Note:

1. When tip boom is used, the lifting capacity on tip boom is the same as that on main boom head within the same radius, but it can not exceed 55.1×1000 lb.
2. Whether the tip boom is used or not, the lifting capacity on main boom is the same ;
3. Load hook attached on tip boom can not work together with that on main boom head.

ZOOMLION

Note: The lifting capacity is given in “(lb)×1000”, and “*/” indicates “lifting capacity/radius”. The lifting capacities whose background colors are grey are determined by strength of boom frame; while those whose background color are white depend on the stability of the machine.

Note:

1. Load hook attached on tip boom can not work together with that on light boom head (luffing jib head).
2. When tip boom is used, the lifting capacity on tip boom is the same as that on light boom head within the same radius, but it can not exceed 27.6×1000 lb.

ZOOMLION

Note: The lifting capacity is given in “(lb)×1000”, and “*/*” indicates “lifting capacity/radius”. The lifting capacities whose background colors are grey are determined by strength of boom frame.

When S-boom angle is 85°, the W-luffing jib angle can be adjusted from 15° to 75°;

When S-boom angle is 75°, the W-luffing jib angle can be adjusted from 15° to 65°;

When S-boom angle is 65°, the W-luffing jib angle can be adjusted from 15° to 55°;

The W-luffing jib angle should be kept at least 10° smaller than the S-boom angle.

Note: When S-boom angle varies from 65° to 75° or 75° to 85°, we should determine the corresponding smaller value in the chart as the rated lifting capacity. In order to give full play to the crane's performance, please operate the crane under the operating conditions with three prescribed boom angles.

Note: Under this boom configuration with S-boom angle of 85°: when W-luffing jib angle exceeds 60°, the luffing jib with a load should not be raised/lowered at high speed. And the load should be the min. lifting capacity under this boom configuration; otherwise the luffing jib is liable to overturning. Before the load is detached from the load hook, lower the luffing jib to a position (less than 60°). In other words, lower the luffing fly jib to 60° by the pulling force of load.

[illegible]

1. Whether the tip boom is used or not, the lifting capacity on luffing jib is the same.
2. When tip boom is used, the lifting capacity on tip boom is the same as that on luffing jib head within the same radius, but it can not exceed $27.6 \times 1000 \text{ lb}$.

ZOOMLION

Note: The lifting capacity is given in “(lb)×1000”, and “*/” indicates “lifting capacity/radius”. The lifting capacities whose background colors are grey are determined by strength of boom frame; while those whose background color are white depend on the stability of the machine.

Note: main boom and fixed jib are not permitted to work at the same time.

ZOOMLION

Note:

1. The lifting capacity is given in "(lb)×1000", and "**/*" indicates "lifting capacity/radius". The lifting capacities whose background colors are grey are determined by strength of boom frame; while those whose background color are white depend on the stability of the machine.
2. Under this boom configuration, S-boom angle varies from **50~83°**, FV- heavy fixed jib angle is either **14°** or **20°** and heavy fixed jib length is **6m**.
