

VOLVO WHEEL LOADER

L120D

- **Engine output SAE J1995:**
gross 153 kW (208 hp)
ISO 9249, SAE J1349
net 148 kW (201 hp)

- **Operating weight:** 18,4–20,6 t

- **Buckets:** 3,0–9,5 m³

- **Volvo high performance-low emission engine**
 - with excellent low rpm performance
 - meets all exhaust emission regulations for off-road vehicles

- **Volvo transmission with APS II**

- 2nd generation Automatic Power Shift with mode selector
- optimizes performance

- **Wet disc brakes**

- fully sealed, oil-circulation cooled
- outboard mounted

- **Torque Parallel Linkage**

- high breakout torque throughout the working range
- excellent parallel lift-arm action

- **Care Cab II**

- pressurized cab with high comfort and safety

- **Contronic II monitoring system**

- **Load-sensing steering system**

- **Pilot-operated working hydraulics**

Optional Equipment

- Hydraulic attachment bracket
- Long Boom
- Boom Suspension System
- Comfort Drive Control

VOLVO

SERVICE REFILL CAPACITIES

The Contronic II monitoring system provides information on scheduled service intervals and machine condition. Minimizes time required for troubleshooting.

Service accessibility: Large, easy-to-open engine access doors with gas struts. Hinged radiator grille and radiator.

Fuel tank	255 l	Transmission	35 l
Engine coolant	65 l	Engine oil	24 l
Hydraulic tank	145 l	Axle front / rear	36/41 l

ENGINE

The Volvo engine offers high torque and quick response at low rpm. The machine operates efficiently at low engine speeds which contributes to good fuel economy, less noise, reduced wear and longer life.

Engine: 6-cylinder, in-line, direct-injected, turbocharged, intercooled 4-stroke diesel engine with wet replaceable cylinder liners.

Air cleaning: three-stage.

Engine	Volvo TD 73 KDE
Max. power at	35 r/s (2 100 r/min)
SAE J1995 gross	153 kW (208 hp)
ISO 9249, SAE J1349 net.	148 kW (201 hp)
ISO 9249, SAE J1349 net.	151 kW (205 hp)*
Max. torque at	18,3 r/s (1 100 r/min)
SAE J1995 gross	925 Nm
ISO 9249, SAE J1349 net.	920 Nm
Displacement	6,7 l

* With optional EU noise reduction kit

ELECTRICAL SYSTEM

Contronic II monitoring system with increased function control. Electrical system with circuit boards, well protected by fuses. The system is pre-wired for installation of optional equipment.

Central warning system: Central warning light for the following functions, (buzzer with gear engaged): Engine oil pressure, transmission oil pressure, brake pressure, parking brake, axle oil temperature, steering system pressure, coolant temperature, transmission oil temperature, hydraulic oil temperature, overspeeding in engaged gear, brake charging, computer malfunction.

Voltage	24 V
Batteries	2x12 V
Battery capacity	2x140 Ah
Cold cranking capacity, ea	1050 A
Reserve capacity, ea	290 min
Alternator rating	1 680 W / 60 A
Starter-motor output	5,4 kW (7,3 hp)

DRIVETRAIN

The drivetrain and working hydraulics are well-matched and of reliable design. Quick acceleration increases productivity. Extensive Volvo component coordination facilitates service work.

Torque converter: Single-stage

Transmission: Volvo Power Shift transmission of counter-shaft type with single lever control. Fast and smooth forward / reverse shifting.

Shifting system: Volvo Automatic Power Shift (APS II) with mode selector.

Axles: Volvo, fully floating axle shafts with planetary-type hub reductions. Cast-steel axle housing. Fixed front axle and oscillating rear axle. 100 % differential lock on front axle.

Transmission	Volvo HT 205
Torque multiplication	2,85:1
Speeds, max forward/reverse	
1	7,3 km/h
2	13,3 km/h
3	25,2 km/h
4	35,5 km/h
Measured with tires	23.5 R25* L2
Front axle	Volvo / AWB 31
Rear axle	Volvo / AWB 30
Oscillation, rear axle	± 13°
Ground clearance at	
13° oscillation	460 mm

BRAKE SYSTEM

A simple and reliable brake system with few moving parts. Self-adjusting oil circulation cooled wet disc brakes give long service intervals. Brake wear indicator and brake test in Contronic II are included in the brake system.

Service brakes: Volvo, dual-circuit system with nitrogen-charged accumulators for dead engine braking. Fully hydraulically operated, enclosed internal oil circulation-cooled, outboard mounted disc brakes. Transmission declutch during braking can be preselected with a switch on the instrument panel. Brake performance test in the Contronic II system.

Parking brake: Enclosed wet multi-disc brake built into the transmission. Spring-loaded application. Electro-hydraulic release via a switch on the instrument panel. Automatically applied when the key is turned off.

Secondary brake: Either of the service brake circuits or the parking brake fulfills ISO/SAE safety requirements.

Standards: The brake system complies with the requirements of ISO 3450, SAE J1473

Number of discs/wheel	1
Number of accumulators	3
Volume, each	1,0 l

BUCKET SELECTION CHART

The choice of bucket is determined by the density of the material and the bucket fill factor. The TP-linkage uses a very open bucket design, has very good roll back in all positions and fills the bucket very well. This means that the actual volume carried is often larger than the rated capacity of the bucket. Bucket fill factors for different materials and how they affect the actual bucket volume are shown in the table. Example: Sand and gravel. Fill factor ~105%. Density 1,65 ton/m³. Result: The 3,3 m³ bucket carries 3,5 m³. For optimum stability always consult the bucket selection chart.

Material	Bucket fill %		Material density ton/m³	ISO/SAE bucket volume, m³	Actual volume, m³
Earth/Clay	~ 110		~ 1,7	3,0	~ 3,3
			~ 1,5	3,3	~ 3,6
			~ 1,4	3,5	~ 3,8
Sand/Gravel	~ 105		~ 1,75	3,0	~ 3,2
			~ 1,65	3,3	~ 3,5
			~ 1,5	3,5	~ 3,7
Aggregate	~ 100		~ 1,9	3,0	~ 3,0
			~ 1,7	3,3	~ 3,3
			~ 1,6	3,5	~ 3,5
Rock	≤ 100		~ 1,8	3,0	~ 3,0

The volume handled varies with the bucket fill and is often greater than indicated by the bucket's ISO/SAE volume. The table shows optimum bucket choice with regard to the material density.

Operating load: 6 400 kg (including logging counterweight)

STEERING SYSTEM

Easily operated steering results in fast work cycles. The power-efficient system results in good fuel economy, good directional stability and a smooth ride.

Steering system: Load-sensing hydrostatic articulated steering with power amplification.

System supply: The steering system is supplied by a separate steering pump.

Pump: Double variable-flow axial piston pump.

Cylinders: Two double-acting cylinders.

Steering cylinders	2
Bore	80 mm
Piston rod diameter	50 mm
Stroke	476 mm
Relief pressure	21 MPa
Max. flow	91 l / min
Articulation	± 40 °

CAB

Care Cab II with wide door opening and easy entry. Inside of cab lined with noise-absorbent materials. Noise and vibration suppressing suspension. Good all-round visibility through large glass areas. Curved front windshield of greentinted glass. Ergonomically positioned controls and instruments permit a comfortable operating position.

Instrumentation: All important information is centrally located in the operator's field of vision. Display for Contronic II monitoring system in center console on dashboard.

Heater and defroster: Heater coil with filtered fresh air and fan with four speeds. Defroster vents for all windows.

Operator's seat: Operator's seat with adjustable suspension and retractable seatbelt. The seat is mounted on a bracket on the rear cab wall. The forces from the retractable seatbelt are absorbed by the seat rails.

Standards: The cab is tested and approved according to ROPS (ISO/CD 3471, SAE J1040), FOPS (ISO 3449, SAE J231). The cab meets with requirements according to ISO 6055 ("protective roof for high-lift vehicles") and SAE J386 ("Operator Restraint System").

Emergency exits	2
Sound level in cab	
According to ISO 6396	LpA 77 dB(A)
External sound level	
According to ISO 6395	LwA 109 dB(A)
External sound level	
Optional EU noise red. kit	LwA 106 dB(A)
According to EU 2002/2006 requirements	
Ventilation	9 m³/min
Heating capacity	11 kW
Air conditioning (optional equipment)	8 kW

HYDRAULIC SYSTEM

Open center hydraulic system with efficient, high capacity vane pumps allows precision control and quick movements at low rpm.

Pump: Vane pump fitted to a power take-off on the transmission. The pilot system is supplied from a combined pilot/brake pump which is mounted in series with the steering pump.

Valve: Double-acting 3-spool valve. The control valve is actuated by a 3-spool pilot valve.

Lift function: The valve has four functions: raise, hold, lower and float. Inductive/magnetic automatic boom kickout can be switched on and off and is adjustable to any position between maximum reach and full lift height.

Tilt function: The valve has three functions: rollback, hold and dump. Inductive/magnetic automatic bucket positioner that can be switched on and off.

Cylinders: Double-acting

Filter: Full-flow filtration through 20 µm (absolute) filter cartridge.

Vane pump	
Relief pressure	22,5 MPa
Flow	275 l/min
at	10 MPa
and engine speed	35 r/s (2 100 r/min)
Pilot system

Dump*	1,7 s
Lower, empty	2,8 s
Total cycle time	10,3 s

* with load as per ISO 5998 and SAE J818

LIFT-ARM SYSTEM

TP Linkage combines high breakout torque throughout the working range with nearly exact parallel lift-arm action. These features, together with high lift height and long reach, make the lift-arm system equally good for bucket loading and work with attachments.

Lift cylinder	2
Bore	160 mm
Piston rod diameter	80 mm
Stroke	676 mm
Tilt cylinder	1
Bore	230 mm
Piston rod diameter	110 mm

VARNING!

Läs alla skyltar och anvisningar som finns på maskinen och säkerhetsinstruktionerna i instruktionsboken innan Du börjar arbetet på maskinen.

Monteringsanvisningen är baserad på användning av specialverktyg, E-verktyg och i allmänna handeln tillgängliga standardverktyg samt instruktions- och verkstadshandböcker.

Utrustningen ska monteras av behörig person på auktoriserad verkstad.

Volvo CE Customer Support AB fransäger sig allt ansvar om andra verktyg eller arbetsmetoder än de i anvisningen beskrivna kommer till användning.

3:e hydraulfunktion

Arbetsbeskrivning

Manöverventil

- 1 Höj lyftramverket och säkra med stöd 9993831.
- 2 Gör rent manöverventilen samt slangarna vid manöverventilen.
- 3 Anslut en vakuumpump till hydrauloljetanken. I annat fall måste hydrauloljetanken tömmas.
- 4 Ta bort befintliga pluggar på manöverventilens fjäderkåpor till den 3:e sektionen. Sätt dit nippel och packningar.

Fig. 1

1 Stöd, 9993831

Art.nr.	Benämning	Antal	Pos. i Fig. 5

WARNING!

Read all signs and instructions on the machine and the safety instructions in the operators manual, before you start working on the machine.

The installation instructions are based on the use of special tools, the E-tool and standard tools generally available on the market, and also on our operators manuals and service manuals.

The equipment should be installed by qualified personnel of an authorised workshop.

Volvo CE Customer Support AB disclaims all responsibility if tools and work methods other than those described in the instructions are used.

4th hydraulic function

Work description

Requirement: The machine is equipped with 3rd hydraulic function.

- 1 Raise lifting frame and secure with support 9993831.
- 2 Disconnect the main switch.
- 3 Connect a vacuum pump to the tank or in other case empty the hydraulic oil tank.
- 4 Remove the cover plate on the front frame.

Fig. 1
Support, 9993831

Valve

- 5 Fit the change-over valve on the front frame.
See Fig. 4, 5 and Fig. 6.

Part No.	Description	Qty.	Pos.	Fig.
11018391	Change-over valve	1	1	4, 5
13965183	Flange screw	2	2	4, 5

- 6 Move the existing servo hoses from the control valve's 3rd section, port A1 and B1, to the change-over valve's upper ports. Connect the hose from the left lifting arm to the left port on the change-over valve, marked A1.
Connect the hose from the right lifting arm to the right port on the change-over valve, marked B1. Use the existing flange halves and the flange bolts. See Fig 4, 5 and Fig. 6.

- 7 Fit the hoses and O-rings on the change-over valve for the 4th function. Connect the hose 7 to port B2 and the hose 9 to port A2. See Fig. 4, 5 and Fig. 6.

Part No.	Description	Qty.	Pos. in Fig. 4, 5 and 6
13948700	O-ring	2	4
11015455	Flange half	4	5
946472	Flange screw	8	6
935054	Hose	1	7
935053	Hose	1	9

- 8 Fit the pipes on the hoses 7 and 9. See Fig. 4.

Part No.	Description	Qty.	Pos. in Fig. 4
11015729	Pipe	1	8
11015785	Pipe	1	10

- 9 Fit the hoses on the lifting frame. Fit the nipples, sealing washers and the dust cover. Use the existing clamps and attachments for the 3rd hydraulic function. See Fig. 4.

Part No.	Description	Qty.	Pos. in Fig. 4
11133036	Hose	1	11
11133039	Hose	1	12
11043022	Nipple	2	13
14013070	Sealing washer	2	14
11147586	Dust cover	2	15

- 10 Fit two hoses from the control valves' 3rd section to the centre ports change-over valve, marked PA and PB. The hose from the control valve's port, marked B1, connects to the change-over valve's left port, marked PA. The second hose connects between the control valve's port, marked A1 and the change-over valve's right port, marked PB.

See Fig. 4, 5 and Fig. 6.

Part No.	Description	Qty.	Pos. in Fig. 4, 5 and 6
13933650	Hose	2	16
13948700	O-ring	4	17
946472	Flange screw	16	6
11015455	Flange half	8	5

- 11 Clean the existing terminal block for the front frame's differential lock.

Note! In those cases the machine is equipped with an attachment lock, must the terminal block removes and moves to the left side of the terminal block for the 4th hydraulic function.

- 12 Fit the terminal block and the solenoid valve on the front frame. See Fig. 4 and Fig. 5.

Part No.	Description	Qty.	Pos. in Fig. 4 and 5
4974291	Terminal block	1	20
11003548	Solenoid valve	1	21
13960168	O-ring	2	22
13974896	Control rod	3	23
13945408	Nut	3	24
959193	Hexagon socket head bolt	4	25
13944524	Nipple	4	26
943907	Gasket	4	27

- 13 Fit the hoses between the front frame's terminal block and the change-over valve. The hose from port A on the terminal block connects to port PS on the right side of the change-over valve. The hose from port B on the terminal block connects to port PS on the left side of the change-over valve. See Fig. 4, 5 and Fig. 6.

Part No.	Description	Qty.	Pos. in Fig. 4, 5 and 6
935182	Hose	2	28

Electrical installation

- 14 Remove the cover over the control lever carrier in the cab.

Fig. 2

- 15 Drill a hole, Ø12 mm (0.47 in), in the cover. See Fig. 2.

- 16 Fit the switch SW906 and the decal on the cover. See Fig. 2.

Part No.	Description	Qty.	Pos. in Fig. 2
4786696	Switch	1	29
11025792	Decal	1	30

- 17 Connect the switch contact SW906 to the existing cable harness under the control lever carrier. Contact marked SW906. See Fig. 2.

Fig. 3

- A Contact FR in the electrical box
B Solenoid valve, MA907

- 18 Connect the contact marked MA907 on the cable harness to the solenoid valve MA907 on the front frame. Connect the contact marked FR on the cable harness to the connection on the electrical box marked FR on the front frame's inside. Clamp the cable harness tight to the existing point of the attachment. See Fig. 3.

Part No.	Description	Qty.	Pos. in Fig. 3
11133112	Cable harness	1	1
13949746	Clamp	4	2

Note! In those cases the machine is equipped with the differential lock, replace the clamp with a double clamp.

Part No.	Description	Qty.	Pos. in Fig. 3
11132105	Clamp	1	3

- 19 Remove the vacuum pump or fill up with oil in the hydraulic oil tank.

- 20 Check the function as shown in the service manual.

- 21 Write equipment number 80288 on the machine card.

Fig. 4

Fig. 5

Fig. 6

- A The 3rd function to the right lifting arm, port B1 on the change-over valve.
- B The 3rd function to the left lifting arm, port A1 on the change-over valve.
- C Port PB on the change-over valve to the port A1 on the control valve.
- D Port PA on the change-over valve to the port B1 on the control valve.
- E Port PS, right side on the change-over valve to the port A on the terminal block on the front frame.
- F Port PS, left side on the change-over valve to the port B on the terminal block on the front frame.
- G The 4th function to the right lifting arm, port B2 on the change-over valve.
- H The 4th function to the left lifting arm, port A2 on the change-over valve.

Applies to Wheel Loaders						

AC compressor, fill with oil

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause

Remanufactured AC compressors are not filled with oil when delivered from the warehouse. Investigations of failed remanufactured AC compressors have shown that approximately 40% suffers from lack of oil. The most common reason for claiming remanufactured AC compressors is seized AC compressor.

Action

To make sure the remanufactured AC compressor is filled with oil before installing it to the machine, a tag with information about the need to fill the AC compressor with oil prior to installation has been added.

Figure 1

Tag on remanufactured AC compressor

The service operation 874–006 will be updated with information about making sure the compressor is filled with oil prior to installation.

AC safety, description

<https://truckmanualshub.com/>

If system pressure becomes too high, above 21–25 bar (305–363 psi), or too low, below 1–2 bar (14.5–29 psi), SE804 breaks the operating current to RE802 which is deactivated and the current supplied to MA801 and RE801 (connection 85) is turned off. SE804 closes the circuit again at 3 bar and 14–18 bar (203–261 psi) respectively.

RE801's coil (connection 85) is now connected to earth via SE803–MA801 and is activated.

RE801 will now remain activated until its supply of current is broken with SW806.

Even if the pressure is normal and SE804 closes the operating current circuit so that RE802 is activated, the air-conditioning unit will not restart because RE801 is activated and so does not supply current to MA801 via RE802 (connection 30).

If the pressure monitor turns off the air-conditioning unit because system pressure is too high or too low, the operator must turn off the air-conditioning unit and then turn it on again so that it will restart.

This function is provided to inform the operator that the pressure has been abnormal.

After a stoppage caused by a pressure fault in the system, the air-conditioning unit must always be checked by authorized personnel.

Accumulator, checking (removed)<https://truckmanualshub.com/>

Op nbr 52701

[11 666 020 Pressure gauge 0–25 MPa \(0–3626 psi\)](#)

[11 666 037 Hose](#)

[11 666 030 Hydraulic jack \(pump only\)](#)

[999 3335 Hose](#)

[999 3522 Quick-coupling](#)

[E 1234 Nipple](#)

[E 1281 Nipple](#)

NOTE!

Maintain greatest possible cleanliness during all work with the brake system. Wipe off all pipe and hose connections before they are disconnected. Plug all pipes, hoses, etc. immediately after disconnecting.

If the functional check of the brake system indicates that one or more of the accumulators has insufficient precharge pressure or is missing precharge pressure, each accumulator can be checked individually as follows:

Removing

1. **WARNING**

Even if the engine has been stopped, there remains an accumulated pressure in the brake system of approx. 15 MPa (150 bar) (2175 psi). If the system is opened without first releasing the pressure, oil under high pressure will rush out.

Release the brake system pressure by depressing the brake pedal repeatedly (30–40 times).

2. Carefully remove the connection pipes to the accumulators and plug the connections.

CAUTION

The brake system may still contain pressure.

3. Remove the accumulators.

Pressure checking

4. Check the accumulators one at a time.
Connect the checking equipment according to [Invalid linktarget].

Figure 1
Checking removed accumulator

A. Accumulator

1. 11 666 030
2. 11 666 037
3. E 1234
4. 11 666 019
5. Included in 11 666 037
6. E 1281

<https://truckmanualshub.com/>

5. Pump oil into the accumulator.

After a few pump strokes, the pressure will increase rapidly to the precharge pressure and will then continue to increase slowly.

Precharge pressure: **min. 3.5 MPa (508 psi)**

If the precharge pressure falls below 3.5 MPa (508 psi), the accumulator must be discarded, see [Invalid linktarget].

Installing

6. Install the accumulators.
7. Start the engine and let it run with slightly increased engine speed until the unloading pressure is 15–15.5 MPa (2175 - 2248 psi).
8. Check functionality according to [Invalid linktarget].

Action for reducing risk of fire

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

It frequently happens that construction machines work in environments where inflammable material collects on the machine. Machine fires can be caused by different reasons, such as:

- Heating up through the exhaust system
- Sparks in the electrical system

To reduce the risk of fire, check the following points when carrying out maintenance work on the machine.

General

It is important that the machine is provided with suitable equipment to reduce the risk of inflammable material collecting on the machine in its working environment and then catching fire:

- Guard over silencer
- Protective screen for radiator to prevent collection and blockage by wood chips, sawdust and similar.
- Cyclone pre-cleaner of turbo II type to increase the cleaning capacity, particularly against coarse dust, sawdust, wood chips etc. This is self-emptying and is not connected to the ejector connection on the exhaust pipe. This connection is plugged, meaning that the spark extinguishing function of the silencer is still effective.
- Keep the machine and equipment free from dirt, waste material, fuel and oil spillage.
Instruct the machine owner to keep the machine clean at all times.

NOTE!

If high-pressure washing is used for cleaning, take care not to damage the insulation on the electric cables, which can happen even at a relatively low water pressure and temperature.

Engine

Clean off all debris from the engine, particularly around the exhaust system, turbocharger and alternator.

- Check that there is no fuel or oil leakage and that the hoses are clamped in such a way that no chafing occurs.
- Fuel filling.
Take care when filling up with fuel that none is spilt outside the filling pipe.
If fuel has run out when filling up, wipe it up immediately.
Do not fill up with fuel near an open fire.

Electrical system

- If the machine is left unattended, always turn off the battery disconnection switch.
- Check the electric cables for abrasion and that they are not subjected to wear. This particularly applies to unfused cables, which are red and marked R (B+).
E.g., cables between:
 - Batteries
 - Battery and starter motor
 - Alternator and starter motor
 - Cable to engine starter element
 - Wire to engine stop solenoid

In cases where these cables have been disconnected it is important to make sure that they are fitted and clamped in such a way that there is no risk of abrasion. Unfused cables must not come into contact with oil or fuel hoses.

- When fitting any extra equipment, make sure that all cables are fused and arranged and clamped in such a way that there is

no risk of abrasion.

<https://truckmanualshub.com/>

Transmission

- Clean off all debris.
- Check that there is no oil leakage.

Brake system (hydraulic)

- Check that there is no oil leakage and that pipes and hoses are protected, undamaged and properly clamped.

Protecting plates (bottom guard plates)

On machines which are provided with bottom guard plates it is important that debris which has collected inside and on the plates is removed every day.

The guard plates must be handled with care as they are very heavy.

Instructions for correct handling of the plates can be found in the instruction book or supplement for the respective machine.

Hydraulic system

Check that there is no leakage.

Welding

Take great care when carrying out welding work on the machine. Make sure that fire extinguishing equipment is available.

Take particular care when welding close to fuel and oil lines and tanks.

If fire breaks out

At the slightest sign of fire, and if the situation permits, take the following action:

- Drive the machine away from the hazardous area
- Let down the lifting arms to bottom position
- Stop the engine with the stop control and turn the key switch to "0"-position.
Later model wheel loaders engine stop is controlled through the ignition switch.
Turn the key switch to the "0"-position only.
- Get out of the cab
- Turn off the main current with the battery disconnection switch
- Start fire extinguishing work and alert the fire service if necessary

In connection with delivery instructions or at other service visits, please inform the owner/driver of the contents of this SB.

Applies to Wheel Loaders, Articulated Haulers						

Action to be taken in case of abnormal lubricating oil consumption

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

Introduction

The oil consumption is in many cases used as a measure of the condition of the engine. Normally all engines use a certain amount of oil. The film of oil that lubricates the upper piston rings is combusted at the same time as the fuel, which gradually causes the oil level to drop. There are of course also other factors that affects the oil consumption, e.g. operating conditions and the condition of the engine. Here follows a short description of influencing factors, checking and measuring methods and which action can be taken to manage any problems.

Factors influencing the oil consumption

Larger engines have as a rule a higher oil consumption than small engines.

Oil has the ability to penetrate the smallest openings. Therefore, proceed as follows:

- Check for oil leakage around the engine and components
- Check for oil leakage at the turbocharger
- Check for oil leakage at induction manifold / charge air pipe
- Take a lubricating oil sample

All affected bolts should be check-tightened.

A too high oil level causes more oil to be thrown up on the cylinder walls and this increases the oil consumption. The oil level should be kept slightly below the full mark on the oil dipstick. Only check the oil level a few minutes after the engine has stopped to allow the oil to run back to the sump, see Fig. 1.

Figure 1

Too thin oil will result in a higher oil consumption because of difficulties of maintaining a sealing film of oil between piston rings and cylinder wall at high temperatures. Too thick oil provides unsatisfactory lubrication and thereby increased wear, which in the long run will result in increased oil consumption. Always use the recommended oil grade and type according to the Operator's Manual.

Continuously high engine speed will result in warmer and thereby thinner oil. Increased oil consumption as described above.

Frequent use of engine retarding causes increased oil consumption.

Also long periods of idling / operating at low speed may cause increased oil consumption.

Faulty and worn piston rings, oil scraper rings, ring grooves, pistons, cylinders, valve guides result in high oil consumption, as oil leaks into the combustion chamber.

Abnormally low oil consumption

Some attention should also be given to low oil consumption, because the low oil consumption may be illusory. Used up oil may have been compensated through condensation water, coolant or fuel dilution, thus keeping the level unchanged. Intermixed coolant gives the oil a greyish tint, whereas intermixed fuel does not show. These factors result in impaired lubrication and should lead to more frequent oil changes. Intermixed fuel also mean an additional safety risk as the flash point of the oil is lowered. Take samples of lubricating oil and have them analysed.

Checking and estimating oil consumption

The duration of the check / test period should be at least 250 hours (suitably between two oil changes and filter replacements) in

order to avoid jumping to conclusions and taking unnecessary action. On an engine that has reached working temperature, the oil dipstick can be read off three minutes after stop. If the engine has been started, but not reached working temperature, wait for at least five minutes.

- Copy the enclosed report form and make a note of the hour recorder reading at the start of the test period.
- Begin with full fuel tank and new oil filled to the upper marking on oil the dipstick.
- Note the hour recorder reading and amounts every time you fill fuel, oil or coolant.
- Do not top up the oil until the level has reached the minimum line.
- Never fill oil to above the maximum line.
- In case the oil is changed during the test period, check the oil level before draining and then fill to the same level.
- At the end of the test period, top up with oil to the maximum line and make a note of the amount.

Add up the noted information which then forms the base for calculating the oil consumption. The oil consumption is always stated as a relation between consumed oil and the amount of used fuel during the same period.

Example: An engine has during 250 hours used 18 litres of oil and 3000 litres of fuel.

$18/3000 \times 100 \% = 0.6 \%$

Normal consumption

A new or fully overhauled engine often uses more oil than a run-in engine. Only after 1000–1500 operating hours, when the piston rings have bedded-in in the cylinders, is it possible correctly to determine the oil consumption.

- Oil consumption of 0.3% or less = OK at full-load operation
- Oil consumption of 0.3–0.75% = OK at light-load operation
- If these limit values are exceeded, proceed as follows:
Carefully check the oil consumption (see instructions on the previous page) and contact the respective dealer regarding whether any action can be approved as a warranty job. A copy of the report form should be enclosed with the claim.

Oil/

L60925AG

Air cleaner, description

<https://truckmanualshub.com/>

The air cleaning system consists of three stages and it is of decisive importance for the engine's reliability and service life. In stage 1 a cyclone cleaner separates heavier particles which are automatically carried away through an ejector in the exhaust system. Approximately 85% of the impurities are filtered out in this first stage and this means that the main filter has a light load.

The main filter (stage two) is a paper filter that can be cleaned and therefore has lengthy replacement intervals. However, it should be changed after it has been cleaned five times, or if it is damaged. If the main filter becomes clogged the informative text "clogged air filter" will be displayed.

The safety filter/secondary filter (stage three) comes into play if the main filter has become damaged and impurities can pass through it. It catches the impurities and so quickly becomes clogged, which is indicated by the warning lamp.

To improve reliability in demanding environments the machine can be equipped with an oil-bath air cleaner. This is connected in series before the regular air cleaner, the filter changing intervals of which are thus extended.

Op nbr

NOTE!

Components such as the recirculation filter, evaporator and condenser must be clean

1. Warm up the machine to normal working temperature and park it in the shade.
2. Measure the ambient temperature and relative humidity. Do this in the shade.
3. Close windows and doors. Ventilation hatches should be closed and all air outlets in the cab should be fully open.

Figure 1
Cab

1. Rear wall, right air nozzle
4. Run the engine at 1500 rpm. Set the cab fan switch to position 4, set the recirculation control to maximum and the heater control to minimum.
5. Turn on the air conditioning.
6. The performance of the air conditioning is checked by measuring the temperature of the air coming out of the right air vent on the rear wall.
7. Within a time period of max. 30 minutes, the temperature should drop to or fall slightly below the temperature values given in the specifications.
8. If the specified temperatures are not achieved in the performance test, see VHB "Heating, ventilation and air conditioning unit R134a" under fault diagnosis.

Air-conditioning unit temperatures in performance tests

VARNING!

Läs alla skyltar och anvisningar som finns på maskinen och säkerhetsinstruktionerna i instruktionsboken innan Du börjar arbetet på maskinen.

Monteringsanvisningen är baserad på användning av specialverktyg, E-verktyg och i allmänna handeln tillgängliga standardverktyg samt instruktions- och verkstadshandböcker.

Utrustningen ska monteras av behörig person på auktoriserad verkstad.

Volvo Construction Equipment Group fransäger sig allt ansvar om andra verktyg eller arbetsmetoder än de i anvisningen beskrivna kommer till användning.

Luftkonditionering

Arbetsbeskrivning

Evaporator

1 Bryt huvudströmmen.

2 Sätt dit fästena på evaporatorn.

OBS! Placera brickorna under skruvskallarna.
Såga av plaströret och sätt dit plaströrsbitarna på skruvarna. Se Fig. 1 och Fig. 13.

Fig. 1

Art.nr	Benämning	Antal	Pos. i Fig. 1
11412984	Evaporator	1	1
11007291	Fäste	1	7

946440	Flänsskruv	1	23
4881440	Bandklamma	2	22

Hytt

- 31 Öppna höger fönster. Ta bort skruvarna och lyft upp höger instrumentpanel.

Fig. 21

- 32 Sätt dit termostaten på konsolen, se Fig. 21. För ner termostatsens kapillärrör i befintligt hål i plastkåpan till evaporatorn. Kontrollera att termostaten är vriden medurs till maximalt "på".

Art.nr	Benämning	Antal	Pos. i Fig. 19
955896	Bricka (12x22x2)	1	31
11104241	Termostat	1	30
4881440	Bandklamma	1	33

- 33 Linda termostatsens kapillärrör 4 - 5 varv, tätt mot evaporatorns stora rör. Se Fig. 19.

OBS! Kapillärröret får inte bockas i skarpa veck.
Använd inte verktyg. Isolera kapillärrörets lindning mot röret med den svarta tejp.

Art.nr	Benämning	Antal	Pos. i Fig. 19
11003291	Tejp, 150 mm	1	32

34 Sätt dit strömställaren SW806 på höger instrumentpanel.

Art.nr	Benämning	Antal	Pos. i Fig. 22
11039205	Lins	1	32
4803455	Strömställare	1	33

35 Anslut befintliga kontakter till strömställaren SW806 och termostaten SE803.

36 Sätt dit en ledningsmatta med reläsocklar och reläer i elcentralen.

Art.nr	Benämning	Antal	Pos. i Fig. 23
11040625	Ledningsmatta	1	38
4786690	Relä	2	41

Air filter pressure

<https://truckmanualshub.com/>

The function monitors how clogged the air filter is and informs the operator when it is time to change it or if there is a system malfunction.

Input signals	Output function conditions	Output functions
○ Air filter pressure, SE208	○ High negative pressure (blocked filter)	○ Amber central warning lamp ○ ----- INFO ----- Clogged Engine Air Filter
○ Monitoring, SE208	○ System malfunction, signal outside limits	○ Amber central warning lamp ○ ----- ERROR ----- Monitoring Engine Air Filter

Air-conditioning unit, specifications

Air-conditioning unit temperatures in performance tests				
Temperatures in °C at different ambient temperatures in relation to the relative humidity. Measured at the right-hand air nozzle in the rear wall.				
Relative humidity of the air	Ambient temperature Air conditioning temperature values			
	25 °C (77 °F)	30 °C (86 °F)	35 °C (95 °F)	40 °C (104 °F)
10%	7 °C (45 °F)	7 °C (45 °F)	7 °C (45 °F)	7 °C (45 °F)
20%	7 °C (45 °F)	7 °C (45 °F)	7 °C (45 °F)	7 °C (45 °F)
30%	7 °C (45 °F)	7 °C (45 °F)	7 °C (45 °F)	7 °C (45 °F)
40%	7 °C (45 °F)	7 °C (45 °F)	7 °C (45 °F)	8 °C (46 °F)
50%	7 °C (45 °F)	7 °C (45 °F)	8 °C (46 °F)	11 °C (52 °F)
60%	7 °C (45 °F)	8 °C (46 °F)	10 °C (50 °F)	14 °C (57 °F)
70%	7 °C (45 °F)	10 °C (50 °F)	13 °C (55 °F)	17 °C (63 °F)
80%	7 °C (45 °F)	11 °C (52 °F)	15 °C (59 °F)	20 °C (68 °F)
90%	7 °C (45 °F)	12 °C (54 °F)	18 °C (64 °F)	23 °C (73 °F)

Normal air-conditioning unit system pressure, engine speed 1500 rpm	
System pressure varies with the ambient temperature. The values should be regarded as guiding values. A lower pressure on the low-pressure side may occasionally be observed.	
At ambient temperatures below +30 °C (+86 °F)	
Low-pressure side	0.3–2.7 bar (4.4–39.2 psi)
High-pressure side	6.5–15.5 bar (94.3–224.8 psi)
At ambient temperatures above +30 °C (+86 °F)	
Low-pressure side	0.7–2.3 bar (10.2–33.4 psi)
High-pressure side	14–18 bar (203–261 psi)

Alternative lubricants for axles with wet brakes

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause

97303, WB101

Volvo Wet Brake Transaxle Oil 97303, WB101 is intended for use in axles with built in wet brakes. For these applications **Volvo Wet Brake Transaxle Oil** (Volvo product denomination), should be used.

Action

Performance requirements for **Volvo Wet Brake Transaxle Oil 97303** are described in Volvo Construction Equipment Standard 1273.03.

NOTE!

Using non-approved products may affect warranties in case of component problems.

Volvo Super Wet Brake Transaxle Oil 97304, WB102

Volvo Super Wet Brake Transaxle Oil 97304, WB102 is intended for long drain intervals or severe service in axles with built in wet brakes. WB102 gives lower fuel consumption, maximizes machine performance and improves the durability of the machine. For these applications, **Volvo Super Wet Brake Transaxle Oil** (Volvo product denomination), should be used.

Performance requirements for Volvo Super Wet Brake Transaxle Oil 97304 are described in Volvo Construction Equipment Standard 1273.04.

If Volvo Super Wet Brake Transaxle Oil is not available, then Volvo Wet Brake Transaxle Oil, WB101, can be used as an alternative.

NOTE!

Only when using Volvo Super Wet Brake Transaxle Oil WB102 will the machine achieve maximum performance and service life, as well as the best possible fuel economy. Service intervals may also be shorter when using other oil than Volvo Super Wet Brake Transaxle Oil WB102

In the future, Volvo Construction Equipment will not officially state alternative products.

Alternator, description

<https://truckmanualshub.com/>

The alternator is a 60A alternating current generator with a normal charging voltage of 28.5 V and a built-in charging regulator.

Machines operating in an aggressive environment may as an alternative be fitted with a brushless 50 A alternator.

Machines that have been equipped with a large number of components using electric power, such as extra work lights, can be equipped with a 100 A alternator as an alternative.

When the engine is turned off, the batteries normally give a voltage of approx. 24-26 V, depending on their charging status. When the engine is running, the batteries are normally charged by the alternator, since the alternator's normal charging voltage is higher than the battery voltage.

If the batteries do not seem to take a charge, this may be due to incorrect charging voltage from the alternator. Also check the acidity in the battery electrolyte, see [Invalid linktarget].

Alternator, specifications

<https://truckmanualshub.com/>

Alternator, 60 A, with regulator	
Type	Alternating current
Output (rated output)	1680 W

We consider that no special installations instructions are required for fitting this equipment.

För montering av denna utrustning anser vi att någon speciell monteringsanvisning inte erfordras.

To facilitate the fitting we enclose:

- Kit list
- Installation drawing

För att underlätta montering inkluderas:

- Satslista
- Monteringsritning

**WARNING!**

Read all signs and instructions on the machine and the safety instructions in the operators manual, before you start working on the machine.

The installation instructions are based on the use of special tools, the E-tool and standard tools generally available on the market, and also on our operators manuals and service manuals.

The equipment should be installed by qualified personnel of an authorised workshop.

Volvo CE Customer Support AB disclaims all responsibility if tools and work methods other than those described in the instructions are used.

**WARNING!**

Läs alla skyltar och anvisningar som finns på maskinen och säkerhetsinstruktionerna i instruktionsboken innan Du börjar arbetet på maskinen.

Monteringsanvisningen är baserad på användning av specialverktyg, E-verktyg och i allmänna handeln tillgängliga standardverktyg samt instruktions- och verkstadshandböcker.

Utrustningen ska monteras av behörig person på auktoriserad verkstad.

Volvo CE Customer Support AB fransäger sig allt ansvar om andra verktyg eller arbetsmetoder än de i anvisningen beskrivna kommer till användning.

L150D	11110154	SE 2964/00/C2
L180D	11110154	SE 2964/00/C2
L220D	11110154	SE 2964/00/C2

NOTE!

The silencer with part No. 11110201 which is fitted on L70D has been approved since 2000-09-01 and has the approval number 59B.

This SB is to be considered as a technical information and comprises normal warranties within the rules for the same.

APS II

<https://truckmanualshub.com/>

The function controls gearshifting based on the current operating mode and determines which gear should be used and when shifting should take place to protect the transmission.

Mode selector SW412 has two ranges "MANUAL" and "AUTOMATIC".

With "MANUAL" in position "MAN", gears are shifted manually.

Figure 1
Mode selector, SW412

In "AUTOMATIC" there are four shifting program positions, "LIGHT position 1, LIGHT position 2, V (Normal), HEAVY", that the operator can select, depending on operating conditions.

Input signals	Output function conditions	Output functions
○ Mode selector, SW412 ○ Gear selector travel direction, SW402 ○ Gear selector, SW401B ○ Transmission disengagement, SW411 ○ Kickdown steering column, SW401C ○ Kickdown lever steering, SW410 ○ Kickdown lever console, SW405 ○ Engine brake, SW406 ○ Engine speed, SE201 ○ Travel speed, SE403 ○ Engine speed relationship	○ Mode selector in position MAN	○ Gears are shifted manually with gear selector
	Mode selector in range AUTOMATIC ○ LIGHT position 1 ○ LIGHT position 2 ○ V (Normal) ○ HEAVY	○ Directional gear F, N, R ○ Travel speed gear 1, 2, 3, 4 ○ Engine speed limitation ○ Kickdown ○ Warning overspeed transmission
	○ Transmission disengagement in position On	○ Transmission disengagement
	○ Engine brake in position On	○ Engine brake (downshifting)
	○ Kickdown activated ○ Travel speed < 9 km/h (5.6 mph)	○ Kickdown
	○ Incorrect input signal from APS II System selects LIGHT position 1	○ Amber central warning lamp
	Acknowledgement by turning off machine	-----ERROR----- APS II- switch

Mode selector in position MAN

Travel speed gears are shifted manually with gear selector SW401B to the desired gear position 1-4.

Directional gear is shifted manually with gear selector SW402 to the desired gear position F-N-R.

Engine brake (downshifting) is activated with SW406.

Kickdown is activated with SW401C or SW405 or SW410.

Transmission disengagement is activated with SW402.

Directional gear

When shifting from N (neutral) to F or R, the travel speed gear is changed from selected to engaged gear as in the following:

Selected - Engaged gear	Travel speed
1 - 2	> 9 km/h (5.6 mph)
1 - 3	> 16 km/h (9.9 mph)
1 - 4	> 34 km/h (21.1 mph)
2 - 3	> 16 km/h (9.9 mph)
2 - 4	> 34 km/h (21.1 mph)
3 - 4	> 34 km/h (21.1 mph)

Mode selector set in range AUTOMATIC, automatic shifting

Figure 2
Mode selector, SW412

Start

When starting from a stationary machine with the gear selector in position 3 or 4, directional gear F or R is selected and the machine starts in 2nd gear. When the machine is in motion, starting takes place in 3rd gear, as in the table.

Travel speed (Rpm output shaft)	Starting gear
> 7 km/h (4.3 mph) (458 rpm)	3

Changing travel direction

Change of travel direction at lower travel speed takes place in 2nd gear. If travel speed is too high, 3rd gear is engaged first and then, when the machine is stationary, 2nd gear engages as in the table below.

Gear	Travel speed conditions
2	<= 15 km/h (9.3 mph)
3	> 15 km/h (9.3 mph)
3-2	0 km/h (0 mph)

Manual travel speed shifting with SW401B and mode selector SW412 in AUTOMATIC range

When shifting manually from one speed gear to another, the gear is changed from **Selected gear** to **Obtained gear** according to travel speed conditions in the table below.

Selected Gear	Obtained gear	Travel speed conditions
1	2	> 9 km/h (5.6 mph)
1	3	> 16 km/h (9.9 mph)
1	4	> 34 km/h (21.1 mph)
2	3	> 16 km/h (9.9 mph)
2	4	> 34 km/h (21.1 mph)
3	2	< 16 km/h (9.9 mph) and depending on upshift and downshift conditions, see below.
3	3	
3	4	> 34 km/h (21.1 mph)
4	2	< 16 km/h (9.9 mph) and depending on upshift and downshift conditions, see below.
	3	
	4	
4	3	> 34 km/h (21.1 mph) and depending on upshift and downshift conditions, see below.
	4	

Automatic shifting

Shifting is automatic. Conditions for shifting are combinations of mode selector (SW412) setting, engine speed and the machine's travel speed.

Automatic shifting takes place between gears,

Forward: 2nd – 3rd – 4th; Reverse: 2nd – 3rd – 4th.

Downshifting to 1st gear does not take place until Kickdown has been activated with any of the Kickdown controls on the steering column, lever console or lever steering (if lever steering is installed).

Upshifting to 2nd gear takes place on further activation of any of the Kickdown controls or if certain critical engine speed and travel speed limits are exceeded.

The gearshifting points vary depending on whether the engine is pulling or retarding.

At least 1 second must elapse between two upshifts or downshifts. The time between an upshift and a downshift (or the reverse) must be at least 3 seconds.

Shifting programs

- LIGHT position 1, shifting at low engine speed
- LIGHT position 2, shifting at slightly higher engine speed than in position 1
- ▽ (Normal), shifting at slightly higher engine speed than in position 2
- HEAVY, shifting at slightly higher engine speed than in position ▽

Kickdown

Kick-down means downshifting to 1st gear by activating the Kick-down function on the gear selector control, or on the control lever console. The time for downshifting to 1st gear depends on the mode selector setting as well as the engine and travel speeds.

1st gear will be engaged if the machine has a sufficiently low speed, or if the speed becomes sufficiently low, 5 km/h (3.1 mph), within 8 seconds after the Kick-down function was activated. Engagement of 1st gear is indicated by a short signal from the buzzer.

In order to then upshift to 2nd gear, the Kick-down button must be activated once again.

Changing travel direction

Change of travel direction at a lower speed takes place in 2nd gear. If travel speed is too high, 3rd gear will be engaged first and then, when speed has been reduced, 2nd gear will be engaged.

Engine retarding / downshifting

2nd gear is the basic gear in which the machine always starts when the gear selector is in the position for 3rd or 4th gear. Engine retarding is obtained when the throttle pedal is fully released and the engine retardation/downshift button SW406 is pressed. Downshifting then takes place in stages, one gear each time that the button is pressed, from 4th to 3rd and after another press of the button, from 3rd to 2nd, if the speed is below speed 22 km/h (13.6 mph).

Additional downshifting to 1st gear, see kickdown.

If the engine retarding/downshifting button SW406 is pressed in while at the same time pressing down the throttle pedal, upshifting is prevented.

NOTE!

As a safety feature, upshifting to a higher gear takes place if certain critical engine and travel speeds are exceeded.

Language Code GB	Product WLO	Group 924	https://truckmanualshub.com/	No. 9	Version 1	Date 03/08/2002

Attachment bracket, cylinder

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This SB is to be considered as a technical information and comprises normal warranties within the rules for the same.

Figure 1

- 1. Bolt
- 2. Socket
- 3. Attachment bracket

Locking cylinder for attachment bracket with part Nos 80209, 80096, 80283, 80286

There have been cases where the locking cylinder in the cast attachment bracket, with part Nos 80209, 80096, 80283, 80286, has worked loose in its attachment. Because of this, the attachment has been altered in that bolt and support sleeve have been replaced. The bolt has been replaced with one with a bigger diameter and the support sleeve has been replaced with a longer sleeve. The new bolt and sleeve can also be installed on earlier attachment brackets.

Item in Fig. 1	Designation	New part No.	Discontinued part No.	Qty
1	Bolt	965196	959241	1
2	Socket	11157678	11142475	1

Working instructions

- 1. Secure the lifting frame at normal working height.
- 2. Remove the cover plate over the locking cylinder.
- 3. Remove the bolt and the sleeve, which fix the cylinder.
- 4. Drill so that the existing hole will run through the lower member of the attachment bracket, see item 3 in Fig. 1. Use an 8.5 mm drill bit.
- 5. Then make the hole wider from the other side. Use a 10.2 mm drill bit. Tap the hole to M12x1.75.
- 6. Fix the cylinder and install the new bolt 1 and sleeve 2, see Fig. 1.
Tightening torque 85 Nm (85 kgf m) (63 lbf ft).
- 7. Re-install the cover plate and restore the machine.

Language Code GB	Product WLO	Group 993	https://truckmanualshub.com/	No. 6	Version 1	Date 03/06/2008
Applies to Wheel Loaders						

Automatic greasing systems of foreign manufacture

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause and action

It has come to our attention that our customers and dealers are equipping our machines with automatic greasing systems of foreign manufacture. The following is our policy with regards to this:

Among factors that determine the lifespan of bearings and bushings are: the type of lubrication used, dosage, frequency and operational reliability of the lubricating apparatus. Warranty responsibility presumes that we can influence factors that affect lifespan and thereby the overall quality impression given by the machine.

Operational reliability is regularly discussed with current subsuppliers of our factory-installed automatic greasing systems with a view to optimising quality. These suppliers have been specially selected because they are able to supply a product that corresponds to our quality requirements.

Consequently warranty liability concerning abnormal bearing and bushing wear and also other matters related to lubrication is acceptable only where the machine is equipped with automatic greasing systems supplied and approved by Volvo Construction Equipment.

Language Code GB	Product ART/WLO	Group 160	https://truckmanualshub.com/	No. 64	Version 2	Date 11/10/2011
Applies to Articulated Haulers, Wheel Loaders						

Automatic transmission lubricants

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

NOTE!

The special lubricants (SAE10W and 30) are required to be used for L330E and L350F.

Cause and action

Volvo Automatic Transmission Fluid AT101(Volvo transmission oil 97341)

AT101 is intended for use in automatic transmissions in trucks and construction equipment. AT101 is required for filling/topping up at service where we earlier made demands that the transmission oil should meet quality standards Dexron II, Dexron III, or other Dexron levels.

Performance requirements for AT101 are described in Volvo Corporate Standard 1273,41.

The recommended oil change interval for AT101 is:

- 1000 h for Articulated Haulers, E-Series.
- 2000 h for Wheel Loaders, F-series.
— **L220F with serial number 8026– excluded!**
AT101 not approved, instead AT102 MUST be used.
— **All Wheel Loaders equipped with Optishift excluded!**
AT101 not approved, instead AT102 MUST be used

NOTE!

For L330E and L350F must the Volvo Super Transmission Oil (SAE 10W and 30) be used with service interval 1000h.

A new type of transmission oil has been introduced:

Volvo Automatic Transmission Fluid AT102. (Volvo transmission oil 97342)

Performance requirements for AT102 are described in Volvo Corporate Standard 1273,42.

Volvo Automatic Transmission Fluid AT102 is factory fill for F-series Articulated Haulers and G-series Wheel Loaders.

NOTE!

The recommendation is to use AT102 when changing transmission oil for:

- Articulated Haulers, E-Series and F-Series.
- Wheel Loaders, F-series and G-series. (**L350F excluded!**)

The recommended oil change interval for AT102 is:

- 2000h for Articulated Haulers, E-series and F-Series.
- 4000h for Wheel Loaders, F-series and G-series (**L350F excluded!**)

When changing oil on machines where AT101 has been used, small amounts of remaining old oil can be mixed with the new oil AT102 without causing damage.

AT102 can also be used in connection with service on earlier generations equipped with HT-transmissions.

NOTE!

For L350F must the Volvo Super Transmission Oil (SAE 10W and 30) be used with service interval 1000h.

Back-up alarm

<https://truckmanualshub.com/>

The function informs bystanders and surroundings that the machine is reversing.

Input signals	Output function conditions	Output functions
Directional gear	Directional gear in position Reverse	Reversing alarm SE 803

Back-up valve, opening pressure, checking

Op nbr

[11 666 018 Pressure gauge, range 0–2.5 MPa \(0–363 psi\)](#)

[11 666 037 Hose](#)

The following applies when checking:

Temperature: **Normal operating temperature**

Engine speed: **Low idle speed**

The bucket must be tilted forward. If the bucket is tilted back, pressure may increase to maximum working pressure and damage the pressure gauge.

1. Lower the lift arms so that the bucket is positioned flat on the ground.
2. Connect a pressure gauge to the pressure outlet.
3. Start the engine and let it run at low idle. Tilt forward slowly so that the machine is raised and read off the pressure.
Opening pressure: **1.0–2.0 MPa (145–290 psi)**

NOTE!

The valve is not adjustable.

Battery and alternator test procedure

NOTE!

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause

Some alternators without any failure have been returned. Also batteries without failure have been replaced.

Action

Before replacing alternators and/or batteries, follow the work instruction in this Service bulletin. Both alternator and battery can be checked under field conditions to find the root cause by following the work instruction.

The work instruction is valid for all 24 Volt machines.

Work instruction

Tools	Part No.
Multimeter	88890074
Clip-on ampere meter	88890091

Battery capacity check

Op nbr

1. V1131869

Figure 1

The battery should not be used for minimum 2 hours before the test.

2. Test the battery voltage.

Battery voltage	Equivalent approx. capacity
25.44 V	100%
24.24 V	50%
23.20 V	5–10%

NOTE!

If the battery voltage is low, check if the batteries need to be charged. If so, check the battery voltage again after charging. If the voltage is still low, the batteries are damaged and should be replaced.

Alternator check

Op nbr

1. Check the battery voltage (see above).

- <https://truckmanualshub.com/>
2. Start the engine and raise the engine rpm for a short time (charging warning lamp off).
 3. Switch off all possible electrical consumers.
 4. Monitor the battery voltage for approx. 2 minutes on low idle.
 5. The battery voltage should increase depending on the battery capacity. The voltage should reach between 26.00 V – 28.50 V.

NOTE!

If the battery voltage does not increase with the engine running, the alternator is damaged and should be replaced.

Alternator output check

Figure 2

Op nbr

1. Install the clip-on ampere meter (testing range 100 A) on the alternator wire B+, connect the clip-on ampere meter to the multimeter for displaying the value.
2. Start the engine and raise the engine rpm for a short time, check that the charging warning lamp is off.
3. With the engine on low idle, check the alternator output current on the multimeter. Note the value.
4. Switch on as many electrical consumers as possible, e.g. the cab fan on max speed and lamps (head lamps, working lamp on cab and fenders).
5. Raise the engine rpm to maximum (high idle).
6. With the engine on high idle and electrical consumers on, check the alternator output current on the multimeter. Note the value. The output value on high idle should be higher than on low idle. (Each lamp raises the current with approx. 2.5 A. If work lamp on cab front and fenders are on at the same time as the headlamps and fan, the high idle value shall be 10–20 A higher.)
7. After check, shut down the engine and remove tools.

NOTE!

If the alternator output is the same, or not significantly higher on high idle with electrical consumers on than on low idle, the alternator is damaged.

Battery, charging

<https://truckmanualshub.com/>

WARNING

During battery charging, hydrogen is formed. Hydrogen is flammable and may be explosive. A short circuit, open flame or spark near the battery can cause a powerful explosion. Therefore, ventilate well. Never smoke near batteries.

- Batteries must only be charged using a battery charger.
- Check the battery terminal connections and make sure that they are adequately tightened and free from corrosion and dirt.
- Check the battery voltage when the batteries are at rest, that is, before starting. Each battery must be at least half-charged.

CAUTION

Always disconnect the electric power to the battery charger before the charging clamps are removed.

WARNING

Corrosive sulphuric acid

The battery electrolyte contains corrosive sulphuric acid. Electrolyte spilled on bare skin must be removed immediately. Wash with soap and plenty of water. If electrolyte has splashed into the eyes or on any other sensitive part of the body, rinse immediately with plenty of water and contact a physician immediately.

Battery, description

<https://truckmanualshub.com/>

The battery consists of two 12 V batteries connected in series, which together give 24 V with a capacity of 340 Ah. The batteries are located one on each side of the rear frame, behind the rear wheels, with the battery disconnect switch located at the rear of the machine on the right side under the radiator casing.

The batteries must be in good condition when troubleshooting is performed on the electrical system. If necessary, charge the batteries with a battery charger. If the batteries fail to accept charging, check the level of the electrolyte in the battery cells.

Battery, specifications

<https://truckmanualshub.com/>

Battery	
Number of thermostats	2 batteries connected in series
Battery disconnect switch (Frame connection)	Connected to negative terminal
Voltage	12 V
Battery capacity	2 x 170 Ah

Charge level	Voltage
Fully charged battery	12.7 V
Half-charged battery	12.4 V
Discharged battery	11.6 V and lower

Battery electrolyte density	
Fully charged battery	1.275 –1.285 kg/dm³
The battery must be recharged at	1.250 kg/dm³

Language Code GB	Product WLO	Group 160	https://truckmanualshub.com/	No. 17	Version 2	Date 04/01/1999

Biodegradable hydraulic fluids

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

Since the middle of the 1980's, our customers have expressed the desire to use biodegradable hydraulic fluids for our construction equipment. To meet the requirement Volvo approved first a synthetic ester in 1992 and then another one in 1995.

The reason why Volvo has not been able to issue a general approval but has been compelled to mention two makes, is partly due to the uneven quality of the fluids and the complexity of international standards.

To come to grips with this problem and at the same time contribute to a greater increase in the use of biodegradable fluids, VCE has published a technical regulation, no. 766107, see appendix to this SB.

The technical regulation, which contains technical criterias on biodegradation and toxicity, should be applied as follows:

A biodegradable hydraulic fluid, that complies with technical regulation 766107, can be filled in a wheel loader on the aftermarket on condition that the following points are fulfilled:

- A written assurance from the suppliers that their product complies with regulation 766107.
- When the hydraulic fluid is filled in a machine for the first time, filling must follow the instructions in SB L-160-WLO 09, see pages 2 and 3.
- Should a fault occur in the machine's hydraulic system that is caused by the use of an hydraulic fluid not approved according to this SB, any compensation claims in connection herewith will not be accepted.

NOTE!

This applies to the after-market and not to filling at the factory.

Where a machine is ordered with biodegradable hydraulic fluid, it will be filled with an hydraulic fluid that is approved by Volvo for filling at the factory. The following hydraulic fluids are currently approved for filling at the factory:

- BP Biohyd SE-S 46
- Panolin HLP synth 46

Both these fluids can also be filled on the after-market without any prior approval of the hydraulic fluid manufacturer.

Instructions

The greatest possible care must be used when emptying the system of old fluid before filling with the new fluid, since the additives in both fluids can negatively affect the individual qualities of the fluids.

With fluid change, biodegradable fluid shall be regarded as environmentally dangerous waste. This means that it may not be emptied into the ground. The criterias are the same as those that apply to waste oil.

Storage: Biodegradable fluid shall be stored in sealed containers to prevent water absorption. Avoid exposing biodegradable fluid to sunlight and large swings in temperature.

NOTE!

Biodegradable oil may only be used in the hydraulic system.

Technical requirements for biodegradable hydraulic fluid

The fluid is intended for use as a pressure medium in mobile system for construction equipment, where high requirements for a good protection against wear at a wide temperature range have been specified.

Working conditions

Temperature Working temp.: 20 °C to 90 °C

Ambient temp.: -40 °C to 50 °C
<https://truckmanualshub.com/>
 Max. peak temp.: 110 °C

Type of systems Open centre system, open circuit
 Load-sensing closed centre system, open circuit
 Hydrostatic transmission, closed circuit

Reservoir The reservoir is placed over the pumps. Atmospheric pressure in the reservoir, which is zinc-phosphated on the inside.

Filter Full-flow cartridge inside the reservoir. Filter capacity down to 10 µm absolute.
 Bypass pressure 0.08 - 0.15 MPa (0.8 - 1.5 bar). Max. degree of contamination 18/13 according to ISO 4406.

Technical criterias ^{1, 2}

Property	Unit	Requirement		Test method
		46	68	
Density at 15 °C	kg/m³	Specify	Specify	ISO 3675
Viscosity in delivery condition, at: 40 °C 100 °C -20 °C	mm³/s (cSt)	41,4 - 50,6 Specify Max. 2400	61,2 - 74,8 Specify Max. 5000	SS-ISO 3104
Shearstability		Reported	Reported	CEC-L-45-T93/ DIN 52350, part 6, 20 hours.

Air separation at 50 °C	Min.	Max. 7	Max. 10	DIN 51381
Copper corrosion		Max. 1b		SS-ISO 2160 100 °C, 3 ηουρσ
Rust protection, steel		Approved		ISO 7120 A, 24 ηουρσ, 60 °C
Elastomer	Shore	Difference in hardness, max. 10		ISO 1817 NBR at 100 °C, 1000 ηουρσ
	%	Difference in volume, max.-3/+10		
		Tensile strength max., max. 50% reduced		
		Elongation at fracture, max. 50% reduced		
Foam	ml	Max. 150/0		ASTM D 892-89 Sequence I
		Max. 75/0		Sequence II
		Max. 150/0		Sequence III

Property	Unit	Requirement		Test method
		46	68	
Water separation	Min.	Max. 30		ASTM D 1401 to 40-40-0
Filterability	%	Min. 80		CETOP RP124H Step I
		Min. 60		Step II
Anti-wear, properties	mg	Total weight loss vanes, max. 15 Weigh loss ring, max. 75		Vickers M-2952-S
Load carrying capacity, FZG	Load stage	> 10		DIN 51354

Hydrolysis stability	mgKOH/g	Increasing TAN max. 2.0 measured in the oil part https://truckmanualshub.com/	RR 1006 ⁷ 120 hours, 90 °C, 10 % H ₂ O.
Mixing		No technical problems with hydraulic fluids.	
Water content	PPM	Max. 300	DIN 51777
Low temperature		Fluid must be clear and bright after storage at -25 °C for 7 days.	
Degree of contamination at delivery		Max. 15/13	ISO 4406
Oxidation stability	h	Min. 1000	ASTM D943, to increasing TAN 2.0 Modified ⁸

Environment criterias ³

Main components 5 - 100 %

Biodegradability > 60 % according to OECD-test 301 for poorly soluble substances for each of the main components ⁴.

Acute aquatic toxicity (toxicity degree to water) (LC₅₀/EC₅₀) > 100 mg/ml for each of the main components ⁵.

Minor components 0 - 5 %

Criteria for minor components are valid up to a total maximum of 5 % of the product.

Components with acute aquatic toxicity (toxicity degree to water)

(LC₅₀/EC₅₀) > 1 mg/ml are only allowed up to a total maximum of 1 % of the product ⁵.

Whole product

The product may not contain components that leads to classification dangerous to the health (Xn), irritant (Xi) or worse. (Classification according to KIFS 1994:12, National Chemicals Inspectorate of Sweden ⁶.)

The product should be approved according to the "Blue Angel", RAL-UZ 79.

Notes

- The technical criterias are based on the SMR (Swedish Society of Mechanical Engineers) standard for hydraulic fluids, 1996-2.
- The test should be done by a EN45000 or GLP certified laboratory.
- These criterias are the same as those in the Swedish National Standard SS 15 54 34.
- For the time being OECD 301B may be used. If the product contains more than one component, biodegradation data must be shown for each component.
If only one main component is included, biodegradation data on the whole product is acceptable. Acceptable if the "time window" of 10 days in the OECD test 301 is not completely fulfilled, on condition that 60 % or more of the component is degraded after 28 days and an ultimate degradation course is indicated. results according to test method CEC-L-33-A-93 must either be supplemented with DOC studies of the water phase in the test, or be correlated to an OECD 301 test for that type of component. Biodegradation test corresponding to OECD 301 according to ISO-EU standard may be accepted. Biodegradation tests must be carried out by laboratories certified according to EN45000 or Good Laboratory Practice (GLP).
- Acute aquatic toxicity can be measured according to OECD - 201, 202 or 203. Other standardized test methods may be accepted such as ISO, DIN, EPA-FIFRA standards. Chronic toxicity can be studied as alternative or complement. In this case NOEC should be > 0,01mg/l when using an OECD test. Test carried out according to the WAF-principle (Water Accomodated Fraction) is acceptable for separate components. Testing should generally be done at laboratories certified according to EN45000 or Good Laboratory Practice (GLP). Of technically comparable additives, the less harmful should be chosen.
- The Swedish Chemicals Inspectorate regulations KIFS 1994:12.
Some interpretations are:
Substances mutagenic to man: < 0,1 % of the product.
Substances with high/medium high cancerogeni potential to man:
< 0,1 % of the product.
Substances teratogenic to man: < 0,5 % of the product.
Substances allergic by inhalation or skin contact: < 1 % of the product.
Substances irritating skin, eyes and respiratory system: < 20 % of the product.
Definition of above features of substances is also done according to KIFS 1994:12.
- If it is impossible to run the RR 1006-test, the hydrolysis stability has to be verified in another documented test.
- Follow the procedure in ASTM D943 except for the addition of water.

Boom Suspension System (BSS)<https://truckmanualshub.com/>

The purpose of the function is to activate and deactivate the boom suspension system and to inform the operator about activation or if there is a system malfunction.

Switch SW907 is used to activate the Boom Suspension System while switch SW908 is used to select speed-dependent or gear-dependent Boom Suspension. The Boom Suspension System is engaged in accordance with the conditions in the following table.

Whether boom suspension is engaged or disengaged can be seen on the display panel under the HYDRAULICS function group, see [\[Invalid linktarget\]](#).

Input signals	Output function conditions	Output functions
○ Boom suspension system, SW907 ○ Boom suspension system, SW908 ○ Engine On/Off ○ Travel speed, SE403 ○ Kickdown ○ Directional gear ○ Active gear	Travel speed dependent: ○ SW907 in activated mode (boom suspension system control lamp on) ○ SW908 in Boom Suspension System travel speed dependent mode[T1] ⓘ ○ Engine On ○ Travel speed > 6 km/h (3.7 mph)	○ Activation of boom suspension system ○ Information display "HYDRAULICS" BSS ON
	Deactivation if one of the following conditions is fulfilled: ○ Directional gear in position F and travel speed < 5 km/h (3.1 mph) ○ Directional gear in position R and travel speed < 2 km/h (1.2 mph) ○ Directional gear in position N and travel speed < 2 km/h (1.2 mph)	○ Disengagement Boom Suspension System ○ Information display "HYDRAULICS" BSS OFF
	Gear dependent: ○ SW907 in activated mode (Boom Suspension System control lamp on) ^(a) ○ SW908 in Boom Suspension System gear-dependent mode ○ Engine On ○ Gear not in position F1 or R1 ○ Kickdown not requested	○ Activation of boom suspension system ○ Information display "HYDRAULICS" BSS ON
	Deactivation if one of the following conditions is fulfilled: ○ Gear in position F1 or R1 ○ Kickdown requested	○ Disengagement Boom Suspension System ○ Information display "HYDRAULICS" BSS OFF
○ Monitoring, RE7	○ System malfunction, open circuit or short circuit	○ Amber central warning lamp ○ -----ERROR----- Relay BSS

[T1]The control lamp is on constantly when the function is activated.

Boom Suspension System (BSS400), checking function

Op nbr

Checking pressure limitation

1. Start the engine and raise the lift arms to the horizontal position.
2. Charge the accumulator unit by tilting in (roll-back) against stop for approx. 4 seconds at full throttle. Then tilt away from the stop.
3. Activate the boom suspension system with the switch SW907.
The lift arms must not move. The pressure balance is then correct.
NOTE! Switch SW908 should not be activated (pressed in at the top).

Checking flow path between lift cylinder and accumulator

4. Switch SW908 should not be activated (pressed in at the top).
5. Fit a standard bucket and place it in a level position approx. 100 mm (4 in) above the ground.
6. Tilt the bucket forward so that the front wheels start to lift off the ground.
7. Engage the float position with switch SW903 and the machine should "fall" to the ground.
8. Engage the boom suspension system with switch SW907 and disengage the float position, switch SW903. The engine should run at idle speed.
9. Tilt in (roll-back) the bucket to the level position. The lift arms should "give" so that the bucket sinks to the ground. If this occurs, the flow path is correct.

Checking electrical functions

10. Switch SW908 is not activated (pressed in at the top, Kick-down dependent disengagement of boom suspension system).
11. Raise the lift arms to horizontal position. Activate the boom suspension system with switch SW907 and tilt in (roll-back) against the stop and hold the lever in that position.
Go to the "Hydraulics" menu on the operator display unit.
12. The lift arms must not move. (Indicator light is always green).
Menu "Hydraulics" should show that BSS is activated (on).
13. Place the bucket in a level position, approx. 100 mm (4 in) above ground.
Tilt the bucket forward (against the ground). The lift arms should "give" and move upward. The "Hydraulics" menu should show that BSS is activated (on).
14. Place the bucket in a level position, approx. 100 mm (4 in) above ground.
Apply the parking brake. Engage 1st gear. Tilt the bucket forward (against the ground). The lift arms should be rigid and not move upward.
The "Hydraulics" menu should show that BSS is not activated (off).
15. Place the bucket in a level position, approx. 100 mm (4 in) above ground. Servo levers in neutral position.
Deactivate the boom suspension system with switch SW907. The indicator light goes out.
16. Engage 1st gear and activate the Boom Suspension System. The indicator light should shine with a fixed green light.
Turn off the engine and check that the boom suspension system is disengaged when the ignition key is turned to position 1; indicator light goes out.
17. Start the engine and activate switch SW908 (lower part pressed in, speed dependent disengagement of boom suspension system) at approx. 5 km/h (3.1 mph).
18. Engage the boom suspension system with switch SW907.
The "Hydraulics" menu should show that BSS is not activated (off).

19. Fill the bucket with a full load. Operate the machine forward at a speed exceeding 5 km/h (3.1 mph).
Menu "Hydraulics" should show that BSS is activated (on).
<https://truckmanualshub.com/>
20. Reduce speed to below 5 km/h (3.1 mph).
The "Hydraulics" menu should show that BSS is not activated (off).
21. Operate the machine at a speed exceeding 5 km/h (3.1 mph).
Menu "Hydraulics" should show that BSS is activated (on).
22. Reduce speed to below 5 km/h (3.1 mph).
The "Hydraulics" menu should show that BSS is not activated (off).

Checking BSS function when operating with a load

23. Start the machine, switches SW907 and SW908 not activated. Green indicator light is off.
24. Fill the bucket with a full load. Raise the lift arms to carry position.
NOTE!
Do not tilt the bucket against the stop.
25. Engage 2nd gear and operate the machine at 0–10 km/h (0–6.2 mph).
The lift arms should not move. The green indicator light is off.
26. Activate switch SW907. Repeat step 3.
Menu "Hydraulics" should show that BSS is activated (on).
27. Engage 1st gear and activate switch SW907. Repeat step 3.
The "Hydraulics" menu should show that BSS is not activated (off).
28. Activate switches SW907 and SW908.
29. Engage 1st gear and operate the machine at a speed of 0 - 10 km/h (0 - 6.2 mph).
Check the following:
Speed below 5 km/h (3.1 mph). The lift arms should not move.
The "Hydraulics" menu should show that BSS is not activated (off).
Speed over 6 km/h (3.7 mph). The lift arms should move (spring action).
The "Hydraulics" menu should show that BSS is activated (on).

Boom Suspension System (BSS400), electrical system description

Electrical system

NOTE!

Boom Suspension System (BSS400) is described in wiring diagram 23.

Gear-dependent disengagement, upper end of SW908 pressed in

Activate the Boom Suspension System by pressing in switch SW907 and releasing it. When SW907 is pressed in, a voltage pulse is fed to connection EA23 on the V-ECU. From connection EC10 on the V-ECU, connection 86 on relay RE7 is fed with a hold current.

RE7 is activated and current is now fed via fuse FU2 to relay RE7, (30 - 87 are connected), solenoid valves MA910, MA911 and MA908 are fed and the system is engaged.

The indicator light is illuminated with a fixed glow on the centre instrument panel by the I-ECU.

If 1st gear is selected, the V-ECU interrupts the fed to 86 on RE7 and thus the current to solenoid valves MA910, MA911 and MA908 is interrupted, and the system is disengaged.

The operator's display "Hydraulics" shows that BSS is not activated (off).

The indicator light will still light with a fixed glow.

The system will automatically be engaged again when 2nd, 3rd or 4th gear is selected.

The operator display unit "Hydraulics" will show that BSS is activated (on).

Speed dependent disengagement, lower end of SW908 pressed in

When the lower end of switch SW908 is pressed in, the I-ECU receives a voltage signal on connection P2.4 via fuse FU30. This signal indicates to the system that it should be disengaged if the travel speed is below approx. 5 km/h (3.1 mph).

The operator display unit "Hydraulics" will show that BSS is not activated (off).

When the travel speed is above 5 km/h (3.1 mph), the system will be engaged again.

The operator display unit "Hydraulics" will show that BSS is activated (on).

The indicator light will light the whole time with a fixed glow.

Deactivating Boom Suspension System

Deactivate the Boom Suspension System by pressing in switch SW907 and then releasing it. Via the V-ECU, the current is interrupted to connection 86 on RE7 which is deactivated and interrupts the current to solenoid valves MA910, MA911 and MA908, and the system is disengaged.

The operator's display "Hydraulics" shows that BSS is not activated (off).

The indicator light will go out.

Figure 1
Wiring diagram 23 Boom Suspension System

Boom Suspension System (BSS400), hydraulic system description

System deactivated

Logic element 1 is closed because MA911 is open and MA910 is closed.

When the system is not activated, the pressure will be different in the lift cylinders and the accumulator.

For logic element 1 to remain closed, its top must be connected to the unit with the highest pressure.

If the lift cylinders have the highest pressure, the connection will be via restriction C10, MA911 and non-return valve CT6. The small logic element 2 is then closed.

If the accumulator has the highest pressure, the connection will be via logic element 2 as it then is open.

Non-return valve CT6 prevents flow through the back way from the accumulator to the lift cylinders.

Valve block, single-acting lift

Logic element 3 is closed when MA908 is closed.

Charging accumulator(s)

The accumulator(s) are charged when the system is not activated.

This is in order to prevent the lift arms (the boom) from sinking when the system is engaged.

Charging is done via pressure reducing valve (CT8), pressure copying valve (CT7) and non-return valve (CT5) when the pressure from the working hydraulics pump exceeds the pressure in the accumulator(s).

Charging can only take place when the system is temporarily disengaged or not activated.

When the system is active, pressure copying valve (CT7) is open as long as the pressure in the accumulator(s) is less than the pressure in the lift cylinders. That is, pressure copying valve (CT7) makes sure that the maximum pressure created in the lift cylinders is copied to the accumulators.

Pressure reducing valve (CT8) limits the maximum charging pressure to 12 MPa (1740 psi), which corresponds to the pressure needed in the lifting cylinders to support the maximum load.

Logic element 1
Logic element 2

<https://truckmanualshub.com/>

Activating the system

Valve block Boom Suspension System, V1

Before activation takes place and if the accumulator and the lift cylinders have the same pressure, then logic element 2 is closed.

The top of logic element 1 is then connected to the lift cylinders via restriction (CT10), MA911 and non-return valve (CT6).

When the system is activated, MA911 and MA910 close, causing the top of logic element 1 to be drained to tank via restriction (CT3) and MA910.

This means that logic element 1 opens and a connection is established between lift cylinders and accumulators.

Before activation takes place and if the accumulator pressure is higher than in the lift cylinders, then logic element 2 is open.

The top of logic element 1 is then connected to the accumulator via logic element 2.

When the system is activated, MA911 closes and MA910 opens, causing the top of the logic element to be drained to tank via restriction (CT3) and MA910.

Since logic element 1 is open, oil is fed from the accumulators to the top of logic element 1 and thus, the top of logic element 1 will have the same pressure as the accumulators (restriction CT3 maintains the pressure).

In this way, logic element 1 remains closed until the accumulators have been drained to the pressure level existing in the lift cylinders. When this happens, logic element 1 is closed, which means that the top of the logic element is drained via restriction (CT3) and MA910. Logic element 1 opens and a connection is obtained between lift cylinders and accumulators. In this manner, a balance in pressure is obtained between accumulators and lift cylinders before a connection is created.

Without pressure balancing, the oil from the accumulators would flow in to the lift cylinders and the lift arms would then rise in a quick and uncontrolled movement.

Valve block, single-acting lift, V2

Logic element 3 is opened when MA908 is opened. When this occurs, a connection is created between piston rod ends (-) of the lift cylinders and the tank. The lift arms have unrestricted upward movement when there is a springing action of the lift arms.

If only single-acting lift is desired without after-filling on the +sides of the lift cylinders, MA908 can be activated by itself with a switch on the right instrument panel (depending on machine model).

Description of fault symptoms, BSS

RE7 is monitored by V-ECU. In the event of a break or short circuit in the coil, the message "ERROR Relay BSS" will appear on the display panel in the cab.

If a fault develops in the individual solenoid valves the following description of symptoms may be of help in determining where the fault is located.

MA908 (closed in disengaged position)

1. MA closed in engaged position
 - Boom Suspension System functionality poor or non-existent
 - single-acting lift inoperative

2. MA jammed in open position

- the machine cannot be lifted by means of the lift unit with disengaged Boom Suspension System because no pressure build-up can be achieved.

MA910 (closed in disengaged position)

1. MA closed in engaged position
 - Boom Suspension System functionality poor or non-existent

Check functionality by undoing the connection to MA 911 and then engaging the Boom Suspension System. If the lifting arms sink, MA 910 is open and consequently in working order.

2. MA jammed in open position

- the lifting arms sink with the Boom Suspension System disengaged. The accumulators cannot be precharged.

MA911 (open in disengaged position)

1. MA open in engaged position
 - the lifting arms sink with the Boom Suspension System engaged.

2. MA jammed in closed position

- The lifting arms can sink just when the Boom Suspension System is engaged.

Pressure copying valve CT7

1. If the pressure copying valve has jammed in the closed position, the lifting arms may sink on engagement of the Boom Suspension System.

2. If the pressure copying valve has jammed in the open position it may cause a slight delay in engagement of the Boom Suspension System because the accumulator has to be drained via LE2. The accumulator will be charged with 120 bar (174 psi) irrespective of the pressure prevailing in the lifting cylinder if any hydraulic function is run.

Boom Suspension System (BSS400), <http://truckmanualshub.com/>

BSS400 makes operation with or without a load even and smooth at all speeds and prevents the machine from bouncing and rocking.

The system consists of 1 accumulator which is in communication via a valve system with the machine's lifting cylinders. BSS400 has accumulators with a maximum working pressure of 400 bar (5800 psi). The accumulators, which are of the piston type, are precharged with nitrogen gas.

Figure 1
Control lever carrier

SW907 Switch, activation of Boom Suspension System

Activating Boom Suspension System

The system is activated with switch SW907.

The indicator light on the centre instrument panel, I-ECU, lights with a fixed glow as long as the system is activated.

When the system is activated and engaged, a connection is opened between the +side of the lift cylinders and the accumulators as well as between the -side of the lift cylinders and the tank, which means that oil can pass freely in both directions.

Figure 2
Centre instrument panel

1. Indicator light
2. Operator display unit

If the system is to operate efficiently, it is important that the lift arms can move freely up and down. For example, the bucket must not rest against a mechanical stop.

SW908	Switch, function selection, gear dependent alternatively speed dependent
SW909	Switch, single-acting lift function

Gear-dependent disengagement of Boom Suspension System

If the Boom Suspension System is activated with SW907 and the upper end of switch SW908 is pressed in, the system is activated and engaged when 2nd, 3rd, or 4th gear is selected. It disengages automatically when 1st gear is selected.

In this way, the system is activated but disengaged during the bucket filling stage when 1st gear is selected. The system is automatically engaged when upshifting takes place.

In the hydraulic menu on the operator display unit, it is shown whether the Boom Suspension System is engaged or temporarily disengaged.

Speed dependent disengagement of the Boom Suspension System

When the lower part of SW908 is pressed in, the system is engaged if the travel speed exceeds 5 km/h (3.1 mph). At a travel speed below 5 km/h (3.1 mph), the system is disengaged regardless of which gear is used.

Speed dependent disengagement is advantageous in i.e. log handling where 2nd gear is normally used.

In the hydraulic menu on the operator display unit, it is shown whether the Boom Suspension System is engaged or temporarily disengaged.

Charging of accumulators

Accumulators can only be charged when the Boom Suspension System is disengaged or not activated. MA908, MA910 and MA911 do not receive any voltage.

In this way, unwanted movements are avoided when another hydraulic function is used (i.e. tilt or 3rd/4th function) when the system is activated and engaged.

With the boom suspension system disengaged, the accumulators always have the same pressure as the pressure in the hydraulic system.

[999 3875 Adjusting tool](#)

Removing

NOTE!

As a spare part, the brake disc is supplied without a pump rotor. Transfer the pump rotor to the new disc and centre it. Use the new bolt, lock nuts and spring pins supplied with the new disc.

1. Lift up the machine and position axle stands under the axle. Remove the wheels.
2. Drain the oil from the hub reductions and the axle housing.
Oil capacity, AWB30: **approx. 41 l (10.8 US gal)**
Oil capacity, AWB31: **approx. 33 l (8.7 US gal)**
3. Release the brake system pressure by depressing the brake pedal repeatedly (30–40 times).
4. Mark up the hub reduction position in relation to the axle housing, connect lifting device 999 3802 to the hub reduction. Remove the attaching bolts and the hub reduction.
Hub reduction weight: **approx. 250 kg (552 lbs)**

NOTE!

In certain cases, the stub axle and the brake disc may remain in the hub reduction.

Figure 1
Removing hub reduction

1. 999 3802
5. Remove the brake disc.
Remove the brake plate and the guide pins.

Figure 2
Brake plate and guide pins

1. Brake plate
2. Guide pins, 4 pcs

6. Loosen the lock nuts. Turn out the adjusting screws for the brake piston approx. 1 turn. Clean and check the parts for any wear and damage.

Figure 3

1. Adjusting screws with lock nuts

7. On certain axles, the wear indicator pin must be fitted from the hub side. Check if this is the case. In such cases, the brake piston must be removed and the seal rings must be changed, see [Invalid linktarget].

Centring the pump rotor on brake disc

8. Remove the pump rotor from the old brake disc.
9. Centre the pump rotor on the new brake disc as follows:
 - Position the new brake disc on a flat surface with a pump housing half on each side. Centre the pump housing halves

on the brake disc by knocking in two spring pins (6.35 x 24 mm) in two diametrically opposed bolt holes.

- Fit the bolts in the other two holes.
Tightening torque: **12 Nm (8.9 lbf ft)**
- Knock out the spring pins and fit the bolts.
Tightening torque: **12 Nm (8.9 lbf ft)**

Figure 4
Centring pump housing halves on brake disc

1. Spring pins for centring of pump housing halves

NOTE!

Applies only to axles on which the wear indicators must be fitted from the hub side. Otherwise, continue under heading [Invalid linktarget].

Brake piston, removing and installing

10. Fully depress the brake pedal and block it in that position with a suitable tool. When the brake pedal is blocked in the depressed position, the hydraulic tank oil is prevented from running out to respective brake caliper.

NOTE!

The brake pedal must remain blocked until the front axle has been installed again.

11. Remove the brake piston with a pry bar.
Collect any oil that drains.
Brake piston weight: **approx. 17 kg (38 lbs)**
Clean and check the parts for any wear and damage.

Figure 5
Removing brake piston

12. Grease the brake piston and the O-rings. <https://truckmanualshub.com/>
Fit the O-rings with the flat surface against the bottom of the groove in the brake piston.

Figure 6

1. O-rings

13. If the wear indicator pin cannot be fitted after the brake piston has been installed;
Adjust the length of the wear indicator pin so that it is 89 mm (3.5 in) (basic adjustment).

Figure 7
Basic adjustment of wear indicator

<https://truckmanualshub.com/>

Installing

16. Fit the O-ring on the axle housing.
Fit the brake disc.

Figure 10
Installing brake disc (principle illustration)

1. Brake disc
2. O-ring

17. Fit the brake plate and the guide pins, 4 pins.

Figure 11

1. Brake plate
2. Guide pins, 4 pcs

18. Attach lifting device 999 3802 to the hub reduction.
Hub reduction weight: **approx. 250 kg (552 lbs)**
Fit the hub reduction.

NOTE!

Check to make sure that the guide pins in the hub reduction fit in the brake piston slots.

Figure 12
Installing hub reduction

1. 999 3802

19. Fit and tighten the hub reduction attaching bolts.
Tightening torque: **310 Nm (229 lbf ft)**

Brake piston, adjusting stroke

20. Bleed the brake circuit, see [Invalid linktarget].

Oil under high pressure.

Figure 13

21. Start the engine and run up the brake pressure. Stop the engine and apply the foot brake.

NOTE!

The brake must be applied until the wear indicator has been adjusted and adjusting tool 999 3875 has been removed.

22. Turn in the adjusting screws against the activated brake piston.
Then, turn out the adjusting screws 1/2 turn. Lock the adjusting screws with the lock nuts.

NOTE!

This work should only be done if a new brake disc has been installed.

Adjusting wear indicator

23. Remove the wear indicator.
24. Adjust the length of the wear indicator pin so that it is 89 mm (3.5 in) (basic adjustment).

Figure 14
Basic adjustment of wear indicator

1. 89 mm (3.5 in)

25. Fit the wear indicator.
Fit adjusting tool 999 3875 for the wear indicator and tighten until it bottoms out.

Figure 15
Adjusting wear indicator

1. 999 3785

26. Remove the adjusting tool, still with the brake applied. Fit and tighten the plug on the wear indicator.
27. Release the brake.
28. Fill oil in the axle.
Oil capacity, AWB30: **approx. 41 l** (10.8 US gal)
Oil capacity, AWB31: **approx. 33 l** (8.7 US gal)
29. Fit the wheels and remove the supports.
30. Check function.

Op nbr 5160151701

[999 3831 Support](#)

The following applies when checking:

Brakes must be applied.

NOTE!

Maintain greatest possible cleanliness when working on the brakes.

1. Start the engine and charge the accumulators. Raise and secure the boom with support 999 3831. Stop the engine and apply the brake.

CAUTION

The brake must be applied the entire time when checking wear.

Figure 1

1. 999 3831 Support
2. Remove the plug on the wear indicator.

Figure 2

<https://truckmanualshub.com/>

1. Plug
3. Press in the wear indicator pin until it stops.

Figure 3

Press in the wear indicator pin

4. Brake disc wear is indicated by the position of the flat surface B on the wear indicator pin in relation to the flat surface of the nipple A, see [Invalid linktarget].
The position of the flat surface of the pin varies depending on how much the brake disc is worn. For a new brake disc, the indicator pin cannot be pressed in more than to a position where its flat surface is 2.3 mm (0.1 in) outside the flat surface of the nipple.

Figure 4

Checking brake disc wear

Brake return spring moved

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause and action

To facilitate assembling, the brake return springs have been moved from the brake piston to the brake plate.

The moving of the brake return springs means that the brake piston and the brake plate have been changed. On certain axles also the seal rings have been changed.

Brake plates and brake pistons of the earlier type cannot be ordered as spare parts. This means that when replacing for example the brake piston on an axle of earlier type, also the brake plate and in certain cases also the seal rings must be replaced.

Op nbr 52037

Plastic hose, inside diameter approx. 6 mm (0.236 in), length approx. 1 m (3 ft)

The brake system is divided into two circuits. This means that if only one circuit has been opened (a line has been disconnected, etc.), only that circuit needs to be bled free of air.

WARNING

Oil under high pressure!

1. Check the oil level in the hydraulic oil tank.
Oil capacity L90D: approx. **95 l (25.1 US gal)**
Oil capacity L120D: approx. **155 l (40.9 US gal)**
2. Fully depress the brake pedal and block it in that position with a suitable tool.
3. Start the engine and run it at a low idle.
4. Connect the plastic hose and carefully open the bleeder screw. Close the bleeder screw when oil free of air flows out.

Figure 1
Bleeding brakes

1. Plastic hose
 2. Bleeder screw
5. Turn off the engine. Adjust the oil level in the hydraulic oil tank.
Oil capacity L90D: approx. **95 l (25.1 US gal)**
Oil capacity L120D: approx. **155 l (40.9 US gal)**
 6. Check function.

Op nbr 52002

[999 3721 Service display unit](#)

The following applies when checking:

- The machine must be without load.
- Machine speed must exceed 20 km/h (12.4 mph).
- The ground surface must be level and have good friction, dry asphalt, dry concrete or similar surface.
- Brakes must be applied without locking up the wheels.
- Do not pump or release the brake pedal during braking.
- Together with the supervisor, select a location where the brake test can be performed without risking accidents or being run into from behind, etc.

The brake test must only be performed in a place where there is no risk of accidents.

1. Connect the service display unit to the socket on the right instrument panel.
2. Start the engine and activate the service display unit.
3. Scroll to the function group "BRAKES".

Figure 1

4. Scroll to the sub-menu "BRAKE TEST LOG".

Figure 2

5. Turn the gear selector to position A (automatic).
6. If the menu for the brake test is selected, the buzzer will emit a short signal when the travel speed exceeds 20 km/h (12.4 mph), indicating that the brake test can be performed.
7. Brake the machine maximally without locking the wheels or releasing the pedal.
8. Read off the value for retardation.
9. The service display unit shows the four most recent measured values, with the latest data far to the left.

10. If the latest measured retardation is below 4.75 m/s^2 (0.48 g), the test should be repeated. If that test also gives a result below 4.75 m/s^2 , the brake system must be checked according to [Invalid linktarget] and [Invalid linktarget].

This function calculates the machine's retarding ability to obtain information on the condition of the brakes.

The brake test can be performed when the machine is driven at a travel speed of > 20 km/h (12.4 mph). Retardation is calculated and the result and average brake pressure are shown on the display panel.

If the test is not approved, no test results will be shown on the display panel.

When travel speed exceeds 10 km/h (6.2 mph) for the first time after completion of the test, the test result disappears until a new test has been performed.

The latest three approved measurements are saved for presentation in the service display unit.

NOTE!

The test result is strongly dependent on the road surface and the road gradient.

Input signals	Output function conditions	Output functions
Brake test display Travel speed, SE403 Output brake pressure, SE 501	Brake test display should be open Travel speed >20 km/h (12.4 mph) when measurement is started; short signal from buzzer when the speed is exceeded. Retardation is calculated from the time it takes to decelerate from 15 to 5 km/h (3.1 mph) when braking and may be maximum 8 m/s² (16.4 ft/s²)	Buzzer ----- BRAKE TEST ----- Speed z.zz m/ s2 See instructions xx yyy vvv bar ↑ LEIFSDAHL

Break in computer communication

WARNING!

Read all signs and instructions on the machine and the safety instructions in the operators manual, before you start working on the machine.

The installation instructions are based on the use of special tools, the E-tool and standard tools generally available on the market, and also on our operators manuals and service manuals.

The equipment should be installed by qualified personnel of an authorised workshop.

Volvo Construction Equipment Group disclaims all responsibility if tools and work methods other than those described in the instructions are used.

Boom suspension system

Work description

- 1 Raise lifting frame and secure with support 9993831.
- 2 Disconnect the main switch.
- 3 Remove the cover plate in front of the control valve.
- 4 Connect a vacuum pump to the tank or in other case empty the hydraulic oil tank.
- 5 In case the machine is equipped with the single-acting lifting function the switch to solenoid valve MA908 has to be disconnected.

Fig. 1

- 1 Support, 9993831

Accumulators

The accumulators have no charging pressure when delivered and therefore must be charged either to 2.0 MPa (290 psi) respective 6.0 MPa (870 psi). See the service manual. Mark accumulators with respective load pressure.

- 6 Fit the clamps to the accumulators on the inside of the frame.

Part No.	Description	Qty.	Pos. in Fig. 2
11133321	Clamp	4	18
946471	Flange screw (M10x16)	8	20

- 7 Fit the accumulators in the attachments. The accumulator, which has 6.0 MPa (870 psi), charging pressure, place the accumulator on the right inside of the frame.

Part No.	Description	Qty.	Pos.	Fig.
11704948	Accumulator	2	22 and 26	2
11133322	Clamp	4	19	2
13965185	Bolt (M10x40)	4	21	1

Fig. 2

Valve

- 8 Fit solenoid valve MA908, for the single-acting lifting function, on the inside of the frame. See Fig. 3 and Fig. 4.

Fig. 3

Part No.	Description	Qty.	Pos. in Fig. 4
11101827	Valve	1	10
13965189	Bolt (M10x90)	2	9

Fig. 4

- 9 Fit the testing nipple and nipples on the boom suspension system valve.

Part No.	Description	Qty.	Pos. in Fig. 2
11410639	Valve	1	1
13933251	Testing nipple	1	2
4881644	Nipple	1	3
4897257	Elbow nipple	1	4
4881171	Nipple	1	5

- 10 Fit the valve on the left inside of the frame.

Part No.	Description	Qty.	Pos. in Fig. 2
13965189	Bolt (M10x90)	2	9

Hoses

11 Fit a nipple on the block.

Part No.	Description	Qty.	Pos. in Fig. 4
11411596	Block	1	23
931228	Nipple	1	25

12 Fit the block on the right accumulator. Fit a hose between the accumulators.

Part No.	Description	Qty.	Pos. in Fig. 4
935312	Flange half	4	6
13948699	O-ring (25x3.5)	3	8
11133679	Hose (3/4x750)	1	29
13946752	Flange screw (M10x35)	4	7
13947790	Flange screw (M10x80)	4	24

13 Fit a hose between the boom suspension system valve, port A and the accumulator.

Part No.	Description	Qty.	Pos.	Fig.
11133439	Hose (3/4x750)	1	30	4
935312	Flange half	2	6	2
13948699	O-ring (25x3.5)	1	8	2

14 Remove the existing plug on the plus side of the lifting cylinder. Fit a hose between the valve of the boom suspension system, port B and the plus side of the lifting cylinder. See Fig. 2, 4 and Fig. 7.

Part No.	Description	Qty.	Pos.	Fig.
11133437	Hose (3/4x950)	1	27	4
935312	Flange half	2	6	2
13948699	O-ring (25x3.5)	1	8	2
13946752	Flange screw (M10x35)	4	7	2

15 Remove the existing testing nipple on the control valve's left side. Fit nipples and the existing testing nipple. See Fig. 2 and Fig. 5.

Part No.	Description	Qty.	Pos. in Fig. 2
4821861	Nipple	1	14
931225	Nipple	1	16
4881498	Nipple	1	17

Fig. 5

- 16 Fit a hose between the valve, port C and nipple of the control valve. See Fig. 2, pos. C in Fig. 4 and Fig. 5.

Part No.	Description	Qty.	Pos. in Fig. 4
935477	Hose (3/8x550)	1	32

Fig. 6

- 17 Remove the existing hose and nipple from the return pipe. Fit nipples and existing hose on the return pipe. See Fig. 4 and Fig. 6.

Part No.	Description	Qty.	Pos. in Fig. 4
4821881	T-nipple	1	13
4821861	Nipple	1	14
4864926	Coupling	1	15

- 18 Fit a hose between the valve, port D and the return pipe. See Fig. 4 and Fig. 6.

Part No.	Description	Qty.	Pos. in Fig. 4
935478	Hose (3/8x550)	1	33

- 19 Fit the hose between the return pipe and the solenoid valve MA908.

Part No.	Description	Qty.	Pos.	Fig.
11133463	Hose (3/4x700)	1	31	4
13948699	O-ring (25x3.5)	1	8	2
11015454	Flange half (19)	2	11	2
946472	Flange screw (M10x30)	4	12	2

Fig. 7

- 20 Remove the existing plug on the minus side of the lifting cylinder. Fit a hose between the valve for the single-acting lifting function and the lifting cylinder minus side. See Fig. 2, 4 and Fig. 7.

Part No.	Description	Qty.	Pos.	Fig.
11133438	Hose (3/4x950)	1	28	4
935312	Flange half	2	6	2
13948699	O-ring (25x3.5)	1	8	2
13946752	Flange screw (M10x35)	4	7	2

- 21 Remove the vacuum pump or fill up with oil in the hydraulic oil tank.

Electrical installation on front frame

- 22 Connect the cable harness from solenoid valve MA908, MA910, MA911 and FD contact in the plastic box. The plastic box is placed over the control valve.

Part No.	Description	Qty.
11133107	Cable harness	1
13949746	Clamp	1
4881440	Strip clamp	5

Electrical part in the cabin

- 23 Fit two switches on the right instrument panel and connect the existing cable harness.

Fig. 8

Part No.	Description	Qty.	Pos. in Fig. 8
4803509	Switch (SW908)	1	1
4803548	Lens to SW908	1	2
11006184	Decal	1	3
4803455	Switch (SW909)	1	4
11039482	Lens to SW909	1	5

Fig. 9

- 24 Remove the plastic cover in front of the electrical distributor box fuses. Fit relay RE7 in the electrical distribution box.

Part No.	Description	Qty.	Pos. in Fig. 9
3171420	Relay	1	RE7

- 25 Remove the levers balls, the plastic cover and the plastic round the servo valve.

- 26 Drill a hole in the plastic cover and fit switch SW907 with the cable harness.

Part No.	Description	Qty.	Pos. in Fig. 10
11170675	Cable harness	1	1

Fig. 10

Fig. 11

- 27 Fit switch SW907 with the cable harness to the existing SE contact under the servo valve. See Fig. 11.
- 28 Test drive and check function also for leakage. Check oil level in hydraulic oil tank.
- 29 Fit the cover plate in front of the control valve and the other protections.
- 30 Write equipment number 80142 on the machine card.

Function check

Note! Applies to machines equipped with the 400 bars boom suspension system.

The system consists of two valve blocks: A boom suspension system and a system with a single-acting lifting function.

The boom suspensions system valve block = Lifting cylinder, piston side - accumulators.

The single-acting lifting function valve block = Lifting cylinder, piston rod side - tank.

Checking pressure limitation

- 1 Start the engine and raise the lifting arms to the horizontal position.
- 2 Change the accumulator unit by tilting in towards stop for about 4 seconds at full throttle. Then tilt back from stop.
- 3 Engage the boom suspension system with switch SW907. The lifting arms must not move. The pressure balance is correct.

Note! Switch SW908 to off position, i.e. upper half pushed in.

MA 375

Fig. 12

Checking flow path between lifting cylinder and accumulator

- 1 Switch SW908 to off position, i.e. upper half pushed in.
- 2 Attach a standard bucket and position it level approx. 100 mm (4 in) above the ground.
- 3 Tilt the bucket forwards so that the front wheels start to lift from the ground.
- 4 Engage floating position with switch SW909. The machine should sink to the ground.
- 5 Engage the boom suspension system with switch SW907, and disengage floating position with switch SW909. Let the engine run at idle speed.
- 6 Tilt the bucket back to level position. The lifting arms should drop so that the bucket sinks to the ground. This will indicate correct flow path.

Checking and setting of pressure-reduction valve CT8 in valve block

Note! Setting on delivery, 12 MPa.

- 7 Fit the load weight or select full load for standard bucket.
- 8 Run engine to approx. 2000 rpm, tilt towards stop and hold lever in this position, max. 15 seconds.

Activate the boom suspension system with SW907. In those cases where the lifting arms sinks is the pressure lower than 12 MPa (CT8).

Fig. 13

Fig. 14

- 9 The lifting arms must not move. Control lamp green light on. The hydraulics-menu should show that the boom suspension system is on.
- 10 Approx the bucket level, approx. 100 mm (4 in) above the ground.
Tilt the bucket towards the ground. The lifting arms should move upwards. The hydraulics-menu should show that the boom suspension system is on.
- 11 Approx the bucket level, approx. 100 mm (4 in) above the ground.
Apply the parking brake and engage 1st gear. Tilt the bucket towards the ground. The lifting arms should remain in the fixed position and not move.
The hydraulics-menu should show that the boom suspension system is off.
- 12 Approx the bucket level, approx. 100 mm (4 in) above the ground. Servo levers in neutral.
Disengage the boom suspension system with switch SW907. Control lamp off.

Test driving with load

- 1 Start the machine. Switches SW907 and SW908 off.
The green control lamp off.
- 2 Fill the bucket full. Raise the lifting arms to the transport position.

Note! Do not tilt the bucket towards stop.

- 3 Engage 2nd gear and drive the machine at speed of 0-10 km/h.
No movement from lifting arms. The green control lamp off.
- 4 Activate switch SW907. Repeat step 3.
The hydraulics-menu should show that the boom suspension system is on.
- 5 Engage 1st gear and activate switch SW907.
Repeat step 3.
The hydraulics-menu should show that the boom suspension system is off.
- 6 Activate switches SW907 and SW908.
- 7 Engage 1st gear and drive the machine at speed of 0-10 km/h.
Check the following:
Speed below 5 km/h. No movement from lifting arms.
The hydraulics-menu should show that the boom suspension system is off.
Speed above 6 km/h. Slight movement from lifting arms.
The hydraulics-menu should show that the boom suspension system is on.

Cab suspension, description

<https://truckmanualshub.com/>

Figure 1
Cab suspension

1. Rear cab element
2. Front cab element

Figure 2
Rear cab element

Figure 3
Front cab element

Op nbr 81002

Total procedure time (hr): NaN

[Sling, 4 metres \(13 ft\) 4](#)

1. Attach the lifting device.

Figure 1

1. Sling, 4 m (13 ft) (4)
2. Place washer B and, if necessary, adjusting shims A and F on each cab element.

The adjusting shims must be refitted on the same cab element as they were removed from to ensure that no changes occur in the functionality of the cab elements.

Figure 2
Cab element (diagrammatic drawing)

- A. Adjusting shim
- B. Washer
- C. Air slot
- D. Attachment

- E. Plate
- F. Adjusting shim, approx. 1 mm (0.039 in) thick
- G. Washer

3. Lift the cab into place.

Cab weight: **approx. 800 kg (1764 lbs)**

Fit plate E, washer G and, if necessary, adjusting shim F together with each bolt.

4. Tighten the bolts.

Tightening torque, rear attachment – frame: 580 Nm (428 lbf ft)

Tightening torque, front attachment – frame: 400 Nm (295 lbf ft)

5. Check air slot C on each cab element.

The air slot should be visible at some place, all or part of the way round.

6. If no air slot is visible, remove the bolt and fit an extra adjusting shim, pos. F.

Then tighten the bolt to the correct torque.

A maximum of 2 adjusting shims F can be fitted on each cab element.

7. Remove the lifting device

8. Pull the wiring through the hole in the wall of the cab.

Plug the wiring connectors into the electrical distribution box.

Bolt the lead-through plate into place.

Figure 3

9. Fit the steering valve.

Figure 4

- 1. Retaining bolts (4)

10. Fit the foot-brake valve.

Figure 5

11. Fit the extra pedal for operating the foot brake.

Figure 6

12. Plug the connector into the servo valve
Fit the servo valve on the control lever carrier.
Fit the front floor plate.

Figure 7

1. Connector

13. Fit the plastic casing on the side of the control lever carrier and the lever for angle adjustment of the control lever carrier.
Fit the casing over the servo levers. Fit the knobs on the servo levers.

Figure 8

1. Upper casing
2. Side casing
3. Lever for regulating inclination

14. Fit the floor mat. Where applicable, bolt the throttle pedal in place.
15. Connect the coolant hoses to the heater unit.
16. Points 17 to 20 concern machines equipped with an air conditioning unit.
17. Fit the evaporator.

Figure 9
Evaporator

1. Evaporator

18. Fit the support plate securing the evaporator.

Figure 10
Support plate

<https://truckmanualshub.com/>

1. Support plate

19. Carefully wind on the capillary tube. Fit the insulating compound.

Figure 11
Capillary tube

1. Capillary tube
2. Evaporator pipe
3. Insulating compound

20. Fit the plate together with the recirculation damper.
Fit the control wire for the recirculation damper. Fit the filter casing together with the air filters.

Figure 12

1. Striker plate, recirculation damper
2. Plate

Cab, removing

Op nbr 81001

Total procedure time (hr): NaN

[Sling, 4 metres \(13 ft\) 4](#)

Figure 1

1. Striker plate, recirculation damper
2. Plate

CAUTION

When working on a machine with air conditioning.

Do not detach any hoses or air conditioning unit connections and so inadvertently allow refrigerant to escape.

Points 2–4 concern machines equipped with air conditioning.

1. Remove the filter casing together with the air filters.
Remove the plate together with the recirculation damper.
2. Remove the support plate that holds the evaporator.

Figure 2
Support plate

1. Support plate

3. Remove the insulating compound. Carefully unwind the capillary tube and detach it from the evaporator and filter casing.

Figure 3
Capillary tube

1. Capillary tube
2. Evaporator pipe
3. Insulating compound

4. Carefully fold out the evaporator and place it on the step with some protective padding to rest on.

Figure 4

1. Evaporator
2. Padding

5. Fit pinch-off pliers on the coolant hoses or else drain off the coolant. Then detach the coolant hoses from the cab heater unit.
6. Remove the floor mat. It might be necessary to remove the throttle pedal from the floor.
7. Remove the knobs from the servo levers. Remove the casing from the servo levers. Remove the plastic casing on the side of the control lever carrier and the lever for angle adjustment of the control lever carrier.

Figure 5

1. Upper casing
 2. Side casing
 3. Lever for regulating inclination
8. Remove the servo valve from the control lever carrier.
Unplug the connector from the servo valve.

Figure 6

1. Connector
9. Remove the front floor plate.
Lower the servo valve down through the hole in the floor.

Figure 7

10. Remove the extra pedal for operating the foot brake.

Figure 8

Figure 9

11. Detach the foot brake valve from the cab floor and place it on the frame.

Figure 10

12. Detach the steering valve from the cab floor and place it on the frame.

Figure 11

1. Retaining bolts (4)

13. Detach the wiring from the electrical distribution box. Remove the lead-through plate from the rear wall of the cab and withdraw the wiring through the hole.

Figure 12

Figure 13
Cab element (diagrammatic drawing)

- A. Adjusting shims, selected before the rubber elements are fitted in place, for compensating for dimensional differences between cab and cab mounting
- B. Washer
- C. Air slot
- D. Attachment
- E. Plate
- F. Adjusting shim, approx. 1 mm (0.039 in) thick (front cab element only)

NOTE!

Important to prevent excessive compression of the rubber element.

- G. Washer

14. Remove the cab's four retaining bolts, washers, plate and, if fitted, adjusting shims.

The adjusting shims must be refitted on the same cab element as they were removed from. This is to ensure that no change occurs in the functionality of the cab elements.

15. Attach the lifting device and sling as shown in the illustration.

Figure 14

1. Sling, 4 m (4)

16. Lift away the cab.

Cab weight: **approx. 800 kg (1764 lbs)**

<https://truckmanualshub.com/>

17. Collect the washer (pos. B) and adjusting shims (pos. A, F) from each cab element, [Invalid linktarget].

The adjusting shims must be refitted on the same cab element as they were removed from to ensure that no changes occur in the functionality of the cab elements.

Capacities

<https://truckmanualshub.com/>

Engine, when changing oil incl. filter	16 l (4.2 US gal)
Fuel tank	210 l (55.4 US gal)
Cooling system, total	53 l (14.0 US gal)
Hydraulic transmission, total	33 l (8.7 US gal)
Hydraulic transmission, when changing oil incl. filter	25 l (6.6 US gal)
Dropbox when changing oil	4.7 l (1.2 US gal)
Front axle, when changing oil	33 l (8.7 US gal)
Rear axle	41 l (10.8 US gal)
Amount of refrigerant R134a	2.0 + 0.1 kg (4.4 + 0.2 lbs)
Hydraulic system, total	130 l (34.3 US gal)
Hydraulic oil tank	102 l (26.9 US gal)

Capacities

Engine, when changing oil incl. filter	24 l (6.3 US gal)
Fuel tank	255 l (67.3 US gal)
Cooling system, total	65 l (17.2 US gal)
Hydraulic transmission, total	45 l (11.9 US gal)
Hydraulic transmission, when changing oil incl. filter	35 l (9.2 US gal)
Front axle, when changing oil	33 l (8.7 US gal)
Rear axle	41 l (10.8 US gal)
Amount of refrigerant R134a	2.0 + 0.1 kg (4.4 + 0.2 lbs)
Hydraulic system, total	210 l (55.4 US gal)
Hydraulic oil tank	145 l (38.3 US gal)

CareTrack

WARNING!

Read all signs and instructions on the machine and the safety instructions in the operators manual, before you start working on the machine.

The installation instructions are based on the use of special tools, the E-tool and standard tools generally available on the market, and also on our operators manuals and service manuals.

The equipment should be installed by qualified personnel of an authorised workshop.

Volvo Construction Equipment AB, Customer Support Division disclaims all responsibility if tools and work methods other than those described in the instructions are used.

Work description

- 1 Start Tech Tool. In the identify window, chose machine, type " Other" and chose model "CARETRACK"
- 2 Create a chassis-ID for the CareTrack W-ECU by running the operation 17061-3 "Central system, update, create Care-Track chassis-ID". Make a note of the chassis-ID.
- 3 Update the machine in the central system with the operation 17056-3 "Central System, Updating, Chang Software ". If asked for the chassis-ID, use the newly created chassis-ID from the previous step. Check W-ECU Part No.
- 4 See table for conversion kit number in table on previously page.
- 5 Download the software for CareTrack.
- 6 Turn of the battery disconnect switch.

Antenna mounting.

NOTE! Mount antenna with unobstructed view to sky, with no metal structure covering antenna. Antenna should also be placed as far away from each other as practical and away from other radio communication devices to avoid possible signal interference.

- 7 Measure antenna locations on cab roof. Quantity of location will depend upon quantity of antennas being utilized. One for the GPS/GSM antenna (oval Area) and one for the satellite antenna (round area). The recommended hole size is 15mm. Mount the antenna. Antennas may also be mounted on mirror brackets, or even inside the cab, close to the vehicle windscreen. using locally manufactured mounting brackets.

Fig. 1 Suggested antenna positions on roof.

NOTE! When drilling in the cab, avoid any ROPS/FOPS structure.

NOTE!

When the bracket and satellite antenna have been mounted, ensure that the antenna and the bracket are grounded properly to the rest of the machine. A poor ground will affect the performance of the satellite antenna.

Fig. 2 Antennas mounted

Part nr.	Qty.	Designation	Pos. in fig.
15198186	1	Satellite antenna	-
17413636	1	GPS/GSM antenna	-
8 Route the antenna cables into the cab at a suitable location. Use an existing hole or drill a new hole $\varnothing$ 16 mm to allow routing. Protect the cables from the hole edges using a cable grommet.			
9 Measure out a location inside the cab that if possible, is hidden from view. Drill 3 holes $\varnothing$ 4 mm that match the hole pattern on the W-ECU.			

Ref. no.	Kit no. 11171864	Option no. ---	Operation no. ---	Issuer WLO	Date	Page 5/6
----------	---------------------	-------------------	----------------------	---------------	------	-------------

Fig. 4

Fig. 5

Inside the Cab

Mount the W-ECU where it is suitable.

- 10 Connect the antenna cables. Blue and violet connectors (GPS/GSM antenna). Black connector (optional satellite antenna) See figure 4.
- 11 Connect the 18 pin connector on the cable harness to the W-ECU.
- 12 Connect the cable harness as follows. Further holes may need to be drilled to gain access to the engine compartment. See also wiring diagram on last page.
- 13 Cable No 101 (white) to generator signal (active low)
Cable No 105 (Red) Battery feed + (30)
Cable No 110 (Red) Ignition key, active high (15)
Cable No 111 (Black) Earth (31)
- 14 Reset the battery disconnect switch.
- 15 Program the W-ECU with downloaded software by using operation 39736-3 "MID 142 Control unit, Programming".
- 16 If satellite modem used run operation 17030-3 "Parameter programming" and set parameter "IGU Satellite Modem Installed" set to "1"
- 17 Run operation 39796-3 "MID 142 Control unit, reset".
- 18 A flashing diode on the W-ECU indicates that the unit is receiving power correctly
- 19 The vehicle/CareTrack unit can now be registered on the CareTrack web page.

VARNING!

Läs alla skyltar och anvisningar som finns på maskinen och säkerhetsinstruktionerna i instruktionsboken innan Du börjar arbetet på maskinen.

Monteringsanvisningen är baserad på användning av specialverktyg, E-verktyg och i allmänna handeln tillgängliga standardverktyg samt instruktions- och verkstadshandböcker.

Utrustningen ska monteras av behörig person på auktoriserad verkstad.

Volvo Construction Equipment Group fransäger sig allt ansvar om andra verktyg eller arbetsmetoder än de i anvisningen beskrivna kommer till användning.

Spakstyrning

Arbetsbeskrivning

- 1 Avlasta lyftframverket mot golvet.
- 2 Anslut en vakuumpump till hydrauloljetanken. I annat fall måste hydrauloljetanken tömmas.

Ventil

- 3 Ta bort täckplåten under hyttgolvet vid den vänstra stegen.
- 4 Sätt dit nipplar och packningar i ventilen, port A och B.

Art.nr	Benämning	Ant.	Pos. i Fig. 1
11039561	Ventil	1	3
4880281	Nippel	2	15
4897257	Vinkelnippel	2	16

Fig. 1

- 5 Sätt dit nipplar och packningar i ventilen, port P och T.
Se Fig. 1 och Fig. 4.

26 Sätt dit skyddet på hyttväggen bakom förarstolen.

27 Skriv in utrustningsnumret 80264 på maskinkortet.

MA 856

Fig. 9

Provningsföreskrifter för spakstyrning (CDC)

Efter installation enligt gällande monteringsritningar för respektive produkt, ska styrningens egenskaper trimmas in.

Detta sker med två trimskruvar på styrreglagets ovansida.

OBS! Borra hål i plasten vid A och B, se Fig. 14.

Vänster skruv A är för justering av styrhastigheten åt vänster och höger skruv B är för justering av styrhastigheten åt höger.

Vridning medurs ökar och vridning moturs minskar hastigheten.

Justering av styrhastigheten ska ske efter varmkörning av maskinen och vid ett motorvarvtal på 25 r/s (1500 r/min).

Fig. 10

- 1 Se till att det finns utrymme kring maskinen och att det inte finns folk inom riskzonen för styrmanöver.
Starta och låt motorn gå på tomgång.
- 2 Fäll ner vänster armstöd på förarstolen.
- 3 Aktivera strömställaren för "Dubbelkommando" på armstödet till höger om styrspaken.
Grön kontrollampa lyser för aktiverat "Dubbelkommando" på instrumentpanelen.
- 4 För styrspaken sakta åt vänster respektive höger för kontroll av styrfunktionen.
- 5 Justera trimskruvarna så att tiden från fullt höger till fullt vänster blir 3,5-4,0 sekunder.
OBS! Spaken ska vara fullt utstyrd åt respektive håll och motorvarvtalet 25 r/s (1500 r/min).
Styrhastigheten åt vänster respektive höger ska vara så lika som möjligt.
- 6 Låt motorn gå på tomgång.
- 7 Lyft armstödet till uppfällt läge.
Den gröna kontrollampan för aktiverat "Dubbelkommando" ska automatiskt släckas när mikrobrytaren i armstödet påverkas, samtidigt som armstödet passerar ca 45° vinkel från horisontalplanet.

- 8 Fäll ner vänster armstöd på förarstolen.
- 9 Aktivera strömställaren för "Dubbelkommando" på armstödet till höger om styrspaken.
Grön kontrollampa lyser för aktiverat "Dubbelkommando" på instrumentpanelen.
- 10 För växelspaken vid ratten till läge "fram". Den gröna kontrollampan för aktiverat "dubbelkommando" ska då automatiskt släckas = Prioriterad rattstångsomkopplare, fram/back.
- 11 Aktivera strömställaren för "Dubbelkommando" på armstödet till höger om styrspaken.
Grön kontrollampa lyser för aktiverat "Dubbelkommando" på instrumentpanelen.
- 12 För växelspaken vid ratten till läge "back". Den gröna kontrollampan för aktiverat "Dubbelkommando" ska då automatiskt släckas = Prioriterad rattstångskopplare, fram/back.
- 13 Aktivera strömställaren för "Dubbelkommando" på armstödet till höger om styrspaken.
Grön kontrollampa lyser för aktiverat "Dubbelkommando" på instrumentpanelen.
- 14 Fram till vänster på armstödet sitter en vippströmbrytare för växellägena fram, neutral och back.
Kontrollera att denna funktion blir rätt när det gäller fram och back.
- 15 På armstödet vänstra sida sitter en liten svart knapp för funktionen "Kick down". Den kan endast användas när strömställaren för "Dubbelkommando" är aktiverad och den gröna lampan lyser.

Kontroll av fram/back - funktionen

- 1 Kontrollera att maskinen reagerar normalt på den ordinarie växelspakens funktioner.
- 2 Kontrollera att maskinen inte reagerar på fram/back - manöver från vänster armstöd.

- 3 Aktivera strömställaren för "Dubbelkommando".
Den gröna lampan ska lysa.
- 4 Kontrollera att maskinen reagerar på manöver från fram/
back- reglaget på vänster armstöd.
- 5 Kontrollera att den ordinarie styrningen fungerar även när
"Dubbelkommando" är aktiverat.

OBS! När styrspaken inte är påverkad samtidigt som
rattstyrningen används.

- 6 Avaktivera "Dubbelkommando" genom att fälla upp armstö-
det.
- 7 Kör maskinen med aktiverad spakstyrning. Kontrollera på
maskindisplayen att 4:e växeln går in.

Central lubrication

<https://truckmanualshub.com/>

The function engages central lubrication and prevents unnecessary lubrication of the machine, such as when the machine is idling with the gear selector in Neutral.

To ensure lubrication even in the event of no signal, such as due to a break in the cable, the signal to central lubrication is inverted, in other words no signal activates central lubrication.

Input signals	Output function conditions	Output functions
○ Directional gear ○ Engine On/Off	○ Directional gear in Forward or Reverse ○ Engine On	○ Activation of central lubrication

Charging of batteries

<https://truckmanualshub.com/>

Explosion hazard

When a battery is being charged, an explosive mixture of oxygen and hydrogen gas is formed. A short circuit, an naked flame or a spark near the battery can cause a powerful explosion. Always switch off the charging current before removing the charging clamps. Ventilate well, especially if the battery is charged in a confined space.

Corrosive sulphuric acid

The battery electrolyte contains corrosive sulphuric acid. Electrolyte spilled on bare skin must be removed immediately. Wash with soap and plenty of water. If electrolyte gets into your eyes or any other sensitive part of the body, rinse off immediately with plenty of water and seek immediate medical attention.

Designation	Function

31AC	Cab frame, ground terminals, AC relays

Figure 1

Op nbr 52001

[11 666 020 Pressure gauge 0–25 MPa \(0 - 3626 psi\)](#)

[11 666 037 Hose](#)

The following applies when checking:

Temperature: **Normal operating temperature**

Engine speed: **Low idle speed**

Unloading (cut-out) pressure (max. pressure): **15–15.5 MPa (2176–2248 psi)**

Cut-in pressure: **12–13 MPa (1740–1885 psi)**

Checking

1. Release the brake system pressure by depressing the brake pedal repeatedly (30–40 times).
2. Connect the pressure gauge to the pressure outlet on the brake valve.

Figure 1
Connecting pressure gauge

1. Hose 11 666 037 with pressure gauge 11 666 020
 2. Adjusting screw, unloading pressure
3. Start the engine and let it run at a slow idle. The pressure gauge will show a rapid increase in pressure up to the lowest precharge pressure of any of the accumulators. The pressure will then rise slowly, see also [Invalid linktarget]. Check that the warning lamp for low brake pressure goes out at approx. 9 MPa (1305 psi), see [Invalid linktarget].

Precharge pressure: **min. 3.5 MPa (508 psi)**

Max. pressure: **15.0–15.5 MPa (2176–2248 psi)**

NOTE!

If an accumulator has lost all precharge pressure, it will not be detected during this check.

Figure 2
Instrument panel

1. Warning light, low brake pressure
2. Central warning

Figure 3
Diagram, brake pressure

4. Any adjustment of the unloading pressure (max. pressure) is done on the adjusting screw on the underside of the foot brake valve, pos. 2 [Invalid linktarget].
5. Apply the brake a few times with the engine running at low idle. When the pressure has dropped to 12 MPa (1740 psi), the brake pump should cut in so that the pressure increases to the max. pressure for the brake system.
6. Run the engine until max. pressure is obtained, then turn off the engine.
Max. pressure: **15.0–15.5 MPa (2176–2248 psi)**
7. Carefully brake until the pressure has dropped to 13 MPa. Then check that the number of "full brake applications" is at least three (pedal slowly depressed fully and then released) before the pressure drops to 9 MPa and the warning lamp for low brake pressure lights up.
If the pressure has dropped below 9.0 MPa (1305 psi), it is an indication of a malfunction in the brake system. The problem may be due to:
 - air in the brake lines, see Brake system, bleeding air.
 - an accumulator has a precharge pressure which is too low or is missing precharge pressure altogether, i.e., defective diaphragm, see also Accumulator, checking.
8. Depress the brake pedal repeatedly and check that the brake pressure stops at the previously measured value for lowest accumulator pressure. Release the brake system pressure according to step 1.
If the precharge pressure in any one accumulator has dropped below 3.5 MPa (508 psi), then it must be changed.

Checking stall speed

<https://truckmanualshub.com/>

Op nbr 23602

Figure 1
Checking idle speed

1. Display panel
2. Connection point for service display panel

Before checking the stalling speeds, make sure that the engine, hydraulic transmission and hydraulic system have reached normal operating temperature.

When carrying out this check, all major current consuming equipment and the air conditioning system, if fitted, must be switched off.

NOTE!

For reasons of safety, engine rpm should only be checked from the cab. Reading should be carried out within 10 seconds. If the engine is run for longer periods it could overheat.

1. Select information about the engine and engine speed on the information display unit.
2. Check the high idle speed and adjust if necessary.
3. Engage third gear (forward or reverse). Apply the service brake and parking brake so that the wheels are locked and the machine cannot move.
4. Run the engine at maximum revs. Read off the stall speed.

Stall speed, 3, gear L90D: 2190 ±75 rpm.

Stall speed, 3, gear and working hydraulics L120D: 2120 ± 75 rpm.

Keep third gear engaged and move the lever for 3/4 function all the way forward. On machines not equipped with 3- or 3/4 function, the lifting arm is lowered with full lever movement.

Stall speed L90D/L120D: 1580 ±100 rpm.

If the speed reading obtained is higher than the specified stalling speed, this could be due to the torque converter, hydraulic transmission or hydraulic system, e.g. pressure too low.

If the speed is lower than that specified, this could be because the torque converter or engine (or its peripheral equipment) is in poor condition and perhaps because of too high a working pressure in the hydraulic system.

A divergent stalling speed is not in itself a fault that calls for repair but should be used as an aid in connection with fault tracing.

Circuit list

<https://truckmanualshub.com/>

Circuit No.	Wiring diagram	Function

Cleaning of the machine

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause

- Information concerning corrosion protective coating applied to all Volvo Construction Equipment.
- Information concerning removal of the corrosion protective coating once the machines arrive at the Volvo Dealership.

Action

The corrosion protective coating that is applied to all Construction Equipment is a proven coating that provides excellent protection to metal exposed to harsh outdoor conditions.

There is a trend to use more and stronger chemicals with a pressure water jet. It is important that the proper mixture of concentration with water is correct. Use of higher concentration of chemicals and washing sponges with hard surfaces for frequent use will remove the surface protection.

Volvo Construction Equipment is using the following rust protection:

- Rust protector Dinitrol 4010 is mainly used under the cabin, for zink coated tubes, fittings and around the engine. It is sprayed over the whole engine and it is durable for up to 160 °C (320 °F). This protection is almost impossible to remove and should not be removed. Strong solvents will damage the paint work inside and outside.
- If the rust protector has to be removed on outside painted surfaces, hot water under high pressure is recommended.

We advice you to follow below recommendations for cleaning

The machine should be cleaned regularly using conventional car wash products or conventional machine wash products to minimize the risk of damage to the lacquer and other surfaces on the machine.

In order to minimize damage caused by road/sea salts or other corrosion compounds on newly delivered machines Volvo Construction Equipment requires that the machine be thoroughly washed within 2 days of arrival.

Recommendations for cleaning the machine

- Place the machine in a cleaning area where washing chemicals are normally collected.
- Use a normal car wash/machine wash product. Follow the instruction with the product.
- The water temperature must not exceed 60 °C (140 °F).
- If a pressure water jet is used, keep at least a 20–30 cm (8–12 in) distance between the nozzle and the machine surface.
- Use a sponge with a soft surface.
- Always finish with a complete wash only with just water.

NOTE!

If a high-pressure jet is used for cleaning, take great care. The electrical components and electrical leads can be damaged even at a fairly low pressure and temperature. Protect electrical leads in an appropriate way. The engine should be turned off and the battery disconnect switch switched off.

Removal of asphalt or other special hard dirt

- Use Whitespirit or conventional degreaser in a cold process. Follow the recommendation for use of the product.
- All removal (cleaning) should be followed by a normal wash procedure with the cleaner and be finished by a complete wash with only water.
- Please keep in mind that the use of degreaser agents may require special places for this work or you have to clean up the remains from the washing.

Keep the equipment in a good condition

- Frequent cleaning of the equipment.
- Polishing of surfaces, especially areas such as Cab or other similar once a year.
- Damaged surfaces should be repaired with recommended paint products as needed.
- Because of UV rays machines are best kept under cover for better paint protection. Machines stored in open hot sun light

could dull the paint work if not regularly cleaned and waxed.
<https://truckmanualshub.com/>

Cleaning engine compartment, instruction

- Machines operating in dusty environment or environment exposed to fire hazards, e. g. wood-processing, woodchip handling or grain handling and animal feed industries require daily attention and cleaning of the engine compartment and surrounding areas.
- When operating in other environments, inspection and cleaning is required at least once a week.

WARNING

Beware of rotating parts. Keep a safe distance.

WARNING

The engine must not be running when cleaning as rotating parts may cause injuries.

Please pay attention to the following:

- Loose material is removed with, for example, compressed air.
- Cleaning should preferably be carried out at the end of the working shift before the machine is parked.
- Begin with the highest areas and end with the lowest on top of the fuel tank and areas near the fuel tank.
- Use personal protective equipment such as protective goggles, gloves and respirator.
- After cleaning, check and rectify any leaks. Close all covers and hoods.

Cleanliness, brake and hydraulic systems

<http://www.manualshub.com/>

The utmost cleanliness must be observed in connection with all work on these systems. Wipe off all pipe and hose connections before they are disconnected, remove flakes of paint, etc. Plug all pipes, hoses, cylinders, etc. immediately after they have been disconnected. Never refit an unplugged hydraulic hose until it has been thoroughly cleaned.

X = Pressure

0 = No pressure

*) Any malfunctioning due to internal leakage in the gear selector valve or between the clutch shaft and the oil distributor can be detected if all transmission pressures are checked simultaneously as described below.

Combined tank unit, removing and installing https://www.manualslib.com/

Op nbr 234XX

Removing

1. Cut the current with the battery disconnect switch.

Figure 1
Battery disconnect switch

- A. L120D
- B. L90D

2. Open the engine cover on the left-hand side of the machine.
3. Disconnect the cable to the level sensor (SE207) from the combined tank unit. Undo the cable clamp.

Figure 2

- 1. Connector
- 2. Cable clamp

4. Detach the bleed line.

Figure 3

1. Bleed line
2. Fuel lines

5. Detach the fuel lines from the combined tank unit.
6. Unscrew the detached combined tank unit.

Figure 4

7. Lift up the unit and remove it.

Figure 5

Installing

8. Position the unit and screw it in place.

Figure 6

9. Connect the two fuel lines and bleed line.

Figure 7

1. Fuel lines
2. Bleed line

10. Connect the cable to the combined tank unit and fit the cable clamp.

Figure 8

1. Connector
2. Cable clamp

11. Restore the machine to operating condition.

Figure 1
Communication

I-ECU	Instrument control unit
V-ECU	Vehicle control unit
IA	Service socket for service display unit

General

Vehicle electronics are based on the principle that all communication between control units takes place via two data buses. The machine's two control units are connected to the buses so that they can communicate with each other.

The different control units communicate with each other and report to the service sockets on data buses CAN/J1939 and J1708/J1587.

The buses conform to SAE standards and consist of two pair-twisted cables. The purpose of the twisted cabling is to protect the bus from electrical interference.

If a malfunction should occur in a system, a signal is sent out on the information bus which makes it possible to read the information on the operator's instruments or via the service display unit or VCADS Pro.

The illustration shows the principle on which the control units and service sockets are connected to the buses.

CAN/J1939 Control bus

System **control signals** are sent via this bus. The control bus is very fast, which is a prerequisite for efficient control of the entire system and rapid adjustment to varying operating conditions.

The primary communication alternative is the CAN/J1939 bus.

J1708/J1587 information bus

The information bus is connected to the control units and service sockets. **Information and diagnostics signals** are sent on this bus.

The bus also functions as a "backup" for the control bus, if it should fail for some reason.

The system status is continuously updated and available for reading by way of the information bus.

Figure 5

1. 999 3673 Bolt and drift
6. Remove the seal and enlarge the existing drain holes (11) in the pump housing to a diameter of 7 mm (0.276 in). See [Invalid linktarget].
7. Clean and check the parts with regards to wear and other damage.

Assembling

8. Grease the bearing pin and press the bearing onto the pin.

NOTE!

Press in the inner bearing race.

Figure 6

1. Pipe, Ø 31 mm (1.220 in)
 9. Grease the bearing position and press the bearing, together with the bearing pin, into the pump housing together.
- NOTE!**
Press in the outer bearing race.

Figure 7

1. Pipe, Ø 60 mm (2.362 in)
10. Fit the protective plate (9), washer (3), spacer sleeve (10) and lock ring (2), [Invalid linktarget].
NOTE!
The chamfer on the spacer sleeve and the lock ring lugs must face the bearing.
11. Press on the belt pulley using a suitable pipe.
NOTE!
Position a support against the bearing pin, for example, a pipe with inside diameter 27 mm (1.06 in) and outside diameter 34 mm (1.34 in).

Figure 8

1. Suitable pipe.
2. Support against bearing trunnion, a suitable pipe having an inside diameter of 27 mm (1.06 in) and an outside diameter of 34 mm (1.34 in).
12. Apply a thin film of locking compound, normal type, on the coolant seal contact face.
13. Press in the coolant seal with tool 999 8039. Check that the shaft is not moved from its position in the bearing pin. The bolt from 999 3673 may be used to fix the position of the shaft.

Figure 9
Pressing in coolant seal

1. 999 8039

14. Press the impeller onto the pump shaft, see [Invalid linktarget] . Screw bolt 999 3673 against the pump shaft. Use 999 3673, fixture and a spacer such as a washer.
Press-in measurement: $2 \pm 0.2 \text{ mm}$ ($0.08 \pm 0.008 \text{ in}$)

NOTE!

The spacer must have a thickness of 2 mm (0.08 in) and an inside diameter greater than the pump shaft diameter. Correct press-in measurement is obtained with the spacer between the fixture and the impeller.

Figure 10

1. 999 3673 Bolt, fixture
2. Spacer, i.e. a washer

15. Fit the end plate according to the markings. Use a new O-ring.
Fit the pipes, use new seals.

Op nbr 26203

1. Remove the protective fan grating.

Figure 1
Fan grating

1. Screws for fastening the fan grating

Removing

2. Open the left engine hood.
3. Disconnect the hoses from the pump.

NOTE!

Clamp off the hoses with hose pliers to prevent the coolant from draining.

Figure 2

1. Hose connections
2. Belt for coolant pump

4. Loosen the belt tension and remove the belt for the coolant pump.

Figure 3

1. Belt tensioner
2. Belt for coolant pump

5. Remove the bolts for the pump, then remove the pump itself.

Installing

6. Plug the two upper drain holes in the pump. Use plastic plugs with part no. 11030155-3.

Figure 4

Plug the two upper drain holes.

1. Upper drain hole
2. 11030155-3 Plastic plugs
3. Lower drain hole

7. Fit the coolant pump for the intercooler with the bolts.

8. Fit the belt for the coolant pump and adjust the belt tension.

When the belt is correctly tensioned, it should be possible to depress the belt about 15 mm (0.6 in) by exerting a relatively high pressure.

Figure 5

1. Belt tensioner
2. Belt for coolant pump

9. Refit the hoses on the pump connections. <https://truckmanualshub.com/>
10. Start the engine and check to make sure that there are no leaks.
11. Check the coolant level in the system. Top up if needed.
12. Fit the protective grille.

Op nbr 26202

Removing

1. Cut the current with the battery disconnect switch.

Figure 1
Battery disconnect switch

- A. L120D

2. Remove the filler cap from the header tank.

Figure 2

3. Drain the coolant.
Coolant capacity: **approx. 42 litres** (11.1 US gal)

Figure 3

4. Open the radiator cowl.
Release the gas spring and swing out the radiator cowl as far as possible.
5. Swing out the radiator.
6. Remove the bolts securing the fan and remove the fan rearwards.

Figure 4

7. Open the engine cover on the right-hand side of the machine.
8. Remove the protective grille for the fan.

Figure 5

9. Remove the fan grille's upper attachment.

NOTE!

Note the positions of the spacers.

Figure 6

10. Open the engine cover on the left-hand side of the machine.
11. Remove the protective grille for the fan.

Figure 7

12. Remove the belt tension for the intercooler coolant pump.
<https://truckmanualshub.com/>

Figure 8

13. Remove the bolts securing the intercooler pump and put the pump aside.

NOTE!

Do not remove the pump's hose connections.

14. Prise the tensioning wheel in and remove the fan belts.

Figure 9

1. PU spanner, 36 mm (1.417 in)

15. Remove the belt pulley of the fan, including hub, bracket, and tension wheel.

NOTE!

It will be easiest to remove the belt pulley from the rear of the machine.

16. Remove the bolts securing the coolant pump.

Figure 10

1. Retaining bolts

17. Remove the bolts from the coolant pipe and the pipe bracket.

NOTE!

A little coolant runs out.

Figure 11

18. Remove the coolant pump.

Installing

19. Change the 3 O-rings and the rubber seal.

Figure 12

1. O-ring
2. Rubber seal

<https://truckmanualshub.com/>

20. Fit the coolant pump and bolt it in place.

21. Fit the bolts securing the coolant pipe and the pipe bracket.

Figure 13

22. Fit the upper bracket for the fan grille.

Figure 14

23. Fit the protective fan grille.

Figure 15

<https://truckmanualshub.com/>

25. Prise the tensioning wheel in and fit the fan belts.

Figure 16

1. PU spanner, 36 mm (1.417 in)
26. Fit the coolant pump for the intercooler.
27. Fit the bolt for the intercooler coolant pump and tension the belt.
28. Bolt the pump in place.
29. Fit the protective fan grille.

Figure 17

30. Fit the fan.

Figure 18

31. Restore the machine to operating condition.
32. Warm up the engine and top up with coolant as necessary.
33. Check for leaks.

Coolant temperature, engine <https://truckmanualshub.com/>

The function monitors the engine coolant temperature and informs the operator if the temperature is too high or if there is a system malfunction.

The Engine Shut Down function, which limits engine speed to 900 rpm, will be engaged if the coolant temperature is high, see [Invalid linktarget].

The coolant temperature is also used as an input signal for:

- [Invalid linktarget]
- [Invalid linktarget]

Input signals	Output function conditions	Output functions
○ Coolant temperature engine, SE205 ○ Directional gear	○ High coolant temperature > 103 °C (217 °F) The alarm remains active until the coolant temperature has dropped to < 102 °C (216 °F)	○ Warning lamp The gauge reading increases more than the temperature, so that the pointer ends up in the red area. ○ Red central warning lamp ----- WARNING ----- High Engine Coolant Temp LB734762 ○ Engine Shutdown
	According to above, also: ○ Directional gear in Forward or Reverse	○ Buzzer

Coolant temperature, outlet, radiator

The function monitors the coolant temperature after the radiator and warns the operator if there is a system malfunction.
The coolant temperature is used as an input signal for radiator fan control, see [Invalid linktarget].

Input signals	Output function conditions	Output functions
Coolant temperature, outlet, radiator, SE210		Signal to radiator fan control

Coolant

<https://truckmanualshub.com/>

To ensure reliable and trouble-free functioning of the cooling system, the following measures should be taken at regular intervals:

- Check the coolant level.
- Blow the radiator clean.

Coolant with antifreeze and corrosion protection

As supplied, the cooling system is normally filled with a mixture of tap water and Volvo's concentrated antifreeze giving protection against freezing down to a temperature of -25°C (-13°F). If there is a risk that the machine will be exposed to lower temperatures, the antifreeze should be adjusted, see below.

To protect the engine from corrosion and the radiator from clogging, the concentrated antifreeze contains active corrosion protection additives.

These additives have a limited life so the coolant should be changed once a year or every 2000 hours.

NOTE!

Do not mix coolants or additives from a different manufacturer as this could have adverse effects.

The proportion of antifreeze should not be less than 40%

Cooling system capacity:

L90D, approx. 53 litres.

L120D, approx. 65 litres.

L90D, 40% (21 litres (5.5 US gal)) = -25°C (-13°F) and 50% (26.5 litres (7 US gal)) = -37°C (-35°F).

L120D, 40% (26 litres (6.9 US gal)) = -25°C (-13°F) and 50% (32.5 litres (8.6 US gal)) = -37°C (-35°F).

Coolant with corrosion protection only

If the climate is such that antifreeze is not needed, a coolant consisting of Volvo's corrosion protection additive and tap water is recommended.

- add about 3 litres (0.8 US gal) of corrosion protection additive to 40 litres (10.6 US gal) of water.

To maintain the level of corrosion protection, add 0.5 litres (0.13 US gal) of corrosion protection additive to the coolant every 400 running hours.

Coolant, checking

Check the coolant level every 50 hours.

The level should be up to the max. mark on the header tank. Top up as necessary.

Figure 1
Header tank

Coolant, change

There is a danger of scalding when opening the filler cap on the header tank (radiator filler cap) on account of the pressure in the system.

Change the coolant every 2000 hours.

The coolant in machines with a coolant filter need only be changed every 3000 hours or every other year.

Figure 2
Draining, coolant
Draining

1. remove the header tank filler cap.
2. open the drain nipple on the cylinder block.
3. Press in the clamp on the drain nipple so that the coolant can run out.

Dispose of waste oil and fluids in an environmentally safe and sound manner.

Filling up

The system is filled with coolant via the header tank, see [Invalid linktarget].

- the engine must be switched off and the heater control turned on.
- fill with coolant up to the max. mark on the header tank.
- warm up the engine and top up the cooling system until it is completely full and bled of air.
- the level should be checked after the engine has been warmed up and then cooled down.

NOTE!

The system can also be filled through the drain nipple.

Never fill up with cold coolant when the engine is hot as this could lead to cracks developing in the cylinder block and cylinder head.

Neglecting to change the coolant could result in clogging and lead to engine damage.

2. Dust cap
3. Steel ring
4. Upper sealing ring, copper sleeve
5. Lower sealing ring, copper sleeve
6. Copper sleeve
7. Copper washer (all TD73)
8. Cylinder head

CAUTION

To obtain the correct clearance between copper sleeve and steel ring (0.10–0.45 mm (0.004–0.018 in)), these two parts should always be changed together.

CAUTION

The copper sleeves fitted in production on TD63/TD73 are approx. 1 mm (0.039 in) shorter than those supplied as spare parts. This means that on replacement of the copper sleeve the new steel ring will be approx. 1 mm (0.039 in) higher up in the cylinder head.

Removing

Figure 2
Removing the steel ring

<https://truckmanualshub.com/>

D- arm cracks

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause

A number of cases have been reported regarding cracks in D-arms on L120E and L120F lift frame at low operating hours.

Action

Most of the cases of this type of cracks have been found on models L120E & L120F and directed to those models, however all models listed may encounter similar cracks. The repair method for all listed wheel loaders is common.

Figure 1

Carbon arc to an U-shaped groove

Lifting frame, repair instruction for cracks in “D”-arms on the cross tube.

The welding rod to use in the repair should be of a stainless steel type. A high alloy welding rod containing 18-30% Chrome and 8% Nickel.

These types of welding rods are in general easy to use and have less impact on the heat treatment than standard rods for steel.

Recommended welding rods:

OK 67.45 (EN 1600 E 18 8 Mn B, AWS A5.4) ESAB

OK 68.81 (EN 1600 E 29 9R 32,SFA7AWS A5.4) ESAB

Elgaloy Mix 18 (EN 1600 E 18 8 Mn R 53,AWS A5.4-92), ELGA

Repair instruction.

It's crucial that the repair is carried out as soon as the crack is discovered. Crack should not be deeper than 30mm on the D-arm.

Carbon Arc the crack to a u-shaped groove. Grind if necessary to remove slag and sharp edges. Do not remove more material than needed, just enough to get rid of the crack. The corners are sensitive areas and should be left as untouched as possible due to the risk of new cracks may develop if too much material is removed. If necessary use copper plate to support the weld.

The area has to be pre-heated up to 150-200 C° (300 - 400 degrees F) before welding.

Important! The weld seam has to be wider than the depth to reduce the risk of heat cracks.

Remove all slag between each new seam.

Cold hammering of repaired area after the welding procedure is recommended.

This to remove stress built in during the welding process.

Grind to a smooth and even surface, apply primer and touch up.

The ground connection must be safely secured as close to the point of welding as possible.

For additional information see SB 000WLO122 Instructions for shielded metal arc welding and PROSIS descriptions 170 Electric welding.

DEF/AdBlue/AUS32 sampling, method

NOTE!

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause and action

Figure 1

Sample kit (Black) including sample bottle.

A new test for AdBlue/DEF sampling has been developed.

Applies to models

Valid for all products specified in the header of this Service bulletin equipped with Tier 4 Final engines.

Required parts

Designation	Qty.	Part no.
AdBlue sample kit (Black)	As required	VOE17412114 (Europe)

Work instructions

Sampling technique

It is vital to take a correct sample for receiving representative result of the analysis. Irrespective if you want to take the sample from the AdBlue/DEF tank on the machine or a storage tank the technique is the same.

AdBlue/DEF sampling with vacuum pump

If sampling on a machine - Please note that there is a strainer in the filler tube that has to be removed.

Op nbr

1. Use a new hose for each sampling. Cut the hose to a suitable length and connect it to the vacuum pump.
2. Install the sample bottle on the vacuum pump.
3. Insert the hose in the tank. Make sure that the sample is not taken from the bottom. The sample should be taken slightly above the middle range of the liquid.

Figure 2

Example of AdBlue/DEF sampling.

4. Draw up liquid to flush the hose.
5. Remove the sample bottle and empty it. Make sure that the AdBlue/DEF is taken care of in an environmentally safe way.
6. Install the sample bottle on the vacuum pump and fill the sample bottle $\frac{3}{4}$ full.
7. Attach one label on the sample bottle and one on the submission form.

Submission form

Fill in the Submission form. The Submission form can be downloaded from the Oil Analysis web site.

It's important to fill in the submission form correctly. Fill in the top section as normal with machine data etc.

There is no prefilled fields for AdBlue/DEF system, please use the field Others and write in "AdBlue/DEF".

In the comments field you should fill in where the sample is taken. AdBlue/DEF tank on machine, Storage tank id: xx etc.

Tick in from where the sample is sent in at the bottom and send the sample to the laboratory together with the submission form.

V1138273

Description, camshaft

<https://truckmanualshub.com/>

The camshaft runs in seven bearings. Axial clearance is determined by the camshaft gear, the shoulder on the camshaft's front bearing trunnion and the thrust washer screwed to the front surface of the cylinder block.

Description, connecting rods

<https://truckmanualshub.com/>

The connecting rods are of I section with perforations for forced feed lubrication of the gudgeon pin. Since the big ends of the connecting rods are split diagonally the con rods can be pulled up through the cylinder liners on disassembly.

On **TD73** the connecting rods have a trapezoidal small end. As a result, the piston can be made stronger, see [Invalid linktarget].

Figure 1

TD71 and TD73

Connecting rod with trapezoidal gudgeon pin end

Description, crankshaft

<https://truckmanualshub.com/>

The crankshaft runs in seven main bearings. Its axial bearings consist of thrust washers located at the middle main bearing. The crankshaft is balanced statically and dynamically. At the front the crankshaft has a "polygon section" (polygon hub) and at the rear a flange on which the flywheel is bolted.

The crankshaft is hardened through nitrocarburizing. Provided that the it does not first need straightening it can be reground to a maximum of 2nd undersize without renewed nitrocarburizing.

Figure 1

Crankshaft and camshaft

The front and rear crankshaft seals consist of rubber sealing rings. The rear crankshaft seal also has an oil deflector ring (not on hauler).

Description, cylinder block

<https://truckmanualshub.com/>

The cylinder is a one-piece casting and has wet replaceable cylinder liners. The compression pressure gives rise to tensile stresses in the cylinder head bolts and these stresses are carried directly to the main bearings through stiffening parts of the cylinder block walls.

The camshaft bearings are drilled to the correct size after assembly.

Figure 1
Cylinder liner with flame lip

1. Flame lip
2. Sealing rings

Description, cylinder head

<https://truckmanualshub.com/>

The engine has two cylinder heads, each covering three cylinders. Each cylinder head is secured by 20 bolts (M11) equally distributed round the cylinders.

In the surface of the cylinder head are channels formed by two wide concentric grooves recessed in the cylinder head immediately above the cylinder liner collar, see [Invalid linktarget]. The size of the sealing surface is determined by these grooves so that the necessary sealing pressure is obtained without necessitating such a high tightening torque as to constitute a risk of deformation damage to the liner shoulder in the cylinder block. There is also a groove for the cylinder liner's flame lip.

Figure 1
Gasket, cylinder block – cylinder head

1. Cylinder liner flame lip
2. Sealing groove in the gasket. The groove is made by the channel in the cylinder head.
3. Gasket (cylinder head)

The cylinder head gasket is made of solid sheet steel.

-The channels deform the gasket and hold it in place.

-The cylinder liner's flame lip protects the gasket from the combustion pressure and temperature.

Due to emission requirements, the position of the injectors relative to the piston must be determined with extremely high precision and for this reason the seat of the copper sleeve must not be milled and the cylinder head must not be surface ground.

Figure 2

Cylinder head

A Inlet passage

B Exhaust passage

Description, cylinder liner

<https://truckmanualshub.com/>

The cylinder liners are replaceable and of wet type. The cylinder liners have a "flame lip", see [Invalid linktarget]. This flame lip, which fits in a groove in the cylinder head, reduces the stresses on the cylinder head gasket.

Four rubber O-rings are used for the outer sealing of the cylinder liner. The three lower rings fit in grooves machined in the cylinder block. These rings are made of different materials. The two upper sealing rings are identical and made of fluor rubber (black). The lower sealing ring is violet and made of ethylene propylene rubber (EPDM).

Sealing at the upper part of the cylinder liner is effected partly by an O-ring under the liner flange and partly through the cylinder head gasket pressing the liner flange down against the shoulder in the cylinder block.

Figure 1

Cylinder block

Description, engine transmission <https://truckmanualshub.com/>

The transmission consists of helical spur gears. The injection pump and camshaft are driven from the crankshaft gear via an idler gear. The engine lubricating oil pump is also driven from the crankshaft via an idler gear.

TD63 has a transmission gear with two different surface treatment methods: case hardening and nitrocarburizing. The injection pump gear has no marking vis-a-vis the idler gear.

Figure 1

1. Crankshaft gear
2. Idler gear for oil pump
3. Oil pump gear
4. Idler gear
5. Gear, injection pump
6. Gear, coolant pump
7. Gear, camshaft
8. Gear, compressor
9. Gear, oil pump

TD73 has a transmission gear with two different surface treatment methods: case hardening and nitrocarburizing. The injection pump gear has no marking relative to the idler gear.

Description, flywheel

<https://truckmanualshub.com/>

The flywheel is bolted to a flange at the rear of the crankshaft. It is balanced statically. The starter ring gear is a shrink fit on the flywheel.

Description, frame and big-end bearing

<http://www.mitsubishimanualshub.com/>

The bearings are precision manufactured and ready for direct assembly. Five oversizes are available as spare parts. The thrust washers for the crankshaft are available in three oversizes.

Description, general

<https://truckmanualshub.com/>

Fuel is sucked from the fuel tank by the feed pump and passed through the fine filter to the injection pump. Surplus fuel is returned through the overflow valve located on the injection pump. The injection pump then pumps at high pressure the amount of fuel corresponding to the power requirement through the delivery pipes to the injectors which atomize the fuel under high pressure in the engine's combustion chambers. The return fuel from the injectors passes through the leak-off fuel line via the overflow valve and return line back to the tank.

Description, general

<https://truckmanualshub.com/>

The equipment allows that steering, forward/reverse shifting, as well as Kick-down engagement can be controlled through controls located in the left armrest.

When operating on a public road, the steering wheel must be used and lever steering must be disengaged.

Figure 1
Armrest, CDC

SE603	Steering lever
SW408	Activation, CDC
SW409	Shifting, forward/reverse
SW410	Kick-down
SW407	Activation, CDC in armrest
CU601	Electronic unit

The steering lever has two adjusting screws for adjusting steering speed. The electronic unit CU601 is not adjustable, it has fixed dampening.

The CDC steering control valve is located under the cab on the right side. The control valve is connected in parallel with the primary steering valve.

The shuttle valve for LS-pressure is located by the primary steering valve.

The primary gear selector has priority in relation to the forward/reverse switch on the armrest. This means that lever steering is disengaged if the gear selector is moved to the forward or reverse position.

Figure 2
Control valve, CDC

1. MA601

An indicator light on the centre instrument panel is lit when lever steering is engaged.

Figure 3

Description, lubrication and oil system

The engines incorporate a force-feed lubrication system with an oil filter of full-flow type, and in certain cases a part-flow filter, and an oil cooler.

Basically, the lubrication system is of the same design on the different engine versions. Engines having piston cooling differ externally in that they have an extra part-flow oil filter. All valves for the lubrication system are grouped in the filter head.

Figure 1

Lubricating oil pump (single pump)

NOTE!
The U-shaped pipe between the cylinder block walls is fitted only on engines with piston cooling.

All bearings and gudgeon pins, as well as the valve mechanism and gear transmission bearing arrangements, are lubricated by force-feed lubrication.

Lubrication of the transmission gears is accomplished by shot lubrication from the idler gear bearing trunnions which are in communication through channels with the main oilway.

The injection pump and turbocharger are force-feed lubricated.

Figure 2

Lubricating oil pump (double pump)

1. Oil pumps
2. Oil housing
3. Oil strainer for rear pump

Lubricating oil pump

The lubricating oil pump is located in the sump at the front and driven by the crankshaft via an idler gear. The pump is of gear type. Oil is sucked through the strainer and suction pipe to the suction side of the pump.

Oil filter

The oil filter is of full-flow type, which means that all oil is filtered before it continues to the lubricating points. The filter is mounted on the right-hand side of the cylinder block. The filter element consists of folded filter paper.

Figure 3

Lubricating oil pump (double pump)

1. Oil cooler TD73
2. Oil filter TD63 and TD73
3. Oil cooler TD63

Description, pistons and piston rings, L90D

TD63

The pistons are made of light alloy and fitted with two compression rings and one oil ring. The shape of the combustion bowl in the piston is different to TD61 and the piston rings are positioned higher up. The top piston ring is of "Keystone" type (double trapezium cross-section). The gudgeon pin is displaced laterally 0.50 mm, which reduces the stresses on the piston during the combustion phase.

Piston rings

Each piston is fitted with two compression rings and one oil ring, see [Invalid linktarget].

Figure 1

A. Piston and piston rings TD63

The compression rings should be fitted with the marking facing upwards.

The oil ring can be fitted either way round. It has two scraper edges that are pressed against the cylinder wall by the ring's own spring pressure and also by an expander spring on the inside of the ring. The opening in the expander spring should be positioned opposite the oil ring's opening.

Description, pistons, L120D

<https://truckmanualshub.com/>

TD73

The pistons are made of light alloy. They are oil cooled.

Piston rings

Each piston is fitted with two compression rings and one oil ring, see [Invalid linktarget].

12. Oil seal

Description

<https://truckmanualshub.com/>

The L90D is equipped with an engine having the designation TD63KBE and the L120D is equipped with an engine having the designation TD73KDE. Both engines are low-emission, six-cylinder, four-stroke, direct-injected, turbocharged diesel engines with intercooler.

The engine has wet replaceable cylinder liners and two separate cylinder heads that cover three cylinders each. The cylinder heads are interchangeable.

Lubrication is achieved with a force-feed lubrication system where an oil pump presses lubricating oil to all lubrication points.

The turbocharger supplies the engine with pressurised fresh air, resulting in a surplus of air. Thus, the injected fuel amount can be increased, giving more engine power. The turbocharger is lubricated and cooled by the engine's lubricating oil, and is driven by the engine exhausts and makes use of energy that otherwise would remain unused.

The intercooler, located in the induction manifold, cools the air which contributes to cleaner exhausts and improved engine power. A separate pump circulates coolant counter-clockwise in the intercooler.

Description

<https://truckmanualshub.com/>

The turbocharger consists of turbine and compressor sections with a bearing housing between them. The shaft joining the turbine and compressor wheel is journalled in the housing in "floating" plain bearings. The compressor is lubricated by the engine's lubricating oil. The return oil outlet is of large diameter to ensure that the oil will run quickly back to the engine. Seals of piston ring type are used to prevent oil from leaking out of the bearing housing.

The turbocharger is mounted directly on the outlet pipe and it is the energy of the exhaust utilised by the turbine that drives the compressor.

Figure 1
Turbocharger, cross-section view

- A. Air intake
- B. Exhaust gases
- C. Lubricating oil

Description

<https://truckmanualshub.com/>

The engines are equipped with a piston-type thermostat whose sensitive element contains wax. When the engine is cold the thermostat keeps the passage to the radiator completely closed. The coolant is then carried through a by-pass line directly back to the engine. This by-pass line closes as the engine successively opens the passage to the radiator.

For opening temperature, see the specifications.

Description

<https://truckmanualshub.com/>

Wheel loader L90D is equipped with hydraulic transmission HT131. Wheel loader L120D is equipped with hydraulic transmission HT205. Both HT131 and HT205 are hydro-mechanical, four-speed Power Shift transmissions, with torque converter, cylindrical spur gears and hydraulically operated disc clutches.

The engine power is transmitted hydraulically to the wheels and mechanically through the hydraulic transmission, via a torque converter that adapts its output torque to the torque demand.

The clutch drums for the different gears rotate freely on the clutch shafts. When a gear is engaged, the clutch drum that transfers the power mechanically, is connected to respective clutch shaft by the hydraulically affected clutch discs. The mechanical power transfer in the hydraulic transmission takes place through gears which are in constant mesh.

The L90D is equipped with AWB30 drive axles and the L120D with a WB31 drive axle at the front and an AWB30 drive axle at the rear. The front axle is equipped with a differential lock.

Description

<https://truckmanualshub.com/>

Drive axles AWB 30 and AWB31 have floating axle shafts and planetary gear hub reductions with sealed oil-cooled disc brakes.

The brakes are controlled hydraulically and are joined to the hub reductions in such a way that the brakes, through the planetary gears, utilise the reduction ratio of the planetary gears.

Pump rotors are mounted on each side of the brake discs, and they direct oil along the sides of the brake discs for circulation of oil in the axle as well as cooling of the brakes. The axles have a common oil space for the hub reductions and the final drive.

The front axle version of the drive axles is equipped with a hydraulically controlled differential lock with dog clutch. As an alternative, certain drive axle versions can be equipped with an automatic differential brake of "Limited Slip" type.

L63126A

Figure 1
Drive axle AWB30

Description

<https://truckmanualshub.com/>

Service brake

The machine is equipped with a fully hydraulically controlled brake system divided into two circuits, where one circuit acts on the front axle brakes and the other circuit acts on the rear axle brakes.

Both the front axle and rear axle are equipped with wet disc brakes.

The system also includes a hydraulic oil pump, a brake valve and accumulators.

The hydraulic oil pump is common to the brake and servo systems. the oil is drawn from the hydraulic oil tank.

Each circuit has its own accumulator. The L120D also has a third accumulator that is common to both circuits. The accumulators are pre-charged with nitrogen gas and their function is to store oil under pressure and to ensure good braking capacity with a wide margin, even if the engine stops.

L90D: There is a pressure reducing valve in the rear circuit. If the output brake pressure is lower than 1.5 MPa, only the front circuit is used to brake the machine. This allows for softer braking. The valve has internal leakage through a restriction parallel with the valve itself.

L120D: There are damper accumulators on the front and rear circuits that allow for soft, comfortable brake application through a slow build-up of pressure.

If the pressure drops below 9 MPa (1305 psi) in the accumulator circuit, an indication is given by the brake system warning light, the central warning is activated, and the buzzer will sound if the gear selector is moved to a forward or reverse gear. The information display unit will also issue a warning about low brake pressure.

8. Accumulator

Figure 2
Instrument panel

1. Warning light, low brake pressure
2. Central warning

Brake valve

The brake valve includes a **control valve**, **unloading valve** and a **foot brake valve**.

The control valve (located in the foot brake valve) distributes the oil flow from the pump to the brake system and the servo system.

The foot brake valve is divided into two circuits, where one circuit acts on the front axle brakes and the other circuit acts on the rear axle brakes.

The function of the unloading valve is to distribute the oil flow to the different brake circuits as well as to control the system pressure.

Electrically controlled parking brake, optional equipment

Manufacturing location	Serial number
Arvika	17558
Ashville	64279
Pedeneiras	70549

The parking brake is electrically controlled with a switch on the instrument panel. The parking brake is applied by a hydraulically controlled spring brake cylinder that acts on the brake caliper. The parking brake is released with hydraulic pressure.

NOTE!
Applies to electrically controlled parking brake:
When the engine is turned off (ignition key in position 0), the parking brake is automatically applied. when the engine is started again, the parking brake must be released by moving switch SW501 first to position 1 (parking brake applied) and then to position 0

(parking brake released).

<https://truckmanualshub.com/>

Description

<https://truckmanualshub.com/>

The parking brake on the L120D is of the wet disc brake type and is located in the hydraulic transmission on the output shaft.

The parking brake is electrically controlled with a switch on the instrument panel. The parking brake is applied by a hydraulically controlled spring brake cylinder that acts on the brake caliper. The parking brake is released with hydraulic pressure.

Figure 1
Electrically controlled parking brake

1. Switch SW501

NOTE!

When the engine is turned off (ignition key in position 0), the parking brake is automatically applied. When the engine is started again, the parking brake must be released by moving switch SW501 first to position 1 (parking brake applied) and then to position 0 (parking brake released).

Description

<https://truckmanualshub.com/>

The wheel loader is equipped with hydrostatic articulated frame steering consisting of pump, steering valve and two cylinders. The machine can be equipped with lever steering (CDC) and secondary steering. The steering system hydraulic pump, driven by the right power take-off on the transmission, is a load-sensing axial piston pump. The hydraulic oil tank is common to the steering system, working hydraulics and brake system. The steering valve pressure outlet is connected to the plus side of one steering cylinder and the minus side of the other steering cylinder for steering in one direction, and vice versa for steering in the other direction.

Description

<https://truckmanualshub.com/>

The system includes an electrically driven hydraulic pump controlled by the ECUs. The pump is located on the right side of the engine.

The I-ECU receives its signals from test switch SW601.

The V-ECU receives its signals from two sensors, SE601 and SE602.

Figure 1
SW601

The flow and pressure differential sensor SE601 senses the flow from the primary steering pump as well as the difference between the main pressure and the LS-pressure.

Pressure sensor SE602 senses the main pressure.

Figure 2

1. Indicator light, indicates malfunction in primary steering system
2. Indicator light, indicates that secondary steering pump starts

Before starting the engine

If test switch SW601, flow and differential pressure sensor SE601 or pressure sensor SE602 is connected, the ECUs consider the equipment installed.

The ECU's check the sensor circuits. With the ignition in position 1 and the engine turned off, the indicator light showing malfunction in the primary steering system when there is an open sensor circuit blinks.

While operating

If the flow and differential pressure sensor SE601 (sensor closed) is activated, the secondary steering pump starts if travel speed exceeds 5 km/h (3.1 mph).

The indicator light showing that the secondary steering pumps starts lights up and the pump continues to operate for as long as the sensor is closed.

In case of a primary steering system pressure loss, the flow and differential pressure sensor SE601 and the primary steering pressure sensor SE602 will close. This causes the secondary steering pump to start if travel speed exceeds 5 km/h (3.1 mph). The indicator lights for the secondary steering pump and steering system malfunction light illuminate at the same time as the central warning light begins to flash. In this case, the pump will continue to operate for as long as travel speed exceeds 5 km/h (3.1 mph).

Valve with flow and differential pressure sensor, SE601

Valve and function diagram, [Invalid linktarget] shows situation before start.

Prior to start, the peg (1) is held in the closed position by the spring (5) via the guide (4) and the piston (2). At the same time, the guide keeps the pin (3) in, which results in sensor SE601 being closed. Pressure sensor SE602 is also closed.

After starting, sensor SE602 remains open as long as the steering pressure in connection PP stays above 1.0 MPa (145 psi). Sensor SE601 opens when the pin (3) is pressed outwards (towards SE601) and the PP-PU connection opens. When the flow of oil from the steering pump through connection PU exceeds 10 litres/minute the cone (1) is held in the open position and the pin (3) is thus pressed outwards (towards SE601) via the piston (2). This function is independent of the pressure differential between the steering pressure and the LS pressure.

The pressure in connection PU acts on the piston (2), pressing it against the guide (4), the pin (3) and the spring (5). LS pressure

enters the valve via the LS connection and endeavours to press the piston in the opposite direction. When the difference between the steering pressure and the LS pressure is greater than 0.7 MPa (102 psi), the spring will be compressed and the pin opens sensor SE601.

The LS-pressure also acts directly on the pin (3), and when the LS-pressure exceeds 7 MPa (1015 psi), the pin will compress the spring via the guide regardless of the steering pressure, and the sensor will open. This occurs, for example, when steering against the lock (end) position when the steering pressure and the LS-pressure reach the same value.

Secondary steering starts:

- 1: When travel speed exceeds 5 km/h (3.1 mph).
- 2: When the flow of oil from the regular steering pump drops below approx. 10 l/min (2.6 US gal/min).
- 3: When the difference between steering pressure and LS pressure is less than 0.7 MPa (102 psi).
- 4: When LS pressure is below 7 MPa (1015 psi).

NOTE!

During limp-home operation, the secondary steering system is disconnected and 3rd and 4th gear are blocked.

Figure 3
Valve with flow and pressure diagram plus function diagram

A. Steering valve

1. Peg
2. Piston
3. Pin
4. Steering
5. Spring

On the L120D the flow- and differential pressure sensor is replaced by a purely differential pressure sensor. This does not sense the flow but only registers the difference between the pump pressure/LS pressure relative to the LS pressure.

Functional test

The functional test of the secondary steering system is performed with the machine stationary and the engine turned off. The ignition must be in position 1. When switch SW601 is pressed, the connection to the I-ECU is opened. When sensors SE602 and SE601 are closed, the secondary steering pump starts and the indicator light for the secondary steering pump lights up. The pump will operate as long as the switch is pressed down.

Figure 4
Wiring diagram 16, secondary steering

The pump consists of an inlet housing, an outlet housing two side plates, a drive shaft and a pump unit.

The pump unit consists of an elliptical cam ring, a rotor with 12 vanes and pressure pins, mounted to the drive shaft with splines.

The hydraulic oil flows into the pump units through the inlet, is forced out through the side plate and leaves the pump through the outlet.

Function

The rotor is turned inside the cam ring by the drive shaft. When the rotor turns, the centrifugal force and the pressurized pins press out the vanes so that they follow the inside of the cam ring. The radial movement of the vanes and the rotation of the rotor causes the spaces between the vanes to increase when they pass the inlet to the cam ring, resulting in the creation of a vacuum and oil being drawn into the spaces between the vanes.

When the oil has passed the inlet, it is trapped between the vanes, cam ring, rotor and the side plates. The closer the oil gets to the outlet, the higher the pressure. As the oil reaches the outlet, the distance between the rotor and the cam ring is reduced, and the oil is forced out.

Descriptions

<https://truckmanualshub.com/>

For the injection pump to work it must be supplied with fuel at a certain pressure. This is ensured by the feed pump, which is of piston type, see [Invalid linktarget].

The feed pump is located on the injection pump and driven by the injection pump camshaft. Feed pressure is determined by the fuel system's overflow valve.

Figure 1

Feed pump

1. Push rod
2. Piston
3. Non-return valve
4. Hand pump

The pump camshaft's eccentric presses the feed pump piston (2) down by means of the push rod (1). This causes a certain quantity of fuel to be carried from the suction strainer by the piston via the non-return valve (3) to its delivery side while the piston spring is tensioned at the same time.

By means of the feed pump's hand pump (4) it is possible to pump fuel to the filter and injection pump when the engine is not running.

Detecting leaks with inspection lamp

WARNING
Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Figure 1

For this work the following tools are used

Inspection lamp 9812517

Always wear protective gloves and use safety glasses for all work with refrigerant. Risk of frostbite.

The receiver drier part No. 11164457 contains fluorescent paint to facilitate detecting leaks. A leak can be made visible with the aid of inspection lamp and associated glasses. In case of a leak the paint appears as luminous green. Shine the inspection lamp on the components included in the AC system and also on its pipes and couplings.

Removing fluorescent paint

When the leak has been rectified, it is important that the area around the leak is cleaned. Use water and then wipe dry. Check with the inspection lamp and the glasses that there is no paint left.

NOTE!

Very small leaks are difficult to discover with the aid of inspection lamp and the fluorescent compound.

2. Jam nut
7. Fit tool 999 3806 over the diaphragm sleeve. See illustration.

Figure 3

1. 999 3806
8. Check that the drive flange lies tooth top to tooth top by rotating a gear. A ticking should be heard. Adjust as needed. Screw the diaphragm sleeve anticlockwise to move the drive flange closer or clockwise to move it farther away.
9. Remove the M10 bolt with jam nut and fit the lock screw in the diaphragm sleeve **without changing the setting**.
10. Adjust the sensor so that it comes to its break position. Use tool 11666140 or the like to check this. Then screw the sensor **anticlockwise 3/4 turn** to obtain the right setting.
11. Remove tool 999 3806 and refit the differential cover.
12. Check the function.

Activate the differential lock and make sure it is engaged securely (drive flanges meshed).

Adjust the sensor so that it comes to its break position. Use tool 11666140 or the like to check this.

Screw the sensor **clockwise 2 3/4 turn** to obtain the correct setting.

Figure 4

Differential lock sensor, adjusting (Differential cover fitted)

Differential lock

<https://truckmanualshub.com/>

The function controls differential lock engagement and informs the operator if the differential lock is engaged or if there is a system malfunction.

Engagement of the differential lock takes place with the foot switch which, via I-ECU and V-ECU, operates solenoid valve MA407. When the differential lock is engaged, pressure monitor SE408 sends a signal to V-ECU acknowledging that and the control lamp on the instrument panel comes on to indicate it also.

Op nbr

WARNING

A discarded accumulator that has not been punctured may still contain high pressure, always handle it with care. If the accumulator is exposed to high heat in, for example, an incineration plant, there is a serious risk of personal injuries.

WARNING

Use safety glasses.

1. Accumulators that are to be discarded must first be relieved of all pressure.
This is done by carefully drilling and puncturing the accumulator with a 3 mm (1/8 in) drill bit.

Discontinued recommendation for usage of anti-corrosion agent in cooling system

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Corrosion-protection with part no. 1129709 will be removed from stock since it does not meet the standards from Volvo Construction Equipment and shall not be used in Volvo engines. The corrosion-protection cannot be combined with the coolant Volvo Coolant VCS. Only coolants recommended by Volvo shall be used in our engines to obtain correct heat transfer and to avoid cavitation as well as corrosion on aluminum, copper, brass, steel, and soldering.

Display panel, general

<https://truckmanualshub.com/>

The purpose of the display panel is to give the operator information about the functions that are monitored by instrument control unit I-ECU.

In case of abnormal operating values or malfunctions, the display unit shows a warning/info display, a warning lamp is activated and the red central warning lamp flashes. If directional gear Forward or Reverse is engaged, the buzzer is also activated.

When a function is activated/deactivated, or needs to be kept under observation, a flashing amber central warning lamp is activated at the same time as information is shown on the display panel.

- In cases that generate warnings:
Flashing amber central warning lamp – investigate the cause at the next stop
- In cases that generate warnings:
Flashing red central warning lamp – stop the machine immediately and investigate the cause

Communication with the display panel takes place by way of the keypad, located to the left on the instrument panel.

Two unit combinations can be selected:

- **SI/Metric** (°C, km/h, km, bar, litres)
- **Foot-pound** (°F, mph, mile, psi, US gal)

When the machine is started, a start display is shown for approx. 4 seconds, then operating display, see [Invalid linktarget].

Display panel, information displays<https://truckmanualshub.com/>

Information displays, general

Each function group consists of one or more displays.

To scroll within the function group, press arrow up or arrow down.

"Er" (Error) indicates that a system malfunction has arisen (fault in electrical circuits or functions).

When "Er" is displayed the following occurs:

- Fault messages are shown for 2 seconds. The previous display is then shown for 3 seconds. This is repeated as long as the malfunction situation persists.
- Amber central warning lamp flashes

"—" indicates that no information is available.

Starting sequence

Ignition key in position 1, operating position.

The start sequence takes approx. 4 - 5 seconds and entails the running of a test program in order to verify the system.

The test is 'stepped up' on the display panel with black square markings from 1 to 7.

During the first part, the indicator lights will light up and the needles in the gauges will go to positions at 12 o'clock.

The operator is not prevented from starting the machine immediately.

The ignition switch has five different positions

- 0 = Stop engine
- R = Radio position
- 1 = Operating position
- 2 = No electric function[T1] ⓘ
- 3 = Starter motor

[T1]Position 2 prevents re-engagement of starter motor from position 1 when engine is running.

Figure 1

"Er" (Error) indicates that a system malfunction has arisen (fault in electrical circuits or functions).

When "Er" is displayed the following occurs:

- Fault messages are shown for 2 seconds. The previous display is then shown for 3 seconds. This is repeated as long as the malfunction situation persists.
- Amber central warning lamp flashes

"–" indicates that no information is available.

Setup

L66371A

- Press SETUP to end up in the "SETUP" menu.
- Press SELECT to choose language. (If setting is not required, press SELECT to go to the "Units" line.)

Figure 1

- Scroll to desired language with the arrow keys.
- After selecting language, press SELECT to go to the "Units" line.
- Perform settings for the units you want with the arrow keys, and press SELECT.
- Press arrow down to go to the next menu "MACHINE HOURS".

Setting machine hours

NOTE!

Setting of machine hours can only be carried out after changing vehicle control unit (V-ECU), if necessary. This is to restore the total operating hours of the machine.

- Press SELECT to change the existing machine hours.

Figure 2

- Scroll to the number value for the existing machine hours with the arrow keys.
- When the first digit is selected, press SELECT and the marking moves to the next digit, and so on.

If setting is not needed, only press SELECT for each digit.

To confirm setting of machine hours, press SELECT after entering the last digit.

- Press arrow down to go to the next menu "Shut Down".

Setting Shut Down

- Select On or Off with the arrow keys.
- After selecting, press SELECT.

Figure 3

- Press arrow down to go to the next menu "Additional heating".

Setting additional heating

- Select On or Off with the arrow keys.
- After selecting, press SELECT.

<https://truckmanualshub.com/>

Figure 4

- Press arrow down to go to the next menu "DATE/TIME".

Setting date and time

- Press SELECT to change display alternative.
- Select display alternative 1-5 with the arrow keys.

Figure 5

The following display alternatives are available for date/time:

1. yyyy-mm-dd, yy:yy, 24 h
2. yyyy-mm-dd, yy:yy, am/pm
3. mm-dd-yyyy, yy:yy, 24 h
4. mm-dd-yyyy, yy:yy, am/pm
5. dd-mm-yyyy, yy:yy, 24 h
6. dd-mm-yyyy, yy:yy, 24 h

- After selecting display alternative, press SELECT
- To change a digit value, scroll to the next digit with the arrow keys and confirm with SELECT. The marking moves to the next digit, and so on.

NOTE!

If you want to cancel a setting, press ESC. In this case, you go to the top of the selected menu and can start again with the setting.

Downshift audible signal (beep) <https://truckmanualshub.com/>

By briefly sounding a buzzer the function notifies the operator that a downshift to 1st gear has been made.

ECU, functional check

NOTE!

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause

The purpose of this service bulletin is to provide support to ongoing quality investigation on ECUs.

Action

To increase the value of the information concerning ECUs, the described work instruction has to be performed before any troubleshooting work is started based on symptoms.

The information collected according to the work instructions makes up the basis for a support request and shall be attached to the Techline call that is sent to the regional support.

Work instructions

Op nbr

1. Fill in table 1, "Machine data".
2. Read off the active and saved error codes, vehicle information test, as well as parameter read-off using VCADS Pro and attach the job card with the completed tables in this service bulletin. (Error codes, vehicle information test, parameter) Save the job card in the following text format:
"machine model"- "machine serial number"- "read-off date".xml
Example: L110F-3971-20081215.XML Document.
3. Do a function check of the machine according to table 2, 3, 4, 5 "Function check". When the test is finished (Designation), enter an "X" in the right column if read-off was performed. If any deviations are detected during the "Function test", describe how the malfunction behaves or how to reproduce it to give maximal information for continued investigation.
4. Attach the completed tables in this SB together with TechTool job card if there is a Techline call.

Group	Op. no.	Designation	OK	
8. Body, cab and interior			Yes	No
87- Temperature and control system	87373-3 87376-3	ECC input and output signals status, test Sensor values, ECC check		
	Remark if not OK:			

Questions regarding machine's behaviour:			Yes	No
Is the loader equipped with "NON-VOLVO" optional equipment?				
What optional equipment is used or installed?				
.....				
What defects/malfunctions are there?				
Description:				
.....				
When does the problem/error message occur?				
After "Turning on ignition"?		after seconds		
During start attempt?		after seconds		

After "Engine running"?	after seconds		
After activation of a function (state which function)?			
Other:			
Any specific situations that result in the problem? If YES, which?			
.....			
What operating modes were selected for the machine when the problem occurred? (E.g., CDC, automatic lift and tilt, etc.)			
Note during which special situation or activation of function that the problem occurs.			
What other functions are activated?			
How often does the problem occur?			
	Seldom (no pattern)		
	Sometimes		
	Regularly		
	Periodically		
	Other:		

Questions regarding machine's behaviour:	Y e s	N o
Does the engine's behaviour change when the problem occurs?		
Does the I-ECU work as it should when the problem occurs?		
Does the machine's functions work as they should when the problem occurs?		
What does not work?		
If central warning generates alarm:	Y e s	N o
Red central warning		
Amber central		

[illegible]

Important information before the ECU is replaced:

First, the relevant ECU shall always be reprogrammed (with existing software before the ECU is replaced and normal diagnostics of cable harnesses, ECU connectors and pins, etc. has been performed. If new ECU + programming of the same solves the problem, then reinstall the old ECU. If the problem returns the root cause may be traced to the ECU and not the machine configuration.

Replaced ECU:

Part number	Serial number:	
.		
.....		
.....		
.....

Notes:

[Handwritten notes area]

https://truckmanualshub.com/	Yes	No
Are additional components replaced during this repair time?		
Notes:		
Has the machine had problems in the past that led to replacement of components in the electric system?		
Notes:		
Has the machine been in for repair again after ECU exchange with similar symptoms as before the ECU change?		
Notes:		

Name of person submitting information:

In case of a "Techline call" regarding problems that concern an ECU, the completed document as well as TechTool job card can be requested from regional or global technical support.

NOTE!
Causing part in the Techline call shall be the part number of the ECU that was replaced.

Electric welding

<https://truckmanualshub.com/>

Before electric welding is performed on the machine or any attachments connected to the machine, electric power must be interrupted by turning off the battery disconnect switch or disconnecting the battery ground connection.

Connect the welding unit as close as possible to the welding point.

RE802	19	8.090	Air conditioning (AC)
RE803	20	8.180	Operator's seat with air suspension
RE804	32, 32B	5.045	Automatic activation, parking brake, rider truck safety norms
RE9	3	2.010	Starter inhibitor, only Limp-home
RF1	8	3.285	Flasher relay
RT801	19	8.090	Air conditioning (AC)
RT802	32, 32B	5.045	Time relay, rider truck safety norms

[T1]RE602 is located in the armrest.

Earlier machines are equipped with relays with diodes (shiny caps) and later machines are equipped with relays with resistors (black caps).

The relays on the circuit board are interchangeable with each other but note that relay RE11 must always have a diode (shiny cap) to protect the ECUs.

NOTE!

A new circuit board with diode for RE11 mounted on the circuit board was introduced in 2001. This means that all relays are fitted with resistors (black caps).

L90D

The circuit board is introduced in cabs manufactured in Hallsberg from and including serial number 3145 and in cabs manufactured in Pederneiras from and including serial number 70527.

L120D

The circuit board is introduced in cabs manufactured in Hallsberg from and including serial number 3416 and in cabs manufactured in Pederneiras from and including serial number 70600.

Electrical distribution box, description

Relays and fuses are mainly located in the electrical distribution box behind the operator's seat and can be accessed once the distribution box cover has been opened. The inside of the cover is provided with a decal which specifies what power consumer (component) is connected to the respective relay and fuse.

NOTE!

Relays on the circuit board are interchangeable with each other. See [Invalid linktarget].

Figure 1
Location

1. Circuit board
2. Vehicle control unit V-ECU
3. Instrument control unit I-ECU

The machine has a 24 V electrical system with two 12-volt batteries connected in series and located on both sides of the rear frame, behind the rear wheels.

The battery disconnect switch is located under the radiator casing.

Relays and fuses are mainly located in the electrical distribution box behind the operator's seat and can be accessed once the distribution box cover has been opened. The inside of the cover is provided with a decal which specifies what power consumer (component) is connected to the respective relay and fuse.

The components are marked according to function group. The first digit in the marking, e.g. SE201, indicates that the component belongs to engine (group 2). Other digits are sequential numbers.

The machine is equipped with an electronic control system having two control units as follows:

- **Instrument control unit I-ECU** is integrated with the display panel, warning lamps and instruments and gives the operator information by means of them.
- **Vehicle control unit V-ECU** processes values from sensors and operating controls and also controls machine components.

For a more detailed description, see [Invalid linktarget].

Cab fan MO805 is controlled with switch SW805.

The air-conditioning unit is turned on and off with switch SW806.

When SW806 is turned on, MO805 is supplied with current via connection 5–7 on SW805 and the cab fan runs at its lowest speed. RE802 is activated via pressure monitor SE804.

When RE802 is activated, compressor electromagnet MA801 is supplied with current from FU4 via SW806, RE801, RE802 and thermostat SE803 at the same time as RE801 receives current on connection 85. Since RE801 was previously supplied with current on connection 86 it will not be activated.

To ensure that RE802 is activated before RE801, capacitor C801 is connected in parallel with RE801.

When the diesel engine is started the air-conditioning unit is turned on for 10 seconds by means of time-delay relay RT801. Time-delay relay RT801 is supplied with current from FU50 via connection 50 on SW101 (start position) and is activated. The air-conditioning unit is turned on via DI802 as above except that the cab fan is not started.

The air-conditioning unit is then turned on for 10 seconds. This is to prevent water hammer in the compressor and so extend its service life.

Summary

When the air-conditioning unit is in operation, SW806, RE802 and pressure monitor SE804 are activated. The temperature is regulated by thermostat SE803.

RE801 is not activated and receives positive current on both 86 and 85.

Diode DI801 is a quenching diode that protects thermostat SE803 when it breaks the supply of current to compressor clutch MA801.

Figure 1
Wiring diagram 19. Cab

Electrical system, instructions for working on the electrical system

1. Fully charged and otherwise functional batteries must always be used for all checking of the electrical system.
2. Test the batteries with an acid tester and a cell tester. The battery disconnect switch must be turned off.
3. When installing a battery, make sure that the battery is connected with the correct polarity.
4. When changing batteries connected in series they must have the same capacity, e.g. 2 batteries of 105 Ah. The batteries should be approximately the same age (equally good). The reason for this is that the charging current needed to give the battery a certain charge varies with battery age.
5. If a booster battery is needed to start the engine, the instructions in the operator's manual must be strictly followed. See also the Safety section.
6. Before any test are done on the alternator or regulator, the batteries must be checked for insulation, loose connections and corrosion. Check the alternator belts. All eventual problems with the above must be corrected before any electrical tests are started.
7. During all testing of alternating current equipment, "secure" connections must be used. A loose lead can result in destruction of both the alternator and regulator.
8. Never disconnect the alternator cables while the engine is running. This could damage both the alternator and governor.
9. Grounding the alternator power outlet will damage the alternator and may also damage the regulator.
10. When removing or installing components in the electrical system, the ground connection must first be disconnected or the battery disconnect switch must be turned off.
11. Before performing any electric welding on the machine or attachments connected to the machine, the ground connection must be opened using the battery disconnect switch or by disconnecting the battery ground lead (chassis connection). Connect the welding unit as close as possible to the welding point.

Electrical system, specifications <https://truckmanualshub.com/>

Electrical system	
System voltage	24 V

Figure 1

1. Vehicle control unit V-ECU
2. Instrument control unit I-ECU
3. Service socket for service display unit

Vehicle electronics contain two control units, instrument control unit I-ECU and vehicle control unit V-ECU, which communicate with each other through two data links. Each control unit not only processes values from sensors and operating controls but also controls components so as to obtain the desired function.

The vehicle electronics facilitate troubleshooting through an extensive diagnostics system. The operator is informed of the location of the malfunction through a warning lamp accompanied by a text message.

For service personnel, the service display unit can be connected to the service socket located on the right-hand side panel.

Instrument control unit I-ECU is located in the instrument panel and contains software for presentation of operator information on the display panel and for warning and control lamps. The control unit also receives information from V-ECU via a data link.

Vehicle control unit V-ECU is located by the electrical distribution box behind the operator's seat and contains software to control components and handle information from sensors located outside the cab. The vehicle control unit sends information to I-ECU via a data link.

The service display unit is used for obtaining readings of input and output signals on ECUs, making settings, reading vehicle information, etc.

If a fault arises in any system, information is sent via the data link, which makes it possible to read the information on the operator display panel or by using the service display unit.

Encasing alternator

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

The following service solution has been developed to increase the service life of the alternator. The alternator, with part No. 873757, is encased and cleaner cooling air is taken from a different place. See the following working instructions.

This SB is to be considered as a technical information and comprises normal warranties within the rules for the same.

Type of compensation	Yes	No	Note
Material cost	x	-	-
Labour cost	x	-	2.0 hours
Travel cost	-	x	-
Other costs	-	x	-
Expenses, etc.	-	x	-

The following parts are required and can be ordered from the respective parts department:

Item in Figs 1 and 2	Designation	Part No.	Qty
1	Casing	11152236	1
2	Hose	9518555	2
3	Hose connection	11172340	1
4	Air filter	11033214	1

-	Flange bolt	946671	3
-	Hose clip	13927480	2

Figure 1

Working instructions

Item designations in the text refer to the figures.

1. Switch off the main current.
2. Remove the alternator.
3. Clean the alternator and replace carbon brushes when required.
4. In case the alternator is not functioning, replace it with a new or remanufactured unit.
5. Remove the plastic casing over the diode bridge.
6. Install casing 1, part No. 11152236, at the rear end of the alternator.
Use four nuts, part No. 942530.

NOTE!

Make sure that the cut-outs for the + and – leads are pointing in the correct direction.

7. Install the alternator and connect the leads.
8. Connect hose 2, part No. 9518555, to the casing on the alternator.
9. Route the hose in the most suitable way from the alternator to the engine hood.

Figure 2

NOTE!

The following applies to L150D and L180D: Hose 5 is routed through the engine compartment wall 6. Regarding the making of a hole in the engine compartment wall, see the dimensional drawing.

10. Make a hole in the engine hood in a suitable place. Hole diameter, $\varnothing$ 79 mm (3.11 in).
11. Drill three, $\varnothing$ 8.5 mm (0.33 in) holes, for hose connection, see item 3.

NOTE!

Plate, part No. 11152262, may be used as a template.

12. Install hose connection 3 to the underside of the engine hood and plate 11152262 on top of the engine hood. Use bolts and washers (3 pcs), part Nos 946671 and 976944.
13. Connect hose 2, part No. 9518555.
14. Install filter 4, part No. 11032214.
15. Route the hose so that it does not form sharp bends. Check that the hose does not lie too close to hot parts.

WARNING!

Read all signs and instructions on the machine and the safety instructions in the operators manual, before you start working on the machine.

The installation instructions are based on the use of special tools, the E-tool and standard tools generally available on the market, and also on our operators manuals and service manuals.

The equipment should be installed by qualified personnel of an authorised workshop.

Volvo Construction Equipment Group disclaims all responsibility if tools and work methods other than those described in the instructions are used.

Electrical engine heater, 220V/1500 W

Work description

1. Drain the coolant.
2. Remove the plug on the right side of the engine. Check that the gasket sealing surface is free from dirt. Fit the engine heater element. Make sure the engine heater element is not lying against the engine block, see Fig. 1.

5. Fill with coolant. Test run the function of the engine heater contact. Check for leakage.
6. Write equipment number 80259 on the machine card.

Fig. 3
Engine viewed from the front

Engine oil filter, changing

<https://truckmanualshub.com/>

Change the oil filters at every oil change, i.e. every 500 hours.

The oil filters are of disposable type, i.e. they cannot be cleaned and must be changed.

Removing

- use a filter wrench or undo the centre screw (depending on type of filter).

Installing

- fill the filters with oil and smear oil on the gasket, see [Invalid linktarget].

Figure 1

- Screw the filters in place so that the gasket just touches the sealing surface. Then tighten another 1/2 turn by hand.
- Start the engine and check that the gaskets seal properly. If they do not, remove the filters and inspect the sealing surface. Harder tightening does not usually help matters.

NOTE!

After an oil filter change the engine should be run at idling speed for at least one minute to ensure that it is properly lubricated before the machine is put to work.

CAUTION

Fill the filters with oil before fitting them in place. This is important and ensures proper lubrication of the engine immediately after starting.

Engine oil pressure

<https://truckmanualshub.com/>

The function monitors engine oil pressure and warns the operator if it is too low or if there is a system malfunction.

If engine oil pressure is too low the Engine Shut Down function is activated, limiting engine speed to 900 rpm, see [Invalid linktarget].

Input signals	Output function conditions	Output functions
○ Engine oil pressure, SE202 ○ Directional gear	○ Low engine oil pressure Alarm limits for low engine oil pressure: < 80 kPa (11.6 psi) at 400 rpm for 2 seconds < 300 kPa (43.5 psi) at 1200 rpm for 10 seconds	○ Warning lamp ○ Red central warning lamp ----- WARNING ----- Low Engine Oil Pressure 167346A2 ○ Engine Shutdown
	According to above, also: ○ Directional gear in Forward or Reverse	○ Buzzer
○ Monitoring, SE202	○ System malfunction, signal outside limits	○ Amber central warning lamp ----- ERROR ----- Monitoring Engine Oil Pressure 167352A2 ○

Engine oil, changing

<https://truckmanualshub.com/>

WARNING

Hot oil can cause burns.

Change the oil every 500 hours.

Conditions for the 500-hour interval to be applicable are:

Figure 1
Releasing the parking brake

- A. dipstick
- B. filler pipe

- ☐ the oil filters are changed at every oil change.
- ☐ genuine Volvo long-life filters and by-pass filter for the L120D and genuine Volvo long-life filters for the L90D are fitted.
- ☐ the fuel sulphur content does not exceed 0.2% by weight.
- ☐ fuel consumption between oil changes (500 hours) must not exceed 8000 litres (2112 US gal) (L120D) and 6000 litres (1584 US gal) (L90D).
- ☐ the grade of oil is, see [Invalid linktarget].
- ☐ the correct viscosity for the prevailing temperature conditions according to the diagram is used, see [Invalid linktarget].

If any of these conditions is not satisfied, the oil should be changed every 250 hours and must be at least to API CE or ACEA-E3 specification.

If the machine is used in an aggressive, corrosive or extremely dusty environment, the oil should be changed every 125 hours.

Draining

Drain the oil while the engine is still hot.

The drain nipple is located on the right-hand side of the machine (behind the rear axle).

Figure 2

CAUTION

Dispose of waste oil and fluids in an environmentally safe and sound manner.

Filling up

Oil is refilled via the oil filler pipe (A), see [Invalid linktarget] .

Oil capacity when changing:

L90D, approx. 16 litres, including filter.

L120D, approx. 21 litres, including filter.

Oil grade, see [Invalid linktarget].

Figure 3
Engine oil filter

Engine Shut Down (power reduction) <http://truckmanualshub.com/>

This function protects the transmission by limiting engine speed when direction is changed.

Input signals	Output function conditions	Output functions
○ Engine speed, SE201 ○ Engine speed limitation parameter from APS	○ Engine speed > requested rpm from engine speed limitation APS	○ Engine power reduction via hold (detent) solenoid MA201

Engine Shutdown

This function makes limited machine travel possible even though the alarm level has been reached for coolant temperature, engine oil pressure or transmission oil temperature.

Input signals	Output function conditions	Output functions
○ Engine speed ○ High coolant temperature, SE205 ○ Low engine oil pressure, SE202 ○ High transmission oil temperature, SE406 ○ Setting "Engine Shut Down"	○ Setting "Engine Shut Down" selected on display panel If any of the following conditions are met, Engine Shut Down will be engaged: ○ High coolant temperature ○ Low engine oil pressure ○ High transmission oil temperature	○ Signal to CU201 on engine speed limitation via MA201 The engine is stopped at > 1500 rpm and started at < 800 rpm

Engine speed for V-ECU

<https://truckmanualshub.com/>

The function measures engine rpm on the transmission input shaft and warns the operator if there is a system malfunction. Engine rpm is used for different functions in the system and is presented in the operating display on the display panel. Engine On and Off are used for different functions in the system.

Input signals	Output function conditions	Output functions
○ Engine speed, SE201	○ Machine in operation	○ Engine speed, rpm 1230 rpm F2 09:34 20° 22 km/h LB73032
	○ Engine speed < 50 rpm	○ Engine = Off
	○ Engine speed > 300 rpm	○ Engine = On
○ Monitoring, SE201	○ System malfunction, open circuit or short circuit	○ Amber central warning lamp ----- ERROR ----- Monitoring Engine Revolutions LB7301A2 ○ Er rpm Er rpm F2 09:34 20° 22 km/h LB73032

Engine, air cleaner

<https://truckmanualshub.com/>

Engine wear depends to a very large extent on the cleanliness of the intake air. The air cleaner prevents dust and other impurities from entering the engine. It is therefore extremely important to inspect the air cleaner periodically and maintain it correctly.

Figure 1
Air filter

Primary filter maintenance

The air filter should be changed or cleaned every 1000 hours or when the informative text "Clogged engine air filter" is displayed.

If the informative text is still displayed after a primary filter change, the secondary filter should also be changed, see [Invalid linktarget] .

Operating time between filter changes will vary, depending on the environment in which the machine works. In certain types of environment the filter will need changing at more frequent intervals.

The filter can be cleaned as directed by an authorised workshop. After it has been cleaned five times or if it is damaged, it must be changed.

NOTE!

Mark the number of times the primary filter has been changed or cleaned on the decal by the end plate of the secondary filter.

Changing the primary filter

- when changing the filter the air cleaner cover should also be cleaned, as it acts as a container for the particles that are not trapped in the filter.
- Check that all hose and pipe connections from the air cleaner to the engine intake pipe are tight. Retighten hose clips.

Do not under any circumstances run the engine without a filter or with a damaged filter.

Always have a spare filter to hand and keep it well protected from dirt.

Ratchet block, 750 kg (1654 lbs)

1. Secure the frame joint with the joint lock.
2. Cut the current with the battery disconnect switch.

3. **WARNING**

Pressure in the cooling system may cause burns when the cap of the expansion tank (radiator cap) is opened.

Open the expansion tank filler cap and drain the coolant.

Volume: **53 litre (11.66 US gal.)**

Drain the engine oil.

Volume: **16 litre (3.52 US gal.)**

4. Remove the hood plates on top of and from both sides of the hydraulic oil tank.
5. Loosen the following:
 - Exhaust pipe from the silencer.
 - Hoses from the expansion tank.
 - Hose from hydraulic oil tank breather filter.
 - Suction hose from the turbocharger.
 - Hoses from the air cleanliness indicator.
6. Remove the hood plate above the engine and the side covers as a unit together with the silencer, air cleaner, and expansion tank.
Weight: **approx. 100 kg (app. 220 lbs)**

Figure 1
Removing hood plate

7. Disconnect the throttle control from the fuel injection pump.
8. Disconnect the necessary cables and clamps from:

- the starter motor
 - the preheating coil
 - the alternator
 - the temperature sensor
 - the oil pressure sensor and the stop solenoid.
- <https://truckmanualshub.com/>

9. Disconnect the preheating coil's relay console and console for any air conditioning receiver-drier from the bracket at the inlet line of the engine.
Place the receiver-drier on the frame without loosening the hoses.

⚠ WARNING

10. **Do not loosen hoses of the air conditioning unit (AC) because gas will leak out.**

Disconnect the compressor of the air conditioning unit, including brackets and hoses, and place it on the fuel tank.

11. Loosen the bracket for the engine's oil and coolant drain hoses.
Disconnect the fuel lines from the fuel injection pump and feed pump.
Loosen the water trap and lay it on the frame.
12. Swing out the radiator and condenser, if any. Remove the fan.
Remove the attachment rods of the air deflection disc, 3 pcs.
Remove the fan belts.
13. Remove the belt pulley of the fan, including hub, bracket, and tension wheel.

Figure 2
The belt pulley of the fan complete with hub, bracket, and tension wheel

14. Remove the axle ventilation filter and loosen any secondary steering pumps.
15. Remove the lead for the air filter's air cleanliness indicator from the tank.
16. Attach a lifting device to the engine, see [Invalid linktarget].
Remove the screws between the engine mounts and the rubber elements.
Remove the screws between the engine and the transmission.

3. Disconnect the wire from the recirculation damper.
Remove the plate together with the recirculation damper.

Figure 2

1. Striker plate, recirculation damper
2. Plate
4. Remove the support plate that holds the evaporator.

Figure 3
Support plate

1. Support plate
5. Make sure that the capillary tube to the thermostat does not become pinched when the evaporator is folded out. Alternatively, the capillary tube can be removed from the evaporator pipe by first removing the insulating compound and then carefully removing the capillary tube.

Figure 4
Capillary tube

1. Capillary tube
2. Evaporator pipe
3. Insulating compound
6. Carefully fold out the evaporator.

Figure 5
Evaporator

1. Evaporator
7. Clean the evaporator by blowing it with compressed air or hosing it with water. (Do not use high-pressure washing equipment.)

Figure 6
Cleaning evaporator

1. Evaporator
8. Refit the evaporator.
9. Refit the support plate that holds the evaporator.
10. If the capillary tube has been removed, carefully refit it on the evaporator pipe together with the insulating compound.
11. Refit the plate together with the recirculation damper.
Reconnect the wire to the recirculation damper.
12. Refit the filter casing.
13. Close the cab filter access cover.

Explanations of cable and component markings

Figure 1
Principle illustration, wiring diagram

Example of cable and component designations				
1	30	Box with designation for feed	Positive feed (30, 15, 15E, etc.)	
2	SW601	SW = switch	6 = Function group	01 = Running number
3	SCH16	Diagram number		
4	6.100	6 = Function group	100 = Running number	
5	30 –20	30 = Feed (30, 15, 15E, etc.)	20 = Fuse number	
6	6101	6 = Function group	1 = Electrical event[1] ⓘ	01 = Running number
7	6201	6 = Function group	2 = Electrical event	01 = Running number
8	31	31 = DIN marking (30, 15, 31, etc.)		
9	31	Box with designation for chassis connection	Earth connection (31, etc.)	
10	SCH05	Diagram number next to an arrow-shaped box is a reference to another diagram		
11	3	A reference number in an arrow-shaped box can be found in an arrow-shaped box in the diagram that is referred to.		
12	Lead	A lead drawn with a thick line shows that it is a printed circuit on the circuit board		

Cable and component designations

Cables and components on wiring diagrams are designated by function group division.

Cable designations:

A cable marked 30–20, for example, indicates that it is 30-feed via fuse 20 to a component. After the component, the marking may be 6101, for example, where 6 indicates function group, 1 indicates electrical event (the digit changes for each electrical event, 1 becomes 2 and so on), 01 is the running number.

Component designation

A component marked SW601, for example: SW stands for switch, 6 indicates function group, 01 is the running number.

NOTE!

Relays and fuses located on the circuit board are not marked according to function group division.

Function group division

- 1 Feeds and earth connections
- 2 Engine
- 3 Electrical system, lighting, etc.
- 4 Power transmission
- 5 Brakes
- 6 Steering
- 7 Miscellaneous
- 8 Cab
- 9 Hydraulics

Positive feed

<https://truckmanualshub.com/>

Designation 30, 15, 15E, etc. in the boxes

The current direction is from large box drawn with a thick line to a small box drawn with a thin line.

Boxes with the same designation are connected to each other on the circuit board via printed circuits.

Chassis connections

Designation 31xx in the boxes

The current direction is from a small box drawn with a thin line to a large box drawn with a thick line.

Boxes with the same designation are connected to each other on the circuit board via printed circuits.

Colour marking of leads

Y	=	Yellow	BN/W	=	Brown/White
GN	=	Green	BL/W	=	Blue/White
BL	=	Blue	VO	=	Violet
GR	=	Grey	GN/W	=	Green/White
W	=	White	BL/Y	=	Blue/Yellow
BN	=	Brown	BL/R	=	Blue/Red
OR	=	Orange	P	=	Pink
Y/W	=	Yellow/White	SB	=	Black
GN/R	=	Green/Red			

NOTE!

There are more combinations of lead colour markings.

Colour marking of leads, positive feed / chassis connection

30-feed	=	Red
15-feed	=	Red/White
5 volt feed	=	Red/Grey
24-volt feed[T1] ⓘ	=	Red/black
Chassis connections	=	Black
Chassis connection, electronics	=	Black/White

[T1]24 V stabilized voltage from I-ECU.

[1]An electrical event is when a lead has passed something, for example, a switch or a relay, which may have caused an electrical change (an electrical event). With each such electrical event, the digit changes, 1 becomes 2 and so on.

Filter indicator, checking

<https://truckmanualshub.com/>

Check the functionality of the filter indicator every 1000 hours. Proceed as follows:

1. run the engine at idling speed.

Figure 1
Ejector hose

2. remove the air cleaner ejector hose and plug the opening.
3. Remove the air intake cover and cover the air filter intake with a stiff panel.
4. Leave an air gap of about 10 mm (0.394 in).
5. Slowly increase engine speed. The text "Clogged engine air filter" will appear on the display panel.

Listen and feel for possible leakage.

Figure 2
Air filter intake

Fluid levels

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

It has been decided that the approved levels for all fluids, oils and other fluids, should be between medium and max on the various fluid level marks on the machines.

To repeat: approved level is between medium and max levels.

If the level is below medium level top-up and charge the extra cost involved as a delivery inspection cost.

For approval, each individual case must be reported when submitting a claim. This does not apply if the dealer has installed extra equipment, e.g., hydraulic equipment.

Compensation for oils or other fluids in connection with repairs:

- We will approve, via normal claims procedure, compensation for complete fluid loss or substantially reduced fluid level as a result of hose or pipe failure.
This does not apply to normal or high engine oil consumption.
- Systems that have to be emptied of fluid in conjunction with component repairs must be refilled via the filter unit. No compensation will be paid for any new fluid related to such repairs.

Foot brake pedal, adjusting angle and pedal clearance

Op nbr

1. Remove the foot brake pedal.
2. Move the bolt under the pedal in order to adjust the pedal to a 35°, 40°, 45° or 50° angle. Pos. A in [Invalid linktarget] corresponds to a 45° pedal angle.

Figure 1
Adjusting foot brake pedal angle

3. Adjust the "free pedal travel" by turning the adjusting screw (B) until the travel between the brake pedal (1) and the piston (2) is 0.4 ± 0.2 mm (0.016 ± 0.008 in).

The numbers in parenthesis refer to the figures in the text as well as the figure on page 33.

Dismantling

1. Secure the valve in a vice.
2. Remove the lock ring, tap out the pin (37) and remove the pedal.
3. Remove the three bolts (32) with lock washers (35) and remove the bracket plate (1).
NOTE!
The bolts are locked with thread locking compound.
4. Remove the springs (12 and 13), the stroke limiter (5), the O-ring (14) and scraper seal (17).
5. Remove the lock ring (15) and lift out the washer (19).
6. Screw out the plug (22) and the O-ring (23). The spring (9) is located in the plug.
NOTE!
The plug is locked with thread locking compound.
7. Press out the spools (24 and 25) and the spring (8) downward.
8. Remove the packing box (20).
9. Screw out the plug (16) and lift out one non-return valve (A) and the spacer pin (B).

Figure 1

10. Lift out the valve retainer (11), including the two O-rings as well as the other non-return valve (A).
NOTE!
The valve retainer may be difficult to remove. Make sure not to damage it.
11. Screw out the plugs (27 and 27A).
12. Press out the piston (28) and the spring (10) upward.
13. Screw out the plug (4) and the O-ring (29) without breaking the safety seal (21).
14. Remove the thrust washers (7A) and the spring (7).
15. Screw out the plug (31) and the O-ring (30).
16. Screw out the valve body (3) including the valve peg and the spring (5).
17. Lift out the sleeve (5A) and the compression spring (6).
18. Pull out the spool (A) downward.

Figure 2

<https://truckmanualshub.com/>

19. Tap out the valve housing (36), guide sleeve (2), including O-rings, back-up rings, washer (B) and the piston (C) upward.
20. Clean and inspect the parts with regards to any damage or wear. Change all worn or damaged parts. Change all O-rings, back-up rings as well as the scraper seal (17) and the packing box (20).

Assembling

21. Refit the valve housing (36).
NOTE!
Make sure that the top O-ring is positioned correctly.
22. Assemble the guide sleeve (2) and the washer (B).
Refit the parts.

Figure 3

23. Refit the piston (C) and the spring (6).
24. Refit the sleeve (5A), spring (5), the valve and screw in the valve body (3).
25. Screw in the plug (31).
26. Refit the spool (A) in the valve housing (36) from underneath.
27. Refit the thrust washers (7A) and the spring (7).
28. Screw in the plug (4).
29. Screw in the plug (27A).
30. Refit the spring (10) and the piston (28).
31. Screw in the plug (27).
Tightening torque: **60 Nm (44 lbf ft)**
32. Assemble the non-return valves (A), the spacer pin (B) as well as the valve retainer (11). Then refit the parts in the foot brake valve.
NOTE!
Make sure that the valve retainer is securely installed.

Figure 4

33. Screw in the plug (16).
34. Install the packing box (20).
35. Fit the washer (19) and lock it with the lock ring (15).
36. Press up the spools (24 and 25) as well as the spring (8) from underneath.
37. Screw in the plug (22) with the spring (9).

Tightening torque: **60 Nm (44 lbf ft)**

<https://truckmanualshub.com/>

NOTE!

The plug must be locked with thread locking compound.

38. Press out the piston (18) from the bracket plate and change the scraper seal (17).
39. Grease the piston (18) with lithium grease and refit it in the bracket plate (1).
40. Refit the springs (12 and 13) as well as the stroke limiter (5) in the foot brake valve.
41. Refit the bracket plate and tighten the bolts (32).
Tightening torque: **22 Nm (16 lbf ft)**
NOTE!
The bolts must be locked with thread locking compound.
42. Refit the pedal.
NOTE!
Make sure that the spring is turned the correct way.

Fork arms, information warranty matters, altered procedures

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause and action

If fork arms are the subject of a claim and need to be replaced, photographs and a copy of the report on the last page of this SB should be sent to the regional office and from there passed on to the marketing person who is responsible for technical questions at Volvo Construction Equipment AB Customer Support Division. A copy of a filled-in report is required for each repair.

NOTE!

The report is also available in Word format in Techline. It can be downloaded, filled in digitally and sent in by E-mail.

The report must contain machine data, which type of claim is intended and an explanatory text about the cause of the replacement. In case of a break, the fracture area and the position of the break must be photographed. The fracture area must be photographed at the latest within one week. It is important that a sharp photograph is obtained. After photographing, spray the fracture area with anti-rust agent.

NOTE!

The fork arms must then be stored for six months in order to be available for further investigation.

A precondition for the damage to be considered as a warranty matter is that the requested information has been filled in on the report on the last page.

Fork arms, which are replaced because of wear or incorrect use, will not be compensated through a claim.

[999 3742 Socket](#)

Sling 2 m (6.5 ft), 2 slings.

Sling 6 m (19 ft), 2 slings.

Torque amplifier

1. Position the axle correctly under the machine.
Connect a lifting device.
Axle weight: **approx. 1500 kg (3308 lbs)**
2. Lift up the axle with the lifting device, and secure the axle with a hydraulic jack to prevent it from turning during the lift.
Fit the attaching bolts.
Tightening torque: **804 Nm (593 lbf ft)**
3. Fit the propeller shaft to the front axle.
Fit the attaching bolts.
Tightening torque: **50 Nm (37 lbf ft)**
4. Fit the electrical cabling and the hoses to the differential lock and brake as well as the breather hose for the axle. Fit the cabling for the temperature sensor.
5. Fill oil in the front axle.
Oil capacity: **approx. 36 litres (new axle), 33 litres (at oil change)**
6. Fit the front wheels.
Tightening torque: **600 Nm (443 lbf ft)**
Fit the mudguards.
7. Remove the support under the boom, the axle stands and the steering joint lock.
8. Bleed the front brake circuit, see *Section 5, Brake system, bleeding*.

Front axle, removing

<https://truckmanualshub.com/>

Op nbr 46102

[999 3831 Support](#)

[999 3742 Socket](#)

Sling 2 m (6.5 ft), 2 slings.

Sling 6 m (19 ft), 2 slings.

Torque amplifier

1. Lock the steering joint.

Figure 1

2. Lift the front wheels using the lift arms.
Position axle stands under the tie-down eyes in the front frame.
3. Run up the lift arms and position the support (999 3831) under the raised boom, see [Invalid linktarget].
Release pressure and put the bucket in the empty position.

Figure 2

1. 999 3831 Support

4. Remove the front mudguards and the front wheels.
5. Drain the axle oil.
Oil capacity: **approx. 33 litres (8.7 US gal)**
6. Tie up the propeller shaft and remove the drive flange attaching bolts at the front axle.
7. Release the pressure in the brake system by depressing the brake pedal repeatedly (30–40 times).
8. Fully depress the brake pedal and block it in that position with a suitable tool. When the brake pedal is blocked in the depressed position, the hydraulic tank oil is prevented from running out to respective brake caliper.

NOTE!

The brake pedal must remain blocked until the front axle has been installed again.

9. Remove all electrical cabling and hoses for the differential lock and brake as well as the breather hose for the axle. Use plastic plugs to plug all hoses. Remove the cabling to the temperature sensor.
10. Connect a lifting device to the front axle and remove the attaching bolts.
Front axle weight: **approx. 1500 kg (3308 lbs)**
11. Lower the axle on two pallets, each pallet standing on a pallet forklift. Secure the axle (with a hydraulic jack or the like) to prevent it from falling over.
Pull out the axle.

Fuel feed pump, checking feed pressure, L90D

Op nbr 23304

[11 666 017 Pressure gauge, 600 kPa \(87 psi\)](#)

[11 666 037 Hose](#)

[999 3871 Nipple](#)

[999 3720 Nipple](#)

NOTE!

Observe the strictest cleanliness when working on the fuel system.

1. Park the machine on a level surface and turn off the engine. Apply the parking brake. Open the engine hood on the right side of the machine.
2. Remove the bleeder screw from the secondary filter housing.

Figure 1

1. Bleeder screw

3. Fit nipple 999 3871 on the bleed screw and connect to the pressure gauge using the hose.

NOTE!

Make sure that the hose is cleaned.

4. Start the engine and run it at about 1000 rpm for half a minute. Release the accelerator and let the engine run at idling speed for one minute. Read off the feed pressure.
Feed pressure: **130–180 kPa (19–26 psi)**

5. Check the feed pressure once again, this time with the engine fully loaded.

6. Run the engine to stall speed and read off the pressure gauge at the same time. The pressure must not drop below 100 kPa (1 bar) (15 psi) during the test.

NOTE!

Keep in mind that the pressure gauge reading may be delayed due to stroke/diameter, temperature and poorly cleaned hose.

Pressure too high:

If the pressure is too high, the overflow valve needs to be changed.

Pressure too low:

If the feed pressure is too low, the cause may be a clogged suction line, malfunction of the feed pump, clogged fuel filter or malfunction of the overflow valve.

Check the filters by checking the feed pressure before the filters (1) with nipple 999 3720. The plate (2) may have to be removed to make room for the nipple and hose.

Figure 2

7. Repair any malfunctions and check the feed pressure again.
8. Remove the measuring nipple and refit the bleeder screw.

2. Remove the bleeder screw from the secondary filter housing.

Figure 1

1. Bleeder screw

3. Fit nipple 999 3871 on the bleed screw and connect to the pressure gauge using the hose.

NOTE!

Make sure that the hose is cleaned.

4. Start the engine and run it at about 1000 rpm for half a minute. Release the accelerator and let the engine run at idling speed for one minute. Read off the feed pressure.
Feed pressure: **130–180 kPa** (19–26 psi)

5. Check the feed pressure once again, this time with the engine fully loaded.

6. Run the engine to stall speed and read off the pressure gauge at the same time. The pressure must not be below 100 Kpa (15 psi) during the test.

NOTE!

Keep in mind that the pressure gauge reading may be delayed due to stroke/diameter, temperature and poorly cleaned hose.

Pressure too high:

If the pressure is too high, the overflow valve needs to be changed.

Pressure too low:

If the feed pressure is too low, the cause may be a clogged suction line, malfunction of the feed pump, clogged fuel filter or malfunction of the overflow valve.

Check the filters by checking the feed pressure before the filters (1) with nipple 999 3720.

Figure 2

7. Repair any malfunctions and check the feed pressure again.
8. Remove the measuring nipple and refit the bleeder screw.

Fuel injection pump, TD63

<https://truckmanualshub.com/>

The injection pump is flange mounted in the timing gear casing and driven by a gear from the engine transmission. Lubrication takes place through connection to the engine lubrication system. The delivery oil line is located externally and the return oil flows through a hole in the injection pump connection flange to the timing gear casing.

The pump is of constant stroke piston type. The pump pistons can be rotated during operation by means of the control rod to change the quantity of fuel that is injected.

The overflow valve is located in the return fuel line.

The pump is fitted with a centrifugal governor, see [Invalid linktarget] .

The injection angle is checked by means of a test instrument. The instrument sensor is located in an outlet on the governor.

Figure 1
Fuel system, outline diagram, TD63

Fuel injection pump, TD73

<https://truckmanualshub.com/>

The injection pump is located on a shelf on the left-hand side of the engine via a pump coupling from the engine transmission. Lubrication is through connection to the engine lubrication system. The delivery oil line is located externally and the return oil flows via an external oil pipe back to the sump.

The pump is of constant stroke piston type. The pump pistons can be rotated during operation by means of the control rod to change the quantity of fuel that is injected.

The overflow valve is located in the return fuel line.

The pump is fitted with a centrifugal governor, see [Invalid linktarget] .

The injection angle is checked by means of a test instrument. The instrument sensor is located in an outlet on the governor.

Fuel injection pump

<https://truckmanualshub.com/>

In the in-line pump there is a pump element for each cylinder in the engine. Each pump element consists of a piston and a cylinder. The pump piston is pressed up by a camshaft and down by a spring.

When the piston is at BDC the pressure chamber above the piston is filled with fuel by the feed pump. The fuel flows into the cylinder through the inlet holes.

When the piston is pressed up it closes the inlet holes and presses fuel through the delivery valve to the pressure pipe.

Figure 1

Fuel system. Outline diagram for TD73.

Figure 2

Outline diagram showing injection pump construction.

1. Pressure pipe connection
2. Pump element mounting flange
3. Delivery valve
4. Pump cylinder
5. Filling hole
6. Pump piston
7. Control sleeve
8. Control rod
9. Control rod attachment to the governor
10. Tappet
11. Camshaft (pump shaft)

Injection is interrupted when the piston's spiral groove exposes the discharge hole. If the pump piston is turned, the spiral groove will expose the discharge hole earlier or later, depending on which direction it is turned. The duration of the injection time thus varies and with it also the amount of fuel injected. If the piston is turned so that its vertical groove is opposite the hole in the pump cylinder, it will exert no pressure on the fuel. Injection then comes to a complete stop. The pump pistons are turned by means of a control rod. This rod is connected to the governor by a linkage system.

Figure 3

- A. Pressure chamber
- B. Fuel chamber

Fuel flows from the injection pump fuel chamber into the pump element's high-pressure chamber	The top of the piston closes the filling hole and the pressure starts to rise	The pressure is sufficiently high to open the delivery valve	The filling holes are opened by the control edge (overflow) and fuel feed stops	The fuel flows back to the pump's fuel chamber	The pump piston changes direction
---	---	--	---	--	-----------------------------------

Delivery valve

The delivery valve, [Invalid linktarget] point 3, is located between the pressure chamber above the pump piston and the delivery pipe. The valve has a dual function. It must break the connection between the pressure chamber and the delivery pipe as soon as the pump piston's spiral groove has exposed the relief hole and injection has finished. It must lower the pressure in the pipe after injection so that the nozzle closes quickly without letting any subsequent drops of fuel pass out, particularly under full load and high engine rpm. Otherwise, powerful pressure waves would be reflected towards the nozzle needle and cause it to open. This is also called an "echo".

Governor

On a diesel engine the air intake passages are restricted as little as possible. The system is completely separate from the fuel system.

This principle entails a risk of the engine overrevving or stopping if the load changes. The fuel supplied to the engine must therefore be controlled by a governor that senses engine speed and varies the supply of fuel accordingly.

The governor forms part of a closed system consisting of the engine, injection pump and governor. The governor must react very quickly to all changes in engine speed. At the same time the system must have sufficient stability to avoid continuous variations in rpm as the engine "hunts" above and below the correct value.

Mechanical centrifugal governors are used in these engines.

All-speed governor, RQV

Figure 4

All-speed governor, RQV

1. Injection pump control rod
2. Clearance equalisation spring
3. Adjusting nut
4. Governor springs
5. Centrifugal weight
6. Angle arm
7. Thrust ring
8. Spring-loaded governor sleeve
9. Full-load stop
10. Link rod
11. Governor arm
12. Guide piston
13. Link arm
14. Guide plate

The regulator springs are mounted in the centrifugal weights. The weights move constantly outwards at increasing speed within the prescribed control range. Each position of the governor control arm corresponds to a definite engine speed at which governing starts. The movement of the governor control arm is transferred to the control rod over the two-piece link arm (toggle joint) and guide piston in the governor arm. The pivot point of the governor arm is adjustable in the link guide. It is also controlled by a guide plate mounted in the governor cover so that the gear ratio of the governor arm can be changed.

The governor sleeve, which is the connecting link between the centrifugal weights and the governor arm, is so designed as to be resilient to compression and extension (safety spring).

Pressure-dependent full load stop (smoke limiter) and cold starting device

On TD63 the pressure-dependent full load stop (smoke limiter) is located on top of the centrifugal governor, see [Invalid linktarget].

[Invalid linktarget] shows smoke limiter on TD73.

Smoke limiter, TD73)
A Full load amount without or with limited charge pressure
B Full load amount with full charge pressure
1 Charge pressure
2 Control rod
3 Full load stop (without or with limited charge pressure)
4 Full load stop (max. fuel amount at max. turbo pressure)

Figure 5

Engine TD63

1. smoke limiter

Pressure equaliser

Figure 6

Smoke limiter, engine, TD73

To reduce pressure variations in the pump housing a pressure equaliser of steel diaphragm type (Roco diaphragm) is used. Those engines without a pressure equaliser have instead an overflow valve with a pressure equalising function known as a compensation overflow valve, see [Invalid linktarget].

Figure 7

Compensation overflow valve

Overflow valve

The purpose of the valve is to limit feed pressure and also to ensure continuous venting of the fuel system.

A "compensation overflow valve" also has an integral pressure equalisation function.

When the valve opens the fuel passes through the return line and back to the tank.

<https://truckmanualshub.com/>

The overflow valve is located on the injection pump. This means that the return fuel passes through the injection pump before it flows back to the tank. The flow of fuel thus cools the fuel in the pump's fuel chamber at the same time as the temperature, and with it the viscosity, of the fuel in the fuel chamber is equalised. As a result, the amount of fuel injected into the cylinders is more evenly distributed.

Figure 8

Injectors

1. Compression spring
2. Adjusting washers
3. Nozzle needle

Injectors

Figures in parentheses refer to [Invalid linktarget]

Each injector consists principally of a nozzle holder and a nozzle.

When fuel pressure has increased to the preset value (opening pressure) the nozzle needle (3), which is held against its seat by the compression spring (1), is lifted and atomised fuel is injected into the engine through precisely calibrated holes in the nozzle sleeve.

The tension of the compression spring determines the opening pressure of the injector. It is adjusted by adjusting washers (2).

The injectors are designed to:

- atomise the fuel to ensure ignition and combustion.
- together with the turbulence of the air, to atomise the fuel jets in the combustion chamber so that a mixture of air and fuel is obtained.

To avoid unnecessary replacement and adjustment of injectors, they should not be checked unless they display unmistakable symptoms of abnormal functioning, e.g. through:

- heavily increased exhaust smoke
- engine reluctant to start
- engine runs rough
- fuel consumption too high
- poor performance

Delivery fuel pipes

TD63 and TD73 are fitted with pressure prestressed delivery fuel pipes. Under no circumstances should the pipes be bent or re-

routed. If a pressure prestressed pipe is bent or deformed there is a high degree of probability that it will break. A damaged pipe should always be changed.

<https://truckmanualshub.com/>

Figure 9

Delivery fuel pipes. Under no circumstances should the pipes be bent or re-routed.

When removing an injector or injection pump the complete set of pipes must be removed. Do not remove the clamps but remove the pipes three at a time. If the entire set of pipes is clamped together, remove the complete set.

Delivery fuel pipes for earlier TD61 must not be used on TD63 and delivery fuel pipes for earlier YD71 must not be used on TD73.

.

Fuel filters

The fuel system is fitted with fuel filters connected in parallel with a common cover. The fuel filters are of disposable type and the filter insert consists of spirally wound paper.

Fuel level

<https://truckmanualshub.com/>

The function monitors the fuel level in the fuel tank and warns the operator if it is too low or if there is a system malfunction. Low fuel level is indicated on the L90D when approx. 5 litres (1.3 US gal)of fuel remain and on the L120D when approx. 7 litres (1.9 US gal) remain.

Fuel sampling, method

WARNING
Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause and action

A new test for fuel sampling has been developed.

V1101812

Figure 1
Sample kit including aluminum sample bottle

Applies to models

Valid for all product lines specified in the header of this Service bulletin.

Required parts

Designation	Qty.	New Part No.
Fuel sample kit (Europe)	As required	VOE17210950

Work instructions

Sampling technique

It is vital to take a correct sample for receiving representative result of the analysis. Irrespective if you want to take the sample from the fuel tank on the machine or a storage tank the technique is the same. Please note that on some machines there is a strainer in the filler tube that has to be removed.

Op nbr

1. Fuel sampling with vacuum pump

Use a new hose for each sampling. Cut the hose to a suitable length and connect it to the vacuum pump.

2. Install the fuel sample bottle on the vacuum pump.

3. Insert the hose in the fuel tank. Make sure that the sample is not taken from the bottom. The fuel sample should be taken slightly above the middle range of the fuel.

<https://truckmanualshub.com/>

V1101813

Figure 2
Example of fuel sampling

4. Draw up fuel to flush the hose.
5. Remove the sample bottle and empty it. Make sure that the fuel is taken care of in an environmentally safe way
6. Install the sample bottle on the vacuum pump and fill the sample bottle $\frac{3}{4}$ full. The sample bottle is made of aluminium and makes it a bit tricky to control the volume that is sampled.
7. Attach one label on the sample bottle and one on the submission form.

Submission form

Fill in the Submission form. It's important to fill in the submission form correctly. Fill in the top section as normal with machine data etc.

There is no prefilled fields for fuel system, please use the field Others and write in "Fuel, Sulphur".

In the comments field you should fill in where the fuel sample is taken. Fuel tank on machine, Storage tank id: xx etc.

Tick in from where the sample is sent in at the bottom and send the sample to the laboratory together with the submission form.

	Hydraulic (H)	Swing gearbox (S)	Swing gearbox 2 (G) only EC460 & EC700	Wet brakes (W)	Coolant (C), please specify:	Other, please specify: Fuel, Sulphur

Op nbr 23301

1. Open the bleeder hose of the primary filter housing. Connect a hose and collect the fuel that is pumped out into a suitable container.

Figure 1
Primary fuel filter

- A. Bleeder screw
- B. Hand pump

2. Pump with the hand pump of the primary filter until fuel free of air bubbles flows out.
3. Remove the hose and tighten the bleeder screw.
4. Loosen the bleeder screw of the secondary filter housing. Connect a hose and collect the fuel that is pumped out in a suitable container.

Figure 2
Secondary fuel filter

- A. Bleeder screw, filter head
- B. Hand pump, feed pump

5. Pump with the hand pump until fuel free of air bubbles flows out.

6. Remove the hose and tighten the bleeder screw.
<https://truckmanualshub.com/>
7. Start the engine and check to make sure that there are no leaks.

Figure 1
Refuelling

Fuel tank

Clean fuel is essential for trouble-free operation of the diesel engine.

- Thoroughly clean the area round the fuel tank filler cap before removing it.
- Avoid spillage when refuelling - spilt fuel collects dirt and could constitute a fire hazard if it gets onto hot surfaces.
- Keep the fuel tank full in wintertime to counteract the formation of condensate.
- If necessary, remove the plug in the bottom of the fuel tank and drain off any sludge that might be present.

Figure 2
Air filter

1. hand pump
2. bleed screw
3. drain nipple

Fuel filters

Change the fuel filters every 1000 hours.

The fuel filters consist of a primary fuel filter integrated with the water trap and two secondary fuel filters.

The primary fuel filter and water trap are integrated into a single unit and located inside the engine cover on the left-hand side of the machine. Mounted on the filter head is a separate built-in feed pump that is used for bleeding the system and draining off water. The primary filter acts as a prefilter for the feed pump.

The two secondary fuel filters are located inside the engine cover on the right-hand side of the machine.

When fitting the filters they should be tightened by hand only. The filter insert should be changed by service personnel at an authorised workshop.

The path taken by the fuel as it leaves the fuel tank is as follows:

tank - primary fuel filter with water trap - feed pump on injection pump - secondary fuel filter - injection pump - engine.

Figure 3
Secondary fuel filter

1. bleed screw

Fuel system, air bleeding

The large volume of air in the water trap precludes filling and bleeding via the regular feed pump.

Filling and bleeding must be carried out in two stages, as follows:

Figure 4
Hand pump

1. Fill up with fuel.
2. Open the bleed screw on the primary filter head.
3. Pump with the hand pump on the primary filter head until the fuel flowing out is free from air bubbles.
4. Close the bleed screw.
5. Open the bleed screw on the secondary fuel filter head.
6. Pump with the feed pump on the injection pump until the fuel flowing out is free from air bubbles.
7. Close the bleed screw.

After starting, check that no leakage occurs.

Figure 5
Primary fuel filter/water trap

<https://truckmanualshub.com/>

1. hand pump
2. bleed screw
3. drain nipple

Fuel system, water trap

Drain the water trap every 250 hours.

Draining off water from the fuel must be done by hand.

A non-return valve in the filter head prevents the fuel from running back to the tank. Since no fuel can run back, the pressure will remain and prevent the water from being drained unless fresh fuel is pumped in.

Proceed as follows:

1. fit a hose on the drain nipple.
2. undo the drain nut
3. pump with the hand pump on the primary filter head until all the water has been pumped out of the water trap.

Tighten the drain nut and remove the hose.

Figure 6
Breather filter

Fuel system, breather filter

Change the filter every 2000 hours.

The filter is located behind the access cover on the top surface of the engine cover.

Function

<https://truckmanualshub.com/>

Charging, brake in resting position

When the engine is started, the oil flows from the pump (1) into the brake valve through connection P.

The oil flow from the pump is greater than what the restriction (2) lets through. This causes the piston (3) in the control valve to open and oil flows to the servo system through the connection marked N.

All oil to the brake system flows through the restriction (2). If the system pressure is below 12 MPa (1740 psi), the unloading valve spool (4) will be in its upper position. Oil flows to the unloading spool through the channel (5), and from there, the oil is directed to the control valve and in at the back of the piston (3). The oil is also directed through the channel in the unloading valve spool to the space above the unloading spool.

From the restriction (2), the oil also flows across the non-return valve (6). The oil is directed through the channel (7) to the parking brake circuit. The non-return valve (9) lets oil flow to the accumulator (11) at the connection marked S1 and through a channel to the spool (13) in the foot brake valve.

The non-return valve (10) lets oil flow to the accumulator (12) at the connection marked S2 and through a channel to the spool (14) in the foot brake valve.

When the pressure has increased to the pre-charge pressure, approx. 5 MPa (725 psi), the nitrogen gas will be compressed and the accumulators will fill with oil during the increase in the system pressure.

During the charging phase, there is equal pressure on both sides of the piston (15). The system pressure acts directly on the unloading valve spool (4) and works against the spring (16).

Figure 1

- Green = Return pressure

Unloading, brake in resting position

When the accumulators (one for each brake circuit and one for the parking brake) are being filled with oil, the system pressure increases towards max. pressure 15.5 MPa (2248 psi). The oil pressing on the unloading valve (4) overcomes the spring force (16) and the spool is pushed down. A return connection to the tank is then created for the space above the unloading valve spool (4). The spool will be kept in the lower position by the system pressure acting on the piston (15). The active area of the piston is slightly larger than the corresponding area on the spool. A return connection to the tank is also created for the space behind the piston (3) in the control valve. The pressure required to keep the valve open is reduced. This results in the closing of the non-return valve (6) by the system pressure.

All oil flow from the pump (1), in this position, passes the piston (3) and flows to the servo system.

When the brakes are activated and the accumulated pressure drops to approx. 12 MPa (1740 psi), the unloading spool (4) will be pushed up by the spring force.

The return connection to the tank through the unloading spool (4) closes and the oil will be directed to the underside of the piston (3) in the control valve. This results in a pressure increase on top of the piston and the pump flow will supply the brake system through the non-return valve (6). The difference between the unloading (cut-out) pressure and the charging (cut-in) pressure is determined by the area difference on the piston (15) and the unloading spool (4).

Brake in resting position (not activated)

When the foot brake valve is not activated, the return springs (19 and 20) push up the spools (13 and 14).

The pressure channels (21 and 22) are then closed and the brake connections marked B1 and B2 are, through channels in the valve housing, connected to tank from the connection marked T, see [Invalid linktarget] .

- Orange = Servo pressure
 Red = System pressure
 Green = Return pressure

Partial brake application

If the brake pedal is depressed slightly, pressure will be exerted on the spring (23). The spools (13 and 14) will then be pushed down, closing the tank connection for the brakes, and oil from the pressure channels (21 and 22) can flow to the brakes through the connections marked B1 and B2. The brakes are thus applied and the pressure increases in connections B1 and B2. When this pressure corresponds to the force that the pedal exerts on the spring (23), it helps the return spring (19) to push up the spool (13) and the spring (20) to push up the spool (14). In this way, the oil flow to the brakes is closed and a braking force, corresponding to the brake pedal depression, is obtained.

Figure 3

1. Adjusting screw for output brake pressure <https://truckmanualshub.com/>
2. Security seal

Full brake application

The downward movement of the brake pedal is limited by the adjusting screw for the foot brake pedal, see Fig. 6. When the pedal is pressed down to its end position, the valve still assumes a partial brake position and the pressure to the brakes is restricted to approx. 8 MPa (1160 psi).

Function

<https://truckmanualshub.com/>

Engaging, operating and disengaging

In order to engage CDC lever steering, the armrest must first be lowered, which causes switch SW407 to close. Check to make sure that the primary gear selector is in neutral and, at the same time, turn the handle to 4 (automatic).

Now, engage lever steering with switch SW408 on the armrest. The indicator light on the centre instrument panel should light up.

Move the steering lever to the desired steering position. The steering speed will increase proportionally according to the lever stroke. Move the lever distinctly toward the neutral position when the steering movement is to be interrupted.

Select forward, neutral and reverse gear with switch SW409. The Kick-down function is engaged with switch SW410 on the side of the armrest.

CDC lever steering can be disengaged by lifting up the armrest or by moving the primary gear selector to the forward or reverse position.

In order to engage lever steering again, switch SW408 must be pressed.

Figure 1

SE603	Steering lever
SW408	Activation, CDC
SW409	Shifting, forward/reverse
SW410	Kick-down
SW407	Activation, CDC in armrest
CU601	Electronic unit

Electronic unit CU601

Power for the equipment is supplied by FU30 and via relay RE602 which is controlled by the V-ECU. Before lever steering can be engaged the engine must be running and machine travel speed must be below 5 km/h (3.1 mph). In addition, the primary gear selector must be in the N position. With the armrest lowered (SW407 closed), lever steering can be activated with SW408 if the above-mentioned conditions are fulfilled. RE602 is then supplied with current via the V-ECU.

RE602 supplies current to switch SW410 for kickdown, CDC valve MA601 and electronic unit CU601. By means of lever steering SE603 the CDC valve, and consequently steering speed, can subsequently be modulated in proportion to lever deflection.

More agreeable steering can be obtained by means of electronic unit CU601 in that the signal to the CDC valve is damped. This means that the output current from the CDC valve builds up slowly even if the steering lever is moved rapidly from neutral to full lock or vice versa.

Shifting, forward or reverse

Shifting, forward or reverse, takes place by means of switch SW409. In the case of dual command (see wiring diagram 9), SW409 has priority over SW404 and the F/R switch by the control lever carrier cannot then be used when CDC is activated.

Kick-down

Kickdown can be selected either by SW401C (primary gear selector), SW405 (by the control lever carrier) or by SW410 on the armrest. SW410 can only be used when CDC is activated. <https://truckmanualshub.com/>

If the armrest is raised or if primary gear selector SW401 is actuated (F or R), SW407 opens and lever steering is disengaged. To engage lever steering again SW 408 must be re-activated. The armrest must then still be in the lowered position and the primary gear selector in the N position.

Gear selector valve, description <https://truckmanualshub.com/>

The gear selector valve has two different types of spools, where the N/D spool are different from the rest.

NOTE!

The spools can be turned the wrong way (not the N/D spool). The spools must be turned with the shorter end towards the solenoid.

When the solenoid is not activated, the valve spool control side has a connection to the tank via the solenoid (connection 2 – 3). The return spring, located on the opposite side, presses the valve spool against the solenoid.

When the solenoid is activated, the solenoid core closes connection 3 to tank, the connection from the pump to the valve spool opens (connection 1 – 2), and the valve spool is pressed over to the opposite side.

Figure 1

Gear selector

<https://truckmanualshub.com/>

The purpose of the function is to coordinate the three gear selectors for travel direction and inform the operator which control is active or if there is a system malfunction.

- The three gear selectors for travel direction (**Forward/Reverse**) are located on the steering column, lever console and armrest lever steering (CDC).
- To coordinate the three steering column, lever console and lever steering (CDC) kickdown controls.

The function allows shifting **Forward/Reverse** to be performed with the steering column, lever console or armrest gear selector, depending on which control is active. Activation of **kickdown** can be effected with any of the three kickdown controls. In order to obtain kickdown with the armrest control, the armrest must be lowered and lever steering activated.

Gear selector priority means that if a gear selector with higher priority than the active gear selector is activated, the gear selector having a lower priority will be deactivated.

Input signals	Output function conditions	Output functions

General

<https://truckmanualshub.com/>

The machine is an articulated four-wheel drive wheel loader.

The engine is a six-cylinder, four-stroke, direct injection, turbocharged diesel engine with the designations TD63KBE (for the L90D) and TD73KDE (for the L120D).

Hydraulic transmissions HT131 for the L90D and HT 205 for the L120D are hydromechanical and of the Power Shift type where all gear wheels are in constant mesh.

There is a single-stage hydraulic torque converter between engine and transmission.

The front and rear axles are fully floating drive axles with planetary gears in the hubs. The front axle is equipped with a dog-clutch type differential lock.

The service brake is of wet disc type, built together with each hub's planetary gear. The parking brake on the L90D is of type dry disc type and located externally on the hydraulic transmission output shaft. The parking brake on the L120D is of wet disc type and is located internally on the hydraulic transmission output shaft.

The steering system is hydrostatic with a variable displacement axial piston pump and two hydraulic cylinders (steering cylinders).

More detailed descriptions of functions and components are available in respective sections.

Labour Time Guide

Foreword, Labour Time Guide

The Labour Time Guide sets the standard times for repairs of current Volvo Motor Graders G700B models S/N 35000 and up.

The standard times are issued for the purpose of:

- Planning and preparation of work in the workshop
- Estimations of repair work
- Invoicing customers for completed work
- Basis for completed warranty work

The standard times are based on the time required by the service technician to carry out a particular job, provided that all needed and recommended equipment, tools, parts and material are available. An allowance of 20% is included in every operation, in order to cover normal interruptions.

The following is not included in the listed times:

- Additional time because of rusted or sheared bolts
- Cleaning before work
- Procuring parts, materials and tools
- Work which is more difficult because of optional equipment
- Diagnostic or fault tracing time

The operations and times are listed per machine according to Volvo Construction Equipment Functional Group system, 0-9. Each repair job is designated by a title and a classification code:

- 1 = Replaced
- 2 = Repaired
- 3 = Overhauled
- 4 = Adjusted

During the continuous follow up and development of methods and equipment, times may change and times will be added. **Information about changes or new times will be issued as they occur.**

The Labour Time Guide is intended for internal use of Volvo Construction Equipment authorized distributors and must not be distributed outside the organization without written permission from Volvo Construction Equipment Customer Support.

Greasing of hydraulic pump drive shaft

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause and action

For some time now standard procedure has been to grease the hydraulic pumps' drive shaft in connection with bolting down the pumps on the transmission when installing them on the assembly lines in our different factories.

The purpose of this is to increase the service life and to counteract wear of the pump shaft's splines joint as well as the corresponding drive sleeve in the transmission's power take-off.

For the same reason we want to recommend use of splines grease in connection with changing or repairing hydraulic pumps in the field.

Part	Part number	Quantity	Temperature range
Ultra grease lithium complex ep2 (Splines grease)	VOE 15026328	400 g	- 20° C — + 150° C

Heating, ventilation and air conditioning unit, description

The machine is equipped with a heating, ventilation and air conditioning unit which maintains a constant overpressure in the cab by means of the fan to keep out pollutants. In addition, all air is filtered, i.e. including recirculated air. The cab is equipped with a heater unit as standard but is also available with an air-conditioning unit (AC) as an optional extra.

All controls for the heating, ventilation and air-conditioning unit are mounted on the right-hand side panel.

The four-speed cab fan is regulated by means of a switch (1).

The temperature is adjusted by means of a slide control (3) which via wires actuates a valve that regulates the flow of coolant through the heater unit. The slide control (2) regulates the amount of air that is recirculated. The air-conditioning unit is turned on by means of button (4).

Figure 1

1. Switch, fan speed
2. Recirculation control
3. Temperature control
4. Switch for air-conditioning unit
5. Air nozzles

Air which is sucked into the cab first passes through the air intake (2), see [Invalid linktarget]. From there the air continues through a replaceable primary filter (8), [Invalid linktarget], which is accessible via a cover panel on the right-hand side of the cab. The primary filter is supplemented by a replaceable cab filter (9), see [Invalid linktarget].

During recirculation the main volume of air will follow the path shown by arrow C in [Invalid linktarget] via recirculation damper (7). With the control (1) at maximum about 90% of the air will be recirculated and only about 10% comes from outside in order to maintain the overpressure in the cab.

Figure 2
Heating, ventilation and air conditioning unit/air duct system

1. Controls
2. Air inlet
3. Fan motor

After the air has passed the cab filter it is drawn via the evaporator (5) (optional equipment) into the fan (4) and then forced through the heater unit (3) and distributed throughout the cab, see [Invalid linktarget].

The air is distributed in the cab by means of 10 air nozzles that are individually adjustable and can also be turned on and off individually.

The cab air is ventilated out through shutters with valves in the cab door.

A certain over-pressure is required in order to open the valves, and this high pressure also helps to keep the cab dust-free.

Heating, ventilation and air conditioning unit, description

The evaporator (5) is located between the cab filter (9) and the cab fan (4), see [Invalid linktarget].

When the air-conditioning unit starts the evaporator is cold and the air passing its fins is cooled down. If the air becomes too cold it can be adjusted by selecting a different cab fan speed or by means of the heater control (2).

The air-conditioning unit, [Invalid linktarget] is filled with a refrigerant (R134a) that is pumped round the system by the compressor (D).

The compressor is driven from the diesel engine by means of a V-belt and has an electromagnetic clutch for turning it on and off. Safety valve H opens at 35 bar (508 psi) and closes at 25 bar (363 psi).

Compressor D pumps the refrigerant to condenser E and increases the pressure so that the refrigerant condenses (liquefies). Compression of the refrigerant generates heat which is carried away from the condenser by means of the diesel engine's regular radiator fan.

Dryer filter F absorbs any moisture that may be present in the refrigerant and also serves as a storage place for it. The dryer filter is located in the space between the engine bay and the radiator fan on the right-hand side of the machine. Pressure monitor G breaks when the pressure is both too high and too low. It breaks at 1–2 bar (14.5–29) and at 21–25 bar (305–363).

The amount of refrigerant flowing through evaporator B is controlled by expansion valve A which senses the temperature at the evaporator outlet by means of capillary tube I. The restriction in the expansion valve lowers the pressure so that the refrigerant changes from liquid to gas. This evaporation substantially lowers the temperature of the refrigerant.

When the cold refrigerant passes through the evaporator, heat is removed from the air passing into the cab through the evaporator fins. As a result, the air blown into the cab is cold.

The temperature of the evaporator is regulated by means of a thermostat C which senses its temperature via capillary tube J, [Invalid linktarget]. It is used for preventing the formation of ice on the evaporator. When there is a danger of ice forming, the thermostat disconnects the compressor until the temperature has increased.

Condensate that forms on the evaporator is drained through a valve (6) underneath it, see [Invalid linktarget].

In order to obtain maximum cooling of the cab, a recirculation damper (7) can be opened and approximately 90% of the air flow is drawn from the cab through this damper.

The recirculated air is filtered through the ordinary cab filter (9).

For more detailed descriptions of the included components as well as repair instructions, see Service Manual "AIR CONDITIONING, R134a" and any service bulletins.

Hold (stand-by) pressure and working pressure

Op nbr 6451564528

[11 666 019 Pressure gauge 0–6 MPa \(0–870 psi\)](#)

[11 666 020 Pressure gauge 0–25 MPa \(0–3625 psi\)](#)

[11 666 037 Hose](#)

The following applies when checking:

Temperature: **Normal operating temperature**

Hold (stand-by) pressure (Op no. 64515)

CAUTION

When checking hold (stand-by) pressure, the steering wheel must absolutely not be moved. The smallest deviation from neutral position will cause the pressure to increase, which may damage the pressure gauge.

1. Connect the frame joint lock.

Figure 1

2. Connect pressure gauge 11 666 019 (0–6 MPa) (0–870 psi) to the pressure outlet on the steering valve.

Figure 2
Checking hold (stand-by) pressure

1. 11 666 019 (0–6 MPa) (0–870 psi)
2. 11 666 037
3. Pressure outlet

3. Start the engine and let it run at low idle.
4. Check the hold (stand-by) pressure with the steering in neutral position (steering not activated).
Hold (stand-by) pressure: **3.0 ±0.3 MPa (435 ±43.5 psi)**

CAUTION

Do not hold the hose while taking the pressure reading. Hang up the pressure gauge so that it can be read.
<https://truckmanualshub.com/>

Adjusting

- Any adjustment is done on the steering pump flow compensator (located behind the plate under the cab). Remove the plug over the adjusting screw, adjust the pressure.

Figure 3
Adjusting hold (stand-by) pressure

- Hold (stand-by) pressure (during adjustment)

Figure 4

- Hold (stand-by) pressure
- Working pressure

Working pressure (Op no. 64528)

- Connect the frame joint lock.

Figure 5

- Connect pressure gauge 11 666 020 (0–25 MPa, 0–3626 psi) to the pressure outlet on the steering valve. Start the engine and let it run at a fast idle.

Figure 6
Checking working pressure

1. 11 666 020 (0–25 MPa) (0–3625 psi)
 2. 11 666 037
 3. Pressure outlet
8. Steer to full lock (end) position and check the working pressure.
Working pressure: **21 ±0.35 MPa (3045 ±51)**

Do not hold the hose while taking the pressure reading. Hang up the pressure gauge so that it can be read.

Adjusting

9. Any adjustment is done with the screw on the steering pump pressure compensator. Lock the screw with paint after adjusting.

Figure 7
Adjusting working pressure

Hydraulic system, bleeding

<https://truckmanualshub.com/>

Bleeding in connection with repairs or replacement of hydraulic pumps

A breakdown in a hydraulic pump may be due to several different causes. Before a new or repaired hydraulic pump is installed, the following points should be followed:

1. Inspect the hydraulic tank and clean it if necessary.
2. Clean the return oil filter's magnetic rod (if fitted).
3. Inspect the return oil filter and change it if visible impurities are present. If the machine's running time is more than 50% of the filter's normal change interval, the filter should be changed.
4. Top up all hydraulic oil, both fresh and re-used, via the hydraulic tank's return filter.
5. Before starting the machine, the pressure limiting valve for working pressure should be adjusted downwards by unscrewing the adjusting screw about 1 turn. The reason for this is that the pressure will frequently have been adjusted upwards when a worn hydraulic pump is used.

NOTE!

To reduce the risk of cavitation damage when starting, the following should be observed:

6. Start the engine and run it at a **slow idle** for about 15 minutes without activating any hydraulic functions.
7. Use all the hydraulic functions a few times with the engine running at a **slow idle**.

NOTE!

The hydraulic cylinders must not be run to their end positions.

8. Check that the oil in the hydraulic tank's level indicating pipe **does not contain any air bubbles**. If it does, repeat points 6 and 7.
9. Activate all hydraulic functions a few times to overflow (hydraulic cylinder to its end position) with the engine running at higher speed, about 1200-1500 rpm.
10. Warm up the hydraulic system. Check and adjust the working pressure.

Control valve

Figure 1
Control valve with control unit

15	Control spool	24	Solenoid valve
21	Solenoid valve	25	Control unit, CU601
22	Solenoid valve	27	Position sensor
23	Solenoid valve	28	Light-emitting diode

When the steering lever SE603 is activated, an electric signal is sent via the electronic unit CU601 to the control unit (25) on the control valve (11 V or lower for left turn, 13 V or higher for right turn).

Two of the solenoid valves (21 and 22 or 23 and 24) in the control unit are activated, which causes oil to be let in on one side of the control spool (15). The control spool is moved and opens a controlled oil flow to one of the steering cylinders. The position sensor (27) sends signals back to the control unit, indicating the position of the spool. Oil is let in until the control spool (15) has been moved a distance that corresponds to the lever stroke, and the desired steering speed is obtained.

When the spool has assumed the position that corresponds to the signal to the control unit, then the control unit interrupts the feed to the solenoid valve (21) or (23) depending on the steering direction.

The control unit of the control valve has a light-emitting diode (28) which shines green when steering. If the control spool jams in the activated position when the lever is returned to the neutral position, the light-emitting diode will switch to a red light. If such a malfunction occurs, the machine will continue to turn even though the steering lever is not activated.

Hydraulic system, general

<https://truckmanualshub.com/>

The hydraulic oil tank is common to the working hydraulics, brake system and steering system.

The hydraulic system's pressure limiting valve is set at the factory to the correct pressure. If the valve is altered other than by service personnel from an authorised workshop the manufacturer's warranty will be invalidated.

Figure 1

Oil level, hydraulic oil

Hydraulic system, checking the oil level

Check the oil level daily. It should be between the max. and min. marks on the level indicating pipe.

NOTE!

The oil level should be checked when the lifting arms are in their lower position and the attachment is in a level position.

Oil is filled up through the plug on the top of the tank.

Hydraulic system, oil change

(working hydraulics, brake system and steering system)

WARNING

Hot oil can cause burns.

Change the oil every 2000 hours (engine oil and biodegradable hydraulic oil).

Change every 4000 hours if the system is filled with hydraulic oil.

Oil capacity of the hydraulic tank when changing:

L90D, approx. 95 litres (25.1 US gal)

L120D, approx. 155 litres (40.9 US gal)

Oil grade, see [Invalid linktarget].

NOTE!

When other hydraulic equipment is used, such as brushes, drills and snow slingers, the oil should be changed at more frequent intervals, i.e. every 1000 hours.

Proceed as follows when changing the hydraulic oil:

1. run the machine until the oil in the hydraulic system is at normal operating temperature.

Figure 2

Oil filter, transmission, L90D

2. Park the machine on a level surface with the bucket (attachment) lowered to the ground.
3. switch off the engine and depressurise the brake system by depressing the brake pedal repeatedly.
4. drain the hydraulic oil via the drain cock in the bottom of the tank.
5. fill up with oil to the correct level.
6. start the engine and operate the lifting and tilting cylinders to both end positions.
7. top up with oil as necessary.
8. check that no leakage occurs.

Dispose of waste oil and fluids in an environmentally safe and sound manner.

Filling up with hydraulic oil or carrying out other work on the system calls for a high degree of cleanliness. Even extremely small particles can damage the system or bring it to a halt. Clean the area round the filling point before filling the hydraulic oil tank with oil.

Hydraulic system, draining sludge

Figure 3

Filling up, hydraulic oil

Drain sludge and condensate from the hydraulic oil tank via the drain cock in the bottom of the tank every 1000 hours, see changing the hydraulic oil, points 1–8 above.

Figure 4
Hydraulic system, return oil filter
Hydraulic system, return oil filter
Change the return oil filter every 2000 hours.

Proceed as follows:

1. remove the cover.
2. lift out the filter and dismantle it by removing the split pin, nut, spring retainer and spring.
3. remove the filter, which is of disposable type, and fit a new one. Inspect the sealing rings when fitting them in place.

Figure 5

Hydraulic transmission, description

<https://truckmanualshub.com/>

Design

The hydraulic transmission is a four-speed hydro-mechanical Power Shift transmission which consists of three main sections:

- A front section with torque converter, transmission oil pump and two power take-offs for driving hydraulic pumps.
- A middle section (transmission) with spur gears for forward and rearward propulsion as well as gears 1–4, hydraulic clutches for the spur gears as well as a control valve for these.
- A rear/lower dropbox part consisting of dropbox with parking brake.

The hydraulic power transmission takes place via a torque converter both transmits torque and amplifies the same.

The mechanical torque transmission takes place via the clutch shafts, where the drive gears for directional and speed gears are in constant mesh. The drive gears on the clutch shafts rotate freely and are locked with hydraulic pressure in different drive gear combinations when a gear is engaged.

Gearshifting

Gearshifting takes place electro-hydraulically. When a gear is selected, one or several solenoids are activated in the gear selector valve. The solenoids act on the spools in the gear selector valve, which in turn control the oil flow to the clutch shafts.

In order to engage the desired gear, a voltage supply is required to one or several solenoids, which in turn control the spools.

The gear shifting spools have two positions: In one direction they are affected hydraulically via the solenoids, and the in the other direction (resting position), they are held in position by a spring.

The neutral spool as well as the forward/reverse spool can also be force-operated hydraulically in case of an electrical malfunction.

Hydraulically driven cooling fan L120D, description

The system consists of the components shown in [Invalid linktarget].

The V-ECU receives an input signal from the engine speed sensor (SE201) which tells whether the engine has started or not. When the engine has started and is cold, the fan will rotate at 400 rpm. The V-ECU then receives information from the various temperature sensors indicating whether or not the system requires cooling, i.e. higher fan speed. The system is controlled mainly by the radiator outlet temperature sensor (SE210). The other sensors do not have any effect until the temperature in these systems approaches close to the alarm limits.

The V-ECU will control MA202.

Figure 1
Hydraulically driven cooling fan (optional equipment for L120D)

1. Control piston
2. Flow compensator
3. Pressure compensator
4. Restriction
5. Restriction
6. Fan pump
7. Hydraulically driven fan
8. Radiator
9. Return oil filter

The pressure built up in the main circuit is led into the pressure/flow compensator (2, 3 and 5) and MA202 via the restriction (4). A control pressure is built up between restriction 4 and MA202 (see diagram [Invalid linktarget]). This control pressure acts on the rear of the flow compensator. If the signal to MA202 changes, the control pressure changes and so also does the pressure in the main circuit which in its turn has an effect on fan speed.

The pressure in the main circuit will be the control pressure plus the pressure needed to overcome the flow compensator's preset spring force (2). Through feedback from the fan speed sensor (SE211) the V-ECU can compensate for the signal to MA202 to obtain a correct fan speed.

Cold machine

If none of the temperature sensors requests increased cooling the V-ECU will send out the current (approx. 3 V) that is needed for the fan to rotate at approx. 400 rpm.

Figure 2

Normal operation

The output signal to MA202 and, in turn, the control pressure are continuously controlled within the temperature interval 60–80°C (140–176 °F) on the temperature sensor for the output temperature of the radiator (SE210).

If the temperature of one of the other circuits concerned nears its alarm limits, they will also control MA202.

Figure 3

If there is a request for maximum fan speed, the signal to MA202 will be 14–16 V, depending on if fan programme A, B, or C was chosen.

Figure 4

Figure 5

- X= Max. fan speed that can be selected in three levels:
 A = Noise Reduction Kit
 B = EU execution
 C = High cooling performance
- * = Selection of cooling fan speed

Temperature limits

Fan speed	<400 rpm	Max. rotation speed 1200–1550 rpm
Coolant temperature (SE210)	60 °C (140 °F)	80 °C (176 °F)
Hydraulic oil temperature (SE906)	70 °C (158 °F)	95 °C (203 °F)
Transmission oil temperature (SE406)	90 °C (194 °F)	133 °C (271 °F)
Engine temperature (SE205)	85 °C (185 °F)	95 °C (203 °F)

For SE406 or SE205 to control the fan, they must both be within their temperature limits.

Sensor errors are indicated in the driver panel.

If there are errors with SE210 or SE211 (sensors for fan speed), V-ECU will control MA202 for max. cooling.

Pressure check

When the pressure check mode has been activated via the service display unit, the V-ECU sends a signal of approx. 22 V to MA202, which makes it close. The flow compensator (2) will then remain closed and the pump will deliver maximum flow. This flow makes pressure build up until the pressure compensator opens and regulates max. pressure to 21 MPa (3045 psi).

Figure 6

Hydraulically driven cooling fan, <https://truckmanualshub.com/>

Op nbr 26304

[999 3721 Service display unit](#)

1. Place the machine in a location that allows 2 m (6.6 ft) free space behind it. Check that all radiators (hydraulic oil cooler, condenser, radiator) are well cleaned.
2. Loosen the connection to SE210 (output radiator temperature), located at the coolant pipe, from the partition wall to the engine on the right side of the machine.
3. Connect the service display unit to the socket on the right-hand instrument panel.

Figure 1
Socket for the service display unit

4. Start the engine.
5. Scroll to the "SETUP" menu and make sure alternative C is selected.

Figure 2

6. Scroll to the "FAN PRESSURE TEST" menu.

Figure 3

7. Run the engine at high idling speed and read off the fan speed.
Fan speed: **1550 rpm**
Any adjustments should be made to the pump's flow compensator.
NOTE!
The side plate on the right side of the machine must be removed to adjust the flow.

If the rotation speed is incorrect:

Check the output signal to MA202 on pin EM7. The signal should be 16 ± 1 V. Use a frequency meter to check that the output signal of EM7 is 200 Hz. An incorrect output signal could possibly be caused by a problem in the V-ECU.

Figure 4

1. Flow compensator

If the rotation speed is too high despite adjustments, check the max. pressure according to [Invalid linktarget].

8. Restore the machine to operating condition.

Figure 5

1. Flow compensator (fan speed)
2. Pressure compensator (max. pressure)

Hydraulically driven cooling fan, <https://truckmanualshub.com/>

[999 3721 Service display unit](#)

[11 666 037 Hose](#)

[11 666 020 Pressure gauge, 0–25 MPa \(0–3625 psi\)](#)

1. Place the machine in a location that allows 2 m free space behind it. Check that all radiators (hydraulic oil cooler, condenser, radiator) are well cleaned.

Figure 1

1. 11 666 037
2. Remove the right rear fender of the machine.
Weight: **approx. 26 kg (app. 57 lbs)**
3. Remove the plate inside the rear fender.
4. Attach 11 666 037 and 11 666 020 to the pressure outlet of the proportional valve.
5. Connect the service display unit to the socket on the right-hand instrument panel.

Figure 2
Socket for the service display unit

6. Start the engine.

<https://truckmanualshub.com/>

7. Scroll to the "FAN PRESSURE TEST" menu.

Figure 3

8. Select max. pressure check by pressing *.

9. Read the max. pressure from the pressure gauge at high idling speed.

Max. pressure: **21 MPa (3045 psi)**

Any adjustments should be made to the pump's pressure compensator.

NOTE!

The side plate on the right side of the machine must be removed to adjust the pressure.

If the pressure is too low:

Check the output signal to MA202 on pin EM7. The signal should be 22 ± 1 V. Measure the frequency of the output signal of EM7 to ensure that it is 200 Hz. An error in the signal would probably be caused by a problem in the V-ECU.

If the necessary pressure cannot be attained it could also be due to internal leakage in the hydraulic motor/pump or solenoid valve.

Figure 4

1. Pressure compensator

10. Restore the machine to operating condition.

Idle speed, checking and adjusting

Op nbr 23601

The following applies when checking:

Normal operating temperature.

Units and equipment that use a lot of electricity and air conditioning (if installed) must be turned off.

The engine is equipped with protection against unauthorised work on the fuel injection pump. Adjustment of high idle speed must only be performed by diesel workshops authorised by Bosch.

1. Select information about the engine and engine speed on the information display unit.

Figure 1
Checking idle speed

Improved hour recorder

Figure 1

NOTE!

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause

The number wheel on the hour recorder gets stuck, sometimes only after one hour's use, It is caused by a friction between the number wheel and the pinion gear.

Action

The affected part number is VOE15047153 and improvements are introduced from manufacturing date 04-06-13 (shown on the sticker on the rear side of the hour recorder).

Pump coupling

1. Clamping bolt
14. Tighten the pump coupling clamping bolt until the coupling can just about be rotated against the rotational direction.
- NOTE!**
The pump coupling must always be rotated against the rotational direction when setting the injection angle in order to eliminate any clearance between the timing gears.
15. Rotate the pump coupling against the rotational direction until both light-emitting diodes light up on injection timing tool 998 7057. Tighten the pump coupling.
If the pump coupling is rotated too far, adjustment must be repeated according to points 14 - 16.
Tightening torque: **60 ±5 Nm** (44 ±3.7 lbf ft)
16. Check the injection timing setting by rotating the crankshaft approx. 1/4 turn contrary to the rotational direction of the engine. Then rotate the crankshaft in the engine's rotational direction until both light-emitting diodes on injection timing tool 998 7057

light up. Read off the flywheel marking.

<https://truckmanualshub.com/>

Timing setting L90D: **13° BTDC**

Timing setting L120D: **9° BTDC**

Remember to refit the lock sleeve.

17. After checking or adjusting is completed, remove the injection timing tool sensor and refit the plug in the governor housing. Remove 999 3590 and fit the cover. Fit the cover over the flywheel marking.

Installation kit for Air sprung operator's seat, (ISRI) 11104274

Note! Seat 11104274 to be ordered seperately

We consider that no special installation
instructions are required for fitting
this equipment.

To facilitate fitting we enclose:

- Kit list
- Installation drawing
- User instruction

*Use existing washers fitted to machine

- ① **Handtag för inställning av sitthöjd och sittvinkel.** Genom inställning med de båda handtagen och samtidig avlastning av sittdynans fram- resp. bakdel kan önskad sitthöjd och sittvinkel erhållas.
- ② **Handtag för ryggstödsinställning.** Inställning av ryggstödet sker genom att dra i handtaget och samtidigt med ryggen trycka mot ryggdynan. Låsning av inställd position sker när handtaget släpps.
- ③ **Viktinställning.** Genom att trycka på knappen märkt med(+) för fyllning och (-) för tömning, kan lämplig hårdhet i sitsfjädringen ske individuellt efter förarvikt. **Observera!** Ska ej användas som höjdinställning.
- ④ **Svankstödsinställning.** Med de båda knapparna kan man var för sig fylla resp. tömma övre och nedre svanksöd.

- ① **Handles for adjusting the height and angle of the seat.** The desired seat height and angle can be adjusted using both handles and simultaneously relieving the load on the front and back of the seat cushion.
- ② **Handle for adjusting the backrest.** The angle of the backrest is adjusted by pulling the handle and simultaneously pressing your back against the backrest cushion. The desired position is locked when the handle is released.
- ③ **Weight adjustment.** The hardness of the seat springs can be adjusted to suit the weight of the individual driver. This is done by pressing the buttons marked (+) for filling and (-) for emptying.
Note! This is not to be used for adjusting the height.
- ④ **Lumbar support adjustment.** Both buttons can be used to individually fill and empty the upper and lower lumbar supports.

Applies to Wheel Loaders						

Instructions for crack in lifting frame

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause and action

In the event of wheel loader frame cracks, it is necessary to have the correct information for investigation follow up. It is important to have correct information to access the problem properly.

Clear photos, both close up shots and overview shots, to identify the crack in relation to the total lifting frame are needed.

These photos are required in your Techline report along with other descriptive information.

Casting numbers as show on following pages are also required to identify production runs.

Portions of lifting frames may be requested to be returned for examination.

Rust proof any cracks in the lifting frame immediately to preserve original metallurgy, as rusted/corroded metal are extremely difficult to analyse.

Coat the crack areas with oil to protect the metal.

Instructions for drilling in ROPS structure

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

It is permissible to drill holes in the ROPS structure on the wheel loaders within marked areas, see Fig. 1. At the most three holes with a maximum diameter of 9.5 mm (0.374 in) may be drilled within each area and there must be at least 100 mm (3.937 in) between the holes.

V1024829

Applies to Wheel Loaders						

Instructions for shielded metal arc welding

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

Scope

These instructions have been provided to ensure that modifications or repairs involving welding on Volvo Wheel Loader's machines will be of the highest quality.

These are general welding instructions that must be supplemented with drawings, sketches and specifications from Volvo CE Customer Support.

In cases where the use of MIG, TIG, Fluxcore or submerged arc welding is required, contact VCE Customer Support for approval.

Welder competence, qualifications and requirements

Unless otherwise specified or approved, all welding must be carried out by a welder whose competence meets the requirements according to the American Welding Society, Specification D1.1 or D14.3, or ASME Pressure Vessel Code, Section IX.

NOTE!

Each country has its own welding standards and specifications. All welding must be carried out by a competent welder in order to meet the requirements specified by the country where the work is to be carried out.

Base materials

Refer to drawings, sketches and specifications which are made available by VCE Customer Support.

Filler materials (Coated electrodes)

Electrode classification must be according designations on accompanying drawings, sketches or specifications which are made available by VCE Customer Support.

The welding electrodes must meet the following requirements:

EN 499-95	E 42 4 B 42 H5
Swedish National Standard 79	SS 3211-H10
AWS A5. 1-91	E 7018-M
DIN 1913-84	E 51 55 B10 120
ISO 2560-73	E 51 5 B 120 20 H

These electrodes may be used:

- E 8018: AWS A5.5, class E 8018-D3
- E 9018: AWS A5.5, class E 9018-D1 or E 9018-M
- E 10018: AWS A5.5, class E 10018-D2 or E 10018-M
- E 11018: AWS A5.5, class E 11018-M
- OK 67.45 (EN 1600 E 18 8 Mn B, AWS A5.4) ESAB
- OK 68.81 (EN 1600 E 29 9R 32, SFA7AWS A5.4) ESAB
- Elgaloy Mix 18 (EN 1600 E 18 8 Mn R 53, AWS A5.4-92)), ELGA

Electrode sizes

The electrode size must be adapted and be suitable for the type of material, type of weld joint, welding position and other circumstances affecting the work.

The maximum size of electrodes and current strength are as follows:

Position	3.17 mm	3.97 mm	4.76 mm	6.35 mm
	1/8"	5/32"	3/16"	1/4"
Flat/horizontal	100/150	175/225	225/275	350
Vertical	120/140	140/160	-	-
Overhead	110/135	140/170	-	-

6.35 mm (1/4") max. diameter for horizontal fillet welds.

6.35 mm (1/4") max. diameter for root passes or fillet welds made in the flat position and for weld joints made in the flat position with backing bar (root passes) and with an root opening of 6.35 mm (1/4") or greater.

3.97 mm (5/32") max. diameter for welding made in the vertical and overhead positions.

<https://truckmanualshub.com/>

Care and storage of electrodes

Electrodes in hermetically sealed containers may be used immediately from the container for a specific period of time after the container has been opened.

Time periods are as follows:

E7018 - 4 hours

E8018 - 2 hours

E9018 - 1 hours

E10018- 30 minutes

E11018- 30 minutes

All electrodes which are not used within the above specified times must be stored in an oven at a temperature of at least 121 °Celsius (250 °F).

Electrodes which have been exposed to the atmosphere for a longer time than specified above, must be dried for at least one hour at a temperature between 371 and 427 °C (700 and 800 °F) before they are used.

Preparation of materials

The surface, which is to be welded, must be free from moisture, slag, rust, paint, grease, oil or other foreign material which prevent proper welding.

In cases where original parts have been removed by carbon arc welding, all oxides, slag and carbon deposits must be removed by grinding to remove sharp undercuts, cracks, nicks or gouges. This is to be followed by welding and grinding if required to provide a smooth and even surface.

Assembling

Aligning parts:

Parts to be joined by fillet welding must be placed as close together as piratically possible.

The distance between the two parts must normally not exceed 3.17 mm (1/8"). If the distance exceeds 1.58 mm (1/16"), the leg of the filled weld must be increased by the distance between the parts.

All parts must be supported to provide the best possible alignment between the parts and to minimise stresses on tack welds and root passes.

Tack welds are subjected to the same quality requirements and limitations as the final welds.

All tack welds must be thoroughly cleaned from slag prior to incorporating them in the final welds.

Cracked or faulty tack welds must be removed by grinding prior to final welding.

Position

The pieces to be welded should be placed flat where possible.

Preheating and temperature of the work pieces

- Interpass temperature – the temperature throughout the material

The material to be welded must be preheated, when required, to reach a minimum preheating temperature which is specified in supplemental drawings, sketches and specifications supplied by VCE Customer Support

Unless otherwise specified, the temperature must not be less than 10 °C (50 °F).

The preheating temperature must be measured 75 mm (3") from the centre line of the weld and at the opposite side of the work piece from where the heat was supplied. This technique will assists in ensuring that the heat has penetrated through the material.

Maximum interpass temperature are 204 °C (400 °F) unless otherwise specified. If possible all welding should be carried out in an order that balances the supplied heat during the progress of the welding.

A device for measuring the surface temperature is to be used to check the preheating temperature and the interpass temperature throughout the material. In cases where temperature sensitive crayons are used, all remaining crayon residue or other contaminants must removed from the surface to be welded.

Welding must not be carried out when the workpiece is exposed to strong wind, draught or moisture.

Electrical specifications

Use direct current, reverse polarity (electrode positive) at amperages and voltages recommended by the electrode manufacturer.

The ground connection must be safely secured as close to the point of welding as possible. Do not connect the ground connection so that the electrical current of the welding circuit has to pass across a bearing. For example, when welding on the front frame of the wheel loader, do not attach the ground connection to the rear frame.

Welding technique

Electrode handling:

The arc length must be kept as small as possible during the entire welding work.

All welding beads, except vertical ones, are to be deposited as stringer beads, the width of which must not exceed four times the diameter of the electrode. When welding vertically, a partial weaving technique may be used.

The width should be limited to twice the diameter of the electrode. When starting a new electrode, back puddle slightly to heat surrounding base material and to fill the crater in the previous welding bead.

Fill all arc craters at the end of each bead.

<https://truckmanualshub.com/>

Interpass Cleaning

Slag must be removed from all welding beads before starting on the next bead.

Remove all visible defects such as cracks, pores and undercuts by grinding before beginning the next bead.

Welding bead size

Groove welds:

The maximum thickness of layers deposited after the root pass in fillet welds and all layers of groove welds is:

6 mm (1/4") for root passes of groove welds.

3 mm (1/8") for subsequent layers of welds made in the flat position.

5 mm (3/16") for subsequent layers of welds made in the vertically, overhead and horizontal positions.

Fillet welds:

The maximum size of fillet welds which may be made in one pass is:

10 mm (3/8") in the flat position.

8 mm (5/16") in the horizontal or overhead positions.

12 mm (1/2") in the vertical position.

Welding sequence

The welding sequence must be arranged so as to minimise distortion and shrinkage.

If possible, all welds should be made in a sequence that balances the applied heat of welding while welding progresses. Backstep welding technique is recommended.

Backstep welding technique

Figure 1

Backstep welding

- Weld in the direction of the arrow
- X = Start
- (n) = Welding sequence

Peening

Welded metal may be peened after each pass, while the bead is still very hot to reduce stresses and distortion. Peening can be carried out using a heavy hammer (especially intended for peening), but it is much more effective to use a 7 or a 9 kg (15 or 20 lb) air hammer with a blunt chisel point tip with a diameter of 6.35 mm (1/4") to peen each layer of welded metal.

NOTE!

Peening is not permissible on the first or final layers.

Back gouging

Complete joint penetration groove welds made without the use of steel backing must have the root gouged down to sound metal before welding is started from the other side. Gouging may be done by grinding or carbon-arc cutting. Gouging with oxy-fuel gas cutting torch is not permitted.

Inspection

The surface of the final weld beads must be free of slag, abrupt peaks or valleys, overlaps or undercuts and the surface must be smooth and even.

All completed welded joints should be magnetic particle inspected.

Additional inspection requirements may be specified by accompanying instructions for assembling, sketches or drawings which are made available by VCE Customer Support.

This SB is to be considered as a technical information and comprises normal warranties within the rules for the same.

WARNING!

Read all signs and instructions on the machine and the safety instructions in the operators manual, before you start working on the machine.

The installation instructions are based on the use of special tools, the E-tool and standard tools generally available on the market, and also on our operators manuals and service manuals.

The equipment should be installed by qualified personnel of an authorised workshop.

Volvo CE Customer Support AB disclaims all responsibility if tools and work methods other than those described in the instructions are used.

Seat for the instructor

Work description

- 1 Assemble the parts as shown in Fig. 1.

Note! Tighten the bolts 9 and 10 and loosen 0.5 turn.

Fig. 1

- 2 Screw the seat tight behind the operator seat, see Fig. 2.
- 3 Write equipment number 80556 on the machine card.

Fig. 2

Instrument control unit I-ECU, functional description

The instrument control unit is integrated with the main instrument and receives information by way of the data bus. The information is processed and shown via gauges, control lamps, warning lamps and the display panel.

Figure 1
Instrument control unit with display panel

Figure 2
Keypad for display panel
Functions

- Values for gear position, machine hours as well as status values for parking brake and warning messages are processed and result in a number of displays on the display unit.
- Special warnings, such as central warnings, low engine oil pressure, etc. are detected and the corresponding warning lamp is activated.
- Values for transmission oil temperature, coolant temperature and fuel level are shown on gauges.
- Setting of display alternatives and parameter alternatives for the display panel.
- Storage and display of operating hours

11040682	Cable harness	1	14

10 Fit the cover on the control lever carrier and screw the instrument panel tight on the right side.

11 Start the engine and test the function.

12 Write equipment number 80098 on the machine card.

Fig. 4

1. The basic steering speed setting is 3.5–4.0 seconds from full lock to full lock (at 1500 rpm).
Steering speed is adjusted by turning the adjusting screws clockwise (increases speed) or counter-clockwise (reduces speed).
The steering speed to the left and right should be as equal as possible, and the steering lever must be fully deflected (maximum steering stroke) when the adjustment is performed.

Figure 1
Adjusting screws for steering speed

- A. Steering, left
- B. Steering, right

Lever steering, checking and adjusting control valve

Op nbr

Lever for mechanical activation of control valve spool or suitable wrench

Checking

1. Connect the frame joint lock.
Apply the parking brake.

Figure 1

2. Fit the lever (wrench) for mechanical activation on the CDC valve, located under the cab on the right side of the machine.
3. Start the engine and engage CDC lever steering with SW408.
4. Check to make sure that lever for mechanical activation does not move back and forth (oscillate).
If the lever moves in any direction, the electronic and the hydraulic neutral positions are not the same, and the lever will move back and forth.
Max. clearance: **2 mm (0.08 in)**

Figure 2

- | | |
|---|---------------------|
| x | Max. 2 mm (0.08 in) |
| A | Steering, left |
| B | Steering, right |

Adjusting

5. Any adjustment is done on the adjusting screw (1). Turn the adjusting screw counter-clockwise or clockwise depending on if the lever moves in direction A or B. 1/2 turn of the adjusting screw corresponds to a lever movement of 3 mm (0.12 in)

Figure 3
Adjusting lever movement in direction A

Lighting, description

<https://truckmanualshub.com/>

Travel lights are operated with switch SW301, located on the right-hand instrument panel.

- Position 1: parking lights and instrument lighting
- Position 2: parking lights, instrument lighting and travel lights.

Main and dipped beams are controlled with SW302, the right-hand stalk switch on the steering column.

- Stalk switch in neutral position, dipped beams
- Stalk switch pressed away from steering wheel: main beams and control lamp LC12 on the instrument panel lights up.

The front work lights are controlled with switch SW303, located on the right-hand instrument panel. When the work lights are on, control lamp LC7 on the instrument panel is also on.

- Position 1: regular front work lights
- Position 2: regular front work lights and auxiliary front work lights (LA317, LA318, LA319) via relay RE10.

Rear work lights are controlled with switch SW304, located on the right-hand instrument panel. When the work lights are on, control lamp LC7 on the instrument panel is also on.

- Position 1: regular rear work lights
- Position 2: regular rear work lights and auxiliary rear work lights (LA322, LA323).
See [Invalid linktarget] and [Invalid linktarget].

Limitation, TP-linkage

WARNING
Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause

There have been cases where the arm up to the B bearing, the B arm and the HIJ link has been exposed to mechanical wear, which may cause the GH link to collide with the tilting cylinder piston rod. Also, before the GH link collides with the tilting cylinder piston rod, the GDF link is exposed to great forces, as the geometry between the links no longer is according to the drawings because of the wear. The wear is visible on the B arm in that the material has been hammered.

Figure 1

1. Wear plate

Action

In order to compensate for the wear on the B arm, a wear plate, which is to be attached to the B arm with one bolt, can be manufactured. See the following job description.

NOTE!

It is not permissible to weld on the B arm.

Required parts

Designation	Qty.	Part No.
Wear plate L90C, L90D, L120C, L120D	1	Manufacture plate acc. to Fig. 3
Bolt (M16x100) L90C, L90D, L120C, L120D	1	VOE968591
Lock nut (M16) L90C, L90D, L120C, L120D	1	VOE13967934
Wear plate L150C, L150D, L180C, L180D, L220D	2	Manufacture plate acc. to Fig. 3
Bolt (M16x100) L150C, L150D, L180C, L180D, L220D	2	VOE968591
Lock nut (M16) L150C, L150D, L180C, L180D, L220D	2	VOE13967934

NOTE!
The wear plate can be manufactured also for E, F and G generation wheel loaders with small changes due to lifting frame work updates.

<https://truckmanualshub.com/>

Figure 2
Wear plate on L180F
Work instruction

1.

Manufacture the wear plate in Hardox 440/XAR 400 according to Fig. 3.
2.

Use the plate as a template for drilling a hole in the B arm. The hole must have a Ø of 18 mm (0.709 in). On some machines the hole is there as standard.
3.

Install the wear plate and check the function.

Figure 3

A. Use this hole as a template for drilling in the B arm

Machine	L	L1	B minimum	X	Y
L90C L90D	210	140	54	50	100

L220D	220	220	53	110	150

NOTE!
The wear plate can be manufactured also for E, F and G generation wheel loaders with small changes due to lifting frame work updates.

Limp-home operation

<https://truckmanualshub.com/>

Op nbr

[930032 Nipple, 2 pcs. forward operation, 4 pcs reverse operation](#)
[11 666 037 Hose, 1 pc. forward operation, 2 pcs. reverse operation](#)

Figure 1
Pressure outlet

M Pressure outlet, main pressure
(equipped with quick-coupling)

WARNING

During limp-home operation, the gear will be engaged immediately when the engine is started. Apply the service brake when starting the engine.

Limp-home operation forward

1. Remove the N/D plug on the gear selector valve, [Invalid linktarget], and fit nipple having part no. 930032.

Figure 2
Gear selector valve

N/D Valve spool, neutral - drive

2. Connect hose 11 666 037 between the nipples.

3. Keep the gear selector in neutral, and start the engine. 3rd gear forward will now be engaged.
4. When limp-home operation has been completed, restore with pressure outlet and plugs.

Limp-home operation reverse

5. Remove the N/D and F/R plugs on the gear selector valve [Invalid linktarget], fit nipples having part no. 930032.

Figure 3
Pressure outlet

- 3 Pressure outlet, 3rd gear
(equipped with quick-coupling)

Figure 4
Gear selector valve

N/D	Valve spool, neutral - drive
F/R	Valve spool, forward - reverse

6. Connect hose 11 666 037 between the main pressure outlet on the measuring ramp and the N/D outlet on the gear selector valve. Connect the other hose between the pressure outlet for the 3rd gear's clutch on the measuring ramp and the F/R outlet on the gear selector valve.
7. Keep the gear selector in neutral and start the engine. 3rd gear reverse will now be engaged.
8. When limp-home operation has been completed, restore with plugs.

Limp-Home, by-passed V-ECU

<https://truckmanualshub.com/>

In the event of a V-ECU malfunction, the unit can be by-passed. The machine can then only be operated in second gear forward or reverse.

The by-pass is performed with separate cables hanging in the electrical distribution box with connectors marked TA and EM.

NOTE!

Operating with a by-passed V-ECU is only for the purpose of moving the machine to the nearest service location.

When the V-ECU is by-passed, the following functions will be present:

- The machine can only be operated in second gear forward or reverse.
- The parking brake can be applied and released.
- Engine preheating can be operated manually.
- Low brake pressure warning provided (warning lamp).
- The engine cooling fan will run at maximum speed (only on the L120D with hydraulically driven radiator fan).

NOTE!

If the machine has secondary steering it will be rendered inoperative.

By-passing V-ECU

- 1 Remove the upholstery from the rear cab wall.
- 2 Disconnect the wiring hanging loosely in the electrical distribution box, connectors marked TA and EM.
- 3 Unplug the regular wiring's TA connector from the sheet metal bracket (between the V-ECU and the circuit board)
- 4 Connect the regular wiring's TA connector to the loose wiring's TA connector.
- 5 Plug the loose wiring's EM connector into the circuit board socket marked EM.
- 6 Unplug all the connections from V-ECU: connectors EA, EB and EC.
- 7 It is now possible to move the machine with a by-passed V-ECU.

NOTE!

By-passed V-ECU is shown in wiring diagram 14.

Figure 1
Electrical distribution box with by-passed V-ECU

1. The loose wiring connected to the regular wiring's connector marked TA and connected to EM on the circuit board
2. V-ECU with connectors EB, EA and EC unplugged
3. Sheet metal bracket with regular wiring's TA connector unplugged
4. Circuit board, with the loose wiring's EM connector plugged in

Re-engagement of V-ECU

- 1 After the machine has been moved and the necessary measures have been taken.
- 2 Unplug the loose wiring's EM connector from the circuit board.
- 3 Unplug the connectors marked TA.
- 4 Plug the regular wiring's TA connector back into the sheet metal bracket.
- 5 Plug the connectors into the loose wiring's connectors (marked TA and EM)
- 6 Plug in the connectors to V-ECU, EA, EB and EC.
- 7 Refit the upholstery on the rear cab wall.
- 8 The V-ECU is now re-connected.

Figure 2
Electrical distribution box with V-ECU connected

1. Loosely hanging wiring in the electrical distribution box with connectors marked TA and EM
2. V-ECU
3. Regular wiring with TA connector
4. Sheet metal bracket

Lubrication system, TD63

<https://truckmanualshub.com/>

The lubrication system has three valves

A Overflow valve for oil filter The overflow valve opens if clogging of the filter(s) occurs and so ensures that oil continues to circulate.

Figure 1

Lubricating oil system valves (without piston cooling), TD63

B Oil cooling valve This valve is also called a piston cooling valve when piston cooling nozzles are fitted. The valve controls the flow of oil to the oil cooler and, when fitted, to the piston cooling nozzles. The valve opens when engine rpm reaches just above idling speed and when the oil pressure increases. The oil then flows via an oil passage drilled in the cylinder block to the oil cooler and, if fitted, to the piston cooling nozzles. The valve shuts off the flow of oil at low engine rpm and all oil is then supplied to the lubrication system, ensuring the engine of good lubrication when starting and running at idling speed.

C Reducing valve The reducing valve opens when oil pressure is too high and directs the surplus oil back to the sump.

Figure 2

Lubrication system valves (with piston cooling), TD73 (outline diagram)

The oil filter is of full-flow type, which means that all oil is filtered before it continues to the lubricating points. The filter is mounted on the right-hand side of the cylinder block. The filter element consists of folded filter paper.

On TD73 there is also a part-flow filter for the lubricating oil.

Manual release of parking brake, L90D <http://truckmanualshub.com/>

Park the machine on a level surface. Fit blocks in front of and behind the wheels in order to prevent the machine from rolling.

Manufacturing location	Serial number
Arvika	17558
Ashville	64279
Pedeneiras	70549

1. Remove the cover (1).
2. To disable the parking brake, slacken the adjusting screw under the cover (1) two turns. This releases the parking brake.

Figure 1
Releasing the parking brake, L90D, later version

1. cover

Manual release of parking brake, L90D <http://truckmanualshub.com/>

Block the wheels in order to prevent the machine from rolling.

If the parking brake cannot be released with the parking brake lever, release the parking brake manually as follows:

Release the parking brake by loosening the lock nut (1) and then turning the adjusting screw (2) counter-clockwise until the parking brake is released.

The machine can now be moved **but the parking brake is not functional**. The towed machine can only be braked by the towbar from the towing vehicle.

Figure 1
Releasing the parking brake

1. Lock nut
2. Adjusting screw

When restoring the parking brake, it is adjusted so that there is an approximate clearance of 0.25 mm (0.010 in) between the brake disc and the brake pads when the brake is released. The clearance between the brake disc and the brake pad can only be adjusted when the engine is running and the parking brake has been released with hydraulic pressure.

If the machine is left unattended after towing/recovering and without having restored the parking brake to working order, a notice must be attached to the steering wheel with the information that the parking brake has been released manually and that it is not working.

Manual release of parking brake, L120D <https://www.manualshub.com/>

Block the wheels to prevent the machine from rolling.

If the parking brake cannot be released with the parking brake lever, release the parking brake manually as follows:

WARNING

Hot oil can cause burns!

Release the parking brake by removing the three plugs on the front of the transmission and replace the plugs with M10 x 90 mm bolts that are available in the machine's tool kit. Replace the plugs one at a time and screw the bolts in by hand.

NOTE!

Oil will drain until the plug has been replaced. Thus, plugs should be replaced one at a time.

Figure 1
Releasing parking brake, L120D

When all plugs are replaced, the bolts should be alternately screwed incompletely to the bottom, until the parking brake is released.

The machine can now be moved **but the parking brake is not functional**. The towed machine can only be braked by the towbar from the towing vehicle.

The parking brake is restored by alternately unscrewing the bolts and refitting the plugs.

If the machine is left unattended after towing/recovering and without having restored the parking brake to working order, a notice must be attached to the steering wheel with the information that the parking brake has been released manually and that it is not working.

Functions with warning lamps

1 Amber central warning lamp

Amber central warning lamp for Operator Information flashes to indicate that a function is activated/deactivated or that some function needs to be kept under observation (such as a clogged filter, etc.).

At the same time, information is shown on the display panel.

2 Red central warning lamp

Red central warning lamp flashes and a warning appears on the display panel at the same time. If the function has a warning lamp, this comes on.

If a directional gear is engaged (Forward or Reverse), the buzzer is also activated.

Buzzer (reinforces central warning)

The buzzer sounds and the red central warning lamp flashes simultaneously if there is a malfunction in any of the following functions:

- Serious engine malfunction
- Primary steering system malfunction (low steering pressure)

The buzzer sounds and the red central warning lamp flashes simultaneously if there is a malfunction in any of the following functions and a directional gear (Forward or Reverse) is engaged:

1. Low engine oil pressure
2. Low transmission oil pressure
3. Low brake pressure
4. Parking brake (applied during simultaneous operation)
5. High hydraulic oil temperature (L120D with hydraulically driven radiator fan)
6. High axle oil temperature, front and rear axles
7. High transmission oil temperature
8. High engine coolant temperature
9. Brake pressure charging malfunction

<https://truckmanualshub.com/>

Neutral position, HT205.

<https://truckmanualshub.com/>

The pumps P, [Invalid linktarget] suck oil from the tank N through strainer O. The flow from pump element P2 passes through filter S and continues to pressure-limiting valve A which is integrated with the gear selector valve in the form of a spool.

The oil passes from the pressure-limiting valve to the various selector spools. All selector spools are in the rest position.

Spool N/D (neutral and drive spool) blocks the oil to spool F/R (forward and reverse spool). Spool H/L (high and low spool) admits the oil to spool 3/4 (controls 3rd and 4th gears) which in this position routes the oil to 3rd gear in clutch 3 which is thus engaged. Since the neutral and drive spool is in the rest position and does not admit any oil to the forward and reverse spool, no driving can take place. Spool 1/2 (controls 1st and 2nd gears) receives no oil from spool H/L in this position.

When main pressure has been built up the spool in valve A moves to the open position and allows oil to pass through. This flow joins the flow from pump element P1 and passes through line X with safety valve B, which protects the torque converter, to torque converter M and through it to the cooling circuit which controls the pressure in the torque converter.

After the torque converter the oil passes through the oil cooler. The subsequently cooled oil is used for cooling and lubricating all bearings and clutches. Valve C controls lubricating oil pressure by directing surplus oil back to the suction side of the pump.

Figure 2
Gearshifting diagram

-
- The diagram illustrates the hydraulic circuit for a truck's transmission and auxiliary systems. It features a pump (S) at the bottom right, which feeds into a control valve (X). The control valve has four positions: Forward (F), Reverse (R), Neutral (N/D), and a fourth position (A). The Forward and Reverse positions are further divided into sub-positions (1, 2, 3, 4). The Neutral position is labeled N/D. The fourth position (A) is labeled A. The control valve is connected to a selector valve (Y) at the top. The selector valve has five positions: 1, 2, 3, 4, and 5. The selector valve is connected to various solenoid valves (S1, S2, S3, S4, S5) and actuators (R1, R2, B). The actuators are connected to the hydraulic lines. The diagram also shows the flow paths for Forward (F), Reverse (R), and Neutral (N/D) operations. The flow is color-coded: red for pressure, green for return, and blue for pilot lines. The diagram is a detailed schematic of a truck's hydraulic system, showing the flow of fluid through various components including the pump, valves, and actuators.

New alternator

NOTE!

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

NOTE!

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause

To fulfill Volvo's quality demands, a new alternator has been developed.

Action

A new alternator with an installation kit is introduced for machines listed below. The electric connection of the new alternator differs from the old connection, but is the same for all machine models.

Images of different alternator installations with new adapter brackets are found at the end of this Service bulletin.

Model	New alternator	Alternator kit	Old alternator	Engine

L50D		VOE17411636		TD40

Electrical connection for the alternator

Below is the wiring diagram for the new alternator.

Op nbr

1. In addition to the already existing wires, a key-dependant 15 connection is required. Locate, by using a test light or a multimeter, a suitable key-dependant 15 connection in the machine.
2. Connect the long blue/green cable in the adapter harness.
3. After installation of the alternator, perform a charging test according to instructions in Service bulletin 321 WLO 25K.

New differential lock

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This SB is to be considered as a technical information and comprises normal warranties within the rules for the same.

New type differential lock control on AWB axles

With effect from start of production of the D-type wheel loaders, a new type of differential lock control has been introduced. The new type has a simplified adjusting method and minimises the risk of internal leakage to the axle housing.

Working instructions

1. When adjusting the differential lock the dog clutches should be placed tooth against tooth.
2. The control arm piston should protrude 3 mm (0.12 in) above the axle housing face, see item 1 in Fig. 1.
3. Lock the screw, see Fig. 1.

NOTE!

To be able to keep the control arm piston at the measurement of 3 mm (0.12 in) during the adjustment procedure, there is a tool with part No. 9993806 available.

New muffler mounting

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

In order to improve mounting of the muffler, a new type of mounting has been introduced in production from and incl. the following serial numbers:

Machine	Serial no.
L90D	17226- (ARV)
L90D	64083- (ASH)
L90D	70523- (PED)
L90D Open ROPS	70523- (PED)
L120D	14284- (ARV)
L120D	63033- (ASH)
L120D	70515- (PED)
L150D	5197- (ARV)
L150D	62545- (ASH)
L180D	4173- (ARV)
L180D	62032- (ASH)
L180D High Lift	4173- (ARV)
L220D	1502- (ARV)
L330D	61055- (ASH)

Spare parts

Only the new version of the muffler bracket will be available as a spare part, however, only as an included part and not as a complete unit.

Designation	Additional Part no.	Quantity	Discontinued Part no.
Rubber cushion	11110276	3	9958348
Bracket	11105301	2	-
Washer	13960145	2	-
Washer	1130930	10	-
Nut	13971099	6	13971096
Bolt	13946817	4	-

Service

This SB should be regarded as technical information and is covered by normal warranties, according to governing regulations for warranties.

For L220D: Se work number 202 in Update 2000.

Only the above parts will be available as spare parts. When repairing C-generation machines, order parts from respective spare parts department.

Figure 1

New relays

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This SB is to be considered as a technical information and comprises normal warranties within the rules for the same.

Metal relay in production

We have previously notified you that RE11 should be replaced with a metal-encased relay with a quenching diode, part No. 4786690, in order to avoid damage to the V-ECU and the I-ECU (see L-372-WLO 4 R dated 2001-06).

With effect from the following serial numbers, the metal-encased relay has been introduced in the production:

Machine	W.e.fr. serial No.
L50D	13362– (ESK)
L70D	17960– (ESK)
L90D	17491– (ARV), 64198– (ASH)
L120D	14541– (ARV), 63110– (ASH)
L150D	5371– (ARV), 62540– (ASH)
L180D	4312– (ARV), 62025– (ASH)
L180D High Lift	4312– (ARV), 62025– (ARV)
L220D	1667– (ARV)
L330E	61051– (ASH)

Circuit board with improved quality

With effect from the following serial numbers, a new circuit board has been introduced, and because of this, the plastic relay has been re-introduced in production, see Table 2. Please also make a note of this in the Parts Catalogue.

Machine	W.e.fr. serial No.	W.e.fr. cab No. (ASH)
L50D	13580– (ESK)	-
L70D	18570– (ESK)	-
L90D	17711– (ARV)	3416–
L120D	14747– (ARV)	3416
L150D	5500– (ARV)	2313–
L180D	4447– (ARV)	2313–
L180D High Lift	4447– (ARV)	2313–
L220E	2001– (ARV)	-
L330D	61125– (ASH)	

The fuse FU18 has been changed from 10 A to 20 A on the new circuit board and a quenching diode DI32 for relay RE11 has been installed, see Fig. 1. These measures have been taken in order to avoid problems with the V-ECU and I-ECU. The new circuit board replaces the earlier one:

Designation	New part No.	Discontinued part No.
Circuit board	11170013	11040669

New starter switch

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause

There have been failures due to inadequate mechanical connection between ignition key lock and contact part.

(missing infotext)

Improved starter switch introduced in production from Serial No. according to table below.

New parts replaces discontinued parts on all models affected, see header in this Service bulletin.

New warranty routines for Bosch diesel equipment

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

For the more effective processing of warranty and claims routines with regard to Bosch diesel equipment, Bosch and the VCE-companies ART, EXC and WLO have reached an agreement on warranty matters covering ordinary warranty time.

The agreement applies with effect from 970101. This means that, in future, these warranty matters will be handled according to one of the following routines.

Alternative 1:

Simpler faults of such a kind that the VCE dealer or Bosch representative can remedy it.

Where the entire work is done by the VCE dealer, the costs involved will be settled by sending a claim to the VCE-company concerned.

In those cases where the Bosch representative does the whole job, the Bosch representative will bear the entire cost.

Examples of simpler faults: Replacing a feed pump, replacing nozzles or changing a pump shaft seal.

Alternative 2

Bigger faults of such a kind that the VCE dealer lets the Bosch representative repair the fault. Bosch pays for the repair costs, while removal and fitting costs are settled via a claim against the VCE-company concerned. Example: The fault is of such a kind that, after repairs, the injection pump has to be run on a test bench.

Alternative 3:

With bigger faults of such a kind that the VCE-dealer decides that the component in question must be replaced by an exchange component, the component is ordered according to standard routines.

Any claims demands are to be made to be VCE-company concerned.

Example: It has been established that an injection pump cannot be repaired, or it cannot be repaired within a reasonable time.

When a claim has been sent to a VCE-company, it shall state three groups of digits:

Code for manufacturing date; serial number; and the Bosch part number, see [Invalid linktarget].

Claims will be rejected unless they have these three groups of numbers.

Non - VCE buckets and attachments

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

There are many situations where a non - VCE bucket or attachment is needed to do a specific job or meet a customer requirement. These applications should not and cannot be ignored as they are a significant portion of our loader business. Because of this we have established Allied Supplier Agreements with key equipment suppliers in most markets. We work closely with these suppliers to insure that they have the proper information to produce a quality attachment that fits our machine properly.

If a needed attachment is not available from VCE or one of our allied suppliers, every effort should be made to get the attachment in a Hook-on configuration. This insures proper pin fit up and proper stop locations in the linkage. Where this is impossible to do, precautions must be taken to insure that any Pin-on attachments purchased are properly manufactured.

The manufacturing control and tolerance of attachments are critical to the life of the attachment, loader pins, bushings and the linkage. Similar dimensional controls are needed in any Pin-on attachment used. All machining must be completed after final welding of the attachment. Not only is the accuracy of the pin bores critical in terms of size but also in terms of alignment. The location, alignment and parallelism is important to the proper function of the pin seals and bushing life. **This becomes even more critical when it comes to the tapered roller bearings and locking cones on the L330C.**

VCE does not accept responsibility for damage to a machine using a bucket or attachment not authorized by VCE.

Warranty claims for such will be unconditionally rejected.

Any questions on attachment usage and requests for technical assistance should be directed to your VCE representative.

Oil analyses

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

Various companies carry out oil analyses on VCE's machines. A great risk with these analyses is that their monitoring limits in certain cases lie at other levels as compared with ours.

This means that customers receive alarm reports and are worried entirely unnecessarily.

The reason for that other companies have different monitoring areas than VCE, is that they do not have detailed knowledge of the specific properties of our components, and believe that we have the same monitoring limits as our competitors. For VCE machines the monitoring limits according to tables 1 and 2 apply.

Table 1

Monitoring limits for components made by Volvo:

Particle		Engine	HT-transmission	PT-transmission	Dropbox	Note
Aluminium	Al	30	30	50	30	PPM
Lead	Pb	40	1200	50	30	PPM
Iron	Fe	200	100	100	500	PPM
Silica	Si	20	50	50	50	PPM
Copper	Cu	20	300	300	30	PPM
Chromium	Cr	20	20	20	20	PPM
Nickel	Ni	5	10	10	10	PPM
Tin	Sn	20	20	50	20	PPM
Water		0.20	0.20	0.20	0.20	%

The values are to be regarded as monitoring limits and not as absolute values.

It is important to establish a trend and not to make judgements based on isolated samples.

Table 2

Monitoring limits for components and hydraulic systems made by Volvo:

Particle		Axles, AWB (Axles with wet built-in brakes)	Axles, AH (Axles with dry external brakes)	Hydraulic system	Note
Aluminium	Al	30	30	20	PPM
Lead	Pb	50	50	20	PPM
Iron	Fe	500	900	50	PPM
Silica	Si	50	50	20	PPM
Copper	Cu	120	150	20	PPM
Chromium	Cr	20	20	20	PPM
Nickel	Ni	10	10	10	PPM
Tin	Sn	20	20	20	PPM
Water		0.20	0.20	0.20	%

The values are to be regarded as monitoring limits and not as absolute values.

It is important to establish a trend and not to make judgements based on isolated samples.

In cases where oil analysis shows a high PPM content, carry out:

1. Oil change and filter replacement. <https://truckmanualshub.com/>
2. Further oil analyses:
 - at first directly after the oil change and filter replacement.
 - and then three oil analyses at intervals of 100 hours.

These oil analyses provides an answer to the tendency, which may turn out as follows:

1. PPM content drops. Wear is normal.
2. PPM content remains at a high but stable level. Wear is normal.
3. PPM content continues to rise. This indicates abnormal wear and the customer should be informed.
4. PPM content varies greatly up and down. This indicates presence of foreign particles caused by working environment, storage of oil etc.

It is important to note that iron content rises with faulty air cleaner system before it is possible to note rising silicon content, that is, in the case of rising iron content, the air cleaner system should be checked.

Oil sampling should be carried out as follows:

- The oil should be at normal operating temperature.
- The engine should be running at low idling and a draining hose should be connected to a pressure outlet for the transmission.
- Regarding engines where there is no pressure outlet, the oil should be sucked up with the aid of a "hand pump".

The sample bottle must not be filled directly from the drain plug, as the oil at the bottom of the sump may have a higher concentration of contaminants and this will lead to a misleading analysis.

The possible origin of the different particles is shown in table 3.

Certain breakdowns can develop fairly quickly, that is, an oil analysis at x hours may show normal PPM contents and a breakdown may occur prior to the next oil sample.

When in doubt as to what action should be taken as a result of the oil analysis, contact VCE Service Department.

Other aspects of oil analyses

All oils contain a varying degree of different additives in order to achieve required quality and performance requirements.

These additives also contain the metals which show up in the analysis. Various amounts of metals occur depending on:

1. Which type of oil is being produced (engine, transmission, axle oil).
2. Which company is making the oil.
3. On which market the oil will be sold (price, quality, competition).
4. Which requirements the customer demands.

The following metals occur:

Barium	Ba
Calcium	Ca
Magnesium	Mg
Boron	B
Phosphorus	P
Zinc	Zn
Sodium	Na

Table 3

Probable origin of particles

Particle		Engine	Transmission
Iron	Fe	Cylinder liners, camshaft, valve tappets, valve guides and crankshaft.	Clutch discs and ferrous parts of the transmission.
Lead	Pb	Big-end bearings and crankshaft main bearings. (All types of slide bearing). Oil cooler	Clutch discs and oil cooler.
Copper	Cu	Big-end bearings and crankshaft main bearings. (All types of slide bearing). Water and oil coolers	Clutch discs and oil cooler.

Tin	Sn	Slide bearings	Clutch discs
Chromium	Cr	Piston rings and valves.	Alloy metals
Aluminium	Al	Pistons	Bearings, clutches and torque converter
Silica	Si	Dust, dirt etc.	Dust, dirt etc.
Water		Cooling and condensation water	Cooling and condensation water

Oil cooler, description

<https://truckmanualshub.com/>

The lubricating oil carries off heat from the engine's hottest parts and equalises the temperature differences in the engine as it circulates. In the oil cooler, heat is transferred from the lubricating oil to the coolant.

On TD63 the oil cooler is located on the right-hand side of the engine beside the oil filter head. The lubricating oil circulates inside the radiator core while the coolant passes between the cell plates.

Figure 1

TD63.

1. Oil filter
2. Oil cooler

On TD73 the oil cooler is located on the left-hand side of the engine below the injection pump. The oil circulates inside the radiator core while the coolant passes between the cell plates.

Figure 4
Example of a filled-in form for an oil sample

Instructions for vacuum pump

Use a new hose for each sampling.

Store the pump in a clean place, when it is not used.

Figure 5

1. 941363 Hose
2. Lock nut
3. 11411003 Vacuum pump
4. Oil-sample bottle

Installing hose

Figure 6

Installing hose

1. Cut a hose to a suitable length.
2. Insert the hose through the head of the vacuum pump.
The hose should protrude 4 cm (1.6 in) outside the base of the pump head.
3. Tighten the lock nut.

Removing hose

Figure 7

Removing hose

1. Loosen the lock nut.
2. Cut off the hose above the lock nut and pull the hose out of the pump.
NOTE!
Check that the hose ends do not contaminate the pump head with oil.
3. Take care of the hose in an environmentally safe way.

Figure 8
Vacuum pump

1. O-ring
2. Diaphragm
3. Cylinder
4. O-ring
5. O-ring
6. Lock nut

The vacuum pump must be cleaned after each sampling to prevent any residual oil in the vacuum pump from contaminating future oil samples.

1. Dismantle the vacuum pump.
2. Wipe the parts with a clean lint-free paper or rag. Apply a thin coat of silicone grease to the O-rings. When required, use compressed air for cleaning.
3. Assemble the vacuum pump and test its function.

NOTE!

The vacuum pump must not be cleaned with diesel fuel, petrol or cleaning agent.

Oil sampling methods

The following applies to all methods:

- Make sure that oil-sample bottle is completely clean.
- Operate the machine until all systems have reached normal working temperature. During the warming-up, all functions should be operated. It is important that all functions connected to the hydraulic system are operated to their respective end positions.
- Take the oil samples immediately after the warming up.
- Seal the oil-sample bottle thoroughly to avoid contamination and loss of oil during the transport.

A) Oil sample method with hose (pressurised system)

This method is used for engine, transmission and working hydraulics.

Tools:

14025152 Hose with nipple

1. Start the engine.

Figure 9
Example of sampling method with hose

2. Connect the hose to the machine so that oil begins to run out into the hose.

NOTE!

Collect the oil that is running out in a suitable vessel. <https://truckmanualshub.com/>

Drain off 2–4 dl (6.8–13.6 US fl oz) into the vessel.

3. Slacken the hose connection to stop the oil flow.
4. Remove the vessel with the oil and make sure that it is taken care of in an environmentally safe way.
5. Make sure that it is possible to collect oil in the oil-sample bottle.
6. Tighten the hose connection again and fill the sample bottle 3/4 full.
7. Put the cap on oil-sample bottle.
Attach one label to the bottle and one label to the form for oil analysis.
8. Remove the hose.
9. Stop the engine.

B) Oil sample method with vacuum pump

The same method is used for axles, engine, dropbox and hub reduction gears.

Tools:

11411003 Vacuum pump

941363 Hose

1. Cut the hose to a suitable length and connect it to the vacuum pump.

Figure 10

Example of test method with vacuum pump.

2. Install oil-sample bottle on the vacuum pump.
3. Insert the hose at the testing point.

NOTE!

Make sure that the oil sample is not taken from the bottom, but rather in the middle or within the working range of the oil.

4. Draw up oil to flush out the hose.
5. Remove the oil-sample bottle and empty it. Make sure that the oil is taken care of in an environmentally safe way.
6. Install oil-sample bottle on the vacuum pump and fill the sample bottle 3/4 full.
7. Remove the oil-sample bottle and put on the cap.
Attach one label to the bottle and one label to the form for oil analysis.

C) Oil sample method with quick-action coupling (pressurised systems), earlier machines

This method is used for engine, transmission and working hydraulics on earlier machines with TEMA-coupling.

Tools:

Snap-on coupling

941363 Hose

Figure 11

1. 9993522 Test nipple
2. 947083 Gasket
3. 963804 Nipple
4. 976928 Gasket
5. 4881092 Nipple
6. 4871469 Air vent valve

1. Cut the hose to a suitable length and connect it to the quick-action coupling.

NOTE!

A new hose should be used for each sampling.

2. Start the engine.

Figure 12

Example of sampling method with quick-action coupling

3. Connect the quick-action coupling to the machine and open the breather valve so that oil begins to run out into the hose.

NOTE!

Collect the oil that is running out in a suitable vessel.

Drain off 2–4 dl (6.8–13.6 US fl oz) into the vessel.

4. Close the breather valve to stop the oil flow.
5. Remove the vessel with the oil and make sure that it is taken care of in an environmentally safe way.
6. Make sure that it is possible to collect oil in the oil-sample bottle.
7. Open the breather valve again and fill the sample bottle 3/4 full.
8. Close the breather valve.
9. Put the cap on the oil-sample bottle.
Attach one label to the bottle and one label to the form for oil analysis.
10. Remove the quick-action coupling.
11. Stop the engine.

Oil-bath precleaner

<https://truckmanualshub.com/>

When working in a very dusty environment the fitting of an oil-bath precleaner in series with the existing standard dry-type air cleaner is recommended. This provides extra safety from engine damage.

The cleaning efficiency of the oil-bath precleaner is between 90 and 95%, which means in practice that the dry-type air cleaner fitted as standard will act as a safety filter with a changing interval at least twice as long, i.e. 2000 hours.

Figure 1
Oil-bath precleaner

Oil-bath precleaner, maintenance
Check the oil daily.

- the level should reach up to the "Normalölstand" mark but no higher.
- change the oil and clean the lower and upper wire mesh filters if:
 - the oil is sludgy and viscous.
 - deposits of sludge or dry places are present on the bottom of the lower wire mesh.
- the holder, the lower and upper wire mesh filters should be washed clean with diesel fuel.
- avoid using petrol for cleaning as residual petrol in the wire mesh filters could cause the engine to race on subsequent starting.
- when topping up or changing the oil it should have the same viscosity as that in the engine.

Clean the wire mesh filters every 2000 hours.

Oils for Volvo"s wheel loaders equipped with AWB axles (Axle Wet Brakes)

WARNING
Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This SB is to be considered as technical information and comprises normal warranties within the rules for the same.

On certain markets there may be some problems with the availability of Axle Oil type VME WB 101, see SB L-160-6. For this reason Volvo Parts will supply an additive for mixing with engine oil and also whole barrels of ready-mixed axle oil type VME WB 101, which may be ordered via the respective parts departments.

- Axle oil type VME WB 101
Whole barrel, 208 litres (55 US gal)
Part No.11998770
- Additive, 4 litres (1.06 US gal)
Part No.11998605
Mixing instructions will be automatically supplied together with the additive. The Ref. No. of the instructions is 21 1 669 6623.

The additive is to be premixed with a straight (single grade) engine oil, SAE 30, according to the following table.

NOTE!

Multi grade oil type 10W/30 or synthetic oil must not be used.

To convert litters to US gal, multiply by 0.264, e.g. 3.8 litres times 0.264 equals 1 US gal.

Ready mixed Axle Oil, litres	Engine Oil, litres	Additive, litres	Note
208.0	181.0	27.0	Whole barrel
200.0	174.0	26.0	—
150.0	130.5	19.5	—
100.0	87.0	13.0	—
70.0	61.5	8.5	—
65.0	57.0	8.0	—
54.0	47.0	7.0	—
46.0	40.0	6.0	—
38.5	33.5	5.0	—
31.0	27.0	4.0	—
23.0	20.0	3.0	—
20.0	17.4	2.6	—
17.0	14.8	2.2	—
10.0	8.7	1.3	—
7.7	6.7	1.0	—
4.6	4.0	0.6	—

Mixture ratio: 13% additive and 87 % engine oil

The engine oil, SAE 30, must be mixed very thoroughly with the additive:

- Too much additive reduces the friction of the brake discs.
- Too little additive may cause the brakes to give off a chattering or jarring noise when braking.

If an incorrect mixture of axle oil has been filled, the oil must be changed.

To facilitate the mixing, the amount of engine oil should be adapted to suit a certain number of whole cans of additive.

Ready mixed Axle Oil, litres	Engine Oil, litres	Additive, litres	Number of Additive cans
184.5	160.5	24.0	6
92.0	80.0	12.0	3
61.5	53.5	8.0	2
31.0	27.0	4.0	1

WARNING!

Read all signs and instructions on the machine and the safety instructions in the operators manual, before you start working on the machine.

The installation instructions are based on the use of special tools, the E-tool and standard tools generally available on the market, and also on our operators manuals and service manuals.

The equipment should be installed by qualified personnel of an authorised workshop.

Volvo CE Customer Support AB disclaims all responsibility if tools and work methods other than those described in the instructions are used.

Single lever control

Work description

Servo valve

- 1 Offload the lifting frame by resting it on the floor. Stop the engine and move the servo valve levers forwards and backwards until servo pressure cuts out.
- 2 Connect a vacuum pump to the tank or in other case empty the hydraulic oil tank.
- 3 Remove the existing servo valve from the machine.
- 4 Fit nipples on the servo valve.

15 Remove the vacuum pump or fill up with oil in the hydraulic oil tank.

Fig. 7

- 16 Start the engine and test the function.
- 17 Check for leakage.
- 18 Restore the plastic cover and cover plates.
- 19 Write equipment number 80361 on the machine card.

Output brake pressure

<https://truckmanualshub.com/>

The function monitors the output brake pressure and warns the operator if there is a system malfunction.

The function is used as an input signal for:

- Transmission disengagement, see [Invalid linktarget]

Input signals	Output function conditions	Output functions
○ Monitoring. SE501	○ System malfunction, signal outside limits	○ Amber central warning lamp ○ -----ERROR----- Monitoring Output Brake Pressure 1207414AG

Overspeed transmission

<https://truckmanualshub.com/>

The function monitors the speed of the transmission and warns the operator if transmission speeds are too high. At even higher transmission speeds, shifting will take place to the nearest higher gear. The same rpm limit applies both to forward and reverse. The functions apply to both manual and automatic gearshifting,

Input signals	Output function conditions	Output functions
○ Output speed, transmission, SE403 ○ Travel speed gear	Level 1 (warning): ○ Rpm for active gear exceeded > 2 seconds ○ Travel speed gear 1-4	○ Red central warning lamp ○ Buzzer ----- WARNING ----- High Speed On Selected Gear LE755A01
	Level 2 (upshifting): ○ Rpm for active gear exceeded > 2 seconds ○ Travel speed gear 1-4	○ Upshifting

Socket

Park the machine on a level surface. Fit blocks in front of and behind the wheels in order to prevent the machine from rolling.

Checking adjustment of handle

1. Remove the plastic cover over the parking brake control.
2. Remove the lock pin between the cable and the handle, press the handle all the way down. Check that the hole in the cable and the hole in the handle line up. Any adjustment is done with the adjusting nut. Refit the lock pin after adjustment is completed.

Figure 1
Checking adjustment of handle

1. Adjusting nut
3. Refit the plastic cover over the parking brake control.

Checking and adjusting parking brake

4. Remove the blocks in front of the wheels. Start the engine and check that the parking brake can keep the machine stationary with 3rd gear engaged and the engine at max. throttle. Any adjustment of the parking brake is done on the hydraulic transmission front output shaft.
 1. Release the pull rod for the parking brake by removing the cotter pin and the pivot pin.
 2. Screw in the adjusting screw so that both brake pads press against the brake disc.
 3. Loosen the adjusting screw so that a clearance of 0.25 mm (0.01 in) is obtained on each side of the brake disc. This corresponds to 1/5 turn of the adjusting screw.
 4. Lock the adjusting screw and adjust the pull rod so that its hole lines up with the hole in the lever.
 5. Refit the pivot pin and lock with the cotter pin.

Parking brake, electric

<https://truckmanualshub.com/>

The function controls the parking brake and notifies the operator if an attempt is made to drive away with the parking brake applied or if there is a system malfunction.

An applied parking brake is released with the parking brake switch when the engine is running.

When the machine is switched off, the parking brake is applied irrespective of the position of the parking brake switch.

NOTE!

To protect the transmission there is a safety function which is activated when the parking brake has been applied by switching off the machine.

Parking brake, electric, available as equipment for the L90D.

Input signals	Output function conditions	Output functions
○ Ignition switch, SW101 ○ Parking brake applied, SE503 ○ Engine speed, SE201 ○ Engine On/Off ○ Travel speed, SE403 ○ Directional gear ○ Switch, parking brake, SW501	Machine stationary: ○ Engine = Off ○ Travel speed = 0 ○ Ignition switch in position 0	○ Parking brake applied, no voltage to MA501 and no pressure to SE503
	Machine in starting position: ○ Engine = Off ○ Travel speed = 0 ○ Directional gear in position Neutral ○ Ignition switch in position 1	○ Parking brake applied, no voltage to MA501 and no pressure to SE503 ○ Warning lamp, parking brake
	Machine in operation with gear selector in Neutral position: ○ Parking brake switch in Applied position ○ Engine On ○ Directional gear in position Neutral	○ Parking brake applied, no voltage to MA501 and no pressure to SE503 ○ Warning lamp, parking brake

Portable/refillable O-ring kits

WARNING
Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Figure 1

Cause and action

A new O-ring kit has been introduced and replaces the earlier one that has not reached the quality expected of a Volvo spare part. The O-rings in the new kit are all made of HNBR material. The O-rings in the earlier kit only met this quality level to a certain extent. As well, the box for the O-rings is of a new design which prevents the O-rings from being mixed up if the box should be dropped accidentally, for example.

Designation	Earlier part number	New part number
O-ring kit	VOE 11708294	VOE 15155158

Feeds	
Designation	Function
30	30-feed direct from battery
30A	30-feed for optional equipment
30K	30-feed on circuit board
15	Feed from ignition switch "Operating position". Disconnected in 50 position (starter motor)
15A	15 feed via RE2
15B	15-feed via RE4 (AC, cab fan)
15EA	Electronics feed via RE12[T1] ⓘ
RA	Feed from ignition switch for radio

[T1]15-feed also connected during starter motor cranking

Precharge pressure in accumulators, <https://truckmanualshub.com/>

Op nbr 91602

[11666135 Gas filling kit](#)

[999 3831 Support \(2\)](#)

[13933251 Pressure check connection](#)

[11666037 Hose](#)

NOTE!

The hydraulic pressure must be fully released before the nitrogen pressure in the accumulators is adjusted.

Releasing the hydraulic oil pressure in accumulators

1. Place two supports 9993831 under the lifting frame.
Place the supports on a firm and level surface.

Figure 1

1. Support 9993831 (2)
2. Start the engine and engage the float position with switch SW903 on the instrument panel.
3. Activate the Boom Suspension System in gear-dependent mode.
4. Move the control lever (lift/lower) forwards to the float position and wait 30 seconds.

NOTE!

The engine should be running at idle speed as there is a danger of the machine lifting if the float position is not activated. Because the lever must pass the lowering position to reach the float position, it must be pulled quickly to the float position to minimize the lowering function.

5. Keep the servo lever in the float position and switch off the engine at the same time.
The accumulators should now be drained and the Boom Suspension System depressurized. Only a residual pressure of about 0.3 MPa (43.5 psi) should be present in the system. To make sure that the system is depressurized before service work is started, the following points should be observed:
6. Connect a pressure check connection 13933251 to hose 11666037.
7. Place the end of the hose with the loose pressure check connection in a suitable receptacle and connect the other end of the hose to the pressure check connection on the Boom Suspension System's valve block. If the hose cannot be connected to the Boom Suspension System's valve it may be because the residual pressure in the system is too high. Repeat points 1 to 5.
8. Any residual pressure in the system is drained through the hose.

Figure 2
Gas filling kit

1. a. Unloading valve
b. Unloading valve
2. Accumulator
3. Nitrogen cylinder
4. Gas valve
5. Pressure gauge
6. Non-return valve

Checking precharge pressure

9. When checking and reducing the accumulator precharge pressure, there is no need for the gas cylinder to be connected.
10. Remove the cap nut from the accumulator valve.
11. Loosen the Allen head bolt in the accumulator valve approximately 1/4 turn anticlockwise. Use a 6 mm (0.24 in) Allen key.
12. Screw tool 11 666 135 onto the accumulator by hand. Make sure that there is an O-ring in position in the tool.
In some cases it may be necessary to undo the accumulator attachments and move the accumulator in order to fit the tool in place.
- NOTE!**
Put the accumulator back in its original position after carrying out adjustment. There is otherwise a risk that the hose will chafe.
13. Close unloading valves 1a and 1b.
14. Open valve 4 anticlockwise. When pressure gauge 5 begins to indicate, the valve should be opened one further turn. The pressure gauge shows the filling pressure in the accumulator. Non-return valve 6 prevents the gas from flowing out.

Reducing precharge pressure

15. Open unloading valve 1a or 1b carefully. Gas will flow out of the tool.

Increasing precharge pressure

16. Connect the tool to nitrogen cylinder 3.
17. Open gas valve 4 on the accumulator.
18. Carefully open the nitrogen cylinder's valve. Gas will now flow into the accumulator.
- NOTE!**
Adjust the pressure slowly so that gas valve 4 is not overloaded.
19. Close the nitrogen cylinder valve and read off the pressure on the pressure gauge.

20. Repeat this procedure until the correct precharging pressure is reached. Wait about 5 minutes while temperature equalization takes place and then check the pressure again.

<https://truckmanualshub.com/>

Restoring system

21. When the desired pressure is reached, close accumulator gas valve 4 clockwise.
22. Remove the tool from the accumulator. Retighten the Allen head screw in the gas valve on the accumulator.
Tightening torque: **25 Nm (18.4 lbf ft)**.
23. Check that the gas valve does not leak. Use a soap and water solution.
24. Fit an O-ring in the cap nut, then fit the cap nut.

Preheating of induction air

<https://truckmanualshub.com/>

The function activates preheating and warns the operator if there is a system malfunction.

Manual preheating is activated with switch SW201 and engages preheating if coolant temperature is below +30 °C (86 °F).

Automatic heating is selected by de-activating additional heating via the display panel. Heating is then engaged automatically if coolant temperature is below +10 °C (50 °F) and the motor rotates faster than 150 rpm when the engine starts.

If additional heating is selected the heating coil will be connected in circuit when the motor has been started for additional heating a maximum of 4 times or until the coolant temperature exceeds +35 °C (95 °F).

The overarching conditions for heating are to ensure that the heating coil will not take so much energy from the starter motor that the engine cannot be started.

Engagement of preheating coil HE201 takes place via relay RE201 and is indicated by control lamp LC15 on the instrument panel.

Input signals	Output function conditions	Output functions
○ Activation of preheating, SW201 ○ Coolant temperature, SE205 ○ Engine speed, SE201 ○ Setting additional heating ○ System voltage	Overall conditions for heating Preheating cannot be activated at: ○ Engine speed < 100 rpm ○ System voltage < 12 V Preheating can be activated at: ○ Engine speed < 150 rpm ○ System voltage > 12 V for > 2 seconds	
	Manual preheating ○ Ignition switch SW101 in position 1 ○ SW201 depressed to activate preheating ○ Coolant temperature < +30 °C (86 °F)	○ Activation of preheating coil HE201 via relay RE201 ○ Control lamp LC15 Activation times ○ 50 seconds if coolant temperature < -10 °C (14 °F) ○ 50 –10 seconds if coolant temperature -10 – +30 °C (14 - 86 °F)
	Automatic heating ○ Additional heating not activated via the display panel ○ Engine speed has increased from 0 to > 150 rpm ○ Coolant temperature < +10 °C (50 °F)	○ Activation of preheating coil HE201 via relay RE201 ○ Control lamp LC15 Activation times ○ 50 seconds if coolant temperature < -10 °C (14 °F) ○ 50 –10 seconds if coolant temperature -10 – +10 °C (14 - 50 °F)
	Additional heating ○ Additional heating activated via the display panel ○ Coolant temperature < +35 °C (95 °F) ○ Engine speed has increased from 0 to > 400 rpm ○ Engine speed > 400 rpm for > 2 seconds	○ Activation of preheating coil HE201 via relay RE201 ○ Control lamp LC15 Activation times ○ 40 seconds activation at 20 second intervals. Activation maximum 4 times or until coolant temperature reaches > +35 °C (95 °F)

Preheating, description

<https://truckmanualshub.com/>

The purpose of preheating is to heat the intake air so that starting in cold weather is facilitated and to reduce white smoke when the engine starts.

Preheating is engaged manually by means of switch SW201.

For heating after starting, either automatic heating or additional heating can be selected via the display panel.

Manual preheating

When the key is turned to position 1, switch SW201 and relay RE201 are fed with power.

Preheating is engaged by depressing SW201. An input signal then goes to I-ECU which activates RE201 via V-ECU.

RE201 activates preheating coil HE201 and control lamp LC15 on the centre instrument panel lights up. The control lamp remains on as long as the preheating element is activated.

The duration of activation depends on the temperature of the coolant. If the coolant temperature is above +30 °C (86 °F), the preheating coil is not activated.

Automatic heating

Automatic heating is selected by deactivating additional heating via the display panel.

When the engine has been started, heating is engaged automatically via V-ECU, which activates RE201, if the coolant temperature is below +10 °C (50 °F).

RE201 activates preheating coil HE201 and control lamp LC15 on the centre instrument panel lights up. The control lamp remains on as long as the preheating element is activated.

The duration of activation depends on the temperature of the coolant. If the coolant temperature is above +10 °C (50 °F), the preheating coil is not activated.

Additional heating

Additional heating is selected by activating it via the display panel. When the engine has been started, additional heating is engaged by V-ECU, which activates RE201, if the coolant temperature is below +35 °C (95 °F).

RE201 activates preheating coil HE201 and control lamp LC15 on the centre instrument panel lights up. The control lamp remains on as long as the preheating element is activated.

Heating is engaged four times up to a coolant temperature of +35 °C (95 °F).

For activation times and conditions see [Invalid linktarget].

Pressure back-up for servo circuit

<https://truckmanualshub.com/>

Op nbr

[999 3704 Nipple, 2 pcs.](#)

[11 666 019 Pressure gauge, range 0–6 MPa \(0–870 psi\), 2 pcs.](#)

[11 666 037 Hose, 2 pcs.](#)

1. Connect nipple 999 3704 to the upper side of the lift spool. Connect hose and pressure gauge.
2. Start the engine and run it at idling speed for about 30 seconds. Then stop the engine.
3. Move the lift lever from neutral to maximum lift position. Repeat this 10 times. The servo pressure should not drop below 10 bar (145 psi).

Pressure in circuit, checking and adjusting http://www.alshub.com/

Op nbr 52005

[11 666 020 Pressure gauge 0–25 MPa \(0–3626 psi\)](#)

[11 666 037 Hose](#)

The following applies when checking:

Temperature: **Normal operating temperature**

Pressure in brake circuits: **8 ±0.5 MPa (1160 73 psi)**

NOTE!

Before the system is checked, it must be free of air, see [Invalid linktarget].

WARNING

Oil under high pressure!

1. Release the brake system pressure by depressing the brake pedal repeatedly (30–40 times).
2. Connect a pressure gauge to the pressure outlet for the rear circuit on the brake valve.

Figure 1
Checking pressure in brake circuit

1. 11 666 020
2. 11 666 037
3. Adjusting screw

3. Start the engine, charge the brake system accumulators and turn off the engine.
4. Depress the brake pedal so that it rests against the adjusting screw, see [Invalid linktarget]. At the same time, check that the pressure does not exceed 8.5 MPa (1233 psi).
5. Adjust the pressure in the circuit as follows: Depress the brake pedal fully so that it rests against the adjusting screw. Break off the security seal on the adjusting screw, see [Invalid linktarget], and adjust the pressure in the brake circuit. Release the brake pedal and affix a new security seal on the adjusting screw.

NOTE!

The adjustment should/must be performed by two persons.

1. Adjusting screw for output brake pressure
2. Security seal

Pressure reducing valve (CT8) for <https://truckmanualshub.com/>

Op nbr

[11 666 003 Pressure gauge 0–40 MPa \(0–5800 psi\)](#)

1. Connect a pressure gauge to the pressure outlet, port M on the valve block, (quick-coupling).
2. Start the engine and raise the lift arms to their end position.
3. Stop the lifting function and read off the pressure gauge at the same time. The pressure should rise quickly to 12 MPa (1740 psi). If the correct pressure is not reached, carry out adjustment on the pressure reducing valve with the engine switched off. Check again after adjustment.
4. Turn off the engine, remove the pressure gauge and restore the machine to operating condition.

Product identification plates

<https://truckmanualshub.com/>

The illustration and text below show which product plates should be located on the machine.

When ordering spare parts and in all telephone enquiries or correspondence, the model designation and the Product Identification Number (PIN) must always be quoted.

Where applicable, the information on the additional plate, "INCL. PARTS" must be given.

Figure 1
Product identification plates

1 Engine The engine type designation, part number and serial number are stamped into the cylinder block below the turbocharger (right-hand side of the machine).

3 Product identification plate Includes machine type, manufacturer's name and address. The PIN for the complete machine (includes model designation, engine code and serial number) is located on the left-hand side of the front frame.

5 Primary marking The PIN, model designation, engine code and serial number are stamped into the right-hand side of the front frame (shows the same PIN number as the product identification plate).

7 Transmission The transmission product identification number and serial number, as well as the manufacturer, are located on the right-hand side of the transmission.

8 Differential carrier assembly The differential carrier assembly product identification number and serial number, CIN and manufacturer are located on the differential housing.

2 Cab The serial number, machine type, manufacturer's name and address, ROPS/FOPS number and max. machine weight are located on the right-hand rear roof pillar inside the cab.

4 Additional plate Additional plate located below the product identification plate. Shows machine weight, engine output and year of manufacture as well as providing space for the CE-marking (only EU/EEA countries).

6 Rear axle The rear drive shaft component plate Component Identification Number, CIN, with product identification number and serial number, as well as the manufacturer, are located on the axle casing.

8 Front axle The front axle's component identification number (CIN), with product identification number, serial number and manufacturer is located on the axle casing.

9 Lifting frame The lifting frame's product identification number, serial number and manufacturer are located on its left-hand side.

	Action	Introduced w. e. f. HT.No.	Date Year / month
1	Modified hardening of 3rd and 4th gear clutch shaft introduced. Acceleration piston also modified to give smoother engaging properties. SB D-437-K34	1437-	8402
2	Welded gear wheel, part no. 4718579, on countershaft replaced by forged gear wheel, part no. 4871029.	1837-	8406
3	Splash lubrication of power take-off replaced by force-feed lubrication.	1907-	8406
4	Strengthened clutch hub for 1st-2nd gear and Forward-Reverse gear	-	8410

	introduced.	https://truckmanualshub.com/	
5	A new green sealing ring of viton material introduced on the separator plate for 3rd-4th gear clutch shaft. The earlier sealing ring was affected by high oil temperatures resulting in intermittent drive failure. SB DEI-437-49	2590-	8504
6	Strengthened of hydraulic clutch for 1st-2nd gear introduced. Thickness of friction discs and a new hub for 2nd gear introduced. For co-ordination, these discs have also been introduced on the forward-reverse clutch	3041-	8511

Disc thicknesses as follows: (SB D-437-K50)

	Forward-reverse clutch	1st-2nd gear clutch
Steel disc	2.0 mm (0.079 in)	1.5 mm (0.059 in)
Friction disc	2.0 mm (0.079 in)	2.0 mm (0.079 in)

	Action	Introduced w. e. f. HT.No.	Date Year / month
7	Drilling-out of drain holes in transmission housing and 1st-2nd gear clutch shaft and changing pistons. Modification introduced to give quicker draining and application of hydraulic clutch. SB L-421-K5	-	8611
8	New clutch drums and outer discs as spares. SB G-421-35	-	-
9	New clutch shaft for Forward-Reverse gear as spare. SB AL-421-45	-	
10	Idler gear for power take-off, bolt with higher tensile strength for journals of intermediate gear bearings. SB AL-421-55	-	-
11	Intermediate bearing, power take-off. New torque converter housing as spare part.	-	-

12	New hardened locking ring halves for clutch shafts. SB LX-421-K66	—	—
13	New friction disc for forward and 1st - 2nd clutches. SB L-421-IND 83	—	9310

HT131

	Action	Introduced w. e. f. HT.No.	Date Year / month
1	Separate oil channel for 3rd - 4th gear hydraulic clutch introduced. Lubrication of splines on 1st - 2nd gear shaft introduced and strengthened bearing on splines side. New type of oil filter with improved degree of cleaning.	Start of manufacture of L90, L120	
2	Drilling-out of drain holes in transmission housing and 1st-2nd gear clutch shaft and changing pistons. Modification introduced to give quicker draining and application of hydraulic clutch. SB L-421-K5	L120, 3664- L90, 3750	8608
3	Asbestos-free gaskets introduced.	4193-	8612
4	Fully welded ring gear on torque converter introduced. See also SB ALX-414-5	4945- only L90	8704
5	New solenoid valve with separate holder for locking all solenoids introduced. SB ALX-421-8	L90, 5584- L120, 5576-	8710
6	New type of clutch shaft for 3rd - 4th gear introduced. SB AL-421-25	6140-	8801
7	New typ of gasket between gear selector valve and transmission housing. SB ALX-420-12	L90, 6335- L120, 6322-	8712
8	Modification 1st - 2nd gear clutch shaft. SB AL-421-39	7305-	8808
9	Modification of Forward-Reverse gear clutch shaft. SB AL-421-45	8013-	8811
10	Larger lubricating oil pipe. SB AL-420-21	9869-	8909
11	New clutch drums and outer discs as spares. SB G-421-35	-	-
12	Idler gear for power take-off, bolt with higher tensile strength for journals of intermediate gear bearings. SB AL-421-55	10597-	9002
13	Intermediate bearing, power take-off. SB AL-421-61 R1	L90, 13261- L120, 13276-	9104
14	New hardened locking ring halves for clutch shafts. SB LX-421-K66	-	9106
15	New valve spools in gear selector valve. SB AL-421-71	L90, 3084615312- L90B, 3086910001- L120, 3085415194- L120B, 3087015031-	9112

16	New locking rings, hubs and pressure plates for clutch shafts. SB AL-421-K72	https://trackmania.fanshub.com/ L90, 084615496- L90B, 3086910167- L120, 3085415349- L120B, 3087015180-	9204 9204
17	New type of transmission filter. SB AL-420-32	L90, 3084615536- L90B, 3086910358- L120, 3085415385- L120B, 3087015299-	9206
18	Improved draining of reverse clutch. SB AL-421-K73	L90, 3084615543- L90B, 3086910545- L120, 3085415385- L120B, 3087015303-	9210 9206
19	Countershaft, bolt with higher tensile strength. SB AL-420-37	L90: 3084615236- L90B: 3086910505- L120: 3085415415- L120B: 3087015442-	9209 9209
20	New damping valve for forward and reverse clutch. SB L-421-IND K85	L90: 3084615649- L90B: 3086911103- L120: 3085415506- L120B: 3087015919-	9306 9306
21	Idler gear bearing, power take-off. SB L-421-IND K82	L90: 3084615649- L90B: 3086911323- L120: 3085415506- L120B: 3087016134-	9310 9310
22	New friction disc for forward-reverse and 1st - 2nd clutches. SB L-421-IND 83	—	9310
23	Pipe between gear selector valve and oil distributor Forward / Reverse replaced by a hose. SB L-420-IND 38	L90B : 3086911385- L120B : 3088010025-	9310
24	Modified transmission		
	L90B with effect from serial no.: 12440- (EU) 61589- (USA)	3087910001-	9404
	L120B with effect from serial no.: 9031- (EU) 60949- (USA)	3088010001-	9310

SB L-421-IND K84 R1

25	Modified journalling for reverse gear. SB L-420-IND 39.	L90: 3084615649- L90B: 3087910149- L120: 308541516- L120B: 3088010524-	9405
26	New gear selector valve with increased diameter of restriction for 1st-2nd gear, 2.7mm (0.098 in) to 5mm (0.197 in).	L90C 3089710001-	9406
27	New rear bearing, torque converter. SB L-414-IND 24.	L120B 3088010793-	9408

HT132

	Action	Introduced w. e. f. HT.No.	Date Year / month
1	Separate oil channel for 3rd - 4th gear hydraulic clutch introduced.	Start of manufacture A20	
2	New safety valve, shorter.	3652-	8606
3	Temperature sender unit moved to transmission housing.	4014-	8610
4	Change of bearing retainer and bolt, 3rd - 4th gear shaft.	4119-	8611
5	Asbestos-free gaskets.	4184-	8604
6	Fully welded ring gear on torque converter. See also SB ALX-414-5	4385-	8701
7	New banjo screw, oil line, M12x1.5	4552-	8704
8	New solenoid valve with separate holder for locking all solenoids introduced. SB ALX-421-8	5599-	8710
9	Pressure build-up valve discontinued.	5659-	8710
10	New typ of clutch shaft for 3rd -4td gear introduced. SB AL-421-25	6140-	8801
11	New transmission housing together with new shaft for 3rd - 4th gear introduced.	6140-	8801
12	Change of gasket between gear selector valve and transmission housing. SB ALX-420-12	6367-	8712

13	Modification of clutch shaft 1 - 2. SB AL-421-39	7305- https://truckmanualshub.com/	8808
14	Modification of clutch shaft F - B. SB AL-421-45	7042-	8806
15	Larger oil pipe. Gear selector valve- transmission housing. SB AL-420-21	9937-	8911
16	Countershaft, bolt with higher tensile strength. SB AL-420-37	3084210428-	8912
17	New clutch drums and outer discs as spares. SB G-421-35	-	-
18	Idler gear for power take-off, bolt with higher tensile strength for shaft journals of intermediate bearings. SB AL-421-55	10597-	9002
19	Idler gear bearing, power take- off. SB AL-421-61 R1	13322-	9104
20	New hardened locking ring halves for clutch shafts. SB LX-421-K66	-	9106
21	New valve spools in gear selector valve. SB AL-421-71	3084215036-	9112
22	New locking rings, hubs and pressure plates for clutch shafts. SB AL-421-K72	3084215069-	9204
23	Improved draining of reverse clutch. SB AL-421-K73	3084215090-	9206
24	New type of transmission filter. SB AL-420-32	3084215087-	9206
25	New friction disc for forward- reverse and 1st - 2nd clutches. SB L-421-IND 83	—	9310
26	Idler gear bearing, power take- off. SB A-421-ART K81	3084215173-	9310
27	Pipe between gear selector valve and oil distributor Forward / Reverse, replaced by a hose. SB A-420-ART 40	3084215181-	9310
28	Modified transmission : SB A-421-ART K82	3088110001-	9404
29	Modified journalling for reverse gear. SB A-421-ART 84	3088110015-	9405

HT200

	Action	Introduced w. e. f. HT.No.	Date Year / month
--	--------	-------------------------------	----------------------

1	New type of oil filter with improved degree of cleaning.	1619- https://truckmanualshub.com/	8605
2	Locking ring introduced on turbine shaft to restrict its end float. SB L-414-4	1639-	8604
3	Asbestos-free gaskets introduced.	1800-	8612
4	New spool in damping valve introduced, giving smoother shifting between forward and reverse. New part nos.: 11036167-2 Valve complete 11036166-4 Spool	2004-	8706
5	New type of solenoid valve with separate holder for locking solenoid. SB ALX-421-8	2097-	8710
6	New typ of clutch shaft for 3rd - 4th gear introduced. SB L-421-23	2206-	8801
7	New typ of gasket between gear selector valve and transmission housing. SB ALX-420-12	2235-	8712
8	Support ring for thrust bearing in torque converter. SB L-414-12	2465-	8903
9	Nitrocarbonized clutch drums, 3rd - 4th gear clutch. SB L-421-44	2665-	8902
10	Smaller O-ring between hydraulic pump and power take-off for pump drive. SB L-421-46	2718-	8903
11	New design of dropbox. Altered position of bearing for output shaft. SB L-421-48	2791-	8905
12	HT200 replaced by HT201. SB L-420-25 R1 and L-421-K57 R2	3475-	9010
13	New friction disc for 1st and 2nd clutch. SB L-421-IND 83	—	9310
14	An improved PTO-drive has been introduced. SB L-421-IND K87 and L-421-IND 88	—	9411
15	For other details, see Production Development List for HT201.		

HT201 / HT205 / HT210 / HT220

	Action	Introduced w. e. f. HT.No.	Date Year / month
1	New material in friction linings for	3705-	9102

2	New hardened locking ring halves for clutch halves. SB LX-421-K66	-	9106
3	Restriction channel in gear selector valve plugged, which gives a higher clutch pressure with the engine running at low idling speed. SB L-421-K68	3824-	9207
4	Altered oil supply for front bearing of output shaft. SB L-421-K69	L150, 3086615045- L160, 3086415071-	9110
5	New locking rings, hubs and pressure plates for clutch shafts. SB L-421-K70	L150, 3086615115- L160, 3086415155-	9112
6	New valve spools in gear selector valve. SB AL-421-71	L150, 3086615081- L160, 3086415128-	9112
7	New type of transmission filter. SB AL-420-32	L150 3086615289- L180 3086810060-	9206
8	Strengthened locking ring joint for clutch shafts Forward / 1 and Reverse / 2. SB L-421-K76	L150 : 3086615329- L160 : 3086415155- L180 : 3086810072-	9208
9	Modified transmission : L150 with effect from serial no.: 1601- (EU) 60243- (USA) L180 with effect from serial no.: 1330- (EU) 60099- (USA) SB L-421-IND K78	3088210001- 3088310001-	9308
10	New friction disc for 1st and 2nd clutch. SB L-421-IND 83	—	9310
11	New torque converter with modified PTO-gear. SB L-414-IND 22	L150 3088210184- L180 3088310111-	9406
12	Modified lubrication valve on HT200 series. SB L-421-IND 86	—	9410
13	An improved PTO-drive has been introduced. SB L-421-IND K87	L120C: 3088710003- L150C: 3088210557- L180C: 3088310497- L180 Compactor: 3088610010- HT200R: 3088510016-	9411
14	Modified locking of PTO-drive. SB L-421-IND K88	L120C: 3088710185- L150C: 3088210799-	9507

		L180C: 3088310728- L180 Compactor: 3088610013- HT200R: 3088510031-	
15	New transmission housing with integrated PTO-drive: L120C with effect from serial No.: 10160- (EU) 61379- (USA) 70008- (BRS) L150C with effect from serial No.: 2204- (EU) 60559- (USA) L180C with effect from serial No.: 1963- (EU) 60337- (USA) L180C, Compactor with effect from serial No.: 1963- (EU) 60337- (USA) SB L-420-WLO 43	2250010001- 3089310001- 3089410001- 3089510001- HT200R 3089610001-	9505
16	New hose package for transmission with effect from serial No.: 10073- (EU) 61407- (USA) SB L-420-IND K42	L120C: 3088710240-	9505
17	Oil pressure, torque converter on HT200 series. A new modified safety valve pipe has been introduced. SB L-414-WLO K25	L120C: 2250010286- L150C: 3089310161- L180C: 3089410155- L180 Compactor: 3089510003- HT200R: 3089610001-	9510
18	The pressure sensor for the transmission has been moved to the gear selector valve. SB L-380-IND 4 R1	L120C: 2250010350-	9510

WARNING!

Read all signs and instructions on the machine and the safety instructions in the operators manual, before you start working on the machine.

The installation instructions are based on the use of special tools, the E-tool and standard tools generally available on the market, and also on our operators manuals and service manuals.

The equipment should be installed by qualified personnel of an authorised workshop.

Volvo CE Customer Support AB disclaims all responsibility if tools and work methods other than those described in the instructions are used.

Single lever control

Work description

Servo valve

- 1 Offload the lifting frame by resting it on the floor. Stop the engine and move the servo valve levers forwards and backwards until servo pressure cuts out.
- 2 Connect a vacuum pump to the tank or in other case empty the hydraulic oil tank.
- 3 Remove the existing servo valve from the machine.
- 4 Fit nipples on the servo valve.

Part No.	Designation	Qty.	Pos. in Fig. 1
943907	Gasket	6	23
11104206	Single lever control	1	1
13944524	Nipple	6	22

Fig. 1

Fig. 2

5 Fit nipples in port 3.

Part No.	Designation	Qty.	Pos. in Fig. 1
943907	Gasket	1	17
980781	Ferrule	1	15
11006031	Nipple	1	16
11039677	Pressure monitor	1	SE 903
13944262	T-nipple	1	12
13945357	Elbow nipple	1	13
956983	Fitting nut	1	14

6 Replace the attaching plate.

Part No.	Designation	Qty.	Pos. in Fig. 1
949921	Spring nut	2	10
959223	Hexagon socket head bolt	4	9
11104742	Attaching plate	1	8

7 Fit the new servo valve and connect the existing hoses.

Part No.	Designation	Qty.	Pos. in Fig. 1
13949278	Flange lock nut	4	5
13975980	Six point socket screw	4	4

8 Replace the arm rest.

Part No.	Designation	Qty.	Pos. in Fig. 7
11164348	Arm rest	1	7
948645	Flange nut	1	12
13946173	Flange screw	1	11
11164385	Rail	1	5
11164355	Attachment	1	10

9 Stick the decal on the right window.

Part No.	Designation	Qty.	Pos. in Fig. 3
11006298	Decal	1	20

Fig. 3

Fig. 4

Electrical installation

- 10 Fit the cable harness between the single lever control and right instrument panel. Connect up contact SL under the instrument panel.

Part No.	Designation	Qty.	Pos. in Fig. 4
11040695	Cable harness	1	5

- 11 Fit the cable harnesses, lens and switch in the cover.

Part No.	Designation	Qty.	Pos. in Fig. 4
4881440	Strip clamp	5	-
11039380	Switch (SW920)	1	1
11039700	Lens (SW920)	1	2
11170674	Cable harness (SW403)	1	8
11041403	Cable harness (SW406)	1	7
11170678	Cable harness (SW802)	1	6
11104643	Cover	1	-

12 In case the machine is activate with the boom suspension system drill a hole, $\varnothing 12$ mm, from the inside of the cover.

13 Fit the cover and connect up the cables in the cable harness SE contact. See Fig. 5 and Fig. 6.

Fig. 5
Contact from the cable harness

Fig. 6
Pressure monitor

14 Connect the other contacts from the single lever control.

15 Remove the vacuum pump or fill up with oil in the hydraulic oil tank.

Fig. 7

- 16 Start the engine and test the function.
- 17 Check for leakage.
- 18 Restore the plastic cover and cover plates.
- 19 Write equipment number 80361 on the machine card.

*) Apply to machine with equipment number 80143.

**) Apply to machine with equipment number 80561.

WARNING!

Read all signs and instructions on the machine and the safety instructions in the operators manual, before you start working on the machine.

The installation instructions are based on the use of special tools, the E-tool and standard tools generally available on the market, and also on our operators manuals and service manuals.

The equipment should be installed by qualified personnel of an authorised workshop.

Volvo CE Customer Support AB disclaims all responsibility if tools and work methods other than those described in the instructions are used.

Protecting grating

Work description

- 1 Remove the right and left side mirror.
- 2 Fit the upper- and lower attachment together with the rubber mounts on the protecting grating. Do not tighten the upper attachments at this moment.
- 3 Centre the protection of the cab and adjust the attachment over the mounting hole of the side mirrors. The lower attachment should rest against the front of the cab. Use the lower attachments 5 and 6 as pattern to mark the location for the four holes.
- 4 Remove the protecting grating.

In the cab

- 5 Loosen the instrument panel sufficient to the plates 7. The plates should rest against the cab wall to secure the attachment of the protecting grating. Drill four holes, $\varnothing 14$ mm, in the front of the cab.
Place the plate on the inside of the cab, see view A-A in Fig. 1.
- 6 Fit the protecting grating. Screw tight the upper attachment together with the rear view mirrors. Fit the plates on the inside of the cab and screw tight the lower attachments.
- 7 Refit the instrument panel.

Quality of illustrations in technical reports

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause

Although, today, it is general practice to use a digital camera and/or scanner when producing pictures, it may be appropriate to determine a reasonable level of quality of such material. As Techline is now beginning to be used to greater extent it is even more important that the information made available in this way, is relevant and easy to interpret.

If the pictures are to be of any help to us during discussions with design engineers, suppliers or our own factories, these pictures must clearly show the problem in question.

If used correctly, the digital camera is an excellent tool which greatly improves our understanding of the written word.

Picture size

Depending on what is to be shown, the size of the picture may of course vary. However, sizes smaller than 800*600 pixels are not recommended. The picture can then also be printed with good results and be viewed on paper. A JPG picture in colour of this size requires approximately 300 kb when storing. This means that it is possible to store 4 pictures in a Techline call.

Focus

On most digital cameras it is possible to preview the image immediately after it has been taken. Use this function and check that the image is sharp in the right place. If this is not the case, take another picture. If the picture does not clearly show what is intended, it is of no use.

Figure 1
Picture with good sharpness

Figure 2
Picture with poor sharpness

NOTE!

If there are any doubts as to what the picture describes, it sometimes may be necessary to add notes or comments to enable those who have to analyse the picture to understand what is intended. It is possible to do this in most picture editing programmes available on the market.

Figure 2
Picture with poor sharpness

NOTE!

If there are any doubts as to what the picture describes, it sometimes may be necessary to add notes or comments to enable those who have to analyse the picture to understand what is intended. It is possible to do this in most picture editing programmes available on the market.

Figure 3
Example of how notes or comments can be presented in a picture (it is also OK to insert text boxes, arrows, circles etc. to describe the picture)

1. Example of note/comment
2. Example of note/comment

Figure 4
Example of general layout picture

If it is not clear which part or component is shown in the picture, it can be illustrated by inserting a general layout picture.

NOTE!

This layout should be used when the report applies to attachments, i.e. buckets etc. Insert then a picture of the product identification plate.

How many pictures?

As a rule it can be said that it is the quality of the pictures that determines the value of the pictures not the quantity. Try to show what is important with as few pictures as possible. It is also not a good idea to enclose several pictures showing the same thing. The thinking behind each picture must be to convey important information.

Radiator fan control

<https://truckmanualshub.com/>

The function controls radiator fan speed optimally so that energy consumption and sound level is minimized with adequate cooling capacity and also informs the operator if there is a system malfunction.

Using the service display unit, maximum radiator fan speed can be set by selecting the appropriate letter (A, B or C), depending on the engine cooling requirements.

A	=	400 - 1200 rpm
B	=	400 - 1400 rpm
C	=	400 - 1550 rpm

The basic speed of the radiator fan is 400 rpm ± 100 rpm for all settings.

See Section 2 Hydraulically driven radiator fan, description.

Input signals	Output function conditions	Output functions
○ Coolant temperature engine, SE205 ○ Coolant temperature, outlet, radiator, SE210 ○ Transmission oil temperature, SE406 ○ Hydraulic oil temperature, SE906 ○ Axle oil cooler installed ○ Engine speed, SE201 ○ Radiator fan speed, SE211 ○ Radiator fan mode A, B, C ○ Request pressure test ○ Request sound test	Radiator fan control with radiator fan mode A or B or C from service panel: ○ Coolant temperature, outlet, radiator ○ Coolant temperature, engine ○ Transmission oil temperature ○ Hydraulic oil temperature	○ Radiator fan speed control within selected radiator fan mode, MA202

2. Remove the filler cap from the header tank.

Figure 2

3. Drain the coolant.
Coolant capacity: **approx. 42 litres** (11.1 US gal)

Figure 3

4. Open the radiator cowl.
Release the gas spring and swing out the radiator cowl as far as possible.
5. Swing out the radiator.
6. Detach the upper radiator hose.

Figure 4

7. Detach the lower radiator hose.

Figure 5

8. Detach the bleed line.

Figure 6

9. Remove the inner bolt securing the radiator's lower mounting.
10. Swing the radiator in and remove the outer bolt securing the radiator's lower mounting.
11. Swing out the radiator and attach a lifting device as per [Invalid linktarget].
Radiator weight, L90D: **75 kg** (165 lbs) (Dimensions 95*85*13)
Radiator weight, L120D: **xx kg**

Figure 7

1. Sling, 3 m (9.8 ft)
12. Undo the bolts securing the radiator's upper mounting.
NOTE!
The bolts need be loosened only enough for the bracket to be angled down when it is released from the radiator frame.

Figure 8

13. Release the bracket for the radiator's upper mounting from the radiator frame.

Figure 9

14. Carefully lift out the radiator.
Radiator weight, L90D: **75 kg (165 lbs)**
Radiator weight, L120D: **xx kg**
15. Remove the upper and lower mountings from the radiator.
NOTE!
Only if the removed radiator is to be changed for a new one.

Installing

16. Fit the upper and lower mountings on the radiator.
17. Carefully lift the radiator into position.
Radiator weight, L90D: **75 kg (165 lbs)**
Radiator weight, L120D: **xx kg**
18. Fit the bracket for the radiator's upper mounting on the radiator frame.

Figure 10

19. Tighten the bolts securing the radiator's upper mounting.

Figure 11

<https://truckmanualshub.com/>

20. Remove the lifting device and swing the radiator into place.
21. Fit the outer bolt securing the radiator's lower mounting.
22. Swing out the radiator and fit the inner bolt securing the its lower mounting.
23. Connect the bleed line.

Figure 12

24. Connect the lower radiator hose.

Figure 13

25. Connect the upper radiator hose.

Figure 14

26. Swing the radiator into place and close the radiator casing.
27. Restore the machine to operating condition.
Coolant capacity: **approx. 42 litres (11.1 US gal)**

Raising and supporting machines (up to and including the E models)

WARNING
Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

WARNING
Place the machine on a horizontal and solid surface and block the wheels securely so that there's no risk of the machine starting to roll.

NOTE!
Place the machine in the service position.

Persons, who do not follow the safety instructions and do not pay attention to the warnings in the Service Manuals, must make sure that their working method is safe. Otherwise there is a serious risk of severe or fatal accidents.

When, for example, work is carried out on the hub reduction gear, the brakes or when replacing wheels, the work must only be carried out on one axle at a time.

The most important step of the procedure is the supporting of the front or the rear part respectively in a safe way before proceeding with the next step.

To carry out work on a machine that is only supported on jacks is not recommended.

Figure 1

Figure 2

When positioning stand jacks or axle stands under model E machines, use surfaces intended for this purpose, see item 2.

1. Stand jack
2. Intended surface

Procedure for front axle

Raise the front end of the machine with the aid of the loader unit on the machine. Axle stands should be positioned on either side under the front frame according to Fig. 3. The axle stands must be dimensioned according to the size of the machine.

Fig. 2. shows how stand jacks should be positioned when raising and supporting model E machines. This also applies when axle stands are used.

Figure 3

Axle stands

Figure 4

1. Jack or block of wood

Most suitable method for rear axle

Block the pivoting of the rear axle by positioning a jack or by pushing in a block, preferably of wood or rubber, on either side of the machine between the frame and the rear axle, see Fig. 4.

Figure 5

1. Stand jacks

The machine must be supported on axle stands, which have a capacity of 5–15 tonnes, or on so called stand jacks. Stand jacks, which are a combination of axle stands and jacks, may be ordered from Volvo Parts under part number 11668007. Axle stands are positioned on either side under the rear frame, where the frame is sufficiently level and the surface is sufficiently large. Regarding L50–L220, see Fig. 5.

When both wheels are raised off the ground, it is easier to turn the hubs so that the wheel bolts come in the correct position, see Fig. 5.

Alternative method

If stand jacks are not available, use two ordinary trolley jacks and make sure that there is enough space for positioning the axle stands.

NOTE!

This is only possible on machines L150–L220.

Figure 6

On machines L50–L120, use a jack under the differential. Axle stands must also be positioned under the rear part of the frame, according to Fig. 7.

Figure 7

NOTE!

Avoid using bottle jacks. **Never use** a bottle jack for lifting under the axle housing.

NOTE!

Never work on or under a machine, which is not supported on axle stands.

A wheel trolley or similar, which may be ordered from Volvo Parts, part number 11668010, is recommended for handling the wheel in a safe and controlled way, see Figs 8 and 9.

Figure 8

Removing propeller shaft

1. 999 3742

1. Raise the rear wheels and position supports under the rear frame.
2. Remove the propeller shaft from the final drive.
3. Release the pressure in the brake system by depressing the brake pedal repeatedly (30–40 times).
4. Fully depress the brake pedal and block it in that position with a suitable tool. When the brake pedal is blocked in the depressed position, the hydraulic tank oil is prevented from running out to respective brake caliper.

NOTE!

The brake pedal must remain blocked until the rear axle has been installed again.

5. Remove the lubricating oil pipes from the axle connections, also remove the brake hose from the brake pipe on the axle. Use protective plugs.
6. Remove the cabling from the temperature sensor on the axle as well as the hose from the breather filter.
7. Remove the rear wheels.
8. Attach a lifting device to the axle, see [Invalid linktarget].
Position a hydraulic jack under the axle.
Axle weight incl. mounts: **approx. 1550 kg (3418 lbs)**
Remove the bolts between the axle mount and the frame.

Figure 2
Lowering of rear axle

1. Pallet forklift
2. Jack securing the axle

9. Secure the axle with a jack underneath in order to prevent the axle from falling over, see [Invalid linktarget]. Lower the axle on two pallet forklifts with pallets. Pull out the axle.

NOTE!

Make sure that the front axle mount does not slide off the axle.

WARNING!

Read all signs and instructions on the machine and the safety instructions in the operators manual, before you start working on the machine.

The installation instructions are based on the use of special tools, the E-tool and standard tools generally available on the market, and also on our operators manuals and service manuals.

The equipment should be installed by qualified personnel of an authorised workshop.

Volvo CE Customer Support AB disclaims all responsibility if tools and work methods other than those described in the instructions are used.

Electrically heated rear-view mirrors

Work description

1 Disconnect the main switch.

2 Remove the outer rear-view mirrors.

3 Fit the new rear-view mirrors.

Use the existing bolts.

Part No.	Designation	Qty.	Pos. in Fig. 1
11121153	Rear-view mirror	2	4

Recommendations for Oil Sampling Intervals

NOTE!

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause and action

Oil analysis detects contamination and fluid degradation before these conditions cause equipment failure.

V1135034

Figure 1

The success of an oil analysis program is the regularity of the oil sampling.

Based on our technical experience Volvo CE recommends the below intervals and numbers of samples when you start up your Volvo Oil Analysis program.

When you have got experienced on your actual market you may change the sampling intervals according to your knowledge about the need.

The Wear limitations or Monitoring limits for Volvo components can be found in Service Bulletins:

ART	160ART8K
EXC	160EXC8K

Recovering/reclaiming refrigerant R134a using recovery unit FRS-10 GS

Regarding:

Recovering/reclaiming refrigerant R134a using recovery unit FRS-10 GS, part no. 9812443 (supersedes refrigerant station 11 666 070-5 and manometer set 11 666 072-1)

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

Figure 1

R134a "Tetrafluorethane" is the refrigerant that is used in the air conditioning system. Environmental legislation requires that different types of refrigerants be recovered and reclaimed in a safe manner. The following precautions must be observed at all times when there is a risk of R134a leaking out:

Accreditation

Service workshops must be accredited where it concerns the handling of refrigerant. An accredited workshop should have at least one person in a supervisory position with the required certified expertise.

General

Safety precautions

WARNING

R134a is moderately dangerous to one's health. When handling refrigerant, wear close-fitting goggles and protective gloves. In liquid form refrigerant can cause frost-bite and when in the form of a gas at high concentration it has an anaesthetising effect and at lower concentration it primarily affects the nervous system.

Causes of cooling unit malfunction

The most common causes of cooling unit malfunction are as follows:

Moisture in the refrigerant circuit, dirt or dust. Moisture in the refrigerant will cause icing and eventually a clogged expansion valve. To lessen the risk of moisture getting into the system during repairs, the following is important. Do the repair work quickly and keep the system clean and dry while the work is being carried out.

AC oil should be kept in sealed containers, otherwise there is a risk of the oil absorbing moisture from the air. The protective plugs on

new components must remain in place until the moment when the components are connected up.

<https://truckmanualshub.com/>

Important:

Do not clean by blowing with compressed air.

In the event of damage arising from vehicle collision, it is important that each component suspected of being damaged is thoroughly checked. Check in particular all soldered joints; dampness around the joint is a sign of leakage. Deformed or cracked piping must not be repaired. Should it be suspected that dirt has entered a component, it must be checked and cleaned. In the event of a major repair, component replacement, or if moisture is suspected in the system, the dryer must be replaced.

Fault tracing

To find the correct cause of the fault quickly, a performance test and a pressure test should be carried out. Refer to the respective service manual or separate service bulletin.

The service procedures and test are based on a 20°C ambient air temperature. The measurement values will increase with higher ambient temperatures.

The equipment

The equipment can be ordered from the respective Parts Department.

Recovery unit FRS-10GS With the FRS-10GS recovery unit, part number 9812443, the refrigerant can be emptied, cleaned, recycled, and refilled. The plant can also be vacuum pumped at the recovery unit.

Parts supplied together with the recovery unit:

- Nipples (2), part number 9812446, for connection to refrigerant bottle.
- Nipple, part number 9812447, for oil hose 9998237

Hose connections for high and low pressure hoses are available as spare parts. Red high pressure hose, part number 9812432, and blue low pressure hose, part number 9512210.

Equipment used together with the recovery unit, but supplied separately

- Scale FRV-100VBE with automatic setting function for draining and filling, located in the compartment at the rear of the recovery unit, part no. 9812444 (supersedes 11 666 074-7).
- Vacuum pump Royal 2 part no. 9812445. (supersedes 11 666 071-3).
- Vacuum pump hose with vacuum pressure gauge for vacuum pumping of AC unit, part no. 9812452, and nipple, part no. 9812453 for connecting the vacuum pump hose to the vacuum pump
- Rubber bag for non-condensable gases, part no. 9812448.
- Oil hose for filling AC oil, part no. 9988237
- Leak detector for indications of leaks, part no. 9511207. (supersedes 11 666 073-9).
- Refrigerant R134a

Technical data:

Net voltage: 230 V Single phase 50/60 Hz

Connection power rating: 205 W

Fused: 2 x 6.3 amp glass fuse 5 x 25 mm

Dimensions: depth 350 mm, width 320 mm,

Height: 230 mm

Weight: 28 kg

Capacity: 10 kg/h liquid refrigerant (R134a + 20° C) About 100 kg/h when connecting according to the pressure method.

Cleaning: Filter replacement at least 6 times a year or 50 drain operations, filter part no. 9812449 positioned inside the front panel.

Flow chart

Machine care

Changing the oil in the recovery unit

The oil in the recovery unit compressor should be changed at least 6 times a year. There are different types of AC oil, and these must not be confused. For the recovery unit compressor, ester oil part no. 9812442 should be used.

Open the side panel.

Place the recovery unit with the front facing up.

Slacken the sealing cap on the service outlet 1.

Slacken the sealing cap on air union inside the panel, and oil will start to run out. Facilitate draining by inclining the recovery unit to the right. Pull the recovery unit upright, put the sealing cap back into position on the air union, and fit the panel. Connect a hose and lower it in to a reservoir containing new oil.

Start the recovery unit by pressing button no. 12 and suck up the oil.

Turn off the recovery unit and fit the sealing cap.

Hoses and connections

Red hose

High pressure hose for refrigerant out. to be connected when filling to the high pressure outlet, and when draining to the refrigerant container

Yellow hose

High pressure hose for refrigerant in. To be connected when emptying to high pressure outlet, and when filling to refrigerant container.

Blue hose

Low pressure hose for refrigerant in. To be connected to the low pressure outlet.

Figure 4

The connections are provided with safety coupling to prevent the hoses from slackening unintentionally. When fitting and removing the connections, proceed as follows:

Turn off the tap, you cannot remove the connection unless the tap is completely closed.

Pull the ring towards you whilst keeping the button pressed in.

Figure 5

O = open C = closed

The connections should always be placed on the respective blind plug 13, on the recovery unit when they are not connected to the AC unit or refrigerant container.

Leak detector

Figure 6

Technical data:

Batteries: 4 alkaline AA 1.5 V pen-light batteries.

Sensitivity:

Low sensitivity: down to 15 times a year R12, 30 times a year R134a.

High sensitivity: down to 3 times a year R12, 15 times a year R134a.

Temperature range: 0° C to 50° C

Leak detector 9511207 should be used to check the tightness of the AC unit. The leak detector indicates any refrigerant leakage by means of a audio signal, a visual signal, or a combination of both.

The instrument is based on a micro computer with a memory unit and a sensor unit at the end of the 46 cm long flexible cable. The sensor current is affected by the content of refrigerant gas in the air. The memory unit in the leak detector stores a normal reading when starting, from which deviations upwards are indicated by means of an alarm. When tracing for leakage, the highest measured reading recording so far is stored. This enables you to approach and find the point where there is leakage.

Handling

Figure 7

NOTICE

Make sure the leak detector is always turned off when replacing the sensor unit. The instrument generates a high voltage at the end of the flexible cable, and this can give rise to uncomfortable shocks if you touch it. The high voltage may be dangerous to people with a weak heart, for example.

NOTE!

The leak detector must not be forced to give a maximum alarm by removing the sensor casing or by adjusting high sensitivity.

Turn off the leak detector immediately by pressing the OFF button if the sensor is affected by foreign particles such as water. Make sure the parts are dry and clean before putting the leak detector back into operation.

Start/Stop

Start the leak detector by pressing the ON button. A start tone will first be heard and subsequently you will hear every other second a low base tone, the "zero value signal".

The "zero value signal" is given when the electronic unit in the leak detector is calibrated according to the content of any refrigerant gas in the surrounding air. The leak detector is re-calibrated automatically when it is moved to an area where there are lower contents of refrigerant gas.

NOTICE

The leak detector must not be forced to give a maximum alarm by removing the sensor casing or by adjusting high sensitivity.

Turn off the leak detector immediately by pressing the OFF button if the sensor is affected by foreign particles such as water. Make sure the parts are dry and clean before putting the leak detector back into operation.

NOTE!

The leak detector is turned off automatically and must be started again after 15 minutes

Turn off the leak detector by pressing the OFF button.

Alarm

When the sensor is moved to an area where there are larger contents of refrigerant gas, the "zero value signal" becomes a more high-frequency tone. The alarm signal indicates increasing contents of refrigerant gas, in the air by a successively higher tone.

By pressing the ALARM SELECT button, the alarm indication can be changed from giving just an audio alarm to a visual alarm instead. The visual alarm consists of 10 red LED bars. The "zero value signal" is displayed visually by the left-hand LED bar lighting up every other second.

The visual alarm signal indicates higher contents of refrigerant gas in the air by the LED bar showing a solid light. When there is a further increase on the contents, the lighted bar is moved one or more steps to the right. Moving the LED bar one step means that the contents of refrigerant gas increase by 10% in relation to the latest registered value.

The next time you select the ALARM SELECT button, you will get a combined audio and visual alarm.

Figure 8

Leakage detection

By pressing the LOCK OUT button, the electronic unit proceeds to automatic detection of the leakage point. The highest measured concentration of refrigerant gas is stored in the memory unit. If the leak detector sensor is then moved to an area where there are lower contents of refrigerant gas, there will be no new calibration, but the highest level remains in the memory until the sensor is moved back to an area where there are higher contents.

With a refrigerant gas concentration of 95 %, compared with the value registered in the memory, the leak detector gives a characteristic audio signal at the same time as several LED bars start to flash intensely. If the leak detector sensor is moved to an area where there is a higher concentration of gas, compared with the value registered in the memory, the instrument gives an alarm as usual with a higher tone and/or by the LED bar being moved one or more steps to the right.

The highest measured value is stored continuously in the memory unit. By pressing the CLEAR button, you can erase the memory for the lock out function, and the leak detector will then be calibrated to a new zero value.

Adjustment

By pressing the SENSITIVITY button briefly, the left-hand LED bar will light up, and this corresponds to normal sensitivity. If you keep the button pressed in, the illuminated LED bar will be moved one step to the right for every second the button is kept pressed in. The sensitivity of the leak detector increases correspondingly. When the right-hand LED bar flashes, the leak detector is adjusted to the highest sensitivity.

In most cases, normal sensitivity is quite a sufficient setting as the leak detector detects extremely low incidences of refrigerant gas. When detecting very small leakage, and also when working with the R134a refrigerant, a sensitivity setting corresponding to LED bars 5-10 may be justified. However, the risk of a false alarm will increase correspondingly as other factors, such as air humidity, will have an effect. A moisture filter can then be used to dampen the effect of air humidity on the sensor.

NOTE!

When setting high sensitivity, the leak detector may give a ma. alarm indication. This should be avoided. Sensitivity must then be adjusted downwards a step or two.

NOTICE

The leak detector is turned off automatically and must be started again after 15 minutes.

Turn off the leak detector by pressing the OFF button.

Care

When there is too low a drive voltage, the fifth LED bar, marked *LO-BAT: will light up. This indicated that it is time to replace the 4 AA alkaline 1.5 V batteries.

The sensor element should be replaced at certain intervals to ensure a correct function of the leak detector. If the sensor is subjected to foreign bodies such as oil or water, the leak detector should be turned off immediately. Replace with dry and clean parts. It is important that the sensor element is turned the right way, see the reverse side of the instrument. A fouled sensor element must be cleaned in a spirit or a thinner.

The "Dirt protection" is used partly to protect the sensor against dirt, and partly to give clearer directional effect to the sensor when localising minor leakage.

Scale 9812444

Figure 9

1. Controlled 230 V electrical outlet for connection of unit.
2. Push button for general setting, kilo.
3. Push button for fine setting, grams.
4. Push button for draining/filling.
5. Push button for engagement/disengagement for control 230 V electrical outlet 1.
6. Push button, off.
7. Push button, on, and zero setting of scale.
8. Indicator lamp, draining.
9. Indicator lamp, filling.
10. Display
11. Indicator lamp, controlled 230 V electrical outlet, marked 230 VAC.

Technical data:

Max. load weight = 100 kg, accuracy = 20 grams

Main voltage: 230V50/60 Hz or with battery 6F22U 9 V inside the lid on the end panel

Vakuum pump 9812445

Figure 10

1. Connection nipple
2. Sight glass
3. Oil filling
4. Switch on/off
5. Adjustable feet
6. Oil drain plug

Technical data:

Number of steps = 2

Capacity = 30 l/min

Vacuum = 50 microns

Oil: part no 9812450, 0,25 l

Machine care

Check the oil level through the sight glass (2) on the side of the pump, the oil should be changed at least twice a year. Drain through the oil plug (6) next to the sight glass. Topping up with oil is made by means of the plug (3) on the top of the pump.

Special tools and other equipment

Figure 11

1. Nipple 9812446 (2) for connecting refrigerant container and vacuum pump.
2. Nipple with tap 9812447 for oil hose.
3. Rubber bag 9812448 for non-condensable gases.
4. Oil hose 9998237 for topping up of AC oil.
5. Multimeter 11666140 for measuring the temperature.
6. Temperature sensor 11666141 to be used together with multimeter 11666140.
7. Vacuum pump hose 9812452 with vacuum pressure gauge.
8. Nipple 9812453 for connecting the vacuum pump hose to the vacuum pump.

Service procedures

Emptying the AC unit, draining AC oil

NOTICE

When setting high sensitivity, the leak detector may give a ma. alarm indication. This should be avoided. Sensitivity must then be adjusted downwards a step or two.

NOTE!

the refrigerant container may be filled to a maximum of 75% of the filling weight. Other special equipment: 9812443, 9812444, 9812448

- Take the scale 9812444.
Connect the scale to a 230 V electrical outlet.
Take a refrigerant container.
- Find out the tare weight and filling weight of the refrigerant container.
Look at the marking on the refrigerant container.
Calculate 75% of the filling weight. Add the values and make a note of the total (Tare + 75% of the filling weight)..

Figure 12

Exempel: The tare weight of the refrigerant container is 6.7kg. The maximum filling weight of the refrigerant container is 75% of 10kg. The set reading on the scale should be -14.2 kg. If these settings are made correctly, the scale will be turned off automatically when the refrigerant container is filled.

NOTE!

If too high a reading is set by mistake, press button 4 to change from - to +. Lamp 8 will light up. When the right reading is set, press button 4 so that lamp 9 lights once again.

the minus sign will disappear if the display shows less than -9.99.

NOTICE

The refrigerant container may be filled to a maximum of 75% of the filling weight. Other special equipment: 9812443, 9812444, 9812448.

Emptying the AC unit

- Place the recovery unit 9812443 close to the AC service valves at the machine. Remove the protective caps for low and high pressure outlets on the AC units.

Figure 13

R Red hose, to nipple 2446 on the refrigerant container.
BL Blue hose, to the low pressure outlet on the AC unit.
Y Yellow hose, to the high pressure outlet on the AC-unit.

Place nipple 98124446 to the refrigerant container outlet. Place the refrigerant container on the scale. Connect the recovery unit to the scale 230 V outlet.

Connect

- red high pressure hose from the recovery unit to nipple 9812446 on the refrigerant container.
- blue low pressure hose to the low pressure outlet on the AC-unit.
- yellow hose to the high pressure outlet on the AC-unit.

Figure 14

Open the refrigerant container tap.

O = open

- Open the taps on the connections to.
 - the refrigerant container, red hose
 - the low pressure, blue hose
 - the high pressure, yellow hose
- Press button 5 for connecting up the scale 230 V outlet. Lamp 230VAC will light up.

NOTICE

NOTE! If too high a reading is set by mistake, press button 4 to change from - to +. Lamp 8 will light up. When the right reading is set, press button 4 so that lamp 9 lights once again.

The minus sign will disappear if the display shows less than -9.99.

NOTE!

If button 7 on the scale is pressed in before button 5, the scale 230 V electrical outlet will lock until another button is pressed in, lamps 8 and 9 and 230 VAC will light up. This function can be used when the scale are not used and the recovery unit is to be engaged, such as when vacuum pumping.

Figure 15

- Start the recovery unit by pressing button 12. Emptying then starts. After emptying for a while, the refrigerant can be seen through the sight glass 7. Emptying is completed when the indicator on the low pressure gage 9 (blue) shows a reading that is lower than 0 (vacuum) and the refrigerant can no longer be seen through the sight glass 7 in the recovery unit.
- The scale are closed automatically when the refrigerant container is full (the scale display shows -0), irrespective of whether the AC unit is completely empty or not. Close the recovery unit by pressing button 12. Turn off the taps on the connections. Change to another refrigerant container. Move nipple 9812446. Set the tear and maximum filling weight for the new refrigerant container as per items 2-3. Connect the red hose to the refrigerant container. Start emptying once again to item 6.

NOTICE

If button 7 on the scale is pressed in before button 5, the scale 230 V electrical outlet will lock until another button is pressed in, lamps 8 and 9 and 230 VAC will light up. This function can be used when the scale are not used and the recovery unit is to be engaged, such as when vacuum pumping.

NOTE!

If the pressure in the refrigerant container becomes too high, the indicator on the high pressure gauge (red) will start to rise. At about 18 bar, the recovery unit's high pressure alarm will be released, and lamp 8 on the recovery unit will start to light up. Close the recovery unit by pressing button 12. Turn off the taps on the connections. Vent the refrigerant container. Refer to "Taking care of non-condensable gases" in the service bulletin. Start emptying once again from item 6.

- Close the recovery unit by pressing button 12 when emptying is concluded

Figure 16

C = closed

Close the tap on the connection for

- the refrigerant container, red hose
- the low pressure outlet, blue hose
- the high pressure outlet, yellow hose close the refrigerant container tap
- Remove the connections and re-fit them on the respective blind plugs on the recovery unit. Remove the refrigerant container from the scale.

Draining AC oil

Figure 17

- Open tap 2 for the oil separator recovery unit by screwing it inwards. Drain any AC oil in to a measuring glass. Close the tap for the oil separator when all the oil has run out.

NOTICE

If the pressure in the refrigerant container becomes too high, the needle on the high pressure gauge will start to rise. At approx. 18 bar (261 psi), the station's high pressure alarm will be activated, and light 8 on the station will light up. Turn off the station using button 12. Close the valves at all connections. Bleed air from the refrigerant container. See "Handling non-condensable gases". Start discharging again from step 8.

NOTE!

The amount of oil that has been drained is to be refilled in the AC unit. Always refill with at least 40 ml PAG oil. Part no. 1161468-2 40 ml container.

Refilling with refrigerant in AC unit, vacuum pumping, and refilling with AC oil.

Scale 9812444 should be connected to the 230 V electrical outlet. The recovery unit 9812443 should be connected to the scale 230 V electrical outlet. Activate the scale's electrical outlet by pressing button 5.

Special tool: 9998237

Other special equipment: 9511207, 9812443, 9812444, 9812445, 9812447, 9812448, 9812452

Vakuum pumping

Figure 18

- Take the vacuum pump 9812445. Place nipple 9812453 on the vacuum pump. Connect the vacuum pump to the 230 V electrical outlet. Place vacuum pump hose 9812452 (X) on nipple 9812453.

Figure 19

Y Yellow hose, to the high pres.sure outlet on the AC-unit.

X Vacuum pump hose 9812452 with vacuum pressure gage, from the recovery unit to nipple 2453 on the vacuum pump.

BL Blue hose, to the low pressure outlet on the AC-unit.

6 Connection for vacuum pump hose to recovery unit.

- Fit the vacuum pump hose 9812452 (X) with vacuum pressure gage to outlet 6 on the recovery unit
- Fit yellow hose to the high pressure outlet on the AC-unit.

L60654A

Figure 20

O = open

- Open the tap on the connection for the high pressure outlet for the dryer
- Start the vacuum pump.

NOTICE

The amount of oil that has been drained is to be refilled in the AC unit. Always refill with at least 40 ml PAG oil. Part no. 1161468-2 40 ml container.

NOTE!

Vacuum pumping the AC unit to ensure that all moisture is boiled and removed from the system takes about 50 minutes. It is appropriate to top up with AC oil in the beginning of the vacuum pumping

Figure 21

1. Part no. 9812447
2. Part no. 9998237
3. Part no. 1161468 (40 ml PAG oil)

- Remove blue hose and fit nipple 9812447 and oil hose 9998237 to the low pressure outlet on the AC unit. Dip the oil hose in to the measuring glass. Open the tap on nipple 9812447. The right amount of AC oil is sucked in to the AC unit. Close the tap on nipple 9812447. Remove oil hose 9998237 and nipple 9812447 from the low pressure outlet. Connect blue hose and continue vacuum pumping.
- Conclude vacuum pumping after at least 50 minutes. Close the vacuum pump. Check to make sure that the indicator on the vacuum pump hose pressure gauge shows 0.
- Remove the vacuum pump hose from the vacuum pump. Perform a leakage test according to the vacuum method. Check to make sure that the indicator on the vacuum pump hose vacuum pressure gauge does not rise. If it does rise, this means there is a leak in the unit.

Figure 22

C = closed

- Close the tap on the connection to the high pressure outlet. Remove the connection and put it back on the blind plug.
- Remove the vacuum pump hose from the vacuum pump to outlet 6 on the recovery unit. Remove nipple 9812453 from the vacuum pump.

Refilling refrigerant in the AC unit

Figure 23

R Red hose, to high pressure outlet on the AC-unit.
Y Yellow hose, nipple 2446 on the refrigerant container.
BL Blue hose connected to blind plug at recovery unit.

- Nipple 9812446 should be placed on the refrigerant container. Connect the yellow hose to the refrigerant container and the red hose to the high pressure outlet on the AC-unit.

NOTICE

Vacuum pumping the AC unit to ensure that all moisture is boiled and removed from the system takes about 50 minutes. It is appropriate to top up with AC oil in the beginning of the vacuum pumping.

NOTE!

Filling of refrigerant should only be done through red hose to high pressure side.

- Open the tap on the refrigerant container and also the tap on the connection to therefrigerant container.

Figure 24

- Place the refrigerant container on the scale with the button facing up. Press button 7, the scale are set to zero. Press button 4, lamp 8 (emptying) will light up.
- Find out the amount of refrigerant that should be included in the machines AC unit. See the specifications in the respective service manuals. Alternatively, you can look at the plate next to the evaporator. Set the prescribed amount of refrigerant that is to be included in the machine AC unit by pressing buttons 2 (kilograms) and 3 (grams) on the scale.

NOTICE

Filling of refrigerant should only be done through red hose to high pressure side.

NOTE!

If too high a reading is set by mistake, press button 4 to shift from + to -. Lamp 9 will light up. When the right reading is set, press button 4 so that lamp 8 lights up again.

- Press button 5 to activate the scale 230 V electrical outlet. Lamp 230 VAC lights up. Start the recovery unit by pressing button 12.
- Open the tap on the connection to high pressure outlet, red hose, and top up with about 200 grams of refrigerant. Close the tap on the connection to the high pressure outlet, red hose. Close the station by pressing button 12.

Figure 25

- Search for leaks in the machine AC unit using leak detector 9511207.
- Top up with the remaining amount of refrigerant. Start the recovery unit by pressing button 12. Open the tap on the connection to the high pressure outlet, red hose. The recovery unit will stop automatically and topping up will cease when the scale show -0. Remove the refrigerant container from the scale. Close the tap on the connection to the refrigerant container and also the tap on the refrigerant container.

Figure 26

C = closed

- Close the tap on the connection 2:
 - The high pressure outlet
 - The refrigerant container
- Remove the yellow hose from the refrigerant container and refit it on the blind plug.
- Perform a performance test. Refer to the respective service manual or separate service bulletin.
- Fit the protective plugs on to the high and low pressure outlets. Close the front hatch. Place the equipment back in to position.

Handling procedures for non-condensable gases

Non-condensable gases are a mixture of air and a very small amount of refrigerant. These gases should be evacuated from the refrigerant container at regular intervals so that the container can take the amount of refrigerant normally contained in the AC unit when emptying. When there is a over pressure in the refrigerant container, emptying is discontinued when the pressure at the high pressure gage (red) proceeds 18 bar, and a high pressure alarm is indicated by lamp 8 on the recovery unit.

By comparing the temperature of the non-condensable gases in the refrigerant container, with the temperature of the refrigerant, you can determine the increasing g pressure in the refrigerant container. A pressure scale in bar is given on the edge of the pressure gages, and the temperature scale (°C) towards the centre.

Example: The pressure gauge shows a pressure of 18 bar, which corresponds to about + 66° C. The temperature of the bottom of the refrigerant container that is read is +20°C, which corresponds to a pressure of about 4.8 bar. The difference between these two readings is an over pressure of about 13.2 bar, which must be evacuated until a pressure of just over 4.8 bar is reached in the refrigerant container.

NOTICE

If too high a reading is set by mistake, press button 4 to shift from + to -. Lamp 9 will light up. When the right reading is set, press button 4 so that lamp 8 lights up again.

NOTE!

To avoid the risk of emptying the refrigerant container of pure refrigerant, the overpressure in the refrigerant container should be evacuated at a pressure that is slightly higher than what is corresponded by the measured refrigerant temperature.

The non-condensable gases contained in the refrigerant container should be handled by means of recycling unit FRS-10 GS and a rubber bag, part no. 981 2448. When the rubber bag is full, the gases are transferred to another refrigerant container designed only for non-condensable gases. When the container is full, it should be sent to a special place where the non-condensable gases can be taken care of correctly from an environmental point of view.

NOTICE

To avoid the risk of emptying the refrigerant container of pure refrigerant, the overpressure in the refrigerant container should be evacuated at a pressure that is slightly higher than what is corresponded by the measured refrigerant temperature.

The recovery unit 9812443 should be connected to a 230 V electrical outlet.

Special tools: 11666140, 11666141. Other special equipment: 9812443, 9812446, 9812448.

Figure 27

- Take the temperature of the refrigerant. Connect multimeter 11666140 to temperature sensor 11666141. Hold the sensor tip of the temperature sensor against the bottom of the refrigerant container. Place the multimeter handle in the mV position, and read off the temperature of the refrigerant.

Figure 28

Low pressure gauge 9 (blue)
High pressure gauge 10 (red)

- Read the pressure which corresponds to the temperature on the refrigerant in the refrigerant container by looking at one of the pressure gauges. See also vapour table on page 20..

Figure 29

R Red hose, to refrigerant container
2446 Nipple for connection to refrigerant container

- Connect red hose to nipple 9812446 on the refrigerant container. Connect rubber bag 9812448 to connection 6 on the recovery unit.
- Open the tap on the connection to refrigerant container, and a tap on the refrigerant container. Read off the pressure in the refrigerant container on high pressure gauge 10.
- Press button 11 and keep it pressed in until the indicator on the high pressure gauge has fallen to a level just above the pressure corresponding to the measured refrigerant temperature.

NOTICE

If the pressure is allowed to drop too much, clean refrigerant will flow out of the refrigerant container and into the rubber container.

NOTE!

If the pressure is allowed to fall too low, pure refrigerant will start to flow from the refrigerant container into the rubber bag.

- Max. filling amount for rubber bag 9812448 is 140 g. (Tare + 140 g).

Figure 30

C = closed

<https://truckmanualshub.com/>

- Close the tap on the refrigerant container and also the tap on the connection to therefrigerant container.
- Take a refrigerant container that is used specially for non-condensable gases. Fit nipple 9812446 to the refrigerant container. Connect the red hose to the refrigerant container.
- Transfer the non-condensable gases from the rubber bag to the refrigerant container. (Specially used for none condensable gases)Start the recovery unit by pressing button 12.
- Conclude when the rubber bag is completely empty. Close the recovery unit by pressing button 12.
- Close the tap for the refrigerant container, and also the tap for the connection to the refrigerant container. Remove the red hose from the refrigerant container and refit it on the blind plug. Remove nipple 9812446 from the refrigerant container. Remove the rubber bag from connection 6 on the recovery unit.

Reinforcement of seat with air suspension

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This SB is to be considered as a technical information and comprises normal warranties within the rules for the same.

Seat with air suspension with part No. 11104274

During certain type operations there have been cases where the frame on the air-suspended operator seat has broken due to overload. The cause is that the lower front cross stay, to which the shock absorber is attached, under certain operating conditions, has not coped with the actual load within acceptable time frames. To avoid damage and to increase the service life of the cross stay in question, a reinforcement kit with part No. 11164364 has been made available in co-operation with the supplier, in order to make the stay stiffer. The reinforcement kit may be ordered from the respective Spare Parts Departments.

Designation	Part No.
Reinforcement kit	11164364

The reinforcement has been introduced in production w.e.fr. seat with serial No. 67010032580 and w.e.fr. machines with serial numbers according to table 1. Seats with serial numbers up to incl. 67010032579 and seats installed in machines with serial numbers lower than those stated in table 1, ought thus to be reinforced according to the following work description.

Machine	Ser. No.
L50D	13789
L70D	19126
L90D	18163
L120D	15365
L150D	all
L150E	6012
L180D	all
L180E	5013
L220E	2228
L330D	all
L330E	62011

With the exception of L220D the information in the text preceding table 1 concerns the mentioned seat on all D-series machines up to the listed serial numbers. On L220D the seat concerned was introduced w.e.fr. machines with serial No. 1492–. This concerns all machines of the E-series prior to the serial numbers stated in table 1.

Figure 1

1. Seat frame
2. Nuts
3. Reinforcement frame
4. Spacer washers
5. Bellows fixation

Working instructions

1. Loosen the bellows from the seat frame 1.
2. Unscrew the four nuts 2.
3. Bolt on reinforcement frame 3. Tightening torque:
20 ±5 N m (2 ±0.5 kgf m) (15 ±3.7 lbf ft). Install the two spacer washers 4, see Fig. 1.

Removing propeller shafts

<https://truckmanualshub.com/>

The parking brake will not function when the propeller shafts have been removed!

1. Place the machine in the service position.
2. Block the wheels in order to prevent the machine from rolling.
3. Remove the propeller shafts.

If the machine is left unattended with the propeller shafts removed, a notice must be attached to the steering wheel with the information that the propeller shafts have been removed.

Repair instructions for attachments

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause and action

In some cases it is necessary to repair Volvo manufactured attachments e.g. buckets due to cracks or other problems. The timeframe for response is approx. 1 week.

If a repair instruction is needed a request must be sent using Techline. In order to get a fast and correct repair instruction the following information needs to be added to the Techline call:

- Information about model, serial number and attachment.
- Photo of the ID-plate of the attachment. **Make certain all photo information on the ID plate is clear and readable.**

V1096165

Figure 1

- Photo showing the complete attachment with the cracked/worn parts highlighted.

V1096166

Figure 2

- Close up photo of the crack/wear.

V1096167

Figure 3

- Photo of the site, if possible showing the machine in action.

Replaced fuel level sensor

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause

The manufacture of the fuel level sensor for L50D–L120D and for early E-series machines within the size range of L60E–120E has ceased and must therefore be replaced by a new level sensor from a new supplier.

The new sensor with part No. 11170252 is 369 mm (14.528 in) which is slightly longer than the earlier sensor which was 365 mm (14.370 in). This results in the positive secondary effect that the capacity of the fuel tank is better utilised with the longer sensor.

Sensor with part No. 11170356 has the same length as previously, i.e. 350 mm (13.780 in).

However, there is a complication with the new sensors. Because their shape differ slightly, they cannot be installed in the plastic tanks of the E-series machines unless both sensor and tank are shaped to permit installation of the sensor in its position in the tank.

The steel plate tanks on the D-series machines do not require any additional measures.

NOTE!

Because of altered thread size of the hose connection on the new fuel level sensors with part No. 11170252 and 11170356, the sensors must be supplemented with the following additional parts:

L50D, L70D, L90D with plastic tank	L120D/E with metal tank	E-series models with plastic tank		
11039821 replaced with:	11039701 replaced with:	11039821 replaced with:	Designation	New Part No.
2 pcs	1 pc	1 pc	Banjo bolt	941686
2 pcs	1 pc	1 pc	Banjo nipple	977754
–	1 pc	1 pc	Plug	13966143
–	1 pcs	1 pcs	Fitting	14213266
4 pcs	4 pcs	4 pcs	Gasket	976930
–	1 pc	1 pc	Fuel pipe	11411056
1 pc	1 pc	1 pc	Cable harness	11171480
1 pc	–	1 pc	Fuel gauge sensor, 396 mm (15.591 in)	11170252
–	1 pc	–	Fuel gauge sensor, 350 mm (13.780 in)	11170356

Action

For the E-series machines up to incl. the following serial numbers, the fuel level sensor and the fuel tank must be shaped according to work instructions.

Machine	Up to incl. ser. No. ARV	Up to incl. ser. No. ASH	Up to incl. ser. No. PED
L60E	–1736	–60349	–70175
L70E	–21614	–60463	–71065
L90E	–20962	–66548	–70909
L110E	–1439	–60228	–70221
L120E	–17993	–64489	–70834

Working instructions

1. Disconnect the cable harness from the fuel level sensor and lower the tank to the ground.
2. Grind off one of the corners on the fuel level sensor according to figure.

Figure 1

3. Remove the old sensor from the fuel tank and lower the new sensor into position.
4. Note the master splines on the sensor! Identify and mark where on the tank material needs to be removed to allow the sensor to be turned to correct position.
5. Take out the level sensor and then carefully cover the opening for the sensor with masking tape.
6. Ream away the required amount of material from the circumference of the plastic edge around the plate on the tank.

NOTE!

Distance that needs to be treated: approx. 5 cm (2 in) on either side.

7. In a suitable way remove all plastic dust and pull off the masking tape and test whether it is possible to install the sensor in its bayonet mount.

If further material must be removed, identify where, and repeat the procedure.

Figure 2

Hole in the fuel tank

NOTE!

The new sensor does not require a new parameter setting via VCADS Pro.

Replacing brake pressure sensor

WARNING
Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This SB is to be considered as a technical information and comprises normal warranties within the rules for the same.

New brake pressure sensors, SE502 and SE503, of improved quality, have been introduced in production of wheel loaders, see table 1. If orders are placed using the discontinued part numbers, a cable harness will also be supplied, in addition to the new sensor. The cable harness, with part No. 11170743, is to be connected to the circuit board between UA, item 2, and RD, item 3, see Fig. 1. On ceratin older machines the new cable harness may be installed together with the old sensor. The existing cable harness "under the cab" is to be connected to 11170743, see Fig. 2.

Designation	New part No.	Discontinued part No.
Sensor SE502/503	11170071	11039580
Sensor SE502/503	11170072	11039738

The new sensors have been introduced in production according to table 1.

Machine	Ser. No.
L50D	13829– (ESK), 70236– (PED)

Replacing operator seat shock absorber

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This SB is to be considered as a technical information and comprises normal warranties within the rules for the same.

Figure 1

Operator seats concerned

Mechanical	Isringhausen ISRI 6000
Air-suspended	Isringhausen ISRI 6500KM

NOTE!
The shock absorber will only work as intended if the instructions for removing and installing are followed.

Removing, ISRI 6000

<https://truckmanualshub.com/>

The numbers in the text refer to Fig. 1.

1. Remove the seat cushion.
2. Remove bolts 1 as well as clamps 2 from the seat frame cross pipe 3.
3. Disconnect, where required, the electrical connections for the seat heating and switch 5.
4. Remove plastic studs 6 and pull up the bellows from the bottom frame in the area around the lower attachment for the shock absorber.
5. Remove bolts 7 and take out the shock absorber.

Removing, ISRI 6500KM

The numbers in the text refer to Fig. 1.

1. Remove the seat cushion.
2. Remove bolts 1 as well as clamps 2 from the seat frame cross pipe 3.
3. Disconnect, where required, the electrical connections for the seat heating and switch 5.
4. Pull up and secure the seat suspension in its highest position in a suitable way.
5. Remove plastic studs 6 and pull up the bellows from the bottom frame.
6. Remove bolts 9 and shock absorber 10.

Installing

Install the new shock absorber in the reverse order.

NOTE!

The label "Top" must face upwards and oil reservoir 12, visible as a bulge by the base of the shock absorber, must be pointing downward.

Language Code GB	Product ART/BHL/CEX/ CWL/SSL/WLO	Group 000	https://truckmanualshub.com/	No. 204	Version 1	Date 10/29/2008
Applies to Articulated Haulers, Wheel Loaders, Skid Steer Loaders, Compact Wheel Loaders, Compact Excavators, Backhoe Loaders						

Reporting of product misuse & near-miss report

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

A **Product misuse & near-miss report** is used to report an unplanned event that did not result in injury, illness, or damage - but had the potential to do so. Any use of a product that Volvo CE has specifically warned against in its instructions is a misuse. Only a fortunate break in the chain of events prevented an injury, fatality or damage.

To support our effort in building safe products, and because of increasing demands by various authorities, we would like to encourage you to report each Product misuse & near-miss with this report. The report documents events which you have become aware of and VCE machines have been involved. We regard the report as a mutual obligation to report and to follow up on such misuse and near-miss occurrences.

Please copy and fill in the enclosed form.

NOTE!

The report is also available in Word format in Techline. It can be downloaded, filled in digitally and sent in by E-mail. Send the form to the respective VCE regional office to be forwarded on to the person responsible for the market and technical matters at Volvo Construction Equipment AB Customer Support Division

The description of the Product misuse & near-miss report must be objective. Personal opinions should be avoided. However, it is of great importance that facts are reported.

OK to write: The insulation burnt off at...

Do not write: The damage was probably caused by the fact that the insulation was damaged at...

Also other observations should be noted in the report, for example lack of maintenance, carelessness and other circumstances which may be of importance. For example, slippery conditions, poor visibility, previous repairs etc.

How to fill in the form

Machine model	https://truckmanualshub.com/	Fill in the machine model.
Serial number		Fill in the serial number of the machine.
Customer's name		Fill in the name and address of the owner or user of the machine.
Site location		Fill in the name of the location where the event occurred.
Date identified		Fill in the date this event was seen.
Person(s) involved		Fill in the names of the people involved in this event.
Identify the misuse and/or the near miss		Fill in all information about what was seen, how this was a hazard and what could have happened.
Instructions or comments provided		Fill in the instruction or comments you provided to avoid this type of event and to whom this was given.
Reported by		Fill in the name of the person completing this report. .
Representing		Fill in the name and address of your company.

Reports

NOTE!

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause and action

To facilitate root cause analysis and recovery handling, technical support and warranty department need reports when claiming some focused items.

The requests for the different reports have been sent out in different service bulletins and this service bulletin is only a summary.

Requested reports

These referenced service bulletins must be filled out completely, otherwise warranty claim will not be approved. The respective dealer/distributor must send a completed form to the regional tech support through Techline within five days of the date of inspection.

See specific bulletins for more information about how and when to make the reports.

This is a time guide for RM Compaction ABG machines.

This time guide is **not** created with the conditions that we described for the normal time guide.

All times in this list has also a different layout comparing to the normal time guide.

There are no operation numbers for the jobs available.

This is a temporary solution to help our dealers with information and when new machines are released they will be found in the normal time guide and with a related repair method connected.

This Time Guide will only be available in English and in PDF format.

Machines covered in this list are:

ABG DD22, ABG DD24, ABG DD85-1, ABG DD 95-1

Drum ABG

System	Sub-System	Component	Sub-Component	Action	ABG DD 22	ABG DD24	ABG DD 85-1	ABG DD 95-1
Drum	Eccentric	Spline Shaft		Replace	8,00	8,00	8,00	8,00
Drum	Eccentric	Housing	O-ring	Replace	8,00	8,00	8,00	8,00
Drum	Eccentric	Seal		Replace	4,00	4,00	4,00	4,00
Drum	Drive Plate			Replace	3,00	3,00	3,00	3,00
Drum	Shock			Replace	1,50	1,50	1,50	1,50
Drum				Replace	8,00	8,00	8,00	8,00
Drum	Scraper Bar	Inside		Replace	1,50	1,50	1,50	1,50
Drum	Scraper Bar	Inside		Repair	2,00	2,00	2,00	2,00
Drum	Scraper Bar	Outside		Replace	1,00	1,00	1,00	1,00
Drum	Scraper Bar	Outside		Repair	1,00	1,00	1,00	1,00

Hydraulic ABG

System	Sub-System	Component	Sub-Component	Action	ABG DD22	ABG DD24	ABG DD85-1	ABG DD95-1

Structural	Tank	Hydraulic	Cap	Replace	0,50	0,50	0,50	0,50
Structural	Tank	Hydraulic	Misc.	Repair	1,00	1,00	1,00	1,00
Structural	Tank	Hydraulic		Replace	4,00	4,00	12,00	12,00

Drive System ABG

System	Sub-System	Component	Sub-Component	Action	ABG DD 22	ABG DD24	ABG DD85-1	ABG DD95-1
Drive System	Brake	Hose		Replace	2,00	2,00	4,00	4,00
Drive System	Brake	Hose		Reroute	2,00	2,00	4,00	4,00
Drive System	Brake	Hose		Tighten	0,50	0,50	0,50	0,50
Drive System	Brake	Tubeline		Replace	1,00	1,00		
Drive System	Brake	Tubeline		Tighten	0,50	0,50		
Drive System	Brake	Fitting		Replace	1,00	1,00	1,00	1,00
Drive System	Brake	Fitting		Tighten	0,50	0,50	0,50	0,50
Drive System	Brake	Park Brake Lever		Replace	1,00	1,00		

WATER ABG

System	Sub-System	Component	Sub-Component	Action	ABG DD 22	ABG DD 24	ABG DD85-1	ABG DD95-1
Water	System	Filter	Element	Replace	0,50	0,50	1,00	1,00
Water	System	Filter Assembly		Replace	1,00	1,00	2,00	2,00
Water	System	Fitting		Replace	0,50	0,50	0,50	0,50
Water	System	Fitting		Tighten	0,50	0,50	0,50	0,50
Water	System	Line / Piping		Replace	0,50	0,50	0,50	0,50
Water	System	Line / Piping		Repair	0,50	0,50	0,50	0,50
Water	System	Tank		Replace	3,50	3,50	3,50	3,50
Water	System	Tank	Fill Strainer	Replace	0,50	0,50	0,50	0,50
Water	System	Valve, Shut-off		Replace	1,00	1,00	1,00	1,00
Water	System	Pump		Replace	2,00	2,00	3,00	3,00
Water	System	Spray Bar		Replace	1,50	1,50	1,50	1,50
Water	System	Spray Bar	Nozzle	Replace	0,50	0,50	0,50	0,50
Water	System	Tank	Cap	Replace	0,50	0,50	0,50	0,50
Water	System	Misc		Replace	0,50	0,50	0,50	0,50

This is a time guide for RM Compaction machines.

This time guide is **not** created with the conditions that we described for the normal time guide.

All times in this list has also a different layout comparing to the normal time guide.

There are no operation numbers for the jobs available.

This is a temporary solution to help our dealers with information and when new machines are released they will be found in the normal time guide and with a related repair method connected.

This Time Guide will only be available in English and in PDF format.

Machines covered in this list are:

This is a time guide for RM ABG Paving systems.

This time guide is **not** created with the conditions that we described for the normal time guide.

All times in this list has also a different layout comparing to the normal time guide.

There are no operation numbers for the jobs available.

This is a temporary solution to help our dealers with information and when new machines are released they will be found in the normal time guide and with a related repair method connected.

This Time Guide will only be available in English and in PDF format.

Machines covered in this list are:

Screeds:

VB30, VB78, VB88, VDT-V78, VDT V-88, MB120, MB122, VDT120, VDT 121

Pavers.

Rotating warning beacon

WARNING!

Read all signs and instructions on the machine and the safety instructions in the operators manual, before you start working on the machine.

The installation instructions are based on the use of special tools, the E-tool and standard tools generally available on the market, and also on our operators manuals and service manuals.

The equipment should be installed by qualified personnel of an authorised workshop.

Volvo Construction Equipment Group disclaims all responsibility if tools and work methods other than those described in the instructions are used.

We consider that no special installation instructions are required for fitting this equipment.

To facilitate the fitting we enclose:

- Kit list
- Installation drawing

VARNING!

Läs alla skyltar och anvisningar som finns på maskinen och säkerhetsinstruktionerna i instruktionsboken innan Du börjar arbetet på maskinen.

Monteringsanvisningen är baserad på användning av specialverktyg, E-verktyg och i allmänna handeln tillgängliga standardverktyg samt instruktions- och verkstadshandböcker.

Utrustningen ska monteras av behörig person på auktoriserad verkstad.

Volvo Constuction Equipment Group fransäger sig allt ansvar om andra verktyg eller arbetsmetoder än de i anvisningen beskrivna kommer till användning.

För montering av denna utrustning anser vi, att någon speciell monteringsanvisning inte erfordras.

För underlättande av montering bifogar vi:

Fig. 1

Safety filter (secondary filter)

<https://truckmanualshub.com/>

The secondary filter acts as a safety filter if there is no primary filter.

If the warning lamp comes on, even though the primary filter has been changed or cleaned, it indicates that the secondary filter is clogged.

Figure 1

Safety filter (secondary filter)

The secondary filter must always be changed, never cleaned.

Also change the secondary filter when the primary filter has been changed three times, but not later than every 2000 hours.

Never remove the secondary filter if it is not to be changed.

Seals

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This Service Bulletin is to be considered as technical information only and is not subject to any reimbursement programs outside normal warranty.

Cause

"O-ring Face Seal fittings" (ORFS) have been used for about 20 years and have assisted in eliminating leaks in coupling systems. The ORFS coupling has always been a matter of discussion because of its ability of "loosing" the O-ring during transport or installation. After the problem of lost O-rings was solved through the introduction of CORG, encased O-rings, the next step in the development was finding a way of solving the problem with O-rings that slipped out of their location during installation of pipes.

(missing infotext)

A trapezoidal seal, Trap Seal, has turned out to counteract the tendency of seals slipping out of their locations during installation of pipes.

Figure 1

Trapezoidal seal, Trap Seal

The seal is trapezoidal for optimum seal between pipe and coupling. This eliminates the risk of the seal falling out or becoming pinched during installation. The Trap Seal is symmetrical and can be installed from either side.

When installing trapezoidal seals, it is important to make sure that the seal is correctly installed.

Figure 2

Correctly installed trapezoidal seal

As spare part, both standard shaped O-ring as well as trapezoidal seal may be used, if the coupling is of the CORG-type. Today trapezoidal seals are used to some extent in production, but will be gradually introduced fully.

Secondary steering: Introduction of non-return valve

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This SB is to be considered as a technical information and comprises normal warranties within the rules for the same.

The following non-return valve has been introduced to avoid damage to the valve block on the hydraulic pump for the secondary steering.

Figure 1

1. Valve block
2. Existing nipple
3. Non-return valve
4. Existing hose

L50D–L180D

The non-return valve for L50D–L180D, with part No. 11173385, has been introduced in running production w.e.fr. the serial numbers in table 1.

Non-return valve 11173385 introduced

Machine	W.e.fr. serial No.
L50D	13736–
L70D	19002–
L90D	18118–
L120D	15271–
L150D	5840–
L180D	4714–

L220E

The non-return valve for L220E, with part No. 11173386, has been introduced in running production w.e.fr. serial No. 2221–.

For previously supplied L220E machines, and for earlier machines belonging to the C and D generation it is recommended that, if crack formation has occurred on the hydraulic pump valve block, also these should be modified according to Fig. 1 in connection with a subsequent repair.

NOTE!

Also in connection with modification non-return valve with part No. 11173385 should be used for L50C/D–L180C/D and non-return valve with part No. 11173386 be used for L220D/E.

Secondary steering

<https://truckmanualshub.com/>

The purpose of the function is to make it possible for the operator to steer the machine when the primary steering pump fails and to notify the operator if there is a malfunction in the primary steering system or if there is a system malfunction.

The secondary steering pump is also engaged when the capacity of the primary steering pump is insufficient, such as at low engine speeds.

Input signals	Output function conditions	Output functions
○ Secondary steering installed ○ Control test secondary steering, SW601 ○ Differential pressure secondary steering, SE601 ○ Steering pressure, SE602 ○ Engine On/Off ○ Travel speed, SE403	Start of secondary steering pump for back-up of primary steering pump: ○ Secondary steering installed ○ Travel speed exceeds > 3 km/h (1.9 mph) for > 5 seconds ○ Differential pressure secondary steering high for > 0.5 seconds Secondary pump is activated for as long as the above conditions apply.	○ RE601, start secondary steering pump MO601 ○ Control lamp, Secondary steering engaged
	Start of secondary steering pump for secondary steering: ○ Secondary steering installed ○ Travel speed above > 3 km/h (1.9 mph) ○ Differential pressure secondary steering high for > 0.3 seconds ○ Steering pressure low for > 0.3 seconds Secondary steering pump is activated until travel speed drops < 3 km/h (1.9 mph)	○ RE601, start secondary steering pump MO601 ○ Warning lamp, Malfunction in primary steering system ○ Red central warning lamp ○ Buzzer
	Function test secondary steering: ○ Secondary steering installed ○ Engine = Off ○ Control test secondary steering pressed down ○ Differential pressure secondary steering low ○ Steering pressure low Secondary steering pump is activated until the control is released	○ RE601, start secondary steering pump MO601 ○ Control lamp, Secondary steering engaged
○ Monitoring, SE601 and SE602	○ System malfunction, open circuit ○ Engine = Off	○ Amber central warning lamp
○ Monitoring, RE601	○ System malfunction, open circuit or short circuit	○ Amber central warning lamp

Section 2 Engine

Engine	
Type designation	TD63KBE, part no. 8188107
Flywheel output at 2100 rpm	113 kW SAE J 1349 Net 113 kW DIN 70020
Gross output at 2100 rpm	118 kW SAE J 1349 Gross
Max. torque at 1100 rpm	690 Nm SAE J 1349 Net 695 Nm SAE J 1349 Gross 690 Nm DIN 70020
Number of cylinders	6
Cylinder bore	98.43 mm (3.88 in)
Stroke	120 mm (4.72 in)
Cylinder displacement, total	5.48 dl ³
Compression ratio	18.3:1
Compression at starter motor speed, 200 rpm	2.4 MPa (348 psi)
Max. pressure difference allowed between cylinders at starter motor speed	0.3 MPa (44 psi)
Injection sequence	1-5-3-6-2-4
Idle speed, low	670 ±50 rpm
Idle speed, high	2420 ±60 rpm
Stall speed	2190 ±75 rpm
Stall speed, 3-speed + working hydraulics	1580 ±100 rpm

Valve system	
Valve clearance, (warm or cold engine)	
inlet valve	0.40 mm (0,016 in)
exhaust valve	0.55 mm (0,022 in)

Lubrication system	
Oil pressure	395–545 kPa (57–79 psi)
Oil pressure, idle min.	80 kPa (12 psi)

Fuel feed pump	
Type	Piston pump
Feed pressure	100–150 kPa (15–22 psi)

Fuel injection pump	
Type	In-line pump
Pump timing setting	13° BTDC

Injectors	
Type	Multi-hole nozzle (6 holes)
Opening pressure	25 + 0.8 MPa (3625 + 116 psi)
Setting pressure, for new spring	26 + 0.8 MPa (3770 + 116 psi)

Air cleaner	
Triple-stage air cleaning:	Pre-cleaner – primary filter – safety filter

Intercooler	
Type	Liquid/air-cooled with separate coolant pump

Cooling system	
Type	92

Header tank cap opens at

50 kPa (7 psi)

Section 2 Engine

Engine	
Type designation	TD73KDE, part no. 8188126
Flywheel output at 2100 rpm	148 kW SAE J 1349 Net
Gross output at 2100 rpm	153 kW SAE J 1349 Gross
Max. torque at 1100 rpm	920 Nm (678.5 lbf ft) SAE J1349 Net 925 Nm (682.2 lbf ft) SAE J1349 Gross
Number of cylinders	6
Cylinder bore	104.77 mm (4.124 in)
Stroke	130 mm (5.12 in)
Cylinder displacement, total	6.7 dm ³ (1.77 US gal)
Compression ratio	17.5:1
Compression at starter motor speed, 200 rpm	2.4 MPa (348 psi)
Max. pressure difference allowed between cylinders at starter motor speed	0.3 MPa (44 psi)
Injection sequence	1-5-3-6-2-4
Idle speed, low	670 ±50 rpm
Idle speed, high	2345 ±60 rpm
Stall speed	2120 ±75 rpm

Valve system	
Valve clearance, (warm or cold engine)	
inlet valve	0.40 mm (0.016 in)
exhaust valve	0.55 mm (0.022 in)

Lubrication system	
Oil pressure	375–527 kPa (54–76 psi)
Oil pressure, idle min.	50 kPa (7 psi)

Fuel feed pump	
Type	Piston pump
Feed pressure	100–150 kPa (15–22 psi)

Fuel injection pump	
Type	In-line pump
Pump timing setting	9° BTDC

Injectors	
Type	Multi-hole nozzle (6 holes)
Opening pressure	25 + 0.8 MPa (3625 + 116 psi)
Setting pressure, for new spring	26 + 0.8 MPa (3770 + 116 psi)

Air cleaner	
Triple-stage air cleaning:	Pre-cleaner – primary filter – safety filter

Intercooler	
Type	Liquid/air-cooled with separate coolant pump

Cooling system	
Type	Closed system
Header tank cap opens at	50 kPa (7 psi)

Thermostat	
------------	--

Type	Piston thermostat https://truckmanualshub.com/
Number of thermostats	1
Begins to open at	82 °C (180 °F)
Fully open at	92 °C (198 °F)

Hydraulically driven cooling fan (optional equipment for L120D)	
Max. fan motor speed	1200 rpm with fan programme A
	1400 rpm with fan programme B
	1550 rpm with fan programme C
Base rotation speed	400 rpm
Max. pressure (for pressure check using the service display unit)	21.0 MPa (3045 psi)

Cold-start device	
Preheating coil	In induction manifold

Section 5 Brakes

<https://truckmanualshub.com/>

Wheel brake	
Type	Dual circuit, fully hydraulic wet disc brakes
Brake pad area per wheel	1290 cm ² (200 in ²)
Brake disc, min. thickness	7.2 mm (0.28 in)
Brake discs, thickness, new disc	9.6 mm (0.38 in)
Accumulator capacity	1.0 l, 2 accumulators
Precharge pressure, new accumulator	5 MPa (725 psi)
Min. allowed precharge pressure	3.5 MPa (508 psi)

Foot brake valve/unloading valve	
System pressure, unloading (cut-out) pressure	15.0–15.5 Mpa (2175–2248 psi)
System pressure, charging (cut-in) pressure	12.0–13.0 MPa (1740–1885 psi)
Max. output brake pressure	7.4–8.6 Mpa (1073–1247 psi)
Low pressure indication	8.1–9.9 Mpa (1175–1436 psi)

Brake pump (common with servo system) is included in the hydraulic system double-pump	
Type	Vane pump
Displacement	15.9 cm ³ (0.97 in ³)
Flow at 2200 rpm and 10 MPa pressure	31.0 l/min (8 US gal/min)
Servo pressure (throughout entire engine speed range)	3.0–4.0 MPa (435–580 psi)
Increased pressure, separate attachment locking (optional equipment)	15 ±0.5 MPa (2175 ±73 psi)
Accumulator 0.5 l (0.13 US gal) in servo circuit, precharge pressure	1.5 MPa (218 psi)

Parking brake	
Type	Mechanically or electrically operated disc brake, located externally on the hydraulic transmission front output shaft.
Brake pads	
thickness	10 mm (0.39 in)
thickness, min.	2 mm (0.08 in)
Brake disc	
thickness	22 mm (0.87 in)
thickness, min.	18 mm (0.71 in)
max. allowed wear	4 mm (0.16 in)

Section 6 Steering system

<https://truckmanualshub.com/>

Steering	
Type	Load-sensing hydrostatic
Steering angle	±40°
Number of steering wheel turns, total	4.15 revolutions
Steering time (approx.), full lock – full lock, slow idling speed.	6.5 s
Steering time (approx.), full lock – full lock, fast idling speed	2.5 s

Oil pump	
Type	Axial piston pump, variable displacement
Flow at 2100 rpm and 10 MPa pressure	91 l/min (24 US gal/min)
Working pressure, high idle speed	21 ±0.35 MPa (3045 ±51 psi)
Hold (stand-by) pressure, low idle speed	2.8–3.3 MPa (406–479 psi)

Steering valve	
Type	"Closed centre"

Shock valves	
Number of valves	2
Opening pressure at 10 l/min (2.6 US gal/min)	28 MPa (4060 psi)

Steering cylinder	
Type	Double-acting
Piston rod diameter	40 mm (1.6 in)
Inside diameter/stroke	70/419 mm (2.76/16.5 in)

Section 6 Steering system

<https://truckmanualshub.com/>

Steering	
Type	Load-sensing hydrostatic
Steering angle	±40°
Number of steering wheel turns, total	3.75 revolutions
Steering time (approx.), full lock - full lock, slow idle	6.5 s
Steering time (approx.), full lock - full lock, fast idle	4 s

Oil pump	
Type	Axial piston pump, variable displacement
Displacement	45 cm ³ (2.7 in ³)
Flow at 2100 rpm and 10 MPa (1450 psi)	91 l/min (24 US gal/min)
Working pressure, high idle speed	21 ±0.35 MPa (3045 ±51 psi)
Hold (stand-by) pressure, low idle speed	2.8–3.3 MPa (406–479 psi)

Shift valve	
Cut-in pressure of steering cylinder piston rod end	17.5 ±1.0 MPa (2538 145 psi) pump pressure 16.0 MPa (2320 psi) LS-pressure

Steering valve	
Type	"Closed centre"

Shock valves	
Number of valves	2
Opening pressure at 10 l/min (2.6 US gal/min)	28 MPa (4060 psi)

Steering cylinder	
Type	Double-acting
Piston rod diameter	50 mm (2 in)
Inside diameter/stroke	80/476 mm (3.15/18.74 in)

Air-conditioning unit temperatures in performance tests

Section 9 Hydraulic system

<https://truckmanualshub.com/>

Hydraulic system	
Type	Servo-assisted of "open centre" type

Control valve	
Shock valve, rear tilt (plus side)	24.5 ±0.6 MPa (3553 87 psi)
Shock valve, forward tilt (minus side)	17.5 ±0.6 MPa (2538 87 psi)
Shock valve, lift	32.0 ±0.6 MPa (4640 87 psi)
Back-up valve, forward tilt and lower	1.0–2.0 MPa (145–290 psi)

Operating times (approx.), fast idle	Seconds
Lift, with SAE work load	5.5
Lower, without load	2.5
Forward tilt, with SAE work load	2
Forward tilt, without load	2.5

Hydraulic oil pump (working hydraulics) included in hydraulic system double-pump	
Type	Vane pump, fixed displacement
Displacement	98.3 cm ³ (6 in ³)
Working pressure, high idle speed	22.5 ±0.4 MPa (3263 ±58 psi)
Flow at 2200 rpm and 10 MPa (1450 psi)	212 l/min (56 US gal/min)

Servo pump (common with brake system) included in hydraulic system double-pump	
Type	Vane pump
Displacement	15.9 cm ³ (0.97 in ³)
Flow at 2200 rpm and 10 MPa	31.0 l/min (8 US gal/min)
Servo pressure (throughout entire engine speed range)	3.0–4.0 MPa (435–580 psi)
Increased pressure, separate attachment locking (optional equipment)	15 ±0.5 MPa (2175 ±73 psi)
Accumulator 0.5 l (0.13 US gal) in servo circuit, precharge pressure	1.5 MPa (218 psi)

Boom Suspension System	
Accumulator, precharge pressure, 1 pc.	3.0 MPa (435 psi)

Lift cylinder	
Type	Double-acting
Piston rod diameter	70 mm (2.76 in)
Inside diameter/stroke	130/710 mm (5.1/27.9 in)

Tilt cylinder	
Type	Double-acting
Piston rod diameter	90 mm (3.5 in)
Inside diameter/stroke	190/430 mm (7.5/16.9 in)

Section 9 Hydraulic system

<https://truckmanualshub.com/>

Hydraulic system	
Type	Servo-assisted of "open centre" type

Control valve	
Shock valve, rear tilt (plus side)	24.5 ±0.6 MPa (3553 87 psi)
Shock valve, forward tilt (minus side)	17.5 ±0.6 MPa (2538 87 psi)
Shock valve, lift	32.0 ±0.6 MPa (4640 87 psi)
Back-up valve, forward tilt and lower	1.0–2.0 MPa (145–290 psi)

Operating times (approx.), fast idle	Seconds
Lift, with SAE work load	6
Lower, without load	3
Forward tilt, with SAE work load	2
Forward tilt, without load	3

Hydraulic oil pump (working hydraulics) included in hydraulic system double-pump	
Type	Vane pump, fixed displacement
Displacement	136 cm ³ (8.3 in ³)
Working pressure, high idle speed	22.5 MPa (225 bar) (3263 psi)
Flow at 2100 rpm and 10 MPa (1450 psi)	275 l/min (73 US gal/min)

Servo pump (common with brake system) included in hydraulic system double-pump	
Type	Vane pump
Displacement	15.9 cm ³ (0.97 in ³)
Flow at 2100 rpm and 10 MPa (1450 psi) pressure	29.5 l/min (7.8 US gal/min)
Servo pressure (throughout entire engine speed range)	3.0–4.0 MPa (435–580 psi)
Increased pressure, separate attachment locking (optional equipment)	15 ±0.5 MPa (2175 ±73 psi)
Accumulator 0.5 l (0.13 US gal) in servo circuit, precharge pressure	1.5 MPa (218 psi)

Boom Suspension System	
Accumulator, precharge pressure	3.0 MPa (435 psi)
	6.0 MPa (870 psi)

The pressures of 3.0 MPa and 6.0 MPa are minimum and maximum values for the accumulator precharging pressure. Suspension characteristics can be adapted by individually precharging the accumulator/accumulators to a pressure between the min. and max. values, i.e. 3.0 MPa and 6.0 MPa.

Lift cylinder	
Type	Double-acting
Piston rod diameter	80 mm (3.1 in)
Inside diameter/stroke	160/676 mm (6.3/26.6 in)

Tilt cylinder	
Type	Double-acting
Piston rod diameter	110 mm (4.3 in)
Inside diameter/stroke	230/412 mm (9.1/16.2 in)

Service display unit, axles and brakes

- xx = Input brake pressure, normal/low.
- yy = Output brake pressure in bar / psi or ERo / ERs in case of sensor malfunction
- z = Retardation memory for the 3 most recent brake applications in m/s²
- x = Output brake pressure memory for the 3 most recent brake applications in bar / psi
- y = Result from the latest brake test ends up on the far left
- y = Unit in bar / psi

Figure 1
Image 5.1

- xx = Axle oil temperature in front axle in °C / °F or ERo / ERs in case of sensor malfunction
- yy = Axle oil temperature in rear axle in °C / °F or ERo / ERs in case of sensor malfunction

Figure 2
Image 5.2

- xx = Selects between two alarm limits for temperature in axles (selected in °C / °F)
It is possible to select the warning trigger points at 110 °C, (230 °F) or 140 °C, (284 °F).
- yy = Time (hours:min) with temperature above selected alarm limit for front axle
- zz = Time (hours:min) with temperature above selected alarm limit for rear axle
- Selection of alarm limit is performed with # control
- * = Resetting to zero

Service display unit, electrical control input signals 2

Electrical control input signals 2 shows the current status of input signals to the vehicle control unit (V-ECU) from monitoring functions.

In the display, **x** represents different pins in connectors EA and EC. Connectors EA and EC are connected to the vehicle control unit (V-ECU).

Figure 1
Image 3.3

The pins are presented in numerical order from left to right and grouped in the following rows:

V 37: position V37-V40

The value of **x** may be 1 or 0, depending on whether the input signal is activated or not activated.

Pos.	Value (x)	Meaning	Conditions	Connector pin	Wiring diagram
V37	Washer fluid level, monitoring MO802			EA26	SCH18
	0	Low	- low level		
	1	OK	- normal level or - incorrect input signal		
V38	Not connected			EA40	-
V39	Not connected			EA13	-
V40	Secondary steering, test MO601			EC3	SCH16
	0	Active	- SW601 in position On - primary steering pressure low SE602 - differential pressure low SE601 - engine off		
	1	Not active			

Service display unit, electrical control input signals 3

Electrical control input signals 3 shows the current status of input signals to the instrument control unit (I-ECU) from different controls and monitoring functions.

In the display, **x** represents different pins in connectors P1 and P2. Connectors P1 and P2 are connected to the instrument control unit (I-ECU).

Figure 1
Image 3.4

The pins are presented in numerical order from left to right and grouped in the following rows:

- I 1: position I1-I12
- I 13: position I13-I24
- I 25: position I25-I33

The value of **x** may be 1 or 0, depending on whether the input signal is activated or not activated.

Service display unit, electrical control output signals 1

Electrical control output signals 1 shows the current status of output signals from the vehicle control unit (V-ECU).

In the display, **xy** represents different pins in connector EC. Connector EC is connected to the vehicle control unit (V-ECU).

EL ON/OFF OUT 1		cl =
V 1:	xyxyxy	xyxyxy
V 7:	xyxyxy	xyxyxy
V13:	xyxyxy	xyxyxy

Figure 1
Image 3.5

The pins are presented in numerical order from left to right and grouped in the following rows:

- V 1: position V1-V6 (connector pins EC1-EC6)
- V 7: position V7-V12 (connector pins EC7-EC12)
- V 13: position V13-V18 (connector pins EC13-EC24)

The value of **x** may be either 1 or 0, depending on whether the output signal is activated or not activated.

The value of **y** has meanings according to the table below.

Value (y)	Meaning
shiny	Normal and fully-functional circuit
o	Break in circuit
s	Short-circuit in circuit
m	Malfunction detected in last operating cycle/ignition switch activation
M	Malfunction detected in earlier operating cycle/operating cycles

Memory functions **m** and **M** are reset by pressing the * key.

Signal description

Pos.	Value (x)	Meaning	Conditions	Connector pin	Wiring diagram
V1	Manual preheating, status			EC1	SCH03
	0	Not activated	- SW201 in position Off		
	1	Activated	- SW201 in position On		
V2	Differential lock, status			EC2	SCH12
	0	Not activated	- SW414 in position Off or - incorrect input signal		
	1	Activated	- SW414 in position On - machine travel speed < 10 km/h (6.2 mph)		
V3	Secondary steering, status			EC3	SCH16
	0	Not activated	- activation conditions not fulfilled or - incorrect input signal		
	1	Activated	- travel speed > 3 km/h (1.9 mph) - steering differential pressure high ≥ 0.5 s or - travel speed > 3 km/h (1.9 mph) - steering differential pressure high 0.3 s - primary steering pressure low or - SW601 secondary steering test in position On - steering pressure low - steering differential pressure high - engine speed 0 rpm		
V4	Parking brake, status			EC4	SCH15B
	0	Not active (applied)	- ignition switch SW101 in position 0 or - ignition switch SW101 in position 1

Service display unit, electrical control output signals 2

Electrical control output signals 2 shows the current status of certain output signals from the vehicle control unit (V-ECU). In the display, **xy** represents different pins in connector EC. Connector EC is connected to the vehicle control unit (V-ECU).

Figure 1
Image 3.6

The pins are presented in numerical order from left to right and grouped in the following rows:

- V 19:** position V19-V24 (connector pins EC26-EC39)
- V 25:** position V25 (connector pin EC41)

The value of **x** may be either 1 or 0, depending on whether the output signal is activated or not activated.

The value of **y** has meanings according to the table below.

Value (y)	Meaning
shiny	Normal and fully-functional circuit
o	Break in circuit
s	Short-circuit in circuit
m	Malfunction detected in last operating cycle/ignition switch activation
M	Malfunction detected in earlier operating cycle/operating cycles

Memory functions **m** and **M** are reset by pressing the ***** key.

Service display unit, general

<https://truckmanualshub.com/>

The service display unit plugs into a socket in the electrical distribution box behind the operator's seat. The display unit is used for service/troubleshooting and gives additional information to that supplied by the display panel.

Using the service display unit, it is possible to read stored information such as pressures and temperatures. It is also possible to change settings and reset logged values.

Figure 1
Service display unit 999 3721

The service display unit is started by pressing the keys  and  at the same time.

The displays are divided into 6 groups:

1. Start display and setup (settings)
2. Engine
3. Electrical system
4. Transmission
5. Axles/brakes
6. Hydraulics

With the upper display key  you go to the first display in the next group, regardless of which display is being shown.

With the lower display key  you go to the next display in the group. When the final display in the group has been reached, you are returned to the first display in that group.

To perform settings, use the  and  keys.

The display unit consists of 4 rows of information with 20 characters/row. It is updated at intervals of 0.5 seconds.

Five different languages can be selected: Swedish, English, German, Spanish and French.

There are two unit combinations that can be selected: Metric (°C, km, bar)/ Foot-pound (°F, mile, psi).

Figure 2

WARNING!

Read all signs and instructions on the machine and the safety instructions in the operators manual, before you start working on the machine.

The installation instructions are based on the use of special tools, the E-tool and standard tools generally available on the market, and also on our operators manuals and service manuals.

The equipment should be installed by qualified personnel of an authorised workshop.

Volvo CE Customer Support AB disclaims all responsibility if tools and work methods other than those described in the instructions are used.

Servo valve, functional description <https://truckmanualshub.com/>

The servo valve consists of six valve spools, one for each hydraulic function.

In principle, the servo valve functions like a pressure reducing valve. In the neutral position, the valve spool closes off the servo pressure while the connection from the control valve is connected to tank. When the pressure pin is acted on by the lever (function activated), the valve spool is pressed down by the spring and first close the connection to tank. When the movement continues, the valve spool opens for the servo pressure out to the control valve. The output servo pressure also acts on the valve spool which is pressed up against the spring. When the output pressure reaches a value corresponding to the lever stroke and thus the spring force, the valve closes. This results in a controlled oil pressure acting on the spool in the control valve.

As the valve spool in the servo valve opens, an immediate so-called start pressure is obtained, which is the lowest pressure that is able to move the spool to the closed position. The start pressure results in the movement of respective spool in the control valve to a position just before the connection to the hydraulic cylinder is opened.

Between the start position and the so-called forced opening in the servo valve, the output pressure is regulated proportionally with the lever stroke. The forced opening results in a mechanical contact between the pressure pin and the valve spool.

The output servo pressure just before the forced opening, is the pressure required to press the spool in the control valve to its end position. When the forced opening has been reached, the output servo pressure increases to the same level as the input servo pressure. For the functions that are equipped with electromagnets (detent solenoids), forced opening should be obtained at the so-called sensing position. The servo valve is in the sensing position when extra resistance can be felt in the lever.

1. Remove the cover and the switch.

Figure 1

1. Cover with switch

Removing Control levers

2. Adjust the distance between the lever adjusting screw and the pressure pin.

Figure 2

1. Adjusting screw
2. Pressure pin

NOTE!

The sensing position is the position that the lever must pass before the detent solenoid draws (hold position), as well as the transfer point between the lower and float positions.

Sensing position at 2.1 MPa (304.5 psi)

3. The sensing position is adjusted using the adjusting screws (1) [Invalid linktarget].

NOTE!

The adjusting screw must only be turned in complete turns.

Figure 3
Sensing position

1. Adjusting screw
2. Pressure pin

4. The force required to pass the sensing position is adjusted with the pressure pin (2) [Invalid linktarget] (2 mm, 0.08 in. Allen key).

Alt. 1: the sensing position should be reached at a distance of 2–3 mm (0.08–0.12 in) between magnet (solenoid) and stop washer, see pos A [Invalid linktarget].

Alt. 2: Connect a pressure gauge according to [Invalid linktarget], adjust so that the sensing position is reached at 2.1 MPa (304.5 psi).

NOTE!

Alt. 1 requires that the hold (detent) solenoid is correctly adjusted.

Figure 4

- A. 2–3 mm (0.08–0.12 in)
1. Stop washer
2. Hold (detent) solenoid
3. Spacer washers

Hold (detent) solenoid, bucket leveller, boom kick-out and float position

5. Move the lever to the sensing position. After adjusting the sensing position according to Alt. 2 step 4, adjust the clearance between the hold (detent) solenoid and the stop washer to 2–3 mm (0.08–0.12 in), see [Invalid linktarget]. Adjust with adjusting shims behind the hold (detent) solenoids.

Microswitch

6. The microswitch should be activated when the hold (detent) solenoid draws (hold position), i.e. the float position is engaged, but is unaffected in the sensing position. Adjustment is made by loosening and moving the microswitch, see [Invalid linktarget].

Note: Check that the switch for float position, see [Invalid linktarget], is activated.

NOTE!

The float position must never be engaged before the sensing position has been passed.

7. Fit the cover and the switch.

Shift valve L120D, description <https://truckmanualshub.com/>

The L120D has a shift valve the purpose of which is to disconnect the minus sides of the steering cylinders under light steering conditions. Only the plus side of a cylinder is then used for steering. If steering becomes heavy the shift valve connects the minus side of the opposite cylinder in circuit to obtain greater power.

Neutral position

Connection P1 is connected to the pump and connection P2 is connected to the steering valve. The steering valve is in the neutral position and only hold (stand-by) pressure is built up in the shift valve up to the regulating spools (7). The minus sides of the steering cylinders are connected to tank through the regulating spools (7). The oil on the plus sides of respective steering cylinder is trapped between the steering valve and its shock valves.

Figure 1

| Blue | = Increased return pressure |
| Violet | = Trapped oil |
| Orange | = Hold (stand-by) pressure |

Steering, right (light steering conditions)

Light steering conditions, LS-pressure below 16.0 MPa (2320 psi)

Oil from the steering valve enters at connection R1, flows on to the plus side of the left steering cylinder from connection R2, and acts on the directional spool (9). This shifts position so that oil from the LS-line reaches the piston (6). The LS-pressure is too low to move the regulating spool (7). The minus side of the right steering cylinder is filled with oil from the return side via the regulating slide (7) and one of the anti-cavitation valves (8). The machine is now steered with oil only on the plus side of the left steering cylinder. See [Invalid linktarget].

Steering, right (heavy steering conditions)
Heavy steering conditions, LS-pressure above 16.0 MPa (2320 psi)

The starting position is the same as for steering during light conditions. The LS-pressure acting on the piston (6) wants, due to the area difference between the piston and the regulating slide (7), to start moving the regulating slide which presses on the damping piston (5). The oil in the piston is drained, to start with, through restrictions (3) and (4). Before the regulating slide (7) opens, the restriction (4) closes and the oil can then only drain through restriction (3), which gives a soft pressure increase out to the minus side of the right steering cylinder. The non-return valve (10) ensures engagement even if the LS-pressure drops to below 16.0 MPa (2320 psi) for a short period. The machine is thus steered with oil to the plus side of the left steering cylinder and to the minus side of the right steering cylinder. See [Invalid linktarget].

When steering left, the corresponding will take place.

8. Press out the regulating spools and pistons (press in the connections for the damping valves). Clean and check the parts with regards to any damage and wear. Change the O-rings. Fit the spools and pistons as well as the new O-rings.

Figure 7

T Tank connection

9. Fit the damping valves with the housing.
10. Remove the plugs and press out the non-return valves (from the end). Clean and check the parts with regards to any damage and wear. Fit the non-return valves, the new springs and plugs.

Figure 8

11. Fit the end plate and tighten down with the Allen head screws.
12. Fit the union fittings for the tank connections.

Shock and anti-cavitation valve <https://truckmanualshub.com/>

Functions of shock and anti-cavitation valve

- Shock function
- Anti-cavitation function

Shock function

When the pressure from the cylinder (6) increases, the pilot valve (1) will open at the preset opening pressure. When the oil starts to flow past the pilot valve, the pressure in the chamber (2) will drop in relation to the pressure from the cylinder. The pipe (3) which functions as a moveable restriction, will follow with the flow and seal against the pilot valve. At this point, the shock pressure acts on the entire area of the pipe. The oil in the chamber is connected to tank via the open pilot valve. The piston (5) can now open and the shock pressure is drained directly to the tank connection.

Figure 1
Shock function

The sequence of events is shown from left to right

1. Pilot valve
2. Chamber
3. Pipe
4. Tank connection
5. Piston
6. Connection to cylinder

Blue Increased return pressure
Pink Partial pressure of working pressure
Red Working pressure

Anti-cavitation function

When the pressure in the cylinder drops, the pressure in the chamber (1) also becomes lower than the tank pressure. Now, the tank pressure acts on the piston (4) and lifts it, and the anti-cavitation function is engaged.

Figure 2
Anti-cavitation function

The sequence of events is shown from left to right

NOTE!

Always use the support to secure the boom when working under a raised boom.

1. Raise the boom and position the support, release the pressure. Tilt the bucket forward against its end position.
2. Connect the vacuum pump to the hydraulic tank, see [Invalid linktarget].

NOTE!

A condition for using vacuum pump 14 360 000 is that it is constantly connected and not shut off. Never leave the machine unattended. The negative pressure in the hydraulic oil tank must not exceed a maximum of 70 kPa (10.2 psi) (max. 0.3 bar absolute in the hydraulic tank).

Software in E-ECU for engines supplied as spare part

WARNING

Please pay attention to the safety instructions in the Operator's and Service Manuals concerned.

This SB is to be considered as a technical information and comprises normal warranties within the rules for the same.

The engine control unit (E-ECU) on D6D and D7D is provided with software that is adapted to the serial number for the respective chassis. The engine manufacturer will make the software available by entering it in a database from which the respective product company then can download the software for the respective machines. This is done with VCADS Pro on the production line. At the same time the database will also be updated and will link the serial number of the engine with the serial number of the machine. The procedure is connected to the emission demands of the authority.

The procedure for engines ordered as a spare part is the same, i.e. the software is downloaded from the database. Subsequently the software must be stored in the machine to create an operational and certified machine. This can be done in the following way:

1. The engine, which physically is kept in Volvo CE's store, is ordered from Volvo CE by stating the serial number of the machine and its model designation. Volvo CE will download the software to the ECU in the engine and tie the software of the engine to the machine. It will then be possible for the workshop concerned to install the engine in the chassis without any further measures, such as using the VCADS Pro.
2. The engine is ordered from Volvo CE to be stored at the customer or similar. At a later date, when the engine is to be used, contact will have to be made with the person responsible for VCADS Pro within the respective sales company. Information about the model designation and serial number of the machine, and the engine serial number must be provided. Thereafter, the software can be downloaded to and stored in the machine using VCADS Pro. This is done by the workshop concerned using VCADS Pro.

Specification L90D, general

<https://truckmanualshub.com/>

Servo pump (common with brake system) included in hydraulic system double-pump	
Type	Vane pump
Displacement	15.9 cm ³ (1.0 in ³)
Flow rate at 2200 rpm and 10 MPa (1450 psi) pressure	31.0 l/min (8.2 US gal/min)
Servo pressure (throughout entire engine speed range)	3.0–4.0 MPa (435–580 psi)
Increased pressure, separate attachment locking (optional equipment)	15 ±0.5 MPa (2175 ±72.5 psi)
Accumulator 0.5 l (0.13 US gal) in servo circuit, precharge pressure	1.5 MPa (217.5 psi)

Steering	
Type	Load-sensing hydrostatic
Steering angle	±40°
Number of steering wheel turns, total	4.15 revolutions
Steering time (approx.), full lock –full lock, slow idle speed	6.5 sec
Steering time (approx.), full lock –full lock, fast idle speed	2.5 sec

Specification L90D, general

<https://truckmanualshub.com/>

Oil pump	
Type	Axial piston pump, variable displacement
Displacement	45 litres (12 US gal)
Flow rate at 2100 rpm and 10 MPa pressure	91 l/min (24 US gal/min)
Working pressure, high idle speed	21 ±0.35 MPa (3045 ±51 psi)
Hold (stand-by) pressure, low idle speed	2.8–3.3 MPa (406–479 psi)

Steering valve	
Type	"Closed centre"

Shock valves	
Number of valves	2
Opening pressure at 10 l/min (2.6 US gal/min)	28 MPa (4060 psi)

Steering cylinder	
Type	Double-acting
Piston rod diameter	40 mm (1.6 in)
Inside diameter/stroke	70/419 mm (2.8/16.5 in)

Specification L90D, general

<https://truckmanualshub.com/>

Operating times (approx.), fast idle speed	
Lift, with SAE work load	5.5 s
Lower, without load	2.5 s
Forward tilt, with SAE work load	2 s
Forward tilt, without load	2.5 s

Specification L90D, general

<https://truckmanualshub.com/>

Hydraulic oil pump (working hydraulics) included in hydraulic system double-pump	
Type	Vane pump, fixed displacement
Displacement	98.3 cm ³ (6 in ³)
Working pressure, high idle speed	22.5 ±0.4 MPa (3263 ±58 psi)
Flow rate at 2200 rpm and 10 MPa (1450 psi) pressure	212 l/min (56 US gal/min)

Boom Suspension System	
Accumulator, precharge pressure, 1 pc.	3.0 MPa (435 psi)

Specification L90D, general

<https://truckmanualshub.com/>

Lift cylinder	
Type	Double-acting
Piston rod diameter	70 mm (2.76 in)
Inside diameter/stroke	130/710 mm (5.1/28.0 in)

Tilt cylinder	
Type	Double-acting
Piston rod diameter	90 mm (3.5 in)
Inside diameter/stroke	190/430 mm (7.5/16.9 in)

Specification L120D, general

<https://truckmanualshub.com/>

Steering	
Type	Load-sensing hydrostatic
Steering angle	±40°
Number of steering wheel turns, total	3.75 revolutions
Steering time (approx.), full lock –full lock, slow idle speed	6.5 sec
Steering time (approx.), full lock –full lock, fast idle speed	4 sec

Specification L120D, general

<https://truckmanualshub.com/>

Operating times (approx.), fast idle speed	
Lift, with SAE work load	6 s
Lower, without load	3 s
Forward tilt, with SAE work load	2 s
Forward tilt, without load	3 s

Specification L120D, general

<https://truckmanualshub.com/>

Hydraulic oil pump (working hydraulics) included in hydraulic system double-pump	
Type	Vane pump, fixed displacement
Displacement	136 cm ³ (8.3 in ³)
Working pressure, high idle speed	22.5 MPa (225 bar) (3263 psi)
Flow rate at 2100 rpm and 10 MPa (1450 psi) pressure	275 l/min (73 US gal/min)

Specification L120D, general

<https://truckmanualshub.com/>

Servo pump (common with brake system) included in hydraulic system double-pump	
Type	Vane pump
Displacement	15.9 cm ³ (1.0 in ³)
Flow rate at 2100 rpm and 10 MPa (1450 psi) pressure	29.5 l/min (7.8 US gal/min)
Servo pressure (throughout entire engine speed range)	3.0–4.0 MPa (435–580 psi)
Increased pressure, separate attachment locking (optional equipment)	15 ±0.5 MPa (2175 ±72.5 psi)
Accumulator 0.5 l (0.13 US gal) in servo circuit, precharge pressure	1.5 MPa (217.5 psi)

Boom Suspension System	
Accumulator, precharge pressure	3.0 MPa (435 psi)
	6.0 MPa (870 psi)

The pressures 3.0 MPa (435 psi) and 6.0 MPa (870 psi) are minimum and maximum values for accumulator precharging pressure. Suspension characteristics can be adapted by individually precharging the accumulator or accumulators between the minimum and maximum values, 3.0-6.0 MPa (435-870 psi).

Specification L120D, general

<https://truckmanualshub.com/>

Lift cylinder	
Type	Double-acting
Piston rod diameter	80 mm (3.1 in)
Inside diameter/stroke	160/676 mm (6.3/26.6 in)

Tilt cylinder	
Type	Double-acting
Piston rod diameter	110 mm (4.3 in)
Inside diameter/stroke	230/412 mm (9.1/16.2 in)

Starter motor, specifications

<https://truckmanualshub.com/>

Starter motor	
Output	6.6 kW

Starting system, description

<https://truckmanualshub.com/>

When battery disconnecter SW101 is closed, ignition switch SW101, relay RE8 and relay RE202 are supplied with power.

When the key is turned to position 1, relay RE2 is energized and supplies alternator ALT1 with a pre-magnetization voltage. Resistor R1 limits this voltage to 3 volts.

When the key is turned to position 3, relay RE8 is activated and via relay RE9 supplies voltage to the starter motor (MO201).

When a Forward or Reverse gear is engaged (SW401), engagement of the starter motor is prevented by relay RE9 (starter inhibitor).

The key cannot be turned to position 3 to prevent the engagement of the starter motor while the engine is running.

If starting fails, the key must be turned back to position 0 before a new attempt can be made.

Wiring diagram 3

Figure 1

Starting with booster batteries

<https://truckmanualshub.com/>

When starting with booster batteries, the following must be noted:

Check that the booster batteries or other power source have **the same voltage** as the regular batteries.

WARNING

The batteries could explode due to the current surge if a fully charged battery is connected to a completely discharged battery. Injuries could then be caused.

Take the following precautions:

1. Move the gear selector to neutral.
2. Apply the parking brake.
3. Make sure that the booster batteries or other power source have the same voltage as the regular batteries.
4. Under no circumstances disconnect the leads connected to the regular batteries.
5. Connect the positive terminal (+) on the booster battery to the positive terminal (+) on the battery nearest the starter motor.
6. Connect the other cable from the negative terminal (-) on the booster battery to the machine chassis (earth), e.g. a frame member near the starter motor.
7. Start the engine using the ignition key in the cab.
8. When the engine starts, first remove the jumper cable between the chassis and the booster battery's negative terminal (-). Then remove the jumper cable between the positive (+) terminals.
9. Refit the protective caps on the battery terminals.

Steering pump, description

<https://truckmanualshub.com/>

Steering pump

The steering pump is a nine cylinder axial piston pump with variable displacement. The principle for such a pump is described in [Invalid linktarget]. The drive shaft (9) rotates, causing the cylinder block (6), pistons (7) and swash plate (8) to rotate as well. The stroke of the pistons will then be dependent on the angle of the yoke (10). The angle is determined by the pressure difference from the spring and oil pressure on the control piston. When the piston is in its innermost position and is on its way outward, it passes a bow-shaped groove (4) in the distribution plate (5). The oil is drawn (or more correctly, forced by the atmospheric pressure) from the inlet port (3) via the inlet groove (4) into the cylinder. When the piston has passed its outermost position and is on its way into the cylinder, oil is forced out through the outlet groove (2) and on to the outlet port (1). See [Invalid linktarget] and [Invalid linktarget] .

- 7. Spring
- 8. Control piston
- 9. Flow compensator (hold/standby pressure)
- 10. Pressure compensator (Working pressure)

Pressure/flow compensator

The function of the flow compensator is to reduce the pump displacement when steering is not used. In the neutral position, there is only hold (stand-by) pressure and no flow.

The function of the pressure compensator is to control the pump via the control piston so that the max. pressure is limited.

Neutral position

Steering valve C in neutral position. Diesel engine running. Pressure compensator spool (2) held in lower position by the spring (1). When the pump tries to direct a flow to a closed centre the pressure in the outlet (5) rises. The pressure on the underside of the flow compensator spool (3) is able to compress the spring (12) so that oil can pass out to the control piston (7) with the result that the swash plate angle is reduced and no flow occurs. The pressure from the pump is regulated to a holding pressure that depends on the force of the spring (12) plus the pressure in the LS line (9), which in neutral is the same as the pressure in the tank line from the steering valve.

Figure 4
Neutral position (stand-by)

8	Pressure line		
9	Load-sensing line (LS)		
		Green	= Return, no pressure
		Blue	= Increased return pressure
		Violet	= Trapped oil
		Orange	= Hold (stand-by) pressure

Steering

When the steering wheel is turned (and the steering valve is thus opened), oil from the pump flows to the steering cylinder. At the same time, a connection between the LS line (9) and the pressure line in the steering valve (C) is opened so that the pressure on the top of the flow compensator spool (3), together with the spring force, endeavours to press the spool down. The oil behind the control piston (7) can now be drained back to the pump housing via the spools (3 and 2) and the swash plate is angled for maximum flow by means of the spring (11). If the pump delivers more oil than is needed, the outgoing pressure rises. This pressure then overcomes the LS pressure and the spring force on the top of spool 3. Oil can again pass to the control piston (7) and angle the pump for the correct flow rate. The accumulator (15) ensures smooth engagement and disengagement of the steering.

Figure 5
Steering, normal

B	Pump	11	Spring
C	Steering valve	12	Spring
1	Spring	13	Adjusting screw
2	Pressure compensator spool	14	Drain to pump
3	Flow compensator spool	15	Accumulator
4	Restriction (plug serial no. 12363-)		
5	Outlet from pump	Red	
6	Inlet to pump	Green	= Return, no pressure
7	Control piston	Blue	= Increased return pressure
8	Pressure line		
9	Load-sensing line (LS)		

Steering to full lock (end) position

The pressure in the LS-line (9) increases, and the pressure combined with the spring force is able to press the flow compensator spool (3) to the closed position (downward). The pressure below the pressure compensator spool (2) moves the spool towards the open position, and thus the oil passes the spool (3) and on to the control piston (7). The angle of the yoke is reduced and thus also the flow, but maximum pressure is maintained.

Figure 6

Red = Pressure oil
Green = Return, no pressure
Blue = Increased return pressure

Steering valve, description

<https://truckmanualshub.com/>

The steering valve is a non-reaction type with closed centre. The steering valve has a load-sensing port (LS) from which a steering pressure is obtained for the flow compensator on the pump.

Function

The steering valve is in the neutral position when the steering wheel is stationary, which means a closed centre. The pump is angled down and only supplies hold (stand-by) pressure. When the steering wheel is turned in any direction, it causes turning of the inner and outer spools. When the turn reaches 1.5°, the channels to the metering unit and the load-sensing port (LS) begin to open. The pressure from the steering pump is directed to the load-sensing port, which causes the pump to angle up and to supply a flow. Oil is supplied via the metering unit to the steering cylinders proportional to the steering wheel movement. When the steering wheel is released, the inner and outer spools spring back to the closed position and the pump now only supplies hold (stand-by) pressure.

Dismantling

1. Mark the steering valve parts in relation to each other in order to facilitate assembling.
Secure the steering valve in a vice. Use soft protective jaws.
Remove the cover.
2. Remove the metering unit as well as the rotor shaft and the distribution plates.
Remove the O-ring.

Figure 2

3. Remove the cross-pin.
Remove the steering valve from the vice and remove the ball.

Figure 3
Removing ball

4. Remove the inner and outer spools.

NOTE!

Do not pull on the outer spool. There is a risk that the parts will fall apart, causing the return springs to lock the inner spool in the housing.

Figure 4
Removing inner and outer spools

5. Remove the axial disc, needle bearing, bearing race and the ring.

Figure 5
Removing needle bearing and ring

6. Remove the inner and outer seals.
7. Carefully press the inner spool out from the outer spool.
Remove the leaf springs.
Clean and check all parts with regards to wear and any damage.
Change worn and damaged parts.
Change all seals and washers.
Remove any small burrs with a fine-grain whetstone.
Lapping paste must **not** be used.

Lubricate all parts with hydraulic oil before assembling.

Assembling

8. Fit the outer seal ring.
Secure the valve housing in a vice. Use soft protective jaws.

Figure 6
Installing seal ring

1. 6999 007
2. 6999 025
3. 6999 034

9. Place the assembled seal on the drift plate and press the seal into the housing.

Figure 7
Installing seal ring

1. 6999 007
2. 6999 025
3. 6999 034

10. Assemble the inner and outer spools so that the grooves for the leaf springs line up and the T-shaped groove (A) in the inner spool lines up with the small holes (B) in the outer spool. Check that the punch marks on top of the spools line up.

Figure 8

- A. T-shaped groove (inner spool)
- B. Hole (outer spool)
- C. Scribing

11. Fit the leaf springs. Make sure that they are positioned correctly.

Figure 9

Position of leaf springs

12. Fit the axial disc, needle bearing, bearing race and the ring on the inner and outer spools.

NOTE!

Fit the bearing race with the chamfer towards the inner spool. Fit the cross-pin on the inner and outer spools.

Figure 10

Positioning axial disc, needle bearing, bearing race and ring

- 1. Ring
- 2. Bearing race
- 3. Needle bearing
- 4. Axial disc

13. Fit the inner and outer spools in the valve housing. Rotate the inner and outer spools so that drive pin ends up at 90° in relation to surface A.

If the inner and outer spools are installed incorrectly in the steering valve, the steering valve may function as a motor and the machine will steer uncontrollably by itself.

Figure 11
Position of inner and outer spools as well as drive pin in valve housing

14. Fit the O-ring. Fit the distributor plates so that the channel holes line up with the corresponding holes in the valve housing.

Figure 12
Distributor plate on valve housing

15. Fit the rotor shaft. Fit the O-ring and fit the rotor kit so that the top of two rotor teeth are parallel with surface "A".

Figure 13
Position of metering unit in relation to valve housing

16. Fit the cover and the screws.
Fit the ball through pressure connection (P) and then fit the screw with the lock pin. Wiggle the valve and listen to hear if the ball moves freely.
Tighten the screws crosswise.
Tightening torque: **30–35 Nm (22–26 lbf ft)**

Figure 14
Position of ball in valve housing

Stop solenoid, description

<https://truckmanualshub.com/>

The engine's fuel injection pump is equipped with a stop solenoid that is activated through the ignition SW101 and the electronic unit CU201.

The function of CU201 is to provide a ground connection for the pull coil and hold coil in stop solenoid MA201.

Depending on the position of the ignition and the output signal from the ECU, voltage is provided to the three connections on CU201 as follows:

Ignition in position	Connection	Voltage to electronic unit CU201
0	1	0 V
	2	0 V
	7, 8	24 V
	6, 12	24 V
	3, 9	24 V
	11	24 V
1, 2 or 3	1	24 V
	2	0 V (24 V at engine shutdown)
	7, 8	24 V
	6, 12	24 V
	3, 9, 11	0 V (pull position, MA201) 0.3 sec.
	3, 9	24 V (hold position, MA201)
	11	0 V (hold position, MA201)

Figure 1

<https://truckmanualshub.com/>

Turning off engine

With the ignition in position 0, voltage to connection 1 on electronic unit CU201 is interrupted. The current to stop solenoid MA201 is then interrupted and the solenoid control spring moves the injection pump to the stop position.

Starting engine

With the ignition in position 1, 2 or 3, voltage is supplied to connection 1 on electronic unit CU201. Stop solenoid MA201 is now supplied with current through connections 6 and 12 on electronic unit CU201. Stop solenoid MA 201 is activated and the injection pump assumes normal operating position.

**Figure 2**

Stop solenoid MA201

P Pull coil (approx. 1 Ω)

H Hold coil (approx. 55 Ω)

Stop solenoid MA201

The stop solenoid consists of two coils, a pull coil (approx. 1 Ω) and a hold coil (approx. 55 Ω). When the stop solenoid is activated, the pull coil receives a stronger current (approx. 20 A) for a very short period of time (approx. 0.3 s) and then it is disconnected. The hold coil is now supplied with current of approx. 0.5 A and holds the stop solenoid in the normal operating position.

The pull coil for stop solenoid MA201 is disconnected since its ground connection is interrupted via electronic unit CU201 (connection 3, 9 to 5, 10).

See also *wiring diagram 3, Section 3*.

Stop solenoid, troubleshooting advice

<https://truckmanualshub.com/>

If the stop solenoid remains in its operating position when the ignition key is turned to position 1, this may be due to:

- ☐ Electric malfunction.
- ☐ Open circuit in solenoid hold coil.
- ☐ Incorrectly adjusted linkage so that the inner stop position of the injection pump limits the solenoid stroke. This means that the solenoid does not reach the hold position. The solenoid disengages from its hold position after approx. 0.3 seconds.

If the stop solenoid remains in its operating position when the ignition key is turned to position 0, this may be due to:

- ☐ Binding injection pump governor or cable.
- ☐ Malfunction in stop solenoid.
- ☐ Malfunction in control unit for electric key engine shut-off.

We consider that no special installation instructions are required for fitting this equipment.

För montering av denna utrustning anser vi, att någon speciell monteringsanvisning inte erfordras.

To facilitate the fitting we enclose:

- Kit list
- Installation drawing

För underlättande av montering inkluderas:

- Satslista
- Monteringsritning

WARNING!

Read all signs and instructions on the machine and the safety instructions in the operators manual, before you start working on the machine.

The installation instructions are based on the use of special tools, the E-tool and standard tools generally available on the market, and also on our operators manuals and service manuals.

The equipment should be installed by qualified personnel of an authorised workshop.

Volvo CE Customer Support AB disclaims all responsibility if tools and work methods other than those described in the instructions are used.

VARNING!

Läs alla skyltar och anvisningar som finns på maskinen och säkerhetsinstruktionerna i instruktionsboken innan Du börjar arbetet på maskinen.

Monteringsanvisningen är baserad på användning av specialverktyg, E-verktyg och i allmänna handeln tillgängliga standardverktyg samt instruktions- och verkstadshandböcker.

Utrustningen ska monteras av behörig person på auktoriserad verkstad.

Volvo CE Customer Support AB fransäger sig allt ansvar om andra verktyg eller arbetsmetoder än de i anvisningen beskrivna kommer till användning.

System voltage

<https://truckmanualshub.com/>

The function monitors system voltage and warns the operator if the system voltage is too high or too low.

Input signals	Output function conditions	Output functions
○ Engine On/Off ○ System voltage	○ Voltage level > 31 V	○ Amber central warning lamp ----- INFO ----- High Voltage LB7375AG
	○ Engine On ○ Voltage level < 19 V	○ Amber central warning lamp ----- INFO ----- Low Voltage LB7375AG

Tightening torques

<https://truckmanualshub.com/>

Refer to Volvo standard tightening torques for bolted joints not listed here.

Engine	
Engine – engine mount	85 ±8 Nm (63 ±6 lbf ft)
Flywheel housing – hydraulic transmission	85 ±8 Nm (63 ±6 lbf ft)
Engine mount – tapered rubber damper	220 ±22 Nm (162 ±16 lbf ft)
Tapered rubber damper – frame	45 ±4.5 Nm (33 ±3 lbf ft)
Hydraulic transmission	
Transmission mount – transmission	220 ±22 Nm (162 ±16 lbf ft)
Transmission mount – rear frame	220 ±22 Nm (162 ±16 lbf ft)
Lock bolt for rubber bushing	220 ±22 Nm (162 ±16 lbf ft)
Frame	
Counterweight – frame	430 ±43 Nm (317 ±32 lbf ft)
Hitch – frame	430 ±43 Nm (317 ±32 lbf ft)
Cab	
Cab, rear mount – frame	400–450 Nm (295–332 lbf ft)
Cab, front mount – frame	400–450 Nm (295–332 lbf ft)
Hydraulic system	
Hydraulic oil pump (working hydraulics)	220 ±22 Nm (162 ±16 lbf ft)
Lift/tilt cylinder	
Piston – piston rod	25 Nm (18 lbf ft)

The following applies to the use of Volvo Construction Equipment guideline times

Listed times indicate **guideline times** for maintenance and repairs of machines manufactured by Volvo CE (Volvo Construction Equipment AB).

Guideline time is the time that the mechanic normally needs to perform an operation according to the instructions normally found in each machine's service manual or component manual, and that is performed according to the conditions listed below.

Feedback address for Time Guide: servicemanuals@volvo.com

Applicability

The time for performing an operation varies with a number of parameters, e.g., environment (where the work is done), training and equipment. Guideline times are developed with the following conditions:

- Workshop in an indoor environment with a solid and level concrete floor.
- Workshop equipped with lifting device that has lifting capacity and lifting height adapted to a majority of operations (except lifting complete machine units/machine frames) performed on machines handled by the workshop.
- Use of approved support and lifting equipment, in addition to the equipment indicated in each machine's service manual.
- Workshop equipped with compressed air, electricity and lighting.
- Use of indicated Volvo CE special tools.
- Tools stored in easily accessed location, in the immediate vicinity of the workplace.
- Where applicable, oils/fluids are handled in an environmentally correct manner.

For guideline times to apply it is required, in addition to the above conditions, that the mechanic has the training and experience required for the machine and the work that is being done (e.g., Basic Course Electricity and hydraulics as well as machine course step 1 Volvo CE Service school).

Guideline times apply when one person performs the operation. However, in the operations actions may be performed that require help from another person. In these cases, the time for that step which requires two persons has been doubled. The guideline times do not apply if more than one mechanic performs the entire operation.

Actions not included in guideline times are:

- Transport of machine to and from workshop site.
- Troubleshooting not described as a separate operation.
- Retrieval of spare parts, consumables and tools that are not stored in easily accessed location.
- Washing of the whole or parts of the machine before repair/maintenance.
- Actions that due to deformation, corrosion or external damage increase the repair time.
- Additional work that due to retrofitted equipment reduces access, unless these work steps are mentioned in the method description in each service manual.

Other

For every operation there is an operation number, heading and guideline time. The description for how the work is done is normally found in the service manual for each machine under the corresponding operation number.

Foreword

New format of operation number

In the time guide, each operation number has a heading with a three-digit function group number (see **function group** below) as well as a three-digit running number.

Example: Op no. 210-070 Engine removing

210-	070
Function group	Running number (Sequential number)

Example of discontinued op. no. is 21070 alt. 21070-1 (Engine removing).

Function group:

According to Volvo Construction Equipment function group index, where the first digit indicates section and is divided in the following functions, which follows the same design as other service information:

1. Standard parts, service
2. Engine with mounting and equipment
3. Elec.system; Warning system; Information system; Instruments
4. Power transmission
5. Brakes
6. Steering
7. Frame; Springs; Damping; Axle suspension; Wheel/track unit
8. Machinery house; Cab; Exterior trim parts anywhere
9. Hydraulic system; Digging/handling/grading equipment; Misc. Equip. hydraulics

The second and third digit (10) indicate sub-group, which in turn divides the functions within the group, also this follows the same design as other service information.

Running number:

Running number or sequential number 001 to 899 (in the example 070) is a number to identify each operation.

Other

Equipment:

Running number 901 to 999 are reserved for installation times for equipment (installation instructions).

Earlier (discontinued) format of operation numbers:

From 2005-03-08, only the new format for operation numbers shall be used, with the exception of operations for VCADS Pro. Already published service information makes use of the earlier format for operation numbers.

VCADS Pro:

For the time being, VCADS Pro operations will adhere to the same design as before, XXXXX-X, and will have a code digit (-3) for test procedures.

2		ENGINE WITH MOUNTING AND EQUIPMENT	
20		GENERAL	
200-068	1.25	E-ECU, MID 128, changing non-programmed ECU	430101 - 440000
200-070	0.90	E-ECU, MID 128, changing pre-programmed ECU	430101 - 440000
21		ENGINE	
210-070	6.00	Engine, removing	1415047 - 1420000
210-070	4.50	Engine, removing	430101 - 440000
210-072	6.00	Engine, installing	1415047 - 1420000
210-072	5.00	Engine, installing	430101 - 440000
210-083	0.60	Engine protection plates, removing and installing	430101 - 440000
212-071	0.50	Crankcase ventilation separator, replacing	430101 - 440000
214-012	2.50	Valves, adjusting	430101 - 440000

Op.no.	time (h)		Notes
214-012	2.50	Valves, adjusting	1415047 - 1420000
218-009	1.25	Engine mounts, replacing	1415047 - 1420000
22		LUBRICATING SYSTEM	
221-021	0.40	Lubrication oil pressure, checking	1415047 - 1420000
23		FUEL SYSTEM	
233-001	0.10	Fuel system, bleeding	1415047 - 1420000
233-001	0.10	Fuel system, bleeding	430101 - 440000
233-002	0.40	Feed pump, replacing	430101 - 440000
233-011	0.80	Fuel pump, removing	1415047 - 1420000
233-012	0.70	Fuel pump, installing	1415047 - 1420000
233-014	0.40	Fuel filters, replacing	1415047 - 1420000
233-014	0.50	Fuel filters, replacing	430101 - 440000
234-011	0.60	Fuel tank, removing	
234-012	0.60	Fuel tank, installing	
236-079	2.00	Injection pumps, changing	430101 - 440000
237-002	3.50	Injectors, replacing all	430101 - 440000
237-040	0.40	Overflow pipe, checking for leakage	430101 - 440000
239-001	0.60	Fuel cooler, replacing	430101 - 440000
25		INLET SYSTEM; EXHAUST SYSTEM	
252-020	1.50	Silencer, replacing	1415047 - 1420000
252-021	0.40	Exhaust pipe, flexible tube, replacing	1415047 - 1420000
252-023	0.60	Exhaust pipe, replacing	430101 - 440000
254-001	3.00	Diesel particulate filter, check and clean	430101 - 440000
256-010	0.40	Air cleaner, removing	430101 - 440000
256-010	0.40	Air cleaner, removing	1415047 - 1420000
256-011	0.40	Air cleaner, installing	1415047 - 1420000
256-011	0.30	Air cleaner, installing	430101 - 440000
258-023	0.90	Charge air cooler, removing	430101 - 440000
258-024	0.90	Charge air cooler, installing	430101 - 440000
26		COOLING SYSTEM	
261-011	2.00	Radiator, removing	1415047 - 1420000
261-011	1.75	Radiator, removing	430101 - 440000
261-012	0.50	Radiator hose upper, replacing	430101 - 440000
261-012	0.40	Radiator hose upper, replacing	1415047 - 1420000
261-013	1.25	Radiator, installing	430101 - 440000
261-013	0.80	Radiator, installing	1415047 - 1420000
261-014	0.80	Radiator hoses lower, replacing	430101 - 440000
261-014	0.80	Radiator hoses lower, replacing	1415047 - 1420000
261-018	0.70	Expansion tank, replacing	430101 - 440000
261-018	0.80	Expansion tank, replacing	1415047 - 1420000
263-012	0.80	Fan belt and/or alternator belt, replacing	430101 - 440000

Op.no.	time (h)		Notes
263-012	0.80	Fan belt and/or alternator belt, replacing	1415047 - 1420000
263-013	0.80	Fan belt and/or alternator belt, checking and adjusting tension	430101 - 440000
263-084	2.50	Fan shroud, replacing	430101 - 440000
263-084	2.00	Fan shroud, replacing	1415047 - 1420000
27		ENGINE CONTROL	
271-002	0.60	Throttle control cable, removal	1415047 - 1420000
271-003	0.80	Throttle control cable, installation	1415047 - 1420000
29		Miscellaneous	
293-002	2.00	EGR cooler, pressure test	430101 - 440000
3		ELEC. SYSTEM; WARNING SYSTEM; INFORMATION SYSTEM; INSTRUMENTS	
30		GENERAL	
302-130	0.50	Loader lever, electrical measuring	
31		BATTERY	
311-002	0.30	Batteries, replacing	
36		OTHER ELECTRICAL EQUIPMENT	
366-064	2.00	V-ECU, MID 187, changing non-programmed ECU	430101 - 440000
366-066	1.50	V-ECU, MID 187, changing pre-programmed ECU	430101 - 440000

4 POWER TRANSMISSION

43 GEARBOX,

431-021	5.50	Swing gearbox, replacing
431-031	3.00	Pump gearbox coupling assembly, replacing
431-053	6.50	Swing unit, replacing
431-117	1.25	Track gearbox, replacing cover
431-127	6.50	Track unit, replacing

44 HYDROSTATIC DRIVE

441-021	2.50	Swing motor, replacing
441-022	0.70	Swing motor relief valve, replacing
441-024	1.50	Swing motor, replacing plate (brake)
441-025	1.25	Swing motor, replacing brake piston seal
441-112	0.70	Track motor relief valve, replacing
443-037	5.50	Center passage, replacing
443-038	7.00	Center passage, replacing seal kit
443-039	1.00	Center passage hose (valve – center passage), replacing
443-040	1.50	Center passage hose (center passage – motor), replacing

49 MISCELLANEOUS

492-021	11.00	Swing ring gear, replacing
492-031	3.00	Swing ring gear outer seal, replacing
492-032	9.00	Swing ring gear inner seal, replacing
492-091	0.40	Ring gear grease pipe, replacing

7 FRAME; SPRINGS; DAMPING; AXLE SUSPENSION; WHEEL/TRACK UNIT

71 FRAME

710-001	3.50	Superstructure, removing
710-002	4.50	Superstructure, installing

Op.no.	time (h)	Notes
716-001	0.70	Counterweight, removing
716-002	0.90	Counterweight, fitting
77		WHEELS; TRACKS; TYRE; HUB; DRUM
775-011	3.00	Front idler, replacing one
775-021	3.50	Sprocket, replacing one
775-034	1.25	Track chain assembly, removing
775-035	1.75	Track chain assembly, installing
775-036	9.50	Track links, replacing
775-051	1.00	Top roller, replacing one
775-061	1.50	Bottom roller, replacing one
775-066	3.00	Bottom roller, replacing seal
775-071	0.90	Track guard, replacing one
775-081	3.00	Track recoil spring (tensioner) assembly, replacing
8		MACHINERY HOUSE; CAB; EXTERIOR TRIM PARTS ANYWHERE
81		CAB, NAKED; CANOPY
810-001	1.75	Cab, removing
810-001	1.75	Cab, removing
810-002	2.50	Cab, installing
82		ENGINE HOOD; MUDGUARD; FOOT STEP
821-005	0.90	Engine hood, replacing
84		TRIM PART, OUTSIDE; GLASS; SEALING MOULDING
841-061	0.30	Rear-view mirror, changing
843-002	1.50	Windscreen, replacing
843-012	4.00	Rear window, replacing
843-013	4.50	Side window, replacing
843-048	0.70	Door window, replacing
85		CAB INTERIOR/UPHOLSTERY
852-008	1.25	Seat, replacing
852-012	1.75	Longitudinal adjustment cable, replacing
852-013	0.60	Longitudinal suspension cable, replacing
852-089	0.30	Seat cushion, replacing
852-090	0.60	Backrest, replacing
852-091	2.50	Seat support, replacing
87		AIR CONDITIONING UNIT
870-001	5.00	Cooler and Heater assembly, replacing
870-010	0.70	ECC, MID 146, changing pre-programmed ECU

Op.no.	time (h)	Notes
870-011	1.00	ECC, MID 146, changing non-programmed ECU
873-004	3.00	Heater core, replacing
873-006	0.80	Fan motor, replacing
873-011	0.70	Air mix door actuator, replacing
874-006	1.75	Compressor, replacing incl draining and filling
874-010	1.75	Condenser, replacing incl draining and filling
874-011	1.75	Receiver, replacing incl draining and filling
874-012	3.00	Evaporator, replacing incl draining and filling
874-013	3.00	Expansion valve, replacing incl draining and filling
874-016	0.30	Compressor, replacing magnetic clutch (compressor removed)
874-094	0.60	Vent actuator, replacing
874-095	0.60	Mode (foot) actuator, replacing
874-096	0.60	Intake actuator, replacing
88		INTERIOR EQUIPMENT
881-003	1.00	Instrument panel, replacing (left)
881-005	1.25	Instrument panel, replacing (right)
9		HYDRAULIC SYSTEM; DIGGING/ HANDLING/ GRADING EQUIPM.; MISC. EQUIP.
91		WORKING HYDRAULICS; SERVO HYDRAULICS
911-005	1.75	Pump suction hose and pipe, replacing
911-015	0.50	Oil level gauge, replacing
911-024	0.30	Pipe and hose (pump - valve), replacing
911-033	1.75	Oil cooler line bypass valve (check valve), replacing
911-038	2.50	Hydraulic oil tank, replacing
911-040	0.40	Hydraulic oil tank, vacuum-pumping, connecting and disconnecting pump
911-051	0.20	Breather, replacing
912-001	8.00	Control valve, replacing
912-067	0.50	Main pressure relief valve, replacing
912-071	0.80	Rupture valve, replacing (boom cylinder)
912-073	0.80	Rupture valve, replacing (dipper arm cylinder)
913-007	0.30	Hydraulic pump (removed), changing shaft seal
913-010	4.50	Hydraulic pump, replacing
913-029	0.50	Pump regulator, replacing
914-041	0.80	Proportional solenoid valve (power shift), replacing
914-051	0.30	Accumulator, replacing
914-060	0.70	Servo pump, replacing
914-081	1.75	Remote control valve (lever), replacing

Op.no.	time (h)	Notes
914-084	1.75	Remote control valve (pedal), replacing
914-091	1.00	Solenoid valve, replacing
916-096	0.80	Hammer and shear pedal valve (RCV), replacing
92		MECHANICAL EQUIPMENT/ATTACHMENT
924-005	0.80	Quickfit, removal
924-006	1.00	Quickfit, installation
925-011	1.25	Bucket assembly, replacing
925-012	0.60	Bucket assembly, removal
925-013	1.00	Bucket assembly, installation
97		UNIT, DIGGING
974-010	12.00	Boom, replacing
974-013	4.50	Boom, removal
974-014	4.00	Boom, installation
974-021	3.00	Boom cylinder, replacing
974-031	1.50	Boom cylinder, removal
974-032	1.25	Boom cylinder, installation
974-038	3.50	Lower boom cylinder bushing, replacing
974-039	3.50	Upper boom cylinder bushing, replacing
975-006	1.50	Dipper arm connecting rod, removal
975-007	1.50	Dipper arm connecting rod, installation
975-011	3.00	Dipper arm, removal
975-012	3.00	Dipper arm, installation
975-014	1.25	Dipper arm cylinder, removal
975-015	1.50	Dipper arm cylinder, installation
975-024	1.25	Dipper arm connecting rod, replacing
975-025	3.00	Dipper arm cylinder, replacing
975-028	1.00	Connecting rod yoke, replacing
975-032	1.25	Connecting rod yoke, removal
975-035	1.25	Connecting rod yoke, installation
975-039	8.00	Dipper arm, replacing
975-040	3.00	Dipper arm cylinder bushing on boom, replacing
975-061	2.50	Bucket cylinder, replacing
975-062	1.25	Bucket cylinder, removal
975-065	1.50	Bucket cylinder, installation

Op.no.	time (h)		Notes

Op.no.	time (h)		Notes
1		STANDARD PARTS, SERVICE	
17		SERVICE	
173-002	0.80	Maintenance service, daily	210001 - 220000 220001 - 230000
173-004	1.50	Maintenance service, every 50 hours	210001 - 220000 220001 - 230000
173-007	2.50	Maintenance service, every 250 hours	210001 - 220000 220001 - 230000
173-010	4.50	Maintenance service, every 500 hours	210001 - 220000 220001 - 230000
173-012	6.50	Maintenance service, every 1000 hours	210001 - 220000 220001 - 230000
173-014	11.00	Maintenance service, every 2000 hours	210001 - 220000 220001 - 230000
173-018	12.00	Maintenance service, every 4000 hours	210001 - 220000 220001 - 230000
173-019	3.00	Maintenance service, every 4500 hours	210001 - 210373
173-019	0.40	Maintenance service, every 4500 hours	210374 - 220000 220001 - 230000
173-022	3.00	Maintenance service, every 6000 hours	210001 - 210373
173-022	0.60	Maintenance service, every 6000 hours	210001 - 210373
173-040	1.75	Maintenance service, first 500 hours	210001 - 220000 220001 - 230000
173-079	0.90	Swing motor gearbox, changing oil	
173-101	0.50	Track motor gearbox, changing oil	
173-401	0.60	Engine oil and filter, changing	210001 - 220000 220001 - 230000
173-412	0.20	Hydraulic oil tank breather filter, replacing	
173-451	1.25	Hydraulic oil, changing	
173-649	0.20	Hydraulic oil return filter, replacing	
2		ENGINE WITH MOUNTING AND EQUIPMENT	
20		GENERAL	
200-068	1.50	E-ECU, MID 128, changing non-programmed ECU	210001 - 220000 220001 - 230000
200-070	1.00	E-ECU, MID 128, changing pre-programmed ECU	210001 - 220000 220001 - 230000
21		ENGINE	
210-002	4.00	Compression test	210001 - 220000 220001 - 230000
210-070	4.50	Engine, removing	210001 - 220000 220001 - 230000
210-072	5.00	Engine, installing	210001 - 220000

Op.no.	time (h)		Notes
			220001 - 230000
214-012	3.00	Valves, adjusting	210001 - 220000 220001 - 230000
217-005	1.50	Oil level sensor, changing	210001 - 220000 220001 - 230000
22		LUBRICATING SYSTEM	
221-022	0.90	Lubrication oil pressure, checking with pressure gauge	210001 - 220000 220001 - 230000
23		FUEL SYSTEM	
230-001	0.50	Carbon dioxide in fuel system, check	
233-001	0.30	Fuel system, bleeding	210001 - 220000 220001 - 230000
233-004	0.60	Feed pump, checking feed pressure	210001 - 220000 220001 - 230000
234-041	0.40	Fuel filling pump, removing	
234-042	0.50	Fuel filling pump, installing	
237-124	0.70	High pressure fuel system, pressure relief	210001 - 220000 220001 - 230000
25		INLET SYSTEM; EXHAUST SYSTEM	
252-021	0.60	Exhaust pipe, flexible tube, replacing	210001 - 220000 220001 - 230000
254-001	2.50	Diesel particulate filter, check and clean	210001 - 220000 220001 - 230000
254-022	0.90	ACM (After treatment control module), replacing, non-programmed	210001 - 220000 220001 - 230000
254-023	0.80	ACM (After treatment control module), replacing, pre-programmed	210001 - 220000 220001 - 230000
254-031	0.90	Air pump, replacing	210001 - 220000 220001 - 230000
254-033	1.50	Burner, replacing	210001 - 220000 220001 - 230000
254-046	0.40	Spark plug, replacing	210001 - 220000 220001 - 230000
254-047	0.40	Spark plug, checking	210001 - 220000 220001 - 230000
254-056	0.50	NOx sensor, replacing	210001 - 220000 220001 - 230000
254-066	0.40	Exhaust Aftertreatment System, T-junction, replacing	210001 - 220000 220001 - 230000
255-071	2.50	Turbocharger, replacing	210001 - 220000 220001 - 230000
256-001	0.20	Air cleaner, cleaning filter element	
256-003	0.10	Air cleaner, primary filter replacing	
256-004	0.10	Air cleaner, secondary filter replacing	
256-006	0.70	Preheating coil, replacing	210001 - 220000

Op.no.	time (h)		Notes
			220001 - 230000
258-002	4.00	Intercooler, replacing	210001 - 220000 220001 - 230000
26		COOLING SYSTEM	
260-001	0.70	Carbon dioxide in coolant system, checking	
261-002	0.10	Coolant, checking anti-freeze resistance	
261-004	0.50	Coolant, changing	210001 - 220000 220001 - 230000
261-008	4.50	Radiator, replacing	210001 - 220000 220001 - 230000
261-016	0.80	Radiator hoses all, replacing	210001 - 220000 220001 - 230000
261-018	0.90	Expansion tank, replacing	210001 - 220000 220001 - 230000
262-098	0.80	Thermostat, replacing	210001 - 220000 220001 - 230000
263-012	0.50	Fan belt and/or alternator belt, replacing	210001 - 220000 220001 - 230000
263-022	0.50	Fan belt and/or alternator-, compressor belt, replacing all belts	210001 - 220000 220001 - 230000
29		Miscellaneous	
293-001	3.00	EGR cooler, replacing	210001 - 220000 220001 - 230000
293-004	3.00	EGR cooler, cleaning	210001 - 220000 220001 - 230000
293-005	3.00	EGR valve, replacing	210001 - 220000 220001 - 230000
3		ELEC. SYSTEM; WARNING SYSTEM; INFORMATION SYSTEM; INSTRUMENTS	
30		GENERAL	
300-072	1.25	I-ECU, MID 140, changing non-programmed ECU	
300-074	0.80	I-ECU, MID 140, changing pre-programmed ECU	
31		BATTERY	
311-001	0.80	Battery charging capacity, checking	
311-001	0.70	Battery charging capacity, checking	230001 - 240000 240001 - 260000 270001 - 310000 260001 - 270000
311-002	1.00	Batteries, replacing	
311-002	1.00	Batteries, replacing	230001 - 240000 240001 - 260000 270001 - 310000

Op.no.	time (h)		Notes
			260001 - 270000
311-006	0.60	Earth lead to battery, replacing	
311-006	0.60	Earth lead to battery, replacing	230001 - 240000 240001 - 260000 270001 - 310000 260001 - 270000
32		ALTERNATOR; CHARGE REGULATOR	
321-002	0.70	Alternator, replacing incl function check	230001 - 240000 240001 - 260000 270001 - 310000 260001 - 270000
321-075	0.50	Alternator, test	
33		STARTING SYSTEM	
331-018	1.25	Starter motor, replacing	230001 - 240000 240001 - 260000 270001 - 310000 260001 - 270000
331-018	1.25	Starter motor, replacing	
331-021	0.30	Starter motor, tests	
331-081	0.30	Starter relay, replacing	230001 - 240000 240001 - 260000 270001 - 310000 260001 - 270000
331-081	0.30	Starter relay, replacing	
334-002	0.70	Starter switch, testing	
35		LIGHTING	
356-056	0.50	Work lighting, replacing one head lamp assy	
36		OTHER ELECTRICAL EQUIPMENT	
362-002	0.30	Horn, replacing	
362-041	0.30	Rotating beacon, replacing	
362-051	0.50	Travel alarm, replacing	
363-002	1.25	Windscreen wiper front, replacing motor	
363-003	0.90	Windscreen wiper, replacing switch	
363-004	0.60	Windscreen flusher pump, replacing	230001 - 240000 240001 - 260000 270001 - 310000 260001 - 270000
363-004	0.50	Windscreen flusher pump, replacing	
363-091	0.50	Windscreen wiper, replacing controller	
364-003	0.60	Control lockout lever switch, replacing	
364-014	0.50	Ignition switch, replacing	
364-056	0.80	Pre-heating relay, replacing	
366-064	1.75	V-ECU, MID 187, changing non-programmed ECU	

Op.no.	time (h)	Notes	
366-066	1.25	V-ECU, MID 187, changing pre-programmed ECU	
367-075	0.90	Engine speed control switch, replacing	
37		CABLE; FUSE; RELAY	
371-043	0.80	Battery disconnecter, replacing	
371-090	2.00	Engine wire harness, replacing	
372-002	0.50	Electrical distribution box, circuit board replacing	
38		INSTRUMENT; SENSOR; WARNING AND INFORMATION SYSTEM	
383-001	0.30	Hour meter, replacing	
386-006	0.50	Engine temperature sensor, replacing	230001 - 240000 240001 - 260000 270001 - 310000 260001 - 270000
386-006	1.50	Engine temperature sensor, replacing	
386-007	0.60	Engine oil pressure sensor, replacing	230001 - 240000 240001 - 260000 270001 - 310000 260001 - 270000
386-007	0.60	Engine oil pressure sensor, replacing	
386-011	0.30	Fuel level sender, replacing	
386-017	0.50	Hydraulic oil temperature sensor, replacing	
386-038	0.60	Engine rotation speed sensor, replacing	230001 - 240000 240001 - 260000 270001 - 310000 260001 - 270000
386-038	0.60	Engine rotation speed sensor, replacing	
386-088	0.40	Engine rotation speed sensor (camshaft), replacing	230001 - 240000 240001 - 260000 270001 - 310000 260001 - 270000
386-088	0.90	Engine rotation speed sensor (camshaft), replacing	
39		MISCELLANEOUS	
393-001	0.50	Voltage converter, replacing	
393-021	0.60	Radio, replacing	
395-021	0.70	Antenna, replacing	
395-031	0.40	Speaker, replacing	
398-001	0.60	CareTrack antenna, replacing	
398-002	0.90	W-ECU, MID142, changing pre-programmed ECU	210127 - 270000
398-002	1.00	W-ECU, MID142, changing pre-programmed ECU	210001 - 210126
398-003	1.50	W-ECU, MID142, changing non-programmed ECU	210127 - 270000
398-003	1.50	W-ECU, MID142, changing non-programmed ECU	210001 - 210126
398-004	0.50	CareTrack battery, replacing	

Op.no.	time (h)		Notes
4		POWER TRANSMISSION	
43		GEARBOX,	
431-021	6.50	Swing gearbox, replacing	
431-031	3.50	Pump gearbox coupling assembly, replacing	
431-115	1.75	Track gearbox (removed), replacing floating seal	
431-115	1.25	Track gearbox (removed), replacing floating seal	
431-117	1.00	Track gearbox, replacing cover	210013 - 220000
431-117	1.25	Track gearbox, replacing cover	210001 - 210012
431-127	6.00	Track unit, replacing	
44		HYDROSTATIC DRIVE	
441-021	2.50	Swing motor, replacing	
441-022	0.80	Swing motor relief valve, replacing	
441-024	1.50	Swing motor, replacing plate (brake)	
441-025	1.50	Swing motor, replacing brake piston seal	
441-026	0.70	Swing motor removed, replacing seal	
441-112	0.70	Track motor relief valve, replacing	220001 - 230000 210001 - 210441
443-037	5.50	Center passage, replacing	
443-038	7.00	Center passage, replacing seal kit	
49		MISCELLANEOUS	
492-021	11.00	Swing ring gear, replacing	
492-031	3.00	Swing ring gear outer seal, replacing	210001 - 210257
492-031	3.00	Swing ring gear outer seal, replacing	210258 - 220000
492-032	9.50	Swing ring gear inner seal, replacing	210001 - 210257
492-032	9.00	Swing ring gear inner seal, replacing	210258 - 220000
492-091	0.40	Ring gear grease pipe, replacing	
7		FRAME; SPRINGS; DAMPING; AXLE SUSPENSION; WHEEL/TRACK UNIT	
71		FRAME	
710-001	3.50	Superstructure, removing	
710-002	4.50	Superstructure, installing	
716-001	0.90	Counterweight, removing	
716-002	0.90	Counterweight, fitting	
77		WHEELS; TRACKS; TYRE; HUB; DRUM	
775-011	3.00	Front idler, replacing one	
775-034	1.25	Track chain assembly, removing	
775-035	1.75	Track chain assembly, installing	
775-051	1.00	Top roller, replacing one	

Op.no.	time (h)		Notes
775-061	1.50	Bottom roller, replacing one	
775-066	3.00	Bottom roller, replacing seal	
775-081	4.00	Track recoil spring (tensioner) assembly, replacing	
8		MACHINERY HOUSE; CAB; EXTERIOR TRIM PARTS ANYWHERE	
81		CAB, NAKED; CANOPY	
810-001	1.75	Cab, removing	
810-001	1.75	Cab, removing	
810-002	2.50	Cab, installing	
810-070	1.00	Electric pedal control on X1 (on/off), replacing	
810-071	0.90	Electric pedal control on X1 (proportional), replacing	
82		ENGINE HOOD; MUDGUARD; FOOT STEP	
821-005	0.90	Engine hood, replacing	
84		TRIM PART, OUTSIDE; GLASS; SEALING MOULDING	
841-061	0.30	Rear-view mirror, changing	
843-002	1.50	Windscreen, replacing	
843-012	4.00	Rear window, replacing	
843-013	4.50	Side window, replacing	
843-048	0.70	Door window, replacing	
85		CAB INTERIOR/UPHOLSTERY	
852-008	1.25	Seat, replacing	
852-012	1.75	Longitudinal adjustment cable, replacing	
852-013	0.60	Longitudinal suspension cable, replacing	
852-089	0.30	Seat cushion, replacing	
852-090	0.60	Backrest, replacing	
852-091	2.50	Seat support, replacing	
87		AIR CONDITIONING UNIT	
870-001	5.00	Cooler and Heater assembly, replacing	210001 - 220000 220001 - 230000
870-010	0.70	ECC, MID 146, changing pre-programmed ECU	
870-011	1.00	ECC, MID 146, changing non-programmed ECU	
872-001	0.50	Cab filter, replacing	
873-004	3.00	Heater core, replacing	
873-006	0.80	Fan motor, replacing	
873-011	0.70	Air mix door actuator, replacing	
874-006	1.75	Compressor, replacing incl draining and filling	210001 - 220000 220001 - 230000

Op.no.	time (h)		Notes
874-010	1.75	Condenser, replacing incl draining and filling	210001 - 220000 220001 - 230000
874-011	1.75	Receiver, replacing incl draining and filling	210001 - 220000 220001 - 230000
874-012	3.00	Evaporator, replacing incl draining and filling	210001 - 220000 220001 - 230000
874-013	3.00	Expansion valve, replacing incl draining and filling	210001 - 220000 220001 - 230000
874-016	0.30	Compressor, replacing magnetic clutch (compressor removed)	
874-094	0.60	Vent actuator, replacing	
874-095	0.60	Mode (foot) actuator, replacing	
874-096	0.60	Intake actuator, replacing	
88		INTERIOR EQUIPMENT	
881-003	1.00	Instrument panel, replacing (left)	
881-005	1.25	Instrument panel, replacing (right)	

9 HYDRAULIC SYSTEM; DIGGING/ HANDLING/ GRADING EQUIPM.; MISC. EQUIP.

91		WORKING HYDRAULICS; SERVO HYDRAULICS	
911-011	4.50	Oil cooler, replacing	
911-015	0.50	Oil level gauge, replacing	
911-024	0.70	Pipe and hose (pump - valve), replacing	
911-033	1.50	Oil cooler line bypass valve (check valve), replacing	
911-038	3.50	Hydraulic oil tank, replacing	
911-040	0.40	Hydraulic oil tank, vacuum-pumping, connecting and disconnecting pump	
911-051	0.20	Breather, replacing	
912-001	8.00	Control valve, replacing	
912-067	0.50	Main pressure relief valve, replacing	
912-071	0.80	Rupture valve, replacing (boom cylinder)	
912-073	0.80	Rupture valve, replacing (dipper arm cylinder)	
912-160	0.80	Port relief valve pressure, checking and adjusting	
913-007	0.30	Hydraulic pump (removed), changing shaft seal	
913-010	3.50	Hydraulic pump, replacing	210001 - 220000 220001 - 230000
913-029	0.40	Pump regulator, replacing	
914-041	0.80	Proportional solenoid valve (power shift), replacing	
914-051	0.50	Accumulator, replacing	210001 - 220000 220001 - 230000
914-060	0.70	Servo pump, replacing	

Op.no.	time (h)		Notes
914-081	1.75	Remote control valve (lever), replacing	
914-084	1.75	Remote control valve (pedal), replacing	
914-091	1.00	Solenoid valve, replacing	210001 - 220000 220001 - 230000
916-096	0.80	Hammer and shear pedal valve (RCV), replacing	
92		MECHANICAL EQUIPMENT/ATTACHMENT	
924-005	0.80	Quickfit, removal	
924-006	1.00	Quickfit, installation	
924-040	0.80	Quickfit, replacing	
925-011	1.25	Bucket assembly, replacing	
925-012	0.60	Bucket assembly, removal	
925-013	1.00	Bucket assembly, installation	
97		UNIT, DIGGING	
974-010	12.00	Boom, replacing	
974-013	4.00	Boom, removal	
974-014	4.00	Boom, installation	
974-021	3.00	Boom cylinder, replacing	
974-031	1.50	Boom cylinder, removal	
974-032	1.50	Boom cylinder, installation	
974-038	3.50	Lower boom cylinder bushing, replacing	
974-039	3.50	Upper boom cylinder bushing, replacing	
975-006	1.50	Dipper arm connecting rod, removal	
975-007	1.50	Dipper arm connecting rod, installation	
975-011	3.00	Dipper arm, removal	
975-012	3.00	Dipper arm, installation	
975-014	1.25	Dipper arm cylinder, removal

2 ENGINE WITH MOUNTING AND EQUIPMENT

20		GENERAL	
200-068	1.50	E-ECU, MID 128, changing non-programmed ECU	210001 - 230000
200-068	1.50	E-ECU, MID 128, changing non-programmed ECU	230001 - 250000
			270001 - 310000
			250001 - 260000
			260001 - 270000
200-070	0.80	E-ECU, MID 128, changing pre-programmed ECU	230001 - 250000
			270001 - 310000
			250001 - 260000
			260001 - 270000
200-070	1.00	E-ECU, MID 128, changing pre-programmed ECU	210001 - 230000
21		ENGINE	
210-002	4.00	Compression test	210001 - 230000
210-070	4.50	Engine, removing	230001 - 250000
			270001 - 310000
			250001 - 260000
			260001 - 270000
210-070	4.50	Engine, removing	210001 - 230000
210-072	5.50	Engine, installing	230001 - 250000
			270001 - 310000
			250001 - 260000
			260001 - 270000
210-072	5.00	Engine, installing	210001 - 230000
214-012	3.00	Valves, adjusting	210001 - 230000
214-012	3.00	Valves, adjusting	230001 - 250000
			280001 - 310000
214-012	3.00	Valves, adjusting	270001 - 280000
			250001 - 260000
			260001 - 270000

Op.no.	time (h)		Notes
217-005	1.50	Oil level sensor, changing	230001 - 250000 270001 - 310000 250001 - 260000 260001 - 270000
217-005	1.50	Oil level sensor, changing	210001 - 230000
22		LUBRICATING SYSTEM	
221-022	0.70	Lubrication oil pressure, checking with pressure gauge	230001 - 250000 270001 - 310000 250001 - 260000 260001 - 270000
221-022	0.90	Lubrication oil pressure, checking with pressure gauge	210001 - 230000
223-006	1.25	Oil cooler, replacing	230001 - 250000 270001 - 310000 250001 - 260000 260001 - 270000
23		FUEL SYSTEM	
230-001	0.50	Carbon dioxide in fuel system, check	
233-001	0.30	Fuel system, bleeding	210001 - 230000
233-001	0.30	Fuel system, bleeding	230001 - 250000 270001 - 310000 250001 - 260000 260001 - 270000
233-004	0.60	Feed pump, checking feed pressure	230001 - 250000 270001 - 310000 250001 - 260000 260001 - 270000
233-004	0.60	Feed pump, checking feed pressure	210001 - 230000
234-041	0.40	Fuel filling pump, removing	
234-042	0.50	Fuel filling pump, installing	
237-124	0.70	High pressure fuel system, pressure relief	210001 - 230000
25		INLET SYSTEM; EXHAUST SYSTEM	
252-020	1.00	Silencer, replacing	230001 - 250000 270001 - 310000 250001 - 260000 260001 - 270000
252-021	1.00	Exhaust pipe, flexible tube, replacing	230001 - 250000 270001 - 310000 250001 - 260000 260001 - 270000
252-021	0.60	Exhaust pipe, flexible tube, replacing	210001 - 230000
254-001	2.50	Diesel particulate filter, check and clean	210001 - 230000
254-022	0.90	ACM (After treatment control module), replacing, non-programmed	210001 - 230000
254-023	0.80	ACM (After treatment control module), replacing, pre-programmed	210001 - 230000

Op.no.	time (h)		Notes
254-031	0.90	Air pump, replacing	210001 - 230000
254-033	1.50	Burner, replacing	210001 - 230000
254-046	0.40	Spark plug, replacing	210001 - 230000
254-047	0.40	Spark plug, checking	210001 - 230000
254-056	0.50	NOx sensor, replacing	210001 - 230000
254-066	0.40	Exhaust Aftertreatment System, T-junction, replacing	210001 - 230000
255-071	2.50	Turbocharger, replacing	210001 - 230000
255-071	2.50	Turbocharger, replacing	230001 - 250000 270001 - 310000 250001 - 260000 260001 - 270000
256-001	0.20	Air cleaner, cleaning filter element	
256-003	0.10	Air cleaner, primary filter replacing	
256-004	0.10	Air cleaner, secondary filter replacing	
256-006	0.70	Preheating coil, replacing	210001 - 230000
256-006	0.50	Preheating coil, replacing	230001 - 250000 270001 - 310000 250001 - 260000 260001 - 270000
258-002	4.00	Intercooler, replacing	210001 - 230000
258-002	4.00	Intercooler, replacing	230001 - 250000 270001 - 310000 250001 - 260000 260001 - 270000
26		COOLING SYSTEM	
260-001	0.70	Carbon dioxide in coolant system, checking	
261-002	0.10	Coolant, checking anti-freeze resistance	
261-004	0.50	Coolant, changing	230001 - 250000 270001 - 310000 250001 - 260000 260001 - 270000
261-004	0.50	Coolant, changing	210001 - 230000
261-008	4.50	Radiator, replacing	210001 - 230000
261-008	4.50	Radiator, replacing	230001 - 250000 270001 - 310000 250001 - 260000 260001 - 270000
261-016	0.80	Radiator hoses all, replacing	230001 - 250000 270001 - 310000 250001 - 260000 260001 - 270000
261-016	0.80	Radiator hoses all, replacing	210001 - 230000
261-018	0.90	Expansion tank, replacing	210001 - 230000
261-018	0.80	Expansion tank, replacing	230001 - 250000 270001 - 310000 250001 - 260000

Op.no.	time (h)		Notes
			260001 - 270000
262-098	0.80	Thermostat, replacing	210001 - 230000
262-098	0.80	Thermostat, replacing	230001 - 250000
			270001 - 310000
			250001 - 260000
			260001 - 270000
263-012	0.80	Fan belt and/or alternator belt, replacing	230001 - 250000
			270001 - 310000
			250001 - 260000
			260001 - 270000
263-012	0.50	Fan belt and/or alternator belt, replacing	210001 - 230000
263-022	0.50	Fan belt and/or alternator-, compressor belt, replacing all belts	210001 - 230000
263-022	0.50	Fan belt and/or alternator-, compressor belt, replacing all belts	230001 - 250000
			270001 - 310000
			250001 - 260000
			260001 - 270000
29		Miscellaneous	
293-001	3.00	EGR cooler, replacing	210001 - 230000
293-004	3.00	EGR cooler, cleaning	210001 - 230000
293-005	3.00	EGR valve, replacing	210001 - 230000

3 ELEC. SYSTEM; WARNING SYSTEM; INFORMATION SYSTEM; INSTRUMENTS

30 GENERAL

300-072	1.25	I-ECU, MID 140, changing non-programmed ECU	
300-074	0.80	I-ECU, MID 140, changing pre-programmed ECU	

31 BATTERY

311-001	0.80	Battery charging capacity, checking	
311-001	0.70	Battery charging capacity, checking	270001 - 310000
			250001 - 260000
			260001 - 270000
			230001 - 250000
311-002	1.00	Batteries, replacing	
311-002	1.00	Batteries, replacing	270001 - 310000
			250001 - 260000
			260001 - 270000
			230001 - 250000
311-006	0.60	Earth lead to battery, replacing	
311-006	0.60	Earth lead to battery, replacing	270001 - 310000
			250001 - 260000
			260001 - 270000
			230001 - 250000

Op.no.	time (h)		Notes
32		ALTERNATOR; CHARGE REGULATOR	
321-002	0.70	Alternator, replacing incl function check	270001 - 310000 250001 - 260000 260001 - 270000 230001 - 250000
321-075	0.50	Alternator, test	
33		STARTING SYSTEM	
331-018	1.25	Starter motor, replacing	270001 - 310000 250001 - 260000 260001 - 270000 230001 - 250000
331-018	1.25	Starter motor, replacing	
331-021	0.30	Starter motor, tests	
331-081	0.30	Starter relay, replacing	270001 - 310000 250001 - 260000 260001 - 270000 230001 - 250000
331-081	0.30	Starter relay, replacing	
334-002	0.70	Starter switch, testing	
35		LIGHTING	
356-056	0.50	Work lighting, replacing one head lamp assy	
36		OTHER ELECTRICAL EQUIPMENT	
362-002	0.30	Horn, replacing	
362-041	0.30	Rotating beacon, replacing	
362-051	0.50	Travel alarm, replacing	
363-002	1.25	Windscreen wiper front, replacing motor	
363-003	0.90	Windscreen wiper, replacing switch	
363-004	0.60	Windscreen flusher pump, replacing	270001 - 310000 250001 - 260000 260001 - 270000 230001 - 250000
363-004	0.50	Windscreen flusher pump, replacing	
363-091	0.50	Windscreen wiper, replacing controller	
364-003	0.60	Control lockout lever switch, replacing	
364-014	0.50	Ignition switch, replacing	
364-056	0.80	Pre-heating relay, replacing	
366-064	1.75	V-ECU, MID 187, changing non-programmed ECU	
366-066	1.25	V-ECU, MID 187, changing pre-programmed ECU	
367-075	0.90	Engine speed control switch, replacing	
37		CABLE; FUSE; RELAY	
371-043	0.80	Battery disconnecter, replacing	270001 - 310000
371-043	0.80	Battery disconnecter, replacing	

Op.no.	time (h)		Notes
371-090	2.00	Engine wire harness, replacing	
371-090	1.50	Engine wire harness, replacing	270001 - 310000
372-002	0.50	Electrical distribution box, circuit board replacing	
38		INSTRUMENT; SENSOR; WARNING AND INFORMATION SYSTEM	
383-001	0.30	Hour meter, replacing	
386-006	0.50	Engine temperature sensor, replacing	270001 - 310000 250001 - 260000 260001 - 270000 230001 - 250000
386-006	1.50	Engine temperature sensor, replacing	
386-007	0.60	Engine oil pressure sensor, replacing	270001 - 310000 250001 - 260000 260001 - 270000 230001 - 250000
386-007	0.60	Engine oil pressure sensor, replacing	
386-011	0.30	Fuel level sender, replacing	
386-017	0.50	Hydraulic oil temperature sensor, replacing	
386-038	0.60	Engine rotation speed sensor, replacing	270001 - 310000 250001 - 260000 260001 - 270000 230001 - 250000
386-038	0.60	Engine rotation speed sensor, replacing	
386-088	0.40	Engine rotation speed sensor (camshaft), replacing	270001 - 310000 250001 - 260000 260001 - 270000 230001 - 250000
386-088	0.90	Engine rotation speed sensor (camshaft), replacing	
39		MISCELLANEOUS	
393-001	0.50	Voltage converter, replacing	
393-021	0.60	Radio, replacing	
395-021	0.70	Antenna, replacing	
395-031	0.40	Speaker, replacing	
398-001	0.60	CareTrack antenna, replacing	
398-002	1.00	W-ECU, MID142, changing pre-programmed ECU	210001 - 210319
398-002	0.90	W-ECU, MID142, changing pre-programmed ECU	210320 - 270000
398-003	1.50	W-ECU, MID142, changing non-programmed ECU	210320 - 270000
398-003	1.50	W-ECU, MID142, changing non-programmed ECU	210001 - 210319
398-004	0.50	CareTrack battery, replacing	

Op.no.	time (h)		Notes
4		POWER TRANSMISSION	
43		GEARBOX,	
431-021	6.50	Swing gearbox, replacing	
431-031	3.50	Pump gearbox coupling assembly, replacing	
431-053	6.50	Swing unit, replacing	
431-115	1.25	Track gearbox (removed), replacing floating seal	
431-117	1.50	Track gearbox, replacing cover	
431-127	6.00	Track unit, replacing	
44		HYDROSTATIC DRIVE	
441-021	2.50	Swing motor, replacing	
441-022	0.70	Swing motor relief valve, replacing	
441-024	1.50	Swing motor, replacing plate (brake)	
441-025	1.50	Swing motor, replacing brake piston seal	
441-026	0.70	Swing motor removed, replacing seal	
441-112	0.70	Track motor relief valve, replacing	
443-037	5.50	Center passage, replacing	
443-038	7.00	Center passage, replacing seal kit	
49		MISCELLANEOUS	
492-021	11.00	Swing ring gear, replacing	
492-031	3.00	Swing ring gear outer seal, replacing	210001 - 210615
492-031	3.00	Swing ring gear outer seal, replacing	210616 - 230000
492-032	9.50	Swing ring gear inner seal, replacing	210001 - 210615
492-032	9.00	Swing ring gear inner seal, replacing	210616 - 230000
492-091	0.40	Ring gear grease pipe, replacing	
7		FRAME; SPRINGS; DAMPING; AXLE SUSPENSION; WHEEL/TRACK UNIT	
71		FRAME	
710-001	3.50	Superstructure, removing	
710-002	4.50	Superstructure, installing	
716-001	0.90	Counterweight, removing	
716-002	0.90	Counterweight, fitting	
77		WHEELS; TRACKS; TYRE; HUB; DRUM	
775-011	3.00	Front idler, replacing one	
775-021	3.50	Sprocket, replacing one	
775-034	1.75	Track chain assembly, removing	
775-035	2.00	Track chain assembly, installing	
775-036	11.00	Track links, replacing	
775-051	1.00	Top roller, replacing one	

Op.no.	time (h)	Notes	
775-061	1.50	Bottom roller, replacing one	
775-066	3.00	Bottom roller, replacing seal	
775-081	4.00	Track recoil spring (tensioner) assembly, replacing	
8		MACHINERY HOUSE; CAB; EXTERIOR TRIM PARTS ANYWHERE	
81		CAB, NAKED; CANOPY	
810-001	1.75	Cab, removing	
810-001	1.75	Cab, removing	
810-002	2.50	Cab, installing	
810-070	1.00	Electric pedal control on X1 (on/off), replacing	
810-071	0.90	Electric pedal control on X1 (proportional), replacing	
82		ENGINE HOOD; MUDGUARD; FOOT STEP	
821-005	0.90	Engine hood, replacing	
84		TRIM PART, OUTSIDE; GLASS; SEALING MOULDING	
841-061	0.30	Rear-view mirror, changing	
843-002	1.50	Windscreen, replacing	
843-012	4.00	Rear window, replacing	
843-013	4.50	Side window, replacing	
843-048	0.70	Door window, replacing	
85		CAB INTERIOR/UPHOLSTERY	
852-008	1.25	Seat, replacing	
852-012	1.75	Longitudinal adjustment cable, replacing	
852-013	0.60	Longitudinal suspension cable, replacing	
852-089	0.30	Seat cushion, replacing	
852-090	0.60	Backrest, replacing	
852-091	2.50	Seat support, replacing	
87		AIR CONDITIONING UNIT	
870-001	5.00	Cooler and Heater assembly, replacing	210001 - 230000
870-001	3.50	Cooler and Heater assembly, replacing	270001 - 310000
			250001 - 260000
			260001 - 270000
			230001 - 250000
870-010	0.70	ECC, MID 146, changing pre-programmed ECU	
870-011	1.00	ECC, MID 146, changing non-programmed ECU	
872-001	0.50	Cab filter, replacing	
873-004	3.00	Heater core, replacing	
873-006	0.80	Fan motor, replacing	

Op.no.	time (h)		Notes
873-011	0.70	Air mix door actuator, replacing	
874-006	2.50	Compressor, replacing incl draining and filling	270001 - 310000 250001 - 260000 260001 - 270000 230001 - 250000
874-006	1.75	Compressor, replacing incl draining and filling	210001 - 230000
874-010	1.75	Condenser, replacing incl draining and filling	210001 - 230000
874-010	1.50	Condenser, replacing incl draining and filling	270001 - 310000 250001 - 260000 260001 - 270000 230001 - 250000
874-011	1.75	Receiver, replacing incl draining and filling	210001 - 230000
874-011	1.75	Receiver, replacing incl draining and filling	270001 - 310000 250001 - 260000 260001 - 270000 230001 - 250000
874-012	3.00	Evaporator, replacing incl draining and filling	270001 - 310000 250001 - 260000 260001 - 270000 230001 - 250000
874-012	3.00	Evaporator, replacing incl draining and filling	210001 - 230000
874-013	3.00	Expansion valve, replacing incl draining and filling	210001 - 230000
874-013	3.00	Expansion valve, replacing incl draining and filling	270001 - 310000 250001 - 260000 260001 - 270000 230001 - 250000
874-016	0.30	Compressor, replacing magnetic clutch (compressor removed)	
874-094	0.60	Vent actuator, replacing	
874-095	0.60	Mode (foot) actuator, replacing	
874-096	0.60	Intake actuator, replacing	
88		INTERIOR EQUIPMENT	
881-003	1.00	Instrument panel, replacing (left)	
881-005	1.25	Instrument panel, replacing (right)	
9		HYDRAULIC SYSTEM; DIGGING/ HANDLING/ GRADING EQUIPM.; MISC. EQUIP.

85		CAB INTERIOR/UPHOLSTERY
852-008	1.25	Seat, replacing
852-012	1.75	Longitudinal adjustment cable, replacing
852-013	0.60	Longitudinal suspension cable, replacing
852-089	0.30	Seat cushion, replacing
852-090	0.60	Backrest, replacing
852-091	2.50	Seat support, replacing
87		AIR CONDITIONING UNIT
870-001	3.50	Cooler and Heater assembly, replacing
870-017	1.75	CCM, changing non-programmed ECU
870-018	1.75	CCM, changing pre-programmed ECU
872-001	0.50	Cab filter, replacing
873-004	3.00	Heater core, replacing
873-006	0.80	Fan motor, replacing
873-011	0.50	Air mix door actuator, replacing
874-006	2.00	Compressor, replacing incl draining and filling
874-010	1.50	Condenser, replacing incl draining and filling
874-011	1.75	Receiver, replacing incl draining and filling
874-012	4.00	Evaporator, replacing incl draining and filling
874-013	4.00	Expansion valve, replacing incl draining and filling
874-016	0.30	Compressor, replacing magnetic clutch (compressor removed)
874-094	0.50	Vent actuator, replacing
874-095	0.60	Mode (foot) actuator, replacing
874-096	0.50	Intake actuator, replacing
88		INTERIOR EQUIPMENT
881-003	0.60	Instrument panel, replacing (left)
881-005	0.80	Instrument panel, replacing (right)
9		HYDRAULIC SYSTEM; DIGGING/ HANDLING/ GRADING EQUIPM.; MISC. EQUIP.
91		WORKING HYDRAULICS; SERVO HYDRAULICS
911-011	5.50	Oil cooler, replacing
911-015	0.40	Oil level gauge, replacing
911-033	1.25	Oil cooler line bypass valve (check valve), replacing
911-034	4.00	Oil cooler fan motor, replacing

Op.no.	time (h)	Notes
911-035	1.75	Oil cooler fan pump, replacing
911-040	0.40	Hydraulic oil tank, vacuum-pumping, connecting and disconnecting pump
911-051	0.20	Breather, replacing
912-001	8.50	Control valve, replacing
912-067	0.60	Main pressure relief valve, replacing
912-071	0.80	Rupture valve, replacing (boom cylinder)
912-073	0.90	Rupture valve, replacing (dipper arm cylinder)
912-160	0.80	Port relief valve pressure, checking and adjusting
913-007	0.30	Hydraulic pump (removed), changing shaft seal
913-010	4.50	Hydraulic pump, replacing
913-029	0.40	Pump regulator, replacing
914-041	0.50	Proportional solenoid valve (power shift), replacing
914-051	0.40	Accumulator, replacing
914-060	1.75	Servo pump, replacing
914-081	1.75	Remote control valve (lever), replacing
914-084	1.75	Remote control valve (pedal), replacing
914-091	1.25	Solenoid valve, replacing
916-096	0.80	Hammer and shear pedal valve (RCV), replacing
92		MECHANICAL EQUIPMENT/ATTACHMENT
924-040	1.25	Quickfit, replacing
924-040	1.25	Quickfit, replacing
97		UNIT, DIGGING
974-010	12.00	Boom, replacing
974-021	3.00	Boom cylinder, replacing
974-038	3.50	Lower boom cylinder bushing, replacing
974-039	3.50	Upper boom cylinder bushing, replacing
975-024	2.00	Dipper arm connecting rod, replacing
975-025	2.50	Dipper arm cylinder, replacing
975-028	1.75	Connecting rod yoke, replacing
975-039	6.50	Dipper arm, replacing
975-040	3.50	Dipper arm cylinder bushing on boom, replacing
975-042	3.50	Dipper arm cylinder bushing on dipper arm, replacing
975-061	2.00	Bucket cylinder, replacing
975-072	3.50	Bucket cylinder bushing on dipper arm, changing
975-073	3.50	Bucket cylinder bushing lever-link, replacing

Op.no.	time (h)	Notes
1		STANDARD PARTS, SERVICE
17		SERVICE
173-003	0.90	Maintenance service, every 10 hours
173-004	1.25	Maintenance service, every 50 hours
173-007	1.50	Maintenance service, every 250 hours
173-010	3.50	Maintenance service, every 500 hours
173-012	5.00	Maintenance service, every 1000 hours
173-014	7.50	Maintenance service, every 2000 hours
173-018	10.00	Maintenance service, every 4000 hours
173-019	1.25	Maintenance service, every 4500 hours
173-022	1.50	Maintenance service, every 6000 hours
173-040	2.00	Maintenance service, first 500 hours
173-303	0.30	Lubrication, every 50 hours
173-319	1.25	Diesel particulate filter, checking and cleaning
173-332	0.40	MATRIS and Tech Tool, reading
2		ENGINE WITH MOUNTING AND EQUIPMENT
20		GENERAL
200-066	2.50	ECM (Engine control module), replacing pre-programmed
200-067	3.00	ECM (Engine control module), replacing non-programmed
200-200	0.60	Engine belts, replacing
21		ENGINE
210-002	11.00	Compression test
210-070	5.50	Engine, removing
210-072	6.50	Engine, installing
210-092	0.70	Engine rotation speed sensor (camshaft), replacing
210-093	0.60	Engine rotation speed sensor (crank shaft), replacing
212-071	1.00	Crankcase ventilation separator, replacing
214-012	2.50	Valves, adjusting
214-092	9.50	Rocker arms, replacing
215-042	6.50	Camshaft, replacing
215-043	1.50	Camshaft setting, checking
217-005	1.00	Oil level sensor, changing
22		LUBRICATING SYSTEM
221-022	0.50	Lubrication oil pressure, checking with pressure gauge

Op.no.	time (h)	Notes
23		FUEL SYSTEM
230-001	0.50	Carbon dioxide in fuel system, check
230-002	0.90	Air in fuel system, checking
233-001	0.30	Fuel system, bleeding
233-004	0.20	Feed pump, checking feed pressure
237-002	9.50	Injectors, replacing all
237-010	1.50	Unit injectors, adjusting pretension
237-017	8.50	Injector sleeves, replacing
25		INLET SYSTEM; EXHAUST SYSTEM
252-021	0.80	Exhaust pipe, flexible tube, replacing
254-001	1.25	Diesel particulate filter, check and clean
254-022	1.00	ACM (After treatment control module), replacing, non-programmed
254-023	0.60	ACM (After treatment control module), replacing, pre-programmed
254-034	2.50	Compressor, replacing
254-056	0.60	NOx sensor, replacing
254-059	0.70	Inlet throttle, replacing
254-064	1.00	High pressure air system, pressure, checking
254-069	0.40	Exhaust aftertreatment system fuel flow, checking
254-101	1.25	AdBlue®/DEF pump, replacing
254-102	0.80	AdBlue®/DEF nozzle, replacing
254-103	1.50	AdBlue®/DEF tank, tank armature, replacing
254-104	0.30	Aftertreatment fuel nozzle, replacing
254-106	1.50	AdBlue®/DEF hoses, replacing
254-107	2.50	AdBlue®/DEF pump unit, replacing
254-108	1.00	Aftertreatment fuel dosing unit, replacing
254-109	0.20	Aftertreatment fuel nozzle, cleaning
254-111	1.50	Muffler, replacing
254-112	2.50	AdBlue®/DEF tank, replacing
254-114	1.50	AdBlue®/DEF, draining
254-117	1.25	AdBlue®/DEF pump unit, components, replacing
254-118	0.80	SCR system, dosing test
254-121	0.50	AdBlue®/DEF quality, checking
255-003	1.25	Actuator, variable turbocharger, replacing
255-071	2.50	Turbocharger, replacing
258-002	5.50	Intercooler, replacing
26		COOLING SYSTEM
260-001	0.70	Carbon dioxide in coolant system, checking
261-002	0.10	Coolant, checking anti-freeze resistance
261-004	0.70	Coolant, changing
261-008	5.50	Radiator, replacing

Op.no.	time (h)	Notes
29		Miscellaneous
293-001	4.50	EGR cooler, replacing
293-002	2.00	EGR cooler, pressure test
293-004	6.50	EGR cooler, cleaning
293-005	1.25	EGR valve, replacing
293-007	0.40	EGR pressure sensor, replacing
293-010	0.70	EGR Venturi tube, replacing
293-013	1.00	EGR venturi tube, cleaning
 3		 ELEC. SYSTEM; WARNING SYSTEM; INFORMATION SYSTEM; INSTRUMENTS
31		BATTERY
311-001	0.60	Battery charging capacity, checking
311-002	0.90	Batteries, replacing
311-006	0.50	Earth lead to battery, replacing
32		ALTERNATOR; CHARGE REGULATOR
321-002	0.90	Alternator, replacing incl function check
321-075	0.50	Alternator, test
33		STARTING SYSTEM
331-018	1.25	Starter motor, replacing
331-021	0.30	Starter motor, tests
334-002	0.70	Starter switch, testing
35		LIGHTING
356-056	0.50	Work lighting, replacing one head lamp assy
36		OTHER ELECTRICAL EQUIPMENT
362-002	0.40	Horn, replacing
362-041	0.40	Rotating beacon, replacing
362-051	0.50	Travel alarm, replacing
363-002	1.25	Windscreen wiper front, replacing motor
363-003	0.40	Windscreen wiper, replacing switch
363-004	0.60	Windscreen flusher pump, replacing
364-003	0.80	Control lockout lever switch, replacing
364-014	0.50	Ignition switch, replacing
364-056	0.90	Pre-heating relay, replacing
366-103	0.80	HMICU, changing pre-programmed ECU
366-104	1.50	HMICU, changing non-programmed ECU
366-105	0.70	GPMECU1, changing pre-programmed ECU
366-106	1.25	GPMECU1, changing non-programmed ECU

Op.no.	time (h)	Notes
37		CABLE; FUSE; RELAY
371-090	3.50	Engine wire harness, replacing
371-092	0.70	Electrical battery disconnect switch, replacing
372-002	0.80	Electrical distribution box, circuit board replacing
38		INSTRUMENT; SENSOR; WARNING AND INFORMATION SYSTEM
383-001	0.30	Hour meter, replacing
386-006	0.70	Engine temperature sensor, replacing
386-007	0.80	Engine oil pressure sensor, replacing
386-011	0.60	Fuel level sender, replacing
386-017	0.50	Hydraulic oil temperature sensor, replacing
39		MISCELLANEOUS
393-001	0.80	Voltage converter, replacing
393-021	0.70	Radio, replacing
395-021	0.50	Antenna, replacing
395-031	0.40	Speaker, replacing
398-001	0.60	CareTrack antenna, replacing
398-004	0.50	CareTrack battery, replacing
398-005	1.25	W-ECU, replacing, non-programmed
398-006	0.90	W-ECU, replacing, pre-programmed
4		POWER TRANSMISSION
43		GEARBOX,
431-021	6.50	Swing gearbox, replacing
431-026	1.75	Swing gearbox removed, replacing seal
431-027	2.50	Swing gearbox removed, replacing shaft
431-031	4.00	Pump gearbox coupling assembly, replacing
431-053	6.50	Swing unit, replacing
431-115	1.75	Track gearbox (removed), replacing floating seal
431-115	1.25	Track gearbox (removed), replacing floating seal
431-117	1.50	Track gearbox, replacing cover
431-127	6.00	Track unit, replacing
44		HYDROSTATIC DRIVE
441-021	3.50	Swing motor, replacing
441-022	0.70	Swing motor relief valve, replacing
441-024	1.75	Swing motor, replacing plate (brake)
441-025	1.50	Swing motor, replacing brake piston seal
441-026	0.80	Swing motor removed, replacing seal
441-111	6.50	Track motor, replacing
441-112	0.70	Track motor relief valve, replacing
443-037	6.00	Center passage, replacing

Op.no.	time (h)	Notes
443-038	6.00	Center passage, replacing seal kit
49		MISCELLANEOUS
492-021	11.00	Swing ring gear, replacing
492-031	3.00	Swing ring gear outer seal, replacing
492-032	9.00	Swing ring gear inner seal, replacing
492-032	9.00	Swing ring gear inner seal, replacing
492-091	0.50	Ring gear grease pipe, replacing
7		FRAME; SPRINGS; DAMPING; AXLE SUSPENSION; WHEEL/TRACK UNIT
71		FRAME
710-001	3.50	Superstructure, removing
710-002	4.50	Superstructure, installing
716-003	2.00	Counterweight, replacing
77		WHEELS; TRACKS; TYRE; HUB; DRUM
775-009	2.50	Front idler, removing
775-010	3.00	Front idler, installing
775-011	4.50	Front idler, replacing one
775-021	3.50	Sprocket, replacing one
775-034	1.75	Track chain assembly, removing
775-035	2.00	Track chain assembly, installing
775-036	11.00	Track links, replacing
775-081	4.50	Track recoil spring (tensioner) assembly, replacing
775-094	1.75	Full track guard, replacing
8		MACHINERY HOUSE; CAB; EXTERIOR TRIM PARTS ANYWHERE
81		CAB, NAKED; CANOPY
810-001	1.75	Cab, removing
810-002	2.50	Cab, installing
810-070	1.00	Electric pedal control on X1 (on/off), replacing
810-071	0.90	Electric pedal control on X1 (proportional), replacing
82		ENGINE HOOD; MUDGUARD; FOOT STEP
827-091	1.00	Tool box assembly, replacing
84		TRIM PART, OUTSIDE; GLASS; SEALING MOULDING
843-002	1.50	Windscreen, replacing

Op.no.	time (h)	Notes
843-012	4.50	Rear window, replacing
843-013	4.50	Side window, replacing
843-048	0.90	Door window, replacing
85		CAB INTERIOR/UPHOLSTERY
852-008	1.25	Seat, replacing
852-012	1.75	Longitudinal adjustment cable, replacing
852-013	0.60	Longitudinal suspension cable, replacing
852-089	0.30	Seat cushion, replacing
852-090	0.60	Backrest, replacing
852-091	2.50	Seat support, replacing
87		AIR CONDITIONING UNIT
870-001	3.50	Cooler and Heater assembly, replacing
870-017	1.75	CCM, changing non-programmed ECU
870-018	1.75	CCM, changing pre-programmed ECU
872-001	0.50	Cab filter, replacing
873-004	3.00	Heater core, replacing
873-006	0.80	Fan motor, replacing
873-011	0.50	Air mix door actuator, replacing
874-006	2.00	Compressor, replacing incl draining and filling
874-010	1.50	Condenser, replacing incl draining and filling
874-011	1.75	Receiver, replacing incl draining and filling
874-012	4.00	Evaporator, replacing incl draining and filling
874-013	4.00	Expansion valve, replacing incl draining and filling
874-016	0.30	Compressor, replacing magnetic clutch (compressor removed)
874-094	0.50	Vent actuator, replacing
874-095	0.60	Mode (foot) actuator, replacing
874-096	0.50	Intake actuator, replacing
88		INTERIOR EQUIPMENT
881-003	0.60	Instrument panel, replacing (left)
881-005	0.80	Instrument panel, replacing (right)
