
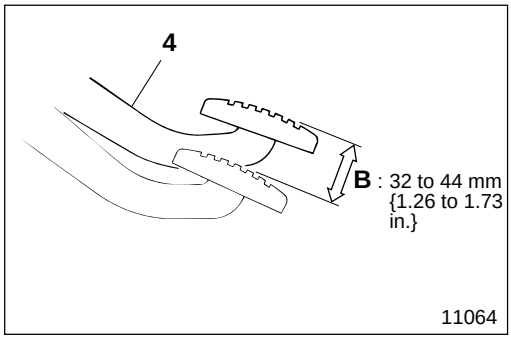
[Adjustment]

- Loosen nut **3** and turn head **A** of push rod **2** to extend the push rod until it stops.
- Then, slacken off head **A** of push rod **2** by the following value and retighten nut **3**.

  Amount of slackening off : Approximately three turns

- If push rod **2** does not return by the above amount, replace the clutch disc because it is worn beyond the limit.



[Confirmation]

Push clutch pedal **4** with your hand until you feel a resistance and measure free play **B**.

If the measured value deviates from the standard value, readjust or replace the clutch disc.

https://truckmanualshub.com/

◆ Service procedure

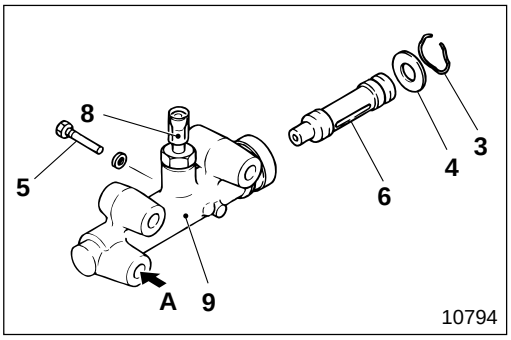
1 Adjustment of push rod length

If dimension **A**, as illustrated, deviates from the standard value, loosen lock nut **B** of push rod **1**, and adjust the length by turning head **C**.
After adjustment, tighten the lock nut at specified torque.



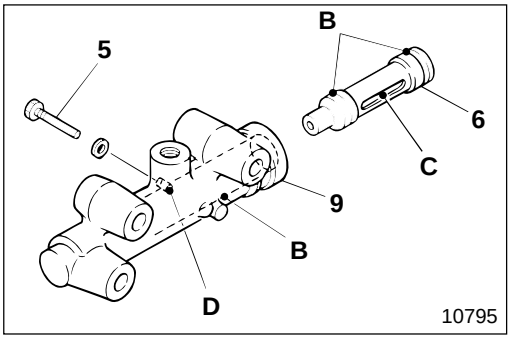
6 Piston assembly

[Removal]

- Remove piston stop ring **3**, piston stop plate **4** and supply valve stopper **5**.
- Block nipple **8** of cylinder **9**, and apply compressed air from **A** as illustrated to remove piston assembly **6**.

WARNING⚠

You must apply compressed air gradually when you remove piston assembly 6. If you applied compressed air strongly at one time, the piston assembly would be violently ejected.



[Installation]

- Before installing the assembly, apply rubber grease to friction surface **B** of piston assembly **6** and cylinder **9**.
- To install the piston, align groove **C** of piston assembly **6** with hole **D** of cylinder **9**, then insert valve stopper **5** to hold the piston in place.

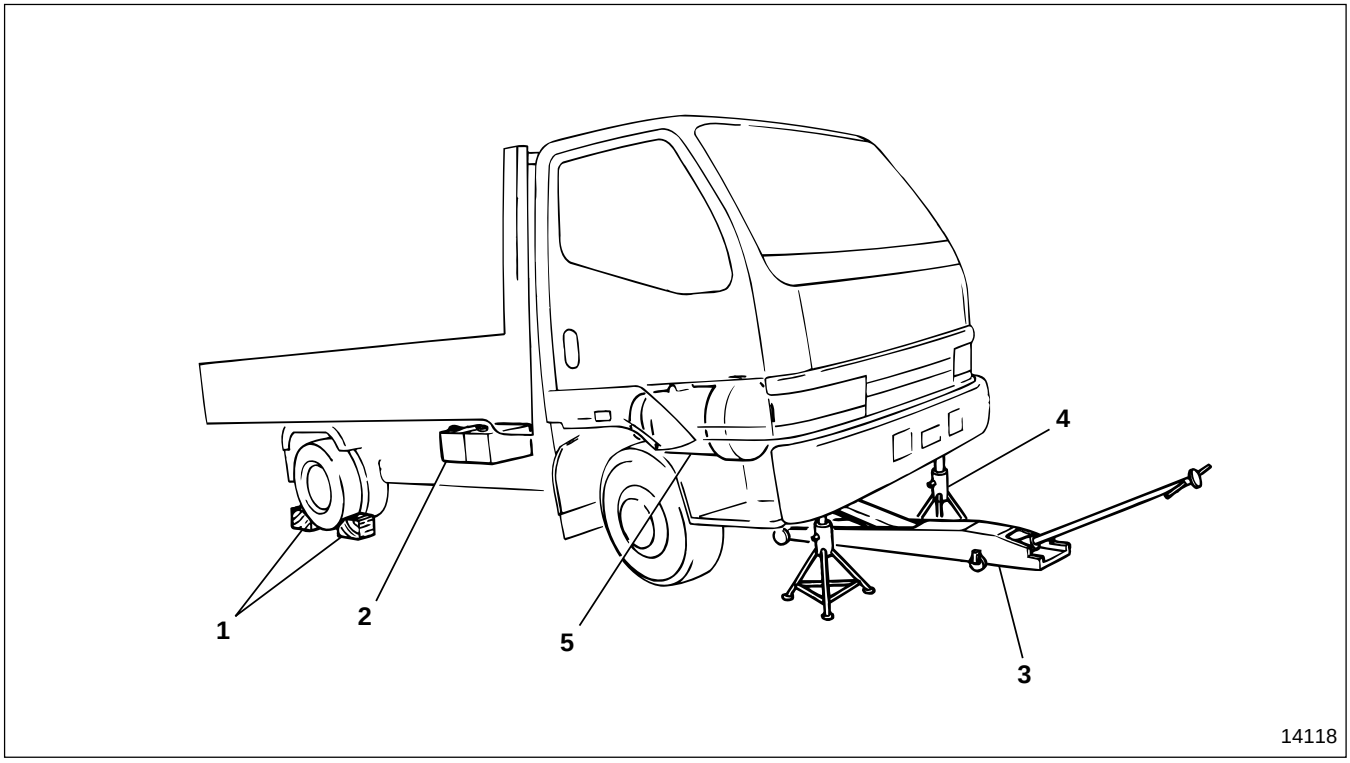
WORK BEFORE REMOVAL AND INSTALLATION OF CLUTCH BODY



● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect the negative battery cable. Gr 54
3 Jack up the front axle using a garage jack.
4 Support the front frame on rigid racks.
5 Remove the transmission. Gr 22

WARNING

- **Since the parking brake will be removed, naturally it cannot be used. Therefore, you must chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION

Keep the transmission in neutral throughout the operation.

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

https://truckmanualshub.com/

MEMO

Unit : mm {in.}

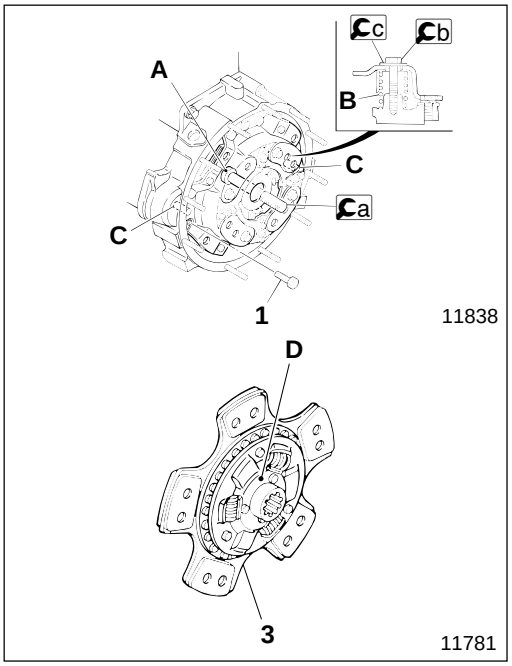
Location	Tool name and shape	Part No.	Application
2	Stopper bolt Washer 	ME521425 < Stopper bolt > ME521426 < Washer >	Removal and installation of pressure plate and lever assembly
3	Clutch alignment arbor 	MH061986	Holding of clutch disc



◆ Service procedure

2 Removal and installation of pressure plate and lever assembly

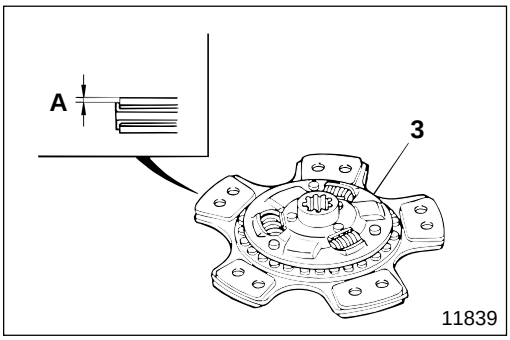
- Insert Ca clutch alignment arbor into flywheel pilot bearing **A** to hold clutch disc **3**.
- Compress pressure springs **B** using Cb stopper bolt and Cc washer, then remove bolt **1**.
- For installation, follow the removal sequence in reverse.
- Install clutch disc **3** so that part No. **D** is visible.
- Tighten bolts **1** gradually, in diagonal order, to specified torque.

CAUTION

- **Make sure you use Cb stopper bolts and Cc washers (four points) when you remove bolt 1. If you do not, pressure springs B might force up pressure plate and lever assembly 2, damaging the strap plate, and separate and fall off knock pin C.**
- **Remember to remove Cb stopper bolts and Cc washers after installation (four points). If the stopper bolts and washers are left on, the clutch will not engage.**

NOTE

Clean flywheel contact surface of clutch disc 3 before installing pressure plate and lever assembly 12.

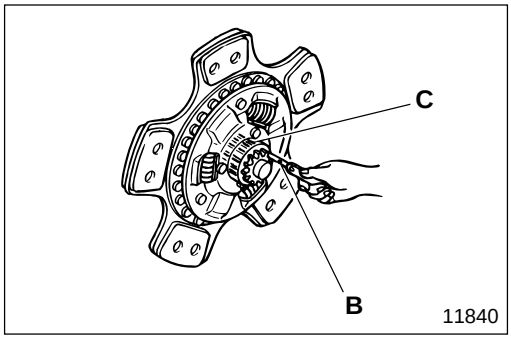


3 Clutch disc

(1) Height of facing

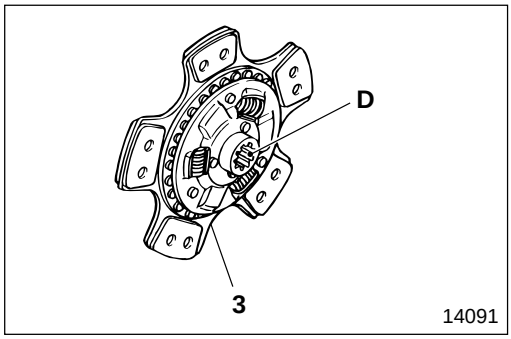
Measure illustrated dimension **A** of clutch disc **3**. If the measured value is lower than the limit, replace the clutch disc.

https://truckmanualshub.com/



(2) Play in direction of revolution

- First, reshape feeler gauge **B** for insertion into drive pinion spline **C**, and measure play at the spline.
- If the measured value is higher than the limit, replace clutch disc **3** or the drive pinion.
- Carry out the same measurement on new clutch disc **3**. If the measured value is higher than the limit, replace the drive pinion.



(3) Applying grease

Apply grease evenly to spline **D** and the entire tooth surface of clutch disc **3**. Apply grease to the grease groove of spline up to its large diameter.

CAUTION

Be careful not to apply too much grease because excessive grease causes grease leakage from the spline D and makes the clutch slippery.

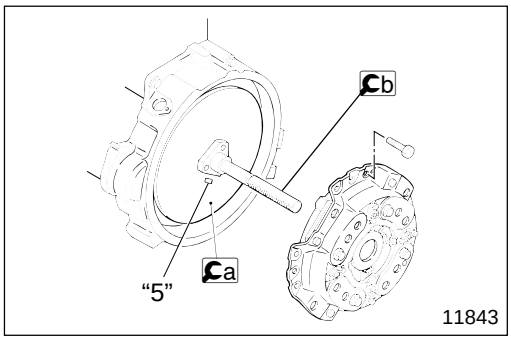
10	Clutch installer  01277	MH061051	Removal and installation of clutch cover

https://truckmanualshub.com/

◆ Service procedure



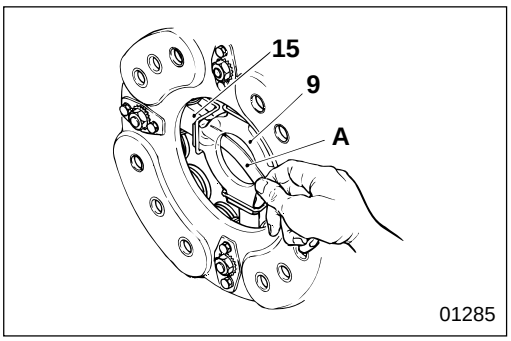
● **Work before disassembly**

Put alignment marks on all parts before disassembly.

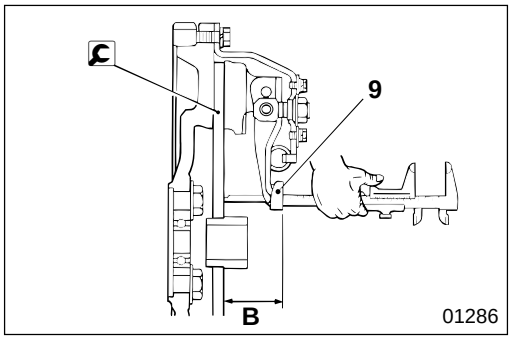
● **Inspection and adjustment after assembly**

(1) Measurement of release lever height

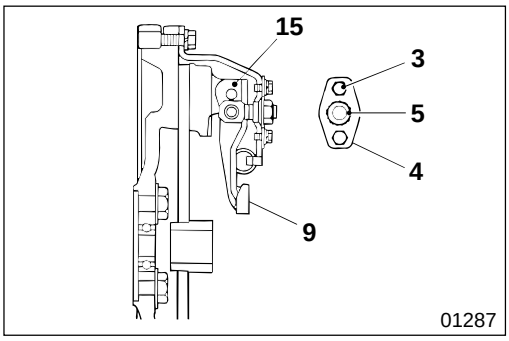
- Install the pressure plate and lever assembly using Ca clutch master plate and Cb clutch alignment arbor in place of the clutch disc.
- Install Ca clutch master plate so that identification mark "**5**" is visible.



- Make certain that the clearance between release lever **15** and release lever plate **9** is such that a 0.05 mm {0.0020 in.} feeler gauge **A** cannot be inserted between them.
  If there is excessive clearance, press in strongly using your fingers, and return slowly to lessen the clearance.

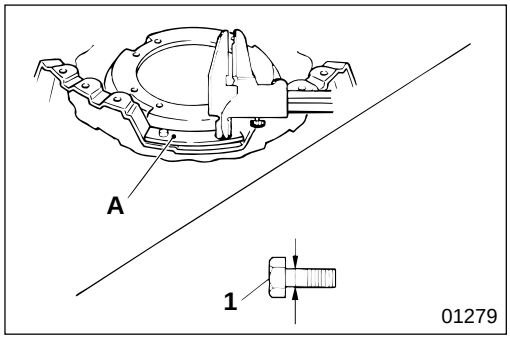


- Measure dimension **B**, C clutch master plate to upper surface of release lever plate **9** (at four points).
  If the measured value does not conform to the standard value, adjust as explained below. Note that even if the measured value is within the standard value, adjustment is necessary if the difference between any two points is higher than 0.5 mm {0.020 in.}.



(2) Adjustment of release lever height

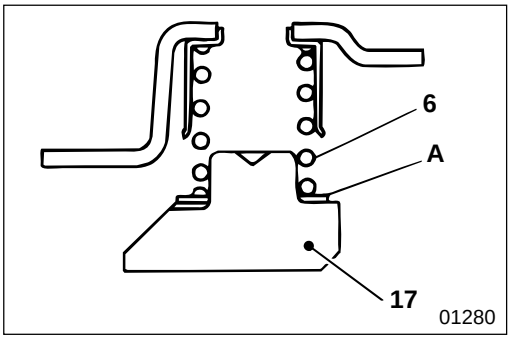
Remove bolt **3** and lock plate **4**, then turn support nut **5** to adjust.
After adjustment, install lock plate **4**, then lock support nut **5**, and check the height of release lever plate **9**.



1 **A** **Clearance between strap bolt and strap plate**

If the measured value is higher than the limit, replace the faulty parts.
A : Strap plate

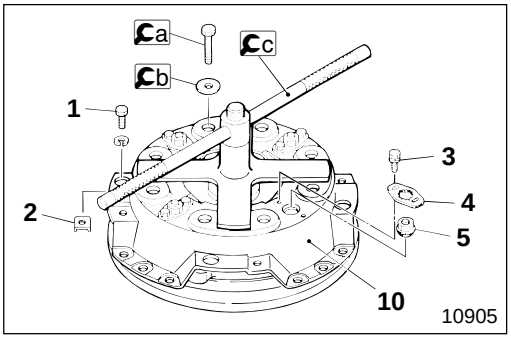
https://truckmanualshub.com/



6 Installation of pressure spring

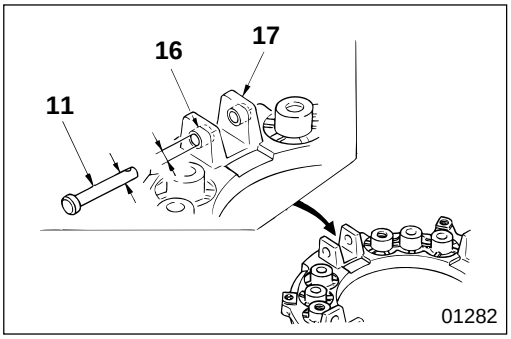
When pressure plate **17** has been corrected by grinding, place adjusting washer **A** equivalent to the correction depth between the plate and pressure spring **6**.

Amount of correction made	Thickness of washers and quantity
Less than 1 mm {0.039 in.}	Not required
1 to 2 mm {0.039 to 0.079 in.}	1×1.2 mm {0.047 in.}
2 to 3 mm {0.079 to 0.12 in.}	2×1.2 mm {0.047 in.}, or 1×2.3 mm {0.091 in.}



10 Removal and installation of clutch cover

- Compress pressure spring **6** using Cc clutch installer, and remove Ca stopper bolt, Cb washer, strap bolt **1**, washer **2**, bolt **3**, lock plate **4** and support nut **5**.
- Gradually loosen Cc clutch installer until pressure spring **6** is fully extended, then remove clutch cover **10**.
- For installation, follow the removal procedure in reverse.

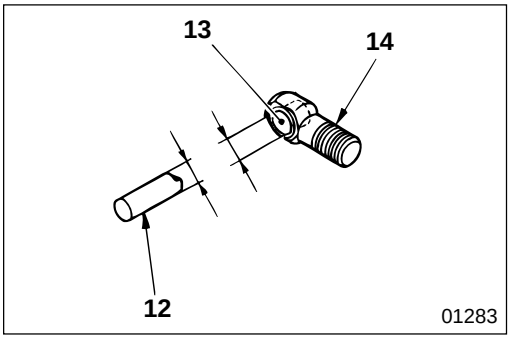


11 16 Clearance between release lever pin and bushing

If the measured value is higher than the limit, replace the faulty parts.

NOTE

Measure the bore of bushing 16 as press-fitted in pressure plate 17.

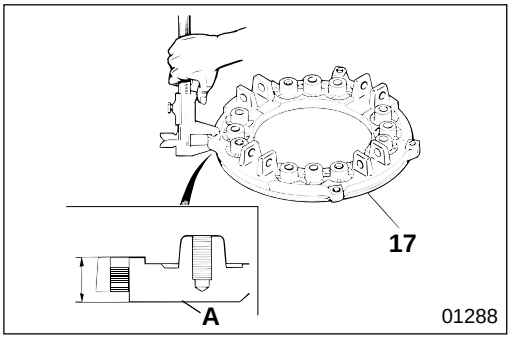


12 13 Clearance between support lever pin and bushing

If the measured value is higher than the limit, replace the faulty parts.

NOTE

Measure the bore of bushing 13 as press-fitted in support lever 14.



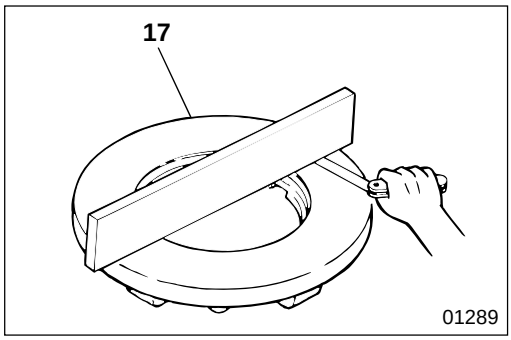
17 Pressure plate

(1) Thickness

Measure friction surface **A** of pressure plate **17** (measuring position must be within the maximum and minimum diameters), and if the measured value is lower than the limit, replace the pressure plate.

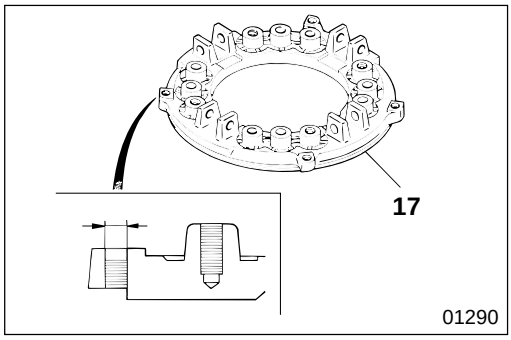
Maximum diameter	320 mm {12.6 in.}
Minimum diameter	220 mm {8.66 in.}

https://truckmanualshub.com/



(2) Flatness

If the measured value is higher than the limit, replace pressure plate **17**.



(3) Strap bolt fitting hole inner diameter

If the measured value is higher than the limit, replace pressure plate **17**.

1 Drive pinion
2 4th and 5th synchronizer assembly
3 Shift rail
4 Interlock mechanism
5 2nd and 3rd synchronizer assembly
6 Shift fork
7 1st and reverse constant mesh assembly
8 6th synchronizer assembly < S6 >
9 Reverse idler gear
10 Countershaft
11 Mainshaft

The transmission changes revolution and torque generated by the engine into those that match the vehicle's power requirement (driving force). Revolution and torque are increased or decreased by making a selection from several sets of engaged gears. The transmission uses an interlock mechanism to avoid double engagement.

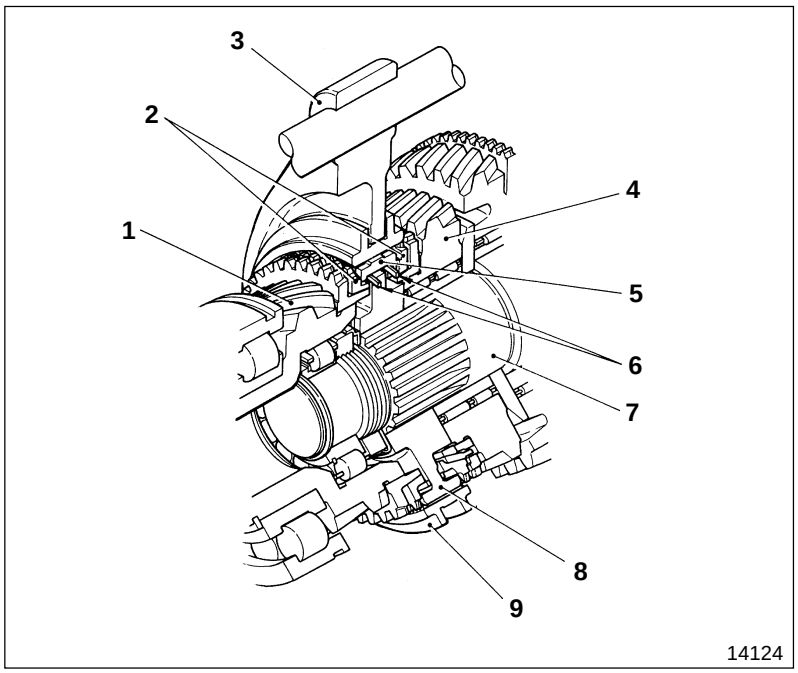
https://truckmanualshub.com/

Synchromesh Mechanism

This vehicle has two synchromesh mechanisms, a single cone type, and a double cone type, and uses the key system. The single or double cone type is used depending on the gear positions as shown below:

Synchromesh type	Parts used
Single cone type	4th, 5th, 6th
Double cone type	2nd and 3rd

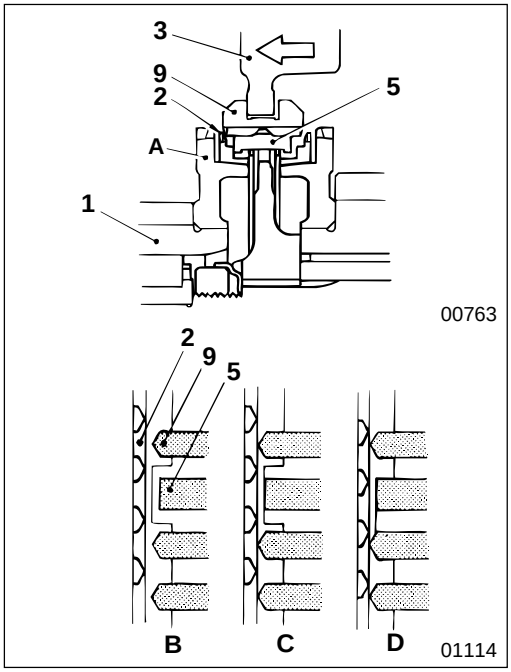
Single Cone Type



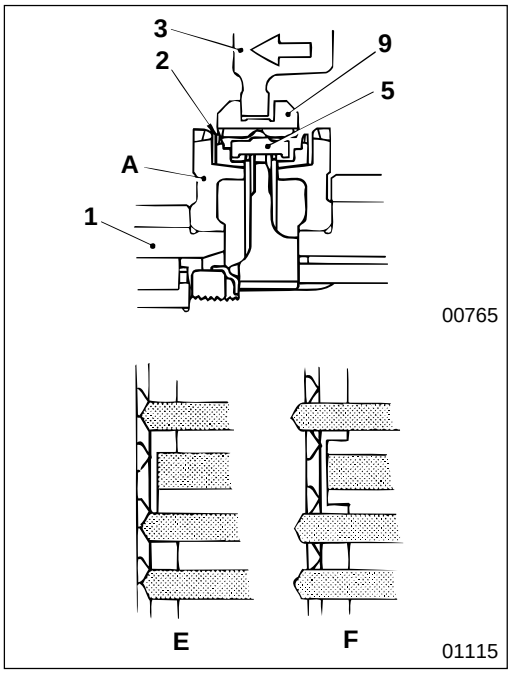
1 Drive pinion
2 Synchronizer ring
3 4th and 5th shift fork
4 4th gear
5 Shifting key
6 Shifting key spring
7 Mainshaft
8 Synchronizer hub
9 Synchronizer sleeve

- The following descriptions are for 4th and 5th gear
  The inside of synchronizer hub **8** engages the spline of mainshaft **7** and rotates with it. The outside of the synchronizer hub has a spline that engages synchronizer sleeve **9** and three keyways.
- Shifting keys **5** are inserted into these keyways. When the gear shift is in neutral, a protrusion in the center of each shifting key engages a groove inside the synchronizer sleeve and the shifting keys are pressed against the inside of the synchronizer sleeve by shifting key springs **6**.
- Synchronizer rings **2** are inserted into drive pinions **1** in the front and rear of synchronizer hub **8**, and the taper cone of 4th gear **4**.
- The internal tapers of synchronizer rings **2** have fine threads, and the outer splines engage synchronizer sleeve **9**. On the hub side of the synchronizer rings are three keyways in which the ends of shifting keys **5** are inserted. These keyways are wider than the width of the shifting keys.
- Synchronizer rings **2** rotate relative to synchronizer sleeve **9** by the amount of play of the keyways.

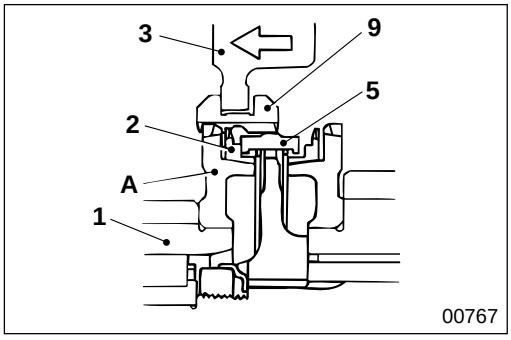
https://truckmanualshub.com/



- When the gear shift is in neutral (Figure **B**), moving shift fork **3** in the direction of the arrow as illustrated, moves synchronizer sleeve **9** slightly to the left. At the same time, shifting key **5**, the central protrusion of which engages the synchronizer sleeve, moves to the left and presses synchronizer rings **2** against taper cone **A** of drive pinion **1**. (Figure **C**)
- When the taper surfaces of synchronizer rings **2** make contact with the taper cone of the drive pinion, the taper surfaces of the synchronizer rings act as cone clutches. This frictional torque rotates the synchronizer rings in the rotating direction of the drive pinion by the amount of play between shifting key **5** and the synchronizer rings. The spline chamfers of the synchronizer rings and the spline chamfer of synchronizer sleeve **9** are offset from each other. (Figure **D**)
- The disengagement direction of synchronizer rings **2** is defined by the speed of rotation of the synchronizer—sleeve **9**, and the synchronized—drive pinion **1**. When increasing the vehicle speed by shifting up, disengagement is made in the opposite direction to rotation, and when decreasing the vehicle speed by shifting down, disengagement is made in the rotating direction.



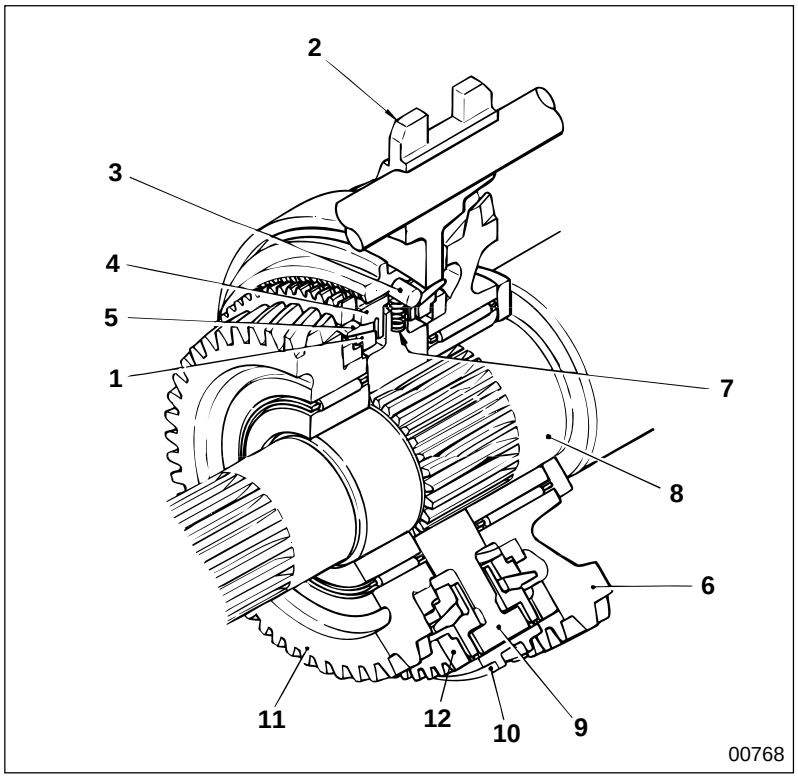
- When synchronizer sleeve **9** moves further to the left, synchronizer rings **2** prevent shifting key **5** from moving, and the synchronizer sleeve disengages from the protrusion of the shifting key.
- Since synchronizer rings **2** remain disengaged, the spline chamfer of synchronizer sleeve **9** presses the spline chamfers of the synchronizer rings, which in turn press the synchronizer rings against taper cone **A** of drive pinion **1**.
- As the frictional torque increases on the taper surfaces, the relative speed of the synchronizer and the synchronized gradually decreases.
  E : In synchronization
  F : After synchronization



- When synchronizer sleeve **9** and drive pinion **1** rotate at the same speed, synchronizer rings **2** no longer prevent the synchronizer sleeve from moving, and the synchronizer sleeve moves further to the left and smoothly engages the spline of taper cone **A** of drive pinion **1**, transmitting the driving force.

https://truckmanualshub.com/

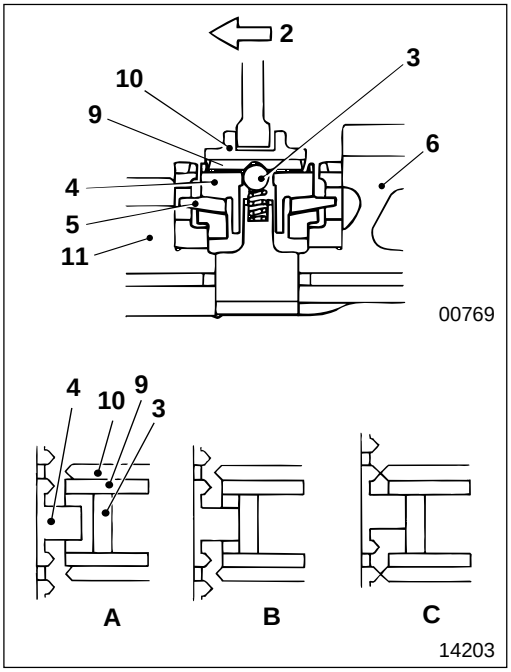
Double Cone Type



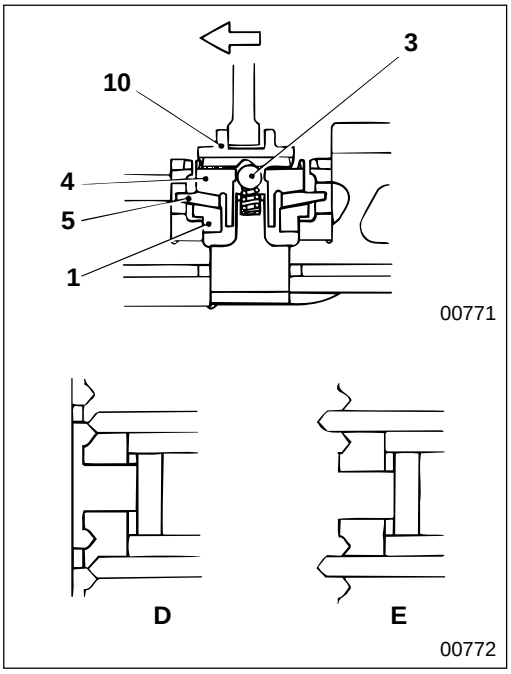
1 Synchronizer inner ring
2 2nd and 3rd shift fork
3 Shifting key
4 Synchronizer outer ring
5 Synchronizer center cone
6 2nd gear
7 Shifting key spring
8 Mainshaft
9 Synchronizer hub
10 Synchronizer sleeve
11 3rd gear
12 Dog clutch

- The following descriptions are for 2nd and 3rd gear
  The synchromesh structure and operation of the double cone type are basically the same as for the single cone type.
- Synchronizer center cone **5** is a taper cone independent of 2nd gear **6** and 3rd gear **11**, (both the inside and outside surfaces are tapered). The synchronizer center cone is between synchronizer inner ring **1** and synchronizer outer ring **4** to increase the synchronization capacity.
- Six protrusions on the outside of center cone **5** fit into corresponding gear holes, in the same manner as the taper cone of the single cone type. The center cone and the gear are installed as if integrated.
  Shifting key **3** is a cylinder installed so that the lengthwise direction of the cylinder is at right angles to the diameter direction of synchronizer hub **9**. Shifting key spring **7** is a coil spring inserted in a hole in the synchronizer hub, this spring presses the shifting key against the inside of synchronizer sleeve **10**.

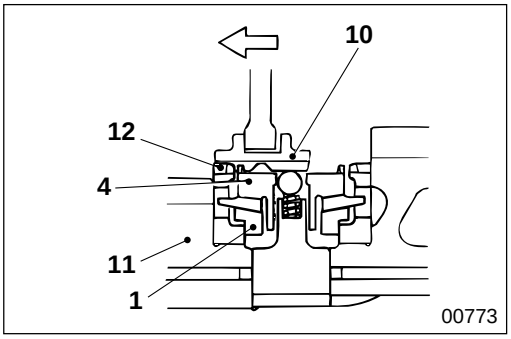
https://truckmanualshub.com/



- When the gear shift is in neutral (Figure **A**), moving shift fork **2** in the direction of the arrow as illustrated, moves synchronizer sleeve **10** slightly to the left. At the same time, shifting key **3**, the central protrusion of which engages the synchronizer sleeve, moves to the left and presses synchronizer outer ring **4** against synchronizer center cone **5**. (Figure **B**)
- When the taper surface of synchronizer outer ring **4** makes contact with the taper cone of synchronizer center cone **5**, the taper surface of the synchronizer outer ring acts as a cone clutch. This frictional torque rotates the synchronizer outer ring in the rotating direction of 3rd gear **11** by the amount of play between the synchronizer outer ring and synchronizer hub **9**. The spline chamfer of the synchronizer outer ring and the spline chamfer of synchronizer sleeve **10** are offset from each other. (Figure **C**)
- The disengagement direction of synchronizer outer ring **4** is defined by the speed of rotation of the synchronizer—the sleeve, and the synchronized—3rd gear **11**. When increasing the vehicle speed by shifting up, disengagement is made in the opposite direction to rotation, and when decreasing the vehicle speed by shifting down, disengagement is made in the rotating direction.



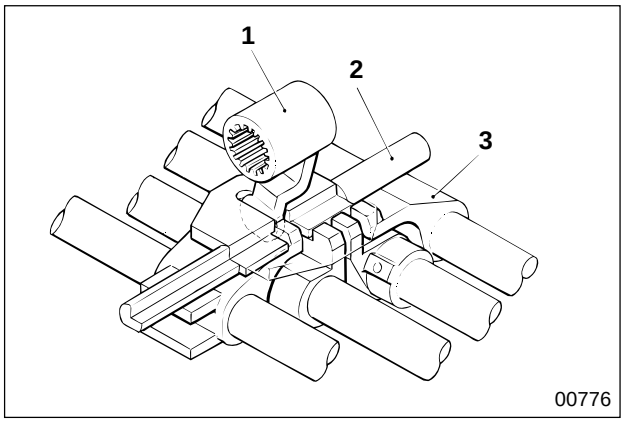
- When synchronizer sleeve **10** moves further to the left, synchronizer outer ring **4** prevents shifting key **3** from moving, and the synchronizer sleeve disengages from the protrusion of the shifting key.
- Since synchronizer outer ring **4** remains disengaged, the spline chamfer of synchronizer sleeve **10** presses the spline chamfer of the synchronizer outer ring, which in turn presses the synchronizer outer ring against the taper cone of synchronizer center cone **5**, and the frictional torque acts on the taper surface.
- As the frictional torque increases on the taper surface of synchronizer inner ring **1**, the relative speed of the synchronizer and the synchronized gradually decreases. The frictional torque acts on both sides of the synchronizer center cone. The double cone type has greater capacity for synchronization than the single cone type.
  D : In synchronization
  E : After synchronization



- When synchronizer sleeve **10** and 3rd gear **11** rotate at the same speed, synchronizer outer ring **4** no longer prevents the synchronizer sleeve from moving and the synchronizer sleeve moves further to the left and smoothly engages the spline of dog clutch **12** of the 3rd gear, transmitting the driving force.

https://truckmanualshub.com/

Interlock Mechanism



In the interlock mechanism, the rail beneath interlock plate **2** locks jaws **3**, (apart from the jaws shifted by gear shift slide lever **1**), preventing double engagement of gears.

https://truckmanualshub.com/

Possible causes \ Symptoms		Gears slip out of engagement	Gears hard to engage	Noise when engine is idling	Noise while cruising	Noise when changing gear
Transmission body faulty	Mainshaft rear lock nut loose	○	○			
	Mainshaft thrust washer worn	○	○			
	Mainshaft bearing worn or damaged	○	○			
	Synchronizer ring and synchronizer sleeve spline worn	○				
	Synchronizer ring and gears taper cone area worn		○			
	Mainshaft pilot bearing worn or damaged			○	○	
	Drive pinion bearing worn or damaged			○		
	Countershaft bearing worn or damaged			○		
	Needle bearings of gears worn or damaged			○	○	
	Mainshaft and countershaft bearings worn or damaged				○	
	Mainshaft and countershaft gears backlash excessive				○	
	Spline of gears worn					○
	Gears damaged				○	
	Gear oil insufficient				○	
Control mechanisms faulty	Control cable joint play	○	○			
	Set board assembly bushings worn	○				
	Shift rail steel ball and groove worn	○				
	Shift rail poppet spring fatigued or damaged	○				
	Shift rail sliding movement faulty		○			
	Shift fork jaws worn		○			
	Shift fork bent		○			
Clutch faulty	Clutch disengagement faulty		○			○
	Clutch pedal play faulty		○			
Synchronizer faulty	Contacting surfaces of synchronizer ring and gear taper cone worn					○
	Shifting key worn					○
	Shifting key spring deteriorated or damaged					○
	Synchronizer sleeve worn or damaged				○	○

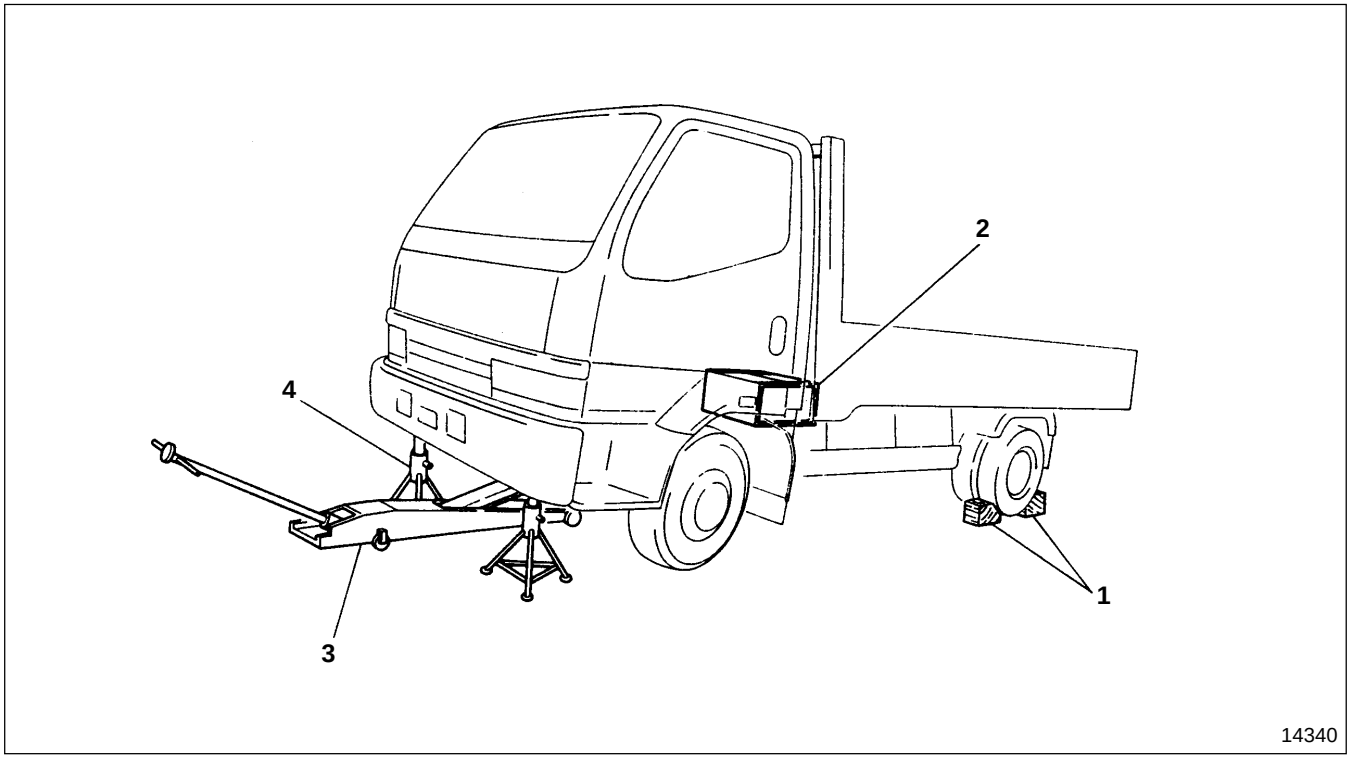
WORK BEFORE REMOVAL AND INSTALLATION OF TRANSMISSION ASSEMBLY



● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect negative battery cable. Gr 54
3 Jack up the front axle on a garage jack.
4 Support the front frame on jack stands.

WARNING⚠

- **Since the parking brake will be removed, naturally it cannot be used. Therefore, you must chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on jack stands.**
- **Leave the garage jack and jack stands in place until the entire operation is completed. Never remove them during the operation.**

CAUTION⚠

Keep the transmission in neutral throughout the operation.

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

https://truckmanualshub.com/

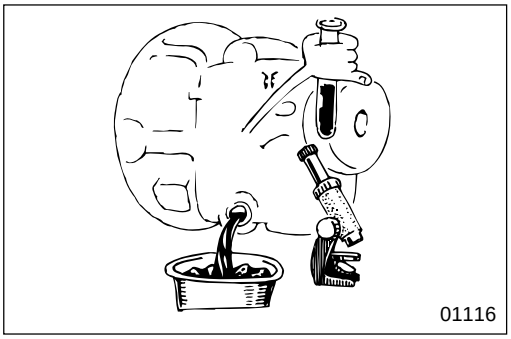
Lubricant and sealant

Location	Points of application	Kinds	Quantity
9	Thread area of inspection plug	THREEBOND 1105D	As required
10, 11	Thread area of drain plug	THREEBOND 1105D	As required
13	Spline of drive pinion	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

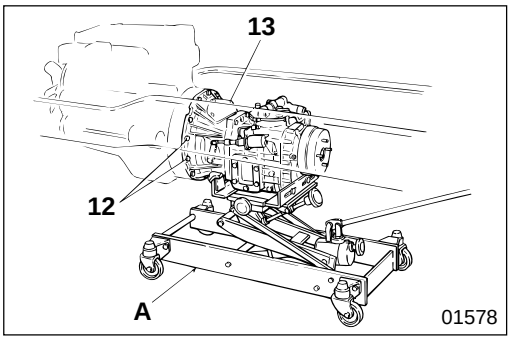
◆ Service procedure



● Oil change

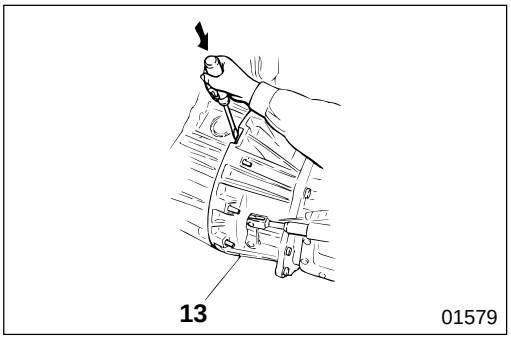
[Draining]
- When draining oil, check the quantity and quality of oil, especially for small pieces of metal and metal dust.
- Clean inspection plug **9** before reinstalling it because it is magnetic.

[Filling]
- Check that drain plugs **10**, **11** are tightened at specified torque.
- Pour in gear oil until the oil overflows from the inspection hole. (For oil quantity, see specifications.) See illustrations on page 22-12.



12 Removal of transmission mounting nut or bolt

- Support transmission assembly **13** on transmission jack **A**.
- Loosen transmission mounting nuts or bolts **12**.

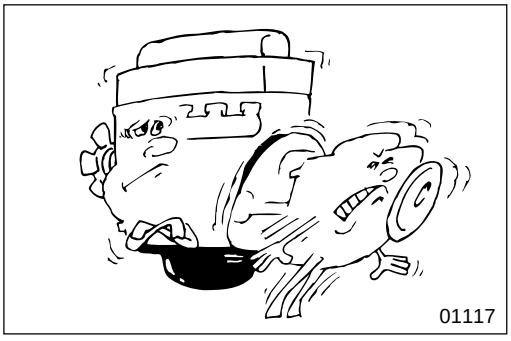


13 Transmission assembly

[Removal]
- Insert a screwdriver into the three removal grooves and pry transmission assembly **13** from the engine.

CAUTION⚠

Make sure that you remove hoses and cables before starting service operations.



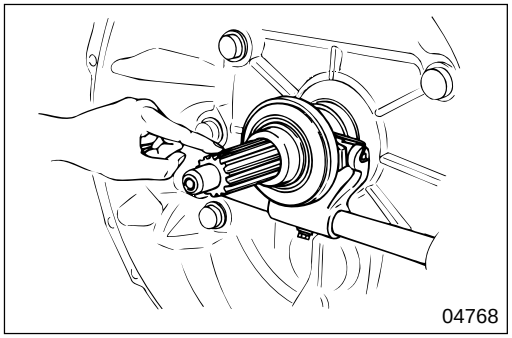
- Move transmission assembly **13** backward until the spline of the drive pinion is detached from the clutch.

CAUTION⚠

Make sure that you pull transmission assembly 13 out in a straight line. If you seesaw the transmission assembly violently, you will damage the spline that connects the drive pinion and the clutch.

https://truckmanualshub.com/

REMOVAL AND INSTALLATION OF TRANSMISSION ASSEMBLY

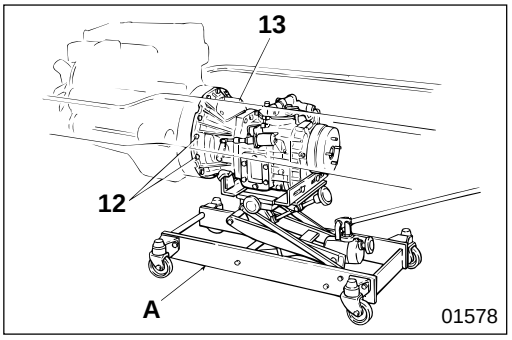


[Installation]

- Check the spline of the drive pinion for rust.
- If rust is found, remove it using a wire brush.
- Rub grease onto the clutch disc sliding surfaces of the drive pinion using your hand.

CAUTION

Make sure that you apply only the necessary amount of grease because too much grease would drip and cause clutch slip.



- Support transmission assembly **13** on transmission jack **A**, and insert the transmission assembly into the pilot bearing of the flywheel paying attention to the drive pinion spline.
- Tighten transmission mounting nuts or bolts **12** at specified torque.

GEAR SHIFTER UPPER AND INTERLOCK PLATE

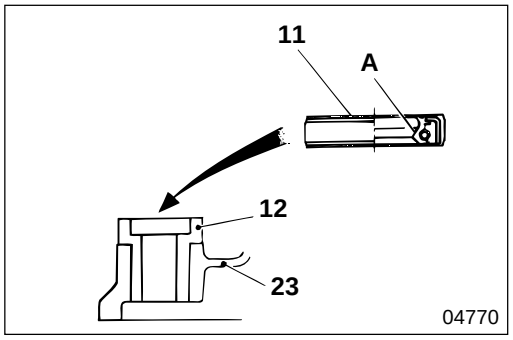
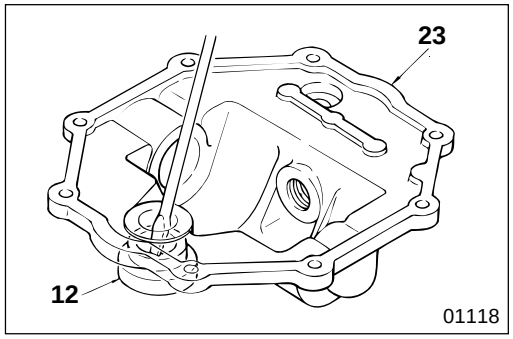
◆ Service procedure



11 Installation of oil seal

- Apply grease to lip area **A** of oil seal **11**.
- Press-fit oil seal **11** into bushing **12** in the direction as illustrated.



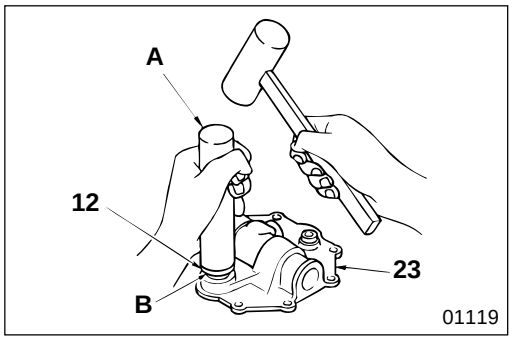
12 Bushing

[Removal]

Remove bushing **12** from selector lever case **23** using a screwdriver.

CAUTION

Be careful not to damage selector lever case 23.

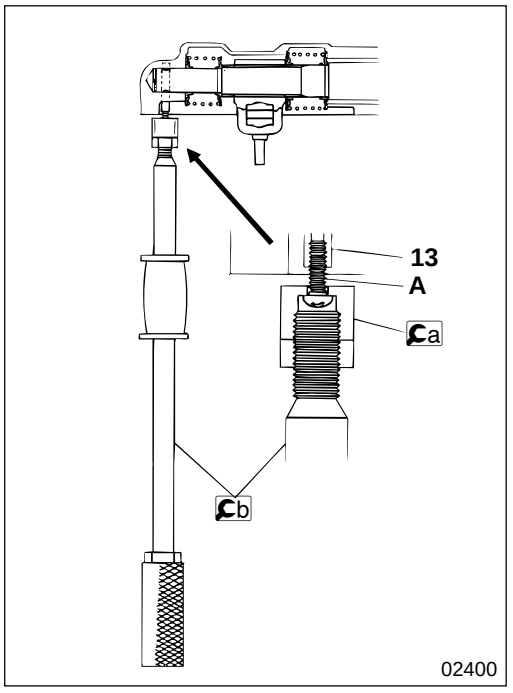


[Installation]

- Clean the inner surface of selector lever case **23**.
- Press-fit bushing **12** into selector lever case **23** using bar **A** (approximately ø40 mm {1.57 in.}).
- When press-fitting bushing **12**, take care not to damage selector lever case **23**.
- After press-fitting, apply sealant to press-fitted side **B** of bushing **12**.

CAUTION

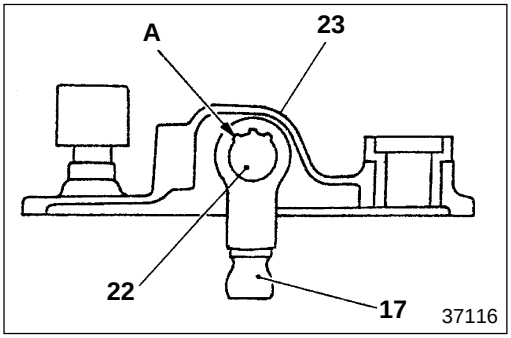
Prevent sealant from sticking to the inner surface of bushing 12.



13 Removal of spring pin

- Tap spring pin **13** using an M4 tap.
- Insert Ca spring pin puller with an M4 thread **A** of appropriate length into spring pin **13**.
- Position Cb reverse shaft puller on Ca spring pin puller.
- Remove spring pin **13** from selector lever case **23** using Ca spring pin puller and Cb reverse shaft puller.

https://truckmanualshub.com/



17 **Installation of gear shift slide lever**

When you install gear shift slide lever **17** in gear shift lever **22**, position spline **A** is as illustrated.

https://truckmanualshub.com/

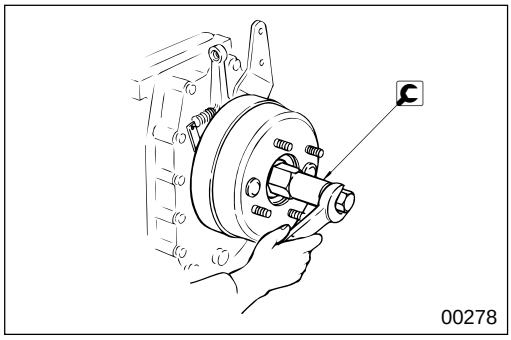
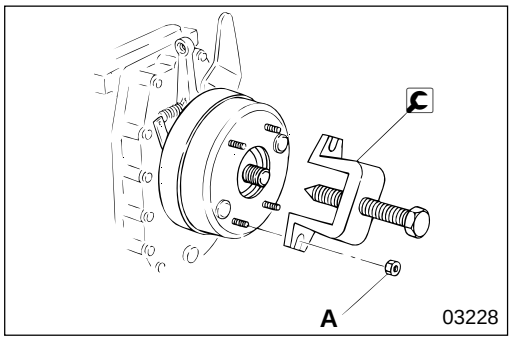
◆ Service procedure



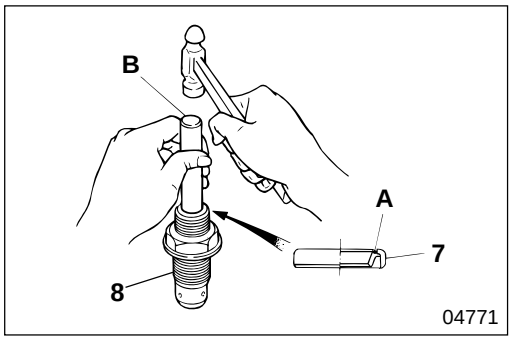
1 **Removal and installation of lock nut**

: Socket wrench



4 **Removal of companion flange**

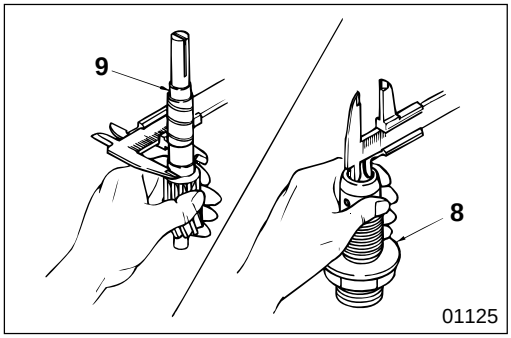
A : Propeller shaft mounting nut
: Flange puller



7 **Press-fitting of oil seal**

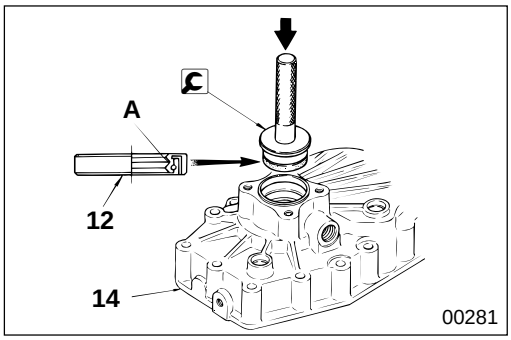
- Apply grease to inside of oil seal **7** packing **A**.
- Press-fit oil seal **7** into speedometer gear bushing **8** in the direction as illustrated using bar **B** (approximately ø15 mm {0.59 in.}).

https://truckmanualshub.com/



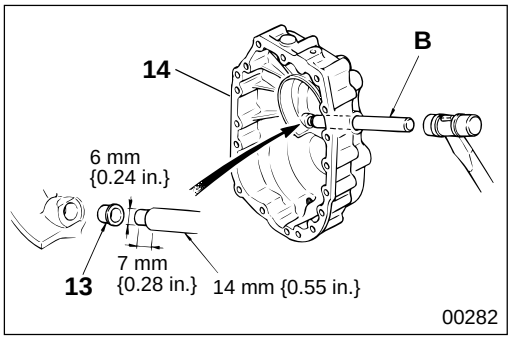
8 **9** **Clearance between speedometer gear bushing and speedometer gear**

If the clearance is higher than the limit, replace the faulty parts.



12 **Installation of oil seal**

- Apply grease to lip area **A** of oil seal **12**.
- Press-fit oil seal **12** into extension housing or rear cover **14** in the direction as illustrated using oil seal installer.



13 **Installation of speedometer gear bushing A**

Press-fit speedometer gear bushing A **13** into extension housing or rear cover **14** using bar **B**, turned to the dimensions as illustrated.

https://truckmanualshub.com/

6TH GEAR < S6 > AND REVERSE IDLER GEAR

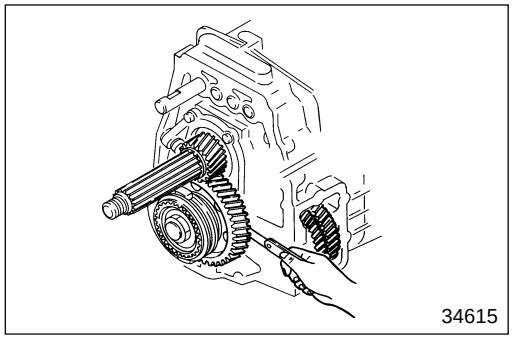
Special tools

Location	Tool name and shape	Part No.	Application
8	Single spanner  01126	MH061555 < S6 >	Removal and istallation of countershaft rear lock nut
22	Drive pinion and reverse shaft puller  02118	03726-82000	Removal of reverse ilder shaft

◆ Service procedure

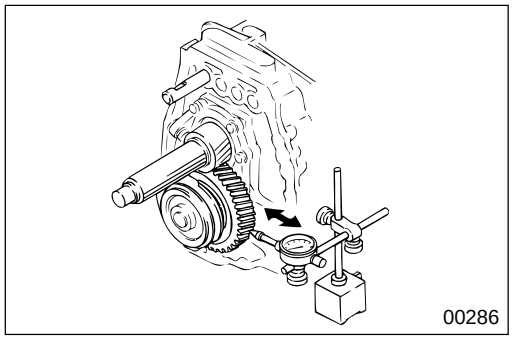


34615

● Inspection before disassembly

(1) End play of various gears < S6 >

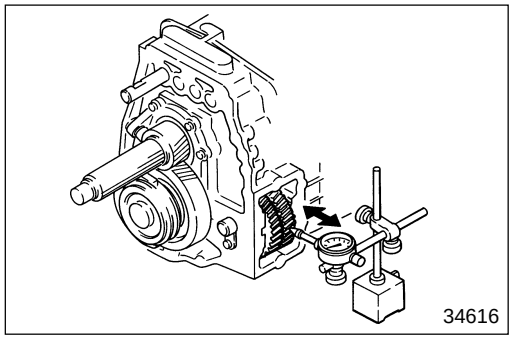
- If the measured value is higher than the limit, replace the faulty parts.
- Reinspect play after assembly to check that the measured value is within the limit.



00286

(2) Play of countershaft O/D gear in the diameter direction < S6 >

- If the measured value is higher than the limit, replace the faulty parts.
- Reinspect play after assembly to check that the measured value is within the limit.

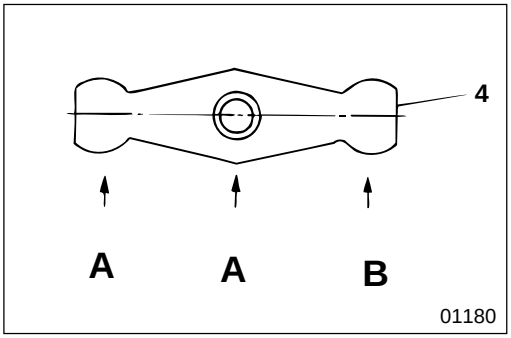


34616

(3) Play of reverse ilder gear in the diameter direction

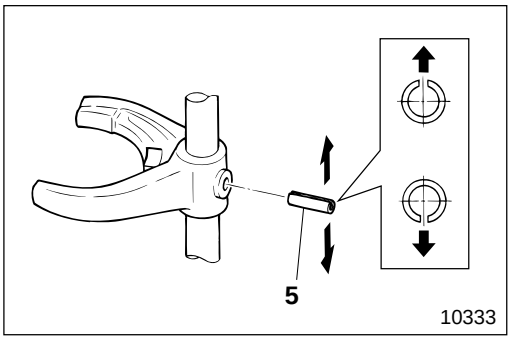
- If the measured value is higher than the limit, replace the faulty parts.
- Reinspect play after assembly to check that the measured value is within the limit.

https://truckmanualshub.com/



4 Bend of O/D shift lever

If bend **B** exeeds the limit on the basis of illustrated **A - A**, replace O/D shift lever **4**.

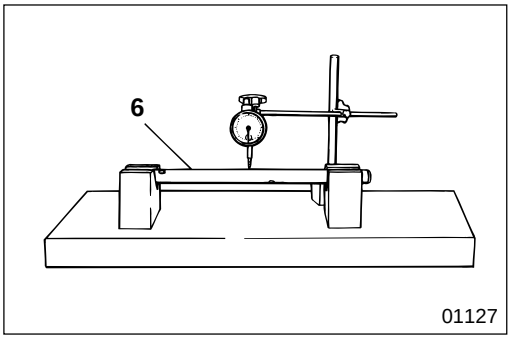


5 Installation of spring pin

Install spring pin **5** in O/D gear shift fork **7** in the direction as illustrated.

CAUTION

Make sure you do not drive in spring pin 5 fully, leave 0 to 0.5 mm {0 to 0.020 in.} outside to prevent them from slipping out.

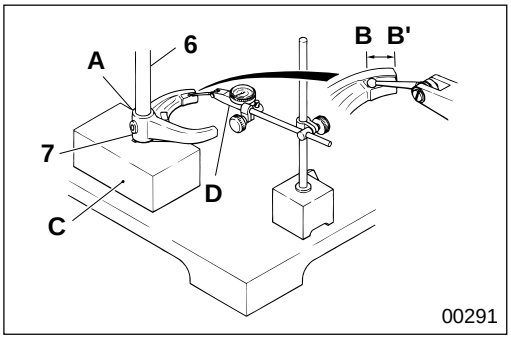


6 Bend of O/D shift rail C

If the measured value is higher than the limit, correct or replace O/D shift rail **C6**.

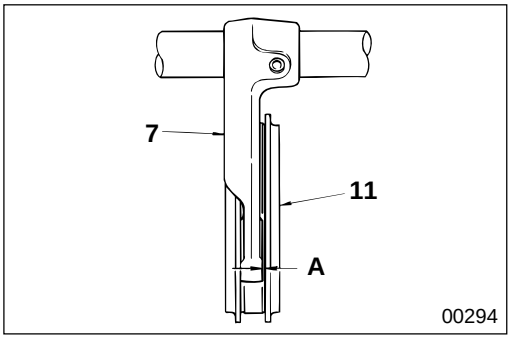
NOTE

Read the dial gauge after turning O/D shift rail C6 one full revolution. The bend is one half of the indicated value.



7 Tilt of O/D gear shift fork claw

- Measure the tilt (difference between **B** and **B'**) of claw **B-B'** against hole **A** of O/D shift rail C**6** of O/D gear shift fork **7** with the shift rail upright.
- If the measured value is higher than the limit, replace gear shift fork **7**.
  C: V-block
  D: Dial gauge

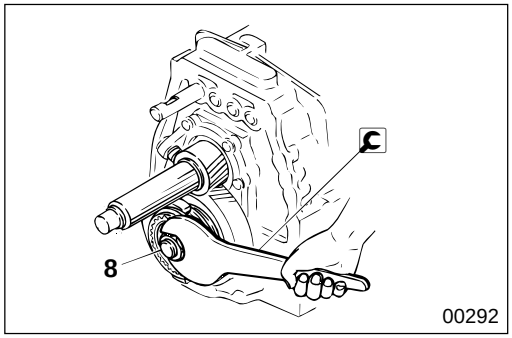


7 11 Clearance between O/D gear shift fork and synchronizer sleeve

- Measure clearance **A** between O/D gear shift fork **7** and synchronizer sleeve **11**.
- If the measured value is higher than the limit, replace the faulty parts.

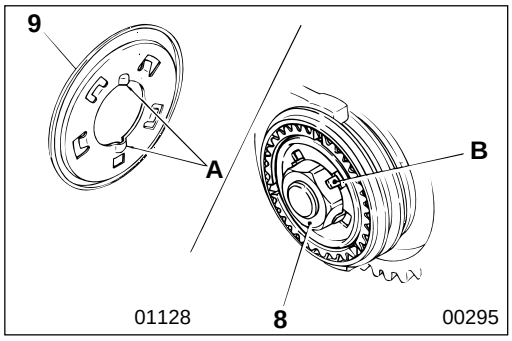
https://truckmanualshub.com/

6TH GEAR < S6 > AND REVERSE IDLER GEAR



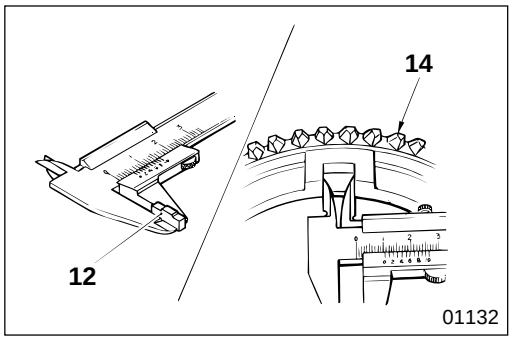
8 **Removal and installation of countershaft rear lock nut**

Have transmissions engaged in two gears to lock counter shaft for this work.
: Single spanner



9 **Installation of shifting key retainer**

- Install so that shifting key retainer **9** protrusions **A** (at 2 places) rest in recessions provided on synchronizer hub.
- After tightening of lock nut, stake the areas with slits **B** at 4 places of shifting retainer, toward lock nut **8**.

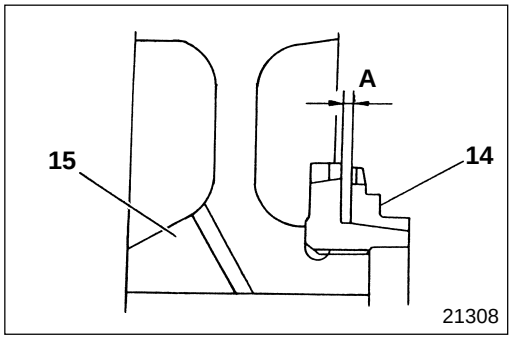


10 **to** **15** **Synchromesh mechanism and countershaft O/D gear assembly**

[Inspection]

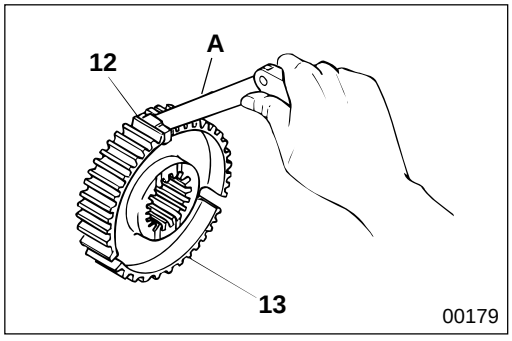
(1) Clearance between synchronizer ring 14 and shifting key 12.

If the measured value is higher than the limit, replace the faulty parts.



(2) Clearance between synchronizer ring 14 and countershaft O/D gear assembly 15

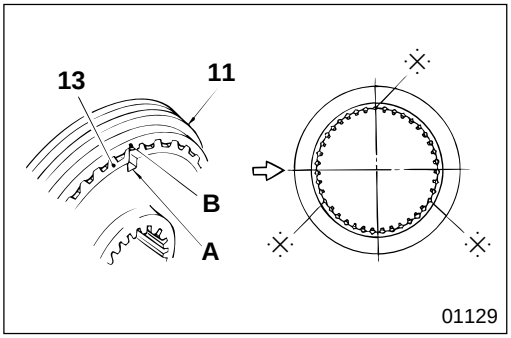
- Measure clearance **A** between synchronizer ring **14** and the gear cone of countershaft O/D gear assembly **15**.
- When measuring this value, press synchronizer ring **14** evenly, and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.



(3) Clearance between shifting key 12 and synchronizer hub 13

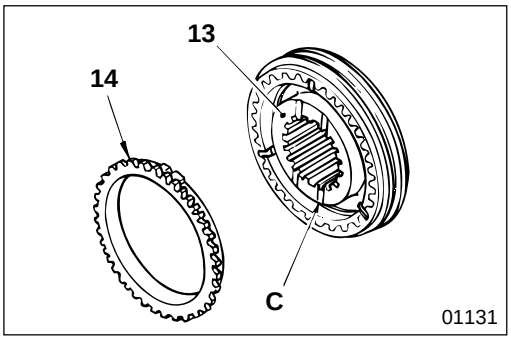
If the measured value is higher than the limit, replace the faulty parts.
A : Feeler gauge

https://truckmanualshub.com/

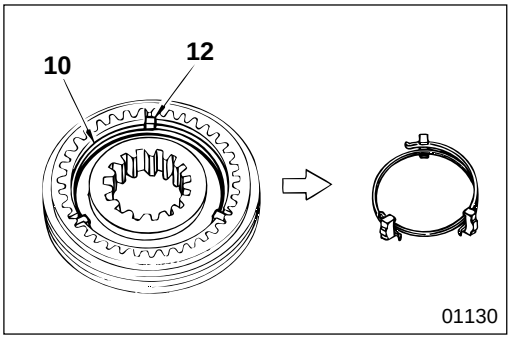


[Installation]

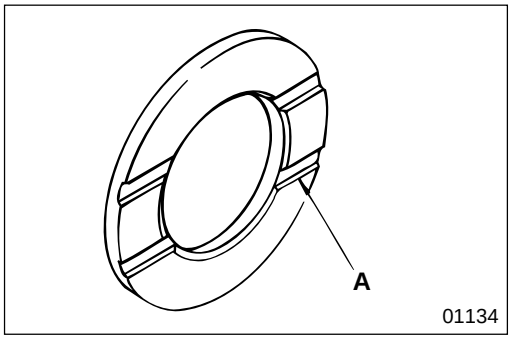
- Align the three keyways **A** of synchronizer hub **13** with the three stub teeth **B** (illustrated by ⋇ mark) of synchronizer sleeve **11** to install the synchronizer hub.
- To reassemble synchronizer hub **13** and synchronizer sleeve **11**, align the alignment marks made during disassembly.



- Assemble synchronizer ring **14** on synchronizer hub **13** with the keyway aligned to the side where oil groove **C** is located.

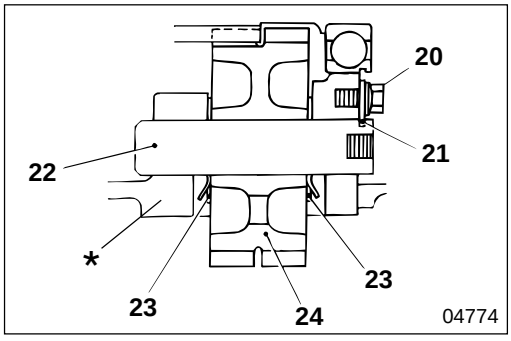


- Insert shifting key **12** into the keyway.
- Install shifting key spring **10** so that its opening is offset from the one of the shifting key.
- Make sure that the openings of shifting key springs do not align with each other.



17 Installation of thrust washer

Install with the side having oil grooves **A** facing the side of gear.

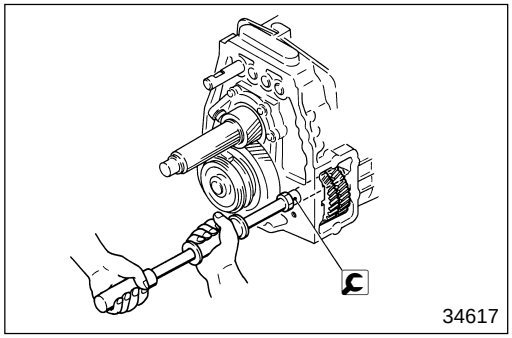


20 to 24 Assembly of reverse idler gear

- Install reverse shaft gear side washer **23** and reverse idler gear **24** in trasmission body *****.
- Install reverse idler shaft **22** in transmission body ***** using a plastic-headed mallet.
- Install reverse shaft lock piece **21** in transmission body ***** with mounting bolt **20**.

https://truckmanualshub.com/

6TH GEAR < S6 > AND REVERSE IDLER GEAR



22 **Removal of reverse idler shaft.**

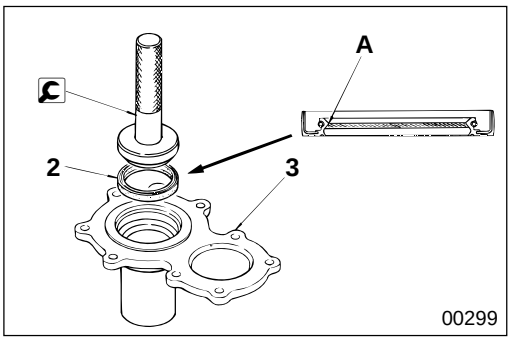
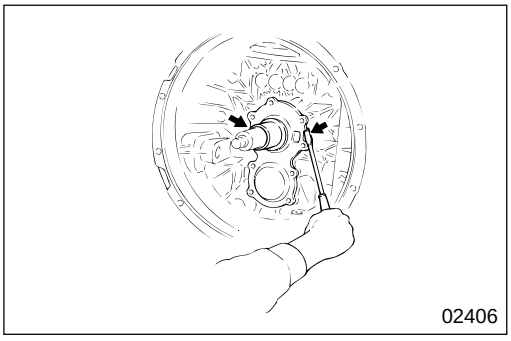
◆ Service procedure



2 **Installation of oil seal**

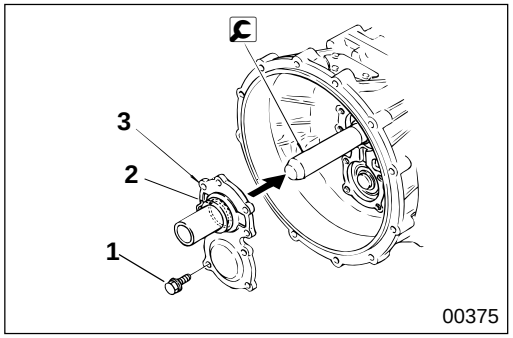
- Apply grease to lip area **A** of oil seal **2**.
- Press-fit oil seal **2** into front bearing retainer **3** in the direction as illustrated using oil seal installer.



3 **Front bearing retainer**

[Removal]

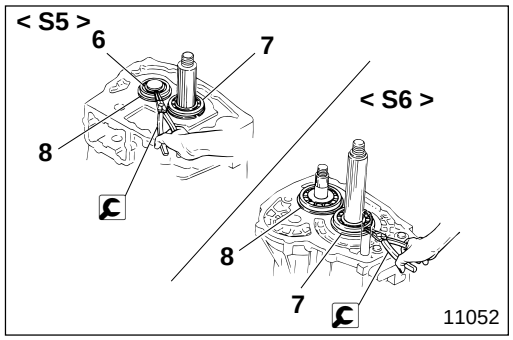
https://truckmanualshub.com/



[Installation]
Press-fit front bearing retainer **3** into clutch housing assembly **19** using 🔧 oil seal front guide.

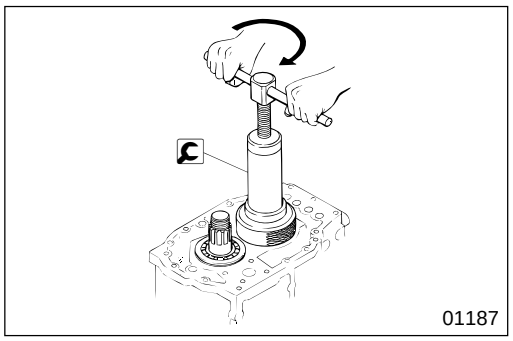
CAUTION⚠

Be careful when installing front bearing retainer 3, that you do not damage oil seal 2 installed on the front bearing retainer.



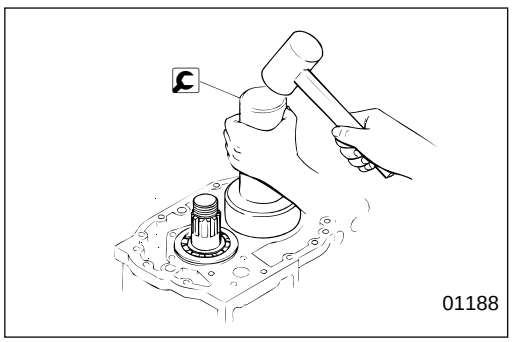
6 to 8 Removal and installation of snap ring

🔧 : Snap ring expander

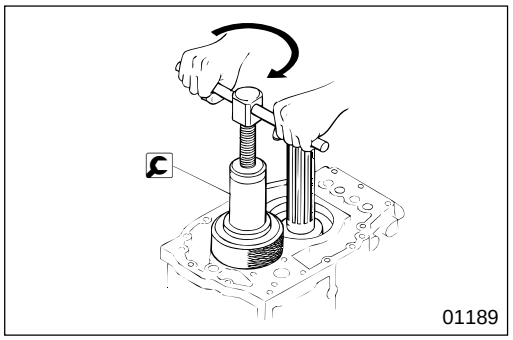


9 Mainshaft rear bearing

[Removal]
🔧 : Mainshaft bearing puller



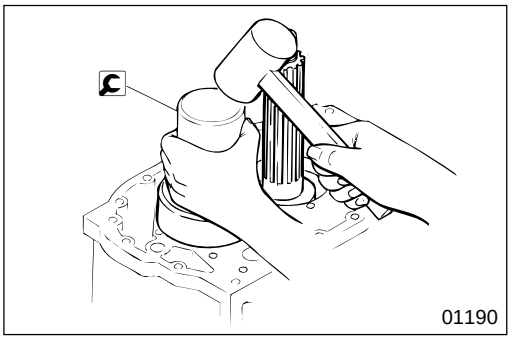
[Installation]
🔧 : Mainshaft bearing installer



10 Countershaft rear bearing

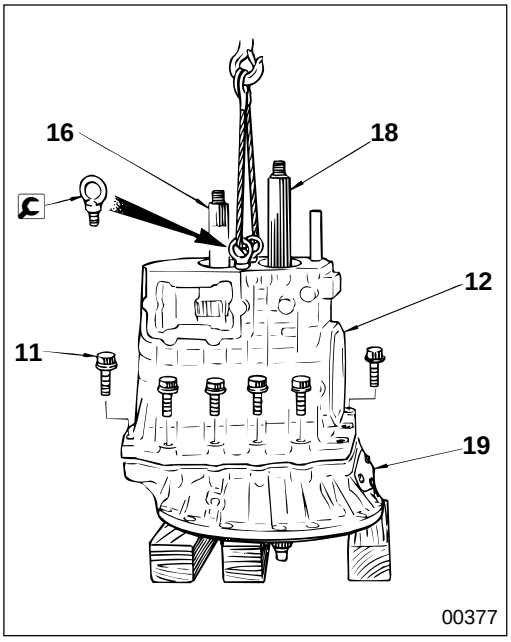
[Removal]
🔧 : Countershaft bearing puller

https://truckmanualshub.com/



[Installation]

: Countershaft bearing installer



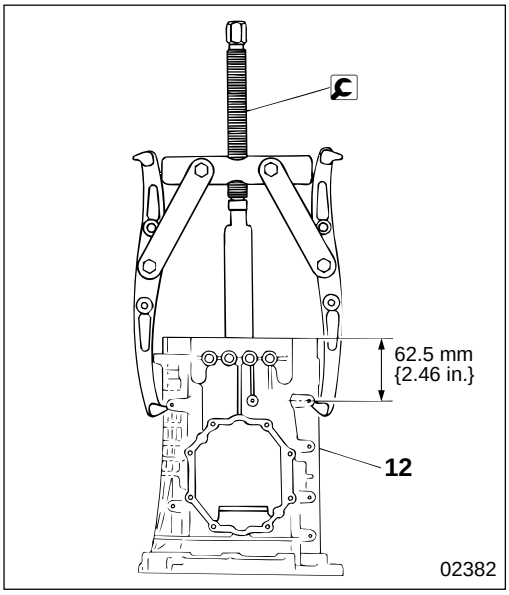
12 Removal and installation of transmission case

[Removal]

● **Remove transmission case 12.**

Method 1

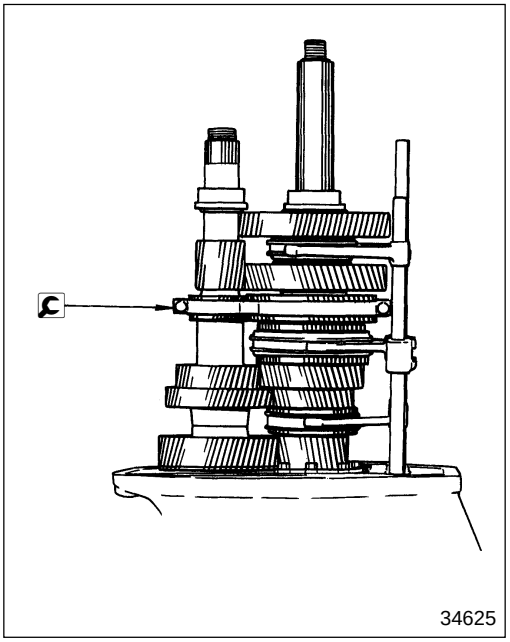
- When lifting up with a crane, install eye bolts on transmission case **12** and pass a steel sling through them.
- After removing bolts **11**, lift transmission case **12** up with a crane and keep hitting the rear ends of clutch housing assembly **19**, mainshaft assembly **18** and countershaft assembly **16**. Use a plastic-headed or copper-headed mallet to remove the transmission case.



Method 2

- A gear puller can be used instead of a crane.
  Puller installation position

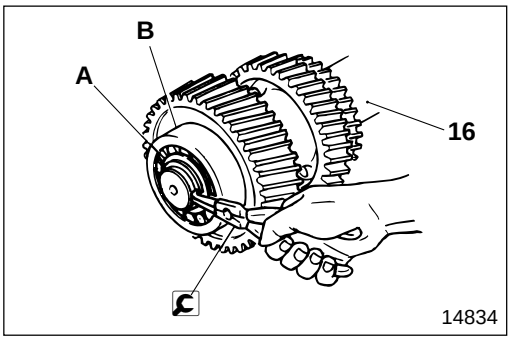
https://truckmanualshub.com/



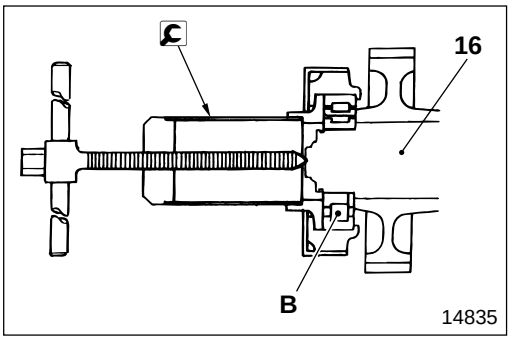
- After removing transmission case **12**, fit the 2nd gear unit using 🔧 steel lifting band to ensure safety.

CAUTION ⚠

Be sure to tighten 🔧 steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.



- Remove snap ring **A** from countershaft assembly **16**.
  B : Countershaft front bearing
  🔧 : Snap ring expander



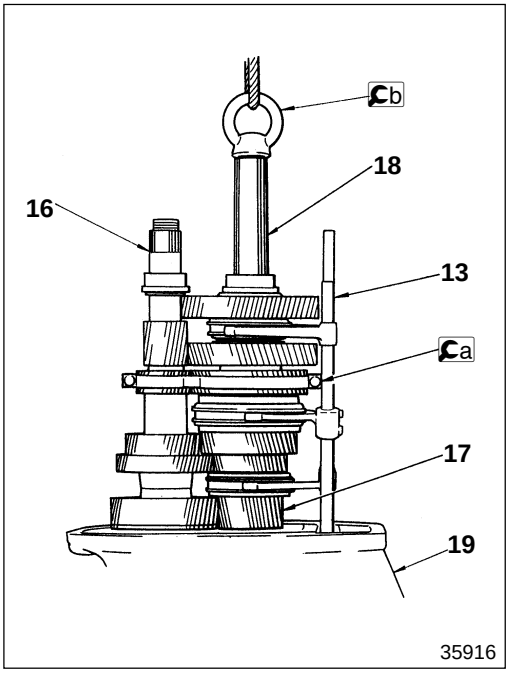
- Remove countershaft bearing **B** from countershaft assembly **16**.
  🔧 : Countershaft bearing puller

[Installation]
Follow the removal sequence in reverse.

CAUTION ⚠

Be careful not to damage mainshaft assembly 18, or rear bearings 9, 10 of countershaft assembly 16 during installation.

https://truckmanualshub.com/



13 **16** **to** **18** **Shift rail and shift fork, countershaft assembly, drive pinion assembly, and mainshaft assembly**

[Removal]
Remove or install shift rail and shift fork **13**, countershaft assembly **16**, drive pinion assembly **17**, and mainshaft assembly **18** as a group.

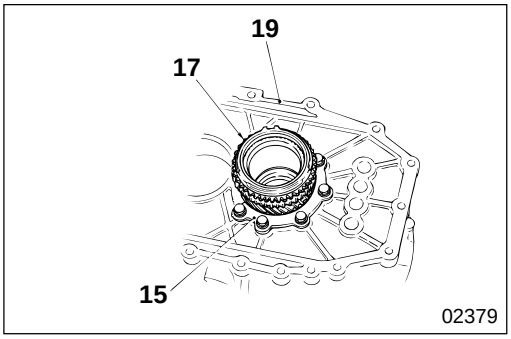
- Before lifting, after removing the case, install b eye nut at the end of mainshaft **18**, fitted with a steel lifting band.
- Fix shift rail and shift fork **13** to mainshaft assembly **18** with a rubber band.
- Fix a piece of wood to clutch housing assembly **19**, and use a crane to lift the clutch housing together with drive pinion assembly **17** up, at the same time hitting them with a plastic-headed mallet to remove them.

CAUTION

- **Be sure to tighten a steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.**
- **Make sure, when lifting mainshaft assembly 18 or other parts, that you support drive pinion assembly 17 with your hand in order to prevent it from falling when the mainshaft assembly and countershaft assembly 16 come apart.**

[Installation]
Method 1

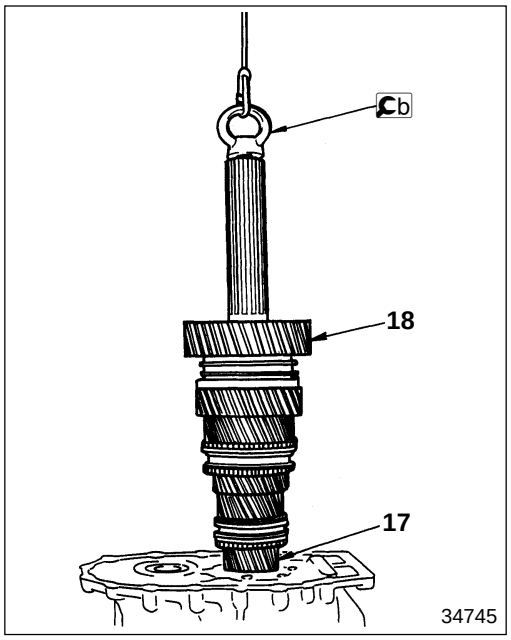
- Follow the removal sequence in reverse.



Method 2

- After installing drive pinion assembly **17** in clutch housing assembly **19**, install drive pinion bearing retainer **15**.

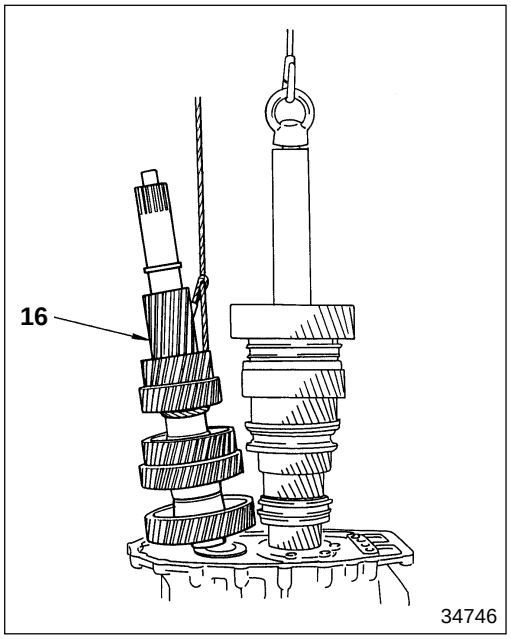
https://truckmanualshub.com/



- Install Cb eye nut at the end of mainshaft assembly **18**.
- Lift mainshaft assembly **18** up using a crane and install the mainshaft assembly on drive pinion assembly **17**.

CAUTION

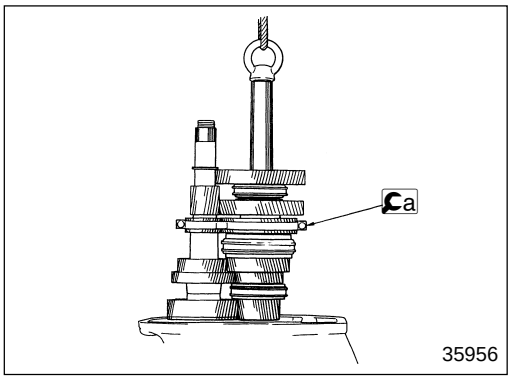
To prevent mainshaft assembly 18 from falling, support it using a crane.



- Install countershaft assembly **16** in clutch housing assembly **19**.

CAUTION

If you use this method of installation, first remove the countershaft front bearing. P22-56

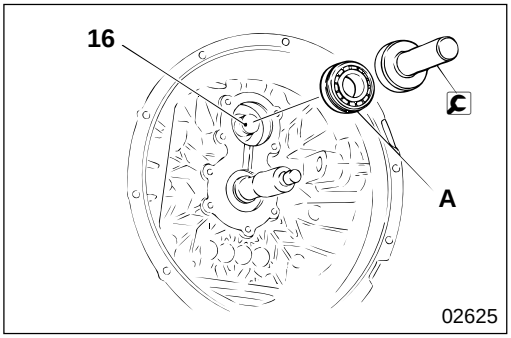


- Fit the 2nd gear unit using Ca steel lifting band to ensure safety.

CAUTION

Be sure to tighten Ca steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.

https://truckmanualshub.com/



- Install shift rail and shift fork **13** and transmission case **12** in clutch housing assembly **19**.
- Place cluch housing assembly **19** horizontally so that countershaft assembly **16** is uppermost.
- Install the countershaft front bearing **A** into clutch housing assembly **19** using countershaft bearing installer.

CAUTION

Be sure to install the snap ring of the countershaft front bearing.

https://truckmanualshub.com/

TRANSMISSION BODY

Shift Rail and Shift Fork

Service standards

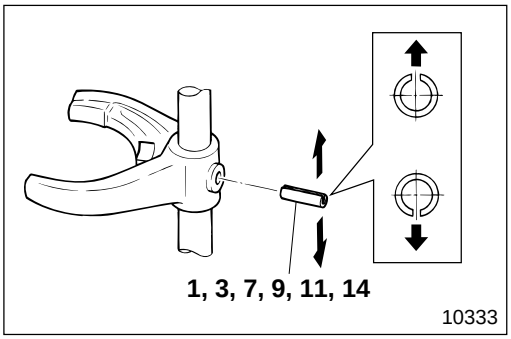
Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2, 10, 15	Bend of shift rail	0.039 {0.0015} or less	0.08 {0.0031}	Correct or replace
5, 13, 16	Tilt of shift fork claw	0.1 {0.0039} or less	0.2 {0.0079}	Replace
5, *a	Clearance between 1st and reverse shift fork and synchronizer sleeve	0.3 to 0.5 {0.012 to 0.020}	1.0 {0.039}	Replace
6	Bend of 6th shift rail	0.047 {0.0019} or less	0.09 {0.0035}	Correct or replace
13, *a	Clearance between 4th and 5th shift fork and synchronizer sleeve	0.3 to 0.6 {0.012 to 0.024}	1.0 {0.039}	Replace
16, *a	Clearance between 2nd and 3rd shift fork and synchronizer sleeve	0.2 to 0.4 {0.0079 to 0.016}	1.0 {0.039}	Replace

Sealant

Location	Points of application	Specified sealant	Quantity
1, 3, 7, 9, 11, 14	Spring pin	LOCTITE 601	As required

◆ Service procedure

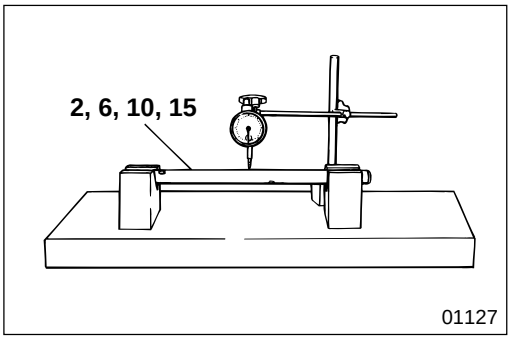


1 **3** **7** **9** **11** **14** **Installation of spring pin**

Install spring pins **1**, **3**, **7**, **9**, **11, 14** in the direction as illustrated.

CAUTION

- **Make sure you do not drive in spring pins 1, 3, 7, 9, 11, 14 fully, leave 0 to 0.5 mm {0 to 0.020 in.} outside to prevent them from slipping out.**
- **Do not remove spring pin 9 for 4th and 5th shift fork 13 (made of aluminum), except when replacing shift fork 13 or shift rail 10.**
- **Note that the length of spring pin 9 differs from that of spring pins 1, 3, 7, 11, 14.**
- **Be careful when driving in spring pins 1, 3, 7, 9, 11, 14 that you do not subject shift rails 2, 6, 10, 15 to excessive strain, because this would cause faults such as bent shift rails.**



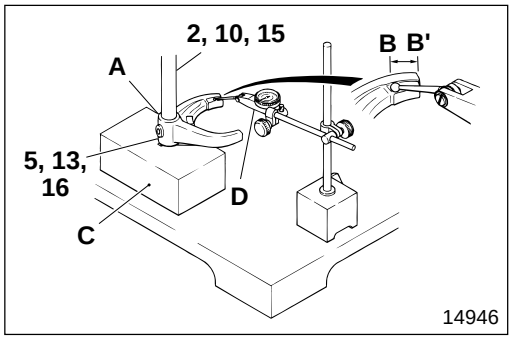
2 **6** **10** **15** **Bend of shift rail**

If the measured value is higher than the limit, correct or replace shift rail **2**, **6**, **10** or **15**.

NOTE

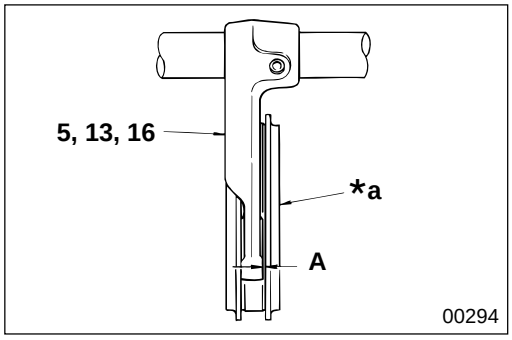
Read the dial gauge after turning shift rails 2, 6, 10, 15 one full revolution. The bend is one half of the indicated value.

https://truckmanualshub.com/



5 **13** **16** **Tilt of shift fork claws**

- Measure the tilt (difference between **B** and **B'**) of claw **B**–**B'** against hole **A** of shift rails **2, 10, 15** of shift forks **5, 13, 16** with the shift rails upright.
- If the measured value is higher than the limit, replace shift fork **5**, **13**, or **16**.
  C : V-block
  D : Dial gauge



5 **13** **16** ***a** **Clearance between gear shift fork and synchronizer sleeve of mainshaft**

If clearance **A** is higher than the limit, replace the faulty parts.
***a** : Synchronizer ring of mainshaft assembly

◆ Service procedure

● **Work before disassembly**

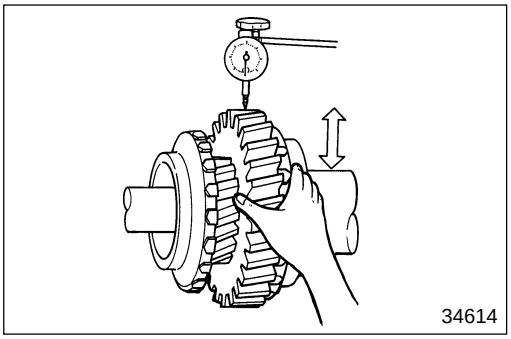
[Inspection]

(1) End play of gears

A : Reverse gear
B : 2nd gear
C : 3rd gear
D : 4th gear
E : 1st gear

If the measured value is higher than the limit, replace the faulty parts.

Also inspect this item after assembly and make sure that the measured value is within the limit.

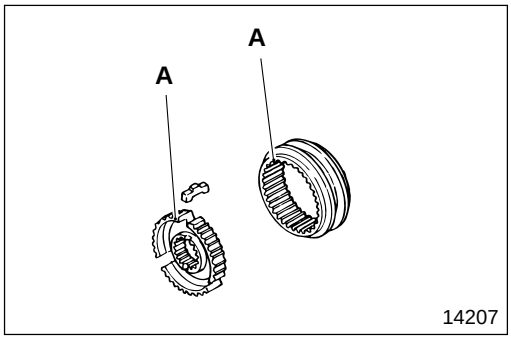


(2) Play of gears in diameter direction

If the measured value is higher than the limit, replace the faulty parts. Also inspect this item after assembly and make sure that the measured value is within the limit.

CAUTION⚠

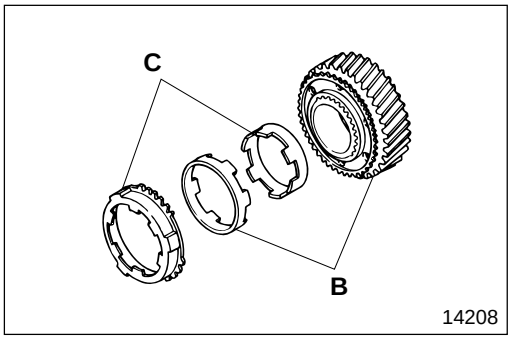
Be sure when you replace the two needle bearings of a gear, that both needle bearings are from the same color package.



[Alignment marks]

(1) Synchronizer sleeve and synchronizer hub

Before disassembling the synchronizer sleeve and the synchronizer hub, put alignment marks **A** on the places where the shifting keys are installed. When reusing parts, align the alignment marks to assemble.

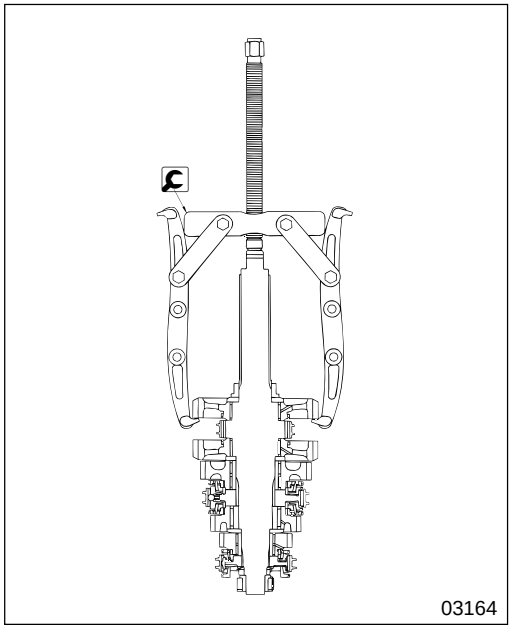


(2) Ring, cone and gear assembly of double cone synchronizer

Before disassembling synchronizer center cone and gear assembly (**B**), and synchronizer center ring and synchronizer outer ring (**C**), put alignment marks on them. When reusing parts, align the alignment marks to assemble.

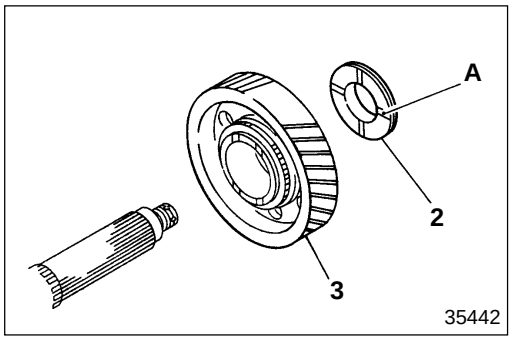
https://truckmanualshub.com/

MAINSHAFT ASSEMBLY



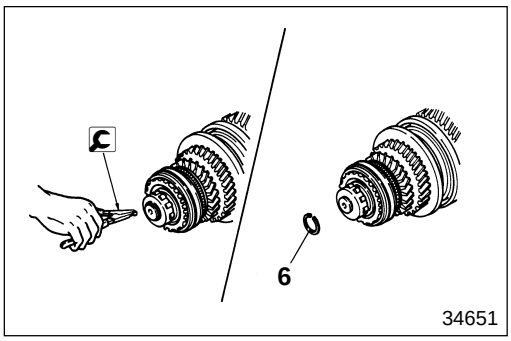
1 **Removal of mainshaft rear bearing inner race < S6 >**

: Gear puller



2 **Installation of reverse gear thrust washer**

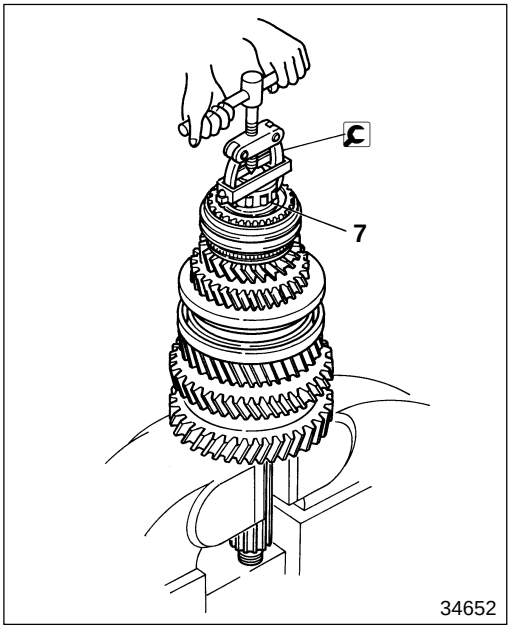
A : Oil groove



6 **Removal and installation of snap ring**

: Snap ring expander

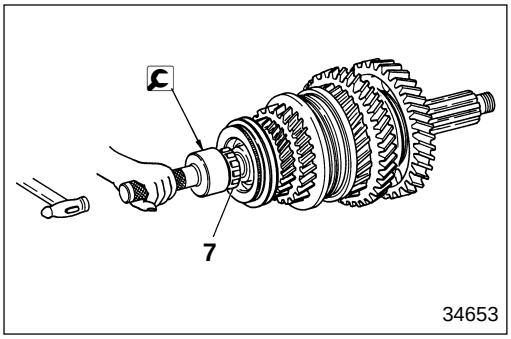
https://truckmanualshub.com/



7 **Pilot bearing**

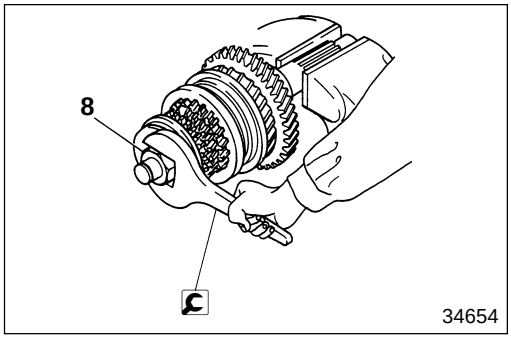
[Removal]

: Pilot bearing puller



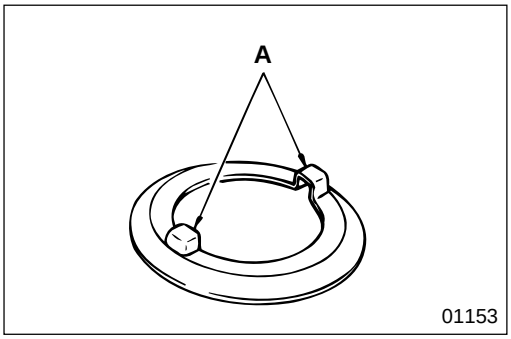
[Installation]

: Pilot bearing installer



8 **Removal and installation of lock nut**

: Single spanner

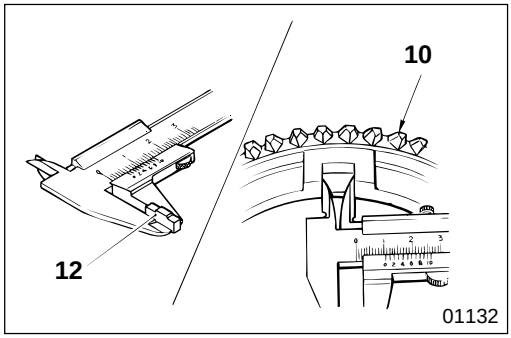


9 **Installation of lock washer**

Install so that protrusions **A** (two points as illustrated) fit into the grooves of synchronizer hub **14**.

https://truckmanualshub.com/

MAINSHAFT ASSEMBLY

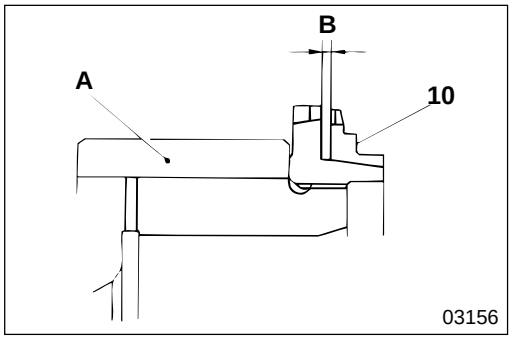


10 to 15 Synchromesh mechanism and 4th gear

[Inspection]

(1) Clearance between synchronizer ring 10 and shifting key 12

If the measured value is higher than the limit, replace the faulty parts.

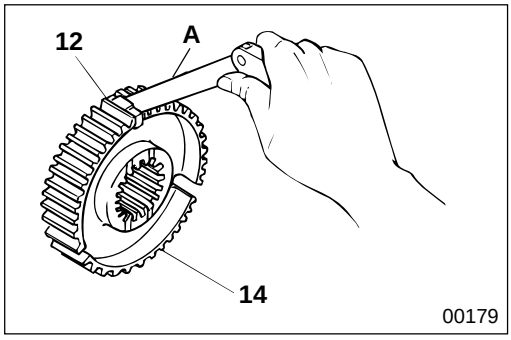


(2) Clearance between synchronizer ring 10 and drive pinion

- Measure clearance **B** between synchronizer ring **10** and the gear cone of drive pinon **A**.
- When measuring this value, press synchronizer ring **10** evenly, and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.

(3) Clearance between synchronizer ring and 4th gear

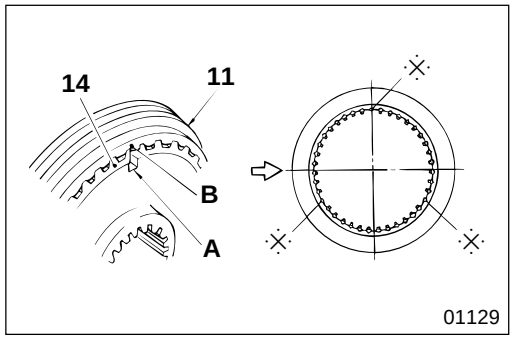
- According to the procedure described in (2), measure clearance between synchronizer ring **10** and the gear cone of 4th gear **15**.



(4) Clearance between shifting key 12 and synchronizer hub 14

If the measured value is higher than the limit, replace the faulty parts.

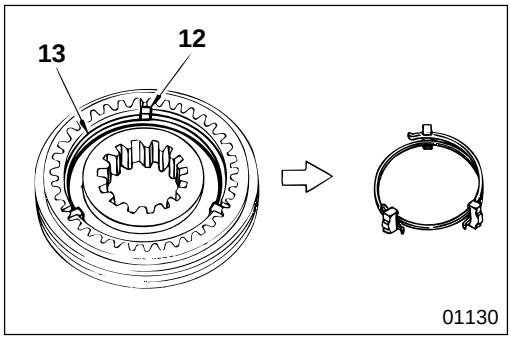
A : Feeler gauge



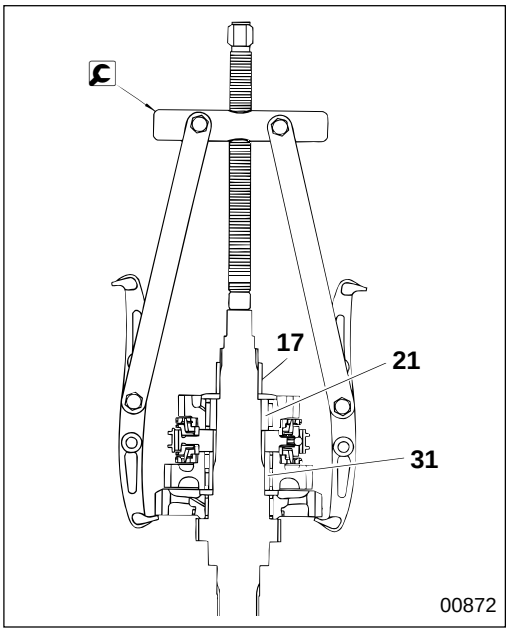
[Installation]

- Align the three keyways **A** of synchronizer hub **14** with the three stub teeth **B** (illustrated by ·⁜· mark) of synchronizer sleeve **11** to install the synchronizer hub.
- To reassemble synchronizer hub **14** and synchronizer sleeve **11**, align the alignment marks made during diassembly.

https://truckmanualshub.com/

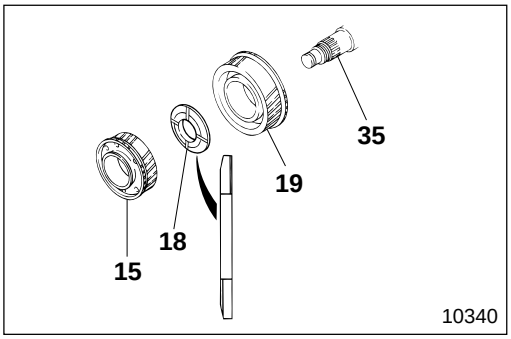


- Insert shifting key **12** into the keyway.
- Install shifting key spring **13** so that its opening is offset from the one of the shifting key.
- Make sure that the openings of shifting key springs do not align with each other.

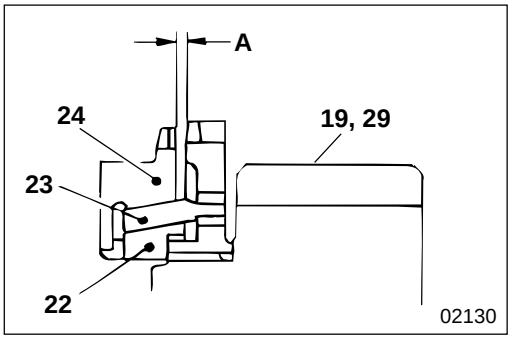


17 **21** **31** **Removal of 4th, 3rd, 2nd gear bearing sleeves**

: Gear puller



18 **Installation of 3rd and 4th gear thrust washer**



19 **24** **29** **Clearance between synchronizer outer ring and 3rd gear assembly or 2nd gear assembly**

- Measure clearance **A** between synchronizer outer ring **24** and the cone of 3rd gear assembly **19** or 2nd gear assembly **29**.
- When measuring this value, press synchronizer inner ring **22**, synchronizer outer ring **24** and synchronizer center ring **23** evenly and measure all around the circumference.
- If the measured value is higher than the limit, replace the faulty parts.

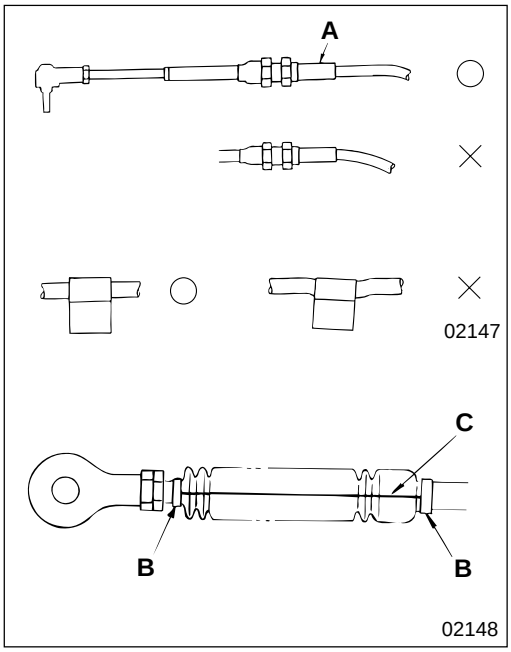
Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1 to 4	Nut (Ball joint or rubber damper mounting)	19 to 24 {14 to 17, 1.9 to 2.4}	—
5, 6	Cable lock nut tightening	59 to 83 {43 to 61, 6 to 8.5}	—

https://truckmanualshub.com/

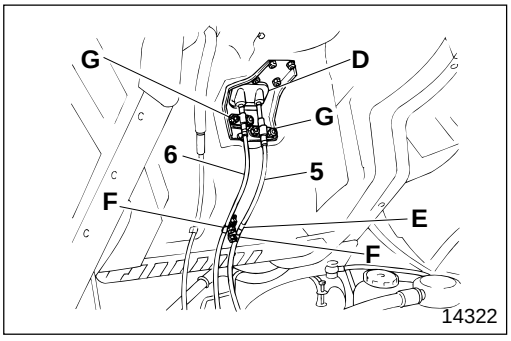
◆ Service procedure



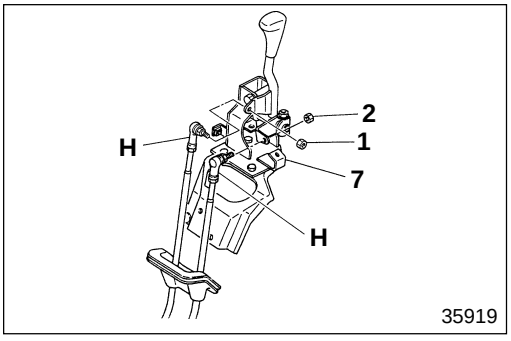
5 **6** **Installation of shift cable and selector cable**

CAUTION

- **Be sure to install casing cap A lengthwise.**
- **Make sure the radius of the bend is 200 mm {7.87 in.} or more.**
- **Make sure the cable operates smoothly.**
- **Be sure to install the clamps vertically against the cable.**
- **Make sure you do not twist clamps B at both ends of the boot. Make sure that white line C on the boot is aligned.**
- **Make sure the identification marks on the cable, the ball joint and the rubber damper point in the right direction when you install the cables. Installing the cables with the identification marks in the wrong direction can remarkably reduce the durability of the cables.**



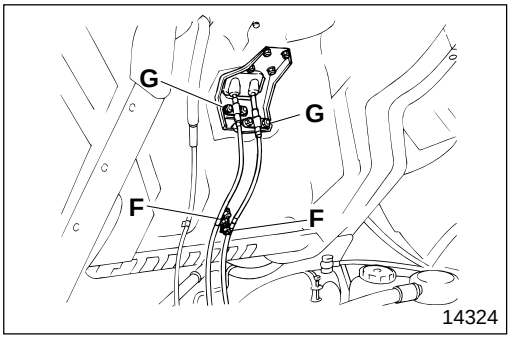
- Install shift cable **5** and selector cable **6** to the frame after having temporarily installed all the clamps.
- Insert shift cable **5** and selector cable **6** through grommet **D** of the cab floor into the inside of the cab, then install clip **F** and clip **G** temporarily by making identification mark **E** on the shift cable come to clip **F** position. (The selector cable has no identification mark.)



- Lower the cab.
- Install ball joint **H** of the cable to the shift lever and selector lever of transmission control lever assembly **7**.

CAUTION

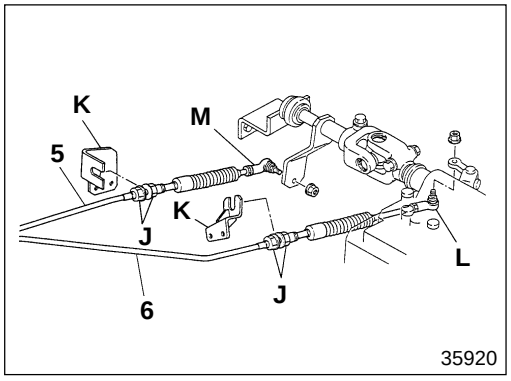
Make sure that ball joint H faces the correct direction.



- Tilt the cab up and tighten clip **F** and clip **G** permanently without applying force to the cables.

https://truckmanualshub.com/

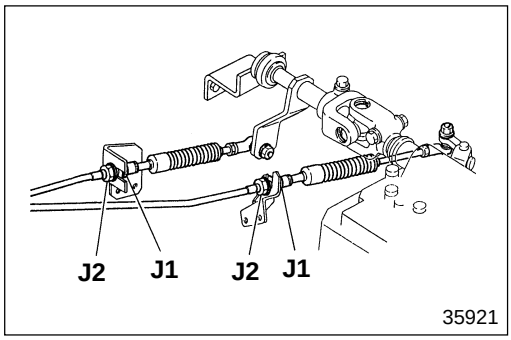
TRANSMISSION CONTROL



- Install lock nut **J** to bracket **K** temporarily and connect ball joint **L** or rubber damper **M** to the shift lever and selector lever.
- Tighten lock nut **J** permanently without applying force to the cables.

CAUTION ⚠

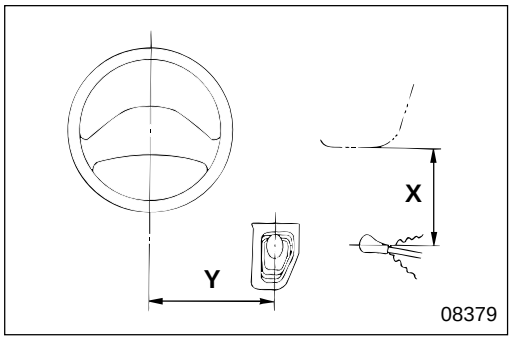
Make sure that ball joint L and rubber damper M face the correct direction.



CAUTION ⚠

Make sure not to move lock nut J1 of the transmission side when tightening lock nut J. Tighten lock nut J2.

- Check when you operate the gear shift lever that it shifts and selects each position smoothly.



- If the gear shift lever leans to the front or rear, or to the left or right, excessively, adjust the length of the cable.
- When adjusting the gear shift lever, use the distance from the center of the steering wheel or from the instrument panel as the reference distance.

Unit : mm {in.}

Front and rear direction X (Distance from the instrument panel)	Left and right direction Y (Distance from the steering wheel center)
309 {12.17}	350 {13.78} (4th and 5th gear position)

	Shift cable **5**	Selector cable **6**
To front	Shorten	—
To rear	Lengthen	—
To right	—	Lengthen
To left	—	Shorten

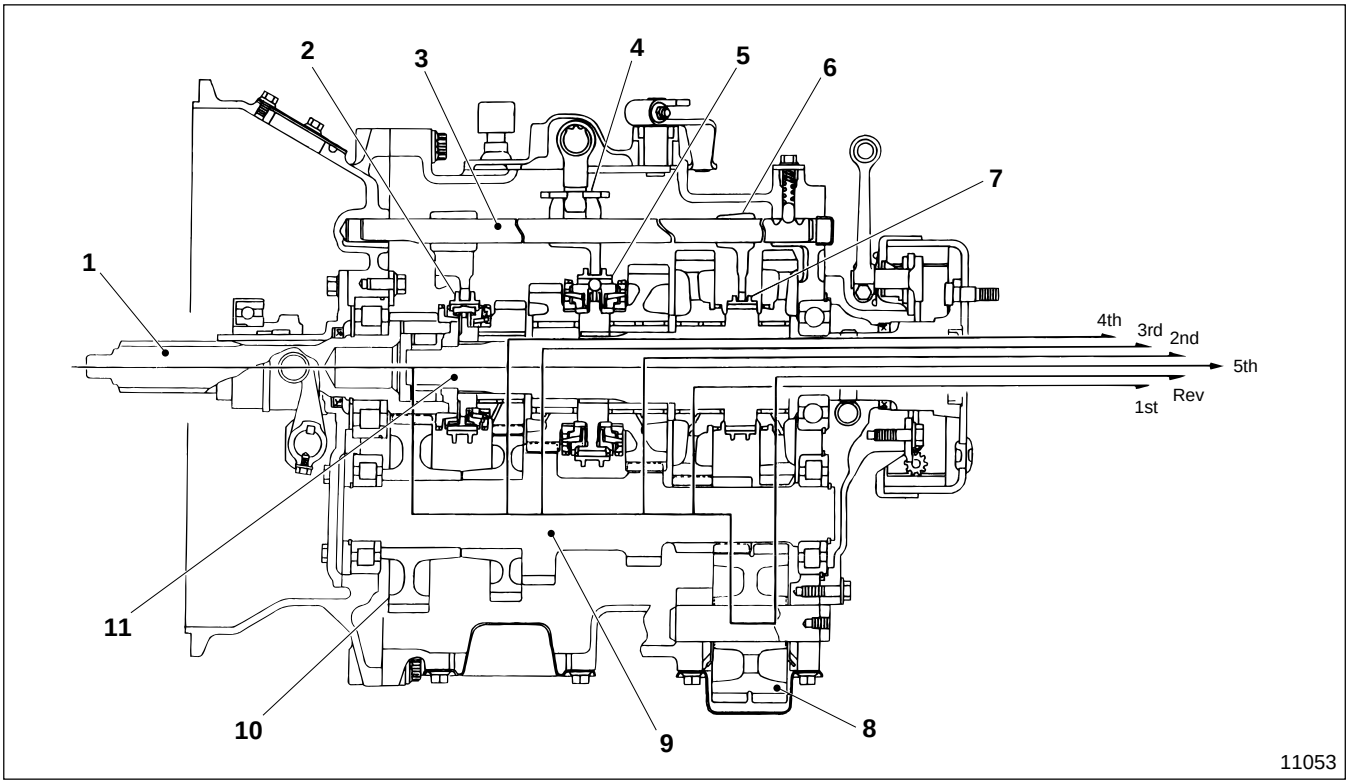
Transmission



1 Drive pinion
2 4th and 5th synchronizer assembly
3 Shift rail
4 Interlock mechanism
5 2nd and 3rd synchronizer assembly
6 Shift fork
7 1st and reverse constant mesh assembly
8 Reverse idler gear
9 Countershaft
10 Non-backlash mechanism
11 Mainshaft

The transmission changes revolution and torque generated by the engine into those that match the vehicle's power requirement (driving force). Revolution and torque are increased or decreased by making a selection from several sets of engaged gears. The transmission uses an interlock mechanism to avoid double engagement and the non-backlash mechanism reduces the idling noise of the transmission when the engine is idling.

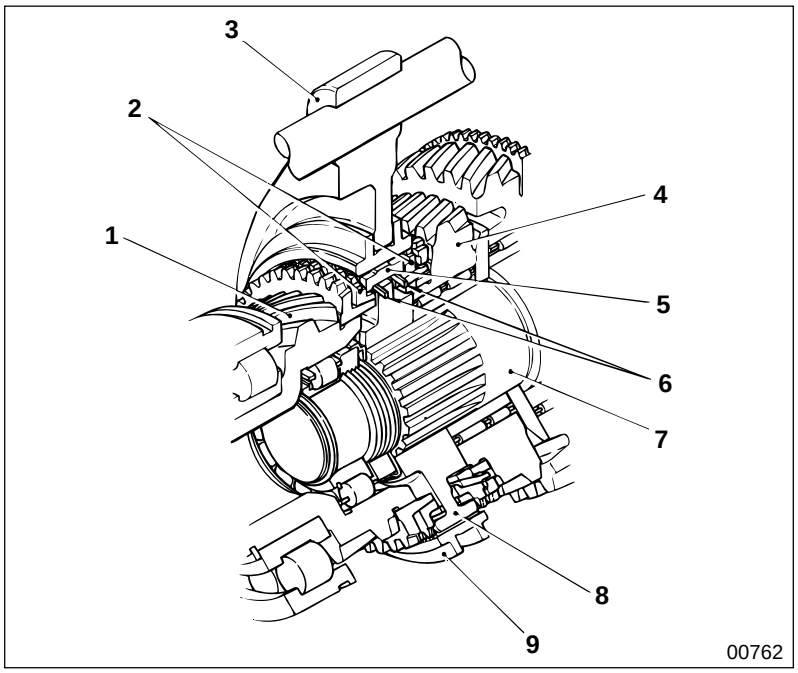
https://truckmanualshub.com/

Synchromesh Mechanism

This vehicle has two synchromesh mechanisms, a single cone type, and a double cone type, and uses the key system. The single or double cone type is used depending on the gear positions as shown below:

Synchromesh type	Parts used
Single cone type	5th
Double cone type	2nd and 3rd, 4th

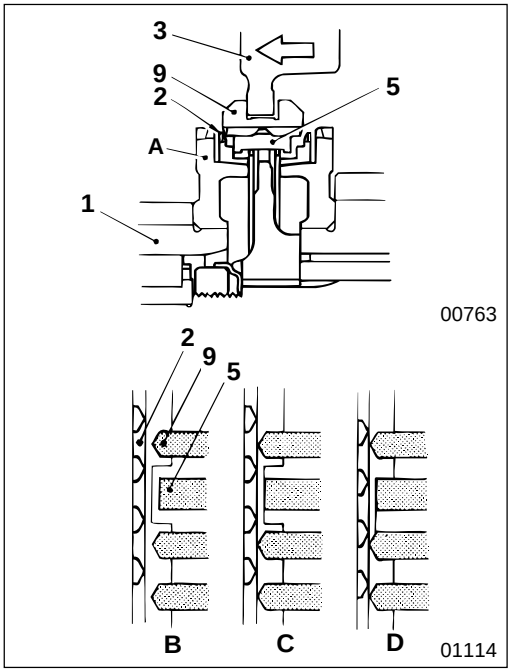
Single Cone Type



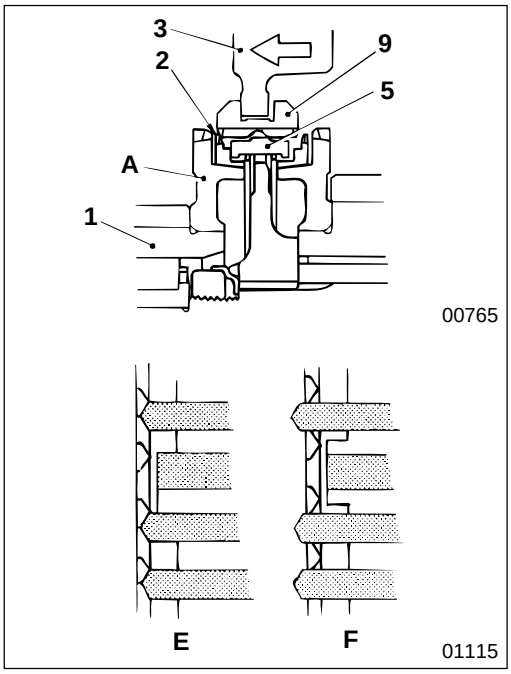
1 Drive pinion (Single cone type)
2 Synchronizer ring
3 4th and 5th shift fork
4 4th gear (Double cone type)
5 Shifting key
6 Shifting key spring
7 Mainshaft
8 Synchronizer hub
9 Synchronizer sleeve

- The following descriptions are for 4th and 5th gear
  The inside of synchronizer hub **8** engages the spline of mainshaft **7** and rotates with it. The outside of the synchronizer hub has a spline that engages synchronizer sleeve **9** and three keyways.
- Shifting keys **5** are inserted into these keyways. When the gear shift is in neutral, a protrusion in the center of each shifting key engages a groove inside the synchronizer sleeve and the shifting keys are pressed against the inside of the synchronizer sleeve by shifting key springs **6**.
- Synchronizer rings **2** are inserted into drive pinions **1** in the front and rear of synchronizer hub **8**, and the taper cone of 4th gear **4**.
- The internal tapers of synchronizer rings **2** have fine threads, and the outer splines engage synchronizer sleeve **9**. On the hub side of the synchronizer rings are three keyways in which the ends of shifting keys **5** are inserted. These keyways are wider than the width of the shifting keys.
- Synchronizer rings **2** rotate relative to synchronizer sleeve **9** by the amount of play of the keyways.

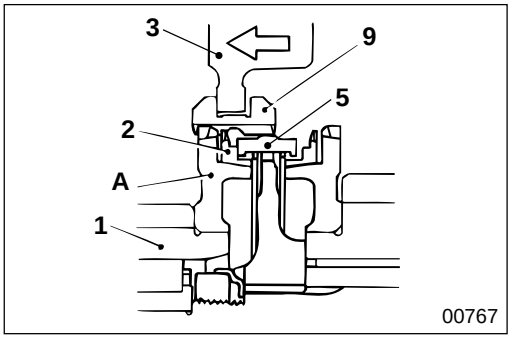
https://truckmanualshub.com/



- When the gear shift is in neutral (Figure **B**), moving shift fork **3** in the direction of the arrow as illustrated, moves synchronizer sleeve **9** slightly to the left. At the same time, shifting key **5**, the central protrusion of which engages the synchronizer sleeve, moves to the left and presses synchronizer rings **2** against taper cone **A** of drive pinion **1**. (Figure **C**)
- When the taper surfaces of synchronizer rings **2** make contact with the taper cone of the drive pinion, the taper surfaces of the synchronizer rings act as cone clutches. This frictional torque rotates the synchronizer rings in the rotating direction of the drive pinion by the amount of play between shifting key **5** and the synchronizer rings. The spline chamfers of the synchronizer rings and the spline chamfer of synchronizer sleeve **9** are offset from each other. (Figure **D**)
- The disengagement direction of synchronizer rings **2** is defined by the speed of rotation of the synchronizer—sleeve **9**, and the synchronized—drive pinion **1**. When increasing the vehicle speed by shifting up, disengagement is made in the opposite direction to rotation, and when decreasing the vehicle speed by shifting down, disengagement is made in the rotating direction.



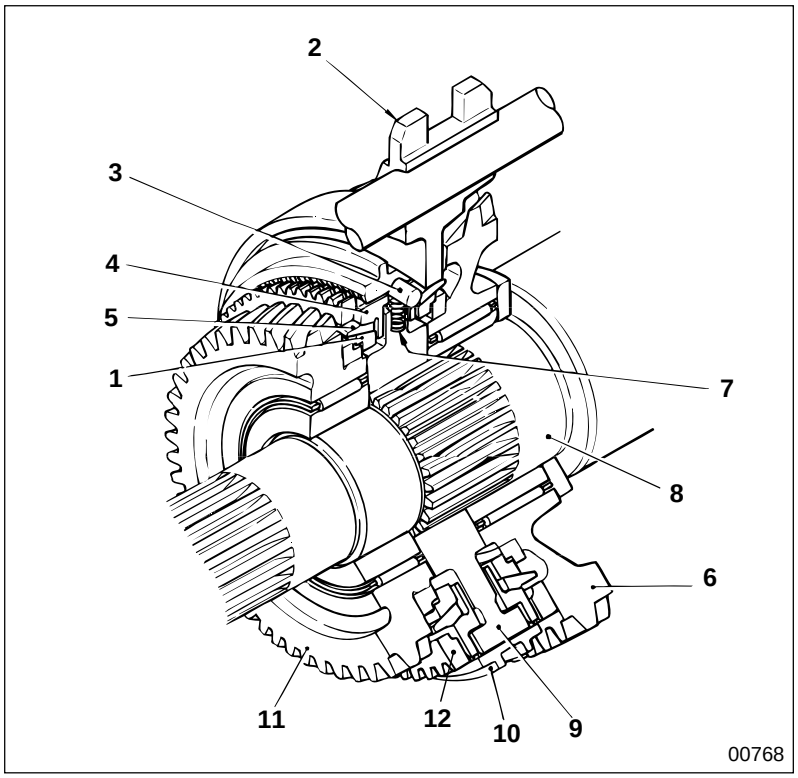
- When synchronizer sleeve **9** moves further to the left, synchronizer rings **2** prevent shifting key **5** from moving, and the synchronizer sleeve disengages from the protrusion of the shifting key.
- Since synchronizer rings **2** remain disengaged, the spline chamfer of synchronizer sleeve **9** presses the spline chamfers of the synchronizer rings, which in turn press the synchronizer rings against taper cone **A** of drive pinion **1**.
- As the frictional torque increases on the taper surfaces, the relative speed of the synchronizer and the synchronized gradually decreases.
  E : In synchronization
  F : After synchronization



- When synchronizer sleeve **9** and drive pinion **1** rotate at the same speed, synchronizer rings **2** no longer prevent the synchronizer sleeve from moving, and the synchronizer sleeve moves further to the left and smoothly engages the spline of taper cone **A** of drive pinion **1**, transmitting the driving force.

https://truckmanualshub.com/

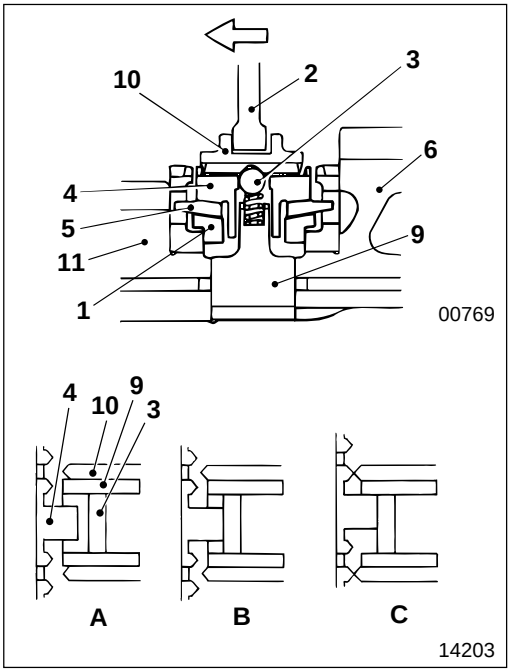
Double Cone Type



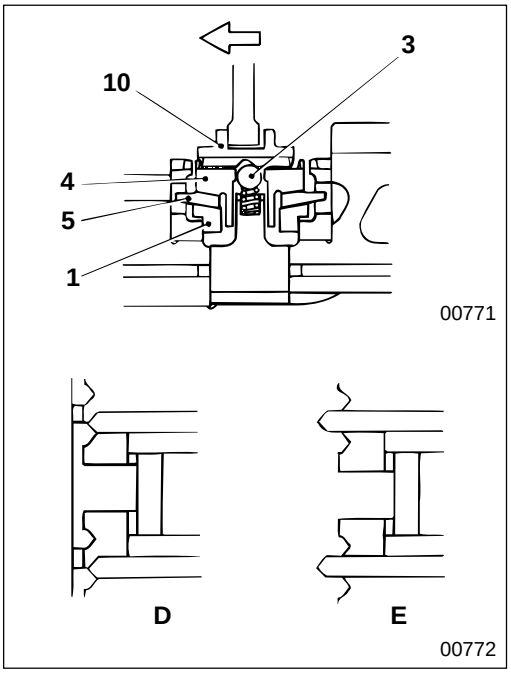
1 Synchronizer inner ring
2 2nd and 3rd shift fork
3 Shifting key
4 Synchronizer outer ring
5 Synchronizer center cone
6 2nd gear
7 Shifting key spring
8 Mainshaft
9 Synchronizer hub
10 Synchronizer sleeve
11 3rd gear
12 Dog clutch

- The following descriptions are for 2nd and 3rd gear
  The synchromesh structure and operation of the double cone type are basically the same as for the single cone type.
- Synchronizer center cone **5** is a taper cone independent of 2nd gear **6** and 3rd gear **11**, (both the inside and outside surfaces are tapered). The synchronizer center cone is between synchronizer inner ring **1** and synchronizer outer ring **4** to increase the synchronization capacity.
- Six protrusions on the outside of center cone **5** fit into corresponding gear holes, in the same manner as the taper cone of the single cone type. The center cone and the gear are installed as if integrated.
  Shifting key **3** is a cylinder installed so that the lengthwise direction of the cylinder is at right angles to the diameter direction of synchronizer hub **9**. Shifting key spring **7** is a coil spring inserted in a hole in the synchronizer hub, this spring presses the shifting key against the inside of synchronizer sleeve **10**.
- The 4th gear uses the double cone type; however, the structure of shifting key **3** and shifting key spring **7** is the same as for the single cone type.

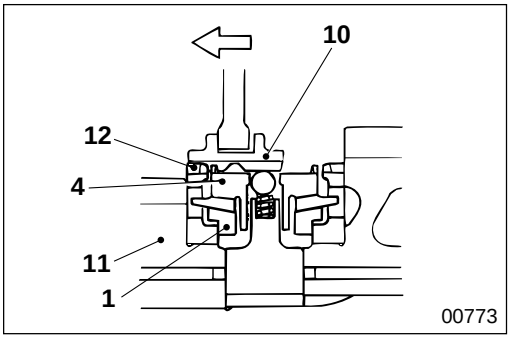
https://truckmanualshub.com/



- When the gear shift is in neutral (Figure **A**), moving shift fork **2** in the direction of the arrow as illustrated, moves synchronizer sleeve **10** slightly to the left. At the same time, shifting key **3**, the central protrusion of which engages the synchronizer sleeve, moves to the left and presses synchronizer outer ring **4** against synchronizer center cone **5**. (Figure **B**)
- When the taper surface of synchronizer outer ring **4** makes contact with the taper cone of synchronizer center cone **5**, the taper surface of the synchronizer outer ring acts as a cone clutch. This frictional torque rotates the synchronizer outer ring in the rotating direction of 3rd gear **11** by the amount of play between the synchronizer outer ring and synchronizer hub **9**. The spline chamfer of the synchronizer outer ring and the spline chamfer of synchronizer sleeve **10** are offset from each other. (Figure **C**)
- The disengagement direction of synchronizer outer ring **4** is defined by the speed of rotation of the synchronizer—the sleeve, and the synchronized—3rd gear **11**. When increasing the vehicle speed by shifting up, disengagement is made in the opposite direction to rotation, and when decreasing the vehicle speed by shifting down, disengagement is made in the rotating direction.



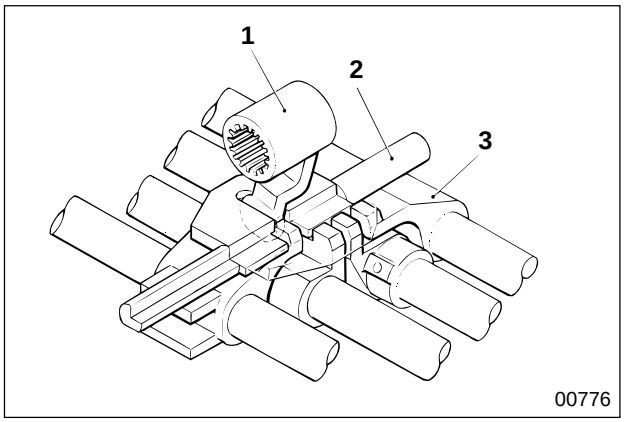
- When synchronizer sleeve **10** moves further to the left, synchronizer outer ring **4** prevents shifting key **3** from moving, and the synchronizer sleeve disengages from the protrusion of the shifting key.
- Since synchronizer outer ring **4** remains disengaged, the spline chamfer of synchronizer sleeve **10** presses the spline chamfer of the synchronizer outer ring, which in turn presses the synchronizer outer ring against the taper cone of synchronizer center cone **5**, and the frictional torque acts on the taper surface.
- As the frictional torque increases on the taper surface of synchronizer inner ring **1**, the relative speed of the synchronizer and the synchronized gradually decreases. The frictional torque acts on both sides of the synchronizer center cone. The double cone type has greater capacity for synchronization than the single cone type.
  E : In synchronization
  F : After synchronization



- When synchronizer sleeve **10** and 3rd gear **11** rotate at the same speed, synchronizer outer ring **4** no longer prevents the synchronizer sleeve from moving and the synchronizer sleeve moves further to the left and smoothly engages the spline of dog clutch **12** of the 3rd gear, transmitting the driving force.

https://truckmanualshub.com/

Interlock Mechanism



In the interlock mechanism, the rail beneath interlock plate **2** locks jaws **3**, (apart from the jaws shifted by gear shift slide lever **1**), preventing double engagement of gears.

https://truckmanualshub.com/

MEMO

https://truckmanualshub.com/

TROUBLESHOOTING

Possible causes \ Symptoms		Gears slip out of engagement	Gears hard to engage	Noise when engine is idling	Noise while cruising	Noise when changing gear
Transmission body faulty	Mainshaft rear lock nut loose	○	○			
	Mainshaft thrust washer worn	○	○			
	Mainshaft bearing worn or damaged	○	○			
	Synchronizer ring and synchronizer sleeve spline worn	○				
	Synchronizer ring and gears taper cone area worn		○			
	Mainshaft pilot bearing worn or damaged			○	○	
	Drive pinion bearing worn or damaged			○		
	Countershaft bearing worn or damaged			○		
	Needle bearings of gears worn or damaged			○	○	
	Mainshaft and countershaft bearings worn or damaged				○	
	Mainshaft and countershaft gears backlash excessive				○	
	Spline of gears worn					○
	Gears damaged				○	
	Gear oil insufficient				○	
Control mechanisms faulty	Control cable joint play	○	○			
	Set board assembly bushings worn	○				
	Shift rail steel ball and groove worn	○				
	Shift rail poppet spring fatigued or damaged	○				
	Shift rail sliding movement faulty		○			
	Shift fork jaws worn		○			
	Shift fork bent		○			
Synchronizer faulty	Contacting surfaces of synchronizer ring and gear taper cone worn					○
	Shifting key worn					○
	Shifting key spring deteriorated or damaged					○
	Synchronizer sleeve worn or damaged				○	○

● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect negative battery cable. Gr 54
3 Jack up the front axle on a garage jack.
4 Support the front frame on rigid racks.

WARNING⚠

- **Since the parking brake will be removed, naturally it cannot be used. Therefore, you must chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION⚠

Keep the transmission in neutral throughout the operation.

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

https://truckmanualshub.com/

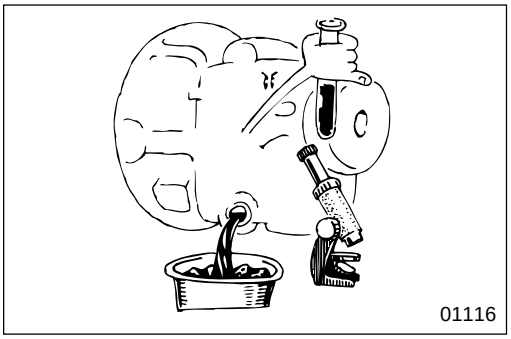
◆ Service procedure



01116

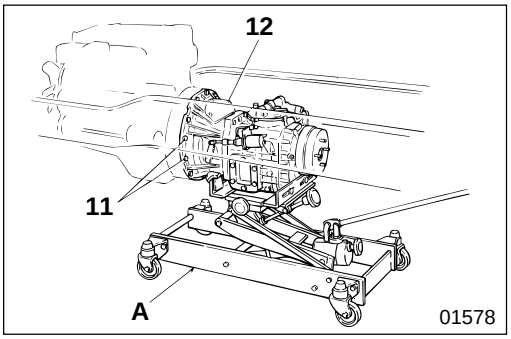
● Oil change

[Draining]

- When draining oil, check the quantity and quality of oil, especially for small pieces of metal and metal dust.
- Clean drain plug **10** before reinstalling it because it is magnetic.

[Filling]

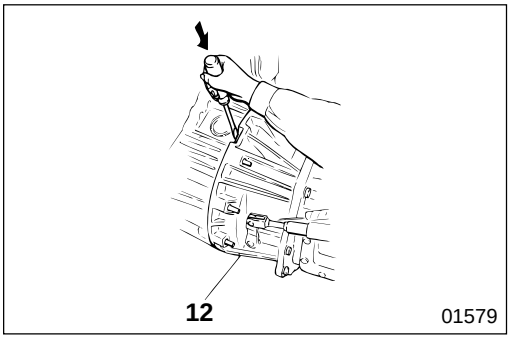
- Check that drain plug **10** are tightened at specified torque.
- Pour in gear oil until the oil overflows from the inspection hole. (For oil quantity, see specifications.)



01578

11 Removal of transmission mounting bolt

- Support transmission assembly **12** on transmission jack **A**.
- Tighten transmission mounting bolt **11**.



01579

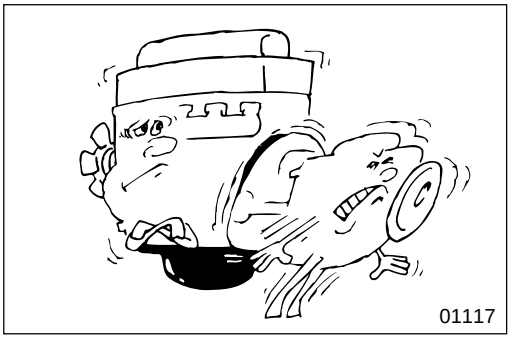
12 Transmission assembly

[Removal]

- Insert a screwdriver into the three removal grooves and pry transmission assembly **12** from the engine.

CAUTION⚠

Make sure that you remove hoses and cables before starting service operations.



01117

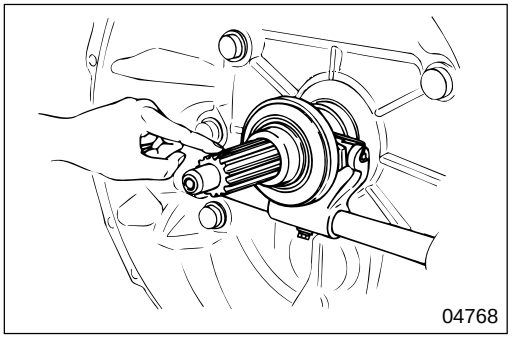
- Move transmission assembly **12** backward until the spline of the drive pinion is detached from the clutch.

CAUTION⚠

Make sure that you pull transmission assembly 12 out in a straight line. If you seesaw the transmission assembly violently, you will damage the spline that connects the drive pinion and the clutch.

https://truckmanualshub.com/

REMOVAL AND INSTALLATION OF TRANSMISSION ASSEMBLY

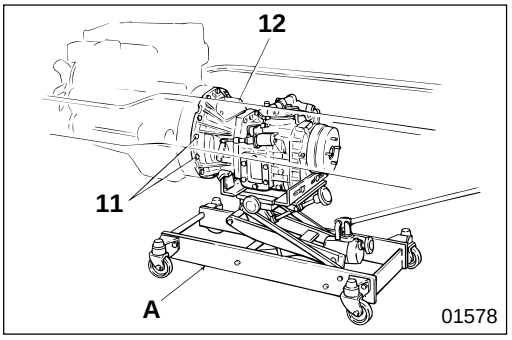


[Installation]

- Check the spline of the drive pinion for rust.
- If rust is found, remove it using a wire brush.
- Rub grease onto the clutch disc sliding surfaces of the drive pinion using your hand.

CAUTION

Make sure that you apply only the necessary amount of grease because too much grease would drip and cause clutch slip.



- Support transmission assembly **12** on transmission jack **A**, and insert the transmission assembly into the pilot bearing of the flywheel paying attention to the drive pinion spline.
- Tighten transmission mounting bolt **11** at specified torque.

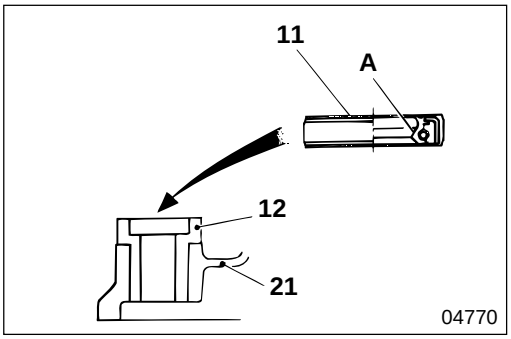
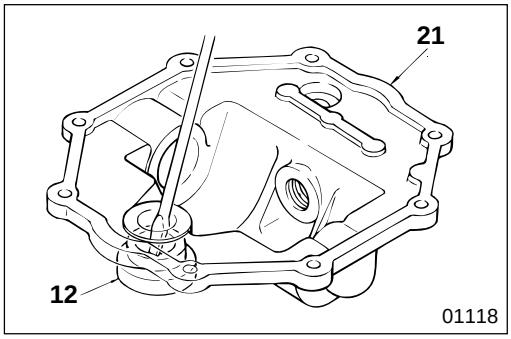
◆ Service procedure



11 Installation of oil seal

- Apply grease to lip area **A** of oil seal **11**.
- Press-fit oil seal **11** into bushing **12** in the direction as illustrated.



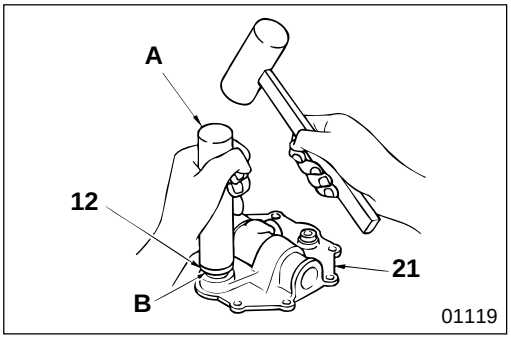
12 Bushing

[Removal]

Remove bushing **12** from selector lever case **21** using a screwdriver.

CAUTION

Be careful not to damage selector lever case 21.

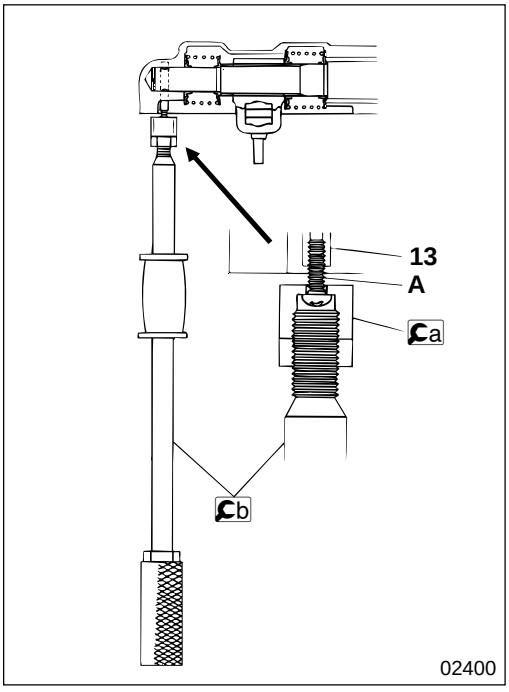


[Installation]

- Clean the inner surface of selector lever case **21**.
- Press-fit bushing **12** into selector lever case **21** using bar **A** (approximately ø40 mm {1.57 in.}).
- When press-fitting bushing **12**, take care not to damage selector lever case **23**.
- After press-fitting, apply sealant to press-fitted side **B** of bushing **12**.

CAUTION

Prevent sealant from sticking to the inner surface of bushing 12.

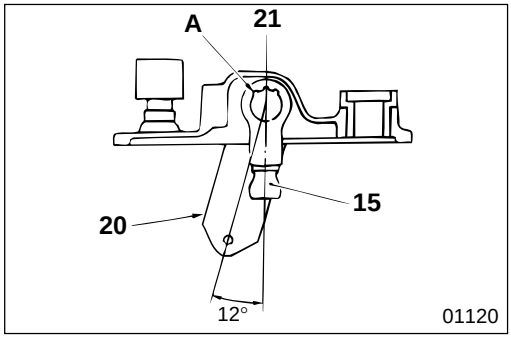


13 Removal of spring pin

- Tap spring pin **13** using an M4 tap.
- Into Ca spring pin puller with an M4 thread **A** of appropriate length into spring pin **13**.
- Position Cb reverse shaft puller on Ca spring pin puller.
- Remove spring pin **13** from selector lever case **21** using Ca spring pin puller and Cb reverse shaft puller.

https://truckmanualshub.com/

GEAR SHIFTER UPPER AND INTERLOCK PLATE



15 **20** **Installation of gear shift slide lever and gear shift lever**

When you install gear shift slide lever **15** in gear shift lever **20**, position spline **A** so that the angle between the slide lever and the shift lever is as illustrated.

4	Bolt (Reverse shaft lock piece mounting)	40 {30, 4.1}	—

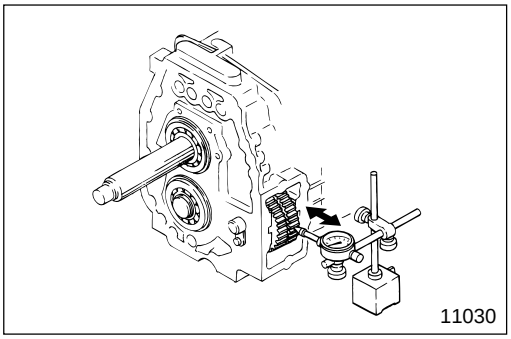
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
6	Drive pinion and reverse shaft puller  02118	03726-82000	Removal of reverse idler shaft

https://truckmanualshub.com/

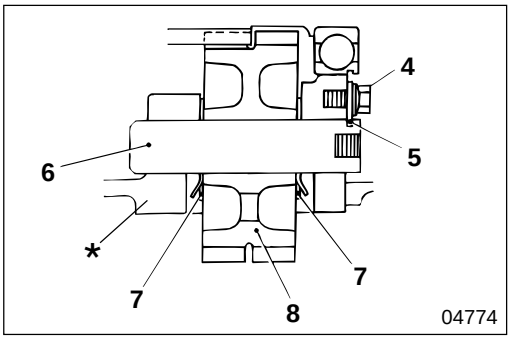
◆ Service procedure



● Inspection before disassembly

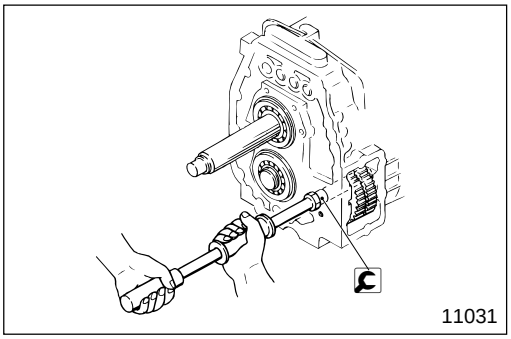
Play of reverse idler gear in the diameter direction

- If the measured value is higher than the limit, replace the faulty parts.
- Reinspect play after assembly to check that the measured value is within the limit.



4 to 8 Assembly of reverse idler gear

- Install reverse shaft gear side washer **7** and reverse idler gear **8** in transmission body *.
- Install reverse idler shaft **6** in transmission body * using a plastic-headed mallet.
- Install reverse shaft lock piece **5** in transmission body * with mounting bolt **4**.



6 Removal of reverse idler shaft

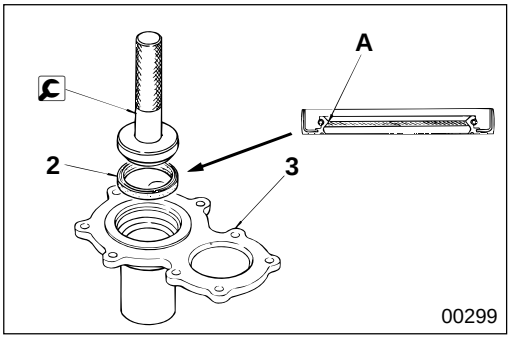
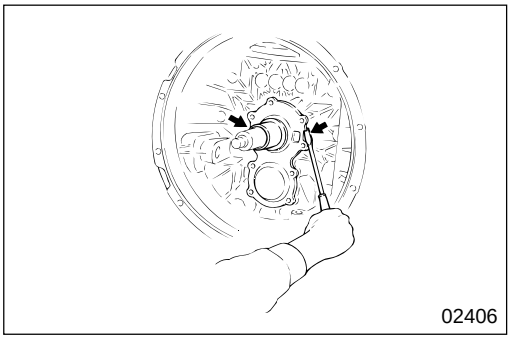
◆ Service procedure



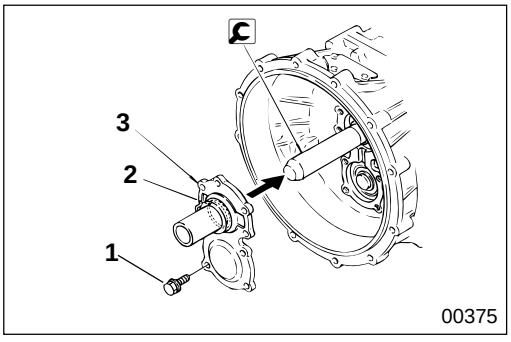
2 Installation of oil seal

- Apply grease to lip area **A** of oil seal **2**.
- Press-fit oil seal **2** into front bearing retainer **3** in the direction as illustrated using 🔧 oil seal installer.



3 Front bearing retainer

[Removal]



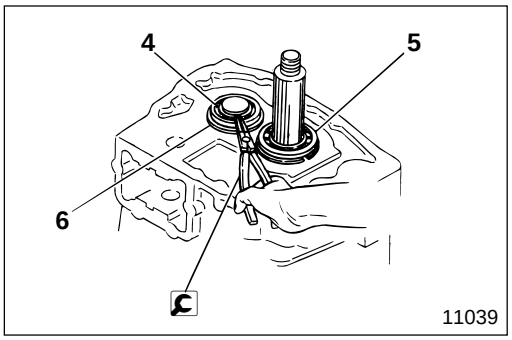
[Installation]

Press-fit front bearing retainer **3** into clutch housing assembly **19** using 🔧 oil seal front guide.

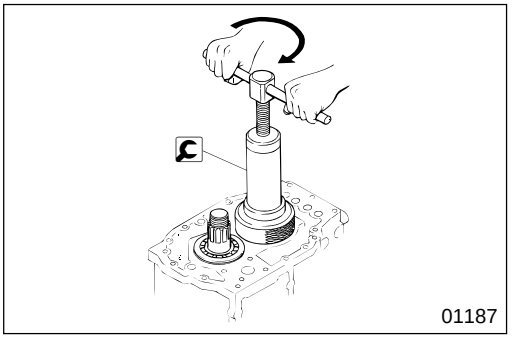
CAUTION⚠

Be careful when installing front bearing retainer 3, that you do not damage oil seal 2 installed on the front bearing retainer.

https://truckmanualshub.com/

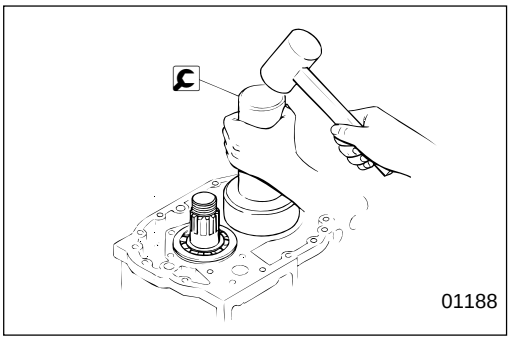


4 to **6** **Removal and installation of snap ring**

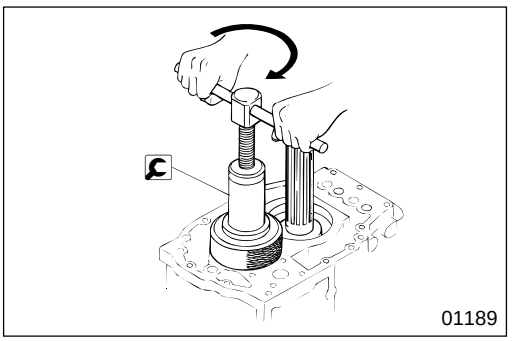


7 **Mainshaft rear bearing**

[Removal]

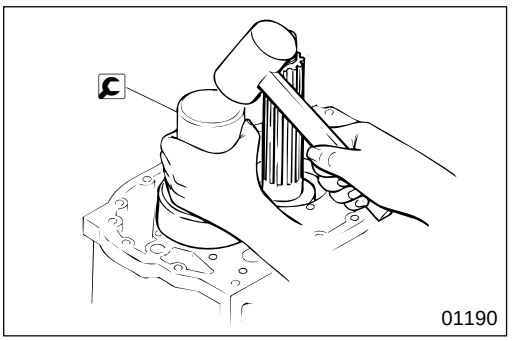


[Installation]



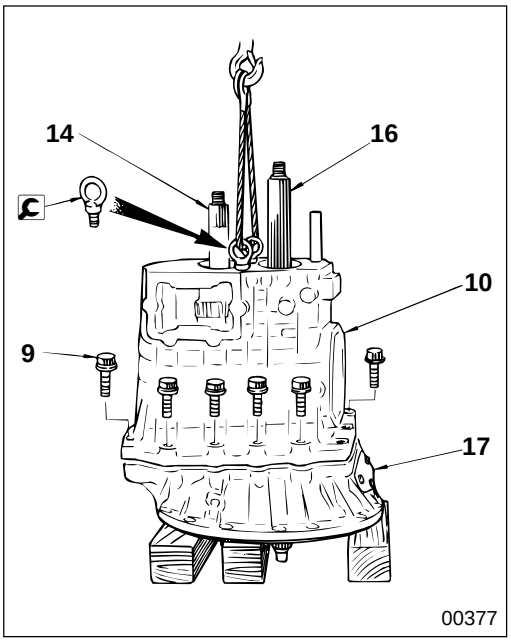
8 **Countershaft rear bearing**

[Removal]



[Installation]

https://truckmanualshub.com/



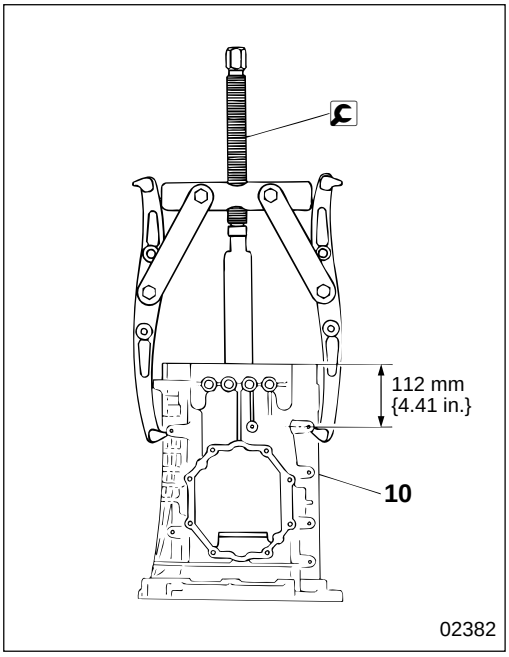
10 Removal and installation of transmission case

[Removal]

● **Remove transmission case 10.**

Method 1

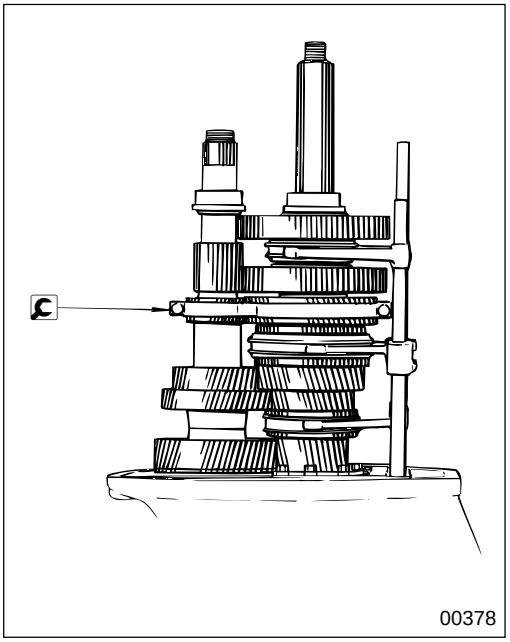
- When lifting up with a crane, install 🔧 eye bolts on transmission case **10** and pass a steel sling through them.
- After removing bolts **9**, lift transmission case **10** up with a crane and keep hitting the rear ends of clutch housing assembly **17**, mainshaft assembly **16** and countershaft assembly **14**. Use a plastic-headed or copper-headed mallet to remove the transmission case.



Method 2

- A 🔧 gear puller can be used instead of a crane.

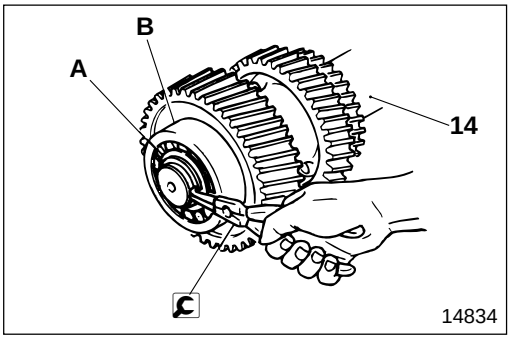
https://truckmanualshub.com/



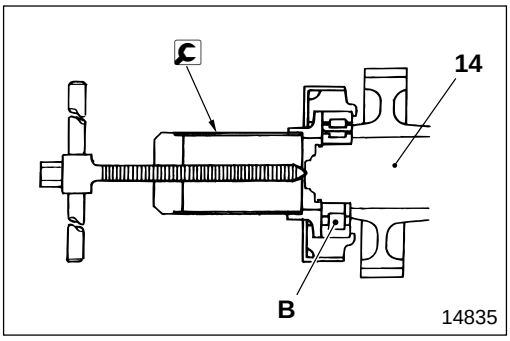
- After removing transmission case **10**, fit the 2nd gear using steel lifting band to ensure safety.

CAUTION

Be sure to tighten steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.



- Remove snap ring **A** from countershaft assembly **14**.
  B : Countershaft front bearing



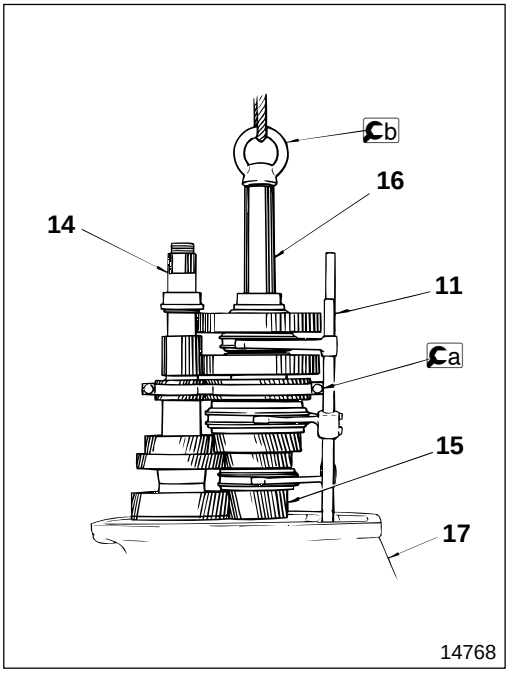
- Remove countershaft bearing **B** from countershaft assembly **14**.

[Installation]
Follow the removal sequence in reverse.

CAUTION

Be careful not to damage mainshaft assembly 16, or rear bearings 7, 9 of countershaft assembly 14 during installation.

https://truckmanualshub.com/



11 **14** **to** **16** **Shift rail and shift fork, countershaft assembly, drive pinion assembly, and mainshaft assembly**

[Removal]
Remove or install shift rail and shift fork **11**, countershaft assembly **14**, drive pinion assembly **15**, and mainshaft assembly **16** as a group.

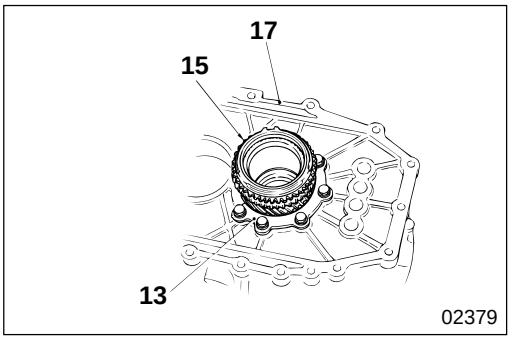
- Before lifting, after removing the case, install b eye nut at the end of mainshaft **18**, fitted with a steel lifting band.
- Fix shift rail and shift fork **11** to mainshaft assembly **16** with a rubber band.
- Fix a piece of wood to clutch housing assembly **17**, and use a crane to lift the clutch housing together with drive pinion assembly **15** up, at the same time hitting them with a plastic-headed mallet to remove them.

CAUTION

- **Be sure to tighten a steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.**
- **Make sure, when lifting mainshaft assembly 16 or other parts, that you support drive pinion assembly 15 with your hand in order to prevent it from falling when the mainshaft assembly and countershaft assembly 14 come apart.**

[Installation]
Method 1

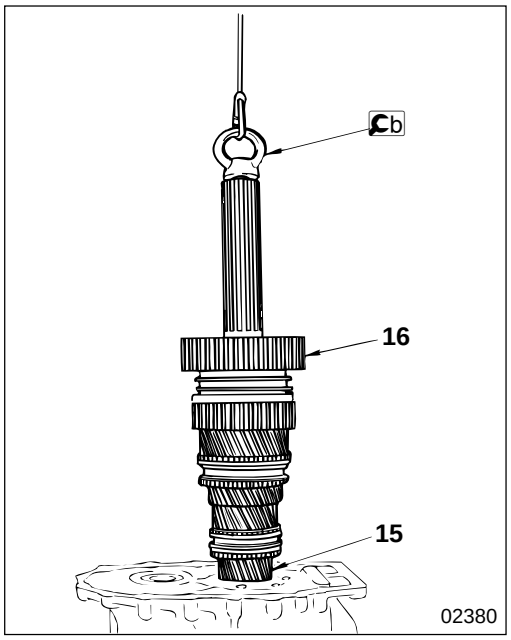
- Follow the removal sequence in reverse.



Method 2

- After installing drive pinion assembly **15** in clutch housing assembly **17**, install drive pinion bearing retainer **13**.

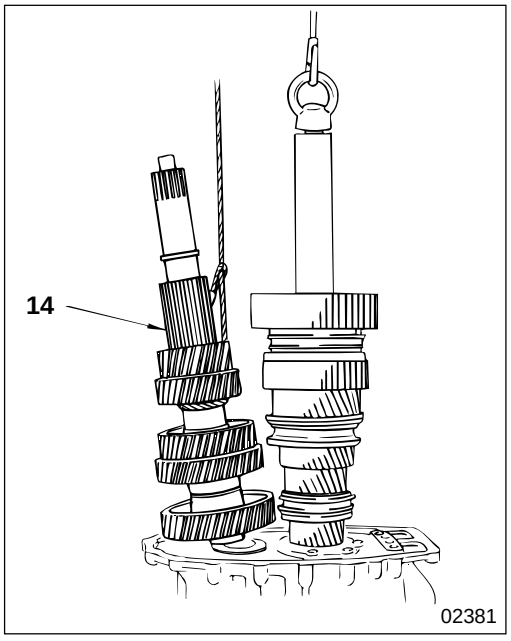
https://truckmanualshub.com/



- Install b eye nut at the end of mainshaft assembly **16**.
- Lift mainshaft assembly **16** up using a crane and install the mainshaft assembly on drive pinion assembly **15**.

CAUTION

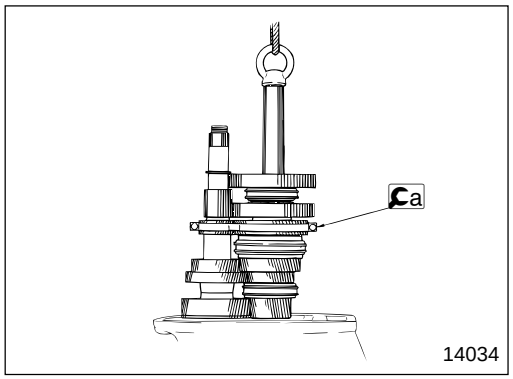
To prevent mainshaft assembly 16 from falling, support it using a crane.



- Install countershaft assembly **14** in clutch housing assembly **17**.

CAUTION

If you use this method of installation, first remove the countershaft front bearing. P22-52

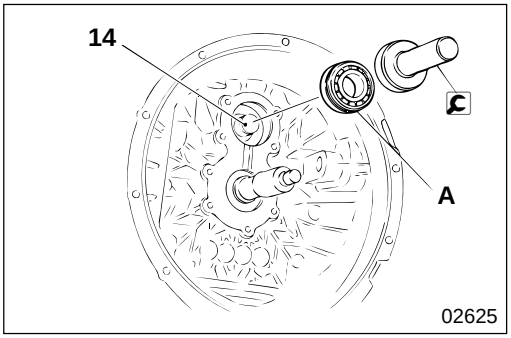


- Fit the 2nd gear unit using a steel lifting band to ensure safety.

CAUTION

Be sure to tighten a steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.

https://truckmanualshub.com/



- Install shift rail and shift fork **11** and transmission case **10** in clutch housing assembly **17**.
- Place clutch housing assembly **17** horizontally so that countershaft assembly **14** is uppermost.
- Install the countershaft front bearing **A** into clutch housing assembly **17** using countershaft bearing installer.

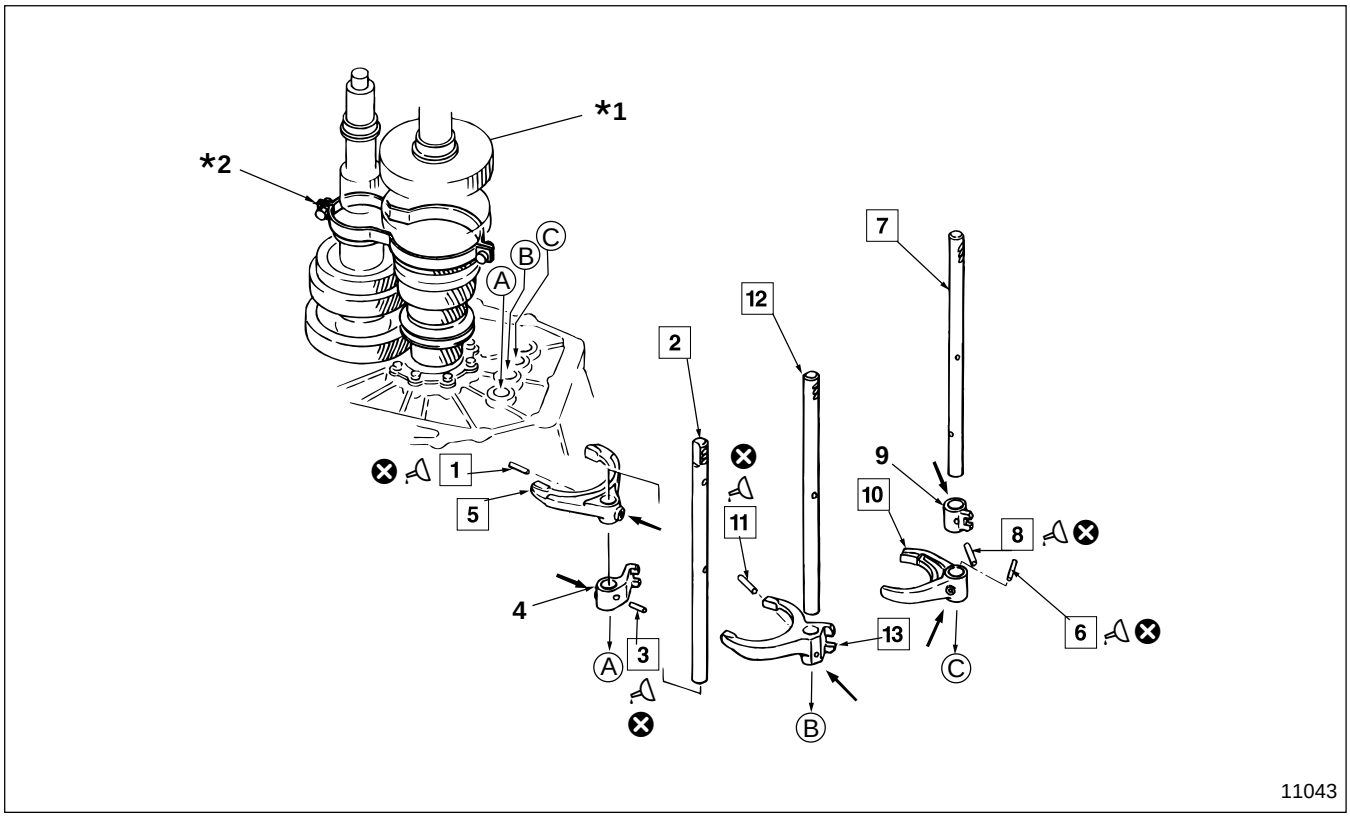
CAUTION

Be sure to install the snap ring of the countershaft front bearing.

https://truckmanualshub.com/

TRANSMISSION BODY

Shift Rail and Shift Fork



Arrow mark : Removal and installation direction for spring pin

● **Disassembly sequence**

(When the mainshaft assembly is not removed or installed and only the shift rail and shift fork is disassembled)

1 Spring pin
2 1st and reverse shift rail
3 Spring pin
4 1st and reverse shift rail jaw
5 1st and reverse shift fork
6 Spring pin
7 4th and 5th shift rail

12 2nd and 3rd shift rail
13 2nd and 3rd shift fork

***1** : Mainshaft assembly
***2** : steel lifting band
⊗ : Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse. Remove steel lifting band after installing the shift rail and shift fork.

Service standards

Unit : mm {in.}

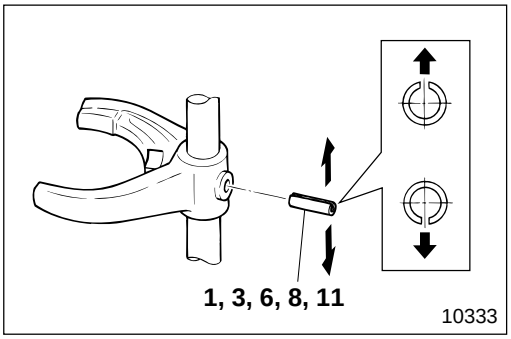
Location	Maintenance item	Standard value	Limit	Remedy
2, 7, 12	Bend of shift rail	0.039 {0.0015} or less	0.08 {0.0031}	Correct or replace
5, 10, 13	Tilt of shift fork claw	0.1 {0.0039} or less	0.2 {0.0079}	Replace
5, *1	Clearance between 1st and reverse shift fork and synchronizer sleeve	0.3 to 0.5 {0.012 to 0.020}	1.0 {0.039}	Replace
10, *1	Clearance between 4th and 5th shift fork and synchronizer sleeve	0.3 to 0.6 {0.012 to 0.024}	1.0 {0.039}	Replace
13, *1	Clearance between 2nd and 3rd shift fork and synchronizer sleeve	0.2 to 0.4 {0.0079 to 0.016}	1.0 {0.039}	Replace

https://truckmanualshub.com/

Sealant

Location	Points of application	Kinds	Quantity
1, 3, 6, 8, 11	Spring pin	LOCTITE 601	As required

◆ Service procedure

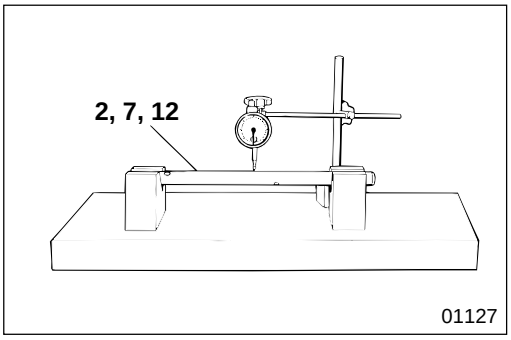


1 **3** **6** **8** **11** **Installation of spring pin**

Install spring pins **1**, **3**, **6**, **8**, **11** in the direction as illustrated.

CAUTION

- **Make sure you do not drive in spring pins 1, 3, 6, 8, fully, leave 0 to 0.5 mm {0 to 0.020 in.} outside to prevent them from slipping out.**
- **Do not remove spring pin 6 for 4th and 5th shift fork 10 (made of aluminum), except when replacing shift fork 10 or shift rail 7.**
- **Note that the length of spring pin 6 differs from that of spring pins 1, 3, 8, 11.**
- **Be careful when driving in spring pins 1, 3, 6, 8, 11, that you do not subject shift rails 2, 7, 12 to excessive strain, because this would cause faults such as bent shift rails.**

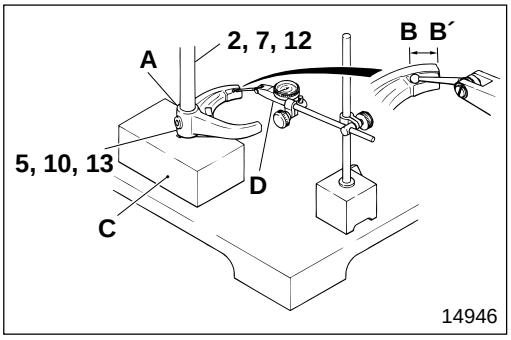


2 **7** **12** **Bend of shift rail**

If the measured value is higher than the limit, correct or replace shift rail **2**, **7**, or **12**.

NOTE

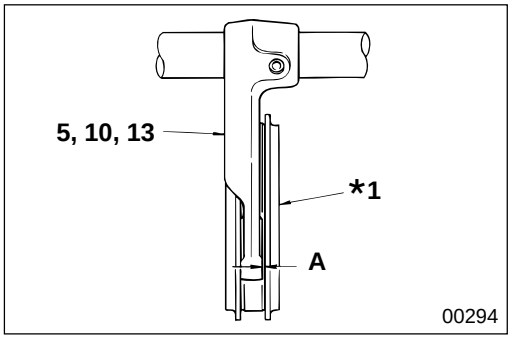
Read dial gauge after turning shift rails 2, 7, 12 one full revolution. The bend is one half of the indicated value.



5 **10** **13** **Tilt of shift fork claws**

- Measure the tilt (difference between **B** and **B´**) of claw **B-B´** against hole **A** of shift rails **2**, **7**, **12** of shift forks **5**, **10**, **13** with the shift rails upright.
- If the measured value is higher than the limit, replace shift forks **5**, **10**, or **13**.

C : V-block
D : Dial gauge



5 **10** **13** ***1** **Clearance between gear shift fork and synchronizer sleeve of mainshaft**

If clearance **A** is higher than the limit, replace the faulty parts.

***1** : Synchronizer ring of mainshaft assembly

◆ Service procedure

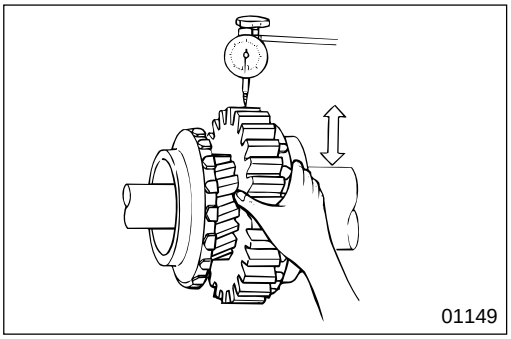
● Work before disassembly

[Inspection]

(1) End play of gears

A : Reverse gear
B : 2nd gear
C : 3rd gear
D : 4th gear
E : 1st gear

If the measured value is higher than the limit, replace the faulty parts. Also inspect this item after assembly and make sure that the measured value is within the limit.

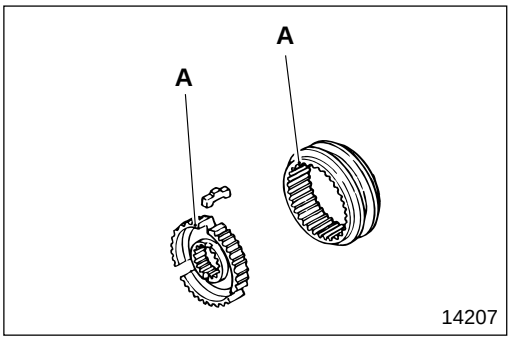


(2) Play of gears in diameter direction

If the measured value is higher than the limit, replace the faulty parts. Also inspect this item after assembly and make sure that the measured value is within the limit.

CAUTION⚠

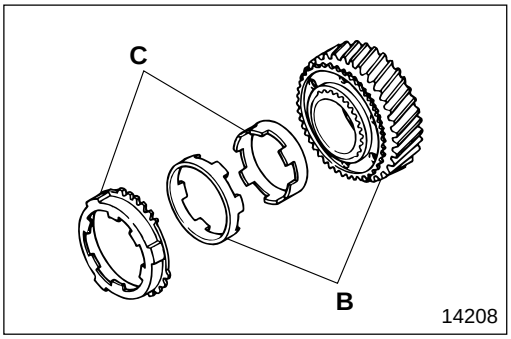
Be sure when you replace the two needle bearings of a gear, that both needle bearings are from the same color package.



[Alignment marks]

(1) Synchronizer sleeve and synchronizer hub

Before disassembling the synchronizer sleeve and the synchronizer hub, put alignment marks **A** on the places where the shifting keys are installed. When reusing parts, align the alignment marks to assemble.

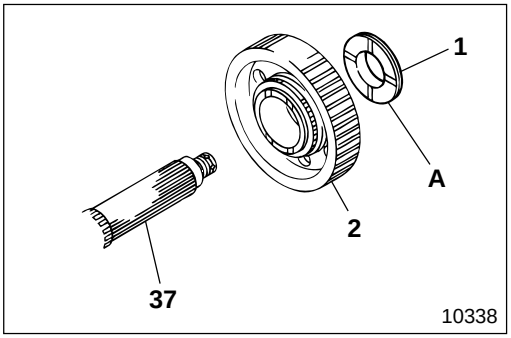


(2) Ring, cone and gear assembly of double cone synchronizer

Before disassembling synchronizer center cone and gear assembly (**B**), and synchronizer center ring and synchronizer outer ring (**C**), put alignment marks on them. When reusing parts, align the alignment marks to assemble.

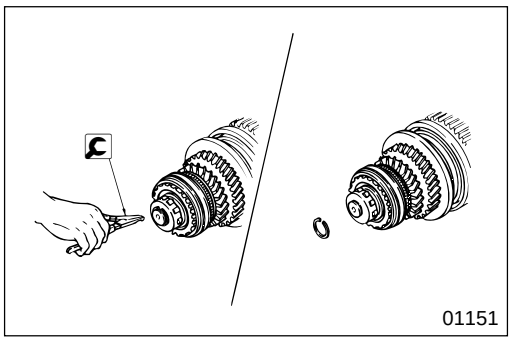
https://truckmanualshub.com/

MAINSHAFT ASSEMBLY

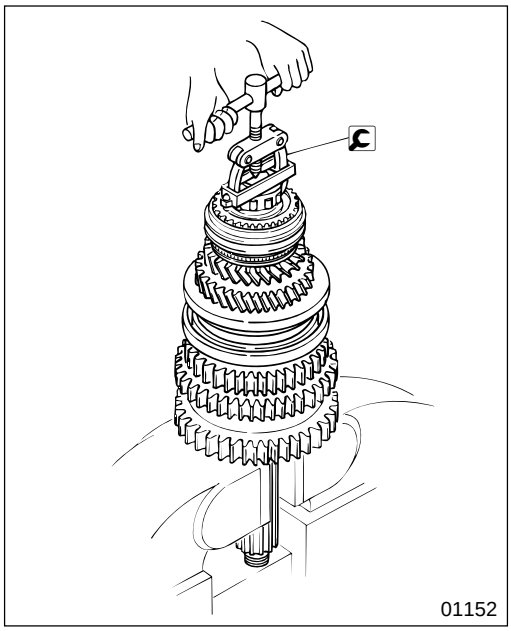


1 **Installation of reverse gear thrust washer**

A : Oil groove

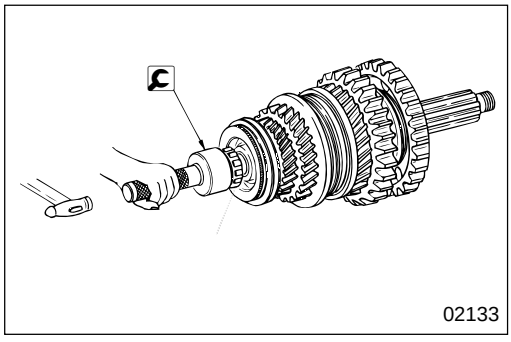


5 **Removal and installation of snap ring**



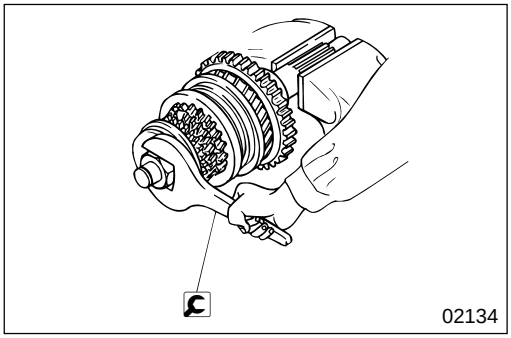
6 **Pilot bearing**

[Removal]

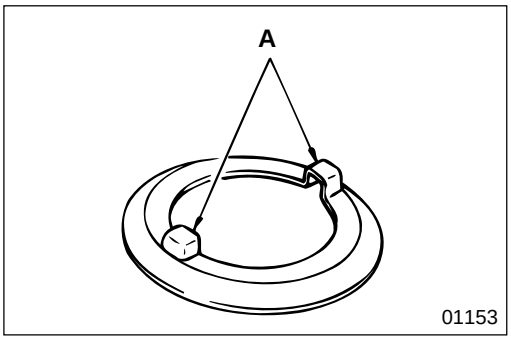


[Installation]

https://truckmanualshub.com/

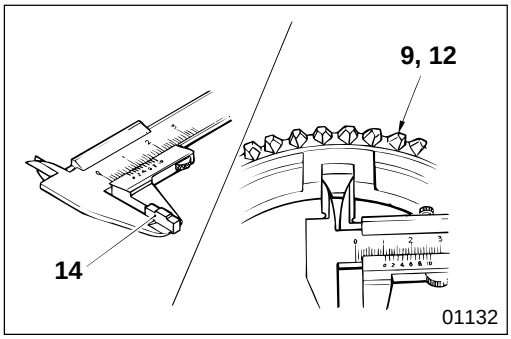


7 **Removal and installation of lock nut**



8 **Installation of lock washer**

Install so that protrusions **A** (two points as illustrated) fit into the grooves of synchronizer hub **16**.

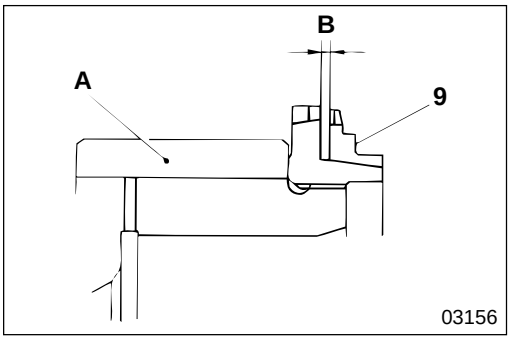


9 **to** **17** **Synchromesh mechanism and 4th gear**

[Inspection]

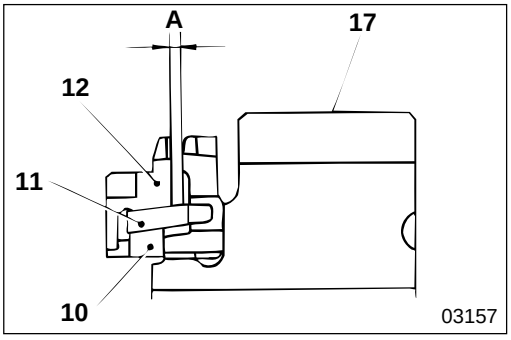
(1) Clearance between synchronizer ring 9 or outer ring 12 and shifting key 14

If the measured value is higher than the limit, replace the faulty parts.



(2) Clearance between synchronizer ring 9 and drive pinion

- Measure clearance **B** between synchronizer ring **9** and the gear cone of drive pinon **A**.
- When measuring this value, press synchronizer ring **9** evenly, and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.

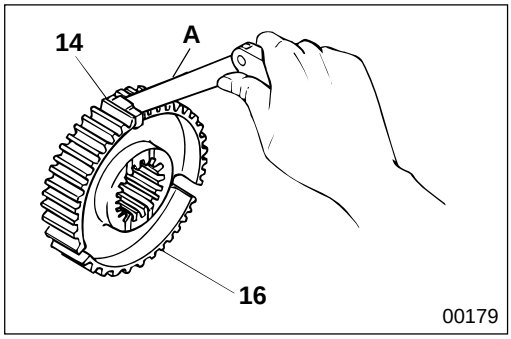


(3) Clearance between synchronizer outer ring and 4th gear

- Measure clearance **A** between synchronizer outer ring **12** and the gear cone of 4th gear **17**.
- When measuring this value, press synchronizer inner ring **10**, center cone **11**, and the outer ring evenly and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.

https://truckmanualshub.com/

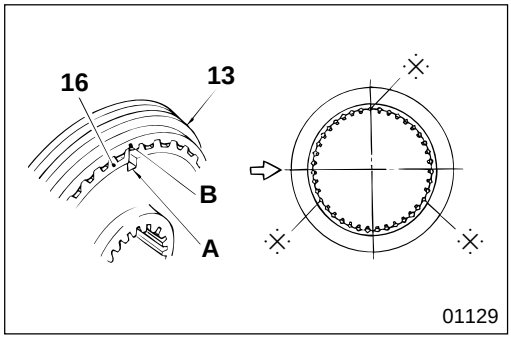
MAINSHAFT ASSEMBLY



(4) Clearance between shifting key 14 and synchronizer hub 16

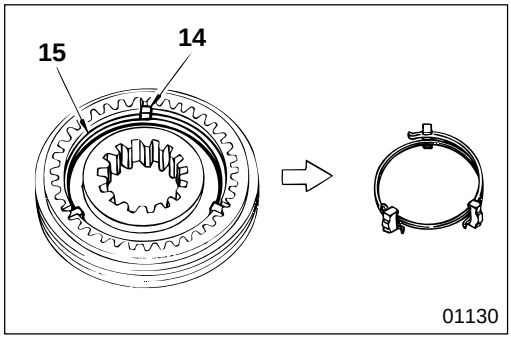
If the measured value is higher than the limit, replace the faulty parts.

A : Feeler gauge

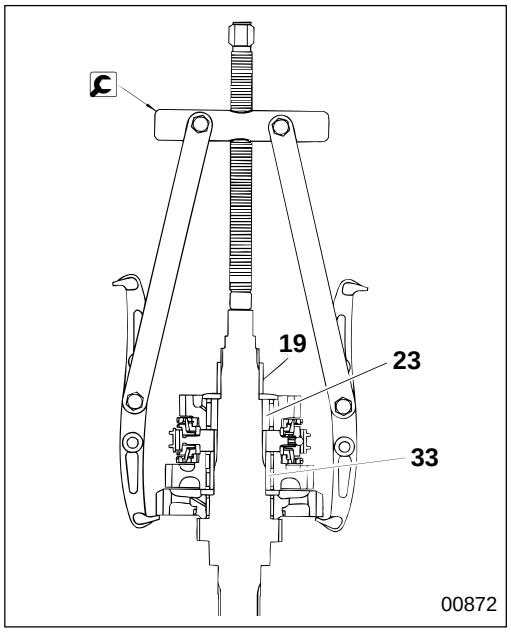


[Installation]

- Align the three keyways **A** of synchronizer hub **16** with the three stub teeth **B** (illustrated by ⁜ mark) of synchronizer sleeve **13** to install the synchronizer hub.
- To reassemble synchronizer hub **16** and synchronizer sleeve **13**, align the alignment marks made during disassembly.

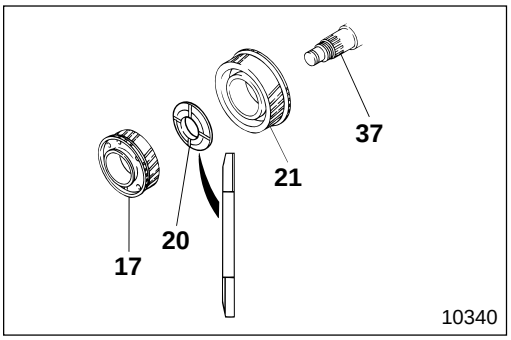


- Insert shifting key **14** into the keyway.
- Install shifting key spring **15** so that its opening is offset from the one of the shifting key.
- Make sure that the openings of shifting key springs do not align with each other.

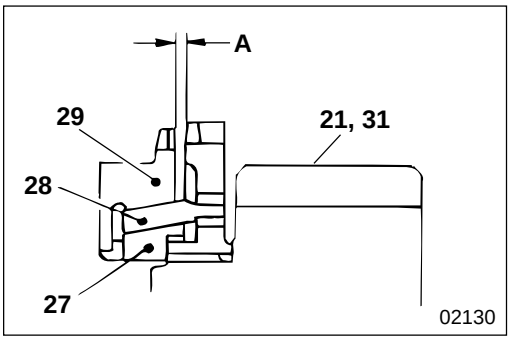


19 **23** **33** **Removal of 4th, 3rd, 2nd gear bearing sleeves**

https://truckmanualshub.com/



20 **Installation of 3rd and 4th gear thrust washer**



21 **29** **31** **Clearance between synchronizer outer ring and 3rd gear assembly or 2nd gear assembly**

- Measure clearance **A** between synchronizer outer ring **29** and the cone of 3rd gear assembly **21** or 2nd gear assembly **31**.
- When measuring this value, press synchronizer inner ring **27**, synchronizer outer ring **29** and synchronizer center ring **28** evenly and measure all around the circumference.
- If the measured value is higher than the limit, replace the faulty parts.

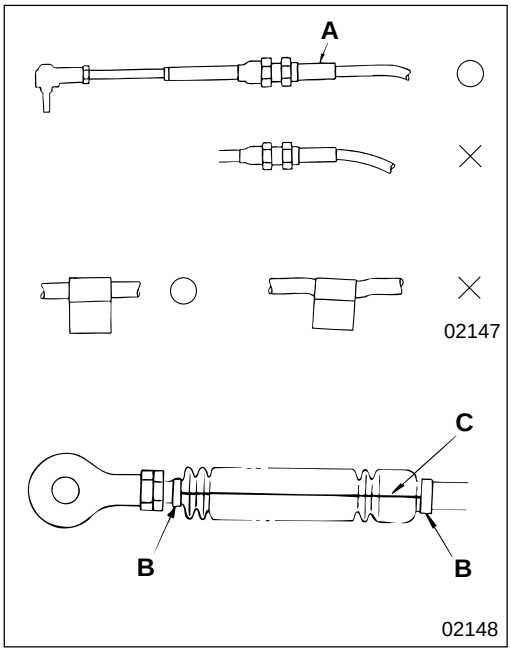
Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1 to 4	Nut (Ball joint or rubber damper mounting)	19 to 24 {14 to 17, 1.9 to 2.4}	—
5, 6	Cable lock nut tightening	59 to 83 {43 to 61, 6 to 8.5}	—

https://truckmanualshub.com/

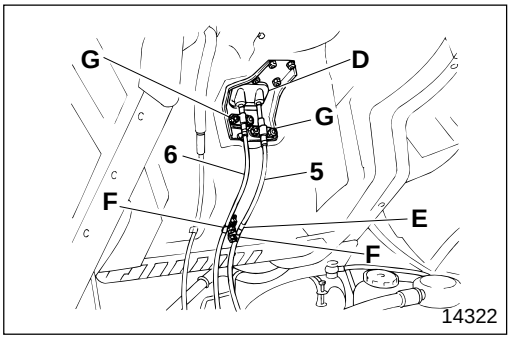
◆ Service procedure



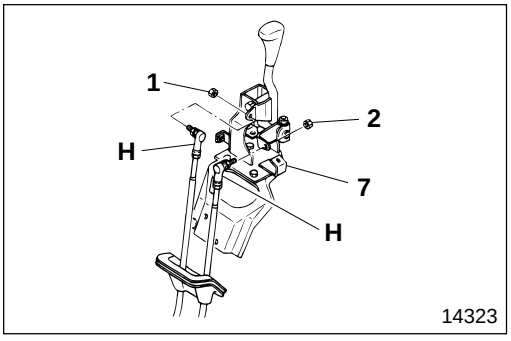
5 6 **Installation of shift cable and selector cable**

CAUTION

- **Be sure to install casing cap A lengthwise.**
- **Make sure the radius of the bend is 200 mm {7.87 in.} or more.**
- **Make sure the cable operates smoothly.**
- **Be sure to install the clamps vertically against the cable.**
- **Make sure you do not twist clamps B at both ends of the boot. Make sure that white line C on the boot is aligned.**
- **Make sure the identification marks on the cable, the ball joint and the rubber damper point in the right direction when you install the cables. Installing the cables with the identification marks in the wrong direction can remarkably reduce the durability of the cables.**



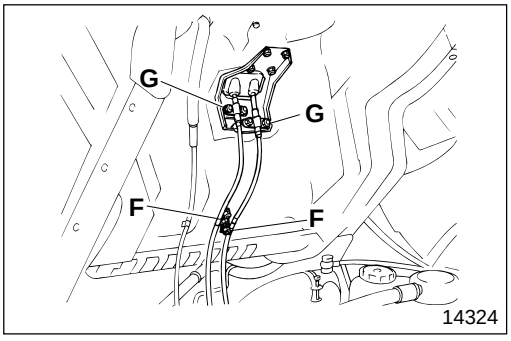
- Install shift cable **5** and selector cable **6** to the frame after having temporarily installed all the clamps.
- Insert shift cable **5** and selector cable **6** through grommet **D** of the cab floor into the inside of the cab, then install clip **F** and clip **G** temporarily by making identification mark **E** on the shift cable come to clip **F** position. (The selector cable has no identification mark.)



- Lower the cab.
- Install ball joint **H** of the cable to the shift lever and selector lever of transmission control lever assembly **7**.

CAUTION

Make sure that ball joint H faces the correct direction.



- Tilt the cab up and tighten clip **F** and clip **G** permanently without applying force to the cables.

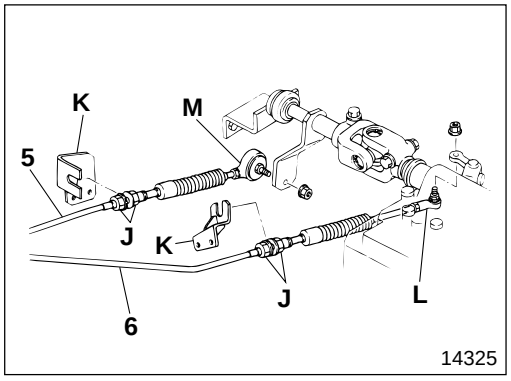
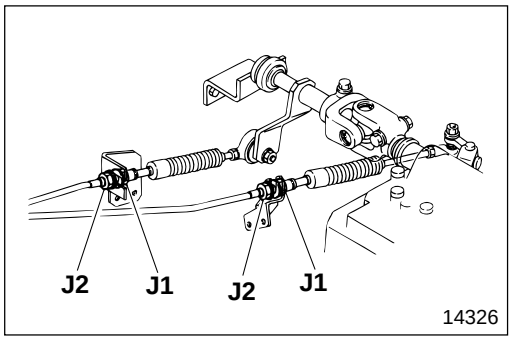
TRANSMISSION CONTROL



- Install lock nut **J** to bracket **K** temporarily and connect ball joint **L** or rubber damper **M** to the shift lever and selector lever.
- Tighten lock nut **J** permanently without applying force to the cables.

CAUTION ⚠

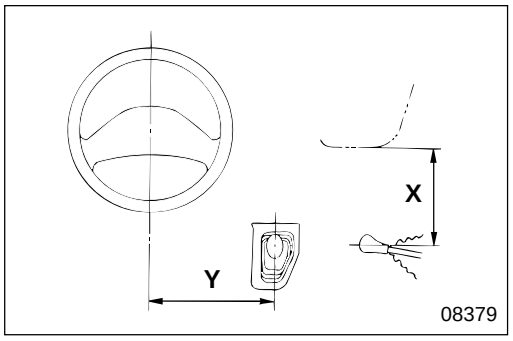
Make sure that ball joint L and rubber damper M face the correct direction.



CAUTION ⚠

Make sure not to move lock nut J1 of the transmission side when tightening lock nut J. Tighten lock nut J2.

- Check when you operate the gear shift lever that it shifts and selects each position smoothly.



- If the gear shift lever leans to the front or rear, or to the left or right, excessively, adjust the length of the cable.
- When adjusting the gear shift lever, use the distance from the center of the steering wheel or from the instrument panel as the reference distance.

Unit : mm {in.}

Front and rear direction X (Distance from the instrument panel)	Left and right direction Y (Distance from the steering wheel center)
309 {12.17}	350 {13.78} (4th and 5th gear position)

	Shift cable **5**	Selector cable **6**
To front	Shorten	—
To rear	Lengthen	—
To right	—	Lengthen
To left	—	Shorten

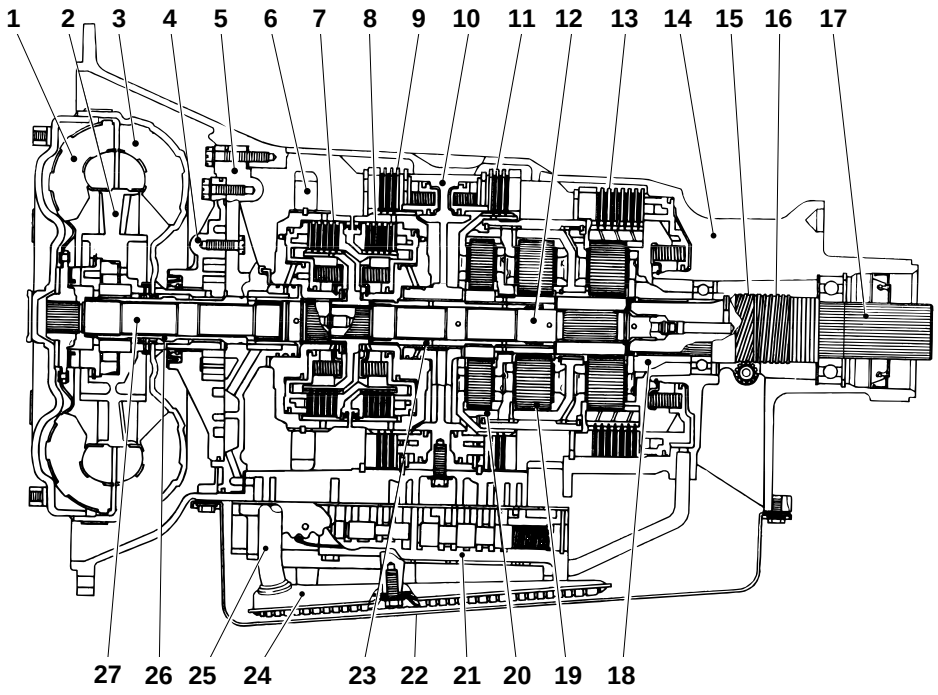
Automatic Transmission Assembly



13919

1	Turbine	**10**	Center support	**19**	Center planetary gear set
2	Stator	**11**	2nd clutch	**20**	Front planetary gear set
3	Impeller	**12**	Mainshaft	**21**	Control valve assembly
4	Oil pump assembly	**13**	1st and reverse clutch	**22**	Oil pan
5	Front support	**14**	Transmission case	**23**	Sun gear shaft
6	Power take-off drive gear	**15**	Governor drive gear	**24**	Oil filter
7	Forward clutch	**16**	Speedometer sensor drive gear	**25**	Intake pipe
8	4th clutch	**17**	Output shaft	**26**	Stator shaft
9	3rd clutch	**18**	Rear planetary gear set	**27**	Turbine shaft

The automatic transmission consists of a torque converter and a fully automatic 4-speed gear system.

- **Torque converter**

  The torque converter is driven by the engine crankshaft, and functions as the input device for the transmission. The torque converter also acts as the fluid coupling, absorbing shock during engine start up and gear shifting.

- **Transmission (4 forward speeds, 1 reverse speed)**

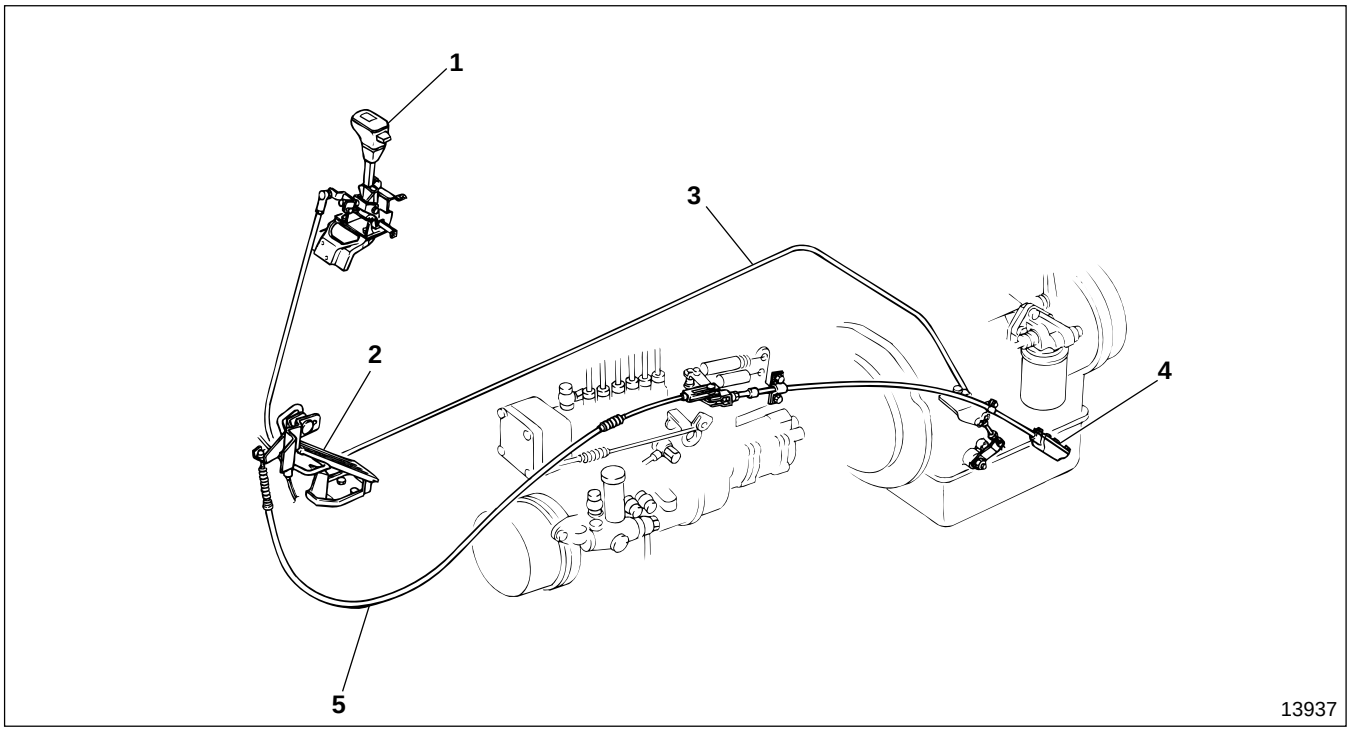
  The transmission is accomplished by three sets of planetary gears **18**, **19**, **20** and five sets of oil pressure-operated, wet-type multiple disc clutches **7**, **8**, **9**, **11**, **13**. These oil-cooled clutch discs are self-adjusting to compensates for wear.

- **Oil pressure control area**

  This oil pressure control area consists of oil pump **4**, control valve assembly **21** that controls the changeover between clutches **7**, **8**, **9**, **11**, and **13**, the modulator that monitors the amount the accelerator pedal is depressed, and the governor that monitors the vehicle speed. Gear shift is made automatically and depends on how much the accelerator pedal is depressed and how fast the vehicle is travelling.

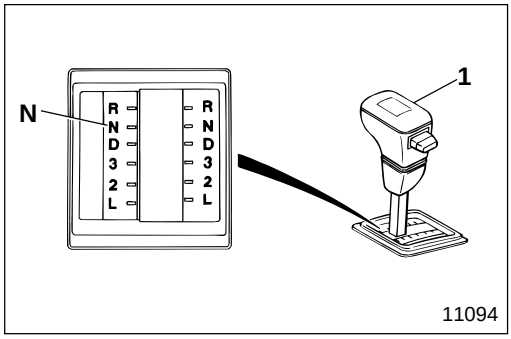
https://truckmanualshub.com/

Automatic Transmission Control



1 Range selector lever
2 Accelerator pedal
3 Selector cable
4 Modulator
5 Accelerator control cable

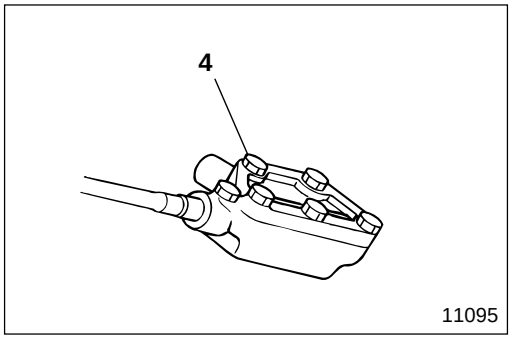
Selector Lever



Range selector lever **1** selects the most suitable range for the operating conditions, ensuring optimum service from the automatic transmission. Safety features are incorporated that make sure that the engine cannot be started when the range selector lever is in any position other than neutral (N).

N : Neutral

Modulator



Modulator **4** converts the amount the accelerator pedal is depressed into hydraulic pressure.

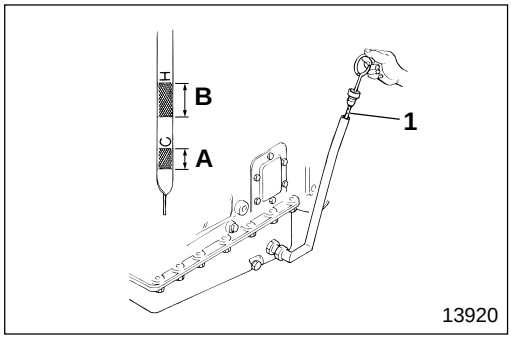
INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection of Automatic Transmission Fluid

(1) Inspection of characteristics

If the automatic transmission fluid smells burnt or if it contains metal particles or sludge as a result of internal friction and wear of metal or other material, the transmission assembly must be completely overhauled. Make sure you carefully examine the automatic transmission fluid on the dipstick. If you find the quality questionable, take a sample and examine it more closely.



(2) Inspection of automatic transmission fluid level

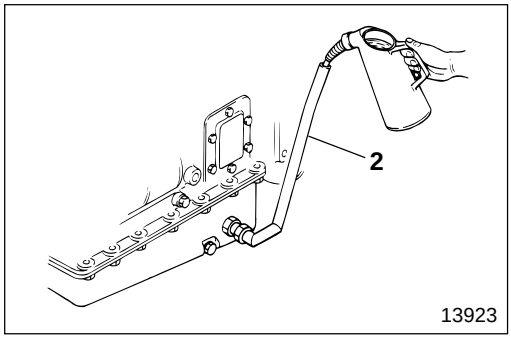
- Park the vehicle on level ground, make sure that the parking brake is fully activated and chock the wheels to keep them from rolling.
- Start the engine and let it idle. To fill the hydraulic circuit with automatic transmission fluid, shift the range selector lever from N → R → N → D → 2 → D → N. Repeat this process five times, finally shifting to N.
- While the engine is still idling, pull out dipstick **1** and wipe off the fluid sticking to it. Reinsert the dipstick, then pull it out again and check the fluid level.
- If the fluid level is inspected right after the engine is started and the fluid temperature is still low (approximately 15 to 49°C {60 to 120°F}), the level should be within area **A** marked COLD on the dipstick.
- If the fluid level is inspected after the vehicle has been driven and the fluid temperature is high (approximately 71 to 93°C {160 to 200°F}), the level should be within area **B** marked HOT on dipstick **1**.

WARNING⚠

Take care during the inspection because the engine will be running. Take sufficient care to avoid burns or injuries resulting from contact with moving parts.

NOTE

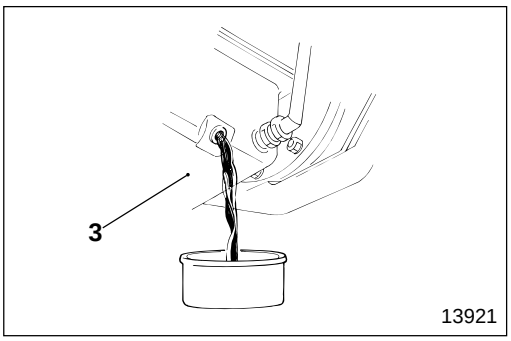
- **Make sure the vehicle is parked on level ground when you are checking the fluid level.**
- **Make sure the range selector lever is in the N position and the engine is idling when you are checking the fluid level. When the engine is stopped, the fluid level appears higher than it actually is.**
- **Be sure to wipe off the dust from the safety cap and the upper part of dipstick guide 2 before you pull out dipstick 1.**
- **To ensure the fluid is correct, reinspect the fluid level after an actual drive.**



- If the fluid level is low, add automatic transmission fluid (DEXRON or DEXRON II type) through dipstick guide **2** until the correct level on dipstick **1** is reached.

https://truckmanualshub.com/

Replacement of Automatic Transmission Fluid



(1) Draining

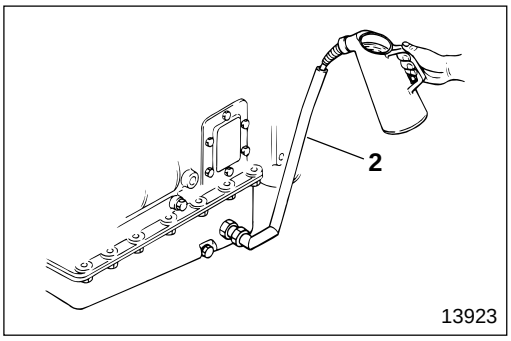
- Park the vehicle on level ground, chock the wheels and shift the range selector lever to the **N** position.
- Place a container under oil pan **3**, remove the drain plug and drain the fluid.
- Clean oil pan **3** and the drain plug. Replace the oil filter. P23-19
- Replace the outer oil filter. P23-28

WARNING

Take care because the fluid temperature immediately after the engine has stopped is very high. To avoid scalds, wait until a safe temperature has been reached before draining the fluid.

NOTE

- **The fluid will drain faster if the engine is first run to raise the fluid temperature.**
- **The fluid cannot be drained from the hydraulic circuit, the torque converter or the oil cooler.**
- **Check the drained fluid for dirt, metal particles and metal fragments.**



(2) Supply

- Install oil filter, oil pan **3** and drain plug. P 23-19
- Add 8.5 L {9.0 qts} of fluid via dipstick guide **2**.

CAUTION

Make sure that dirt and foreign particles do not become mixed in with the fluid when it is added.

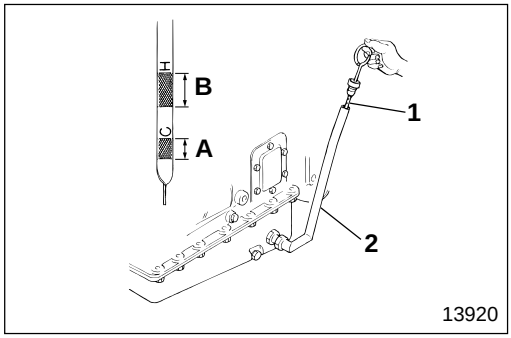
- Shift the range selector lever to the N position, start the engine and let it idle for about one minute.
- After shifting the lever through all positions once, shift it back to N position.

CAUTION

To prevent burning out the interior of the automatic transmission assembly, make sure that the engine is not allowed to race when you do the above.

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

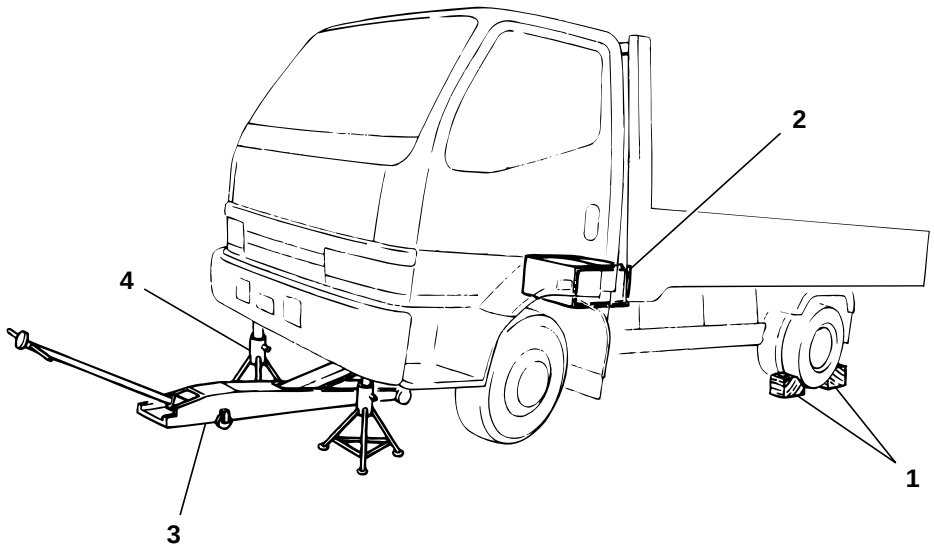


- Check and adjust so that the fluid level is within the specified area on dipstick **1**.

NOTE

- **As the temperature of the fluid rises, so does the fluid level. If you add fluid while the temperature is still low (approximately 15 to 49°C {60 to 120°F}), make sure that the level stays within area A, marked COLD on dipstick 1.**
- **Let the engine idle and, while paying attention to the fluid level, pour in the fluid slowly.**
- **It is sometimes hard to check the fluid level, immediately after supplying fluid, because of the fluid adhering to the interior of dipstick guide 2. If this is the case, check the fluid level several times at intervals.**
- **Be careful not to supply too much fluid because you might mistake the fluid that overflows from the air breather for fluid leakage.**

https://truckmanualshub.com/



● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect the negative battery cable Gr 54
3 Jack up the front axle with a garage jack.
4 Support the front frame on rigid racks.

WARNING⚠

- **The parking brake will be removed so naturally it cannot be used. Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION⚠

Be sure to keep the automatic transmission in neutral throughout the operation.

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

3 Harness connector
4 Parking brake cable Gr 36
5 Propeller shaft Gr 25
6 Oil cooler hose
7 Starter Gr 54
8 Bolt
9 Nut
10 Automatic transmission assembly

A : Flywheel
B : Torque converter
C : Torque converter pilot area

● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
8	Bolt (Torque converter and flywheel mounting)	51 to 61 {38 to 45, 5.20 to 6.22}	—
9	Nut (Automatic transmission assembly mounting)	39 to 58 {28 to 43, 3.9 to 6.0}	—

Lubricant

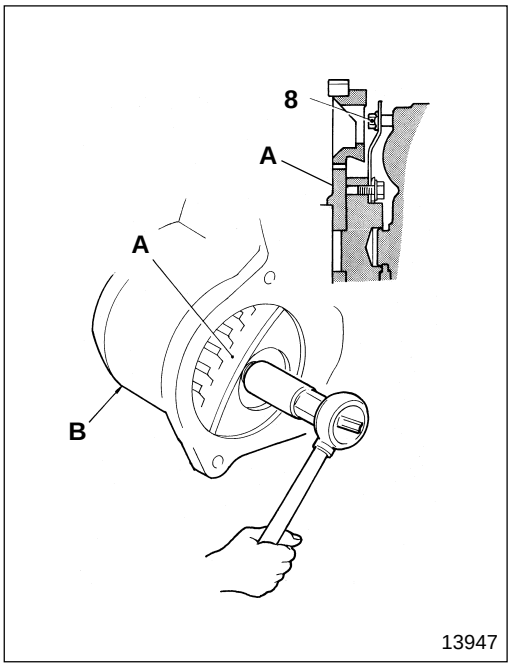
Location	Points of application	Kinds	Quantity
10	Torque converter pilot area (area C)	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

Special tools

Location	Tool name and shape	Part No.	Application
10	Converter installer  03726	ME633437	Automatic transmission assembly installation guide

https://truckmanualshub.com/

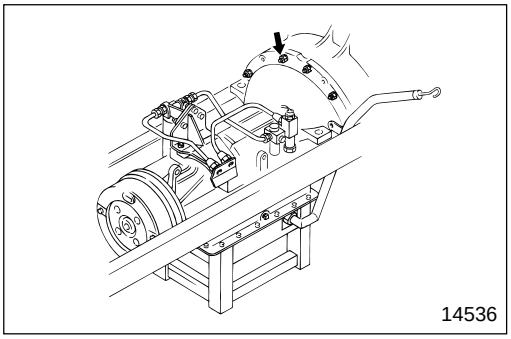
◆ Service procedure



10 Automatic transmission assembly

[Removal]

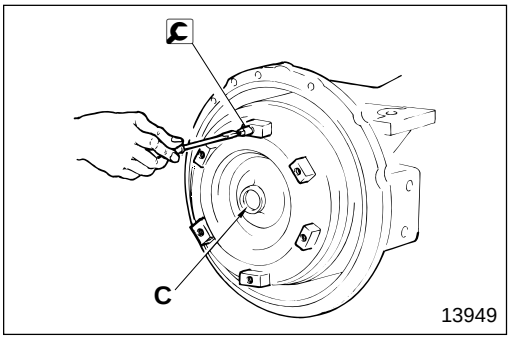
- Rotate flywheel **A** and remove bolts **8** in sequence.
  B : Starter housing



- Use a square bar or a similar object to support the oil pan of automatic transmission assembly **10**, then remove it by pulling it out backward.

CAUTION⚠

- **Be careful not to apply force unevenly to any of the oil pan parts.**
- **Be careful not to let the torque converter fall from the transmission body because as a single unit the torque converter can come loose easily.**

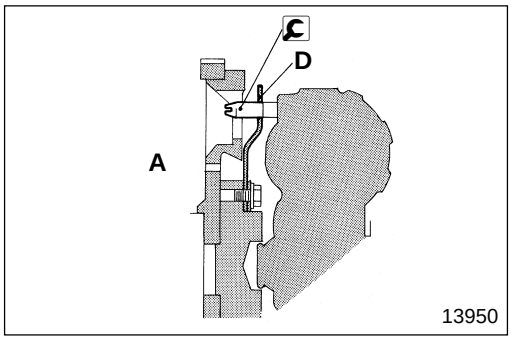


[Installation]

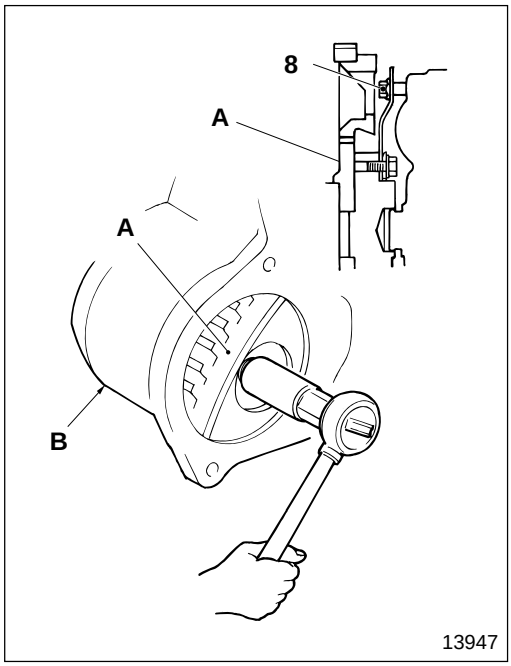
- Apply molybdenum disulfide grease to torque converter pilot area **C**.
- Mount 🔧 torque converter installer in the tapped hole on the torque converter periphery.

https://truckmanualshub.com/

REMOVAL AND INSTALLATION OF AUTOMATIC TRANSMISSION ASSEMBLY



- Install the automatic transmission assembly to the engine flywheel housing, by aligning torque converter installer with the hole in flexplate **D** of flywheel **A**.



- Rotate flywheel **A** and tighten bolts **8**, in sequence, through the working hole of starter housing **B** (6 points).
- Remove the converter installer and replace it with bolt **8**.
- First tighten all six bolts **8** temporarily, then tighten at specified torque.

NOTE

Be careful not to drop bolts 8 into the gap between flywheel A and the torque converter.

OIL SEAL AND SPEEDOMETER WORM

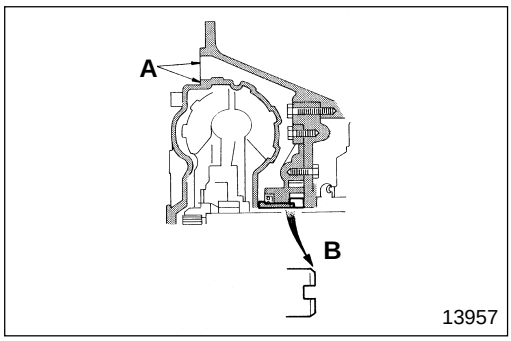
◆ Service procedure



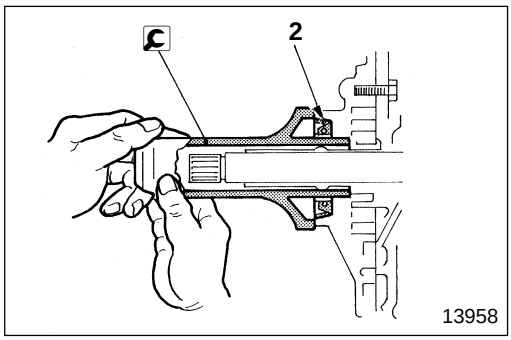
1 **Installation of torque converter**

Align the hub groove of torque converter **1** with the claw of the oil pump, then insert until the welded part on the converter periphery and the housing flange almost coincide.

CAUTION

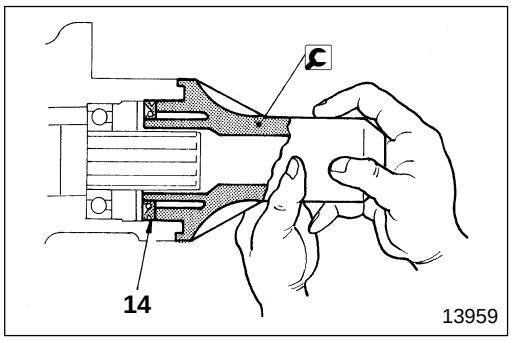
Be careful not to scratch the oil seal.

A : Guide to insertion position (Align faces)
B : Align claw position



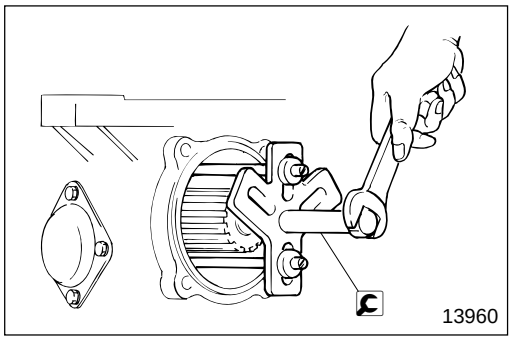
2 **Installation of oil seal**

- Apply grease to the lip area, and apply sealant to the periphery of oil seal **2**.
- Use 🔧 pump seal installer and install oil seal **2**.



14 **Installation of oil seal**

- Apply grease to the lip area, and apply sealant to the periphery of oil seal **14**.
- Use 🔧 rear oil seal installer and install oil seal **14**.



16 **Bearing**

[Removal]

- Insert the claw on the tip of 🔧 bearing remover set rod between the bearing race of bearing **16**.
- Insert the bolt of 🔧 bearing remover set into the automatic transmission output shaft, then remove bearing **16** by tightening the bearing remover.

https://truckmanualshub.com/

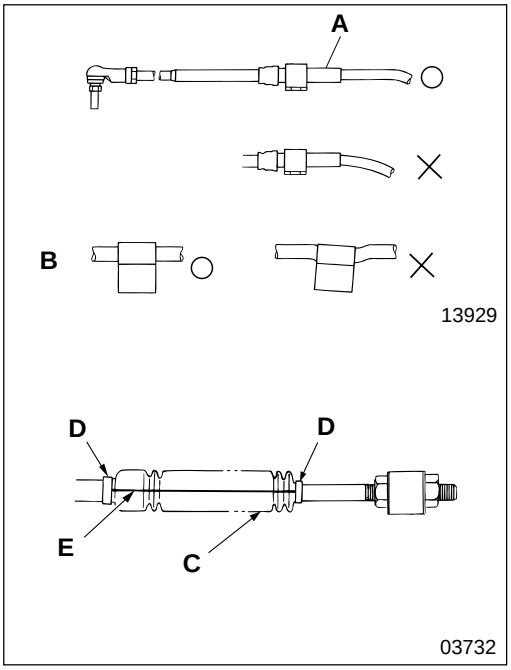
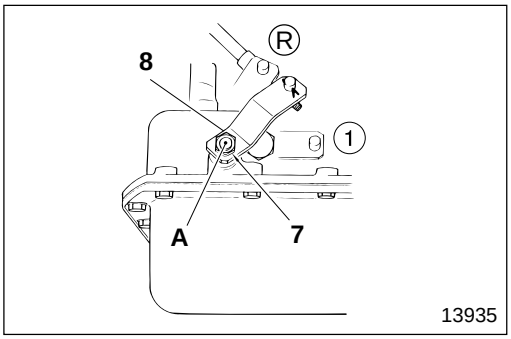
◆ Service procedure



6 Installation of selector cable

NOTE

- **Make sure casing cap A is installed in a straight line.**
- **Cable bend radius must be 20 cm {7.87 in.} or more.**
- **Make sure the cable is straight.**
- **Install the clamp at right angles to the cable. (Figure B)**
- **Do not twist clamps D at the ends of boot C. Install so that white line E on the boot is a straight line. (Figure E)**



8 Installation of selector lever

If selector lever **8** has been removed, rotate selector shaft **A** and move it to an intermediate position between, but other than, ① and Ⓡ, then tighten nut **7**.

CAUTION ⚠

Be careful not to overtighten nut 7, it might cause the internal lever to malfunction.

● Inspection after installation

- Make sure that when the range selector lever * on the driver's side is operated, the detent positions of selector lever **8** on the automatic transmission side agree with the corresponding positions of the range selector lever on the driver's side. Also make sure that the range selector lever on the driver's side and the selector lever on the automatic transmission side are both operating smoothly.
- Make sure the modulator cable moves smoothly.
- Make sure the starter switch can be operated only in the neutral position, and is disabled for all other positions.
- Make sure the backup lamps light when the selector is in the reverse (R) position.
  (The lamps do not light when the engine is stopped.)

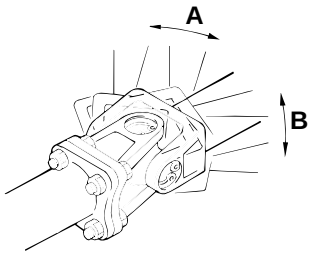
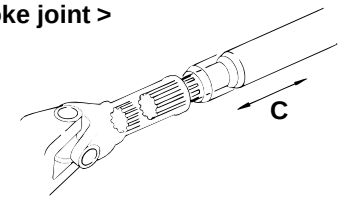
STRUCTURE AND OPERATION

Swing of Propeller Shaft

< Universal joint >



< Slip yoke joint >



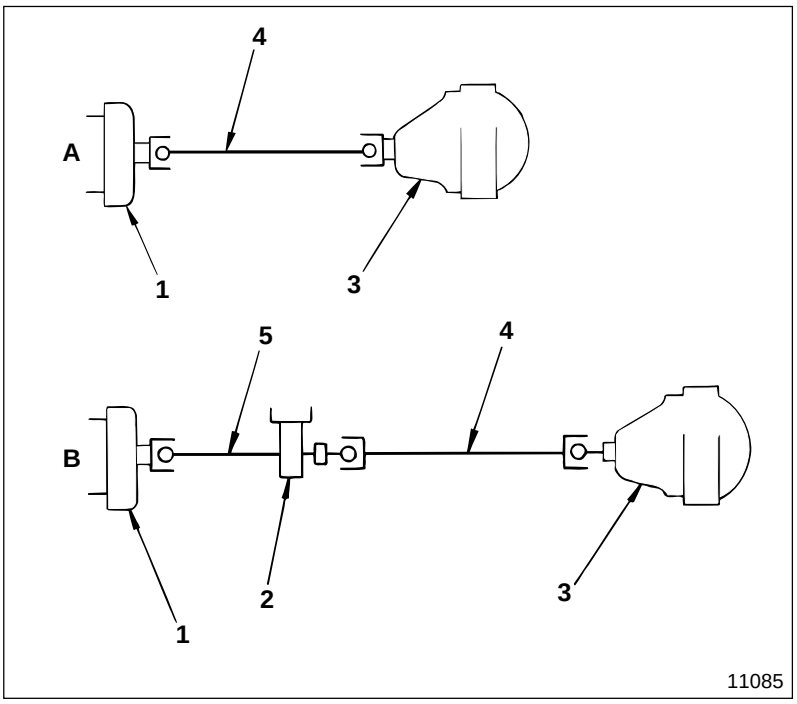
00815

A : Lateral swing
B : Longitudinal swing
C : Fore-and-aft movement

Relative positions of transmission and rear axle vary depending on the fluctuation of the road surface and load carried when operating the vehicle.
The universal joint and the slip yoke joint are provided to absorb these influences.

https://truckmanualshub.com/

Configuration of Propeller Shaft Connection



1 Parking brake drum
2 Center bearing
3 Rear axle
4 Rear propeller shaft
5 Front propeller shaft

A : Single-shaft connection
B : Twin-shaft connection

TROUBLESHOOTING

Symptoms / Possible causes		Propeller shaft vibrating		Noise from propeller shaft		
		Vibration at high speed	Vibration at low speed	Noise when starting or while coasting	Noise while cruising	Clicking noise
Flange yoke assembly direction incorrect		○				
Companion flange tightening torque excessive						○
Slip yoke joint	Lubrication insufficient				○	
	Spline play excessive		○	○		
Universal joint	Clearance in spider axial direction excessive		○		○	
	Needle bearing lubricated insufficiently				○	
	Needle bearing worn	○		○	○	
Center bearing < Twin-shaft connection >	Lubrication insufficient				○	
	Seized, worn, or rotation faulty	○			○	
	Cushion rubber deteriorating or deformed			○		
	Bracket mounting bolt loose			○		
Propeller shaft	Mounting bolt loose	○		○		
	Bent	○				
	Dynamic balance adjusted incorrectly	○				
Transmission gear selection too high			○

Repair kit : Universal joint spider kit

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value (Basic diameter in [ ])	Limit	Remedy
1 to 6	Clearance in axial direction of spider	0 to 0.25 {0 to 0.0098}	—	Adjust
2, 6	Clearance between needle bearing and spider	[26.7] 0.02 to 0.07 {[1.05] 0.00079 to 0.0028}	0.2 {0.0079}	Replace
11, 12	Play to revolving direction between slip yoke joint and rear propeller shaft	0.07 to 0.18 {0.0028 to 0.0071}	0.3 {0.012}	Replace
12	Bend of rear propeller shaft (Center)	—	0.6 {0.024}	Correct or replace

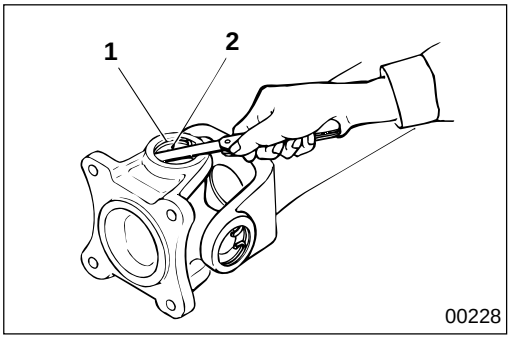
https://truckmanualshub.com/

Lubricant

Location	Points of application	Kinds	Quantity
5	Supply via grease nipple	Wheel bearing grease [NLGI No. 2 (Li soap)]	Pack until grease overflows from spider dust cover
9	Inner surface of cork seal	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
10	Supply via grease nipple	Wheel bearing grease [NLGI No. 2 (Li soap)]	Pack until grease overflows from dust plug hole

Special tools

Location	Tool name and shape	Part No.	Application
1	Snap ring repressor  00227	MH061001	Removal and installation of snap ring



00228

◆ Service procedure

● **Inspection before disassembly**

Clearance in axial direction for spider

Press needle bearing **2** downward firmly, and measure the clearance between snap ring **1** and the needle bearing. If the measured value is higher than the standard value, adjust it by changing the thickness of the snap ring.

- Available snap ring thicknesses

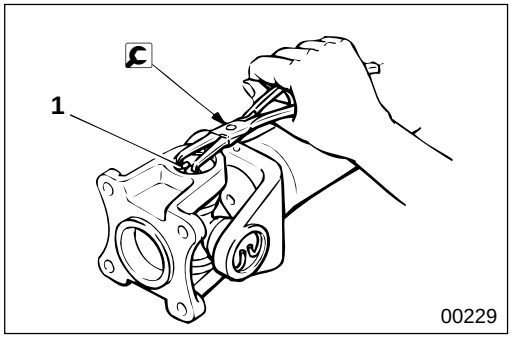
Part name	Thickness	Identification color
Snap ring A	2.5 mm {0.098 in.}	Green
Snap ring B	2.6 mm {0.10 in.}	Red

NOTE

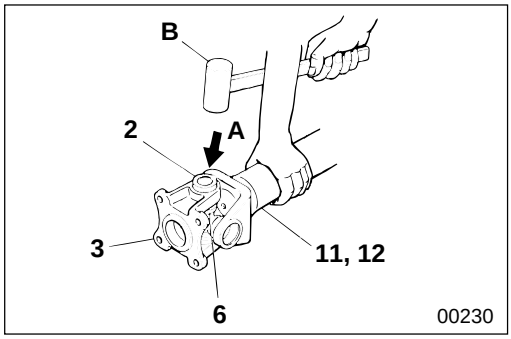
For snap ring 1, it is recommended that you use rings with the same thickness on both ends to ensure balanced revolution.

https://truckmanualshub.com/

REAR PROPELLER SHAFT

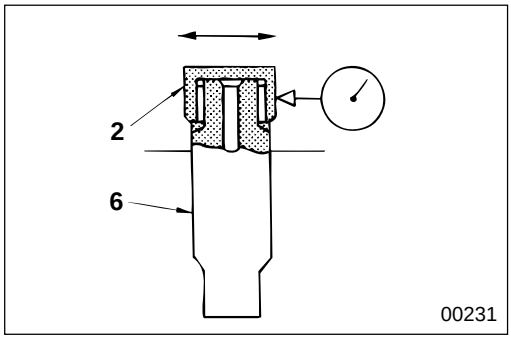


1 **Removal and installation of snap ring**



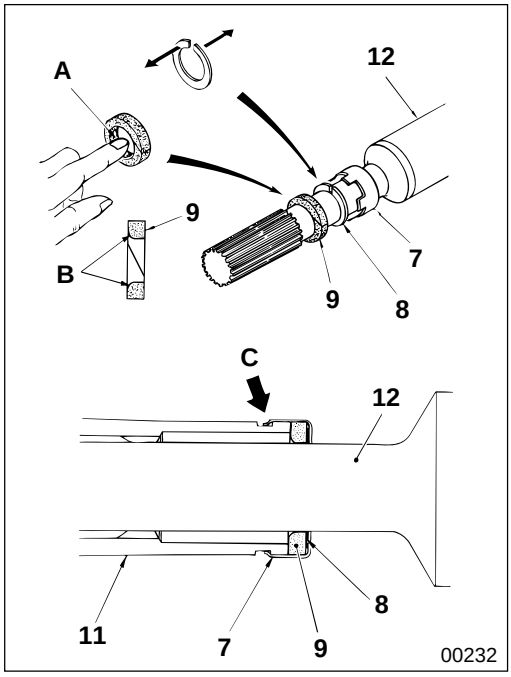
2 **Removal of needle bearing**

- Make alignment marks on needle bearing **2** and spider **6**.
- Make alignment marks across flange yoke **3**, slip yoke joint **11** and rear propeller shaft **12**.
- Hit the yoke lightly at shoulder area **A** so that needle bearing **2** bounces out due to reaction.
  B : Mallet



2 **6** **Clearance between needle bearing and spider**

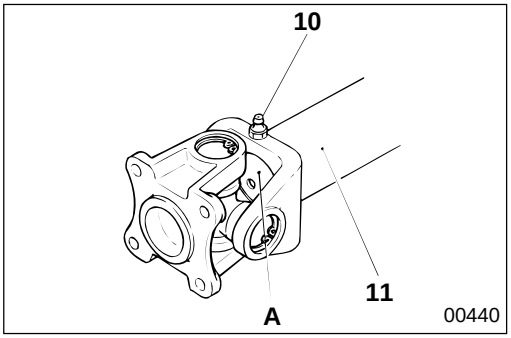
Measure the play towards the diameter direction between needle bearing **2** and spider **6**. If the measured value is higher than the limit, replace with universal joint spider kit.



7 **to** **9** **Assembly of dust cap, retainer and cork seal**

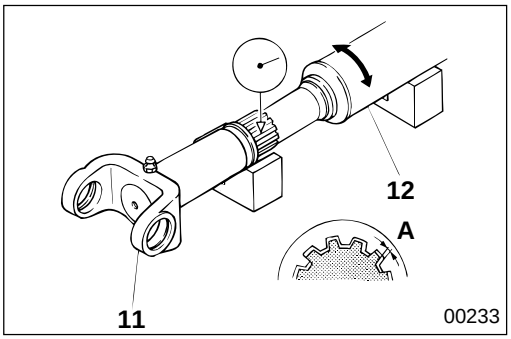
- Insert dust cap **7** into rear propeller shaft **12** and expand retainer **8** carefully to mount it on the propeller shaft. Then, release the retainer and allow it to return to its original shape.
- Apply grease to inner surface **A** of cork seal **9**, face its chamfered side **B** towards the spline and mount in the same way as retainer **8**.
- Press cork seal **9**, compressing it by 1 to 2 mm {0.039 to 0.079 in.}, against slip yoke joint **11**, then caulk pawl area **C**.

https://truckmanualshub.com/



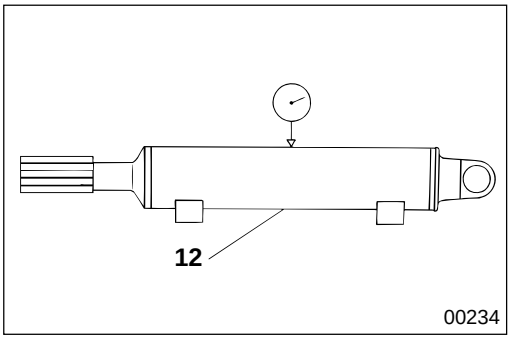
10 **Supply of grease via grease nipple**

Pack grease via grease nipple **10** until grease starts overflowing from the hole in dust plug **A** of slip yoke joint **11**.



11 **12** **Play between slip yoke joint and rear propeller shaft spline in rotaring direction**

Measure play **A** between slip yoke joint **11** and rear propeller shaft **12** at the spline area. If the measured value is higher than the limit, replace the faulty parts.



12 **Bend of rear propeller shaft**

Measure bend of rear propeller shaft **12** at its center. If the measured value is higher than the limit, correct or replace it.

CAUTION

Be sure to check for cracks at the welded area after straightening has been done by means of a press.

NOTE

To measure the bend of rear propeller shaft 12, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

https://truckmanualshub.com/

FRONT PROPELLER SHAFT

Follow the disassembly sequence in reverse.

Repair kit : Universal joint spider kit

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value (Basic diameter in [ ])	Limit	Remedy
1 to 6	Clearance of spider is axial direction	0 to 0.25 {0 to 0.0098}	—	Adjust
2, 6	Clearance between needle bearing and spider	[26.7] 0.02 to 0.07 {[1.05] 0.00079 to 0.0028}	0.2 {0.0079}	Replace
18	Bend of front propeller shaft (Center)	—	0.6 {0.024}	Correct or replace

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
7	Nut (Companion flange mounting)	200 to 340 {145 to 255, 20 to 35}	—

https://truckmanualshub.com/

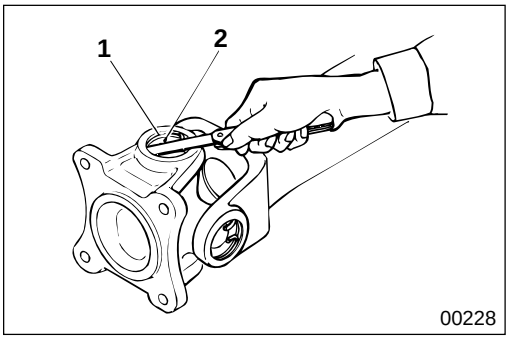
Lubricant

Location	Points of application	Kinds	Quantity
5	Supply via grease nipple	Wheel bearing grease [NLGI No. 2 (Li soap)]	Pack until grease overflows from spider dust cover
12	Lip area of oil seal	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
14	Pack area of center bearing assembly that houses ball bearings	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
16	Supply via grease nipple	Wheel bearing grease [NLGI No. 2 (Li soap)]	Pack until grease overflows from relief valve

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Snap ring expander  00227	MH061001	Removal and installation of snap ring
9	Flange puller  00552	MC881524	Removal of companion flange
17	Gear puller  00553	MH061102	Removal of center bearing



00228

◆ Service procedure

● **Inspection before disassembly**

Clearance in axial direction for spider

Press needle bearing **2** downward firmly, and measure the clearance between snap ring **1** and the needle bearing. If the measured value is higher than the standard value, adjust it by changing the thickness of the snap ring.

- Available snap ring thicknesses

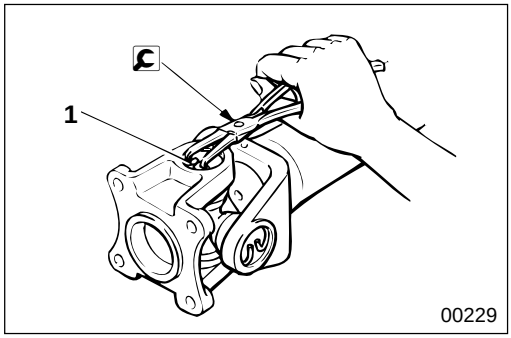
Part name	Thickness	Identification color
Snap ring A	2.5mm {0.098 in.}	Green
Snap ring B	2.6mm {0.10 in.}	Red

NOTE

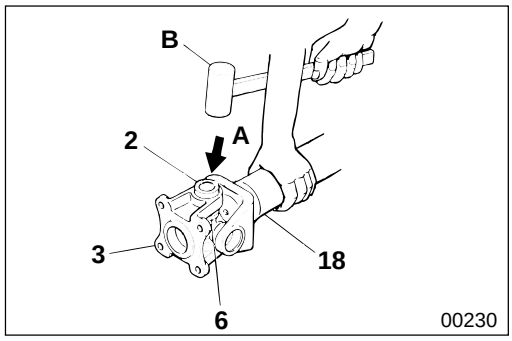
For snap ring 1, it is recommended that you use rings with the same thickness on both ends to ensure balanced revolution.

https://truckmanualshub.com/

FRONT PROPELLER SHAFT

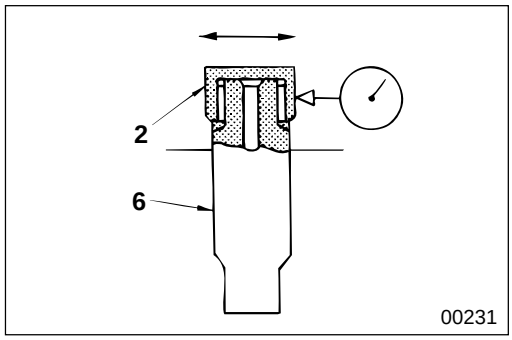


1 **Removal and installation of snap ring**



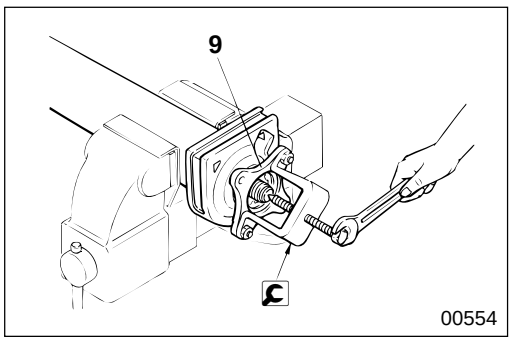
2 **Removal of needle bearing**

- Make alignment marks on needle bearing **2** and spider **6**.
- Make alignment marks across flange yoke **3** and front propeller shaft **18**.
- Hit the yoke lightly at shoulder area **A** so that needle bearing **2** bounces out due to reaction.
  B : Mallet

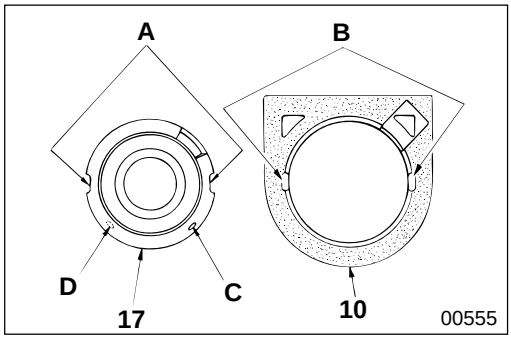


2 **6** **Clearance between needle bearing and spider**

Measure the play towards the diameter direction between needle bearing **2** and spider **6**. If the measured value is higher than the limit, replace with universal joint spider kit.



9 **Removal of companion flange**

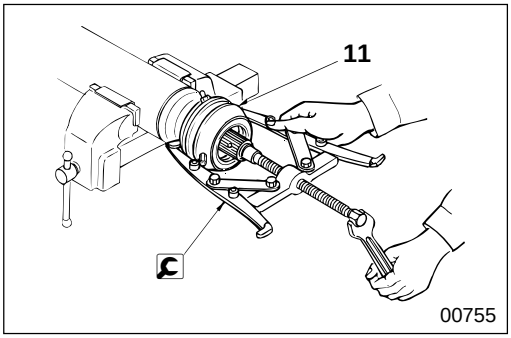


10 **Installation of cushion rubber**

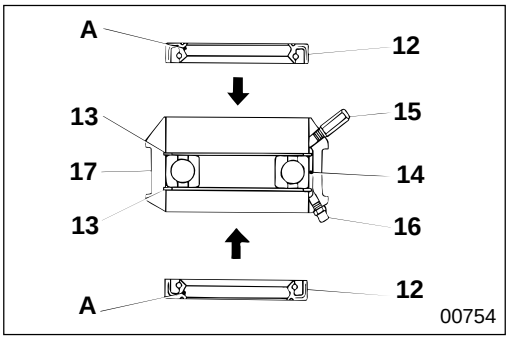
- Align part **A** of center bearing case **17** to part **B** of cushion rubber **10**, and fit them together. When it is hard to fit them together, apply some soapy water to facilitate the fitting work.
- Assemble center bearing case **17** so that grease nipple mounting hole **D** faces downward.

  C : Relief valve mounting hole
  D : Grease nipple mounting hole

https://truckmanualshub.com/

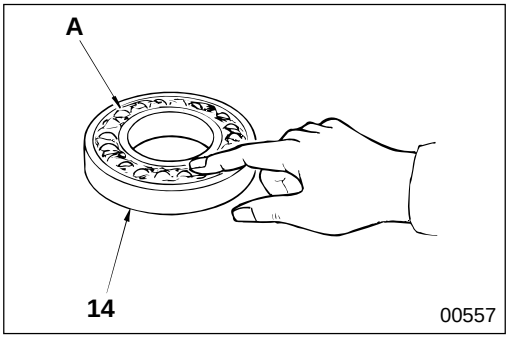


11 Removal of center bearing assembly



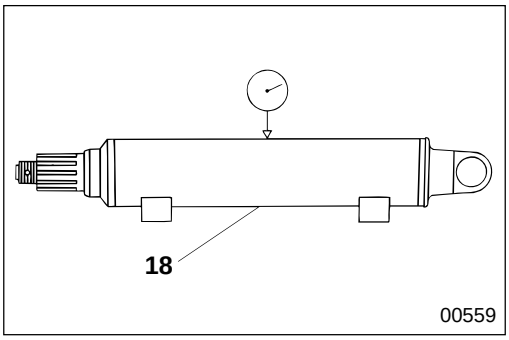
12 Installation of oil seal

- Apply grease to oil seal **12** lip area **A** and install to the direction as illustrated.
- Install oil seal **12** flush with center bearing case **17** end surface.



14 Packing grease in center bearing

Pack grease into the area that houses ball bearings **A** of center bearing **14**.



18 Bend of front propeller shaft

Measure bend of front propeller shaft **18** at its center. If the measured value is higher than the limit, connect or replace it.

CAUTION

Be sure to check for cracks at the welded area after straightening has been done by means of a press.

NOTE

To measure the bend of front propeller shaft 18, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

https://truckmanualshub.com/

BALANCING PROPELLER SHAFT

Adjustment after Assembly

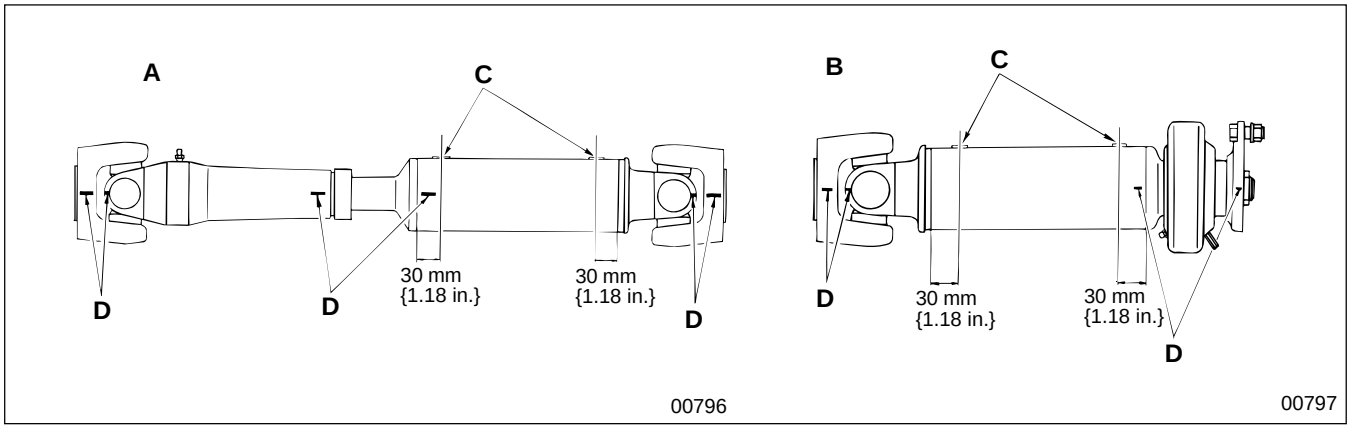
(1) After correction of propeller shaft deflection, or replacement of flange yoke and universal joint, adjust the amount of balance of the completed propeller shaft assembly on a balancing machine, and adjust by adding balance piece(s) so that the amount comes within the permissible limit.

(2) For correction of dynamic balance, use the polar coordination method.

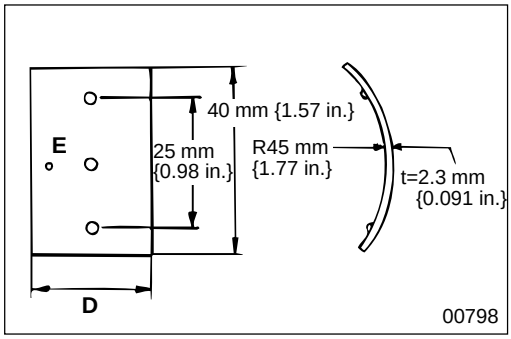
(3) Permissible amount of unbalance
0.49 N·cm {0.0036 lbf.ft, 50 gf·cm}/1600 rpm (Pipe outer periphery)

(4) Method of correction by way of the polar coordination method

- Balance piece attachment point



A : Rear propeller shaft
B : Front propeller shaft
C : Balance piece attachment point
D : Alignment mark



- Balance pieces available

Part name	Mass {oz}	Dimension D mm {in.}
Balance piece G	10 {0.35}	14 {0.55}
Balance piece A	20 {0.71}	28 {1.1}
Balance piece B	40 {1.41}	55.7 {2.19}
Balance piece C	60 {2.36}	83.5 {3.29}
Balance piece H	30 {1.06}	42 {1.65}

E : Mass punch mark

NOTE

- **Maximum balance piece allowed for one point is 120 g {4.23 oz}.**
- **Use a combination that keeps balance pieces to the minimum.**

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Adjustment of Wheel Alignment

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
—	Wheel alignment	Toe-in (With tires on the ground)	0±1 {0±0.039}	—	Adjust
		Camber	1°30'±1°00'	—	Adjust
		Caster	2°30' $^{+1°30'}_{-1°00'}$	—	Adjust
		Kingpin inclination angle	7°00'	7°00'±30'	Replace

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

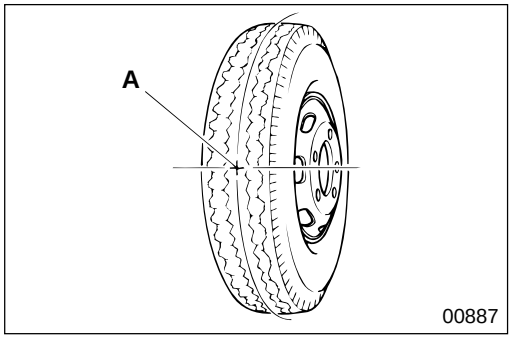
Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Tie rod end clamp fastening)	78 {58, 8}	Wet

NOTE

- **Measure the wheel alignment when the vehicle is empty and level.**
- **Be sure that each part of the front axle has been serviced perfectly before adjusting the wheel alignment.**

Before adjusting the wheel alignment, check for the following faults:

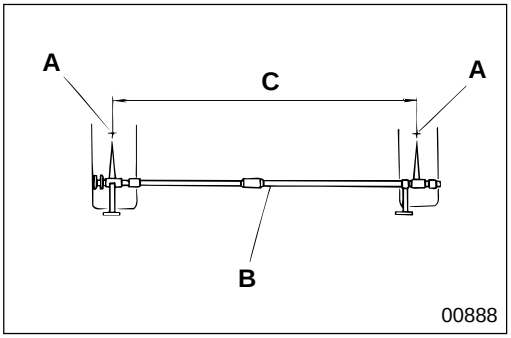
- Play in front wheel hub
- Play or looseness in kingpin
- Play or looseness in the joint between the tie rod and the knuckle arm
- Looseness of any fasteners
- Permanently set or damaged leaf springs
- Incorrect tire pressure
- Power steering booster backlash adjustment incorrect



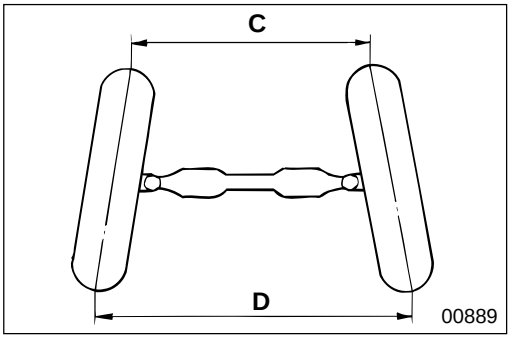
(1) Measurement and adjustment of toe-in

- Point the front wheels forward exactly in running order.
- Put mark **A** on the left and right front tires at the height of front wheel axis and in the middle of the tire width.

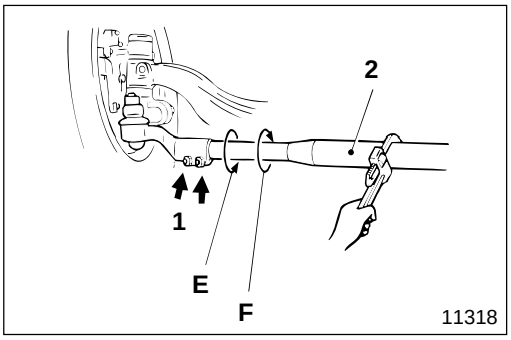
https://truckmanualshub.com/



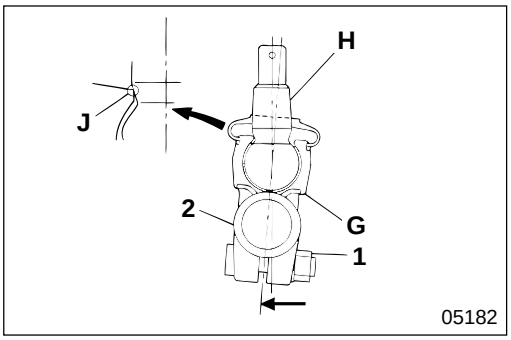
- Align the two points of toe-in gauge **B** to the respective marks **A** on the front tires. Measure the distance **C** between the marks at the front of the vehicle.



- Rotate the tires 180° and measure distance **D** between the marks at the rear of the vehicle with the tires on the ground.
- Check if the difference between distances **C** and **D** is within the standard value.



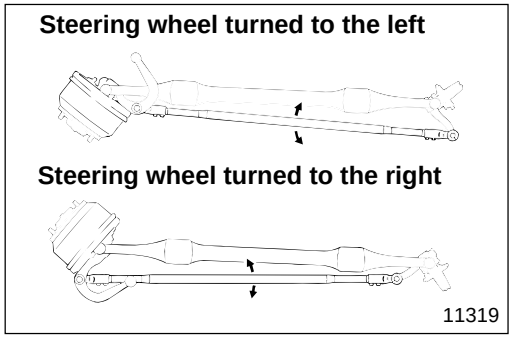
- If the measured value deviates from the standard value, with the tires pointed forward, loosen the left and right pairs of nuts **1**. (Total four nuts)
- Adjust the toe-in to the standard value by turning tie rod **2** with a pipe wrench.
  E : To adjust toe-in outward.
  F : To adjust toe-in inward.
  (★ : If tie rod **2** does not swing after the adjustment on 🕮 P26-6, redo from this item.)



- When tightening nuts **1**, push down and hold tie rod **2** backward or forward in the longitudinal direction of the vehicle so that left and right tie rod ends **G** are in contact (**J** as illustrated) with ball studs **H** at the same time.
- Tighten nuts **1** without allowing tie rod ends **G** to move backward or forward in the longitudinal direction of the vehicle.
- If you have to do the above work on your own; after you tighten nuts on one side of tie rod end **G**, when you tighten the nuts on the other end of the tie rod, make sure you keep the tie rod pushed down in the same direction.

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

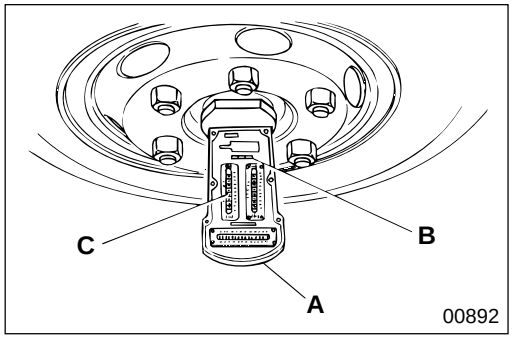


- After adjustment, turn the steering wheel to the left (until the knuckle stopper bolt is contacted), then shake tie rod **2** backward and forward in the longitudinal direction of the vehicle and see if the tie rod moves. Do the same with the steering wheel turned to the right.
  (If the tie rod can be moved, it means that tie rod end **G** and ball stud **H** are in simultaneous contact.)

WARNING⚠

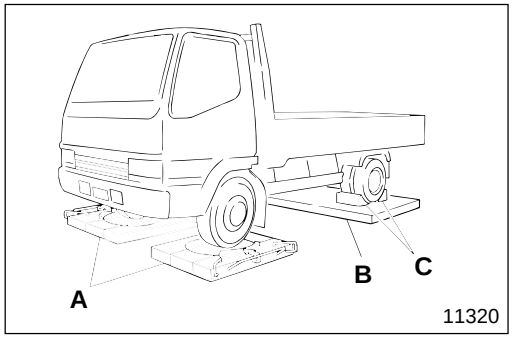
You must be careful not to catch your hand when turning the steering wheel to the left or right, since the tie rod moves.

- If tie rod **2** does not swing, redo the procedure from the item marked ★. 🕮 P26-5



(2) Measurement of camber

- Point the front wheels exactly forward.
- Remove the hub caps.
- Wipe off grease from the knuckle end, and attach camber/caster/kingpin gauge **A** to the knuckle.
- While keeping the bubble in level **B** centered, measure the camber angle by reading the scale mark at the center of the bubble on camber scale **C**.
  Follow this procedure to measure the camber angles on the left and right sides.



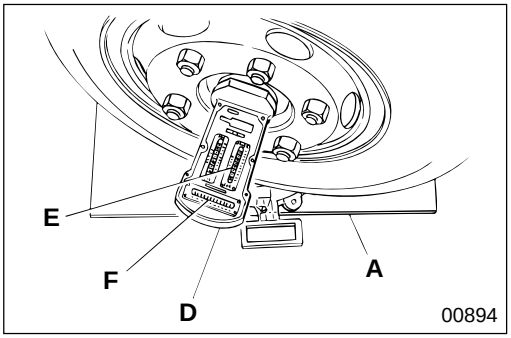
(3) Measurement of caster and kingpin inclination angle

- Prepare a platform **B** having the same height as turning radius gauges **A** and place the platform under the rear wheels so that the vehicle is kept level.
- Keep the turning radius gauges **A** locked.
- Jack up the vehicle and set the left and right wheels so that the ground contact area of both front tires and the turntables of turning radius gauges **A** meet at their respective centers.

WARNING⚠

- **After jacking up the vehicle, chock the rear wheels securely with chocks C.**
- **Do not remove chocks C until the entire operation is completed.**

https://truckmanualshub.com/



- Unlock turning radius gauge **A**, and set the scale to 0°.
- As in measuring camber explained previously, attach camber/caster/kingpin gauge **D** tightly to the front wheel hub and keep the bubble centered.
- Apply the brake to the front wheels and turn the steering wheel slowly from the 0° point on the scale of turning radius gauge **A**, until direction changes 20° to the left for the left front wheel and 20° to the right for the right front wheel.

NOTE

It is not possible to obtain an exact reading of camber unless the brake is applied to the front wheels because the tires might rotate slightly.

- At the 20° point, align the bubbles in caster scale **E** and kingpin scale **F** to 0° by turning the adjuster.

NOTE

Kingpin scale F has scales for left and right; use the left scale when adjusting the left wheel, and the right scale when adjusting the right wheel.

- Turn the steering wheel slowly until the left front wheel changes its direction 20° to the right, or until the right front wheel changes its direction 20° to the left, past the 0° point of turning radius gauge **A** scale. At this point read the scale marks at the center of the bubbles on caster scale **E** and kingpin scale **F**. The scale marks indicate the caster and kingpin inclination angles.

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Adjustment of Steering Angle

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Steering angle	Inside (Outside: reference)	54° (38°52´)	—	Adjust

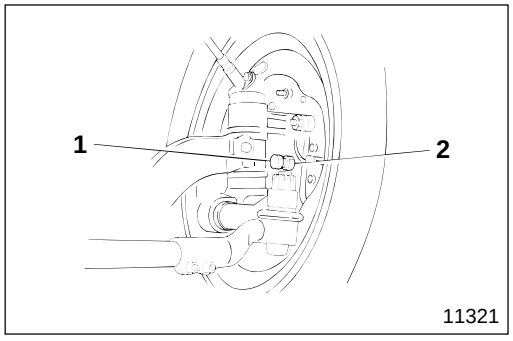
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Lock nut (Knuckle stopper bolt fastening)	71±12 {52±9, 7.25±1.25}	—

NOTE

Be sure that wheel alignment is adjusted perfectly before adjusting the steering angle.

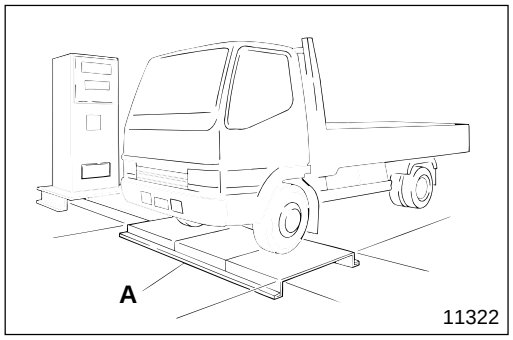


- To adjust the steering angle, set the turning radius gauges and platform in the same way as for caster and kingpin inclination angle measurement.
- Turn the steering wheel to the left or right completely, and from the position where the turning radius gauge is aligned to 0°, adjust knuckle stopper bolt **1**. Adjust so that the steering angle is within the standard inside steering angle value, to the left for the left front wheel, and to the right for the right front wheel. Then, tighten lock nut **2** at specified torque.

Measurement of Side Slip

NOTE

Be sure that wheel alignment is adjusted fully before measuring side slip.



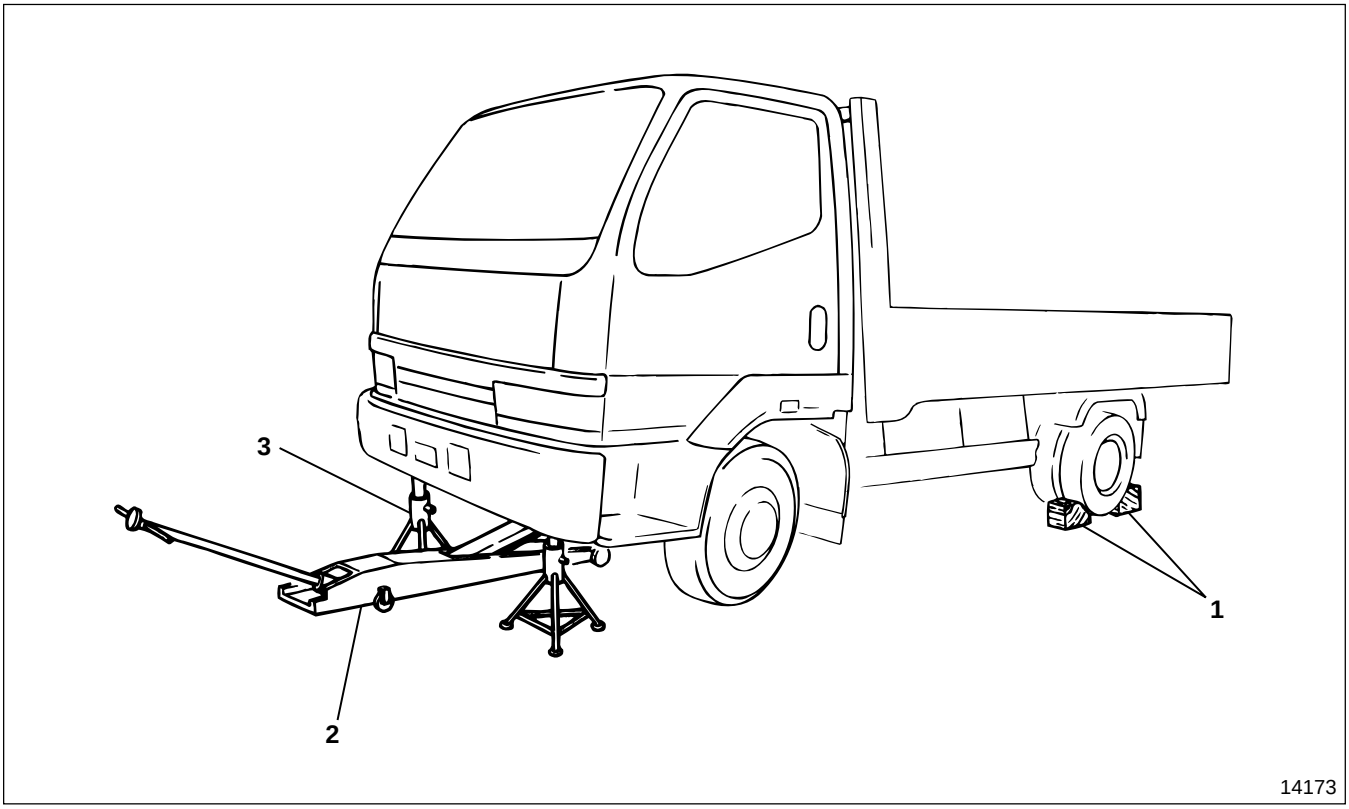
- Point the front wheels exactly forward.
- Maintain this position and slowly move vehicle forward, over side slip tester **A**, as slowly as possible.

NOTE

Make sure, when measuring side slip, that the wheels point exactly forward when the vehicle passes over side slip tester A. Do not allow the wheels to veer from side-to-side.

- The side slip is indicated by side slip tester **A** after the vehicle has passed through the tester. Readjust wheel alignment if slippage is 3 mm {0.12 in.} or more per meter {3.28 ft.}.

https://truckmanualshub.com/



● **Work sequence before removal**

1 Place wheel chocks.
2 Jack up the front axle with a garage jack.
3 Support the front frame on rigid racks.

WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

https://truckmanualshub.com/

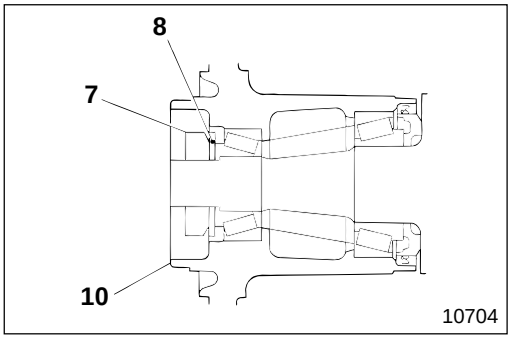
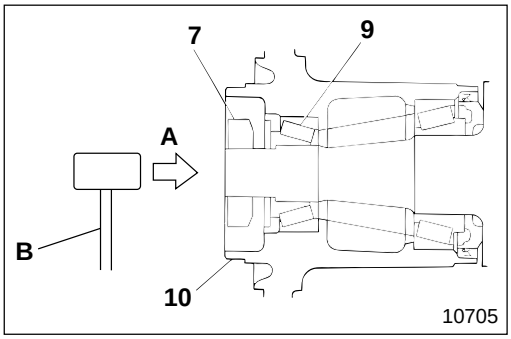
◆ Service procedure



● **Starting torque of wheel hub bearing**

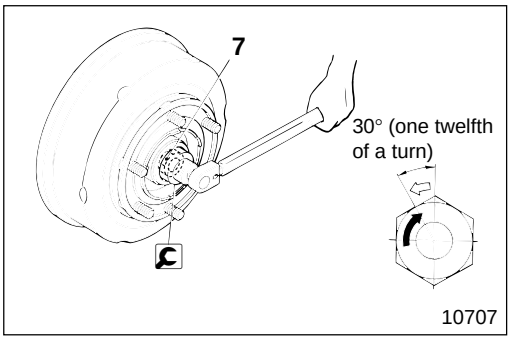
[Adjustment]

- Install lock washer **8** and lock nut **7** on wheel hub and brake drum assembly **10**, then tighten the lock nut at specified torque by 3 turns or more.
- Then, slacken off lock nut **7** completely until there is clearance with lock washer **8**.



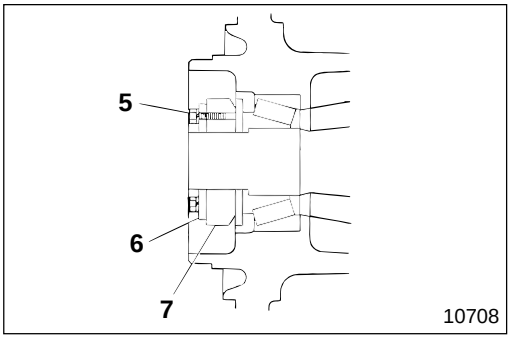
- Return outer bearing 9 toward lock nut **7** by hitting illustrated part **A** two or three times while turning wheel hub and brake drum assembly **10**.

  B : Copper-headed hammer

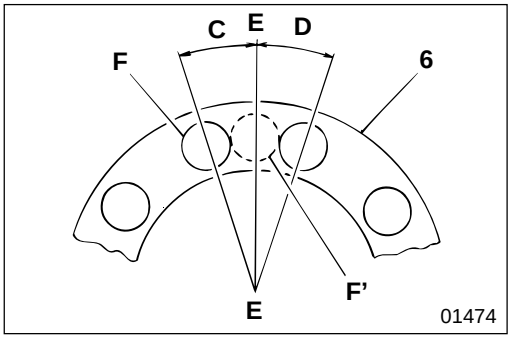


★ • After retightening lock nut **7** at specified torque, slacken it off by 30° (one twelfth of a turn).

(★: If any fault is found in the tangential force measurement in 📖 P26-14, redo the procedure from this step.)



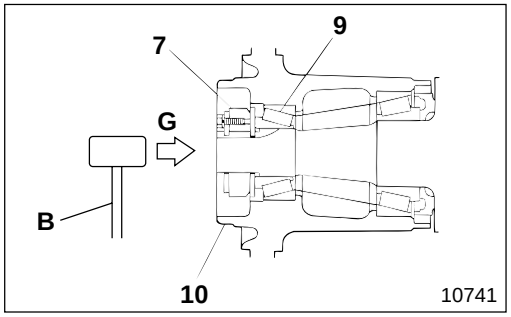
- Fit lock plate **6** into place, making sure that lock nut **7** and the mounting holes in the lock plate align, then tighten mounting bolts **5** at specified torque.



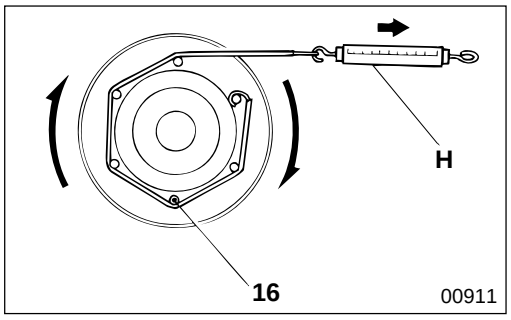
- If the mounting holes of lock plate **6** and lock nut **7** do not align, align them as follows:

Lock nut hole position	How to align lock plate hole
Range **C**	Slacken off lock nut
Range **D**	Turn over lock plate and slacken off lock nut
On line **E-E**	Turn over lock plate (Hole position changes **F´** to **F**)

https://truckmanualshub.com/

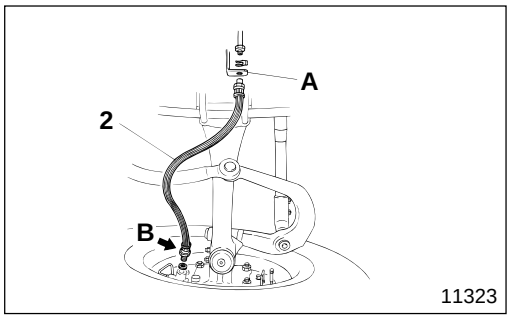


- Return outer bearing **9** toward the lock nut **7** by hitting illustrated part G two or three times while turning wheel hub and brake drum assembly **10**.
  B : Copper-headed hammer



[Measurement]
- Fasten spring balance **H** to hub bolt **16** and measure the tangential force.
- If the measured tangential force is the standard value, the starting torque conforms to the standard value.
- Make sure that the starting torque is smaller than the tangential force.
- If the tangential force deviates from the specified value, adjust the starting torque again.
- If the measured value deviates from the standard value, redo the procedure from the item marked ★. P26-13
- If, after this, the result is still not satisfactory, replace outer bearings **9**, **13** and inner bearings **12**, **18**.

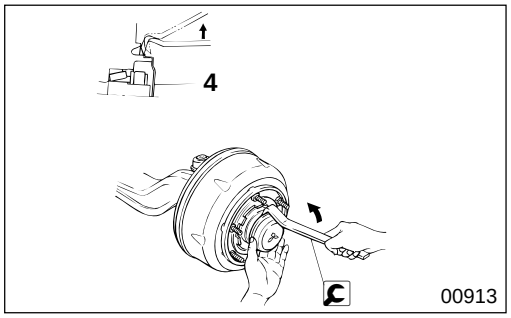
NOTE
- **Measure the starting torque when oil seal 11 has been installed.**
- **Make sure that the brake lining and brake drum 15 do not drag before measurement.**



2 Removal and installation of brake hose

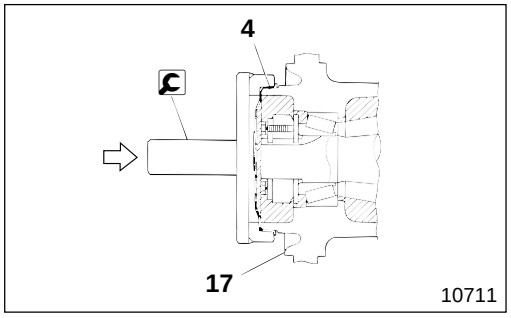
First remove brake hose **2** from bracket **A** (on the frame), then remove the brake hose from wheel brake **B**. For installation, follow this procedure in reverse.

CAUTION
Make sure that brake hose 2 is not twisted when you install it.



4 Wheel hub cap

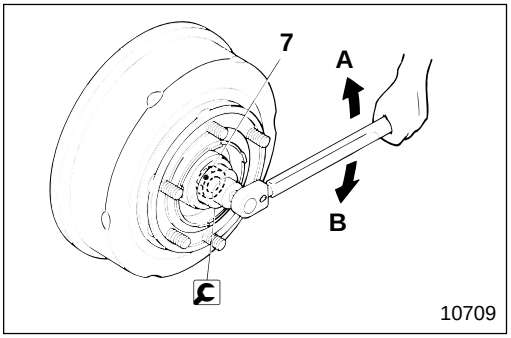
[Removal]



[Installation]
Pack grease into wheel hub cap **4** and apply sealant to the contact surface with wheel hub **17**, then install it.

CAUTION
Be careful during installation not to hit wheel hub cap 4 too hard with the mallet, or you will deform the contact surfaces, spoiling the water tightness.

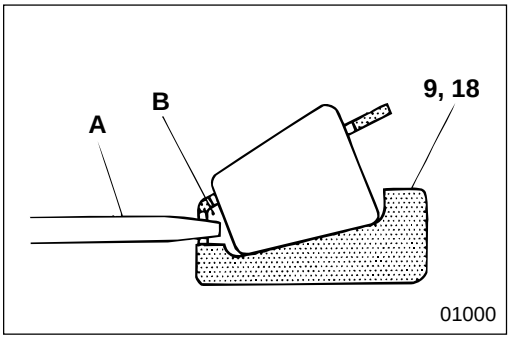
https://truckmanualshub.com/



7 **Removal and installation of lock nut**

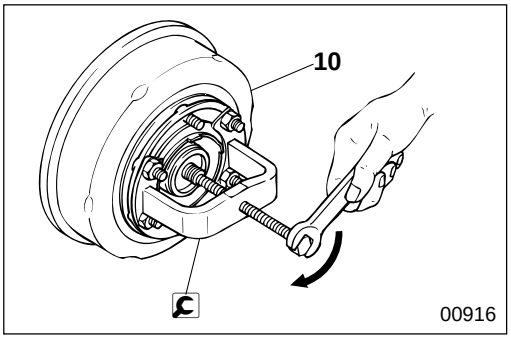
Refer to adjustment of starting torque of wheel hub bearing. P26-13

A : Removal
B : Installation



9 **18** **Packing grease into outer and inner bearing inner races**

A : Grease pump nozzle
B : Between rollers

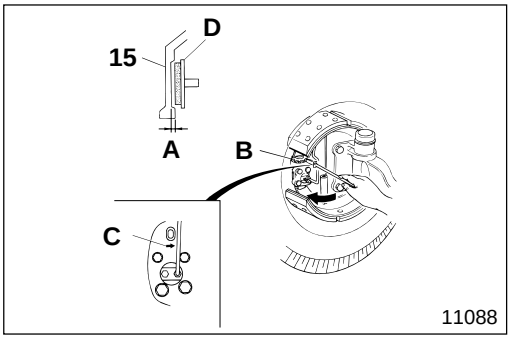


10 **Wheel hub and brake drum assembly**

[Removal]

CAUTION

Make sure you remove wheel hub and brake drum assembly 10 in a straight line to prevent damage to oil seal 11.



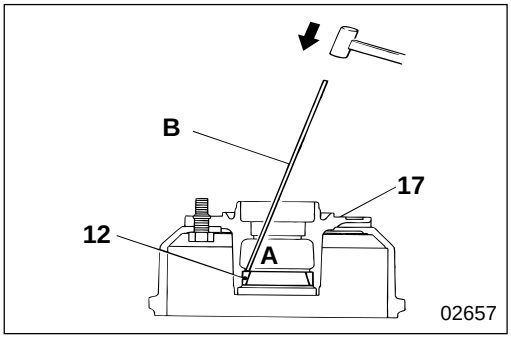
- If it is hard to remove wheel hub and brake drum assembly **10** because brake drum **15** has stepped wear **A**, remove the wheel hub and brake drum assembly as follows:
- Turn adjuster **B** in the opposite direction to arrow **C** on the backing plate, and expand the clearance between brake drum **15** and brake shoe **D**. Then remove the brake drum.

CAUTION

Be sure to correct brake drum 15 if it is faulty. **Gr 35**

[Installation]

After installing wheel hub and brake drum assembly 10, adjust the brake shoe clearance. Gr 35



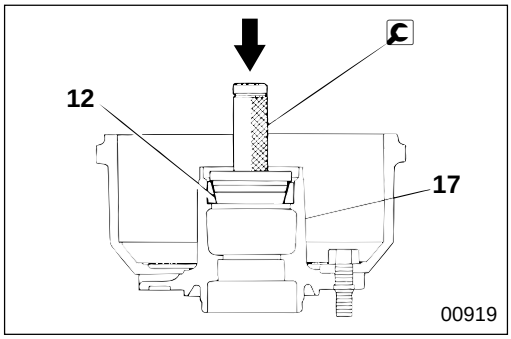
12 **Inner bearing outer race**

[Removal]

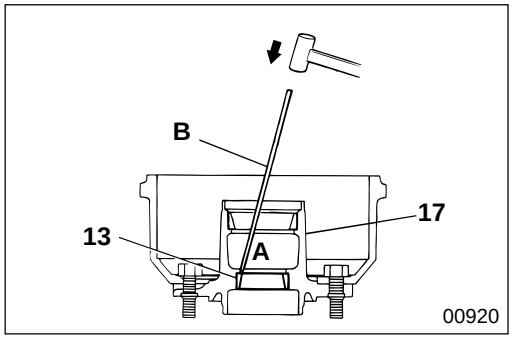
Drive out inner bearing outer race **12** from the two indented parts **A** in wheel hub **17**.

B : Pin-punch

https://truckmanualshub.com/

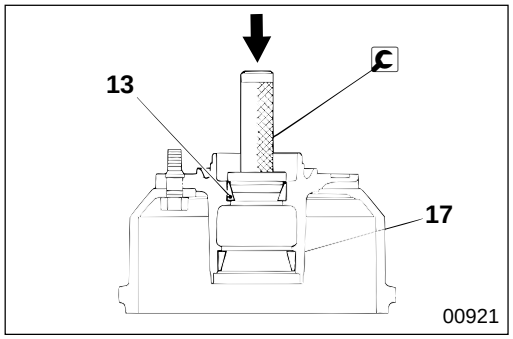


[Installation]

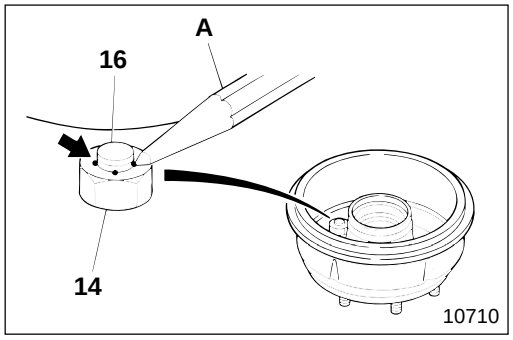


13 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **13** from the two indented parts **A** in wheel hub **17**.
B : Pin-punch

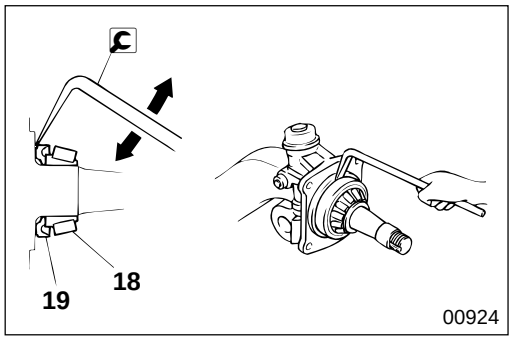


[Installation]



14 **16** **Installation of nut and hub bolt**

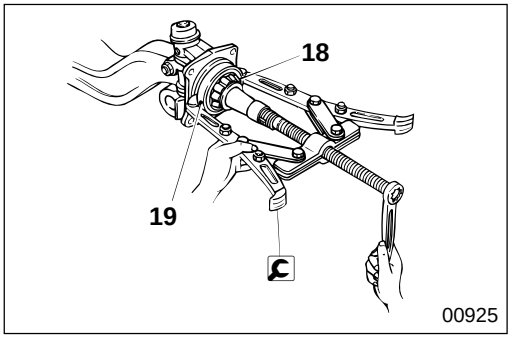
Tighten nut **14** at specified torque, then caulk hub bolt **16** evenly at four points.
A : Punch

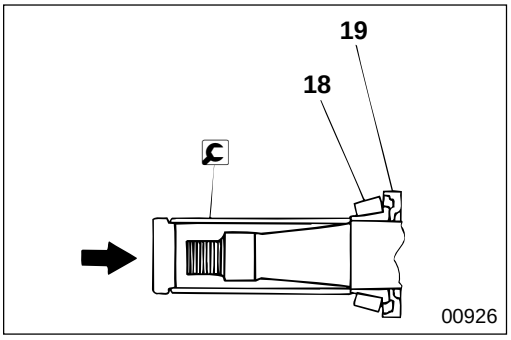


18 **19** **Inner bearing inner race and knuckle retainer**

[Removal]

https://truckmanualshub.com/





[Installation]

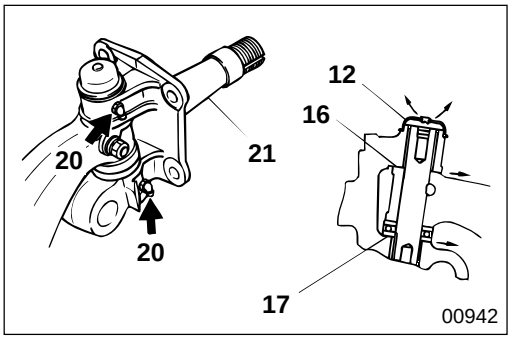
◆ Service procedure

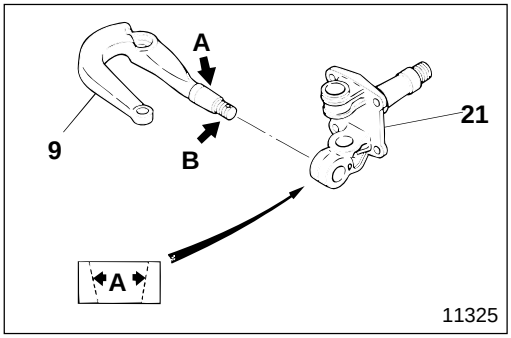


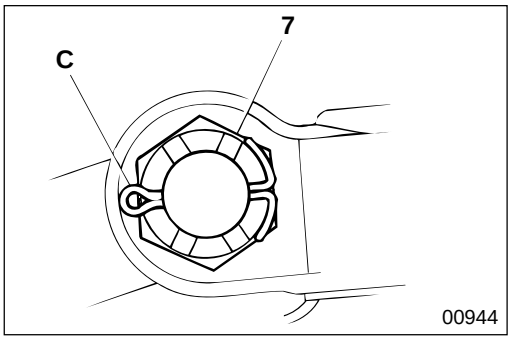
00942

● Work after assembly

Pack knuckle **21** with grease via grease nipple **20**. Pack until grease starts overflowing from the dust cap of upper cap **12**, thrust washer **16**, and the press side of bearing **17**.

https://truckmanualshub.com/





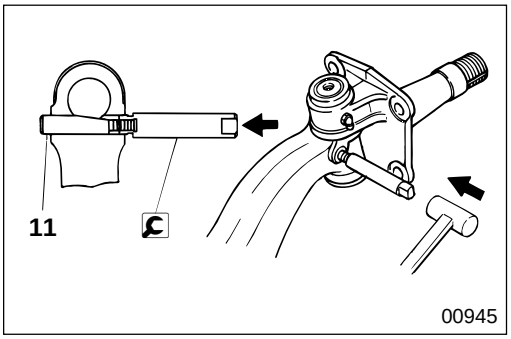
9 **21** **Installation of knuckle arm and knuckle**

(1) Reassembly of existing knuckle arm 9 and/or knuckle 21

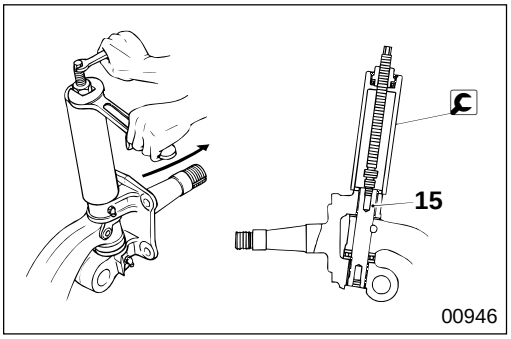
- Polish taper surfaces **A** of knuckle arm **9** and knuckle **21** with emery paper (120 grit or finer) uniformly, until abrasion traces left by the emery paper are only just visible. For new parts, polishing is not necessary.
- Clean taper surfaces **A** of knuckle arm **9** and knuckle **21**, and thread **B** of the knuckle arm. (Use a cleaning solvent for acetone color checking or other solvent.)
- Install knuckle arm **9** after applying grease to thread **B**. (Do not grease the taper surface of the knuckle arm and knuckle **21**.)
- Tighten new nut **7** at specified torque. Make sure you align the pin hole by turning in the tightening direction when you insert and fix split pin **C**.

(2) Installation of new knuckle arm 9 and knuckle 21

- Clean taper surfaces **A** of knuckle arm **9**, knuckle **21**, and thread **B** of the knuckle arm, and install them without greasing.
- Tighten new nut **7** at specified torque. Make sure you align the pin hole by turning in the tightening direction when you insert and fix split pin **C**.

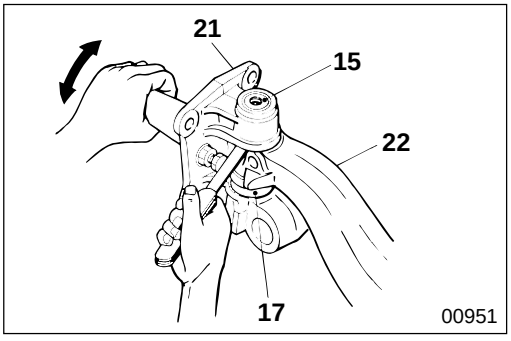


11 **Removal of set bolt**



15 **Removal of kingpin**

- Remove the kingpin cap; tighten kingpin puller bolt into the thread of kingpin **15** to remove the kingpin.

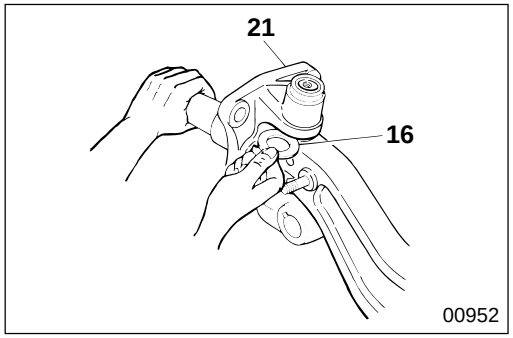


16 **21** **22** **Thrust washer, knuckle and front axle**

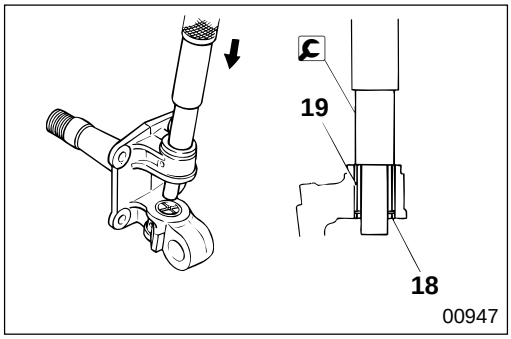
[Inspection]

- Assemble kingpin **15** and bearing **17** temporarily, and turn knuckle **21** a few times to smooth its operation.
- Measure the clearance between the upper surface of front axle **22** and the lower part of knuckle **21**.
- If the measured value is higher than the limit, adjust the clearance with thrust washer **16**.

https://truckmanualshub.com/

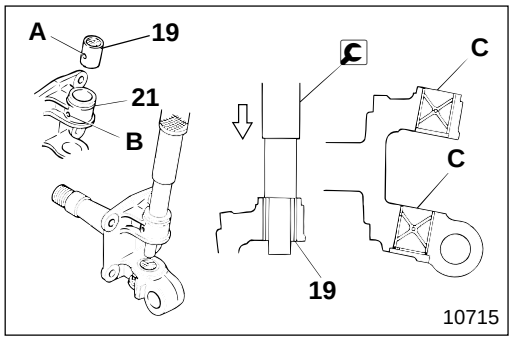


[Adjustment]
- Available adjusting thrust washer **16** thicknesses: 2.1 to 2.8 mm {0.083 to 0.11 in.} (8 thicknesses are available in 0.1 mm {0.0039 in.} increments.)
- Minimize the clearance by selecting appropriate thrust washer **16**.
- Check that knuckle **21** turns smoothly after assembly.

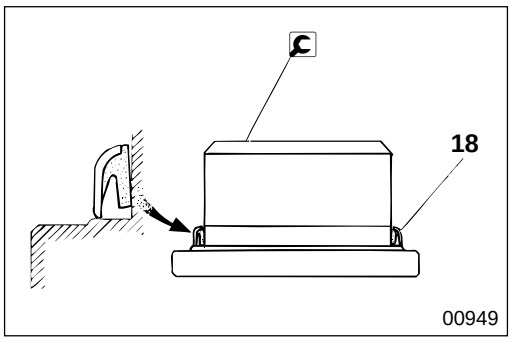


18 **19** **Oil seal and bushing**

[Removal]

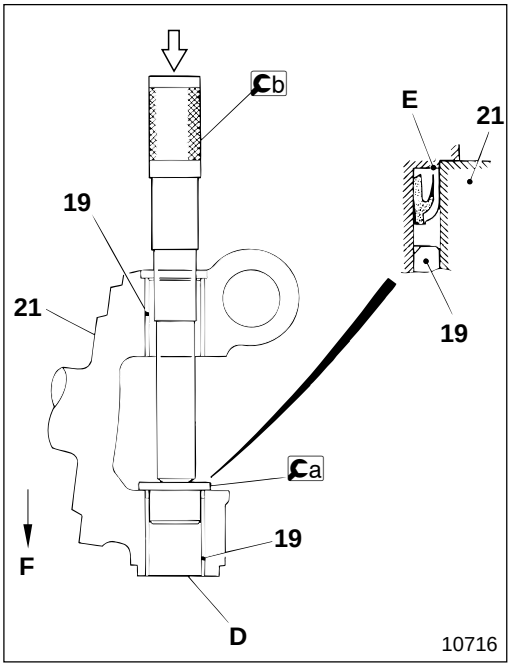


[Installation]
- Install bushing **19** so that the direction of oil hole **A** is aligned with oil hole **B** of knuckle **21** and the bushing end is set in the same plane with end **C**.



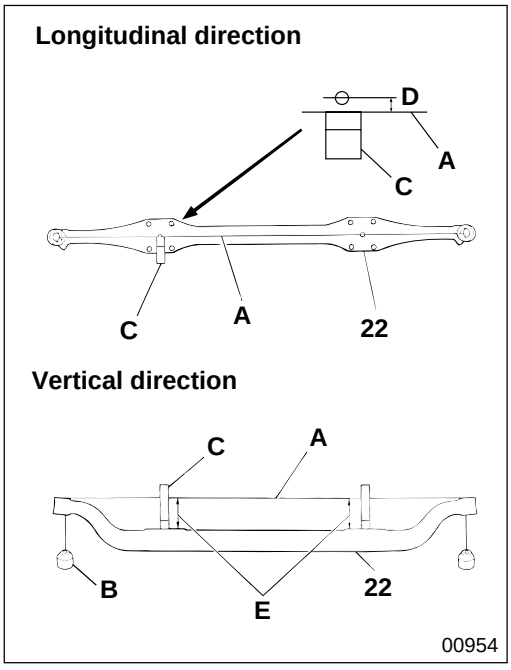
- Apply grease to the lip area of oil seal **18** and install it on oil seal installer.

https://truckmanualshub.com/



- Next, install a oil seal installer on knuckle **21** in the direction as illustrated.
- Pass b kingpin bushing remover through kingpin hole until it makes contact with a oil seal installer.
- Drive the head of b kingpin bushing remover using a mallet until a oil seal installer makes contact with knuckle **21**.
- Check that end **D** of bushing **19** is aligned with knuckle **21**.
- Make sure that oil seal end **E** does not protrude from knuckle **21**.

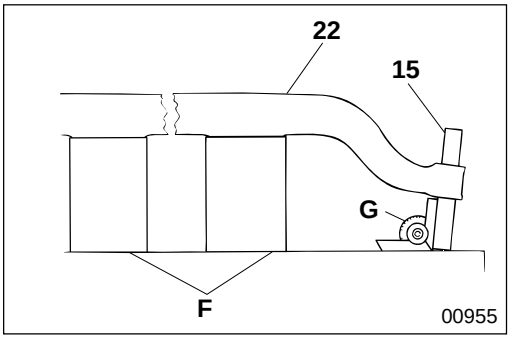
  F : Top of vehicle



22 Inspection of front axle

(1) Measurement of bend in front axle 22 in longitudinal and vertical directions

- Pass a piece of thread **A** through the kingpin hole of front axle **22** and hang weights **B** on both ends.
- Use square **C** to find the degree of bend in both the longitudinal direction **D** and the vertical direction **E**.
- If the measured value is higher than the limit, replace front axle **22**.



(2) Measurement of kingpin inclination angle

Mount kingpin **15** in front axle **22** as illustrated, and measure the kingpin inclination angle. If the measured value is higher the limit, replace the front axle.

F : Block gauge

G : Angle gauge

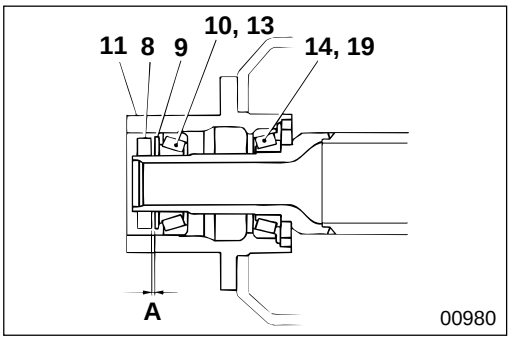
	Oil seal retainer installer 	MH061008	Press-fitting of oil seal retainer

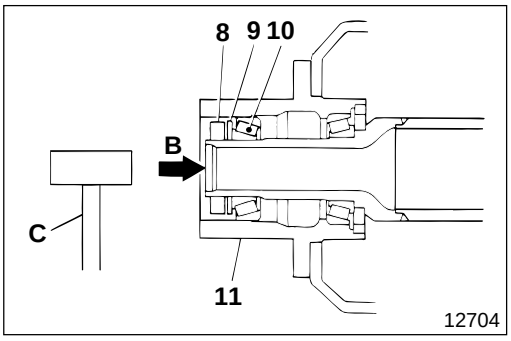
◆ Service procedure

● Starting torque of wheel hub bearing



[Adjustment]

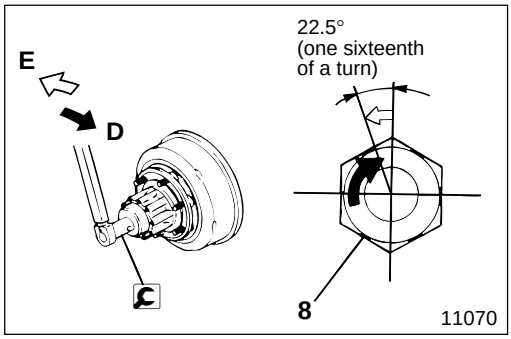
- Install lock washer **9** and lock nut **8**.
- Turn wheel hub and brake drum assembly **11** several times to smooth operation of outer bearings **10**, **13** and inner bearings **14**, **19**.
- Tighten lock nut **8** at specified torque.
- Slacken off lock nut **8** to obtain clearance **A** between the lock nut and lock washer **9**.



- To slide outer bearing inner race **10** towards lock nut **8**, hit end **B** of the axle tube two or three times with a mallet, while turning wheel hub and brake drum assembly **11**.
  C : Copper-headed mallet

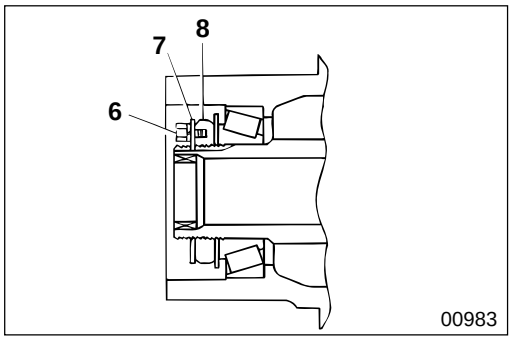
https://truckmanualshub.com/

WHEEL HUB AND BRAKE DRUM

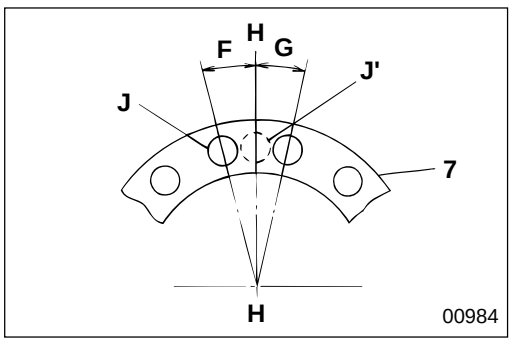


★ • Tighten lock nut **8** at specified torque.
D : Tightening direction

• Slacken off lock nut **8** by 22.5° (one sixteenth of a turn).
E : Slackening off direction
(★ : If any fault is found when measuring tangential force, redo from this item.)

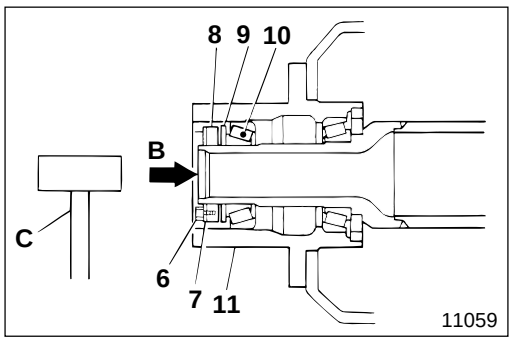


• Install lock plate **7**.
• Make sure that bolt **6** mounting holes of lock nut **8** and lock plate **7** align.
• Tighten bolt **6** at specified torque.



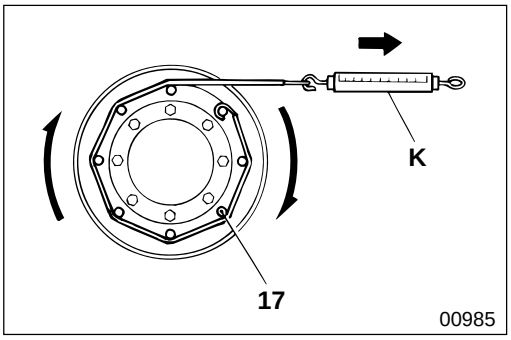
• If the mounting holes of lock plate **7** and lock nut **8** do not align, align as follows:

Hole position of lock nut	How to align hole of lock plate
Within range **F**	Loosen lock nut to align holes
Within range **G**	Turn over lock plate and loosen lock nut to align holes
On line **H-H**	Turn over lock plate to align holes (Hole position **J**' changes to **J**)



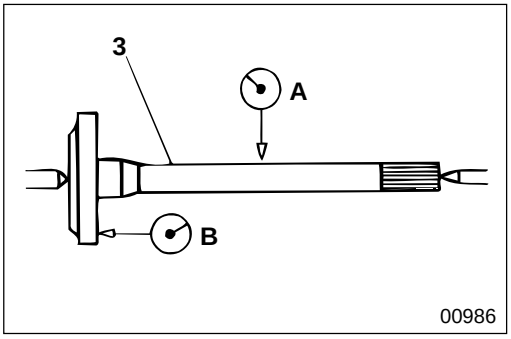
• To slide outer bearing inner race **10** towards lock nut **8**, hit end **B** of the axle tube two or three times with a mallet, while turning wheel hub and brake drum assembly **11**.
C : Copper-headed mallet

https://truckmanualshub.com/



[Measurement]
- Install spring balance **K** on hub bolt **17**.
- Measure tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- Do not allow the tangential force to become higher than the upper limit of the specified value.
- If the measured tangential force deviates from the specified value, repeat from step ★.
- If the result is still not satisfactory, replace outer bearings **10, 13** and inner bearings **14, 19**.

NOTE
- **Make sure that there is no drag in brake drum 16 and the brake lining before you measure the tangential force.**
- **Measure the starting torque when oil seal 12 has been installed.**

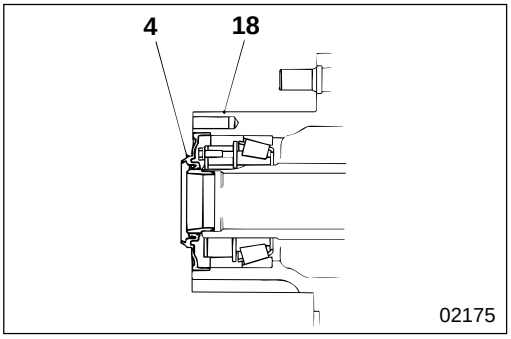


3 Inspection of axle shaft

A : Bend of shaft center

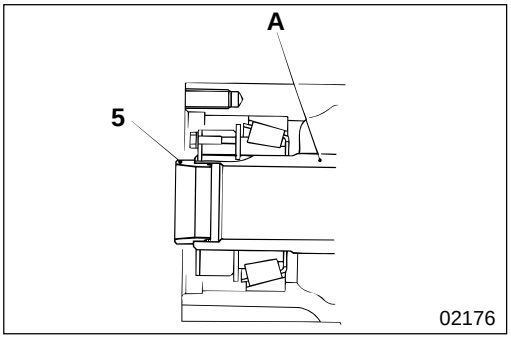
NOTE
To measure the bend of axle shaft 3, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

B : Wobble of flange face



4 Installation of oil seal

Press-fit oil seal **4** until it is flush with the end of wheel hub **18**.



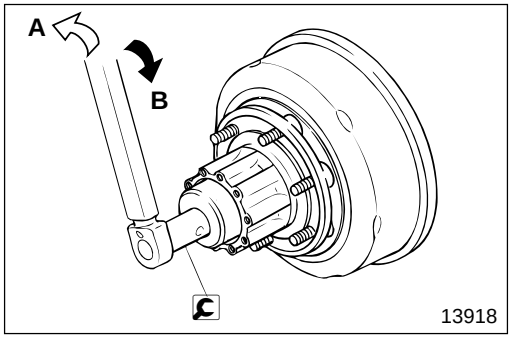
5 Oil seal retainer

[Removal]
It is not necessary to remove oil seal retainer **5** other than for replacement of oil seal **4**.

[Installation]
Press-fit oil seal retainer **5** until it is flush with the end of axle tube **A**.

https://truckmanualshub.com/

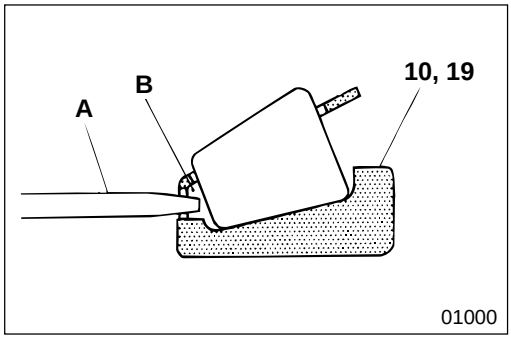
WHEEL HUB AND BRAKE DRUM



8 **Removal and installation of lock nut**

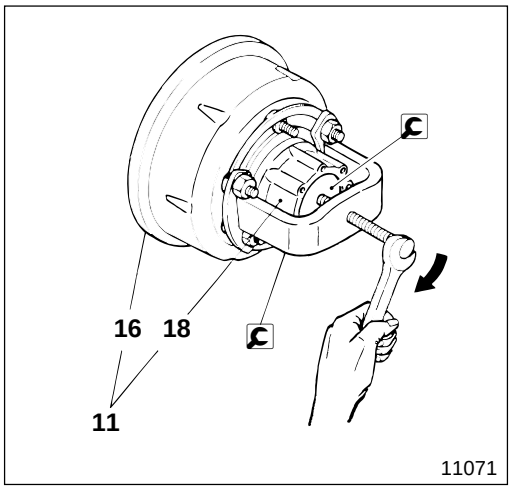
After installation, adjust the starting torque of the wheel hub bearing. P27-11

A : Removal
B : Installation



10 **19** **Packing grease in outer bearing inner race and inner bearing inner race**

A : Grease pump nozzle
B : Space between rollers

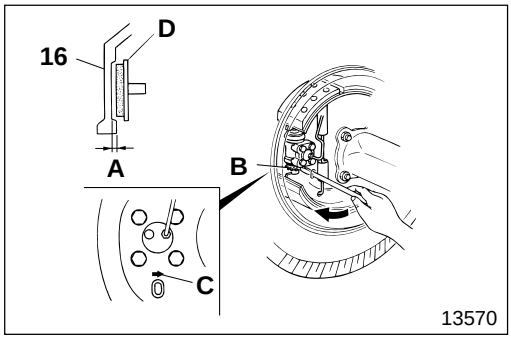


11 **Wheel hub and brake drum assembly**

[Removal]

CAUTION

Make sure you remove wheel hub and brake drum assembly 11 in a straight line to prevent damage to oil seal 12.



- If wheel hub and brake drum assembly **11** cannot be removed because of stepped wear **A** in brake drum **16**, carry out the following:
- Turn adjuster **B** in the opposite direction to arrow **C** on the packing plate, and expand the clearance between brake drum **16** and brake shoe assembly **D**. Then remove wheel hub and brake drum assembly **11**.

CAUTION

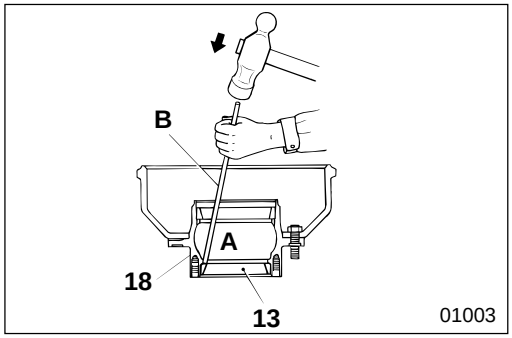
If brake drum 16 is faulty, correct it. **Gr 35**

[Installation]

After installing wheel hub and brake drum assembly **11**, adjust the brake shoe clearance.

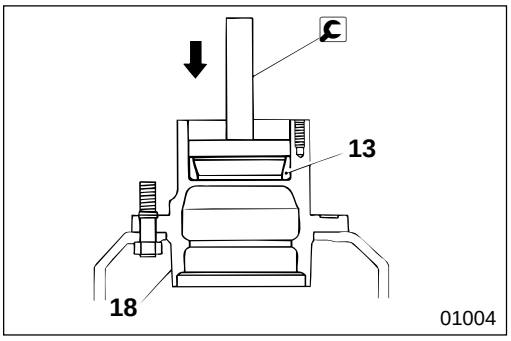
Gr 35

https://truckmanualshub.com/

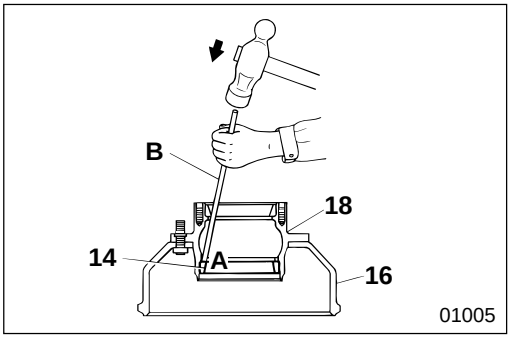


13 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **13** evenly from four indented parts **A** in wheel hub **18**.
B : Pin-punch

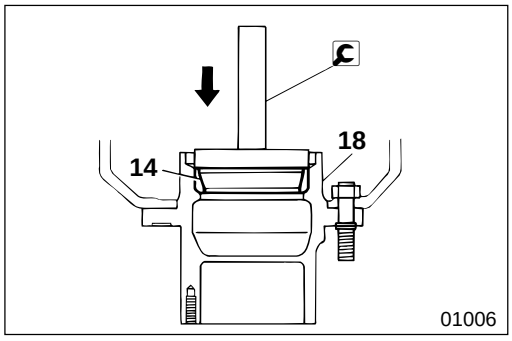


[Installation]

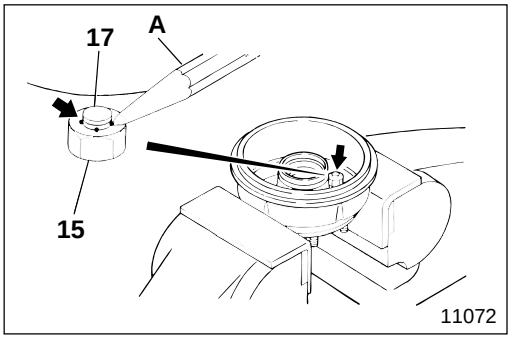


14 **Inner bearing outer race**

[Removal]
Drive out inner bearing outer race **14** evenly from four indented parts **A** in wheel hub **18**.
B : Pin-punch



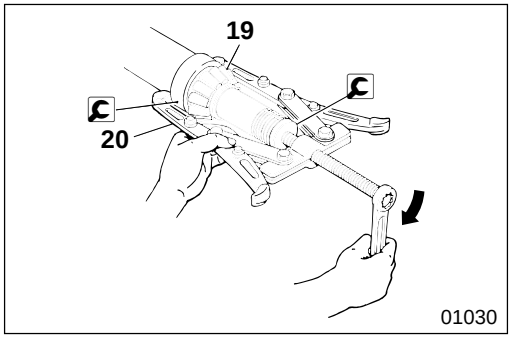
[Installation]



15 **17** **Installation of hub bolt and nut**

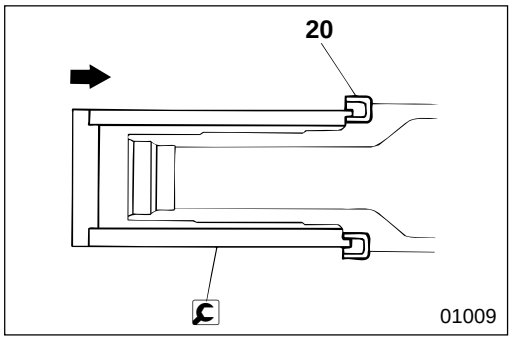
- Install hub bolt **17**.
- Tighten nut **15** at specified torque.
- Caulk nut **15** evenly at four points to keep it from turning.
  A : Pin-punch

https://truckmanualshub.com/



19 **20** **Inner bearing inner race and oil seal retainer**

[Removal]



[Installation]

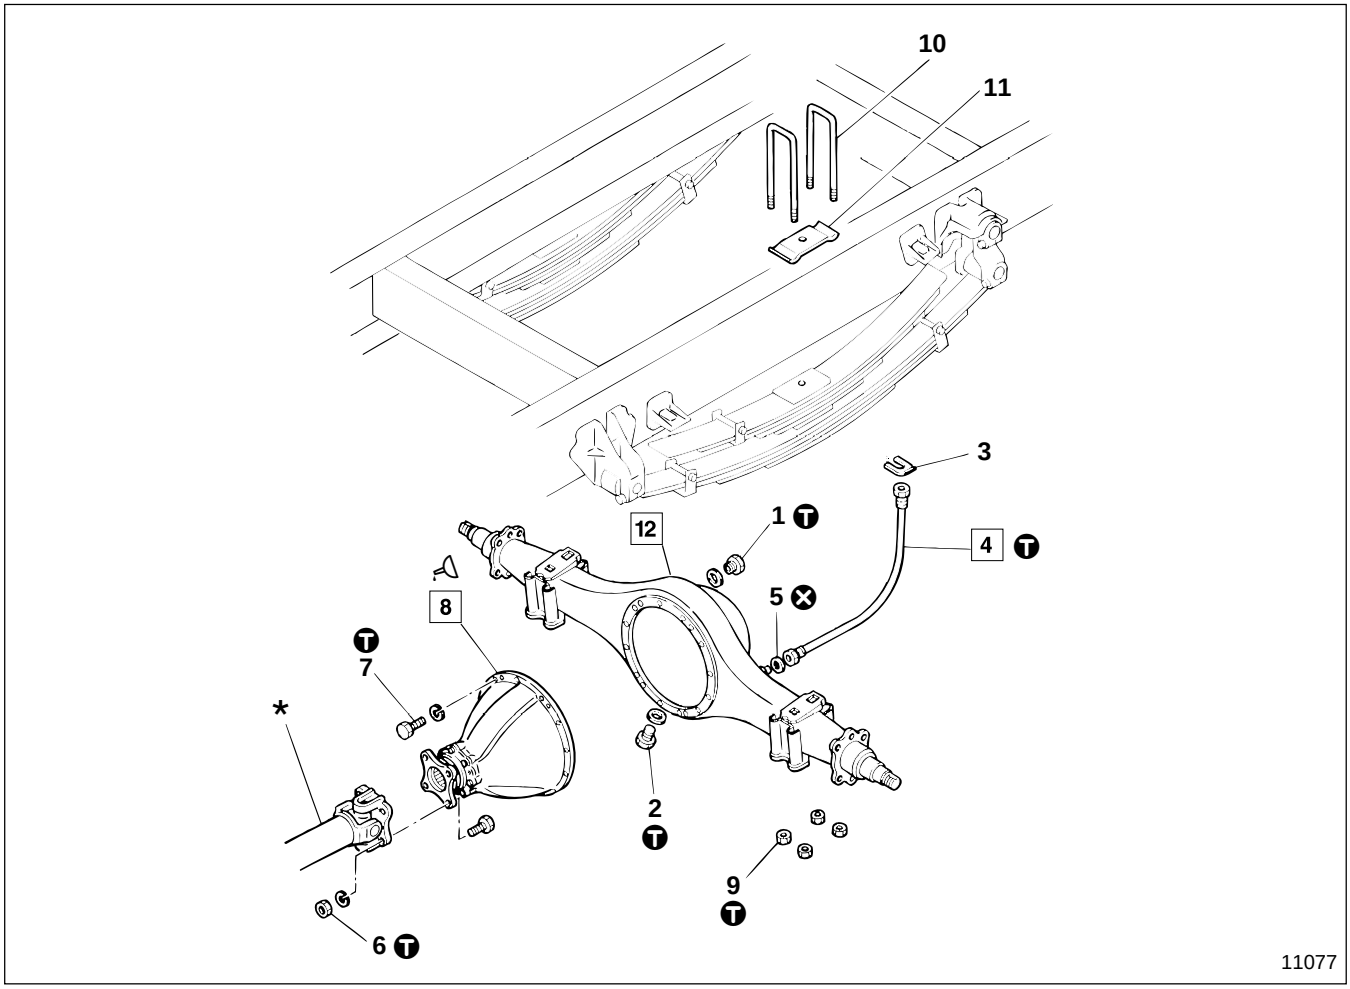
AXLE HOUSING



● **Work before removal** P27-19

● **Removal sequence**

1 Inspection plug
2 Drain plug
3 Clip
4 Brake hose
5 Packing
6 Nut
7 Bolt
8 Reduction and differential assembly P27-22
9 U-bolt nut
10 U-bolt
11 Spring upper pad
12 Axle housing

*: Propeller shaft Gr 25
⊗: Non-reusable parts

CAUTION

Be sure to protect brake hose 4 from dust by fitting blanking plugs after removal.

NOTE

Do not remove axle housing 12 unless it is faulty.

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION

Make sure that brake hose 4 is not twisted when you install it.

NOTE

Do not let sealant ooze from the mounting surfaces of reduction and differential assembly 8 and axle housing 12.

● **Work after installation** P27-19

https://truckmanualshub.com/

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
12	Bend of axle housing (C-B)	0.2 {0.0079} or less	0.5 {0.020} or more	Replace

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Inspection plug	98 to 115 {72 to 87, 10 to 12}	—
2	Drain plug	98 to 115 {72 to 87, 10 to 12}	—

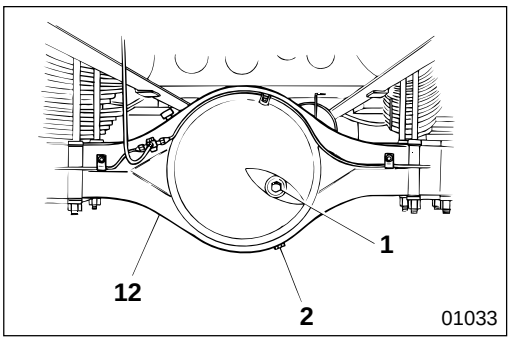
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
12	Measuring bar 	MH061003	Measures bend of axle housing : Two required



◆ Service procedure

● **Work before removal**

Remove drain plug **2** and drain the gear oil.

WARNING⚠

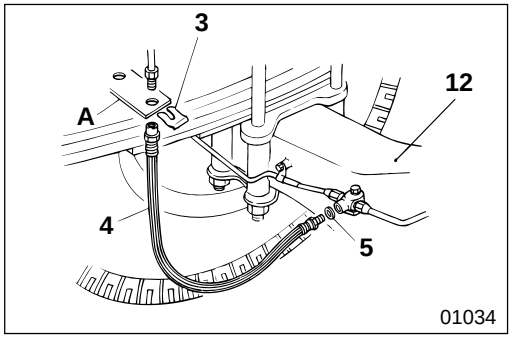
The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.

● **Work after installation**

Fill with the specified amount of gear oil via inspection plug **1**.

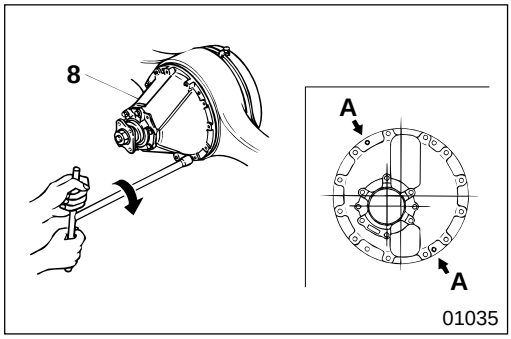
https://truckmanualshub.com/

AXLE HOUSING



4 **Removal and installation of brake hose**

- Remove brake hose **4** from frame **A** side first, then from axle housing **12** side.
- For installation, follow the removal sequence in reverse.

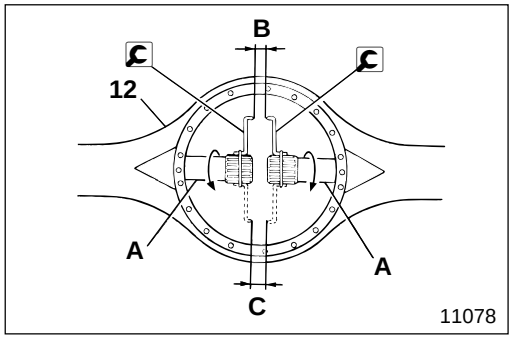


8 **Removal of reduction and differential assembly**

To remove reduction and differential assembly **8**, screw two M12×1.25 mm bolts evenly into two screw holes **A**.

NOTE

Completely remove adhered sealant from the mounting surfaces of reduction and differential assembly 8 and axle housing 12.



12 **Bend of axle housing**

- Leave axle shaft **A** installed in axle housing **12**.
- Install measuring bar on axle shaft **A**, and measure clearance **B**.
- Turn axle shaft **A** 180°, and measure clearance **C**.
- The difference between **B** and **C** is the amount of bend of axle housing **12**.
- If the bend of axle housing **12** is higher than the limit, replace the axle housing.

REDUCTION AND DIFFERENTIAL

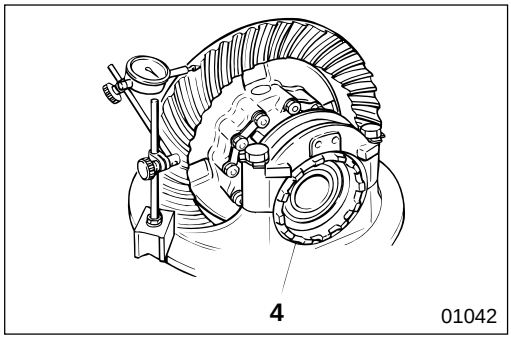
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
9	Side bearing installer 	MH061748	Press-fitting of side bearing inner race
12	Bearing retainer guide pin 	MH061745	Installation of pinion assembly : Two required

◆ Service procedure

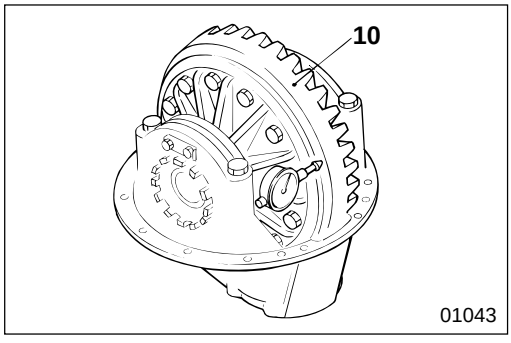


● **Inspection before disassembly**

Inspect for faulty parts before disassembly.

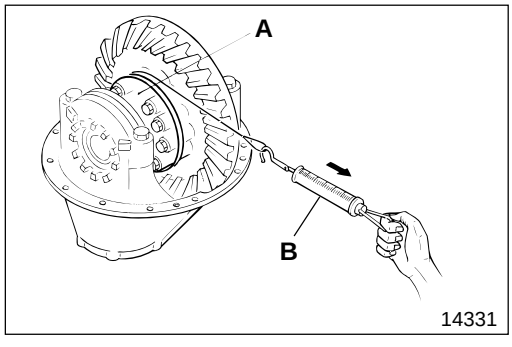
(1) Backlash of reduction gear and reduction pinion

If there is any fault, it is considered to be because of the amount adjusting screw **4** was tightened.



(2) Wobble of back face of reduction gear

Measure wobble at a point 145 mm {5.71 in.} (on the radius) from the center of the reduction gear, turning differential assembly **10** one full revolution.



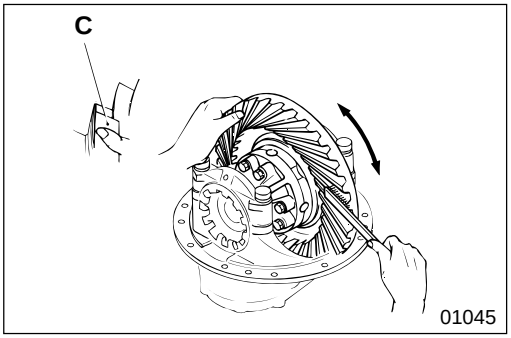
(3) Starting torque of side bearing

- Install spring balance **B** at 170 mm {6.69 in.} outer periphery point of differential case **A**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.

NOTE

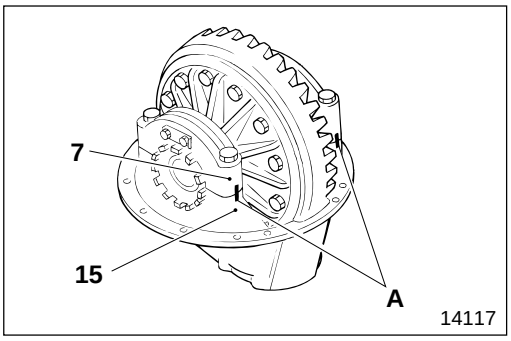
Measure the starting torque within reduction gear and reduction pinion backlash range.

https://truckmanualshub.com/



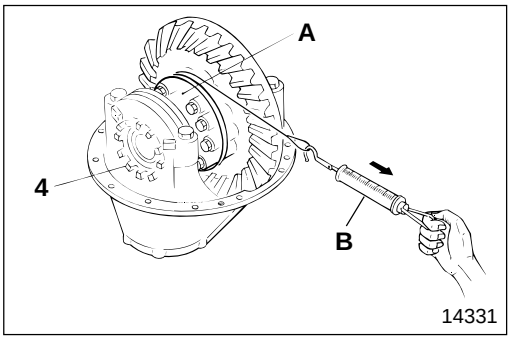
(4) Tooth contact of reduction gear

Apply red lead to three or four gear teeth, turn the gear a few times, and examine tooth contact with a piece of paper **C**.



● **Work before disassembly**

Put alignment marks **A** on bearing cap **7** and differential carrier **15** to identify left and right.



● **Inspection and adjustment after assembly**

(1) Starting torque of side bearing

[Inspection]

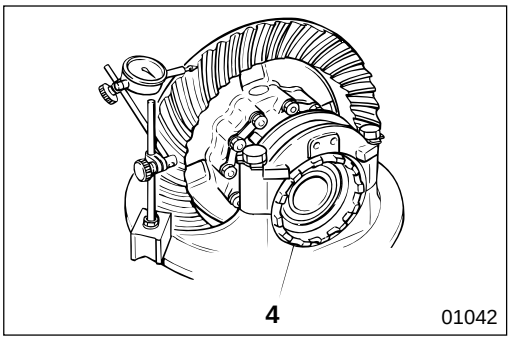
- Install spring balance **B** at 170 mm {6.69 in.} outer periphery point of differential case **A**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the specified value, adjust.

[Adjustment]

If the measured value does not meet the specified value, adjust using left and right adjusting screws **4**.

CAUTION

- **Tighten left and right adjusting screws 4 the same amount.**
- **Adjust the starting torque within the reduction gear and reduction pinion backlash range.**



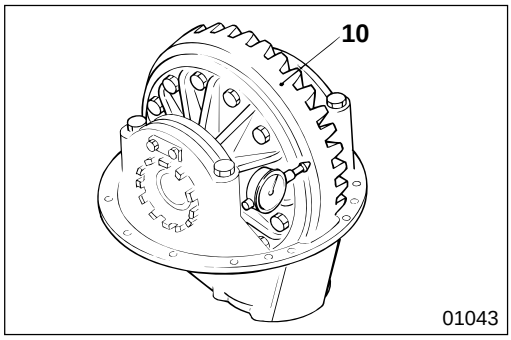
(2) Adjustment of backlash between reduction gear and reduction pinion

Adjust the starting torque of the side bearings using left and right adjusting screws **4**, taking care not to change the starting torque.

CAUTION

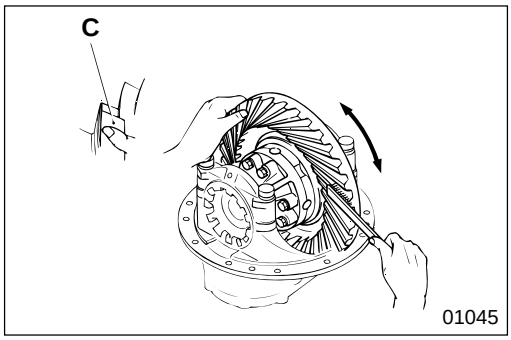
Make sure when you loosen one adjusting screw 4 that you tighten the other adjusting screw by the same amount, because the starting torque of the side bearing changes.

https://truckmanualshub.com/



(3) Inspection of wobble of back face of reduction gear

Measure wobble at a point 145 mm {5.71 in.} (on the radius), from the center of the reduction gear, turning differential assembly **10** one full revolution.



(4) Tooth contact of reduction gear

[Inspection]

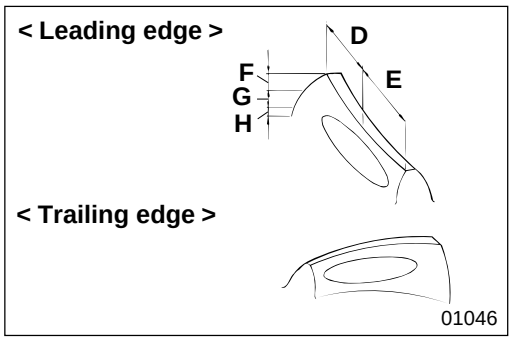
Apply red lead to three or four gear teeth, turn the gear a few times, and examine tooth contact with a piece of paper **C**.

[Adjustment]

If contact area is remarkably offset, adjust with reduction pinion mounting adjusting shims **14** to increase or decrease the backlash.

CAUTION ⚠

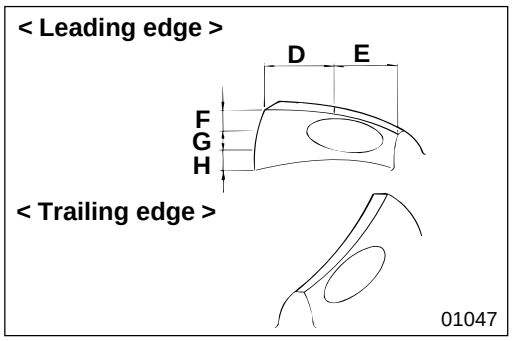
- **Make sure you replace as a reduction gear set (reduction gear and reduction pinion), when you replace the gear because of excessive teeth wear.**
- **When good tooth contact adjustment has been obtained, but backlash does not meet the standard value, tooth contact has priority. It is not necessary to adjust backlash to the standard value if it is less than 0.15 mm {0.0059 in.} out.**



● **Normal tooth contact at no load**

< Reduction gear >

D : Heel
E : Toe
F : Face
G : Flank
H : Clearance



< Reduction pinion >

D : Heel
E : Toe
F : Face
G : Flank
H : Clearance

https://truckmanualshub.com/

Maintenance item			Assembly standards
At no load	Tooth contact position	Lengthwise direction of tooth	From center toward toe
		Vertical direction	From center toward top of tooth for reduction gear and center of tooth for pinion
	Tooth contact shape	Length	About 50 to 70% of tooth width
		Width	About 50 to 70% of tooth depth
	Degree of tooth contact		Degree of tooth contact becomes weaker as it comes nearer to root or top

NOTE

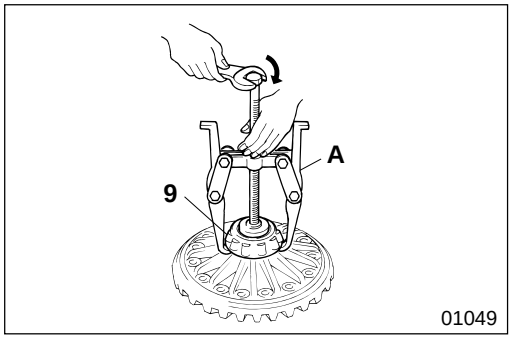
When tooth contact area is nearer to toe at no load, it becomes middle area contact under load.

Adjustment of Tooth Contact

	Mode of adjustment	Moving direction
Adjustment by adding or reducing shims	Advances reduction pinion to reduction gear (Shims are reduced) 	< Leading edge > < Trailing edge > Tooth contact moves toward root of tooth
	Retards reduction pinion from reduction gear (Shims are added) 	 Tooth contact moves toward top of tooth
Adjustment using adjusting screw	Advance reduction gear to reduction pinion axis (Less backlash) 	Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to toe and slightly nearer to root of tooth Trailing edge: Nearer to heel and slightly nearer to top of tooth
	Retard reduction gear from reduction pinion axis (More backlash) 	Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to heel and slightly nearer to top of tooth Trailing edge: Nearer to toe and slightly nearer to root of tooth

https://truckmanualshub.com/

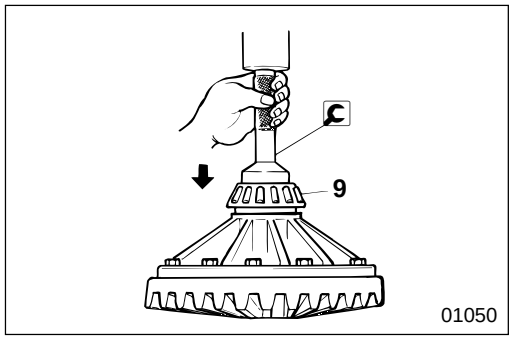
◆ Service procedure



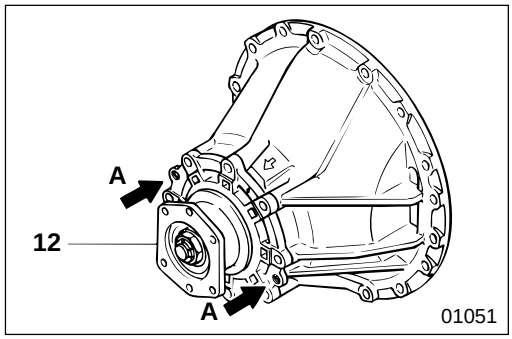
9 **Side bearing inner race**

[Removal]

A : Gear puller (General tool)



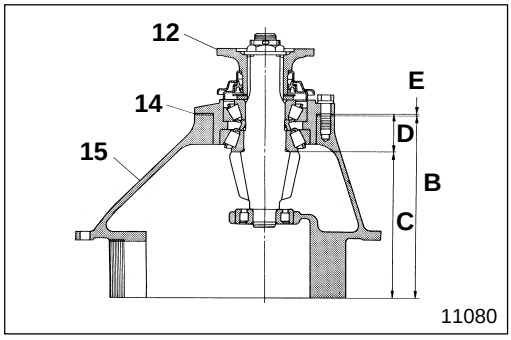
[Installation]



12 **Pinion assembly**

[Removal]

To remove pinion assembly **12**, screw two M12×1.25 mm bolts evenly into the two pinion assembly removal screw holes **A**.



[Adjustment]

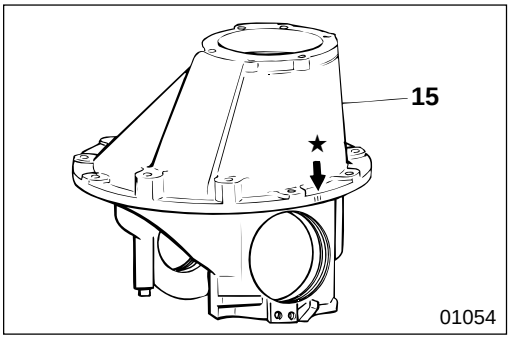
- Carry out the following procedure so that **B**, **C** and **D** conform to the standard dimension.
- Calculate shim thickness **E** according to the following formula based upon the machining error data stamped on pinion assembly **12** and differential carrier **15**.

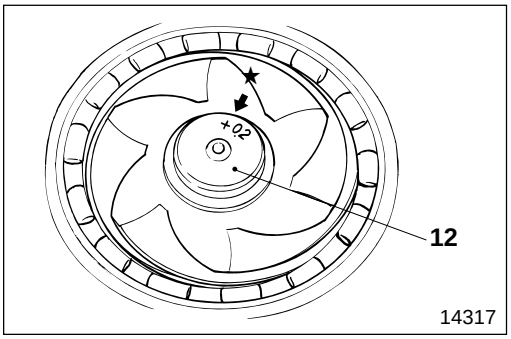
Formula for calculation:

E = 0.5 {0.020}–b+c+d

b : Deviation from basic dimension **B**
c : Deviation from basic dimension **C**
d : Deviation from basic dimension **D**

https://truckmanualshub.com/





Unit : mm {in.}

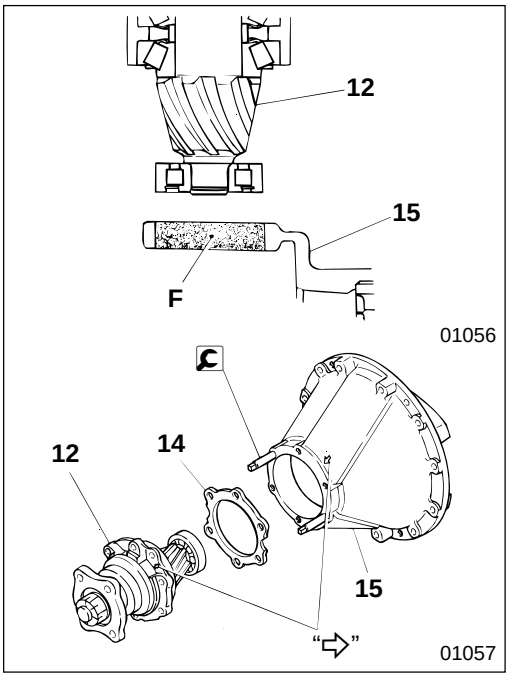
Location	Standard dimension	How to calculate deviation
Shim thickness	0.5 {0.020}	—
B	227 {8.94}	The basic dimension, multiplied by 100, is stamped on the periphery of differential carrier **15** flange
C	175 {6.89}	The basic dimension is stamped on the top of pinion assembly **12**
D	52 {2.05}	Measure the deviation from **D** using a dial gauge. However, If it is difficult to measure the actual deviation, assume a value from 0 to 0.2 {0 to 0.0079}

★ : Stamped number position

NOTE

Thickness is stamped in millimeters.

- Select shim **14** from shim thickness **E**.
  Available thicknesses of shim **14** : 0.1 mm {0.0039 in.} and 0.2 mm {0.0079 in.}



[Installation]

- Apply lock paint to pinion pilot bearing mounting surface **F** of differential carrier **15**.
- Install pinion assembly **12**.

CAUTION⚠

- **Be sure to let the lock paint harden undisturbed for 30 minutes to two hours after installation.**
- **Be sure to wait at least three hours before running the vehicle, and if possible wait 24 hours to let the lock paint harden.**

◆ Service procedure

● **Inspection and adjustment after assembly**

Starting torque of pinion bearing

[Inspection]

- Apply load of approximately 39.2 kN {8.8 klbf, 4000 kgf} to companion flange **3** or tighten lock nut **1** at specified torque.
- Install spring balance **A** at 134 mm {5.28 in.} outer periphery point of bearing retainer **14**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the specified value, adjust.

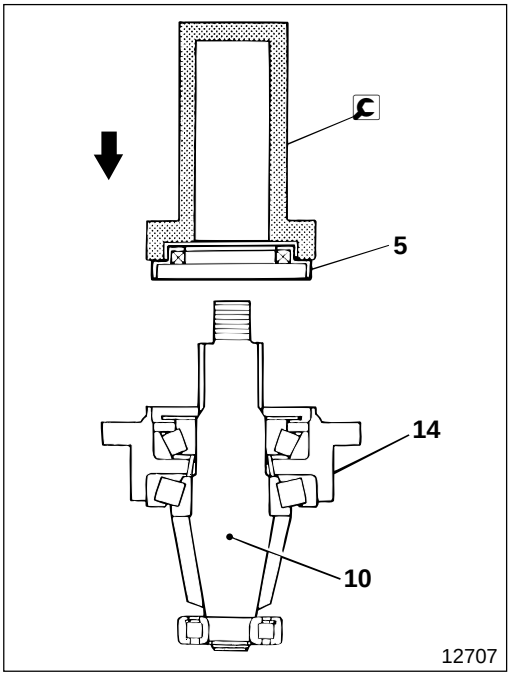
NOTE

- **Tighten companion flange 3 before measuring.**
- **Measure with oil seal 5 removed.**

[Adjustment]

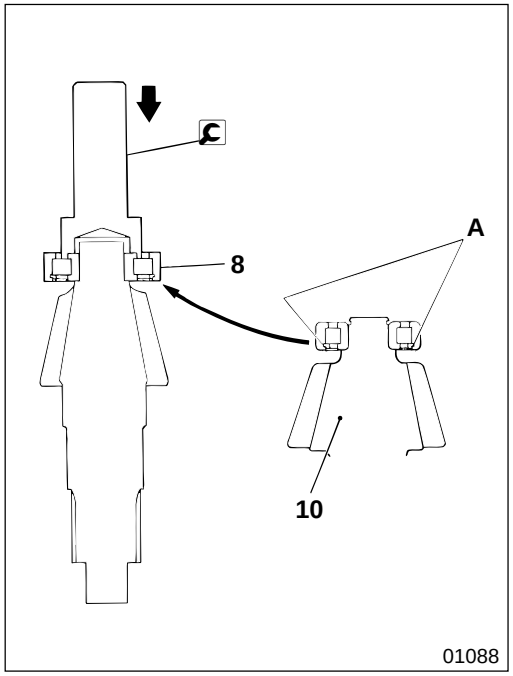
If the measured value does not conform to the specified value, adjust with collar **6** to obtain specified tangential force. Choose an appropriate collar by referring to the table below.

Thickness of collar : 15.875 to 16.475 mm {0.62 to 0.65 in.} (25 thicknesses in 0.025 mm {0.00098 in.} increments)



5 **Installation of oil seal**

https://truckmanualshub.com/



8 **Installation of pinion pilot bearing**

Press-fit pinion pilot bearing **8** in the direction as illustrated.

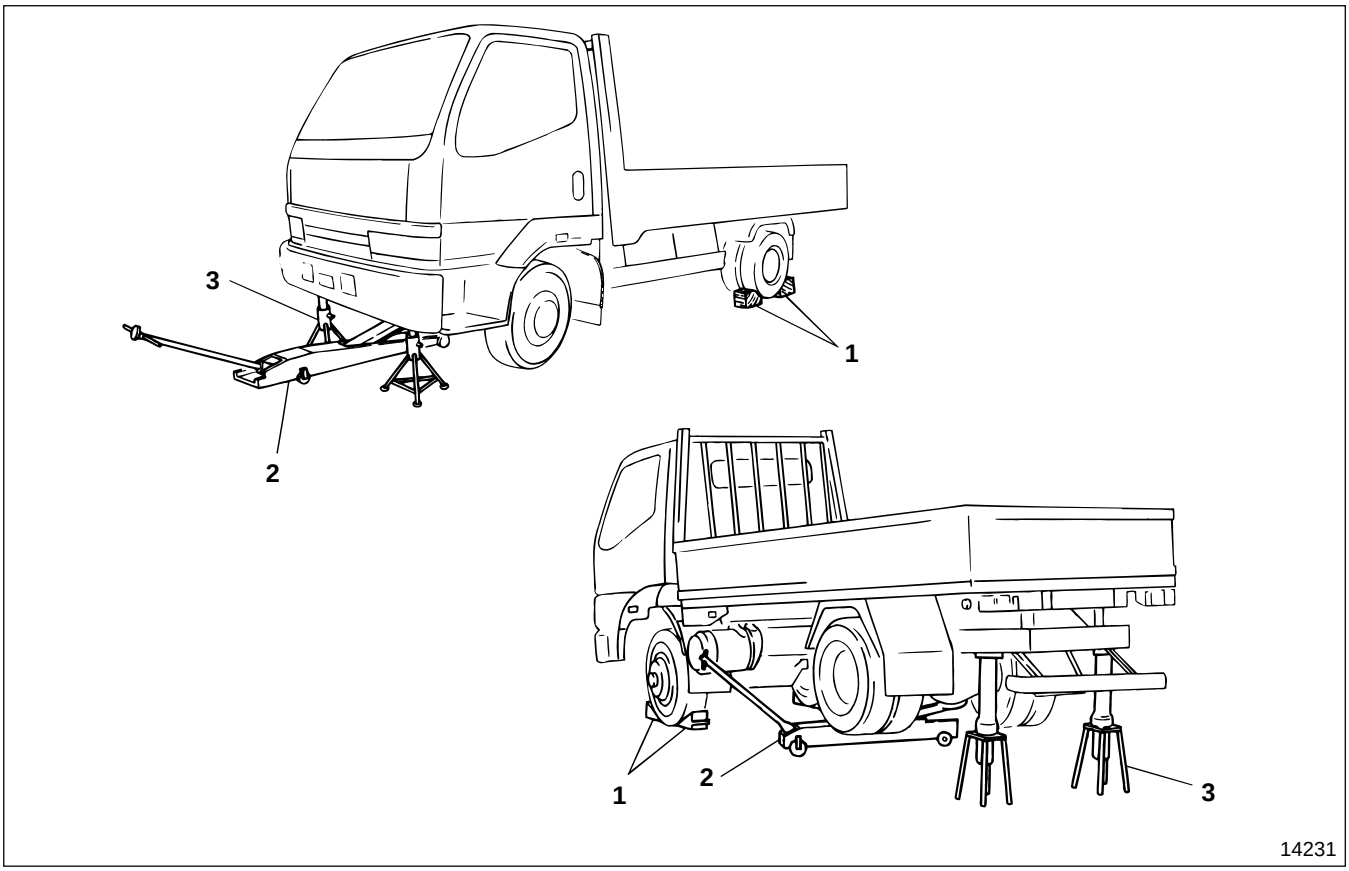
Work for Removal and Installation of Wheel and Tire



● **Work sequence**

1 Place wheel chocks.
2 Jack up the front or rear axle using a garage jack placed under the center of the axle.
3 Support the frame on rigid racks.

WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after removal and installation**

Follow the work sequence in reverse.

https://truckmanualshub.com/

WHEEL AND TIRE

NOTE

Use right-hand threaded wheel nuts marked “R” for right side wheel and left-hand threaded wheel nuts marked “L” for left side wheel.

Tightening torque

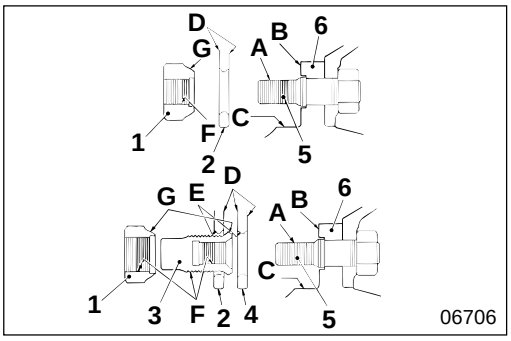
Unit : N·m {lbf.ft, kgf·m}

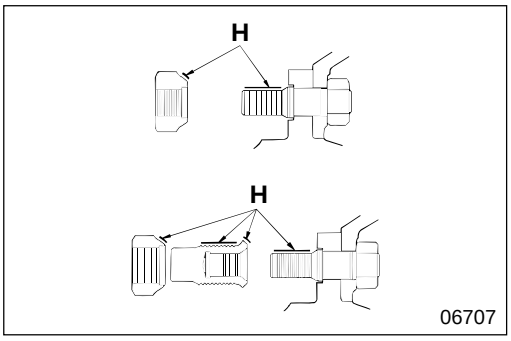
Location	Parts to be tightened	Tightening torque	Remarks
1, 3	Wheel nut	370 to 410 {275 to 305, 38 to 42}	Wet

https://truckmanualshub.com/

Lubricant

Location	Points of application	Kinds	Quantity
1	Wheel nut spherical area	Chassis grease [NLGI No. 1 (Ca soap)] or Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
3	Thread and spherical areas of wheel nut (inner)	Chassis grease [NLGI No. 1 (Ca soap)] or Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
5	Thread area of hub bolt	Chassis grease [NLGI No. 1 (Ca soap)] or Wheel bearing grease [NLGI No. 2 (Li soap)]	As required





◆ Service procedure

● **Cleaning and applying grease before installation**

[Cleaning]

To prevent wheel nuts **1** and **3** and hub bolt **5** from becoming loose and to prevent mounting parts (tire assemblies **2** and **4** and hub **6**) from being damaged, remove rust, dust, additional coatings of paint, and foreign particles from the following areas:

A : Hub bolt thread area
B : Wheel mounting surface of hub
C : Wheel alignment area of hub
D : Disc wheel mating surface
E : Disc wheel nut mounting surface
F : Wheel nut thread area
G : Wheel nut spherical area

[Applying grease]

H : Grease application location

WARNING⚠

Never use grease containing molybdenum disulfide, since it can cause loosening of fitted screws.

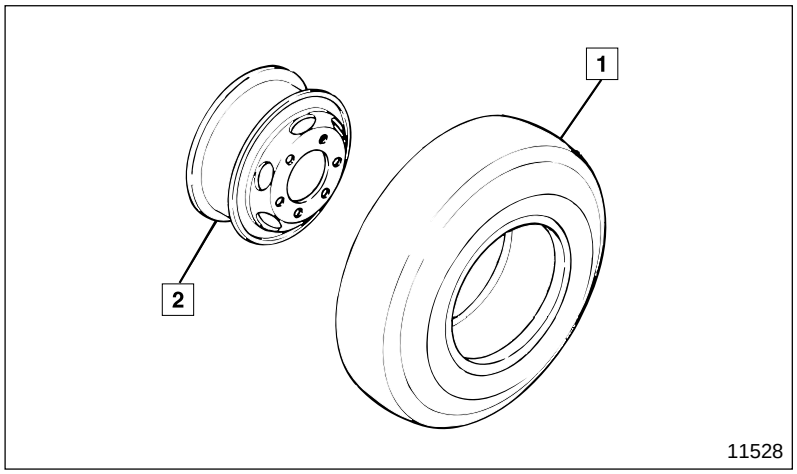
WHEEL AND TIRE

Tire Assembly



● **Disassembly sequence**

1 Tire
2 Disc wheel

● **Assembly sequence**

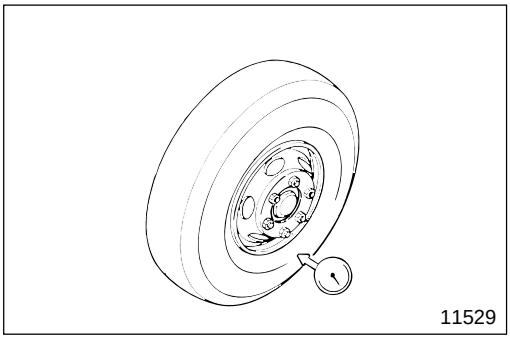
Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

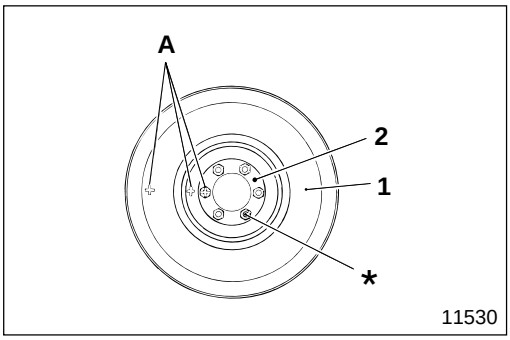
Location	Maintenance item		Standard value	Limit	Remedy
1	Horizontal deflection of tire (When assembled)		3.5 {0.14} or less	—	—
2	Disc wheel	Flatness	0.2 {0.0079} or less	—	—
		Horizontal deflection	1.5 {0.059} or less	—	—
		Vertical deflection	1.5 {0.059} or less	—	—

◆ Service procedure



1 **Deflection of tire**

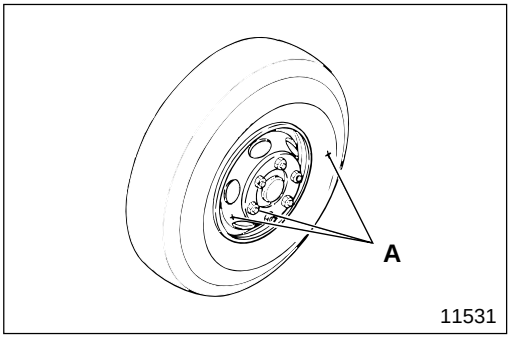
[Inspection]
If the measured value is higher than the limit, make corrections as follows.



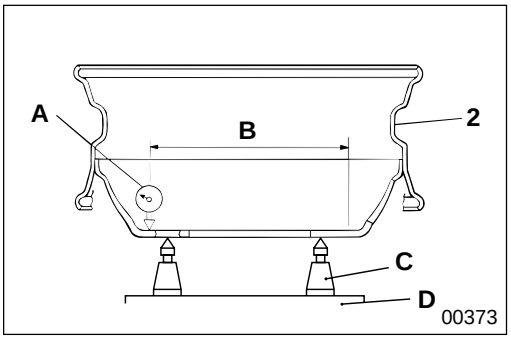
[Correction]

- Put chalk marks on tire **1**, disc wheel **2**, and hub bolt * (positions **A** as illustrated).
- Remove tire **1** from disc wheel **2**.

https://truckmanualshub.com/



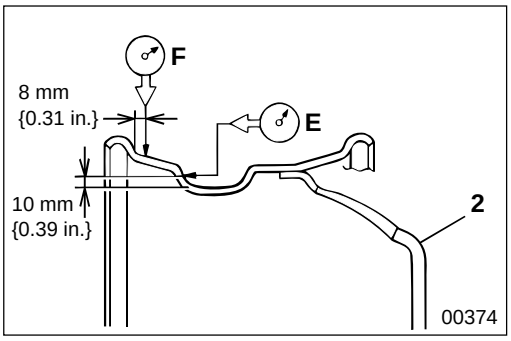
- Measure deflection of disc wheel **2**. If the most deflective position is near the chalk mark, reinstall tire **1** rotating it half a turn from the chalk mark and tighten nuts.
- Remeasure deflection of tire **1**.
- If the measured value is still higher than the limit, replace tire **1** and disc wheel **2** together as an assembly.



2 Inspection of disc wheel

(1) Flatness

- Measure flatness at specified position **B** from the center of disc wheel **2**.
  Measure flatness at six equidistant points (wheel with 6 studs) on the wheel.
  A : Dial gauge
  B : ø170 to 270 mm {6.69 to 10.6 in.}
  C : Portable screw jacks (x 4)
  D : Surface plate
- Replace disc wheel **2** if the measured value is higher than the limit.



(2) Deflection

Replace disc wheel **2** if the measured value is higher than the limit.
E : Horizontal deflection measuring point
F : Vertical deflection measuring point

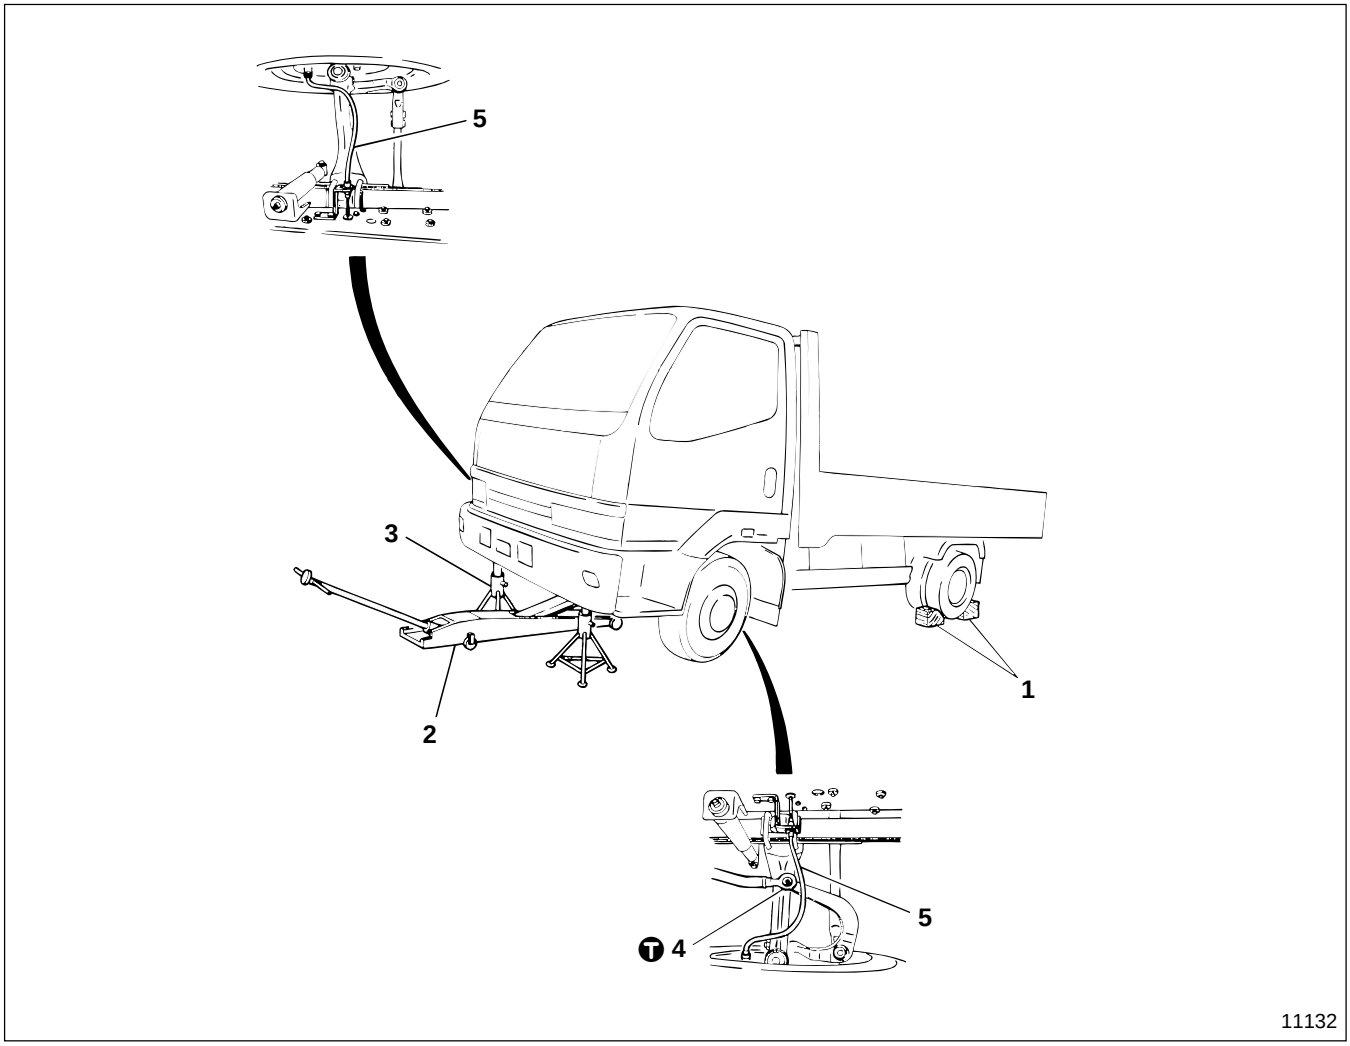
WORK BEFORE REMOVAL AND INSTALLATION OF FRONT SUSPENSION



● **Removal sequence**

1 Place wheel chocks.
2 Jack up the front axle with a garage jack.
3 Support the front frame on rigid racks.
4 Remove the nut (that connect the knuckle arm and the drag link).
5 Disconnect the brake hose (on the frame side).

WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame with rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION⚠

Be sure to protect the brake hose from dust by fitting blanking plugs.

● **Installation sequence**

Follow the removal sequence in reverse.

https://truckmanualshub.com/

WARNING

You must bleed air from the brake system after connecting the brake hose, failure to do so would cause the brakes to malfunction. Gr 35

CAUTION

Be sure that the brake hose is not twisted when you connect it.

REMOVAL AND INSTALLATION OF LEAF SPRING ASSEMBLY

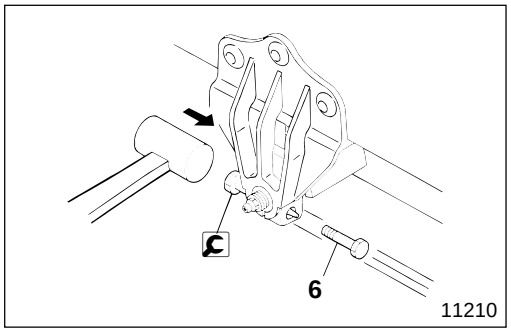
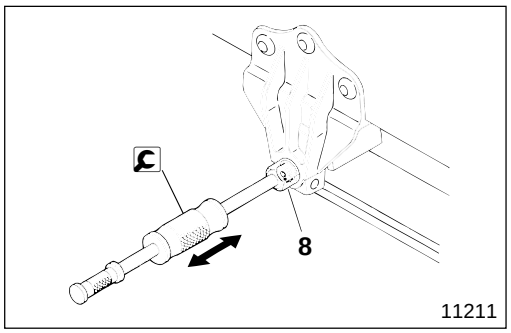
◆ Service procedure

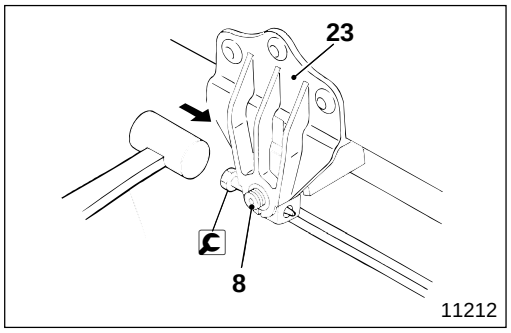


6 **Removal of bolt**

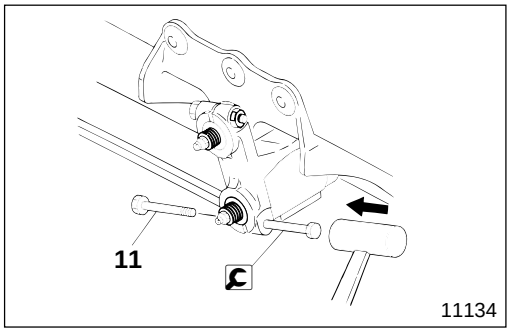


8 **Shackle pin**

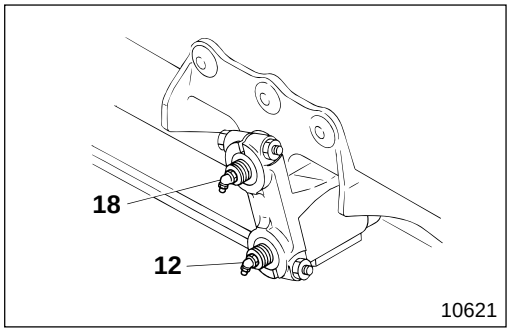
[Removal]



[Installation]
Align the bolt hole of front spring front bracket **23** and the bolt slot of shackle pin **8** using shackle pin setting bar.



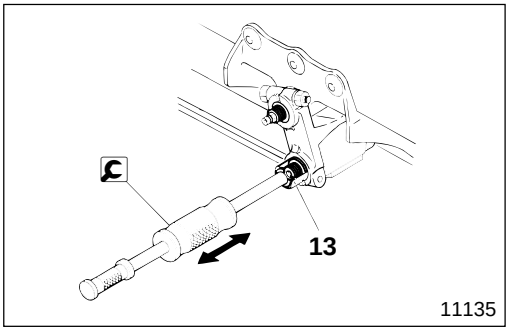
11 **Removal of bolt**



12 **18** **Installation of grease nipple**

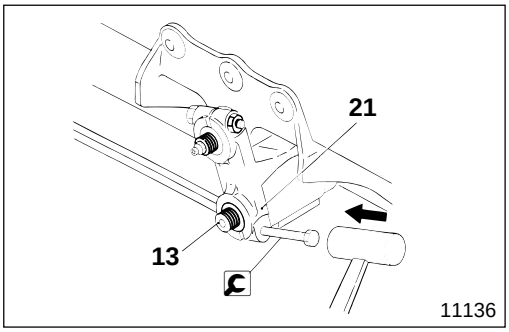
- Install grease nipples **12**, **18** on the driver's side (rear left) so that they face the most convenient side for supplying grease.
- For the automatic transmission model, also install grease nipples **12**, **18** on the passenger's side (rear right) so that they face the most convenient side for supplying grease.

https://truckmanualshub.com/

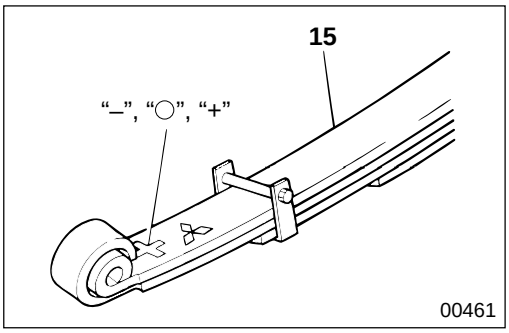


13 **Shackle pin**

[Removal]



[Installation]
Align the bolt hole of shackle link **21** and the bolt slot of shackle pin **13** using 🔧 shackle pin setting bar.



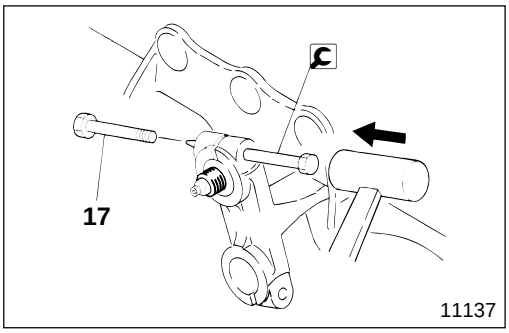
15 **Leaf spring assembly left/right height combinations**

When replacing leaf spring assembly **15**, select the members so that the left and right height marks "+", "○" and "–" are combined as shown below.

Item	Combination				
	1	2	3	4	5
Right leaf spring assembly, passenger's side	–	–	○	○	+
Left leaf spring assembly, driver's side	–	○	○	+	+

CAUTION ⚠

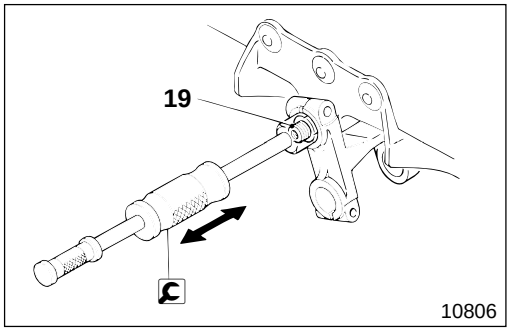
Passenger's side leaf spring assembly 15 differs from driver's side leaf spring assembly in camber (arch). Do not mix them up when mounting, or this would cause vehicle tilt.



17 **Removal of bolt**

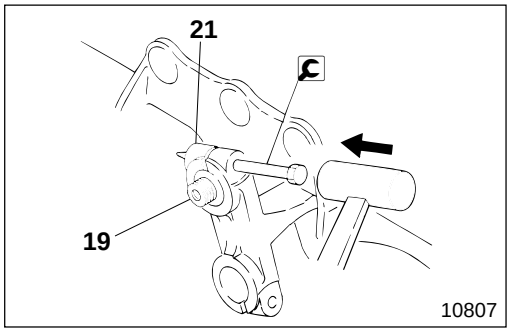
https://truckmanualshub.com/

REMOVAL AND INSTALLATION OF LEAF SPRING ASSEMBLY



19 **Shackle pin**

[Removal]



[Installation]
Align the bolt hole of shackle link **21** and the bolt slot of shackle pin **19** using shackle pin setting bar.

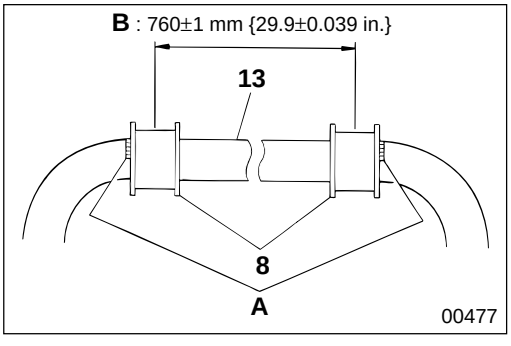
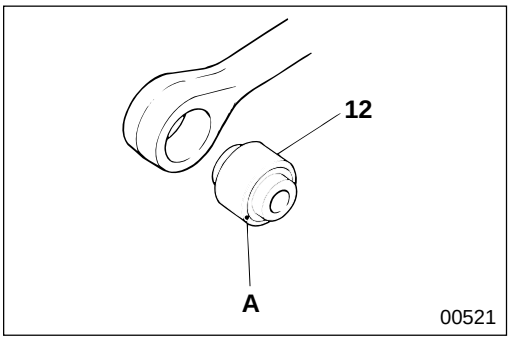
9	Nut (Stabilizer bracket mounting)	410 to 550 {295 to 405, 41 to 56}	—

◆ Service procedure



8 **Stabilizer bushing**

Align the ends of stabilizer bushings **8** with markings **A** of stabilizer bar **12** so that the distance between each bushing center is **B**.



12 **Removal and installation of bushing**

Compress outer cylinder **A** to remove bushing **12**. For installation, follow the removal sequence in reverse.

CAUTION ⚠

Make sure you apply force to the outer cylinder when compressing outer cylinder A to avoid damaging bushing 12.

Manufacturer	NIPPON ABS

STRUCTURE AND OPERATION
Anti-lock Brake System (ABS)

The anti-lock brake system (ABS) prevents tire slippage due to wheel lockup caused by sudden braking and braking on slippery road surfaces. The ABS provides a driver with vehicle controllability and directional stability in braking.

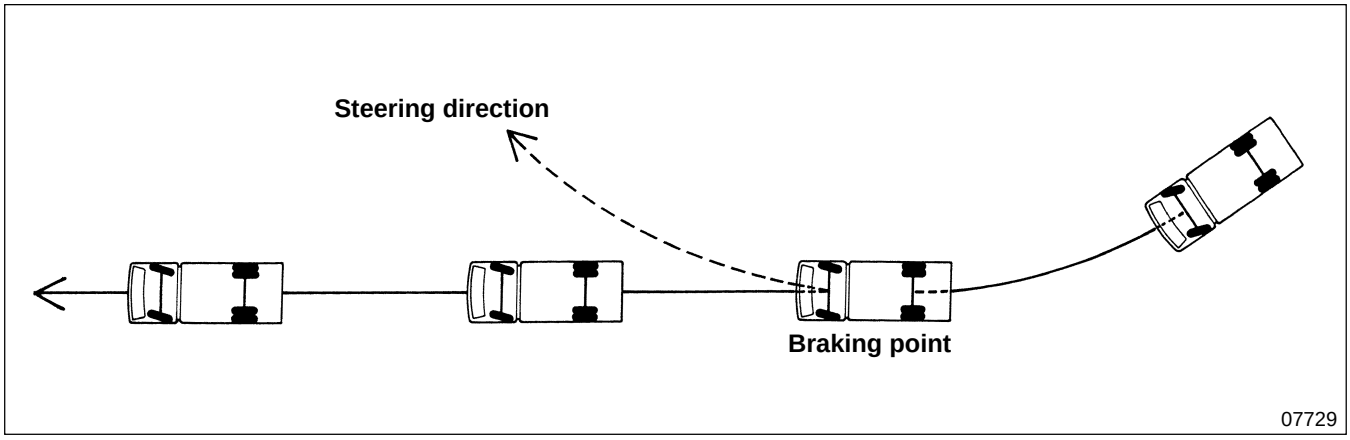
● Wheel lockup

Rotating tires of a moving vehicle have a tendency to continue traveling in the direction of tire rotation. Because of this characteristic, a driver can control the vehicle's traveling direction by moving the front wheels to a desired direction using the steering wheel.

In a vehicle not equipped with an anti-lock brake system, when a driver depresses the brake pedal with full force, the wheels can lock up under certain conditions. Tires in a wheel lockup condition lose the tendency to maintain directional characteristic, and the vehicle starts sliding in a direction of an externally applied force regardless of the tire direction. In other words, when wheel lockup occurs, the vehicle loses its directional stability, disallowing the driver to control the vehicle's movement.

The following shows how a vehicle without ABS loses its directional stability when different tires lock up on slippery road surfaces.

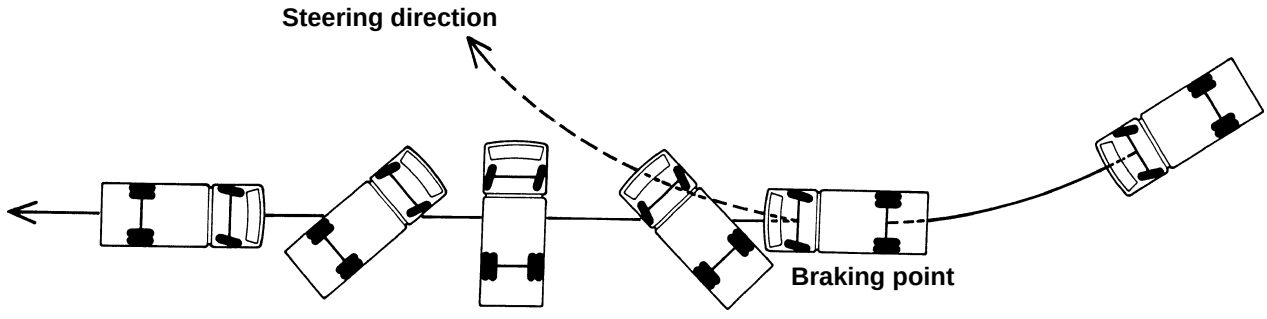
● Front wheel lockup (both front tires)



The front tires lose directional stability, but the rear tires try to travel in the direction of rotation since they are not locked up. Because of the front wheel lockup, a steering wheel operation does not change the vehicle's moving direction.

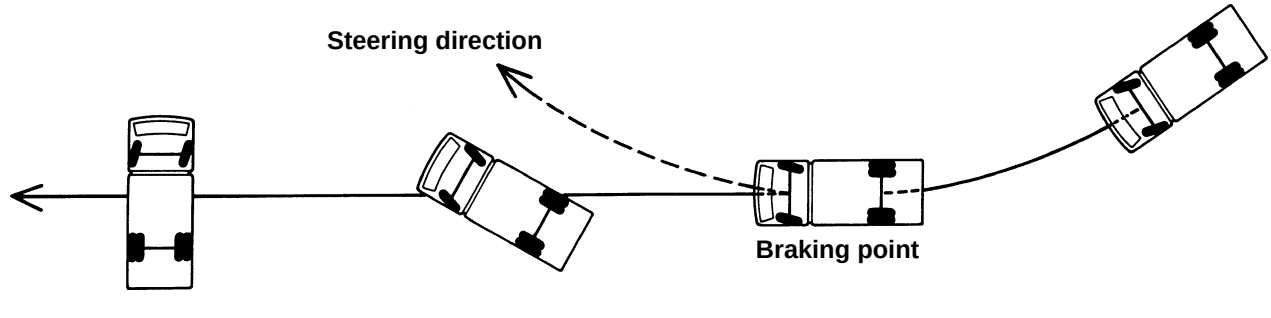
https://truckmanualshub.com/

● **Rear wheel lockup (both rear tires)**



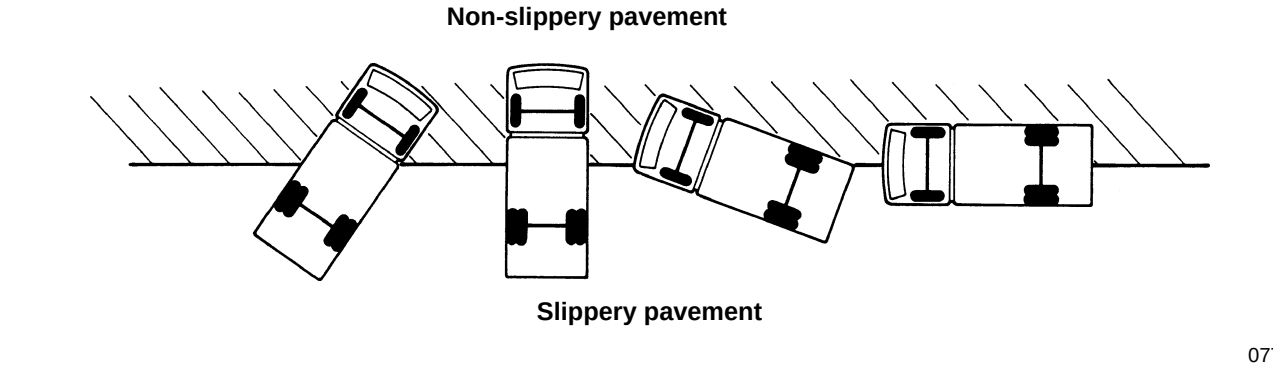
When the steering wheel is operated with the rear wheels in a lockup condition, the front tires try to change the vehicle's direction of travel, but the rear tires slide sideways, causing the vehicle to spin. If wheel lockup occurs in a vehicle traveling in a straight direction, the force of inertia continues to push the vehicle straight ahead from the back of the vehicle due to the lack of stopping force in the rear tires, and the vehicle can spin.

● **All wheel lock up (front and rear tires)**



When wheel lockup occurs in both front and rear tires, all four tires lose directional stability. Therefore, the vehicle slips in the direction of inertia regardless of the steering direction.

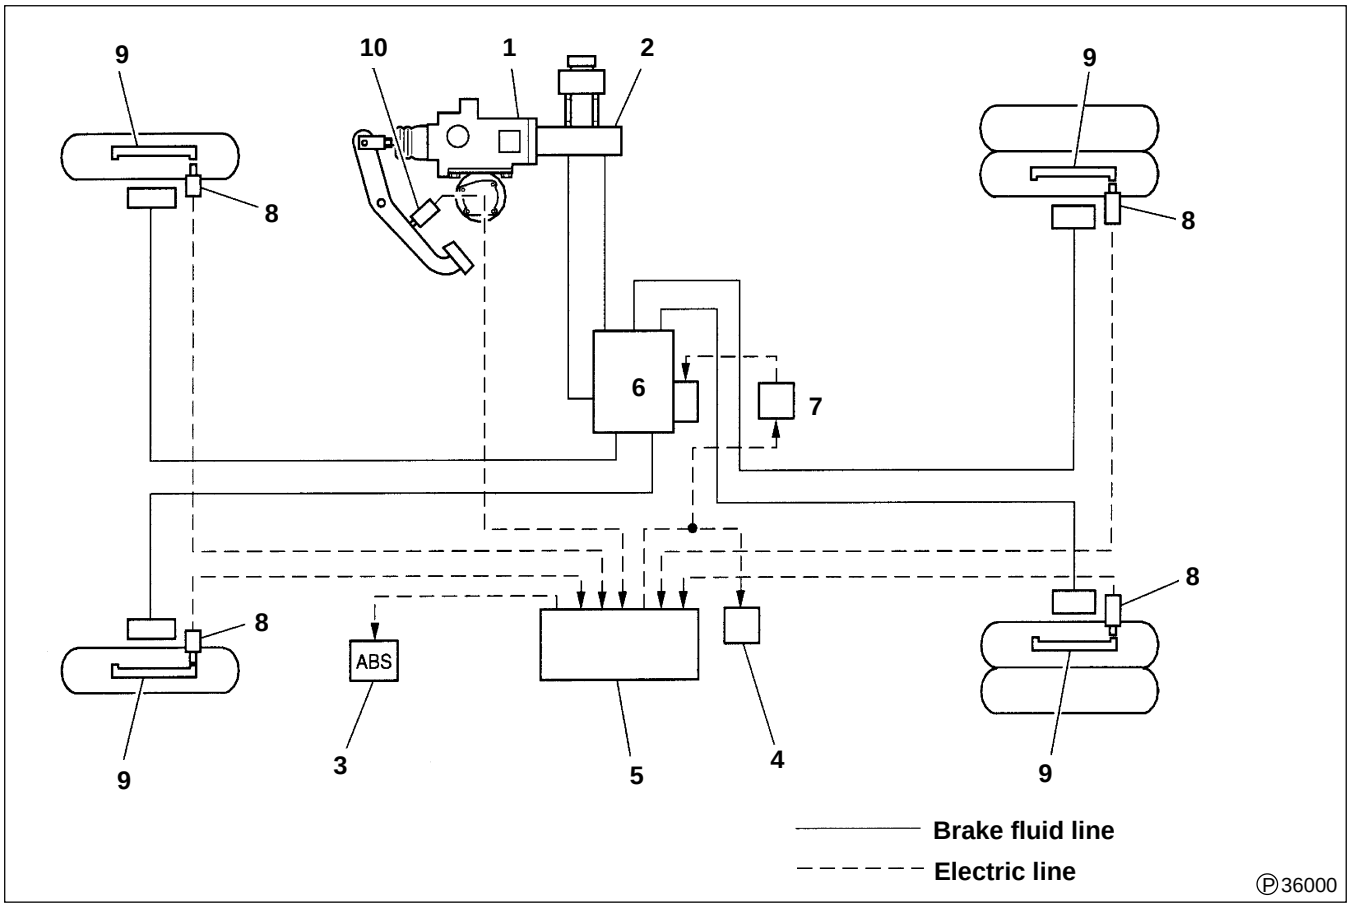
● **Wheel lockup on surfaces with split μ factors (road surface with different friction coefficients for right and left tires)**



The tires on a surface with a lower friction coefficient lock up first. The tires in a lockup condition start sliding, thus failing to provide effective stopping force. Due to this imbalance in the stopping power between the right and left tires, one side of the vehicle slows down while the other side continues traveling, thus resulting in the loss of directional stability. When this happens during sudden braking, the vehicle spins.

https://truckmanualshub.com/

Structure of ABS

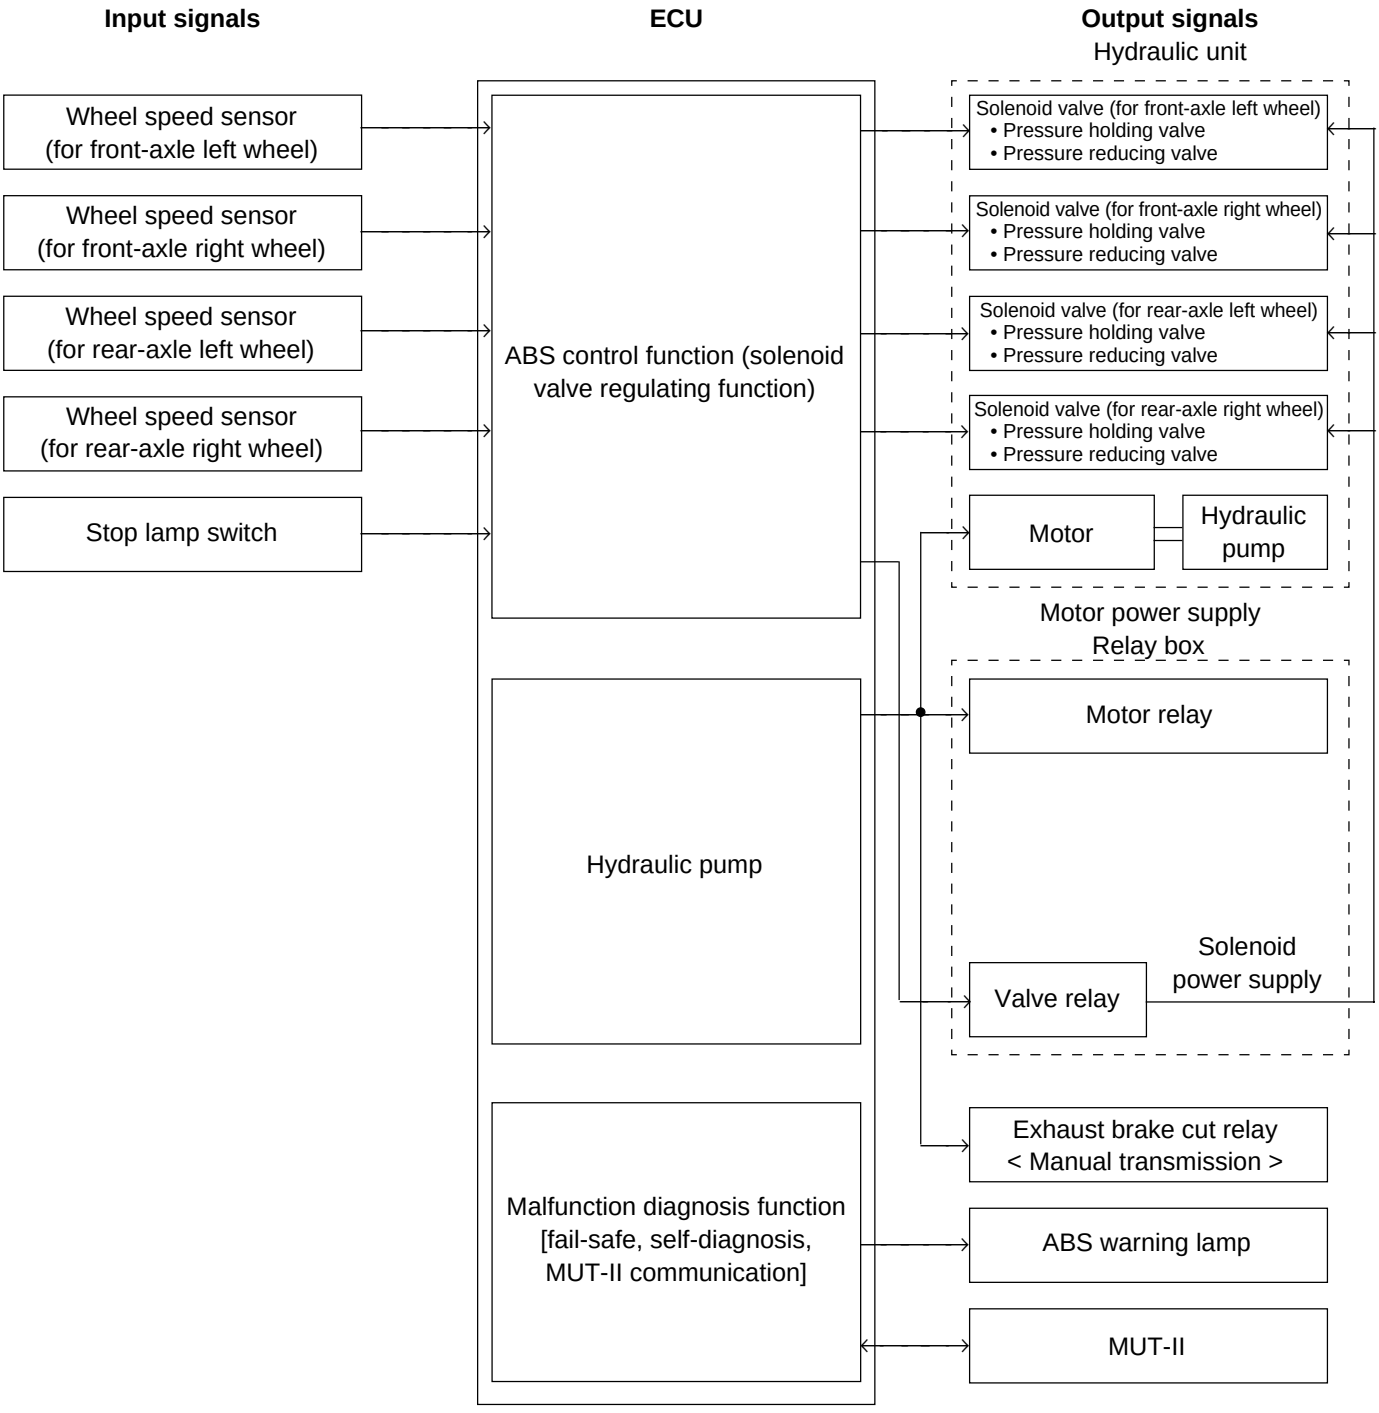


1 Hydraulic booster
2 Brake master cylinder
3 ABS warning lamp
4 Exhaust brake cut relay
< Manual transmission >
5 ECU
6 Hydraulic unit
7 Relay box
8 Wheel speed sensor
9 Rotor
10 Stop lamp switch

The ABS uses wheel speed sensors **8** and ECU **5** to monitor the rotating speed of each wheel. When the wheel speed exceeds the preset deceleration speed or slip rate, the ECU detects it as a tendency leading to wheel lockup, and sends control signals to hydraulic unit **6** and relay box **7**. The signals activate the solenoid valves to reduce the brake fluid pressure in the wheel brakes and ease the braking force to prevent wheel lockup. Then, when the wheel speed increases, wheel speed sensors **8** send signals to the solenoid valves in hydraulic unit **6** by way of ECU **5** to increase the brake fluid pressure in the wheel brakes to augment the braking force. This control cycle is repeated to prevent wheel lockup on slippery pavements and ensure the vehicle's directional stability during braking. The 4-sensor 4-channel anti-lock brake system uses four wheel speed sensors **8**, which are located at the front and rear wheels, to control each of the four wheels.

https://truckmanualshub.com/

● **ABS function**



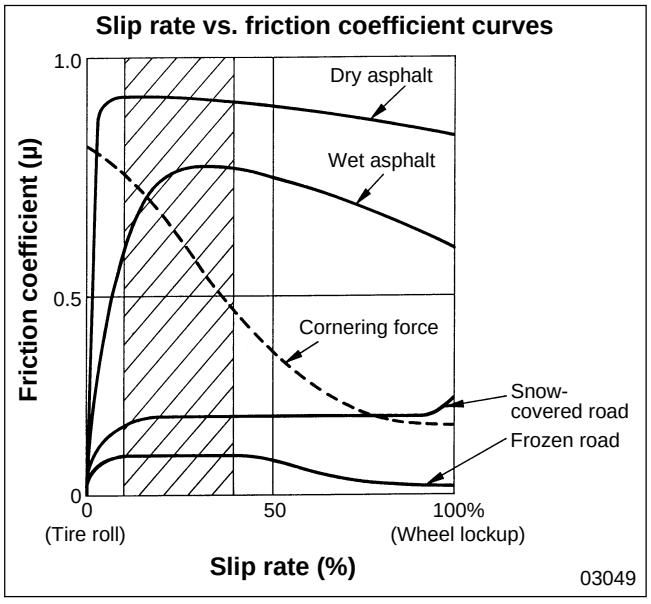
https://truckmanualshub.com/

● **ABS control function**

To provide optimum stopping power, the ABS controls the braking force based on the slip rate determined by the relationship between the wheel speed and the vehicle speed. When the brake is applied, the resulting force slows down the wheel rotation, thus reducing the vehicle speed. However, inertia acts on the vehicle and tries to maintain the vehicle's forward movement despite the stopping force applied by the tires. When there is a difference between the wheel speed and vehicle speed, slipping occurs. The degree of slippage is expressed by a slip rate.

$$\text{Slip rate (\%)} = \frac{\text{Vehicle speed} - \text{Wheel speed}}{\text{Vehicle speed}} \times 100$$

When the slip rate is 0%, there is no slippage between the tires and pavement. The slip rate of 100% refers to a wheel lockup condition.



The graph shows the time-based changes in the friction coefficient of a rolling tire during the process of wheel lockup. When the brake is applied gradually while the tires are rotating on pavement, the tires begin to slip while in rotation.

When the brake is applied harder, the tires stop rotating and start to slide on the pavement. This condition is called wheel lockup.

The friction coefficient is highest when the slip rate is within the shaded area on the graph.

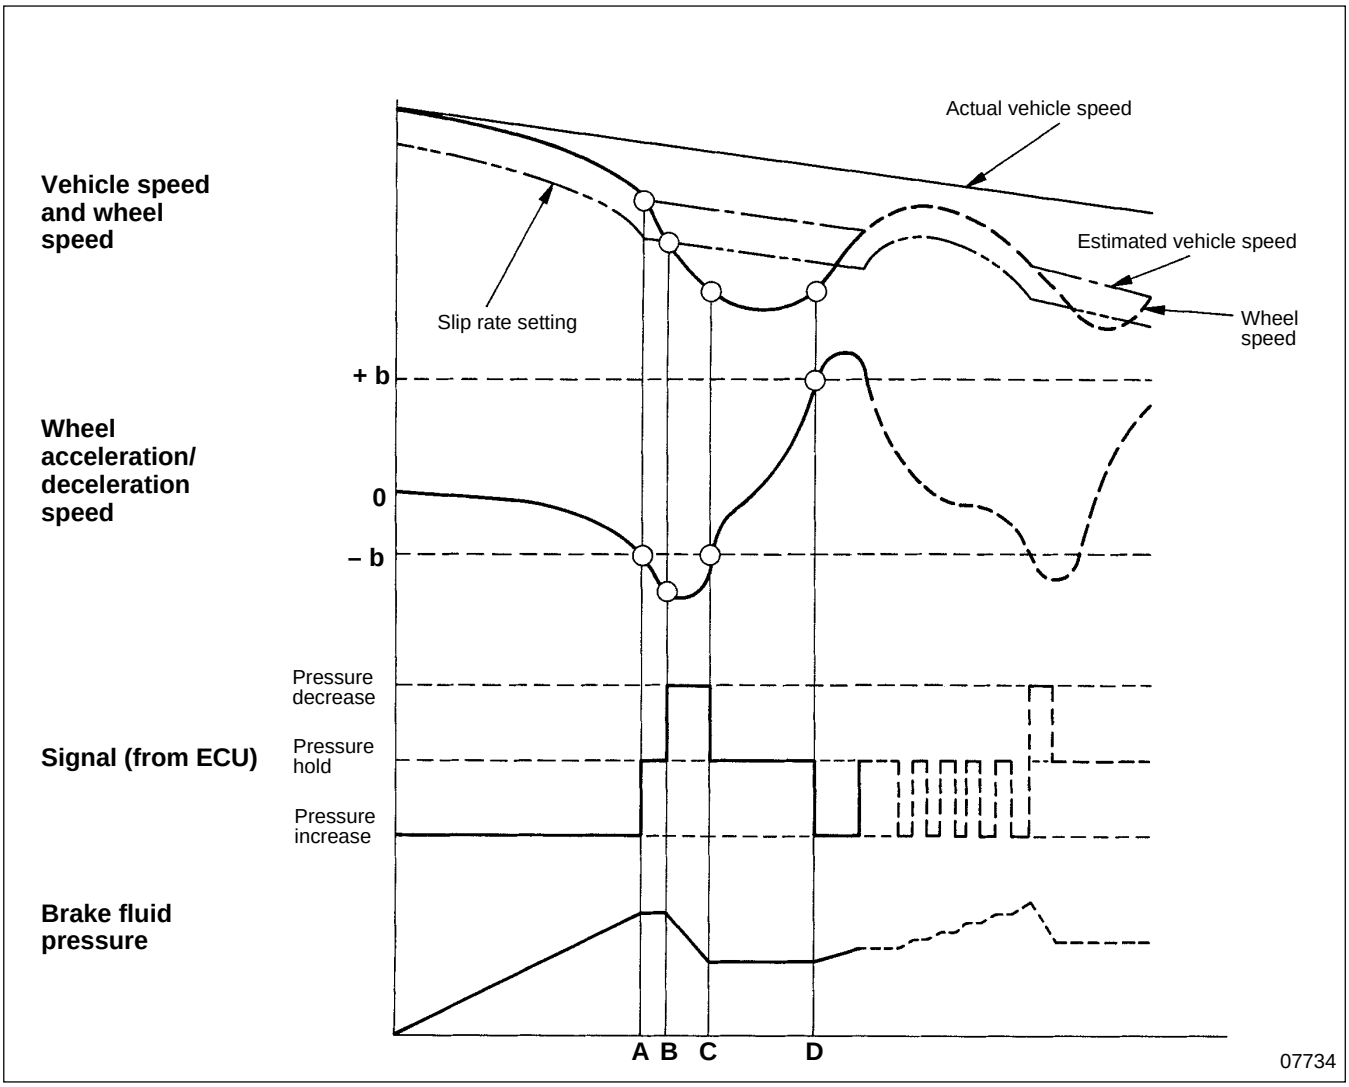
In other words, tires provide maximum friction when the braking force is appropriately controlled to maintain the slip rate in the range indicated by the shaded area on the graph, rather than when the brake is applied at full force.

In a vehicle equipped with ABS, the ECU and hydraulic unit adjust the braking force and maintain it within the shaded area on the graph where the friction coefficient is high, thus preventing tire slippage and ensuring braking stability.

https://truckmanualshub.com/

ABS Operation

● **ABS control characteristic curve**



The above ABS control characteristic graph shows the time-based changes in vehicle speed, wheel acceleration/ deceleration speed and brake fluid pressure level during braking.

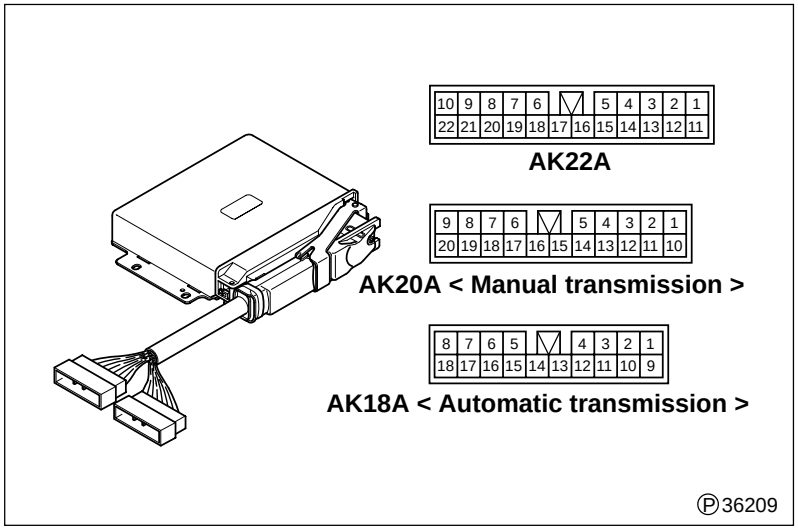
- When the wheel deceleration speed exceeds the speed setting **– b** at point **A**, the ECU sends a signal to maintain the brake fluid pressure at the same level.
  At the same time, the ECU estimates the vehicle speed according to a programmed calculation method.
- When the vehicle speed decreases further and the slip rate exceeds the setting at point **B**, the ECU detects it as a tendency leading to wheel lockup, and sends a signal to reduce the brake fluid pressure.
- When the wheel speed increases because of the reduced brake fluid pressure and the wheel speed exceeds the setting **– b** at point **C**, the ECU sends a signal to maintain the brake fluid pressure at the same level.
- When the wheel speed increases further and the wheel speed exceeds the setting **+ b** at point **D**, the ECU determines that there is no risk of wheel lockup and sends a signal to increase the brake fluid pressure.

By repeating the above control cycle, the ABS prevents wheel lockup and provides maximum friction between the tires and pavement to ensure high stability during braking.

● **ABS and exhaust brake system**

On slippery road surfaces, activation of the exhaust brake system can result in wheel lockup. If the exhaust brake activates during an ABS braking operation, proper braking function cannot be provided by the ABS.
To prevent this, the exhaust brake system is deactivated during ABS operation even when the exhaust brake switch is turned ON.
When the ABS stops providing its function, the exhaust brake system becomes operable if the exhaust brake switch is ON.

https://truckmanualshub.com/



● **ECU**

This component calculates the wheel speed and estimates the vehicle speed based on signals sent from the wheel speed sensors. Based on the calculation results, it determines the degree of wheel lockup tendency, and sends brake fluid pressure control signals to the solenoid valves of the hydraulic unit to regulate brake fluid pressure accordingly.

The ECU is equipped with a self-diagnosis function. Should an abnormality occur, the ECU turns on the warning lamp on the instrument panel to indicate the system malfunction and deactivates the ABS control to set the brake system in normal condition (without anti-lock brake system control).

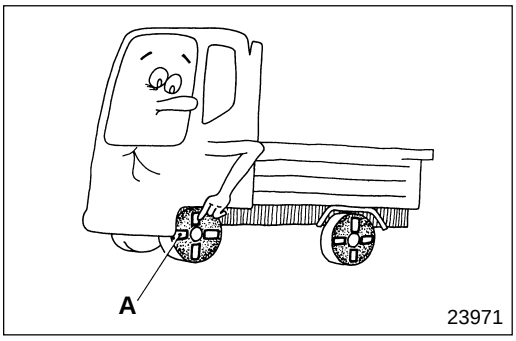
Periodic Inspection Procedures

(1) Periodic inspection of Anti-lock brake system

- Inspect the vehicle's Anti-lock brake system following the procedure below.
- If an abnormality is found in this inspection, further inspect the Anti-lock brake system using MUT-II (multi-use tester) by referring to TROUBLESHOOTING section.
  P35A-15

- Inspection procedure
  ① With the vehicle stationary, press the brake pedal and inspect the hydraulic unit for fluid leaks.
  If fluid leaks from the hydraulic unit, replace the unit. If fluid leaks from the fluid pipe or connector, tighten the joint.
  ② Inspection using brake tester
  Check the braking force at each wheel with a brake tester by following the inspection procedure for ordinary vehicles.
  If an abnormality is found, inspect the wheel brake units, service brake system and hydraulic unit.
  ③ Drive the vehicle and check the operation of the Anti-lock brake system.
  - Conduct a test drive at an open area to ensure safety.
  - Conduct a test drive without cargo.

  Attach white tape **A** on the sides of tires, so that it is easy to observe the rotation of the front and rear wheels.
  - Turn the starter switch from the OFF position to the ON position, and make sure that the ABS warning lamp lights.
    Then, check that the ABS warning lamp turns off approximately two seconds after the starter switch is turned on.
  - Drive the vehicle at a speed of 20 to 30 km/h {12 to 19 mph}, and apply a sudden brake. Make sure that wheel lockup does not occur in any of the tires.



https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

Adjustment of Wheel Speed Sensor Clearance

Tightening torque

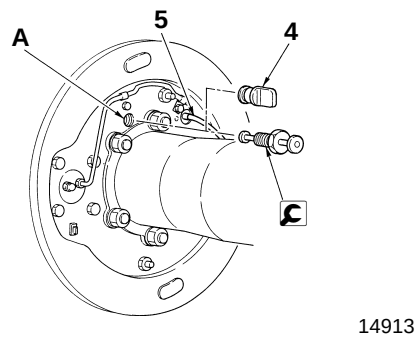
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
7	Bolt (Anchor bracket mounting)	135 {100, 13.8}	—

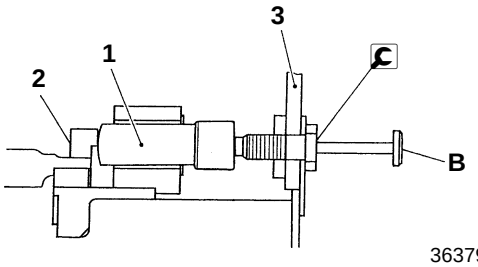
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Adjuster  14912	MH062080	Adjustment of wheel speed sensor clearance



14913



36379

Tighten adjuster to extend wheel speed sensor **1**, and adjust clearance between the sensor and rotor **2**.

- Remove plug **4** located on the back side of back plate **3**.
- Mount adjuster in adjustment hole **A**, and tighten the adjuster.
- Wheel speed sensor **1** contacts the rotor before adjuster is completely tightened. Therefore, do not press shaft **B**, and tighten the adjuster until resistance is felt.
- Be sure to reinstall plug **4** after adjustment.

5: Wheel speed sensor harness

https://truckmanualshub.com/

Inspection of Wheel Speed Sensor Signal Waveform Using Oscilloscope

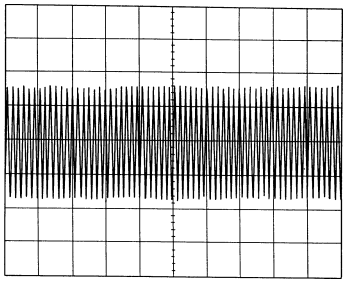
Inspect the rotor for dents using an oscilloscope, since the tester cannot be used for dent detection.

NOTE

Use an oscilloscope with a waveform recording function.

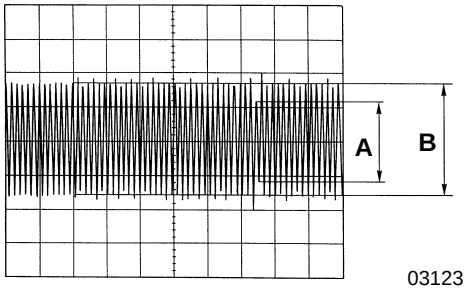
- Lift the wheel to be tested off the ground, and disconnect the connector at the wheel speed sensor.
- Connect the terminal of the oscilloscope to the terminal of the disconnected connector. Rotate the wheel at a constant speed. Check the waveform shown on the oscilloscope to check for dents on the rotor.

Normal waveform (no dent on rotor)



03122

Abnormal waveform (with dents on rotor)



03123

- Rotor dents are often made by the rotor press-fit on the hub end contacting the axle during installation of the hub and brake drum assembly on the axle. When installing the hub & brake drum assembly, pay close attention to prevent the rotor from contacting other parts.

A: Vmin (Minimum peak)

B: Vmean (Average of maximum peaks)

$$\frac{\text{Vmean} - \text{Vmin}}{\text{Vmean}} = 0.2 \text{ (20\% or lower)}$$

If more than 20%, replace the rotor.

https://truckmanualshub.com/

Hydraulic Unit Operation Check

Operation check using MUT-II

- Lift the vehicle using a jack and support it with jack stands, or position the tires on brake tester rollers.

WARNING⚠

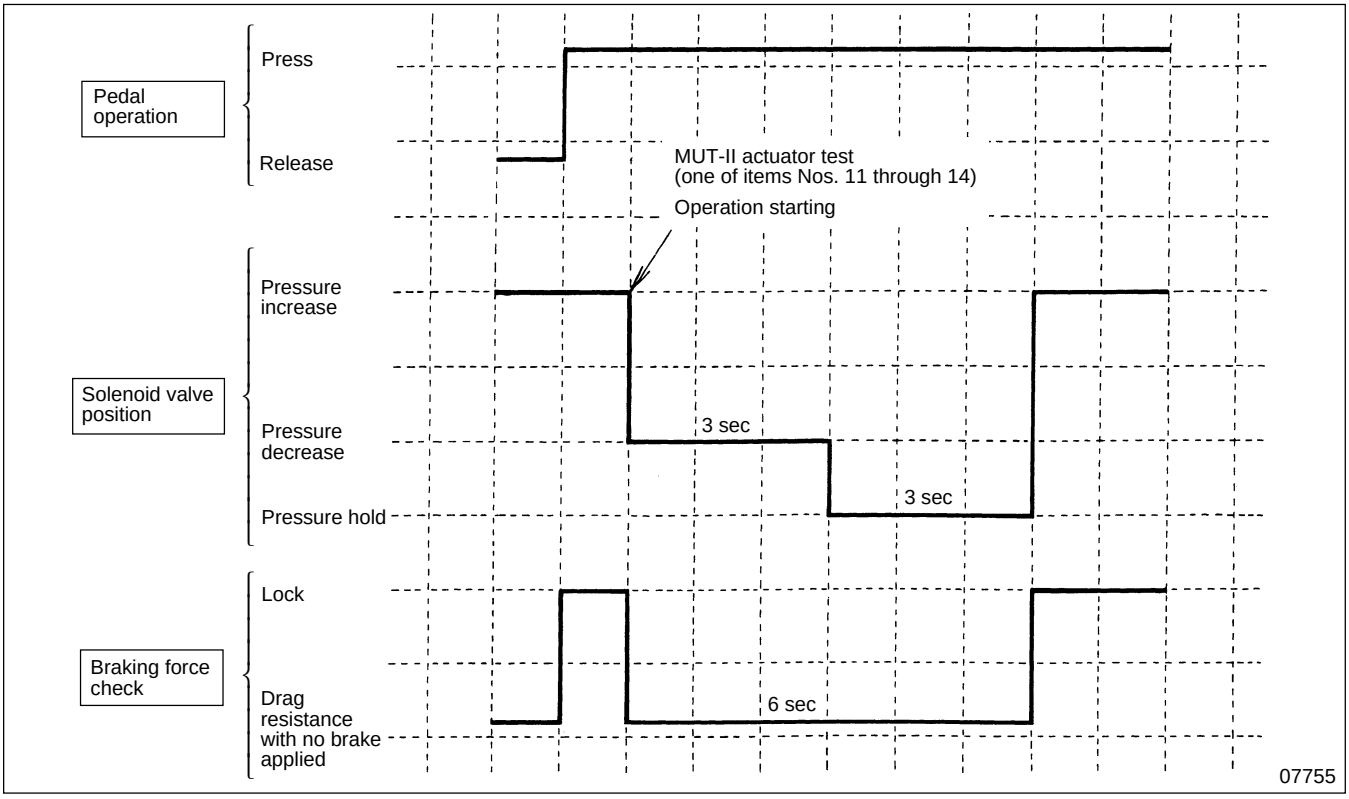
- **The brake tester rollers and tires must be dry during inspection.**
- **To test the front brakes, apply the parking brake. To test the rear brakes, place wheel chokes at the front tires to secure them in position.**

- Disengage the parking brake, and feel the drag resistance of the brake on each wheel.
  When using a brake tester, record the indicated drag resistance of the brake.
- Set the starter switch to the OFF position, then connect the MUT-II.
- Set the testing equipment and system on the MUT-II.
- After making sure that the transmission is in the neutral position, start the engine.

NOTE

- **When the engine is turned on, the ABS switches to the MUT-II mode and the ABS warning lamp flashes.**
- **When the ABS function is deactivated due to the ECU's fail-safe function, the actuator test cannot be performed with the MUT-II.**

https://truckmanualshub.com/



- If an abnormality is found during the inspection, take appropriate measures described in the following operating condition evaluation chart.

Operating condition evaluation chart

Item No.	MUT-II indication	Operation	Judgment		Cause	Remedy
			Normal	Malfunction		
11	FR ABS MV ON	(1) Depress the brake pedal to lock wheels. (2) On the MUT-II, select the wheel to be tested and forcibly drive the actuator. (3) Rotate the selected wheel using the brake tester or by hand, and check the change in braking power.	Braking force eases for 6 seconds from locked condition.	Wheel does not lock when brake pedal is depressed.	Clogging in brake line other than HU	Inspect and clean brake lines.
12	FL ABS MV ON				Clogging in hydraulic line inside HU	Replace HU assembly.
13	RR ABS MV ON			Braking force does not ease.	Erroneous HU brake tube connection	Correct tube connection.
14	RL ABS MV ON				Faulty HU solenoid valve	Replace HU assembly.

HU: Hydraulic unit • After inspection, set the starter switch to OFF before disconnecting the MUT-II.

https://truckmanualshub.com/

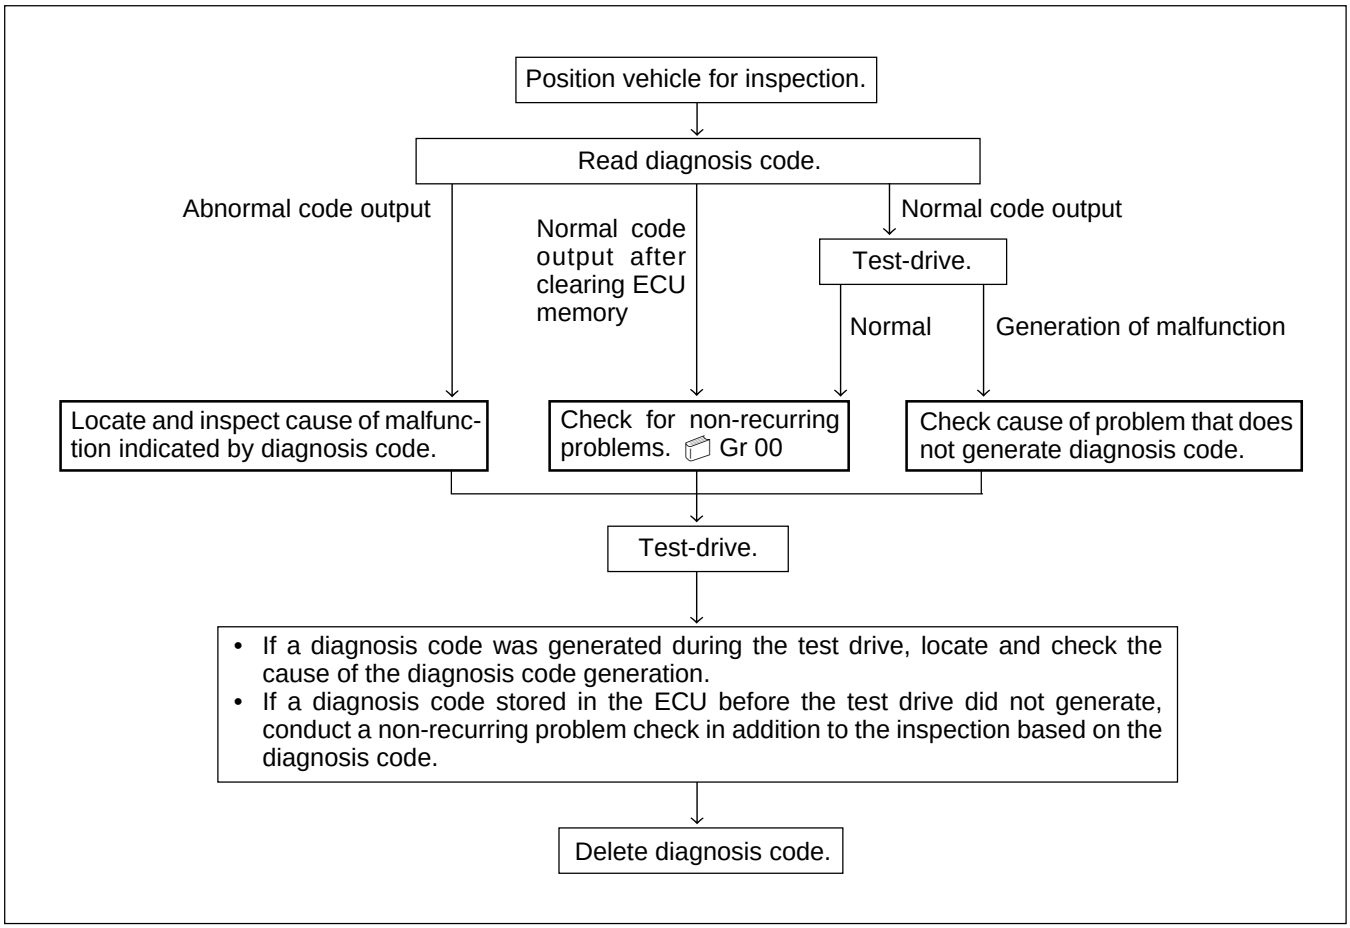
TROUBLESHOOTING

Troubleshooting Procedures

Inspection flow chart

The MUT-II allows efficient inspection of the ABS.
The types of system inspections can be roughly divided according to the malfunction condition and diagnosis code, as shown below.

- Inspection based on individual malfunction diagnosis codes stored in the ECU
- Inspection based on symptoms not indicated by diagnosis codes
- Correcting non-recurring problems

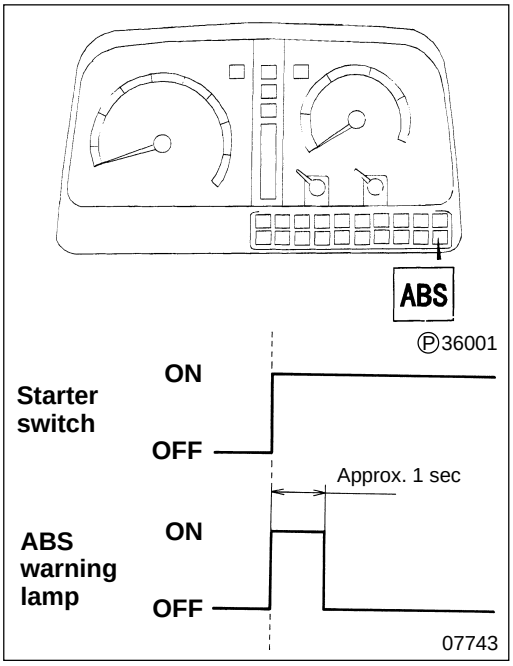


Cautions in malfunction diagnosis

- The ABS uses electronic control to regulate the braking system. The following phenomena may occur during normal ABS operation, but they do not denote a malfunction.

Phenomenon	Description
System checking sound	When the engine starts, a slight clunking sound may be generated in the left side of the frame near the cargo bed. This sound is produced by the system conducting an operation check, and does not denote a malfunction.
ABS operating sound	• Motor noise from the hydraulic unit (humming sound) • Noise generated as the brake pedal feel changes (grinding sound) • Noise from the chassis produced by repeated ON and OFF operations of the ABS (wheels: short squeak, suspension: slight thud)
ABS operation effect (longer stopping distance)	On snow-covered surfaces and gravel roads, a vehicle equipped with ABS may require a longer distance to come to a complete stop. Therefore, when driving on such road surfaces, reduce the speed sufficiently and drive carefully to minimize the use of brakes.

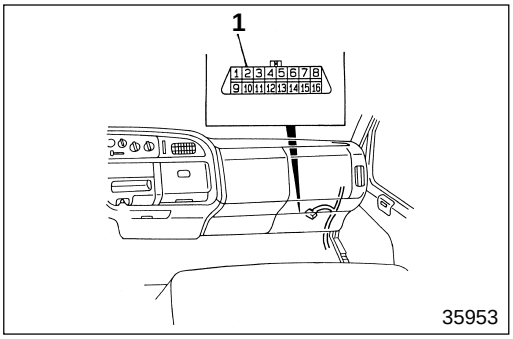
https://truckmanualshub.com/



● **Inspection of ABS warning lamp**

Check the ABS warning lamp to make sure that the following operation turns on the lamp.

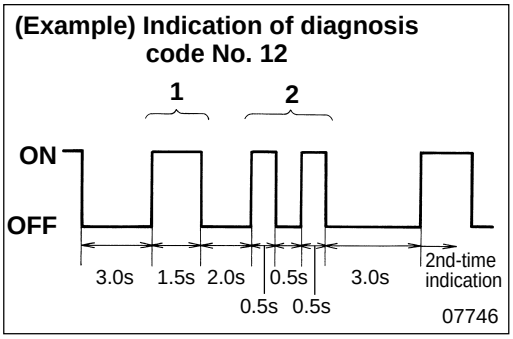
- Set the starter switch to the ON position, and check that the ABS warning lamp lights for about 1 second and turns off.
- If the lamp does not light as described above, check diagnosis codes stored in the ECU.



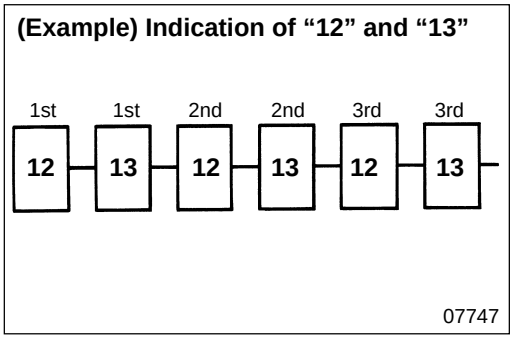
Diagnosis code indication

● **Without MUT-II**

- With the vehicle stationary, ground terminal No. 16 of MUT-II connector **1**, then turn the starter switch to the ON position. The ABS warning lamp will flash to indicate a diagnosis code.
- The ABS warning lamp starts flashing 3.0 seconds after the starter switch is turned ON. The flashing pattern of the warning lamp indicates a diagnosis code.

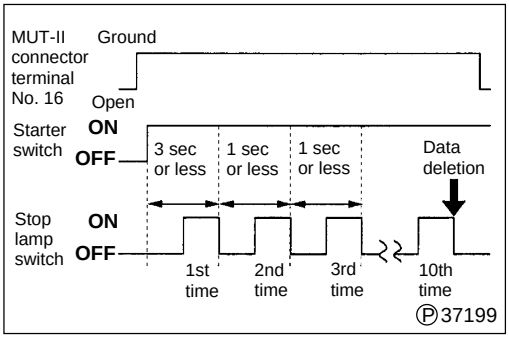


- A diagnosis code is indicated in the following manner.
  - To indicate the tens digit (left digit), the lamp remains ON for 1.5 seconds, then remains OFF for 0.5 seconds. To indicate the ones digit (right digit), the lamp remains ON for 0.5 second, then remains OFF for 0.5 second.
  - For multiple diagnosis codes, each code is indicated one time, in sequence. When there is no other diagnosis code to indicate, the lamp repeats the diagnosis code indication from the beginning for 7 cycles.
  - When there is no diagnosis code stored in the memory (normal condition), the ABS warning lamp repeats On/Off in 0.25-second intervals.



- When two or more diagnosis codes are stored in the ECU.

https://truckmanualshub.com/



● **Deletion of diagnosis codes**

Connect terminal No. 16 of the MUT-II connector to the chassis for grounding. Turn on the starter switch, and depress the brake pedal within 3 seconds and turn On and Off the stop lamp switch ten times in intervals of 1 second or less. This erases diagnosis codes from the memory.

● **Completion of diagnosis code check**

The diagnosis code check completes when diagnosis codes are erased from the ECU of terminal No. 16 of the MUT-II connector is disconnected.

NOTE

The diagnosis code check also ends when the vehicle moves from a stationary condition during the diagnosis code check.

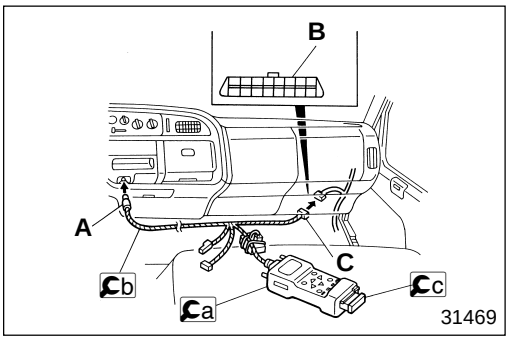
With MUT-II

Special tools

Tool name and shape	Part No.	Application
MUT-II  19492	MB991496	Inspection of Anti-lock brake system
MUT-II harness (for data communication)  19141	MK327601	
ROM pack (MRT-E6)  19493	MK344606	

https://truckmanualshub.com/

Tool name and shape	Part No.	Application
MUT-II harness (for circuit tester)  20536	MB991499	Inspection of Anti-lock brake system
Memory card (for MUT-II)  20538	MB991500	



31469

Connecting the MUT-II

- Turn the starter switch to the LOCK position.
- Connect the Cb MUT Communication Harness to the Ca MUT-II, and insert the Cc ROM Pack.
- Plug connector **A** into the cigarette lighter socket.
- Fit connector **C** onto MUT connector **B** (16 pin) in the relay box.

NOTE

Instructions for operation of the MUT-II are given in the separate MUT-II Reference Manual.

Current diagnosis codes

- Turn the starter switch to the ON position.
- Determine the fault location(s) in accordance with the MUT-II diagnosis code(s).

Past diagnosis codes

- Turn the starter switch to the ON position.
- Determine the fault location(s) in accordance with the past MUT-II diagnosis code(s).

Diagnosis code erasure

- Turn the starter switch to the ON position.
- Using the MUT-II, erase all diagnosis codes stored in the control unit.

https://truckmanualshub.com/

TROUBLESHOOTING

Diagnosis Code Chart

Diagnosis codes can be read by using the MUT-II or ABS warning lamp.

Diagnosis code	Malfunction location

02972

◆ Service procedure

10 Rotor

[Removal]

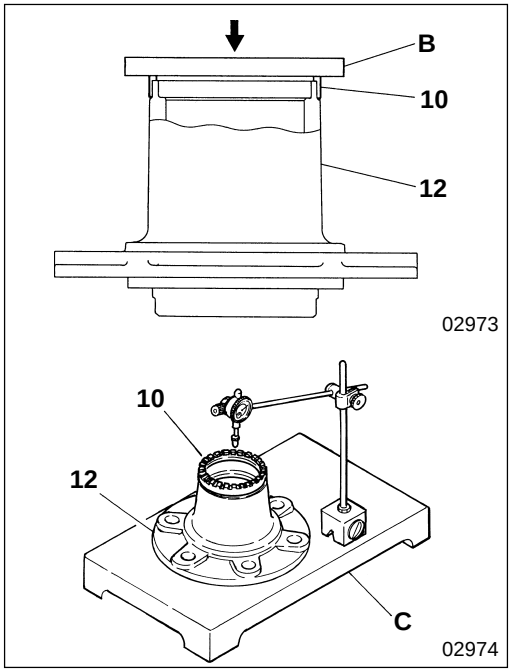
Strike the outer edge of rotor **10** evenly with flat-tip screwdriver **A** to remove the rotor from the wheel hub.

CAUTION⚠

Be careful not to damage wheel hub 12.

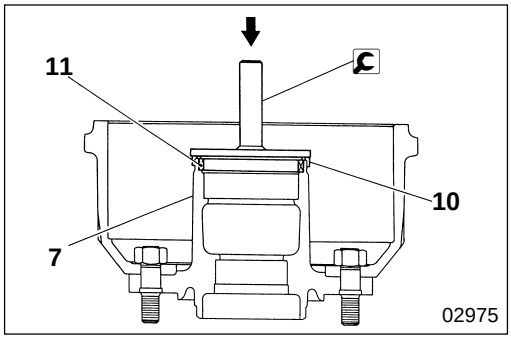
https://truckmanualshub.com/

WHEEL SPEED SENSOR AND ROTOR < FRONT AXLE >



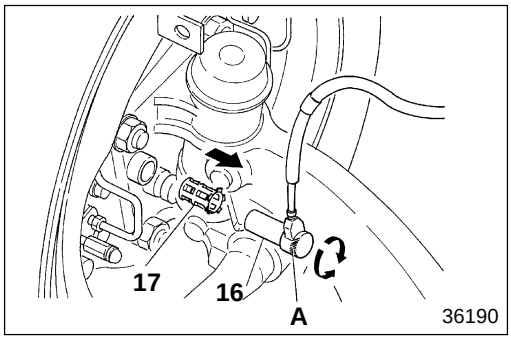
[Installation]
Heat rotor **10** to approximately 150°C {302°F}. Press the rotor evenly with iron plate **B** to press-fit the rotor to wheel hub **12**. Make sure there is no space between the rotor and wheel hub.

[Inspection]
- If the amount of wobbling exceeds the standard value, repeat the assembly procedure from the beginning.
- If the amount of wobbling exceeds the standard value after reassembly, replace defective parts.
  C : Base



11 **Installation of oil seal**

CAUTION
When hub and brake drum assembly 7 is removed for a service operation and if rotor 10 is still mounted on the wheel hub, use 0 ABS oil seal installer to press-fit oil seal 11.

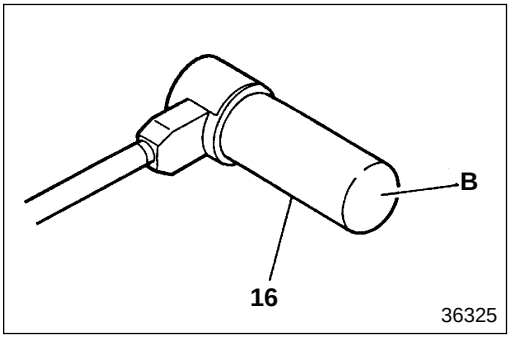


16 **Wheel speed sensor**

[Removal]
Hold shaded section **A** of wheel speed sensor **16** with pliers, and remove the sensor by twisting it slightly in left and right directions.

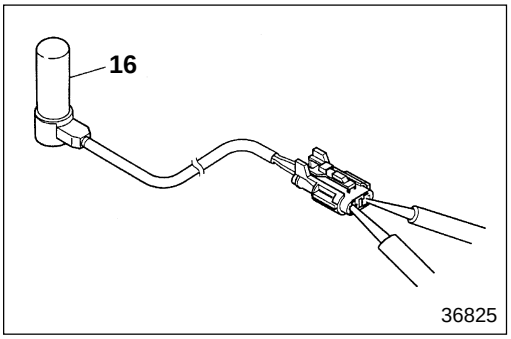
CAUTION
- **When holding wheel speed sensor 16 with pliers, do not grip any section other than shaded area A in the diagram.**
- **When removing wheel speed sensor 16, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **If wheel speed sensor 16 dismounts easily, replace spring spacer 17.**

https://truckmanualshub.com/

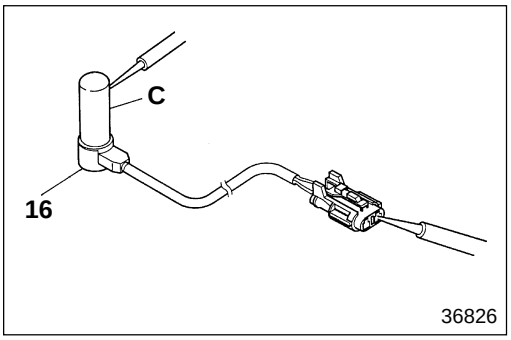


[Inspection]

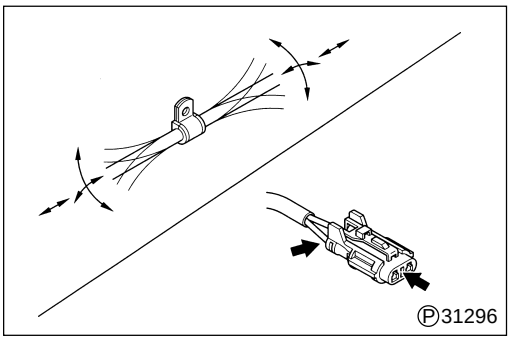
- Since pole piece section **B** is magnetized by the magnet inside wheel speed sensor **16**, it attracts metals. Do not allow the pole piece to collect metallic objects.



- Measure the resistance between the terminals of wheel speed sensor **16**.
  If the measured value deviates from the standard value, replace the wheel speed sensor.



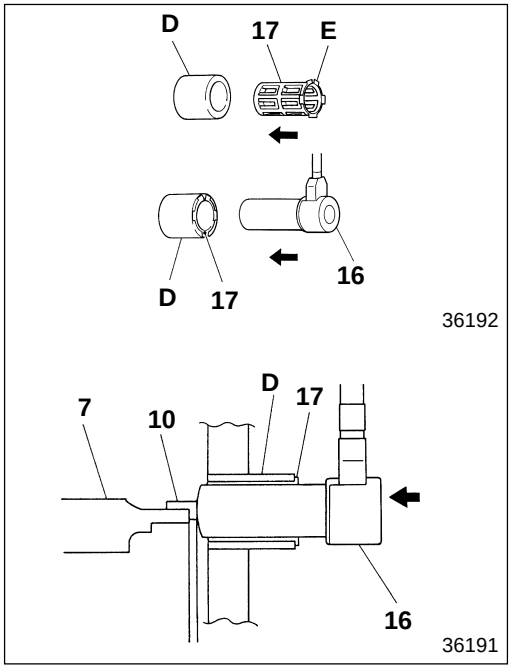
- Measure the insulation resistance between body **C** of wheel speed sensor **16** and each terminal.
  If the measured values deviate from the standard value, replace the wheel speed sensor.



- To check for broken wires, remove the harness clamp section from the vehicle. Bend and extend the harness to check if there is any broken wire in the harness. Also, inspect the connector for proper contact.
  If a defect is found, replace wheel speed sensor **16**.

https://truckmanualshub.com/

WHEEL SPEED SENSOR AND ROTOR < FRONT AXLE >

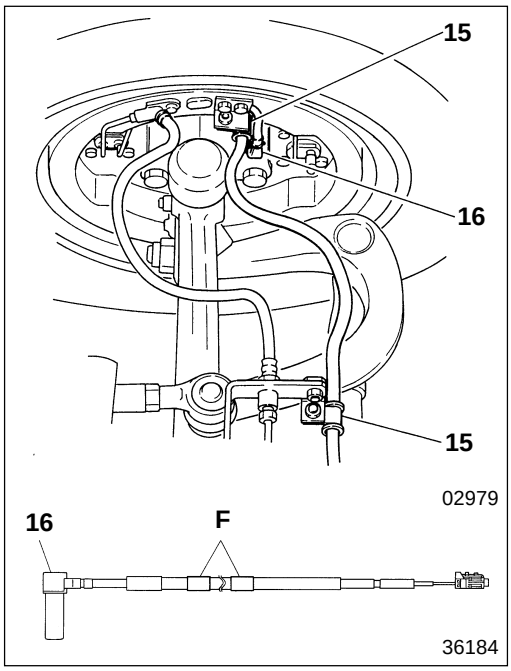


[Installation]

- Insert spring spacer **17** into holder section **D** of the knuckle, and press until stopper section **E** contacts the holder.
- Insert wheel speed sensor **16**, and press until it contacts rotor **10**.
- Rotate hub and brake drum assembly **7** slowly for two or three turns (2 seconds per turn) to make sure it rotates smoothly.

CAUTION

When installing wheel speed sensor 16, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.



- Secure white tape section **F** of the harness of wheel speed sensor **16** in place using clip **15** on the wheel brake side and clip **15** on the frame side.

CAUTION

Be sure to clamp the harness of wheel speed sensor 16 at two white tape sections F. Make sure the harness does not interfere with other parts and there is no twist or slack in the harness.

12 Hub bolt
13 Rotor
14 Oil seal
15 Wheel hub
16 Brake drum
17 Bolt
18 Clip
19 Sensor holder
20 Wheel speed sensor
21 Spring spacer
22 Inner bearing
23 Oil seal retainer

*: Rear brake assembly

● **Assembly sequence**

Follow the disassembly sequence in reverse.

- Do not remove oil seal retainer **4** unless it is damaged (scratches, bending, tilting).

CAUTION

- **When removing or installing hub and brake drum assembly 10, handle rotor 13 with care to prevent damage. Also, do not damage oil seal 14 during assembly.**
- **Keep oil and grease off lining surface of rear brake assembly * and the inner surface of brake drum 16.**

https://truckmanualshub.com/

Service standards

Unit : mm {in.}

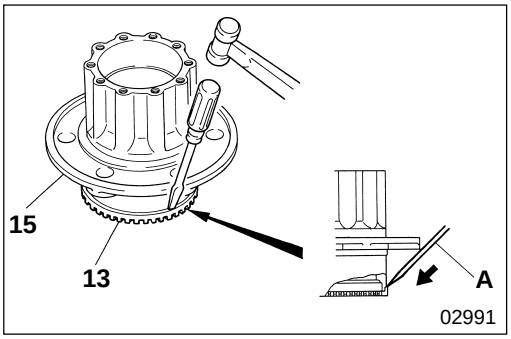
Location	Maintenance item		Standard value	Limit	Remedy
13	Wobbling of rotor		0.1 {0.0039}	—	Replace
20	Wheel speed sensor	Resistance between terminals	950 to 1450Ω	—	Replace
		Insulation resistance	1MΩ or higher	—	Replace

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
14	Anti-lock brake system oil seal installer 	MH062664	Press-fitting of oil seal

◆ Service procedure



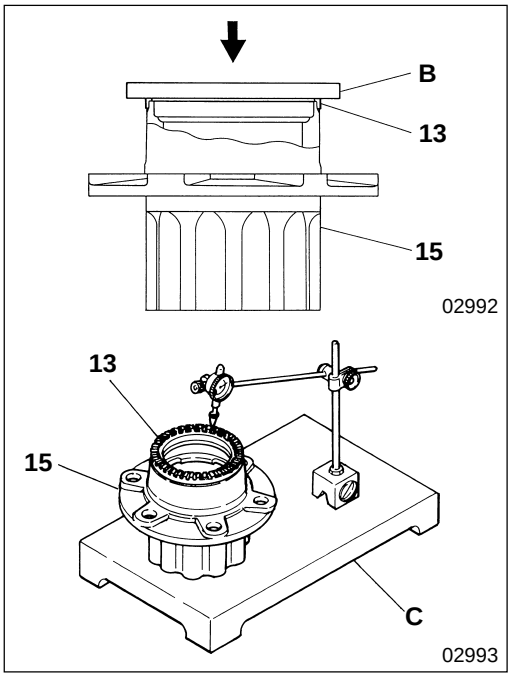
13 **Rotor**

[Removal]

Strike the outer edge of rotor **13** evenly with flat-tip screwdriver **A** to remove the rotor from the wheel hub.

CAUTION

Be careful not to damage wheel hub 15.



[Installation]

Heat rotor **13** to approximately 150°C {302°F}. Press the rotor evenly with iron plate **B** to press-fit the rotor to wheel hub **15**. Make sure there is no space between the rotor and wheel hub.

[Inspection]

- If the amount of wobbling exceeds the standard value, repeat the assembly procedure from the beginning.
- If the amount of wobbling exceeds the standard value after reassembly, replace defective parts.

C : Base

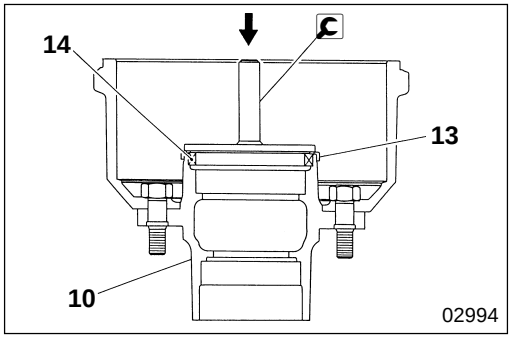
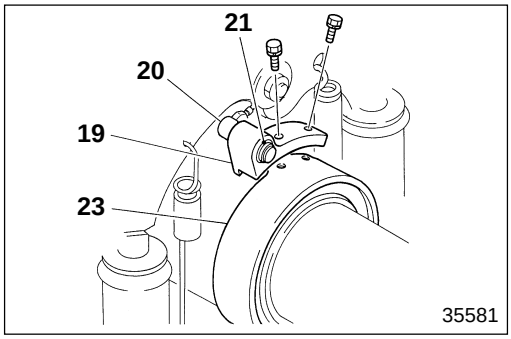
WHEEL SPEED SENSOR AND ROTOR < REAR AXLE >



14 Installation of oil seal

NOTE

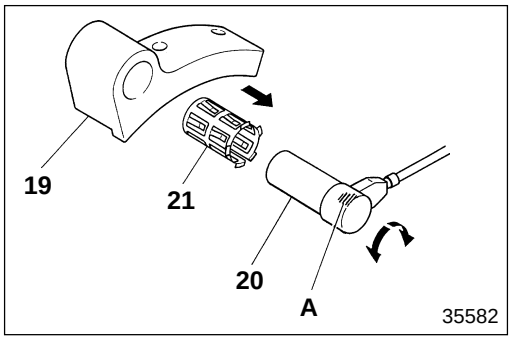
When hub and brake drum assembly 10 is removed for a service operation and if rotor 13 is still mounted on the wheel hub, use Anti-lock brake system oil seal installer to press-fit oil seal 14.



20 Wheel speed sensor

[Removal]

- With wheel speed sensor **20** and spring space **21** installed in sensor holder **19**, remove the sensor holder from oil seal retainer **23**.

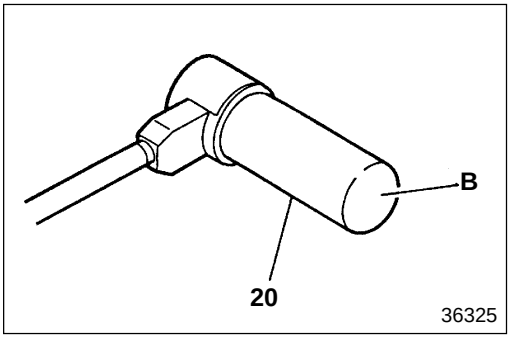


- Hold shaded section **A** of wheel speed sensor **20** with pliers, and remove the sensor by twisting it slightly in left and right directions.

CAUTION

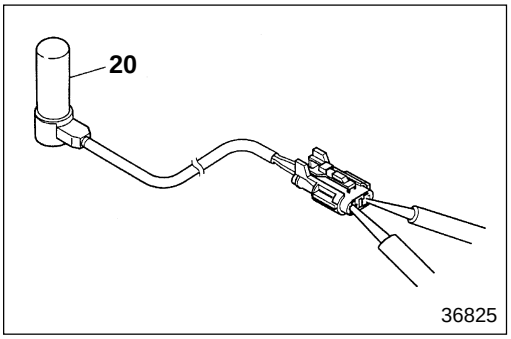
- **When holding wheel speed sensor 20 with pliers, do not grip any section other than shaded area A in the diagram.**
- **When removing wheel speed sensor 20, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **If wheel speed sensor 20 dismounts easily, replace spring spacer 21.**

https://truckmanualshub.com/

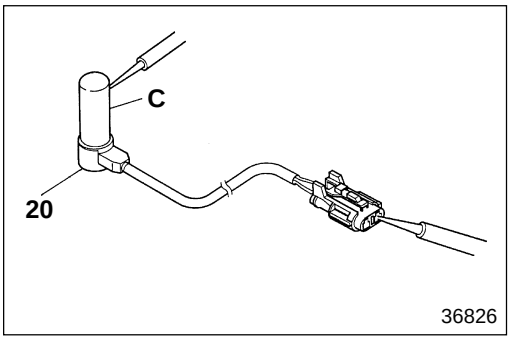


[Inspection]

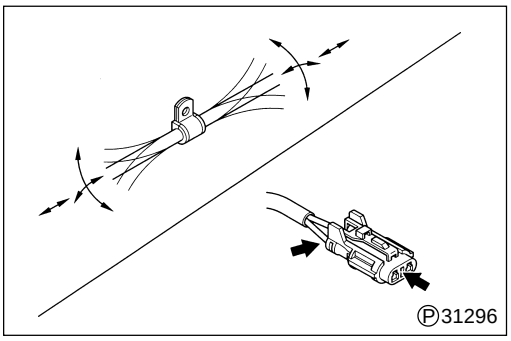
- Since pole piece section **B** is magnetized by the magnet inside wheel speed sensor **20**, it attracts metals. Do not allow the pole piece to collect metallic objects.



- Measure the resistance between the terminals of wheel speed sensor **20**.
  If the measured value deviates from the standard value, replace the wheel speed sensor.



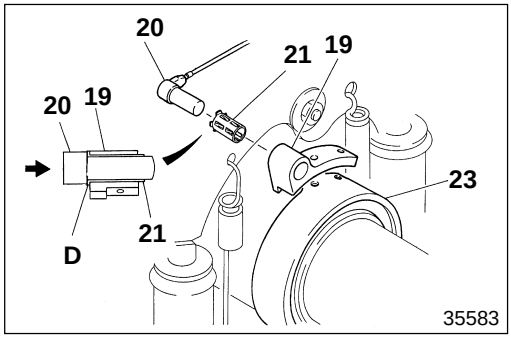
- Measure the insulation resistance between body **C** of wheel speed sensor **20** and each terminal.
  If the measured values deviate from the standard value, replace the wheel speed sensor.



- To check for broken wires, remove the harness clamp section from the vehicle. Bend and extend the harness to check if there is any broken wire in the harness. Also, inspect the connector for proper contact.
  If a defect is found, replace wheel speed sensor **20**.

https://truckmanualshub.com/

WHEEL SPEED SENSOR AND ROTOR < REAR AXLE >



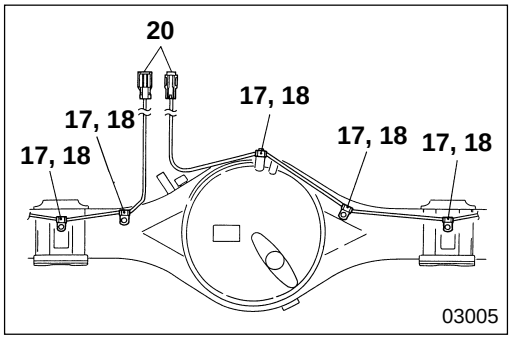
[Installation]

- Insert wheel speed sensor **20** from the back plate, and press until spring spacer **21** and stopper section **D** of the wheel speed sensor contacts sensor holder **19**.
- With wheel speed sensor **20** and spring spacer **21** installed in sensor holder **19**, mount the sensor holder on oil seal retainer **23**.

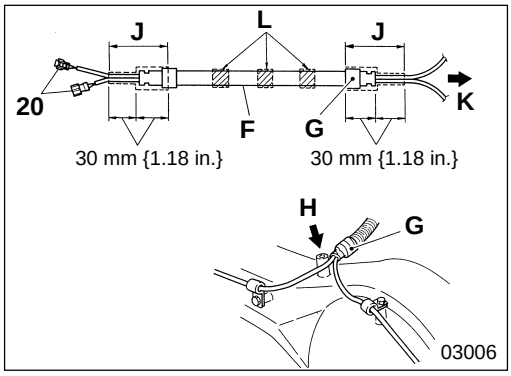
CAUTION

- **When installing wheel speed sensor 20, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **Note that wheel speed sensor 20 is different for left and right wheels.**

Location	Harness connector color	Harness connector shape
Left wheel	Gray	Male
Right wheel	Black	Female

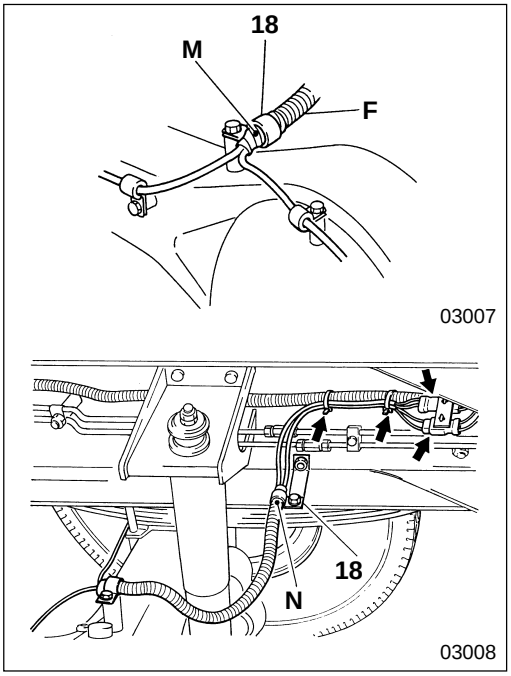


- Rear axle housing section
  Starting from the wheel brake side, secure the harness of wheel speed sensor **20** in place with clip **18** and bolt **17**. Make sure the harness does not interfere with other parts and there is no twist or slack in the harness.

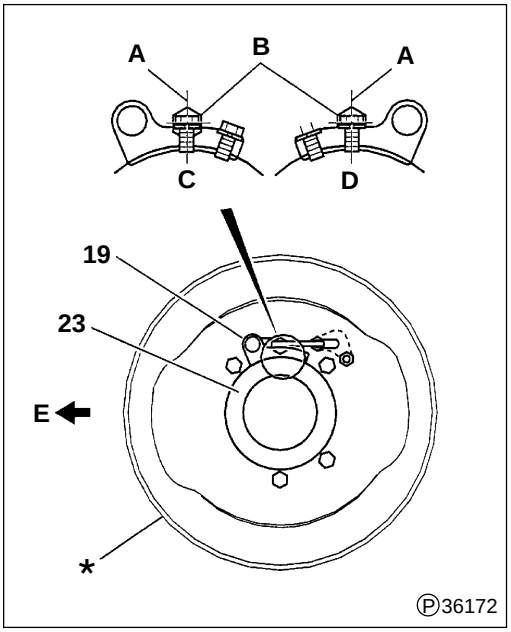


- Binding of harness
  - Gather the harnesses of left and right wheel speed sensors **20**, and bind with corrugated tube **F**.
  - Adjust the position of the corrugated tube **F** so that white tape section **G** is located at clip position **H** on the rear axle housing. Then, turn the corrugated tube so that the slit faces down. Wrap black tape (electric harness tape) on both ends **J** of the corrugated tube. The tape should be placed over the tube end and harness.
    K: Rear axle housing side
  - Wrap tape on the harnesses of wheel speed sensors **20** at sections **L** (three locations at equal intervals).

https://truckmanualshub.com/



- Clamping of harness
  - Secure section **M** of corrugated tube **F** to the rear axle housing using clip **18**, and attach section **N** of the corrugated tube to the frame using clip **18**.
  - Connect the wheel speed sensor connector to the harness connector on the chassis side, and secure the connectors in place using the bracket.



23 **Installation of oil seal retainer**

When installing oil seal retainer **23**, align mounting bolt center **A** of sensor holder **19** with the center line of mounting bolt **B** of rear brake assembly *.

C : For left wheel
D : For right wheel
E : Front of vehicle

NOTE

The brake assembly diagram shows a left wheel.

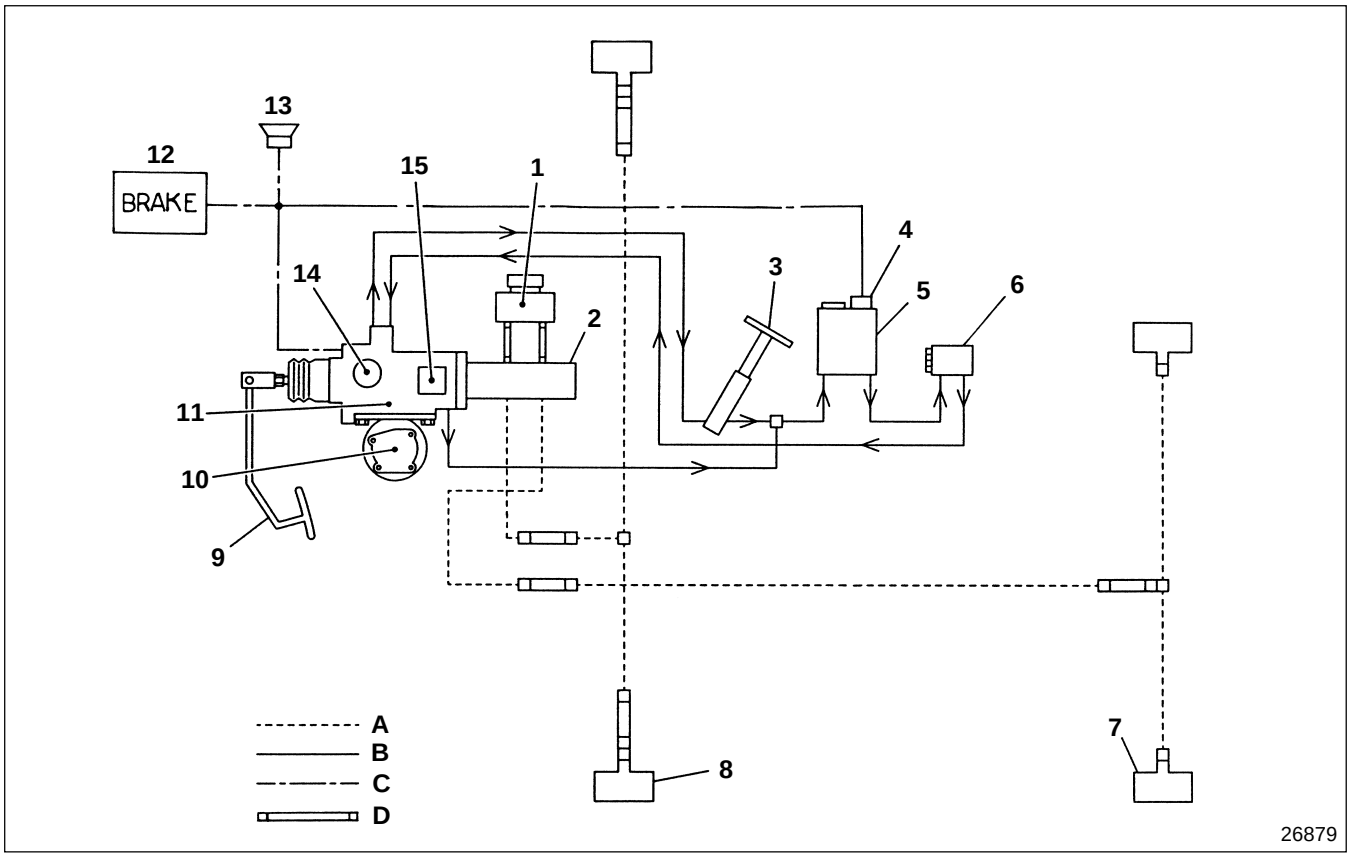
MEMO

https://truckmanualshub.com/

Hydraulic booster brake system



1	Brake fluid tank	**8**	Front wheel cylinder	**14**	Flow switch
2	Brake master cylinder	**9**	Brake pedal	**15**	Motor relay
3	Power steering booster	**10**	Emergency pump motor		
4	Power steering fluid level sensor	**11**	Brake booster (Hydraulic booster)	**A** :	Brake fluid line
5	Power steering oil tank			**B** :	Power steering fluid line
6	Power steering oil pump	**12**	Brake warning lamp	**C** :	Electric line
7	Rear wheel cylinder	**13**	Warning buzzer	**D** :	Hose

- The brake system is a hydraulic booster brake type, all-wheel braking type consisting of separate front and rear systems.
- The servo system is fitted with brake booster (hydraulic booster) **11**.
- The hydraulic booster brake type uses the fluid pressure from power steering oil pump **6** to boost brake pedal **9** operating force.
- If fluid pressure stops being generated because of engine stoppage, power steering oil pump **6** failure, or fluid leakage from the power steering piping, it is detected by flow switch **14**. To ensure proper fluid pressure in an emergency, the emergency pump motor **10** rotates by the action of operating currents from motor relay **15**.

https://truckmanualshub.com/

- Emergency pump **10** operates only when brake pedal **9** is depressed.
  Operation conditions details are as follows.

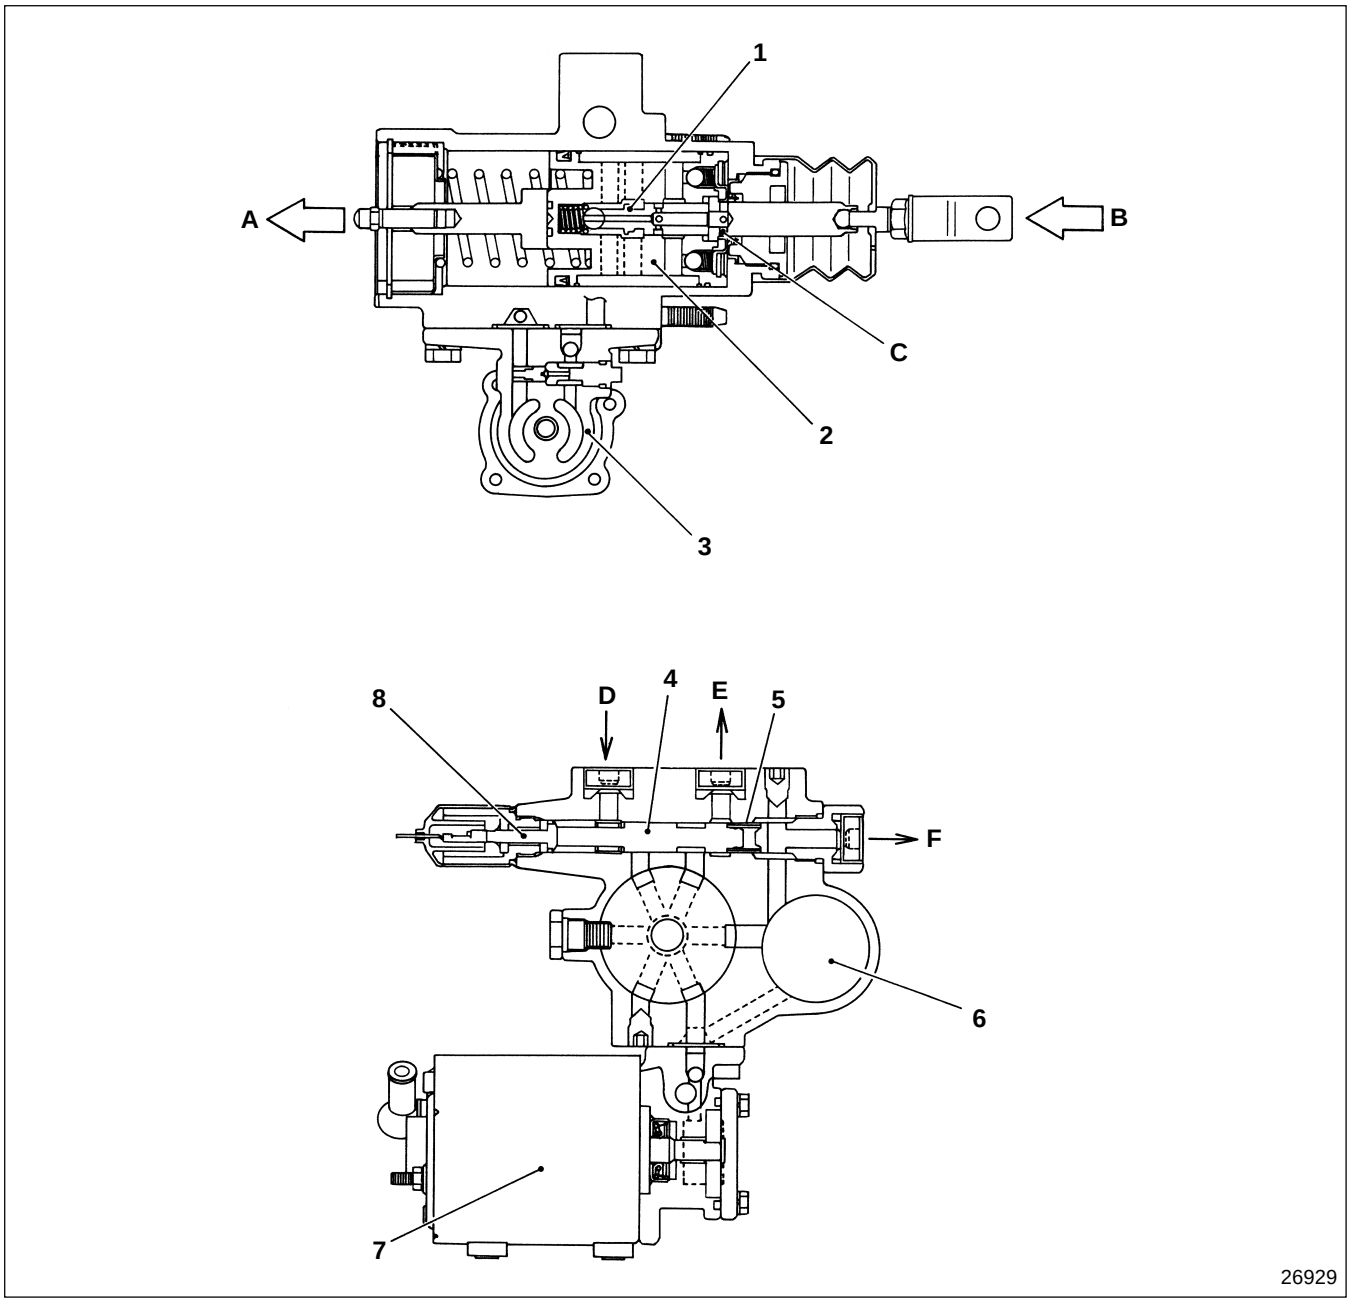
Starter switch	Engine	Parking brake switch	Alarms		Power steering fluid pressure	*1 Emergency pump motor	Vehicle condition
			Brake warning lamp ○ ··· Lit × ··· Not lit	Warning buzzer ○ ··· Sounding × ··· Silent		○ ··· Running × ··· Stopped	
ON	Running	ON (Pulled)	×	×	Present	×	When normal
			○	○	Absent	○	*2 Power steering piping fluid leakage
		OFF (Returned)	×	×	Present	×	When normal
			○	○	Absent	○	*2 Power steering piping fluid leakage
	Stopped	ON (Pulled)	○	○		○	When engine is started
						○	When engine stalls during take-off on a slope
		OFF (Returned)	○	○		○	When engine stalls
OFF		ON (Pulled)	×	×		○	When vehicle starts moving right after being parked (when parking brake force is insufficient)
		OFF (Returned)	×	×		○	When engine is cut off right before the vehicle comes to a stop
ON	—	—	○	○	—	—	When fluid level in power steering oil tank is below “MIN” or above “MAX”
OFF	—	—	×	×	—	—	

*1 : The emergency pump motor operates when the brake pedal is depressed.

*2 : Fluid pressure is obtained by the action of the brake booster (hydraulic booster) fail-safe system which cuts off the flow of fluid to the power steering piping. P35-6

https://truckmanualshub.com/

Brake Booster (Hydraulic Booster)



1 Spool valve
2 Hydraulic piston
3 Emergency pump
4 Piston
5 Spring
6 Reservoir
(Brake booster built-in)
7 Emergency pump motor
8 Flow switch

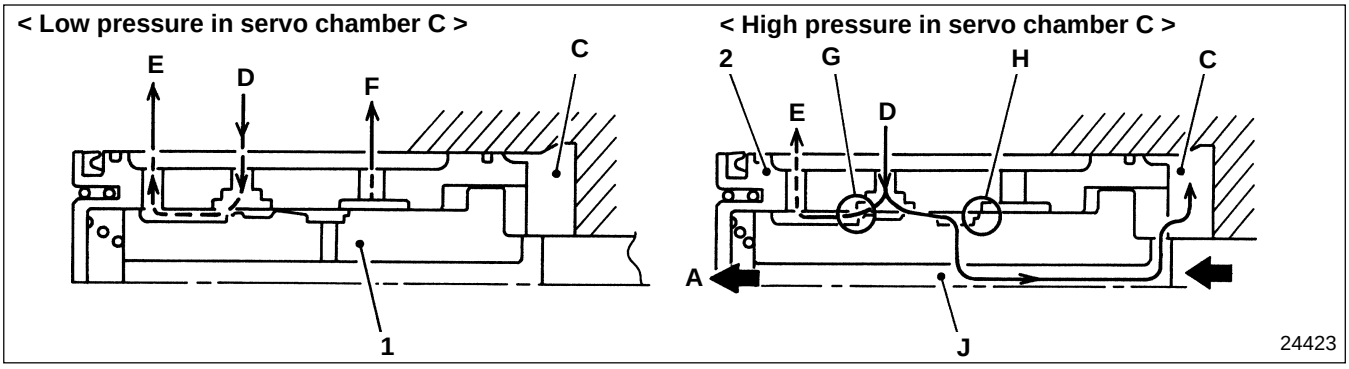
A : Brake master cylinder
B : Brake pedal
C : Servo chamber
D : Power steering oil pump
E : Power steering booster
F : Drain

- Spool valve **1** is an adjusting valve linked to brake pedal **B** that generates fluid pressure in accordance with the pedal operating force.
- Hydraulic piston **2** is linked to brake master cylinder **A**, by storing the fluid supplied via spool valve **1** in servo chamber **C** its force is boosted.

https://truckmanualshub.com/

- In case there is fluid leaking from the power steering piping and fluid pressure is lost, piston **4** is depressed by the action of spring **5** and moves to the left, shutting off the flow of fluid to power steering oil pump **D** and power steering booster **E**. As a result fluid hydraulic circuit is created only inside the brake booster.
- When piston **4** moves to the left, flow switch **8** is turned ON and emergency pump motor **7** starts operating. By the action of emergency pump **3**, fluid pressure is generated within the fluid hydraulic circuit inside the brake booster.

● Spool valve



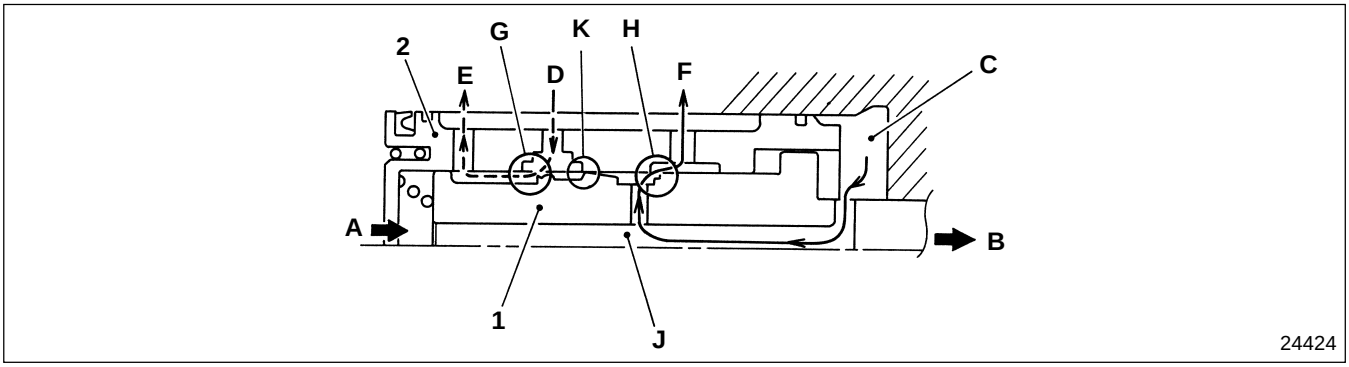
At operation

Through the action of brake pedal **B** spool valve **1** moves to the left, narrowing down land **G*** and closing off land **H** → Pressure of fluid coming from power steering oil pump **D** rises → High pressure fluid flows into servo chamber **C** via fluid groove **J**

↓

Hydraulic piston **2** is pushed to the left → Piston of brake master cylinder **A** is pushed and the brake is operated

***** : When the brake is operating, land **G** is not completely shut, therefore the power steering booster is not affected.



When released

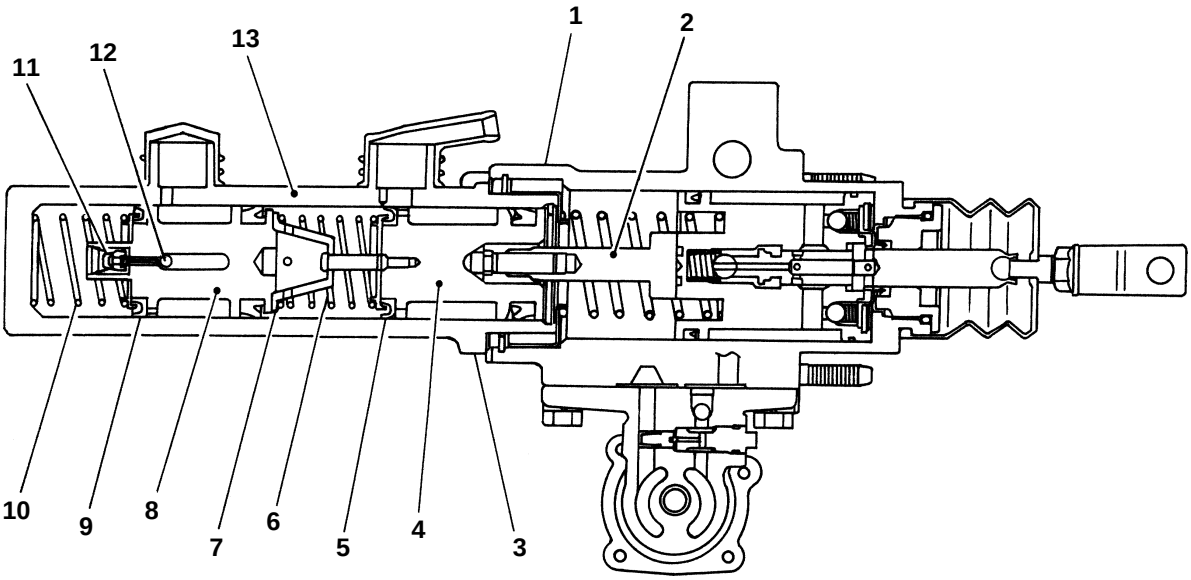
Through the action of brake pedal **B** spool valve **1** moves to the right, opening lands **G** and **H** and closing fluid groove **K** → Pressure of fluid from power steering oil pump **D** falls → Fluid from servo chamber **C** flows into reservoir **4** and drain **F**

↓

Hydraulic piston **2** moves to its original position → Brake master cylinder **A** piston is released

https://truckmanualshub.com/

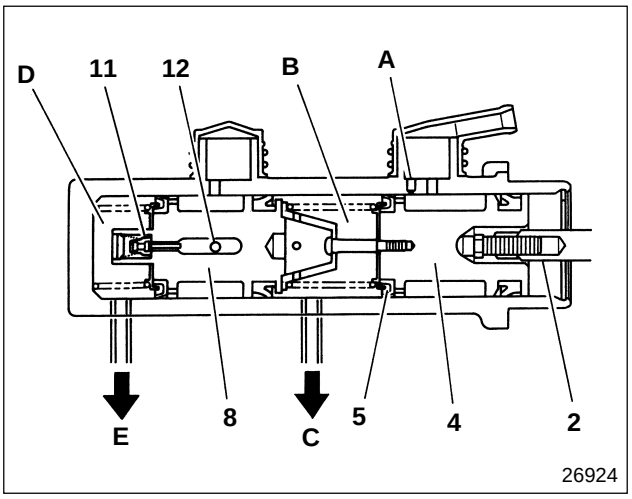
Brake Master Cylinder



1 Brake booster (Hydraulic booster)
2 Hydraulic piston
3 Brake master cylinder
4 Primary piston
5 Packing cup
6 Primary piston return spring
7 Retainer
8 Secondary piston
9 Packing cup
10 Secondary piston return spring
11 Supply valve
12 Supply valve stopper
13 Cylinder

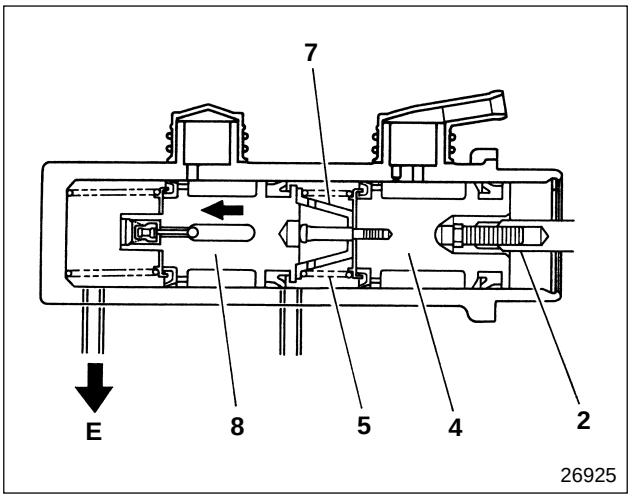
- Brake master cylinder **3** consists of separate and independent front and rear hydraulic systems. Therefore, if by chance there should be leakage in either the front or the rear hydraulic systems, the safety mechanism ensures that the other unaffected system can operate the brakes.

https://truckmanualshub.com/



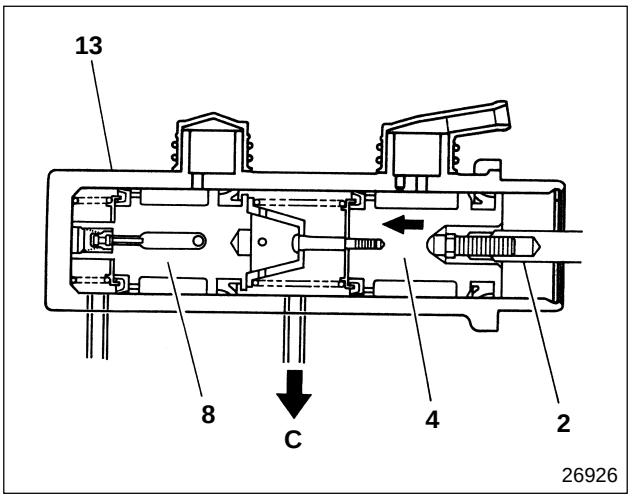
● When brake pedal is depressed

- Depressing the brake pedal makes brake booster (hydraulic booster) hydraulic piston **2** push in primary piston **4** and secondary piston **8**, packing cup **5** passes return port **A**, generates hydraulic pressure in chamber **B**, and feeds fluid to front brake system **C**.
- Supply valve **11** separates from supply valve stopper **12**, generates hydraulic pressure in chamber **D**, and feeds fluid to rear brake system **E**.



● When there is fluid leakage in the front brake system

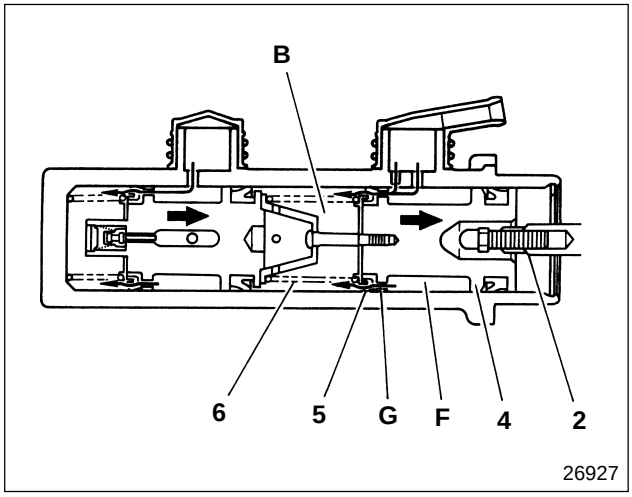
- Depressing the brake pedal makes hydraulic piston **2** push in primary piston **4**. However, if the brake fluid in the front brake system leaks, hydraulic pressure is not generated in the front brake system.
- Depressing the brake pedal further makes primary piston **4** compress primary piston return spring **6** causing retainer **7** to push in secondary piston **8**, thus generating hydraulic pressure only in the rear brake system **E**.



● When there is fluid leakage in the rear brake system

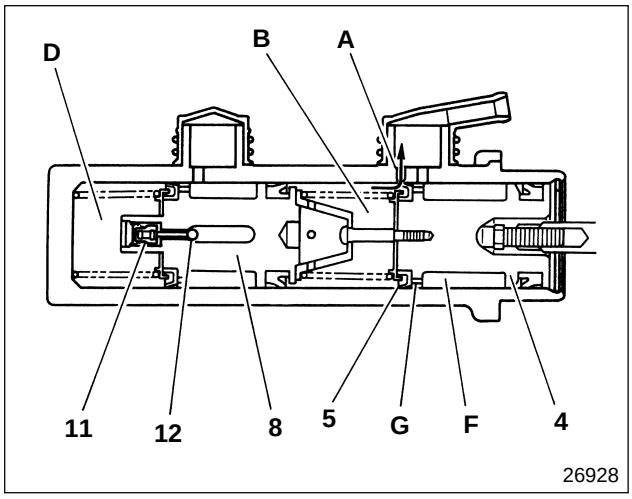
- Depressing the brake pedal makes hydraulic piston **2** push in primary piston **4** and secondary piston **8**. However, if the brake fluid in the rear brake system leaks, hydraulic pressure is not generated in the rear brake system.
- Depressing the brake pedal further makes the end of secondary piston **8** hit against cylinder **13**, pushing primary piston **4** and generating hydraulic pressure only in the front brake system **C**.

https://truckmanualshub.com/



● **When the brake pedal is released**

- When hydraulic piston **2** returns to its original position, as a result of the repercussive force of primary piston return spring **6**, primary piston **4** begins to return immediately. However, because of a lack of a pressure difference between chambers **B** and **F** brake fluid delivered from the brake master cylinder cannot return quickly.
- When primary piston **4** begins to return, hydraulic pressure in chamber **B** becomes lower than that in chamber **F**, the pressure difference causes packing cup **5** to deform opening up passage **G**. This causes brake fluid from chamber **F** to flow into chamber **B**.

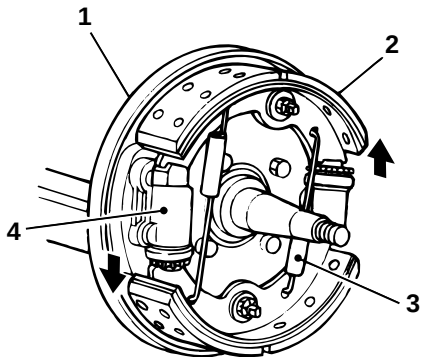


- When primary piston **4** moves further and returns to its original position, the pressure in chambers **B** and **F** become the same, and packing cup **5** closes passage **G**. The hydraulic fluid in the brake pipe returns from chamber **B** to the reservoir tank via return port **A**.
- The same action also takes place in the secondary side. However, when secondary piston **8** is pushed back, supply valve **11** hits against supply valve stopper **12** and the supply valve opens.
- Therefore the hydraulic fluid in the brake pipe returns from chamber **D** to the reservoir tank via supply valve **11**.

https://truckmanualshub.com/

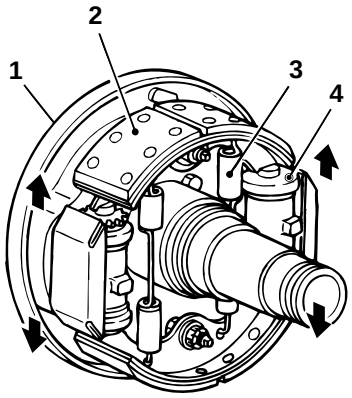
Wheel Brake

< Front >



12964

< Rear >



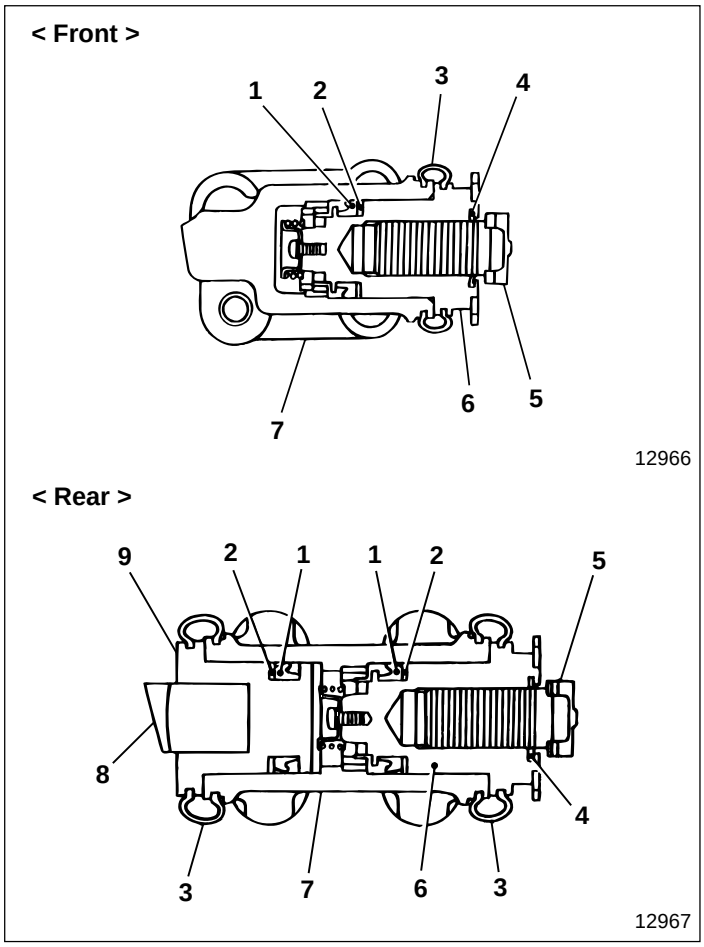
12965

1 Backing plate
2 Brake shoe assembly
3 Return spring
4 Wheel cylinder assembly

- The front wheel brake is an internal expanding 2-leading brake type.
- The rear wheel brake is an internal expanding dual 2-leading brake type.
- Front and rear wheel cylinder assemblies **4** have shoe clearance automatic adjusting mechanisms to adjust shoe clearance within a specific range.

https://truckmanualshub.com/

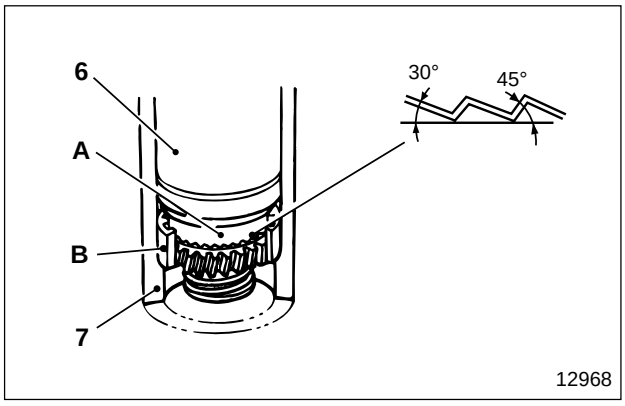
● Wheel cylinder assembly



1 Piston cup
2 Backup ring
3 Boot
4 Seal
5 Screw
6 Piston
7 Cylinder body
8 Anchor piece < Rear >
9 Piston < Rear >

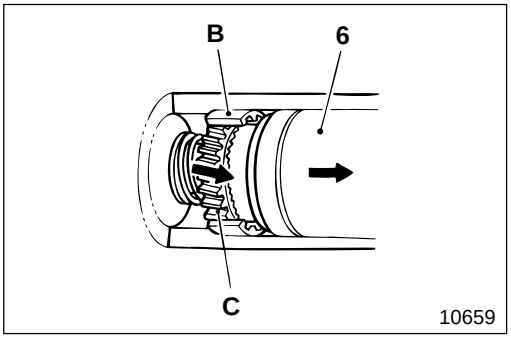
Even if the brake lining has worn to the extent that the brake shoe clearance is higher than the specified value, the brake shoe clearance automatic adjusting mechanism automatically adjusts the brake shoe clearance to maintain the appropriate brake shoe clearance when the vehicle is braked when moving forward.

● Operation of automatic shoe clearance adjusting mechanism (one-way clutch)



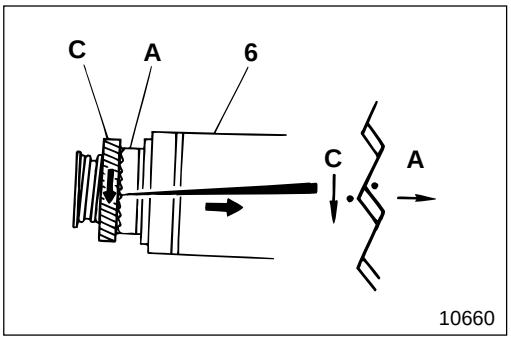
30° : When piston **6** appears, the double helical gear slides out easily.
45° : When turning piston **6**, the double helical gear receives and maintains the rotational force.
A : Clutch
B : Guide

https://truckmanualshub.com/

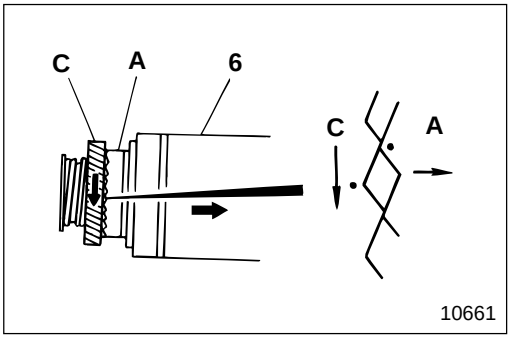


● **When braking starts**

- When hydraulic braking pressure acts on the wheel cylinder, it pushes piston **6** forward.
- Idler **C** of extended piston **6** is engaged with the diagonal gears cut in guide **B** of the cylinder body, so the idler advances while turning, in accordance with the travel of the piston.



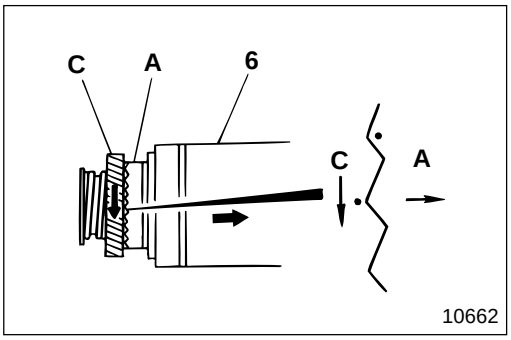
- The rotation of idler **C** slides out the double helical gear of clutch **A**.



● **When depressing brake pedal**

When the brake shoe clearance conforms to the specified value

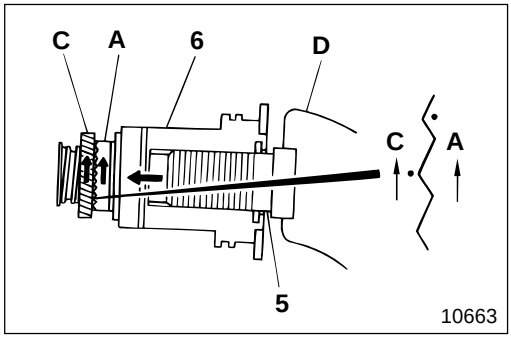
- The amount of travel of idler **C** is proportional to the amount of travel of piston **6**. The amount of travel is not enough to make the double helical gear of clutch **A** climb over the opposite double helical gear when the brake shoe clearance is within the specified value.



When the brake shoe clearance is higher than the specified value

- When the brake shoe clearance is higher than the specified value, the amount of travel of idler **C** increases enough to make the double helical gear of clutch **A** climb over the opposite double helical gear.

https://truckmanualshub.com/

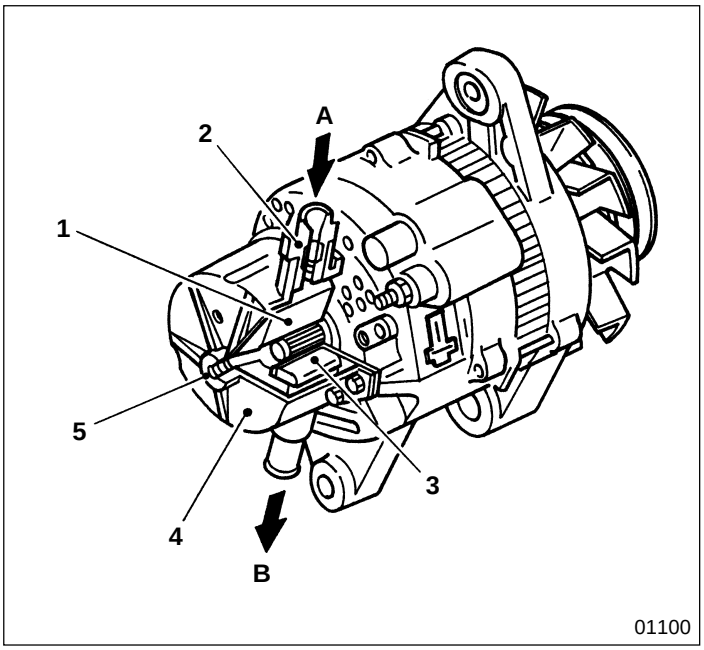


● **When releasing brake pedal**

- As the brake fluid pressure decreases and piston **6** returns, idler **C** also returns, turning in the opposite direction along guide **B** of the cylinder body.
- When the brake shoe clearance is within the specified value, piston **6** returns to its original position without turning, because the double helical gear of clutch **A** has not climbed over the opposite double helical gear.
- When the brake shoe clearance is higher than the specified value, piston **6** returns while turning by one gear tooth, since the double helical gear of clutch **A** has climbed over the opposite gear. This lowers the brake shoe clearance to the specified value, because screw **5** of the piston is fixed by brake shoe **D** and does not turn.

https://truckmanualshub.com/

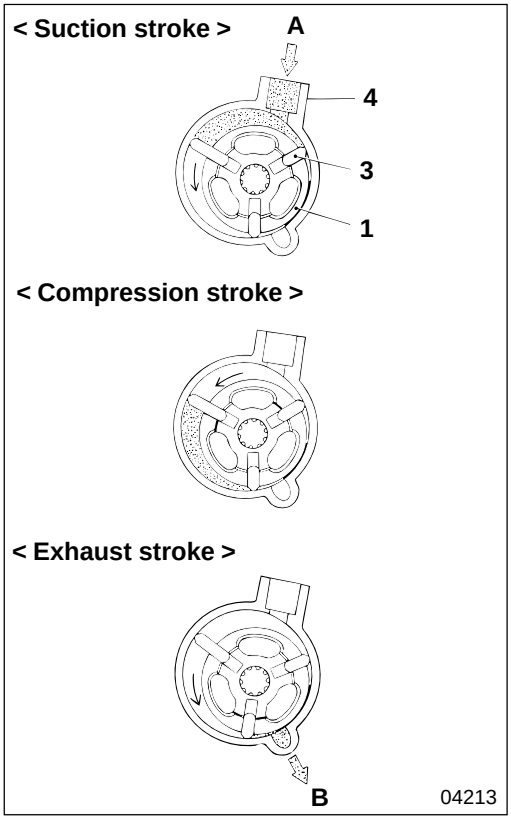
Vacuum Pump



1 Rotor
2 Check valve
3 Vane
4 Housing
5 Oil filler hole

A : Inlet
B : Outlet

- The vacuum pump is installed on the rear part of alternator and is rotated by the V-belt.
- Check valve **2** is fitted to prevent the atmospheric pressure and the lubricating oil from flowing in reverse from the vacuum pump when the engine is stopped.

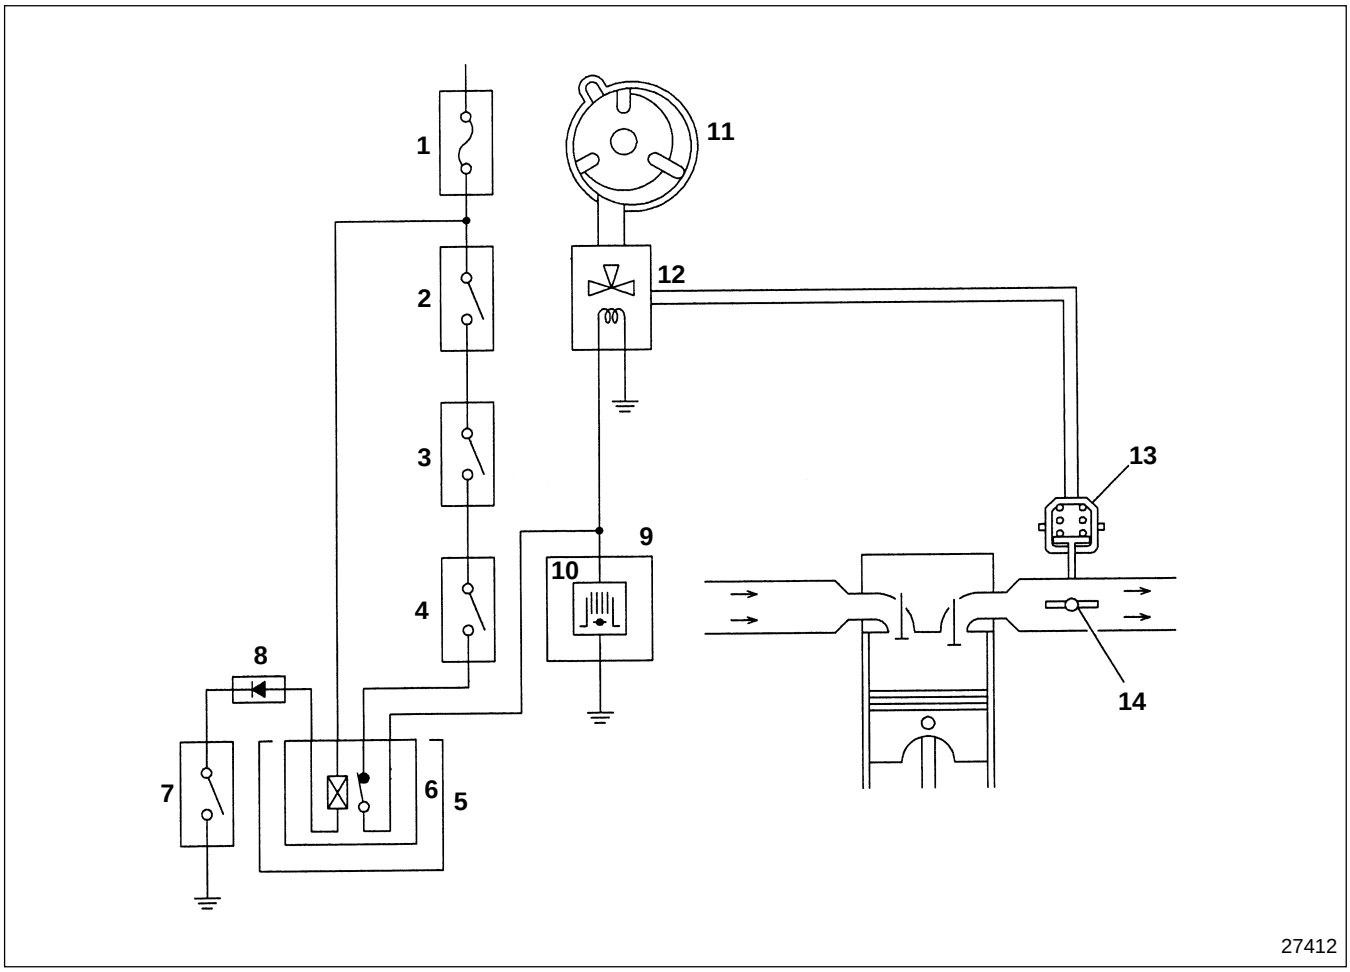


● **Operation**

- Inside cylindrical housing **4**, rotor **1** equipped with three vanes (movable blades) **3** rotates, pressing the vanes against the inside surface of the housing by centrifugal force.
- Since rotor **1** is eccentric with respect to housing **4**, as the rotor rotates, the atmospheric pressure of the exhaust brake unit is drawn in from inlet **A** and discharges from outlet **B** by the gradual compression of the air. This repetition of the suction, compression and exhaust strokes generates a vacuum, realizing a near-vacuum in the exhaust brake unit.
- The engine oil that lubricates and cools the inside of housing **4** is returned, along with air pressure, through outlet **B** to the oil pan.

https://truckmanualshub.com/

Exhaust Brake System

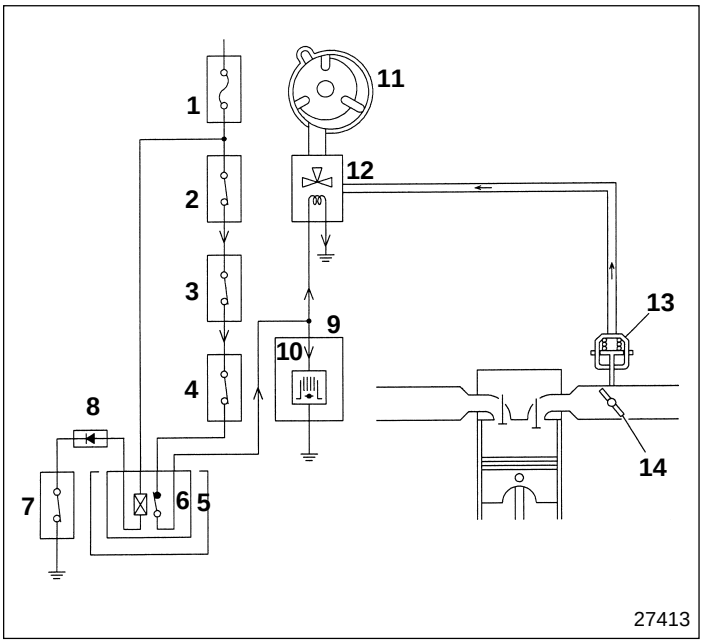


1 Fuse box
2 Clutch switch
3 Accelerator switch
4 Exhaust brake switch
5 Relay box
6 Exhaust brake cut relay
7 Transmission neutral switch
8 Diode
9 Meter cluster
10 Exhaust brake indicator lamp
11 Vacuum pump
12 3-way magnetic valve
13 Exhaust brake unit
14 Butterfly valve

- Excitation of the coil of 3-way magnetic valve **12** closes the atmospheric valve and opens the vacuum valve. This makes the vacuum pump **11** act on exhaust brake unit **13** which closes butterfly valve **14**, activating the exhaust brake.
- If the exhaust brake is activated while the vehicle is stationary, the coolant temperature can rise excessively, overheating the engine. To avoid this, when the transmission is in neutral, transmission neutral switch **7** turns ON, cutting the exhaust brake system.

https://truckmanualshub.com/

● When exhaust brake system is activated

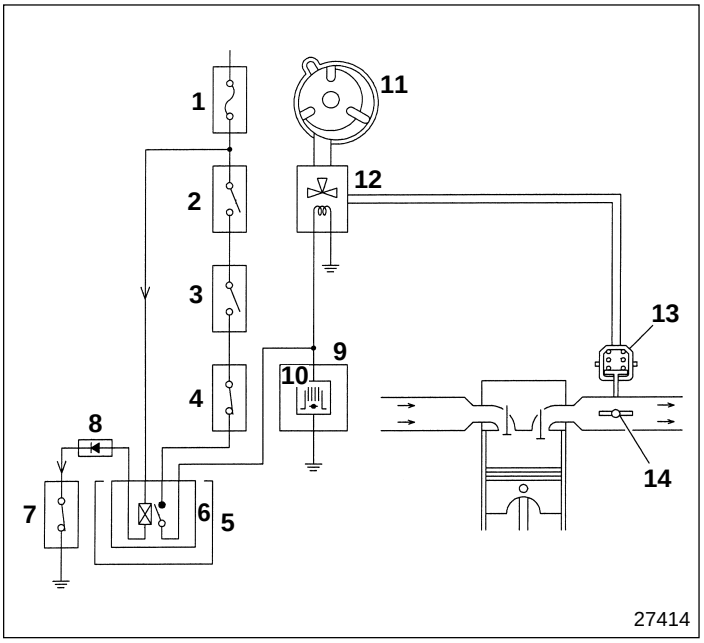


When exhaust brake switch **4** is turned on, the current flows as illustrated to activate the exhaust brake.

Fuse **1**→Clutch switch **2**→Accelerator switch **3**→Exhaust brake switch **4**→Exhaust brake cut relay **6**→3-way magnetic valve **12**→Ground

→Exhaust brake indicator lamp **10** (ON)→Ground

● When the exhaust brake system is released



When the accelerator pedal or clutch pedal is depressed while the exhaust brake is working, all switches **3**, **2** turn off, shutting off the current, releasing the exhaust brake.

● When clutch pedal is depressed

Fuse **1**→Clutch switch **2** (OFF)→Since no current flows, the circuit turns off and the exhaust brake is released.

● When accelerator pedal is depressed

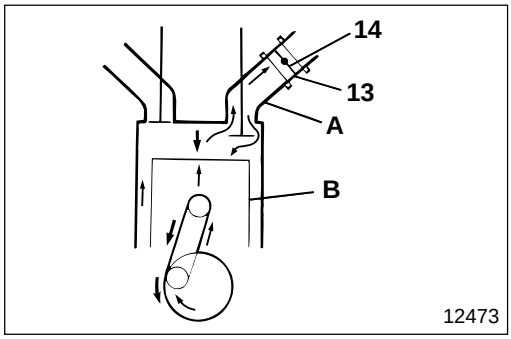
Fuse **1**→Clutch switch **2**→Accelerator switch **3** (OFF)→Since there is no grounding, current does not flow, so the exhaust brake is released.

https://truckmanualshub.com/

● Releasing exhaust brake system by placing transmission in neutral

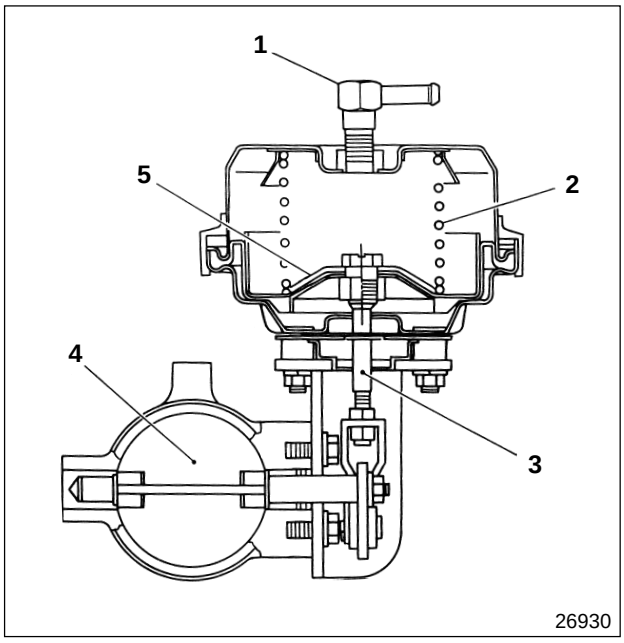
Fuse **1**→Exhaust brake cut relay **6** excitation→Transmission neutral switch **7**→Ground
Fuse **1**→Clutch switch **2**→Accelerator switch **3**→Exhaust brake switch **4**→Exhaust brake cut relay **6** (OFF)→Beyond this, current does not flow so the exhaust brake is released.

● Working principle of exhaust brake



When butterfly valve **14** of exhaust brake unit **13**, in exhaust pipe **A**, is closed, the pressure in the exhaust pipe rises. The pressure rises further in the exhaust stroke, generating a force that pushes back piston **B**, the exhaust braking force.

● Exhaust brake unit



1 Connector
2 Spring
3 Push rod
4 Butterfly valve
5 Diaphragm

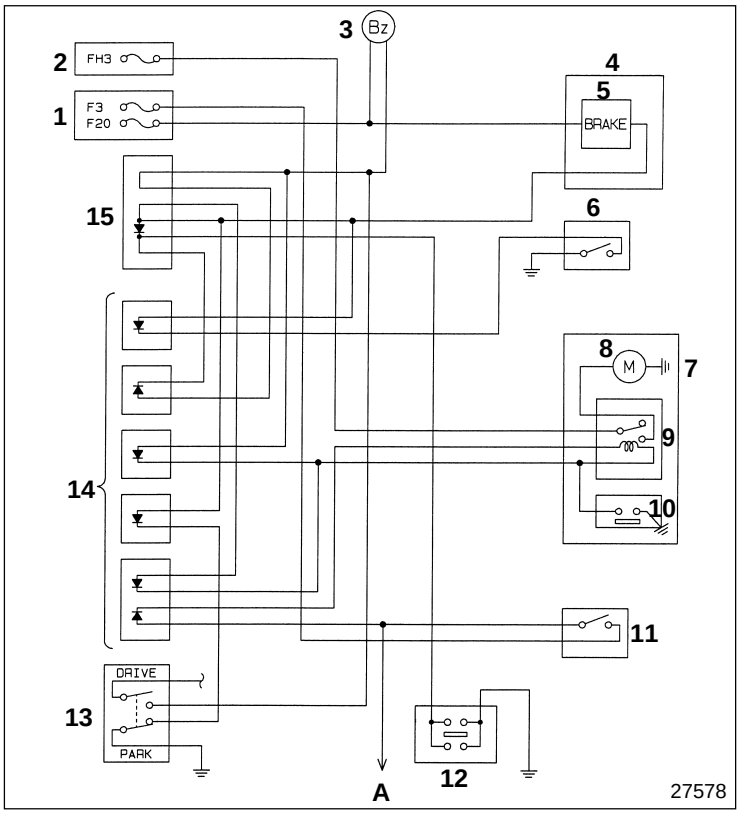
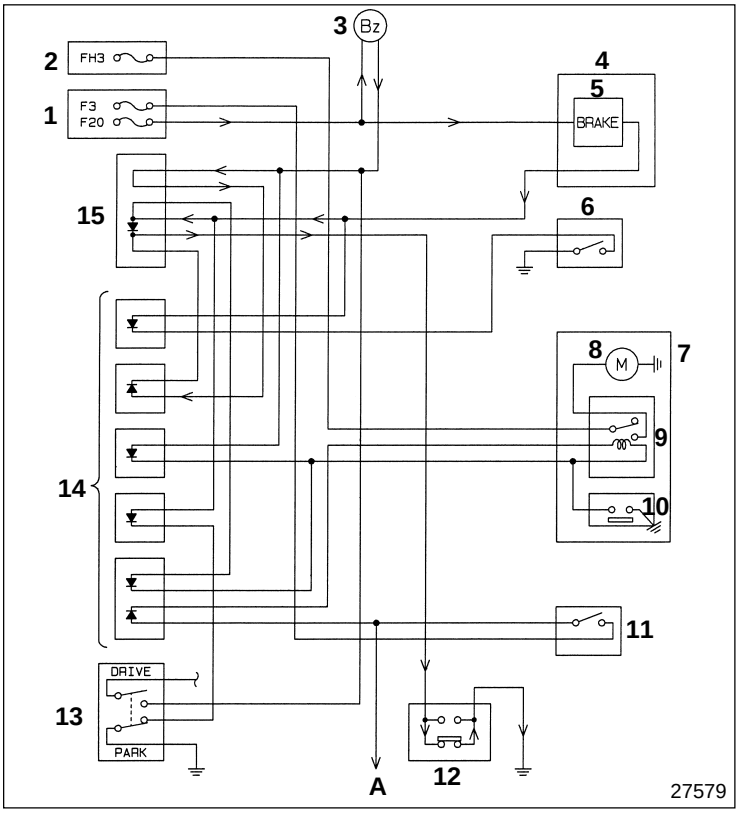
Brake Warning and Brake booster (Hydraulic Booster) Fail-Safe System



1 Fuse box
2 High current fuse box
3 Warning buzzer
4 Meter cluster
5 Brake warning lamp
6 Brake fluid level switch
7 Brake booster (Hydraulic booster)
8 Emergency pump motor
9 Motor relay
10 Flow switch
11 Stop lamp switch
12 Power steering fluid level sensor
Gr 37
13 Parking brake switch
14 Diode
15 Joint connector

A: To stop lamp

● Power steering fluid level warning circuit



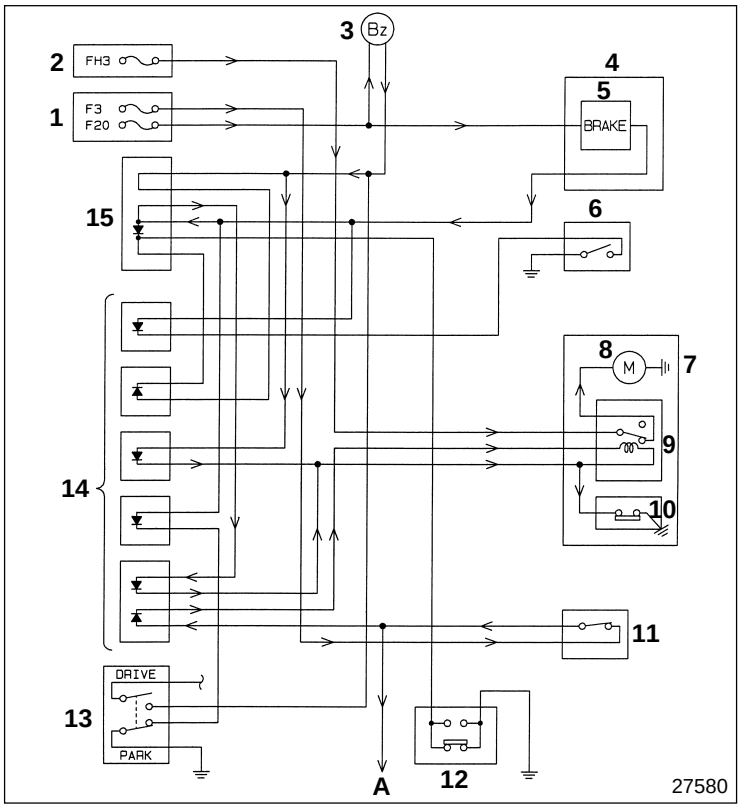
- Since the fluid pressure of the power steering fluid is also used for brake booster (hydraulic booster) **7**, the power steering fluid level warning circuit is connected to warning buzzer **3** and brake warning lamp **5**.
- When the power steering fluid level drops below the **"MIN"** level or rises above the **"MAX"** level of the power steering oil tank, power steering fluid level sensor **12** is turned ON, and the flow of current at such time is as follows.

Fuse **1** → Warning buzzer **3**
↓ ↓
Brake warning lamp **5** Joint connector **15**
↓
Diode **14**
↓
Joint connector **15**
↓
Power steering fluid level sensor **12**
↓
Ground

As a result warning buzzer **3** sounds and warning lamp **5** lights to warn the driver.

https://truckmanualshub.com/

● **Brake booster (hydraulic booster) fail-safe system**



- If there is a fluid leakage in the power steering system piping and hydraulic pressure is lost, the brake booster (hydraulic booster) fail-safe system will act in the following manner.

  Flow switch **10** is turned ON and the flow of current is as follows.

  Fuse **1** → Warning buzzer **3**
  ↓ ↓
  Brake warning lamp **5** Diode **14**
  ↓ ↓
  Joint connector **15** → Flow switch **10**
  ↓ ↓
  Diode **14** Ground

  As a result warning buzzer **3** sounds and brake warning lamp **5** lights.

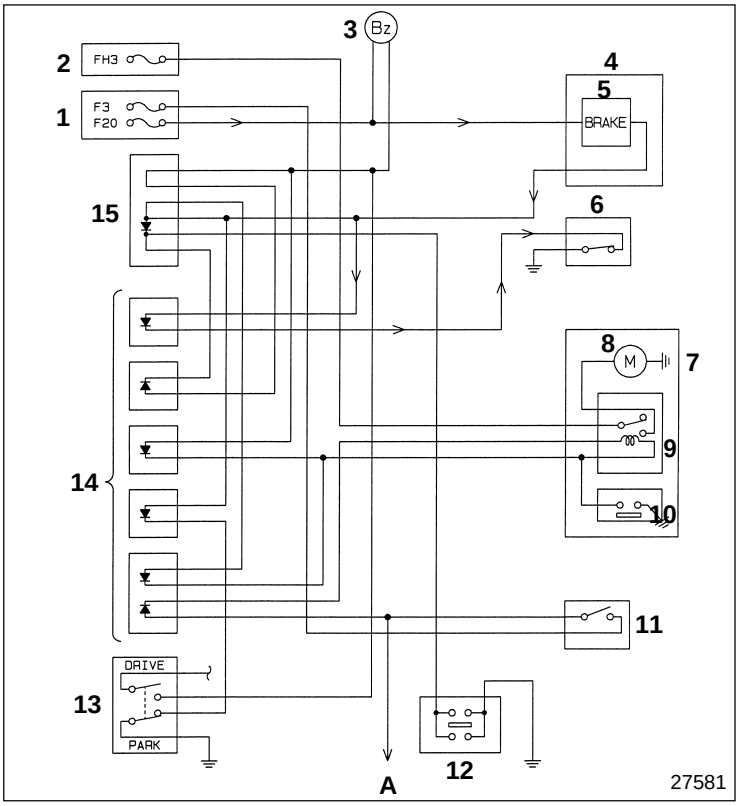
  Depressing the brake pedal when flow switch **10** is ON, will cause the current to flow as follows.

  Fuse **1** → Stop lamp switch **11**
  ↓
  High current fuse **2** → Diode **14**
  ↓
  (Contact) → Motor relay **9** (coil)
  ↓
  Emergency pump motor **8** ← Flow switch **10**
  ↓ ↓
  Ground Ground

  As a result emergency pump motor **8** starts operating, maintaining the hydraulic pressure during an emergency.

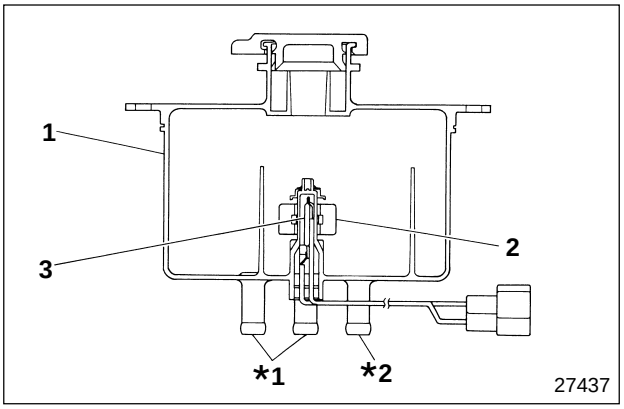
https://truckmanualshub.com/

● **Brake fluid warning circuit**



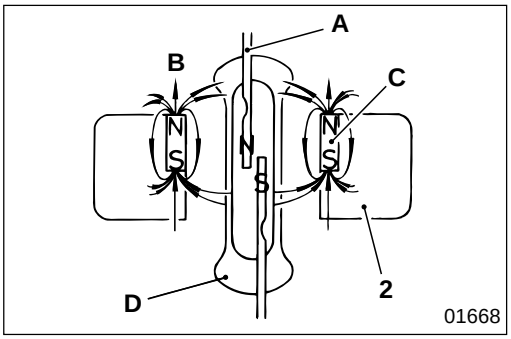
- When the brake fluid in the fluid tank drops below the specified level, brake fluid level switch **6** in the fluid tank turns on, brake warning lamp **5** lights.

● **Brake fluid level switch**



1 Fluid tank
2 Float
3 Brake fluid level switch
***1** : For brakes
***2** : For clutch

- Brake fluid level switch **3**, installed on fluid tank **1**, monitors the brake fluid level in the fluid tank. If the brake fluid level drops below the specified level, float **2** moves and lights up the warning lamp within the meter cluster to alert the driver.



- If the brake fluid level in fluid tank **1** drops and float **2** drops lower than level **L**, magnetic force **B** that passes through the contact point (ferromagnetic body **A**), increases generating north and south poles at the ends of the contact points. Therefore, the contact points pull each other and overcome the repercussive force of the springs of the contact points, forming an electric circuit.
  C : Permanent magnet
  D : Glass

TROUBLESHOOTING

Symptoms / Possible causes		Brake drums overheating			Brakes squeaking					Remarks
		All wheels overheating	One wheel overheating	Brakes squeaking	Squeaking in new vehicle or after brake lining replacement	Action too severe	Brake juddering	Brake pedal return faulty	Brake drags	
Tires	Air pressures uneven, etc.									Gr 31
	Left and right tire sizes different									Gr 31
Axle	Wheel hub bearing adjusted incorrectly		○	○			○			Gr26, 27
	Left and right wheelbase difference excessive									Gr26, 27
	Wheel alignment incorrect									Gr26
	Kingpin bushing worn						○			Gr26
Wheel brakes	Backing plate ledge surface rough								○	
	Backing plate ledge surface not smooth		○							
	Backing plate deformed, mounted incorrectly					○				
	Oil or water on brake lining surfaces									
	Brake lining changed in quality or wrong material used									
	Brake lining unevenly worn or surface roughened									
	Brake lining fading (surface change in material)					○				
	Brake lining worn out completely									
	Abrasive on brake lining			○						
	Brake lining worn			○						
	Brake lining contact incorrect				○					
	Brake lining ground radius irregular									
	Wheel cylinder malfunctioning		○						○	
	Wheel cylinder piston cup faulty		○						○	
	Shoe return spring fatigued or broken		○						○	
	Brake drum worn unevenly									
	Brake drum warped									
	Brake drum worn									
	Brake drum surface roughened									
	Brake drum roughness excessive									
	Brake drum glassy					○

ON-VEHICLE INSPECTION AND ADJUSTMENT

Replacement of Brake Fluid

Fluid

Location	Points of application	Specified fluid	Quantity
3	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Vinyl hose 	MH033102	Air bleeding

WARNING

- **The clutch fluid system and the brake fluid system use the fluid tank in common.**
- **You must use new brake fluid (SAE J17031 or FMVSS No. 116 DOT 3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose.**

CAUTION

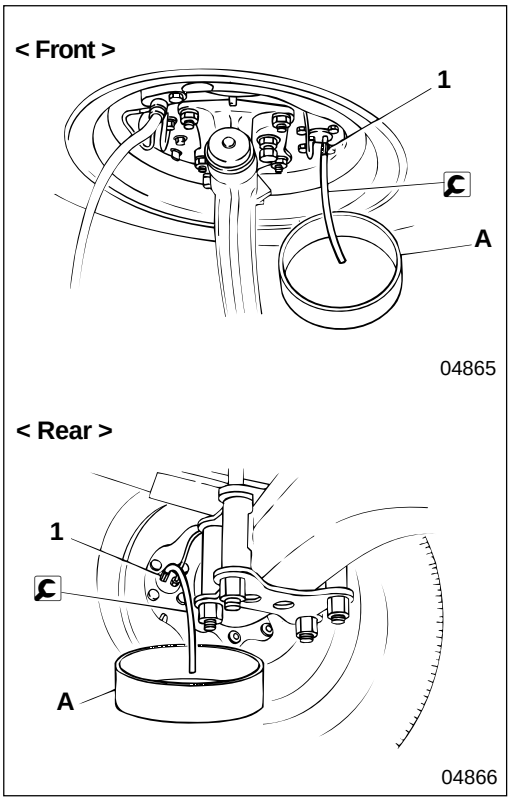
- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

NOTE

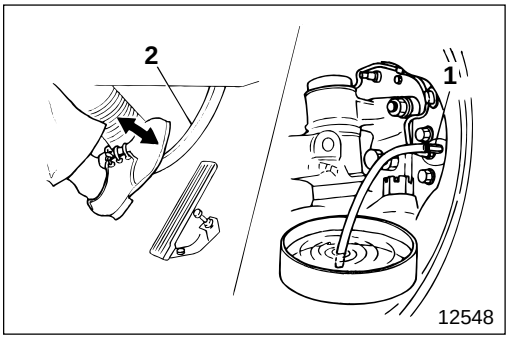
Supply and maintain the brake fluid level to the “MAX” level of the fluid tank.

https://truckmanualshub.com/

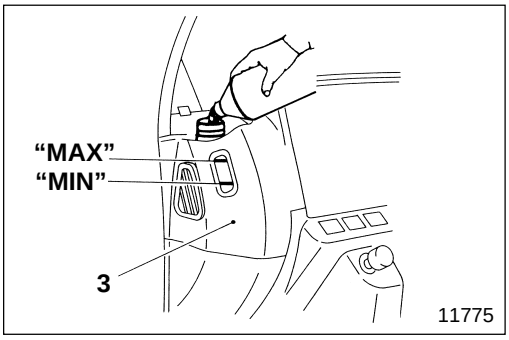
- Start engine and let it idle until brake fluid replacement is completed.



- Attach one end of vinyl hose to air bleeder **1** and place the other end in container **A**.



- Loosen air bleeder **1** and depress brake pedal **2** to drain brake fluid completely.



- Maintain a supply of new brake fluid up to the "**MAX**" level of fluid tank **3**, depress the brake pedal repeatedly until the old brake fluid of the brake system is replaced with new fluid.

- Bleed air from the brake system.
P35-30

https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

Air Bleeding of Brake System

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Air bleeder	7.8 to 12 {5.8 to 8.5, 0.8 to 1.2}	—

Fluid

Location	Points of application	Specified fluid	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Vinyl hose 	MH033102	Air bleeding

WARNING

- **The clutch fluid system and the brake fluid system use the fluid tank in common.**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT 3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose.**

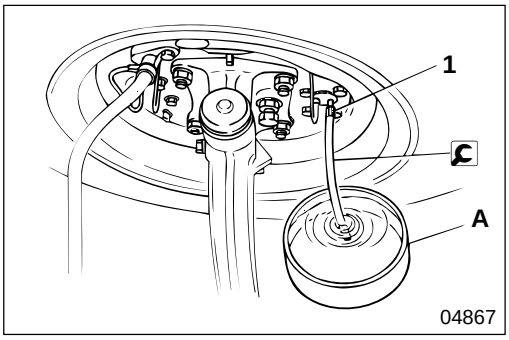
https://truckmanualshub.com/

CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

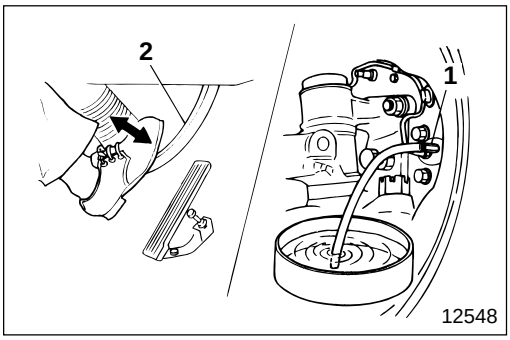
NOTE

- **Supply and maintain brake fluid to the "MAX" level of the fluid tank.**
- **Make sure you maintain brake fluid at the "MAX" level of the fluid tank since the brake fluid level drops during air bleeding.**



- Start engine and let it idle until brake fluid replacement is completed.
- Attach one end of vinyl hose to air bleeder **1** of the wheel brake. Place free end in container **A** filled with brake fluid.
- Carry out air bleeding in the following sequence:

Front brake system	Rear brake system
Right-hand side wheel brake	Right-hand side wheel brake
↓	↓
Left-hand side wheel brake	Left-hand side wheel brake



- Depress brake pedal **2** slowly a few times, and with the brake pedal depressed, loosen air bleeder **1** to drain brake fluid containing air.
- Tighten air bleeder **1**, and release brake pedal **2**.
- Repeat this service procedure until air is no longer present in the fluid being drained.
- Tighten air bleeder **1** at specified torque as soon as brake fluid flowing out is free of air bubbles.

- Adjust brake shoe clearance when you have finished air bleeding. P35-30
- Check that brake fluid comes up to level "**MAX**" of fluid tank. If it does not, refill with new brake fluid.
- Depress brake pedal **2** a few times and check for any leakage of brake fluid, then test the brakes.

https://truckmanualshub.com/

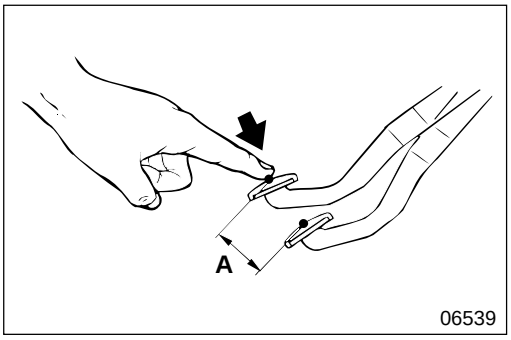
ON-VEHICLE INSPECTION AND ADJUSTMENT

Inspection and Adjustment of Brake Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Free play of brake pedal	10 to 15 {0.39 to 0.59}	—	Adjust



[Inspection]
Check if brake pedal free play **A** confirms to the standard value. If the measured value deviates from the standard value, adjust the position of the brake pedal.

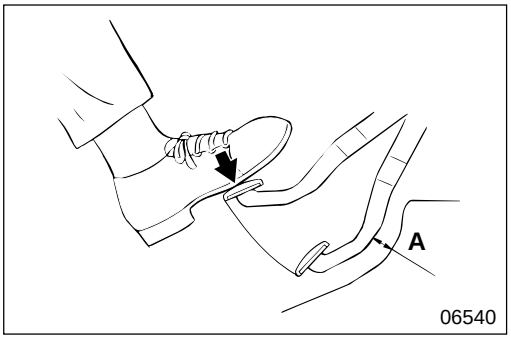
[Adjustment]
P35-39

Inspection and Adjustment of Clearance between Brake Pedal and Floor Panel

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Clearance between brake pedal and floor panel (with pedal depressed at 490 N {110 lbf, 50 kgf})	52 {2.05} or more	—	Adjust



[Inspection]
Depress the brake pedal using 490 N {110 lbf, 50 kgf} when the engine is idling to check if clearance **A** between the brake pedal and the floor panel conforms to the standard value. If the measured value deviates from the standard value, adjust the position of the brake pedal.

[Adjustment]
P35-39

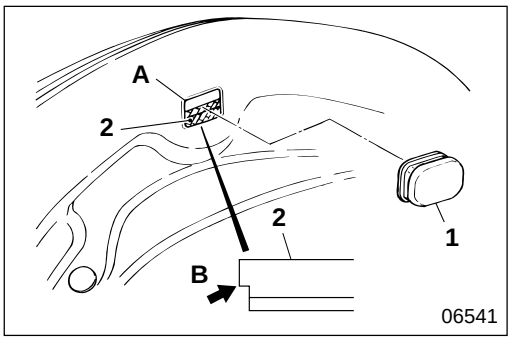
https://truckmanualshub.com/

Thickness Inspection and Replacement of Brake Lining

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2	Thickness of brake lining	—	5.5 {0.22} (Side shoulder means wear limit)	Replace



[Inspection]

NOTE

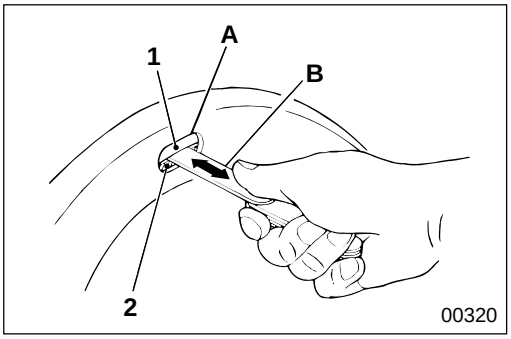
Be sure to inspect at two points for each wheel per side.

- Remove check hole plug **1** from the backing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall check hole plug **1**.

[Replacement]

P35-42, 50

Inspection of Brake Shoe Clearance



NOTE

When the vehicle is jacked up and the wheel is being turned, make sure that there is no dragging.

- Remove the check hole plug from the backing plate.
  A : Check hole
- Try to insert a 1 mm {0.039 in.} feeler gauge **B** between brake drum **1** and brake lining **2**. Check that the clearance is too small to let the feeler gauge enter.
  If feeler gauge **A** enters the clearance, disassemble the wheel cylinder and inspect.
  P35-48, 56

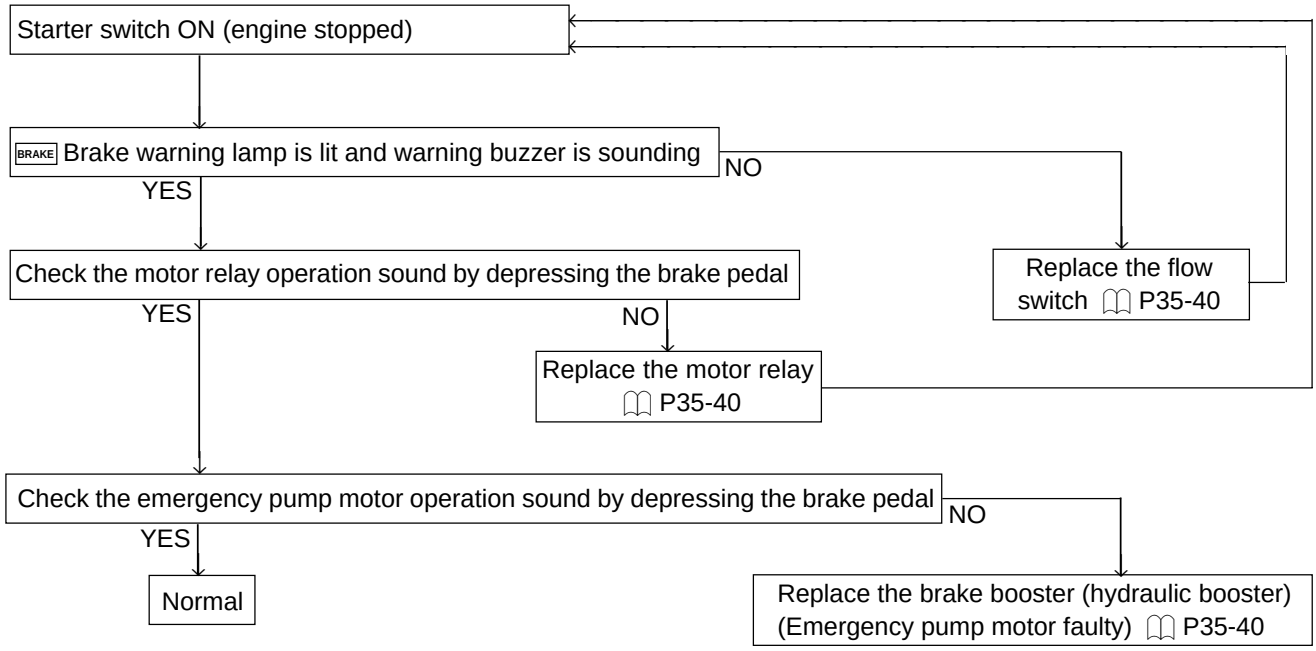
https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

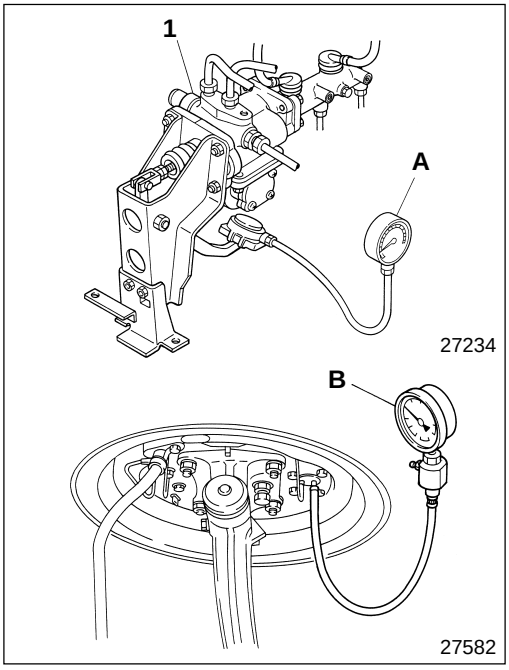
Inspection of Brake Booster (Hydraulic Booster)

(1) Inspection of electric equipment

Perform inspection in accordance with the flow-chart below. Make sure the power steering fluid level sensor is working properly and power steering oil tank fluid level is normal. Make sure the parking brake is working properly and the wheels are choked during inspection.



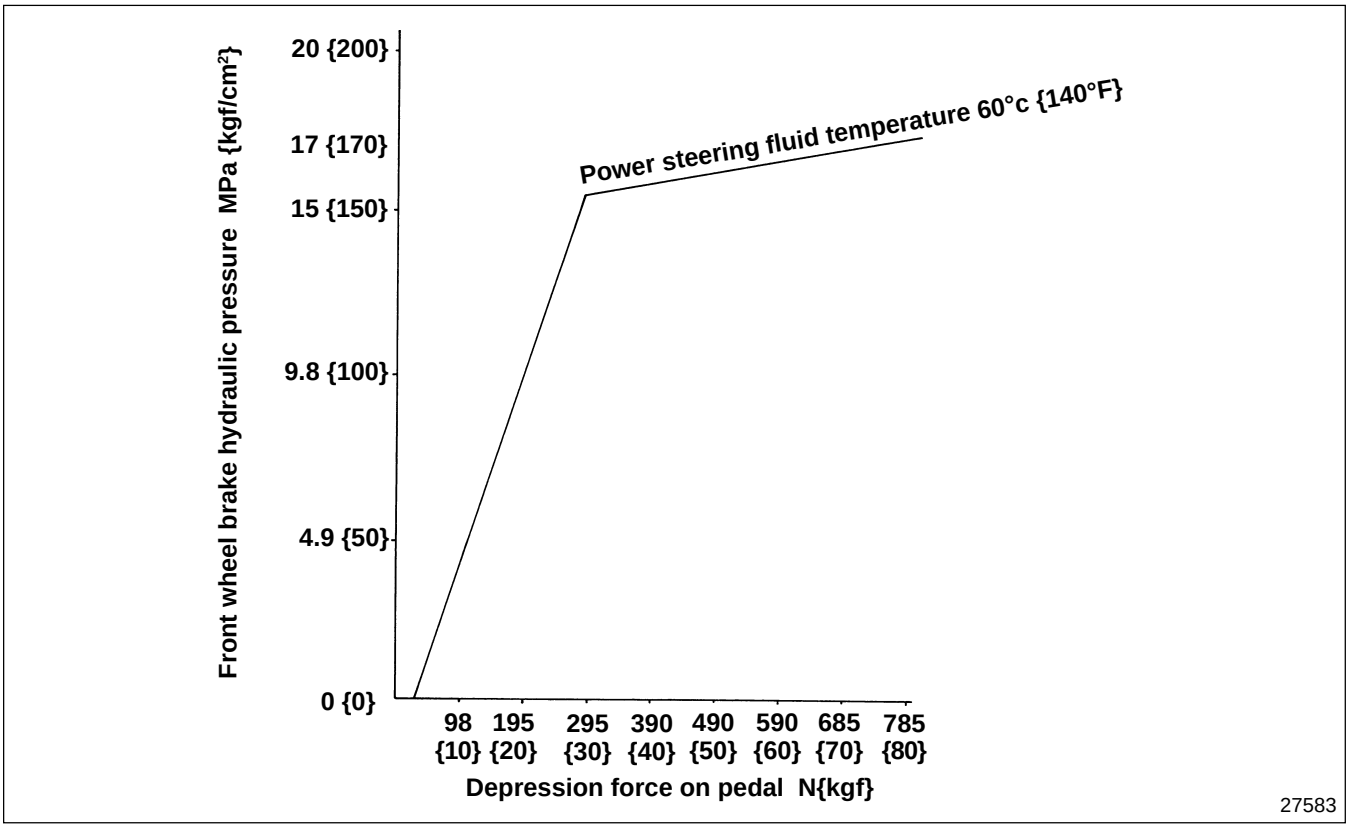
https://truckmanualshub.com/



(2) Performance inspection

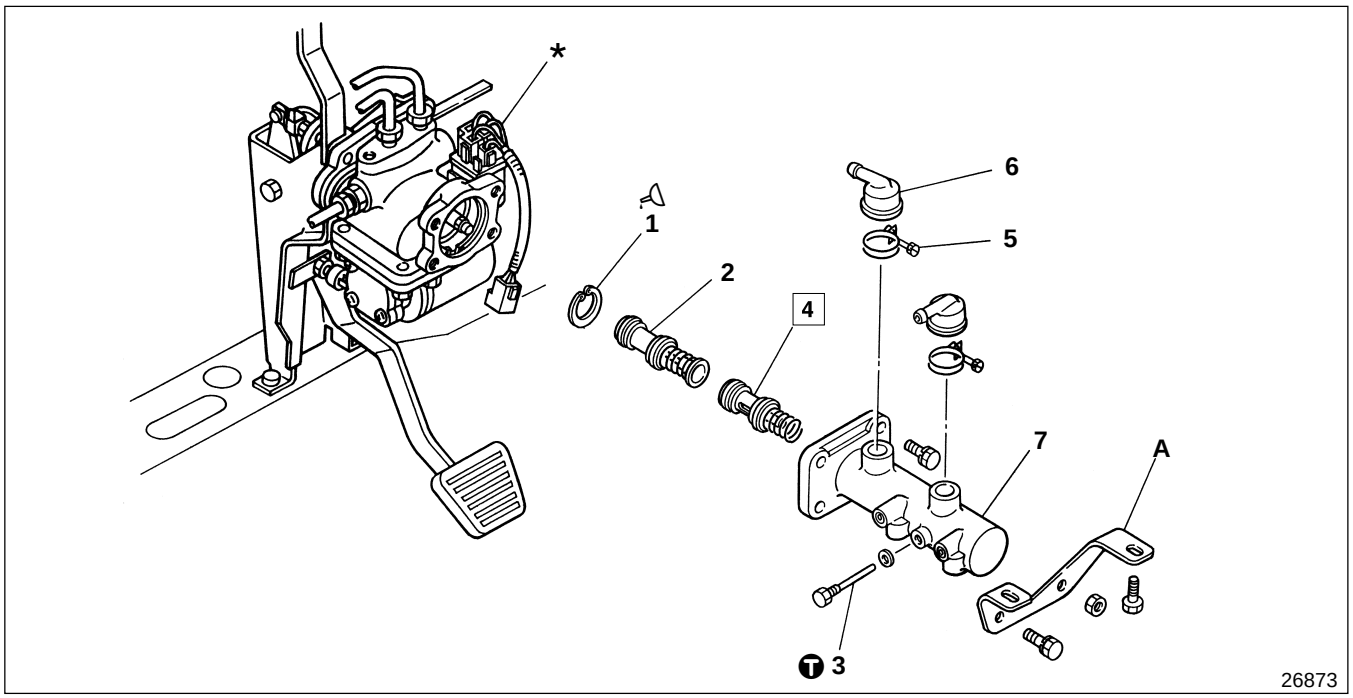
- Mount foot pressure meter **A** on the brake pedal, remove the front wheel brake air bleeder and after installing oil pressure gauge **B**, bleed the air from the pressure gauge.
- Carry out a performance evaluation test on the power steering system and make sure hydraulic pressure in the power steering fluid system is at a normal level. Gr 37
- If the above proves normal, check to make sure the hydraulic pressure of the front wheel brakes in response to foot pressure on the brake pedal is in conformity with the performance characteristics chart.
  If faulty, replace brake booster (hydraulic booster) **1**.
  Gr 35-38

Performance characteristics chart



https://truckmanualshub.com/

BRAKE MASTER CYLINDER



● **Disassembly sequence**

1 Retaining ring
2 Primary piston assembly
3 Set bolt
4 Secondary piston assembly
5 Clamp
6 Connector
7 Cylinder body

A : Brake booster support
***** : Brake pedal and brake booster (hydraulic booster) 🕮 P35-38

WARNING⚠

Be sure not to damage the inner surface of cylinder body 7, since it will cause air to get mixed in or will result in brake fluid leakage during the removal and installation of primary piston assembly 2 and secondary piston assembly 4.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value (Basic diameter in [ ])	Limit	Remedy
2	Primary piston assembly spring load (Installed length 35.1{1.38})	100 to 115 N {22 to 26 lbf, 10.2 to 11.7 kgf}	93 N {21 lbf, 9.5 kgf}	Replace
2, 4, 7	Clearance between primary and secondary piston assemblies and cylinder body	[41.28] 0.02 to 0.10 {[1.63] 0.00079 to 0.0039}	0.2 {0.0079}	Replace
4	Secondary piston assembly spring load (Installed length 34.1{1.34})	71 to 86 N {16 to 19 lbf, 7.2 to 8.8 kgf}	67 N {15 lbf, 6.8 kgf}	Replace

https://truckmanualshub.com/

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

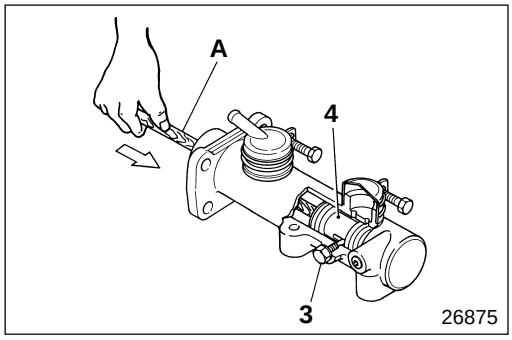
Location	Parts to be tightened	Tightening torque	Remarks
3	Set bolt	6.86 to 8.82 {5.1 to 6.5, 0.7 to 0.9}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
1	Periphery of retaining ring	Rubber grease	As required

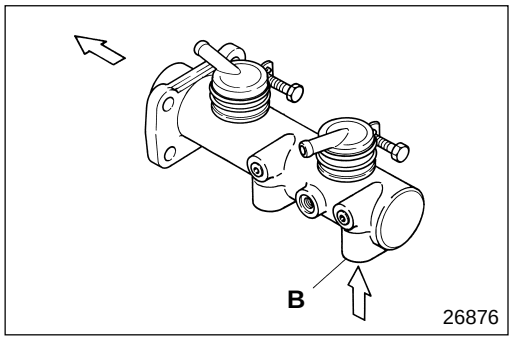
◆ Service procedure

4 Secondary piston assembly



[Removal]

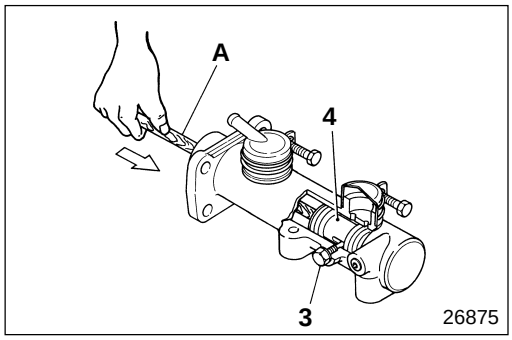
- Using rod **A**, push in secondary piston assembly **4**, then loosen set bolt **3**.



- Feed compressed air via discharge port **B** that leads to the rear wheel brake to extract secondary piston assembly **4**.

WARNING ⚠

You must apply compressed air gradually when you remove secondary piston assembly 4. If you applied compressed air strongly at one time, the secondary piston assembly would be violently ejected.

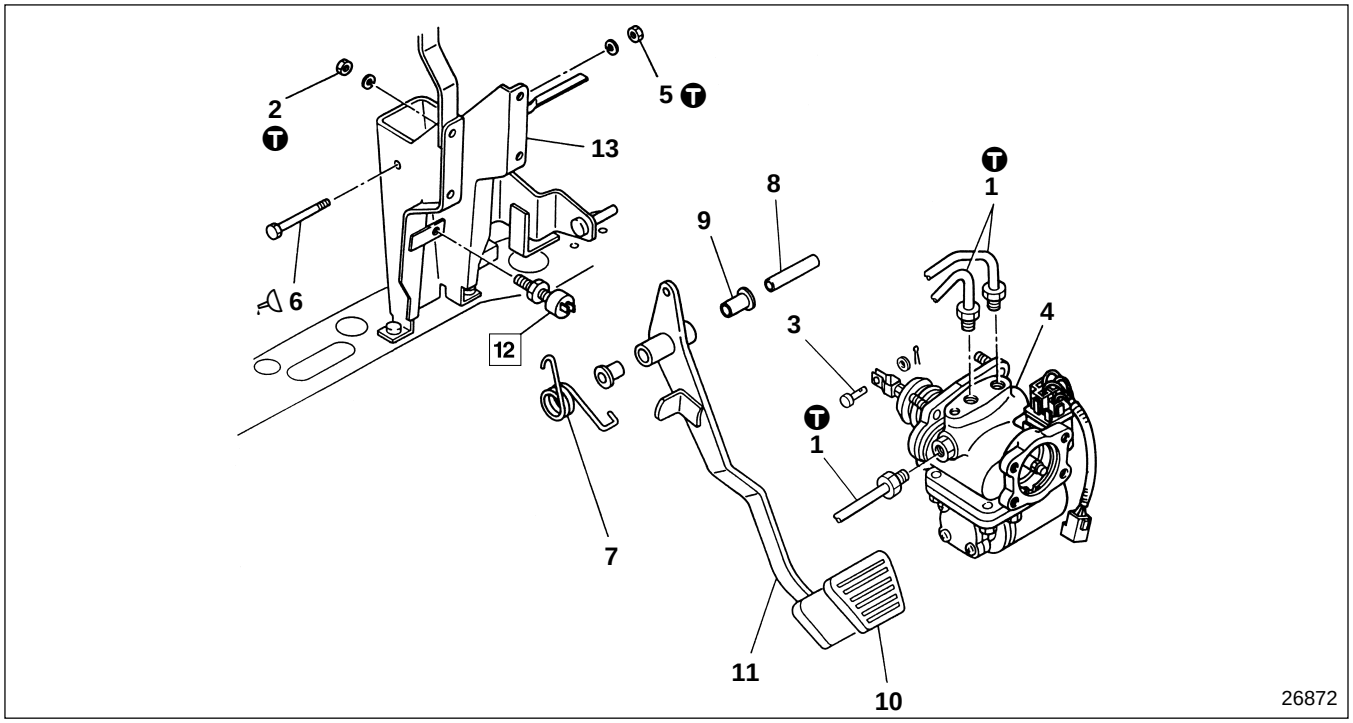


[Installation]

Using rod **A**, push in secondary piston assembly **4**, then tighten set bolt **3** at specified torque.

https://truckmanualshub.com/

BRAKE PEDAL AND BRAKE BOOSTER (HYDRAULIC BOOSTER)



● **Disassembly sequence**

1 Pipe 🗀 Gr 37
2 Nut
3 Clevis pin
4 Brake booster (Hydraulic booster) 🕮 P35-40
5 Nut
6 Bolt
7 Spring
8 Collar
9 Bushing
10 Pedal pad
11 Brake pedal
12 Stop lamp switch 🗀 Gr 54
13 Support assembly

WARNING ⚠

Power steering fluid is a mineral fluid. Make sure it does not get mixed with brake fluid (vegetable fluid) during disassembly, because it causes the rubber parts of the brake equipment to expand resulting in brake dragging or malfunction.

NOTE

Do not disassemble brake booster (hydraulic booster) 4 because it is a non-disassemble type.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

● **Adjustment after assembly** 🕮 P35-39

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value (Basic diameter in [ ])	Limit	Remedy
8, 9	Clearance between collar and bushing		[16] 0.02 to 0.26 {0.00079 to 0.010}	0.5 {0.020}	Replace
11	Brake pedal	Height from pedal pad center to instrument panel underside	264 {10.4}	—	Adjust
		Full stroke	163 {6.42}	—	Adjust
11, 12	Clearance between brake pedal stopper and tip of stop lamp switch thread area		0 to 0.1 {0 to 0.0039}	—	Adjust

https://truckmanualshub.com/

Tightening torque

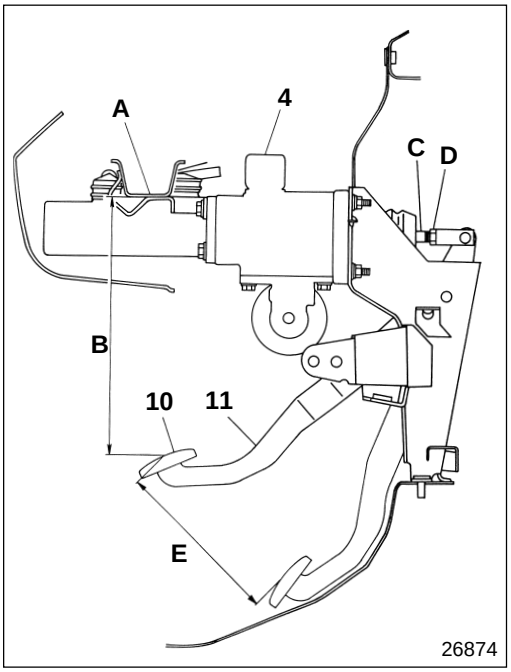
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Pipe (Brake booster connecting)	66.69±12.75 {49±9.4, 6.8±1.3}	—
2	Nut (Brake booster mounting)	8.8 to 14 {6.5 to 10, 0.9 to 1.4}	—
5	Nut (Brake pedal mounting)	34.3 to 53.9 {25 to 40, 3.5 to 5.5}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
6	Friction surface of bolt bushing	Chassis grease [NLGI No.1 (Ca soap)]	As required

◆ Service procedure



● Adjustment after assembly

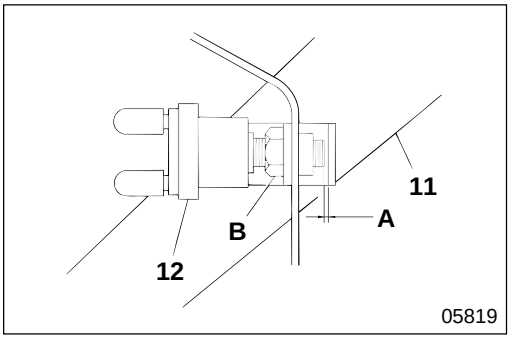
- Adjustment of brake pedal installation height
  By turning operating rod **C** of brake booster (hydraulic booster) **4**, adjust height **B** from the center of pedal pad **10** to the underside of instrument panel **A** to the standard value, then secure in place using nut **D**.

WARNING ⚠

Make sure, when brake pedal 11 is depressed fully, that operating rod C of brake booster (hydraulic booster) 4 functions as the stopper and the pedal does not come to a stop by hitting against the floor panel, since this will reduce brake effectiveness.

- Inspection of brake pedal full stroke
  Make sure that full stroke **E** when brake pedal **11** is depressed fully conforms to the standard value.
  If there is any fault, adjust the installation height of the brake pedal.

- Inspection of play towards brake pedal 🕮 Gr 35-32



12 **Adjustment of stop lamp switch**

Turn stop lamp switch **12** to adjust clearance **A** between the top of the thread area of the stop lamp switch and the stopper of brake pedal **11** to the standard value, and fasten with lock nut **B**.

WARNING ⚠

Make sure, when brake pedal 11 is released, that stop lamp switch 12 does not stop the pedal, since this will cause the brake to drag.

		Cylindrical accuracy	0.05 {0.0020}		0.2 {0.0079}	Correct or replace

* : Indicates correction limit.

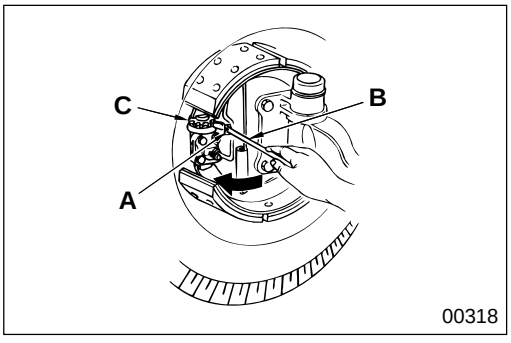
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Joint assembly mounting)	9.8±1.0 {7.2±1.4, 1.0±0.2}	—
3, 5	Flair nut (Pipe assembly mounting)	14±2.0 {10±1.4, 1.4±0.2}	—
4	Bolt (Pipe clamp mounting)	4.9±1.0 {3.6±0.7, 0.5±0.1}	—
14	Bolt (Wheel cylinder assembly mounting)	78±16 {58±12, 8.0±1.6}	—
15	Bolt (Wheel cylinder assembly mounting)	44±8.8 {33±6.5, 4.5±0.9}	—
19	Nut (Holder pin mounting)	29±5.9 {22±4.3, 3,0±0.6}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
9, 10, 16	Contact areas between washer and brake shoe assembly; and between brake shoe assembly and wheel cylinder assembly	Wheel bearing grease [NLGI No.2 (Li soap)]	As required



◆ Service procedure

● **Initial adjustment of brake shoe clearance after installation**

- Jack up the front wheels, and make sure that there is no play in the hub bearings.
- Insert screwdriver **B** into adjusting hole **A** and turn adjuster **C** in the direction of the arrow marked on backing plate **21** until the wheel drags slightly when turned by hand.

NOTE

- **Be sure to adjust the clearance at two points for each wheel per side.**
- **The arrow mark on backing plate 21 is near adjusting hole A.**

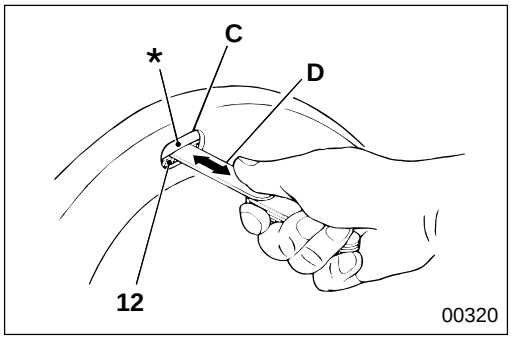
https://truckmanualshub.com/

- After depressing the brake pedal several times, release it and make sure that the wheel drags lightly when turned by hand. If the wheel turns without stress, repeat the above steps. Slacken off adjuster **B**, in the reverse direction to the arrow mark, by eight or nine notches.

NOTE

Be sure to adjust the clearance at two points for each wheel per side.

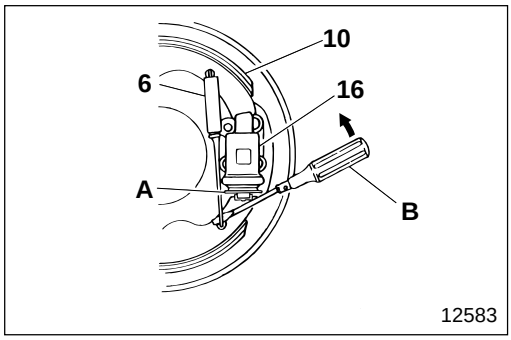
- Make sure that the wheel does not drag when turned by hand. If the wheel drags, repeat the above steps.



- Insert feeler gauge **D** between brake drum ***** and brake lining **12** through check hole **C**, and make sure that a little resistance is felt when the feeler gauge is pulled out or pushed in.

NOTE

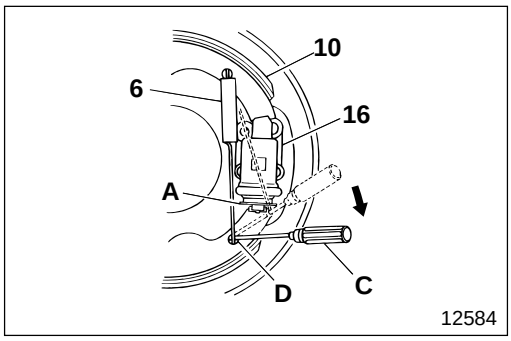
Be sure to adjust the clearance at two points for each wheel per side.



6 Return Spring

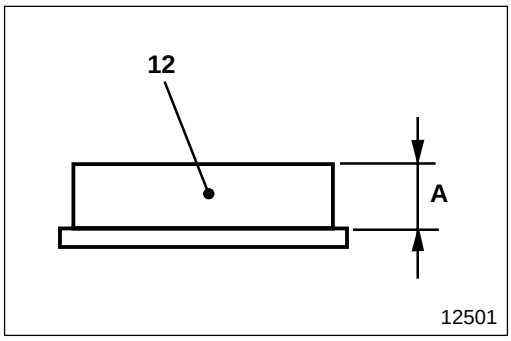
[Removal]

To remove return spring **6**, place screwdriver **B** on the hook of the return spring, then pry and remove the return spring making use of wheel cylinder assembly **16** adjuster **A** as a fulcrum.



[Installation]

- Install the shorter hook end of return spring **6** in brake shoe assembly **10** at the side opposite to adjuster **A** of wheel cylinder assembly **16**.
- Insert a small Phillips screwdriver **C** into the hook of return spring **6**, insert the tip of the screwdriver into return spring installation hole **D** of the brake shoe assembly to pry on the return spring.

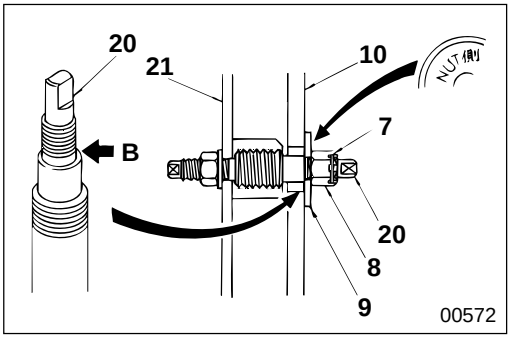


10 Brake shoe assembly

[Inspection]

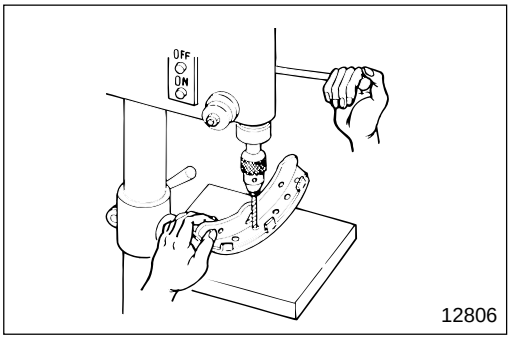
If thickness **A** of brake lining **12** is lower than the limit replace the brake lining on the same axle as a unit.

https://truckmanualshub.com/



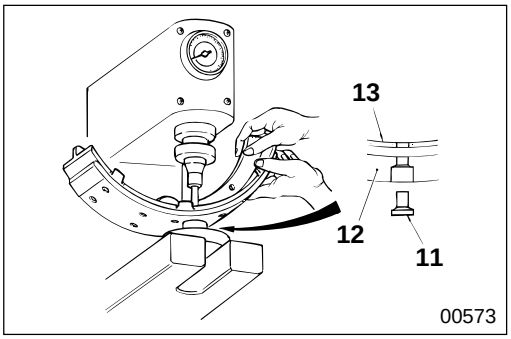
[Installation]

- Install brake shoe assembly **10**.
- Insert washer **9** with the side stamped “NUT 側” facing outside, screw down holder pin nut **8** until washer hits stepped area **B** of holder pin **20** gently, then slacken off the nut within the 0 to 60° limit until the nut is aligned with the first split pin hole.
- Insert split pin **7**, and bend it securely.



12 **Brake lining**

[Removal]



[Installation]

- Clean the mounting surfaces of brake lining **12** and brake shoe **13** with cleaning fluid and dry them.
- Insert rivets **11** from brake lining **12** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **13** and the brake lining.

  Caulking load for rivets : 17 to 19 kN {3750 to 4190 lbf, 1700 to 1900 kgf}

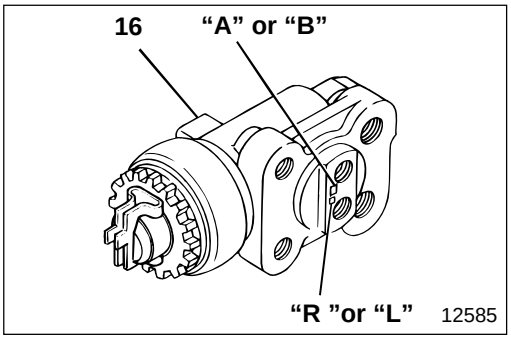
- Make sure that you inspect contact with the inner surface of brake drum ***** after you replace brake linings **12**. If contact is incorrect, correct with the brake assembled.

WARNING⚠

Do not leave lubricant on the surface of brake lining 12 because this reduces braking performance.

CAUTION⚠

Make sure that the type of brake linings 12 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one shaft.

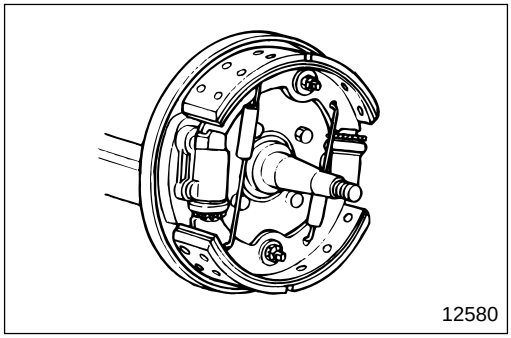


16 **Installation of wheel cylinder assembly**

Identification mark	Installation position
RA	Front of front axle right wheel
RB	Rear of front axle right wheel
LA	Front of front axle left wheel
LB	Rear of front axle left wheel

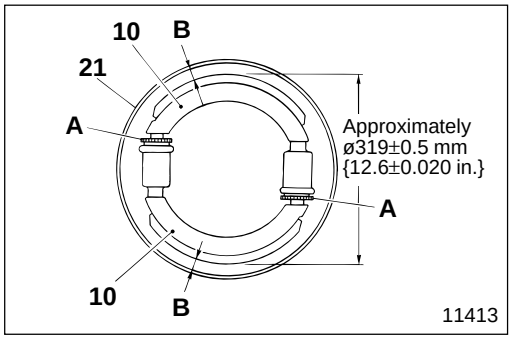
https://truckmanualshub.com/

FRONT WHEEL BRAKE

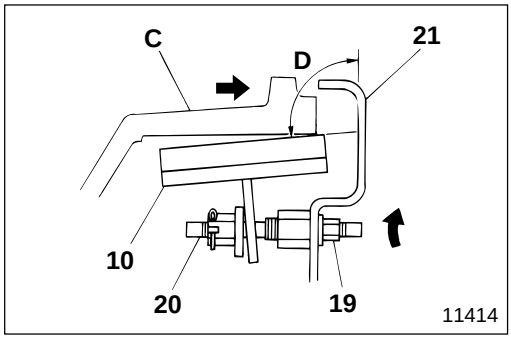


20 **Adjustment of holder pin**

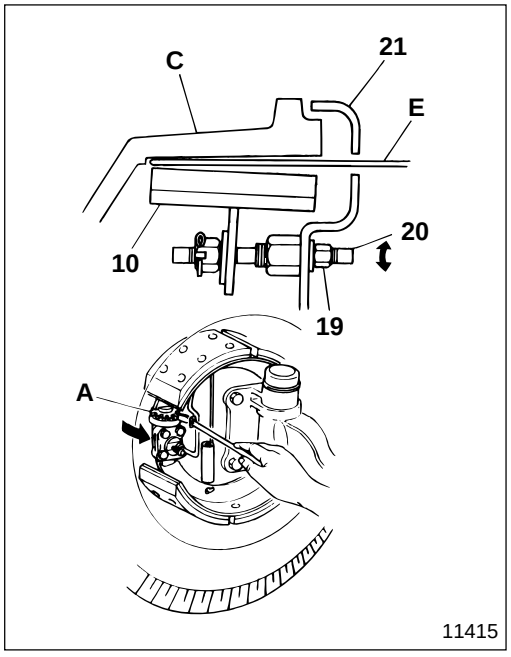
- Install the front wheel brake assembly on the front axle. Gr 26



- Turn adjuster **A** to adjust the outer diameter to approximately ø319±0.5 mm {12.6±0.020 in.}.
- Then, move brake shoe assembly **10** to adjust clearance **B** evenly.

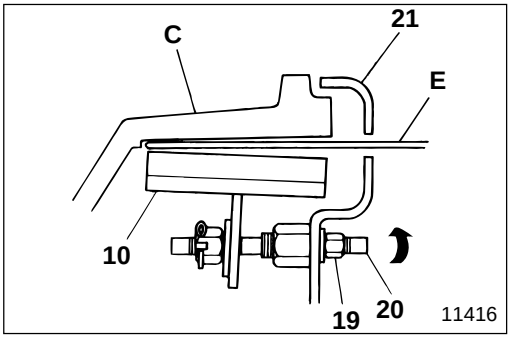


- Install hub and drum assembly **C** on the front wheel brake assembly. Gr 26
  At this time, the hub and drum assembly cannot be inserted in the specified position if squareness **D** is 90° or more, so loosen nut **19** and turn holder pin **20** to adjust the squareness to as close to 90° as possible.
- Bleed the brake system. P35-30



★• Turn adjuster **A** to widen brake shoe assembly **10** until 0.2 mm {0.0079 in.} feeler gauge **E** cannot be pulled out easily.
★• Loosen nut **19** and turn holder pin **20** to the right or left so that feeler gauge **E** can be pushed in or pulled out easily.
- Repeat the above steps (marked ★) until feeler gauge **E** cannot be pushed in or pulled out easily.
- Depress the brake pedal a few times lightly to equalize clearance **B** (adjusted in the previous section).
- Repeat the above steps (marked ★) until feeler gauge **E** cannot be pushed in or pulled out easily.

https://truckmanualshub.com/



- If feeler gauge **E** cannot be pushed in or pulled out easily it is because it is making contact over the full width of brake shoe assembly **10**.
- Turn holder pin **20** so that when you pull out feeler gauge **E**, in the above condition, and reinsert the feeler gauge, pushing in or pulling out the feeler gauge at the rear is difficult.
- After adjustment, tighten nut **19** at specified torque.

* Correction of brake drum

If the cylindrical accuracy of brake drum * is higher than the limit, or there are seams, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

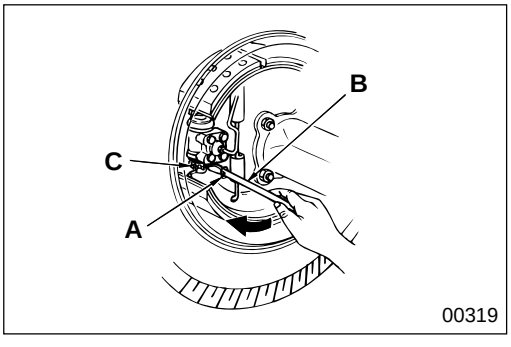
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Pipe clamp mounting)	4.9±1.0 {3.6±0.7, 0.5±0.1}	—
2	Flair nut (Pipe assembly mounting)	14±2.0 {10±1.4, 1.4±0.2}	—
11	Bolt (Wheel cylinder assembly mounting)	78±16 {58±12, 8.0±1.6}	—
16	Nut (Holder pin mounting)	29±5.9 {22±4.3, 3,0±0.6}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
6, 7, 12	Contact areas between washer and brake shoe assembly; and between brake shoe assembly and wheel cylinder assembly	Wheel bearing grease [NLGI No.2 (Li soap)]	As required



◆ Service procedure

● Initial adjustment of brake shoe clearance after installation

- Jack up the front wheels, and make sure that there is no play in the hub bearings.
- Insert screwdriver **B** into adjusting hole **A** and turn adjuster **C** in the direction of the arrow marked on the back plate until the wheel drags slightly when turned by hand.

NOTE

- **Be sure to adjust the clearance at two points for each wheel per side.**
- **The arrow mark on backing plate 18 is near adjusting hole A.**

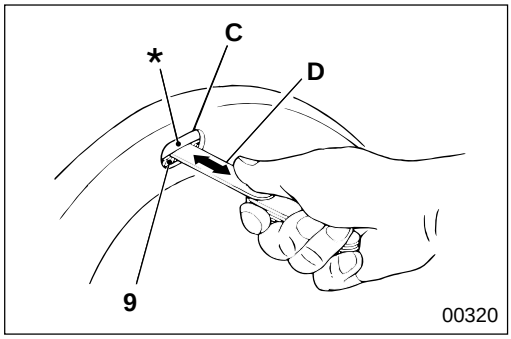
https://truckmanualshub.com/

- After depressing the brake pedal several times, release it and make sure that the wheel drags lightly when turned by hand. If the wheel turns without stress, repeat the above steps. Slacken off adjuster **B**, in the reverse direction to the arrow mark, by eight or nine notches.

NOTE

Be sure to adjust the clearance at two points for each wheel per side.

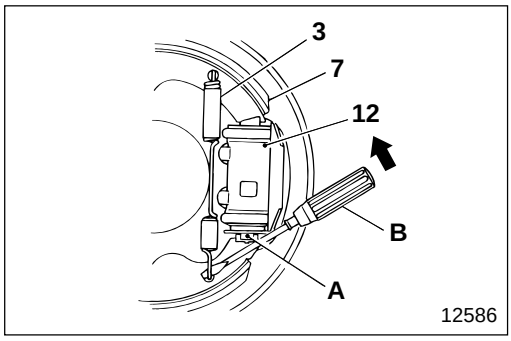
- Make sure that the wheel does not drag when turned by hand. If the wheel drags, repeat the above steps.



- Insert feeler gauge **D** between brake drum ***** and lining **9** through check hole **C**, and make sure that a little resistance is felt when the feeler gauge is pulled out or pushed in.

NOTE

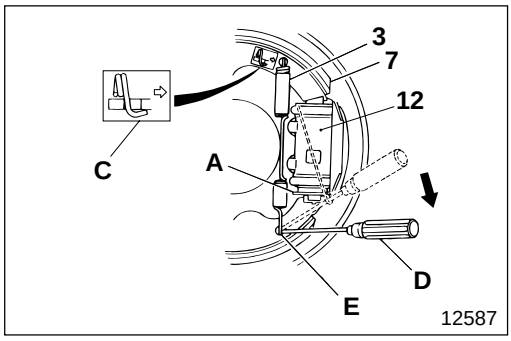
Be sure to adjust the clearance at two points for each wheel per side.



3 Return Spring

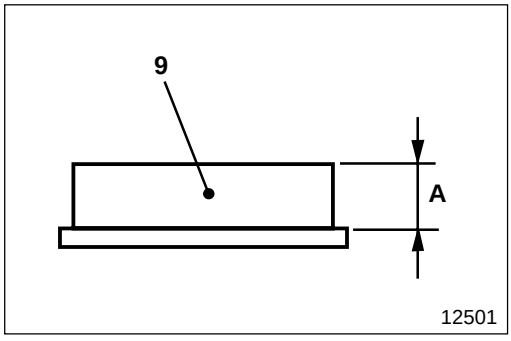
[Removal]

To remove return spring **3**, place screwdriver **B** on the hook of the return spring, then pry and remove the return spring making use of wheel cylinder assembly **12** adjuster **A** as a fulcrum.



[Installation]

- Refer to the illustration on the caution plate fitted to brake shoe assembly **7** or marking **C**, and connect shorter hook end of return spring **3** to the brake shoe assembly at the side opposite the adjuster of wheel cylinder assembly **12**.
- Insert a small Phillips screwdriver **D** into the hook of return spring **3**, insert the tip of the screwdriver into return spring installation hole **E** of brake shoe assembly **7** to pry on the return spring.

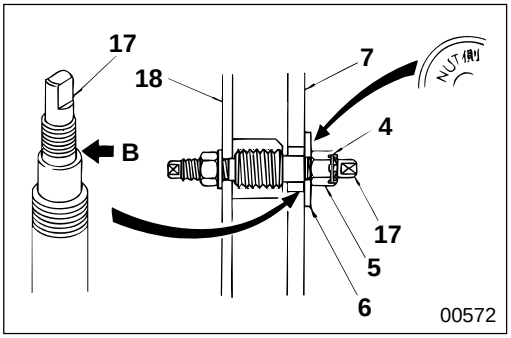


7 Brake shoe assembly

[Inspection]

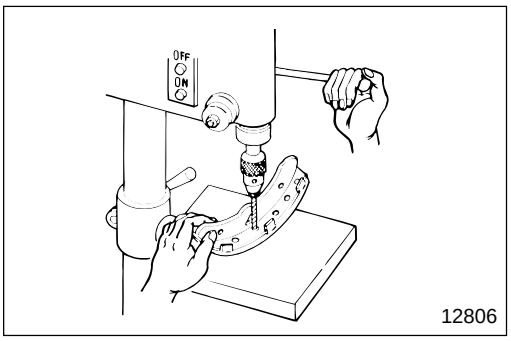
If thickness **A** of brake lining **9** is lower than the limit replace the brake lining on the same axle as a unit.

https://truckmanualshub.com/



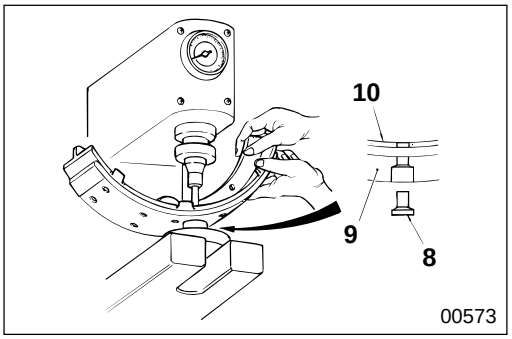
[Installation]

- Install brake shoe assembly **7**.
- Insert washer **6** with the side stamped “NUT 側” facing outside, screw down holder pin nut **5** until washer hits stepped area **B** of holder pin **17** gently, then slacken off the nut within the 0 to 60° limit until the nut is aligned with the first split pin hole.
- Insert split pin **4**, and bend it securely.



9 Brake lining

[Removal]



[Installation]

- Clean the mounting surfaces of brake lining **9** and brake shoe **10** with cleaning fluid and dry them.
- Insert rivets **8** from brake lining **9** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **10** and the brake lining.

  Caulking load for rivets : 17 to 19 kN {3750 to 4190 lbf, 1700 to 1900 kgf}

- Make sure that you inspect contact with the inner surface of brake drum ***** after you replace brake linings **9**. If contact is incorrect, correct with the brake assembled.

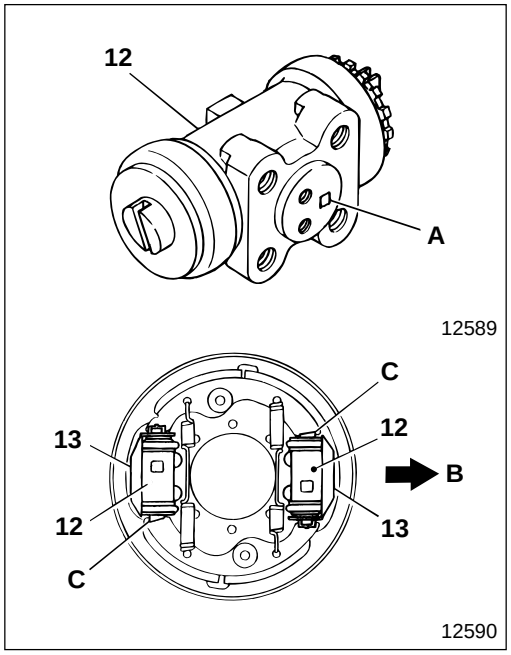
WARNING⚠

Do not leave lubricant on the surface of brake lining 9 because this reduces braking performance.

CAUTION⚠

Make sure that the type of brake linings 9 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one shaft.

https://truckmanualshub.com/

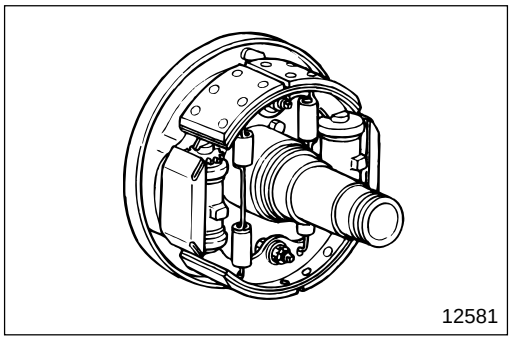


12 **Installation of wheel cylinder assembly**

A : Identification mark

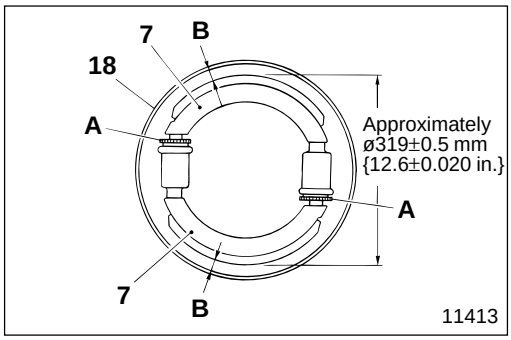
Identification mark	Installation position
R	Right wheel forward
L	Left wheel forward
No mark	Left and right wheel rearward

- Install anchor piece **C** so its recession is at the deeper side of the brake shoe at the outside.
  B : Front of the vehicle

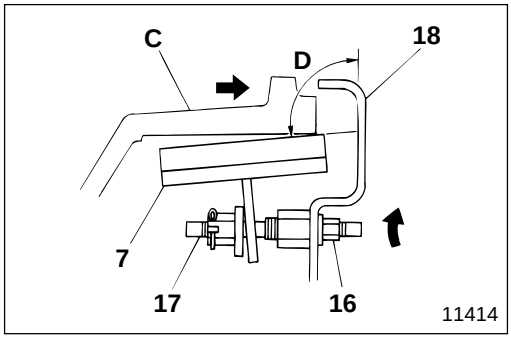


17 **Adjustment of holder pin**

- Install the rear wheel brake assembly on the rear axle. Gr 27

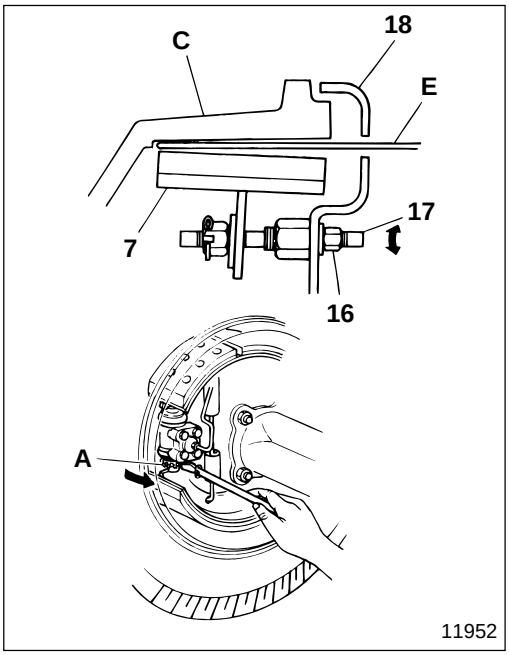


- Turn adjuster **A** to adjust the outer diameter to approximately ø319±0.5 mm {12.6±0.020 in.}.
- Then, move brake shoe assembly **7** to adjust clearance **B** evenly.



- Install hub and drum assembly **C** on the rear wheel brake assembly. Gr 27
  At this time, the hub and drum assembly cannot be inserted in the specified position if squareness **D** is 90° or more, so loosen nut **16** and turn holder pin **17** to adjust the squareness to as close to 90° as possible.
- Bleed the brake system. P35-30

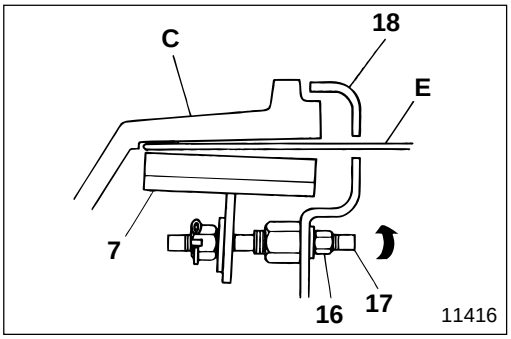
https://truckmanualshub.com/



★• Turn adjuster **A** to widen brake shoe assembly **7** until 0.2 mm {0.0079 in.} feeler gauge **E** cannot be pulled out easily.

★• Loosen nut **16** and turn holder pin **17** to the right or left so that feeler gauge **E** can be pushed in or pulled out easily.

- Repeat the above steps (marked ★) until feeler gauge **E** cannot be pushed in or pulled out easily.
- Depress the brake pedal a few times lightly to equalize clearance **B** (adjusted in the previous section).
- Repeat the above steps (marked ★) until feeler gauge **E** cannot be pushed in or pulled out easily.



- If feeler gauge **E** cannot be pushed in or pulled out easily it is because it is making contact over the full width of brake shoe assembly **7**.
- Turn holder pin **17** so that when you pull out feeler gauge **E**, in the above condition, and reinsert the feeler gauge, pushing in or pulling out the feeler gauge at the rear is difficult.
- After adjustment, tighten nut **16** at specified torque.

✱ Correction of brake drum

If the cylindrical accuracy of brake drum ✱ is higher than the limit, or there are seams, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

https://truckmanualshub.com/

◆ Service procedure

● **Adjustment after assembly**

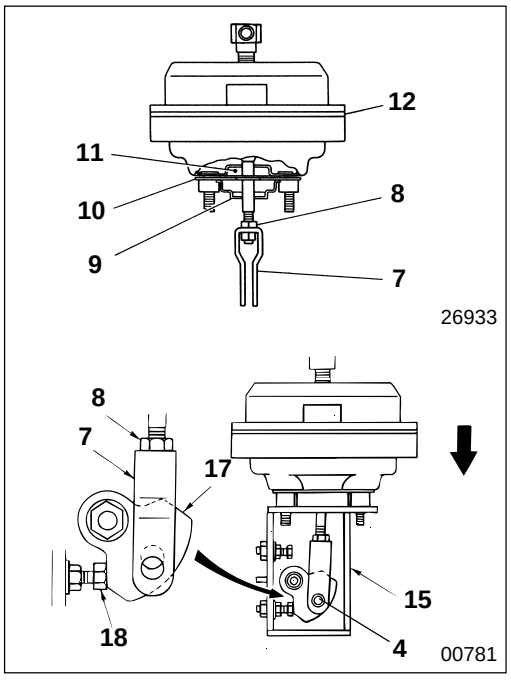
Adjustment of valve when fully-closed

- While applying negative pressure **B** of 87 to 93 kPa {25.6 to 27.5 in.Hg, 650 to 700 mmHg} to vacuum chamber assembly **12**, adjust by turning adjusting bolt **18** so that clearance **D** and **E** between the butterfly valve and body **C** conforms to the standard value.
- After adjustment, tighten lock nut **19** at specified torque.
- Average value of clearance **D, E** = (**D + E**)/2.
- Fully-opened adjustment of butterfly valve **A** is done while valve and bracket assembly **15** is installed.

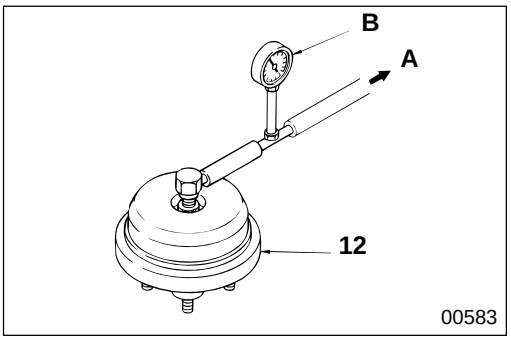


12 **Vacuum chamber assembly**

[Installation]

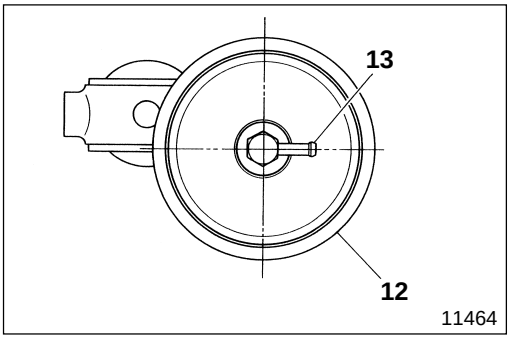
- Adjust valve and bracket assembly **15**. P35-63
- Adjust the hole of clevis **7** to position as illustrated.
- Fix clevis **7** using lock nut **8**.
- Push up and align clevis **7** with the hole of lever **17** and install using clevis pin **4**.

https://truckmanualshub.com/

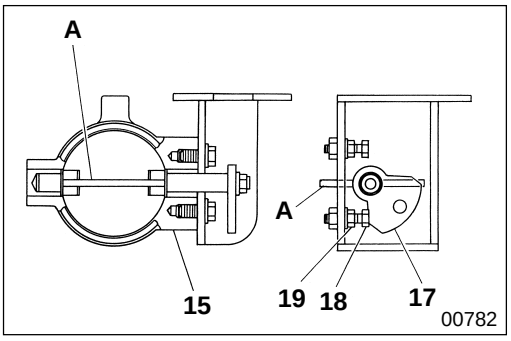


[Inspection]

Apply negative pressure **A** of 67 kPa {19.6 in.Hg, 500 mmHg} or more to vacuum chamber assembly **12**. Check to ensure that the value of negative pressure gauge **B** 15 seconds after indicating 67 kPa {19.6 in.Hg, 500 mmHg} conforms to the standard value.



13 **Installation of connector**



15 **Adjustment of valve and bracket assembly butterfly valve when fully-opened**

- Adjust by turning adjusting bolt **18** so that lever **17** and the head of the adjusting bolt meet horizontally (butterfly valve **A** is fully opened at such time).
- After adjustment, tighten lock nut **19** at specified torque.

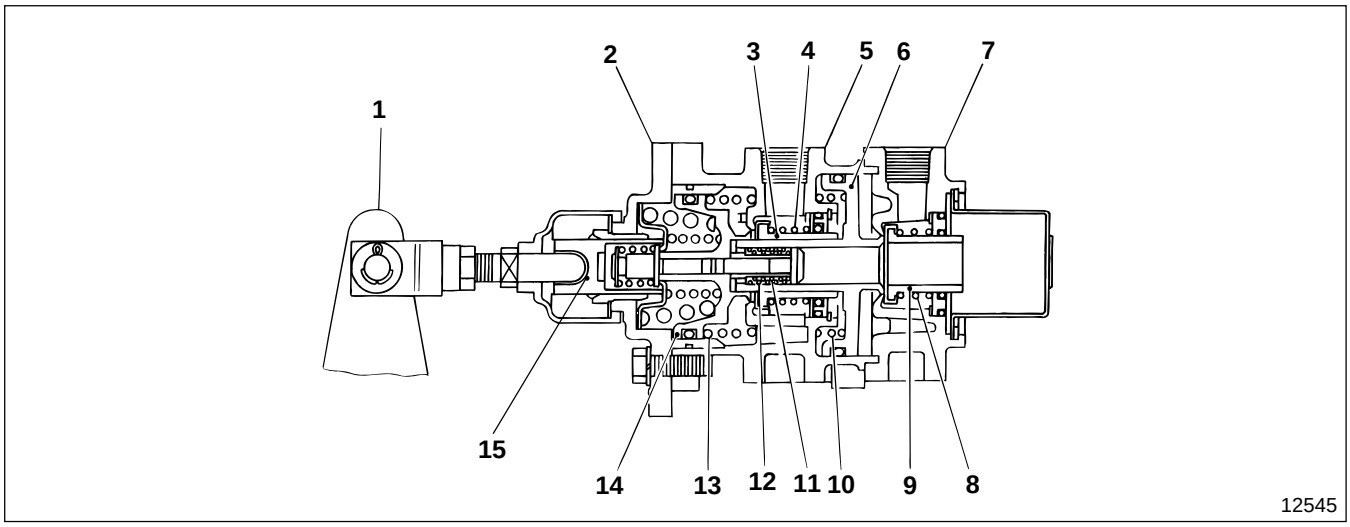
- The brake system is an air over hydraulic, all-wheel braking type consisting of separate front and rear systems.
- The servo system is fitted with airmasters **9**, **10**.
- An exhaust brake system, of the exhaust pipe opening and closing valve type, is fitted as a sub-brake system.

https://truckmanualshub.com/

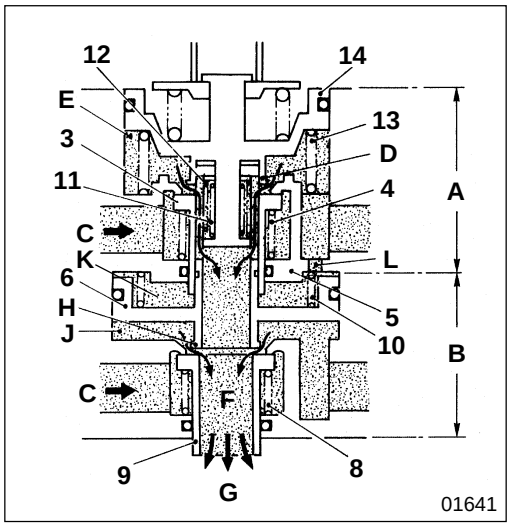
Dual Brake Valve



1 Brake pedal
2 Plate assembly
3 Primary inlet valve
4 Primary inlet valve spring
5 Body
6 Relay piston
7 Cover
8 Secondary inlet valve spring
9 Secondary inlet valve
10 Relay piston spring
11 Sleeve inner spring
12 Sleeve outer spring
13 Primary piston spring
14 Primary piston
15 Plunger

The dual brake valve controls the braking force of the vehicle by feeding pressurized air to the airmaster in accordance with the brake pedal depression angle of brake pedal **1**.

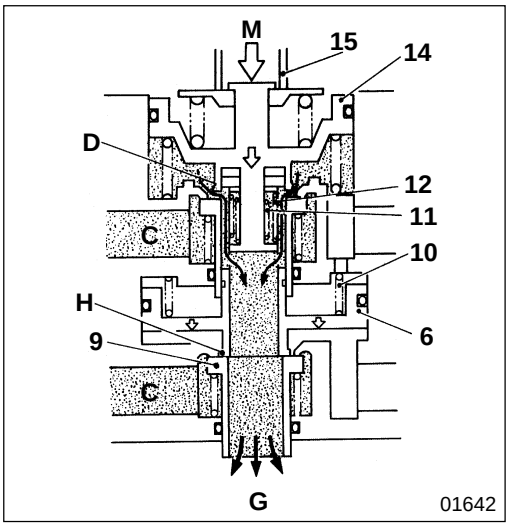
● When depressing brake pedal (braking pressure is generated)



- The repercussive forces of primary inlet valve spring **4** and secondary inlet valve spring **8** seat primary inlet valve **3** at primary side **A**, and secondary inlet valve **9** at secondary side **B**, on their respective seats. This shuts off air **C** from the air tank to maintain airtightness.
- The repercussive force of primary piston spring **13** raises primary piston **14** to its upper position. Exhaust valve seat **D** opens and chamber **E** is open to atmosphere **G** via chamber **F**.
- Since the repercussive forces of sleeve inner spring **11** and sleeve outer spring **12** is stronger than the repercussive force of relay piston spring **10**, relay piston **6** is raised to its upper position and exhaust valve seat **H** is opened. This opens chamber **J** to atmosphere **G** via chamber **F**.
  Chamber **E** at the primary side and chamber **K** at the upper part of relay piston **6** at the secondary side are connected via passage port **L** of body **5**.

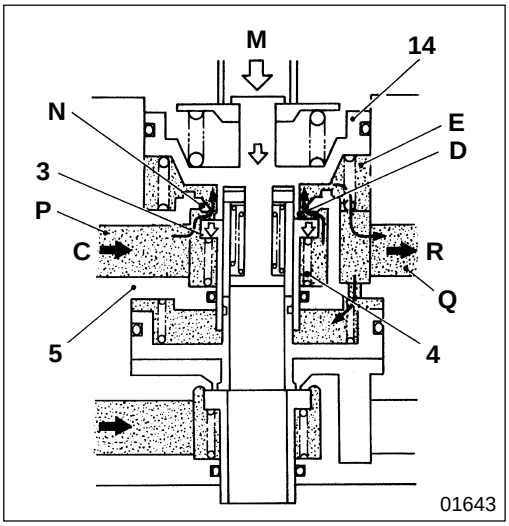
https://truckmanualshub.com/

● When depressing brake pedal (before braking pressure is generated)



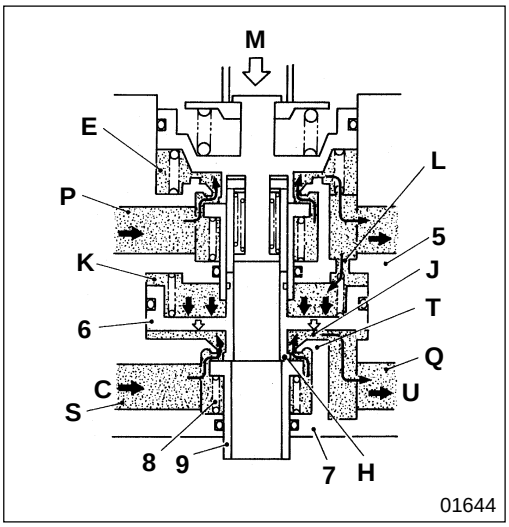
- Depressing the brake pedal (illustrated as pedal action **M**), forces down primary piston **14** via plunger **15**.
- Forcing down primary piston **14** changes the balance between the repercussive forces of inner spring **11** and outer spring **12**, and the repercussive force of relay piston spring **10**, forcing down relay piston **6**. This seats the relay piston on secondary inlet valve **9** and closes exhaust valve seat **H**.
- This closes the secondary side exhaust passage; however, primary side exhaust valve seat **D** remains open. No braking pressure is generated at either primary or secondary sides.

● When depressing brake pedal (braking pressure is generated)



Primary side

- As the brake pedal is depressed further (illustrated as brake pedal action **M**), primary piston **14** is forced down until it is seated on primary inlet valve **3**, closing exhaust valve seat **D**.
- Primary inlet valve **3** is forced down, compressing primary valve spring **4**, and supply valve seat **N** of body **5** separates from the primary inlet valve. The air in chamber **P** flows into chamber **E** and is fed to rear brake system **R** via discharge port **Q** as braking pressure.



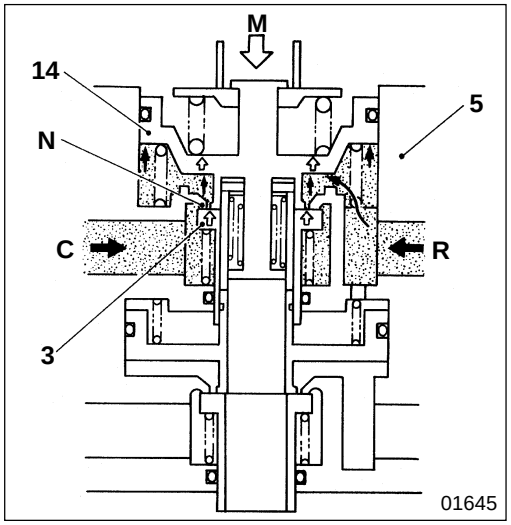
Secondary side

- The air at the primary side flows into chamber **K** via passage port **L** of body **5**.
- The air fed into chamber **K** acts on the upper part of relay piston **6** to force down the relay piston and compress secondary valve spring **8**, forcing down secondary inlet valve **9**.
- This separates supply valve seat **T** and secondary inlet valve **9** of cover **7**.
- The air in supply port chamber **S** flows into chamber **J** and is fed to front brake system **U** via discharge port **Q** as braking pressure.

https://truckmanualshub.com/

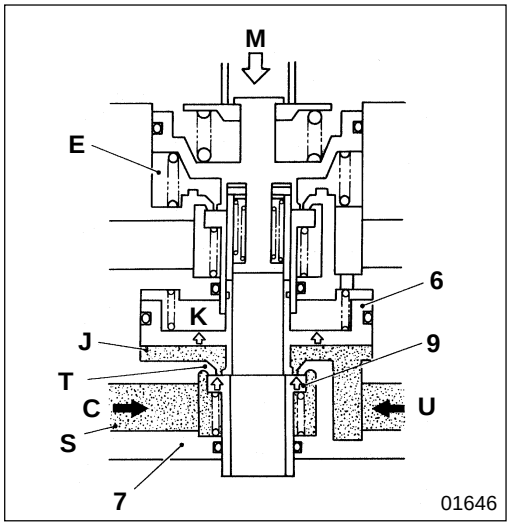
● Stabilization of braking pressure

When the brake pedal remains depressed at the specified depression angle, the braking air pressure stabilizes at the pressure corresponding to the brake pedal depression angle.



Primary side

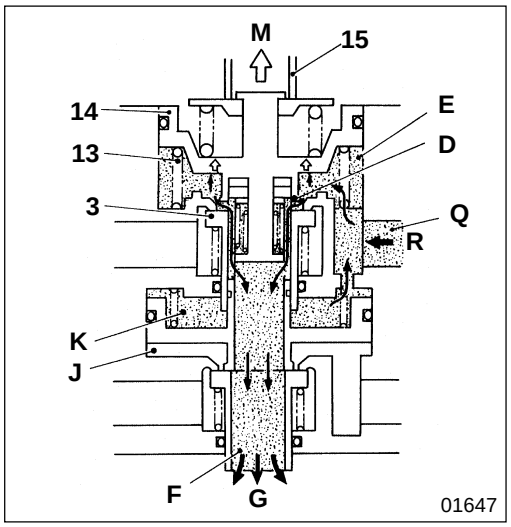
- The braking air pressure fed under the bottom of primary piston **14** raises the primary piston and primary inlet valve **3** together in tandem.
- Primary inlet valve **3** makes contact with supply valve seat **N** of body **5**, then the supply of air **C** from the air tank ceases and the increases in the braking air pressure stops. This stabilizes braking pressure **R** for the rear brake system.



Secondary side

- As the braking pressure (pressure in chamber **J**) for the front brake system balances the pressures in chambers **E** and **K**, the force raising relay piston **6** disappears, and the relay piston rises in tandem with secondary inlet valve **9**.
- Secondary inlet valve **9** makes contact with supply valve seat **T** of cover **7**, then the supply of air from supply port chamber **S** to chamber **J** ceases. This stabilizes brake pressure **U** for the front system.

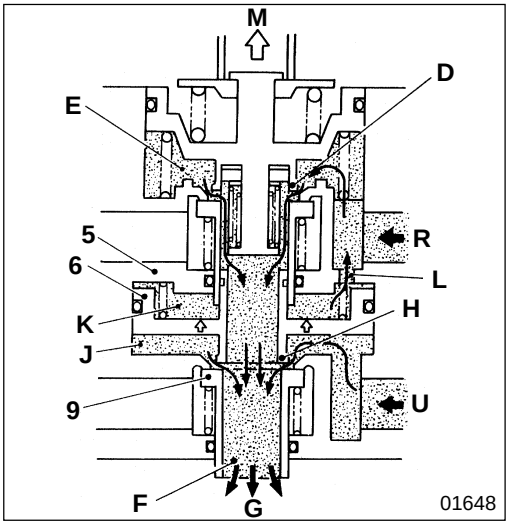
● Release of brake pressure



Primary side

When the brake pedal is released (illustrated as brake pedal action **M**), primary piston spring **13** and air pressure **R** at discharge port **Q** (pressure in chamber **E**) raise plunger **15** and primary piston **14**. Then, exhaust valve seat **D** at the lower end of the primary piston separates from primary inlet valve **3**. The air pressure of the rear brake system flows through chamber **E** to be discharged from exhaust passage chamber **F** into atmosphere **G**.

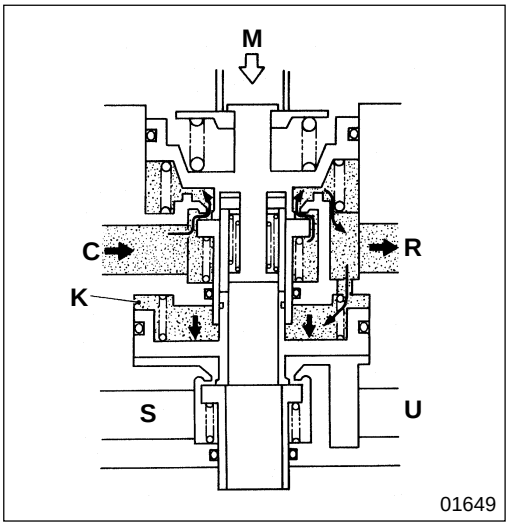
https://truckmanualshub.com/



Secondary side

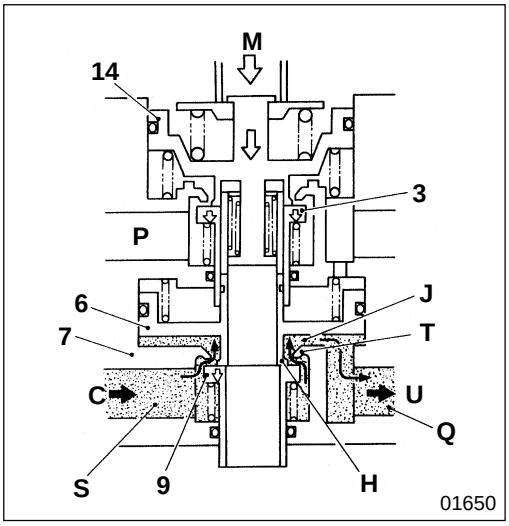
- As the air pressure in the rear brake system drops, the air pressure in chamber **K** is discharged via passage port **L** of body **5**, and chambers **E**, **F** into atmosphere **G**.
- This changes the air pressure balance between chambers **K** and **J**. The air pressure in chamber **J** raises relay piston **6**, and exhaust valve seat **H** at the lower end of the relay piston separates from secondary inlet valve **9**. Air pressure **U** in the front brake system is discharged from exhaust passage chamber **F** into atmosphere **G**.

● When abnormality occurs



Operation when the air pipe of the front brake system fails

- The primary side operates the same as normal, generating braking pressure in rear brake system **R**.
- At the secondary side, even if the primary side generates air pressure in chamber **K**, braking pressure is not generated in front brake system **U**, since no air pressure is generated in supply port **S**.

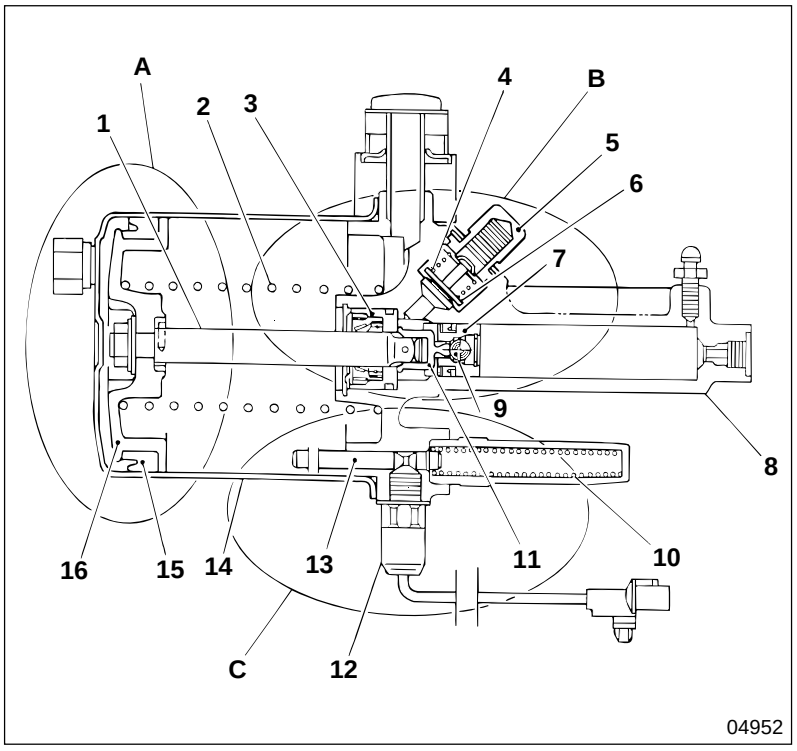


Operation when the air pipe of the rear brake system fails

- In the rear brake system, air pressure is not generated up to supply port **P**. Therefore, even if the brake pedal is depressed (causing primary piston **14** to force down primary inlet valve **3**), braking pressure is not generated.
- If the brake pedal is depressed further (illustrated as brake pedal action **M**), primary piston **14** makes contact with relay piston **6** and they force down secondary inlet valve **9**.
- This action separates supply valve seat **T** of cover **7** from secondary inlet valve **9**. The air pressure flows into chamber **J** from chamber **S** and is fed to front brake system **U** via discharge port **Q** as braking pressure.

https://truckmanualshub.com/

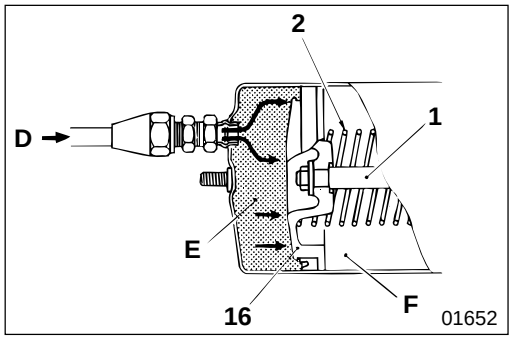
Brake Booster (Airmaster)



1 Push rod
2 Return spring
3 Retainer assembly
4 Spring
5 Connector
6 Residual valve
7 Hydraulic piston
8 Body assembly
9 Steel ball
10 Return spring
11 Yoke
12 Stroke switch
13 Rod
14 Cylinder shell
15 Cup packing
16 Piston plate

A : Power cylinder area
B : Hydraulic piston area
C : Power piston stroke detection switch area

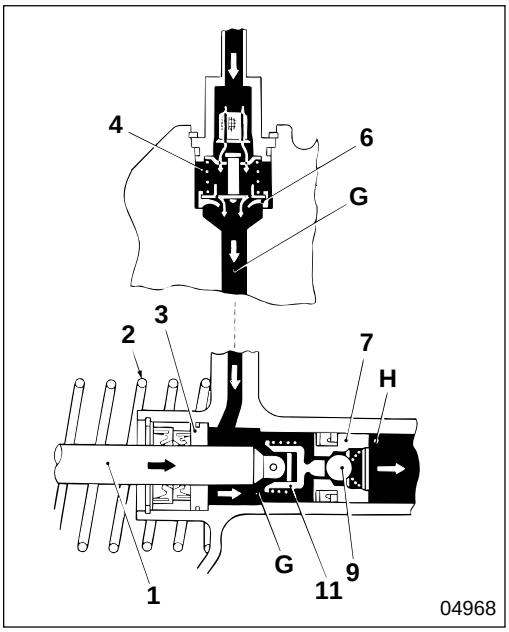
● Power cylinder area



- Operation of the dual brake valve feeds compressed air **D** into chamber **E**, activating piston plate **16**. This opens chamber **F** to the atmosphere, generating a pressure difference between chambers **E** and **F**. When this force becomes greater than the repercussive force of return spring **2**, the piston plate moves to the right.
- Piston plate **16** is fitted with push rod **1** that transmits the force of the compressed air received at the piston plate to hydraulic piston area **B**.

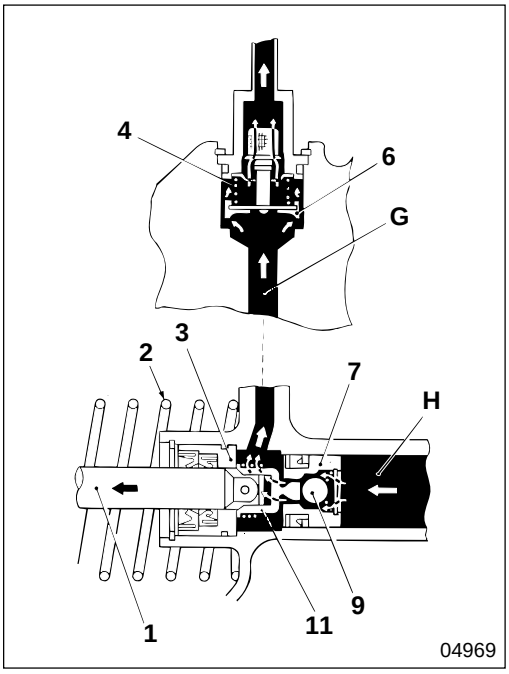
https://truckmanualshub.com/

● **Hydraulic piston area**



When functioning

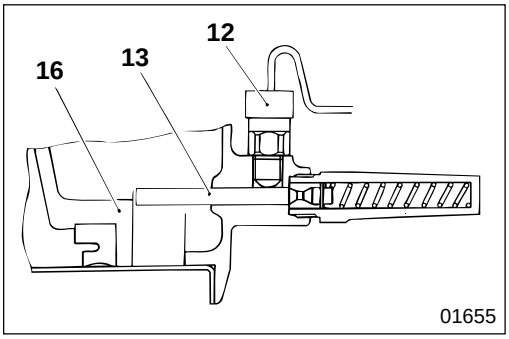
- The movement of the piston plate compresses return spring **2**, which moves push rod **1**, then hydraulic piston **7** to the right. This movement separates yoke **11** from retainer assembly **3**, and seats steel ball **9** at the end of the hydraulic piston. This closes the passage between brake fluid tank chamber **G** and wheel cylinder chamber **H**. The hydraulic piston moves to the right and pressurizes the brake fluid in chamber **H**, transmitting power to the wheel cylinder.
- In residual valve **6**, negative pressure from chamber **G** increases as the volume expands in line with the movement of the hydraulic piston. This opens the residual valve, allowing it to suck brake fluid from the fluid tank.



When released

- Releasing the brake pedal frees the compressed air at the rear side of the piston plate into the atmosphere. Hydraulic piston **7** is returned to its original position by the combined repercussive forces of return spring **2** of push rod **1**, and the brake fluid pressure of chamber **H** yoke **11** hits retainer assembly **3**, connecting chamber **G** and chamber **H**.
- Brake fluid flows through chamber **G** to compress spring **4** of residual valve **6**. The brake fluid passes around the residual valve and returns to the fluid tank.
- Residual valve **6** closes when the repercussive forces of spring **4** and the brake fluid pressure balance.

● **Power piston stroke detecting switch area**



- When brake fluid has been lost due to damage to the brake pipe, the stroke of the power piston increases, and piston plate **16** hits the end of rod **13**, and the rod is moved to the right.
- Because of this, stroke switch **12** leaves the recessed area of the rod **13**, and turns the stroke switch ON. This turns on a warning lamp within the meter cluster to alert the driver.

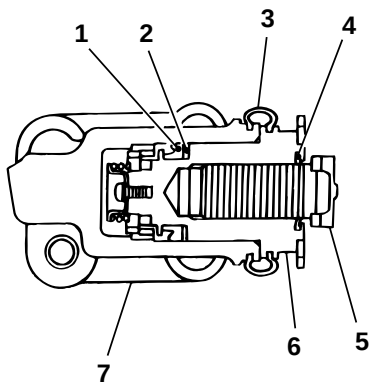
3 Return spring
4 Wheel cylinder assembly

- The front wheel brake is an internal expanding 2-leading brake type.
- The rear wheel brake is an internal expanding dual 2-leading brake type.
- Front and rear wheel cylinder assemblies **4** have shoe clearance automatic adjusting mechanisms to adjust shoe clearance within a specific range.

https://truckmanualshub.com/

● Wheel cylinder assembly

< Front >



12966

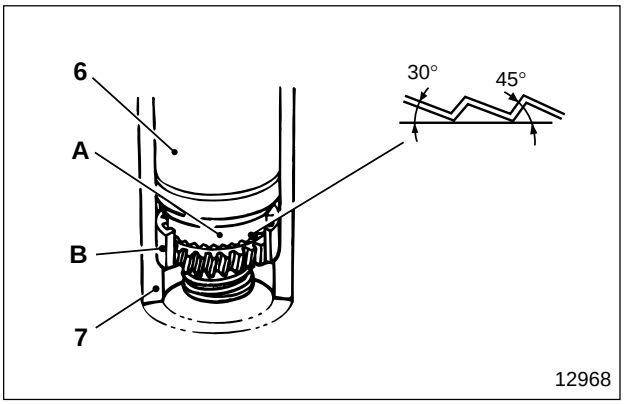
12967

1 Piston cup
2 Backup ring
3 Boot
4 Seal
5 Screw
6 Piston
7 Cylinder body
8 Anchor piece < Rear >
9 Piston < Rear >

Even if the brake lining has worn to the extent that the brake shoe clearance is higher than the specified value, the brake shoe clearance automatic adjusting mechanism automatically adjusts the brake shoe clearance to maintain the appropriate brake shoe clearance when the vehicle is braked when moving forwards.

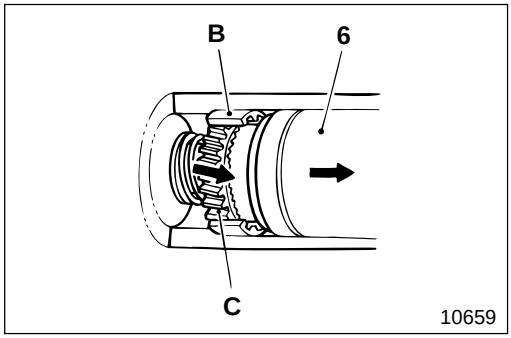
● Operation of automatic shoe clearance adjusting mechanism (one-way clutch)



12968

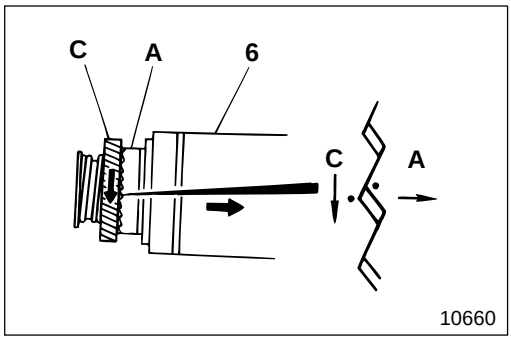
30° : When piston **6** appears, the double helical gear slides out easily.
45° : When turning piston **6**, the double helical gear receives and maintains the rotational force.
A : Clutch
B : Guide

https://truckmanualshub.com/

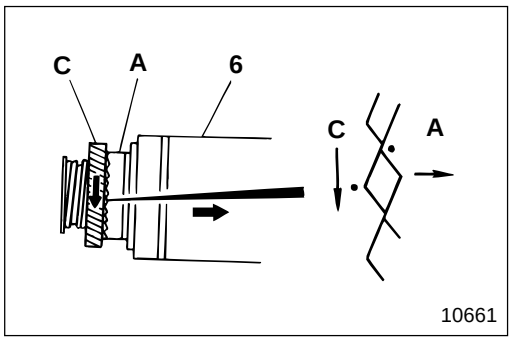


● **When braking starts**

- When hydraulic braking pressure acts on the wheel cylinder, it pushes piston **6** forward.
- Idler **C** of extended piston **6** is engaged with the diagonal gears cut in guide **B** of the cylinder body, so the idler advances while turning, in accordance with the travel of the piston.



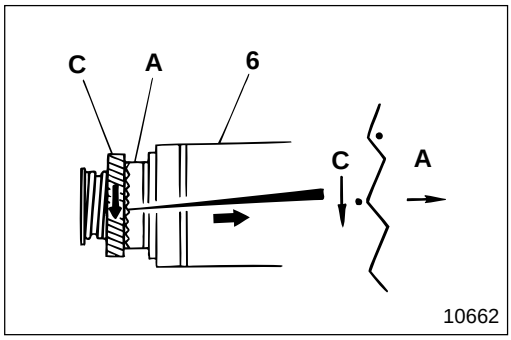
- The rotation of idler **C** slides out the double helical gear of clutch **A**.



● **When depressing brake pedal**

When the brake shoe clearance conforms to the specified value

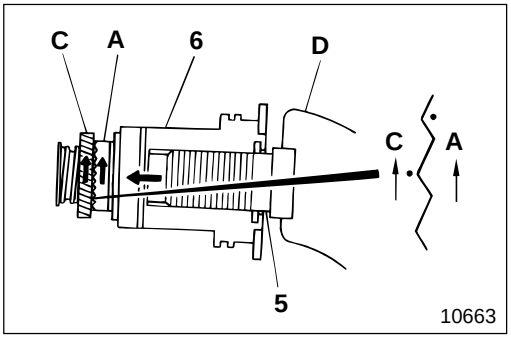
- The amount of travel of idler **C** is proportional to the amount of travel of piston **6**. The amount of travel is not enough to make the double helical gear of clutch **A** climb over the opposite double helical gear when the brake shoe clearance is within the specified value.



When the brake shoe clearance is higher than the specified value

- When the brake shoe clearance is higher than the specified value, the amount of travel of idler **C** increases enough to make the double helical gear of clutch **A** climb over the opposite double helical gear.

https://truckmanualshub.com/

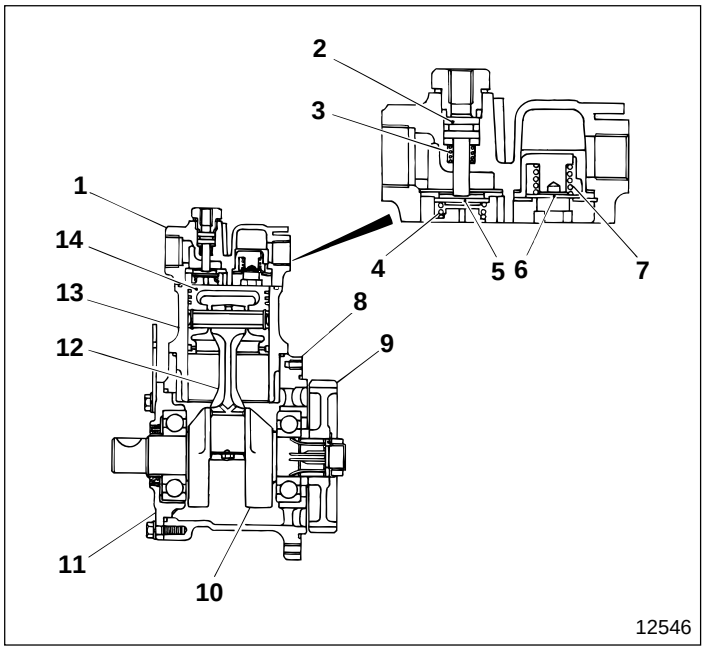


● **When releasing brake pedal**

- As the brake fluid pressure decreases and piston **6** returns, idler **C** also returns, turning in the opposite direction along guide **B** of the cylinder body.
- When the brake shoe clearance is within the specified value, piston **6** returns to its original position without turning, because the double helical gear of clutch **A** has not climbed over the opposite double helical gear.
- When the brake shoe clearance is higher than the specified value, piston **6** returns while turning by one gear tooth, since the double helical gear of clutch **A** has climbed over the opposite gear. This lowers the brake shoe clearance to the specified value, because screw **5** of the piston is fixed by brake shoe **D** and does not turn.

https://truckmanualshub.com/

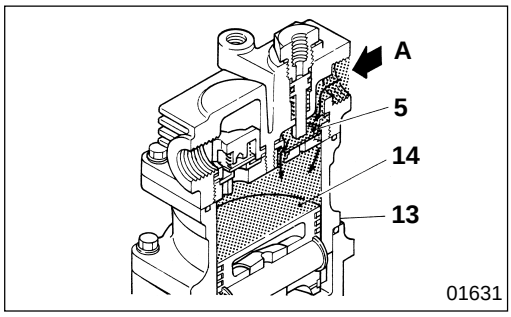
Air Compressor



1 Cylinder head
2 Unloader valve
3 Unloader valve spring
4 Suction valve spring
5 Suction valve
6 Delivery valve
7 Delivery valve spring
8 Crankcase
9 Drive gear
10 Crankshaft
11 Bearing holder
12 Connecting rod
13 Cylinder liner
14 Piston

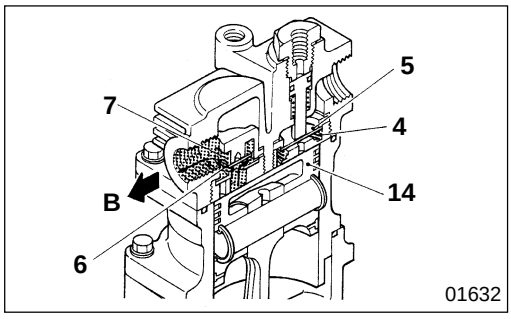
The air compressor is driven by the engagement of drive gear **9** with the engine timing gear.

● **During suction**



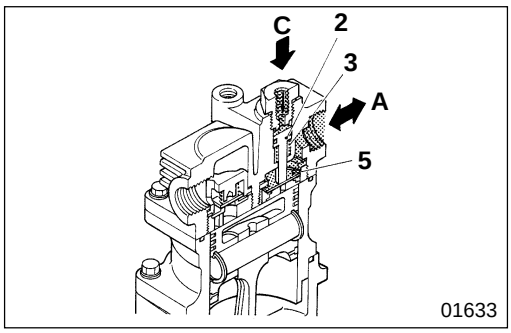
- When drive gear **16** is driven, crankshaft **10** engaged with the drive gear turns to force down piston **14**.
- The negative pressure generated at this time opens suction valve **5**, sucking air **A** into cylinder liner **13**.

● **During pressurized delivery**



- As piston **14** rises and enters into the compression stroke, suction valve spring **4** closes suction valve **5**.
- The pressure of the compressed air overcomes the repercussive force of delivery valve spring **7** and opens delivery valve **6** to compress and deliver air **B** to the air tank.

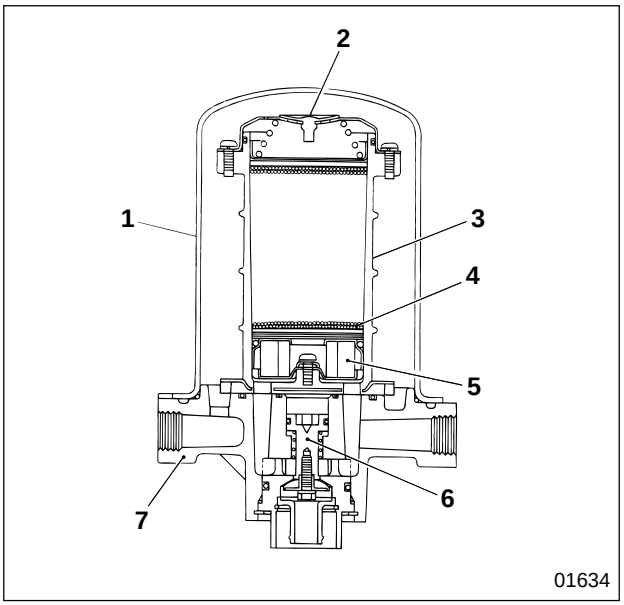
● **When unloader valve operates**



- When the air pressure in the air tank becomes higher than the specified value, the air pressure governor feeds compressed air **C** to unloader valve **2**. This forces down the unloader valve and holds suction valve **5** open at the same time. Therefore, air **A** is not compressed and the air compressor idles.
- When the air pressure in the air tank drops below the specified value, the air pressure governor discharges compressed air from the upper part of unloader valve **2**. So, unloader spring **3** returns the unloader valve to its original position.

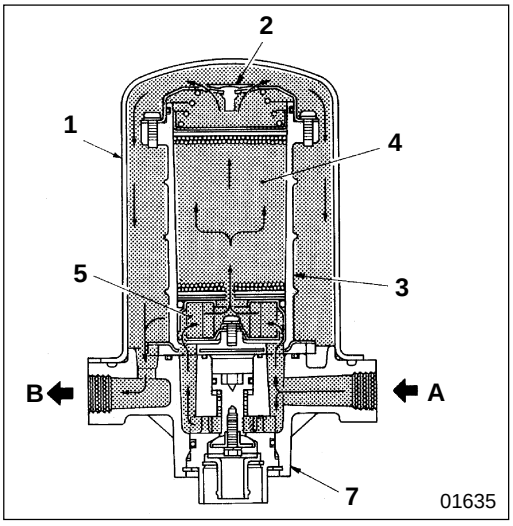
https://truckmanualshub.com/

Air Dryer



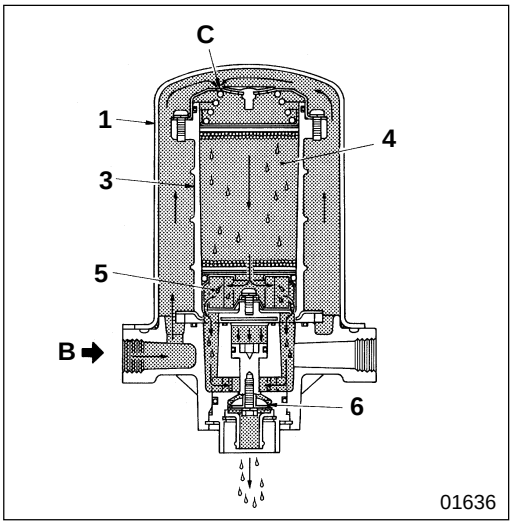
1 Purge chamber
2 Check valve
3 Case
4 Desiccant
5 Oil filter
6 Valve
7 Body

The air dryer removes moisture and oil in the air compressed by the air compressor and protects the brake assembly.



Dehumidification

- The pressurized air from the air compressor enters delivery side **A** of the air dryer. Once in body **7**, moisture and oil are separated from the air and collected in the bottom. Then, the air passes through oil filter **5**, where small oil droplets and dust are removed. Next, the air is delivered into case **3**, where moisture is removed by desiccant **4**.
- As the air travels from the bottom to the top of case **3**, it comes into contact with more dried desiccant. This removes residual moisture from the air, drying the air as it reaches the top of the case. The air passes through check valve **2** and purge chamber **1**, and is delivered to the air tank through exhaust side **B**.

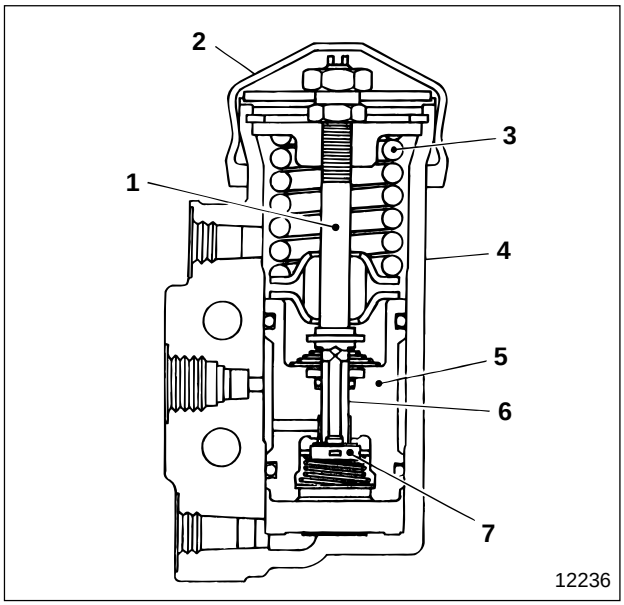


Regeneration of desiccant

- When the supply of air from the air compressor stops, pressure **D** from the air pressure governor opens valve **6** of the control port of the air dryer. The pressure in case **3** cleans oil filter **5**, releasing the condensed water and oil into the atmosphere.
- After being quickly decompressed, the dry air in purge chamber **1** passes through hole **C**, where the air expands under the reduced pressure, becoming super dry air. This air flows back through case **3** and collects the moisture in desiccant **4**, releasing this moisture into the atmosphere, thereby recycling the desiccant.

https://truckmanualshub.com/

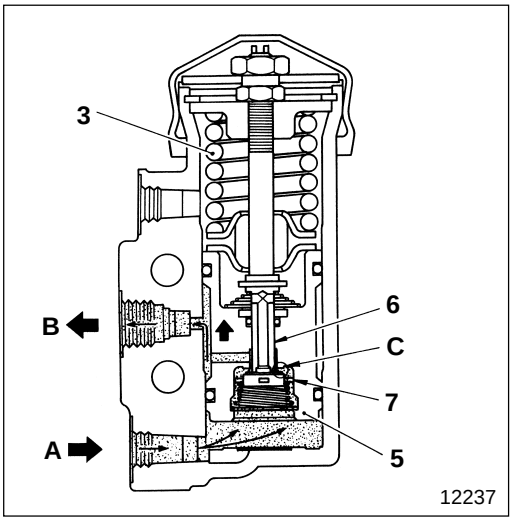
Air Pressure Governor



1 Adjusting screw
2 Cover
3 Spring
4 Body
5 Piston
6 Exhaust stem
7 Valve

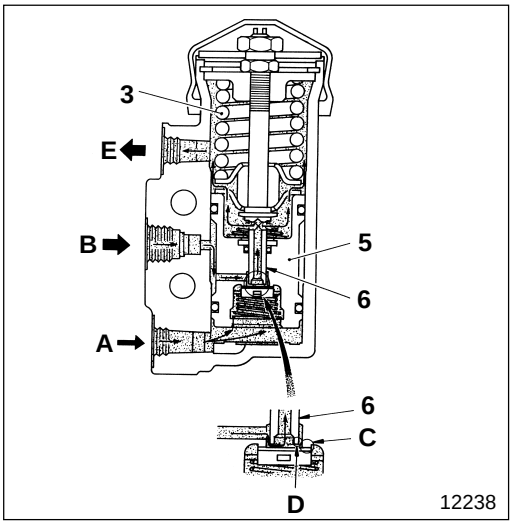
The air pressure governor keeps the air pressure in the air tank at the specified pressure, by operating the air compressor with or without load in accordance with the air pressure in the air tank.

● **High specified-pressure**



- Pressurized air **A** from the air tank acts constantly on piston **5**. As the pressure in the air tank rises to overcome the repercussive force of spring **3**, the piston rises and valve **7** closes.
- As air pressure **A** from the air tank rises further to become higher than the high specified-pressure, piston **5** rises further. Therefore, exhaust stem **6** opens inlet valve **C** and the air pressure in the air tank flows from unloader port **B** to the unloader valve of the air compressor via the inlet valve. Then the air compressor enters unloaded operation. Pressure also reaches the air dryer to recycle the desiccant.

● **Low specified-pressure**



When pressurized air **A** from the air tank gradually drops below the specified-pressure, spring **3** forces down piston **5**. This closes inlet valve **C** and opens exhaust valve seat **D** so pressurized air **B**, up to the unloader valve of the air compressor, is discharged through the opening of cover **2** via exhaust stem **6** as exhausted air **E**, operating the air compressor at load. The pressurized air up to the air dryer is also discharged into the atmosphere.

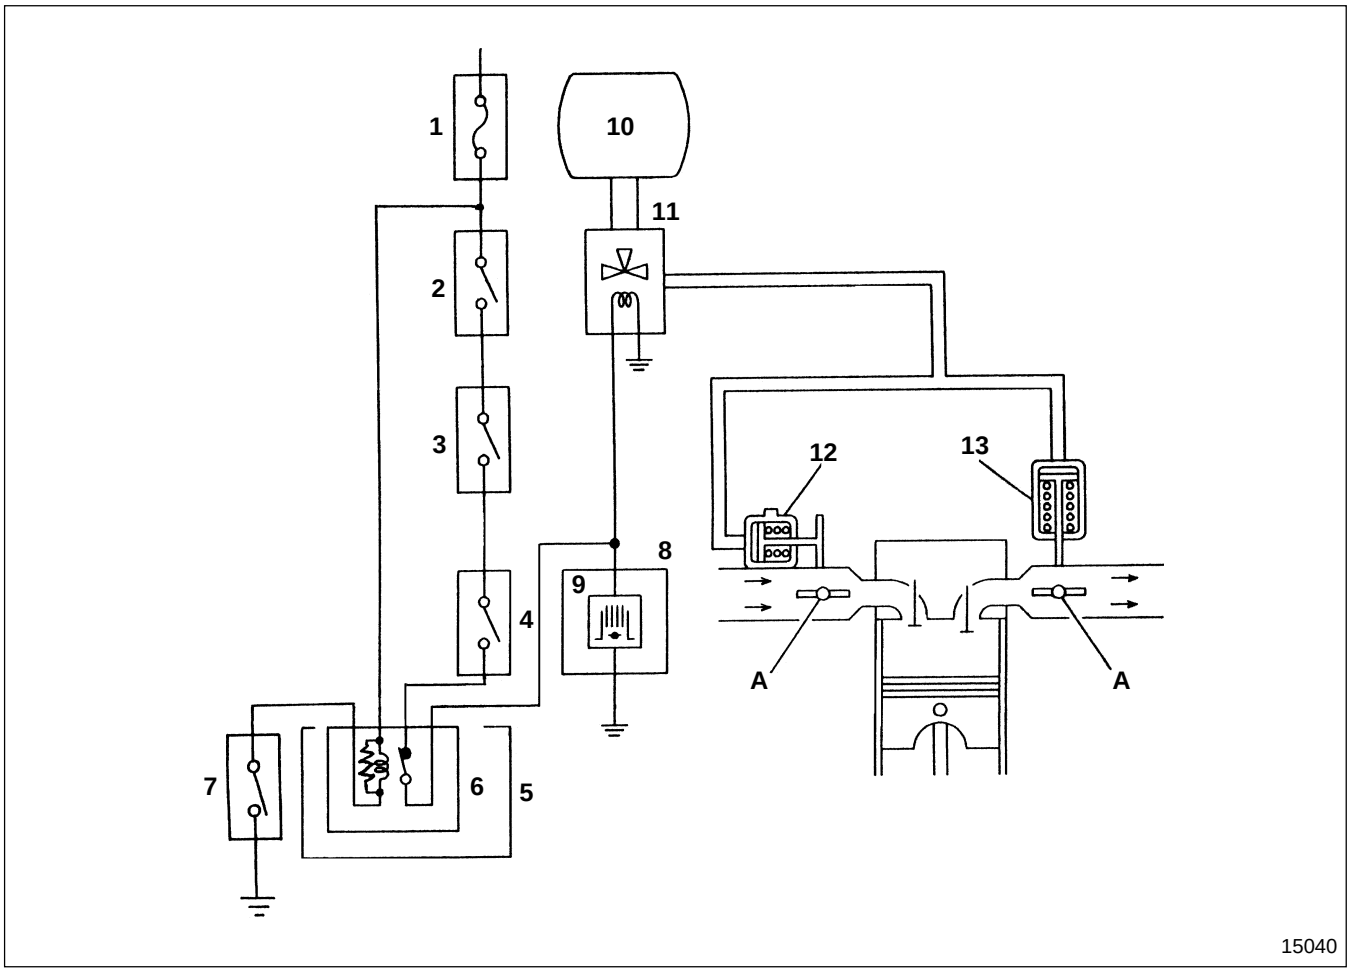
MEMO

https://truckmanualshub.com/

Exhaust Brake System



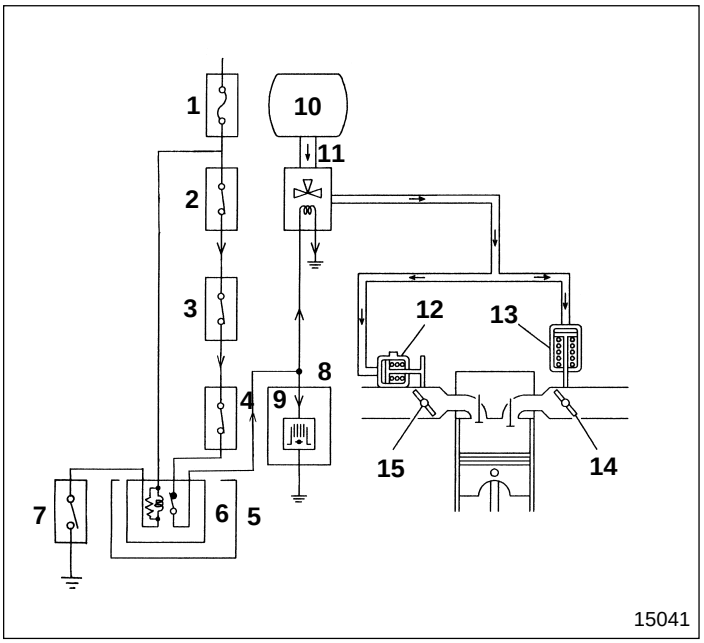
1 Fuse box
2 Clutch switch
3 Accelerator switch
4 Exhaust brake switch
5 Relay box
6 Exhaust brake cut relay
7 Transmission neutral switch
8 Meter cluster
9 Exhaust brake indicator lamp
10 Air tank
11 3-way magnetic valve
12 Intake silencer actuator
13 Exhaust brake unit

A : Butterfly valve

- Excitation of 3-way magnetic valve **11** causes the air pressure in air tank **10** to act on intake silencer actuator **12** and exhaust brake unit **13** to close butterfly valve **A**, activating the exhaust brake.
- If the exhaust brake is activated while the vehicle is stationary, the coolant temperature can rise excessively, overheating the engine. To avoid this, when the transmission is in neutral, transmission neutral switch **7** turns ON, cutting the exhaust brake system.

https://truckmanualshub.com/

● When exhaust brake system is activated

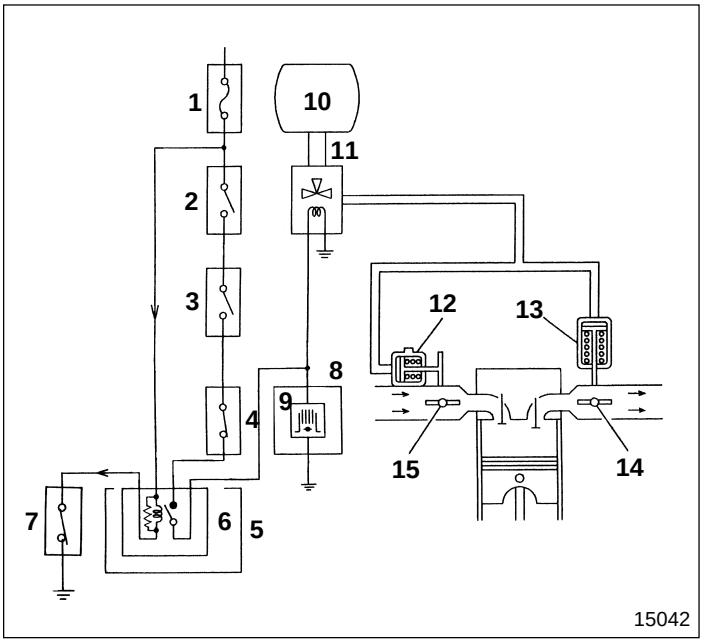


When exhaust brake switch **4** is turned on, the current flows as illustrated to activate the exhaust brake.

Fuse **1**→Clutch switch **2**→Accelerator switch **3**→Exhaust brake switch **4**→Exhaust brake cut relay **6**⟶3-way magnetic valve **11**→Ground

⟶Exhaust brake indicator lamp **9** (ON)→Ground

● When the exhaust brake system is released



When the accelerator pedal or clutch pedal is depressed while the exhaust brake is working, all switches **3**, **2** turn off, shutting off the current, releasing the exhaust brake.

● When clutch pedal is depressed

Fuse **1**→Clutch switch **2** (OFF)→Since no current flows, the circuit turns off and the exhaust brake is released.

● When accelerator pedal is depressed

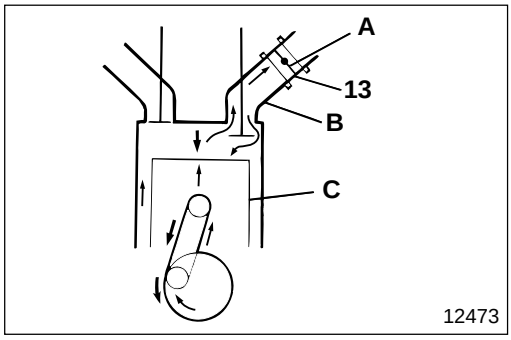
Fuse **1**→Clutch switch **2**→Accelerator switch **3** (OFF)→Since there is no grounding, current does not flow, so the exhaust brake is released.

https://truckmanualshub.com/

● Releasing exhaust brake system by placing transmission in neutral

Fuse **1**→Exhaust brake cut relay **6** excitation→Transmission neutral switch **7**→Ground
Fuse **1**→Clutch switch **2**→Accelerator switch **3**→Exhaust brake switch **4**→Exhaust brake cut relay **6** (OFF)→Beyond this, current does not flow so the exhaust brake is released.

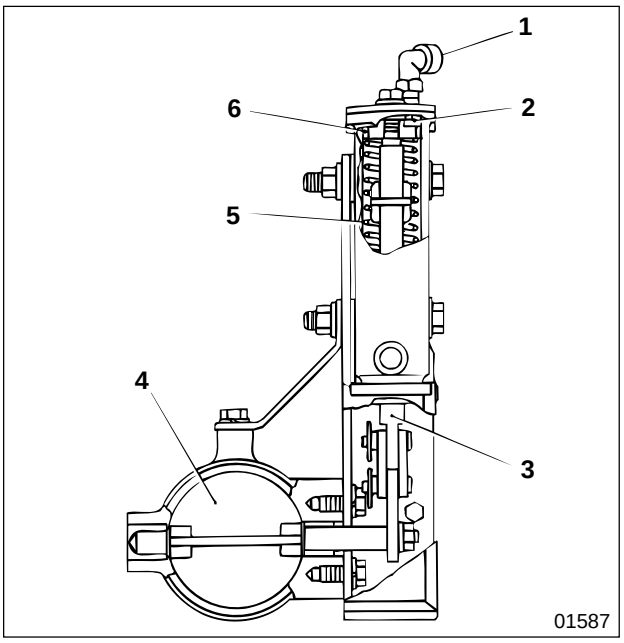
● Working principle of exhaust brake



When butterfly valve **A** of exhaust brake unit **13**, in exhaust pipe **B**, is closed, the pressure in the exhaust pipe rises. The pressure rises further in the exhaust stroke, generating a force that pushes back piston **C**, the exhaust braking force.

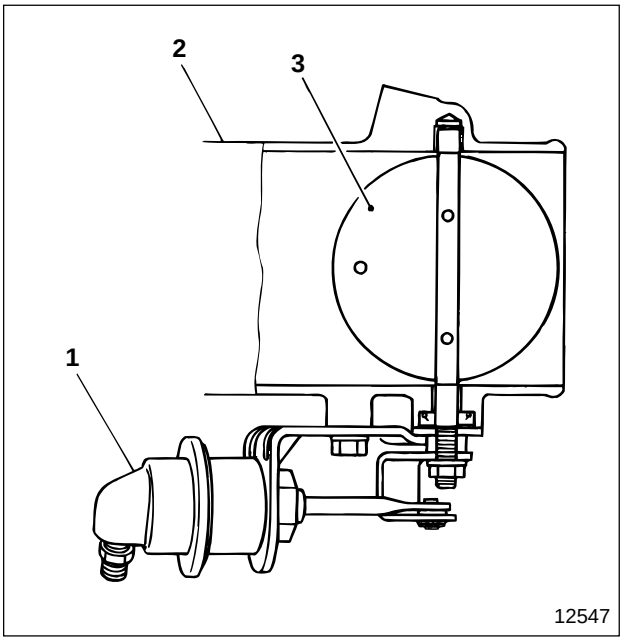
https://truckmanualshub.com/

● Exhaust brake unit



1 Connector
2 Packing
3 Shaft assembly
4 Butterfly valve
5 Spring
6 Plate

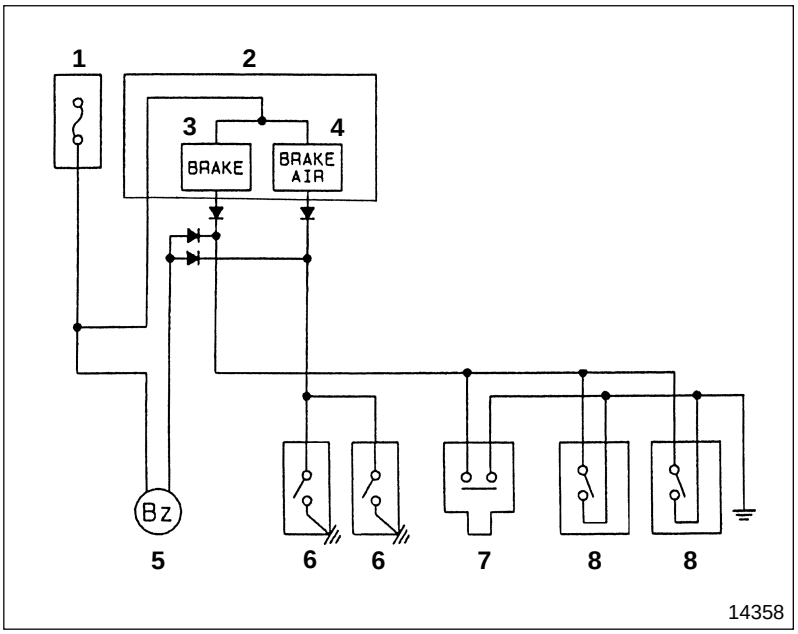
● Intake silencer



1 Actuator assembly
2 Intake pipe
3 Butterfly valve

https://truckmanualshub.com/

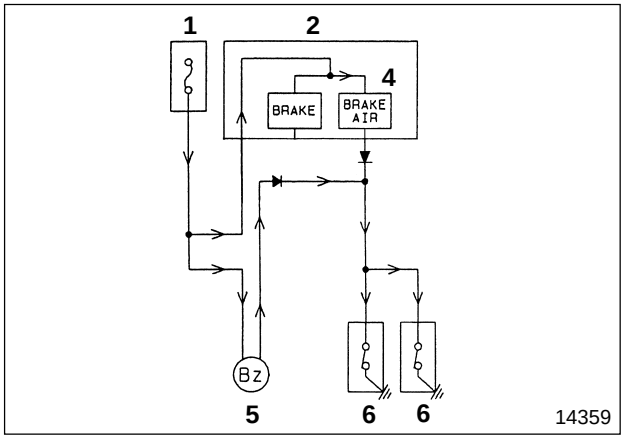
Brake Warning System



1 Fuse and relay box
2 Meter cluster
3 Brake fluid warning lamp
4 Air warning lamp
5 Warning buzzer
6 Low air pressure switch
7 Brake fluid level switch (installed on fluid tank)
8 Stroke switch (installed on airmaster)

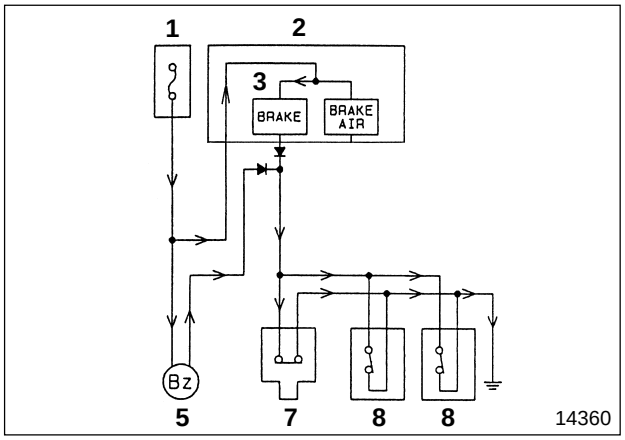
The brake warning system consists of two circuits: the air pressure warning circuit and the brake fluid warning circuit. The first detects decrease of air pressure in the air tank, the second detects decrease in brake fluid in the fluid tank and brake fluid leakage in the brake fluid system. Both circuits light warning lamps and at the same time sound a buzzer to alert the driver.

● Air pressure warning circuit



When the air pressure in the air tank drops below the specified value, low air pressure switch **6** turns on to light air warning lamp **4** and sound warning buzzer **5**.

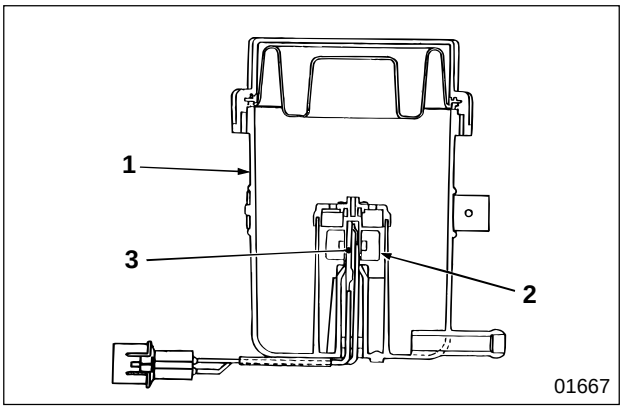
● Brake fluid warning circuit



- When the brake fluid in the fluid tank drops below the specified level, brake fluid level switch **7** in the fluid tank turns on, brake fluid warning lamp **3** lights and warning buzzer **5** sounds. At this time, current flows as follows:
- If brake fluid leaks from the brake fluid system, stroke switch **8** of the airmaster turns on, brake fluid warning lamp **3** lights and warning buzzer **5** sounds.

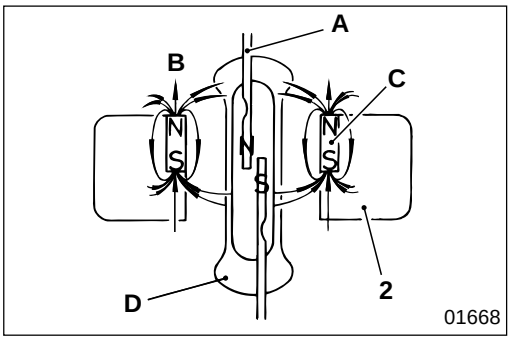
https://truckmanualshub.com/

● Brake fluid level switch



1 Fluid tank
2 Float
3 Brake fluid level switch

- Brake fluid level switch **3**, installed on fluid tank **1**, monitors the brake fluid level in the fluid tank. If the brake fluid level drops below the specified level, float **2** moves and lights up the warning lamp within the meter cluster to alert the driver.



- If the brake fluid level in fluid tank **1** drops and float **2** drops lower than level **L**, magnetic force **B** that passes through the contact point (ferromagnetic body **A**), increases generating north and south poles at the ends of the contact points. Therefore, the contact points pull each other and overcome the repercussive force of the springs of the contact points, forming an electric circuit.
  C : Permanent magnet
  D : Glass

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Replacement of Brake Fluid

Fluid

Location	Points of application	Kinds	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Vinyl hose 	MH033102	Air bleeding

WARNING

- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3).**
- **Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the brake system, because this will cause the rubber parts of the brake system to swell, resulting in brake dragging or ineffective braking.**
- **Do not allow foreign particles or water to get mixed in with the brake fluid when you add it.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oil.**

CAUTION

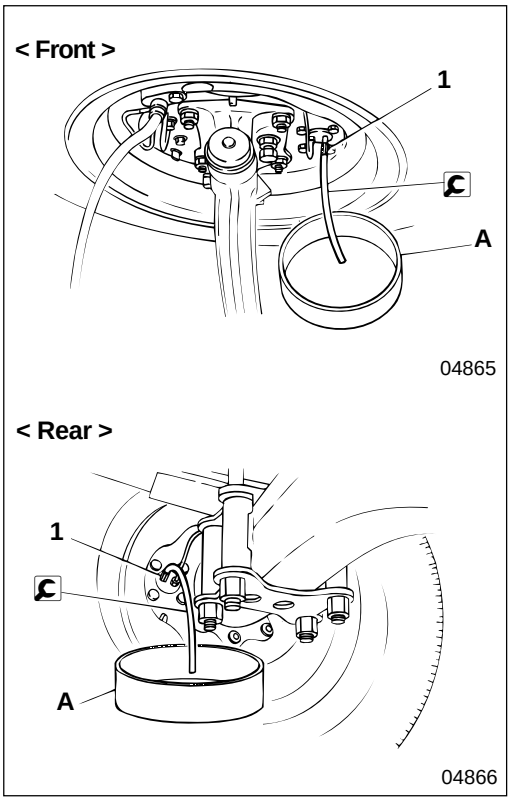
- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

NOTE

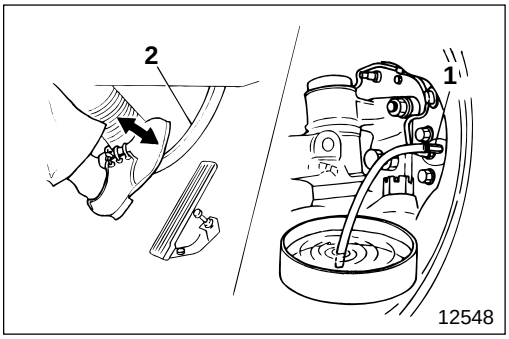
Supply and maintain brake fluid to the “H” level of the fluid tank.

https://truckmanualshub.com/

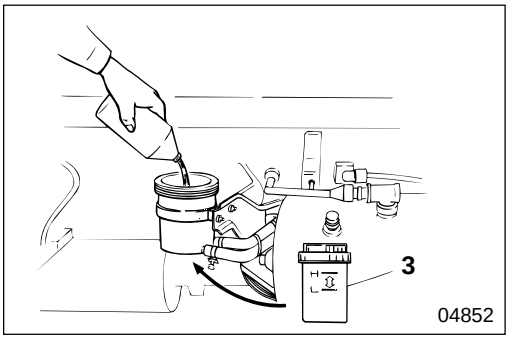
- Start engine and let it idle until brake fluid replacement is completed.



- Attach one end of vinyl hose to air bleeder **1** and place the other end in container **A**.

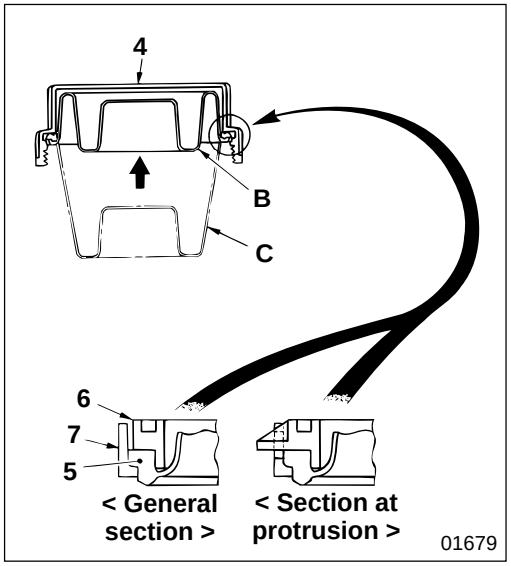


- Loosen air bleeder **1** and depress brake pedal **2** to drain brake fluid completely.



- Maintain a supply of new brake fluid up to the "**H**" level of fluid tank **3**, depress the brake pedal repeatedly until the old brake fluid of the brake system is replaced with new fluid.

https://truckmanualshub.com/



- If diaphragm **5** is not in its normal posture when the brake fluid is supplied, correct it to its normal posture, and install cap **4**. If brake fluid leaks from the cap area after you have supplied brake fluid, check whether the diaphragm is assembled as illustrated.

  6 : Slide ring
  7 : Ring cover
  B : Correct condition of diaphragm when brake fluid is being supplied
  C : Condition when diaphragm is extended when brake fluid has decreased

- Air bleeding of brake system. P35-32

Air Bleeding of Brake System

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
—	Air bleeder (Airmaster)	6.9 to 12.7 {5.1 to 9.4, 0.7 to 1.3}	—
—	Air bleeder (Wheel brake)	7.8 to 12 {5.8 to 8.5, 0.8 to 1.2}	—

Fluid

Location	Points of application	Kinds	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
2	Vinyl hose 	MH033102	Air bleeding

https://truckmanualshub.com/

WARNING⚠

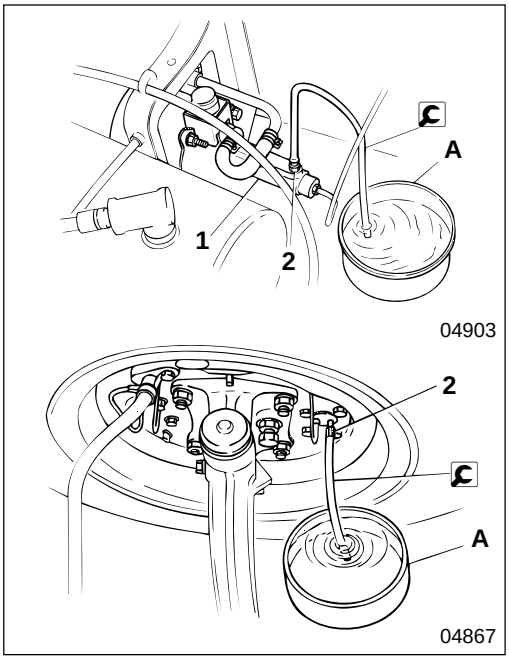
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3).**
- **Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the brake system, because this will cause the rubber parts of the brake system to swell, resulting in brake dragging or ineffective braking.**
- **Do not allow foreign particles or water to get mixed in with the brake fluid when you add it.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oil.**

CAUTION⚠

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

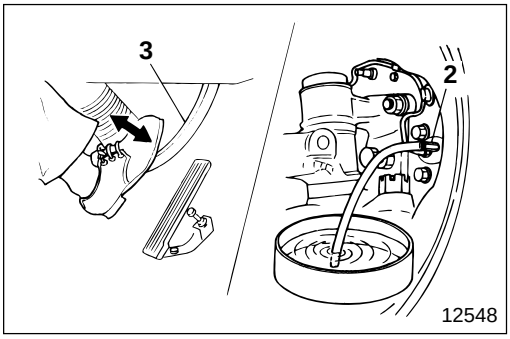
NOTE

- **Supply and maintain brake fluid to the "H" level of the fluid tank.**
- **Make sure you maintain brake fluid at the "H" level of the fluid tank since the brake fluid level drops during air bleeding.**



- Start engine and let it idle until brake fluid replacement is completed.
- Attach one end of vinyl hose to front or rear airmaster **1**. Then, attach one end of another vinyl hose to air bleeder **2** of the wheel brake. Finally, place both free ends in container **A** filled with brake fluid.
- Carry out air bleeding in the following sequence:

Front brake system	Rear brake system
Airmaster for front	Airmaster for rear
↓	↓
Right-hand side wheel brake	Right-hand side wheel brake
↓	↓
Left-hand side wheel brake	Left-hand side wheel brake



- Depress brake pedal **3** slowly a few times, and with the brake pedal depressed, loosen air bleeder **2** to drain brake fluid containing air.

https://truckmanualshub.com/

- Tighten air bleeder **2**, and release brake pedal **3**.
- Repeat this service procedure until air is no longer present in the fluid being drained.
- Tighten air bleeder **2** at specified torque as soon as brake fluid flowing out is free of air bubbles.

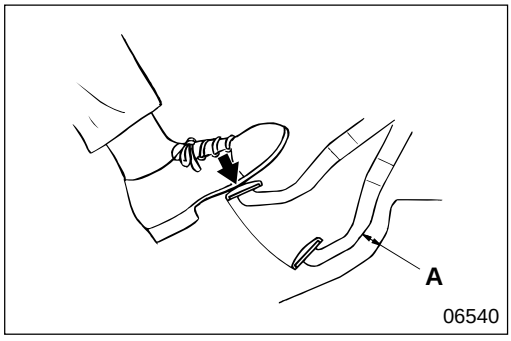
- Adjust brake shoe clearance when you have finished air bleeding. P35-32
- Check that brake fluid comes up to level "**H**" of fluid tank. If it does not, refill with new brake fluid.
- Depress brake pedal **3** a few times and check for any leakage of brake fluid, then test the brakes.
- When you test the brakes, if the brake warning lamp within the meter cluster lights, it means that air has not been bled completely. Redo air bleeding.

Inspection and Adjustment of Clearance between Brake Pedal and Floor Panel

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Clearance between brake pedal and floor panel (with pedal depressed at 490 N {110 lbf, 50 kgf})	45 {1.8} or more	—	Adjust



[Inspection]
Depress the brake pedal using 490 N {110 lbf, 50 kgf} when the engine is idling to check if clearance **A** between the brake pedal and the floor panel conforms to the standard value. If the measured value deviates from the standard value, adjust the height of the brake pedal.

[Adjustment]
P35-38

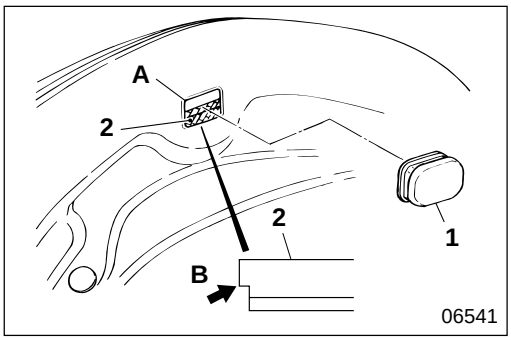
https://truckmanualshub.com/

Thickness Inspection and Replacement of Brake Lining

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2	Thickness of brake lining	—	5.5 {0.22} (Side shoulder means wear limit)	Replace



[Inspection]

NOTE

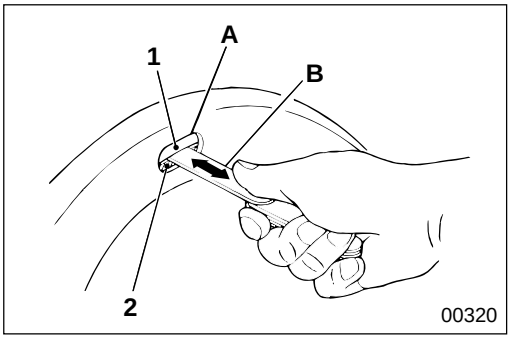
Be sure to inspect at two points for each wheel per side.

- Remove check hole plug **1** from the backing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall check hole plug **1**.

[Replacement]

P35-56, 64

Inspection of Brake Shoe Clearance



NOTE

When the vehicle is jacked up and the wheel is being turned, make sure that there is no dragging.

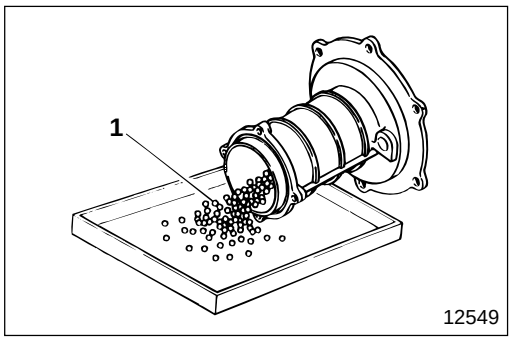
- Remove the check hole plug from the backing plate.
  A : Check hole
- Try to insert a 1 mm {0.039 in.} feeler gauge **B** between brake drum **1** and brake lining **2**. Check that the clearance is too small to let the feeler gauge enter.
  If feeler gauge **A** enters the clearance, disassemble the wheel cylinder and inspect.
  P35-62, 70

https://truckmanualshub.com/

Inspection and Maintenance of Air Dryer

Carry out inspection and maintenance according to the following interval or vehicle milage.

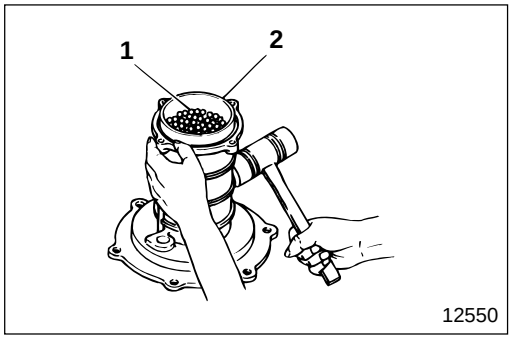
(1) Every three months or 10000 km {6000 miles}



- To check that the air dryer operates correctly, open the drain cock of the air tank and see if any drainage comes out.
- If a little drainage comes out, check if desiccant **1** is discolored. If more than one fifth of the desiccant has changed color from white to brown, renew desiccant.

NOTE

In an operational environment where the decrease of the ambient temperature in the air tank is higher than 16°C {29°F}, a little moisture might collect.



- Pour desiccant **1** into container **2**, tap around the container lightly to settle the desiccant.

- Carefully inspect the drainage from the exhaust port of the air dryer body. Inspect the air compressor and take appropriate action for abnormal oil consumption.
  P35-72

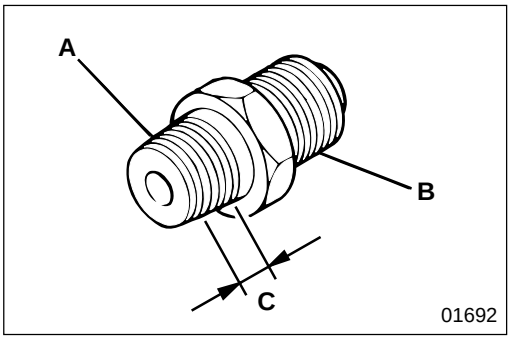
(2) Every year or every 60000 km {36000 miles}

Disassemble the air dryer body. Replace the oil filter, filter and all the rubber parts together with a repair kit.
P35-80

https://truckmanualshub.com/

Sealant

Location	Points of application	Kinds	Quantity
—	Taper thread of connector	THREEBOND 1110B	As required



- If the connectors for the brake air system are to be reused after removal, thoroughly remove residual sealant, oil, moisture, etc.
- Apply sealant to the threads of the connector taper except for one or two turns from the end, then tighten.
- When positioning, adjust in the tightening direction.
  A : Taper thread
  B : Parallel thread (Do not apply sealant here)
  C : Apply sealant here

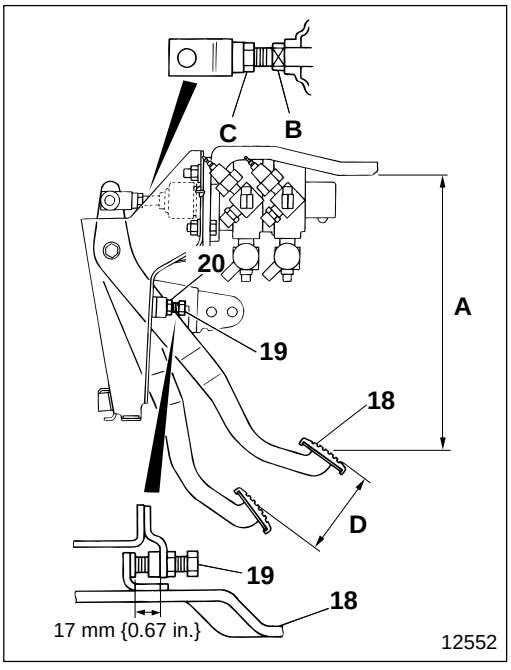
Lubricant

Location	Points of application	Kinds	Quantity
11	Friction surfaces of bolt and bushing	Chassis grease [NLGI No.1 (Ca soap)]	As required



◆ Service procedure

● Adjustment after assembly

(1) Adjustment of brake pedal installation height

- Adjust the installation distance of pedal stopper bolt **19** to 17 mm {0.67 in.}.
- Turn operating rod **B** to adjust brake pedal installation height **A** to the standard value. After adjustment, fix using lock nut **C**.

(2) Inspection of brake pedal stroke

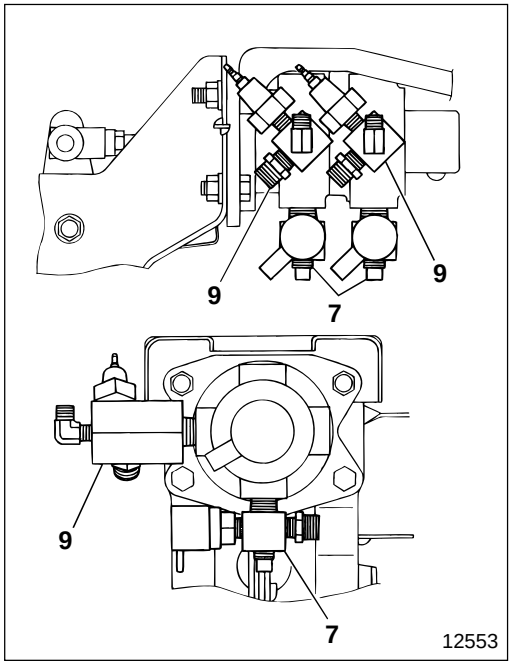
- Make sure that brake pedal stroke **D** is the standard value when brake pedal **18** is depressed fully.
- If any fault is found, adjust the brake pedal installation height.

WARNING ⚠

Make sure that brake pedal 18 is stopped by operating rod B, because if the brake pedal makes contact with the floor panel when depressed fully, braking force is reduced.

https://truckmanualshub.com/

BRAKE PEDAL



7 **9** **Installation of connector**

For connectors **7**, **9**, determine the direction within one turn of exceeding 29 N·m {22 lbf.ft, 3 kgf·m}.

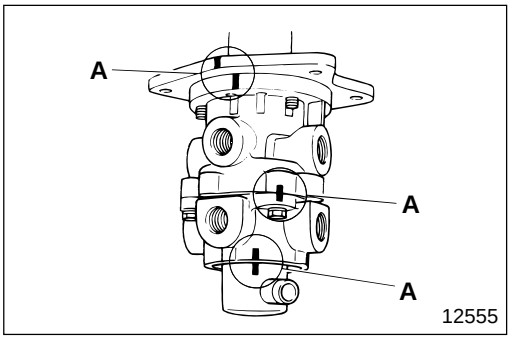
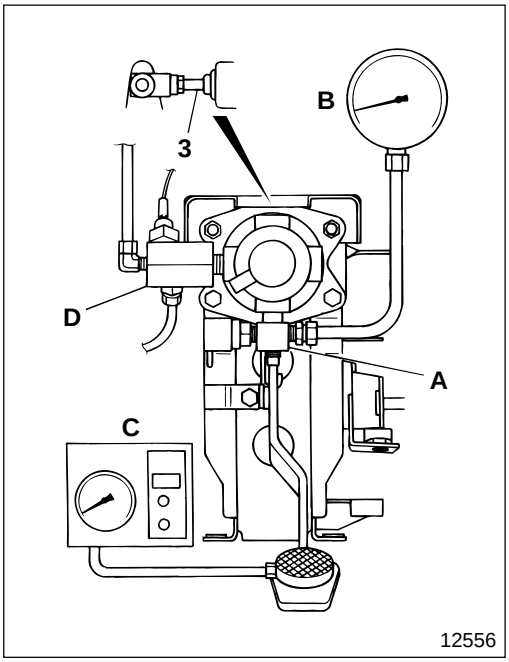
* : JIDOSHA KIKI Part No.

◆ Service procedure



● Work before disassembly

A : Alignment mark



● Inspection of function after assembly

Check if the output air pressure, corresponding to the stroke of push rod **3**, conforms to the standard value. This inspection of function is carried out by installing a gauge on the brake pedal. 📖 P35-38

- Install pressure gauge **B** capable of measuring 980 kPa {140 lbf/in^2, 10 kgf/cm^2} or more on primary output side port **A**.
- Install depression gauge **C** on the brake pedal.
- Apply air pressure of 685 kPa {100 lbf/in^2, 7 kgf/cm^2} to primary input side port **D** and inspect the parts for air leakage.
- If an air leakage is found, take the following countermeasures:
  - Tighten connectors further.
  - Disassemble the dual brake valve and inspect the O-ring assemblies of all parts.
- Then, adjust the installation height of the brake pedal.
- After adjustment, read pressure gauge **B** and make sure that the primary output pressure, corresponding to the stroke of push rod **3**, conforms to the standard value as shown in the input/output characteristic curve diagram overleaf.
- If the primary output air pressure is lower than the standard value, replace the following springs:
  - Spring **11**
  - Outer spring **25**
  - Inner spring **26**

https://truckmanualshub.com/

DUAL BRAKE VALVE

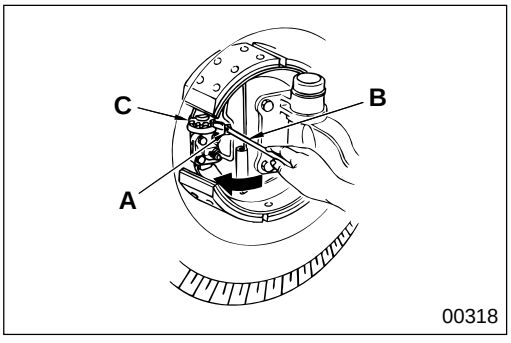
19	Nut (Holder pin mounting)	29±5.9 {22±4.3, 3,0±0.6}	—

Lubricant

Location	Points of application	Kinds	Quantity
9, 10, 16	Contact areas between washer and brake shoe assembly; and between brake shoe assembly and wheel cylinder assembly	Wheel bearing grease [NLGI No.2 (Li soap)]	As required



◆ Service procedure

● **Initial adjustment of brake shoe clearance after installation**

- Jack up the front wheels, and make sure that there is no play in the hub bearings.
- Insert screwdriver **B** into adjusting hole **A** and turn adjuster **C** in the direction of the arrow marked on backing plate **21** until the wheel drags slightly when turned by hand.

NOTE

- **Be sure to adjust the clearance at two points for each wheel per side.**
- **The arrow mark on backing plate 21 is near adjusting hole A.**

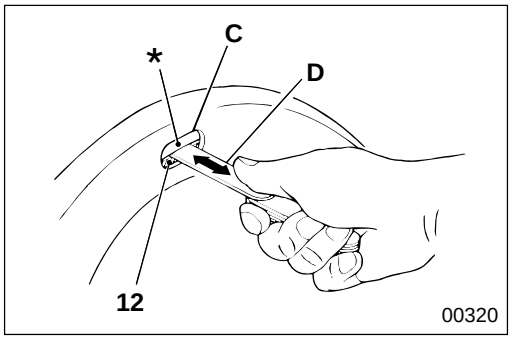
https://truckmanualshub.com/

- After depressing the brake pedal several times, release it and make sure that the wheel drags lightly when turned by hand. If the wheel turns without stress, repeat the above steps. Slacken off adjuster **B**, in the reverse direction to the arrow mark, by eight or nine notches.

NOTE

Be sure to adjust the clearance at two points for each wheel per side.

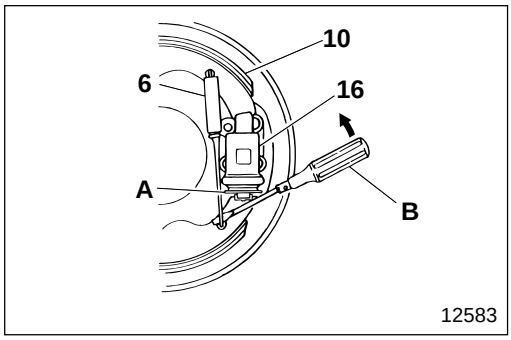
- Make sure that the wheel does not drag when turned by hand. If the wheel drags, repeat the above steps.



- Insert feeler gauge **D** between brake drum ***** and brake lining **12** through check hole **C**, and make sure that a little resistance is felt when the feeler gauge is pulled out or pushed in.

NOTE

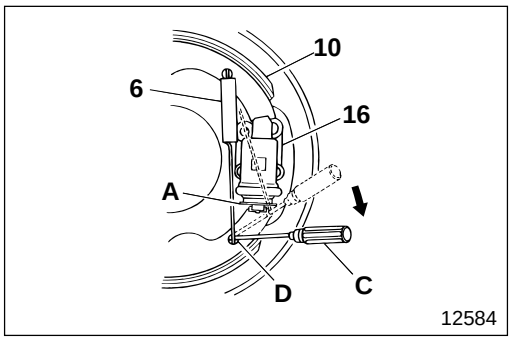
Be sure to adjust the clearance at two points for each wheel per side.



6 Return Spring

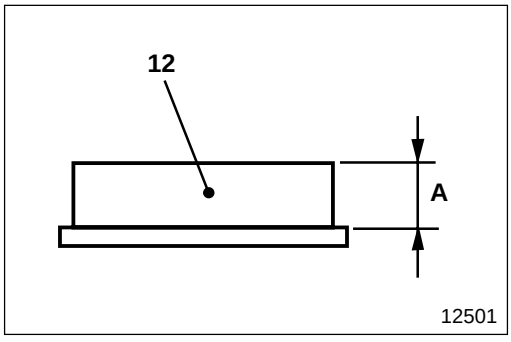
[Removal]

To remove return spring **6**, place screwdriver **B** on the hook of the return spring, then pry and remove the return spring making use of wheel cylinder assembly **16** adjuster **A** as a fulcrum.



[Installation]

- Install the shorter hook end of return spring **6** in brake shoe assembly **10** at the side opposite to adjuster **A** of wheel cylinder assembly **16**.
- Insert a small Phillips screwdriver **C** into the hook of return spring **6**, insert the tip of the screwdriver into return spring installation hole **D** of the brake shoe assembly to pry on the return spring.

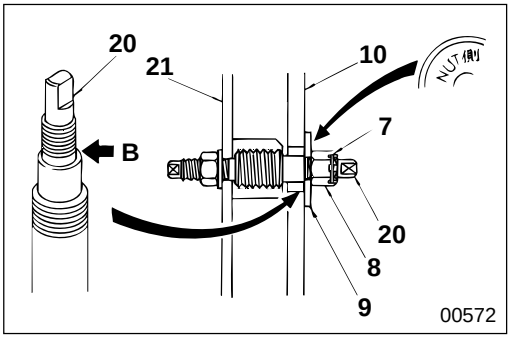


10 Brake shoe assembly

[Inspection]

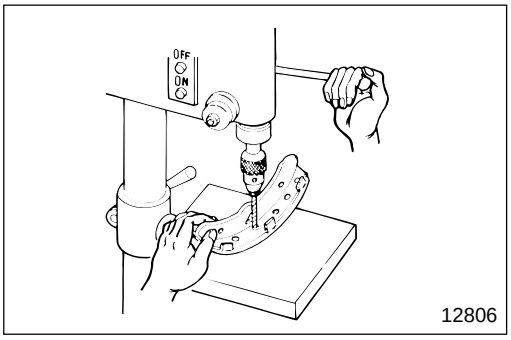
If thickness **A** of brake lining **12** is lower than the limit replace the brake lining on the same axle as a unit.

https://truckmanualshub.com/



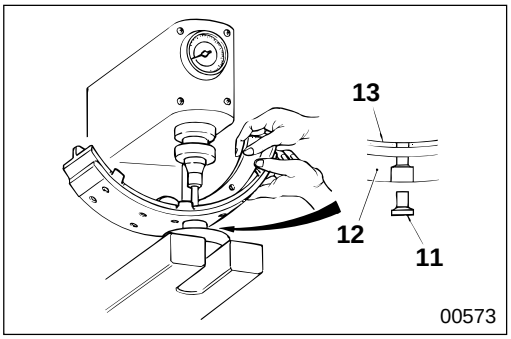
[Installation]

- Install brake shoe assembly **10**.
- Insert washer **9** with the side stamped “NUT 側” facing outside, screw down holder pin nut **8** until washer hits stepped area **B** of holder pin **20** gently, then slacken off the nut within the 0 to 60° limit until the nut is aligned with the first split pin hole.
- Insert split pin **7**, and bend it securely.



12 **Brake lining**

[Removal]



[Installation]

- Clean the mounting surfaces of brake lining **12** and brake shoe **13** with cleaning fluid and dry them.
- Insert rivets **11** from brake lining **12** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **13** and the brake lining.

  Caulking load for rivets : 17 to 19 kN {3750 to 4190 lbf, 1700 to 1900 kgf}

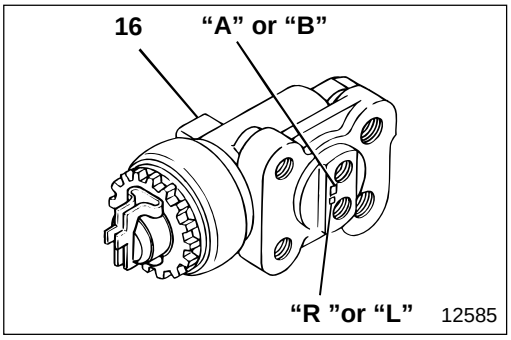
- Make sure that you inspect contact with the inner surface of brake drum ***** after you replace brake linings **12**. If contact is incorrect, correct with the brake assembled.

WARNING⚠

Do not leave lubricant on the surface of brake lining 12 because this reduces braking performance.

CAUTION⚠

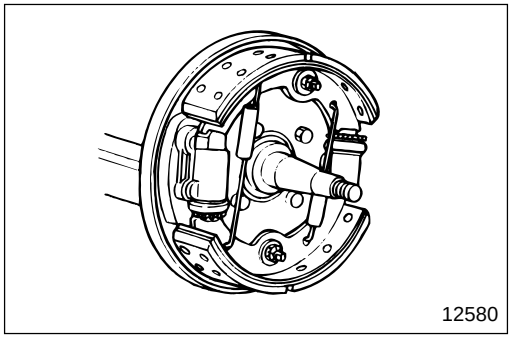
Make sure that the type of brake linings 12 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one shaft.



16 **Installation of wheel cylinder assembly**

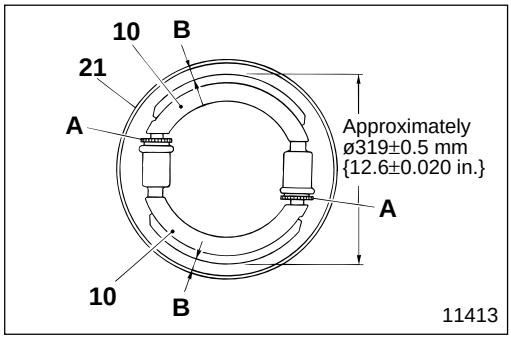
Identification mark	Installation position
RA	Front of front axle right wheel
RB	Rear of front axle right wheel
LA	Front of front axle left wheel
LB	Rear of front axle left wheel

https://truckmanualshub.com/

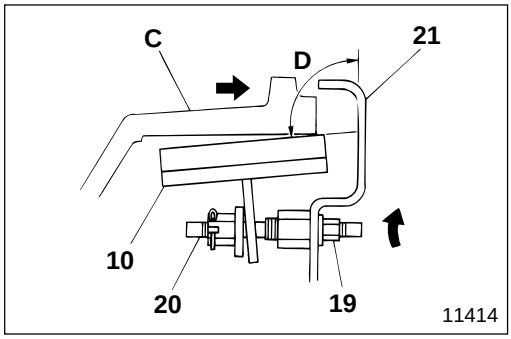


20 **Adjustment of holder pin**

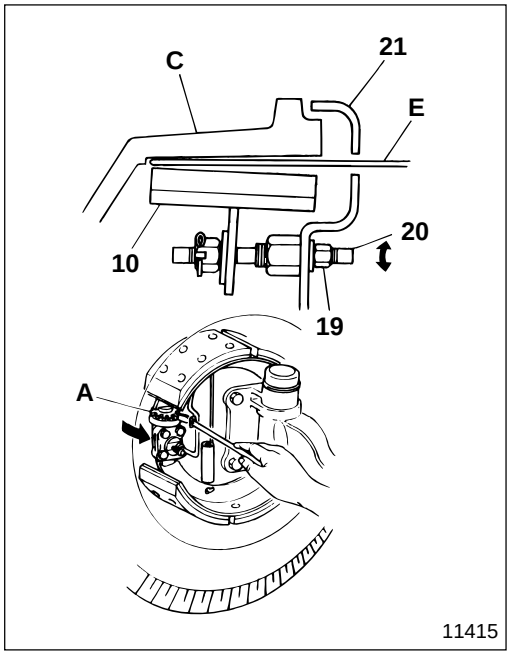
- Install the front wheel brake assembly on the front axle. Gr 26



- Turn adjuster **A** to adjust the outer diameter to approximately ø319±0.5 mm {12.6±0.020 in.}.
- Then, move brake shoe assembly **10** to adjust clearance **B** evenly.

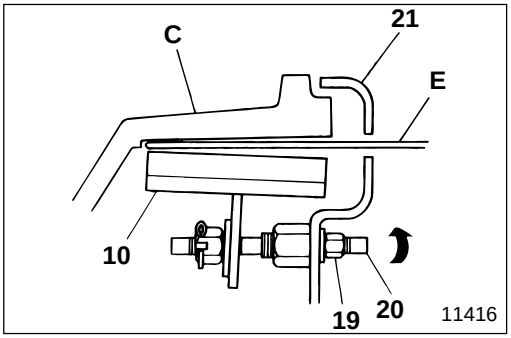


- Install hub and drum assembly **C** on the front wheel brake assembly. Gr 26
  At this time, the hub and drum assembly cannot be inserted in the specified position if squareness **D** is 90° or more, so loosen nut **19** and turn holder pin **20** to adjust the squareness to as close to 90° as possible.
- Bleed the brake system. P35-32



★• Turn adjuster **A** to widen brake shoe assembly **10** until 0.2 mm {0.0079 in.} feeler gauge **E** cannot be pulled out easily.
★• Loosen nut **19** and turn holder pin **20** to the right or left so that feeler gauge **E** can be pushed in or pulled out easily.
- Repeat the above steps (marked ★) until feeler gauge **E** cannot be pushed in or pulled out easily.
- Depress the brake pedal a few times lightly to equalize clearance **B** (adjusted in the previous section).
- Repeat the above steps (marked ★) until feeler gauge **E** cannot be pushed in or pulled out easily.

https://truckmanualshub.com/



- If feeler gauge **E** cannot be pushed in or pulled out easily it is because it is making contact over the full width of brake shoe assembly **10**.
- Turn holder pin **20** so that when you pull out feeler gauge **E**, in the above condition, and reinsert the feeler gauge, pushing in or pulling out the feeler gauge at the rear is difficult.
- After adjustment, tighten nut **19** at specified torque.

* Correction of brake drum

If the cylindrical accuracy of brake drum * is higher than the limit, or there are seams, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

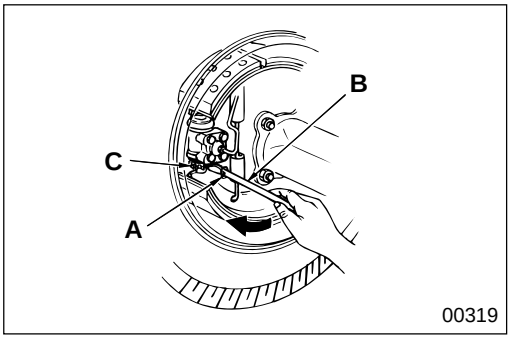
6, 7, 12	Contact areas between washer and brake shoe assembly; and between brake shoe assembly and wheel cylinder assembly	Wheel bearing grease [NLGI No.2 (Li soap)]	As required



◆ Service procedure

● Initial adjustment of brake shoe clearance after installation

- Jack up the front wheels, and make sure that there is no play in the hub bearings.
- Insert screwdriver **B** into adjusting hole **A** and turn adjuster **C** in the direction of the arrow marked on the back plate until the wheel drags slightly when turned by hand.

NOTE

- **Be sure to adjust the clearance at two points for each wheel per side.**
- **The arrow mark on backing plate 18 is near adjusting hole A.**

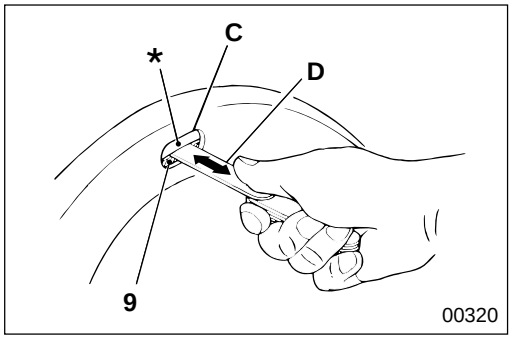
https://truckmanualshub.com/

- After depressing the brake pedal several times, release it and make sure that the wheel drags lightly when turned by hand. If the wheel turns without stress, repeat the above steps. Slacken off adjuster **B**, in the reverse direction to the arrow mark, by eight or nine notches.

NOTE

Be sure to adjust the clearance at two points for each wheel per side.

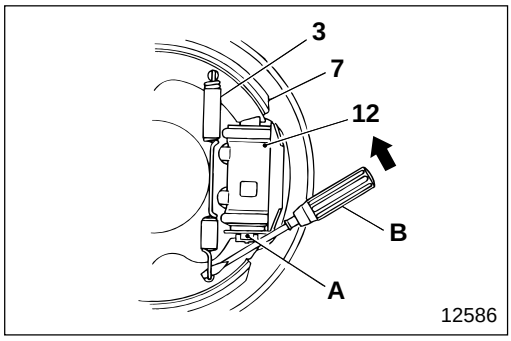
- Make sure that the wheel does not drag when turned by hand. If the wheel drags, repeat the above steps.



- Insert feeler gauge **D** between brake drum ***** and lining **9** through check hole **C**, and make sure that a little resistance is felt when the feeler gauge is pulled out or pushed in.

NOTE

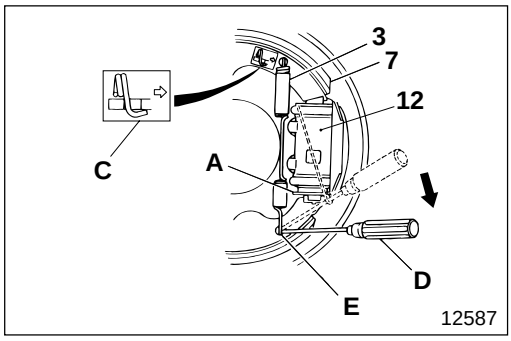
Be sure to adjust the clearance at two points for each wheel per side.



3 Return Spring

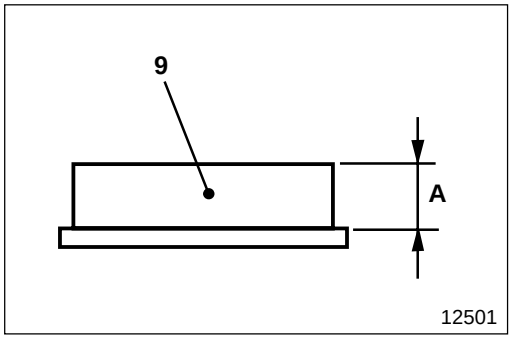
[Removal]

To remove return spring **3**, place screwdriver **B** on the hook of the return spring, then pry and remove the return spring making use of wheel cylinder assembly **12** adjuster **A** as a fulcrum.



[Installation]

- Refer to the illustration on the caution plate fitted to brake shoe assembly **7** or marking **C**, and connect shorter hook end of return spring **3** to the brake shoe assembly at the side opposite the adjuster of wheel cylinder assembly **12**.
- Insert a small Phillips screwdriver **D** into the hook of return spring **3**, insert the tip of the screwdriver into return spring installation hole **E** of brake shoe assembly **7** to pry on the return spring.

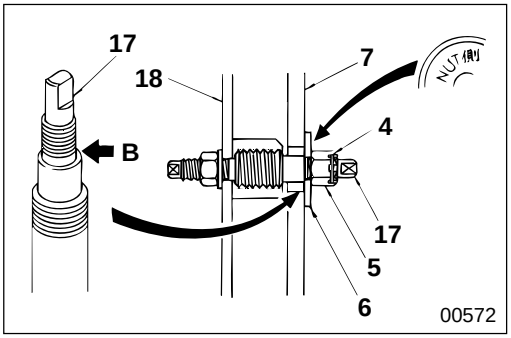


7 Brake shoe assembly

[Inspection]

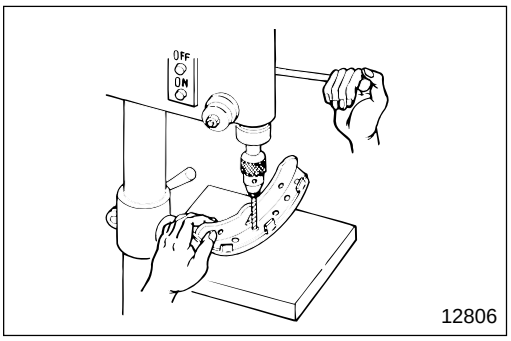
If thickness **A** of brake lining **9** is lower than the limit replace the brake lining on the same axle as a unit.

https://truckmanualshub.com/



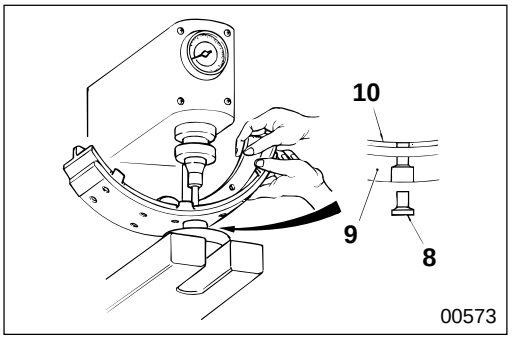
[Installation]

- Install brake shoe assembly **7**.
- Insert washer **6** with the side stamped “NUT 側” facing outside, screw down holder pin nut **5** until washer hits stepped area **B** of holder pin **17** gently, then slacken off the nut within the 0 to 60° limit until the nut is aligned with the first split pin hole.
- Insert split pin **4**, and bend it securely.



9 Brake lining

[Removal]



[Installation]

- Clean the mounting surfaces of brake lining **9** and brake shoe **10** with cleaning fluid and dry them.
- Insert rivets **8** from brake lining **9** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **10** and the brake lining.

  Caulking load for rivets : 17 to 19 kN {3750 to 4190 lbf, 1700 to 1900 kgf}

- Make sure that you inspect contact with the inner surface of brake drum ***** after you replace brake linings **9**. If contact is incorrect, correct with the brake assembled.

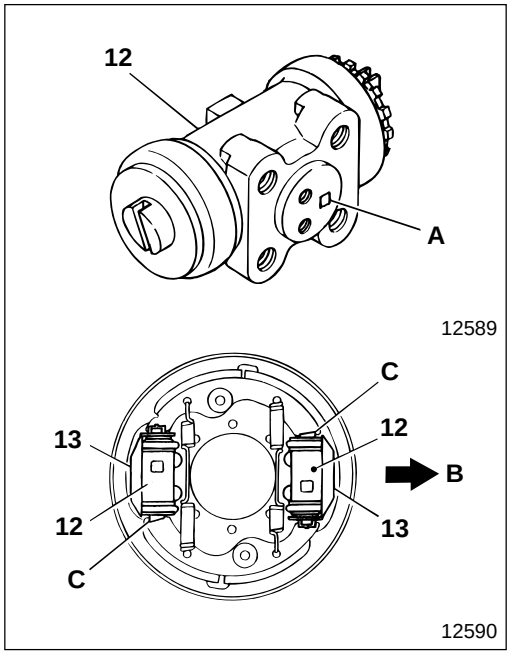
WARNING⚠

Do not leave lubricant on the surface of brake lining 9 because this reduces braking performance.

CAUTION⚠

Make sure that the type of brake linings 9 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one shaft.

https://truckmanualshub.com/

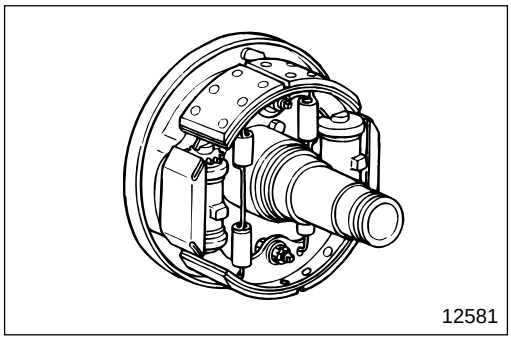


12 **Installation of wheel cylinder assembly**

A : Identification mark

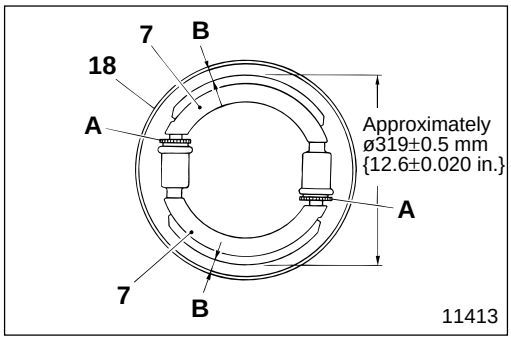
Identification mark	Installation position
R	Right wheel forward
L	Left wheel forward
No mark	Left and right wheel rearward

- Install anchor piece **C** so its recession is at the deeper side of the brake shoe at the outside.
  B : Front of the vehicle

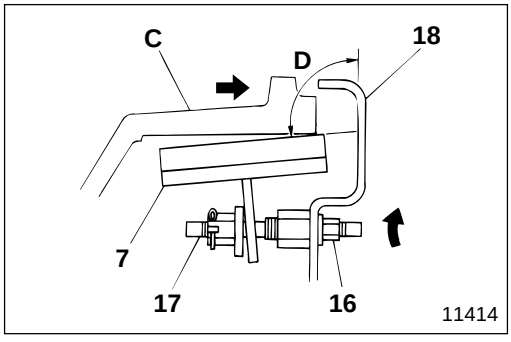


17 **Adjustment of holder pin**

- Install the rear wheel brake assembly on the rear axle. Gr 27

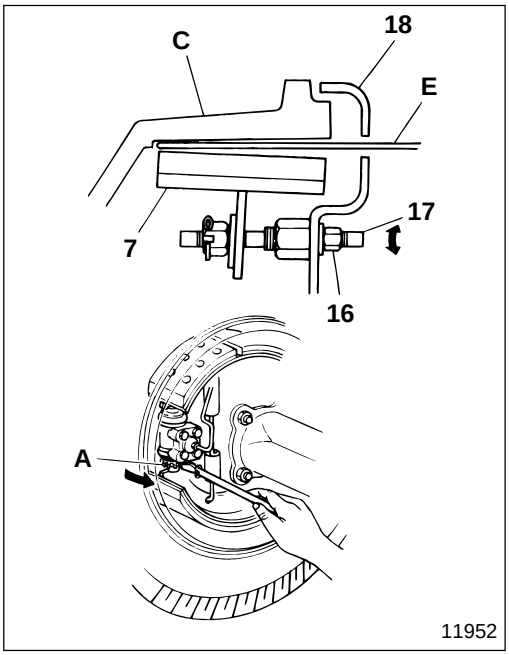


- Turn adjuster **A** to adjust the outer diameter to approximately ø319±0.5 mm {12.6±0.020 in.}.
- Then, move brake shoe assembly **7** to adjust clearance **B** evenly.



- Install hub and drum assembly **C** on the rear wheel brake assembly. Gr 27
  At this time, the hub and drum assembly cannot be inserted in the specified position if squareness **D** is 90° or more, so loosen nut **16** and turn holder pin **17** to adjust the squareness to as close to 90° as possible.
- Bleed the brake system. P35-32

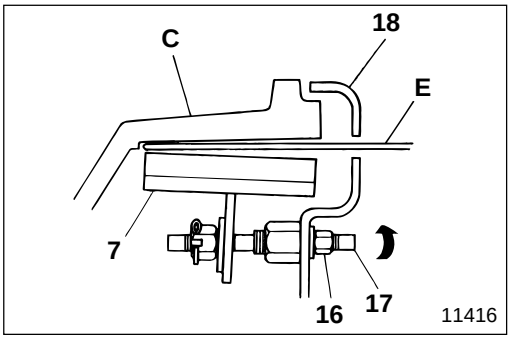
https://truckmanualshub.com/



★• Turn adjuster **A** to widen brake shoe assembly **7** until 0.2 mm {0.0079 in.} feeler gauge **E** cannot be pulled out easily.

★• Loosen nut **16** and turn holder pin **17** to the right or left so that feeler gauge **E** can be pushed in or pulled out easily.

- Repeat the above steps (marked ★) until feeler gauge **E** cannot be pushed in or pulled out easily.
- Depress the brake pedal a few times lightly to equalize clearance **B** (adjusted in the previous section).
- Repeat the above steps (marked ★) until feeler gauge **E** cannot be pushed in or pulled out easily.



- If feeler gauge **E** cannot be pushed in or pulled out easily it is because it is making contact over the full width of brake shoe assembly **7**.
- Turn holder pin **17** so that when you pull out feeler gauge **E**, in the above condition, and reinsert the feeler gauge, pushing in or pulling out the feeler gauge at the rear is difficult.
- After adjustment, tighten nut **16** at specified torque.

✱ Correction of brake drum

If the cylindrical accuracy of brake drum ✱ is higher than the limit, or there are seams, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

https://truckmanualshub.com/

◆ Service procedure

● Inspection after installation

- Start the engine.
- Make sure that air is exhausted from the port of exhaust cover **25** when the air pressure reaches the specified level and the air compressor is switched to idling.

NOTE

If high air pressure is exhausted first and approximately three seconds later, you cannot hear an exhausting sound, do not worry, it is normal.

- Make sure that there is no air leakage from any piping connection.

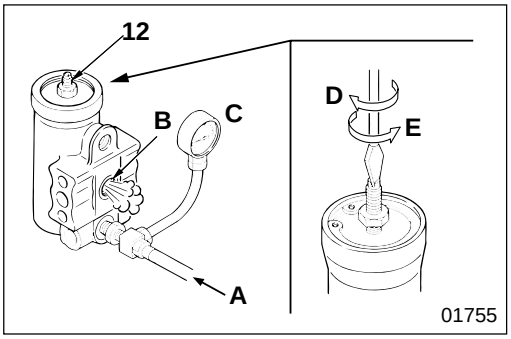
17	Outer periphery of piston and O-ring groove	Multipurpose grease [NLGI No. 2 (Li soap)]	As required
21	Interior of body	Multipurpose grease [NLGI No. 2 (Li soap)]	As required

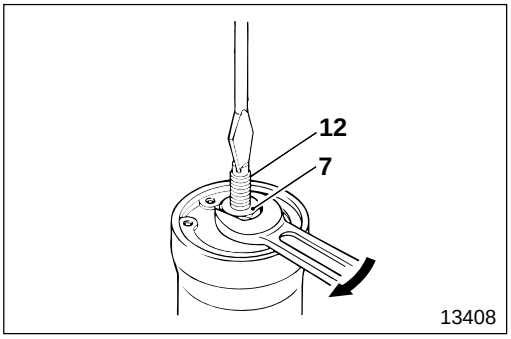
◆ Service procedure

● Inspection of function after assembly

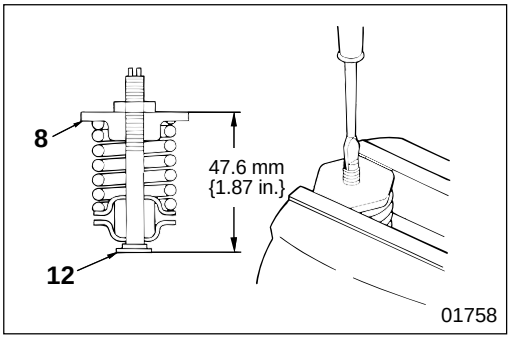


- Increase air pressure **A** gradually and read the value on air pressure gauge **C** when air is discharged from **B**. Adjust by turning adjusting screw **12** so that the reading conforms to the standard value (high specified-pressure).
  D : Turning clockwise decreases the pressure
  E : Turning counterclockwise increases the pressure
- Lower air pressure **A** to 685 kPa {100 lbf/in^2, 7 kgf/cm^2} or less, then raise the air pressure gradually. Read air pressure gauge **C** when it stops and check that the value conforms to the standard value (high specified-pressure). If the value deviates from the standard value, readjust.

- Lower air pressure **A** gradually. When the discharge of air from **B** ceases, read air pressure gauge **C** to check that the valve conforms to the standard value (high specified-pressure). If the value deviates from the standard value, replace the air pressure governor assembly.



- After adjusting, tighten lock nut **7** to prevent adjusting screw **12** being turned accidentally.



6 **Preliminary adjustment of adjusting screw assembly**

It is recommended that you adjust the distance from the upper level of upper spring seat **8** to the lower level of adjusting screw **12** to 47.6 mm {1.87 in.} by turning the adjusting screw, because this makes adjustment to the specified value easier.

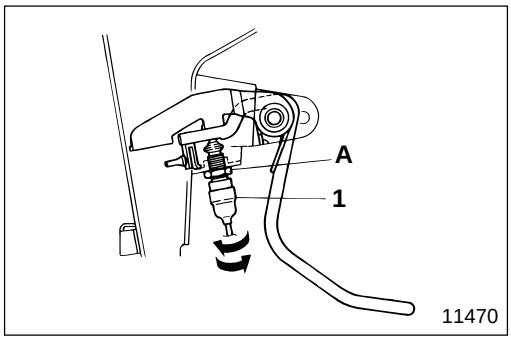
Inspection and Adjustment of Exhaust Brake System

[Inspection]
Turn the exhaust brake switch ON, depress the accelerator pedal gradually, and make sure that when the engine revolution reaches 800 to 950 rpm the exhaust brake operation indicator lamp within the meter cluster goes out. If any fault is found, adjust accelerator switch **1**.

◆ Service procedure

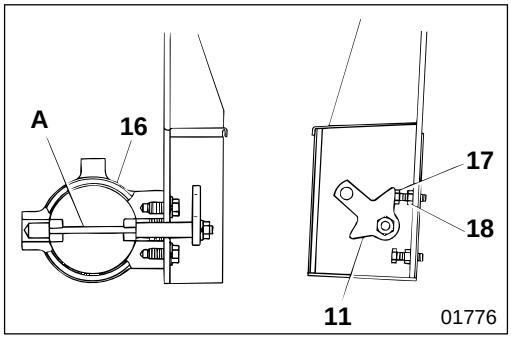


1 **Adjustment of accelerator switch**

- Turn the exhaust brake switch ON while the engine is idling, depress the accelerator pedal gradually, and check the engine revolution when the exhaust brake operation indicator lamp within the meter cluster goes out.
- Turn accelerator switch **1** to adjust the engine revolution, referring to the following table:

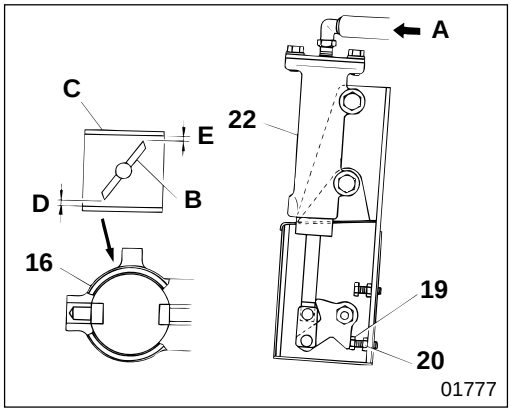
Confirmed engine revolution	Adjusting direction of accelerator switch 1
800 rpm or less	↻
950 rpm or more	↺

- After adjustment, tighten nut **A** to fix accelerator switch **1**.



11 **16** **to** **18** **Adjustment of fully opened position of butterfly valve of valve assembly**

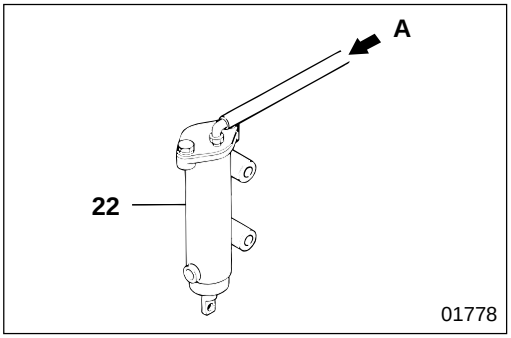
Turn adjusting bolt **17** so that its head is level with lever **11** (at this time, butterfly valve **A** of valve assembly **16** is fully open). Then, tighten lock nut **18** at specified torque.



16 **19** **20** **22** **Adjustment of fully closed position of butterfly valve of valve assembly**

- Supply air pressure **A** of 685±49 kPa {100±7.1 lbf/in^2, 7±0.5 kgf/cm^2} to control cylinder **22**, and turn adjusting bolt **19** (bolt for adjustment of fully closed position) so that the mean value of clearances **D** and **E** between butterfly valve **B** and body **C** conforms to the standard value.
- Calculate the mean value of clearances **D** and **E** by (**D**+**E**)/2.
- Tighten lock nut **20** at specified torque.

https://truckmanualshub.com/



22 **Inspection of airtightness of control cylinder**

Check that there is no air leakage when pressure **A** of 980 kPa {140 lbf/in^2, 10 kgf/cm^2} is applied to control cylinder **22**. Replace any control cylinder that leaks.

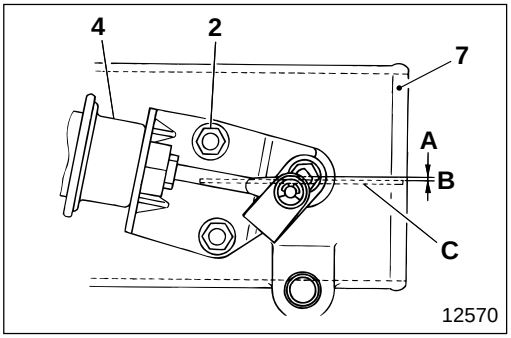
Lubricant and sealant

Location	Points of application	Kinds	Quantity
1	Thread area of nut	LOCTITE 271	As required
6	Both surfaces of thrust washer	Molybdenum disulfide grease	As required

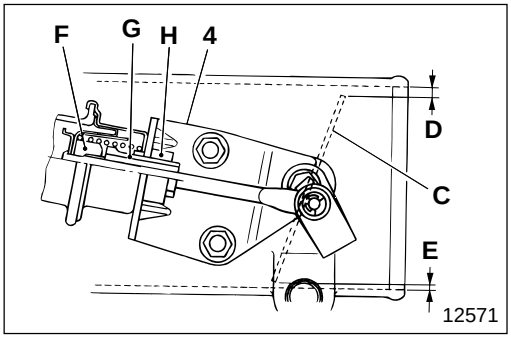
◆ Service procedure



● Adjustment after assembly

(1) Butterfly valve full-open adjustment

- Loosen bolt **2** so that actuator assembly **4** can move slightly.
- Move actuator assembly **4** to adjust clearance **A** to the standard value.
- After adjustment, tighten bolt **2** at specified torque.
  B : Center of air inlet pipe **7**
  C : Butterfly valve



(2) Butterfly valve full-close adjustment

- Move butterfly valve **C** so that stopper **F** makes contact with adjusting screw **G**.
- Turn adjusting screw **G** to adjust clearances **D** (upper) and **E** (lower) to their respective standard values, and check that the mean value of upper and lower clearances **D**, **E** conforms to the standard value.
- Calculate the mean value of the upper and lower clearances by (**D**+**E**)/2.
- After adjustment, fix adjusting screw **G** using lock nut **H**.

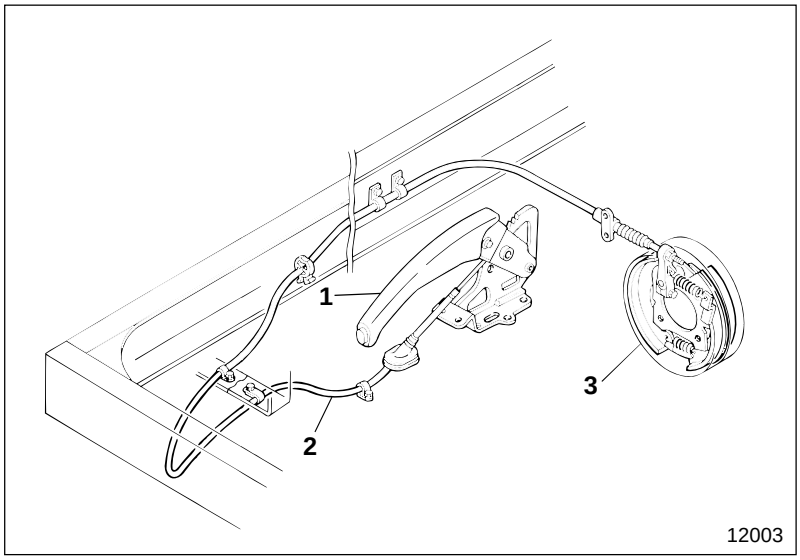
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Item \ Vehicle model		FH211-A	FH211-B
		Manual transmission	Automatic transmission
Brake	Type	Propeller shaft internal expanding type brake	
	Operation type	Mechanical cable type	
Parking brake assembly	Type	Dual-servo type	
	Inner diameter of drum mm {in.}	ø203.2 {8}	ø254 {10}
	Lining width×Thickness mm {in.}	50×4.0 {1.97×0.16}	60×5.8 {2.36×0.23}

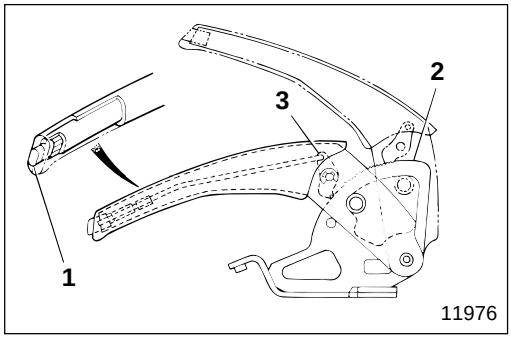
STRUCTURE AND OPERATION

Parking Brake Control



1 Parking brake lever
2 Parking brake cable
3 Parking brake assembly

Parking Brake Lever

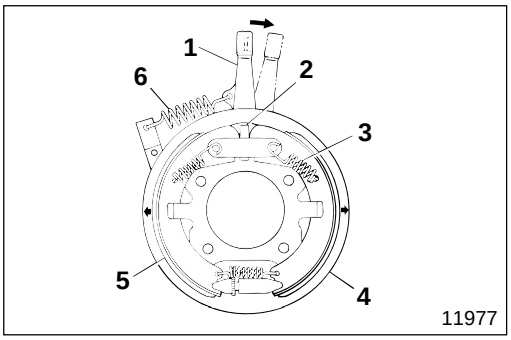


1 Release rod knob
2 Lever bracket
3 Locking latch

The parking brake has a built-in locking mechanism that prevents inadvertent release of the brake.
To release locking, push release rod knob **1** which will disengage from the serration of lever bracket **2** and the tooth of locking latch **3** freeing the parking brake lever and allowing it to return.

https://truckmanualshub.com/

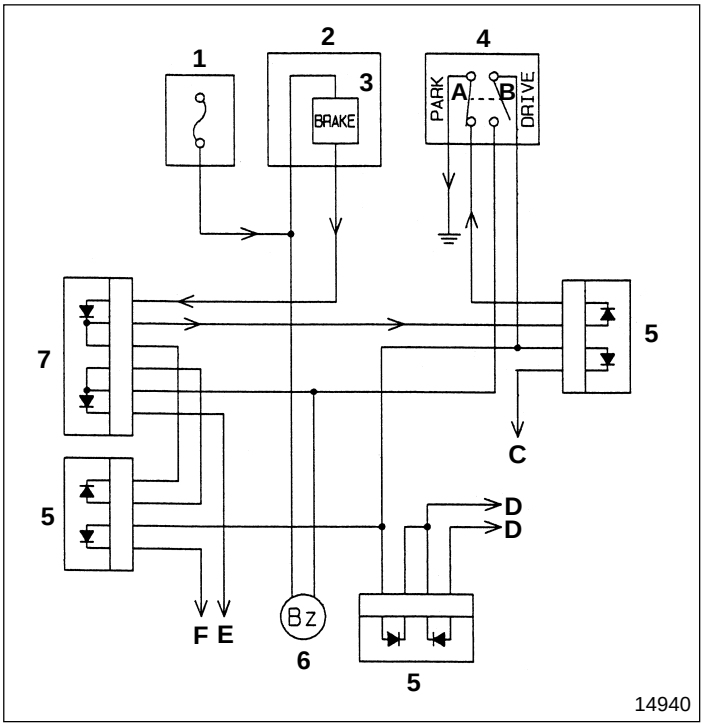
Parking Brake Assembly



1 Camshaft lever
2 Camshaft
3 Shoe return spring
4 Dust cover or support plate and cover assembly
5 Shoe and lining assembly
6 Camshaft lever return spring

Pulling the parking brake lever pulls the parking brake cable, which in turn pulls camshaft lever **1**. At the same time, camshaft **2** rotates in conjunction with the camshaft lever, and expands shoe and lining assembly **5** making it press against the brake drum. This frictional force locks the propeller shaft that is connected to the drum. When the brake lever is released, the repercussive force of shoe return spring **3** releases the brake.

Parking Brake Electrical System



1 Fuse box
2 Meter cluster
3 Parking brake indicator lamp
4 Parking brake switch
5 Diode unit
6 Buzzer
7 Joint connector

C : Cooling system
D : Automatic transmission system
E : Brake system
D : Engine oil pressure system

- The parking brake electrical system is provided for indictaing, its detecting and indictaing function is activated by pulling the parking brake lever.
- When the parking brake lever is pulled, contact point **A** of parking brake switch **4** closes (ON), and parking brake indicator lamp **3** is lit, indicating that the parking brake is operating.
  The current flows as below:
  Fuse **1** → Parking brake indicator lamp **3** →
  Joint connector **7** → Diode unit **5** →
  Parking brake switch **4** → Ground
- Buzzer **6** sounds and gives a warning when any fault is detected in the cooling system, automatic transmissionn system, brake system or engine oil pressure system. Pulling the parking brake lever opens (OFF) contact point **B** of parking brake switch **4** to stop the buzzer from sounding.

https://truckmanualshub.com/

TROUBLESHOOTING

Possible causes / Symptoms		Parking brake does not work	Parking brake does not release smoothly (dragging)	Remarks
Parking brake cable	Inner cable stretched or damaged	○	○	
	Inner cable rusted		○	
Parking brake lever	Ratchet bar and ratchet pawl engaging incorrectly	○		
	Pulling stroke insufficient		○	
	Pulling stroke excessive	○		
Parking brake assembly	Shoe clearance insufficient		○	
	Shoe clearance excessive	○		
	Parking brake drum inner surface deformed or warped	○		
	Lining worn unevenly	○		
	Brake drum inner surface greasy or oily	○		
	Lining surface greasy or oily	○		
	Camshaft lever return spring fatigued or fractured		○	
	Shoe return spring fatigued or fractured		○	

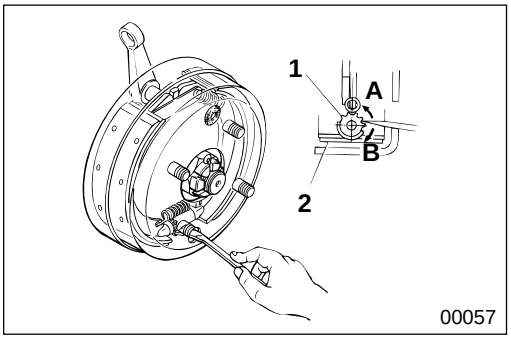
https://truckmanualshub.com/

Adjustment of Parking Brake Shoe Clearance and Lever Stroke

Service standards

Unit : mm {in.}

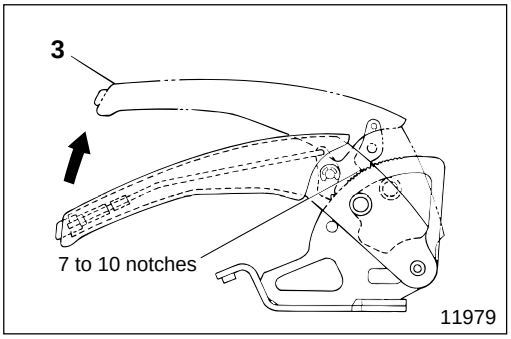
Location	Maintenance item	Standard value	Limit	Remedy
—	Brake shoe clearance	0.1 to 0.25 {0.0039 to 0.0098}	—	Adjust
3	Brake lever pulling stroke (at operating force of 490 N {110 lbf, 50 kgf})	7 to 10 notches	—	Adjust



(1) Shoe clearance

When the camshaft lever is released, turn adjusting screw **1** in the expansion direction, using a screwdriver inserted through the shoe adjusting hole of the brake drum, and return 8 notches from the position where shoe **2** is in close contact with the drum. Then, the shoe clearance will be the standard value.

A : Expansion
B : Contraction



(2) Lever pulling stroke

Adjust camshaft lever lock nut **4** so that the number of notches (clicks heard) is the standard value when parking brake lever **3** is pulled from the released position by an operating force of 490 N {110 lbf, 50 kgf}. Operate the parking brake lever two or three times after adjusting to verify the pulling stroke, to make sure that the parking brake is operating properly and that the parking brake drum does not drag when the parking brake is released.

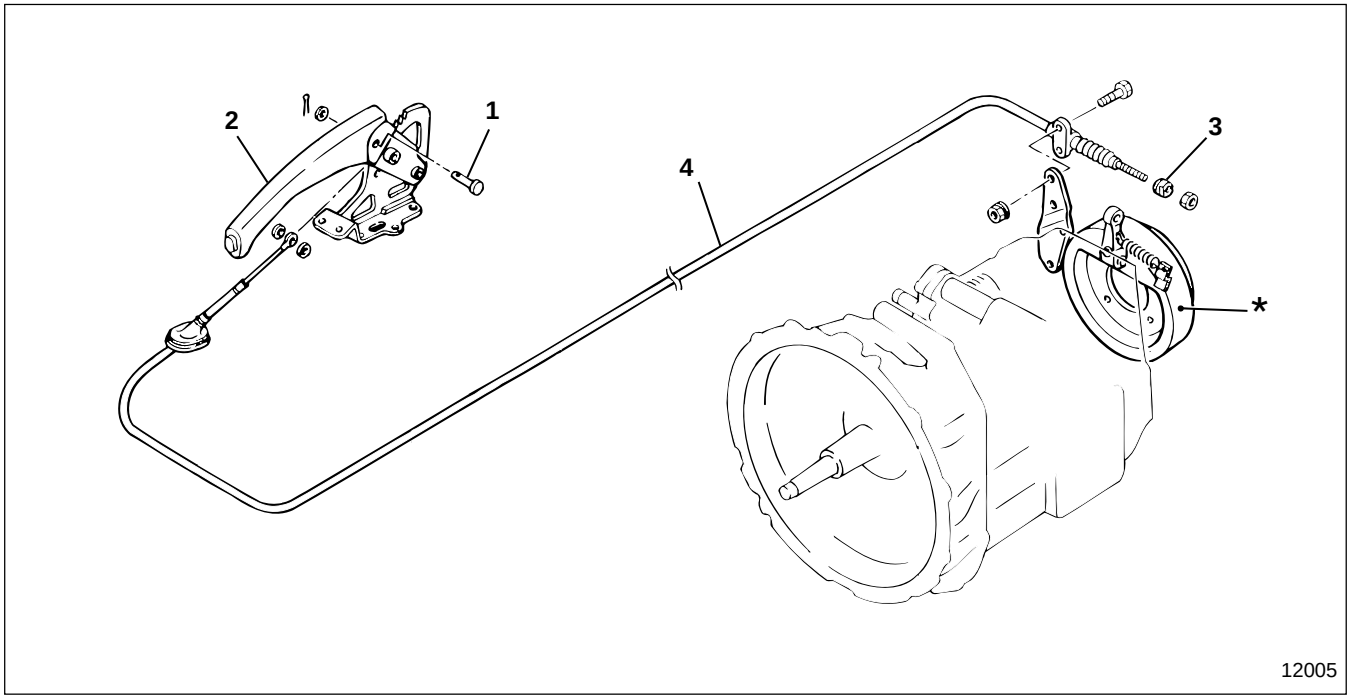
PARKING BRAKE CONTROL



● **Removal sequence**

1 Clevis pin
2 Parking brake lever assembly 🕮 P36-7
3 Ball bushing
4 Parking brake cable

***** : Parking brake assembly 🕮 P36-8

WARNING⚠

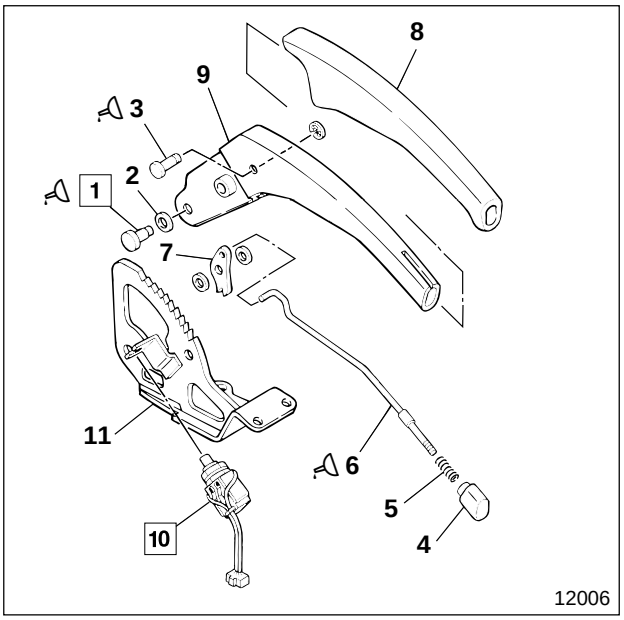
- **You must place wheel chocks securely in place to prevent the vehicle from moving.**
- **Do not remove the chocks until the entire operation is completed.**

● **Installation sequence**

Follow the removal sequence in reverse.

https://truckmanualshub.com/

Parking Brake Lever Assembly



● **Disassembly sequence**

1 Pin
2 Spacer
3 Pin
4 Release rod knob
5 Return spring
6 Release rod
7 Locking latch
8 Grip
9 Parking brake lever
10 Parking brake switch Gr 54
11 Lever bracket

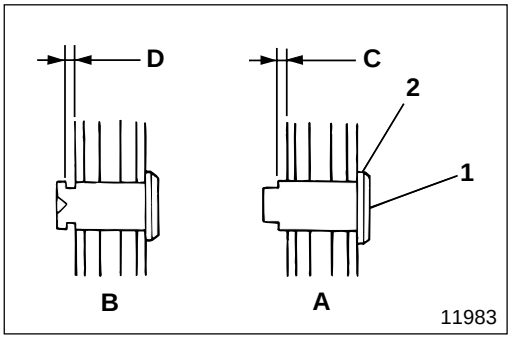
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Lubricant and sealant

Location	Points of application	Kinds	Quantity
1, 3	Rotating area and friction surface of pins	Chassis grease [NLGI No.1 (Ca soap)]	As required
6	Thread area of release rod	Cemedine 1500	As required

◆ Service procedure

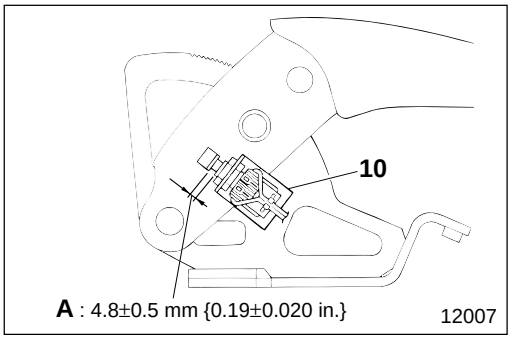


1 **Installation of pin**

A : Before caulking
B : After caulking

When clearance **C** (before caulking) is less than 0.6 mm {0.024 in.}, do not use spacer **2**.
Also, use the spacer to adjust if clearance is 0.6 to 0.96 mm {0.024 to 0.038 in.}.

	Without spacer	With spacer
Dimension **D**	0.06 to 0.6 mm {0.0024 to 0.024 in.}	0 to 0.36 mm {0 to 0.014 in.}



10 **Installation of parking brake switch**

Install parking brake switch **10** so that the stroke equals **A**.

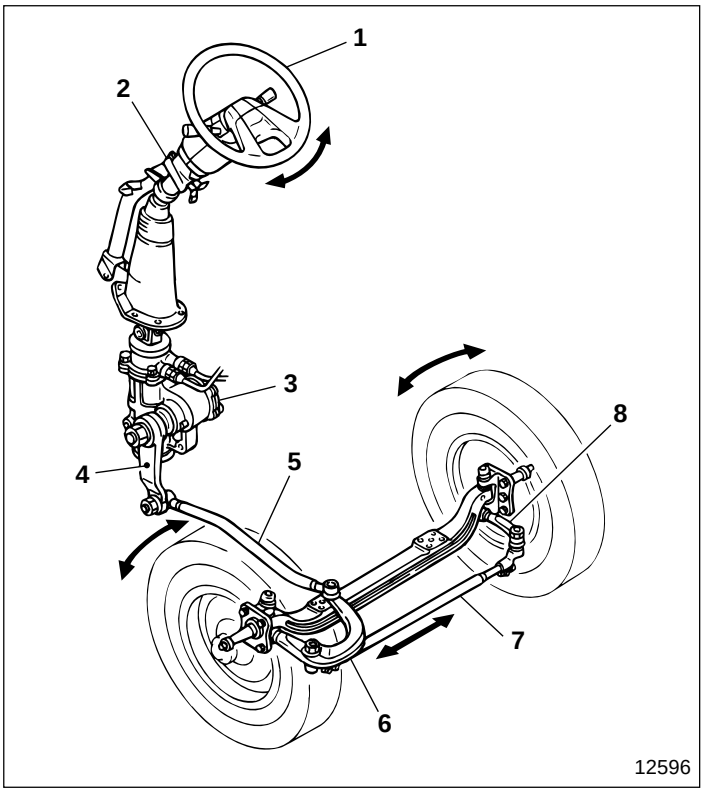
SPECIFICATIONS

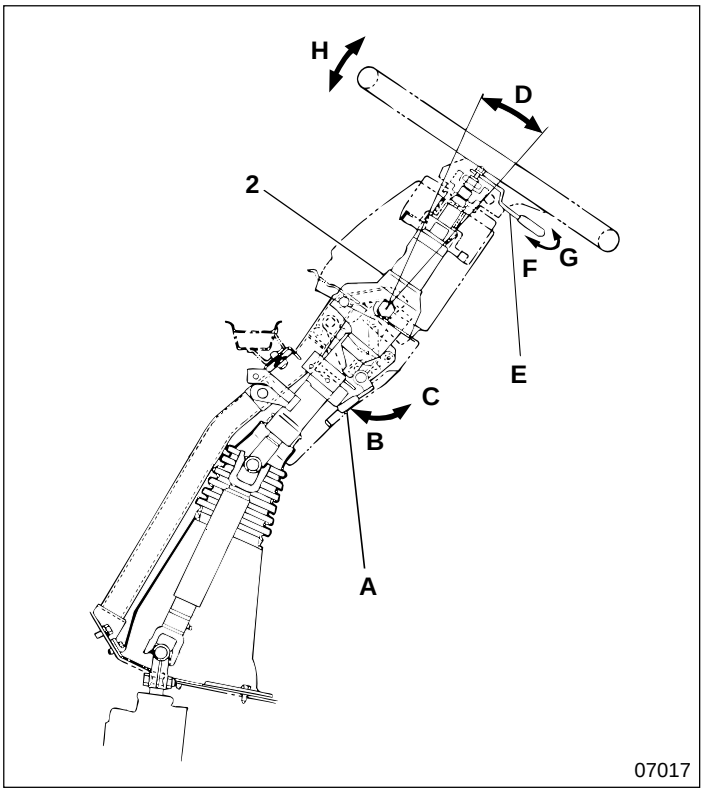
Item		Specification
Steering wheel	Type	2-spoke type
	Outer diameter mm {in.}	450 {17.7}
Steering shaft	Type	Universal joint type (High tilt and telescopic type)
Power steering booster	Manufacturer	JIDOSHA KIKI
	Type	Ball nut type
	Form	Integral type
	Gear ratio	17.1 to 20
	Cylinder diameter mm {in.}	85 {3.35}
	Mass (without pitman arm and fluid) kg {lb}	21 {46}
Power steering oil pump	Manufacturer	JIDOSHA KIKI
	Type	Vane type
	Discharge amount cm^3 {cu. in.}/rotation	11.2 {0.68}
	Regulated flow amount L {qts}/min	12 {13}
	Regulated pressure (relief valve) MPa {lbf/in^2, kgf/cm^2}	12.3 {1780, 125}
	Permissible revolutions rpm	600 to 4800
	Mass (without drive gear and fluid) kg {lb}	2.7 {6.0}

https://truckmanualshub.com/

Steering System



1 Steering wheel
2 Steering column subassembly
3 Power steering booster
4 Pitman arm
5 Drag link
6 Knuckle arm
7 Tie rod
8 Tie rod arm

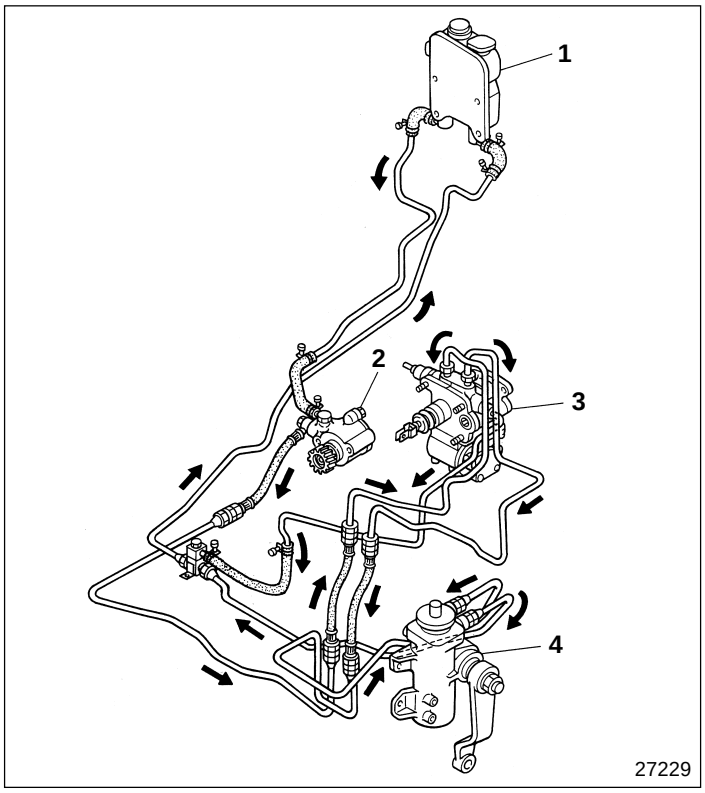


Shifting lock lever **A** from lock position **B** to release position **C** produces high tilt **D**, and turning telescopic lever **E** (counterclockwise) from lock position **F** to release position **G** allows telescopic movement **H**. In this way, the structure of steering column subassembly **2** can be adjusted for optimum driving position.

https://truckmanualshub.com/

STRUCTURE AND OPERATION

Power Steering System

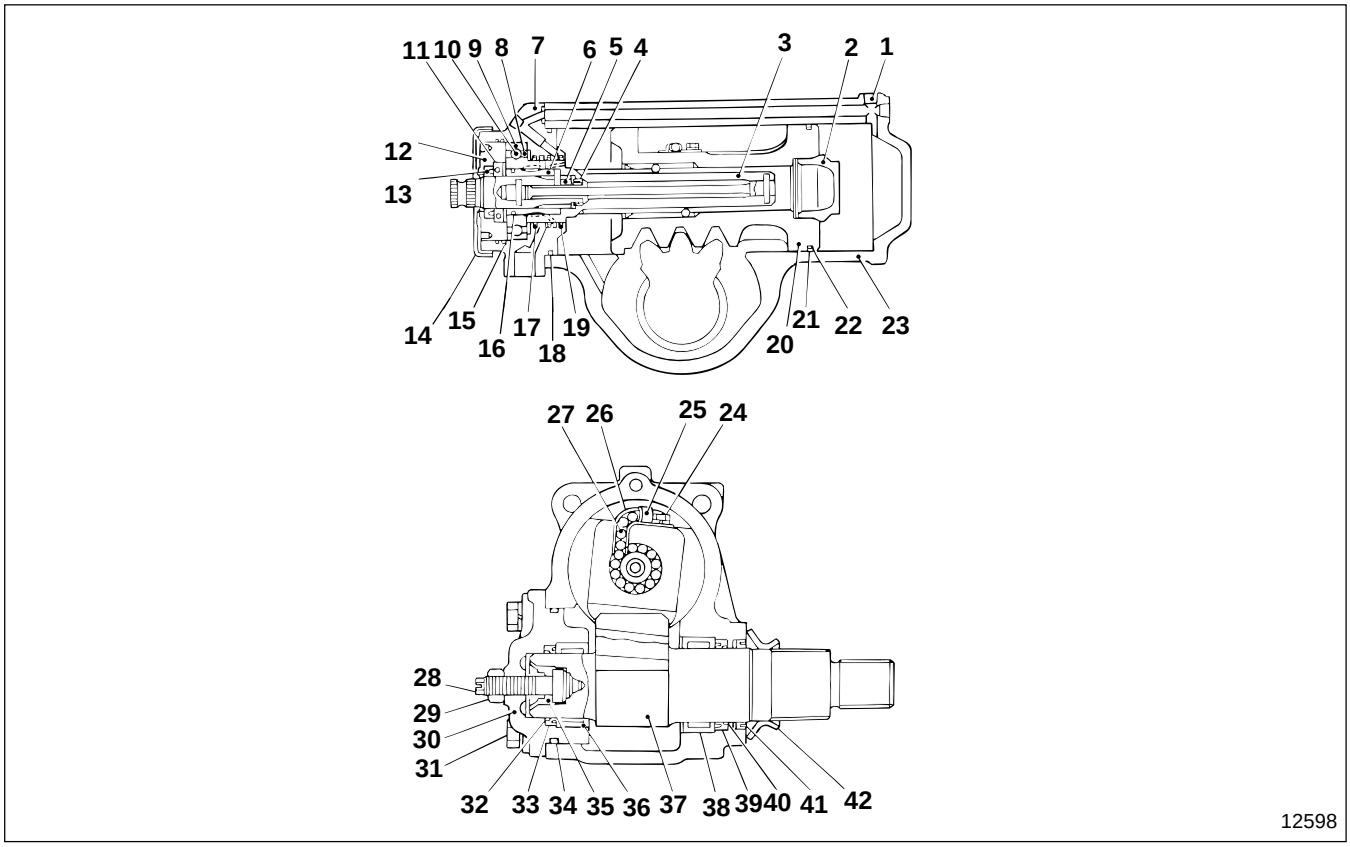


1 Power steering oil tank
2 Power steering oil pump
3 Brake booster (Hydraulic booster)
4 Power steering booster

⬅ : Fluid flow

- In vehicles equipped with hydraulic booster brake, power steering oil pump **2** hydraulic pressure is also used for brake booster (hydraulic booster) **3** by the power steering system. Although the power steering pump is shared by both the power steering system and the brake system, the spool valve inside brake booster (hydraulic booster) ensures that power steering booster **4** and brake booster (hydraulic booster) operate without interfering with each other.
  (For information on brake booster operation, refer to Gr 35.)

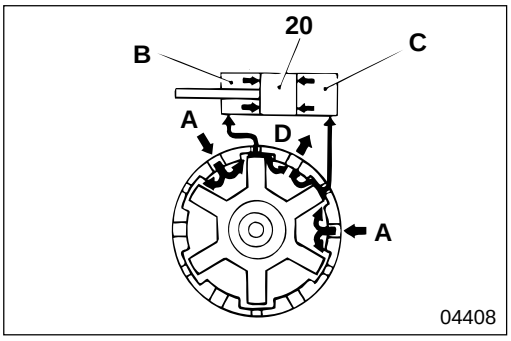
Power Steering Booster



https://truckmanualshub.com/

1	Taper plug	**15**	O-ring	**29**	Nut
2	Plug	**16**	Seal ring	**30**	Side cover
3	Worm shaft	**17**	O-ring	**31**	Bolt
4	Needle bearing	**18**	O-ring	**32**	Backup ring
5	Stub shaft	**19**	Seal ring	**33**	Y-packing
6	Rotor	**20**	Piston	**34**	O-ring
7	Valve housing	**21**	Seal ring	**35**	Retainer
8	Bearing cage	**22**	O-ring	**36**	Needle bearing
9	Side race	**23**	Body	**37**	Sector shaft
10	Steel ball	**24**	Screw	**38**	Needle bearing
11	Ball bearing	**25**	Ball tube clip	**39**	Y-packing
12	Adjusting plug	**26**	Ball tube	**40**	Backup ring
13	Oil seal	**27**	Steel ball	**41**	Oil seal
14	Dust cover	**28**	Adjusting screw	**42**	Dust cover

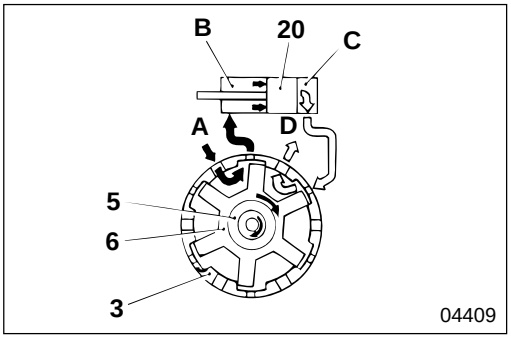
The rotary valve is the central part of the power steering booster. The torsion bar allows the steering reaction force and valve return to operate lightly and smoothly at low speed, and ensures stable steering feel even at high speed.



● **Straight-ahead operation**

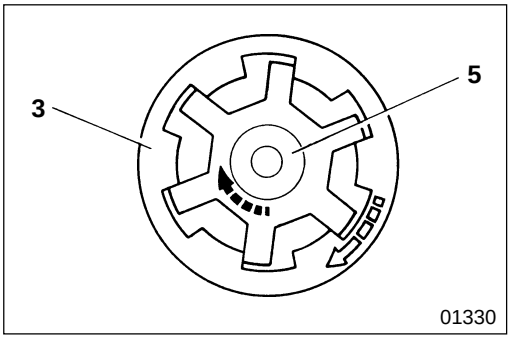
Piston **20** is in the neutral position as chambers **B** and **C** of the piston are under equal pressure.

A : From oil pump
D : To oil tank



● **Steering operation**

Turning the steering wheel rotates stub shaft **5**, causing rotor **6** to close the fluid feed passage to cylinder chamber **C**. This produces a pressure difference between cylinder chambers **B**, **C**, which causes piston **20** to move, and facilitates rotation of worm shaft **3**.

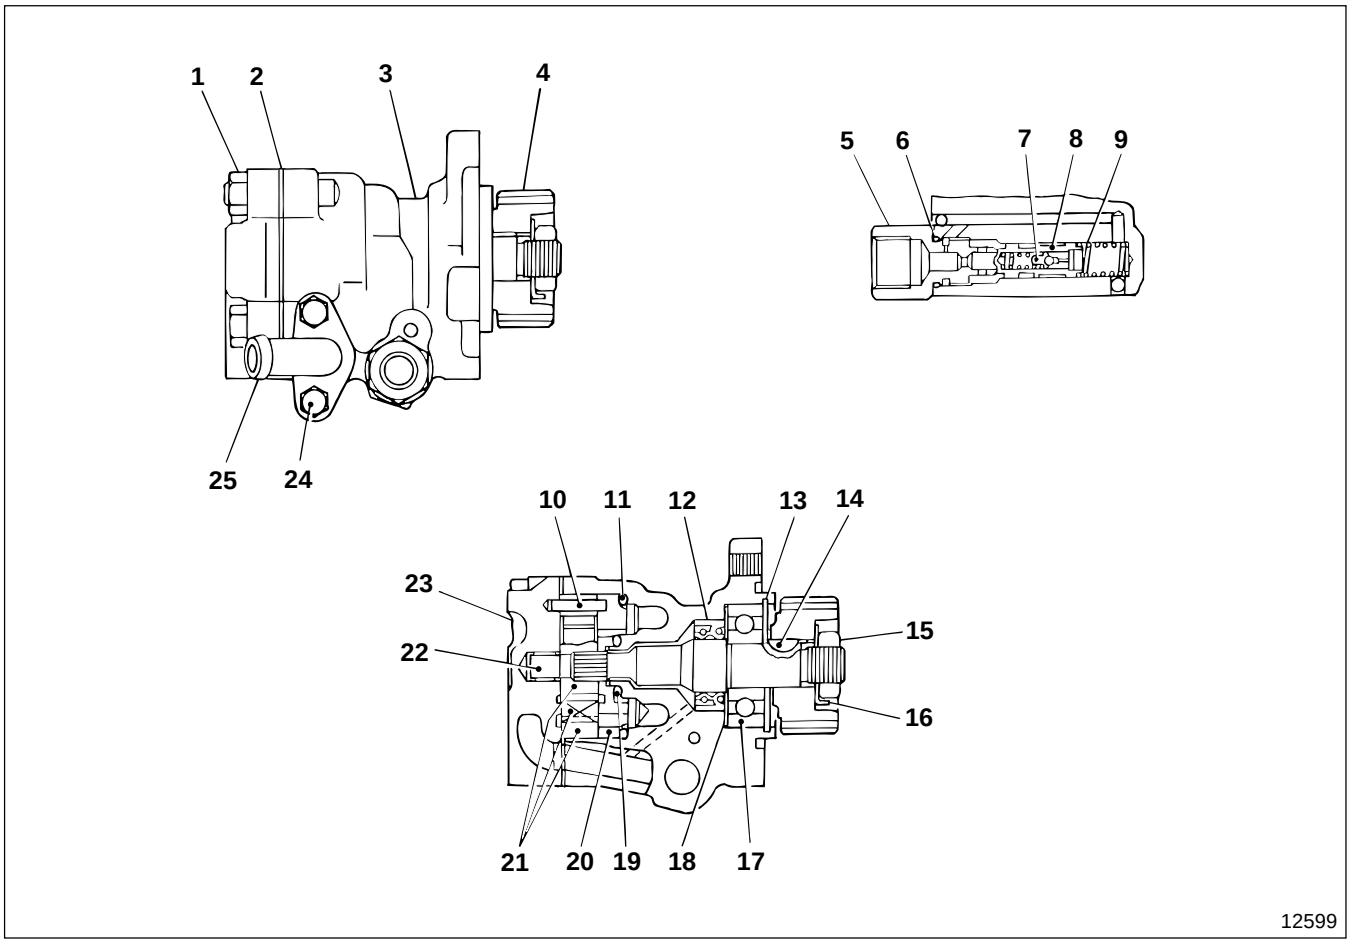


If the hydraulic circuit fails

The safety mechanism allows the vehicle to be steered manually, when the rotating force of stub shaft **5** alone directly turns worm shaft **3**, transmitting the steering force.

https://truckmanualshub.com/

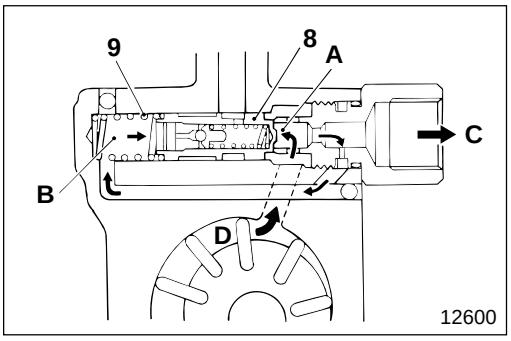
Power Steering Oil Pump



1 Bolt
2 Gasket
3 Front body
4 Gear
5 Connector
6 O-ring
7 Relief valve
8 Flow control valve assembly
9 Flow control spring
10 Straight pin
11 O-ring
12 Oil seal
13 Retaining ring
14 Key
15 Nut
16 Lock washer
17 Ball bearing
18 Retaining ring
19 O-ring
20 Pressure plate
21 Cartridge assembly
22 Shaft
23 Rear body
24 Bolt
25 Suction pipe

https://truckmanualshub.com/

Flow Control Valve Assembly



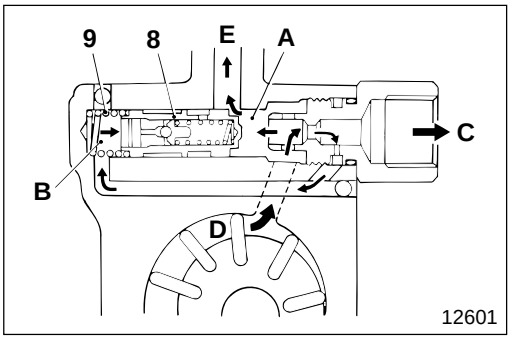
● **Operation of flow control valve**

(1) When not operating (When oil pump rotating at low speed)

The fluid pressure from chamber **A** does not move flow control valve assembly **8** because the fluid pressure is lower than the combined force of the fluid pressure from chamber **B** and the repercussive force of flow control spring **9**.

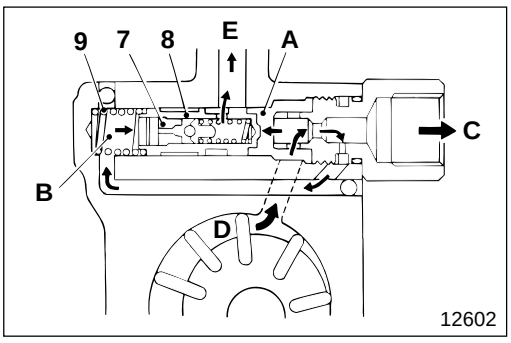
C : To power steering booster

D : Pressure chamber



(2) When operating (When oil pump rotating at middle or high speed)

The fluid pressure from chamber **A** moves flow control valve assembly **8** because the fluid pressure is higher than the combined force of the fluid pressure from chamber **B** and the repercussive force of flow control spring **9**. Then, port **E** opens to release the fluid, maintaining the level of flow in chamber **A**.

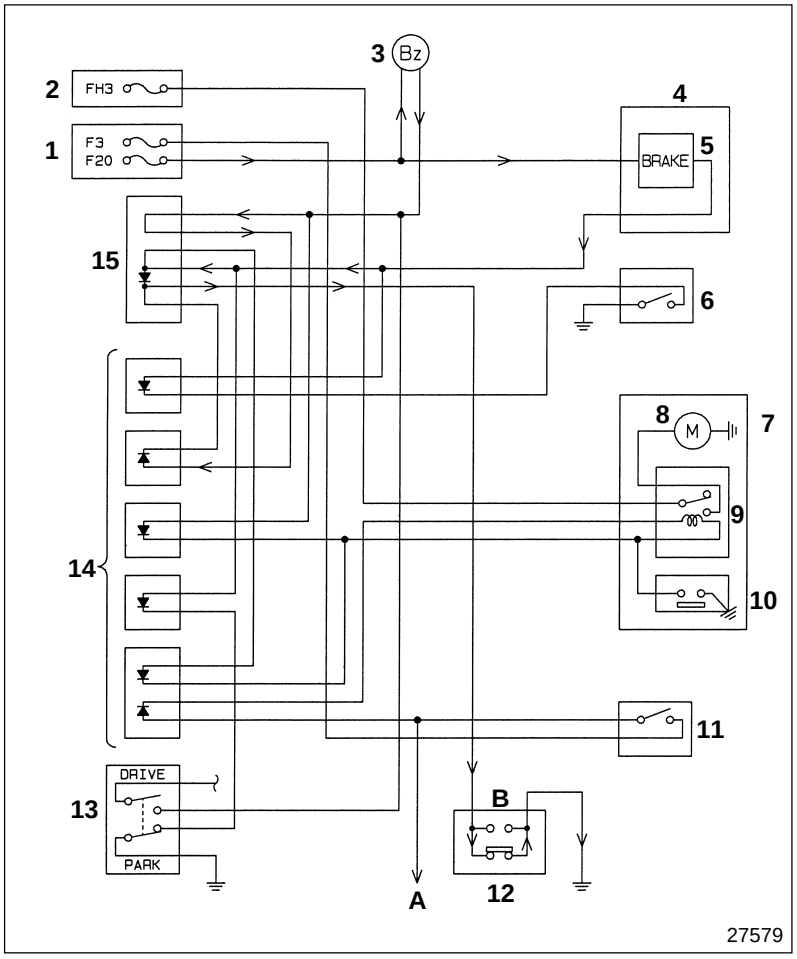


● **Operation of relief valve**

The combined force of the fluid pressure from chamber **B** and the repercussive force of flow control spring **9** moves flow control valve assembly **8** because the fluid pressure is higher than the fluid pressure from chamber **A**. The hydraulic pressure in chamber **B** rises further to open relief valve **7** and port **E**, stabilizing the fluid pressure in chamber **B**.

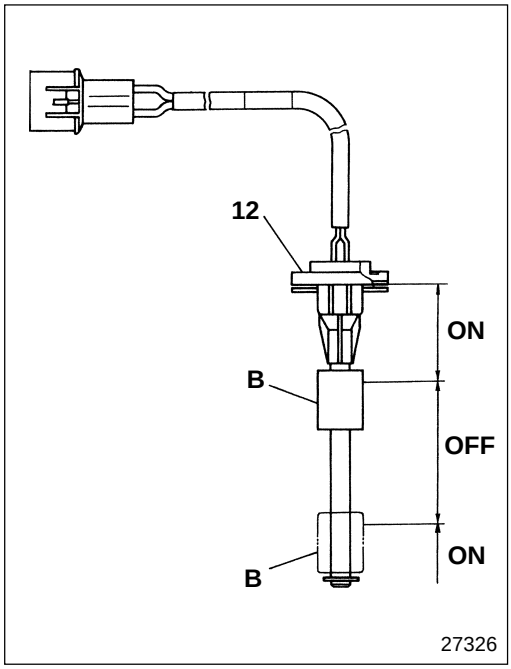
https://truckmanualshub.com/

Power Steering Fluid Level Warning Circuit



1 Fuse box
2 High-current fuse box
3 Warning buzzer
4 Meter cluster
5 Brake warning lamp
6 Brake fluid level switch
7 Brake booster (Hydraulic booster)
8 Emergency pump motor
9 Motor relay
10 Flow switch
11 Stop lamp switch
12 Power steering fluid level sensor
13 Parking brake switch
14 Diode
15 Joint connector

A : To stop lamp
B : Float



- Power steering oil pump hydraulic pressure is also used for brake booster (hydraulic booster) **7** which reinforces brake. So the power steering fluid level warning circuit is connected to warning buzzer **3** and brake warning lamp **5**.
- When the power steering fluid level drops below the **"MIN"** level or rises above the **"MAX"** level of the power steering oil tank, the magnet inside float **B** in power steering fluid level sensor **12** turns the power steering fluid level sensor ON. Warning buzzer **3** sounds and brake warning lamp **5** lights to warn the driver.

https://truckmanualshub.com/

Possible causes \ Symptoms		Steering wheel operation heavy	Steering wheel play excessive and unstable	Steering wheel pulls to one side	Steering wheel vibration	Steering wheel self-return poor	Steering wheel does not turn	Steering angle insufficient or difference between right and left	Fluid leaking	Oil pump fluid pressure faulty	Oil pump gurgles	Oil pump squeaks	Oil pump growls	Remarks

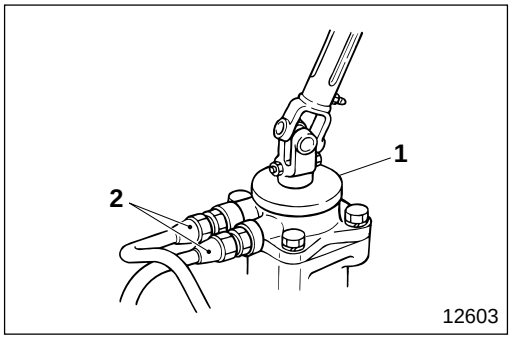
ON-VEHICLE INSPECTION AND ADJUSTMENT

Change of Power Steering Fluid

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Oil pipe	66.69±12.75 {49±9.4, 6.8±1.3}	—



[Draining]
- Jack up the front wheels.
- Loosen oil pipe **2** connected to power steering booster **1**.
- Turn the steering wheel fully left and right repeatedly, and drain the fluid from power steering booster **1**.
- After draining the fluid, tighten oil pipe **2** at specified torque.

[Filling]
P37-12

Bleeding of Power Steering System

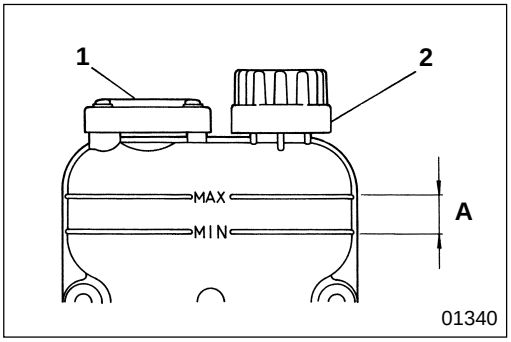
Fluid

Location	Points of application	Specified fluid	Quantity
1	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Between the "MAX" and "MIN" levels in the power steering oil tank

WARNING

Because the brake booster (hydraulic booster) uses power steering fluid, do not let other fluids such as brake fluid, etc. get mixed with the power steering fluid inside the power steering oil tank.

https://truckmanualshub.com/



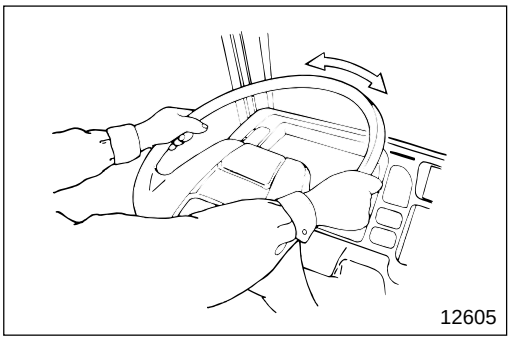
- Supply fluid into power steering oil tank **1** up to filler cap **2**.
- With the engine stopped, jack up the front wheels and turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.
- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- Depress the brake pedal fully several times repeatedly, until as in the case of the steering wheel, the fluid level does not drop anymore. (The steering wheel at such time does not need to be operated)
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times, next depress the brake pedal several times to raise the fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times to make sure there is no abnormal noise.
- With the engine stopped, depress the brake pedal several times, activate the brake booster (hydraulic booster) emergency pump and bleed air.
- When there is no abnormal noise after the above procedure has been performed, bleeding is completed. Check oil tank **1** fluid level, and pipe and hose connections for fluid leakage.
- After bleeding is completed, inspect brake booster (hydraulic booster) performance (input and output characteristics). Gr 35

Steering Wheel Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Steering wheel play (Measure at the outer circumference of steering wheel)	10 to 40 {0.39 to 1.57}	—	Adjust



Point the wheels directly forward and gently turn the steering wheel left and right and measure the outer circumference play. If the play deviates from the standard value, adjust tightening points and power steering booster backlash. P37-31

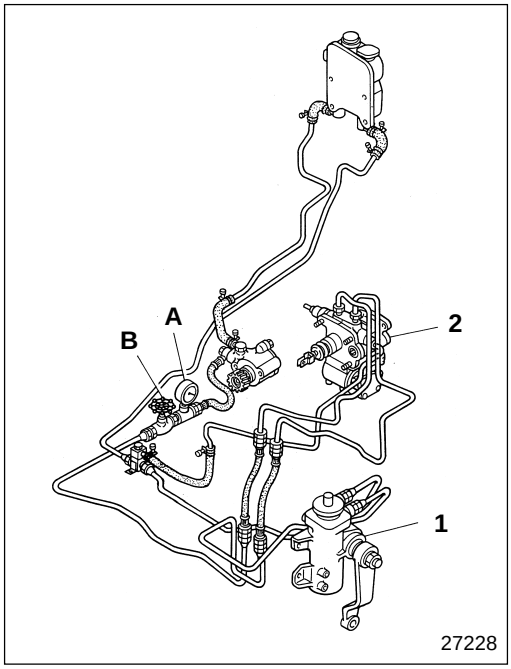
https://truckmanualshub.com/

ON-VEHICLE INSPECTION AND ADJUSTMENT

Performance Verification Test of Power Steering System

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Steering system fluid pressure (With hands off steering wheel)	490 kPa {71 lbf/in^2, 5 kgf/cm^2}	—	Repair
—	Relief set pressure (Measure with engine speed at 1000 to 1500 rpm and the stop valve closed)	12.3 MPa {1780 lbf/in^2, 125 kgf/cm^2}	Maximum +785 kPa {115 lbf/in^2, 8 kgf/cm^2} Minimum –1180 kPa {170 lbf/in^2, 12 kgf/cm^2}	Replace



Verify that power steering booster **1** and the power steering oil pump are operating properly by testing the following items.

NOTE

If the fluid pressure is higher than 490 kPa {71 lbf/in^2, 5 kgf/cm^2} with engine idling and the steering wheel free, inspect power steering booster 1, brake booster (hydraulic booster) 2 and the fluid circuit for clogging.

Test item	Test procedure	Assembly standards
Verification of smooth operation	Jack up the front wheels and turn steering wheel fully left and right	Smooth operation through-out test
Measurement conditions	• Install oil pressure gauge **A** capable of measuring above 14.7 MPa {2130 lbf/in^2, 150 kgf/cm^2} and stop valve **B**, then bleed air • With engine idling, turn steering wheel left and right several times to raise fluid temperature to 50 to 60°C {122 to 140°F} • With the engine idling, open stop valve **B**	
Measurement of fluid pressure	• Measure fluid pressure with hands off steering wheel	490 kPa {71 lbf/in^2, 5 kgf/cm^2}
Measurement of relief pressure	• Gradually increase engine speed and maintain it at 1000 to 1500 rpm, and close stop valve **B** to measure maximum fluid pressure • Do not keep stop valve **B** closed for more than fifteen seconds	Relief set pressure 12.3 MPa {1780 lbf/in^2, 125 kgf/cm^2}

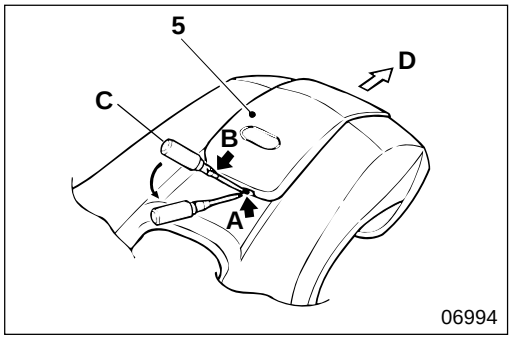
Lubricant

Location	Points of application	Specified lubricant	Quantity
12	Contact area between combination switch of cover assembly and horn contact	Wheel bearing grease [NLGI No.2 (Li soap)]	As required

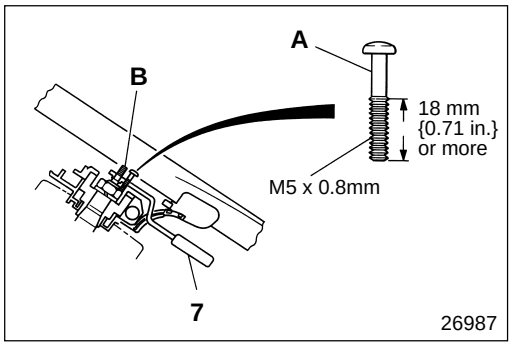
https://truckmanualshub.com/

◆ Service procedure



5 **Removal of horn pad**

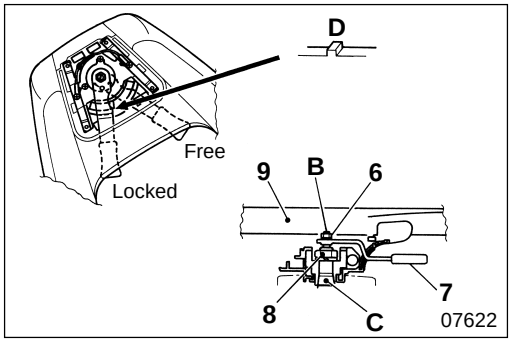
Insert flat-blade screwdriver **C** in grooves **A**, **B** of horn pad **5** and press down on the screwdriver until the horn pad is removed with a “click”. To remove the horn pad, raise and press it in direction **D** as illustrated.



7 **Telescopic lever**

[Removal]

Drive in screw **A** (M5 x 0.8 mm) into tapped hole of telescopic lever **7** and remove the telescopic lever from telescopic shaft **B**.



[Installation]

Locate telescopic lever **7** at the specified position (locked), and adjust until the specified torque is applied to telescopic shaft **B**.

CAUTION ⚠

Do not crush the screw tip of telescopic shaft B.

v

https://truckmanualshub.com/

Start procedure

Install steering wheel assembly **9**. Using a long socket wrench, tighten nut **8** at specified torque 39 to 49 N·m {29 to 36 lbf.ft, 4 to 5 kgf·m}

Rotate telescopic shaft **B** counterclockwise with your fingers and check for looseness

Looseness found

No looseness

Using a flat-blade screwdriver turn telescopic shaft **B** clockwise and drive it in until it hits lightly with a "clunk", but do not turn it any further

CAUTION

Be careful not to tighten too forcibly or you will crush the end of the telescopic shaft, requiring replacement of telescopic shaft assembly C

Install telescopic lever **7** at a location that allows easy tightening, then tighten nut **6** until the telescopic lever will not slip

Tighten telescopic shaft **B** at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 lbf.ft, 0.7 to 0.8 kgf·m}. (Tighten telescopic bar **7** at torque 69 to 78 N {15 to 18 lbf, 7 to 8 kgf} 100 mm {3.94 in.}from the center of steering wheel assembly **9**

To maintain lock, hold telescopic lever **7** clockwise, then loosen and remove lock nut **6**

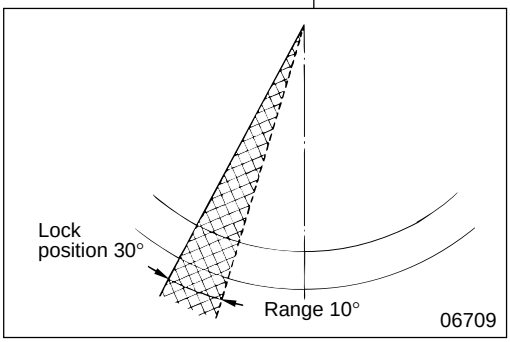
Remove telescopic lever **7**

NOTE

Remove telescopic lever 7 following the description under [Removal], taking care not to loosen telescopic shaft B.

Set telescopic lever **7** to specified lock position **D**, marked "凸"

Tighten nut **6** at specified torque 8.8 to 9.8 N·m {6.5 to 7.2 lbf.ft, 0.9 to 1.0 kgf·m}



When telescopic lever **7** is released, and telescopic shaft **B** is retightened at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 lbf.ft, 0.7 to 0.8 kgf·m}, the telescopic lever should lock in the 10° range this side of specified lock position 30°

Out of the range

Within the range

Joggle steering wheel assembly **9** up and down and check for looseness

Looseness found

No looseness

Remove nut **6**

Procedure is completed

Remove telescopic lever **7**

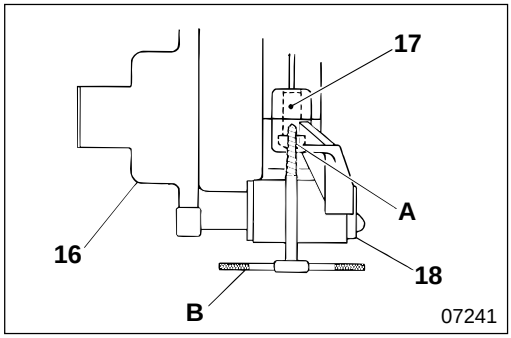
CAUTION

Be sure not to operate telescopic shaft B while steering wheel assembly 9 is removed.

NOTE

Be sure to assemble telescopic lever 7 only after steering wheel assembly 9 has been installed.

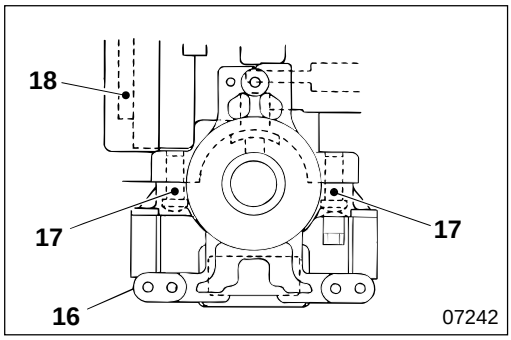
https://truckmanualshub.com/



17 **18** **Head cutting bolt, starter switch**

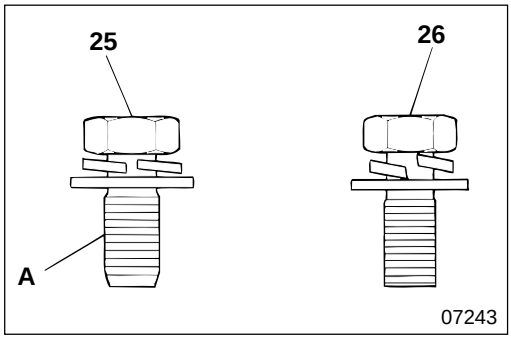
[Removal]

- After removing bracket **16**, drill a ø5.5 to 6.0 mm {0.22 to 0.24 in.} hole 10 to 15 mm {0.39 to 0.59 in.} deep in surface **A** of head cutting bolt **17** for mounting starter switch **18**.
- Screw in screw extractor **B** counterclockwise, then remove head cutting bolt **17**.



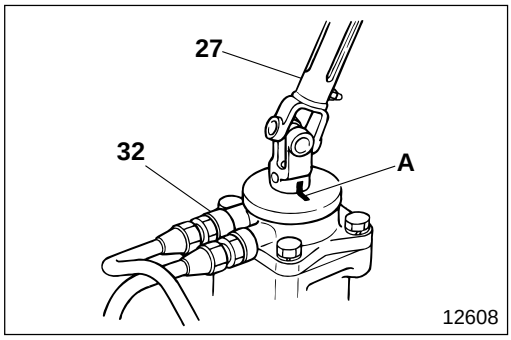
[Installation]

- With new head cutting bolt **17**, tighten starter switch **18** at specified torque to cut the head off the bolt.
- After installing bracket **16**, verify operation of the steering lock function of starter switch **18**.



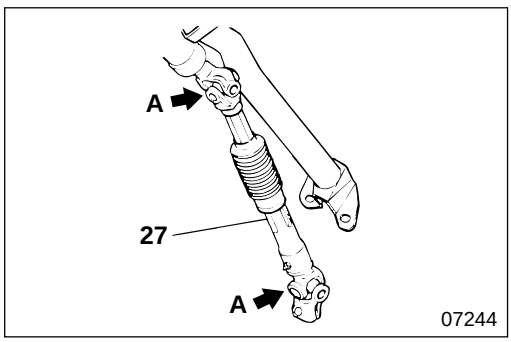
25 **26** **Installation of bolt**

- Bolts **25** and **26**, differ in shape. Do not mix them up when installing.
- Thread area **A** of bolt **25** is elliptical to facilitate grounding of the horn circuit.



27 **32** **Removal and installation of steering column subassembly, and power steering booster**

Before removing steering column subassembly **27** or power steering booster **32**, be sure to make alignment mark **A**.



27 **Steering column subassembly**

When the spline of steering column subassembly **27** has been disconnected, align marks **A** on the yokes to face the same direction.

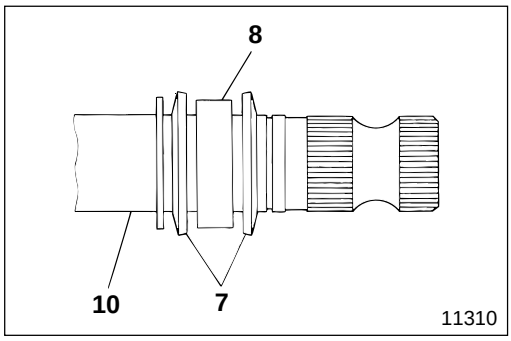
	Friction surfaces of column support upper and bolt	Wheel bearing grease [NLGI No.2 (Li soap)]	As required

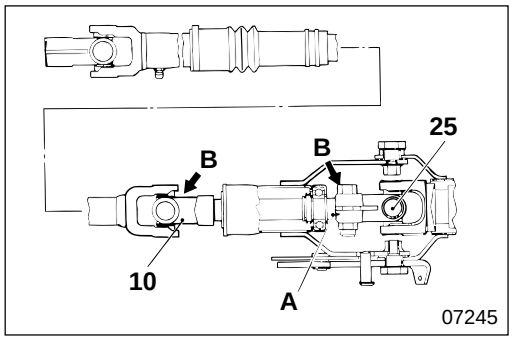
https://truckmanualshub.com/

◆ Service procedure



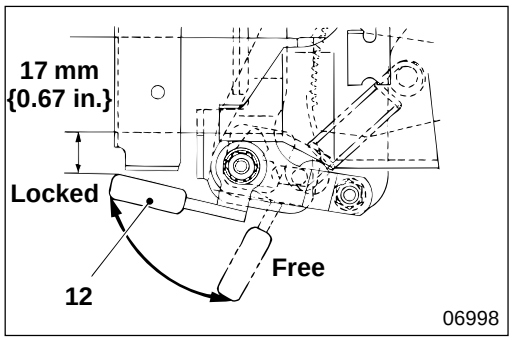
7 **Installation of stopper**

Install stoppers **7** on steering shaft assembly **10** in the direction as illustrated so that they straddle bearing spacer **8**.



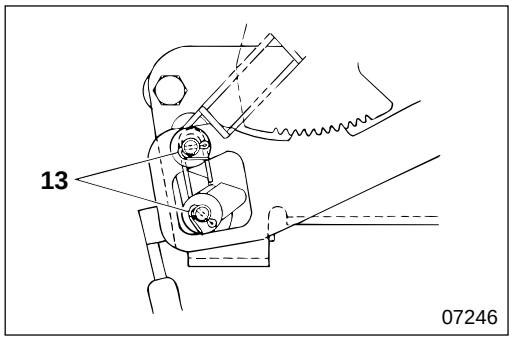
10 **Steering shaft assembly**

- Before removing steering shaft assembly **10**, be sure to make alignment mark **A**.
- Install the steering shaft with direction **B** of the telescopic shaft assembly **25** yoke and steering shaft assembly **10** yoke aligned or at phase angle of 90°.



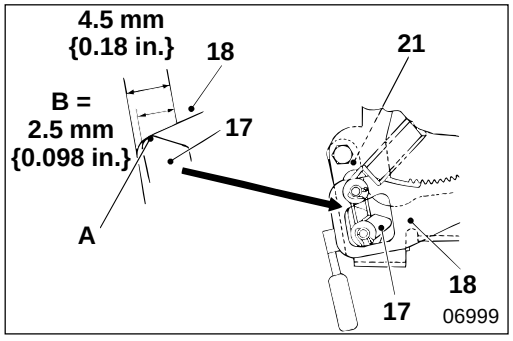
12 **Installation of lock lever**

- Install lock lever **12** so it is within the working angle when locked.
- After installing lock lever **12**, make sure that the lever operates smoothly (operating force less than 49 N {11 lbf, 5 kgf}). With the lever free, make sure that high tilt operates smoothly.



13 **Installation of split pin**

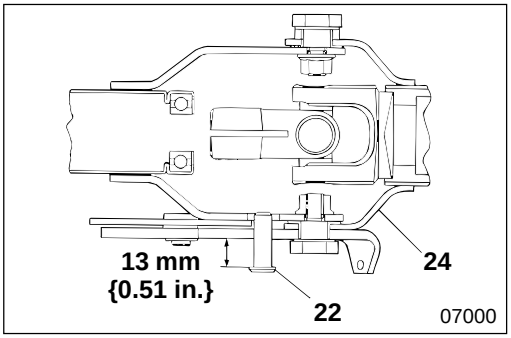
Bend split pin **13** to face outwards as illustrated.



17 **Installation of cam**

Adjust lever support **21** so that the top surface **A** of cam **17** is within dimension **B** of lock plate **18** to install the cam.

https://truckmanualshub.com/



22 **Installation of clevis pin**

Drive clevis pin **22** into column support upper **24** so that the drive dimension is obtained.

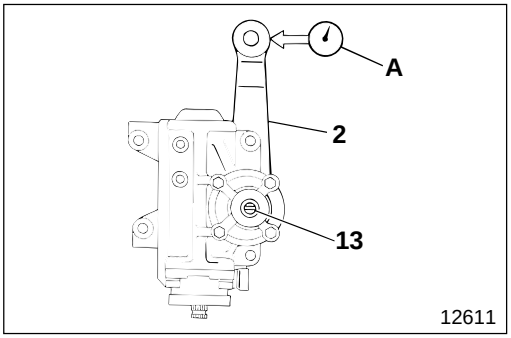
◆ Service procedure

● Work before disassembly

Move pitman arm **2**, and align slit **A** of the V-groove of sector shaft **14** to the center of body **49** so that the gears are in neutral position.

https://truckmanualshub.com/

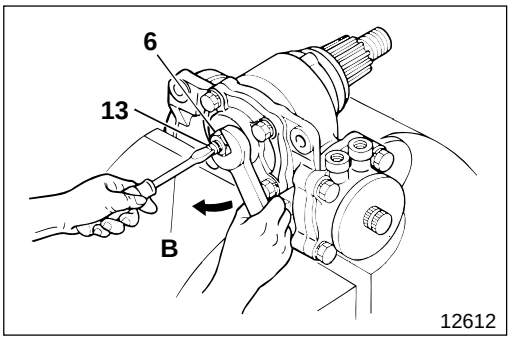


● **Adjustment after assembly**

Adjustment of backlash

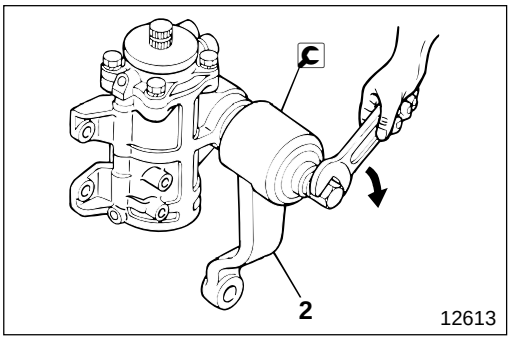
- (Carry out this work with the gears in neutral position.)
  Measure play at the end of pitman arm **2** with dial gauge **A**, and adjust adjusting screw **13** so that the reading meets the standard value.

  Measuring load : ±15 N {3.3 lbf, 1.5 kgf}



Tightening nut

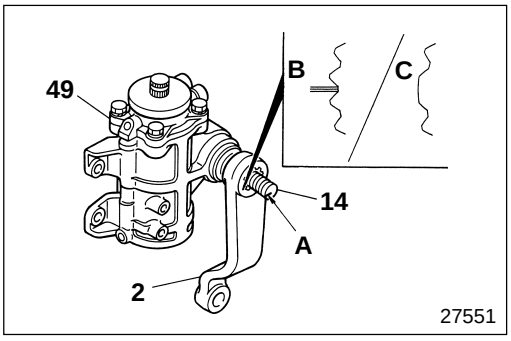
- After adjusting backlash, apply sealer to thread area of adjusting screw **13**. Hold it in place with screwdriver **B** and tighten nut **6** at specified torque.



2 **Pitman arm**

[Removal]

: Pitman arm puller

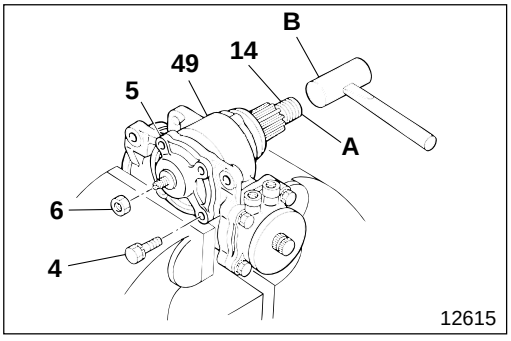


[Installation]

Align slit **A** of the V-groove of sector shaft **14** to the center of body **49**, and align slit **B** of the V-groove of pitman arm **2** or serration missing part **C** on the same line.

NOTE

Have pitman arm 2 make a full stroke of the piston to make sure that the piston moves smoothly.



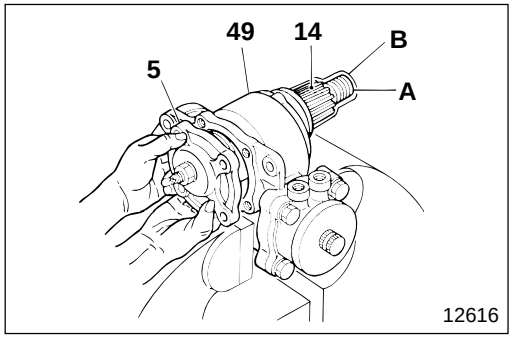
5 **Sector shaft assembly and side cover assembly**

[Removal]

- Make sure that the piston is in the neutral position (slit **A** of the V-groove at one end of sector shaft **14** is aligned with the center of body **49**).
- Tap the end of sector shaft **14** and pull out sector shaft assembly and side cover assembly **5**.

  B : Plastic-headed mallet

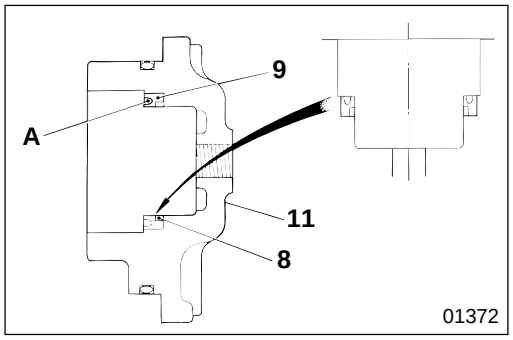
https://truckmanualshub.com/



[Installation]
Position sector shaft **14** of sector shaft assembly and side cover assembly **5** so that slit **A** of its V-groove is aligned with the center of body **49**, and the piston gear and sector shaft gear engage at their centers.

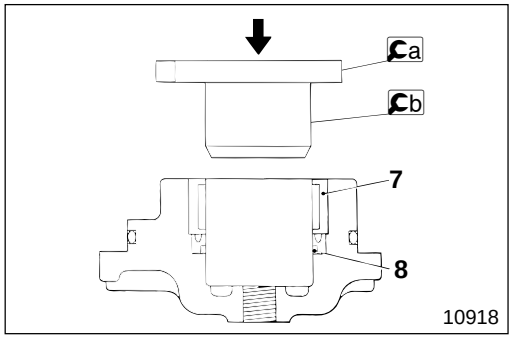
CAUTION

Before installation, apply tape B to the Y-packing to prevent it being damaged by the threads of sector shaft 14.

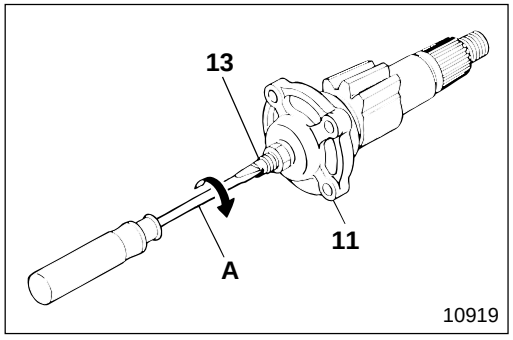


8 **9** **Backup ring, Y-packing**

[Installation]
- Install Y-packing **9** into side cover **11** in the direction as illustrated.
- After installing backup ring **8**, pack groove **A** of Y-packing **9** with grease.

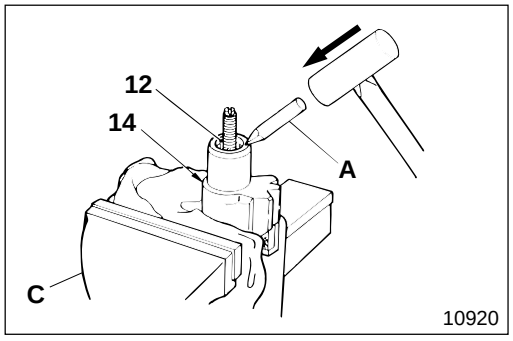


- After installing needle bearing **7** into backup ring **8**, form the bent up part of the backup ring using a insert tool assembly and b insert tool.



11 **Removal of side cover**

Screw in adjusting screw **13** and remove side cover **11**.
A : Screwdriver



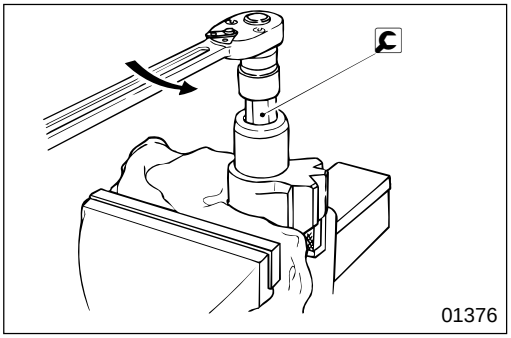
12 **Retainer**

Disassemble sector shaft **14**, as follows, only if it is faulty :
[Removal]
- Pry up (2 points) of retainer **12**.
  A : Chisel

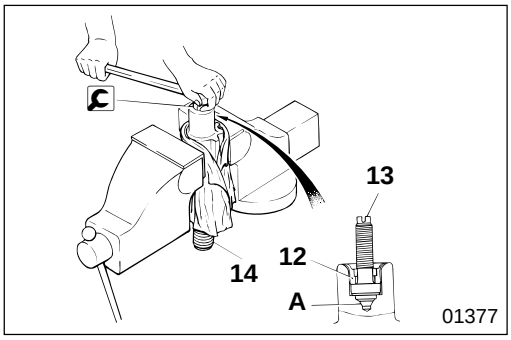
CAUTION

Make sure you use a cloth when you grip sector shaft 14 in vise C to prevent damage.

https://truckmanualshub.com/

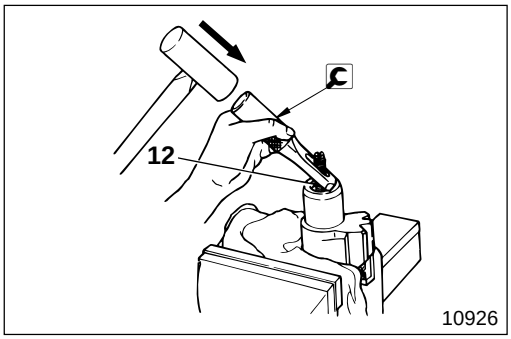


- Remove retainer **12** using [c] bar.

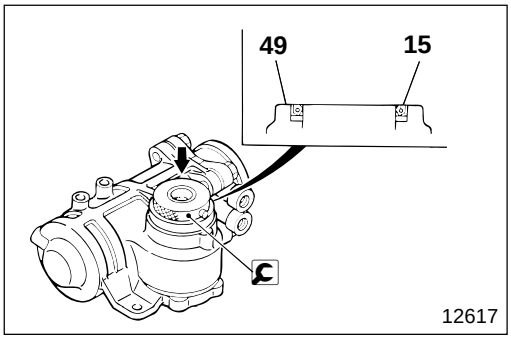


[Installation]

- Pack adjusting screw **13** mounting hole **A** of sector shaft **14** with grease.
- Install adjusting screw **13** into sector shaft **14**.
- Install retainer **12** into sector shaft **14** using [c] bar.
- After installation, slacken off by 180°, retighten at 39 N·m {29 lbf.ft, 4 kgf·m}, then slacken off by 20°.
- Make sure that adjusting screw **13** turns smoothly.

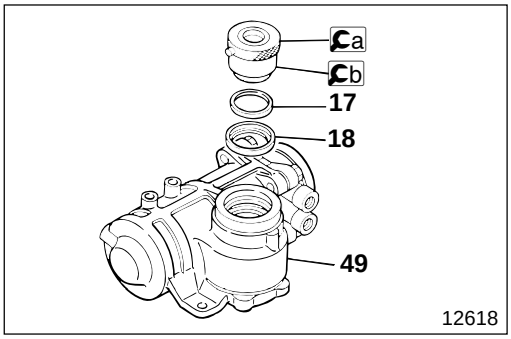


- After installing retainer **12**, caulk the retainer (2 points) using [c] squeeze tool.



15 **Installation of oil seal**

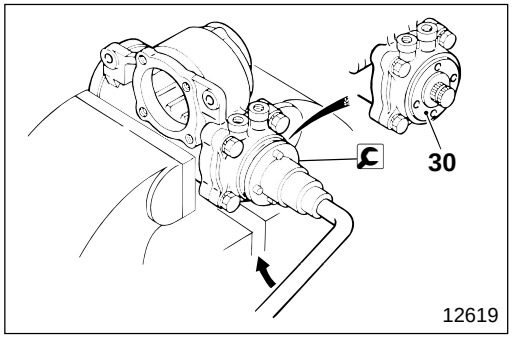
Install oil seal **15** into body **49** in the direction as illustrated.



17 **18** **Installation of backup ring and Y-packing**

- Install Y-packing **18** and backup ring **17** to body **49**.
- Pack the groove of Y-packing **18** with grease.
- Form the shape of backup ring **17** using [ca] insert tool assembly and [cb] insert tool.

https://truckmanualshub.com/



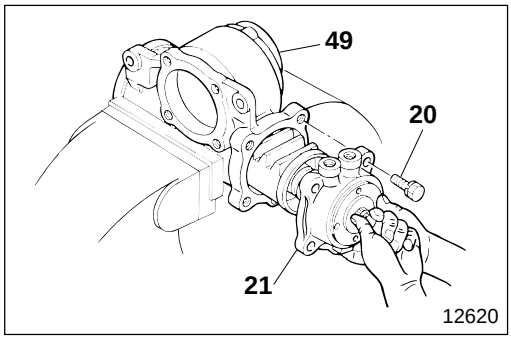
21 **Ball screw assembly**

[Removal]

- Loosen adjusting plug assembly **30** by approximately 180° using wrench assembly.

CAUTION

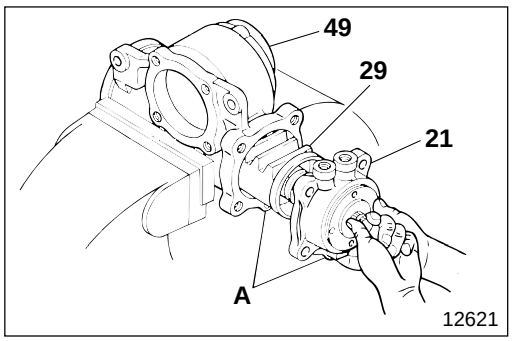
Make sure you only loosen adjusting plug assembly 30, do not undo it completely because the bearing inside the valve housing might spring out.



- Loosen bolt **20** and remove ball screw assembly **21** from body **49**.

CAUTION

- **Make sure that the balls of the ball screw do not spring out.**
- **Be careful not to damage the piston or the interior of body 49.**



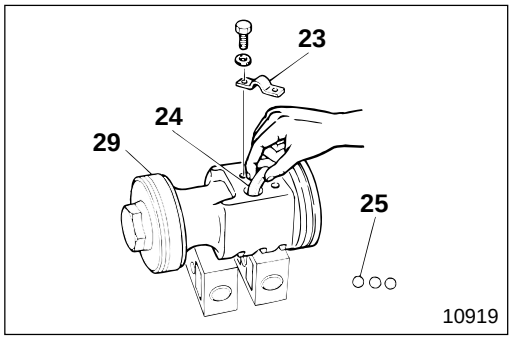
[Installation]

- Install ball screw assembly **21** into body **49**, holding piston **29** so it will not turn.

CAUTION

Be careful not to damage the piston seal ring or the interior of body 49.

- Align oil passage ports **A** of ball screw assembly **21** and body **49**, then tighten.

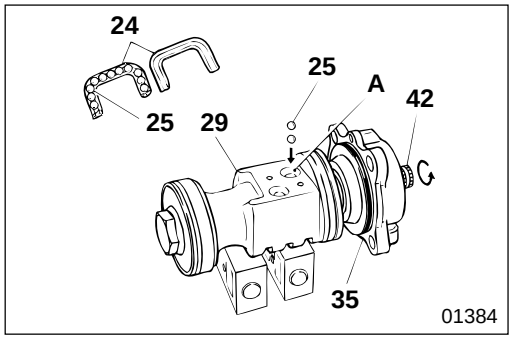


24 **25** **Ball tube and steel ball**

First remove steel balls **25** from piston **29** and place them in the receiving tray, remove ball clip **23**, grip ball tube **24** with your fingers and pull it out gently.

CAUTION

Be careful not to loose any steel balls 25 (×30).



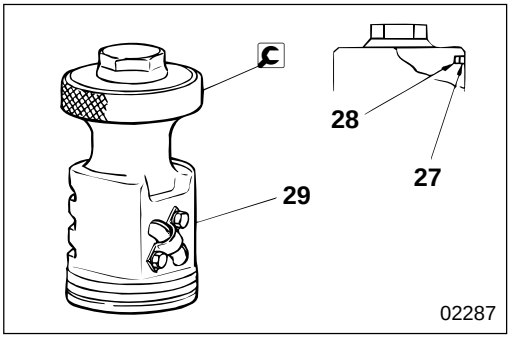
[Installation]

- Pack the interior of ball tube **24** with grease, lay 10 or 11 steel balls **25** in place, then mount the other side of the ball tube.
- Place piston **29** on a level surface, align assembled worm shaft assembly and valve housing assembly **35** and the piston ball race, then drop the steel balls through ball tube hole **A** while turning stub shaft **42**.

CAUTION

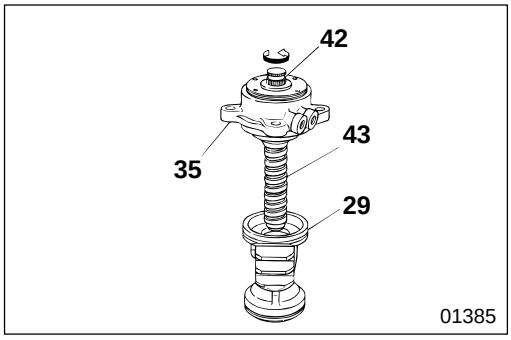
Make sure that you do not pull out worm shaft assembly and valve housing assembly 35 too far, or steel balls 25 will drop out of the ball race.

https://truckmanualshub.com/



27 **28** **Installation of O-ring and seal-ring**

Install O-ring **28** and seal ring **27** in the outside grooves of piston **29**, then form the shape of the seal ring with [C] inserting tool.

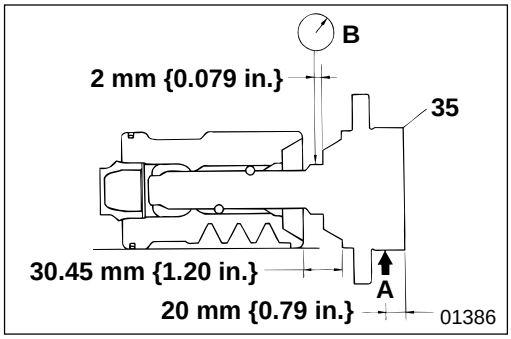


29 **Piston**

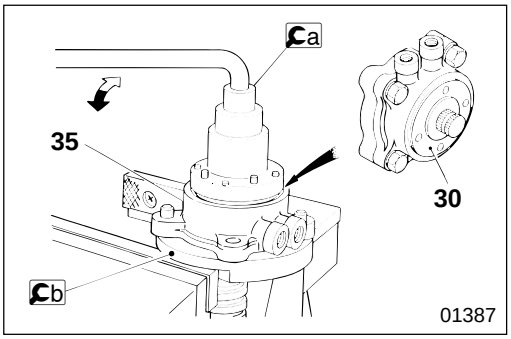
[Removal]
Holding worm shaft assembly and valve housing assembly **35** so that piston **29** is at the bottom, turn stub shaft **42** and remove the piston.

CAUTION

Be careful not to tilt piston 29 when you do this, otherwise steel balls 25 in the races of the piston and worm shaft 43, will drop into the piston.

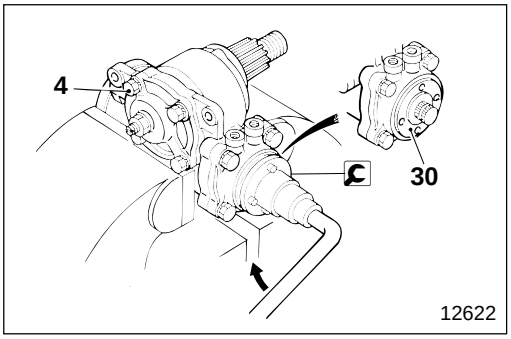


[Inspection]
Measure side play (play in axial direction) **B** of worm shaft assembly and valve housing assembly **35** when 49 N {11 lbf, 5 kgf} is applied to **A** as illustrated.



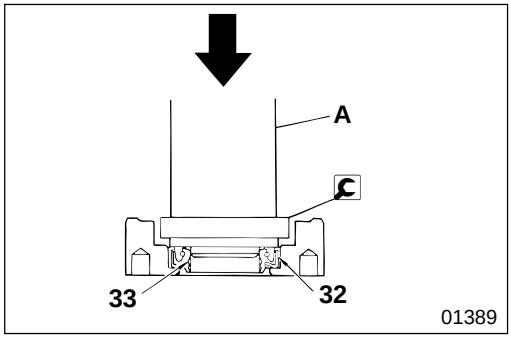
30 **Installation of adjusting plug assembly**

- After tightening adjusting plug assembly **30** of worm shaft assembly and valve housing assembly **35** at specified torque, slacken off by approximately 180°.



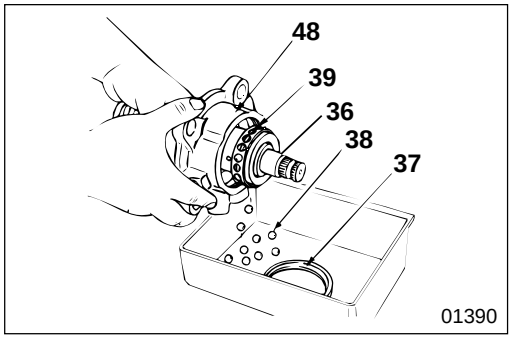
- Tighten bolt **4** at specified torque, then retighten adjusting plug assembly **30** at specified torque using [C] wrench assembly.

https://truckmanualshub.com/



32 **Installation of oil seal**

Install oil seal **32** into adjusting plug **33** in the direction as illustrated.
A : Hand press



36 **Worm shaft assembly**

[Removal]
Push out worm shaft assembly **36** from valve housing **48** by pushing out the side of the worm shaft assembly where the piston is assembled.

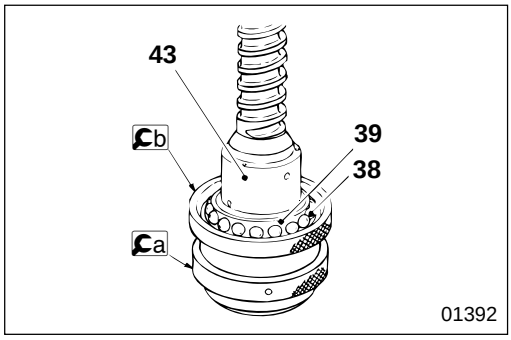
NOTE

Have a tray or box ready to catch side race 37, steel balls 38, and bearing cage 39 as these items separate on removal.

[Installation]

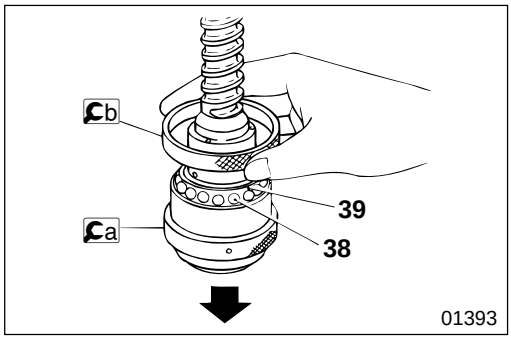
CAUTION

Be careful that worm shaft assembly 36 ball race does not damage seal ring 44.



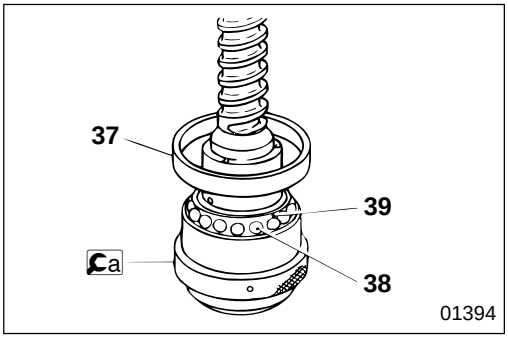
37 **to** **39** **Installation of side race, steel ball, and bearing cage**

- Install b guide assembly on a tool assembly, and insert worm shaft **43** in the direction as illustrated.
- Assemble bearing cage **39** and steel balls **38** on worm shaft **43**.

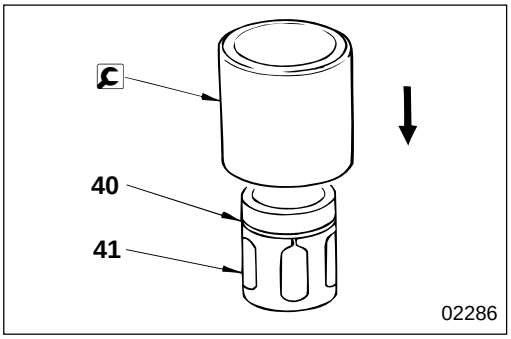


- Hold down b with your hand and slide a downward, so that you can position steel balls **38** as specified.

https://truckmanualshub.com/

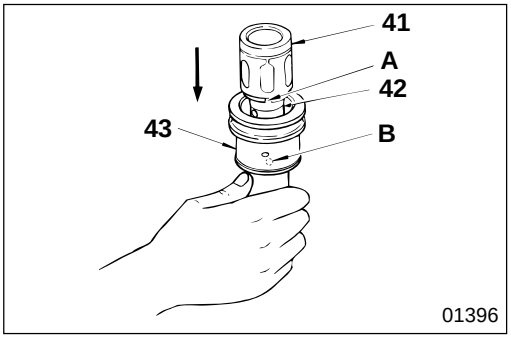


- Install side race **37** on top of steel balls **38** and bearing cage **39**.



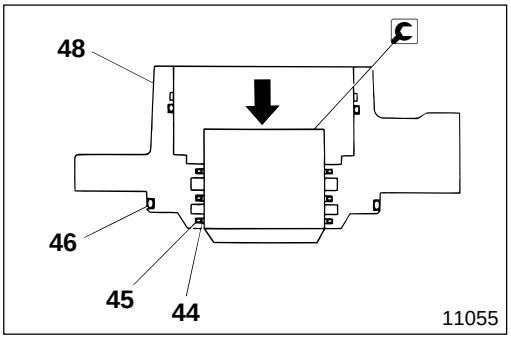
40 **Installation of seal ring**

- Install seal ring **40** onto rotor **41**.
- Form seal ring **40** using insert tool.



41 **Installation of rotor**

Install rotor **41** between stub shaft **42** and worm shaft **43** so that indent **A** of the rotor fits positioning pin **B** of the worm shaft.



44 **to** **46** **Installation of seal ring and O-ring**

- Install seal ring **44** and O-ring **45**, **46** into valve housing **48**.
- Form seal ring **44** using insert tool.

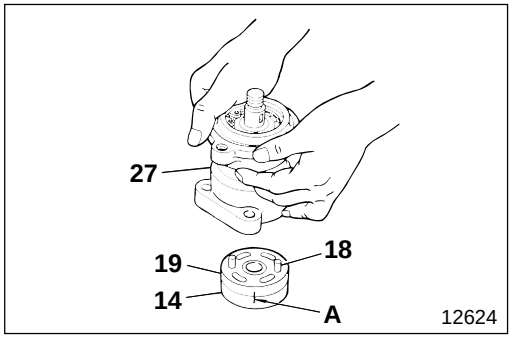
◆ Service procedure

2 **Installation of lock washer**

After installing nut **1**, bend up one lug on the circumference of lock washer **2**.

https://truckmanualshub.com/

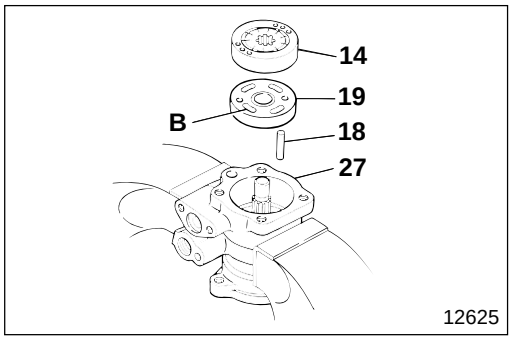
POWER STEERING OIL PUMP



14 Removal and installation of cartridge assembly

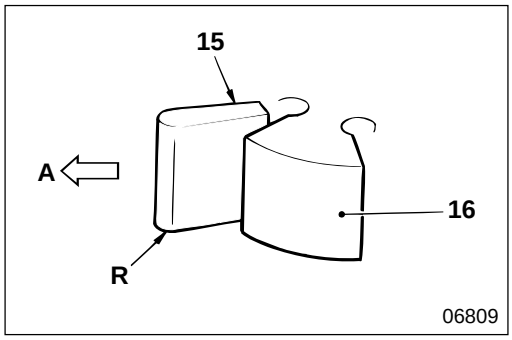
[Removal]

- Remove cartridge assembly **14**, pressure plate **19** and straight pin **18** together from front body **27**.
- Put alignment marks **A** around the outer circumferences of cartridge assembly **14** and pressure plate **19**.



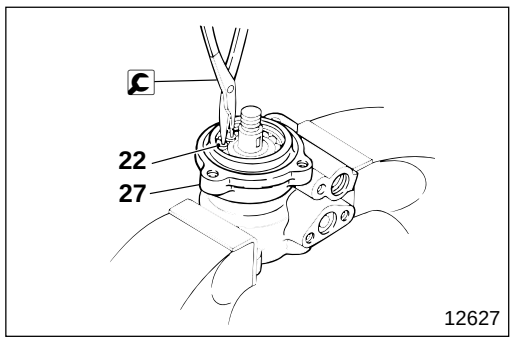
[Installation]

- Install straight pin **18** into front body **27**.
- Install pressure plate **19** onto front body **27**, so that groove **B** of the pressure plate faces the direction as illustrated.
- Align cartridge assembly **14** with straight pin **18**, then install the cartridge assembly.



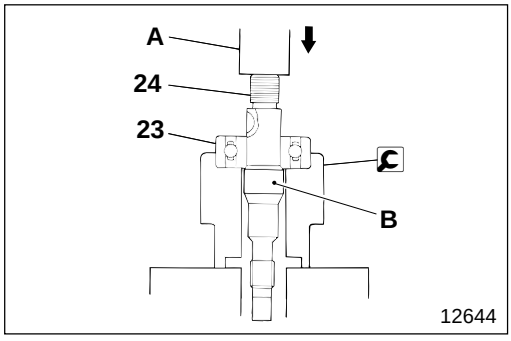
15 Installation of vane

With point **R** of vane **15** facing outside **A**, install it into rotor **16** and make sure that the vane moves smoothly. If it is faulty, replace the cartridge assembly.



22 Removal of retaining ring

Remove retaining ring **22** using pliers.



23 Removal and installation of ball bearing

Remove ball bearing **23** from shaft **24** using press-fitting tool.

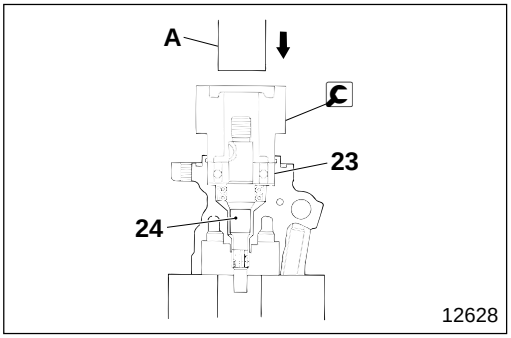
A : Hand press

For installation, follow the removal sequence in reverse.

CAUTION

Be careful not to damage oil seal contact surface B.

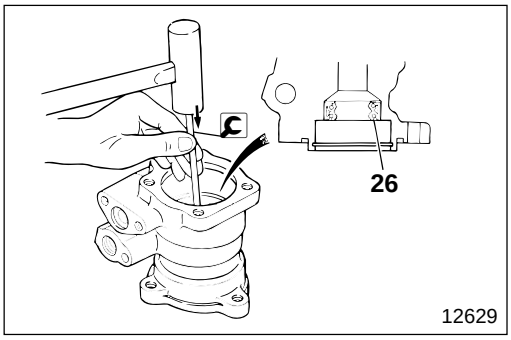
https://truckmanualshub.com/



23 **24** **Installation of ball bearing and shaft**

Install ball bearing **23** and shaft **24** using press-fitting tool.

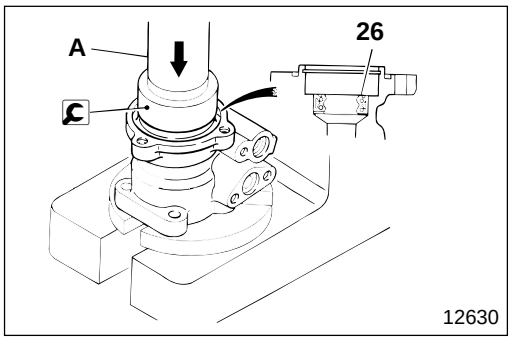
A : Hand press



26 **Oil seal**

[Removal]

Remove oil seal **26** using stick.



[Installation]

Install oil seal **26** in the direction as illustrated using press-fitting tool.

A : Hand press

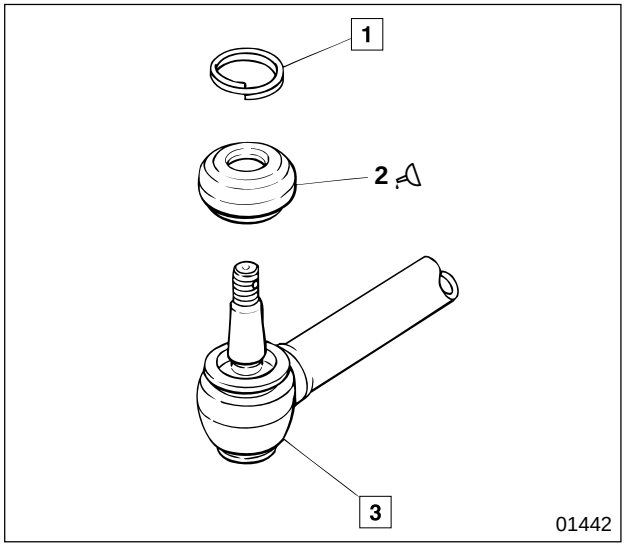
DRAG LINK



● **Disassembly sequence**

1 Clip
2 Dust cover
3 Drag link

NOTE

- **Do not remove clip 1 or dust cover 2 unless they are faulty.**
- **Do not disassemble drag link 3 because it is a unit construction.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Lubricant

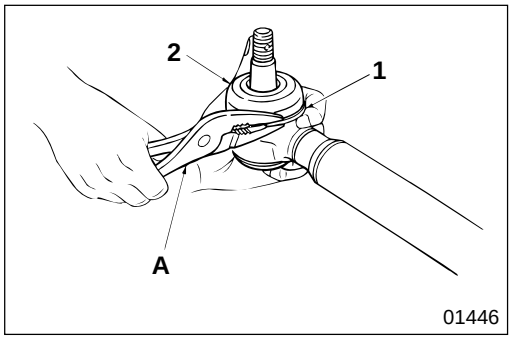
Location	Points of application	Specified Lubricant	Quantity
2	Lip area of dust cover	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required
	Pack interior of dust cover	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	11 g {0.39 oz}

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Clip guide 	MH061831	Installation of clip

◆ Service procedure



1 **Clip**

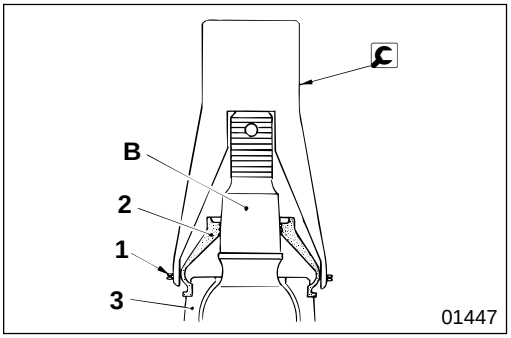
[Removal]

A : Long nose pliers

CAUTION

- **Be careful not to damage clip 1 or dust cover 2 when you remove the clip.**
- **If clip 1 is deformed, do not reuse it.**

https://truckmanualshub.com/

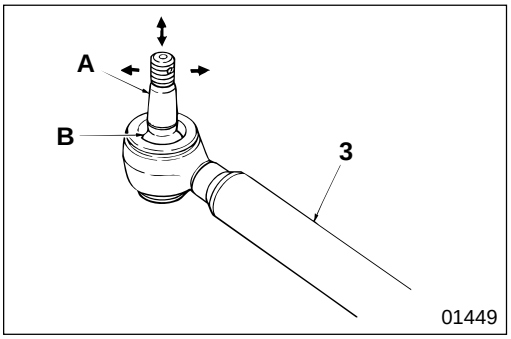


[Installation]

- Position the assembly so ball stud **B** is vertical.
- Place clip guide on drag link **3**.
- Install clip **1** into the groove of dust cover **2**.

CAUTION

- **Be careful that clip guide end does not dig into dust cover 2.**
- **Be especially careful that clip 1 end does not damage dust cover 2.**

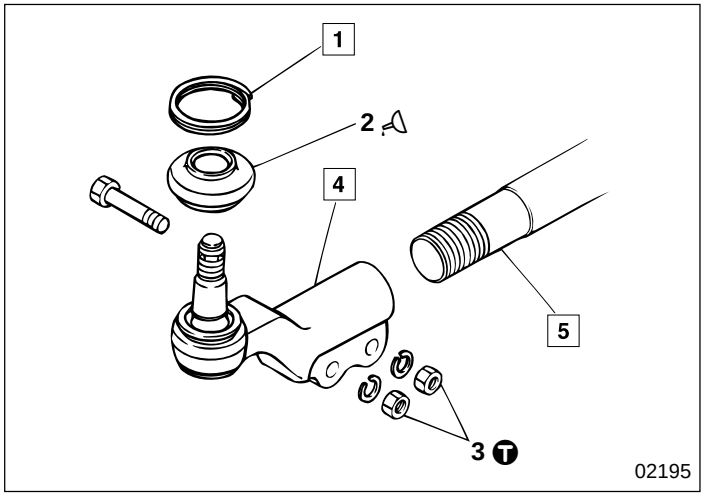


3 Inspection of drag link

Move ball stud area **A** of drag link **3** vertically and horizontally to make sure that there is no play. Also, check that ball section **B** moves evenly. If any fault is found, replace the tie rod assembly.

https://truckmanualshub.com/

TIE ROD ASSEMBLY



● **Disassembly sequence**

1 Clip
2 Dust cover
3 Nut
4 Tie rod end assembly
5 Tie rod

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

Do not attempt to disassemble tie rod end assembly 4 because it is a unit construction.

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
5	Bend of tie rod	1 {0.039} or less	1 {0.039}	Replace

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Nut (Tie rod end assembly fastening)	78 {58, 8}	Wet

Lubricant

Location	Points of application	Specified lubricant	Quantity
2	Lip area of dust seal	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required
	Pack into dust cover	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	11 g {0.39 oz}

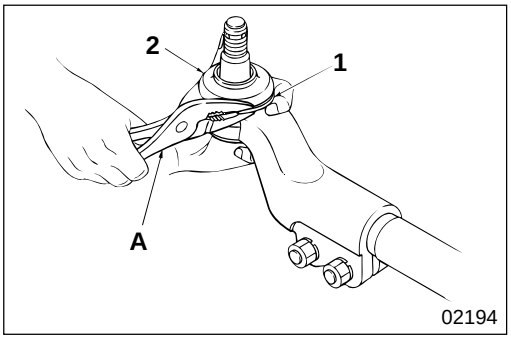
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Clip guide 	MH061831	Installation of clip

https://truckmanualshub.com/

◆ Service procedure



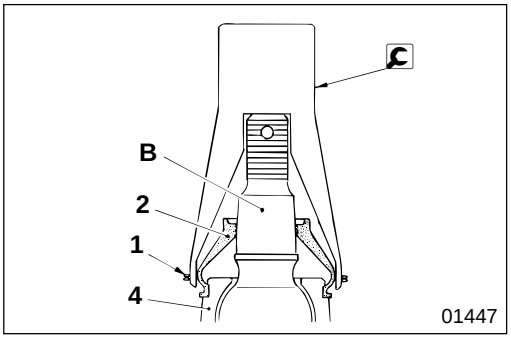
1 **Clip**

[Removal]

A : Long nose pliers

CAUTION

- **Be careful not to damage clip 1 or dust cover 2 when you remove the clip.**
- **If clip 1 is deformed, do not reuse it.**

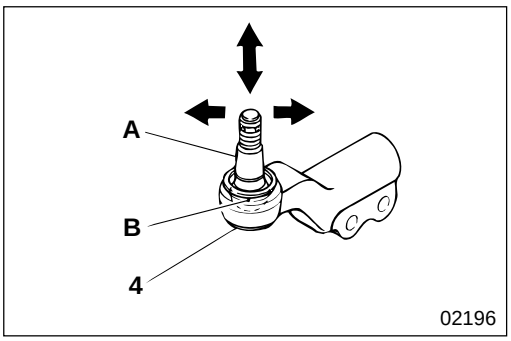


[Installation]

- Position so ball stud **B** is vertical.
- Place clip guide on tie rod end assembly **4**.
- Install clip **1** into the groove of dust cover **2**.

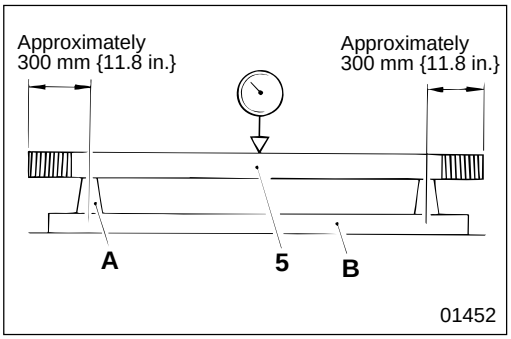
CAUTION

- **Be careful that clip guide end does not dig into dust cover 2.**
- **Be especially careful that clip 1 end does not damage dust cover 2.**



4 **Inspection of tie rod end assembly**

Move ball stud area **A** of tie rod end assembly **4** vertically and horizontally to make sure that there is no play. Also, check that ball section **B** moves evenly. If any fault is found, replace the tie rod end assembly.



5 **Bend of tie rod**

Measure the bend of tie rod **5** at the center point. If the measured value exceeds the limit, correct or replace the tie rod.

NOTE

To measure the deflection of tie rod 5, turn it one full rotation and read the dial gauge indicator. The deflection is one half of the indicated value.

A : V-block

B : Surface plate

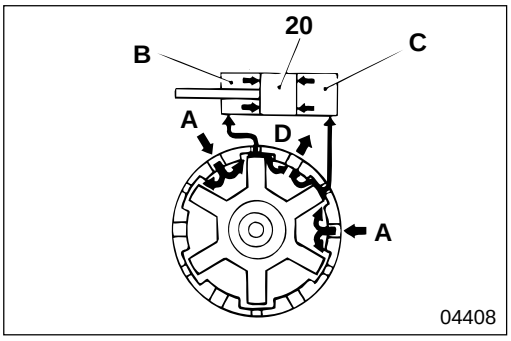
11	Ball bearing	**25**	Ball tube clip	**39**	Y-packing
12	Adjusting plug	**26**	Ball tube	**40**	Backup ring
13	Oil seal	**27**	Steel ball	**41**	Oil seal
14	Dust cover	**28**	Adjusting screw	**42**	Dust cover

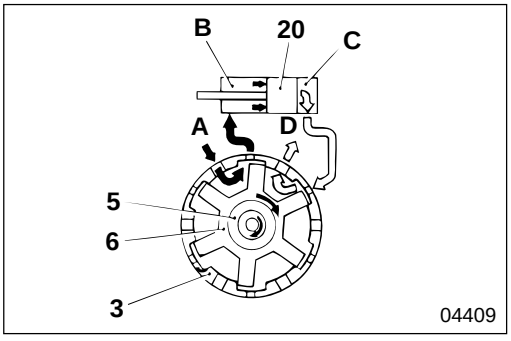
The rotary valve is the central part of the power steering booster. The torsion bar allows the steering reaction force and valve return to operate lightly and smoothly at low speed, and ensures stable steering feel even at high speed.



● **Straight-ahead operation**

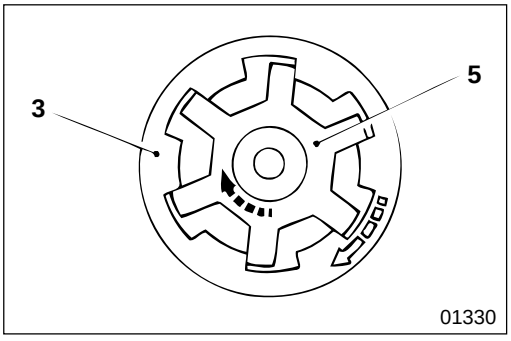
Piston **20** is in the neutral position as chambers **B** and **C** of the piston are under equal pressure.

A : From oil pump
D : To oil tank



● **Steering operation**

Turning the steering wheel rotates stub shaft **5**, causing rotor **6** to close the fluid feed passage to cylinder chamber **C**. This produces a pressure difference between cylinder chambers **B**, **C**, which causes piston **20** to move, and facilitates rotation of worm shaft **3**.

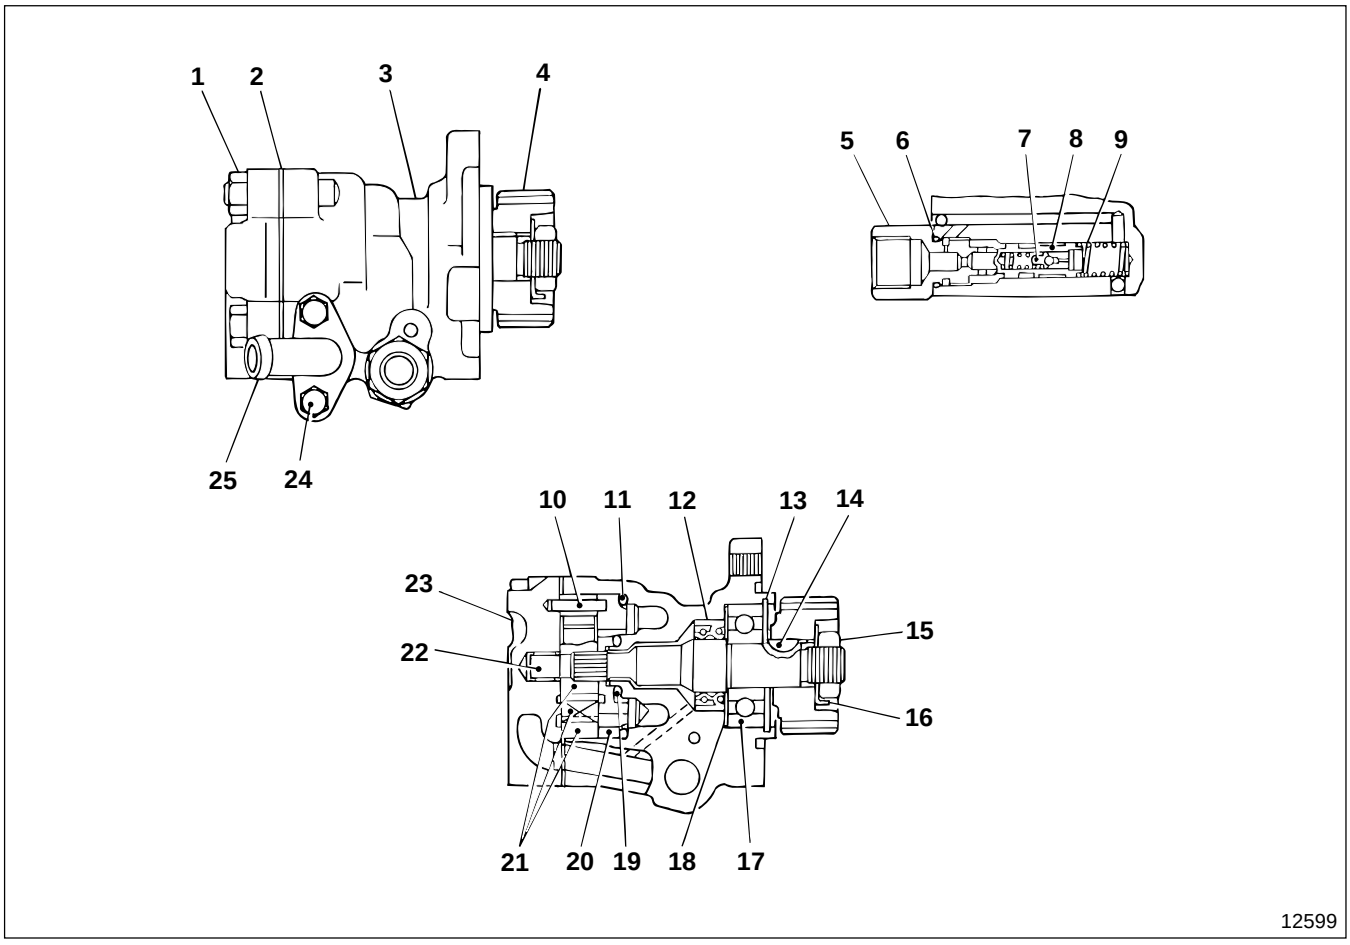


If the hydraulic circuit fails

The safety mechanism allows the vehicle to be steered manually, when the rotating force of stub shaft **5** alone directly turns worm shaft **3**, transmitting the steering force.

https://truckmanualshub.com/

Power Steering Oil Pump



1 Bolt

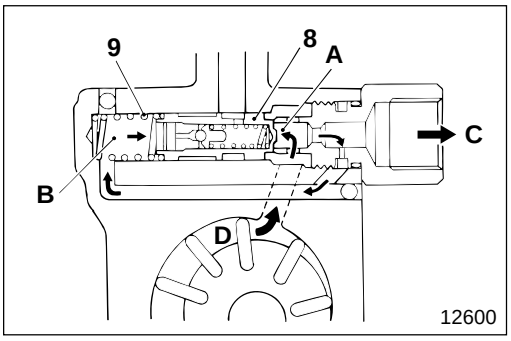
https://truckmanualshub.com/

Flow Control Valve Assembly



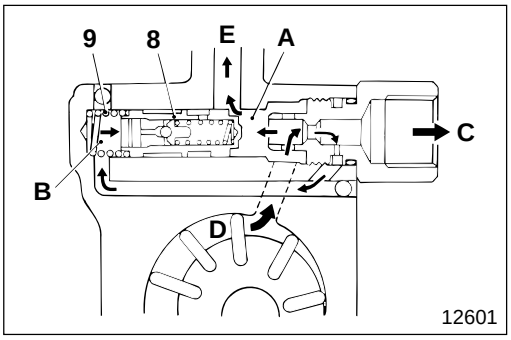
● **Operation of flow control valve**

(1) When not operating (When oil pump rotating at low speed)

The fluid pressure from chamber **A** does not move flow control valve assembly **8** because the fluid pressure is lower than the combined force of the fluid pressure from chamber **B** and the repercussive force of flow control spring **9**.

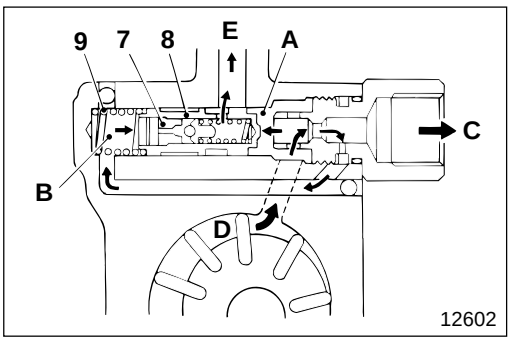
C : To power steering booster

D : Pressure chamber



(2) When operating (When oil pump rotating at middle or high speed)

The fluid pressure from chamber **A** moves flow control valve assembly **8** because the fluid pressure is higher than the combined force of the fluid pressure from chamber **B** and the repercussive force of flow control spring **9**. Then, port **E** opens to release the fluid, maintaining the level of flow in chamber **A**.



● **Operation of relief valve**

The combined force of the fluid pressure from chamber **B** and the repercussive force of flow control spring **9** moves flow control valve assembly **8** because the fluid pressure is higher than the fluid pressure from chamber **A**. The hydraulic pressure in chamber **B** rises further to open relief valve **7** and port **E**, stabilizing the fluid pressure in chamber **B**.

https://truckmanualshub.com/

TROUBLESHOOTING

Possible causes \ Symptoms		Steering wheel operation heavy	Steering wheel play excessive and unstable	Steering wheel pulls to one side	Steering wheel vibration	Steering wheel self-return poor	Steering wheel does not turn	Steering angle insufficient or difference between right and left	Fluid leaking	Oil pump fluid pressure abnormal	Oil pump gurgles	Oil pump squeaks	Oil pump growls	Remarks

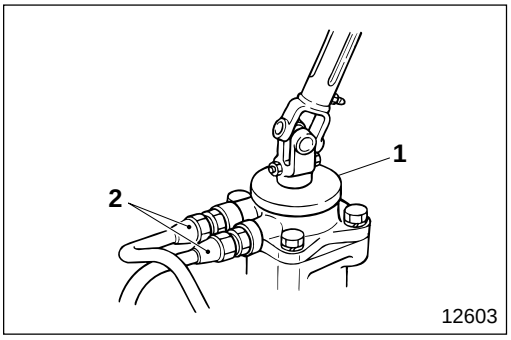
Change of Power Steering Fluid

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Oil pipe	66.69±12.75 {49±9.4, 6.8±1.3}	—



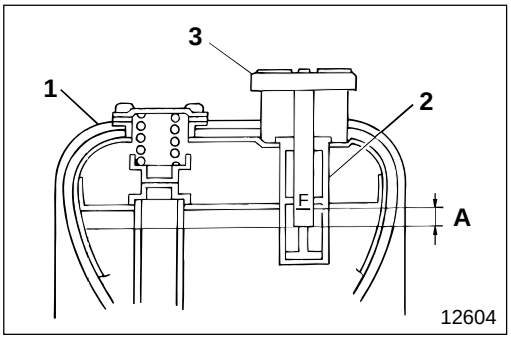
[Draining]
- Jack up the front wheels.
- Loosen oil pipe **2** connected to power steering booster **1**.
- Turn the steering wheel fully left and right repeatedly, and drain the fluid from power steering booster **1**.
- After draining the fluid, tighten oil pipe **2** at specified torque.

[Filling]
P37-11

Bleeding of Power Steering System

Fluid

Location	Points of application	Kinds	Quantity
1	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Filler cap dipstick on filler cap between end and F



- Pour fluid into power steering oil tank **1** up to the inner port of strainer **2**.
- With the engine stopped, jack up the front wheels and turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.

NOTE

Check the fluid level without screwing on filler cap 3.

- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times to raise the fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise, bleeding is completed.
- When bleeding is finished, check the fluid level of power steering oil tank **1**, and pipe and hose connections for fluid leaks.

https://truckmanualshub.com/

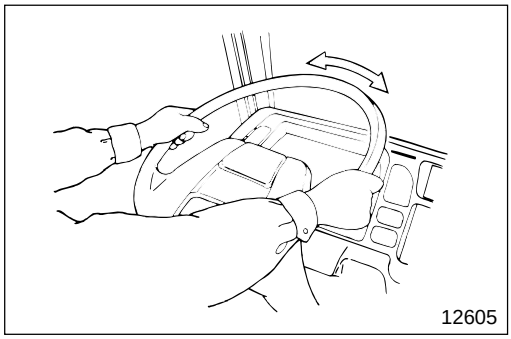
INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Steering Wheel Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Steering wheel play (Measure at the outer circumference of steering wheel)	10 to 40 {0.39 to 1.57}	—	Adjust



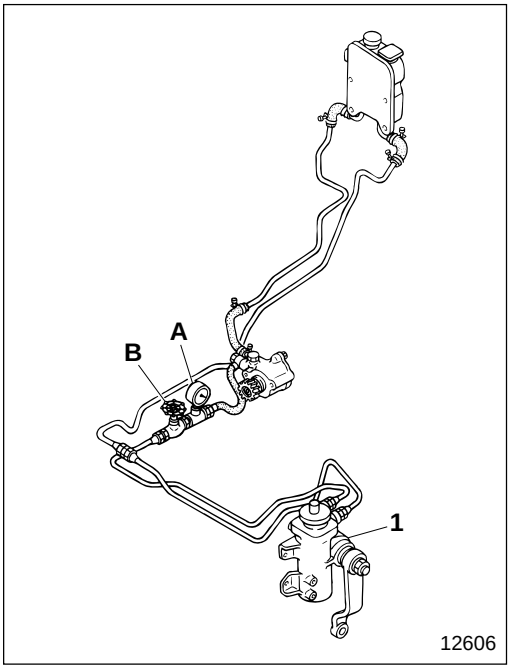
Point the wheels directly forward and gently turn the steering wheel left and right and measure the outer circumference play. If the play deviates from the standard value, adjust tightening points and power steering booster backlash. P37-27

https://truckmanualshub.com/

Performance Verification Test of Power Steering System

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Steering system fluid pressure (With hands off steering wheel)	490 kPa {71 lbf/in^2, 5 kgf/cm^2}	—	Repair
—	Relief set pressure (Measure with engine speed at 1000 to 1500 rpm and the stop valve closed)	12.3 MPa {1780 lbf/in^2, 125 kgf/cm^2}	Maximum +785 kPa {115 lbf/in^2, 8 kgf/cm^2} Minimum –1180 kPa {170 lbf/in^2, 12 kgf/cm^2}	Replace



Verify that power steering booster **1** and the power steering oil pump are operating properly by testing the following items.

NOTE

If the fluid pressure is higher than 490 kPa {71 lbf/in^2, 5 kgf/cm^2} with engine idling and the steering wheel free, inspect power steering booster 1 and the fluid circuit for clogging.

Test item	Test procedure	Assembly standards
Verification of smooth operation	Jack up the front wheels and turn steering wheel fully left and right	Smooth operation throughout test
Measurement conditions	• Install oil pressure gauge **A** capable of measuring above 14.7 MPa {2130 lbf/in^2, 150 kgf/cm^2} and stop valve **B**, then bleed air • With engine idling, turn steering wheel left and right several times to raise fluid temperature to 50 to 60°C {122 to 140°F} • With the engine idling, open stop valve **B**	
Measurement of fluid pressure	• Measure fluid pressure with hands off steering wheel	490 kPa {71 lbf/in^2, 5 kgf/cm^2}
Measurement of relief pressure	• Gradually increase engine speed and maintain it at 1000 to 1500 rpm, and close stop valve **B** to measure maximum fluid pressure • Do not keep stop valve **B** closed for more than fifteen seconds	Relief set pressure 12.3 MPa {1780 lbf/in^2, 125 kgf/cm^2}

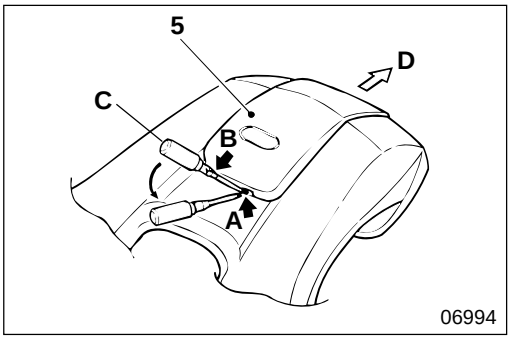
Lubricant

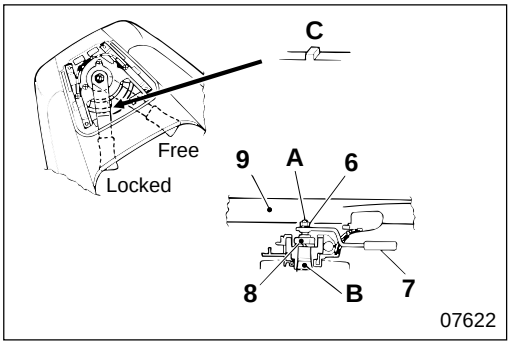
Location	Points of application	Kinds	Quantity
12	Contact area between combination switch of cover assembly and horn contact	Wheel bearing grease [NLGI No.2 (Li soap)]	As required

◆ Service procedure



5 **Removal of horn pad**

Insert flat-blade screwdriver **C** in grooves **A**, **B** of horn pad **5** and press down on the screwdriver until the horn pad is removed with a “click”. To remove the horn pad, raise and press it in direction **D** as illustrated.



7 **Installation of telescopic lever**

Locate telescopic lever **7** at the specified position, and adjust until the specified torque is applied to telescopic shaft **A**.

CAUTION

Do not crush the screw tip of telescopic shaft A.

https://truckmanualshub.com/

Start procedure

Install steering wheel assembly **9**. Using a long socket wrench, tighten nut **8** at specified torque 39 to 49 N·m {29 to 36 lbf.ft, 4 to 5 kgf·m}

Rotate telescopic shaft **A** counterclockwise with your fingers and check for looseness

Looseness found

No looseness

Using a flat-blade screwdriver turn telescopic shaft **A** clockwise and drive it in until it hits lightly with a "clunk", but do not turn it any further

CAUTION

Be careful not to tighten too forcibly or you will crush the end of the telescopic shaft, requiring replacement of telescopic shaft assembly B

Install telescopic lever **7** at a location that allows easy tightening, then tighten nut **6** until the telescopic lever will not slip

Tighten telescopic shaft **A** at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 lbf.ft, 0.7 to 0.8 kgf·m}. (Tighten telescopic bar **7** at torque 69 to 78 N {15 to 18 lbf.ft, 7 to 8 kgf} 100 mm {3.94 in.} from the center of steering wheel assembly **9**

To maintain lock, hold telescopic lever **7** clockwise, then loosen and remove lock nut **6**

Remove telescopic lever **7**

NOTE

Remove telescopic lever 7 by prying it out vertically, taking care not to loosen telescopic shaft A. Prying the lever horizontally can loosen the telescopic shaft

Remove telescopic lever **7**

Looseness found

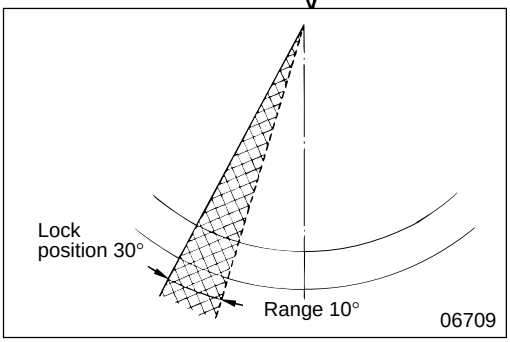
Remove nut **6**

No looseness

Procedure is completed

Set telescopic lever **7** to specified lock position **C**, marked "⏃"

Tighten nut **6** at specified torque 8.8 to 9.8 N·m {6.5 to 7.2 lbf.ft, 0.9 to 1.0 kgf·m}



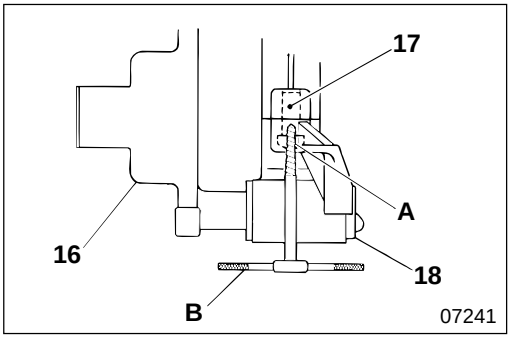
When telescopic lever **7** is released, and telescopic shaft **A** is retightened at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 lbf.ft, 0.7 to 0.8 kgf·m}, the telescopic lever should lock in the 10° range this side of specified lock position 30°

Out of the range

Within the range

Joggle steering wheel assembly **9** up and down and check for looseness

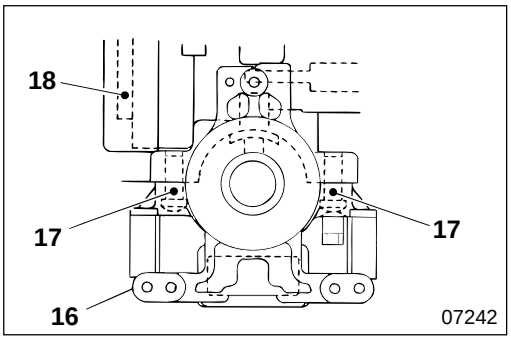
https://truckmanualshub.com/



17 **18** **Head cutting bolt, starter switch**

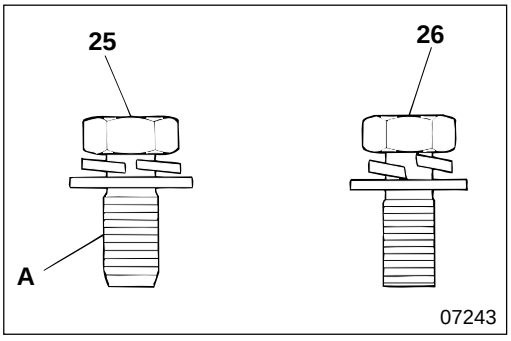
[Removal]

- After removing bracket **16**, drill a ø5.5 to 6.0 mm {0.22 to 0.24 in.} hole 10 to 15 mm {0.39 to 0.59 in.} deep in surface **A** of head cutting bolt **17** for mounting starter switch **18**.
- Screw in screw extractor **B** counterclockwise, then remove head cutting bolt **17**.



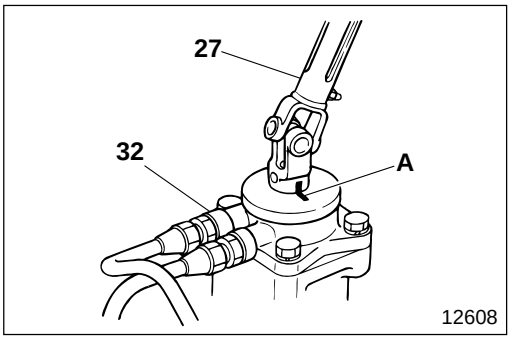
[Installation]

- With new head cutting bolt **17**, tighten starter switch **18** at specified torque to cut the head off the bolt.
- After installing bracket **16**, verify operation of the steering lock function of starter switch **18**.



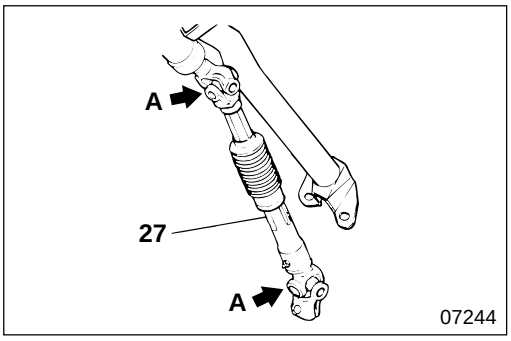
25 **26** **Installation of bolt**

- Bolts **25** and **26**, differ in shape. Do not mix them up when installing.
- Thread area **A** of bolt **25** is elliptical to facilitate grounding of the horn circuit.



27 **32** **Removal and installation of steering column subassembly, and power steering booster**

Before removing steering column subassembly **27** or power steering booster **32**, be sure to make alignment mark **A**.



27 **Steering column subassembly**

When the spline of steering column subassembly **27** has been disconnected, align marks **A** on the yokes to face the same direction.

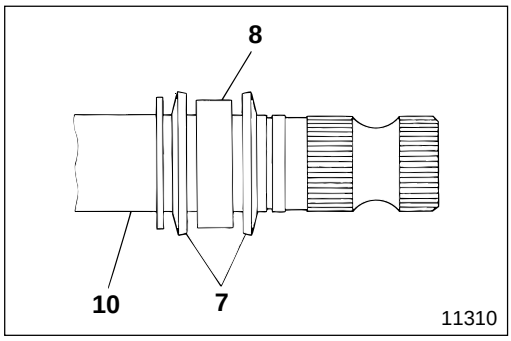
	Friction surfaces of column support upper and bolt	Wheel bearing grease [NLGI No.2 (Li soap)]	As required

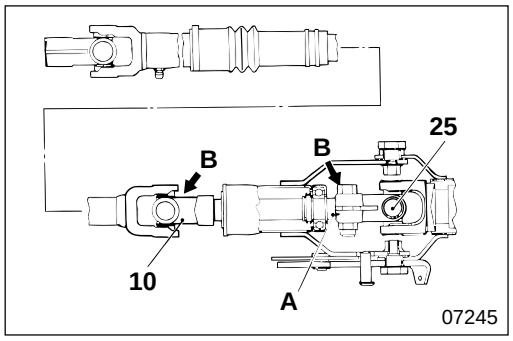
https://truckmanualshub.com/

◆ Service procedure



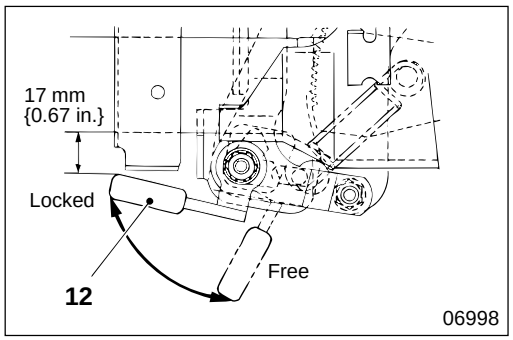
7 **Installation of stopper**

Install stoppers **7** on steering shaft assembly **10** in the direction as illustrated so that they straddle bearing spacer **8**.



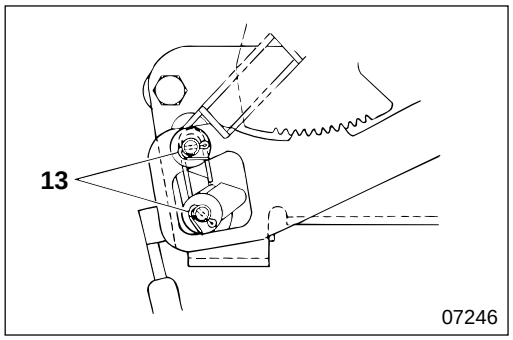
10 **Steering shaft assembly**

- Before removing steering shaft assembly **10**, be sure to make alignment mark **A**.
- Install the steering shaft with direction **B** of the telescopic shaft assembly **25** yoke and steering shaft assembly **10** yoke aligned or at phase angle of 90°.



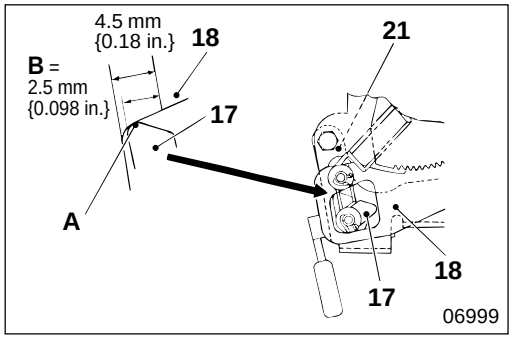
12 **Installation of lock lever**

- Install lock lever **12** so it is within the working angle when locked.
- After installing lock lever **12**, make sure that the lever operates smoothly (operating force less than 49 N {11 lbf, 5 kgf}). With the lever free, make sure that high tilt operates smoothly.



13 **Installation of split pin**

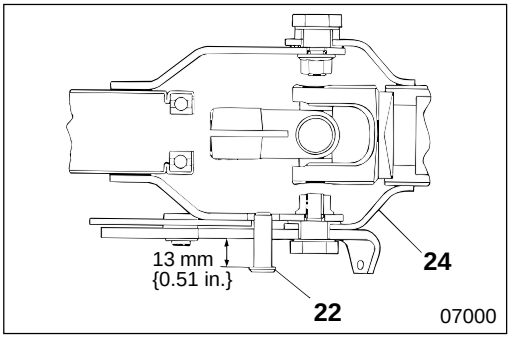
Bend split pin **13** to face outwards as illustrated.



17 **Installation of cam**

Adjust lever support **21** so that the top surface **A** of cam **17** is within dimension **B** of lock plate **18** to install the cam.

https://truckmanualshub.com/



22 **Installation of clevis pin**

Drive clevis pin **22** into column support upper **24** so that the drive dimension is obtained.

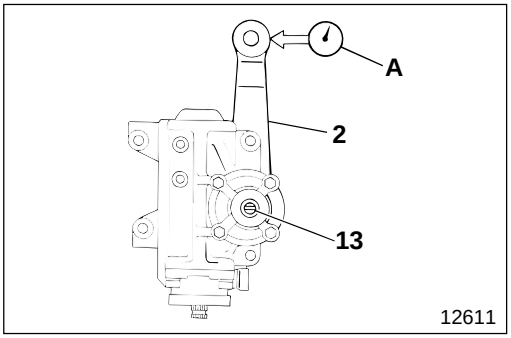
◆ Service procedure

● Work before disassembly

Move pitman arm **2**, and align slit **A** of the V-groove of sector shaft **14** to the center of body **49** so that the gears are in neutral position.

https://truckmanualshub.com/

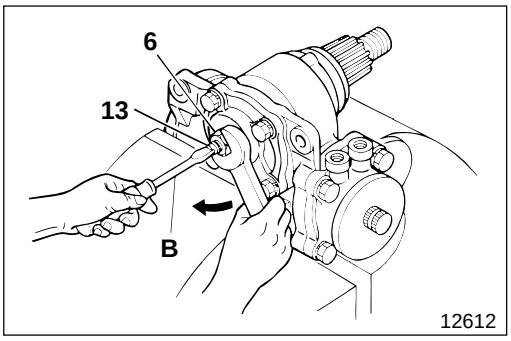


● **Adjustment after assembly**

Adjustment of backlash

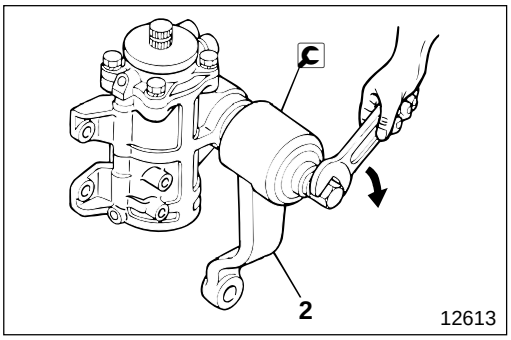
- (Carry out this work with the gears in neutral position.)
  Measure play at the end of pitman arm **2** with dial gauge **A**, and adjust adjusting screw **13** so that the reading meets the standard value.

  Measuring load : ±15 N {3.3 lbf, 1.5 kgf}



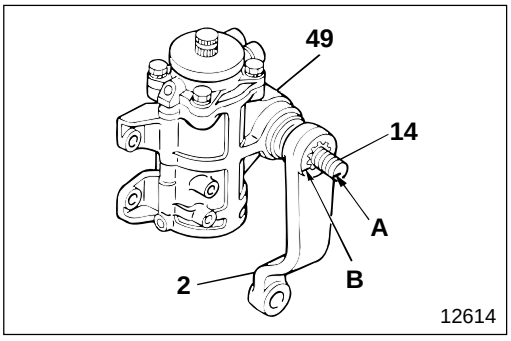
Tightening nut

- After adjusting backlash, apply sealer to thread area of adjusting screw **13**. Hold it in place with screwdriver **B** and tighten nut **6** at specified torque.



2 **Pitman arm**

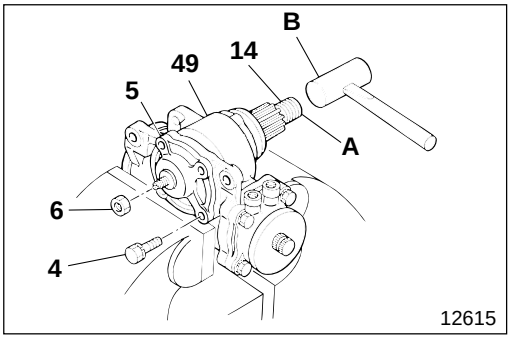
[Removal]



[Installation]
Align slit **A** of the V-groove of sector shaft **14** to the center of body **49**, and align slit **B** of the V-groove of pitman arm **2** on the same line.

NOTE

Have pitman arm 2 make a full stroke of the piston to make sure that the piston moves smoothly.



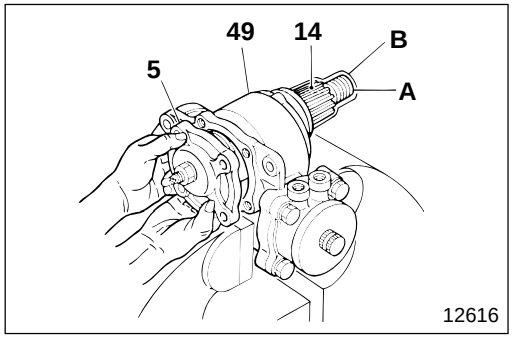
5 **Sector shaft assembly and side cover assembly**

[Removal]

- Make sure that the piston is in the neutral position (slit **A** of the V-groove at one end of sector shaft **14** is aligned with the center of body **49**).
- Tap the end of sector shaft **14** and pull out sector shaft assembly and side cover assembly **5**.

  B : Plastic-headed mallet

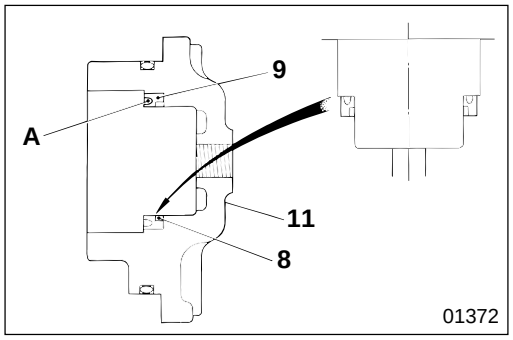
https://truckmanualshub.com/



[Installation]
Position sector shaft **14** of sector shaft assembly and side cover assembly **5** so that slit **A** of its V-groove is aligned with the center of body **49**, and the piston gear and sector shaft gear engage at their centers.

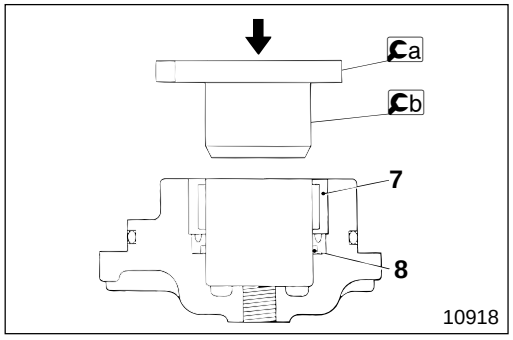
CAUTION

Before installation, apply tape B to the Y-packing to prevent it being damaged by the threads of sector shaft 14.

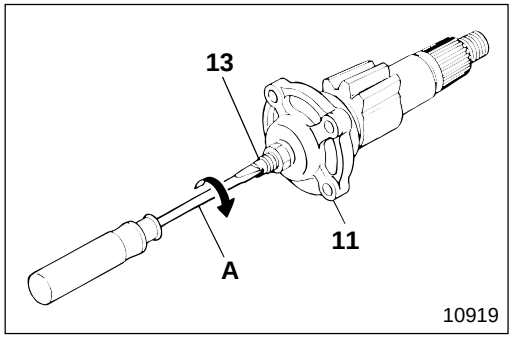


8 **9** **Backup ring, Y-packing**

[Installation]
- Install Y-packing **9** into side cover **11** in the direction as illustrated.
- After installing backup ring **8**, pack groove **A** of Y-packing **9** with grease.

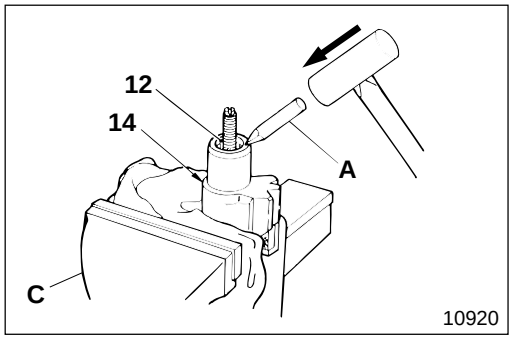


- After installing needle bearing **7** into backup ring **8**, form the bent up part of the backup ring using a insert tool assembly and b insert tool.



11 **Removal of side cover**

Screw in adjusting screw **13** and remove side cover **11**.
A : Screwdriver



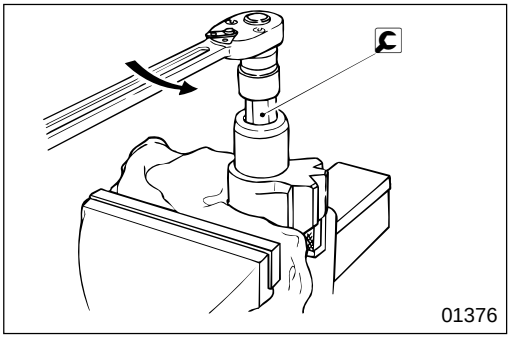
12 **Retainer**

Disassemble sector shaft **14**, as follows, only if it is faulty :
[Removal]
- Pry up (2 points) of retainer **12**.
  A : Chisel

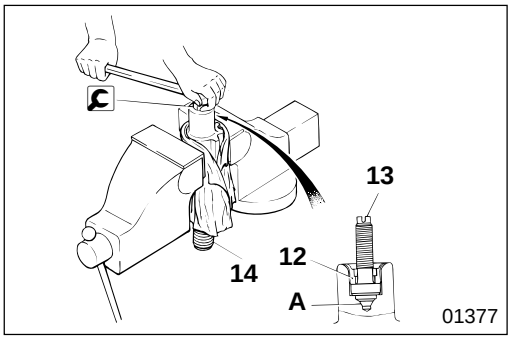
CAUTION

Make sure you use a cloth when you grip sector shaft 14 in vise C to prevent damage.

https://truckmanualshub.com/

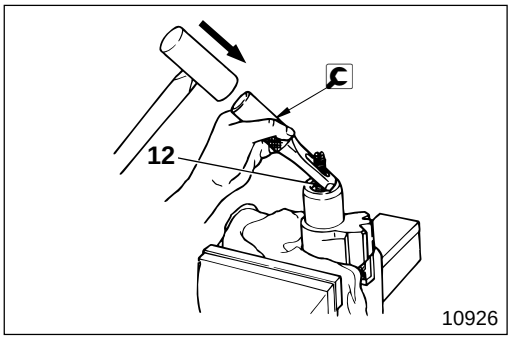


- Remove retainer **12** using bar.

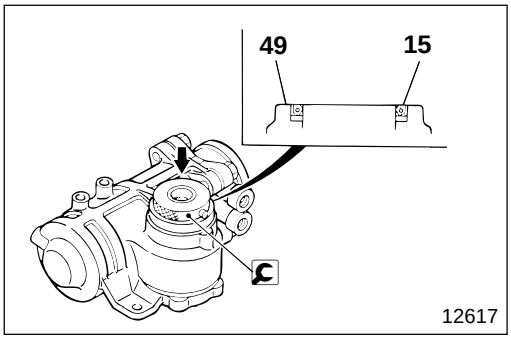


[Installation]

- Pack adjusting screw **13** mounting hole **A** of sector shaft **14** with grease.
- Install adjusting screw **13** into sector shaft **14**.
- Install retainer **12** into sector shaft **14** using bar.
- After installation, slacken off by 180°, retighten at 39 N·m {29 lbf.ft, 4 kgf·m}, then slacken off by 20°.
- Make sure that adjusting screw **13** turns smoothly.

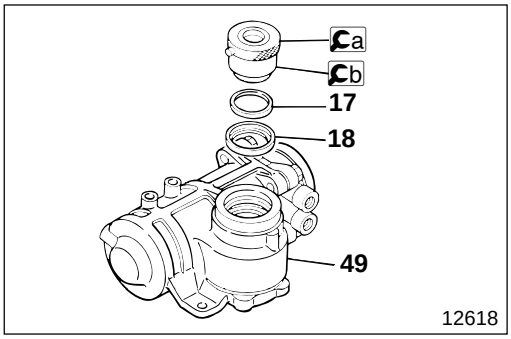


- After installing retainer **12**, caulk the retainer (2 points) using squeeze tool.



15 Installation of oil seal

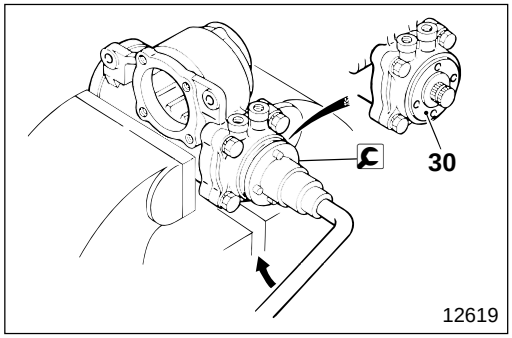
Install oil seal **15** into body **49** in the direction as illustrated.



17 18 Installation of backup ring and Y-packing

- Install Y-packing **18** and backup ring **17** to body **49**.
- Pack the groove of Y-packing **18** with grease.
- Form the shape of backup ring **17** using a insert tool assembly and b insert tool.

https://truckmanualshub.com/



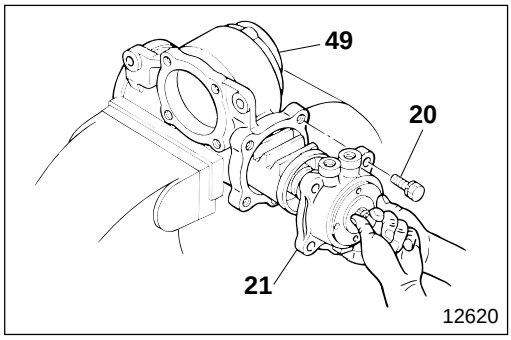
21 **Ball screw assembly**

[Removal]

- Loosen adjusting plug assembly **30** by approximately 180° using wrench assembly.

CAUTION

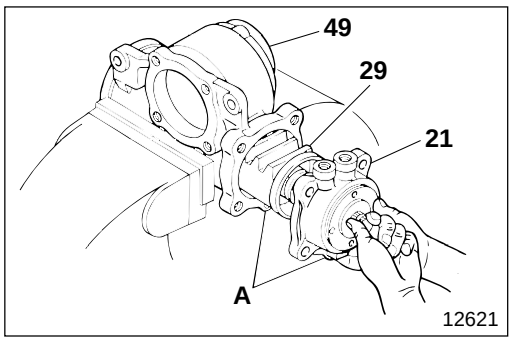
Make sure you only loosen adjusting plug assembly 30, do not undo it completely because the bearing inside the valve housing might spring out.



- Loosen bolt **20** and remove ball screw assembly **21** from body **49**.

CAUTION

- **Make sure that the balls of the ball screw do not spring out.**
- **Be careful not to damage the piston or the interior of body 49.**



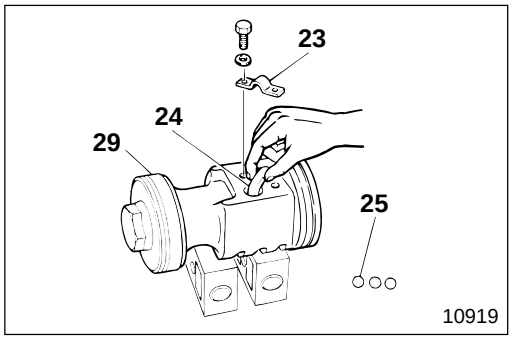
[Installation]

- Install ball screw assembly **21** into body **49**, holding piston **29** so it will not turn.

CAUTION

Be careful not to damage the piston seal ring or the interior of body 49.

- Align oil passage ports **A** of ball screw assembly **21** and body **49**, then tighten.

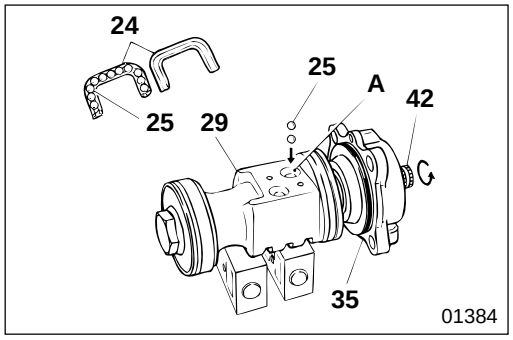


24 **25** **Ball tube and steel ball**

First remove steel balls **25** from piston **29** and place them in the receiving tray, remove ball clip **23**, grip ball tube **24** with your fingers and pull it out gently.

CAUTION

Be careful not to loose any steel balls 25 (×30).



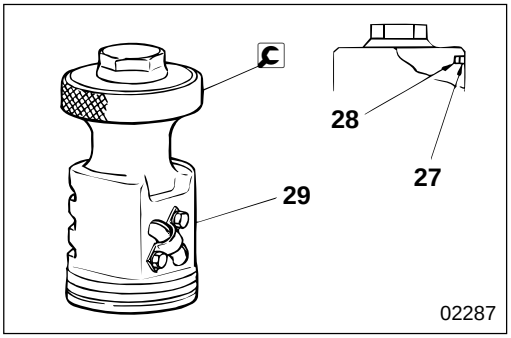
[Installation]

- Pack the interior of ball tube **24** with grease, lay 10 or 11 steel balls **25** in place, then mount the other side of the ball tube.
- Place piston **29** on a level surface, align assembled worm shaft assembly and valve housing assembly **35** and the piston ball race, then drop the steel balls through ball tube hole **A** while turning stub shaft **42**.

CAUTION

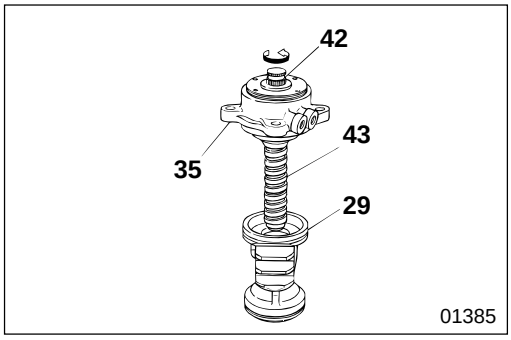
Make sure that you do not pull out worm shaft assembly and valve housing assembly 35 too far, or steel balls 25 will drop out of the ball race.

https://truckmanualshub.com/



27 **28** **Installation of O-ring and seal-ring**

Install O-ring **28** and seal ring **27** in the outside grooves of piston **29**, then form the shape of the seal ring with inserting tool.

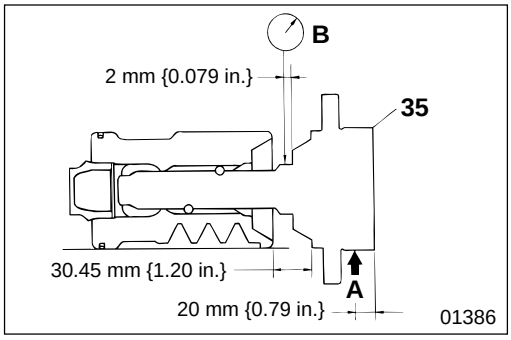


29 **Piston**

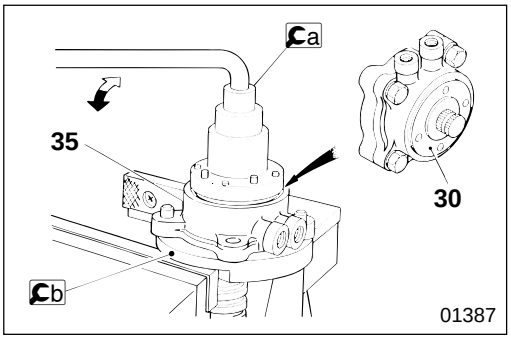
[Removal]
Holding worm shaft assembly and valve housing assembly **35** so that piston **29** is at the bottom, turn stub shaft **42** and remove the piston.

CAUTION

Be careful not to tilt piston 29 when you do this, otherwise steel balls 25 in the races of the piston and worm shaft 43, will drop into the piston.

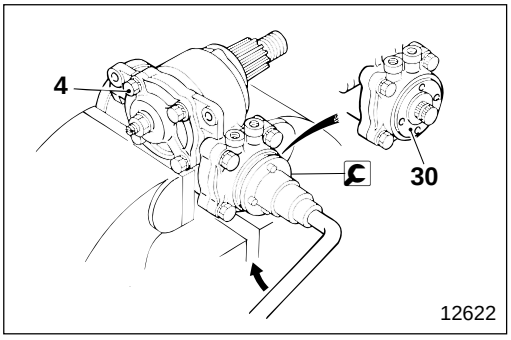


[Inspection]
Measure side play (play in axial direction) **B** of worm shaft assembly and valve housing assembly **35** when 49 N {11 lbf, 5 kgf} is applied to **A** as illustrated.



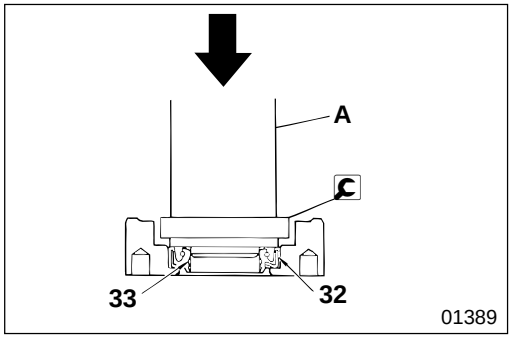
30 **Installation of adjusting plug assembly**

- After tightening adjusting plug assembly **30** of worm shaft assembly and valve housing assembly **35** at specified torque, slacken off by approximately 180°.



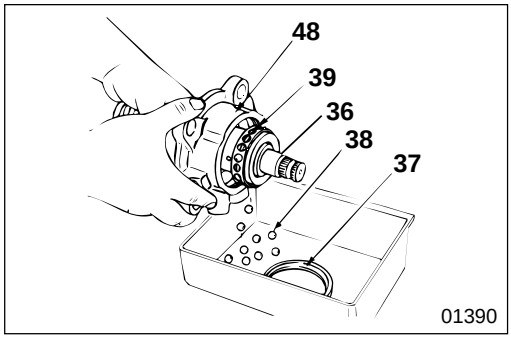
- Tighten bolt **4** at specified torque, then retighten adjusting plug assembly **30** at specified torque using wrench assembly.

https://truckmanualshub.com/



32 **Installation of oil seal**

Install oil seal **32** into adjusting plug **33** in the direction as illustrated.
A : Hand press



36 **Worm shaft assembly**

[Removal]
Push out worm shaft assembly **36** from valve housing **48** by pushing out the side of the worm shaft assembly where the piston is assembled.

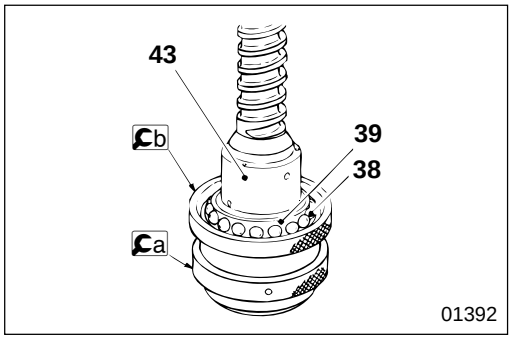
NOTE

Have a tray or box ready to catch side race 37, steel balls 38, and bearing cage 39 as these items separate on removal.

[Installation]

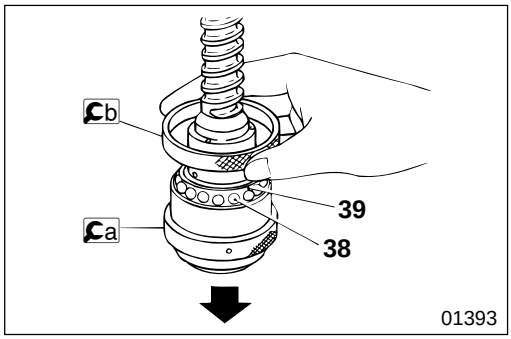
CAUTION

Be careful that worm shaft assembly 36 ball race does not damage seal ring 44.



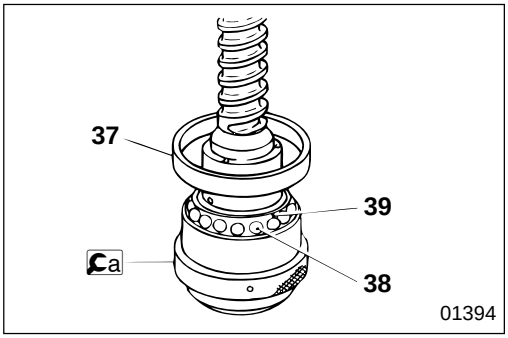
37 **to** **39** **Installation of side race, steel ball, and bearing cage**

- Install b guide assembly on a tool assembly, and insert worm shaft **43** in the direction as illustrated.
- Assemble bearing cage **39** and steel balls **38** on worm shaft **43**.

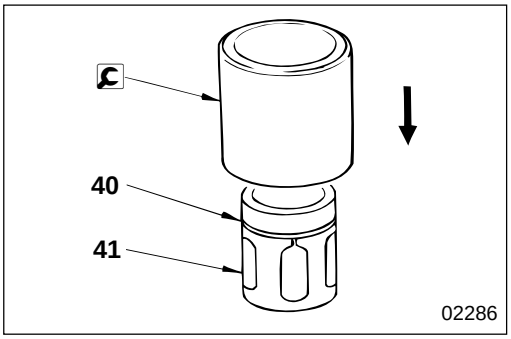


- Hold down b with your hand and slide a downward, so that you can position steel balls **38** as specified.

https://truckmanualshub.com/

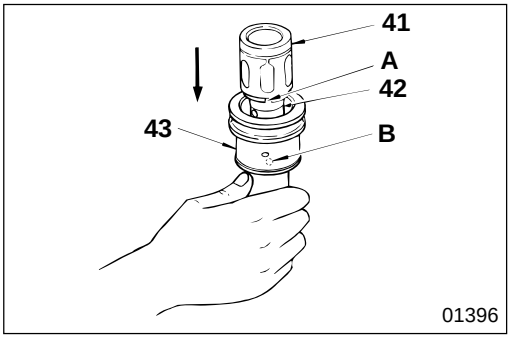


- Install side race **37** on top of steel balls **38** and bearing cage **39**.



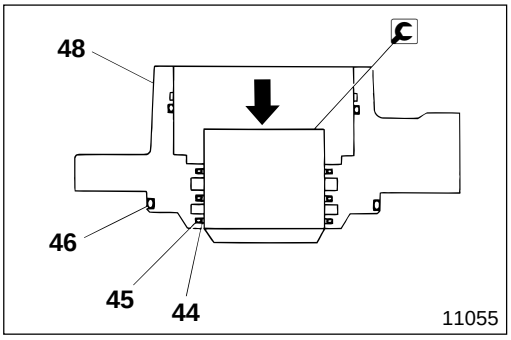
40 **Installation of seal ring**

- Install seal ring **40** onto rotor **41**.
- Form seal ring **40** using insert tool.



41 **Installation of rotor**

Install rotor **41** between stub shaft **42** and worm shaft **43** so that indent **A** of the rotor fits positioning pin **B** of the worm shaft.



44 **to** **46** **Installation of seal ring and O-ring**

- Install seal ring **44** and O-ring **45**, **46** into valve housing **48**.
- Form seal ring **44** using insert tool.

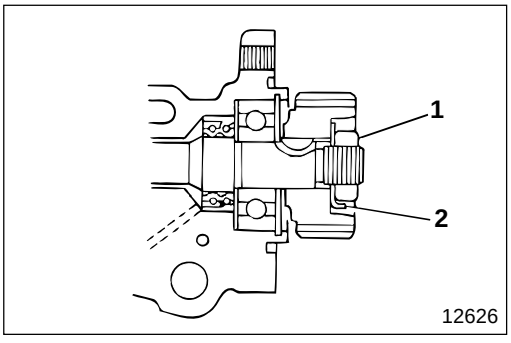
22	Pliers	*910-22570	Removal and installation of retaining ring
23	Press-fitting tool	*910-23061	Removal and installation of ball bearing, and installation of shaft
26	Stick	*910-21632	Driving out of oil seal
	Press-fitting tool	*910-23062	Press-fitting of oil seal

* JIDOSHA KIKI part No.



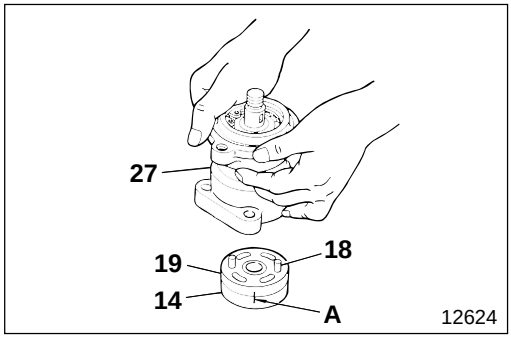
◆ Service procedure

2 **Installation of lock washer**

After installing nut **1**, bend up one lug on the circumference of lock washer **2**.

https://truckmanualshub.com/

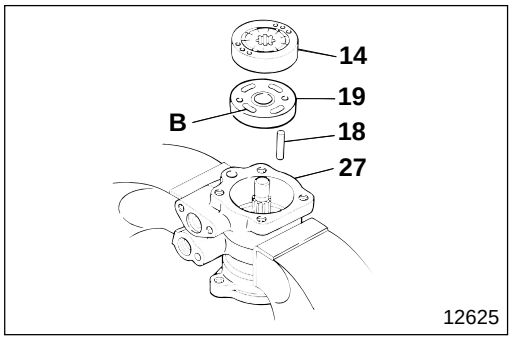
POWER STEERING OIL PUMP



14 Removal and installation of cartridge assembly

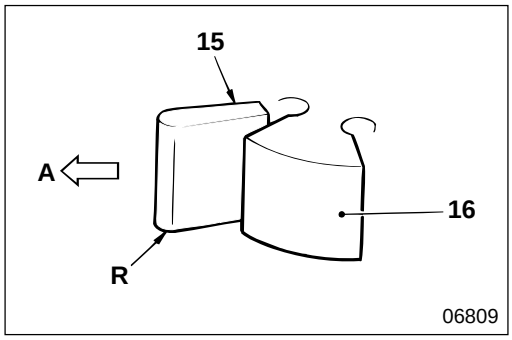
[Removal]

- Remove cartridge assembly **14**, pressure plate **19** and straight pin **18** together from front body **27**.
- Put alignment marks **A** around the outer circumferences of cartridge assembly **14** and pressure plate **19**.



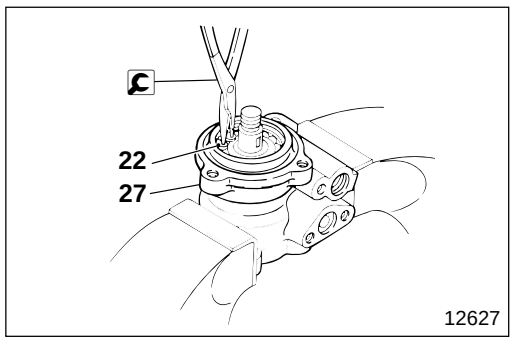
[Installation]

- Install straight pin **18** into front body **27**.
- Install pressure plate **19** onto front body **27**, so that groove **B** of the pressure plate faces the direction as illustrated.
- Align cartridge assembly **14** with straight pin **18**, then install the cartridge assembly.



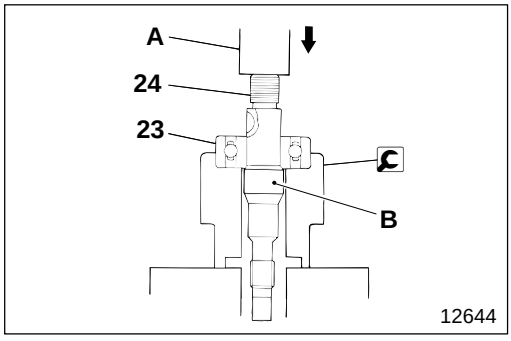
15 Installation of vane

With point **R** of vane **15** facing outside **A**, install it into rotor **16** and make sure that the vane moves smoothly. If it is faulty, replace the cartridge assembly.



22 Removal of retaining ring

Remove retaining ring **22** using pliers.



23 Removal and installation of ball bearing

Remove ball bearing **23** from shaft **24** using press-fitting tool.

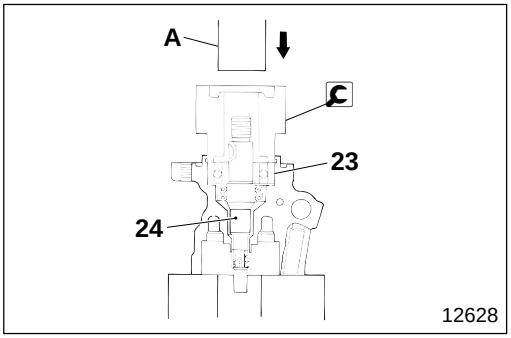
A : Hand press

For installation, follow the removal sequence in reverse.

CAUTION

Be careful not to damage oil seal contact surface B.

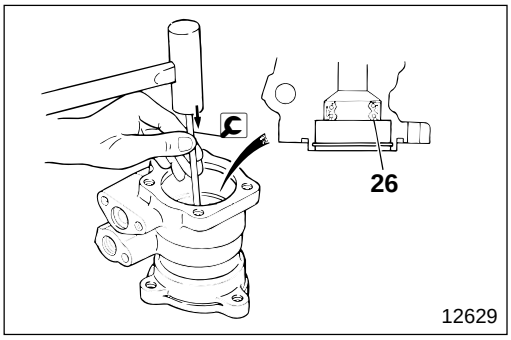
https://truckmanualshub.com/



23 **24** **Installation of ball bearing and shaft**

Install ball bearing **23** and shaft **24** using press-fitting tool.

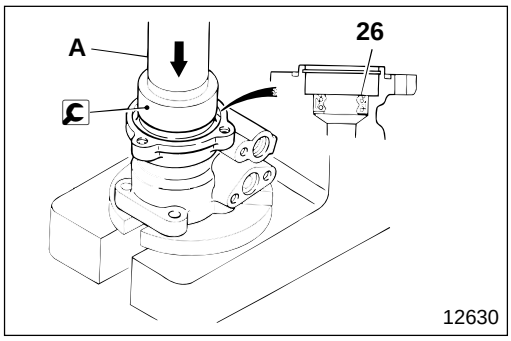
A : Hand press



26 **Oil seal**

[Removal]

Remove oil seal **26** using stick.



[Installation]

Install oil seal **26** in the direction as illustrated using press-fitting tool.

A : Hand press

https://truckmanualshub.com/

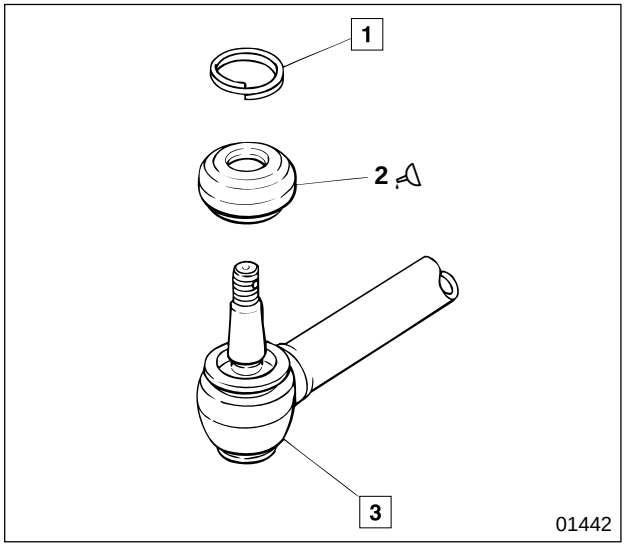
DRAG LINK



● **Disassembly sequence**

1 Clip
2 Dust cover
3 Drag link

NOTE

- **Do not remove clip 1 or dust cover 2 unless they are faulty.**
- **Do not disassemble drag link 3 because it is a unit construction.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Lubricant

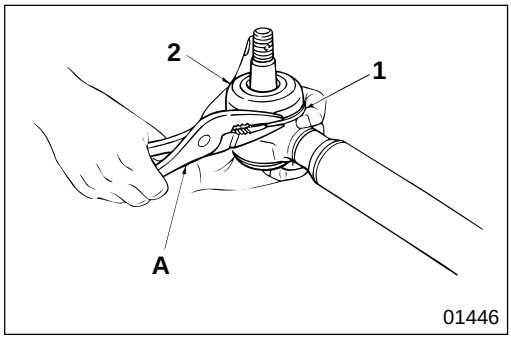
Location	Points of application	Kinds	Quantity
2	Lip area of dust cover	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required
	Pack interior of dust cover	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	11 g {0.39 oz}

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Clip guide 	MH061831	Installation of clip

◆ Service procedure



1 **Clip**

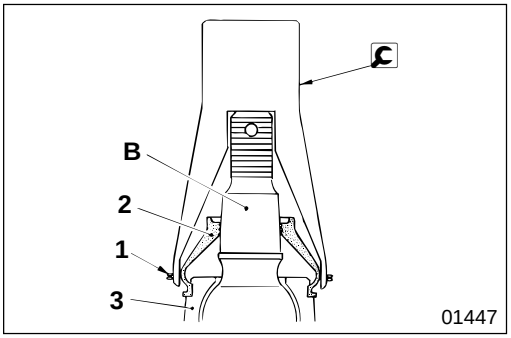
[Removal]

A : Long nose pliers

CAUTION

- **Be careful not to damage clip 1 or dust cover 2 when you remove the clip.**
- **If clip 1 is deformed, do not reuse it.**

https://truckmanualshub.com/

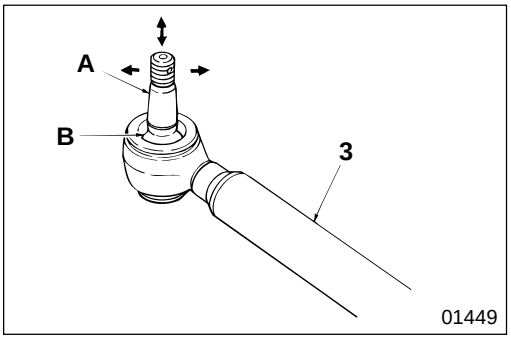


[Installation]

- Position the assembly so ball stud **B** is vertical.
- Place clip guide on drag link **3**.
- Install clip **1** into the groove of dust cover **2**.

CAUTION

- **Be careful that clip guide end does not dig into dust cover 2.**
- **Be especially careful that clip 1 end does not damage dust cover 2.**

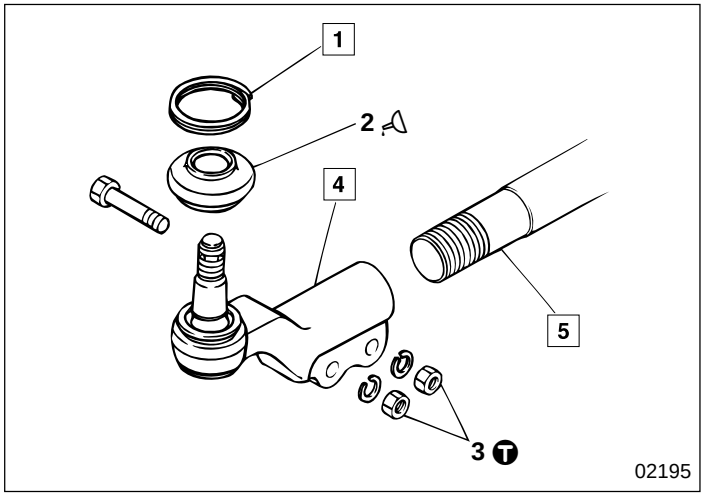


3 Inspection of drag link

Move ball stud area **A** of drag link **3** vertically and horizontally to make sure that there is no play. Also, check that ball section **B** moves evenly. If any fault is found, replace the tie rod assembly.

https://truckmanualshub.com/

TIE ROD ASSEMBLY



● **Disassembly sequence**

1 Clip
2 Dust cover
3 Nut
4 Tie rod end assembly
5 Tie rod

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

Do not attempt to disassemble tie rod end assembly 4 because it is a unit construction.

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
5	Bend of tie rod	1 {0.039} or less	1 {0.039}	Replace

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Nut (Tie rod end assembly fastening)	78 {58, 8}	Wet

Lubricant

Location	Points of application	Kinds	Quantity
2	Lip area of dust seal	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required
	Pack into dust cover	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	11 g {0.39 oz}

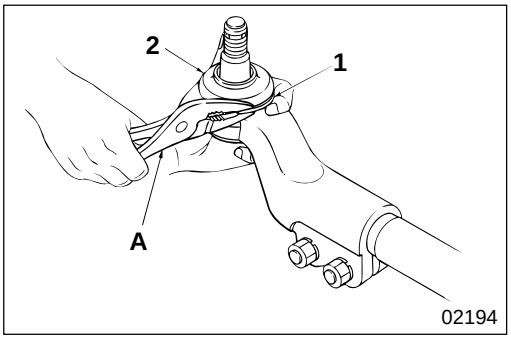
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Clip guide 	MH061831	Installation of clip

https://truckmanualshub.com/

◆ Service procedure



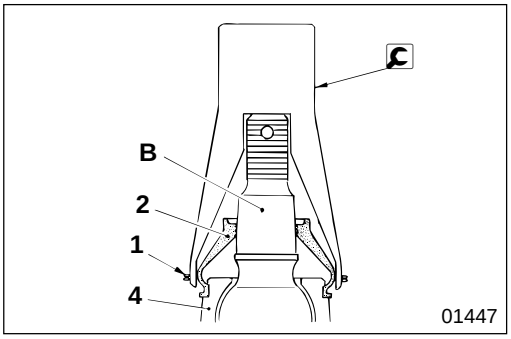
1 Clip

[Removal]

A : Long nose pliers

CAUTION

- **Be careful not to damage clip 1 or dust cover 2 when you remove the clip.**
- **If clip 1 is deformed, do not reuse it.**

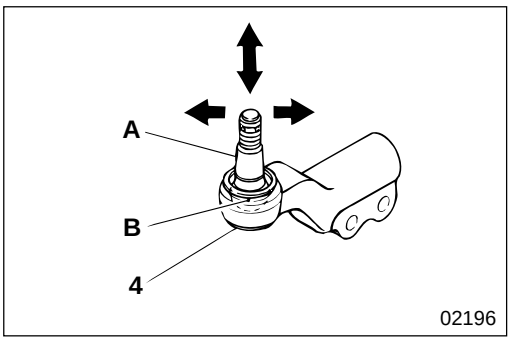


[Installation]

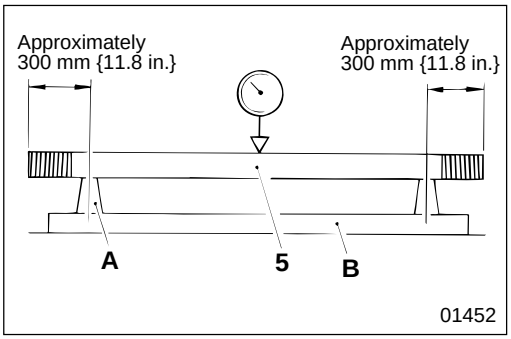
- Position so ball stud **B** is vertical.
- Place clip guide on tie rod end assembly **4**.
- Install clip **1** into the groove of dust cover **2**.

CAUTION

- **Be careful that clip guide end does not dig into dust cover 2.**
- **Be especially careful that clip 1 end does not damage dust cover 2.**



Move ball stud area **A** of tie rod end assembly **4** vertically and horizontally to make sure that there is no play. Also, check that ball section **B** moves evenly. If any fault is found, replace the tie rod end assembly.



5 Bend of tie rod

Measure the bend of tie rod **5** at the center point. If the measured value exceeds the limit, correct or replace the tie rod.

NOTE

To measure the deflection of tie rod 5, turn it one full rotation and read the dial gauge indicator. The deflection is one half of the indicated value.

A : V-block
B : Surface plate

Location	Parts to be tightened	Tightening torque	Remarks
3	Nut (Cross member to side rail side wall mounting)	85 to 110 {61 to 80, 8.5 to 11}	—

◆ Service procedure

● Cleaning of frame

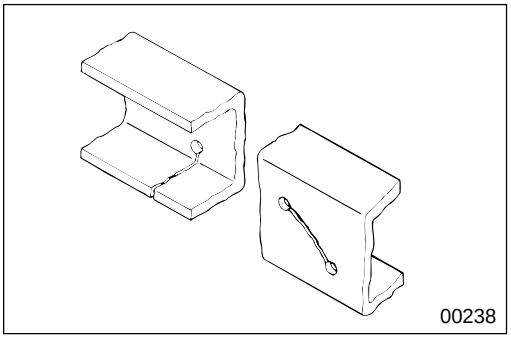
Carefully remove mud, grease, rust, etc. that is stuck to the outer and inner surfaces of the frame.

● Inspection for frame deformation

If any fault such as deformation is found, repair the frame.

● Inspection for cracks in frame

- Remove paint from any areas that are seemingly faulty and carefully inspect.
- If visual inspection is difficult, inspect using color contrast penetrant examination or other methods.
  If a crack is found, repair as follows.

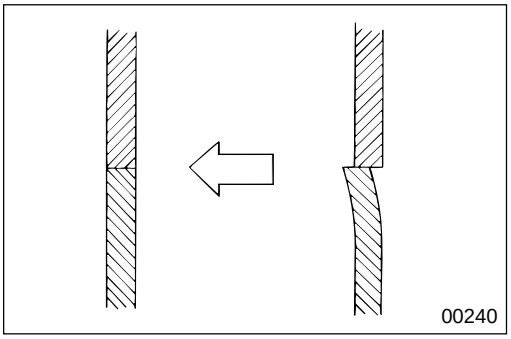


● Repair of crack in frame

- With the vehicle unloaded, level the frame.
- Drill a hole, about twice the thickness of the frame, 10 mm {0.39 in.} from the end of the crack.

NOTE

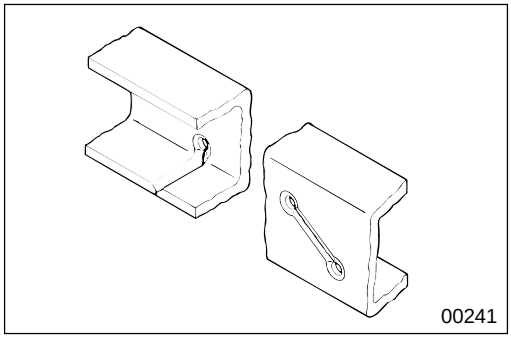
If a crack is found inside the frame, drill holes at both ends of the crack.



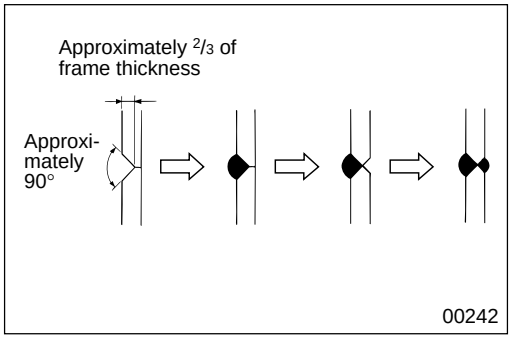
- If the edges of the crack are not flush, make them flush with each other.

https://truckmanualshub.com/

INSPECTION AND REPAIR OF FRAMES



00241



00242

- Using a grinder, etc., grind a 90° V-section channel, two-thirds of the frame thickness, then weld.

WARNING

You must cover any inflammable materials, such as pipelines, wiring harnesses, rubber parts, and the fuel tank, that are near the welding site.

CAUTION

- **Do not use gas welding because the high temperature produced alters the material properties and weakens the welded area. Be sure, therefore, to use electric welding.**
- **Be sure to remove the negative terminal of the battery, then ground the welder near the area to be welded to prevent reversed flow of current from the welder which might burn out electrical components.**
- **Be sure to protect mountings such as main sills that can be damaged by heat, by using heat insulators, etc.**

NOTE

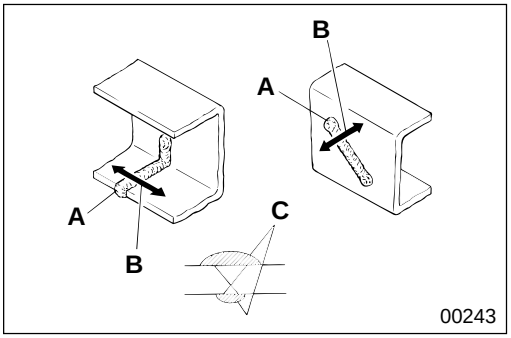
- **Use low-hydrogen type coated CO_2 and arc welding electrodes for welding to prevent harmful defects such as undercutting, blow holes, etc.**
- **Preheat the area to be welded to approximately 50 to 350°C {122 to 662°F} before welding when the workshop temperature is below 0°C {32°F}.**

- Next, grind a V-section channel, as described above, on the opposite side of the weld and weld. At the same time, fill the holes at both ends of the crack by welding.

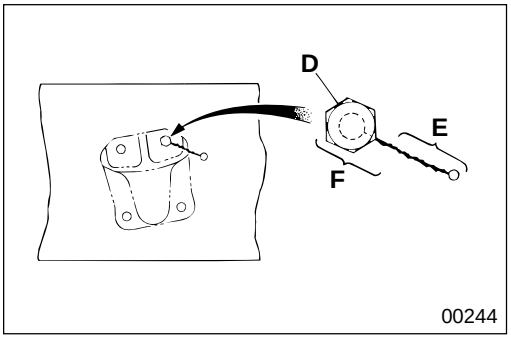
NOTE

In cold districts, heat the welded area to approximately 200°C {392°F} after welding.

https://truckmanualshub.com/

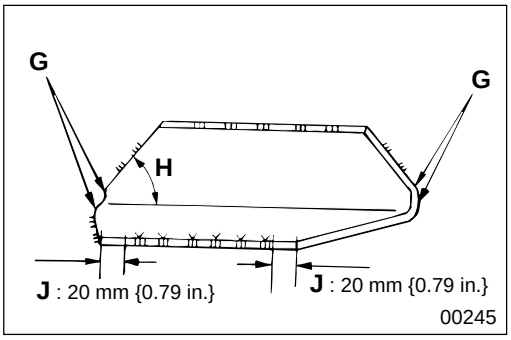


- After welding, grind bead **A** at right angles **B** to remove shaded area **C** as illustrated and grind the area flat.
- Finish the surface so that the frame thickness is identical to the original thickness.



[Repairing cracks caused by rivets or bolt holes]

- To make the edges of the holes flush at the cracked area, temporarily tighten bolt **D** in the hole.
- Weld cracked point **E** at least 20 mm {0.79 in.} from the center of the bolt.
  For welding method refer to the above-mentioned procedures for repairing cracks. P41-3
- After removing the bolt and making the edges flush, weld remaining area **F** and fill the hole.
- After drilling a hole in the filled area, install a rivet or bolt.

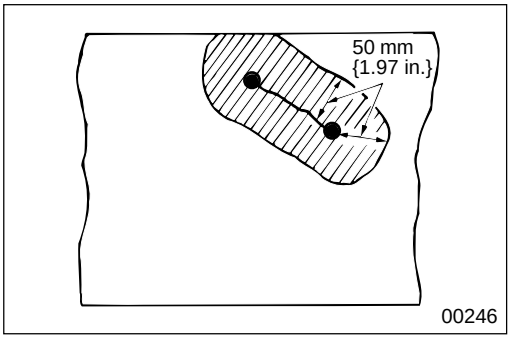


[Repairing using reinforcement plate]

- To prevent concentrated stress being produced at ends **G** of the reinforcement plate, weld the plate with angle **H** at both ends opened 30° or less.
  Do not weld area **J**.
- The reinforcement plate must have enough strength for the cracked area.

NOTE

- **Thickness of reinforcement plate : same as frame thickness**
- **Reinforcement plate material : HTP540 (high tensile strength steel) or equivalent strength.**



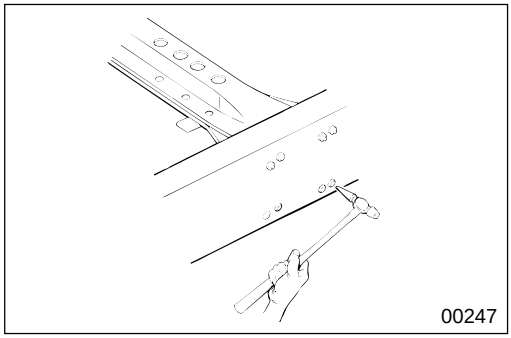
- After welding, heat the shaded area to 600 to 700°C {1112 to 1292°F}.

CAUTION

Be sure to protect mountings such as main sills that can be damaged by heat, by using heat insulators, etc.

https://truckmanualshub.com/

INSPECTION AND REPAIR OF FRAMES

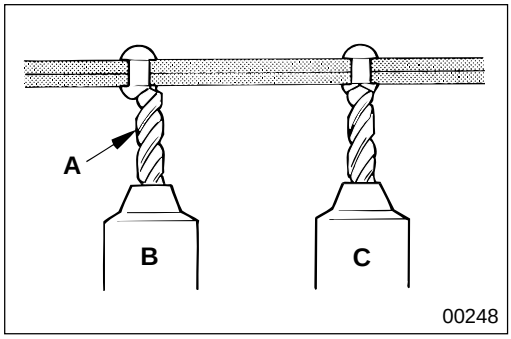


● **Inspection for loose rivets**

- Gently tap the rivet head using an inspection hammer and judge the condition by checking the vibration using the tip of your finger, or by listening to the sound.
- Rust between rivet and frame indicates that the rivet is loose.

CAUTION

Be sure to replace loose rivets because they can break or cause cracking of the frame in the area around the rivet hole, causing accidents.

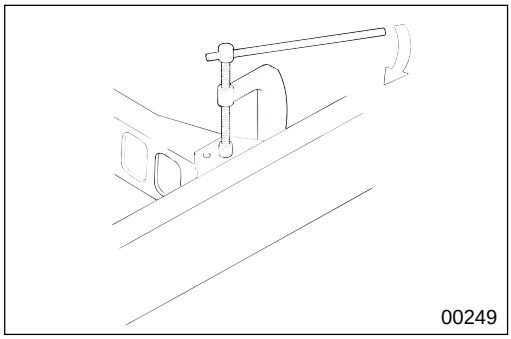


● **Repair of rivet**

- When removing rivets, use a center punch to make an indent in the center of the rivet head; then, drill out using drill **A** or grind.
  B : Incorrect
  C : Correct

CAUTION

Make sure that you do not damage the rivet hole.



- When rivetting, first clamp both plates tightly near the rivet hole using a clamp to eliminate gaps between plates.

- Using a rivetting machine, insert the rivet (cold rivet).
- If rivetting is impossible, ream the rivet hole, drive in a reamer bolt, fully tightening the nut, then weld it in place.
  A flange bolt and flange nut should be used for the reamer bolt and nut.

● **Inspection for loose bolts and nuts**

- Inspect the mounting bolts of the cross member and the helper stopper for looseness. Loosened bolts should be tightened at specified torque. P41-2, Gr 34

NOTE

Tighten the nut side when working on the helper stopper mounting bolts.

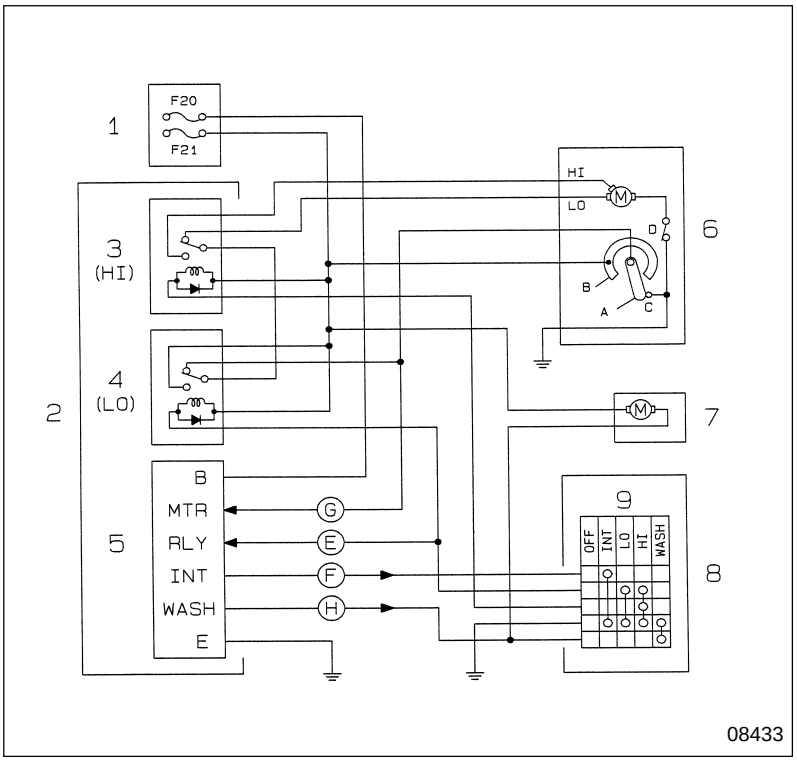
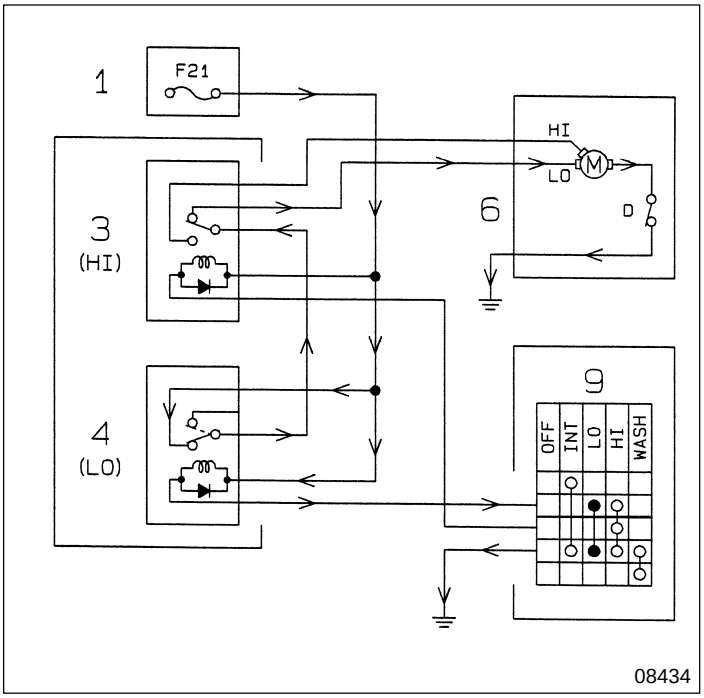
Wiper and Washer Electric Circuit



1 Fuse box
2 Relay box
3 Wiper relay (HIGH)
4 Wiper relay (LOW)
5 Multipurpose timing control unit
6 Wiper motor
7 Washer motor
8 Combination switch
9 Wiper and washer switch

Wiper motor **6** section
A : Cam
B : Plate
C : Contact point
D : Circuit breaker

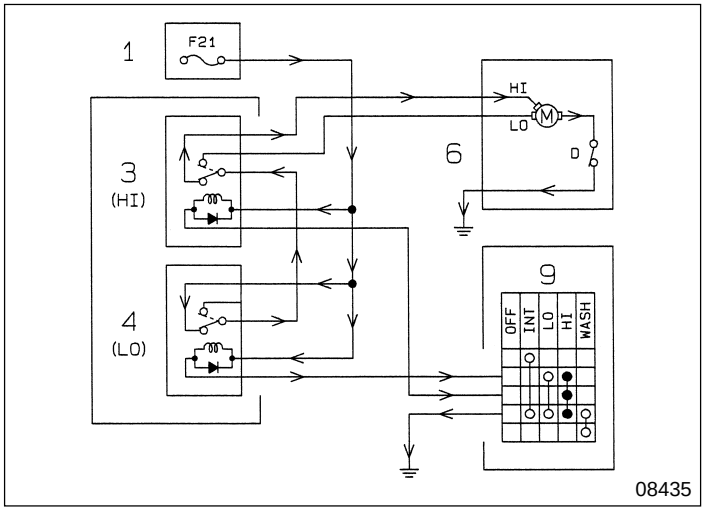
Ⓔ : Wiper motor driving signal (when wiper operating intermittently)
Ⓕ : Intermittent switch signal (when wiper operating intermittently)
Ⓖ : Cam signal (when wiper stops)
Ⓗ : Washer switch signal



When wiper operating at LOW speed

Position of wiper and washer switch **9** : LO
- **1** (F21) → **4** (coil) → **9** (LO) → Ground
- **1** (F21) → **4** (contact point) → **3** (contact point) → **6** (LO) → **6** (D) → Ground
  Wiper motor **6** rotates at low speed.

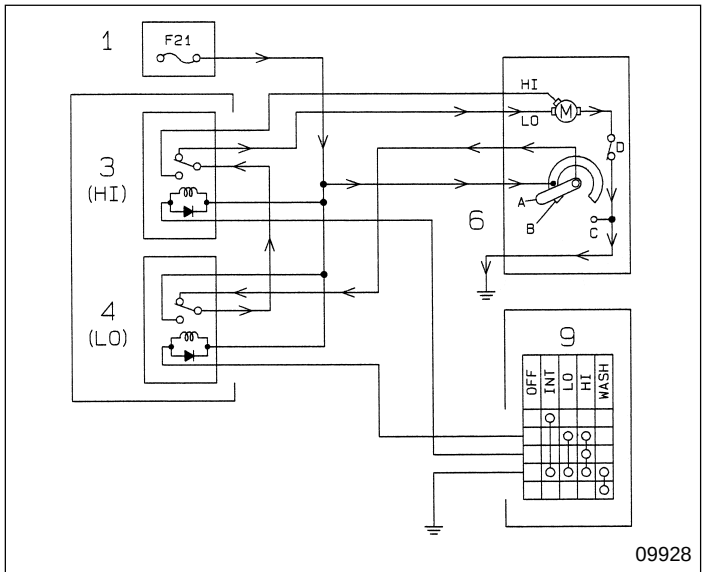
https://truckmanualshub.com/



When wiper operating at HIGH speed

Position of wiper and washer switch **9** : HI

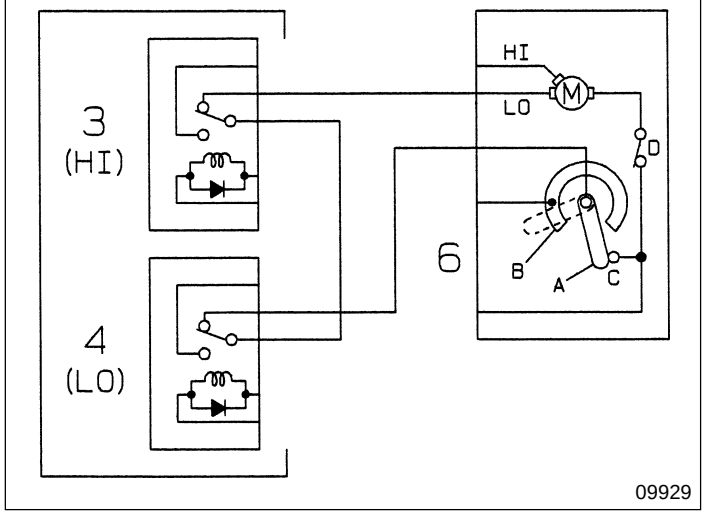
- **1** (F21) → **3** (coil) → **9** (HI) → Ground
  → **4** (coil) → **9** (HI) → Ground
- **1** (F21) → **4** (contact point) → **3** (contact point) → **6** (HI) → **6** (D) → Ground
  Wiper motor **6** rotates at high speed.



When wiper stops

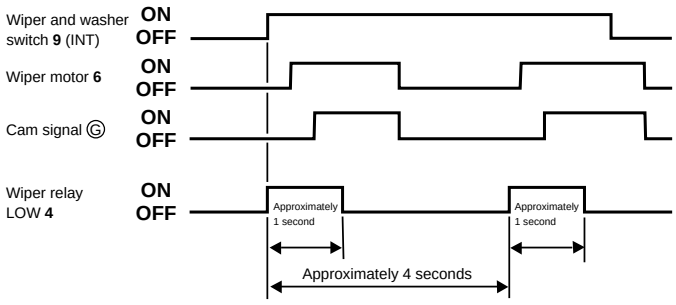
Position of wiper and washer switch **9** : OFF

- **1** (F21) → **6** (B) → **6** (A) → **4** (contact point) → **3** (contact point) → **6** (LO) → **6** (D) → Ground
  Wiper motor **6** continues to rotate at low speed.

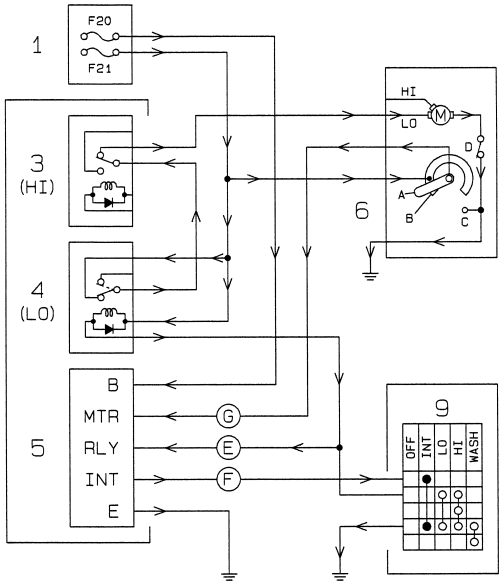


- When cam **A** is separated from plate **B** by rotation of wiper motor **6**, the current to the motor is cut off.
- Wiper motor **6** continues to rotate due to the inertia force of the motor and the wiper link.
- When cam **A** of wiper motor **6** makes contact with contact point **C**, the following ungrounded circuit is formed.
  → **6** (LO) → **6** (D) → **6** (C) → **3** (contact point) ← **4** (contact point) ← **6** (A) ←
- Wiper motor **6** stops by dynamic (electric) braking because of this circuit.

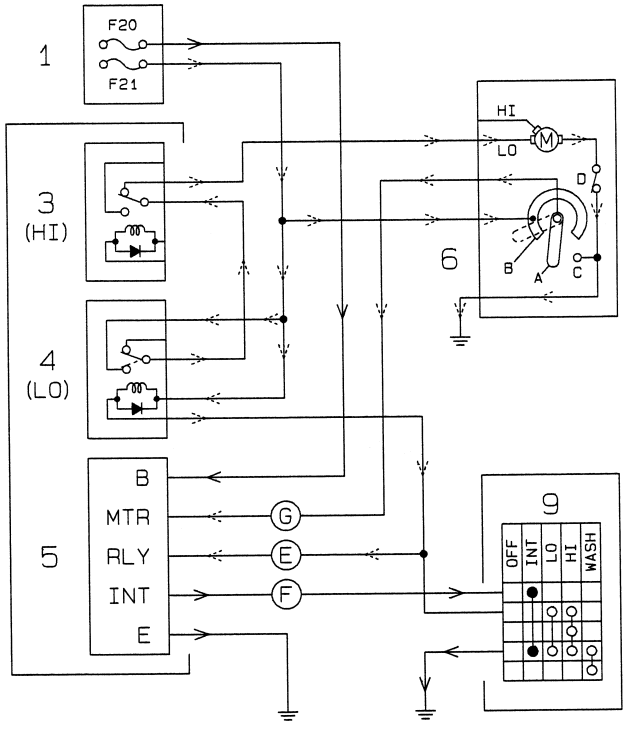
https://truckmanualshub.com/



08654



09931



09932

When wiper operating intermittently

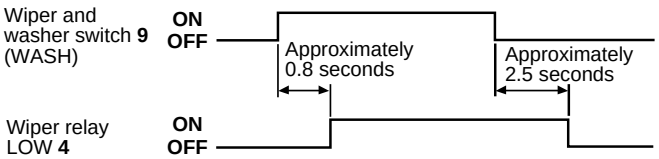
Operation mode with multipurpose timing control unit **5**

Position of wiper and washer switch **9** : INT

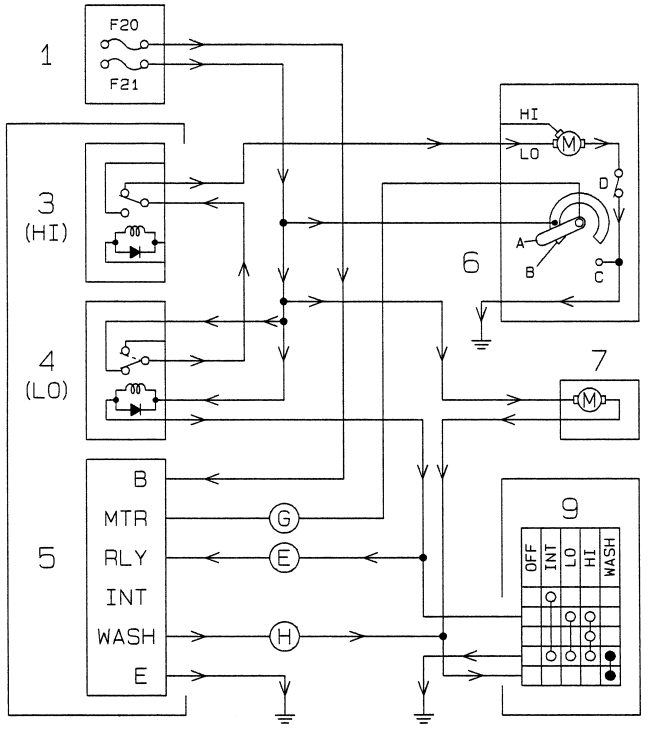
- **1** (F20) → **5** (B) → Ground
- **5** (INT) —Ⓕ→ **9** (INT) → Ground
- Multipurpose timing control unit **5** sends wiper motor driving signal Ⓔ when it receives intermittent switch signal Ⓕ.
  1 (F21) → **4** (coil) —Ⓔ→ 5 (RLY)
- **1** (F21) → **4** (contact point) → **3** (contact point) → **6** (LO) → **6** (D) → Ground
  Wiper motor **6** rotates at low speed.
- Multipurpose timing control unit **5** sends wiper motor driving signal Ⓔ, then sends cam signal Ⓖ.
  1 (F21) → **6** (B) → **6** (A) –Ⓖ→ **5** (MTR)

- When cam **A** of wiper motor **6** is separated from plate **B**, cam signal Ⓖ turns OFF.
- When cam signal Ⓖ is turned OFF, multipurpose timing control unit **5** turns wiper motor driving signal Ⓔ OFF for specified time.
  The illustrated part ⊣ of the circuit turns OFF.
- Wiper motor **6** stops. 🕮 Gr 42-8
- After specified time has passed, multipurpose timing control unit **5** sends wiper motor driving signal Ⓔ again.
- Wiper motor **6** rotates at low speed.

https://truckmanualshub.com/



11125



11126

When washer operating

Operation mode with multipurpose timing control unit **5**

Position of wiper and washer switch **9** : WASH

- **1** (F20) → **5** (B) → Ground
- **1** (F21) → **7** → **9** → Ground
  5 (WASH)-Ⓗ

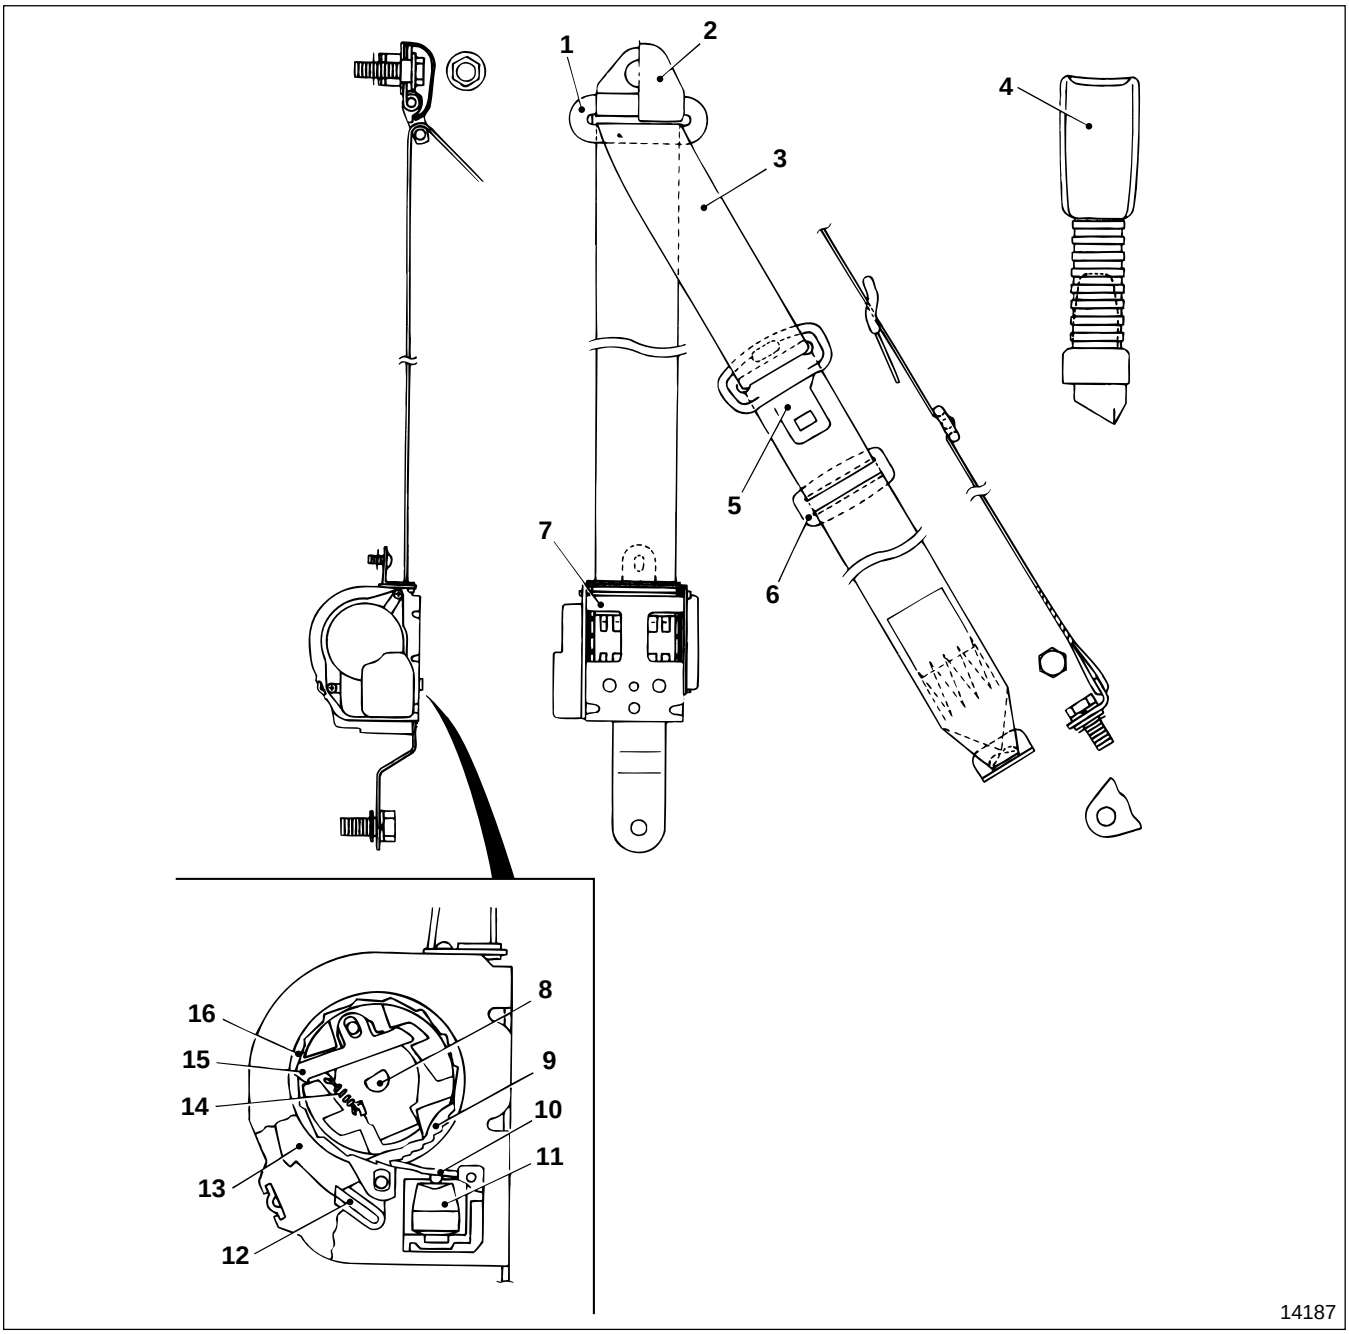
When washer motor **7** operates to spray washer fluid, multipurpose timing control unit **5** transmits washer switch signal Ⓗ.

- 1 (F21) → **4** (coil) —Ⓔ→ **5** (RLY)
  Washer switch signal Ⓗ makes multipurpose timing control unit **5** input wiper motor drive signal Ⓔ.
- 1 (F21) → **4** (contact point) → **3** (contact point)

  → **6** (LO) → **6** (D) → Ground
  Wiper motor **6** operates at LOW speed.
- When wiper and washer switch **9** is turned to OFF, washer motor **7** stops.
- Then, washer switch signal Ⓗ is turned off and multipurpose timing control unit **5** turns off wiper motor drive signal Ⓔ after specified time.
- Wiper motor **6** automatically stops.
  P42-8

https://truckmanualshub.com/

Emergency Locking Retractor (ELR) Type Seat Belt

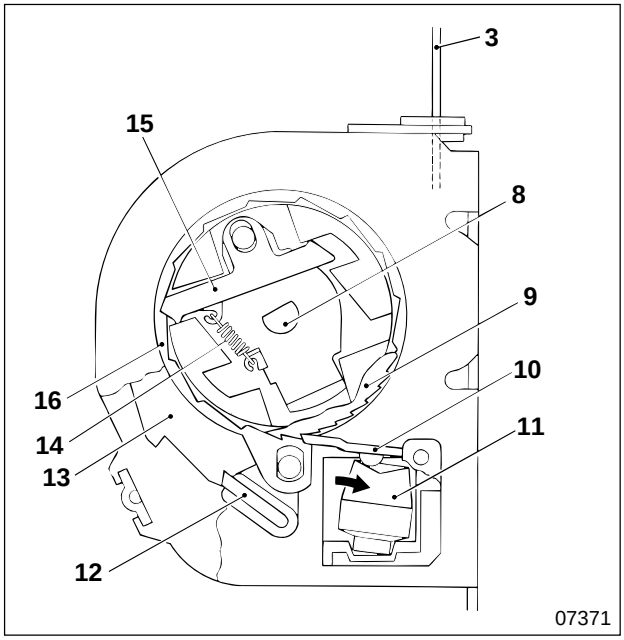


1 Sash guide
2 Cover
3 Webbing
4 Buckle assembly
5 Tongue plate
6 Tongue stopper
7 Emergency locking retractor assembly
8 Spindle
9 Locking gear
10 Mechanism lever
11 Mechanism weight
12 Pawl
13 Ratchet gear
14 Sensor spring
15 Lock arm
16 Clutch

CAUTION⚠

Do not disassemble emergency locking retractor assembly 7, or malfunctions might occur.

https://truckmanualshub.com/



Webbing detecting lock

- When the vehicle is subjected to a sudden impact, such as a crash, webbing **3** retracts according to the movement of passengers, and spindle **8** rotates.
- As the rotation of spindle **8** is higher than the specified value, the repercussive force of sensor spring **14** can no longer retain lock arm **15**. Then, the arm is pulled out from the specified position and is locked by clutch **16**.
- If spindle **8** further rotates, clutch **16** lifts pawl **12** to lock with ratchet gear **13**, making spindle rotation impossible.

Body detecting lock

- When the body is tilted excessively, mechanism weight **11** is tilted, engaging mechanism lever **10** with locking gear **9**, locking it.
- If spindle **8** further rotates, clutch **16** operates as described above, and the spindle cannot rotate.

Cab as a Whole

Possible causes \ Symptoms		Cab shimmy (pitching and rolling vibration)	Cab or steering wheel high-frequency vibration (above 20 Hz) or noise	Cab cannot be tilted up	Cab cannot be locked to rear mounting post	Cab tilt warning lamp does not light	Cab tilt warning lamp does not go out	Remarks
Cab-related	Cab mounting loose or play	○						
	Front rubber, rear rubber deteriorated		○					
	Cab mounted incorrectly		○					
	Link assembly from anchor hook does not release			○				
	L-lever release faulty			○				
	Torsion bar damaged or fatigued			○				
	Torsion bar arm installation position incorrect			○				
	Link assembly not hooked to anchor hook				○			
	Link assembly contact with side cushion incorrect				○			
	Cab tilt lock switch adjusted incorrectly					○	○	
	Cab tilt lock switch faulty					○	○	
	Cab tilt warning lamp bulb burnt-out					○		
	Fuse, high-current fuse blown					○		
	Wiring broken or connection faulty					○		
Engine-related	Crossed axes angle of propeller shaft excessive due to increased tilt caused by deteriorated engine mounting		○					
	Engine installation faulty		○					Gr 10
	Intake and exhaust system installation faulty		○					
Transmission-related	Transmission installation faulty		○					Gr 22, 23
Propeller shaft-related	Propeller shaft run-out excessive		○					
	Universal joint worn excessively		○					
	Slip yoke joint spline play		○					
	Center bearing play excessive		○					Gr 25
	Crossed axes angle of mounting dimension excessive due to deteriorated center bearing cushion rubber, etc.			○				
	Crossed axes angle of propeller shaft excessive due to increased tilt of drive axis caused by overloading		○

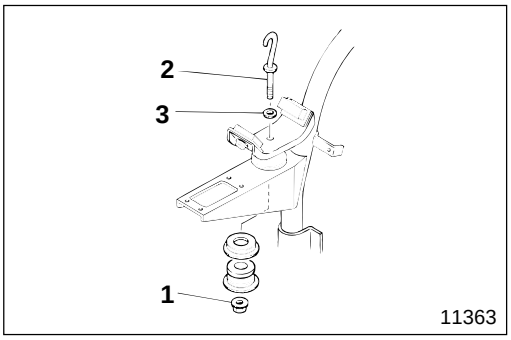
Adjustment of Cab Tilt

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Lock nut (Anchor hook mounting)	83 to 98 {61 to 72, 8.5 to 10.0}	—
4	Bolt (Lock handle mounting)	29 to 39 {22 to 29, 3.0 to 4.0}	—



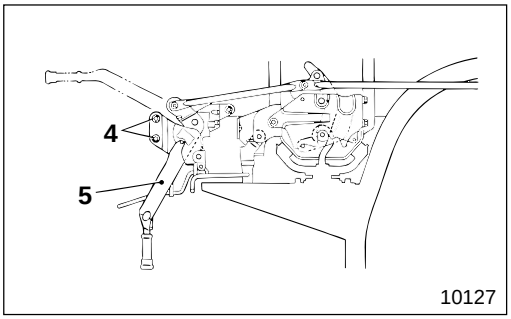
(1) Adjustment of lock handle operating force

Adjust the lock handle operating force by increasing or decreasing the number of spacers **3** as follows:

1 : Lock nut

2 : Anchor hook

	Number of spacers
Heavy operating force	Increased
Light operating force	Decreased



(2) Adjustment for unsmooth latch

If latch operation is not smooth, loosen bolt **4**, and adjust installation of lock handle **5**.

https://truckmanualshub.com/

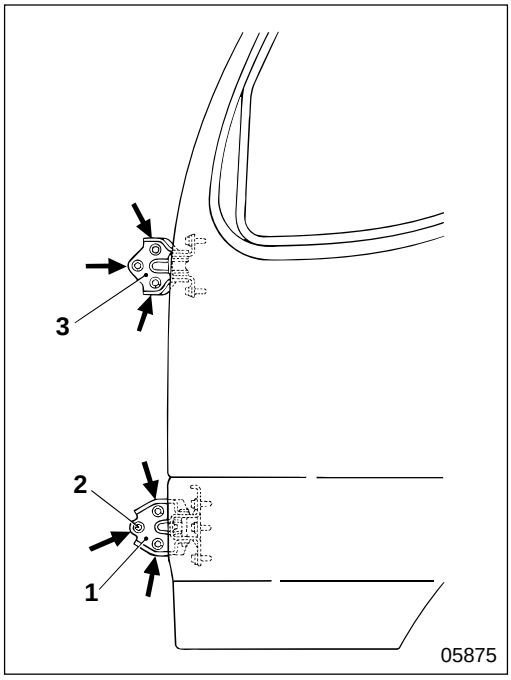
INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Adjustment of Door Fitting

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Bolt (Upper and lower hinge mounting)	17 to 25 {12 to 19, 1.7 to 2.6}	—
7	Screw (Striker mounting)	8.8 to 14 {6.5 to 10, 0.9 to 1.4}	—

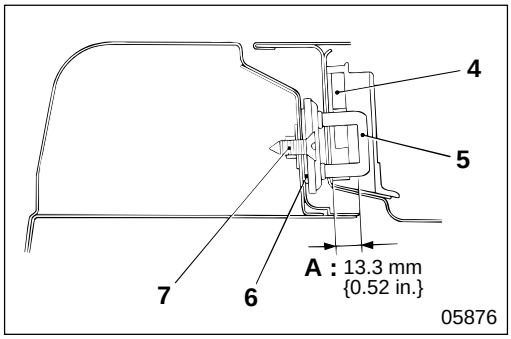


Adjust door fitting at hinge and striker.
(For door fitting dimensions: 🕮 P42-19.)

(1) Adjustment of hinge

For adjustment, use front-side bolt **2** of lower hinge **1** as the reference point.

3 : Upper hinge



(2) Adjustment of striker

Engagement condition between door lock latch **4** and striker **5** should be adjusted with shim **6** within illustrated range **A**.

7 : Screw

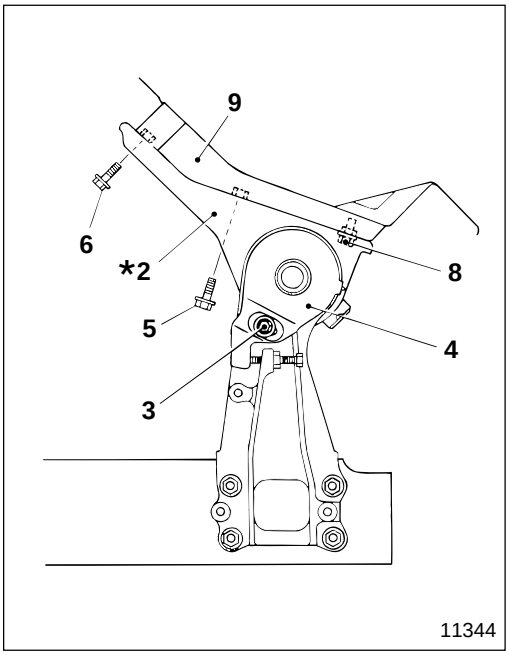
T Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Anchor lever adjusting bolt locking)	59 to 83 {43 to 60, 6 to 8.5}	—
3	Bolt (Anchor lever mounting)	34 to 54 {25 to 40, 3.5 to 5.5}	—
5, 6, 8	Bolt (Front floor cross member mounting)	70 to 95 {51 to 70, 7.1 to 9.7}	—
7	Bolt (Cab stay mounting)	19 to 27 {14 to 21, 1.9 to 2.8}	—

https://truckmanualshub.com/

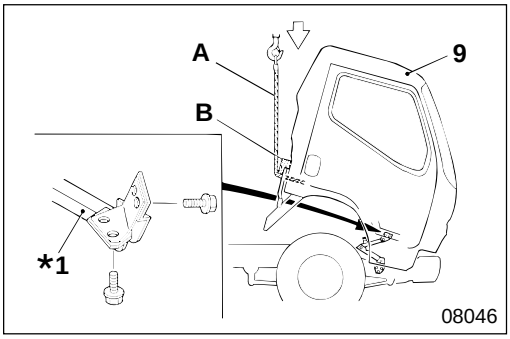
◆ Service procedure



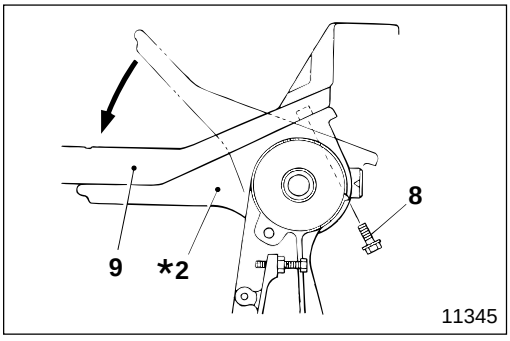
9 **Cab assembly**

[Removal]

- Tilt cab assembly **9** and lock cab stay ***1** securely.
- Remove bolt **3**, and remove anchor lever **4**.
- Of the three bolts that retain front floor cross member ***2**, remove bolts **5**, **6** at rear side, leaving bolt **8** at front side.



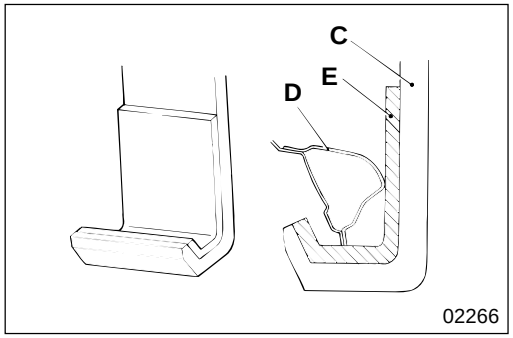
- To separate cab stay ***1** from cab assembly **9**, support the cab securely using crane **A** that is capable of lifting the cab.
  B : Use a wood block for protecting the rear of the cab
- Using crane **A**, lower cab assembly **9** until cab stay ***1** can be removed, then remove it.



- Fully lower cab assembly **9** to remove remaining bolt **8** that retains front floor cross member ***2**.

https://truckmanualshub.com/

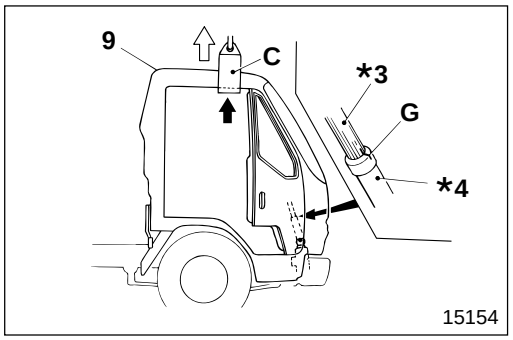
REMOVAL AND INSTALLATION OF CAB



- Set up hoist attachment **C** for the cab as illustrated.

CAUTION

- **Make sure when you set up hoist attachment C that it is capable of lifting cab assembly 9 which weighs approximately 390 kg {860 lb}.**
- **Make sure you install rubber E on hoist attachment C to prevent cab roof D being deformed when the cab is lifted.**



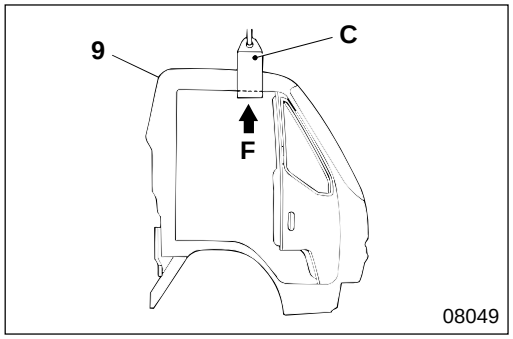
- Mount hoist attachment **C** at center-of-gravity point **F** of cab assembly **9**. Verify the position at which the cab can be lifted horizontally when the cab is lifted slightly.
- Slowly lift cab assembly **9** straight up, and finish lifting when steering yoke ***3** is pulled out from steering shaft ***4**. Make alignment mark **G** before the steering yoke is pulled out from the steering shaft.

WARNING

Never get under cab assembly 9 when it is being lifted.

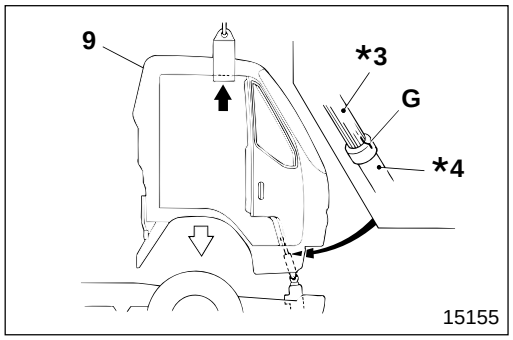
CAUTION

Make sure, when lifting cab assembly 9, that the wiring harness, cable, hoses, etc. are completely disconnected when the cab is lifted slightly.



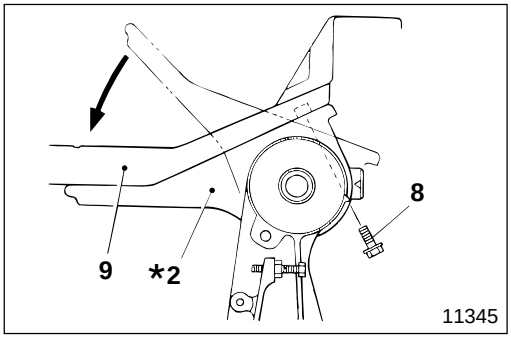
[Installation]

- Mount hoist attachment **C** at center-of-gravity point **F** of cab assembly **9**.

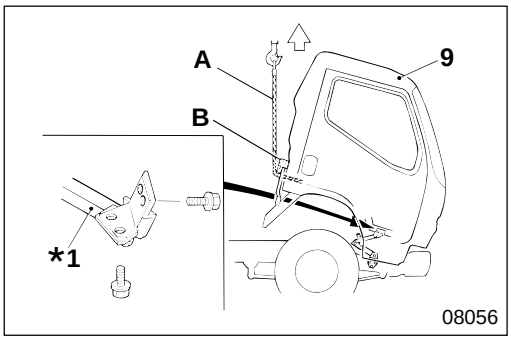


- Slowly lower cab assembly **9** horizontally to insert steering yoke ***3** into steering shaft ***4**, aligning alignment mark **G**.

https://truckmanualshub.com/



- Slowly lower cab assembly **9** further, and remove hoist attachment **C** after it comes down fully.
- Tighten front bolt **8**, one of the three bolts used for installing front floor cross member ***2**.

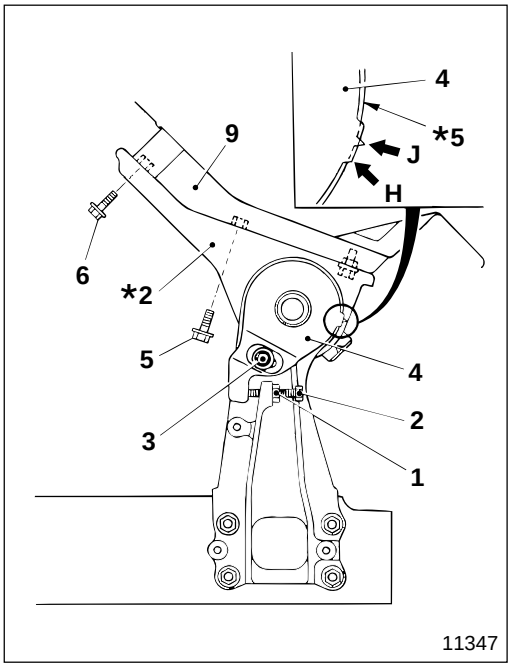


- Securely support cab on crane **A** to tilt cab assembly **9**.
  B : Use a wood block for protecting the rear of the cab
- Using crane **A** tilt cab assembly **9**, and install cab stay ***1**.

WARNING

You must pay close attention to the tilt angle when tilting cab assembly 9 using crane A. It is very dangerous to tilt the cab excessively because it will topple over.

- After installing cab stay ***1**, tilt cab assembly **9** slowly until it is completely tilted, securely lock cab stay, then detach the cab from crane **A**.



- Tilt cab assembly **9**, and securely lock cab stay ***1**.
- Tighten bolts **5**, **6** to install front floor cross member ***2**.
- Position and install pointer **J** of front cab mounting bracket ***5** in convex area **H** of anchor lever **4** and fix it with bolt **3**.
- Position bolt **2** on anchor lever **4** and lock it with nut **1**.
- After mounting cab assembly **9**, check and adjust the operating force required for the lock handle. P42-17

https://truckmanualshub.com/

FRONT CAB MOUNTING

12 Bushing, LH
13 Front rubber assembly, LH
14 Front cab mounting bracket, LH

⊗ : Non-reusable parts
* : Frame

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

Since the following parts are assembled at the time the cab is mounted, see removal and installation of cab (P42-24) for assembly procedure.
1 : Bolt (Connection of front floor cross member assembly and cab assembly)
2 : Bolt (Adjustment of anchor lever)
3 : Nut
4 : Bolt (Installation of anchor lever)
5 : Anchor lever

Ⓣ Tightening torque

Unit : N·m {lbf.ft, kgf·m}

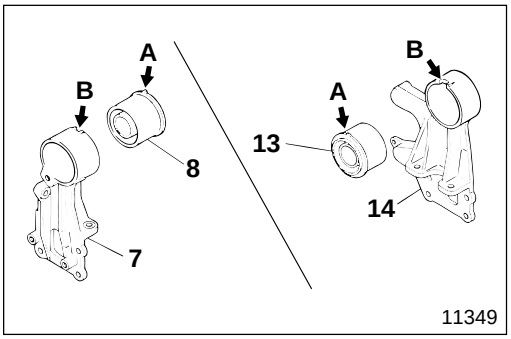
Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Front floor cross member assembly and cab assembly mounting)	70 to 95 {51 to 70, 7.1 to 9.7}	—
3	Nut (Lock of anchor lever adjustment bolt)	59 to 83 {43 to 61, 6 to 8.5}	—
4	Bolt (Anchor lever mounting)	34 to 54 {25 to 40, 3.5 to 5.5}	—
6	Bolt (Front cab mounting bracket mounting)	70 to 85 {51 to 63, 7.1 to 8.7}	—

https://truckmanualshub.com/

Lubricant

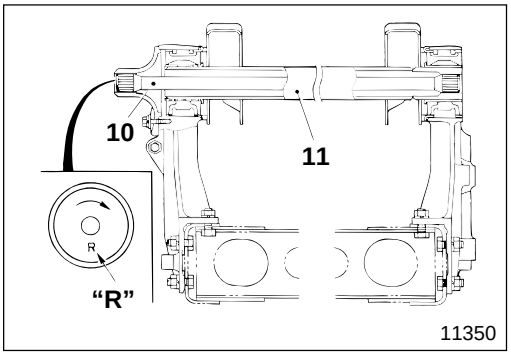
Location	Points of application	Kinds	Quantity
8, 13	Contact area between front rubber assemblies and front floor cross member assembly	Rubber grease	As required

◆ Service procedure



8 **13** **Installation of front rubber assembly**

Install front rubber assembly RH **8** and LH **13** fitting protrusions **A** to the indents **B** of mounting bracket RH **7** and LH **14** respectively.

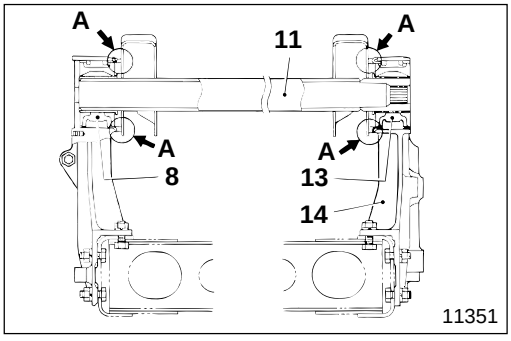


10 **Installation of torsion bar**

Install torsion bar **10** to front floor cross member assembly **11** in the direction as illustrated.

CAUTION⚠

Be sure not to mistake the left side for the right side, when installing torsion bar 10, because the torsion bar will be damaged if its torsion direction is reversed.



11 **Installation of front floor cross member assembly**

Install front floor cross member assembly **11**, adjusting front cab mounting bracket LH **14** so there is no gap between the front floor cross member assembly and front rubber assembly RH **8** and LH **13** at points **A**.

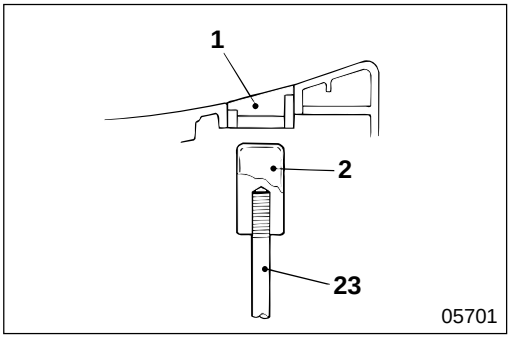
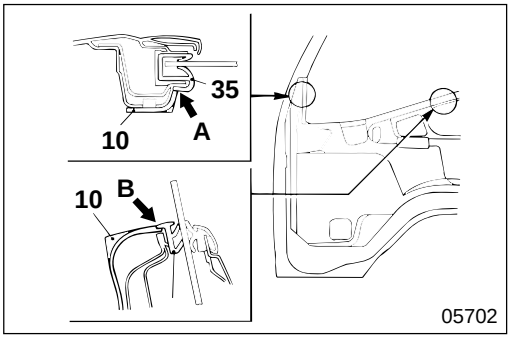
37	Friction part of regulator and rail assembly	DYNAMIC GB	As required
38	Door panel and waterproof cover mounting surface	BUTYL TAPE	As required

◆ Service procedure



2 **Installation of door lock knob**

- Screw door lock knob **2** onto door lock rod **23** and turn to the right fully.
- Slacken off door lock knob **2** to the left by one or two turns.
- Install cover **1** to prevent door lock knob **2** from turning excessively.

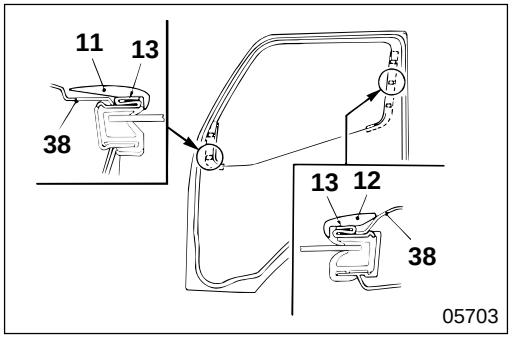


10 **Installation of door trim**

- At front pillar, tap door trim **10** against lip area **A** of run channel **35** .
- In belt line, insert door trim **10** into lip area **B** of inner weatherstrip **17** and install.

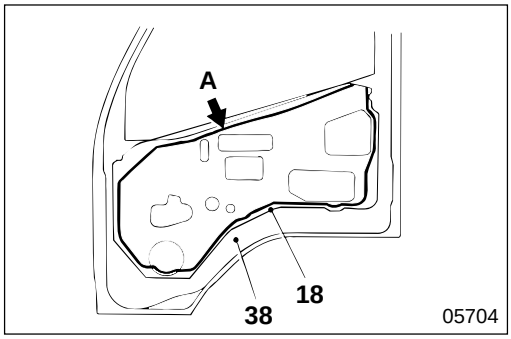
https://truckmanualshub.com/

DOOR



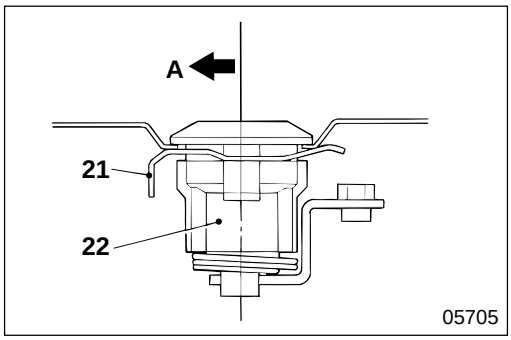
11 **12** **Installation of front garnish and rear garnish**

- Install clips **13** on door panel **38**.
- Install front garnish **11** and rear garnish **12** on clips **13**.



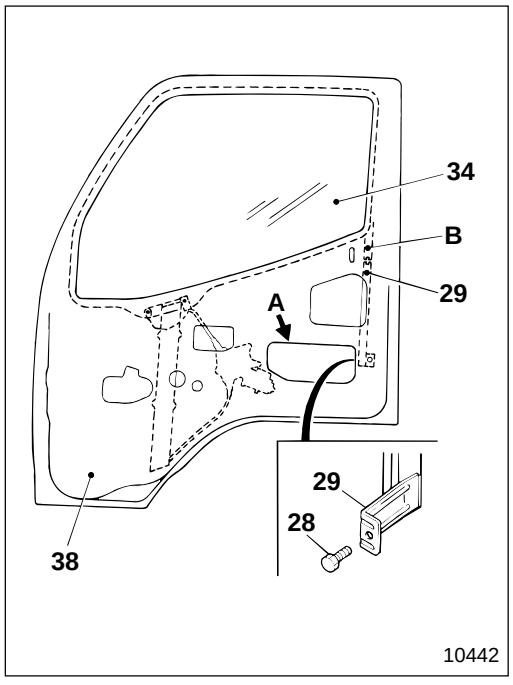
18 **Installation of waterproof cover**

- Apply butyl tape **A** to door panel **38** as illustrated.
- Stick waterproof cover **18** over butyl tape **A**.



22 **Installation of door lock cylinder**

21 : Clip
A : Front of the vehicle

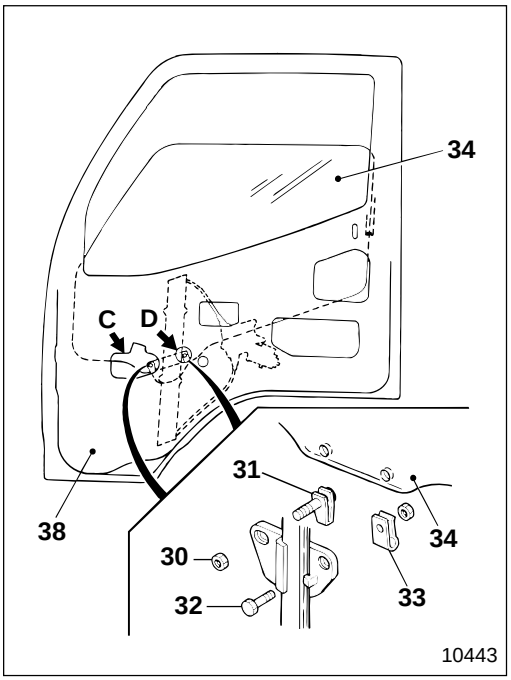


34 **Removal and installation of door glass**

Remove all parts supporting door glass **34** and remove the door glass from the door opening.

- Raise door glass **34** to the upper limit.
- Remove bolt **28** through hole **A** of door panel **38** to remove lower sash **29** which is inserted into upper sash **B**.

https://truckmanualshub.com/



- Lower door glass **34** to the level where nut **30** and bolt **32** can be seen through holes **C** and **D** of door panel **38** respectively.
- Hold door glass **34** with your hands and remove glass holders **31, 33**.
- Remove door glass **34** via the door opening.
- For installation, follow the removal sequence in reverse.

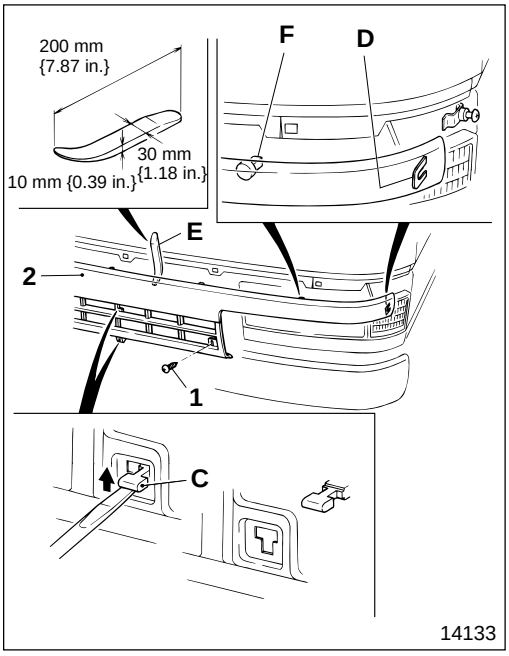
◆ Service procedure



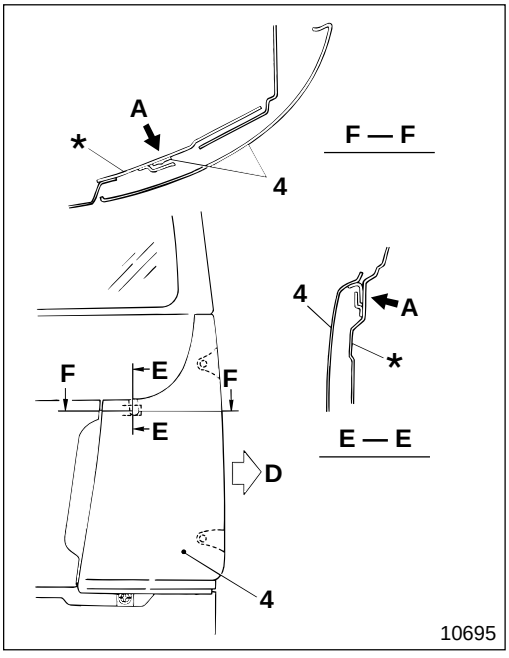
2 **Removal and installation of front grille**

- Remove screws **1** (two points) from front grilles **2**.
- Lift up the ends of clips **C** (two points), located in the center of front grilles **2**, using a screwdriver, and unlock them from the clips.
- Pull out front grilles **2** horizontally, in the vehicle forward running direction, to remove them.

CAUTION

- **Be careful not to apply too much force to front grilles 2, because this would damage them. Be especially careful to avoid applying force to clips D at both sides, support the clips using your hands. If it is hard to remove the front grilles, remove them using nylon jig E as illustrated.**
- **Be careful not to use force when you pull out clips F (five points) from the tops of front grilles 2, because this would damage them.**

- For installation, follow the removal sequence in reverse.



3 **4** **Installation and removal of front side panels RH, LH**

- Move front side panels RH **3**, LH **4** to the outside of the vehicle to remove them from the cab assembly *.

***2** : Assistant driver's side lower panel P42-51

NOTE

Before disassembling parts 11 to 28, remove the instrument panel to allow access to them. P42-49

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
2	Wiping force of wiper arm	5.7±0.49 N {1.28±0.11 lbf, 0.58±0.05 kgf}	—	Replace

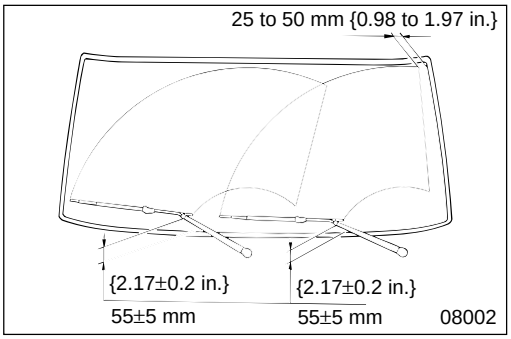
https://truckmanualshub.com/

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

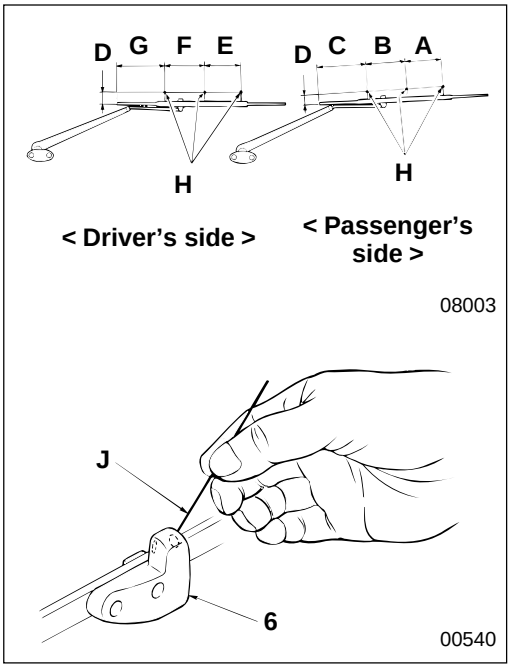
Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Wiper arm and blade assembly mounting)	9.8 to 15 {7.2 to 11, 1 to 1.5}	—
10	Nut (Packing washer mounting)	14 to 20 {10 to 14, 1.4 to 2}	—
12	Nut (Hose joint mounting)	0.6 to 0.9 {0.4 to 0.7, 0.06 to 0.09}	—
19	Nut (Wiper link mounting)	9.8 to 15 {7.2 to 11, 1 to 1.5}	—
23	Nut (Wiper motor and wiper link mounting)	1.7 to 2.4 {1.2 to 1.7, 0.17 to 0.24}	—
24, 25	Bolt (Wiper motor bracket mounting)	9.8 to 15 {7.2 to 11, 1 to 1.5}	—
27	Bolt (Wiper motor mounting)	5.4 {4, 0.55}	—

◆ Service procedure



2 **Installation of wiper arm and blade assembly**

Install wiper arm and blade assembly **2** so that dimensions from the edges of the weatherstrip are as illustrated.



6 **Inspection of washer nozzle assembly**

Make sure that washer fluid spreading target positions **H** are within dimensions **A** to **G**. (Illustration shows the view from inside cab.)

Unit : mm {in.}

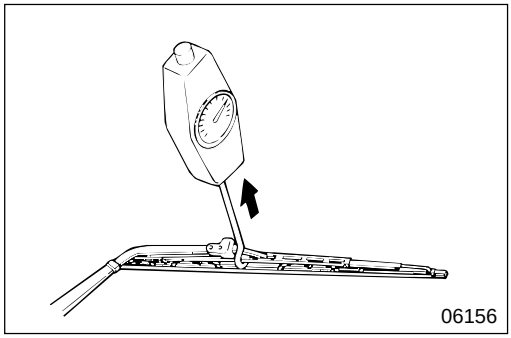
		H
Passenger's side	A	110 {4.33}
	B	90 {3.54}
	C	170 {6.69}
	D	15 {0.59}
Driver's side	E	90 {3.54}
	F	90 {3.54}
	G	160 {6.30}

If washer fluid spreading target positions **H** deviate from these dimensions, adjust the jet hole angle of washer nozzle assembly **6** using wire **J**.

CAUTION

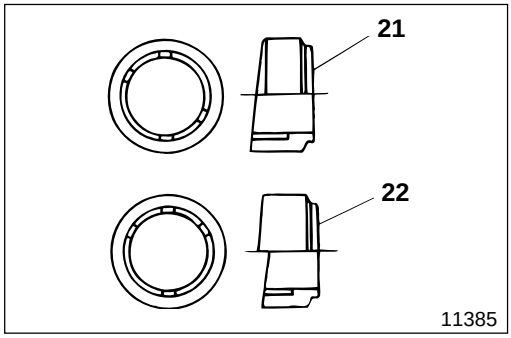
Be careful not to damage the jet hole of washer nozzle assembly 6 with wire J when adjusting the angle.

https://truckmanualshub.com/



8 **Inspection of wiper arm**

If the measured value deviates from the standard value, replace wiper arm **8**.



21 **22** **Packing washer**

Because the shape of packing washer **21** for the passenger's side and packing washer **22** for the driver's side are different, be careful not to mix them up during assembly.

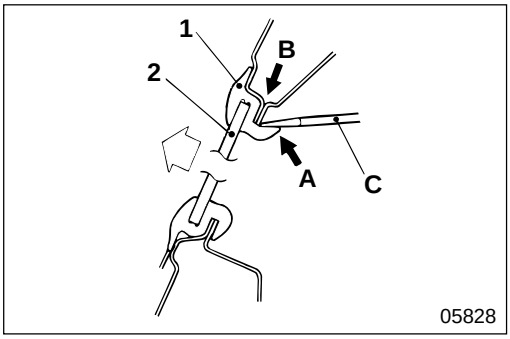
Lubricant

Location	Points of application	Kinds	Quantity
1, 3	Lip area of weatherstrip	Soapy water	As required

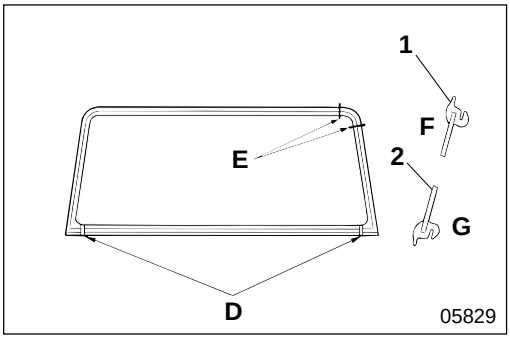
◆ Service procedure



1 **2** **Weatherstrip and windshield**

[Removal]

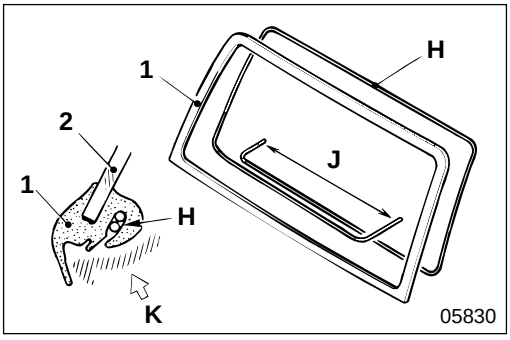
- From the inside of the cab, separate lip **A** of weatherstrip **1** from flange lip **B** of the cab.
  C : Screwdriver
- Push windshield **2** outward to remove it from the cab.



[Installation]

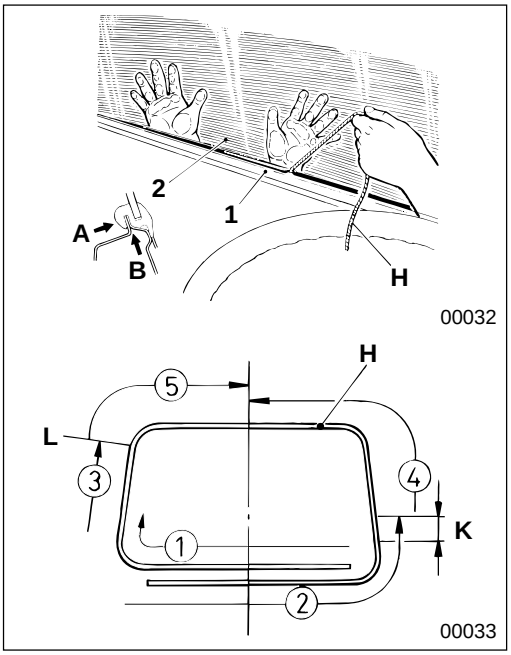
When installing the windshield, pull cord **H** attached to weatherstrip **1** and turn over lip **A**, following the procedure below:

- Position drain hole **D** and joint part **E** of weatherstrip **1** as illustrated and install them on windshield **2**.
  F : Outside
  G : Inside



- Lay cord **H** in the cab mounting groove of weatherstrip **1** as illustrated, and overlap the cord at the lower side of the glass by the specified length, see **J**.
- Apply soapy water **K** to weatherstrip **1**.
- Align windshield **2** with the cab.

https://truckmanualshub.com/

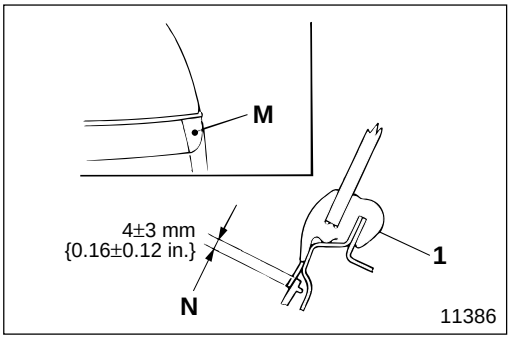


- Push windshield **2** inward from the outside of the cab firmly.
- Inside the cab, pull one end of cord **H** to install lip **A** of weatherstrip **1** into flange lip **B** of the cab.

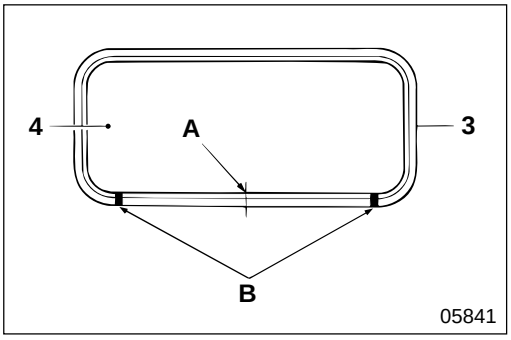
- Pull cord **H** in the numbered order as illustrated and at the same time have someone push windshield **2** into weatherstrip **1**, tapping the windshield with a rubber-headed mallet.
  K : approximately 100 mm {3.94 in.} from the starting point of straight line
  L : up to the end of straight line

CAUTION

Make sure that windshield 2 is installed correctly into the cab before hitting the windshield with the rubber-headed mallet, otherwise the windshield might be broken.



- Provide an overlapped margin **N** on weatherstrip **1** and side garnish **M** to prevent water flowing backwards from the water drain hole.



3 **4** **Weatherstrip, rear window glass**

- Install so that joint **A** of weatherstrip **3** is at the center of rear window **4**.
  B : Water drain hole
- Except for the point mentioned above, follow the same service procedure as for installation of windshield. P42-54

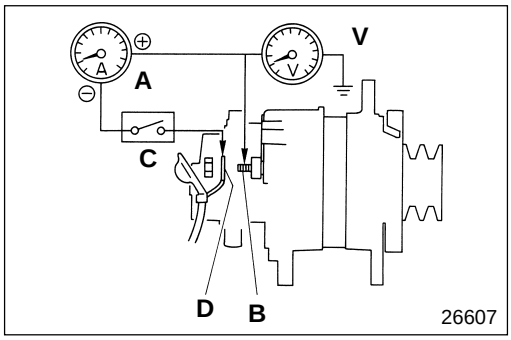
B : Terminal B
E : Terminal E
L : Terminal L
R : Terminal R

https://truckmanualshub.com/

Possible causes \ Symptoms		Battery electrolyte decreases too early	Battery overheating	Battery is normal but overdischarged	Charge warning lamp does not light when turning starter switch ON, with engine stopped	Alternator is normal but battery overdischarged	Remarks
Connector connection faulty, harness broken, grounding faulty				○		○	
Fuse blown					○		
V-belts loose				○		○	Gr 14
V-belts damaged				○		○	Gr 14
Battery faulty		○				○	
Alternator	Stator coil broken			○			
	Stator coil short-circuited with core			○			
	Field coil broken			○			
	Rectifier faulty			○			
	Regulator faulty		○	○	○		
	Brush worn			○			
	Brush spring fatigued			○			
	Wiring faulty			○			
Meter cluster faulty					○		

https://truckmanualshub.com/

Inspection of Alternator



Performance test

- Connect the meters to the alternator as illustrated.
  A : Ammeter (100 amperes class)
  B : Terminal B on alternator
  C : Switch
  D : Terminal
  V : Voltmeter

WARNING

- **Terminal D is always loaded with voltage from the battery.**
- **You must handle terminal D carefully, it will short-circuit if it touches any part other than terminal B on the alternator.**

- Turn switch **C** ON and make sure that voltmeter **V** indicates the voltage of the battery.
- Start the engine.
- Turn the switches ON of all the lamps on the vehicle immediately.
- Raise the engine speed immediately and measure the current when the speed reaches approximately 2260 rpm.
- The alternator is assumed to be normal if the measured value is higher than 70% of the specified output.

Specified output of alternator

Alternator model	Voltage	Output
A4TU0388	12 V	80 A

NOTE

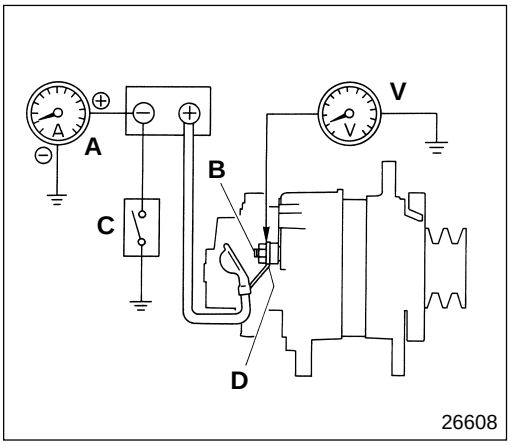
Since the above inspection is only a simplified check, it is necessary to conduct a stringent bench test for an official check.
P54-1-8

https://truckmanualshub.com/

Inspection of Regulator

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Adjustment voltage of regulator	14.7±0.3 V	—	Replace



- Connect the meters to the alternator as illustrated.
  A : Ammeter (100 amperes class)
  B : Terminal B on alternator
  C : Switch
  D : Terminal
  V : Voltmeter

WARNING

- **Terminal D is always loaded with voltage from the battery.**
- **You must handle terminal D carefully, it will short-circuit if it touches any part other than terminal B on the alternator.**

- Turn OFF the lamps, heater, etc., to ensure that there is no electrical loading during inspection.
- Turn switch **C** OFF and start the engine.

CAUTION

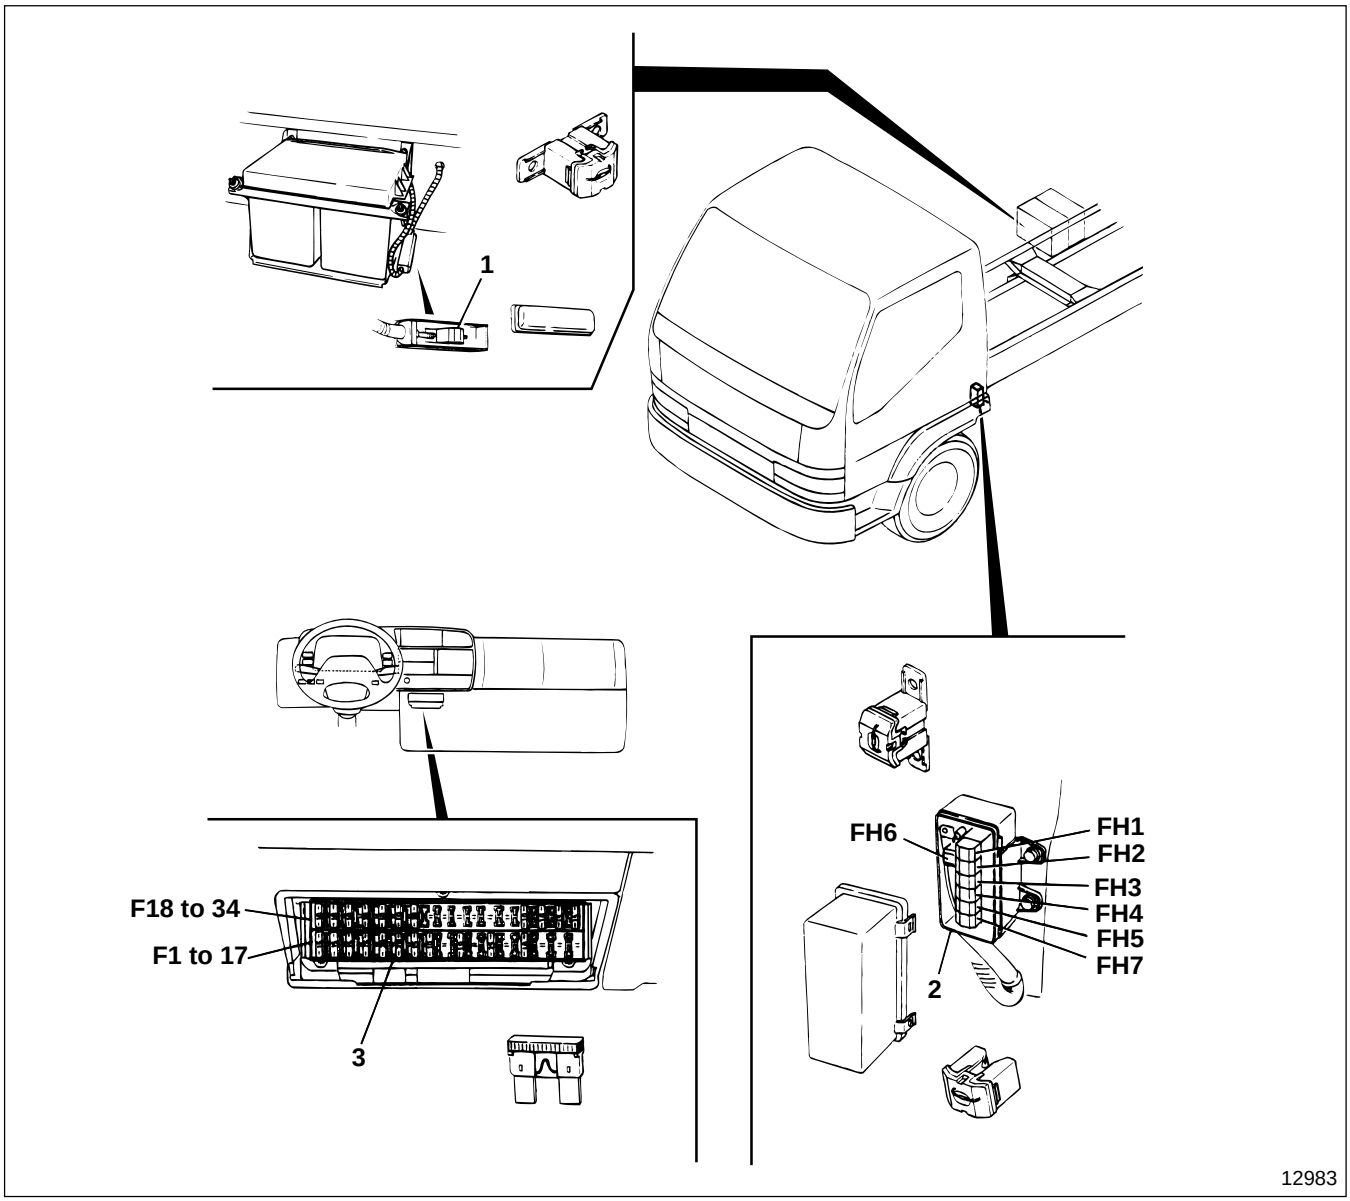
Do not start the engine with switch C turned ON because the starter current will flow into ammeter A and damage it.

- If the charge current is five amperes or less and the engine speed is approximately 2260 rpm, measure the adjustment voltage.
- If the charge voltage is five amperes or more, do one of the following :
  - Run the engine for a while to charge the battery.
  - Replace the old battery with a fully-charged one.
- If the measured value deviates from the standard value, reexamine on the test bench. P54-1-8

https://truckmanualshub.com/

104 FUSE

Installation Location



1 Main high-current fuse
2 High-current fuse box
3 Fuse box

CAUTION

- **If a fuse blows, make sure you identify and remedy the cause, then replace the fuse.**
- **Make sure that you replace the fuse with one having the same rating.**
- **Make sure that you remove the ⊖ terminal of the battery cable before removing main high-current fuse 1 and high-current fuses FH1 to 7. 101 ('96 Model Gr 54 (Pub. No. TWME9502-54))**

https://truckmanualshub.com/

Main high-current fuse

Fuse No.	Main load	Capacity
—	High-current fuse box	120 A

High-current fuse box

Fuse No.	Main load	Capacity

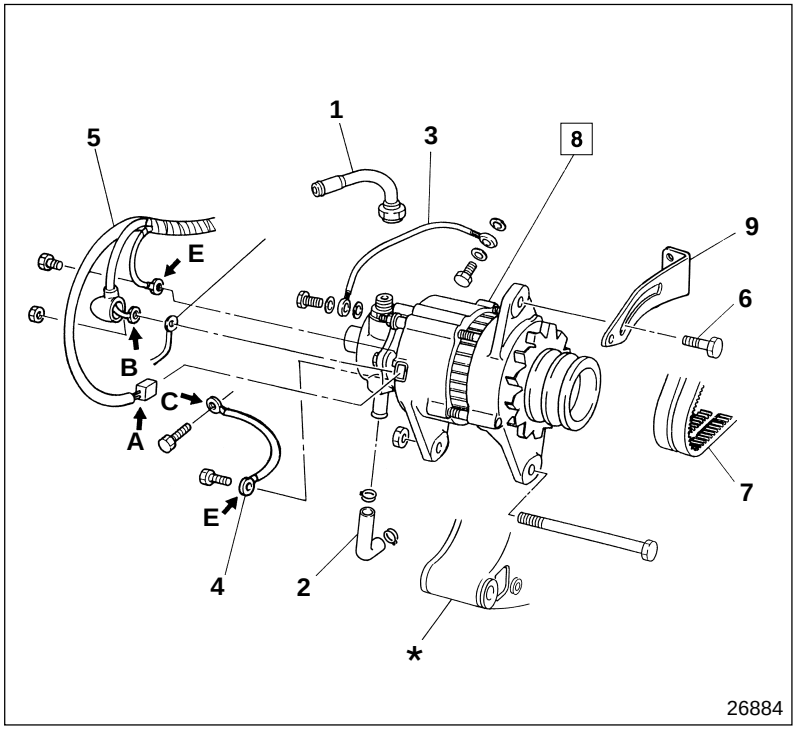
106 ALTERNATOR



● **Removal sequence**

1 Vacuum pipe
2 Oil return hose
3 Oil inlet hose
4 Ground cable
5 Chassis harness
6 Adjusting bolt
7 V-belts
8 Alternator 📖 P54-1-10
9 Adjusting plate

***** : Timing gear case and front plate 📦 Gr 11
A : To terminals L and R
B : To terminal B
C : Connected to crankcase
E : To terminal E

WARNING ⚠

- **Terminal B is always loaded with voltage from the battery, supplied via chassis harness 5. Therefore when you remove the harness from terminal B, make sure that tools do not touch any adjacent parts because this would cause a short-circuit.**
- **Make sure that you disconnect terminal ⊖ of the battery before removing the harness and insulate the terminal with tape.**

● **Installation sequence**

Follow the removal sequence in reverse.

● **Adjustment after installation**

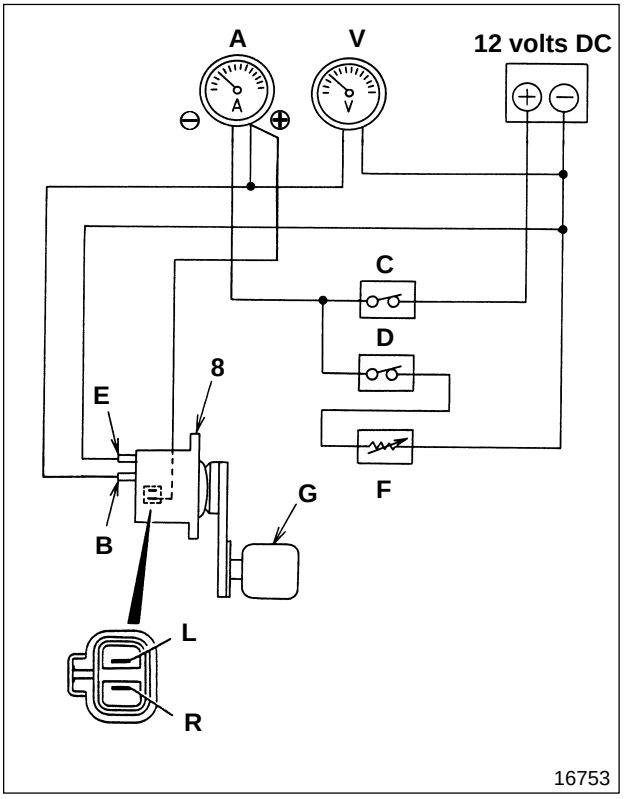
Adjustment of V-belt **7** tension 📦 Gr 14

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
8	Output current (***** When engine is hot and 13.5 V is loaded)	At 1500 rpm	37 A or more	—	Inspect
		At 2500 rpm	64 A or more	—	
		At 5000 rpm	75 A or more	—	
	Adjustment voltage of regulator (At 5000 rpm, 5 A is loaded)		14.7±0.3 V	—	Replace

***** : The value of the ambient temperature is measured after running the engine at maximum power (5000 rpm) for 30 minutes.

https://truckmanualshub.com/



8 Inspection of alternator

(1) Inspection of alternator performance (bench test)

- Connect each unit to alternators **8** as illustrated.

CAUTION

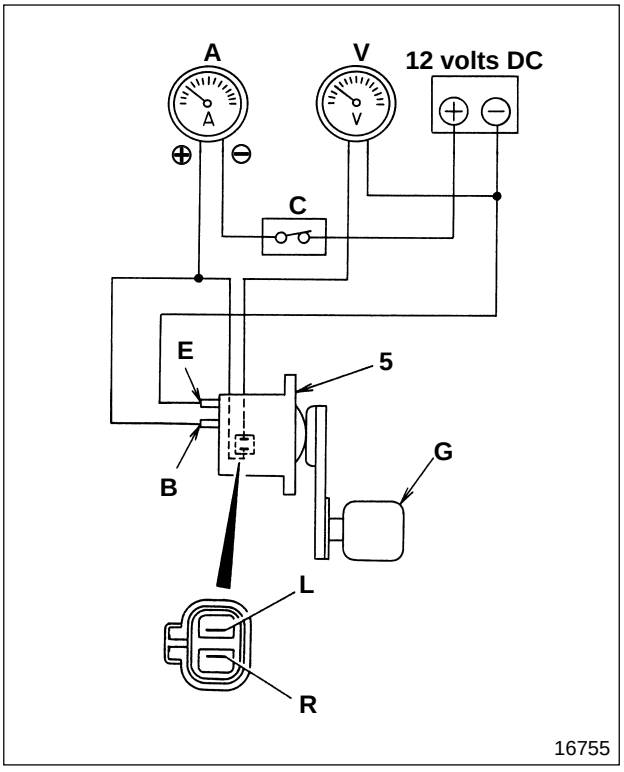
Use sufficiently thick wires for the wiring and make sure all connecting parts are securely connected.

A : Ammeter
B : Terminal B on alternator
C : Switch
D : Switch
E : Terminal E on alternator
F : Load resistance (variable resistance)
G : Alternator drive motor
L : Terminal L on alternator
R : Terminal R on alternator
V : Voltmeter

- Maximize load resistance **F** (load current hardly flows).
- Warm-up alternator **8** by letting it run for 30 minutes at 5000 rpm.

- Turn switches **C**, **D** ON.
- Adjust load resistance **F** to maintain the specified current.
  Specified output of the alternator : 12 V-80 A
- Increase the rotation of alternator **8** gradually and measure current at specified rpm.
- If the measured value deviates from the standard value, disassemble and inspect alternator **8**. P54-1-10

(2) Inspection of regulator (bench test)

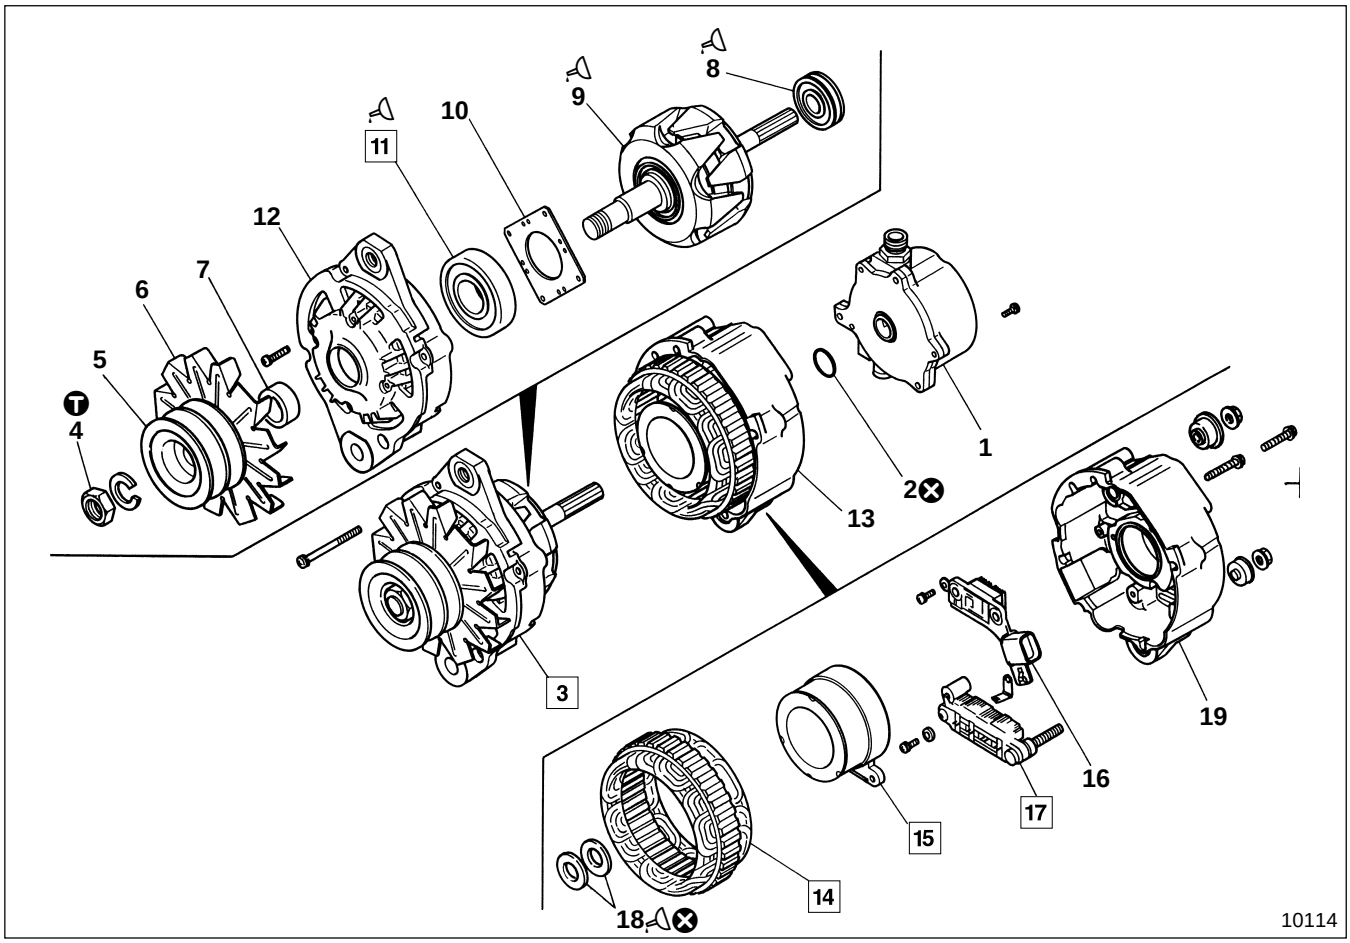


- Connect each unit to the alternators as illustrated.
  A : Ammeter
  B : Terminal B on alternator
  C : Switch
  E : Terminal E on alternator
  G : Alternator drive motor
  L : Terminal L on alternator
  R : Terminal R on alternator
  V : Voltmeter
- Turn switch **C** ON.
- Run alternator **8** at low speed.
- Measure the voltage (adjustment voltage) when alternator **8** has reached a speed of 5000 rpm. Make sure at such time that the value of the current is five amperes or less.
- If the measured value deviates from the standard value, perform either of the following.
  - If the measured value is higher than the standard value : Replace the regulator
  - If the measured value is lower than the standard value : Before replacing the regulator check the alternator area.

https://truckmanualshub.com/

106 ALTERNATOR

Alternator



● **Disassembly sequence**

1. Vacuum pump Gr35
2. O-ring
3. Rotor and front bracket assembly
4. Nut
5. Pulley
6. Fan
7. Spacer
8. Rear bearing
9. Rotor assembly
10. Cover
11. Front bearing
12. Front bracket
13. Stator and rear bracket assembly
14. Stator assembly
15. Field coil
16. Regulator
17. Rectifier
18. Oil seal
19. Rear bracket

⊗ : Non-reusable parts

NOTE

Do not remove parts 8, 11, 14 unless they are faulty.

● **Assembly sequence**

13 → 3 → 2→ 1

13 : 19 → 18 → 16 → 17 → 15 → 14

3 : 12 → 11 → 10 → 9 → 8 →7 → 6 → 5→ 4

https://truckmanualshub.com/

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
15	Field coil resistance (20°C {68°F})	2.6 to 3.1 Ω	—	Replace

Tightening torque

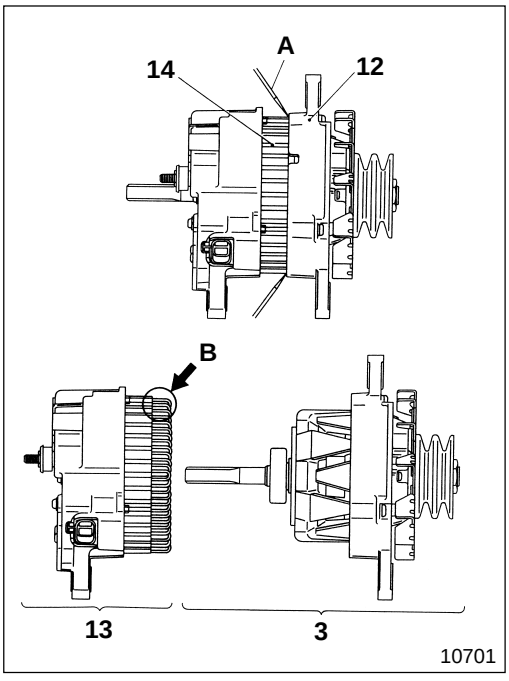
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Nut (Pulley mounting)	132 to 162 {98 to 120, 13.5 to 16.5}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
8	Rear bearing inner periphery	Engine oil	As required
9	Front bearing installation part of rotor assembly	Engine oil	As required
11	Front bearing outer periphery	Engine oil	As required
18	Oil seal lip area	Idemitsu Autolex	As required

◆ Service procedure



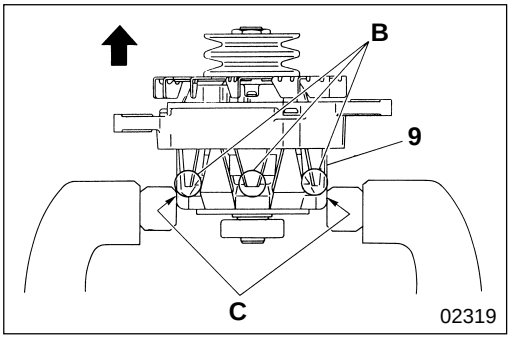
3 **Rotor and front bracket assembly**

[Removal]

- Insert screwdriver **A** between front bracket **12** and stator assembly **14**.
- Use screwdriver **A** to pry rotor and front bracket assembly **3** away from stator and rear bracket assembly **13**.

CAUTION

Be careful not to insert the screwdriver too deep or it will damage coil B of stator assembly 14 and might cause a short-circuit.

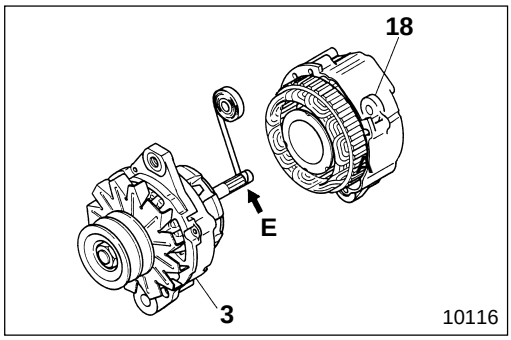


[Disassembly]

CAUTION

Make sure, when you hold rotor assembly 9 in a vise, to grip root C of the core claws. Gripping claws D can damage them.

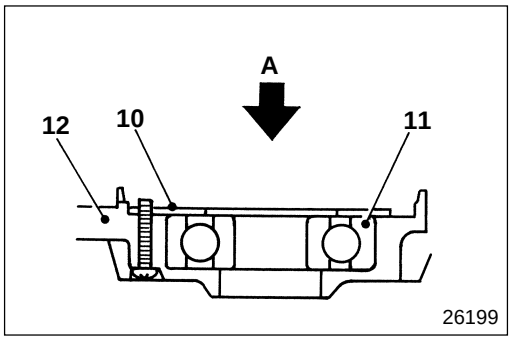
https://truckmanualshub.com/



[Installation]

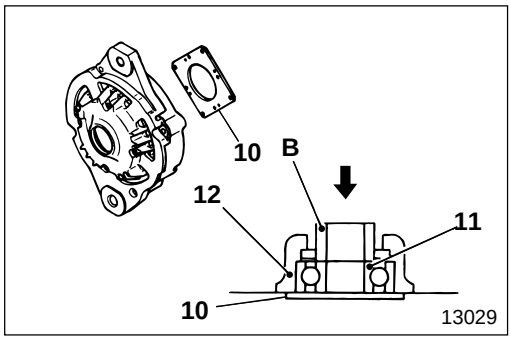
CAUTION

To prevent damaging oil seal 18 during assembly, cover spline area E of the shaft of rotor and front bracket assembly 3 with tape.

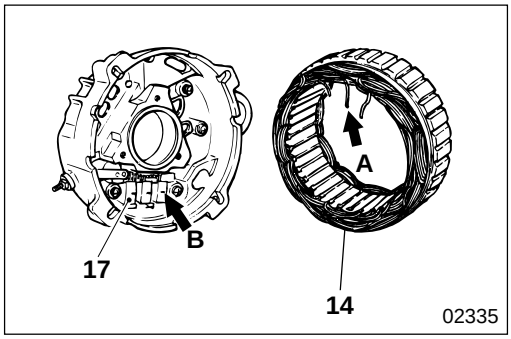


11 Installation of front bearing

- Press-fit front bearing **11** until it is flush with the installation part of cover **10**.
  A : Press



- Install cover **10**.
- Press spacer **B** until it makes contact with front bearing **11** and cover **10**, using a press.



14 Stator assembly

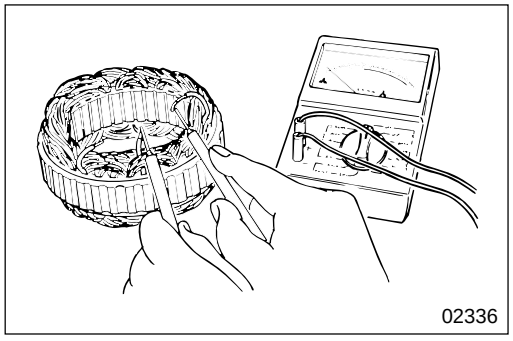
[Removal and installation]

- Disconnect lead **A** of stator assembly **14** from rectifier **17**. The lead is soldered to diode **B** of rectifier **17** at three points.

CAUTION

Make sure that you desolder within five seconds because the diode is heat sensitive.

- To install, follow the removal sequence in reverse.

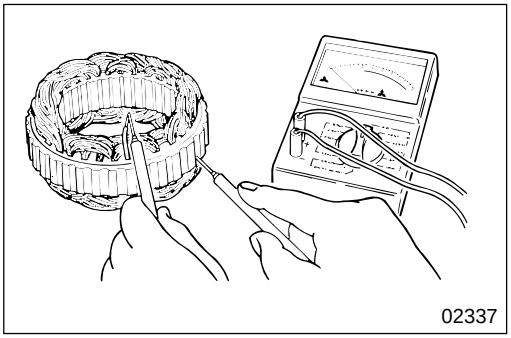


[Inspection]

(1) Continuity of each lead wire

- Make sure that each lead wire has continuity.
- If there is no continuity, the lead wire is broken. Replace stator assembly **14**.

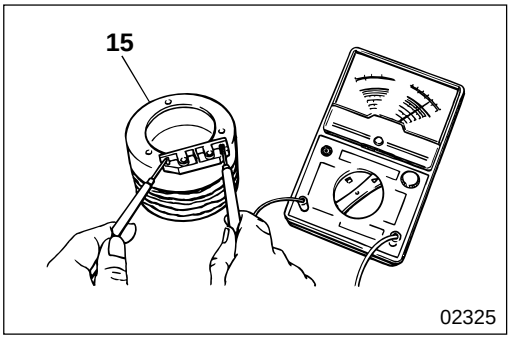
https://truckmanualshub.com/



02337

(2) Continuity between lead wires and the core

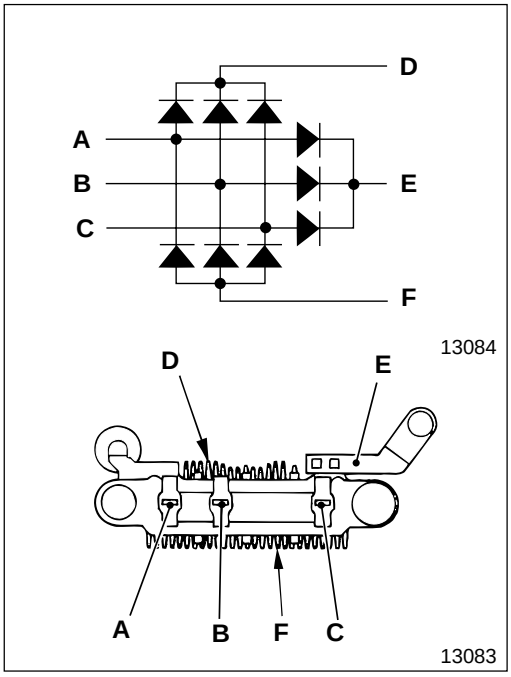
- Make sure that there is no continuity between lead wires and the core.
- If there is continuity, replace stator assembly **14**, since it might be short-circuited.



02325

15 Inspection of field coil

- Measure the resistance between the terminals of field coil **15**.
- If the measured value deviates from the standard value, replace field coil **15**.



13084

13083

17 Inspection of rectifier

- Inspect whether the diode inside rectifier **17** functions properly, and if any fault is found, replace the rectifier.
  A, B, C : Lead connecting area of stator coil
  D, E : Heat sink area
  F : Regulator connecting area
- Inspect the rectifier twice, before and after the ⊕ side and ⊖ side of the tester have been changed over.

CAUTION⚠

When inspecting using a tester, the current becomes weaker than the usual current flowing through rectifier 17. Therefore, an incomplete resistance value might be indicated.
Also, this tendency increases as the range of the tester gets smaller. Therefore, use as large range as possible.

			At 1500 rpm	1500±110 rpm		
			At 2000 rpm	2000±110 rpm		
			At 2500 rpm	2500±110 rpm		
			At 3000 rpm	3000±110 rpm		
			At 4500 rpm	4500±125 rpm		

◆ Service procedure

3 Inspection of speedometer

- Measure the indication area of speedometer **3** at various speed ranges using a speedometer tester.
- If the measured value deviates from the standard value, carry out the following inspection. If the inspection does not indicate a fault, replace speedometer **3**.

(1) Inspection of vehicle speed sensor body 802

: '96 Model Gr 54 (Pub. No. TWME9502-54)

(2) Inspection of installed condition of vehicle speed sensor

Gr 22 < Manual transmission >
Gr 23 < Automatic transmission >

https://truckmanualshub.com/

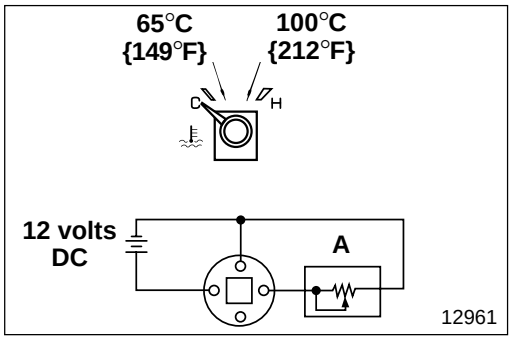
4 Inspection of fuel gauge

- Connect a variable resistor to fuel gauge **4** as illustrated.
  A : Variable resistor
- Measurement order
  FULL → 1/2 → EMPTY

NOTE

The movement of the gauge needle is subject to hysteresis (oscillation). Be sure to measure following the measurement order.

- Increase the value of variable resistor **A** gradually from 0 Ω.
- Measure the resistance respectively when the needle of fuel gauge **4** indicates FULL, 1/2 and EMPTY.
- If the measured value deviates from the standard value, replace fuel gauge **4**.



5 Inspection of water temperature gauge

- Connect a variable resistor to water temperature gauge **5** as illustrated.
  A : Variable resistor
- Measurement order
  Low temperature → High temperature

NOTE

The movement of the gauge needle is subject to hysteresis (oscillation). Be sure to measure following the measurement order.

- Increase the value of variable resistor **A** gradually from 0 Ω.
- Measure the resistance respectively when the needle of water temperature gauge **5** indicates 65°C {149°F} and 100°C {212°F}.
- If the measured value deviates from the standard value, replace water temperature gauge **5**.

6 Inspection of tachometer

- Measure the indication area of tachometer **6** at various revolution ranges using an engine revolution counter.
- If the measured value deviates from the standard value, carry out the following inspection. If the inspection does not indicate a fault, replace tachometer **6**.

(1) Inspection of the engine revolution sensor body 📖 **801**

📖 : '96 Model Gr 54 (Pub. No. TWME9502-54)

(2) Inspection of the installed condition of the engine revolution sensor 📖 **Gr 13**

500 ON-VEHICLE INSPECTION AND ADJUSTMENT

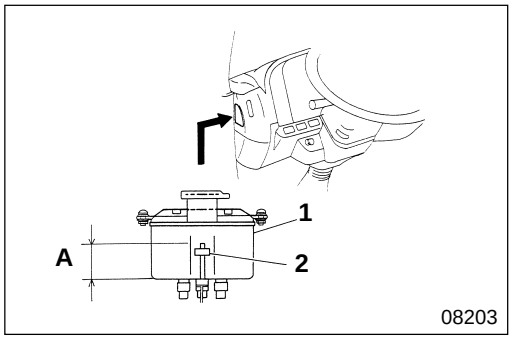
Inspection of Brake Fluid Level Switch

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Warning lamp lighting position for brake fluid level switch	41.0±3 {1.61±0.12}	—	Replace



- Start engine.
- Drain the brake fluid gradually from fluid tank assembly **1**.

CAUTION

If brake fluid is spilt on any part of the vehicle, wipe it off immediately, since the solvent in the fluid can damage the paintwork.

- Measure height **A** of brake fluid level switch **2** when BRAKE warning lamp within the meter cluster lights.
- If the measured value deviates from the standard value, remove and check fluid tank assembly **1**.

Inspection : 515

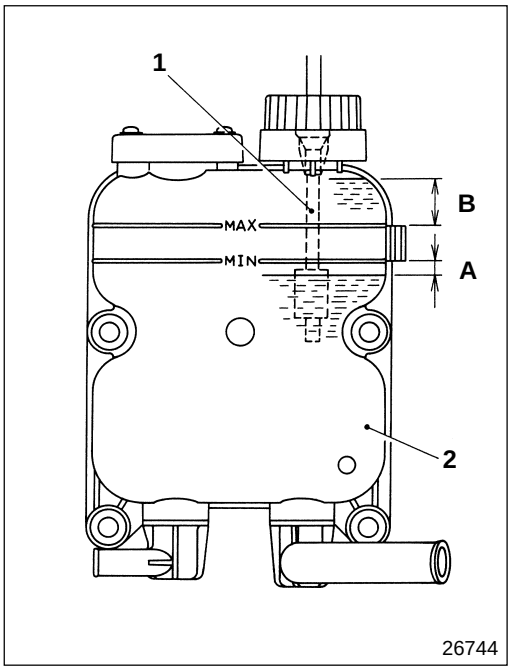
https://truckmanualshub.com/

Inspection of Power Steering Fluid Level Sensor

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
—	Warning lamp lighting position for power steering fluid level sensor	Height from oil tank MIN level to fluid surface	15 {0.59}	—	Replace
		Height from oil tank MAX level to fluid surface	25 {0.98}	—	



Perform the following inspection and if any fault is found, remove and inspect power steering fluid level sensor **1**.

Removal and installation : Gr 37

Inspection : 549

Perform inspection by turning the starter switch ON and determining the power steering fluid level when BRAKE warning lamp within the meter cluster lights (buzzer sounds at the same time).

(1) Inspection procedure when the power steering fluid level is low

- Drain the power steering fluid gradually from power steering oil tank **2**.
- Inspect to make sure that, when BRAKE warning lamp is lit, height **A** from power steering fluid surface to the **"MIN"** level of power steering oil tank **2**, is within the standard value.

(2) When power steering fluid level is too high

- Supply power steering fluid gradually into power steering oil tank **2**.
- Inspect to make sure that, when BRAKE warning lamp is lit, height **B** from power steering fluid surface to the **"MAX"** level of power steering oil tank **2**, is within the standard value.

515 BRAKE WARNING CIRCUIT

◆ Service procedure

2 Inspection of brake fluid level switch

- Drain the brake fluid gradually from the brake fluid tank assembly.

CAUTION ⚠

If brake fluid is spilt on any part of the vehicle, wipe it off immediately, since the solvent in the fluid can damage the paintwork.

- Measure height **A** of brake fluid level switch **2** when continuity is present between terminals ① and ②.
- If the measured value deviates from the standard value, replace the fluid tank assembly.

OFF		○	○

(1) Operation inspection

- While applying negative pressure of –99.99 kPa {–29.5 in. Hg, –750 mm Hg} through input port **A**, apply direct-current voltage between terminals ① and ② gradually, starting at 0 volt. Measure the voltage (minimum operating voltage) when 3-way magnetic valve **15** is activated under this condition. (You can tell if the magnetic valves are ON or OFF by listening for an operating sound.)
- Seal output port **B** tightly and applying a pressure of 98.1 kPa {14 lbf/in^2, 1kgf/cm^2} through exhaust port **C**, apply voltage and perform inspection in the same way as described above.

https://truckmanualshub.com/

(2) Airtightness inspection

- When the 3-way magnetic valve is ON :
  - Seal output port **B** tightly.
  - While applying negative pressure of –99.99 kPa {–29.5 in. Hg, –750 mmHg} through input port **A**, apply 12 volts DC between terminals ① and ②. Check to ensure air is not sucked in through exhaust port **C** at such time.
  - Next, seal output port **B** tightly, and while applying a pressure of 98.1 kPa {14 lbf/in^2, 1kgf/cm^2} through exhaust port **C**, apply 12 volts DC between terminals ① and ②. Check to ensure there is no air leakage from input port **A** at such time.
- When the 3-way magnetic valve is OFF :
  - Seal output port **B** tightly, apply negative pressure of –99.99 kPa {–29.5 in. Hg, –750 mmHg} through input port **A** and check to ensure air is not sucked in through exhaust port **C**.
  - Next, seal output port **B** tightly, apply pressure of 1 kPa {14 lbf/in^2, 1kgf/cm^2} through exhaust port **C** and check to ensure there is no air leakage from input port **A**.

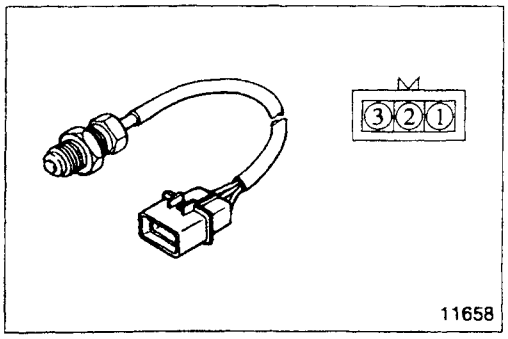
The values in ( ) are reference values.

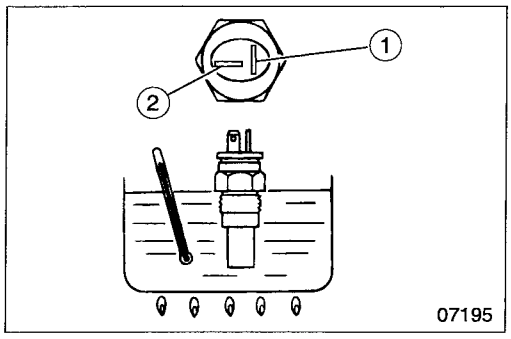
◆ Service procedures



5 Inspection of engine revolution sensor

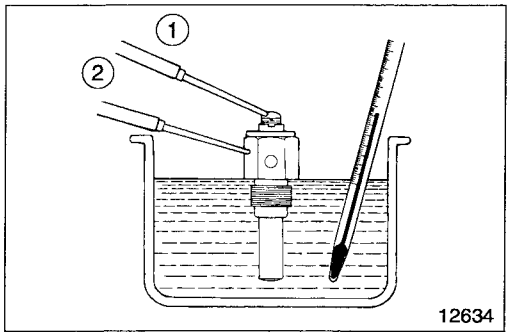
- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace engine revolution sensor **5**. Gr 13

https://truckmanualshub.com/



8 Inspection of water temperature sensor

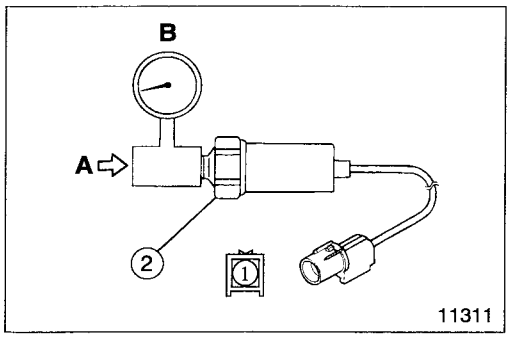
- Place water temperature sensor **8** in engine oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the resistance between terminal ① and the body, and terminal ② and the body.
  Terminal ① : Water temperature gauge connection
  Terminal ② : Multipurpose timing control unit connection
- If the measured value deviates from the standard value, replace water temperature sensor **8**. Gr 14



9 Inspection of overheating switch

Carry out the following inspection. If any fault is found, replace overheating switch **9**. Gr 14

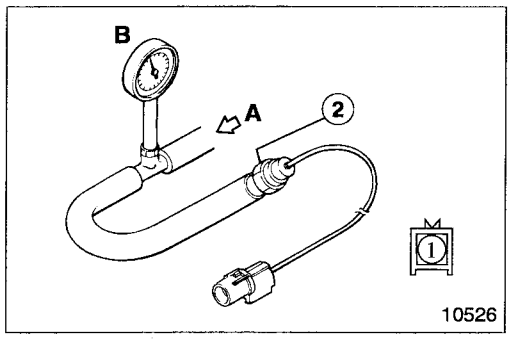
- Make sure that there is no continuity between terminals ① and ② (Body) at room temperature (20°C {68°F}).
- Place overheating switch **9** in a container filled with engine oil and raise the oil temperature while stirring the oil.
  Measure the temperature when there is continuity between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.
- Lower the oil temperature and measure the temperature when continuity is lost between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.



11 Inspection of engine oil pressure switch

Carry out the following inspection. If any fault is found, replace engine oil pressure switch **11**. Gr 12

- Make sure that there is continuity between terminals ① and ② (Body) when air pressure **A** is not applied to engine oil pressure switch **11**.
- Apply air pressure **A** to engine oil pressure switch **11** gradually starting from 0 kpa {0 lbf/in², 0 kgf/cm²}.
  Measure the air pressure when continuity is lost between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.
  B : Air pressure gauge



12 Inspection of engine oil bypass alarm switch

Carry out the following inspection. If any fault is found, replace engine oil bypass alarm switch **12**. Gr 12

- Make sure that there is no continuity between terminals ① and ② (Body) when air pressure **A** is not applied to engine oil bypass alarm switch **12**.
- Apply air pressure **A** to engine oil bypass alarm switch **12** gradually starting from 0 kpa {0 lbf/in², 0 kgf/cm²}.
  Measure the air pressure when continuity is present between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.
  B : Air pressure gauge

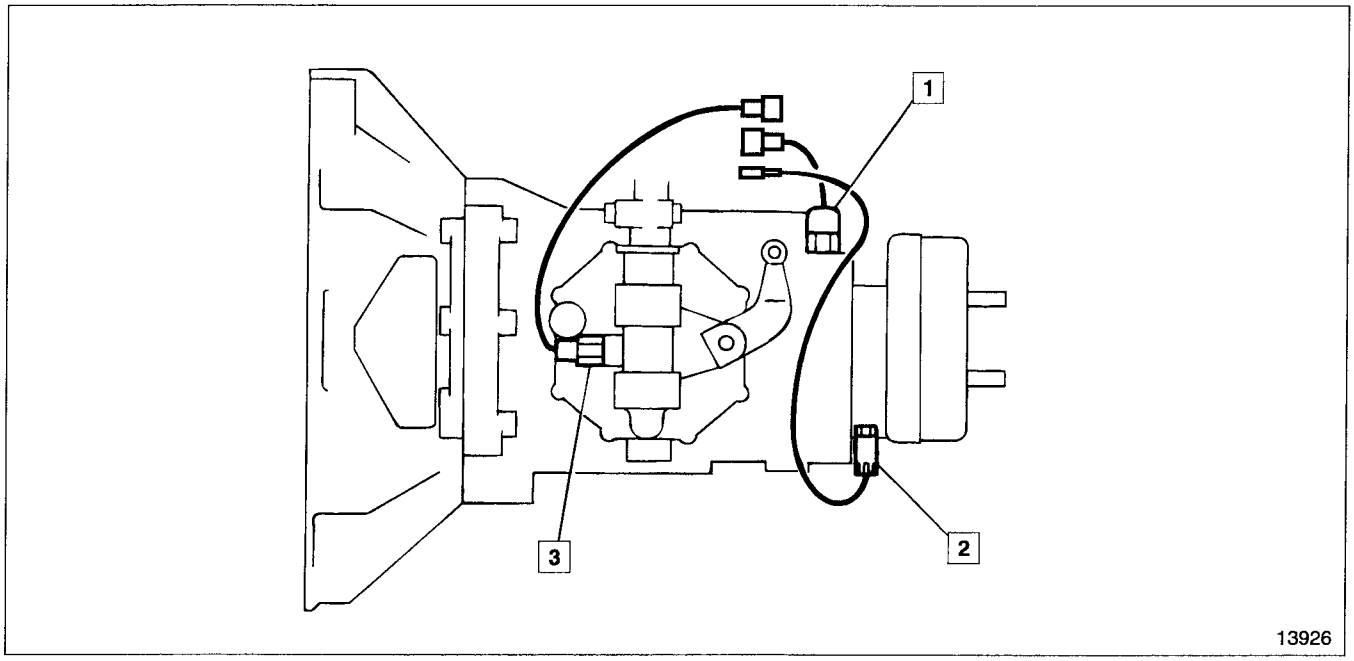
MEMO

https://truckmanualshub.com/

Installation Position



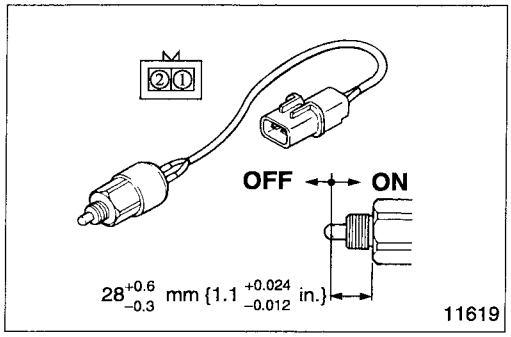
1 Backup lamp switch
2 Vehicle speed sensor
3 Transmission neutral switch

Service standards

Location	Maintenance item			Standard value	Limit	Remedy
2	Pulse output voltage of vehicle speed sensor (8 pulses) 	①–②	Low pulse	1.5 V or less	—	Replace
			High pulse	12 V–(0.5 V or less)	—	

https://truckmanualshub.com/

◆ Service procedure



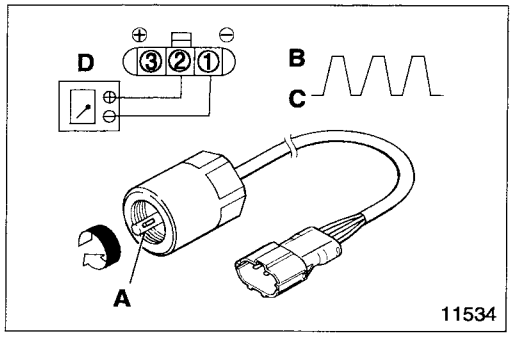
1 Inspection of Backup lamp switch

- Follow the table below to inspect continuity

	①	②
OFF		
ON	○—○	

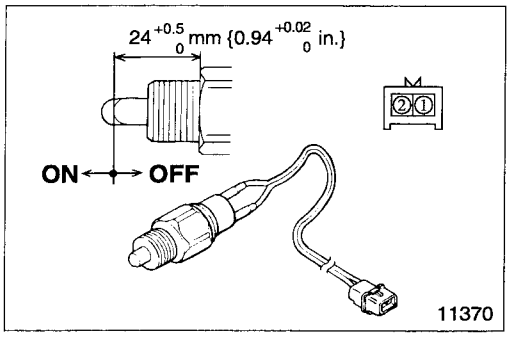
○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace backup lamp switch **1**. Gr 22



2 Inspection of vehicle speed sensor

- Apply 12 volts DC between terminals ① and ③, and rotate shaft **A** of vehicle speed sensor **2** slowly.
- At this state, measure the maximum voltage (High pulse voltage **B**) and the minimum voltage (Low pulse voltage **C**) generated between terminals ① and ②.
  D : Tester
- If the measured value deviates from the standard value, replace vehicle speed sensor **2.** Gr 22



3 Inspection of transmission neutral switch

- Follow the table below to inspect continuity

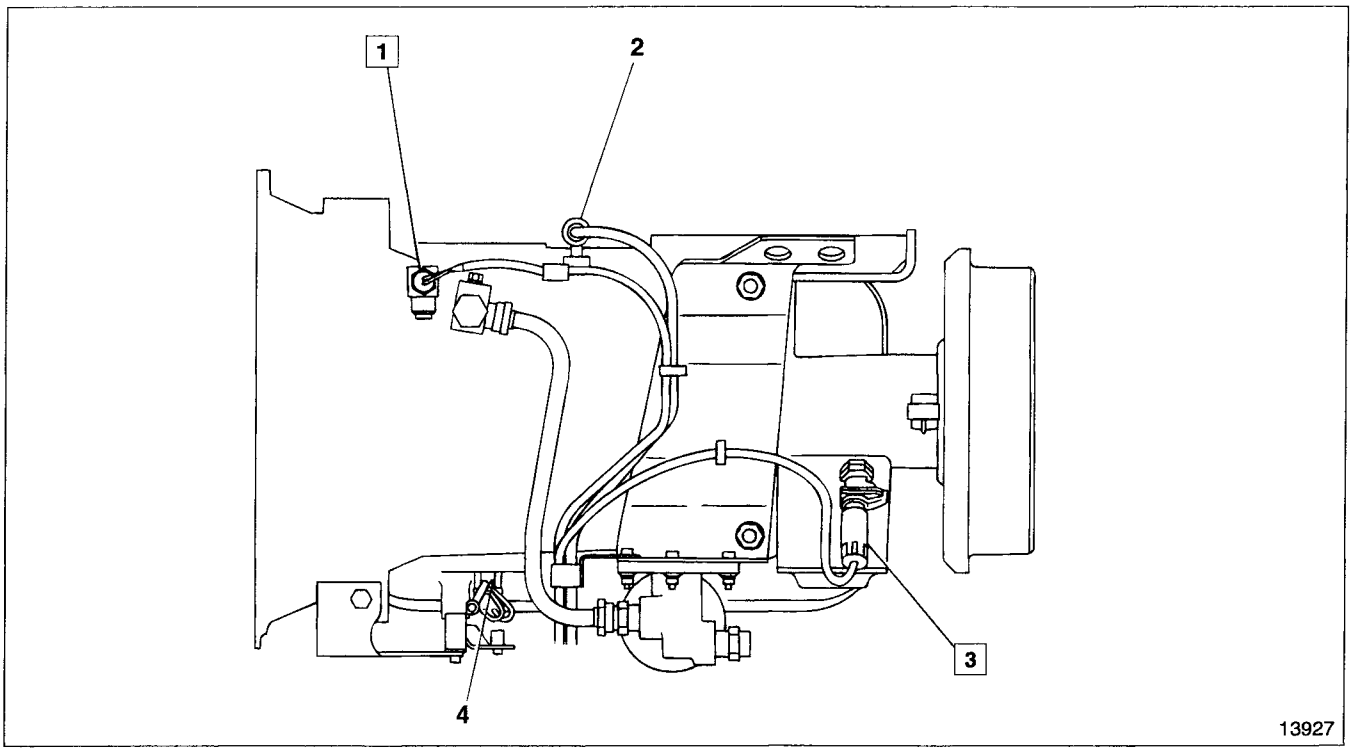
	①	②
OFF		
ON	○—○	

○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace transmission neutral switch **3**. Gr 22

https://truckmanualshub.com/

Installation Position



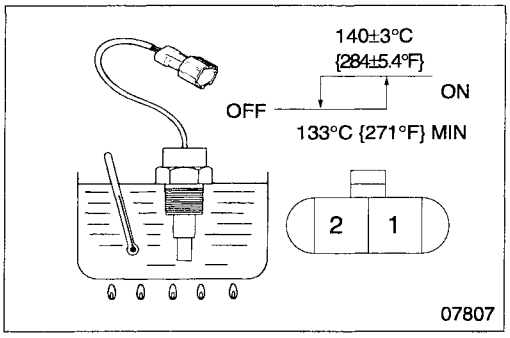
1 Automatic transmission fluid temperature switch
2 Backup lamp switch Gr 23
3 Vehicle speed sensor
4 Automatic transmission neutral switch Gr 23

Service standards

Location	Maintenance item			Standard value	Limit	Remedy
1	Operating temperature of automatic transmission fluid temperature switch	When increases (OFF→ON)		140±3°C {284±5.4°F}	—	Replace
		When decreases (ON→OFF)		133°C {271°F} MIN		
3	Output voltage of vehicle speed sensor 	①–②	Low pulse	1.5 V or less	—	Replace
			High pulse	12 V–(0.5 V or less)	—	

https://truckmanualshub.com/

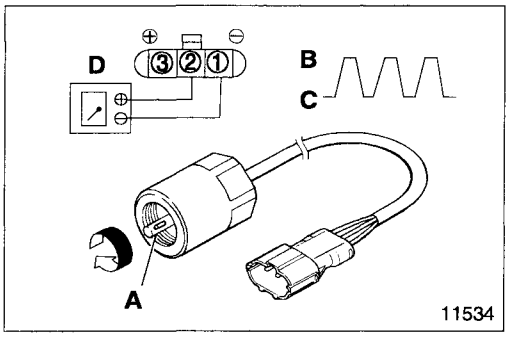
◆ Service procedure



1 **Inspection of automatic transmission fluid temperature switch**

Carry out the following inspection. If any fault is found, replace automatic transmission fluid temperature switch **1**. Gr 23

- Make sure that there is no continuity between terminals ① and ② at room temperature (20±5°C {68±9°F}).
- Place automatic transmission fluid temperature switch **1** in a container filled with engine oil and raise the oil temperature while stirring the oil. Measure the temperature when there is continuity between terminals ① and ②, and make sure that the measured value conforms to the standard value.
- Lower the oil temperature and measure the temperature when continuity is lost between terminals ① and ②, and make sure that the measured value conforms to the standard value.



3 **Inspection of vehicle speed sensor**

- Apply 12 volts DC between terminals ① and ③, and rotate shaft **A** of vehicle speed sensor **3** slowly.
- At this state, measure the maximum voltage (High pulse voltage **B**) and the minimum voltage (Low pulse voltage **C**) generated between terminals ① and ②.
  D : Tester
- If the measured value deviates from the standard value, replace vehicle speed sensor **3**. Gr 23

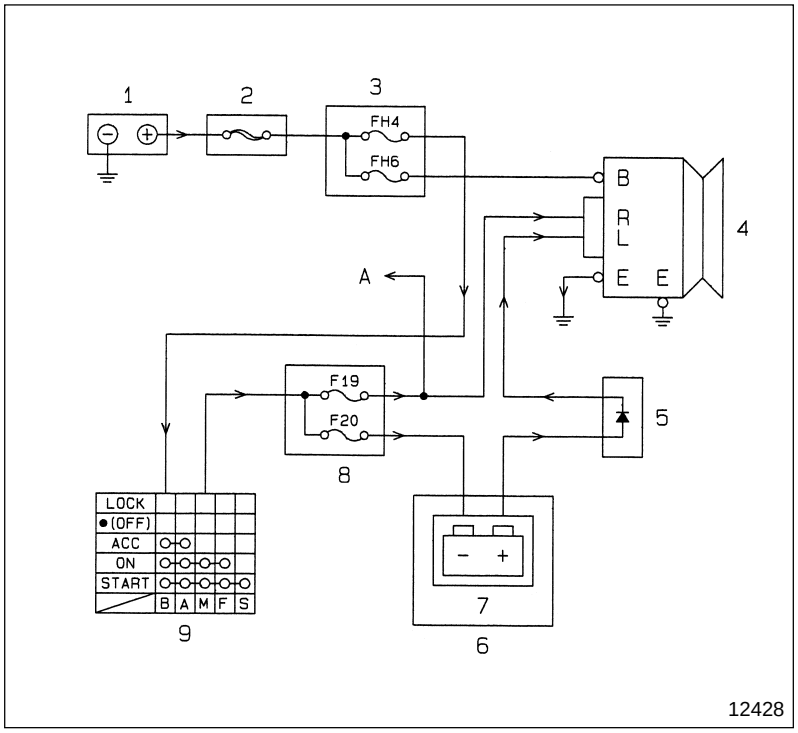
3 High-current fuse box
4 Alternator
5 Diode
6 Meter cluster
7 Charge warning lamp
8 Fuse box
9 Starter switch

A : To each unit
B : Terminal B
E : Terminal E
L : Terminal L
R : Terminal R



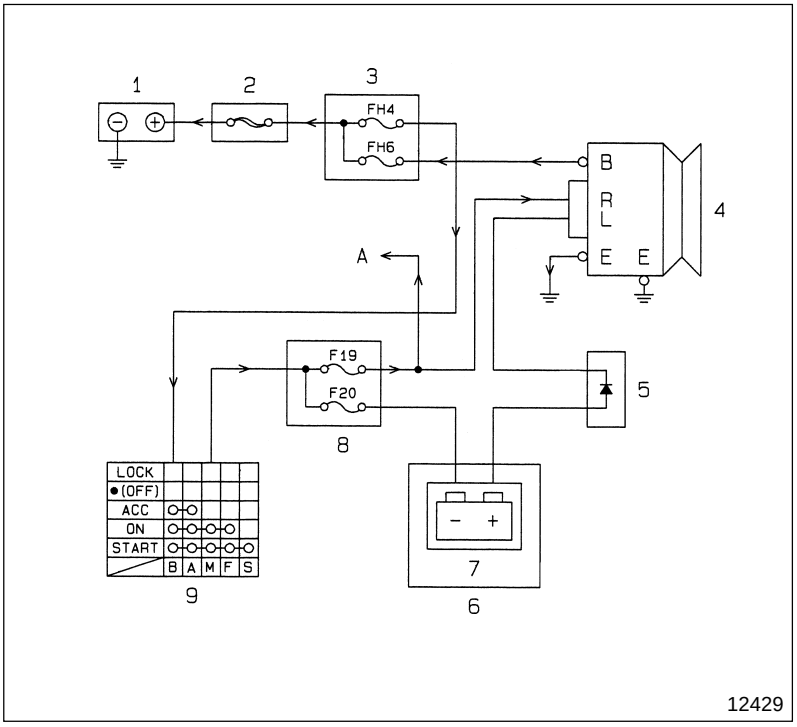
At engine standstill (before starting)

Position of starter switch **9** : ON

- 1→2→3→9
  ⟶8 (F19)→4 (R→E)→Ground
  └→8 (F20)→7→5→4 (L→E)→Ground

- Charge warning lamp [−+] **7** lights up.
  To improve the low-speed power generation build-up performance of alternator **4**, current is fed to terminal **R** immediately after the engine is started.

https://truckmanualshub.com/



After engine start-up

Position of starter switch **9** : ON

- Alternator **4** starts to generate power.
- The voltage at terminal **B** of alternator **4** rises higher than the voltage of battery **1**.
- As alternator **4** starts to charge battery **1**, units **A** are supplied with power.
  4(B)→1→Ground
  →2→3→9→8(F19)→A
- Since there is no electric potential difference between the output voltage of terminal **L** of alternator **4** and the voltage of battery **1**, charge warning lamp **7** goes off.

https://truckmanualshub.com/

TROUBLESHOOTING

Possible causes \ Symptoms		Battery electrolyte decreases too early	Battery overheating	Battery is normal but overdischarged	Charge warning lamp [-+] does not light when turning starter switch ON, with engine stopped	Alternator is normal but battery overdischarged	Remarks

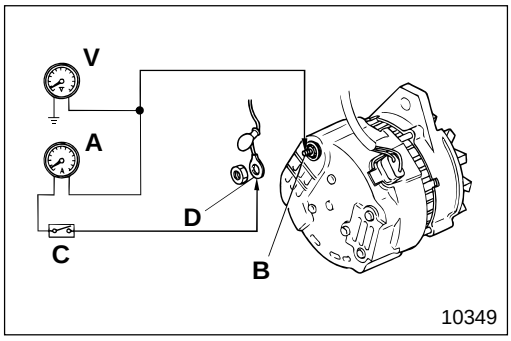
100 INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection of Alternator



Performance test

- Connect the meters to the alternator as illustrated.
  A : Ammeter (100 amperes class)
  B : Terminal B on alternator
  C : Switch
  D : Terminal
  V : Voltmeter

WARNING

- **Terminal D is always loaded with voltage from the battery.**
- **You must handle terminal D carefully, it will short-circuit if it touches any part other than terminal B on the alternator.**

- Turn switch **C** ON to supply battery voltage to terminal **B** on the alternator.
- Start the engine.
- Turn the switches ON of all the lamps on the vehicle immediately.
- Measure the current when the engine speed reaches approximately 2260 rpm.
- The alternator is assumed to be normal if the measured value is higher than 70% of the specified output.

Specified output of alternator

Alternator model	Voltage	Output
A4TU0088	12 V	80 A

NOTE

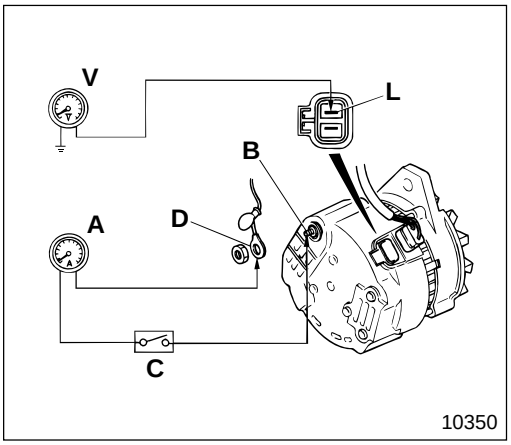
Since the above inspection is only a simplified check, it is necessary to conduct a stringent test bench for an official check.
P54-1-17

https://truckmanualshub.com/

Inspection of Regulator

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Adjustment voltage of regulator	14.7±0.3 V	—	Replace



- Connect the meters to the alternator as illustrated.
  A : Ammeter (100 amperes class)
  B : Terminal B on alternator
  C : Switch
  D : Terminal
  L : Terminal L on alternator
  V : Voltmeter

WARNING⚠

- **Terminal D is always loaded with voltage from the battery.**
- **You must handle terminal D carefully, it will short-circuit if it touches any part other than terminal B on the alternator.**

- Turn switch **C** ON and make sure that voltmeter **V** indicates 0 volt.
- If the needle of voltmeter **V** oscillates, something is wrong with the alternator or the wiring.
- Turn switch **C** OFF and start the engine.

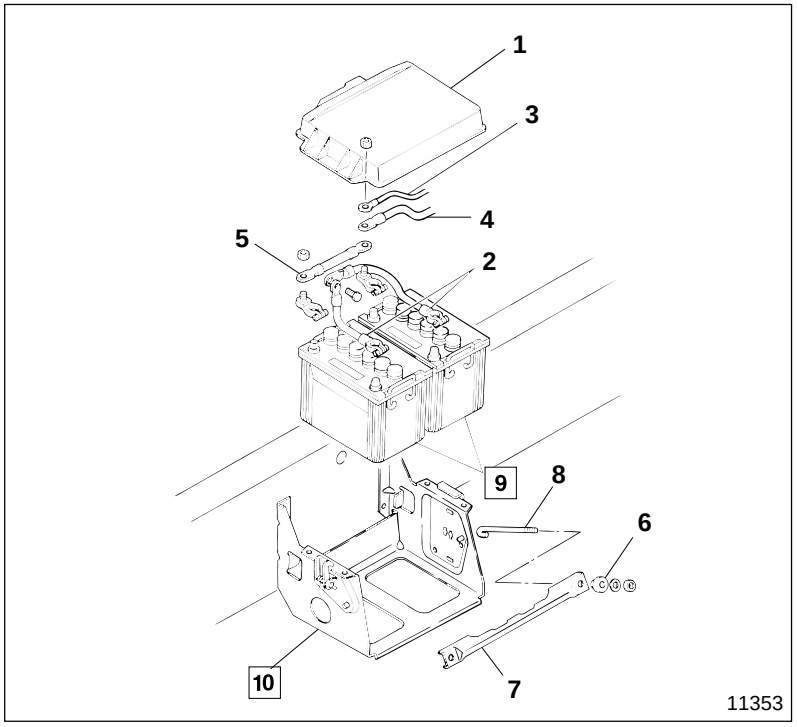
CAUTION⚠

Do not start the engine with switch C turned ON because the starter current will flow into ammeter A and damage it.

- If the charge current is five amperes or less and the engine speed is approximately 2260 rpm, measure the adjustment voltage.
- If the charge voltage is five amperes or more, do one of the following :
  - Run the engine for a while to charge the battery.
  - Replace the old battery with a fully-charged one.
  - Connect a $^1/_4$ Ω (25 W) resistor in series with the battery to limit the charge current.
- If the measured value deviates from the standard value, change the regulators.

https://truckmanualshub.com/

101 BATTERY



● **Removal sequence**

1 Battery cover
2 Battery cable ⊖
3 Harness (Main high-current fuse)
4 Starter cable
5 Battery cable ⊕
6 Rubber
7 Angle frame
8 Set bolt
9 Battery
10 Battery box

● **Installation sequence**

Follow the removal sequence in reverse.

DANGER⚠

- **Since flammable hydrogen gas is generated by battery 9, be sure to obey the following warnings :**
  - **Do not short-circuit the ⊕ and ⊖ terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over battery 9.**
- **Because the battery electrolyte is diluted sulfuric acid and is corrosive, when handling battery 9 wear safety glasses and rubber gloves to protect the eyes and hands.**

WARNING⚠

To prevent a short-circuit be sure that disconnected battery cables 2 and 5 do not accidentally touch the battery terminals.

CAUTION⚠

- **Make sure that you disconnect battery cable ⊖ 2 first when you disconnect battery cables 2 and 5.**
- **Make sure that all electrical switches of the vehicle are OFF before connecting battery cables 2 and 5.**
- **Make sure that you connect battery cable ⊕ 5 before you connect battery cable ⊖ 2.**

Service standards

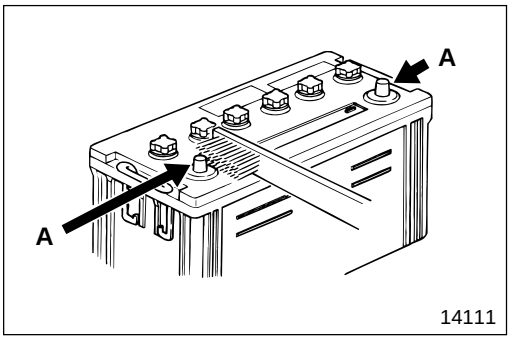
Location	Maintenance item	Standard value	Limit	Remedy
9	Specific gravity of battery electrolyte (20°C {68°F})	1.280	1.220	Charge or replace

https://truckmanualshub.com/

◆ Service procedure

9 Inspection of battery

(1) Visual inspection

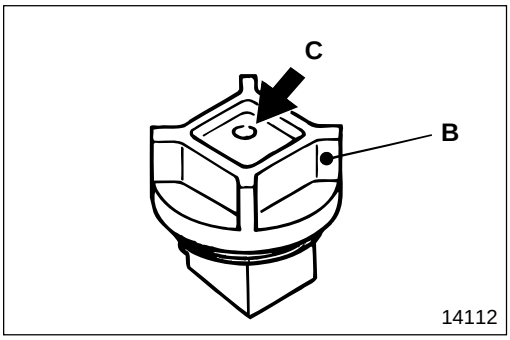


14111

- If terminal **A** is corroded, scrub off the corrosion from it using a wire brush.
- If cracks or defects are found on battery **9**, replace it since the cracks or defects can cause liquid spills.

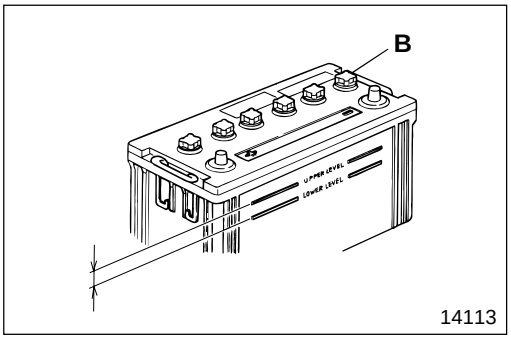
CAUTION

Make sure you grease the ⊕ side of terminal A because it is easily corroded.



14112

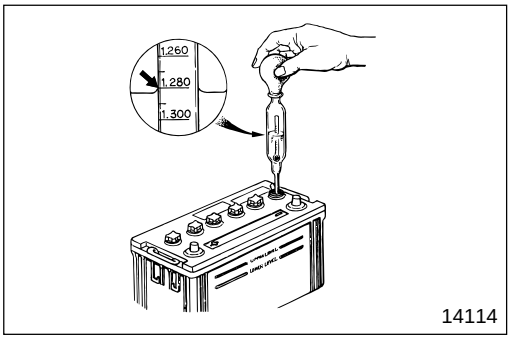
- If bleed hole **C** of vent plug **B** is clogged, clean the hole.



14113

(2) Inspection of fluid level

- Make sure that the battery electrolyte level is between UPPER and LOWER.
- If the level is below LOWER, remove vent plug **B** and fill the battery with distilled water or battery replenisher to UPPER.



14114

(3) Measurement of specific gravity

Measure the specific gravity of the battery electrolyte. If the measured value is lower than the limit, charge the battery.

NOTE

The specific gravity of the battery electrolyte depends on the liquid temperature. Use the following formula to convert the actual value to the value were the temperature 20°C {68°F}.

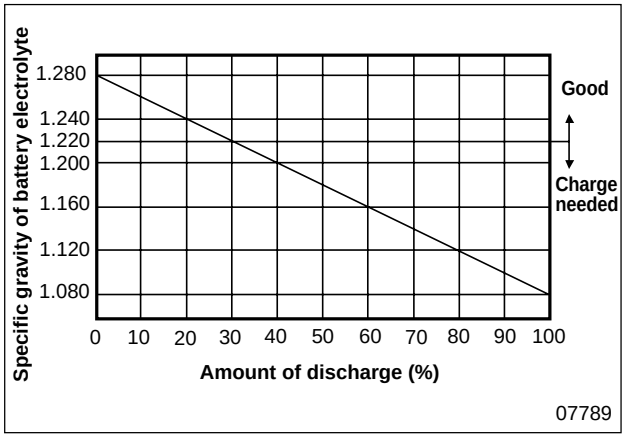
$$S_{20}\{68\} = S_t + 0.0007\,(t - 20\{68\})$$

S_{20}{68} : Specific gravity were the temperature 20°C {68°F}

S_t : Specific gravity actually measured with the temperature at t°C {t°F}

t : Temperature of battery electrolyte

https://truckmanualshub.com/



(4) Charging

- Although, as a rule, charging of battery **9** should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect battery cable ⊖ **2**.
- Remove vent plug **B** before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity / 10	*Amount of discharge (Ah) / Charge current (A) ×1.2(to 1.5)	45 {113}
Quick charge	Value of 5-hour rating capacity / 1.5	0.5	55 {131}

* Amount of discharge (Ah)=5-hour rating capacity (Ah)× Amount of discharge (%) / 100

- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep naked lights away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because its dangerous.**
- **After charging the battery, tighten vent plug B, wash away sulfuric acid from the battery using water, and dry the surface.**

10 Inspection of battery box

- If battery box **10** is corroded, scrub off the corrosion from it using a wire brush and apply acid resistant coating.
- If battery box **10** is corroded excessively or if it is broken or cracked, replace it.

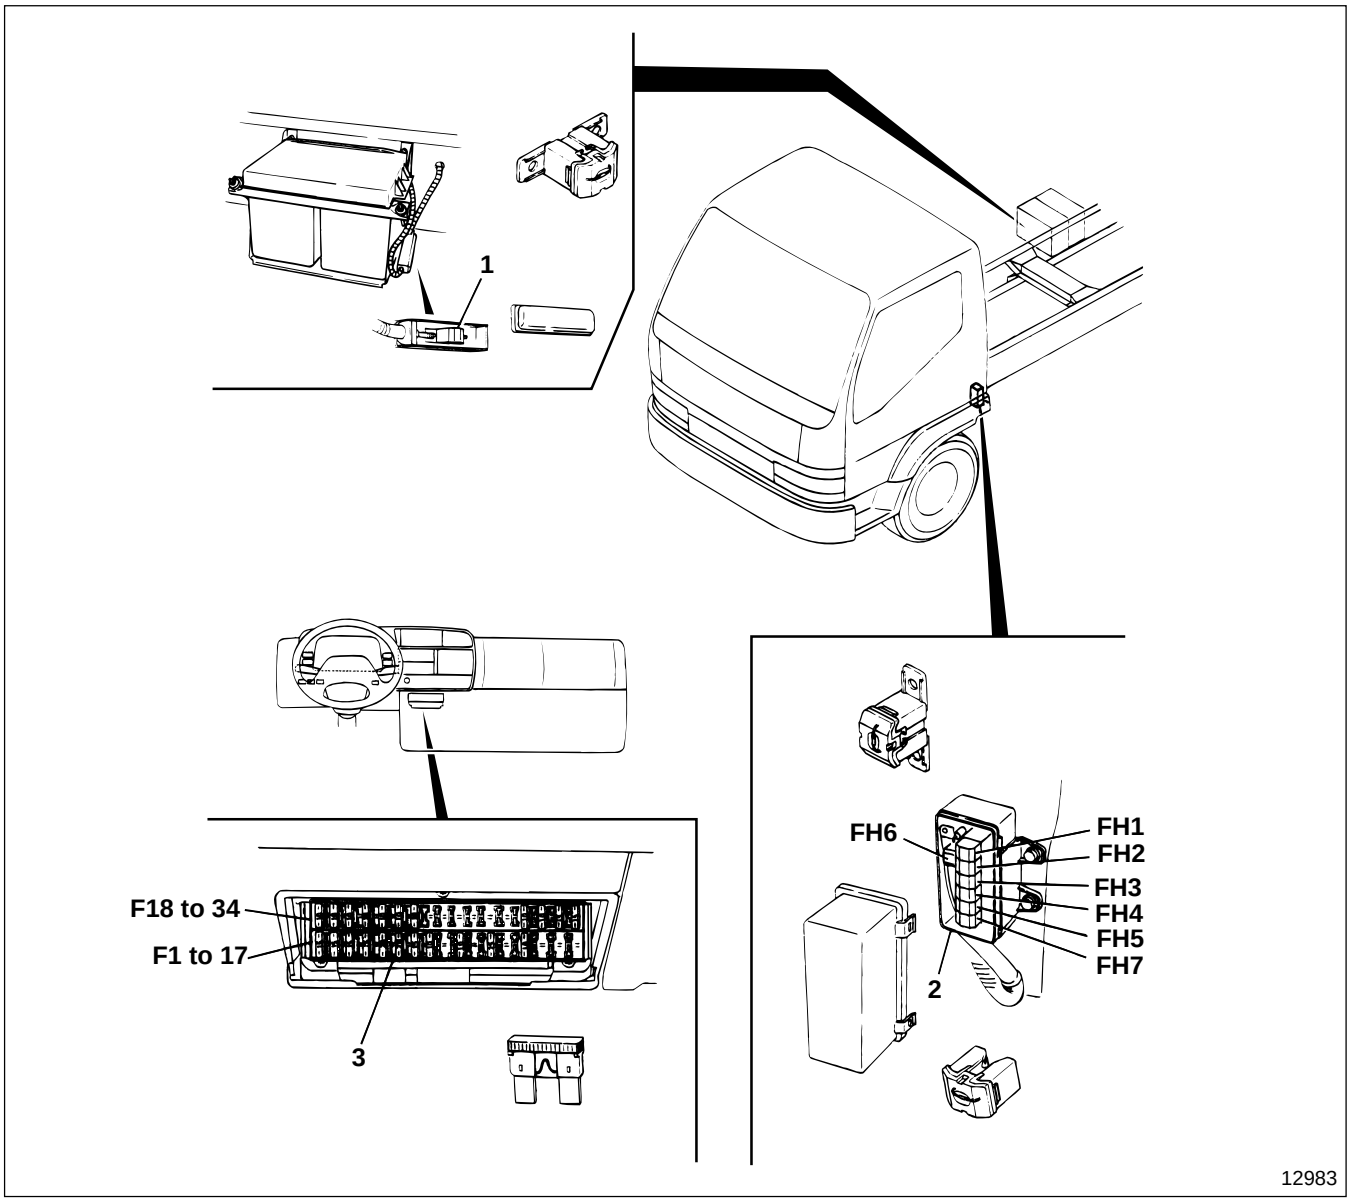
https://truckmanualshub.com/

M E M O

https://truckmanualshub.com/

104 FUSE

Installation Location



1 Main high-current fuse
2 High-current fuse box
3 Fuse box

CAUTION

- **If a fuse blows, make sure you identify and remedy the cause, then replace the fuse.**
- **Make sure that you replace the fuse with one having the same rating.**
- **Make sure that you remove the ⊖ terminal of the battery cable before removing main high-current fuse 1 and high-current fuses FH1 to 7.** 101

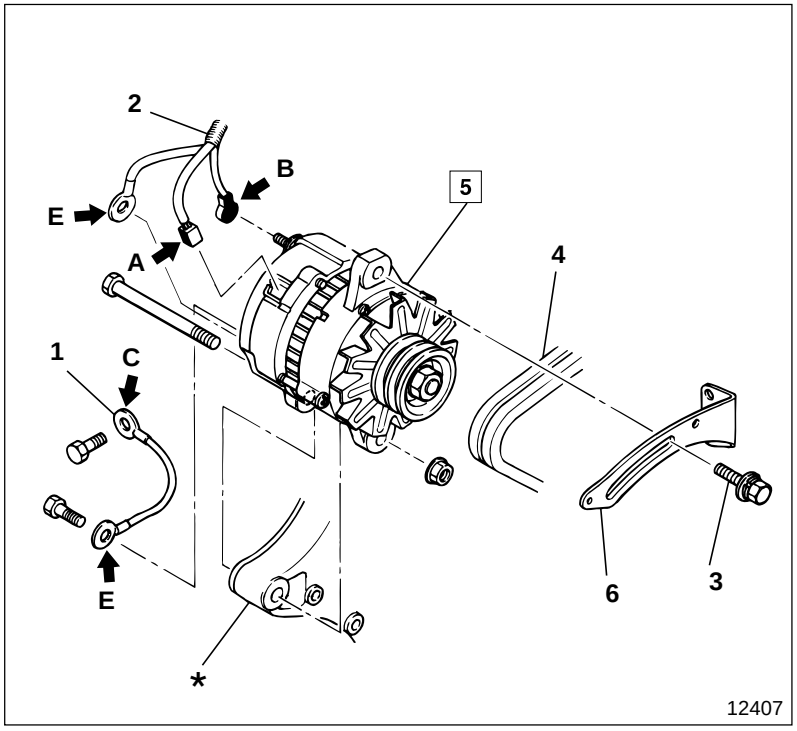
106 ALTERNATOR



● **Removal sequence**

1 Ground cable
2 Chassis harness
3 Adjusting bolt
4 V-belts
5 Alternator 📖 P54-1-18
6 Adjusting plate

***** : Timing gear case and front plate 📦 Gr 11
A : To terminals L and R
B : To terminal B
C : Connected to crankcase
E : To terminal E

WARNING ⚠

- **Terminal B is always loaded with voltage from the battery, supplied via chassis harness 2. Therefore when you remove the harness from terminal B, make sure that tools do not touch any adjacent parts because this would cause a short-circuit.**
- **Make sure that you disconnect terminal ë of the battery before removing the harness and insulate the terminal with tape.**

● **Installation sequence**

Follow the removal sequence in reverse.

● **Adjustment after installation**

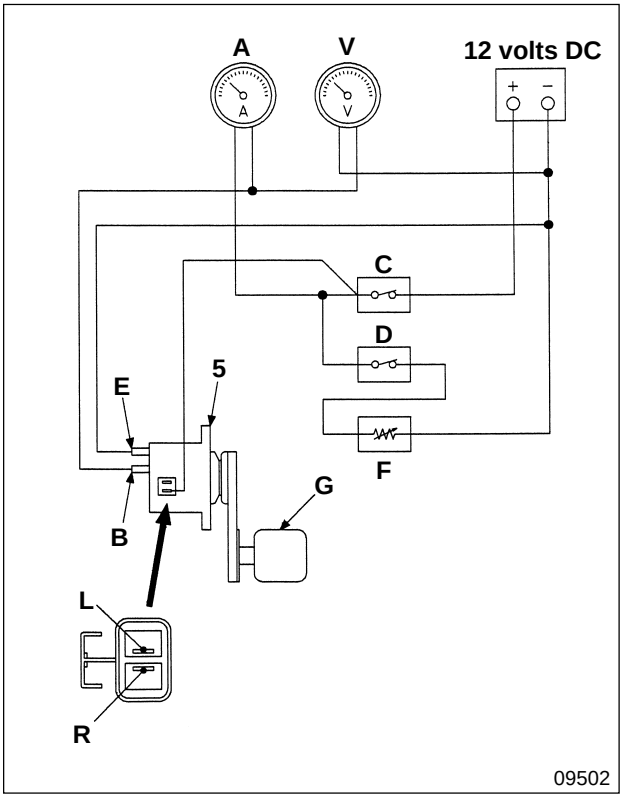
Adjustment of V-belt **4** tension 📦 Gr 14

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
5	Output current (***** When engine is hot and 13.5 V is loaded)	At 1500 rpm	38 A or more	—	Inspect
		At 2500 rpm	65 A or more	—	
		At 5000 rpm	76 A or more	—	
	Adjustment voltage of regulator (At 5000 rpm, 5 A is loaded)		14.7±0.3 V	—	Replace

***** : The value of the ambient temperature is measured after running the engine at maximum power (5000 rpm) for 30 minutes.

https://truckmanualshub.com/



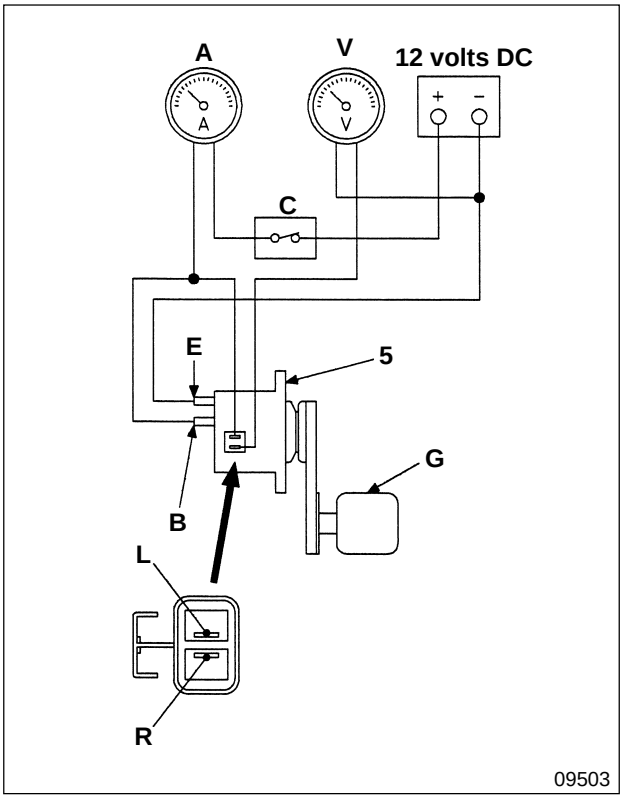
5 Inspection of alternator

(1) Inspection of alternator performance (bench test)

- Connect each unit to the alternators as illustrated.
  A : Ammeter
  B : Terminal B on alternator
  C : Switch
  D : Switch
  E : Terminal E on alternator
  F : Load resistance (variable resistance)
  G : Alternator drive motor
  L : Terminal L on alternator
  R : Terminal R on alternator
  V : Voltmeter
- Turn switches **C**, **D** OFF.
- Run alternator **5** at 5000 rpm.
- Adjust load resistance **F** to maintain the specified current.

  Specified output of the alternator : 12 V-80 A

- After adjustment, run alternator **5** for 30 minutes.
- Maximize load resistance **F** (current hardly flows).
- Turn switches **C**, **D** ON.
- Increase the rotation of alternator **5** gradually and measure current at specified rpm.
- If the measured value deviates from the standard value, disassemble and inspect alternator **5**. P54-1-18



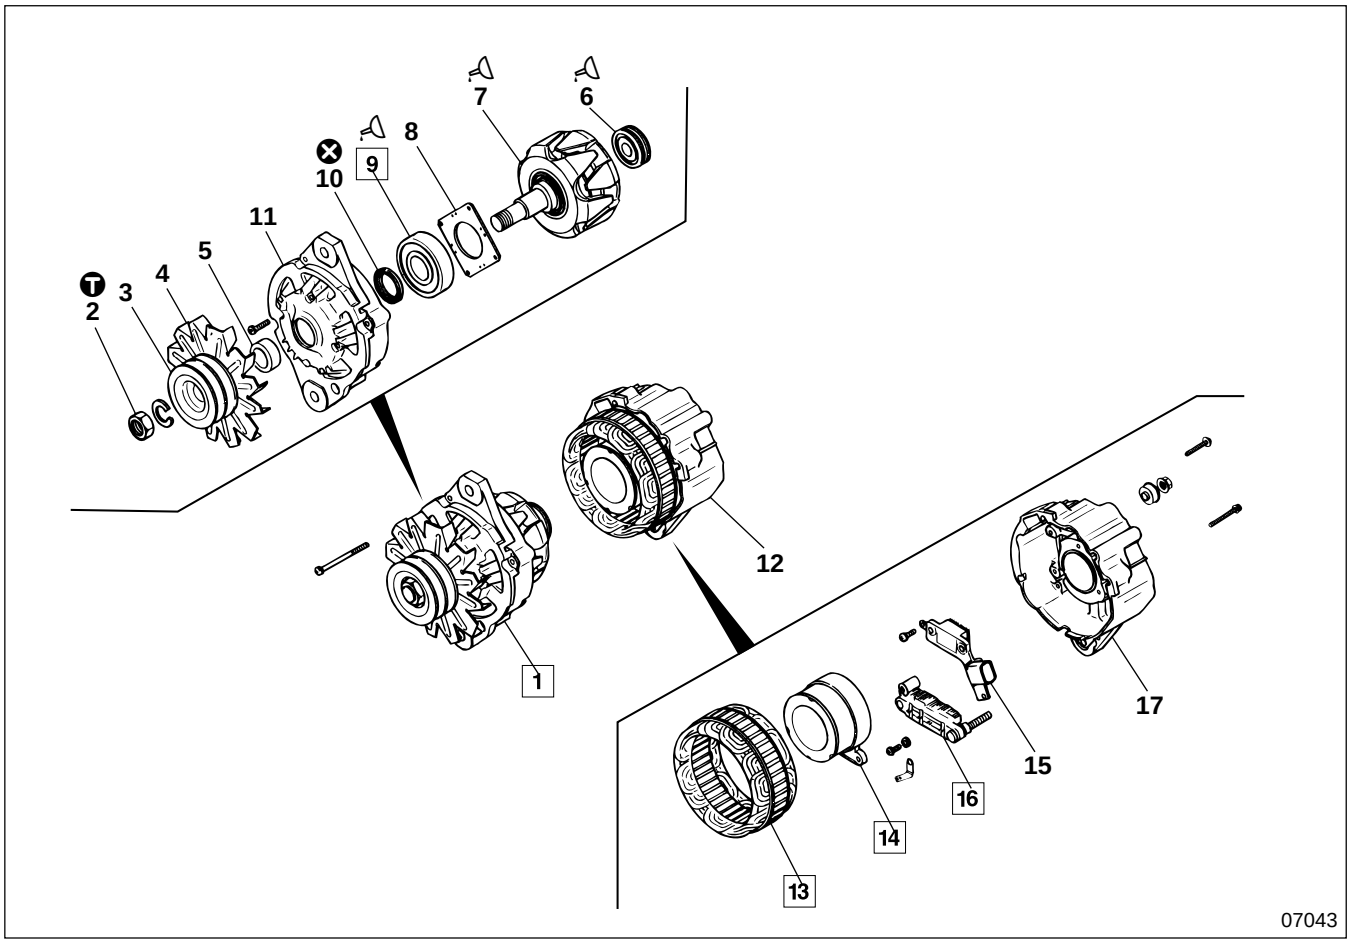
(2) Inspection of regulator (bench test)

- Connect each unit to the alternators as illustrated.
  A : Ammeter
  B : Terminal B on alternator
  C : Switch
  E : Terminal E on alternator
  G : Alternator drive motor
  L : Terminal L on alternator
  R : Terminal R on alternator
  V : Voltmeter
- Turn switch **C** ON.
- Run alternator **5**.
- Make sure that the value of the current at 5000 rpm is five amperes or less.
- Measure voltage (adjustment voltage).
- If the measured value deviates from the standard value, replace the regulator (in alternator **5**).

https://truckmanualshub.com/

106 ALTERNATOR

Alternator



● **Disassembly sequence**

1 Rotor and front bracket assembly
2 Nut

15 Regulator
16 Rectifier
17 Rear bracket

⊗ : Non-reusable parts

NOTE

Do not remove parts 6, 9, 13 unless they are faulty.

● **Assembly sequence**

12 → 1　　12 : 17 → 16 → 15 → 14 → 13

1 : 11 → 10 → 9 → 8 → 7 → 6 → 5 → 4 → 3 → 2

https://truckmanualshub.com/

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
14	Field coil resistance (20°C {68°F})	2.6 to 3.4 Ω	—	Replace

Tightening torque

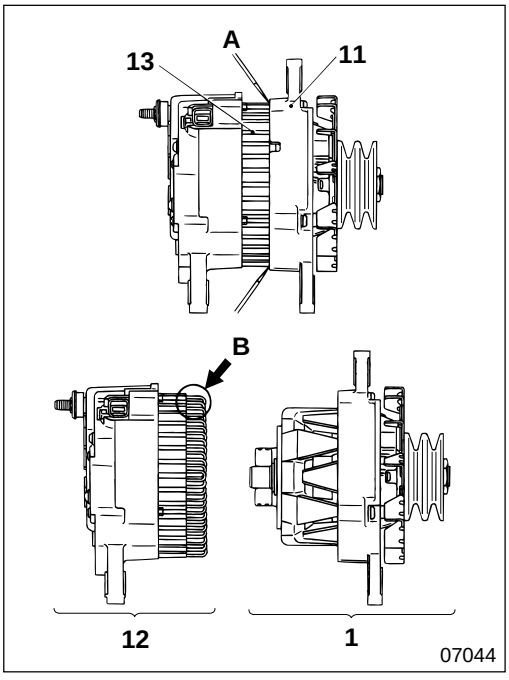
Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Nut (Pulley mounting)	132 to 162 {98 to 120, 13.5 to 16.5}	—

Lubricant

Location	Points of application	Kinds	Quantity
6	Rear bearing inner periphery	Engine oil	As required
7	Front bearing installation part of rotor assembly	Engine oil	As required
9	Front bearing outer periphery	Engine oil	As required

◆ Service procedure



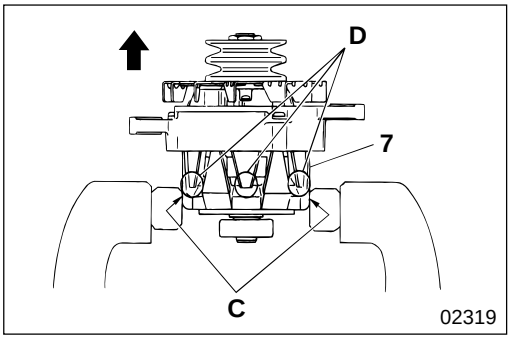
1 Rotor and front bracket assembly

[Removal]

- Insert screwdriver **A** between front bracket **11** and stator assembly **13**.
- Use screwdriver **A** to pry rotor and front bracket assembly **1** away from stator and rear bracket assembly **12**.

CAUTION

Be careful not to insert the screwdriver too deep or it will damage coil B of stator assembly 13 and might cause a short-circuit.

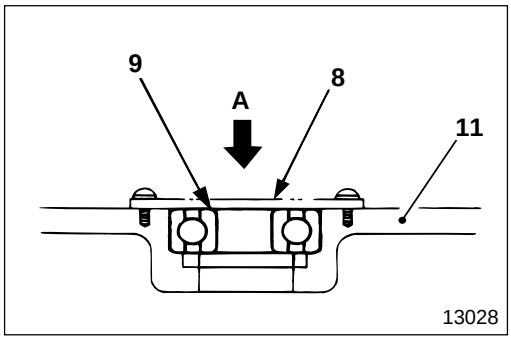


[Disassembly]

CAUTION

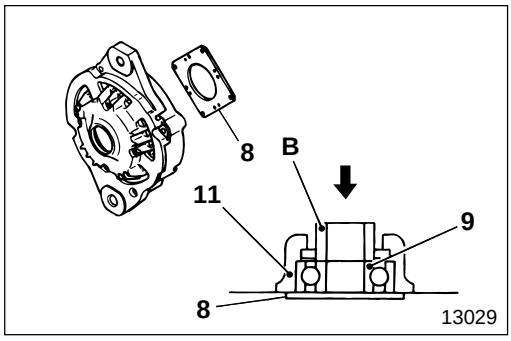
Make sure, when you hold rotor assembly 7 in a vise, to grip root C of the core claws. Gripping claws D can damage them.

https://truckmanualshub.com/

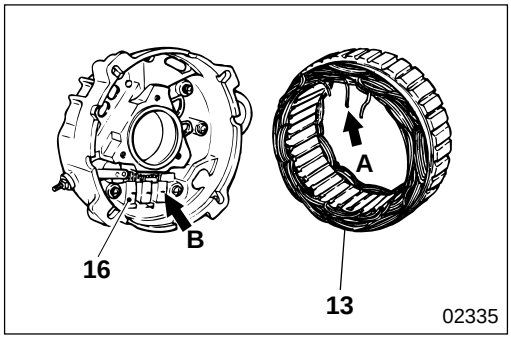


9 **Installation of front bearing**

- Press-fit front bearing **9** until it is flush with the installation part of cover **8**.
  A : Press



- Install cover **8**.
- Press spacer **B** until it makes contact with front bearing **9** and cover **8**, using a press.



13 **Stator assembly**

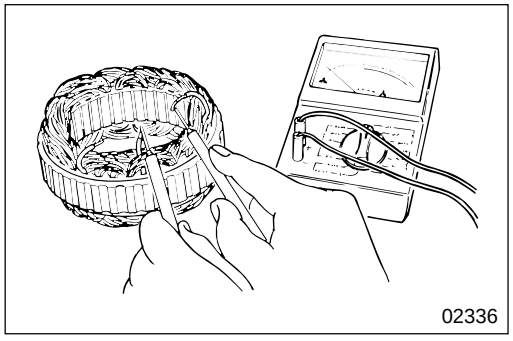
[Removal and installation]

- Disconnect lead **A** of stator assembly **13** from rectifier **16**. The lead is soldered to diode **B** of rectifier **16** at three points.

CAUTION

Make sure that you desolder within five seconds because the diode is heat sensitive.

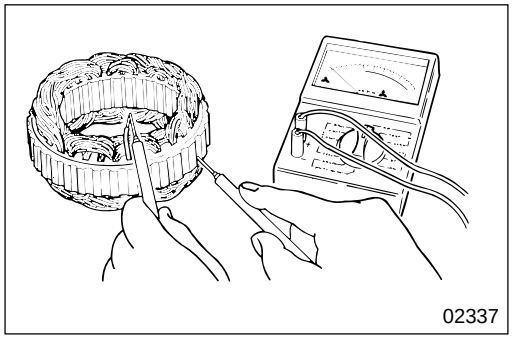
- To install, follow the removal sequence in reverse.



[Inspection]

(1) Continuity of each lead wire

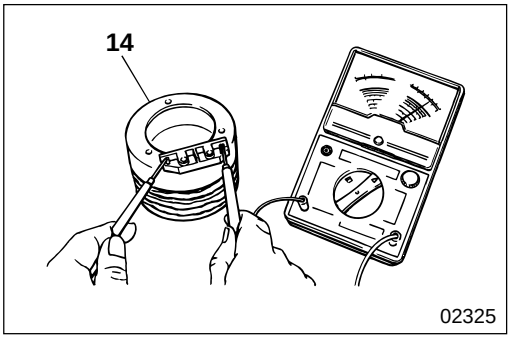
- Make sure that each lead wire has continuity.
- If there is no continuity, the lead wire is broken. Replace stator assembly **13**.



(2) Continuity between lead wires and the core

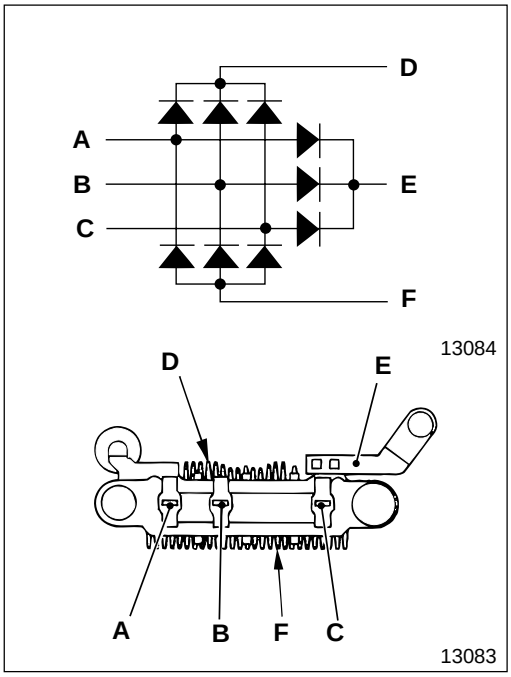
- Make sure that there is no continuity between lead wires and the core.
- If there is continuity, replace stator assembly **13**, since it might be short-circuited.

https://truckmanualshub.com/



14 Inspection of field coil

- Measure the resistance between the terminals of field coil **14**.
- If the measured value deviates from the standard value, replace field coil **14**.



16 Inspection of rectifier

- Inspect whether the diode inside rectifier **16** functions properly, and if any fault is found, replace the rectifier.
  A, B, C : Lead connecting area of stator coil
  D, E : Heat sink area
  F : Regulator connecting area
- Inspect the rectifier twice, before and after the ⊕ side and ⊖ side of the tester have been changed over.

CAUTION ⚠

When inspecting using a tester, the current becomes weaker than the usual current flowing through rectifier 16. Therefore, an incomplete resistance value might be indicated.
Also, this tendency increases as the range of the tester gets smaller. Therefore, use as big a range as possible.

12436

● Engine preheating circuit

This circuit improves the engine starting performance when the engine coolant temperature is low. The preheating system is controlled by multipurpose timing control unit **4**. P54-9-2

Basic preheating operation

Operation mode P54-2-9

When engine coolant temperature is low (Approximately 60°C {140°F} or less)

Position of starter switch **15** : ON

15→1 (F20)→4→Ground
└Ⓔ→5→12→Ground

Multipurpose timing control unit **4** detects the engine coolant temperature.

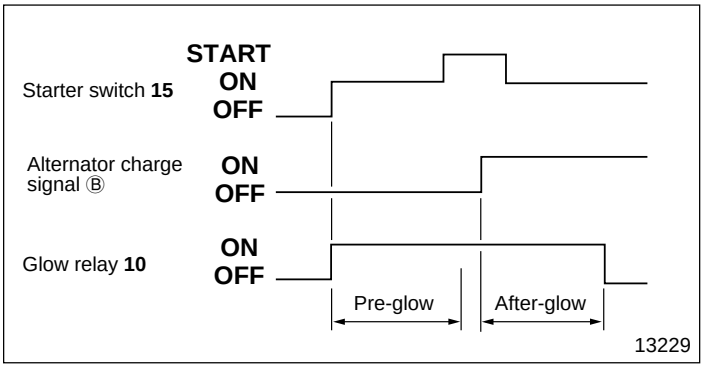
- When the engine coolant temperature is low, multipurpose timing control unit **4** outputs glow relay activation signal Ⓒ.
  4 —Ⓒ→10→Ground

- Glow relay **10** operates to feed power to glow plug **11** and lights up engine preheating indicator lamp **9**.
  10 (contact point)→11→Ground
  15→1 (F20)→9—Ⓓ→4→Ground

When engine coolant temperature is high (Approximately 60°C {140°F} or more)

- Position of starter switch **15** : ON
  15→1 (F20)→4→Ground
  └Ⓔ→5→12→Ground

  Multipurpose timing control unit **4** detects the engine coolant temperature.
- When the engine coolant temperature is high, multipurpose timing control unit **4** does not output glow relay activation signal Ⓒ, so no preheating is performed.

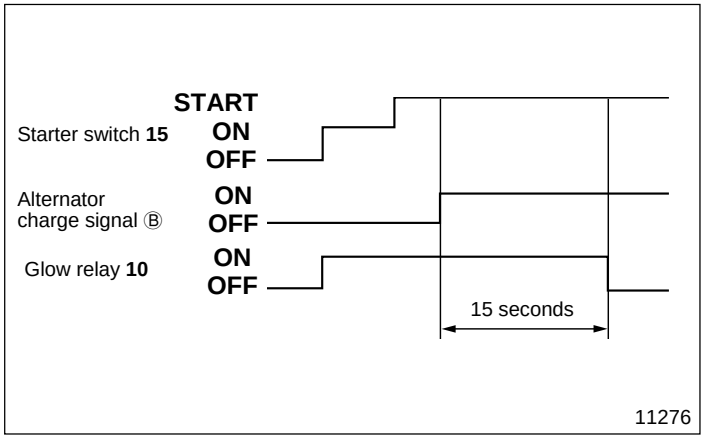


13229

Pre-glow and after-glow

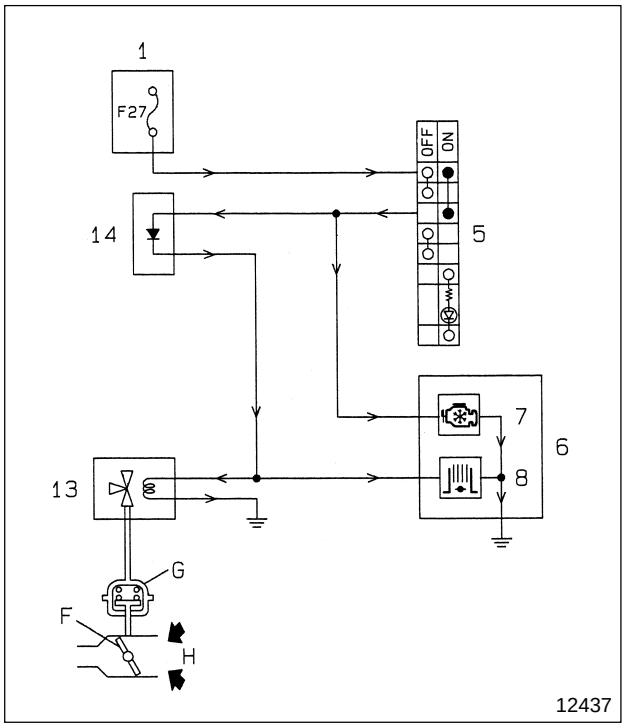
- There are two types of preheating: one is pre-glow, performed before starting the engine; the other is after-glow, performed after starting the engine. They are both controlled by start signal Ⓐ and alternator charge signal Ⓑ.

https://truckmanualshub.com/



Fail-safe

- If the contacts of the glow relay driving relay in multipurpose timing control unit **4** are welded, engine preheating indicator lamp **9** blinks to alert the driver of the fault.
- When all of the following conditions are satisfied, the fail-safe function turns off glow relay **10**.
  - Coolant temperature is 60°C {140°F} or less.
  - Engine start signal Ⓐ is ON.
  - Alternator charge signal Ⓑ is ON for 15 seconds.



● **Cold start circuit**

This circuit helps the engine preheating performance when the ambient temperature is low.

Position of cold start switch **5** : ON

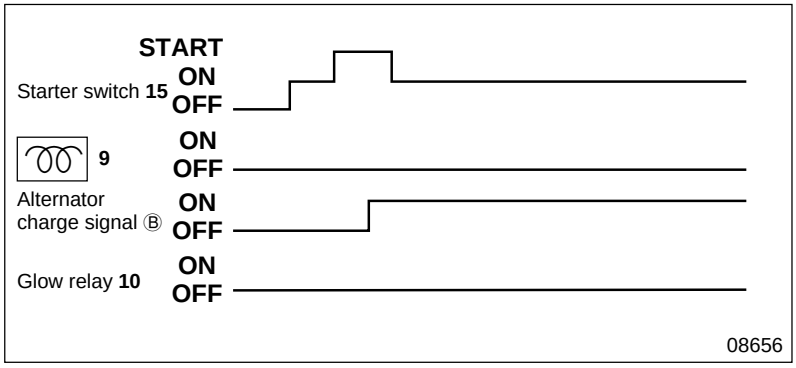
1→5→7
5→14→8→Ground
5→13→Ground

This circuit forces exhaust brake 3-way magnetic valve **13** to operate, closing exhaust brake butterfly valve **F**.

This decreases incoming cool air **H** from the engine exhaust system and reduces preheating time.

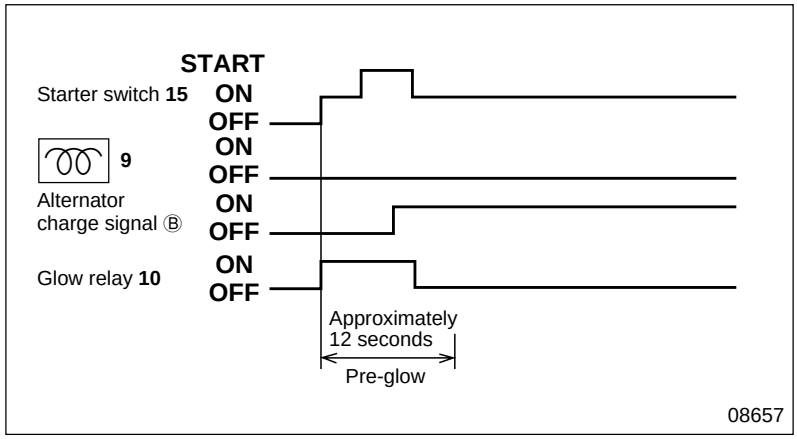
F : Exhaust brake butterfly valve
G : Exhaust brake unit
H : Cool air from engine exhaust system

https://truckmanualshub.com/

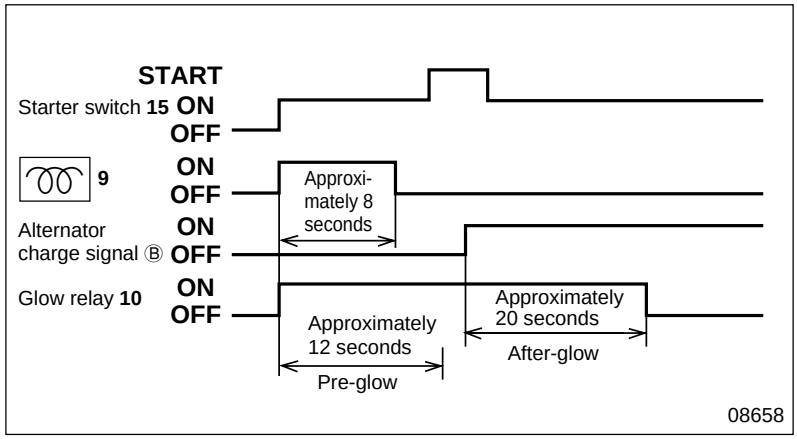


Operation mode

- Where the engine coolant temperature is 60°C {140°F} or more.

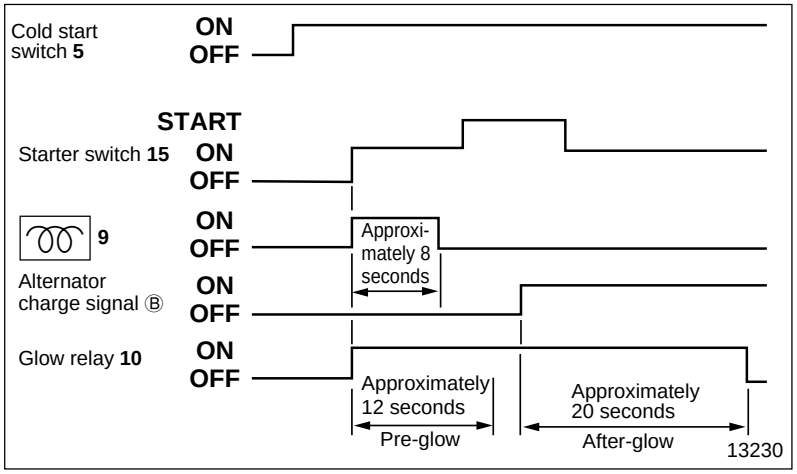


- Where the engine coolant temperature is 0 to 60°C {32 to 140°F}.



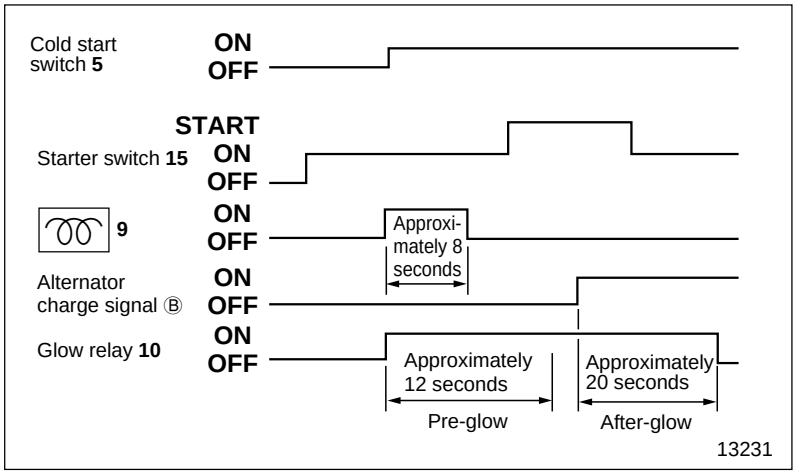
- Where the engine coolant temperature is 0°C {32°F} or less.

https://truckmanualshub.com/



Operation mode when cold start switch is used

- When starter switch **15** is turned ON after cold start switch **5** is turned ON.



- When cold start switch **5** is turned ON after starter switch **15** is turned ON.
  (Where the engine coolant temperature is 0°C {32°F} or more.)

Possible causes \ Symptoms		Engine does not start although sub-starter switch is turned ON	Cold start function does not work	Remarks
Connector connection faulty, harness broken, grounding faulty		○	○	
Fuse blown		○	○	
Battery charge insufficient		○	○	
Starter	Magnetic switch contact point stuck or melted	○		
	Magnetic switch coil broken	○		
	Overrunning clutch malfunctioned			
	Pinion worn or damaged			
Starter relay faulty		○		
Starter switch faulty		○		
Flywheel ring gear worn or damaged				Gr 11
Fuel-cut relay faulty				
Fuel-cut motor faulty				
Engine stop cable broken or damaged				Gr 13
Engine stop cable adjusted incorrectly				Gr 13
Glow plug faulty				
Glow relay faulty				
Water temperature sensor faulty			○	
Multipurpose timing control unit faulty			○	
Connecting plate connection faulty				Gr 11
Transmission neutral switch faulty < Manual transmission >		○		
Transmission neutral relay faulty < Manual transmission >		○		
Sub-starter switch faulty		○		
Cold start switch faulty			○	
Exhaust brake 3-way magnetic valve faulty			○	
Parking brake relay faulty < Automatic transmission >			○

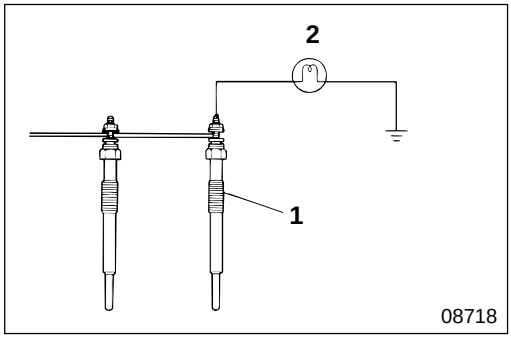
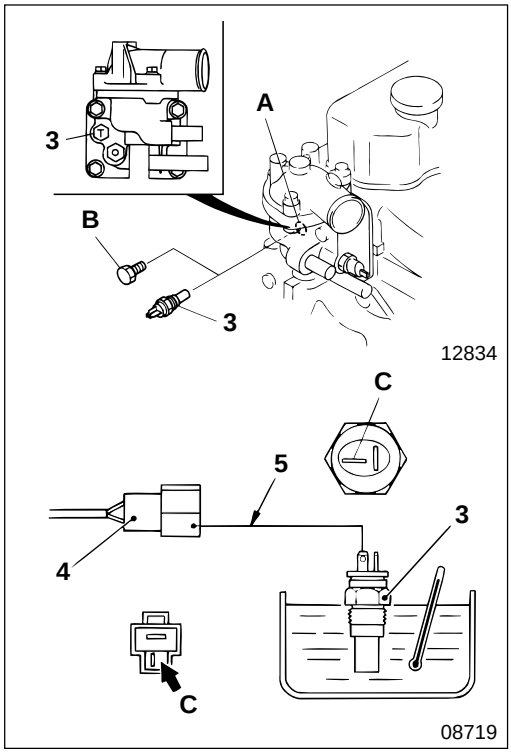
Inspection of Engine Preheating System

Service standards

Location	Maintenance item			Standard value	Limit	Remedy
—	Pre-glow time	Water temperature	60°C {140°F} or more	Does not pre-glow	—	Inspect
			0 to 60°C {32 to 140°F}	Approximately 12 seconds	—	
			0°C {32°F} or less	Approximately 12 seconds	—	
	After-glow time	Water temperature	60°C {140°F} or more	Does not after-glow	—	
			0 to 60°C {32 to 140°F}	Does not after-glow	—	
			0°C {32°F} or less	Approximately 20 seconds	—	
	Indicator lamp lighting time	Water temperature	60°C {140°F} or more	Does not light	—	
			0 to 60°C {32 to 140°F}	Does not light	—	
			0°C {32°F} or less	Approximately 8 seconds	—	



- Turn the starter switch OFF.
- Turn the cold start switch OFF.
- Connect inspection lamp **2** to glow plug **1**.



- Remove water temperature sensor **3** from the engine and plug sensor mounting part **A** with plug **B** (M16×1.5 mm).
  Removal and installation of water temperature sensor **3** Gr 14
- Connect extension harness **5** between water temperature sensor **3** and connector **4**.

NOTE

Connect extension harness 5 to terminal C of the multipurpose timing control unit.

- Put water temperature sensor **3** into a container filled with water.
- Carry out the following inspection while changing the water temperature in the container. If any fault is found, inspect each unit.

(1) Inspection of pre-glow time and indicator lamp lighting time

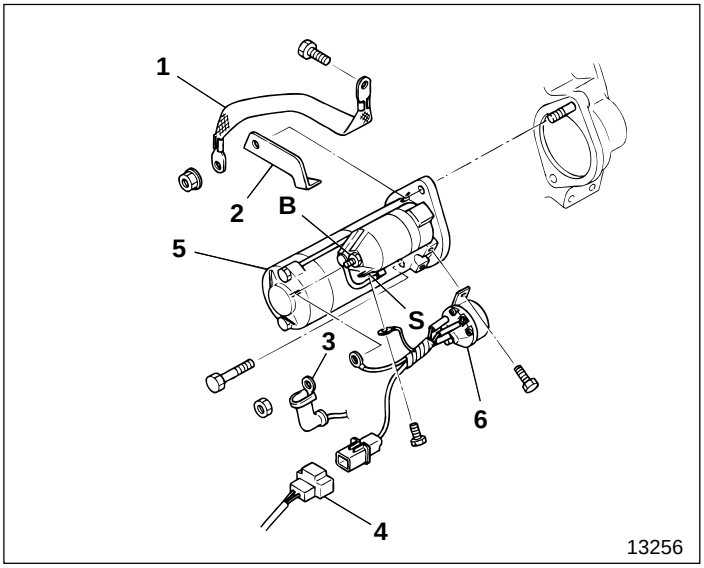
Turn the starter switch ON but do not start the engine. Make sure that the pre-glow time and the indicator lamp lighting time at each water temperature conform to the standard value.

- For pre-glow time inspection, measure the lighting time of inspection lamp **2**.
- For indicator lamp lighting time inspection, measure the lighting time of lamp within the meter cluster directly.

(2) Inspection of after-glow time

Start the engine and measure the lighting time of inspection lamp **2** from the point lamp within the meter cluster goes off, and make sure that the after-glow time conforms to the standard value.

https://truckmanualshub.com/



● **Removal sequence**

1 Ground strap (Engine ground)
2 Bracket
3 Starter cable (to battery connection)
4 Chassis harness
5 Starter 🕮 54-2-16
6 Starter relay

B : Terminal B
S : Terminal S

WARNING⚠

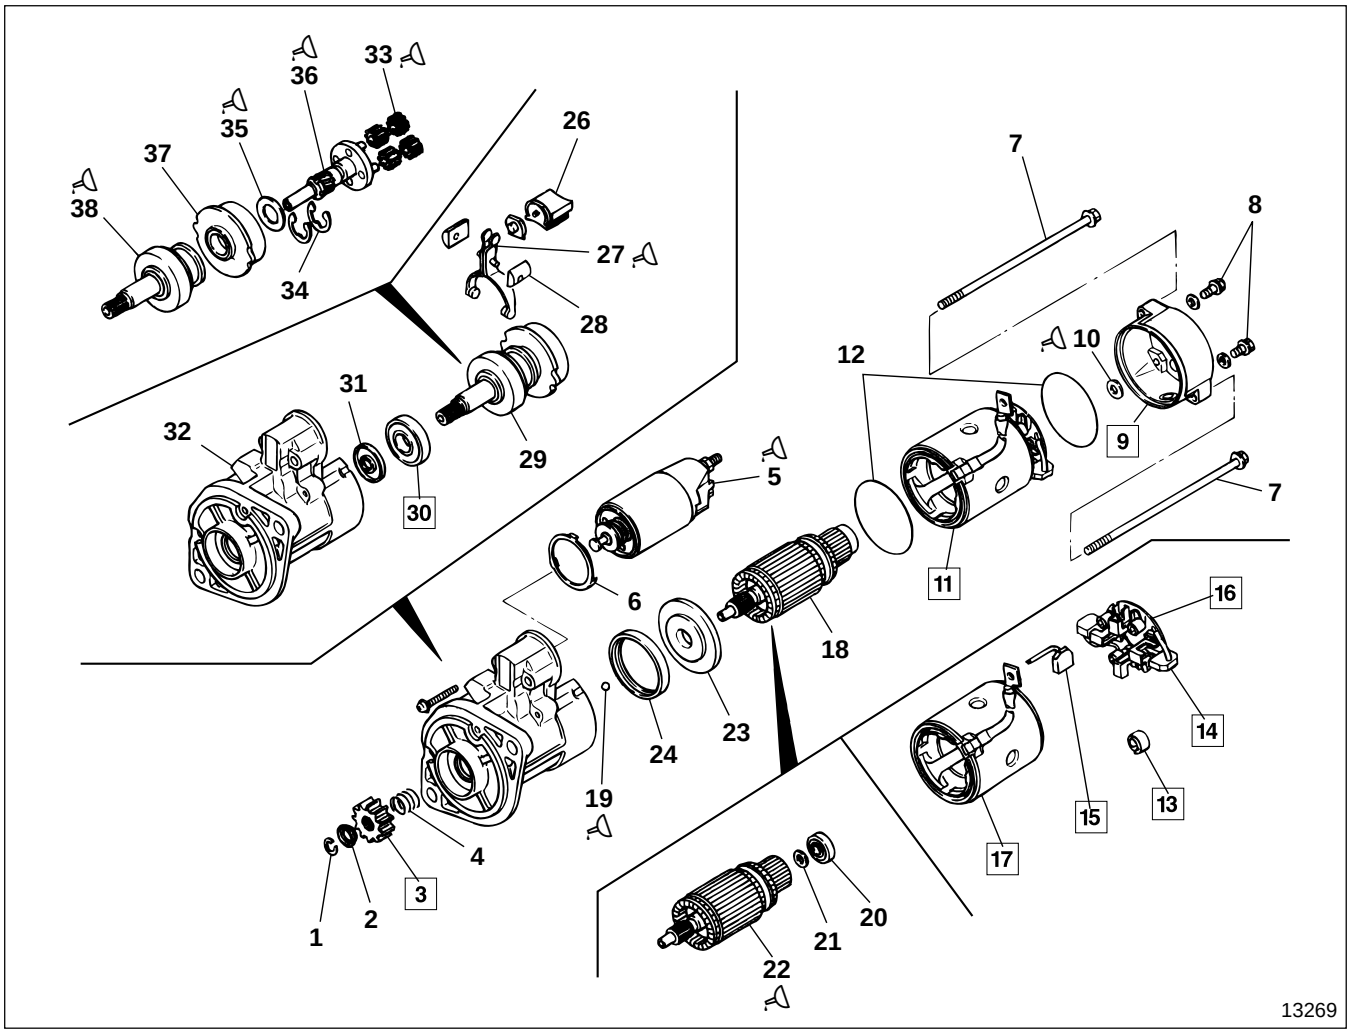
Never touch the starter with tools when you remove the harness from terminal B. This is because voltage is always supplied to it from starter cable 3, and you will short-circuit the starter. Before removing the harness from terminal B, remove the ⊖ battery terminal and tape it up to insulate it.

● **Installation sequence**

Follow the removal sequence in reverse.

https://truckmanualshub.com/

Starter



● **Disassembly sequence**

1 Stopper ring
2 Pinion stopper
3 Pinion
4 Spring
5 Magnetic switch
6 Shim

https://truckmanualshub.com/

CAUTION⚠

- **When removing yoke and brush holder assembly 11, make sure you first pull out brushes 14, 15 from brush holder assembly 16 to avoid damaging the commutator of armature 22.**
- **Do not remove bearings 20, 30 unless they are faulty.**
- **Make sure you do not drop armature assembly 18 when you remove yoke and brush holder assembly 11 from front bracket assembly 25.**
- **Be careful not to lose ball 19, since it might come out together with armature assembly 18 when you remove it.**

NOTE

- **You do not have to remove pinion 3 when you disassemble or inspect only the motor assembly, for example: when inspection of the brush assembly is required.**
- **Except for the above, make sure you remove pinon 3 before disassembling any parts.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

Whenever magnetic switch 5 has been replaced, be sure to adjust the pinion gap.

● **Inspection after assembly**

🕮 P54-2-18

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
—	Pinion gap		0.5 to 2.0 {0.02 to 0.079}	—	Adjust
—	No-load characteristic (11 V when current flowing)	Current	180 A or less	—	Inspect
		Revolutions per minute	3800 rpm or more	—	
13	Pressure of brush spring		29 to 39 N {6.6 to 8.8 lbf, 3 to 4 kgf}	20 N {4.4 lbf, 2 kgf}	Replace
14, 15	Length of brush		18 {0.71}	11 {0.43}	Replace
18	Armature assembly	Outer diameter of commutator	32 {1.26}	31.4 {1.24}	Replace
		Deflection of commutator periphery	—	0.05 {0.002} or more	Replace
		Mica depth between segments	0.5 {0.02}	0.2 {0.0079} or less	Correct or replace

Lubricant

Location	Points of application	Kinds	Quantity
5	Contact surface between lever and magnetic switch	Multipurpose grease [NLGI No.2 Li soap]	As required
10	Conical washer	Multipurpose grease [NLGI No.2 Li soap]	As required
19	Ball	MOLYKOTE ® AG650	As required

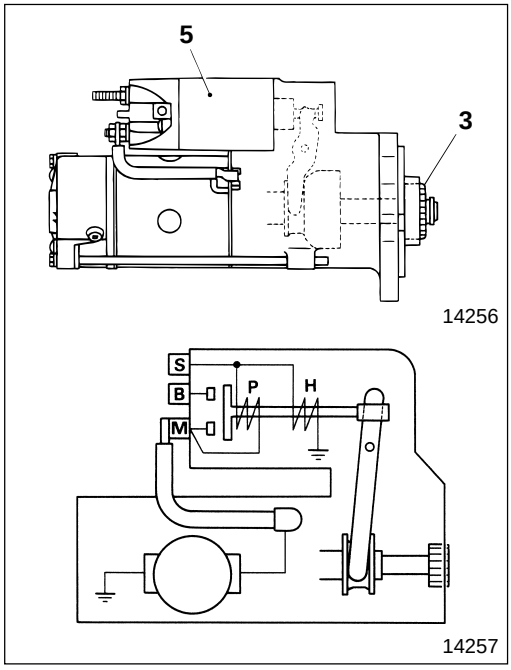
27	Friction surfaces of lever and overrunning clutch	Multipurpose grease [NLGI No.2 Li soap]	As required
35	Washer	MOLYKOTE ® AG650	As required
36, 38	Friction surfaces of gear shaft and overrunning clutch	Multipurpose grease [NLGI No.2 Li soap]	As required
38	Spline of overrunning clutch	Multipurpose grease [NLGI No.2 Li soap]	As required

https://truckmanualshub.com/



◆ Service procedure

● Inspection after assembly

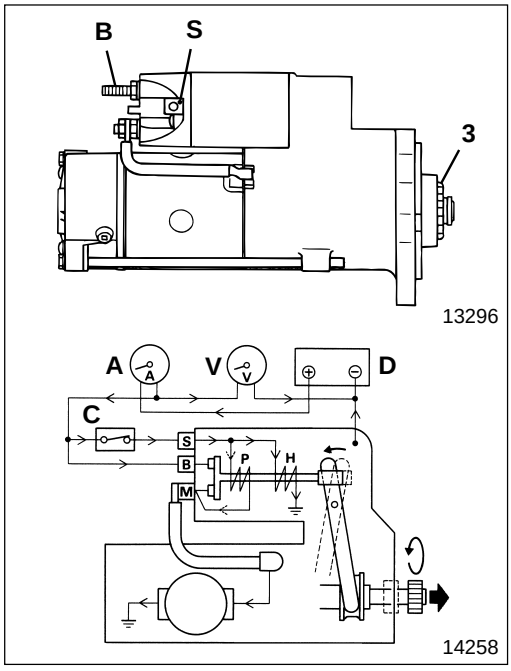
Inspections after assembling the starter should be carried out with current fed to the starter.

WARNING⚠

- **Do not touch pinion 3 because it jumps out and turns when current is fed to the starter.**
- **Take care not to burn your hand, magnetic switch 5 might be hot after inspection.**

CAUTION⚠

- **The current feeding time to the starter should be within 10 seconds at pull-in coil P side and within 30 seconds at holding coil H side. If the current feeding time exceeds these limits the coil might burn due to overheating.**
- **When current is flowing into the starter, a current of over 100 amperes is fed. When inspecting, use thick cable, such as a booster cable, and make secure connections.**



(1) Performance test

- Connect the starter as illustrated.
  A : Ammeter
  B : Terminal B of starter
  C : Switch
  D : DC power supply (12 volts)
  S : Terminal S of starter
  V : Voltmeter
- Set the voltage to 11 volts DC.

CAUTION⚠

Up to 12 volts can be loaded.

- The following work should be done with current fed to the starter. You must complete the full procedure of measuring the intensity of the current and the number of revolutions within 30 seconds.
  - Turn switch **C** ON and feed current into the starter. In this state, pinion **3** jumps out and rotates.

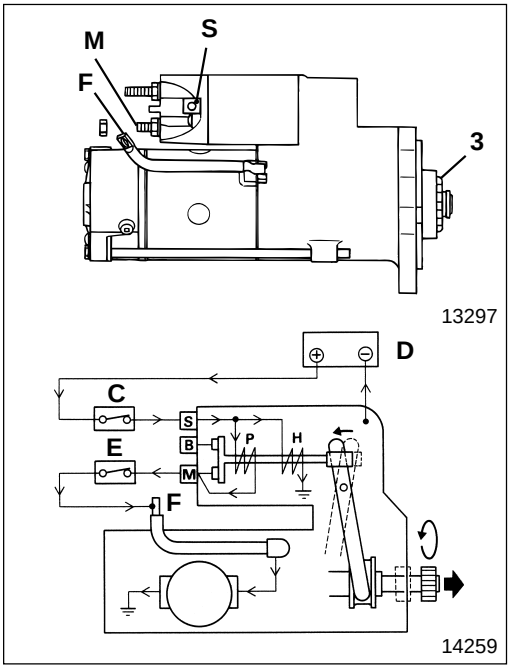
CAUTION⚠

When switch C is turned ON, current is fed both to pull-in coil P and holding coil H. When a large amount of current is fed into terminal M from DC power supply D, via terminal B of the starter, the current stops flowing into the pull-in coil but continues to flow into the holding coil.

To avoid burning the holding coil, be sure to carry out the performance test within 30 seconds.

- Measure the intensity of the current and the number of revolutions of the starter. Train a strobe light on pinion **3** to measure the revolutions.
- Turn switch **C** OFF to stop current to the starter.
- If the measured value deviates from the standard value, disassemble the starter again and inspect it.

https://truckmanualshub.com/

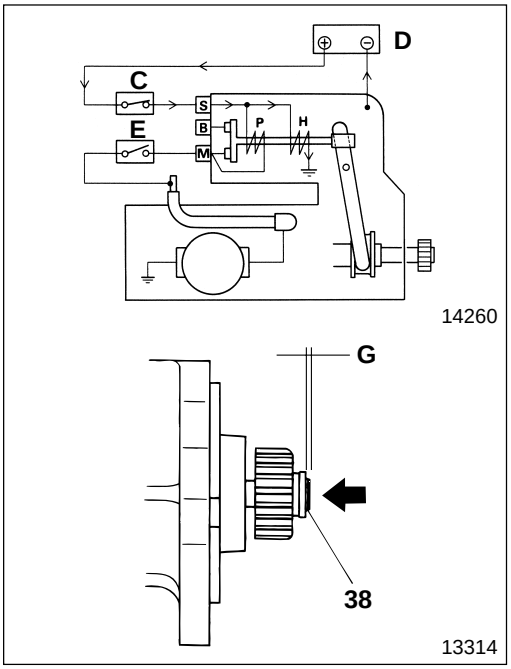


(2) Pinion gap

[Inspection]

- Connect the starter as illustrated.
  - **C** : Switch
  - **D** : 12 volts DC
  - **E** : Switch
  - **F** : Cable
  - **M** : Terminal M of starter
  - **S** : Terminal S of starter

- The following work should be done with current fed to the starter. You must complete the full procedure for measuring the pinion gap within 30 seconds.
  - Turn switches **C** and **E** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.



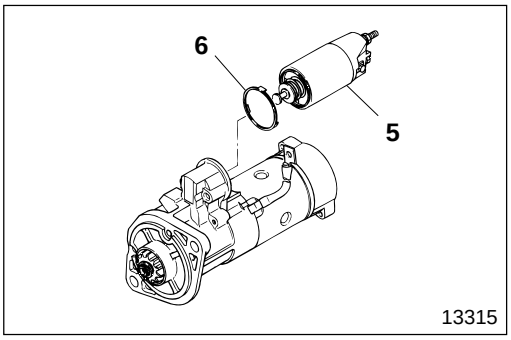
- Within five seconds of pinion **3** rotating, turn switch **E** OFF to stop rotation of the pinion.

CAUTION ⚠

When switches C and E are turned ON, current is fed both to pull-in coil P and holding coil H. The circuit is wired in such a way that the voltage is not applied to terminal B of the starter, so the current continues to flow into the pull-in coil while pinion 3 rotates.

To avoid burning the pull-in coil, be sure to turn switch E OFF within 5 seconds of the pinion rotating.

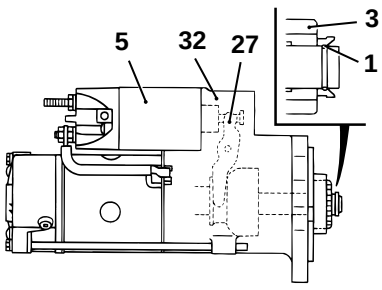
- Push the tip of overrunning clutch **38** lightly and measure pinion gap **G** in the axial direction.
- Turn switch **C** OFF to stop current to the starter.
- If the measured value deviates from the standard value, adjust the pinion gap as follows.



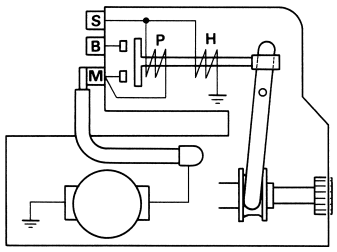
[Adjustment]

- Remove magnetic switch **5** from front bracket assembly **25**.
- Change the thickness of shims **6**. Adding shims decreases pinion gap **G**.
- Type of shim : 0.5, 0.25 mm {0.02, 0.0098 in.}

https://truckmanualshub.com/



14261



14257

3 Pinion

[Removal]

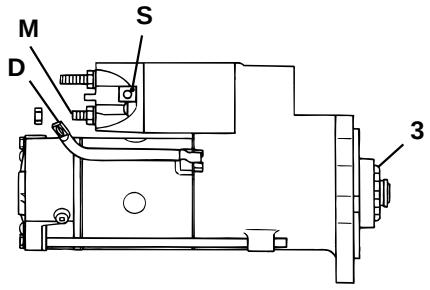
Feed current to the starter and protrude pinion **3** to remove the pinion.

WARNING

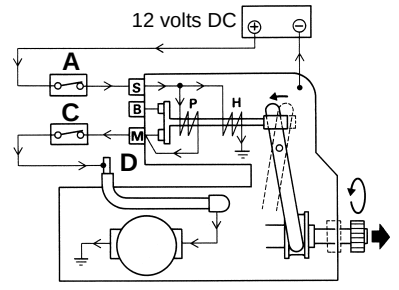
- **Do not touch pinion 3 because it jumps out and turns when current is fed to the starter.**
- **Take care not to burn your hand, magnetic switch 5 might be hot after inspection.**

CAUTION

- **The current feeding time to the starter should be within 10 seconds at pull-in coil P side and within 30 seconds at holding coil H side. If the current feeding time exceeds these limits, the coil might burn due to overheating.**
- **Before making pinion 3 jump out, be sure to feed current to the starter to obtain the correct state. If current is not fed to the starter and lever 27 is pulled to protrude the pinion, front bracket 32 or the lever might be damaged due to the shock produced on removal of stopper ring 1.**
- **The current, when fed to the starter, is over 100 amperes. When inspecting, use thick cable, such as a booster cable, and make secure connections.**



13297

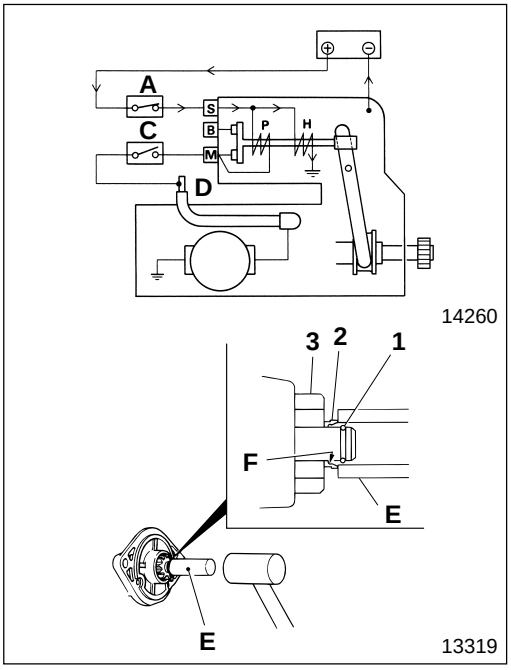


14259

- Connect the starter as illustrated.
  A : Switch
  C : Switch
  D : Cable
  M : Terminal M of starter
  S : Terminal S of starter

- The following work should be done while current is flowing into the starter. You must complete the full procedure for removing pinion **3** within 30 seconds.
- Turn switches **A** and **C** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.

https://truckmanualshub.com/



- Within 5 seconds of pinion **3** rotating, turn switch **C** OFF to stop rotation of the pinion.

CAUTION

When switches A and C are turned ON, current is fed both to pull-in coil P and holding coil H. The circuit is wired in such a way that the voltage is not applied to terminal B of the starter, so the current continues to flow into the pull-in coil while pinion 3 rotates.

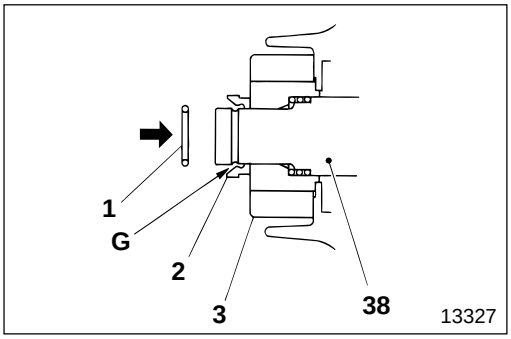
To avoid burning the pull-in coil, be sure to turn switch C OFF within five seconds after the pinion rotates.

- Apply pipe-shaped tool **E** onto pinion stopper **2**.
- Hit tool **E** lightly using a mallet to remove stopper ring **1** from ring groove **F** of pinion stopper **2**.
- Remove stopper ring **1** and pinion **3**.
- Turn switch **A** OFF to stop current to the starter.

NOTE

When the current to the starter is stopped, stopper ring 1 might fall back into ring groove F of pinion stopper 2 because pinion 3 is pushed inside.

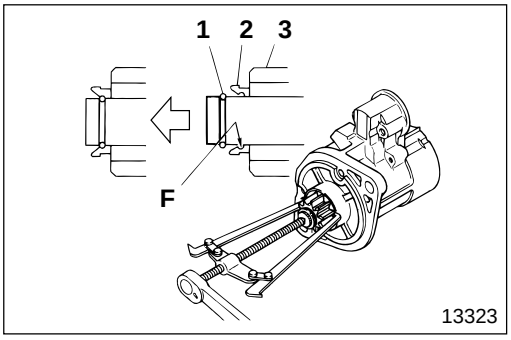
If this occurs, feed current to the starter again and carry out the work.



[Installation]

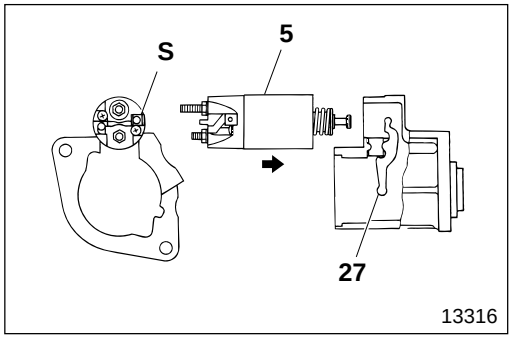
When installing pinion **3**, it is not necessary to feed current to the starter.

- Install pinion stopper **2** and pinion **3** onto overrunning clutch **38** in the direction as illustrated.
- Fit stopper ring **1** into ring groove **G** of overrunning clutch **38**.



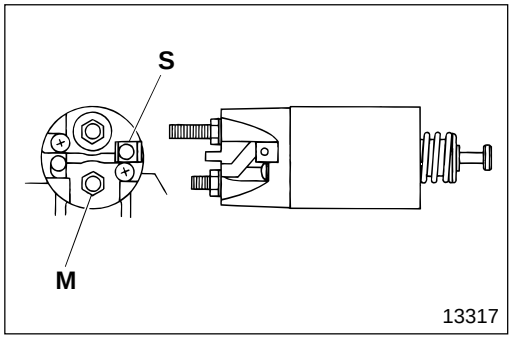
- Pull pinion **3** firmly and set stopper ring **1** on groove **F** of pinion stopper **2**.

https://truckmanualshub.com/



5 Magnetic switch

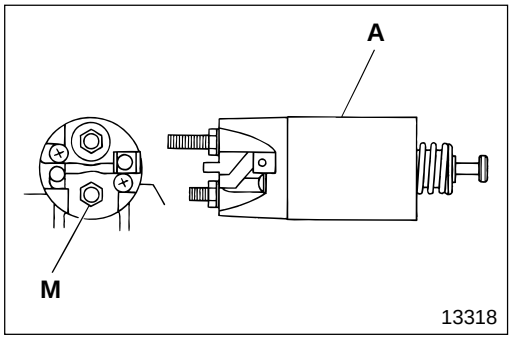
[Installation]
Install magnetic switch **5** to lever **27**, with terminal **S** facing the direction as illustrated.



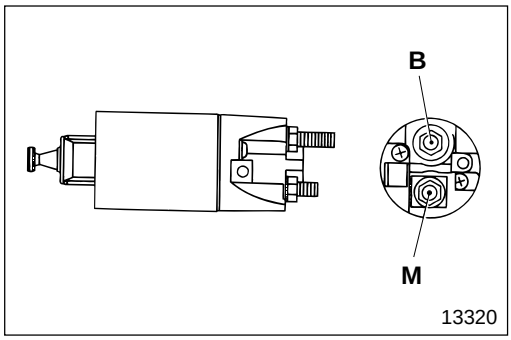
[Inspection]

(1) Testing for coil discontinuity

- Make sure that there is continuity between terminals **S** and **M**.
- If there is no continuity, replace magnetic switch **5**.

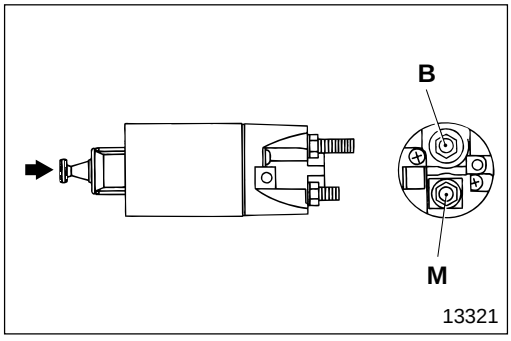


- Make sure that there is continuity between terminal **M** and body **A** of magnetic switch **5**.
- If there is no continuity, replace magnetic switch **5**.



(2) Inspection of welded connections

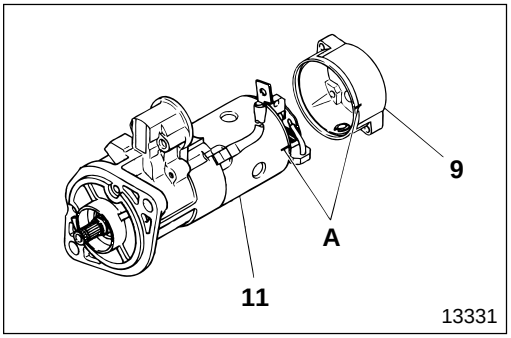
- Make sure that there is no continuity between terminals **B** and **M**.
- If there is continuity, replace magnetic switch **5**.



(3) Inspection of connections

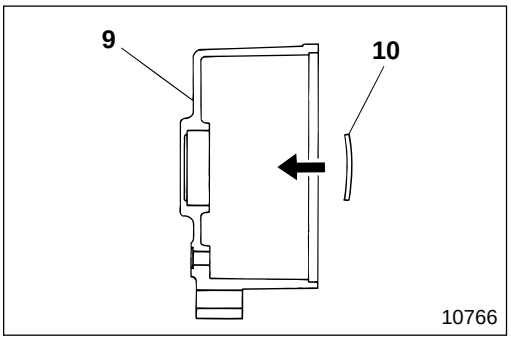
- Push the tip of magnetic switch **5** to close the internal connection.
- Make sure that there is continuity between terminals **B** and **M**.
- If there is no continuity, replace magnetic switch **5**.

https://truckmanualshub.com/



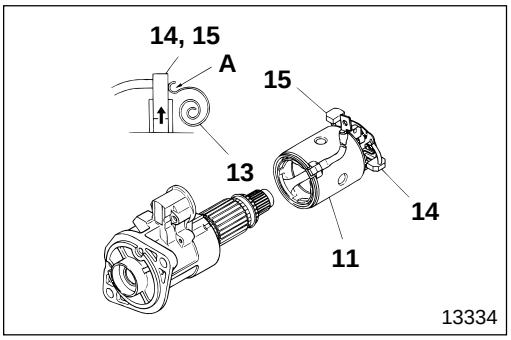
9 **Installation of rear bracket**

A : Alignment mark



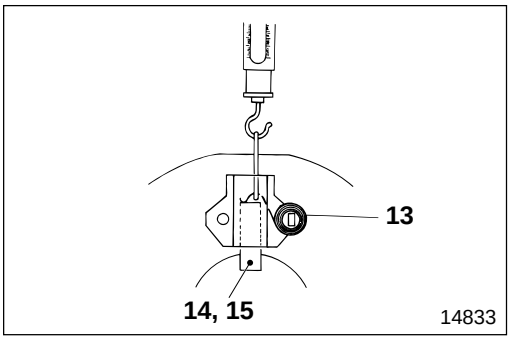
10 **Installation of conical washer**

Install conical washer **10** to rear bracket **9** in the direction as illustrated.



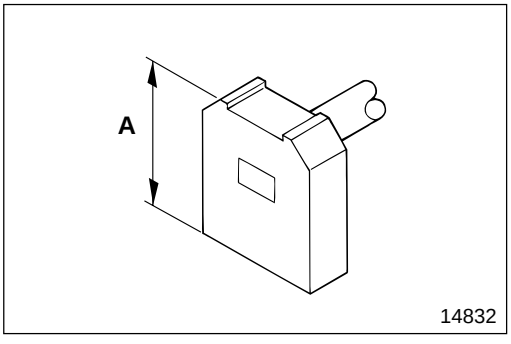
11 **Removal and installation of yoke and brush holder assembly**

- Pull point **A** of brush spring **13** to pull out brushes **14**, **15**.
- After pulling out brushes **14**, **15**, secure them with brush spring **13** as illustrated.
- Remove yoke and brush holder assembly **11**.
- For installation, reverse the removal procedure.



13 **Inspection of brush spring**

- Use new brushes **14**, **15** and measure the load when brush spring **13** is detached from the brushes.
- If the measured value is higher than the limit, replace brush spring **13**.



14 **15** **Inspection of brush**

(1) Length of brush

If the measured value is lower than the limit, replace brushes **14**, **15**.

A : Length of brush

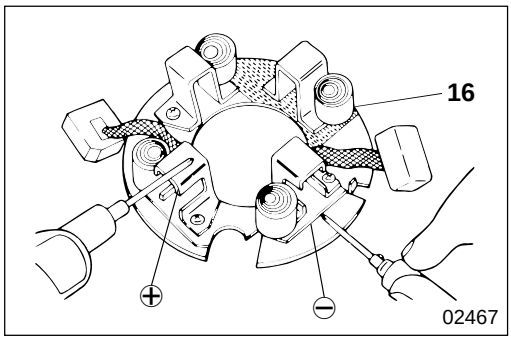
NOTE

To replace brush ⊖ 14, replace entire brush holder assembly 16.

(2) Contact surface with commutator

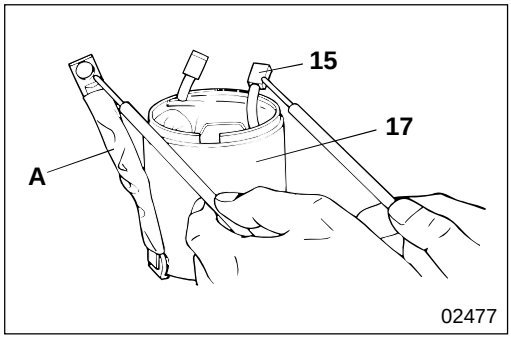
If the surface where the brushes contact the commutator is rough or is worn unevenly, polish the surface with emery paper (300 to 500 grit).

https://truckmanualshub.com/



16 Inspection of brush holder assembly

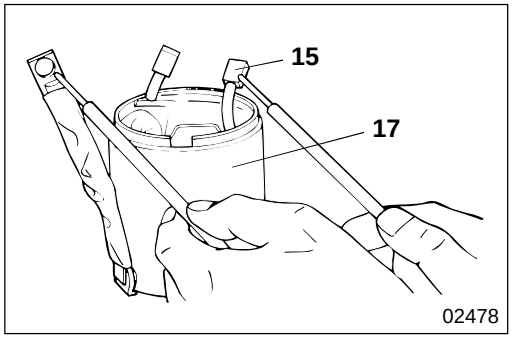
- Make sure that there is no continuity between the ⊕ side of the brush holder and the ⊖ side of the holder plate.
- If there is continuity, they are grounded. Replace brush holder assembly **16**.



17 Inspection of yoke assembly

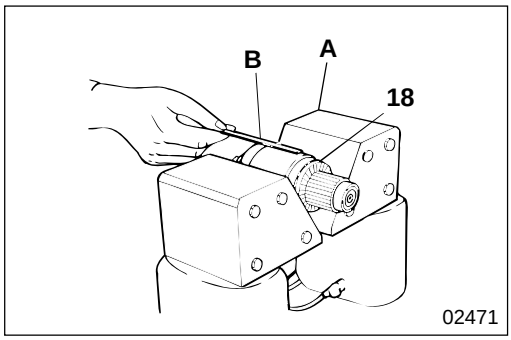
(1) Testing for coil disconnection

- Make sure that there is continuity between cable **A** and brush ⊕ **15**.
- If there is no continuity, they are disconnected. Replace brush ⊕ **15** or yoke assembly **17**.



(2) Testing for coil grounding

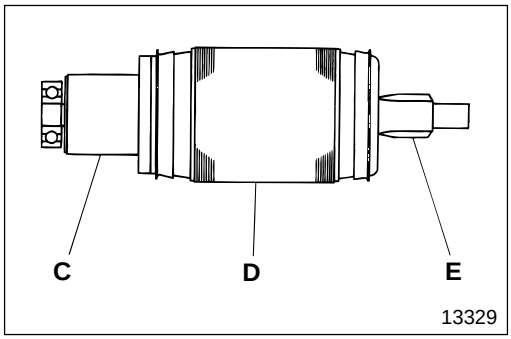
- Make sure that there is no continuity between yoke assembly **17** and brush ⊕ **15**.
- If there is continuity, they are short-circuited. Inspect the insulated point. If it is hard to repair, replace brush ⊕ **15** or yoke assembly **17**.



18 Inspection of armature assembly

(1) Testing for coil short-circuit

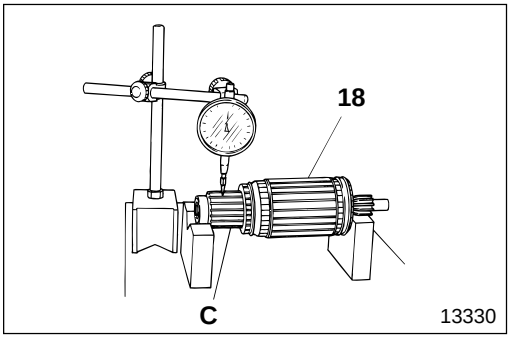
- Place iron rod **B** parallel to armature assembly **18**.
  A : Armature tester
- Rotate armature assembly **18** slowly.
- If iron rod **B** is pulled or shakes, it indicates that armature assembly **18** is short-circuited, so replace it.



(2) Testing for coil grounding

- Make sure that there is no continuity between commutator **C** and core **D** (or shaft **E**).
- If there is continuity between them, they are short-circuited. Replace armature assembly **18**.

https://truckmanualshub.com/

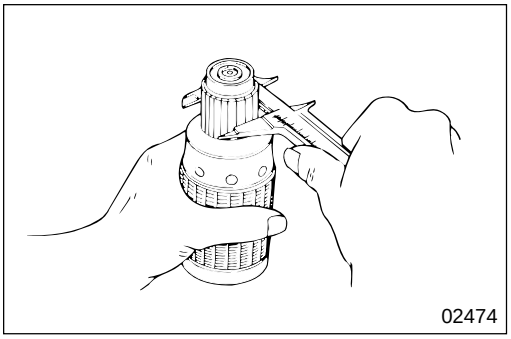


(3) Deflection of commutator

If the measured value is higher than the limit, adjust the outer diameter of commutator **C** within the limit.

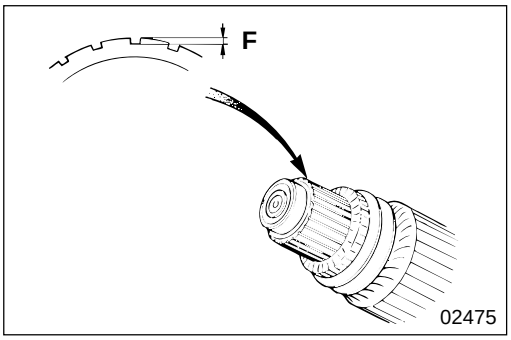
(4) Rough commutator surface

- If the surface is rough or has stepped wear, polish the surface with emery paper (300 to 500 grit).
- After polishing, check deflection of commutator **C**.



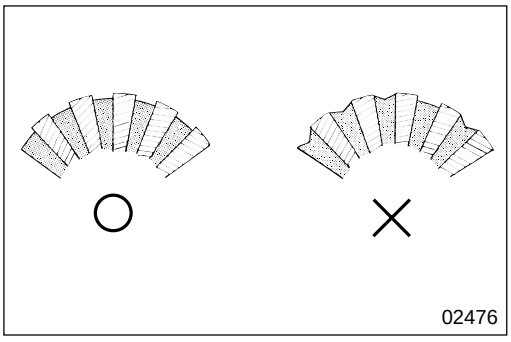
(5) Outer diameter of commutator

If the measured value is higher than the limit, replace armature assembly **18**.



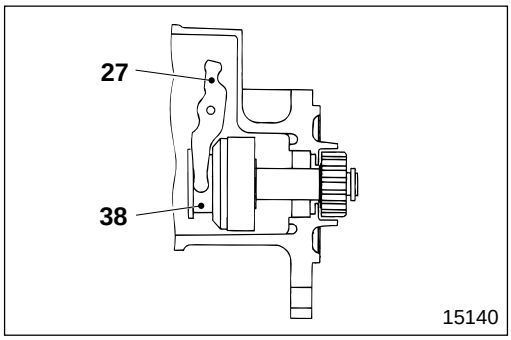
(6) Mica depth between segments

- If the measured value is lower than the limit, correct or replace armature assembly **18**.
  F : Mica depth



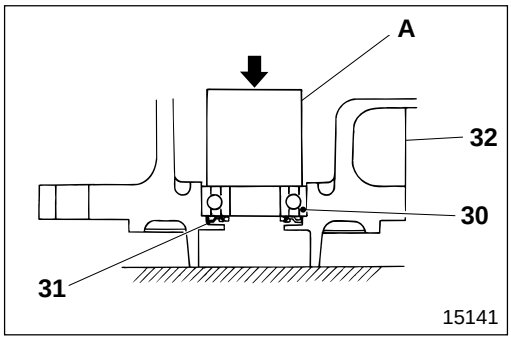
- If the mica is worn as illustrated, replace armature assembly **18**.
  ○ : Good
  × : Faulty

https://truckmanualshub.com/



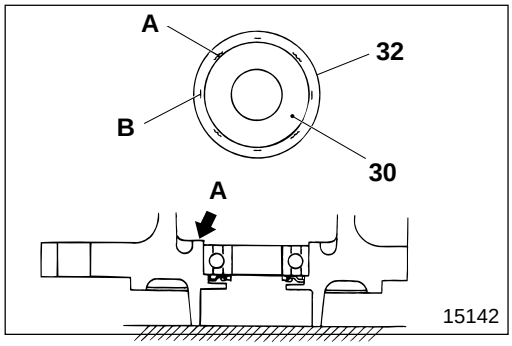
27 **Installation of lever**

Install lever **27** onto overrunning clutch **38** in the direction as illustrated.



30 **Installation of front bearing**

- Install dust seal **31** before press-fitting front bearing **30**.
- Press-fit front bearing **30** into front bracket **32** using pipe-shaped tool **A**.

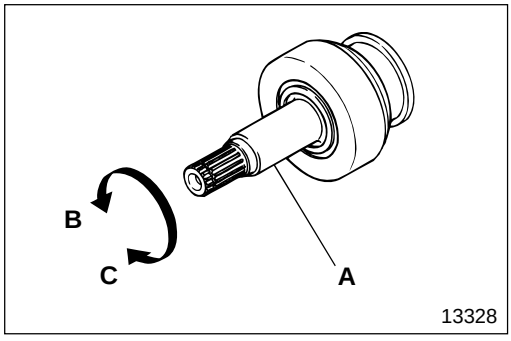


- Re-caulk front bracket **32**.

NOTE

Do not re-caulk previously caulked points B.

A : Caulking points (4 points)



38 **Installation of overrunning clutch**

Carry out the following inspection. If any fault is found, replace overrunning clutch **38**.

- Make sure that shaft **A** turns smoothly when turned in direction **B**.
- Make sure that shaft **A** locks when turned in direction **C**.

1 Sealed beam unit (HIGH beam)
2 Sealed beam unit (HIGH/LOW beam)
3 Screw (HIGH/LOW beam, vertical adjustment)
4 Screw (HIGH/LOW beam, horizontal adjustment)
5 Screw (HIGH beam, vertical adjustment)
6 Screw (HIGH beam, horizontal adjustment)
7 Housing
8 Extension spring
9 Extension spring

- The headlamp unit consists of sealed beam units **1, 2** separately installed in housing **7**. Sealed beam unit **1** is for HIGH beam, and sealed beam unit **2** is for HIGH/LOW beam.
- The headlamp aiming can be adjusted by changing the installation angle of sealed beam units **1, 2**.
- To adjust the installation angle of sealed beam unit **1**, turn screws **5, 6**. Extension spring **8** sets the angle of the sealed beam unit.
- To adjust the installation angle of sealed beam unit **2**, turn screws **3, 4**. Extension spring **9** sets the angle in the same way as for sealed beam unit **1**.

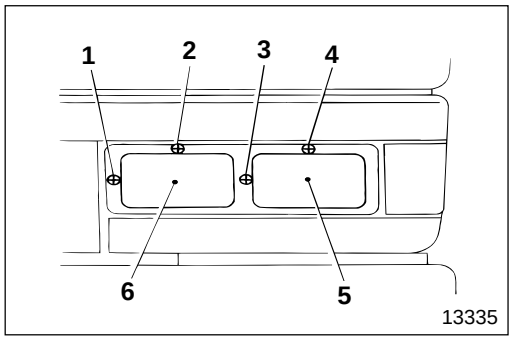
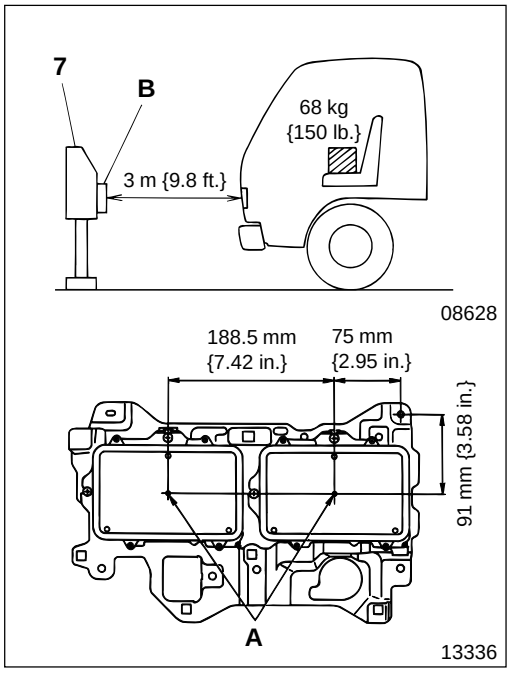
Headlamp Aiming



1 Screw (HIGH beam, horizontal adjustment)
2 Screw (HIGH beam, vertical adjustment)
3 Screw (HIGH/LOW beam, horizontal adjustment)
4 Screw (HIGH/LOW beam, vertical adjustment)
5 HIGH/LOW beam
6 HIGH beam

To adjust the headlamp move the optical axis of HIGH beam **6** by turning screws **1, 2**; and move the optical axis of HIGH/LOW beam **5** by turning screws **3, 4.** You need to adjust the aiming of both the HIGH and the HIGH/LOW beams on both the left and right headlamps.



(1) Preparatory work before adjustment

- Park the vehicle on a level place.

WARNING

You must put wheel chocks securely in place.

- Unload the vehicle and make sure no one is in it.
- Inflate the tires to specified pressure. Gr 31
- Seat one person or an equivalent mass (68 kg {150 lb}) in the vehicle.
- Start the engine and check that the battery is being charged.
- Place convergent headlamp tester **7** in line with HIGH beam **6** or HIGH/LOW beam **5** of either the left or right headlamp at a distance of **3** m {9.8 ft}.
- Align the center of convergent lens **B** of convergent headlamp tester **7** with lamp center **A** of HIGH beam **6** or HIGH/LOW beam **5** . (The illustration shows a left headlamp.)
- When adjusting one headlamp, mask the other to avoid light leakage.

(2) Adjustment

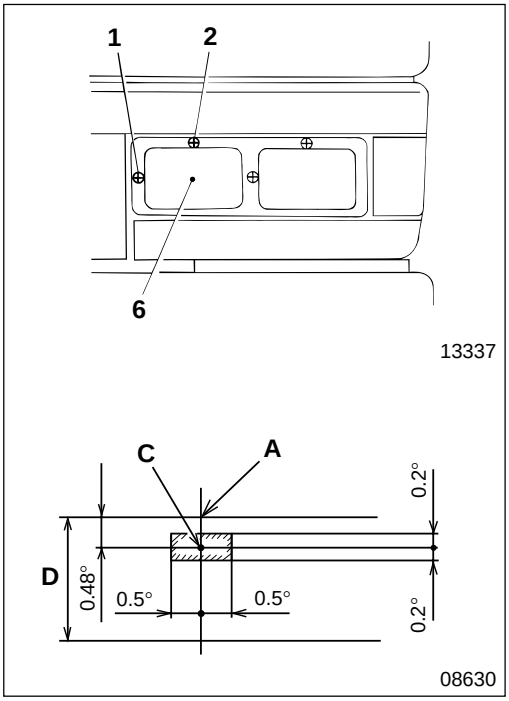
WARNING

Do not mask a lit headlamp for more than 10 minutes or the heat generated might cause a fire.

CAUTION

When completing the adjustment using screws 1 to 4, the action must be finished in the tightening direction.

https://truckmanualshub.com/



● **Adjustment of HIGH beam unit**

- Turn on HIGH beam **6**.
- Adjust as follows so that the optical axis (maximum illumination point) **C** of HIGH beam **6** is located as illustrated:
  - Vertical adjustment: Turn screw **2** to adjust.
  - Horizontal adjustment: Turn screw **1** to adjust.

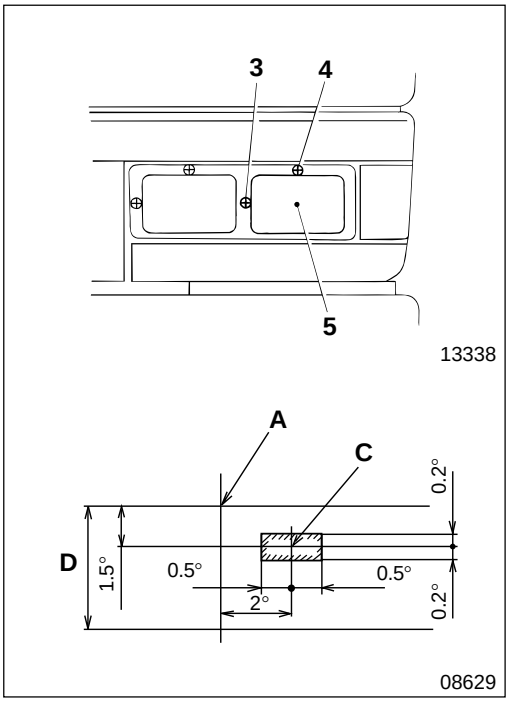
  The aiming of both left and right HIGH beams **6** should be adjusted to the position as illustrated.

▨ : Tolerance of adjustment

A : Center of headlamp
D : Height from the ground to headlamp center

	Adjusting direction for optical axis			
	Upward	Downward	Leftward	Rightward
Screw 1	—	—	(Counter-clockwise)	(Clockwise)
Screw 2	(Clockwise)	(Counter-clockwise)	—	—

Turning direction of the screws in the table is as viewed from the front.



● **Adjustment of HIGH/LOW beam unit**

- Turn on the LOW beam of HIGH/LOW beam **5**.
- Adjust as follows so that the optical axis (maximum illumination point) **C** of HIGH/LOW beam is located as illustrated:
  - Vertical adjustment: Turn screw **4** to adjust.
  - Horizontal adjustment: Turn screw **3** to adjust.

  The aiming of both left and right HIGH/LOW beams **5** should be adjusted to the position as illustrated.

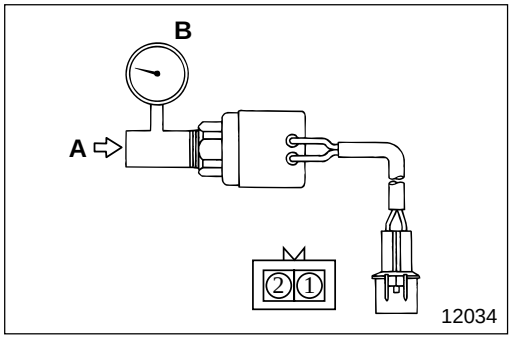
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
3	Operating pressure of stop lamp switch	29±9.8 kPa {4.3±1.4 lbf/in², 0.3±0.1 kgf/cm²}	—	Replace



◆ Service procedure

3 **Inspection of stop lamp switch**

Carry out the following inspection. If any fault is found, replace stop lamp switch **3**.

- Make sure that there is no continuity between terminals ① and ② when air pressure **A** is not applied to stop lamp switch **3**.
- Apply air pressure **A** to the stop lamp switch gradually starting from 0 kPa {0 lbf/in², 0 kgf/cm²}.
  Measure air pressure **A** when continuity is present between terminals ① and ② to make sure that the value conforms to the standard value.

340 BACKUP LAMP CIRCUIT

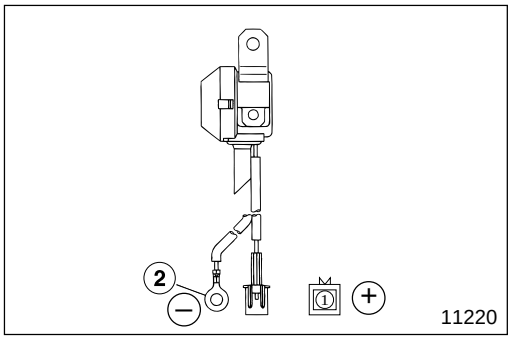
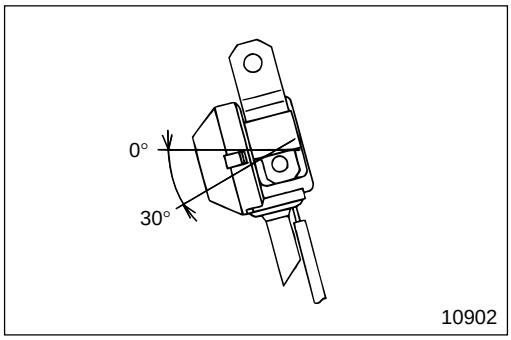
◆ Service procedure



4 **Back buzzer**

[Inspection]
- Make sure that back buzzer **4** sounds intermittently when you apply 12 volts DC between terminals ① and ②.
- If any fault is found, replace back buzzer **4**.



[Installation]
Install back buzzer **4** to the frame within the angle range as illustrated.

CAUTION⚠

Be careful to install back buzzer 4 within the illustrated angle range or the back buzzer will not be drained normally.

			At 1103.2 kPa {160 lbf/in², 11.3 kgf/cm²}	1103.2±50 kPa {160±7 lbf/in², 11.2±0.5 kgf/cm²}		
	Tolerance of reading by two needles under the same pressure		At 519.9 kPa {75.4 lbf/in², 5.3 kgf/cm²}	±50 kPa {±7 lbf/in², 0.5 kgf/cm²}		
			At 896.3 kPa {130 lbf/in², 9.1 kgf/cm²}	±50 kPa {±7 lbf/in², 0.5 kgf/cm²}		

◆ Service procedure

3 Inspection of speedometer

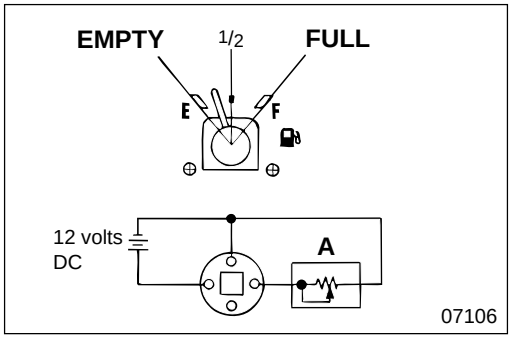
- Measure the indication area of speedometer **3** at various speed ranges using a speedometer tester.
- If the measured value deviates from the standard value, carry out the following inspection. If the inspection does not indicate a fault, replace speedometer **3**.

(1) Inspection of vehicle speed sensor body 802

(2) Inspection of installed condition of vehicle speed sensor

Gr 22 < Manual transmission >
Gr 23 < Automatic transmission >

https://truckmanualshub.com/



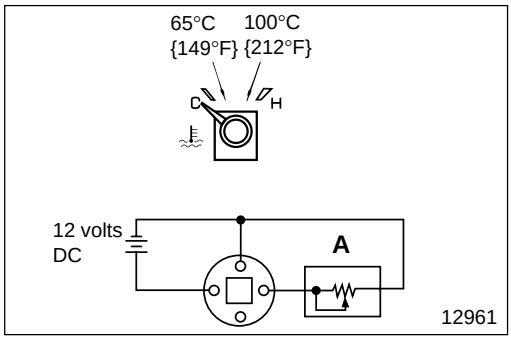
4 Inspection of fuel gauge

- Connect a variable resistor to fuel gauge **4** as illustrated.
  A : Variable resistor
- Measurement order
  FULL → 1/2 → EMPTY

NOTE

The movement of the gauge needle is subject to hysteresis (oscillation). Be sure to measure following the measurement order.

- Increase the value of variable resistor **A** gradually from 0 Ω.
- Measure the resistance respectively when the needle of fuel gauge **4** indicates FULL, 1/2 and EMPTY.
- If the measured value deviates from the standard value, replace fuel gauge **4**.



5 Inspection of water temperature gauge

- Connect a variable resistor to water temperature gauge **5** as illustrated.
  A : Variable resistor
- Measurement order
  Low temperature → High temperature

NOTE

The movement of the gauge needle is subject to hysteresis (oscillation). Be sure to measure following the measurement order.

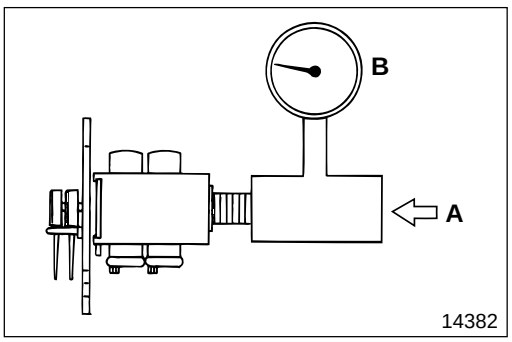
- Increase the value of variable resistor **A** gradually from 0 Ω.
- Measure the resistance respectively when the needle of water temperature gauge **5** indicates 65°C {149°F} and 100°C {212°F}.
- If the measured value deviates from the standard value, replace water temperature gauge **5**.

6 Inspection of tachometer

- Measure the indication area of tachometer **6** at various revolution ranges using an engine revolution counter.
- If the measured value deviates from the standard value, carry out the following inspection. If the inspection does not indicate a fault, replace tachometer **6**.

(1) Inspection of the engine revolution sensor body 801

(2) Inspection of the installed condition of the engine revolution sensor Gr 13



7 Inspection of air pressure gauge

- Apply air pressure **A** to air pressure gauge **7**.
  B : Air pressure gauge
- Measure the indication area of air pressure gauge **7** at standard pressure.
- If the measured value deviates from the standard value, replace air pressure gauge **7**.

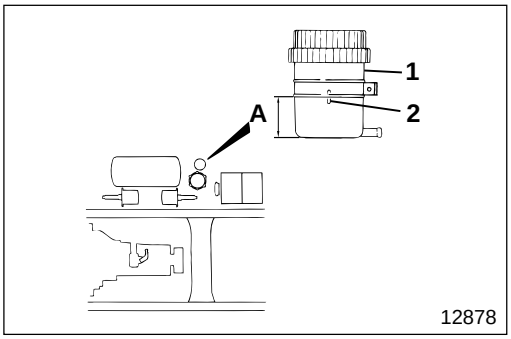
Location	Maintenance item	Standard value	Limit	Remedy
—	Warning lamp lighting position for brake fluid level switch	$57^{+3.5}_{-0.5}$ {$2.24^{+0.14}_{-0.02}$}	—	Replace



- Start engine.
- Drain the brake fluid gradually from fluid tank assembly **1**.

CAUTION

If brake fluid is spilt on any part of the vehicle, wipe it off immediately, since the solvent in the fluid can damage the paintwork.

- Measure height **A** of brake fluid level switch **2** when BRAKE warning lamp within the meter cluster lights.
- If the measured value deviates from the standard value, remove and check fluid tank assembly **1**.

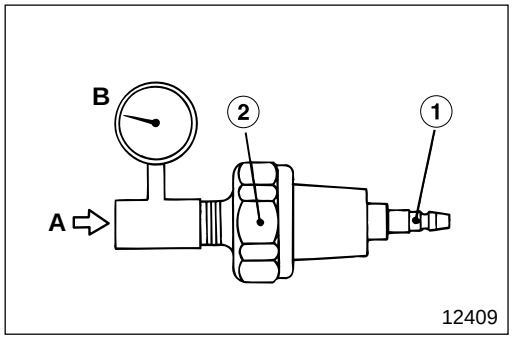
Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
6	Low air pressure switch operating pressure	When applying pressure	470 to 510 kPa {68 to 74 lbf/in^2, 4.8 to 5.2 kgf/cm^2}	—	Replace
		When releasing pressure	470 to 560 kPa {68 to 81 lbf/in^2, 4.8 to 5.7 kgf/cm^2}	—	
8	Continuity position of brake fluid level switch		$57\ ^{+3.5}_{-0.5}$ {$2.24\ ^{+0.14}_{-0.02}$} (Equivalent to 345 cm^3 {21.1 cu.in., 345 cc})	—	Replace

https://truckmanualshub.com/

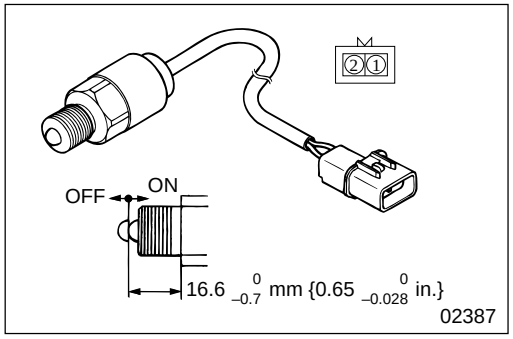
◆ Service procedure



6 **Inspection of low air pressure switch**

Carry out the following inspection. If any fault is found, replace low air pressure switch **6**.

- Make sure that there is continuity between terminals ① and ② (Body) when air pressure **A** is not applied to low air pressure switch **6**.
- Apply air pressure **A** to low air pressure switch **6** gradually starting from 0 kPa {0 lbf/in^2, 0 kgf/cm^2}.
  Measure the air pressure when continuity is lost between terminals ① and ② (Body) to make sure that the measured value conforms to the standard value.
  B : Air pressure gauge
- When air pressure **A** of 785 kPa {115 lbf/in^2, 8 kgf/cm^2} has been applied to low air pressure switch **A**, gradually release the air pressure.
  Measure the air pressure when continuity is present between terminals ① and ② (Body) and make sure that the measured value conforms to the standard value.

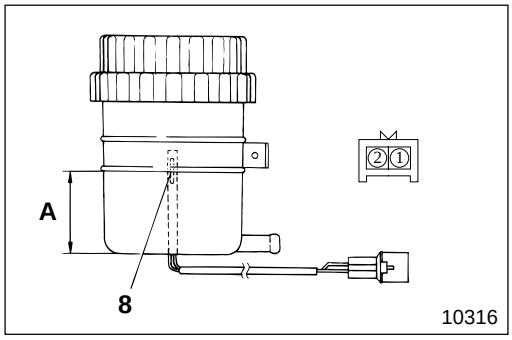


7 ollow the table below to inspect continuity:

	①	②
OFF		
ON	○——○	

○——○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace air master stroke switch **7**. Gr 35



8 **Inspection of brake fluid level switch**

- Drain the brake fluid gradually from the brake fluid tank assembly.

CAUTION

If brake fluid is spilt on any part of the vehicle, wipe it off immediately, since the solvent in the fluid can damage the paintwork.

- Measure height **A** of brake fluid level switch **8** when continuity is present between terminals ① and ②.
- If the measured value deviates from the standard value, replace the fluid tank assembly. Gr 35

547 AUTOMATIC TRANSMISSION FLUID TEMPERATURE WARNING CIRCUIT

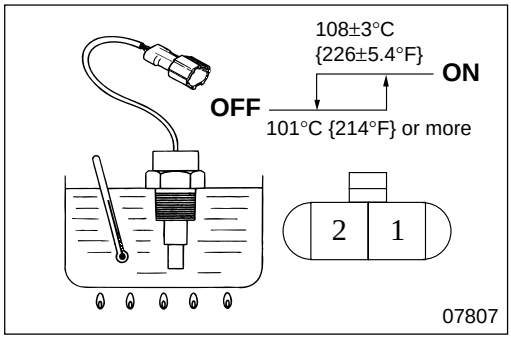
Service standards

Location	Maintenance item		Standard value	Limit	Remedy
9	Operating temperature of automatic transmission fluid thermostat switch	When increases (OFF→ON)	108±3°C {226±5.4°F}	—	Replace
		When decreases (ON→OFF)	101°C {214°F} or more		



◆ Service procedure

9 **Inspection of automatic transmission fluid thermostat switch**

Carry out the following inspection. If any fault is found, replace automatic transmission fluid thermostat switch **9**. Gr 23

- Make sure that there is no continuity between terminals ① and ② at room temperature (20±5°C {68±9°F}).
- Place automatic transmission fluid thermostat switch **9** in a container filled with engine oil and raise the oil temperature while stirring the oil. Measure the temperature when there is continuity between terminals ① and ②, and make sure that the measured value conforms to the standard value.
- Lower the oil temperature and measure the temperature when continuity is lost between terminals ① and ②, and make sure that the measured value conforms to the standard value.

Warning buzzer	Rated voltage	V	12
	Rated current	mA	150 or less
	Sound pressure	dB	75±10 (at 1 m {3.3 ft})

TROUBLESHOOTING

Symptoms / Possible causes	Cigarette lighter		Audio					Remarks
	Does not glow	Does not return	Specific frequency band does not work	Spurious noise generated	Sound quality poor	Sound from one side only	Left and right volume different	
Connector connection faulty, harness broken, grounding faulty	○			○		○		
Fuse blown	○							
Cigarette lighter faulty	○	○						
Antenna and antenna cable connection faulty				○				
Speaker faulty			○	○	○	○	○	
Left and right speaker impedance different							○	

https://truckmanualshub.com/

Accessory noise generation source

Accessory	Noise	Symptoms
Alternator	Whistling	High pitch sound when accelerator pedal suddenly depressed (Stops soon after engine stopped)
Water temperature gauge	Scratching	Occurs when engine running (Continues for a while after engine stops)
Engine oil pressure switch	Rattling	Depends on engine speed (Does not occur during idling)
Fuel gauge unit	Scratching	Occurs when engine suddenly revved, while running on rough roads, or starter switch turned ON
Flasher unit	Banging	When turn signal blinks
Horn	Hissing	Occurs when horn button pressed or released
Wiper motor	Whining	Depends on windshield wiper speed
Washer motor	Whining	When windshield washer operates

Symptoms / Possible causes	Horn				Remarks
	No Sound	Continuous sound	Small sound	Sound quality poor	
Connector connection faulty, harness broken, grounding faulty	○				
Fuse blown	○				
Horn switch faulty	○	○			
Horn faulty	○		○	○	
Horn stay warped			○	○	
Battery voltage insufficient	○		○		
Air leaking from air system	○		○	○

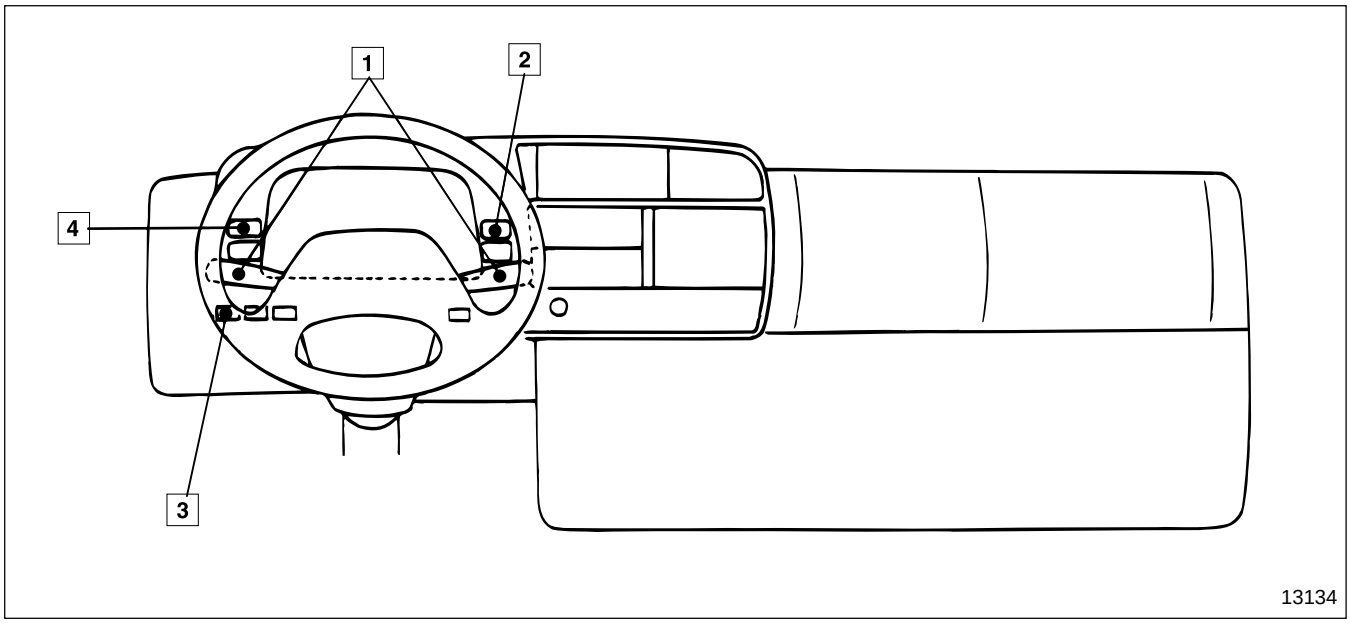
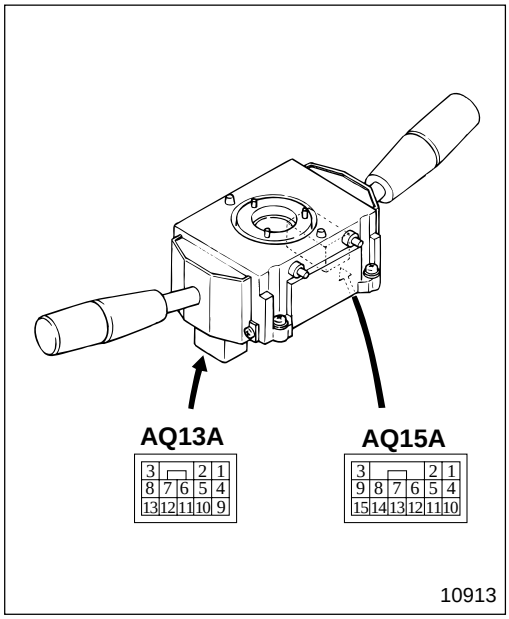
601 SWITCH

Installation Position



1 Combination switch
2 Van body dome light switch
3 Rheostat switch
4 Cold start switch



◆ Service procedure

1 **Inspection of combination switch**

- Operate combination switch **1**.
- Check for continuity between connector terminals, referring to the connector connection table.
  There is continuity between terminals ○ and ○ in the table.

- If any fault is found, replace combination switch **1**.

https://truckmanualshub.com/

AQ13A Connector connection table

		①	②	③	⑦	⑧	⑨	⑩	⑪	Body ground	Internal connection

2 **Inspection of van body dome light switch**

- Follow the table below to inspect continuity:

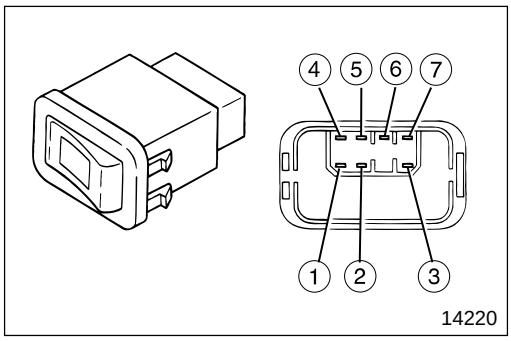
	①	⑤	⑦	LED (Operation indication light)	③
ON	○—○		○	—W—▷—	○
OFF					

○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace van body dome light switch **2**.

3 **Inspection of rheostat switch**

- Rheostat switch **3** contains a control circuit, because of this it is difficult to inspect rheostat switch **3** independently, therefore you should inspect the rheostat switch indirectly, by inspecting the system harness and the related parts.
- If no fault is found in the related parts but the system is faulty, replace rheostat switch **3**.



4 **Inspection of cold start switch**

- Follow the table below to inspect continuity:

	①	⑥	⑤	②	④	⑦	LED (Operation indication light)	③
ON	○		○			○	—W—▷—	○
OFF	○—○			○	○			

○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace cold start switch **4**.

Service standards

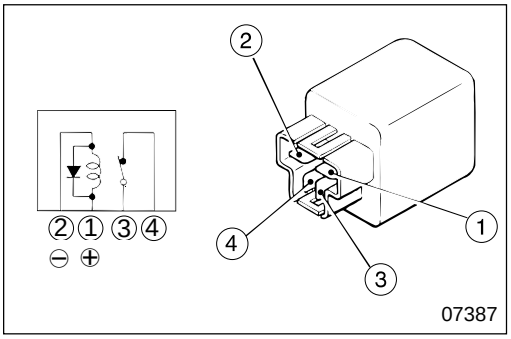
Location	Maintenance item	Standard value	Limit	Remedy
14	Exhaust brake cut relay time lag (Time lag relay)	10±3.5 seconds	—	Replace

https://truckmanualshub.com/

◆ Service procedure

1 5 6 Inspection of control unit

Since it is difficult to check each unit separately, judge the soundness of each unit indirectly by checking switches, harnesses, and related parts in the system.



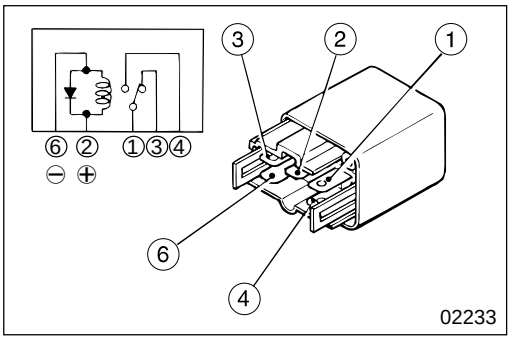
2 Inspection of relay (Close type 4-pin)

- Follow the table below to inspect continuity:

	①	②	③	④
No current	○	○		
			○	○
Current	⊕	⊖	◌	◌

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.
◌----◌ : Indicates that continuity between the terminals is lost.

- If any fault is found, replace the relay.



3 4 13 18 Inspection of relay (Open type 5-pin)

- Follow the table below to inspect continuity:

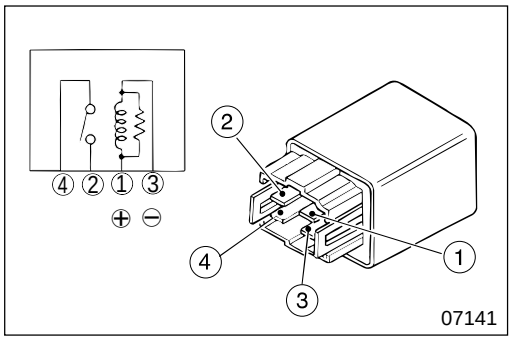
	①	②	③	④	⑥
No current	○		○		
		○			○
Current	○			○	
		⊕			⊖

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.

https://truckmanualshub.com/

604 RELAY AND CONTROL UNIT



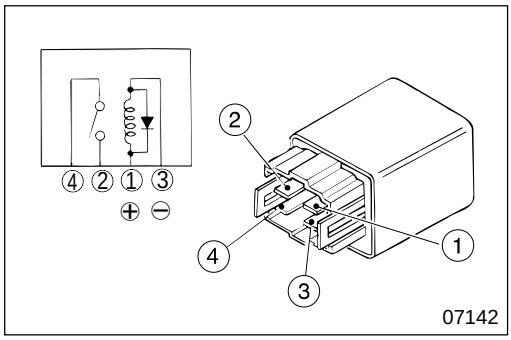
7 to 11 Inspection of relay (Open type 4-pin)

- Follow the table below to inspect continuity:

	①	②	③	④
No current	○		○	
Current	⊕		⊖	○

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.



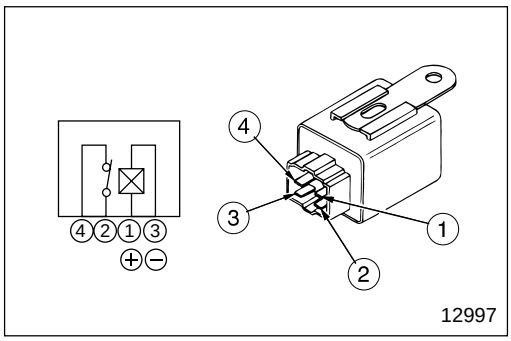
12 15 to 17 Inspection of relay (Open type 4-pin)

- Follow the table below to inspect continuity:

	①	②	③	④
No current	○		○	
Current	⊕		⊖	○

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.



14 Inspection of relay (Close type 4-pin time lag relay)

- Follow the table below to inspect continuity:

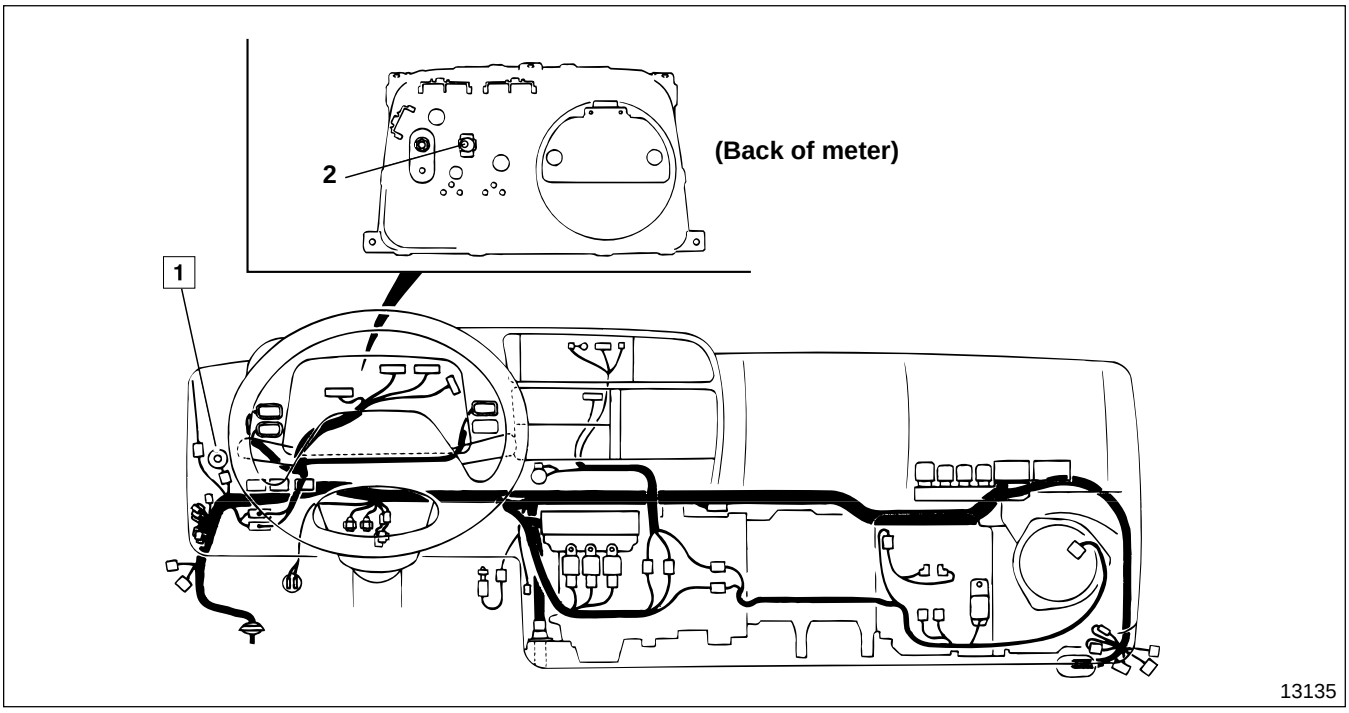
	①	②	③	④	Remarks
No current	○		○		—
Current	⊕		⊖	○ ----- ○	Measure time lag until continuity between the terminals is lost

○—○ : There is continuity between terminals ○ and ○.
⊕—⊖ : Indicates that 12 volts DC is applied to the line between the terminals.
○ ----- ○ : Indicates that continuity between the terminals is lost.

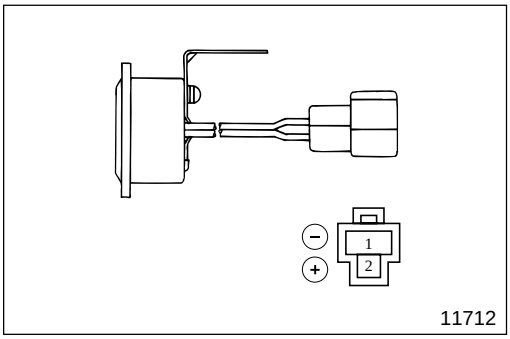
- If any fault is found, replace the relay.

https://truckmanualshub.com/

Installation Position



1 Warning buzzer
2 Meter warning buzzer 401



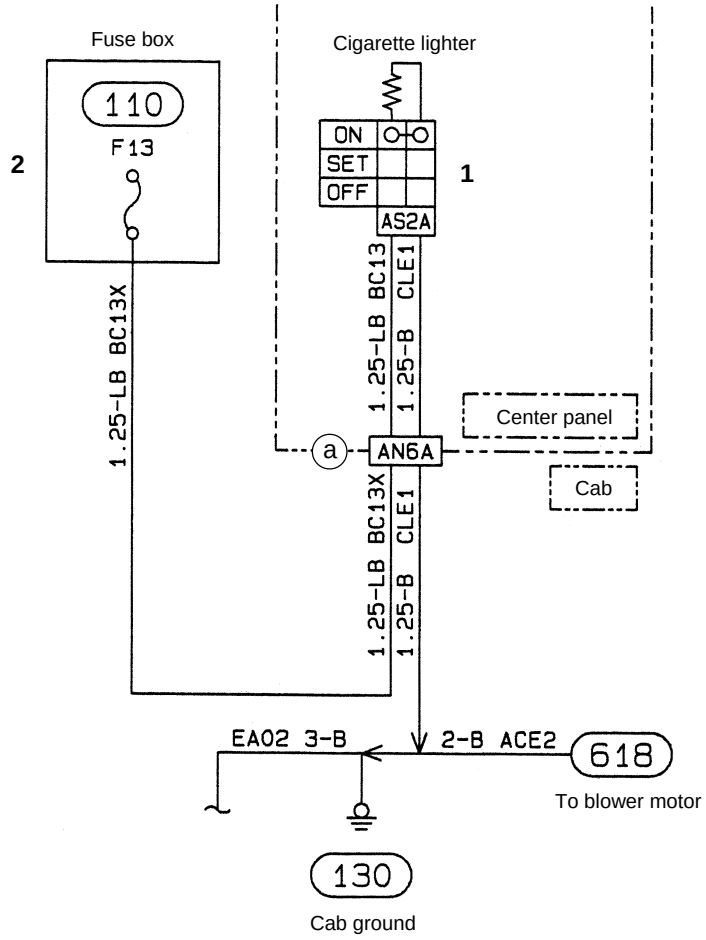
◆ Service procedure

1 Inspection of warning buzzer

- Make sure that warning buzzer **1** sounds when you apply 12 volts DC between terminals ① and ②.
- If any fault is found, replace warning buzzer **1**.

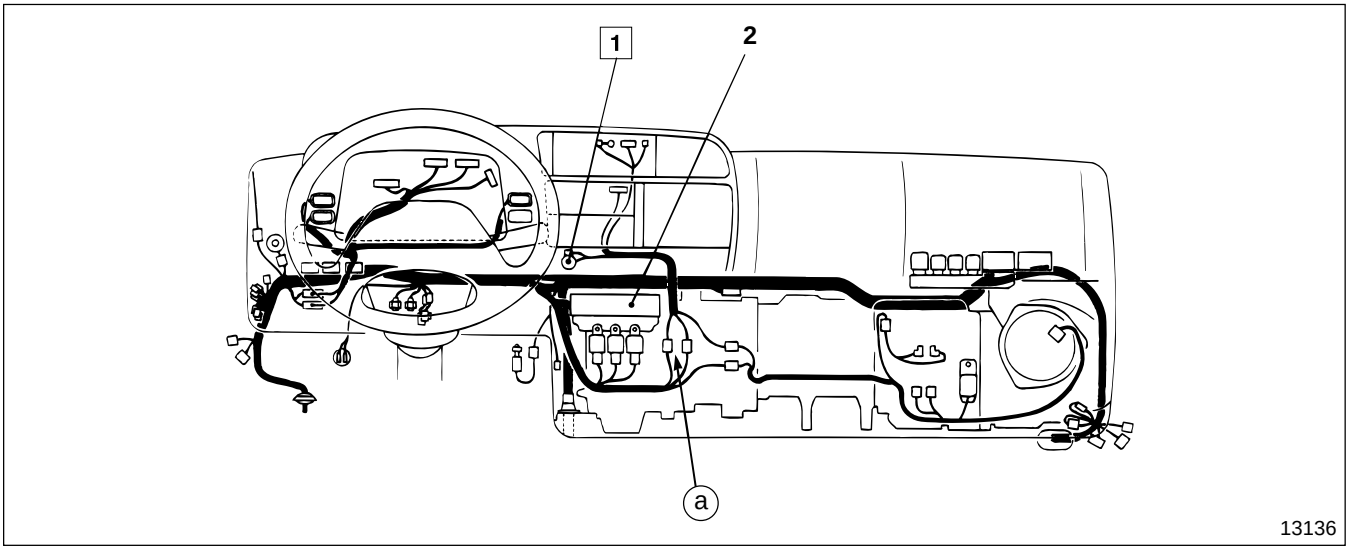
https://truckmanualshub.com/

610 CIGARETTE LIGHTER CIRCUIT



12221

https://truckmanualshub.com/

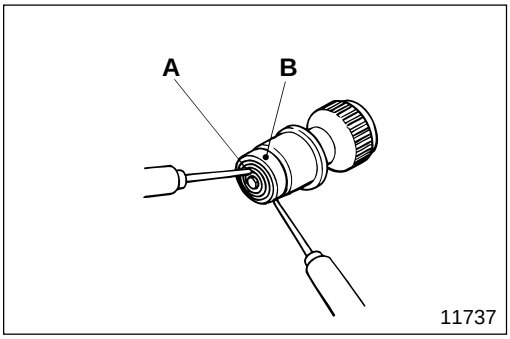


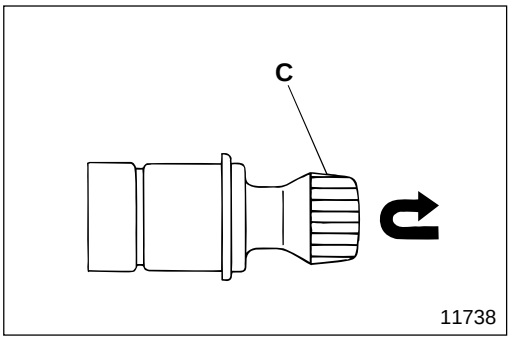
1 Cigarette lighter
2 Relay box 604
3 Fuse box 104

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
1	Cigarette lighter plug return time	15±5 seconds	—	Replace

◆ Service procedure





1 **Inspection of cigarette lighter**

Carry out the following inspection. If any fault is found, replace cigarette lighter **1** :

- Make sure that there is continuity between heater element **A** and body **B**.
- Make sure that plug **C** returns to its original position quickly when it is pushed in.
- Turn the starter switch to ACC or ON.
- Push plug **C** into the socket of the vehicle.
- Measure the time required for pushed-in plug **C** to return to its original position.
- Make sure that heater element **A** is glowing.

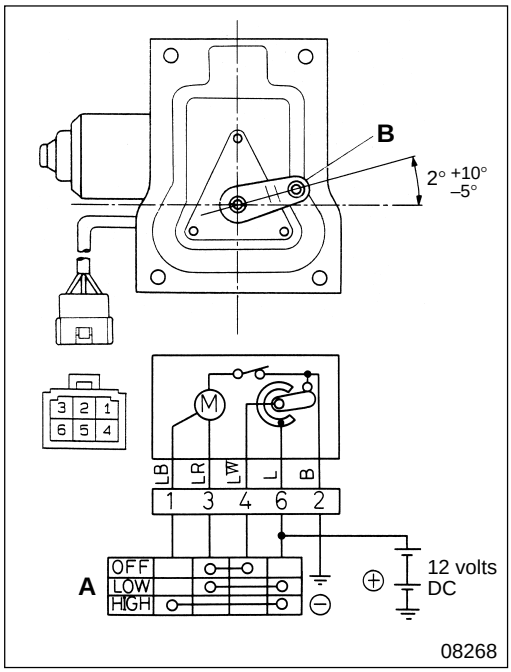
◆ Service Procedure



3 Inspection of wiper motor

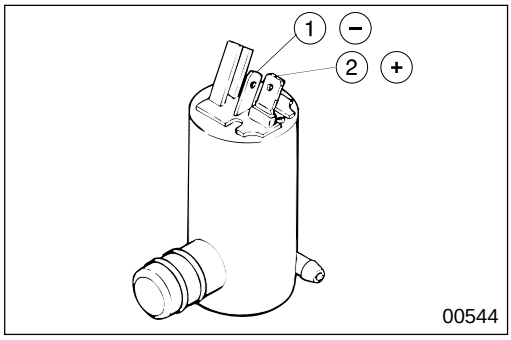
- Connect wiper motor **3** as illustrated.
  A : Switch
- Carry out the following inspection. If any fault is found, replace wiper motor **3**. Gr 42

(1) Inspection of motor operation

- Make sure that wiper motor **3** turns at high speed when you turn switch **A** to HIGH.
- Make sure that wiper motor **3** turns at low speed when you turn switch **A** to LOW.

(2) Inspection of automatic stopping position

- Turn switch **A** to LOW to turn wiper motor **3** at low speed.
- When crank arm **B** is at any position other than the automatic stopping position (other than the illustrated angle), turn switch **A** to OFF.
- Make sure that crank arm **B** stops at the automatic stopping position (within the illustrated angle).



5 Inspection of washer motor

- Apply 12 volts DC between terminals ① and ② and make sure that washer motor **5** operates.
- If washer motor **5** does not operate, replace it. Gr 42

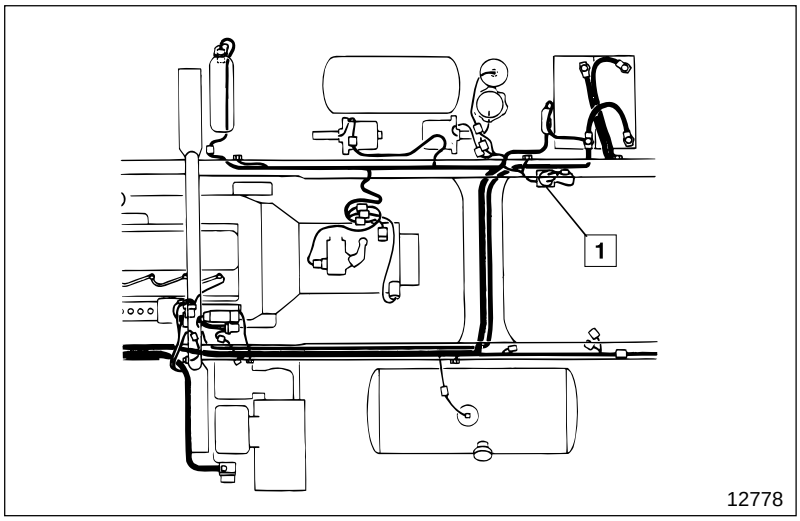
701 MAGNETIC VALVE

Installing Position

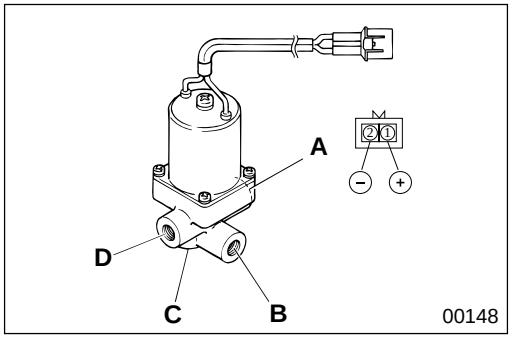


1 3-way magnetic valve

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
1	Minimum operating voltage of 3-way magnetic valve  14318	10 V or less	—	Replace

◆ Service procedure



1 Inspection of 3-way magnetic valve

Carry out the following inspection. If any fault is found, replace 3-way magnetic valves **1** :

Air circuit table (There is air continuity between terminals ○ and ○.)

	Input port B	Output port D	Unused A	Exhaust port C
ON	○	○		
OFF		○		○

(1) Operation inspection

- Apply voltage between terminals ① and ②, increasing gradually from 0 volt.
- Measure voltage (minimum operating voltage) when magnetic valves **1** starts operating. (You can tell if the magnetic valves are ON or OFF by listening for an operating sound.)

(2) Airtightness inspection

- When magnetic valve is ON :
  - Close output port **D**.
  - Apply **12** volts DC between terminals ① and ②.
  - Make sure that there is no air leaking from exhaust port **C** when air pressure (295 to 980 kPa {43 to 140 lbf/in^2, 3 to 10 kgf/cm^2}) is applied to input port **B**.
- When magnetic valve is OFF :

  Make sure that there is no air leaking from exhaust port **C** or output port **D** when air pressure (295 to 980 kPa {43 to 140 lbf/in^2, 3 to 10 kgf/cm^2}) is applied to input port **B**.

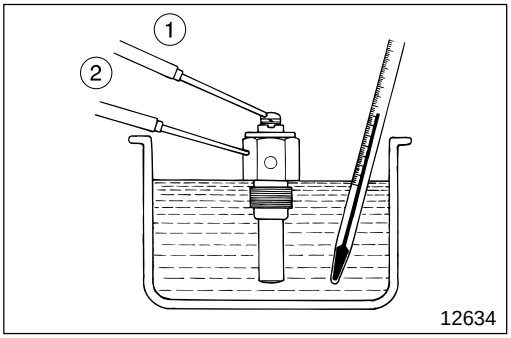
8 Inspection of water temperature sensor

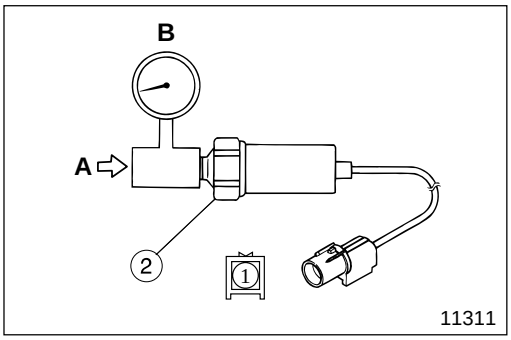
- Place water temperature sensor **8** in engine oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the resistance between terminal ① and the body, and terminal ② and the body.
  Terminal ① : Water temperature gauge connection
  Terminal ② : Multipurpose timing control unit connection
- If the measured value deviates from the standard value, replace water temperature sensor **8**. Gr 14



9 Inspection of overheating switch

Carry out the following inspection. If any fault is found, replace overheating switch **9**. Gr 14

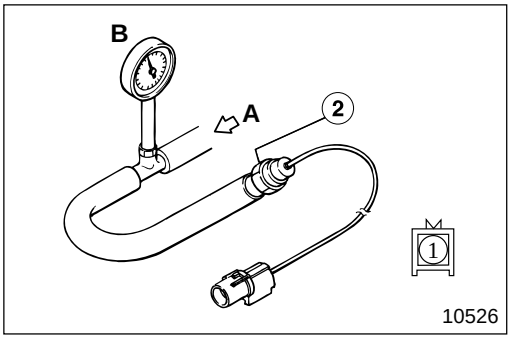
- Make sure that there is no continuity between terminals ① and ② (Body) at room temperature (20°C {68°F}).
- Place overheating switch **9** in a container filled with engine oil and raise the oil temperature while stirring the oil.
  Measure the temperature when there is continuity between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.
- Lower the oil temperature and measure the temperature when continuity is lost between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.



11 Inspection of engine oil pressure switch

Carry out the following inspection. If any fault is found, replace engine oil pressure switch **11**. Gr 12

- Make sure that there is continuity between terminals ① and ② (Body) when air pressure **A** is not applied to engine oil pressure switch **11**.
- Apply air pressure **A** to engine oil pressure switch **11** gradually starting from 0 kpa {0 lbf/in^2, 0 kgf/cm^2}.
  Measure the air pressure when continuity is lost between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.
  B : Air pressure gauge



12 Inspection of engine oil bypass alarm switch

Carry out the following inspection. If any fault is found, replace engine oil bypass alarm switch **12**. Gr 12

- Make sure that there is no continuity between terminals ① and ② (Body) when air pressure **A** is not applied to engine oil bypass alarm switch **12**.
- Apply air pressure **A** to engine oil bypass alarm switch **12** gradually starting from 0 kpa {0 lbf/in^2, 0 kgf/cm^2}.
  Measure the air pressure when continuity is present between terminals ① and ② (Body), and make sure that the measured value conforms to the standard value.
  B : Air pressure gauge

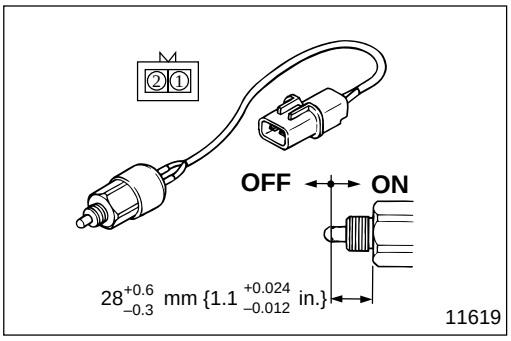
◆ Service procedure



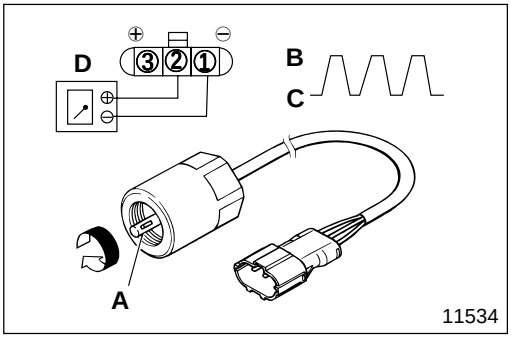
1 **Inspection of Backup lamp switch**

- Follow the table below to inspect continuity

	①	②
OFF		
ON	○—○	

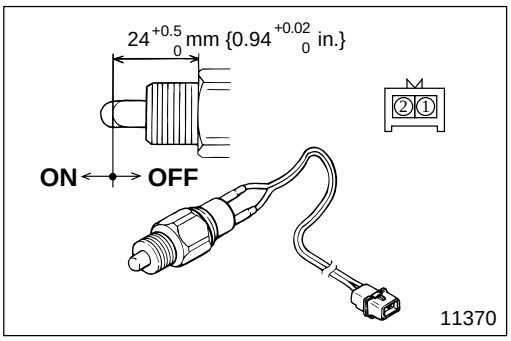
○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace backup lamp switch **1**. Gr 22



2 **Inspection of vehicle speed sensor**

- Apply 12 volts DC between terminals ① and ③, and rotate shaft **A** of vehicle speed sensor **2** slowly.
- At this state, measure the maximum voltage (High pulse voltage **B**) and the minimum voltage (Low pulse voltage **C**) generated between terminals ① and ②.
  D : Tester
- If the measured value deviates from the standard value, replace vehicle speed sensor **2.** Gr 22



3 **Inspection of transmission neutral switch**

- Follow the table below to inspect continuity

	①	②
OFF		
ON	○—○	

○—○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace transmission neutral switch **3**. Gr 22

905 JOINT CONNECTOR 54-9-6

910 MULTIPURPOSE TIMING CONTROL UNIT CIRCUIT 54-9-8

https://truckmanualshub.com/

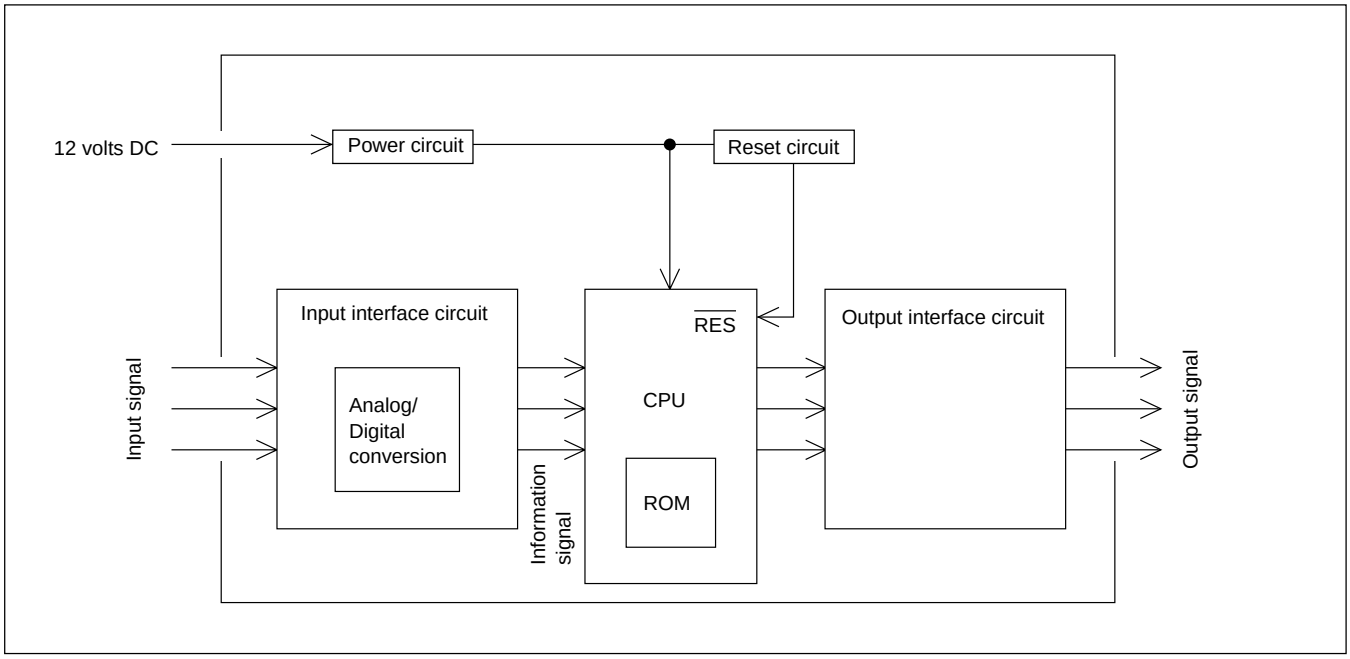
Multipurpose Timing Control Unit

- The multipurpose timing control unit controls the following functions:

Intermittent wiper activation function	Gr 42
Wiper activation function (Even if the wiper switch is OFF, this function automatically activates the wiper when the window washer works)	Gr 42
Engine preheating function	Gr 54-2-6
Water level warning function	Gr 14

- Sensors and switches are fitted to these systems as information sources for the multipurpose timing control unit.
- Using the information provided, circuits in the multipurpose timing control unit control the functions mentioned above.

● Internal structure of multipurpose timing control unit



- The internal structure mainly consists of the input interface circuit, *1CPU, *2ROM, and the output interface circuit.
  - *1CPU : Central Processing Unit. Compares the input information with information stored in the memory to output commands.
  - *2ROM : Read Only Memory. Stores fixed data and programs that are not erased even after the power is turned off.
- Input signals are transmitted from information sources, such as sensors and switches, to the input interface circuit.
- The input interface circuit converts these input signals from analog signals to digital signals. This enables the CPU to calculate data and transmits them to the CPU as information signals.
- The CPU compares the information signals with the data in the ROM, calculates the signals, and sends them to the output interface circuit.
- The output interface circuit issues commands to systems, based on the above comparison and calculated results, as output signals.
- Sequential execution of the above processes allows optimum control over functions.

1. SPECIFICATIONS

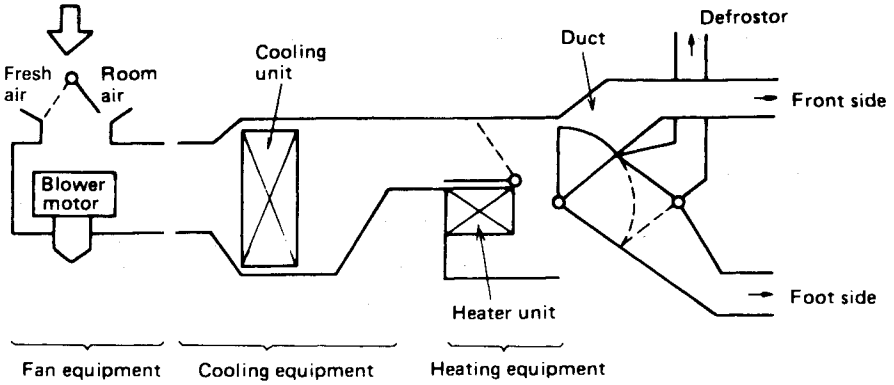
Item			Description
Vehicle name & model			FE
*Cooling capacity (on JIS conditions)			4,200 W (3,600 kcal/h, 14,300 B.T.U/h)
Compresssor	Model		MSC90T
	Displacement		90 cc
	Maximum revolution		MAX 9,000 min^{-1} (9,000 rpm)
	Compressor oil		SUNPAG 56, 120cc (7.3 cu.in)
Magnetic clutch	Type		Dry single disc magnet
	Voltage & input		DC 12V, 38 W
Cooling unit assembly	Type		Laminated type
Controls	Air flow control		Rotary switch, Four step type
	Temperature control		Electric thermostat
Condenser	Type		Corrugated fin type
Receiver assembly			Cylinder type, approx 350 cc (21.4 cu.in)
Protective equipment	Frost prevention (thermostat)		OFF : 33 °F (0.5 °C) ON : 38 °F (3.5 °C)
	Relief valve		Open : 3.50 ~ 4.10 MPaG (508 ~ 594 Lb/in^2G, 35.7 ~ 41.8 kgf/cm^2G) Close : 2.94 MPaG (427 Lb/in^2G, 30 kgf/cm^2G)
	Dual pressure switch	Low pressure switch	OFF : 0.2 MPaG (28 Lb/in^2G, 2 kgf/cm^2G) ON : 0.225 MPaG (32 Lb/in^2G, 2.25 kgf/cm^2G)
		High pressure switch	OFF : 2.94 MPaG (418 Lb/in^2G, 30 kgf/cm^2G) ON : 2.35 MPaG (334 Lb/in^2G, 24 kgf/cm^2G)
	Fuse (Blower fan) Fuse (Magnetic clutch)		15 A 15 A
Refrigerant and quantity			HFC - 134a, 1.4 lb (650 g)

*The * marked cooling capacity is based on JIS conditions
Compressor speed : 1,800 rpm
Condensing temperature : 131 °F (55 °C)
Cooling unit inlet air dry bulb temperature : 80.6 °F (27 °C)
Cooling unit inlet air wet bulb temperature : 67.1 °F (19.5 °C)
Terminal voltage : DC 12V

https://truckmanualshub.com/

2. OUTLINES OF REFRIGERATION SYSTEM

2.1 Air system



Cooling operation

Fresh air is induced to the cooling unit assembly by a blower fan, where it is cooled down and dehydrated, then discharged at the front side outlet through a duct.

Heating operation

Fresh air is induced to the heater unit by a blower fan through the cooling unit assembly, where it is heated, then discharged at the foot side outlet through a duct.

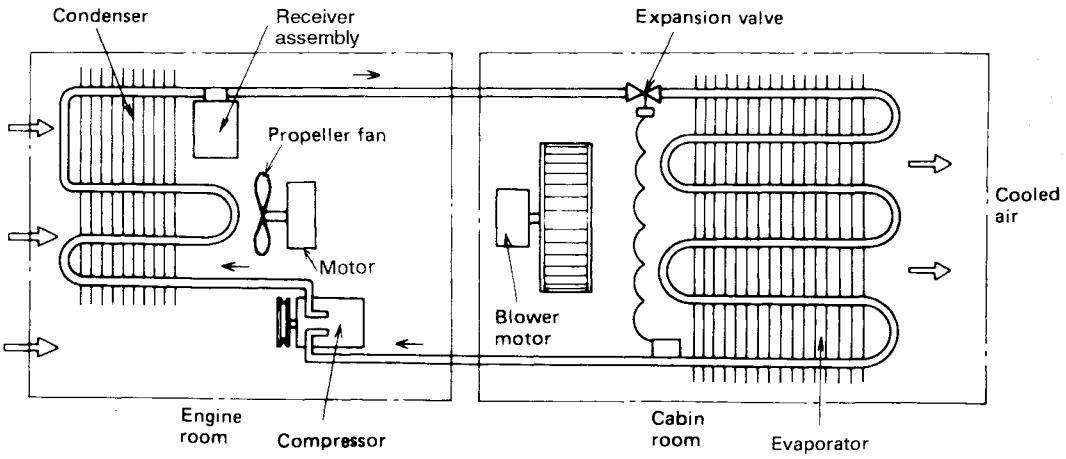
Dehumidifying operation

Fresh air is induced to the cooling by a blower fan,where it is cooled down and dehydrated,and succeedingly to the heater unit for warming, then discharged at the front side outlet through a duct.

Temperaure control

Cooled air and warmed air are mixed for temperature control of the room inside.

2.2 Refrigerating cycle



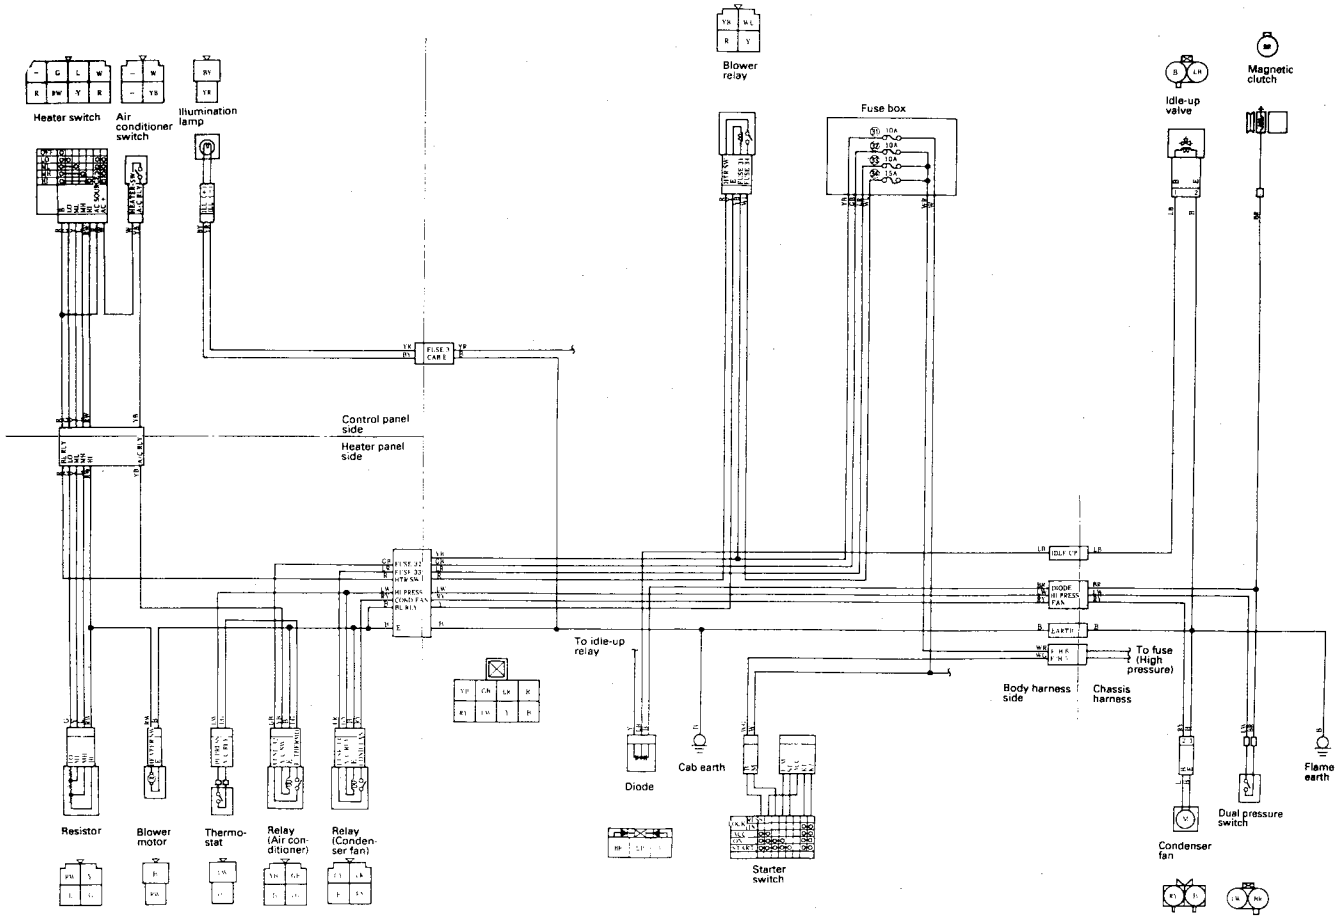
https://truckmanualshub.com/

While the refrigerant, HFC-134a is cooling the air drawn into the evaporator, it evaporates and becomes a gas. This gas is compressed to high pressure and temperature in the compressor, and sent into the condenser where it is cooled and becomes liquid.

This cooling in the condenser is carried out by the open air passing through the condenser sucked by radiator fan and vehicle motion of the vehicle. The liquid refrigerant flows through the receiver assembly where water and dirt are removed, and then it enters the expansion valve. Here the liquid refrigerant is throttled and changed to a mixture of liquid and gas in low temperature and low pressure, and is sent to the evaporator.

In the evaporator, the refrigerant absorbs heat from the surroundings and becomes a gas. That is, because the evaporator itself is cooled at this time, the return air to the cooling unit is cooled, and the interior of the vehicle becomes cool. In this way the refrigerant flow makes a complete circuit.

2.3 Electrical system



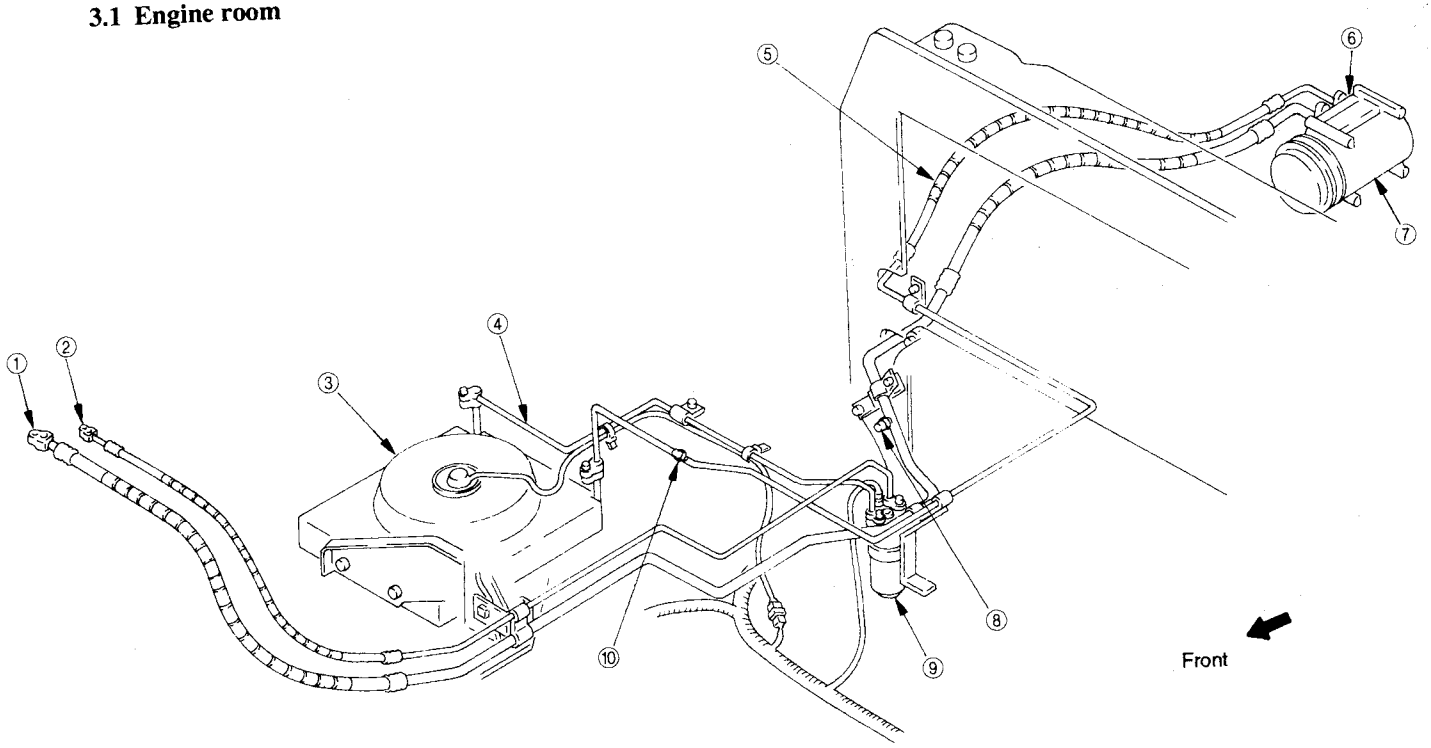
The power source is supplied from the TRUCK battery. When the blower switch is put ON, the power relay becomes ON, and electricity is connected to the magnetic clutch of the compresssor. The magnetic clutch switches ON or OFF by air conditioner switch, thermostat, and low pressure switch as the controls for operation service, or safety protection.

The cabin room air temperature is set to a preset point by adjusting the temp.control lever, and the opening degree of the air mix damper.

https://truckmanualshub.com/

3. CONSTRUCTION

3.1 Engine room



① Suction hose
② Liquid hose
③ Side condenser assembly
④ Pipe (LQ)
⑤ Discharge hose
⑥ Relief valve
⑦ Compressor & clutch assembly
⑧ Check valve (LP)
⑨ Receiver assembly
⑩ Check valve (HP)

② Heater unit
③ Cooling unit assembly
④ Blower motor
⑤ Drain hose
⑥ Resistor

https://truckmanualshub.com/

3.3 Control system

(1) Controls in panel
Do not run the air conditioner when it is child.

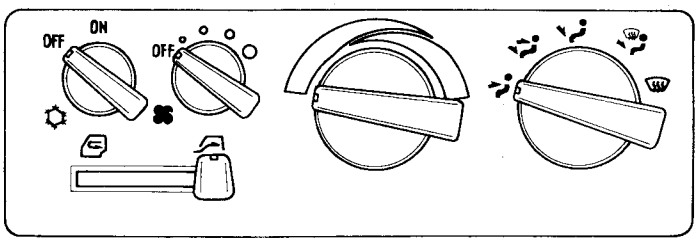
Air conditioner switch
By select the air conditioner switch initially in cooling or drying operation, the compressor starts running.

Fan switch
The air flow is selectable, out of the below four volume.

OFF	No air flow
○	Gentle
○	Low
○	Medium
○	High

Air outlet mode select switch
The air outlet is selected by positioning in cooling and heating operation.

- .....The conditioned air is discharged at the center and both side outlets directed by the louvers as required.
- .....The conditioned air is discharged at the center and both side and foot outlets directed by the louvers as required.
- .....The conditioned air is discharged at the foot outlets directed by the louvers as required.
- .....The conditioned air for dehumidifying is discharged at the foot outlets and to the front glass.
- .....The conditioned air for dehumidifying is discharged to the front glass.



Shift lever, air sirculation
The resirculation air is selectable out of the below sirculation models.

- .....ROOM AIR CIRCULATION
- .....FRESH AIR INTAKE

Temperature control switch
The discharged air temperature is controllable by selecting the position of the control lever in cooling, heating or drying operation.

BLUE ZONE ..... For cool air blow

RED ZONE ..... For warm air blow

By turning the switch toward the BLUE and RED ZONE sides, the supply air temperature becomes more cooler and warmer respectively.

https://truckmanualshub.com/

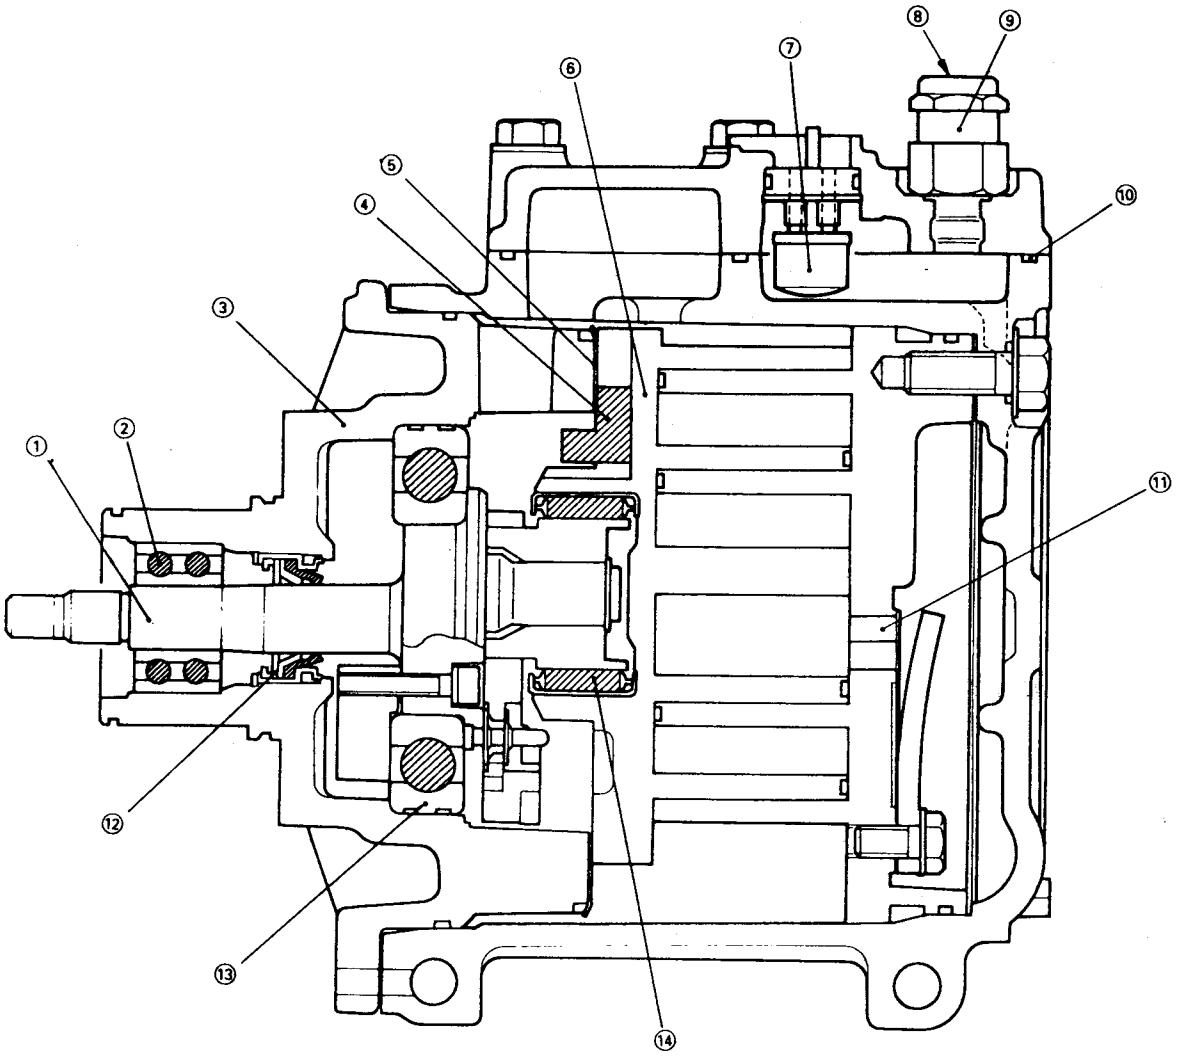
(2) Oeration control

Operation mode	Setting control lever	Air delivery	Remarks
COOL			Earlier cooling service, or conditioning at dusty, polluted air prevailing places: Shift lever, air circulation – –
HEAT			Earlier cooling service, or conditioning at dusty, polluted air prevailing places: Shift lever, air circulation Air outlet mode select switch —
DEHUMIDIFY			Wetty conditioning in head cooled, and foot warmed : Shift lever, air outlet Air outlet mode select switch —
DEFROST			
VENTILATION			

https://truckmanualshub.com/

3.4 Compressor and clutch assembly

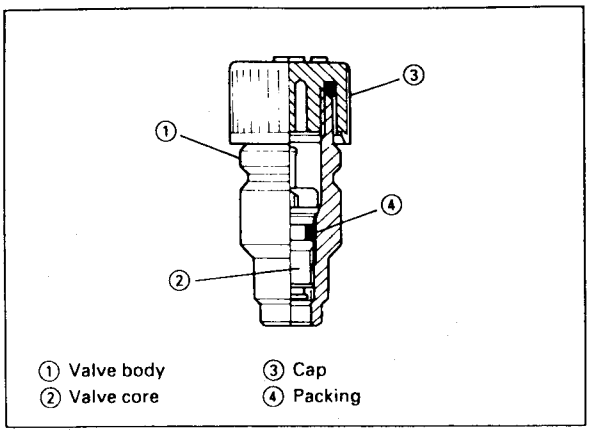
3.4.1 Compressor



① Crankshaft
② Bearing
③ Front case assembly
④ Housing assembly
⑤ Thrust plate
⑥ Orbit scroll assembly
⑦ Thermostat
⑧ Dust seal
⑨ H/P relief valve
⑩ O ring
⑪ Port hole
⑫ Shaft seal
⑬ Bearing
⑭ Needle bearing

https://truckmanualshub.com/

3.4.2 Check valve

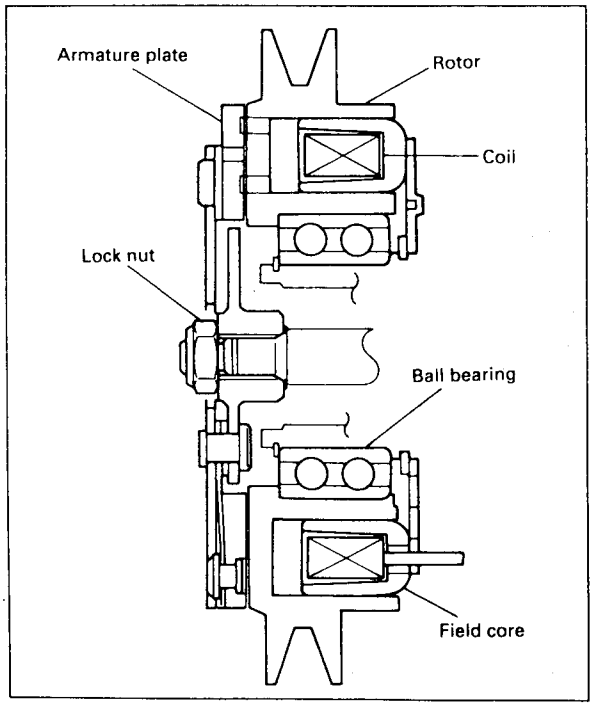


The suction hose and discharge hose are provided with check valve, and designed for gas evacuation and charging service. (shown above)

In the valves, a valve rubber tube, as in automobile tire tubes, is provided as shown in the figure.

Slackening the flare nut on the gauge manifold causes the passage to close automatically by the spring force, and tightening the flare nut causes the passage to open while pressing the compressed spring.

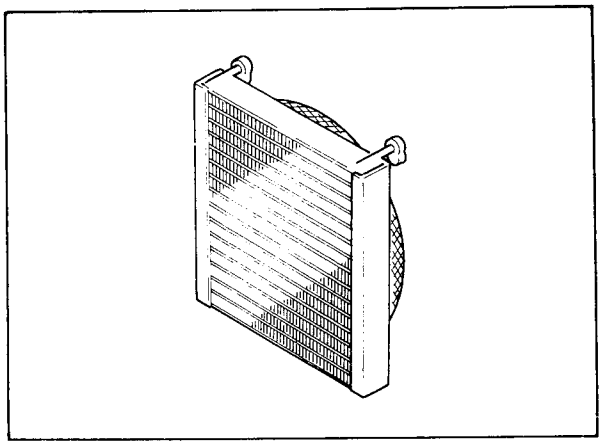
3.4.3 Magnetic clutch



The magnetic clutch is mounted on the compressor crankshaft to start and stop the compressor.

This means that the magnetic clutch is actuated to control the compressor operation electrically by the thermostat.

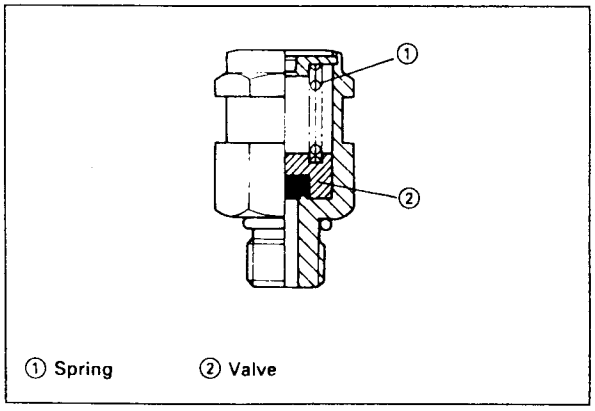
3.5 Side condenser assembly



The condenser is a means to liquefy the refrigerant gas. As the condenser is cooled by the air pulled in by the condenser fan, the refrigerant in the condenser is cooled into liquid. Therefore, when any obstacle prevents the air from flowing evenly to the condenser or the air flow is short circuited, the cooling effect is reduced, with a decrease in the performance of the condenser. When the vehicle is driven at a high speed, the air flow increases resulting in an increase of the cooling effect, and performance of the condenser.

3.6 Relief valve

The relief valve is mounted to the compressor & clutch assembly. The relief valve is usually closed by spring. If pressure of refrigerant in air conditioner system is higher than spring pressure, refrigerant is discharged from relief valve. The pressure drop due to discharge refrigerant, and relief valve is closed again.

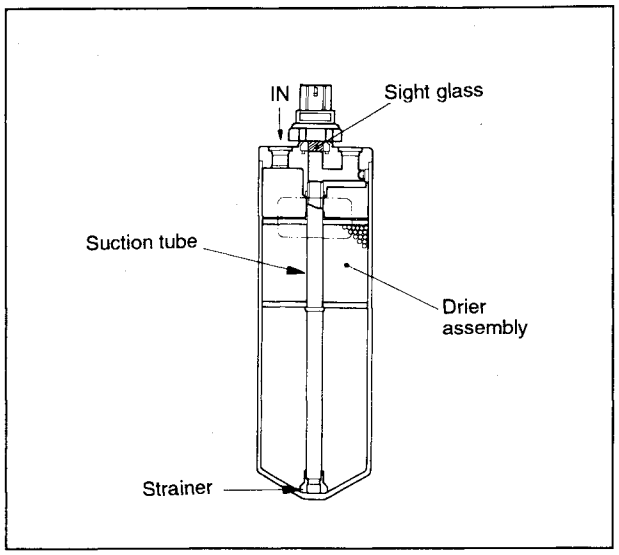


Preset : MPaG (Lb/in²G, kgf/cm²G)

Open	3.50~4.10 (508~594, 35.7~41.8)
Close	2.94 (427, 30)

https://truckmanualshub.com/

3.7 Receiver assembly



A receiver assembly is served as a refrigerant reservoir located between the condenser and the expansion valve.

The receiver assembly consists of a filter and a sight glass. The filter is used to remove dust, the drier is used to remove moisture from the refrigerant in the circuit, and the sight glass is used to check the refrigerant charge.

Any moisture in the refrigerant may not only corrode metal surfaces in the refrigerant circuit, but also cause the throttle of the expansion valve to be frosted, resulting in the interruption of refrigerant circulation.

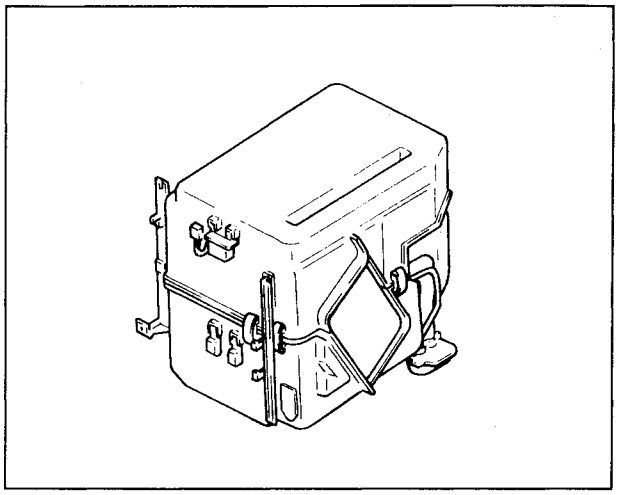
Therefore,the receiver assembly must be handled very carefully. When storing or installing it,care should be taken to protect it from the deterioration of drying performance due to exposure to the air.

The retardation of heat exchange, or any fire around the refrigerant circuit will cause excessive pressurization or heating of the refrigerant. Should such an accident occur, the refrigerant in the circuit must be expelled to the outside to prevent the above hazards.

The sight glass is a sort of peep window used to check the refrigerant flow in the refrigerant circuit.

The sight glass appears clear when the refrigerant flow is enough, and shows bubbles flowing when the refrigerant flow is short.

3.8 Cooling unit assembly



Evaporator core

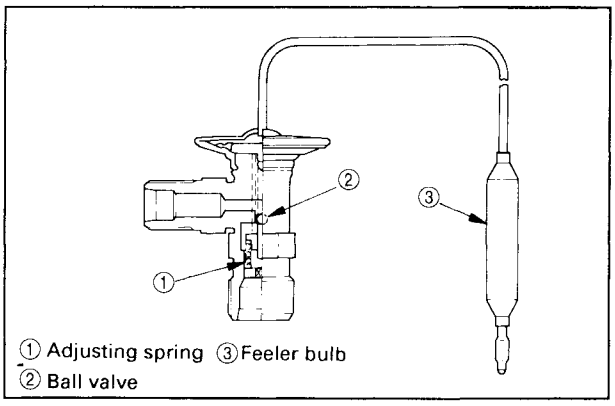
The evaporator core is a type of corrugated fin and tube.

The tube is arranged in zigzag to achieve high efficiency, and to make the core system compact.

A thicker reinforced plastic plate is used as the enclosure to inclease heat and shock resistance,and to protect the core from humidity. This case is a split type, and in a simple design to facilitate installation on the floor panel and the instrument panel frame of the vehicle.

3.9 Expansion valve

The expansion valve is mounted at the inlet of the cooling unit. The liquid refrigerant from the receiver is led to it through a narrow passage (for throttle action), where-in, the liquid refrigerant is condensed with pressure dropping and at the same time the flow rate is adjusted before the refrigerant is sent to the cooling unit. The refrigeration load in the cooling unit is not constant, but usually fluctuates over a certain range. So the refrigerant flow should undergo the control in design. An automatic expansion valve performs this function automatically. The air conditioner uses a thermal type automatic expansion valve.



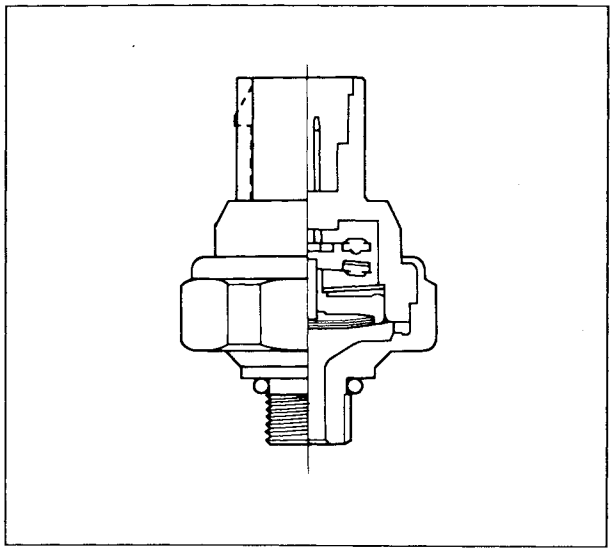
https://truckmanualshub.com/

3.10 Dual pressure switch

The dual pressure switch, fixed to the receiver functions as a protector for stopping the compressor (OFF) at a preset value of pressure in the refrigerant circuit.

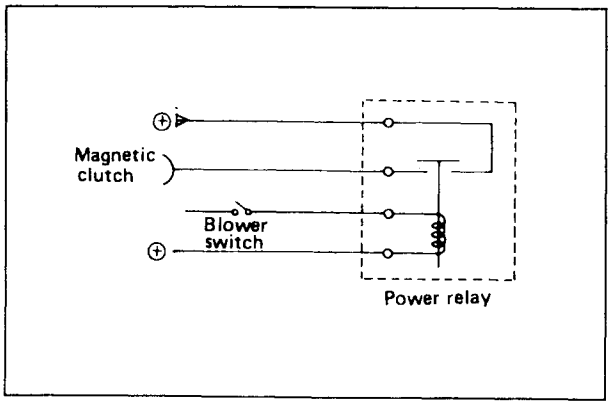
Preset : MPaG (Lb/in²G, kgf/cm²G)

	L.P.SW	H.P.SW
OFF	0.2 (28, 2)	2.94 (418, 30)
ON	0.225 (32, 2.25)	2.35 (334, 24)



3.11 Power relay

The power relay is excited at a closed position of the micro switch and enables the magnetic clutch to be ready for engaging electrically.

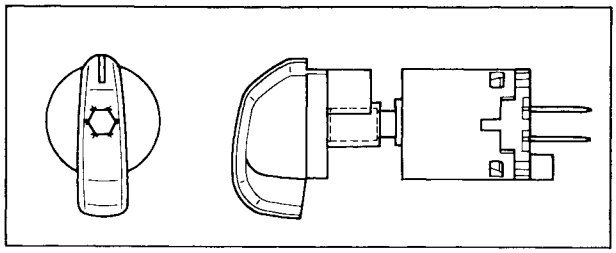


3.12 Air conditioner switch

The air conditioner switch functions as an operation controller for starting or stopping the compressor in cooling and dehumidifying

Set the it to the "ON" position, the magnetic clutch becomes engaged and the compresssor starts.

Set the it to the "OFF" position, the magnetic clutch becomes disengaged and the compresssor stops.



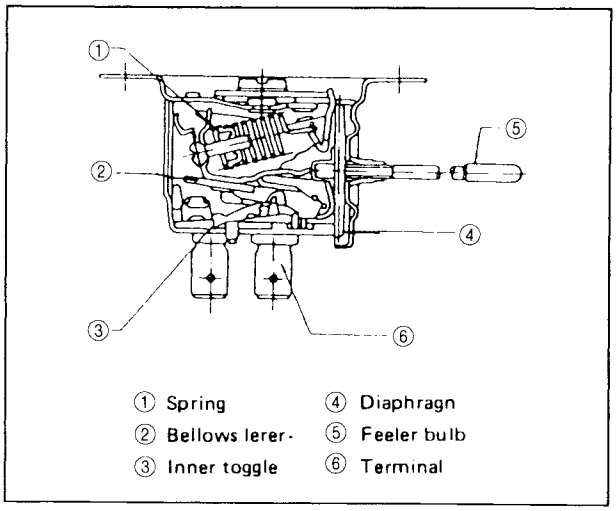
3.13 Thermostat

The thermostat is mounted on the evaporator case.

It senses the temperature of the evaporator fins, and controls the compressor operation for ON or OFF as specified below.

Preset : °F(°C)

OFF	33 (0.5)
ON	38 (3.5)



https://truckmanualshub.com/

4. TROUBLE SHOOTING

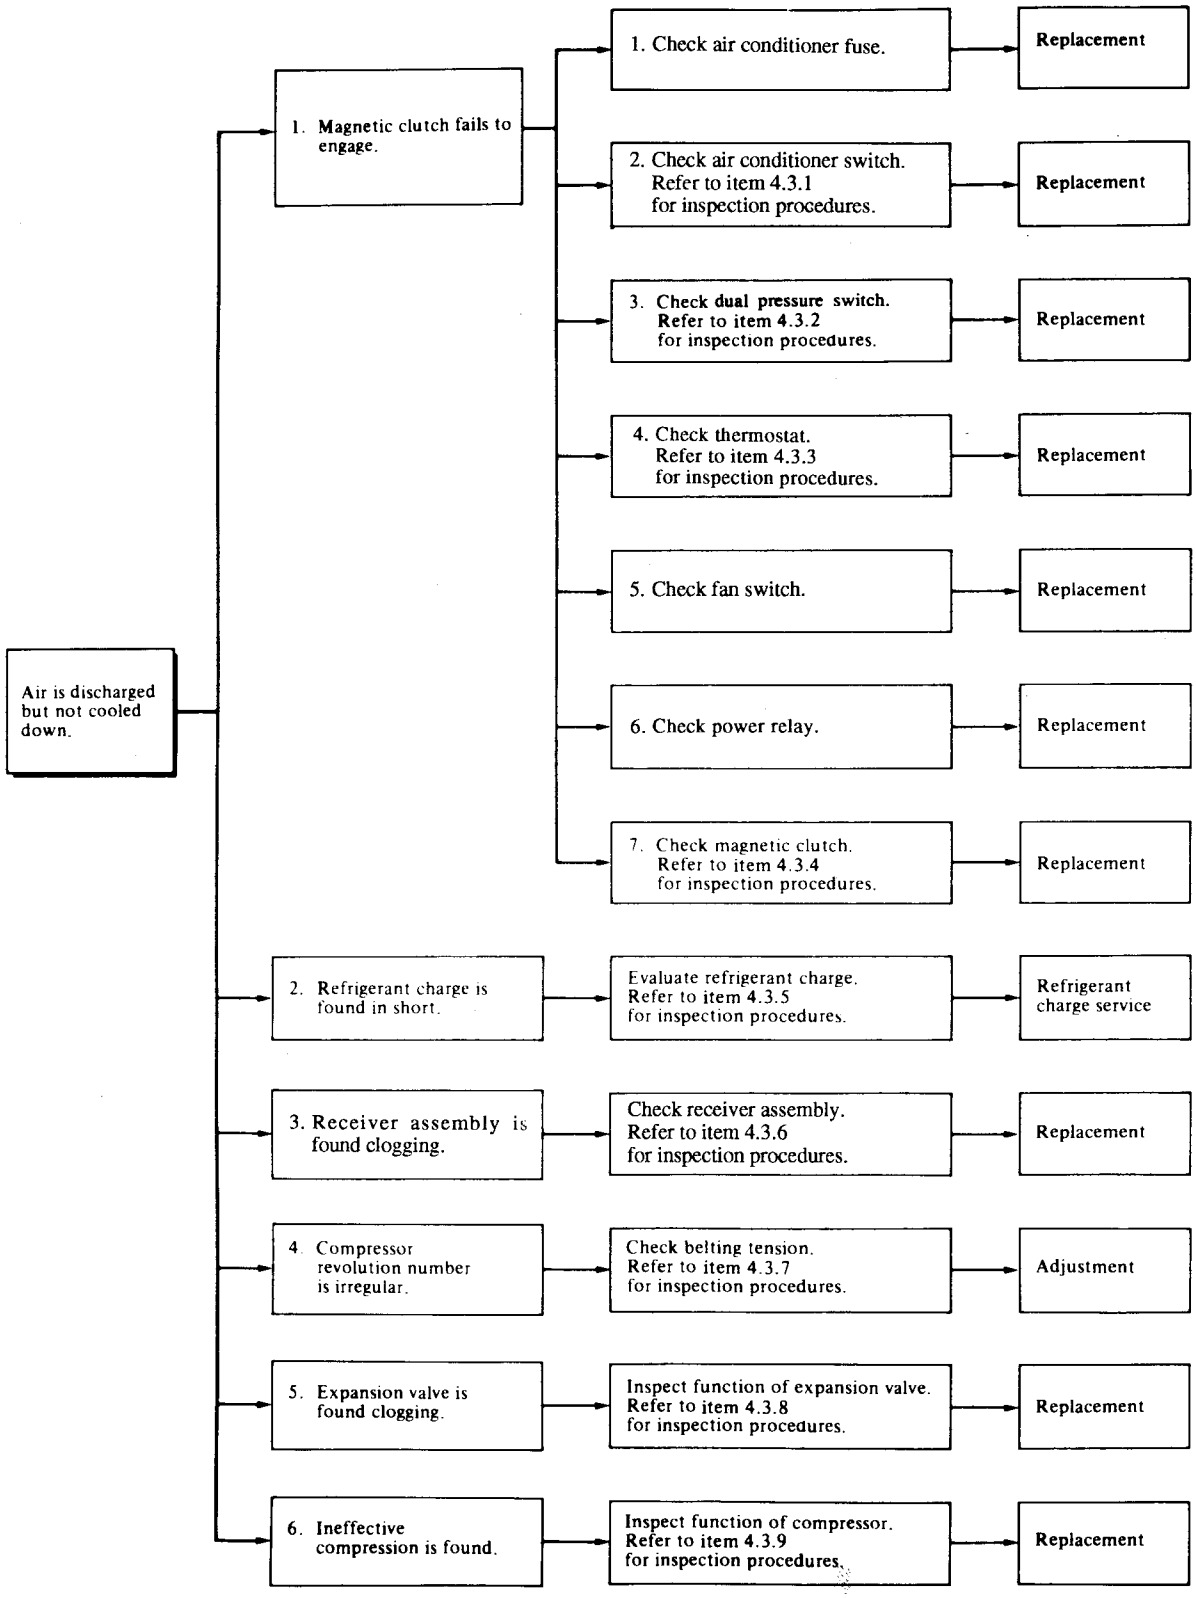
4.1 General precautions

(1) When handling refrigerant (HFC-134a), the following precautions must be observed.
   a. Always wear eye protection and a pair of gloves which handling refrigerant.
   b. Be careful the liquid refrigerant dose not contact the skin.
   c. Keep the refrigerant container blow 100 degrees F (40 degrees C).
   d. Do not handle the refrigerant in an enclosed area having an open flame.The refrigerant may produce a poisonous gas.
   e. When dumping the refrigerant from the system, release it slowly so as not to expell all the compressor oil.

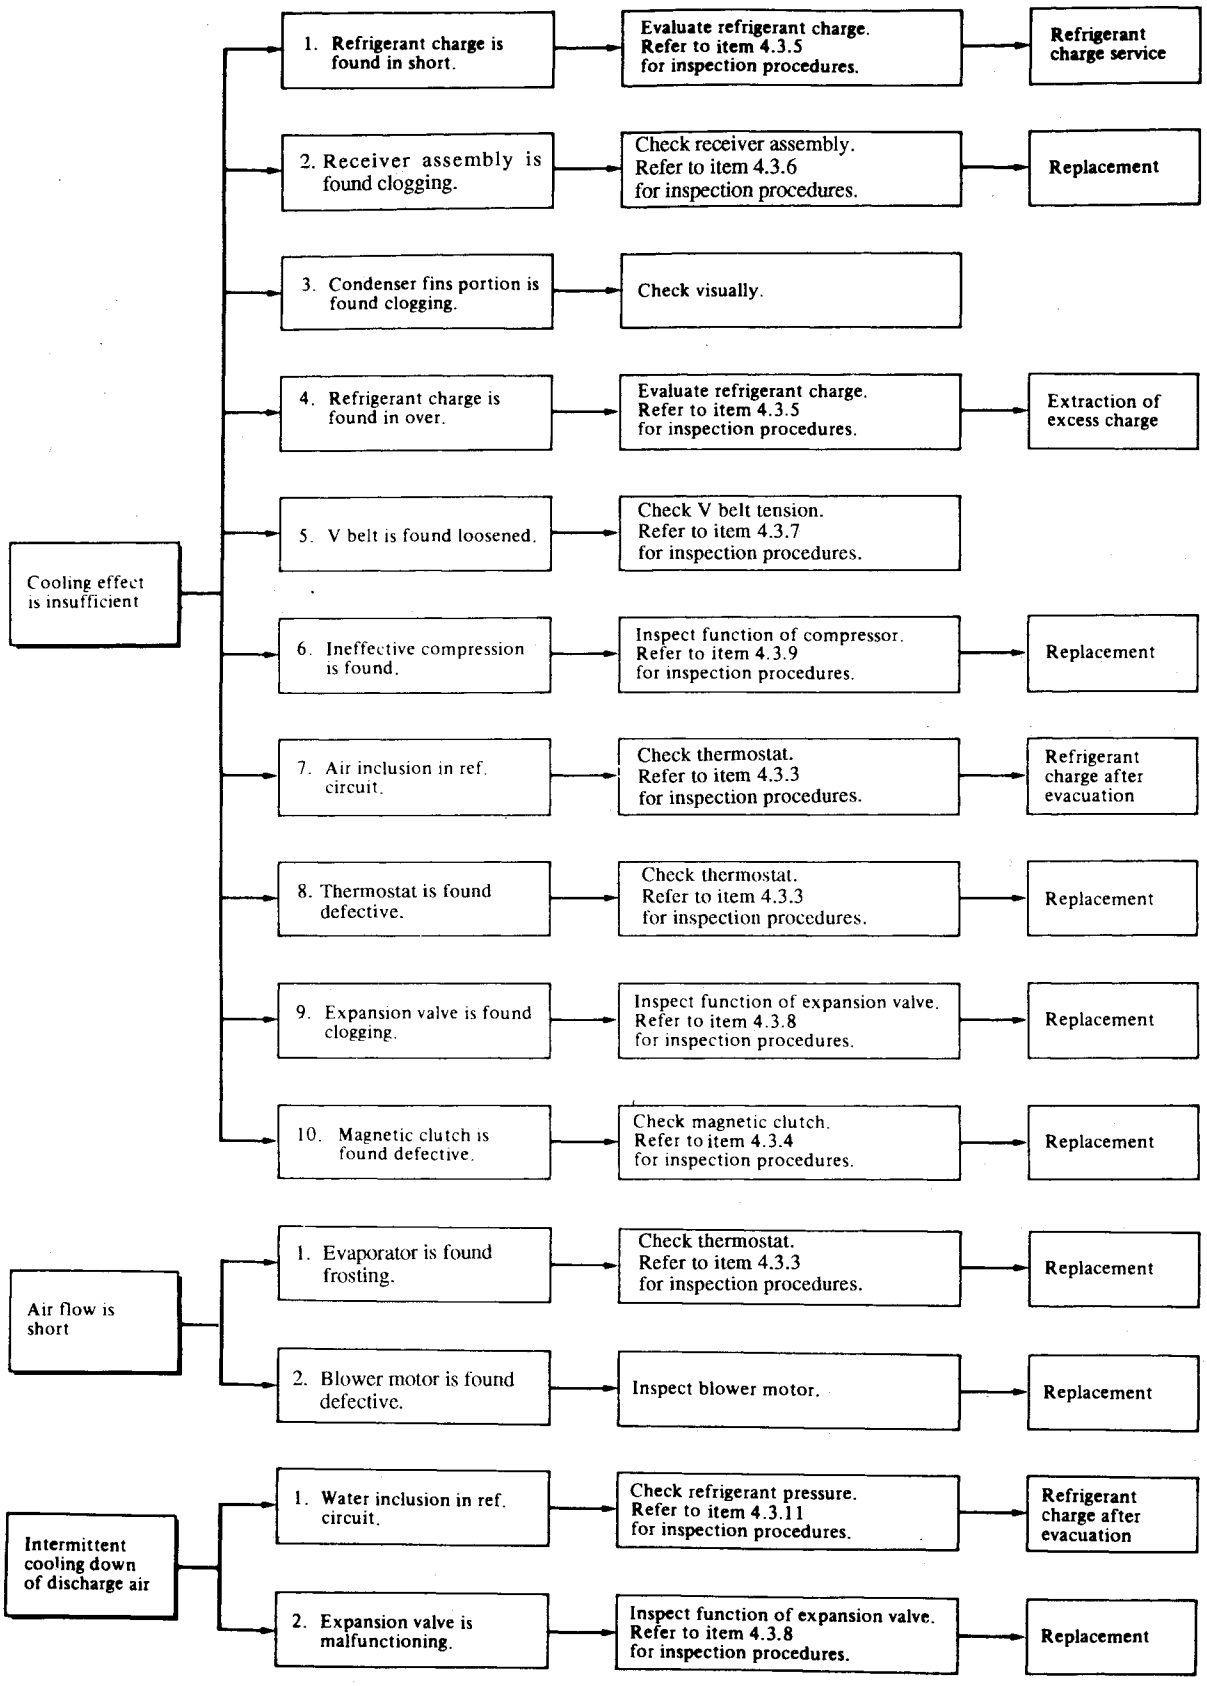
(2) If liquid refrigerant strikes eye or skin.
   a. Do not rub eye or skin.
   b. Splash large quantities of cool water on the eye or skin.
   c. Rush to a physician or hospital for immediate professional treatment.

https://truckmanualshub.com/

4.2 Trouble cause and remedy



https://truckmanualshub.com/



https://truckmanualshub.com/

ection procedures

r conditioner switch

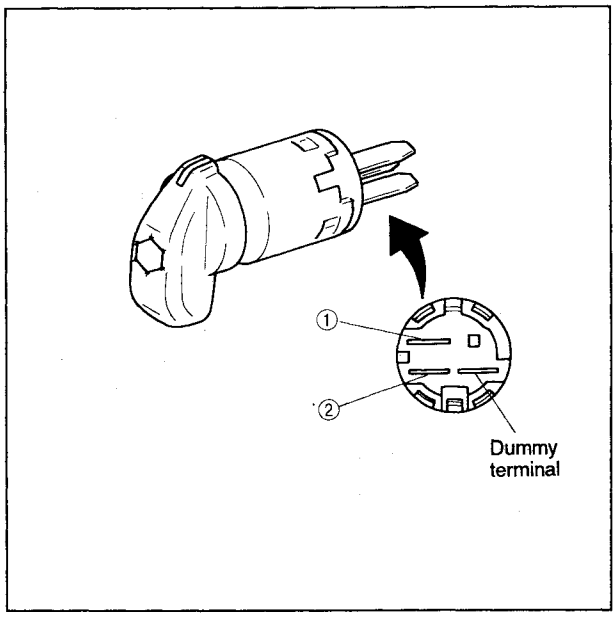
ug the air conditioner switch.

:k the continuity between terminals of the air itioner switch with a tester.

:inuity

itch position	Terminal's number	Result, in normal
OFF	①—②	No
ON	①—②	Yes

Terminal's number / h ion	1	2
OFF	○	
ON	○——	——○

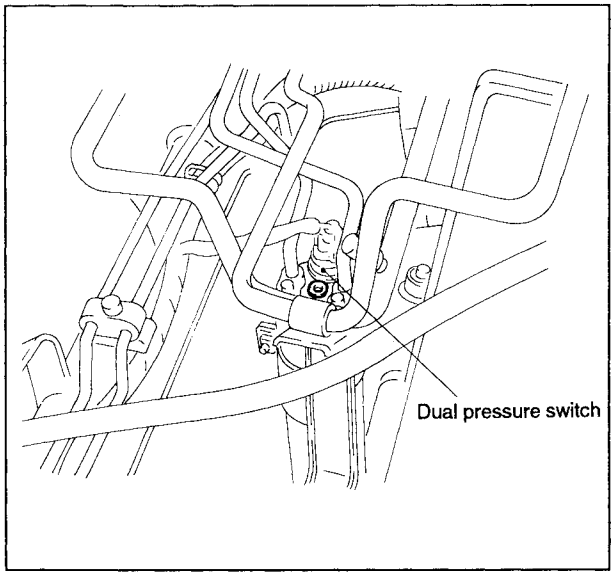


)ual pressure switch

dual pressure switch is attached to the receiver)ly for controlling the operation of the air oner by checking the inside pressure of the r assembly.

MPaG (Lb/in²G, kgf/cm²G)

High side	Low side
2.94 (418, 30)	0.2 (28, 2)
2.35 (334, 24)	0.225 (32, 2.25)



ıplug the connector at the receiver assembly.

ıeck the continuity between terminals of the nnector with a tester.

hen electric continuity is found, connect the nnector to the high pressure switch.

:tach the high pressure gauge and low pressure ıuge.

perate the air conditioner.

)ver the surface of the condenser by using a piece ' paper.

'hen the high pressure exceeds 2.94 MPaG (418 b/in²G, 30 kgf/cm²G), if the magnetic clutch is ırned off, the switch is normal.

' the magnetic clutch is not turned off, replace ressure switch with new one.

Check the accuracy of the preset as below.

ı) Stop the air conditioner.

)) Purge the air conditioner of refrigerant slowly starting at over 0.225 MPaG (32 Lb/in²G, 2.25kgf/cm²G).

(c) At reading the pressure 0.2 MPaG (28 Lb/in²G, 2 kgf/cm²G), the switch opens.

(d) Here, stop the purging, then turn it to charging.

(e) At reading the pressure 0.225 MPaG (32 Lb/in²G, 2.25 kgf/cm²G), the switch closes.

If the dual pressure switch does not meet specifications, replace the switch.

https://truckmanualshub.com/

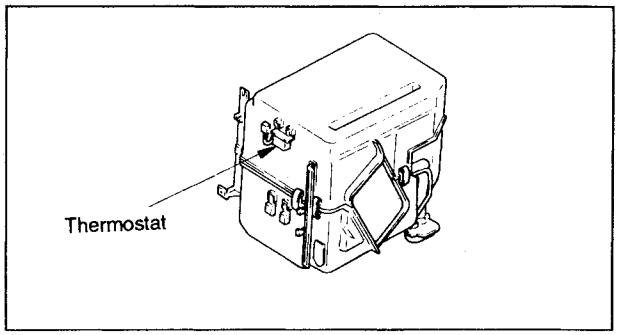
4.3.3 Thermostat

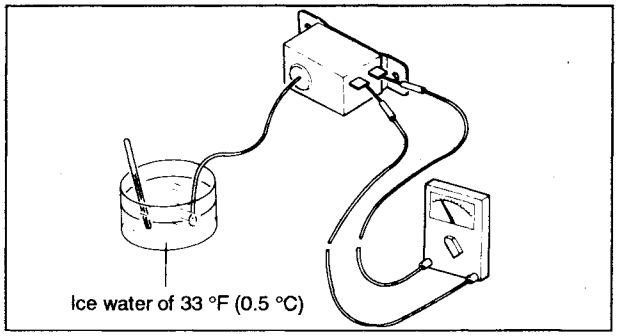
The thermostat is mounted on the evaporator case. It controls the operation of the air conditioner by sensing the temperature of the evaporator fins.

Preset : °F (°C)

OFF	33 (0.5)
ON	38 (3.5)

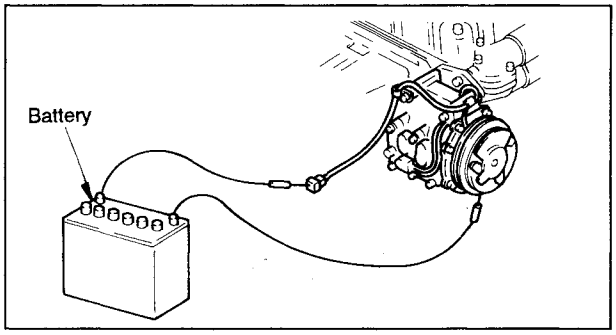
(1) Check the accuracy of the preset as below.
  (a) Soak the sensor of the thermostat in ice-water of below 33 °F (0.5 °C).
  (b) Check the cotinuity between the switch terminals.
  (c) Pull the sensor out of the ice-water, and check the continuity at over 38 °F (3.5 °C) of the sensor.





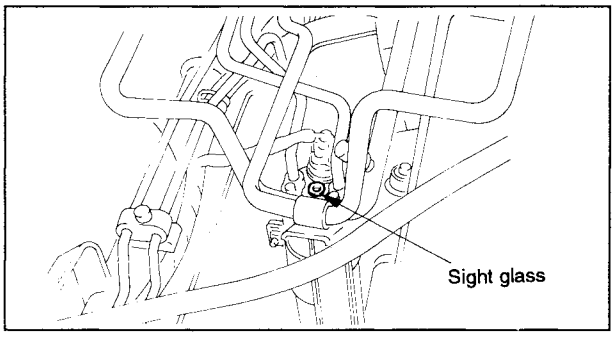
4.3.4 Magnetic clutch

(1) Disconnect the wiring to the magnetic clutch.
(2) Apply a positive side power voltage to the magnetic clutch through the wiring.
(3) In the case of regular functioning, the pulley and magnetic clutch are engaged with a clicking sound. The failing means any malfunction of the magnetic clutch.



4.3.5 Refrigerant charge

(1) Set the temperature control lever at the cool position.
(2) Open doors of the room.
(3) Set the blower switch at the ON position.
(4) Adjust the engine revolution at 1500 rpm.
(5) Operate the air conditioner switch for comp. ON.
(6) Watch the sight glass of the receiver assembly at the inside of the engine room.
  (a) If judged as insufficient refrigerant charging, repair the leaks, then charge it additionally.
  (b) If judged as over charging of refrigerant, extract an excess refrigerant.
(7) Diagnosis by pressure reading
  (a) Short of refrigerant :
  Lower pressure for both L.P. and H.P. reading
  (b) Express of refrigerant :
  Higher pressure for L.P. and H.P. reading



Sight glass		Remarks
Proper refrigerant level	Bubble	1. Bubble occasionally appears. 2. Bubble disappear if speed is a little increased.

Insufficient refrigerant	Bubble	Considerable bubbles appear. If the system is extremely short of refrigerant, the sight glass appear white.
Excessive refrigerant		1. No bubbles appear. 2. Slight bubbles appear if speed is decreased.

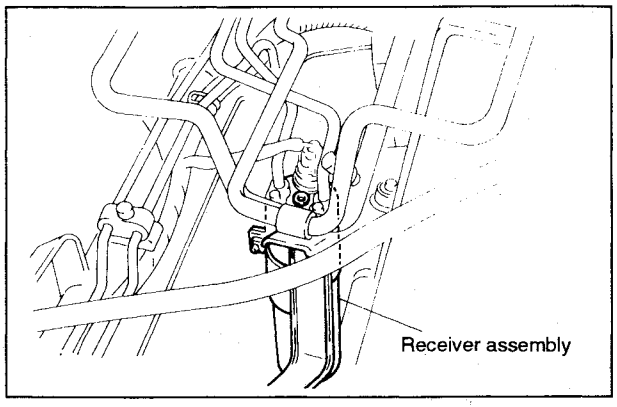
https://truckmanualshub.com/

4.3.6 Receiver assembly

(1) While operating the air conditioner, touch the refrigerant piping with a hand at the inlet and outlet portions.

(a) Sensed temperature difference :

It is possible that clogging is happening at the inside, liquid receiver assembly is to be replaced with a new one.



4.3.7 Belt tension

(1) Depress the V belt with a thumb at the ⬅ marked position, and adjust the stretching as below.

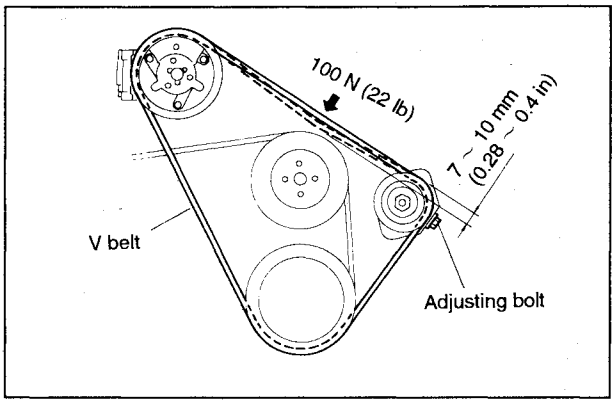
Stretching degree : 7 ~ 10 mm (0.28 ~ 0.40 in) (deflection)

(2) Adjustment

(a) Loosen the nut of the tension pulley.

(b) Control the belting tension by the adjusting bolt.

(c) After finishing, retighten the nut as before.



4.3.8 Expansion valve

⚠CAUTION

The test should be applied to only the case of the other components being free from troubles, and the expansion malfunctioning singly.

(1) Build up the test circuit with a gauge manifold.

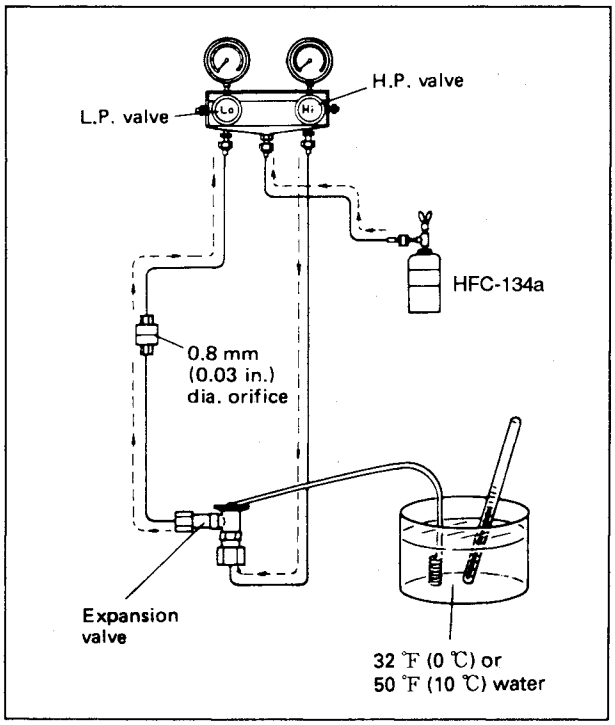
(2) Soak the sensor bulb in ice water of 32 °F (0 °C), and of 50 °F (10 °C) respectively.

(3) Pressurize the H.P. side with dry nitrogen gas of 1.03MPaG (10.5 kgf/cm²G).

(4) Check the reading of the L.P. side pressure gauge for the standard range.

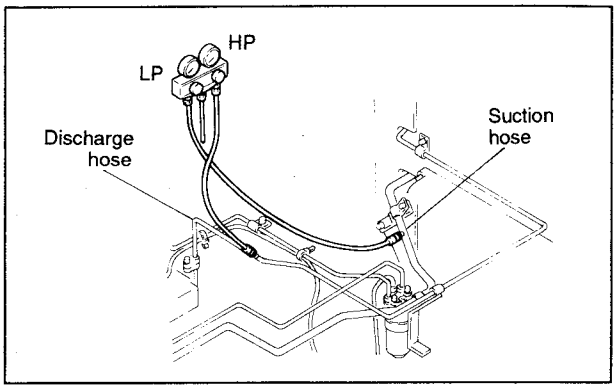
At 32 °F (0 °C) --- 0.127 MPaG (18.4 Lb/in²G, 1.3 kgf/cm²G)

At 50 °F (10 °C) --- 0.23 MPaG (33.4 Lb/in²G, 2.35 kgf/cm²G)



https://truckmanualshub.com/

4.3.9 Pressure check



(1) Mount a low pressure gauge hose and a high pressure gauge hose on the check valve.

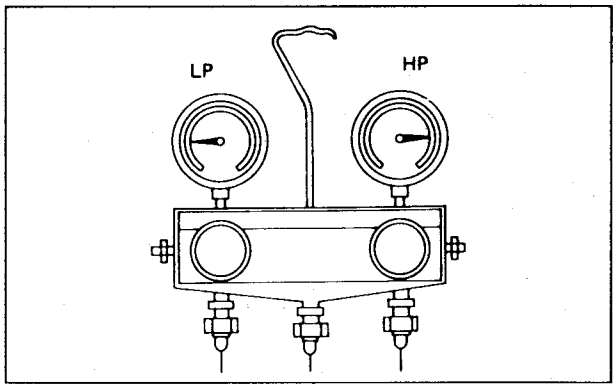
(2) Drive the air conditioner.

(3) Showing of higher L.P. side pressure and lower H.P. side pressure evidences ineffective compression.

Standard pressure

L.P. side pressure	About 0.26 MPaG (38.4 Lb/in²G, 2.7 kgf/cm²G)
H.P. side pressure	About 1.42 MPaG (207.6 Lb/in²G, 14.6 kgf/cm²G)

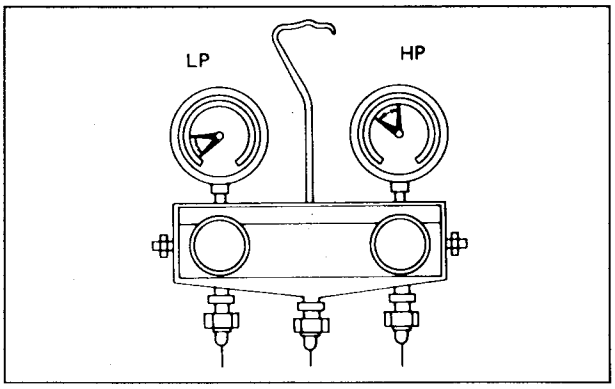
4.3.10 Air inclusion in ref.circuit



The abnormal reading of the refrigerant circuit evidences afraid air inclusion.

A little higher L.P. side pressure Noticeably higher H.P. side pressure

4.3.11 Moisture inclusion in ref. circuit



(1) During the operation, cooled air supply is interrupted periodically with a time interval.
This phenomenon evidences afraid water inclusion.

(2) Check the refrigerant pressure at a stop of the cooled air supply to make sure of the water inclusion.

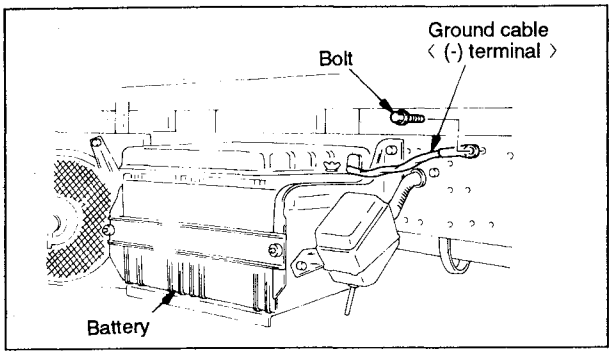
L.P. side pressure ..... Almost vacuum
H.P. side pressure ..... Noticeably low

https://truckmanualshub.com/

5. REMOVAL AND INSTALLATION

5.1 Precaution for removal and installation.

1. Disconnect the (-) ground cable from the battery, and place a cover on the battery.



2. Make certain all the openings are covered with caps in order to prevent entry of foreign substances such as dust and dirt.
3. Never tamper with the brake and fuel systems, including the brake tubes and hoses.
4. Avoid doing the work in a dusty place or outdoors in rainy weather. If tubes or functional parts are removed, put a cap in position immediately in order to prevent entry of dust and moisture.
5. Connect the charging hose of the gauge manifold to the check valves (suction and discharge) of the suction hose and discharge hose, and recover the refrigerant by refrigerant recovery unit until its pressure is reduced to 0 kPaG (0 psiG, 0 kgf/cm²G). (Make sure that there is no internal pressure in the equipment.)

   Abrupt discharging might result in the discharge of the refrigerant oil from the compressor.
6. When coupling the flared tube, coat the flared portion with the compressor oil at the inner side.
7. Make sure to use the wheel chocks.

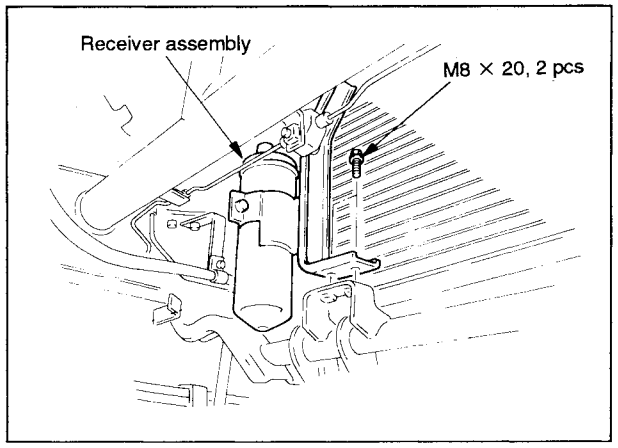
5.2 Removal

5.2.1 Inside the engine room

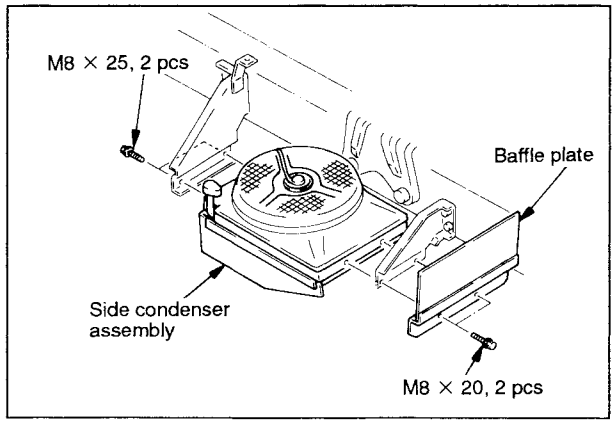
(1) Compressor & clutch assembly
   (a) Withdraw the wiring of the magnetic clutch at the connector.
   (b) Remove the V belt by loosening fixature of the tension pulley.
   (c) Take of the archor bolts : M8 × 100, 3 pcs and M8 × 130, 1 pc.
   (d) Dismount the compressor.

(2) Receiver assembly
   (a) Unplug the dual pressure switch at the connector.
   (b) Separate the interconnecting refrigerant pipe of the receiver assembly.

   (c) Take off the fixing bolt : M8 × 20, 2 pcs.
   (d) Dismount the receiver assembly.



(3) Side condenser assembly
   (a) Unplug the condencer fan harness at the vehicle side harness.
   (b) Take off the fixing bolt : M8 × 20, 2 pcs and M8 × 25, 2 pcs.
   (c) Dismount the side condenser assembly (and baffle plate).

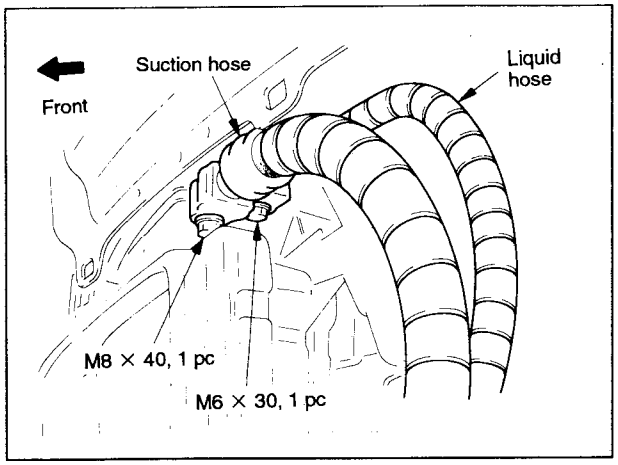


https://truckmanualshub.com/

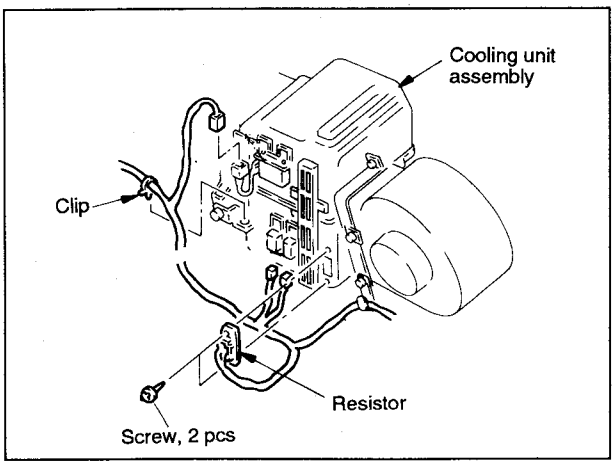
5.2.2 Cabin room

(1) Cooling unit assembly

(a) Separate the interconnecting refrigerant pipes of the cooling unit assembly.



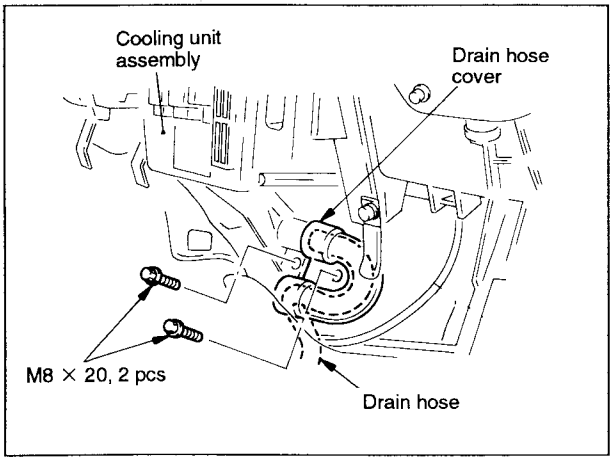
(b) Withdraw the wiring of the cooling unit assembly at the connectors.



(c) Take off the fixing bolts : M8 × 20, 2 pcs.

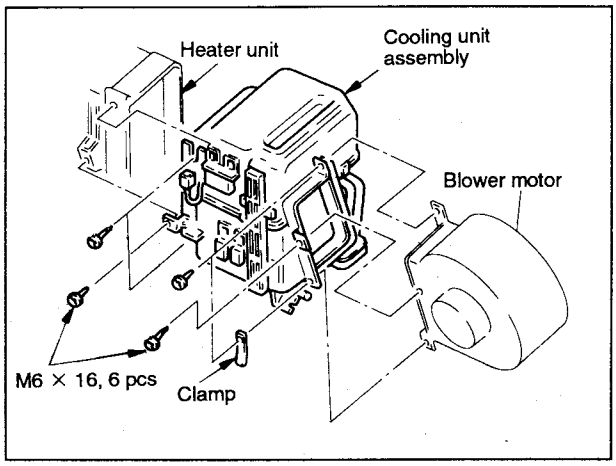
(d) Dismount the drain hose cover.

(e) Reconnect the drain hose from the cooling unit assembly.



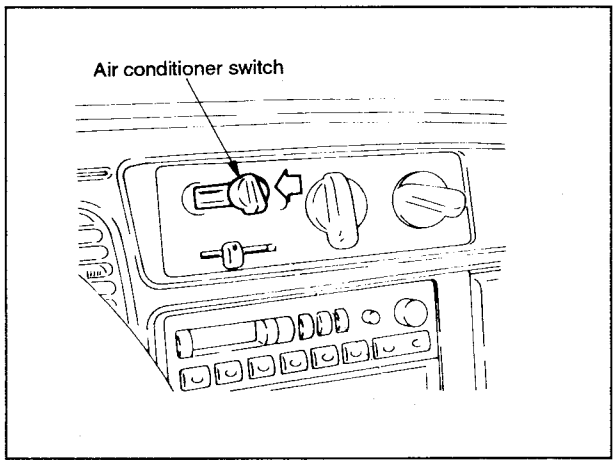
(f) Take off the fixing screws : M6 × 16, 6 pcs.

(g) Dismount the cooling unit assembly.



(2) Air conditioner switch

Pull out the air conditioner switch.



https://truckmanualshub.com/

5.3 Installation

Installation is performed in the opposite sequence of removal.

○ Torques for tightening coupler of refrigerant tubing.

Nm (Lb.ft.kgm)

Compressor suction hose	29-34 (21 ~ 24, 3.0 ~ 3.5)
Compressor discharge hose	20-25 (14 ~ 18, 2.0 ~ 2.5)
Compressor inlet hose	20-25 (14 ~ 18, 2.0 ~ 2.5)
Compressor outlet hose	12-14 (8.6 ~ 10, 1.2 ~ 1.5)
Liquid receiver assembly inlet and outlet hoses	12-14 (8.6 ~ 10, 1.2 ~ 1.5)
Cooling unit inlet hose	12-14 (8.6 ~ 10, 1.2 ~ 1.5)
Cooling unit outlet hose	29-34 (21 ~ 24, 3.0 ~ 3.5)

○ Torques for tightening general bolt and nut

Nm (Lb.ft. kgm)

Nominal size	Pitch	Tightening torque		
		Head mark 4	Head mark 7	Head mark 8
M 5	0.8	3-4 (2.1 ~ 2.9, 0.3 ~ 0.4)	5-6 (3.6 ~ 4.3, 0.5 ~ 0.6)	5-7 (3.6 ~ 5, 0.5 ~ 0.7)
M 6	1.0	5-6 (3.6 ~ 4.3, 0.5 ~ 0.6)	9-11 (6.4 ~ 7.9, 0.9 ~ 1.1)	8-12 (5.7 ~ 8.6, 0.8 ~ 1.2)
M 8	1.25	12-14 (8.6 ~ 10, 1.2 ~ 1.5)	19-24 (13.6 ~ 17, 2.0 ~ 2.5)	19-29 (13.6 ~ 21, 2.0 ~ 3.0)
M10	1.25	24-29 (17 ~ 21, 2.5 ~ 3.0)	38-48 (27 ~ 34, 4.0 ~ 5.0)	43-58 (30.7 ~ 41.4, 4.5 ~ 6.0)
M10	1.5	17-26 (12 ~ 18.6, 1.8 ~ 2.7)	32-48 (23 ~ 34.3, 3.3 ~ 5.0)	41-58 (29.3 ~ 41.4, 4.3 ~ 6.0)
M12	1.25	34-43 (24.3 ~ 31, 3.5 ~ 4.5)	58-77 (41 ~ 55, 6.0 ~ 8.0)	82-106 (58.6 ~ 75.7, 8.5 ~ 11.0)
M14	1.5	72-82 (51 ~ 59, 7.5 ~ 8.5)	115-134 (82 ~ 96, 12.0 ~ 14.0)	125-173 (89.3 ~ 123.6, 13.0 ~ 18.0)

NOTE

For the cases of spring washer seated, and thread or seating surface coated with oil, the value shall be reduced down to 85 percent of the data listed.

https://truckmanualshub.com/

6. TREATMENT AFTER INSTALLATION

6.1 Check and adjustment

After installation, check the following points and confirm that everything is normal, then charge the gas, and do the performance and operation tests.

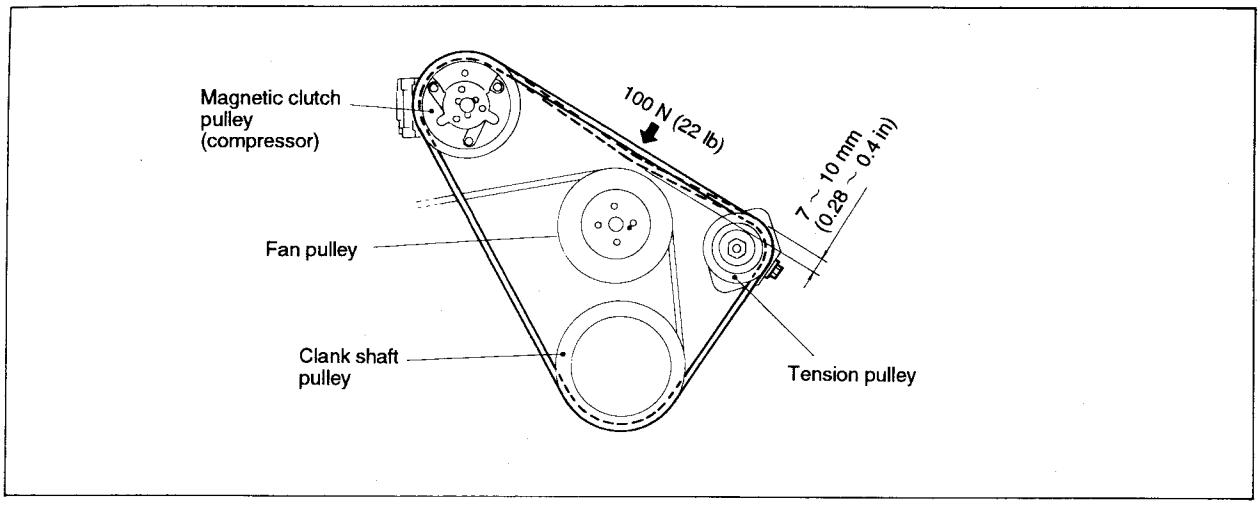
(1) Check if any abnormal vehicle performance, happens or not by installing the air conditioner.

(2) Check the operation of the magnetic clutch. (with the compressor disengaged)

(3) Check if any parts left unmounted or any tool left in the vehicle.

(4) Check to ensure that the temperature control lever operates properly.

(5) Check the tension of the belt.



6.2 Leak test

After all the piping works are completed, conduct an leak test by the following procedure to check any leaks at the flare coupling, etc. and then evacuate the system. If this leak test is omitted and evacuation is immediately started, there is no way of detecting possible leak. If there are leaks, the specified vacuum cannot be attained. In order to save the service time be sure to conduct the leak test before evacuation.

6.2.1 Test points

(1) All pipe joint.

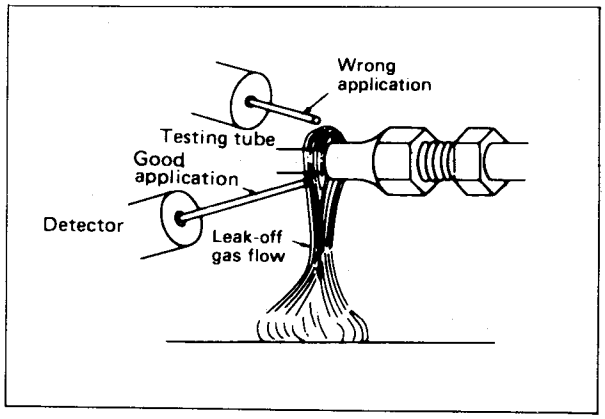
(2) Shaft seal and check valve on the compressor.

6.2.2. Test procedure

(1) For the gas leak test, the use of an electric gas leak detector is recommended. (HFC-134a SAE Approved)

(2) Perform the test at a place as in free from air flowing.

(3) The refrigerant is heavier than air. Leaks will concentrate at the bottom. Make certain that the testing tube is applied below the check point.



(4) The test should be performed patiently. Make certain that testing tube is moved slowly [approx. 10 mm/sec. (0.4 in./sec.)].

(5) The high pressure side refrigerant circuit should be tested for gas leaks during operation. Those areas which are dangerous or hard to test during operation (including areas around the compressor and condenser) should be tested direct after shutdown.

https://truckmanualshub.com/

(6) The low pressure side refrigerant circuit should be tested during shutdown after the gas pressure has balanced.

(7) The test should be performed on the basis of the following standards:

Gas leak test standards

Test Point / Instrument	Compressor shaft seal	Other parts
Electric gas leak detector	Pointer shall not swing more than 0.1 mA at the low sensitivity.	Pointer must not swing more than 0.1 mA at the high sensitivity.
Halide torch gas leak detector	Flame colour (moss green) shall not change.	

⚠ WARNING

- **Smoking should be forbidden if a gas leak is detected.**
- **If a flame is applied to the refrigerant, toxic phosgene gas will be produced. Do not keep the detector in contact with a leaky point for a long time.**

- Leak test procedure

1. Attach refrigerant supply and gauge set as shown with all valves closed. Open refrigerant supply valve on can.
2. Loosen the center charging hose fitting at the manifold gauge end to blow any air from the hose until it hisses for a few seconds, then retighten it.
3. Open both gauge valves to partially charge the system and then close both valves.
4. The system can then be checked for leaks using an electronic leak detector.
5. If leaks are found that require the system to be opened (to repair or replace hoses, fittings, etc.), release any charge in the system.
6. After checking and repairing leaks, system must be evacuated.

6.3 System Charging

GENERAL PRECAUTIONS

⚠WARNING

When handling refrigerant (HFC-134a), the following precautions must be observed.

— Always wear eye protection and gloves while handling refrigerant.

— Be careful that liquid refrigerant does not contact the skin.

If liquid refrigerant strikes eye or skin:

— Do not rub on skin.

— Splash large quantities of cool water on the eye or skin.

— Flush eyes or skin with cool water for 5 minutes.

— Rush to a physician or hospital for immediate professional treatment.

— Do not attempt to treat it yourself.

— Keep the refrigerant (HFC-134a) container below 104°F (40°C).

— Do not handle the refrigerant in an enclosed area having an open flame; the refrigerant may produce a poisonous gas.

— Use approved recovery equipment to recover HFC-134a refrigerant before attempting service of this or any other HFC-134a system.

— Do not attempt to leak test an HFC-134a system with high pressure air or nitrogen. Mixing HFC-134a with a concentrated quantity of air may be combustible in the presence of ignition.

https://truckmanualshub.com/

6.3.1 Evacuation

INSTALLATION OF SIMPLE HFC-134a EQUIPMENT

(1) Connect the manifold gauge to the service valves.

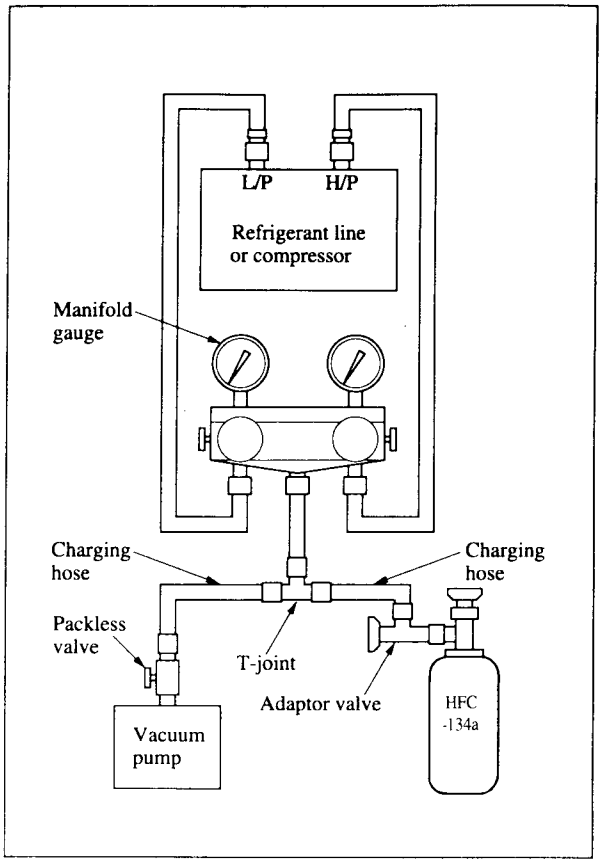
(2) Connect the packless valve to the vacuum pump.

(3) With the charge valve handle turned back all the way, install the service can.

(4) Connect the equipment as illustrated.

⚠CAUTION

1. **Do not connect the high and low pressure sides adversely. (Connect high pressure side to the condenser and low pressure side to the cooling unit assembly)**
2. **The indications "DIS" and "SUC" on the compressor indicate high and low pressure sides respectively.**

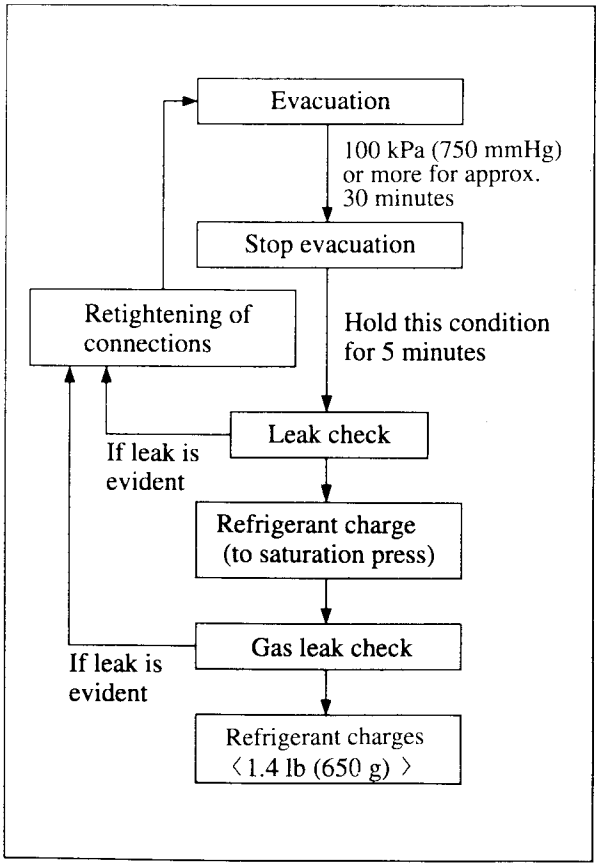


6.3.2 Evacuate the System

The refrigerant system must be evacuated before charging. Charge using HFC-134a refrigerant only. HFC-134a is available in bulk tanks. Follow the safety precautions for handling HFC-134a as listed in this section.

Follow the evacuation procedure below and at right.

This procedure assumes no HFC-134a refrigerant has been introduced into the system. If evacuating a charged system, it is necessary to recover the existing HFC-134a refrigerant before continuing with these instructions. Refer to the recovery equipment manufacturer's instructions for proper refrigerant recovery.



https://truckmanualshub.com/

(1) Start up the vacuum pump.

⚠CAUTION

1. **Do not use the compressor for evacuation.**
2. **Do not operate the compressor in the vacuum condition; damage may occur.**

(2) Open the manifold gauge handles and the packless valve.

(3) Evacuate to a vacuum reading of 100 kPa (750 mmHg) or higher (approx. 30 minutes).

(4) Turn back the packless valve all the way and close the service valve.

(5) Stop the vacuum pump and allow to stand for 5 minutes.

(6) Check for leak. (Good if the vacuum is held.)

CHARGING WITH BULK TANK

(1) Open the charge valve to charge the system with refrigerant.

(2) When the refrigerant is no longer drawn in, turn back the high pressure side manifold gauge handle.

(3) Check for refrigerant leaks using a leak detector.

(4) Start the engine.

(5) Operate the air conditioner and set at the lowest temperature (MAX. COOL).

(6) Fix the engine speed at 1,500 rpm.

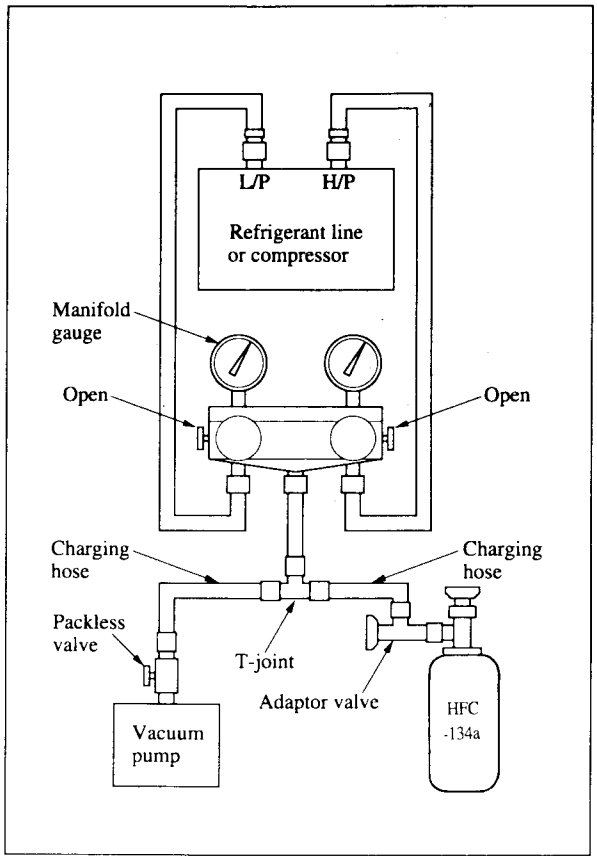
(7) Continue charging system until proper refrigerant quantity is introduced into the system.

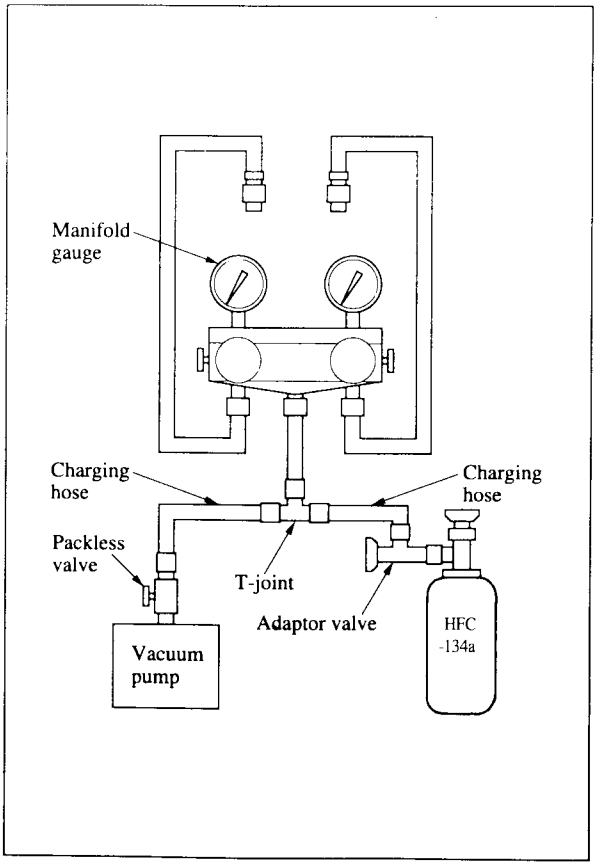
⚠CAUTION

If the bulk tank is inverted, liquid refrigerant may be drawn into the compressor damaging it by liquid compression.

Keep the bulk tank upright to ensure that refrigerant is charged in gas state.

(8) Upon completion of charging, turn back the low pressure side manifold gauge handles.





https://truckmanualshub.com/

6.3.3 Removal of Charge Equipment

(1) Close the charge valve.

(2) Remove the manifold gauge from each service valve.

⚠CAUTION

Do not remove the bulk tank, T-joints and adaptor valves but keep them connected for next charge operation.

CORRECTING LOW REFRIGERANT LEVEL

Locate the source of the low refrigerant level, recover system, repair system, evacuate system, charge system, check for leaks.

⚠CAUTION

If the bulk tank is not emptied completely, keep the charge valve connected to the can for next charging.

6.3.4 Discharging System

Use the refrigerant recovery unit which can be purchased in local market to discharge refrigerant gas from the system.

⚠CAUTION

Refer to that Refrigerant Recovery Unit Instruction Manual for operation which is attached on the unit.

LIQUID CHARGE, through high side using charging station:

⚠CAUTION

Do not run engine when performing liquid charge; compressor will be damaged.

(1) After the system is evacuated, close gauge valves, connect center hose to refrigerant supply. Loosen center fitting at gauge to blow any air out of the hose and then retighten.

(2) Following charging station manufacturer's instructions charge the system until 1.4 lb (650 g) of refrigerant is pumped into the system.

(3) When system is fully charged, close high gauge valve and refrigerant supply valve, then quickly disconnect gauge hoses from service valves.

(4) After charging the system, refer to Pre-Delivery Inspection.

https://truckmanualshub.com/

6.4 Performance test

6.4.1 Preparation

Reinstall all vehicle parts that were removed for installation of the air conditioner at their original positions, adjust the mounting, and test the following items.

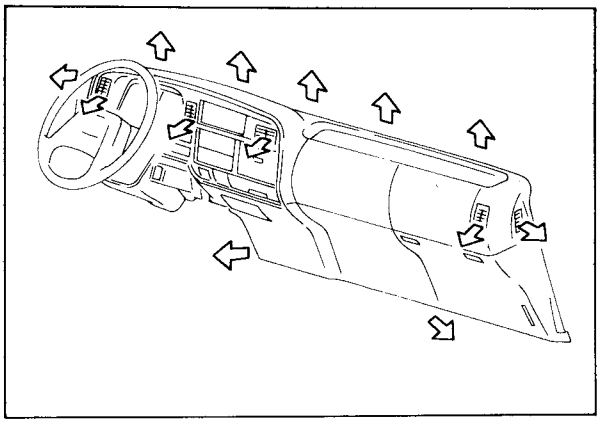
1. Installation of grommets
   Install the specified grommets

6.4.2 Stationary performance test

1. Operating conditions
   a. Place the vehicle in the shade with doors open.
   b. Keep the return air temperature between 77 to 86°F (25 to 30°C). (Adjust by changing the opening degree of the doors).
   c. Set the fan switch to the max position.
   d. Turn the thermostat control lever to the cool position.
   e. Set the engine speeed to approx. 1,500 rpm.
   f. Set the high pressure at 1.17 to 1.37 MPa (170 to 200 Lb/in²G, 12 to 14 kgf/cm²G). (If the high side pressured does not rise up, place paper or the like in front of the condenser.)

2. Test procedure

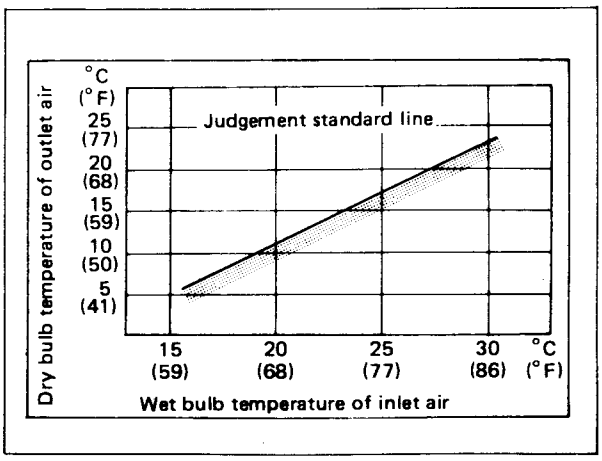
Operate the air conditioner for more than 10 minutes under the above operating conditions in order to stabilize the high and low pressures. Then perform the test by the following procedure:



a. Measure the outlet air temperature at the inside space of the outlet grille.

b. Measure the air conditioner intake air temperature, humidity, etc., and the items shown in the Table of Measuring Items at a position free from the effects of cool outlet air.

c. The intersecting point of the plotted line perpendicular to the point which corresponds to the air conditioner intake and outlet air temperature difference and the plotted line perpendicular to the point which corresponds to the relative humidity of intake air should be between the oblique lines in bigure.



https://truckmanualshub.com/

7. MAINTENANCE

No.	Check point	Service and inspection intervals				
		When used only in summer (approx. for three months)		When used in all seasons		
		At the beginning of season	At the end of season	Every 5,000 km (3,000 miles)	Every 10,000 km (6,000 miles)	Every 20,000 km (12,000 miles)
1	Check condenser and radiator fin for clogging.	○	○	○		
2	Retighten all bolts.	○			○	
3	Check for refrigerant leaks.	○			○	
4	Check refrigerant level.	○		○		
5	Check V-belt tension.	○		○		
6	Check operation of magnetic clutch.	○			○	
7	Check operation of thermostat.	○				○
8	Cooling unit assembly performance test.	○		○		
9	Compressor overhaul.		Every four years			Every 40,000 km (24,000 miles)

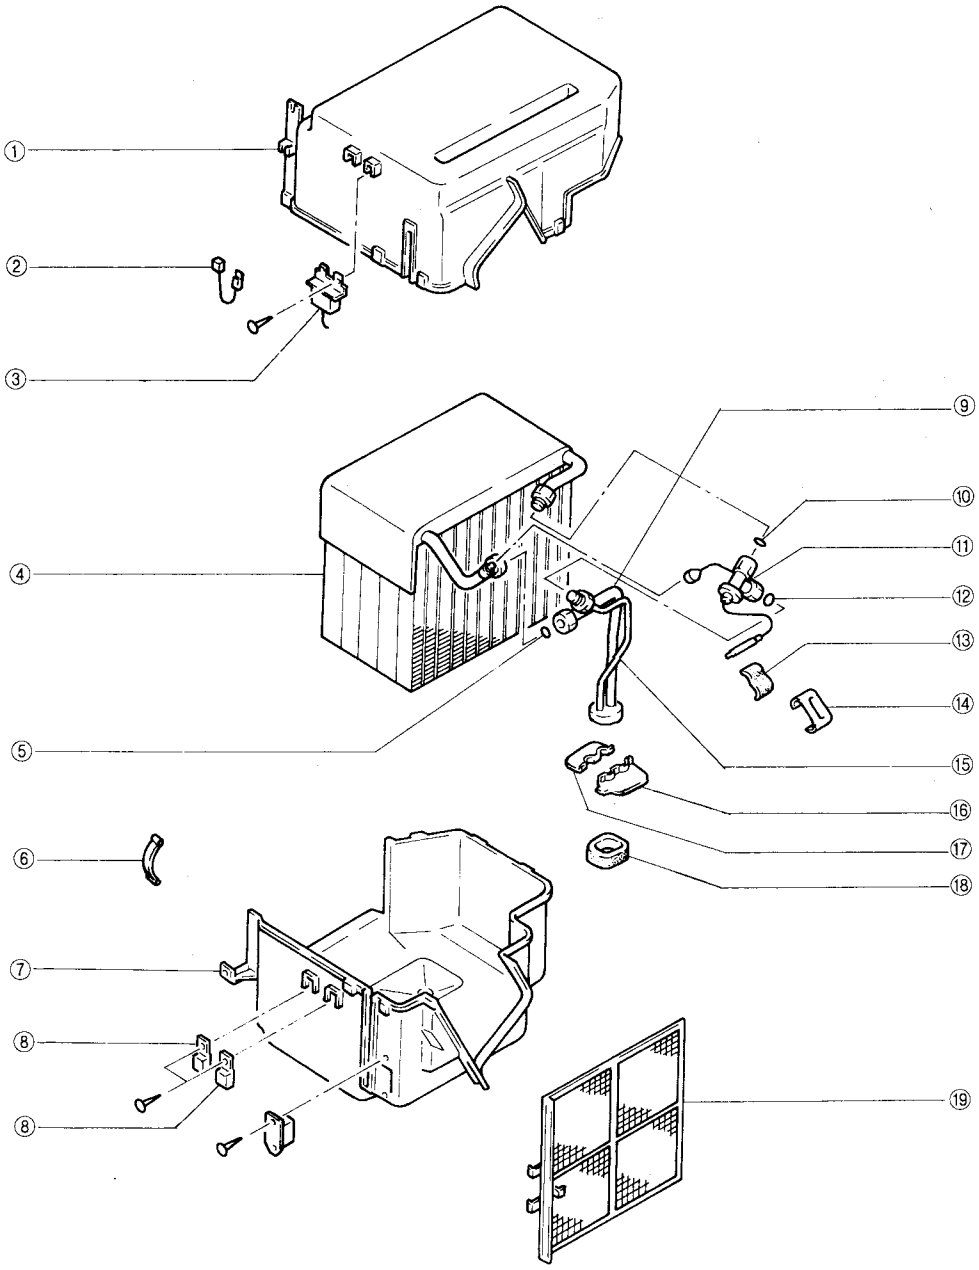
⚠ CAUTION

Even after the hot season is over, the air conditioner should be kept ready for operation all year round. Do not remove the V-belt or other parts.
This is because the air conditioner must be operated once a week for several minutes regardless of the season in order to prevent gas leaks caused by drying of the compressor shaft seal, and also to maintain the compressor itself in the best condition.

https://truckmanualshub.com/

8. COOLING UNIT ASSEMBLY

8.1 Components



① Cooler case (upper)
② Joint harness
③ Thermostat
④ Evaporator
⑤ O-ring
⑥ Clip
⑦ Cooler case (lower)
⑧ Power relay
⑨ Pipe
⑩ O-ring
⑪ Expansion valve
⑫ O-ring
⑬ Insulation rubber
⑭ Clip
⑮ Baffle plate
⑯ Battle plate
⑰ Insulation rubber
⑱ Air filter

https://truckmanualshub.com/

8.2 Cautions in disassembling

(1) Direct after disconnecting the refrigerant piping blind the opening to prevent dust and moisture etc. from entering in it.

(2) When disconnecting the expansion valve, surely apply two spanners to prevent unstable twisting from applying with the one for supporting and the other for torquing at the connection.

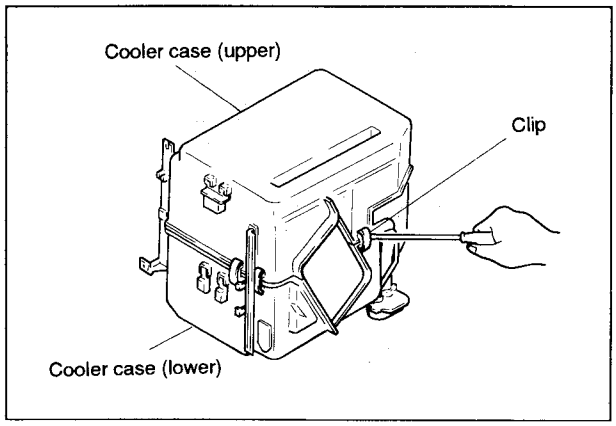
(3) Pipings in the cooling unit assembly should be handled gently. Particularly, the ingress and egress portions should be from any bending trouble in carrying it.

(4) If the cooling unit assembly is stored, or transported on disassembled condition, be careful not to deform the fins.

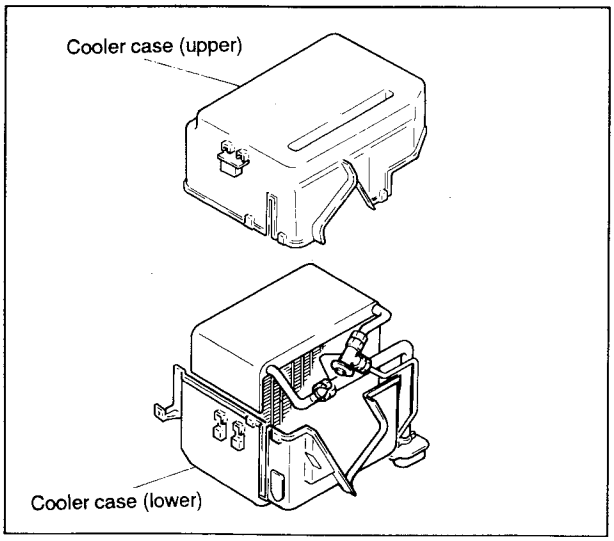
(5) When disconnecting the wirring, avoid pulling it with the insulation cover catched, but apply force by pinching the terminals or by catching the connectors.

8.3 Disassembling

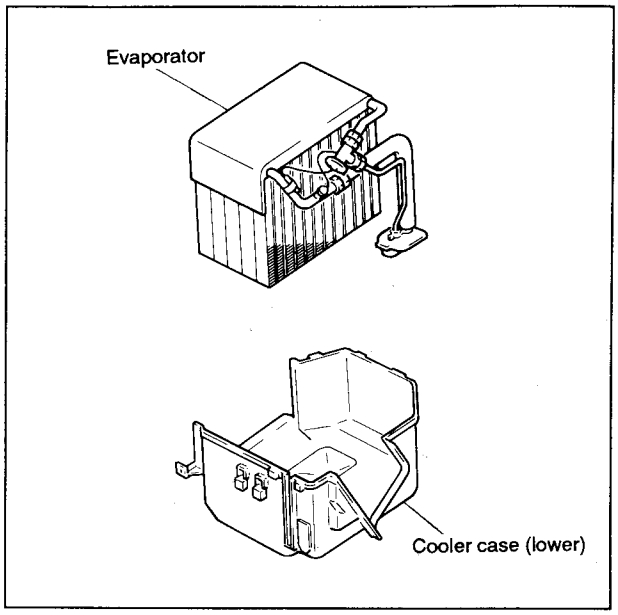
(1) Remove the clips for jointings the upper & lower side cooler case with a flat type screwdriver.



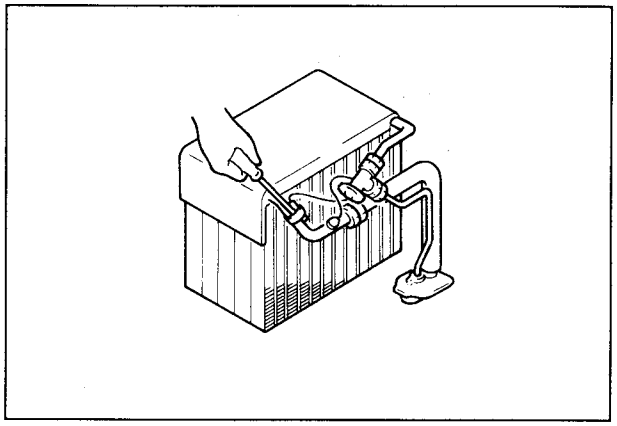
(2) Dismount the cooler case (upper).



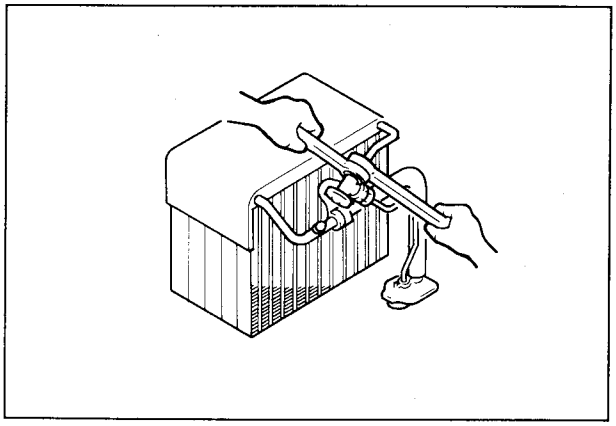
(3) Dismount the evaporator.



(4) Separate the expantion valve.
Dismount the feeler bulb at the suction side.



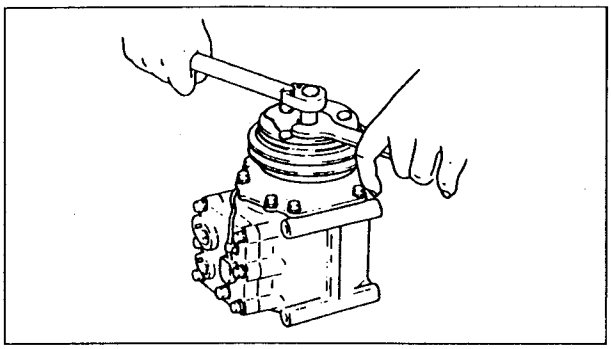
(5) Disconnect the expansion valve from the circuit.



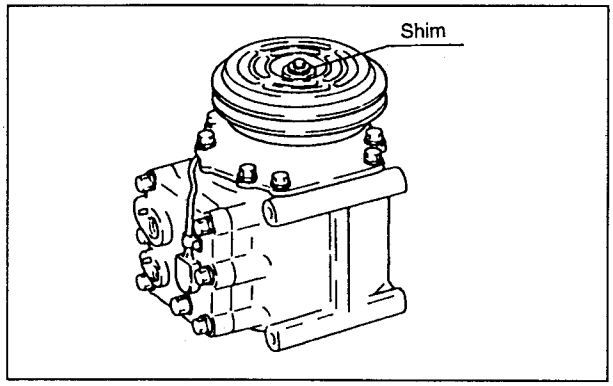
https://truckmanualshub.com/

9. COMPRESSOR & CLUTCH ASSEMBLY

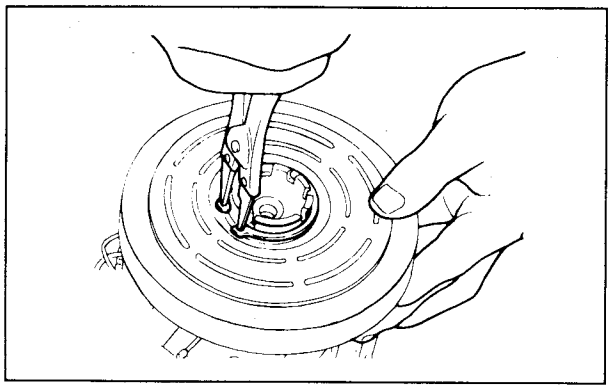
9.1 Disassembling the clutch.



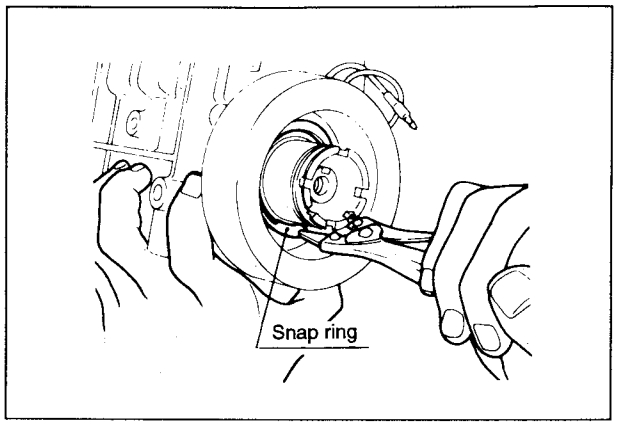
(1) Removal of armature plate.
   (a) Lock up the armature plate with a armature plate fixture and remove the lock nut.
   (b) Remove the armature plate.



(2) Remove the shim.



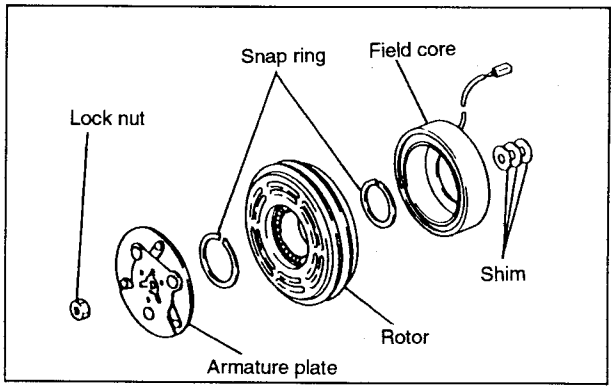
(3) Withdrawing rotor.
   (a) Remove the snap ring at the front case side with snap ring pliers.
   (b) Withdraw the rotor toward you and remove it from the front case.



(4) Removal of field core.
   (a) Remove the snap ring for fixing the field core with snap ring pliers.

   (b) Remove the ground wire with a cross point screwdriver and withdraw the field core toward you to remove it from the crankcase.

(5) Removal of key.
   Remove the key from the shaft using the top of a flat type screwdriver.



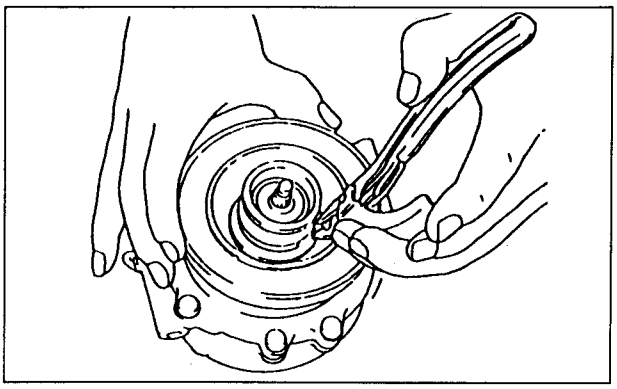
(6) Components of magnetic clutch.

https://truckmanualshub.com/

9.2 Reassembly the clutch.

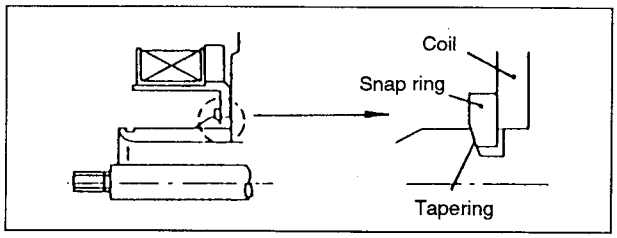
(1) Insert the key into the crankshaft.

(2) Insert the field core.



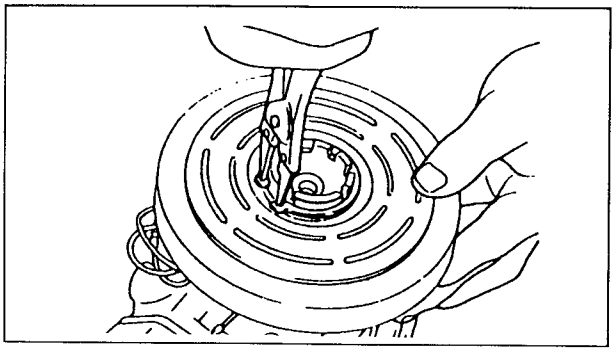
(a) Insert the field core into the front case and position it with a knock pin.

(b) Insert the snap ring for fixing field core into the groove and fix it with snap ring pliers as shown the below.

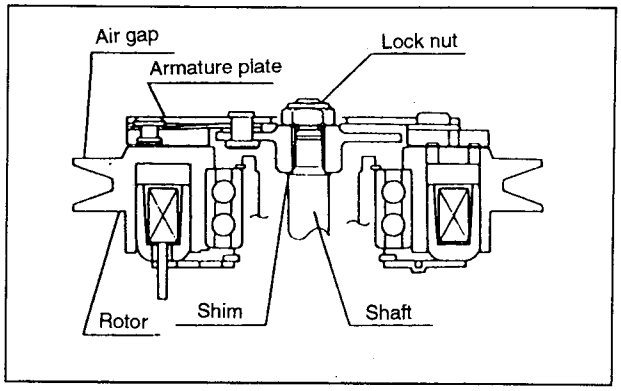


(c) Connect the ground wire.

(3) Insert the rotor into the front case.



(4) Insert the snap ring for the front case side into the groove with snap ring pliers.



(5) Install the armature plate.

(a) Place a shim on the end of the shaft and insert the armature plate, adjusting to the key.

(b) Tighten the center bolt to the specified torque, 15.7 N.m (160 kgf.cm), with in-between plain washer.

(c) Measure the air gap.
The air gap shoud be within 0.4 to 0.65 mm (0.016 ~ 0.026 in).
Adjust it by shim if it is not within the specifications. Adjusting shim : 0.1, 0.3, 0.5, or 0.8 mm (0.004, 0.012, 0.02, or 0.03 in).

https://truckmanualshub.com/

5 Air filter
6 Duct assembly
7 Heater hose (Heater in)
8 Thermostat
9 Engine
10 Heater hose (Heater out)

A : To duct
B : To radiator
C : From radiator

Outside air (Intake)

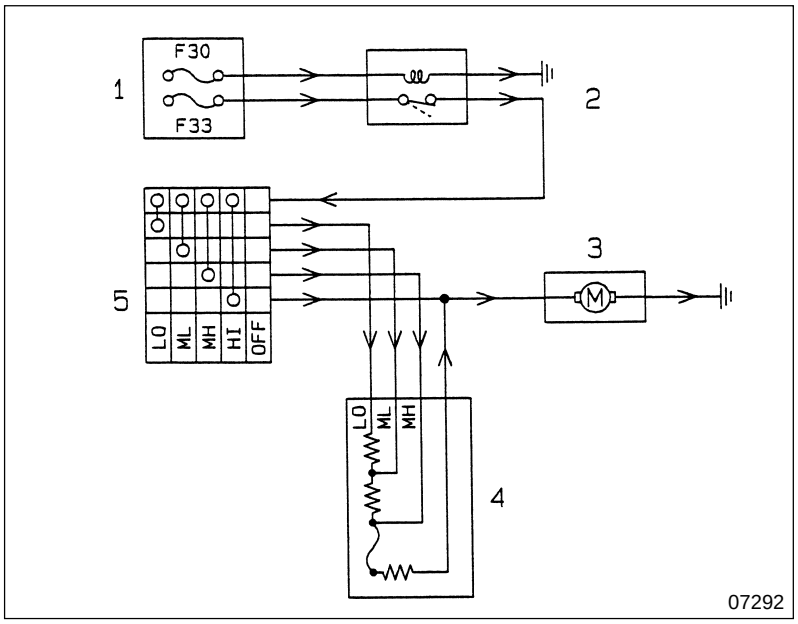
Inside air (Circulation)

Filtered air

- Warm engine coolant that has absorbed heat from engine **9** does not flow through thermostat **8** but circulates as follows:
  7→2→10→9
  ↑ ┘
- Air sent to heater unit **1** from blower assembly **3** is warmed by heater core **2** (heat exchanger). Then the ducts deliver the warmed air to the cab.

https://truckmanualshub.com/

Heater Electric Circuit



1 Fuse box
2 Blower fan relay
3 Blower motor
4 Blower resistor
5 Fan switch (Heater switch)

- The resistance of blower resistor **4** controls blower motor **3**, which in turn controls the air flow, except when the air flow is set to HI (high speed). When the air flow is set to HI, the current does not flow through the blower resistor.

Fan switch 5 set to LO position

- 1 (F30)→2 (coil)→Ground
- 1 (F33)→2 (contact point)→5 (LO)→4 (LO)→3→Ground

Fan switch 5 set to HI position

- 1 (F30)→2 (coil)→Ground
- 1 (F33)→2 (contact point)→5 (HI)→3→Ground

Fan switch 5 set to either ML or MH position

The current flows through blower resistor **4** in the same way as when set to LO position, routing ML or MH respectively instead of LO.

10 Water pipe
11 Hose clamp
12 Heater hose (Heater in)
13 Hose clamp
14 Heater hose (Heater out)

***** : Heater unit
A : White mark

NOTE

- **Drain engine coolant from radiator before removing hoses.** **Gr 14**
- **Make sure that white mark A on heater hoses 6, 9 are clearly visible before removing parts. If there are no marks, make identification marks before removing parts.**

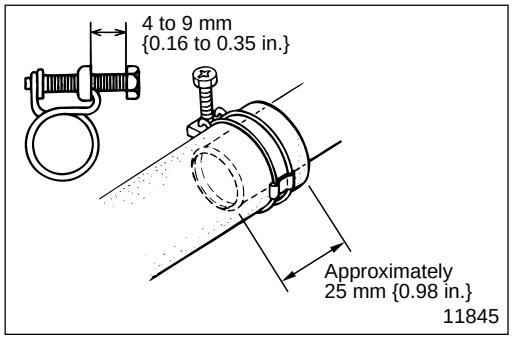
● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Be sure that hoses are inserted securely to prevent coolant leaking.**
- **Make sure not to mix up heater hoses 2, 4, 6, 9, 12, 14 when connecting them because mistaken connection would damage the heater unit.**

◆ Service procedure



1 to **6** **8** **9** **11** to **14** **Installation of heater hose and hose clamp**

- Install heater hoses **2**, **4**, **6**, **9**, **12**, **14** conform to the dimension as illustrated.
- Tighten hose clamps **1**, **3**, **5**, **8**, **11**, **13** to conform to the dimension as illustrated.

https://truckmanualshub.com/

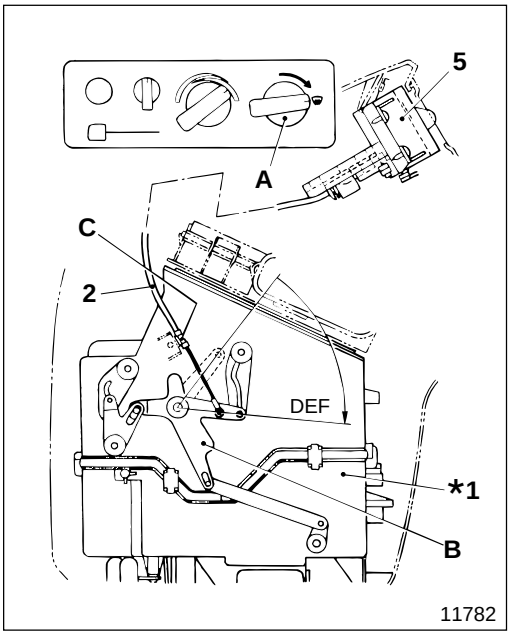
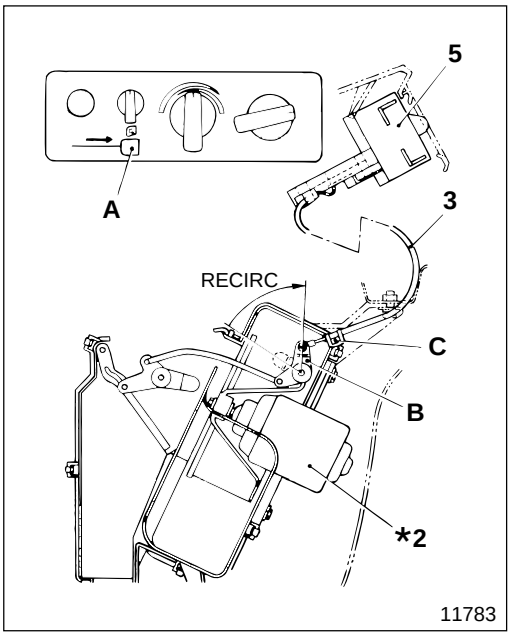
◆ Service procedure



2 Installation of mode changeover control cable

- Turn mode changeover control dial **A** of heater control assembly **5** to (DEF).
- Turn mode changeover damper lever **B** of heater unit assembly ***1** to DEF.
- Under these conditions, install mode changeover control cable **2** onto mode changeover damper lever **B** and fasten it with clip **C**.

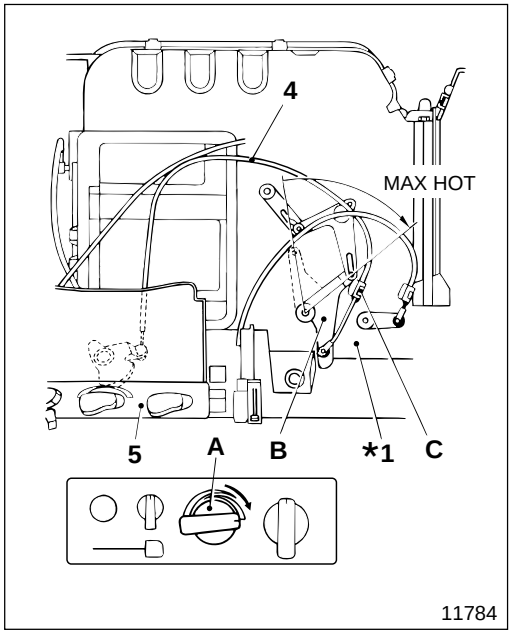


3 Installation of inside/outside air changeover control cable

- Set inside/outside changeover lever **A** of heater control assembly **5** to (RECIRC : Inside air).
- Turn inside/outside air changeover damper lever **B** of blower assembly ***2** to RECIRC.
- Under these conditions, install inside/outside air changeover control cable **3** onto inside/outside air changeover damper lever **B** and fasten it with clip **C**.

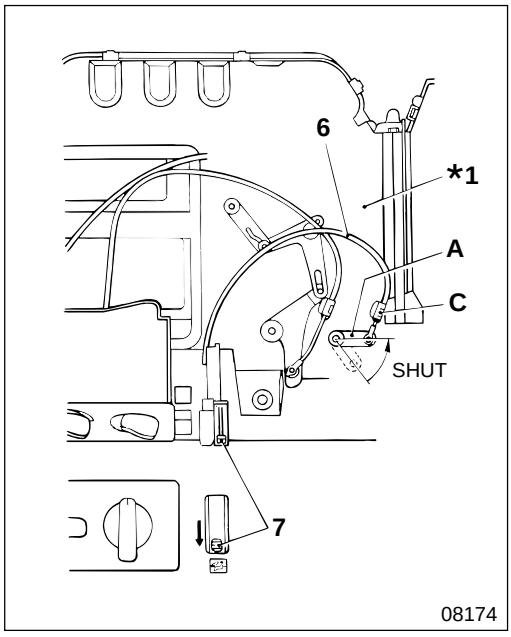
https://truckmanualshub.com/

HEATER CONTROL



4 Installation of air mixing control cable

- Fully turn temperature control dial **A** of heater control assembly **5** clockwise to MAX HOT (maximum heating).
- Turn air mixing damper lever **B** of heater unit assembly ***1** to MAX HOT (maximum heating).
- Under these conditions, install air mixing control cable **4** onto air mixing damper lever **B** and fasten it with clip **C**.



6 Installation of air bypass changeover control cable

- Set air bypass changeover control lever **7** to SHUT.
- Set air bypass lever **A** of heater unit assembly ***1** to SHUT.
- Under these conditions, install air bypass changeover control cable **6** onto air bypass lever **7** and fasten it with clip **C**.

SERVICE MANUAL

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of the Mitsubishi Fuso Truck FK, FM Series. Read this manual carefully as an aid to providing correct, efficient and fast maintenance. Please note, however, that due to continued vehicle improvements the specifications and numbers given for use in maintenance might change without notice. If you have any questions, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso Dealer or Distributor.

HOW TO READ THIS MANUAL

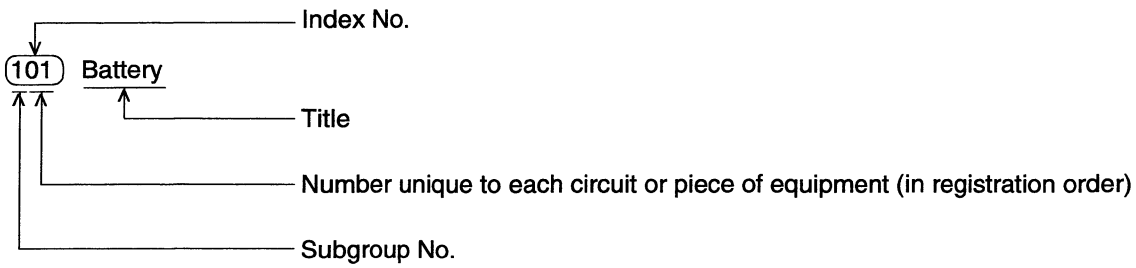
How This Manual Is Compiled

- This manual is compiled by classifying various systems into certain groups.
- Each group contains specifications; troubleshooting; maintenance service standards; tightening torque; lubricant, fluid and sealant; special tools; and service procedure.
- Group 54 Electrical is divided into subgroups 1 to 9 and each subgroup has its own index No. (100 to 999) for systematic documentation.

The index No. has the following format:



- Page enumeration is independent by every group where first page is always 1.

Group No.	Group denomination	Contents
00	General	Model coding system, power train table, chassis No., engine No., power train label, vehicle identification No., precautions for maintenance operation, table of standard tightening torques, connector configuration chart
01	Maintenance schedule	Maintenance schedule tables, maintenance operations, lubrication
10	Removal and installation of engine	Removal and installation of engine from vehicle
11	Engine	Engine body
12	Lubrication	Lubrication system, oil pressure system
13	Fuel and engine control	Fuel system, engine control, pre-stroke control injection pump system
14	Cooling	Cooling system
15	Intake and exhaust	Intake and exhaust system, turbocharger, intercooler
21	Clutch	Clutch body and clutch control system
22A	Manual transmission < M060S5, S6, M070S6 >	Transmission body and transmission control system
22B	Manual transmission < M8S2x5 >	Transmission body and transmission control system
23	Automatic transmission	Transmission control system, oil cooler system
25	Propeller shaft	Front and rear propeller shafts, center bearing assembly
26	Front axle	Front axle and wheel alignment
27	Rear axle	Axle drive mechanism
31	Wheel and tire	Wheel and tire
33	Front suspension	Leaf suspension mechanism
34	Rear suspension	Leaf suspension mechanism

https://truckmanualshub.com/

Group No.	Group denomination	Contents
35A	Brake < Air over hydraulic brake >	Brake mechanism, dual brake valve, brake booster (airmaster), air compressor, air dryer, exhaust brake system
35B	Brake < Full air brake >	Brake mechanism, dual brake valve, air compressor, air dryer, exhaust brake system
36A	Parking brake < Center parking brake >	Control system, center brake body
36B	Parking brake < Wheel parking brake >	Control system, parking brake control valve, spring brake valve
37	Steering	Steering system, power steering booster, oil pump
41	Frame	Frame repair
42	Cab	Cab mounting and tilt, door, exterior fittings, interior fittings
54	Electrical	Power supply, charging and grounding system, engine start and stop systems, lighting system, meter system, indicator and warning systems, cab electric devices, chassis electric devices, engine and transmission electric devices
55A	Air-conditioner	Air-conditioner
55B	Heater	Heater

General Explanation of This Manual

● **Specifications**
Particulars relative to maintenance service are made.

● **Structure and operation**
(1) Regarding conventional equipment, descriptions are made in brief.
(2) Regarding new equipment, descriptions of system and operating condition are made in detail.

● **Troubleshooting**
Symptoms of troubles and possible causes are described comparatively.

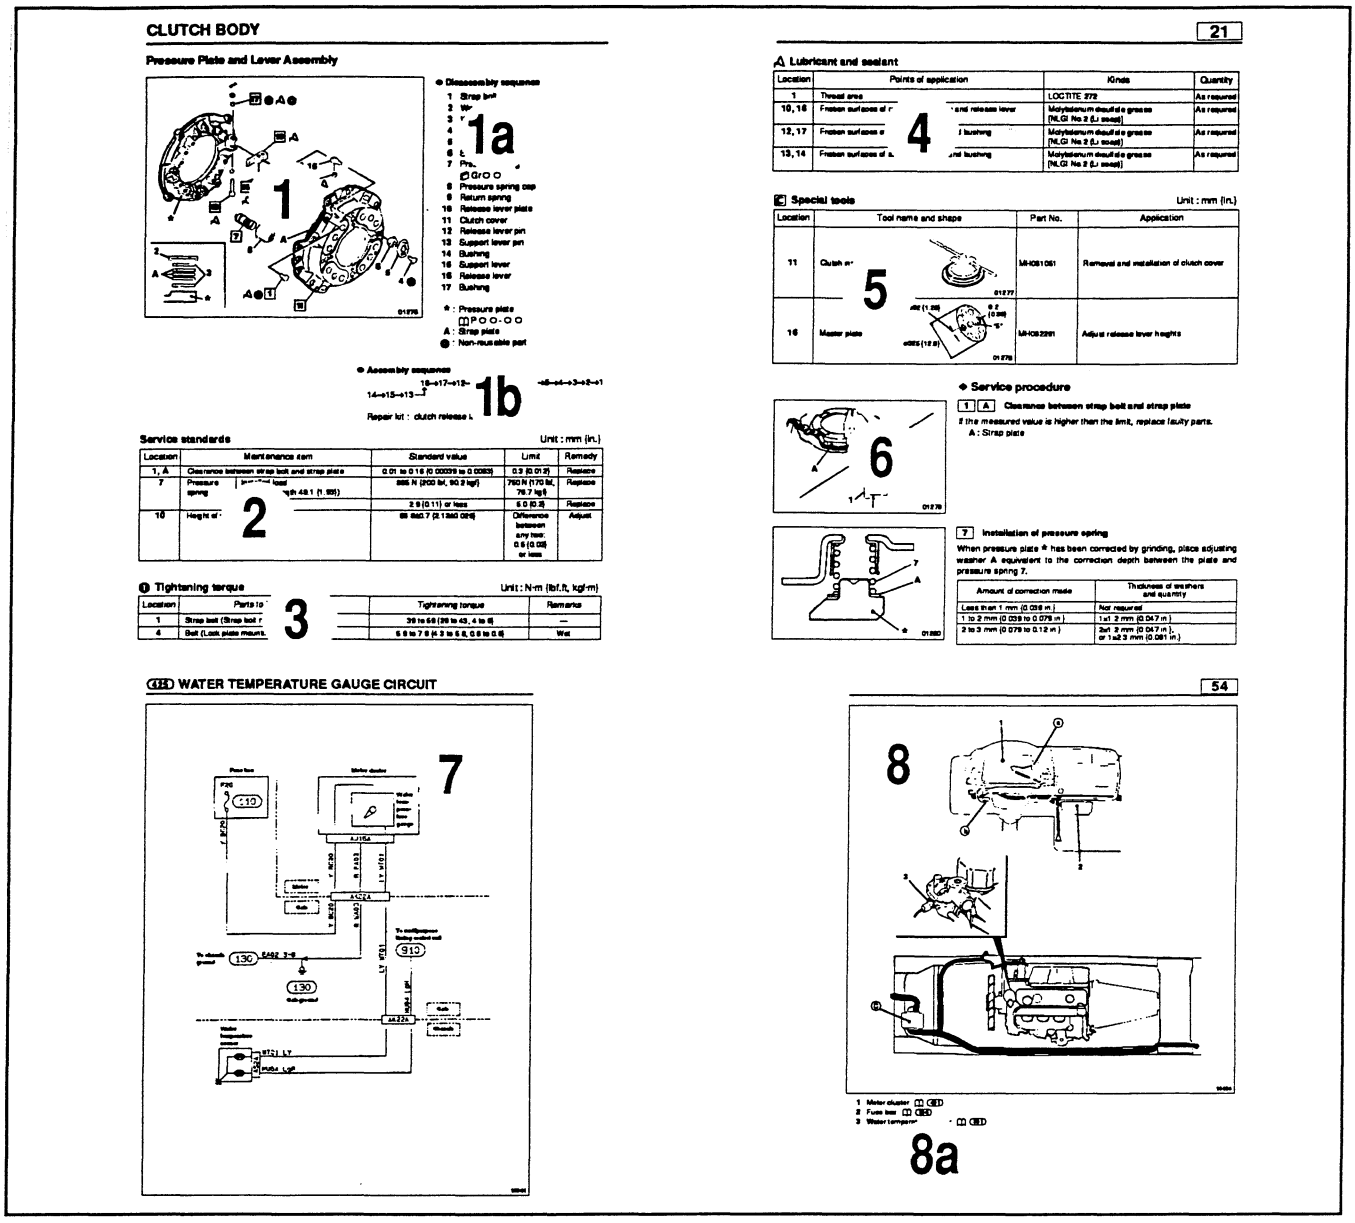
● **Inspection and adjustment mounted in vehicle**
Descriptions are made regarding inspection and adjustment of units mounted in vehicle.

● **Service procedure**
In principle, an explanation is given at the spread title page so that the service procedure can be understood. Servicing points are explained as a supplementary explanation.

https://truckmanualshub.com/

HOW TO READ THIS MANUAL

Regarding the design of this manual



1. .....Illustration for disassembly and assembly or removal and installation : 3-D exploded view of component parts is displayed.
   1a. .....Names of parts show an example of the disassembly (removal) sequence.
   1b. .....When the assembly (installation) sequence differs from the disassembly (removal) sequence, an example of the assembly (installation) sequence is shown.
2. .....Service standards are shown collectively, classified by location.
3. .....Tightening torques are shown collectively, classified by location.
4. .....Points of lubricant, fluid and sealant application are shown collectively, classified by location.
5. .....Special tools to be used are shown collectively, classified by location.
6. .....When it is considered hard to understand the service procedure, just by the foregoing description, a supplementary description of the service procedure is given.
7. .....Various system circuits are illustrated starting from the fuses. Battery to fuse wiring is treated as a power supply circuit.
8. .....Circuit diagram of parts, connectors and harnesses.
   8a. .....Part names.

https://truckmanualshub.com/

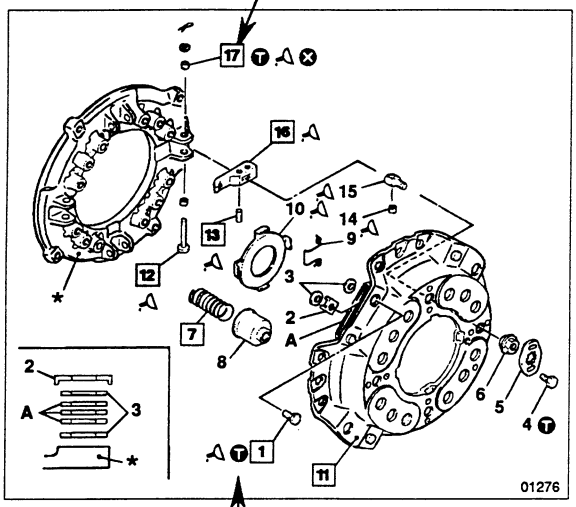
1. Illustration for disassembly and assembly or removal and installation

This shows that the appropriate service procedure is described in the text.

This shows the key No. of the part. In the text, this No., is referred to uniformly throughout.

CLUTCH BODY

Pressure Plate and Lever Assembly



● Disassembly sequence

1 Strap bolt
2 Washer
3 Washer
4 Bolt
5 Lock plate
6 Support nut
7 Pressure spring
Gr ○ ○
8 Pressure spring cap
9 Return spring
10 Release lever plate
11 Clutch cover
12 Release lever pin
13 Support lever pin
14 Bushing
15 Support lever
16 Release lever
17 Bushing

* : Pressure plate
P ○ ○ - ○ ○
A : Strap plate
⊗ : Non-reusable part

● Assembly sequence

16→17→12→10→9→8→7→6→5→4→3→2→1
14→15→13→

Repair kit : clutch rel e lever kit

This shows an example of the disassembly (removal) sequence.

This shows that the service procedure is described in another section.

P ○ ○ - ○ ○
: shows reference page within the same group.

Gr ○ ○
: shows reference group within the same book.

No service procedure is referred to in this section, but the item can be an objective of various procedures.

Meaning of symbols

- T : shows that the tightening torque is specified.
- : shows that application of lubricant, fluid or sealant is required.
- ⊗ : shows that the part should not be reused.

This is shown when the assembly (installation) sequence is not the reverse of the disassembly (removal) sequence.

This shows that a repair kit is available.

https://truckmanualshub.com/

HOW TO READ THIS MANUAL

2. Service standards table

Only the relevant service standards are shown.

Service standards Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1, 11	Clearance between strap bolt and strap plate		0.01 to 0.16 {0.00039 to 0.0063}	0.3 {0.012}	Replace
7	Pressure spring	Installed load (Installed length 49.1 {1.93})	835 N {185 lbf, 85 kgf}	710 N {160 lbf, 72.3 kgf}	Replace
		Tilt	2.9 {0.11} or less	5.0 {0.20}	Replace

This shows the key No. of the relevant part.

3. Tightening torque table

This shows specified tightening torque.

Tightening torque Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Strap bolt (Strap bolt mounting)	39 to 59 {29 to 43, 4 to 6}	—
4	Bolt (Lock plate mounting)	5.9 to 7.8 {4.3 to 5.8, 0.6 to 0.8}	Wet

This shows that the item is to be tightened wet.

This shows the key No. of the relevant part.

4. Lubricant, fluid and sealant table

Only the relevant lubricant, fluid and sealant are shown.

This shows the application point.

Lubricant, fluid and sealant

Location	Points of application	Kinds	Quantity
1	Thread area of bolt	LOCTITE 272	As required
10, 16	Friction surfaces of release lever plate and release lever	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

This shows the key No. of the relevant part.

This shows the specified brand.

https://truckmanualshub.com/

5. Special tools table

Only the relevant special tools are shown.

Purpose of special tools is shown.

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
11	Clutch installer  01277	MH061051	Removal and installation of clutch cover
16	Master plate  01278	MH062291	Adjust release lever heights

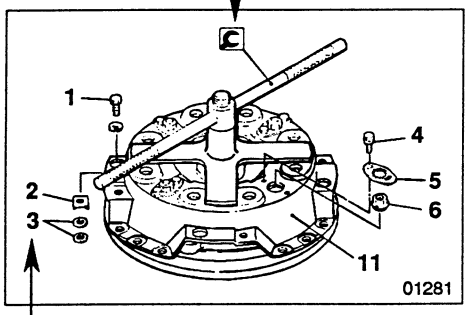
This shows the key No. of the relevant part.

Quote this number when placing an order for the part.

6. Service procedure

This indicates a special service tool.

This shows the key No. of the relevant part.



11 Removal and installation of clutch cover

- Depress pressure spring **7** using clutch installer, then remove the following parts:
  Strap bolt **1**, washer **2**, washer **3**, bolt **4**, lock plate **5**, support nut **6**
- Loosen the clutch installer gradually, then remove clutch cover **11** when the pressure spring is fully released.
- For installation, follow the removal sequence in reverse.

Servicing procedures of disassembly (removal), assembly (installation), inspection, adjustment, etc. are shown collectively.

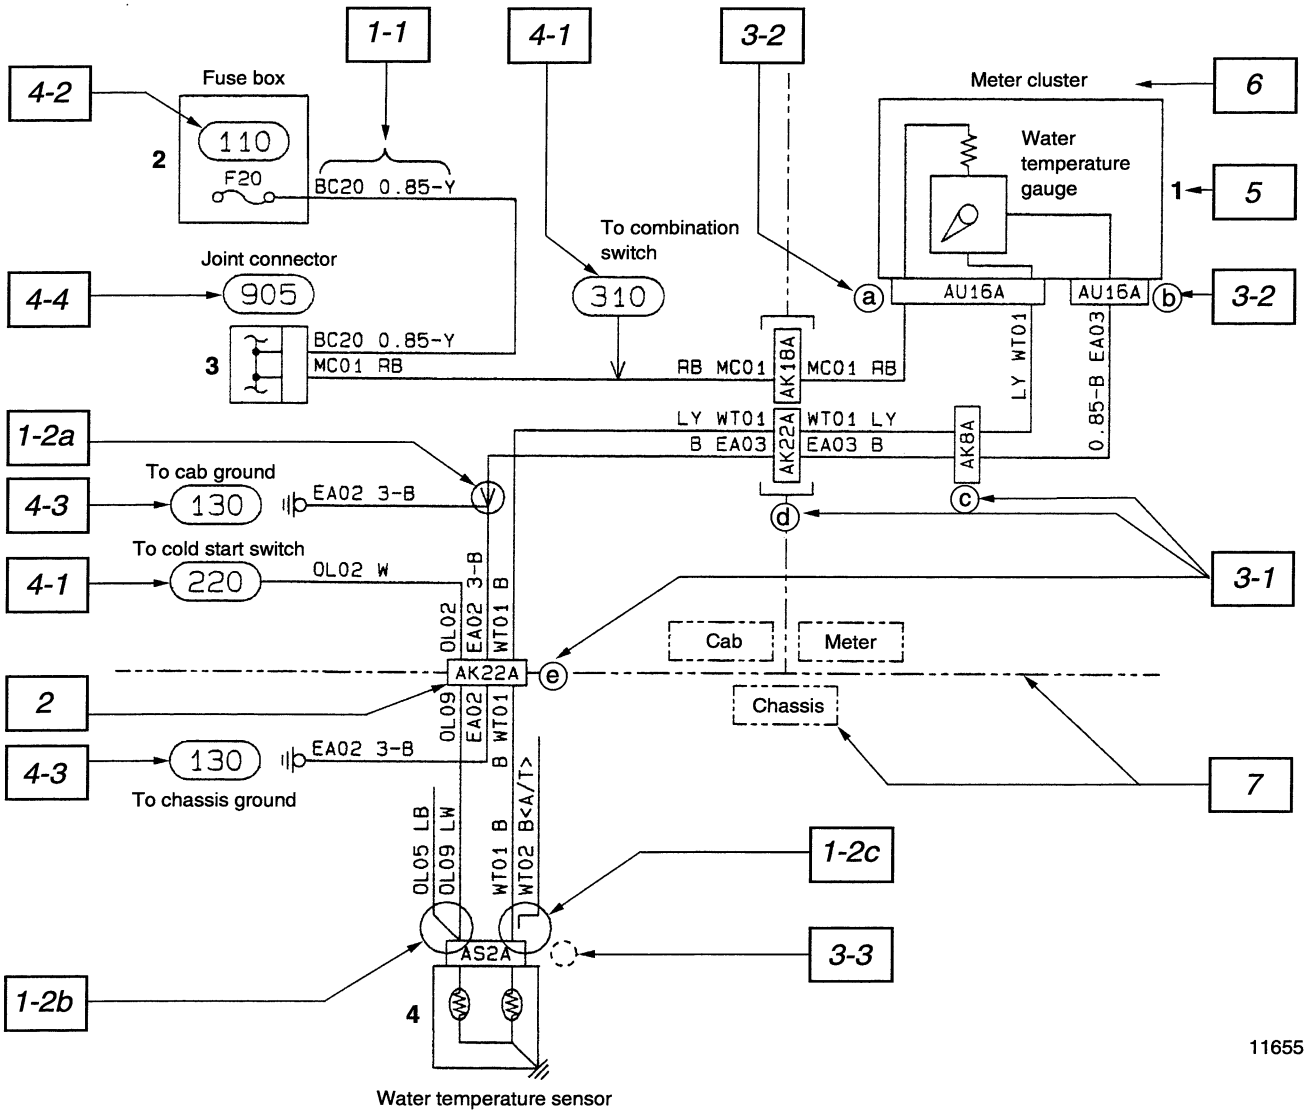
The key No. referred to in the text is always the same as the key No. shown in the illustration.

https://truckmanualshub.com/

HOW TO READ THIS MANUAL

7. Circuit Description

- The circuits show systems classified by index numbers.
- Only the functioning wires in the system are described. When a wire is connected to the system circuit, but does not function in the system, the wire is referred to by an index number. (*4-1*)
- The connector installation point mark corresponds to the marks in the vehicle layout so that the connector installation points can be checked during inspection. (*3-1, 3-2*)
- In basic descriptions, the fuse box is considered as the power source for a circuit. The circuit from the battery to the fuse box is separately described as a power circuit and referred to by the index number in each circuit. (*4-2*)
  However, for circuits that require a description of the circuit from the battery, the battery is considered as the power source.
- Switches and relays in the circuit diagram are shown in the state where no current flows through the circuit.



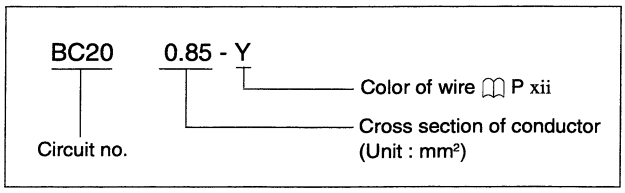
- Items described in circuit diagram
  - *1* Wire
  - *2* Connector
  - *3* Connector installation point mark
  - *4* Index number
  - *5* Key number
  - *6* Part name
  - *7* Indication of harness installation area on the vehicle

For details, see overleaf.

https://truckmanualshub.com/

1 Wire

1-1 Circuit number, cross section of conductor and color of wire are indicated for each wire.



As 0.5 mm² cross section wire is the most commonly used, the cross section indication is omitted when it is 0.5 mm². All the other figures are indicated as illustrated.

Example : 0.5 mm²; BC20 Y 0.85 mm²; BC20 0.85-Y 5 mm²; BC20 5-Y

1-2 Different types of wire connection are indicated as follows:

1-2a When wire is connected normally.

(Indicated by an arrow. The arrow direction, however, does not indicated the current flow direction.)

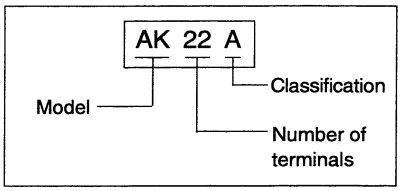
1-2b When two or more wires are connected to a connector terminal.

1-2c When the type of wire or connection differs according to specifications.

2 Connector

Connector type is indicated in a box □ . Whether the connector is female or male is not indicated. 🖻 Gr ○ ○

Though several connectors can be installed in one point on an actual vehicle, only the connector related to the system is indicated in the circuit diagram.



3 Connector installation point mark

Connector installation point marks (ⓐ, ⓑ, ⓒ ...) indicate the installation positions on a vehicle corresponding to the vehicle layout. The marks are indicated only where the actual installation position on the vehicle is difficult to check or when you need to distinguish the connector in question from among several other connectors at the same point.

3-1 When the actual position on the vehicle is difficult to check.

A mark is indicated for each connector. When several connectors are installed at one point they are indicated by a mark in [ ].

3-2 When it is difficult to identify the connector in question because there are several connectors of the same type.

3-3 When the connector installation point is clear enough, the mark is not indicated.

4 Index number

The index number (110) in a circuit diagram shows the connecting destination that is not directly used in the system or indicates another diagram that provides a detailed description of each unit. This can be used as a reference to check the relationship with other circuits. Different types of index numbers are indicated as follows:

4-1 To show the connecting destination with another circuit.

4-2 To show the power circuit from the battery and the connecting destination with another circuit connected to the fuse.

4-3 To show the grounding position on the vehicle and the connecting destination of another circuit that is grounded.

4-4 To show a diagram that describes the details of a unit that has complex wiring.

5 Key number

Key numbers correspond to those in the vehicle layout.

6 Part name

Part names are preceded by key numbers.

7 Installation area of harness on the vehicle

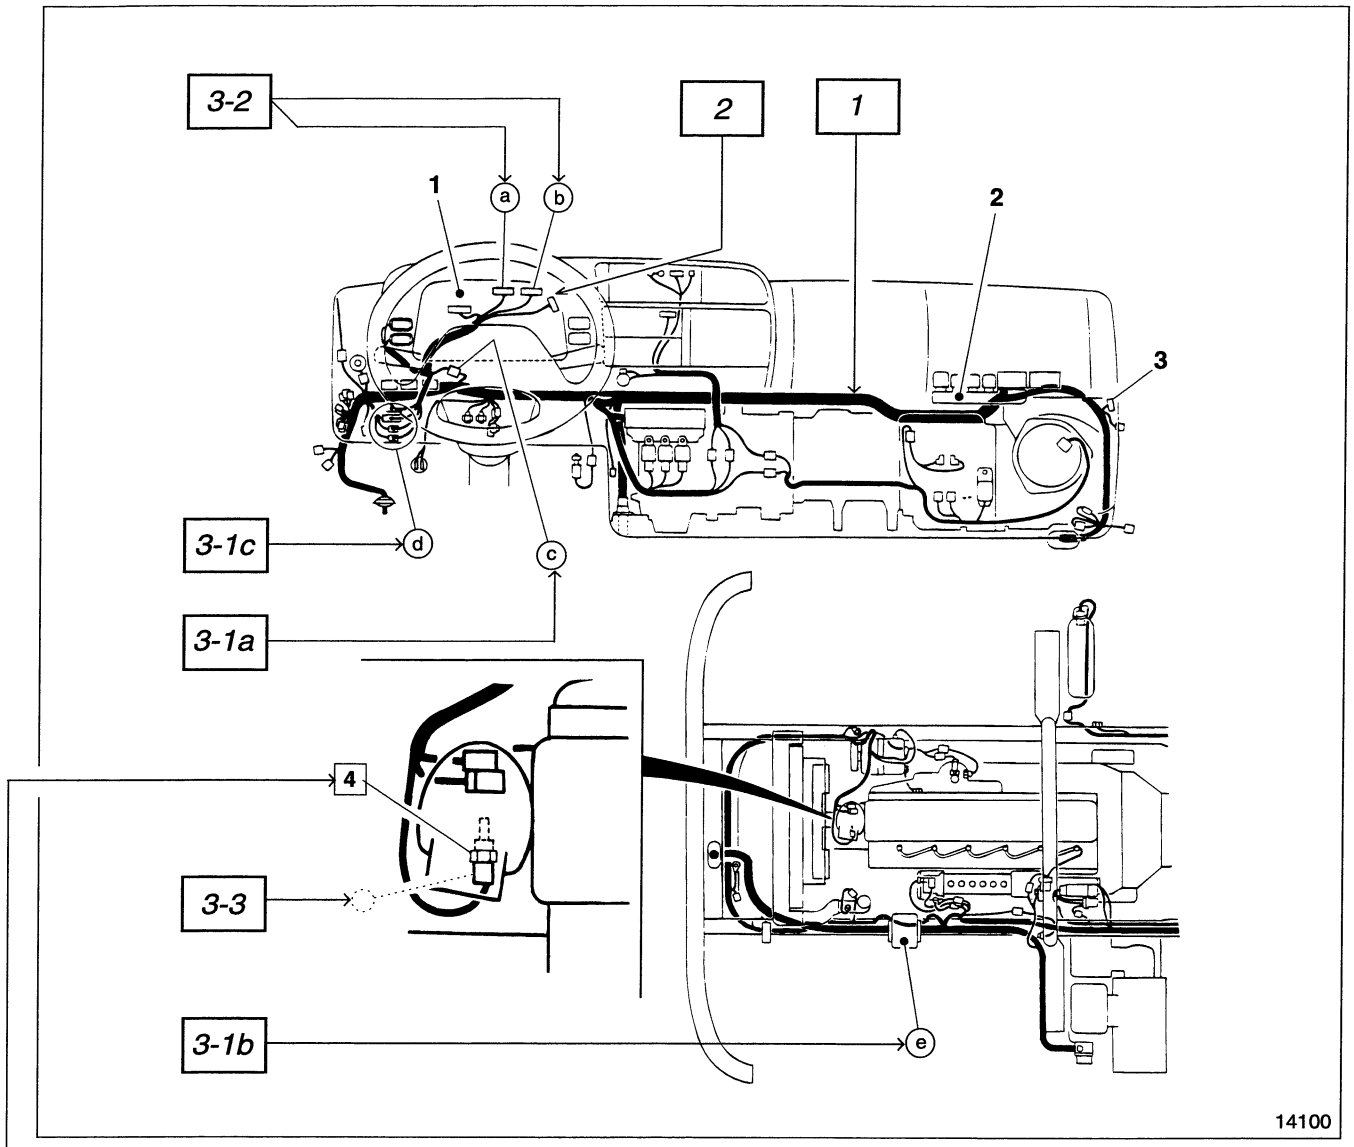
This indicates the area where the harness is installed on the vehicle using border lines so that the connector installation positions can be checked easily.

https://truckmanualshub.com/

HOW TO READ THIS MANUAL

8. Vehicle layout description

• Vehicle layout describes installation points of parts, connectors and harnesses.



1 Meter cluster 📖 (401)
2 Fuse box 📖 (104)
3 Joint connector 📖 (905)
4 Water temperature sensor Gr 14

8-1
4
5
6
8-2
9

• Items described in vehicle layout

1 Wire
2 Connector
3 Connector installation point mark
4 Index number
5 Key number
6 Part name
(*7* Described only in circuit diagram)
8 Reference mark
9 Reference group

For details, see overleaf.

https://truckmanualshub.com/

1 Wire

This indicates the wiring status of the harness actually installed on the vehicle.

2 Connector

The connector installation point is indicated briefly (in a two dimensional or three dimensional drawing).

3 Connector installation point mark

The connector installation point marks are normally indicated clockwise, starting from the top left of the layout. The marks correspond to those in the circuit diagram. However, some of the marks directly indicated in the circuit diagram are indicated indirectly as follows in the vehicle layout.

3-1 When it is difficult to recognize the connector position on the actual vehicle

3-1a Indicates the connector in question.

3-1b Indicates the connector box or bracket for the connector in question, but does not indicate the connector itself.

3-1c Indicates the area where connectors, including the one in question, are located, but does not indicate the connector itself.

(This indication is used when several connectors are installed in one area and the connectors are not fixed with clips, and it is difficult to identify the actual position of the connector in question solely by the wiring status of the harness.)

3-2 When connectors of the same type are located closely together, and it is difficult to identify which is the one in question

3-3 Marks are not indicated when the connector position is clear enough.

4 Index number

In the vehicle layout, the index number is indicated so that parts can be easily inspected. For this reason, index numbers do not indicate the connecting destination of a circuit, as in the circuit diagram, but indicate the numbers where removal and installation, inspection, or adjustment procedures are described.

5 Key number

Key numbers are normally indicated clockwise, starting from the top left of the layout. The numbers correspond to those in the circuit diagram. When the key number is enclosed in a box, the service procedure for the part is described.

6 Part name

(*7* Described only in circuit diagram)

8 Reference mark

Two types of reference mark are indicated as follows:

8-1 When referring to a part in the same group : 🕮

8-2 When referring to a part in another group : 📦

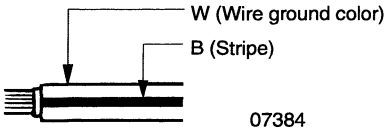
9 Reference group

https://truckmanualshub.com/

HOW TO READ THIS MANUAL

● Wire Colors

Example: WB means a wire whose ground color is white and whose stripe is black.



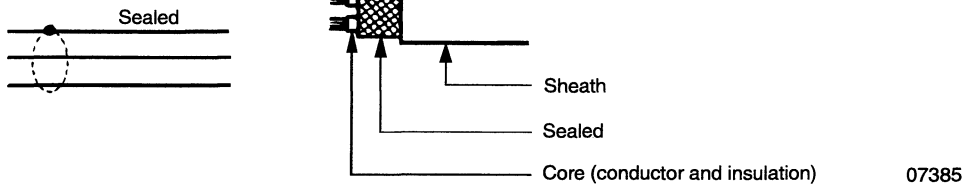
Wire ground color		Wire ground color + Stripe							
W	White	WR	White red	WB	White black	WL	White blue	WG	White green
B	Black	BW	Black white	BY	Black yellow	BR	Black red		
R	Red	RW	Red white	RB	Red black	RY	Red yellow	RG	Red green
Y	Yellow	YR	Yellow red	YB	Yellow black	YG	Yellow green	YL	Yellow blue
G	Green	GW	Green white	GR	Green red	GY	Green yellow	GB	Green black
Br	Brown	BrW	Brown white						
L	Blue	LW	Blue white	LR	Blue red	LY	Blue yellow	LB	Blue black
Lg	Yellow green	LgR	Yellow green red	LgY	Yellow green yellow	LgB	Yellow green black	LgW	Yellow green white
O	Orange								
P	Pink	PB	Pink black						

RL	Red blue
YW	Yellow white
GL	Green blue
LO	Blue orange

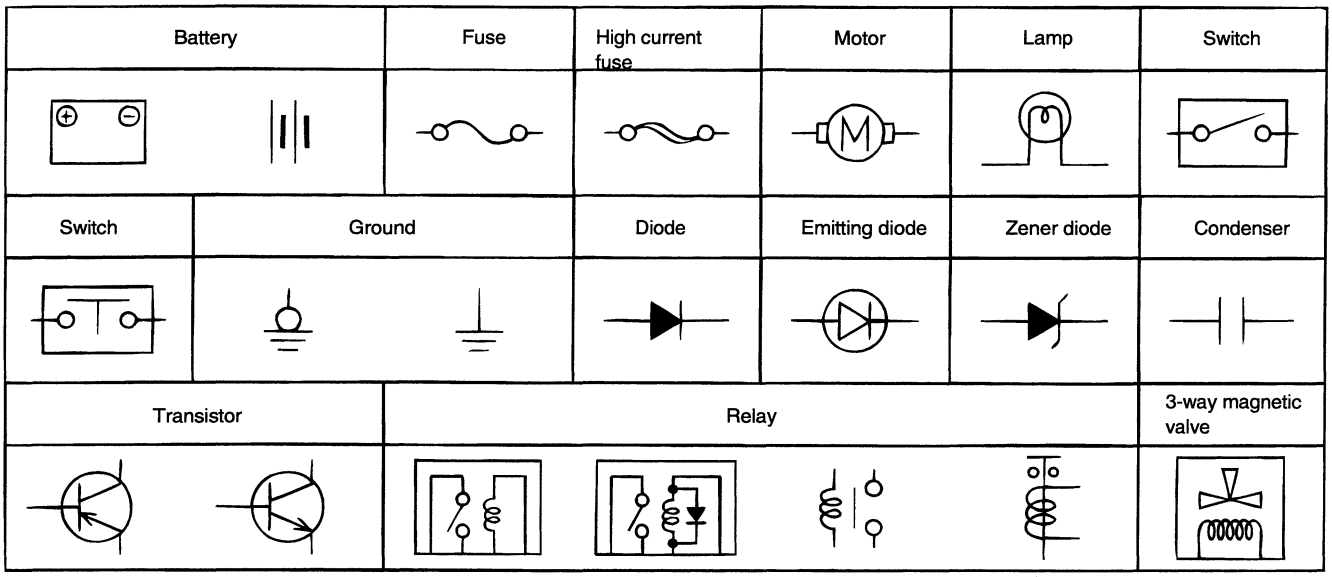
● Sealed Wire

A sealed wire is clearly identified as follows:

Example



● Symbol Mark



https://truckmanualshub.com/

Terms and Units

The terms and units in this manual are defined as follows.

- This service manual contains important cautionary instructions and supplementary information under the following four headings which identify the nature of the instructions and information:

DANGER ⚠	Precautions that should be taken in handling potentially dangerous substances such as battery fluid and coolant additives.
WARNING ⚠	Precautionary instructions, which, if not observed, could result in serious injury or death.
CAUTION ⚠	Precautionary instructions, which, if not observed, could result in damage to or destruction of equipment or parts.
NOTE	Suggestions or supplementary information for more efficient use of equipment or a better understanding.

- **Front and rear**

  The forward running direction of the vehicle is the front and the reversing direction is the rear.

- **Left and right**

  Left hand side and right hand side, when facing the forward running direction of the vehicle, are respectively left and right.

- **Terms of service standards**

  (1) Standard value

  Standard value dimensions in designs indicating: the design dimensions of individual parts, the standard clearance between two parts when assembled, and the standard value for an assembly part, as the case may be.
  The figure in [ ] is the basic diameter.

  (2) Limit

  When the value of a part exceeds this, it is no longer serviceable in respect of performance and strength and must be replaced or repaired.

- **Tightening torque**

  Excessive or insufficient tightening torque has particular importance in respect of performance. Accordingly, tightening torque is specified in locations that are to be tightened.
  Where there is no specified figure for tightening torque, follow the table covering standard tightening torques.
  When the item is to be tightened in a wet state, wet is indicated. Where there is no indication, read it as dry, and tighten at specified torque.

- **Unit**

  Length, weight, surface area and capacity are in SI units. Imperial and metric units are given in brackets. Temperatures are given in degrees Celsius with degrees Fahrenheit given in brackets.

PRECAUTIONS FOR MAINTENANCE OPERATION

DANGER ⚠

This product contains or emits chemicals known to the State of California to cause cancer and birth defects or other reproductive harm.

https://truckmanualshub.com/

GROUP 01 MAINTENANCE SCHEDULE

MAINTENANCE OPERATIONS

- **Battery 01-2**
- **Fuse 01-6**

https://truckmanualshub.com/

MAINTENANCE OPERATIONS

Battery

DANGER ⚠

- **Since flammable hydrogen gas is generated by the battery, be sure to obey the following warnings:**
  - **Do not short-circuit the ⊕ and ⊖ terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over the battery.**
- **Because the battery electrolyte is diluted sulfuric acid and is corrosive, when handling the battery wear safety glasses and rubber gloves to protect the eyes and hands.**
- **Battery posts, terminals and related accessories contain lead and lead compounds. Wash hands after handling.**

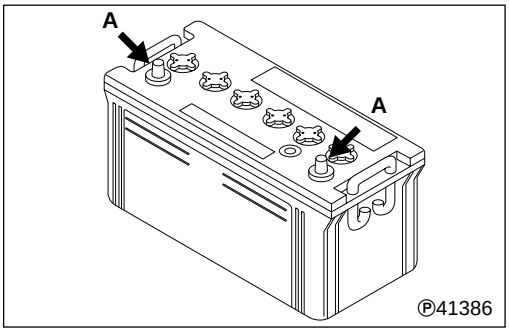
WARNING ⚠

To prevent a short-circuit be sure that the disconnected battery cables do not accidentally touch the battery terminals.

CAUTION ⚠

- **Make sure that you disconnect the battery cable ⊖ first when you disconnect the battery cables.**
- **Make sure that all electrical switches of the vehicle are OFF before connecting the battery cables.**
- **Make sure that you connect the battery cable ⊕ before you connect the battery cable ⊖.**

https://truckmanualshub.com/

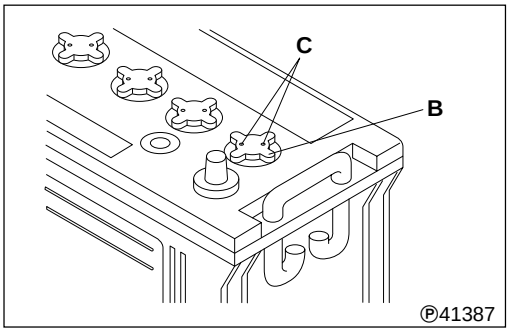


Visual inspection

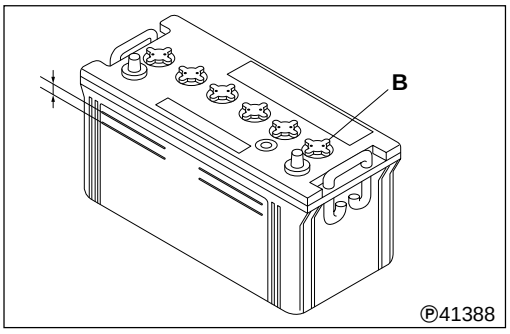
- If terminal **A** is corroded, scrub off the corrosion using a wire brush.
- If cracks or defects are found on the battery, replace it since the cracks or defects can cause liquid spills.

CAUTION ⚠

Make sure you grease the ⊕ side of terminal A because it is easily corroded.

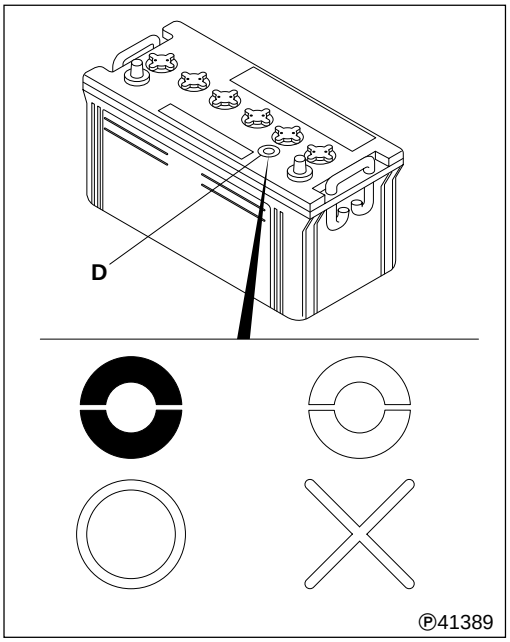


- If bleed hole **C** of vent plug **B** is clogged, clean the hole.



Inspection of fluid level

- Make sure that the battery electrolyte level is between the UPPER and LOWER level lines.
- If the level is below the LOWER level line, remove vent plug **B** and fill the battery with distilled water or battery replenisher to the UPPER level line.

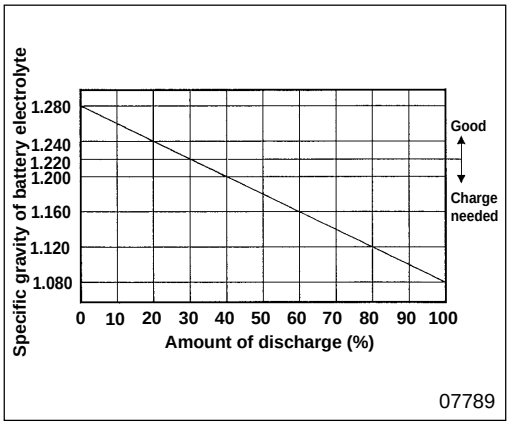


Measurement of specific gravity

You can tell the specific gravity of the battery electrolyte by the color shown in indicator **D**.

Blue : Good
White : Charge or replace

https://truckmanualshub.com/



Charging

- Although, as a rule, charging of the battery should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect the battery cable ⊖.
- Remove vent plug **B** before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	$\frac{\text{Value of 5-hour rating capacity}}{10}$	$\frac{\text{*Amout of discharge (Ah)}}{\text{Charge current (A)}} \times 1.2$ (to 1.5)	45 {113}
Quick charge	$\frac{\text{Value of 5-hour rating capacity}}{1.5}$	0.5	55 {131}

* Amount of discharge (Ah) = 5-hour rating capacity (Ah) $\times \frac{\text{Amount of discharge (\%)}}{100}$

- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER ⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep work lights away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because it is dangerous.**
- **After charging the battery, tighten vent plug B, wash away sulfuric acid from the battery using water, and dry the surface.**
- **Be sure to check the electrolyte level before charging the battery. Charging with the electrolyte level below the lower limit (LOWER LEVEL) can cause premature deterioration, heat generation and explosion of the battery.**

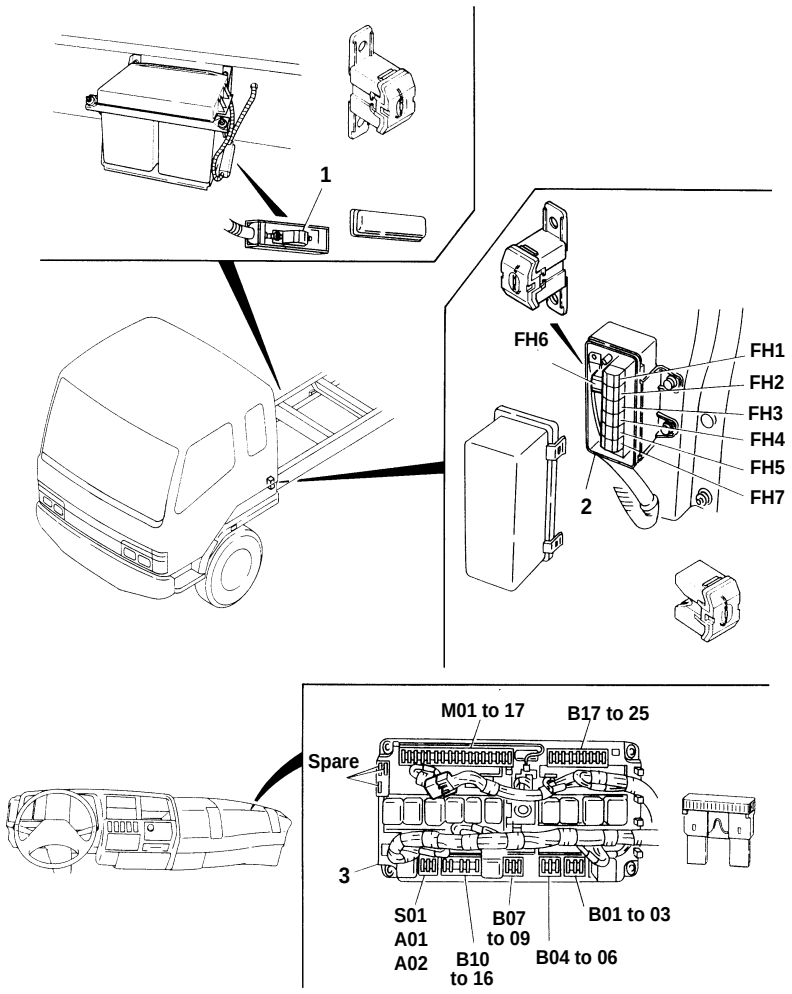
MAINTENANCE OPERATIONS

Fuse



12033

1 Main high-current fuse
2 High-current fuse box
3 Relay and fuse box

CAUTION ⚠

- **If a fuse blows, make sure you identify and remedy the cause, then replace the fuse.**
- **Make sure that you replace the fuse with one having the same rating.**
- **Make sure that you remove the ⊖ terminal of the battery cable before removing main high-current fuse 1 and high-current fuses FH1 to 7.**

GROUP 11 ENGINE

STRUCTURE AND OPERATION 11-2

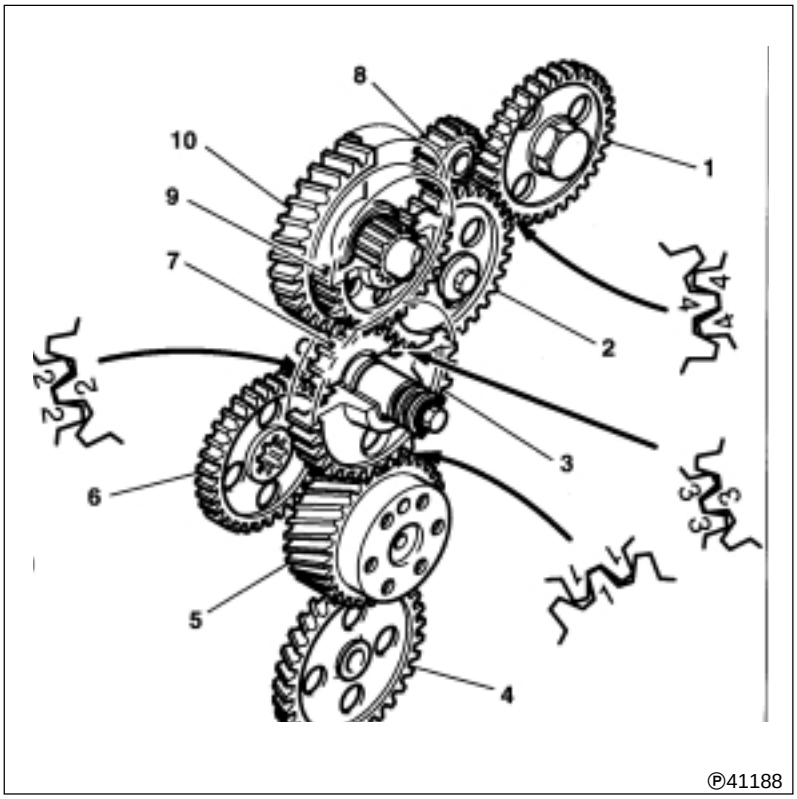
FLYWHEEL POWER TAKE-OFF 11-4

TIMING GEARS 11-8

CRANKSHAFT AND CRANKCASE 11-12

https://truckmanualshub.com/

Timing Gears



1 Camshaft gear
2 No. 2 idler gear
3 No. 1 idler gear (outer)
4 Oil pump gear
5 Crankshaft gear
6 Air compressor drive gear
7 No. 1 idler gear (inner)
8 Power steering pump gear
9 Power take-off idler gear
10 Power take-off idler gear

Each gear is stamped with a timing gear alignment mark (“**1**”, “**2**”, “**3**”, or “**4**”,) to facilitate reassembly.

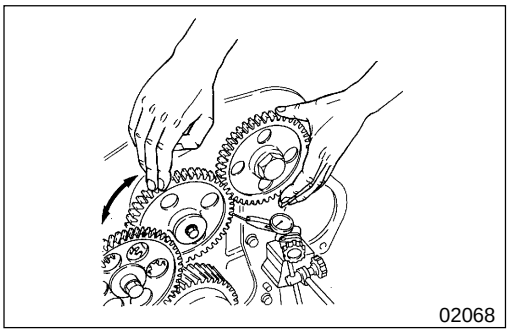
3, 7	Idler Gear Bushing Remover/Installer A: ϕ 40 {1.57} (No. 1 idler gear bushing), ϕ 44 {1.73} B: ϕ 32 {1.26} (No. 2 idler gear bushing), ϕ 35 {1.38}  02066	<No. 1> MH061228 <No. 2> MH061779	Removing and fitting idler gear bushings

◆ Service procedure

● **Pre-disassembly inspection**

(1) Gear backlash

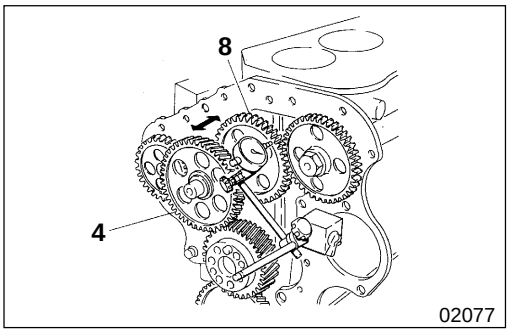
For each gear pair, measure backlash at three or more points. If any measurement exceeds the specified limit, replace the defective part(s).



02068

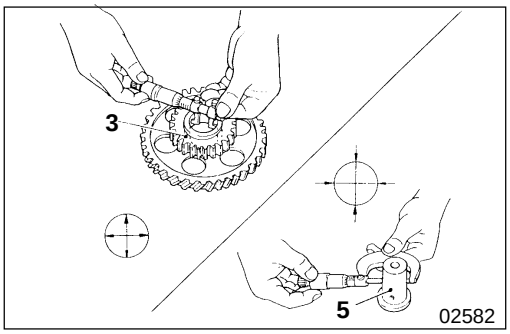
(2) No. 2 idler gear end play

If the measurement exceeds the specified value, replace the defective part(s).



02077

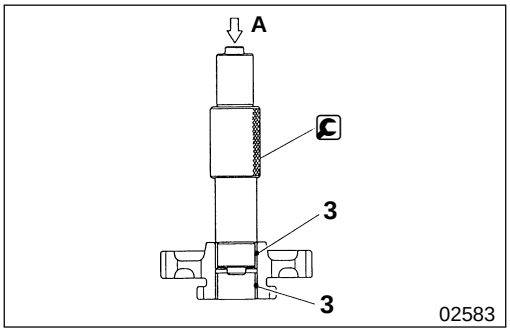
https://truckmanualshub.com/



3 5 **No. 1 idler shaft and No. 1 idler gear bushing**

[Inspection]

If the clearance exceeds the specified limit, replace the defective part(s).

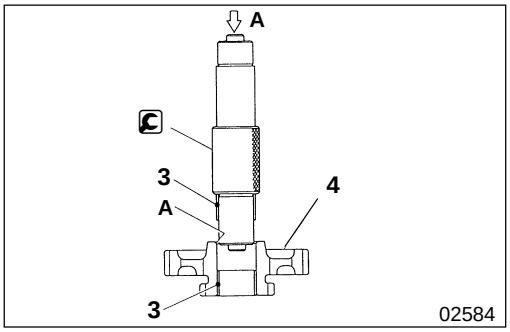


No. 1 idler gear bushing

[Removal]

The No. 1 idler gear bushing **3** consists of two pieces. Remove them at the same time.

A: Press

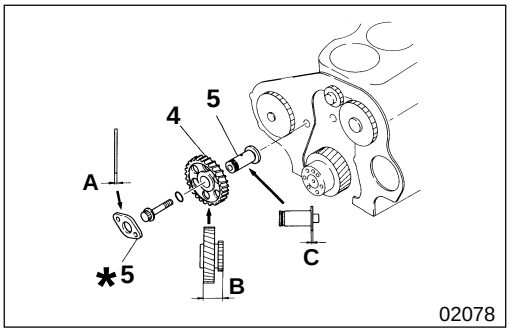


[Installation]

- Using the Idler Gear Bushing Installer, press-fit both pieces of No. 1 idler gear bushing **3** into the No. 1 idler gear **4** at the same time from the upper and lower sides.

  A: Press

- After installation, measure the clearance again. If the measurement is below the nominal value range, ream the bushing **3**.

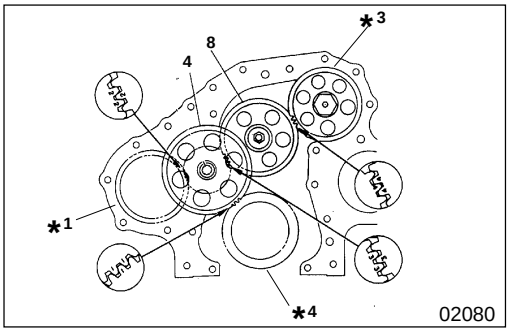


4 **No.1 idler gear end play**

Measure the illustrated dimensions of the parts, then calculate the end play **D**. If the end play exceeds the limit, replace the defective part(s).

72.15 mm {2.84 in.} – (A + B + C) = D

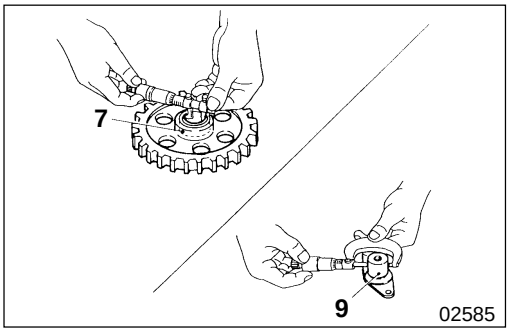
https://truckmanualshub.com/



4 8 **Installation of No. 1 and No. 2 idler gears**

- Fit the idler gears **4**, **8** such that their alignment marks "**1**", "**2**", "**3**" and "**4**" are aligned with the corresponding alignment marks.

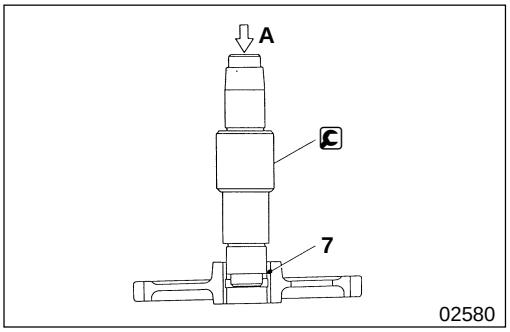
  *__1__: Drive gear
  *__3__: Camshaft gear
  *__4__: Crankshaft gear



7 9 **No. 2 idler gear bushing and No. 2 idler shaft**

[Inspection]

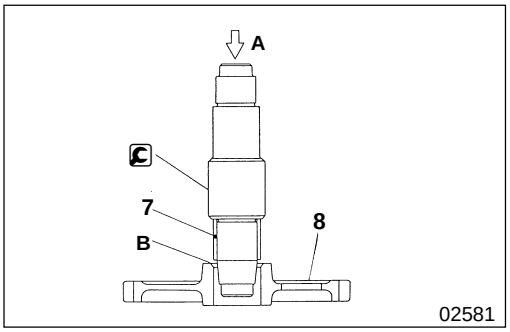
If the clearance exceeds the specified limit, replace the defective part(s).



No. 2 idler gear bushing

[Removal]

A: Press



[Installation]

- Press-fit the No. 2 idler gear bushing **7** into the No. 2 idler gear **2** using the C Idler Gear Bushing Installer. Install the bushing with the chamfered side **B** toward the gear.

  A: Press

- After installation, measure the clearance again. If the measurement is below the nominal value range, ream the No. 2 idler gear bushing **7**.

https://truckmanualshub.com/

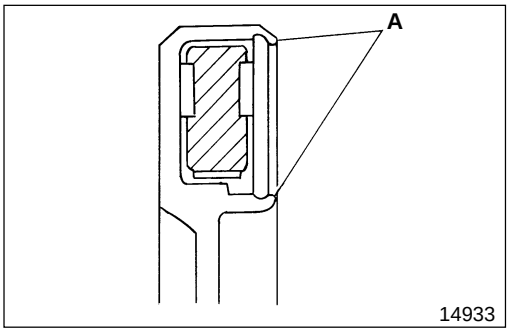
◆ Service procedure

● **Pre-disassembly inspection**

Crankshaft end play

If the measurement exceeds the specified limit, replace the defective part(s).

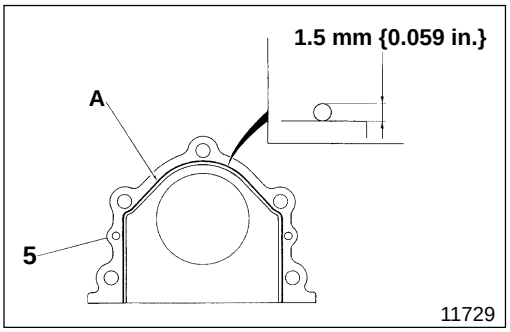


4 **Torsional damper**

CAUTION ⚠

The torsional damper is of a viscous type and filled with silicone oil. It can cause oil leaks at the staked portion A and thereby fail to function properly if handled roughly. To prevent this, pay attention to the following:

- **Ensure that the staked portion A is free from dents and other damages.**
- **Never give shocks such as by hammering or dropping it.**
- **Avoid trundling or stacking with heavy objects.**

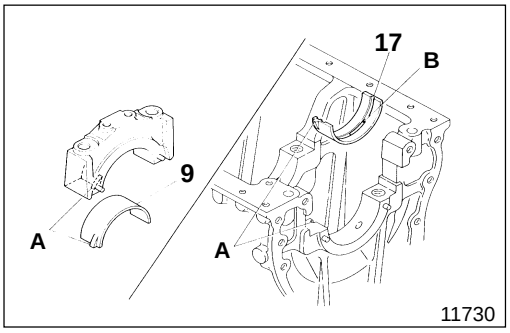


5 **Installation of front cover assembly**

- Apply an even, unbroken bead of sealant **A** to the surface of the front cover assembly **5** that contacts the crankcase **20** when installed.
- Fit the front cover assembly **5** onto the crankcase **20** within 3 minutes of applying the sealant **A**.

CAUTION ⚠

- **Ensure that the sealant application position on the front cover assembly 5 is clean before applying sealant.**
- **When fitting the front cover assembly 5, hold it firmly in position to prevent spreading the sealant.**
- **After fitting the front cover assembly 5, wait at least an hour before starting the engine.**
- **Apply a new bead of sealant A whenever the mounting bolts of the front cover assembly 5 have been loosened.**



9 17 **Main bearings**

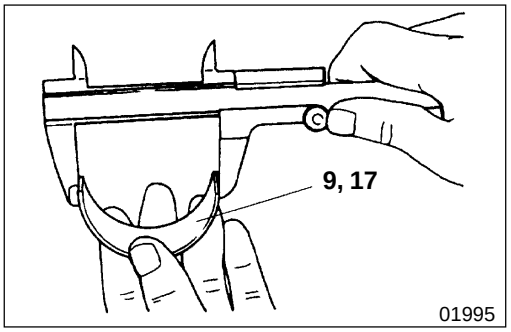
[Installation]

Install the main bearings **9**, **17** such that their lugs **A** fit into the corresponding grooves.

CAUTION ⚠

The upper main bearing 17 has an oil hole B. The lower main bearing 9 has no oil hole. Take care not to confuse the upper and lower parts.

https://truckmanualshub.com/



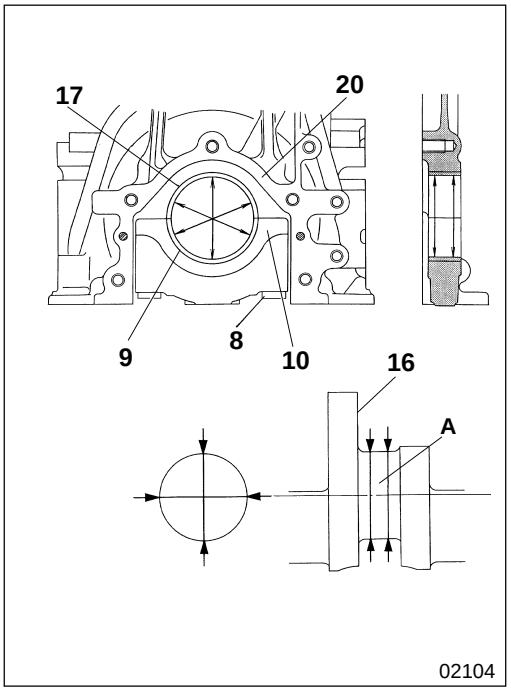
[Inspection]

CAUTION ⚠

- **Do not attempt to manually expand either bearing 9, 17 if its span is insufficient.**
- **Upper and lower bearings 9, 17 must be replaced as a set.**

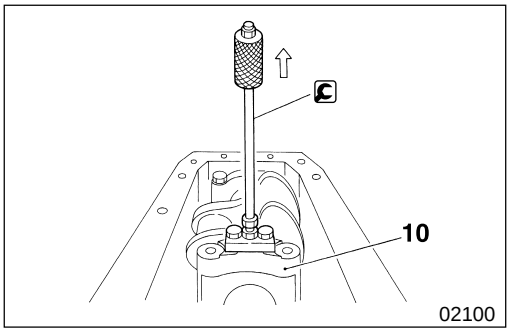
(1) Span when free

If either bearing's span when free exceeds the specified limit, the bearings **9**, **17** must be replaced.

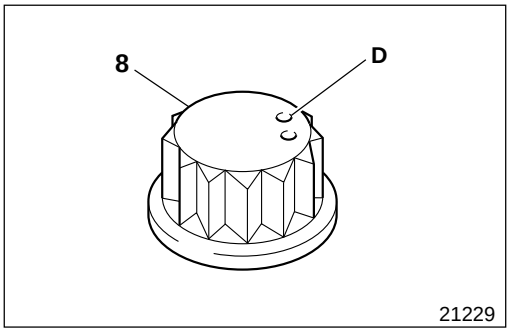


(2) Main bearing-to-crankshaft clearance

- Fit the upper main bearing **17** into the crankcase **20** and the lower main bearing **9** into the main bearing cap **10**. Then, tighten the bolts **8** to their specified torque.
- Measure the internal diameters of the main bearings **9**, **17** and the journal outside diameter **A** of the crankshaft **16**. If the clearance exceeds the specified limit, replace the defective part(s).



10 **Main bearing caps**
: Main Bearing Cap Extractor

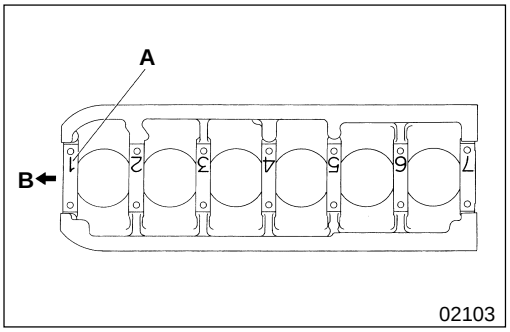


[Installation]

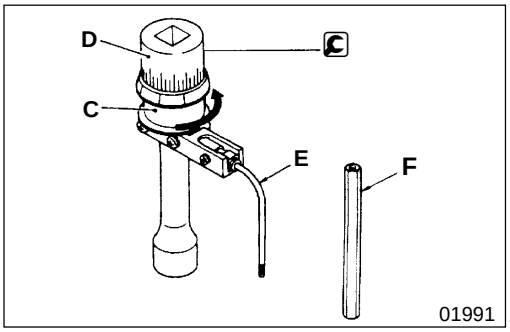
CAUTION ⚠

- **Before fitting any bolt 8, check the punch marks D on its head. Do not use the bolt if there are more than two punch marks.**
- **The punch marks indicate the number of times each bolt has been tightened using the plastic area tightening method. Any bolt that already has three punch marks must be replaced.**

https://truckmanualshub.com/

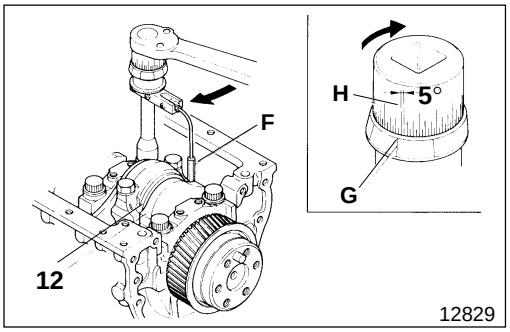


- Starting at the front of the engine **B**, fit the main bearing caps **10** in the order of the numbers **A** embossed on them and such that the numbers are in the positions illustrated.



- Tighten the bolts **8** to the specified torque. Then, turn the bolts further in accordance with the following procedure:
- Turn the holder **C** of the Socket Wrench counter-clockwise to tension the built-in spring.

  D: Socket
  E: Rod
  F: Rod (extension)

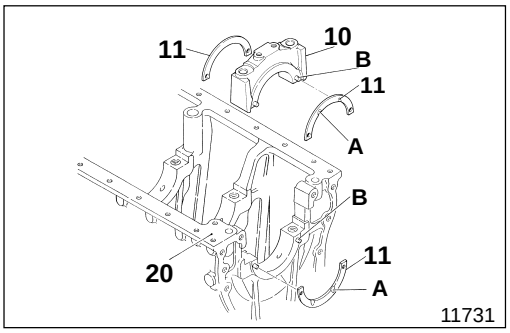


- Set the socket wrench such that the built-in spring forces the rod (extension) **F** against the crankshaft assembly **12**.
- Align any inscribed line **G** on the holder **C** with any inscribed line **H** on the socket. (Use this point as reference 0° position.)
- From the above reference position, turn the socket **D** by 90° clockwise. (One gradation on the scale represents 5°.)

CAUTION ⚠

By performing the above procedure, the bolt 8 is tightened to the plastic area. Do no attempt to tighten further after turning specified angle.

- After tightening, perform the following checks:
  - Turn the crankshaft by hand to check for smooth rotation.
  - Measure the crankshaft end play.



11 Installing thrust plates

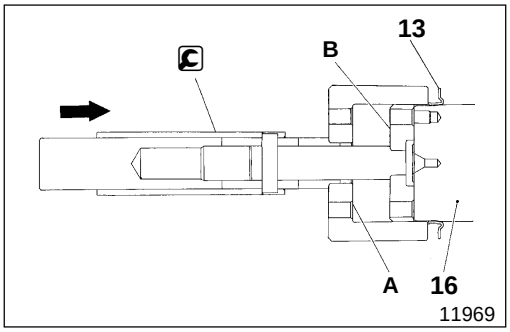
Fit a thrust plate **11** on each side of the main bearing caps **10** and at the rear end of the crankcase **20** such that the oil grooves **A** are on the outside.

B: Locating pin

CAUTION ⚠

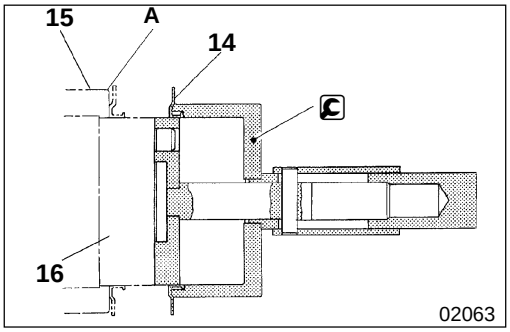
If any oversize thrust plates 11 are to be used, make sure that the upper and lower thrust plates installed at the rear end of the crankcase 20 are of the same size. However, the thrust plates installed on both sides of the main bearing cap 10 may be different in size.

https://truckmanualshub.com/



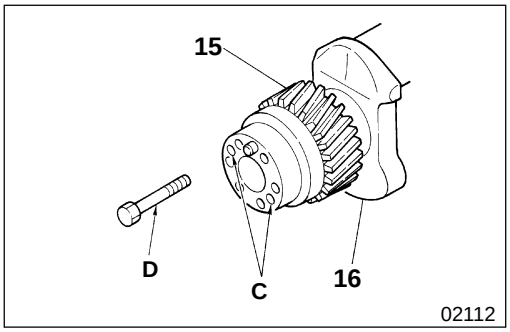
13 Installation of front oil seal slinger

Using the Front Oil Seal Slinger Installer, drive the front oil seal slinger **13** onto the crankshaft **16** until the tool's end face **A** is pressed firmly against the guide **B**.



14 Installation of rear oil seal slinger

Using the Rear Oil Seal Slinger Installer, drive the rear oil seal slinger **14** onto the crankshaft **16** until it touches the end surface **A** of the crankshaft gear **15**.



15 Crankshaft Gear

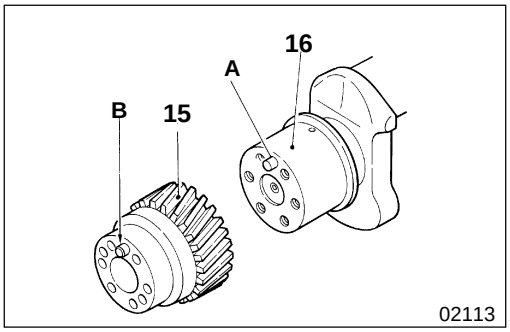
<With flywheel power take-off>

[Removal]

Screw the flywheel mounting bolts **D** evenly into the threaded holes **C** in the crankshaft **16** to remove the gear. The gear can also be removed by using the Gear Puller.

CAUTION

Do not tap off the crankshaft gear 15 since this could damage it.



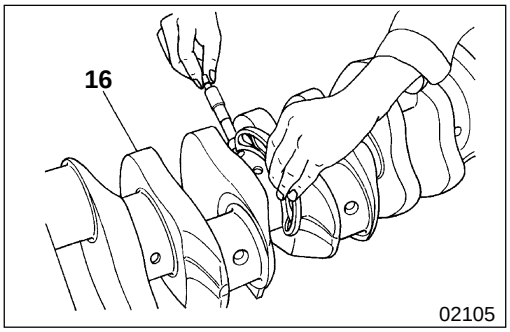
[Installation]

- Using a piston heater or the like, heat the crankshaft gear **15** to a temperature of approximately 100°C {212°F}.

WARNING

Be careful not to get burned.

- Align the locating pin **A** on the crankshaft **16** with the dowel pin **B** on the crankshaft gear **15**. Then, drive the gear into position by striking its end face with a plastic mallet.



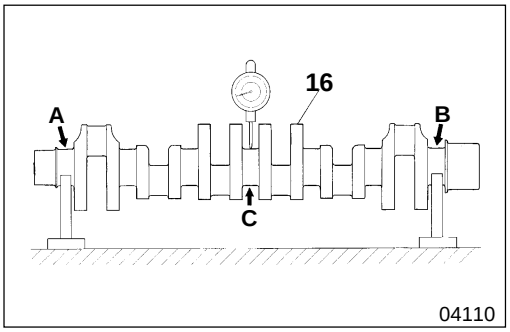
16 Crankshaft

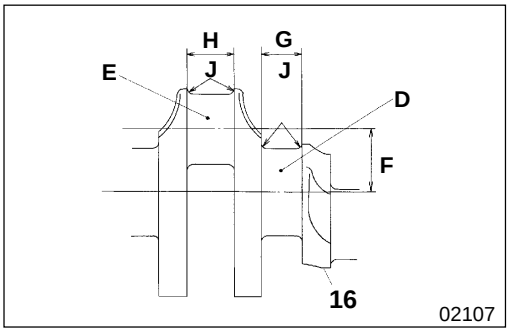
[Inspection]

(1) Roundness and cylindricity of crankshaft journal and pin

If either measurement exceeds the specified limit, grind it to undersize or replace the crankshaft **16**.

https://truckmanualshub.com/





(2) Bend

- Support the crankshaft **16** at its No.1 journal **A** and No. 7 journal **B**. Measure the extent of bending in the crankshaft at the center of the No.4 journal **C**.
- If the measurement exceeds the specified limit, replace the crankshaft.

CAUTION ⚠

Turn the crankshaft 16 through one revolution. One-half of the dial indicator reading represents the extent of bending.

[Rectification]

CAUTION ⚠

If the crankshaft 16 is rectified by grinding, the main bearings 9, 17 must be replaced with undersized ones.

- Grind such that the center-to-center distance **F** between the journal **D** and pin **E** never be changed.

  F: $57.5\ ^{+0.025}_{-0.075}$ mm $\left\{2.26\ ^{+0.00098}_{-0.00295}\ \text{in.}\right\}$
- Grind such that the journal width **G** and pin width **H** do not change.

  G: 37 mm {1.45 in.}

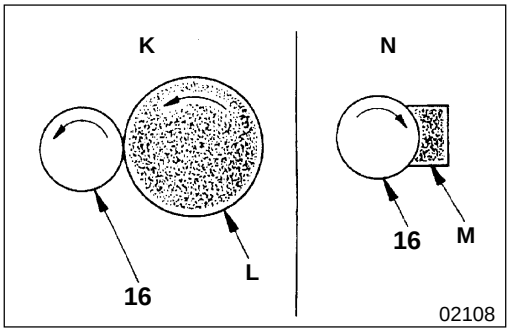
  H: $42\ ^{+0.2}_{0}$ mm $\left\{1.65\ ^{+0.0078}_{0}\ \text{in.}\right\}$
- Finish the corner fillet smoothly and to the specified radius **J**.

  J: R5 ± 2 mm {R0.02 ± 0.0079 in.}
- Carry out a magnetic inspection to check for cracks caused by grinding. Also, check that the Shore hardness of the surface has not dropped below Hs 75.

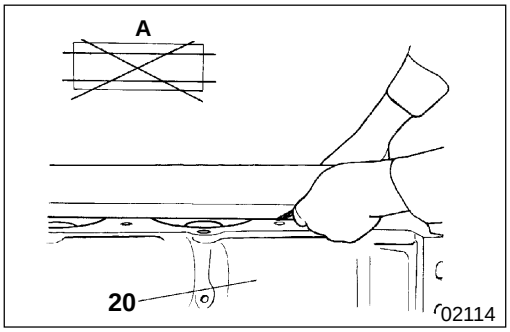
Crankshaft undersize dimensions — Unit: mm {in.}

	Degree of undersize			
	0.25 {0.0098}	0.50 {0.020}	0.75 {0.030}	1.00 {0.039}
Finished journal diameter	83.685 to 83.705 {3.294 to 3.295}	83.435 to 83.455 {3.284 to 3.285}	83.185 to 83.205 {3.274 to 3.275}	82.935 to 82.955 {3.265 to 3.266}
Finished pin diameter	64.67 to 64.69 {2.5460 to 2.5468}	64.42 to 64.44 {2.5362 to 2.5370}	64.17 to 64.19 {2.5263 to 2.5271}	63.92 to 63.94 {2.5165 to 2.5173}
Roundness	0.01 {0.00039} or less			
Cylindricity	0.006 {0.00024} or less			

https://truckmanualshub.com/



- When grinding **K**, turn the crankshaft **16** counter-clockwise as viewed from its front end. The grinder **L** should rotate in the same direction.
- When finishing **N** the crankshaft **16** with whetstone or sandpaper **M**, rotate the crankshaft clockwise.



20 Inspecting crankcase upper surface distortion

If distortion exceeds the specified limit, correct it with a surface grinder.

A: Measurement positions

CAUTION ⚠

When grinding the crankcase 20, take care that the piston projections stay within specification.

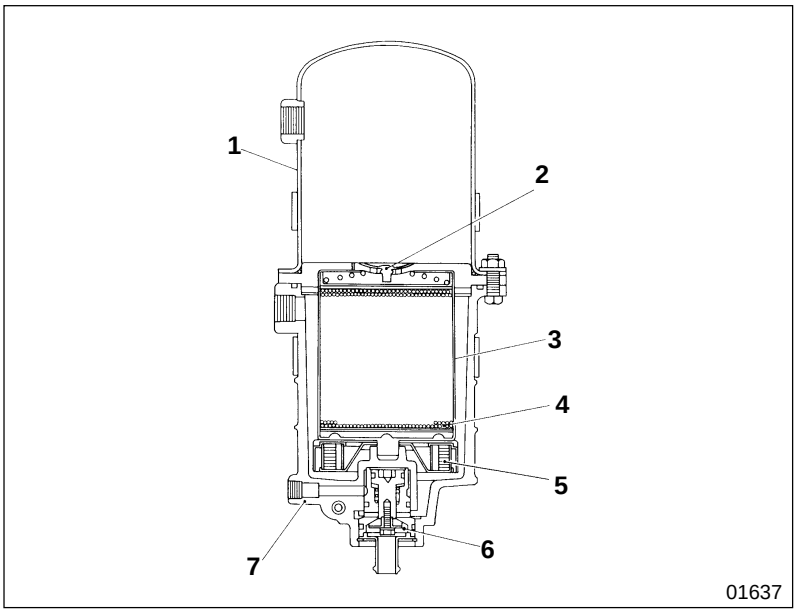
SPECIFICATIONS

Air Dryer

Item		Specifications
Manufacturer		NABCO
Type		DR-31
Heater capacity V-W		12-50
Thermostat operating temperature °C {°F}	ON	4 ± 4 {39.2 ± 7.2}
	OFF	20 {68} or lower
Purge chamber capacity L {qts}		1.4 {1.48}
Required time for recycling desiccant sec.		50

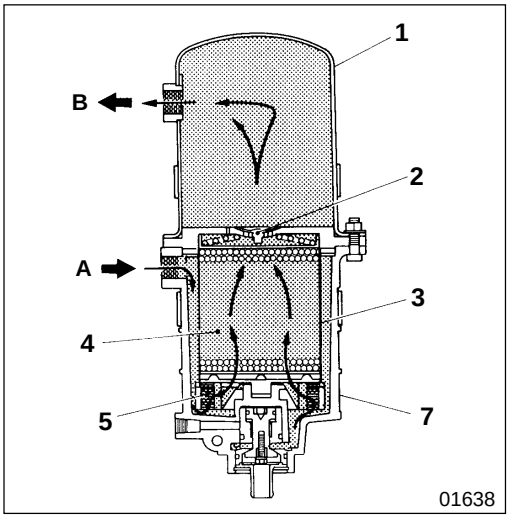
https://truckmanualshub.com/

Air Dryer



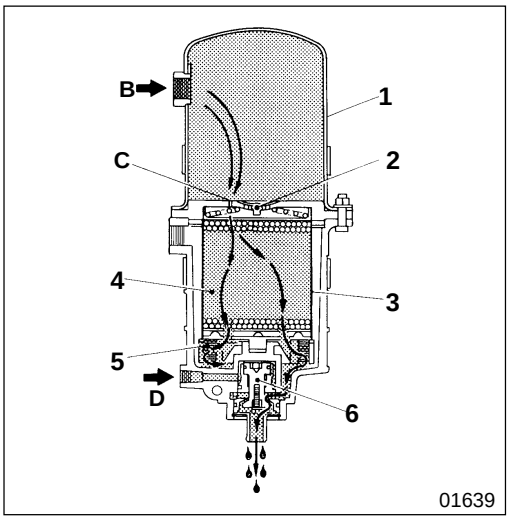
1 Purge chamber
2 Check valve
3 Case
4 Desiccant
5 Oil filter
6 Valve
7 Body

The air dryer removes moisture and oil from the air compressed by the air compressor, protecting the brake system.



Dehumidification

- The pressurized air from the air compressor enters the air dryer through delivery port **A**. First, it flows in body **7** where moisture and oil are separated from the air and collected in the bottom. Then, the air passes through oil filter **5** where oil mist and dust are removed. Next, it is delivered into case **3** where moisture contained in the air is removed by desiccant **4**.
- As the air travels from the bottom to the top of case **3**, it comes into contact with more dried desiccant **4**. This removes residual moisture from the air, drying the air as it reaches the top of the case. The air passes through check valve **2** and purge chamber **1**, and is delivered to the air tank through exhaust port **B**.



Regeneration of desiccant

- When the supply of air from the air compressor stops, command pressure **D** from the air pressure governor opens valve **6** of the control port of the air dryer. This allows the pressure in case **3** to clean oil filter **5** and release the condensed water and oil into the atmosphere.
- Because of quick pressure reduction in the case, the dry air in purge chamber **1** flows through orifice **C** in the case **3** where the air expands under the reduced pressure, becoming super dry air. This air flows back through case **3** while removing the moisture from desiccant **4**, and is discharged together with moisture into the atmosphere, thereby recycling the desiccant.

Ⓣ Tightening torque

Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Purge chamber and body mounting)	8.8 to 13.7 {6.5 to 10, 0.9 to 1.4}	—
26	Bolt (Valve assembly mounting)	3.9 to 6.9 {2.9 to 5.1, 0.4 to 0.7}	—
33	Bolt (Bracket mounting)	4.9 to 5.9 {3.6 to 4.3, 0.5 to 0.6}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
—	O-ring and piston sliding surface	Multipurpose grease [NLGI No. 2 (Li soap)]	As required

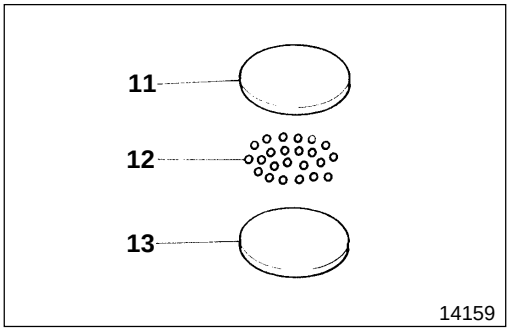
https://truckmanualshub.com/

◆ Service procedure

● Inspection after assembly

Inspection for air leakage

- Plug the air outlet port of the air dryer completely, and apply pressures of 49 kPa {7.1 lbf/in^2, 0.5 kgf/cm^2} and 880 kPa {130 lbf/in^2, 9 kgf/cm^2} from the air inlet port. Check to ensure that each section except valve assembly **30** is free from any air leaks. As for the valve assembly, a small amount of air leaks not exceeding 20 cm^3 {1.22 cu. in.}/min is permissible.
- Check to ensure that there are no air leaks in the air dryer body when an air pressure of 880 kPa {130 lbf/in^2, 9 kgf/cm^2} is applied from the command pressure port of the air dryer.



11 13 Installation of filter

Install filters **11** and **13** with their softer layer facing desiccant **12**.

2 Battery cable ⊖
3 Harness (Main high-current fuse)
4 Starter cable
5 Battery cable ⊕
6 Rubber Cushion
7 Angle frame
8 Set bolt
9 Battery
10 Battery box

● **Installation sequence**

Follow the removal sequence in reverse.

DANGER ⚠

- **Because flammable hydrogen gas is generated from battery 9, be sure to obey the following.**
  - **Never attempt to short-circuit the positive and negative terminals of battery 9, and generate sparks, or smoke a cigarette near it.**
  - **Do not wear metal objects on your arms or do not lean over battery 9.**
- **Sulfuric acid of the electrolyte is very corrosive. Whenever handling battery 9, wear safety goggles and rubber gloves to protect your eyes and hands.**
- **Battery posts, terminals and related accessories contain lead and lead compounds. Wash hands after handling.**

WARNING ⚠

When you disconnect battery cables 2 to 5, disconnect battery cable ⊖ 2 first.

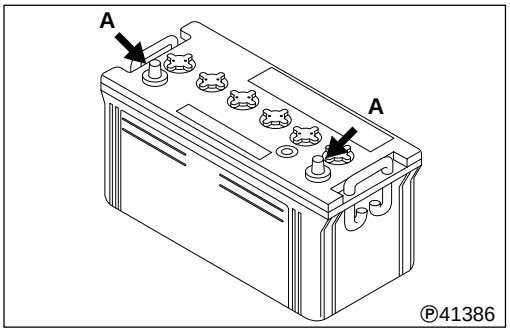
CAUTION ⚠

- **Make sure that all electrical switches of the vehicle are off before connecting battery cables 2 and 5.**
- **Be sure to connect battery cable ⊕ 5 first before you connect battery cable ⊖ 2.**
- **To prevent a short-circuit, take care that disconnected battery cables 2 and 5 do not accidentally touch the battery terminals.**

Service standards

Location	Inspection item	Standard value	Limit	Remedy
9	Specific gravity of battery electrolyte (20°C {68°F})	1.220 to 1.290	—	Charge or replace

https://truckmanualshub.com/



◆ Service procedure

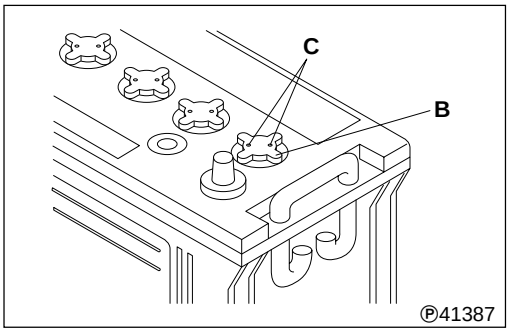
9 Inspection of battery

(1) Visual inspection

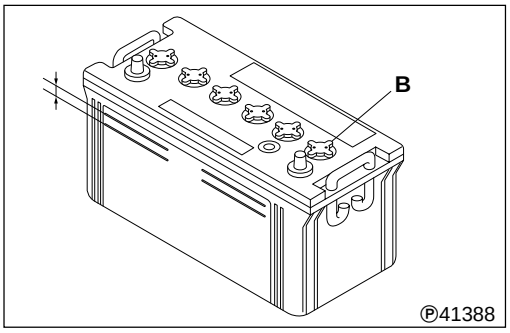
- If terminal **A** is corroded, scrub off the corrosion using a wire brush.
- If cracks or defects are found on battery **9**, replace it because the cracks or defects can cause liquid spills.

CAUTION ⚠

Be sure to apply grease to the ⊕ side of terminal A because it is easily corroded.

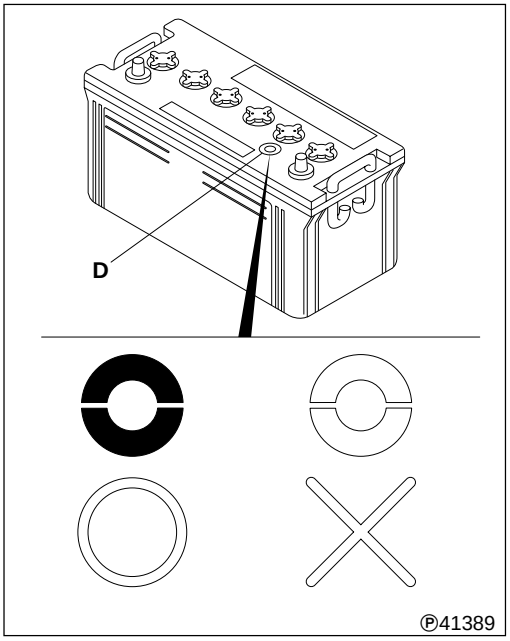


- If the air bleed hole **C** of vent plug **B** is clogged, clean the hole.



(2) Inspection of fluid level

- Confirm that the level of battery electrolyte is between the UPPER and LOWER LEVEL lines.
- If the level is below the LOWER LEVEL line, remove vent plug **B** and replenish the distilled water or battery fluid to the UPPER LEVEL.

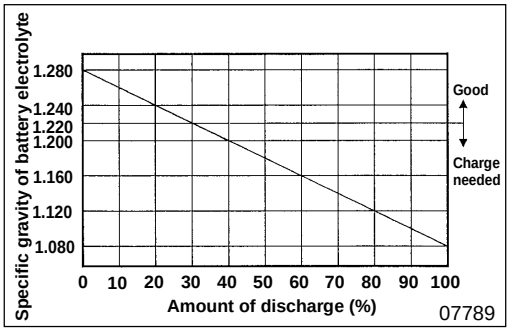


(3) Specific gravity measurement

You can tell the specific gravity of the battery electrolyte by the color shown in indicator **D**.

Blue : Good
White : Charge or replace

https://truckmanualshub.com/



(4) Charging

- Battery **9** must be, as a rule, charged in the off-vehicle condition. If it is charged on vehicle, however, be sure to remove the grounding cable before starting the procedure.
- The battery must be charged with its all of vent plugs removed.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity/10	{*Amount of discharge (Ah)/ Charge current (A)} × 1.2 (to 1,5)	45 {113}
Quick charge	Value of 5-hour rating capacity/1.5	0.5	55 {131}

* Amount of discharge (Ah) = 5-hour rating capacity (Ah) × [Amount of discharge (%)]/100

- Use the graph shown on the left to calculate the amount of discharge (%).
- For the battery electrolyte, use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water.
- The specific gravity of fully-charged battery electrolyte is 1.280 at the liquid temperature of 20°C {68°F}.

DANGER ⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep open flame away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because it is dangerous.**
- **After charging the battery, tighten the vent plugs, wash away sulfuric acid from the battery using water, and dry the surface.**
- **Be sure to check the electrolyte level before charging the battery. Charging with the electrolyte level below the lower limit (LOWER LEVEL) can cause premature deterioration, heat generation and explosion of the battery.**

10 Inspection of battery box

- If battery box **10** is corroded, scrub off the corrosion off of it using a wire brush and apply acid resistant coating.
- If the battery box **10** is corroded excessively, deformed or cracked, replace it with a new one.

FK/FM

SERVICE MANUAL

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of 2000 model Mitsubishi Fuso Truck FK/FM series.
Read this manual carefully as an aid to providing correct, efficient and fast maintenance.
Please note, however, that due to continuous improvements on the specifications, numbers and description for maintenance might be changed without prior notice.
If you have any question, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso dealer or distributor.

GROUP 35C ANTI-LOCK BRAKE SYSTEM (ABS)

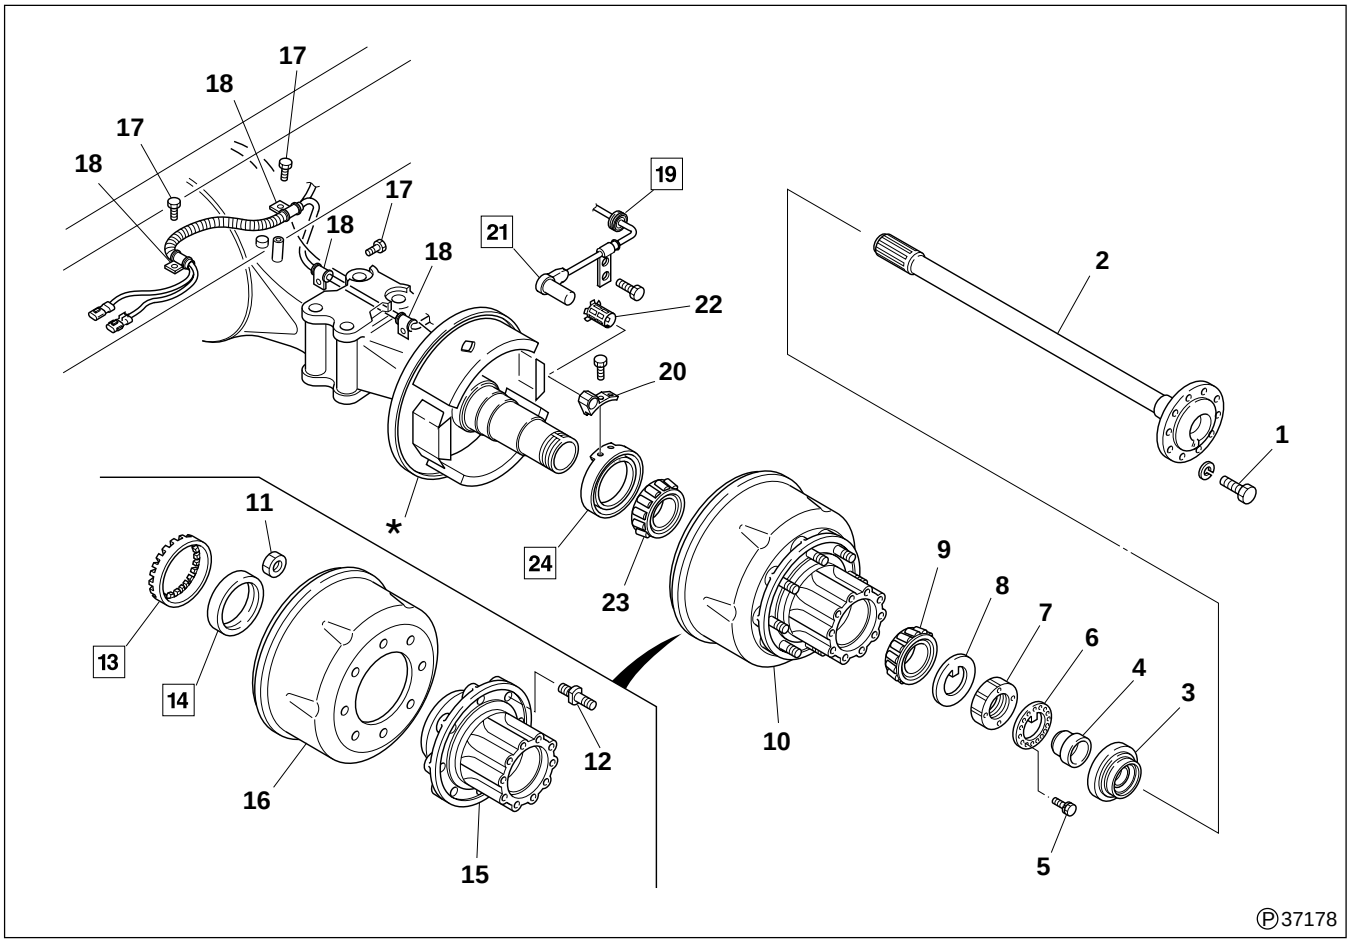
WHEEL SPEED SENSOR AND ROTOR
< REAR AXLE >..... 35C-2

https://truckmanualshub.com/

WHEEL SPEED SENSOR AND ROTOR < REAR AXLE >

< FK >

The following describes the service procedures for wheel speed sensors and rotors only.
Regarding the procedures for servicing other components, refer to Gr 27.



● **Disassembly sequence**

1 Bolt
2 Rear axle shaft
3 Oil seal
4 Oil seal retainer
5 Bolt
6 Lock plate
7 Lock nut
8 Lock washer
9 Outer bearing
10 Hub and brake drum assembly
11 Nut
12 Hub bolt
13 Rotor
14 Oil seal
15 Wheel hub
16 Brake drum
17 Bolt
18 Clip
19 Grommet
20 Sensor holder
21 Wheel speed sensor
22 Spring spacer
23 Inner bearing
24 Oil seal retainer

***** : Rear brake assembly

● **Assembly sequence**

Follow the disassembly sequence in reverse.

- Do not remove oil seal retainer **4** unless it is damaged (scratches, bending, tilting).

CAUTION⚠

- **When removing or installing hub and brake drum assembly 10, handle rotor 13 with care to prevent damage. Also, do not damage oil seal 14 during assembly.**
- **Keep oil and grease off lining surface of rear brake assembly * and the inner surface of brake drum 16.**

https://truckmanualshub.com/

Service standards

Unit : mm {in.}

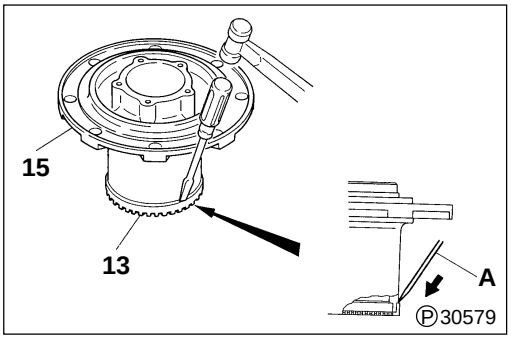
Location	Maintenance item		Standard value	Limit	Remedy
13	Wobbling of rotor		0.1 {0.0039}	—	Replace
21	Wheel speed sensor	Resistance between terminals	950 to 1450Ω	—	Replace
		Insulation resistance	1MΩ or higher	—	Replace

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
14	Anti-lock brake system oil seal installer 	MH062664	Press-fitting of oil seal

◆ Service procedure



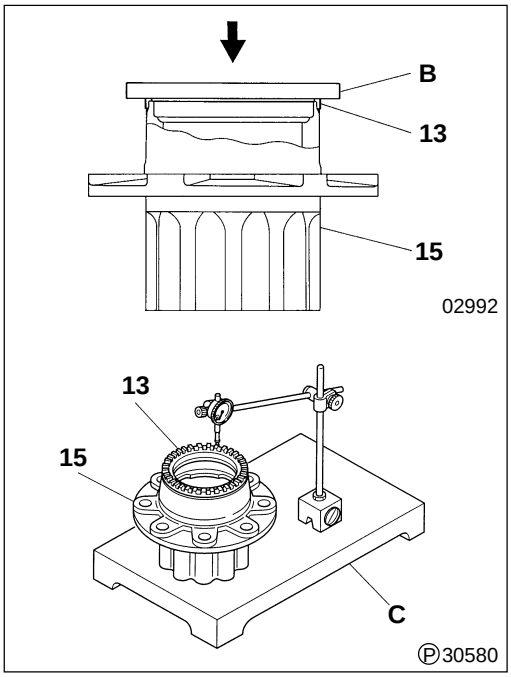
13 Rotor

[Removal]

Strike the outer edge of rotor **13** evenly with flat-tip screwdriver **A** to remove the rotor from the wheel hub.

CAUTION⚠

Be careful not to damage wheel hub 15.



[Installation]

Heat rotor **13** to approximately 150°C {302°F}. Press the rotor evenly with iron plate **B** to press-fit the rotor to wheel hub **15**. Make sure there is no space between the rotor and wheel hub.

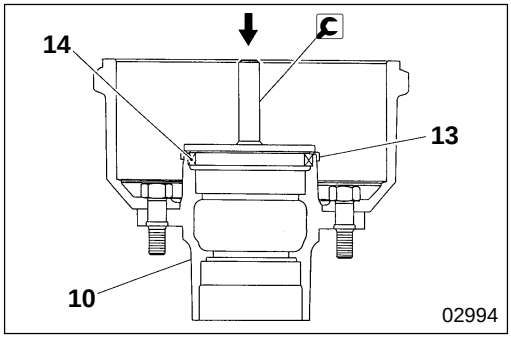
[Inspection]

- If the amount of wobbling exceeds the standard value, repeat the assembly procedure from the beginning.
- If the amount of wobbling exceeds the standard value after reassembly, replace defective parts.

C : Base

https://truckmanualshub.com/

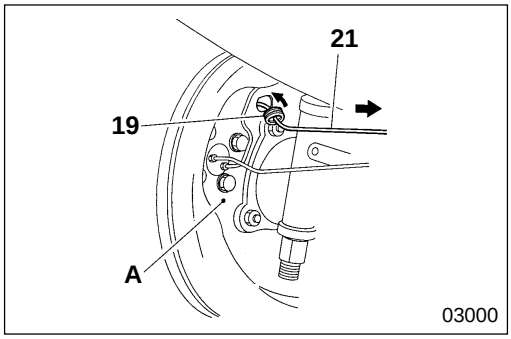
WHEEL SPEED SENSOR AND ROTOR < REAR AXLE >



14 Installation of oil seal

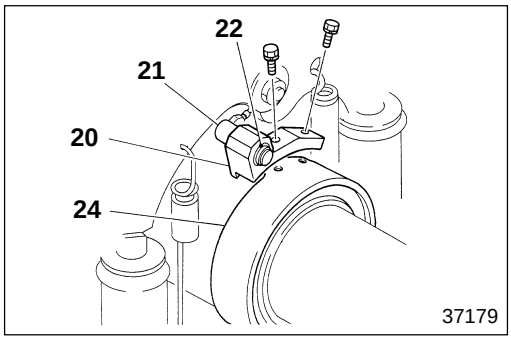
NOTE

When hub and brake drum assembly 10 is removed for a service operation and if rotor 13 is still mounted on the wheel hub, use Anti-lock brake system oil seal installer to press-fit oil seal 14.



19 Installation of grommet

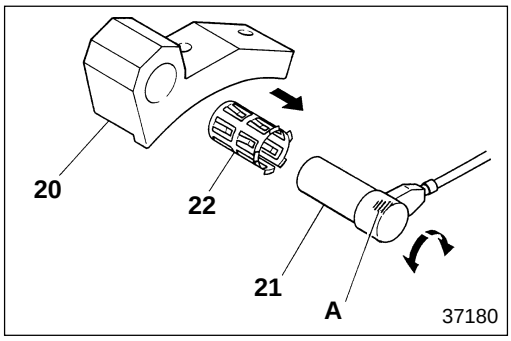
Mount grommet **19** on back plate **A**, and pull the harness of wheel speed sensor **21** to make sure there is no slack inside the wheel brake.



21 Wheel speed sensor

[Removal]

- With wheel speed sensor **21** and spring space **22** installed in sensor holder **20**, remove the sensor holder from oil seal retainer **24**.

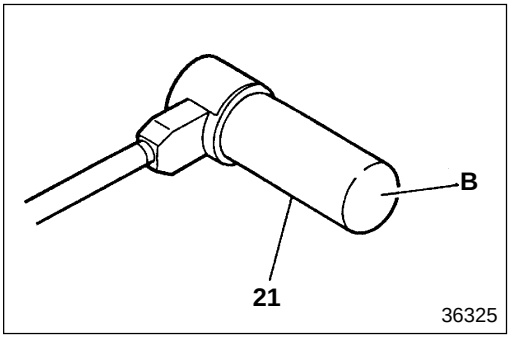


- Hold shaded section **A** of wheel speed sensor **21** with pliers, and remove the sensor by twisting it slightly in left and right directions.

CAUTION

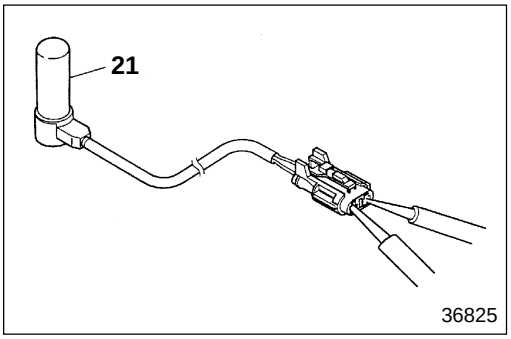
- **When holding wheel speed sensor 21 with pliers, do not grip any section other than shaded area A in the diagram.**
- **When removing wheel speed sensor 21, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **If wheel speed sensor 21 dismounts easily, replace spring spacer 22.**

https://truckmanualshub.com/

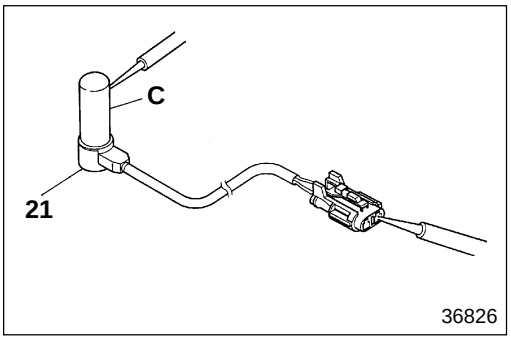


[Inspection]

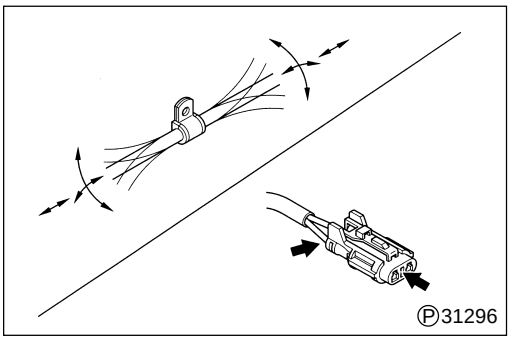
- Since pole piece section **B** is magnetized by the magnet inside wheel speed sensor **21**, it attracts metals. Do not allow the pole piece to collect metallic objects.



- Measure the resistance between the terminals of wheel speed sensor **21**.
  If the measured value deviates from the standard value, replace the wheel speed sensor.



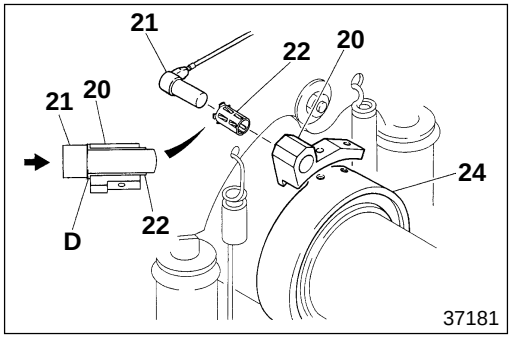
- Measure the insulation resistance between body **C** of wheel speed sensor **21** and each terminal.
  If the measured values deviate from the standard value, replace the wheel speed sensor.



- To check for broken wires, remove the harness clamp section from the vehicle. Bend and extend the harness to check if there is any broken wire in the harness. Also, inspect the connector for proper contact.
  If a defect is found, replace wheel speed sensor **21**.

https://truckmanualshub.com/

WHEEL SPEED SENSOR AND ROTOR < REAR AXLE >



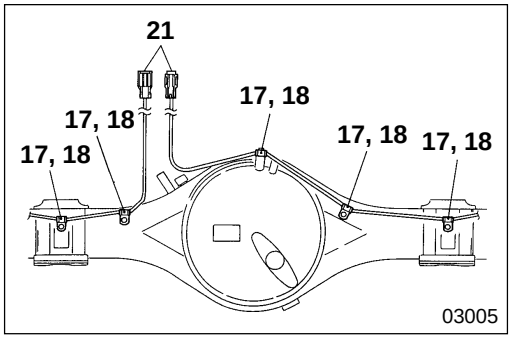
[Installation]

- Insert wheel speed sensor **21** from the back plate, and press until spring spacer **22** and stopper section **D** of the wheel speed sensor contacts sensor holder **20**.
- With wheel speed sensor **21** and spring spacer **22** installed in sensor holder **20**, mount the sensor holder on oil seal retainer **24**.

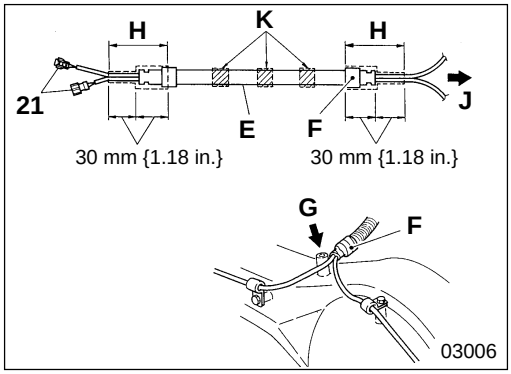
CAUTION

- **When installing wheel speed sensor 21, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **Note that wheel speed sensor 21 is different for left and right wheels.**

Location	Harness connector color	Harness connector shape
Left wheel	Gray	Male
Right wheel	Black	Female

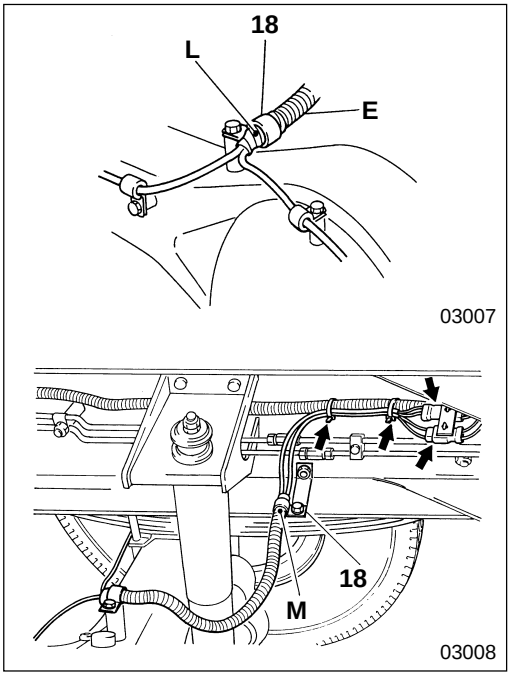


- Rear axle housing section
  Starting from the wheel brake side, secure the harness of wheel speed sensor **21** in place with clip **18** and bolt **17**. Make sure the harness does not interfere with other parts and there is no twist or slack in the harness.

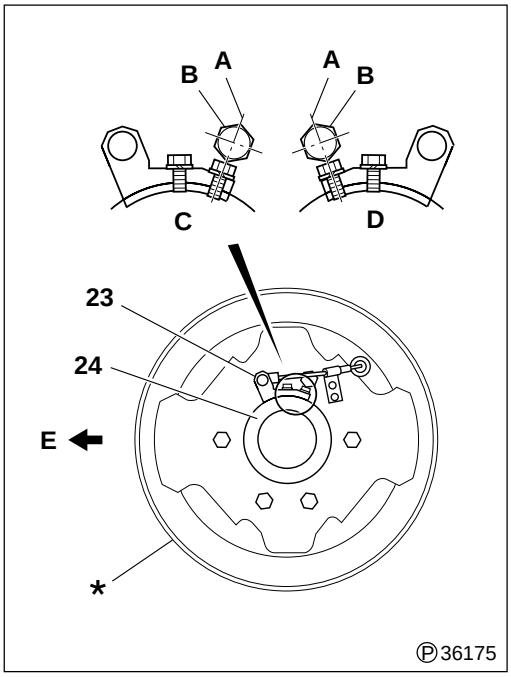


- Binding of harness
  - Gather the harnesses of left and right wheel speed sensors **21**, and bind with corrugated tube **E**.
  - Adjust the position of the corrugated tube **E** so that white tape section **F** is located at clip position **G** on the rear axle housing. Then, turn the corrugated tube so that the slit faces down. Wrap black tape (electric harness tape) on both ends **H** of the corrugated tube. The tape should be placed over the tube end and harness.
    J: Rear axle housing side
  - Wrap tape on the harnesses of wheel speed sensors **21** at sections **K** (three locations at equal intervals).

https://truckmanualshub.com/



- Clamping of harness
  - Secure section **L** of corrugated tube **E** to the rear axle housing using clip **18**, and attach section **M** of the corrugated tube to the frame using clip **18**.
  - Connect the wheel speed sensor connector to the harness connector on the chassis side, and secure the connectors in place using the bracket.



24 **Installation of oil seal retainer**

When installing oil seal retainer **24**, align mounting bolt center **A** of sensor holder **23** with the center line of mounting bolt **B** of brake assembly *.

C : For left wheel
D : For right wheel
E : Front of vehicle

NOTE

The brake assembly diagram shows a left wheel.

DOOR

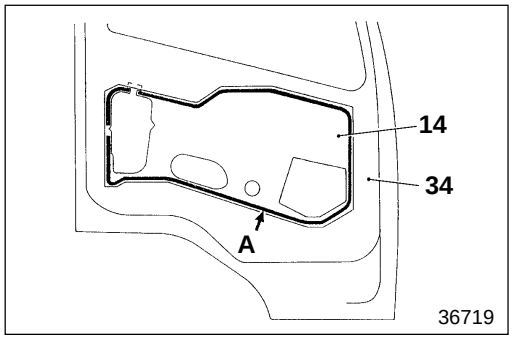
Lubricant and/or sealant

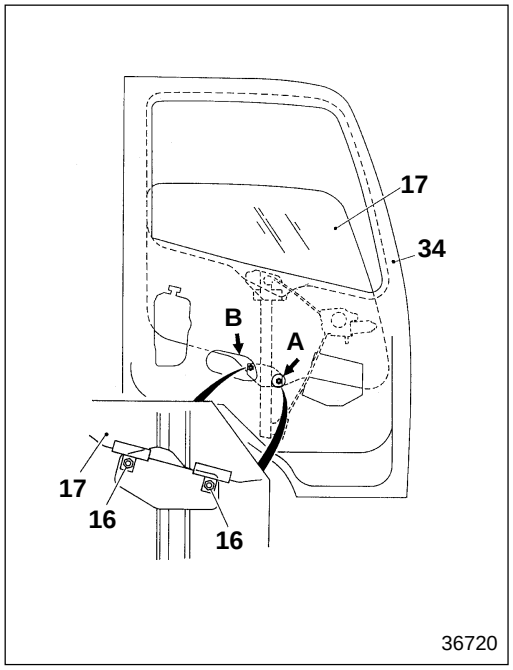
Location	Points of application	Specified lubricant and/or sealant	Quantity
15	Rotating surface of inside handle	Multipurpose grease [NGLI No.2 (Li soap)]	As required
18	Door glass mounting surface of glass holder	YH America Inc. M(RC-50KE) Primer	As required
19	Glass holder mounting surface of door glass	YH America Inc. G(MS-90) Primer	As required
	Glass holder mounting surface, 5 minutes after application of above primer	YH America Inc. WS-70FK Sealant (Urethane Base)	As required
23	Regulator sliding section of regulator & rail assembly	Dynamic GB	As required
26	Sliding surface of door lock actuator	Multipurpose grease [NGLI No.2 (Li soap)]	As required
34	Waterproof cover installation surface of door panel	Butyl tape	As required

◆ Service procedure



14 **Installation of waterproof cover**

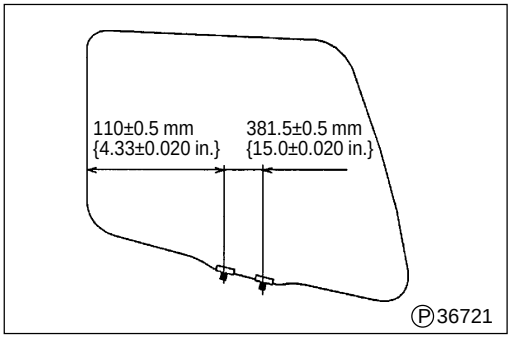
- Apply butyl tape **A** to door panel **34**, as indicated in the illustration.
- Install waterproof cover **14** by pasting onto butyl tape **A**.



17 **Removal and installation of door glass assembly**

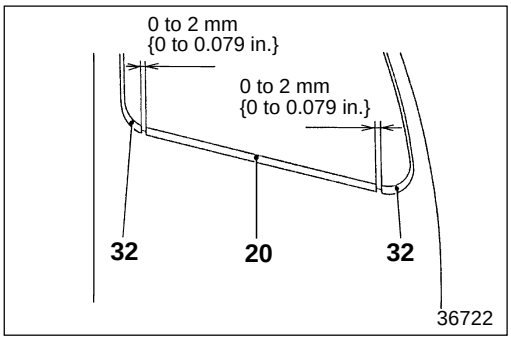
- Move door glass assembly **17** until bolts **16** of the door glass assembly become visible through holes **A** and **B** in the door panel **34**.
- While supporting door glass assembly **17** by hand, remove bolts **16**.
- Remove door glass assembly **17** through the open space in the door.
- To install, follow the removal procedure in reverse.

https://truckmanualshub.com/



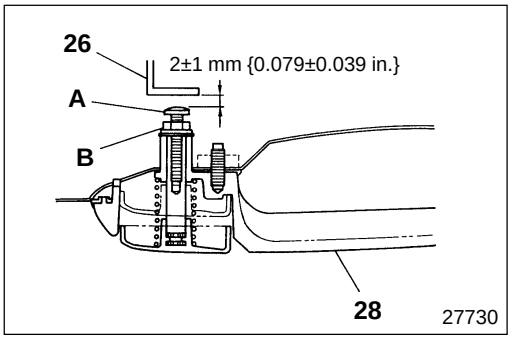
18 **Installation of glass holder**

Install glass holder **18** to door glass **19** at the location indicated in the illustration.



20 **Installation of door belt line molding**

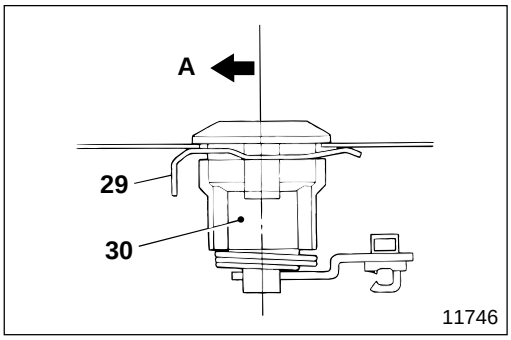
Install door belt line molding **20** so that gaps between the molding and run channel **32** are as indicated in the illustration.



28 **Installation of outside handle**

Turn push bolt **A** of outside handle **28** to adjust the gap between the push bolt and door actuator **26** as indicated in the illustration.

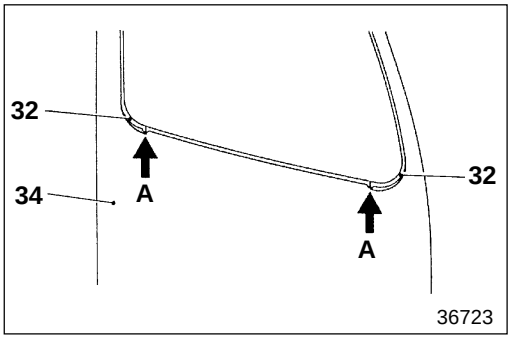
B : Lock nut



30 **Installation of door lock cylinder**

Install door lock cylinder **30** with clip **29** in the direction indicated in the illustration.

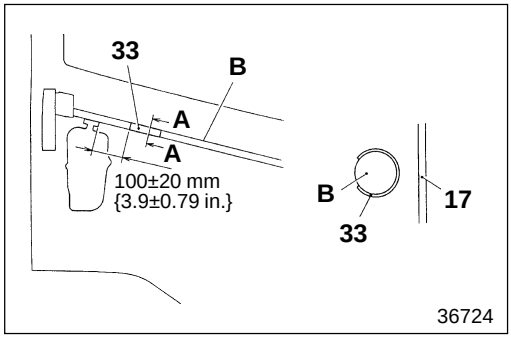
A : Vehicle front side



32 **Installation of run channel**

Install run channel **32** by aligning it with notches **A** on door panel **34**.

https://truckmanualshub.com/



33 **Installation of cushion rubber**

Install cushion rubber **33** to door side beam **B** in the direction indicated in the illustration.

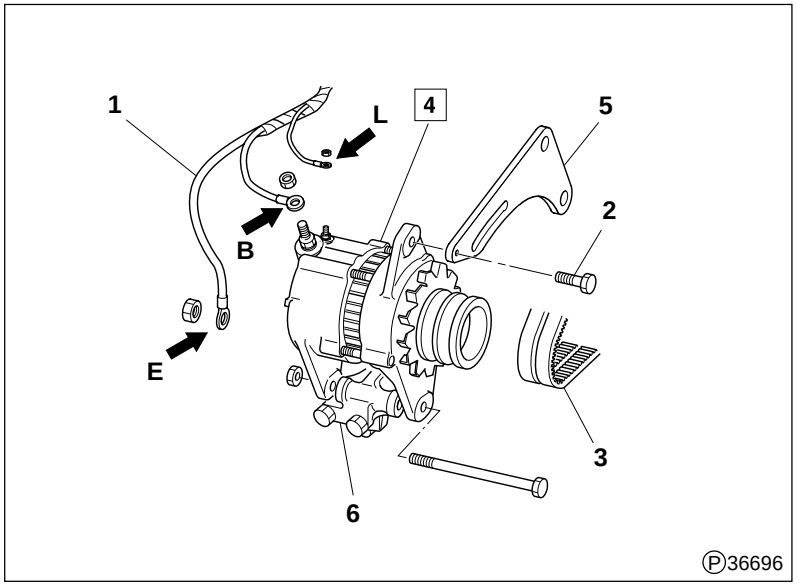
106 ALTERNATOR



● **Removal sequence**

1 Chassis harness
2 Adjusting bolt
3 V-belts
4 Alternator 📖 P54-8
5 Adjusting plate
6 Alternator bracket

B : To terminal B
E : To terminal E
L : To terminal L

WARNING ⚠

- **Terminal B is always loaded with voltage from the battery, supplied via chassis harness 1. Therefore when you remove the harness from terminal B, make sure that tools do not touch any adjacent parts because this would cause a short-circuit.**
- **Make sure that you disconnect terminal ⊖ of the battery before removing the harness and insulate the terminal with tape.**

● **Installation sequence**

Follow the removal sequence in reverse.

● **Adjustment after installation**

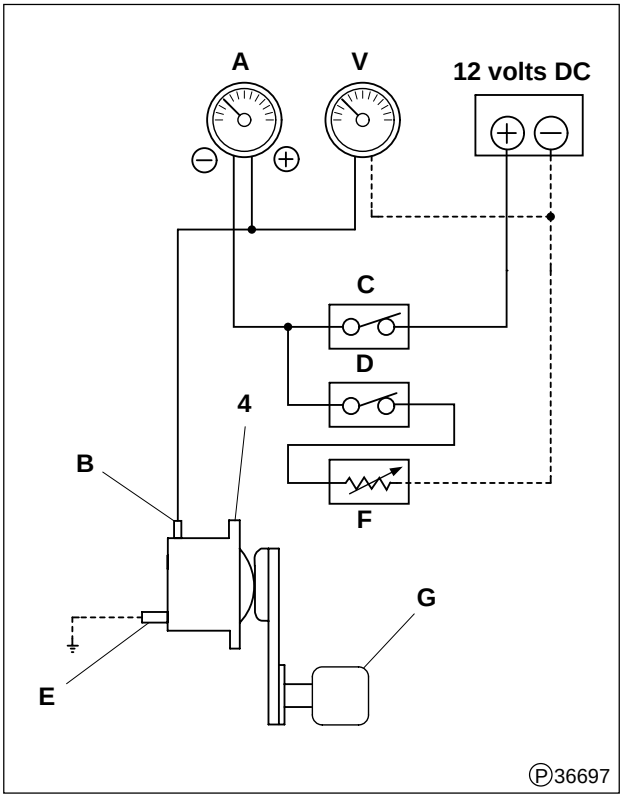
Adjustment of V-belt **3** tension 📖 Gr 14

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
4	Output current (* When engine is hot and 13.5 V is loaded) at 25°C (77°F)	At 1000 rpm	Approx. 20 A	—	Inspect
		At 2000 rpm	Approx. 80 A	—	
		At 3500 rpm	Approx. 100 A	—	
	Adjustment voltage of regulator (At 5000 rpm, 10 A is loaded) at 25°C (77°F)		14.2±0.2 V	—	Replace

* The value of the ambient temperature is measured after running the alternator drive motor at maximum power (5000 rpm) for 30 minutes.

https://truckmanualshub.com/



4 Inspection of alternator

(1) Inspection of alternator performance (bench test)

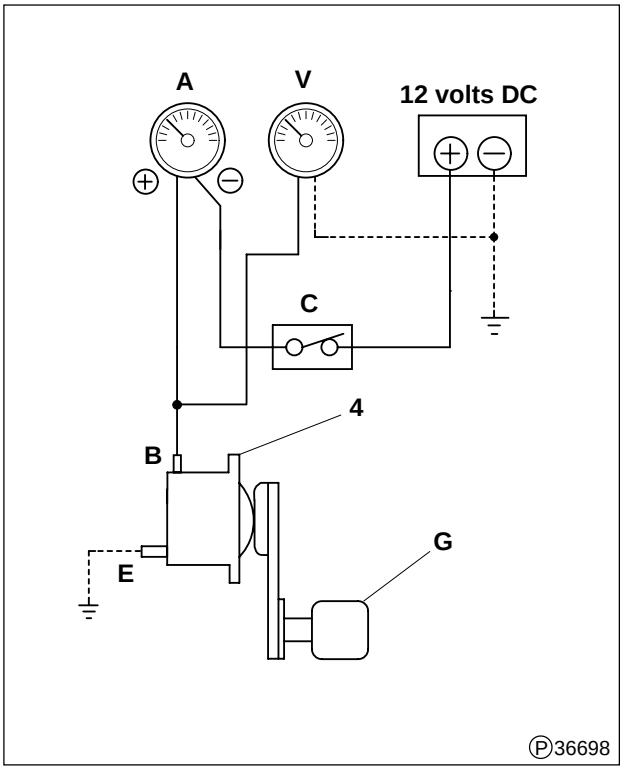
- Connect each unit to alternators **4** as illustrated.

CAUTION⚠

Use sufficiently thick wires for the wiring and make sure all connecting parts are securely connected.

A : Ammeter
B : Terminal B on alternator
C : Switch
D : Switch
E : Terminal E on alternator
F : Load resistance (variable resistance)
G : Alternator drive motor
L : Terminal L on alternator
R : Terminal R on alternator
V : Voltmeter

- Maximize load resistance **F** (load current hardly flows).
- Turn switches **C**, **D** ON.
  With the alternator **4** rotating at 5000 rpm, adjust load resistance **F** to the current specified in the Service Standards table. Then, operate the alternator for 30 minutes.
  Specified output of the alternator : Approx. 12 V-100 A
- Increase the rotation of alternator **4** gradually and measure current at specified rpm.
- If the measured value deviates from the standard value, disassemble and inspect alternator **4**. 🕮 P54-8



(2) Inspection of regulator (bench test)

- Connect each unit to the alternators as illustrated.
  A : Ammeter
  B : Terminal B on alternator
  C : Switch
  E : Terminal E on alternator
  G : Alternator drive motor
  L : Terminal L on alternator
  R : Terminal R on alternator
  V : Voltmeter
- Turn switch **C** ON.
- Run alternator **4** at low speed.
- Measure the voltage (adjustment voltage) when alternator **4** has reached a speed of 5000 rpm. Make sure at such time that the value of the current is 10 amperes or less.
- If the measured value deviates from the standard value, perform either of the following.
  - If the measured value is higher than the standard value : Replace the regulator
  - If the measured value is lower than the standard value : Before replacing the regulator check the alternator area.

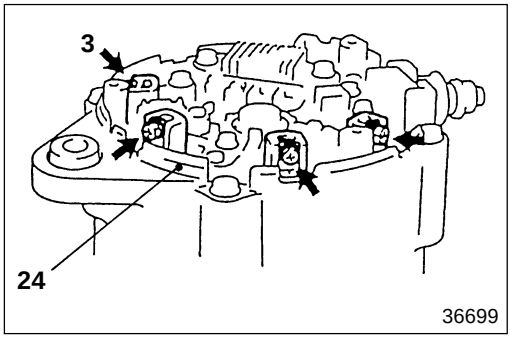
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

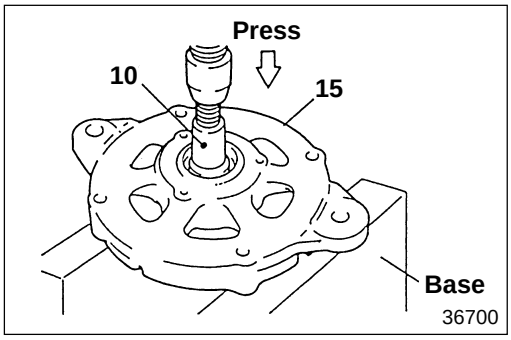
Location	Parts to be tightened	Tightening torque	Remarks
6	Nut (Pulley mounting)	117.6 to 137.2 {26 to 31, 12 to 14}	—



◆ Service procedure

5 **Drive frame assembly**

Remove screw **3** and separate the stator **17** outlet terminal and the rectifier **24**.



10 **Rotor**

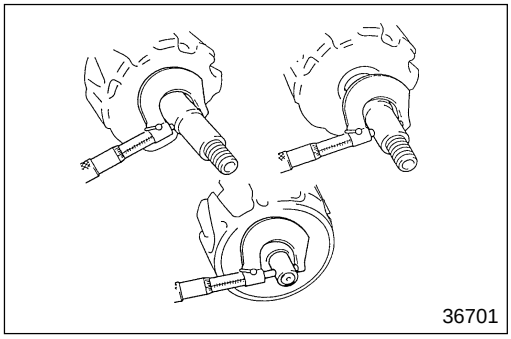
[Removal]

Using a press, remove the rotor **10** from the drive frame **15**.

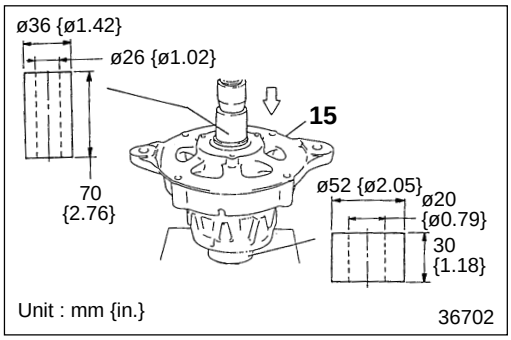
CAUTION⚠

Do not drop the rotor 10.

https://truckmanualshub.com/



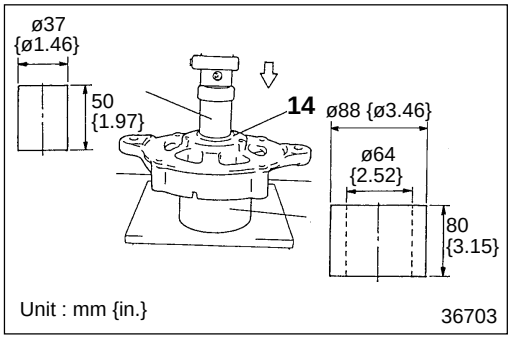
[Inspection]
- Measure the outer diameter of the portion as illustrated.
- If the measured value deviates from the standard value, replace rotor **10**.



[Installation]
Using a press, press the rotor **10** into the bearing in the drive frame **15**.

CAUTION

Press the rotor 10 while making sure that the rotor's shaft is perpendicular to the bearing. During pressing, make sure not to damage the portion of the rotor 10 that presses into the rear bearing 28.

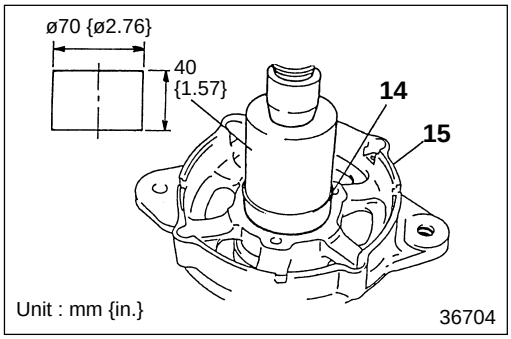


14 **Front bearing**

[Removal]
Using a press, remove the front bearing **14** from the drive frame **15**.

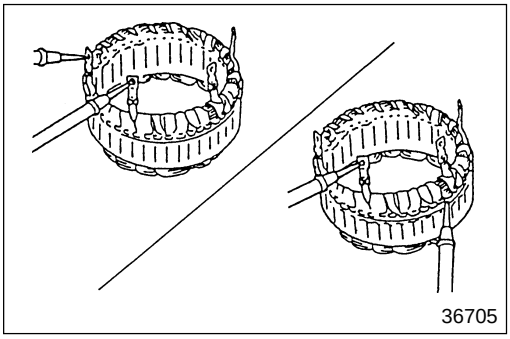
CAUTION

Do not drop the front bearing 14.



[Installation]
Using a press, press the front bearing **14** into the drive frame **15**.

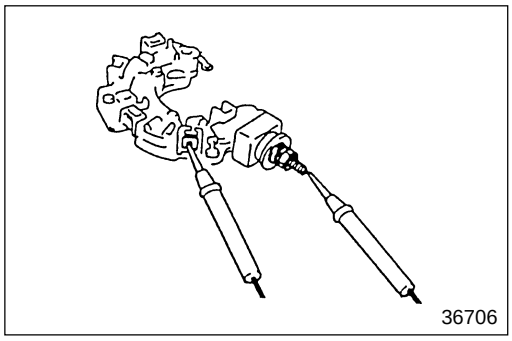
https://truckmanualshub.com/



36705

17 **Inspection of stator**

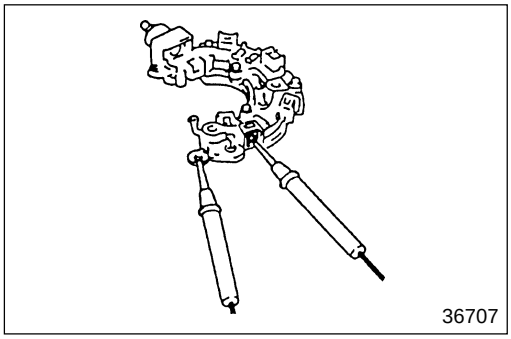
- Measure the resistance between the coil outlet terminals. (using a circuit tester)
- Measure the resistance between the coil outlet terminal and core. (using a multi tester)
- If the measured value deviates from the standard value, replace stator **17**.



36706

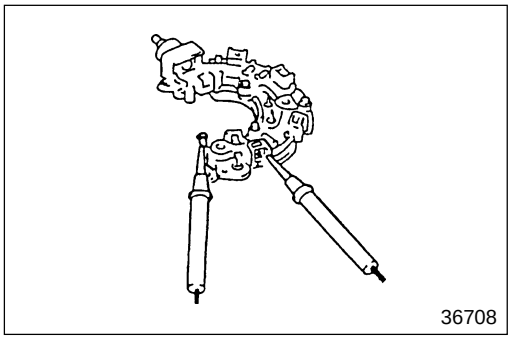
24 **Inspection of rectifier**

- Check for continuity between the **B** terminal and the heat sink.
- When polarity is changed, there is continuity in one direction but not in the opposite direction.



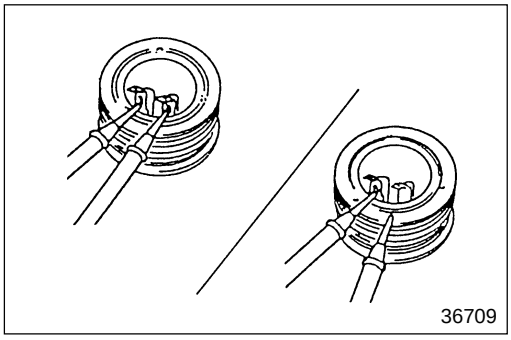
36707

- Check for continuity between the ⊖ terminal and the heat sink.
- When polarity is changed, there is continuity in one direction but not in the opposite direction.



36708

- Check for continuity between the auxiliary diode terminal and the heat sink.
- When polarity is changed, there is continuity in one direction but not in the opposite direction.

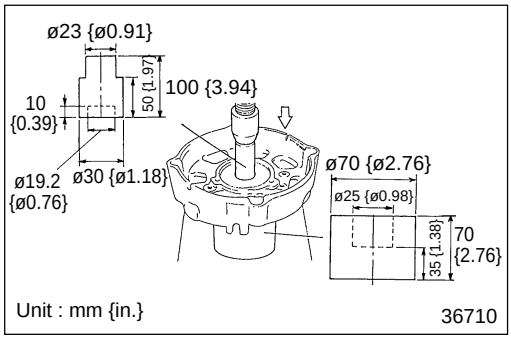


36709

27 **Inspection of exciting coil**

- Measure the resistance between the coil outlet terminal. (using a circuit tester)
- Measure the resistance between the coil outlet terminal and core.
- If the measured value deviates from the standard value, replace exciting coil **27**.

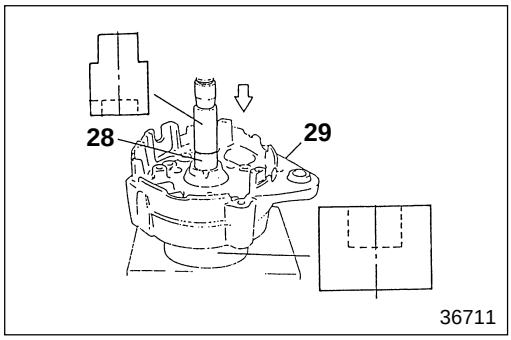
https://truckmanualshub.com/



28 **Rear bearing**

[Removal]
Using a press, remove the rear bearing **28** from the rear frame **29**.

CAUTION
Do not drop the rear bearing 28.



[Installation]
Using a press, press a new rear bearing **28** into the rear frame **29**.

CAUTION
Once a bearing is removed, do not reuse it.

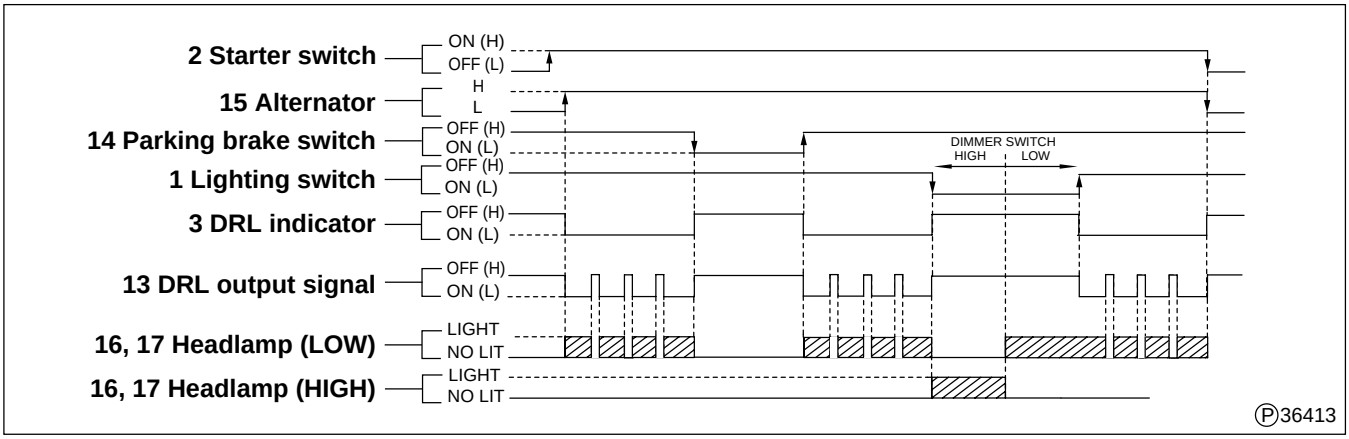
1 : '96 model Gr 54 (TWME9503-54)
A - N - Wiring connectors



[Outline]
The daytime running light system (DRL) turns on head lamps **16**, **17** in low beam as soon as the engine starts even if the light switch is in the OFF position.
Headlamps **16**, **17** repeat On/Off operations at 120 Hz according to the above timing chart. Because of the cyclic On/Off operations, the headlamps are dimmer than when the headlamp switch is ON.
Explanation of timing chart

- After the engine starts, when alternator **15** begins generating electricity with starter switch **2** in the ON position, headlamps **16**, **17** light.
- When parking brake switch **14** is ON, the DRL turns off to switch off the headlamps.

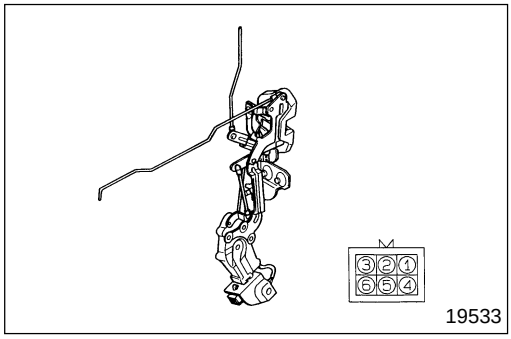
◆ Service procedure

2 Inspection of power window switch & controller

- Since the units alone cannot be readily checked in the off-vehicle state, check the harness, switch and other related parts in each system.
- If any fault is not found in the related parts, and the problem still remains in the system, replace the control unit or other units.



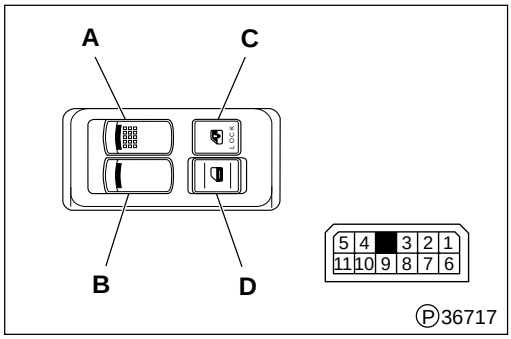
3 Inspection of door lock actuator (driver's seat side)

- Follow the table below to check for continuity and operation.

	①	③	②	④	⑤
LOCK		○—○		⊖—⊕	
UNLOCK	○—○			⊕—⊖	

○—○ : There is continuity between terminals.
⊕—⊖ : Indicates the terminals where 12 volts DC is to be applied.

- If any fault is found, replace door lock actuator (driver's seat side) **3**. 📖 Gr 42



4 Inspection of power window switch (driver's seat side)

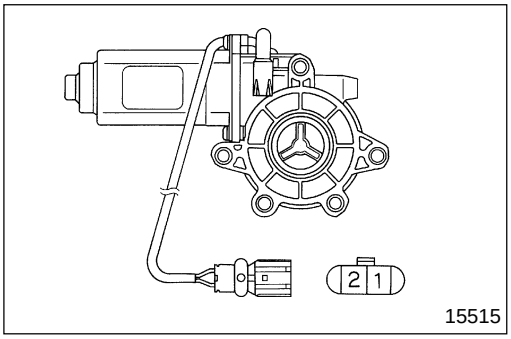
- Follow the table below to check for operation.

			①	②	⑤	⑥	⑦	⑧	⑨	⑩	⑪
A	UP	Manual		○	———	▶|				○	
		Auto		○	▶|—○					○	
	NEUTRAL										
	DOWN	Manual		○	———	▶|					○
		Auto		○	▶|—○						○
B	UP			○	———			○			
	NEUTRAL										
	DOWN			○	———				○		
C	UNLOCK		○	———				○			
			○	———					○		
	LOCK										
D	UNLOCK		○	———		○					
	LOCK		○	———			○				

○—○ : There is continuity between terminals.

- If any fault is found, replace the power window and auto door lock switch **4**.

https://truckmanualshub.com/



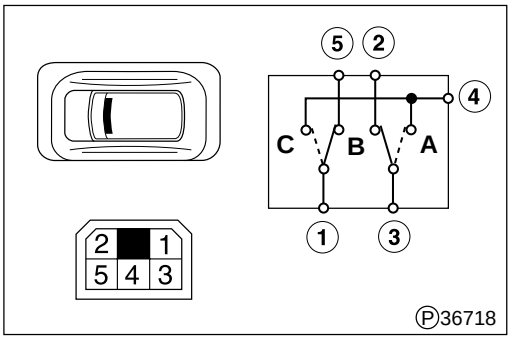
5 7 Inspection of power window motors

- Follow the table below to check for operation.

	①	②
UP (Close)	⊕	⊖
DOWN (Open)	⊖	⊕

⊕——⊖ : Indicates the terminals where 12 volts DC is to be applied.

- If any fault is found, replace power window motors **5** or **7**. 🕮 Gr 42



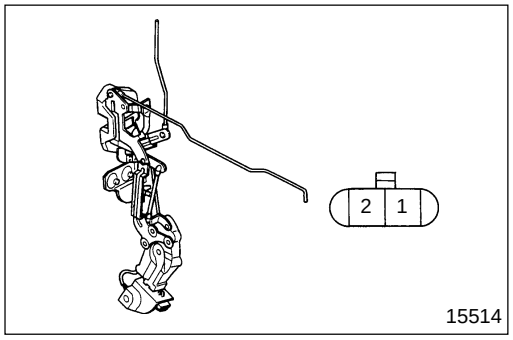
6 Inspection of power window switch

- Follow the table below to check for continuity.

	①	②	③	④	⑤
A: OPEN	○				○
			○	○	
B: NEUTRAL		○	○		
	○				○
C: CLOSE	○			○	
		○	○		

○——○ : There is continuity between terminals.

- If any fault is found, replace power window switch **7**.



8 Inspection of door lock actuator (passenger's seat side)

- Follow the table below to check for operation.

	①	②
LOCK	⊖	⊕
UNLOCK	⊕	⊖

⊕——⊖ : Indicates the terminals where 12 volts DC is to be applied.

- If any fault is found, replace door lock actuator (passenger's seat side) **8**. 🕮 Gr 42

SERVICE MANUAL

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of 1999 model Mitsubishi Fuso Truck FK, FM series.
Read this manual carefully as an aid to providing correct, efficient and fast maintenance.
Please note, however, that due to continuous improvements on the specifications, numbers and description for maintenance might be changed without prior notice.
If you have any question, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso dealer or distributor.

–	Portable Tester	★916-00021	Function check after assembly

★ JIDOSHA KIKI part No.

◆ Service procedure

● Inspection of function after assembly

(1) Install the brake booster on the vehicle, and conduct the performance test using Portable Tester.

- Setting up of pressure gauge
  - Connect a pressure gauge (PG4) for measuring the command pressure to the air supply port of the power cylinder.
  - Remove air bleeder **10** from the hydraulic cylinder and connect an oil pressure gauge (PG2). Then bleed air from the inside of the tester.
- Raise the air pressure in the air tank to 590 kPa {85 PSI, 6 kgf/cm^2), then inspect the functions given in the following table with the engine stopped.

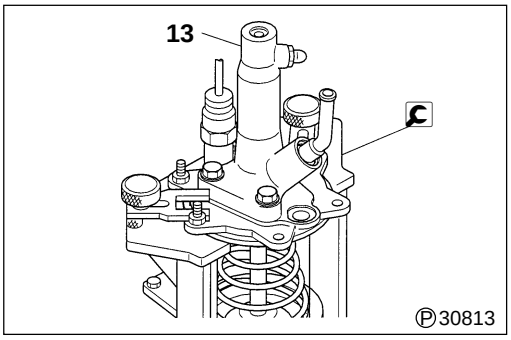
Test item	Test condition	Standard value in assembled condition	Limit	Remedy
Air-tightness at full load	Air pressure decrease after keeping brake pedal fully depressed for 15 seconds	–	Air pressure gauge (PG4) reading less than 59 kPa {8.5 PSI,0.6 kgf/cm^2}	Replace O-ring **15** and/or cup packing **19**
Operation at full load	Confirm that command air pressure (PG4) is 590 kPa {85 PSI, 6 kgf/cm^2} with the brake pedal fully depressed	Oil pressure gauge (PG2) reading 14.0 to 15.4 MPa {2030 to 2230 PSI, 143 to 157 kgf/cm^2}	Oil pressure gauge (PG2) reading 13.7 to 15.7 Mpa {1990 to 2280 PSI, 140 to 160 kgf/cm^2}	Replace hydraulic piston **26** and/or cup packing **27**
Brake booster operation starting pressure	Depress brake pedal grad ually and read the com-mand pressure when oil pressure gauge (PG2) starts rising	Air pressure gauge (PG4) reading 14 to 33 kPa {2.0 to 4.8 PSI, 0.14 to 0.34 kgf/cm^2}	Air pressure gauge (PG4) reading 43 kPa {6.3 PSI, 0.44 kgf/cm^2}	Replace valve seal assembly **26**, cup packing **19** and/or cup packing **27**
Residual pressure	When brake pedal is released after depressed	Oil pressure gauge (PG2) reading 78 to 125 kPa {11 to 18 PSI, 0.8 to 1.3 kgf/cm^2}	Oil pressure gauge (PG2) reading 59 to 155 kPa {8.5 to 23.0 PSI, 0.6 to 1.6 kgf/cm^2}	Replace valve assembly **9** and/or spring **8**

(2) After completion of the above tests, conduct the function test of stroke switch **4**. Loosen the air bleeder so as to allow fluid to leak out. Depress the brake pedal to let the power piston move full stroke so that stroke switch **4** may be operated. Then confirm that the brake warning lamp on the meter cluster comes on.

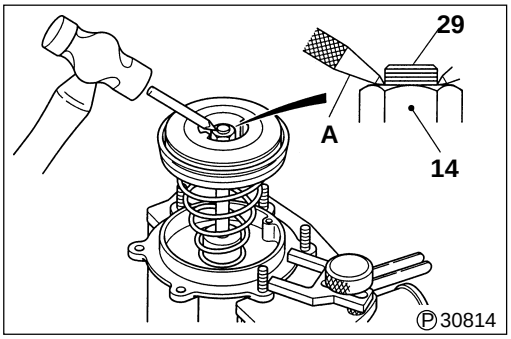
(3) Always bleed the brake system and pour brake fluid to the "**H**" line of the brake fluid tank after performing the brake booster function check.

https://truckmanualshub.com/

◆ Service procedure



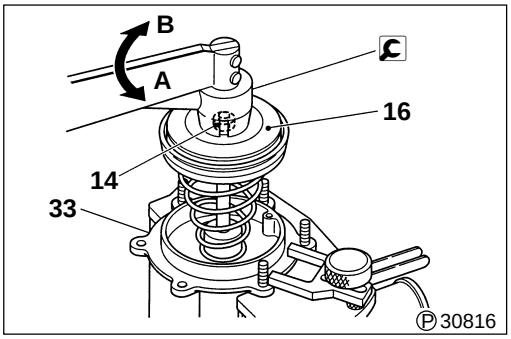
13 **Installation of body assembly**



14 **Installation of nut**

After tightening nut **14** at specified torque, stake the nut and push rod **29** thread area.

A : Center punch

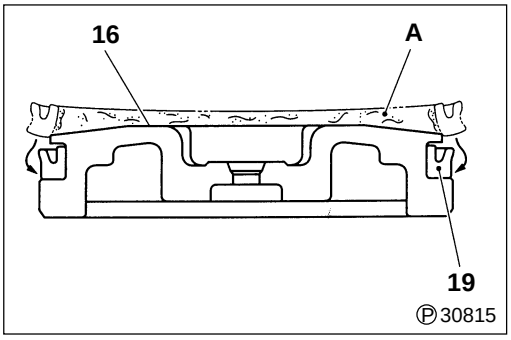


16 **Removal and installation of piston plate**

A : Removal
B : Installation

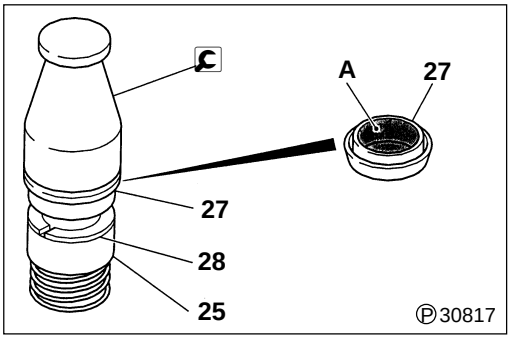
NOTE

To install, while pressing piston plate 16 to end plate 33 with sufficient force, tighten nut 14 to specified torque.



19 **Installation of cup packing**

A : Grease

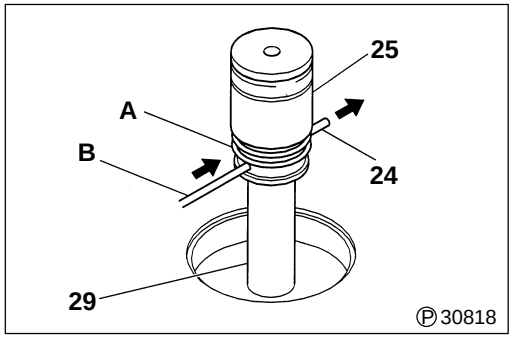


27 **Installation of cup packing**

A : Brake fluid

https://truckmanualshub.com/

BRAKE BOOSTER (AIRMASTER)

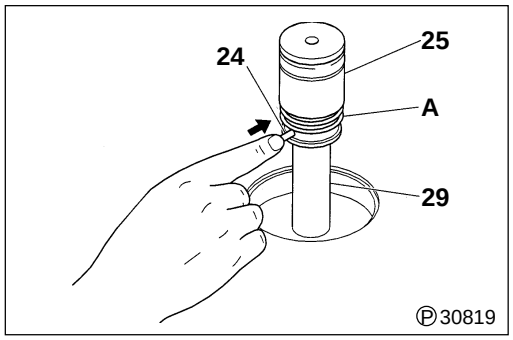


25 **Hydraulic piston**

[Removal]

A : Spring

B : Needle



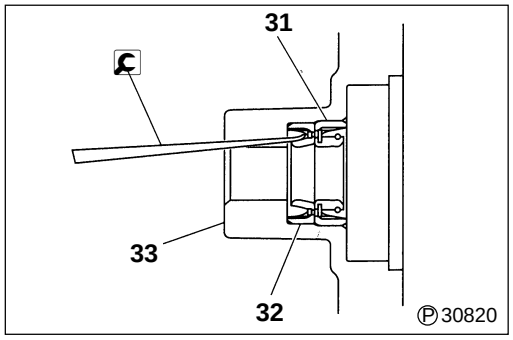
[Installation]

Align the holes of hydraulic piston **25**, valve seal assembly **26** and push rod **29**, and insert straight pin **24**.

A : Spring

NOTE

After inserting straight pin 24, make sure that the hydraulic piston spring is hanging over the straight pin and working as a stopper.

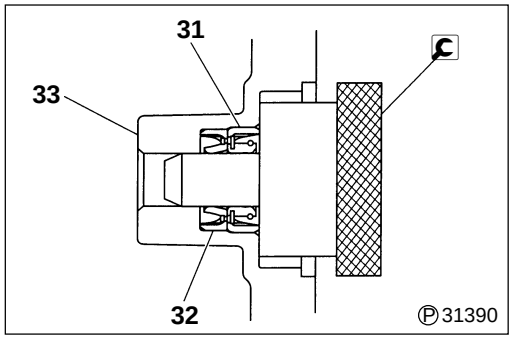


31 **32** **Oil seals**

[Removal]

CAUTION ⚠

Remove oil seals 31, 32 by tapping evenly. Be careful not to scratch inner surface of end plate 33.



[Installation]

Install oil seals on end plate **33** in the direction shown in the diagram.

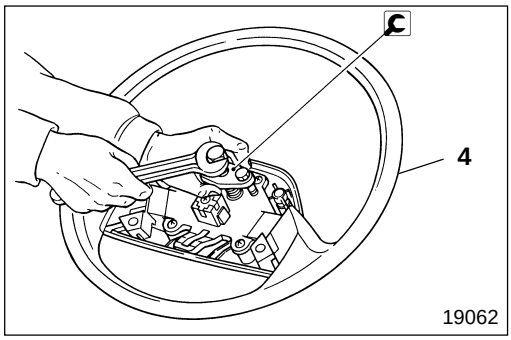
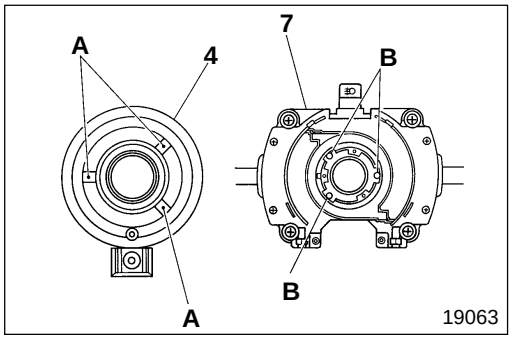
Unit : mm

Location	Tool name and shape	Part No.	Application
4	Steering wheel puller 	MH062421	Removal of steering wheel

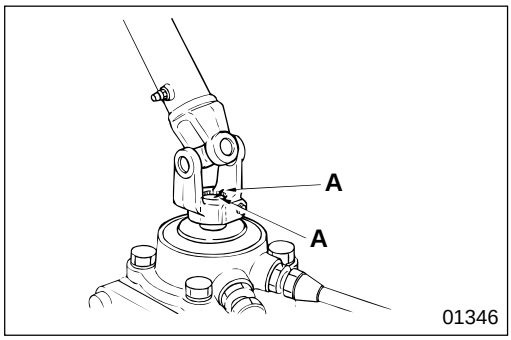
◆ Service procedure



4 **Removal of steering wheel**

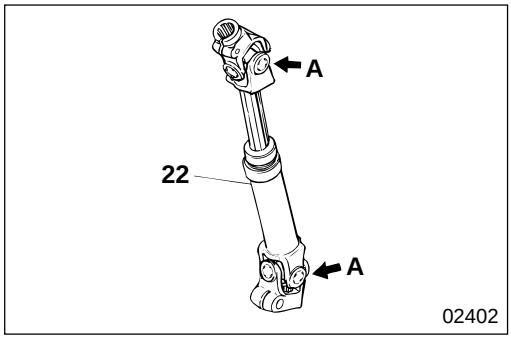


[Installation]
Align slots **A** in steering wheel **4** with cancel cam protrusions **B** of combination switch **7**.



18 **Removal of steering shaft assembly**

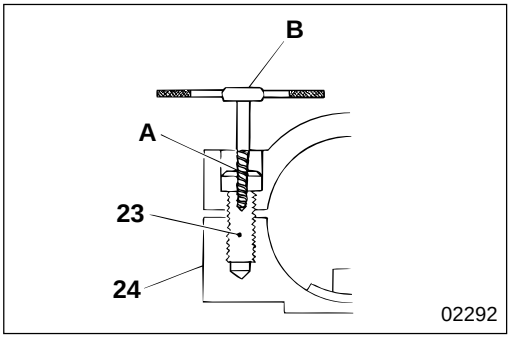
A : Alignment mark



22 **Steering lower shaft assembly**

When the spline of steering lower shaft assembly **22** has been disconnected, align marks **A** on the yokes to face the same direction.

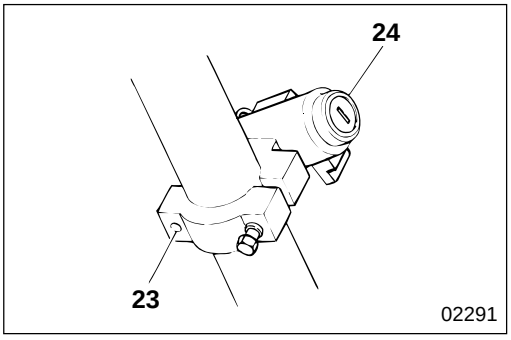
https://truckmanualshub.com/



24 **Starter switch**

[Removal]

- Grip one end of the column in a vise, then drill a ø5.5 to 6 mm {0.22 to 0.24 in.} hole 10 to 15 mm {0.39 to 0.59 in.} deep in surface **A**, where the head was cut off, of head cutting bolt **23** for mounting starter switch **24**.
- Screw in screw extractor **B** counterclockwise, then remove head cutting bolt **23** from the steering column.



[Installation]

- Tighten new head cutting bolt **23** at specified torque to cut the head off the bolt.
- Check the steering lock mechanism after installation.

410 SPEEDOMETER CIRCUIT

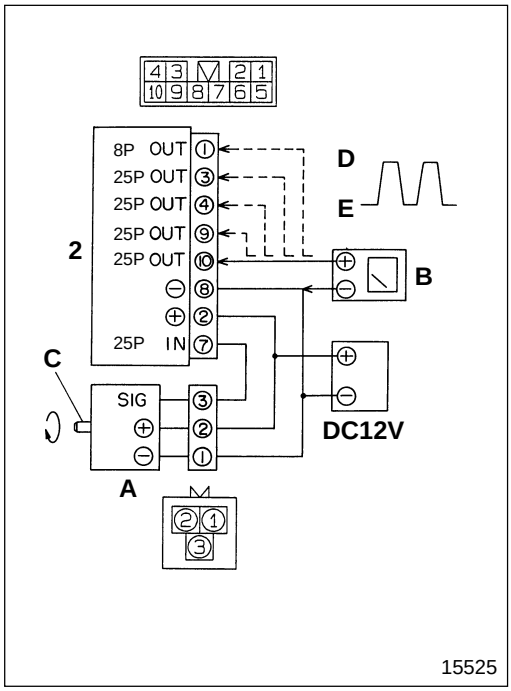
Service standards

Location	Maintenance item			Standard value	Limit	Remedy
2	Output voltage of pulse divider	8-pulse	Low pulse	1.5V or less	—	Replace
			High pulse	8±1V		
		25-pulse	Low pulse	0.6V or less		
			High pulse	8±1V		



◆ Service procedure

2 **Inspection of pulse divider**

- Make test setup of the pulse divider **2** as shown.

  A : Speed sensor (25-pulse)
  B : Tester

- Slowly rotate the shaft **C** of the speed sensor **A** by hand and measure the maximum voltage (high pulse voltage **D**) and minimum voltage (low pulse voltage **E**) generated between each of the pulse divider **2**'s output terminals ①, ③, ④, ⑨ and ⑩ and the terminal ⑧.
- Confirm that the measurements are same as the voltages generated by the speed sensor **A**. Outline of changes
- If any fault is found, replace the pulse divider **2**.

SERVICE MANUAL

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of 1998 model Mitsubishi Fuso Truck FK, FM series.
Read this manual carefully as an aid to providing correct, efficient and fast maintenance.
Please note, however, that due to continuous improvements on the specifications, numbers and description for maintenance might be changed without prior notice.
If you have any question, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso dealer or distributor.

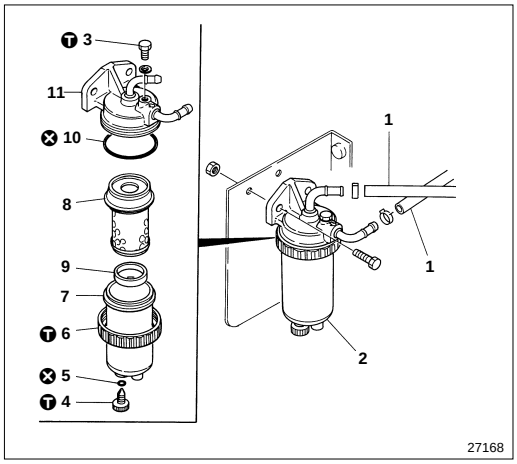
1998 MODEL CHANGES

Item	’98 Model	⇦	’97 Model
Gr 00 General • Modified vehicle identification number.	See page 6 in this manual		—
Gr 01 Maintenance Schedule • Power steering booster and oil pump internal rubber parts replacement interval is changed.	Every 48 months		Every 24 months
• Power steering hose replacement interval is changed.	Every 48 months		Every 24 months
• Engine oil viscosity of manual transmission is changed. (Applies to ’96 model and later)	SAE 30 or SAE 40		SAE 40 or SAE 50
Gr 13 Fuel and Engine Control • Water separator changed from dual type to single type.	 27241		 27242



27168

● **Disassembly sequence**

1 Fuel feed hose
2 Water separator assembly
3 Air vent plug
4 Drain plug
5 O-ring
6 Ring nut
7 Case
8 Screen assembly
9 Water level ring
10 O-ring
11 Head

⊗ : Non-reusable parts

WARNING⚠
- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any spilled gas oil because it can cause a fire.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Ⓣ Tightening torque Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Air vent plug	8 to 12 {5.8 to 8.7, 0.8 to 1.2}	—
4	Drain plug	3 to 4 {2.2 to 2.9, 0.3 to 0.4}	—
6	Ring nut	23 to 27 {17 to 20, 2.3 to 2.8}	—

	Insertion tool	*910-26500	
44	Socket	*910-21982	Installation and removal of cylinder

* JIDOSHA KIKI part No.

◆ Service procedure

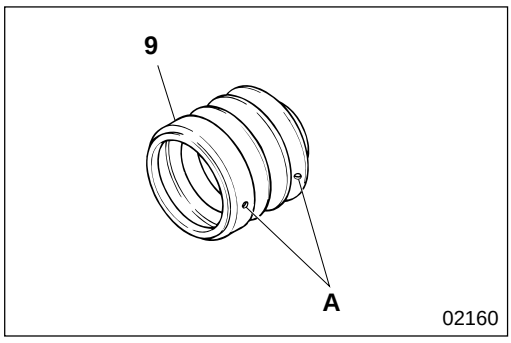
● Inspection before disassembly

(1) Apply 735 kPa {105 lbf/in^2, 7.5 kgf/cm^2} of pressure to the power shift assembly from the connector, check the airtightness when not operating (valve in neutral), and when operating valve is pressed and pulled. If the measured value deviates from the standard value, replace the faulty parts.

Maintenance item	Standard value	
Airtightness when not operating	Decrease of pressure after 15 seconds	9.8 kPa {1.4 lbf/in^2, 0.1 kgf/cm^2}
Airtightness when operating		49 kPa {7.1 lbf/in^2, 0.5 kgf/cm^2}

(2) Measure the sliding resistance in the disengagement direction. If the measured value deviates from the standard value, replace the faulty parts, or grease them.

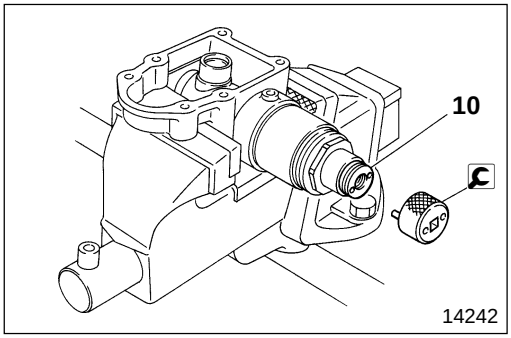
Maintenance item	Standard value
Resistance in shifting direction	38 N {8.6 lbf, 3.9 kgf}



9 **Installation of boot**

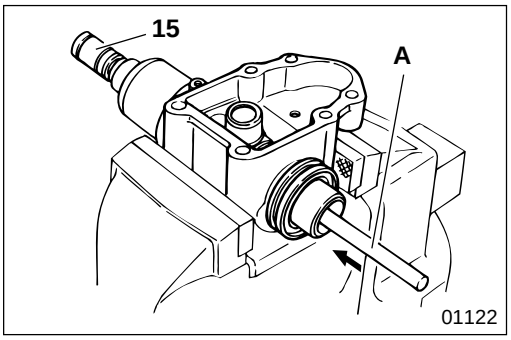
When you install boot **9** on housing **54**, point drain holes **A** downward.

https://truckmanualshub.com/



10 Installation and removal of connector

: Connector



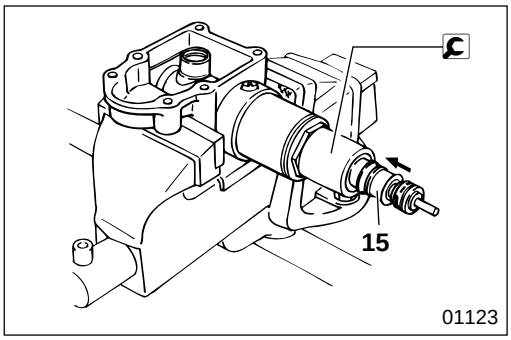
15 Valve assembly

[Removal]

Gently push valve assembly **15** off the shift rod from the lever side with rod A.

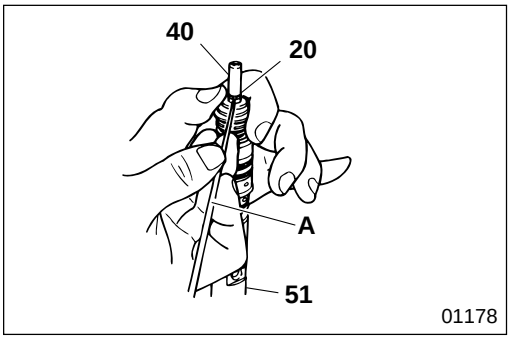
CAUTION

Use of excessive force to remove valve assembly 15 may result in damage.



[Installation]

- Apply grease to valve assembly **15**.
- Taking care not to damage the seals, install valve to shift rod with sleeve.



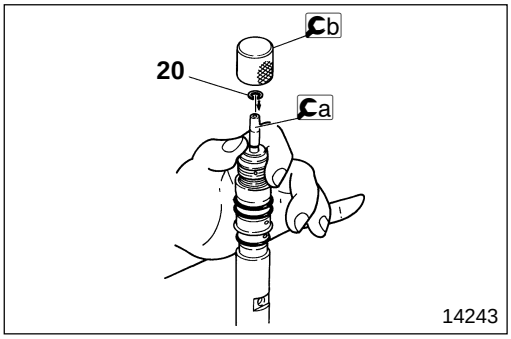
20 Retaining ring

[Removal]

- Secure shift rod **51** with a vise to prevent damage.
- Remove retaining ring **20** from pipe **40** with needle shaped object **A**.

CAUTION

- **When retaining ring 20 is removed, all valve parts are disconnected.**
- **To avoid wrong assembly, arrange all valve parts in correct order before assembly.**



[Installation]

- Attach valve parts to pipe **40**.
- Connect a insertion tool to end of pipe **40**.
- Insert retaining ring **20** correctly in groove in pipe **40** with b insertion tool.

CAUTION

Do not use excessive force when inserting retaining ring 20.

CAUTION⚠

- **When removing yoke and brush holder assembly 12, make sure you first pull out brushes 15, 16 from brush holder assembly 17 to avoid damaging the commutator of armature 23.**
- **Do not remove bearings 21, 31 unless they are faulty.**
- **Make sure you do not drop armature assembly 19 when you remove yoke and brush holder assembly 17 from front bracket assembly 26.**
- **Be careful not to lose ball 20, since it might come out together with armature assembly 19 when you remove it.**

NOTE

- **You do not have to remove pinion 4 when you disassemble or inspect only the motor assembly, for example: when inspection of the brush assembly is required.**
- **Except for the above, make sure you remove pinon 4 before disassembling any parts.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

Whenever magnetic switch 6 has been replaced, be sure to adjust the pinion gap.

● **Inspection after assembly**

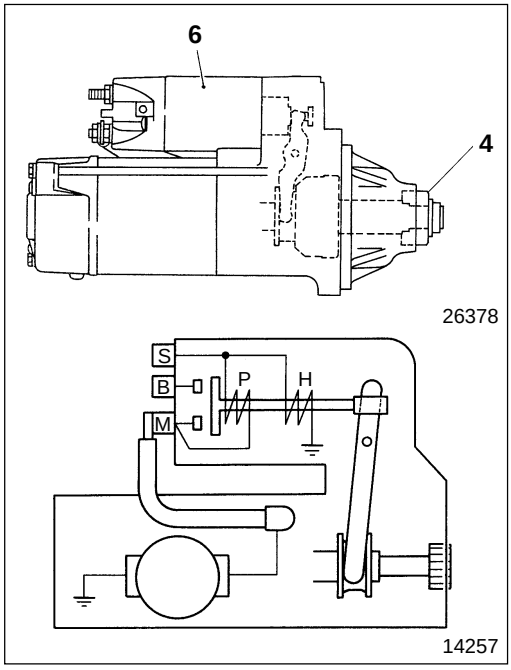
		Revolutions per minute	3600 rpm or more	—	
14	Pressure of brush spring		29 to 39 N {6.6 to 8.8 lbf, 3 to 4 kgf}	20 N {4.4 lbf, 2 kgf}	Replace
15, 16	Length of brush		18 {0.71}	11 {0.43}	Replace
19	Armature assembly	Outer diameter of commutator	32 {1.26}	31.4 {1.24}	Replace
		Deflection of commutator periphery	—	0.05 {0.002} or more	Replace
		Mica depth between segments	0.5 {0.02}	0.2 {0.0079} or less	Correct or replace

Lubricant

Location	Points of application	Specified lubricant	Quantity
6	Contact surface between lever and magnetic switch	Multipurpose grease [NLGI No.2 Li soap]	As required
11	Conical washer	Multipurpose grease [NLGI No.2 Li soap]	As required
20	Ball	MOLYKOTE ® AG650	As required
23, 34	Teeth of armature gear and planetary gear	MOLYKOTE ® AG650	As required
23, 37	Friction surfaces of gear shaft and armature	MOLYKOTE ® AG650	As required
28	Friction surfaces of lever and overrunning clutch	Multipurpose grease [NLGI No.2 Li soap]	As required
36	Washer	MOLYKOTE ® AG650	As required
37, 39	Friction surfaces of gear shaft and overrunning clutch	Multipurpose grease [NLGI No.2 Li soap]	As required
39	Spline of overrunning clutch	Multipurpose grease [NLGI No.2 Li soap]	As required

https://truckmanualshub.com/



◆ Service procedure

● Inspection after assembly

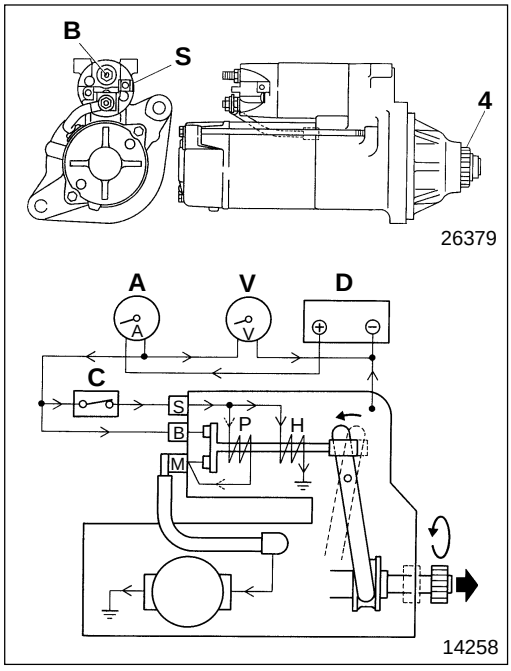
Inspect starter post-assembly while connecting power to the starter.

WARNING⚠

- **Keep hands well away when connecting power to starter as pinion 4 flies out rotating.**
- **Be careful when touching magnet switch 6 during inspection procedure as it may become hot.**

CAUTION⚠

- **Power connection time to the starter should be less than 10 seconds for the pull-in coil and 30 seconds for the holding coil. If power is on for longer than this, coils may over-heat and seize.**
- **When power is turned on to the starter, the current exceeds 100A, so use thick wiring like booster cable wire for the inspection. All connections must be properly secured.**



(1) Performance test

- Wiring should be as shown in the diagram.
  A : Ammeter
  B : Starter terminal **B**
  C : Switch
  D : DC power
  S : Starter terminal **S**
  V : Voltmeter
- Set voltage at 12 volts DC.

CAUTION⚠

Do not increase voltage beyond 12V.

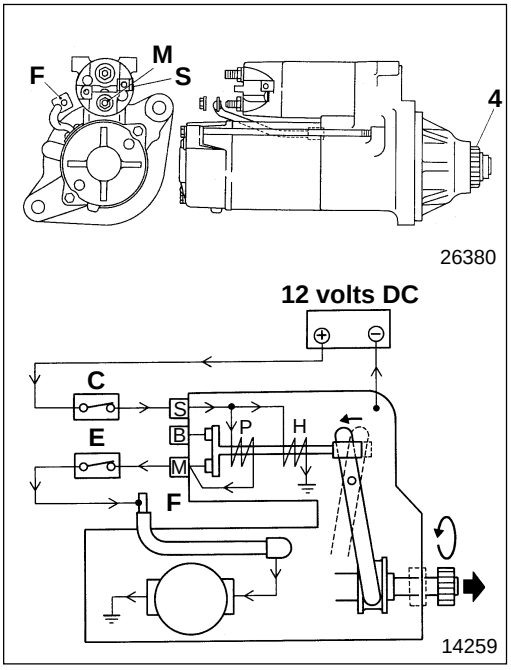
- The following operations are performed by connecting power to the starter so ensure that no more than 30 seconds at a time is required to complete measurement of the starter's current flow and revolution frequency.
  - Turn switch **C** on and connect power to starter. Pinion **4** flies out rotating.

CAUTION⚠

- **When switch C is turned on, power is connected to both pull-in coil P and holding coil H. The moment strong electric current from DC power D flows from starter terminal B to terminal M, current flow to pull-in coil P ceases, but continues to holding coil H.**
- **To prevent the holding coil from burning out, ensure the operation does not exceed 30 seconds.**

  - Measure the current, and revolution frequency of the starter. Revolution frequency is measured by applying a strobe etc., to pinion **4**.
  - Turn off switch **C**, and stop power connection to starter.
- If measured values deviates from the limits, disassemble the starter again and check it.

https://truckmanualshub.com/



(2) Pinion gap

[Inspection]

- Starter wiring should be as shown in the diagram.
  C : Switch
  E : Switch
  F : Cable
  M : Starter terminal **M**
  S : Starter terminal **S**

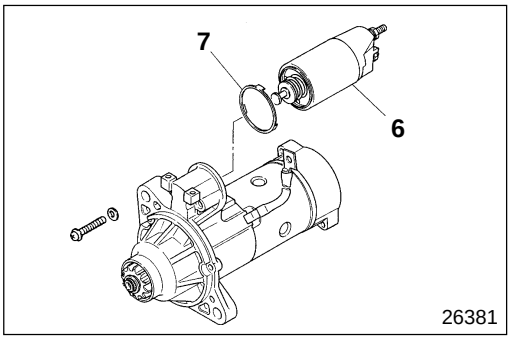
- The following operations are performed by connecting power to the starter so ensure that no more than 30 seconds at a time is required to complete measurement of the pinion gap.
  - Turn switch **C** and switch **E** on and connect power to the starter. Pinion **4** flies out rotating.

  - Turn switch **E** off (within 5 seconds) after pinion **4** starts rotating, and it stops.

CAUTION

When switch C and switch E are turned on, power is connected to both pull-in coil P and holding coil H. Voltage does not flow to starter terminal B with this wiring, and when pinion 4 is rotating current flows to the pull-in coil.
To prevent the pull-in coil from burning out, turn off switch E within 5 seconds after the pinion rotation.

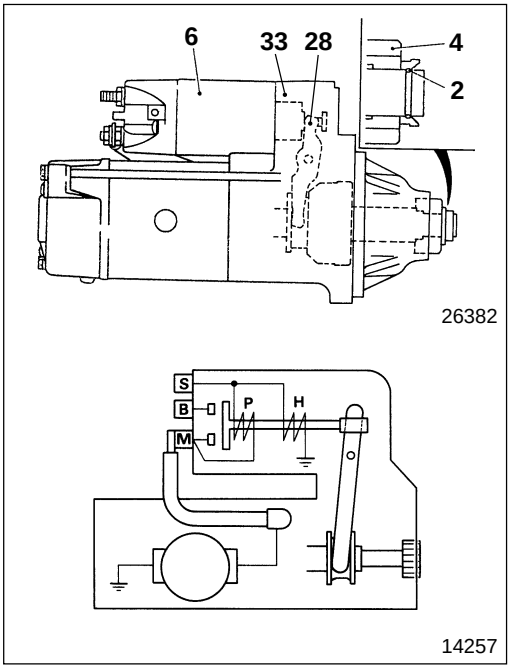
  - Measure axial movement of **G** (the pinion gap) when lightly pressing the end of overrunning clutch **39**.
  - Turn off switch **C** and stop power connection to starter.
- If values measured deviates from the limits, make the following adjustments.



[Adjustment]

- Remove magnet switch **6** from front bracket assembly **26**.
- Adjust thickness of shim **7**.
  Increasing the number of shims decreases pinion gap **G**.
  Shim type: 0.25, 0.5 mm.

https://truckmanualshub.com/



3 Pinion

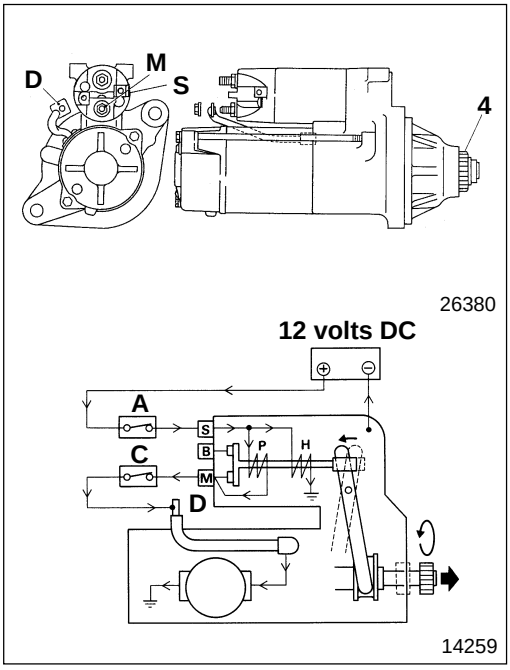
[Removal]
Removal of pinion **4** is performed by connecting power to the starter and making the pinion fly out.

WARNING

- **When connecting power to the starter, pinion 4 comes out rotating so keep hands well away.**
- **Be careful when touching magnet switch 6 as it may become hot during inspection.**

CAUTION

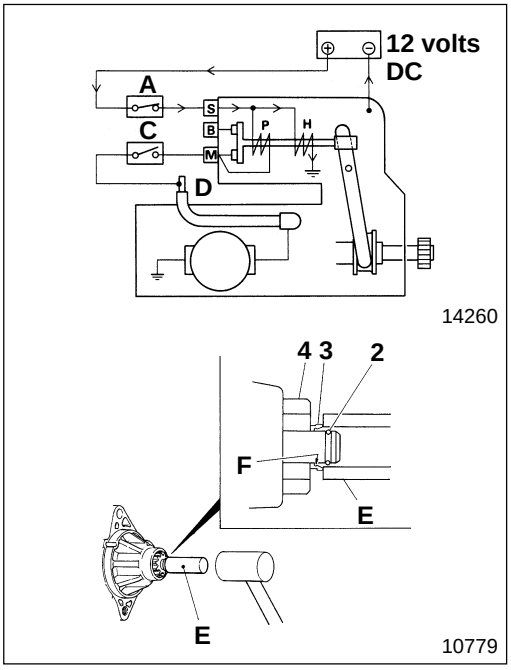
- **Power connection time should be less than 10 seconds for the pull-in coil and 30 seconds for the holding coil.**
  If power is on for longer than this, coils may over-heat and seize.
- **Connecting power is the only correct method for getting pinion 4 to come out. If the pinion is got out by pulling lever 28, without connecting power, front bracket 33 and the lever may be damaged due to impact when stopper ring 2 disconnects.**
- **When power is connected to the starter, the current exceeds 100A, so use thick wiring like booster cable wire for the inspection. All connections must be properly secured.**



- Wiring should be as shown in the diagram.
  A : Switch
  C : Switch
  D : Cable
  M : Starter terminal **M**
  S : Starter terminal **S**

- The following operations are performed by connecting power to the starter to ensure that no more than 30 seconds at a time is required until pinion **4** is removed.
  - Turn switch **A** and switch **C** on and turn power on to starter. Pinion **4** flies out rotating.

https://truckmanualshub.com/



- Turn switch **C** off (within **5** seconds) after pinion **4** starts rotating, and it stops.

CAUTION

When switch A and switch C are turned on, power is connected to both pull-in coil P and holding coil H. Voltage does not flow to starter terminal B with this wiring, and when pinion 4 is rotating, current flows to pull-in coil P.

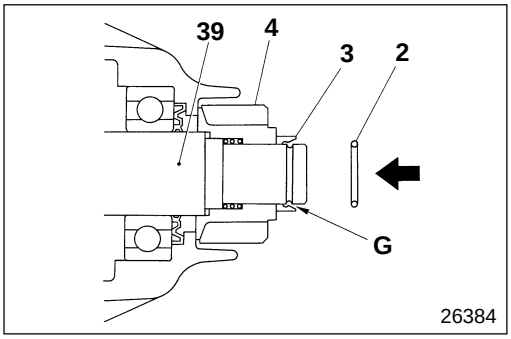
To prevent pull-in coil P from burning out, turn off switch C (within 5 seconds) after the pinion rotation.

- Apply pipe **E** to pinion stopper **3**.
- Tap **E** gently with a hammer, and remove stopper ring **2** from ring groove **F** in pinion stopper **3**.
- Unfasten stopper ring **2**, and remove pinion **4**.
- Turn switch **A** off and disconnect power to starter.

CAUTION

When power to the starter is stopped, pinion 4 pulls in and stopper ring 2, may go right back inside ring groove F of pinion stopper 3.

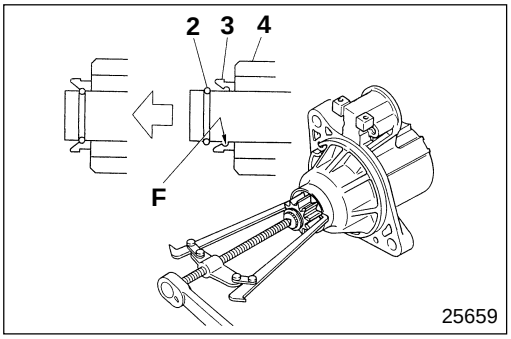
If so, turn starter power back on and perform the operation again.



[Installation]

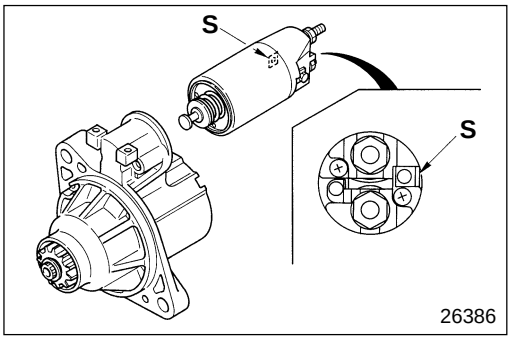
It is not necessary to connect power to the starter when installing pinion **4**.

- Install pinion stopper **3** and pinion **4** on over-running clutch **39** as illustrated.
- Attach stopper ring **2** in ring groove **G** in over-running clutch **39**.



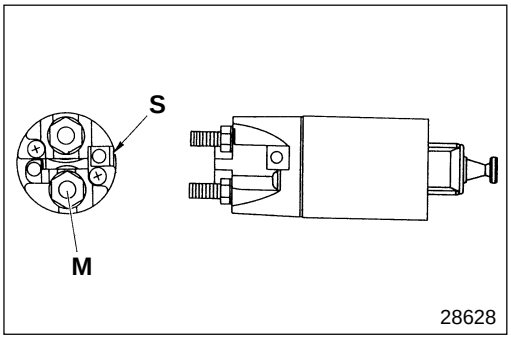
- Pull pinion **4** hard to secure stopper ring **2** firmly in ring groove **F** of pinion stopper **3**.

https://truckmanualshub.com/



6 Magnetic switch

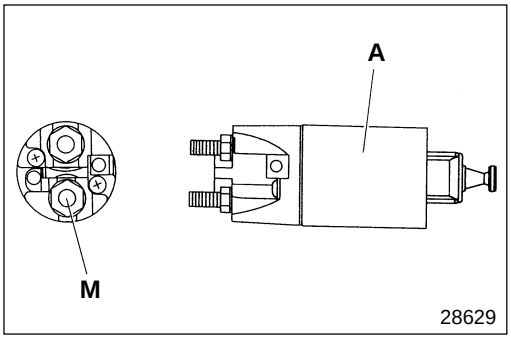
[Installation]
Install magnetic switch **6** onto lever **28** in the direction as illustrated.
S : Terminal **S**



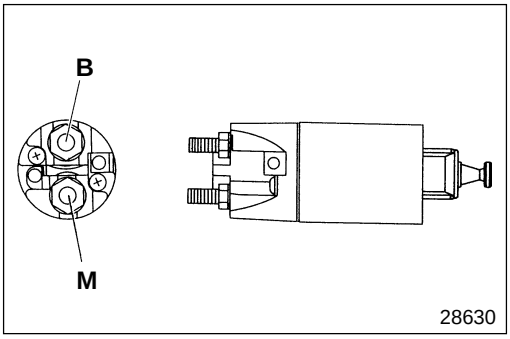
[Inspection]
Carry out the inspection as follows. If any fault is found, replace magnetic switch **6**.

(1) Testing for coil discontinuity

- Check that there is continuity between terminals **S** and **M**.

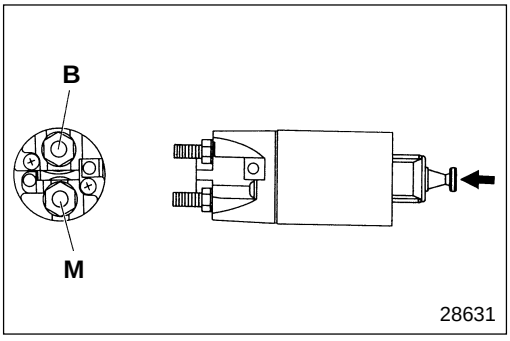


- Check that there is continuity between terminal **M** and the body **A** of magnetic switch **6**.



(2) Inspection of welded connections

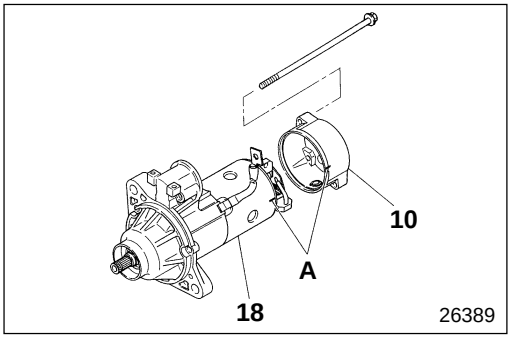
- Check that there is no continuity between terminals **B** and **M**.



(3) Inspection of connections

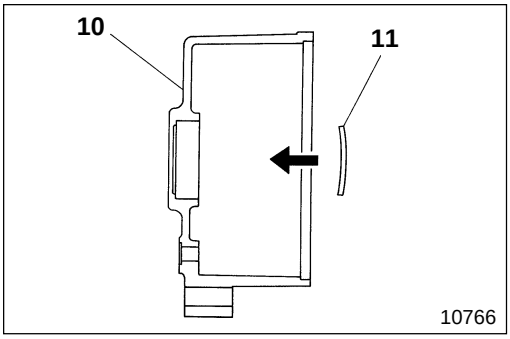
- Push the tip of magnetic switch **6** to close the internal connection.
- Check that there is continuity between terminals **B** and **M**.

https://truckmanualshub.com/



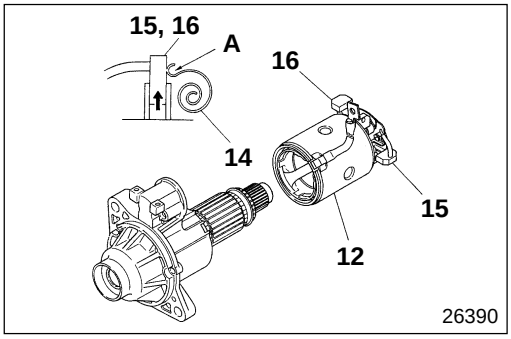
10 Installation of rear bracket

A : Counter mark



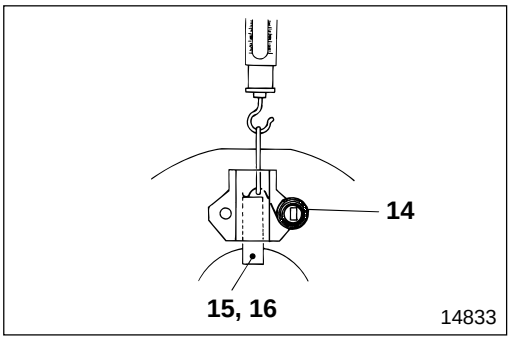
11 Installation of conical washer

Install conical washer **11** on rear bracket **10** facing the direction as shown.



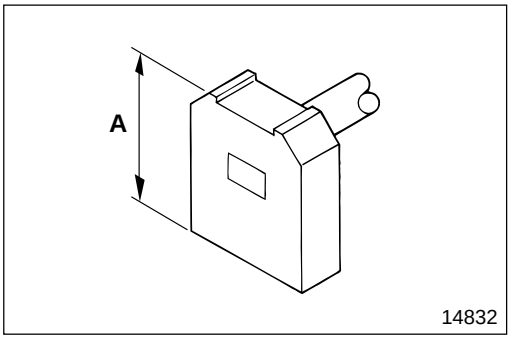
12 Removal and installation of yoke and brush holder assembly

- Pull part **A** of brush spring **14** and lift up brushes **15** and **16**.
- Secure the lifted brushes **15** and **16** with brush spring **14** as shown.
- Remove yoke and brush holder assembly **12**.
- The assembly sequence follows the disassembly sequence in reverse.



14 Inspection of brush spring

- Use new brushes **15**, **16** and measure the load when brush spring **14** is detached from the brushes.
- If the measured value is lower than the limit, replace brush spring **14**.



15 16 Inspection of brush

(1) Length of brush

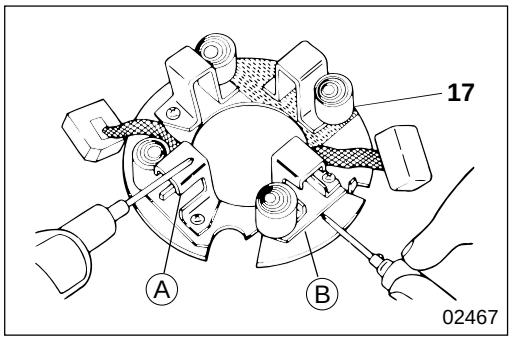
If the measured value is lower than the limit, replace brushes **15**, **16**.

A : Length of brush

(2) Contact surface with commutator

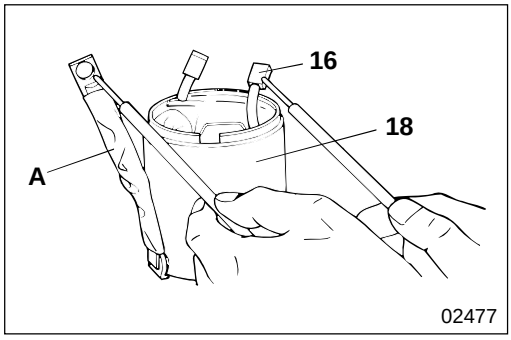
If the surface where the brushes contact the commutator is rough or is worn unevenly, polish the surface with emery paper (300 to 500 grit).

https://truckmanualshub.com/



17 Inspection of brush holder assembly

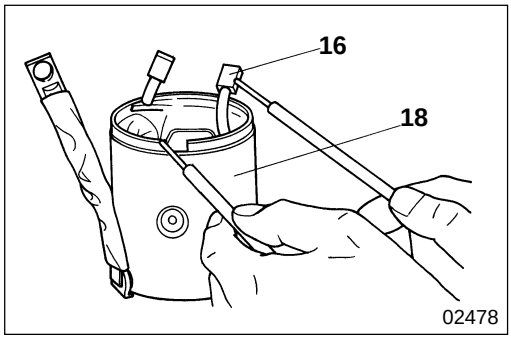
- Clean the ⊕ side of the brush holder **A** and - side of the brush holder **B** well, and check that there is no continuity between them.
- If there is continuity, they are grounded. Replace brush holder assembly **17**.



18 Inspection of yoke assembly

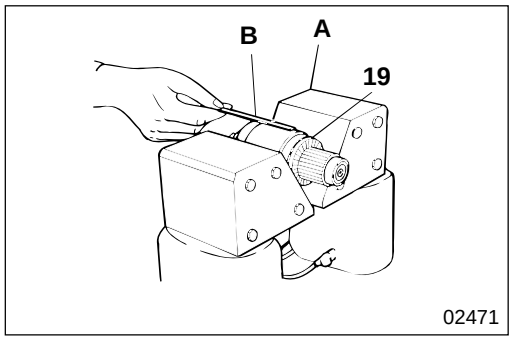
(1) Testing for coil disconnection

- Check that there is continuity between cable **A** and brush ⊕ **16**.
- If there is no continuity, they are disconnected. Replace brush ⊕ **16** or yoke assembly **18**.



(2) Testing for coil grounding

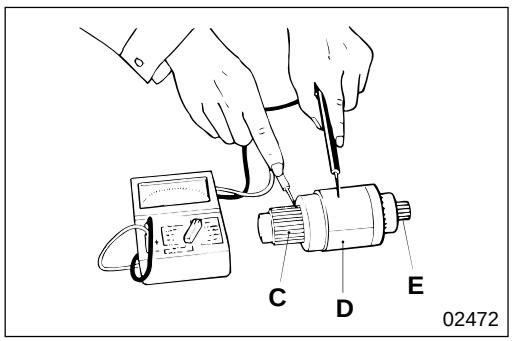
- Check that there is no continuity between yoke assembly **18** and brush ⊕ **16**.
- If there is continuity, they are grounded. Locate the disconnection. If it is hard to repair, replace brush ⊕ **16** or yoke assembly **18**.



19 Inspection of armature assembly

(1) Testing for coil short-circuit

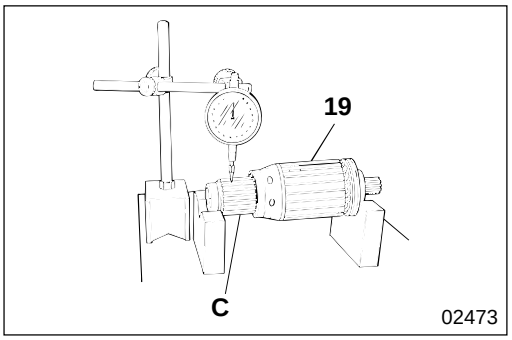
- Place iron rod **B** parallel to armature assembly **19**.
  A : Armature tester
- Rotate armature assembly **19** slowly.
- If iron rod **B** is pulled or shakes, it indicates that armature assembly is short-circuited, replace armature assembly.



(2) Testing for coil grounding

- Check that there is no continuity between commutator **C** and core **D** (or shaft **E**).
- If there is continuity between them, they are grounded. Replace armature assembly **19**.

https://truckmanualshub.com/

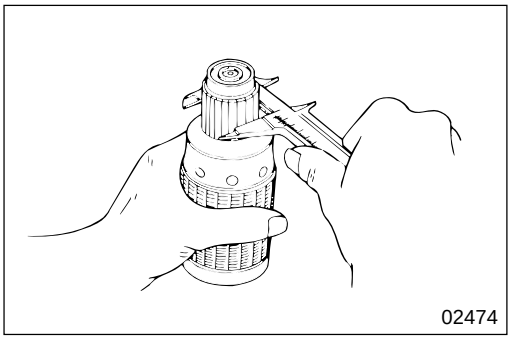


(3) Deflection of commutator

If the measured value is higher than the limit, adjust the outer diameter of commutator **C** within the limit.

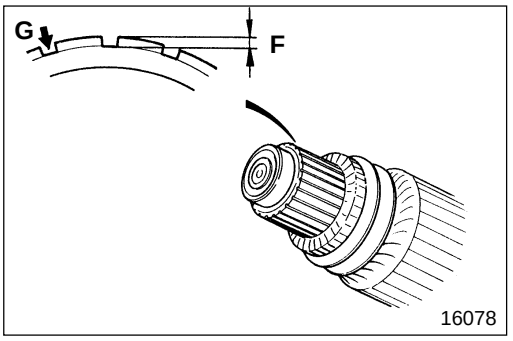
(4) Condition of commutator surface

- If the surface is rough or has stepped wear, polish the surface with emery paper (300 to 500 grit).
- After polishing, check deflection of commutator **C**.



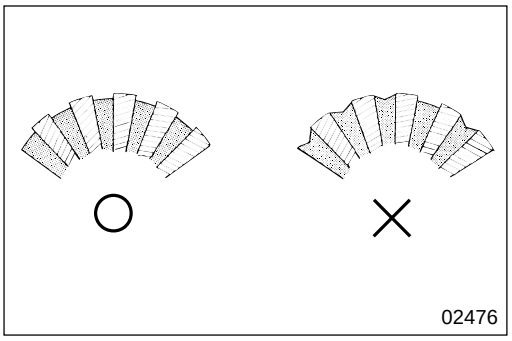
(5) Outer diameter of commutator

If the measured value is higher than the limit, replace armature assembly **19**.

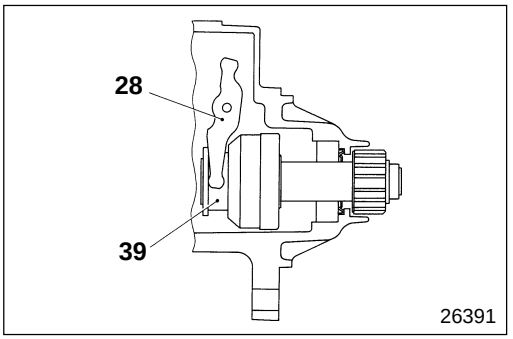


(6) Mold depth between segments

- If the measured value is lower than the limit, correct or replace armature assembly **19**.
  F : Mold depth
- Correct by shaving part **G** as shown.



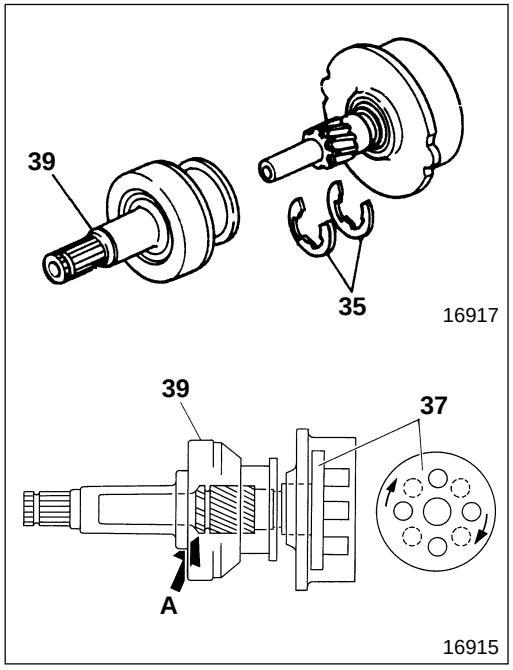
- If the mold is worn as illustrated, replace armature assembly **19**.
  ○ : Good
  × : Faulty



28 Installation of lever

Install lever **28** on over running clutch **39** facing the direction as shown.

https://truckmanualshub.com/

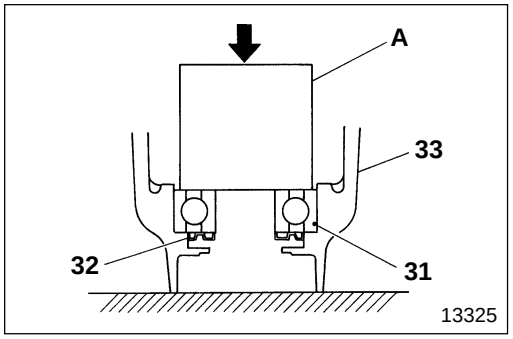


30 Gear shaft and overrunning clutch assembly

Remove washer **35** and remove gear shaft and overrrunning assembly from overrunning clutch **39**.

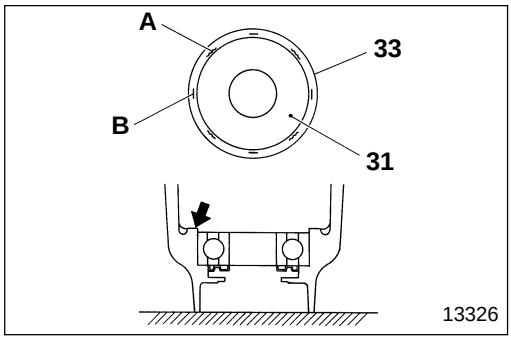
If gear spline **A** of gear shaft gear shaft is stuck inside overrung clutch and cannot be removed, perform the following;

- Press gear shaft **37** against overrunning clutch **39**.
- Rotate gear shaft **37** by 1/8 of a turn, move the location of spline part **A** and remove.



31 Installation of the front bearing

- Install dust seal **32** before pressing in front bearing **31**.
- Press front bearing **31** into front bracket **33** with pipe-shaped tool **A**.

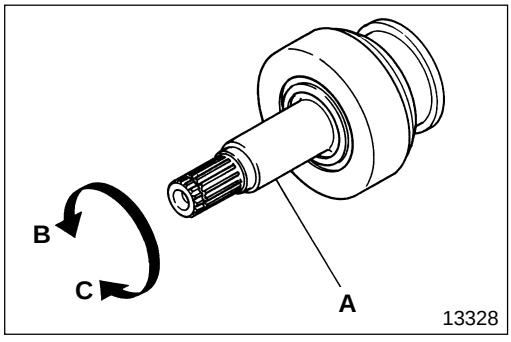


- Caulk front bracket **33** side again.

CAUTION

Avoid old caulk point B when caulking.

A : Caulking points (4).



39 Inspection of over running clutch

Inspect the following points and replace over running clutch **39** if abnormalities are detected.

- Check that shaft **A** rotates smoothly when rotated in direction **B**.
- Check that shaft **A** locks properly when rotated in direction **C**.

SERVICE MANUAL

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair or 1997 model Mitsubishi Fuso Truck FK, FM series.
Read this manual carefully as an aid to providing correct, efficient and fast maintenance.
Please note, however, that due to continuous improvements on the specifications, numbers and description for maintenance might be changed without prior notice.
If you have any question, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso dealer or distributor.

1997 MODEL CHANGES

Item	'97 Model ⇦	'96 Model
Gr 00 General **The power train has been changed.** • Clutch C6M35 has been replaced with clutch C6M35 (Spicer AR 350), and direct drive transmission, M060S6 with overdrive transmission M060S6. The power train has also been changed.	See page 3 in this manual.	—
Gr 11 Engine • A flywheel for clutch C6M35 (Spicer AR 350) has been added.	See pages 4 to 5 in this manual.	—
Gr 13 Fuel and engine control • Seals have been added to injection pumps to fit within the legal restriction. **CAUTION ⚠** **Injection pumps should not be adjusted by anyone other than the specified ZEXEL service stations.**	 20778 *** : Sealed part**	 13114 *** : Sealed part**
Gr 21 Clutch • Clutch C6M35 has been replaced with clutch C6M35 (Spicer AR 350).	See pages 6 to 13 in this manual.	—
Gr 22A Manual transmission • Direct drive transmission, M060S6 has been replaced with overdrive transmission, M060S6.	'96 model is equipped with overdrive transmission M060S6. For details refer to the revised edition of Group 22A Manual Transmission < M060S5, S6, M070S6 >. 🗀 Gr 22A (Pub. No. TWME9620)	—
Gr 31 Wheel and tire • The number of wheel mounting hub bolts has been reduced from ten to eight.	See pages 14 to 15 in this manual.	—
Gr 54 Electrical • The sub-starter switch and the sub-starter circuit have been eliminated.	The eliminated sub-starter circuit is same as Group 54 ('96 model) engine starting circuit. 🗀 Gr 54 ('96 model)	—
• The cold starter switch, cold starter 3-way magnetic valve (automatic transmission only), and cold start indicator lamp have been eliminated.	See pages 16 to 19 in this manual.

Group 21
Clutch

< C6M35 (AR 350) > : '97 MODEL

Items not covered in this manual are the same as those of C6M35 : '96 model.

https://truckmanualshub.com/

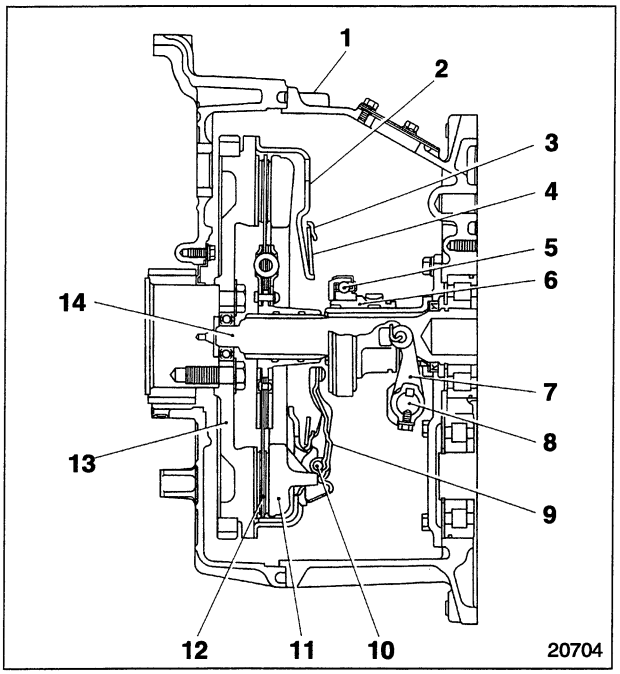
SPECIFICATIONS

Item		Specifications
Clutch	Model	C6M35 (AR350)
Drive type		Strap drive
Clutch disc	Type	Dry, single plate type
Pressure plate	Type	Diaphragm spring type
Control system		Hydraulic pressure type
Clutch master cylinder	Manufacturer	NABCO
Clutch power cylinder	Manufacturer	NABCO

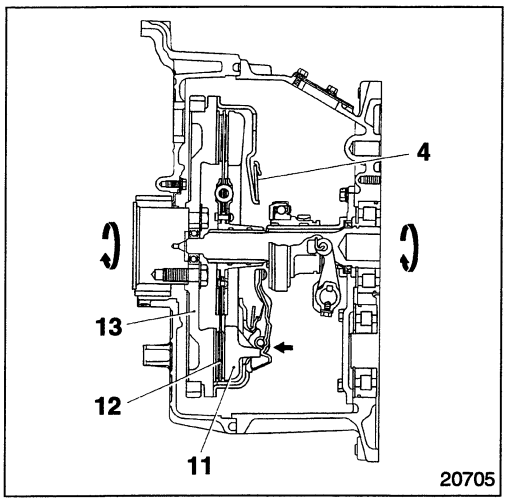
https://truckmanualshub.com/

STRUCTURE AND OPERATION

Clutch < C6 (AR 350) >

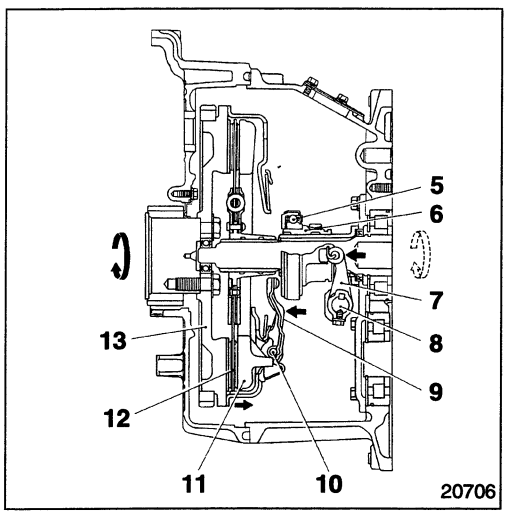


1 Clutch housing
2 Bracket
3 Spring ring
4 Belle spring
5 Release bearing
6 Clutch shifter
7 Release fork
8 Release fork shaft
9 Release lever
10 Pivot pin
11 Pressure plate
12 Clutch disc
13 Flywheel
14 Drive pinion



When clutch pedal is released

- Pressure plate **11**, activated by belle spring **4**, forces clutch disc **12** against flywheel **13**.
- Clutch disc **12** forced against flywheel **13** runs together with the flyweel and transmits power from the engine to transmission drive pinion **14**.



When clutch pedal is depressed

- Hydraulic pressure generated within the clutch master cylinder activates the clutch power cylinder.
- Release fork shaft **8** actuates release fork **7** and pushes release bearing **5** forward toghther with clutch shifter **6**, pushing release lever **9**.
- Release lever **9**, with pivot pin **10** acting as the fulcrum. Retracts pressure plate **11**, which opens a clearance between clutch disc **12** and flywheel **13**, cutting off power transmission from the engine.

https://truckmanualshub.com/

Possible causes \ Symptoms		Clutch disengaged but drags	Clutch slips	Clutch does not engage smoothly	Clutch makes noise on disengagement	Clutch makes noise on engagement	Judder when vehicle starting	Remarks
Clutch cover assembly	Release bearing faulty	○			○			
	Release lever heights uneven	○	○	○			○	
	Pressure plate warped or faulty	○	○	○			○	
	Belle spring fatigued		○	○		○		
	Loose strap rivets						○	
	Strap plate bent				○

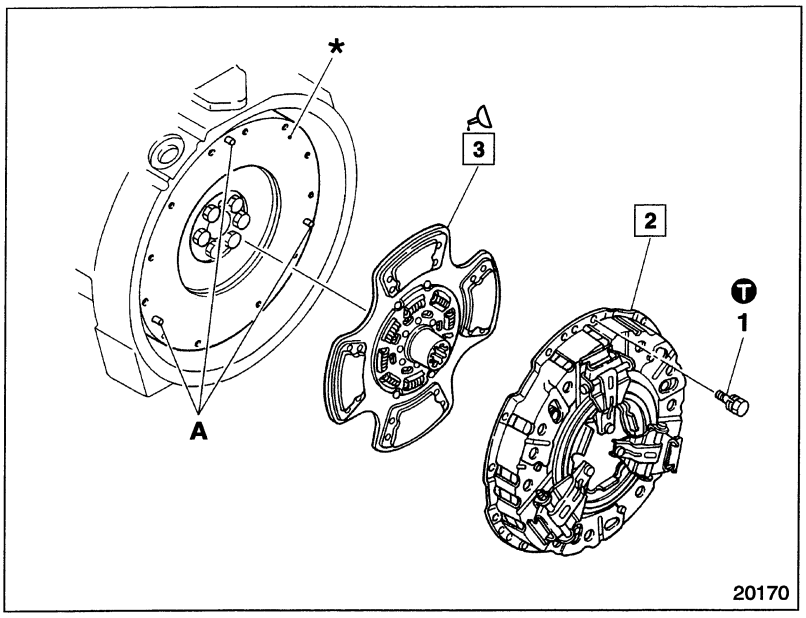
CLUTCH BODY < C6 (AR 350) >



● **Removal sequence**

1 Bolt
2 Clutch cover assembly
3 Clutch disc

* : Flywheel Gr 11
A : Positioning pins (three points)

WARNING

Be careful when you handle clutch cover assembly 2 because it is rather heavy.

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION

Be careful not to get oily substances on clutch disc 3 surfaces because this will cause the clutch to slip.

Service standards

Unit : mm {in.}

T Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Clutch cover assembly mounting)	17 to 25 {12 to 19, 1.7 to 2.6}	—

Lubricant

Location	Points of application	Kinds	Quantity
3	Spline of clutch disc	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	3 to 5 g {0.11 to 0.18 oz}

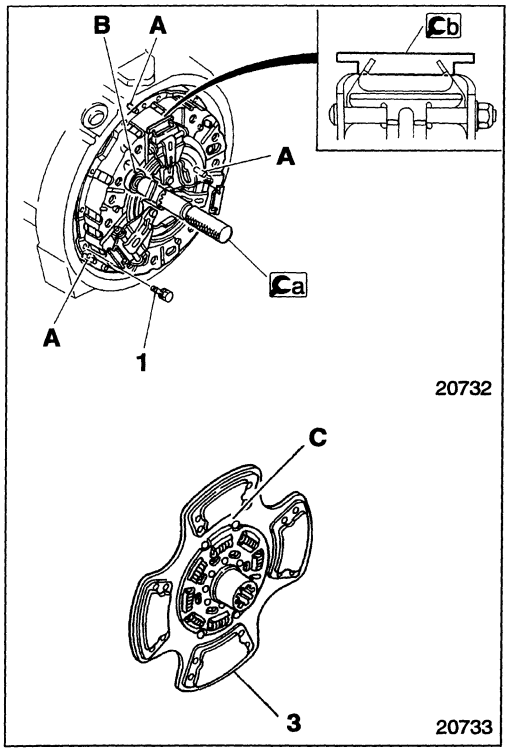
https://truckmanualshub.com/

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
2	Ship block 	MH063407	Removal and installation of clutch cover assembly
2, 3	Clutch alignment arbor 	MH063406	Holds clutch disc

◆ Service procedure



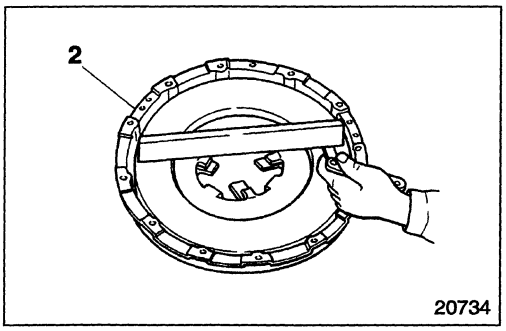
2 Clutch cover assembly

[Removal]

- Insert Ca clutch alignment arbor in flywheel pilot bearing **B** to hold clutch disc **3**.
- Insert Cb ship block in clutch cover assembly **2**, then remove bolt **1**.
- For installation, follow the removal sequence in reverse.
- Install clutch disc **3** so that part No. **C** is visible.
- Tighten bolts **1** gradually, in diagonal order, to specified torque.

CAUTION ⚠

- **Beware, if you do not use Cb ship blocks (three points) to remove bolt 1, the force of the belle spring might push out pressure plate and release lever damaging the strap plate. It might even come apart from knock pin A and drop off.**
- **Remember to remove ship blocks after installation (three points). If the ship blocks are left on, the clutch will not engage.**

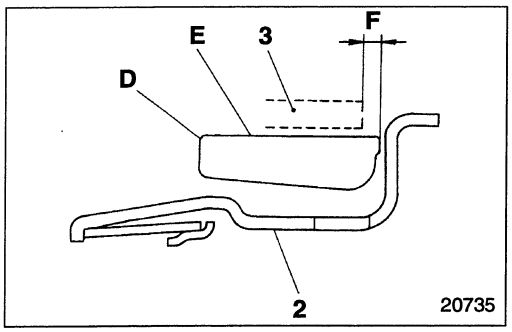


[Flatness of pressure plate]

If the measured value is higher than the limit, replace clutch cover assembly **2**.

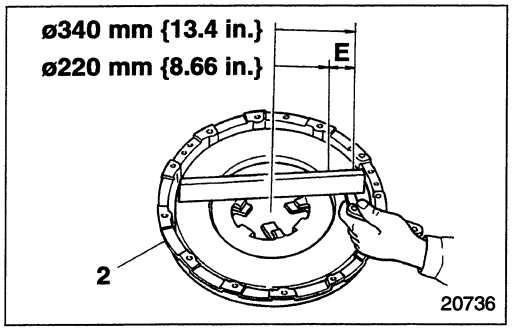
https://truckmanualshub.com/

CLUTCH BODY < C6 (AR 350) >

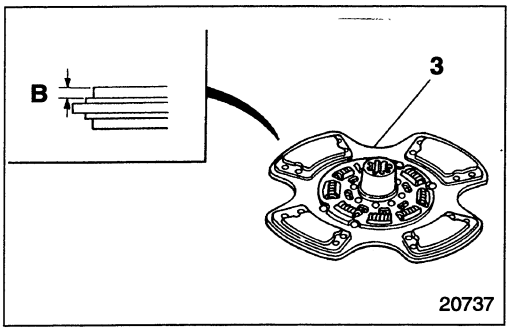


[Wear amount of pressure plate]

- To check clutch cover assembly **2** pressure plate **D** for wear, measure the amount of wear on friction surface **E** according to the following procedure. If the measured value is higher than the limit, replace the clutch cover assembly.



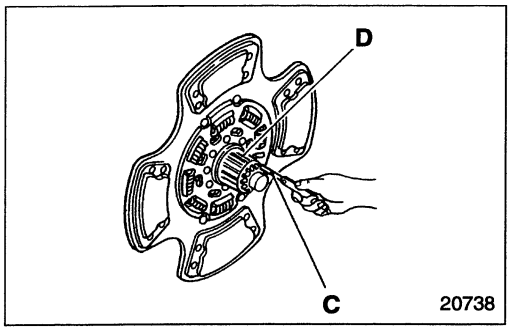
- Measure the clearance between datum face **F** (area not in contact with clutch disc **3**) and friction surface **E** (area as illustrated). The measured value represents the amount of wear.



3 Clutch disc

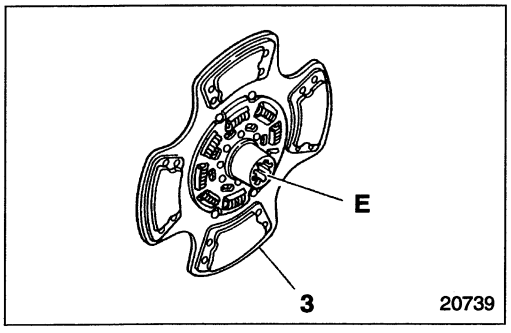
(1) Height of facing

Measure dimension **B** as illustrated.
If the measured value does not conform to the limit, replace clutch disc **3**.



(2) Play in direction of revolution

- Reshape feeler gauge **C** for insertion into drive pinion spline **D**, and measure play.
- If the measured value is higher than the limit, replace clutch disc **3** or the drive pinion.
- Carry out the same measurement on new clutch disc **3**. If the measured value is higher than the limit, replace the drive pinion.



(3) Applying grease

Apply grease evenly to spline **E** and the entire tooth surface of clutch disc **3**. Apply grease to the grease groove of the spline up to its large diameter.

CAUTION⚠

Be careful not to apply too much grease because excessive grease causes grease leakage from spline E and makes the clutch slippery.

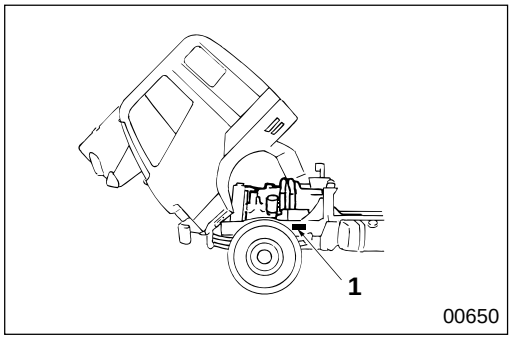
CHASSIS NUMBER AND ENGINE NUMBER/POWER TRAIN LABEL

CHASSIS NUMBER AND ENGINE NUMBER

The serial numbers for chassis and engines are assigned to the respective vehicles and engines in manufacturing sequence: each vehicle and engine has its own number. These numbers are required for registration and incidental inspection of the vehicle. Please do not fail to mention these numbers to the dealers when ordering spare parts.



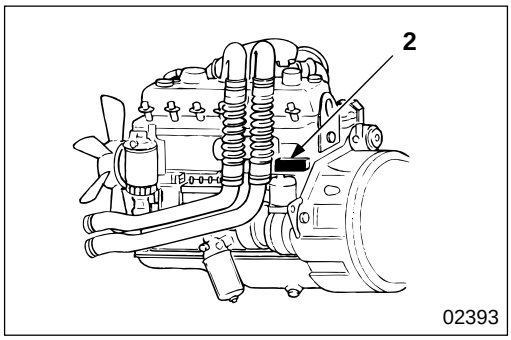
Chassis number

Chassis number **1** is punch-marked on the frame by the left-side front wheel.

Example : FK617H–□□□□□□

Vehicle model

Chassis number



Engine number

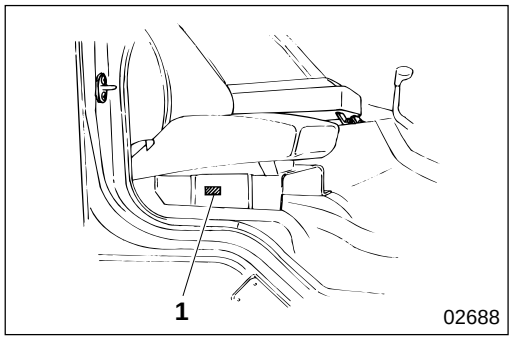
Engine number **2** is punch-marked on the left of the crankcase.

Example : 6D16–□□□□□□

Engine number

Engine model

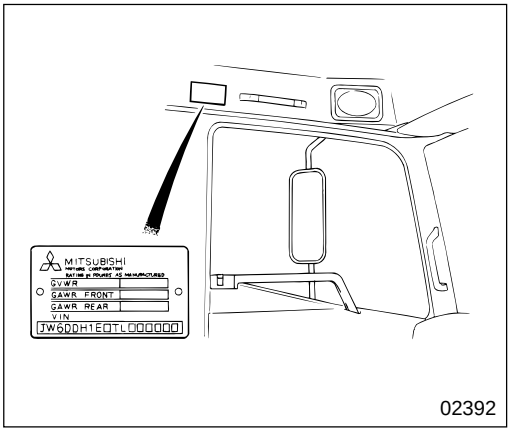
POWER TRAIN LABEL



Power train label **1** located in the position illustrated indicates the vehicle model, chassis number and information relevant to the vehicle's power transmission components.

https://truckmanualshub.com/

VEHICLE IDENTIFICATION NUMBER



The vehicle identification number is punch-marked on the plate, which is attached in the position as illustrated.
The vehicle identification number consists of a 17-digit set of alphanumeric characters. Each digit represents the following specifications.

J W 6 D D H 1 E □ T L □ □ □ □ □ □

① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨ ⑩ ⑪ ⑫

①	Country	J :	Japan
②	Make	W :	Mitsubishi Fuso
③	Vehicle type	6 :	Incomplete Vehicle
④	Gross vehicle weight/Brake system	C :	7258 to 8845 kg {16001 to 19500 lbs} /Air over hydraulic
		D :	8851 to 11800 kg {19501 to 26000 lbs}/Air over hydraulic
		E :	11801 to 14970 kg {26001 to 33000 lbs}/Air over hydraulic

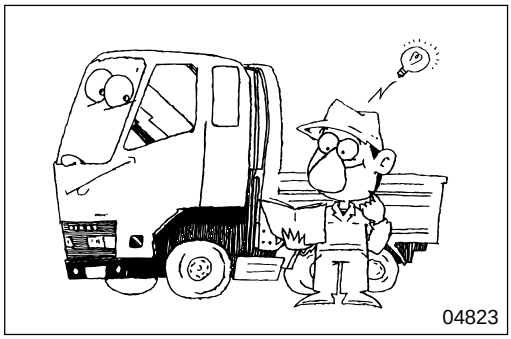
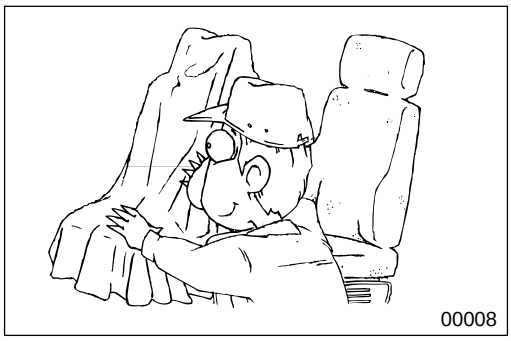
PRECAUTIONS FOR MAINTENANCE OPERATION

In order to determine the condition of the vehicle adequately, attend the vehicle beforehand to find and keep record of the accumulated mileage, operating condition, what the customer's demand is, and other information that may be necessary. Prepare the steps to be taken and perform efficient and wasteless maintenance procedure.

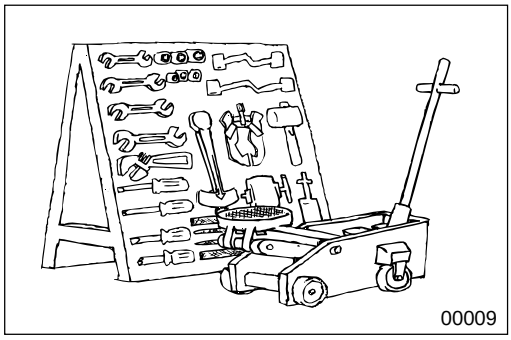


Determine where the fault exists and check for the cause to see whether removal or disassembly of the part is necessary. Then follow the procedure specified by this manual.



Perform maintenance work at a level area.
Prepare the following.

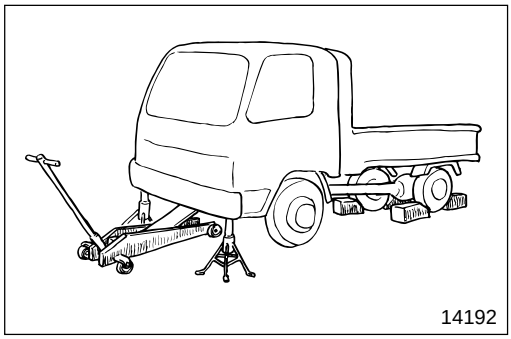
- To prevent the seats, upholstery, floor and bodywork from being spoiled or scratched, cover with workshop sheet cover(s).



- Prepare general and special tools necessary for the maintenance work.

WARNING ⚠

Do not attempt to use tools other than special tools where use of special tools is specified in this manual. This will avoid injury or damage.



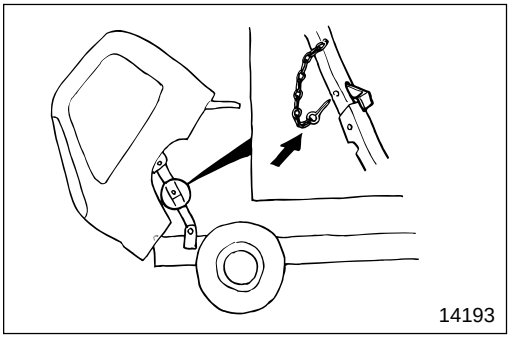
When jacking up the vehicle to work under the vehicle, carry out the following preparatory work:

- Chock the wheels on both sides.
- Jack up the vehicle using a garage jack.
- Support the frame on rigid racks.

WARNING ⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

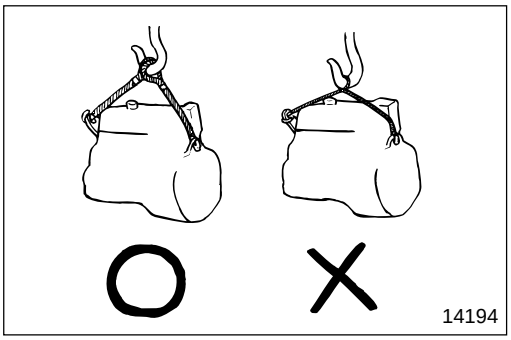
https://truckmanualshub.com/



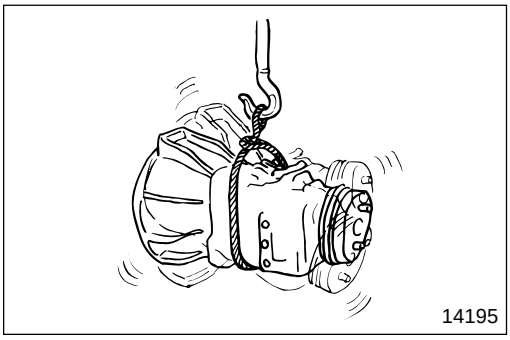
When tilting the cab, be sure to insert the safety pin into the cab stay so that the cab stay remains locked and is not released when the cab is tilted.

Pay special attention to safety when removing or installing heavy items such as engines, transmissions and axles.

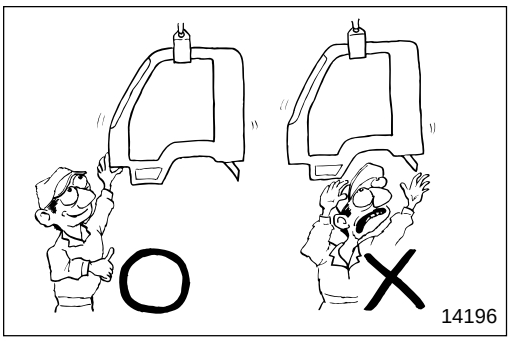
When lifting up heavy items using cables, pay special attention to the following points:



- Check the mass of the item to be lifted and use a cable capable of lifting that mass.



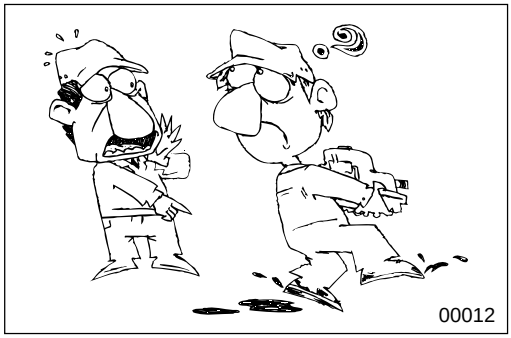
- If you do not have the specified lifting hanger, secure the item using cable taking the point-of-balance of the item into consideration.



- You must work in a position where you will not be injured even if the cable comes undone and the lifted item falls.

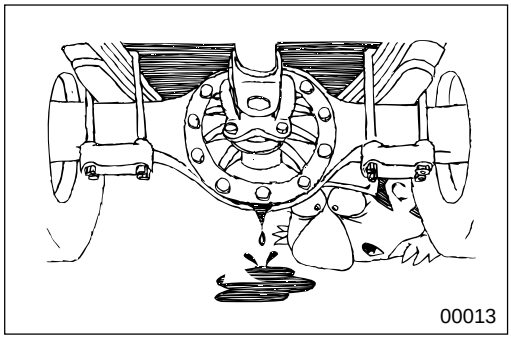
https://truckmanualshub.com/

PRECAUTIONS FOR MAINTENANCE OPERATION



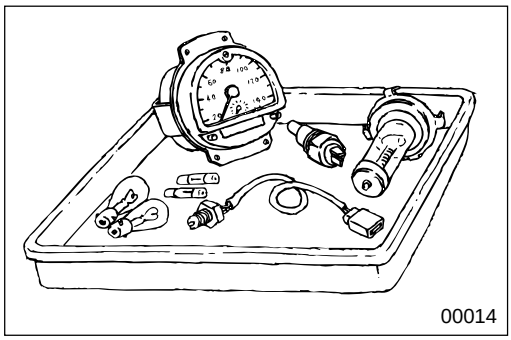
00012

Be particularly careful not to work in shoes that have oily soles and are slippery. When working as a team of two or more, arrange signals in advance and keep confirming safety. Be careful not to accidentally bump switches or levers.



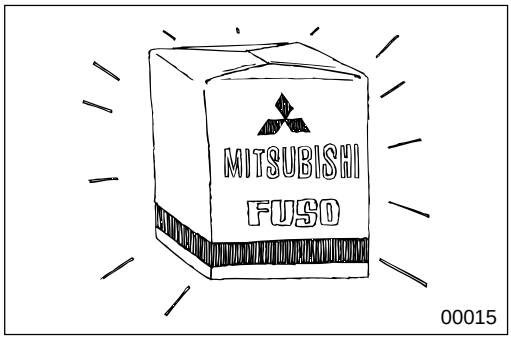
00013

Check for oil leakage before cleaning the area having the fault otherwise you might miss detecting the leakage.



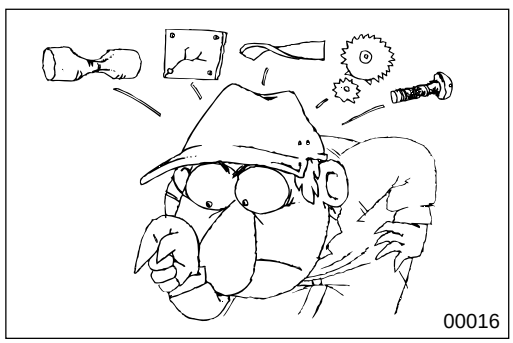
00014

Prepare replacement part(s) beforehand.



00015

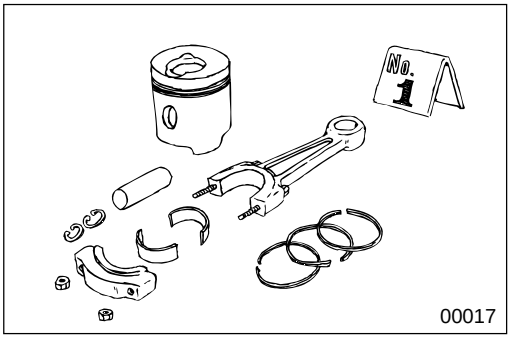
Replace oil seals, packing, O-rings and other rubber parts; gaskets and split pins with new parts whenever any of them has been removed. Use only genuine MITSUBISHI replacement parts.



00016

On disassembly, visually inspect all parts for wear and tear, cracks, damage, deformation, degradation, rust, corrosion, smoothness in rotation, fatigue, clogging and any other possible defect.

https://truckmanualshub.com/

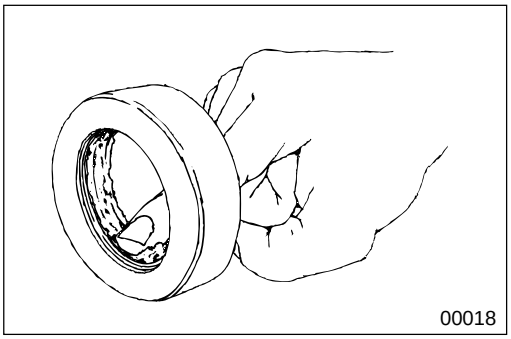


00017

Put alignment marks on part combinations before disassembly and arrange the disassembled parts neatly. This will help avoid mismating of the parts later.
Put the alignment marks, punch marks, etc. where performance and appearance will not be affected.
Cover the area left open after removal of parts to keep it free from dust.

CAUTION

- **Take care to avoid mixing up numerous parts, similar parts, left and right, etc.**
- **Keep new parts for replacement and original (removed) parts separate.**

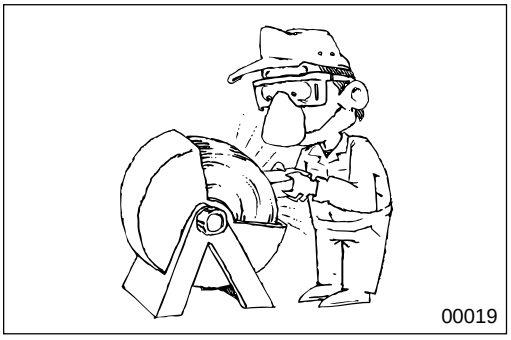


00018

Apply the specified oil or grease to U-packings, oil seals, dust seals and bearings during assembly.
Use only the specified oil, grease, etc. for lubricant, remove the excess immediately after application with a piece of waste, etc.

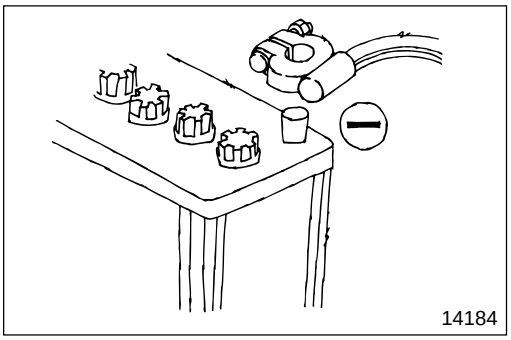
CAUTION

When the specified lubricant, fluid and sealant is not available, you may use an equivalent.



00019

Wear goggles when using a grinder or welder. Pay full attention to safety by wearing gloves when necessary. Watch out for sharp edges, etc. that might injure your hands or fingers.



14184

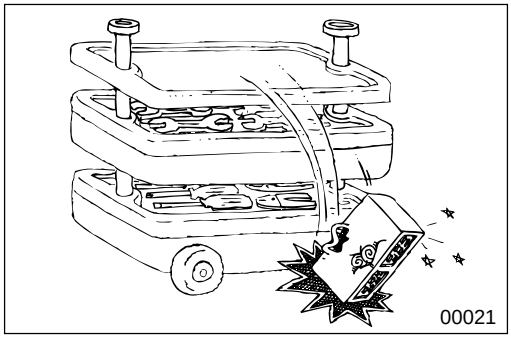
Before carrying out maintenance work on the electric system, disconnect the negative terminals of the batteries to prevent them from short-circuiting and burning-out.

CAUTION

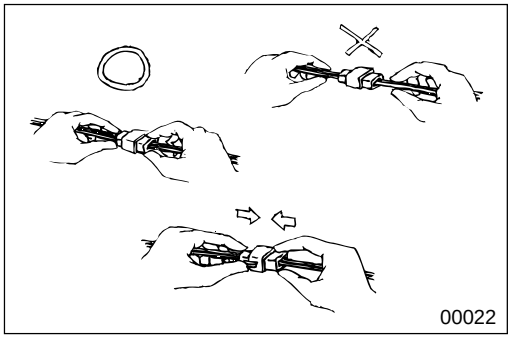
Be sure to turn starter and lighting switches, etc. off before disconnecting or connecting battery terminals, because the semiconductors can be damaged.

https://truckmanualshub.com/

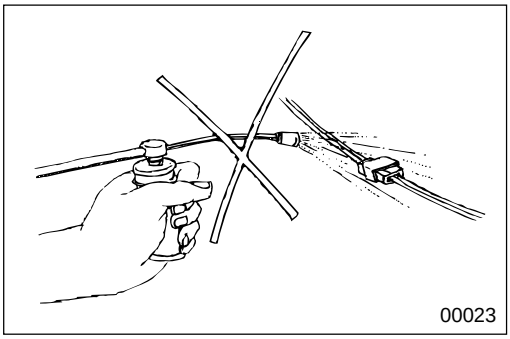
PRECAUTIONS FOR MAINTENANCE OPERATION



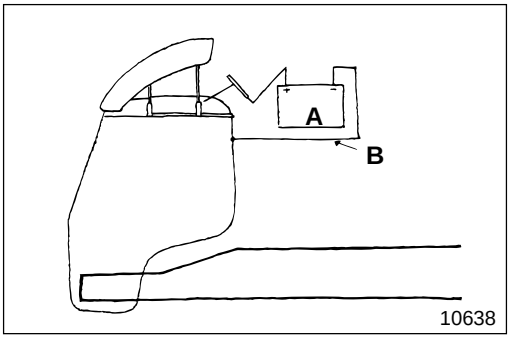
Take care when handling sensors, relays, etc. which are vulnerable to shock and heat. Do not attempt to remove the cover from, or apply paint to, the electronic control unit.



Pull the connector, and not the harness lead, to separate connectors. To separate a lock-type connector, first push toward arrow mark. To reconnect a lock-type connector, press the separated parts until they click together.



When washing the vehicle, cover the electric system parts and instruments with waterproof material beforehand (Cover with vinyl sheet or the like). Keep water away from harness wire connectors and sensors. If any of them should get wet, wipe them off immediately.

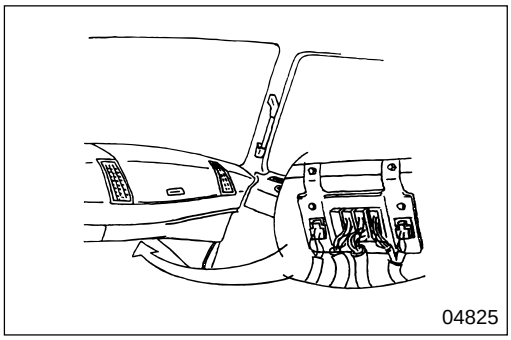


When using an electric welder, such electronic parts that are directly connected to the batteries might be damaged due to the flow of current from the welder that flows through the negative circuit. Parts that have switches might be subject to the same danger if the switches are left on. Therefore, do not fail to observe the following.

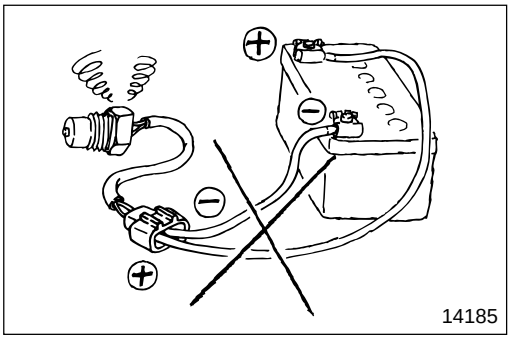
A : Welder

B : Connect the negative terminal of the welder as near as possible to the area that is to be welded.

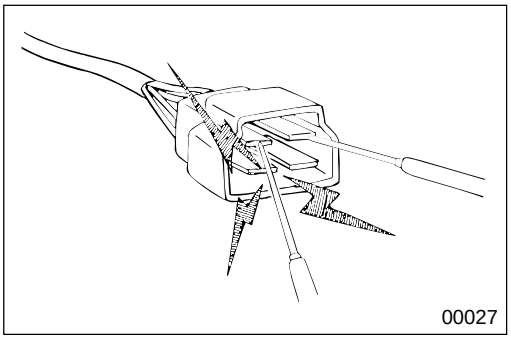
https://truckmanualshub.com/



- Disconnect the negative terminals of batteries.
- Disconnect connections between the cab harness wires and the chassis harness wires.

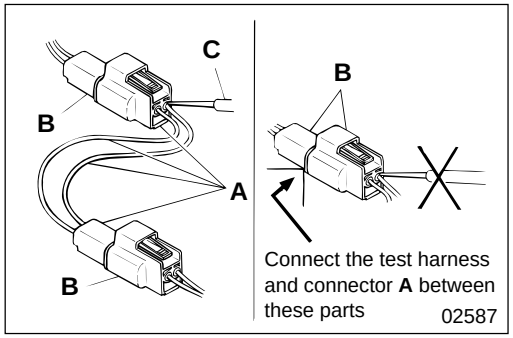


To apply voltage for testing, check that the positive and negative cables are connected properly, then increase voltage gradually from 0 volt. Do not apply voltage higher than the specified value.
In particular, pay close attention to the electronic control unit and sensors, since they are not always fed the battery voltage.



When using testers or the like for continuity tests, be careful not to allow test probes to touch the wrong terminals.

https://truckmanualshub.com/



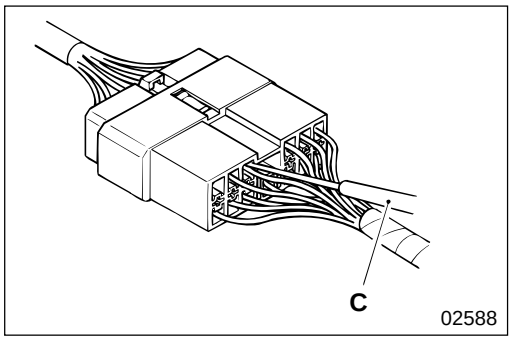
Measurement procedures using connectors

- **Test with connectors engaged (continuity through circuit obtained)**

  < Waterproof connector >

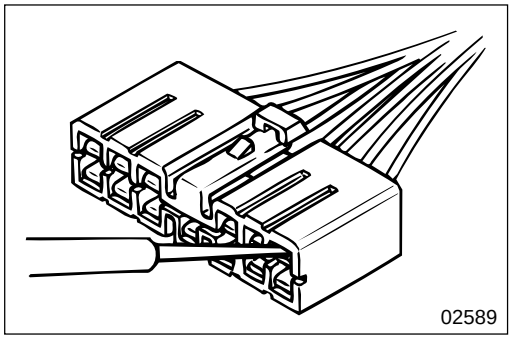
  Prepare a test harness and connectors **A**, then connect if between the two parts of harness **B** that is to be tested. Check the circuit by touching test probe **C** to the test connector.

  Never insert the test probe from the harness side of the waterproof connection, or waterproof performance might be diminished causing corrosion of the connector.



< Non-waterproof connector >

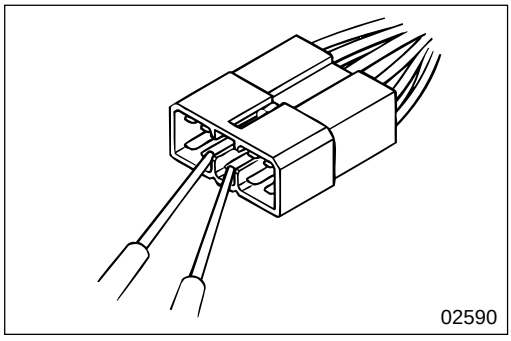
Insert test probe **C** from the harness side of the connector. Where control units, etc. have connectors that are too small to accept the test probe, do not force the test probe into them.



- **Test with connectors disengaged**

  Using female pins

  Insert a test probe into a terminal. However, do not force the probe into the terminal, or it will cause a poor contact.



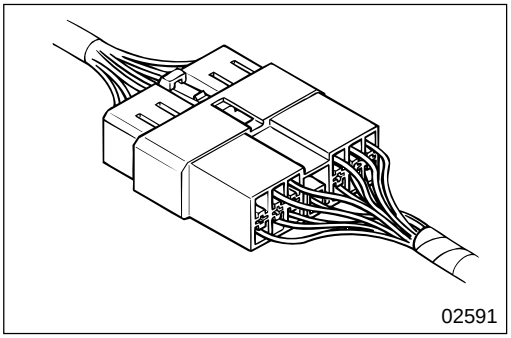
Using male pins

Touch the pins directly using test probes.

CAUTION⚠

Be sure that you do not short circuit the connector pins when you use the test probe because this could damage the internal circuit of the electronic control unit.

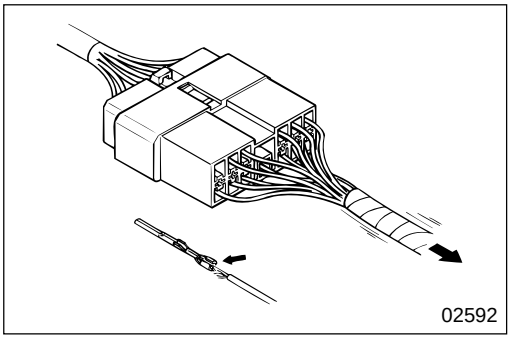
https://truckmanualshub.com/



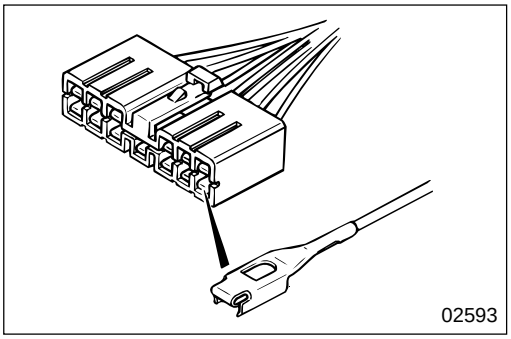
Connector inspection procedures

- **Visual inspection**

  Check for loose connection and poor engagement.

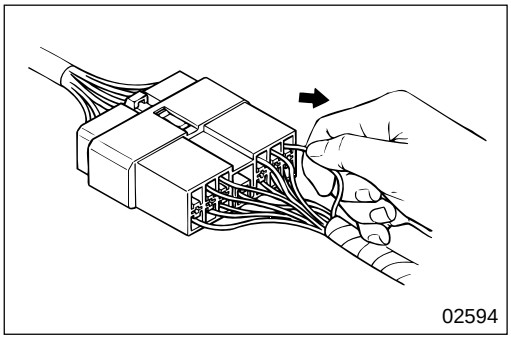


Check if harnesses are broken by pulling gently around the terminals.



Check for a decrease in contact pressure between the male and female terminals.

Check for poor contact caused by connector pins having fallen out, rusted terminals or foreign particles.

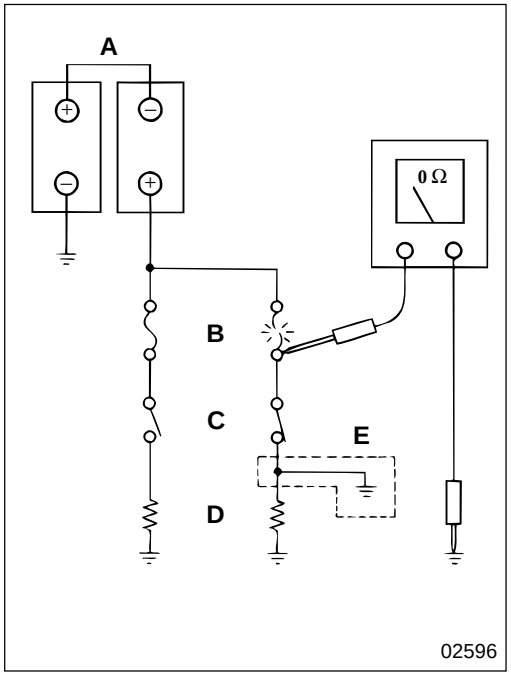


- **Connector pin fall out inspection**

  Damaged connector pin stoppers can cause poor engagement of the terminals (male and female pins) even if the connector body is secured, and might cause some pins to fall out. Check if the pins have fallen out from the connector by pulling each harness gently.

https://truckmanualshub.com/

PRECAUTIONS FOR MAINTENANCE OPERATION



Inspection procedures for blown fuses

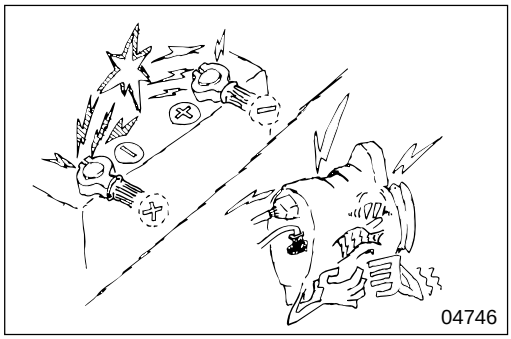
Remove fuse **B** and measure resistance between the loaded side of the fuse and ground.

Turn on all circuit switches (connected to the fuse). If the resistance value reading is approximately 0 Ω, a short has occurred between the switch and the loaded point. A value of other than zero may indicate that the fuse was blown by a temporary short but the short is no longer present.

The major causes of a short circuit are as follows:

- Harness stuck onto the vehicle body.
- Harness sheath damaged by friction or heat.
- Water in connectors or circuits.
- Mistakes (accidental short circuits)

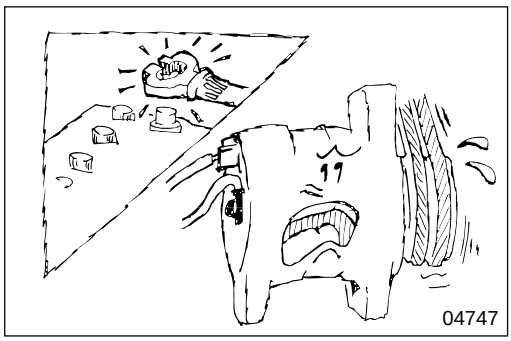
A : Battery
B : Fuse
C : Loaded switch
D : Load
E : Short circuit



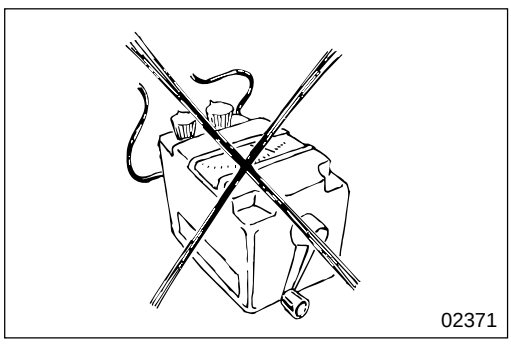
Precautions for handling alternator

When servicing the alternator, pay attention to the following :

- Do not connect the alternator with battery polarities reversed.
  If the alternator is connected with reversed polarities, a large current flow from the battery to the alternator occurs, and the diode or regulator might be damaged.

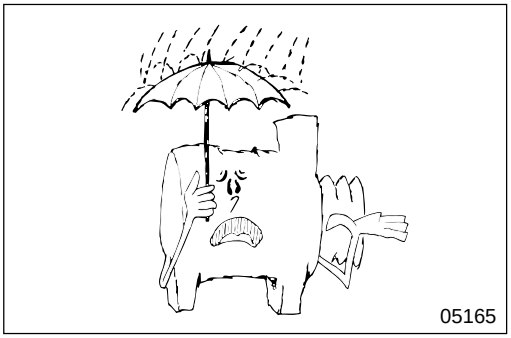


- While the engine is running, do not remove the battery terminals. If the battery terminals are removed at that time, a surge voltage is generated and the diode or regulator might be weakened.

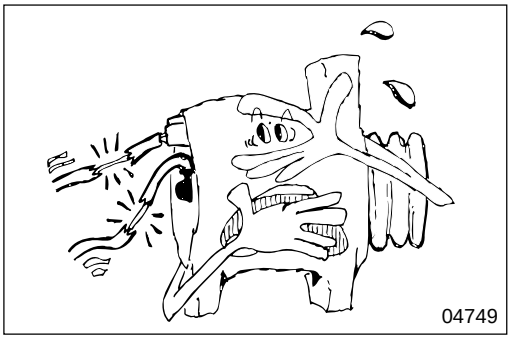


- Do not use a high-voltage tester such as a megger for inspection.
  If a high-voltage tester is used, the diode or regulator might be destroyed.

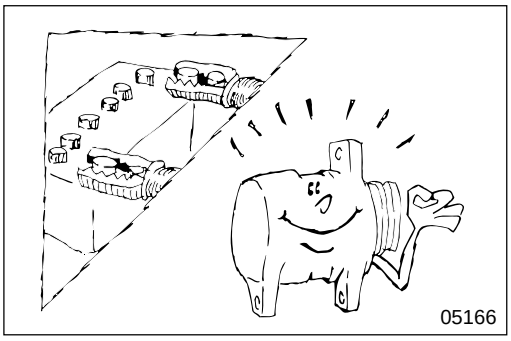
https://truckmanualshub.com/



- Do not splash water over the alternator.
  If water is directly splashed over the alternator, individual components will be short-circuited and might be destroyed.

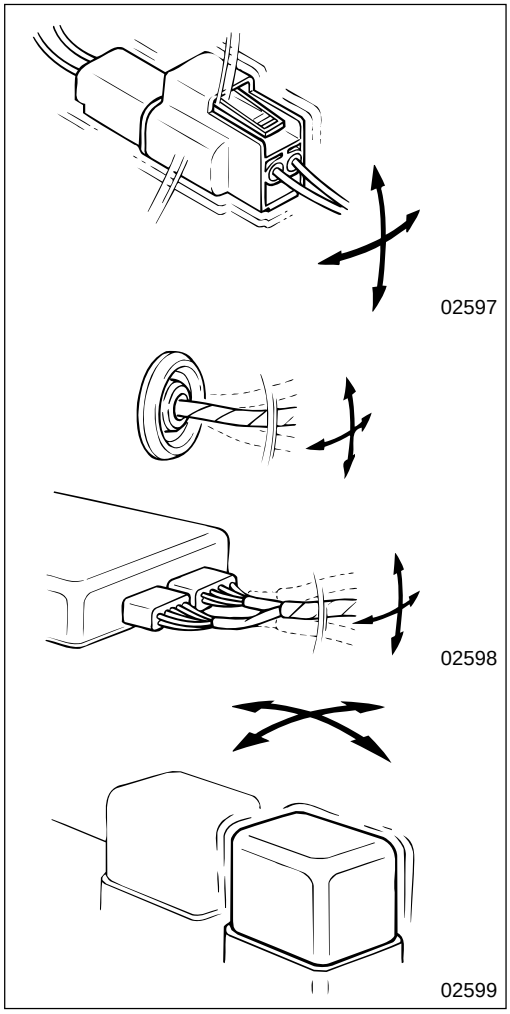


- Do not short-circuit terminal B and terminal L while running the alternator.
  If the terminals are short-circuited while the alternator is running, the diode trio might be destroyed.



- Disconnect the battery terminals before quick-charging the battery. Quick-charging without disconnecting the battery terminals might damage the diode or regulator.

https://truckmanualshub.com/



Measures for temporary faults

Temporary faults often occur under certain conditions. So identifying those conditions helps to find possible causes. To find the conditions under which temporary faults occurred, you need to reproduce the faults after interviewing customers in detail about actual driving conditions, weather, frequency of occurence and fault phenomena.
Then determine if the faults were caused by vibration, temperature or other possible elements depending on the actual conditions identified.
If vibration is suspected as a possible cause, inspect individual connectors as follows to check if the fault will occur:

- Shake the connector gently in all four directions of the arrows as illustrated.
- Shake the wiring harness gently in all four directions of the arrows as illustrated.
- Wiggle each sensor or piece of equipment by hand.
- Gently shake the wiring harnesses near movable parts such as suspensions.

The inspection subjects include possible causes related to the diagnosis code outputs and faults, as well as the connectors and other parts in the inspection procedure.

https://truckmanualshub.com/

MEMO

https://truckmanualshub.com/

TABLE OF STANDARD TIGHTENING TORQUES

- Use specified bolts and nuts and tighten them at specified torques according to the following table, unless otherwise specified.
- Threads and contact seats shall be dry.
- Where there is a difference in strength classification between the nut and bolt (or stud bolt), the torque specified for the bolt shall apply.

Hex-head Bolt and Stud Bolt

MAINTENANCE SCHEDULE

HOW TO READ THE MAINTENANCE SCHEDULE TABLES 2

MAINTENANCE SCHEDULE TABLES 3

MAINTENANCE OPERATIONS 7
- Replacement of Oil Filter 7
- Replacement of Fuel Filter 8
- Draining of Water Separator Condensation 9
- Cleaning of Fuel Feed Pump Gauze Filter 9
- Bleeding of Air from Fuel Line 10
- Adjustment of V-Belt Tension 11
- Cleaning and Replacement of Air Cleaner Element 13
- Inspection of Clutch Pedal Free Play 14
- Tire 15
- Inspection of Brake Lining Thickness 21
- Battery 21
- Fuse 24

LUBRICATION 26
- Engine Oil 27
- Clutch Fluid (Brake Fluid) 29
- Manual Transmission Gear Oil 31
- Automatic Transmission Fluid and Oil Filter 32
- Rear Axle Gear Oil 35
- Power Steering Fluid 36
- Brake Fluid 38
- Greasing Various Areas of Chassis 42

HOW TO READ THE MAINTENANCE SCHEDULE TABLES

Example Table :

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.
*2 : 60000 km/36000 miles or 12 months, whichever occurs first.
*3 : FK617, FM617
*4 : FM657
Ⓔ : Exhaust emission items
Ⓝ : Noise control items

Inspection and maintenance (1)		Time of inspection and maintenance (2)					Working procedures (3)	Remarks (4)
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Inspection interval: Every 10000 km/6000 miles	Inspection interval: Every 30000 km/18000 miles *1	Inspection interval: Every 60000 km/36000 miles *2		
ENGINE								
1	Air, fuel, oil or coolant leakage from engine			×			Check engine for air, fuel, oil and coolant leakage	Gr 11, 12, 13, 14
2	Ⓔ Ⓝ Engine starting performance, speed, noise and exhaust gas conditions			×			Check for engine starting performance, idling speed, abnormal engine noise, dark smoke or other abnormal exhaust gas during idling and acceleration. Check engine speed on tachometer	Gr 11, 13, 15
3	Retightening of inlet and exhaust manifold bolts					×	Check manifold bolts for looseness	Gr 15
4	Ⓔ Va…		×			×	Check valve clearance with fe…	
				Every 20000 km/12000 miles			Replace element…	

(1) This column contains the maintenance and inspection items.
(2) The periods between inspection and service are based on the assumption that the vehicle will be driven approximately 60000 kilometers (36000 miles) per year.
Inspections which must be made are indicated by an "×" or by the appropriate period between servicing.
(3) This column provides a simplified explanation of the operational procedures involved for each inspection or maintenance item.
(4) The Gr. No. refers to the "group number" in this vehicle Service Manual. For visual checks and simple inspections, see the sections labelled "Working Procedures".

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.
*2 : 60000 km/36000 miles or 12 months, whichever occurs first.
*3 : FK617, FM617
*4 : FM657
Ⓔ : Exhaust emission items
Ⓝ : Noise control items

Inspection and maintenance		Time of inspection and maintenance					Working procedures	Remarks
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Inspection interval: Every 10000 km/6000 miles	Every 30000 km/18000 miles *1	Every 60000 km/36000 miles *2		
ENGINE								
1	Air, fuel, oil or coolant leakage from engine			×			Check engine for air, fuel, oil and coolant leakage	Gr 11, 12, 13, 14
2	Ⓔ Ⓝ Engine starting performance, speed, noise and exhaust gas conditions			×			Check for engine starting performance, idling speed, abnormal engine noise, dark smoke or other abnormal exhaust gas during idling and acceleration. Check engine speed on tachometer	Gr 11, 13, 15
3	Retightening of inlet and exhaust manifold bolts					×	Check manifold bolts for looseness	Gr 15
4	Ⓔ Valve clearance		×			×	Check valve clearance with feeler gauge	Gr 11
5	Ⓔ Oil filter replacement			Every 20000 km/12000 miles On new vehicles, replace the first filter at 10000 km/6000 miles			Replace element	Gr 12
6	Ⓔ Ⓝ Check injection nozzles			Every 90000 km/54000 miles			Check and clean injection nozzles	Gr 13
7	Ⓔ Ⓝ Fuel injection pressure and spray pattern of injection nozzles			Every 250000 km/150000 miles			Remove injection nozzle and check with nozzle tester	Gr 13
8	Ⓔ Ⓝ Fuel injection timing					×	Turn crankshaft in normal running direction and check injection starting timing of No.1 cylinder	Gr 13
9	Ⓔ Cleaning fuel feed pump filter					×	Remove connector from fuel feed pump inlet and clean filter inside connector with gas oil	
10	Ⓔ Fuel filter replacement				×		Replace element	Gr 13
11	Ⓔ Water separator water discharge	×					Loosen water separator drain plug to discharge water	Gr 13
12	Ⓔ Removal of water and sediment from fuel tank			Every 24 months			Remove fuel tank drain plug and remove water and sediment	Gr 13
13	Retightening of fuel tank bracket bolts			×			Check mounting bolts for looseness and retighten to a torque of 69 to 93 N·m {51 to 69 lbf.ft, 7 to 9.5 kgf·m}	Gr 13
14	Ⓔ Replacing fuel hose in engine compartment			Every 24 months			Replace fuel hose in engine compartment	Gr 13
15	Ⓔ Check fuel line outside of engine compartment			Every 24 months			Check fuel line outside of engine compartment. Replace if necessary	Gr 13
16	Ⓔ Ⓝ V-belt tension and damage	×		×			Press midpoint of V-belt firmly with your finger to measure deflection and check for belt damage	Gr 14
17	Coolant level and leakage from cooling system	×					Check coolant level and if level is low, check for coolant leakage	Gr 14
18	Coolant replacement			Every 24 months			Replace with new coolant	Gr 14
19	Radiator cap condition			×			Check radiator cap for sealing and mounting condition	Gr 14
20	Ⓔ Cooling system hose clamp position and clamping condition			×			Check clamp position and clamping condition of cooling system hose	Gr 14
21	Ⓔ Turbocharger rotor play			Every 250000 km/150000 miles			Check whether rotor has excessive end play using a dial indicator	Gr 15
22	Ⓔ Ⓝ Cleaning of air cleaner	×					Check air cleaner dust indicator. If the red signal appears, clean the element	Gr 15
23	Ⓔ Ⓝ Air cleaner element replacement			Every 50000 km/30000 miles			Replace element	Gr 15
24	Ⓔ Ⓝ Damage of inlet system, looseness of clamp and loss of parts			×			Check inlet system for damage and check that all parts are installed	Gr 15
25	Ⓔ Ⓝ Exhaust system			×			Check the exhaust system for damage, corrosion and loose connections causing leakage	Gr 15
26	Starter function					×	Operate starter switch and check the switch functions properly	Gr 54
27	Alternator function					×	Check function with a circuit tester	Gr 54

MAINTENANCE SCHEDULE TABLES

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.
*2 : 60000 km/36000 miles or 12 months, whichever occurs first.
*3 : FK617, FM617
*4 : FM657
Ⓔ : Exhaust emission items
Ⓝ : Noise control items

Inspection and maintenance		Time of inspection and maintenance					Working procedures	Remarks
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Inspection interval: Every 10000 km/6000 miles	Inspection interval: Every 30000 km/18000 miles *1	Inspection interval: Every 60000 km/36000 miles *2		
POWER TRAIN								
28	Air or oil leakage from power train			×			Check power train for air and oil leakage	
29	Clutch pedal play			×			Press clutch lightly and check that play is adequate	Gr 21
30	Clutch function			×			(1) Press the clutch pedal to check for unusual noise or stiffness. Also check if gearshift engages quietly (2) Check the clutch does not slip and engages smoothly	Gr 21
31	Manual transmission gearshift control looseness				×		In NEUTRAL position, check shift lever for looseness. With shift lever in each gear position, check engagement condition and degree of looseness. Also check if control cable is damaged	Gr 22A, B
	Automatic transmission range selector linkage and throttle (modulator) linkage condition				×		Shifting to each shift range must be done firmly and securely	Gr 23
32	Propeller shaft couplings and bearings looseness		×	×			(1) Check flange yoke bolt and center bearing attaching bolt for looseness (2) Turn propeller shaft manually to check for spline looseness (3) Check looseness between spider and needle roller bearing On new vehicle inspection at 4000 km/2500 miles, check only the bolts for looseness	Gr 25
FRONT AND REAR AXLES								
33	Axle shaft torsion and cracks					×	Remove axle shaft and check for torsion, bending, and cracks	Gr 27
34	Front wheel hub bearing looseness				×		With front axle jacked up, move the wheel up and down holding the top and bottom of the tire to check for bearing looseness	Gr 26
35	Rear wheel hub bearing damage					×	Disassemble rear wheel and check for hub bearing wear and damage	Gr 27
36	Retightening wheel nuts		×	×			Check wheel nuts for looseness	Gr 31
37	Disc wheel damage			×			Check disc wheel for corrosion, deformation and cracks	Gr 31
38	Tire inflation pressure, cracking, tread groove depth, abnormal wear, etc.	×		×			(1) Measure inflation pressure with tire gauge, and check that tire tread groove is deep enough (2) Check tire tread and side walls for cracks, damage, uneven wear, stepped wear and other abnormal wear	Gr 31
39	Tire rotation			×			Rotate all tires	Gr 31
SUSPENSION SYSTEM								
40	Looseness, play and damage of suspension system				×		Check suspension system for looseness, play and damage	Gr 33, 34
41	Damage and looseness of leaf springs	×			×		Check leaf springs for damage and looseness	Gr 33, 34
42	Retightening U-bolts		×		×		Check U-bolts for looseness	Gr 33, 34
43	Oil leakage and damage of shock absorbers				×		Check for oil leakage and damage of cylinder, etc.	Gr 33, 34
BRAKING SYSTEM								
44	Air pressure and its charging speed	×					After discharging air from air tank, start and run the engine at idle and measure time taken to charge air to specified pressure in air tank	Gr 35A, B
45	Air and fluid leakage from braking system			×			Check braking system for air and fluid leakage	Gr 35A, B
46	Looseness, play and damage of braking system parts			×			Check braking system parts for looseness, play and damage	Gr 35A, B
47	Condensation in air tank	×					Open drain cock and check for condensation in the air tank	Gr 35A, B

https://truckmanualshub.com/

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.
*2 : 60000 km/36000 miles or 12 months, whichever occurs first.

*4 : FM657
Ⓔ : Exhaust emission items
Ⓝ : Noise control items

Inspection and maintenance		Time of inspection and maintenance					Working procedures	Remarks
				Inspection interval				
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Every 10000 km/ 6000 miles	Every 30000 km/ 18000 miles *1	Every 60000 km/ 36000 miles *2		
48	Brake pedal play and stroke			×			Press pedal lightly to measure play. Check pedal depression angle and air output pressure	Gr 35A, B
49	Foot brake effectiveness	×		×			While driving the vehicle at low speed, check braking effect and check for uneven braking	Gr 35A, B
50	Operation of exhaust brake	×		×			Check exhaust brake operation	Gr 35A, B
51	Exhaust brake control cylinder packing replacement			Every 12 months			Check exhaust brake control cylinder packing; replace if necessary	Gr 35A, B
52	Operation of air dryer			×			Open drain cock of air tank and make sure there is no drainage. If there is a small amount of drainage from the FK series, remove the plug from the air dryer and check the color of the indicator. If it is pink, replace the desiccant	Gr 35A, B
53	Check drain from air dryer exhaust port			×			Check to see that oil is not discharged abnormally from exhaust port of air dryer	Gr 35A, B
54	Air dryer disassembly and inspection					×	FK series : Remove the plug from the air dryer and check the color of the indicator. If it is pink, disassemble and replace desiccant FM series : Disassemble air dryer and check every part of it. If more than 1/5 of the desiccant is discolored, replace the desiccant	Gr 35A, B
55	Air dryer desiccant replacement			Every 24 months			Disassemble the air dryer and replace the desiccant and rubber parts	Gr 35A, B
56	Brake shoe clearance				×		Measure clearance with feeler gauge *3	Gr 35A, B
							Measure brake chamber push rod stroke *4	
57	Brake lining wear				×		Check lining wear	Gr 35A, B
58	Brake drum wear					×	Disassemble and check drum for wear, cracks and damage	Gr 35A, B
59	Slack adjuster cracking *4					×	Check slack adjuster for cracks and other damage	Gr 36B
60	Parking brake effectiveness			×			On a slope, check that vehicle can be held stationary	Gr 36A, B
61	Parking brake operation *4	×		×			(1) Check for operation of parking brake control valve (2) Check operation when brake line air pressure is reduced	Gr 36B
62	Parking brake lever stroke *3	×		×			With lever fully pulled, check that lever is locked completely and that there is allowance in pulling stroke	Gr 36A
63	Parking brake drum and lining wear *3					×	Disassemble and check drum for wear, cracks and damage and check lining for wear	Gr 36A
64	Wheel cylinder piston cup and dust seal replacement *3			Every 12 months			Check wheel cylinder piston cup and dust seal; replace if necessary	Gr 35A
65	Brake booster packing, cup and rubber parts replacement *3			Every 12 months			Check brake booster packing, cup and rubber parts; replace if necessary	Gr 35A
66	Brake hose replacement			Every 12 months			Check brake hose; replace if necessary	Gr 35A, B
67	Check valve packing and rubber parts replacement			Every 12 months			Check the check valve packing and rubber parts; replace if necessary	Gr 35A, B
68	Brake valve packing and rubber parts replacement			Every 12 months			Check brake valve packing and rubber parts; replace if necessary	Gr 35A, B
69	Air compressor and pressure gauge hoses replacement			Every 24 months			Replace air compressor and pressure gauge hoses	Gr 35A, B
70	Brake booster power cylinder packing replacement *3			Every 24 months			Replace brake booster power cylinder packing	Gr 35A
71	Brake fluid tank tube replacement *3			Every 24 months			Check and replace brake fluid tank tube	Gr 35A

STEERING SYSTEM								
72	Fluid leakage from steering system			×			Check steering system for fluid leakage	Gr 37
73	Steering wheel play	×		×			Turn steering wheel right and left to measure play at steering wheel rim. Measure while engine is running	Gr 37
74	Steering operating condition	×		×			Check steering wheel to see if it vibrates, pulls to one side or requires unusual steering effort	Gr 37
75	Looseness and play of steering system (including hoses and pipes)			×			(1) Check steering system for looseness and play (2) Check power steering hoses and pipes for looseness	Gr 37
76	Wheel alignment					×	Measure toe-in, camber, caster and kingpin inclination angles	Gr 26
77	Right and left turning angles and power					×	(1) Check that the stopper bolt is sufficiently tight, without causing damage, and that the steering linkage operates smoothly until stopped by the stopper bolt (2) Check that the steering wheel does not make contact with other parts	Gr 26
78	Power steering booster and oil pump internal rubber parts replacement			Every 24 months			Replace internal rubber parts	Gr 37
79	Power steering hose replacement			Every 24 months			Replace power steering hose	Gr 37
CAB AND FRAME								
80	Looseness and damage of chassis and body			×			(1) Check the frame, cross members and other parts for cracks and damage, also check for loose rivets (2) Also check for body damage and loose mounting bolts	Gr 41, 42
81	Heater and defroster operation			×			Check operation and installation of defroster	Gr 55
82	Reflection of rearview mirrors and reflectors	×					Check for reflecting condition, stains and damage	Gr 42
83	Door lock function			×			Check door lock mechanism functions properly	Gr 42
84	Seat belt mounting condition			×			Check seat belt for damage, buckle and retracting function and mounting condition	Gr 42
ELECTRICAL SYSTEM								
85	Looseness and damage of electrical wiring and connections			×			Check wiring, connectors and battery terminals for looseness and corrosion	Gr 54
86	Battery electrolyte level and specific gravity			Every 20000 km/12000 miles			(1) Check electrolyte level (2) Measure electrolyte specific gravity with hydrometer	Gr 54
87	Operation and damage of the lighting system and turn signal lamps	×		×			(1) Check operation, damage and installation of each lighting unit (2) Check that turn signal lamps are operated by the turn signal switch	Gr 54
88	Operation of horn	×		×			Check operation, damage and mounting condition	Gr 54
89	Operation and fluid level of windshield wiper and washer	×		×			Check operation, damage and mounting condition Check if fluid level in washer tank is okay	Gr 42
90	Gauges and pilot lamps function	×		×			Check function of gauges and pilot lamps	Gr 54
91	Switch function					×	Check operation, damage and installation of each switch	Gr 54
OTHER								
92	Road test of vehicle			×			Drive the vehicle to check for overall vehicle operating condition	

https://truckmanualshub.com/

This section explains simple maintenance procedures. See the relevant Group in this manual for further details.

Replacement of Oil Filter

Lubricant

Location	Points of application	Kinds	Quantity
2	Inside oil filter	Engine oil	Approximately 2.3 L {2.4 qts}
	Gasket area of oil filter with thin application	Engine oil	As required

Special tools

Unit : mm {in.}

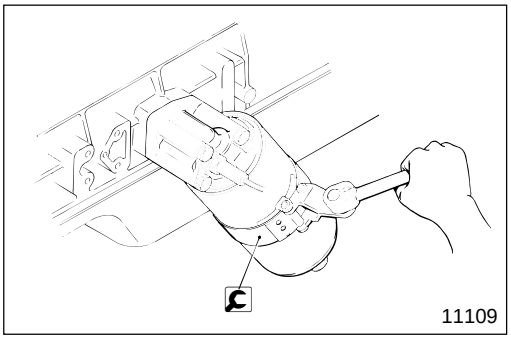
Location	Tool name and shape	Part No.	Application
2	Oil filter wrench  01503	MH061537	Removal of oil filter

WARNING

- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**

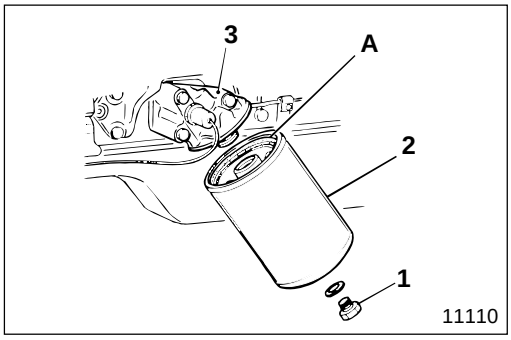
CAUTION

Take care not to spill engine oil on the V-belts, because this would cause them to slip, reducing service life.



11109

[Removal]



11110

[Installation]

- Clean the surface of oil filter head **3** that makes contact with oil filter **2**.
- Apply engine oil thinly and evenly to gasket area **A** of oil filter **2**.
- Screw in oil filter **2** to oil filter head **3** until gasket area **A** sits on the filter head. From this position, tighten further by rotating by one and one eighth to one and three eighths of a turn.
- After installation, run the engine and check that there is no oil leakage from gasket area **A**.
- Check the oil level and if it is low, top it up.

https://truckmanualshub.com/

Replacement of Fuel Filter

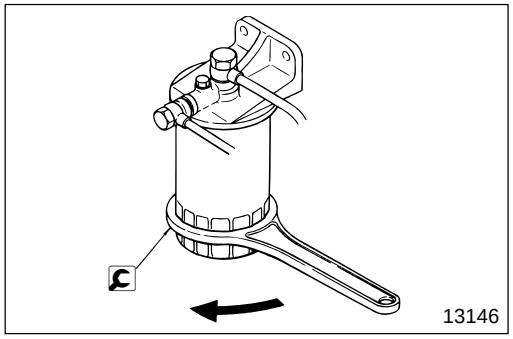
Lubricant

Location	Points of application	Kinds	Quantity
2	Gasket contact surfaces of fuel filter and fuel filter head	Engine oil	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
2	Filter wrench  01882	MH061572	Removal of fuel filter

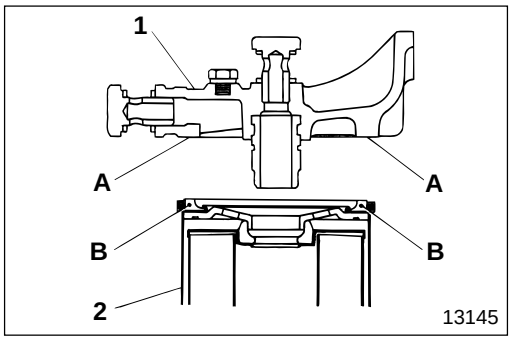


13146

WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any gas oil that has been spilled because it can cause a fire.**
- **Do not use an unsuitable filter because it can cause a fire.**

[Removal]



13145

[Installation]

- Install by tightening by three quarters to one full turn after contact surface **A** of fuel filter head **1** contacts gasket **B** of fuel filter **2**. Be sure to tighten by hand.
- After installation, run the engine and check for fuel leakage.

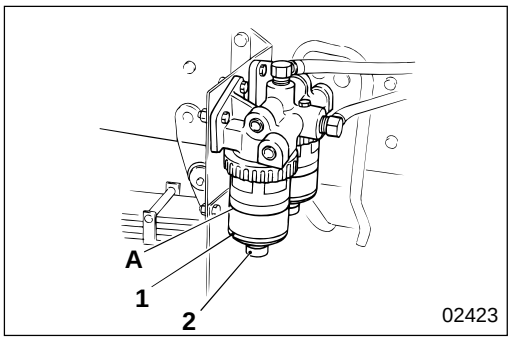
https://truckmanualshub.com/

Draining of Water Separator Condensation

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Drain plug	2.9 to 3.9 {2.2 to 2.9, 0.3 to 0.4}	—



Visually inspect the water separator before driving.
When float **1** reaches red line **A**, drain the condensation as follows:

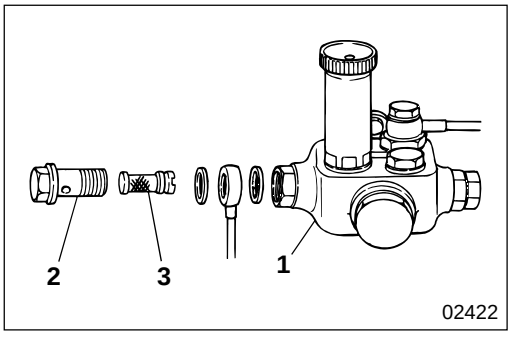
- Loosen drain plug **2** and drain out the condensation.
- When float **1** has dropped to the bottom, tighten drain plug **2**.
- Carefully wipe the water separator and the surrounding area.
- Check for fuel leakage.

Cleaning of Fuel Feed Pump Gauze Filter

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Eye bolt	25 to 29 {18 to 22, 2.5 to 3}	—



WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any gas oil that has been spilled because it can cause a fire.**
- **Do not use an unsuitable filter because it can cause a fire.**

- Remove eye bolt **2** on the inlet side of fuel feed pump **1**.
- Remove gauze filter **3** from eye bolt **2**.
- Clean gauze filter **3** with gas oil.
- Follow the removal sequence in reverse and reinstall gauze filter **3**. Install eye bolt **2** in the fuel feed pump.
- Bleed the air from the fuel line.
- Start the engine and check for fuel leakage.

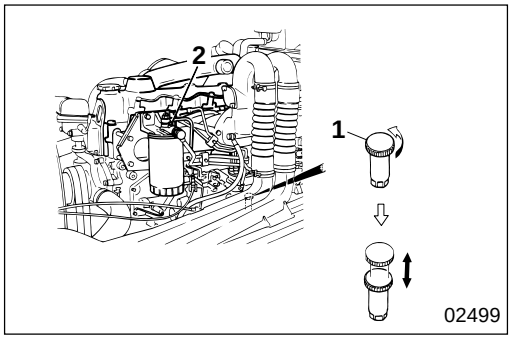
https://truckmanualshub.com/

Bleeding of Air from Fuel Line

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Air vent plug	7.8 to 12 {5.8 to 8.7, 0.8 to 1.2}	—



WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any gas oil that has been spilled because it can cause a fire.**

- Turn the top of priming pump **1** of the injection pump counterclockwise and pull it up so the top protrudes.
- Loosen air vent plug **2** of the fuel filter and move the top part of priming pump **1** up and down.
- Move priming pump **1** up and down repeatedly until air bubbles are no longer present in the fuel drained from air vent plug **2**.
- When the fuel being drained is free of air bubbles, tighten air vent plug **2**.
- After moving priming pump **1** up and down another five or six times, push the top down and turn clockwise to drive it in fully.
- After bleeding the air, carefully wipe up spilled fuel and start the engine.
- Check for fuel leakage.

https://truckmanualshub.com/

Adjustment of V-Belt Tension

Newly installed V-belts can stretch during their initial running-in period. To prevent this from becoming a problem, run the engine for several minutes after installing the V-belt, then readjust. Perform this cycle several times.

WARNING⚠

You must take special precautions to prevent the engine from rotating while a V-belt is being inspected or adjusted.

CAUTION⚠

- **Make sure that you turn off the engine before attempting to inspect or adjust the V-belts.**
- **Make sure that you fasten all bolts and nuts securely after adjusting the V-belts. Remember that too much tension can damage the V-belts and bearings.**
- **Do not grease V-belts. This causes them to slip, which reduce service life.**

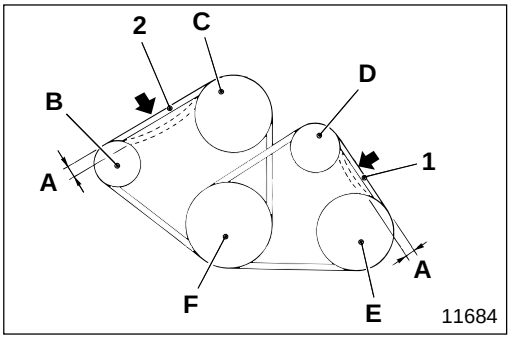
Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1, 2	V-belt tension (Each one)	Fan	10 to 15 {0.39 to 0.59}	—	Adjust
		Air-conditioner	7 to 10 {0.28 to 0.39}		

Special tools

Location	Tool name and shape	Part No.	Application
1, 2	Belt tension gauge 03612	MH062345	Measurement of tension of V-belt

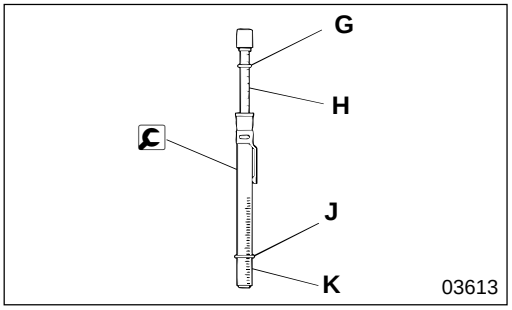


[Inspection]

Measure the extent of flex **A** when the center of V-belts **1**, **2** as illustrated is depressed with a force of 98 N·m {72 lbf.ft, 10 kgf·m}.

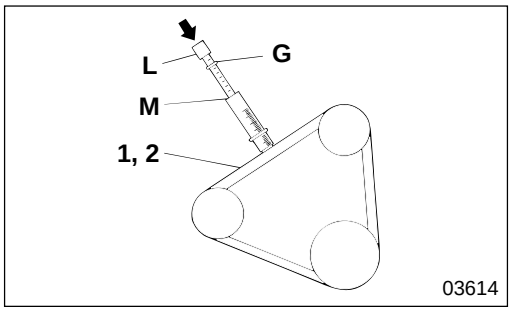
- **B** : Alternator pulley
- **C** : Water pump pulley
- **D** : Tension pulley
- **E** : Cooler compressor pulley (Air-conditioner)
- **F** : Crankshaft pulley

https://truckmanualshub.com/

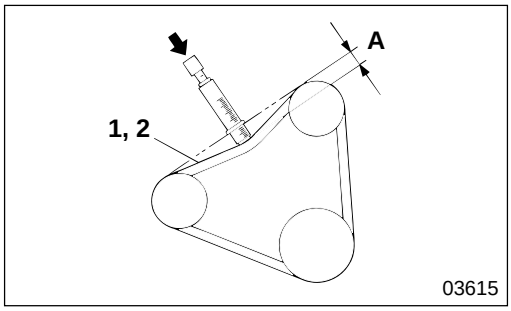


Use of special tool belt tension gauge

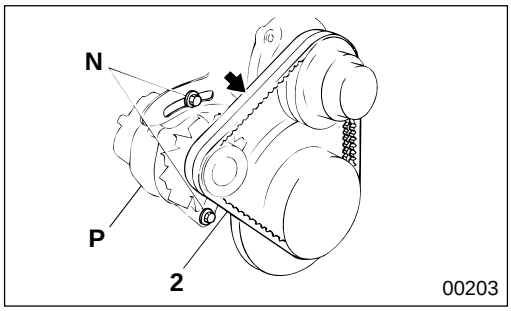
- Set upper O-ring **G** of belt tension gauge to 98 N·m {72 lbf.ft, 10 kgf·m} (push load) on graduation **H**.
- Set lower O-ring **J** of belt tension gauge to graduation **K** (maximum flex of belt).



- Place belt tension gauge at the center of V-belts **1**, **2** perpendicularly as illustrated and push top **L** all the way down until upper O-ring **G** hits upper edge **M**.



- Measure the extent of flex **A** of V-belts **1**, **2** at this point, and if the measured value deviates from the standard value, adjust as follows:



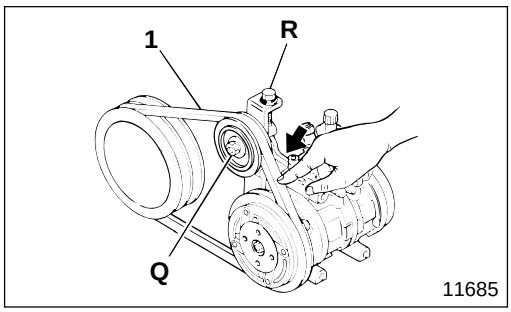
[Adjustment]

(1) Adjustment of tension of V-belts for fan

- Loosen alternator mounting bolts **N** (two points).
- Adjust the tension of V-belt **2** by rocking alternator **P** left and right.
- After adjustment, tighten mounting bolts **N** securely.

CAUTION

- **Bear in mind that excessive tension of V-belts 2 might damage the belts and bearings that engage with the V-belts.**
- **Be sure to replace V-belts 2 as a set to maintain even tension between them.**
- **Be careful not to let oil stick to V-belts 2. If oil gets onto the belts, it causes slipping, resulting in overheating and insufficient battery charging.**



(2) Adjustment of tension of V-belt for air-conditioner

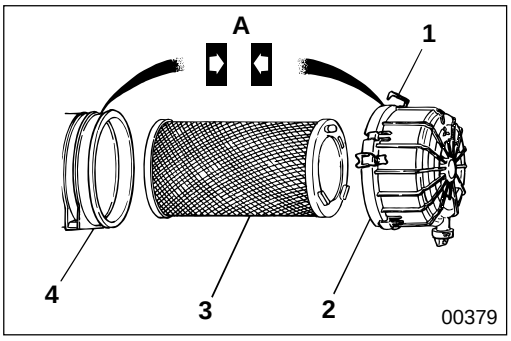
- Loosen tension pulley mounting nut **Q**, and adjust the tension of V-belt **1** moving adjusting bolt **R**.
- After adjustment, tighten mounting nut **Q** securely.

CAUTION

- **Bear in mind that excessive tension of V-belt 1 might damage the belt and bearings that engage with the V-belt.**
- **Be careful not to let oil stick to V-belt 1. If oil gets onto the belt, it causes slipping, resulting in poor performance of the air-conditioner.**

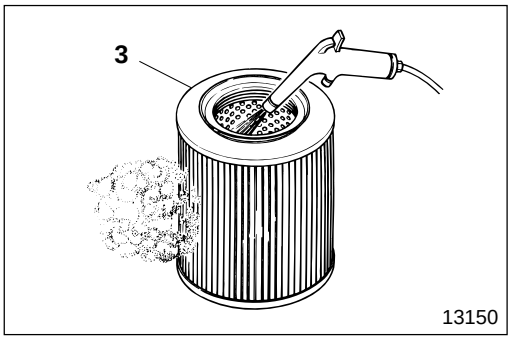
https://truckmanualshub.com/

Cleaning and Replacement of Air Cleaner Element



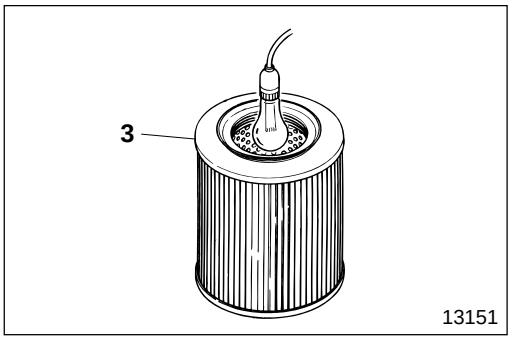
[Removal]
- Remove clamp **1** to remove cover **2**.
- Remove air cleaner element **3**.

[Installation]
Install case **4** and cover **2** by aligning alignment marks **A**.



[Cleaning]
- Blow compressed air of 685 kPa {100 lbf/in^2, 7 kgf/cm^2} or less through air cleaner element **3** from the inside.
- When using compressed air, move the blower's nozzle up and down along the pleats of air cleaner element **3** evenly.

CAUTION ⚠
- **Do not tap or hit air cleaner element 3 to remove dust.**
- **Do not blow compressed air through air cleaner element 3 from the outside.**



[Inspection]
- Illuminate the inside of air cleaner element **3**.
- If parts of the filter paper are torn or thin, or if the packing of the upper surface of air cleaner element **3** is damaged, replace the air cleaner element.

NOTE

If the dust on air cleaner element 3 is wet due to oil smoke or soot, replace the air cleaner regardless of the scheduled replacement interval.

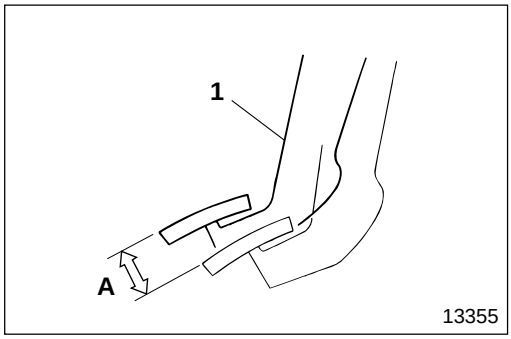
https://truckmanualshub.com/

Inspection of Clutch Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1	Clutch pedal free play	Except for FM657 (M8S2×5)	32 to 44 {1.26 to 1.73}	—	Adjust or replace
		FM657 (M8S2×5)	25 to 37 {0.98 to 1.46}	—	



[Confirmation]
Push clutch pedal **1** with your hand and measure the amount of movement **A** (free play) until you meet resistance. If the measured value does not conform to the standard value, adjust by stroke of the clutch power cylinder or the clutch booster push rod, or replace the clutch disc.

[Clutch operation]
- Check for unusual noises when clutch pedal **1** is pressed while the engine is idling, and also for abnormally heavy clutch operation. Also check to be certain that it is not difficult to shift the vehicle into first and reverse gears.
- Gradually release clutch pedal **1** to set the vehicle in motion.
  Check to be sure there is no slippage, and that the clutch engages smoothly.

https://truckmanualshub.com/

Tire

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	Depth of tire tread grooves	—	1.6 {0.063}	Replace

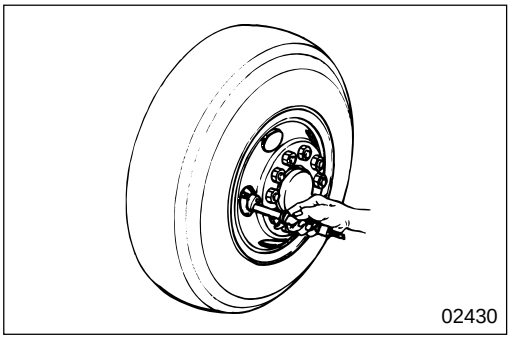
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Wheel nut	400 to 440 {295 to 325, 41 to 45}	Wet

Lubricant

Location	Points of application	Kinds	Quantity
2	Wheel nut spherical area	Chassis grease [NLGI No.1 (Ca soap)] or Wheel bearing grease [NLGI No.1 (Li soap)]	As required
4	Wheel nut (inner) at thread area and spherical area		
6	Thread area of hub bolt		



Air pressure

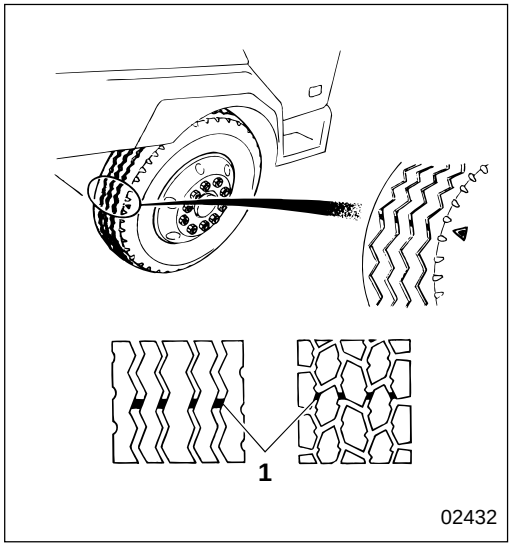
Tire air pressure should be checked before the vehicle is driven, while the tires are still cool.

Model	Tire size	Air Pressure kPa {Psi, kgf/cm^2}
FK	9R 22.5-12PR	Front : 750 {105, 7.50} Rear : 675 {95, 6.75}
FM	11R 22.5-14PR	

CAUTION

- **Make certain that there is no difference in the air pressure between the inner and outer rear tires.**
- **Make certain you use valve caps on the air valves.**
- **It is not necessary to increase the air pressure for high-speed driving.**

https://truckmanualshub.com/

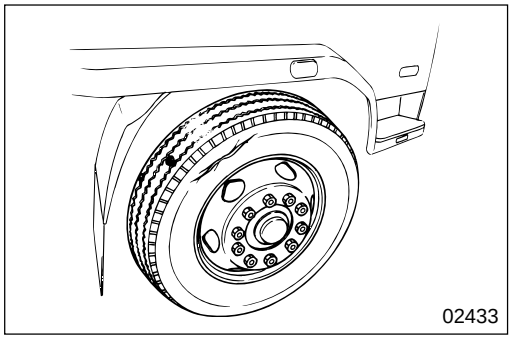


Checking tread depth

- Check all around the tire treads to make sure that the depth of the tread grooves is above the wear limit.
- If the tread grooves are not deep enough, slip sign **A** appears at the position of the △ mark, where the tread groove has worn away.

WARNING⚠

If the depth of the tread grooves is not adequate, the tires will slip on wet roads and present a hazard. Such tires are also extremely dangerous because they are more susceptible to hydroplaning when the vehicle is running at high speeds in the rain. Such tires must be replaced with new ones as soon as possible.



Checking for cracks, damage, and objects embedded in the treads

- Check the tire treads and walls for cracks and damage.
- Check tire treads for uneven wear or other abnormal wear.
- Check if metal objects or nails have penetrated the tires.
- Check for stones embedded between double tires.

WARNING⚠

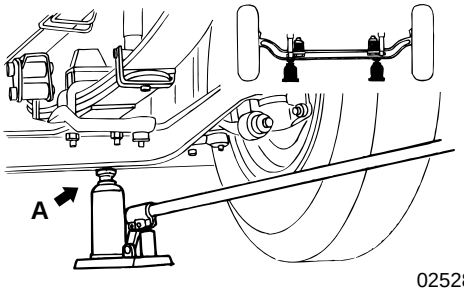
Badly damaged or worn tires are extremely dangerous, because they can be punctured more easily when the vehicle is running, they must be replaced with new ones as soon as possible.

https://truckmanualshub.com/

Removing tires

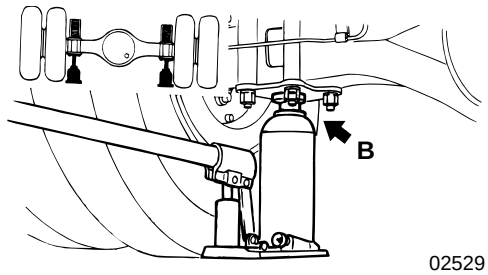
- Jacking up point
  - For front wheels : Front axle bottom A
  - For rear wheels : Rear axle tube bottom B

< Front wheel >



02528

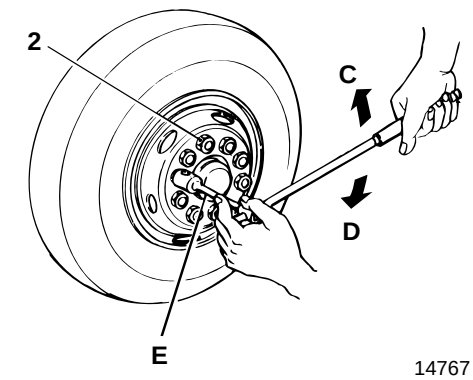
< Rear wheel >



02529

WARNING

- **The jack should be placed on flat, solid ground, and should not be used to raise the vehicle higher than necessary.**
- **Do not use the jack at vehicle locations other than those illustrated.**
- **Keep in mind the danger of a slipping jack. Never crawl under the vehicle while the jack is in use or rock the vehicle. Also, do not start the engine while the vehicle is jacked up.**
- **To increase safety, use supports for the vehicle when it is necessary to leave it jacked up for long periods.**
- **Chock both the tire to be removed and the tire diagonally opposite to it so that they will not rotate when you are removing the tire.**



14767

- Loosen wheel nuts **2** slightly. The wheel nuts for right tires **C** have right-hand threads "**R**", and the wheel nuts for left tires **D** have left-hand threads "**L**".

WARNING

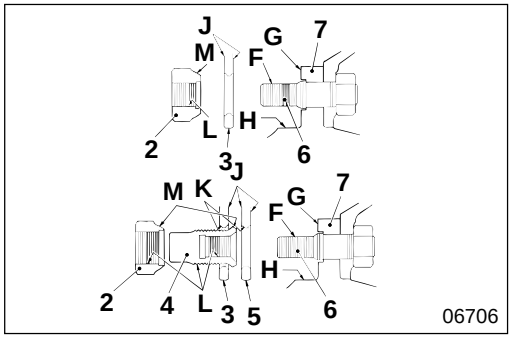
Make certain that wheel nut wrench E is fully engaged, all the way to the back of nuts 2. If it is not, it could slip.

CAUTION

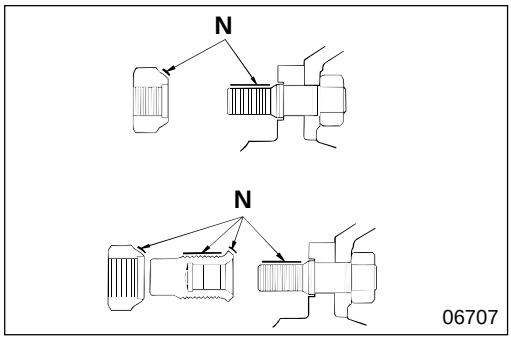
Only loosen wheel nuts 2 slightly. Do not remove them.

- Jack up the vehicle carefully, until the tire is slightly off the ground. Remove wheel nuts **2**, then remove the tire.
- When working on the double tires at the rear of the vehicle, first remove the outside tire, then lower the vehicle and loosen the nuts on the inside tire. After doing this, jack the vehicle back up and remove the tire.

https://truckmanualshub.com/



06706



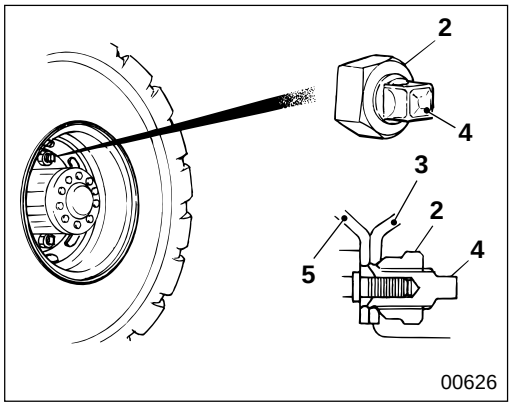
06707

Mounting tires

- To prevent wheel nuts **2**, **4** and hub bolt **6** from becoming loose and to prevent mounting parts (tire assemblies **3**, **5** and hub **7**) from being damaged, remove rust, dust, additional coatings of paint, and foreign particles from the following areas:
  F : Hub bolt thread area
  G : Wheel mounting surface of hub
  H : Wheel alignment area of hub
  J : Disc wheel mating surface
  K : Disc wheel nut mounting surface
  L : Wheel nut thread area
  M : Wheel nut spherical area
  N : Grease application area

WARNING⚠

Never use grease containing molybdenum disulfide, because it would cause loosening of fitted screws.



00626

- Put on the double rear tires as follows:
  - After mounting inner tire **5** and fully tightening inner wheel nuts **4**, jack the vehicle up and mount on outer tire **3**, then tighten outer wheel nuts **2**.
  - Even if only outside tire **3** is to be changed, do not mount it until inner wheel nuts **4** have been fastened at the specified torque.
  - Slide the air valves on the inside and outside tires down when mounting the tires.

WARNING⚠

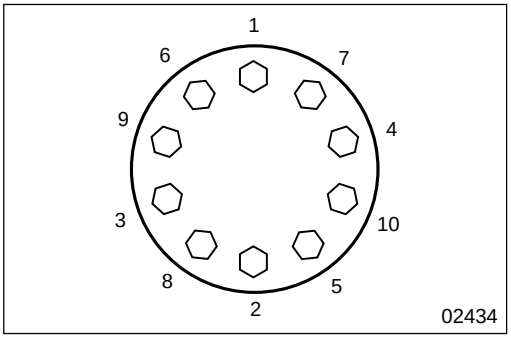
If the threads are scored, or the disc wheel is deformed or cracked, change bolts 6, nuts 2, 4 and disc. Driving the truck before correcting such problems can cause the tire in question to come loose, which could be the source of major accidents.

CAUTION⚠

Check hub bolt 6 threads carefully for scratches before putting the tire on.

- Place the tapered end of wheel nuts **2**, **4** towards the disc wheel and fasten temporarily. Center so that there is no eccentricity between bolts **6** and the disc wheel bolt holes.
- Lower the vehicle.

https://truckmanualshub.com/



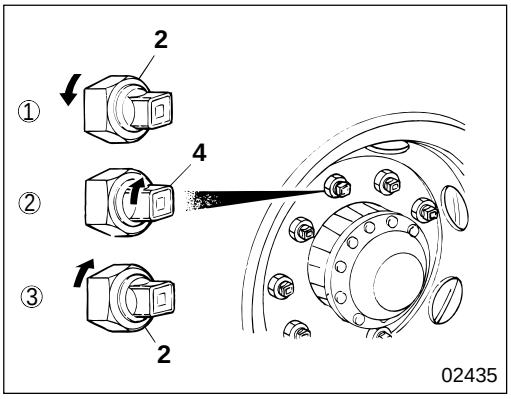
- Tighten the nuts in the order as illustrated, tightening each nut two or three times. To finish, tighten each nut at the specified torque.

WARNING

Always use the specified torque when tightening the wheel nuts. If the wheel nuts are not tightened properly, the wheels could come loose while the vehicle is being driven, which could result in life threatening accidents or the truck being disabled.

CAUTION

Over-tightening the wheel nuts can damage them.



Checking the wheel nuts for looseness

The wheel nuts should be checked for looseness every 10000 km (6000 miles). All the nuts should be tightened at specified torque.

- Check the double rear tires for looseness as follows:

① Loosen outer wheel nuts **2**.
② Tighten inner wheel nuts **4** at specified torque.
③ Tighten outer wheel nuts **2** at specified torque.

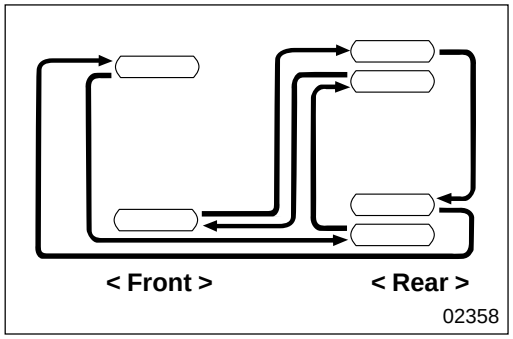
CAUTION

If outer wheel nuts 2 are tightened without first being loosened, it might not be possible to tighten them at the specified torque.

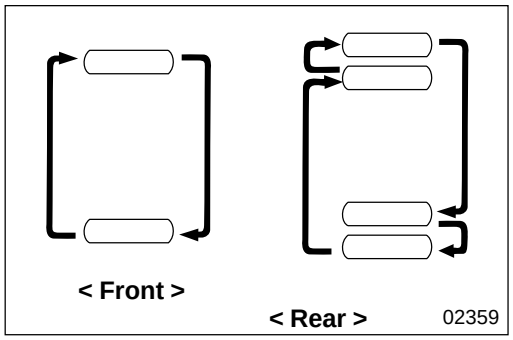
https://truckmanualshub.com/

Tire rotation

Tires wear differently, according to the location where they are mounted. To make this wear uniform and prolong the life of your tires, they should be rotated every 10000 km (6000 miles) in the rotation order shown below:



- When the tread patterns for all tires are identical:



- When the tread patterns are different for the front and rear tires:

CAUTION ⚠

- **Always adjust air pressure after running-in new tires.**
- **When using tires of different tread patterns, use rib-type patterns for the front tires and traction type patterns for the rear tires.**
- **Avoid using both radial and biased tires on the same vehicle.**

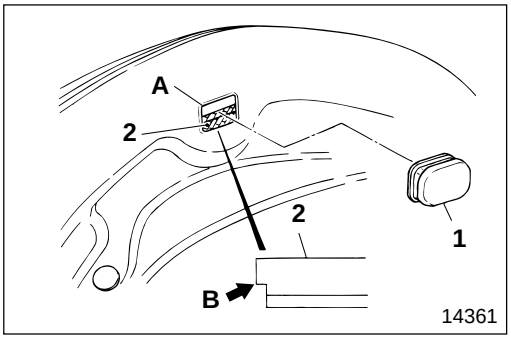
https://truckmanualshub.com/

Inspection of Brake Lining Thickness

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
2	Thickness of brake lining	FK617, FM617	—	5.5 {0.22} (Side shoulder means wear limit)	Replace
		FM657	—	6 {0.24} (Side shoulder means wear limit)	Replace



NOTE

Be sure to inspect at two points for each wheel per side.

- Remove check hole plug **1** from the backing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall check hole plug **1**.

Battery

DANGER⚠

- **Since flammable hydrogen gas is generated by the battery, be sure to obey the following warnings :**
  - **Do not short-circuit the ⊕ and ⊖ terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over the battery.**
- **Because the battery electrolyte is diluted sulfuric acid and is corrosive, when handling the battery wear safety glasses and rubber gloves to protect the eyes and hands.**

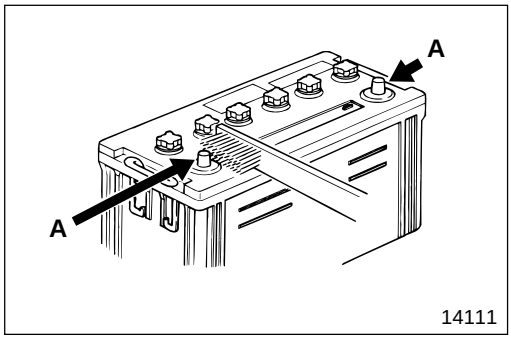
WARNING⚠

To prevent a short-circuit be sure that disconnected the battery cables do not accidentally touch the battery terminals.

CAUTION⚠

- **Make sure that you disconnect the battery cable ⊖ first when you disconnect the battery cables.**
- **Make sure that all electrical switches of the vehicle are OFF before connecting the battery cables.**
- **Make sure that you connect the battery cable ⊕ before you connect the battery cable ⊖.**

https://truckmanualshub.com/

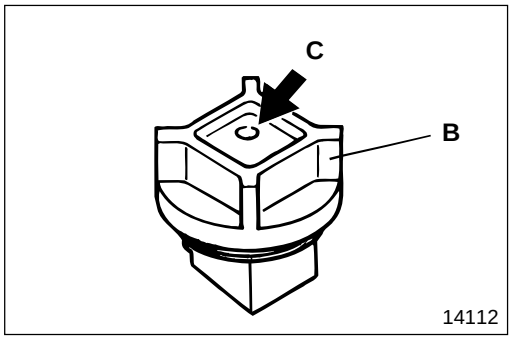


Visual inspection

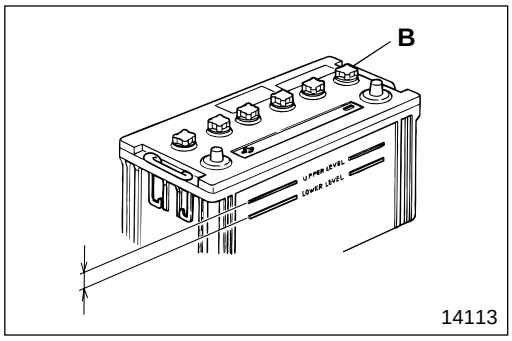
- If terminal **A** is corroded, scrub off the corrosion from it using a wire brush.
- If cracks or defects are found on the battery, replace it since the cracks or defects can cause liquid spills.

CAUTION

Make sure you grease the ⊕ side of terminal A because it is easily corroded.

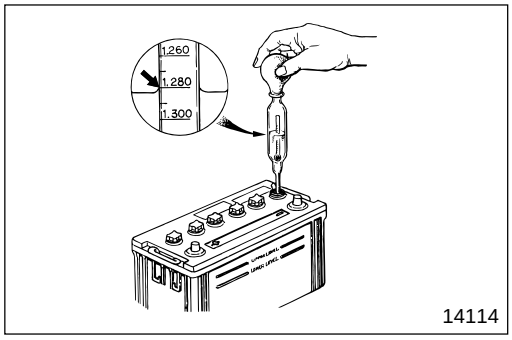


- If bleed hole **C** of vent plug **B** is clogged, clean the hole.



Inspection of fluid level

- Make sure that the battery electrolyte level is between UPPER and LOWER.
- If the level is below LOWER, remove vent plug **B** and fill the battery with distilled water or battery replenisher to UPPER.



Measurement of specific gravity

Measure the specific gravity of the battery electrolyte. If the measured value is lower than the limit, charge the battery.

NOTE

The specific gravity of the battery electrolyte depends on the liquid temperature. Use the following formula to convert the actual value to the value were the temperature 20°C {68°F}.

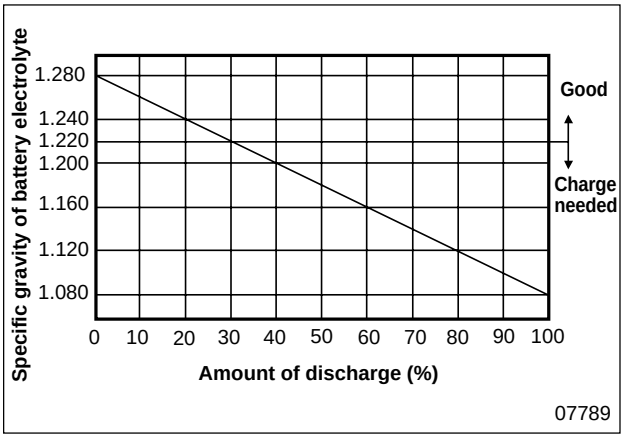
$$S_{20}\{68\} = S_t + 0.0007\,(t - 20\{68\})$$

$S_{20}\{68\}$: Specific gravity were the temperature 20°C {68°F}

S_t : Specific gravity actually measured with the temperature at t°C {t°F}

t : Temperature of battery electrolyte

https://truckmanualshub.com/



Charging

- Although, as a rule, charging of the battery should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect the battery cable ⊖.
- Remove vent plug **B** before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity / 10 {113}	*Amount of discharge (Ah) / Charge current (A) ×1.2(to 1.5)	45
Quick charge	Value of 5-hour rating capacity / 1.5 {131}	0.5	55

* Amount of discharge (Ah)=5-hour rating capacity (Ah)× Amount of discharge (%) / 100

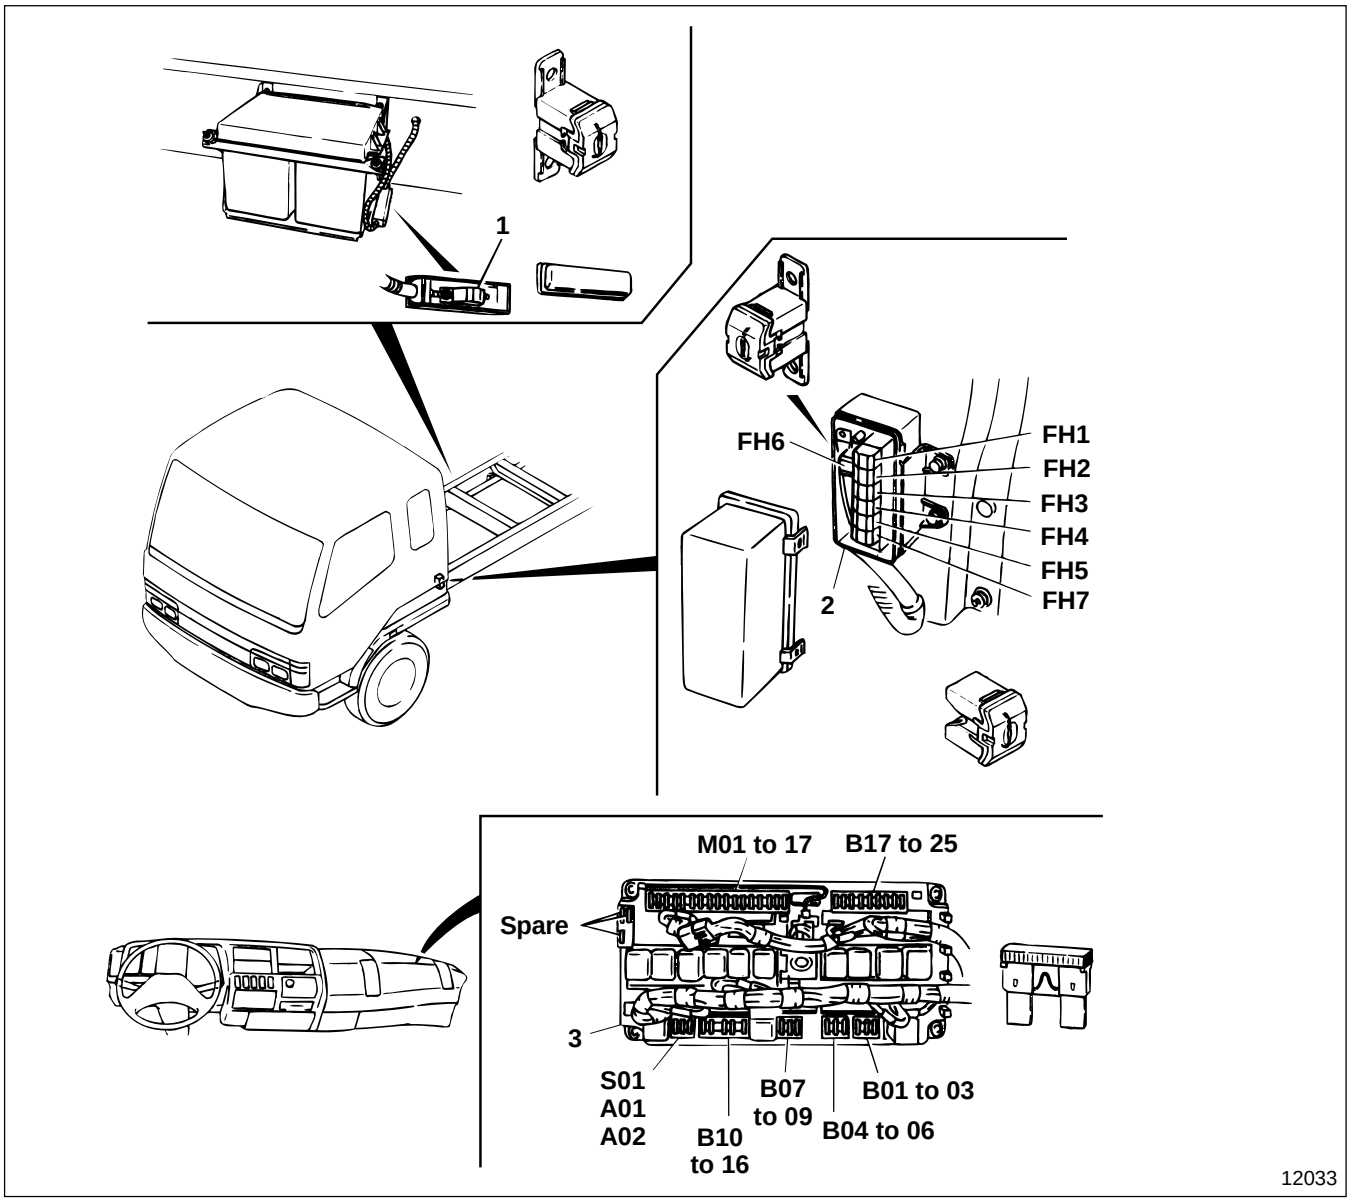
- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep naked lights away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because its dangerous.**
- **After charging the battery, tighten vent plug B, wash away sulfuric acid from the battery using water, and dry the surface.**

https://truckmanualshub.com/

Fuse



1 Main high-current fuse
2 High-current fuse box
3 Relay and fuse box

CAUTION ⚠

- **If a fuse blows, make sure you identify and remedy the cause, then replace the fuse.**
- **Make sure that you replace the fuse with one having the same rating.**
- **Make sure that you remove the ⊖ terminal of the battery cable before removing main high-current fuse 1 and high-current fuses FH1 to 7.**

https://truckmanualshub.com/

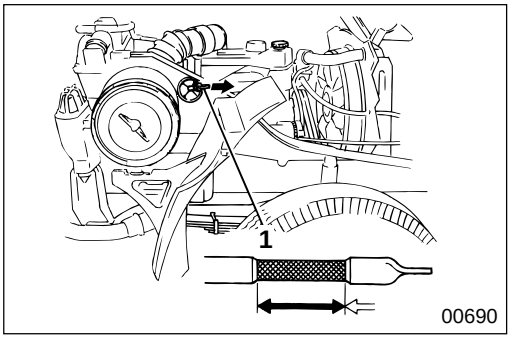
Engine Oil

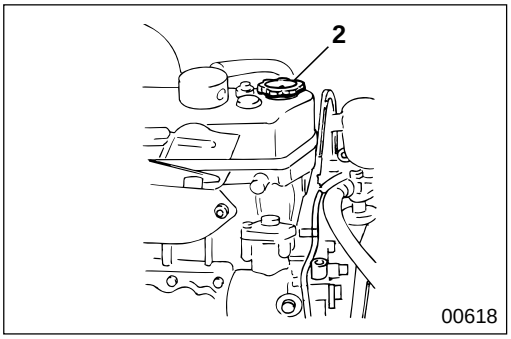
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Oil pan drain plug	69 {51, 7}	—



[Inspection]
- Pull out dipstick **1**, wipe off the oil with a cloth.
- Reinsert dipstick **1**, then pull it out carefully.
- Oil level is correct if there is oil sticking to dipstick **1** within the hatched area.
- If the level is low, top it up.
- Tilt the cab.

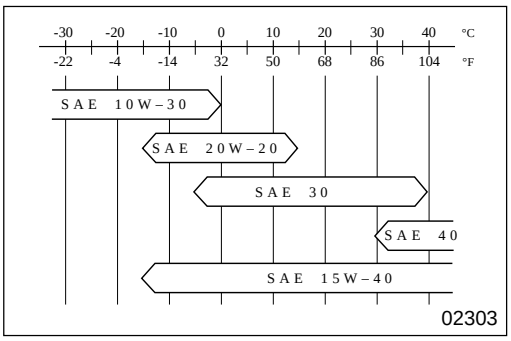


[Replenishment]
- Clean the area surrounding oil filler cap **2** and prevent dust from entering through the filler.
- Remove oil filler cap **2** and top up with engine oil.
- Wait five minutes before checking the oil level.
- Replace filler cap **2**.

WARNING⚠
- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**

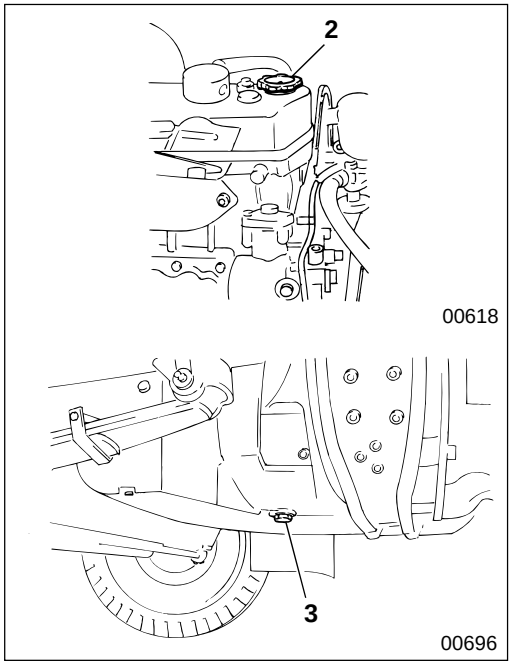
CAUTION⚠

Take care not to spill engine oil on the V-belts, because this would cause them to slip, reducing service life.



[Replacement]
Since engine oil greatly influences the performance, the life expectancy, and the ability to start the engine, use only oil of the specified grade and viscosity.
The chart illustrates the relationship between oil viscosity and the ambient air temperature.

https://truckmanualshub.com/



- Clean the area surrounding oil filler cap **2** and prevent dust from entering through the filler.
- Remove oil filler cap **2**.
- Remove oil pan drain plug **3**, and drain the oil. At the same time replace the oil filter.
- After reinstalling drain plug **3**, slowly add engine oil through the oil filler.
- Using the dipstick, check the oil level after more than six minutes have passed.
- Start the engine and let it idle. When the oil has reached all parts, stop the engine. Let 30 minutes pass before checking the oil level again.

https://truckmanualshub.com/

Clutch Fluid (Brake Fluid)

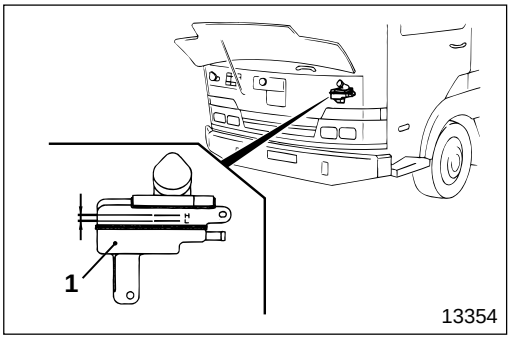
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Air bleeder (For air bleeding of clutch power cylinder)	25 to 34 {18 to 25, 2.5 to 3.5}	—

Fluid

Location	Points of application	Kinds	Quantity
1	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

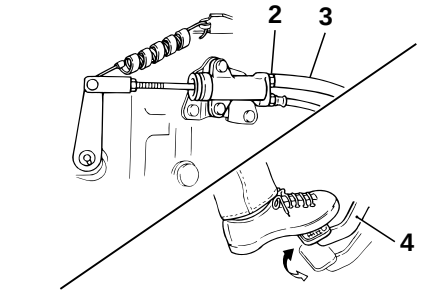


CAUTION

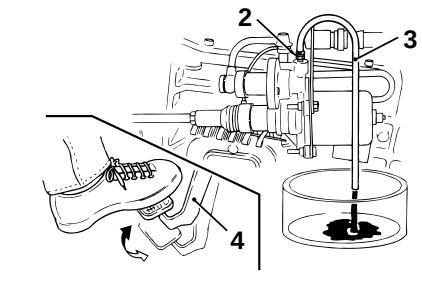
- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**
- **You must use new brake fluid (SAE J1703f or FMVSS No.116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system to swell, resulting in faulty clutch operation.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will cause faulty clutch operation.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oils.**

[Inspection and replenishment]
Inspect the level of the brake fluid in fluid tank **1**. It should fall between the "**H**" and "**L**" levels.
If it is below the "**L**" level, lift up the lid flap and remove the cap from fluid tank **1**, then supply the specified brake fluid until the level has come up to the "**H**" level. Do not fill above the "**H**" level.

< Except for FM657 (M8S2×5) >



< FM657 (M8S2×5) >

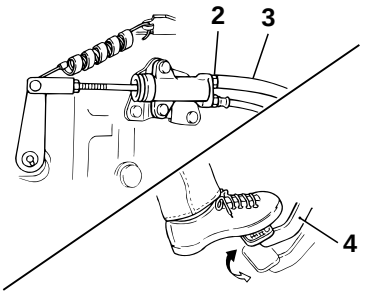


[Replacement]

- Attach vinyl pipe **3** to air bleeder **2** of the clutch power cylinder or the clutch booster.
- Loosen air bleeder **2** and depress clutch pedal 4 several times to drain brake fluid completely.
- Supply new brake fluid to the "**H**" level of fluid tank **1**. Depress clutch pedal **4** repeatedly until the old brake fluid discharged from vinyl pipe **3** is replaced by the new brake fluid.

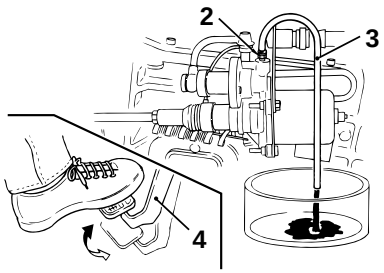
https://truckmanualshub.com/

< Except for FM657 (M8S2×5) >



11772

< FM657 (M8S2×5) >



13429

[Air bleeding]

NOTE

Carry out this operation maintaining the brake fluid level in fluid tank 1 between "H" and "L".

- Attach vinyl pipe **3** to air bleeder **2** of the clutch power cylinder or the clutch booster as in the replacement procedure.
- Fill fluid tank **1** with brake fluid, and loosen air bleeder **2** of the clutch power cylinder or the clutch booster, then depress clutch pedal **4** continuously.
- Keep depressing clutch pedal **4**, and tighten air bleeder **2** when air is bled completely.
- Depress clutch pedal **4** several times again, then keep it depressed at its fullest extent.
- With clutch pedal **4** depressed, loosen air bleeder **2** to drain brake fluid containing air. Release the pedal after tightening the air bleeder.
- Repeat this operation until air is no longer present in the fluid being drained.
- When this operation is completed, tighten air bleeder **2** at specified torque.
- Check that brake fluid is at the "**H**" level of fluid tank **1**, and supply new brake fluid if necessary.
- Check for brake fluid leakage from each of the parts with clutch pedal **4** depressed.

https://truckmanualshub.com/

Manual Transmission Gear Oil

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Inspection plug	69±15 {51±11, 7±1.5}	—
2	Drain plug	69±15 {51±11, 7±1.5}	—

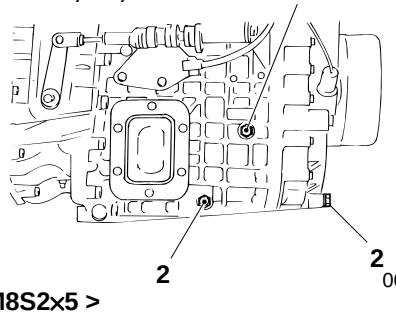
Sealant

Location	Points of application	Kinds	Quantity
1	Thread area of inspection plug	THREEBOND 1105D	As required
2	Thread area of drain plug	THREEBOND 1105D	As required

WARNING

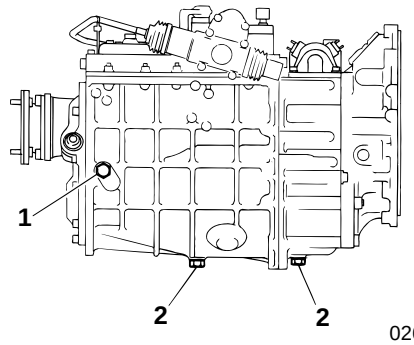
The engine is hot immediately after the vehicle stopped, so take care not to burn yourself.

< M060S5, S6, M070S6 >

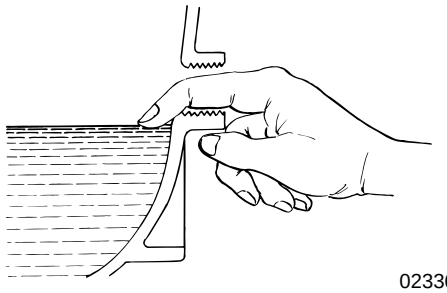


00370

< M8S2x5 >



02651



02336

[Inspection and replenishment]

- Remove inspection plug **1** and check whether the oil level is up to the edge of the entrance.
- If the level is low, add oil through the inspection plug hole until the level comes up to the edge of the entrance.

[Replacement]

- Drain the oil after removing inspection plug **1** and drain plug **2**.
- Remove any metal particles sticking to the magnetic part of drain plug **2** before reinstalling the plug.
- Add oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Insert inspection plug **1**.

https://truckmanualshub.com/

LUBRICATION

Automatic Transmission Fluid and Oil Filter

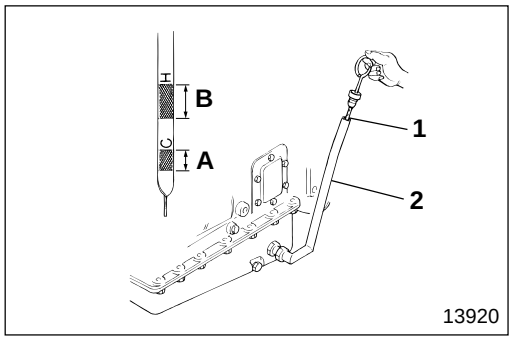
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Drain plug	20 to 27 {15 to 20, 2.05 to 2.75}	—
5	Dipstick guide connector	125 to 135 {91 to 100, 12.55 to 13.76}	—
6	Bolt (Oil pan mounting)	14 to 18 {10 to 13, 1.4 to 1.8}	—
8	Bolt (Oil filter mounting)	14 to 18 {10 to 13, 1.4 to 1.8}	—
12	Oil filter	9.8 to 20 {7 to 14, 1 to 2}	—

Fluid

Location	Points of application	Kinds	Quantity
11	Body of O-ring	Automatic transmission fluid (DEXRON or DEXRON II type)	As required
12	Gasket of oil filter with thin application	Automatic transmission fluid (DEXRON or DEXRON II type)	As required



[Inspection and replenishment]

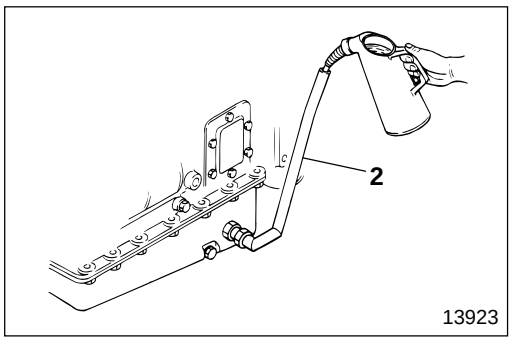
- Park the vehicle on level ground, make sure that the parking brake is fully activated and chock the wheels to keep them from rolling.
- Start the engine and let it idle. To fill the hydraulic circuit with automatic transmission fluid, shift the range selector lever from N → R → N → D → 2 → D → N. Repeat this process five times, finally shifting to N.
- While the engine is still idling, pull out dipstick **1** and wipe off the fluid sticking to it. Reinsert the dipstick, then pull it out again and check the fluid level.
- If the fluid level is inspected right after the engine is started and the fluid temperature is still low (approximately 15 to 49°C {60 to 120°F}), the level should be within area **A** marked COLD on dipstick **1**.
- If the fluid level is inspected after the vehicle has been driven and the fluid temperature is high (approximately 71 to 93°C {160 to 200°F}), the level should be within area **B** marked HOT on dipstick **1**.

WARNING

Take care during the inspection because the engine will be running. Take sufficient care to avoid burns or injuries resulting from contact with moving parts.

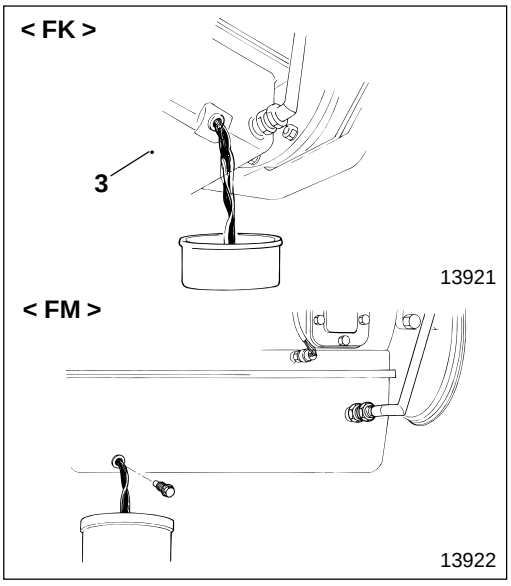
NOTE

- **Make sure the vehicle is parked on level ground when you are checking the fluid level.**
- **Make sure the selector lever is in the N position and the engine is idling when you are checking the fluid level. When the engine is stopped, the fluid level appears higher than it actually is.**
- **Be sure to wipe off the dust from the safety cap and the upper part of dipstick guide 2 before you pull out dipstick 1.**
- **To ensure the fluid is correct, reinspect the fluid level after an actual drive.**



- If the fluid level is low, add automatic transmission fluid (DEXRON or DEXRON II type) through dipstick guide **2** until the correct level on dipstick **1** is reached.

https://truckmanualshub.com/



[Replacement]

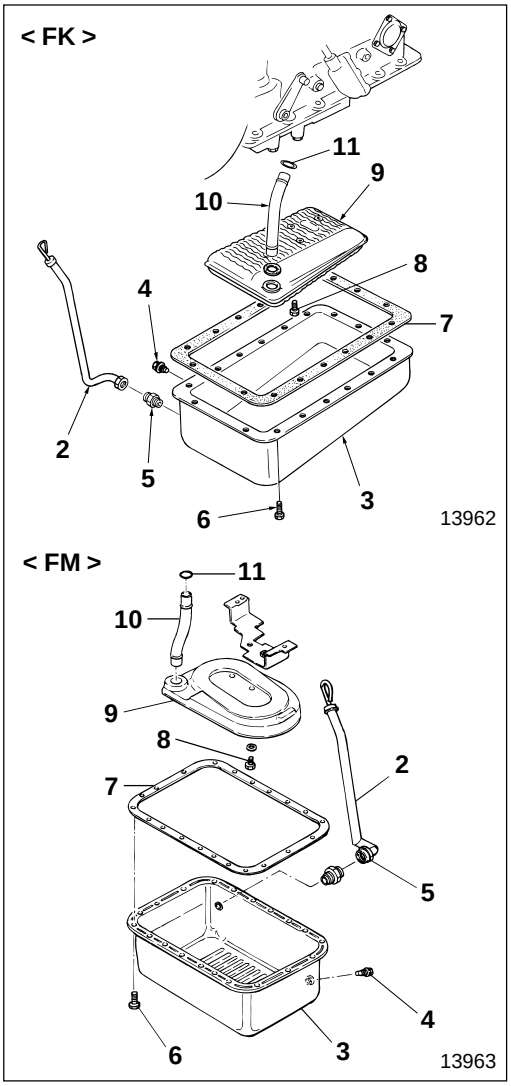
- Park the vehicle on level ground, chock the wheels and shift the range selector lever to the N position.
- Place a container under oil pan **3**, remove drain plug **4** and drain the fluid.

WARNING

Take care because the fluid temperature immediately after the engine has stopped is very high. To avoid scalds, wait until a safe temperature has been reached before draining the fluid.

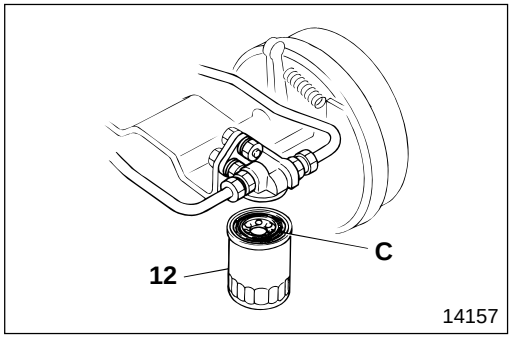
NOTE

- **The fluid will drain faster if the engine is first run to raise the fluid temperature.**
- **The fluid cannot be drained from the hydraulic circuit, the torque converter or the oil cooler.**
- **Check the drained fluid for dirt, metal particles and metal fragments.**

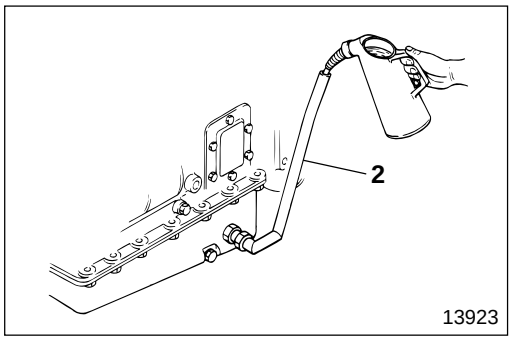


- Remove oil pan **3**, intake pipe **10**, O-ring **11**, gasket **7** and oil filter **9**.
- Clean oil pan **3**.
- Replace O-ring **11**, gasket **7** and oil filter **9**.

https://truckmanualshub.com/



- Remove oil filter **12** (for oil cooler) by turning it counterclockwise.
- Lightly coat gasket **C** with the fluid before installing oil filter **12**. Then tighten the oil filter.



- Supply fluid through dipstick guide **2**.

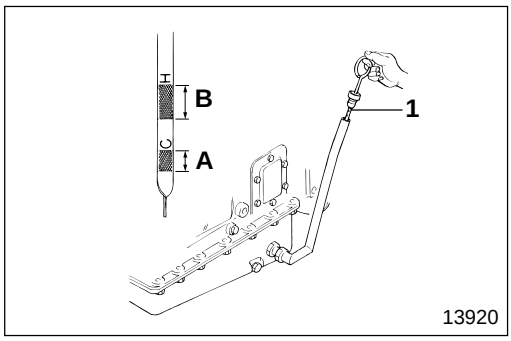
CAUTION

Make sure that dirt and foreign particles do not become mixed in with the fluid when it is added.

- Shift the range selector lever to the N position, start the engine and let it idle for about one minute.
- After shifting the lever through all positions once, shift it back to N position.

CAUTION

To prevent burning out the interior of the automatic transmission assembly, make sure that the engine is not allowed to race when you do the above.



- Check and adjust so that the fluid level is within the specified area on dipstick **1**.

NOTE

- **As the temperature of the fluid rises, so does the fluid level. If you add fluid while the temperature is still low (approximately 15 to 49°C {60 to 120°F}), make sure that the level stays within area A, marked COLD on dipstick 1.**
- **Let the engine idle and, while paying attention to the fluid level, pour in the fluid slowly.**
- **It is sometimes hard to check the fluid level, immediately after supplying fluid, because of the fluid adhering to the interior of dipstick guide 2. If this is the case, check the fluid level several times at intervals.**
- **Be careful not to supply too much fluid because you might mistake the fluid that overflows from the air breather for fluid leakage.**

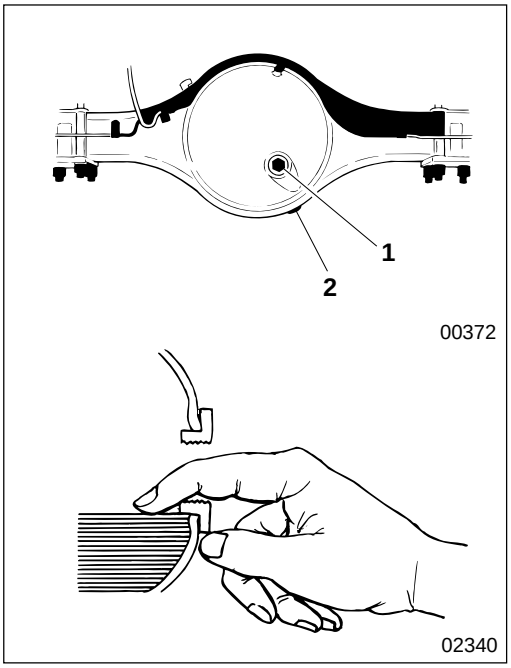
https://truckmanualshub.com/

Rear Axle Gear Oil

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened		Tightening torque	Remarks
1	Inspection plug	FK	98 to 115 {72 to 87, 10 to 12}	—
		FM	175 to 195 {130 to 145, 18 to 20}	
2	Drain plug	FK	98 to 115 {72 to 87, 10 to 12}	—
		FM	175 to 195 {130 to 145, 18 to 20}	



[Inspection and replenishment]

WARNING

The oil temperature is high immediately after the vehicle stopped, so take care not to scald yourself.

- Remove inspection plug **1**, check the oil level and make sure it is up to the edge of the entrance.
- If the oil level is low, add oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Insert inspection plug **1**.

[Replacement]

- Drain the oil after removing inspection plug **1** and drain plug **2**.
- Remove any metal particles sticking to the magnetic part of drain plug **2** before reinstalling the plug.
- Supply oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Reinstall the inspection plug.

LUBRICATION

Power Steering Fluid

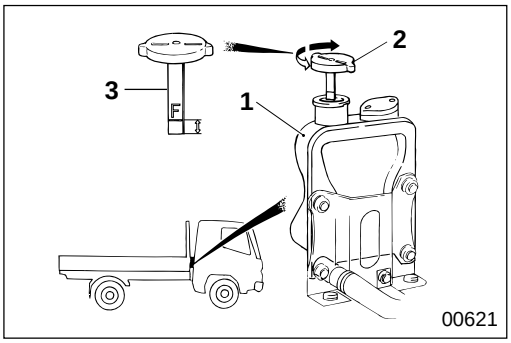
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Oil pipe	66.69±12.75 {49±9.4, 6.8±1.3}	—

Fluid

Location	Points of application	Kinds	Quantity
1	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Between end and "**F**" on filler cap dipstick



[Inspection and replenishment]

- Straighten the front wheels and stop the engine.
- Remove filler cap **2** of power steering oil tank **1** by turning the filler cap counterclockwise.
- Wipe off the fluid sticking to dipstick **3** on filler cap **2**. Replace the filler cap.

NOTE

Check the fluid level without screwing on filler cap 2.

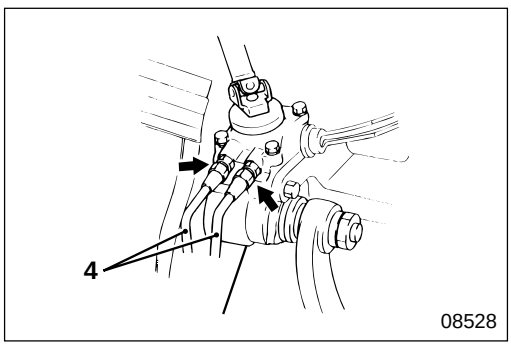
- Carefully lit up filler cap **2** and check the fluid sticking to dipstick **3** to make sure that the fluid is at a point between the end and "**F**" on the dipstick. If the level is low, add fluid.
- After inspection install filler cap **2** by turning it clockwise.

WARNING⚠

Close filler cap 2 firmly; otherwise power steering fluid will leak and could catch fire. Also wipe up spilled fluid.

CAUTION⚠

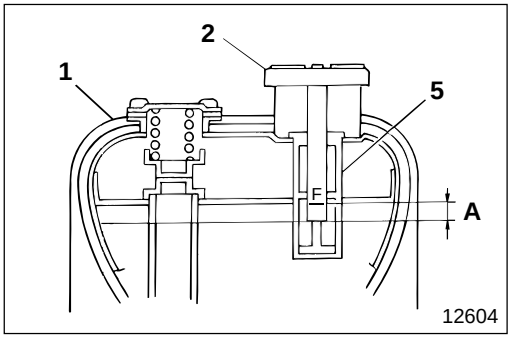
If the fluid level is far below the recommended range, the fluid may be leaking.



[Replacement]

- Drainage
  - Jack up the front wheels.
  - Disconnect oil pipe **4** connected to the power steering booster.
  - Turn the steering wheel fully left and right repeatedly, and drain the fluid from the power steering booster.
  - After draining the fluid, tighten oil pipe **4** at specified torque.

https://truckmanualshub.com/



[Supply]

- Pour fluid into power steering oil tank **1** up to the inner port of strainer **5**.
- With the engine stopped, jack up the front wheels and turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.

NOTE

Check the fluid level without screwing on filler cap 2.

- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times to raise the fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise, bleeding is completed.
- When bleeding is finished, check fluid level of power steering oil tank **1**, and pipe and hose connections for fluid leakage.

LUBRICATION

Brake Fluid

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
—	Air bleeder (Airmaster)	6.9 to 12.7 {5.1 to 9.4, 0.7 to 1.3}	—
—	Air bleeder (Wheel brake)	7.8 to 12 {5.8 to 8.5, 0.8 to 1.2}	—

Fluid

Location	Points of application	Kinds	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
—	Vinyl hose 	MH033102	Air bleeding

WARNING

- **You must use new brake fluid (SAE J1703f or FMVSS No.116 DOT3).**
- **Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the brake system, because this will cause the rubber parts of the brake system to swell, resulting in brake dragging or ineffective braking.**
- **Be sure not to allow dirt or water to become mixed into brake fluid when refilling, because this will cause the brake to malfunction.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oils.**

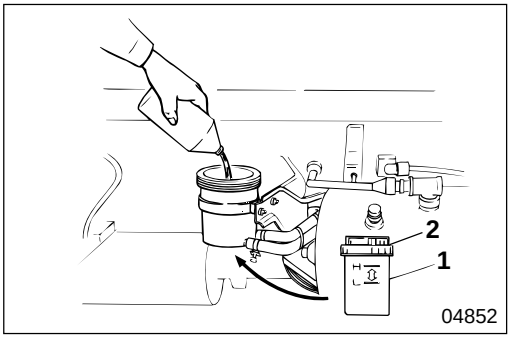
CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

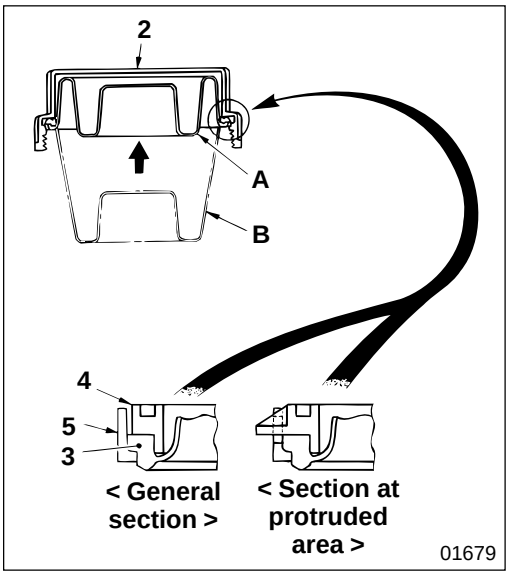
NOTE

Supply brake fluid to maintain the “H” level of the brake fluid tank always.

https://truckmanualshub.com/



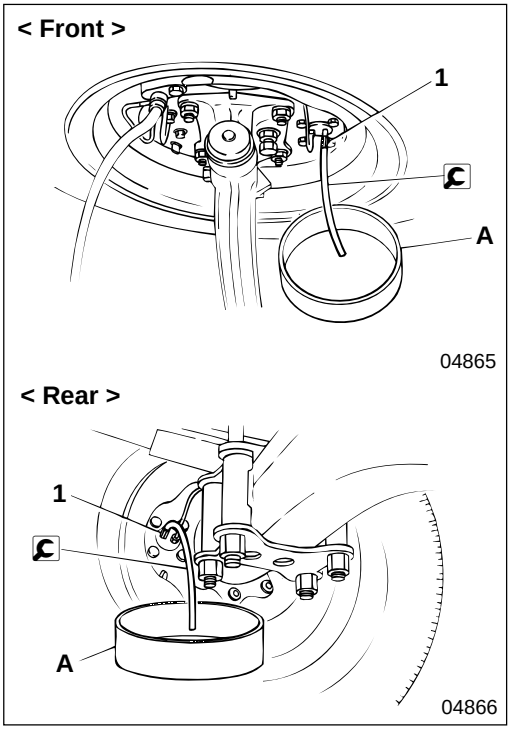
[Inspection and replenishment]
Inspect the level of the brake fluid in fluid tank **1**. It should fall between the "**L**" and "**H**" levels. If it is below the "**L**" level, remove cap **2** from the fluid tank, then supply the specified brake fluid until the level comes up to the "**H**" level. Do not fill above the "**H**" level.



- If diaphragm **3** is not in its normal posture when the brake fluid is supplied, correct it to its normal posture, and install cap **2**. If brake fluid leaks from the cap area after you have supplied brake fluid, check whether the diaphragm is assembled as illustrated.

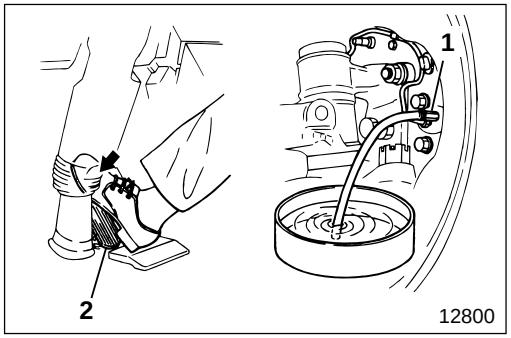
  4 : Slide ring
  5 : Ring cover
  A : Correct condition of diaphragm when brake fluid is being supplied
  B : Condition when diaphragm is extended when brake fluid has decreased

[Replacement]
- Start engine and let it idle until brake fluid replacement is completed.

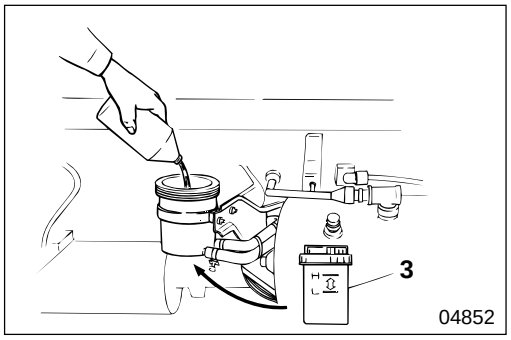


- Attach one end of vinyl hose to air bleeder **1** and place the other end in container **A**.

https://truckmanualshub.com/

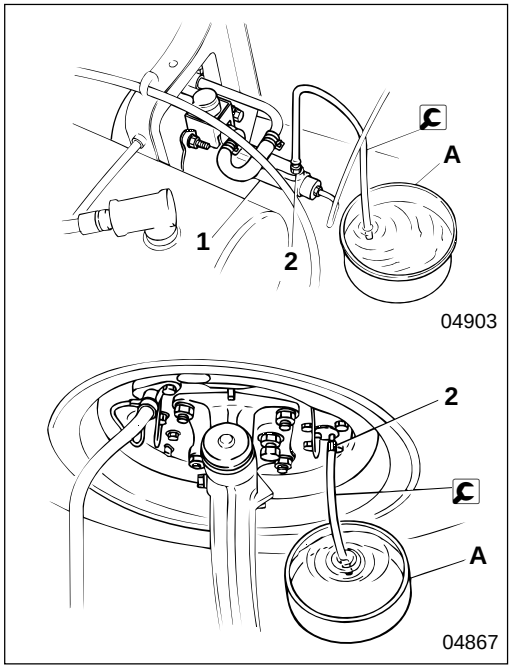


- Loosen air bleeder **1** and repeatedly depress brake pedal **2** to drain brake fluid completely.



- Maintaining a supply of new brake fluid up to the "**H**" level of fluid tank **3**, depress the brake pedal repeatedly until the old brake fluid of the brake system is replaced with new fluid.
- Carry out air bleeding of the brake system.

[Air bleeding]

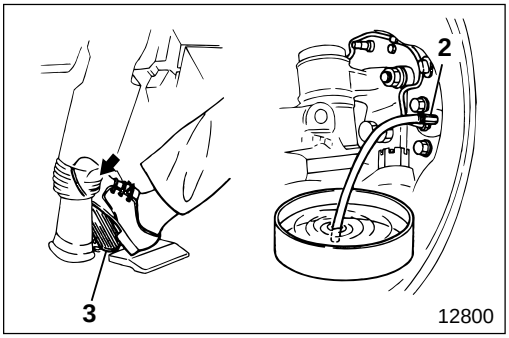


- Start the engine and let it idle until brake fluid replacement is completed.
- Attach one end of vinyl hose to front or rear airmaster **1**. Then, attach one end of another vinyl hose to air bleeder **2** of the wheel brake. Finally, place both free ends in container **A** filled with brake fluid.

- Carry out air bleeding in the following sequence:

Front brake system	Rear brake system
Airmaster for front	Airmaster for rear
↓	↓
Right-hand side wheel brake	Right-hand side wheel brake
↓	↓
Left-hand side wheel brake	Left-hand side wheel brake

https://truckmanualshub.com/



- Depress brake pedal **3** slowly a few times, and with the brake pedal depressed, loosen air bleeder **2** to drain brake fluid containing air.

- Tighten air bleeder **2**, and release brake pedal **3**.
- Repeat this service procedure until air is no longer present in the fluid being drained.
- Tighten air bleeder **2** at specified torque as soon as brake fluid flowing out is free of air bubbles.

- Adjust brake shoe clearance when you have finished air bleeding.
- Check that brake fluid comes up to level "**H**" of fluid tank. If it does not, refill with new brake fluid.
- Depress brake pedal **3** a few times and check for any leakage of brake fluid, then test the brakes.
- When you test the brakes, if the brake fluid warning lamp within the meter cluster lights, it means that air has not been bled completely. Redo air bleeding.

10 Valve cap
11 Valve cotter
12 Upper retainer
13 Outer valve spring
14 Inner valve spring
15 Valve stem seal
16 Valve guide

- Valve stem seal **15** is fitted to valve **1, 2** to control the lubricant supplied to valves **1**, **2** and valve guide **16**.
- A combination of variable pitch springs is used for valve springs **13**, **14** to avoid abnormal vibration at high speed. The spiral direction of the two springs is opposite to avoid interference between the two springs.
- The front of the engine has smaller camshaft bearings, so removal and installation is easier from the rear.

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection of Engine Compression

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Engine Compression	Each cylinder (2000 rpm)	2550 kPa {370 lbf/in^2, 26 kgf/cm^2}	1960 kPa {285 lbf/in^2, 20 kg/cm^2}	Inspect
		Pressure difference between each cylinder	—	within 390 kPa {57 lbf/in^2, 4 kgf/cm^2}	Inspect

Special tools

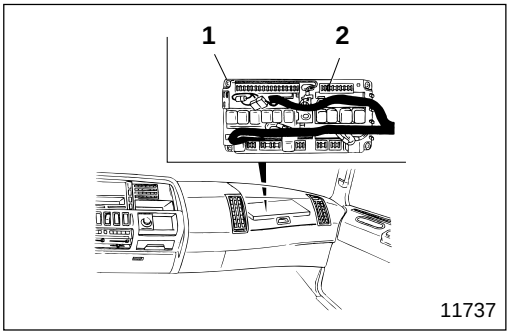
Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
—	Compression gauge adapter 	MH061461	Measurement of engine compression

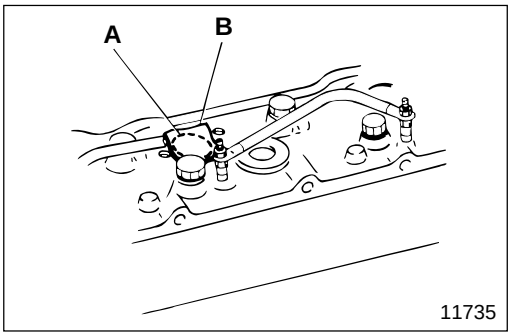
The decrease of engine compression is a signal that it is time to overhaul the engine. It is strongly recommended that this item is inspected periodically and that you record the history of deterioration in engine performance as this will help you to diagnose causes of future irregularities.
When the vehicle is still new or immediately after installation of new parts, there may be a slight increase in engine compression, but normal performance will be restored soon.

- Before inspection make sure that engine oil, starter and battery are in normal condition.
- Before inspecting the vehicle do the following:
  - Run the engine to bring the temperature of the coolant up to approximately 75 to 85°C {167 to 185°F}.
  - Turn all the lights and accessory equipment OFF.
  - Put transmission in neutral. (N range for automatic transmission)
  - Set the steering wheel at center and straight position.

https://truckmanualshub.com/



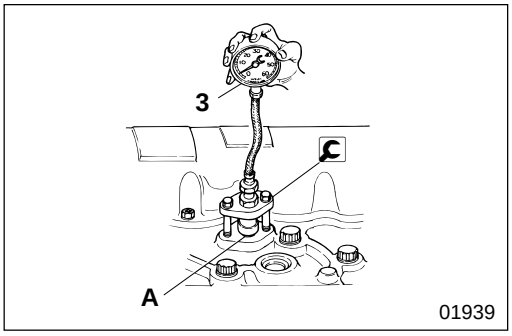
- Remove fuel-cut motor fuse **2** from fuse and relay box **1** in the driver's cab so that no injection of fuel takes place when cranking the engine using the starter.



- Remove all the injection nozzles. Gr 13
- Check that no foreign particles are sticking to waste cloth **B** covering injection nozzle mounting hole **A** after cranking the engine.

WARNING

You must stay clear of injection nozzle mounting hole A when you crank the engine during this inspection. Assume that all cylinders have cracked, and that coolant, engine oil, fuel, etc. have seeped into the cylinder chambers. If this is the state when the engine is cranked, there is an extreme danger of these substances being injected out of the injection nozzle mounting hole at high temperature.



- Mount the nozzle gasket and compression gauge adaptor in injection nozzle mounting hole **A**, then mount compression gauge **3**.
- Measure engine compression while cranking the engine.
- Measure engine compression of cylinders and calculate the difference among the cylinders.
- If the engine compression and pressure difference between each cylinder deviate from the limit, reinspect by pouring a small amount of engine oil into injection nozzle mounting hole **A**.
  - When pressure is high : It is likely that either wear or damage of the slide-contact area of both the piston ring and the cylinder inner surface has taken place.
  - When pressure is low : It is likely that burning of the valve, faulty contact of valve surfaces and/or faults in the cylinder head gasket have developed.

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Inspection and Adjustment of Valve Clearance

Service standards

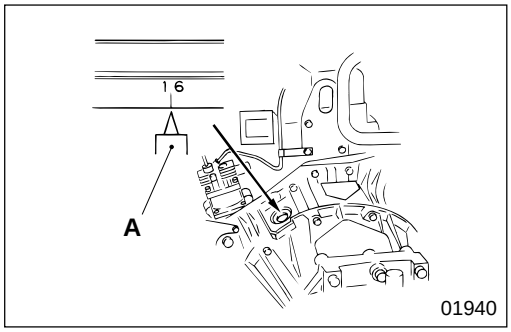
Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Valve clearance (When engine is cold)	0.4 {0.016}	—	Adjust

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Lock nut	34 {25, 3.5}	—



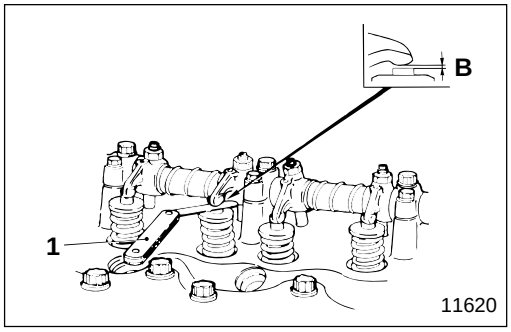
Inspect and adjust the valve clearance while the engine is cold in the following way.

[Inspection]

- Crank the engine to move No.1 or No.6 piston to top dead center, aligning stamped mark "**1.6**" on the flywheel with pointer **A** on the flywheel housing inspection window.

NOTE

The cylinder whose push rod is not pushing up the inlet/outlet rocker is the one whose piston is at top dead center.



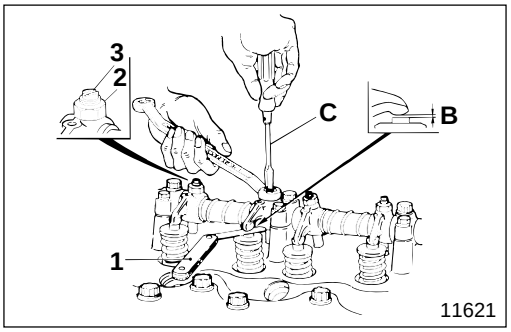
- Measure valve clearance **B** when either No.1 or No.6 piston is at top dead center in accordance with the following tabulated sequence of each valve.

Piston No.	1		2		3		4		5		6	
Valve arrangement	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust
No.1 piston at top dead center	○	○	○	×	×	○	○	×	×	○	×	×
No.6 piston at top dead center	×	×	×	○	○	×	×	○	○	×	○	○

NOTE

Be sure when taking measurements using feeler gauge 1 that some resistance is felt when inserting the gauge. If the gauge can be inserted freely without any resistance, an accurate measurement cannot be obtained.

- If the measured value deviates from the limit, adjust as follows:



[Adjustment]

- Adjust valve clearance **B** so that feeler gauge **1** encounters some resistance when it is inserted. Do this by loosening lock nut **2** and turning adjusting screw **3**.
- After adjusting, tighten adjusting screw **3** using screwdriver **C** and tighten lock nut **2**. Reinspect valve clearance **B** using feeler gauge **1**.

Special tools

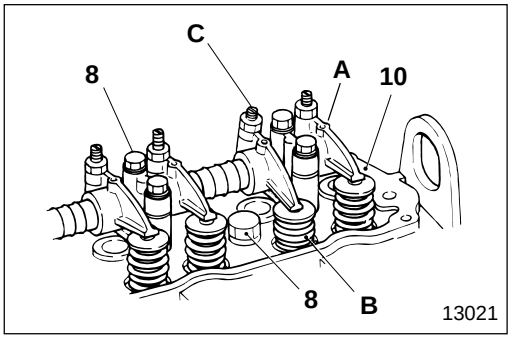
Location	Tool name and shape	Part No.	Application
10	Socket wrench  01984	MH061560	Installation of cylinder head and valve assembly

◆ Service procedure

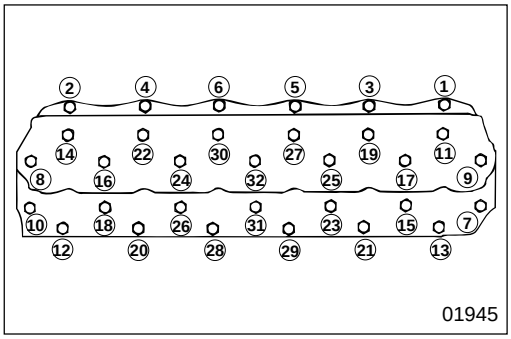
10 Cylinder head and valve assembly

[Removal]

- Before undoing cylinder head bolts **8**, first loosen adjusting screw **C** of rocker **A** that pushes down valve spring **B**.



- First loosen cylinder head bolts **8** in the numbered order as illustrated, then remove them.

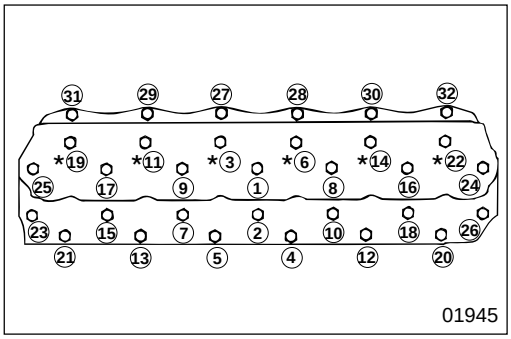


[Installation]

- Center punch the heads of cylinder head bolts **8** < M14 bolts > before installation.

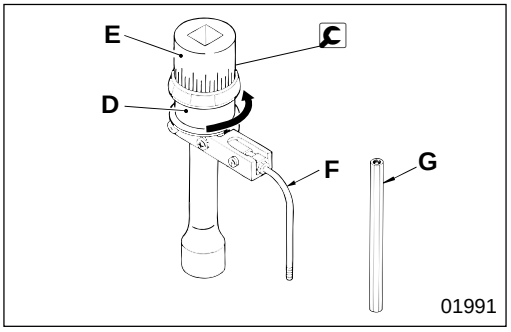
CAUTION⚠

If there are already three center-punch marks, replace the cylinder head bolt 8 with a new one.



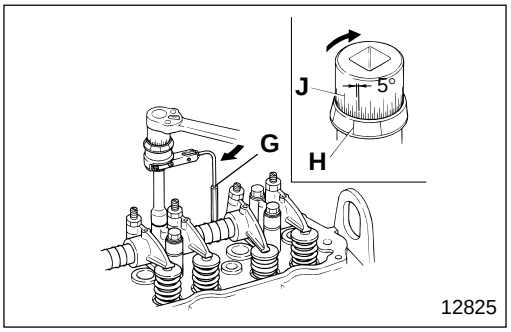
- After tightening cylinder head bolts **8** at specified torque (M14 bolt : 78 N·m {58 lbf.ft, 8 kgf·m}, M10 bolt : 17 N·m {13 lbf.ft, 1.75 kgf·m}) in the numbered order as illustrated, tighten further as follows:
  ✱ : Tightened simultaneously with rocker and bracket assembly
  ① to ㉖ : M14 bolt (Wet)
  ㉗ to ㉜ : M10 bolt

https://truckmanualshub.com/

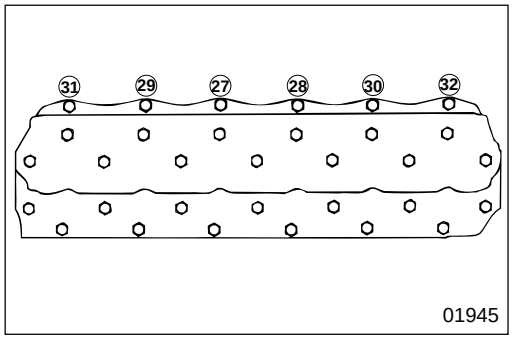


< M14 bolt >

- Turn 🔧 socket wrench holder **D** counterclockwise and keep the spring in the wrench compressed.
  E : Socket
  F : Rod
  G : Rod (for connection)



- Set 🔧 socket wrench holder **D** so that the repercussive force of the spring presses rod **G** (for connection) against adjacent parts such as, rocker shaft bracket or the injection pipe.
- Select a scale that is convenient for reading graduation **H** on holder **D**.
- Tighten further by turning socket **H** clockwise by 180° (setting is in 5° increments), referring to graduation **J** on the selected scale.



< M10 bolt >

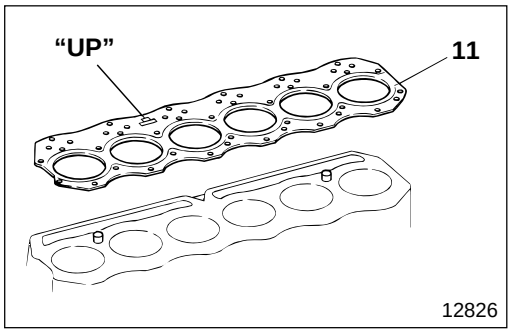
After tightening M14 bolts, tighten cylinder head bolts **8** (M10 bolt) at specified torque (34 N·m {25 lbf.ft, 3.5 kgf·m}) in the numbered order as illustrated.

11 **Cylinder head gasket**

[Removal]

CAUTION ⚠

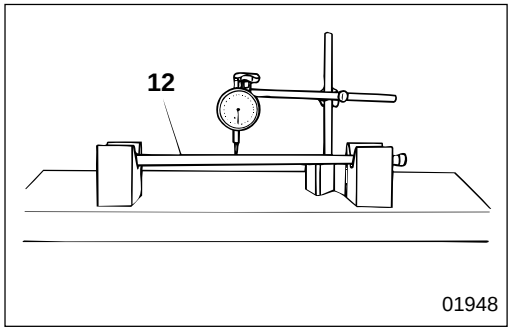
Be careful not to scratch the cylinder head or crankcase * when you remove cylinder head gasket 11.



[Installation]

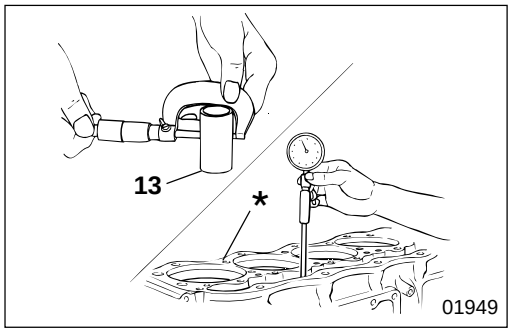
- Install cylinder head gasket **11** onto crankcase * in the direction as illustrated.

https://truckmanualshub.com/



12 **Push rod deflection**

If the measured value is higher than the limit, replace push rod **12**.



13 ***** **Clearance between tappet and crankcase tappet hole**

If the measured value is higher than the limit, replace the faulty parts.

https://truckmanualshub.com/

◆ Service procedure

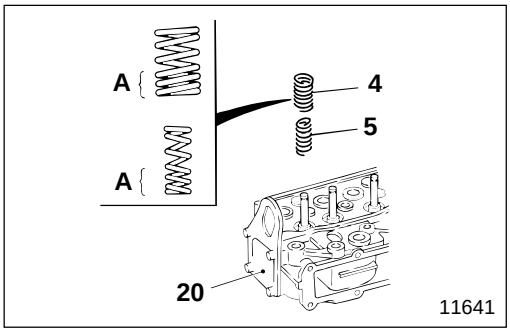
2 **Valve cotter**

[Removal]
Remove valve cotter **2** making sure that valve springs **4**, **5** are squarely and evenly pressed down by 🔧 valve lifter.

[Installation]
Follow the removal procedure in reverse.

CAUTION⚠

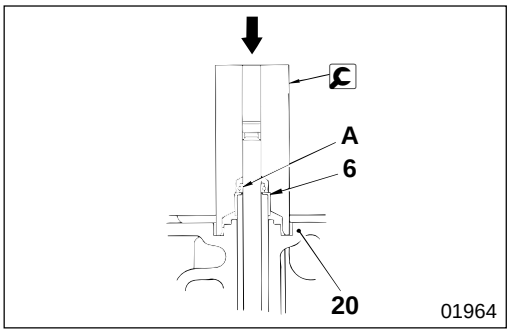
Be sure not to press down on valve springs 4, 5 too hard because this would cause upper retainer 3 to contact valve stem seal 6 and damage it.



4 **5** **Installation of outer and inner valve springs**

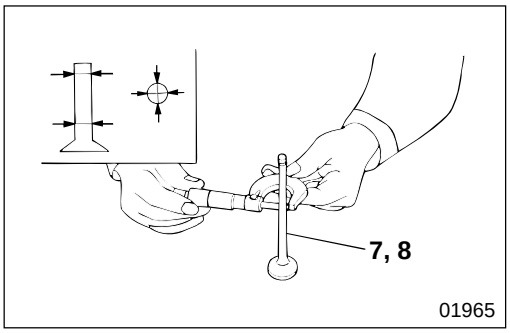
Install outer springs **4** and inner springs **5** in cylinder head **20** in the direction as illustrated.

A : Closely wound area



6 **Installation of valve stem seal**

- Apply engine oil to lip **A** of valve stem seal **6**.
- Tap down 🔧 valve stem seal installer until it hits cylinder head **20**.



7 **8** **Inlet valve and exhaust valve**

[Inspection]

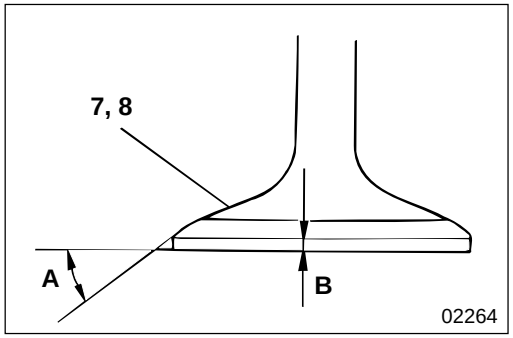
(1) Inspection of stems

If the measured value is lower than the limit or in the case of excessive wear, replace valves **7**, **8**.

CAUTION⚠

Be sure to lap valve seats 17, 18 when valves 7, 8 are replaced with new ones. 🕮 **P11-23**

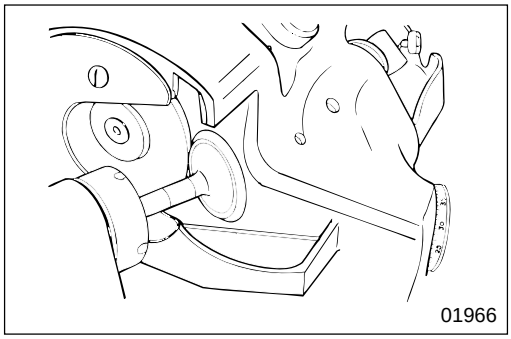
https://truckmanualshub.com/



(2) Valve seat angle and valve margin

If the measured value is higher than the limit, correct or replace valves **7**, **8**.

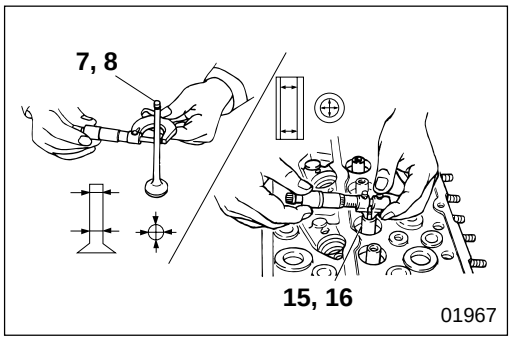
A : Valve seat angle
B : Valve margin



[Correction]

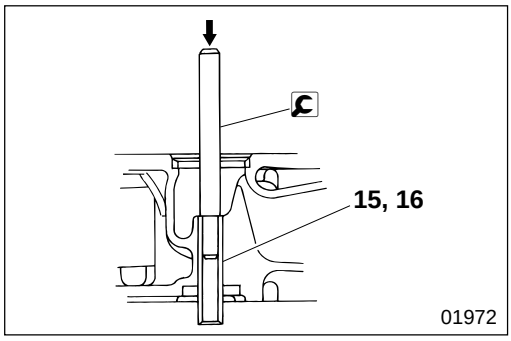
NOTE

- **Be sure to keep the grinding work as light as possible.**
- **Be sure to replace valves 7, 8 after grinding if valve margin deviates from the limit.**
- **Be sure to lap valve 7, 8 and valve seats 17, 18 after grinding.** **P11-23**



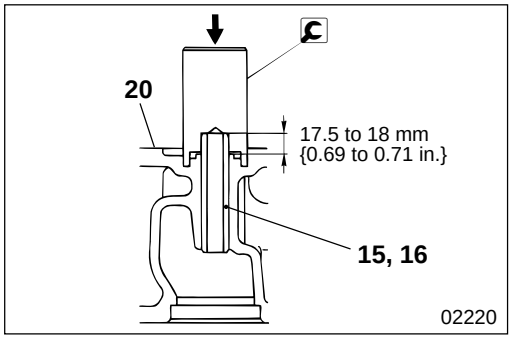
7 **8** **15** **16** **Valve and valve guide**

[Inspection]
When the clearance is higher than the limit, replace the faulty parts.



Valve guide

[Removal]



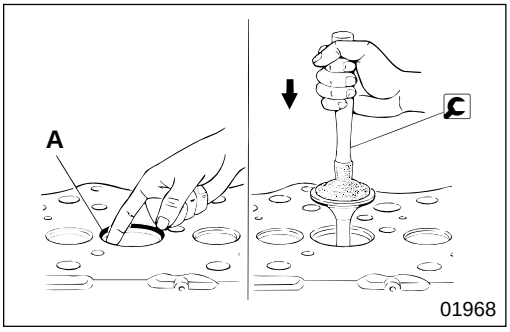
[Installation]

- Tap down valve guides **15**, **16** with valve guide installer until it hits cylinder head **20**.

CAUTION

- **The length of fit of valve guides 15, 16 is standardized. Be sure to use valve guide installer.**
- **Be sure to distinguish between valve guides 15, 16. Exhaust valve guide 15 is longer.**

https://truckmanualshub.com/



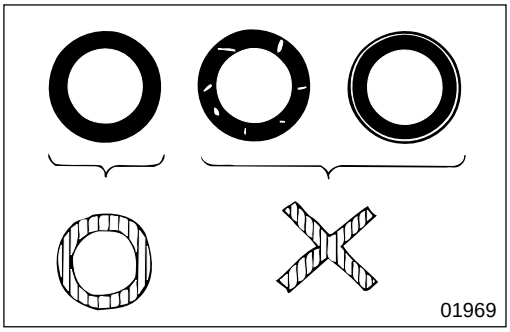
7 **8** **17** **18** **Valve and valve seat**

[Inspection]

- Apply red lead evenly to entire surface **A** of valve seats **17**, **18** that contact valves **7**, **8**.
- Fit valves **7**, **8** to valve seats **17**, **18** and tap once without rotating.

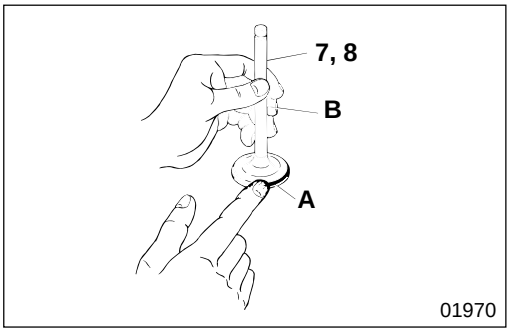
NOTE

Be sure to carry out inspection under the condition that valves 7, 8 and all parts of valve guides 15, 16 are normal.



- Check how much red lead has transferred to valves **7**, **8** to determine the contact of the valve and the seat. According to the degree of abnormality, take proper measures to correct it.

Contact conditions	Correction measures
Minor fault	Valve lapping
Major fault	Repair of valve and seat or replacement of both



[Correction]

Valve polishing is done in the following manner:

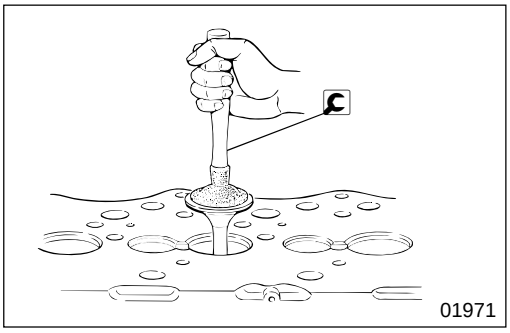
- Apply valve lapping compound thinly to contact surface **A** of valves **7**, **8** with valve seats **17**, **18**.

CAUTION ⚠

Take care not to smear stems B of valves 7, 8 with the compound.

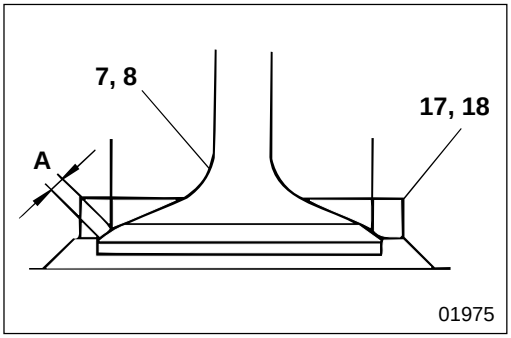
NOTE

- **Start with medium grit compound (120 to 150 grit) and for finishing up, use finer grit (200 grit or finer).**
- **Mixing with a small amount of engine oil will make the compound consistent and make even application easier.**



- Tap valves **7**, **8** against valve seats **17**, **18** several times while rotating the valves slightly at each strike.
- Clean off the compound with gas oil.
- Apply engine oil to contact surface **A** of valve seats **17**, **18** and smooth the surface.
- Check the contact of valves **7**, **8** and valve seats **17**, **18**.
- If contact does not take place completely around the seat, replace valve seats **17**, **18**.

https://truckmanualshub.com/



17 **18** **Valve seat**

[Inspection]

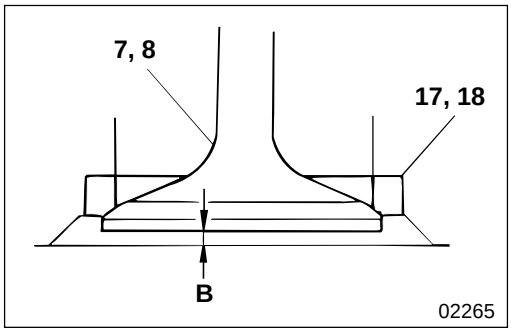
(1) Valve seat width

If the measured value is higher than the limit, replace valve seats **17**, **18**.

A : Valve seat width

NOTE

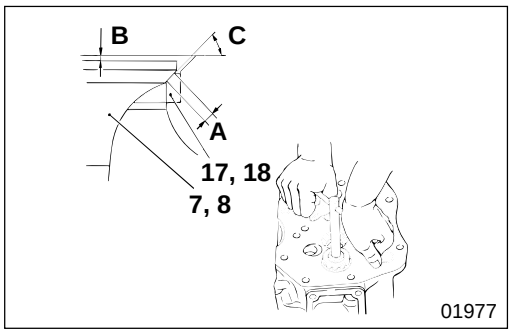
Be sure to lap and fit valves 7, 8 and valve seats 17, 18 after correction or replacement.



(2) Extent of valve recess from the bottom surface of cylinder head

If the measured value is higher than the limit, correct or replace the faulty parts.

B : Extent of valve recess



[Correction]

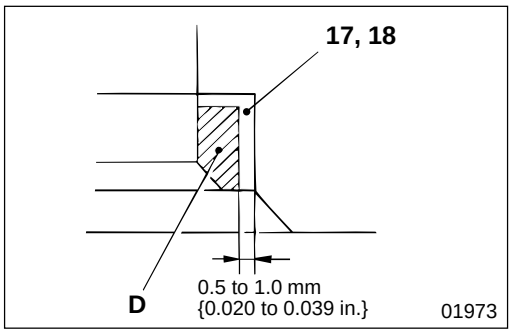
- Grind valve seats **17**, **18** using valve seat cutter or valve seat grinder.
- After grinding, do another light abrasion using 400 grit emery paper placed between the cutter and the seat.
- Adjust the seat width **A** of valves **7**, **8** using 15° or 75° cutter to make seat width conform to the standard value.

C : Valve seat angle

CAUTION ⚠

Be sure that as a result of grinding, recess B of valves 7, 8 does not become higher than the limit.

- After correction is done, be sure to carry out lapping and fitting on valves **7**, **8** and valve seats **17**, **18**.

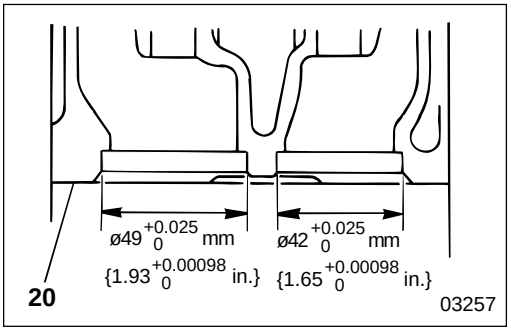


[Removal]

- Valve seats **17**, **18** have been set in by the cooling-off-process, and have to be thinned by grinding off the inner side for removal under normal temperature.

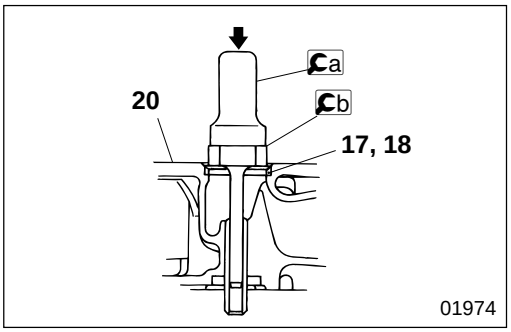
D : Part to be ground

https://truckmanualshub.com/

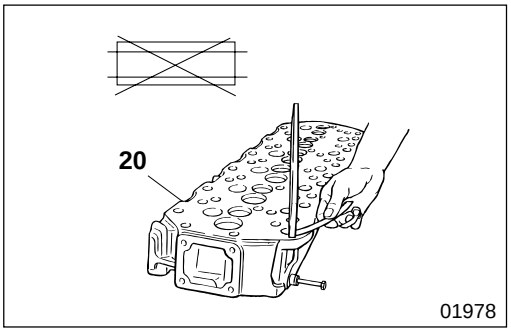


[Installation]

- Make sure that the diameter of valve seat hole of cylinder head **20** conforms to the standard value.
  E : Inlet valve seat hole diameter
  F : Exhaust valve seat hole diameter



- Immerse valve seats **17**, **18** in liquid nitrogen and cool them substantially. Press-fit into the cylinder head using Ca caulking tool body and Cb caulking rings inlet and exhaust.
- After installation of valve seats **17**, **18**, work until they contact valves **7**, **8** smoothly.



20 Inspection of cylinder head

Measure the extent of distortion of the bottom of cylinder head **20**, and if the measured value is higher than the standard value, grind using a surface grinder.

CAUTION

Be sure to keep the amount of grinding within the limit of the height of cylinder head 20.

https://truckmanualshub.com/

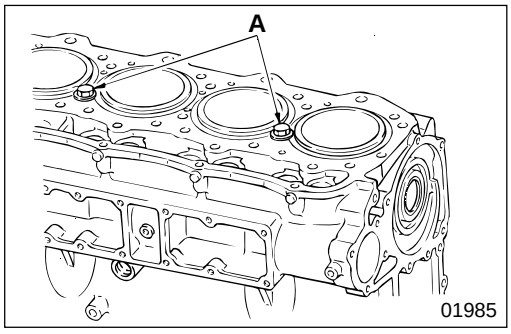
	Cylinder sleeve installer  01983	MH061771	Installation of cylinder sleeve

https://truckmanualshub.com/

◆ Service procedure



● **Inspection before disassembly**

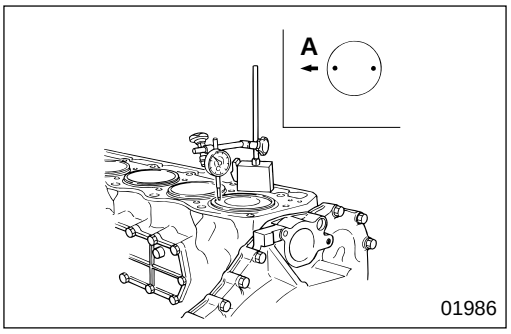
(1) Extent of piston protrusion from the upper surface of crankcase

NOTE

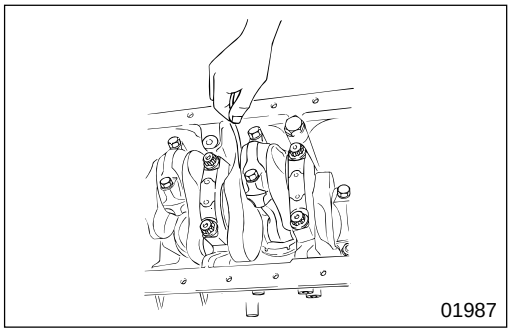
Always inspect the extent of piston protrusion because it affects the engine performance greatly.

WARNING⚠

Cylinder sleeves 6 might slip out beyond the top surface of the crankcase if the crankcase is cranked, or if the crankshaft is rotated. To avoid this, hold down the sleeves using bolts, tightened down with washers A at the cylinder sleeve flange.

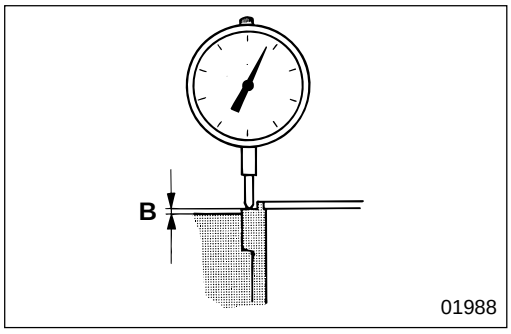


- Measure piston protrusion at two points on the top of the piston, and produce the average value.
  A : Front of the engine
- If the average value deviates from the limit, inspect clearance of the related parts.



(2) End play of connecting rod

- Measure the end play of each connecting rod.
- If the measured value is higher than the limit, replace the faulty parts.



(3) Extent of cylinder sleeve flange area protrusion from the upper surface of crankcase

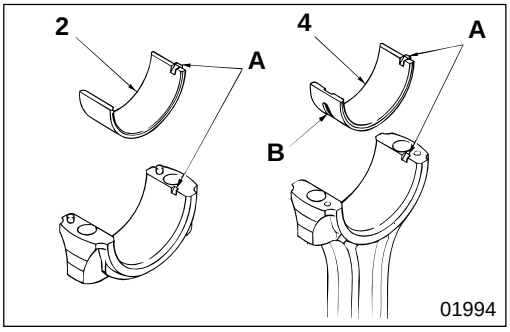
Replace cylinder sleeve **6** if the measured value deviates from the standard value.

B : Protrusion at cylinder sleeve flange area

CAUTION⚠

Unless the protrusion at the flange of cylinder sleeve 6 is adequate, contact pressure exerted upon the cylinder head gasket around the circumference of the cylinder sleeve will be low, and might cause leakage of combustion gases.

https://truckmanualshub.com/



2 **4** **Connecting rod bearing**

[Installation]
Install connecting rod bearings **2**, **4** by matching lugs **A** to the connecting rods.

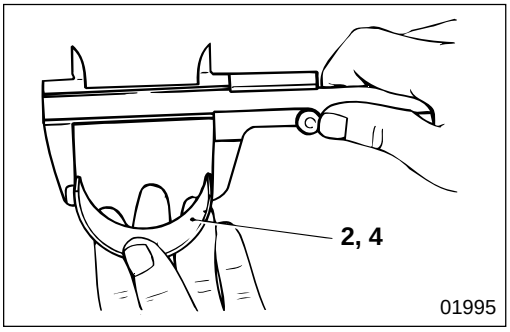
CAUTION

Be sure to distinguish between upper and lower connecting rod bearings 2, 4. The upper bearing has oil opening B while the lower bearing has no oil opening.

[Inspection]

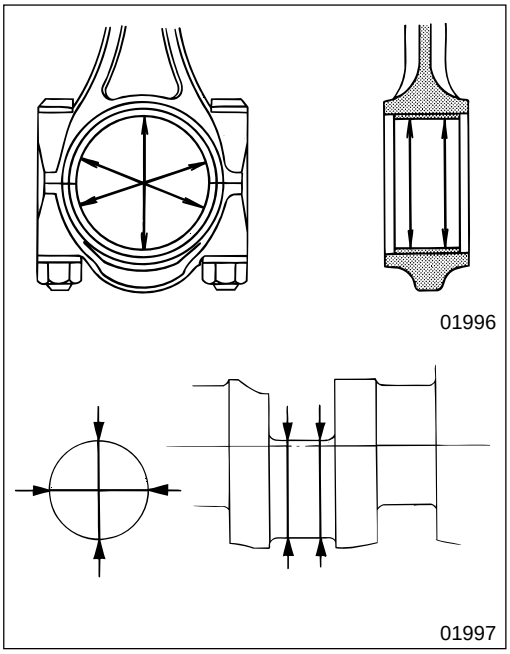
CAUTION

- **Do not forcibly open or expand connecting rod bearings 2, 4.**
- **When either upper or lower connecting rod bearings 2, 4 needs replacing, replace as a set.**



(1) Expansion at free state

If the measured value is lower than the limit, replace connecting rod bearings **2**, **4**.

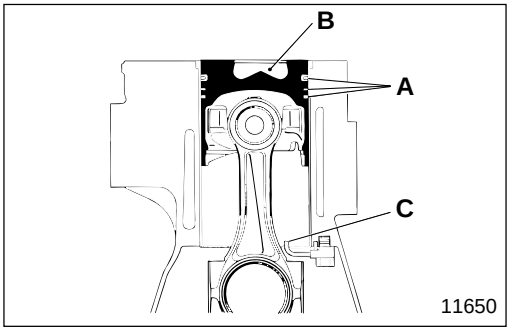


(2) Clearance between connecting rod bearing and crankshaft

If the clearance between connecting rod bearing **2**, **4** and crankshaft is lower than the limit, replace the faulty parts.

https://truckmanualshub.com/

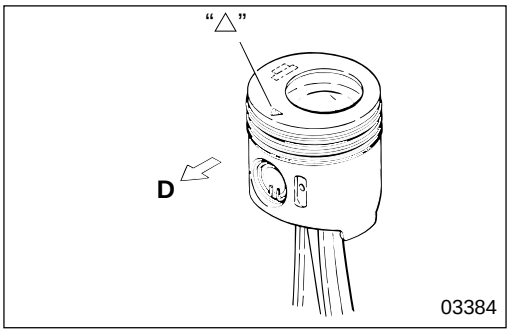
PISTON, CONNECTING ROD AND CYLINDER SLEEVE



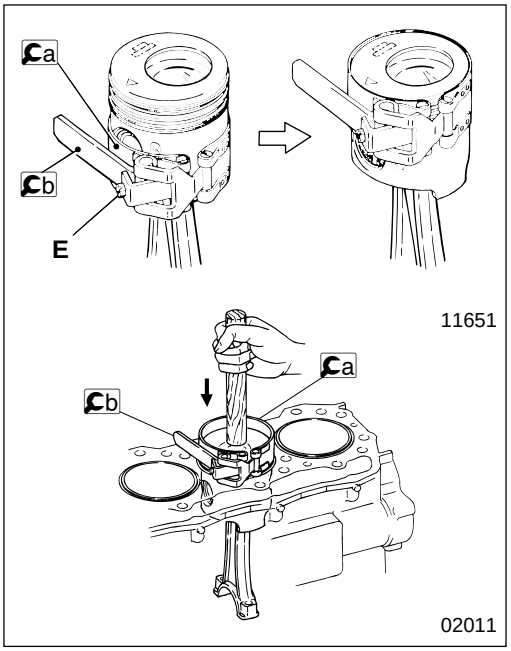
5 Installation of piston and connecting rod assembly

CAUTION

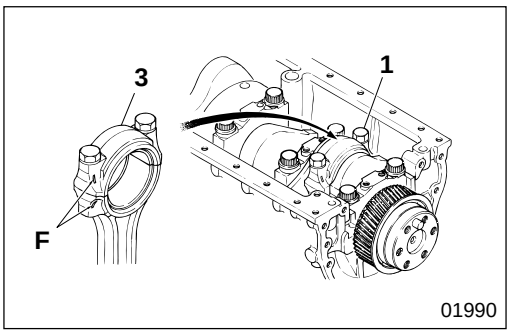
- **Be sure to fit piston ring A in the correct position.**
  P11-38
- **Be careful not to scratch or damage head B of the piston (a part of the combustion chamber).**
- **Make sure that the connecting rod does not hit oil jet C.**



- Install piston front mark "△" directed towards the front of the engine using the following procedure.
  D : Front of the engine

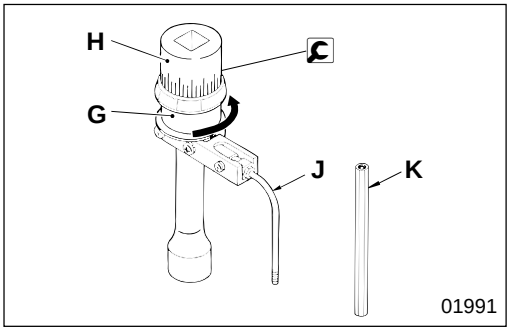


- Match the inner diameter of a piston guide clamp to the outer diameter of the piston skirt by turning adjusting bolt **E** of b piston guide lever.
- After adjusting, set a clamp and b lever at the top of the piston so that the clamp is flush with the top of the piston.

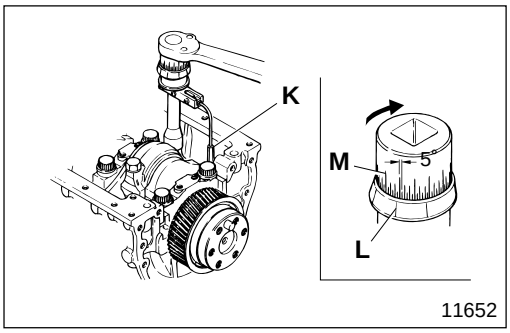


- After the piston is inserted, align alignment marks **F** on the connecting rod with the alignment marks on connecting rod cap **3** and tighten bolt **1** at specified torque. Then tighten the bolt further as follows:

https://truckmanualshub.com/



- Turn socket wrench holder **G** counterclockwise and keep the spring in the wrench compressed.
  H : Socket
  J : Rod
  K : Rod (for connection)

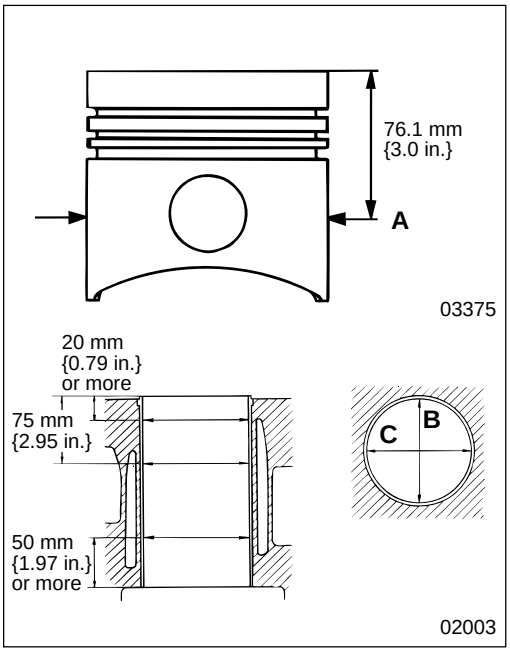


- Set the socket wrench holder **G** so that the repercussive force of its spring presses rod **K** (for connection) against the crankshaft.
- Select a scale that is convenient for reading graduation **L** on holder **G** side.
- Tighten further by turning socket **H** clockwise by 90°±5° (setting is in 5° increments) referring to graduation **M** using the selected scale.

NOTE

After installation of connecting rod cap 3, inspect the following points :

- **End play of the connecting rod : 🕮 P11-28**
- **Piston protrusion : 🕮 P11-28**



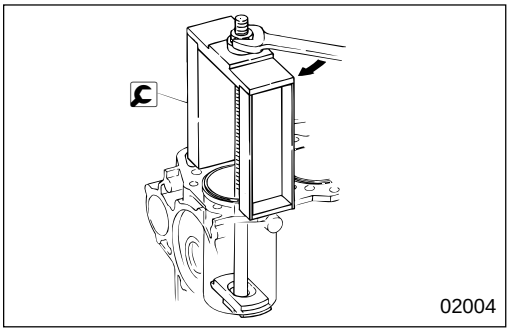
5 **6** **Piston and connecting rod assembly and cylinder sleeve**

[Inspection]
Replace the cylinder sleeve if the clearance deviates from the standard value

A : Position to measure the outer diameter of the piston
B : In the direction of the crankshaft axis
C : At right angles to the crankshaft axis

NOTE

Cylinder sleeve 6 is a thin type so it is impossible to bore it out. Also, do not remove it except for replacement, because it is liable to become deformed when you remove it .



Cylinder sleeve

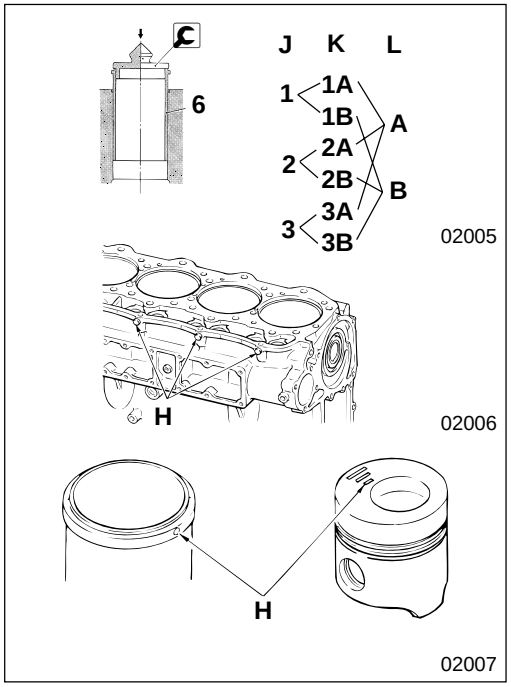
[Removal]

NOTE

If you have no option other than to reinstall cylinder sleeve 6, paint an alignment mark across the cylinder sleeve and the crankcase before removal so you can replace them in the same position.

https://truckmanualshub.com/

PISTON, CONNECTING ROD AND CYLINDER SLEEVE



[Installation]

Apply engine oil to the outer surface of cylinder sleeve **6**, hold the entire upper part of cylinder sleeve installer in your hand evenly, and insert the cylinder sleeve slowly into the crankcase.

CAUTION

- **Use size marks H on cylinder sleeve 6, piston and connecting rod assembly 5, and the crankcase, as a reference when replacing the piston and crankcase.**
  - **J : Crankcase size mark**
  - **K : Cylinder sleeve size mark**
  - **L : Piston size mark**
- **Handle cylinder sleeve 6 with utmost care because it is thin; do not subject it to strong impact from a hammer, etc.**

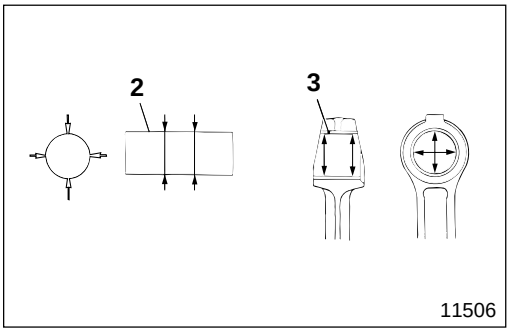
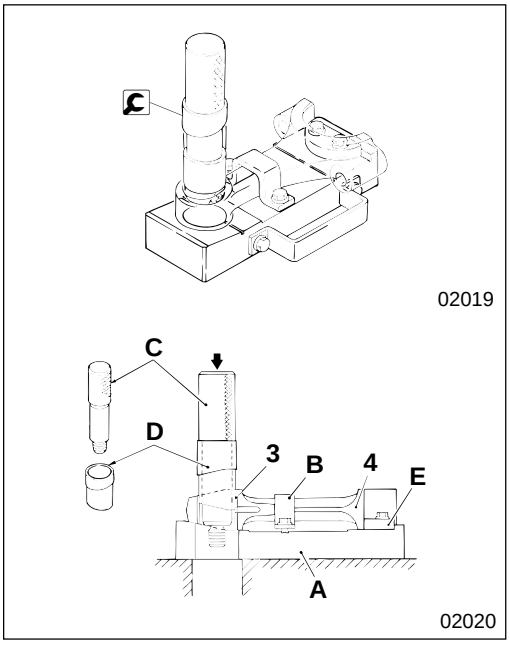
◆ Service procedure



11506

2 **3** **Piston pin and connecting rod bushing**

[Inspection]
If the clearances are higher than the limit, replace the faulty parts.



02019
02020

Connecting rod bushing

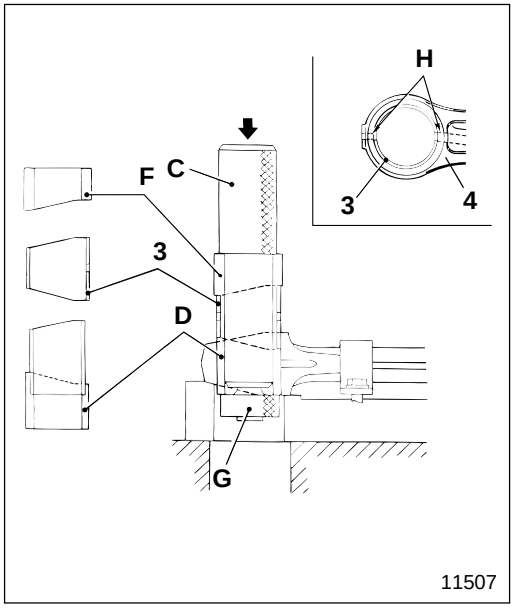
Use 🔧 connecting rod bushing puller kit to replace connecting rod bushing **3**.
(Components of 🔧 connecting rod bushing puller kit)

A : Base **B** : Bracket **C** : Puller **D** : Collar
E : Plate **F** : Collar **G** : Nut

[Pulling-out]

- Remove upper connecting rod bearing from the big end of connecting rod **4**.
- Place connecting rod **4** on base **A** and fix it to the base at two points, bracket **B** and plate **E**.
- Fit collar **D** in puller **C** in the direction as illustrated, and pull out connecting rod bushing **3** with a gradual load of approximately 49 kN {11020 lbf, 5000 kgf}.

https://truckmanualshub.com/

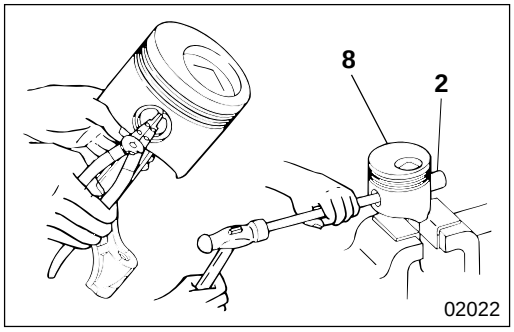


[Press-fitting]

- Apply engine oil to the exterior peripheral area of connecting rod bushing **3** and the inner area of the bushing fitting ring of connecting rod **4**.
- Fit collar **F**, connecting rod bushing **3** and collar **D** in puller **C** in the arrangement and direction as illustrated and mount them with nut **G**.
- Align oiling holes **H** of connecting rod bushing **3** and connecting rod **4**, and gradually press in the bushing with approximately 49 kN {11020 lbf, 5000 kgf} load.
- After press-fitting, ream connecting rod bushing **3** to make its clearance with piston pin **2** conform to the standard value.

NOTE

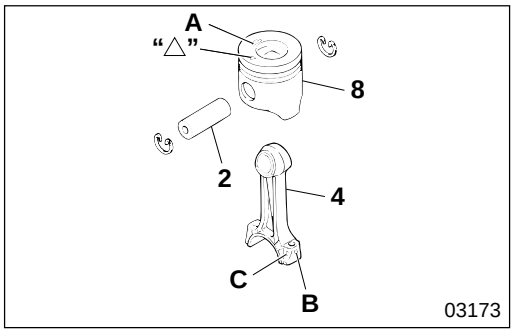
After press-fitting bushing 3, insert piston pin 2 and make sure that the rod moves smoothly without any excessive play.



2 4 8 Piston pin and connecting rod and piston

[Disassembly]

- Drift out piston pin **2** using a rod.
- When removal of piston pin **2** is difficult, warm piston **8** using a piston heater or hot water.



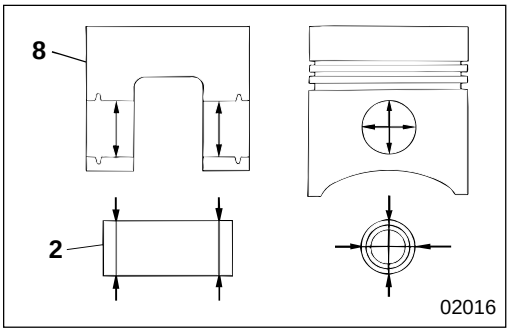
[Installation]

- Apply engine oil to piston pin **2** and assemble connecting rod **4** and piston **8** in the direction as illustrated.
  - **A** : Piston mass (Mass of piston is marked)
  - **B** : Connecting rod mass mark (Alphabetical : A, B, C, D, E, F, G, H, I, V, W, X, Y, Z)
  - **C** : Mounting base of connecting rod cap
  - △ : Front mark
- When piston pin **2** insertion is difficult, warm piston **4** using a piston heater or hot water.

CAUTION⚠

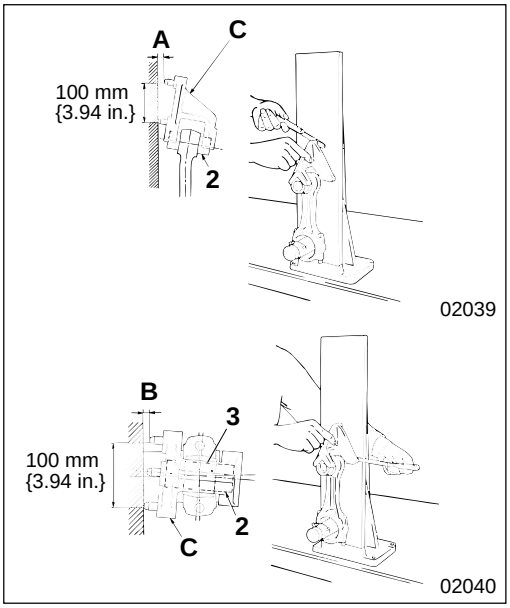
- **Make sure that the total mass error of all pistons 8 in one engine is 10 g {0.35 oz} or less.**
- **Be sure to install connecting rods 4, to be used in one engine, that have identical mass mark B.**
- **Be sure that after inserting piston pin 2 the connecting rod operates smoothly without excessive play.**

https://truckmanualshub.com/



2 **8** **Clearance between piston pin and piston**

If the clearance is higher than the limit, replace the faulty parts.



4 **Degree of bend or distortion of connecting rod**

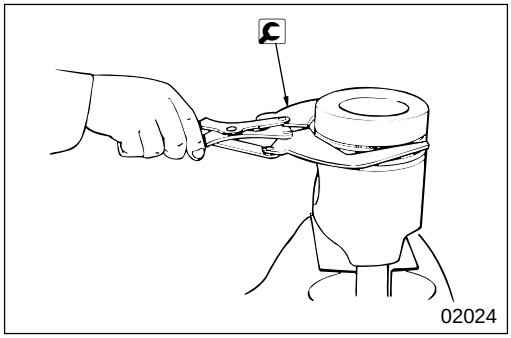
- Mount connecting rod bushing **3** and piston pin **2** to connecting rod **4**.
- Measure degree of bend **A** and distortion **B** of connecting rod **4**. If the measured value is higher than the limit, repair or replace the connecting rod.
  C : Connecting rod aligner (Measuring instrument)

NOTE

- **When making measurements by mounting connecting rod 4 to connecting rod aligner C, make sure that the upper connecting rod bearing and the lower connecting rod bearing are mounted on the rod.**
- **Mount the connecting rod cap by tightening the bolt at specified torque.** 🕮 **P11-26**

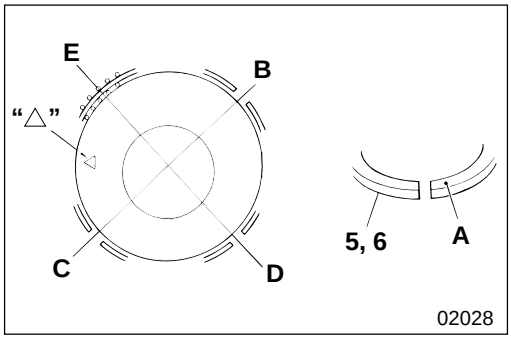
https://truckmanualshub.com/

PISTON, CONNECTING ROD AND CYLINDER SLEEVE



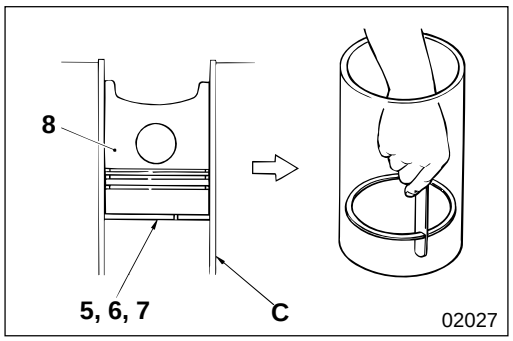
5 to 8 Piston ring and piston

Piston ring
[Removal]



[Installation]

- Install oil ring **7** so that split **D** and the butting joint of expander spring **E** come to the points as illustrated.
- Compression rings **5** and **6** have a manufacturer's mark **A** at the split, and installation should be made with the mark outward.
  B : The split of the 1st compression ring
  C : The split of the 2nd compression ring
  D : Oil ring slit
  E : Oil ring expander spring butt joint
  △ : Front mark of piston



[Inspection]

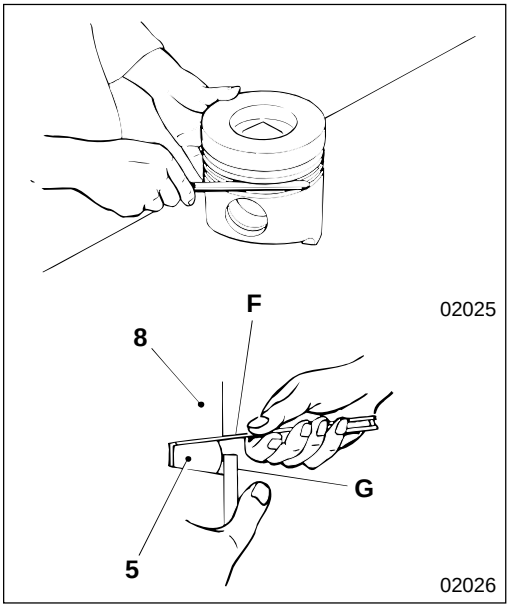
(1) Clearance of piston ring slit

- Install piston rings **5** to **7** into the crankcase cylinder sleeve using the head of piston **8** to level the piston ring.
- Measure the clearance of the piston ring split while keeping them level and stationary. If the measured value is higher than the limit, replace the piston ring.

NOTE

- **Use piston 8 to ensure that piston rings 5 to 7 are kept level when inserting them into the crankcase cylinder sleeve.**
- **Insert piston rings 5 to 7 into the lower part of the crankcase cylinder sleeve, where the area is less worn, when measuring clearance of piston ring split 5 to 7.**
- **Exchange the whole set of piston rings 5 to 7 as a set if any of the rings is faulty.**

https://truckmanualshub.com/



02025

02026

(2) Clearance between piston ring and ring groove

- If the measured value is higher than the limit, replace the faulty parts.
- Measure using feeler gauge **F**, by pressing 1st compression ring **5** against piston **8** with straight edge **G**.

NOTE

- **Measurement has to be conducted around the whole periphery of piston 8 after removing carbon deposits.**
- **Be sure to exchange the whole set of piston rings 5 to 7 as a set if any of the rings is faulty.**

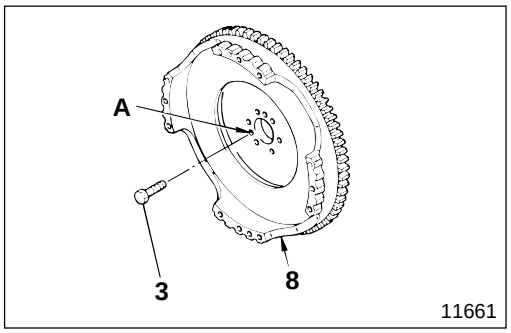
	Magnet base < Manual transmission > 00471	MH062356	

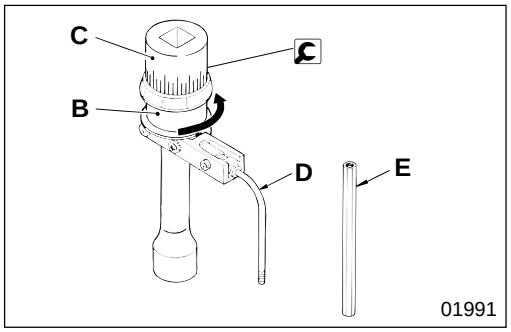
https://truckmanualshub.com/

◆ Service procedure



8 **Flywheel assembly**

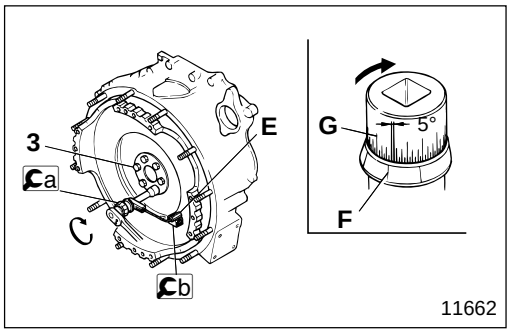
[Removal]
Screw bolt **3** into extraction hole **A** of flywheel assembly **8** to remove the flywheel assembly.



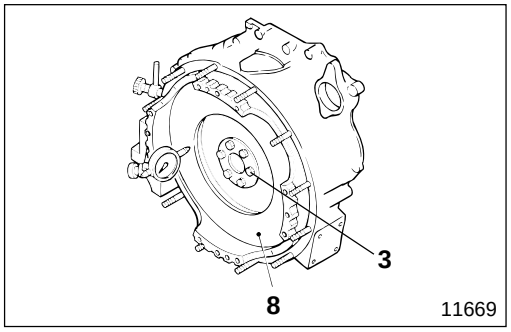
[Installation]
< Manual transmission >
- Center punch the head of bolt **3** before installation.

CAUTION
If there are three punches already, replace with a new bolt.

- After tightening bolt **3** at specified torque, tighten further as follows :
- Turn socket wrench holder **B** counterclockwise and keep the spring in the wrench compressed.
  C : Socket
  D : Rod
  E : Rod (for connection)



- Set socket wrench holder **B** so that the repercussive force of its spring presses rod **E** (for connection) against b magnetic base.
- Select a scale that is convenient for reading graduation **F** on holder **B** side.
- Tighten further by turning the socket clockwise by 150° (setting is in 5° increments) referring to graduation **G** on the selected scale.

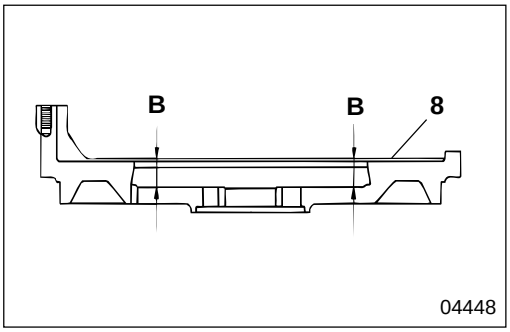


[Inspection]
< Manual transmission >

(1) Wobble

If the measured value is higher than the limit, check the fastening of bolt **3**, the attachment surface of crankshaft assembly, and depending on the condition found, either repair or replace flywheel assembly **8**.

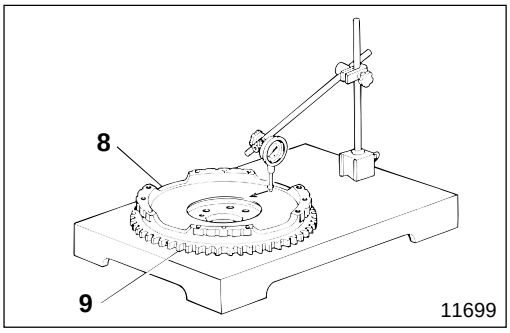
https://truckmanualshub.com/



(2) Height of friction surfaces

If the measured value is lower than the limit, repair or replace flywheel assembly **8**.

B : Height from bolt mounting surface to friction surface

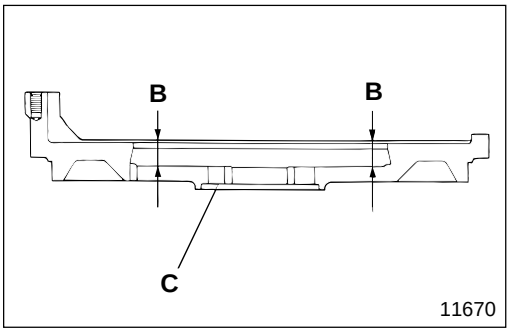


(3) Distortion of friction surface

If the measured value is lower than the limit, repair or replace flywheel assembly **8**.

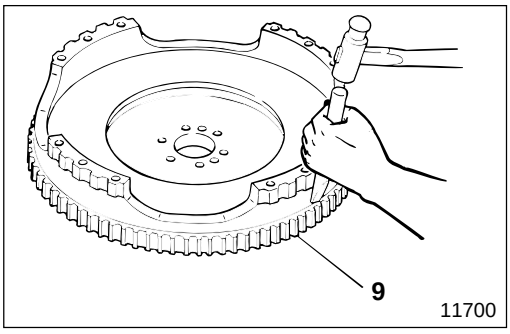
NOTE

If any fault is found in ring gear 9, replace it first, then begin the inspection.



[Correction]

Make sure when grinding the friction surfaces for correction, that height **B** is not lower than the limit while maintaining the degree of parallel with surface **C** within 0.1 mm {0.0039 in.}.



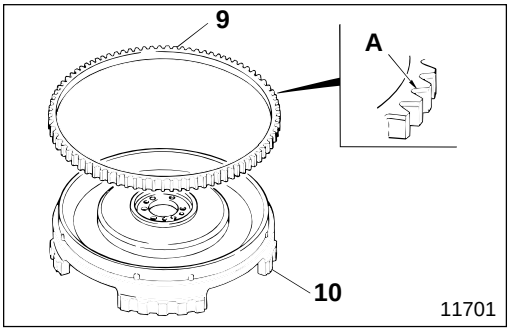
9 Ring gear

[Inspection]

Check and see if there is any damage, wear or other fault, and if any fault is found, replace ring gear **9**.

[Removal]

- Heat up ring gear **9** evenly using an acetylene torch.
- Hammer the outer edge of ring gear **9** evenly until it drops off.

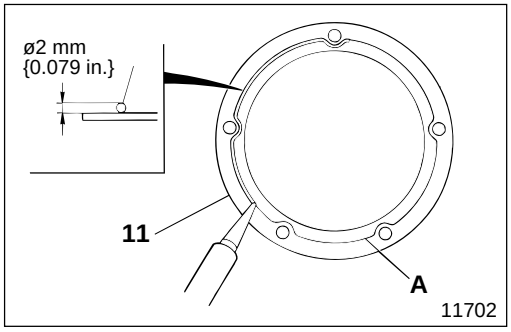


[Installation]

- Heat up ring gear **9** using a piston heater to approximately 100°C {212°F} for three minutes.
- With the side of the chamfered teeth of ring gear **9** facing you, mount it on flywheel **10**.

  A : Chamfered ring gear side

https://truckmanualshub.com/

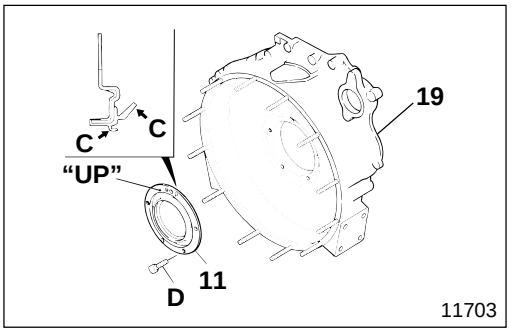


11 Installation of rear oil seal

- Apply sealant **B** along line **A** of rear oil seal **11** evenly without break.

CAUTION

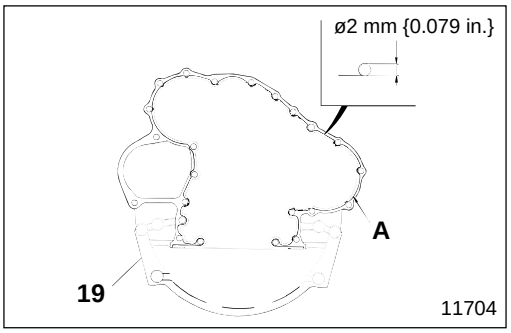
- **Be sure the surface of rear oil seal 11, where sealant is to be applied, is clean.**
- **Be sure not to disturb the sealant during installation.**
- **Do not start the engine for at least 30 minutes after installing rear oil seal 11.**
- **Be sure to reapply sealant B if the mounting bolts of rear seal 11 are loosened.**



- Apply engine oil to lip area **C** of rear oil seal **11**.
- Install rear oil seal **11** into flywheel housing **19** in the direction as illustrated.

CAUTION

Be sure to reapply sealant B if bolts D (for mounting rear oil seal 11) are loosened or removed by any cause whatsoever after mounting.



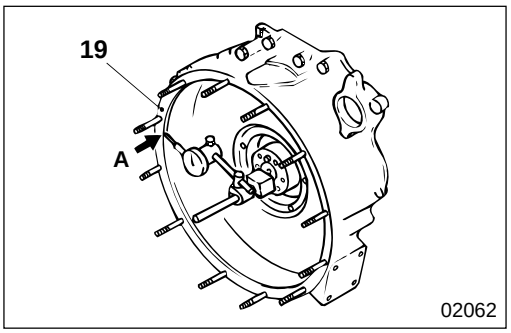
19 Flywheel housing

[Installation]

- Apply sealant **A** to the mounting surface of flywheel housing **19**, where the crankcase is to be installed, evenly without break.
- After applying sealant **A**, within three minutes, mount flywheel housing **19** to the crankcase.

CAUTION

- **Be sure the surface of flywheel housing 19, where the sealant is to be applied, is clean.**
- **Be sure not to disturb the sealant during installation.**
- **Do not start the engine for at least 1 hour after installing flywheel housing 19.**
- **Be sure to reapply sealant A if the mounting bolts of rear seal 19 are loosened.**



[Inspection]

- Turn crankshaft * and measure the amount of eccentricity (out-of-roundness) at mating recession **A** of flywheel housing **19**.
- Reassemble if the amount of eccentricity exceeds the limit.
- If the amount of eccentricity exceeds the limit after reassembly, replace the faulty parts.

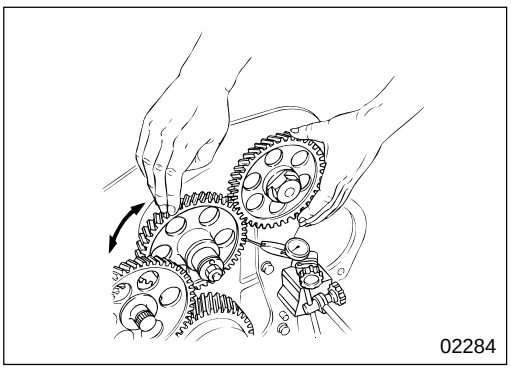
◆ Service procedure



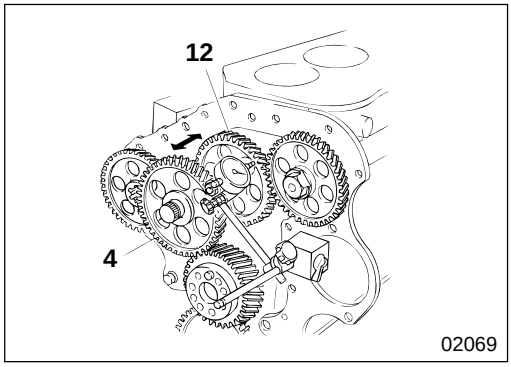
02284

● Inspection before disassembly

(1) Backlash of each gear

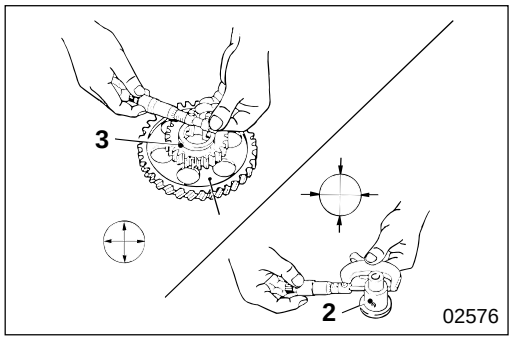
Measure three or more locations on the pairing gears and if the measurements are higher than the limit, replace the faulty parts.

https://truckmanualshub.com/



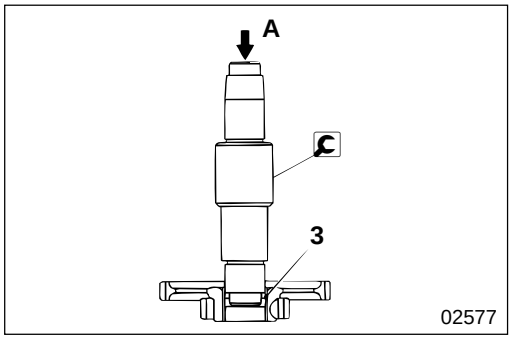
(2) End play of No.1, 2 idler gears

If the measured value is higher than the limit, replace the faulty parts.



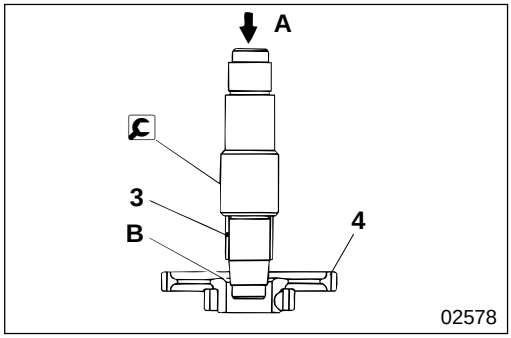
2 3 No.1 idler shaft and No.1 idler gear bushing

[Inspection]
If the clearance is higher than the limit, replace the faulty parts.



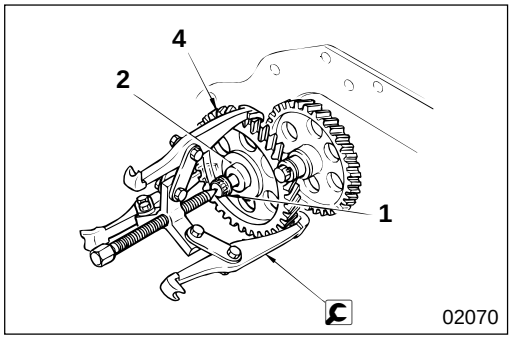
No.1 idler gear bushing

[Removal]
A : press



[Press-fitting]

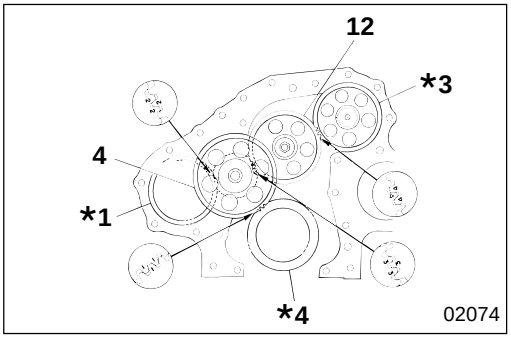
- Press in No.1 idler gear bushing **3** from the chamfered end **B** of No.1 idler gear **4**.
  A : press
- After press-fitting, finish the fitting by adjusting the clearance between idler gear bushing **3** and idler shaft **2** to the standard value.



2 4 Removal of No.1 idler shaft and No.1 idler gear

Loosen bolt **1** by about 15 mm {0.59 in.} to remove No.1, 2 idler shafts and No.1, 4 idler gears in combination.

https://truckmanualshub.com/



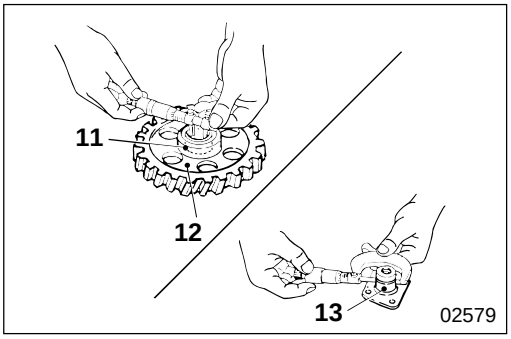
4 **12** **Installation of No.1, 2 idler gears**

Install idler gears **4**, **12** by matching alignment marks "**1**", "**2**", "**3**", "**4**" on the gears that engage with those on the idler gears.

***1** : Drive gear
***3** : Camshaft gear
***4** : Crankshaft gear

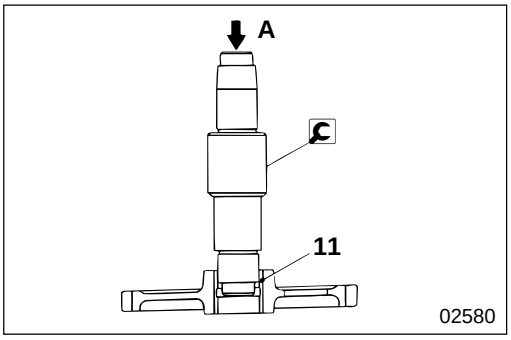
NOTE

When aligning each gear with its alignment mark, make sure that pistons No.1, 6 are higher than top dead center.



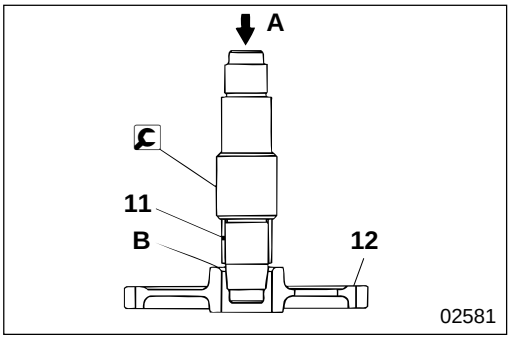
11 **13** **No.2 idler gear bushing and No.2 idler shaft**

[Inspection]
If the clearance is higher than the limit, replace the faulty parts.



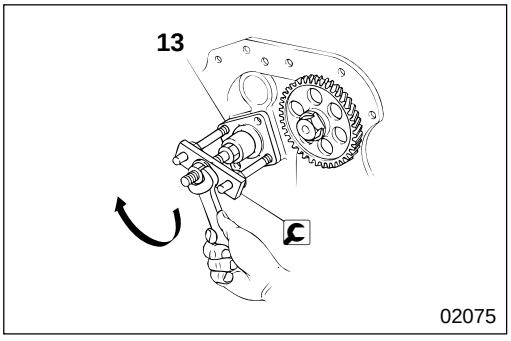
No.2 idler gear bushing

[Removal]
A : press



[Installation]

- Press in No.2 idler gear bushing **3** from the chamfered end **B** of No.2 idler gear **12**.
  A : press
- After press-fitting, finish the fitting by adjusting the clearance between idler gear bushing **11** and idler shaft **13** to the standard value.



13 **Removal of idler shaft No.2**

https://truckmanualshub.com/

02084

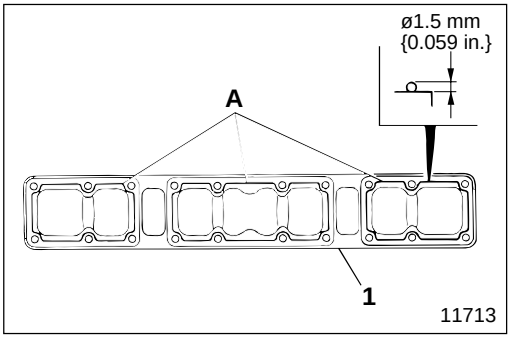
◆ Service procedure

● Inspection before disassembly

Camshaft end play

If the measured value is higher than the limit, replace the thrust plate.

https://truckmanualshub.com/

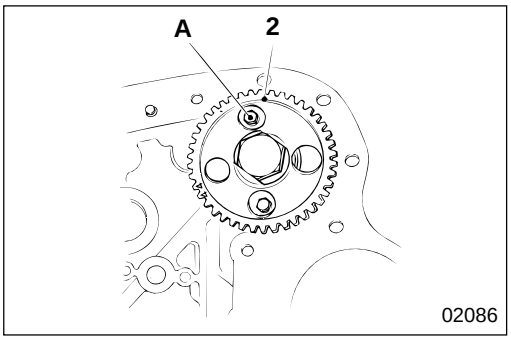


1 Installation of side cover

- Apply sealant **A** to the mounting surface of side cover **1**, evenly without break.
- After applying sealant **A**, within three minutes, mount side cover **1** to the crankcase.

CAUTION

- **Be sure the surface of side cover 1, where the sealant is to be applied, is clean.**
- **Be sure not to disturb the sealant during installation.**
- **Do not start the engine for at least 1 hour after installing side cover 1.**
- **Be sure to reapply sealant A if the mounting bolts of side cover 1 are loosened.**



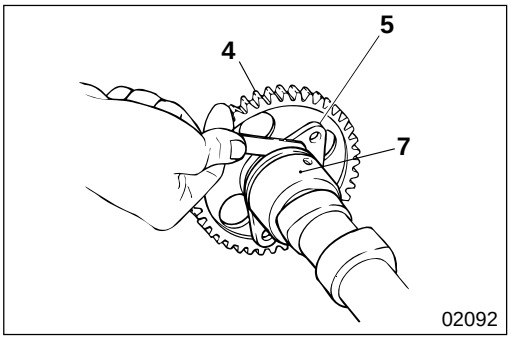
2 Camshaft assembly

[Removal]

- To remove camshaft assembly **2** first remove side cover **1**.
- Then, remove bolt **A** from the hole in camshaft gear **8**, then withdraw camshaft assembly **2** slowly, supporting it with your hand.

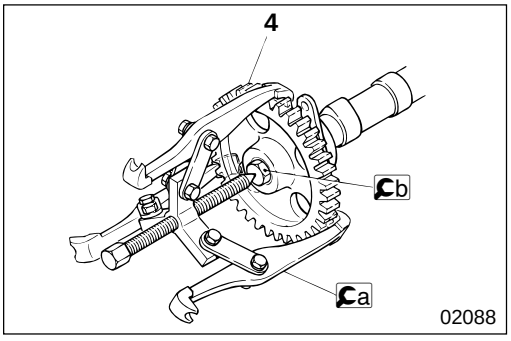
CAUTION

Be careful not to damage camshaft bushings 12 to15 when you remove camshaft assembly 2.



[Installation]

- Before installing camshaft assembly **2**, measure the end play between thrust plate **5** and camshaft **7**.
- If the measured value is higher than the limit, replace thrust plate **5**.
- Install the camshaft assembly by matching the alignment mark on camshaft gear **4** with the alignment mark on the No.2 idler gear. P11-49



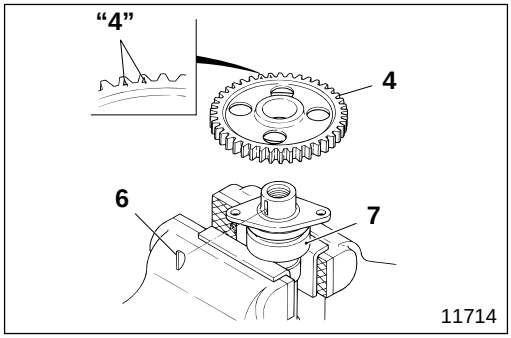
4 Camshaft gear

[Removal]

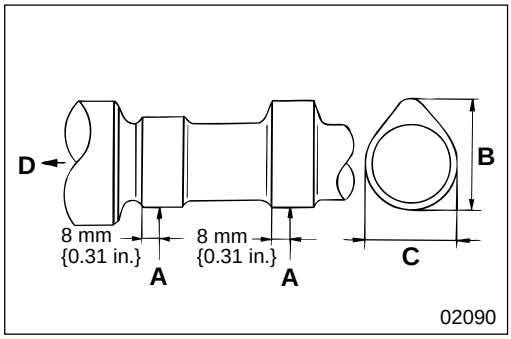
CAUTION

Never remove camshaft gear 4 by striking, hitting or hammering it.

https://truckmanualshub.com/



[Installation]
- Install camshaft gear **4** onto camshaft **7** in the direction as illustrated.
- Be sure when finishing the installation to install key **6**.



7 Inspection of camshaft

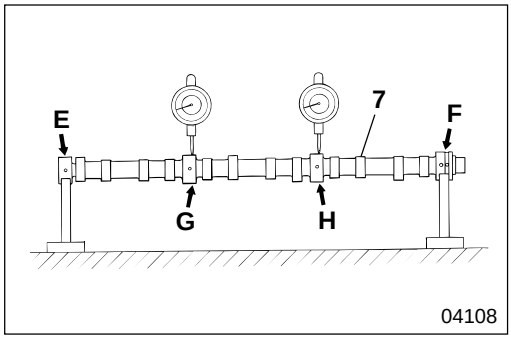
(1) Difference between short diameter and long diameter

If the measured value is lower than the limit, replace camshaft **7**.

NOTE

Measure at point A as illustrated, because the cam is tapered.

B : Long diameter
C : Short diameter
D : Front of the engine

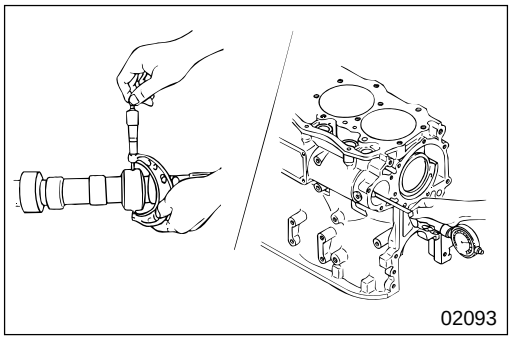


(2) Degree of bend

To measure bend, support camshaft **7** at area **E** of No.1 journal, and area **F** of No.4 journal. Then, measure the amount of bend at area **G** of No.2 journal and area **H** of No.3 journal. If any of the measured values are higher than the limit, replace the camshaft.

NOTE

The degree of bend of camshaft 7 is half of the indicated value of the gauge after rotating the shaft 360°.

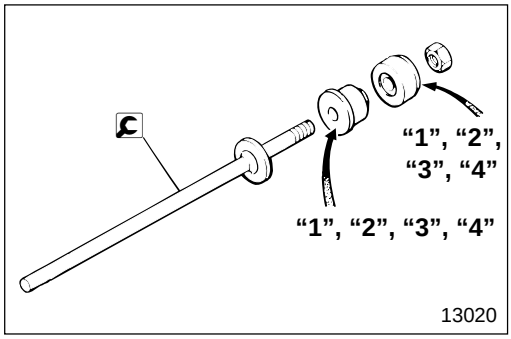


7 to 11 Camshaft and camshaft bushing

[Inspection]
If the measured value is higher than the limit, replace the faulty parts.

NOTE

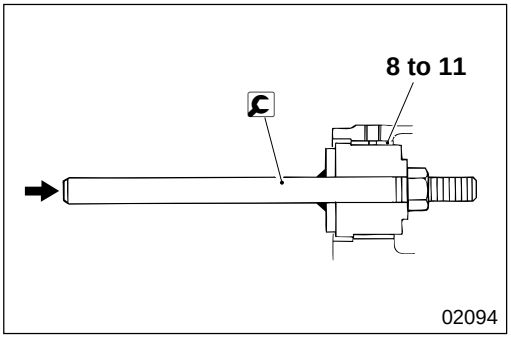
Measure bushings 8 to 11 mounted in crankcase.



To remove or install the camshaft bushings, use camshaft bushing installers and extractors, which have identification numbers "**1**", "**2**", "**3**" and "**4**" to identify the corresponding bushing.

Bushing No. (From engine front)	Identification marks
1	**1**
2	**2**
3	**3**
4	**4**

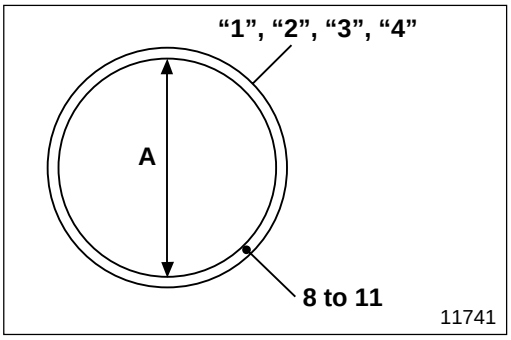
https://truckmanualshub.com/



Camshaft bushing

[Removal]

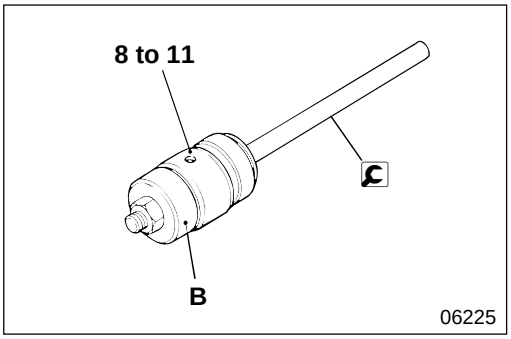
Remove No.4, 3 camshaft bushings **8**, **9** from the rear end of the engine, and No.2, 1 camshaft bushings **10**, **11** from the front end of the engine.



[Press-fitting]

- Identification numbers "**1**", "**2**", "**3**" or "**4**" on camshaft bushings **8** to **11** indicate the corresponding camshaft numbers. If the number is not clear, measure the bushing inner diameter and identify the corresponding camshaft number by referring to the table below :

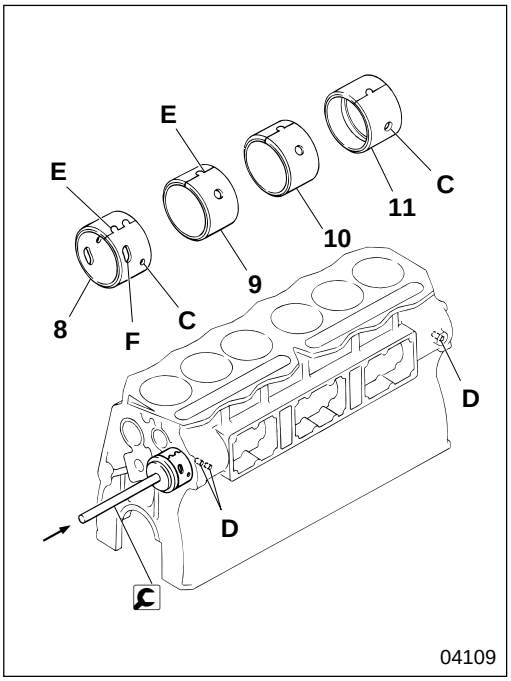
Bushing No. (From engine front)	Identification number	Inner diameter mm {in.}
No. 1	1	57.75 {2.27}
No. 2	2	58.00 {2.28}
No. 3	3	58.25 {2.29}
No. 4	4	58.50 {2.30}



- For press-fitting, mount guide **B** to camshaft bushing installer and extractor.
- Install camshaft bushings **8** to **11** in descending order from No.3 to 1.

NOTE

Install No.3, 4 camshaft bushings 9, 8 from the rear end of the engine, and No.2, 1 camshaft bushings 10, 11 from the front end of the engine.



- Install the camshaft bushings by aligning bushing oil port **C** and crankcase oil port **D** at No.1 camshaft bushing **11**, and No.4 camshaft bushing **8**.
  Position bushing No.4 so that the oblong side of oil port **F** comes to the rear of the engine and press bushing No.4 in.
  E : Butting area of bushing

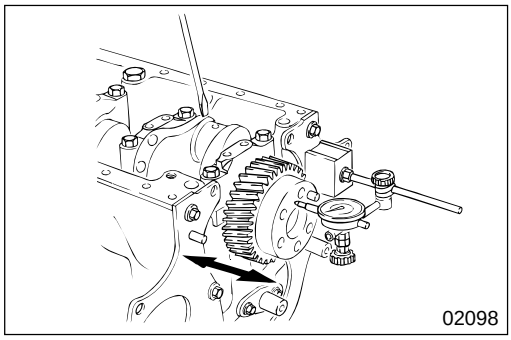
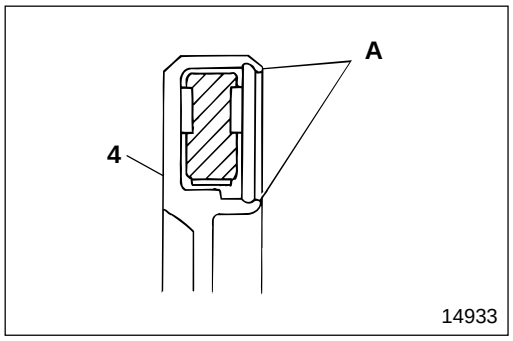
◆ Service procedure



● **Inspection before disassembly**

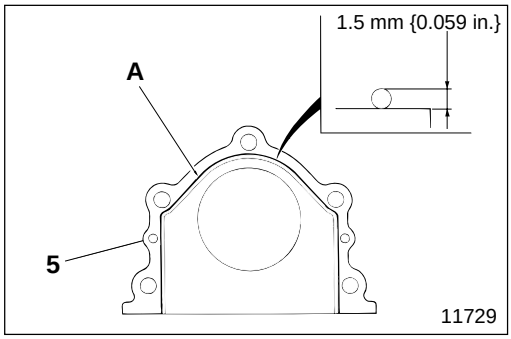
Crankshaft assembly end play
If the measured value is higher than the limit, replace thrust plates **12** with oversized ones. 📖 P11-60
< Available oversize ones >
+0.15, +0.30, +0.45 mm {+0.0059, +0.012, +0.018 in.}



4 **Torsional damper**

CAUTION⚠

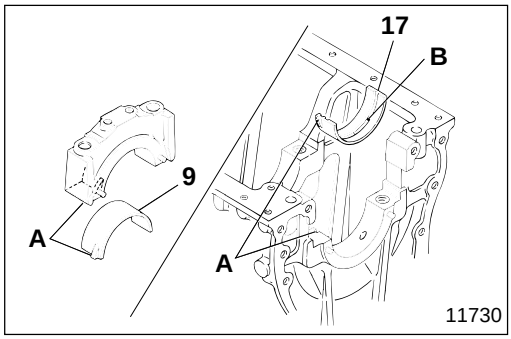
Pay attention to the following because silicon oil leakage from caulked area A of viscous type torsional damper 4 might cause damage to its function.
- **Make sure that there are no dents or marks caused by hammer blows in caulked area A.**
- **Be sure not to subject it to shock from hammer blows or by dropping it.**
- **Do not roll it or pile parts up on it.**



5 **Installation of front cover assembly**

- Apply sealant **A** to the mounting surface of front cover assembly **5** where the crankcase is to be installed, evenly without break .
- After applying sealant **A**, within 3 minutes, mount front cover assembly **5** to the crankcase.

CAUTION⚠
- **Be sure the surface of front cover assembly 5 , where the sealant is to be applied, is clean.**
- **Be sure not to disturb the sealant during installation.**
- **Do not start the engine for at least 1 hour after installing front cover assembly 5.**
- **Be sure to reapply sealant A if the mounting bolts of front cover assembly 5 are loosened.**



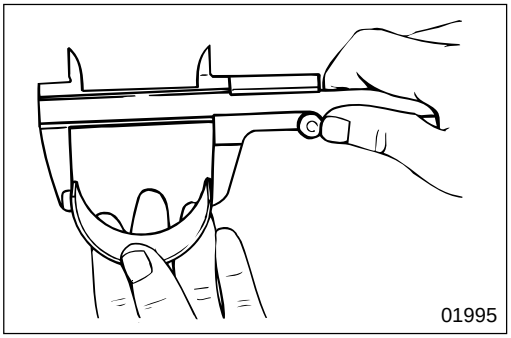
9 **17** **Main bearing**

[Installation]
When installing main bearings **9**, **17** align lugs **A**.

CAUTION⚠

Be sure to distinguish between main bearings 9, 17. The upper bearing has oil opening B while the lower bearing has no oil opening.

https://truckmanualshub.com/



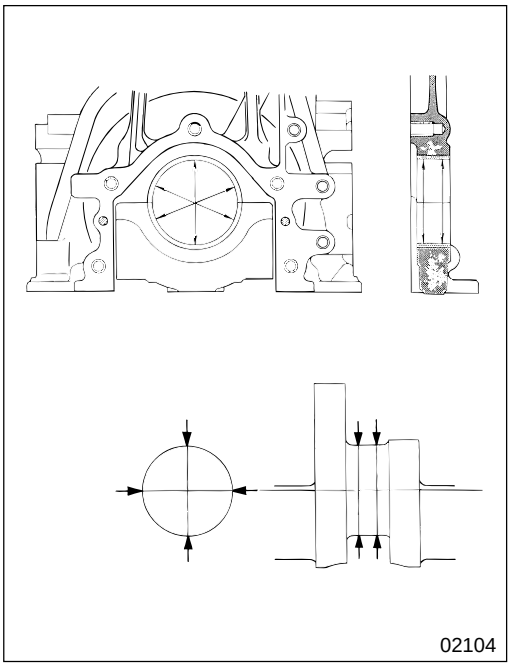
[Inspection]

CAUTION⚠

- **Do not forcibly expand main bearings 9, 17.**
- **Be sure to replace both upper and lower main bearings 9, 17 as a pair when replacement is necessary.**

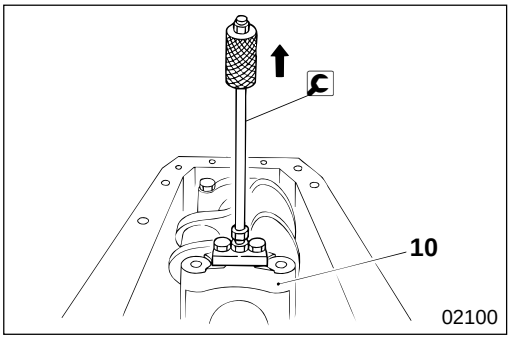
(1) Expansion at free state

If the measured value is lower than the limit, replace main bearings **9**, **17**.



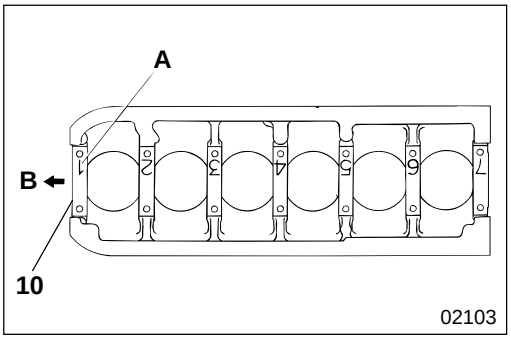
(2) Clearance between main bearing and crankshaft

If the measured value is lower than the limit, replace the faulty parts.



10 Main bearing cap

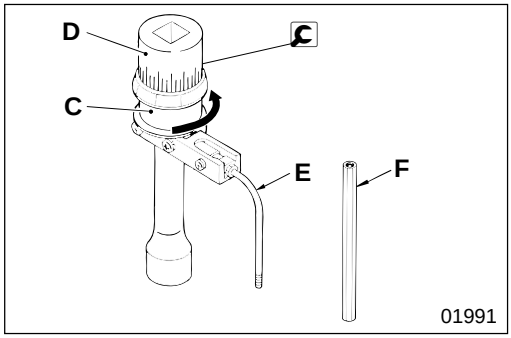
[Removal]



[Installation]

- Install main caps **10** in the direction as illustrated, from punched number **A** at the front of the engine **B**.

https://truckmanualshub.com/

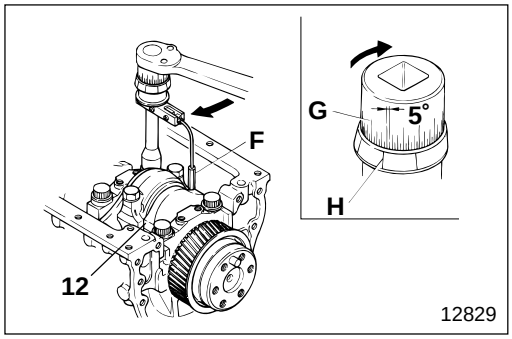


- Center punch the head of bolt **8** before installation.

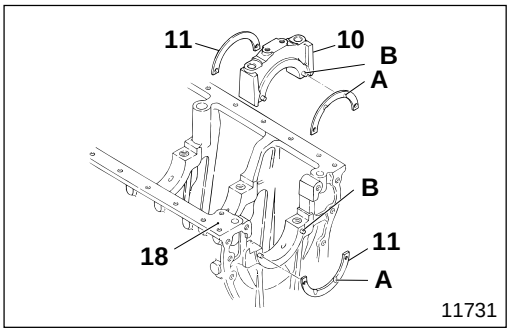
CAUTION

If there are three punches already, replace with a new bolt.

- Turn socket wrench holder **C** counterclockwise and keep the spring in the wrench compressed.
  D : Socket
  E : Rod
  F : Rod (for connection)



- Set socket wrench holder **C** so that the repercussive force of the spring presses rod **F** (for connection) against crankshaft **12**.
- Select a scale that is convenient for reading graduation **G** on holder **C**.
- Tighten further by turning socket **D** clockwise by 90° (setting is in 5° increments) referring to graduation **H** on the selected scale.
- After installation, check the following points :
  - Crankshaft assembly can be rotated easily by hand.
  - The end play of crankshaft assembly **12**. P11-58



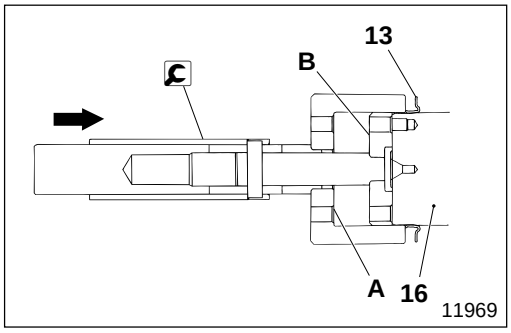
11 **Installation of thrust plate**

Install thrust plates **11** on both ends of rear main bearing cap **10** and the rear end of crankcase **18** with oil grooves **A** facing towards the outside.

B : Positioning pin

NOTE

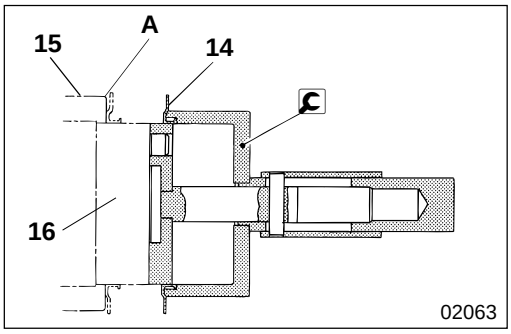
When installing oversized thrust plates 11, mount them on the front and rear of rear main bearing cap 10. It is not necessary that the thrust plates used are all of the same size, but use the same-size-combination of thrust plates for mounting on the rear of crankcase 18 and on the rear of the rear bearing cap.



13 **Installation of front oil seal slinger**

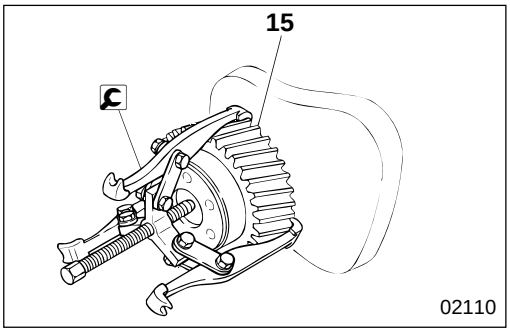
To install front oil seal slinger **13**, drive the front oil seal slinger into crankshaft **16** until end surface **A** of front oil seal slinger installer makes secure contact with guide **B**.

https://truckmanualshub.com/



14 Installation of rear oil seal slinger

Press in rear oil seal slinger **14** using 🔧 rear oil seal slinger installer until end contacts with end **A** of crankshaft gear **15** securely.

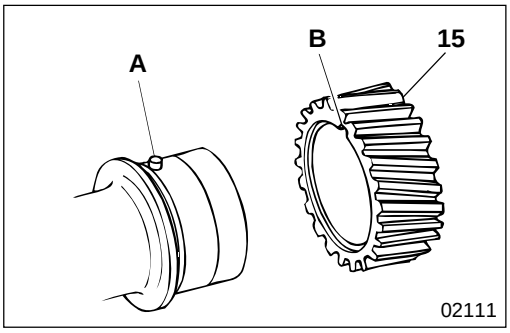


15 Crankshaft gear

[Removal]

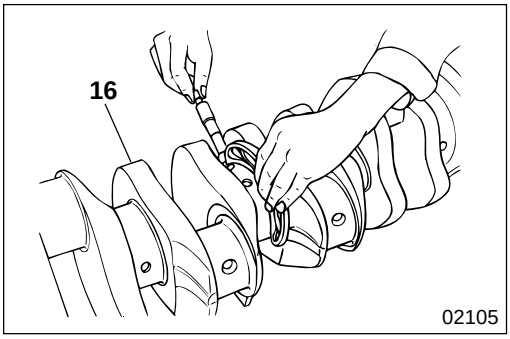
CAUTION ⚠

Do not tap out crankshaft gear 15, or it might be damaged.



[Installation]

- Warm up crankshaft gear **15** to 100°C {212 °F} using a piston heater.
- Align indents **B** of positioning pin **A** and crankshaft gear **15** with each other, and drift in by lightly tapping the end of the gear using a mallet.

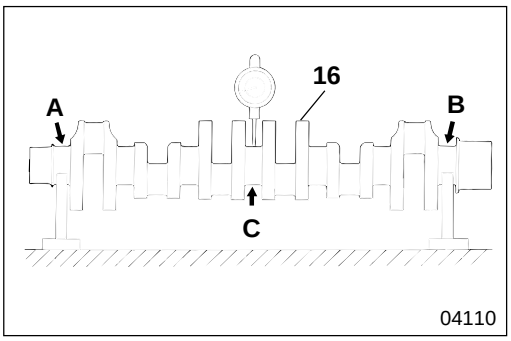


16 Crankshaft

[Inspection]

(1) Cylindrical and circular accuracy of the journal and the pin

If the measured value is higher than the limit, grind and correct crankshaft **16** to convert it to the undersize specifications or replace it.



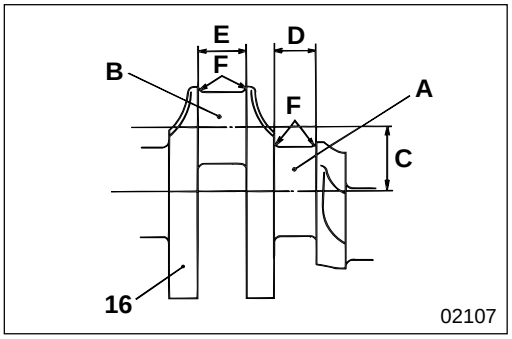
(2) Degree of bend

The degree of bend of crankshaft **16** is measured at No.4 journal **C** by supporting No.1 journal **A** and No.7 journal **B.** If the measured value is higher than the limit, replace the crankshaft.

NOTE

The degree of bend of crankshaft 16 is half of the indicated value of the gauge after rotating the shaft 360°.

https://truckmanualshub.com/

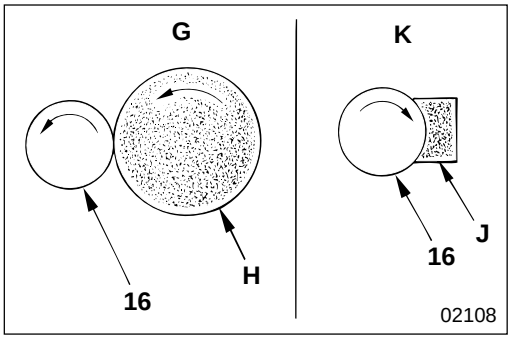


[Correction]

NOTE

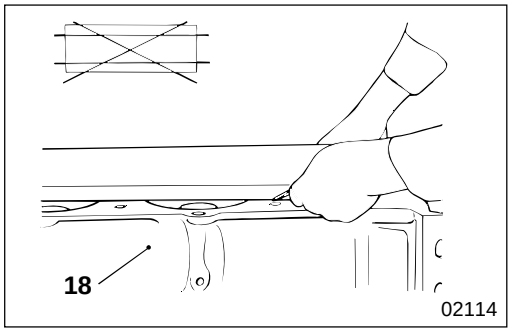
Be sure to replace main bearings 9, 17 with those that meet the undersize specifications after crankshaft 16 is corrected by grinding.

- Set **C**, distance between the center line of the journal **A** and that of the pin **B**, constant.
  C : $57.5^{+0.025}_{-0.075}$ mm {$2.26^{+0.00098}_{-0.0030}$ in.}
- Set the width of journal **D** and pin **E** so they are constant.
  D : 37 mm {1.46 in.} (No.7 journal : $37^{+0.025}_{0}$ mm {$1.46^{+0.00098}_{0}$ in.})
  E : $42^{+0.2}_{0}$ mm {$1.65^{+0.0079}_{0}$ in.}
- Finish the fillet **F** smoothly.
  F : R4±0.2 mm {0.0079 in.}
- Check and confirm that there has been no cracking caused by grinding using the magnetic particle inspection method (Magnafluxing). Also make sure the surface hardness has not deteriorated (Shore hardness to be maintained at not less than Hs 75).
- When grinding **G**, set crankshaft **16** and grinder **H** so that they both rotate counterclockwise as viewed from the front of the crankshaft.
- To finish grinding **J** using a grindstone or emery paper **K,** rotate crankshaft **16** clockwise.



Undersize specifications of crankshaft Unit : mm {in.}

	Undersize scales			
	0.25 {0.0098}	0.50 {0.020}	0.75 {0.030}	1.00 {0.039}
Finish outer diameter of journal	79.685 to 79.705 {3.1371 to 3.1379}	79.435 to 79.455 {3.127 to 3.128}	79.185 to 79.205 {3.117 to 3.118}	78.935 to 78.955 {3.107 to 3.108}
Finish outer diameter of pin	64.67 to 64.69 {2.5460 to 2.5468}	64.42 to 64.44 {2.536 to 2.537}	64.17 to 64.19 {2.526 to 2.527}	63.92 to 63.94 {2.516 to 2.517}
Circular accuracy	0.01 {0.00039} or less			
Cylindrical accuracy	0.006 {0.00024} or less			



18 **Crankcase top surface distortion**

If the measured value is higher than the limit, grind and correct using a surface grinder.

CAUTION⚠

When grinding crankshaft 18 be sure that the extent of piston protrusion does not deviate from the standard value.
Piston protrusion : 🕮 P11-28

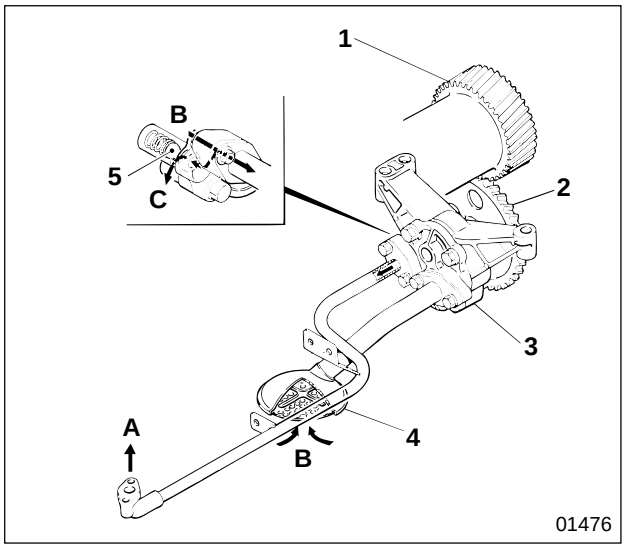
28 Oil pan

https://truckmanualshub.com/

Oil Pump

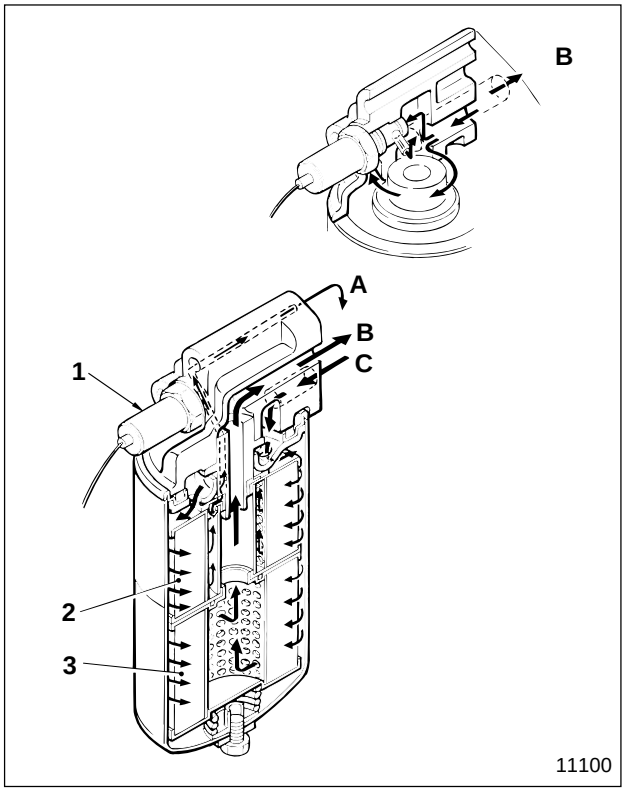


1 Crankshaft gear
2 Oil pump gear
3 Oil pump
4 Oil strainer
5 Relief valve

A : To oil filter
B : From oil pan
C : To oil pan

Oil pump **3** is a gear type, driven by rotation of the crankshaft transmitted by crankshaft gear **1** that engages oil pump gear **2**. Relief valve **5** is installed on the oil pump and when the oil pump discharge pressure becomes higher than standard, part of the engine oil is returned to the oil pan by relief action of the valve, protecting the lubricating system from breakdown caused by excessive oil pressure.

Oil Filter



1 Engine oil bypass alarm switch
2 Bypass filter element
3 Full-flow filter element

A : To oil pan
B : To oil cooler
C : From oil pump

This oil filter uses a spin-on filter paper type element that integrates full-flow filter element **3** and bypass filter element **2**.

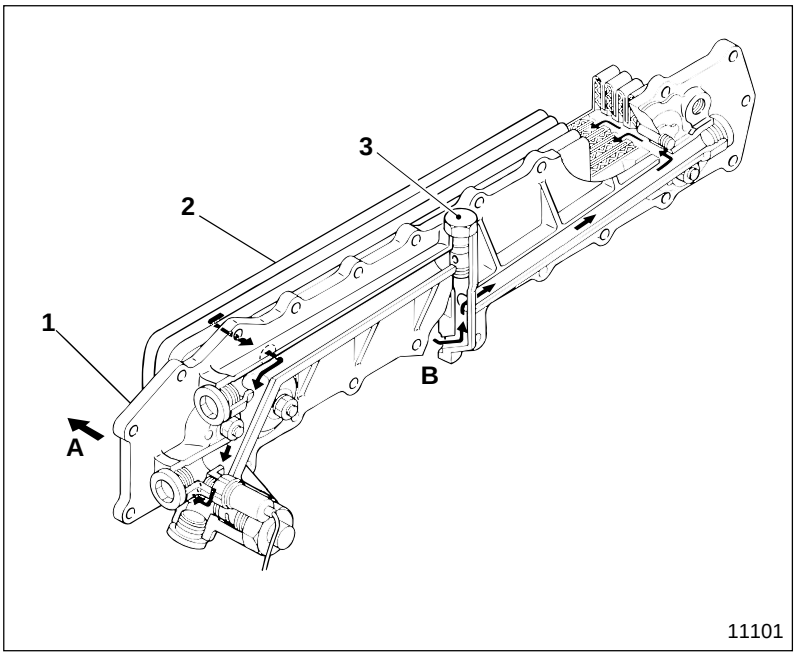
Operation of engine oil bypass alarm switch

- When the oil filter element is clogged, the engine oil pressure on flow becomes low and might cause seizure of engine parts, engine oil bypass alarm switch **1** is installed to prevent this.

- When the oil filter element is clogged, engine oil bypass alarm switch **1** lets the engine oil flow directly to oil cooler **B**, bypassing full-flow filter element **3**. When the engine oil bypass alarm switch is activated it lights the warning lamp, warning the driver that the oil filter element is clogged.

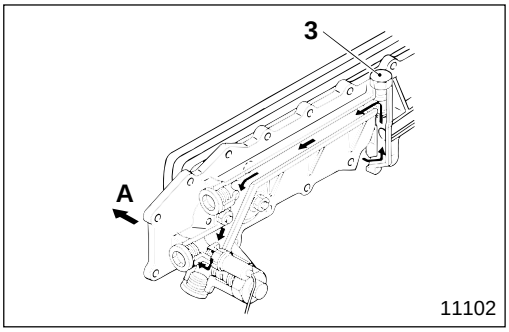
https://truckmanualshub.com/

Oil Cooler



1 Oil cooler cover
2 Oil cooler element
3 Bypass valve

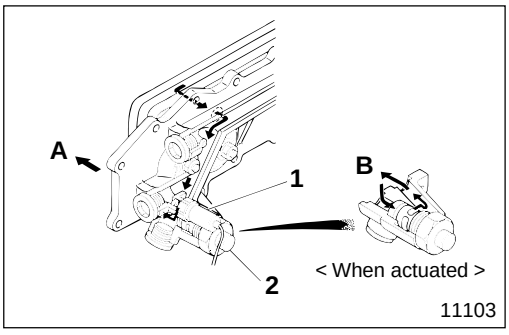
A : To main oil gallery
B : From oil filter



● **Bypass valve**

When the viscosity of the engine oil is high at low temperatures, or when oil cooler element **2** is clogged, flow resistance is high, and if this happens, bypass valve **3** opens to let the engine oil return directly to main oil gallery **A** without going through the oil cooler.

Engine Oil Pressure Switch, Regulator Valve



1 Engine oil pressure switch
2 Regulator valve

A : To main oil gallery
B : To oil pan

● **Engine oil pressure switch**

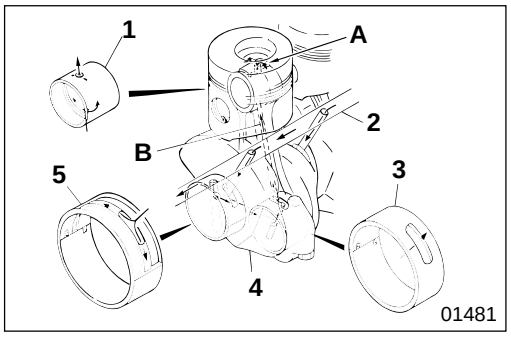
When pressure for delivering the engine oil to main oil gallery **A** becomes lower than standard, the built-in electric contact point of engine oil pressure switch **1** closes to light warning lamp in the meter cluster, warning the driver that the oil pressure is abnormal.

● **Regulator valve**

When the oil pressure in the main oil gallery becomes higher than standard, regulator valve **2** opens to let part of the engine oil return to oil pan **B**, thereby regulating the oil pressure.

https://truckmanualshub.com/

Lubrication of Related Parts



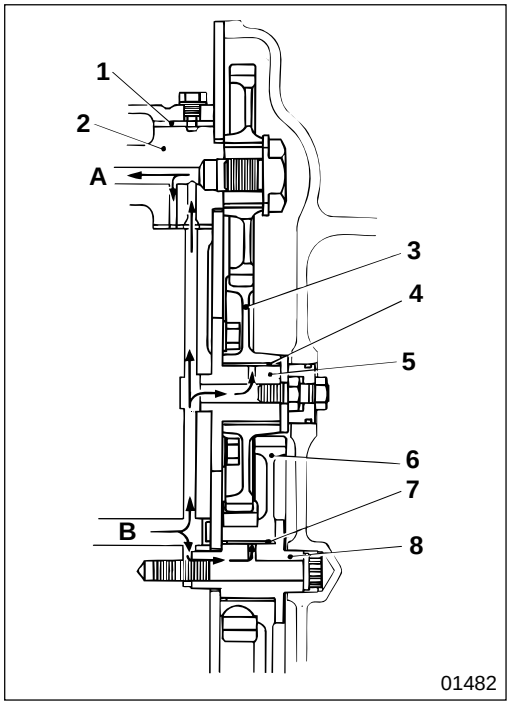
Engine oil delivered to the main oil gallery lubricates the following related parts.

● **Main bearing and connecting rod bearing**

1 Connecting rod bushing
2 Main oil gallery
3 Main bearing
4 Crankshaft
5 Connecting rod bearing

A : Oil jet
B : Connecting rod oil passage

Engine oil supplied through the oil passage drilled in crankshaft **4** flows through connecting rod oil passage **B** to lubricate the small end of the connecting rod, the engine oil then sprays out oil jet **A** at the top of the connecting rod to cool the piston.



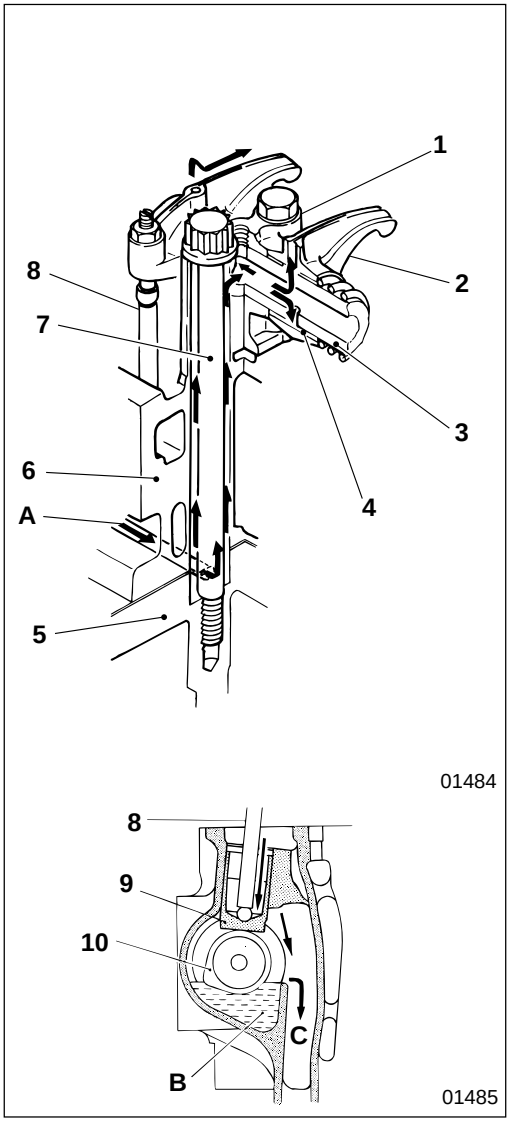
● **Timing gear and camshaft**

1 Camshaft bushing No.4
2 Camshaft
3 Idler gear No.2
4 Idler gear bushing
5 Idler gear shaft No.2
6 Idler gear No.1
7 Idler gear bushing
8 Idler gear shaft No.1

A : To rocker bushing
B : From main oil gallery

Engine oil flows through the inside of camshaft **2** and lubricates each camshaft bushing.

https://truckmanualshub.com/

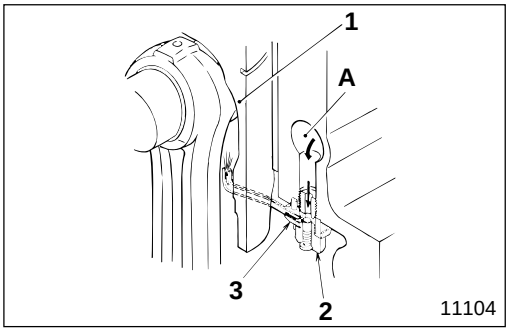


● **Valve mechanism**

1 Rocker shaft bracket
2 Rocker
3 Rocker shaft
4 Rocker bushing
5 Crankcase
6 Cylinder head
7 Cylinder head bolt
8 Push rod
9 Tappet
10 Camshaft

A : From No.4 camshaft bushing
B : Oil sump
C : To oil pan

Engine oil is lead to oil reservoir **B** to lubricate camshaft tops after lubricating rocker **2**, camshaft bushing, etc.



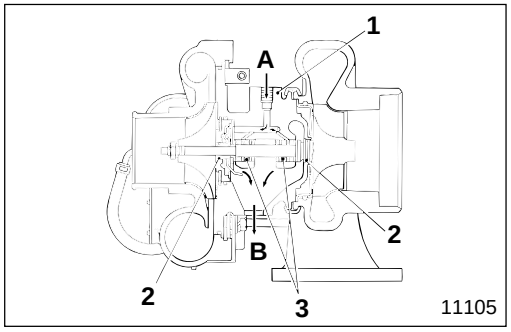
● **Oil jet**

1 Piston
2 Check valve
3 Oil jet

A : Main oil gallery

An oil jet **3** is installed, in the lower part of main oil gallery **A**, for each cylinder and cools pistons **1** by injecting engine oil toward the inside of the piston. The oil jet is fitted with check valve **2** which opens and closes at standard oil pressure levels. This prevents a decrease of oil volume at low oil pressure as well as a decrease of oil pressure itself.

https://truckmanualshub.com/

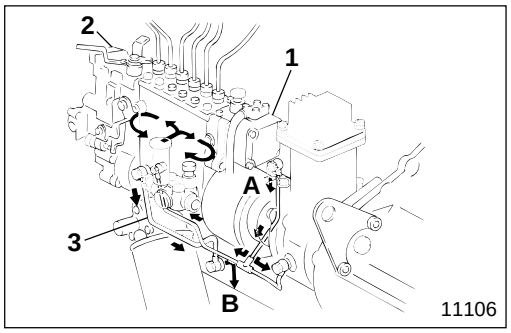


● **Turbocharger**

1 Bearing housing
2 Piston ring
3 Bearing

A : From main oil gallery
B : To oil pan

Engine oil is delivered from the main oil gallery to bearing housing **1** through the oil pipe to lubricate the inside of the bearing housing. Piston ring **2** installed at both ends of the turbine wheel shaft works as an oil seal.

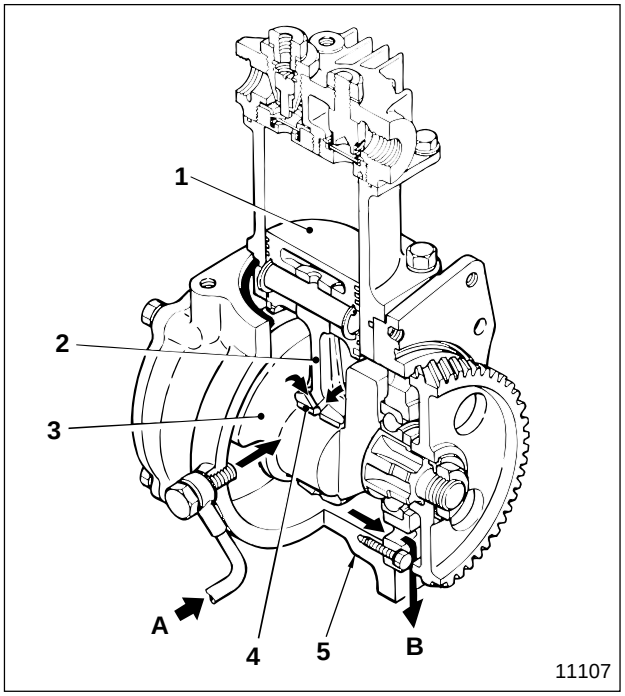


● **Injection pump**

1 Injection pump
2 Governor
3 Oil return pipe

A : From main oil gallery
B : To oil pan

Engine oil that has lubricated injection pump **1** and governor **2** returns to the oil pan through oil return pipe **3**.



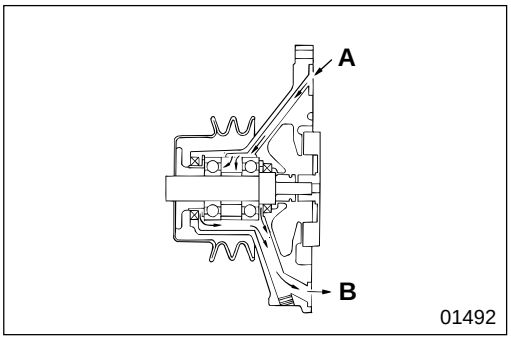
● **Air compressor**

1 Piston
2 Connecting rod
3 Crankshaft
4 Connecting rod bushing
5 Crankcase

A : From main oil gallery
B : To oil pan

Engine oil from the main oil gallery splashes connecting rod **2** and lubricates connecting rod bushing **4**. Then the rotation of crankshaft **3** splashes engine oil onto piston **1** and the small end of the connecting rod to lubricate them.

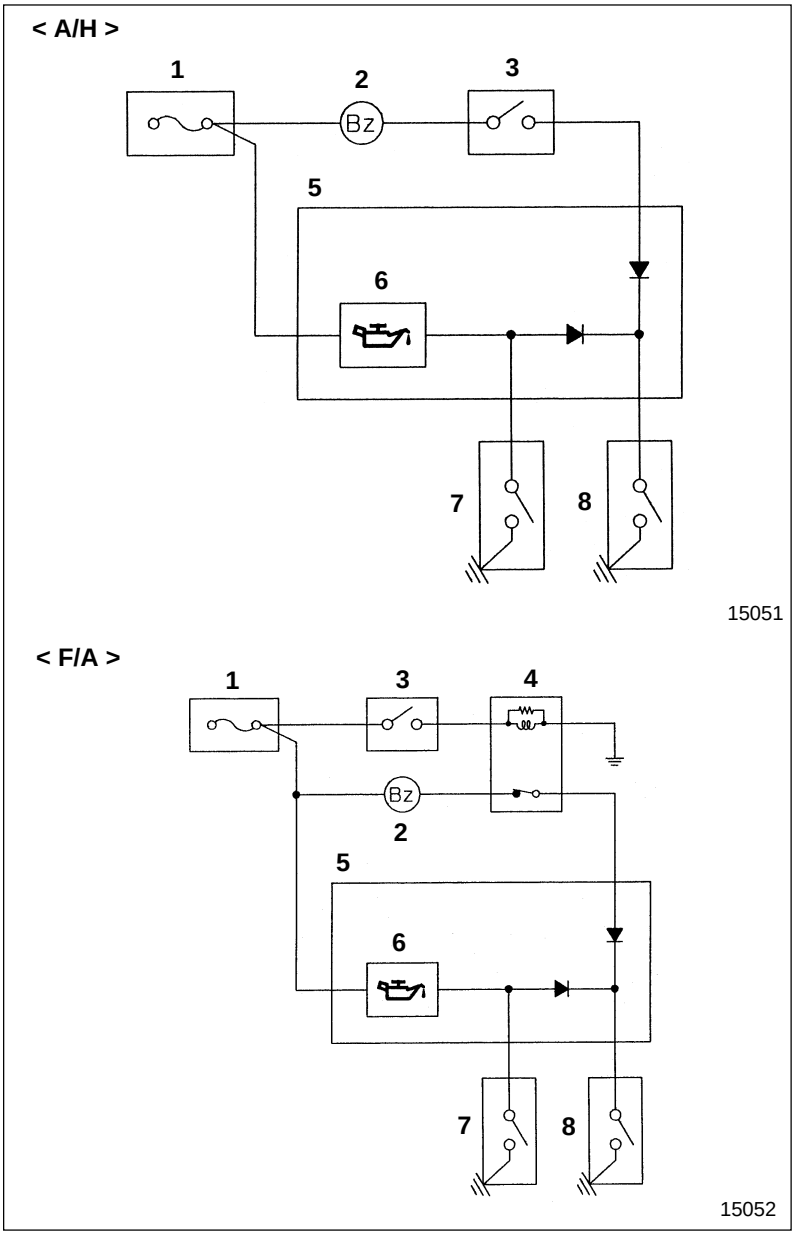
https://truckmanualshub.com/



● **Water pump**

A : From oil main gallery
B : To oil pan

Warning Circuit at Lubricating System



1 Relay and fuse box
2 Buzzer
(Buzzer does not work when the parking brake is engaged.)
3 Parking brake switch
4 Parking brake relay
5 Meter cluster
6 Warning lamp for oil pressure and oil filter
7 Oil bypass alarm switch
8 Oil pressure switch

A/H : Air over hydraulic brake
F/A : Full air brake

Replacement of Oil Filter

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Oil filter drain plug	7.8±2 {5.8±1.4, 0.8±0.2}	—

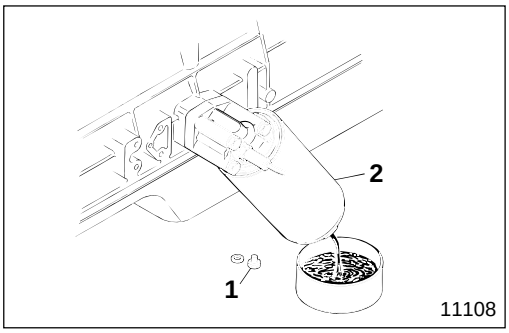
Special tools

Unit : mm {in.}

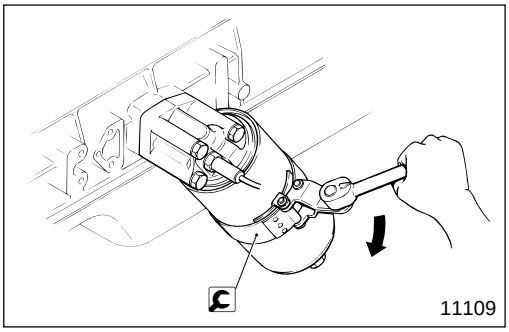
Location	Tool name and shape	Part No.	Application
—	Oil filter wrench  01503	MH061537	Removal of oil filter

WARNING

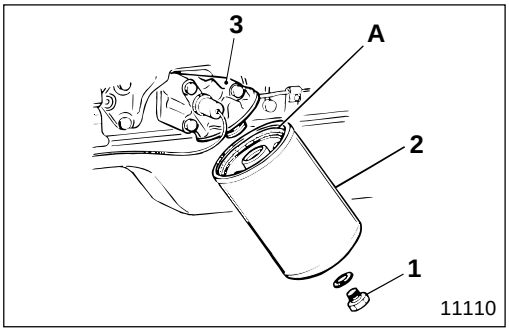
- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**
- **When replacing oil filter 2, take care not to spill oil on the V-belt.**



11108



11109



11110

[Removal]

1 Oil filter drain plug
2 Oil filter

[Installation]

- Clean the surface of oil filter head **3** that makes contact with oil filter **2**.
- Apply engine oil thinly and evenly to gasket area **A** of oil filter **2**.
- Screw in oil filter **2** to oil filter head **3** until gasket area **A** sits on the oil filter head.
- From this position, tighten further by rotating by one and one eighth to one and three eighths of a turn.
- Install oil filter drain plug **1**.
- After installation, run the engine and check that there is no oil leakage from gasket area **A**.
- Check the engine oil level and if it is low, fill to correct level.

https://truckmanualshub.com/

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Replacement of Engine Oil

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

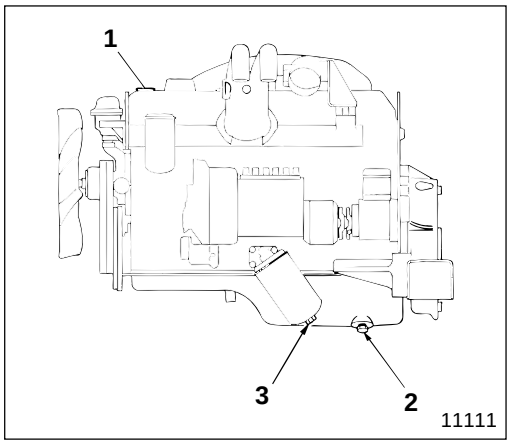
Location	Parts to be tightened	Tightening torque	Remarks
2	Oil pan drain plug	69 {51, 7}	—
3	Oil filter drain plug	7.8±2 {5.8±1.4, 0.8±0.2}	—

Lubricant

Location	Points of application	Kinds	Quantity
—	Oil pan	Engine oil (Grade CD or above as per API Classification)	Approximately 11 L {12 qts}
—	Oil filter	Engine oil (Grade CD or above as per API Classification)	Approximately 2.3 L {2.4 qts}

WARNING

- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**
- **When replacing engine oil, take care not to spill oil on the V-belt.**



[Draining]

- After warming-up the engine, remove oil filler cap **1**.
- Remove oil pan drain plug **2** and oil filter drain plug **3** and drain the engine oil.

[Refilling]

Tighten drain plug **2** of the oil pan and oil filter drain plug **3** at specified torque and fill with the specified quantity of engine oil.

https://truckmanualshub.com/

Measurement of Oil Pressure

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Oil pressure (Oil temperature 70 to 90°C {158 to 194°F})	At no-load minimum revolution	145 to 295 kPa {21 to 43 lbf/in², 1.5 to 3 kgf/cm²}	49 kPa {7.1 lbf/in², 0.5 kgf/cm²}	Inspect
		At no-load maximum revolution	295 to 490 kPa {43 to 71 lbf/in², 3 to 5 kgf/cm²}	195 kPa {28 lbf/in², 2 kgf/cm²}	—

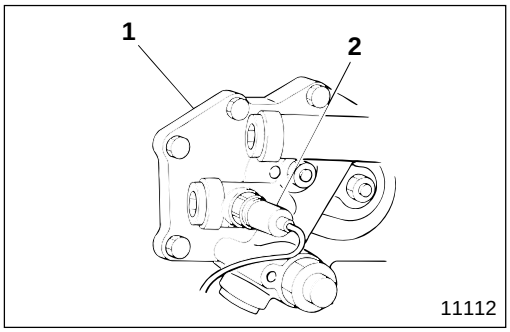
Tightening torque

Unit : N·m {lbf.ft, kgf·m}

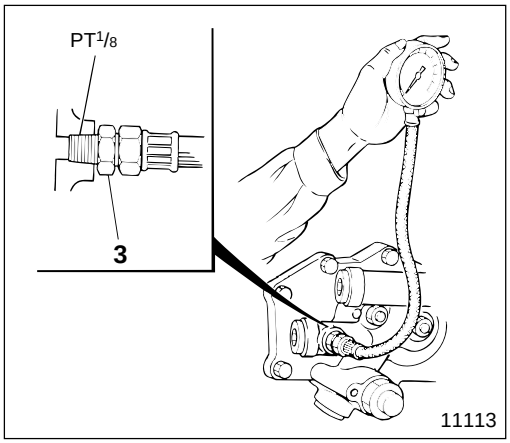
Location	Parts to be tightened	Tightening torque	Remarks
2	Engine oil pressure switch	15 to 22 {11 to 16, 1.5 to 2.2}	When engine is cold

Sealant

Location	Points of application	Kinds	Quantity
2	Thread area of engine oil pressure switch	Teflon tape	3 1/2 turns



- Remove oil pressure switch **2** from oil cooler **1**.
- Mount the oil pressure gauge after installing adaptor **3** onto oil cooler **1**.
- Warm up the engine until the oil temperature reaches 70 to 90°C {158 to 194°F}.
- Measure oil pressure at no-load minimum revolution and at no-load maximum revolution. If the measured values are lower than the limit, overhaul the lubricating system.



- After measurement, install engine oil pressure switch **2** and tighten at specified torque.

CAUTION

Be sure to install oil pressure switch 2 when the engine is cold.

Inspection of engine oil pressure switch

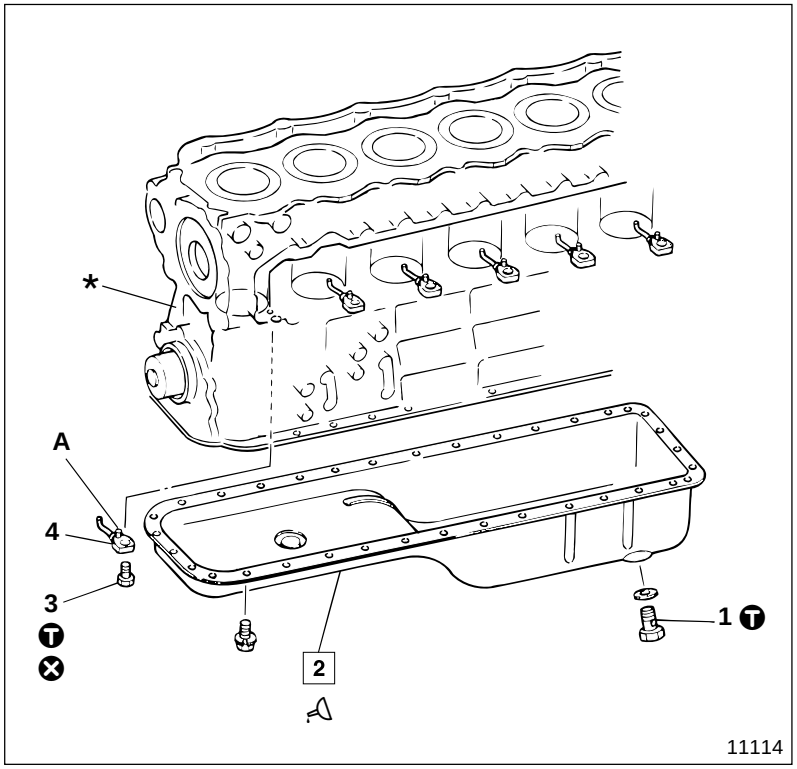
OIL PAN AND OIL JET



● **Disassembly sequence**

1 Drain plug
2 Oil pan
3 Check valve
4 Oil jet

***** : Crankcase Gr 11
A : Positioning pin
⊗ : Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION

Make sure that you do not tighten check valve 3 higher than specified torque, because excessive tightening causes faulty operation resulting in engine burning.

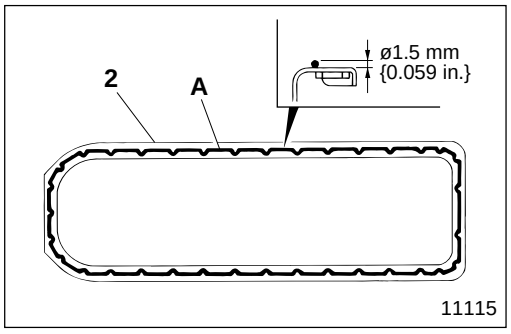
T Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Drain plug	69 {51, 7}	—
3	Check valve	34 {25, 3.5}	—

Sealant

Location	Points of application	Kinds	Quantity
2	Oil pan to crankcase connecting surface	THREEBOND 1207C	As required



◆ Service procedure

2 **Installation of oil pan**

- Apply sealant **A** to lower connecting surface of oil pan **2** as illustrated evenly without break.
- After applying sealant **A**, within three minutes, mount oil pan **2** to crankcase *****.

CAUTION

- **Be sure to clean and wipe off oily substances from the surface where sealant A is to be applied.**
- **Make sure that sealant A is not transferred to other areas while the mounting work is being done.**
- **Do not start the engine within an hour of mounting oil pan 2.**
- **Be sure to reapply sealant A if the bolts (for mounting oil pan 2) are loosened or removed by any cause whatsoever after mounting.**

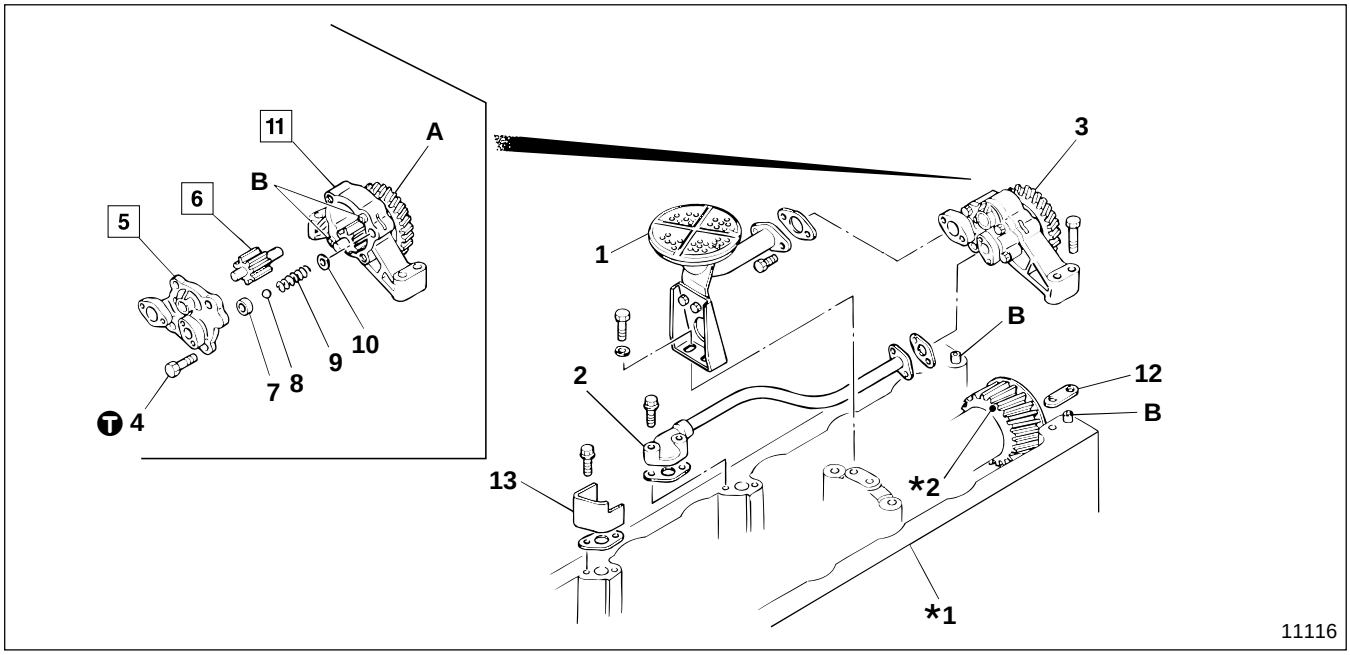
OIL PUMP AND OIL STRAINER



● **Inspection before disassembly**

P12-17

● **Disassembly sequence**

1 Oil strainer
2 Oil pipe
3 Oil pump assembly
4 Bolt
5 Cover
6 Driven gear assembly
7 Ring
8 Relief valve
9 Relief valve spring
10 Washer
11 Gear and case assembly
12 Shim
13 Oil deflector

***1** : Crankcase Gr 11
***2** : Crankshaft gear Gr 11
A : Oil pump gear
B : Positioning pin

NOTE

- **Do not remove oil pipe 2, oil strainer 1, and the oil pump as an assembly unless they are faulty.**
- **Gear and case assembly 11 is a unit construction, if there is a fault in it, replace it as a unit.**
- **Do not remove parts ring 7 through to washer 10 from gear and case assembly 11 unless they are faulty. If removed, replace ring 7.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

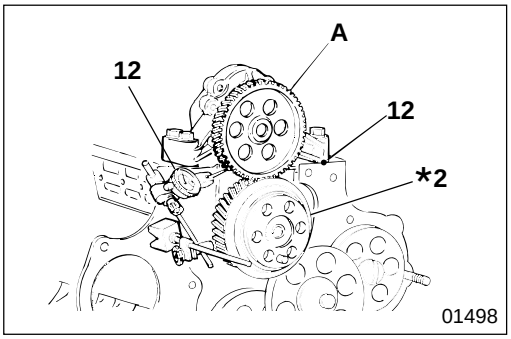
Location	Maintenance item	Standard value (Basic diameter in [ ])	Limit	Remedy
5, 11	Clearance between drive gear shaft and inner diameter of cover	[20] 0.04 to 0.07 {[0.79] 0.0016 to 0.0028}	0.15 {0.0059}	Replace
5, 6, 11	Clearance between driven gear shaft and inner diameter of case and cover	[20] 0.04 to 0.07 {[0.79] 0.0016 to 0.0028}	0.15 {0.0059}	Replace
6, 11	Clearance between case and tooth tip of each gear	0.10 to 0.19 {0.0039 to 0.0075}	0.2 {0.0079}	Replace
	Difference between height of each gear and depth of case	0.06 to 0.11 {0.0024 to 0.0043}	0.15 {0.0059}	Replace
8	Relief valve opening pressure	980 to 1180 kPa {140 to 170 lbf/in^2, 10 to 12 kgf/m^2}	—	Replace
9	Relief valve spring load (Installed length 30 {1.18})	84 N {19 lbf, 8.6 kgf}	—	Replace
***2, A**	Backlash between oil pump gear and crankshaft gear	0.08 to 0.18 {0.0031 to 0.0071}	0.35 {0.014}	Adjust with shims

https://truckmanualshub.com/

Tightening torque

Unit : N·m {lbf.ft, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Bolt (Oil pump cover mounting)	25±4.9 {18±3.6, 2.5±0.5}	—



◆ Service procedure

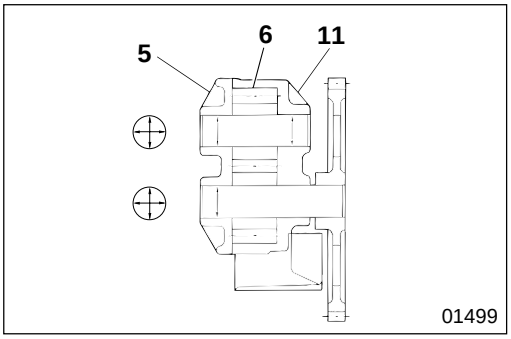
● Inspection before disassembly

Measure backlash between oil pump gear **A** and crankshaft gear **2**, if the measured value is higher than the limit, adjust with shims **12**.

Shim thickness	Backlash graduation
0.1 mm {0.0039 in.}	0.073 mm {0.0029 in.}
0.2 mm {0.0079 in.}	0.146 mm {0.0057 in.}

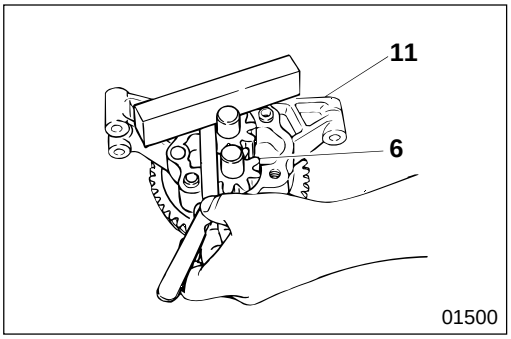
CAUTION ⚠

Make sure that you use the same thickness adjustment shims 12 for left and right sides.



5 6 11 Inspection of cover, driven gear assembly, gear and case assembly

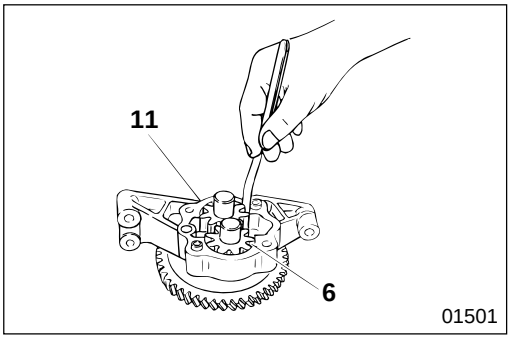
Measure the clearance between each gear shaft and cover **5**, and the clearance between the shaft and the shaft bore of gear and case assembly **11**. If the measured value is higher than the limit, replace the faulty parts.



6 11 Inspection of driven gear assembly, gear and case assembly

(1) Difference between height of each gear and depth of gear and case assembly

If the measured value is higher than the limit, replace the faulty parts.



(2) Clearance between tooth tip and case

If the measured value is higher than the limit, replace the faulty parts.
