Bucket selection chart

The choice of bucket is determined by the density of the material and the bucket fill factor. The TP-linkage uses a very open bucket design, has very good roll back in all positions plus fills the bucket very well. This means that the actual volume carried is often larger than the rated capacity of the bucket. Bucket fill factor in different materials and how they affect the actual bucket volume are shown below. **Example: Sand and gravel. Fill factor ~105%. Density 1,70 ton/m³. Result: The 4,2 m³ bucket carries 4,4 m³.** For optimum stability always consult the bucket selection chart.

Material	Bucket fill, %	Material density, ton/m ³	ISO/SAE bucket volume, m ³	Actual volume, m ³
Earth/Clay	~110	~1,60	4,2	~4,6
		~1,55	4,4	~4,8
		~1,45	4,6	~5,1
Sand/Gravel	~105	~1,70	4,2	~4,4
		~1,65	4,4	~4,6
		~1,50	4,6	~4,8
Aggregate	~100	~1,80	4,2	~4,2
		~1,70	4,4	~4,4
		~1,60	4,6	~4,6
Rock	≤100	~1,70	4,2	~4,2
				

The size of rock buckets is optimized for optimal penetration and filling capability rather than the density of the material.

HYDRAULIC SYSTEM

Open center hydraulics with highly efficient vane pumps allows precision control and quick movements even at low rpm's thanks to the high capacity pumps.

Pump: A double vane pump mounted on a power take-off on the transmission. Pump 1 works with all tilt and lift movements. Pump 2 works with tilt out and lift up to 20 MPa (2900 psi). A pilot-controlled selector valve cuts-in flow to the system.

Valve: Double-acting 3-spool valve actuated by a 3-spool pilot valve.

Lift function: The valve has four functions: raise, hold, lower and float. Inductive/magnetic automatic boom kickout can be switched on and off and is adjustable to any position between maximum reach and full lift height.

Tilt function: The valve has three functions: rollback, hold and dump. Inductive/magnetic automatic bucket positioner, that can be switched on and off.

Cylinders: Double-acting

Filter: Full-flow filtration through 20 µm (absolute) filter cartridge.
