https://truckmanualshub.com/



9 Inspection of control rack position sensor

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA Dealer.

● **Measurements on connectors**

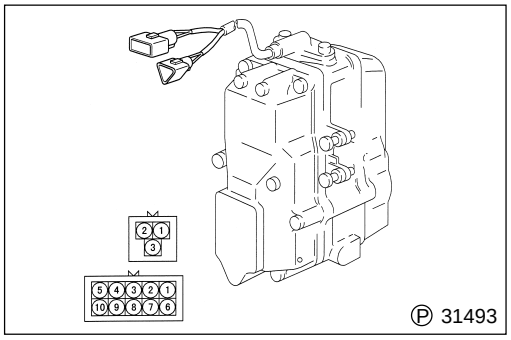
Measure the resistances between the following terminals: 3 pin connector's ③ and 10 pin connector's ④; 10 pin connector's ③ and ⑨; ④ and ⑨.

https://truckmanualshub.com/

INSPECTION OF OTHER DEVICES

11 Inspection of linear DC motor

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA Dealer.



(1) Measurements on connectors

Measure the resistance between terminals ① and ② on each connector.

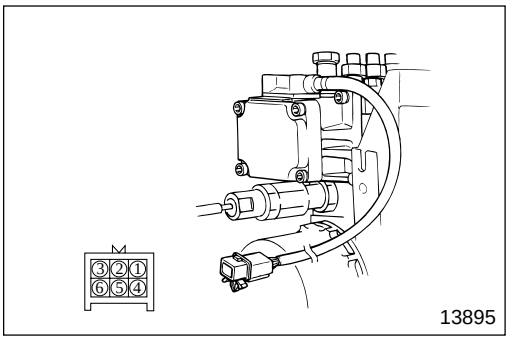
https://truckmanualshub.com/

12 Inspection of pre-stroke actuator

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA Dealer.

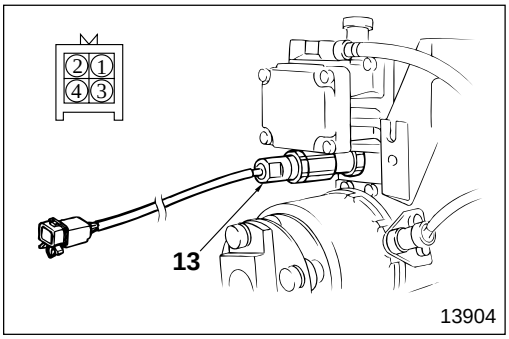
CAUTION ⚠

The pre-stroke actuator 12 must be inspected when the engine is cold.



(1) Measurements on connectors

Measure the resistance between terminals ② and ③; ① and ③; ① and ②; ④ and ⑤.

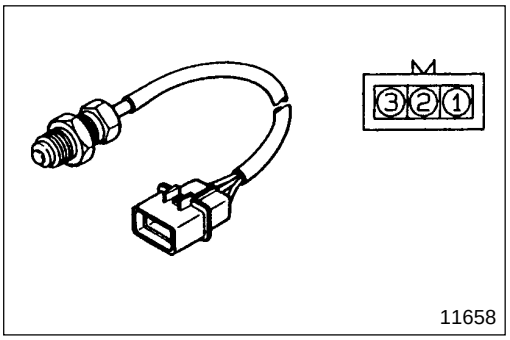


13 Inspection of sub control rack position sensor

- Measure the resistances between the following terminals: ① and ④; ① and ③; ③ and ④.
- If any resistance is out of specification, replace the sub control rack position sensor **13**.
- Have replacement performed by the nearest MFTA Dealer.

https://truckmanualshub.com/

INSPECTION OF OTHER DEVICES



14 Engine speed sensor

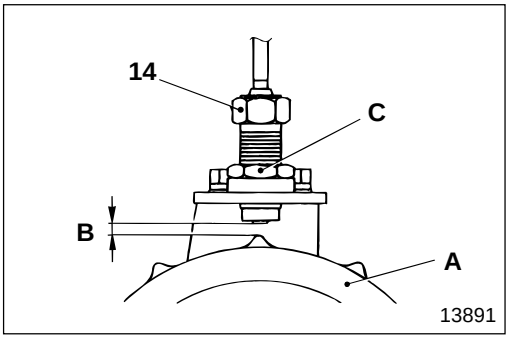
[Inspection]

(1) Main Unit

- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace engine speed sensor **14**.

CAUTION

Be sure to check the tightening torque of engine speed sensor 14. If the tightening torque is insufficient, the sensor may not output a signal.



(2) Clearance between protrusions

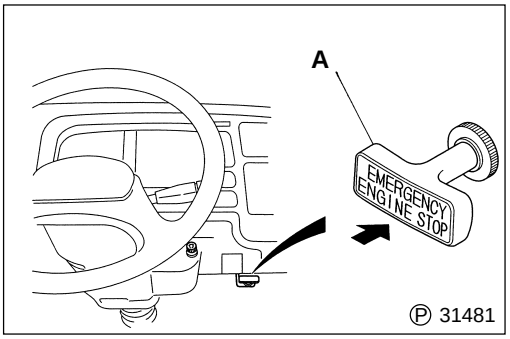
If the clearance between engine speed sensor **14** and timer housing protrusion **A** deviates from the standard value, adjust by following the procedure below.

[Adjustment]

- Loosen lock nut **C**, and rotate engine speed sensor **14** to adjust the clearance.
- After adjustment, tighten lock nut **C** to the specified torque.

CAUTION

If clearance B between engine speed sensor 14 and timer housing protrusion A is too large, the sensor may not output a signal. If the clearance is too small, the sensor may contact the protrusions.



16 Inspection of emergency engine stop button

- Push emergency engine stop button **16** all the way.
- In this step, make sure that stop lever **A** of the governor is in contact with stopper bolt **B**.
- If the stop lever does not contact the stopper bolt, turn nut **C** until they contact, and tighten nut **D** to secure it in place.
- Inner wire **E** of stop cable **F** should be taut. If not, make adjustment.

CAUTION

Be careful not to make the tension of inner wire E too high, since excess tension prevents stop lever A from fully contacting stopper bolt B.

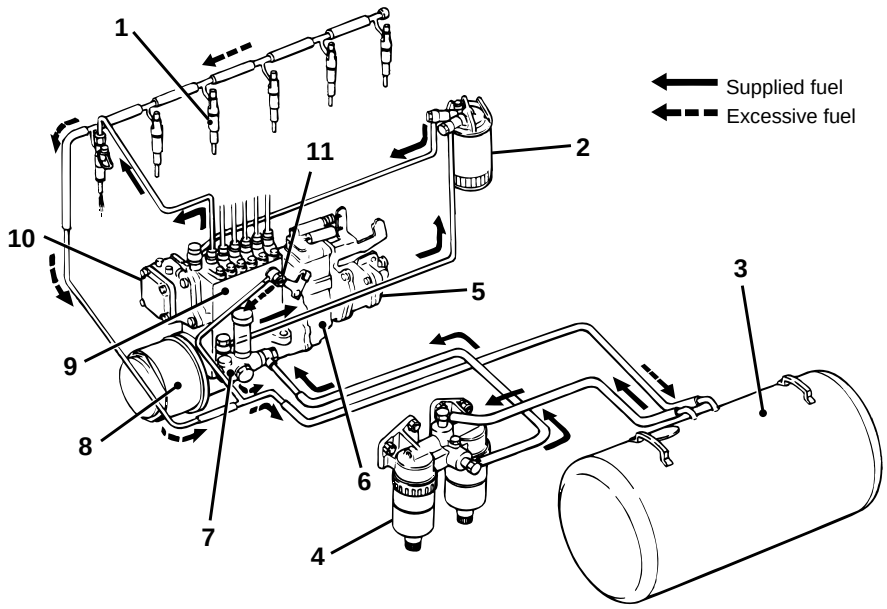
Fuel System (Flow of Fuel)



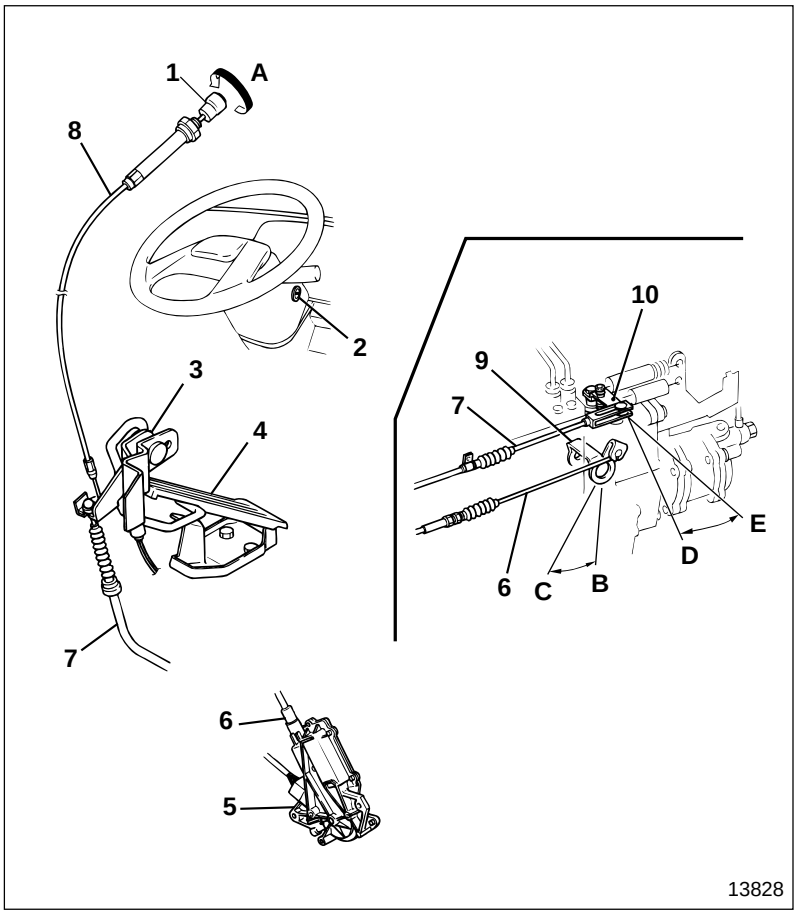
13827

1 Injection nozzle
2 Fuel filter
3 Fuel tank
4 Water separator
5 Boost compensator
6 Governor
7 Feed pump
8 Automatic timer
9 Injection pump
10 Pre-stroke actuator
11 Overflow valve

Fuel in fuel tank **3** is sucked up by feed pump **7** which is driven by the cam action of injection pump **9** and is filtered through fuel filter **2** which removes dirt and other foreign particles.
Filtered fuel is sent to the injection pump where the fuel pressure is boosted and injected through injection nozzle **1** into the combustion chamber.
When fuel pressure is higher than the specified value, overflow valve **11** opens to let the fuel return to the fuel tank.

https://truckmanualshub.com/

Engine Control



1 Idling control knob
2 Starter switch
3 Accelerator arm assembly
4 Accelerator pedal assembly
5 Fuel-cut motor
6 Engine-stop cable
7 Accelerator control cable
8 Idling control cable
9 Engine-stop lever
10 Idling control lever

A : Idling revolution rising
B : Engine-stop position
C : Engine start-up position
D : Full-load position
E : Idling position

(1) Idling control knob

Idling control knob **1** is for making fine adjustment to the idling revolution of the engine. Turning the knob clockwise raises the revolution. It works in the same way as accelerator pedal assembly **4** does when it is depressed.

(2) Fuel-cut motor

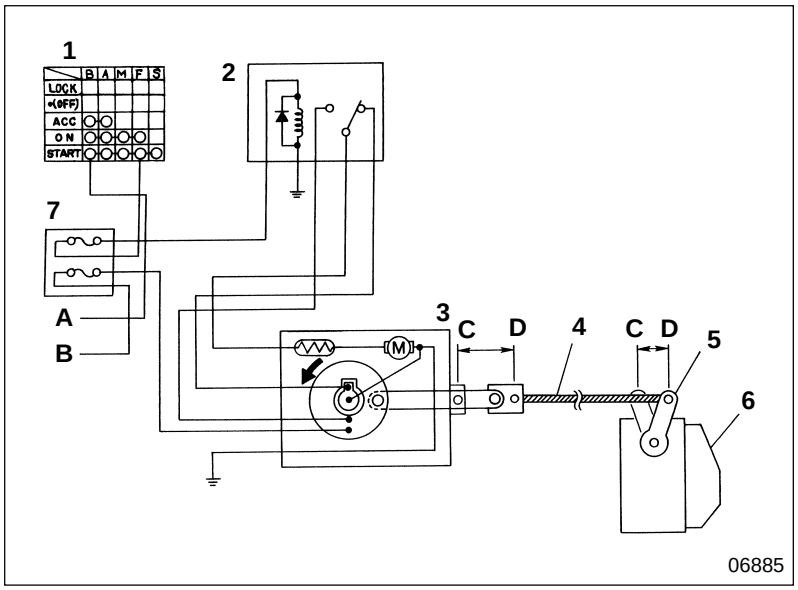
Fuel-cut motor **5** is connected to starter switch **2**, and it is activated by the starter switch being turned ON (or to S). This brings engine-stop lever **9** of the governor to engine-stop position **B** (or engine start-up position **C**), and stops (or starts) the engine. P13-6

(3) Accelerator pedal

When accelerator pedal assembly **4** is freed from foot pressure, the governor return spring forces idling control lever **10** to idling position **E**, restoring the pedal to its original position.

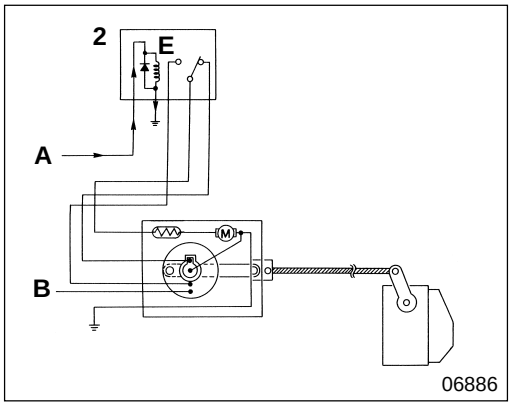
https://truckmanualshub.com/

Engine Stopping Circuit



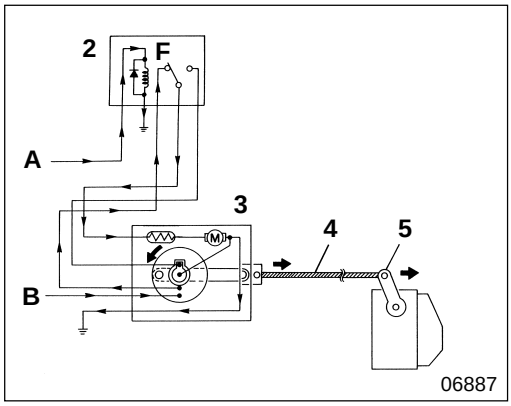
1 Starter switch
2 Fuel-cut relay
3 Fuel-cut motor
4 Engine-stop cable
5 Engine-stop lever
6 Governor
7 Fuse box

A : Power source
B : Power source
C : Engine-stop position
D : Engine start-up position



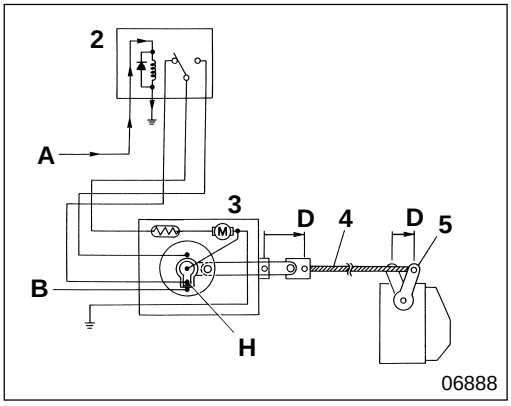
● **At engine start-up (starter switch ON)**

- Electric current flows as illustrated, and coil **E** of fuel-cut relay **2** is magnetized.

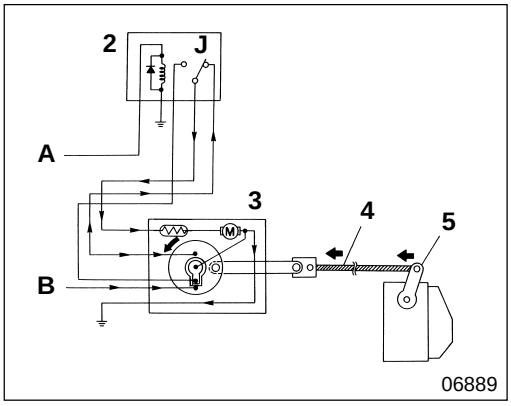


- Contact point **F** of fuel-cut relay **2** closes, and fuel-cut motor **3** is activated.
- Engine-stop cable **4** is pushed out, and engine-stop lever **5** moves to engine start-up position.

https://truckmanualshub.com/

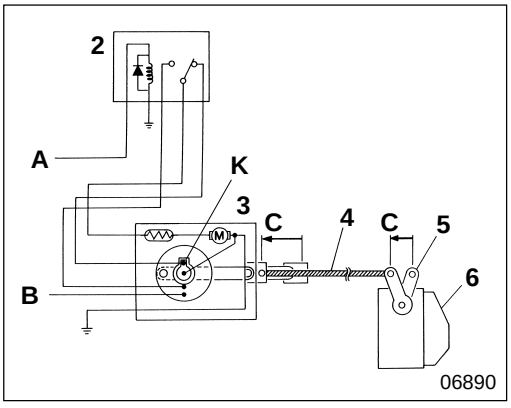


- Engine-stop lever **5** moves to engine start-up position **D**, and fuel is ready to flow. Contact point **H** of fuel-cut motor **3** opens, and the fuel-cut motor stops.



● **When engine is at standstill (starter switch OFF)**

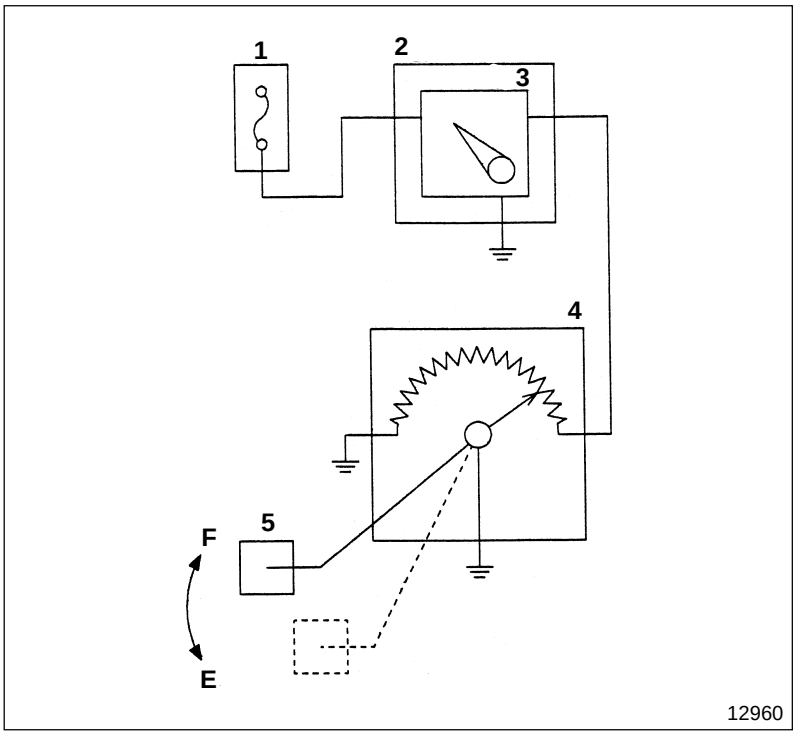
- Electric current from the starter switch is broken, and contact point **J** of fuel-cut relay **2** closes, and fuel-cut motor **3** is activated.
- Engine-stop cable **4** is pulled to bring engine-stop lever **5** to engine-stop position.



- When engine-stop lever **5** reaches engine-stop position **C**, fuel flow stops and the engine stops. Simultaneously, contact point **K** of fuel-cut motor **3** opens, and the fuel-cut motor stops.

https://truckmanualshub.com/

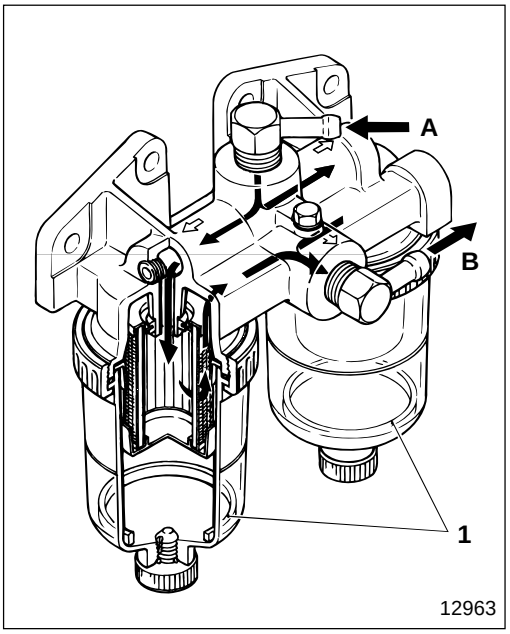
Fuel Gauge Electric Circuit



1 Relay and fuse box
2 Meter cluster
3 Fuel gauge
4 Fuel gauge unit
5 Float

The fuel gauge circuit indicates the amount of fuel remaining by means of a gauge.

Water Separator



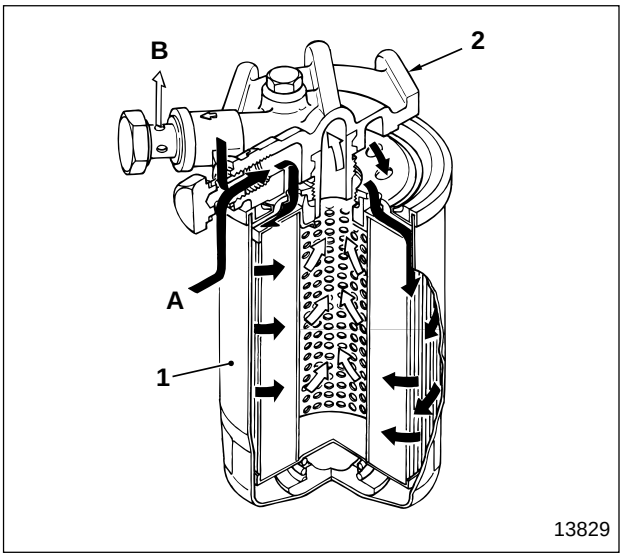
1 Water level ring

A : From fuel tank
B : To feed pump

The water separator is installed between the fuel tank and the feed pump. Any water present in the fuel is separated by the baffle plate and the screen assembly.

https://truckmanualshub.com/

Fuel Filter



1 Fuel filter
2 Fuel filter head

A : From feed pump
B : To injection pump

Pressurized fuel is delivered from the feed pump of the injection pump to the fuel filter which separates water from the fuel. Dirt and other foreign particles are removed from the fuel by fuel filter **1**.

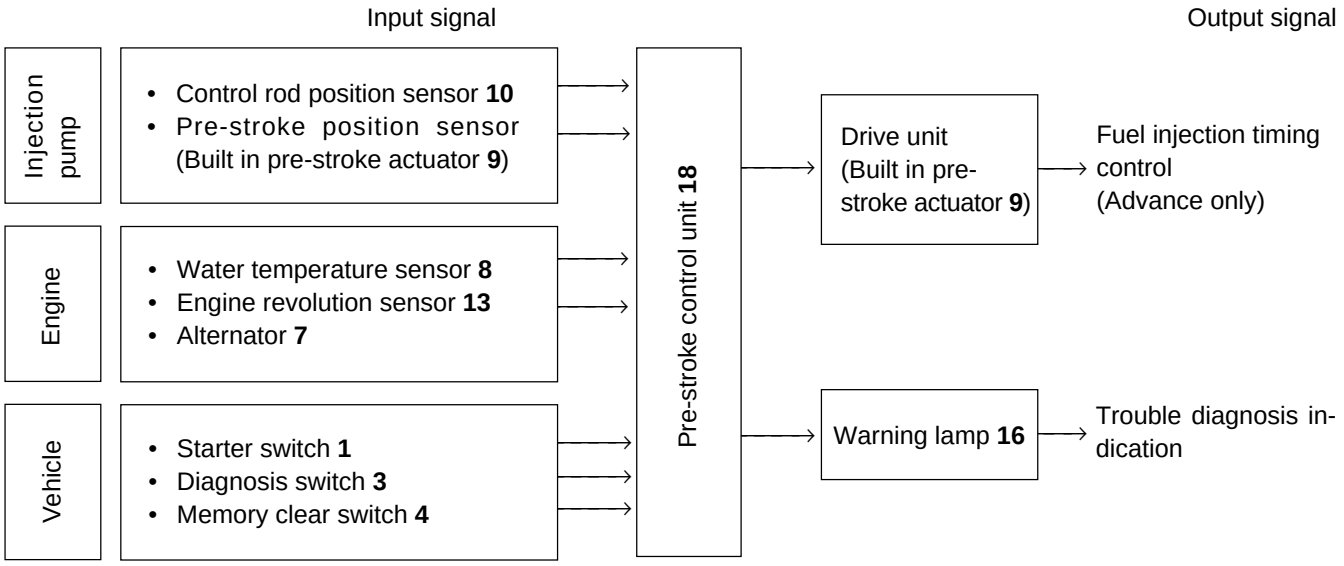
18 Pre-stroke control unit	Control of entire system	

https://truckmanualshub.com/

- The pre-stroke control injection pump system uses, in the injection pump body, electronically controlled pre-stroke control injection pump **12**, mechanical governor **11**, and mechanical timer **14**.
- The lifting speed of the plunger in the injection pump varies with the engine revolution. Because of this, the pressure in the injection pipe also changes.
- This change of pressure in the injection pipe means the appropriate state of fuel injection and air/fuel mixture from the injection nozzle is no longer obtainable.
- In low- and medium-range engine revolution, the amount of pre-stroke is made larger so that the fuel is injected at the point the plunger lifting speed increases during the second half of cam lift. 🕮 P13-18
- On the other hand, in high-range engine revolution, the amount of pre-stroke is made smaller so that the fuel is injected while the plunger lifting speed remains low during the first half of cam lift. This prevents the pressure in the injection pipe from becoming excessively high.
- Because of this variation in the amount of pre-stroke, pre-stroke control injection pump **12** can obtain the appropriate injection state and air/fuel mixture for combustion.
- Thus, engine torque is larger than engines that use a normal injection pump. Also, the exhaust gas emission is cleaner.
- Control is achieved by making the pre-stroke adjustable in conjunction with the drive of pre-stroke actuator **9**, which is mounted on the rear of the injection pump body. This pre-stroke actuator is activated by commands received from pre-stroke control unit **18**, which processes data signals received from the various sensors installed on the engine and vehicle body.
  This system also has a trouble diagnosis function and a fail-safe function. The following table shows control items.

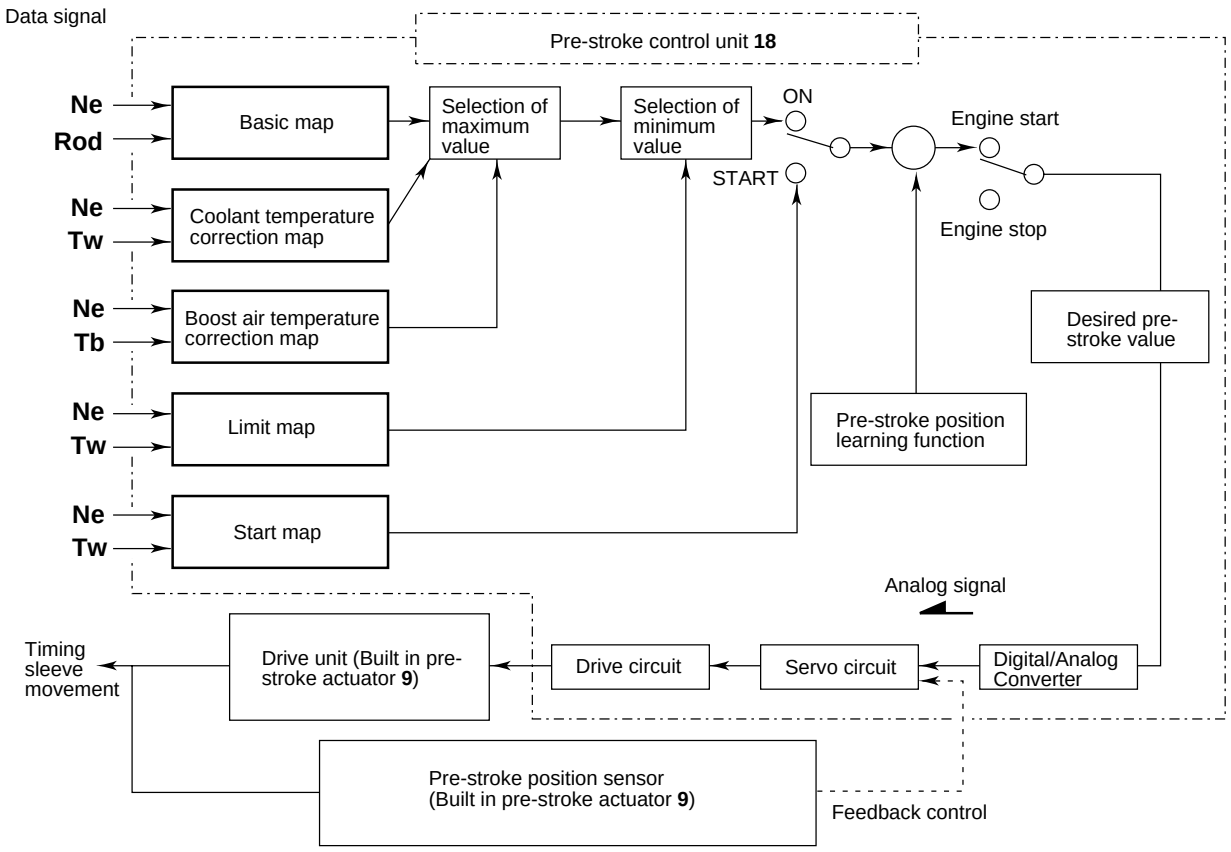
Control item	Control description	Information source	
		Sensor	Data signal
Pre-stroke control	Adjusts the fuel injection timing by changing the timing sleeve position to change the pre-stroke	6 to 10, 13	Ⓐ to Ⓗ
Trouble diagnosis function	Checks and diagnoses the status of the sensors of the pre-stroke control injection pump system while the engine is running. Warns the driver, via warning lamp **16**, if any trouble occurs, and memorizes the data on the trouble 🕮 P13-13	ALL	ALL
Fail-safe function	When trouble occurs, backup mode is activated and countermeasures for the trouble are taken 🕮 P13-13	ALL	ALL
* Fuel injection quantity control	Controlled by mechanical governor **11** 🕮 P13-20	—	—
* Fuel injection timing control (retard)	Controlled by mechanical timer **14** 🕮 P13-22	—	—

* : This is not controlled by the pre-stroke control injection pump system but by ordinary mechanical control.



https://truckmanualshub.com/

● Pre-stroke control



Ne : Engine revolution **Rod** : Control rod position
Tw : Engine coolant temperature **Tb** : Engine intake air temperature
Digital/Analog converter : Converts digital signals into analog signals

Control by Pre-stroke Control Unit 18

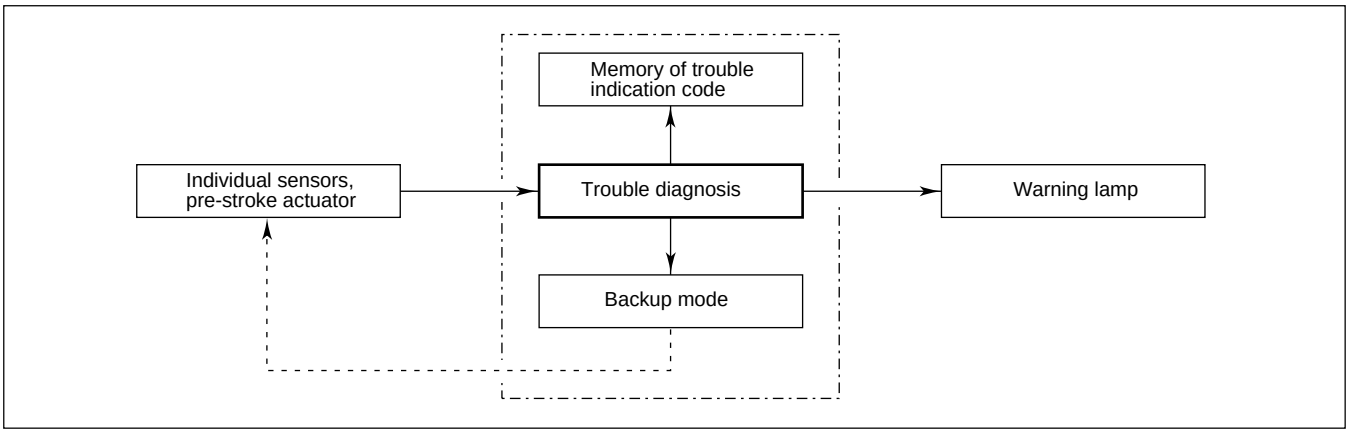
- The control unit commands the system while the engine is running, and selects the maximum value of the desired pre-stroke value based on data signals received from the basic map, coolant temperature correction map, and boost air temperature correction map.
- After the maximum value has been selected, the limit map selects and processes the minimum value so that the desired pre-stroke value does not exceed the maximum value.
- The desired pre-stroke value is further determined by the pre-stroke position learning function. This corrects any deviation in positional adjustment by the pre-stroke position sensor and any deviation by the injection pump, correcting the output voltage of the pre-stroke position sensor.
- The pre-stroke thus determined is converted into continuous analog signals by the Digital/Analog converter and transmitted through the servo circuit and drive circuit to actuate the drive unit. The drive unit moves the timing sleeve position to change the pre-stroke.
- Control at the time of engine start up is handled by the start map.

Control by Pre-stroke Position Sensor (built in pre-stroke actuator 9)

- The pre-stroke position sensor monitors the operating condition of the drive unit by feeding back signals to pre-stroke control unit **18** and judging whether the pre-stroke is controlled in accordance with the desired value by noting the timing sleeve position.
- When pre-stroke control unit **18** receives the feedback signals, it computes the actual measured value of the timing sleeve position, and if there is any difference between the desired and actual values, it issues a correction command.
- This operation is repeated to constantly maintain the timing sleeve position at the desired position, thus determining the final pre-stroke.

https://truckmanualshub.com/

● Trouble diagnosis function, fail-safe function



- The trouble diagnosis function detects and diagnoses troubles reported by the various sensors and the pre-stroke actuator, while the engine is running. If any trouble occurs, this function warns the driver by lighting warning lamp and at the same time stores the trouble point in memory as a diagnosis code.
- The fail-safe function is put into operation simultaneously and the trouble is treated accordingly in the backup mode.
- In the backup mode, the pre-stroke control starts when trouble occurs. If the trouble does not affect the operation of the engine, fixed data from the backup mode is used to treat the trouble. If the trouble dangerously affects the operation of the engine, the pre-stroke control stops.
- If the function goes into backup mode, the function stays in that mode until the starter switch is set to LOCK. When a normal signal is returned, control of the system returns and warning lamp goes off.
- There are two kinds of diagnosis code, current and previous.
  - Current diagnosis code : Indicates data when the engine has been running with the starter switch set to ON since the abnormality occurred.
  - Previous diagnosis code : Indicates previous data when the engine was stopped with the starter switch set to ACC or LOCK after the abnormality occurred.

Table of diagnosis codes

Diagnosis code	Abnormal item	Countermeasures taken by pre-stroke control unit (Backup mode)
01	Normal	—
03	Pre-stroke learning function	Controls with correction value assumed to be 0
04	Pre-stroke actuator power source	Stoppage of pre-stroke control
05	Engine revolution sensor (No pulse)	Controls with engine revolution assumed to be 0
12	Pre-stroke servo system	Stoppage of pre-stroke control
13	Pre-stroke position sensor	Stoppage of pre-stroke control
15	Engine revolution sensor (Wiring breakage)	Controls with engine revolution assumed to be 0
21	Water temperature sensor	Controls with water temperature assumed to be 80˚C {176˚F}
22	Control rod position sensor	Controls with control rod position assumed to be full load
41	Boost air temperature sensor	Controls with boost air temperature assumed to be 80˚C {176˚F}

It is possible to run the vehicle even if the pre-stroke control develops an abnormality. However, do not run the vehicle for a long period of time, run it only for the time necessary to obtain repairs.

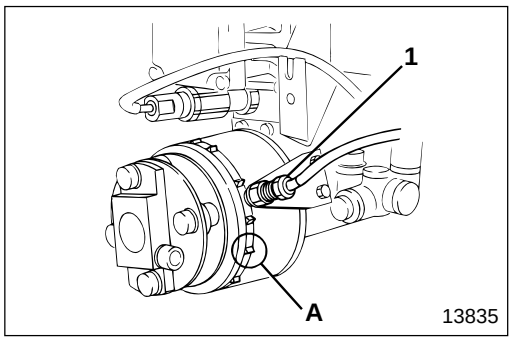
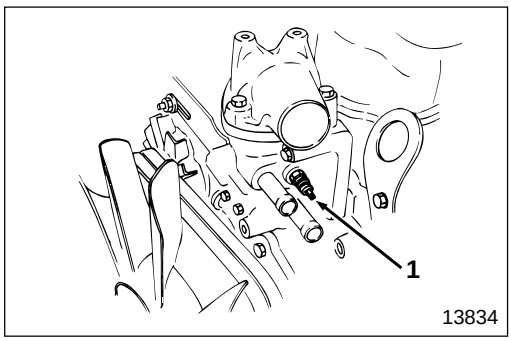
Engine Revolution Sensor



- Engine revolution sensor **1** is a pick-up type that detects the revolution of the injection pump and converts the revolution value into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the engine revolution signal, which is used as the correction value by the control unit to determine the desired pre-stroke position value.

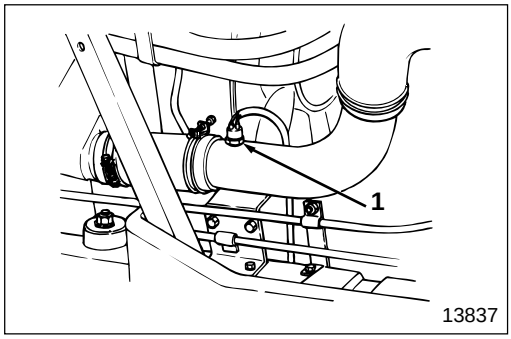
  A : Timer housing protrusion

Water Temperature Sensor



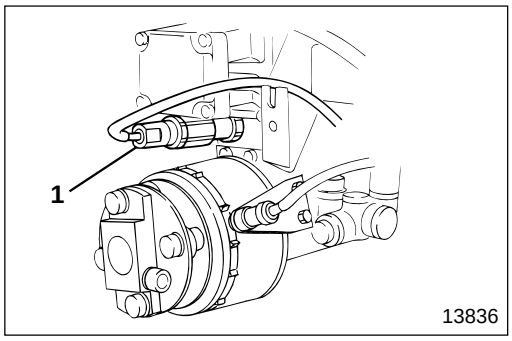
- Water temperature sensor **1** is a thermistor type that converts the coolant temperature into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the engine coolant temperature signal, which is used as the correction value by the control unit to determine the desired pre-stroke position value.

Boost Air Temperature Sensor



- Boost air temperature sensor **1** is a thermistor type that converts the intake air temperature, immediately after its passage through the intercooler, into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the boost air temperature signal, which is used as the correction value by the control unit to determine the desired pre-stroke position value.

Control Rod Position Sensor



- Control rod position sensor **1** is a resistor type that converts the amount of movement of the control rod into an electric signal.
- This electric signal is transmitted to the pre-stroke control unit as the control rod position signal, which is used as the correction value by the control unit to determine the desired pre-stroke position value.

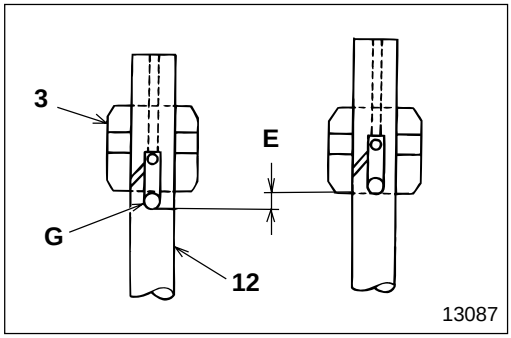
16 Pre-stroke actuator
17 Drive unit
18 Pre-stroke position sensor

A : Control rod position sensor P13-16
B : Mechanical governor P13-20
C : Engine revolution sensor P13-16
D : Mechanical timer P13-22

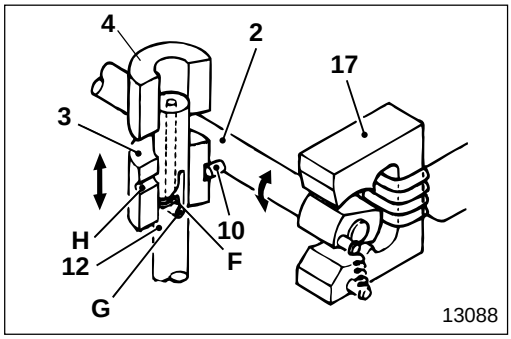
- The injection pump has a variable pre-stroke mechanism.
- Because of the variation in the amount of pre-stroke, the appropriate injection state and air/fuel mixture for combustion can be obtained, thus the engine torque is larger than when a normal injection pump is used and the exhaust gas emission is cleaner.

https://truckmanualshub.com/



Pre-stroke

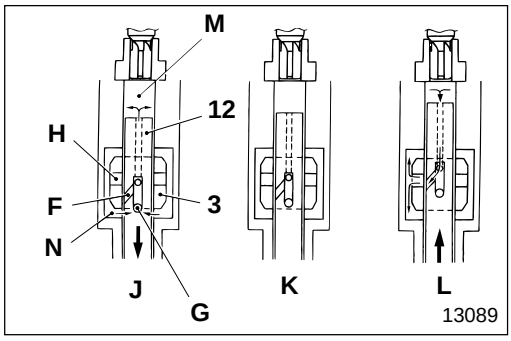
Pre-stroke is stroke **E** whose range is from the bottom dead point of plunger **12** to the starting point of pressurized delivery of fuel, at which point suction port **G** is closed by timing sleeve **3**. An ordinary injection pump has a fixed stroke length.



Pre-stroke variable mechanism

F : Indent
G : Suction port
H : Exhaust port

- In a conventional injection pump, plunger barrel **4** is fixed. In the pre-stroke control injection pump system, vertically movable timing sleeve **3** is fitted in the fixed plunger barrel.
- Timing rod **2**, pin **10** and drive unit **17** are installed to operate timing sleeve **3**.
- The operation of drive unit **17** rotates timing rod **2**, causing pin **10** to move timing sleeve **3** vertically.
- As timing sleeve **3** is fitted with fuel exhaust port **H**, the pre-stroke changes in accordance with the movement of the timing sleeve.

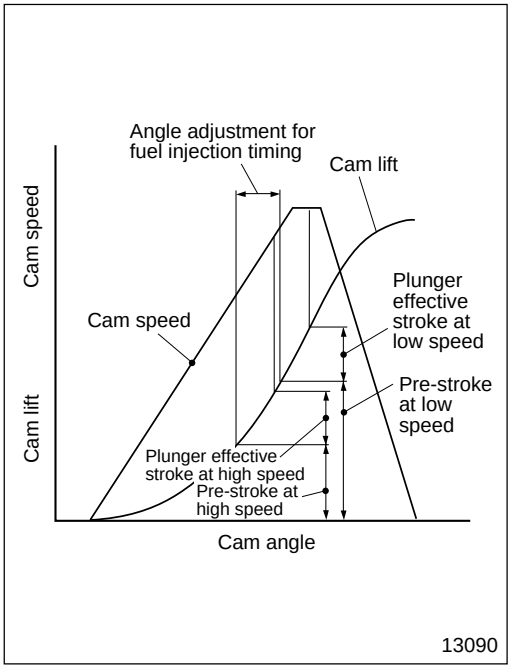


Pressurized fuel delivery

J : Ongoing suction
K : Start of pressurization
L : Delivery ends

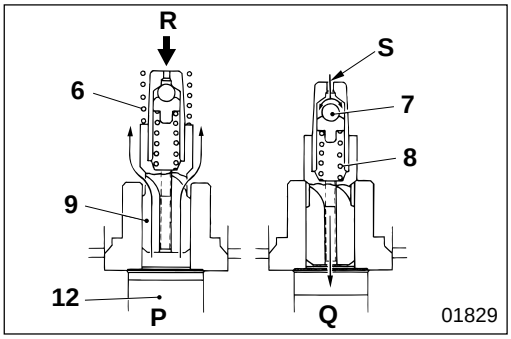
- When suction port **G** opens as plunger **12** moves down from the top dead point, fuel is delivered into pressure chamber **M** by both the negative pressure caused by the downward movement of the plunger and the pressure of the fuel itself delivered by the feed pump.
- When the lift of plunger **12** is low enough, the pressure in pressure chamber **M** does not increase as the fuel in pressure the chamber flows via suction port **G** into fuel reservoir **N**, even if the plunger lifts.
- As plunger **12** lifts further and suction port **G** is closed by timing sleeve **3**, pressurization of the fuel starts. The pressure increases as the plunger lifts further, making the injection pump start pressurized fuel delivery.
- When indent **F** on plunger **12** meets exhaust port **H** of timing sleeve **3**, the fuel in pressure chamber **M** is pushed back to fuel reservoir **N**, stopping pressurized fuel delivery.
- Adjustment of the fuel quantity to be injected is made by changing the relative meeting position of exhaust port **H** of timing sleeve **3** and indent **F**, by the rotation of plunger **12**.

https://truckmanualshub.com/



Fuel injection timing and fuel injection characteristics

- The pre-stroke changes according to changes in the position of timing sleeve **3**, whereby the fuel injection timing can be advanced or retarded.
- By making the pre-stroke smaller, suction port **G** of plunger **12** closes early, making the fuel injection timing quicker accordingly.
  Retard of fuel injection timing is not controlled by the variable pre-stroke mechanism, but by mechanical timer **D**.
- By making the pre-stroke larger, suction port **G** of plunger **12** closes late, making the fuel injection timing slower accordingly.
  The quick response of the fuel injection timing improves engine start-up performance at low temperatures.



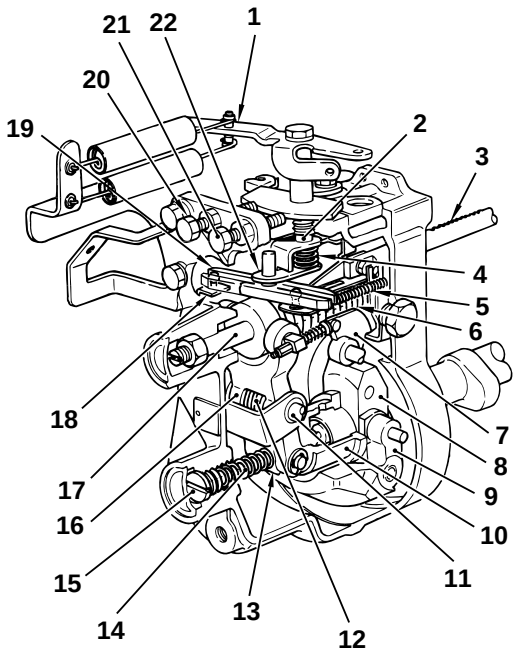
Delivery valve

P : Start of pressurized delivery
Q : End of pressurized delivery

- Delivery valve **9** keeps residual pressure **R** in the injection pipe at a certain level throughout the entire engine revolution range preventing cavitation and allowing high-pressure injection.
- When the fuel pressure on plunger **12** side, as the plunger is lifted, overcomes the combined force of residual pressure **R** in the injection pipe and the repercussive force of delivery valve spring **6** of the plunger, delivery valve **9** is pushed up and pressurized fuel delivery starts.
- Fuel in the injection pipe returns quickly to plunger **12** side the moment pressurized delivery from the plunger ends, and the delivery valve is closed.
- The excess fuel is returned slowly through orifice **S**, reducing the pressure in the injection pipe.
- When the repercussive force of spring **8** in delivery valve **9** equalizes with the pressure in the injection pipe, ball **7** closes orifice **S** and residual pressure **R** in the injection pipe is kept at a specified level.

https://truckmanualshub.com/

Governor



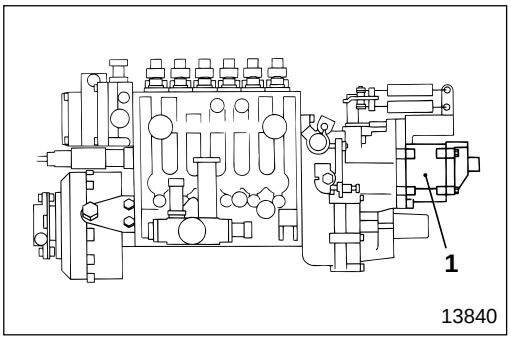
13839

1 Control lever
2 Adjusting lever shaft
3 Control rod
4 Cancel spring B
5 Start spring
6 Governor spring
7 Torque cam
8 Flyweight holder
9 Flyweight
10 Sleeve
11 Tension lever shaft
12 Cancel spring A
13 Shifter
14 Idling spring
15 Idling screw
16 Tension lever
17 Governor shaft
18 Guide lever
19 Floating lever
20 Idling set bolt
21 Full-speed set bolt
22 Supporting lever

The governor is a mechanical type that uses centrifugal force generated by flyweights **9**, its characteristics are between those of a minimum/maximum speed governor and those of an all-speed governor. Because there is no repercussive force from governor spring **6** or control lever **1**, when the accelerator pedal is depressed, the repercussive force transmitted to the accelerator pedal, via the control lever, is quite light, making accelerator pedal operation easy.

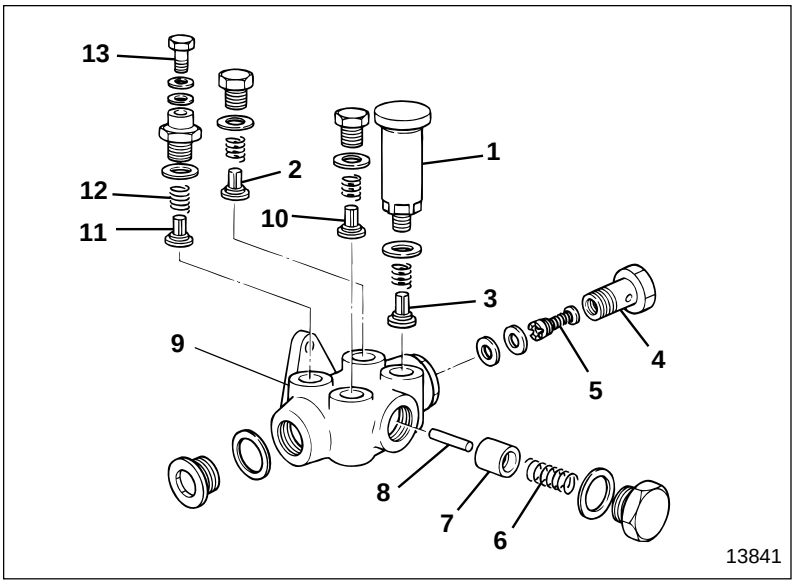
https://truckmanualshub.com/

Boost Compensator



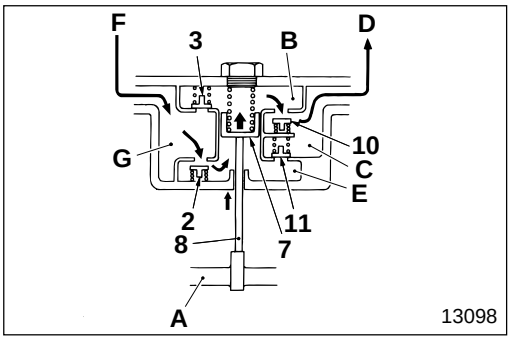
Boost compensator **1** is a device that automatically adjusts the quantity of fuel to be injected to suit the increase in the intake air mass delivered into the engine cylinders by the turbocharger.

Feed Pump



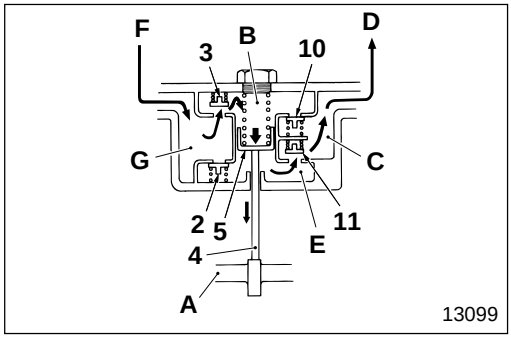
1 Priming pump
2 Check valve
3 Check valve
4 Eye bolt on fuel inlet side
5 Gauze filter
6 Piston spring
7 Piston
8 Push rod
9 Feed pump housing
10 Check valve
11 Check valve
12 Check valve spring
13 Eye bolt on fuel outlet side

- The feed pump is a double-action type pump which, with four check valves operating, sucks and discharges fuel during both strokes of pistons **7**.
- Push rod **8** makes contact with the injection pump camshaft directly, moving piston **7**.
- Priming pump **1** can be manually operated, when the injection pump is not operating, to suck up fuel and thus can be used for air bleeding.
- Gauze filter **5** eliminates large foreign particles from the fuel sucked up from the fuel tank to prevent clogging of the feed pump. This gauze filter must be cleaned with gas oil periodically.



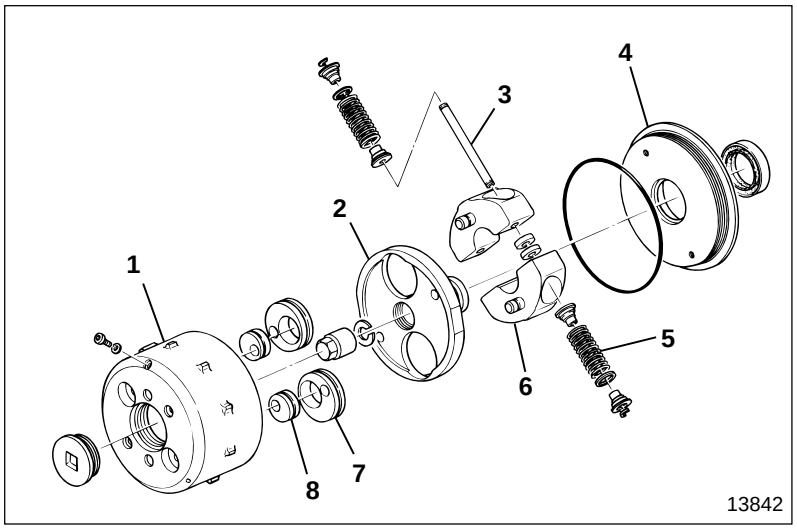
The rotation of injection pump camshaft **A**, pushes up push rod **8** and piston **7**, and the pressure in inner chamber **B** increases. This closes check valve **3**, and check valve **10** opens to let the fuel in inner chamber **B** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **E** decreases, check valve **11** closes, and check valve **2** opens to let fuel flow from fuel tank **F** through outer chamber **G** to inner chamber **E**.

https://truckmanualshub.com/



When injection pump camshaft **A** rotates further, it pushes down push rod **4** and piston **5**, and the pressure in inner chamber **E** increases. This closes check valve **2**, and check valve **11** opens to let the fuel in inner chamber **E** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **B** decreases, check valve **10** closes, and check valve **3** opens to let fuel from fuel tank **F** flow through outer chamber **G** to inner chamber **B**.

Automatic Timer

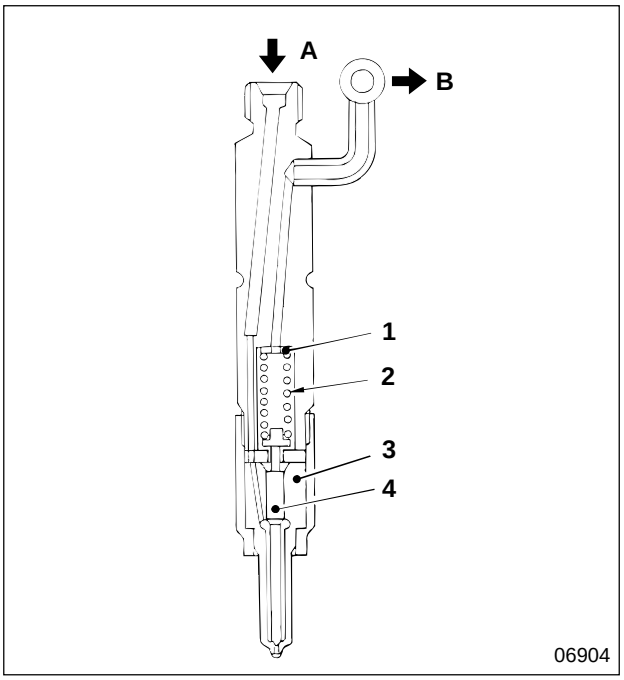


1 Timer housing
2 Timer holder
3 Pilot pin
4 Cover
5 Timer spring
6 Flyweight
7 Eccentric cam (Large)
8 Eccentric cam (Small)

- The mechanical type automatic timer changes fuel injection timing automatically when the engine revolution reaches the specified rate.
- The automatic timer controls the retard of fuel injection timing. The pre-stroke control unit controls the advance of fuel injection timing.

https://truckmanualshub.com/

Injection Nozzle



1 Washer
2 Spring
3 Nozzle tip
4 Needle valve

A : From injection pump
B : To fuel tank

- As the pressure of the fuel delivered from the injection pump overcomes the repercussive force of spring **2**, needle valve **4** is pushed up to allow the fuel to spray out the opening at the tip of the nozzle.

- Injection pressure can be adjusted by increasing or decreasing the number of washers **1**.

https://truckmanualshub.com/

TROUBLESHOOTING

Possible causes \ Symptoms		Engine does not start	Engine hard to start	Engine knocks	Engine output inconsistent	Engine output does not develop full power	Engine maximum revolution too high	Engine idling unstable	Engine starts but stalls	Engine revolution does not reach specified maximum speed	Engine does not stop	Accelerator pedal hard to depress	Fuel supply insufficient

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection and Adjustment of Fuel Injection Timing

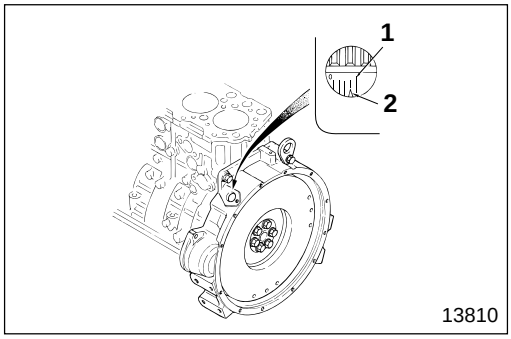
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Fuel injection timing (BTDC)	5°±0.5°	—	Adjust

Tightening torque

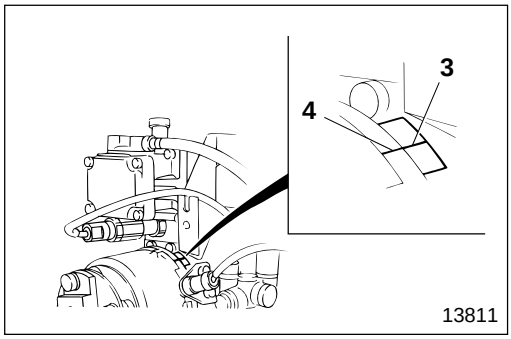
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
5	Adjusting bolt	59 to 64 {43 to 47, 6 to 6.5}	—

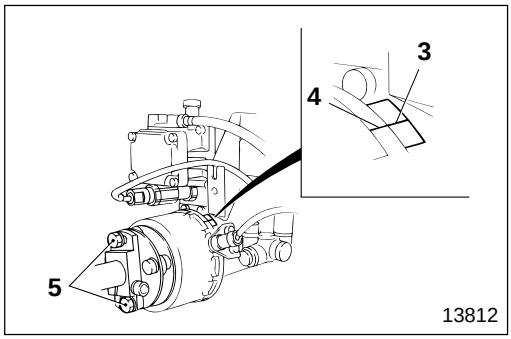


[Inspection]

- Crank the crankshaft more than 180° in the forward running direction. Check if notch **1** on the flywheel and pointer **2** on the flywheel housing show the standard fuel injection timing.



- When pointer **3** on the injection pump and notch **4** on the automatic timer align, the fuel injection timing is standard.
- If the fuel injection timing is not standard, adjust as follows.



[Adjustment]

- Loosen adjusting bolts **5** and turn the automatic timer to align pointer **3** and notch **4**.
- Tighten adjusting bolts **5** at specified torque.
- Reinspect the fuel injection timing.

CAUTION

Do not loosen any bolts other than adjusting bolts 5.

https://truckmanualshub.com/

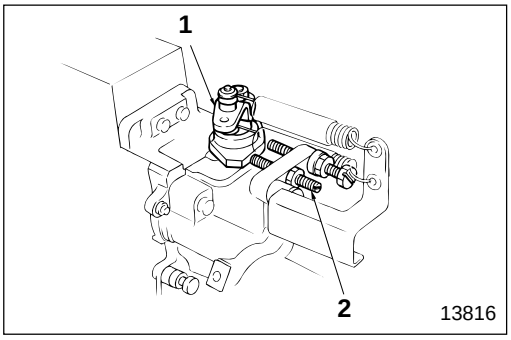
Inspection and Adjustment of No-load Minimum and Maximum Revolution

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	No-load minimum revolution (Idling revolution)	Manual transmission	650 to 700 rpm	—	Adjust
		Automatic transmission	700 to 750 rpm	—	Adjust
—	No-load maximum revolution		3650 to 3750 rpm	—	Adjust

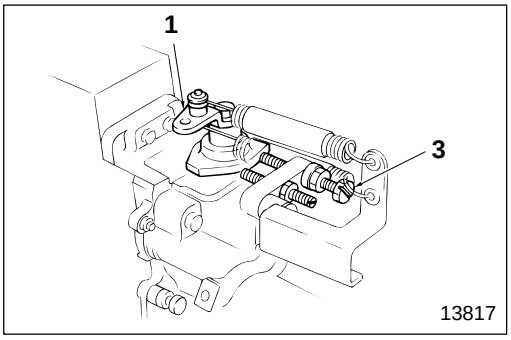
● **Before inspecting the vehicle do the following :**

- Run the engine to bring the coolant temperature up to approximately 80 to 90°C {176 to 194°F}.
- Turn all the lights and accessory equipment OFF.
- Put transmission in neutral. (For automatic transmission, put transmission in **N** range.)
- Set the steering wheel at center and straight position.



(1) No-load minimum revolution (Idling revolution)

- Make sure that control lever **1** strikes idling set bolt **2**, and in this state, check and see if the minimum revolution is within the standard value.
- If the minimum revolution deviates from the standard value, adjust using idling set bolt **2**.
- After adjustment increase the revolution from between 2800 rpm to 3400 rpm once, and check the minimum revolution.



(2) No-load maximum revolution

- Make sure that control lever **1** strikes full-speed set bolt **3**, and in this condition, check and see if the maximum revolution is within the standard value.
- If the maximum revolution deviates from the standard value, adjust using full-speed set bolt **3**.

NOTE

Ensure that the engine does not stall or hunt when control lever 1 is moved from the full-speed position to the idling position quickly. If performance is faulty, adjust it to within standard values.

https://truckmanualshub.com/

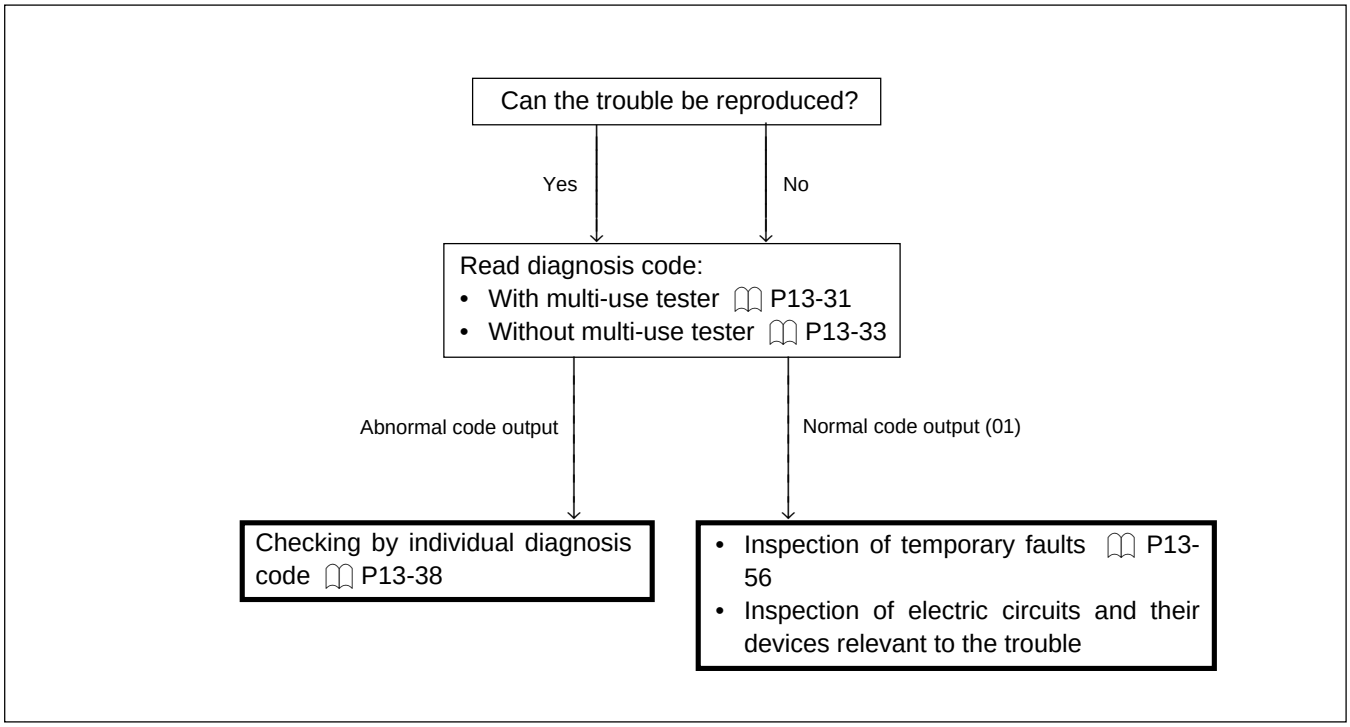
PRE-STROKE CONTROL INJECTION PUMP SYSTEM

Troubleshooting Procedure

The pre-stroke control type injection pump system has a trouble diagnosis function, this function is used for troubleshooting.

This means you have to read the diagnosis code memorized in the pre-stroke control unit, and carry out an inspection based on this code. There are two ways of reading the code; with a multi-use tester, and without a multi-use tester.

In the case of trouble that does not have a diagnosis code, the normal 01 code is indicated, and it is necessary to carry out a check depending on the situation. In this case, inspect the electric circuits and their relative devices.



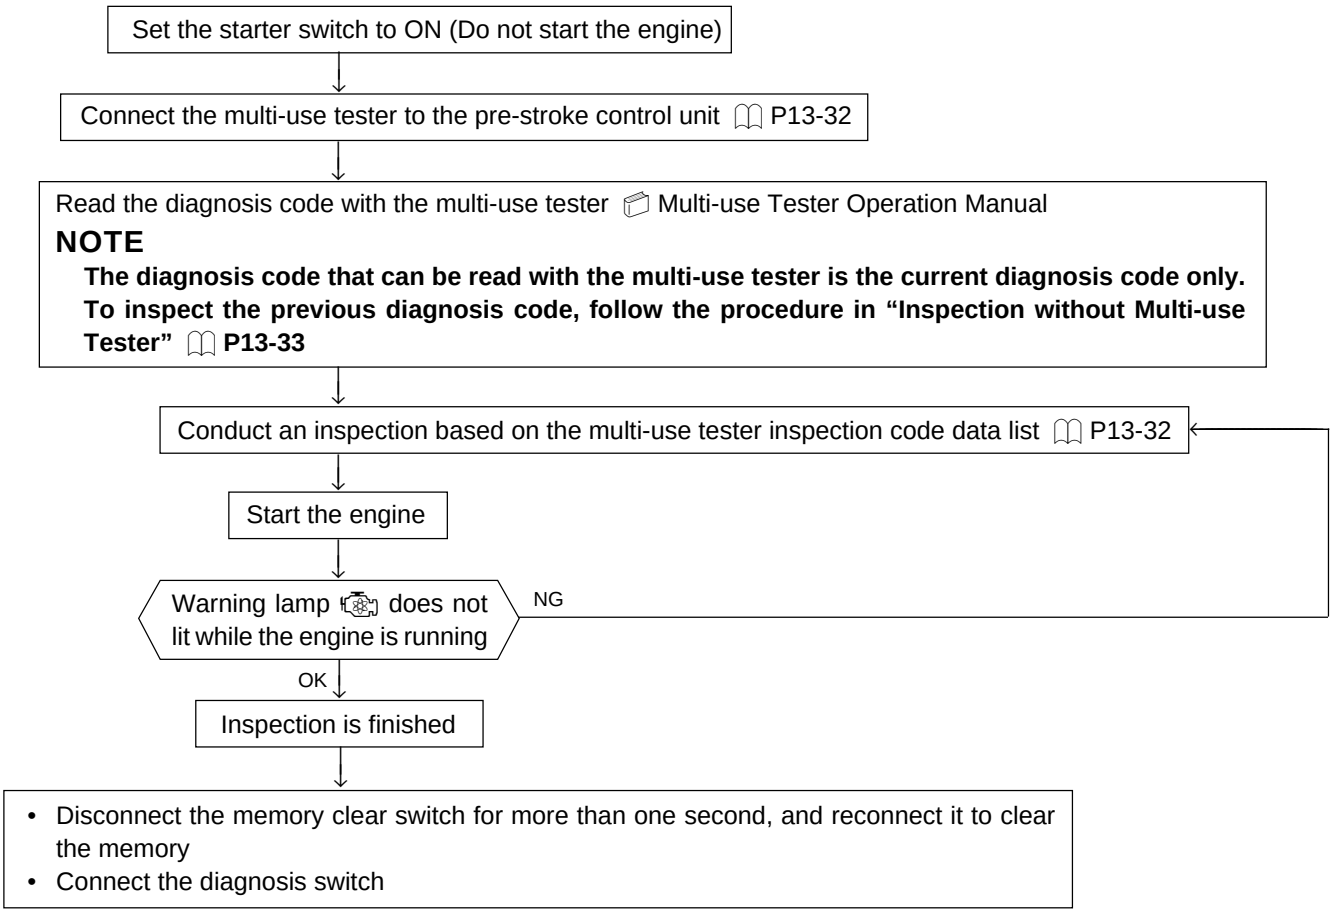
https://truckmanualshub.com/

● Inspection with multi-use tester

Special tools

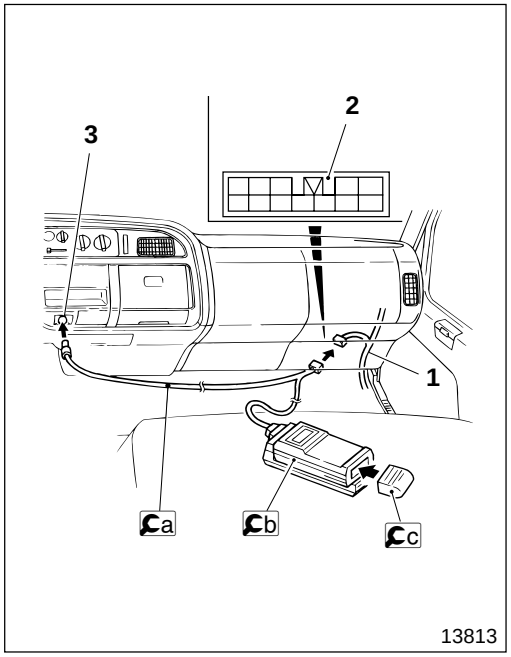
Tool name and shape	Part No.	Application
Multi-use tester sub-assembly  02803	MC858999	Inspection of system
Multi-use tester harness  02804	MB991231	
ROM pack  02805	MC858989	

● Inspection flow chart



https://truckmanualshub.com/

PRE-STROKE CONTROL INJECTION PUMP SYSTEM



● **Connection of Multi-use Tester to Pre-Stroke Control Unit**

- Set the starter switch to LOCK.
- Connect a multi-use tester harness to multi-use tester connector **2** of cab harness **1** and to cigarette lighter socket **3**.
- Connect a multi-use tester harness to b multi-use tester sub-assembly.
- Connect c ROM pack to b multi-use tester sub-assembly.

NOTE

Refer to the Multi-use Tester Operation Manual for details regarding the operation of the multi-use tester.

● **Inspection with Multi-use Tester**

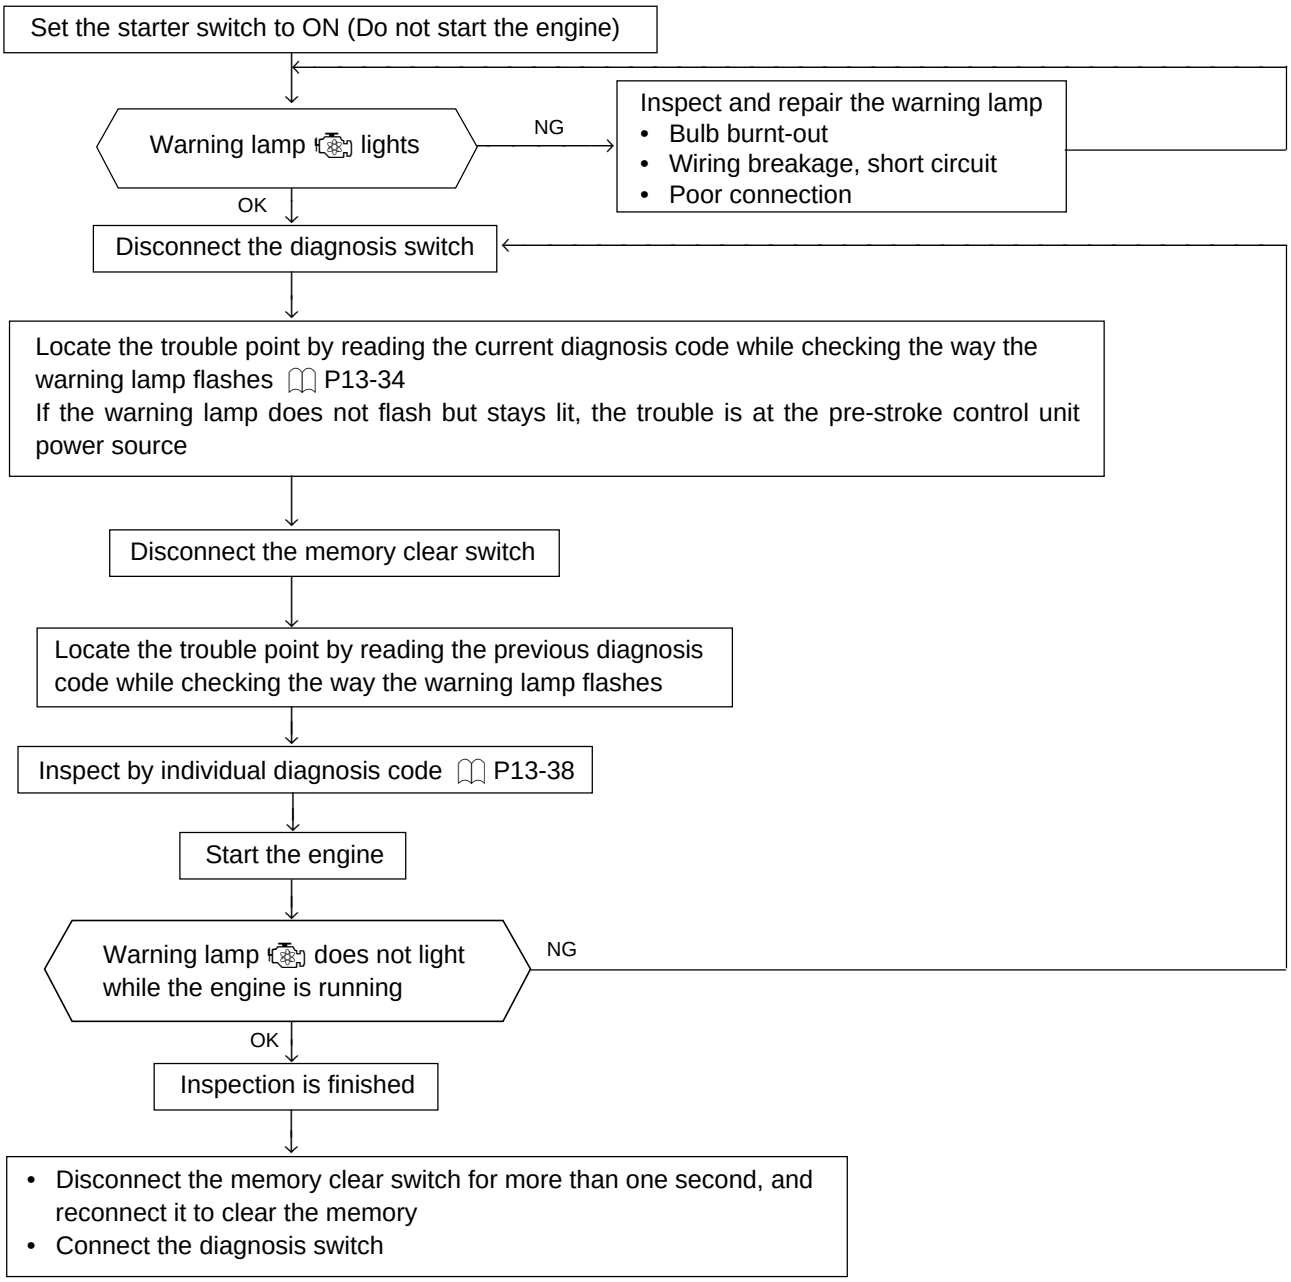
Inspection using service data is possible as well as by diagnosis code indication (self-diagnosis) using the multi-use tester. This enables you to compare the indicated figures (service data) that represent the data signals from the various sensors on the vehicle with the judgement standards, and judge whether they are good or bad. The service data code is indicated as well as the diagnosis code.

Self-diagnosis			Inspection using Service Data				
Indicated on multi-use tester			Indicated on multi-use tester			Inspection procedure	
Diagnosis code	Trouble item (Inspected instrument)	Inspection procedure	Service data code	Data signal name	Service data	Condition at inspection	Judgement standard
03	PS OFFSET	🕮 P13-38	—				
04	PS VOLTAGE		—				
05	NE NO PULS		—				
12	PS SERVO		12	PS ANG DIFF	■■.■■ deg	Engine running	Within ±5.5 deg
13	PS SNSR		—			400<Ne≦2000 Ne : Engine revolution	Within ±2°CA
15	NE SNSR		15	ENGINE SPEED	■■ rpm	Racing	Synchronization with tachometer
—			16	CTRL ROD ADJ	■■ V	Starter switch set to ON	Within ±0.04 V
21	WTR TEMP SNSR		21	WATER TEMP	■■ °F	While engine is cool While engine is warmed up Engine is stopped after warming up	Equivalent to ambient temperature Gradually rising temperature Gradual falling temperature
22	CTRL ROD SNSR		22	CTRL ROD VOLT	■■ V	Engine running	3 V or less
41	BST TEMP SNSR		41	BOOST TEMP	■■ °F	At high idling	4.9 V or less

https://truckmanualshub.com/

● Inspection without multi-use tester

● Inspection flow chart



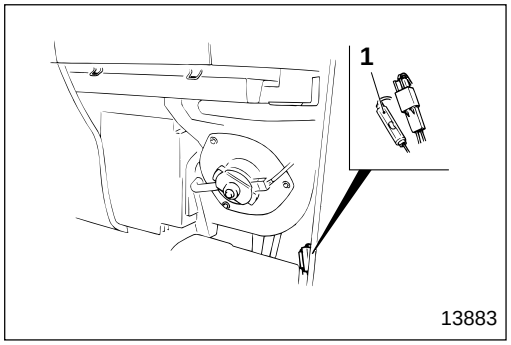
https://truckmanualshub.com/

PRE-STROKE CONTROL INJECTION PUMP SYSTEM

● **Reading of Diagnosis Code with Warning Lamp**

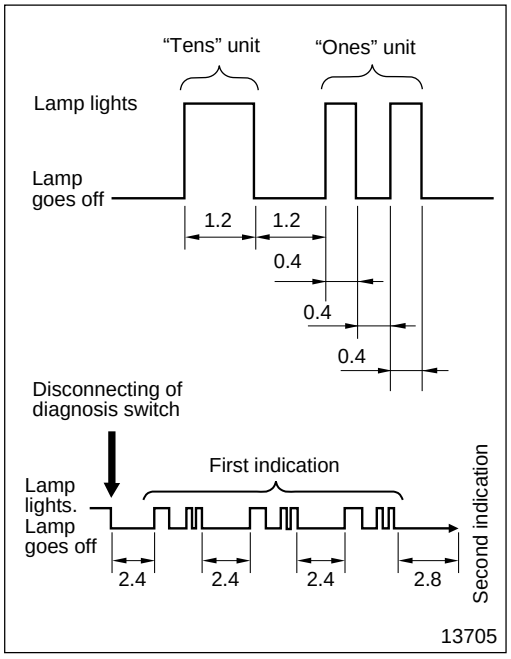
CAUTION

- **Make sure you read the current diagnosis codes first, then read the previous diagnosis codes.**
- **You must take care not to disconnect memory clear switch 2 (1-pin connector) before removing diagnosis switch 1 (1-pin connector without locking device) because this would make it impossible for the system to indicate the current diagnosis code.**
- **Note that if memory clear switch 2 is reconnected after being disconnected, it will clear all the diagnosis codes.**



Current diagnosis code

- When diagnosis switch **1** is disconnected, the pre-stroke control unit starts diagnosis of the trouble and indicates the current diagnosis codes by flashing warning lamp within the meter cluster.



- The diagnosis codes are read by the number of flashes and the duration of flashes of warning lamp.
  - The flash duration differs for the "tens" unit and the "ones" unit.
    "Tens" unit : Every 1.2 seconds
    "Ones" unit : Every 0.4 seconds
  - The number of flashes indicates the numeral for each unit.
  - The diagnosis code indication shows the "tens" unit first, then the "ones" unit. However, when the "tens" unit begins with a zero, only the "ones" unit is shown.
- A diagnosis code is shown by the repetition of three consecutive indications. After the code indication, if another code does not exist, the indication returns to the first code and is again shown three times.
- When diagnosis switch **1** is connected, the pre-stroke control unit immediately terminates code indication.

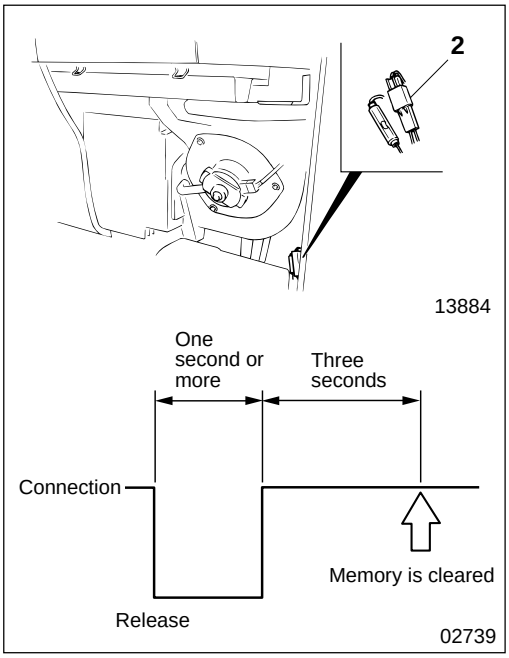
Previous diagnosis code

After reading the current diagnosis codes (with diagnosis switch **1** disconnected), disconnect memory clear switch **2**. Warning lamp starts flashing again. This flashing indicates the previous diagnosis codes, and by interpreting these codes, the location of the trouble is determined.

https://truckmanualshub.com/

Diagnosis code	Warning lamp flashing pattern
01 (Normal)	
03 (Pre-stroke learning faulty)	
04 (Pre-stroke actuator power source faulty)	
05 (Engine revolution sensor no pulse faulty)	
12 (Pre-stroke servo system faulty)	
13 (Pre-stroke position sensor faulty)	
15 (Engine revolution sensor wiring breakage faulty)	
21 (Water temperature sensor faulty)	
22 (Control rod position sensor faulty)	
41 (Boost air temperature sensor faulty)	

13970



Clearing diagnosis codes

By disconnecting memory clear switch **2** once and reconnecting it, all the diagnosis codes memorized in the pre-stroke control unit are cleared.

CAUTION

Clearing of diagnosis codes must be done using memory clear switch 2.

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1	Resistance value of engine revolution sensor (at 25˚C {77˚F})  14013	①–②	2.3±0.2 kΩ	—	Replace
	Clearance between engine revolution sensor and timer housing protrusion		0.5 to 2.0 {0.02 to 0.079}	—	Adjust

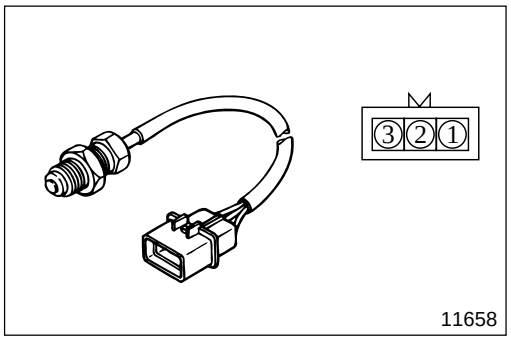
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Lock nut of engine revolution sensor	24 to 35 {17 to 26, 2.4 to 3.6}	—

https://truckmanualshub.com/

◆ Service procedure



1 Engine revolution sensor

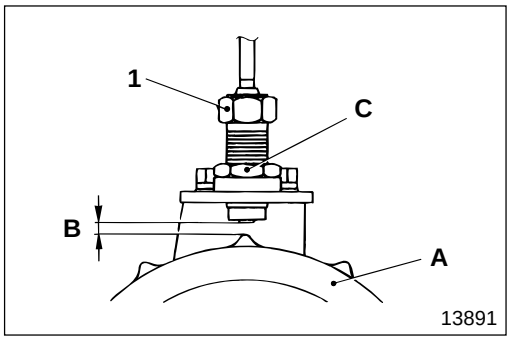
[Inspection]

(1) Sensor body

- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace engine revolution sensor **1**.

CAUTION

Be sure to adjust the clearance between engine revolution sensor 1 and the protrusion on the timer housing after replacing the engine revolution sensor.



(2) Clearance to protrusion

If clearance **B** between engine revolution sensor **1** and protrusion **A** on the timer housing deviates from the standard value, adjust the clearance as follows.

[Adjustment]

- Loosen lock nut **C** and rotate engine revolution sensor **1** to adjust.
- After adjustment, fix by tightening lock nut **C** at specified torque.

NOTE

If the clearance between engine revolution sensor 1 and protrusion A on the timer housing is too large, the signal might not be output. If the clearance is too small, the engine revolution sensor might hit the protrusion.

Location	Maintenance item		Standard value	Limit	Remedy
1	Resistance value of pre-stroke actuator (at connector point)  13714	②-③	5.5 to 6.1 Ω	—	Replace (to be carried out by a ZEXEL service station)
		①-③	11.0 to 12.2 Ω	—	
		①-②	5.5 to 6.1 Ω	—	
		④-⑤	1.0 to 1.3 Ω	—	
	Resistance value of pre-stroke actuator (Actuator body)  13789	ⒶⒸ	11.0 to 12.2 Ω	—	Replace (to be carried out by a ZEXEL service station)
		ⒷⒸ	5.5 to 6.1 Ω	—	
		ⒶⒷ	5.5 to 6.1 Ω	—	
		ⒹⒺ	1.0 to 1.3 Ω	—	

https://truckmanualshub.com/

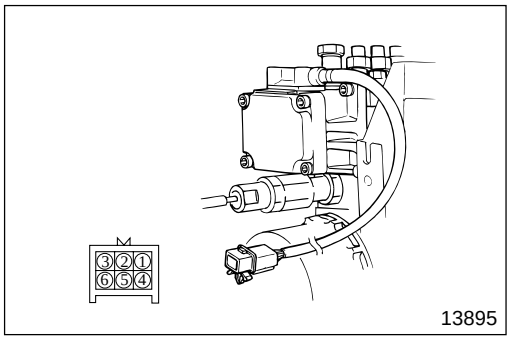
◆ Service procedure

1 Inspection of pre-stroke actuator

Inspect the following points and if any fault is found, have the unit inspected and repaired by a ZEXEL service station.

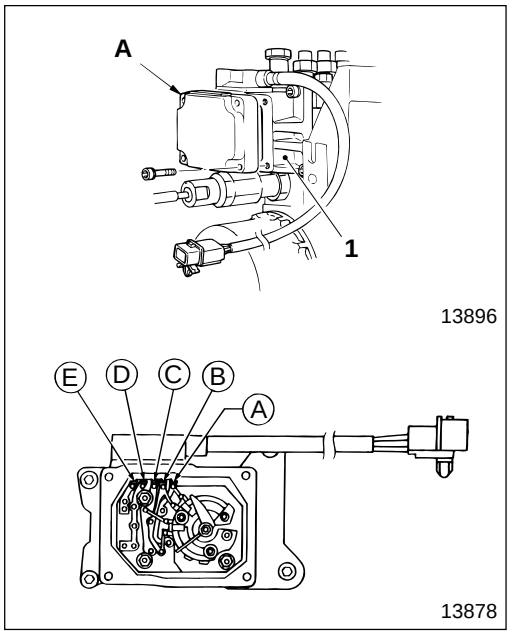
NOTE

Inspection of pre-stroke actuator 1 must be carried out when the engine is cold.



(1) Inspection at connector point

- Measure resistance between terminals ②-③, ①-③, ①-② and ④-⑤.



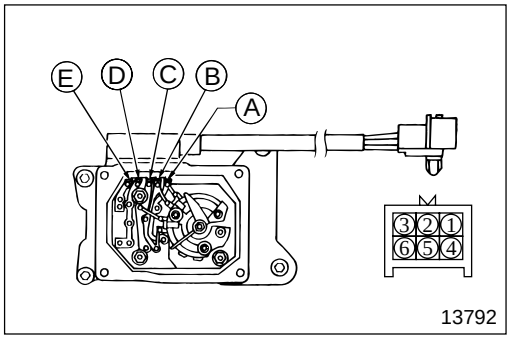
(2) Inspection of pre-stroke actuator body

- Remove cover **A** from pre-stroke actuator **1**.

CAUTION ⚠

- **Remove only cover A from pre-stroke actuator 1, never remove the actuator body itself. If the actuator is removed, it requires special tools to replace and adjust it.**
- **When removing cover A, do not exert excessive force on pre-stroke actuator 1 with your hands or by treading on it, etc.**

- Measure resistance between terminals Ⓐ-Ⓒ, Ⓑ-Ⓒ, Ⓐ-Ⓑ and Ⓓ-Ⓔ.

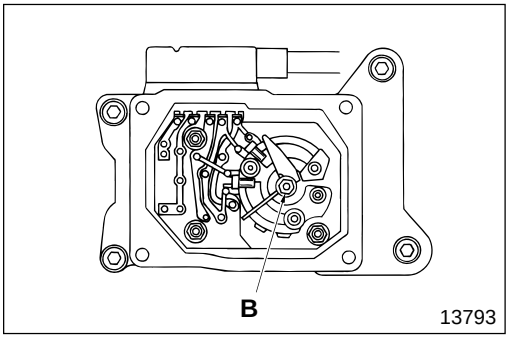


(3) Inspection of continuity between pre-stroke actuator and connector

Make sure that continuity exists between terminals as listed in the table below.

Connector terminal	Pre-stroke actuator body	Application
④	Ⓓ	Pre-stroke actuator driving power source ⊖
⑤	Ⓔ	Pre-stroke actuator driving power source ⊕
⑥	GND	Shield
①	Ⓒ	Pre-stroke position sensor (GND)
②	Ⓑ	Pre-stroke position sensor (MDL)
③	Ⓐ	Pre-stroke position sensor (OSC)

https://truckmanualshub.com/



(4) Inspection of copper plate mounting nut

Check that copper plate mounting nut **B** was not loosened when the cover of pre-stroke actuator **1** was removed.
If nut **B** is loose, tighten it.

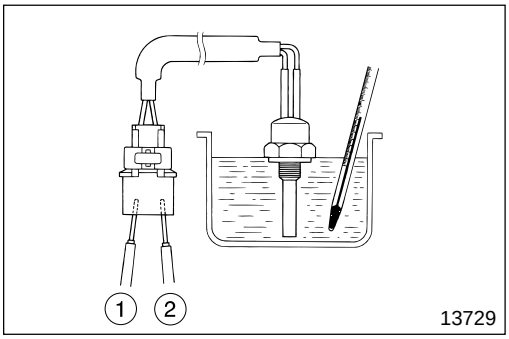
1 Boost air temperature sensor
2 Pre-stroke control unit

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
1	Resistance value of boost air temperature sensor	0˚C {32˚F}	5880±588 Ω	—	Replace
		20˚C {68˚F}	2455±245 Ω	—	Replace
		80˚C {176˚F}	322±32 Ω	—	Replace



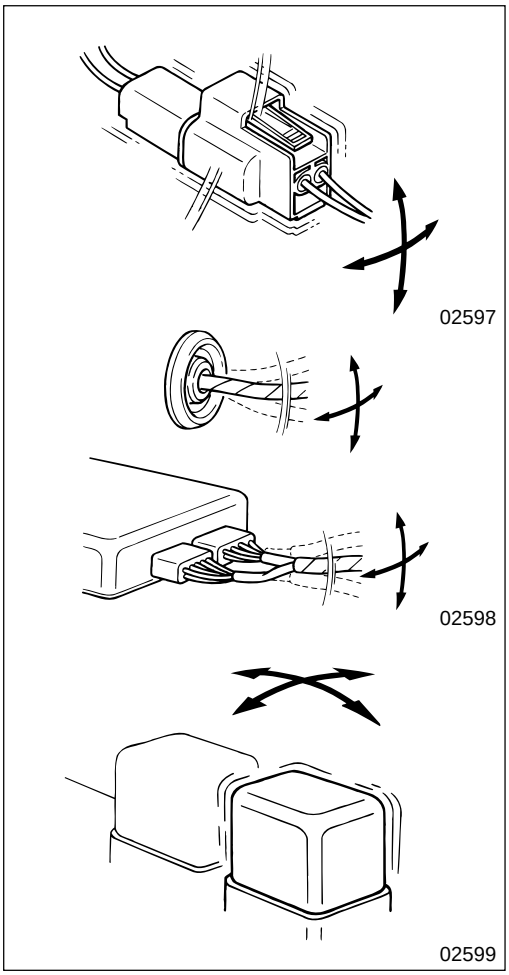
◆ Service procedure

1 **Inspection of boost air temperature sensor**

- Place boost air temperature sensor **1** in rape seed oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace boost air temperature sensor **1**. Gr 15

https://truckmanualshub.com/

Inspection of Temporary Faults



Temporary faults often occur under certain conditions. So identifying those conditions helps to find possible causes. To find the conditions under which temporary faults occurred, you need to reproduce the faults after interviewing customers in detail about actual driving conditions, weather, frequency of occurence and fault phenomena.
Then determine if the faults were caused by vibration, temperature or other possible elements depending on the actual conditions identified. If vibration is suspected as a possible cause, inspect individual connectors as follows to check if the fault will occur:

- Shake the connector gently in all four directions of the arrows as illustrated.
- Shake the wiring harness gently in all four directions of the arrows as illustrated.
- Wiggle each sensor or piece of equipment by hand.
- Gently shake the wiring harnesses near movable parts such as suspensions.

The inspection subjects include possible causes related to the diagnosis code outputs and faults, as well as the connectors and other parts in the inspection procedure.

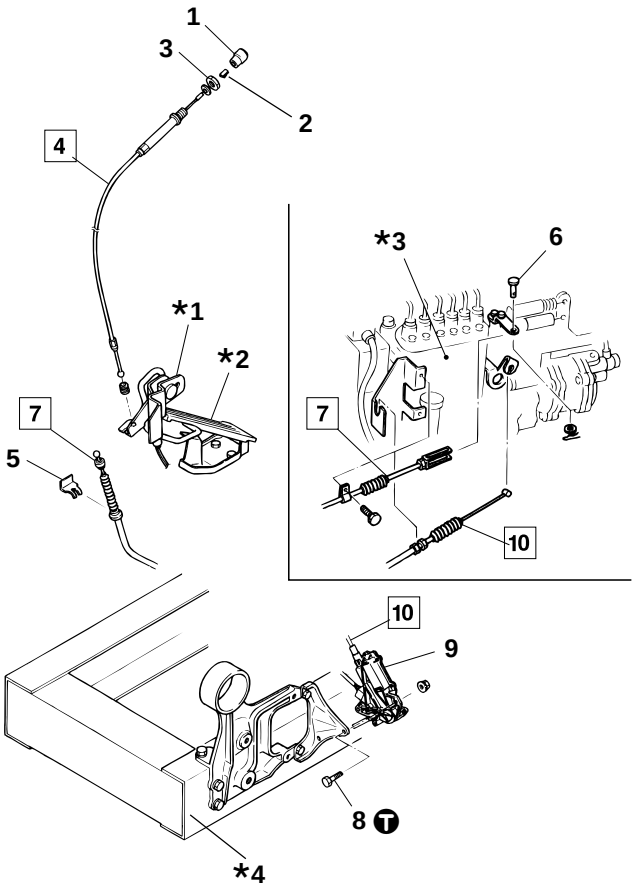
ENGINE CONTROL



13818

● **Disassembly sequence**

1 Idling control knob
2 Clip
3 Nut
4 Idling control cable
5 Cable clip
6 Clevis pin
7 Accelerator control cable
8 Bolt
9 Fuel-cut motor Gr 54
10 Engine stop cable

***1** : Accelerator arm assembly P13-62
***2** : Accelerator pedal assembly P13-61
***3** : Injection pump assembly P13-68
***4** : Frame Gr 41

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION⚠

Be sure when laying and routing cables, not to let them contact metal edges.

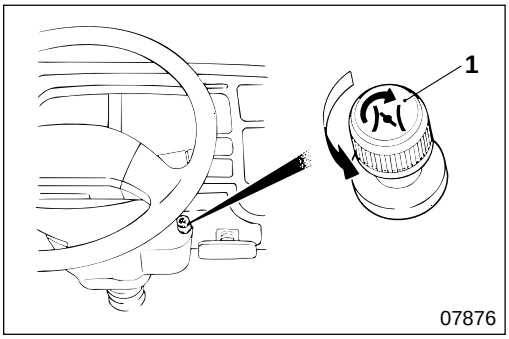
https://truckmanualshub.com/

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

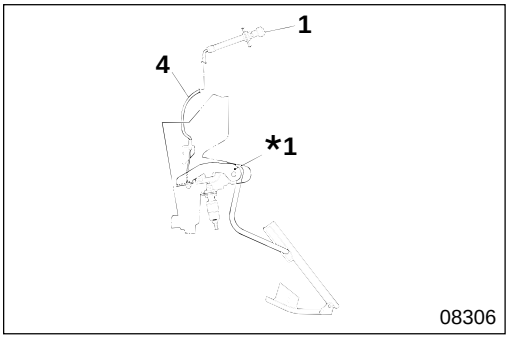
Location	Parts to be tightened	Tightening torque	Remarks
8	Bolt (Fuel-cut motor mounting)	4.9 to 5.9 {3.6 to 4.3, 0.5 to 0.6}	—

◆ Service procedure

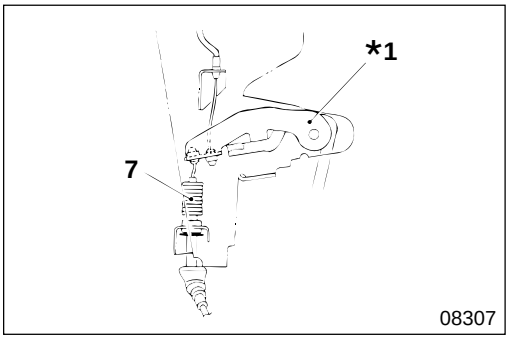


4 **Installation of idling control cable**

- Rotate idling control knob **1** counterclockwise until the inner cable protrudes at its maximum.



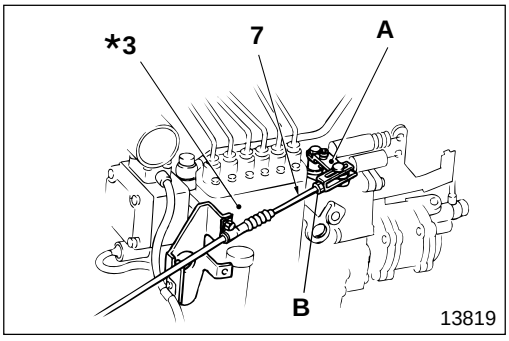
- While maintaining this state, install accelerator arm assembly ***1**.



7 **Accelerator control cable**

[Installation]

- Mount accelerator control cable **7** to accelerator arm assembly ***1**.

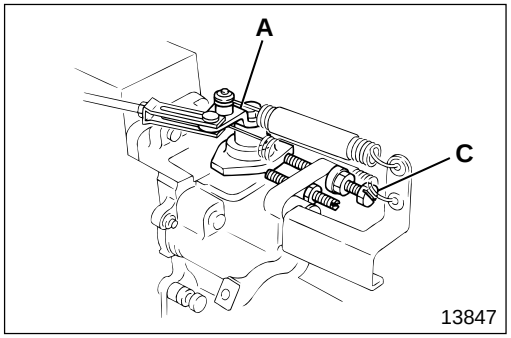


- Make sure that the accelerator pedal does not move by turning idling control knob **1** clockwise as far as it will go.
- Mount the engine end of accelerator control cable **7** to control lever **A** of injection pump assembly ***3**.
- Tighten the accelerator control cable **7** using adjustor nut **B** so that the accelerator pedal does not move.

NOTE

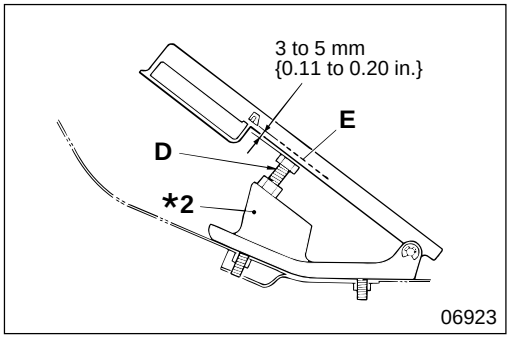
When mounting accelerator control cable 7, do not move control lever A.

https://truckmanualshub.com/

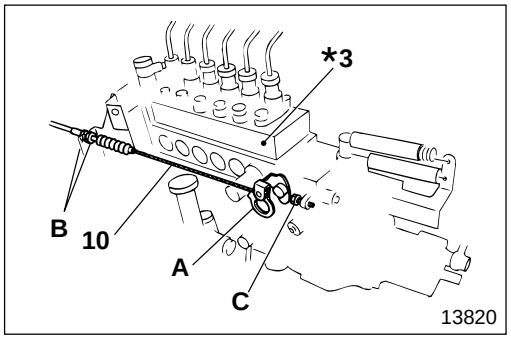


[Adjustment]

- Turn the starter switch ON, and press down on the accelerator pedal until control lever **A** hits stopper bolt **C**.



- Adjust the height of stopper bolt **D** of accelerator pedal assembly ***2** in such a manner that the clearance between stopper bolt contact surface **E** and the stopper bolt conforms to the specified value.



10 **Installation of engine stop cable**

- Mount engine stop cable **10** to stop lever **A** of injection pump assembly ***3**.
- Turn the starter switch to ACC or LOCK. Fasten using mounting nut **B** while keeping stop lever **A** pressed against stopper bolt **C**.
- After installation, start the engine using the starter switch, and make sure that the engine stops when the switch is turned to ACC.

⊗ : Non-reusable parts

https://truckmanualshub.com/

WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any spilled fuel because it can cause a fire.**

CAUTION

- **Be sure to protect all openings by covering them after removal of hoses and pipes because the engine performance is adversely affected if dirt and foreign particles enter injection pump assembly 26.**
- **Do not hold the control lever when lifting injection pump assembly 26. Also, do not remove the control lever because removal of the lever might cause poor performance of the pump.**
- **Do not remove injection pump bracket 28 unless it is faulty.**
- **Make sure you connect fuel hose *6 at a high position because fuel in the fuel tank would leak out if the end of the fuel hose were at a position lower than the tank.**

● **Installation sequence**

Follow the removal sequence in reverse.

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
28	Injection pump bracket (eccentricity of injection pump centering tool to air compressor crankshaft)	0.2 {0.0079} or less	—	Adjust

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened		Tightening torque	Remarks
7, 9, 15	Eye bolt (Fuel suction pipe and fuel feed pipe mounting)		25 to 29 {18 to 22, 2.5 to 3}	—

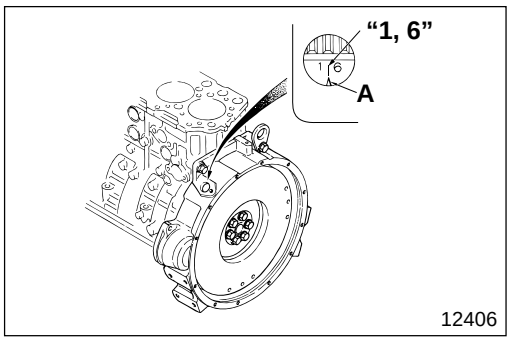
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
28	Injection pump centering tool  14311	MH063336	Positioning of injection pump bracket

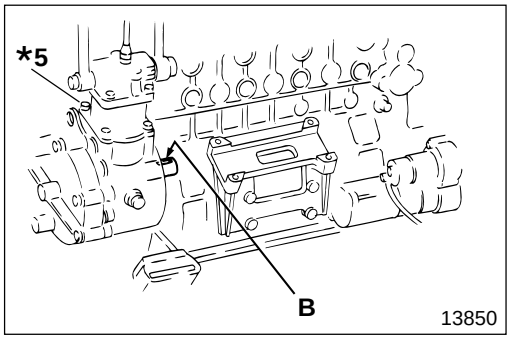
https://truckmanualshub.com/

◆ Service procedure

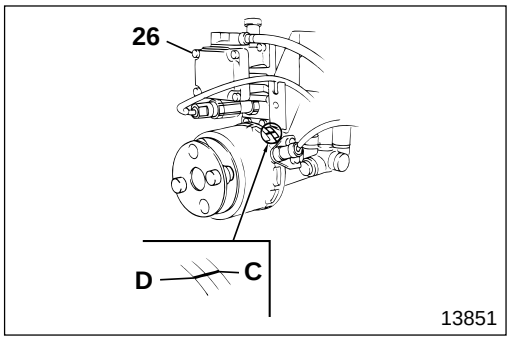


26 **Installation of injection pump assembly**

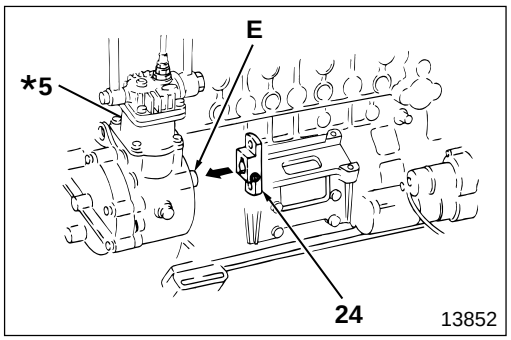
- Crank the engine to bring No. 1 cylinder piston to top dead center in the compression cycle, and align mark "**1**, **6**" of the flywheel with pointer **A** on the flywheel housing.



- In this state, make sure that keyway **B** in the crankshaft of air compressor ***5** faces upward.
- If keyway **B** is not facing upward, turn the engine crankshaft by one turn.

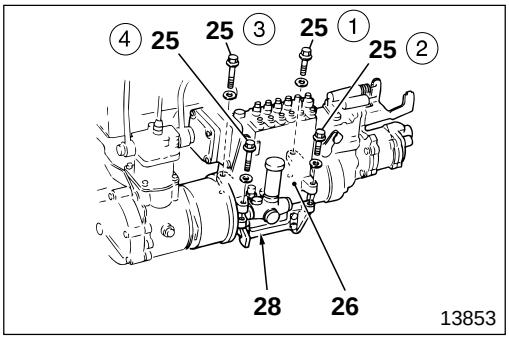


- Align pointer **C** on injection pump assembly **26** with notch **D** on the automatic timer.

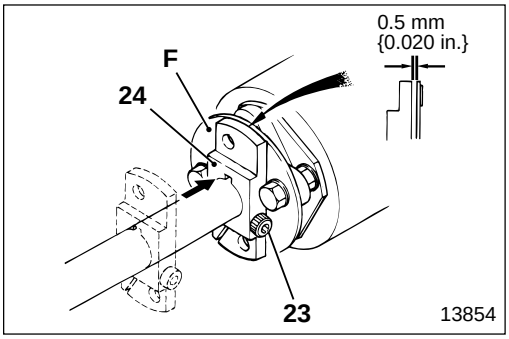


- Install driving coupling **24** to crankshaft **E** of air compressor ***5** and place the driving coupling on the air compressor side.
- Install injection pump assembly **26** on the injection pump bracket.

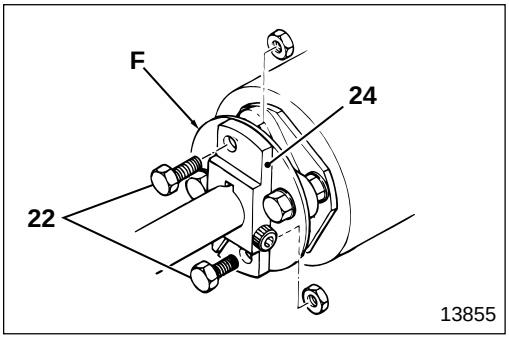
https://truckmanualshub.com/



- Install injection pump assembly **26** on injection pump bracket **28**.
- Tighten bolts **25** in the order as illustrated at specified torque for primary tightening.
- Retighten bolts **25** in the order as illustrated at specified torque for secondary tightening.

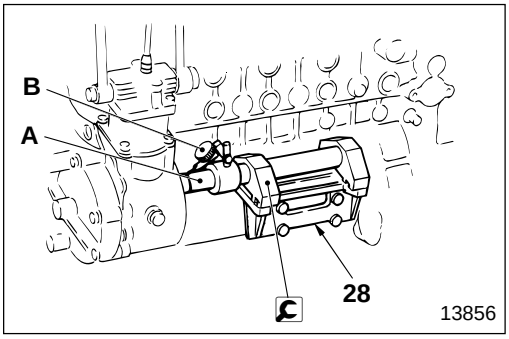


- Move driving coupling **24** to adjust the clearance between the driving coupling and coupling plate **F** as illustrated, then tighten cotter bolt **23** at specified torque.



- Attach driving coupling **24** and coupling plate **F** using bolts **22** and tighten the bolts temporarily.

- In this state, adjust the fuel injection timing.
  Adjustment of fuel injection timing : P13-28
  After adjusting the fuel injection timing, tighten bolts **22** at specified torque.



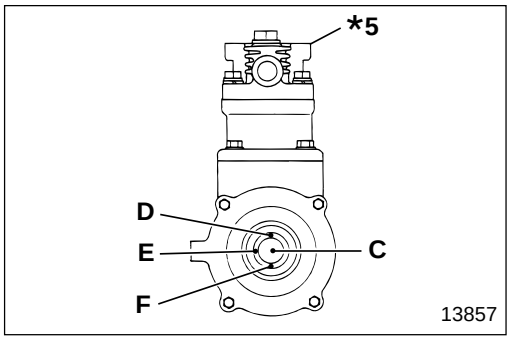
28 **Injection pump bracket**

[Inspection]

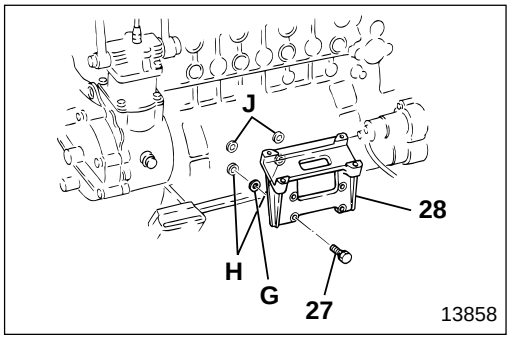
- Attach dial gauge **B** to arbor **A** of injection pump centering tool and adjust to carry out zero point adjustment.

https://truckmanualshub.com/

INJECTION PUMP



- Slide dial gauge **B** toward air compressor ***5** and measure the eccentricity of crankshaft **C** against arbor **A** at points **D**, **E** and **F**.
- If the measured value is higher than the standard value, adjust as follows.



[Adjustment]

- When the measured value at point **E** is higher than the standard value:
  Insert shims **G** into four points equally.
- When the measured value at point **D** is higher than the standard value:
  Insert shims **G** into lower side **H**.
- When the measured value at point **F** is higher than the standard value:
  Insert shims **G** into upper side **J**.

CAUTION

Insert shims G observing the following conditions:

- **Number of shims per point is three or less.**
- **The same number of shims should be used for the front and the rear.**
- **The difference in number of shims used for bottom and top is none or one.**

- Tighten bolt **27** at specified torque, then reinspect.

5 O-ring
6 Injection nozzle assembly
7 Retaining nut
8 Tip packing
9 Straight pin
10 Needle valve
11 Nozzle
12 Pressure pin
13 Spring
14 Adjusting shim
15 Nozzle holder
16 Nozzle gasket

* : Cylinder head Gr 11
⊗ : Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

WARNING

Wipe up any spilled fuel because it can cause a fire.

CAUTION

- **Be sure not to touch the slide-contact area of needle valve 10 because any scratches or corrosion might spoil the airtightness of nozzle 11. It must be handled with utmost care.**
- **Never change the combination of needle valve 10 and nozzle 11 for each cylinder.**
- **Be sure to protect all openings by covering them after removal of hoses and pipes because the engine performance is adversely affected if dirt and foreign particles enter injection nozzle assembly 6.**

NOTE

Remove carbon deposits and clean injection nozzle assembly 6 before working on it, then test the injection pressure and jet spray condition, and check for fuel leakage before disassembly. If no fault is found, do not disassemble.

—	Nozzle cleaning tool	★105789-0010	Cleaning of injection nozzle assembly

★ ZEXEL code number

◆ Service procedure

● Inspection before disassembly

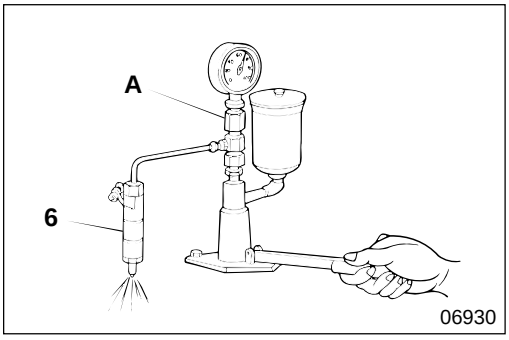
Attach injection nozzle assembly **6** to nozzle tester **A**, and conduct the following inspection.

WARNING

Never touch the spray from nozzle 11 or let your hands get too close to the spray point during the test.

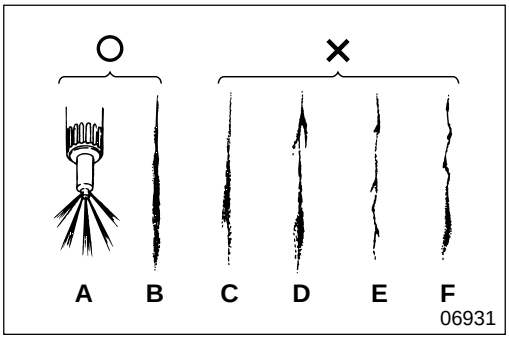
NOTE

Before inspection, bleed the air out in a couple of bursts by pressing nozzle tester A lever.



(1) Valve opening pressure

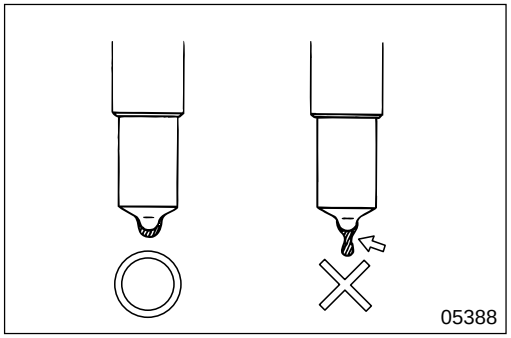
- Raise the pressure of nozzle tester **A** by operating the lever, and measure the pressure that the gauge registers when the pressure is released which will be observed by the sudden movement of the gauge indicator.
- If the measured value deviates from the standard value, disassemble the nozzle and clean, and adjust it using adjusting shims **14**.
- Variation of 0.05 mm {0.0020 in.} thickness in adjusting shims **14** causes a difference of 735 kPa {105 lbf/in^2, 7.5 kgf/cm^2} of pressure, for example, to alter the pressure for 98 kPa {14 lbf/in^2, 1 kgf/cm^2}, a thickness of 0.0067 mm {0.00026 in.} is required.
- If the performance cannot reach the standard value even after adjustment, replace injection nozzle assembly **6**.



(2) Spray condition

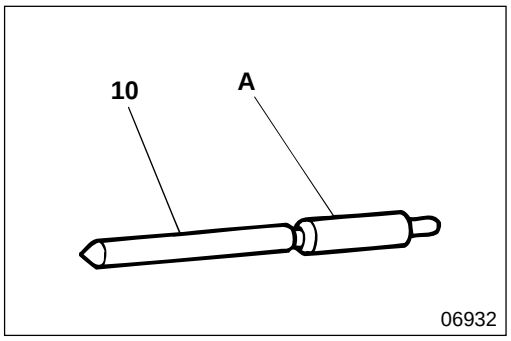
- Test injection spray condition by quick lever actions of nozzle tester **A**, 4 to 6 actions per second.
  - **A** : Even spray from all five orifices (Good)
  - **B** : Even and symmetrical spray (Good)
  - **C** : Asymmetrical spray (Faulty)
  - **D** : Spray direction deviates from the nozzle axis line (Faulty)
  - **E** : Thin and insufficient spray (Faulty)
  - **F** : Irregular spray (Faulty)
- If faulty spray cannot be corrected, disassemble injection nozzle assembly **6** and clean every part and repeat the test.
  If faulty spray still occurs after repeating test, replace the injection nozzle assembly.
- Make sure that there is no post-spray dripping after injection.

https://truckmanualshub.com/



(3) Fuel air tightness and leakage at related contact points

- Maintain interior pressure of nozzle at 1960 kPa {285 lbf/in^2, 20 kgf/cm^2} lower than the valve opening pressure, and check and see if any fuel seeps out of the nozzle tip within 10 seconds.
- If any fault is found, disassemble injection nozzle assembly **6** and clean every part and repeat the test. If any fault is still found, replace the injection nozzle assembly.

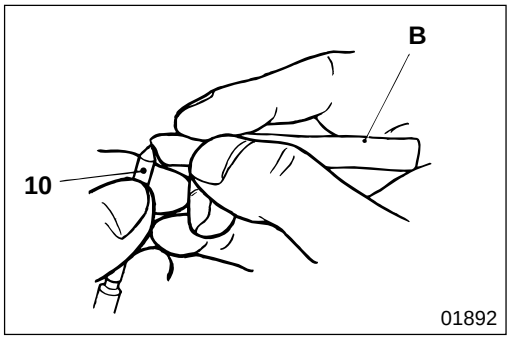


6 Injection nozzle assembly

[Disassembly]

CAUTION

- **Be sure not to touch sliding part A of needle valve 10 with your hands.**
- **Never change the combination of removed needle valve 10 and nozzle 11 for each cylinder.**



[Cleaning]

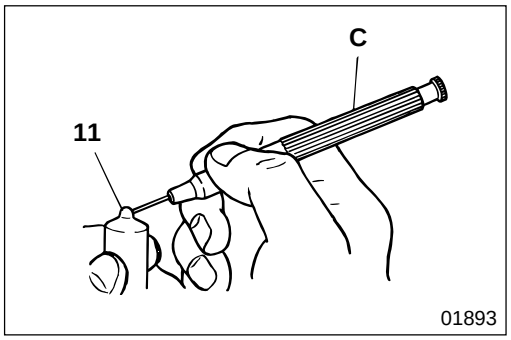
Clean needle valve **10** and nozzle **11** with gas oil (cleaning solvent).

Remove carbon deposits with 🔧 cleaning tool in the following manner:

- Clean needle valve **10** by removing carbon deposits from its tip using cleaning bar **B** of 🔧 cleaning tool.

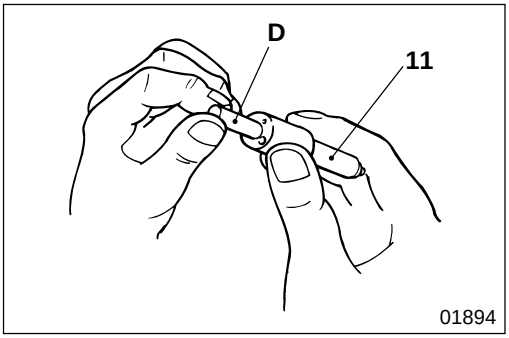
CAUTION

Never use a wire brush or hard steel for cleaning.

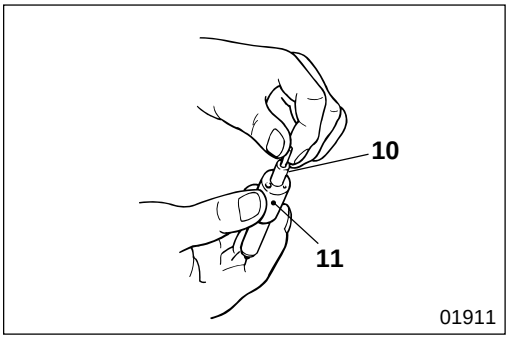


- To clean nozzle **11**, remove carbon deposits from the orifices of the nozzle using needle cleaner **C** of 🔧 cleaning tool, by inserting it into the orifices and turning it.
  Needle cleaner diameter : ø0.25 mm {0.0098 in.} or less

https://truckmanualshub.com/



- Clean the seat of nozzle **11** using cleaning needle **D** of [tool] cleaning tool.
- Use FUSO carbon remover to remove hard-to-remove, burnt-on carbon deposits.



[Inspection]

- Immerse needle valve **10** and nozzle **11** in gas oil (cleaning solvent) and clean them thoroughly.
- Check and see if needle value **10** drops by its own weight into the nozzle from the position where a third of its length is pulled out. (Repeat this several times rotating the needle valve.)
- If needle valve **10** does not drop smoothly, repeat cleaning and repeat the test. If any fault is still found, replace both the needle valve and nozzle **11** together as a set.

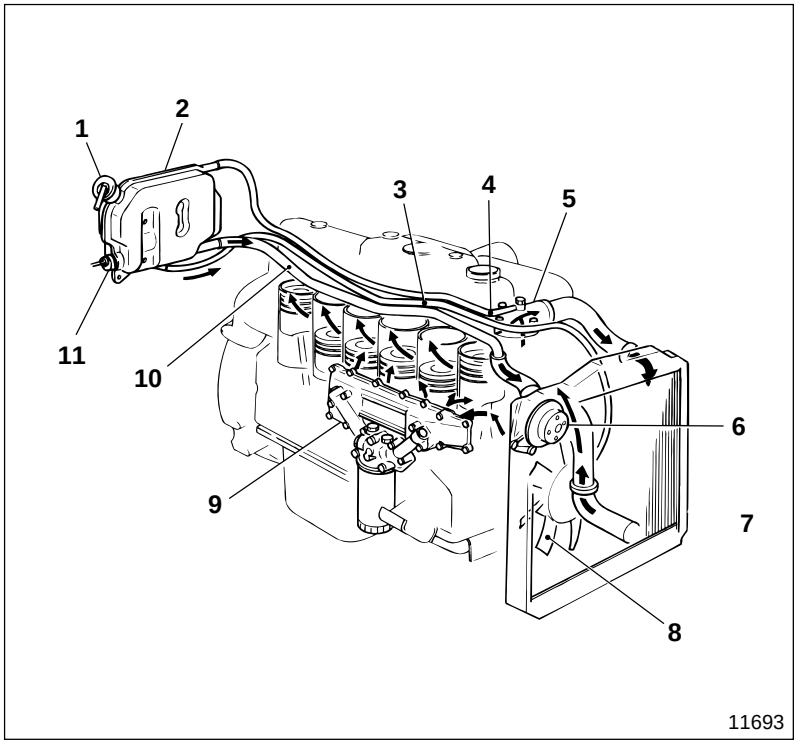
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Item	Specifications
Kind of cooling system	Forced water circulation system
Water pump type	Belt-driven involute type
Thermostat type	Wax-pellet, bottom bypass type (with jiggling valve)
Automatic cooling fan coupling type	Continuous control type
Radiator type	Tube and corrugated fin type
Coolant capacity L {qts}	21 {22}

STRUCTURE AND OPERATION

Cooling System (Flow of Coolant)

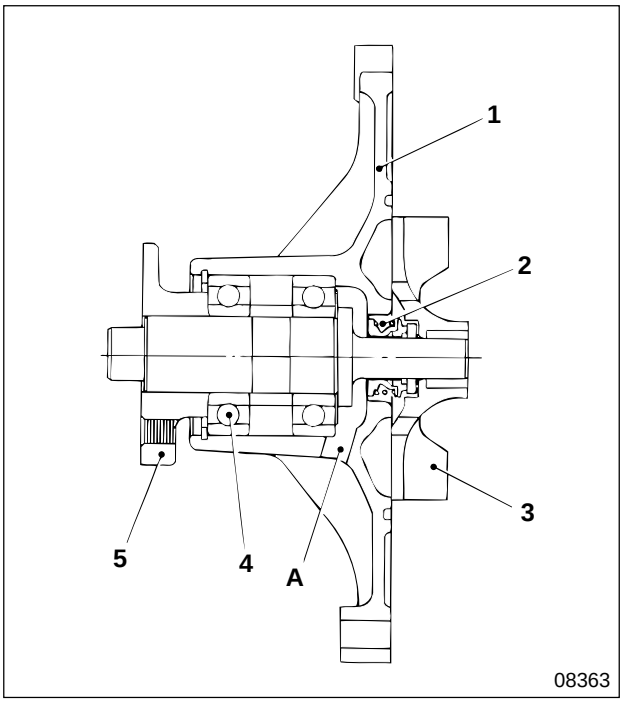


1 Pressure cap
2 Surge tank
3 Suction pipe
4 Air pipe
5 Thermostat
6 Water pump
7 Radiator
8 Cooling fan
9 Oil cooler
10 Water inlet pipe
11 Water level sensor

Surge tank **2** is installed at a higher position than radiator **7** and automatically adds coolant when the coolant level in the radiator drops.

https://truckmanualshub.com/

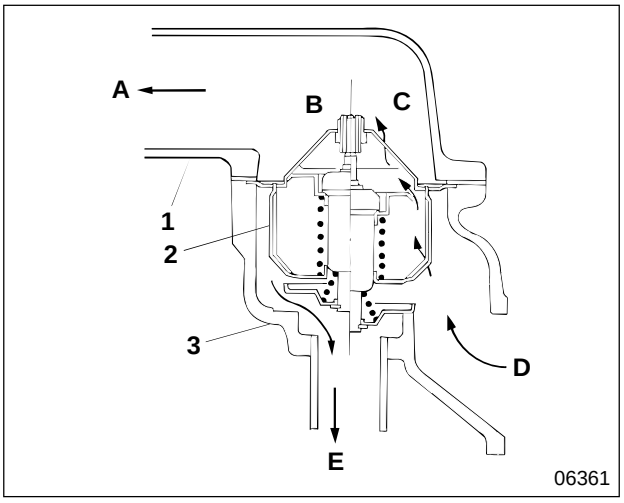
Water Pump



1 Case
2 Unit seal
3 Impeller
4 Ball bearing
5 Flange

A : Drain hole

Thermostat



1 Thermostat cover
2 Thermostat
3 Thermostat case

A : To radiator
B : When low coolant temperature
C : When high coolant temperature
D : From cylinder head
E : To water pump

Thermostat **2** is a bottom bypass type that uses wax pellets as its regulating element. As the wax changes its form from solid to liquid according to changes in temperature, the volume of the wax changes. Therefore, the position of the valve, changed by the coolant temperature, regulates the flow of the coolant to the radiator and water pump (bypass side) and controls the coolant temperature.

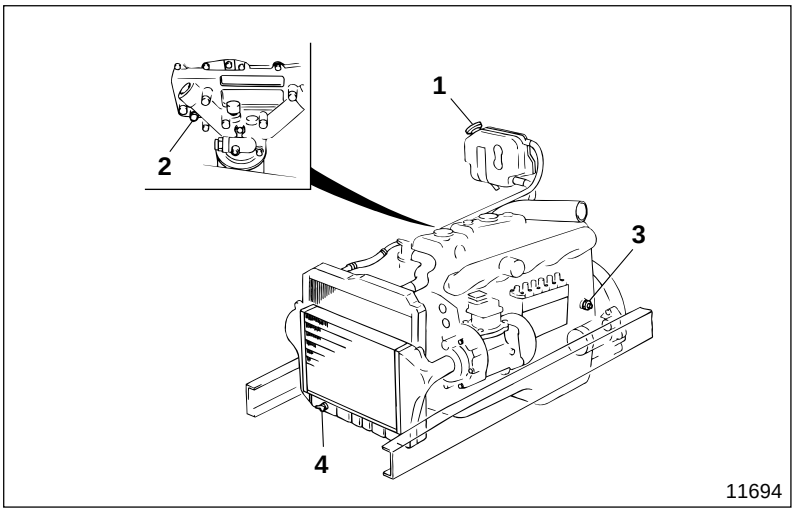
INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Replacing Coolant and Cleaning Cooling System



1 Pressure cap
2 Oil cooler drain plug
3 Crankcase drain plug
4 Radiator drain plug

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Oil cooler drain plug	34 to 39 {25 to 29, 3.5 to 4.0}	—
3	Crankcase drain plug	98 {12, 10}	—

Using the radiator for a long period of time without cleaning it will cause overheating because rust and scale deposits will accumulate inside the cooling system. Periodical cleaning is recommended.

● **Draining coolant**

First loosen pressure cap **1,** to lower the pressure in the cooling system, before draining coolant.

WARNING

- **You must make sure that the engine coolant is cold before draining it so as not to scald yourself.**
- **It is dangerous to open pressure cap 1, when the coolant temperature is high, without taking due care because the hot water would spray out. Be sure to cover the pressure cap with a cloth and loosen slowly to bleed the pressure before opening fully.**

● **Cleaning procedure**

- Keep the coolant temperature at approximately 90°C {194°F} so that the thermostat valve remains open and the coolant continues to circulate in the radiator.
- For the sake of convenience you can raise the coolant temperature quickly by covering the front of the radiator with corrugated cardboard or something similar.
- Set the temperature adjusting lever of the heater controller at maximum so that the coolant can circulate freely in the heater piping area.
- In cases where a great amount of rust has accumulated it often happens that as a result of cleaning the radiator starts leaking. Conduct a thorough check for leakage after cleaning.
- Soft water to be used should have the following properties.

CAUTION

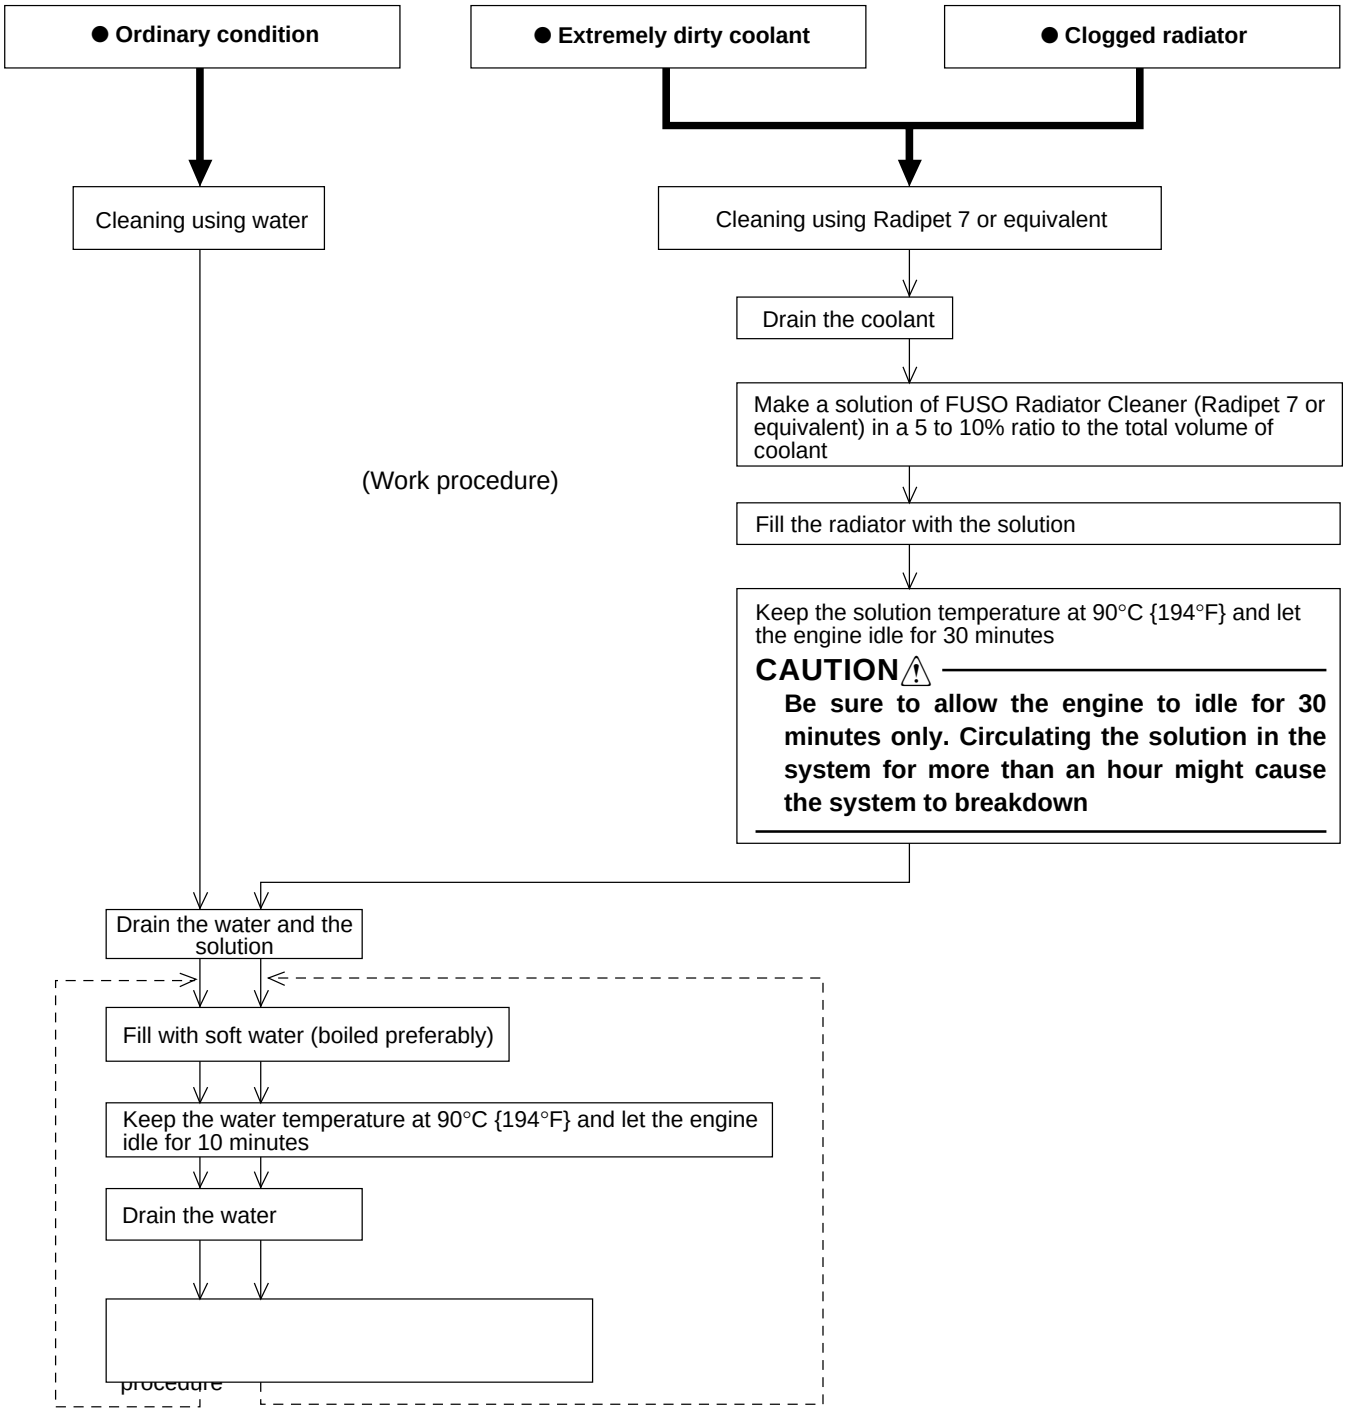
Do not use hard water as it causes scale and rust.

Required properties of soft water

Total hardness	300 ppm or less	Total dissolved solids	500 ppm or less
Sulfate SO_4^-	100 ppm or less	pH	6 to 8
Chloride Cl^-	100 ppm or less		

https://truckmanualshub.com/

Method of cleaning the cooling system depends on its condition.



DANGER

If FUSO DIESEL LONG LIFE COOLANT solution gets in your eyes accidentally, you must immediately rinse your eyes with copious amounts of water, and be sure to consult a doctor.

WARNING

FUSO DIESEL LONG LIFE COOLANT is inflammable. Do not put it near naked lights.

NOTE

- **After cleaning with solution, fill with coolant as quickly as possible.**
- **To prevent freezing of the coolant and corrosion of the cooling system, use specified coolant solution of FUSO DIESEL LONG LIFE COOLANT. (See the Owner's Handbook for use of these materials.)**

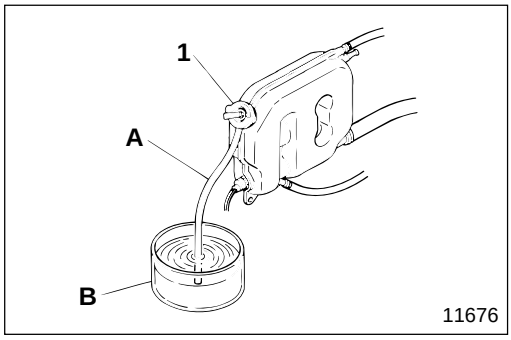
https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Air Bleeding of Cooling System

- Remove the pressure cap and keep the coolant temperature at 90°C {194°F} while letting the engine idle and bleed the air out completely. Keep the temperature adjusting lever of the heater controller at maximum so that the coolant can circulate freely in the heater piping area.
- After completing adequate air bleeding of the cooling system, refill coolant sufficiently enough for the surge tank.

Gas Leakage Test

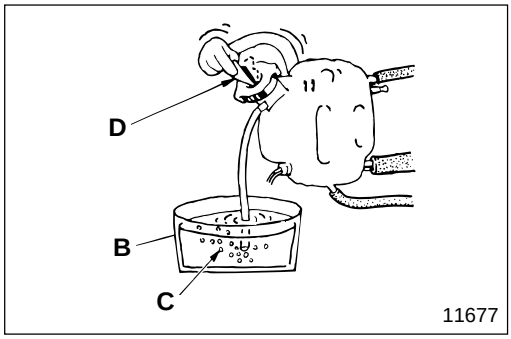


Air or exhaust gas in the coolant increases corrosion and rusting in the system. Therefore, carry out the following test:

- Remove surge tank pressure cap **1** and check if the coolant level comes up to the lip of the tank.
- Put the end of overflow pipe **A** into water tank **B**.

WARNING⚠

Be sure that the coolant temperature is low enough so that hot coolant does not spout out when you loosen pressure cap 1.



- Run the engine to bring the coolant temperature to approximately 90°C {194°F}.
- Lift lever **D** of pressure cap **1**.
- If air bubbles **C** continuously rise in water tank **B**, it is an indication that air or exhaust gas has gotten into the coolant.
- If it is air, it is possible that the cylinder head bolts, the water pump mounting bolts or the hose connections are loose, or that the hose is damaged.
- If it is exhaust gas, it is possible that the cylinder head gaskets are damaged, or that the cylinder head is cracked.

◆ Service procedure

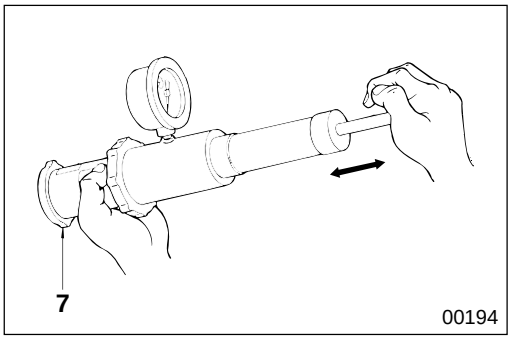
2 4 6 Installation of hose

The depth of hose installation is as follows.

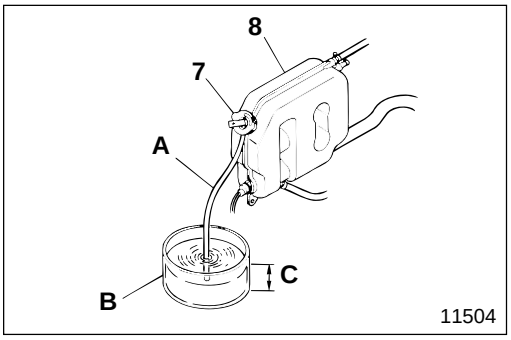
A : 15 mm {0.59 in.}
B : 30 mm {1.18 in.}



7 Inspection of pressure cap

(1) Pressure valve opening pressure

If the measured value deviates from the standard value, replace pressure cap **7**.



(2) Inspection of vent valve

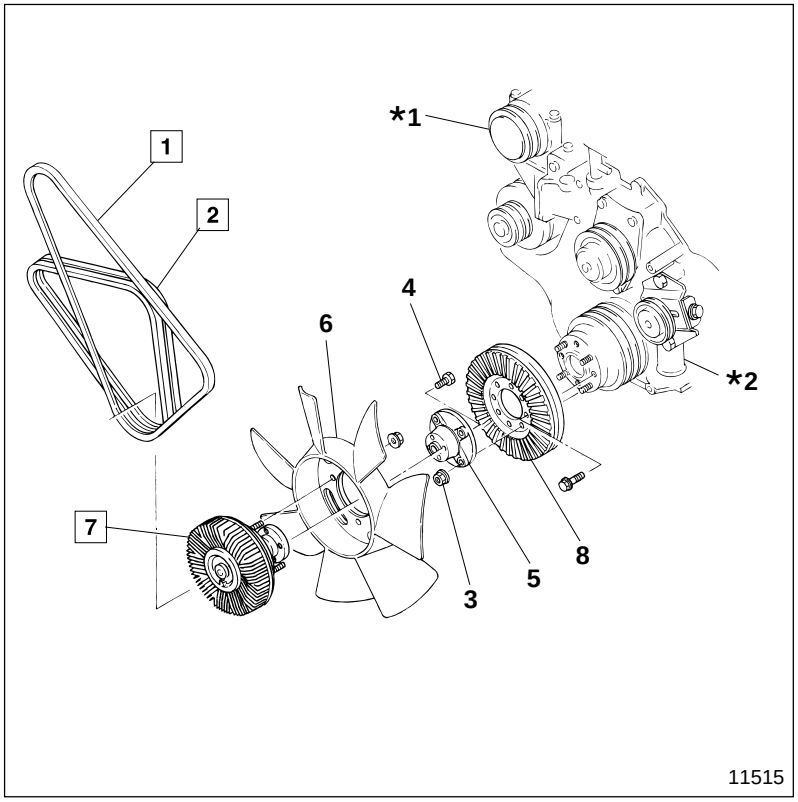
- Check that the coolant level comes up to the lip of surge tank **8**. If the level is low, add coolant.
- Tighten pressure cap **7**.
- Put the end of overflow hose **A** into water tank **B**.
- Check coolant level **C** of water tank **B**.
- Run the engine at a high revolution to increase the coolant temperature.
- Stop the engine when some of the coolant in surge tank **8** has overflown into water tank **B**.
- Leave things for a while.
- Check the time it takes for the coolant temperature to return to the ambient temperature, and check whether coolant level **C** in the tank is the same as before running the engine.
- If the coolant level has not returned to that before running engine, replace pressure cap **7**.

NOTE

Do not remove pressure cap 7 before the coolant temperature decreases to the ambient temperature. If you do the coolant will not return to reservoir tank A because negative pressure in the radiator is lost.

https://truckmanualshub.com/

COOLING FAN AND V-BELT



● **Removal sequence**

1 V-belt (Air-conditioner)
2 V-belt (Fan)
3 Nut
4 Bolt
5 Fan spacer
6 Cooling fan
7 Automatic cooling fan coupling
8 Torsional damper

***1** : Cooler compressor
***2** : Tension pulley

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION⚠

- **Be sure to replace automatic cooling fan coupling 7 as an assembly if it is faulty because it is a unit construction.**
- **Be sure to replace V-belts 2 as a set to maintain even tension between them.**

Service standards

Unit : mm {in.}

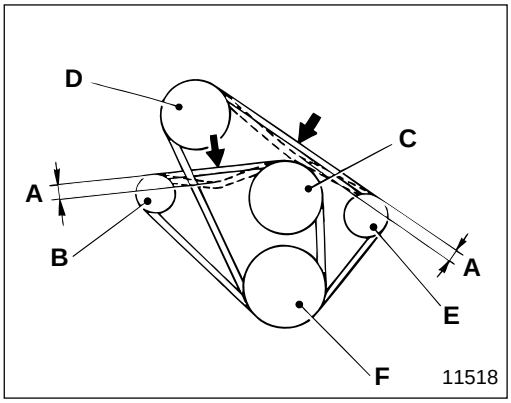
Location	Maintenance item	Standard value	Limit	Remedy
1	V-belt tension (Air-conditioner)	16 to 20 {0.63 to 0.79}	—	Adjust
2	V-belt tension (Fan)	12 to 16 {0.47 to 0.63}	—	Adjust

Special tools

Location	Tool name and shape	Part No.	Application
1, 2	Belt tension gauge 03612	MH062345	Measurement of tension of V-belt

https://truckmanualshub.com/

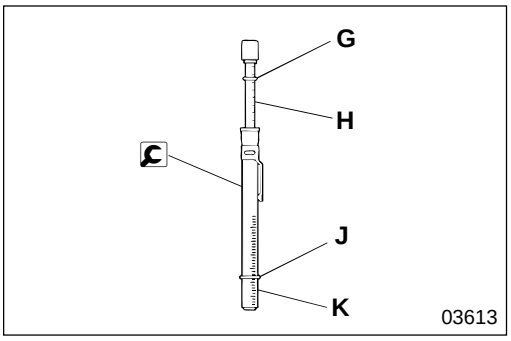
◆ Service procedure



1 **2** **V-belt**

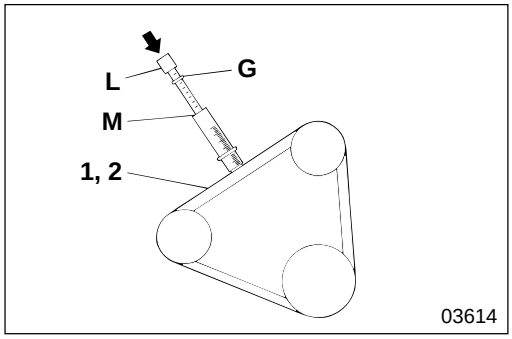
[Inspection]
Measure the extent of flex **A** when the center of V-belts **1**, **2** as illustrated is depressed with a force of approximately 98 N {72 lbf, 10 kgf}.

B : Alternator pulley
C : Water pump pulley
D : Cooler compressor pulley (Air-conditioner)
E : Tension pulley
F : Crankshaft pulley

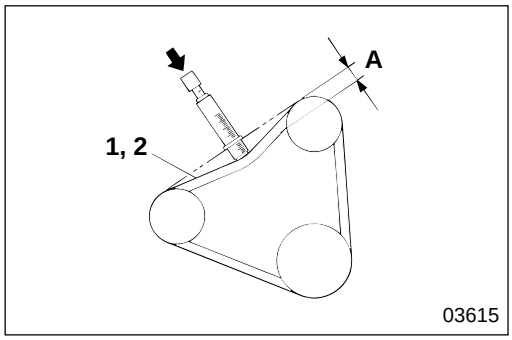


● **Use of special tool belt tension gauge**

- Set upper O-ring **G** of belt tension gauge to 98 N {72 lbf, 10 kgf} (push load) on graduation **H**.
- Set lower O-ring **J** of belt tension gauge to graduation **K** (maximum flex of belt).



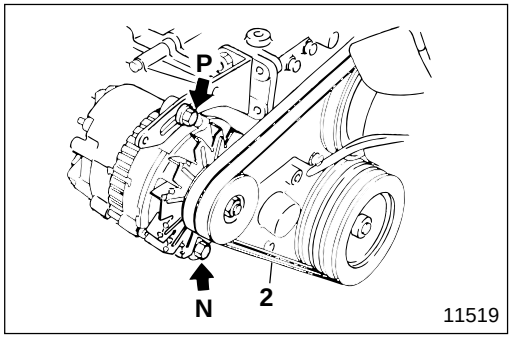
- Place belt tension gauge at the center of V-belts **1**, **2** perpendicularly as illustrated and push top **L** all the way down until upper O-ring **G** hits upper edge **M**.



- Measure the extent of flex **A** of V-belts **1**, **2** at this point, and if the measured value deviates from the standard value, adjust as follows.

https://truckmanualshub.com/

COOLING FAN AND V-BELT



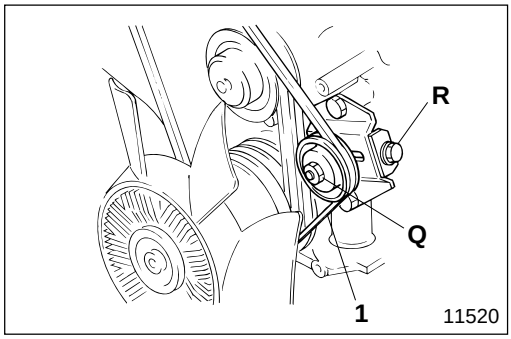
[Adjustment]

(1) Adjustment of V-belt tension for fan

- Loosen alternator mounting bolts **N** (two places), and adjust the tension of V-belts **2** using adjusting bolt **P**.
- After adjustment, tighten the bolts and nuts securely.

CAUTION

- **Bear in mind that excessive tension of V-belts 2 might damage the belts and bearings that engage with the V-belts.**
- **Be sure to replace V-belts 2 as a set to maintain even tension between them.**
- **Be careful not to let oil stick to V-belts 2, if oil gets onto the belts, it causes slipping, resulting in overheating and insufficient battery charging.**

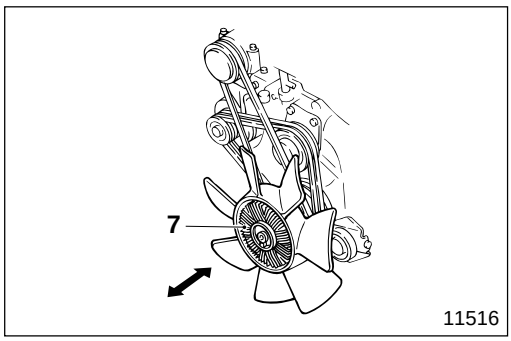


(2) Adjustment V-belt tension for air-conditioner

- Loosen tension pulley mounting nut **Q**, and adjust the tension of V-belt **1** using adjusting bolt **R**.
- After adjustment, tighten the bolt **R** and nut **Q** securely.

CAUTION

- **Bear in mind that excessive tension of V-belt 1 might damage the belt and bearings that engage with the V-belt.**
- **Be careful not to let oil stick to V-belt 1, if oil gets onto the belt, it causes slipping, resulting in poor performance of the air conditioner.**

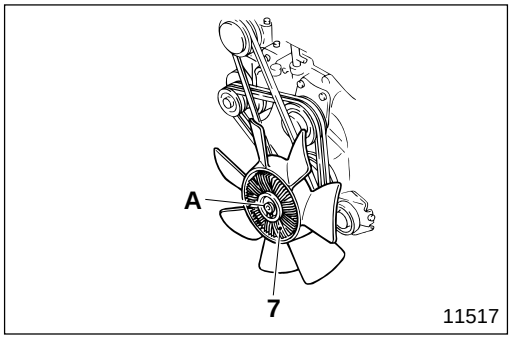


7 Automatic cooling fan coupling

[Inspection]

Carry out the following inspection of automatic cooling fan coupling **7** and if any fault is found, replace the unit.

- Check for any leakage of lubricating oil sealed in the coupling body.
- Rotate automatic cooling fan coupling **7** by hand, and check for any irregularity in rotation related to the coupling bearing or any abnormal noise.
- Check for any excessive play of automatic cooling fan coupling **7** in the axial direction when the engine is cool.



[Cleaning]

- If there are any foreign particles sticking to bimetal **A**, remove them by brushing lightly.

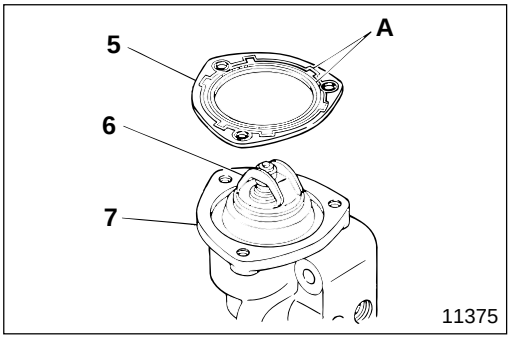
11	Water temperature sensor	34±6.9 {25±5.1, 3.5±0.7}	—
12	Overheating switch	27 to 41 {20 to 30, 2.8 to 4.2}	—
13	Water temperature sensor	34±6.9 {25±5.1, 3.5±0.7}	—

Lubricant

Location	Points of application	Kinds	Quantity
10	O-ring	Soapy water	As required

https://truckmanualshub.com/

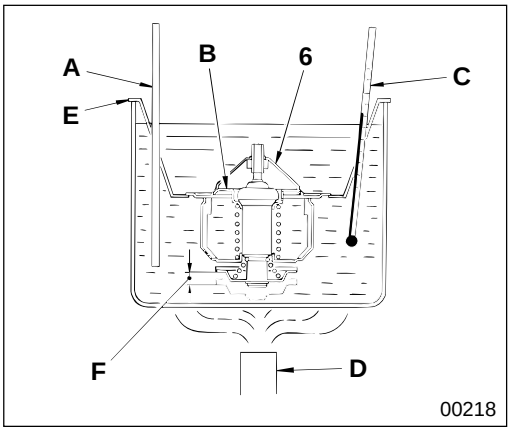
◆ Service procedure



5 **Mounting of thermostat cover gasket**

Mount thermostat cover gasket **5** on thermostat case **7** in the direction as illustrated.

A : Sealant application surface



6 **Thermostat**

[Inspection]

Stir the water using stick **A** to maintain an even water temperature in the container, then carry out the following tests. If the measured value deviates from the standard value, replace thermostat **6**.

(1) Valve opening temperature

- Hold thermostat **6** with wire **E** so as not to get the thermostat too close to heat **D**.
- Heat the water gradually to raise the temperature to the valve opening temperature.
- Maintain this temperature for five minutes and make sure that valve **B** has opened.
- Make sure that valve **B** has closed when the water temperature has dropped to 65°C {149°F}.

  C : Water temperature gauge

(2) Extent of valve lift

Measure valve lift **F**, while maintaining the water temperature a little higher than the valve opening temperature, with valve **B** fully open for five minutes.

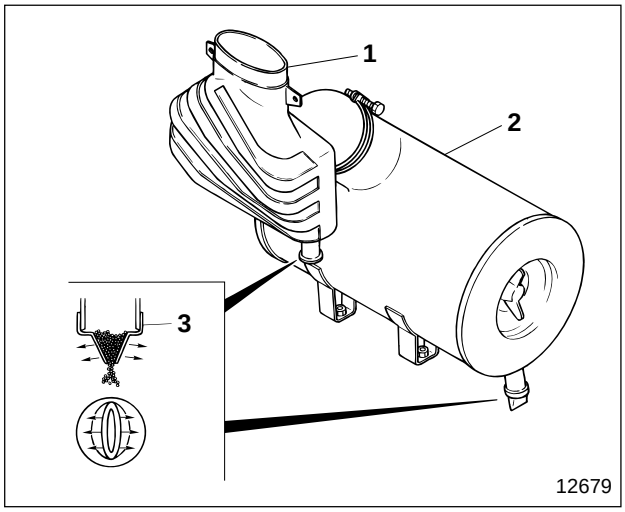
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Items		Specifications
Air cleaner element		Cyclone paper filter type
Turbocharger	Model	TD06
	Manufacturer	MITSUBISHI HEAVY INDUSTRIES
Intercooler type		Air-cooled, tube and corrugated fin type

STRUCTURE AND OPERATION

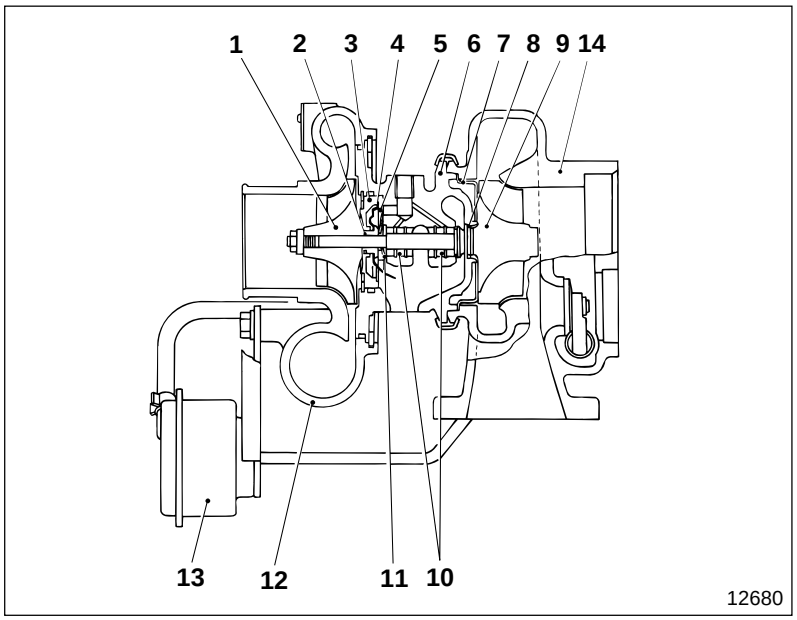
Air Cleaner



1 Air lower duct
2 Air cleaner assembly
3 Evacuator valve

- Air cleaner assembly **2** uses a single element.
- Evacuator valves **3** are fitted with air lower duct **1** and air cleaner assembly **2**.
- Evacuator valves **3** automatically vent dust and dirt by the repercussive force of the rubber of the valve that overcomes the inner negative pressure when the engine revolution falls below the specified revolution.

Turbocharger



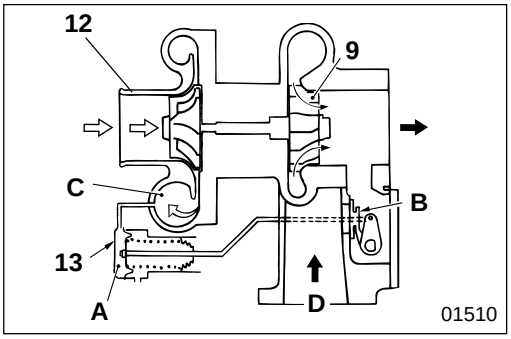
1 Compressor wheel
2 Thrust sleeve
3 Insert
4 Oil deflector
5 Thrust bearing
6 Bearing housing
7 Turbine backplate
8 Piston ring
9 Shaft and turbine wheel
10 Bearing
11 Thrust bearing
12 Compressor cover
13 Actuator
14 Turbine housing assembly

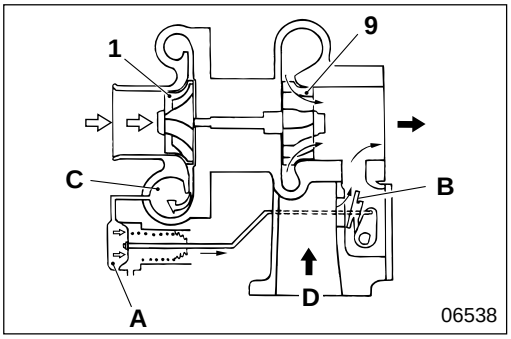
1 to **11** : Cartridge assembly

https://truckmanualshub.com/

Waste gate mechanism

- The waste gate mechanism relieves the boost pressure of excess exhaust gas using actuator **13**. This controls the boost pressure appropriately and prevents the turbocharger from overrunning, and prevents excessive pressure in the intake manifold.
- The boost pressure is fed into chamber **A** of actuator **13** from compressor cover **12** via a rubber hose. When boost pressure **C**, acting on the chamber, is lower than the preset value, the actuator does not operate and waste gate valve **B** remains closed, therefore exhaust gas **D** is blown against shaft and turbine wheel **9**.

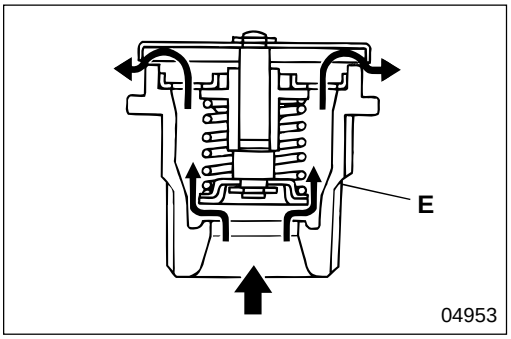




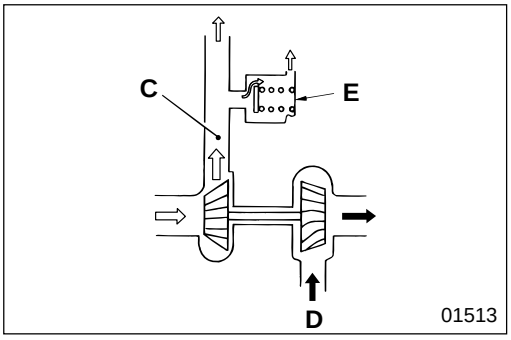
- As the boost pressure acting on chamber **A** increases to become higher than the preset value, waste gate valve **B** is opened and the exhaust gas blown against shaft and turbine wheel **9** decreases. Therefore the rotation of compressor wheel **1** decreases, causing the boost pressure to decrease.

Operation of over-boost valve

- Over-boost valve **E** operates when the boost pressure increases abnormally because of faulty operation of the waste gate mechanism.

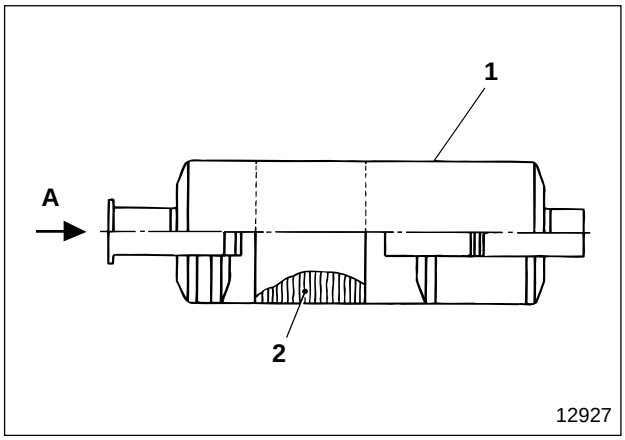


- If boost pressure **C** of over-boost valve **E** increases to become higher than the preset value, the excessive boost pressure is discharged into the atmosphere, protecting the engine from excessive boost pressure. When the valve is operating, a pipe-blowing sound is generated.



https://truckmanualshub.com/

Muffler



1 Muffler
2 Catalytic converter

A : Exhaust gas intake

Converter **2** is built into muffler **1** to decrease the amount of particulate matter (PM) in the exhaust gas.

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

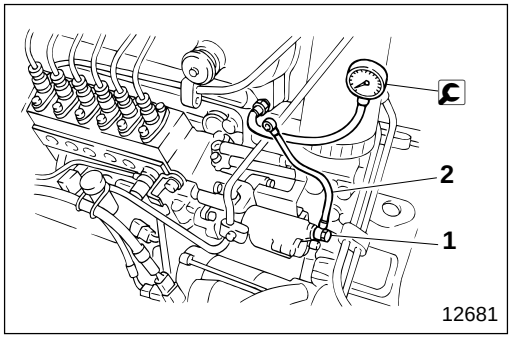
Measurement of Turbo Boost Pressure

Service standards

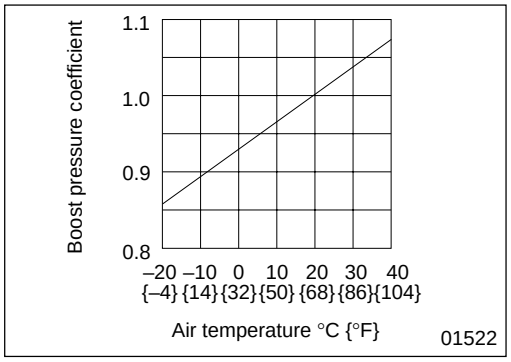
Location	Maintenance item	Standard value	Limit	Remedy
—	Boost pressure (Air temperature 20°C {68°F}, Atmospheric pressure 100 kPa {29.9 in. Hg, 760 mmHg})	—	32 kPa {9.45 in. Hg, 240 mmHg}/ 3700 rpm	Inspect and adjust

Special tools

Location	Tool name and shape	Part No.	Application
—	Boost pressure gauge  01524	MH061366	Measurement of turbo boost pressure

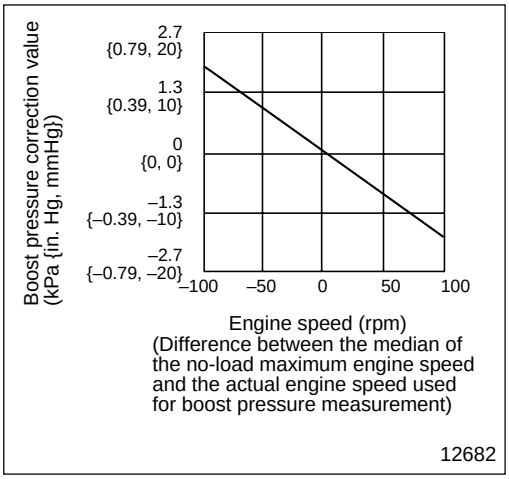


- Before measuring the turbo boost pressure, clean or replace the air cleaner element.
- Slacken off eye bolt **1** of boost compensator and remove boost compensator pipe **2**, then attach boost pressure gauge.
- After warming up the engine, measure the boost pressure at the no-load maximum engine speed. Also, measure the engine speed and the air temperature.



- Correct the boost pressure at standard conditions. (Since the boost pressure varies depending on the air temperature and engine speed.)
  [Correction for air temperature]
  Identify boost pressure coefficient depending on the air temperature from the graph.

https://truckmanualshub.com/



[Correction for engine speed]
Subtract the engine speed actually used for measuring the boost pressure from the median of the no-load maximum engine speed. Identify the boost pressure correction value (**Pa**) according to the graph.
Median value : 3700 rpm

[Calculation of corrected boost pressure]
Given the measured boost pressure to be **P**, corrected boost pressure **Pb** can be calculated from the following equation:

Pb = ktP + Pa

- **Pb** : Corrected boost pressure
- **P** : Measured boost pressure
- **kt** : Boost pressure correcting coefficient depending on air temperature
- **Pa** : Boost pressure correction value

If **Pb** is lower than the limit, the turbocharger must be inspected and adjusted.

https://truckmanualshub.com/

◆ Service procedure

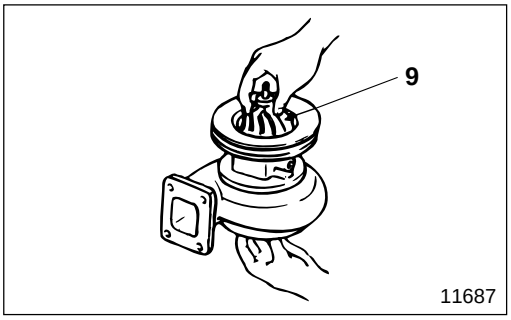
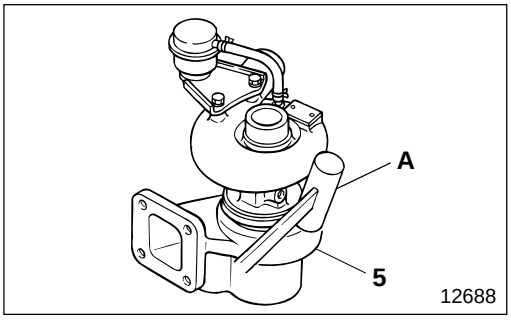
● Work before disassembly

Put alignment marks **A** on coupling **4**, turbine housing **5**, compressor cover **7** and cartridge assembly **9**.



● Inspection after assembly

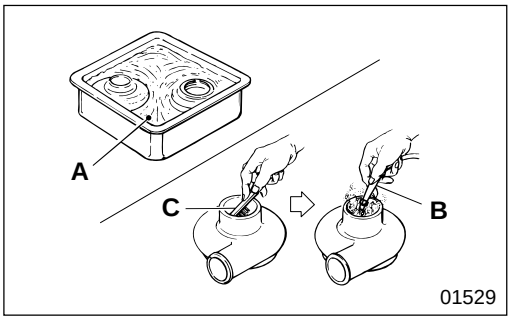
Turn the turbine wheel and the compressor wheel of cartridge assembly **9** to make sure that they turn smoothly.



5 Removal of turbine housing

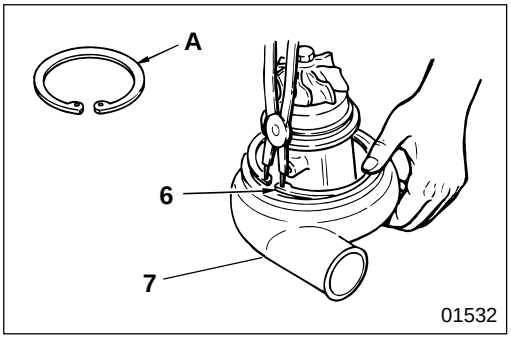
CAUTION

- **When removing turbine housing 5, tap all around the circumference lightly using rubber-headed hammer A so as not to damage the turbine housing.**
- **Do not hit the turbine wheel near turbine housing 5, since the blade of the turbine wheel can be easily bent.**



5 7 Cleaning of turbine housing and compressor cover

- Visually inspect related parts before cleaning to check if there are any burns or scratches as these would not be seen after cleaning. If any fault is found, replace the faulty parts.
- Remove any foreign particles before cleaning by scraping them off using plastic scraper or bristle-headed brush **C**. Immerse the disassembled parts in nonflammable solvent **A** (DAIDO KAGAKU KOGYO DAICLEANER T-30), then take them out and blow compressed air **B** on them.



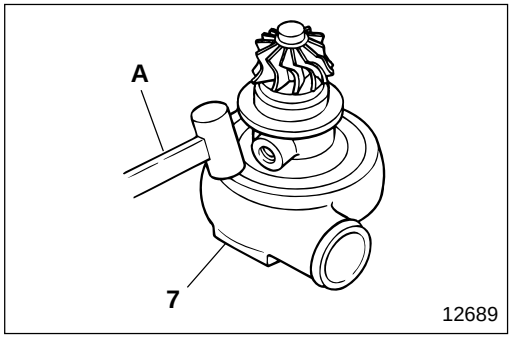
6 Installation of snap ring

Install snap ring **6** into compressor cover **7** with taper surface **A** upward.

WARNING

Use your hand to hold snap ring 6 in place to prevent it from springing out.

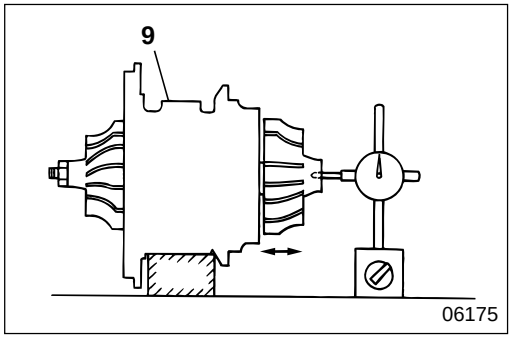
https://truckmanualshub.com/



7 **Removal of compressor cover**

CAUTION

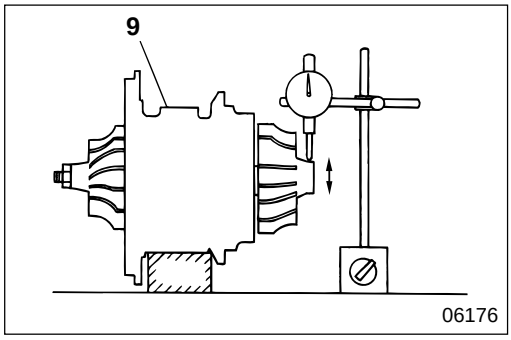
- **When removing compressor cover 7, tap all around the circumference lightly so as not to damage the compressor cover.**
- **Avoid hitting the compressor wheel near compressor cover 7, since the blade of the compressor wheel can be easily bent.**



9 **Inspection of cartridge assembly**

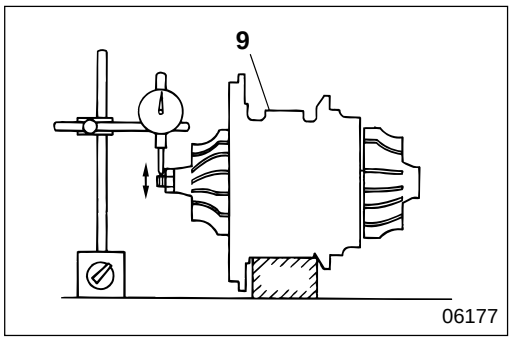
(1) Play in the shaft direction of the shaft and turbine wheel assembly

If the measured value deviates from the standard value, replace cartridge assembly **9**.



(2) Play at right angles to the shaft of the shaft and turbine wheel assembly

- Play on turbine wheel side
  If the measured value is higher than the limit, replace cartridge assembly **9**.



- Play on compressor wheel side
  If measured value is higher than the limit, replace cartridge assembly **9**.

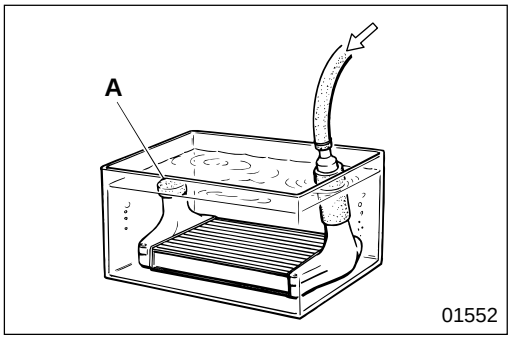
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1, 3, 5, 7, 9, 11	Clamp	2.9 to 3.4 {2.2 to 2.5, 0.3 to 0.35}	—
14	Boost air temperature sensor	14.7±2 {11±1.4, 1.5±0.2}	—



◆ Service procedure

13 **Inspection of intercooler**

- Fit plug **A** on one of the air inlets of intercooler **13** and connect a hose to the other, then lower the intercooler into the water tank. Apply air at the specified pressure (150 kPa {21 lbf/in², 1.5 kgf/cm²}) from the hose side and check for air leaks.
- If air leaks, replace intercooler **13**.

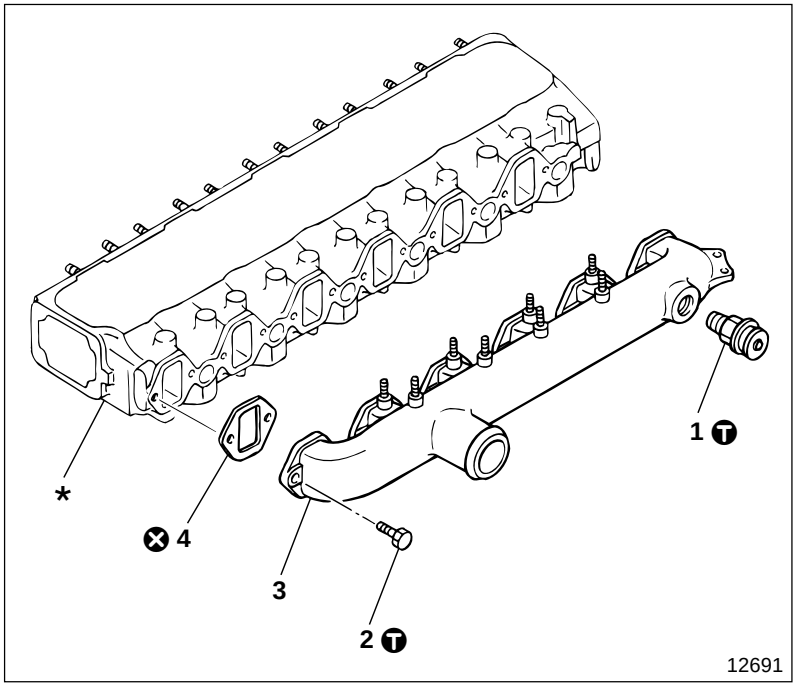
INTAKE MANIFOLD



● **Disassembly sequence**

1 Over-boost valve
2 Bolt
3 Intake manifold
4 Gasket

* : Cylinder head Gr 11
⊗ : Non-reusable parts

● **Assembly sequence**

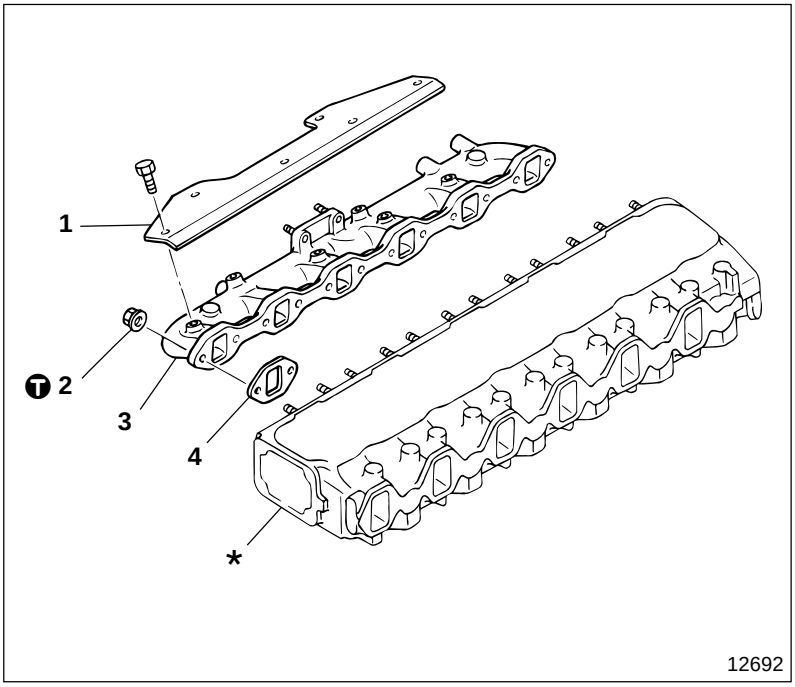
Follow the disassembly sequence in reverse.

T Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Over-boost valve	49 {36, 5}	—
2	Bolt (Intake manifold mounting)	17 to 25 {12 to 19, 1.7 to 2.6}	—

https://truckmanualshub.com/



● **Disassembly sequence**

1 Insulator
2 Nut
3 Exhaust manifold
4 Gasket

*** : Cylinder head Gr 11
⊗ : Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

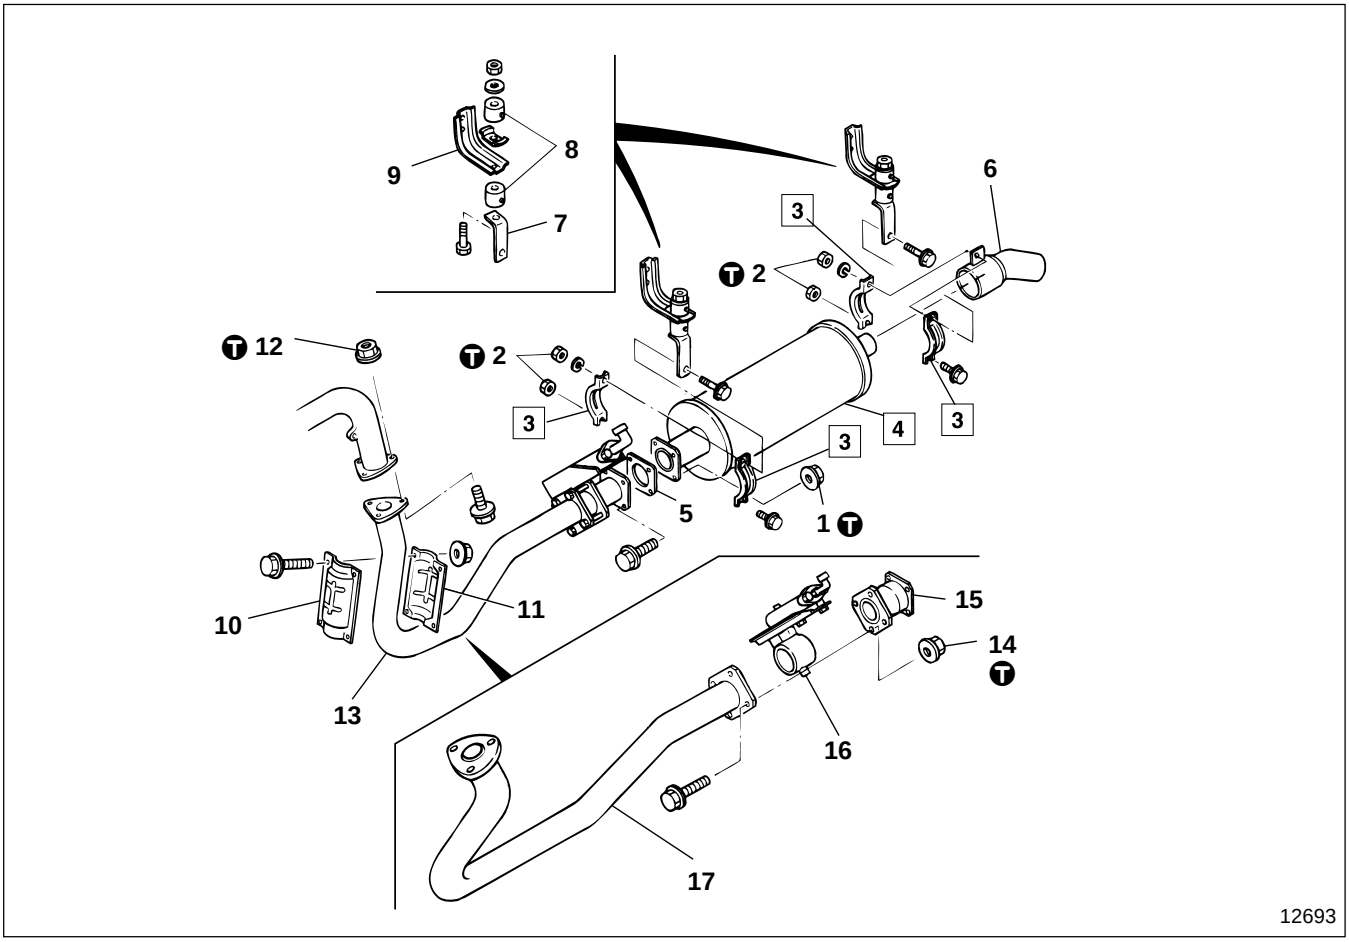
Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Nut (Exhaust manifold mounting)	58 {43, 5.9}	—

https://truckmanualshub.com/

EXHAUST PIPE AND MUFFLER



● **Disassembly sequence**

1 Nut
2 Nut
3 Clamp
4 Muffler
5 Gasket
6 Tail pipe
7 Pipe clamp stay
8 Rubber cushion
9 Exhaust pipe hanger
10 Exhaust pipe insulator
11 Exhaust pipe cover
12 Nut
13 Front pipe assembly
14 Nut
15 Center pipe
16 Exhaust brake unit Gr 35A, B
17 Front pipe

● **Assembly sequence**

Follow the disassembly sequence in reverse.

WARNING

- **Never hit or kick muffler 4, or the catalyzer in the muffler will be damaged.**
- **A small amount of water sometimes collects inside muffler 4. Never touch this water, if you do by mistake, wash it off immediately with clean water.**

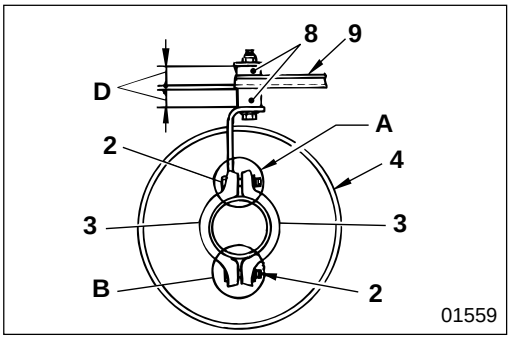
T Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Muffler mounting)	43 {32, 4.4}	—
2	Nut (Clamp tightening)	20 {14, 2}	—
12	Nut (Front pipe assembly mounting)	58 {43, 5.9}	—
14	Nut (Exhaust brake unit mounting)	58 {43, 5.9}	—

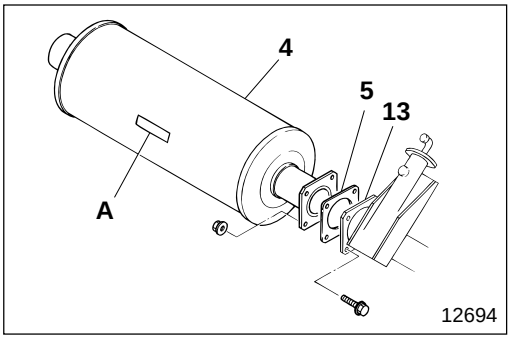
https://truckmanualshub.com/

◆ Service procedure



3 **8** **Installation of clamp and rubber cushion**

- Tighten bolt **2** temporally to let clamp **3** move slightly.
- Tighten bolt **2** until it makes contact with area **A** of clamp **3**.
- After tightening area **A**, tighten area **B** using bolt **2**.
- Tighten until dimension **D** of rubber cushion **8** is as follows:
  D : Before tightening 25 mm {0.98 in.}
  After tightening 23 mm {0.91 in.}



4 **Installation of muffler**

Install muffler **4** on front pipe assembly **13** in the direction as illustrated.
A : Part No. marked position

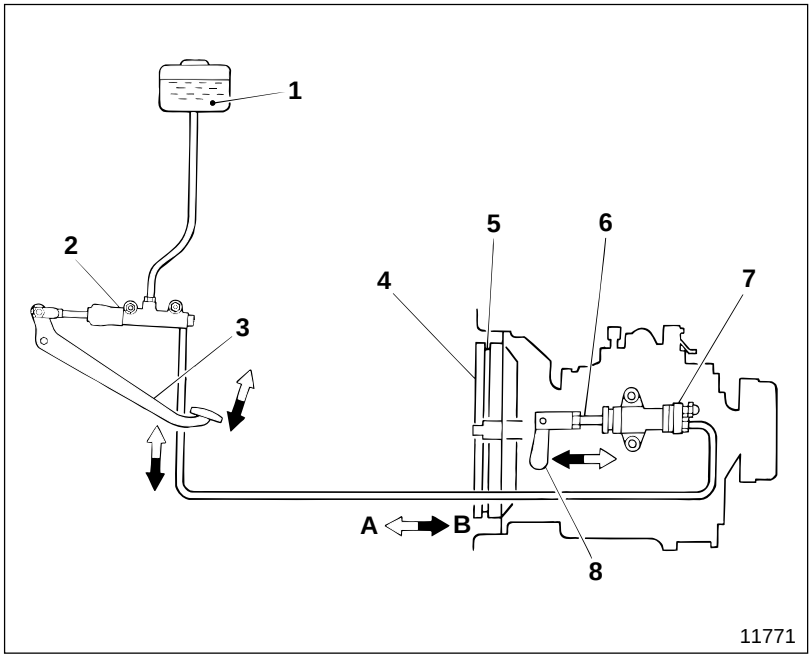
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Item		Specifications
Clutch	Model	C5M33
Drive type		Strap drive
Clutch disc	Type	Dry, single plate type
Pressure plate	Type	Coil spring type
Control system		Hydraulic pressure type
Clutch master cylinder	Manufacturer	NABCO
Clutch power cylinder	Manufacturer	NABCO

STRUCTURE AND OPERATION

Clutch Control

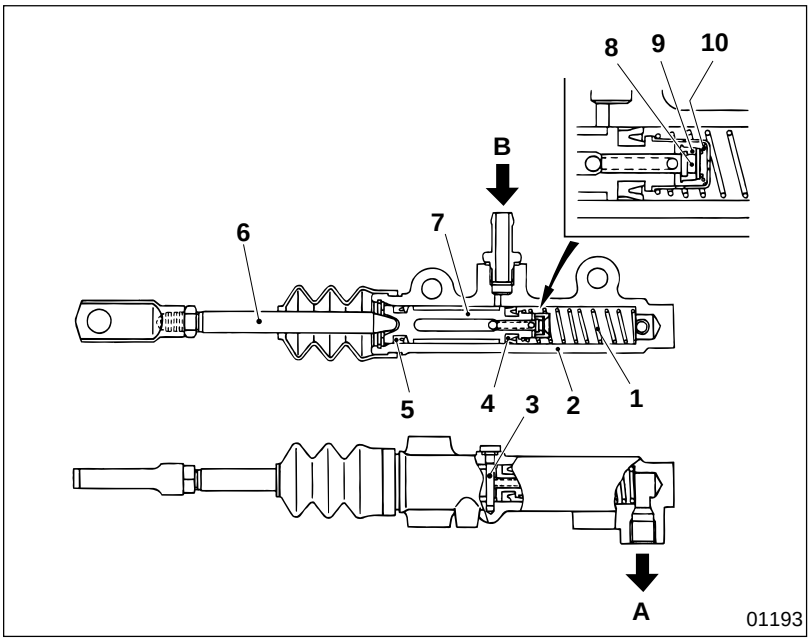


1 Fluid tank
2 Clutch master cylinder
3 Clutch pedal
4 Flywheel
5 Clutch disc
6 Push rod
7 Clutch power cylinder
8 Release fork shaft

A : Engine power transmitted
B : Engine power cut off

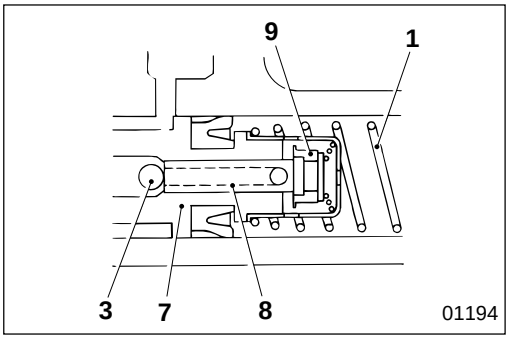
https://truckmanualshub.com/

Clutch Master Cylinder



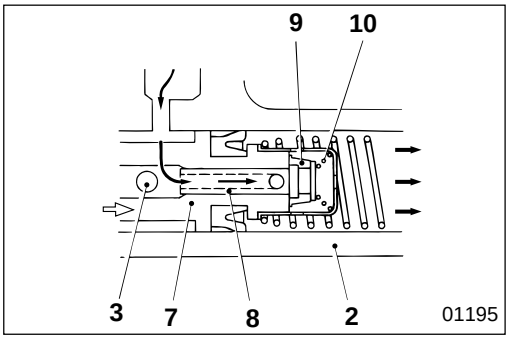
1 Return spring
2 Cylinder
3 Supply valve stopper
4 Primary cup
5 Secondary cup
6 Push rod
7 Piston
8 Supply valve rod
9 Supply valve
10 Supply valve spring

A : To clutch power cylinder
B : From fluid tank



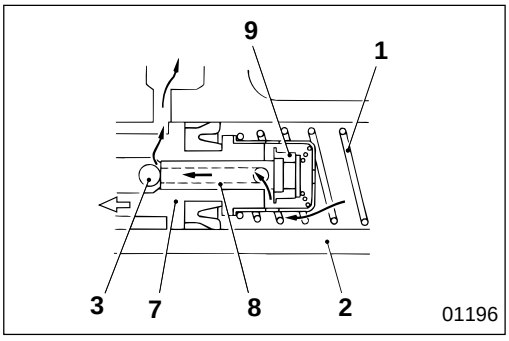
Before clutch pedal is depressed

- As piston **7** is pressed towards the push rod side by return spring **1**, supply valve rod **8** rests against supply valve stopper **3**, and supply valve **9** remains open.
- Thus, the passage between the fluid tank and the clutch is open.



When clutch pedal is depressed

- As push rod **6** pushes piston **7**, supply valve rod **8** moves away from supply valve stopper **3**, and supply valve **9** is closed by the repercussive force of supply valve spring **10**.
- As piston **7** is pressed further, the hydraulic pressure generated within cylinder **2** actuates the clutch power cylinder.
- This results in fluid being supplied in direct proportion to the movement of piston **7**.

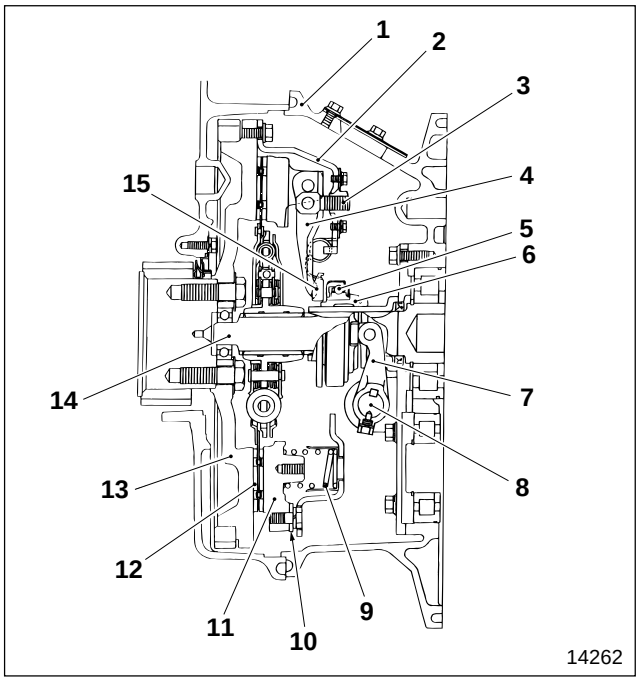


When clutch pedal is released

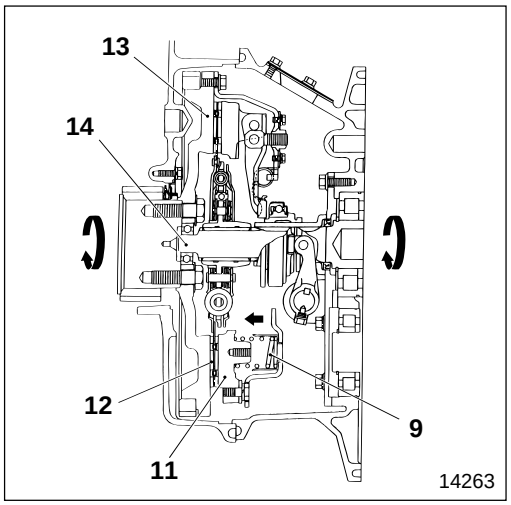
- As piston **7** is pushed back by the hydraulic pressure from cylinder **2** and the repercussive force of return spring **1**, supply valve rod **8** hits valve stopper **3** and supply valve **9** opens.
- Thus, the fluid in the clutch power cylinder side returns to the fluid tank and the hydraulic pressure drops to zero.

https://truckmanualshub.com/

Clutch

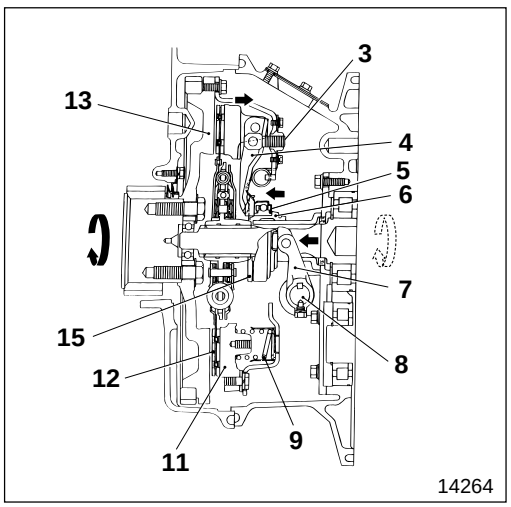


1 Clutch housing
2 Clutch cover
3 Support lever
4 Release lever
5 Release bearing
6 Clutch shifter
7 Release fork
8 Release fork shaft
9 Pressure spring
10 Strap plate
11 Pressure plate
12 Clutch disc
13 Flywheel
14 Drive pinion
15 Release lever plate



When clutch pedal is released

- Pressure plate **11**, activated by pressure spring **9**, presses clutch disc **12** firmly against flywheel **13**.
- Clutch disc **12** forced against flywheel **13** runs together with the flywheel and transmits power from the engine to transmission drive pinion **14**.



When clutch pedal is depressed

- Hydraulic pressure generated within the clutch master cylinder activates the clutch power cylinder. Thus, release fork shaft **8** actuates release fork **7**, pushing forward release bearing **5** and clutch shifter **6**, which in turn push release lever plate **15** and release lever **4**.
- Release lever **4**, using support lever **3** as a fulcrum, compresses pressure spring **9** and retracts pressure plate **11**, creating a clearance between clutch disc **12** and flywheel **13**, cutting off the transmission of engine power.

Possible causes \ Symptoms		Clutch disengaged but drags	Clutch slips	Clutch does not engage smoothly	Clutch makes noise on disengagement	Clutch makes noise on engagement	Judder when vehicle starting	Remarks
Pressure plate and lever assembly	Release bearing faulty	○			○			
	Release lever heights uneven	○	○	○			○	
	Pressure plate warped or faulty	○	○	○			○	
	Pressure spring fatigued		○	○		○		
	Strap bolts loose						○	
	Strap plate bent				○			
Clutch disc	Disc deformed	○		○			○	
	Disc rivets loose			○			○	
	Disc torsion spring fatigued or fractured		○	○	○	○	○	
	Spline worn	○			○	○	○	
	Spline rusted	○		○				
	Facing worn		○					
	Facing surface hardened		○	○			○	
	Facing oily or greasy		○	○			○	
Clutch pedal	Pedal free play inadequate		○					
	Pedal free play excessive	○						
	Pedal stroke inadequate	○						
	Return spring fatigued		○					
	Pedal friction surfaces faulty			○			○	
Clutch master cylinder	Piston and piston cup sliding movement faulty	○	○	○				
	Spring fatigued	○	○	○				
	Brake fluid port clogged	○	○	○				
Clutch power cylinder	Return spring fatigued	○	○	○				
	Piston and piston cup sliding movement faulty	○	○	○				
	Brake fluid port clogged	○	○	○				
Clutch control	Release bearing faulty						○	
	Clutch shifter sliding movement faulty						○	
	Clutch shifter lubricated incorrectly						○	
	Clutch release fork deformed						○	
Transmission drive pinion spline area worn		○				○		Gr 22
Engine idling speed too slow						○		Gr 13
Engine mounting fatigued							○	Gr 10
Flywheel warped, deformed or stepped wear		○	○	○			○	Gr 11
Flywheel pilot bearing faulty		○			○			
Air mixed in clutch hydraulic system		○						
Clutch hydraulic system leaking		○

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Clutch Fluid (Brake Fluid) Replacement and Air Bleeding

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

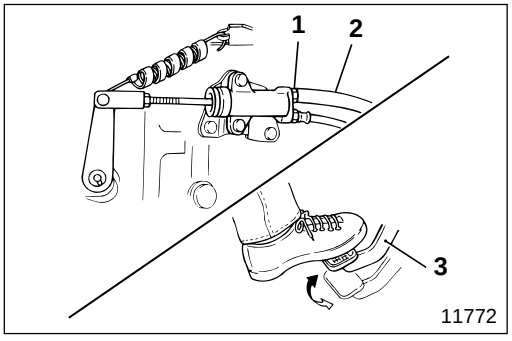
Location	Parts to be tightened	Tightening torque	Remarks
1	Air bleeder	25 to 34 {18 to 25, 2.5 to 3.5}	—

Fluid

Location	Points of application	Kinds	Quantity
4	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

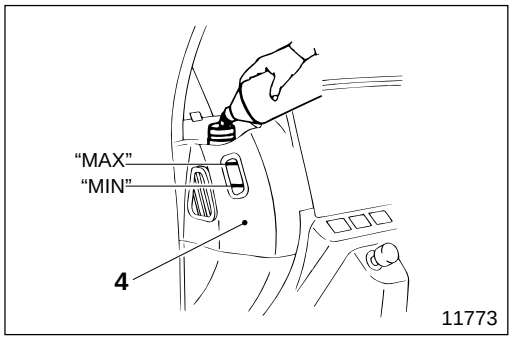
CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system to swell, resulting in faulty clutch operation.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will cause faulty clutch operation.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oils.**



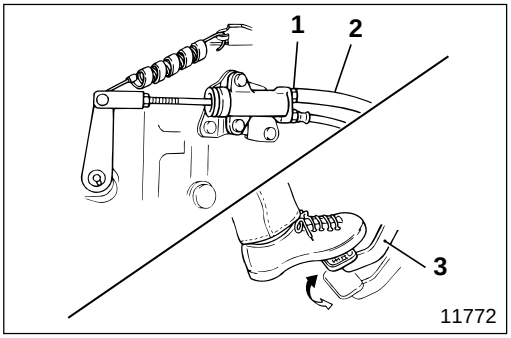
(1) Replacement of brake fluid

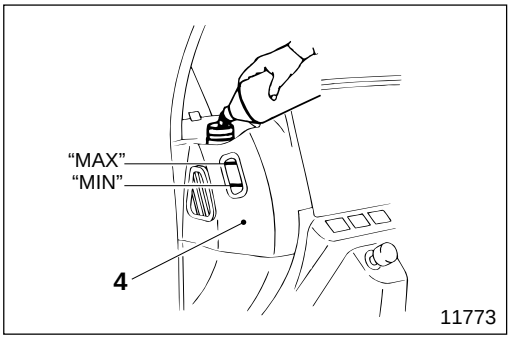
- Attach vinyl pipe **2** to air bleeder **1** of the clutch power cylinder.
- Loosen air bleeder **1** and depress clutch pedal **3** several times to drain brake fluid completely.



- Supply new brake fluid to the "MAX" level of fluid tank **4**. Depress clutch pedal **3** repeatedly until the old brake fluid discharged from vinyl pipe **2** is replaced by the new brake fluid.

https://truckmanualshub.com/





(2) Air bleeding of clutch system

NOTE

Carry out this operation maintaining the brake fluid level in fluid tank 4 between "MAX" and "MIN".

- Attach vinyl pipe **2** to air bleeder **1** of the clutch power cylinder as in the replacement procedure.
- Fill fluid tank **4** with brake fluid, and loosen air bleeder **1** of the clutch power cylinder, then depress clutch pedal **3** continuously.
- Keep depressing clutch pedal **3**, and tighten air bleeder **1** when air is bled completely.
- Depress clutch pedal **3** several times again, then keep it depressed at its fullest extent.
- With the clutch pedal depressed, loosen air bleeder **1** to drain brake fluid containing air. Release the pedal after tightening the air bleeder.
- Repeat this operation until air is no longer present in the fluid being drained.
- When this operation is completed, tighten air bleeder **1** at specified torque.
- Check that brake fluid is at the "MAX" level of fluid tank **4**, and supply new brake fluid if necessary.
- Check for brake fluid leakage from each of the parts with clutch pedal **3** depressed.

https://truckmanualshub.com/

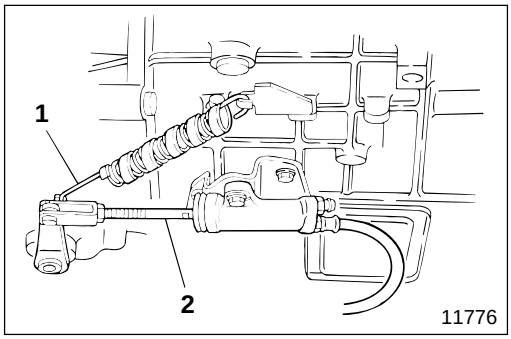
Clutch Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2	Push rod stroke	3.6 {0.14}	—	Adjust or replace
4	Clutch pedal free play	32 to 44 {1.26 to 1.73}	—	Adjust or replace

Inspect and adjust the free play of the clutch pedal, by noting the stroke of the clutch power cylinder push rod, after the clutch pedal has been correctly adjusted.



[Inspection]

- Bleed air from the clutch system. P21-7
- Adjust the clutch pedal. P21-11
- Disconnect return spring **1** and check the free play of push rod **2** by hand. If the measured value deviates from the standard value, adjust as follows:
